6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	8.54	annual days of extreme heat
Extreme Precipitation	6.90	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	14.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract

Exposure Indicators	—
AQ-Ozone	7.52
AQ-PM	14.5
AQ-DPM	30.0
Drinking Water	48.2
Lead Risk Housing	23.7

SWCA Project No. 73999

May 2023

EXECUTIVE SUMMARY

SWCA Environmental Consultants (SWCA) has prepared this Biological Impact Report (BIR) for the Cypress Point Affordable Housing Community Project (Project). MidPen Housing Corporation (MidPen) is proposing the construction of a 66,738-square-foot affordable housing community, which will include 71 units in 16 two-story buildings and a community building, in the community of Moss Beach, San Mateo County, California. The Project would cluster the residential units toward the northwestern corner of the site, retaining the forested open space on the northernmost portion of the site, and leaving room for landscaping and public trails to the south and east. The Project does not include changes to the two existing water tanks on the site.

The purpose of this BIR is to document the biological resources within the Project biological study area (BSA), which consists of the Project footprint (Project area) and a 200-foot buffer surrounding the Project area. SWCA conducted a literature review of existing sources of information regarding occurrences of special-status species and sensitive resources near the BSA. A field survey was conducted within the BSA to document biological resources, including special-status plant and animal species, potentially jurisdictional wetlands and other waters, and environmentally sensitive habitat areas (ESHAs) as defined by the San Mateo County Local Coastal Plan (LCP).

No special-status species were observed within the BSA during the biological field survey. Similarly, no jurisdictional wetlands, water features, or riparian corridors were observed within the Project area.

The BSA has a moderate to high potential to support one special-status plant species—Choris' popcorn flower (*Plagiobothrys chorisianus* var. *chorisianus*)—and one special-status animal species—California red-legged frog (*Rana draytonii*). There is no U.S. Fish and Wildlife Service (USFWS)-designated critical habitat or National Oceanic and Atmospheric Administration (NOAA) designated critical habitat located within the BSA. Three of the vegetation communities observed in the BSA provide suitable nesting and foraging habitat for nesting birds covered under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC).

1 INTRODUCTION

1.1 Purpose of Biological Resources Evaluation

This Biological Impact Report (BIR) has been prepared by SWCA Environmental Consultants (SWCA) at the request of the MidPen Housing Corporation (MidPen) and San Mateo County in support of the Cypress Point Affordable Housing Community Project (Project). The intent of this BIR is to identify sensitive biological resources and environmentally sensitive habitat areas (ESHAs), as defined by the San Mateo County Local Coastal Plan (LCP), that may be impacted by the development of the Project. This BIR includes the results from a desktop review, literature search, and field survey of the Project area, including areas within a 200-foot buffer of the Project area, referred to hereafter as the biological study area (BSA).

1.2 Project Location and Description

The proposed Project is located on an 11.02-acre parcel adjacent to the northeast corner of Carlos and Sierra Streets in the unincorporated community of Moss Beach, San Mateo County, California (Figures 1 and 2). The latitude and longitude of the Project are 37.533542, -122.515883, respectively. The Project is located in Section 4, Township 5 South, and Range 6 West and lies within the extent of the Montara Mountain, California U.S. Geological Survey (USGS) 7.5-minute quadrangle. The parcel is designated as Assessors' Parcel Number (APN) 037-022-070.

The proposed Project is an affordable housing development sponsored by MidPen and designed to provide affordable housing in the San Mateo Midcoast region. The intention of the Project sponsors and County of San Mateo (County) is to improve the jobs/housing balance and jobs/housing fit by providing preference for those who live or work on the San Mateo Coast. The Project consists of development of a 66,738-square-foot affordable housing community, which will include 71 units in 16 two-story buildings and a community building. The Project includes six different building layouts and unit configurations, ranging in height from 23 to 28 feet, which would be clustered toward the northwestern corner of the site, retaining the forested open space on the northernmost portion of the site, and leaving room for landscaping and public trails to the south and east. The project would retain approximately 193 of the existing trees on the site and remove approximately 295 trees. Of the 295 trees proposed to be removed, approximately 190 are considered Significant or Heritage (HortScience 2022). The Project does not include changes to the two existing water tanks on the site.

2 REGULATORY SETTING

2.1 Federal

2.1.1 *Clean Water Act*

Section 404 of the Clean Water Act (CWA) prohibits the discharge of dredged or fill material into waters of the United States (WOTUS). Policies relating to the loss of aquatic habitats generally stress the need for no net loss of wetland resources. Under Section 404, actions in WOTUS may be subject to an individual permit, nationwide permit (NWP), or regional general permit, or may be exempt from regulatory requirements.

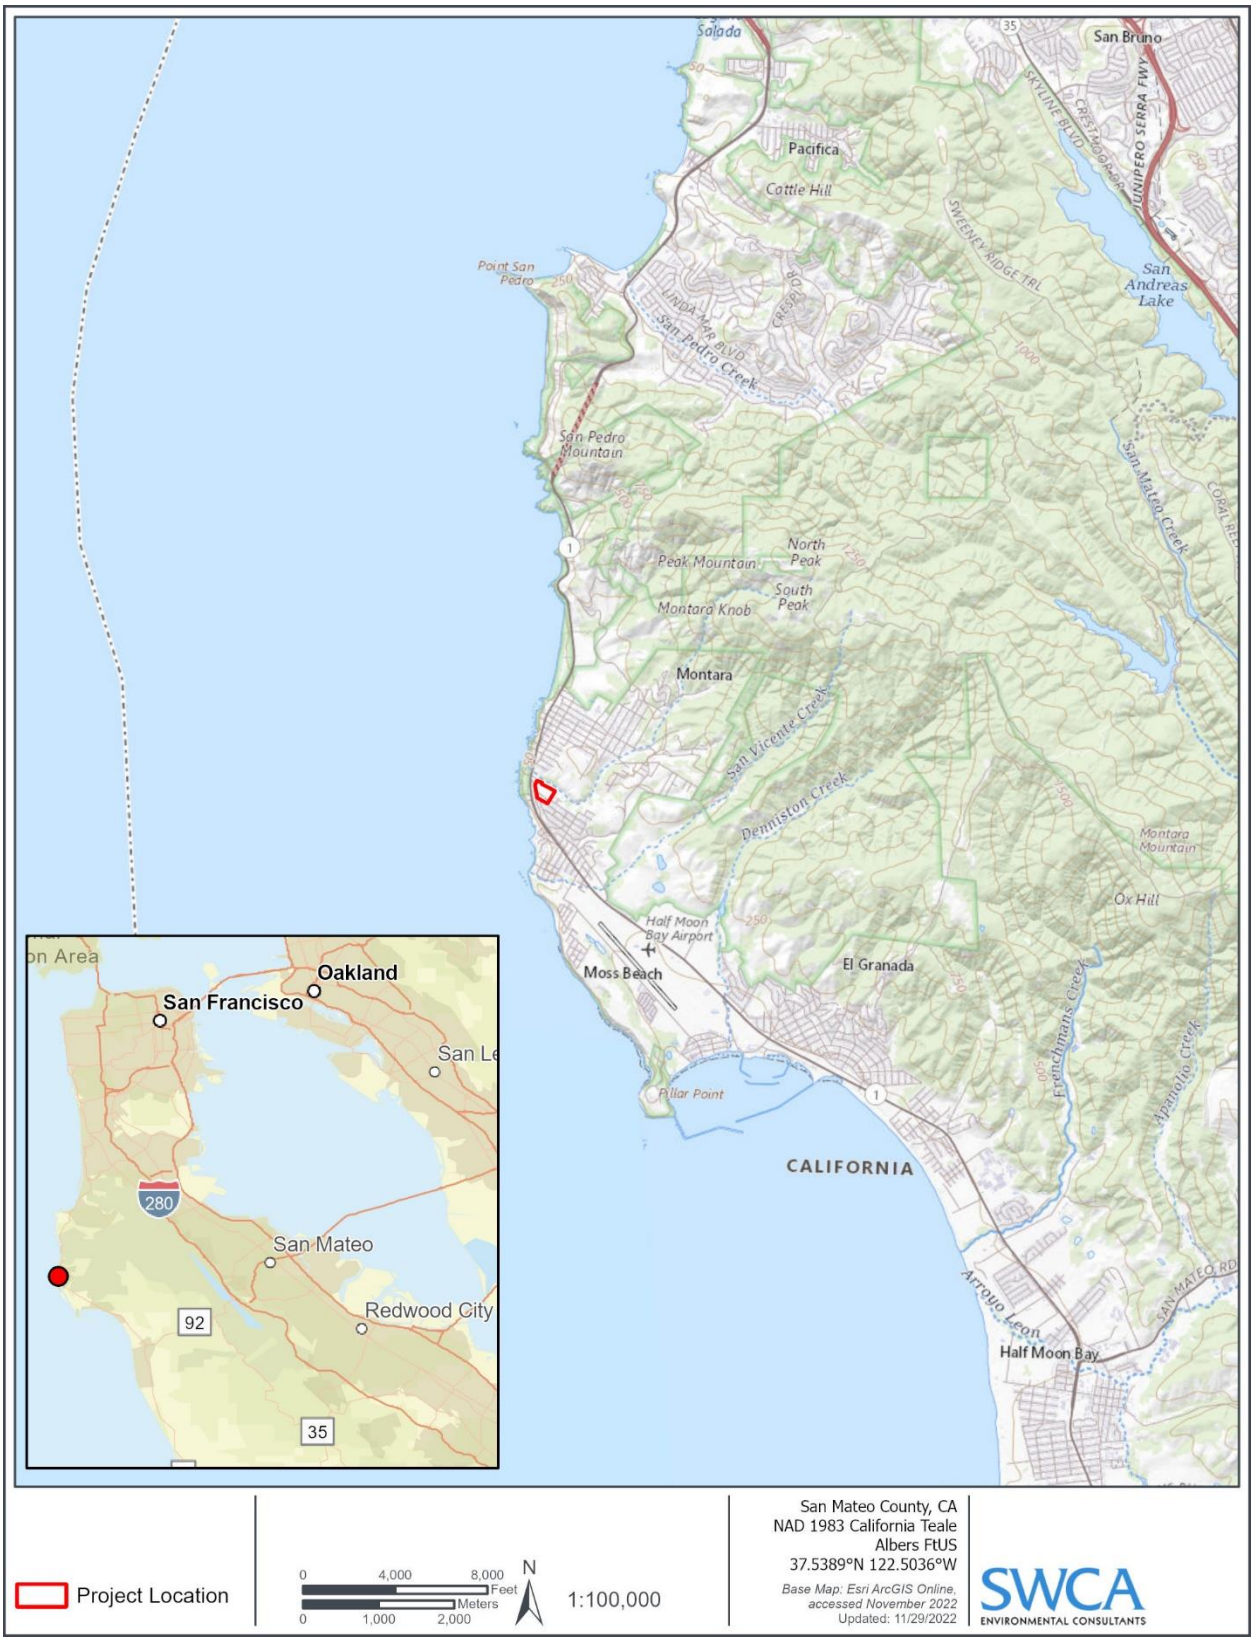

Figure 1. Project location map.

Figure 2. Project vicinity map.

The protection of federal jurisdictional WOTUS has been historically contentious and subject to numerous legal decisions. Most recently, on December 30, 2022, the U.S. Army Corps of Engineers (USACE) and U.S. Environmental Protection Agency (USEPA) announced a final rule (USACE and USEPA 2020) that will update the definition of WOTUS from 1986. A summary of that definition of WOTUS is as follows:

1. Traditional navigable waters, the territorial seas, and interstate waters;
2. Impoundments of waters of the United States;
3. Tributaries to traditional navigable waters, the territorial seas, interstate waters, or impoundments of waters of the United States, if the tributaries meet either the relatively permanent standard or the significant nexus standard;
4. Wetlands (a) adjacent to traditional navigable waters, the territorial seas, and interstate waters; (b) adjacent to and with a continuous surface connection to relatively permanent impoundments of waters of the United States; (c) adjacent to tributaries that meet the relatively permanent standard; and (d) adjacent to and with a significant nexus to impoundments of waters of the United States or jurisdictional tributaries; and
5. Intrastate lakes and ponds, streams, or wetlands not listed above that meet either the relatively permanent standard or the significant nexus standard.

Wetlands are defined as those areas "that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 Code of Federal Regulations [CFR] 328.3(b)). Because of the ongoing controversy and legal challenges surrounding WOTUS, there may be additional changes to federal regulations during Project planning that would be captured during design and permitting.

2.1.2 *Endangered Species Act*

The Federal Endangered Species Act (FESA) of 1973 is administered by the U.S. Fish and Wildlife Service (USFWS) and prevents the unlawful "take" of listed fish, animal, and plant species. Section 9(a)(1)(B) specifically states take of species listed as threatened or endangered is unlawful. Take is defined as any action that would harass, harm, pursue, hunt, wound, shoot, kill, trap, capture, or collect any threatened or endangered species. Section 10 of the FESA allows the USFWS to issue incidental take permits if take of a listed species may occur during otherwise lawful activities. Section 10(a)(1)(B) requires a Habitat Conservation Plan for an incidental take permit on non-federal lands.

2.1.3 *Migratory Bird Treaty Act*

The Migratory Bird Treaty Act (MBTA) of 1918 (16 United States Code [USC] 703–711) prohibits taking, killing, possessing, transporting, and importing of migratory birds, parts of migratory birds, and their eggs and nests, except when specifically authorized by the U.S. Department of the Interior. As used in the MBTA, the term "take" is defined as meaning, "to pursue, hunt, capture, collect, kill or attempt to pursue, hunt, shoot, capture, collect or kill, unless the context otherwise requires." An April 11, 2018, memorandum from the USFWS, which enforces the MBTA, provided guidance to "clarify what constitutes prohibited take" (USFWS 2018). The USFWS memorandum stated that the "take of birds, eggs or nests" was prohibited only when the purpose of the activity was to conduct take but was not prohibited when the purpose of the activity was not to conduct take. On January 7, 2021, the USFWS published the Final Rule formalizing this interpretation of the MBTA (USFWS 2021). Therefore, the MBTA is currently limited to purposeful actions, such as directly and knowingly removing a nest to

construct a project, hunting, and poaching and not to actions resulting in incidental take. This rule should be monitored closely as it may change again in the near future under the current administration.

2.2 State

2.2.1 *California Endangered Species Act*

The California Endangered Species Act (CESA) of 1970 generally parallels the main provisions of the FESA, but unlike its federal counterpart, the CESA applies the take prohibitions to species proposed for listing (called "candidates" by the state). Section 2080 of the California Fish and Game Code (CFGC) prohibits the take, possession, purchase, sale, and import or export of endangered, threatened, or candidate species, unless otherwise authorized by permit or in the regulations. Take is defined in CFGC Section 86 as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." The CESA allows for take incidental to otherwise lawful activities under CFGC Section 2081. Project proponents wishing to obtain incidental take permits are able to do so through a permitting process outlined in California Code of Regulations (CCR) Section 783.

2.2.2 *California Fish and Game Code*

2.2.2.1 FULLY PROTECTED SPECIES

The State of California first began to designate species as "Fully Protected" before the creation of the FESA and CESA. Lists of Fully Protected Species were initially developed to provide protection to those animals that were rare or faced possible extinction, and included fish, mammals, amphibians, reptiles, and birds. Most Fully Protected Species have since been listed as threatened or endangered under the FESA and/or CESA. The Fully Protected Species Statute (CFGC Section 4700) provides that Fully Protected Species may not be taken or possessed at any time. Furthermore, the California Department of Fish and Wildlife (CDFW) may authorize take of Fully Protected Species only in very limited circumstances, such as for necessary scientific research.

2.2.2.2 PROTECTION FOR BIRDS

According to CFGC Section 3503, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (with limited exceptions). Section 3503.5 specifically protects birds in the orders Falconiformes and Strigiformes (birds of prey). Section 3513 essentially overlaps with the MBTA, prohibiting the take or possession of any migratory non-game bird. Disturbances that cause nest abandonment and/or loss of reproductive effort are considered "take" by the CDFW.

2.2.2.3 PROTECTION FOR PLANTS

The Native Plant Protection Act (NPPA) of 1977 (CFGC Sections 1900–1913) includes provisions that prohibit the take of endangered or rare native plants. The CDFW administers the NPPA and generally regards as rare many plant species with a California Rare Plant Rank (CRPR) of 1A, 1B, 2A, and 2B in the California Native Plant Society (CNPS) Rare Plant Inventory (CNPS 2022a). In addition, sometimes CRPR 3 and 4 plants are considered if the population has local significance in the area and is impacted by the Project. Section 191(b) of the CFGC includes a specific provision to allow for the incidental removal of endangered or rare plant species, if not otherwise salvaged by CDFW, within a right-of-way to allow a public utility to fulfill its obligation to provide service to the public.

2.2.2.4 LAKE AND STREAMBED ALTERATION AGREEMENT

Section 1602 of the CFGC requires that a Lake and Streambed Alteration Agreement application be submitted to the CDFW for "An entity may not substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake." Evaluation of CDFW jurisdiction followed guidance in the CFGC and *A Review of Stream Processes and Forms in Dryland Watersheds* (CDFW 2010). In general, under CFGC Section 1602, CDFW jurisdiction extends to the maximum extent or expression of a stream on the landscape (CDFW 2010).

2.2.3 *California Species of Special Concern*

Species of Special Concern (SSC) is a category conferred by the CDFW to fish and animal species that meet the state definition of threatened or endangered, but have not been formally listed (e.g., federally or state-listed species), or are considered at risk of qualifying for threatened or endangered status in the future based on known threats. SSC is an administrative classification only, but these species should be considered "special-status" for the purposes of the California Environmental Quality Act (CEQA) analysis (see Section 3.1.1, *Special-Status Plant Species*, and Section 3.1.2, *Special-Status Animal Species*).

2.2.4 *Porter-Cologne Water Quality Control Act*

The Regional Water Quality Control Board (RWQCB) regulates activities pursuant to CWA Section 401(a)(1). Section 401 specifies that certification from the state is required for any applicant requesting a federal license or permit to conduct any activity, including, but not limited to, the construction or operation of facilities that may result in any discharge into navigable waters. Through the Porter-Cologne Water Quality Control Act (Porter-Cologne Act), the RWQCB asserts jurisdiction over "waters of the state" (WOTS), which are generally identical in extent to WOTUS, but may also include waterbodies not currently under federal jurisdiction, such as isolated, intrastate waters. The Porter-Cologne Act defines WOTS as "surface water or ground water, including saline waters, within the boundaries of the state."

2.3 Local

2.3.1 *California Coastal Act and County of San Mateo Local Coastal Program*

The California Coastal Act (CCA) of 1976 governs the decisions made by the California Coastal Commission (CCC) regarding issues such as shoreline public access and recreation, terrestrial and marine habitat protection, water quality, commercial fisheries, and development within the California coastal zone. Development within the coastal zone requires either a Coastal Development Permit (CDP) or CDP Exemption from the CCC or from a local government with a CCC-certified LCP. Pursuant to Public Resources Code (PRC) Section 30106, development in this context means:

> . . . on land, in or under water, the placement or erection of any solid material or structure; discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste; grading, removing, dredging, mining, or extraction of any materials; change in the density or intensity of use of land, including, but not limited to, subdivision pursuant to the Subdivision Map Act (commencing with Section 66410 of the Government Code), and any other division of land, including lot splits, except where the

> land division is brought about in connection with the purchase of such land by a public agency for public recreational use; change in the intensity of use of water, or of access thereto; construction, reconstruction, demolition, or alteration of the size of any structure, including any facility of any private, public, or municipal utility; and the removal or harvesting of major vegetation other than for agricultural purposes, kelp harvesting, and timber operations which are in accordance with a timber harvesting plan submitted pursuant to the provisions of the Z'berg-Nejedly Forest Practice Act of 1973 (commencing with Section 4511).

Whereas, "structure" includes, but is not limited to, any building, road, pipe, flume, conduit, siphon, aqueduct, telephone line, and electrical power transmission and distribution line.

The CCC also regulates activities in wetlands. Unlike the federal government, the CDFW and CCC have adopted the Cowardin et al. (1979) definition of wetlands:

> Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface of the land or is covered by shallow water. For purposes of this classification, wetlands must have one or more of the following three attributes: (1) at least periodically, the land supports predominantly hydrophytes (at least 50 percent of the aerial vegetative cover); (2) the substrate is predominantly undrained hydric soil; and (3) the substrate is nonsoil and is saturated with water or covered by shallow water at some time during the growing season of each year.

The Project is located within the coastal zone in San Mateo County. The San Mateo County LCP was approved by the County Board of Supervisors and CCC in 1980. In April 1981, the County assumed responsibility for implementing the State Coastal Act in the unincorporated areas of San Mateo County, including issuance of CDPs. For a permit to be issued, the development must comply with the policies of the LCP and those ordinances adopted to implement the LCP. The LCP defines wetlands as:

> . . . an area where the water table is at, near, or above the land surface long enough to bring about the formation of hydric soils or to support the growth of plants which normally are found to grow in water or wet ground. Such wetlands can include mudflats (barren of vegetation), marshes, and swamps. Such wetlands can be either fresh or saltwater, along streams (riparian), in tidally influenced areas (near the ocean and usually below extreme high water of spring tides), marginal to lakes, ponds, and man-made impoundments. Wetlands do not include areas which in normal rainfall years are permanently submerged (streams, lakes, ponds and impoundments), nor marine or estuarine areas below extreme low water of spring tides, nor vernally wet areas where the soils are not hydric.
>
> In San Mateo County, wetlands typically contain the following plants: cordgrass, pickleweed, jaumea, frankenia, marsh mint, tule, bullrush, narrow-leaf cattail, broadleaf cattail, pacific silverweed, salt rush, and bog rush. To qualify, a wetland must contain at least a 50% cover of some combination of these plants, unless it is a mudflat.

The County provides the following definition for Sensitive Habitats:

> . . . any area in which plant or animal life or their habitats are either rare or especially valuable and any area which meets one of the following criteria: (1) habitats containing or supporting "rare and endangered" species as defined by the State Fish and Game Commission, (2) all perennial and intermittent streams and their tributaries, (3) coastal tide lands and marshes, (4) coastal and offshore areas containing breeding or nesting sites

> and coastal areas used by migratory and resident water-associated birds for resting areas and feeding, (5) areas used for scientific study and research concerning fish and wildlife, (6) lakes and ponds and adjacent shore habitat, (7) existing game and wildlife refuges and reserves, and (8) sand dunes.
>
> Sensitive habitat areas include, but are not limited to, riparian corridors, wetlands, marine habitats, sand dunes, sea cliffs, and habitats supporting rare, endangered, and unique species.

Policies of the San Mateo County LCP take precedence over San Mateo County General Plan policies for property located in the Coastal Zone. Actions taken by counties or municipalities within the coastal zone may be appealed to the CCC only under defined circumstances (specified in PRC Section 30603). The CCC also retains permit authority in certain limited areas, such as tidelands and submerged lands (CCA Section 30519(b)). Development must also comply with other provisions of the County Code and Ordinances, such as zoning, building, and health regulations.

2.3.2 *Significant Tree Ordinance of San Mateo County*

The Significant Tree Ordinance (2016) governs the cutting of significant trees and tree communities and requires the replacement of significant trees communities on public and private property within the unincorporated area of the County. Cutting or removal of a Significant Tree requires a permit from the County. The County defines significant trees as "any live woody plant rising above the ground with a single stem or trunk of a circumference of thirty-eight (38") or more measured at four- and one-half feet (4 ½') vertically above the ground or immediately below the lowest branch, whichever is lower, and having the inherent capacity of naturally producing one main axis continuing to grow more vigorously than the later axes."

2.3.3 *Regulations for the Protections of Heritage Trees*

These Heritage Trees Ordinance (2016) requires submittal of an Existing Tree Plan, including (1) an Arborist's report of all significant or heritage trees to be removed, and (2) a Tree Protection Plan for all trees to be preserved.[1,2] Permits must be acquired for all regulated trees to be removed. The Planning Commission will act upon any tree removal in a scenic corridor. Significant trees to be removed must be replaced with 3 or more trees, as determined by the Community Development Director.

3 METHODOLOGY

3.1 Literature and Records Review

SWCA performed an extensive literature review, including a review of the previously-prepared August 2020 DeNovo *Biological Resources Report*, and the 2022 HortScience | Bartlett Consulting *Arborist Report* to gain familiarity with the Project and identify potential sensitive biological features, including ESHAs, target flora and fauna species, and wetlands or other waters that have the potential to occur in the BSA (Figure 3). The review consisted of a records search of current versions of the USFWS online Information for Planning and Consultation (IPaC) species list system (USFWS 2023b) (Appendix A),

CDFW California Natural Diversity Database (CNDDB 2023) (Appendix B), and CNPS Online Inventory of Rare and Endangered Plants (CNPS 2023b) within the Montara Mountain, San Mateo, and Half Moon Bay, California USGS 7.5-minute quadrangles (USGS 2023a). The CNDDB and CNPS searches were further refined to a 2-mile search surrounding the Project area (see Appendix B). The USFWS Critical Habitat Mapper (USFWS 2023a) was queried to identify critical habitat for terrestrial and aquatic species near the BSA (Appendix C). All of the special-status species and sensitive habitats found in the literature review were compiled into a table for use during the field survey, as described in Section 3.2, *Field Survey* (Appendix D).

The National Wetlands Inventory (NWI) Database (USFWS 2023c) and USGS National Hydrography Dataset (NHD) (USGS 2023b) (Appendix E), U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) Soil Survey for San Mateo County (NRCS 2023) (see Appendix E), and aerial imagery were also reviewed to provide additional information for soils and potential wetland features known to occur in the BSA.

3.1.1 *Special-Status Plant Species*

For the purposes of this BIR, special-status plant species are defined as the following:

- Plants listed or proposed for listing as threatened or endangered under the FESA (50 CFR 17.12 for listed plants and various notices in the *Federal Register* for proposed species).
- Plants that are candidates for possible future listing as threatened or endangered under the FESA.
- Plants considered by the CNPS to be “rare, threatened, or endangered” in California (CRPR 1A, 1B, 2A, and 2B in CNPS [2023b]).
- Plants listed or proposed for listing by the State of California as threatened or endangered under the CESA (14 CCR Section 670.5).
- Plants listed under the NPPA (CFGC Section 1900 et seq.).
- Plants considered sensitive by other federal agencies (e.g., U.S. Forest Service, U.S. Bureau of Land Management), state and local agencies, or jurisdictions.

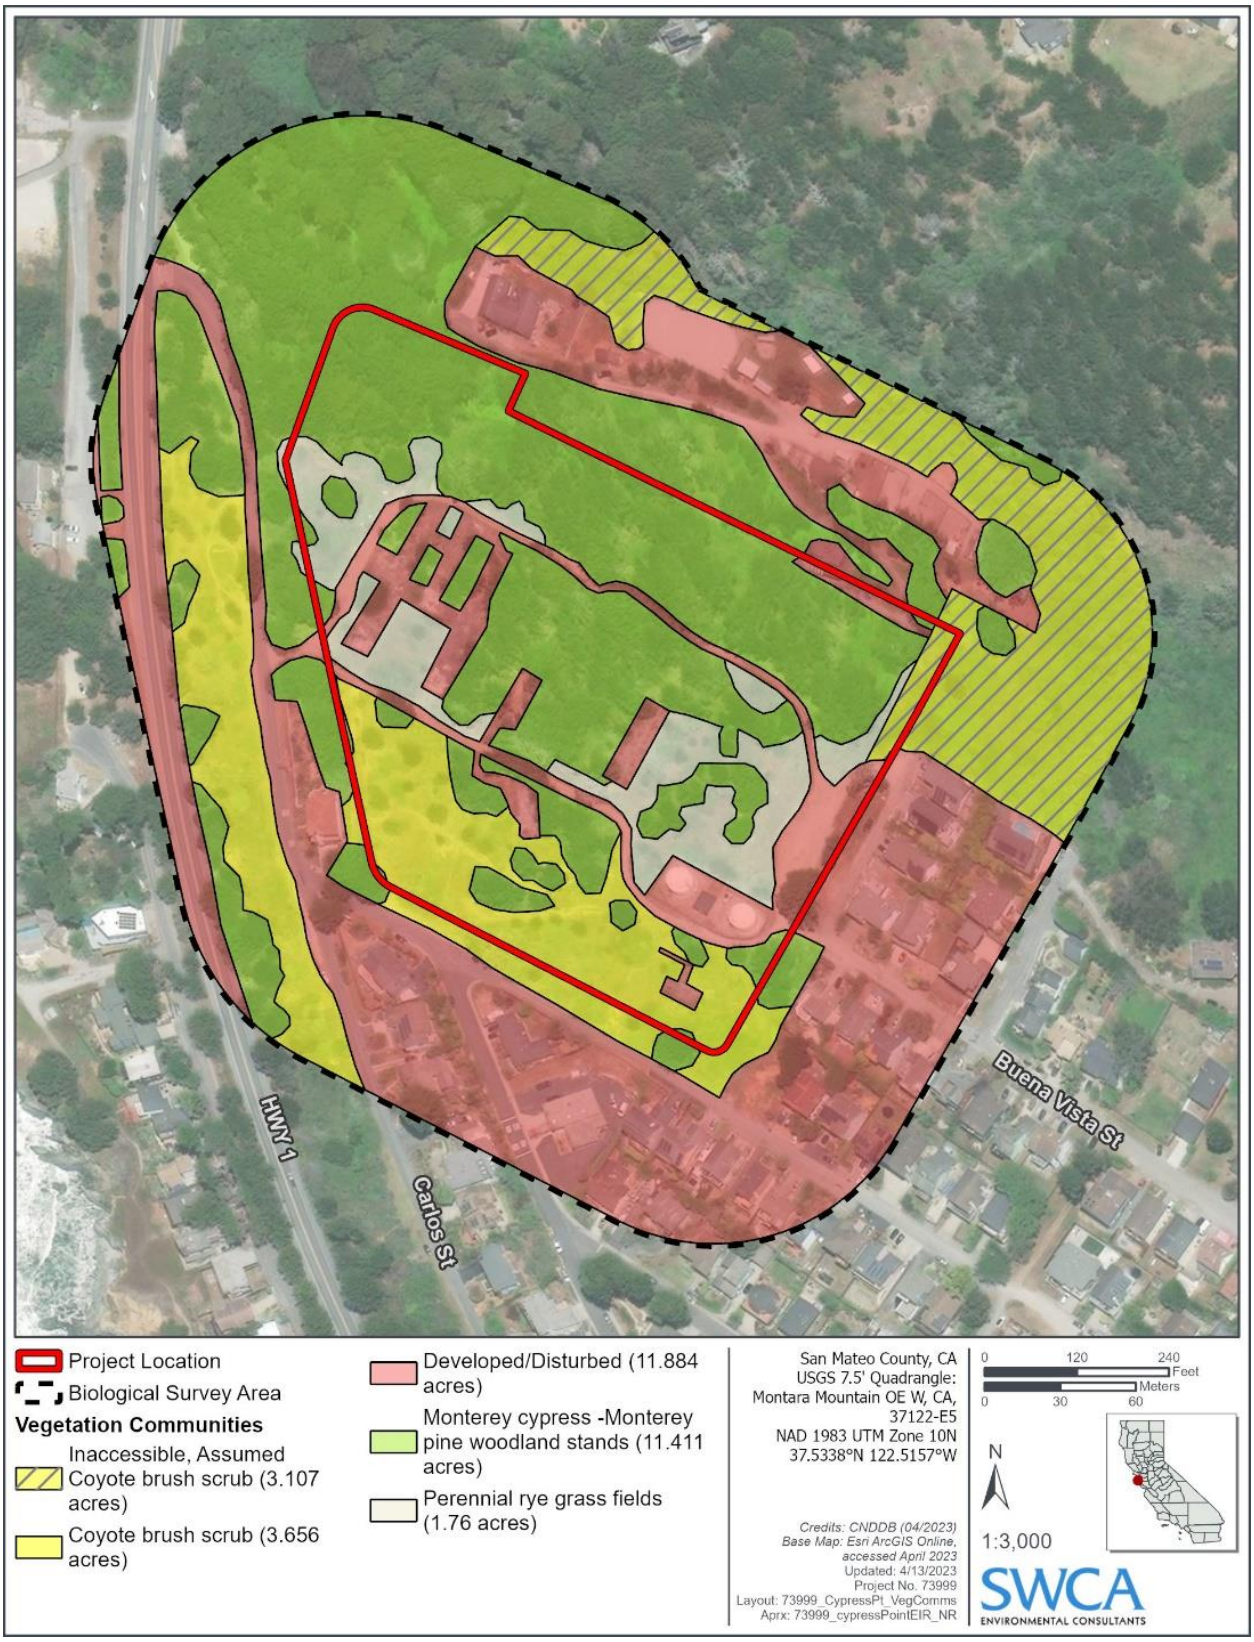

Figure 3. Biological resources map: vegetation communities.

3.1.2 *Special-Status Animal Species*

For the purposes of this BIR, special-status animal species are defined as the following:

- Animals listed or proposed for listing as threatened or endangered under the FESA (50 CFR 17.11 for listed animals and various notices in the *Federal Register* for proposed species).
- Animals that are candidates for possible future listing as threatened or endangered under the FESA.
- Animals listed or proposed for listing by the State of California as threatened and endangered under the CESA (14 CCR 670.5).
- Animals that are SSC to the CDFW.
- Animal species that are Fully Protected in California (CFGC Sections 3511 [birds], 4700 [mammals], and 5050 [reptiles and amphibians]).

3.2 Field Survey

On April 3, 2023, SWCA biologist Charlotte Soergel conducted a reconnaissance-level survey of the BSA. The purpose of the field survey was to evaluate the presence or absence of suitable habitat for special-status species determined to have the potential to occur in the BSA, sensitive habitats with potential to occur, potentially jurisdictional wetland features, and other ESHAs as defined by the County LCP. In addition, the surveyor identified and mapped vegetation communities using *A Manual of California Vegetation,* Second Edition (Sawyer et al. 2009). The survey included walking throughout the Project area and the surrounding 250-foot buffer (BSA) where accessible (see Figure 3).

A complete list of plant and animal species observed within the BSA during the field survey is included in Appendix F. When necessary, the biologist referred to *The Jepson Manual* (Baldwin et al. 2012) to identify plant species. Representative photographs depicting existing conditions are included in Appendix G.

4 RESULTS

4.1 Soils, Topography, and Elevation

The topography within the BSA is generally flat and gently slopes westward toward the Pacific Ocean. Elevations within the BSA range from approximately 85 to 195 feet above mean sea level. According to the NRCS Web Soil Survey (NRCS 2023), soils in the BSA consist of one soil type: Typic Argiustolls, loamy-Urban land association, 5 to 15 percent slopes (see Appendix E). Typic Arguistolls soils are moderately well-drained soils comprised of coastal alluvium derived from weathered sedimentary rock. This soil type is moderately well drained and typically occurs along fluviomarine terraces (NRCS 2023).

4.2 Vegetation Communities

The BSA consists of developed uses, including neighboring residences and roadways, water tanks and an associated maintenance structure operated by Montara Water and Sanitary District (MWSD), concrete remnants of military facilities that are scattered throughout the Project area, and dirt access roads that travel around the perimeter of the Project area, and undeveloped land dominated by a mix of native and non-native vegetation. Four vegetation communities were mapped in the BSA and were classified using

the naming conventions of *A Manual of California Vegetation*, Second Edition (Sawyer et al. 2009). Vegetation communities present in the BSA include Monterey cypress – Monterey pine woodland stands (*Hesperocyparis macrocarpa – Pinus radiata* Forest and Woodland Semi-Natural Alliance), coyote brush scrub (*Baccharis pilularis* Shrubland Alliance), perennial rye grass fields, and developed/disturbed areas.

Photographs (see Appendix G) and mapping (see Figure 3) depict the characteristics and locations of vegetation communities within the BSA.

4.2.1 *Monterey Cypress – Monterey Pine Woodland Stands*

Monterey cypress – Monterey pine woodland stands (*Hesperocyparis macrocarpa – Pinus radiata* Forest and Woodland Semi-Natural Alliance) are characterized by a predominance of Monterey cypress (*Hesperocyparis macrocarpa*), Canary Island pine (*Pinus canariensis*), Aleppo pine (*Pinus halepensis*), Italian stone pine (*Pinus pinea*), and Monterey pine (*Pinus radiata*) in the tree canopy along with coast wattle (*Acacia cyclops*) and eucalyptus (*Eucalyptus* spp.) species. This vegetation community is naturalized on the coast and is often planted as trees, groves, and windbreaks (Sawyer et al. 2009).

This vegetation community occurs throughout the BSA with dense cover occurring through the central and along the northern and eastern survey perimeters. This community has the potential to support nesting and foraging birds protected under the MBTA and may provide marginal overwintering habitat for monarch butterfly.

4.2.2 *Coyote Brush Scrub*

Coyote brush scrub is characterized by coyote brush as dominant or co-dominant in the shrub canopy along with coastal sage brush (*Artemisia californica*), blueblossom (*Ceanothus thyrsiflorus*), beaked hazelnut (*Corylus cornuta*), sticky monkeyflower (*Diplacus aurantiacus*), California buckwheat (*Eriogonum fasciculatum*), lizard tail (*Eriophyllum staechadifolium*), California coffeeberry (*Frangula californica*), coast silk tassel (*Garrya elliptica*), salal (*Gaultheria shallon*), oceanspray (*Holodiscus discolor*), deerweed (*Acmispon glaber*), coastal bush lupine (*Lupinus arboreus*), California wax myrtle, California blackberry (*Rubus ursinus*), white sage (*Salvia apiana*), purple sage (*Salvia leucophylla*), and poison oak (*Toxicodendron diversilobum*). Emergent trees may be present at low cover, including Bishop pine (*Pinus muricata*), Douglas fir (*Pseudotsuga menziesii*), coast live oak (*Quercus agrifolia*), or California bay (*Umbellularia californica*). This vegetation community occurs on river mouths, stream sides, terraces, stabilized dunes of coastal bars, spits along the coastline, coastal bluffs, open slopes, and ridges with variable soils ranging from sandy to relatively heavy clay (Sawyer et al. 2009).

This vegetation community occurs throughout the BSA, primarily in the areas where there are gaps in the tree canopy. In the BSA, coyote brush is dominant with cotoneaster (*Cotoneaster coriaceus*), poison oak, California blackberry, ocean spray, red elderberry (*Sambucus racemosa*), and pampas grass (*Cortaderia selloana*) along the western extent of the BSA and southwestern extent of the Project area. Coyote brush scrub in the BSA has the potential to serve as upland dispersal habitat for California red-legged frog and may support special-status plant species, including Choris' popcorn-flower. This community has the potential to support nesting and foraging birds protected under the MBTA.

4.2.3 *Perennial Rye Grass Fields*

Perennial rye grass fields are characterized by a dominance or co-dominance of perennial rye grass in the herbaceous layer along with redtop (*Agrostis stolonifera*), wild oats (*Avena fatua*), black mustard (*Brassica nigra*), ripgut brome (B*romus diandrus*), soft chess (*Bromus hordeaceus*), bull thistle (*Cirsium vulgare*), reed fescue (*Festuca arundinacea)*, common velvetgrass (*Holcus lanatus*), seaside barley

(*Hordeum marinum*), hawkbit (*Leontodon saxatilis*), bird's foot trefoil (*Lotus corniculatus*), Harding grass (*Phalaris aquatica*), Kentucky blue grass (*Poa pratensis*), curly dock (*Rumex crispus*), and various clover species (*Trifolium* spp.).

This vegetation community occurs primarily along the northwest and southern perimeters of the Project area and is dominated by perennial rye grass, wild oats, ripgut brome, four seeded vetch (*Vicia tetrasperma*), and soft chess. Other species observed in this community include Bermuda buttercup (*Oxalis pes-capre*), wild radish (*Raphanus sativus*), rattle snake grass (*Briza maxima*), limited cover of prairie June grass (*Koeleria macrantha*), and common dandelion (*Taraxacum californicum*). Along the southeastern extent of the Project area, limited patches of spreading rush (*Juncus patens*), little-robin (*Geranium purpureum*), bird's foot trefoil (*Lotus corniculatus*), and common cat's ear (*Hypochaeris radicata*) are present. The perennial rye grass field community in the BSA has the potential to serve as upland dispersal habitat for California red-legged frog and may support special-status plant species, including Choris' popcorn-flower. In addition, this community has the potential to support nesting and foraging birds protected under the MBTA.

4.2.4 *Developed/Disturbed*

Developed/disturbed areas are generally characterized by residential or commercial development dominated by a mix of exotic ornamental and native plant species. Vegetation density, canopy cover, and species composition will vary based on purpose and/or design. This habitat type occurs on the eastern, southern, and western sides of the BSA and includes Lincoln, Buena Vista, and Carlos Streets. These areas are characterized by residential development and paved public roadways. Vegetation types in these areas include ornamental trees and shrubs. In addition, within the Project area, there are remnants of concrete structures from previous military uses distributed throughout the site. Two water towers and an associated maintenance hut occur in the southeastern portion of the BSA. Unpaved, dirt maintenance roads traverse the perimeter of the Project area.

Disturbed areas throughout the BSA were dominated by invasive plant species, including French broom (*Genista monspessulana*), cape ivy (*Delairea odorata*), pride of madeira (*Echium candicans*), borage (*Borago officinalis*), fairy stonecrop (*Crassula multicava*), longleaf wattle (*Acacia longifolia*), and periodic ice plant (*Carpobrotus edulis*) mats. Occasional native species occur within this community and include California bee plant (*Scrophularia californica*), California mugwort (*Artemisia douglasiana*), common yarrow (*Achillea millefolium*), and pacific sanicle (*Sanicula crassicaulis*).

4.3 Critical Habitat

There is no federally listed critical habitat within the Project area or BSA. However, there is USFWS federally designated critical habitat for California red-legged frog (a federally threatened species and CDFW SSC) approximately 1.1 mile east of the Project area in San Vicente Creek, which flows south of the Project area towards the Pacific Ocean.

Additionally, there is National Oceanic and Atmospheric Administration (NOAA) federally designated critical habitat for five marine species within 2 miles of the Project area within the Pacific Ocean: black abalone (*Haliotis cracherodii*; a federally endangered species) critical habitat is located approximately 0.1 mile west of the Project area, leatherback sea turtle (*Dermochelys coriacea*; a federally endangered species) critical habitat is located approximately 1 mile west of the Project area, green sturgeon (*Acipenser medirostris*; a federally threatened species) critical habitat is located approximately 1 mile west of the Project area, killer whale (*Orcinus orca*; a federally endangered species) critical habitat is located approximately 1 mile west of the Project area, and humpback whale (*Megaptera novaeangliae*; a federally endangered species) critical habitat is located approximately 1.5 miles west of the Project area.

No critical habitat will be affected by the Project (see Appendix C).

4.4 Special-Status Species with Potential to Occur

Based on the existing biological conditions in and adjacent to the BSA, a review of relevant literature, the known occurrences of special-status species in the area, and SWCA biologists' local knowledge of the region, 10 special-status plant species and eight special-status animal species were identified to have potential to occur within the BSA. Summary descriptions for these species are provided below, and descriptions of other plants and animal species that were evaluated for potential occurrence are provided in Appendix D.

4.4.1 *Special-Status Plant Species*

Based on CNDDB and CNPS queries, 10 special-status plant species were identified with potential to occur in the Montara Mountain, San Mateo, and Half Moon Bay, California USGS 7.5-minute quadrangles. SWCA further evaluated the species and their habitat requirements to identify which special-status plant species have the potential to occur within the BSA. This analysis compared the known habitat requirements of the 10 species with the BSA's existing conditions, elevation, and soils. The evaluation also took into consideration which species had recent occurrences within 2 miles of the BSA (see Appendix B).

No special-status plant species identified during the desktop review were observed during the field survey. The survey was conducted within the bloom windows for all plant species analyzed. One occurrence of Choris' popcorn flower (*Plagiobothrys chorisianus* var. *chorisianus*; CRPR 1B.2) was identified in 2016, located approximately 0.8 mile northeast of the BSA (CNDDB 2023); however, this species was not observed during the April 2023 field survey. Of the ten species considered for potential occurrence (see Appendix D, Table D-1), four species, coastal marsh milkvetch (*Astragalus pycnostachyus* var. *pycnostachyus*), Coast yellow leptisiphon *(Leptosiphon croceus),* San Francisco owl's-clover *(Triphysaria floribunda),* and Ornduff's meadowfoam (*Limnanthes douglasii* ssp. *ornduffii*) were determined to have no potential to occur due to lack of suitable habitat, soils, or elevation requirements.

One species, Choris' popcorn flower, was determined to have moderate potential to occur in the BSA. The following five special-status plant species have low potential to occur within the BSA due to a lack of high-quality suitable habitat and the absence of recent occurrences within the 2-mile records search:

- Blasdale's bent grass (*Agrostis blasdalei*)
- Hickman's cinquefoil (*Potentilla hickmanii*)
- Kellogg's horkelia (*Horkelia cuneata* var. *sericea*)
- Perennial goldfields (*Lasthenia californica* ssp. *macrantha*)
- Rose leptosiphon (*Leptosiphon rosaceus*)

Species that were determined to have low potential to occur or be absent from the BSA are not discussed further in this BIR. Special-status plant species habitat descriptions and rationale for potential to occur in the BSA are provided in Appendix D. Given the above information, in addition to the implementation of avoidance and minimization measures provided in Section 5, *Avoidance and Minimization Measures*, no impacts to special-status plant species are anticipated.

4.4.1.1 CHORIS' POPCORN FLOWER

Choris' popcorn flower is an annual herb in the borage family (Boraginaceae) that blooms from March to June. It typically occurs in mesic areas in coastal prairie, chaparral, northern coastal scrub, and wetland riparian areas, at elevations ranging from 20 to 525 feet (Baldwin et al. 2012; Calflora 2023; CNPS 2023a, 2023b).

There is one CNDDB record of Choris' popcorn flower within 2 miles of the of the BSA (CNDDB 2023), one of which was documented in 2016, located approximately 0.8 mile northeast of the BSA. Choris' popcorn flower has a moderate potential to occur within or adjacent to the BSA due to the suitable mesic coastal scrub habitat. No Choris' popcorn flower was observed at the time of the April 2023 site assessment, which was conducted during the blooming period for this species. Vegetation communities within the BSA that could potentially support this species are limited to coyote brush scrub and perennial rye grass fields. Portions of the Project work area are anticipated to occur in coyote brush scrub and perennial rye grass field vegetation communities; therefore, a preconstruction survey for this species, during the appropriate bloom period of March to June, is recommended. With implementation of avoidance and minimization measures, including preconstruction survey and special-status plant avoidance, provided in Section 5, *Avoidance and Minimization Measures*, no Project impacts to Choris' popcorn flower are anticipated.

4.4.2 *Special-Status Animal Species*

Based on a CNDDB query and a review of existing literature, eight special-status animal species were identified in the Montara Mountain, San Mateo, and Half Moon Bay, California USGS 7.5-minute quadrangles. None of the eight special-status animal species identified during desktop review were observed during the field survey.

SWCA evaluated the species to identify which special-status animal species have the potential to occur within the BSA. This analysis compared the known habitat requirements of those species with the BSA's existing conditions. The evaluation also took into consideration which species have been recorded in the CNDDB within 2 miles of the BSA (see Appendix B).

Of the eight species considered for potential occurrence, one—California red-legged frog (*Rana draytonii*; federally threatened, CDFW SSC)—was determined to have moderate potential to occur within the Project area and BSA. Of the remaining seven species, five were determined to have low potential to occur and two were determined to be absent from the Project area and BSA due to a lack of suitable foraging and/or breeding habitat, aestivating habitat, life history, and/or other biotic considerations.

California red-legged frog was determined to have moderate potential to occur in the BSA, and the following five special-status animal species have low potential to occur within the BSA:

- Western bumble bee (*Bombus occidentalis*): California candidate endangered (low potential)
- Monarch butterfly (*Danaus plexippus*): federal candidate species (low potential)
- Saltmarsh common yellowthroat (*Geothlypis trichas sinuosa*): CDFW SSC (low potential)
- San Francisco garter snake (*Thamnophis sirtalis tetrataenia*): federally and state endangered, CDFW Fully Protected Species (low potential)

Due to its moderate potential to occur, California red-legged frog is discussed in the following section. Species that were determined to have low potential to occur or be absent from the BSA (see Appendix D, Table D-1) are not discussed further in this BIR.

4.4.2.1 CALIFORNIA RED-LEGGED FROG

California red-legged frog, a federally threatened species and CDFW SSC, occurs in various different habitat types, depending on its life cycle stage. Breeding areas include aquatic habitats, such as lagoons, streams, and natural and humanmade ponds. The species prefers aquatic habitats with little or no flow, the presence of surface water to at least early June, surface water depths to approximately 2 feet, and the presence of emergent vegetation (e.g., cattails, bulrush). During periods of wet weather, some individuals may make overland dispersals through adjacent upland habitats of distances up to 1 mile (USFWS 2002). Upland habitats, including small mammal burrows and woody debris, can also be used as refuge during the summer if water is scarce or unavailable (Jennings and Hayes 1994). California red-legged frogs typically travel between sites and are unaffected by topography and vegetation types during migration. Dispersal habitat makes it possible for California red-legged frog to locate to new breeding and non-breeding sites and is crucial for conservation of the species.

Seven California red-legged frog occurrences have been recorded within 2 miles of the BSA between 2006 and 2019 (CNDDB 2023). The closest CNDDB occurrence (2012) was recorded approximately 0.7 mile north of the BSA (see Appendix B). While no suitable aquatic breeding habitat was observed on-site, potentially suitable upland dispersal habitat for this species is present within the BSA. Additionally, Montara Creek, which is located approximately 250 feet north of the Project area and immediately north of the BSA, may provide marginally suitable aquatic dispersal habitat during wet season periods of inundation. Although there is potentially suitable upland dispersal habitat within the BSA, this species is more likely to utilize higher-quality, suitable aquatic and non-breeding habitat within and adjacent to Montara Creek where there is also more woody debris used for refugia. In addition, the BSA does not provide a suitable overland route to other aquatic breeding sites and no small mammal burrows were observed within the BSA. California red-legged frog was not observed in the BSA during the field survey.

Based on the above information and number of known occurrences within 2 miles of the Project area and within the BSA, there is moderate potential for dispersing California red-legged frog to occur in the BSA and Project area during the wet season (October 15–May 31) and low potential for the species to occur in the BSA during the dry season (June 1–October 15). With implementation of avoidance and minimization measures, including having a biological monitor present during Project initial ground-disturbing activities and installation of wildlife exclusion fencing, provided in Section 5, *Avoidance and Minimization Measures*, Project impacts to California red-legged frog are not anticipated.

4.5 Nesting Migratory Passerine Birds and Raptors

The BSA contains suitable nesting and foraging habitat for avian species protected under the MBTA and CFGC Sections 3503 and 3513 during the typical nesting season (February 15–September 15). Suitable nesting and foraging habitats would include the non-native grassland areas, shrubs, and trees within and adjacent to the Project area. Nesting is unlikely outside of the typical nesting season, although some avian species may forage year-round near the site. Avian species protected by the MBTA and CFGC observed in the BSA during the April 2023 field survey included American crow (*Corvus brachyrhynchos*), black phoebe (*Sayornis nigricans*), Brewer's blackbird (*Euphagus cyanocephalus*), California quail (*Callipepla californica*), common raven (*Corvus corax*), house finch (*Haemorhous mexicanus*), house wren (*Troglodytes aedon*), killdeer (*Charadrius vociferus*), red-shouldered hawk (*Buteo lineatus*), red-tailed hawk (*Buteo jamaicensis*), savannah sparrow (*Passerculus sandwichensis*), song sparrow (*Melospiza melodia*), and turkey vulture (*Cathartes aura*).

No nesting birds were observed during the field survey, which occurred during the typical nesting season. However, the Project has the potential to impact nesting birds, including their eggs or young, covered

under the MBTA and CFGC. With implementation of avoidance and minimization measures provided in Section 5, *Avoidance and Minimization Measures*, no impacts to these avian species are anticipated.

4.6 Wildlife Habitat and Movement Corridors

Suitable migration habitat for amphibians, reptiles, birds, and mammals are present along the Pacific Ocean coastline to the west of the BSA. In addition, migrating raptors are known to occur in the area adjacent to the Project area, especially during the fall. However, there are no known migratory corridors that intersect the BSA. The BSA is bordered by urban and residential development to the east and south and Highway 1 to the west. Riparian corridors adjacent to the BSA to the north and south are more likely to be utilized by wildlife traveling through the surrounding area. The BSA contains moderately suitable upland dispersal habitat for California red-legged frog and is likely utilized by common wildlife species. However, because the BSA is contained within residential and urban development, the Project is not expected to interfere substantially with the movement of any native resident or migratory animals.

4.7 Sensitive Habitats

As mentioned previously, coyote brush scrub and perennial rye grass field communities in the BSA may provide moderately suitable upland dispersal habitat for California red-legged frog. However, these vegetation communities within the BSA are unlikely to be considered a Sensitive Habitat by the County given the surrounding development (i.e., fragmentation of habitat) that diminishes the dispersal habitat value. No other Sensitive Habitats, as defined by the San Mateo County LCP Policies 7.1 through 7.14, were observed within the Project area.

4.8 Marine and Wildlife Reserves

The BSA is not located within 200 feet of a marine or wildlife reserve. The closest marine or wildlife reserve to the Project site is the Fitzgerald Marine Reserve, which is located approximately 0.63 mile south of the BSA.

4.9 Wetlands and Waters

A formal wetland delineation was not conducted as part of this BSA. However, no potentially jurisdictional waters or wetlands were observed during the field investigation. Montara Creek is located approximately 250 feet north of the Project area and immediately north of the BSA. In addition, San Vicente Creek is located approximately 0.6 mile south of the BSA.

5 AVOIDANCE AND MINIMIZATION MEASURES

The following avoidance and minimization measures are designed to prevent the Project from having a potentially significant biological impact:

1. Prior to the start of the Project, all construction crew members, including the project stormwater inspector, will attend an environmental awareness training presented by a qualified biologist. A training brochure describing special-status species, Project avoidance and minimization measures, key contacts, and potential consequences of impacts to special-status species and potentially jurisdictional features will be distributed to the crew members during the training. During the training the qualified biologist will review with the project stormwater inspector the requirement

of weekly inspection of wildlife exclusion fencing as described in Avoidance Measure 7. Trainees will sign an environmental training attendance sheet.

2. A preconstruction survey for California red-legged frog shall be conducted within the Project area immediately prior to ground disturbance. If no individuals are detected, then construction-related activities may proceed provided project avoidance and minimization measures in this document are adhered to. If adults are present in the construction area, work shall be stopped until individuals are allowed to disperse on their own volition, or the species is relocated by a qualified biologist with permission to handle California red-legged frog.
3. A qualified biological monitor shall be present during all initial ground-disturbing activities, including grubbing and/or vegetation removal and installation of the wildlife exclusion fence.
4. Disturbance to vegetation shall be kept to the minimum necessary to complete the Project activities. To minimize impacts to vegetation, a qualified biologist shall work with the contractor to designate the work area and any staging areas and clearly delineate areas that shall be avoided with exclusion fencing (e.g., high-visibility orange construction fencing, silt fence, ERTEC fencing, or other similar material).
5. Ground-disturbing construction activities (e.g., grubbing or grading) should occur during the dry season (June 1 to October 15) to facilitate avoidance of California red-legged frog. Regardless of the season, no ground disturbing activities shall occur within 24 hours following a significant rain event (greater than 1/4 inch in a 24-hour period). Following a significant rain event and the 24-hour drying-out period, a qualified biologist would conduct a preconstruction survey for California red-legged frog prior to the restart of any Project ground disturbing activities.
6. To avoid impacts to California red-legged frog and other sensitive wildlife species, a wildlife exclusion fence (e.g., silt fence, ERTEC fencing, or other similar material) shall be installed around the perimeter of the Project, at the discretion of the qualified biologist.
7. The wildlife exclusion fence shall be inspected by a qualified biologist or project stormwater inspector, who has received environmental awareness training from a qualified biologist, on a weekly basis to ensure that the fence is functioning as intended throughout the duration of construction activities that may impact California red-legged frog (e.g., ground disturbance, materials staging/parking required on the north side of the Project Area). Removal of the wildlife exclusion fence may be conducted at the discretion of a qualified biologist if ground disturbance activities have been completed and remaining Project activities would not impact California red-legged frog (i.e., only interior site build out activities remain).
8. Regardless of the season, construction shall adhere to State Water Resources Control Board best management practices (BMPs), and no ground disturbing activities shall occur within 24 hours following a significant rain event (defined as greater than 1/4 inch in a 24-hour period).
9. Before completion of the Project, all exposed or disturbed surfaces shall be permanently protected from erosion with reseeding and landscaping.
10. If any animals are encountered during Project activities, said animals shall be allowed to leave the work area unharmed. Animals shall not be picked up or moved in any way.
11. All spoils, such as dirt, excavated material, debris, and construction-related materials, generated during Project activities shall be placed within the limits of the designated construction area. Spoils shall be covered or secured to prevent sediment from escaping. Once the spoil pile is no longer active, it shall be removed from the work area and disposed of lawfully at an appropriate facility.
12. All exposed soils in the work area resulting from Project activities shall be stabilized immediately following the completion of work to prevent erosion. Erosion and sediment control BMPs, such

as silt fences, straw hay bales, gravel or rock-lined drainages, water check bars, and broadcast straw, can be used. BMPs shall be made of certified weed-free materials. Straw wattles, if used, shall be made of biodegradable fabric (e.g., burlap) and free of monofilament netting. At no time shall silt-laden runoff be allowed to enter any drainages or other sensitive areas.

13. Prior to the start of construction, a preconstruction survey for Choris' popcorn flower shall be conducted during the appropriate blooming period. Choris' popcorn flower occurrences within 50 feet of the Project work areas shall be flagged for avoidance by the Project. If the Project cannot avoid impacts to this species, MidPen shall consult with the CDFW on appropriate measures and/or actions to protect or salvage the plant(s) prior to beginning construction.
14. During Project activities, all trash that may attract predators shall be properly contained, removed, and disposed of regularly. Following construction, trash/construction debris shall be removed from work areas.
15. Construction materials, including, but not limited to, wooden pallets, BMPs, equipment, or other materials, that are left on the ground for more than 24 hours shall be inspected before and during moving of the materials to prevent potential impacts to animals that may have used the materials as a temporary refuge. Plastic pipes, if used, shall be covered with material to prevent animals from entering the pipes.
16. The number of access routes, number and size of staging areas, and total area of the activity shall be limited to the minimum necessary to complete the Project, and their boundaries shall be clearly demarcated.
17. All fueling and maintenance of vehicles and other equipment and staging areas shall occur at least 100 feet from any drainages and other water features. Crew members shall ensure that contamination of habitat does not occur during such operations. Prior to the onset of work, the construction contractor shall prepare a plan to be approved by the County before construction begins to allow a prompt and effective response to any accidental spills. All workers shall be informed of the importance of preventing spills and the appropriate measures to take should a spill occur.
18. If Project activities, including grass mowing and tree trimming/removal, are conducted during nesting bird season (February 15–September 15), preconstruction nest surveys shall be conducted in and near the Project area (within 250 feet for large raptors and 100 feet for all other birds) by a qualified biologist within 7 days of the start of construction. If nesting birds are identified during the preconstruction survey, then the Project shall be modified (i.e., a no-work exclusion buffer of appropriate size [to be determined by the qualified Project biologist] shall be erected around active nests) and/or delayed as necessary to avoid impacts to the identified nests, eggs, and/or young.
19. Construction activities shall avoid Heritage or significant trees, as defined by the San Mateo County Tree Ordinance, that have not previously been authorized for removal with the County. If construction activities are occurring near a Heritage or significant tree or trees, exclusion fencing will be installed to keep construction activities out of the area.

APPENDIX A

USFWS IPaC Records Search Results

IPaC resource list

IPaC will be down for a maintenance event the week of April 10th. We apologize for any inconvenience this may cause. ×

This [illegible]cal habitat [illegible]'s (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

San Mateo County, California

Local office

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building

Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Reptiles

NAME	STATUS
Green Sea Turtle Chelonia mydas No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/6199	Threatened

Amphibians

NAME	STATUS
California Red-legged Frog Rana draytonii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2891	Threatened
Foothill Yellow-legged Frog Rana boylii No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/5133	Proposed Threatened

Fishes

NAME	STATUS
Longfin Smelt Spirinchus thaleichthys No critical habitat has been designated for this species.	Proposed Endangered

Flowering Plants

NAME	STATUS
Hickman's Potentilla Potentilla hickmanii Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/6343	Endangered

NOT FOR CONSULTATION

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern https://www.fws.gov/program/migratory-birds/species
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

NOT FOR CONSULTATION

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Allen's Hummingbird *Selasphorus sasin* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
Belding's Savannah Sparrow *Passerculus sandwichensis beldingi* This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/8	Breeds Apr 1 to Aug 15
Black Oystercatcher *Haematopus bachmani* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9591	Breeds Apr 15 to Oct 31
Black Skimmer *Rynchops niger* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/5234	Breeds May 20 to Sep 15
Black Swift *Cypseloides niger* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/8878	Breeds Jun 15 to Sep 10
Black Turnstone *Arenaria melanocephala* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere

NOT FOR CONSULTATION

Bullock's Oriole Icterus bullockii This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Mar 21 to Jul 25
California Gull Larus californicus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 1 to Jul 31
California Thrasher Toxostoma redivivum This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Jul 31
Clark's Grebe Aechmophorus clarkii This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jun 1 to Aug 31
Common Yellowthroat Geothlypis trichas sinuosa This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/2084	Breeds May 20 to Jul 31
Golden Eagle Aquila chrysaetos This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31
Marbled Godwit Limosa fedoa This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9481	Breeds elsewhere
Nuttall's Woodpecker Picoides nuttallii This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9410	Breeds Apr 1 to Jul 20
Olive-sided Flycatcher Contopus cooperi This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/3914	Breeds May 20 to Aug 31

NOT FOR CONSULTATION

Scripps's Murrelet Synthliboramphus scrippsi This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Feb 20 to Jul 31
Short-billed Dowitcher Limnodromus griseus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9480	Breeds elsewhere
Tricolored Blackbird Agelaius tricolor This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/3910	Breeds Mar 15 to Aug 10
Western Grebe aechmophorus occidentalis This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/6743	Breeds Jun 1 to Aug 31
Willet Tringa semipalmata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Wrentit Chamaea fasciata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 10

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

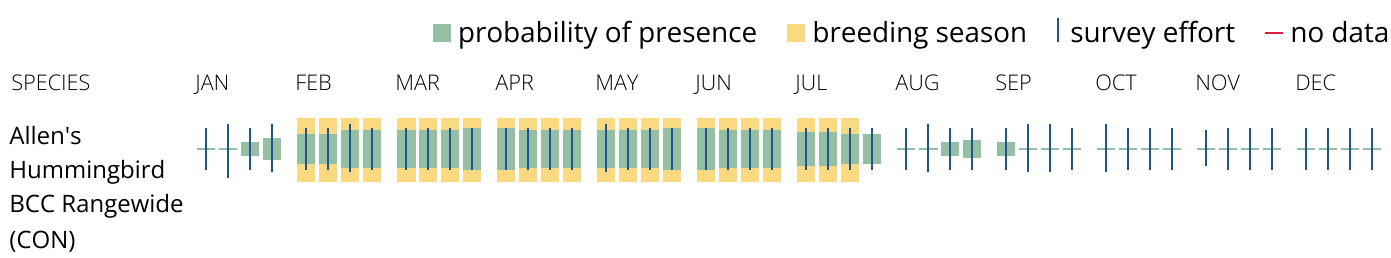
Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

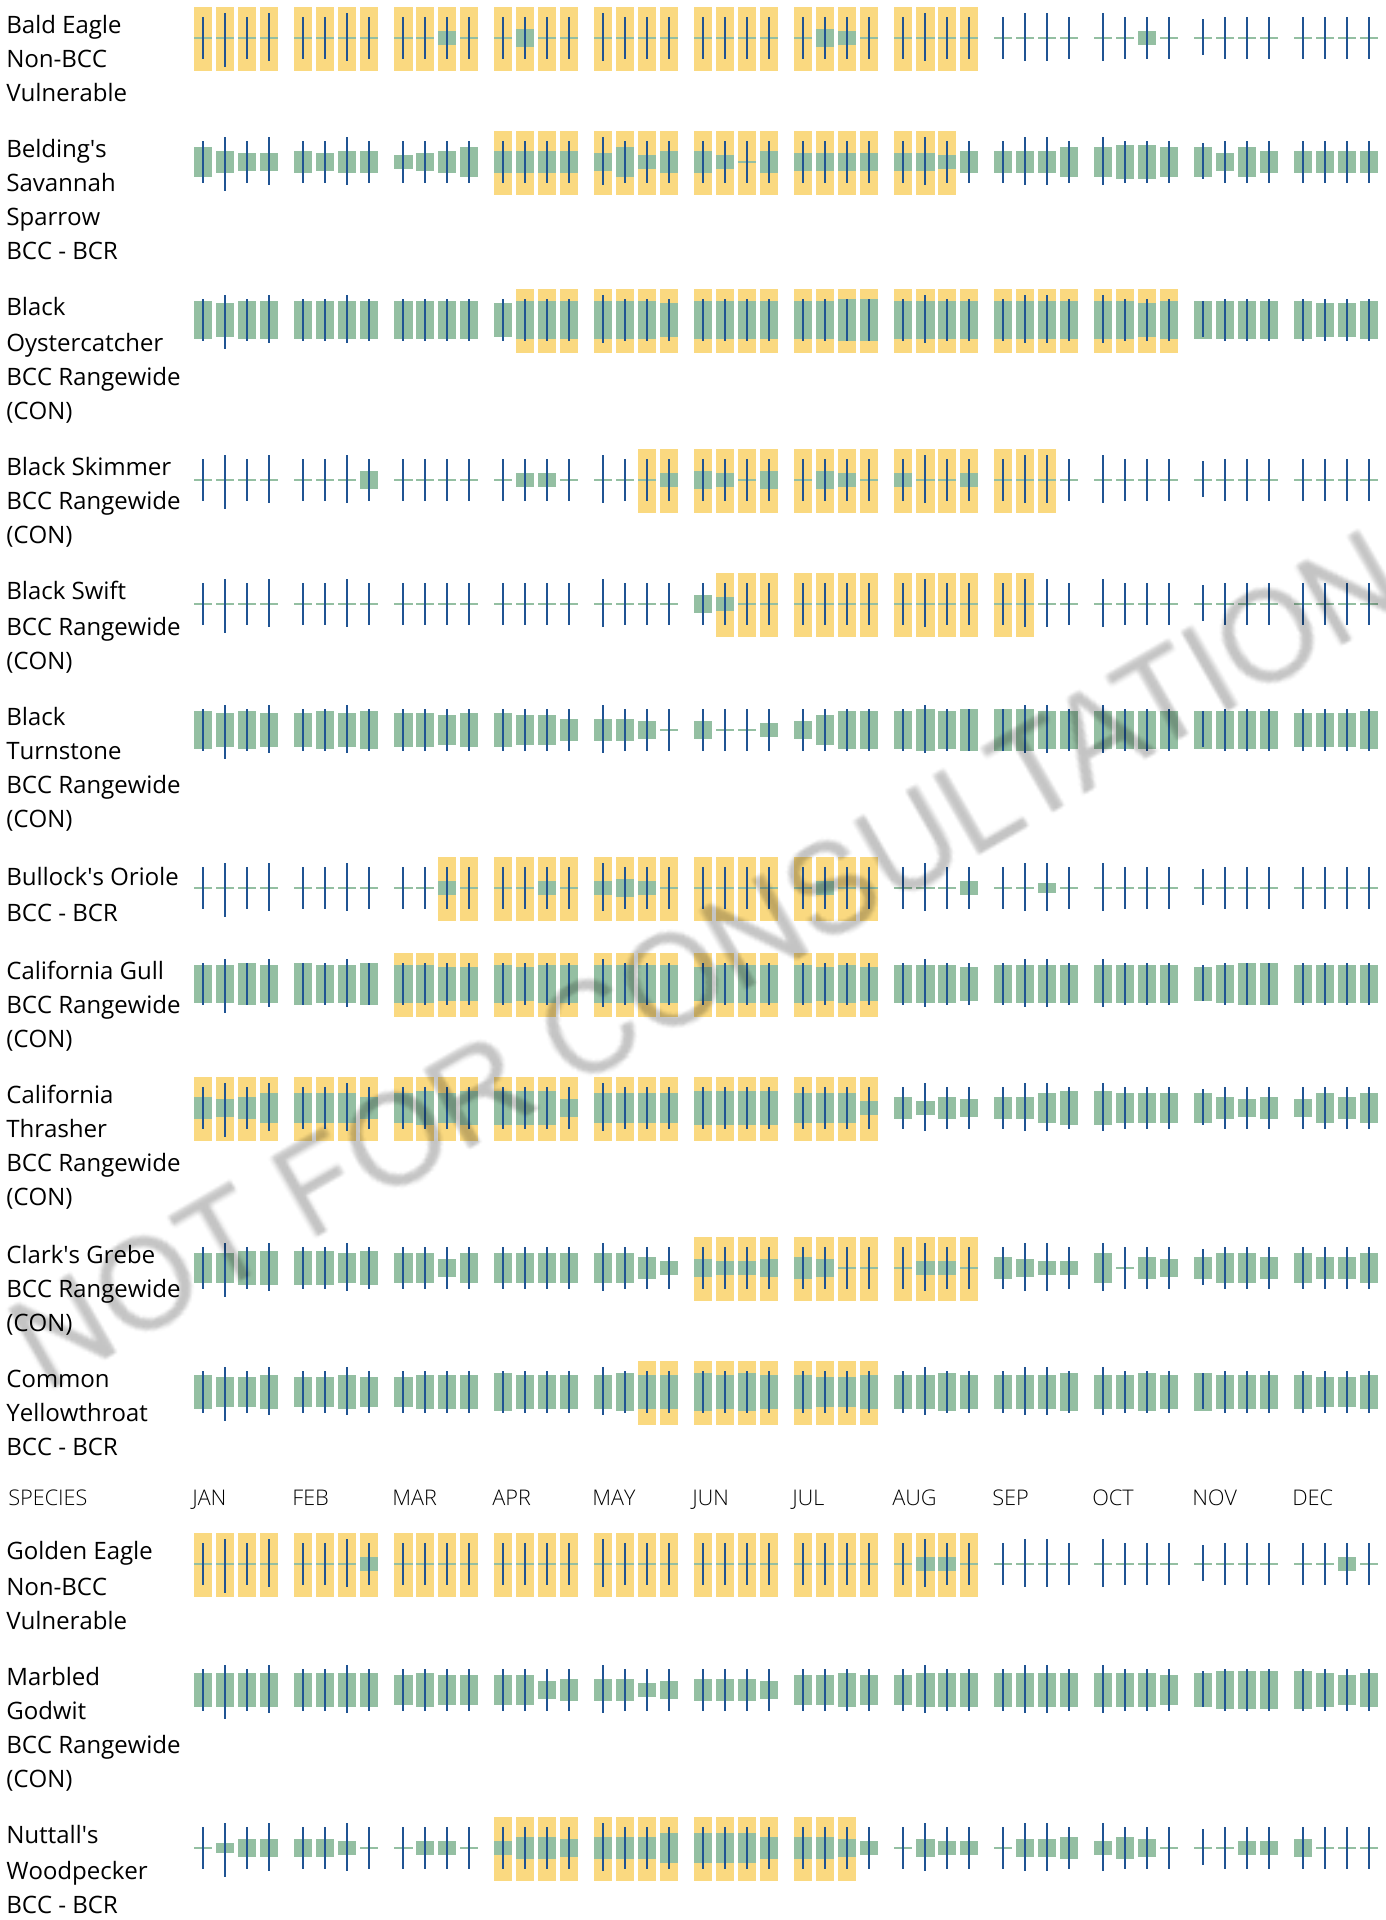
1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.



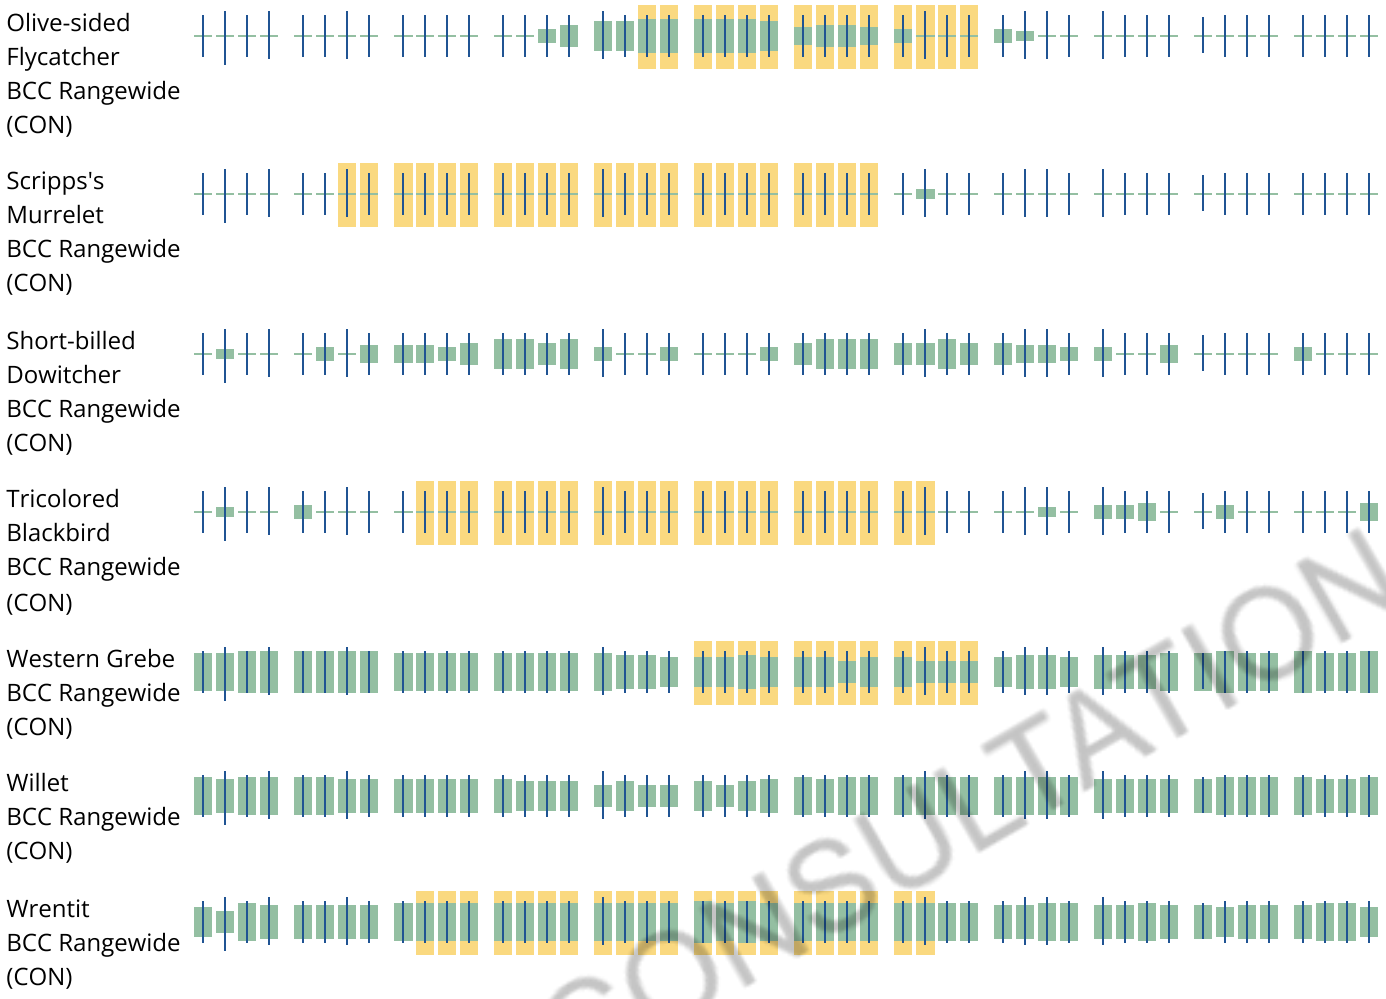
Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.



To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.



Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the RAIL Tool and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

NOT FOR CONSULTATION

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

This location did not intersect any wetlands mapped by NWI.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

NOT FOR CONSULTATION

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

APPENDIX D

Special-Status Species Considered for Potential Occurrence in the Biological Study Area

Table D-1. Special-Status Species Considered for Potential Occurrence in the Biological Study Area

Species Name	General Habitat Description	Legal Status Federal/State/ CNPS Status	Potential for Occurrence and Rationale
Plants			
Blasdale's bent grass (*Agrostis blasdalei*)	Perennial rhizomatous herb that occurs in coastal bluff scrub, coastal dunes, and coastal prairie habitats. Elevation: 5-150 meters. Blooming period: May–June.	--/--/1B.2	**Low:** Potentially suitable coyote brush scrub habitat that is present within the BSA is of marginal quality. This species was not observed during the field survey, which was conducted within the appropriate blooming period for this species. There is one recorded CNDDB occurrence located approximately 0.32 mile south of the BSA.
Choris' popcorn-flower (*Plagiobothrys chorisianus* var. *chorisianus*)	Annual herb that occurs in wetland and riparian areas in chaparral, coastal prairie, and coastal scrub. Elevation: 15–160 meters. Flower Season: March–June.	--/--/1B.2	**Moderate:** Potentially suitable coyote brush scrub habitat is present along the northwest portions of the BSA. This species was not observed during the field survey, which was conducted within the appropriate blooming period for this species. There is one recorded CNDDB occurrence located approximately 0.80 mile north of the BSA.
Coastal marsh milkvetch (*Astragalus pycnostachyus* var. *pycnostachyus*)	Perennial herb that occurs in coastal marshes, seeps, and adjacent sand along northern and central California coast. Elevation: 0–150 meters. Flower season: April–October.	--/--/1B.2	**None:** Suitable habitat is absent within the BSA. No CNDDB occurrences have been recorded within 2 miles of the BSA.
Coast yellow leptisiphon *(Leptosiphon croceus)*	Annual herb that occurs in coastal bluff scrub and coastal prairie habitats. Blooming period: April–May. Elevation: 10-150 meters	--/--/1B.2	**None:** Suitable habitat is absent within the BSA. This species has one known population and was not observed during the field survey, which was conducted within the appropriate blooming period for this species. There is one recorded CNDDB occurrence located approximately 0.24 mile southwest of the BSA in coastal bluff scrub habitat.
Hickman's cinquefoil (*Potentilla hickmanii)*	Occurs in vernally wet meadows, coastal bluff scrub, closed-cone coniferous forest, vernally mesic meadows and seeps, and freshwater marshes and swamps. Found along central California coast. Blooming period: April–August. Elevation: 10–149 meters.	FE/SE/1B.1	**Low:** Suitable Monterey Cypress – Monterey Pine Woodland habitat within the BSA is of marginal quality due to extensive historic development-related disturbance. The BSA lacks suitable mesic habitat with granitic soils. This species was not observed during the field survey, which was conducted within the appropriate blooming period for this species. There is one recent recorded CNDDB occurrence within 2 miles of the BSA.
Kellogg's horkelia (*Horkelia cuneata* var. *sericea*)	Perennial herb that occurs in closed-cone coniferous forest, chaparral, coastal dunes, and coastal scrub. Elevation: 10–200 meters. Flower season: April–September.	--/--/1B.1	**Low:** Potentially suitable coyote brush scrub habitat is present on the western and northeastern extent of the BSA; however, no CNDDB occurrences have been recorded within 2 miles of the BSA. The CNPS database recorded this species within the Half Moon Bay, California USGS 7.5-minute quadrangle; this occurrence is greater than 20 years old. This species was not observed during the field survey, which was not conducted during the appropriate blooming period.

Species Name	General Habitat Description	Legal Status Federal/State/ CNPS Status	Potential for Occurrence and Rationale
Perennial goldfields (*Lasthenia californica* ssp. *macrantha*)	Perennial herb that occurs in coastal bluff scrub, coastal dunes, and coastal scrub. Elevation: 6–750 meters. Flower season: January–November.	--/--/1B.2	**Low:** Potentially suitable coyote brush scrub habitat is present on the western and northeastern extent of the BSA but is of marginal quality and lacks the strong coastal influence typical of blufftops on the immediate coast. This species was not observed during the field survey, which was not conducted within the appropriate blooming period for this species. There is one recorded CNDDB occurrence approximately 0.91 mile from the BSA within coastal bluff scrub habitat adjacent to Montara State Beach.
Rose leptosiphon (*Leptosiphon rosaceus*)	Annual herb that occurs in coastal bluff scrub. Elevation: 0–100 meters. Flower season: April–July.	--/--/1B.1	**Low:** Potentially suitable coyote brush scrub habitat is present on the western and northeastern extent of the BSA. This species was not observed during the field survey, which was conducted within the appropriate blooming period for this species. There is one recorded CNDDB occurrence approximately 0.10-mile northwest of the BSA within coastal bluff scrub habitat adjacent to Point Montara Lighthouse; however, the occurrence is from the 1950s and is presumed extirpated.
San Francisco owl's-clover (*Triphysaria floribunda*)	Annual herb found in coastal prairie, coastal scrub, and coastal grasslands on serpentine soils. Blooming period: April–June. Elevation: 10–160 meters.	--/--/1B.2	**None:** No suitable habitat occurs within the BSA. This species was not observed during the field survey, which was conducted within the appropriate blooming period for this species. In addition, no serpentine soils are present within the BSA. There is one recorded CNDBB occurrence within 2 miles south of the BSA.
Ornduff's meadowfoam *(Limnanthes douglasii* ssp. *ornduffii)*	Annual herb found in agricultural fields, meadows, and seeps. Restricted to single agricultural field in San Mateo County. Blooming period: November–May. Elevation: 10–20 meters.	--/--/1B.1	**None:** No suitable habitat occurs within the BSA. This species was not observed during the field survey. There are two recorded CNDDB occurrences within 2 miles of the BSA located approximately 1.4 and 1.6 miles southeast of the BSA within agricultural and meadow habitat required for this species. This species has only been documented in these two locations.
Natural Communities of Concern			
Northern Coastal Salt Marsh	Marsh habitat supporting herbaceous, suffrutescent, salt-tolerant hydrophytes often active in summer and dormant in winter. Characteristic species include marsh jaumea (*Jaumea carnosa*), sea lavender (*Limonium californicum*), and alkali heath (*Frankenia salina*). Developed around Humboldt Bay, Tomales Bay, San Francisco Bay, Elkhorn Slough, and Morro Bay.		**None:** The Project area does not support northern coastal salt marsh.

Species Name	General Habitat Description	Legal Status Federal/State/ CNPS Status	Potential for Occurrence and Rationale
Northern Maritime Chaparral	Dense shrub habitat composed of several species of manzanita, wild lilac, and chamise. Associated with sandy substrates in coastal fog zone, usually on rolling to hilly terrain. Occurs from Santa Cruz to Sonoma Counties.		**None:** The Project area does not support northern maritime chaparral.
Animals			
Invertebrates			
Western bumble bee (*Bombus occidentalis*)	In California, populations are currently restricted to high elevation sites in Sierra Nevada, though there have been few observations on northern California coast (Xerces Society 2021). Basic habitat requirements include suitable nesting sites for colonies, nectar and pollen from floral resources available throughout duration of colony period (spring, summer, and fall), and suitable overwintering sites for queens (U.S. Forest Service 2021).	--/SC	**Low:** The BSA contains marginally suitable foraging habitat for this species and impacts to this species are not expected. There are no recorded CNDDB occurrences within 2 miles of the BSA.
Monarch butterfly (*Danaus plexippus*)	Occurs along coast from northern Mendocino to Baja California, Mexico. Winter roosts in wind-protected tree groves (eucalyptus, Monterey pine, and cypress), with nectar and water sources nearby.	FC/--	**Low:** The BSA contains marginally suitable overwintering habitat for this species within Monterey cypress – Monterey pine woodland habitat; however, the trees within the Project area were likely planted as windbreaks and do not provide dense canopy cover preferred by this species. In the northwestern portion of the BSA, the Monterey cypress are denser and may provide more suitable overwintering habitat for monarchs. However, this area is not within the Project footprint. In addition, there is only one recorded CNDDB occurrence, approximately 1.4 miles northeast of the Project area; the record is from 1984. Therefore, potential for overwintering monarchs is low.
San Bruno elfin butterfly (*Callophrys mossii bayensis*)	Small brownish butterfly that occurs in coastal mountains near San Francisco Bay, in fog belt of steep north-facing slopes that receive little direct sunlight. Primary larval host plant is stonecrop (*Sedum spathulifolium*).	FE/--	**None:** No suitable habitat for this species occurs within the BSA. There are no recorded CNDDB occurrences within 2 miles of the BSA.

Species Name	General Habitat Description	Legal Status Federal/State/ CNPS Status	Potential for Occurrence and Rationale
Amphibians			
California red-legged frog (*Rana draytonii*)	Inhabits permanent and temporary pools, streams, freshwater seeps, and marshes in lowlands and foothills occurring from sea level to 6,500 feet. Uses adjacent upland habitat for foraging and refuge. Breeds during wet season from December through March. Lays between 300 and 4,000 eggs in large cluster attached to plants near water surface. Eggs hatch after about 4 weeks and undergo metamorphosis in 4 to 7 months.	FT/SSC	**Moderate:** No suitable aquatic habitat for this species was observed on-site; however, there is potentially suitable aquatic habitat for this species in Montara Creek immediately north of the BSA if the area is inundated for a sufficiently long period of time during the wet season and within San Vicente Creek approximately 0.6 mile south of the BSA. In addition, potentially suitable upland dispersal habitat is present within coyote brush scrub habitat along the western portions of the BSA. The species was not observed in the BSA during the field survey. Seven CNDDB occurrences have been recorded within 2 miles of the BSA between 2006 and 2019.
Foothill yellow-legged frog (*Rana boylii*)	Frequents rocky streams and rivers with rocky substrate and open, sunny banks, in forests, chaparral, and woodlands. Range in California includes north and central coasts and western Sierra Nevada.	FC/SE, SSC	**None:** No suitable aquatic habitat for this species was observed on-site or within the BSA. There are no recorded CNDDB occurrences within 2 miles of the BSA.
Mammals			
American badger (*Taxidea taxus*)	Occurs in open stages of shrub, forest, and herbaceous habitats; needs uncultivated ground with friable soils.	--/--/SSC	**None:** The BSA contains marginally suitable habitat for this species within grassland habitat on-site. However, no burrows were observed during the site visit and the level of disturbance within the BSA has likely impacted soils and habitat viability for this species. There are no recorded CNDDB occurrences within 2 miles of the BSA.
Reptiles			
Green sea turtle (*Chelonia mydas*)	Occurs in marine environments and often found in shallow waters with marine grass flats, coral reefs, and algae. Typically found in tropical waters.	FT/--/--	**None:** The BSA does not provide suitable habitat for this species. No CNDDB occurrences have been recorded within the BSA.
San Francisco garter snake *(Thamnophis sirtalis tetrataenia*)	Uses wide range of habitats; prefers grassland or wetland near ponds, marshes, and sloughs; and may overwinter in upland areas away from water.	FE/SE, FP	**Low:** Marginally suitable upland dispersal habitat for this species is present within the BSA within grassland habitat throughout the BSA, yet it is unlikely for this species to occur in the BSA given the marginal quality of habitat and distance (approximately 250 feet) from the potentially suitable aquatic habitat in Montara Creek. Eighteen CNDDB occurrences have been recorded within 2 miles of the BSA since the 1930s. However, suitable high-quality foraging and aquatic habitat for this species is absent within the BSA. This species was not observed in the BSA during the field survey.

Species Name	General Habitat Description	Legal Status Federal/State/ CNPS Status	Potential for Occurrence and Rationale
Fish			
Longfin smelt (*Spirinchus thaleichthys*)	Anadromous smelt found in California's bay, estuary, and nearshore environments from San Francisco Bay north to Lake Earl, near Oregon border. San Francisco Estuary and Sacramento-San Joaquin Delta support largest longfin smelt population in California.	FC/ST, SSC	**None:** The BSA does not provide suitable habitat for this species. No CNDDB occurrence recorded within BSA.
Birds			
California least tern (*Sternula antillarum browni*)	Largely coastal species that feeds on fish and nests on sandy dunes or beaches. Once common in California; currently nesting colonies are isolated to southern California and scattered Bay Area beaches.	FE/SE/--	**None:** The BSA does not provide suitable habitat for this species. No CNDDB occurrence recorded within BSA.
Marbled murrelet (*Brachyramphus marmoratus marmoratus*)	Spends most of non-breeding season in offshore or nearshore environments near coniferous forests. Only California alcid species to nest inland. Typically nests in upper branches of redwoods or Douglas fir forests. Builds nests with lichens and mosses.	FT/SE/--	**None:** The BSA does not provide suitable habitat for this species. No CNDDB occurrence recorded within BSA.
Saltmarsh common yellowthroat (*Geothlypis trichas sinuosa*)	Frequents low, dense vegetation near water, especially marshes and wetlands. Nests usually placed on or within 8 centimeters (3 inches) of ground. May be over water, in emergent aquatic vegetation, dense shrubs, or other dense growth.	--/SSC	**Low:** The BSA does not contain suitable marsh habitat for this species or dense vegetation near water to support nesting and foraging behavior. Coastal scrub habitat located at the western and northeastern extents of the Project site may provide marginal foraging habitat for this species. No CNDDB occurrence recorded within BSA.
Western snowy plover (*Charadrius alexandrinus nivosus*)	Found in shores, peninsulas, offshore islands, bays, estuaries, and rivers along Pacific Coast. Breeding sites entail coastal beaches above high-tide line, sand spits, dune-backed beaches, and river bars.	FT, MBTA/SSC	**None:** The BSA does not contain suitable nesting or foraging habitat for this species. No CNDDB occurrence recorded within BSA.

Sources: Baldwin et al. (2012); CNDDB (2023); USFWS (2023b)

Status Codes:
-- = No status
Federal: FE = Federal Endangered; FT = Federal Threatened; FC = Federal Candidate; MBTA = Protected by Migratory Bird Treaty Act
State: SE = State Endangered; ST = State Threatened; SC = State Candidate; SR = State Rare; SSC = California Species of Special Concern; FP = Fully Protected

California Native Plant Society:
List 1B = Rare, threatened, or endangered in California and elsewhere
List 2 = Rare, threatened, or endangered in California, but more common elsewhere

CNPS Threat Code:
_.1 = Seriously endangered in California (more than 80% of occurrences threatened / high degree and immediacy of threat)
_.2 = Fairly endangered in California (20–80% occurrences threatened)
_.3 = Not very endangered I California (<20% of occurrences threatened or no current threats known)

Potential for Occurrence Ratings:

Present = The species has been observed during Project surveys.
High = The Project area is located within the geographic and elevation ranges of the species; suitable habitat that meets the life history requirements of the species is present in or near the Project area; and observations have been documented recently (i.e., within the past 20 years) within 0.25 mile of the Project.
Moderate = The Project area is located within the geographic and elevation ranges of the species; suitable habitat for the species is present in or near the Project area, but may be of low quality; and observations may have been documented within 1 mile of the Project.
Low = The Project area is not located within the geographic and/or elevation ranges for the species; suitable habitat for the species is present, but may be of marginal quality; barriers to migration/dispersal may be present; the species was not documented within 1 mile of the Project; and/or all observation records within 1 mile are more than 20 years old.
None = Suitable habitat does not exist in the Project area, or the species is restricted to or known to be present only within a specific area outside of the Project area. Nearby occurrence records, if present, are extirpated or are more than 20 years old.
Absent = Surveys for the species have been conducted during the appropriate season and the species was not observed.

APPENDIX F

Plant and Animal Species Observed During Field Survey

Table F-1. Plant Species Observed During the Field Survey

Scientific Name	Common Name	Origin	Form	Rarity Status	Cal-IPC Status[1]	Wetland Status (AW 2016)[2]
Acacia sp.	Acacia	Non-native (invasive)	Shrub	-	-	-
Achillea millefolium	Yarrow	Native	Perennial herb	-	-	-
Allium triquetrum	White flowered onion	Non-native	Perennial herb	-	-	-
Artemisia californica	California sage brush	Native	Shrub	-	-	-
Artemisia douglasiana	California mugwort	Native	Perennial herb	-	-	-
Avena barbata	Slim oat	Non-native (invasive)	Annual grass	-	Moderate	-
Baccharis pilularis	Coyote brush	Native	Shrub	-	-	-
Bellis perennis	English lawn daisy	Non-native	Perennial herb	-	-	-
Brassica rapa	Common mustard	Non-native (invasive)	Annual herb	-	Limited	FACU
Bromus diandrus	Ripgut brome	Non-native (invasive)	Annual grass	-	Moderate	-
Carduus pycnocephalus ssp. *pycnocephalus*	Italian thistle	Non-native (invasive)	Annual herb	-	Moderate	-
Carpobrotus edulis	Iceplant	Non-native (invasive)	Perennial herb	-	High	-
Ceanothus thyrsiflorus	Blueblossom	Native	Shrub	-	-	-
Cirsium vulgare	Bull thistle	Non-native (invasive)	Perennial herb	-	Moderate	FACU
Conium maculatum	Poison hemlock	Non-native (invasive)	Perennial herb	-	Moderate	FACW
Cortaderia jubata	Andean pampas grass	Non-native (invasive)	Perennial grass	-	High	FACU
Cotoneaster franchetii	Cotoneaster	Non-native (invasive)	Shrub	-	Moderate	-
Crassula ovata	Jade plant	Non-native	Shrub	-	-	-
Delairea odorata	Cape ivy	Non-native (invasive)	Perennial herb	-	High	FAC
Echium candicans	Pride of madeira	Non-native (invasive)	Shrub	-	Limited	-
Erigeron canadensis	Canada horseweed	Native	Annual herb	-	-	-
Festuca myuros	Rattail sixweeks grass	Non-native (invasive)	Annual grass	-	Moderate	-
Festuca perennis	Italian rye grass	Non-native (invasive)	Annual, perennial grass	-	Moderate	FAC
Foeniculum vulgare	Fennel	Non-native (invasive)	Perennial herb	-	High	-
Fragaria chiloensis	Beach strawberry	Native	Perennial herb	-	-	-

Scientific Name	Common Name	Origin	Form	Rarity Status	Cal-IPC Status[1]	Wetland Status (AW 2016)[2]
Genista monspessulana	French broom	Non-native (invasive)	Shrub	-	High	UPL
Geranium dissectum	Wild geranium	Non-native (invasive)	Annual herb	-	Limited	-
Geranium molle	Crane's bill geranium	Non-native	Annual, perennial herb	-	-	-
Hedera helix	English ivy	Non-native (invasive)	Vine or shrub	-	High	-
Helminthotheca echioides	Bristly ox-tongue	Non-native (invasive)	Annual, perennial herb	-	Limited	FAC
Hirschfeldia incana	Short-podded mustard	Non-native (invasive)	Perennial herb	-	Moderate	FAC
Hesperocyparis macrocarpa	Monterey cypress	Native	Tree	Rank 1B.2	-	-
Holcus lanatus	Common velvetgrass	Non-native (invasive)	Perennial grass	-	Moderate	-
Hordeum murinum	Foxtail barley	Non-native (invasive)	Annual grass	-	Moderate	FACU
Hypochaeris radicata	Hairy cats ear	Non-native	Perennial herb	-	Moderate	FACU
Iris douglasiana	Douglas iris	Native	Perennial herb	-	-	-
Juncus patens	Rush	Native	Perennial grass-like herb	-	-	FACW
Lotus corniculatus	Bird's foot trefoil	Non-native	Perennial herb	-	-	FAC
Lysimachia arvensis	Scarlet pimpernel	Non-native	Annual herb	-	-	FAC
Malva parviflora	Cheeseweed	Non-native	Annual herb	-	-	-
Medicago polymorpha	California burclover	Non-native	Annual herb	-	Limited	FACU
Oxalis pes-caprae	Bermuda buttercup	Non-native (invasive)	Perennial herb	-	Moderate	-
Pinus radiata	Monterey pine	Native	Tree	Rank 1B.1	-	-
Plantago coronopus	Cut leaf plantain	Non-native	Annual herb	-	-	FAC
Plantago lanceolata	Ribwort	Non-native	Perennial herb	-	Limited	FAC
Polystichum munitum	Western sword fern	Native	Fern	-	-	FACU
Prunus cerasifera	Cherry plum	Non-native	Tree	-	Limited	-
Pseudognaphalium luteoalbum	Jersey cudweed	Non-native	Annual herb	-	-	FAC
Raphanus sativus	Radish	Non-native (invasive)	Annual, biennial herb	-	Limited	-
Rubus ursinus	California blackberry	Native	Vine, shrub	-	-	FAC
Rumex acetosella	Sheep sorrel	Non-native (invasive)	Perennial herb	-	Moderate	FACU
Rumex crispus	Curly dock	Non-native (invasive)	Perennial herb	-	Limited	FAC

Scientific Name	Common Name	Origin	Form	Rarity Status	Cal-IPC Status[1]	Wetland Status (AW 2016)[2]
Rumex pulcher	Fiddleleaf dock	Non-native	Perennial herb	-	-	FAC
Sambucus racemosa	Red elderberry	Native	Shrub	-	-	FACU
Sanicula crassicaulis	Pacific sanicle	Native	Perennial herb	-	-	-
Senecio vulgaris	Common groundsel	Non-native	Annual herb	-	-	FACU
Scrophularia californica	California bee plant	Native	Perennial herb	-	-	FAC
Silybum marianum	Milk thistle	Non-native (invasive)	Annual, perennial herb	-	Limited	-
Sonchus asper ssp. *asper*	Sow thistle	Non-native	Annual herb	-	-	FAC
Sonchus oleraceus	Sow thistle	Non-native	Annual herb	-	-	UPL
Stipa pulchra	Purple needle grass	Native	Perennial herb	-	-	-
Symphyotrichum chilense	Pacific aster	Native	Perennial herb	-	-	FAC
Taraxia ovata	Sun cup	Native	Perennial herb	-	-	-
Toxicodendron diversilobum	Poison oak	Native	Vine, shrub	-	-	FACU
Trifolium hirtum	Rose clover	Non-native	Annual herb	-	Limited	-
Vicia sativa	Common vetch	Non-native	Annual herb, vine	-	-	-
Vinca major	Big-leaf periwinkle	Non-native (invasive)	Perennial herb	-	Moderate	FACU
Zantedeschia aethiopica	Calla lily	Non-native	Perennial herb	-	-	-

[1] California Invasive Plant Council (Cal-IPC) Ratings:
High: These species have severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal and establishment. Most are widely distributed ecologically.
Moderate: These species have substantial and apparent-but generally not severe-ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal, though establishment is generally dependent upon ecological disturbance. Ecological amplitude and distribution may range from limited to widespread.
Limited: These species are invasive but their ecological impacts are minor on a statewide level or there was not enough information to justify a higher score. Their reproductive biology and other attributes result in low to moderate rates of invasiveness. Ecological amplitude and distribution are generally limited, but these species may be locally persistent and problematic.

[2] Facultative Wetland (FACW) = Usually occur in wetland, but may occur in non-wetland; Facultative (FAC) = Occur in wetland and non-wetland; Facultative Upland (FACU) = Usually occur in non-wetland, but may occur in wetland; Upland (UPL) = Almost never occur in wetland.

Table F-2. Animal Species Observed During the Field Survey

Scientific Name	Common Name
Birds	
Corvus brachyrhynchos	American crow
Turdus migratorius	American Robin
Calypte anna	Anna's hummingbird
Sayornis nigricans	Black phoebe
Euphagus cyanocephalus	Brewer's blackbird
Psaltriparus minimus	Bushtit
Melozone crissalis	California towhee
Callipepla californica	California quail
Corvus corax	Common raven
Haemorhous mexicanus	House finch
Troglodytes aedon	House wren
Charadrius vociferus	Killdeer
Zenaida macroura	Mourning dove
Buteo lineatus	Red-shouldered hawk
Buteo jamaicensis	Red-tailed hawk
Melospiza melodia	Song sparrow
Cyanocitta stelleri	Steller's jay
Cathartes aura	Turkey vulture
Aphelocoma californica	Western scrub-jay

Arborist Report

Cypress Point
Moss Beach, CA

Executive Summary

MidPen Housing is planning to develop Cypress Point in Moss Beach, CA. HortScience | Bartlett Consulting was asked to prepare an Arborist Report for the trees potentially impacted by the project.

Trees were assessed on April 18, 28 and May 5, 2022. Four hundred eighty-eight (488) trees were assessed, representing four species. Overall, nearly half of the trees were in poor condition (47%), and only 14% of trees were in good condition.

The site was a relatively flat area with several old building foundations, grassy and shrubby areas, and areas of dense trees typical of coastal California. The northern half of the site sloped downward to 16th Street. Tree diversity was very low with two species making up 99% of the trees. Three Italian stone pines in good condition and one myoporum in fair condition were mixed into the landscape dominated by Monterey cypress and Monterey pine.

Each tree was rated for suitability for preservation based upon its age, health, structural condition, and ability to safely coexist within a development environment. We consider trees with high suitability for preservation to be the best candidates for preservation. We do not normally recommend retention of trees with low suitability for preservation in areas where people or property will be present. Retention of trees with moderate suitability for preservation depends upon the intensity of proposed site changes.

Based on my review of the plan, I have listed whether individual trees will be removed or can be preserved in the **Tree Disposition** exhibit. Overall:

- 295 trees will be removed (190 *Significant*)
- 193 trees can be preserved (158 *Significant*)

The goal of tree preservation is not merely tree survival during development but maintenance of tree health and beauty for many years. Trees retained on sites that are either subject to extensive injury during construction or are inadequately maintained become a liability rather than an asset. The response of individual trees depends on the amount of excavation and grading, care with which demolition is undertaken, and construction methods.

A **TREE PROTECTION ZONE** shall be identified for each tree to be preserved on the Tree Protection Plan. No grading, excavation, construction or storage or dumping of materials shall occur within the **Tree Protection Zone**.

Introduction and Overview

MidPen Housing is planning to develop Cypress Point in Moss Beach, CA. HortScience | Bartlett Consulting (Divisions of The F. A. Bartlett Tree Expert Co.) was asked to prepare an **Arborist Report** for the trees potentially impacted by the project as required by Section 12 of Part Three of Division VIII of the San Mateo County Ordinance Code.

This report provides the following information:

1. An assessment of the health and structural condition of the trees within the proposed project area based on a visual inspection from the ground.
2. An evaluation of the impacts to trees based on site plans provided by the client.
3. Guidelines for tree preservation during the design, construction, and maintenance phases of development.

Tree Assessment Methods

Trees were assessed on April 18, 28 and May 5, 2022. The assessment included all trees with a trunk diameter of 6" or larger within the project boundary. The assessment procedure consisted of the following steps:

1. Identifying the tree species.
2. Tagging each tree with an identifying number and recording its location on a map.
3. Measuring the trunk diameter at a point 54 inches above grade.
4. Evaluating the health and structural condition using a scale of 1 – 5:

   5 - A healthy, vigorous tree, reasonably free of signs and symptoms of disease, with good structure and form typical of the species.
   4 - Tree with slight decline in vigor, small amount of twig dieback, minor structural defects that could be corrected.
   3 - Tree with moderate vigor, moderate twig and small branch dieback, thinning of crown, poor leaf color, moderate structural defects that might be mitigated with regular care.
   2 - Tree in decline, epicormic growth, extensive dieback of medium to large branches, significant structural defects that cannot be abated.
   1 - Tree in severe decline, dieback of scaffold branches and/or trunk; most of foliage from epicormics; extensive structural defects that cannot be abated.
5. Rating the suitability for preservation as "high", "moderate" or "low". Suitability for preservation considers the health, age and structural condition of the tree, and its potential to remain an asset to the site for years to come.

   High: Trees with good health and structural stability that have the potential for longevity at the site.
   Moderate: Trees with somewhat declining health and/or structural defects than can be abated with treatment. The tree will require more intense management and monitoring and may have shorter life span than those in 'good' category.
   Low: Trees in poor health or with significant structural defects that cannot be mitigated. Tree is expected to continue to decline, regardless of treatment. The species or individual may have characteristics that are undesirable for landscapes, and generally are unsuited for use areas.

Description of Trees

Four hundred eighty-eight (488) trees were assessed, representing four species (Table 1). Overall, nearly half of the trees were in poor condition (47%), and only 14% of trees were in good condition. Descriptions of each tree are found in the ***Tree Assessment*** and approximate locations are shown on the ***Tree Assessment Map*** (see Exhibits).

Table 1: Condition ratings and frequency of occurrence of trees Cypress Point, Moss Beach, CA

Common Name	Scientific Name	Condition				Total
		Dead (0)	Poor (1-2)	Fair (3)	Good (4-5)	
Monterey cypress	*Hesperocyparis macrocarpa*	8	68	71	34	**181**
Myoporum	*Myoporum laetum*	-	-	1	-	**1**
Italian stone pine	*Pinus pinea*	-	-	-	3	**3**
Monterey pine	*Pinus radiata*	3	161	107	32	**303**
Total		**11**	**229**	**179**	**69**	**488**

The site was a relatively flat area with several old building foundations, grassy and shrubby areas, and areas of dense trees typical of coastal California (Photo 1). The northern half of the site sloped downward to 16th Street. Tree diversity was very low with two species making up 99% of the trees. Three Italian stone pines in good condition and one myoporum in fair condition were mixed into the landscape dominated by Monterey cypress and Monterey pine.

Photo 1. The site was relatively flat with areas of dense trees and areas of shrubs, grass, and old building foundations.

Monterey pine was the most common species with 303 trees (62% of the population). As is typical throughout the San Francisco Bay Area, the pines were in poor condition (53%) with

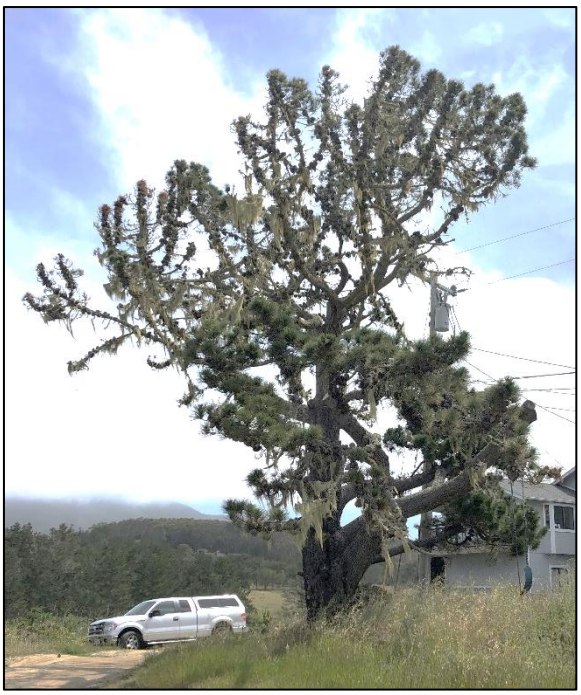

Photo 2. Monterey pine #376 was one of the largest trees assessed (45-inch trunk diameter) and one of the least healthy.

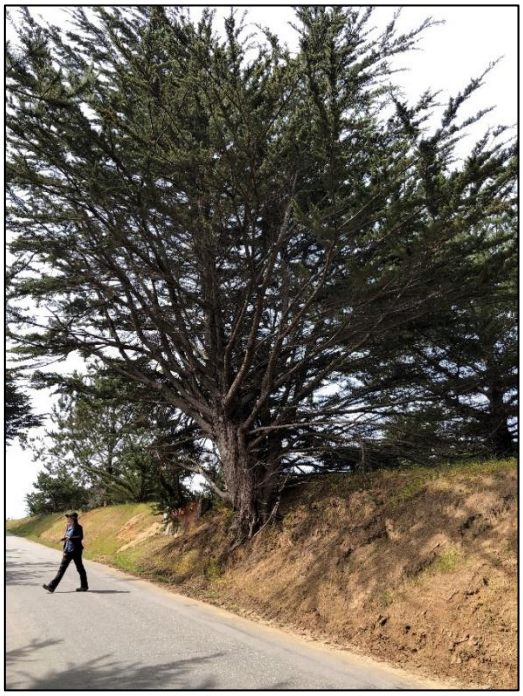

Photo 3. Monterey cypress #485 was in good condition with trunk diameters of 26, 25, 22, and 13 inches.

35% in fair condition and only 11% in good condition. The pines ranged from young trees (6-inch trunk diameter) to old (45" trunk diameter). Of the 259 single stemmed Monterey pines included in the assessment, the average trunk diameter was 15 inches. For example,

Monterey pine #376 was one of the largest pines (45" trunk diameter), and it was in poor condition with over half of the crown dead (Photo 2).

Monterey cypress was the other common species with 181 trees (37% of the population). The cypress were in fair (71 trees) to poor (68 trees) condition with 34 trees in good condition. The Monterey cypress were larger than the pines; the average trunk diameter of the single stemmed cypresses was 24 inches including tree #309 (68 inches). But this likely underestimates the size of the cypresses because many of the largest trees were multi-trunked trees. For example, tree #485 was in good condition and had four trunks (26, 25, 22, and 13 inches; Photo 3).

San Mateo County Tree Protection Requirements

Section 12 of Part Three of Division VII of the San Mateo County Ordinance Code defines *Significant Trees* as having a trunk circumference of 38 inches or greater (12 inch diameter). Based on this definition, 348 trees are considered *Significant*. *Significant Trees* along with Heritage Trees and trees growing within the Public right-of-way cannot be removed except with a permit. There do not appear to be any Heritage or Public trees, however, *Significant Trees* are identified in the ***Tree Assessment*** (see Exhibits).

Suitability for Preservation

Before evaluating the impacts that will occur during development, it is important to consider the quality of the tree resource itself, and the potential for individual trees to function well over an extended length of time. Trees that are preserved on development sites must be carefully selected to make sure that they may survive development impacts, adapt to a new environment and perform well in the landscape.

Our goal is to identify trees that have the potential for long-term health, structural stability, and longevity. For trees growing in open fields, away from areas where people and property are present, structural defects and/or poor health present a low risk of damage or injury if they fail.

We must be concerned, however, about safety in use areas. Therefore, where development encroaches into existing plantings, we must consider their structural stability as well as their potential to grow and thrive in a new environment. Where development will not occur, the normal life cycles of decline, structural failure, and death should be allowed to continue.

Evaluation of suitability for preservation considers several factors:

- **Tree health**
  Healthy, vigorous trees are better able to tolerate impacts such as root injury, demolition of existing structures, changes in soil grade and moisture, and soil compaction than non-vigorous trees are. Monterey pine #376 was mostly dead and would be unlikely to recover from significant root injury.

- **Structural integrity**
  Trees with significant amounts of wood decay and other structural defects that cannot be corrected are more likely to fail. Such trees should not be preserved in areas where damage to people or property is likely. For example, Monterey cypress #249 had multiple trunks arising from the base, some of which had failed. These poorly attached trunks will likely continue to fail, and this tree should not be preserved.

- **Species response**
  There is a wide variation in the response of individual species to construction impacts and changes in the environment. For example, Monterey pines are less tolerant of root loss thank Monterey cypress.

- **Tree age and longevity**
  Old trees, while having significant emotional and aesthetic appeal, have limited physiological capacity to adjust to an altered environment. Young trees are better able to generate new tissue and respond to change.

- **Invasiveness**
  Species which spread across a site and displace desired vegetation are not always appropriate for retention. This is particularly true when indigenous species are displaced. The California Invasive Plant Inventory Database (https://www.cal-ipc.org/plants/inventory/) lists species identified as being invasive. Myoporum is moderately invasive.

Each tree was rated for suitability for preservation based upon its age, health, structural condition, and ability to safely coexist within a development environment (See ***Tree Assessments*** in Exhibits, and Table 2). We consider trees with high suitability for preservation to be the best candidates for preservation. We do not normally recommend

retention of trees with low suitability for preservation in areas where people or property will be present. Retention of trees with moderate suitability for preservation depends upon the intensity of proposed site changes.

Table 2: Tree suitability for preservation.
Cypress Point, Moss Beach, CA

High	Trees in good health and with structural stability that have the potential for longevity at the site. Twenty-six (26) trees on the site had a high suitability for preservation.
Moderate	Trees in fair health and/or with structural defects that may be abated with treatment. Trees in this category require more intense management and monitoring and may have shorter lifespans than those in the "high" category. One hundred seven (107) trees had moderate suitability for preservation.
Low	Trees in poor health or with significant defects in structure that cannot be abated with treatment. These trees can be expected to decline regardless of management. The species or individual tree may possess either characteristics that are undesirable in landscape settings or be unsuited for use areas. Three hundred forty-four (344) trees had lower suitability for preservation.

Evaluations of Impacts and Recommendations

Appropriate tree retention develops a practical match between the location and intensity of construction activities with the quality and health of trees. The ***Tree Assessment*** was the reference point for tree condition and quality. To evaluate impacts from the project, I reviewed the *Tree Protection and Removal Plan* created by PYATOK dated June 21, 2022. This plan showed the locations of all the trees near construction and the limit of grading.

Based on my review of the plan, I have listed whether individual trees will be removed or can be preserved in the **Tree Disposition** exhibit. Overall:

- 295 trees will be removed (190 *Significant*)
- 193 trees can be preserved (158 *Significant*)

Dense development is planned in the center of the project area. Demolition, grading, construction and landscaping will likely require the removal of all trees in this area. All trees shown within the limits of grading will be removed. It is also important to assess the impacts to trees just outside of the limits of grading. Of the 61 trees within 30 feet grading, 40 will be removed. Included on this list of removals are healthy trees like Monterey cypress #366 that are too close to grading (~3 feet) to survive the root loss and trees that are relatively far from grading like Monterey pine #394 (~19 feet) but are in poor condition.

Most of the trees that can be preserved on the site (172 trees) are more than 30 feet from the planned grading. An additional 21 trees will likely have their roots impacted by grading but are far enough away and healthy enough to hopefully tolerate that level of root loss. Of the listed to be preserved, 11 dead trees and 83 trees in poor condition are included. If these

areas are going to managed as semi-natural areas, that may be appropriate. If these areas are going to be re-imagined, or heavily used, this should be re-evaluated. Successful preservation of trees to be preserved will require adherence to the **Tree Preservation Guidelines**.

Tree Preservation Guidelines

The goal of tree preservation is not merely tree survival during development but maintenance of tree health and beauty for many years. Trees retained on sites that are either subject to extensive injury during construction or are inadequately maintained become a liability rather than an asset. The response of individual trees depends on the amount of excavation and grading, care with which demolition is undertaken, and construction methods. Coordinating any construction activity inside the **TREE PROTECTION ZONE** can minimize these impacts. The following recommendations will help reduce impacts to trees from development and maintain and improve their health and vitality through the clearing, grading and construction phases.

Tree Protection Zone

1. **A TREE PROTECTION ZONE** shall be identified for each tree to be preserved on the Tree Protection Plan. The **TREE PROTECTION ZONE** will be just outside of the limit of grading within approximately 30 feet of any trees being preserved.
    a. Fence all trees to be retained to completely enclose the **TREE PROTECTION ZONE** prior to demolition, grubbing or grading. Fences shall be 6 ft. chain link with posts sunk into the ground or equivalent as approved by the County.
    b. Fences must be installed prior to beginning demolition and must remain until construction is complete.
    c. No grading, excavation, construction or storage or dumping of materials shall occur within the **TREE PROTECTION ZONE**.

Design recommendations

1. Plans affecting the trees should be reviewed by the consulting arborist with regard to tree impacts. These include, but are not limited to, site plans, improvement plans, utility and drainage plans, grading plans, landscape and irrigation plans, and demolition plans.
2. Plan for tree preservation by designing adequate space around trees to be preserved. This is the **TREE PROTECTION ZONE:** No grading, excavation, construction or storage of materials should occur within that zone. Route underground services including utilities, sub-drains, water or sewer around the **TREE PROTECTION ZONE**. For design purposes, the **TREE PROTECTION ZONE** trees shall be defined as the tree dripline.
3. **Tree Preservation Guidelines** prepared by the Consulting Arborist, which include specifications for tree protection during demolition and construction, should be included on all plans.
4. Any herbicides placed under paving materials must be safe for use around trees and labeled for that use.
5. Do not lime the subsoil within 50’ of any tree. Lime is toxic to tree roots.
6. As trees withdraw water from the soil, expansive soils may shrink within the root area. Therefore, foundations, footings and pavements on expansive soils near trees should be designed to withstand differential displacement.
7. Ensure adequate but not excessive water is supplied to trees; in most cases occasional irrigation will be required. Avoid directing runoff toward trees.

Pre-demolition and pre-construction treatments and recommendations

1. The demolition and construction superintendents shall meet with the Consulting Arborist before beginning work to review all work procedures, access routes, storage areas, and tree protection measures.
2. Fence all trees to be retained to completely enclose the **TREE PROTECTION ZONE** prior to demolition, grubbing or grading. Fences shall be 6 ft. chain link with posts sunk into the ground or equivalent as approved by the City.
3. Fences are to remain until all grading and construction is completed. Where demolition must occur close to trees, such as removing curb and pavement, install trunk protection devices such as winding silt sock wattling around trunks or stacking hay bales around tree trunks.
4. Trees to be removed shall be felled so as to fall away from **TREE PROTECTION ZONE** and avoid pulling and breaking of roots of trees to remain. If roots are entwined, the Consulting Arborist may require first severing the major woody root mass before extracting the trees, or grinding the stump below ground.
5. All tree work shall comply with the Migratory Bird Treaty Act as well as California Fish and Wildlife code 3503-3513 to not disturb nesting birds. To the extent feasible tree pruning and removal should be scheduled outside of the breeding season. Breeding bird surveys should be conducted prior to tree work. Qualified biologists should be involved in establishing work buffers for active nests.

Recommendations for tree protection during construction

1. All contractors shall conduct operations in a manner that will prevent damage to trees to be preserved.
2. If roots 2” and greater in diameter are encountered during site work and must be cut to complete the construction, the Consulting Arborist must be consulted to evaluate effects on the health and stability of the tree and recommend treatment.
3. Any brush clearing required within the **TREE PROTECTION ZONE** shall be accomplished with hand-operated equipment.
4. Spoil from trench, footing, utility or other excavation shall not be placed within the **TREE PROTECTION ZONE**, neither temporarily nor permanently.
5. All grading within the dripline of trees shall be done using the smallest equipment possible. The equipment shall operate perpendicular to the tree and operate from outside the **TREE PROTECTION ZONE**. Any modifications must be approved and monitored by the Consulting Arborist.
6. If injury should occur to any tree during construction, it should be evaluated as soon as possible by the Consulting Arborist so that appropriate treatments can be applied.
7. No excess soil, chemicals, debris, equipment or other materials shall be dumped or stored within the **TREE PROTECTION ZONE**.
8. Any additional tree pruning needed for clearance during construction must be performed by a Certified Arborist and not by construction personnel.

Maintenance of impacted trees

Preserved trees will experience a physical environment different from that pre-development. As a result, tree health and structural stability should be monitored. Occasional pruning, fertilization, mulch, pest management, replanting and irrigation may be required. In addition,

provisions for monitoring both tree health and structural stability following construction must be made a priority. Inspect trees annually and following major storms to identify conditions requiring treatment to manage risk associated with tree failure.

Our procedures included assessing trees for observable defects in structure. This is not to say that trees without significant defects will not fail. Failure of apparently defect-free trees does occur, especially during storm events. Wind forces, for example, can exceed the strength of defect-free wood causing branches and trunks to break. Wind forces coupled with rain can saturate soils, reducing their ability to hold roots, and blow over defect-free trees. Although we cannot predict all failures, identifying those trees with observable defects is a critical component of enhancing public safety.

Furthermore, trees change over time. Our inspections represent the condition of the tree at the time of inspection. As trees age, the likelihood of failure of branches or entire trees increases. Annual tree inspections are recommended to identify changes to tree health and structure. In addition, trees should be inspected after storms of unusual severity to evaluate damage and structural changes. Initiating these inspections is the responsibility of the client and/or tree owner.

If you have any questions about my observations or recommendations, please contact me.

Subject: Geotechnical Investigation Report
Cypress Point Family Community
16th and Carlos Streets
Moss Beach, California

Dear Ms. Ip,

We are pleased to present our geotechnical investigation report, dated June 28, 2022, for the proposed Cypress Point Family Community affordable housing development in Moss Beach, California. Our geotechnical investigation was performed in accordance with our General Consultant Services Agreement with MP Moss Beach Associates L.P., dated March 21, 2017.

The project site is located on the eastern side of Carlos Street between Sierra Street to the south and 16th Street to the north. The subject property encompasses an area of 10.875 acres of vacant land and is bordered by a combination of single-family homes and vacant land to the north and east, single-family homes to the south, and Carlos Street to the west. The site slopes up gently to moderately to the east/northeast except for a north-facing slope along the northern side of the site, which slopes moderately down to the north, and some localized flat areas near the center and eastern portions of the site. There are numerous concrete slabs along with low concrete retaining walls that are remnants from previous military buildings that were part of a World War II training facility that occupied the site around 1945. Heavy vegetation, including numerous mature trees and shrubs, occupies much of the site outside the limits of the concrete slabs.

Plans are to construct 16 two-story buildings containing 71 residential units and one community building. Proposed improvements on the remainder of the site will include surface parking, drive aisles, landscaping, and storm water retention areas.

Based on our investigation, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concern

for development of the site is the presence of undocumented fill and unknown buried foundations and utility lines from the previous site development, as well as the likely presence of large tree roots beneath some of the proposed improvements. We conclude the proposed buildings may be supported on conventional spread footings bearing on engineered fill.

The recommendations contained in our report are based on a limited subsurface exploration. Consequently, variations between expected and actual subsurface conditions may be found in localized areas during construction. Therefore, we should be engaged to observe site preparation and grading and footing subgrade preparation, during which time we may make changes in our recommendations, if deemed necessary.

We appreciate the opportunity to provide our services to you on this project. If you have any questions, please call.

Sincerely yours,
ROCKRIDGE GEOTECHNICAL, INC.

GEOTECHNICAL INVESTIGATION
CYPRESS POINT FAMILY COMMUNITY
16TH AND CARLOS STREETS
Moss Beach, California

1.0 INTRODUCTION

This report presents the results of the geotechnical investigation performed by Rockridge Geotechnical, Inc. for the proposed Cypress Point Family Community affordable housing development in Moss Beach, California. The project site is on the eastern side of Carlos Street between Sierra Street to the south and 16th Street to the north, as shown on the Site Location Map, Figure 1.

The subject property encompasses an area of 10.875 acres of vacant land, as shown on the Site Plan and Existing Geology, Figure 2A. It is bordered by a combination of single-family homes and vacant land to the north and east, single-family homes to the south, and Carlos Street to the west. The site slopes up gently to moderately to the east/northeast except for a north-facing slope along the northern side of the site, which slopes moderately down to the north, and some localized flat areas near the center and eastern portions of the site. There are numerous concrete slabs along with low concrete retaining walls that are remnants from previous military buildings that were part of a World War II training facility that occupied the site around 1945. Heavy vegetation, including numerous mature trees and shrubs, occupies much of the site outside the limits of the concrete slabs.

Easements for the Montara Water and Sanitary District (MWSD) and Pacific Gas & Electric (PG&E) utilities extend along the unpaved roadways within the property. MWSD infrastructure on the site includes water storage tanks in the southeastern portion of the site, a booster pump system, and distribution facilities with a fenced-in parcel of land adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the property.

Plans are to construct 16 two story-buildings containing 71 residential units and one community building as shown on the attached Site Plan - Proposed Building Layout, Figure 2B. Proposed

improvements on the remainder of the site will include surface parking, drive aisles, landscaping, and storm water retention areas.

Structural design loads were not available at the time this report was prepared. Based on our experience with similar buildings we estimate the buildings will impose an average building pressure of 300 pounds per square foot (psf).

2.0 SCOPE OF SERVICES

Our investigation was performed in accordance with our General Consultant Services Agreement with MP Moss Beach Associates L.P., dated March 21, 2017. Our scope of services consisted of exploring subsurface conditions at the site by drilling nine test borings, performing a geologic site reconnaissance, performing laboratory testing on selected soil samples, and performing engineering analyses to develop conclusions and recommendations regarding:

- subsurface conditions
- site seismicity and seismic hazards, including the potential for liquefaction and liquefaction-induced ground failure
- geological hazard evaluation, including slope stability
- the most appropriate foundation type(s) for the proposed buildings
- design criteria for the recommended foundation type(s), including vertical and lateral capacities
- estimates of foundation settlement
- subgrade preparation for slab-on-grade floors and concrete flatwork
- site grading and excavation, including criteria for the fill quality and compaction
- pavement section for asphalt concrete and Portland-cement concrete
- 2019 California Building Code (CBC) site class and design spectral response acceleration parameters
- construction considerations.

3.0 GEOLOGIC RECONNAISSANCE AND FIELD INVESTIGATION

Our geologist performed a geologic reconnaissance of the site on June 12, 2018 to visually identify any geologic hazards, including landslide hazards. Our field investigation consisted of drilling nine test borings and performing laboratory testing on selected soil samples. Details of the field investigation and laboratory testing are described below.

3.1 Test Borings

We planned to drill 10 borings; however, one of the proposed boring locations (Boring B-1) could not be accessed with the track-mounted drill rig. Prior to mobilizing to the site, we prepared a Drilling Notification Form (attached in Appendix A) in accordance with our Annual Geotechnical Drilling Permit with the San Mateo County Environmental Health Services Division (SMCEHSD), contacted Underground Service Alert (USA) to notify them of our work, as required by law, and retained a private utility locator, Precision Locating LLC, to check that the borehole locations were clear of existing utilities.

The test borings, designated B-2 through B-10, were drilled on May 11 and 12, 2017 at the approximate locations shown on Figures 2A and 2B. The borings were drilled by Britton Exploration of Los Gatos, California to depths ranging from 11.5 to 25 feet below the existing ground surface (bgs) using a track-mounted CME-55 drill rig equipped with eight-inch-outside-diameter hollow-stem flight augers. During drilling, our field engineer logged the soil encountered and obtained representative samples for visual classification and laboratory testing. The logs of the borings are presented on Figures A-1 through A-9 in Appendix A. The soil encountered in the borings was classified in accordance with the classification chart shown on Figure A-10.

Soil samples were obtained using the following samplers:

- Sprague and Henwood (S&H) split-barrel sampler with a 3.0-inch outside diameter and 2.5-inch inside diameter, lined with 2.43-inch inside diameter brass/stainless steel tubes.
- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside and 1.5-inch inside diameter, without liners.

The S&H and SPT samplers were driven with a 140-pound automatic hammer falling 30 inches per drop. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers were recorded every six inches and are presented on the boring logs. A "blow count" is defined as the number of hammer blows per six inches of penetration or 50 blows for six inches or less of penetration. The blow counts used for this conversion were: (1) the last two blow counts if the sampler was driven more than 12 inches, (2) the last one blow count if the sampler was driven more than six inches but less than 12 inches, and (3) the only blow count if the sampler was driven six inches or less. The blow counts required to drive the S&H and SPT samplers were converted to approximate SPT N-values using factors of 0.84 and 1.44, respectively, to account for sampler type and approximate hammer energy. The converted SPT N-values are presented on the boring logs.

Upon completion, the boreholes were backfilled with neat cement grout in accordance with SMCEHSD grouting guidelines. The soil cuttings generated by the borings were placed on the ground next to each boring location. Straw wattles were placed and staked around the soil cuttings at each boring location to reduce silt content in surface water runoff that comes in contact with the cuttings.

3.2 Laboratory Testing

We re-examined each soil sample obtained from our borings to confirm the field classifications and select representative samples for laboratory testing. Soil samples were tested to measure moisture content, dry density, Atterberg limits, grain-size distribution, resistance value (R-value), and corrosivity. The results of the laboratory tests are presented on the boring logs and in Appendix B.

4.0 SITE AND SUBSURFACE CONDITIONS

4.1 Site Conditions

The subject property encompasses an area of 10.875 acres of vacant land. It is bordered by a combination of single-family homes and vacant land to the north and east, single-family homes

to the south, and Carlos Street to the west. The site slopes up gently to moderately to the east/northeast except for a north-facing slope along the northern side of the site, which slopes moderately down to the north, and some localized flat areas near the center and eastern portions of the site. Ground surface elevations across the site range from about 95 feet (datum unknown) along the northern edge of the site to about 205 feet along the eastern edge of the site. The inclinations of on-site slopes are generally 5:1 (horizontal:vertical) or flatter, except in localized areas and along the northern and southern property lines where the slope inclinations are as steep approximately 3:1.

There are numerous concrete slabs along with low concrete retaining walls that are remnants from previous military buildings that were part of a World War II training facility that occupied the site around 1945. The site was also previously used as a school and a fire training facility for firefighters. Heavy vegetation, including numerous mature trees and shrubs, occupies much of the site outside the limits of the concrete slabs. Notable hydrophilic plants (pampas grass) are abundant on the eastern part of the lower terrace; these pampas grass likely grows where surface run off from the relatively steeper and impermeable upper terrace accumulates within the relatively thicker soil and low-angle down-slope terrace deposits.

Easements for the Montara Water and Sanitary District (MWSD) and Pacific Gas & Electric (PG&E) utilities extend along the unpaved roadways within the property. MWSD infrastructure on the site includes water storage tanks in the southeastern portion of the site, a booster pump system, and distribution facilities with a fenced-in parcel of land adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the property.

According to a Limited Phase II Subsurface Investigation report prepared by AEI Consultants, dated February 15, 2017, there are records of two water wells on the site. One well, referred to as the “upper well”, was found along the northern edge of the site; however, the second well could not be located. It is not known whether either of these wells was properly abandoned in accordance with local regulations.

4.2 Site Geology and Subsurface Conditions

The geologic units in the site vicinity are mapped as Quaternary (1.6 million years [Ma] to recent) alluvial fan (Qf) and marine terrace deposits (Qmt) and Cretaceous (145 to 65 Ma) Montara Mountain granitic rocks (Kgr) of the Salinian Complex (Brabb *et al*., 1983; Wagner *et al*.,1990 and Brabb *et al*.,1998). The site locality is shown lying in part, on marine terrace deposits (Qmt) in the eastern half and granitic rocks (Kgr) in the western half (Brabb *et al*.,1998), as shown on Figure 2A.

Our borings indicate there is up to 3-1/2 feet of undocumented fill consisting of medium stiff sandy clay or medium dense clayey sand with varying amounts of gravel in localized areas of the site. Beneath the fill is stiff to hard clay and sandy clay interbedded with medium dense to very dense clayey sand and sand with clay that extend to the top of bedrock, where encountered, or to the maximum depths explored. Atterberg limits tests indicate the soil underlying the site has low plasticity and, therefore, has low expansion potential.

During our subsurface exploration and reconnaissance, we encountered granitic bedrock in the western part of the site (Borings B-2, B-5, B-6, B-7, B-9, and B-10) at depths of greater than 17.5 feet bgs and at the eastern part of the site (Borings B-3, B-4, and B-8) as shallow as 4.5 feet bgs. More specifically, the depth to granitic bedrock increased from east to west between Borings B-8 and B-7 from 8.5 feet bgs to greater than 25 feet bgs, respectively, and within B-3 and B-2 from 4.5 feet bgs to greater than 21 feet bgs, respectively; this suggests a relatively steeply westward dipping bedrock surface that bisects the site from north to south that is overlain by shallow (4.5 to 8.5 feet) terrace deposits in the eastern part and thicker (>17 feet) terrace deposits in the western part of the property. We interpret that the relatively steeply dipping bedrock surface is perhaps a buried and eroded paleoseacliff that is separating two different age marine terrace surfaces. Borings B-3, B-4 and B-8 are located on the outer (western) edge of a older and eroded marine terrace surface and the western borings (Borings B-2, B-5, B-6, B-7, B-9, and B-10) lie on the eastern part of the younger terrace in an area where more accumulation of colluvium and alluvium has occurred.

4.3 Groundwater Conditions

Groundwater was not encountered in our borings which were drilled to depths up to 26.5 feet bgs. The AEI report referenced above indicates "standing and static water levels" were measured in an on-site water well depths of 168 and 35 feet, respectively, in June 1986. The depth to groundwater is expected to fluctuate several feet seasonally, depending on the amount of rainfall.

5.0 SEISMIC CONSIDERATIONS

5.1 Regional Seismicity

The site is located in the Coast Ranges Geomorphic Province of California that is characterized by northwest-trending valleys and ridges. These topographic features are controlled by folds and faults that resulted from the collision of the Farallon plate and North American plate and subsequent strike-slip faulting along the San Andreas Fault system. The San Andreas Fault is more than 600 miles long from Point Arena in the north to the Gulf of California in the south. The Coast Ranges Geomorphic Province is bounded on the east by the Great Valley and on the west by the Pacific Ocean.

The geologic structure in the site vicinity is dominated by the Seal Cove Fault which is believed to be the onshore-strand of the greater Holocene-active San Gregorio Fault. The San Gregorio Fault extends for about 143 miles from the Big Sur region south of Monterey Bay and northward to where it merges with the San Andreas Fault System near Bolinas Bay north of San Francisco. Continuing activity along the Seal Cove Fault is revealed by a northwestward striking fault scarp that offsets the young Half Moon Bay Terrace near the Half Moon Bay Airport approximately three quarters of mile to the south of the site.

The major active faults in the area are the San Gregorio, San Andreas, and Hayward faults. These and other faults in the region are shown on the Regional Fault Map, Figure 3. For these and other active faults within a 50-kilometer radius of the site, the distance and direction from

the site, and characteristic moment magnitude[1] [Petersen et al. (2014) & Thompson et al. (2016)] are summarized in Table 1. These references are based on the Third Uniform California Earthquake Rupture Forecast (UCERF3), prepared by Field et al. (2013).

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude
San Gregorio North	0.2	West	7.44
Total North San Andreas (SAO+SAN+SAP+SAS)	11	East	8.04
North San Andreas (Peninsula, SAP)	11	East	7.38
Monte Vista - Shannon	19	East	7.14
Butano	28	Southeast	6.93
Total Hayward + Rodgers Creek (RC+HN+HS+HE)	40	East	7.58
Hayward (South, HS)	40	East	7.00
Hayward (North, HN)	41	Northeast	6.90
Zayante – Vergeles (2011 CFM)	42	Southeast	7.48
North San Andreas (North Coast, SAN)	42	North	7.52

Since 1800, four major earthquakes have been recorded on the San Andreas Fault. In 1836, an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale occurred east of Monterey Bay on the San Andreas Fault (Toppozada and Borchardt 1998). The estimated Moment magnitude, M_w, for this earthquake is about 6.25. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of

[1] Moment magnitude (M_w) is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), an M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The most recent earthquake to affect the Bay Area was the Loma Prieta Earthquake of 17 October 1989 with an M_w of 6.9. This earthquake occurred in the Santa Cruz Mountains about 58 kilometers southwest of the site.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward Fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras Fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake (M_w of 6.2).

As a part of the UCERF3 project, researchers estimated that the probability of at least one $M_w \geq 6.7$ earthquake occurring in the greater San Francisco Bay Area during a 30-year period (starting in 2014) is 72 percent. The highest probabilities are assigned to sections of the Hayward (South), Calaveras (Central), and the North San Andreas (Santa Cruz Mountains) faults. The respective probabilities are approximately 25, 21, and 17 percent.

5.2 Geologic Hazards

Because the project site is in a seismically active region, we evaluated the potential for earthquake-induced geologic hazards including ground shaking, ground surface rupture, liquefaction,[2] lateral spreading,[3] and cyclic densification[4]. We used the results of our field investigation to evaluate the potential of these phenomena occurring at the project site.

---

[2] Liquefaction is a phenomenon where loose, saturated, cohesionless soil experiences temporary reduction in strength during cyclic loading such as that produced by earthquakes.

[3] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[4] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing ground-surface settlement.

5.2.1 Ground Shaking

The seismicity of the site is governed by the activity of the nearby San Gregorio Fault, although ground shaking from future earthquakes on other faults, including the San Andreas and Hayward faults, will also be felt at the site. The intensity of earthquake ground motion at the site will depend upon the characteristics of the generating fault, distance to the earthquake epicenter, and magnitude and duration of the earthquake. We judge that strong to very strong ground shaking could occur at the site during a large earthquake on one of the nearby faults.

5.2.2 Ground Surface Rupture

The active Seal Cove part of San Gregorio Fault system lies approximately 0.4 miles south of the site. Several subsidiary splays of the Seal Cove Fault have been mapped sub-parallel and to the northeast of Seal Cove Fault that project toward the site from the southeast; however, the California Geological Survey (CGS) has concluded that these subsidiary splays are not Holocene active and extensive trench studies to the southeast of the site suggest that these fault traces do not strike through the site (CGS, 2003).

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. We therefore conclude the risk of fault offset at the site from a known active fault is very low. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure from previously unknown faults is also very low.

5.2.3 Liquefaction and Associated Hazards

When a saturated, cohesionless soil liquefies, it experiences a temporary loss of shear strength created by a transient rise in excess pore pressure generated by strong ground motion. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits. Flow failure, lateral spreading, differential settlement, loss

of bearing strength, ground fissures and sand boils are evidence of excess pore pressure generation and liquefaction. The project site is **not** located within a zone of liquefaction potential on the map titled *Earthquake Zones of Required Investigation, Montara Mountain Quadrangle*, dated April 4, 2019, and shown on Figure 4.

The site is underlain by stiff to very stiff cohesive soil and medium dense to dense clayey sand and sand with clay that is not susceptible to liquefaction because of its cohesion and/or its high relative density. Further, it appears the depth to groundwater is more than 30 feet bgs. Therefore, we conclude the potential for liquefaction and liquefaction-related hazards, such as lateral spreading, is nil.

5.2.4 Cyclic Densification

Cyclic densification (also referred to as differential compaction) of non-saturated sand (sand above groundwater table) can occur during an earthquake, resulting in settlement of the ground surface and overlying improvements. We used the data from our borings to evaluate the potential for settlement due to cyclic densification within the soil above the water table. The results of our investigation indicate the soil encountered above the groundwater table has sufficient cohesion and/or sufficiently high relative density, such that the potential for cyclic densification to occur at the site is nil.

5.2.5 Landslide Hazards

To evaluate the potential for landslides to occur on the site, we performed a geologic reconnaissance and reviewed available published maps showing mapped existing landslides in San Mateo County. A portion of a landslide map prepared by Brabb and Pampeyan (1972) is attached (Figure 5). No evidence of landslides, slope instability, or erosional issues was observed during the geologic reconnaissance.

On the basis of our geologic reconnaissance and the findings from our subsurface investigation, we conclude the potential for landsliding at the site under both static and seismic conditions is low because of the lack of evidence of historic slope instability on the site, the high shear

strength of the soil and weathered bedrock underlying the site and the apparent absence of any significant seepage on the slope faces. Further, we conclude construction of the proposed improvements will not impact slope stability at the site or in the surrounding area provided the grading and construction of improvements are performed in accordance with the recommendations presented in this report. Therefore, in our opinion, no slope instability mitigation measures are required for this project.

6.0 DISCUSSION AND CONCLUSIONS

From a geotechnical standpoint, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concern at the site is the presence of undocumented fill and unknown buried foundations and utility lines from the previous site development, as well as the likely presence of large tree roots beneath some of the proposed improvements. Our conclusions and recommendations for this and other geotechnical aspects of the project are presented in this section.

6.1 Foundation Support and Settlement

The results of our investigation indicate the native soil underlying the site has moderate to high strength and low compressibility and, therefore, is capable of supporting the proposed structures on conventional spread footings. For conventional spread footings to be feasible, however, it will be necessary to overexcavate and recompact any existing undocumented fill beneath and within five horizontal feet from proposed buildings. We estimate settlement of buildings supported on spread footings bearing on stiff native soil and/or properly compacted fill will be less than 1/2 inch and differential settlement will be less than 1/4 inch over a horizontal distance of 30 feet.

6.2 Construction Considerations

The soil to be excavated consists primarily of clay and clayey sand, which can be excavated with conventional earth-moving equipment such as loaders and backhoes. If site grading is performed during the rainy season, repeated loads by heavy equipment will reduce the strength of the

surficial soil and decrease its ability to resist deformation; this phenomenon could result in severe rutting and pumping of the exposed subgrade. To reduce the potential for this behavior, heavy rubber-tired equipment as well as vibratory rollers, should be avoided during the rainy season.

6.3 Soil Corrosivity

Corrosivity testing was performed by Project X Corrosion Engineering of Murrieta, California on samples of soil obtained during our field investigation from Boring B-2 at a depth of four feet bgs and from Boring B-6 at a depth of two feet bgs. The results of the tests are presented in Appendix B of this report.

The resistivity test results (7,370 and 5,963 ohm-cm) indicate the near-surface soil is "moderately corrosive[5]" to buried metallic structures. Accordingly, buried iron, steel, cast iron, galvanized steel, and dielectric-coated steel or iron should be properly protected against corrosion. The results of the pH tests (8.4 and 7.5) indicate the near-surface is "negligibly" corrosive to buried metallic and concrete structures. The chloride ion concentrations (84 and 156 mg/kg) indicate the chlorides in the near-surface soil are "negligibly to mildly corrosive" to buried metallic structures and reinforcing steel in concrete structures below ground. The results also indicate the sulfate ion concentrations (30 and 210 mg/kg) are sufficiently low such that sulfates do not to pose a threat to buried concrete.

7.0 RECOMMENDATIONS

Our recommendations for site preparation and grading, design of foundations and retaining walls, pavement design, seismic design, and other geotechnical aspects of the project are presented in this section.

[5] Roberge, Pierre R. (2018). *Corrosion Basics, an Introduction, Third Edition*. NACE International, P. 189.

7.1 Site Preparation and Grading

Site clearing should include removal of existing foundations, slabs, pavements, and underground utilities, if present. In general, abandoned underground utilities should be removed to the property line or service connections and properly capped or plugged with concrete. Where existing utility lines are outside of the footprint of the proposed improvements and will not interfere with the proposed construction, they may be abandoned in-place provided the lines are filled with lean concrete or cement grout to the property line. Voids resulting from demolition activities should be properly backfilled with engineered fill following the recommendations provided later in this section. Any vegetation and the upper 2 to 3 inches of organic topsoil should be stripped in areas to receive improvements (i.e., building, pavement, or flatwork). Stripped organic soil, if any, can be placed in future landscaped areas. Tree roots larger than 1/2 inch in diameter within three feet of the existing ground surface beneath the proposed buildings should also be removed.

After site clearing is completed, the proposed building pads should be excavated to a depth of at least three feet below existing site grades. In proposed pavement and flatwork areas, the overexcavation depth should be at least 18 inches below existing site grades. The excavations should extend at least five feet beyond the perimeters of the proposed buildings, except where constrained by property lines or existing utilities. The excavations should extend at least one foot beyond the edges of proposed pavements and flatwork. The exposed subgrade at the base of the excavations should be scarified to a depth of at least eight inches, moisture-conditioned to above optimum moisture content, and compacted to at least 92 percent relative compaction[6]. The excavated material and imported select fill, if needed, should then be placed in lifts not exceeding eight inches in loose thickness, moisture-conditioned to above optimum moisture content, and compacted to at least 92 percent relative compaction beneath buildings and at least 90 percent below pavements and flatwork.

[6] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557 laboratory compaction procedure.

Subgrade soil or general fill consisting of clean sand or gravel (defined as soil with less than five percent fines by weight) should be compacted to at least 95 percent relative compaction. Soil subgrade for vehicular pavements should be compacted to at least 95 percent relative compaction and be non-yielding. The soil subgrade should be kept moist until it is covered by fill for improvements.

Excavations should be backfilled with properly compacted fill. Fill should consist of on-site soil or imported soil (select fill) that is free of organic matter (including roots larger than 1/2 inch in diameter), contains no rocks or lumps larger than three inches in greatest dimension, and is approved by the Geotechnical Engineer. Select fill should also have a liquid limit of less than 40 and a plasticity index lower than 15. Samples of proposed imported fill material should be submitted to the Geotechnical Engineer at least three business days prior to use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed imported material.

7.1.1 Utility Trench Backfill

Excavations for utility trenches can be readily made with a backhoe. All trenches should conform to the current CAL-OSHA requirements. To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of clean sand or fine gravel. After the pipes and conduits are tested, inspected (if required) and approved, they should be covered to a depth of six inches with sand or fine gravel, which should be mechanically tamped. Backfill for utility trenches and other excavations is also considered fill, and should be placed and compacted according to the recommendations previously presented. If imported clean sand or gravel (defined as soil with less than five percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the pavement section.

7.1.2 Temporary and Permanent Slopes

Excavations that will be deeper than five feet and will be entered by workers should be sloped or shored in accordance with CAL-OSHA standards (29 CFR Part 1926). The contractor should be responsible for the construction and safety of temporary slopes. We judge temporary slopes excavated in the near-surface clay and clayey sand with a maximum inclination of 1:1 (horizontal to vertical) should be stable, provided the slope is not surcharged by adjacent structures, construction equipment, or stockpiled soil. If granular soil is encountered, however, flatter slopes will be required.

Permanent cut and fill slopes should be constructed at gradients no steeper than 2:1 (horizontal:vertical). If fills will be placed on existing slopes within an inclination steeper than 5:1, the slopes should be constructed with a keyway at least 10 feet wide and founded at least four feet into competent soil on the downslope side. The need for installing a subdrain in keyways will be assessed once grading plans are available. Fill slopes should be overbuilt two feet and cut back to exposed a firm compacted surface.

7.1.3 Erosion Control

Areas disturbed by grading should be protected against erosion during rainfall events. The bare portions of cut and fill slopes should be planted with deep-rooted, fast growing vegetation prior to winter. The surface slopes should be rolled to create a firm slope surface. The finished surface should be covered with appropriate erosion matting or hydro-seeded. Best Management Practices (BMP's) should be implemented to prevent silt from entering the storm drains during and after construction.

7.1.4 Drainage and Landscaping

Positive surface drainage should be provided around the building to direct surface water away from the foundations. To reduce the potential for water ponding adjacent to the buildings, we recommend the ground surface within a horizontal distance of five feet from the building slope down away from the building with a surface gradient of at least two percent in unpaved areas and

one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundations. The use of water-intensive landscaping around the perimeter of the buildings should be avoided to reduce the amount of water introduced to the near-surface clay.

Care should be taken to minimize the potential for subsurface water to collect beneath non-permeable pavements and pedestrian walkways. Where landscape beds and tree wells are immediately adjacent to pavements and flatwork which are not designed as permeable systems, we recommend vertical cutoff barriers be incorporated into the design to prevent irrigation water from saturating the subgrade and aggregate base. These barriers may consist of either flexible impermeable membranes or deepened concrete curbs.

7.1.5 Bio-Retention Areas

The primary concerns with the proposed bio-retention areas are: 1) providing suitable support for foundations and curbs constructed near the bio-retention areas, and 2) potential for subsurface water from the bio-retention areas to migrate (and possibly build up) beneath pavements and proposed buildings. Consequently, we recommended that bio-retention features constructed at the site be provided with underdrains and/or drain inlets. In addition, we recommend bio-retention features, such as bioswales, be constructed no closer than five feet from buildings or pavements. If it is necessary to construct bio-retention features within five horizontal feet of buildings or pavements, the features should be constructed with an impermeable membrane at least 15 mils thick. Unlined bio-retention features should not be constructed on slopes steeper than 5:1. Bio-retention features may be constructed on slopes steeper than 5:1 provided they are lined with an impermeable membrane.

Due to the low permeability of the on-site near-surface soil, these systems should be designed for *no exfiltration* into the subgrade soil. The drainage layer beneath the “treatment” soil should consist of a minimum 12-inch-thick layer of Caltrans Class 2 Permeable drainage material and include a minimum 4-inch-diameter perforated drain pipe placed with the perforations facing downward. An impermeable liner consisting of a high-density polyethylene liner (or equivalent)

that is at least 15 mils thick should line the entire bottom and sides of the system, where required. The sides of bioswales should be sloped at a maximum gradient of 2:1 above the gravel layer. The sides of the bioswales may be cut vertical where they are adjacent to the gravel layer.

Where a vertical curb or foundation is constructed near a bio-retention area, the curb and the edge of the foundations should be founded below an imaginary line extending up at an inclination of 1.5:1 (horizontal: vertical) from the base of the bio-retention area.

7.2 Spread Footings

The proposed structures, including site retaining walls, may be supported on conventional spread footings bottomed in stiff, undisturbed native soil and/or properly compacted fill. Continuous footings should be at least 16 inches wide. Footings should bottom at least 18 inches below the lowest adjacent exterior grade or 12 inches below the bottom of the capillary break, whichever is deeper. If footings will be constructed on sloping ground or on level ground near slopes, the footings should be bottomed at a depth such that the face of the footing, measured at the footing bottom, is at least seven feet from the face of the slope. Footings for buildings, retaining walls, and other improvements may be designed using allowable bearing pressures of 3,000 psf for dead-plus-live loads and 4,000 psf for total design loads, which include wind or seismic forces.

Lateral loads may be resisted by a combination of passive pressure on the vertical faces of the footings and friction between the bottoms of the footings and the supporting soil. To compute lateral resistance for transient and sustained loads, we recommend using a uniform pressure of 1,500 psf and an equivalent fluid weight (triangular distribution) of 270 pcf, respectively. The upper foot of soil should be ignored unless confined by a slab or pavement. Frictional resistance should be computed using a base friction coefficient of 0.30. The passive pressure and frictional resistance values include a factor of safety of at least 1.5.

In general, we recommend all footings be founded below an imaginary plane extending up at an inclination of 1.5:1 (horizontal:vertical) from the base of any vault, utility trench, bioswale/ storm water treatment area, etc. If the design footing depth is above this plane, the footing can

either be deepened, or over-excavated below the line and replaced with lean concrete (200 psi minimum) to make up the difference.

Footing excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. The bottoms and sides of the excavations should be moistened following excavation and maintained in a moist condition until concrete is placed. We should check footing excavations prior to placement of reinforcing steel to check for proper bearing and cleanout.

7.3 Concrete Slab-on-Grade Floor

If water vapor moving through the building floor slabs is considered detrimental, we recommend installing a capillary moisture break and water vapor retarder beneath the floor slabs. A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The particle size of the capillary break material should meet the gradation requirements presented in Table 2.

TABLE 2
Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
1 inch	90 – 100
¾ inch	30 – 100
½ inch	5 – 25
3/8 inch	0 – 6

The vapor retarder should meet the requirements for Class B vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of ASTM E1643. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder.

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and can result in excessive vapor transmission through the slab. Where the concrete is poured directly over the vapor retarder, we recommend the w/c ratio of the

concrete not exceed 0.45. Water should not be added to the concrete mix in the field. If necessary, workability should be increased by adding plasticizers. In addition, the slab should be properly cured. Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

7.4 Exterior Concrete Flatwork

Exterior concrete flatwork that will not receive vehicular traffic (i.e. sidewalk) should be underlain by at least four inches of Class 2 aggregate base compacted to at least 90 percent relative compaction. Prior to placement of the aggregate base, the upper eight inches of the subgrade soil should be scarified, moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction.

7.5 Retaining Walls

Retaining walls should be designed to resist static lateral earth pressures, lateral pressures caused by earthquakes, and traffic loads (if vehicular traffic is expected within a horizontal distance equal to 1.5 times the wall height). All on-site walls, including low retaining walls in landscaped areas, should be designed in accordance with the recommendations presented in this section, although checking the walls for seismic loading is not required for walls less than six feet high. Retaining walls that are restrained from movement at the top or sides (e.g., a wall with a 90-degree turn) should be designed using the at-rest pressure presented in Table 3. Walls that are not restrained from rotation may be designed using the active pressure presented in Table 3.

TABLE 3
Lateral Earth Pressures for Retaining Wall Design

Soil Backfill Type	Active Static Condition (Unrestrained)	At-Rest Static Condition (Restrained)	Seismic Condition
On-site Soil - Drained	35 pcf[1]	55 pcf	35 pcf + 14 pcf
On-site Soil - Undrained	80 pcf	90 pcf	80 pcf + 7 pcf

1. Equivalent fluid weight (triangular distribution); pcf = pounds per cubic foot

The recommended lateral earth pressures above are based on a level backfill condition with no additional surcharge loads. If the retained soil will be sloped, we can provide additional recommendations after the degree to which the soil will be sloped has been determined. Where the below-grade walls are subject to traffic loading within a horizontal distance equal to 1.5 times the wall height, an additional uniform lateral pressure of 100 psf, applied to the entire height of the wall.

The "drained" design pressures presented Table 3 are based on fully drained walls. Although a majority of the retaining walls will be above the groundwater level, water can accumulate behind the walls from other sources, such as rainfall, irrigation, and broken water lines, etc. One acceptable method for backdraining a basement wall is to place a prefabricated drainage panel against the back of the wall. The drainage panel should extend down to a perforated PVC collector pipe at the base of the retaining wall. The pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material or 3/4-inch drain rock wrapped in filter fabric (Mirafi NC or equivalent). The pipe should be connected to a suitable discharge point; a sump and pump system may be required to drain the collector pipes.

Wall backfill material and compaction should conform to the recommendations presented previously in Section 7.1 of this report. Lightweight compaction equipment should be used to reduce stresses induced on the retaining walls during fill placement unless the walls are appropriately braced.

Site retaining walls may be supported on spread footings bottomed on stiff native soil and/or properly compacted fill. The footings should be bottomed at least 18 inches below the lowest adjacent finished grade. The allowable bearing pressure, friction factor, and passive pressure presented for footings design in Section 7.2 may be used for design of site retaining walls.

7.6 Pavement Design

7.6.1 Flexible (Asphalt Concrete) Pavement Design

The State of California flexible pavement design method was used to develop the recommended asphalt concrete pavement sections. The resistance value (R-value) test results indicate the upper native soil has an R-value of approximately 29.

If the proposed pavement will experience little or no truck traffic, including garbage trucks, we recommend a traffic index (TI) of 4.5 be used for asphalt concrete pavement design. Pavement areas that will be subject to garbage truck traffic should be designed for a TI of 5.5. The project civil engineer should check that the TI's presented in this report are appropriate for the intended use. Recommended pavement sections for these traffic indices are presented in Table 4.

TABLE 4
Recommended Asphalt Concrete Pavement Sections

TI	Asphaltic Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	6.0
5.0	3.0	6.0
5.5	3.0	7.5
6.0	3.5	8.0
6.5	4.0	8.0
7.0	4.0	10.0

The upper six inches of the subgrade and the Class 2 aggregate base beneath pavements should be moisture-conditioned to above optimum moisture content and compacted to at least 95 percent relative compaction.

To prevent irrigation water from entering the pavement section, curbs adjacent to landscaped areas should extend through the base rock and at least three inches into the underlying subgrade soil. Where pavement is constructed near bio-swales or other storm water treatment areas, curbs

should be deepened so that the base is founded below an imaginary line extending up at an inclination of 1.5:1 (horizontal:vertical) from the base of the bio-swale/treatment area.

7.6.2 Rigid (Portland Cement Concrete) Pavement

Concrete pavement design is based on a maximum single-axle load of 20,000 pounds and a maximum tandem axle load of 32,000 pounds and light truck traffic (i.e., a few trucks per week). The recommended rigid pavement section for these axle loads is 6-1/2 inches of Portland cement concrete (PCC) over six inches of Class 2 aggregate base. If the concrete pavement will be subject to fire truck traffic, the PCC should be at least seven inches thick. For residential driveways, the recommended pavement section is five inches of PCC over six inches of Class 2 aggregate base.

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at 15-foot spacing. Where the outer edge of a concrete pavement meets asphalt concrete pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. For areas that will receive weekly garbage truck traffic, we recommend the slab be reinforced with a minimum of No. 4 bars at 16-inch spacing in both directions. Recommendations for subgrade preparation and aggregate base compaction for concrete pavement are the same as those we have described above for asphalt concrete pavement.

7.7 Seismic Design

We understand the proposed building will be designed using the seismic provisions in the 2019 CBC. The latitude and longitude of the site are 37.5343° and -122.5168°, respectively. Based on our borings, we recommend Site Class C (Very Dense Soil and Soft Rock) be used. Hence, in accordance with the 2019 CBC, we recommend the following:

- S_S = 2.148g, S_1 = 0.88g
- S_{MS} = 2.577g, S_{M1} = 1.232g
- S_{DS} = 1.718g, S_{D1} = 0.821g

- PGA_M = 1.16g
- Seismic Design Category E for Risk Categories I, II, and III.

8.0 ADDITIONAL GEOTECHNICAL SERVICES

Prior to construction, Rockridge Geotechnical should review the project plans and specifications to verify that they conform to the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing during site preparation, placement and compaction of fill, and installation of foundations. These observations will allow us to compare actual with anticipated subsurface conditions and to verify that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

9.0 LIMITATIONS

This geotechnical investigation has been conducted in accordance with the standard of care commonly used as state-of-practice in the profession. No other warranties are either expressed or implied. The recommendations made in this report are based on the assumption that the subsurface conditions do not deviate appreciably from those disclosed in the exploratory borings. If any variations or undesirable conditions are encountered during construction, we should be notified so that additional recommendations can be made. The foundation recommendations presented in this report are developed exclusively for the proposed development described in this report and are not valid for other locations and construction in the project vicinity.

REGIONAL FAULT MAP

ROCKRIDGE GEOTECHNICAL

Date 06/27/22	Project No. 17-1286	Figure 3

Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake Fault Zones
Zone boundaries are delineated by straight-line segments; the boundaries define the zone encompassing active faults that consititute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Sections 2621.5(a) would be required.

Figure: A-9

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

GRAIN SIZE CHART

Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel coarse fine	3" to No. 4 3" to 3/4" 3/4" to No. 4	76.2 to 4.76 76.2 to 19.1 19.1 to 4.76
Sand coarse medium fine	No. 4 to No. 200 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200	4.76 to 0.075 4.76 to 2.00 2.00 to 0.420 0.420 to 0.075

County Review Draft

ADMONITION

Certain information contained in this report is not intended for general public distribution. Portions of this report locate significant archaeological sites in the region of the project area, and indiscriminate distribution of these data could result in the desecration and destruction of invaluable cultural resources. In order to ensure the security of the critical data in this report, certain maps and passages may be deleted in copies not delivered directly into the hands of environmental personnel and qualified archaeologists.

ABSTRACT

This cultural resource evaluation was carried out for the proposed Cypress Point Project in Moss Beach, County of San Mateo. This evaluation included archival research and a surface survey of the project area. The archival research revealed that there are no recorded cultural resources located within the study area. However, four previously recorded resources are located within a one quarter mile radius of the proposed project area. The closest of these is CA-SMA-55, a prehistoric shell mound site originally recorded by N. Nelson in the early 20th Century and located approximately 150 feet away from the northwest corner of the proposed project area. Midden soils, containing fragments of mussel shell were noted in the central portion of the subject property during surface reconnaissance (see Midden Location Map). Historic foundations, associated with WWII era military activities on the site were also noted in the field. Based on the presence of midden soils within the project area, it is recommended that a subsurface testing program be carried out in this portion of the proposed project area to ascertain the boundaries, depth, and constituents of this archaeological deposit. It is further recommended that the archaeological monitoring and other mitigation measures presented in the Archaeological Treatment Plan for the project (Cartier 2018) be carried out for the proposed project.

REQUEST FOR CULTURAL RESOURCE EVALUATION

The cultural resource evaluation was carried out to determine the presence or absence of any significant cultural resources. Cultural resource services were requested in September of 2017 in order to provide a cultural resource report of the project. This report meets the requirements of CEQA (California Environmental Quality Act).

QUALIFICATIONS OF ARCHAEOLOGICAL RESOURCE MANAGEMENT

Archaeological Resource Management has been specifically engaged in cultural resource management projects in central California since 1977. The firm is owned and supervised by Dr. Robert Cartier. Dr. Cartier is the Principal Investigator, with additional personnel hired to satisfy the needs for specific investigations. ARM's offices are located in downtown San Jose which provides a centrally located headquarters for the majority of the work contracted in the Central California area. These studies have included archival overviews, surface surveys, extensive excavations, and National Register evaluations for both prehistoric and historic resources that meet requirements of CEQA, NHPA, and NEPA (National Environmental Policy Act). Dr. Cartier has a Ph.D. in anthropology, and is certified by the Register of Professional Archaeologists (ROPA) for conducting cultural resource investigations as well as other specialized work in archaeology and history. He also fulfills the standards set forth by the Secretary of the Interior for inclusion as a historian and architectural historian and is certified as such on the State of California referral lists.

Dr. Cartier completed his undergraduate work in anthropology at San Jose State University and earned his M.A. and Ph.D. in anthropology from Rice University in 1975. He is

certified by the Register of Professional Archaeologists (ROPA) in the categories of teaching, field work, and cultural resource management. Cartier organized the firm of Archaeological Resource Management in 1977. Since that time he has been directing archaeological and historical investigations in Santa Clara County and the central California area. The firm has completed projects for private individuals, local cities and counties, the Santa Clara Valley Water District, the State of California (CALTRANS), and the Federal Government (Army Corps of Engineers), as well as purely academic investigations.

LOCATION AND DESCRIPTION OF THE SUBJECT AREA

The subject area consists of approximately 10.66 acres of land off of Sierra Street in Moss Beach, County of San Mateo. On the USGS 7.5 minute quadrangle of Montara Mountain OE W, CA, the Universal Transverse Mercator Grid (UTMG) centerpoint of the project area is 10S 5 42 699mE,41 54 262mN. The elevation ranges from approximately 100 to 150 feet MSL, and the nearest source of fresh water is the Montara Denniston Creek which is located approximately 300 feet north of the proposed project area.

The proposed project consists of the construction of 71 affordable housing units consisting of approximately 25 two-story buildings holding 3-4 units each. This project will involve the necessary excavation, grading, trenching, and other earthmoving activities.

METHODOLOGY

The methodology used in this investigation consists of an archival search, a surface reconnaissance, an evaluation of the potential significance of the property according to the California Register of Historic Resources (CRHR), and a written report of the findings with appropriate recommendations. The archival research is conducted by transferring the study location to a state archaeological office which maintains all records of archaeological investigations. This is done in order to learn if any archaeological sites or surveys have been recorded within a half mile of the subject area. Each archival search with the State is given a file number for verification. The surface reconnaissance portion of the evaluation is done to determine if traces of historic or prehistoric materials exist within the study area. This survey is conducted by a field archaeologist who examines exposed soils for cultural material. The archaeologist is looking for early ceramics, Native American cooking debris, and artifacts of stone, bone, and shell. For historic cultural resources, the field evaluation also considers older structures, distinctive architecture, and subsurface historic trash deposits of potentially significant antiquity. A report is written containing the archival information, record search number, the survey findings, and appropriate recommendations. A copy of this evaluation is sent to the State archaeological office by requirements of State procedure.

Regulatory Framework

California Register Criteria

A cultural resource is considered "significant" if it qualifies as eligible for listing in the California Register of Historic Resources (CRHR). Properties that are eligible for listing in the CRHR must meet one or more of the following criteria:

1. Association with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
2. Association with the lives of persons important to local, California, or national history;
3. Embodying the distinctive characteristics of a type, period, region, or method of construction, or representing the work of a master, or possessing high artistic values; or
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Most Native American prehistoric sites are eligible due to their age, scientific potential, and/or burial remains.

The CRHR interprets the integrity of a cultural resource based upon its physical authenticity. An historic cultural resource must retain its historic character or appearance and thus be recognizable as an historic resource. Integrity is evaluated by examining the subject's location, design, setting, materials, workmanship, feeling, and association. If the subject has retained these qualities, it may be said to have integrity. It is possible that a cultural resource may not retain sufficient integrity to be listed in the National Register of Historic Places yet still be eligible for listing in the CRHR. If a cultural resource retains the potential to convey significant historical/scientific data, it may be said to retain sufficient integrity for potential listing in the CRHR.

National Register Criteria

The National Register of Historic Places was first established in 1966, with major revisions in 1976. The register is set forth in 36 CFR 60 which establishes the responsibilities of the State Historic Preservation Officers (SHPO), standards for their staffs and review boards, and describes the statewide survey and planning process for historic preservation. Within this regulation guidelines are set forth concerning the National Register of Historic Places (36 CFR 60.6). In addition, further regulations are found in 36 CFR 63-66 and 800 which define procedures for determination of eligibility, identification of historic properties, recovery, reporting, and protection procedures.

The National Register of Historic Places was established to recognize resources associated with the accomplishments of all peoples who have contributed to the country's history and heritage. Guidelines were designed for Federal and State agencies in nominating cultural resources to the National Register. These guidelines are based upon integrity and significance of the resource. Integrity applies to specific items such as location, design, setting, materials, workmanship, feeling, and association. Quality of significance in

American history, architecture, archaeology, engineering and culture is present in resources that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and meet at least one of the following criteria:

a. that are associated with events that have made a significant contribution to broad patterns of our history;
b. that are associated with the lives of persons significant in our past;
c. that embody distinctive characteristics of type, period, or method of construction, or that represent the work of master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction;
d. that have yielded, or are likely to yield, information important in prehistory or history.

Ordinarily, properties that have achieved significance within the last 50 years are not considered eligible for the National Register. However, such properties will qualify if they are integral parts of districts that do meet the criteria of the NRHP listed above or if they fall within the following categories:

a. a religious property deriving primary significance from architectural significance or artistic distinction or historic importance; or
b. a building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with an historic person or event; or
c. a birthplace or grave of a historical figure of outstanding importance if there is no other appropriate site or building directly associated with his (or her) productive life; or
d. a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
e. a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
f. a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historical significance; or
g. a property achieving significance within the past 50 years if it is of exceptional importance.

Section 30244 of the California Coastal Act

Article 5; Land Resources, Section 30244 of the California Coastal Act states that:

> "Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required."

This cultural resource evaluation identifies a portion of the proposed project area as containing a potentially significant archaeological resource, and recommends archaeological testing for the purpose of determining the boundaries, depth, and constituents of the archaeological deposit within the proposed project area. The results of

this testing will be used to determine reasonable mitigation measures for the proposed project. Sensitivity for paleontological resources is being addressed in a separate report.

San Mateo County Midcoast Local Coastal Program Policies

In late 1980, the County Board of Supervisors and the California Coastal Commission approved the San Mateo County's Local Coastal Program. In April 1981, the County assumed responsibility for implementing the State Coastal Act in the unincorporated area of San Mateo County, including issuance of Coastal Development Permits. Three policies outlined within the Local Coastal Program have a bearing on cultural resources for the proposed project. These policies are discussed below.

1.25 Protection of Archaeological/Paleontological Resources

> "Based on County Archaeology/Paleontology Sensitivity Maps, determine whether or not sites proposed for new development are located within areas containing potential archaeological/paleontological resources. Prior to approval of development proposed in sensitive areas, require that a mitigation plan, adequate to protect the resource and prepared by a qualified archaeologist/paleontologist be submitted for review and approval and implemented as part of the project."

This cultural resource evaluation identifies a portion of the proposed project area as archaeologically sensitive, and recommends archaeological testing for the purpose of determining the boundaries, depth, and constituents of the archaeological deposit within the proposed project area. The results of this testing will be used to determine appropriate mitigation plan for the proposed project. Sensitivity for paleontological resources is being addressed in a separate report.

8.26 Structural Features

> "Employ the regulations of the Historical and Cultural Preservation Ordinance to protect any structure or site listed as an Official County or State Historic Landmark or is listed in the National Register of Historic Sites."

None of the structures within the proposed project area are currently listed on the County, State, or National Registers as historic resources. In addition, they do not appear to be eligible for listing in any of these registers. Although the proposed project area contains the concrete foundations of structures from the Point Montara Anti-Aircraft Training Center which operated during WWII, these remnants do not appear to adequately convey the character of the original structures or the activities which took place during this period for listing in these registers. Montara Water and Sanitary District infrastructure including tanks, culverts, and other fixtures are also present on the property. These structures are utilitarian in character and do not appear historically significant.

8.27 Natural Features

> "Prohibit the destruction or significant alteration of special natural features through implementation of Landform Policies and Vegetative Form Policies of the LCP."

No special natural features appear to be present within the proposed project area, thus no special natural features will be destroyed or altered by the proposed project.

ETHNOGRAPHIC BACKGROUND

Early ethnographic accounts of local Native American cultures provide a cultural context for archaeological studies. The Ohlone, or Costanoan, Indians inhabited the San Francisco Bay regions from the Golden Gate south to Monterey. Derived from a Spanish word, Costanoan means "people of the coast," and is an older term. Descendants of these people prefer to refer to themselves as "Ohlone," and it is now the generally accepted term. The research area is located in the Salson linguistic area, which shared many cultural traits with other linguistic groups in the Ohlone region. It is believed that the Ohlone Indians inhabited the area since A.D. 500, and that speakers of the Hokan language previously inhabited at least part of the region (Levy 1978). However, it is unclear when the Hokan or even earlier Paleo-Indians first came to the area. Archaeological data documents Native American coastal activity in the Central Coast area over the past 10,000 years, with some indications of occupation as early as 12,000 to 13,000 years ago (Jones et al, 2007). The earliest radiocarbon dates that are available for the area to which the Ohlone came to live are 12,000 B.P. (years before present) at SCR-177 in Scotts Valley (Cartier 1993), 3,200 B.P. at the University Village Site (SMA-77) (Gerow 1968), 6,349 B.P. at Palm Canyon (SCL-106) near Gilroy (Cartier 1980), 6,628 B.P. at Camden Avenue (SCL-64) (Winter 1978), CA-SCR-38 on the Santa Cruz coast, dated to ca. 8850 B.P., CA-SCR-7 dated to ca. 6050 B.P. (Jones and Hilderbrandt 1990), and CA-SCR-239 in Scotts Valley, dated to ca. 4950 B.P. (Cartier 1992).

The Ohlone were gatherers and hunters who utilized only the native flora and fauna with the exception of one domesticate, the dog. Yet, the abundance and high quality of natural resources allowed them to settle in semi-sedentary villages. The Ohlone were typically organized in basic political units called "tribelets" that consisted of 100 to 250 members (Kroeber 1954). The "tribelet" was an autonomous social unit consisting of one or more permanent villages with smaller villages in a relatively close proximity (Kroeber 1962). Parties went out from the major villages to locations within the tribal territory to obtain various resources.

The proximity of both mountainous and bay regions in the local environment made a diversity of resources available during different seasons to the native inhabitants. During the winter months, the low-lying flats near the San Francisco Bay have abundant marine and waterfowl resources, while the surrounding mountainous areas are best in the summer months for their nut, seed, and mammalian resources (King and Hickman 1973). A primary food source was acorns, abundant in autumn and easily stored for the remainder of the year. According to Gifford, the acorn industry of California was probably the most characteristic feature of its domestic economy (Gifford 1951). An

elaborate process of grinding and leaching acorns is necessary to render them palatable. The acorn industry first became a major source of food in the Middle Period as is indicated by the appearance of mortars and pestles in the archaeological record (King and Hickman 1973). Other important resources include various plant foods, land animals, and the marine resources of the San Francisco Bay. Both large and small land mammals were typically hunted, trapped or poisoned. Many items, including shell beads and ornaments, were extensively traded with other groups as far away as the Great Basin of Nevada (Davis 1974).

It is argued that contrary to usual conceptions of hunters and gatherers, native Californian groups, including the Ohlone, practiced a form of resource management that was close to agriculture. Bean and Lawton (1976) consider this pattern a "semi-agricultural" stage which included quasi-agricultural harvesting activity and proto-agricultural techniques. Some plants were pruned and reseeded seasonally for optimal production. Foods such as acorns were stored for many months at a time. Ethnographic accounts also report the repeated burning of woodlands grassbelt to increase animal and plant resources. It is likely to have made hunting conditions better by reducing scrubby growth and encouraging the growth of grasses and other plants that are appealing to grazers such as deer and elk. The plant growth succession after a burning is also rich in grains and legumes that were major food sources for Native Californians.

Bean and Lawton also claim that the abundance of plant and animal resources in California and the development of ingenious technological processes allowed Native Californians to develop social structures beyond the normal parameters of hunting and gathering. These include extensive political systems, controlled production and redistribution of goods, and alliances and trade with other groups.

ARCHIVAL BACKGROUND

Prior to surface reconnaissance of the subject area, a study of the maps and records at the Northwest Information Center of the California Archaeological Site Inventory was conducted and given the file number NWIC# 17-0815. The purpose of this research was to determine if any known archaeological resources had previously been reported in or around the subject area. No previously recorded archaeological sites are located within the project area. However, four previously recorded resources are located within one quarter mile of the proposed project area. These resources are briefly described below:

CA-SMA-55

This prehistoric site, originally designated Nelson 405, was a shell mound originally documented by N. Nelson in 1908. Nels Nelson documented and investigated numerous shell mounds along the Central California Coast in the early years of the 20th Century, many of which have been significantly damaged or completely destroyed.

CA-SMA-171H

This historic district was originally recorded by H. Casper in 1973 and is described as containing the Point Montara Artillery Training Station and the Point Montara Light Station. None of the recorded elements are located within the proposed project area.

P-41-2108

This historic structure was recorded by D. Painter and C. Losee in 2003. It is described as the Montara Cottage.

P-41-2154

This historic resource was recorded in 2005 by D. Edwards. It is described as the Montara Water and Sanitary District Office at Point Montara Training Station.

Four previous studies have been carried out within or adjacent to the proposed project area. These studies are described below:

S-3082

This study was carried out by S. Dietz and T. Jackson in 1970 and entitled "An Archaeological and Historical Reconnaissance of a Portion of the San Mateo County Coastside." This was a broad survey with included the entirety of the current proposed project area within its scope.

S-5389

Carried out by M. Melandry in 1977, this study is entitled "Archaeological Survey Report on Excess Parcels 6695-01-01, 6696-01-01, 7091-01-091-02-01, on Route 1 in San Mateo County P.M. 35.5/35.8." This study extends southwards from the southwest corner of the proposed project area.

S-25083

This study was carried out by J. Holson in 2002 and entitled "Archaeological Survey for Highway 1/ Montara, 8211.38 (PL 1004-07) (letter report)." Archival maps for this study indicate its location as a small circular area located within the eastern central portion of the proposed project area.

S-31887

Carried out by C. Busby in 2005, this study is entitled "Archaeological Assessment - Montara Water and Sanitary District EIR, Vicinity of Montara and Moss Beach and Within Half Moon Bay Airport, San Mateo County (letter report)." This study is located within the eastern central portion of the proposed project area.

A total of 26 additional previous studies have been carried out within a one quarter mile radius of the proposed project area.

AB52: NATIVE AMERICAN CONSULTATION

AB 52 Native American Consultation will be completed by County of San Mateo as the lead agency for the project. This consultation will be presented in a separate document.

HISTORIC BACKGROUND

The proposed project area formerly made up a portion of the Point Montara Artillery Training Facility, a World War II era military complex in use between 1943 and 1945. Several structures within this complex were located within the current proposed project area, including barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD" hanger, and a drill field.

The Point Montara Artillery Training Facility was a top secret military installation operated by the U.S. Navy during World War II, containing 48 permanent structures, and housing over 1500 personnel. Throughout the course of its operation, about 320,000 Navy sailors and merchant marines were trained on what was then the latest technology in anti-aircraft weapons, including the 20mm "Oerlokin", the 40mm "Bofers" and 3 inch/50 caliber anti-aircraft guns.

The facility was notable for its extensive use of Women Air Service Pilots (known as WASPs) who flew planes towing targets for the artillery firing from the coast along Point Montara.

The facility also heavily utilized some of the earliest drone aircraft for target practice. These radio controlled planes were pioneered by Reginald Denny, a Hollywood film star and remote control hobbyist. He realized the potential of the planes for target practice, and entered contracts with the U.S. Army and the U.S. Navy which eventually became a multi-million dollar industry through the course of WWII. These planes were named Target Drone Dennys (TDD's) by the Navy after their inventor (Oeswein 2016).

In the late 1960's the proposed project area was in use as a training facility for firefighters. During this period, the structures within the proposed project area were razed by a controlled burn, leaving only exposed concrete foundations. The property has been vacant since 1970. The project area currently contains concrete foundations, as well as well as a fenced area containing the Montara Water and Sanitary District infrastructure. Some structures and features associated with the military training facility remain standing outside the current proposed project area, along the coast of Point Montara.

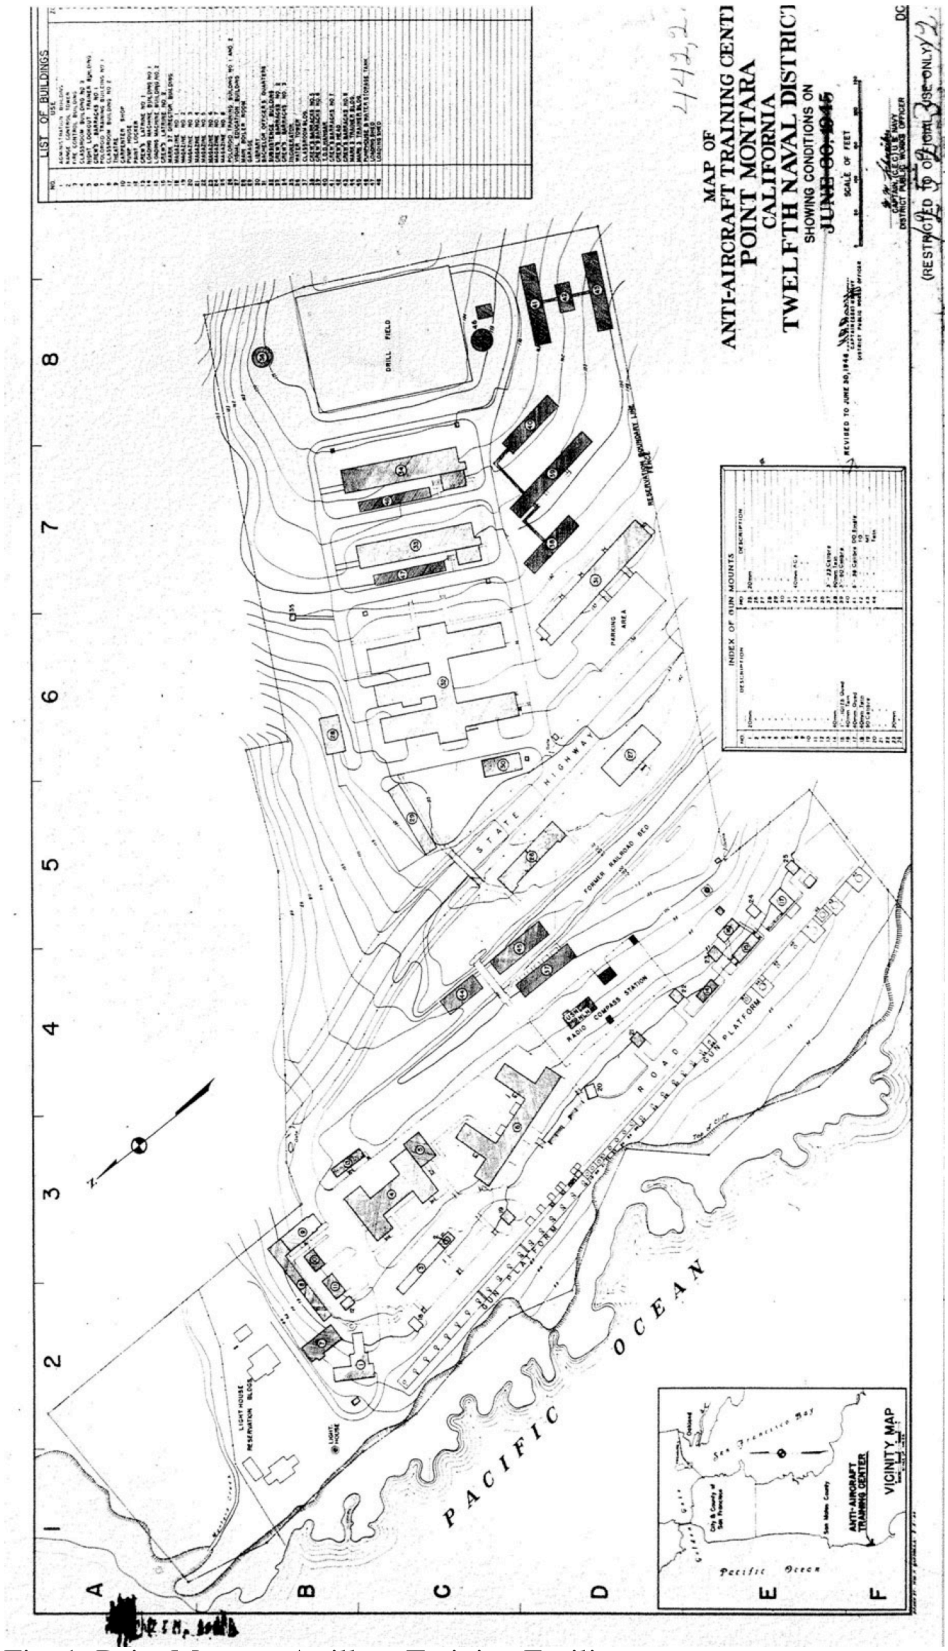

Fig. 1: Point Montara Artillery Training Facility.

Figure 2: Training on the 20mm Oerlikon anti-aircraft gun at Point Montara, 1943.

SURFACE RECONNAISSANCE

A "general surface reconnaissance" was conducted by a field archaeologist on all open land surfaces in the subject area. A "controlled intuitive reconnaissance" was performed in places where burrowing animals, exposed banks and inclines, and other activities had revealed subsurface stratigraphy and soil contents. The boundaries of the proposed project area were well defined in the field by Sierra Street to the South, Carlos Street to the West, Lincoln Street to the East, and 16th Street along the northern boundary. Accessibility to the property was good to fair; the majority of the proposed project area was accessible, however some areas were blocked by dense vegetation and steep slopes. Soil visibility was fair to poor; the majority of the surface area was obscured by vegetation, however sporadic soil exposures provided an understanding of soil characteristics. In addition, portions of the surface were obscured by imported or disturbed soils, particularly in those areas modified for mountain bike recreational activities. Where visible, native soils consisted of a tan sandy loam and clay. Rock types noted included native siltstone gravel as well as imported gravel. Foundations, as well as other concrete features (culverts, other infrastructure) dating from WWII era military activities on the site were noted. A small area of prehistoric shell midden was noted during surface reconnaissance. The midden was sparse, and surface elements consisted of a scatter of *Mytilus* (Mussel) shell fragments. The soil itself was light brown in color,

potentially indicating an older deposit, largely leached of organic materials. This midden soil was observed alongside an informal footpath northwest of the existing water tanks on the property (see Midden Location Map).

CONCLUSION AND RECOMMENDATIONS

The archival research revealed that there are no recorded cultural resources located within the study area. However, four previously recorded resources are located within a one quarter mile radius of the proposed project area. The closest of these is CA-SMA-55, a prehistoric shell mound site originally recorded by N. Nelson in the early 20th Century and located approximately 150 feet away from the northwest corner of the proposed project area. Midden soils, containing fragments of mussel shell were noted in the central portion of the subject property during surface reconnaissance (see Midden Location Map). Historic foundations, associated with WWII era military activities on the site were also noted in the field. Based on the presence of midden soils within the project area, it is recommended that a subsurface testing program be carried out in this portion of the proposed project area to ascertain the boundaries, depth, and constituents of this archaeological deposit. It is further recommended that the archaeological monitoring and other mitigation measures presented in the Archaeological Treatment Plan for the project (Cartier 2018) be carried out for the proposed project.

INTRODUCTION

Project Undertaking and Location

MidPen Housing (MidPen) is developing an affordable housing project located to the north northeast of the intersection of Carlos Street and Sierra Street in Moss Beach, an unincorporated area in San Mateo County (Attachment A: Exhibits 1 through 3). The proposed Project, MidPen Cypress Point Affordable Housing Community Project (Project), is located within the Montara Mountain 7.5-minute U.S. Geological Survey Quadrangle. The Project does not have a legal description, as it lies within an area that has not been so divided. The elevation of the Project ranges between 100 and 200 feet above mean sea level (amsl), based on the National Geodetic Datum of 1929.

The UTM coordinates near the center of the parcel are as follows: 4154197 meters north and 542770 meters east.

The Project is bounded by residential properties along 16th Street and vacant land to the north; residential properties along Carlos, Sierra, and Stetson Streets to the south; residential properties along Lincoln and Buena Vista Street to the east; and one residential property and vacant land along Carlos Street to the west.

On August 15, 2017, the California Coastal Commission asked the Project proponents to provide the following information:

- Include an evaluation of paleontological resources at the project site.
- Include an evaluation of the consistency of the proposed project with California Coastal Act Section 30244, which states "**Archaeological or paleontological resources**. Where development would adversely impact archaeological or paleontological resources as identified by State Historic Preservation Officer, reasonable mitigation measures shall be required."
- Include an evaluation of the consistency of the proposed project with the San Mateo County MidCoast Local Coast Program.

This report is in response to those requests.

Scope of Study and Personnel

The scope of work of this paleontological assessment included a paleontological resource records search at the University of California Museum of Paleontology (UCMP) and a search of published and unpublished literature pertinent to the Project, in conformance with the guidelines established by the Society of Vertebrate Paleontology (SVP 2010). No field survey of the project site has been conducted. Within this report are the conclusions of the comprehensive paleontological resources assessment, with

the intention of satisfying the cultural resource requirements of the California Environmental Quality Act (CEQA) and the County of San Mateo.

Dr. Joe Stewart of FirstCarbon Solutions served as the professional paleontologist. His qualifications are provided in Attachment B.

ENVIRONMENTAL SETTING

The proposed Project lies within the Coastal Ranges Physiographic Province, specifically at the north end of the South Coastal Ranges. The Project is located in the neighborhood of City of Moss Beach in unincorporated San Mateo County, California.

REGULATORY SETTING

CEQA provides regulations concerning significant impacts to paleontological resources. The following is concise description of state and local laws and regulations.

State Level

CEQA provides protection for paleontological resources through environmental legislation. Direction regarding significant impacts on paleontological resources is found under Appendix G (part V) of the CEQA Guidelines. The Guidelines state, "A project will normally result in a significant impact on the environment if it will . . . disrupt or adversely affect a paleontological resource or site or unique geologic feature, except as part of a scientific study." As stated in Section 5097.5 of the Public Resource Code, it is unlawful to remove paleontological remains without authorization and can result in a misdemeanor. In addition, Section 622.5 of the California Penal Code sets the penalties for damage or removal of paleontological resources.

The procedures, types of activities, persons, and public agencies required to comply with the CEQA are defined in the Guidelines for Implementation of CEQA (CEQA Guidelines), as amended on March 18, 2010 (Title 14, Section 15000, et seq. of the California Code of Regulations [i.e., 14 CCR Section 15000, et seq.]) and further amended January 4, 2013. One of the questions listed in the CEQA Environmental Checklist is: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (CEQA Guidelines Section 15064.5 and Appendix G, Section V, Part C).

Local Level

The San Mateo County General Plan has policies that fall into 15 groups. The fifth of these groupings is the County Historical and Archaeological Resources Policies. These historical and archaeological policies contain 27 policies (5.1 through 5.27) to which the County is committed. Policy 5.20 reads as follows:

5.20. Site Survey
Determine if sites proposed for new development contain archaeological/paleontological resources. Prior to approval of a development for these sites, require that a mitigation plan, adequate to protect the resource and prepared by a qualified professional, be reviewed and implemented as a part of the project.

The MidCoast Local Coast Program is the vehicle by which the County of San Mateo assumes responsibility for implementing the State Coastal Act. The project site falls within the Midcoast Land Use Plan area on the map provided by the County. Thus, the Project is subject to the MidCoast Local Coast Program. The program requirements are set forth in the document entitled Local Coastal Program Policies.

There are twelve components to these policies. Within the Locating and Planning New Development Component is this sub-policy:

1.25. Protection of Archaeological/Paleontological Resources
Based on County Archaeological/Paleontological Sensitivity Maps, determine whether or not sites proposed for new development are located within areas containing potential archaeological/paleontological resources. Prior to approval of development proposed in sensitive areas, require that a mitigation plan, adequate to protect the resource and prepared by a qualified archaeologist/paleontologist be submitted for review and approved and implemented as part of the project.

Within the Shoreline Access Component is this sub-policy:

10.24. Definition of Fragile Resources
Define fragile resource as (1) exposed rocky cliff faces, steep slopes as defined in the Hazard Component and hilly coastal terraces, (2) all sensitive habitats defined in the Sensitive Habitats component, and archaeological/paleontological resources.

Within the Sensitive Habitats Component is this sub-policy:

a. Conduct studies by a qualified person agreed by the County and the applicant during the planning and design phases of facilities located within or near sensitive habitats and archaeological/paleontological resources to determine the least disruptive locations for improvements and the methods of construction. These studies should consider the appropriate intensity of use, improvement and management to protect the resources and reduce or mitigate impacts.

b. Provide improvements and management adequate to protect sensitive habitats. These may include, but are not limited to, the following: (1) informative displays, brochures, and signs to minimize public intrusion and impact, (2) organized tours of sensitive areas, (3) landscaped buffers or fences, and (4) staff to maintain improvements and manage the use of sensitive habitats.

Professional Standards

The Society of Vertebrate Paleontology (2010) has provided Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources. These guidelines are recognized throughout the paleontological resource management community.

METHODS

Paleontological Resources Records Search

On September 13, 2017, FirstCarbon Solutions requested a paleontological records search of the UCMP through Dr. Kenneth Finger. Site records with supporting maps and documents are maintained at this facility. The records search included the examination of current geologic maps and paleontological locality maps. The records search is used to determine if any paleontological resources have been recovered within and around the project site, and establish a foundation for gauging the sensitivity of the project site for additional and buried paleontological resources.

Paleontological Resources Literature Search

Published reports concerning pertinent geologic and paleontological topics were investigated.

Pedestrian Survey

No pedestrian survey was performed for this study.

RESULTS

Paleontological Resources Records Search

Dr. Kenneth Finger's report, based on the UCMP paleontology collection, reported that the Project has Pleistocene marine terrace deposits underlain by Cretaceous granitic rocks (Attachment C). The granitic rocks will not produce paleontological resources, but Pleistocene terrace deposits have produced them. A search of the UCMP database records nine localities in unnamed late Pleistocene deposits in San Mateo County. The closest locality in its records is a site at El Granada Beach that is approximately 3 miles to the south of the Area of Potential Effect. Their composite assemblage includes *Uria algae* (guillemot or murre), *Mammuthus columbi* (Columbian mammoth), *Mammut americanum* (American mastodon), *Equus* (horse), *Glossotherium halani* (Harlan's ground sloth), *Camelops hesternus* (extinct large camel), and *Bison latifrons* (giant North American bison). Of these localities, the *Bison* specimen found at V92009 (El Granada Beach), at approximately 3 miles to the south, is the closest to the project site. The existence of *Bison* in the marine terrace deposits demonstrates that the fauna is from the Rancholabrean North American Land Mammal Age.

The report recommended a preconstruction survey of the site for paleontological resources, as well as a paleontological monitoring program for the parts of the Project having Pleistocene marine terrace deposits. Such a program should also involve reporting and curation of any fossils recovered.

The author contacted the County of San Mateo Planning Department in response to its Local Coastal Program Policy 1.25 requirement that County archaeology/paleontology sensitivity maps be consulted. The reality is that the County has no such maps. Any questions concerning archaeological sites are referred to the Northwest Information Center (NWIC) at Sonoma State University. A separate cultural resources assessment was done for this project, and the NWIC was contacted. The NWIC does not specialize in paleontological records, and the records search done for this report through the UCMP is standard and fulfills the intent of this requirement. It showed no known localities within 1 mile of the Project site.

Literature Search

The survey of published literature revealed no paleontological resources within the project footprint. The geologic mappings of Brabb et al. (1988) and of Pampeyan (1994) show the Project to lie on the Pleistocene marine terrace deposits and Cretaceous granitic rocks. The marine terrace deposits are potentially fossiliferous, but the granitic rocks are not. The thickness of the Pleistocene terrace deposits in the Montara area is given as 75 feet (Jack 1969).

Both of the compendia of California Pleistocene vertebrate fossil localities (Jefferson 1991a, b) list localities in coastal Pleistocene deposits of San Mateo County. UCMP localities are discussed, but the collections of the U.S. Geological Survey also contain remains of *Equus* and *Cervus nanodes* (tule elk) from Laguna Alta, and *Smilodon* (sabertooth) and *Mammut americanum* from Montara Beach (Jefferson 1991b).

RECOMMENDATIONS

The sources consulted indicate that the Pleistocene marine terrace deposits, which are underlain by Cretaceous granitic rocks, have a high sensitivity for significant paleontological resources. Therefore, earthmoving of previously undisturbed sediments for the Project could have a significant impact on paleontological resources. The paleontological resources records search from the UCMP recommends a pedestrian survey of the site prior to construction, and paleontological monitoring of construction activities.

MM PAL-1 The project proponent shall retain the services of a paleontologist with the qualifications listed by the Society of Vertebrate Paleontology (SVP 2010). The paleontologist shall be provided with construction plans and shall execute a pedestrian survey of the project footprint for paleontological resources and geologic indicators pertinent to these resources.

MM PAL-2 The paleontologist shall be provided with construction plans and design a paleontological resource monitoring program to be approved by the County of San Mateo. It will address monitoring of all disturbance of previously undisturbed sediments during demolition and construction, sediment sampling and testing, specimen preparation, identification, reporting, and curation.

J. D. STEWART, PH.D.—ON-CALL PRINCIPAL PALEONTOLOGIST

OVERVIEW

- 39 years of experience

Education

- Doctor of Philosophy, Systematics & Ecology, University of Kansas, 1984
- Master of Arts, Systematics & Ecology, University of Kansas, 1979

Training and Certifications

- Certified Paleontologist, Orange and Riverside counties, California
- Hazardous Waste Operations and Emergency Response 40 Hr.
- General Site Worker

Professional Affiliations

- Society of Vertebrate Paleontology

J.D. Stewart, PhD, is a vertebrate paleontologist with 40 years of experience in paleontology and 30 years of experience in the geology and paleontology of California. He has been involved in the permitting or construction of more than ten power plants and has directed the paleontological monitoring and mitigation program for Path 15, a major transmission line project. His publications include more than 40 peer-reviewed articles in books and journals. His research specialties are fossil fishes and Pleistocene vertebrate faunas.

RELATED EXPERIENCE AND CLIENT SUMMARY

Tenaska Imperial Solar Energy Center (ISEC) West Project, Imperial Valley, CA

For the ISEC West Solar Project, Dr. Stewart supervised paleontological monitoring activities on private lands.

BrightSource Sonoran West Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on U.S. Bureau of Land Management (BLM) and private lands. He worked on the Application for Certification (AFC) and wrote the final report when the project was terminated.

TerraGen Project

Dr. Stewart performed pedestrian paleontological surveys of the TerraGen Project site and wrote the Paleontological Resources section for the AFC.

BrightSource Rio Mesa Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on BLM and private lands and prepared the Paleontological Resources section for the AFC.

J. D. STEWART, PH.D.—ON-CALL PRINCIPAL PALEONTOLOGIST

Pio Pico Energy Center, Otay Mesa, CA

The Pio Pico Energy Center (PPEC) is a 300 MW simple-cycle electrical generating facility that is contracted under a 25-year power purchase agreement (PPA) with San Diego Gas & Electric (SDG&E). Pio Pico is located on a ten-acre site in Otay Mesa, an unincorporated area of San Diego County, California, approximately 15 miles southeast of downtown San Diego. Dr. Stewart supervised paleontological surveys and wrote the Paleontological Resources section for the AFC for this project.

Mesquite Nevada Replacement General Aviation Airport, Clark County, NV

Dr. Stewart prepared the Paleontological Resource Assessment for the Federal Aviation Administration (FAA).

Marsh Landing Generating Station Application for Certification, Contra Costa County

Dr. Stewart performed a paleontological pedestrian survey of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC. He also served as the Paleontological Resource Specialist during construction and prepared the final report.

Imperial Valley Solar Application for Certification, Imperial Valley, CA

Dr. Stewart directed paleontological pedestrian surveys within a project area in San Bernardino County and wrote the Paleontological Resources section of the AFC.

Calico Solar Application for Certification, San Bernardino County, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Calico Solar project area, edited the Paleontology section of the AFC, and served as the Paleontological Resource Specialist.

Starwood Power-Midway, LLC Peaking Project Construction

Dr. Stewart wrote a mitigation plan for paleontological resources, oversaw paleontological monitoring during project construction, and wrote the final report.

Calnev Pipeline Project, San Bernardino County, CA and Clark County, NV

Dr. Stewart directed paleontological surveys of a 234-mile-long project area in San Bernardino County, California, and Clark County, Nevada. He also prepared the paleontological assessment.

Willow Pass Generating Station Application for Certification, Contra Costa County, CA

Dr. Stewart participated in paleontological pedestrian surveys of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC.

San Joaquin One and Two Application for Certification, Fresno County, CA

Dr. Stewart directed paleontological pedestrian surveys of a project area in Fresno County and prepared the Paleontological Resources section of the AFC.

J. D. STEWART, PH.D.—ON-CALL PRINCIPAL PALEONTOLOGIST

Carrizo Energy Solar Farm (Ausra) Application for Certification, Simmler, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Carrizo Energy Solar Farm project area and edited the Paleontology section of the AFC.

Starwood Power-Midway, LLC Peaking Project Application for Certification

Dr. Stewart participated in the responses to the CEC Provisional Staff Assessments for Starwood Power-Midway, LLC's Peaking Project AFC.

Path 15 500-kV Power Transmission Line between Los Banos and Gates Substations, Los Banos, CA

Dr. Stewart supervised paleontological resource monitoring, excavations, specimen preparation, specimen identification, and report writing for this 80-mile-long power line.

Re: **Paleontological Records Search for MidPen Affordable Housing Project (PN 50450001), Moss Beach, San Mateo County**

Dear Dr. Pietro,

As per your request, I have conducted a records search of the University of California Museum of Paleontology (UCMP) database for the proposed MidPen Affordable Housing Project in Moss Beach. The project is located in the Montara Mountain quadrangle (1980 USGS 7.5' topographic map). Google Earth imagery reveals that most of this parcel appears to be undeveloped.

Geologic Units

On the part geologic map of Brabb et al. (1998) shown here, the project site (center, outlined in green) includes Pleistocene marine terrace deposits (Qmt) and granitic rocks (Kgr). The marine terrace deposits are potentially fossiliferous. Granitic rocks crystallize from magma at great depth and therefore cannot contain fossils, and the map pattern suggest that they are subjacent to the Pleistocene terrace. None of the other three geologic units in this area are within the half-mile search radius (dashed outline). Of those, two are Holocene, which is too young to contain fossils, while the Tertiary Purisima Formation (Tp) is known to yield significant paleontological resources; however, it is restricted to the coast and is unlikely to be present in the subsurface of the project site.

Key to mapped geologic units

Qcl	Colluvium (Holocene)
Qyf	Younger alluvial fan deposits (Holocene)
Qmt	Marine terrace (Pleistocene)
Tp	Purisima Formation (Pliocene and upper Miocene)
Kgr	Granitic rocks of Montara Mountain (Cretaceous)

County Review Draft

Paleontological Records Search

The University of California Museum of Paleontology (UCMP) database was searched for Pleistocene vertebrate localities in San Mateo County. The database records 9 localities in unnamed late Pleistocene deposits in San Mateo County. Their composite assemblage includes *Uria algae* (guillemot or murre), *Mammuthus columbi* (Columbian Mammoth), *Mammut americanum* (American Mastodon), *Equus* (horse), *Glossotherium harlani* (Harlan's Ground Sloth), *Camelops hesternus* (Extinct Western Camel), and *Bison latifrons* (Giant North American Bison). The latter was the specimen found at V792009 (Grenada Beach) that, at approximately three miles to the south, is the locality closest to the project site. These species represent the Rancholabrean fauna of the late Pleistocene.

Conclusions and Recommendations

Part of the MidPen Affordable Housing Project site is located on Pleistocene marine terrace deposits that have the potential to yield terrestrial or marine vertebrate fossils. Considering that most of the site appears to be undeveloped and has geologic ezpoaures, a preconstruction paleontological survey of the site is warranted. Paleontological monitoring is also recommended for excavations into the Pleistocene terrace. Should any significant paleontological resources be discovered during construction activities, CEQA guidelines stipulate that onsite construction activities are to be diverted away from the discovery until a professional paleontologist can inspect and evaluate the find and, if deemed appropriate, salvage it in a timely manner. Collected fossils should be offered to an appropriate repository, such as the California Academy of Sciences or the UCMP, for the benefit of science and future generations.

If I can be of further assistance on this project, please do not hesitate to contact me.

Sincerely,

County Review Draft

ADMONITION

Certain information contained in this report is not intended for general public distribution. Portions of this report locate significant archaeological sites in the region of the project area, and indiscriminate distribution of these data could result in the desecration and destruction of invaluable cultural resources. In order to ensure the security of the critical data in this report, certain maps and passages may be deleted in copies not delivered directly into the hands of environmental personnel and qualified archaeologists.

THE PRINCIPAL INVESTIGATOR

INTRODUCTION

This report contains the results of a subsurface testing program at archaeological site CA-SMA-431, within the Cypress Point project in Moss Beach, California. A testing program was designed based upon the requirements of the County of San Mateo. The program was undertaken to determine the extent, depth, and constituents of the prehistoric archaeological deposit. The proposed project consists of a residential development. Associated construction activities that may impact the site include grading, trenching, excavation and other earthmoving activities.

Seven mechanical test trenches and two hand excavated 1 x 1 meter testing units were utilized as part of this testing program. The mechanical test trenches were excavated outside the observable surface boundaries of the archaeological site in order to confirm that the site did not extend beyond the visible boundaries. The 1x1 meter units were excavated down to a depth of 40 cm, at which point sterile clay soil was encountered. The mechanical testing trenches were excavated to a depth of 120 cm. No cultural materials were noted in any of the mechanical test trenches. The hand excavated archaeological testing units within the deposit recovered prehistoric materials including marine shell, primarily *Mytilus* (mussel) species, and fire cracked rock. The presence of shell fragments and fire cracked rock (FCR) are typical indicators of a prehistoric archaeological site (shell midden). Recent historic materials were also found in the hand excavated units, indicating historic disturbance.

After the fieldwork was completed, two shell samples were selected and submitted to Beta Analytic Laboratories, Inc., in Miami, Florida for radiocarbon analysis. Sample #1 was given a calibrated date of 1501 to 1683 Cal AD (449-267 Cal BP). Sample #2 was given a calibrated date of 1068 to 1276 Cal AD (882-674 Cal BP).

A set of Department of Parks and Recreation (DPR) forms (see Appendix D attached) was completed for the identified archaeological site and submitted to the Northwest Information Center of the California Historic Resources Information System (CHRIS). The archaeological site within the proposed project area was given the trinomial designation of CA-SMA-431.

Due to the presence of a small area of disturbed shell midden in the proposed project area, construction activity could potentially impact cultural resources. Recommendations to mitigate the project impact are outlined in the Summary and Conclusion section of this report.

QUALIFICATIONS OF ARCHAEOLOGICAL RESOURCE MANAGEMENT

Archaeological Resource Management has been specifically engaged in cultural resource management projects in central California since 1977. The firm is owned and supervised by Dr. Robert Cartier, the Principal Investigator. Dr. Cartier has a Ph.D. in anthropology, and is certified by the Register of Professional Archaeologists (RPA) for conducting cultural resource investigations as well as other specialized work in archaeology. Specific segments of this project were carried out by the following personnel:

Robert Cartier:	Principal Investigator and Report Editor
Douglas Jones:	Field Technician, Report Preparation, and Map Production
Pete Johnson:	Field Technician
Christopher Zimmer:	Native American Monitor

Radiometric Analysis was performed by Beta Analytic, Inc. in Miami, Florida.

PROJECT LOCATION AND SETTING

The subject area consists of approximately 10.66 acres of land off of Sierra Street in Moss Beach, County of San Mateo. On the USGS 7.5 minute quadrangle of Montara Mountain OE W, CA, the Universal Transverse Mercator Grid (UTMG) centerpoint of the project area is 10S 5 42 699mE,41 54 262mN. The elevation ranges from approximately 100 to 150 feet MSL, and the nearest source of fresh water is the Montara Denniston Creek which is located approximately 300 feet north of the proposed project area.

The proposed project consists of the construction of 71 affordable housing units consisting of approximately 25 two-story buildings holding 3-4 units each. This project will involve the necessary excavation, grading, trenching, and other earthmoving activities.

ETHNOGRAPHIC BACKGROUND

Early ethnographic accounts of local Native American cultures provide a cultural context for archaeological studies. The Ohlone, or Costanoan, Indians inhabited the San Francisco Bay regions from the Golden Gate south to Monterey. Derived from a Spanish word, Costanoan means "people of the coast," and is an older term. Descendants of these people prefer to refer to themselves as "Ohlone," and it is now the generally accepted term. The research area is located in the Salson linguistic area, which shared many cultural traits with other linguistic groups in the Ohlone region. It is believed that the Ohlone Indians inhabited the area since A.D. 500, and that speakers of the Hokan language previously inhabited at least part of the region (Levy 1978). However, it is unclear when the Hokan or even earlier Paleo-Indians first came to the area. Archaeological data documents Native American coastal activity in the Central Coast area over the past 10,000 years, with some indications of occupation as early as 12,000 to 13,000 years ago (Jones et al, 2007). The earliest radiocarbon dates that are available for the area to which the Ohlone came to live are 12,000 B.P. (years before present) at SCR-177 in Scotts Valley (Cartier 1993), 3,200 B.P. at the University Village Site (SMA-77) (Gerow 1968), 6,349 B.P. at Palm Canyon (SCL-106) near Gilroy (Cartier 1980), 6,628

B.P. at Camden Avenue (SCL-64) (Winter 1978), CA-SCR-38 on the Santa Cruz coast, dated to ca. 8850 B.P., CA-SCR-7 dated to ca. 6050 B.P. (Jones and Hilderbrandt 1990), and CA-SCR-239 in Scotts Valley, dated to ca. 4950 B.P. (Cartier 1992).

The Ohlone were gatherers and hunters who utilized only the native flora and fauna with the exception of one domesticate, the dog. Yet, the abundance and high quality of natural resources allowed them to settle in semi-sedentary villages. The Ohlone were typically organized in basic political units called "tribelets" that consisted of 100 to 250 members (Kroeber 1954). The "tribelet" was an autonomous social unit consisting of one or more permanent villages with smaller villages in a relatively close proximity (Kroeber 1962). Parties went out from the major villages to locations within the tribal territory to obtain various resources.

The proximity of mountainous, open coast, and bay regions in the local environment made a diversity of resources available during different seasons to the native inhabitants. During the winter months, the low-lying flats near the San Francisco Bay have abundant marine and waterfowl resources, while the surrounding mountainous areas are best in the summer months for their nut, seed, and mammalian resources (King and Hickman 1973). A primary food source was acorns, abundant in autumn and easily stored for the remainder of the year. According to Gifford, the acorn industry of California was probably the most characteristic feature of its domestic economy (Gifford 1951). An elaborate process of grinding and leaching acorns is necessary to render them palatable. The acorn industry first became a major source of food in the Middle Period as is indicated by the appearance of mortars and pestles in the archaeological record (King and Hickman 1973). Other important resources include various plant foods, land animals, and the marine resources of the San Francisco Bay. Both large and small land mammals were typically hunted, trapped or poisoned. Many items, including shell beads and ornaments, were extensively traded with other groups as far away as the Great Basin of Nevada (Davis 1974).

It is argued that contrary to usual conceptions of hunters and gatherers, native Californian groups, including the Ohlone, practiced a form of resource management that was close to agriculture. Bean and Lawton (1976) consider this pattern a "semi-agricultural" stage which included quasi-agricultural harvesting activity and proto-agricultural techniques. Some plants were pruned and reseeded seasonally for optimal production. Foods such as acorns were stored for many months at a time. Ethnographic accounts also report the repeated burning of woodlands grassbelt to increase animal and plant resources. It is likely to have made hunting conditions better by reducing scrubby growth and encouraging the growth of grasses and other plants that are appealing to grazers such as deer and elk. The plant growth succession after a burning is also rich in grains and legumes that were major food sources for Native Californians.

Bean and Lawton also claim that the abundance of plant and animal resources in California and the development of ingenious technological processes allowed Native Californians to develop social structures beyond the normal parameters of hunting and gathering. These include extensive political systems, controlled production and redistribution of goods, and alliances and trade with other groups.

Historic Background

The proposed project area formerly made up a portion of the Point Montara Artillery Training Facility, a World War II era military complex in use between 1943 and 1945. Several structures within this complex were located within the current proposed project area, including barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD" hanger, and a drill field.

The Point Montara Artillery Training Facility was a top secret military installation operated by the U.S. Navy during World War II, containing 48 permanent structures, and housing over 1500 personnel. Throughout the course of its operation, about 320,000 Navy sailors and merchant marines were trained on what was then the latest technology in anti-aircraft weapons, including the 20mm "Oerlokin", the 40mm "Bofers" and 3 inch/50 caliber anti-aircraft guns.

The facility was notable for its extensive use of Women Air Service Pilots (known as WASPs) who flew planes towing targets for the artillery firing from the coast along Point Montara.

The facility also heavily utilized some of the earliest drone aircraft for target practice. These radio controlled planes were pioneered by Reginald Denny, a Hollywood film star and remote control hobbyist. He realized the potential of the planes for target practice, and entered contracts with the U.S. Army and the U.S. Navy which eventually became a multi-million dollar industry through the course of WWII. These planes were named Target Drone Dennys (TDD's) by the Navy after their inventor (Oeswein 2016).

In the late 1960's the proposed project area was in use as a training facility for firefighters. During this period, the structures within the proposed project area were razed by a controlled burn, leaving only exposed concrete foundations. The property has been vacant since 1970. The project area currently contains concrete foundations, as well as well as a fenced area containing the Montara Water and Sanitary District infrastructure. Some structures and features associated with the military training facility remain standing outside the current proposed project area, along the coast of Point Montara.

ARCHIVAL BACKGROUND

Prior to surface reconnaissance of the subject area, a study of the maps and records at the Northwest Information Center of the California Archaeological Site Inventory was conducted and given the file number NWIC# 17-0815. The purpose of this research was to determine if any known archaeological resources had previously been reported in or around the subject area. No previously recorded archaeological sites are located within the project area. However, four previously recorded resources are located within one quarter mile of the proposed project area. These resources are briefly described below:

CA-SMA-55

This prehistoric site, originally designated Nelson 405, was a shell mound documented by N. Nelson in 1908. Nels Nelson documented and investigated numerous shell mounds along the Central California Coast in the early years of the 20th Century, many of which have been significantly damaged or completely destroyed. This site is located on Point Montara approximately 150 feet from the northwest corner of the proposed project boundaries.

CA-SMA-171H

This historic district was recorded by H. Casper in 1973 and is described as containing the Point Montara Artillery Training Station and the Point Montara Light Station. None of the recorded elements are located within the proposed project area.

P-41-2108

This historic structure was recorded by D. Painter and C. Losee in 2003. It is described as the Montara Cottage.

P-41-2154

This historic resource was recorded in 2005 by D. Edwards. It is described as the Montara Water and Sanitary District Office at Point Montara Training Station.

Four previous studies have been carried out within or adjacent to the proposed project area. These studies are described below:

S-3082

This study was carried out by S. Dietz and T. Jackson in 1970 and entitled "An Archaeological and Historical Reconnaissance of a Portion of the San Mateo County Coastside." This was a broad survey with included the entirety of the current proposed project area within its scope.

S-5389

Carried out by M. Melandry in 1977, this study is entitled "Archaeological Survey Report on Excess Parcels 6695-01-01, 6696-01-01, 7091-01-091-02-01, on Route 1 in San Mateo County P.M. 35.5/35.8." This study extends southwards from the southwest corner of the proposed project area.

S-25083

This study was carried out by J. Holson in 2002 and entitled "Archaeological Survey for Highway 1/ Montara, 8211.38 (PL 1004-07) (letter report)." Archival maps for this study indicate its location as a small circular area located within the eastern central portion of the proposed project area.

S-31887

Carried out by C. Busby in 2005, this study is entitled "Archaeological Assessment - Montara Water and Sanitary District EIR, Vicinity of Montara and Moss Beach and Within Half Moon Bay Airport, San Mateo County (letter report)." This study is located within the eastern central portion of the proposed project area.

A total of 26 additional previous studies have been carried out within a one quarter mile radius of the proposed project area.

AB52: NATIVE AMERICAN CONSULTATION

AB 52 Native American Consultation was completed by County of San Mateo as the lead agency for the project. All identified individuals were contacted, and no responses were received. As part of the archaeological testing program, Ms. Irene Zwierlein was contacted as a representative of the Amah Mutsun Tribal Band. Ms. Zwierlein provided a Native American monitor for the archaeological testing within CA-SMA-431. This monitor was present during hand excavation within the deposit.

RESEARCH GOALS / METHODOLOGY

Research Goals

The process of archaeological research conducted for the Cypress Point project was aimed at answering a number of questions regarding the prehistoric use of the study area and in producing an accurate model of the sensitivity and deposition of cultural resources within the project area. Specifically, the purpose of trenching and hand excavation within the project area was to determine the nature, extent, and significance of any possible prehistoric resources within the archaeological deposit, and to produce a chronology, determined by a radiocarbon sample obtained from the excavation.

As the original site boundaries were determined through surface observation, one research goal was to more systematically define the boundaries of the site. The mechanical testing trenches were excavated around the outside of the known area of the deposit in order to determine if a subsurface deposit extended beyond the site's visible surface boundaries.

The constituents and depth of the site were also unknown. Thus the hand excavated testing units were designed to determine the depth of the site, as well as provided detailed information on the cultural materials present.

An understanding of these characteristics of the site will allow for an analysis of its uniqueness, as well as a determination of its significance under the criteria of the CRHR and the NRHP. Based upon the site's significance, appropriate mitigation measures will be developed to address the impact of the proposed project on this resources.

Two shell samples were forwarded to Beta Analytic, Inc. for chronological assessment through radiocarbon analysis. In addition, questions including the contents and function of the site, the temporal period of the site, and the role the site played in the settlement and subsistence patterns of the region may be addressed.

Regulatory Framework

California Register Criteria

A cultural resource is considered "significant" if it qualifies as eligible for listing in the California Register of Historic Resources (CRHR). Properties that are eligible for listing in the CRHR must meet one or more of the following criteria:

1. Association with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
2. Association with the lives of persons important to local, California, or national history;
3. Embodying the distinctive characteristics of a type, period, region, or method of construction, or representing the work of a master, or possessing high artistic values; or
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Most Native American prehistoric sites are eligible due to their age, scientific potential, and/or burial remains.

The CRHR interprets the integrity of a cultural resource based upon its physical authenticity. An historic cultural resource must retain its historic character or appearance and thus be recognizable as an historic resource. Integrity is evaluated by examining the subject's location, design, setting, materials, workmanship, feeling, and association. If the subject has retained these qualities, it may be said to have integrity. It is possible that a cultural resource may not retain sufficient integrity to be listed in the National Register of Historic Places yet still be eligible for listing in the CRHR. If a cultural resource retains the potential to convey significant historical/scientific data, it may be said to retain sufficient integrity for potential listing in the CRHR.

National Register Criteria

The National Register of Historic Places was first established in 1966, with major revisions in 1976. The register is set forth in 36 CFR 60 which establishes the responsibilities of the State Historic Preservation Officers (SHPO), standards for their staffs and review boards, and describes the statewide survey and planning process for historic preservation. Within this regulation guidelines are set forth concerning the National Register of Historic Places (36 CFR 60.6). In addition, further regulations are found in 36 CFR 63-66 and 800 which define procedures for determination of eligibility, identification of historic properties, recovery, reporting, and protection procedures.

The National Register of Historic Places was established to recognize resources associated with the accomplishments of all peoples who have contributed to the country's history and heritage. Guidelines were designed for Federal and State agencies in nominating cultural resources to the National Register. These guidelines are based upon integrity and significance of the resource. Integrity applies to specific items such as location, design, setting, materials, workmanship, feeling, and association. Quality of

significance in American history, architecture, archaeology, engineering and culture is present in resources that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and meet at least one of the following criteria:

a. that are associated with events that have made a significant contribution to broad patterns of our history;
b. that are associated with the lives of persons significant in our past;
c. that embody distinctive characteristics of type, period, or method of construction, or that represent the work of master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction;
d. that have yielded, or are likely to yield, information important in prehistory or history.

Ordinarily, properties that have achieved significance within the last 50 years are not considered eligible for the National Register. However, such properties will qualify if they are integral parts of districts that do meet the criteria of the NRHP listed above or if they fall within the following categories:

a. a religious property deriving primary significance from architectural significance or artistic distinction or historic importance; or
b. a building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with an historic person or event; or
c. a birthplace or grave of a historical figure of outstanding importance if there is no other appropriate site or building directly associated with his (or her) productive life; or
d. a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
e. a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
f. a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historical significance; or
g. a property achieving significance within the past 50 years if it is of exceptional importance.

Section 30244 of the California Coastal Act

Article 5; Land Resources, Section 30244 of the California Coastal Act states that:

"Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required."

The completed cultural resource evaluation identified a portion of the proposed project area as containing a potentially significant archaeological resource, and recommended archaeological testing for the purpose of determining the boundaries, depth, and

constituents of the archaeological deposit within the proposed project area. The results of this testing will be used to determine reasonable mitigation measures for the proposed project.

San Mateo County Midcoast Local Coastal Program Policies

In late 1980, the County Board of Supervisors and the California Coastal Commission approved the San Mateo County's Local Coastal Program. In April 1981, the County assumed responsibility for implementing the State Coastal Act in the unincorporated area of San Mateo County, including issuance of Coastal Development Permits. Three policies outlined within the Local Coastal Program have a bearing on cultural resources for the proposed project. These policies are discussed below.

1.25 Protection of Archaeological/Paleontological Resources

"Based on County Archaeology/Paleontology Sensitivity Maps, determine whether or not sites proposed for new development are located within areas containing potential archaeological/ paleontological resources. Prior to approval of development proposed in sensitive areas, require that a mitigation plan, adequate to protect the resource and prepared by a qualified archaeologist/paleontologist be submitted for review and approval and implemented as part of the project."

This cultural resource evaluation identifies a portion of the proposed project area as archaeologically sensitive, and recommends archaeological testing for the purpose of determining the boundaries, depth, and constituents of the archaeological deposit within the proposed project area. The results of this testing will be used to determine appropriate mitigation plan for the proposed project. Sensitivity for paleontological resources is being addressed in a separate report.

8.26 Structural Features

"Employ the regulations of the Historical and Cultural Preservation Ordinance to protect any structure or site listed as an Official County or State Historic Landmark or is listed in the National Register of Historic Sites."

None of the structures within the proposed project area are currently listed on the County, State, or National Registers as historic resources. In addition, they do not appear to be eligible for listing in any of these registers. Although the proposed project area contains the concrete foundations of structures from the Point Montara Anti-Aircraft Training Center which operated during WWII, these remnants do not appear to adequately convey the character of the original structures or the activities which took place during this period for listing in these registers. Montara Water and Sanitary District infrastructure including tanks, culverts, and other fixtures are also present on the property. These structures are utilitarian in character and do not appear historically significant.

8.27 Natural Features

"Prohibit the destruction or significant alteration of special natural features through implementation of Landform Policies and Vegetative Form Policies of the LCP."

No special natural features appear to be present within the proposed project area, thus no special natural features will be destroyed or altered by the proposed project.

Field Methods

The first phase of the fieldwork involved mechanical test trenching. The test trenching was carried out on February 21, 2018. During trenching, seven mechanically excavated test trenches were placed outside the visible boundaries of the archaeological site in order to determine if subsurface elements of the site extended beyond those boundaries. The trenches were used to help identify the presence or absence of subsurface cultural resources. Trenching records (refer to Appendix B) include information on soil type, color, and rock type. None of the mechanically excavated trenches contained any cultural materials.

The second phase of the fieldwork involved hand excavation of two 1 x 1 meter test units. Excavation of the test units was carried out on February 22, 2018. Placement of the units was determined based upon the defined boundaries of the archaeological deposit. Hand excavation was conducted using standard archaeological techniques with flat-nosed shovels, round-nosed shovels, picks, and trowels in arbitrary levels and dry screened through 1/4 inch mesh. All identified artifactual material was collected from each level. Collected material was curated in level bags and each level recorded as to artifacts present, soil type, color, stratigraphy, and features present. All artifactual material from this process was then placed within its appropriate level bag from the field screening process. Hand excavation of the test units was carried out to a depth of 40 cm at which point sterile soil was encountered. A hand auger boring was then conducted to a depth of 100cm in each unit.

Laboratory Methods

In the laboratory, all materials were washed and cataloged (see Appendix B). All artifacts were washed in cool water and allowed to dry. Then, each item was examined, weighed, and entered into an artifact database.

Specific classes of cultural materials include shell, fire cracked rock (FCR), metal, and glass. All cultural materials were catalogued and weighed; shell was catalogued, weighed, and speciated. In addition, two shell samples were submitted to Beta Analytic, Inc. for radiocarbon dating analysis. The radiocarbon dating was conducted in order to provide a general chronology for the site.

RESULTS

Results of the mechanical test trenching were negative; no cultural materials were observed in soils outside the recorded boundaries of the archaeological site. The hand excavation yielded both prehistoric dietary shell remains and recent historic materials. These data were then synthesized to produce an interpretation of deposition and a chronology of the test area. A discussion of these findings follows in the order of: Mechanical Test Trenches, Unit Summary by Level, Faunal Shell, and Historic/Recent Artifacts.

Mechanical Test Trenching Results

Trench #1

The soil in this trench consisted of a medium brown silty loam for the first 20cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #2

The soil in this trench consisted of a medium brown silty loam for the first 40cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #3

The soil in this trench consisted of a medium brown silty loam for the first 40cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #4

The soil in this trench consisted of a medium brown silty loam for the first 40cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #5

The soil in this trench consisted of a medium brown silty loam for the first 80cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #6

The soil in this trench consisted of a medium brown silty loam for the first 70cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Trench #7

The soil in this trench consisted of a medium brown silty loam for the first 50cm. Below this, a reddish brown silty clay extended to 120cm. Very little rock was present. No cultural materials, prehistoric or historic, were noted in this trench.

Hand Excavated Unit Results

Unit #1

The soil of Unit #1 consisted of a medium brown silty loam to a depth of approximately 27cm, at which point a reddish brown silty clay was encountered to a depth of 40cm. The surface level of this unit contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments, as well as terrestrial snail shell. The 0-20cm level included mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments, FCR, as well as historic materials including glass and plastic fragments, and a wire nail. The 20-40cm level contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments as well as one brown bottle glass fragment. This material was almost entirely concentrated in the upped 7cm of the level; the reddish silty clay from 27-40cm appeared sterile. A hand auger boring was conducted at the base of the 20-40cm level, to a depth of 100cm. Soils in this auger boring consisted of a reddish brown silty clay gradually shifting to an orange clay and sand. No cultural materials were noted in the auger boring.

Unit #2

The soil of Unit #2 consisted of a medium brown silty loam to a depth of approximately 40cm, at which point a reddish brown silty clay was encountered. The surface level of this unit contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments. The 0-20cm level included mussel (*Mytilus),* barnacle (*Balanus),* turban shell, and chiton (*Cryptochiton*) shell fragments, terrestrial snail shell, and FCR, as well as historic materials including one fragment of clear glass. The 20-40cm level contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments as well as terrestrial snail shell. Dense reddish brown silty clay was encountered at approximately 40cm. A hand auger boring was conducted at the base of the 20-40cm level, to a depth of 100cm. Soils in this auger boring consisted of a reddish brown silty clay gradually shifting to an orange clay and sand. No cultural materials were noted in the auger boring.

Faunal Shell

Shell remains comprised a majority of the cultural material in both the hand excavated units. The shell recovered was comprised of multiple species. Recovered shell included mussel (*Mytilus*), which was the most abundant species, as well as smaller amounts of barnacle (*Balanus)* shell, Turban shell (*Turbinidae*), and chiton (*Cryptochiton*). These shell species are discussed briefly below.

Mytilus californianus (California mussel) is a large mussel that can grow to a length of 80-130 mm. This shell is considerably elongated with a straight, narrow anterior margin and a curved, posterior margin. Its ribs are prominent, especially near its base, but they are not high in number. Its usual color is a bluish-black; however, younger mussels often display brown and white streaks. This bivalve can be found on the rocky open coast between tide lines where it is exposed to the surf. It attaches itself to rock by byssal threads. This species of shell was used by the Ohlone as a food resource.

Balanus glandula (Acorn barnacle)
This small barnacle is a filter feeder usually about one inch in height with a rough tube for a shell, closed at its basal end and open at its feeding aperture. It attaches itself to the shells of other animals, such as mussels. Consequently, its appearance in a midden is not neccessarily the result of intentional harvest. This species occurs in great numbers on rocks in the high zone but they also occur in lower zones.

Tegula funebralis (black top) is a snail with a bluntly pyramidal robust shell, with 4-5 wrinkled whorls. It is found on rocky shorelines in the intertidal zone and was used by the Ohlone as a food resource (Morris 1966).

Cryptochiton stelleri (Chiton) is a large (usually 6-8 inches), oblong mollusk with shell plates completely hidden under a leathery girdle when alive. They are found in moderately deep water, and the plates are usually found separate. The Ohlone used them as a food resource.

As noted, these shellfish varieties were used primarily as dietary resources. Mytilus shell could be collected from shallow water or the shoreline at low tide. The species of shell identified at CA-SMA-431 were all locally available to its prehistoric residents. Of the total of 934.5 grams of shell recovered from the test units, 801.2g (approximately 86%) were *Mytilus* (mussel shell).

Fire-Cracked Rock

Fire-cracked rock (FCR) is often used as a surface indicator of a prehistoric archaeological deposit. Prehistoric inhabitants of the region often used rock in their cooking activities. Heated rocks were placed in baskets in order to boil water and cook foods. Rocks were also used in the construction of hearths, and may have become fire-cracked from repeated fire burning. Although rocks may be affected by fires which burn naturally across the land, rocks which are fire-cracked and heavily damaged appear to have been repeatedly exposed to high temperature fires and rapid cooling, potentially related to human activity. Fire-cracked rock is characterized by sharp foliations and cracks in the surface that contrasts with the worn natural exterior of the rock. There is often a pinkish discoloration on the cracked surface.

Historic Artifacts

Small amounts of historic material were encountered in both hand excavated units. These historic artifacts were mixed with the prehistoric deposit and may be the result of previous construction activities or rodent burrowing at this location. Historic materials including glass and metal were noted down to 40 centimeters in both units, indicating that the deposit is disturbed. In general, the historic artifacts recovered appear to date from the mid to late 20th Century to the present.

Radiometric Analysis (C-14)

The most reliable of the absolute dating techniques available to archaeologists involves the analysis of carbon 14 (C14), an unstable isotope of carbon. This dating technique relies on three characteristics of C14. The first is that all living things contain a set percentage of C14 in their bodies while they are alive. The second is that C14 has a characteristic half-life (the time needed for half the original number of unstable atoms to change to stable ones) of 5,730 years. Third, although the levels of C14 atoms in the environment have fluctuated through geological time, scientists have been able to document these changes using ice cores, dendrochronology, and other cross checks. Radiocarbon dates are calibrated to compensate for the varying levels of C14. Once an organism dies, it no longer exchanges carbon with its environment, and the amount of C14 that was originally in the organism begins to decay into stable N14, while the amount of stable C12 remains the same. The C14 decays by ejecting electrons from its nucleus, a process known as beta decay. By measuring the amount of C14 that remains

in the organism, it is possible to determine the time elapsed since the organism's death (Fagan, 1994).

The amount of C14 remaining is measured by one of two methods. In the AMS (accelerator mass spectrometric) method, only a few milligrams of organic material are needed as a sample, the C14 and the C12 atoms are counted using a laser enabled instrument called a mass spectrometer. In the second and more common method, larger samples are used and the radiation from these samples is measured directly. It should be noted that the C14 measurement refers to the date of the organism's death, not necessarily the use of the dated item (Cartier, 1993b).

It is also important to note that the age of any given radiocarbon sample can be expressed in several different ways, resulting in a potentially confusing suite of dates for any given sample. The Measured or Conventional Radiocarbon Age represents the original raw date obtained from the dating process, and is expressed as a date with a range (i.e., 8700 $\pm$ 60 BP.). This date is then calibrated, using climatic, tree-ring, and coral cross checks, in an effort to arrive at a more accurate calendric date. Calibrated dates are expressed as ranges with varying degrees of probability (i.e., 9730 to 9555 BP.), or simply as a single date (i.e., 9665 BP). Ranges are provided for 1 Sigma Calibrated Results (68% probability), and for 2 Sigma Calibrated Results (95% probability). The Calibrated Radiocarbon Age represents the intercept of the Conventional Radiocarbon Age with the given calibration curve. The dates for the current study will be specified as either "conventional" or "calibrated," and calibrated dates will be in the 2 Sigma range for the greatest accuracy possible.

After the fieldwork was completed, two samples were selected and submitted to Beta Analytic Laboratories, Inc., in Miami, Florida. Sample #1 was taken from the 0-20cm level of Unit #1. Sample #2 was taken from the 20-40cm level of Unit #2. Sample #1 was given a conventional radiocarbon age of 1000 +/- 30 BP (Before Present) and a calendar calibration date of 1501 to 1683 Cal AD (449-267 Cal BP). Sample #2 was given a conventional radiocarbon age of 1520 +/- 30 BP, and a calendar calibration date of 1068 to 1276 Cal AD (882-674 Cal BP).

The carbon date suggests that the site was occupied during the Late Period. A short description of each of the major cultural periods in the central California chronological sequence is given below.

Early Period (3000 to 500 B.C)

Early Period sites are rare, and little information is known about this period. Early period sites are often characterized by general cultural patterns such as the practice of burying the dead in a fully extended position and the common use of red ochre in graves. Hunting during the Early Period primarily made use of spear throwers, the bow and arrow were not introduced to California until much later. Shell beads were used as a medium of exchange, and in early period sites the most commonly occurring style of bead is known as the L Type (Bennyhoff and Hughes, 1987). L type beads were made of abalone (*Haliotis*) shell, and are distinguished by a thick, rectangular shape.

Middle Period (500 B.C. to 900 A.D.)

Variation, in a multiplicity of dimensions, is the pervasive characteristic of the Middle Period. This variation is found both spatially and temporally. The duration of period is

marked by change and transition in almost every cultural element studied by archaeologists. Initial portions of the Middle Period share many traits of the Early Period, whereas the closing of the Middle Period is marked in many ways by characteristics of the Late Period. In this sense, the Middle Period was very aptly referred to by Lilliard et al. as the "Transitional" (1939). There are also synchronic variations within the period between geographic regions. Assemblages reported at the same point in time, but with some spatial distance from one another, show wide contrasts in artifactual make up. The Middle Period is marked by a massive growth of population. This can been seen in the archaeological record as the higher proportion of sites dating to the Middle Period then any other prehistoric time frame. Perhaps due to this increase in population, violence seems to have been common during the Middle Period. Many of the burials excavated from this period have projectile points penetrating into their bones or exhibit other signs of violent death. A specific form of shell bead, known as an F Type bead, is closely associated with this period. The Middle Period also exhibited a marked change in the economy of the native peoples of the area. This included such things as the use of the acorn as a staple food and the use of heated groundstones to prepare it. These stones are referred to as fire cracked rock, or FCR, and are most abundant in Middle Period sites.

Late Period (900 A.D. to 1700 A.D.)

The Late Period in the local chronological sequence is characterized by several broad cultural characteristics. Burials from this period are predominantly flexed, and their orientation is indiscriminate. An increase in the frequency and elaboration of grave goods is also noted. Burials may contain bone whistles and other bone artifacts with incised design, as well as ceremonially "killed" artifacts (artifacts which are punctured or broken to release their spirit before burial), as well as shell beads. Beads frequently found in Late Period sites include types M, S.1, B.1. and C.1.a (Bennyhoff and Hughes 1987). During the Late Period, the primary staple used by the Native Americans was the acorn, leached and ground into meal. Mortars and pestles of granite or sandstone, used for grinding the acorns, are frequently associated with Late Period sites, and the bow-and-arrow was introduced. Population apparently was lower than during the Middle Period as evidenced by a decline in the number of sites dating from the late period.

Discussion

The archaeological deposit at CA-SMA-431 is contained within a small, well defined area (approximately 80 feet by 30 feet). Based upon the surface dimensions and depth of the deposit as observed during this testing program (approximately 1 foot), it is estimated that the entire deposit contains approximately 90 cubic yards of soil.

As the deposit consists primarily of mussel shell, which has been consumed throughout the historic period up until today, a question arises as to whether the deposit may represent historic activities, such as a mussel bake by military personnel during the WWII occupation of the site. However, the deposit is identifiable as Native American in origin due to multiple factors. These include the presence of dietary shell not generally consumed during the historic period in this area (such as barnacles, turban shells, and chiton). In addition, the very weathered and fragmentary nature of the shell points to a prehistoric origin. The deposit also contained fire cracked rock (FCR), which is characteristic of Native American food preparation activities in this area of California. Radiocarbon analysis of two shell samples returned calibrated dates of 1501 to 1683 Cal AD (449-267 Cal BP) and 1068 to 1276 Cal AD (882-674 Cal BP).

However, historic artifacts in the form of materials such as glass, plastic, and metal were present at all levels of the deposit. This indicates that the deposit is heavily disturbed. The property as a whole was extensively developed by the military during WWII, and the archaeological deposit at CA-SMA-431 is located within a small terrace a short distance from a large concrete foundation which is a remnant of this era. Hummocks of soil material spread throughout the larger subject property also indicate that more recent importations of soil have taken place. Earthmoving activities by the Montara Water and Sanitary District within the proposed project area have been largely restricted to pipeline construction (Martinez 2018).

Local historian J.Q. Oswein has written extensively about the history of the Point Montara Artillery Training Facility and has visited the project area many time. He notes that the proposed project area has frequently been used as a dumping site for a variety of materials, including garbage, rocks, and spoils dirt (Oswein 2018).

The presence of relatively modern plastic fragments within the deposit indicate disturbance after military ownership of the property, either during its use as a firefighter training facility in the 1960's, or as a result of more recent dumping activities. Thus the historic patterns of grading and construction on this property point to the possibility that the deposit itself was imported from a nearby archaeological site, such as CA-SMA-55, located on Point Montara approximately 150 feet from the northwest corner of the proposed project boundaries. Alternatively, the deposit may represent the heavily disturbed basal layer of a deeper site removed during historic earthmoving on the property. Thus the deposit may contain isolated intact features.

Based upon the lack of diagnostic artifactual material within the deposit, and its heavily disturbed nature, CA-SMA-431 does not appear to have the potential to yield important prehistoric or historic information, and thus does not appear eligible for either the CRHR or the NRHP. However there is the possibility that isolated artifacts/remains are present within the deposit.

SUMMARY AND CONCLUSION

This archaeological testing program was undertaken to determine the extent, depth, and constituents of the prehistoric archaeological deposit. The proposed project consists of a residential development. Associated construction activities that may impact the site include grading, trenching, excavation and other earthmoving activities.

Seven mechanical test trenches and two hand excavated 1 x 1 meter testing units were utilized as part of this testing program. The mechanical test trenching was excavated outside the observable surface boundaries of the deposit in order to confirm that buried portion of the site did not extend beyond the visible boundaries. No cultural materials were noted in any of the mechanical test trenches. The hand excavated archaeological testing units within the deposit recovered prehistoric materials including marine shell, primarily *Mytilus* (mussel) species, and fire cracked rock. The presence of shell fragments is a typical indicator of a prehistoric archaeological site (shell midden) in this region. Traces of historic materials were also found in the hand excavated units.

A set of Department of Parks and Recreation (DPR) forms (see Appendix D attached) was completed for the identified archaeological site and submitted to the Northwest Information Center of the California Historic Resources Information System (CHRIS). The archaeological site within the proposed project area was given the trinomial designation of CA-SMA-431.

The 1x1 meter units were excavated down to a depth of 40 cm, at which point sterile clay soil was encountered. The mechanical testing trenches were excavated to a depth of 120 cm.

A small area of disturbed prehistoric shell midden deposit was found within the proposed project area. Based upon the results of the hand excavation, it appears that this deposit is highly disturbed and possibly imported from outside the proposed project area during modern dumping activities. The midden material is not significant enough to warrant preservation, however it may contain significant isolated artifacts/remains and any construction activities carried out within the vicinity of the site should be monitored by an archaeologist. Realizing that imported soils may have brought in/buried archaeological materials on the property, it is also recommended that archaeological monitoring take place during subsurface demolition/construction throughout the project area as a whole. This archaeological monitoring should be carried out as per the measures presented in the Archaeological Treatment Plan for the project (Cartier 2018b).

REPORT OF RADIOCARBON DATING ANALYSES

Robert R. Cartier

Archeological Resource Management

Report Date: March 19, 2018

Material Received: March 02, 2018

Laboratory Number	Sample Code Number	Conventional Radiocarbon Age (BP) or Percent Modern Carbon (pMC) & Stable Isotopes Calendar Calibrated Results: 95.4 % Probability High Probability Density Range Method (HPD)	
Beta - 488906	**CypressPt#1**	**1000 +/- 30 BP**	IRMS δ13C: 0.0 o/oo IRMS δ18O: +1.1 o/oo

(95.4%) 1501 - 1683 cal AD (449 - 267 cal BP)

Submitter Material:	Shell (Marine)
Pretreatment:	(shell) acid etch
Analyzed Material:	Shell
Analysis Service:	RadiometricPLUS-Standard delivery
Percent Modern Carbon:	88.29 +/- 0.33 pMC
Fraction Modern Carbon:	0.8829 +/- 0.0033
D14C:	-117.05 +/- 3.30 o/oo
Δ14C:	-124.18 +/- 3.30 o/oo(1950:2017)
Measured Radiocarbon Age:	(without d13C correction): 590 +/- 30 BP
Calibration:	BetaCal3.21: HPD method: MARINE13
DeltaR:	297 +/- 35

Results are ISO/IEC-17025:2005 accredited. No sub-contracting or student labor was used in the analyses. All work was done at Beta in 4 in-house NEC accelerator mass spectrometers and 4 Thermo IRMSs. The "Conventional Radiocarbon Age" was calculated using the Libby half-life (5568 years), is corrected for total isotopic fraction and was used for calendar calibration where applicable. The Age is rounded to the nearest 10 years and is reported as radiocarbon years before present (BP), "present" = AD 1950. Results greater than the modern reference are reported as percent modern carbon (pMC). The modern reference standard was 95% the 14C signature of NIST SRM-4990C (oxalic acid). Quoted errors are 1 sigma counting statistics. Calculated sigmas less than 30 BP on the Conventional Radiocarbon Age are conservatively rounded up to 30. d13C values are on the material itself (not the AMS d13C). d13C and d15N values are relative to VPDB-1. References for calendar calibrations are cited at the bottom of calibration graph pages.

Quality Assurance Report

This report provides the results of reference materials used to validate radiocarbon analyses prior to reporting. Known-value reference materials were analyzed quasi-simultaneously with the unknowns. Results are reported as expected values vs measured values. Reported values are calculated relative to NIST SRM-4990B and corrected for isotopic fractionation. Results are reported using the direct analytical measure percent modern carbon (pMC) with one relative standard deviation. Agreement between expected and measured values is taken as being within 2 sigma agreement (error x 2) to account for total laboratory error.

Report Date: March 19, 2018

ADMONITION

Certain information contained in this report is not intended for general public distribution. Portions of this report locate significant archaeological sites in the region of the project area, and indiscriminate distribution of these data could result in the desecration and destruction of invaluable cultural resources. In order to ensure the security of the critical data in this report, certain maps and passages may be deleted in copies not delivered directly into the hands of environmental personnel and qualified archaeologists.

THE PRINCIPAL INVESTIGATOR

INTRODUCTION

This archaeological treatment plan is designed to mitigate the possible impact to prehistoric or historic cultural resources that may be unearthed as part of the proposed Cypress Point Project in the County of San Mateo. During surface reconnaissance in 2017, a prehistoric deposit was noted within the proposed project area. This prehistoric deposit was recorded on Department of Parks and Recreation (DPR) forms and given the trinomial CA-SMA-431. An archaeological testing excavation was carried out within this deposit in February 2018.

Seven mechanical test trenches and two hand excavated 1 x 1 meter testing units were utilized as part of this testing program. The mechanical test trenches were excavated outside the observable surface boundaries of the archaeological site in order to confirm that the site did not extend beyond the visible boundaries. The 1x1 meter units were excavated down to a depth of 40 cm, at which point sterile clay soil was encountered. The mechanical testing trenches were excavated to a depth of 120 cm. No cultural materials were noted in any of the mechanical test trenches. The hand excavated archaeological testing units within the deposit recovered prehistoric materials including marine shell, primarily *Mytilus* (mussel) species, and fire cracked rock.

Thus it has been determined that the proposed earthmoving activities at the project site have the potential to impact cultural materials. In accordance with the California Environmental Quality Act (CEQA) it is required that potential impacts to cultural resources be addressed prior to proceeding with project implementation.

The treatment plan is designed to mitigate the specific impacts to these potential resources resulting from earthmoving activities associated with the Cypress Point project. The treatment plan includes archival background information for the proposed project area, discussing the potential for both prehistoric and historic subsurface archaeological materials to occur on the property. It outlines the methods to be employed for data recovery within the project area during construction in order to reduce impacts to these resources to a less-than-significant level. In addition, this archaeological treatment plan outlines the methods for archaeological monitoring during earthmoving activities and treatment of additional cultural materials that may be uncovered during the excavations.

QUALIFICATIONS OF ARCHAEOLOGICAL RESOURCE MANAGEMENT

Archaeological Resource Management has been specifically engaged in cultural resource management projects in Santa Clara County since 1977. The firm is owned and supervised by Dr. Robert Cartier. Dr. Cartier is the Principal Investigator, with additional personnel hired to satisfy the needs for specific investigations. ARM's offices are located in downtown San Jose which provides a centrally located headquarters for the majority of the work contracted in the Central California area. These studies have included archival overviews, surface surveys, extensive excavations, and National Register evaluations for both prehistoric and historic resources that meet requirements of CEQA, NHPA and NEPA (National Environmental Policy Act).

PROJECT PERSONNEL

Specific segments of this project will be carried out by the following personnel:

Robert Cartier: Principal Investigator, Field Director, and Report Editor

Dr. Cartier completed his undergraduate work in anthropology at San Jose State University and earned his M.A. and Ph.D. in anthropology from Rice University in 1975. He is certified by the Register of Professional Archaeologists (RPA) in the categories of teaching, field work, and cultural resource management. Cartier organized the firm of Archaeological Resource Management in 1977. Since that time he has been directing archaeological and historical investigations in Santa Clara County and the central California area. The firm has completed projects for private individuals, local cities and counties, the Santa Clara Valley Water District, the State of California (CALTRANS), and the Federal Government (Army Corps of Engineers), as well as purely academic investigations. He also fulfills the standards set forth by the Secretary of the Interior for inclusion as a Historian and architectural historian and is certified as such on the State of California referral lists.

Doug Jones: Field Monitor, Report Preparation, Graphics Production

Doug Jones joined ARM in February 2000, working full-time. Mr. Jones completed his Masters in Applied Anthropology from San Jose State University in 2016. He has written cultural and historic evaluations in both CEQA and NEPA formats, and has experience with bone identification, prehistoric, and historic remains. He assists office staff in the preparation of graphics for report production and in laboratory analysis for catalog production. He also acts as an excavator and as a monitor in the field under the direction of Dr. Cartier.

LOCATION AND DESCRIPTION OF THE SUBJECT AREA

The subject area consists of approximately 10.88 acres of land adjacent to Carlos Street and Sierra Street in Moss Beach, County of San Mateo. On the USGS 7.5 minute quadrangle of Montara Mountain OE W, CA, the Universal Transverse Mercator Grid (UTMG) center point of the project area is 10S 5 42 699mE,41 54 262mN. The elevation ranges from approximately 100 to 150 feet MSL, and the nearest source of fresh water is the Montara Denniston Creek which is located approximately 300 feet north of the proposed project area.

The proposed project consists of the construction of 71 affordable housing units consisting of approximately 22 two-story buildings holding 2-4 units each. This project will involve excavation, grading, trenching, and other earthmoving activities.

CALIFORNIA REGISTER CRITERIA

A cultural resource is considered "significant" if it qualifies as eligible for listing in the California Register of Historic Resources (CRHR). Properties that are eligible for listing in the CRHR must meet one or more of the following criteria, as well as have integrity as described below:

1. Association with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
2. Association with the lives of persons important to local, California, or national history;
3. Embodying the distinctive characteristics of a type, period, region, or method of construction, or representing the work of a master, or possessing high artistic values; or
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Most Native American prehistoric sites are eligible due to their age, scientific potential, and/or burial remains.

The CRHR interprets the integrity of a cultural resource based upon its physical authenticity. An historic cultural resource must retain its historic character or appearance and thus be recognizable as an historic resource. Integrity is evaluated by examining the subject's location, design, setting, materials, workmanship, feeling, and association. If the subject has retained these qualities, it may be said to have integrity. Cultural resources may be listed as significant at the level of the National Register of Historic Places (NRHP), the CRHR, or local jurisdictions. It is possible that a cultural resource may not retain sufficient integrity to be listed in the NRHP yet still be eligible for listing in the CRHR. If a cultural resource retains the potential to convey significant historical/scientific data, it may be said to retain sufficient integrity for potential listing in the CRHR.

ETHNOGRAPHIC BACKGROUND

Early ethnographic accounts of local Native American cultures provide a cultural context for archaeological studies. The Ohlone, or Costanoan, Indians inhabited the San Francisco Bay regions from the Golden Gate south to Monterey. Derived from a Spanish word, Costanoan means "people of the coast," and is an older term. Descendants of these people prefer to refer to themselves as "Ohlone," and it is now the generally accepted term. The research area is located in the Salson linguistic area, which shared many cultural traits with other linguistic groups in the Ohlone region. It is believed that the Ohlone Indians inhabited the area since A.D. 500, and that speakers of the Hokan language previously inhabited at least part of the region (Levy 1978). However, it is unclear when the Hokan or even earlier Paleo-Indians first came to the area. Archaeological data documents Native American coastal activity in the Central Coast area over the past 10,000 years, with some indications of occupation as early as 12,000 to 13,000 years ago (Jones et al, 2007). The earliest radiocarbon dates that are available for the area to which the Ohlone came to live are 12,000 B.P. (years before present) at SCR-177 in Scotts Valley (Cartier 1993), 3,200 B.P. at the University Village Site (SMA-77) (Gerow 1968), 6,349 B.P. at Palm Canyon (SCL-106) near Gilroy (Cartier 1980), 6,628 B.P. at Camden Avenue (SCL-64) (Winter 1978), CA-SCR-38 on the Santa Cruz coast, dated to ca. 8850 B.P., CA-SCR-7 dated to ca. 6050 B.P. (Jones and Hilderbrandt 1990), and CA-SCR-239 in Scotts Valley, dated to ca. 4950 B.P. (Cartier 1992).

The Ohlone were gatherers and hunters who utilized only the native flora and fauna with the exception of one domesticate, the dog. Yet, the abundance and high quality of natural resources allowed them to settle in semi-sedentary villages. The Ohlone were typically organized in basic political units called "tribelets" that consisted of 100 to 250 members (Kroeber 1954). The "tribelet" was an autonomous social unit consisting of one or more permanent villages with smaller villages in a relatively close proximity (Kroeber 1962). Parties went out from the major villages to locations within the tribal territory to obtain various resources.

The proximity of mountainous, open coast, and bay regions in the local environment made a diversity of resources available during different seasons to the native inhabitants. During the winter months, the low-lying flats near the San Francisco Bay have abundant marine and waterfowl resources, while the surrounding mountainous areas are best in the summer months for their nut, seed, and mammalian resources (King and Hickman 1973). A primary food source was acorns, abundant in autumn and easily stored for the remainder of the year. According to Gifford, the acorn industry of California was probably the most characteristic feature of its domestic economy (Gifford 1951). An elaborate process of grinding and leaching acorns is necessary to render them palatable. The acorn industry first became a major source of food in the Middle Period as is indicated by the appearance of mortars and pestles in the archaeological record (King and Hickman 1973). Other important resources include various plant foods, land animals, and the marine resources of the San Francisco Bay. Both large and small land mammals were typically hunted, trapped or poisoned. Many items, including shell beads and ornaments, were extensively traded with other groups as far away as the Great Basin of Nevada (Davis 1974).

It is argued that contrary to usual conceptions of hunters and gatherers, native Californian groups, including the Ohlone, practiced a form of resource management that was close to agriculture. Bean and Lawton (1976) consider this pattern a "semi-agricultural" stage which included quasi-agricultural harvesting activity and proto-agricultural techniques. Some plants were pruned and reseeded seasonally for optimal production. Foods such as acorns were stored for many months at a time. Ethnographic accounts also report the repeated burning of woodlands grassbelt to increase animal and plant resources. It is likely to have made hunting conditions better by reducing scrubby growth and encouraging the growth of grasses and other plants that are appealing to grazers such as deer and elk. The plant growth succession after a burning is also rich in grains and legumes that were major food sources for Native Californians.

Bean and Lawton also claim that the abundance of plant and animal resources in California and the development of ingenious technological processes allowed Native Californians to develop social structures beyond the normal parameters of hunting and gathering. These include extensive political systems, controlled production and redistribution of goods, and alliances and trade with other groups.

HISTORIC BACKGROUND

The proposed project area formerly made up a portion of the Point Montara Artillery Training Facility, a World War II era military complex in use between 1943 and 1945. Several structures within this complex were located within the current proposed project area, including barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD" hanger, and a drill field.

The Point Montara Artillery Training Facility was a top secret military installation operated by the U.S. Navy during World War II, containing 48 permanent structures, and housing over 1500 personnel. Throughout the course of its operation, about 320,000 Navy sailors and merchant marines were trained on what was then the latest technology in anti-aircraft weapons, including the 20mm "Oerlokin", the 40mm "Bofers" and 3 inch/50 caliber anti-aircraft guns.

The facility was notable for its extensive use of Women Air Service Pilots (known as WASPs) who flew planes towing targets for the artillery firing from the coast along Point Montara.

The facility also heavily utilized some of the earliest drone aircraft for target practice. These radio controlled planes were pioneered by Reginald Denny, a Hollywood film star and remote control hobbyist. He realized the potential of the planes for target practice, and entered contracts with the U.S. Army and the U.S. Navy which eventually became a multi-million dollar industry through the course of WWII. These planes were named Target Drone Dennys (TDD's) by the Navy after their inventor (Oeswein 2016).

In the late 1960's the proposed project area was in use as a training facility for firefighters. During this period, the structures within the proposed project area were razed by a controlled burn, leaving only exposed concrete foundations. The property has been vacant since 1970. The project area currently contains concrete foundations, as well as well as a fenced area containing the Montara Water and Sanitary District infrastructure. Some structures and features associated with the military training facility remain standing outside the current proposed project area, along the coast of Point Montara.

ARCHIVAL BACKGROUND

Prior to surface reconnaissance of the subject area in 2017, a study of the maps and records at the Northwest Information Center of the California Archaeological Site Inventory was conducted and given the file number NWIC# 17-0815. The purpose of this research was to determine if any known archaeological resources had previously been reported in or around the subject area. No previously recorded archaeological sites are located within the project area. However, four previously recorded resources are located within one quarter mile of the proposed project area. These resources are briefly described below:

CA-SMA-55

This prehistoric site, originally designated Nelson 405, was a shell mound documented by N. Nelson in 1908. Nels Nelson documented and investigated numerous shell mounds along the Central California Coast in the early years of the 20th Century, many of which have been

significantly damaged or completely destroyed. This site is located on Point Montara approximately 150 feet from the northwest corner of the proposed project boundaries. The project as currently proposed does not appear to pose either a direct or indirect impact to this resource.

CA-SMA-171H

This historic district was recorded by H. Casper in 1973 and is described as containing the Point Montara Artillery Training Station and the Point Montara Light Station. The recorded boundaries of this site lie entirely outside the current proposed project area, approximately 150 feet to the west of the project boundary. The project as currently proposed does not appear to pose either a direct or indirect impact to this resource.

P-41-2108

This historic structure was recorded by D. Painter and C. Losee in 2003. It is described as the Montara Cottage. This resource is located at 361 14th Street in Montara, approximately 800 feet north of the proposed project area. The project as currently proposed does not appear to pose either a direct or indirect impact to this resource.

P-41-2154

This historic resource was recorded in 2005 by D. Edwards. It is described as the Montara Water and Sanitary District Office at Point Montara Training Station. This resource is located approximately 200 feet west of the proposed project area. The project as currently proposed does not appear to pose either a direct or indirect impact to this resource.

Four previous studies have been carried out within or adjacent to the proposed project area. These studies are described below:

S-3082

This study was carried out by S. Dietz and T. Jackson in 1970 and entitled "An Archaeological and Historical Reconnaissance of a Portion of the San Mateo County Coastside." This was a broad survey with included the entirety of the current proposed project area within its scope. No significant cultural resources were noted within the proposed project area as part of this study.

S-5389

Carried out by M. Melandry in 1977, this study is entitled "Archaeological Survey Report on Excess Parcels 6695-01-01, 6696-01-01, 7091-01-091-02-01, on Route 1 in San
Mateo County P.M. 35.5/35.8." This study extends southwards from the southwest corner of the proposed project area. No significant cultural resources were noted within the proposed project area as part of this study.

S-25083

This study was carried out by J. Holson in 2002 and entitled "Archaeological Survey for Highway 1/ Montara, 8211.38 (PL 1004-07) (letter report)." Archival maps for this study indicate its location as a small circular area located within the eastern central portion of the

proposed project area. No significant cultural resources were noted within the proposed project area as part of this study.

S-31887

Carried out by C. Busby in 2005, this study is entitled "Archaeological Assessment - Montara Water and Sanitary District EIR, Vicinity of Montara and Moss Beach and Within Half Moon Bay Airport, San Mateo County (letter report)." A portion of this study is located within the eastern central portion of the proposed project area. No significant cultural resources were noted within the proposed project area as part of this study.

A total of 26 additional previous studies have been carried out within a one quarter mile radius of the proposed project area.

AB52: NATIVE AMERICAN CONSULTATION

AB 52 Native American Consultation was completed by County of San Mateo as the lead agency for the project. All identified individuals were contacted, and no responses were received. As part of the archaeological testing program, Ms. Irene Zwierlein was contacted as a representative of the Amah Mutsun Tribal Band. Ms. Zwierlein provided a Native American monitor for the archaeological testing within CA-SMA-431. This monitor was present during hand excavation within the deposit.

ARCHAEOLOGICAL TESTING PROGRAM

An archaeological testing program was carried out for CA-SMA-431 in February of 2018 (see CA-SMA-431 Trench and Unit Location Map, Appendix A). The first phase of the fieldwork involved mechanical test trenching. The test trenching was carried out on February 21, 2018. During trenching, seven mechanically excavated test trenches were placed outside the visible boundaries of the archaeological site in order to determine if subsurface elements of the site extended beyond those boundaries. The trenches were used to help identify the presence or absence of subsurface cultural resources. Trenching records (refer to Appendix B) include information on soil type, color, and rock type. None of the mechanically excavated trenches contained any cultural materials.

The second phase of the fieldwork involved hand excavation of two 1 x 1 meter test units. Excavation of the test units was carried out on February 22, 2018. Placement of the units was determined based upon the defined boundaries of the archaeological deposit. Hand excavation was conducted using standard archaeological techniques with flat-nosed shovels, round-nosed shovels, picks, and trowels in arbitrary levels and dry screened through 1/4 inch mesh. All identified artifactual material was collected from each level. Collected material was curated in level bags and each level recorded as to artifacts present, soil type, color, stratigraphy, and features present. All artifactual material from this process was then placed within its appropriate level bag from the field screening process. Hand excavation of the test units was carried out to a depth of 40 cm at which point sterile soil was encountered. A hand auger boring was then conducted to a depth of 100cm in each unit.

Hand Excavated Unit Results

Unit #1

The soil of Unit #1 consisted of a medium brown silty loam to a depth of approximately 27cm, at which point a reddish brown silty clay was encountered to a depth of 40cm. The surface level of this unit contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments, as well as terrestrial snail shell. The 0-20cm level included mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments, FCR, as well as historic materials including glass and plastic fragments, and a wire nail. The 20-40cm level contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments as well as one brown bottle glass fragment. This material was almost entirely concentrated in the upped 7cm of the level; the reddish silty clay from 27-40cm appeared sterile. A hand auger boring was conducted at the base of the 20-40cm level, to a depth of 100cm. Soils in this auger boring consisted of a reddish brown silty clay gradually shifting to an orange clay and sand. No cultural materials were noted in the auger boring.

Unit #2

The soil of Unit #2 consisted of a medium brown silty loam to a depth of approximately 40cm, at which point a reddish brown silty clay was encountered. The surface level of this unit contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments. The 0-20cm level included mussel (*Mytilus),* barnacle (*Balanus),* turban shell, and chiton (*Cryptochiton*) shell fragments, terrestrial snail shell, and FCR, as well as historic materials including one fragment of clear glass. The 20-40cm level contained mussel (*Mytilus)* and barnacle (*Balanus)* shell fragments as well as terrestrial snail shell. Dense reddish brown silty clay was encountered at approximately 40cm. A hand auger boring was conducted at the base of the 20-40cm level, to a depth of 100cm. Soils in this auger boring consisted of a reddish brown silty clay gradually shifting to an orange clay and sand. No cultural materials were noted in the auger boring.

Summary

The hand excavations identified a large number of shell fragments in the top 40 cm of each unit, but no materials below 40 cm. It could not be conclusively determined whether the shell fragments were a natural deposit, a deposit from the occupation of the site by the U.S. military, a deposit from a prehistoric Native American settlement on the site, or whether the soil was moved to this location from another location as part of previous earth-moving activities at the site.

This analysis conservatively assumes that the project's impacts on this resource would be potential significant impacts under CEQA.

ARCHAEOLOGICAL MITIGATION PROGRAM

Based upon the results of the archaeological testing and historic background study, as documented in *Cultural Resource Evaluation Of The Cypress Point Project In Half Moon Bay* (ARM 2018x), the project area as a whole should be considered sensitive for both prehistoric and historic archaeological materials. The proposed project, as currently designed, calls for construction of three structures (labeled B4 on the proposed site plan) within and in the immediate vicinity of the identified boundaries of the CA-SMA-431 deposit, which was determined to be a potentially significant environmental impact. Thus excavation and grading for these structures will necessitate the removal of the majority or all of the archaeological deposit. Preservation in place was determined not to be feasible as the proposed project could not feasibly

be modified to avoid the deposit. Relocating these structures is not feasible in light of the project objectives because the project was designed to: a) be feasible from a construction standpoint by avoiding significant slopes that cover portions of the site, b) be consistent with the character of the surrounding neighborhood in the design and location of buildings; c) minimize impact on neighboring properties; and d) preserve open space, which requires limiting development on portions of the site. Eliminating these structures would negatively impact the key project objective of providing a significant number of affordable housing units in the MidCoast region. As mitigation for this impact, the following mitigation measures are recommended to reduce the impact of the proposed project to a less-than-significant level. Salvage excavation and monitoring procedures are described below.

Mitigation Measure CUL-1: Additional Site Excavation

An archaeological salvage program will take place prior to the commencement of construction earthmoving activities and will consist of four hand excavated 1x1 meter mitigation units. Placement of the units will be based on available archival background data, field observations, and proposed project plans. Hand excavation will be conducted using standard archaeological techniques with trowels, picks, and shovels at arbitrary levels and dry screened through 1/4 inch mesh. All identified artifactual material will be collected from each level. Collected material will be placed in level bags and each level will be recorded using level forms. Artifacts, soil type, color and stratigraphy, and features present will be recorded. All artifactual material from this process will then be placed within its appropriate level bag during the field process.

Mitigation Measure CUL-2: Archaeological Monitoring

Archaeological monitoring will be conducted during all earthmoving activities involved with the project in accordance with the schedule coordinated between the general contractor and project Archaeologist. This will consist of full time monitoring during all earth moving activities within 50 feet of CA-SMA-341. Archaeological spot check monitoring, consisting of periodic monitoring of the project site during ground disturbing activities, including during demolition of the existing concrete foundations, will take place for the remainder of the project. The timing and frequency of these spot checks will be determined throughout the course of earthmoving activities for the proposed project based upon the construction schedule and the nature of any cultural materials encountered. Per the schedule, the archeologist will inspect the site and will subsequently provide an archaeological monitoring report. This report will document all cultural materials encountered, and will be submitted to project representatives within 40 working days of the completion of earth moving activities for the project.

Considering that cultural resources frequently exist below the surface, their location is often not visible. Field archaeologists therefore monitor earthmoving activities to observe whether artifactual remains, soil changes indicating cultural use, and/or other indicators of human activity are present within a project area. Monitoring consists of a qualified archaeological field technician present and observing ground-disturbing activities in native soil.

Mitigation Measure CUL-3: Unanticipated Findings during Construction

If any individual artifacts (prehistoric or historic), features, potential midden soils, or other indicators of cultural use are noted by the archaeological monitor during the course of earthmoving activities, work within 50 feet of the find will be stopped until appropriate measures are formulated by the Project Archaeologist and accepted by the County and the project representative. If the project archaeologist is not present on the site, the County, Owner and Project Archaeologist shall be notified by telephone and the project archaeologist will examine the materials encountered within 24 hours. Any archaeological materials found at the site will be collected and stored for further analysis.

In the event of the discovery of an intact archaeological deposit during the course of archaeological mitigation/monitoring, construction activities shall be halted within 50 feet of the find for the purpose of identifying and mapping the deposit, and further mitigation recommendations will be formulated by the Project Archaeologist and discussed with the project representative. It these materials are determined to be significant, a preservation plan or recovery program will be prepared, submitted to San Mateo County for approval, then implemented.

For any cultural materials discovered, preservation in place is the preferred treatment of an archeological resource (CEQA Section 21083.2(b); CEQA Guidelines Section 15126.4(b)(3)(a)). If preservation in place of an archeological resource is not feasible, data recovery, in accord with the approved data recovery plan will be implemented, prior to any further soil disturbance within 50 feet of the discovered materials (or other appropriate boundary approved by the Project Archaeologist and the County) (CEQA Guidelines Section 15126.4(b)(3)(C)). The recovery plan shall include controlled excavation of the entirety, or a representative sample, of the cultural materials, analysis of the recovered material, and written documentation. The data recovery program shall specify the methods to be used for curation of scientifically significant data in an appropriate curation facility that is compliant with the OHP's Guidelines for the Curation of Archaeological Collections (1993).

Scientific analysis will be performed on the resources recovered from the archaeological monitoring for this project, following basic laboratory operations. Any artifacts and archaeological features found during construction shall be removed, cleaned, stabilized/conserved, and catalogued in accordance with professional curation and archaeological practice. Native American burials, if discovered, will be analyzed in accordance with recommendations from the MLD designated by the NAHC and Mitigation Measure CUL-4.

Recovered materials will be documented in a written report prepared by the Project Archaeologist. The report and recovered material will be submitted to the Owner for storage, curation, or onsite interpretive display. The final report shall be produced documenting and synthesizing all data collected from the above mentioned measures. The report will include recording and analysis of materials recovered, conclusions, and any additional recommendations. Copies of the archaeological report prepared in conjunction with this project will be filed with the California Historical Resources File System, Northwest Information Center (CHRIS/NWIC) at Sonoma State University, as well as the County of San Mateo.

Mitigation Measure CUL-4: Procedures for Discovery and Treatment of Human Remains

If human remains are found during excavation or construction, work will be halted at a minimum of 50 feet from the find, the area will be staked off, and the Owner and Project Archaeologist notified. The owner shall contact the San Mateo County Coroner, and no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner determines that no investigation of the cause of death is required.

If the coroner determines the remains to be Native American, the coroner shall contact the Native American Heritage Commission within 24 hours of this determination. The Native American Heritage Commission (NAHC) shall identify the person or persons it believes to be the Most Likely Descendent (MLD) of the deceased Native American. The MLD may then make recommendations to the Owner and execute an agreement for the means of treating or disposing of, with appropriate dignity, the human remains and associated grave goods, as provided in Public Resources Code Section 5097.98.

If required, reinternment of human remains will be performed according to California law for Native American burials (Chapter 1492, Statutes of 1982). The intent of the California state law is to protect Native American burials, isolated and disarticulated human remains, and associated cultural materials found during the course of an undertaking. It also serves to insure proper analysis prior to their final disposition. The location and procedures of this undertaking will be recorded by the project archaeologist. Reinternment will take place with all due speed upon completion of all necessary analysis. This information will be included in the final report prepared by the Project Archaeologist, or if necessary, as an addendum to the report.

The Owner shall rebury the Native American human remains and associated grave goods with the appropriate dignity on the property in a location not subject to further disturbance if:

1. The NAHC is unable to identify a MLD or the MLD failed to make a recommendation within 24 hours after being notified by the commission.

2. The descendent identified by the NAHC fails to make a recommendation for burial and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the Owner.

Any associated grave goods and soil samples from the burial site will be analyzed per the agreement between the Owner and the MLD. Dependent upon the nature of this agreement, diagnostic artifacts such as projectile points, shell beads and ground stone artifacts may be studied and illustrated in the final report to be prepared by the Project Archaeologist Radiocarbon dating and obsidian hydration and sourcing may be undertaken in order to provide a chronology for newly identified features.

CONCLUSIONS

This archaeological treatment plan for the Cypress Point project in the County of San Mateo has been designed to meet the requirements of the California Environmental Quality Act (CEQA). The archaeological program presented in this treatment plan will reduce the impact of the proposed project on cultural materials to a less-than-significant level by providing procedures for monitoring ground-disturbing activities during project construction, and for the orderly removal, preservation, evaluation, and storage of any cultural materials that are discovered. A table illustrating appropriate actions by project personnel in the event of unexpected archaeological discoveries is provided below:

Materials Encountered	Stop Work	Radius	Contact
Individual Artifact	Yes	50 feet	Project Archaeologist
Archaeological Deposit	Yes	50 feet	Project Archaeologist
Possible Human Remains	Yes	50 feet	Project Archaeologist; Owner; San Mateo County Coroner's Office

RE: SACRED LANDS ENHANCED CONSULTATION CHECK CONCERNING THE CYPRESS POINT PROJECT IN SAN MATEO COUNTY

Dear Ms. Zwierlein:

We want to provide you with notification that the County of San Mateo intends to issue a public notice for the Cypress Point Project in Moss Beach, San Mateo County. This project is proposed to include 71 units of affordable housing and retain approximately half the project area in its current undeveloped state. Although your tribe has not requested notification under Assembly Bill 52, as part of an enhanced consultation check, we are reaching out to your tribe, as a voluntary measure. We would be pleased to initiate consultation, if appropriate, regarding the proposed project.

We requested a Sacred Lands file check from the Native American Heritage Commission (NAHC) for the project area. **The file check did not indicate the presence of Native American cultural resources within the immediate project area.**

We have also completed surface reconnaissance surveys of the project site, which revealed a surface scatter of faunal shells within a limited area of the proposed project site. A description of the findings was documented on a Department of Parks & Recreation form and given the designation P-41-00259 (see site record attached).

On the recommendation of the NAHC, we are contacting you and other tribes they indicated may have an interest in the project site. We would like to obtain any information you may have regarding sacred lands or Native American prehistoric resources within this area.

Should you determine that you have an interest in this site, we will provide you with a copy of the cultural resources report, including the site record.

We have included a project location map showing the project area for your reference. If you have any questions or would like to initiate consultation, please contact our office at (650) 363-4161 within 30 days of the date of this letter.

Thank you.

Sincerely,

Steve Monowitz
Community Development Director

TCE	Trichloroethylene, Trichloroethene
UST	Underground Storage Tank
USDA	United States Department of Agriculture
USGS	United States Geological Survey
VOC	Volatile Organic Compound

EXECUTIVE SUMMARY

AEI Consultants (AEI) was retained by MidPen Housing Corporation to conduct a Phase I ESA in conformance with our proposal and the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property referenced in the table below. Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5 and 1.6 of this report.

PROPERTY DESCRIPTION

PROPERTY INFORMATION	
Property Name	Carlos Street at Sierra Street
Street Address(es)	Carlos Street at Sierra Street
City	Moss Beach
State	California
Location	Approximately 100 feet northeastern corner of the intersection of Carlos Street and Sierra Street
Vicinity Characteristics	Residential
Approximate Site Acreage/Source	10.8 Acres / Site-contact provided information
Property Type	Vacant
Subject Property Use(s)	Vacant
Assessor Parcel Number(s)	037-022-070
SITE AND BUILDING INFORMATION	
Number of Buildings	0
Year(s) of Construction	N/A
Number of Floors/Stories	N/A
Basement or Subgrade Area(s)	N/A
Number of Units	N/A
Building Area (SF)/Source	N/A
Building Description(s)	N/A
Building Occupant(s)	N/A
Additional Improvements	Old building foundations (Two water tanks and associated operational building are presumed to not be a part)
Current On-site Operations	None
Current Use of Hazardous Substances	None identified
UTILITY PROVIDER INFORMATION	
Natural Gas Provider	N/A
Electricity Provider	N/A
Heating System Fuel Source	N/A
Cooling System Power Source	N/A
Potable Water Provider or Source	N/A
Sewage Disposal Provider or Treatment System	N/A
REGULATORY INFORMATION	
Regulatory Database Listings	None identified
Institutional Controls	None identified
Engineering Controls	None identified
Environmental Liens	None identified

Based on a review of historical sources, the subject property was identified to exist as part of a larger World War II training area circa 1945. Military buildings on the property included barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD hanger" and a drill field. After the war was over the mess hall building was converted into a grammar school. However it was abandoned when a new school site was built (date unknown). By the late 1960s the property was used as a training ground for firefighters. Sometime between 1968 and 1970 a controlled burn got out of hand and burned what remained of buildings on the subject property to the ground, leaving only concrete foundations. Since at least 1970, the subject property has been vacant; however the old building foundations remain onsite. The water tanks and associated building are presumed to be off-site for purposes of this report.

The immediately surrounding properties consist of the following:

Direction from Site	Tenant/Use (Address)	Regulatory Database Listing(s)
Northeast	Montara Creek followed by residences (297 and 300 16th Street)	N/A
Southeast	Lincoln Street followed by vacant land and residences (no address and 840-880 Lincoln Street, and 500-501 Buena Vista Street)	N/A
South	Sierra Street followed by residences (400-534 Sierra Street, 495 Stetson Street)	N/A
West	A residence (1993 Carlos Street)	N/A
Northwest	Vacant land (no address)	N/A

Please refer to Section 5.1 for discussion of adjacent sites listed in the regulatory database as noted above.

Based upon topographic map interpretation, the groundwater flow beneath the subject property is inferred to flow to the west-southwest. Based on groundwater monitoring data for a nearby site at 619 Stetson Street (located approximately 0.15 mile southeast of the subject property) obtained from Geotracker, groundwater is presumed to be present at an estimated depth of 10-14 feet below ground surface (bgs).

FINDINGS

Recognized Environmental Condition (REC) is defined by the ASTM Standard Practice E1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. AEI's assessment has revealed the following RECs associated with the subject property or nearby properties:

- Mr. David Cresson of the Half Moon Bay History Association was able to provide a map from 1945 detailing the buildings on the subject property at that time. Buildings on site include a "sustenance building" or mess hall, barracks, offices, a garage, a boiler room, a water tower, a water tank, a pump house, loading sheds, a library, a "T.D.D. hangar" and an incinerator. Additionally, the northeastern corner of the subject property is labelled as a "drill field". Mr. Cresson did not provide any documentation regarding any subject property uses prior or subsequent to the military training base.

Historically, the onsite incinerator may have been used to burn refuse or waste, without regard for the chemical composition of the substances being burned. No records were found during the course of this assessment detailing what substances were burned at the incinerator. As such, there may be toxic residues in onsite soils associated with the combustion of military or other wastes. Likewise, no records were found during the course of this assessment regarding the exact use of the historic drill field. Considering that the site was a military training ground, the drill field may have been used for exercises that involved weaponry. There may be lead-containing or other residues onsite from cartridges or munitions related to historic military training activities.

Based on this information, the historical presence of an incinerator and military drill field onsite represent a recognized environmental condition. AEI recommends surface and subsurface sampling in the vicinity of the historic incinerator and drill field.

- Although the subject property is currently vacant and lacks structures, buildings previously present on the subject property (constructed circa 1945) likely included LBP. LBP residues may be present in soils, around buildings that burned as well as others depending on maintenance and painting practices. Interviews and aerial photographs indicate that the military "sustenance building" on the property burned to the ground in 1969. As the property is under consideration for residential development, the potential presence of LBP residues in soils at the subject property represents a recognized environmental condition (REC). AEI recommends sampling in the vicinity of the former buildings.

Controlled Recognized Environmental Condition (CREC) is defined by the ASTM Standard Practice E1527-13 as a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. AEI's assessment has revealed the following CRECs associated with the subject property or nearby properties:

- AEI did not identify evidence of on-site CRECs during the course of this assessment.

Historical Recognized Environmental Condition (HREC) is defined by the ASTM Standard Practice E1527-13 as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. AEI's assessment has revealed the following HRECs associated with the subject property or nearby properties:

- AEI did not identify evidence of on-site HRECs during the course of this assessment.

Other Environmental Considerations warrant discussion, but do not qualify as RECs as defined by the ASTM Standard Practice E1527-13. These include, but are not limited to, de minimis conditions and/or environmental considerations such as the presence of ACMs, LBP, radon, mold, and lead in drinking water, which can affect the liabilities and financial obligations of the client, the health and safety of site occupants, and the value and marketability of the subject property. AEI's assessment has revealed the following environmental considerations associated with the subject property or nearby properties:

- Documentation of two domestic wells located on the property was provided by San Mateo County Environmental Health Department. These wells were not observed at the time of the site visit and have reportedly been "sealed" however it was unclear if they were properly abandoned. Based on the domestic nature of the wells, they are not expected to represent a significant environmental concern. However if they are not intended for use, they should be abandoned in accordance with applicable regulations.

- The subject property was historically utilized for military barracks and training as well as firefighter training. There is potential for undocumented subsurface features, such as underground storage tanks, or storage shelters, as well as undocumented above ground activities such as vehicle maintenance or waste storage that may have impacted the subsurface. As such and since the property is under consideration for residential development, it may be prudent to perform testing to rule out a widespread release. Further, given the potential for yet unidentified features or conditions of environmental concern to be encountered during development, implementation of an environmental Site Management Plan would also be prudent.

CONCLUSIONS, OPINIONS AND RECOMMENDATIONS

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) of Carlos Street at Sierra Street In the City of Moss Beach, San Mateo County, California, the *subject property*. Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5 and 1.6 of this report.

AEI did not identify evidence of RECs or CRECs in connection with the property except for those previously identified in the Findings section. AEI recommends sampling investigation of the historic incinerator, drill field area, and former building areas to assess potential impacts as discussed above.

1.0 INTRODUCTION

This report documents the methods and findings of the Phase I ESA performed in conformance with the proposal and scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property located at Carlos Street at Sierra Street in the City of Moss Beach, San Mateo County, California (Figure 1: Topographic Map, Figure 2: Site Map, and Appendix A: Property Photographs).

1.1 SCOPE OF WORK

The purpose of the Phase I ESA is to assist the client in identifying potential RECs, in accordance with ASTM E1527-13, associated with the presence of any hazardous substances or petroleum products, their use, storage, and disposal at and in the vicinity of the subject property. Property assessment activities focused on: 1) a review of federal, state, tribal and local databases that identify and describe underground fuel tank sites, leaking underground fuel tank sites, hazardous waste generation sites, and hazardous waste storage and disposal facility sites within the ASTM approximate minimum search distance; 2) a property and surrounding site reconnaissance, and interviews with the past and present owners and current occupants and operators to identify potential environmental contamination; and 3) a review of historical sources to help ascertain previous land use at the site and in the surrounding area.

1.2 ADDITIONAL SERVICES

Other environmental considerations such as ACMs, LBP, lead in drinking water, radon, mold, and wetlands can result in business environmental risks for property owners which may disrupt current or planned operations or cash flow and are generally beyond the scope of a Phase I assessment as defined by ASTM E1527-13. Based upon the agreed-on scope of services this ESA did not include subsurface or other invasive assessments, business environmental risks, or other services not specifically identified and discussed herein.

1.3 SIGNIFICANT ASSUMPTIONS

The following assumptions are made by AEI in this report. AEI relied on information derived from secondary sources including governmental agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, and personal interviews. AEI has reviewed and evaluated the thoroughness and reliability of the information derived from secondary sources including government agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, or personal interviews. It appears that all information obtained from outside sources and reviewed for this assessment is thorough and reliable. However, AEI cannot guarantee the thoroughness or reliability of this information.

Groundwater flow, unless otherwise specified by on-site well data or well data from the subject property or nearby sites, is inferred from contour information depicted on the USGS topographic maps. AEI assumes the property has been correctly and accurately identified by the client, designated representative of the client, property contact, property owner, and property owner's representatives.

1.4 LIMITATIONS

Property conditions, as well as local, state, tribal and federal regulations can change significantly over time. Therefore, the recommendations and conclusions presented as a result of this assessment apply strictly to the environmental regulations and property conditions existing at the time the assessment was performed. Available information has been analyzed using currently accepted assessment techniques and it is believed that the inferences made are reasonably representative of the property. AEI makes no warranty, expressed or implied, except that the services have been performed in accordance with generally accepted environmental property assessment practices applicable at the time and location of the assessment.

Considerations identified by ASTM as beyond the scope of a Phase I ESA that may affect business environmental risk at a given property include the following: ACMs, radon, LBP, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, mold, and high voltage lines. These environmental issues or conditions may warrant assessment based on the type of the property transaction; however, they are considered non-scope issues under ASTM Standard Practice E1527-13.

If requested by the client, these non-scope issues are discussed herein. Otherwise, the purpose of this assessment is solely to satisfy one of the requirements for qualification of the innocent landowner defense, contiguous property owner or bona fide prospective purchaser under CERCLA. ASTM Standard Practice E1527-13 and the United States EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) constitute the "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in:

1) 42 U.S.C. § 9601(35) (B), referenced in the ASTM Standard Practice E1527-13.
2) Sections 101(35) (B) (ii) and (iii) of CERCLA and referenced in the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312).
3) 42 U.S.C. § 9601(40) and 42 U.S.C. § 9607(q).

The Phase I ESA is not, and should not be construed as, a warranty or guarantee about the presence or absence of environmental contaminants that may affect the property. Neither is the assessment intended to assure clear title to the property in question. The sole purpose of assessment into property title records is to ascertain a historical basis of prior land use. All findings, conclusions, and recommendations stated in this report are based upon facts, circumstances, and industry-accepted procedures for such services as they existed at the time this report was prepared (i.e., federal, state, and local laws, rules, regulations, market conditions, economic conditions, political climate, and other applicable matters). All findings, conclusions, and recommendations stated in this report are based on the data and information provided, and observations and conditions that existed on the date and time of the property reconnaissance.

Responses received from local, state, or federal agencies or other secondary sources of information after the issuance of this report may change certain facts, findings, conclusions, or circumstances to the report. A change in any fact, circumstance, or industry-accepted procedure upon which this report was based may adversely affect the findings, conclusions, and recommendations expressed in this report.

1.5 LIMITING CONDITIONS/DEVIATIONS

The performance of this Phase I ESA was limited by the following conditions:

- The User did not complete the ASTM User questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

- Due to the size of the subject property, AEI performed a site inspection of the property utilizing a field technique of traversing the site in an attempt to provide an overlapping field of view. Due to the size of the property and the vegetation present on site, isolated areas of the site may have not been accessible for direct observation during AEI's inspection. Based on the vacant nature of the property and the quality of information from other sources, this limitation is not expected to significantly alter the Findings of this assessment.

- No physical address for the subject property has been provided to or identified by AEI during the course of this assessment. A physical address is often utilized in the historical research process in order to identify any address-specific information, such as regulatory and enforcement actions. However, based on the reliability of other data sources, the lack of a physical address is not expected to significantly alter the findings of this assessment.

1.6 DATA GAPS AND DATA FAILURE

According to ASTM E1527-13, data gaps occur when the Environmental Professional is unable to obtain information required by the Standard, despite good faith efforts to gather such information. Pursuant to ASTM E1527-13, only significant data gaps, defined as those that affect the ability of the Environmental Professional to identify RECs, need to be documented.

Data failure is one type of data gap. According to ASTM E1527-13, data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. Pursuant to ASTM E1527-13, historical sources are required to document property use back to the property's first developed use or back to 1940, whichever is earlier, or periods of five years or greater.

1.6.1 DATA FAILURE

AEI did not identify evidence of data failure during the course of this assessment.

The following data failure was identified during the course of this assessment:

Data Failure	The earliest historical resource obtained during this assessment was a map from 1945. The lack of historical sources for the subject property dating back to first developed use represents historical data source failure. In the 1945 map the subject property appears as part of a military training base. Thus, it is assumed that prior to 1945 the subject property would have been used for military training purposes, if not undeveloped. Therefore, this data failure is not expected to significantly alter the Findings of this assessment.

Information/ Sources Consulted	Half Moon Bay History Association records, aerial photographs

1.6.2 DATA GAPS

AEI did not identify significant data gaps which affected our ability to identify RECs.

1.7 RELIANCE

All reports, both verbal and written, are for the benefit of MidPen Housing Corporation. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors or assigns. Reliance is provided in accordance with AEI's Proposal and Standard Terms and Conditions executed by MidPen Housing Corporation on October 23, 2015. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

2.0 SITE AND VICINITY DESCRIPTION

2.1 SITE LOCATION AND DESCRIPTION

PROPERTY INFORMATION	
Property Name	Carlos Street at Sierra Street
Street Address(es)	Carlos Street at Sierra Street
City	Moss Beach
State	California
Location	Approximately 100 feet northeastern corner of the intersection of Carlos Street and Sierra Street
Vicinity Characteristics	Residential
Approximate Site Acreage/Source	10.8 Acres / Site-contact provided information
Property Type	Vacant
Subject Property Use(s)	Vacant
Assessor Parcel Number(s)	037-022-070
SITE AND BUILDING INFORMATION	
Number of Buildings	0
Year(s) of Construction	N/A
Number of Floors/Stories	N/A
Basement or Subgrade Area(s)	N/A
Number of Units	N/A
Building Area (SF)/Source	N/A
Building Description(s)	N/A
Building Occupant(s)	N/A
Additional Improvements	Old building foundations (Two water tanks and associated operational building)
Current On-site Operations	None
Current Use of Hazardous Substances	None identified
UTILITY PROVIDER INFORMATION	
Natural Gas Provider	N/A
Electricity Provider	N/A
Heating System Fuel Source	N/A
Cooling System Power Source	N/A
Potable Water Provider or Source	N/A
Sewage Disposal Provider or Treatment System	N/A
REGULATORY INFORMATION	
Regulatory Database Listings	None identified
Institutional Controls	None identified
Engineering Controls	None identified
Environmental Liens	None identified

Refer to Figure 1: Topographic Map, Figure 2: Site Map and Appendix A: Property Photographs for site location and description.

2.2 SITE AND VICINITY CHARACTERISTICS

The immediately surrounding properties consist of the following:

Direction from Site	Tenant/Use (Address)	Regulatory Database Listing(s)
Northeast	Montara Creek followed by residences (297 and 300 16th Street)	N/A
Southeast	Lincoln Street followed by vacant land and residences (no address and 840-880 Lincoln Street, and 500-501 Buena Vista Street)	N/A
South	Sierra Street followed by residences (400-534 Sierra Street, 495 Stetson Street)	N/A
West	A residence (1993 Carlos Street)	N/A
Northwest	Vacant land (no address)	N/A

Please refer to Section 5.1 for discussion of adjacent sites listed in the regulatory database as noted above.

2.3 PHYSICAL SETTING

Geology: Based on a review of the USDA Soil Survey for the area of the subject property, the soils in the vicinity of the subject property are classified as the Typic Argiustolls, loamy-Urban land association series. Soils from this series are characterized as a sandy clay loam on the toe slope tread of a fluviomarine terrace land formation. These soils have moderate ability to transmit and store water and are composed of coastal alluvium derived from sedimentary rock.	
USGS Topographic Map:	Montara Mountain OE W, California 2015 Quadrangle
Nearest surface water to subject property:	Montara Creek/Adjacent North
Gradient Direction/Source:	west-southwest/topographic map interpretation
Estimated Depth to Groundwater/Source:	10-14 feet bgs/groundwater monitoring data from the site at 619 Stetson Street (located approximately 0.15 mile southeast of the subject property), obtained on Geotracker

Note: Groundwater flow direction can be influenced locally and regionally by the presence of local wetland features, surface topography, recharge and discharge areas, horizontal and vertical inconsistencies in the types and location of subsurface soils, and proximity to water pumping wells. Depth and gradient of the water table can change seasonally in response to variation in precipitation and recharge, and over time, in response to urban development such as storm water controls, impervious surfaces, pumping wells, cleanup activities, dewatering, seawater intrusion barrier projects near the coast, and other factors.

3.0 HISTORICAL REVIEW OF SITE AND VICINITY

3.1 HISTORICAL SUMMARY

Reasonably ascertainable standard historical sources as outlined in ASTM Standard E1527-13 were used to determine previous uses and occupancies of the subject property that are likely to have led to RECs in connection with the subject property. A chronological summary of historical data found, including but not limited to aerial photographs, historical city directories, Sanborn fire insurance maps and agency records is as follows:

Date Range	Subject Property Description/Use	Source(s)
Circa 1945	World War II military training facility	Half Moon Bay History Association records, aerial photographs
late 1940s to unknown time pre 1960s	Grammar School	Interviews with Half Moon Bay History Association, aerial photographs
Unknown time pre 1960s to late 1960s	Firefighter training ground	Interviews with Half Moon Bay History Association, aerial photographs
~1970-present	Vacant land	Interviews with Half Moon Bay History Association, aerial photographs, site observations, interviews with representative of current owner

Based on a review of historical sources, the subject property was identified to exist as part of a larger World War II training area circa 1945. Military buildings on the property included barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD hanger" and a drill field. After the war was over the mess hall building was converted into a grammar school. However it was abandoned when a new school site was built (date unknown). By the late 1960s the property was used as a training ground for firefighters. Sometime between 1968 and 1970 a controlled burn got out of hand and burned what remained of buildings on the subject property to the ground, leaving only concrete foundations. Since at least 1970, the subject property has been vacant; however the old building foundations remain onsite. The water tanks and associated building are presumed to be off-site for purposes of this report.

Environmental concerns associated with historic military uses of the subject property are discussed in Section 4.1.7.

3.2 AERIAL PHOTOGRAPH REVIEW

AEI reviewed aerial photographs of the subject property and surrounding area. Aerial photographs were reviewed for the following years:

Year(s)	Subject Property Description	Adjacent Site Descriptions
1946	The subject property is developed with military buildings, reflective of the 1945 map provided by the Half Moon Bay History Association (see Section 4.1.7)	**Northeast:** Montara Creek followed by vacant land **Southeast:** Vacant land **South:** Vacant land **West:** Vacant land (part of the military site) **Northwest:** Vacant land **Water Tank Parcel:** and water supply towers pump house, and tank
1956, 1968	Buildings in the northwestern portion of the subject property remain unchanged. It appears that buildings in the central and southeastern portion of the subject property no longer exist.	**Northeast:** Montara Creek followed by vacant land by a residence **Southeast:** No significant changes **South:** No significant changes **West:** No significant changes **Northwest:** No significant changes **Water Tank Parcel:** No significant changes
1970	Roads and building foundations on the subject property are still seen; however all buildings.	**Northeast:** No significant changes **Southeast:** No significant changes **South:** No significant changes **West:** No significant changes **Northwest:** No significant changes **Water Tank Parcel:** Water supply features are gone
1983, 1993, 2005	No significant changes	**Northeast:** No significant changes **Southeast:** Vacant land and several residences **South:** Residences **West:** No significant changes **Northwest:** No significant changes **Water Tank Parcel:** No significant changes
2014	The subject property consists of vacant land	**Northeast:** No significant changes **Southeast:** No significant changes **South:** No significant changes **West:** No significant changes **Northwest:** No significant changes **Water Tank Parcel:** Two water tanks and associated out-building

Environmental concerns associated with historic military uses of the subject property are discussed in Section 4.1.7.

3.3 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance maps were developed in the late 1800s and early 1900s for use as an assessment tool for fire insurance rates in urbanized areas. A search was made of the Environmental Risk Information Services (ERIS) collection of Sanborn Fire Insurance maps.

Sanborn map coverage was not available for the subject property.

If available, copies of historical Sanborn maps are provided in the report appendices.

3.4 CITY DIRECTORIES

A search of historical city directories was conducted for the subject property by ERIS. However, no physical address for the subject property has been provided to or identified by AEI during the course of this assessment. As such, the city directory search did not yield any information regarding historical uses of the subject property.

If available, copies of historical city directories are provided in the report appendices.

3.5 HISTORICAL TOPOGRAPHIC MAPS

On October 28, 2014, AEI searched for historical topographic maps on historicalaerials.com as well as on the USGS topographic map website in attempt to resolve data failure prior to 1945. Unfortunately, no topographic maps dated prior to 1947 were available. As such, historical topographic maps were not reviewed as part of this assessment.

3.6 CHAIN OF TITLE

In accordance with our approved scope of services, a chain of title search was not performed as part of this assessment.

4.0 REGULATORY AGENCY RECORDS REVIEW

4.1 REGULATORY AGENCIES

Local and state agencies, such as environmental health departments, fire prevention bureaus, and building and planning departments are contacted to identify any current or previous reports of hazardous substance use, storage, and/or unauthorized releases that may have impacted the subject property. In addition, information pertaining to AULs, defined as legal or physical restrictions, or limitations on the use of, or access to, a site or facility, is requested.

4.1.1 LOCAL ENVIRONMENTAL HEALTH DEPARTMENT AND/OR STATE ENVIRONMENTAL AGENCY

On October 29, 2015, AEI contacted the San Mateo County Environmental Health Department via online form for information on the subject property. Files at this agency may contain information regarding hazardous substance storage and use, underground storage tanks, unauthorized releases of petroleum hydrocarbons or other contaminants that may affect the soil or groundwater in the area, wells and/or septic systems.

AEI spoke with Ms. Sheila Arkoneel, Office Assistant II who indicated that evidence of current or prior use or storage of hazardous substances or groundwater contamination was not on file for the subject property with the SMCEHD.

Ms. Arkoneel did, however, provided documentation of two domestic wells on the property. These wells were not observed at the time of the site visit and have reportedly been "sealed" however it was unclear if they were properly abandoned. Based on the domestic nature of the wells, they are not expected to represent a significant environmental concern. However if they are not intended for use, they should be abandoned in accordance with applicable regulations.

4.1.2 FIRE DEPARTMENT

On October 28, 2015, AEI contacted the Coast side Fire Protection District via telephone for information on the subject property to identify any evidence of previous or current hazardous substance usage, and/or for any historical information available for the subject property.

AEI spoke with Ms. Michelle Ortiz, Office Technician, who indicated that evidence of current or prior use or storage of hazardous substances was not on file for the subject property with the Fire Department.

4.1.3 BUILDING DEPARTMENT

On October 28, 2015, AEI contacted the San Mateo County Building Department (SMCBD) via telephone for information on the subject property in order to identify historical tenants, features of concern and property use. SMCBD staff stated that permits can be search for using the APN number online. However an online search with the APN number yielded no results.

4.1.4 PLANNING DEPARTMENT

On October 28, 2015, AEI contacted the San Mateo County Planning Department via telephone for information on the subject property in order to identify AULs associated with the subject property.

AEI spoke with Ms. Angela Chavez, Planner, who indicated that evidence indicating the existence of AULs was not on file for the subject property with the department. Additionally Ms. Chavez confirmed that the subject property has no address, and is zoned for residential use.

4.1.5 COUNTY ASSESSOR OFFICE

On October 28, 2015, AEI contacted the San Mateo County assessor's office via website visit for information on the subject property in order to determine the earliest recorded date of development and use.

According to the San Mateo County assessor's website, the subject property APN number is 037-022-070. No further information was provided on the assessor's website.

4.1.6 OIL AND GAS WELLS/PIPELINES

On October 28, 2015, AEI reviewed the California Department of Oil, Gas, and Geothermal Resources (DOGGR) maps concerning the subject property and nearby properties. The maps contain information regarding oil and gas development.

According to the DOGGR map, oil or gas wells are not located within 500 feet of the subject property. AEI did not identify evidence of environmental concerns during the map review.

4.1.7 OTHER AGENCIES SEARCHED

On October 28, 2015, AEI visited the Hazardous Waste Tracking System (HWTS) online database maintained by the **Department of Toxic Substances Control (DTSC)** for information regarding documented hazardous wastes generated at the subject property.

No information indicating the generation of hazardous wastes was on file for the subject property with the DTSC.

On October 28, 2015, AEI visited the **Regional Water Quality Control Board's (RWQCB's)** GeoTracker Website for information on the subject property to identify any evidence of unauthorized releases of hazardous materials to the groundwater. Cases typically handled by the RWQCB include releases from USTs.

No information indicating any release of hazardous materials on the subject property was found on the GeoTracker website.

On October 28, 2015, AEI visited the **Envirostor** online database maintained by the **Department of Toxic Substances Control (DTSC)** for information regarding documented hazardous wastes releases and cleanup sites at the subject property.

No information indicating any release of hazardous materials on the subject property was found on the Envirostor website.

On October 30, 2015, AEI contacted the Half Moon Bay History Association via telephone for historical information on the uses of the subject property.

AEI spoke with Mr. David Cresson, who stated that the subject property was used as a World War II military training site. He stated that after the war, the property was handed over for use as a grammar school. Later, a new school was built off-site, and the subject property was used to conduct training for local firefighters. In the late 1960s a controlled burn got out of hand, and all buildings left on the subject property burned to the ground, leaving only foundations. Since then, the subject property has laid vacant. He stated that he did not know when the site began being used for military training, and stated that before this development the subject property "would not have been used for anything besides farming".

Mr. David Cresson was able to provide a map from 1945 detailing the buildings on the subject property at that time. Buildings on site include a "sustenance building" or mess hall, barracks, offices, a garage, a boiler room, a water tower, a water tank, a pump house, loading sheds, a library, a "T.D.D. hangar" and an incinerator. Additionally, the northeastern corner of the subject property is labelled as a "drill field". Mr. Cresson did not provide any documentation regarding any subject property uses prior or subsequent to the military training base.

Historically, the onsite incinerator may have been used to burn refuse or waste, without regard for the chemical composition of the substances being burned. No records were found during the course of this assessment detailing what substances were burned at the incinerator. As such, there may be toxic residues in onsite soils associated with the combustion of military wastes. Likewise, no records were found during the course of this assessment regarding the exact use of the historic drill field. Considering that the site was a military training ground, the drill field may have been used for exercises that involved weaponry. There may be lead-containing residues onsite from cartridges or gunpowder related to historic military training activities.

Based on this information, the historical presence of an incinerator and military drill field onsite represent a recognized environmental condition. AEI recommends subsurface sampling in the vicinity of the historic incinerator and drill field.

A copy of the military map is provided in the appendices.

4.1.8 STATE ENVIRONMENTAL SUPERLIENS AND PROPERTY TRANSFER LAWS

In accordance with our approved scope of services, AEI did not assess whether the subject property is subject to any state environmental superliens and/or property transfer laws.

5.0 REGULATORY DATABASE RECORDS REVIEW

AEI contracted Environmental Risk Information Service (ERIS) to conduct a search of publicly available information from federal, state, tribal, and local databases containing known and suspected sites of environmental contamination and sites of potential environmental significance. Data gathered during the current regulatory database search is compiled by ERIS into one regulatory database report. Location information for listed sites is designated using geocoded information provided by federal, state or local agencies and commonly used mapping databases with the exception of "Orphan" sites. Due to poor or inadequate address information, Orphan sites are identified but not geocoded/mapped by ERIS, rather, information is provided based upon vicinity zip codes, city name, and state. The number of listed sites identified within the approximate minimum search distance from the federal and state environmental records database listings specified in ASTM Standard E1527-13 is summarized in Section 5.1, along with the total number of Orphan sites. A copy of the regulatory database report is included in Appendix B of this report.

The subject property was not identified in the regulatory databases reviewed.

In determining if a listed site is a potential environmental concern to the subject property, AEI generally applies the following criteria to classify the site as lower potential environmental concern: 1) the site only holds an operating permit (which does not imply a release), 2) the site's distance from, and/or topographic position relative to, the subject property, and/or 3) the site has recently been granted "No Further Action" by the appropriate regulatory agency.

5.1 RECORDS SUMMARY

Database	Search Distance (Miles)	Subject Property Listed	Number of Listings within Search Distance	Recognized Environmental Condition or Other Environmental Consideration (Yes or No)
NPL	1	No	0	
DELISTED NPL	0.5	No	0	
CERCLIS	0.5	No	0	
CERCLIS NFRAP	0.5	No	0	
RCRA CORRACTS	1	No	0	
RCRA-TSDF	0.5	No	0	
RCRA LQG, SQG, CESQGs, VGN, NLR	SP/ADJ	No	0	
US ENG CONTROLS	SP	No	0	
US INST CONTROLS	SP	No	0	
ERNS	SP	No	0	

Database	Search Distance (Miles)	Subject Property Listed	Number of Listings within Search Distance	Recognized Environmental Condition or Other Environmental Consideration (Yes or No)
STATE/TRIBAL HWS	1	No	0	
STATE/TRIBAL SWLF	0.5	No	0	
STATE/TRIBAL REGISTERED STORAGE TANKS	SP/ADJ	No	0	
STATE/TRIBAL LUST	0.5	No	2	No
STATE/TRIBAL EC and IC	SP	No	0	
STATE/TRIBAL VCP	0.5	No	0	
STATE/TRIBAL BROWNFIELD	0.5	No	0	
ORPHAN	N/A	No	19	No; none of the identified orphan sites are located in the immediate vicinity (500-feet) of the subject property, and/or based upon the distance and relative gradient, the sites are not expected to represent a significant environmental concern.
ADDITIONAL ENVIRONMENTAL RECORD SOURCES	SP/ADJ	No	0	

SP: subject property
ADJ: adjacent property

5.2 VAPOR MIGRATION

AEI reviewed reasonably ascertainable information for the subject and nearby properties, including a regulatory database, files for nearby release sites, and/or historical documentation, to determine if potential vapor-phase migration concerns may be present which could impact the subject property.

Based on a review of available resources as documented in this report, AEI did not identify significant on-site concerns and/or regulated listings from nearby sites which suggest that a vapor-phase migration concern currently exists at the subject property.

6.0 INTERVIEWS AND USER PROVIDED INFORMATION

6.1 INTERVIEWS

Pursuant to ASTM E1527-13, the following interviews were performed during this assessment in order to obtain information indicating RECs in connection with the subject property.

6.1.1 INTERVIEW WITH OWNER

The subject property is owned by the California School Employees Association (CSEA). Mr. Roy Ramos, Facilities Director of the CSEA, and acting as representative for the subject property owner, was contacted via telephone on November 3, 2015. Mr. Ramos has been associated with the subject property since 2000. Mr. Ramos stated that the CSEA has owned the property since at least 1969, but has never used it for anything. He stated that although the CSEA has tried to work with outside companies to develop the property for residential use, past attempts have not been successful. He stated that he regularly has vegetation and debris removed from the property, but knows of no other activities onsite.

Mr. Ramos was asked if he was aware of any of the following:

Any knowledge of USTs, clarifiers or oil/water separators, sumps, or other subsurface features.	☐Yes ☒ No
Any knowledge of previous environmental investigations conducted on site.	☐Yes ☒ No
Any knowledge of current or past industrial operations and/or other operations which would involve the use of hazardous substances and/or petroleum products.	☐Yes ☒ No
Any known plans for site redevelopment or change in site use.	☐Yes ☒ No
Any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property.	☐Yes ☒ No
Any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property.	☐Yes ☒ No
Any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.	☐Yes ☒ No
Any incidents of flooding, leaks, or other water intrusion, and/or complaints related to indoor air quality.	N/A

6.1.2 INTERVIEW WITH KEY SITE MANAGER

The key site manager, Mr. Jeff Aguilar, Associate at CBRE Brokerage Services, was contacted via telephone on October 28, 2015. Mr. Aguilar has been associated with the subject property since approximately April 2015. Mr. Aguilar stated that the subject property has been owned by the teachers union since the 1970s but that nothing has ever been done with it. He stated that the property is zoned for residential use due to previous attempts at development, but that no houses have ever been onsite. Mr. Aguilar indicated that the water tanks and building were not part of the subject property. He was not knowledgeable regarding other uses of the subject property and did not know why concrete building pads were onsite.

Mr. Aguilar was asked if he was aware of any of the following:

Any knowledge of USTs, clarifiers or oil/water separators, sumps, or other subsurface features.	☐Yes ☒ No
Any knowledge of previous environmental investigations conducted on site.	☐Yes ☒ No
Any knowledge of current or past industrial operations and/or other operations which would involve the use of hazardous substances and/or petroleum products.	☐Yes ☒ No
Any known plans for site redevelopment or change in site use.	☐Yes ☒ No
Any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property.	☐Yes ☒ No
Any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property.	☐Yes ☒ No
Any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.	☐Yes ☒ No
Any incidents of flooding, leaks, or other water intrusion, and/or complaints related to indoor air quality.	N/A

6.1.3 PAST OWNERS, OPERATORS AND OCCUPANTS

In attempt to interview past owners, operators and occupants regarding historical on-site operations, AEI requested the contact information for these entities from the representative of the current subject property owner, Mr. Roy Ramos. Mr. Ramos was unable to provide the contact information for the past owners, operators and occupants. Other methods of researching the contact information for past owners, operators and occupants are performed by AEI when a data gap is encountered and/or if an item of environmental concern is identified for the subject property, which includes reviewing historical agency records and/or online research, none of which were encountered during the course of this investigation. As such, interviews with past owners, operators and occupants regarding historical on-site operations were not reasonably ascertainable.

6.1.4 INTERVIEW WITH OTHERS

Information obtained during interviews with local government officials is incorporated into the appropriate segments of this section.

Additionally, AEI interviewed two unnamed neighbors during the site visit. The neighbors indicated that the subject property was an "old World War II military training center".

6.2 USER PROVIDED INFORMATION

User provided information is intended to help identify the possibility of RECs in connection with the subject property. According to ASTM E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), certain items should be researched by the prospective landowner or grantee, and the results of such inquiries may be provided to the Environmental Professional. The responsibility for qualifying for LLPs by conducting the inquiries ultimately rests with the User, and providing the information to the Environmental Professional would be prudent if such information is available.

The User did not complete the ASTM User Questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

6.2.1 ENVIRONMENTAL LIENS

In accordance with our approved scope of services, AEI contracted AFX Research LLC to perform an environmental lien search for the subject property.

According to AFX Research LLC, environmental liens were not identified during the review of historical ownership documentation. A copy of AFX Research LLC's report is provided in the appendices.

6.3 PREVIOUS REPORTS AND OTHER PROVIDED DOCUMENTATION

No prior reports or other relevant documentation in association with the subject property was made available to AEI during the course of this assessment.

7.0 SITE RECONNAISSANCE

Site Reconnaissance Date	Site Visit Date
AEI Site Assessor(s)	Lena Chervin
Property Escort(s)/Relationship(s) to Property	Jeff Aguilar/ Key Site Manager
Units/Areas Observed	All areas easily visible
Area(s) not accessed and reason(s)	Areas not visible due to vegetation overgrowth
Weather	Sunny

7.1 SUBJECT PROPERTY RECONNAISSANCE FINDINGS

Yes	No	Observation
☐	☒	Regulated Hazardous Substances/Wastes and/or Petroleum Products in Connection with Property Use
☐	☒	Aboveground/Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs / USTs)
☐	☒	Hazardous Substance and Petroleum Product Containers Not in Connection with Property Use
☐	☒	Unidentified Substance Containers
☒	☐	Electrical or Mechanical Equipment Likely to Contain Fluids
☐	☒	Interior Stains or Corrosion
☐	☒	Strong, Pungent or Noxious Odors
☐	☒	Pools of Liquid
☒	☐	Drains, Sumps and Clarifiers
☐	☒	Pits, Ponds and Lagoons
☐	☒	Stained Soil or Pavement
☐	☒	Stressed Vegetation
☐	☒	Solid Waste Disposal or Evidence of Fill Materials
☐	☒	Waste Water Discharges
☐	☒	Wells
☐	☒	Septic Systems
☐	☒	Biomedical Wastes
☒	☐	Other

The subject property is currently unoccupied. However water supply tanks exist on the subject property.

ELECTRICAL OR MECHANICAL EQUIPMENT LIKELY TO CONTAIN FLUIDS

Toxic PCBs were commonly used historically in electrical equipment such as transformers, fluorescent lamp ballasts, and capacitors. According to United States EPA regulation 40 CFR Part 761, there are three categories for classifying such equipment: <50 ppm of PCBs is considered "Non-PCB"; between 50 and 500 ppm is considered "PCB-Contaminated"; and >500 ppm is considered "PCB-Containing". Pursuant to 15 U.S.C. 2605(e)(2)(A), the manufacture, process, or

distribution in commerce or use of any polychlorinated biphenyl in any manner other than in a totally enclosed manner was prohibited after January 1, 1977.

Transformers

Type	Quantity	Owner	Presumed Date of Installation	Spills or Stains Observed	Non-PCB Label
Pole-Mounted	1	PG&E	Unknown	☐Yes ☒ No	☐Yes ☒ No

The management of potential PCB-containing transformers is the responsibility of the local utility or the transformer owner. Actual material samples need to be collected to determine if transformers are PCB-containing.

Transformers installed prior to 1977 may be PCB containing while transformers installed after 1977 are unlikely to be PCB containing. Federal Regulations (40 CFR 761 Subpart G) require any release of material containing >50 ppm PCB and occurring after May 4, 1987, be cleaned up by the transformer owner following the United States EPA's PCB spill cleanup policy.

AEI did not observe evidence of spills, staining or leaks on or around the transformer. Based on the good condition of the equipment, the transformer is not expected to represent a significant environmental concern.

DRAINS, SUMPS AND CLARIFIERS

Several drains were observed in association with the water tanks on the subject property. AEI did not observe evidence of hazardous substances or petroleum products in the vicinity of the drains. Based on the use of the drains solely for water runoff, the presence of the drains is not expected to represent a significant environmental concern.

OTHER

General debris was observed on various concrete building foundations at the subject property. While no evidence of hazardous materials was observed among this debris, the debris should be removed as a best management practice.

7.2 ADJACENT PROPERTY RECONNAISSANCE FINDINGS

Yes	No	Observation
☐	☒	Hazardous Substances and/or Petroleum Products in Connection with Property Use
☒	☐	Aboveground and Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs / USTs)
☐	☒	Hazardous Substance and Petroleum Product Containers and Unidentified Containers Not in Connection with Property Use
☐	☒	Unidentified Substance Containers
☐	☒	Electrical or Mechanical Equipment Likely to Contain Fluids
☐	☒	Strong, Pungent or Noxious Odors
☐	☒	Pools of Liquid
☐	☒	Drains, Sumps and Clarifiers
☐	☒	Pits, Ponds and Lagoons

Yes	No	Observation
☐	☒	Stained Soil or Pavement
☐	☒	Stressed Vegetation
☐	☒	Solid Waste Disposal or Evidence of Fill Materials
☐	☒	Waste Water Discharges
☐	☒	Wells
☐	☒	Septic Systems
☐	☒	Other

ABOVEGROUND/UNDERGROUND HAZARDOUS SUBSTANCE OR PETROLEUM PRODUCT STORAGE TANKS (ASTS / USTS)

AST(s):

Size (gallons)/ Contents	Location	Construction/ Secondary Containment	Product Piping (Aboveground/ Underground)
2 x ~100,000 gallons/ water	Near the southeastern corner of the subject property	☐Yes ☒ No	Underground

Two large domestic water supply tanks are located on what appears to be a separate parcel near the southeastern corner of the subject property. Due to the non-hazardous nature of the substance contained within the tanks, the presence of the tanks is not expected to represent a significant environmental concern.

8.0 OTHER ENVIRONMENTAL CONSIDERATIONS

8.1 ASBESTOS-CONTAINING BUILDING MATERIALS

The subject property is currently vacant land or lacks structures. Consequently, AEI did not observe building components likely to contain suspect asbestos containing materials during the site reconnaissance.

8.2 LEAD-BASED PAINT

LBP is defined as any paint, varnish, stain, or other applied coating that has ≥1 mg/cm^2 (5,000 µg/g or 5,000 ppm) of lead by federal guidelines; state and local definitions may differ from the federal definitions in amounts ranging from 0.5 mg/cm^2 to 2.0 mg/cm^2. Section 1017 of the Housing and Urban Development (HUD) Guidelines, Residential Lead-Based Paint Hazard Reduction Act of 1992, otherwise known as "Title X", defines a LBP hazard as "any condition that causes exposure to lead that would result in adverse human health effects" resulting from lead-contaminated dust, bare, lead-contaminated soil, and/or lead-contaminated paint that is deteriorated or present on accessible, friction, or impact surfaces. Therefore, under Title X, intact LBP on most walls and ceilings would not be considered a "hazard", although the paint should be maintained and its condition monitored to ensure that it does not deteriorate and become a hazard. Additionally, Section 1018 of this law directed HUD and EPA to require the disclosure of known information on LBP and LBP hazards before the sale or lease of most housing built before 1978. Most private housing, public housing, federally owned or subsidized housing is affected by this rule.

LCP is defined as any paint with any detectable amount of lead present in it. It is important to note that LCP may create a lead hazard when being removed. The condition of these materials must be monitored when they are being disturbed. In the event LCP is subject to abrading, sanding, torching and/or cutting during demolition or renovation activities, there may be regulatory issues that must be addressed.

The information below is for general informational purposes only and does not constitute a lead hazard evaluation. In addition, the information is not intended to comply with federal, state or local regulations in regards to LCP.

In buildings constructed after 1978, it is unlikely that LBP is present. Structures built prior to 1978 and especially prior to the 1960s should be expected to contain LBP.

Although the subject property is currently vacant and lacks structures, buildings previously present on the subject property (constructed circa 1945) likely included LBP. If these buildings burned onsite, LBP residues may be present in soils. Interviews and aerial photographs indicate that the military "sustenance building" on the property burned to the ground in 1969. Especially in cases of planned residential development, the potential presence of LBP residues in soils at the subject property represents a recognized environmental condition (REC). AEI recommends subsurface sampling in the vicinity of the former sustenance building.

8.3 RADON

Radon is a naturally-occurring, odorless, invisible gas. Natural radon levels vary and are closely related to geologic formations. Radon may enter buildings through basement sumps or other openings.

The United States EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three radon zones, with Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action Limit of 4.0 pCi/L. It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not requested as part of this assessment. According to the United States EPA, the radon zone level for the area is Zone 2, which has a predicted average indoor screening level between 2 pCi/L and 4 pCi/L equal to or below the action level of 4 pCi/L set forth by the EPA.

8.4 DRINKING WATER SOURCES AND LEAD IN DRINKING WATER

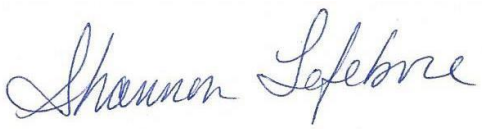
The Montara Water and Sanitary District supplies potable water to the vicinity of the subject property. The most recent water quality report states that 90th percentile lead level in the area's water supply were 6 ppb and therefore are well within standards established by the USEPA.

8.5 MOLD/INDOOR AIR QUALITY ISSUES

The subject property is currently vacant land or lacks structures. Consequently, mold was not addressed as part of this assessment.

9.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312.



I have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

SITE HISTORY:

Extracted from TEC Accutite's March 31, 2010 First Quarter 2010 Groundwater Monitoring Report, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is a private home located on Stetson Street, near the intersection with California Avenue in Moss Beach, California. The nearest surface water is the Pacific Ocean, located approximately 1,000 feet west of the site. A portion of the Fitzgerald State Marine Reserve, which the California Regional Water Quality Control Board (RWQCB) has designated as an area of special biological significance, is directly west of the subject site. Site topography is moderately sloping to the west/southwest, and site elevation is approximately 130 feet

above mean sea level (ft msl). November 2002 One 500-gallon heating oil underground storage tank (UST) removed from the subject site; significant concentrations of petroleum hydrocarbons present in groundwater. September 2003 Five soil borings advanced (B-1 through B-5); Total Petroleum Hydrocarbons as diesel (TPHd) detected in grab groundwater sample. November 2005 Impacted soil at the former UST location was over-excavated (approximately 60 tons of soil removed); significant TPHd concentration detected in western wall of the excavation; monitoring well MW-1 installed downgradient of the former UST; free-phase hydrocarbon encountered in well MW-1. August 2008 to October 2008 Offsite investigation; slug test; groundwater monitoring wells MW-2 and MW-3 installed; free product extent defined to the southwest of the former UST. February 2007 Initiation of ongoing quarterly groundwater monitoring and free product removal. April 6, 2009 Passive skimmer installed in well MW-1 to facilitate product removal.

SITE HISTORY:

Extracted from SVC Environmental's September 17, 2009 Work Plan to Assess Near-Surface Soils for Pesticide Residuals, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. In 1999 a Phase I/II Environmental Assessment was performed on the original 9.23-acre property (Parcels 28, 34, 35 and 36 on Figure 1) by BAGG Engineers. This site history narrative is derived from information presented in their corresponding report (BAGG, 1999), plus supplemental information acquired by SVC directly. Specifically, SVC reviewed a series of historic aerial photographs dating from 1943 to 2009, spoke with Bob Williamson (the property owner in the 1990s), visited the City Building Department, and spoke with the San Mateo Farm Bureau and the San Mateo County Agricultural Commission. The subject lot, along with adjoining land to the east, was farmed at least as early as the 1943 and extending up to the mid to late 1990s. Personal recollections indicate that only food crops, such as beans and peas, were grown here. According to the Farm Bureau trucked vegetables have historically been grown within Half Moon Bay and primarily brussel sprouts and artichokes. SVC found no indications of any prior structures having been present on the subject lot (with the exception of the public bus shelter along Main Street); all of the farm-related buildings and storage yards were located on parcels to the east. No site-specific chemical use records have been found to date, but Mr. Martin told BAGG

staff that he was not aware of DDT having ever been applied here. SVC has no reason to suspect that farming operations encompassing the subject lot deviated significantly from the past practices of the general area. In the before-mentioned Phase I/II Environmental Assessment Report (BAGG, 1999) the results of 10 soil tests for chlorinated pesticides were presented. Two of the sampling locations (E-1 and E-6) fall on the subject 1.4 +/- acre lot (see Figure 2). The EPA Test Method 8081A/8082 used encompasses 21 recognized Priority Pollutant pesticides, plus the chemically similar group of seven PCB compounds. Only DDT and one of its degradation products, DDE, were found, with the E-1 and E-6 concentrations being roughly an order of magnitude lower than the land to the east.

POTENTIAL COMTAMI:

HOUSEHOLD WASTES

SITE HISTORY:

The 31-acre site has operated as a landfill since 1935. Browning Ferris Industries operated the landfill under contract with the City of San Mateo from 1960-1982. The site was also opened to th public in 1982. The site has been restricted to the disposal of municipal waste and to composting of plant material in June 1996 closed the landfill. Post closure activities are overseen by the San Francisco Regional Water Quality Control Board and the Intergrated Waste Management Board.

Appendix: Database Descriptions

Ecolog Environmental Risk Information Services Ltd (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

National Priority List: NPL

National Priorities List (Superfund)-NPL: EPA's (United States Environmental Protection Agency) list of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action.

Government Publication Date: Oct 8, 2015

National Priority List - Proposed: PROPOSED NPL

Includes sites proposed (by the EPA, the state, or concerned citizens) for addition to the NPL due to contamination by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.

Government Publication Date: Oct 8, 2015

Deleted NPL: DELETED NPL

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Government Publication Date: Oct 8, 2015

Comprehensive Environmental Response, Compensation and Liability Information System - CERCLIS: CERCLIS

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

CERCLIS - No Further Remedial Action Planned: CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens: CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jan 30, 2014

RCRA CORRACTS- Corrective Action: RCRA CORRACTS

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: Mar 10, 2015

RCRA non-CORRACTS TSD Facilities: RCRA TSD

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites listed as treatment, storage and/or disposal facilities of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Government Publication Date: Mar 10, 2015

RCRA Generator List: RCRA GEN

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10).

Government Publication Date: Mar 10, 2015

RCRA Non-Generators: RCRA NON GEN

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: Mar 10, 2015

Federal Engineering Controls-ECs: FED ENG

Engineering controls (ECs) encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jul 30, 2014

Federal Institutional Controls- ICs: FED INST

Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's (United States Environmental Protection Agency) expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site.

Government Publication Date: Jul 30, 2014

Emergency Response Notification System: ERNS 1982 TO 1986

Database of oil and hazardous substances spill reports controlled by the The National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting all oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System: ERNS 1987 TO 1989

Database of oil and hazardous substances spill reports controlled by the The National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting all oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System: ERNS

Database of oil and hazardous substances spill reports controlled by the The National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting all oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Oct 7, 2015

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database: FED BROWNFIELDS

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jul 20, 2015

State

State Response Sites: RESPONSE

A list of identified confirmed release sites where the Department of Toxic Substances Control (DTSC) is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. This database is state equivalent NPL.

Government Publication Date: Aug 24, 2015

EnviroStor Database: ENVIROSTOR

The EnviroStor Data Management System is made available by the Department of Toxic Substances Control (DTSC). Includes Corrective Action sites, Tiered Permit sites, Historical Sites and Evaluation/Investigation sites. This database is state equivalent CERCLIS.

Government Publication Date: Aug 14, 2015

Solid Waste Information System (SWIS): SWF/LF

The Solid Waste Information System (SWIS) database made available by the Department of Resources Recycling and Recovery (CalRecycle) contains information on solid waste facilities, operations, and disposal sites throughout the State of California. The types of facilities found in this database include landfills, transfer stations, material recovery facilities, composting sites, transformation facilities, waste tire sites, and closed disposal sites.

Government Publication Date: Sep 02, 2015

EnviroStor Hazardous Waste Facilities: HWP

A list of hazardous waste facilities including permitted, post-closure and historical facilities found in the Department of Toxic Substances Control (DTSC) EnviroStor database.

Government Publication Date: Sep 8, 2015

Land Disposal Sites: LDS

Land Disposal Sites in GeoTracker, the State Water Resources Control Board (SWRCB)'s data management system. The Land Disposal program regulates of waste discharge to land for treatment, storage and disposal in waste management units. Waste management units include waste piles, surface impoundments, and landfills.

Government Publication Date: Jul 16, 2015

Leaking Underground Fuel Tank Reports: LUST

List of Leaking Underground Storage Tanks within the Cleanup Sites data in GeoTracker database. GeoTracker is the State Water Resources Control Board's (SWRCB) data management system for managing sites that impact groundwater, especially those that require groundwater cleanup (Underground Storage Tanks, Department of Defense and Site Cleanup Program) as well as permitted facilities such as operating Underground Storage Tanks. The Leak Prevention Program that overlooks LUST sites is the SWRCB in California's Environmental Protection Agency.

Government Publication Date: Aug 31, 2015

Delisted Leaking Storage Tanks: DLST

This database contains a list of leaking storage tank sites that were removed from the GeoTracker is the State Water Resources Control Board's (SWRCB) data management system.

Government Publication Date: Aug 31,2015

Permitted Underground Storage Tank (UST) in GeoTracker: UST

List of Permitted Underground Storage Tank (UST) sites made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency (EPA).

Government Publication Date: Sep 8, 2015

Aboveground Storage Tanks: AST

A statewide list from 2009 of aboveground storage tanks (ASTs) made available by the Cal FIRE Office of the State Fire Marshal (OSFM). This list is no longer maintained or updated by the Cal FIRE OSFM.

Government Publication Date: Aug 31, 2009

Historical Hazardous Substance Storage Information Database: HHSS

The Historical Hazardous Substance Storage database contains information collected in the 1980s from facilities that stored hazardous substances. The information was originally collected on paper forms, was later transferred to microfiche, and recently indexed as a searchable database. When using this database, please be aware that it is based upon self-reported information submitted by facilities which has not been independently verified. It is unlikely that every facility responded to the survey and the database should not be expected to be a complete inventory of all facilities that were operating at that time. This database is maintained by the California State Water Resources Control Board's (SWRCB) Geotracker.

Government Publication Date: Aug 27, 2015

Site Mitigation and Brownfields Reuse Program Facility Sites with Land Use Restrictions: LUR

The Department of Toxic Substances Control (DTSC) Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents land use restrictions that are active. Some sites have multiple land use restrictions.

Government Publication Date: Aug 6, 2014

Hazardous Waste Management Program Facility Sites with Deed / Land Use Restrictions: HLUR

The Department of Toxic Substances Control (DTSC) Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Government Publication Date: Jul 16, 2015

Deed Restrictions and Land Use Restrictions: DEED

List of Deed Restrictions, Land Use Restrictions and Covenants in GeoTracker made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency. A deed restriction (land use covenant) may be required to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

Government Publication Date: Jul 20, 2015

Voluntary Cleanup Program: VCP

List of sites in the Voluntary Cleanup Program made available by the Department of Toxic Substances and Control (DTSC). The Voluntary Cleanup Program was designed to respond to lower priority sites. Under the Voluntary Cleanup Program, DTSC enters site-specific agreements with project proponents for DTSC oversight of site assessment, investigation, and/or removal or remediation activities, and the project proponents agree to pay DTSC's reasonable costs for those services.

Government Publication Date: Aug 24, 2015

GeoTracker Cleanup Sites Data: CLEANUP SITES

A list of cleanup sites in the state of California made available by The State Water Resources Control Board (SWRCB) of the California Environmental Protection Agency (EPA). SWRCB tracks leaking underground storage tank cleanups as well as other water board cleanups.

Government Publication Date: Aug 31, 2015

Tribal

Leaking Underground Storage Tanks (LUSTs) on Indian Lands: INDIAN LUST

LUSTs on Tribal/Indian Lands in Region 9, which includes California.

Government Publication Date: Aug 28, 2014

Underground Storage Tanks (USTs) on Indian Lands: INDIAN UST

USTs on Tribal/Indian Lands in Region 9, which includes California.

Government Publication Date: Aug 28, 2014

County

Alameda County LOP Sites List: ALAMEDA LOP

A list of Leaking Underground Storage Tanks (LUST) facilities in Alameda County. This list is made available by Alameda County Department of Environmental Health (ACEH). ACEH implements a Local Oversight Program (LOP) under contract with the State Water Resources Control Board to provide regulatory oversight of the investigation and cleanup of soil and groundwater contamination from leaking petroleum USTs.

Government Publication Date: Aug 12, 2014

Alameda County UST List: ALAMEDA UST

A list of all registered Underground Storage Tanks (USTs) in the County of Alameda. The list is made available by Alameda County Department of Environmental Health.

Government Publication Date: Aug 12, 2014

Amador County CUPA List: AMADOR CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Amador County. This list is made available by Amador County Environmental Health Department which is the CUPA for Amador County and administers a consolidated hazardous materials program.

Government Publication Date: Mar 9, 2015

Butte County CUPA List: BUTTE CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Butte County. This list is made available by Butte County Public Health Department, Environmental Health Division which was certified by the California Environmental Protection Agency as the CUPA for Butte County.

Government Publication Date: May 28, 2015

Calaveras County CUPA Facilities List: CALAVERAS CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Calaveras. This list is made available by Calaveras County Environmental Health Department which has been certified by CalEPA to implement the Unified program as a CUPA.

Government Publication Date: Jun 19, 2015

Calaveras County Landfills List: CALAVERAS LF

A list of landfills in Calaveras County. This list is made available by Calaveras County Environmental Health Department which has been designated as the CUPA for the County.

Government Publication Date: Jul 21, 2014

Calaveras County UST Remediation Sites: CALAVERAS LUST

A list of Leaking Underground Storage Tank (LUST) facilities in Calaveras County. This list is made available by Calaveras County Environmental Health Department. Local Implementing Agency (LIA) provides oversight of site remediation with soil contamination while CalEPA - California Regional Water Quality Control Board - Central Valley Region oversees remediation of sites with groundwater contamination.

Government Publication Date: Aug 13, 2014

Colusa County CUPA List: COLUSA CUPA

A list of facilities associated with Business Plan and Hazardous Generator programs in the County of Colusa. This list is made available by Colusa County Environmental Health which was certified by the California Environmental Protection Agency as Certified Unified Program Agency for Colusa County.

Government Publication Date: Sep 12, 2014

Contra Costa County CUPA List: CONTRACO CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Contra Costa. This list is made available by Contra Costa County which has been certified by CalEPA to implement the Unified program as a CUPA.

Government Publication Date: Jun 15, 2015

Del Norte County CUPA Facility List: DELNORTE CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Del Norte County. This list is made available by Del Norte County Environmental Health Division which is the designated CUPA for the county.

Government Publication Date: May 19, 2015

El Dorado County CUPA Facility List: ELDORADO CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in El Dorado County. This list is made available by El Dorado County Department of Environmental Management - Hazardous Waste Division which is approved by CalEPA as CUPA for El Dorado County.

Government Publication Date: Aug 20, 2014

Fresno County CUPA/Solid Waste Programs Resource List: FRESNO CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Fresno County. This list is made available by Fresno County Department of Environmental Health Division which is approved by Cal-EPA as CUPA for the County.

Government Publication Date: Apr 30, 2015

Humboldt County CUPA Facility List: HUMBOLDT CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Humboldt County. This list is made available by Humboldt County Division of Environmental Health which is approved by the State Secretary for Environmental Protection as CUPA for the County.
Government Publication Date: May 28, 2015

Imperial County CUPA Facility List: IMPERIAL CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Imperial County. This list is made available by the California Department of Toxic Substances Control (DTSC) which is appointed as CUPA for Imperial County.
Government Publication Date: May 19, 2015

Inyo County CUPA Facility List: INYO CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Inyo. This list is made available by the Inyo County Environmental Health Services Department which has been certified by CalEPA to implement the Unified program as a CUPA.
Government Publication Date: Jul 16, 2014

Kern County CUPA List: KERN CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Kern. This list is made available by Kern County Environmental Health Services Department which has been certified by CalEPA to implement the Unified program as a CUPA for Kern County.
Government Publication Date: May 19, 2015

Kern County UST List: KERN UST
A list of all registered and inactive Underground Storage Tanks in the County of Kern. The list is made available by Kern County Environmental Health Division.
Government Publication Date: May 19, 2015

Kings County CUPA Facility List: KINGS CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Kings County. This list is made available by Kings County Department of Public Health which is appointed as CUPA for the county.
Government Publication Date: May 26, 2015

Lake County CUPA Facility List: LAKE CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Lake County. This list is made available by Lake County Division of Environmental Health which is CUPA for the entire county.
Government Publication Date: Jun 9, 2015

Los Angeles County - El Segundo City Underground Storage Tanks List: ELSEGUNDO UST
A list of all registered Underground Storage Tanks (USTs) in the City of El Segundo of Los Angeles County. The list is made available by El Segundo City Fire Department.
Government Publication Date: Jul 24, 2014

Los Angeles County - Torrance City Underground Storage Tanks: TORRANCE UST
A list of registered Underground Storage Tank (UST) sites in Torrance City of Los Angeles County. This list is made available by Torrance City Office of Clerk.
Government Publication Date: May 07, 2015

Los Angeles County HMS List: LA HMS
This list contains sites that have or had permits for Industrial Waste, Underground Storage Tanks, or Strom water in the County of Los Angeles. This list is made available by the County of Los Angeles Department of Public Works.
Government Publication Date: Jun 22, 2015

Los Angeles County Long Beach UST List: LA LONGB UST
A list of all registered active Underground Storage Tanks in the City of Long Beach of Los Angeles County. The list is made available by Long Beach Certified Unified Program Agency.
Government Publication Date: Jun 18, 2015

Los Angeles County Solid Waste Sites: LA SWF
List of permitted solid waste facilities, closed landfills, historical dumpsites and other solid waste sites in Los Angeles County, made available by the Department of Public Works in Los Angeles County.
Government Publication Date: May 19, 2014

Madera County CUPA Facility List: MADERA CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Madera County. This list is made available by Madera County Environmental Health Department which is CUPA for the entire county.
Government Publication Date: Sep 16, 2015

Marin County CUPA List: MARIN CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Marin. This list is made available by Marin County which has been certified by CalEPA to implement the Unified program as a CUPA.
Government Publication Date: May 26, 2015

Merced County CUPA Facilities List: MERCED CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Merced. This list is made available by Merced County which has been certified by CalEPA to implement the Unified program as a CUPA for the entire county.
Government Publication Date: May 19, 2015

Mono County CUPA Facility List: MONO CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Mono County. This list is made available by Mono County Environmental Health Department which has been certified by CalEPA to implement the Unified program as a CUPA for the entire county.
Government Publication Date: Jul 15, 2014

Monterey County CUPA Facility List: MONTEREY CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Monterey County. This list is made available by Monterey County Hazardous Materials Management Services which is designated as the CUPA in Monterey County.
Government Publication Date: Jun 17, 2015

Napa County UST List: NAPA UST
A list of all registered active Underground Storage Tanks (USTs) in the County of Napa. This list is made available by Napa County Environmental Health Division.
Government Publication Date: Sep 10, 2015

Nevada County CUPA Facility List: NEVADA CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Nevada County. This list is made available by Nevada County Department of Environmental Health which is the CUPA for all cities and unincorporated areas within Nevada County.
Government Publication Date: Jul 17, 2014

Orange County Aboveground Petroleum Storage Tank Listing: ORANGE AST
A list of Aboveground Petroleum Storage Tank (APST) facilities inspected by Orange County Certified Unified Program Agency (CUPA) Under the Aboveground Petroleum Storage Act (APSA). This list is made available by the Environmental Health Division of Orange County Health Care Agency.
Government Publication Date: May 1, 2015

Orange County Underground Storage Tanks Listing: ORANGE UST
A list of registered Underground Storage Tank (UST) sites in Orange County. This list is made available by Orange County Health Care Agency (OCHCA), Environmental Health Division which oversees the underground storage tank inspection program in most of the cities of Orange County, with the exception of Anaheim, Fullerton, and Orange.
Government Publication Date: May 1, 2015

Placer County CUPA Facilities List: PLACER CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Placer County. This list is made available by Placer County Environmental Health which is designated CUPA for all areas of the county except for the City of Roseville.
Government Publication Date: Aug 13, 2015

Riverside County Local Oversight Program List: RIVERSIDE LOP
A list of Leaking Underground Storage Tank (LUST) facilities in Riverside County. This list is made available by Riverside County Department of Environmental Health. Environmental Cleanup Program provides oversight of assessments and cleanups at properties that have been, or may have been, contaminated with hazardous substances from LUSTs or releases associated with other commercial/industrial use.
Government Publication Date: Jun 10, 2015

Riverside County Underground Storage Tanks List: RIVERSIDE UST
A list of registered Underground Storage Tank (UST) sites in Riverside County. This list is made available by Riverside County Department of Environmental Health. The Hazardous Materials Management Branch (HMMB) regulates and oversees the inspections of constructions, repairs, upgrades, system operation and removal of UST systems.
Government Publication Date: Jun 10, 2015

Sacramento County Master Hazardous Materials Facility List: SACRAMENTO HAZ
A list of Hazardous Materials Facilities in Sacramento County. This list is made available by Sacramento County Environmental Management Department which has been designated as the Certified Unified Program Agency (CUPA) for the County.
Government Publication Date: Feb 2, 2015

Sacramento Toxic Site Cleanup List: SACRAMENTO TOX
Sacramento County Environmental Management Department (EMD)'s Toxic Site Cleanup List includes sites where unauthorized releases of potentially hazardous materials have occurred. The EMD's Site Assessment & Mitigation Program, also referred to as Toxic Site Cleanup Program, provides mandated regulatory oversight of the assessment and remediation of properties on which there has been a release of hazardous materials to soil and/or groundwater.
Government Publication Date: Feb 2, 2015

San Bernardino County CUPA List: SANBERN CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in San Bernardino County. This list is made available by San Bernardino County Fire Department which is the CUPA for all areas of the County except the city of Victorville.
Government Publication Date: Jun 30, 2015

San Diego County Hazardous Materials Management Division Database: SANDIEGO HAZ
A list of facilities with Unified Program Facility Permit in San Diego County. This list has been made available by County of San Diego Environmental Health.
Government Publication Date: May 25, 2015

San Diego County Site Assessment and Mitigation Investigation Sites: SANDIEGO SAM
List of sites which have undergone a Site Assessment and Mitigation investigation. This list is made available by the County of San Diego Department of Environmental Health.
Government Publication Date: Jul 25, 2015

San Diego County Solid Waste Facility List: SANDIEGO SWF
A list of open and closed Solid Waste Facilities in the County of San Diego. The list is made available by San Diego County Department of Environmental Health.
Government Publication Date: Feb 18, 2015

San Francisco County Aboveground Storage Tanks List: SANFRAN AST
A list of Aboveground Storage Tanks (ASTs) facilities inspected by San Francisco Department of Public Health's (SFDPH) Hazardous Materials and Waste Program. Aboveground storage containers or tanks include oil-filled equipment (such as hydraulic systems/reservoirs and heat transfer systems) which have a petroleum storage capacity of 55 gallons or greater.
Government Publication Date: Sep 11, 2015

San Francisco County CUPA Facilities List: SANFRAN CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in San Francisco County. This list is made available by San Francisco County Hazardous Materials and Waste Program which is the CUPA for all areas of the County.
Government Publication Date: Sep 11, 2015

San Francisco County LOP Sites: SANFRAN LOP
A list of Underground Storage Tank (UST) release sites in the County of San Francisco. This list is made available by San Francisco County Department of Public Health Environmental Health Protection Branch.
Government Publication Date: Aug 12, 2014

San Francisco County UST List: SANFRAN UST
A list of all registered Underground Storage Tanks (USTs) in the County of San Francisco. This ist is made available by San Francisco County Environmental Health Division. The Hazardous Materials and Waste Program provides regulatory oversight for the construction, operation, repair and removal of USTs in San Francisco.
Government Publication Date: Sep 11, 2015

San Joaquin County Aboveground Tank List: SANJOAQUIN AST
A list of Aboveground Storage Tanks (ASTs) inspected by San Joaquin County Environmental Health Department (SJCEHD) under Aboveground Petroleum Storage Act (APSA).
Government Publication Date: Jun 5, 2015

San Joaquin County UST List: SANJOAQUIN UST
A list of all registered Underground Storage Tanks in the County of San Joaquin. The list is made available by San Joaquin County Environmental Health Division.
Government Publication Date: Jun 05, 2015

San Joaquin Hazardous Waste Facilities: SANJOAQUIN HW
A list of Hazardous Waste Facilities in San Joaquin County. This list is made available by San Joaquin County Environmental Health Department which has been designated as the CUPA for the County.
Government Publication Date: Jun 5, 2015

San Mateo County CUPA Facilities List: SANMATEO CUPA
A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in San Mateo County. This list is made available by San Mateo County Environmental Health Department which has been designated as the CUPA for the County.
Government Publication Date: May 28, 2015

San Mateo County LOP List: SANMATEO LOP
A list of Leaking Underground Storage Tank (LUST) facilities in San Mateo County. This list is made available by San Mateo County Environmental Health Services Division.
Government Publication Date: May 27, 2015

Santa Clara County CUPA Facilities List: SANTACLARA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Santa Clara County. This list is made available by Santa Clara County Department of Environmental health (DEH). DEH's Hazardous Materials Compliance Division (HMCD) is CUPA for the county with jurisdiction within the Cities of Los Altos Hills, Monte Sereno, and Saratoga; and in all unincorporated areas of Santa Clara County, including Moffett Field, San Martin, and Stanford.

Government Publication Date: May 26, 2015

Santa Clara Local Oversight Program Listing: SANTACLARA LO

A list of Leaking Underground Storage Tanks (LUST) facilities in Santa Clara County Provided by Santa Clara Department of Environmental Health (DEH). Since July 1, 2004 the DEH has served as the oversight agency for investigations and clean-up of petroleum releases from underground storage tanks through implementation of the Local Oversight Program (LOP) contract with the State Water Resources Control Board.

Government Publication Date: Jul 22, 2014

Santa Cruz County CUPA Facility List: SANTACRUZ CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Santa Cruz County. This list is made available by Santa Cruz County Environmental Health Services (EHS) Division which has been designated as the CUPA for the County.

Government Publication Date: May 27, 2015

San Luis Obispo County CUPA Facilities List: SANLUISOB CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in San Luis Obispo County. This list is made available by County of San Luis Obispo Environmental Health Services Division which has been designated as the CUPA for the County.

Government Publication Date: May 27, 2015

Shasta County CUPA Facility List: SHASTA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Shasta County. This list is made available by Shasta County Environmental Health Division which has been designated as the CUPA for Shasta County by CalEPA.

Government Publication Date: Jun 12, 2015

Solano County CUPA List: SOLANO CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the County of Solano. This list is made available by Solano County Environmental Health Division which has been certified by CalEPA to implement the Unified program as a CUPA.

Government Publication Date: Aug 5, 2014

Solano County Local Oversight Program List: SOLANO LOP

A list of Leaking Underground Storage Tank (LUST) facilities in the Solano County. This list is made available by the Solano County Environmental Health Services. Since April 1993, the State Water Resources Control Board has contracted with the County of Solano to provide regulatory oversight for the cleanup of LUSTs under Local Oversight Program (LOP) contract.

Government Publication Date: Jun 19, 2014

Solano County Underground Storage Tanks List: SOLANO UST

A list of all registered Underground Storage Tanks (USTs) in the County of Solano. The list is made available by Solano County Environmental Health Services Division. There are an estimated 190 facilities throughout the county that are subject to the regulatory requirements of the UST program.

Government Publication Date: Aug 5, 2014

Sonoma County CUPA Facilities List: SONOMA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Sonoma County. This list is made available by Sonoma County Hazardous Materials (HazMat) Division which has been designated as the CUPA for the County.

Government Publication Date: May 28, 2015

Sonoma County LOP Site List: SONOMA LOP

A list of Leaking Underground Storage Tank (LUST) facilities in Sonoma County. This list is made available by Sonoma County Department of Health Services. Sonoma County Local Oversight Program (LOP) oversees the investigation and cleanup of fuel releases from underground storage tanks in all areas of the County with the exception of the Cities of Santa Rosa and Healdsburg.

Government Publication Date: Apr 1, 2015

Sonoma County Petaluma City CUPA Facilities: SONOMA PETAL

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Petaluma City. This list is made available by Petaluma Fire Prevention Bureau which is the CUPA for Petaluma City in Sonoma County.

Government Publication Date: May 21, 2015

Sutter County CUPA List: SUTTER CUPA

A list of facilities associated with Aboveground Petroleum Storage Tank (APSA) regulation, Hazardous Materials Business Plan (HMBP) Program and Underground Storage Tank (UST) regulation of Certified Unified Program Agency (CUPA) programs in Sutter County. This list is made available by Sutter County Enviornmental Health Division which has been designated as the CUPA for the County.

Government Publication Date: May 06, 2015

Tuolumne County CUPA Facility List: TUOLUMNE CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Tuolumne County. This list is made available by Tuolumne County Environmental Health which is the CUPA for all areas of the County.

Government Publication Date: June 3, 2015

Ventura County CUPA Facilities List: VENTURA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Ventura County. This list is made available by Ventura County Environmental health Division.

Government Publication Date: Apr 27, 2015

Ventura County City of Oxnard CUPA Facility List: OXNARD CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Oxnard City. This list is made available by Oxnard City Fire Department which is the CUPA for Oxnard City in Ventura County.

Government Publication Date: Jul 24, 2014

Ventura County Inactive Underground Storage Tanks Sites: VENTURA INUST

A list of inactive Underground Storage Tank (UST) sites in Ventura County. This list is made available by Ventura County Environmental Health Division.

Government Publication Date: Apr 27, 2015

Ventura County Leaking Underground Fuel Tanks - Historic: VENTURA HLUFT

A historical list of cleanup oversight of the Leaking Underground Fuel Tank (LUFT) program provided by Ventura County Environmental Health Division. All new and existing underground fuel storage tank releases are now referred to the Los Angeles Regional Water Quality Control Board.

Government Publication Date: May 31, 2008

Yolo County UST List: YOLO UST

A list of registered Underground Storage Tank (UST) sites in Yolo County. This list is made available by Yolo County Environmental Health Department which regulates the construction, operation, repair and removal of USTs throughout Yolo County.

Government Publication Date: May 25, 2015

Yuba County CUPA Facilities List: YUBA CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in Yuba County. This list is made available by Yuba County Environmental Health Division which is the CUPA for all areas of the County.

Government Publication Date: May 27, 2015

City of Bakersfield CUPA List: BKRSFIELD CUPA

A list of facilities associated with various Certified Unified Program Agency (CUPA) programs in the City of Bakersfield. This list is made available by the City of Bakersfield Fire Department.

Government Publication Date: Jun 19, 2015

Gilroy City CUPA Facilities List: SANTACLARA GIL

The Gilroy City Fire Marshal's office maintains a list of CUPA Facilities located in Gilroy City.

Government Publication Date: Jul 17, 2015

Glenn County CUPA List: GLENN CUPA

The Glenn County Air Pollution Control District is the Administering Agency and the Certified Unified Program Agency (CUPA) for Glenn County with responsibility for regulating hazardous materials handlers, hazardous waste generators, underground storage tank facilities, above ground storage tanks, and stationary sources handling regulated substances.

Government Publication Date: Sep 21,2015

Lassen County CUPA List: LASSEN CUPA

The Environmental Health Program of Lassen County tracks Certified Unified Program Agencies (CUPA) facilities.

Government Publication Date: Sep 18,2015

Stanislaus County CUPA List: STANISLAUS CUPA

The Environmental Resources Department of Stanislaus County maintains a list of Certified Unified Program Agency (CUPA) facilities.

Government Publication Date: Sep 21,2015

Trinity County CUPA List: TRINITY CUPA

On January 1, 2005, the Department of Toxic Substances Control (DTSC) was authorized by the California Environmental Protection Agency (Cal/EPA) as the Trinity County Certified Unified Program Agency (CUPA). This CUPA list was made available by the DTSC.

Government Publication Date: Sep 22,2015

Additional Environmental Record Sources

Federal

Facility Registry Service/Facility Index: FINDS/FRS

The US Environmental Protection Agency (EPA)'s Facility Registry System (FRS) is a centrally managed database that identifies facilities, sites or places subject to environmental regulations or of environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, data collected from EPA's Central Data Exchange registrations and data management personnel.

Government Publication Date: Sep 24, 2015

Toxics Release Inventory (TRI) Program: TRIS

The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment.

Government Publication Date: 1987-2013

Hazardous Materials Information Reporting System: HMIRS

US DOT - Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Incidents Reports Database taken from Hazmat Intelligence Portal, U.S. Department of Transportation.

Government Publication Date: Feb 24, 2015

National Clandestine Drug Labs: NCDL

The U.S. Department of Justice ("the Department") provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.

Government Publication Date: Sep 5, 2015

Inventory of Open Dumps, June 1985: ODI

The Resource Conservation and Recovery Act (RCRA of the Act) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

EPA Report on the Status of Open Dumps on Indian Lands: IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified ongressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

Toxic Substances Control Act: TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI).

Government Publication Date: Jun 30, 2014

Hist TSCA: HIST TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.

Government Publication Date: 2006

State

EnviroStor Inspection, Compliance, and Enforcement: INSP COMP ENF

A list of permitted facilities with inspections and enforcements tracked in the Department of Toxic Substance Control (DTSC) EnviroStor.

Government Publication Date: Aug 24, 2015

Clandestine Drug Lab Sites: CDL

The Department of Toxic Substances Control (DTSC) maintains a listing of drug lab sites. DTSC is responsible for removal and disposal of hazardous substances discovered by law enforcement officials while investigating illegal/clandestine drug laboratories.

Government Publication Date: Feb 27, 2015

School Property Evaluation Program Sites: SCH

A list of sites registered with The Department of Toxic Substances Control (DTSC) School Property Evaluation and Cleanup (SPEC) Division. SPEC is responsible for assessing, investigating and cleaning up proposed school sites. The Division ensures that selected properties are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy the new school.

Government Publication Date: Sep 10, 2015

California Hazardous Material Incident Report System (CHMIRS): CHMIRS

A list of reported hazardous material incidents, spills, and releases from the California Hazardous Material Incident Report System (CHMIRS). This list has been made available by the California Office of Emergency Services (OES).

Government Publication Date: Sept 18, 2015

Sites Listed in the Solid Waste Assessment Test (SWAT) Program Report: SWAT

In a 1993 Memorandum of Understanding, the State Water Resources Control Board (SWRCB) agreed to submit a comprehensive report on the Solid Waste Assessment Test (SWAT) Program to the California Integrated Waste Management Board (CIWMB). This report summarizes the work completed to date on the SWAT Program, and addresses both the impacts that leakage from solid waste disposal sites (SWDS) may have upon waters of the State and the actions taken to address such leakage.

Government Publication Date: Dec 31, 1995

Tribal

No Tribal additional environmental record sources available for this State.

County

Los Angeles County Site Mitigation List: LA SML

A Site Mitigation List in the County of Los Angeles. The list is made available by Los Angeles County Fire Department. Site mitigation is handled by the Site Mitigation Unit (SMU) which facilitates completion of site clean-up projects of contaminated sites in an expeditious manner in all cities of the Los Angeles County except El Segundo, Glendale, Long Beach, Santa Fe Springs, and Vernon.

Government Publication Date: Jun 23, 2015

Riverside County Disclosure Facility List: RIVERSIDE HZH

A list of facilities disclosed to Riverside County Department of Environmental Health (DEH). This list is made available by Riverside County DEH which has been designated as the CUPA for the County. A business is required to establish and submit a Business Plan if the facility handles hazardous material equal to or greater than 55 gallons, 500 pounds or 200 cubic feet at any time during the year.

Government Publication Date: Jun 10, 2015

Riverside County Hazardous Waste Generator Sites List: RIVERSIDE HWG

A list of Hazardous Waste Generator Sites in the County of Riverside. This list is made available by Riverside County Department of Environmental Health which has been designated as the CUPA for the County.

Government Publication Date: Jun 10, 2015

San Joaquin County Hazardous Materials Facilities List: SANJOAQUIN HM

A list of Hazardous Materials Facilities in San Joaquin County. This list is made available by San Joaquin County Environmental Health Department which has been designated as the CUPA for the County.

Government Publication Date: Jun 05, 2015

Ventura County Inactive Hazardous Waste Sites: HW INACTIVE

A list of Inactive Hazardous Waste Sites in Ventura County collected by Ventura County's Environmental Health Division.

Government Publication Date: Jun 26, 2015

Delisted County Records: DELISTED COUNTY

Records removed from county or CUPA databases. Records may be removed from the county lists made available by the respective county departments because they are inactive, or because they have been deemed to be below reportable thresholds.

Government Publication Date: June, 2015

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries". All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and were included as reference.

HIG Research Summary

Site Location
350428 AC
Carlos Street At Sierra Street
Moss Beacch, CA

Conducted For
ERIS
80 Valleybrook Drive
Toronto, ON

HIG Project #
1523492
Date Created
11/02/2015

Historical Information Gatherers

This Research Summary identifies the products and services provided by Historical Information Gatherers, Inc. (HIG) for the above referenced site location. All products are provided as PDFs unless otherwise noted.

City Directory Pages/Abstracts

Research Methodology: A search was conducted for city directories that include coverage of the site area using HIG's City Directory Collection and other sources, if needed. Directories for the following years were identified for the site area. A comma between date ranges indicates a gap of 10 years or more in available city directories:

San Mateo County 1976-2011

The above listed directories were reviewed at approximate 5 year intervals to determine if the street(s) specified in the order were included in the directories and had listings for the site area. HIG attempted to identify former street names and aliases and if identified, these were also included in the review.

Research Results: When City Directory Pages are provided, the publication name and date are shown at the top of each page. When a City Directory abstract is provided, the first page of the abstract includes the relevant publication information. The years of coverage identified for each street and any identified historical street names are as follows:

Sierra Street (1976-2011)

Disclaimer & Waiver of Liability

This Research Summary and the related documents and images provided by Historical Information Gatherers (hereafter referred to as the "Site Specific HIG Data") contain information obtained from a variety of public and private sources. Additional information for the site and surrounding properties may exist. Accordingly, there can be no guaranty that the information provided is complete for its intended purpose. No warranty expressed or implied, is made whatsoever in connection with the Site Specific HIG Data. Historical Information Gatherers specifically disclaims the making of any such warranties, including without limitation, merchantability or fitness for a particular purpose. Historical Information Gatherers, its officers, employees and independent contractors cannot be held liable to anyone for any loss or damage, whether arising out of errors or omissions, negligence, accident or any other cause, resulting directly or indirectly from any information provided or any information not provided in the Site Specific HIG Data. Any liability on the part of Historical Information Gatherers is strictly limited to a refund equal to the amount paid for the Site Specific HIG Data.

Hig Copyright Notice

Copyright 2015 by Historical Information Gatherers, Inc. All rights reserved. The person or entity that ordered and paid for the Site Specific HIG Data is granted a limited license to reproduce the Site Specific HIG Data solely for purposes of providing supporting documentation for reports produced for the site location which is noted on page one of this Research Summary. Any other reproduction of the Site Specific HIG Data in any media or format, in whole or in part, is prohibited without prior written permission from Historical Information Gatherers.

Licensing Agreement

The licensing agreement between Historical Information Gatherers and infoGroup provides that Historical Information Gatherers may create photocopies or reproductions of portions of Polk City Directories, Hill-Donnelley Criss-Cross Directories and other directories under infoGroup copyright. The licensing agreement also permits the person or entity that ordered and paid for the Site Specific HIG Data to include photocopies or reproductions of portions of Polk City Directories, Hill-Donnelley Criss-Cross Directories and other directories under infoGroup copyright as supporting documents for reports produced for the site which is the subject of the Site Specific HIG Data.

Re: Well Logs For Farallon Vista Associates

Dear Stan:

As you will recall quite sometime ago, I asked you to locate the well logs for the Farralon Vista Associates' parcel. I represent the California School Employees Association, who is the owner of the land. I believe the APN number is 037-022-040.

Please contact me with this information.

If you any questions, do not hesitate to call.

message w/ Dave on 3/7/05 for file review appointment

 WELL PERMIT NO.: _____

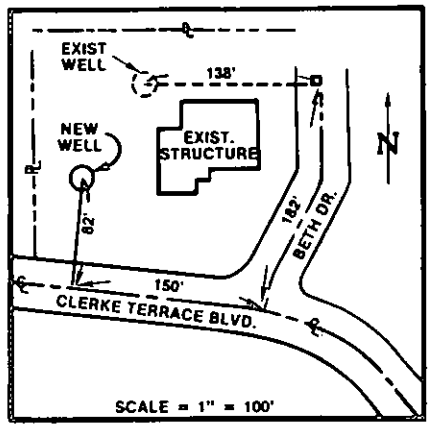
County Review Draft

WELL CONSTRUCTION APPLICATION

Based on information on the application and attachment(s) hereto (if any) and subject to approval noted below, permission is hereby granted to construct (drill) the described well. Permission to start may be withheld until a field check verifies all statements made on application by Permittee and is also subject to the "General" and "Special" Conditions stated below.

WELL LOCATION (Draw Accurately)
Recommend using Assessor's Map

1. Sketch well location to scale, show dimension to nearest foot.
2. Show a minimum of two dimensions at right angles. Dimensions shall be from the centerline of the closest named streets, roads or highways.



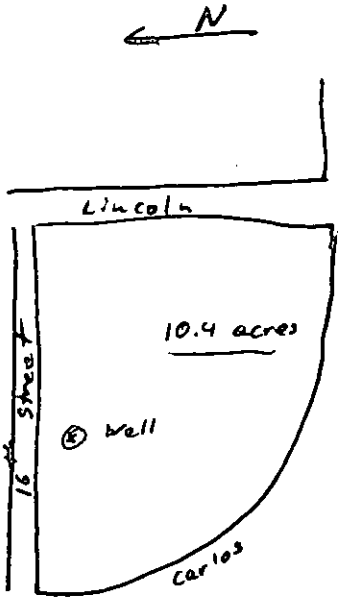


FIGURE 1

Scale: 1" = _____

GENERAL CONDITIONS:

A. Construction under this Permit is subject to any instructions by Health Department representative relative to the "Standards for the Construction of Wells in San Mateo County".

B. Permit may be voided before work begins if field check reveals any misrepresentation under "well location" or "Topographic Features" on application.

C. This Permit is valid only for the purpose specified herein. No change in construction procedure as prescribed on attached Standards and in Special Conditions below will be allowed except upon written permission of the County.

D. Permittee shall assume entire responsibility for all activities and uses under this Permit and shall indemnify, defend and save the County of San Mateo, its officers, agents and employees free and harmless from any and all expense, cost or liability in connection with or resulting from the exercise of this Permit including, but not limited to property damage, personal injury and wrongful death.

E. Compliance with "CAL/OSHA" California Labor Code Section 6300 (and following) is required.

F. Water quality and production from all wells to be used for domestic water supply must be approved by the Office of Environment Health.

G. Permit will be automatically cancelled if not exercised or if extension is not requested by Permittee within 90 calendar days of above date.

H. Driller is to complete State DWR Form 188 and mail original to San Mateo County Health Services within 30 days of completion of well construction.

I. For the construction of water producing wells, a Permittee must be a licensed water well drilling contractor unless the work is to be done by the landowner or employees of the landowner. (See Business & Professions Code § 7026.3, 7028).

J. For monitoring wells refer to State Water Well Standards 74-81. Dry holes shall be backfilled within one week of drilling. Well destruction shall be done in accordance with State and County Standards.

K. Each well site requires a separate Well Construction Application, and permit.

SPECIAL CONDITIONS:

APPROVED: _____ DATE: 8/14/86

APPENDIX G

QUALIFICATIONS

Lena Chervin – Associate Consultant

B.S. – Environmental Toxicology, University of California at Davis

Ms. Chervin has approximately one year of experience in the environmental field. Her past experiences include working for a toxicology consulting company in the Bay Area.

Project experience for Ms. Chervin includes:

- Phase I Environmental Site Assessments
- Environmental Transaction Screens
- Environmental Transaction Analyses
- Regulatory Database Review
- Historical Records Review

Ms. Chervin provides project management to ensure ASTM compliance and satisfaction of client requirements.

Prior to joining the environmental service industry, Ms. Chervin spent more than four years studying a diverse range of environmental disciplines including: toxicology, environmental fate and transport of contaminants, exposure and dose assessment, soil science, water quality management, and environmental law and policy.

Shannon Lefebvre – National Client Manager

BS Earth Science, Western Michigan University

Ms. Lefebvre has nearly 20 years of experience in the environmental services industry, primarily as a project manager working directly with clients to fulfill their environmental needs. Ms. Lefebvre has been responsible for management of small local clients as well as large national and regional accounts.

Project experience for Ms. Lefebvre includes:

- Phase I Environmental Site Assessments – Responsible for scheduling and managing all phases of environmental assessments and due diligence including debt and equity type clients. Properties range from large and small acreage raw land to residential, agricultural, retail, commercial and industrial properties. Projects included single sites and large portfolios of sites.

- Phase II Environmental Site Assessments – Responsible for planning and coordinating all phases of subsurface soil investigation at former landfills, agricultural operations, underground storage tank (UST) sites, dry cleaners, and industrial facilities; interpretation of analytical results and technical review of peer reports. Projects included removal of USTs and associated remediation for Leaking Underground Storage Tank (LUST) case closure.

- National Environmental Policy Act (NEPA) Compliance – Responsible for all aspects of NEPA compliance for telecommunication towers including tribal notification, review of archaeology reports and endangered species reports, State Historic Preservation Office (SHPO) submittals, and windshield surveys), for preparation of Environmental Assessments/Finding of No Significant Impact (FONSI), and Environmental Impact Statements (EIS).

- Stormwater Pollution Prevention Plans (SWPPP)– Responsible for preparation of SWPPPs for Arizona Department of Transportation (ADOT) statewide maintenance facilities, interpretation of analytical results of storm water sampling from ADOT facilities for comparison to regulatory requirements and preparation of reports; conducting annual SWPPP inspections for City of Phoenix Aviation Department, preparation of ADOT Quality Assurance Manual and ADOT Enforcement Response Plan.

- Indoor Air Quality - Responsible for the management and planning of assessment and remediation oversight regarding indoor quality issues for apartment complexes, dialysis facilities, mobile office units, retail centers, and banking workplaces throughout the U.S. Roles include instituting assessment criteria and remediation strategies.

- Asbestos – Responsible for managing asbestos survey and abatement projects throughout the U.S. Properties include multi-family complexes, banking centers, dialysis facilities, mobile office units and retail facilities. Work performed ranged from due diligence and/or proposed demolition projects, including large scale retail malls, to localized assessment for renovations for property upgrades.

Subject: **Limited Phase II Subsurface Investigation**
Carlos Street at Sierra Street
Moss Beach, San Mateo County, California 94038
AEI Project No. 350428

Dear Ms. Liu:

AEI Consultants (AEI) is pleased to provide this report which presents the results of the Limited Phase II Subsurface Investigation (Phase II) performed at the above referenced subject property. This investigation was completed in general accordance with the authorized scope of services outlined in our proposal dated November 19, 2015 (AEI Proposal No. 44236), as well as in accordance with the findings presented in AEI's DRAFT Phase I Environmental Site Assessment Report dated November 10, 2015. The location of the subject property is shown on Figure 1.

The purpose of this investigation is to assess whether or not subsurface conditions (i.e., soil) beneath the property have been impacted by the historical onsite operations. Information regarding the site description, background, scope of work, findings, conclusions, and recommendations for this investigation is provided in the following sections of this report.

1.0 SITE DESCRIPTION

The subject property comprises approximately 10.4 acres of vacant land, located to the north-northeast of the intersection between Carlos Street and Sierra Street in Moss Beach, an unincorporated community within San Mateo County, California. As shown on Figure 2, the property is bounded by residential properties along 16th Street (in Montara), and vacant land to the north, residential properties along Carlos, Sierra, and Stetson Streets to the south, residential properties along Lincoln and Buena Vista Street to the east, and one residential property and vacant land along Carlos Street to the west. Numerous concrete slab-on-grade building foundations, along with foundation retaining walls having scattered areas of graffiti, are present within the western and southwestern portions of the property. In some areas, these foundations are covered by thick vegetation consisting of trees and shrubs. Heavy vegetation also covers the majority of the property outside the areas of the building foundations. Unpaved roadways extend northwest-southeast across the north and central portions of the property. As shown on an Old Republic Title Company Preliminary Title Report Map dated October 8, 2015,

easements for Montara Water and Sanitary District (MWSD) and Pacific Gas and Electric (PG&E) utilities extend along the unpaved roadways within the property. MWSD infrastructure consisting of water storage tanks, a booster pumping system, and distribution facilities are located within a small, fenced-in parcel of land (known as Schoolhouse) adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the property. Another MWSD easement also extends southward form this parcel to Sierra Street, as shown on the Preliminary Title Report Map.

Topographically, the property generally slopes to the west-southwest with the exception of a steeply inclined, north-facing slope along the northern property boundary. Localized, relatively flat areas or topographic benches are present near the west and southwest boundaries of the property, as well as adjacent to Lincoln Street along the northeast corner of the property. Surface elevations at the property generally range between approximately 100 and 200 feet above mean sea level. The closest surface water body includes an unnamed, east-west trending, ephemeral drainage which parallels 16th Street to the north of the property.

Based on our review of a United States Geological Survey (USGS) Open File Report 98-137 Map entitled *Geology of the Onshore Part of San Mateo County, California* (Brabb, et.al., 1998), the subject property is situated upon a marine terrace underlain by Quaternary-aged alluvial deposits, along with thin, scattered veneers of residual soils. These units are further underlain by Montara Mountain granitic bedrock of Cenozoic age. Artificial fill consisting of soils, construction debris, wood debris, and other miscellaneous materials were scattered along the ground surface across the property.

The current estimated depth to groundwater beneath the property is unknown; however, well yield report information associated with a water supply well installed on the property in 1986 showed a static water level of 168 feet below ground surface (bgs). Based on the local site topography, the direction of groundwater flow is inferred to generally flow to the west-southwest, but also is inferred to flow to the north into the drainage adjacent to 16th Street.

2.0 BACKGROUND

As described in AEI's Phase I ESA report, historical sources indicated that the subject property was part of a large World War II training area circa 1945. Numerous military buildings had been present on the subject property, as shown on a drawing entitled *Map of Anti-Aircraft Training Center, Point Montara, California, Twelfth Naval District, Showing Conditions on June 30, 1945*, which was presented in Appendix F of AEI's Phase I ESA report. These buildings included barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD hanger", and a "drill field". After the war was over, the mess hall building was converted into a grammar school, and was later abandoned after a new school site was built (date unknown). By the late 1960s, the property was used as a training ground for firefighters. During firefighter training, AEI assumed that accelerants, such as those containing gasoline, may have been used along concrete pad surfaces. Burned materials from the firefighter training may have been washed off the pads and into unpaved, surrounding areas. Between approximately 1968 and 1970, a controlled burn occurred, which resulted in the burning of the several remaining buildings, leaving only exposed concrete foundations. Since at least 1970, the property has been vacant with the exception of the scattered, older building foundations, as well as the

fenced area containing MWSD infrastructure to support current water storage and distribution operations.

Recognized environmental conditions (RECs) were identified during AEI's Phase I ESA. These included the potential presence of lead-based paint in soils surrounding the building foundations, the "drill field", which may have been used for weaponry or as a shooting range, concrete pad areas potentially used for firefighter training, and an incinerator. In addition, during the planning stages of this Phase II, a boiler room was noted and identified as a REC to be further investigated. Other environmental considerations included two (2) domestic water supply wells that were reportedly no longer in use. Prior to this investigation, the locations of these wells were unknown. It was also unknown if the wells were properly abandoned in accordance with local County regulations.

3.0 INVESTIGATION EFFORTS

The scope of work for this investigation focused on assessing the presence or absence of impacted subsurface conditions (i.e., soil) relative to the former historical operations. AEI's investigation efforts included a site reconnaissance and utility clearance to locate the water supply wells and to check for the presence of underground utilities around planned drilling locations, a drilling/soil sampling program, and laboratory analyses.

3.1 Pre-Field Activities

3.1.1 Health and Safety Plan

A site-specific health and safety plan was prepared, reviewed by onsite personnel, and kept onsite for the duration of the fieldwork.

3.1.2 Permitting and Utility Clearance

Based on the scope of work including only shallow soil sample collection, no drilling permit was required from San Mateo County Environmental Health Services (SMCEHS) for this investigation.

On December 17, 2015, the property was reconnoitered by AEI to attempt to locate the former water supply wells. In addition, planned boring locations were staked and marked with white paint. Upon marking the boring locations, Underground Services Alert (USA) North was contacted, who, in turn, notified subscribing utility companies in order for their underground utility locations to be marked along property boundaries and around planned boring locations.

On December 21, 2015, a limited geophysical survey and utility clearance was performed by Foresite Engineering Surveys (Foresite) of Pleasant Hill, California under subcontract to AEI. The geophysical survey was performed to support site reconnaissance efforts in locating the water supply wells. The utility clearance was performed to check for the presence of underground utilities around planned boring locations and to shift boring locations, as appropriate.

3.1.3 Review of Water Supply Well Information

During December 2015 and January 2016, SMCEHS was contacted on numerous occasions to gather more information about the former water supply wells at the subject property. To date, no

information regarding these wells has been provided by SMCEHS other than the information provided during AEI's Phase I ESA. However, one (1) of the wells appears to have been located during the investigation, as further discussed in Section 4.1.

3.2 Field Activities

3.2.1 Exploratory Borings

The drilling program for this investigation was conducted on December 22 and 23, 2015. Thirty-three exploratory borings (B-1 and B-3 through B-34) were advanced to depths between 2.0 and 9.5 feet bgs. Of these total borings, twenty-seven (27) borings were advanced to the 2.0-foot depth for the collection of soil samples at the 0.0- and 1.5-foot depths. These locations included Boring B-1, which was advanced around the former incinerator area, and Borings B-4 through B-11, B-14, B-16, and B-18 through B-34, which were advanced to the 2.0-foot depth around former concrete foundation areas and "drill field" area. The other five (5) borings were advanced to depths between 5.5 and 9.5 feet bgs with soil samples for laboratory analyses obtained at depths between 2.0 and 7.0 feet bgs. These locations included Boring B-3, which was advanced along the west side of the concrete foundation for the former boiler room, and Borings B-12, B-13, B-15, and B-17 , which were advanced to the 9.5-foot depth around the former locations of concrete pads suspected of using accelerants during firefighter training. Four attempts were made to advance Boring B-2; however, this location was abandoned due to drilling refusal encountered just below the ground surface at each attempted location. The locations of these borings are shown on Figure 3.

The borings were drilled by a State of California C-57 licensed company, Environmental Control Associates, Inc. (ECA) of Aptos, California, under subcontract to AEI. Because of difficult, heavily-vegetated, soft terrain caused by recent rainy weather, the borings were advanced with a track-mounted drilling rig equipped with direct push technology. Upon completion of drilling, the borings were backfilled with soil cuttings generated during the drilling program.

The borings were continuously sampled throughout their entire depths for the purposes of lithologic logging, field screening (headspace testing), and selection of samples for laboratory analyses. Soil samples were obtained using a single-walled coring system approximately 2.25 inches in diameter and 4 feet in length containing plastic liners. The coring system was connected to 1-inch diameter, flush-jointed drill rod that was hydraulically driven (pushed) by the rig to each target sample depth. Upon retrieval from each sample depth interval, the coring system was opened, and the liners were removed and cut for preparing samples for laboratory analyses, as well as for visual inspection and lithologic logging purposes. Recovered soil samples were examined for soil classification and described on detailed boring logs in general conformance with the Unified Soil Classification System (USCS). Headspace tests were performed with a photo-ionization detector (PID) used for detecting the presence of volatile organic compounds (VOCs) in the soil samples. Headspace tests only were conducted in soil samples obtained from Borings B-3, B-12, B-13, B-15, and B-17, which were advanced around the former locations of concrete pads used for firefighter training and the former boiler room. The boring logs are presented in Appendix A.

Soil samples selected for laboratory analyses were sealed, labeled, and entered onto chain of custody documentation for transportation to a California state-certified laboratory for analyses.

Upon collection, the ends of the plastic tubes were covered with Teflon tape and capped. The samples were labeled with the project name, project number, boring number, sample depth, and sampling date/time of sampling. After labeling, the samples were placed into a chilled ice chest for transport to the analytical laboratory.

3.3.2 Headspace Testing

Headspace testing was performed during drilling activities with a photo-ionization detector (PID) for detecting the presence of VOCs in recovered soil samples. Headspace testing was generally performed at every 2-foot interval of the recovered sample cores from Borings B-3, B-12, B-13, B-15, and B-17. To initiate the headspace testing procedure, soil samples were removed from the liners, placed into labeled, plastic bags, and sealed for conducting the tests. After sufficient time elapsed for vapor build-up inside the bags, the bags were punctured with the probe tip of the PID to allow for measurement of the headspace. Measurements of the headspace were obtained in the parts per million (ppm) range for total VOCs. During this investigation, none of the headspace test measurements exceeded ambient air background concentrations, which were generally measured at 0.0 ppm.

3.3.3 Decontamination and Investigation-Derived Wastes

Drilling and sampling equipment were cleaned prior to and after drilling each boring. The equipment also was cleaned between core intervals using a triple rinse method. The initial rinse consisted of an Alconox and water solution, followed by two (2) tap water rinses (second and final rinses). No investigation-derived wastes were generated during this investigation.

3.4 Laboratory Analyses

Soil samples were submitted McCampbell Analytical, Inc. of Pittsburg, California for laboratory analyses. Additional samples also were submitted to the analytical laboratory and initially placed on hold. Additional laboratory analyses for lead were run on soil samples obtained from the 1.5-foot depth at Borings B-7, B-20, and B-21 on the basis of the initial analytical results.

The types and numbers of soil analyses included the following:

- Lead by United States Environmental Protection Agency (EPA) Method 6010.....27 samples
- Volatile Organic Compounds (VOCs) by EPA Method 8260B.....5 samples
- Total Petroleum Hydrocarbons as gasoline (TPH-g) by EPA Method 8015M.....5 samples
- TPH as diesel (TPH-d) and motor oil (TPH-mo) by EPA Method 8015M.....2 samples
- Polychlorinated Biphenyls (PCBs) by EPA Method SW8082 .....1 sample
- Dioxans and Furans by EPA Method 1613 .....1 sample
- California Assessment Manual (CAM) 17 Metals by EPA Method 6010.....1 sample

The samples were analyzed over a standard turnaround time (TAT) except for the additional soil samples, which were analyzed over a 1-day TAT. Chain-of-custody documentation and certified analytical reports are provided in Appendix B.

4.0 FINDINGS

4.1 Water Supply Wells

During AEI's Phase I ESA, it was found that two (2) former domestic water supply wells were located on the property. To gather more information about these wells, AEI attempted to contact SMCEHS; however, no additional information regarding these wells has been provided to date.

Based upon our review of preliminary information appended to AEI's Phase I ESA report, it was noted that at least one (1) domestic well permit (Permit No. W-43-86) was issued to California School Employee Association by San Mateo County Department of Public Health & Welfare on May 28, 1986. On June 18, 1986, a well yield test was performed, which included the well depth, standing and static water levels, and time versus drawdown testing over an approximate 5-hour period of time. As shown on a Well Yield Report Information form dated June 19, 1986, the owner was identified as Farrallon Vista Association under Permit No. DRW #149554. The total depth of the well is 400 feet. Static and standing water levels were measured at depths of 168 and 35 feet bgs, respectively. No information was provided regarding the well construction details other than the recorded well depth. On July 9, 1986, water quality testing for bacteriology and chemistry purposes had been performed at this well. As described under some telephone notes dated December 19, 1990, shown on a County Septic and Well Check-Off List, it was stated that the two (2) wells were installed under one permit and that both wells "would be repaired so that the aquifers were adequately protected." In addition, on this same Check-Off List, it was stated that the "upper well has been sealed by welded steel; lower well has been sealed flush with pad with bolted steel plate."

On the basis of the information provided to date, it appears that information for only one (1) well and its approximate location, instead of two (2) wells, was shown on the well construction application. The locations of the well shown on the application appeared to be the "upper well". No information on the location of the lower well was shown on the application.

During the site reconnaissance, it is believed that the location of the "upper well" was found. It is located upslope and to the east of Boring B-1, as shown on Figure 3. The surface completion for this well consists of a rectangular-shaped concrete pad which surrounds rusted, welded steel cover. The lower well was not located during the site reconnaissance. It is unknown if either of these wells were properly abandoned (i.e., backfilled with a new cement grout using tremie methods) in accordance with local regulations.

4.2 Subsurface Conditions

The results from the drilling program show that the subject property is underlain by alluvial and residual soils primarily consisting of sandy clays and clayey sands to the depths explored. No groundwater was encountered during drilling operation. No visual or olfactory evidence (i.e., soil discoloration, odor) of impacted soils was observed in any of the recovered soil cores during drilling operations. No PID readings above background levels above 0.0 ppm were measured during headspace testing.

4.3 Soil Analytical Results

Soil analytical results are presented on Table 1. Chain-of-custody documentation and certified analytical reports are provided in Appendix B.

Analytical results for soil obtained during this investigation are as follows:

- Lead was detected at concentrations between 4.5 and 230 milligrams per kilogram (mg/kg) in surface soils at each of the borings advanced around the concrete foundation and "drill field" areas.
- No TPH-g or VOCs were detected at concentrations at or above the laboratory reporting limits in any of the soil samples obtained from borings advanced around concrete pad areas used for firefighting purposes.
- TPH-d was detected at a concentration of 1.3 mg/kg at the 2.0-foot depth in Boring B-3, located around the former boiler room. No TPH-d was detected at a concentration at or above the laboratory reporting limit at the 5.0-foot depth in Boring B-3. No TPH-mo was detected at concentrations at or above the laboratory reporting limits in Boring B-3.
- Metals, including arsenic, barium, chromium, cobalt, copper, molybdenum, nickel, vanadium, and zinc, were detected at concentrations between 1.0 and 44 mg/kg at the 1.5-foot depth in Boring B-1, which is located around the former incinerator. No other metals were detected at concentrations at or above the laboratory reporting limits at that location.
- Total hexafurans were detected at a concentration of 2.78 picograms per gram (which is equivalent to 2.78 x 10^{-6} mg/kg) at the 1.5-foot depth in Boring B-1. No other dioxins/furans were detected at concentrations at or above the laboratory reporting limits.
- No PCBs were detected at concentrations at or above the laboratory reporting limits in any of the soil sample obtained from the one boring advanced around the area of the former incinerator.

For the purpose of providing context to the data obtained during this investigation, analytical results for soil were compared to established regulatory screening levels, including California Regional Water Quality Control Board (RWQCB), San Francisco Bay Region, Environmental Screening Levels (RWQCB ESLs) for residential land use for shallow soils (less than approximately 10 feet deep) assuming groundwater is a current or potential drinking water resource and USEPA Regional Screening Levels (RSLs) for resident soils. Of the chemical constituents analyzed, lead was found to exceed its RWQCB ESL within surface soils (0.0-foot depth) only at two (2) locations (Borings B-7 and B-21) adjacent to concrete foundation area. Subsequent analytical results for soils at the 1.5-foot depths at Borings B-7 and B-21 showed lead concentrations at one to two orders of magnitude below the RWQCB ESL. Arsenic was detected at a concentration slightly above its RWQCB ESL and USEPA RSL at the 1.5-foot depth in Boring B-1, located around the former incinerator area.

In summary, none of the detected chemical constituents in soil, including TPH-d and other metals, were found to exceed their respective RWQCB ESLs and USEPA RSLs. With respect to the low concentration of the total hexafurans, no regulatory screening levels are established for this constituent.

5.0 CONCLUSIONS AND RECOMMENDATIONS

AEI has completed a Phase II investigation at the subject property. The purpose of the Phase II at the subject property was to assess whether release(s) have occurred into the subsurface relative to the environmental concerns identified at the subject property. Thirty-three (33) exploratory soil borings were advanced the collection and analyses of soil samples during this investigation. Select samples were analyzed for one or more of the following: Lead, TPHs, VOCs, PCBs, CAM Metals, and Dioxins/Furans.

Detected concentrations of the various chemical constituents in soil were compared with their respective RWQCB ESLs and USEPA RSLs for those regulatory screening levels already established. None of the detected chemical constituents were found to exceed their respective RWQCB ESLs and USEPA RSLs except for lead detected within surface soils at two locations and arsenic detected at the 1.5-foot depth at one location. Additional laboratory analyses were run on soil samples obtained from the 1.5-foot depth to assess the vertical extent of lead-impacted soils at these two locations. Analytical results for the soil samples at the 1.5-foot depth showed lead concentrations below the RWQCB ESL and USEPA RSL. With respect to the presence of arsenic at the one location, its detected concentration is representative of naturally-occurring background conditions, which is within the range of arsenic concentrations found in soils within the San Francisco Bay Area (Bradford, et.al.).

Analytical results generated during this investigation suggest that the lead detected in soils may have originated from lead-based paint on former building exteriors. Furthermore, analytical results also suggest that lead concentrations, where elevated, are localized and appear to be restricted to surface soils at the two (2) identified locations. The vertical extent of lead-impacted soils at these two locations has been delineated on the basis of the lead concentrations not exceeding their RWQCB ESLs. The horizontal extent of lead-impacted soils at these two locations is undefined.

On the basis of the information, presented above, AEI recommends that a limited soil sampling program be performed to further assess the horizontal extent of lead-impacted surface soils around the two identified locations. AEI also recommends that the steel cover for the “upper well” be removed an experienced water well driller under subcontract to AEI to measure the well depth, as well as whether the well has been properly abandoned in accordance with County regulations.

7.0 REPORT LIMITATIONS AND RELIANCE

This report presents a summary of work completed by AEI Consultants. The completed work includes observations and descriptions of site conditions encountered. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide the requested information, subject to scope of work for which AEI was retained and limitations inherent in this type of work, but it cannot be assumed that they are representative of areas not sampled. This report should not be regarded as a guarantee that no further contamination beyond that which could have been detected within the scope of this investigation is present beneath the subject property. Undocumented, unauthorized releases of hazardous material, the remains of which are not readily identifiable by visual inspection and are of different chemical constituents, are difficult and often impossible to detect within the scope of a chemical specific investigation.

Any conclusions and/or recommendations are based on these analyses and observations, and the governing regulations. Conclusions beyond those stated and reported herein should not be inferred from this document. These services were performed in accordance with generally accepted practices, in the environmental engineering and construction field, which existed at the time and location of the work. No other warranty, either expressed or implied, has been made.

This investigation was prepared for the sole use and benefit of MidPen Housing Corporation. All reports, both verbal and written, whether in draft or final, are for the benefit of Seagate Properties, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors or assigns. Reliance is provided in accordance with AEI's Proposal and Standard Terms & Conditions executed by MidPen Housing Corporation. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

If there are any questions regarding our investigation, please do not hesitate to contact AEI at (408) 559-7600.

Sincerely,
AEI Consultants

APPENDIX B

LABORATORY ANALYTICAL REPORTS

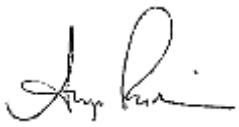
County Review Draft

McCampbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 1512A77



Report Created for: AEI Consultants

3880 S. Bascom Ave, Suite 109
San Jose, CA 95124

Project Contact: Tim Bodkin
Project P.O.:
Project Name: 350428; Carlos & Sierra Streets, Moss Beach, CA

Project Received: 12/28/2015

Analytical Report reviewed & approved for release on 01/11/2016 by:

Angela Rydelius,
Laboratory Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

S	spike recovery outside accepted recovery limits
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

**MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate $250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Carlos & Sierra Streets, Moss Beach, CA
WorkOrder: 1512A77

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

S	spike recovery outside accepted recovery limits
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Subject: **Site Management Plan**
Carlos Street at Sierra Street
Moss Beach, San Mateo County, California 94038
AEI Project No. 350428

Dear Ms. Liu:

AEI Consultants (AEI) is pleased to provide this Site Management Plan (SMP) for the property located at Carlos and Sierra Streets in Moss Beach, California ("the Site"). The location of the Site is shown on Figure 1. The SMP has been prepared in accordance with AEI proposal dated November 19, 2015 (AEI Proposal No. 44236). The SMP has been developed to address worker protection and environmental concerns during construction activities at the Site.

This SMP applies to subsurface disturbances at the Site related to the planned redevelopment activities. The purpose of this SMP is to assess and communicate the presence of contaminants of potential concern (COPCs) that are known or may be present, but unknown at this time, within Site soils and groundwater so that, if necessary, appropriate safety measures can be implemented to protect persons doing invasive work. The only current known COPC includes one metal (lead), which was identified in surface soils, as discussed below. This SMP also provides for the proper management of other unknown environmental conditions that may be identified during redevelopment activities at the Site.

This SMP is not intended to replace Federal, State, or local regulations dictating the handling of contaminated media or regulations addressing worker exposure including Federal and California Occupational Safety and Health Administration (OSHA) training and worker protection rules and regulations, Code of Federal Regulations (CFR) Title 29, Part 1910.120 and California Code of Regulations (CCR) Title 8, § 5192.

This SMP includes the following components:

1. A description of the Site and conceptual project activities;
2. A summary of known and potential environmental conditions;

3. Provisions for an updated Health and Safety Plan (HASP), as well as provisions for odor, storm water, noise, and dust control plans;
4. Guidelines for managing and sampling impacted or potentially-impacted soil and groundwater that may be encountered (contingency plan);
5. Notifications and documentation.

1.0 SITE DESCRIPTION AND BACKGROUND

The subject property comprises approximately 10.4 acres of vacant land, located north-northeast of the intersection between Carlos Street and Sierra Street in Moss Beach, an unincorporated community within San Mateo County, California. As shown on Figure 2, the property is bounded by residential properties along 16th Street (in Montara), and vacant land to the north, residential properties along Carlos, Sierra, and Stetson Streets to the south, residential properties along Lincoln and Buena Vista Street to the east, and one residential property and vacant land along Carlos Street to the west. Numerous concrete slab-on-grade building foundations, along with foundation retaining walls exhibiting scattered areas of graffiti, are present within the western and southwestern portions of the property. In some areas, building foundations and retaining walls are covered by thick vegetation consisting of trees and shrubs. Heavy vegetation also covers the majority of the property outside the areas of the building foundations. Unpaved roadways extend northwest-southeast across the north and central portions of the property.

As shown on an Old Republic Title Company Preliminary Title Report Map dated October 8, 2015, easements for Montara Water and Sanitary District (MWSD) and Pacific Gas and Electric (PG&E) utilities extend along the unpaved roadways within the property. MWSD infrastructure consisting of water storage tanks, a booster pumping system, and distribution facilities are located within a small, fenced-in parcel of land (known as Schoolhouse) adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the property. Another MWSD easement also extends southward form this fenced-in parcel to Sierra Street.

Topographically, the property generally slopes to the west-southwest with the exception of a steeply inclined, north-facing slope along the northern property boundary. Localized, relatively flat areas or topographic benches are present near the west and southwest boundaries of the property, as well as adjacent to Lincoln Street along the northeast corner of the property. Surface elevations at the property generally range between approximately 100 and 200 feet above mean sea level. The closest surface water body includes an unnamed, east-west trending, ephemeral drainage which parallels 16th Street to the north of the property.

Based on our review of a United States Geological Survey (USGS) Open File Report 98-137 Map entitled *Geology of the Onshore Part of San Mateo County, California* (Brabb, et.al., 1998), the subject property is situated upon a marine terrace underlain by Quaternary-aged alluvial deposits, along with thin, scattered veneers of residual soils. These units are further underlain by Montara Mountain granitic bedrock of Cenozoic age. Artificial fill consisting of soils, construction debris, wood debris, and other miscellaneous materials are scattered throughout the entire property.

The current estimated depth to groundwater beneath the property is unknown at this time. Well yield report information associated with a domestic water supply well installed on the property in 1986 showed a static water level of 168 feet below ground surface (bgs). Based on the local site topography, the direction of groundwater flow is inferred to generally flow to the west-southwest, except for a northerly flow direction inferred along the north property boundary into the drainage adjacent to 16th Street. .

In October and November 2015, AEI performed a Phase I Environmental Site Assessment (ESA) at the Site. Phase I ESA findings were presented in a report dated November 10, 2015 (AEI Project Number 350428). As described in AEI's Phase I ESA report, historical sources indicated that the Site was part of a large World War II training area circa 1945. Numerous military buildings had been present on the subject property, as shown on a drawing entitled *Map of Anti-Aircraft Training Center, Point Montara, California, Twelfth Naval District, Showing Conditions on June 30, 1945*, which was presented in Appendix F of AEI's Phase I ESA report. These military buildings included barracks, offices, a mess hall, a library, a garage, a boiler room, an incinerator, a "TDD hanger", and a "drill field". After the war was over, the mess hall building was converted into a grammar school, and was later abandoned after a new school site was built (date unknown). By the late 1960s, the property was then used as a training ground for firefighters. During such firefighter training, AEI assumed that accelerants, such as those containing gasoline, may have been used along concrete pad surfaces. Burned materials from the firefighter training potentially may have been washed off the pads and into surrounding, unpaved areas. Between approximately 1968 and 1970, a controlled burn occurred, which resulted in the burning of several remaining buildings, leaving only exposed concrete foundations. Since at least 1970, the property has been vacant with the exception of the scattered, older building foundations, as well as the fenced area containing MWSD infrastructure used to support current water storage and distribution operations.

Several recognized environmental conditions (RECs) were identified during the course of the Phase I ESA. These included 1) the potential presence of lead-based paint in soils around building foundations, 2) the "drill field", which may have been used for weaponry or as a shooting range, 3) concrete pad areas potentially used for firefighter training, and 4) an incinerator likely used for burning wastes. During the planning stages of the Phase II investigation, a boiler room also was identified as a REC to be further investigated. Other environmental considerations noted during the Phase I ESA included two (2) former domestic water supply wells that were reportedly no longer in use. The locations of these wells were unknown. It was also unknown if the wells were properly abandoned in accordance with local County regulations.

In December of 2015, AEI performed a limited Phase II subsurface investigation at the Site. The results of this investigation were presented in AEI's report dated February 15, 2016. The purpose of the investigation was to assess whether or not release(s) had occurred into the subsurface that resulted from historic Site operations. Thirty-three (33) exploratory soil borings were advanced during the investigation. Soil samples were obtained for various laboratory analyses, including lead, total petroleum hydrocarbons (TPHs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), California Assessment Manual (CAM) 17 Metals, and Dioxins/Furans.

Analytical results showed the presence of lead and other metals in surface soils across the Site. A low concentration of TPH quantified as diesel (TPH-d) was detected in shallow soils around the location of the former boiler room. A low concentration of total hexafurans was detected in shallow soils around the area of the former incinerator. No TPH quantified as gasoline (TPH-g) or motor oil (TPH-mo), VOCs, or PCBs were detected in soils at concentrations at or above the laboratory reporting limits during the investigation. Analytical results for soils are presented in Table 1.

Detected concentrations of the various chemical constituents in soil were compared with their respective screening levels, including California Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) and United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs). None of the detected chemical constituents were found to exceed their respective screening levels, except for lead in surface soils at two (2) locations and arsenic at the 1.5-foot depth at one (1) location. Additional laboratory analyses for lead were run on soil samples from the 1.5-foot depth at the two (2) locations to assess the vertical extent of lead-impacted soils Analytical results for lead in soils at the 1.5-foot depth showed concentrations below established screening levels. The detected concentration of arsenic at the one (1) location was found to be representative of naturally-occurring background conditions, which is within the range of arsenic concentrations in soils within the San Francisco Bay Area.

Analytical results generated during this investigation suggest that the lead concentrations in soils at the two (2) locations may have originated from lead-based paint associated with former building exteriors. Furthermore, analytical results also suggest that lead concentrations at the two (2) locations are somewhat localized and appear to be restricted to surface soils. Analytical results show that the vertical extent of lead-impacted soils has been delineated at these two (2) locations. However, the horizontal extent of lead-impacted soils at these two locations is undefined Further delineation of shallow lead-impacted soils was recommended and will be investigated during the Second Quarter of 2016 in accordance with MidPen Housing Corporation's request.

2.0 SMP BACKGROUND

2.1 PLANNED DEVELOPMENT

Conceptual development plans include the demolition and removal of existing building foundations, retaining walls, and miscellaneous construction debris and garbage scattered across the Site. ____ ( ) will be constructed for residential land use. Proposed excavation depths will be approximately ___ feet bgs.

2.2 CONTAMINANTS OF POTENTIAL CONCERN

Based upon the results from the Phase II investigation, lead was identified as a contaminant of potential concern (COPC) at the Site. Concentrations of this constituent were detected in surface soils at two (2) locations (B-7 and B-21). Detected concentrations I surface soils were found to exceed the RWQCB ESL for direct exposure under a residential direct exposure scenario, but below construction/trench work exposure scenario. If excavated and transported

offsite for disposal, these surface soils will require further characterization and waste profiling to determine appropriate disposal requirements.

2.3 SUBSURFACE CONDITIONS

The results from the Phase II drilling program show that the subject property is underlain by alluvial and residual soils primarily consisting of sandy clays and clayey sands to the depths explored. No groundwater was encountered during drilling operations. No visual or olfactory evidence (i.e., soil discoloration, odor) of impacted soils was observed in any of the recovered soil cores during drilling operations. No photo-ionization (PID) readings for assessing the presence of VOCs in soils above background levels were noted during headspace testing.

3.0 SITE MITIGATION PLAN

3.1 SMP APPLICABILITY

This SMP presents protocol for the following construction activities that may encounter the COPC, including the following:

- Removal of building pads and slab-on-grade foundations;
- Removal of below grade features, such as footings, deeper building foundations, utilities, and other underground features;
- Mass excavation; and
- Construction dewatering, if needed.

Contractors and their subcontractors shall follow the protocols presented in this SMP while performing the aforementioned onsite activities. Contractors and their subcontractors are responsible for the health and safety of their employees, and are required to prepare their own Site-specific HASPs.

3.2 ENVIRONMENTAL RISK MANAGEMENT

This section presents risk management procedures to be followed during the above described construction activities during Site development, including worker training and impact mitigation measures.

3.2.1 Pre-Construction Planning and Notification

Prior to the start of any construction activity that involves below ground work (e.g., slab removal or excavating), a copy of this SMP will be provided to the contractors for their review. In addition, AEI recommends that each contractor provide such information to its subcontractors.

3.2.2 Site-Specific Health and Safety Worker Requirements

A Site-specific health and safety plan (HASP) for the development project will be prepared by the General Contractor. As previously mentioned, the Contractor and subcontractors shall be responsible for the health and safety of their own workers, as required by Cal-OSHA, including but not limited to preparation of their own HASP and Injury and Illness Prevention Plan (IIPP). The purpose of these two (2) documents is to provide general guidance relating to the work

hazards that may be encountered during each phase of Site construction activities. The Contractor and subcontractors are also required to determine the requirements for worker training, based on the level of expected contact to potentially impacted soil and/or groundwater, if any, associated with the Contractor's activities and locations with respect to the COPC described in Section 2.2. The HASP(s) will contain provisions for limiting and monitoring chemical exposure to construction workers, chemical and non-chemical hazards, emergency procedures, and standard safety protocols.

As required by the appropriate regulatory agency, the General Contractor will submit the HASP at least two weeks prior to beginning construction field work. HASPs will be updated as the project proceeds if unforeseen conditions are identified and necessitate modification(s).

3.2.3 Construction Impact Mitigation Measures

During construction activities, measures will be taken by the Contractor and subcontractors to minimize dust generation, appropriately manage storm water runoff, minimize tracking of soil off-site, and minimize other construction related impacts. The construction impact mitigation measures are described below.

3.2.3.1 Site Control

Site control procedures will be implemented by the contractor to control the flow of personnel, vehicles, and materials in and out of the Site while working with potentially contaminated materials. In addition, Site control measures will help control the spread of the COPC from the Site. The Site perimeter will be fenced by the contractor. Access and egress will be controlled at selected locations. Signs will be posted at each Site entrance by the Contractor, instructing visitors to sign in at the project support area.

3.2.3.2 Equipment Decontamination

Decontamination procedures will be established and implemented by the Contractor to reduce the potential for construction equipment and vehicles to transfer potentially impacted soil onto public roadways or other off-site areas. At a minimum, gravel will be placed at all Site access points by the Contractor and excess soil will be removed from construction equipment using dry methods (e.g., brushing or scraping) prior to moving the equipment to off-Site locations.

3.2.3.3 Personal Protective Equipment

Appropriate Personal Protective Equipment (PPE) will be used to isolate workers from the COPC and physical hazards. The minimum level of protection for workers coming into direct contact with potentially contaminated materials is OSHA Level D PPE, listed below. The level of PPE will be evaluated by the Contractor on a continuing basis and modified, if warranted, based upon conditions encountered at the Site and/or type of work activity in accordance with their own HASP (see Section 3.2.2). The minimum PPE to be utilized during construction activities includes the following:

- Coveralls or similar construction work clothing;
- Reflective safety vests;

- Steel-toed boots;
- Hard hat;
- Work gloves, as necessary;
- Safety glasses, as necessary; and
- Hearing protection, as necessary.

3.2.3.4 Dust Control

All demolition and construction activities that have the potential to create dust must comply with specified dust control measures whether or not the activity requires a County-issued permit. Therefore, the following actions are required to adequately address dust control:

- Construction areas will be watered down at a sufficient frequency to eliminate visible dust. Additional watering may be required whenever the wind speed exceeds 15 miles per hour. Watering should be performed in a manner such that runoff will not be produced at any time.
- At the end of each work day, all streets, sidewalks, paths, and intersections, where work has occurred, will be swept or vacuumed to remove visible soil(s).
- All inactive soil piles expected to remain in-place for more than seven (7) days will be covered with plastic sheeting or an equivalent tarp and properly secured to avoid wind damage.
- Signage will be placed along Lincoln, Sierra, Carlos, and Stetson Streets to inform surrounding community members of the hotline phone number(s) to call and report visible dust problems.
- If proposed dust suppression efforts are unsuccessful, other measures will be implemented to help control dust, such as wind breaks and/or dust curtains along street frontages, pending final resolution of necessary dust suppression efforts.
- Materials contained in all loading trucks or metal bins carrying excavated materials will be maintained below the sides and back of the truck or metal bin, and will be properly covered to avoid dust generation and drying of soils during transport. Excavated materials may be moistened prior to transport.
- Drop heights will be minimized while loading and unloading soil.
- Truck tires will be brushed prior to leaving the Site, and truck loading areas will be routinely swept and cleaned to avoid creating visible dust. Soil handling activities will be halted when the wind speed exceeds 25 miles per hour and visible dust is being created that cannot be mitigated by soil moistening.

3.2.3.5 Storm Water Control Plan

A storm water control plan will be prepared by the General Contractor and submitted to the County of San Mateo prior to beginning construction activities. The General Contractor and subcontractors shall comply with the provisions and protocols of the Storm Water Control Plan. As part of the plan, sediment and erosion control procedures may include, but are not limited to the following:

- Constructing temporary berms or erecting silt fences around exposed soils;
- Placing straw bale barriers or sediment traps around catch basins or other entrances to storm drains;
- Covering soil stockpiles with plastic sheeting or tarps during rainfall events; and
- Implementing other appropriate best management practices (BMPs), especially, for sediment and erosion control, as identified in the Storm Water Control Plan.

3.2.3.6 Odor and Noise Controls

Odor and Noise Control Plans will be prepared by the General Contractor and submitted to the County of San Mateo prior to beginning construction activities. These plans will be prepared in accordance with applicable regulations and address the work practices required for the project.

3.3 GROUNDWATER MANAGEMENT PROTOCOLS

No groundwater is anticipated to be encountered during the proposed Site redevelopment activities. However, if groundwater is encountered during excavation activities or water resulting from rainfall occurs and fills excavation areas, if any, then appropriate mitigation measures will be implemented as follows:

3.3.1 Excavation Dewatering

AEI does not anticipate that installation of a dewatering system will be required. However, if groundwater is encountered or accumulates in any excavation(s) due to rainwater, such water will be handled in accordance with the following protocol.

- For relatively small volumes of water, a temporary storage tank (frac tank) will be utilized to hold such groundwater on a short-term basis while testing and disposal is arranged.
- If conditions require installation of a dewatering system or larger volume of groundwater requires handling, proper permits will be obtained and permit conditions followed for discharge into the nearby existing sanitary sewer or storm water system.

3.4 SOIL MANAGEMENT PROTOCOLS AND CONTINGENCY PLAN

The soils management program is designed to ensure proper handling and disposition of soils from an environmental perspective and includes the following components:

- A protocol for screening and monitoring for environmental conditions identified during demolition and excavation work;
- A protocol for properly managing the handling and disposal of impacted soils; and
- A criteria for import fill soils, if needed.

3.4.1 Soil Monitoring and Screening

Soil may be field-screened by the Environmental Consultant in areas of potential environmental impact during demolition and excavation work on an as-needed basis to assess whether metals specifically, lead, in soils may be present. At this time, field screening is not anticipated; however, the Environmental Consultant will be notified if any of the following are encountered:

- Discovery and removal of previously unidentified features of concern, such as underground storage tanks (USTs), sumps, clarifiers, former water supply wells or similar features of potential environmental concern. However, based on the Site background, it is not anticipated that any of the aforementioned features will be encountered during construction activities except for the former water supply wells.
- Areas of suspected contaminated soils as deemed appropriate by the Environmental Consultant or as reported by the contractor.

The Environmental Consultant will be notified by the Contractor of the discovery of the above conditions and will be on-site to perform screening and possible sample collection as discussed below. The Contractor is responsible for notification to the Owner and Environmental Consultant of suspected impacted soils or possible conditions of environmental concern.

If a UST or other features are discovered, work will be suspended in its immediate vicinity, and the Owner and Environmental Consultant will be notified. San Mateo County Department of Environmental Health (SMCDEH) will then be notified of the proposed response actions. Should a UST be encountered, it shall be addressed under permit with the SMCDEH. In addition, SMCDEH will be provided copies of the required reports.

Prior to any significant construction that will result in excavation within impacted soil areas, AEI should be contacted to assess the work area(s). Depending upon the nature of the work, AEI may conduct soil sampling before the start of construction to test for potentially elevated concentrations of lead. AEI also may use a portable, x-ray fluorescence (XRF) analyzer to field screen work area(s) during construction. Work area soils also may be monitored based upon visual observations.

Soils with lead concentrations exceeding applicable regulatory screening levels or other California thresholds may be segregated for further characterization and laboratory analyses. Laboratory analytical results will be used for waste profiling purposes and to determine proper disposal requirements.

3.4.2 Management of Impacted Soil

Based on the analytical results during the Phase II investigation, soil excavated at the Site may require further assessment prior to its acceptance by a receiving facility. Such additional investigation and analysis will be coordinated by the Contractor, or Contractor's representative

with AEI's technical support for potential disposal facilities to ensure that the soils are properly characterized, segregated, and transported from the Site. Such analyses may include the testing of soil samples at additional locations and depths to delineate the lateral and vertical extent of impact(s) and assess waste disposal characteristics, such as Soluble Threshold Leaching Concentrations (STLCs), Toxic Characteristic Leaching Procedures (TCLPs), and other waste classification analyses, as required. Prior to transportation of impacted soils from the Site, a waste profile acceptance will be obtained by the Contractor and/or subcontractors, along with pre-printed, signed manifests provided to the transporter.

During construction activities and based on the procedures outlined in Section 3.4.1, if soil is encountered that is suspected of being contaminated, or if buried structures, such as clarifiers, tanks, debris or un-abandoned wells are encountered, earthwork in these suspect area(s) will be stopped and worker access to the suspect area(s) will be restricted. Areas will be cordoned off using delineators and caution tape, or similar materials provided by the Contractor, followed by notifying the Environmental Consultant. Soils suspected as being contaminated will then be evaluated through screening and/or analytical testing performed by the Environmental Consultant so that appropriate handling and disposal alternatives can be determined.

Site development activities may result in a net export of soil. Such soil shall be properly characterized in accordance with applicable regulations prior to transportation from the Site.

If on-site re-use of potentially contaminated soil is desired, soil samples shall be collected from such soil and analyzed for the COPC. If the COPC is detected, whether above or below regulatory agency screening levels, further investigation of such soils may be performed as determined by the Owner in coordination with the Environmental Consultant. For soils considered for re-use, if the COPC is detected below the applicable ESL, re-use of the soil may be deemed appropriate, at the discretion of the Owner. If the COPC is detected above the applicable ESL and soils are being considered for reuse on-Site, the results and conditions will be communicated to the SMCDEH for concurrence. Otherwise, impacted soils will be profiled for proper disposal at landfill facilities under appropriate waste manifests. Prior to off-site disposal, additional soil samples may be collected and analyzed in accordance with the requirements of disposal facility(s).

Soil suspected of being contaminated during excavation, shall be stockpiled or otherwise segregated from "clean" soil. Such soil shall be stockpiled on-site on top of and covered by an "impermeable" liner (e.g., 6 mil plastic sheeting) or other appropriate materials to reduce infiltration by rainwater and contamination of underlying soil while its disposition is being determined. Any such stockpiles shall be checked daily by the Contractor to verify that they are adequately covered.

3.4.3 Management of Mass Excavation Surplus Soil

In addition to the procedures outlined above for impacted or potentially-impacted soils, surplus soils generated during grading activities will be profiled for acceptance at appropriate facilities. Criteria for acceptance (e.g., concentrations of specific contaminants, odors, additional analytical testing, etc.) will be determined by the acceptance facility(s) as part of the acceptance process.

Transporter information and disposal location(s) for soils have not yet been finalized. The names and applicable license information of such operators will be provided to the SMCDEH once confirmed.

3.4.4 Import Fill

The Environmental Consultant and Geotechnical Engineer will be notified prior to importing fill soils onto the Site. An evaluation of import fill materials will be conducted to ensure such fill meets the geotechnical and environmental requirements for the proposed redevelopment activities. To minimize the potential introduction of contaminated fill onto the Site, AEI recommends that all selected sources of import fill have adequate documentation or certification to verify that the fill source is appropriate for the Site. Documentation should include detailed information on previous land use of the fill source, any Phase I Environmental Site Assessments performed and findings, and the results of any analytical testing performed. If no documentation is available or the documentation is inadequate or if no analytical testing has been performed, AEI recommends that samples of the potential fill material be collected and analyzed prior to delivery of such soil to the Site. The analyses selected should be based on the fill source(s) and knowledge of the previous land use, as determined by the Environmental Consultant. AEI recommends that the sample frequency for potential fill material be conducted in accordance with that outlined in the technical document entitled "*Information Advisory on Clean Imported Fill Material*" (Department of Toxic Substances Control, October 2001). The Environmental Consultant will provide guidance to the Contractor regarding acceptability of imported fill. No fill material will be accepted if contaminant levels exceed current residential environmental screening goals and/or regional background concentrations.

4.0 NOTIFICATION AND DOCUMENTATION

4.1 NOTIFICATIONS

Notifications of the discovery of the COPC in field screening, observations, or analytical results or other conditions of potential environmental concern shall be immediately made to the Owner, Contractor, and Environmental Consultant. If analytical testing shows that the COPC is above its applicable screening level, the Owner and contractor will then be notified. The discovery of any subsurface features will also be reported to the Environmental Consultant, followed by notifying SMCDEH. If such discovery or conditions require notification to another Contractor or subcontractors, then such notification will be made by the Contractor.

4.2 KEY CONTACTS

Company	Role	Contact	Telephone Number
Jennifer Liu	Owner	MidPen Housing Corporation	510-426-5672 (o)
TBD	General Contractor	TBD	TBD
AEI Consultants	Environmental Consultant	Adrian Angel Tim Bodkin	408-559-7600 (o) 831-331-3547 (c) 408-559-7600 (o) 650-622-6560 (c)

(o) office phone number; (c) cell phone number

4.3 DOCUMENTATION

The Environmental Consultant will prepare a report upon completion of excavation and earthwork performed in accordance with the SMP. The report will include a Site map showing areas of excavation and import fill, sample locations, and tables summarizing data. The report also will include appendices with copies of permits, including any dewatering permits, manifests or bills of lading for removed soil and/or groundwater, and laboratory reports for soil and water profiling not previously submitted. The certified final project report will be prepared for the Owner.

6.0 LIMITATIONS

Contractors and subcontractors are responsible for review of this SMP prior to commencing work at the Site and for the health and safety of their own employees and subcontractors. The Owner is responsible for review of the provisions of this SMP and for incorporating its guidelines into their project planning and specifications. This document was prepared for the use and benefit of Midpen Housing Corporation, as well as for their Contractor, subcontractors, and consultants at the Site. Where information prepared by others has been provided, AEI cannot be responsible for its accuracy or completeness or for the availability of all information that may be relevant to the preparation of this document.

This report presents a summary of work completed by AEI Consultants. The completed work includes observations and descriptions of site conditions encountered. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide the requested information, subject to scope of work for which AEI was retained and limitations inherent in this type of work, but it cannot be assumed that they are representative of areas not sampled. This report should not be regarded as a guarantee that no further contamination beyond that which could have been detected within the scope of this investigation is present beneath the subject property. Undocumented, unauthorized releases of hazardous material(s), the remains of which are not readily identifiable by visual inspection and are of different chemical constituents, are difficult and often impossible to detect within the scope of a chemical-specific investigation.

Re: Additional Subsurface Investigation & Water Well Evaluation
Project Number 350428
Cypress Point
Carlos Street and Sierra Street
Moss Beach, San Mateo County, California 94038

Dear Mr. Bielak:

This report presents the results of the Additional Subsurface Investigation conducted by AEI Consultants (AEI) for the Cypress Point development project, located to the north of the intersection of Carlos Street and Sierra Street in Moss Beach, San Mateo County, California (the "Site"). This report has been prepared based on the conclusions and recommendations presented in AEI's *Limited Phase II Subsurface Investigation Report* dated February 15, 2016, as well as in accordance with AEI's proposal dated May 11, 2017 (AEI Proposal No. 52158).

During AEI's *Limited Phase II Subsurface Investigation*, thirty-four (34) exploratory borings (B-1 through B-34) were advanced at the Site. Soil samples obtained at the borings were analyzed for the presence of total petroleum hydrocarbons as gasoline (TPH-g), as diesel (TPH-d), and as motor oil (TPH-mo), as well as for polychlorinated biphenyls (PCBs), metals, total hexafurans, and other dioxins/furans (at few boring locations). Analytical results for soils showed concentrations of lead exceeding applicable San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for any land use/any depth (for construction workers) and residential land use at the 0.0-foot depth at two (2) boring locations (B-7 and B-21). The horizontal extent of lead-impacted soils around these two (2) locations was undefined. The vertical extent of lead-impacted soils at these locations had been delineated based on lead concentrations not exceeding applicable RWQCB ESLs. The locations of the exploratory borings are shown on Figure 1.

An existing water supply well (upper well) also had been identified at the Site during the *Limited Phase II Subsurface Investigation*. The surface completion for this well was found to consist of a rusted, welded steel plate covering the top of the well casing that is encased within a rectangular-shaped, concrete pad. At the time of the Limited Phase II Subsurface Investigation, it was unknown if the well had been properly abandoned in accordance with San Mateo County Environmental Health (SMCEH) regulations.

The purpose of this investigation was to assess the horizontal extent of lead-impacted soils around Borings B-7 and B-21 that were found to exceed applicable RWQCB ESLs. The scope of work included a limited drilling/confirmation sampling program and further inspection and evaluation of the existing water supply well for future abandonment purposes. Information regarding the methodology and results of the investigation is provided in the following sections of this report.

1.0 HEALTH AND SAFETY PLAN

The Site-specific health and safety plan for this project was updated, reviewed by onsite personnel, and kept onsite for the duration of the fieldwork

2.0 PERMITTING AND UNDERGROUND SERVICES ALERT NOTIFICATION

No drilling permit was required from SMCEH for this investigation.

Prior to conducting the drilling program, the planned boring locations were staked and marked with white paint. Upon marking the boring locations, Underground Services Alert (USA) North was contacted, who, in turn, notified subscribing utility companies for their underground utility locations to be marked along property boundaries and around planned boring locations.
February 20, 2018

3.0 FIELD ACTIVITIES

3.1 Exploratory Borings

The drilling program for this investigation was conducted on September 22, 2017. Six (6) exploratory borings (CS-1 through CS-6) were advanced to the 2.0-foot depth using a hand-auger. Borings CS-1 through CS-3 were positioned around existing Boring B-7. Borings CS-4 through CS-6 were positioned around existing Boring B-21. Upon completion of drilling, the borings were backfilled with soil cuttings generated during the drilling program. The locations of these borings are shown on Figure 2.

The borings were continuously sampled throughout their entire depths for the purposes of lithologic logging and selection of soil samples for laboratory analyses. Soil samples were obtained using a hand-driven, slide hammer that contained a core barrel lined with a 2-inch diameter by 6-inch long stainless-steel tube for each sample drive. Soil samples were obtained at the 0.0- and 1.5-foot depths at each boring. Upon retrieval from each sample depth interval, each liner was removed and prepared for laboratory analyses, as well as visually inspected for lithologic logging purposes. Recovered soil samples were examined for soil classification and described on detailed boring logs in general conformance with the Unified Soil Classification System (USCS). The boring logs are presented in Appendix A.

Soil samples selected for laboratory analyses were sealed, labeled, and entered onto chain of custody documentation for transportation to a California state-certified laboratory for analyses. Upon collection, the ends of the sample tubes were covered with Teflon tape and capped. The samples were labeled with the project name, project number, boring number, sample depth, and sampling date/time of sampling. After labeling, the samples were placed into a chilled ice chest containing crushed ice for transport to the analytical laboratory.

3.2 Existing Water Well Evaluation

On October 2, 2017, the existing water well (upper well) was inspected by Wilkinson Well and Pump of Half Moon Bay, California. During their inspection, it was found that the top of the well was covered with tree branches and debris and the well cover had been removed. The driller attempted to obtain a depth-to-water measurement in the well, but could not do so because of blockage present at the 13.3-foot depth. The vertical extent of the blockage below this depth could not be assessed. The driller observed a section of broken or cracked well casing at the 5-foot depth. The driller also noted that the well was constructed with steel casing and contained an inner liner consisting of polyvinyl chloride (PVC) casing. The diameter of the PVC casing was approximately 5 inches. The depths of the outer steel casing and inner PVC casing could not be determined. The total depth of the well also could not be determined.

4.0 LABORATORY ANALYSES

Soil samples obtained during the drilling program were submitted to McCampbell Analytical, Inc. of Pittsburg, California for laboratory analyses. Samples from the 0.0-foot depth were analyzed for the presence of lead using United States Environmental Protection Agency (USEPA) Method 6010. Additional samples from the 1.5-foot depth also were submitted to the analytical laboratory, and placed on hold. The samples were analyzed over a standard turnaround time (TAT). Chain-of-custody documentation and the certified analytical report are provided in Appendix B.

5.0 FINDINGS

5.1 Subsurface Conditions

The results from the drilling program show that the Site is underlain by residual soils primarily consisting of clayey and silty sands. These soils were similar to those soils encountered during AEI's previous investigation. No groundwater was encountered during drilling activities. No visual or olfactory evidence (i.e., soil discoloration, odor) of impacted soils was observed in any of the recovered soil cores during drilling operations.

5.2 Analytical Results

Soil analytical results, along with the analytical results from the previous investigation, are presented on Table 1. As previously mentioned, chain-of-custody documentation and the certified analytical report are provided in Appendix B.

Lead was detected in each of the soil samples analyzed from the 0.0-foot depth in Borings CS-1 through CS-6. Detected concentrations of lead ranged between 13 and 290 milligrams per kilogram (mg/kg). Of these concentrations, lead was found to exceed its applicable RWQCB ESLs for residential land use and any land use/any depth (for construction workers) at only one (1) location, Boring CS-3 (at a concentration of 290 mg/kg), which lies slightly north of Boring B-7.

As discussed with MidPen Housing Corporation, the Site will be redeveloped for residential land use. During redevelopment, the entire Site will be graded and the potential exposure to lead-impacted soils will be removed. The elevated concentrations of lead within the area(s) around Boring CS-3, as well as around Boring B-21, will be graded during future redevelopment. The

areas around Borings CS-1 and B-21 will be covered by community building and residential structure, respectively, as shown on the Conceptual Site Drawings presented in Appendix D.

Because of the anomalous, elevated concentration of lead detected in the surface soil sample at Boring CS-3, along with the non-detect and detected concentrations of lead in other samples analyzed during this investigation and the previous investigation, a statistical analysis for the lead concentrations in surface soils was performed consistent with the lead evaluation procedure identified under Section H of the California Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO) Note Number 4, DTSC-modified Screening Levels (DTSC-SLs), dated June 9, 2011. This statistical analysis was performed on a total of forty-four (44) soil samples that were generally obtained from the 0.0 and 1.5-foot depths (with the exception of a few samples obtained at depths as deep as 7 feet bgs), which exhibited both non-detectable and detectable concentrations of lead. The analysis was run using the USEPA's ProUCL Version 5.1 software to establish a representative Site-wide background concentration for lead and to evaluate potential human health risk.

The results of the statistical analysis show that the calculated 95% Adjusted Gamma Upper Confidence Level (UCL) for lead in surface soils at the Site is 42.04 mg/kg. This concentration is below applicable RWQCB ESLs for both residential use and any land use/any depth for construction workers. The RWQCB ESL for lead under a residential land use scenario is more conservative than the United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for lead in resident soil. Furthermore, the RWQCB ESL is the same as the DTSC-recommended screening level for residential soil, as presented in Table 1 of DTSC's Hero Note No. 3. California Human Health Screening Level (CHHSL) for lead under a residential land use scenario. The USEPA RSL and CHHSL for lead under residential scenarios also were referenced in DTSC Hero Note No. 4. The results of the statistical analysis are presented in Appendix C. As previously mentioned above, the locations of Borings B-7 and B-21, where the elevated concentrations of lead were detected relative to the Conceptual Site Drawings are shown in Appendix D.

6.0 CONCLUSIONS AND RECOMMENDATIONS

AEI completed an additional subsurface investigation and water well evaluation at the Site. The purpose of the investigation was to assess the extent of lead-impacted soils that were found to exceed applicable San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for any land use/any depth (for construction workers) and residential land use. The investigation also was conducted to evaluate the potential human health risk relative to the lead concentrations detected in soils across the Site. In addition, the existing water well was inspected for future abandonment purposes. The well was found not to be properly abandoned in accordance with SMCEH regulations.

Six (6) shallow exploratory borings were advanced during this investigation. The borings were positioned around two (2) locations (Borings B-7 and B-21) where lead concentrations had been found to exceed applicable RWQCB ESLs during the previous investigation. Samples obtained from the 0.0-foot depth were analyzed for the presence of lead. Analytical results showed concentrations of lead that were below applicable RWQCB ESLs except for one (1) of the six (6) locations, where an anomalous, elevated concentration of lead was detected. Because of this outlier, a statistical analysis was performed to establish a representative Site-wide background concentration for lead,

as well as to evaluate its potential human health risk in shallow soils. The results of the statistical analysis show that the calculated 95% Adjusted Gamma UCL for lead in shallow soils is 42.04 mg/kg.

Because the statistical analytical results show that the calculated UCL for lead is below its applicable RWQCB ESLs for both residential and construction worker scenarios, it is concluded that the lead concentrations in shallow soils across the Site do not pose a significant potential human health risk relative to the planned development. Furthermore, massive grading will occur at the Site during redevelopment activities. Because of the planned grading, areas of localized elevated lead concentrations around Borings B-7 and B-21 will be mixed and further homogenized, further reducing the potential human health risks associated with shallow soils.

While no known environmental conditions have been identified, as a precautionary measure, it is recommended that a Site Management Plan (SMP) be developed to provide a framework for appropriately addressing potential environmental conditions, such as underground storage tanks (USTs) or other subsurface structures, that may be encountered during future development activities. The SMP will provide information regarding Site-specific conditions and previous investigation results, a summary of known and potential environmental conditions and contaminants of potential concern, provisions for a Site-specific health and safety plan (HASP), as well as odor, storm water, and noise control plans for worker protection, guidelines for sampling and managing impacted or potential-impacted soils that may be encountered (contingency plan), notification(s) to appropriate regulatory agency(ies), and documentation of environmental conditions encountered during Site development.

On the basis of the information, presented herein, no further investigation or remedial action is warranted at this time. It is recommended that the existing water supply well be properly destroyed in accordance with SMCEH regulations.

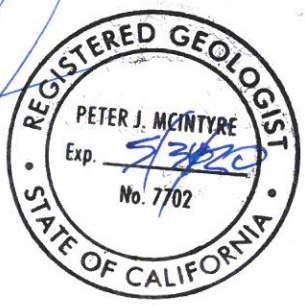
8.0 REPORT LIMITATIONS AND RELIANCE



This report presents a summary of work completed by AEI Consultants. The completed work includes observations and descriptions of site conditions encountered. Where appropriate, it includes analytical results for samples taken during the course of the work. The number and location of samples are chosen to provide the requested information, subject to scope of work for which AEI was retained and limitations inherent in this type of work, but it cannot be assumed that they are representative of areas not sampled. This report should not be regarded as a guarantee that no further contamination beyond that which could have been detected within the scope of this investigation is present beneath the subject property. Undocumented, unauthorized releases of hazardous material, the remains of which are not readily identifiable by visual inspection and are of different chemical constituents, are difficult and often impossible to detect within the scope of a chemical specific investigation.

Any conclusions and/or recommendations are based on these analyses and observations, and the governing regulations. Conclusions beyond those stated and reported herein should not be inferred from this document. These services were performed in accordance with generally accepted practices, in the environmental engineering and construction field, which existed at the time and location of the work. No other warranty, either expressed or implied, has been made.

This investigation was prepared for the sole use and benefit of MidPen Housing Corporation. All reports, both verbal and written, whether in draft or final, are for the benefit of Seagate Properties, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors or assigns. Reliance is provided in accordance with AEI's Proposal and Standard Terms & Conditions executed by MidPen Housing Corporation. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

If you have any questions or comments regarding this report, please do not hesitate to contact me at (925) 746-6000.

Sincerely,

Peter McIntyre, P.G. (7702)
Executive Vice President

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428
WorkOrder: 1709A05

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Quality Control Qualifiers

F13	Indigenous sample results too high for a representative matrix spike analysis.

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate $250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

* If metals are requested for water samples and the water type (Matrix) is not specified on the chain of custody, MAI will default to metals by E200.8.

Please provide an adequate volume of sample. If the volume is not sufficient for a MS/MSD a LCS/LCSD will be prepared in its place and noted in the report.

Water Well Sampling and Well Destruction

AEI Consultants
Environmental & Engineering Services

April 9, 2018

Ms. Serena Ip
MidPen Housing Corporation
303 Vintage Park Drive, Suite 250
Foster City, California 94404

Re: Water Well Sampling and Well Destruction
Project Number 350428
Cypress Point Development
Carlos and Sierra Streets
Moss Beach, San Mateo County, California 94038

Dear Ms. Ip:

This report presents the results of the **Water Well Sampling and Well Destruction** activities performed by AEI Consultants (AEI) for the Cypress Point development project, located near the intersection of Carlos and Sierra Streets in Moss Beach, San Mateo County, California (the "Site"). The project was conducted in accordance with the conclusions and recommendations presented in AEI's *Additional Subsurface Investigation and Water Well Evaluation Report* dated February 20, 2018. Information regarding the previous investigation results, field activities, analytical results, conclusions, and recommendations is provided in the following sections of this report.

1.0 PREVIOUS INVESTIGATION RESULTS

In November 2015, AEI conducted a *Phase I Environmental Site Assessment (ESA)* at the Site. During the file review, it was found that two (2) domestic water supply wells had been installed at the Site in 1986. Limited regulatory agency records that were obtained from San Mateo County Environmental Health Services (SMCEHS) for the wells are provided in Appendix A.

In December 2015, AEI conducted a *Limited Phase II Subsurface Investigation* with the results presented in a report dated February 15, 2016. During a site reconnaissance for the investigation, one (1) of the wells was found within a vegetated area near the northern property boundary. The wellhead consisted of a rusted, welded steel cover that was secured within a rectangular-shape concrete pad. SMCEHS was contacted to gather more information about the well(s) during the investigation; however, no additional information had been provided by SMCEHS at that time. The other well was not found during the reconnaissance. It was unknown if either well had been properly abandoned in accordance with SMCEHS regulations. No well construction details were available for review other than the limited regulatory agency records gathered during the *Phase I ESA*.

As presented in Appendix A, regulatory agency records show that a San Mateo County Department of Public Health and Welfare permit (Permit No. W-43-86) had been issued to the California School

Employee Association (property owner) for the installation and construction of the well(s) in May 1986. The name of the well owner on the permit was listed as Farallon Vista Associates. In June 1986, a flow test was conducted by H.A.M. Drilling, Inc. (HAM) at one (1) of the wells. Their Well Yield Report Information form for the well showed a total depth of 400 feet. The Well Yield Report also showed the DWR Water Well Drillers Report Number than the permit number shown under the County May 1986 permit. The Well Yield Report showed that the standing water well and static water level (assumed to be measured upon completion of flow testing) were measured at depths of 35 feet and 168 feet deep, respectively. The pump for the flow test was set at a depth of 390 feet. The flow test was conducted over an approximate 3-hour period. Flow (pump) rates during testing ranged between 2 and 5 gallons per minute. At the end of the 3-hour period, the drawdown of the water level was measured at 168 feet. After the flow testing was completed, a recovery test was performed for an approximate 20-minute period. After this period ceased, the water level recovered to the 160-foot depth. In July 1988, water quality testing for bacteriology and chemistry purposes also was performed.

In December 1990, as shown on a Septic and Well Check-Off List, Farallon Vista Associates indicated that the two (2) domestic water supply wells had been installed under one (1) permit, and that both wells would be repaired "so that aquifers were adequately protected." In January 1991, also shown on the same Septic and Well Check-Off List, Farallon Vista Associates indicated that the "upper well" had been "sealed with welded steel" and the "lower well" had been "sealed flush with the well pad with a bolted steel plate." During AEI's December 2015 site reconnaissance, it was believed that the "upper well", rather than the "lower well", had been found.

In October 2017, the "upper well" was inspected by Wilkinson Well and Pump of Half Moon Bay, California (Wilkinson) during AEI's *Additional Subsurface Investigation and Water Well Evaluation*. The area around the wellhead was observed to be covered with tree branches and vegetative debris. It was also observed that the well cover had been removed since the time of AEI's *Limited Phase II Subsurface Investigation*. The well was observed to consist of an outer steel casing that was lined with an inner 5-inch diameter polyvinyl chloride (PVC) casing. Wilkinson attempted to measure the groundwater and total well depths. However, because of an obstruction encountered at the 13.3-foot depth, the groundwater depth and well depth measurements could not be obtained. The vertical extent of the obstruction below the 13.3-foot depth also could not be measured. Wilkinson also observed that a section of broken or cracked well casing was present at the 5-foot depth. Upon inspection, it was assumed that debris had been poured into the well after the cover had been removed.

2.0 FIELD ACTIVITIES

Field activities for the groundwater sampling and well destruction are described in the following sections of this report.

2.1 Health and Safety Plan

A site-specific health and safety plan was prepared, reviewed by onsite personnel, and kept onsite for the duration of the fieldwork.

2.2 Permitting and Utility Clearance

A drilling permit was obtained from the SMCEHS for the well destruction. A copy of the drilling permit is provided in Appendix B.

Prior to well destruction activities, the property boundaries were marked on the ground surface with white paint. Upon marking, Underground Services Alert (USA) North was contacted, who, in turn, notified subscribing utility companies of the planned well destruction work for underground utility locations to be marked along the ground surface around the existing well. A utility clearance was conducted by Ground Penetrating Radar Systems, Inc. (GPRS) of San Jose, California under subcontract to AEI on February 21, 2018. No underground utilities were found to be present around the existing well.

2.3 Well Destruction and Removal of Obstruction

Well destruction commenced on February 21, 2018 upon completion of the utility clearance. Well destruction was performed by a C-57 licensed drilling company, Cascade Drilling, Inc. of West Sacramento, California under subcontract to AEI. Well destruction activities were supervised by an experienced field geologist under the oversight of an AEI State of California-licensed Certified Engineering Geologist.

Prior to well destruction, the wellhead was opened to remove the obstruction from the 13.3-foot depth using a well development rig. A 4-inch diameter drilling rod was lowered into casing to remove and/or push through the obstruction. However, it was discovered that the length of the obstruction was quite extensive and could not be removed. Refusal was encountered at the 47-foot depth. SMCEHS inspected the well destruction procedures and further required that the obstruction be removed. At that time, the depth to groundwater was measured at 45.37 feet below the top of well casing.

Well destruction activities resumed on March 6, 2018. Cascade mobilized a track-mounted, sonic drilling rig to the Site to remove the obstruction and complete the well destruction. Upon removal of the obstruction, the inside of the well casing was further reamed out to the 350-foot depth. Materials associated with obstruction and removed from the well casing included pea gravel, tree debris, miscellaneous trash, and glass bottle fragments. At the 350-foot depth, another obstruction was encountered, which included an older submersible pump, that appeared to be left in place from the time the well was installed. Metal fragments and copper wiring were removed, followed by drilling refusal encountered when attempting to drill through the pump at that depth. Because of the depth of the pump and associated drilling refusal, SMCEHS was contacted for further direction. SMCEHS approved destruction of the well beginning at the 350-foot depth, instead of continuing to drill downward to the 400-foot depth.

2.4 Groundwater Sampling

Groundwater sampling was performed prior to well destruction. Prior to sampling, the well was purged with a portable submersible pump. The pump intake was positioned at an approximate depth of 120 feet below the top of well casing. The depth to groundwater prior to purging was

approximately 54.30 feet below the top of casing. During purging, only 55 gallons could be removed due to the slow purge rate of the pump. The total volume of water removed during was significantly less than the total volume of standing water inside the well casing noted prior to sampling.

Upon purging, a groundwater sample was obtained from inside the sonic drilling rods with a clean, disposable bailer. Upon collection, the clarity of the groundwater water sample was observed to be somewhat turbid and cloudy with a discernible sheen on top of the water surface inside the bailer. The sample was transferred into appropriate, laboratory-supplied, sample containers [i.e., 40-ml glass vials preserved with hydrochloric acid (HCl)]. The 40-ml glass vials were sealed so that no headspace or air bubbles were visible within the containers upon filling.

After collection, the bottles were labeled with the project name, project number, boring number, sample depth, and sampling date/time of sampling. After labelling, the samples were placed into an insulated, chilled ice chest containing crush ice for transport to the analytical laboratory. Chain-of-custody documentation was prepared and accompanied the groundwater sample bottles to the analytical laboratory.

2.5 Completion of Well Destruction

On March 7, 2018, the well was destroyed by the backfilling and placement of neat cement grout inside the well casing using tremie methods. Prior to commencing well destruction, Ms. Allison Fang, the SMCEHS inspector, visited the Site and provided AEI with a State of California Department of Water Resources (DWR) Water Well Drillers Report (No. 149554) for the well. This information had not been shared with AEI, when requested on, at least, two separate occasions, prior to the start of this project and during previous investigations. The DWR Water Well Drillers Report confirmed that the owner of the well was Farallon Vista Association and that the well had been installed during the period from June 11 through 18, 1986. The Report also confirmed the 400-foot depth of the well. The diameter of the boring for the well was 10 inches. The well was screened from the 80- to 400-foot depth with a 1/8-inch slot size, and gravel-packed (filter-packed) with 3/8-inch diameter pea gravel from the 50- to 400-foot depth. A sanitary seal for the well was installed to the 50-foot depth. The depth of first-encountered groundwater was 175 feet. A copy of the DWR Water Well Drillers Report is provided in Appendix C.

During well destruction, approximately 1,100 gallons of neat cement were tremie-grouted into the well casing. Following grouting, the top of the well casing was cut below grade and the concrete pad at the wellhead was removed. The top of the neat cement grout was flush with the surrounding ground surface. Well destruction activities were inspected by Ms. Allison Fang of SMCEHS. A copy of the Well Completion Report documenting the destruction of the water supply well is provided in Appendix D.

3.0 ANALYTICAL RESULTS

The groundwater sample was transported under appropriate chain-of-custody documentation to a State of California-certified laboratory, McCampbell Analytical, Inc. of Pittsburg, California. The sample was analyzed for total petroleum hydrocarbons quantified as gasoline (TPH-g), as diesel

(TPH-d), and as motor oil (TPH-mo) United States Environmental Protection Agency (EPA) Method 8015M and volatile organic compounds (VOCs) by EPA Method 8260B. Chain-of-custody documentation and the laboratory analytical report are provided in Appendix E.

Groundwater analytical results showed the presence of TPHs and VOCs. TPH-g was detected at a concentration of 100 micrograms per liter (µg/L), and TPH-d and TPH-mo were detected at concentrations of 20,000 and 60,000 µg/L, respectively. The TPH-g concentration was found not to exceed applicable San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) except that it was found to exceed the RWQCB ESL odor nuisance level for drinking water. The TPH-d and TPH-mo concentrations were found to exceed applicable RWQCB ESLs.

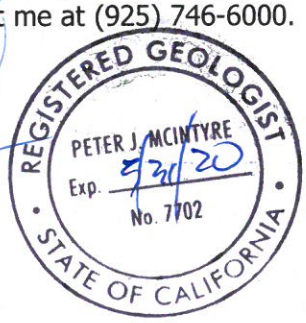
VOCs, including acetone, 2-butanone (methyl ethyl ketone), naphthalene, toluene, and 1,2,4-trimethylbenzene, were detected at concentrations between 0.81 and 13 µg/L. None of the detected VOCs were found to exceed their applicable RWQCB ESLs except for naphthalene, which was found at a concentration (1.9 µg/L) slightly above its RWQCB ESLs for direct exposure human health risk levels, including Maximum Contaminant Level (MCL) Priority and human health risk based only levels.

To further confirm the TPH analytical results, the sample was re-analyzed by EPA Method 8015M with a silica gel cleanup. This analytical approach was utilized to assess whether the TPH results from the initial analyses are representative of petroleum-derived substances originating from the surrounding environment, such as naturally-occurring organic materials, etc. Analytical results showed that the TPH concentrations were the same as those for the initial analyses with the exception of the TPH-mo detected at a slightly lower concentration of 55,000 µg/L. The results of the initial analyses and silica gel analyses also showed that the TPH concentrations were within the same order of magnitude.

The TPH analytical results also were compared with the laboratory chromatograms for the surrogate standard used for diesel and motor oil during the laboratory analyses and actual analytical results. Upon review of the chromatograms, it was noted that the signatures (highest peaks or responses) on both chromatograms were virtually the same (each measured the same at 18.4 minutes). In summary, the analytical results do not appear to be representative of petroleum-derived substances originating from the surrounding environment.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the results of these activities performed at the Site, the well was destroyed in accordance with SMCEHS permitting requirements. Confirmation of the well destruction permit closeout by SMCEHS is provided in Appendix F.



With respect to the groundwater analytical results, it appears that the detected concentrations of TPH-d and TPH-mo are attributed to the older submersible pump that had been left in the well for greater than a 30-year period. Older submersible pumps are known to have seals, bearings, and oil-filled capacitors that contain petroleum-based greases, oil and lubricants, all of which can leak and fail over time.

County Review Draft

Upon recognizing such features in older submersible pumps, the TPH concentrations in this well appear to be associated with an older, leaky submersible pump. Furthermore, during sampling, it was noted that the groundwater sample was somewhat turbid. A representative groundwater sample could not be collected at the time of sampling because the standing water inside the well casing could not be easily removed due to the slow purge rate of the pump.

On the basis of this information, no further investigation or remedial action regarding the well destruction is recommended at this time. If you have any questions or comments regarding this report, please do not hesitate to contact me at (925) 746-6000.

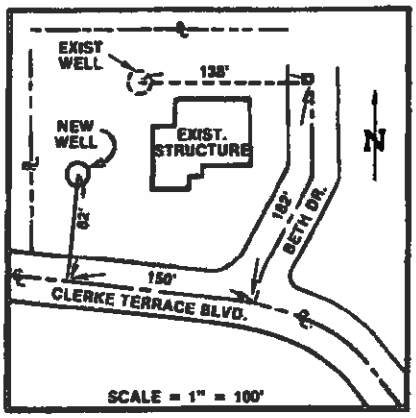
 WELL PERMIT NO.: _____

WELL CONSTRUCTION APPLICATION

Based on information on the application and attachment(s) hereto (if any) and subject to approval noted below, permission is hereby granted to construct (drill) the described well. Permission to start may be withheld until a field check verifies all statements made on application by Permittee and is also subject to the "General" and "Special" Conditions stated below.

WELL LOCATION (Draw Accurately)
Recommend using Assessor's Map

1. Sketch well location to scale, show dimension to nearest foot.
2. Show a minimum of two dimensions at right angles. Dimensions shall be from the centerline of the closest named streets, roads or highways.



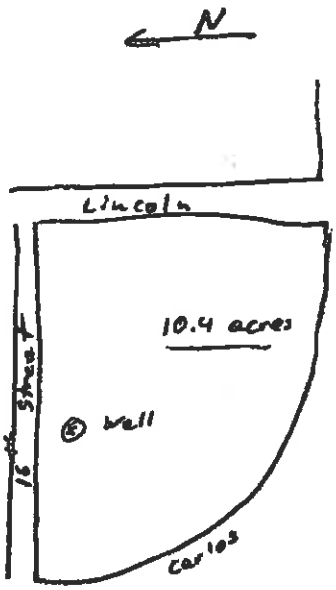


FIGURE 1

N

Scale: 1" = _____

GENERAL CONDITIONS:

A. Construction under this Permit is subject to any instructions by Health Department representative relative to the "Standards for the Construction of Wells in San Mateo County".
B. Permit may be voided before work begins if field check reveals any misrepresentation under "well location" or "Topographic Features" on application.
C. This Permit is valid only for the purpose specified herein. No change in construction procedure as prescribed on attached Standards and in Special Conditions below will be allowed except upon written permission of the County.
D. Permittee shall assume entire responsibility for all activities and uses under this Permit and shall indemnify, defend and save the County of San Mateo, its officers, agents and employees free and harmless from any and all expense, cost or liability in connection with or resulting from the exercise of this Permit including, but not limited to property damage, personal injury and wrongful death.
E. Compliance with "CAL/OSHA" California Labor Code Section 6300 (and following) is required.
F. Water quality and production from all wells to be used for domestic water supply must be approved by the Office of Environment Health.
G. Permit will be automatically cancelled if not exercised or if extension is not requested by Permittee within 90 calendar days of above date.
H. Driller is to complete State DWR Form 188 and mail original to San Mateo County Health Services within 30 days of completion of well construction.
I. For the construction of water producing wells, a Permittee must be a licensed water well drilling contractor unless the work is to be done by the landowner or employees of the landowner. (See Business & Professions Code § 7026.3, 7028).
J. For monitoring wells refer to State Water Well Standards 74-81. Dry holes shall be backfilled within one week of drilling. Well destruction shall be done in accordance with State and County Standards.
K. Each well site requires a separate Well Construction Application, and permit.

Re: Well Logs For Farallon Vista Associates

Dear Stan:

As you will recall quite sometime ago, I asked you to locate the well logs for the Farralon Vista Associates' parcel. I represent the California School Employees Association, who is the owner of the land. I believe the APN number is 037-022-040.

Please contact me with this information.

If you any questions, do not hesitate to call.

Message w/ Dave on 3/7/05 for file review appointment

(12) WELL LOG: Total depth 400 ft. Depth of completed well 400 ft.
from ft. to ft. Formation (Describe by color, character, size or material)

0 - 1 Asphalt & Sub base
1 - 55 Brown Decomposed Granite
55 - 70 Gray DG
70 - 73 White DG
73 - 175 Gray DG
175 - 250 Hard Gray DG (water - 175')
250 - 300 Brown/Gray DG
300 - 320 Hard GrayDG
320 - 400 Soft Gray DG

Work started 6/11 19 86 Completed 6/18 19 86

WELL DRILLER'S STATEMENT:
This well was drilled under my jurisdiction and this report is true to the best of my knowledge and belief.
SIGNED (Well Driller)
NAME HAM Drilling, Inc. (Person, firm, or corporation) (Typed or printed)
Address 1538 Willow Pass Road
City Pittsburg, CA Zip 94565
License No. 426654 Date of this report 6/18/86

"When Quality Counts"

Analytical Report

WorkOrder: 1803635

Report Created for: AEI Consultants

2500 Camino Diablo, Ste.#200
Walnut Creek, CA 94597

Project Contact: William Hicks
Project P.O.: 154987
Project: 350428; Moss Beach

Project Received: 03/07/2018

Analytical Report reviewed & approved for release on 03/15/2018 by:

Heidi Fruhlinger
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Moss Beach
WorkOrder: 1803635

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Moss Beach
WorkOrder: 1803635

Analytical Qualifiers

b1	Aqueous sample that contains greater than ~1 vol. % sediment
b6	Lighter than water immiscible sheen/product is present
d7	Strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
e2	Diesel range compounds are significant; no recognizable pattern
e7	Oil range compounds are significant

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD is out of acceptance criteria.
F3	The surrogate standard recovery and/or RPD is outside of acceptance limits.

MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate $250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

* If metals are requested for water samples and the water type (Matrix) is not specified on the chain of custody, MAI will default to metals by E200.8.

Please provide an adequate volume of sample. If the volume is not sufficient for a MS/MSD a LCS/LCSD will be prepared in its place and noted in the report.

Glossary of Terms & Qualifier Definitions

Client: AEI Consultants
Project: 350428; Moss Beach
WorkOrder: 1803635 A

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analysis Requested

MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate $250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

* If metals are requested for water samples and the water type (Matrix) is not specified on the chain of custody, MAI will default to metals by E200.8.

Please provide an adequate volume of sample. If the volume is not sufficient for a MS/MSD a LCS/LCSD will be prepared in its place and noted in the report.

Good morning, Allison:

I am contacting you to ensure that the permit for our well destruction project has officially been closed out. I assume that you have received the DWR Well Completion Report by now. If you could email me back confirming the permits has been closed out, that would be great. I will need to incorporate it into our report for the project. Thank you very much and look forward to hearing from you.

Kind regards,

--Tim--

Tim,

I just checked the OSWCR website and I do see the WCR however the address needs to be input – does the system not allow you to put an intersection under the well location?

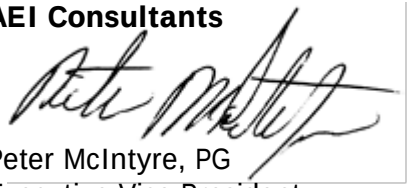
Subject: **Response to Comments**
Cypress Point Development Project
Moss Beach, San Mateo County, California
AEI Project No. 350428

Dear Ms. Ip:



AEI Consultants (AEI) has reviewed the April 9, 2020 *Comments on the MidPen Cypress Point Project, PLN2018-00265* letter prepared by SWAPE (SWAPE Letter) regarding the Cypress Point Development Project located in Moss Beach, California ("the Site"). The SWAPE letter provides comment on the "Preliminary Environmental Evaluation Report" dated April 2019 and several documents prepared by AEI relating to environmental due diligence and environmental testing of the Site, including the February 20, 2018 "Additional Subsurface Investigation & Water Well Evaluation" report. This letter responds to two substantial items in the SWAPE letter, including: 1) the appropriate use of statistical analyses of lead test results, and 2) the relevance of the referenced Terrestrial Habitat Environmental Screening Level (ESL) for lead published subsequent to issuance of the above referenced Site analysis.

As presented in the "Additional Subsurface Investigation & Water Well Evaluation," lead was identified in shallow soils at the Site. In accordance with the "User's Guide: Derivation and Application of Environmental Screening Levels, Interim Final 2019" prepared by the San Francisco Bay Regional Water Quality Control Board (Regional Water Board), the 95-percent upper confidence limit was used to estimate the exposure point concentration (EPC). It is appropriate to statistically estimate the EPC, and not use only the maximum-detected concentrations, since the site will be developed with multiple scattered buildings each consisting of a number of individual apartment-style units. As part of construction activities, some homogenization of soils is to be expected. These buildings will also be surrounded by landscaping and hardscape constituting the common area spaces around the buildings, which also limits exposure to Site soils. These units do not have private yards or gardens, nor are the units to be constructed on individual smaller lots or parcels as would occur for single family homes, condominium, or town-home developments. Therefore, in considering the theoretical exposure to soil by a given future resident, such exposure would be across the larger development, not concentrated in an individual smaller yard area where exposure to a localized "hot spot" would constitute a large fraction of the soil exposure. The project will not create an exceedance of the human health ESL for lead and further mitigation is not necessary.

The Terrestrial Habit ESL for lead in soil was first published in the most recent revision of the ESLs issued in July 2019, which after the issuance of the "Additional Subsurface Investigation & Water Well Evaluation." However, the Regional Water Board continues to provide guidance on how this Terrestrial Habitat ESL should be used. As outlined in Sec 8.0 of the ESL guidance document, it should be noted that the Terrestrial Habitat ESLs also are not applicable to aquatic habitats (e.g., wetlands; ephemeral, intermittent or perennial streams; rivers and mudflats; ponds or lakes; vernal pools; marine intertidal areas). Following development, much of the soils will be improved with buildings and hardscape (Parking, walkways, etc.), including much of the area with the higher lead detections; essentially eliminating the exposure pathway in these areas. The project does include green-scape; such areas will be developed with typical imported topsoil, landscaped lawns, shrubbery and other designed flora. There will be minimal habitat for terrestrial animals or flora, and where there is habitat, Site soils will be below imported topsoil, further limiting contact. The project does not create substantial habitat using soils of the Site, therefore additional analysis or mitigation is not necessary.

AEI appreciates the opportunity to support this important project. If there are any questions or comments, please contact me anytime; I can be reached at (925) 285-8286 or pmcintyre@aeiconsultants.com.

Sincerely,
AEI Consultants

Peter McIntyre, PG
Executive Vice President
Principal Geologist

1 INTRODUCTION

This Wildfire and Evacuation Route Assessment has been prepared for the Cypress Point Affordable Housing Community Project (project). The purpose of the study is to identify wildfire hazards and associated risks with the project and additional hazards and areas of concern in the event of an emergency. The assessment addresses the project location, topography, combustible vegetation (fuel types), fire history, fire behavior, and emergency response capacity, as well as the water supply, emergency access (ingress/egress), structural ignitability and fire-resistant building features, defensible space, and impacts to existing emergency services evacuation.

1.1 Project Location, Description, and Environmental Setting

1.1.1 Project Location

The project site encompasses a total of approximately 11.02 acres within the unincorporated community of Moss Beach in San Mateo County (County), California (Figure 1). The project site is bounded by vacant land to the southwest (toward State Route 1 [SR-1]), residential properties along 16th Street to the northwest (in the community of Montara), and residential properties along Carlos, Sierra, and Lincoln Streets on the other two sides. Individual houses along Stetson Street and Buena Vista Street also border the property. The project site is approximately 750 feet east of the Pacific Ocean and is within 250 feet of Montara Creek at its closest point.

1.1.2 Project Description

The project is an affordable housing development sponsored by MidPen Housing Corporation (MidPen) and designed to provide affordable housing in the San Mateo Midcoast region. The intention of the project sponsors and San Mateo County is to improve the jobs/housing balance and jobs/housing fit by providing preference for those who live or work on the San Mateo Coast.

The project proposes the development of 71 affordable housing units, contained in 16 two-story buildings, and a community building for a total of 66,738 square feet. The project includes six different building layouts and unit configurations, ranging in height from 23 to 28 feet.

The project would cluster the residential units toward the northwestern corner of the site, retaining the forested open space on the northernmost portion of the site. This area primarily contains Monterey cypress (*Hesperocyparis macrocarpa*) and Monterey pine (*Pinus radiata*). To the south and east, the project would consist of landscaping and public trails. The project does not include changes to the two existing potable water tanks on-site.

Unpaved internal roadways extend from the northwest to southeast across the northern and central portions of the project site. In the southeast corner of the site, the existing dirt road is the continuation of Buena Vista Street between Lincoln Street and Carlos Street. The project site can be accessed from the southeast via Buena Vista and Lincoln Streets, and from the west via Carlos Street. The Montara Water and Sanitary District (MWSD) water tanks on the southeastern portion of the site are accessed by this unpaved portion of Buena Vista Street.

Figure 1. Project vicinity map.

1.1.3 Environmental Setting

1.1.3.1. TOPOGRAPHY, ELEVATION, AND CLIMATE

The project site is situated between the Pacific Ocean to the west and Rancho Corral de Tierra, managed by the National Park Service, in the Santa Cruz Mountains to the east. Project site slopes range from 10% to 50%. Elevations range from the high point of 205 feet above mean sea level (amsl) on the east side of the project adjacent to Lincoln Street to the low point of 90 feet amsl at the northwestern boundary along 16th Street. Montara Creek, a perennial stream, is approximately 250 feet to the northeast of the project site and runs in parallel to the northern border of the site (prior to emptying into the Pacific Ocean). Residential communities occur to the east and south of the project site. These communities span approximately 250 and 200 acres, respectively. San Mateo County has a Mediterranean climate characterized by cool wet winters, with an average of 29.6 inches of rain per year, and relatively warmer dry summers with coastal fog. The temperature typically varies from 44 degrees Fahrenheit (°F) to 66°F and is rarely below 38°F or above 75°F (Dwellics 2023; Weatherspark.com 2023).

1.1.3.2. VEGETATION COMMUNITIES

The project site consists of developed uses, including water tanks and an associated maintenance structure operated by the MWSD, concrete remnants of military facilities that are scattered throughout the project area, and dirt access roads that travel around the perimeter of the project area, and undeveloped land dominated by a mix of native and non-native vegetation. Four vegetation communities were mapped and were classified using the naming conventions of *A Manual of California Vegetation*, Second Edition (Sawyer et al. 2009). Vegetation communities present in the biological study area (BSA) include Monterey cypress–Monterey pine woodland stands (*Hesperocyparis macrocarpa–Pinus radiata* Forest and Woodland Semi-Natural Alliance), coyote brush scrub (*Baccharis pilularis* Shrubland Alliance), perennial rye grass fields, and developed/disturbed areas. Thick vegetation also covers the majority of the project site outside the areas of the building foundations.

1.1.3.3. WATER SUPPLY

The project site is served by the MWSD. The project would extend water lines to new project facilities for potable water and fire water supply, as well as for irrigation of landscaping. The proposed water line would extend from the existing MWSD tanks along the existing 10-foot right-of-way (ROW) along the eastern and northern parts of the project. New domestic water and fire water lines would be located in the driveway loop and parking areas, with individual connections to each building.

1.1.3.4. FIRE PROTECTION

Within the project site, fuel loadings vary from low to moderate depending on the species present, past activities on-site, and recent weather patterns. The project site is not located within a California Department of Forestry and Fire Protection (CAL FIRE)–designated very high, high, or moderate fire hazard severity zone (FHSZ) (CAL FIRE 2022).

The Coastside Fire Protection District (Coastside FPD) would provide fire protection services and emergency response on the project site. The Coastside FPD serves the City of Half Moon Bay; the communities of Montara, Moss Beach, Princeton, El Granada, and Miramar; and the surrounding unincorporated areas. Its service area covers approximately 50 square miles and serves a population of approximately 30,000 residents.

In addition to traditional fire service, the Coastside FPD provides advance life support, cliff rescue, water rescue, confined space rescue, and vehicle and residential lock-out services, responding to approximately 2,600 calls each year. These incidents include medical aid, fires and fire alarms, water rescue, cliff rescue, traffic accidents, odor investigations, hazardous materials, and public service assists.

Three fire stations operate within the Coastside FPD: Fire Station 44, located on Stetson Street in Moss Beach 1 block (approximately 300 feet) from the project site; Fire Station 40, located within the downtown area of the City of Half Moon Bay; and Fire Station 41, located within the unincorporated area of El Granada. Fire Station 40 serves as the Coastside FPD headquarters. Fire Station 44 (Moss Beach) would provide initial fire and emergency medical service response to the project site, and Fire Stations 41 (El Granada) and 40 (Half Moon Bay) would support the initial response, if needed.

Coastside FPD's response time goal is within 6 minutes 59 seconds of receiving a call. In an email to SWCA on May 11, 2023, the Coastside FPD Chief confirmed that response times are currently met throughout the service area. The proximity of Fire Station 44 to the project site indicates that response times would meet the established goal.

The Coastside FPD has 32 paid positions, along with 11 volunteer firefighter positions. Paid positions include one assistant fire chief, one fire marshal, one deputy fire marshal, four battalion chiefs, and two administrative support positions. All stations are staffed with one fire captain and two fire apparatus engineers, one of which is a paramedic to provide advance life support service. Shift personnel work a scheduled 3-day/72-hour workweek.

The Half Moon Bay Volunteer Fire Department (Volunteer Fire Department) is a volunteer division of the Coastside FPD. The Volunteer Fire Department comprises approximately 15 members and is under the direction of the fire chief. The number of volunteers reflects the current needs of the Volunteer Fire Department and is determined by the chief of the volunteer division. The objectives of the Volunteer Fire Department are to operate within the boundaries of the Coastside FPD as a supplemental force to the regular paid department, and to operate as a trained unit for both fire suppression and non-suppression situations.

There is an extensive network of roads, both well-maintained dirt and major paved roads, surrounding the project site including SR-1. These roads can support weight loads of fire apparatus and allow for access from all directions. There are main arteries from the nearest communities and fire stations that provide direct emergency response services. Main roads in this network include SR-1, Carlos Street, Sierra Street, Stetson Street, Etheldore Street, California Avenue, and Airport Street.

1.1.4 Regulatory Setting

SPRINKLER SYSTEMS: CALIFORNIA RESIDENTIAL CODE, CHAPTER 3, SECTION R313

All new dwellings, dwelling units, and one- and two-family townhomes must be equipped with an automatic fire-sprinkler system that can protect the entirety of the dwelling. Dwellings and homes constructed prior to January 1, 2011, that do not have a sprinkler system may be retrofitted, but it is not required.

FIRE SAFETY STANDARDS: CALIFORNIA PUBLIC RESOURCES CODE 4290 AND 14 CALIFORNIA CODE OF REGULATIONS (CCR) 1270

These regulations govern roads, driveway width, clearance, turnarounds, signing, and water related to fire safety throughout California. Public Resources Code 4290 is typically enacted through regulation at the county level.

WILDLAND-URBAN INTERFACE BUILDING STANDARDS: CALIFORNIA GOVERNMENT CODE 51189

The Office of the State Fire Marshal is required to create building standards for wildfire resistance. Construction of buildings in the wildland-urban interface must use fire-resistant materials to save life and property. As of 2011, the standards relevant to fire-safe construction for all new structures in the State Responsibility Area (SRA) are the California Building Code, Chapter 7A (for commercial construction) and the California Residential Code, Chapter 3, Section R327 (for residential construction).

STATE RESPONSIBILITY AREA: PUBLIC RESOURCES CODE 4102, 4125–4229 AND 14 CCR 1220

These statutes and regulations establish the locations where CAL FIRE has the financial responsibility for preventing and suppressing fires. These designations define financial arrangements for fire protection services and establish the locations where fire safe and defensible space laws or regulations apply.

HAZARDOUS FIRE AREAS: PUBLIC RESOURCES CODE 4251–4255 AND 14 CCR 1200

These laws and regulations allow petitioners to the Board of Forestry and Fire Protection or CAL FIRE to establish hazardous fire areas, providing for area closures and other restrictions for fire prevention.

DEFENSIBLE VEGETATION CLEARING AROUND STRUCTURES: PUBLIC RESOURCES CODE 4291 AND 14 CCR 1299

Public Resources Code 4291 regulates fuel management around a property. It states that a person who owns or controls a building or structure in or adjoining to forest, brush, or grass covered lands shall follow certain guidelines outlined in the code. At least 100 feet of defensible space is required. The owner of the property is liable for making these changes to protect habitable structures. The 100 feet is separated into two zones, with the closer zone, 30 feet out from the structure, being managed more intensively.

SAN MATEO COUNTY LOCAL COASTAL PROGRAM

The Local Coastal Program provides policies regarding development and project design standards in the coastal zone of San Mateo County (County of San Mateo 2013). This includes hazards such as high-risk fire areas and vegetation management. The Local Coastal Program policies are adopted by reference in the County's Zoning Regulations under Chapter 20B, Section 6328.19 through 6328.30.

SAN MATEO COUNTY GENERAL PLAN, CHAPTER 15

Chapter 15 (Natural Hazards) of the General Plan defines fire hazards as wildland or structural fires that occur in areas that are remote, have difficult access for fire vehicles, and/or contain potentially flammable vegetative communities (County of San Mateo 2021). The General Plan adopts CAL FIRE–designated FHSZs and other fire protection district hazardous area relating to wildfire.

SAN MATEO COUNTY LOCAL HAZARD MITIGATION PLAN

The San Mateo County Department of Emergency Management issued the 2021 Multijurisdictional Local Hazard Mitigation Plan, a large regional and cross-jurisdictional effort to plan for the reduction of risk from natural and human-made disasters (Tetra Tech 2021). The plan addresses natural and human-caused hazards, including wildfire, landslides, and severe weather. The hazard mitigation plan defines measures to reduce risks from natural disasters in the San Mateo County planning area, which consists of the entire county, including unincorporated areas, incorporated cities, and special purpose districts.

CONNECT THE COASTSIDE

Connect the Coastside serves as the San Mateo County Midcoast Comprehensive Transportation Management Plan (CTMP) (County of San Mateo 2022). Connect the Coastside aims to improve the safety and mobility for Midcoast residents, businesses, and visitors by recommending a suite of projects, policies, and programs to address current and future transportation conditions in the Midcoast CTMP. The Midcoast area faces challenges in realizing community goals and vision for transportation. Climate change has accelerated sea level rise, coastal erosion, and the number and severity of emergencies like wildfires.

The following is an overview of different County departments and special projects related to emergency response and hazard mitigation planning:

- In the event of a disaster, the Department of Emergency Management coordinates countywide response and protection services. One of the missions of the Department of Emergency Management is to maintain and improve the Countywide Emergency Operations Plan. This plan establishes policies and procedures and assigns responsibilities to keep residents safe during an emergency situation.

- During an emergency or disaster, law enforcement is responsible for evacuation and the movement of the public away from a hazard area. Representatives from law enforcement and public safety agencies were part of the Connect the Coastside Technical Advisory Committee that reviewed and helped refine the plan proposals.

- In the event of an emergency, public safety agencies such as police and fire will be able to provide emergency information directly to people who have registered for the SMC Alert service. These alerts may include life safety, fire, weather, accidents involving utilities or roadways or disaster notifications. For example, the SMC Alert service would be used to notify Coastside employees and citizens of available evacuation routes during an emergency.

- In March of 2019, Supervisor Don Horsley allocated $75,000 of discretionary Measure K funds to launch the development of a countywide standardized emergency evacuation zone project (Zonehaven). The goals of the project are to reduce the amount of time it takes to notify the public, create a common operating evacuation platform for all jurisdictions, share information, and help people safely and efficiently evacuate in case of an emergency. Since the project began, the CAL FIRE San Mateo Division has worked with every fire and law enforcement agency in San Mateo County to identify over 300 evacuation zones. The project includes a public webpage that shows a map of each evacuation zone and a software application that helps first responders call for evacuations using the standard zones. This will greatly reduce the time from when an evacuation is called to when the public is notified. Additionally, the application integrates with Waze and Google Maps, so as soon as a zone is closed people will be directed accordingly. Zonehaven was used to create an Evacuation

Zone Map for the CZU Lightning Complex Fire in August 2020. The platform is available at https://community.zonehaven.com/

- The County of San Mateo updated its Local Hazard Mitigation Plan (Tetra Tech 2021) and will update the Safety Element of the General Plan. The County will be working with emergency service providers such as CAL FIRE, the Department of Emergency Management, and the new Flood and Sea Level Rise Resiliency District. These efforts will further evaluate hazard risks and identify safety measures on the Midcoast.

2 ANTICIPATED FIRE BEHAVIOR

2.1 Fuels

Fuels within the project site and the surrounding 1-mile area (project area) were classified using fire behavior fuel models (Scott and Burgan 2005). The general classification of fuels is by fire-carrying fuel type. Fuels are then further classified into specific fuel models within a fuel type. Major fuel models for both the project site and project area are listed in Table 1.

The project site is predominantly a low to moderate grass and shrub fuel load with a litter component. Nonburnable substrate is also a major component (Figure 2). The project area is predominantly a low to moderate grass and shrub fuel load with a litter component intermixed with nonburnable substrate (Figure 3). Both the project site and the project area have nonburnable substrate intermixed with flammable vegetation, making fuels discontinuous spatially across the landscape. Smaller-percentage (≤3%) fuel models present in the project area but not present in the project site are not listed in Table 1.

Table 1. Common Fuel Models in the Project Site and 1-mile Buffer Project Area

Fuel Model	Fuel Model Description	Project Site Acres (%)	Project Area Acres (%)
SH2	Moderate shrub fuel load	3.7 (34%)	187.2 (15%)
TU1	Low grass and/or shrub with litter load	3.2 (29%)	93.7 (7%)
TL3	Moderate conifer litter load	1.1 (10%)	100.0 (8%)
NB9 and NB1	Nonburnable bare ground and urban development	0.9 (8%)	334.3 (27%)
GR2	Moderate continuous grass fuel load	0.6 (5%)	178.4 (14%)
TU5	High conifer litter and shrub fuel load	0.6 (5%)	85.4 (6%)
SH5	Heavy shrub fuel load	0.3 (3%)	35.8 (3%)
GS2	Moderate shrub and grass fuel load	0.3 (3%)	13.9 (1%)
SH7	Very heavy shrub fuel load	0.12 (1%)	14.9 (1%)
GR1	Patchy low grass fuel load	0.06 (0.5%)	103 (8%)
GR4	Moderate continuous tall grass fuel load	0.01 (0.1%)	15.5 (1%)

Note: Totals may not add to 100%.

Source: LANDFIRE (2020)

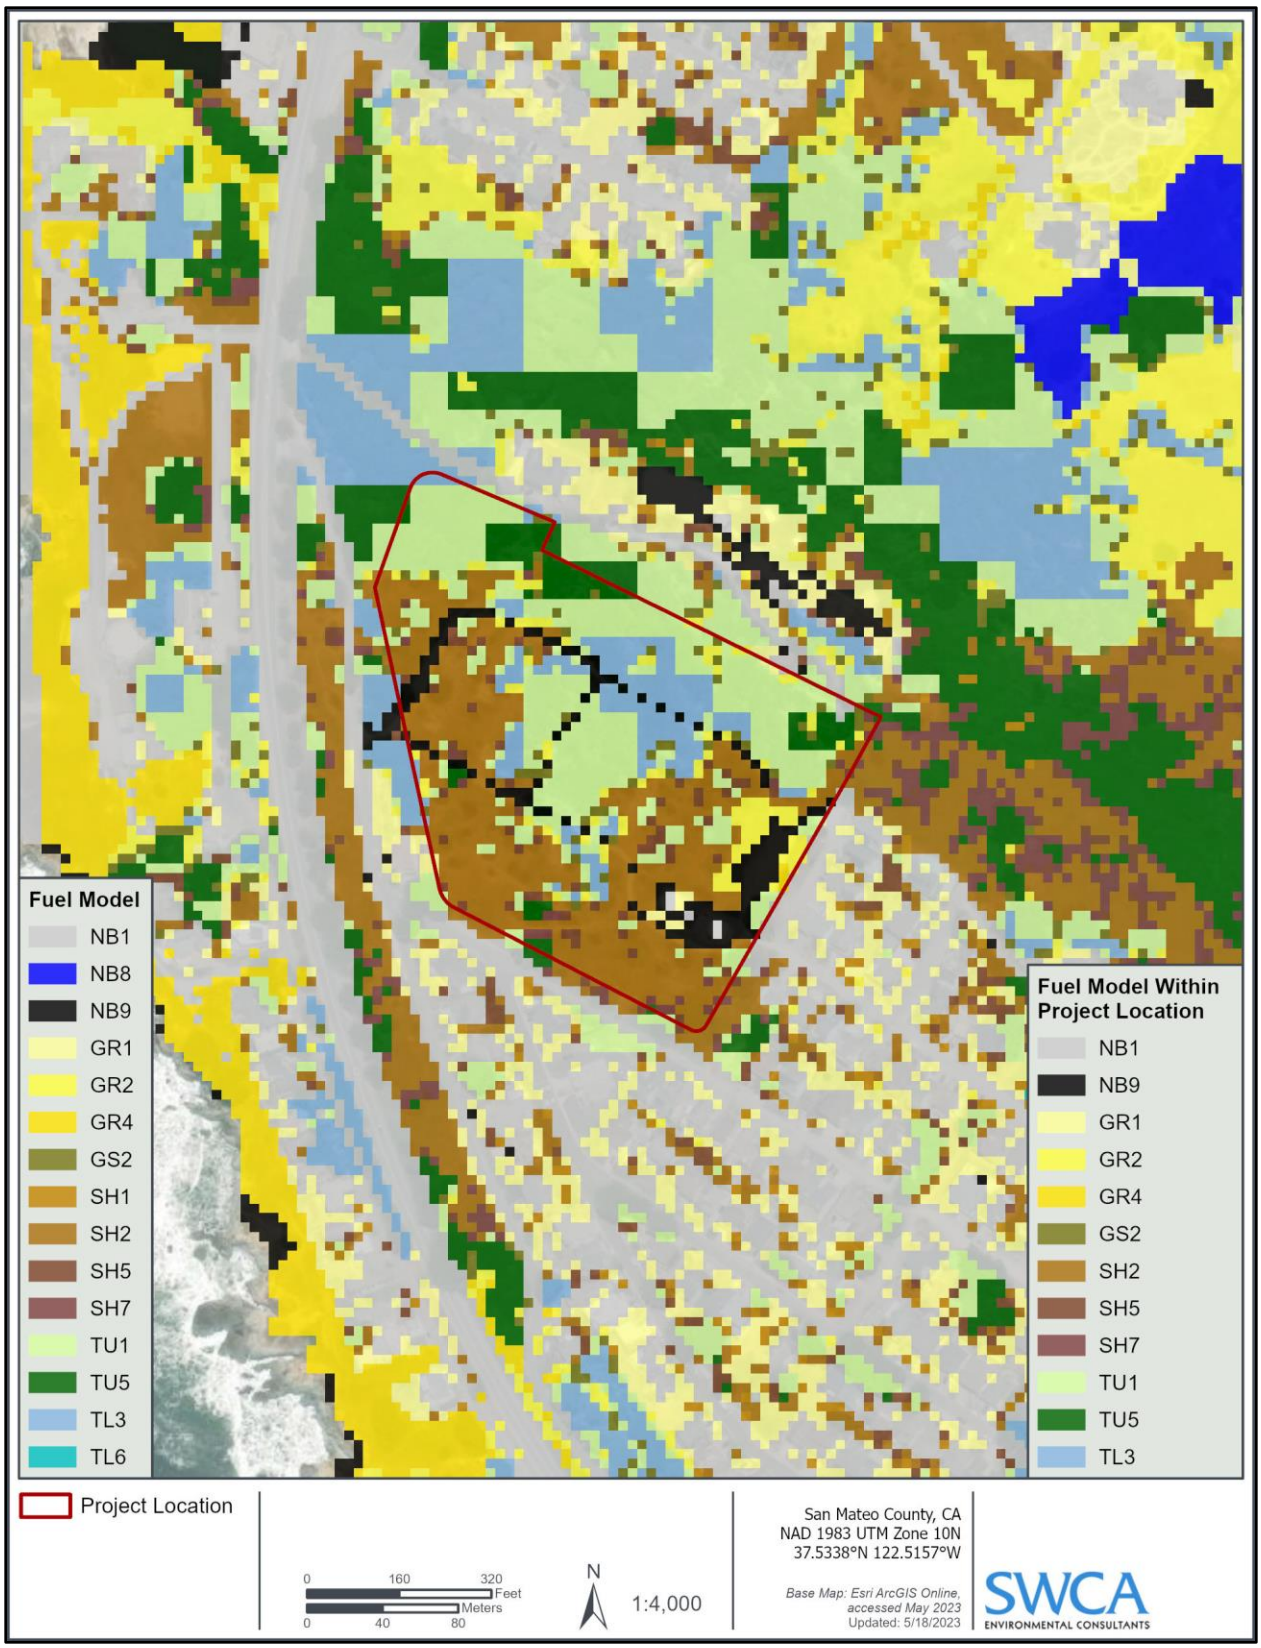

Figure 2. Fire behavior fuel models in the project site.

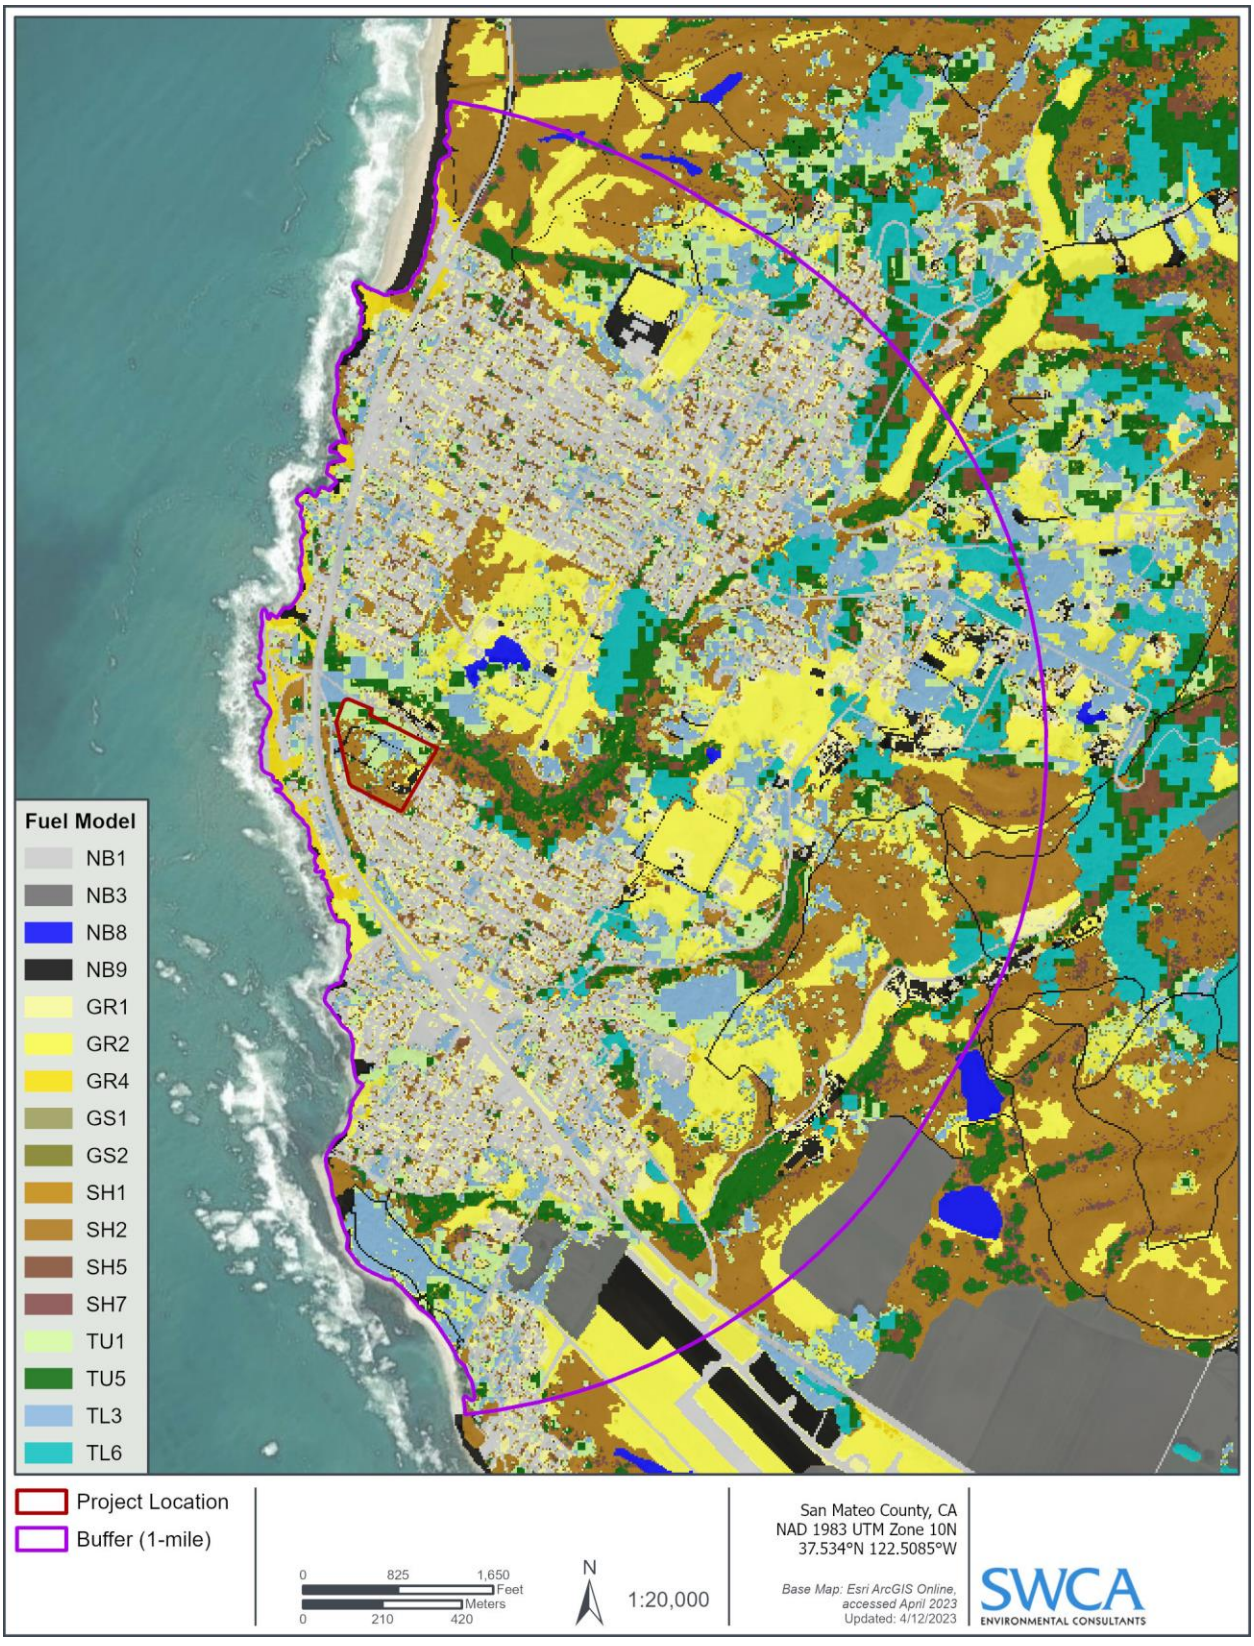

Figure 3. Fire behavior fuel models in the project site and project area.

2.2 Fire Behavior Modeling

The project site is outside of a CAL FIRE–designated very high or high FHSZ. There are SRA very high and high FHSZ–designated areas approximately 0.75 mile north and 0.5 mile east of the project site. There are also Local Responsibility Area (LRA) very high FHSZ–designated areas approximately 1.0 mile east and south of the project site (Figure 4).

The 2022 updated FHSZ data are not yet publicly available for use while updates are open for public commenting through April 2023 (CAL FIRE 2022). CAL FIRE has announced a 2023 release date; an update viewer is currently available to the public. The FHSZ updates are not anticipated to directly impact the project as there would be no change to designation of the project site (CAL FIRE 2022).

Fire behavior metrics were run with parameters set at the 97th percentile from local remote automatic weather stations (RAWS) to represent extreme conditions or the worst-case scenario. Live and dead fuel moistures were modified for the metrics, as available RAWS data used were from 1999 to 2016 and do not account for the continuing long-term drought in the region. Additional details of fire behavior modeling methodology can be found in Appendix A.

Analysis was conducted for the project site and the 1-mile buffer area using the Interagency Fuel Treatment Decision Support System (IFTDSS) (U.S. Department of Interior–Wildland Fire Management RD&A 2021) and FlamMap (U.S. Forest Service 2023) (Table 2). Burn probability, integrated burn hazard, rate of spread, and crown fire activity are the main metrics of predicted fire behavior. Burn probability is the likelihood of an area burning given an ignition source; it is related to historic fire size in the area, which is directly correlated with fire spread and duration. Integrated burn hazard couples burn probability with conditional flame length to show the fire potential at specific locations on the landscape. Rate of spread measures how fast a fire moves in chains per hour (ch/hr), where one chain is approximately 66 feet. Crown fire activity describes the ability for the fire to transition from a more benign surface fire to a more extreme crown fire in the canopy of shrubs and trees. Suppression difficulty index (SDI), a rating of relative difficulty in performing wildfire suppression work in an area, was also considered along with the other fire behavior metrics (Risk Management Assistance 2022). SDI factors in topography, fuels, expected fire behavior under severe fire weather conditions, firefighter line production rates in different fuel types, and accessibility (distance from roads).

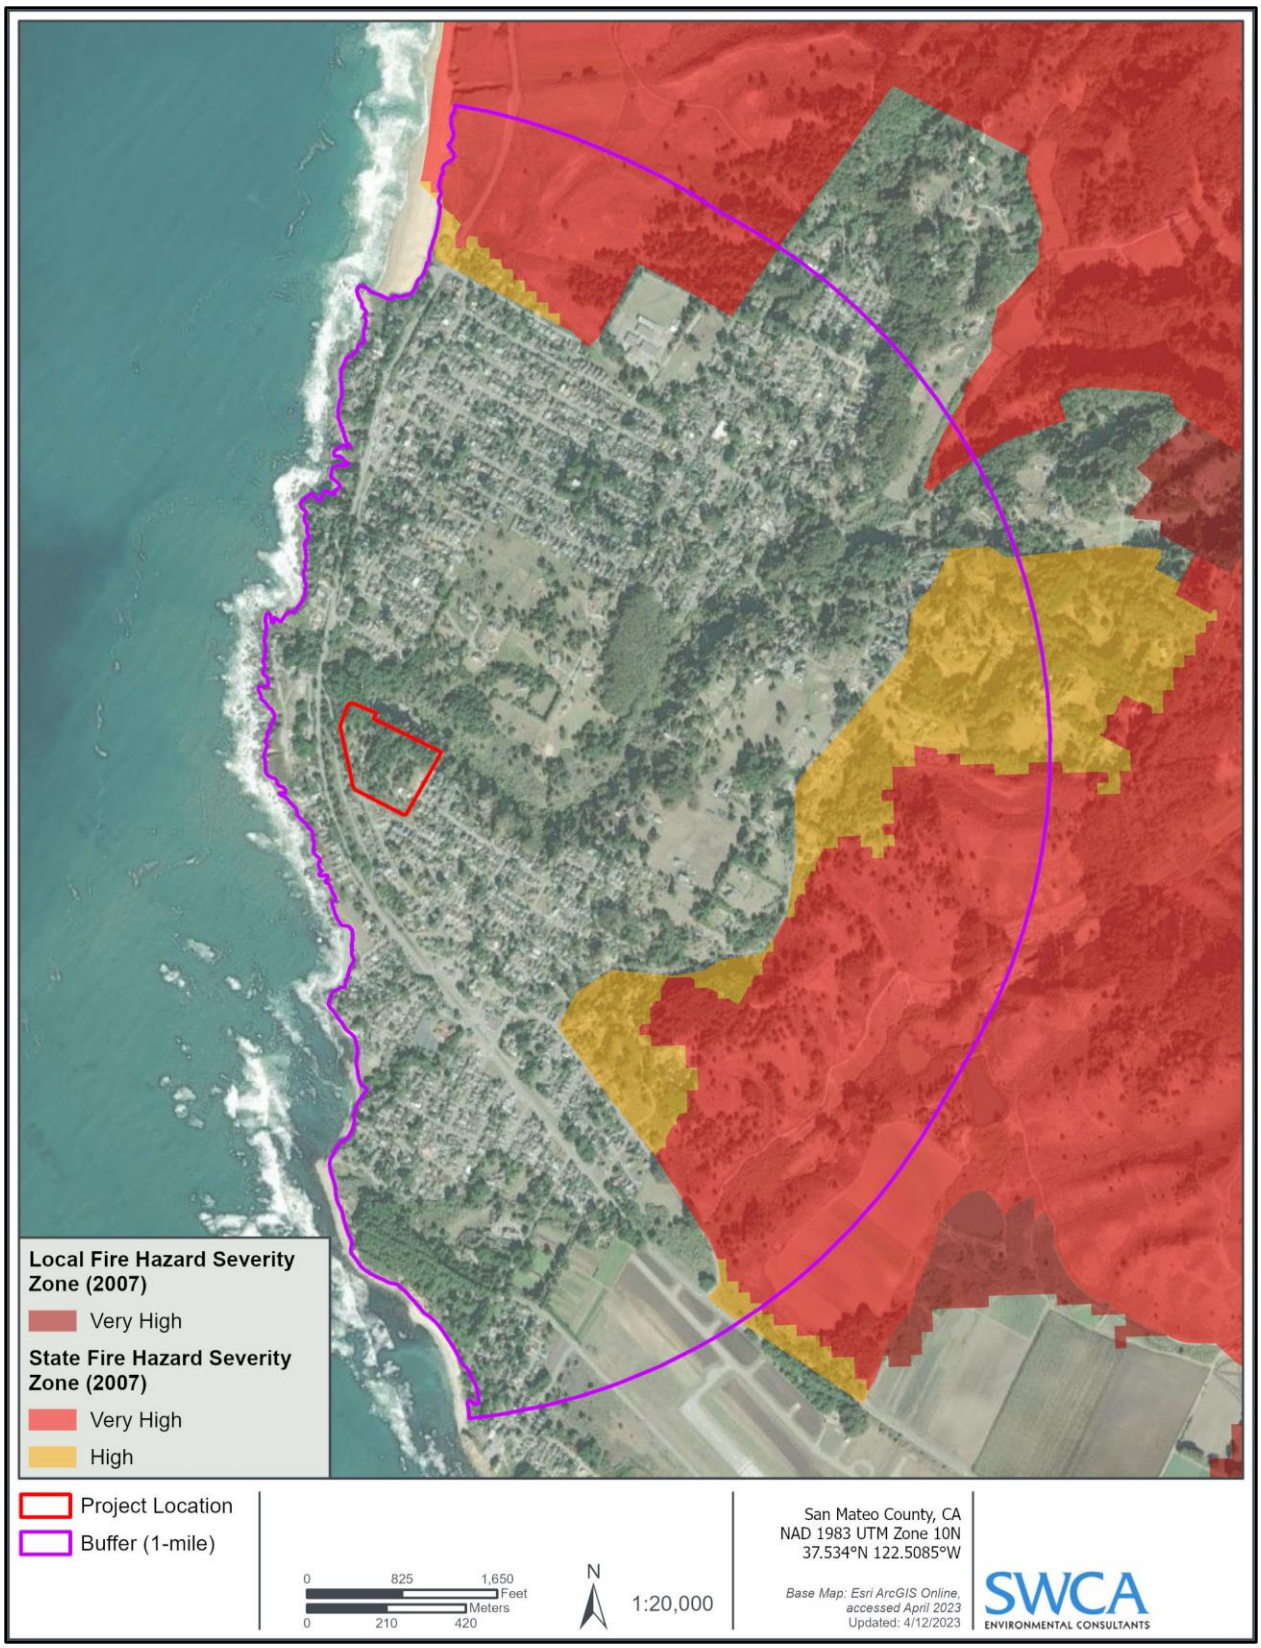

Figure 4. CAL FIRE FHSZ classifications.

Table 2. Fire Behavior Metrics in the Project Site and 1-mile Buffer Area

Burn Probability	Project Site Acres (%)	Project Area Acres (%)	Integrated Burn Hazard	Project Site Acres (%)	Project Area Acres (%)	Rate of Spread (ch/hr)	Project Site Acres (%)	Project Area Acres (%)	Crown Fire Activity	Project Site Acres (%)	Project Area Acres (%)
Non-burnable	3.1 (28%)	586.1 (47%)	**Non-burnable**	3.1 (28%)	586.1 (47%)	**0–5**	4.8 (44%)	731.2 (58%)	**No Fire**	1.0 (9%)	360.2 (29%)
Burnable, not burned	5.6 (50%)	49.3 (4%)	**Burnable, not burned**	5.6 (50%)	49.3 (4%)	**6–20**	2.7 (24%)	336.5 (27%)	**Surface Fire**	6.6 (59%)	616.2 (49%)
Lowest–Lower	2.4 (22%)	616.0 (49%)	**Lowest–Lower**	2.4 (22%)	614.6 (49%)	**21–50**	3.1 (28%)	139.0 (11%)	**Passive Crown Fire**	2.3 (21%)	259.1 (21%)

Higher–Highest	0	0	**Higher–Highest**	0	0.6 (<1%)						

Source: IFTDSS

Fire behavior within the project site was slightly more intense than the surrounding project area for certain metrics (rate of spread and crown fire activity). Fire intensity describes the energy released from the fire or characteristics of the fire behavior. In general, the project site predicts a higher percent capable of sustaining a faster rate of spread, likely due to the dominance of grass and shrub fuel types that exhibit faster rates of spread than other fuel types. There is also a higher percentage of the project site predicted to support crown fire (passive and active) compared to the project area, likely due to the higher percentage of shrub and timber fuel types (Figures 5 and 6).

Burn probability and integrated burn hazard were slightly more moderate in the project site than the buffer area. This is likely due to the larger percent of burnable, not burned acres during modeling, indicating that a fire is unlikely to reach a specific area or spread beyond that specific area due to a slow rate of spread. That is, although flammable vegetation is present, based on fire history it is unlikely a fire would occur or spread on the project site. Additionally, fuels are discontinuous across the landscape because of developed areas and roads; this can contribute to less fire spread. Modifying fuels to reduce fuel load or continuity helps mitigate potential fire behavior by creating fuel conditions and characteristics that naturally exhibit lower fire behavior (Figures 7 and 8).

The SDI for the project site is predominantly of low to lowest difficulty, with a minor percentage as moderate difficulty (Figure 9). The project area is also predominantly of low to lowest difficulty, with a small percentage as moderate difficulty.

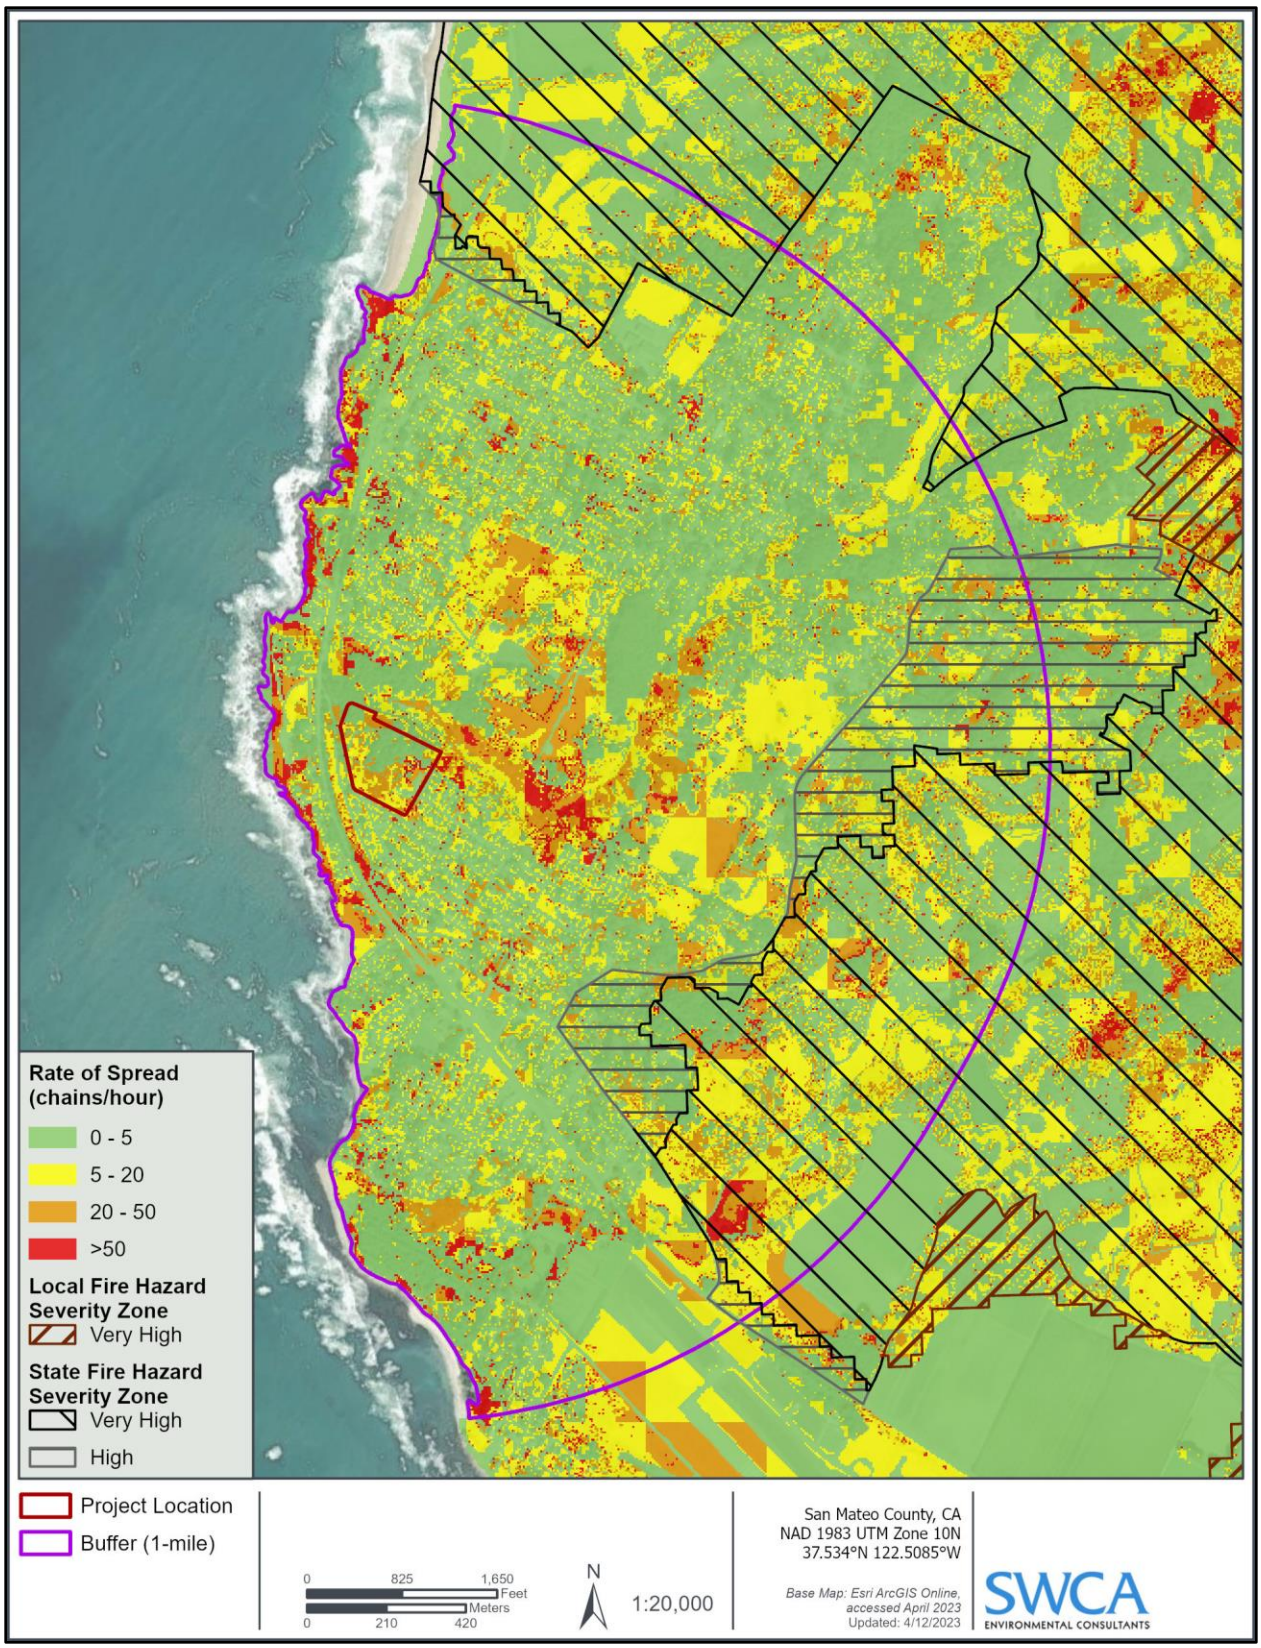

Figure 5. Rate of spread.

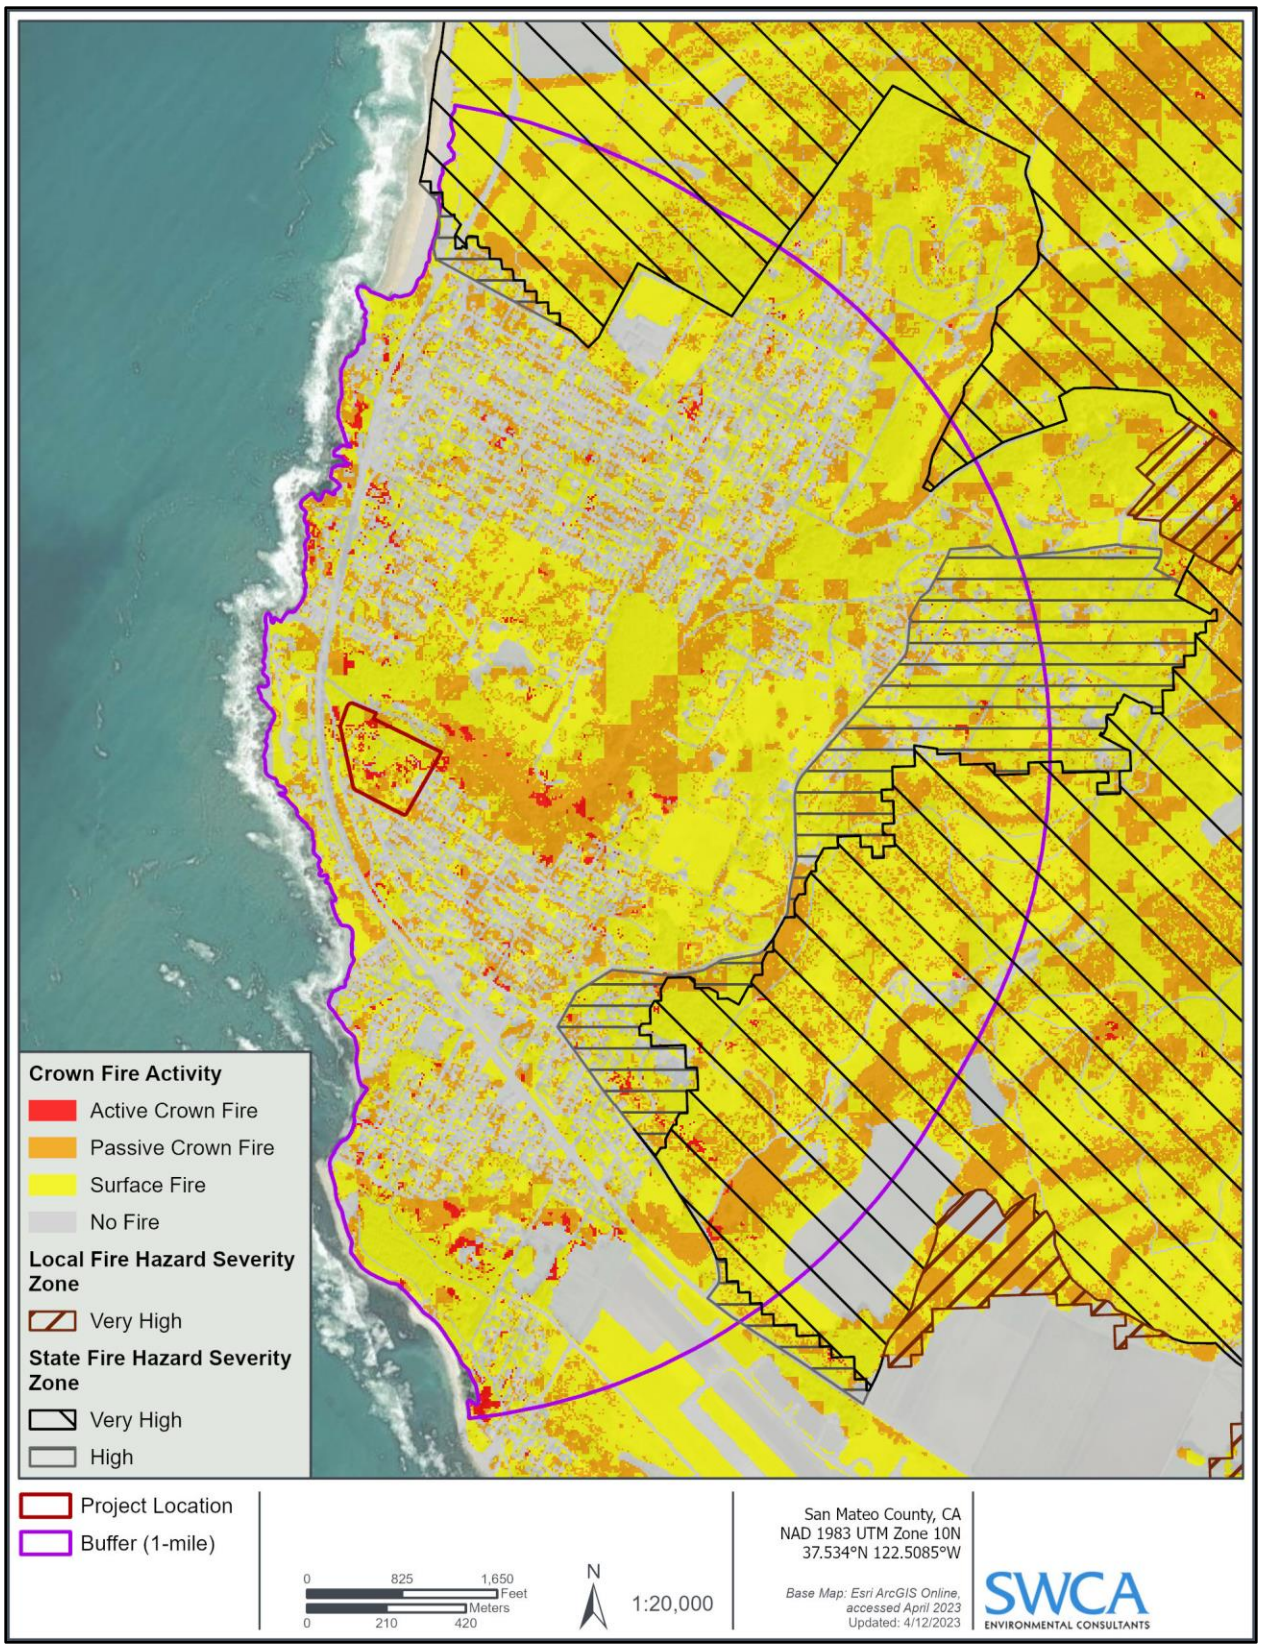

Figure 6. Crown fire activity.

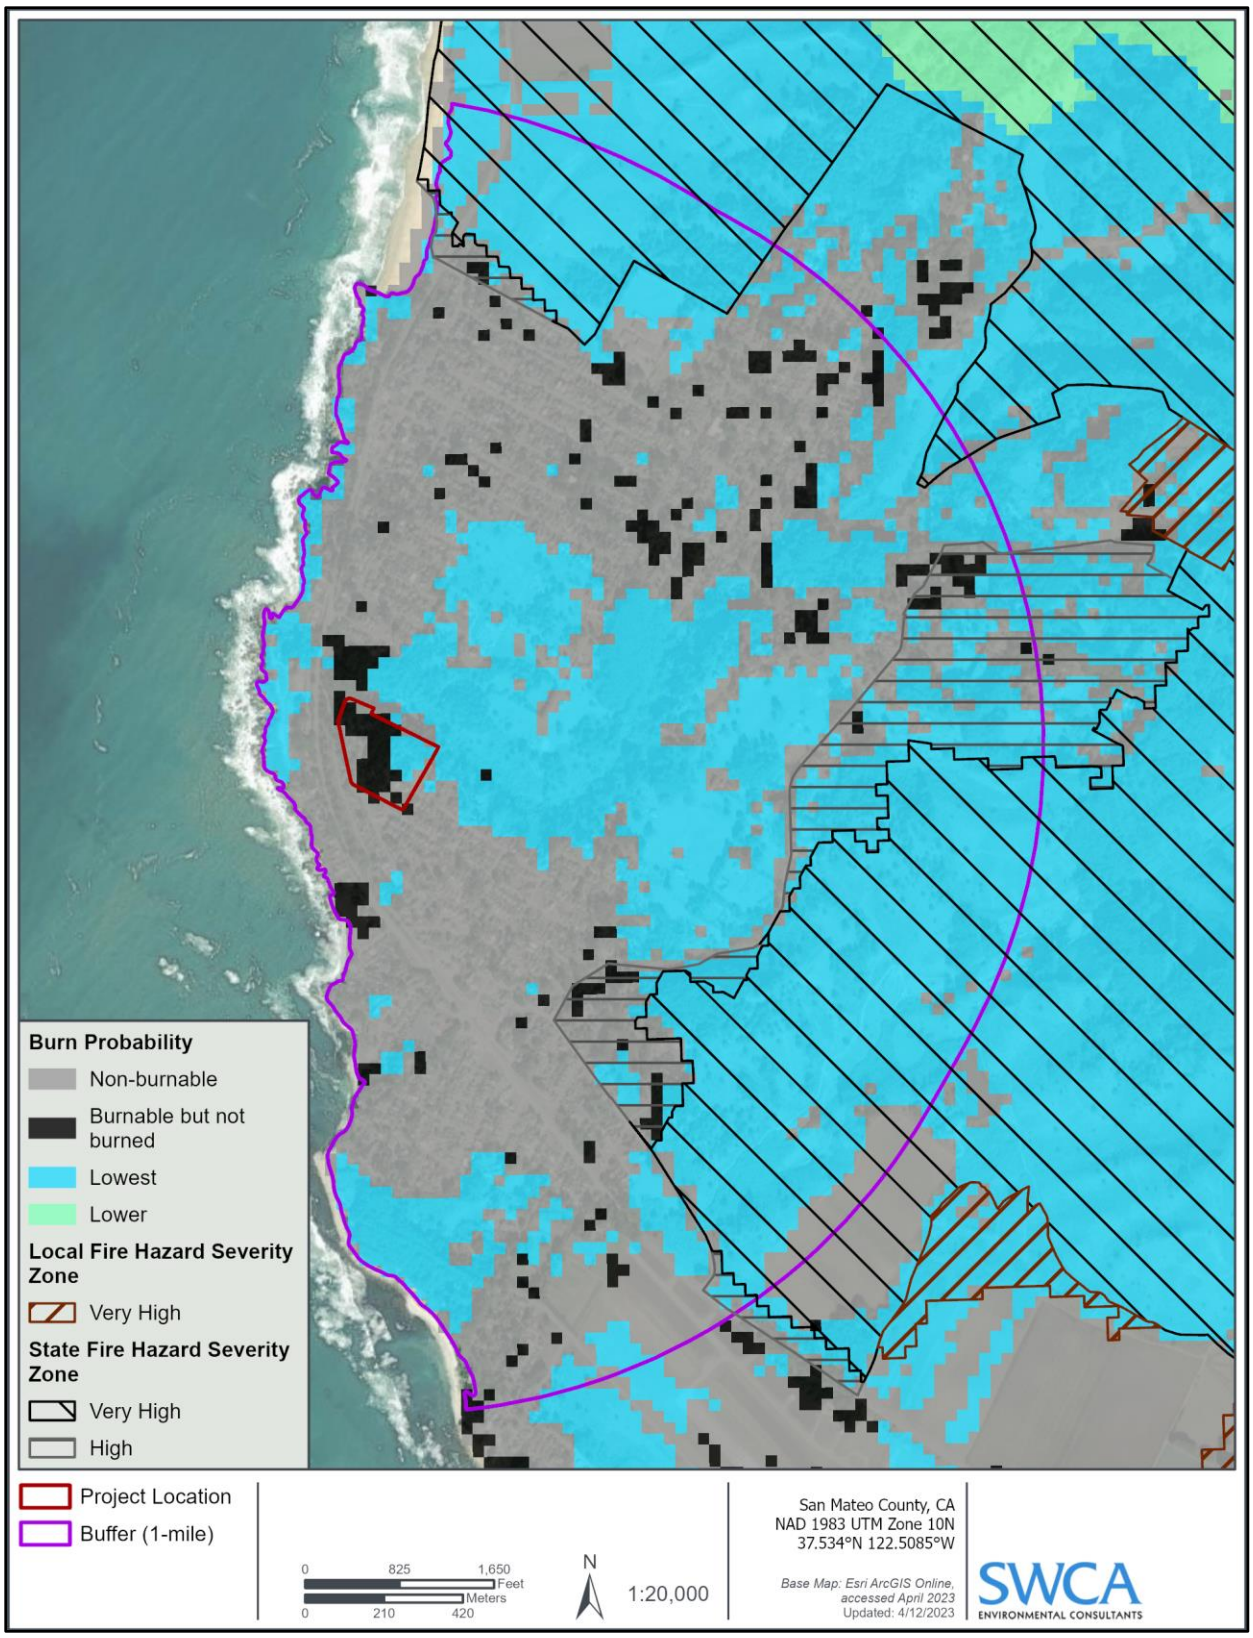

Figure 7. Burn probability.

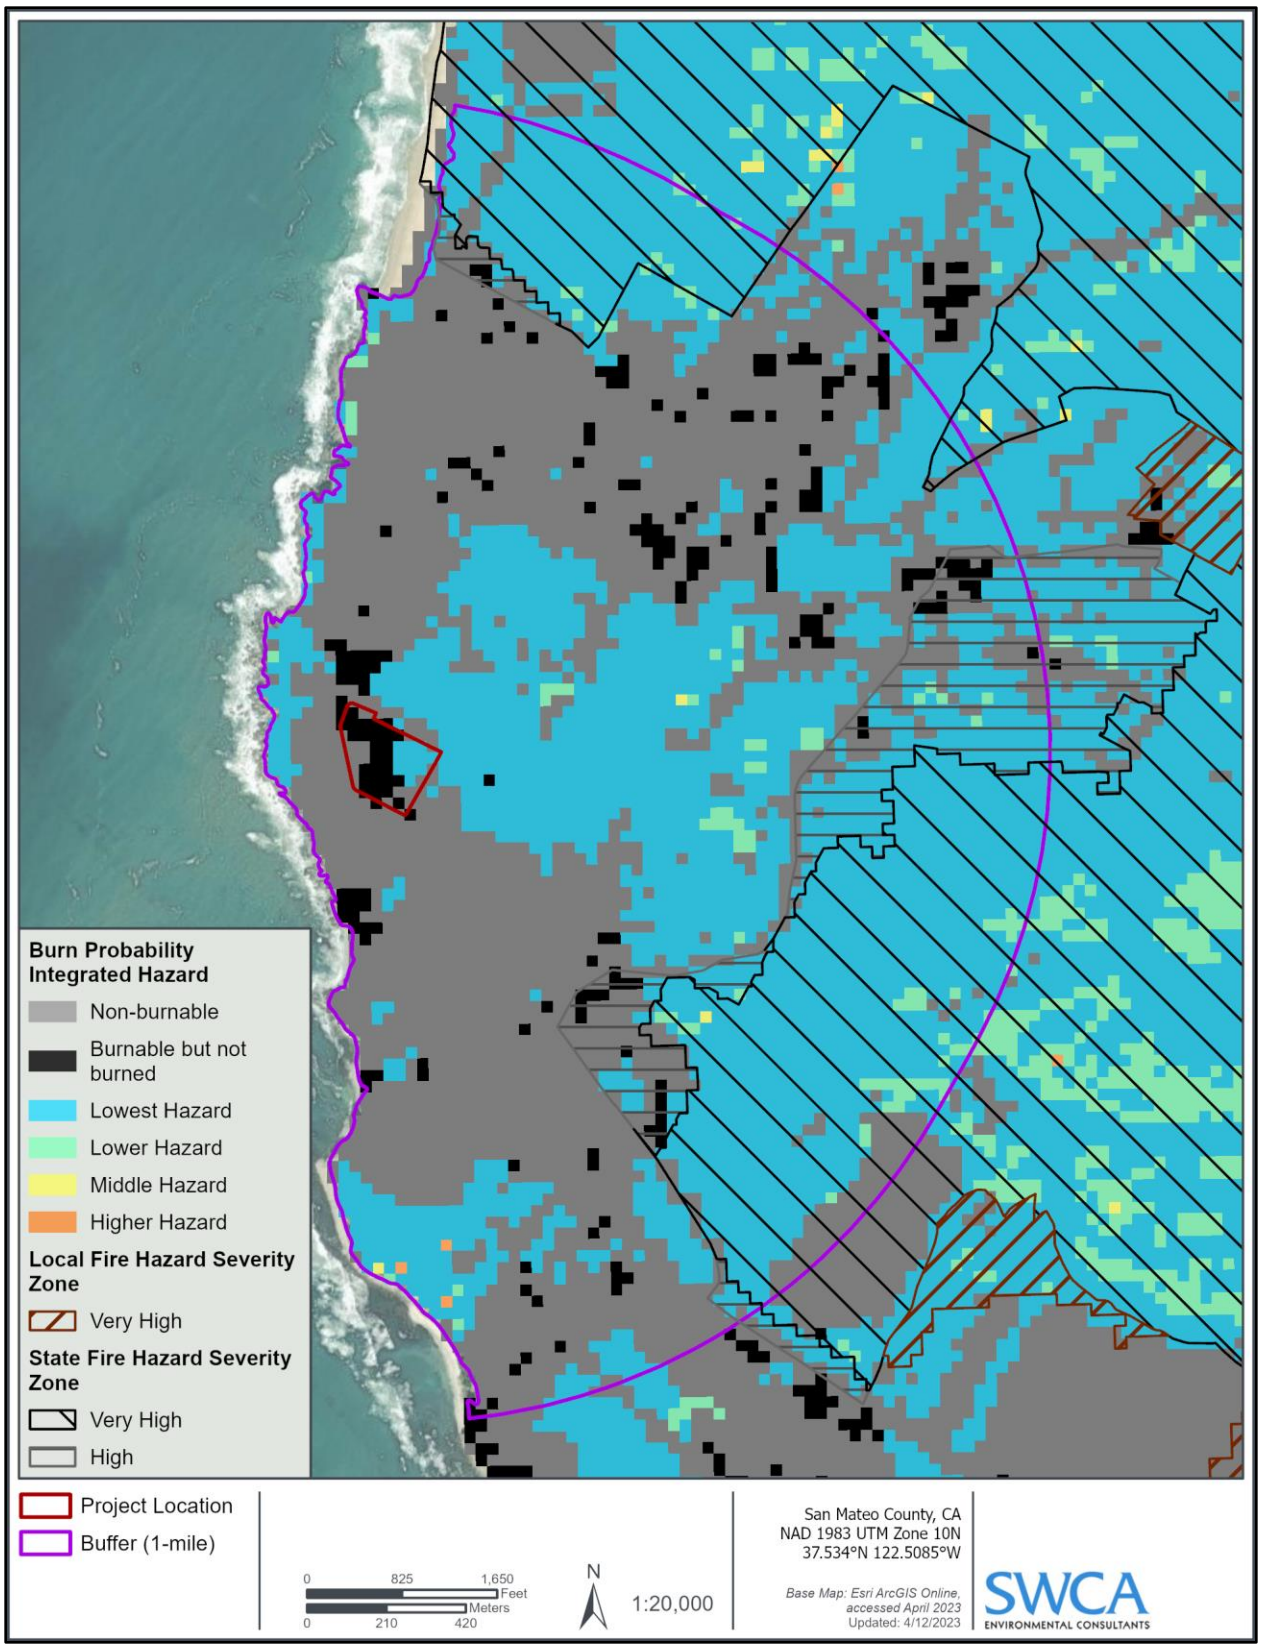

Figure 8. Integrated hazard burn probability.

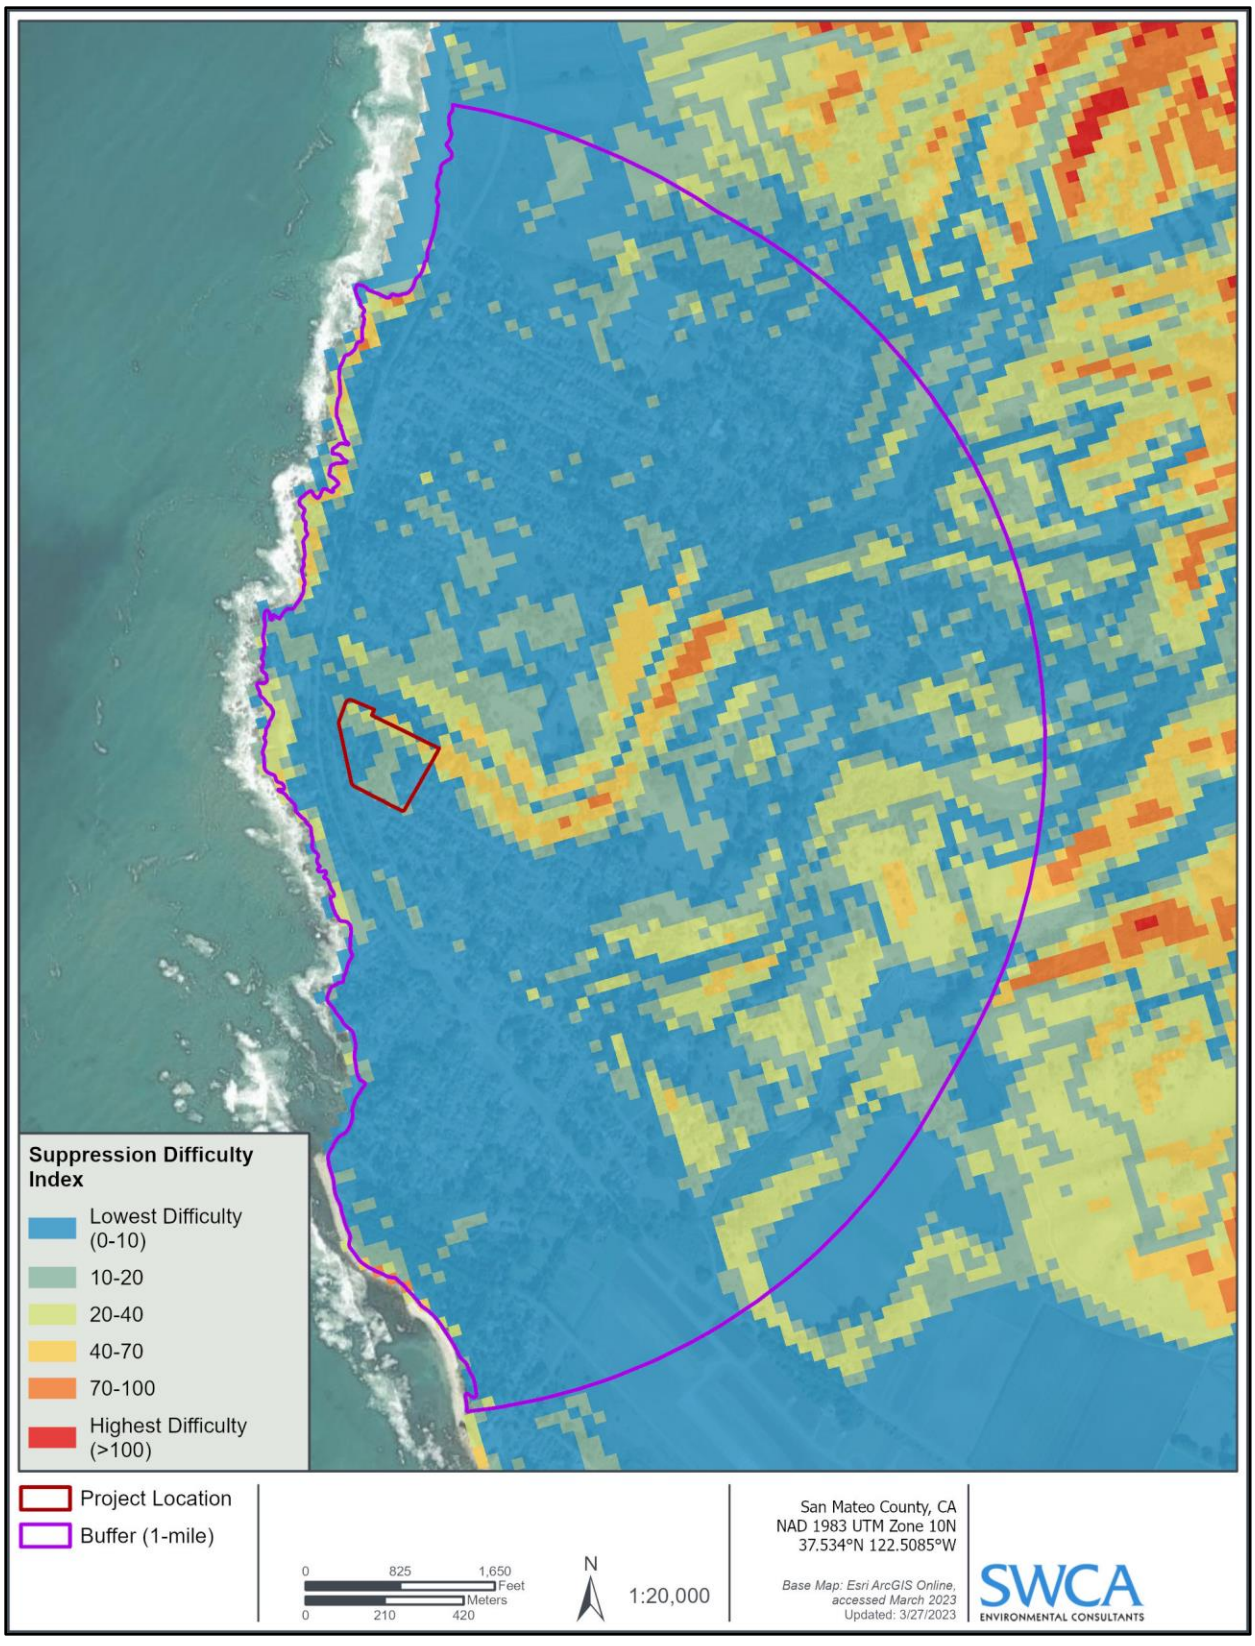

Figure 9. Fire suppression difficulty.

Overall, predicted fire behavior in the project site and 1-mile buffer area is low to moderate. A large percentage of the acres of non-burnable land or burnable, not burned land provides discontinuity in fuels and thus potential fire spread. The rate of spread is low to moderate (less than 50 ch/hr) for most of the project site and project area. Sustained and continuous active crown fire, versus the less extreme passive crown fire, is predicted over a minor percentage of the project site (11%) and project area (1%). Passive crown fire is predicted over less than one-quarter of the project site and project area (21% for each). The low SDI throughout the project site and project area supports the predicted low to moderate fire behavior, low to moderate fuel load, fuel discontinuity, and accessible terrain for emergency responders.

2.3 Fire History

From 2003 to 2022, three fires occurred within a 2-mile radius of the project site (Figure 10). All fires were less than 1 acre and have an "undetermined" cause (Table 3). Historically, in the range of data sourced, the most common causes of wildfires in the County have been "undetermined," equipment use, miscellaneous, and power line/electric power (National Interagency Fire Center 2018).

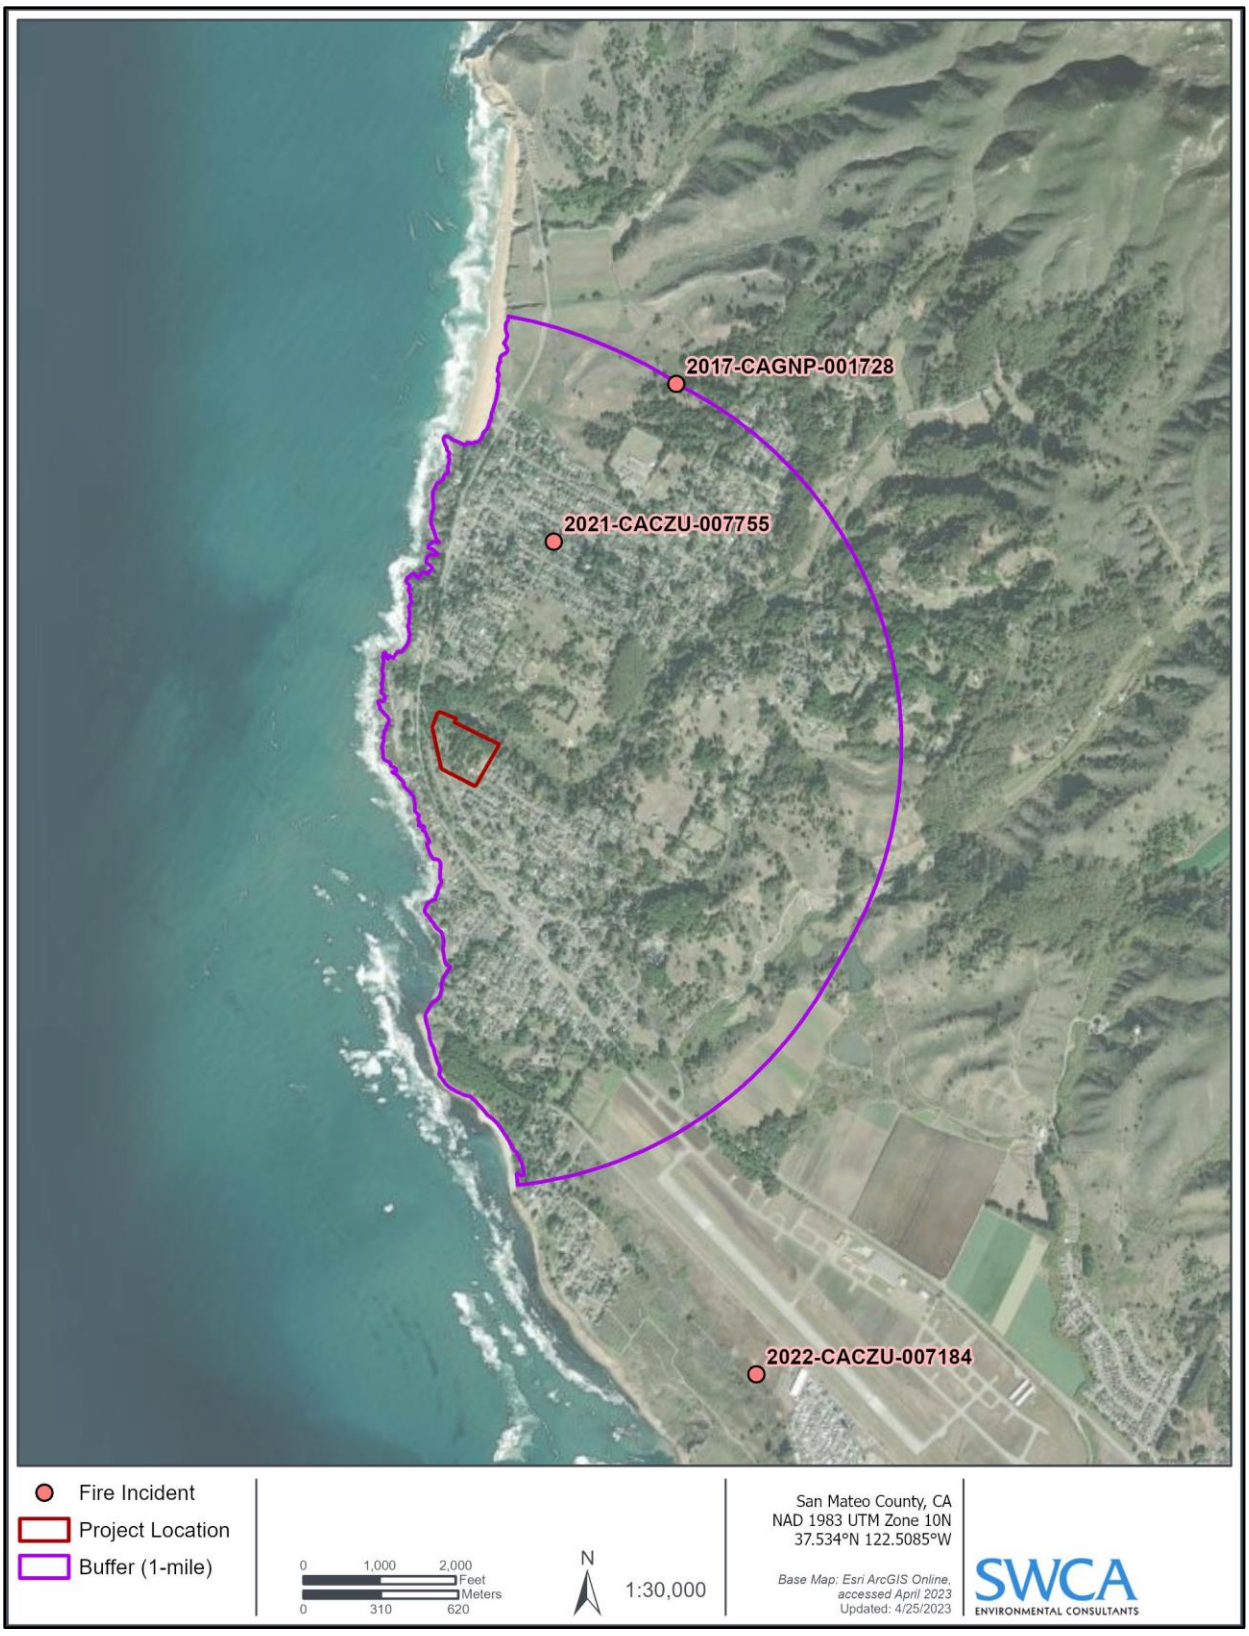

Figure 10. Fire history.

Table 3. Fire History

Date	Incident Name	Size (acres)	Cause
10/20/2022	Airport St Half Moon Bay UNINC (2022-CACZU-007184)	<1	Undetermined
11/19/2021	6th St/East Ave (2021-CACZU-007755)	<1	Undetermined
10/22/2017	Rancho (2017-CAGNP-001728)	<1	Undetermined

3 ANALYSIS OF PROJECT EFFECTS ON WILDFIRE AND EMERGENCY SERVICES

3.1 Emergency Services

The project site is located within a 5-minute drive time from Coastside FPD's Fire Station 44 at Stetson and Kelmore Streets south of Sierra Street, which exceeds the Coastside FPD goal of 6-minute and 59-second response time (Figure 11). There are two additional fire stations within a 10-minute drive time and two additional fire stations within a 15-minute drive time from the project site (Table 4). Drive times were calculated using the ArcGIS Pro Generate Service Areas tool in the Network Analysis toolbox (ESRI 2022). This tool determines a network service area around a facility (the project) to measure accessibility. Travel times were set at 5-minute intervals.

Coastside FPD stations are staffed with one fire captain and two fire apparatus engineers. Additional details on Coastside FPD can be found in Section 1.1.3.4 (Fire Protection). Note that North County Fire Authority Station 72 has a shorter drive time to the project site than Coast Side FPD Station 40. Station 72's primary response area is the Linda Mar area and the southern end of Pacifica.

There are major arteries providing direct access for emergency services to the project site (see Section 3.2 [Emergency Access Routes]). Vehicular ingress/egress to the project site would be provided by a new 28-foot-wide single driveway on Carlos Street on the western boundary of the site, which exceeds the 20-foot road width requirement in the California Fire Code, Section 503 (International Code Council, Inc. [ICC] 2022a). In addition to the main entrance, there would be a 20-foot-wide emergency access route from Lincoln Street to the northeast corner of the project.

Table 4. Fire Stations within a 15-minute Drive Time of the Project Site.

Fire Station	Address	Project Drive Time Interval (minutes)	Distance to Project (miles)
Station 44 Coast Side Fire Protection District	501 Stetson Street, Moss Beach, California	5	0.02
Station 41 Coast Side Fire Protection District	531 Obispo Road, Half Moon Bay, California	10	3.2
Station 72 North County Fire Authority	1100 Linda Mar Boulevard, Pacifica, California	10	3.7
Station 40 Coast Side Fire Protection District	1191 Main Street, Half Moon Bay, California	15	7.3
Station 71 North County Fire Authority	616 Edgemar Avenue, Pacifica, California	15	7.8

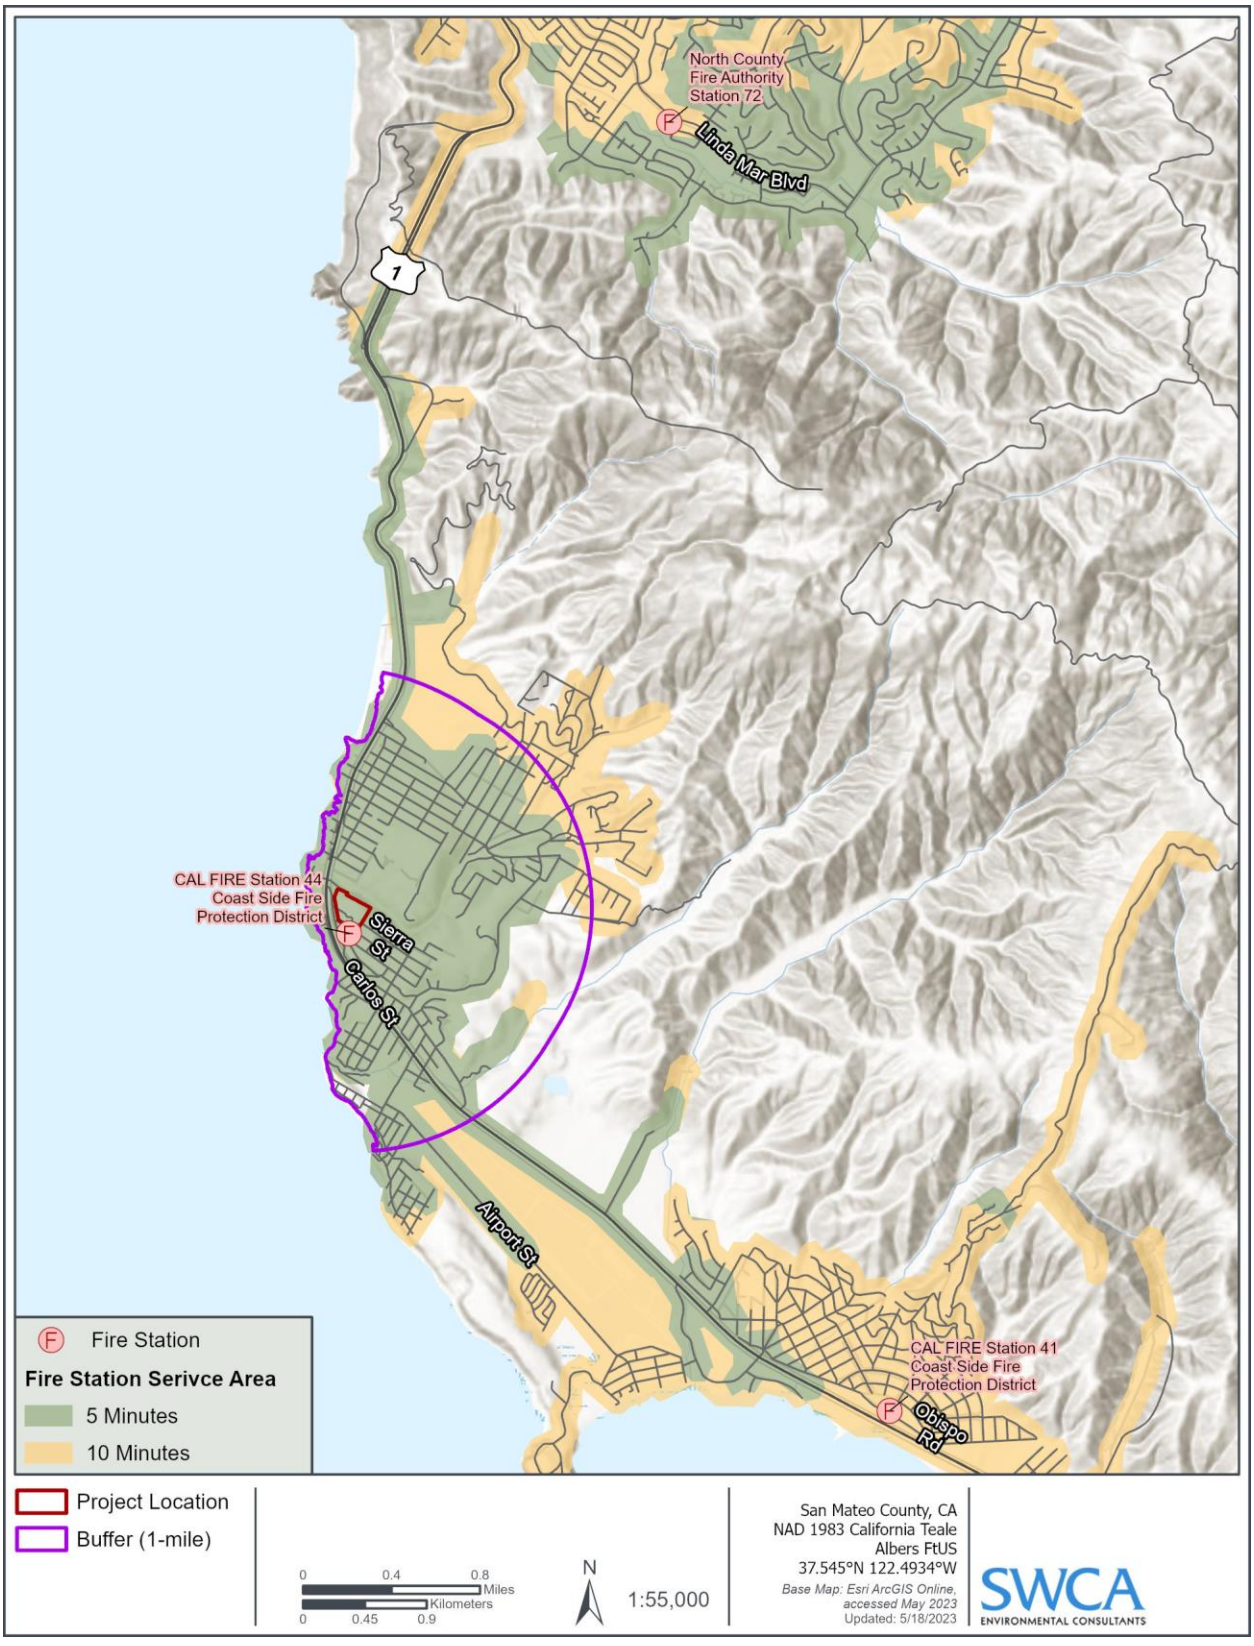

Figure 11. Fire stations within a 10-minute drive time of the project site.

3.2 Emergency Access Routes

There is one existing dirt road on the project site, which is the continuation of Buena Vista Street between Lincoln Street and Carlos Street. The project site can be accessed from Buena Vista Street, Lincoln Street, and Carlos Street. Installation of security gates is not a proposed feature of the project and, therefore, approval from the fire department is not necessary (according to the 2022 California Fire Code, Section 503.6) (ICC 2022a). Addresses would be plainly marked and visible from the street. Numbers would be 4 inches high on a contrasting background, as required by the California Fire Code, Section 505. All access to the project site and identification of site structures have been designed per the 2022 California Fire Code (ICC 2022a).

Vehicular ingress/egress to the project site would be provided by a new 28-foot-wide single driveway on Carlos Street on the western boundary of the site. This road width exceeds the 20-foot road width requirement in the California Fire Code, Section 503 (ICC 2022a). The entrance driveway would split into an access loop that circles the residential and community building areas. In addition to the main entrance, there would be a 20-foot-wide emergency access route from Lincoln Street to the northeast corner of the project.

The applicant has proposed closing Carlos Street between the project driveway and SR-1 to daily traffic from the proposed development; however, it would be available for emergency vehicle ingress/egress and for the public during emergency situations.

All internal driveway and parking areas would be composed of asphalt, concrete, or other approved driving surface capable of supporting the imposed load of fire apparatus weighing up to 75,000 pounds in accordance with California Fire Code, Section D102, which regulates required access and loading for new construction (ICC 2022a).

There is an extensive network of roads, both well-maintained dirt and major paved roads, surrounding the project site, including SR-1. These roads can support weight loads of fire apparatus and allow for access from all directions. There are main arteries from the nearest communities and fire stations that provide direct emergency response services. Descriptions of each roadway facility are presented below.

- SR-1 is a major north-south state highway that facilitates regional travel along California's Pacific coastline and provides the only access to Moss Beach. It connects Moss Beach to destinations in the north such as San Francisco and to the south such as Half Moon Bay. This portion of SR-1 is also known as the Cabrillo Highway. In the vicinity of the project site, it is a two-lane highway with one lane each for both the northbound and southbound directions and median left-turn lanes at the intersections of 16th, Carlos, and Etheldore/Vallemar Streets and California Avenue/Wienke Way. SR-1 has a posted speed limit of 45 miles per hour (mph).
- Carlos Street is a narrow two-way local street that runs north-south through Moss Beach parallel to SR-1. Primary access to the project site is provided via a proposed driveway off Carlos Street north of Sierra Street. North of the project site Carlos Street can be directly accessed from SR-1. From the south access to Carlos Street is from SR-1 via Etheldore Street or California Avenue. The posted speed limit is 25 mph.
- Sierra Street is a two-lane, two-way local street that extends east from Carlos Street to Vermont Street and provides residential access across Moss Beach. The posted speed limit is 15 mph.
- Stetson Street is a two-lane, two-way local street that extends south from Sierra Street near the project site to Sunshine Valley Road and provides access across Moss Beach. The posted speed limit is 15 mph.

- Etheldore Street is a two-lane, two-way local street that connects Moss Beach to SR-1. It extends in a southeasterly direction from the intersection with SR-1 through Moss Beach and intersects with SR-1 further south. The posted speed limit is 15 mph. Vallemar Street is on the west side of SR-1 and is a continuation of Etheldore Street.
- California Avenue is an east-west, two-lane, two-way local street that crosses SR-1 south of the project site, providing SR-1 access to much of the residential area of Moss Beach. The posted speed limit is 15 mph. Wienke Way spurs off California Avenue on the west side of SR-1.
- Airport Street is a north-south, two-lane, two-way local street that runs parallel to SR-1 south of the project site. It provides access from Moss Beach to Half Moon Bay, connecting to local streets in both communities, respectively.

3.3 Fire Water Supply

The project site contains easements for facilities operated by MWSD, including two water storage tanks with a height of 35 feet in the southeastern portion of the site, a booster pump system, and distribution facilities within a fenced parcel of land adjacent to and west of the intersection of Lincoln Street and Buena Vista Street near the eastern boundary of the project site. The project would have water tanks capable of supplying a flow of 100 gallons of water per minute (gpm) for the duration of 2 hours, as required by the California Fire Code, Section 507 (ICC 2019) and in compliance with the San Mateo County General Plan, Chapter 15, Section 15.30 (County of San Mateo 2021). The project would extend water lines to new project facilities for potable water and fire water supply, as well as for irrigation of landscaping. The proposed water line would extend from the existing MWSD tanks along the existing 10-foot right-of-way along the eastern and northern parts of the project site. New domestic water and fire water lines would be located in the driveway loop and parking areas, with individual connections to each building. The fire water would connect to a flow meter in the northeast corner of the driveway loop. The project is considered a R-2 Residential Group occupancy and would have automatic fire sprinkler systems in compliance with California Fire Code, Chapter 9, Section 903.3.1.2 (ICC 2022a). Fire flows for the 63,374 square feet of residential buildings would be at least 1,500 gpm at 20 pounds per square inch residual pressure for a minimum of 2 hours as required by Coastside FPD standards (personal communication via email on October 18, 2022). The fire supply systems meet the requirements listed in California Fire Code, Chapter 5, Section 507.5.1 through 507.5.6 and Appendix C (ICC 2022a). There are 31 fire hydrants located within a 1-mile buffer of the project site (Figure 12). These fire hydrants could be used as additional water sources in the event of wildfire.

Figure 12. Hydrant locations.

3.4 Ignition-Resistant Construction and Fire Protection Systems

Design and construction of new structures within the project site would meet standards in the 2022 California Building Code, Title 24, Part 2, Chapters 7 and 7a for exterior walls and roofing materials, as well as Chapter 9, Section 903 for automatic fire sprinkler systems and fire alarm and detection systems (ICC 2022b). This includes using fire-resistant and ignition-resistant materials of a certain rating for exterior walls and roofing materials.

3.5 Defensible Space and Vegetation Management

The project includes a 30-foot fire break area and a 100-foot reduced fuel zone surrounding the development as required in the Public Resources Code 4291; California Code of Regulations, Title 24, Part 9, Section 4907; and as referenced in the Local Hazard Mitigation Plan (Tetra Tech 2021). The 30-foot fire break would be cleared of all flammable vegetation (except irrigated grass mowed to 4 inches vertical height or less), and the 100-foot reduced fuel zone would maintain vegetation (grass and shrubs) reduced to a maximum of 4 inches vertical height. The reduced fuel zone would ensure adequate spacing between any existing trees, which is a minimum of 10-foot spacing between widest points of the crown of adjacent trees. Tree crowns would be limbed or trimmed to reach this spacing; some trees may also need be removed. The 100-foot reduced fuel zone extends 70 feet beyond the 30-foot fire break area.

The project would retain approximately 193 of the existing trees on-site and remove approximately 295 trees within the project site. Tree Protection Zones would be defined and marked prior to construction to protect each tree to be preserved during construction. Approximately 190 trees would be planted throughout the project site. These trees would be caged for the first year to protect them from herbivores and irrigated until established as evidenced by vigorous top growth in the spring. The project would replant disturbed slopes with native or low-water ground cover and shrubs, and/or seeded with red fescue (*Festuca rubra*) and California poppy (*Eschscholzia californica*), for erosion control.

4 EVACUATION ROUTE ASSESSMENT

Evacuation of residents during an emergency incident is a dynamic situation requiring coordination among different agencies and local residents. Evacuation is recommended by authorities to reduce the risk of residents being impacted by hazards from natural and human-made disasters, such as fire, as well as secondary effects like road congestion. Evacuation recommendations by authorities are done in a manner to help reduce traffic blocks and aid emergency responders during incident operations. A change in population may impact evacuation processes. Ladris Technologies' evacuation platform was used to model potential changes in evacuation times with the increase in residents from the project.

All evacuation simulations were considered with a 1-hour maximum departure timeframe for residents, meaning all vehicles are entering roadways over a 1-hour window. Regional occupancy coverage was set to 100% for each simulation, indicating the maximum number of residents (vehicles) was modeled. All residents within Zone Haven designated zone SMC-E029 (the zone where the project is located) were evacuated to the Coast Side Clinic located at 225 South Cabrillo Highway, Half Moon Bay, California.

Additional details of evacuation modeling methodology can be found in Appendix B.

4.1 Travel Times under Existing and Proposed Development Models

The development proposes an additional 71 residences with approximately 213 occupants. The evacuation modeling platform only considers vehicle counts and not occupancy. Publicly available data indicates recent trends in cars per capita range from 0.8 to 0.9 in the country, depending on specific year. This model assumes 0.85 car per resident. It does not account for possible differences in cars per capita in situations such as affordable or senior housing.

Simulations were run with and without the proposed development to model the impact on travel time from increased vehicles (residents) in the evacuation zone. Table 5 shows the increase in evacuation time by approximately 18% for median travel time and 1% for maximum travel time with the proposed development compared with no proposed development. The development modeled in Table 5 does not include the project mitigation of the temporary closure of Carlos Street between the project driveway and SR-1 as it would be open during an emergency situation.

The model shows all residents within Zone Haven SMC-E029 evacuating within 1-hour to the Coast Side Clinic in Half Moon Bay, California, to the south of Moss Beach. Evacuation times model probable flows of traffic using all available roads and routes to the designated evacuation point; SR-1 and Airport Street are two main arteries. Additional details of the simulation can be found in Appendix B.

Table 5. Travel Times with and without Proposed Development

Project Status	Median Time (H, M)[1]	Percent Increase	Maximum Time (H, M) [1]	Percent Increase
No development	1H, 27M	--	2H, 22M	--
Development	1H, 43M	18.3%	2H, 23M	1%

1. Hours, Minutes

Source: Ladris Technologies

5 CUMULATIVE IMPACTS

The proposed Etheldore Apartments Project is located nearby the project (approximately 2,100 feet southeast). Ethledore Apartments is a project that includes the construction of an eight-unit, multiple-family housing development (San Mateo County 2023). The Etheldore Apartments Project is currently in early planning and development stage of environmental review. The pre-application workshop was held in February 2020. The Etheldore Apartments Project also has the potential to increase human-caused ignitions in the surrounding area, though smaller in scope (fewer housing units). No additional projects are currently planned to occur within 1 mile of the project site.

6 CONCLUSION

The minimal fire history, discontinuity of fuels across the landscape, and the low to moderate predicted fire behavior (burn probability, rate of spread, and crown fire) in the project site and 1-mile buffer area indicate a low fire hazard. While the proposed development of residential buildings where there currently are none potentially increases human-caused ignitions, both during and post-construction, modeled fire behavior does not lend itself to large fire growth. The addition of paved roads and other nonburnable

surfaces associated with project development further fragment flammable fuels, preventing fire spread by acting as fuel breaks. Additionally, the SDI shows a low difficulty in suppression efforts for the project site, indicating the likelihood of stopping forward progression of a fire, minimizing fire size and adverse impacts to the environmental setting.

Given the relatively flat terrain and absence of significant topographic features in the vicinity, it is not likely the topography would exacerbate wildfire risks, and it is not likely a fire would result in landslides, post-fire slope instability, or drainage and debris flow issues. Fire is an intrinsic part of the landscape, and during seasonal prevailing winds when fire season peaks, risks would be reduced by designing an area of defensible space around the building, using ignition-resistant equipment, and adding domestic fire water lines to the buildings.

The project site is located within 300 feet from Fire Station 44, ensuring sufficient emergency response if necessary (less than a 6-minute and 59-second response time). Resident evacuation simulations indicate that the project would increase evacuation time by approximately 1% for median travel time and 18% for maximum travel time. There is, however, a network of roads surrounding the project site. There are main arteries from the nearest communities and fire stations that provide direct emergency response services beyond Station 44.

As the area experiences further growth and development, the County anticipates that exposure to wildfire hazards will remain the same or decrease over time due to codes and regulations enforcement for new construction (Tetra Tech 2021). The project would follow all applicable local, state, and federal regulations designed to reduce wildfire risk for new developments, including defensible space measures (PRC 4291), fire-resistant building materials and features (California Building Code and California Residential Code), and emergency vehicle ingress/egress routes (California Code of Regulations Title 14 and California Fire Code Title 24). Local plans, such as the 2021 Multijurisdictional Local Hazard Mitigation Plan and the Connect the Coastside Plan further describe coordinated actions to reduce wildfire risk and enhance emergency response, including evacuation of the public during emergency situations. The project would not impair the evacuation procedures and warning time protocols as described in the Local Hazard Mitigation Plan (Tetra Tech 2021).

APPENDIX A

Fire Behavior Modeling

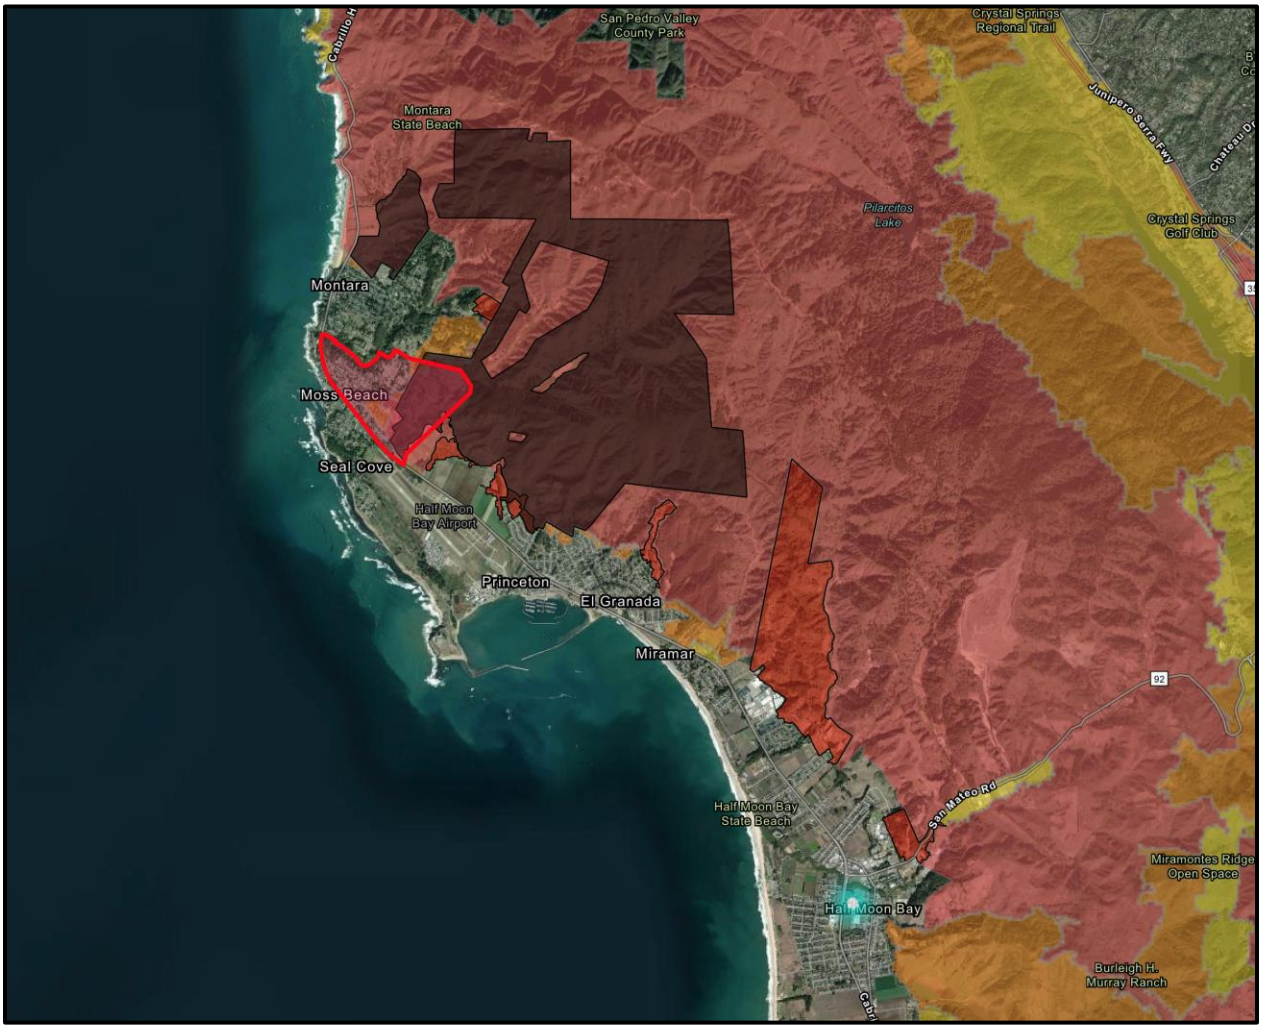
Fire behavior modeling was conducted using the Interagency Fuels Treatment Decision Support System (IFTDSS) (U.S. Department of Interior–Wildland Fire Management RD&A 2021) and FlamMap (U.S. Forest Service 2023). IFTDSS is a web-based application that models fire behavior under a variety of weather conditions and possible fuels treatments for an area of interest or a landscape. FlamMap is a fire behavior mapping and analysis program that computes discrete potential fire behavior characteristics, or metrics. IFTDSS and FlamMap use the following data parameters: 1-hour, 10-hour, and 100-hour dead fuel moistures; herbaceous and woody live fuel moistures; and wind speed and direction. Fuel size classes (1, 10, and 100 hour) used for dead fuel moisture are based on the fuel size diameter and how long it takes for approximately 67% of the moisture content of the woody fuel to reach equilibrium with the environment. Live fuel moistures range from approximately 50% to 300% depending on the stage of vegetative development.

Fire behavior metrics were run with parameters at the 97th percentile to represent extreme conditions or a worst-case scenario. Fire weather and fuels conditions are from the closest remote automated weather station (RAWS) to the project, Spring Valley RAWS. RAWS data available was from July 1999 to October 2016; to account for ongoing drought in the region, some 97th percentile parameters were modified. The 100-hour fuel moisture, live herbaceous fuel moisture, and live woody fuel moisture values were reduced to reflect consistent trends throughout the state and coastal region because of drought. Analysis was conducted for the project site and the 1-mile buffer area.

IFTDSS and FlamMap use fire behavior fuel models to classify the vegetation on the landscape. LANDFIRE was used for certain modeling when the San Mateo Countywide Fine Scale Vegetation Map and Landscape Database Project data were incompatible. LANDFIRE data are at a 30-meter resolution, while the Fine Scale Project data are at a 5-meter resolution.

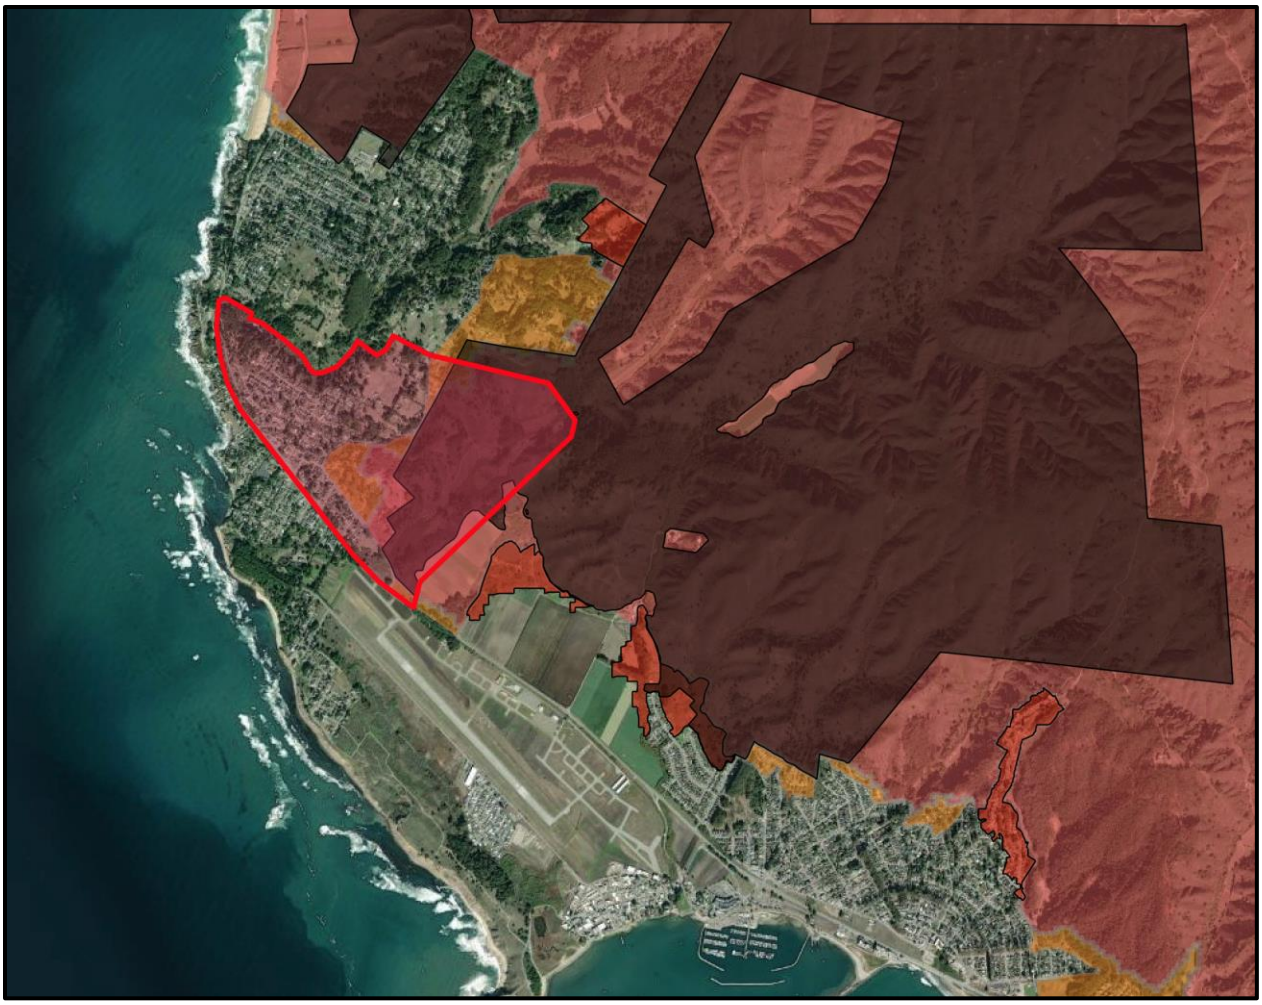
The 30-foot fuel break maintains irrigated grass mowed to 4 inches or less vertical height. This is best represented by a nonburnable substrate as it would not be flammable with constant irrigation.
The 100-foot reduced fuel zone (70 feet beyond the fuel break) would maintain all grass and shrubs to a vertical height of 4 inches or less, making both grass and shrubs behave like grass fuel model GR1 with a low fuel load and thus low predicted fire behavior. This modified 100-foot zone would reduce fuels in critical areas where new fire starts are likely to occur from human activities and also create defensible space from off-site fuels to prevent fire spread to the structure.

APPENDIX B



Evacuation Route Simulations

The Ladris Technologies' evacuation modeling platform considers only vehicle counts and not occupancy. Publicly available data indicates recent trends in cars per capita range from 0.8 to 0.9 in the country, depending on specific year. This model assumes 0.85 car per resident and does not distinguish between local differences in the country average.



All evacuation simulations were considered with a 1-hour maximum departure timeframe for residents, meaning all vehicles are entering roadways over a 1-hour window. A 1-hour departure timeframe represents an extremely urgent evacuation scenario representing a worst-case-scenario. Regional occupancy coverage was set to 100% for each simulation, indicating the maximum number of residents (vehicles) was modeled.

All residents within Zone Haven designated zone SMC-E029 (the zone where the project is located) were evacuated in all simulations. All residents were evacuated to the Coast Side Clinic located at 225 South Cabrillo Highway, Half Moon Bay, California, to represent a potential temporary shelter for evacuating residents during an emergency incident.

Evacuation zone with CAL FIRE FHSZs and evacuation point.

I&R Job No.: 17-158

INTRODUCTION

The Cypress Point affordable housing project is located on approximately 10.88 acres of vacant land northeast of the intersection of Carlos Street and Sierra Street in Moss Beach, an unincorporated community within San Mateo County, California. The project proposes to develop 71 affordable housing units on this lot, consisting of approximately 22 two-story buildings holding 2 to 4 units each. The project would provide a mixture of 1, 2, and 3-bedroom units, including a combination of two-story townhouses and ADA-accessible 1-story flats. In addition to the housing units, the development will include an approximately 3,200 square foot community building that will include the general office, the manager's office, a community room, kitchen, computer room, laundry, and maintenance and storage areas. The project would also include several outdoor amenities, including a community garden, a children's play area, upper and lower greens, and BBQ areas. The total developed area would be approximately 235,000 square feet.

This report evaluates the project's potential to result in significant noise and vibration impacts with respect to applicable California Environmental Quality Act (CEQA) guidelines. The report is divided into three sections: 1) the Setting Section provides a brief description of the fundamentals of environmental noise, summarizes applicable regulatory criteria, and discusses the results of the ambient noise monitoring survey completed to document existing noise conditions; 2) the Policy Consistency Section discusses the noise and land use compatibility of the proposed project utilizing applicable policies; and 3) the Impacts and Mitigation Measures Section describes the significance criteria used to evaluate project impacts on sensitive receptors, provides a discussion of each project impact, and presents measures, where necessary, to mitigate the identified impacts to a less-than-significant level.

SETTING

Fundamentals of Environmental Noise

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound could be caused by its *pitch* or its *loudness*. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (*frequency*) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is a combination of the intensity of sound waves and the reception characteristics of the ear. Intensity may be compared with the height of an ocean wave in that it is a measure of the amplitude of the sound wave.

Several noise measurement scales are used to describe noise in a particular location. A *decibel (dB)* is a unit of measurement which indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and the perception of its intensity. Each 10 decibel increase in sound level

is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms used in this analysis are defined in Table 1.

There are several methods of characterizing sound when multiple frequencies exist or sound intensities change over time. The most common in California is the *A-weighted sound level (dBA)*. This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table 2. Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This *energy-equivalent sound/noise descriptor* is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of different durations.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Community Noise Equivalent Level* (*CNEL*) is a measure of the cumulative noise exposure in a community, with a 5 dB penalty added to evening (7:00 pm - 10:00 pm) and a 10 dB addition to nocturnal (10:00 pm - 7:00 am) noise levels. The *Day/Night Average Sound Level* (*DNL* or L_{dn}) is essentially the same as CNEL, with the exception that the evening time period is dropped and all occurrences during this three-hour period are grouped into the daytime period.

Effects of Noise

Sleep and Speech Interference

The thresholds for interference with conversation indoors are about 45 dBA if the noise is steady, and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noises of sufficient intensity (above 35 dBA) and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA CNEL. Typically, the highest steady traffic noise level during the daytime is about equal to the CNEL and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12 to 17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Sleep and speech interference is therefore possible when exterior noise levels are about 57 to 62 dBA CNEL with open windows and 65 to 70 dBA CNEL if the windows are closed. Levels of 55 to 60 dBA CNEL are common

along collector streets and secondary arterials, while 65 to 70 dBA CNEL is a typical value for a primary/major arterial. Levels of 75 to 80 dBA CNEL are normal noise levels at the first row of development outside a freeway right-of-way. In order to achieve an acceptable interior noise environment, bedrooms facing secondary roadways need to be able to have adequate ventilation, heating, and cooling with their windows closed; those facing major roadways and freeways typically need special glass windows.

Annoyance

Attitude surveys are used for measuring the annoyance felt in a community that result from noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that the causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The CNEL as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 50 dBA CNEL. At a CNEL of about 60 dBA, approximately 12 percent of the population is highly annoyed. When the CNEL increases to 70 dBA, the percentage of the population highly annoyed increases to about 25 to 30 percent of the population. There is, therefore, an increase of about 2 percent in perceived annoyance for each 1 dBA increase between a CNEL of 60 to 70 dBA. Between a CNEL of 70 to 80 dBA, each decibel increase results in an increase of about 3 percent in the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the CNEL is 60 dBA, approximately 30 to 35 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA CNEL adds about 3 percentage points to the number of people highly annoyed. Above 70 dBA CNEL, each decibel increase results in about a 4 percent increase in the percentage of the population highly annoyed.

Fundamentals of Groundborne Vibration

Ground vibration consists of rapidly fluctuating motions or waves with an average motion of zero (i.e. there is no net motion). Several different methods are typically used to quantify vibration amplitude. One method is the Peak Particle Velocity (PPV). The PPV is defined as the maximum instantaneous positive or negative peak of the vibration wave. In this report, a PPV descriptor with units of mm/sec or in/sec is used to evaluate construction generated vibration for building damage and human complaints. Table 3 displays the reactions of people and the effects on buildings that continuous vibration levels produce.

The annoyance levels shown in Table 3 should be interpreted with care since vibration may be found to be annoying at much lower levels than those shown, depending on the level of activity or the sensitivity of the individual. To sensitive individuals, vibrations approaching the threshold of perception can be annoying. Low-level vibrations frequently cause irritating secondary vibration, such as a slight rattling of windows, doors, or stacked dishes. The rattling sound can give rise to exaggerated complaints for vibrations levels where there is very little risk of actual structural damage.

Construction activities can cause vibration that varies in intensity, depending on several factors. The use of pile driving and vibratory compaction equipment typically generates the highest construction related groundborne vibration levels. Because of the impulsive nature of such activities (i.e. periodic, not continuous), the use of the PPV descriptor has been routinely used to measure and assess groundborne vibration and almost exclusively to assess the potential of vibration to induce structural damage and the degree of annoyance for humans.

The two primary concerns with construction-induced vibration, the potential to damage a structure and the potential to interfere with the enjoyment of life, are evaluated against different vibration limits. Studies have shown that the threshold of perception for average persons is in the range of 0.008 to 0.012 in/sec PPV. Human perception to vibration varies with the individual and is a function of physical setting and the type of vibration. Persons exposed to elevated ambient vibration levels, such as people in an urban environment, may tolerate a higher vibration level.

Damage caused by vibration can be classified as cosmetic or structural. Cosmetic damage includes minor cracking of building elements (exterior pavement, room surfaces, etc.). Structural damage involves threats to the integrity of buildings. Damage resulting from construction related vibration typically results only in cosmetic damage. Safe vibration limits that can be applied to assess the potential for damaging a structure vary by researcher and there is no general consensus as to what amount of vibration may pose a threat for structural damage to the building. Construction-induced vibration that can be detrimental to the building is very rare and has only been observed in instances where the structure is at a high state of disrepair and the construction activity occurs immediately adjacent to the structure.

TABLE 1 Definition of Acoustical Terms Used in this Report

Term	Definition
Decibel, dB	A unit describing, the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20 micro Pascals.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in micro Pascals (or 20 micro Newtons per square meter), where 1 Pascal is the pressure resulting from a force of 1 Newton exerted over an area of 1 square meter. The sound pressure level is expressed in decibels as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e. g., 20 micro Pascals). Sound pressure level is the quantity that is directly measured by a sound level meter.
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sounds are below 20 Hz and Ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day/Night Noise Level, L_{dn} or DNL	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 5 decibels in the evening from 7:00 pm to 10:00 pm and after addition of 10 decibels to sound levels measured in the night between 10:00 pm and 7:00 am.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

TABLE 2 Typical Noise Levels in the Environment

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	110 dBA	Rock band
Jet fly-over at 1,000 feet		
	100 dBA	
Gas lawn mower at 3 feet		
	90 dBA	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	80 dBA	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawn mower, 100 feet	70 dBA	Vacuum cleaner at 10 feet
Commercial area		Normal speech at 3 feet
Heavy traffic at 300 feet	60 dBA	
		Large business office
Quiet urban daytime	50 dBA	Dishwasher in next room
Quiet urban nighttime	40 dBA	Theater, large conference room
Quiet suburban nighttime		
	30 dBA	Library
Quiet rural nighttime		Bedroom at night, concert hall (background)
	20 dBA	
		Broadcast/recording studio
	10 dBA	
	0 dBA

TABLE 3 Reaction of People and Damage to Buildings from Continuous or Frequent Intermittent Vibration Levels

Velocity Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.01	Barely perceptible	No effect
0.04	Distinctly perceptible	Vibration unlikely to cause damage of any type to any structure
0.08	Distinctly perceptible to strongly perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
0.1	Strongly perceptible	Virtually no risk of damage to normal buildings
0.3	Strongly perceptible to severe	Threshold at which there is a risk of damage to older residential dwellings such as plastered walls or ceilings
0.5	Severe - Vibrations considered unpleasant	Threshold at which there is a risk of damage to newer residential structures

Regulatory Background

The State of California and San Mateo County have established regulatory criteria that are applicable to this assessment. The State CEQA Guidelines, Appendix G, are used to assess the potential significance of impacts pursuant to local General Plan policies, Municipal Code standards, or the applicable standards of other agencies. A summary of the applicable regulatory criteria is provided below.

State CEQA Guidelines. Appendix G of the CEQA Guidelines provides criteria with which to evaluate the significance of effects of a proposed project. Under CEQA, noise impacts would be considered significant if the project would result in:

(a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

(b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;

(c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;

(d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;

(e) For a project located within an airport land use plan or where such a plan has not been adopted within two miles of a public airport or public use airport, if the

project would expose people residing or working in the project area to excessive noise levels;

(f) For a project within the vicinity of a private airstrip, if the project would expose people residing or working in the project area to excessive noise levels.

Pursuant to recent court decisions, the impacts on project residents of off-site noise or vibration sources unconnected to the project as described in Checklist Questions (a), (e), and (f) are not included in the Impacts and Mitigation Section of this report. These items are discussed in a separate section addressing Noise and Land Use Compatibility, which evaluates the consistency of the proposed project with the policies set forth in the County's General Plan.

CEQA does not define what noise level increase would be considered substantial. Typically, an increase in the CNEL noise level resulting from the project at noise sensitive land uses of 3 dBA or greater would be considered a significant impact when projected noise levels would exceed those considered acceptable for the affected land use. An increase of 5 dBA CNEL or greater would be considered a significant impact when projected noise levels would remain within those considered acceptable for the affected land use.

2016 California Building Code, Title 24, Part 2. The current version of the California Building Code (CBC) requires interior noise levels attributable to exterior environmental noise sources to be limited to a level not exceeding 45 dBA L_{dn}/CNEL in any habitable room.

California Coastal Act. There are no relevant noise policies in the California Coastal Act that would be applicable to the proposed project.

San Mateo County Mid-Coast Local Coastal Program. The San Mateo County Mid-Coast Local Coastal Program offers qualitative noise goals and objectives, including to 1) require that engines use muffler systems, 2) minimize noise impacts on surrounding land uses, especially residential, and 3) require that all development minimize the impacts of noise on adjacent properties and the community at large.

2014 Final Airport Land Use Compatibility Plan (ALUCP) for the Environs of Half Moon Bay Airport (HAF). The ALUCP adopted by the San Mateo County Airport Land Use Commission contains standards for projects within the vicinity of Half Moon Bay Airport, which are relevant to this project:

4.2.1.1 ***Aircraft Noise Contours.*** Existing (2012) and 20-year future (2032) Community Noise Equivalent Level (CNEL) aircraft noise exposure contours were prepared for HAF and are depicted in Chapter Two of this ALUCP. The 20-year noise exposure contour is slightly larger due to a projected increase in operations as indicated in the *2013 Airport Layout Plan Narrative Report*. Therefore, the 2032 noise exposure contours shall be used for evaluation of airport/land use noise compatibility for HAF.

The 60 dB CNEL noise exposure contour is the threshold for residential noise compatibility for HAF.

4.2.1.3 ***Residential Uses.*** Residential uses are considered conditionally compatible in areas exposed to noise levels between 60-64 dB CNEL only if the proposed use is on a lot of record zoned exclusively for residential use as of the effective date of the ALUCP. In such a case, the detached single-family dwellings must be sound-insulated to achieve an indoor noise level of CNEL 45 dB or less from exterior sources. Residential uses are not considered compatible above 65 CNEL.

San Mateo County General Plan, Chapter 16. San Mateo County offers qualitative noise goals and objectives, including to 1) strive toward a livable noise environment, 2) reduce noise impacts through noise and land use compatibility and noise mitigation, 3) promote protection of noise sensitive land uses and noise reduction in quiet areas and noise impact areas, 4) give priority to reducing noise at the source rather than at the receiver, and 5) promote noise reduction through the use of techniques such as site planning, noise barriers, and architectural design and construction.

The San Mateo County General Plan identifies "normal acceptable" exterior noise levels at residential land uses as 60 CNEL or less and interior noise levels in residences as 45 CNEL or less.

San Mateo County Code of Ordinances.

4.88.330 – Exterior noise standards. It is unlawful for any person at any location within the incorporated area of the County to create any noise, or to allow the creation of any noise on property owned, leased, occupied, or otherwise controlled by such person which causes the exterior noise level when measured at any single or multiple family residence, school, hospital, church, or public library situated in either the incorporated of unincorporated area to exceed the noise level standards as set forth in Table 4, below:

TABLE 4 Receiving Land Use: Single or Multiple Family Residence, School, Hospital, Church, or Public Library Properties.

Category	Cumulative Number of Minutes in Any One Hour Time Period	Daytime, dBA 7 am – 10 pm	Nighttime, dBA 10 pm – 7 am
1	30	55	50
2	15	60	55
3	5	65	60
4	1	70	65
5	0	75	70

a) In the event the measured background noise level exceeds the applicable noise level standard in any category above, the applicable standard shall be adjusted in five (5) dBA increments so as to encompass the background noise level.

b) Each of the noise standards specified above shall be reduced by 5 dBA for simple tone noises, consisting primarily of speech or music, or for recurring or intermittent impulsive noises.

c) If the intruding noise source is continuous and cannot reasonably be stopped for a period of time whereby the background noise level can be measured, the noise level measured while the source is in operation shall be compared directly to the noise level standards in Table 4.

4.88.340 – Interior noise standards. No person shall, at any location within the unincorporated area of the County operate, or cause to be operated within a dwelling unit, any source of sound, or create, or allow the creation of, any noise which causes the noise level when measured inside a receiving dwelling unit with windows in their normal seasonal configuration to exceed the following noise level standards as set forth in Table 5:

TABLE 5 Interior Noise Level Standards – Dwelling Unit

Category	Cumulative Number of Minutes in Any One Hour Time Period	Daytime, dBA 7 am – 10 pm	Nighttime, dBA 10 pm – 7 am
1	5	45	40
2	1	50	45
3	0	55	50

a) In the event the measured background noise level exceeds the applicable noise level standard in any category above, the applicable standard shall be adjusted in five (5) dBA increments so as to encompass the background noise level.
b) Each of the noise standards specified above shall be reduced by 5 dBA for simple tone noises, consisting primarily of speech or music, or for recurring or intermittent impulsive noises.
c) If the intruding noise source is continuous and cannot reasonably be stopped for a period of time whereby the background noise level can be measured, the noise level measured while the source is in operation shall be compared directly to the noise level standards in Table 5.

4.88.360 – Exemptions. The following activities shall be exempted from the provisions of this chapter:

d) Any mechanical device, apparatus, or equipment used, related to or connected with emergency machinery, vehicle, or work.
e) Noise sources associated with demolition, construction, repair, remodeling, or grading of any real property, provided said activities do not take place between the hours of 6:00 pm and 7:00 am on weekdays, 5:00 pm and 9:00 am on Saturdays, or at any time on Sundays, Thanksgiving, and Christmas.

4.88.380 – Exemption. Whenever, for the good of the public, a government agency, public utility, or private utility determines a project must be done before 7:00 am or after 6:00 pm, or weekends, and so states in its contract, change order(s), or bid documents, said work shall be exempted from this chapter.

Existing Noise Environment

The project site is located northeast of the Carlos Street and Sierra Street intersection in Moss Beach, California. Figure 1 shows the project site plan superimposed on an aerial image of the site vicinity. As shown on Figure 1, residential land uses (sensitive receptors) bound the project site to the south, east, and north. There are also commercial buildings associated with the Montara Sanitary District to the west opposite California State Highway 1 (Highway 1).

A noise monitoring survey was made at the project site between Wednesday, August 30, 2017 and Friday, September 1, 2017. The noise monitoring survey included two long-term noise measurements (LT-1 and LT-2) and three short-term noise measurements (ST-1 through ST-3),

as shown in Figure 1. The long-term measurements were made to quantify the daily trends in noise levels near the westernmost and easternmost site boundaries. The 10-minute short-term measurements were made to quantify specific noise sources affecting the project vicinity and characterize the range of noise levels throughout the site. The noise environment at the site and at the nearby land uses results primarily from vehicular traffic along Highway 1.

Long-term noise measurement LT-1 was made in the northeast corner of the project site, approximately 125 feet west of the Lincoln Street centerline. This noise measurement was made to quantify existing noise levels near the adjacent sensitive-receptors. Hourly average noise levels at this location typically ranged from 39 to 55 dBA L_{eq} during the day and from 34 to 47 dBA L_{eq} at night. The average community noise equivalent level on Thursday, August 31, 2017 was 51 dBA CNEL. The daily trend in noise levels at LT-1 is shown in Figure 2.

Long-term noise measurement LT-2 was made along the western boundary of the project site, approximately 60 feet east of the Carlos Street centerline and 200 feet east from the centerline of Highway 1. This noise measurement quantified existing noise levels primarily from vehicular traffic along Highway 1. Hourly average noise levels at this location typically ranged from 48 to 57 dBA L_{eq} during the day and from 41 to 52 dBA L_{eq} at night. The average community noise equivalent level on Thursday, August 31, 2017 was 55 dBA CNEL. The daily trend in noise levels at LT-2 is shown in Figure 3.

Short-term noise measurement ST-1 was made on the southeast corner of the Stetson Street and Sierra Street intersection, approximately 20 feet east of the Stetson Street centerline and approximately 30 feet south of the Sierra Street centerline. The 10-minute average noise level measured at this location between 12:20 p.m. and 12:30 p.m. on Wednesday, August 30, 2017 was 44 dBA L_{eq}. Short-term noise measurement ST-2 was made along 16th Street, approximately 15 feet south of the 16th Street centerline and approximately 260 feet east of the Carlos Street centerline. The 10-minute average noise level measured at this location between 12:40 p.m. and 12:50 p.m. on Wednesday, August 30, 2017 was 53 dBA L_{eq}. Short-term noise measurement ST-3 was made near the center of the project site, approximately 400 feet east of the Carlos Street centerline and approximately 510 feet north of the Sierra Street centerline. The 10-minute average noise level measured at this location between 9:40 a.m. and 9:50 a.m. on Friday, September 1, 2017 was 43 dBA L_{eq}. Table 4 summarizes the results of the short-term noise measurements.

FIGURE 2 Daily Trend in Noise Levels at LT-1

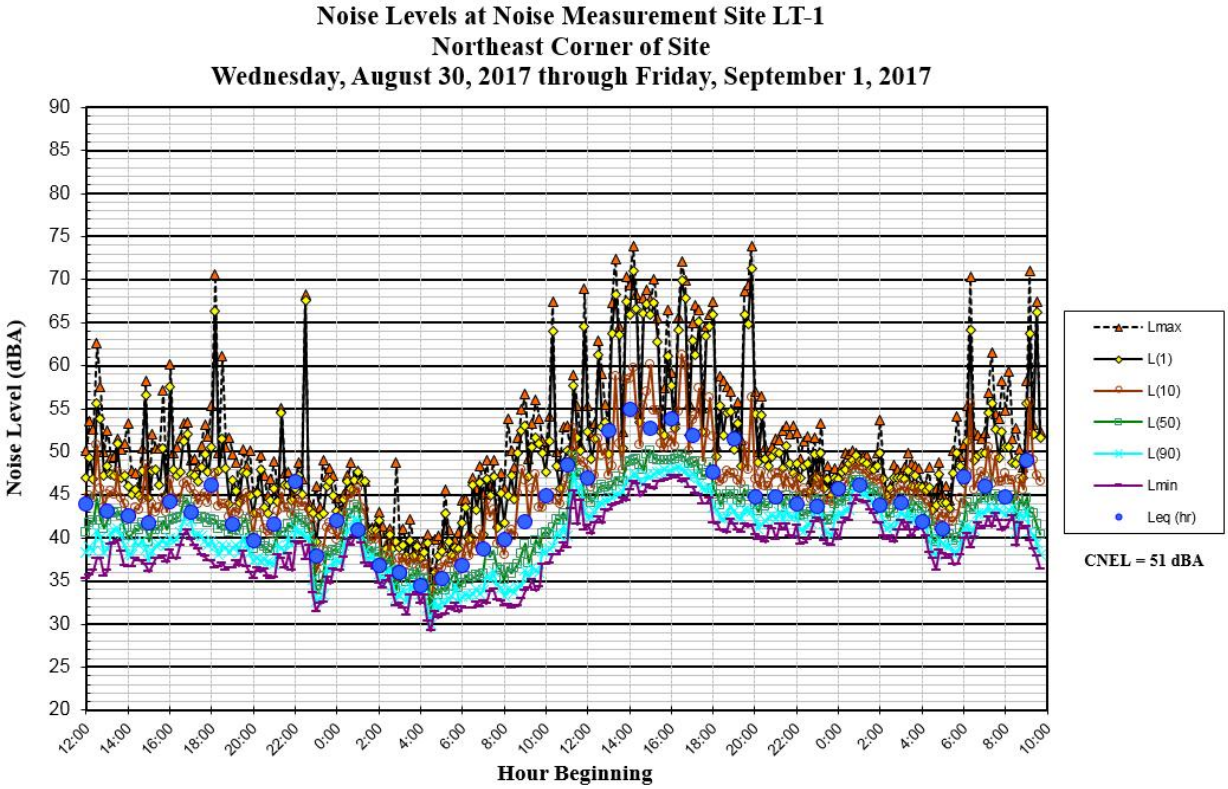

FIGURE 3 Daily Trend in Noise Levels at LT-2

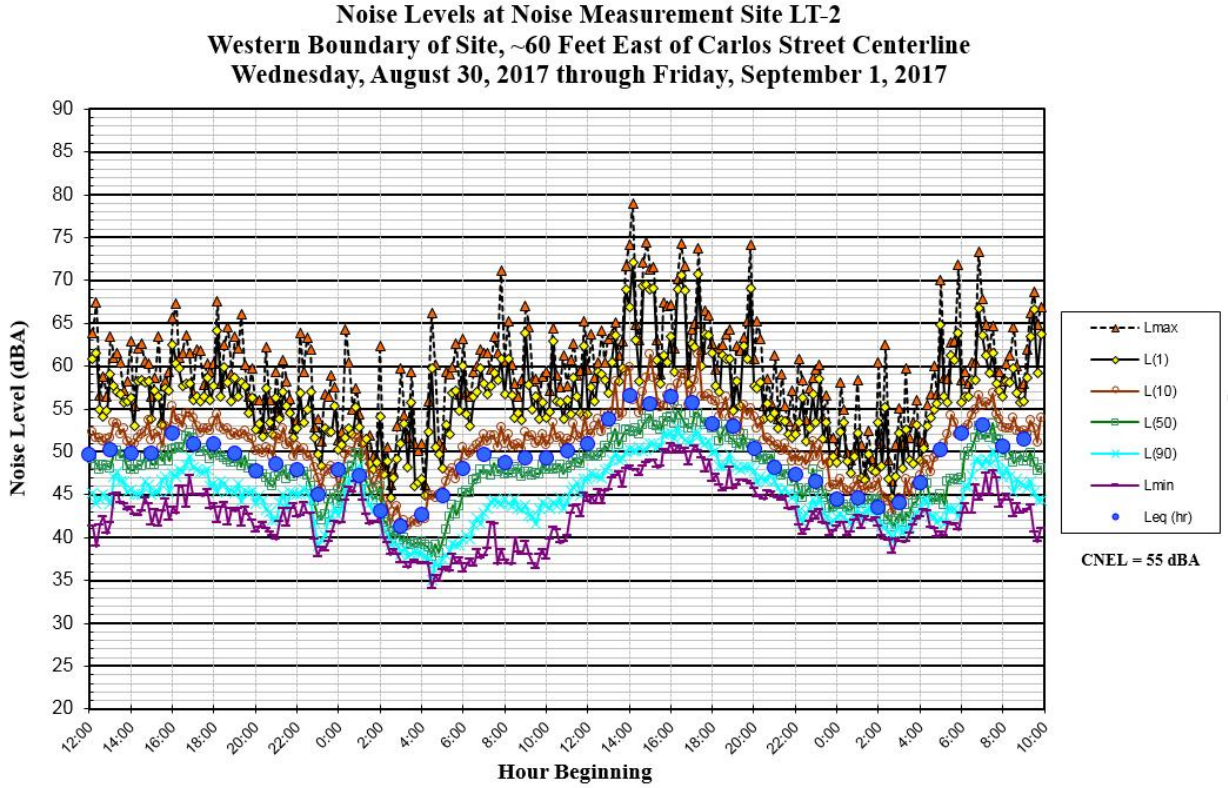

TABLE 4 Summary of Short-Term Noise Measurement Data (dBA)

Noise Measurement Location	L_{max}	$L_{(1)}$	$L_{(10)}$	$L_{(50)}$	$L_{(90)}$	L_{eq}
ST-1: Northeast corner of Stetson Street/Sierra Street intersection. (8/30/2017, 12:20 p.m. - 12:30 p.m.)	51	49	47	43	40	44
ST-2: Along 16th Street. (8/30/2017, 12:40 p.m. - 12:50 p.m.)	60	58	55	52	47	53
ST-3: Center of project site. (9/1/2017, 9:40 a.m. - 9:50 a.m.)	55	51	46	41	38	43

POLICY CONSISTENCY ANALYSIS – COMPATIBILITY OF PROJECT WITH NOISE ENVIRONMENT AFFECTING THE SITE

The County of San Mateo's General Plan sets forth noise policies and programs to mitigate potential impacts through both preventative and responsive measures. The applicable General Plan policies were presented in detail in the Regulatory Background section and are summarized below for the proposed project:

- The County's normally acceptable exterior noise level standard is 60 dBA CNEL or less for the proposed residential land use.

- The County's standard for interior noise at the proposed residential land use is 45 dBA CNEL.

The ambient noise environment at the proposed project site ranges from 51 to 55 dBA CNEL. The future noise environment at the project site would continue to result primarily from vehicular traffic along Highway 1. Traffic volumes in the project vicinity were provided by *Kittelson & Associates, Inc.*[1] A comparison of the traffic volumes indicates that the future cumulative plus project conditions would result in a traffic noise level increase of 2 dBA CNEL along Highway 1 above existing conditions. To estimate the future noise environment at the project site, these increases are applied to the results of the existing measurements described above. Therefore, the future unmitigated ambient noise environment at the project site would range from 53 to 57 dBA CNEL.

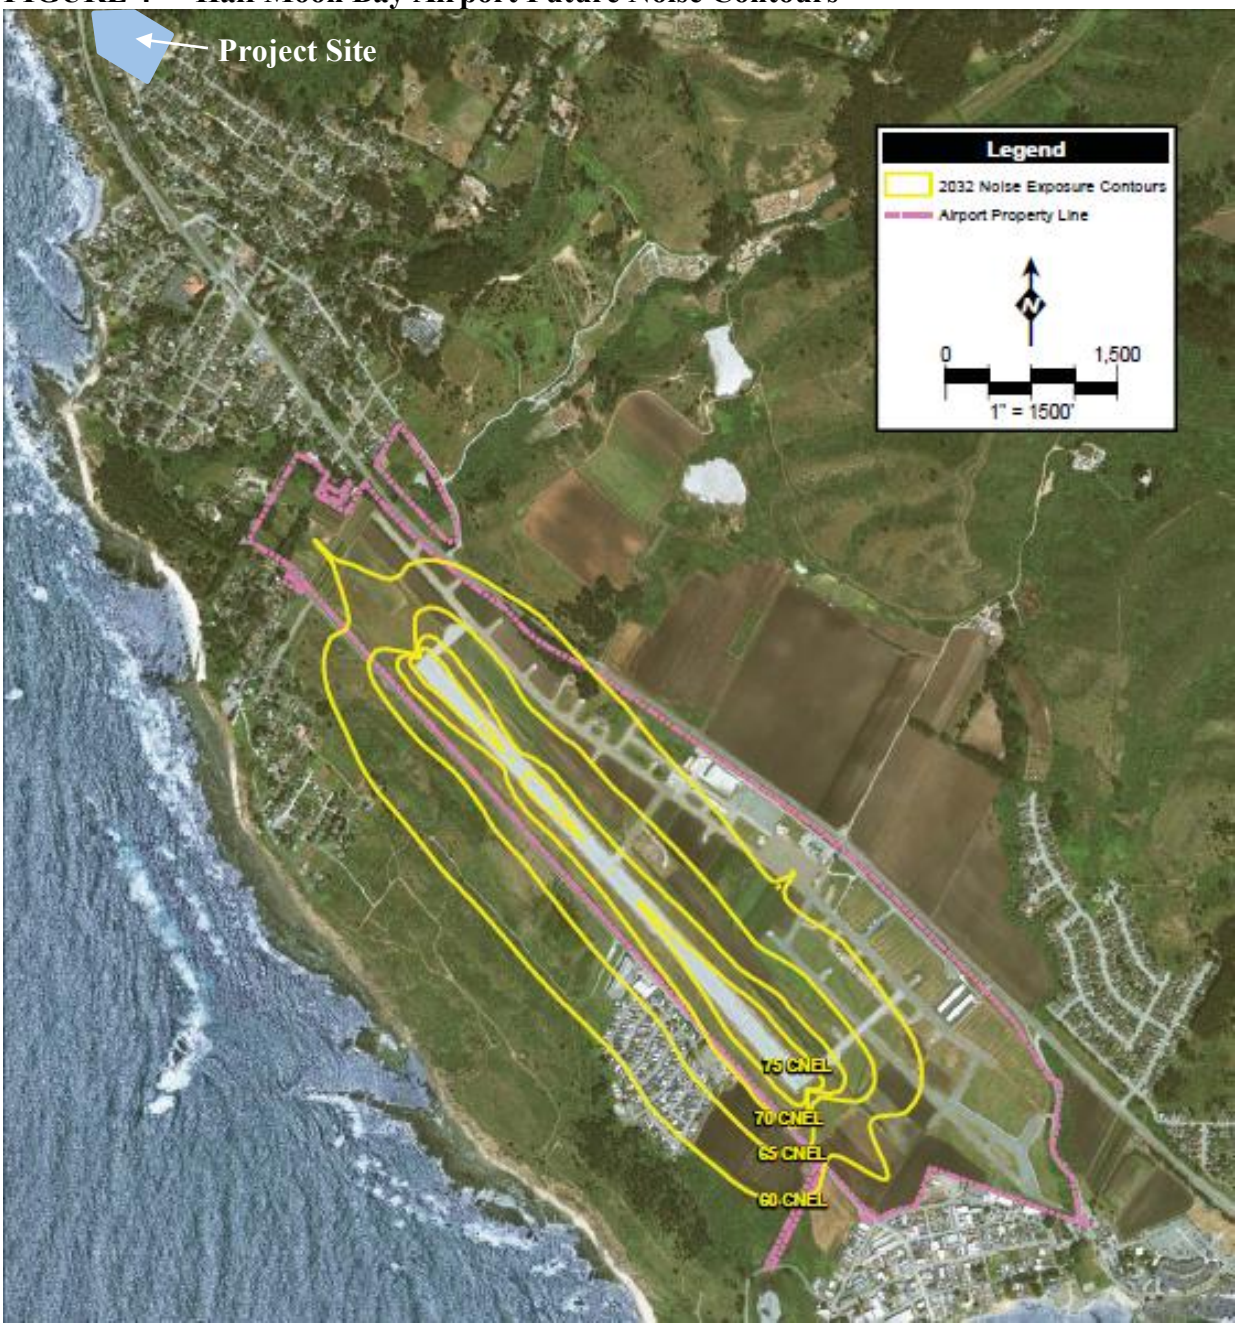
Future Exterior Noise Environment

Common residential outdoor use areas would include a community garden, a children's play area, upper and lower greens, and BBQ areas. As noted above, the County's acceptable exterior noise level standard is 60 dBA CNEL or less. The future exterior noise exposure at the site would be considered compatible with the proposed residential land uses as noise levels are calculated to reach 57 dBA CNEL, and would not exceed the 60 dBA CNEL threshold.

[1] Kittelson & Associates, Inc., "Cypress Point Preliminary Traffic Assessment", June 2017.

Future Interior Noise Environment

The County requires that residential interior noise levels be maintained at 45 dBA CNEL or less. The residences closest to Highway 1 along the western boundary of the project site would experience the greatest future exterior traffic noise exposure, which would be up to 57 dBA CNEL.



Interior noise levels would vary depending upon the design of the buildings (relative window area to wall area) and the selected construction materials and methods. Standard residential construction provides approximately 15 dBA of exterior to interior noise reduction, assuming the windows are partially open for ventilation. Standard construction with the windows closed provides approximately 20 to 25 dBA of noise reduction in interior spaces. Where exterior noise levels range from 60 to 65 dBA CNEL, the inclusion of adequate forced-air mechanical ventilation is often the method selected to reduce interior noise levels to acceptable levels by closing the windows to control noise.

For this project, the set-back from Highway 1 is sufficient to ensure that the interior noise level standard would be met assuming standard construction methods with the windows open for ventilation. No additional noise insulation features (e.g., sound-rated construction methods) would be required.

Aircraft Noise

The Half Moon Bay Airport located approximately 0.8 miles southeast of the project site. The project site lies outside the 2032 60 dBA CNEL noise contour shown in the ALUCP and in Figure 4. Although noise levels resulting from aircraft would be intermittently audible, they would be less than 60 dBA CNEL at the project site and compatible with the proposed land use.

FIGURE 4 Half Moon Bay Airport Future Noise Contours

NOISE IMPACTS AND MITIGATION MEASURES

Significance Criteria

Paraphrasing from the checklist contained in Appendix G of the CEQA Guidelines, a project would normally result in significant noise impacts if noise levels generated by the project conflict with adopted environmental standards or plans, if the project would generate excessive groundborne vibration levels, or if ambient noise levels at sensitive receivers would be substantially increased over a permanent, temporary, or periodic basis. The following criteria were used to evaluate the significance of potential impacts resulting from the project:

- **CEQA Checklist Question (a): Noise Levels in Excess of Standards.** A significant noise impact would be identified if the construction of the proposed project would expose persons in neighboring homes to or generate noise levels that would exceed applicable noise standards presented in the General Plan or Municipal Code. Section 4.88.360 of the San Mateo County Code of Ordinances establishes allowable hours of construction between 7:00 a.m. and 6:00 p.m. on weekdays and 9:00 a.m. and 5:00 p.m. on Saturdays. No construction shall be allowed at any time on Sundays, Thanksgiving, and Christmas.

- **CEQA Checklist Question (b): Groundborne Vibration from Construction.** A significant impact would be identified if the construction of the project would expose persons to excessive vibration levels. Groundborne vibration levels exceeding 0.3 in/sec PPV would have the potential to result in cosmetic damage to normal buildings.

- **CEQA Checklist Question (c): Permanent Noise Increases.** A significant impact would be identified if traffic generated by the project would substantially increase noise levels at sensitive receivers in the vicinity. A substantial increase would occur if: a) the noise level increase is 5 dBA CNEL or greater, with a future noise level of less than 60 dBA CNEL, or b) the noise level increase is 3 dBA CNEL or greater, with a future noise level of 60 dBA CNEL or greater.

- **CEQA Checklist Question (d): Temporary Noise Increases.** A significant noise impact would be identified if construction-related noise would temporarily increase ambient noise levels at sensitive receptors. Hourly average noise levels resulting from project construction exceeding 60 dBA L_{eq}, and increasing ambient noise levels by at least 5 dBA L_{eq}, for a period of more than one year would constitute a significant temporary noise increase at adjacent residential land uses.

Impact NOISE-1: Noise Levels in Excess of Standards. The proposed project would comply with the allowable hours of construction as established in the County's Code of Ordinances. **This is a less-than-significant impact.**

Construction Noise

Section 4.88.360 of the San Mateo County Code of Ordinances establishes allowable hours of construction between 7:00 a.m. and 6:00 p.m. on weekdays and 9:00 a.m. and 5:00 p.m. on Saturdays. No construction is allowed to occur at any time on Sundays, Thanksgiving, and Christmas. The project proponent will be required to comply with the code limits and construction activities will only be allowed to occur during allowable hours. Project construction activities would comply with applicable noise standards and therefore, this would be a less-than-significant impact, and no mitigation is required.

Impact NOISE-2: Exposure to Excessive Groundborne Vibration due to Construction. Construction-related vibration levels resulting from activities at the project site would not exceed 0.3 in/sec PPV at the nearest sensitive receptor. **This is a less-than-significant impact.**

The construction of the project may generate vibration when heavy equipment or impact tools (e.g. jackhammers, hoe rams) are used. Construction activities would include demolition, site preparation, grading, excavating, paving, and new building framing and finishing. This analysis assumes the proposed project would not require pile driving, which can cause excessive vibration.

For structural damage, the California Department of Transportation recommends a vibration limit of 0.5 in/sec PPV for buildings structurally sound and designed to modern engineering standards, 0.3 in/sec PPV for buildings that are found to be structurally sound but where structural damage is a major concern, and a conservative limit of 0.08 in/sec PPV for ancient buildings or buildings that are documented to be structurally weakened. Construction activities would have the potential to produce vibration levels of 0.08 in/sec PPV or more at historical structures located within 60 feet of the project site. However, there are no known ancient buildings or buildings that are documented to be structurally weakened within 60 feet of where construction will take place on the project site. Because it is not known if the buildings surrounding the project site are structurally sound and built to modern standards, this analysis conservatively assumes that ground-borne vibration levels exceeding 0.3 in/sec PPV would have the potential to result in a significant vibration impacts on surrounding residences. For human annoyance, a vibration limit of 0.1 in/sec PPV (Table 3), produced by continuous/frequent intermittent sources of construction vibration would be strongly perceptible and would cause human annoyance.

Table 5 presents typical vibration levels that could be expected from construction equipment at a distance of 25 feet. Project construction activities, such as drilling, the use of jackhammers, rock drills and other high-power or vibratory tools, and rolling stock equipment (tracked vehicles, compactors, etc.), may generate substantial vibration in the immediate vicinity of the activity. At

a distance of 25 feet, jackhammers typically generate vibration levels of 0.035 in/sec PPV, and drilling typically generates vibration levels of 0.09 in/sec PPV. Vibration levels would vary depending on soil conditions, construction methods, and equipment used.

The nearest sensitive receptor to the project site is the residence located along Carlos Street approximately 80 feet southeast of the primary construction area at the project site. Construction activities occurring in the outer landscaped areas of the project site would not likely utilize heavy equipment capable of producing high vibration levels (e.g., vibratory roller). At a distance of 80 feet from the primary construction area, vibration levels attributable to project construction would be up to 0.06 in/sec PPV,[2] which is below the 0.3 in/sec PPV structural threshold and below the 0.1 in/sec PPV human annoyance threshold. Other buildings and sensitive receptors in the project vicinity located further from the project site would also experience construction vibration levels below these thresholds, as vibration attenuates with distance from the source.

At these locations, and in other surrounding areas where vibration would not be expected to cause structural damage, vibration levels may still be perceptible. MidPen has agreed to use administrative controls, such as notifying neighbors of scheduled construction activities and scheduling construction activities with the highest potential to produce perceptible vibration during hours with the least potential to affect nearby businesses, so perceptible vibration can be kept to a minimum. With these controls, and given the intermittent and short duration of the project phases that have the highest potential of producing vibration (use of jackhammers and other high power tools) these levels of vibration would not be considered significant. This would be a less-than-significant impact, and no mitigation is required.

[2] The formula to determined vibration from construction equipment is PPVequip = PPVref x (25/D)^1.1 where PPVequip is the peak particle velocity in in/sec of the equipment adjusted for distance, PPVref is the reference vibration level in in/sec at 25 feet (Table 5), D is the distance from the equipment to the receiver, and 1.1 is used for conservative soil conditions. Formula from the Caltrans Transportation and Construction Vibration Guidance Manual, September 2013.

TABLE 5 Vibration Source Levels for Construction Equipment

Equipment		PPV at 25 ft. (in/sec)	Approximate L_v at 25 ft. (VdB)
Pile Driver (Impact)	upper range	1.158	112
	typical	0.644	104
Pile Driver (Sonic)	upper range	0.734	105
	typical	0.170	93
Clam shovel drop		0.202	94
Hydromill (slurry wall)	in soil	0.008	66
	in rock	0.017	75
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large bulldozer		0.089	87
Caisson drilling		0.089	87
Loaded trucks		0.076	86
Jackhammer		0.035	79
Small bulldozer		0.003	58

Source: Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, May 2006.

Impact NOISE-3: Substantial Permanent Noise Increase due to Project-Generated Traffic. Project-generated traffic would not cause a permanent noise level increase at existing noise-sensitive land uses in the project vicinity. **This is a less-than-significant impact.**

A significant noise impact would occur if traffic generated by the project would substantially increase noise levels at sensitive receptors in the project vicinity. A substantial increase would occur if: a) the noise level increase with the project is 5 dBA CNEL or greater, where existing noise levels are less than 60 dBA CNEL, or b) the noise level increase with the project is 3 dBA CNEL or greater, where existing noise levels are 60 dBA CNEL or greater. The nearest noise-sensitive receptor is approximately 80 feet to the southeast of the project site, where ambient noise levels are expected to remain below 60 dBA CNEL; therefore, a significant impact would occur if project-generated traffic would permanently increase noise levels by 5 dBA CNEL. For reference, traffic volumes would have to double for noise levels to increase by 3 dBA CNEL.

Peak hour traffic volumes along roadways in the project vicinity, as identified in the project's traffic study,[1] were reviewed to calculate the permanent noise increase attributable to project-generated traffic. A comparison of the volumes expected under the Existing Plus Project scenario and the Existing scenario indicated that the hourly average traffic noise level (L_{eq}) would increase by less than 1 dBA as a result of the project. The change in the CNEL would be the same as the change in the peak hour L_{eq}. The permanent noise level increase due to the project-generated traffic would be less than 1 dBA CNEL at noise-sensitive receptors in project vicinity. Therefore, the proposed project would not cause a substantial permanent noise level increase at the nearby noise-sensitive receptors. This is a less-than-significant impact and no mitigation is required.

Impact NOISE-4: Substantial Temporary Noise Increase due to Construction. Existing noise-sensitive land uses would be exposed to construction noise levels in excess of the significance thresholds for a period of more than one year. **This is a potentially significant impact**.

Noise impacts resulting from construction depend upon the noise generated by various pieces of construction equipment, the timing and duration of noise-generating activities, and the distance between construction noise sources and noise-sensitive areas. Construction noise impacts primarily result when construction activities occur during noise-sensitive times of the day (e.g., early morning, evening, or nighttime hours), the construction occurs in areas immediately adjoining noise-sensitive land uses, or when construction lasts over extended periods of time. Project construction is anticipated to occur over an approximate period of 14 month.

While noise level thresholds for temporary construction are not provided in the County's General Plan or Code of Ordinances, the Fundamentals section of this report provides a threshold of 45 dBA for speech interference indoors. Assuming a 15 dBA exterior-to-interior reduction for standard residential construction, this would correlate to an exterior threshold of 60 dBA L_{eq} at residential land uses. Additionally, temporary construction would likely be considered to be annoying to surrounding land uses if the ambient noise environment increased by at least 5 dBA L_{eq} over an extended period of time. The temporary construction noise impact would be considered significant if project construction activities exceeded 60 dBA L_{eq} at nearby residences and exceeded the ambient noise environment by 5 dBA L_{eq} or more for a period longer than one year.

The noise-sensitive receptors to the south of the project site along Carlos Street would have existing daytime ambient noise levels similar to the noise levels recorded at LT-2. Based on these data, the average hourly noise level during daytime construction hours would range from 48 to 57 dBA L_{eq}. The noise-sensitive receptors to the east of the project site would have existing daytime ambient noise levels similar to the noise levels recorded at LT-1. Based on these data, the average hourly noise level during daytime construction hours would range from 39 to 55 dBA L_{eq}.

Construction activities for individual projects are typically carried out in stages. During each stage of construction, there would be a different mix of equipment operating, and noise levels would vary by stage and vary within stages, based on the amount of equipment in operation and the location at which the equipment is operating. Typical construction noise levels at a distance of 50 feet are shown in Tables 6 and 7. Table 6 shows the average noise level ranges, by construction phase, and Table 7 shows the maximum noise level ranges for different construction equipment. Most demolition and construction noise falls with the range of 80 to 90 dBA at a distance of 50 feet from the source.

Notes:
1 Measured at 50 feet from the construction equipment, with a "slow" (1 sec.) time constant.
2 Noise limits apply to total noise emitted from equipment and associated components operating at full power while engaged in its intended operation.
3 Portable Air Compressor rated at 75 cfm or greater and that operates at greater than 50 psi.
Source: Mitigation of Nighttime Construction Noise, Vibrations and Other Nuisances, National Cooperative Highway Research Program, 1999.

Construction activities generate considerable amounts of noise, especially during earth-moving activities when heavy equipment is used. The construction of the proposed project would include demolition, site preparation, grading and excavating, paving, and building erection and finishing. The hauling of excavated materials and construction materials would generate truck trips on local roadways as well.

Noise sensitive land uses located near the project site include residences to the south, east, and north. Hourly average noise levels due to construction activities during busy construction periods outdoors would range from about 74 to 88 dBA L_{eq} at a distance of 50 feet. Construction-generated noise levels drop off at a rate of about 6 dBA per doubling of the distance between the source and receptor. The noise sensitive land uses (residences) are approximately 80 feet to 270 feet from the project site's central primary construction area. At these distances, hourly average noise levels during busy construction periods would range from 70 to 84 dBA L_{eq} at the closest residence to the south, from 63 to 77 dBA L_{eq} at the closest residence to the north, and from 59 to 73 dBA L_{eq} at the closest residence to the east. Construction noise levels would be expected to exceed 60 dBA L_{eq} and to exceed the ambient noise environment by at least 5 dBA L_{eq} at noise-sensitive residential uses in the project vicinity for a period exceeding one year. The impact would be considered significant.

Mitigation Measure NOISE-1: Reduce Construction Noise

Construction activities will be conducted in accordance with the provisions of Section 4.88.360 of the San Mateo County Code of Ordinances, which limits construction work to the hours of 7:00 a.m. and 6:00 p.m. on weekdays and 9:00 a.m. and 5:00 p.m. on Saturdays. No construction shall occur at any time on Sundays, Thanksgiving, and Christmas.

The noise impacts of construction equipment may be minimized through modification of the equipment, the placement of equipment on the site, and by imposing constraints on equipment operations. Construction equipment should be well-maintained and used judiciously to be as quiet as possible. The project proponent shall include the following best management practices in all contracts related to project construction activities near sensitive land uses:

- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

- Unnecessary idling of internal combustion engines should be strictly prohibited.

- Locate stationary noise-generating equipment, such as air compressors or portable power generators, as far as possible from sensitive receptors as feasible. If they must be located near receptors, adequate muffling (with enclosures where feasible and appropriate) shall be used reduce noise levels at the adjacent sensitive receptors. Any enclosure openings or venting shall face away from sensitive receptors.

- Utilize "quiet" air compressors and other stationary noise sources where technology exists.

- Establish construction staging areas at locations that will create the greatest distance between the construction-related noise sources and noise-sensitive receptors nearest the project site during all project construction.

- Locate material stockpiles, as well as maintenance/equipment staging and parking areas, as far as feasible from residential receptors.

- Control noise from construction workers' radios to a point where they are not audible at existing residences bordering the project site.

- Notify all adjacent business, residences, and other noise-sensitive land uses of the construction schedule, in writing, and provide a written schedule of "noisy" construction activities to the adjacent land uses and nearby residences.

- Designate a "disturbance coordinator" who would be responsible for responding to any complaints about construction noise. The disturbance coordinator will determine the cause of the noise complaint (e.g., bad muffler, etc.) and will require that reasonable measures be implemented to correct the problem. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include in it the notice sent to neighbors regarding the construction schedule.

Implementation of the above measures would reduce construction noise levels emanating from the site, limit construction hours, and minimize disruption and annoyance. With the implementation of these measures, and recognizing that noise generated by construction activities would occur over a temporary period, the temporary increase in ambient noise levels would be less-than-significant.

Cotati, CA 94931

Memo

Date: **May 19, 2023**

To: **Craig Stevens, Stevens Consulting**

From: **Michael Thill, Illingworth & Rodkin, Inc.**

SUBJECT: **Cypress Point Affordable Housing Project, San Mateo County, California (17-158)**
Noise Assessment Update of Proposed Tree Removal Activities

This memo summarizes Illingworth & Rodkin, Inc.'s (I&R) evaluation of the noise levels that would be produced by tree removal activities currently proposed as part of the Cypress Point Affordable Housing Project in San Mateo, California. Tree removal activities were not proposed at the time of our prior analysis.[1] Other changes made to the project and supporting technical studies, such as minor modifications to the traffic study, were not considered to be substantial enough to warrant additional analysis.

Tree Removal Activities and Anticipated Noise Levels

Dense development is planned in the center of the project area, and demolition, grading, construction and landscaping will likely require the removal of all trees within the limits of grading. Tree removals will also include healthy trees that are too close to grading to survive the root loss and trees that are relatively far from grading but are in poor condition. In total, approximately 295 trees will be removed. Removal activities would utilize a tub grinder with a 12-foot excavator arm on top to process the trees. Approximately 50 trees per day can be processed, so tree removal activities would last approximately 6 days. The tub grinder will be located towards the center of the parcel, where the majority of trees will be removed.

Noise produced by the tree removal activities proposed by the project would be credibly represented by data collected by I&R at a similar tree removal/wood chipping operation in 2021.[2] Short-term noise measurements were made by I&R to quantify the average noise level produced by the overall operation at various distances from the source. Noise measurements were made using a Larson-Davis Laboratories (LDL) precision Type 1 sound level meter fitted with a ½-inch pre-polarized condenser microphone and windscreen. The sound level meter was calibrated before and after the measurements with an LDL acoustical calibrator. Weather conditions were generally good for the purposes of noise monitoring.

---

[1] Cypress Point Affordable Housing Project, Noise and Vibration Assessment, Illingworth & Rodkin, Inc., June 12, 2018.
[2] Atlas Tree Yard at Pruitt Industrial Park, Windsor, California, Illingworth & Rodkin, Inc., April 9, 2021.

During the noise measurements, a Vermeer HG6800TX Horizontal Grinder, a CAT 966 Wheel Loader, a CAT 323 Excavator, and transport trucks contributed to the measured noise levels. The excavator was used to load stumps, logs, and large branches into the horizontal grinder. The wheel loader moved materials on the site and loaded wood chips onto the transport trucks. The predominant noise source was the horizontal grinder, which remained in operation throughout the entirety of the noise measurements.

Given the size and number of equipment operating, the measured noise data from 2021 would credibly represent a worst-case scenario for the proposed tree removal activities. Measured noise levels were 80 dBA L_{eq} at 75 feet from the center of the operation, 72 dBA L_{eq} at 300 feet from the center of the operation, and 70 dBA L_{eq} at 350 feet from the center of the operation. Noise levels produced by tree processing activities at the Cypress Point project site, measured at 300 feet from the center of the operation (representative of the nearest off-site receptors), would reach 72 dBA L_{eq}.

As noted previously, tree removal activities would last approximately 6 days during the proposed 14 month construction period. Tree removal activities would produce noise levels of approximately 84 dBA L_{eq} at 50 feet from the center of the operation, which is within the range of the noise levels disclosed in our prior analysis (74 to 88 dBA L_{eq} at a distance of 50 feet). Therefore, tree removal activities would not produce higher noise levels than previously disclosed. Since these activities would be limited to a relatively short period of time (6 days), additional mitigation measures are not recommended.

EXECUTIVE SUMMARY

This report presents the results of the transportation study prepared for the proposed Cypress Point project ("project") in support of its Coastal Development Permit application. This study analyzes the potential transportation impacts and effects of the proposed project. The project is analyzed with respect to potential environmental impacts under the California Environmental Quality Act (CEQA) and for transportation effects on local circulation including consistency with Local Coastal Program (LCP) Policy 2.44.

PROJECT DESCRIPTION

The project is located on the northeast corner of Carlos Street and Sierra Street in the unincorporated community of Moss Beach, San Mateo County, California. The 10.875-acre parcel is currently vacant. The proposed project includes 71 affordable housing units. Access to the project site would be provided by a driveway on Carlos Street near the intersection with Sierra Street.

PROJECT IMPACTS

This report identifies the following CEQA impacts related to potential hazards:

- The existing available corner sight distance at the intersection of State Route 1 and Carlos Street is inadequate, and the addition of project traffic will substantially increase the hazard at this intersection.
- The project will increase pedestrian activity with no existing sidewalks along the project frontage and connecting to destinations, including a bus stop, in Moss Beach.
- The nearest SamTrans bus stop (along State Route 1 at 16th Street) would require pedestrians, including residents of the proposed project, to cross State Route 1 at a location without a marked pedestrian crossing and inadequate sight distance.
- The project may result in a significant impact with respect to vehicle miles traveled, pending further analysis. As part of subsequent environmental review, the County may determine whether to rely on a potential screening option to evaluate the project's vehicle miles traveled (which would assume a less-than-significant impact) or a more quantitative analysis approach.

RECOMMENDED MITIGATIONS

Provide additional Transportation Demand Management (TDM) Features

The project's proposed TDM plan includes a package of measures that would be expected to reduce project vehicle trips. The TDM plan would require the project to distribute educational information to residents related to transportation options, bus routes, and transportation safety to address pedestrian safety impacts.

In addition to the TDM elements required as part of the C/CAG TDM Checklist (included as Appendix 9), it is recommended that the project also construct as mitigation measures sidewalk, crosswalk, bicycle route, and transit infrastructure improvements that would improve conditions within Moss Beach for pedestrians and bicyclists.

Address State Route 1 / Carlos Street Sight Distance

The limited sight distance at State Route 1/Carlos Street is deficient for operating conditions. The intersection would provide the main access to and from State Route 1 for the project. This report identifies

an impact related to adding project vehicle trips at this intersection and identifies a combination of mitigation measures that would reduce the impact to less than significant. The mitigation measures include a transportation demand management (TDM) plan and closure of Carlos Street between the Project and State Route 1 to all but emergency vehicles. At the time of this writing, the County is working on a Caltrans Project Initiation Document (PID) as part of the Moss Beach State Route 1 Congestion & Safety Improvements Project. With this project, the County will determine feasibility for a traffic signal and roundabout at a combined State Route 1 / 16th Street / Carlos Street intersection, which would also address the impact and could eventually replace the identified mitigation measure. Implementation authority for that project would rest jointly with the County and Caltrans and is therefore out of the County's exclusive control.

LOCAL CIRCULATION EFFECTS

The results of the operational analysis show project effects degrading the operations to below the level of service standard or adding at least four seconds of delay if the intersection is already below the standard at the following intersections:

- **State Route 1 & California Avenue/Wienke Way** in Existing with project weekday PM and Saturday midday peak hour; in Future with project weekday PM and Saturday midday peak hours; and in Cumulative with project weekday AM, weekday PM, and Saturday midday peak hours;
- **State Route 1 & 16th Street** in the Cumulative with project weekday PM peak hour;
- **State Route 1 & Carlos Street** in the Cumulative with project weekday AM and PM peak hours[1];
- **State Route 1 & Vallemar Street / Etheldore Street** in Cumulative with project weekday PM peak hour conditions.

Recommended Improvements

Change the intersection control at State Route 1 & California Avenue / Wienke Way

The operational analysis shows that a change of intersection control at this intersection would provide Level of Service (LOS) B or better in all conditions and scenarios assuming the intersection is converted from side street stop control to signalization as recommended in San Mateo County's draft *Connect the Coastside* report. A preliminary analysis of changing the intersection control to a roundabout showed a single-lane roundabout option would meet applicable LOS standards as well. A change of traffic control is recommended as a near-term (0 to 7 years) improvement in the County's *Connect the Coastside Report*. However, any change of control at this intersection would be subject to an intersection control evaluation (ICE) report as part of Caltrans procedures; the ICE would compare signal-control and roundabout alternatives to make a final determination on the appropriate intersection control. Final determination and approval authority would require Caltrans approval and does not rest within the County's exclusive control.

[1] The County is currently studying a project that would remove this intersection and provide an alternative intersection geometry, configuration and traffic control. For more information, see the Impact T-1 discussion in the Sight Distance and Safety Impacts section beginning on page 37.

Introduction

INTRODUCTION

Kittelson & Associates, Inc. (Kittelson) has prepared this transportation study of the proposed Cypress Point affordable housing project ("project") in Moss Beach, San Mateo County, California. This study provides two levels of analysis and evaluation:

- California Environmental Quality Act (CEQA) Transportation Analysis
- Local transportation analysis for circulation effects and consistency with Local Coastal Program (LCP) Policy 2.44.

Each analysis approach is described in the Data and Analysis Approach section.

PROJECT DESCRIPTION

The project is an affordable housing project located in the coastal zone on a 10.875-acre parcel adjacent to the northeast corner of Carlos Street and Sierra Street in the unincorporated community of Moss Beach, San Mateo County, California (Figure 1). The property is bounded by vacant land to the southwest (towards State Route 1 [SR1]), residential properties along 16th Street to the northwest (in the community of Montara), and residential properties along Carlos, Sierra, and Lincoln Streets on the other two sides. Individual houses along Stetson Street and Buena Vista Street also border the property.

MidPen proposes the development of 71 affordable housing units on this lot, consisting of approximately 22 two-story buildings holding 2-4 units each (Figure 2). The project would provide a mixture of 1, 2, and 3-bedroom units, including a combination of two-story townhouses and ADA-accessible 1-story flats. All the units, except for the manager's apartment, will be affordable to households earning less than 80% of the Area Median Income (AMI). It is expected that the Cypress Point project will provide housing for approximately 213 people, including adults and children.

In addition to the housing units, the development would include an approximately 3,200 square foot community building, that will include the general office, the manager's office, a community room, kitchen, computer room, laundry, and maintenance and storage areas (Figure 2). The project plan also includes several outdoor amenities, including:

- Landscaping;
- A community garden;
- A children's play area;
- An upper and a lower green;
- BBQ areas; and
- A publicly accessible walking trail.

The project site would include a driveway along Carlos Street and 142 vehicle parking spots, with 5 electric vehicle parking spots in a loop surface parking lot.[2] The site would include racks providing for eight short-term bicycle parking spaces and 36 long-term (i.e., indoors and secure) bicycle parking spaces.

The project also includes a transportation demand management (TDM) plan (see Appendix 9) in accordance with C/CAG requirements (see Appendix 9). The TDM plan includes the following measures:

- M2 – Orientation, Education, Promotional Programs, and/or Materials

[2] This number may change as required by updated code requirements; the project sponsor will coordinate with the County on any changes to requirements and required project description changes.

- M3 – TDM Coordinator/Contact Person
- M6 – Transit or Ridesharing Passes/Subsidies
- M8 – Secure Bicycle Storage
- M9 – Design Streets to Encourage Bike/Ped Access
- M11 – Family-supportive Amenities
- M22 – Active Transportation Subsidies
- M23 – Gap Closure
- M24 – Bike Repair Station

Based on the TDM Checklist, this combination of TDM measures can be expected to reduce project vehicle trips substantially.

Data and Analysis Approach

DATA AND ANALYSIS APPROACH

The project is analyzed based on the San Mateo County *Traffic Analysis and Mitigation Approach for "Small" projects*[3] for its effect on local circulation and safety. As explained on the County of San Mateo Public Works website:

> *Effective July 1, 2020, the County of San Mateo has transitioned to using Vehicle Miles Traveled (VMT) instead of Level of Service (LOS) as the metric for determining transportation-related impacts under CEQA.*
>
> *In the past, CEQA transportation-related impacts from a proposed project have been evaluated based on LOS, which measures delay at signalized intersections surrounding the proposed project. Projects determined to have significant impacts based on LOS are required to mitigate these impacts by road widenings, signal improvements, or similar measures to maintain operational efficiency and capacity.*

Therefore, the analysis in this report is present in two sections: first, a CEQA Transportation Analysis section which evaluates the project for potential environmental impacts and second, a Local Transportation Analysis section which evaluates local circulation effects. The approach for each is described below.

CEQA TRANSPORTATION ANALYSIS

The California Environmental Quality Act (CEQA) Guidelines, Appendix G Environmental Checklist Form describes four recommended categories of impacts related to transportation and traffic. These categories are recommended for formal environmental review of projects but are referenced as appropriate for this TIA. The proposed project's impact would be considered significant if it would:

d. Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
b. Conflict with or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).
c. Substantially increase hazards due to a geometric feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
d. Result in inadequate emergency access.

Significance criteria "b" is related to the implementation of vehicle miles traveled (VMT) as the primary performance metric as described above.

VMT ANALYSIS

Senate Bill 743 (SB 743) was signed into law in September 2013. Senate Bill 743 (Steinberg, 2013) required changes to the California Environmental Quality Act (CEQA) Guidelines regarding the analysis of transportation impacts. The purpose of SB 743 is to promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses.

Prior to implementation of SB 743, CEQA transportation analyses of individual projects typically determined impacts on the circulation system in terms of roadway delay and/or capacity usage at specific locations, such as street intersections or freeway segments. The SB 743 changes include the elimination of auto delay, level of service (LOS), and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts.

[3] San Mateo County Traffic Analysis and Mitigation Approach for "Small" projects subject to LCP 2.52 (November 2020).

Under SB 743, a project's effect on automobile delay shall not constitute a significant environmental impact. Therefore, level of service (LOS) and other similar vehicle delay or capacity metrics can no longer serve as transportation impact metrics for CEQA analysis. The California Office of Planning and Research (OPR) updated the CEQA Guidelines and provided a final technical advisory in December 2018, which recommends vehicle miles traveled (VMT) as the most appropriate measure of transportation impacts under CEQA. The California Natural Resources Agency certified and adopted the CEQA Guidelines including the Guidelines section implementing SB 743. The changes have been approved by the Office of the Administrative Law and are now in effect.

Each agency applies its own analysis procedures and thresholds of significance. Many jurisdictions have developed screening methodologies to evaluate whether a project would require detailed VMT analysis or if it would be unlikely to result in an a VMT-related impact (and can thus forego detailed analysis). Assessing VMT is not yet reflected in the LCP, County Traffic Impact Study Requirements, or C/CAG's Traffic Impact Analysis Policy.

However, in lieu of final thresholds still under development, the County is using OPR's recommendations with some modifications that are relevant to the project. The County lists the following thresholds and screening criteria, as well as significance criteria:

- **Residential project threshold:** 15% below baseline for home-based work trip per capita by residence. (The baseline County average is 13.60 home-based trip VMT per resident.)
- **Affordable housing screening criteria guidance:** projects that are 100% affordable housing in infill areas typically generate lower VMT than market-rate housing.

Revisions to CEQA transportation analysis requirements do not preclude the application of local general plan policies, municipal and zoning codes, conditions of approval, or any other planning requirements through a city's planning approval process. These requirements aim to ensure adequate operation of the transportation system in terms of transportation congestion measures related to vehicular delay and roadway capacity.

IMPACT CRITERIA

For this report's analysis, the project will be considered to have a significant impact if:

- The project will substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). For this study the project would "substantially increase hazards due to a design feature or incompatible use" if it would increase traffic volumes for movements that have restricted sight distance for existing posted speeds per Caltrans *Highway Design Manual* standards.
- The project would result in more than 11.56 daily home-based VMT per capita by residence. (This represents a 15% reduction from the baseline County average of 13.60 home-based trip VMT per resident.) It could be exempt from detailed VMT analysis if it meets County screening criteria.

LOCAL TRANSPORTATION ANALYSIS

The County typically does not require a traffic report for projects that generate fewer than 100 trips during the peak hour but in the interest of sharing information, this report has been prepared to include local circulation and traffic operations effects. The local transportation analysis is provided for informational purposes.

INTERSECTION OPERATIONS

Level of service (LOS) describes the operating conditions experienced by motorists. LOS is a qualitative measure of the effect of a number of factors, including speed and travel time, traffic interruptions and delay, freedom to maneuver, driving comfort, and convenience. LOS A through LOS F covers the entire range of traffic operations that might occur. Motorists using a facility that operates at LOS A experience very little delay, while those using a facility that operates at LOS F will experience long delays. Intersection analyses for the ten study intersections were conducted using the operational methodologies outlined in the 2010 Highway Capacity Manual (HCM) (Transportation Research Board, Washington, D.C., 2010).

Signalized intersection. The HCM procedure calculates a weighted average control delay in seconds per vehicle at a signalized intersection and assigns a level of service designation based upon the delay.

Unsignalized intersection. The HCM methodology calculates a weighted average control delay in seconds per vehicle for each controlled intersection leg and for the intersection. A level of service designation for all-way stop-controlled intersections is based upon the weighted average control delay for all intersection legs, similar to the level of service designation for signalized intersections. For two-way stop-controlled intersections, the LOS for the worst approach is used as the LOS performance measure.

Table 1 presents the relationship of average delay to level of service for both signalized and unsignalized intersections.

Table 1: Level of Service Definition for Intersections

Signalized Intersection Average Delay Per Vehicle (Seconds)	LOS	Description of Traffic Conditions	Unsignalized Intersection Average Delay Per Vehicle (Seconds)
≤10.0	A	Free flowing. Most vehicles do not have to stop.	≤10.0
>10.0 and ≤20.0	B	Minimal delays. Some vehicles have to stop, although waits are not bothersome.	>10.0 and ≤15.0
>20.0 and ≤35.0	C	Acceptable delays. Significant numbers of vehicles have to stop because of steady, high traffic volumes. Still, many pass without stopping.	>15.0 and ≤25.0
>35.0 and ≤55.0	D	Tolerable delays. Many vehicles have to stop. Drivers are aware of heavier traffic. Cars may have to wait through more than one red light. Queues begin to form, often on more than one approach.	>25.0 and ≤35.0
>55.0 and ≤80.0	E	Significant delays. Cars may have to wait through more than one red light. Long queues form, sometimes on several approaches.	>35.0 and ≤50.0
>80.0	F	Excessive delays. Intersection is jammed. Many cars have to wait through more than one red light, or more than 60 seconds. Traffic may back up into "up-stream" intersections.	>50.0

Definition of Acceptable Operations

The assessment of the project is based on the Local Coastal Program (LCP). Policy 2.44 states[4]:

> *In assessing the need for road expansion, consider Service Level D acceptable during commuter peak periods and Service Level E acceptable during recreation peak periods*.

Since a roadway segment's capacity is generally controlled by the downstream intersection, an intersection analysis is sufficient for assessing a project's impacts. The analysis in this report therefore considers project effects to be notable if:

- The project will cause an intersection to operate at a LOS that violates the overall standard LOS D in during the weekday AM or PM peak hour (LOS E in the weekend midday peak hour); or if
- An intersection is operating below the LOS standard without the project, but the addition of project-related trips increases the average control delay at the intersection by four seconds or more.[5]

The policy states that these thresholds should be considered when assessing the need for road expansion but does not require capacity increases as a result of conditions below standard.

ANALYSIS SCENARIOS

The evaluation presented in this report was conducted for the following time-of-day/day-of-week peak periods:

- Weekday AM peak hour: 7:00 to 9:00 AM (representing a commuter peak period);
- Weekday PM peak hour: 4:00 to 6:00 PM (representing a commuter peak period); and
- Saturday peak hour: 11:00 AM to 1:00 PM (representing a recreational peak period).

Data were collected (as described in the *Existing* Conditions description below) during each time period, and the hour with the highest vehicle volumes from each of these periods was used in the transportation analysis. The collected multimodal turning movement counts are attached in APPENDIX 1.

The three peak periods described were analyzed for the following analysis scenarios:

- **Existing Conditions:** Represents current conditions. Traffic volumes were developed by seasonal adjustment of data collected on Thursday, April 20, 2017, and Saturday April 22, 2017, in good weather during the school year. Because State Route 1 is a seasonal route, the peak hour traffic volumes collected in April were adjusted to be consistent with the typically busier summer months. The method used to increase the counts to be representative of summer traffic is described in the Existing Conditions Traffic Volumes section and provided in Appendix 2.
- **Existing Project Conditions:** Represents conditions upon implementation of the project. Traffic volumes were developed by combining the seasonally-adjusted existing traffic volumes with the project only volumes.
- **Future Conditions:** Represents near-term future traffic conditions representing conditions when the project would be anticipated to be complete. The Future conditions represent Existing

[4] County of San Mateo Local Coastal Program Policies 2013. Available at https://www.smcgov.org/planning/local-coastal-program. Accessed June 1, 2022.

[5] This threshold is applied per the County's 2013 Traffic Impact Study requirements, cited here as a way to evaluate an intersection that is already below the standard (available online at https://www.smcgov.org/media/46076/download?inline=).

conditions turning movement volumes plus other projects that have been approved or are in the entitlement process but not yet constructed at the time of the traffic counts.

Based on discussions with the San Mateo County Planning and Building Department, the following projects were identified for inclusion in the Future traffic volume. These projects were either approved but not constructed or were in the entitlement process at the time this analysis was conducted. The anticipated trip generation for these two projects was added to the existing seasonally adjusted traffic volumes. Additionally, these projects are of a sufficient size that their traffic may have more than a negligible effect on traffic operations.

- An RV park with 50 spaces and seven tent camping spaces, a single-story 832 square foot laundry and restroom facility, landscape, and drainage improvements; located at the corner of State Route 1 and Capistrano Road in Princeton (PLN2017-00320, associated with PRE2015-00019).
- Big Wave, a project that includes a 70,500 square-foot Wellness Center with housing for developmentally disabled adults and their aides, 161,263 square feet of office/industrial park, and free public parking for beach access and a gated boat storage yard. This project is located on Airport Street north of the Princeton/Pillar Point Harbor area in unincorporated San Mateo County. It has been approved but not constructed.

- **Future with Project Conditions:** Represents near-term traffic conditions with the addition of project traffic. Traffic volumes for the Future project conditions were developed by combining Future conditions volumes with the project only volumes.
- **Cumulative Conditions:** Represents the anticipated Cumulative conditions for the study intersections for the year 2040. The C/CAG-VTA San Mateo County Travel Demand Model was used to develop the future volume forecast for Cumulative Conditions. The model includes future development throughout the region. The 2040 cumulative forecasts are consistent with regional growth totals projected by the Association of Bay Area Governments (ABAG) Plan Bay Area.[6] Therefore, the traffic forecasts reflect both growth in Moss Beach and increases in traffic volumes on State Route 1 due to regional growth. Base year (Year 2013) and future year (Year 2040) forecasts were extracted from the model and linearly interpolated to develop growth between the traffic count year (2017) and the current model horizon year (2040).
- **Cumulative with Project conditions:** Represents the effect of the project on traffic operations under Cumulative conditions. Traffic volumes for the Cumulative with project conditions were developed using the same additive approach used for the Existing with project and Future with project volumes.

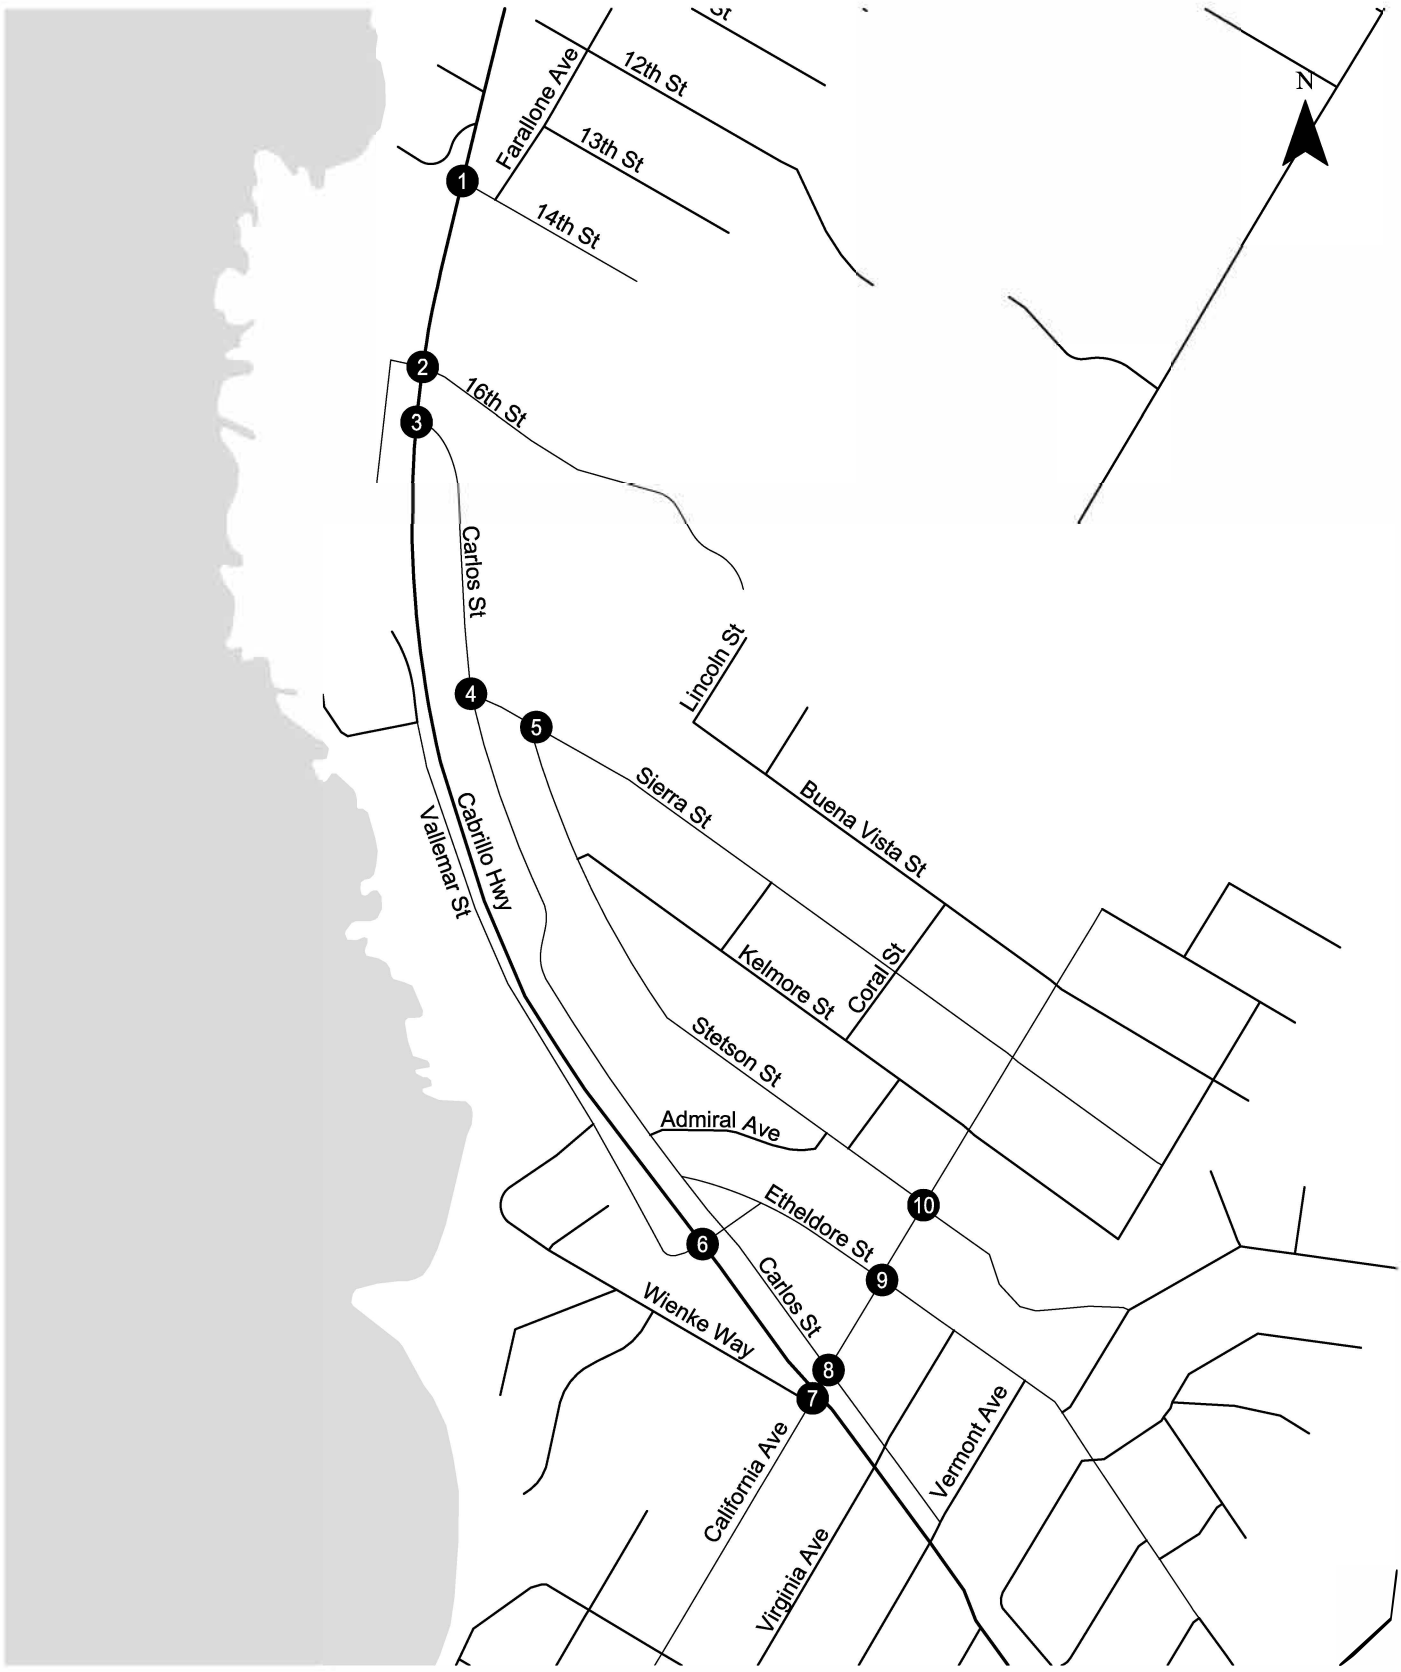
Analysis

ANALYSIS



STUDY AREA & INTERSECTIONS

The purpose of the traffic analysis is to determine whether the project would have transportation-related environmental impacts as defined in the *Data and Analysis Approach* section. Based on discussions with County staff, the following ten intersections were identified to describe an appropriate project study area (Figure 3):

1. State Route 1 & 14th Street;
2. State Route 1 & 16th Street;
3. State Route 1 & Carlos Street;
4. Carlos Street & Sierra Street;
5. Sierra Street & Stetson Street;
6. State Route 1 & Etheldore Street / Vallemar Street;
7. State Route 1 & California Avenue;
8. Carlos Street & California Avenue;
9. California Avenue & Etheldore Street; and,
10. California Avenue & Stetson Street.

As described in the *Data and Analysis Approach* section, these intersections were analyzed in the weekday AM, weekday PM, and weekend midday peak periods for the following scenarios:

- Existing Conditions;
- Existing with Project Conditions;
- Future Conditions;
- Future with Project Conditions;
- Cumulative Conditions; and
- Cumulative with Project conditions.

EXISTING CONDITIONS

ROADWAY NETWORK

Access to the project site is provided off Carlos Street north of Sierra Street. Carlos Street can either be directly accessed from State Route 1 to the north of the project or via State Route 1 south of the project via either Etheldore Street or California Avenue.

- ***State Route 1*** in the vicinity is a two-lane highway running north-south. State Route 1 provides the only access to Moss Beach, connecting it to destinations in the north such as San Francisco and to destinations to the south such as Half Moon Bay.
- ***Carlos Street*** is a narrow two-way local street that runs through Moss Beach parallel to State Route 1. Near the project site, Carlos Street has no pavement markings, on-street parking, sidewalks, or bicycle accommodations. Further south in the commercial area of Moss Beach near California Avenue, Carlos Street includes bicycle pavement markings, on-street parking and sidewalks on one side.
- ***Etheldore Street*** is a two-lane, two-way local street that connects Moss Beach to State Route 1. It extends from the study intersection with State Route 1 and Vallemar Street, through Moss Beach, to State Route 1 further south. Etheldore Street includes intermittent paved sidewalks on its south side and no sidewalks on its north side.
- ***California Avenue*** is a two-lane, two-way local street that crosses State Route 1 south of the project site, providing State Route 1 access to much of the residential area of Moss Beach. California Avenue in the study area includes paved sidewalks on its west side and no sidewalks on its east side.
- ***Stetson Street*** is a two-lane, two-way local street that extends from Sierra Street near the project site to Sunshine Valley Road and provides access across Moss Beach. Stetson Street in the study area includes paved sidewalks on its north side and no sidewalks on its south side.
- ***Sierra Street*** is a two-lane, two-way local street that extends from Carlos Street to Vermont Street and provides residential access across Moss Beach. In the study area, Sierra Street features paved sidewalks on its north side between Coral Street and California Avenue but no paved sidewalks on any other segments.

The 2011 San Mateo County Comprehensive Bicycle and Pedestrian Plan identified planned bikeways through Moss Beach including along Carlos Street but cites no existing bicycle facilities in the study area.

TRANSIT SERVICE

The project site is served by two bus routes (Routes 17 and 18) operated by SamTrans transit service. Service details and changes are the exclusive domain of Samtrans, not San Mateo County. A description of each route, with the closest stops to the project site, is provided below. All route variations are shown in Figure 4.

Route 17

SamTrans Route 17 follows two different northbound routes and two southbound routes.

Northbound

The weekday morning and weekend all-day northbound route include stops at California Avenue / Etheldore Street (0.47 miles from the project) and State Route 1 / 14th Street (0.23 miles from the project). The weekday afternoon/evening northbound route includes a stop at Etheldore Street / Sunshine Valley Road (0.62 miles from the project).

Collectively, these routes operate hourly from 5:30 a.m. to 9:00 p.m. on weekdays and every other hour from 5:13 a.m. to 7:58 p.m. on weekends.

Southbound

The weekday morning southbound route includes a stop at Etheldore Street / Sunshine Valley Road (0.62 miles from the project). The weekday afternoon/evening southbound route stops at State Route 1 / 16th Street (0.11 miles from the project) and California Avenue / Etheldore Street (0.47 miles from the project). Collectively, these routes operate hourly from 6:18 a.m. to 9:50 p.m. on weekdays and every other hour from 6:16 a.m. to 9:28 p.m. on weekends.

Route 18

SamTrans route 18 operates between Main Street / 7th Street in Montara and Moonridge Apartments near Half Moon Bay. The route travels north-south along Sunshine Valley Road and includes stops (in both directions) at Sunshine Valley Road / Etheldore Street (0.47 miles from the project). Route 18 operates two northbound buses in the morning, two northbound buses in the afternoon, three southbound buses in the morning, and two southbound buses in the afternoon.

Transit Service to Schools

SamTrans service would accommodate project students traveling to and from the project to either Manuel F. Cunha Intermediate School via Routes 17 and 18, or Half Moon Bay High School via Route 18.

Transit Stop Access

The nearest Route 17 bus stops are at the following locations:

- **Northbound:** North of the project on the east side of State Route 1 at State Route 1 / 14th Street (0.23 miles from the project). This stop is a widened concrete shoulder with an adjacent paved sidewalk, although there is no sidewalk network or infrastructure to provide walking access to/from the stop.
- **Southbound weekday AM:** South of the project at Etheldore Street / Sunshine Valley Road (0.62 miles from the project). The stop is along a gravel shoulder along Etheldore Street. The stop itself is not connected to any sidewalk network. Sidewalks are provided intermittently in Moss Beach between the Project site and this stop.
- **Southbound weekday PM and weekend:** North of the project on the west side of State Route 1 between Carlos Street and 16th Street (0.11 miles from the project) and at California Avenue / Etheldore Street (0.47 miles from the project). The former transit stop is a pole in an embankment alongside State Route 1 with a few feet of shoulder and is not served by a sidewalk, crossing, or any infrastructure to provide walking access to/from the stop. The latter transit stop is along a gravel shoulder along Etheldore Street. The stop itself is not connected to sidewalk, but a walking path with continuous sidewalk is available between the project site and this stop along Sierra, Stetson, Kelmore, and California Avenue.

SamTrans Service through Moss Beach
Routes 17 and 18

Figure **4**

KITTELSON & ASSOCIATES

Coordinate System: NAD 1983 StatePlane California III FIPS 0403 Feet

EXISTING CONDITIONS TRAFFIC VOLUMES

Multimodal traffic volumes, lane configurations, and traffic controls for each study intersection were used to assess the existing conditions LOS and delay. Table 1 shows the findings of this analysis for the AM, PM, and Saturday peak hours. Detailed calculation worksheets showing operations for all intersection movements for the Existing conditions are provided in APPENDIX 3.

Seasonal Adjustment Methodology

Traffic counts were taken in April 2017 while local schools were in session. For traffic volumes along SR 1, Kittelson checked historical traffic counts to see if an upward adjustment would appropriately represent peak summer conditions.[7]

The available data showed the average two-way annual daily traffic volume on SR1 in the project vicinity to be 16,500 vehicles per day and the peak month daily vehicle volume to 17,600 vehicles per day. Kittelson used the ratio between the two (1.07) to inflate the observed April volumes. All analysis traffic volumes for through movements along SR1 were grown by 7 percent. Appendix 2 shows the correspondence with Caltrans on the appropriateness of this method.

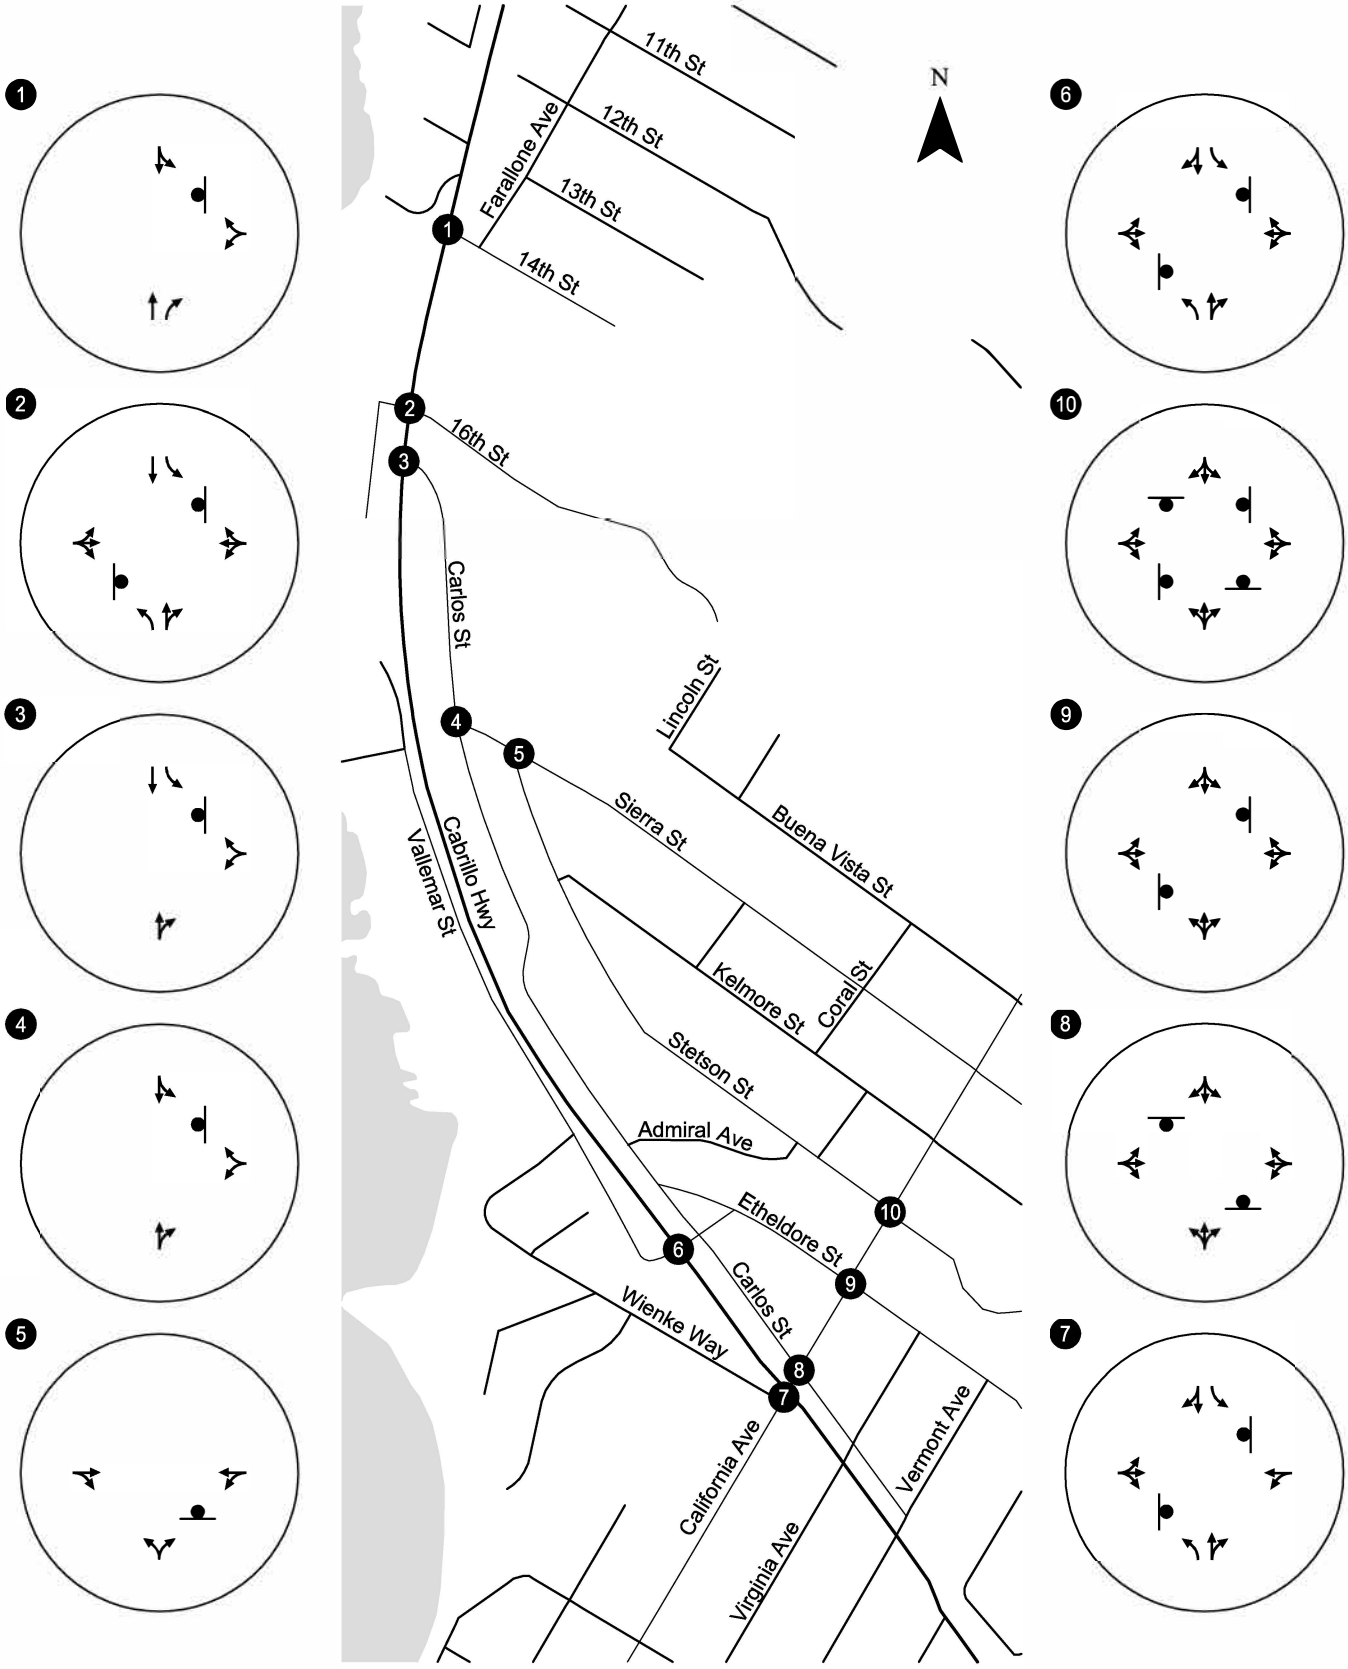
Seasonally Adjusted Volumes

The existing intersection geometries and seasonally-adjusted existing volumes are shown in Figure 5 and Figure 6.

Comparison with 2022 Volumes

Traffic volumes were subsequently collected at the same intersections in October 2022 and compared to the (unadjusted) volumes collected for this analysis.[8]

Locations along State Route 1 experienced a decrease in weekday AM traffic of between 15 and 23 percent, a weekday PM decrease of 5 to 9 percent, and a Saturday midday peak hour decrease between 10 and 17 percent from 2017 to 2022. There has been a more significant decrease in travel for northbound Highway 1 than southbound Highway 1 for Saturday peak hour. For weekday afternoon peak hour, northbound travel did not experience a significant change from 2017; however, southbound travel decreased by around 16 percent. Both directions of travel have had significant decreases (14 to 18 percent) in the weekday AM peak hour.



For local roads, the change in peak hour volumes varies by location. Locations along Sierra Street experienced approximately 50 percent higher weekday morning traffic volumes, while evening traffic volumes remained nearly constant, and Saturday midday peak hour increased between 12 and 19 percent. Locations along California Avenue experienced higher traffic volume for all evaluated peak hours, while the intersection of California Avenue and Carlos Street has experienced a decrease in Weekday morning volumes and Saturday peak hour volumes.

In general, the traffic volumes along State Route 1 (which are currently uncontrolled) generally govern the traffic operations: more traffic along the major street makes gap finding more difficult for drivers on a side

[7] Counts were obtained from the Caltrans Traffic Census Program website. The data used were from 2015 and are available at https://dot.ca.gov/programs/traffic-operations/census.

[8] More detail on these 2022 traffic volumes is available in the *Peer Review of Cypress Point Traffic Impact Analysis and Mitigation Plan* (Fehr & Peers, February 2023).

street with stop control. Therefore, given the decreases along State Route 1, the analysis team determined that the seasonally-adjusted volumes presented in this section are still relevant and appropriate for analysis.

PROJECT VEHICLE TRIP GENERATION

TRIP GENERATION

Trip generation of the project is based on information compiled in the 9th Edition of the Institute of Transportation Engineers (ITE) *Trip Generation* manual.[9] The *Trip Generation* manual does not have trip generation data specific to affordable housing but does have several related uses including apartment, low-rise apartment, mid-rise apartment, and high-rise apartment. Of these land uses, the apartment land use (ITE 220) was used for this study because this land use had a larger sample size than the other related uses and had the higher trip generation rates, resulting in a more conservative estimation of trip generation.[10]

The trip generation rates used in this study and presented in the *Trip Generation* manual represent suburban or exurban land use contexts with minimal transit service and ridership. In this sense, these rates are suitable for the Moss Beach context. There are a number of transportation demand strategies that could be employed at this site that may reduce the number of trips associated with the project. For example, the project site plan may be designed to promote walking and bicycling, which would help to reduce short vehicle trips. However, some typical strategies may be limited in effectiveness given the land use context and the relatively small size of the project relative to larger employer-based TDM programs. For example, an on-site shuttle would not likely have an obvious nearby destination or route schedule.

As summarized in Table 2, the project would generate 473 daily trips, 37 weekday AM peak hour trips, 45 weekday PM peak hour trips, and 37 weekend Saturday midday peak hour trips. These and all trip numbers in this report describe one-way trips.

Table 2: project Trip Generation

Land Use	ITE Code	Unit	Size	Daily	Weekday AM Peak Hour			Weekday PM Peak Hour			Saturday Midday Peak Hour		
					Total	In	Out	Total	In	Out	Total	In	Out
Apartment	220	Dwelling Units	71	473	37	8	29	45	29	16	37	19	18

Source: ITE Trip Generation manual, 9th Edition; Kittelson & Associates, 2022

Although the community center onsite may occasionally be used for public events, it will primarily be used by project residents. Therefore, for the purposes of this analysis, the community center onsite is expected only to generate internal trips, not additional trips from outside the project.

Trip Generation Sources

At the time this analysis was conducted, the 9th Edition was the most current version of the ITE *Trip Generation Manual* and therefore the most appropriate source for trip generation information. ITE has subsequently released several updates and the 11th edition provides a more recently updated source of this information.

[9] Institute of Transportation Engineers. Trip Generation, 9th Edition, Washington, D.C. 2012

[10] The manual lists Land an average rate of 6.65 weekday trips per dwelling unit for land use ITE 220 (Apartment), 6.59 for ITE 221 (low-rise apartment), 4.20 for ITE 222 (High-Rise Apartment), and no reported daily rate for ITE 223 (Mid-Rise Apartment).

A comparison of a few methodologies from the 11th Edition Trip Generation Manual and a comparison of the trip generation rates by each method are presented in **Table 3.**

Table 3. Trip Generation Comparison

	AM Peak Hour			PM Peak Hour			Saturday Peak Hour			Number of Studies
	Trips	In	Out	Trips	In	Out	Trips	In	Out	
TIA Trip Generation – ITE 9th Edition[1]	37	8	29	45	29	16	37	19	18	AM: 78 PM: 90 Saturday: 14
ITE 11th Edition – Multi-Family Low-Rise[2]	45	11	34	51	32	19	29	15	14	AM: 49 PM: 59 Saturday: 1
ITE 11th Edition – Affordable Housing[3]	32	9	23	41	24	17	91	46	45	AM: 6 PM: 8 Saturday: 1

Notes:
1. ITE Trip Generation, 9th Edition (Land Use #220 – General Apartment) Adjacent Street Traffic Peak Hour, Linear equation
2. ITE Trip Generation, 11th Edition (Land Use #220 – Multi-Family Low-Rise) Adjacent Street Traffic Peak Hour, Fitted Curve Equation
3. ITE Trip Generation, 11th Edition (Land Use #223 – Affordable Housing) Adjacent Street Traffic Peak Hour, Fitted Curve Equation

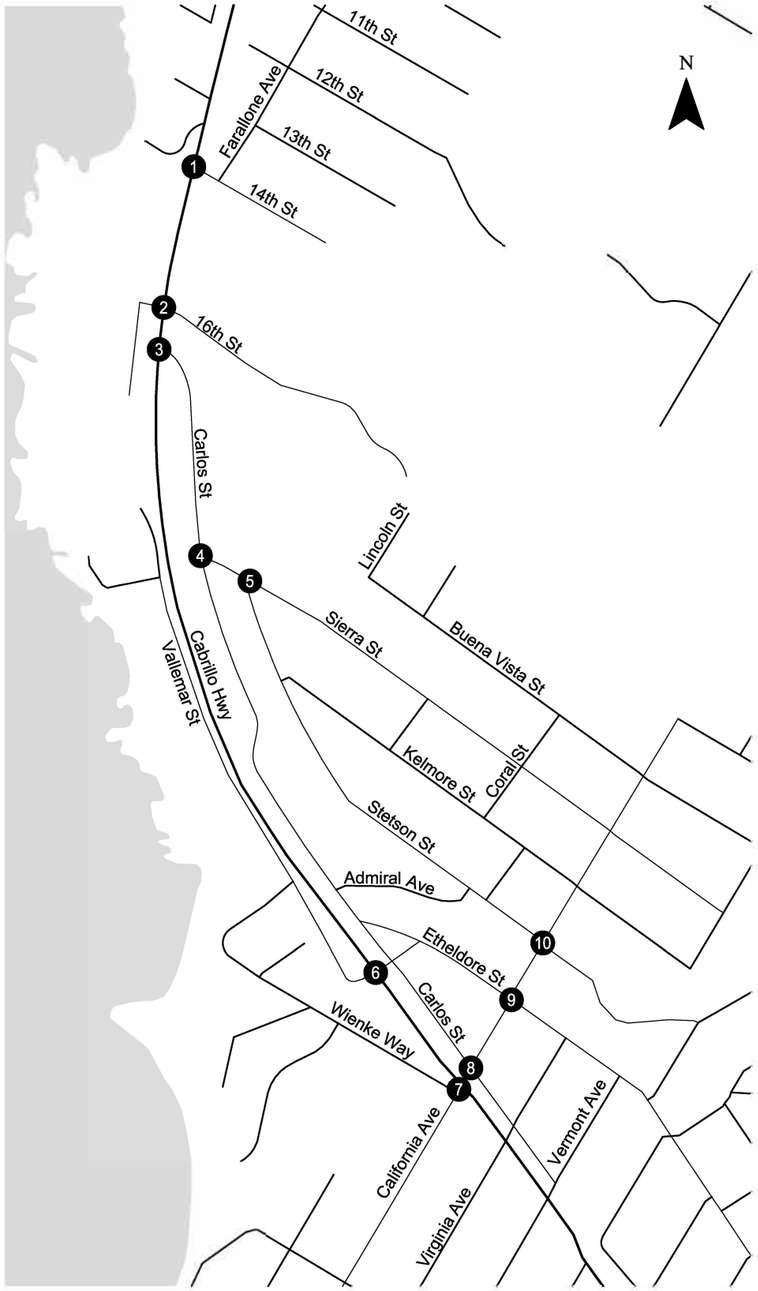
Source: Fehr & Peers, 2022.

Based on the table, the 9th Edition rates are satisfactory for the analysis approach. The appropriate land use in 11th Edition shows slightly higher trip generation rates in the weekday AM and PM Peak Hours compared to the 9th Edition land uses (ranging from 13 to 22 percent) and lower Saturday peak hour trips. In contrast, the affordable housing land use in the 11th edition shows the opposite – fewer weekday AM and PM peak hour trips and drastically higher Saturday trips. (Both 11th edition Saturday observations are based on a single observation and should therefore not be used for this analysis.)

The Affordable Housing land use rates are based on a low number of observations (6 and 8 respectively) so may not necessarily be appropriate to use here. However, combined with other evidence that residents of affordable housing typically drive less (i.e., generate fewer driving trips) than market-rate residents, the 9th Edition rates already used appear to be appropriate in comparison to more recent data.[11] The trip generation analysis is based on the 9th Edition rates.

TRIP DISTRIBUTION AND ASSIGNMENT

The distribution of project trips was derived from existing travel volume data and from knowledge of local travel times. The recorded north/south distribution of traffic along State Route 1 was used to inform the direction that project traffic would be going to or coming from in order to access the project site. Access to State Route 1 from the project was assumed to be via the Carlos Street and State Route 1 intersections. The trip distribution is shown in Table 4. project only trips are shown in Figure 7.



[11] The CAPCOA *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* provides information on affordable housing in relation to driving and vehicle miles traveled production. It is available online at https://www.airquality.org/businesses/ceqa-land-use-planning/ghg-handbook-caleemod.

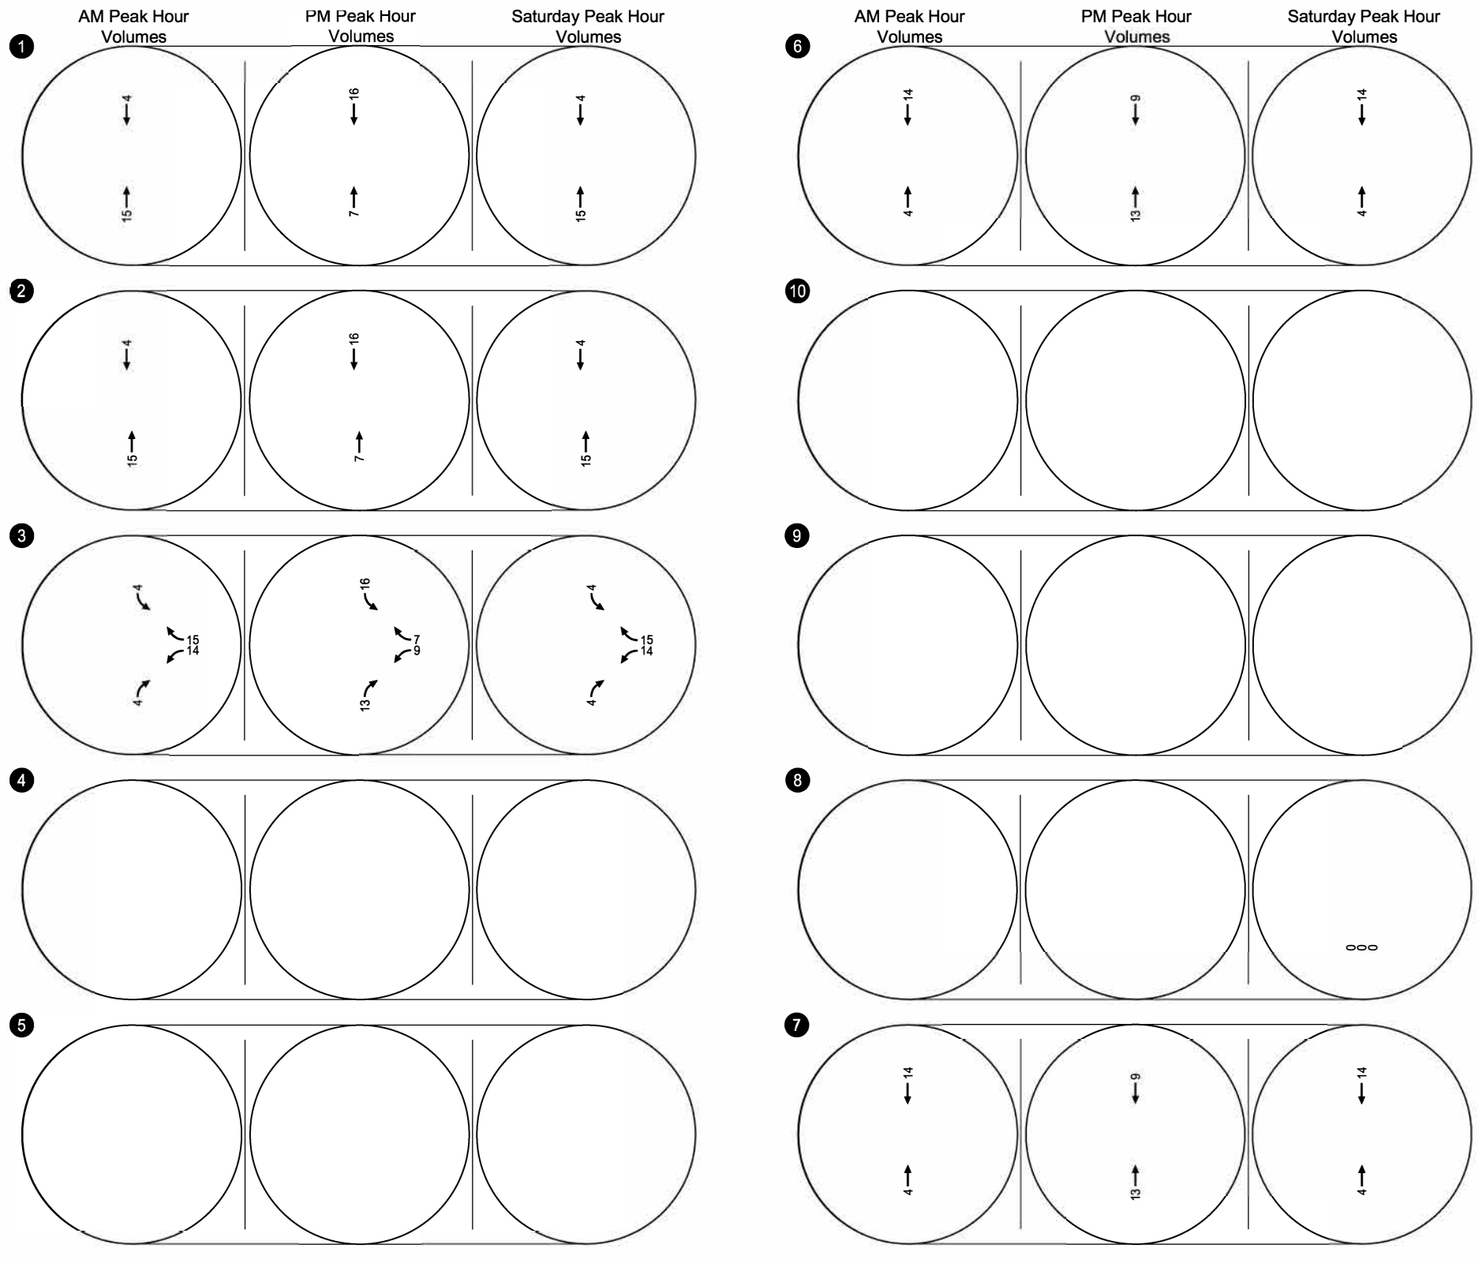


Table 4: project Trip Distribution along State Route 1

To/From project	Direction Along State Route 1	Weekday AM Peak Hour	Weekday PM Peak Hour	Saturday Midday Peak Hour
Outgoing (from project)	Northbound	52%	44%	44%
	Southbound	48%	56%	56%
Incoming (to project)	Northbound (from South)	50%	55%	58%
	Southbound (from North)	50%	45%	42%

Outgoing and incoming trips from each time period sum to 100%.

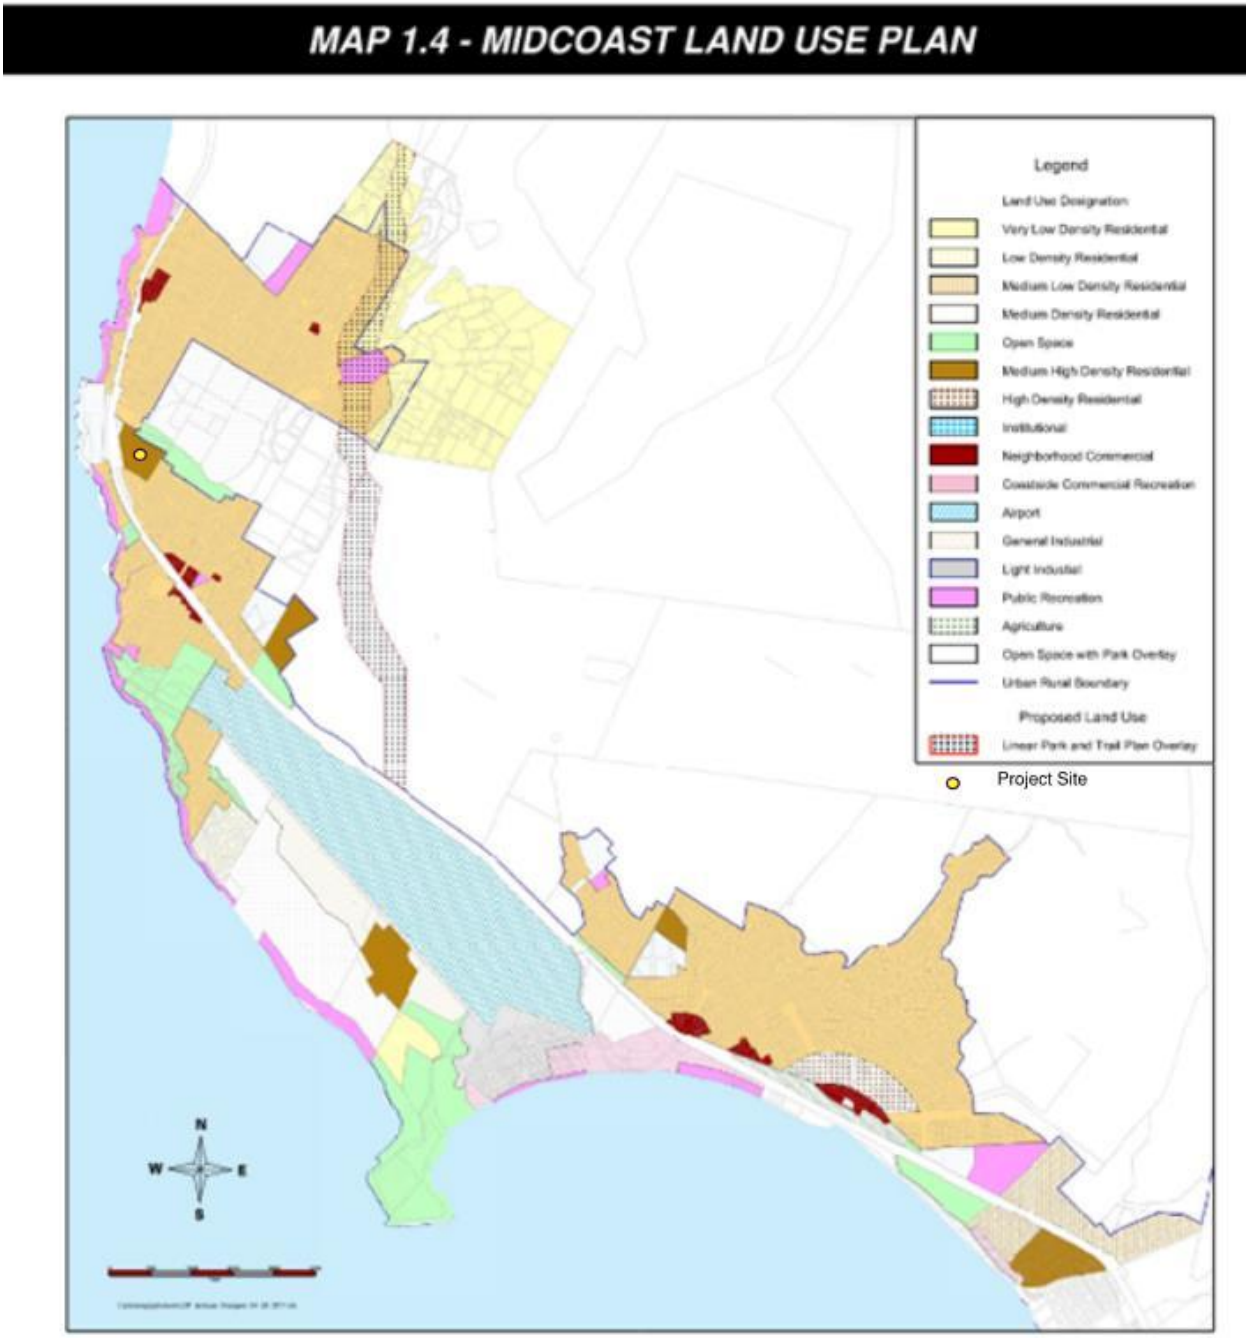
VMT ANALYSIS

As described in the *Data Analysis and Approach* section of this report, the project would represent a significant impact if it project would result in more than 11.56 daily home-based VMT per capita by residence. (This represents a 15% reduction from the baseline County average of 13.60 home-based trip VMT per resident.) It will be exempt from detailed VMT analysis if it meets County screening criteria.

One such screening criterion is for projects that provide 100% affordable housing. Per the County's Interim VMT Analysis Criteria[12] for Affordable Housing, projects that generate 100% affordable housing in infill areas typically generate lower VMT than market-rate housing.



The site is defined as infill and medium density residential in the LCP (see Figure 8) and designated as a priority development site for affordable housing in the San Mateo County Local Coastal Program Policies document (San Mateo County Planning and Building Department 2013). The site is also designated as an affordable housing opportunity site under the San Mateo County Housing Element. (San Mateo County Planning and Building Department 2015).

The C/CAG VMT Estimation Tool shows that the average residential VMT for the Project area is 23.6 daily miles per capita. Using the 2020 baseline year, the Bay Area Regional Average home-based VMT per resident is 14.6, and a 15% reduction from the baseline County average would result in a threshold of 12.41 home-based VMT per resident.

As part of subsequent environmental review, the County may determine whether to rely on the screening option (which would assume a less-than-significant impact) or a more quantitative approach to VMT analysis. The latter may result in a **significant impact**, pending further analysis.

Site Access, Circulation & Parking

SITE ACCESS, CIRCULATION & PARKING

This section analyzes project site access, circulation, and parking. The project site would include a driveway along Carlos Street and 142 vehicle parking spots, with 5 electric vehicle parking spots in a loop surface parking lot.[13] The site would include racks providing for eight short-term bicycle parking spaces and 36 long-term (i.e., indoors, and secure) bicycle parking spaces. The project does not propose to provide any off-site vehicle or bicycle parking.

PARKING ASSESSMENT

This section evaluates the adequacy of parking for the project using two methods. It is first evaluated against San Mateo County zoning regulations on parking. It is also evaluated against parking demand, as estimated based on industry standards. Based on County zoning regulations, a 71-unit apartment complex is required to have 127 parking spaces as shown in Table 5. Therefore, the project provides 15 more parking spaces than required by San Mateo County.

Table 5: Parking Requirements for the project

Apartment Type	Number of Units	Parking Rate (Per Unit)	Parking Required
1 Bedroom	16	1.2	20
2 Bedroom	37	1.5	56
3 Bedroom	18	2	36
Guest Parking[1]		0.2	15
Total:			**127**

[1]*Guest parking at 1 space per 5 units*

Source: Kittelson & Associates, Inc. 2018; San Mateo County Zoning Regulations Chapter 3, Section 6119

An estimate of parking demand was performed using the *Parking Generation Manual* (4th edition) published by the Institute of Transportation Engineers (ITE). This manual is a standard transportation industry document that estimates the demand for parking based on studies conducted at similar sites. The land use in the ITE manual that is the most similar with the project is the Low/Mid-Rise Apartment (LU 221) since the Apartment (LU 220) is not available.

Based on the demand rates from previous studies compiled in the ITE Manual, the average demand for a 71 unit apartment complex would be about 88 parking spaces while the maximum observed demand would be about 138 parking spaces, as shown in Table 6. This demand includes demand from any guests as well as residents. With a parking supply of 142 spaces, the project is anticipated to have about 4 more parking spaces than the anticipated maximum demand.

Using both criteria, the amount of parking contained in the project is adequate to meet the demand.

[13] This number may change as required by updated code requirements; the project sponsor will coordinate with the County on any changes to requirements and required project description changes.

Table 6: Average Estimated Parking Demand for the project

Parking Demand	Number of Units	Demand Rate[1]	Parking Spaces Needed
Average	71	1.23	88
Maximum Observed		1.94	138

Source: Kittelson & Associates, Inc.
Demand based on ITE Parking Generation Manual, 4th Edition (LU 221)
[1]Demand rate in vehicles per apartment

ELECTRIC VEHICLE PARKING

Electric vehicle (EV) parking requirements are determined by the California Green Building Code[14], which was updated in 2022. The code requires 10 percent of spaces (15 total for this project) be EV-capable, 25 percent be equipped with low power charging receptacles (36 total for this project), and 5 percent be equipped with Level 2 EVSE (8 total for this project).

The project provides 5 parking spaces equipped with electric vehicle charging stations, which does not meet the CalGreen requirements. It is recommended that the project increase the number of EV parking spaces to meet CalGreen requirements. The project sponsor has indicated plans to update the project plans to comply with these requirements.

EMERGENCY ACCESS

Emergency access to the project would be provided by the driveway on Carlos Street. Additionally, there is an emergency vehicle access route provided from Lincoln Street. Given the two access points available for emergency vehicle ingress and egress, the project's proposed site plan is expected to provide adequate emergency vehicle access. This analysis assumes that the final design of all circulation improvements shall be required to adhere to all applicable County and other statutes and requirements, including, without limitation, those set forth in the California Fire Code and California Vehicle Code. Therefore, the project does not have an impact on emergency access.

PEDESTRIAN & BICYCLE ACCESS

Bicycle Access

A qualitative assessment was conducted to determine the project's potential impacts on bicyclists and bicycle facilities. San Mateo County's Bicycle and Pedestrian Master Plan (2011) includes planned Class I, Class II, and Class III bikeways in the vicinity of the project. These facilities include:

- Class I multi-use path near State Route 1 between Carlos Street and Main Street
- Class II bicycle lane along Carlos Street
- Class III bicycle route along State Route 1

The project does not conflict with existing or proposed bicycle facilities identified in the Bicycle and Pedestrian Master Plan because the project is not proposing to change roadway geometries in ways which would prevent the development of the proposed bicycle facilities. Therefore, the project does not have an impact on bicycle access.

[14] UpCodes. 2022. *California Green Building Standards Code 2022*. Available: https://up.codes/viewer/california/ca-green-code-2022/chapter/4/residential-mandatory-measures#4.106.4. Accessed December 5, 2022.

Pedestrian Access to Transit

The project may lead to an increase in pedestrians accessing the nearest bus stop which is located across State Route 1 near Carlos Street. This stop serves Route 17 for the weekday PM and weekend service, but there is no marked crosswalk across State Route 1 to access it. Additionally, there is inadequate corner sight distance at the intersection of Carlos Street and State Route 1 for pedestrians to see vehicles and drivers to see pedestrians.

The *Connect the Coastside* study, which was prepared by San Mateo County to evaluate transportation needs in this area, has proposed a change of traffic control at State Route 1 and 16th Street/Carlos Street in the vicinity of the southbound bus stop based on established needs. The County has subsequently initiated a PID to study such a change and is coordinating with Caltrans. Any such project would need Caltrans approval and therefore does not rest within the County's exclusive control.

Since the project will likely increase the pedestrian demand for crossing State Route 1 at an unmarked crossing location with inadequate sight distance, the project will increase the hazard for this crossing, resulting in an impact.

Pedestrian Access to Sidewalk Network

The proposed access driveway for the project is on Carlos Street, which does not provide pedestrian facilities such as sidewalks to connect the project to sidewalks on the north side of Sierra Street and the east side of Stetson Street. Since the project is anticipated to house more than 200 residents, it is likely to increase pedestrian activity in the area. Without a proper connection to the sidewalks on Sierra Street and Stetson Street, project residents would need to walk in the street, resulting in the potential for decreased pedestrian safety. Therefore, the impact is considered to be an impact.

Transit Service

The project site is served by two bus routes (Route 17 and Route 18) operated by SamTrans transit service (see Figure 4). The nearest Route 17 bus stops are at the following locations:

- Northbound: North of the project on the east side of State Route 1 at State Route 1 / 14th Street (0.23 miles from the project). This stop is a widened concrete shoulder with an adjacent paved sidewalk, although there is no sidewalk network or infrastructure to provide walking access to/from the stop.
- Southbound weekday AM: South of the project at Etheldore Street / Sunshine Valley Road (0.62 miles from the project). The stop is along a gravel shoulder along Etheldore Street. The stop itself is not connected to any sidewalk network. Sidewalks are provided intermittently in Moss Beach between the Project site and this stop.
- Southbound weekday PM and weekend: North of the project on the west side of State Route 1 between Carlos Street and 16th Street (0.11 miles from the project) and at California Avenue / Etheldore Street (0.47 miles from the project). The former transit stop is a pole in an embankment alongside State Route 1 with a few feet of shoulder and is not served by a sidewalk, crossing, or any infrastructure to provide walking access to/from the stop. The latter transit stop is along a gravel shoulder along Etheldore Street. The stop itself is not connected to sidewalk, but a walking path with continuous sidewalk is available between the project site and this stop along Sierra, Stetson, Kelmore, and California Avenue.

The nearest Route 18 bus stops in both directions are at Sunshine Valley Road / Etheldore Street (0.47 miles from the project).

Both of these routes primarily travel along State Route 1. Since the majority of State Route 1 traffic movements experience little or no delay, the project traffic is not anticipated to decrease the performance of public transit.

SPEED LIMITS AND SIGHT DISTANCE

The conceptual site plan for the project was reviewed to assess potential hazards due to project design or operations and potential incompatible land uses. The proposed land uses are generally compatible with existing uses in the project vicinity and would not result in undue hazards. Therefore, this assessment focuses on potential hazards due to design. The design topic considered was the project's impact on intersections with restricted sight distance for existing operating speeds per Caltrans *Highway Design Manual* standards.

Kittelson reviewed the study intersections that access State Route 1 to determine if any of these have restricted sight distance that does not meet Caltrans standards. The intersection of State Route 1 and Carlos Street was found to provide 305 feet of sight distance to the south, which is 246 feet less than what is required for an intersection with a 50-mph facility such as State Route 1, per Table 405.1A in the Caltrans *Highway Design Manual*.[15]

Additionally, a two-way left turn lane is present along State Route 1 exclusively between Carlos Street and 16th Street. Considering the need for deceleration before making a left turn from State Route 1 to either street, motorists making northbound left turns to 16th Street and those making southbound left turns to Carlos Street represent overlapping and conflicting uses of the lane. The addition of southbound left-turning project traffic from State Route 1 to Carlos Street would further contribute to potential conflict between the two movements.

Because this intersection would serve as the principal means of access for the project to and from State Route 1, the project would add traffic to both the movements with restricted sight distance and the overlapping left turns, resulting in a sight distance-related project impact.

[15] Note that the applicable section of State Route 1 has a posted speed limit of 45 miles per hour, which would indicate a design speed of 55 miles per hour, which is the applicable standard for corner sight distance per the Caltrans *Highway Design Manual*.

Conclusions and Mitigation Measures

CONCLUSIONS AND MITIGATION MEASURES

This section presents project-related impacts identified in this report and proposed mitigation measures to offset new vehicle trips generated by the project to the extent feasible.

VEHICLE MILES TRAVELED

As part of subsequent environmental review, the County may determine whether to rely on a potential screening option to evaluate the project's vehicle miles traveled (which would assume a less-than-significant impact) or a more quantitative approach to VMT analysis. The project may result in a significant impact, pending further analysis.

SIGHT DISTANCE AND SAFETY IMPACTS

Sight distance and safety impacts were identified related to the following.

Impact T-1: The project would substantially increase hazards by adding vehicle trips to an intersection with existing deficient sight distance (State Route 1 & Carlos Street [#3]).

The project would add traffic to the westbound approach at the intersection of Carlos Street and State Route 1, which has inadequate sight distance for seeing northbound vehicles on State Route 1. It would also cause potential conflict between project trips making a southbound left onto Carlos Street and non-project traffic making a northbound left into the Lighthouse since both movements share a very short left turn lane. This would cause a significant impact under all Project scenarios.

This intersection provides primary access to the project site from State Route 1. Project vehicles would have restricted sight distance when exiting onto State Route 1 making it difficult to judge adequate gap acceptance for safe entry onto State Route 1. To reduce this impact, implement the following mitigation measures.

Mitigation Measure T-1: Provide Additional Transportation Demand Management (TDM) Measures

The project includes a TDM plan (described in the Project Description section and in more detail in the checklist included in Appendix 9), which can be expected to reduce project trips.

As a mitigation measure, the project shall also construct sidewalk, crosswalk, bicycle route, and transit infrastructure improvements that would improve conditions within Moss Beach for pedestrians and bicyclists. The additional measures will include:

- **Carlos Street:** Add sidewalks on Carlos Street from the project entrance to Sierra Street.
- **Sierra Street:** Clear/plane existing sidewalk that fronts project site on Sierra Street from Carlos Street to Stetson Street.
- **Sierra Street/Stetson Street:** Add high visibility crosswalks with advanced yield markings and yield signs for pedestrians to cross Sierra Street to Stetson Street on the southeast corner. Add 1-way stop on northbound Stetson Street.
- **Stetson Street/Kelmore Street:** Add ramp with truncated domes on the northeast corner if feasible with fire station configuration and drainage. Add high-visibility crosswalk to cross Kelmore Street.
- **Stetson Street/California Avenue:** Add high-visibility crosswalk with advanced stop bar to cross Stetson Street (from northeast corner to northwest corner toward Etheldore Street).

- **California Avenue/Etheldore Street:** Add high-visibility crosswalks with advanced stop bars to access bus stops on the southeast and northwest corners.
- **California Avenue, south of Etheldore Street:** Add sidewalk on west side of California Avenue where missing to connect to downtown Moss Beach.
- Contributions toward accessible bus stops at **California Avenue / Etheldore Street** if feasible, including providing bus benches.
- Assist in implementation of the planned Class III Bikeways (per draft Unincorporated San Mateo County Active Transportation Plan) by providing sharrows on **Sierra Street between project site and California Avenue**, and on **California Avenue between Sierra Street and Carlos Street**.

Although a TDM plan and these additional measures would reduce the vehicle trip generation by promoting alternative modes of travel and lessen the impact, the effectiveness of a TDM plan cannot be guaranteed. Therefore, the impact remains.

Mitigation Measure T-2: Close Carlos Street between State Route 1 and the project to all but emergency vehicles.

The removal of traffic from this intersection would negate the need for improving intersection sight distance since drivers would no longer be allowed to turn onto or off of Carlos Street at this location. Project vehicle trips as well as existing trips at the intersection would instead be routed south along Carlos Street and Stetson Street to access State Route 1 at either Etheldore Street or California Avenue.

At the time of this writing, the County is working on a Caltrans Project Initiation Document (PID) as part of the Moss Beach State Route 1 Congestion & Safety Improvements Project. With this project, the County will determine feasibility for a traffic signal and roundabout at a combined State Route 1 / 16th Street / Carlos Street intersection. The County is working with Caltrans, but funding has not yet been identified. Implementation authority rests jointly with the County and Caltrans and is therefore out of the County's exclusive control. The closure recommended in this mitigation measure can therefore be considered a temporary solution intended to mitigate the identified impact until the County can successfully implement a change of traffic control. That future project would be consistent with Caltrans design standards, provide adequate sight distance for the resulting condition.

Additional Mitigation Measures

Two additional potential mitigation options were considered but rejected in favor of Mitigation Measure T-2.

- **Connecting Carlos Street with 16th Street instead of State Route 1.** In field review, 16th Street was found to provide sufficient corner sight distance. This option would reroute Carlos Street at State Route 1 into 16th Street instead, directing all inbound and outbound Carlos Street traffic to 16th Street. However, this option was considered infeasible for the following reasons:
  - A "Tee" intersection of 16th Street and Carlos Street in close proximity (less than one car length) to the existing stop-controlled intersection between State Route 1 and 16th Street would have the potential to create conflicts between vehicles turning from State Route 1 onto 16th Street and vehicles turning from Carlos Street onto 16th Street, especially given a difference in operating speeds for motorists turning from the highway compared to motorists driving along Carlos Street. In order to avoid conflicts, the County could need to obtain additional right of way to increase the distance between State Route 1 and a potential Carlos Street/16th Street intersection.
  - There is a notable grade difference between Carlos Street and 16th Street and providing a formal connection may not be reasonable geometrically. In order to create a reasonable grade for such a connection, the County would potentially need to obtain additional right of way.

  This option is the recommendation provided in the *Connect the Coastside* report, but feasibility and implementation concerns are being assessed as part of the project described above.

- **Grading the east side of State Route 1 to provide clear sight distance.** Given speeds along State Route 1, earthwork or tree clearing would be necessary to clear required sight distance to the south at Carlos Street. This would include cutting back trees and re-grading the berm between Highway 1 and Carlos Street. While clearing the land would provide adequate sight distance for the horizontal curvature of the road (see Figure 1), there is also a vertical curve due to elevation changes that may obstruct sight distance. Because Highway 1 crests south of the Carlos Street intersection, a driver may not be able to see vehicles on the other side of the crest of the curve. A detailed topographic map would be needed to determine if horizontal clearing, which may be prohibitively expensive and would require an encroachment permit from Caltrans, would provide adequate sight distance given the vertical curve.

Impact Conclusion

With the implementation of the recommended mitigation measures, the project impact would be reduced to **less than significant with mitigation.** Closing the intersection to general purpose traffic would eliminate the need to provide sight distance at the subject intersection. The project described above that is currently in the PID phase could successfully mitigate the impact as well. As described, it would require successful completion of the study, acquisition of project funding, and concurrence with Caltrans on a change of control at the intersection.

Impact T-2: The project may lead to an increase in pedestrians crossing State Route 1.

The increase in transit ridership expected as a result of the project may lead to more pedestrians crossing State Route 1 to access the bus stop on southbound State Route 1 at 16th Street. This may increase the potential risk for pedestrian/vehicle interactions on State Route 1 given that there are currently no marked pedestrian crossings across State Route 1 near Carlos Street to access this stop. Additionally, the limited sight distance at this location would not allow sufficient visibility for pedestrians to be seen by vehicles on State Route 1.

The proposed TDM plan would include the "M2 – Orientation, Education, Promotional Programs and/or Materials" measure. This measure offers new residents orientation and educational materials or programs. The educational material should include information on SamTrans routes and would direct project residents to use the bus stop at Etheldore Street and California Street instead of crossing SR1 for the same bus lines.

Implementing TDM strategies may introduce offsetting effects with respect to people crossing State Route 1 on foot. Some TDM strategies are aimed at reducing the overall need for travel (for example, by providing improved delivery services onsite to reduce the need for additional shopping trips). However, other strategies are aimed at shifting driving trips to alternative modes of travel (walking, biking, and riding transit). So, in aggregate, TDM strategies may simultaneously increase and reduce the demand for people crossing State Route 1 and cannot be guaranteed to mitigate this impact.

To reduce this impact, implement the following mitigation measures.

Mitigation Measure T-1: **Provide Additional TDM Measures**

In addition to the project's TDM plan, the project shall also construct sidewalks, crosswalk, bicycle route, and transit infrastructure improvements that would improve conditions within Moss Beach for pedestrians and bicyclists. These improvements would increase the propensity for residents to walk to and from the bus stop at California Avenue / Etheldore Street in Moss Beach but will not guarantee a reduction in the risk of people crossing to get to the bus stop on SR 1.

Other Mitigation Measures

The *Connect the Coastside* report recommends a change of control at State Route 1/Carlos Street (with a preliminary recommendation for a roundabout). This recommendation would provide an opportunity to include a pedestrian crossing alongside traffic control to give a safe crossing of SR1. As previously mentioned, the County is working on a Caltrans Project Initiation Document (PID) as part of the Moss Beach

State Route 1 Congestion & Safety Improvements Project. With this project, the County will determine feasibility for a traffic signal and roundabout at a combined State Route 1 / 16th Street / Carlos Street intersection. The County is working with Caltrans, but funding has not yet been identified. Implementation authority rests jointly with the County and Caltrans and is therefore out of the County's exclusive control.

A change of traffic control on SR1 is not exclusively within the County's control; it would require Caltrans concurrence.

Impact Conclusion

For reasons stated above, with the implementation of the recommended mitigation measures, the project impact would remain **significant and unavoidable.** The County project described above that is currently in PID phase could successfully mitigate the impact but as described would require successful completion of the study, acquisition of project funding, and concurrence with Caltrans on a change of control at the intersection.

Impact T-3: The project will increase walking along Carlos Street and to Moss beach where sidewalks gaps would increase pedestrian/vehicle interactions in the roadway.

To reduce this impact, implement the following mitigation measure.

Mitigation Measure T-1: Provide Additional Transportation Demand Management (TDM) Measures

In addition to the TDM elements required as part of the C/CAG TDM Checklist (included as Appendix 9), the project would also construct sidewalk, crosswalk, bicycle route, and transit infrastructure improvements described on page 37 that would improve conditions within Moss Beach for pedestrians and bicyclists.

Implementation of Mitigation Measure T-1 would improve pedestrian safety and separate people walking from motor vehicles and thereby promote a more welcoming walking environment while reducing the potential for pedestrian/vehicle interactions.

Impact Conclusion

For reasons stated above, with the implementation of the recommended mitigation measures, the project impact would be reduced to **less than significant with mitigation.**

Local Circulation and Traffic Operations

LOCAL CIRCULATION AND TRAFFIC OPERATIONS

This section described the local circulation and operational analysis conducted for informational purposes. Traffic Operations are compared to the LCP Policy 2.44 level of service standard previously described.

EXISTING CONDITIONS

For operational analysis, the existing conditions were analyzed based on the traffic volumes and conditions described in the Existing Conditions section on page 18.

EXISTING NO PROJECT CONDITIONS

As the table shows, Intersection **#7 State Route 1 & California Avenue/Wienke Way** operates below the standard in the weekday AM, weekday PM, and Saturday midday peak periods, and Intersections **#2 State Route 1 & 16th Street** and **#6 State Route 1 & Vallemar Street / Etheldore Street** operate below the standard in the weekday PM.

Table 7: Existing Conditions Intersection Operations Results

No	Location	Control	Existing Weekday AM		Existing Weekday PM		Existing Saturday Midday	
			Delay	LOS	Delay	LOS	Delay	LOS
1	State Route 1 & 14th Street	TWSC	24.4	C	32.6	D	38.1	E
2	State Route 1 & 16th Street	TWSC	31.0	D	**37.6**	**E**	38.4	E
3	State Route 1 & Carlos Street	TWSC	13.8	B	13.3	B	14.8	B
4	Carlos Street & Sierra Street	TWSC	8.4	A	8.7	A	8.6	A
5	Stetson Street & Sierra Street	TWSC	8.6	A	9.0	A	8.7	A
6	State Route 1 & Vallemar Street / Etheldore Street	TWSC	22.3	C	**37.0**	**E**	31.0	D
7	State Route 1 & California Avenue / Wienke Way	TWSC	**43.5**	**E**	**78.2**	**F**	**87.1**	**F**

10	Stetson Street & California Avenue	AWSC	7.2	A	7.3	A	7.2	A

Note: Bold lettering indicates an intersection that does not meet the LCP LOS standard (LOS D overall and for critical movements during weekday peak hours, LOS E overall and for critical movements during weekend peak hours).

AWSC: All-Way Stop Control, TWSC: Two-Way Stop Control. LOS and delay reported for TWSC intersections is for the worst approach or movement.

Source: Highway Capacity Manual 2010; Kittelson & Associates, 2022

EXISTING WITH PROJECT CONDITIONS

Existing with Project turning movement volumes are shown in Figure 5 and Figure 6. Table 8, Table 9, and Table 10 show the Existing with Project intersection operations for the weekday AM, weekday PM, and Saturday midday peak hours, respectively. Detailed calculation worksheets for the Existing with Project conditions are provided in APPENDIX 4.

- **Intersection #7 State Route 1 and California Avenue/Wienke Way** operates below the LOS standard in Existing and Existing with Project conditions in the weekday AM, weekday PM, and Saturday midday peak hours. In the weekday PM and Saturday midday peak hours, the addition of project trips adds at least four seconds of average delay for the critical movement.

Table 8: Existing with Project Weekday AM Peak Hour Intersection Operations

No	Location	Control	Existing Weekday AM		Existing + Project Weekday AM	
			Delay	LOS	Delay	LOS
1	State Route 1 & 14th Street	TWSC	24.4	C	25.1	D

FUTURE CONDITIONS

This section describes near-term traffic conditions representing conditions when the project is anticipated to be complete. The Future conditions represent Existing conditions turning movement volumes plus other projects that have been approved or are in the entitlement process but not yet constructed at the time of the traffic counts.

FUTURE NO PROJECT CONDITIONS

The Future conditions turning movement volumes are shown in Figure 10. The Future operations at the study intersections are shown in Table 11. Detailed calculation worksheets for the Future Conditions are provided in APPENDIX 5.

FUTURE WITH PROJECT CONDITIONS

Table 12, Table 13, and Table 14 show the Future with Project intersection operations for the weekday AM, weekday PM, and Saturday midday peak hours, respectively. Detailed calculation worksheets for the Future with Project conditions are provided in APPENDIX 6.

- **Intersection #7 State Route 1 and California Avenue/Wienke Way** operates below the LOS standard in Future and Future with Project conditions in the weekday AM, weekday PM, and Saturday midway peak hours. In the weekday PM and Saturday midday peak hour, the addition of project trips adds at least four seconds of average delay for the critical movement.

CUMULATIVE WITH PROJECT CONDITIONS

This section discusses the effect of the project on traffic operations under Cumulative conditions. Traffic volumes for the Cumulative with Project condition were developed using the same additive approach used for the Existing with Project and Future with Project volumes. The turning movement volumes resulting from adding the project trips to the Cumulative conditions volumes are shown in Figure 12.

Table 16, Table 17, and Table 18 show the Cumulative with Project intersection operations for the weekday AM, weekday PM, and Saturday midday peak hours, respectively. Detailed calculation worksheets for the Cumulative with Project conditions are provided in APPENDIX 8. Based on the criteria previously described the project increase delay beyond the identified thresholds at the following locations:

- **Intersection #2: State Route 1 and 16th Street** operates below the LOS standard in Cumulative no Project conditions in the weekday AM, weekday PM, and Saturday midday peak hours. The addition of project trips increases delay for the critical movement at the intersection already exceeding the LOS standard by at least 4 seconds per vehicle during the weekday PM peak hour.
- **Intersection #3: State Route 1 and Carlos Street** operates within the LOS standards in Cumulative no Project conditions. The addition of project trips causes the intersection to degrade below the LOS standard during the weekday AM and weekday PM peak hour.[16]
- **Intersection #6: State Route 1 and Vallemar Street/Etheldore Street** operates below the LOS standard in Cumulative no Project conditions in the weekday AM and weekday PM peak hours. The addition of project trips increases delay for the critical movement at the intersection already exceeding the LOS standard by at least 4 seconds per vehicle during the weekday PM peak hour.
- **Intersection #7: State Route 1 and California Avenue/Wienke Way** operated below the LOS standard in Cumulative no Project conditions in the weekday AM, weekday PM, and Saturday midday peak hours. The addition of project trips increases delay for the critical movement at the intersection already exceeding the LOS standard by at least 4 seconds in the weekday AM, weekday PM, and Saturday midday peak hours.

[16] The County is currently studying a project that would remove this intersection and provide an alternative intersection geometry, configuration and traffic control. For more information, see the Impact T-1 discussion in the Sight Distance and Safety Impacts section beginning on page 37.

THRESHOLD COMPARISON

As explained in the Definition of Acceptable Operations section on page 13, this report references LOS standards from LCP Policy 2.44. Those standards consider LOS D acceptable in the weekday AM or PM peak hour and LOS E acceptable in the weekend midday peak hour.

San Mateo County provides different LOS thresholds in a 2014 *Traffic Impact Study Requirements* document[17], which considers the minimum acceptable LOS to be LOS C overall, with, "no individual movement operating at less than 'D'," though it notes that "On occasion, level of service 'D' may be allowed for peak periods in dense urban conditions per County's discretion."

Upon review, the County indicated that the LCP Policy 2.44 was the appropriate and applicable threshold for this analysis, given that the TIS Requirements are not adopted as official policy and are not mandatory.

Applying this stricter threshold would have changed the effects identified for some identified intersections at certain times of day/analysis scenarios. The additionally identified scenarios include:

- **Existing plus project conditions:** no change in results
- **Future plus project conditions:** one additional effect identified (intersection #3 in Saturday midday peak hour conditions)
- **Cumulative plus project conditions:** two additional effects identified -- intersection #3 and #6 in Saturday midday peak hour conditions

The recommended operations improvements (identified in the next section) would not change.

RECOMMENDED OPERATIONS IMPROVEMENTS

This section includes recommendations that relate to the local circulation and operations effects of the proposed project.

Intersection 7: The additional traffic generated by project-related trips would result in an increase in delay for the critical movement at the intersection of State Route 1 and California Avenue/Wienke Way (#7).

This effect was identified in the following analysis scenarios:

- **Existing with project:** The addition of project trips causes the delay for the critical movement to increase by more than 4 seconds during the weekday PM and Saturday midday peak hours for an intersection already operating below the LCP LOS standard.
- **Future with project conditions:** The addition of project trips causes the delay for the critical movement to increase by more than 4 seconds during the weekday PM and Saturday midday peak hours for an intersection already operating below the LCP LOS standard.
- **Cumulative with project conditions:** The addition of project trips increases delay for the critical movement at the intersection already exceeding the LOS standard by at least 4 seconds in the weekday AM, weekday PM, and Saturday midday peak hours.

Improvement Measure T-1: Provide Additional TDM Measures, proposed and described as Mitigation Measure T-1 in the Conclusions and Mitigation Measures section beginning on page 37, would be expected to reduce project trips. Although a TDM plan would reduce the vehicle trip generation and reduce the effect, the effectiveness of a TDM plan cannot be guaranteed. Implementation of Mitigation

[17] County of San Mateo. Traffic Impact Study Requirements. December 9, 2014

Measure T-1 would reduce project-related vehicle trips but would not completely offset project-related trips and would not guarantee a reduction of these operations-related effects.

Improvement Measure T-1: Convert State Route 1 & California Avenue/Wienke Way to a Traffic Signal or Roundabout.

San Mateo County would work with Caltrans to convert the intersection control from two-way stop control into a roundabout or signalized intersection. The exact intersection control will be determined at the conclusion of an Intersection Control Evaluation (ICE) study as required by Caltrans. The ICE study would be performed as part of the design phase for changing the intersection control.

The intersection was modeled as a five-leg signalized intersection and as a single-lane roundabout to assess the mitigation measure. Conversion to either form of traffic control would improve the operation of this intersection to LOS A or LOS B, within identified LOS standards, during all analyzed time periods and scenarios.

In October 2021, the County published the final draft of its *Connect the Coastside* report, which serves as the San Mateo County Midcoast Comprehensive Transportation Management Plan. The report includes a suite of project, policy, and program recommendations to address current and future transportation needs.

The study recommends a change of traffic control at this intersection (with a preliminary recommendation of a multilane roundabout), and the project is listed as "near-term" a project (0 to 7 years). A more detailed analysis would be performed as part of an intersection control evaluation (ICE) during the design phase to select whether a roundabout or signal is preferred. The project is not funded.

Although this mitigation measure with conversion to a signalized intersection would lessen this effect, this intersection is under the jurisdiction of Caltrans. Thus, San Mateo County would need to obtain an encroachment permit from Caltrans. Implementation authority does not rest exclusively with the County.

Intersection 1: The additional traffic generated by project-related trips would result in an increase in delay for the critical movement at the intersection of State Route 1 and 16th Street (#1).

The addition of project trips causes the delay for the critical movement to increase by more than 4 seconds during the weekday PM peak hour in the Cumulative with project scenario for an intersection already operating below the identified LOS standard.

Improvement Measure T-1: Provide Additional TDM Measures, proposed and described as Mitigation Measure T-1 in the Conclusions and Mitigation Measures section beginning on page 37, would be expected to reduce project trips. Although a TDM plan would reduce the vehicle trip generation and reduce the effect, the effectiveness of a TDM plan cannot be guaranteed. Implementation of Mitigation Measure T-1 would reduce project-related vehicle trips but would not completely offset project-related trips and would not guarantee a reduction of these operations-related effects. Additional improvement measures were considered including signalization, left turn restrictions, and the addition of left turn lanes. However, these options were determined to not be feasible for the following reasons:

- **Signalization.** The intersection of 16th Street and State Route 1 does not meet the peak hour signal warrant (APPENDIX 10); therefore, signalization is not warranted.
- **Left Turn Restrictions.** Restricting the westbound left turn out of 16th Street and State Route 1 during the peak periods and reassigning them to the right turn movement would reduce the delay to below the threshold. However, Caltrans has indicated that they would not allow this type of restriction, making this option infeasible.
- **Additional Turn Lanes.** Adding exclusive left turn lane on westbound approach at the intersection would separate the left and right turning traffic reducing queues and delay. However, separating the left and through/right lanes was not sufficient to eliminate the effect since the left turn lanes still have a delay that is at least 4 seconds higher than the no Project conditions.

Intersection 3: The additional traffic generated by project-related trips would result in an increase in delay for the critical movement at the intersection of State Route 1 and Carlos Street (#3).

This additional delay was identified in the Cumulative with project weekday AM and weekday PM peak hours. This intersection would serve as the main access point to the project from State Route 1. To reduce this additional delay, improvement measures would be the same as the mitigation measures recommended for Impact T-1 beginning on page 37 (Mitigation Measure T-1 and Mitigation Measure T-2).

The closure proposed in Mitigation Measure T-2 would make a discussion of operations at the subject intersection irrelevant since existing and Project traffic would instead be routed south along Carlos Street and Stetson Street to access State Route 1 at either Etheldore Street or California Avenue.

However, traffic redistribution associated with this closure was modeled and found to result in a secondary significant impact at the intersection of Etheldore Street and State Route 1 where the critical movement delay fell below the relevant LOS threshold in the Existing with Project weekday PM scenario, Near-Term with Project weekday AM and Saturday midday scenarios, and the Cumulative with Project Saturday midway scenario. Table 16 shows the scenarios for which additional effects would occur. Improvement measures for Intersection 6 are discussed in the next section.

Table 19: Cumulative with Project Weekday AM Peak Hour Intersection Operations

No	Location	Control	No Project		With Project		With Project and Rerouted Traffic	
			Delay	LOS	Delay	LOS	Delay	LOS
1	Existing Weekday PM	TWSC	**37.0**	**E**	**38.2**	**E**	**41.5**	**E**
3	Near-Term Weekday PM	TWSC	44.3	E	**46.1**	**E**	**50.8**	**F**
4	Near-Term Saturday Midday	TWSC	32.3	D	33.4	D	**54.6**	**F**
5	Cumulative Saturday Midday	TWSC	34.1	D	35.1	E	**58**	**F**

*Note: **Bold lettering** indicates an intersection that does not meet the LCP LOS standard (LOS D overall and for critical movements during weekday peak hours, LOS E overall and for critical movements during weekend peak hours). **Gray highlighted cells** indicate locations where the addition of project trips would either degrade operations to below the LOS standard or add at least four seconds of average delay to the critical movement at a location already operating below the LOS standard.*

Source: Highway Capacity Manual 2010; Kittelson & Associates, 2022

Intersection 6: The additional traffic generated by project-related trips would result in an increase in delay for the critical movement at the intersection of State Route 1 and Vallemar/Etheldore Street (#6).

This increase was identified in the Cumulative with project weekday AM and PM peak hours. This intersection would serve as the main access point to the project from State Route 1. To reduce this additional delay, the following improvement measures are proposed.

Improvement Measure T-1: Provide Additional TDM Measures, proposed and described as Mitigation Measure T-1 in the Conclusions and Mitigation Measures section beginning on page 37, would be expected to reduce project trips. Although a TDM plan would reduce the vehicle trip generation and reduce the effect, the effectiveness of a TDM plan cannot be guaranteed. Implementation of Mitigation Measure T-1 would reduce project-related vehicle trips but would not completely offset project-related trips and would not guarantee a reduction of these operations-related effects.

Additional improvement measures were considered including signalization, left turn restrictions, and the addition of left turn lanes. However, these options were determined to not be feasible for the following reasons:

- **Signalization.** The intersection of Etheldore Street and State Route 1 does not meet the peak hour signal warrant (APPENDIX 10), therefore, signalization is not warranted.

- **Left Turn Restrictions.** Restricting the eastbound and westbound left turns out of Etheldore Street and State Route 1 during the peak periods and reassigning them to the intersection of California Avenue/Wienke Way and State Route 1 would reduce the delay to below the identified threshold. However, Caltrans has indicated that they would not allow this type of restriction, making this option infeasible.
- **Additional Turn Lanes.** Adding exclusive left turn lanes on the eastbound and westbound approaches at the intersection would separate the left and right turning traffic reducing queues and delay. However, separating the left and through/right lanes was not sufficient to reduce the delay since the left turn lanes still have a delay that is at least 4 seconds higher than in the No project conditions.

APPENDIX 2.

SEASONAL TURNING MOVEMENT COUNT ADJUSTMENTS

Mike Alston

From: Nowinski, Bill@DOT <bill.nowinski@dot.ca.gov>
Sent: Monday, October 23, 2017 9:20 AM
To: Mike Alston; Pribyl, Cindy L@DOT
Cc: Aaron Elias
Subject: RE: Highway 1 Peak Month ADT

Hello Mike,

The method you described would get you the best estimate for this area.
Due to road closures due to fires and flooding our data is based on estimates from the surrounding areas.
The ratio should give you the best results.

Bill Nowinski
Caltrans, District 5
Traffic Census-south

Hi Mike

I am forwarding your email to the Caltrans local District 5 Traffic Census Staff member Bill Nowinski. I am not familiar with this area's traffic patterns.

Bill is out in the field most days, but he does check his email account.

Subject: Highway 1 Peak Month ADT

Hi Cindy,

I am working on a transportation impact study in Moss Beach, California and am hoping you can provide me with some context on what's available on the Caltrans website.

Specifically, I am looking at the PDF "2015 Traffic Volumes on California State Highways."
(http://www.dot.ca.gov/trafficops/census/docs/2015_aadt_volumes.pdf)

For this project, Kittelson & Associates has Highway 1 traffic counts conducted in April 2017 but have been advised that we should find a conversion factor to represent the peak summer conditions. Based on what's in the PDF, I suspect our best option currently would be to use a ratio between **AADT** and the **Peak Month** to inflate them. (our counts as AADT, and our desired summer count number as peak month).

I am writing to ask you if you have any more granular information—specific months, for example, or any other seasonal/time trend related data. In particular, I am looking at SR1 in Caltrans District 4, San Mateo County, and the Vallemar/Etheldore Streets location (postmile 35.334).

Any guidance or more detailed information you could provide in this matter would be greatly appreciated.

Thank you,
Mike Alston

TDM PLAN

C/CAG TDM Checklist

ccagtdm.org

Residential (Multi-Family) Land Use: Small Project

100-499 ADT; ~20-49 Units

About this Form

Any new development project anticipated to generate at least 100 average daily trips is subject to the C/CAG TDM Policy and must complete a TDM Checklist and implement associated measures to mitigate traffic impacts. Read more at ccagtdm.org

B Required Measures

You must select all measures

Click on each measure's title for more information

	Measure	Percentage	Yes
1	**M2 - Orientation, Education, Promotional Programs and/or Materials** Offer new residents an orientation or education program or materials.	1%	☑
2	**M3 - TDM Coordinator/Contact Person** Provide TDM coordinator/liaison for tenants. May be contracted through 3rd party provider, such as Commute.org.	0.5%	☑
3	**M6 - Transit or Ridesharing Passes/Subsidies** Offer tenants passes or subsidies for monthly public transit or ridesharing costs incurred, equivalent to 30% of value or $50 - whichever is lower.	10%	☑
4	**M8 - Secure Bicycle Storage** Comply with CalGREEN minimum bicycle parking requirements.	1%	☑
5	**M9 - Design Streets to Encourage Bike/Ped Access** Design adjacent streets or roadways to facilitate multimodal travel.	1%	☑
6	**Total from Required Measures** Sum percentages from each selected measure from rows 1-5	13.5%	

Form Continues on Page 2 →

C Additional Recommended

Select enough to meet the 25% trip reduction target

Click on each measure's title for more information

	Measure	Percentage	Yes
7	**M4 - Actively Participate in Commute.org or TMA Equivalent: Certified participation in Commute.org/or TMA** Obtain certification from Commute.org or establish or join a Transportation Management Association (TMA) or equivalent.	4%	☐
8	**M5 - Carpool or Vanpool Program** Establish carpool/vanpool program for tenants and register program with Commute.org.	2%	☐
9	**M10 - Delivery Amenities** Offer delivery amenities, including dedicated receipt and storage areas, to reduce need for multiple trips to conduct similar business.	1%	☐
10	**M11 - Family-supportive Amenities** On-site secure storage of personal car seats, strollers, cargo bicycles, or other large bicycles. Property owners can also provide shared building equipment, such as shopping carts or cargo bicycles for check out by residents.	3%	☑
11	**M14 - Paid Parking at Market Rate** Offer hourly/daily parking rates proportional to monthly rate or equivalent to cost of transit fare.	25%	☐
12	**M15 - Reduced Parking** Provide off-street parking at least 10% below locally-required minimums, or else below the locally-permitted parking maximums. Consideration may be required of potential spillover parking into surrounding areas.	10%	☐
13	**M17 - Developer TDM Fee/TDM Fund** Voluntary impact fee payment on a per unit or square footage basis, to fund the implementation of TDM programs.	4%	☐
14	**M18 - Car Share On-Site** Provide on-site car share or vehicle fleets.	1%	☐
15	**M19 - Land Dedication or Capital Improvements for Transit** Contribute space on, or adjacent to, the project site for transit improvements. Select one or more Bus Pullout Space 1% ☐ Bus Shelter 1% ☐ Visual/Electrical Improvements (i.e., Lighting, Signage) 1% ☐ Other (i.e., Micromobility Parking Zone, TNC Loading Zone) 1% ☐	→ Total percentages selected: ___%	☐
16	**M21 - Bike/Scooter Share On-Site** Allocate space for bike/scooter share parking.	1%	☐
17	**M22 - Active Transportation Subsidies** Offer biking/walking incentives to tenants, such as gift card/product raffles.	2%	☑
18	**M23 - Gap Closure** Construct or enhance quality of biking and walking facilities to/from site to existing trails, bikeways, and/or adjacent streets.	7%	☑
19	**M24 - Bike Repair Station** Offer on-site bike repair space/tools in visible, secure area.	0.5%	☑
20	**M26 - Pedestrian Oriented Uses & Amenities on Ground Floor** Provide on-site, visible amenities to tenants and guests, such as cafes, gyms, childcare, retail.	3%	☐
21	**Total from Additional Measures** Sum percentages from each selected measure from rows 7 - 20	12.5%	

D Project Totals

Percentage from Required Measures (Section B Row 6): 13.5%

\+ Percentage from Additional Measures (Section C Row 21): 12.5%

Total Percentage from all Selected Measures (Sum of required and additional measures): 26%

Trip Reduction Target: 25%

Total Percentage from all selected measures must be greater than or equal to Trip Reduction Target

E Submit Checklist

See ccagtdm.org/submission for how to submit this form.

APPENDIX R

Traffic Impact Analysis Peer Review and

Vehicle Miles Traveled Analysis

Memorandum

Date: May 2, 2023

To: Bharat Singh, Michael Schaller, Steve Monowitz, San Mateo County

From: Mike Hawkins, Nina Price, Fehr & Peers

Subject: Final TIA Peer Review and VMT Analysis

SF22-1162

This memorandum provides a peer review of the *Cypress Point Transportation Impact Analysis and Mitigation Plan* ("TIA"), Kittelson & Associates, July 2022, updated March 14, 2023. The Cypress Point Project ("Project") is in Moss Beach in unincorporated San Mateo County. The proposed Project includes 71 affordable housing units on an 11.02-acre parcel that is currently vacant. Access to the site would be provided by a driveway on Carlos Street, near the intersection with Sierra Street. The peer review is based on guidance from the County of San Mateo Traffic Impact Study Requirements ("TIS Requirements") and County input on local plans and policies.

Introduction

The purpose of this memorandum is to document Fehr & Peers' review of the TIA, which was requested by the County due to traffic and safety concerns associated with the project-related traffic impacts and mitigation measures and the TIA's consistency with local plans, including Connect the Coastside (CTC). Additionally, this memorandum includes analysis of the project VMT.

Fehr & Peers completed a draft peer review of the TIA on February 2, 2023 which was reviewed by the following stakeholders of the project:

1. San Mateo County Planning Department
2. Midpen – Project Developers
3. SWCA – Project Environmental Consultants
4. Kittelson & Associates – Project Transportation Consultants

Kittelson & Associates subsequently updated the TIA based on the comments from the draft TIA Peer Review and the outcomes of discussions with the stakeholders. **Attachment A** documents the comments that were addressed in the most recent update of the TIA, or otherwise determined

unnecessary to incorporate from the draft TIA. Comments on the TIA contained in this memorandum have not yet been incorporated or discussed.

Previous Peer Review

A previous peer review of the TIA was conducted by Pang Engineers in 2019. Upon consultation with County staff, the Project developers, and the Project transportation consultants, it was determined that the comments did not warrant additional analysis nor did they need to be incorporated into the final TIA. The key suggestions from the previous peer review are summarized below for informational purposes only:

- Include traffic counts for a typical school day and summer day, use worst case for LOS calculations.
- Redo all LOS calculations with new counts, proper trip generation estimates, and accurate trip distribution.
- Further parking analysis to find 85th percentile values compared with County Code Requirements (current TIA reflects average and maximum values)
- Providing more parking than required conflicts with the interest to reduce traffic impacts.

Detailed TIA Assessment

The following sections provide a more detailed assessment of the items which may still be considered for incorporation into the TIA. A discussion of transportation related plans and policies is included in **Appendix A**. Additional comments for the Transportation Consultant are attached in **Appendix B** for consideration. A comparison of traffic counts collected in 2017 and 2022 are provided in **Appendix C**, and the raw traffic counts prepared by Quality Counts is provided in **Appendix D**.

Site Access and Circulation

There are plans for bicycle and pedestrian facilities on Highway 1 as described in **Appendix A**. Improvements to safety and connectivity for bicyclists and pedestrians will likely result in a higher volume of bicycle and pedestrian trips. There are several opportunities at the Project site to create higher visibility crossings to provide better visibility for pedestrians and bicyclists and encourage bicycling and walking as modes of transportation.

Fehr & Peers reviewed the Project site and developed a list of considerations to improve vehicle, bicycle, and pedestrian access and circulation. These considerations may be incorporated into a site plan review section of the TIA or may be used by the development team to refine their site design. A list of considerations is provided below:

- Driveway Location – The site driveway is aligned well with Carlos Street to provide a clear line of sight for vehicles approaching from both directions on Carlos Street; however, the

adjacent property wall restricts drivers exiting the site driveway from seeing cars approaching from the left. Vehicles would need to scoot closer into the intersection to see oncoming vehicles. Suggest adding pavement markings and signage to alert drivers on Carlos Street of the intersection.

- Site Circulation - Provide signage and pavement markings ahead of pedestrian crossings around site to alert drivers to yield to pedestrians. Recommend speed humps to maintain low vehicle speeds on site. Sidewalk around site looks quite narrow. Suggest widening sidewalks on site to accommodate both bicycles and pedestrians separate from the roadway with vehicles.
- Transit – Design the Project site to connect with future facilities on Highway 1 for improved pedestrian safety and connectivity, especially on Highway 1 at Carlos Street and 16th Street for access to SamTrans Route 117 southbound stop, and from the site to Highway 1 at 14th Street for access to SamTrans Route 117 northbound stop.
- Pedestrians/Bicyclists – Strengthen pedestrian connection between site and pedestrian and transit facilities. Connect sidewalks internal to site to bus stops on Highway 1 at 16th Street and at 14th Street. Provide signage on site to make drivers aware of bicyclists and pedestrians, especially at the pedestrian crossings throughout the parking areas. Add a discussion of the adequacy of proposed facilities to achieve the Complete Street Policy[1]. Add a discussion of added bike trips/primary travel paths from new residential uses to nearby schools and shops as well as surrounding major bike routes for commuters. Add a discussion of any intersections where major bicycle activity levels are anticipated as a result of the project and needed off-site bicycle improvements to support these activity levels. Add a discussion of pedestrian travel paths from new residential uses to surrounding destinations.
- Emergency Vehicle Access – Show truck turning templates for emergency vehicle circulation on site. Add text identifying the nearest fire station, route, and anticipated travel time to the project site.

Signal Warrant Analysis

Traffic signal warrant analysis was conducted for Study Intersection #2: Highway 1 & 16th Street and Study Intersection #6: Highway 1 & Vallemar Street/Etheldore Street. The TIA found impacts to traffic operations in the Cumulative with Project conditions at both intersections. The warrant analysis was conducted to test whether the traffic volumes warrant a traffic signal, that could potentially reduce the delay at the intersections in their existing traffic control. The TIA studied the appropriate time periods and concluded the warrant is not met for either intersection.

[1] County of San Mateo. 2013. *County of San Mateo General Plan Policies Chapter 12: Transportation Policies.* Available: https://www.smcgov.org/planning/general-plan-policies. For Complete Streets goals and objectives, see pages 12.2P, 12.5P, and 12.9P. Accessed December 5, 2022.

Fehr & Peers reviewed the traffic signal warrants worksheets in Appendix 10 of the TIA and reached the same conclusions that the traffic signal warrants are not met.

Parking

The requirements for vehicle parking presented in the TIA accurately reflect the zoning requirements for San Mateo County. Based on the County zoning regulations, the 71-unit development would require 127 vehicle parking spaces. The site plan provides 142 parking spaces, which exceeds the requirement by 15 spaces.

For bicycle parking spaces, the Project is providing eight short-term (outdoor) and 36 long-term (inside and secure) spaces. San Mateo County Zoning Regulations does not specify bicycle parking requirements for this region[2].

The TIA presented parking demand from the ITE 4th Edition Parking Demand Manual.

Table 5 presents parking demand estimated using two different parking generation methodologies contained within *ITE Parking Generation, 5th Edition*: Multi-Family Low-Rise Apartment, and Affordable Housing. The demand is quantified based on the number of dwelling units in the development.

Table 1. Parking Demand Comparison

ITE Edition	Units	Weekday		
		Fitted Curve Equation	Average Rate	Max Rate
TIA Parking Demand – ITE 4th Edition[1]	Dwelling Unit	63	87	138
ITE 5th Edition – Multi-Family Low Rise[2]	Dwelling Unit	79	86	108
ITE 5th Edition – Affordable Housing[3]	Dwelling Unit	58	70	94

Notes:
1. ITE Parking Demand, 4th Edition (Land Use #221 – Low/Mid-Rise) Adjacent Street Traffic Peak Hour
2. ITE Parking Demand, 5th Edition (Land Use #220 – Multi-Family Low-Rise) Adjacent Street Traffic Peak Hour
3. ITE Parking Demand, 5th Edition (Land Use #223 – Affordable Housing) Adjacent Street Traffic Peak Hour

Source: Fehr & Peers, 2022.

The parking demands estimated in the latest edition of the ITE manual are lower than those presented in the TIA. However, the parking supply exceeds both calculations for maximum

[2] County of San Mateo. 2022. *San Mateo County Zoning Regulations*. Available: https://www.smcgov.org/media/101461/download?inline=. Accessed December 5, 2022.

demand, which supports the TIA's statement that the site plan can support the parking demand for the development.

Fehr & Peers recommends the TIA include a comparison between the 4th Edition Parking Demand estimates with the estimates from latest edition of ITE (ITE 5th edition).

Transportation Demand Management (TDM)

The purpose of the Transportation Demand Management (TDM) program is to provide options to future residents to allow use of non-auto modes, strategies to encourage carpooling, biking, walking, and transit use, and site design features to promote the same. The proposed TDM Plan includes measures that are related to non-drive alone mode education, transit or ridesharing subsidies, bicycle amenities, and infrastructure improvements to support active transportation. The program is used as a mitigation for traffic operations impacts and sight distance and safety impacts.

The TDM program meets the requirements set forth by City/County Association of Governments of San Mateo County (C/CAG) for the project to include a series of measures that achieve a minimum trip reduction target of 25 percent based on the Project's type, size, and location. The Project's TDM Program achieves a total trip reduction of 26 percent of all the selected measures, and therefore meets C/CAG requirements.

It is recommended the TDM Measures are part of the project description to confirm the Project sponsor has agreed to these measures and that they will be implemented. At this time, this has not been confirmed. Per C/CAG, the Project sponsor may consider TDM Measure 4 for participation in Commute.org or Transportation Management Association (TMA) Equivalent. Three *Peninsula Traffic Congestion Relief Alliance (Commute.org)* shuttles provide weekday service through San Mateo County. Although no shuttles operate service near the Project site, Commute.org has a Bicycle to Work Rewards Program that rewards San Mateo County residents, workers, and students up to $100 for logging bicycle commutes that begin or end in the County. Additionally, commuters who live and work in San Mateo County are eligible for the Guaranteed Ride Home program, in which Commute.org will cover the cost of a ride home, up to $60 per trip with a maximum of four trips per calendar year, in case of illness or bicycle theft/breakage. These resources and rewards would help to encourage bicycling for commuting purposes.

Project VMT

The VMT analysis in the TIA is consistent with local guidance and the Governor's Office of Planning and Research (OPR) on CEQA VMT analysis. The TIA has documented the Project would represent a significant impact if the Project would result in more than 11.56 daily home-based Vehicle Miles Traveled (VMT) per capita by resident, which represents a 15 percent reduction from the baseline San Mateo County average of 13.60 home-based trip VMT per resident.

Fehr & Peers used the C/CAG VMT Estimation Tool to determine the residential VMT for the Project Transportation Analysis Zone (TAZ) is 23.6. Using the 2020 baseline year, the Bay Area Regional Average home-based VMT per resident is 14.6, and a 15 percent reduction from the baseline County average would result in a threshold of 12.41 home-based VMT per resident.

Considering the context of the development in Moss Beach, it is also relevant to compare the Project VMT to Coastal TAZs in San Mateo County (from Pacifica to Half Moon Bay). Fehr & Peers used the C/CAG VMT estimation tool to aggregate Coastal TAZ VMT and found that the average VMT for Coastal TAZs, weighted by population, is 19.0 and a 15 percent reduction from the Coastal TAZ average would be 16.15.

The following content is provided to quantify VMT reductions for informational purposes only. This analysis has limitations because the VMT reductions are based on a TAZ with high-income, single-family households, where research has shown these characteristics of a TAZ equate to more frequent vehicle travel and trip lengths much longer than affordable housing that is targeted at a local workforce. This project is consistent with statewide and regional goals[3] and research has shown affordable housing projects to overall reduce VMT.

Per the CAPCOA Handbook,[4] 100 percent affordable housing may have a 28.6 percent reduction in VMT per resident compared with market-rate housing. Below market rate housing provides greater opportunity for lower income families to live closer to job centers and achieve a jobs/housing match near transit. It is also an important strategy to address the limited availability of affordable housing that might force residents to live far away from jobs or school, requiring longer commutes.

An agreement between the County Department of Housing and Moss Beach Associates, L.P. is for the development to set aside 52 of the 70 proposed units as Local Preference Units (about 74 percent of the units), where eligible households are those that include at least one member who lives or works in the City of Pacifica, the City of Half Moon Bay, and/or the unincorporated County region between the City of Pacifica and the City of Half Moon Bay (Greater Moss Beach Region). This requirement may result in shorter commute trips per resident, and thus reduce VMT. However, this type of TDM measure is not quantified in the CAPCOA Handbook and an adjustment factor has not been developed. Fehr & Peers estimated a reduction in VMT for Local Preference Units, and this reduction is shown in **Table 4**. **Table 4** also provides a list of potential

[3] Refer to MTC Plan Bay Area 2050 and California Air Resources Board 2022 Scoping Plan Appendix D: Local Actions. Available: https://www.planbayarea.org/finalplan2050 and https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf, respectively. Accessed January 3, 2023.

[4] California Air Pollution Control Officers Associate. 2021. *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*. Available: https://www.caleemod.com/handbook/full_handbook.html. See pages 80-83. Accessed December 5, 2022.

VMT reductions associated with the Project's TDM Program, using the Caltrans TDM+ Tool[5]. The Project's TDM Program will encourage non-drive alone trips and result in reduced VMT, although implementation of the Program would not bring the Project's home-based VMT per resident below the threshold.

Table 2. VMT Reductions

Measure	Source	VMT Reduction		
		Subsector	Change in VMT	Description
Scale: Project/Site[2]				
Affordable and Below Market Rate Housing	Project Description	Land Use	-28.6%	All the units are affordable housing, and therefore the maximum percent reduction is applied.
Increased Density	Project Description	Land Use	N.A.	The Project is less dense than the average U.S. residential density and therefore no reduction is applied.
Transit Subsidy or Discounted Transit Program	TDM Program	Trip Reduction Programs	-0.73%	The TDM Checklist includes M6 – Transit or Ridesharing Passes/Subsidies, which offers tenants passes or subsidized for monthly public transit or ridesharing costs incurred, equivalent to 30% of value or $50, whichever is lower. The current monthly cost for a SamTrans Express Pass is $130.[1]
End-of-Trip Bicycle Facilities	TDM Program	Trip Reduction Programs	-0.55%	The TDM Checklist includes M8 – Secure Bicycle Storage. The Sponsor will comply with CalGREEN minimum bicycle parking requirements.
Scale: Plan/Community[2]				
Gap Closure and Sidewalk Improvements	TDM Program	Neighborhood Design	-2.73%	The TDM Checklist includes M23 – Gap Closure. As part of this measure, the Sponsor will add sidewalks and high visibility crosswalks as part of mitigation measure T-1 for Impact T-7. Using a study area of approximately 1,000 ft radius of Project site, the existing sidewalk length is about 0.1 miles and with the measure, the sidewalk length will be about 0.2 miles.
Non-CAPCOA Measures				

[5] Caltrans. 2023. *SB 743 Implementation Resources*. Available: https://dot.ca.gov/programs/sustainability/sb-743/sb743-resources. Accessed January 3, 2023. TDM+ is a quick response, excel-based tool developed by Fehr & Peers to assist in calculating VMT reductions from the strategies presented in the 2021 CAPCOA Report Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity. Its interface is designed to allow the user to update the inputs for each measure based on the specific attributes of a project or plan, as well as to pre-populate certain default values based on the project location. This version of TDM+ is currently in beta-testing.

Local Preference Units[4]	Project Description	N.A.	-(0-10.6)%	If 100% of residents in the local preference units live on the coast, apply a 0% reduction. If 100% of residents in the local preference units work on the coast, apply a 10.6% reduction.
Total Reductions: 29.5%-37.0%[3]				

Notes:

1. https://www.samtrans.com/fares/fare-types
2. The CAPCOA Handbook recommends that GHG reductions of transportation measures from different scales of application should not be combined. For this reason, the reduction in VMT is calculated for the Project/Site scale that includes a higher share of VMT reductions compared to the Plan/Community scale.
3. Total VMT reduction is calculated using this equation: $Reduction = 1 - [(1 - A) * (1 - B) * (1 - C)]$ where A, B, and C represent the percent reduction in VMT for a specific TDM Measure. The Project results in a VMT reduction of 29.5%.
4. Local Preference Units are not noted in the CAPCOA Handbook as a quantified measure. If it were, we would expect it to be at the Project/Site scale and within the Land Use subsector. Applying this measure with a maximum reduction of 10% would result in a VMT reduction of 37.0%.

Source: Fehr & Peers, 2022.

The Gap Closure and Sidewalk Improvements measure is expected to reduce the community's VMT. Although these improvements would likely reduce Project-level VMT, when calculating Project-level VMT reductions, the CAPCOA Handbook does not recommend applying community benefits with project benefits as these benefits are at two different scales.

Applying the measures in Table 4 would result in a VMT reduction of 29.5-37.0 percent, which would reduce the Project's residential VMT per resident of 23.6 to 14.87-16.64, which is not below the VMT threshold for the Bay Area Regional Average (12.41) or the County Average (11.56). However, it does fall below the average for the Coastal TAZs (19.0) and would be close to 15 percent below the Coastal TAZ average (16.15). VMT reductions from the TDM would not meet thresholds. Ultimately, the CEQA impact determination will be based on the County's VMT Guidance. From the Interim VMT Guidance[6], VMT thresholds for unincorporated areas of San Mateo County will be determined on a case-by-case basis.

Conclusion

This memorandum summarizes our remaining comments on the revised TIA (March 2023). For a summary of comments which have since been addressed, see **Attachment A**.

[6] San Mateo County. Department of Public Works. "Change to Vehicle Miles Traveled as Metric to Determine Transportation Impacts under CEQA Analysis." (2020).

Attachment A: Addressed Comments from Draft TIA Peer Review

Table 1. Incorporated Peer Review Comments

F&P Comment	Kittelson TIA Incorporation
CEQA environmental impacts related to transportation shall be evaluated using the County's VMT threshold rather than the LOS standard. Update the Conclusions and Mitigations section of the TIA to clearly identify items that are CEQA impacts and corresponding mitigation measures, and items provided for informational purposes only. Include VMT as a measure in the CEQA Significance Criteria.	**Data Analysis and Approach Section:** Analysis split into CEQA Transportation Analysis (analysis section titled "Conclusions and Mitigation Measures") and Local Transportation Analysis (analysis section titled "Local Circulation and Traffic Operations"). Disclaimer added that the local LOS analysis is provided for informational purposes only. **Analysis Section:** LOS tables for future and cumulative scenarios moved to the Local Circulation and Traffic Operations Section **Conclusions and Mitigation Measures:** All LOS related impacts moved to Local Circulation and Traffic Operations Section. Changes in LOS are no longer categorized as formal impacts, instead described by intersection. Additionally, mitigation measures previously associated with LOS impacts are now categorized as "Improvement Measures" in Local Circulation and Traffic Operations Section
The TIS Requirements are for the technical analysis to use standards and methodologies provided by the latest editions of ITE, HCM, and California Department of Transportation. The TIA was completed in 2022 and the latest edition of ITE is the 11th edition. Recommend updating trip generation using the ITE 11th edition rates for land use code 220.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. **Analysis – Project Vehicle Trip Generation Section:** TIA maintains the ITE 9th Edition Trip Generation Calculations but includes new subsection "*Trip Generation Sources*" starting on page 24. This section includes the 11th Edition Trip Generation Table from F&P Peer Review for comparison and discusses justification for prevailing use of 9th Edition.
The TIS Requirements related to trip generation state, "tabulate the estimated number of daily trips and AM and PM peak-hour trips generated by the proposed project entering and exiting the site". Add daily trip generation in the report to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. **Analysis – Project Vehicle Trip Generation Section:** Daily trip generation is now incorporated in Table 2 on page 24.

The TIS Requirements state "trip generation factors and source are to be included in the report". Provide the seasonal adjustment rate and a discussion of analysis method to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. **Analysis – Existing Conditions Traffic Volumes Section:** New subsection "Seasonal Adjustment Methodology" which describes the adjustment rate and methods (page 20).
Fehr & Peers collected traffic counts in October 2022 at the 10 locations identified in the TIA and compared the volumes to those collected in April 2017 for the traffic operations analysis. The TIA should include this comparison to acknowledge potential changes in volumes since the original counts were conducted.	**Analysis – Existing Conditions Traffic Volumes Section:** New subsection "Comparison with 2022 Volumes" describes the variation in volumes across the two data collection periods. The comparison ultimately determines that adjusted 2017 counts are appropriate (page 20).
Electric vehicle (EV) parking requirements are determined by the California Green Building Code[1], which was updated in 2022. The code requires 10 percent of spaces (15 total) be EV Capable, 25% be equipped with low power charging receptacles (36 total), and 5% be equipped with Level 2 EVSE (8 total). The quantity of EV spaces the Project is providing does not meet the CalGreen requirements, therefore Fehr & Peers recommends increasing the number of EV parking spacing to meet CalGreen requirements.	**Site Access, Circulation, and Parking – Parking Assessment Section:** New subsection "Electric Vehicle Parking" includes California Green Building Code parking requirements (page 31)

[1] UpCodes. 2022. *California Green Building Standards Code 2022*. Available: https://up.codes/viewer/california/ca-green-code-2022/chapter/4/residential-mandatory-measures#4.106.4. Accessed December 5, 2022.

Table 2. Incorporated and Unincorporated Comments Regarding Impacts and Mitigations

Impact (Mitigation)	F&P Comment	Incorporated	Not Incorporated
T-1 *(T-1, T-2)* T-2 *(T-1)* T-3 *(T-1)*	Per SB 743, Level of Service is no longer a criteria under CEQA. Provide LOS for informational purposes and for consistency with local planning requirements only. Add additional discussion of plans underway as part of the Moss Beach State Route 1 Congestion & Safety Improvements Project.	**Note:** Now listed as "Intersection 7", "Intersection 1", and "Intersection 3" in "Local Circulation and Traffic Operations" Section **Conclusions and Mitigation Measures:** All LOS related impacts moved to Local Circulation and Traffic Operations Section. Changes in LOS are no longer categorized as formal impacts, instead described by intersection. Additionally, mitigation measures previously associated with LOS impacts are now categorized as "Improvement Measures"	**Conclusions and Mitigation Measures:** The "Improvement Measures" do not include discussion of the Moss Beach State Route 1 Congestion & Safety Project.
T-4 *(T-1)*	Per SB 743, Level of Service is no longer a criteria under CEQA. Provide LOS for informational purposes and for consistency with local planning requirements only. There are no plans being considered at this time for change in intersection control, geometry, or allowable turn movements.	**Note:** Now listed as "Intersection 6" in "Local Circulation and Traffic Operations" Section **Conclusions and Mitigation Measures:** All LOS related impacts moved to Local Circulation and Traffic Operations Section. Changes in LOS are no longer categorized as formal impacts, instead described by intersection. Additionally, mitigation measures previously associated with LOS impacts are now categorized as "Improvement Measures"	
T-5 *(T-1)*	Add additional discussion of plans underway as part of the Moss Beach State Route 1 Congestion & Safety Improvements Project. The TIS Requirements related to mitigation measures state, "The TIS must identify those mitigation measures which will be implemented by others. Those mitigation measures that are assumed to be implemented by others will be made a condition of approval for the project to be in place prior to issuance of building permits". The recommended improvement does not reach a conclusion on the mitigation or party(s) responsible for the mitigation. Need to identify solution and approach to implementation.	**Note:** Now listed as Impact T-1 **Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. **Conclusions and Mitigation Measures:** Mitigation Measure T-1 is now "Provide Additional TDM Measures" which lists supplemental infrastructure improvements to improve bicycle, pedestrian, and transit connectivity. The project sponsor is specified to be responsible for implementation. *Additional Mitigation Measures* include discussion about the Moss Beach State Route 1 Congestion & Safety Project, specifying Caltrans jurisdiction and that it is out of the exclusive control of the county. This sufficiently addresses the responsible party(s) for the mitigation.	

T-6 *(T-1)*	To reduce the impact to less than significant, the Project sponsor would need to coordinate with the City, Caltrans, and SamTrans on facilities to improve pedestrian safety. The sponsor may contribute a fair-share towards the following items to increase safety of pedestrians crossing State Route 1: • Construct sidewalk on Carlos Street from Project driveway to Highway 1. • Construct sidewalk on east side of Highway from Carlos Street to 14th Street for pedestrian path to SamTrans Route 117 northbound bus stop. • Construct crosswalk on Highway 1 to connect to the SamTrans southbound Route 117 stop at 16th Street • Provide bus stop amenities at SamTrans Route 117 northbound and southbound stops near Project site. We don't recommend the use of TDM as a mitigation measure for this impact. The TDM Plan should serve to encourage non-drive alone trips which would likely lead to an increase in pedestrians crossing State Route 1. Add additional discussion of plans underway as part of the Moss Beach State Route 1 Congestion & Safety Improvements Project.	**Note:** Now listed as Impact T-2 **Conclusions and Mitigation Measures:** Impact description now includes disclaimer about the potential for TDM to offset reduced trips overall with more people crossing SR 1 to access transit. TDM implementation is no longer used as a mitigation measure. Mitigation Measure T-1 is now "Provide Additional TDM Measures" which lists supplemental infrastructure improvements to improve bicycle, pedestrian, and transit connectivity. The project sponsor is specified to be responsible for implementation. *Other Mitigation Measures* include discussion about the Moss Beach State Route 1 Congestion & Safety Project, specifying Caltrans jurisdiction and that it is out of the exclusive control of the county. This sufficiently addresses the responsible party(s) for the mitigation. Additional suggested infrastructure measures to reduce the impact to less than significant were not incorporated. The impact remains.	
T-7 *(T-1)*	Need the Project sponsor to commit to the list of improvements identified under Mitigation Measure T-1 to reduce this impact. Consider contributions towards sidewalk or other pathway on east side of Highway 1 to bus stop at 14th St, crosswalk on Highway 1 to bus stop at 16th Street, Class II bike lanes on SR 1, and transit stop improvements for the two bus stops identified. Coordinate with Caltrans, County, SamTrans, San Mateo County Transit District, and the Moss Beach State Route 1 Congestion & Safety Improvements Project team for aligning near term improvements with long term plans.	**Note:** Now listed as Impact T-3 **Conclusions and Mitigation Measures:** Mitigation Measure T-1 is now "Provide Additional TDM Measures" which lists supplemental infrastructure improvements to improve bicycle, pedestrian, and transit connectivity. The project sponsor is specified to be responsible for implementation. Additional suggested infrastructure measures to reduce the impact to less than significant were not incorporated. The impact remains.	

Table 3. Peer Review Comments Determined Unneceassry for TIA

F&P Comment	Kittelson TIA Incorporation
As identified in the TIA, a CEQA Significance Criteria is if the proposed project resulted in inadequate emergency access. The TIA does not include a measure of effectiveness related to emergency access. In addition to providing a measure(s) of effectiveness, add a discussion of the impact criteria in the Conclusions and Mitigations section. Refer to CEQA Guideline's Appendix G checklist. Items to add as measures of effectiveness include if the Project were to impair implementation of or physically interfere with adopted emergency response/evacuation plan, result in inadequate emergency access, and if project is in hazard areas, should analyze the project's effect on evacuation travel times. This may include residents, workers, students, and visitors (and possibly horses). Additionally, consider providing discussion of emergency routes for residents.	Per County direction, discussion regarding measure of effectiveness and impact criteria for emergency access will be included in the Environmental Impact Report. This item does not need to be addressed in the TIA.
In addition to traffic operations assessment using LCP Policies as part of the non CEQA assessment, identify and compare traffic operations to County thresholds as identified in the TIS Requirements.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. Per County direction, the LCP is sufficient for evaluating operations and therefore did not wish to include the TIS Requirements.
TIS Requirements state "A table and a map showing the status, project/zone change/conditional use permit/parcel map/tract number, and the location of each project must be provided" for projects within a 2.5-mile radius that would be in place by the project's build out year. Recommend providing the table and map to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. This figure will be included in the Environmental Impact Report and does not need to be addressed in the TIA.
The TIS Requirements related to trip distribution state "Diagrams showing the percentages and volumes of the project and nearby project's AM and PM peak-hour trips logically distributed on the roadway system must be provided". The report provides the percentage trip distribution along Highway 1 for the project in a table (Table 4 in TIA) rather than in a diagram, and these percentages are not provided for nearby projects or local streets. Update report to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. Per County Direction, the diagrams would not provide additional value if included with existing intersection geometry diagrams, therefore they will not be included in the TIA.

The TIS Requirements related to the project description state "A complete description (including a map) of the existing land uses in the study area as well as their current zoning and use must be included." A map is not included in the TIA with the existing land uses and zoning. Update report to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. This map will be included in the Environmental Impact Report and does not need to be addressed in the TIA.
The TIS Requirements state "Graphics should be included to illustrate the study area and vicinity, study intersections including photographs and lane diagrams for cross-reference, existing, background and future traffic volumes." The TIA does not include photographs of the study intersections. Update report to meet this requirement.	**Note:** The County TIS Requirements are not codified and should therefore be regarded as guidance only. Per County Direction, these photos would not add value to the existing intersection diagrams and therefore do not need to be included in the TIA.
Add a construction traffic and parking assessment to the TIA. This assessment is often included in a TIA for CEQA purposes, particularly for projects that may be developed in phases where detailed construction information is not available for review. It is anticipated that a potential impact would be identified and a mitigation requiring submittal of a construction traffic management plan for each construction phase would be added.	Construction traffic and parking assessment will be included in the Environmental Impact Report. This item does not need to be addressed in the TIA.
Include a section that discusses the relevant plans and documents relating to the Project. Several county-wide and location specific planning documents specify goals and policies for the Cypress Point development and its surrounding area. Fehr & Peers reviewed these plans to evaluate the TIA's consistency with their outlined recommendations, included in **Appendix A.**	Discussion regarding relevant plans and documents as they pertain to the Project will be included in the Environmental Impact Report. This item does not need to be addressed in the TIA.

Appendix A: Relevant Plans & Policies

Relevant Plans and Policies

Local Coastal Program

The Local Coastal Program (LCP) primarily defaults to Connect the Coastside for transportation-related policies and project recommendations, as stated by Policy 2.53. The LCP requires that Midcoast developments evaluate impacts to Level of Service for coastal access and emergency vehicles and develop a Transportation Demand Management plan.

The plan also identifies the California Coastal trail, a continuous inter-connected public trail system along the coastline as a means of encouraging active transportation and fostering appreciation of the natural environment. The Coastal Trail is anticipated to cross Highway 1 at 16th Street, and further plans are identified in Connect the Coastside for creating a safe and continuous crossing.

Connect the Coastside

Connect the Coastside serves as the San Mateo County Midcoast Comprehensive Transportation Management Plan, as part of the Local Coastal Program policy[1]. The most recent iteration of Connect the Coastside was finalized in July 2022.

The plan recommends nine projects which impact the street network surrounding the Project location, presented in **Table A-1.**

Table A-1. Connect the Coastside Project Recommendations

Project Name	Project No.	Description
Highway 1 Side Street Stop Signs	R2	Install stop signs and pavement markings at all side streets of SR-1 where missing
16th St/Highway 1 Intersection Control	R5	Intersection control, with preliminary recommendation of single-lane roundabout
California Ave/Highway 1 Intersection Control	R6	Intersection control, with preliminary recommendation of single-lane roundabout
Carlos Street Realignment to 16th Street	R9	Realign north terminus of Carlos Street at Highway 1 to connect to 16th Street
Carlos Street Traffic Calming	R10	Striping, signage, and completion of missing sidewalk, with conversion to one-way southbound with parking reoriented facing south on Carlos Street to accommodate the Parallel Trail and calm traffic in central Moss Beach

[1] https://www.smcgov.org/planning/local-coastal-program#

New and Improved Crossings of Highways 1 and 92	Pe1	Improve existing and add new pedestrian crossings on Highways 1 and 92 including marked crossings with flashing beacons, overcrossing of Highway 1/south of Carlos St, and improve Highway 1/Coronado
Highway 1 Multimodal Parallel Trail	Pe2	Connected walking and bicycling facilities along the east side of Highway 1 through connected Class I Path, sidewalks, and Class III Bike Route, with marked crossings of intersecting streets with the path
Highway 1 Bikeway	B1	Bikeway designation on Highway 1 of Class II Bike Lanes
Transit Stop Improvements	T1	Ensure all bus stops have ADA accessible pad, with additional amenities, at higher use stations including benches, shelters, and lighting

Moss Beach State Route 1 Congestion & Safety Improvements Project

San Mateo County has plans underway for improvements along State Route 1 (Cabrillo Highway) to improve congestion and safety for the corridor[2]. The project is currently in the initiation stage, determining the feasibility of suggested improvements at the intersections of 16th Street, California Avenue, and Cypress Avenue with SR 1, in addition to the corridor through Moss Beach.

These locations are identified as part of the Connect the Coastside report. The project team is determining feasibility for a traffic signal and roundabout at these locations which would be anticipated for build out in cumulative conditions.

The County is working with Caltrans and the project is anticipated to be completed by 2030, although funding has not yet been identified. Although the project will not be completed for several years, it has the potential to address several transportation impacts that are identified by the TIA. The Project should consider interim mitigation measures in anticipation of the future implementation of corridor improvements.

SamTrans Bus Stop Improvement Plan

SamTrans is in the beginning stages of the development of the SamTrans Bus Stop Improvement Plan[3]. The project seeks to improve the accessibility and comfort of bus stops throughout their service district. However, the bus stops in closest proximity to the development, located at SR 1 and 16th Street, may not receive improvements due to space and access constraints. The Project should consider safety, accessibility, and comfort improvements to stops near the Project site.

Active Transportation Plan

The San Mateo County Active Transportation Plan[4] identifies a vision of a connected network for bicyclists and pedestrians, with improved safety and complete streets. The plan presents a backbone network of

[2] https://www.smcgov.org/planning/moss-beach-sr-1

[3] https://www.samtrans.com/Projects/bus-stop-improvement-plan

[4] https://ccag.ca.gov/wp-content/uploads/2021/06/San-Mateo-County-Comprehensive-Bicycle-and-Pedestrian-Plan-Update-Final-Plan.pdf

bicycle facilities to connect the region, including a bicycle and pedestrian trail that runs north along State Route 1 adjacent to the Project location. There are currently no bicycle facilities in the area, and there are plans included in Connect the Coastside and the additional project recommendations with the Active Transportation Plan that seek to create a robust network of bicycle facilities along the corridors near Cypress Point. The plan identifies the following projects in Moss Beach:

- California Ave from Tierra Alta to lake Street, Class III
- Etheldore Street, Class III
- Vallemar Street, Class III
- Carlos St/Vermont Ave, Class III
- Highway 1 (16th Street to Etheldore), Class I

Appendix B: Additional Comments on the TIA Document

Fehr & Peers completed a detailed review of the TIA document and have provided additional items for consideration in **Table B-1**.

Table B-1. Additional Comments on the TIA Document

Item No.	Page No.	Comment
1	i	On the Contents page, the header has "List of Figures". Update the header in the initial section from page 5-10 for what is listed on the page. For example page 9 says "Appendices" and the page is the executive summary.
2	iii	Appendix 2 is listed as "Seasonal Turning Movement Counts Adjustment". The appendix includes an email with approval to use seasonal adjustments, but does not provide information about this adjustment. Consider providing this for disclosure of how traffic varies, and to document the analysis methodology.
3	1	Consider adding the approximate distance of the project driveway from Sierra Street.
4	1	Considering noting the second driveway location that is to be used as an emergency vehicle route.
5	1	The project impacts are identified on the executive summary. Consider including a description of all of the scenarios studied ahead of the project impacts section for more context. It would also be good to document what the "identified intersection operations standards" are, which are likely the LCP standards.
6	Figure 1	The map scale is not displaying properly. Please update.
7	Figure 1	Recommend showing the project site driveways on the map.
8	Figure 2	Label the streets in the tentative site plan. Confirm this is the most up to date site plan.
9	11	The most recent version of the Highway Capacity Manual (HCM) was released in January 2022. Recommend comparing operation methodologies from 2010 HCM to 2022 to ensure using most up to date guidance.
10	12	Update the policy number to Policy 2.43 in reference to LCP Desired Level of Service
11	13	Consider providing linear interpolation data for the growth between 2017 and 2040.
12	13	Reference #4 is provided in a different format to previous references. Recommend adding additional information to this source.
13	General	Check that references and footnotes are formatted consistently throughout the document
14	Figure 3	Consider adding project area boundary to the figure for more context.
15	17	Note that recently SamTrans renamed routes so routes with 2 digits represent school routes and routes with 3 digits are for general bus service. Route 17 has been renamed to Route 117. No action needed.

16	18	There are additional schools that Routes 117 and 18 serve. In addition to the two listed: Manual F. Cunha Intermediate School and Half Moon Bay High School, near the project site El Granada Elementary School, Wilkinson Elementary School, and Farallone View Elementary School can be served by these routes. Consider listing these in the section as well.
17	Figure 4	Recommend showing the project site driveways on the map.
18	20	Could specify that Appendix 3 detailed calculation worksheets are the Synchro reports.
19	Figure 5	Int #7 is missing an WBR movement
20	24	Reference #8 has a typo in the first clause. Suggest updating. I think it might be "The manual lists land use ITE XXX (XX) an average rate..."
21	33	Provide information on which version of the Caltrans Highway Design Manual was used.
22	Figures 6, 7, 9-12	Suggest changing the order of intersections so it runs 6 through 10 down the right side of the figure. Global comment for the figures displaying intersection movement information.
23	Figure 7	Is it assumed that there are not any project trips off SR 1? Please make it clear whether Project trip distribution was done just for trips on SR 1 or for all project trips.
24	41	Remove word "Page" from the page number for consistency with previous sections. This continues through section 4.

Appendix C: Traffic Counts Comparison

The following tables present a comparison of traffic counts collected in 2017 and 2022. Traffic counts are provided by intersection movement for each time period.

1. Highway 1 and 14th Street

Total Counts

	AM Peak	PM Peak	Sat Peak
2022	1005	1342	1429
2017	1207	1480	1599
% Change	-17%	-9%	-11%

Peak Hour Turning Movements

	NBLeft	NBThru	NBRight	SBLeft	SBThru	SBRight	EBLeft	EBThru	EBRight	WBLeft	WBThru	WBRight

Cumulative Impacts 23

ENERGY APPENDIX

INTRODUCTION

This Energy Technical Report addresses potential energy impacts associated with the proposed residential project located northeast of the intersection of Carlos Street and Sierra Street in Moss Beach, CA. The project proposes to develop 71 affordable housing units (on a 10.875-acre parcel), consisting of 18 two-story buildings with 3 to 4 units each and a one-story community building. The applicant anticipates approximately 213 people to occupy the units upon build out. All units, apart from the manager's unit, will be rented to households that earn less than 80 percent of the Area Median Income. Impacts could result from construction energy use and/or operational energy use.

This Energy Technical Report describes existing primary energy sources in the State, and identifies relevant federal, State, and local regulations pertaining to energy conservation. The types of energy sources that would be consumed by the project are identified and estimates are provided for the amounts of each energy source that would be consumed by the project. These factors and the energy-conserving features of the project are discussed as a basis for determining whether the project would have any adverse effects on energy resources, including the need to develop additional capacity.

Because energy consumption is directly tied to the emissions of anthropogenic greenhouse gases (GHGs), California's focus on legislation and regulations to reduce GHGs will lead to improved energy efficiency and reduced energy consumption across the transportation, building heating and cooling, and power generation sectors of the economy. Over the last decade, regulators focused primarily on developing program-specific targets to advance California's energy system (such as separate targets for renewable energy, energy efficiency, demand response, storage, and other attributes), but the State has begun shifting to a more comprehensive approach aimed at improving the performance of the system and achieving the State's greenhouse gas reduction goals.

This Energy Technical Report addresses the project's energy consumption, usage and conservation as per Public Resources Code Section 21100(b)(3), Appendix F, and Appendix G of the CEQA Guidelines. Specifically, CEQA provides that an environmental impact report shall include a detailed statement identifying the environmental impacts of proposed projects, and setting forth mitigation measures proposed to minimize any significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy (Public Resources Code Section 21100(b)(3)). Appendix F of the CEQA Guidelines states that "the California Environmental Quality Act requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful and unnecessary consumption of energy (see Public Resources Code section 21100(b)(3))." Appendix F includes a list of energy impact possibilities and potential conservation measures "designed to assist in the preparation of an EIR." Appendix G contains the following questions regarding energy: (a) would the project have a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources? and (b) would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Recent case law has clarified the requirements to satisfy Public Resources Code section 21100(b)(3) and Appendix F, holding that an EIR must quantify energy use during construction and operations, including energy associated with transportation associated with the project, and also consider the availability of measures to reduce reliance on fossil fuels. (*California Clean Energy* Committee *v. City of Woodland* (2014) 225 Cal.App.4th 173.) Mere reliance on compliance with the California Building Code and other green building requirements is not sufficient to meet an agency's burden under Appendix F and Public Resources Code section 21100(b)(3); an agency must also consider whether a building should be constructed at all, how large it should be, where it should be located, and investigate renewable energy options that might be available or appropriate for the project.

This Energy Technical Report provides an analysis of potential energy consumption impacts that would result from the implementation of the project and identifies mitigation measures, if necessary.

SETTING

ENERGY RESOURCES

The composition of California's in-State generation capacity (in megawatts, or MW) has increasingly shifted toward renewable resources in recent years. Between 2001 and 2016, the generation capacity of electricity from renewable sources (including rooftop solar) has more than tripled, rising from 6,800 MW in 2001 to 26,300 MW in 2016[1]. The addition of renewable energy sources (solar, wind, geothermal, small hydro, and biomass) in California's electric grid has increased generation from renewables from 28,000 Gigawatt hours (Year 2000) to over 80,000 Gigawatt hours (Year 2017).[2]

The following discussion describes the different energy resources that would be consumed by the project.

ELECTRICITY AND RENEWABLE ENERGY

Electricity is a consumptive utility. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components, including substations and transformers that lower transmission line power (voltage) to a level appropriate for onsite distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid. Conveyance of electricity through transmission lines is typically responsive to market demands.

California's electricity generation capacity is composed of multiple fuel sources, including coal, hydroelectric, natural gas, nuclear, oil, petroleum coke, waste heat, biomass, geothermal, solar photovoltaic, solar thermal, and wind. In 2017, the State had an installed generation capacity from these multiple sources of 206,328 gigawatt hours (GWh).[3] The composition of California's in-State generation capacity has shifted since the 2002 passage of Senate Bill 1078, which required that 20 percent of electric production come from renewable resources by 2017. With the passage of SB X1-2 in 2011, this was increased to 33 percent renewables by 2020; it was raised again to 50 percent renewables by December 31, 2030 by SB 350 (2015).

[2] California Energy Commission, *2018 Integrated Energy Policy Report Update Vol. 1*, CEC-100-2018-001-V1.
[3] California Energy Commission, California Energy Alamac, Electricity Generation Capacity & Energy, In-State Electric Generation by Fuel Type (GWh), Accessed March 8, 2019, https://www.energy.ca.gov/almanac/electricity_data/electric_generation_capacity.html.

Since adoption of the first Renewables Portfolio Standard (RPS) pursuant to SB 1078, the State has significantly increased its portfolio of renewable resources. While natural gas-fired capacity is still the primary source of electricity generation, in the last few years, significant amounts of renewable resources have been brought on-line. Installed capacity of renewable energy in California increased from 6,800 megawatts (MW) in 2001 to almost 21,300 MW in 2016, more than tripling the output of this sector over this time period. When behind-the-meter capacity (such as rooftop solar) and facilities smaller than 1 MW are factored in, installed capacity reached 26,300 MW by the end of 2016.[4]

The most significant increase in renewable sources is from utility-scale solar photovoltaic (PV) panels. Installed operating capacity, including both new facilities and capacity expansions, rose from roughly 40 MW in 2010 to 5,700 MW in 2015. Solar thermal technology was the second largest category of growth, increasing from roughly 400 MW in 2012 to nearly 1,300 MW in 2015. Installed wind capacity increased at a slightly slower pace from around 1,500 MW in 2001 to 4,000 MW in 2011, then jumped to roughly 6,100 MW by 2016. Completion of projects that have environmental permits and are in preconstruction or construction phases is expected to add another 10,000 MW of new renewable capacity.[5] With total in-State electricity generation of 198,227 GWh in 2016, 55,300 GWh of them from renewables, along with increases in capacity currently being implemented, these numbers demonstrate that California is well on its way to meeting the requirement for 33 percent renewables by 2020.

Pacific Gas and Electric Company (PG&E) is the local public utility and energy supplier for the project area. PG&E is an American investor-owned utility (IOU) headquartered in San Francisco. PG&E provides natural gas and electricity to most of the northern two-thirds of California, which represents 5.2 million households. PG&E is overseen by the California Public Utilities Commission. PG&E is one of the four regulated, investor-owned utilities (IOU)s in California; the other three are PacificCorp's Pacific Power, Southern California Edison and Sempra Energy's San Diego Gas & Electric. PG&E delivered 82,226 GWh of electricity in 2017.[6]

PG&E filed for Chapter 11 on January 29, 2019, but they do not expect any impact to natural gas or electric service for customers as a result of the Chapter 11 process.[7]

[7] PG&E, www.pge.com, viewed March 5, 2019.

NATURAL GAS

Natural gas represents approximately one-third of the energy consumed in California each year. Its use falls mainly into four sectors—residential, commercial, industrial, and electric power generation—but it is also used as an alternative to petroleum for fuel in cars, trucks, and buses. Nearly 45 percent of the natural gas burned in California is used for electricity generation, while residential, industrial, and commercial sectors account for 21 percent, 25 percent, and 9 percent of the consumption, respectively. California relies on out-of-state imports for nearly 90 percent of all-natural gas consumed in the State. Statewide consumption of natural gas in totaled 2,115 Trillion Btu in 2017.[8]

The project would receive natural gas from PG&E. PG&E has approximately 42,500 miles of natural gas distribution pipelines, 6,700 miles of backbone and local gas transmission pipelines, and various gas storage facilities.[9] In 2017, PG&E delivered approximately 216 Trillion Btu to its 4.47 million customers.[10]

PETROLEUM

California's production of gasoline in December 2017 ranged from approximately 6.5 to 8.1 million barrels per week, and the State had an inventory of gasoline and blend stocks of about 10.5 million barrels per week. Over the preceding five years, production ranged from about 5.3 to 8.1 million barrels per week, while inventories ranged from about 9.3 to 14.5 million barrels per week.[11]

The Petroleum Industry Information Reporting Act (PIIRA) requires all retail transportation fueling stations in California to file a Retail Fuel Outlet Annual Report (CEC-A15). These stations report retail sales of gasoline, diesel, and other transportation fuels. The California Energy Commission (CEC) compiles these reports into Statewide data, which it compares to California Board of Equalization data, which tracks all gasoline and diesel sales in California for taxation purposes. Based on the results of this data tracking, the CEC reports that retail sales of gasoline throughout the State in 2016 totaled 13.787 billion gallons; in 2017 sales totaled 13.936 billion gallons.[12] Sales data reported does not include commercial fleets, government entities, or rental facilities/equipment yards.

[12] California Energy Commission, California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, Accessed March 11, 2019 at: http://www.energy.ca.gov/almanac/transportation_data/gasoline/piira_retail_survey.html.

The State's diesel fuel production in December 2017 was approximately 2.6 million barrels per week, with an inventory of about 3.6 million barrels per week. Over the preceding five years, production ranged from roughly 1.6 to 3.3 million barrels per week, while inventories ranged from about 2.7 to 4.7 million barrels per week.[13] Statewide retail diesel sales in 2016 and 2017 totaled 1.743 billion gallons and 1.717 billion gallons, respectively.[14]

RELEVANT PLANS, POLICIES AND ORDINANCES SETTING

Federal and State agencies regulate energy consumption through various policies, standards, and programs. At the federal level, energy standards apply to numerous products (e.g., the U.S. Environmental Protection Agency's [EPA's] EnergyStar™ program) and transportation (e.g., fuel efficiency standards). At the state level, Title 24 of the California Code of Regulations sets forth energy standards for buildings. Further, the State provides rebates/tax credits for installation of renewable energy systems and offers the Flex Your Power program that promotes conservation in multiple areas. At the local level, individual cities and counties can establish policies in their general plans and climate action plans (CAPs) related to the energy efficiency of new development and land use planning and to the use of renewable energy sources. Applicable federal, state, and local regulations are discussed in further detail below.

FEDERAL

FEDERAL ENERGY POLICY AND CONSERVATION ACT

In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the National Highway Traffic Safety Administration is responsible for establishing additional vehicle standards. In 2010, fuel economy standards were set at 27.5 miles per gallon for new passenger cars and 23.5 miles per gallon for new light trucks. Fuel economy is determined based on each manufacturer's average fuel economy for the fleet of vehicles available for sale in the United States.

ENERGY INDEPENDENCE AND SECURITY ACT OF 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 (EISA) was signed into law. In addition to setting increased Corporate Average Fuel Economy (CAFE) standards for motor vehicles, the act includes other provisions related to energy efficiency:

- Renewable fuel standard (RFS) (Section 202)
- Appliance and lighting efficiency standards (Sections 301–325)
- Building energy efficiency (Sections 411–441)

[13] California Energy Commission, Energy Assessments Division, Supply Analysis Office, *Petroleum Watch January 2018*, Figure 9: Diesel Production and Inventories, January 30, 2018, Accessed March 11,2019 at: https://www.energy.ca.gov/almanac/petroleum_data/petroleum_watch/2018_Petroleum_Watch/

[14] California Energy Commission, California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, Accessed March 11, 2019 at: http://www.energy.ca.gov/almanac/transportation_data/gasoline/piira_retail_survey.html.

This federal legislation requires increasing use of renewable fuels over time to replace petroleum (Section 202, RFS). The EPA is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. The RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders. The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under EISA, the RFS program was expanded in several key ways that laid the foundation for achieving significant reductions of greenhouse gas (GHG) emissions through the use of renewable fuels, for reducing imported petroleum, and for encouraging the development and expansion of our nation's renewable fuels sector. The updated program is referred to as RFS2 and includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel and set separate volume requirements for each one.
- EISA required the EPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces (EPA 2015).

EPA AND NHTSA JOINT RULE FOR VEHICLE STANDARDS

On April 1, 2010, the EPA and the National Highway Traffic Safety Administration (NHTSA) announced a joint final rule to establish a national program consisting of new standards for light-duty vehicles for model years 2012 through 2016. The joint rule is intended to reduce GHG emissions and improve fuel economy. The EPA promulgated the first-ever national GHG emissions standards under the Clean Air Act, and NHTSA promulgated CAFE standards under the Energy Policy and Conservation Act. This final rule follows the EPA and Department of Transportation's joint proposal on September 15, 2009 and is the result of the President Obama's May 2009 announcement of a national program to reduce GHGs and improve fuel economy. The final rule became effective on July 6, 2010 (EPA and NHTSA 2010).

The EPA GHG standards require new passenger cars, light-duty trucks, and medium-duty passenger vehicles to meet an estimated combined average emissions level of 250 grams of carbon dioxide (CO2) per mile in model year 2016, equivalent to 35.5 mpg if the automotive industry were to meet this CO2 level through fuel economy improvements alone. The CAFE standards for passenger cars and light trucks will be phased in between 2012 and 2016, with the final standards equivalent to 37.8 mpg for passenger cars and 28.8 mpg for light trucks, resulting in an estimated combined average of 34.1 mpg. The rules will simultaneously reduce GHG emissions, improve energy security, increase fuel savings, and provide clarity and predictability for manufacturers (EPA and NHTSA 2010).

In August 2012, the EPA and NHTSA approved a second round of GHG and CAFE standards for model years 2017 and beyond (EPA and NHTSA 2012). These standards will reduce motor vehicle GHG emissions to 163 grams of CO2 per mile, which is equivalent to 54.5 mpg if this level were achieved solely through improvements in fuel efficiency, for cars and light-duty trucks by model year 2025. A portion of these improvements, however, will likely be made through improvements in air conditioning leakage and through use of alternative refrigerants, which would not contribute to fuel economy. The first phase of the CAFE standards (for model years 2017 to 2021) are projected to require, on an average industry fleet-wide basis, a range from 40.3 to 41.0 mpg in model year 2021.

The second phase of the CAFE program (for model years 2022 to 2025) is projected to require, on an average industry fleet-wide basis, a range from 48.7 to 49.7 mpg in model year 2025. The second phase of standards has not been finalized due to the statutory requirement that NHTSA set average fuel economy standards not more than five model years at a time. The regulations also include targeted incentives to encourage early adoption and introduction into the marketplace of advanced technologies to dramatically improve vehicle performance, including the following:

- Incentives for electric vehicles, plug-in hybrid electric vehicles, and fuel cell vehicles
- Incentives for hybrid technologies for large pickups and for other technologies that achieve high fuel economy levels on large pickups
- Incentives for natural gas vehicles
- Credits for technologies with potential to achieve real-world GHG reductions and fuel economy improvements that are not captured by the standards' test procedures

STATE

TITLE 24 OF THE CALIFORNIA CODE OF REGULATIONS

Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Energy consumption by new buildings in California is regulated by the State Building Energy Efficiency Standards, included in Title 24. The efficiency standards apply to new construction of both residential and non-residential buildings, and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit process. Local government agencies may adopt and enforce energy standards for new buildings, provided these standards meet or exceed those provided in Title 24 guidelines. The standards are updated periodically to allow consideration and possible incorporation of new energy-efficiency technologies and methods. The premise for the standards is that energy efficient buildings require less electricity, natural gas, and other fuels. The Title 24, Part 6, standards are updated every three years. The most recent amendments to Title 24, Part 6, referred to as the 2016 standards, became effective on January 1, 2017 and would apply to the project. The previous amendments were referred to as the 2013 standards. Homes built to the 2016 standards use approximately 28% less energy for lighting, heating, cooling, ventilation and water heating than those built to the 2013 standards.[15] The 2016 standards focus on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings. The standards include efficiency improvements to the residential standards for attics, walls, water heating, and lighting. They also include efficiency improvements to the non-residential standards, to bring them into alignment with the American Society of Heating and Air-Conditioning Engineers (ASHRAE) 90.1 2013 national standards.

Title 24 also includes Part 11, known as California's Green Building Standards (CALGreen). The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low rise residential, and State-owned buildings, as well as schools and hospitals. The 2016 CalGreen standards became effective on January 1, 2017. Some mandatory standards related to the project include:

- Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling;
- 20% mandatory reduction in indoor water use;
- 50% of construction and demolition waste must be diverted from landfills;
- Mandatory inspections of energy systems to ensure optimal working efficiency; and
- Low-pollutant emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring, and particle boards.
- Separate water meters for buildings in excess of 50,000 square feet or buildings projected to consume more than 1,000 gallons per day.

[15] California Energy Commission. 2016 Building Energy Efficiency Standards, Frequently Asked Questions. https://www.energy.ca.gov/title24/2016standards/rulemaking/documents/2016_Building_Energy_Efficiency_Standards_FAQ.pdf

- Reduce the generation of wastewater by installation of water-conserving fixtures or using non-potable water systems.

SENATE BILL 32

Building on Assembly Bill (AB) 32, the landmark legislation intended to reduce California's emissions of greenhouse gases (GHGs), Governor Jerry Brown signed Senate Bill (SB) 32 into law on September 8, 2016. AB 32, enacted in 2006 by then-Governor Arnold Schwarzenegger, required the State to reduce emissions of GHGs to 1990 levels by 2020. California is well on its way to meet this target, and the goals has been raised by SB 32, which requires the State to reduce emissions of GHGs to 40 percent below 1990 levels by 2030. Although Governor Brown had previously established this goal by Executive Order B-30-15, SB 32 codifies the target. This must be done while California's population is projected to grow from about 38 million in 2017 to more than 44 million by 2030.

CLEAN ENERGY & POLLUTION REDUCTION ACT

Senate Bill 350, signed into law on October 7, 2015, enacted the Clean Energy & Pollution Reduction Act, which increases California's renewable electricity procurement goal from 33 percent by 2020 to 50 percent by 2030. This will increase the use of Renewables Portfolio Standard (RPS) eligible resources, including solar, wind, biomass, geothermal, and others. In addition, SB 350 requires the State to double Statewide energy efficiency savings in electricity and natural gas end uses by 2030. To help ensure these goals are met and greenhouse gas emission reductions are realized, large utilities will be required to develop and submit Integrated Resource Plans (IRPs) that must detail how each utility will meet their customers resource needs, reduce greenhouse gas emissions, and ramp up the deployment of clean energy resources.

SENATE BILL 1389

Senate Bill 1389 (SB 1389, Bowen and Sher, Chapter 568, Statutes of 2002) requires the California Energy Commission (CEC) to "conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The commission shall use these assessments and forecasts to develop and evaluate energy policies and programs that conserve resources, protect the environment, ensure energy reliability, enhance the State's economy, and protect public health and safety." In compliance with SB 1389, the CEC—in collaboration with federal, State, and local agencies and a wide variety of stakeholders—prepares a biannual Integrated Energy Policy Report (IEPR) that assesses current energy trends and prescribes policies to further the goals established by SB 1389. The most recent IEPR was adopted in February 2017 and an update was published in 2018.

LOCAL

SAN MATEO COUNTY GENERAL PLAN CHAPTER 17 ENERGY AND CLIMATE CHANGE ELEMENT

The Energy and Climate Change Element demonstrates San Mateo County's commitment to achieve energy efficiency and mitigate its impact on climate change by reducing GHG emissions consistent with State legislation. This element is an optional element of the General Plan and is not mandated by the State of California. Authorized by Section 65303 of the Government Code, the inclusion of this element in the General Plan demonstrates the County's commitment to the long-term sustainability and resilience of the unincorporated county. San Mateo County is working to sustain the long-term health of the natural and built environments, achieve effective and meaningful reductions in GHGs, and increase resiliency to the impacts of climate change in the unincorporated county.

SAN MATEO COUNTY CLIMATE ACTIONS PLANS

San Mateo County has two Climate Action Plans currently in place – a Government Operations Climate Action Plan and a Community Climate Action Plan (also known as the Energy Efficiency Climate Action Plan [EECAP]). The County Office of Sustainability is responsible for the update and implementation of both programs.

The EECAP provides a path for achieving local energy efficiency and reductions in GHGs by 2020. The EECAP will function as an implementation tool of the General Plan, working as a shorter-term plan that will be updated on a more regular basis. The EECAP also provides technical analysis to demonstrate the impact of the County's policies and programs on GHG emissions. Maintaining the EECAP separately from the General Plan provides flexibility to the County to assess and revisit the effectiveness of EECAP measures and actions toward achieving this element's overall goals and policies. As a stand-alone plan, the EECAP also has the flexibility to integrate near-term opportunities, new technologies, and research. Together, the General Plan and EECAP function as part of the County's toolkit to achieve resilience to climate change and long-term GHG reductions.

The relevant plan for this project would be the EECAP. The EECAP includes a GHG inventory of all the emissions that result from the unincorporated areas and a list of various proposed measures to reduce these emissions. The Office of Sustainability is currently working with the Planning and Building Department to update the existing Community Climate Action Plan.[16]

The reduction measures included in the EECAP build upon existing efforts and provide a diverse mix of regulatory and incentive-based programs for both new and existing development. The reduction measures also aim to reduce GHG emissions from each source to avoid reliance on any one strategy or sector to achieve the target. In total, GHG reduction measures in the EECAP will reduce GHG emissions in the unincorporated county in 2020 by 67,000 metric tons of CO2 equivalents.[17]

[16] County of San Mateo, Office of Sustainability, Climate Action Plans, https://www.smcsustainability.org/climate-change/climate-action-plans/.
[17] County of San Mateo, Energy Efficiency Climate Action Plan, June 2013.

SAN MATEO COUNTY GREEN BUILDING ORDINANCE

San Mateo County's Green Building Ordinance has been in effect since 2008 and applies to all new construction projects as well as to projects involving a remodel of 50% or greater of the value of the building. All new residential projects must receive at least 50 points on the appropriate GreenPoint Rated Checklist or LEED certification. Expedited building permit processing is available as an incentive to projects achieving higher points or certifications. In the commercial and industrial sector, new buildings or remodels of at least 3,000 square feet in area are required to achieve LEED certification. As with residential projects, expedited permit processing and inspections are available to projects that achieve a higher level of certification; in this case, buildings must achieve LEED Silver or above. [18]

[18] Ibid.

STANDARDS OF SIGNIFICANCE

The standards of significance for the analysis of potential energy impacts are based on the new Energy section in Appendix G of the 2019 CEQA Guidelines.

Would the project:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Neither the CEQA Guidelines nor Public Resources Code Section 21100(b)(3) provide a specific threshold for impacts associated with energy consumption. However, Appendix F of the CEQA Guidelines (14 CCR 15000 et seq.) provides guidance for evaluating whether a development project may result in significant impacts with regard to energy. Based on Appendix F of the CEQA Guidelines and the new Appendix G questions, the standards of significance for this analysis will evaluate whether the project would:

1. Result in wasteful, inefficient, or unnecessary consumption of energy during construction.
2. Result in wasteful, inefficient, or unnecessary consumption of energy during operation.
3. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.
4. Require the construction of new or expanded energy production facilities or infrastructure, the construction of which could cause significant environmental impacts.

In evaluating the standards, the analysis will consider the scale of the project's energy use (size of the project) and project's commitment to feasible opportunities to conserve energy or use alternative fuels or renewable energy.

IMPACTS AND MITIGATION MEASURES

The project would consume energy in three primary forms:

- Liquid fuels (gasoline and diesel) to power construction equipment, haul trucks and worker vehicles during project construction and to power vehicles during operation of the project;
- Electricity to power construction equipment/power tools and to provide lighting of the project site and to power inside and outside electrical uses for the homes and community building; and
- Natural gas to provide heat and hot water in the homes and community building.

The project is not responsible for developing these energy supplies. The project is not involved in the extraction and refining of petroleum or natural gas and does not build or operate power plants. It is reasonably assumed that the companies and public utilities involved in these activities have previously undergone the appropriate environmental review pursuant to CEQA. Therefore, the analysis presented in this report is focused solely on the consumption of existing energy supplies by the project, and whether that consumption could be considered wasteful, inefficient, or unnecessary.

IMPACT ANALYSIS

IMPACT ENERGY-1

Project construction would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources. (Less than Significant)

CONSTRUCTION ENERGY USAGE

Project construction would require site preparation, site grading and excavation, trenching, interior architectural finishing, paving and landscaping. Construction would be typical for the region and building type, and the project site does not include unusual building challenges that would require unusually high energy usage. The importation of a maximum of 7,000 cubic yards of fill material would be required, which would result in a maximum of 692 haul truck trips, as indicated in the California Emissions Estimator Model (CalEEMod) modelling estimates in the Air Quality Technical Report.[19]

[19] Illingworth & Rodkin, Inc., *Cypress Point Affordable Housing Project Air Quality & Greenhouse Gas Emissions Assessment*, June 29, 2018.

Fuel consumption during construction was calculated by CalEEMod, a Statewide land use emissions computer model developed for the California Air Pollution Officers Association (CAPCOA) in collaboration with the California Air Districts. The model inputs assumed project construction would occur eight hours per day, five days per week, for a period of 15 months[20]. It assumed a daily construction crew of approximately 40 workers, resulting in approximately 80 daily one-way trips during building construction, with fewer workers during other construction phases. CalEEMod calculated the emissions and related fuel use for each construction phase, including site preparation, grading, building construction, paving, and architectural coating.[21]

Based on CalEEMod results for project construction and standard fuel consumption conversion factors, construction would require approximately 7,564 gallons of gasoline and 45,508 gallons of diesel fuel. This includes all off-road construction equipment, hauling, vendor, and worker trips over a 320-working day construction period. For the finishing phase of construction, some electricity may be used (e.g., for power tools and work lighting). While this electricity usage cannot be quantified at this time, it is anticipated to be relatively minor compared to normal building operations. When not in use, electric equipment would be powered off so as to avoid unnecessary energy consumption. Natural gas would not be used during construction.

If it is conservatively assumed that all of the fuel used during construction would be consumed in one year, gasoline consumption would represent approximately 0.00005 percent of Statewide gasoline consumption in 2016. The diesel consumption would represent 0.00125 percent of Statewide consumption in 2016. This increase in consumption would be temporary, of relatively short duration, and would cease once project construction is completed. This minor increase in fuel consumption would not require development of new petroleum supplies or construction of new production or distribution facilities. As required by Mitigation Measure AQ-1 of the Air Quality Technical Report, the construction contractor would be required to minimize equipment idling time and maintain equipment in proper operating condition, which would ensure that fuel powering the equipment would not be used in an inefficient or wasteful manner.[22]

MidPen Housing Corporation (the project sponsor) has also committed to the following construction actions[23] that would reduce the energy consumption from project construction:

- Preserve a portion of the site as undeveloped land.
- Make best efforts to use of at least 10 percent local building materials.
- Recycle or reuse at least 50 percent of construction waste or demolition materials.

[20] While the project description assumes a construction period of 18 months, a construction period of 15 months is assumed here to be consistent with the air quality analysis. This is a conservative assumption and would not substantially change the results.

Therefore, for the reasons stated above, the consumption of fuel and other energy during project construction would have a ***less-than-significant impact*** on energy resources.

MITIGATION MEASURES ENERGY-1

None required.

IMPACT ENERGY-2

Project operations would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources. (Less than Significant)

Once the project is operational, transportation fuels (predominantly gasoline) would continue to be consumed through vehicle trips by residents, visitors, maintenance workers, delivery truck drivers, etc. Similar to the construction analysis, operational fuel consumption was calculated by CalEEMod (see Energy Appendix at the end of this report). CalEEMod calculates energy consumption and associated emissions for transportation, areas sources, electricity consumption, natural gas combustion, electricity usage associated with water usage and wastewater discharge, and transport and disposal of solid waste. Key assumptions used in the analysis included the default trip lengths and trip types specified by CalEEMod for San Mateo County. Based on the Transportation Impact Analysis performed for the project, a daily weekday trip generation rate of 6.65 weekday trips per dwelling unit (or 472 daily weekday trips) was assumed.[24]

CalEEMod does not break down fuel usage into gasoline and diesel components; since the majority of residential vehicles are gasoline-fueled, it was assumed that all of the fuel consumption would be gasoline, resulting in estimated annual fuel consumption of approximately 46,548 gallons of gasoline. This would represent approximately 0.0003 percent of Statewide gasoline consumption in 2016.

The CalEEMod was also used to estimate the consumption of electricity and natural gas associated with space and water heating and landscape maintenance (i.e., electricity to control irrigation equipment) expected to occur during operation of the project. The project land use type and size and other project-specific information were input to the CalEEMod. The CalEEMod results indicated that the project's estimated electricity consumption would be approximately 322,439 kWh of electricity and approximately 1.44 billion BTUs of natural gas per year. This would represent approximately 0.00039 percent of PG&E's electricity sales in 2017 and approximately 0.000670 percent of PG&E's natural gas sales in 2017. The project's annual electricity usage would represent approximately 0.00013 percent of Statewide electricity sales in 2017. The project's natural gas usage would represent approximately 0.000068 percent of Statewide natural gas sales in 2017.

[24] Kittleson & Associates, Inc. Cypress Point Traffic Impact Analysis. April 2019.

While implementation of the project would result in consumption of non-renewable energy resources, such consumption is an inherent characteristic of typical development projects. The energy demands of the project would be reduced by energy conservation features that are required in the project type (new multi-family construction using the current Title 24 Building Code), the location (coastal zone with minimal annual air conditioning and heating needs) and energy conservation features that are included in MidPen additional environmental commitments.

As listed in the Project Description[25], MidPen has agreed to a list of environmental commitments to minimize the environmental effects. From that list, the commitments outlined below would reduce the consumption of non-renewable energy resources.

OPERATIONAL ENERGY SAVING FEATURES

In order to achieve energy efficiency beyond Title 24 building standards, MidPen has agreed that the project shall be developed in accordance with the minimum requirements of one of the following programs: Leadership in Energy & Environmental Design; Green Communities; Passive Housing; Living Building Challenge; National Green Building Standard, or the GreenPoint Rated program. The following are features that may be included[26]:

- Natural cross-ventilation of every unit with windows in 3 sides of most units (2-3 BR), and 2 sides of 1 BR units;
- Cool roofs with low reflectance for reduced heat-island effect;
- High-efficacy lighting fixtures throughout; “Night-sky” compliant site lighting;
- Drought-tolerant landscaping with native species and minimized and efficient irrigation;
- Passive on-site storm water management;
- PV ready roofs;
- No air conditioning;
- Shared laundry facilities;
- Secure bike parking facilities to encourage less vehicle use;
- Install toilets using less than 1.6 gallons per flush;
- Install showerheads providing maximum flows of 2.5 gallons per minute or less;
- Install self-closing faucets in non-residential lavatories; and
- Install high-efficiency washing machines with a water factor of 5 or less.

The energy savings from the operational energy savings features above cannot be estimated at this time because the actual program and features that would be included have not been selected. However, it is clear that adopting the minimum requirements of one of the programs would improve the project energy efficiency beyond Title 24 building standards.

ADDITIONAL OPERATIONAL ENERGY CONSERVATION FEATURES

As identified in the Project Description, the intention of the project sponsors and San Mateo County is to improve the jobs/housing balance and jobs/housing fit by providing preference for those who live or work on the San Mateo Coast[27]. Although not quantified, the project would provide opportunities for reduced commutes for existing coastal workers and residents.

The Transportation Impact Analysis[28] recommended three mitigation measures that could conserve energy by improving opportunities for short walking trips and mass transit, as opposed to single occupancy vehicles.

1. Mitigation Measure TRAF-1B – Develop a Transportation Demand Management (TDM) plan for review and approval by San Mateo County which may include:
   - Local live-work preference for residents
   - One or more dedicated car share parking space(s)
   - Free or discounted SamTrans transit passes
   - Provide public transit information and education for residents – maps and schedules for residents, brochures about environmental and health benefits
   - Provide a pedestrian trunk (grocery cart) to eliminate driving to local market
   - Provide both short and long-term secure bicycle parking
   - Support for active transportation through provision of bicycle and pedestrian-supportive infrastructure, streets, etc. within the Project
   - Additional measures that may become available as technology evolves
2. Mitigation Measure TRAF-5A – Construct a sidewalk that connects the Project entrance on Carlos Street to the sidewalk located on the north side of Sierra Street. This includes land both on and adjacent to the Project property.
3. Mitigation Measure TRAF-5B – The project sponsor should distribute informational literature to tenants upon move-in detailing available transit service and bus stop locations. The informational literature should discourage the use of the southbound bus stop at Carlos Street and State Route 1 because of the inadequate corner sight distance provided at the intersection. Residents should be redirected to use the bus stop at Etheldore Street and California Street instead which is approximately a ten-minute walk from the project entrance.

It should be noted that transportation energy consumption could be higher without the project because of the transportation energy use associated with coastal workers commuting from more distant locations.

Given all of the foregoing considerations, the project would not consume energy resources in a wasteful or inefficient manner and would therefore have a **less-than-significant impact** on the consumption of energy resources.

MITIGATION MEASURES ENERGY-2

None required.

IMPACT ENERGY-3

The project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. (Less than Significant)

The Relevant Plans, Policies and Ordinances Setting of this Report describes the regulatory framework for energy usage and conservation at the federal, State, and local level. For building projects, Title 24 (California Code of Regulations) is of particular importance, as it sets standards for energy performance.

As indicated in IMPACT ENERGY-2, MidPen has agreed to a list of environmental commitments to minimize the project's environmental effects, including a commitment that the project would be developed in accordance with a green building program, to be selected in the future, which would include a variety of energy efficient features that are beyond the requirements of Title 24. As such, the project would exceed applicable State standards and would be more energy efficient than what is currently required by the State.

The project has been reviewed relative to the San Mateo County General Plan Energy and Climate Change and the San Mateo County EECAP. This analysis finds that the project would not conflict with or obstruct either of these plans. Furthermore, based on the size of the project, the Air Quality Technical Report indicated that the project is below the Bay Area Air Quality Management District (BAAQMD) operational GHG emissions screening level and all GHG emissions impacts would be less than significant.[29] The project would provide energy efficiency beyond Title 24 requirements and would support the intent of the General Plan and EECAP, which is to reduce GHG emissions in San Mateo County. Therefore, the project would not conflict with or obstruct a state or local plan and any project effect would be a **less-than-significant impact**.

MITIGATION MEASURES ENERGY-3

None required.

IMPACT ENERGY-4

The project would not require the construction of new or expanded energy production facilities or infrastructure, the construction of which could cause significant environmental impacts. (No Impact)

Based on the minimal energy use identified in Impacts ENERGY-1 and ENERGY-2, no expanded energy production facilities would be anticipated, therefore, the project would have **no impact** from the construction of energy production facilities.

[29] Illingworth & Rodkin, Inc., *Cypress Point Affordable Housing Project Air Quality & Greenhouse Gas Emissions Assessment*, June 29, 2018.

MITIGATION MEASURES ENERGY-4

None required.

CUMULATIVE IMPACTS

While the project would incrementally contribute, in addition to other cumulative projects, to the regional demand for energy (electricity, natural gas, gasoline, and diesel fuel), the project's energy impacts would not be individually considerable. As indicated in IMPACT ENERGY-2, the project's annual electricity usage would represent approximately 0.00039 percent of PG&E's electricity sales in 2017 and the project's natural gas usage would represent approximately 0.000670 percent of PG&E's natural gas sales in 2017. Electricity and natural gas are provided to end users on demand, and delivery amount is a function of use. During peak usage, more of the utility can be made available to users in order to avoid any potential outages. While the management of energy resources is a Statewide challenge, and cumulative demand for such resources could be considered cumulatively significant, the project's energy consumption is small and it includes many features that would minimize energy consumption. Therefore, the project's contribution to energy demand would not be cumulatively considerable and the project's cumulative impact to energy resources would be a **less-than-significant impact**.

Further, the Plan Bay Area 2040 Draft Environmental Impact Report (Metropolitan Transportation Commission/Association of Bay Area Governments 2017) contains an analysis of the impact of growth and transportation improvements in the 9-county Bay Area, including San Mateo County. This analysis is cumulative by its nature, and concludes that implementation of the plan "would not result in wasteful, inefficient, or unnecessary consumption of energy, during project construction or operation." Therefore, the cumulative impact related to energy from all Bay Area growth would be less than significant, and the Cypress Point project would not change that determination.
