- **Effects on People and Housing:** Of the approximately 647,000 buildings modeled within the general building stock for Riverside County, about 1% (6,262) are expected to suffer "complete" damage in the 0.2% annual chance flood event (500-year flood) scenario. These building would be considered "red-tagged" or unsafe for continued occupancy. About 94% of the 6,262 buildings are manufactured housing (i.e., mobile homes). Approximately 43,000 buildings (6.6%) are expected to suffer more than 20% damage or more while about 18,000 buildings are estimated to suffer flood damage of less than 20%. As much as 0.78 million tons of debris may result from these damaged buildings – 21% is expected to be heavy debris (concrete and steel), requiring heavy equipment to break down and remove, while 79% is expected to be light debris (wood, brick, drywall and other debris).

Damage to single family and multi-family dwellings is expected to result in the displacement of almost 126,000 households. While many of the displaced may find shelter with friends and family, or in available hotels, as many as 357,000 people are expected to seek short-term public shelter. This large number of people would likely overwhelm the emergency sheltering capacity of the county. The displaced populace should be able to move to safe locations without too much difficulty. While four (4) bridges in the county's transportation system are expected to suffer minor flood damage, the bridges are expected to remain functional.

- **Essential Facility Impacts:** Table 29 provides an overview of essential facility performance in the 0.2% annual chance flood event (500-year flood) with levees scenario. The table lists the number of essential facility sites and buildings (these numbers will differ for multi-building campuses, such as schools and hospitals). The table also provides the total building replacement value, and the number of buildings for which value data was available. As can be seen in the table, replacement cost data for hospitals was generally not available, unlike most other essential facility types. Expected building damage in this flooding event ranges from 0% damage for numerous essential facility types with some, but minimal, flooding, to as much as 7.1% mean damage for one school district. The total economic loss for essential facilities has been estimated to reach about $83 million, almost 91% of which ($75 million) will occur in schools and about 6% of which will occur in EOCs ($5.1 million). It should be noted that no hospital losses were estimated since all hospitals impacted by this flooding scenario did not provide replacement value data. (The full economic impact on hospitals can't be estimated at this time because of the lack of comprehensive replacement value data).

Table 26: Riverside County Essential Facility Loss Estimates – 0.2% Annual Chance Flood Scenario

Essential Facility	Category	No. of Facilities/Sites	No. of Buildings	No. of Beds	Replacement Cost ($1,000)	# Buildings w/ replacement	# Non-Functional Buildings	Time to Restore (Days)	Economic Loss ($1,000)

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

- **Effects on Infrastructure:** A slow-rising flood situation will progress through a series of stages, beginning with minor rainfall and evolving to a major event such as substantial flooding. Once flooding begins, personnel will be needed to assist in rescuing persons trapped by floodwaters, securing utilities, cordoning off flood areas, and controlling traffic. These actions may overtax local agencies, and additional personnel and resources may be required. It is anticipated that existing mutual aid resources would be used as necessary to augment local resources.

  Many essential public and quasi-public facilities and hazardous materials sites are located within the 100- or 500-year flood zones of Riverside County. As of the writing of the Safety Element of the County's General Plan, these included 14 of the County's 39 airports; 4 of 18 hospitals; 47 of 109 police stations, fire stations, and emergency operation centers; 92 of 380 schools; 446 of 1,306 highway bridges; and 695 of 1,978 hazardous materials sites.

- **Effects on Agriculture:** As the historical events in Riverside County show, effects on agriculture can be devastating. Flooding can damage crops, livestock, and dairy stock. In addition to the obvious impacts on animals and crops, flooding can have deleterious effects on soil and the ability to reinvigorate the agricultural activities affected once the flood waters recede.

Risk Assessment Conclusion

Flooding due to heavy precipitation or dam failure is a potential hazard in Riverside County, with the resultant possibilities for damage to property and loss of life. Severe flooding can be particularly costly. In a relative sense, flooding due to precipitation does not present the degree of danger posed by other hazards such as major earthquakes. If there is flooding due to dam failure, the danger could be cataclysmic.

Relationship to Other Hazards – Cascading Effects

Fire can breakout because of dysfunctional electrical goods. Hazardous materials can also get into floodways, causing health concerns and polluted water supplies.

5.3.10 Civil Disorder

Severity: 3

Probability: 2

Risk Score: 1.13

OA Jurisdictions Affected by Civil Disorder

- All incorporated cities of Riverside County

Hazard Definition

Civil disorder or unrest is usually triggered by dramatic political or social events. Every major metropolitan area in California has experienced and is at risk for, civil disorder. The most significant civil unrest incident in the State was the 1992 Los Angeles Civil Disturbance that resulted in 53 deaths, over 2,300 injuries and over $800 million in damages. This event also precipitated simultaneous, but smaller, incidents throughout California and the country.

Civil disorder is an incident intended to disrupt community affairs and threaten the public safety. Civil disorder includes riots, mob violence, and any unlawful demonstration resulting in police intervention and arrests. Civil Unrest is generally associated with controversial political, judicial, and/or economic issues and events.

History

Riverside County is not a place where there has been a lot of historic civil disturbance events of noticeable magnitude. There are locations within Riverside County where large public gatherings take place. These locations have the potential for unstable conditions, possibly affecting the ability of a jurisdiction in the County to provide sufficient law enforcement and fire protective services.

May 1, 2017 – "May Day" protest in Riverside to oppose President Trump's actions against undocumented workers, LGBT rights, fair wages, Black Lives Matter, refugees and immigrants.

January 31, 2017 – Protests held in Riverside to protest President Trumps Travel restrictions from seven primarily Muslim countries.

January 21, 2017 – Thousands marched in Downtown Riverside for Woman's rights.

November 10, 2016 – UC Riverside students marched in an anti-Trump rally.

May 7, 2016 – Trump supporters rally in Temecula approximately 350 people attended.

July 13, 2012 – Rally against violent crimes at the Riverside Public Library.

January 31, 2012 – Union Strike at various locations in Riverside County.

December 2, 2011 - Protests at all of the main entrances to the Mission Inn where Buster was holding a re-election fundraiser.

November 6, 2011 - There was an "Occupy" protest near City Hall, and 8 protesters were arrested.

November 22, 2011 - 200 to 300 students gathered at UCR's bell tower at the center of campus to protest. (Occupy UC Riverside).

April 15, 2010 - Riverside County Tax Day Tea Parties' Protest Rally (Tea Party).

January 13, 2009 - The Riverside County Board of Supervisors today temporarily suspended an ordinance it passed last week to limit protests outside a large Church of Scientology compound near Hemet. Protesters show up about once a month outside Golden Era Productions, home to 500 Scientologists, on Gilman Springs Road.

December 2004 - A demonstration at county administrative buildings that was part of a nationwide protest sponsored by the American Family Rights Association.

Risk Assessment

During a Civil Unrest incident that affects Riverside County, there are certain critical facilities within the County that may be more at risk than others. These critical facilities include venues for musical concerts and sporting events, facilities where legal and illegal demonstrations are held, and any other facilities with events that attract large numbers of people. All of these situations create significant traffic congestion and the potential for disruptive behavior.

- **Effects on people and housing.** The effects of a Civil Unrest are varied and usually based on the type, severity, scope, and duration of the disturbance. Effects may include illegal assemblies, injuries, and even loss of life.

- **Effects on commercial and industrial structures**. Effects may include traffic congestion or gridlock, illegal assemblies, disruption of utility service, and property damage.

- **Effects on infrastructure.** Effects may include traffic congestion or gridlock, disruption of utility service, and property damage.
- **Effects on agriculture.** Effects may include traffic congestion or gridlock, disruption of goods transportation services, and property damage.

Risk Assessment Conclusion

The overall risk of civil unrest in Riverside County is low.

Relationship to Other Hazards – Cascading Effects

Civil Unrest may lead to a fire, destruction of property, disruption of power, injury to persons, and even loss of life. It also has the potential to affect first responder response times by traffic blocking protesting techniques.

Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

5.3.11 Drought

Severity: 3

Probability: 3

Risk Score: 1.13

OA Jurisdictions Affected by Drought

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

A drought is a long period of extremely dry weather when there is not enough rain for the successful growing of crops or the replenishment of water supplies.

Drought is a gradual phenomenon. Normally, one dry year does not constitute a drought in California but rather serves as a reminder of the need to plan for droughts. California's extensive system of water supply infrastructure (reservoirs, groundwater basins, and interregional conveyance facilities) generally mitigates the effects of short-term dry periods for most water users.

Drought can have secondary impacts. For example, drought is a major determinant of wildfire hazard, in that it creates greater propensity for fire starts and larger, more prolonged conflagrations fueled by excessively dry vegetation, along with reduced water supply for firefighting purposes. Drought is also an economic hazard. Significant economic impacts on California's agriculture industry can occur as a result of short and long term drought conditions; these include hardships to farmers, farm workers, packers, and shippers of agricultural products. In some cases, droughts can also cause significant increases in food prices to the consumer due to shortages.

Past experience with California droughts tells us that drought impacts are felt first by those most dependent on or affected by annual rainfall – agencies fighting forest fires, ranchers engaged in dryland grazing, rural residents relying on wells in low yield rock formations, or small water systems lacking a reliable water source.

The driest single year in California's measured hydrologic history is 1977.

California's last major statewide drought was 2014-2017. On April 17, 2017, Governor Jerry Brown issues EO B-40, officially ending the drought state of emergency.

Climate scientists studying California weather patterns find that drought conditions are likely to become more frequent and persistent over the 21st century due to climate change. The experiences of California during recent years underscore the need to examine more closely the state's water storage, distribution, management, conservation, and use policies.

California Progress as of 2017:

In January 2014, with California facing one of the most severe droughts on record, Governor Brown proclaimed a State of Emergency due to drought conditions beginning in 2012 through 2016. An interagency Drought Task Force was convened to monitor drought impacts and advise on actions to be taken if drought conditions worsened. The Drought Task Force also developed a plan for the provision of emergency food supplies, financial assistance and unemployment services in communities that suffer high levels of unemployment due to drought conditions.

In September 2014, Governor Brown issued an Executive Order authorizing Cal OES to provide California Disaster Assistance Act (CDAA) funding for local government assistance to provide emergency water supplies to households without water for drinking and/or sanitation purposes.

In April 2017, Governor Brown lifted the Executive Order Proclaiming a drought, however, he retained prohibition on wasteful practices.

The Drought Contingency Plan (DCP) contains strategies and actions that state agencies have taken or may take to prepare for, respond to, and recover from droughts. Its purpose is to minimize drought impacts by improving agency coordination and enhancing monitoring and early warning capabilities, water shortage impact assessments, and preparedness, response, and recovery programs. The DCP identifies an integrated, regional approach to addressing drought, drought action levels, and appropriate agency responses as drought conditions change. It calls for coordination and clearly defined roles and responsibilities of federal, state, and local agencies, and timely dissemination of information to decision-makers.

Five levels of drought response are identified. These range from Level 1, representing an: Abnormally Dry period (calling for raising awareness), to Level 3, a Severe Drought (requiring mandatory conservation in some communities and emergency actions), to Level 5, an Exceptional Drought (water supplies may be cut off and maximum response). A Governor's emergency drought proclamation may be initiated at Level 3.

Drought can be defined according to meteorological, hydrological, or agricultural criteria.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Meteorological drought is usually based on long-term precipitation departures from normal, but there is no consensus regarding the threshold of the deficit or the minimum duration of the lack of precipitation that makes a dry spell an official drought.

Hydrological drought refers to deficiencies in surface and subsurface water supplies. It is measured as stream flow, as well as lake, reservoir, and ground water levels.

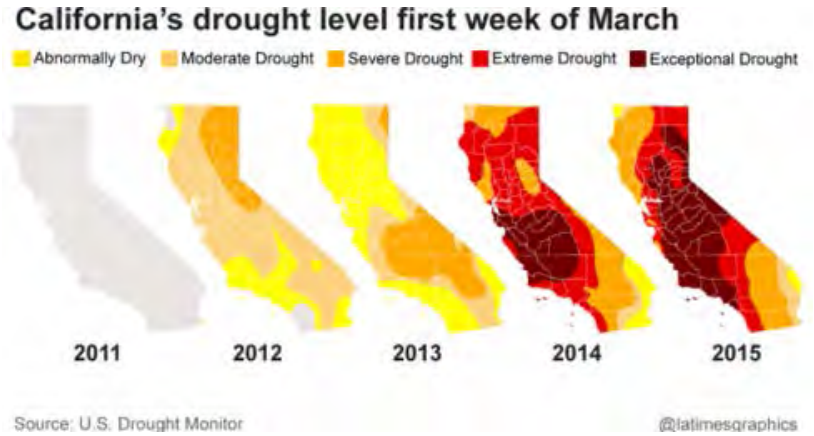
Agricultural drought occurs when there is insufficient soil moisture to meet the needs of a particular crop at a particular time. A deficit of rainfall over cropped areas during critical periods of the growth cycle can result in destroyed or underdeveloped crops with greatly depleted yields. Agricultural drought is typically evident after meteorological drought but before a hydrological drought.

Socioeconomic drought associates the supply and demand of economic goods or services with elements of meteorological, hydrologic, and agricultural drought. Socioeconomic drought occurs when the demand for water exceeds the supply as a result of weather- related supply shortfall. This may also be called a water management drought.

History

Riverside County chronically experiences drought cycles. Drought causes stress on the County's ability to provide water to the community. In addition, drought conditions can cause extensive weakening of trees in forested areas causing them to become highly vulnerable to disease and insect infestation. Many trees have weakened and died, creating a severe fire hazard. Furthermore, wildland brush areas were dry, presenting wildfire risk.

Figure 35: California's drought level first week of March 2011-2015



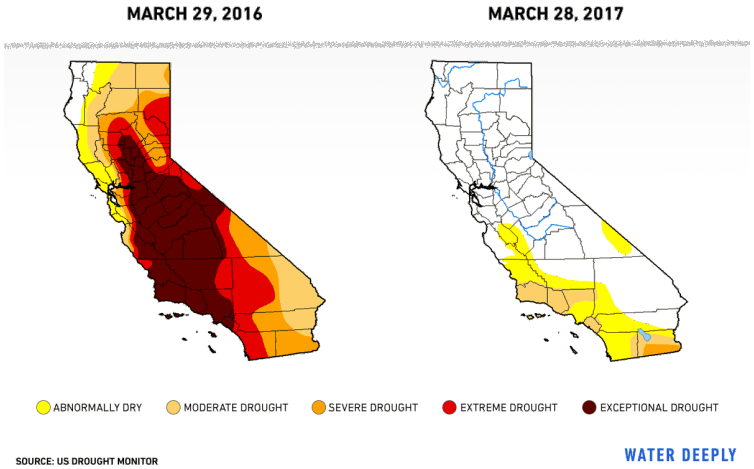


Figure 36: California's drought level March 2016-2017

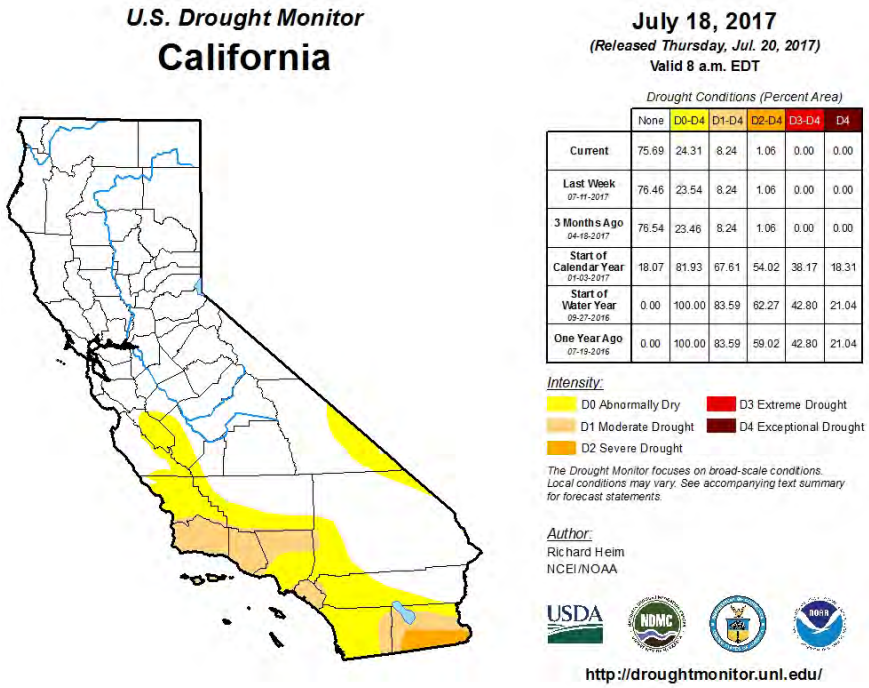
Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Drought Risk Assessment



The Department of Water Resources produces a California Water Plan every five years that not only includes a statewide water budget but also regional watershed water budgets. These water budgets are based on California Department of Finance population projections and indicate clearly that demand for water will exceed supply in 2020 whether or not a drought condition exists at that time. The largest average-year shortages are forecasted for the South Coast Region, which heavily relies on imported water. Future average-year shortages in the South Coast Region reflect forecasted population growth plus lower Colorado River supplies as California reduces its use of Colorado River water to the State's basic apportionment.

Although a drought in and of itself is not a direct threat to property and life, the impact on the County's agricultural industry and home development can be monumental. The costs to the County for the current drought in terms of fire damage and forest management have been in the millions. This is a chronic problem for Riverside County and accounts for significant indirect costs, loss of property and threat to human life.

Relationship to Other Hazards – Cascading Effects

Drought can increase the severity of other hazards. For example, drought can lead to an increase in dead vegetation when can increase fire hazards. It can also lead to increased insect infestations.

Figure 37: U.S Drought Monitor – California

5.3.12 Nuclear/Radiological Incident

Severity: 4

Probability: 1

Risk Score: 1.00

OA Jurisdictions Affected by Nuclear Incidents

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

Radiological Accidents

Radioactive materials are routinely transported in California. These materials include the medical and industrial sources described below, as well as wastes that have radioactive components. Many of the radioactive waste shipments come from research and cleanup efforts at national laboratories.

Radiological accidents that result in the release of radioactive materials may result in long-term health risks and contamination of the state resources, including air, water supply, groundwater, and agricultural lands.

Profiling Radiological Accident Hazards

Due to strict regulation of nuclear power plants in the United States, significant nuclear power incidents that can cause harm to the public have a low probability of occurrence, and none have occurred in California. Even though the probability of a catastrophic event involving a nuclear power plant is extremely low and these plants are extremely well protected, the consequences of a severe accident or a successful terrorist attack on a nuclear power plant that results in a release of radioactive materials could be very significant.

State and local governments having jurisdiction within ten miles of an operating nuclear power plant must plan, train, and conduct emergency exercises annually in accordance with federal regulations. Detailed emergency plans are maintained by each affected agency. Four Emergency Classification Levels (ECLs) have been established in federal regulations to characterize the severity of the emergency and the response actions

required. The ECLs must be used as the foundation for emergency response planning, training and exercises.

Planning Zones

A series of zones have been established around each nuclear power plant to clearly identify the required activities in the event of an accident. Although three specific zones are identified, efforts to protect public health and safety and the environment are made without regard to whether particular areas are inside or outside of these zones:

- The Emergency Planning Zone is an approximate 10-mile radius around the plants. Plans for this zone are in place to protect people, property, and the environment from the effects of exposure to a radioactively contaminated plume.
- The Ingestion Pathway Zone covers an approximate 50-mile radius around the plant. In this zone, plans are in place to mitigate the effects of radioactive contamination to agriculture, and food processing and distribution.

There are three general situations that could affect Riverside County, namely:

1. A situation involving nuclear weapons, which is discussed in the Terrorism section of this LHMP (Section 5.3.7);
2. A situation involving the transportation of nuclear materials; and
3. An incident involving the San Onofre Nuclear Generating Station (SONGS).

As will be discussed in the Terrorism section of this LHMP, the possibility exists that a terrorist organization might acquire the capability of creating a small nuclear detonation. A single nuclear detonation in the United States would likely produce fallout affecting an area many times greater than that of the blast itself. There is also the possibility that a terrorist will construct a “dirty bomb”, a bomb that is used to distribute nuclear-contaminated materials. It would have less of an effect than a “traditional” nuclear bomb, but the terror effect on the population would be great.

A nuclear incident could be initiated by a transportation emergency, either accidental or intentional. See the Transportation Emergencies section of this LHMP (Section 5.3.14).

SONGS is located on the Pacific Coast in northwestern San Diego County, approximately 4 miles southeast of the City of San Clemente. Surrounding San Onofre is a Basic Emergency Planning Zone, approximately 10 miles in radius within which certain precautionary actions must be taken and specific precautionary plans must be prepared.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

This zone does not include any portion of Riverside County. Beyond this zone is an area that could be affected by radioactive fallout being deposited in such a manner as to detrimentally affect the human food chain, which includes all of Riverside County. This area is identified as the Ingestion Pathway Zone. Specifically, the primary threat is that of radioactive iodine 131 being deposited upon fodder consumed by dairy cows and subsequently appearing in milk in the public marketplace.

History of Events

Fortunately, Riverside County has not experienced a nuclear accident.

Risk Assessment

Transportation of nuclear and/or irradiated materials is of growing concern. A severe transportation incident could require the evacuation of a large number of people, major rerouting of traffic systems, and an expensive decontamination process for the area involved. Ancillary problems associated with such an incident are discussed in the sections of this LHMP dealing with Hazardous Materials and with Transportation Incidents.

Radiological Waste Transportation

Since 1989, the staff of the Energy Commission has represented California on two western state groups: the Western Governors' Association WIPP Transportation Advisory Group and the Western Interstate Energy Board's High-Level Radioactive Waste Committee. Both groups work with the U.S. Department of Energy and other state regional groups to develop accident prevention and emergency response plans for major federal non-classified shipments of radioactive waste. Staff also coordinates the California Nuclear Transport Working Group that develops and updates accident prevention and emergency response plans for federal shipments of transuranic waste to the Waste Isolation Pilot Plant (WIPP) in New Mexico.

To mitigate disaster, federal regulations require that:

- radiological materials transported by train use special packaging based on the hazard of the shipment
- there are extensive worker training and documentation
- vehicle and packages of radioactive materials are inspected
- The waste travels via specific, controlled routes.

More information about radiological waste transportation can be found on Cal OES's radiological *transportation website.*

A detailed discussion of radiation hazards and their effects on humans along with a description of the operation of a nuclear power generating facility and the hazards posed thereby are contained in the State of California Nuclear Power Plant Emergency Response Plan and in other documents.

The State Nuclear Power Plant Emergency Response Plan assigns to the County of Riverside responsibility for certain actions to protect the public and the environment within Riverside County from the effects of an accident. The plan also lists the support and assistance available from various State and Federal organizations.

- **Effects on people and housing.** Depending on levels of radiation exposure, the effects could range from minimal to devastating.
- **Effects on commercial and industrial structures.** Depending on levels of radiation exposure, the effects could range from minimal to devastating.
- **Effects on infrastructure.** Depending on levels of radiation exposure, the effects could range from minimal to devastating.
- **Effects on agriculture.** Depending on levels of radiation exposure, the effects could range from minimal to devastating.

Risk Assessment Conclusion

The nearest plant to Riverside County is San Onofre, which is a three tower facility in San Diego County. In 1992 the site retired Tower 1. Towers 2 and 3 remained operational until 2012. In March of 2015 SoCal Edison was granted permission to decommission towers 2 and 3 and permanently close the site. The estimated date for full closure of the power plan is December 31, 2031.

The County is far enough away from nuclear power plants that cataclysmic exposure is not likely. There is the possibility of Riverside County being used as a major evacuation route from a nuclear plant accident. This would tax the County's response resources. The radiation from an accident would, of course, negatively affect the area.

Relationship to Other Hazards – Cascading Effects

Cascading effects of a nuclear incident could include contaminated water, air, and soil. It could also impact first responders and the 911 system.

5.3.13 Extreme Weather

Severity: 3

Probability: 2

Risk Score: 0.75

OA Jurisdictions Affected by Extreme Weather

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

Extreme weather hazards in Riverside County include:

- Extreme Heat
- Severe Cold
- Wind Event
- Fog Event
- Agricultural Event

Climate Change can impact weather patterns within the County. Climate changes can increase or change effects of weather. Some changes may include reduced water supply, increased temperatures, decreased precipitation and increased wildfire risks.

The National Climate Data Center (NCDC) receives Storm Data from the National Weather Service. The National Weather service receives their information from a variety of sources, which include but are not limited to: county, state and federal emergency management officials, local law enforcement officials, SKYWARN spotters, NWS damage surveys, newspaper clipping services, the insurance industry and the general public.

Storm Data Disclaimer:

Storm Data is an official publication of the National Oceanic and Atmospheric Administration (NOAA) which documents the occurrence of storms and other significant weather phenomena having sufficient intensity to cause loss of life, injuries, significant property damage, and/or disruption to commerce. In addition, it is a partial record of other significant meteorological events, such as record maximum or minimum temperatures or precipitation that occurs in connection with another event. Some information appearing in

Storm Data may be provided by or gathered from sources outside the National Weather Service (NWS), such as the media, law enforcement and/or other government agencies, private companies, individuals, etc. An effort is made to use the best available information but because of time and resource constraints, information from these sources may be unverified by the NWS. Therefore, when using information from Storm Data, customers should be cautious as the NWS does not guarantee the accuracy or validity of the information.

Table 32: Storm Data Table (4/30/1950 to 8/7/2017)

Type	# of Events	Property Loss	Crop Loss	Deaths	Injuries

Note: Figures in the chart above were gathered from NOAA's Storm Event Database and may not be a complete listing of previous hazard occurrences.

Riverside County's weather has a history of extremes. There are basically three weather regions in the County, each with its own type of weather and each with a different impact on the County. In some cases, the high temperatures in the desert are harmful to the public, but beneficial to agriculture. In other cases, a steady rainfall that raises the water table can be good for the County, yet too much rain will cause flooding and a disruption in the production of agricultural goods.

Average Climates across the County

The Weather Tables portray the averages for several areas across the County of Riverside. The cities included are Riverside, Idyllwild and Blythe. These cover the Desert, Mountain and Valley Regions, and are clear examples of the weather extremes within the county.

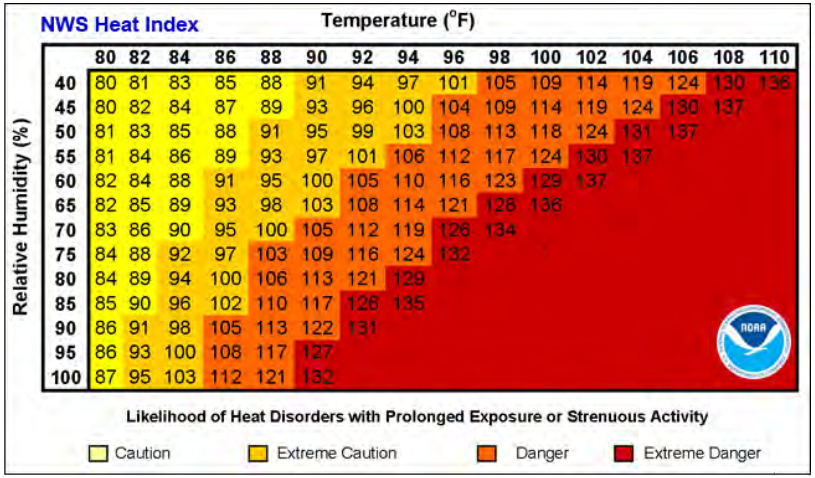
Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

5.3.13.1 Extreme Heat

Overview

Extreme heat can be described as overly hot temperatures that are sustained to the extent that human and animal overexposure can cause heat illness and death. Heat illness is a major cause of preventable morbidity in regions characterized by high ambient temperatures.



Riverside County has a wide range of temperatures, from freezing in some areas during the winter months to extremely hot temperatures for long periods of time during the summer in the deserts and other areas. In 2011 Riverside County and several other counties were impacted by a power outage during a period of high temperatures. The State Hazard Mitigation Plan addresses the issue of Extreme Heat Hazards, and this information has been included in this LHMP.

The figure on the next page illustrates the Heat Index (HI) as a function of heat and relative humidity. The Heat Index describes how hot the heat-humidity combination makes the air feel. As relative humidity increases, the air seems warmer than it actually is because the body is less able to cool itself via evaporation of perspiration. As the Heat Index rises, so do health risks.

Specifically:

- When the Heat Index is 90°F, heat exhaustion is possible with prolonged exposure and/or physical activity.
- When it is 90° to 105°F, heat exhaustion is probable with the possibility of sunstroke or heat cramps with prolonged exposure and/or physical activity.
- When it is 105° to 129°F, sunstroke, heat cramps or heat exhaustion is likely, and heatstroke is possible with prolonged exposure and/or physical activity.
- When it is 130°F and higher, heatstroke and sunstroke are extremely likely with continued exposure. Physical activity and prolonged exposure to the heat increase the risks.

Figure 38: The National Weather Service (NWS) Heat Index

Source: http://www.nws.noaa.gov/os/heat/heat_index.shtml

The National Weather Service (NWS) will initiate its Heat Index Program Alert procedures when the high temperature is expected to exceed 105° to 110° (depending on local climate) for at least two consecutive days.

Extreme Heat and infrastructure

Extreme heat can not only result in loss of life and injury but it can also cause damages to infrastructures. According to the 2017 update Draft of the Safeguarding California Plan, highway systems can be affected by extreme heat by roads buckling and rutting.

Profiling Extreme Heat Hazards (from the 2013 SHMP)

"Heat waves do not cause damage or elicit the immediate response that floods, fires, earthquakes, and other disasters do. They have, however, claimed many lives in comparison with other disasters. For example, the 1989 Loma Prieta Earthquake resulted in 63 deaths while the 1992 Northridge Earthquake was responsible for the loss of 55 lives. The catastrophic 2003 Southern California Firestorms resulted in 24

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

deaths. However, according to the 2013 SHMP, the worst single heat wave event in California occurred in Southern California in 1955, when an eight-day heat wave is said to have resulted in 946 deaths. The 2013 SHMP also states that the July 2006 heat wave in California caused the deaths of at least 136 people over a 13-day period (6 deaths were still under investigation in 2007). Another source, the Spatial Hazard Events and Loss Data for the United States (SHELDUS), estimates that approximately 47 heat events occurred in California between the years 1960 and 2008. Adjusted to 2008 dollars, SHELDUS reports that severe heat events in California caused roughly $1.8 million in property damage and $531.7 million in crop damage. From 2012 to 2014 there were 159 fatalities related to extreme Heat events within California.

The California Climate Adaptation Strategy (CAS), citing a California Energy Commission study, states that "over the past 15 years, heat waves have claimed more lives in California than all other declared disaster events combined." Despite this history, however, not a single heat emergency was formally proclaimed at the state level or declared as a federal disaster between 1960 and 2008. Though no formal explanation exists for this seeming contradiction, scholars have written about the exclusion of heat events as declared disasters. For example, Eric Klinenberg, author of an account of a heat wave which killed 739 people in the City of Chicago in July 1995, suggests that the hidden nature of social vulnerability combined with the inconspicuous nature of heat events (unlike earthquakes, floods, wildfires, tornados, etc.) prevent them from being declared as legitimate disasters.61 Further, although heat events can have a devastating effect on agriculture, heat-caused property damage over the last 48 years has been relatively small.

Treating Heat as a "Legitimate Disaster" (from the 2013 SHMP)

These facts raise several issues. First, since the primary goal of the SHMP is to significantly reduce the loss of life and injuries in the state of California, heat is considered a legitimate disaster type. Though heat does not cause much economic damage or damage to the built environment, the number of people it has killed underscores the importance of mitigating its impacts. Second, heat events highlight the importance of thoughtful social vulnerability analyses. While changes to the built environment can greatly alter vulnerability to different hazards, social vulnerability and resiliency are especially important during heat events. For example, socially isolated elderly persons are especially vulnerable. Any mitigation efforts aimed at reducing heat losses will focus on ways to reduce social isolation as well as changes to the built environment. Third, heat events illustrate how seemingly unrelated phenomena combine to create a disaster. For example, the increased use of air conditioners during heat waves can lead to power outages, which makes the events even more deadly. Upgrading water and power infrastructure, then, is a form of heat disaster mitigation.

Situational and physical characteristics help to identify vulnerable populations that may not comfortably or safely access and use disaster resources. Specifically, when discussing heat related emergency preparedness, the following groups could be considered vulnerable or at greater risk in a heat emergency:

- Infants and small children under age three
- Women who are pregnant
- Elderly people (age 65 and older)
- Homeless
- The obese
- The bedridden
- Mentally ill
- Those with cognitive disorders
- Those with medical conditions (e.g., heart disease, diabetes, high blood pressure)
- Those requiring life-saving medications (e.g., for high blood pressure, depression, insomnia)
- Individuals with drug or alcohol addictions
- Those with mobility constraints
- People who are non-ambulatory
- Those under extreme working conditions
- The poor
- People who are socially isolated
- Non-English speakers who may not have access to information

Animals, including domestic pets, livestock, and poultry are also susceptible to extreme heat. For example, dogs and cats are in danger of heat stroke in temperatures of 110°F. The heat wave of 2006 resulted in 15 reported pet deaths and more than 25,000 cattle, and 700,000 fowl heat-related deaths.

5.3.13.2 Severe Cold

Overview

Riverside County generally experiences a Mediterranean or Desert climate. When temperatures suddenly drop it can potentially lead to loss of life in humans and livestock, as well as severely damage crops.

When temperatures drop below freezing that is the most dangerous time for crops. When water freezes it expands, this effect causes damage to a plants structure and may cause it to die.

Identifying Freeze Hazards (2013 SHMP)

Sustained temperatures below freezing in California's generally mild weather regions can cause life loss and health risks to vulnerable populations. Although infrequent, freezes can severely affect California agriculture. Freezing temperatures occurring during winter and spring growing seasons can cause extensive crop damage.

Secondary impacts of freeze disasters can include major economic impacts on farmers, farm workers, packers, and shippers of agricultural products. Freezes can also cause significant increases in food prices to the consumer due to shortages.

Freezing spells are likely to become less frequent in California as climate temperatures increase. If emissions follow higher pathways, freezing events could occur only once per decade in a sizable portion of the state by the second half of the 21st century. While fewer freezing spells would decrease cold-related health effects, too few freezes could lead to increased incidence of disease as vectors and pathogens do not die off (CNRA 2009).

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

5.3.13.3 Wind Event

Overview

Windstorms are a hazard for many of the participating.

Santa Ana Winds have caused large amounts of damage and increased the fire damage level dramatically. Santa Ana Winds are generally defined as warm, dry winds that blow from the east or northeast (offshore). These winds occur below the passes and canyons of the coastal ranges of Southern California and in the Los Angeles basin. Santa Ana winds often blow with exceptional speed in the Santa Ana Canyon (the canyon from which it derives its name). Forecasters at the NWS in Oxnard and San Diego usually place speed minimums on these winds and reserve the use of "Santa Ana" for winds greater than 25 knots.

The complex topography of Southern California combined with various atmospheric conditions creates numerous scenarios that may cause widespread or isolated Santa Ana events. Commonly, Santa Ana winds develop when a region of high pressure builds over the Great Basin (the high plateau east of the Sierra Mountains and west of the Rocky Mountains including most of Nevada and Utah). The clockwise circulation around the center of this high pressure area forces air downslope from the high plateau. The air warms as it descends toward the California coast at the rate of 5 degrees F per 1000 feet due to compressional heating. Thus, compressional heating provides the primary source of warming. The air is dry since it originated in the desert, and it dries out even more as it is heated.

Santa Ana winds commonly occur between October and February with December having the highest frequency of events. Summer events are rare. Wind speeds are typically north to east at 35 knots through and below passes and canyons with gusts to 50 knots. Stronger Santa Ana winds can have gusts greater than 60 knots over widespread areas and gusts greater than 100 knots in favored areas. Frequently, the strongest winds in the basin occur during the night and morning hours due to the absence of a sea breeze. The sea breeze which typically blows onshore daily can moderate the Santa Ana winds during the late morning and afternoon hours.

The following maps and photos show the direction of the Santa Ana winds as they travel from the stable, high-pressure weather system called the Great Basin High through the canyons and towards the low-pressure system off the Pacific. Riverside County is in the direct path of the ocean-bound Santa Ana winds.

Figure 39: Direction of Santa Ana Wind Patterns

Source: http://www.theweatherprediction.com/weatherpapers/049/

Risk Assessment

The Santa Ana Winds pose several different types of threats.

1. By themselves, the winds pose a threat to the health of the people and to structures in the County.

a. Health risks relate primarily to breathing problems caused by the blowing dust and plant pollen.

b. Structural issues relating to the winds range from roofs being blown off to trees falling onto buildings.

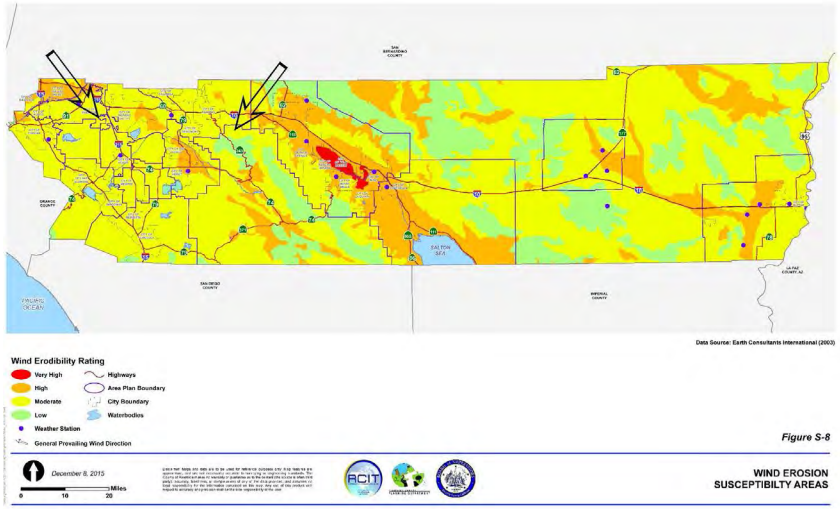
2. The winds increase the threat and/or severity of fires in the urban areas

a. Wind-blown flames will spread more rapidly when pushed by high Santa Ana Winds.

3. Santa Ana Winds dry out brush and forest areas and increase the speed of a fire.

4. Santa Ana Winds cause power lines to arc, resulting in fires
5. Santa Ana Winds can either cause trees to fall on power lines or power lines to break, causing power outages.

Wind Erosion



Soil erosion is also a natural on-going process that transports, erodes and displaces soil particles through a transport mechanism, such as flowing water or the wind. Loose texture and steep slopes primarily result in high wind erosion potential in soils. Wind erosion is most severe in arid regions, where sandy or loamy sediments are un-vegetated and exposed to severe wind conditions.

In addition to the problems caused by the Santa Ana Winds, wind erosion is a serious environmental problem attracting global attention. Soil movement is initiated as a result of wind forces exerted against the surface of the ground. Dust particles in the air create major health problems. Atmospheric dust causes respiratory discomfort, may carry pathogens that cause eye infections and skin disorders and reduces highway and air traffic visibility. Dust storms can cause additional problems. Buildings, fences, roads, crops, trees and shrubs can all be damaged by abrasive blowing soil.

The wind and wind-blown sand are an environmentally-limiting factor throughout much of Riverside County. Approximately 20 percent of the land area of Riverside County is vulnerable to "high" and "very high" wind erosion susceptibility. The Coachella Valley, the Santa Ana River Channel in northwestern Riverside County, and areas in and around the Cities of Hemet and San Jacinto are zones of high wind erosion susceptibility. Human intervention can accelerate the natural erosion process. For instance, typical consequences of development increase erosion potential from the removal of vegetative cover and reduction of overall permeable area. These activities can lead to increased water runoff rates and concentrated flows that have greater potential to erode exposed soils. The effects of excessive erosion range from nuisance problems that require additional maintenance, such as increased siltation in storm drains, to instances of more severe damage, where water courses are down-cut and gullies develop. These processes can eventually undermine adjacent structures or topography. Human activities that disturb soils in arid regions increase wind erosion potential. Many of the desert areas are also susceptible to blowing sand, a severe

form of wind erosion that damages property and accumulates soil on roadways. The majority of the soils within the district exhibit moderate to high erosion potential, which can be compounded by development.

Map 17: Riverside County Wind Erosion Map

5.3.13.4 Fog Event

Overview

Fog forms from air being cooled to the point where it can no longer hold all of the water vapor it contains. For example, rain can cool and moisten the air near the surface until fog forms. A cloud-free, humid air mass at night can lead to fog formation, where land and water surfaces that have warmed up during the summer are still evaporating water into the atmosphere. This is called radiation fog. A warm moist air mass blowing over a cold surface also can cause fog to form, called advection fog.

Fog can have a devastating effect on transportation. Nighttime driving in the fog is dangerous and multi-car pileups have resulted from drivers using excessive speed for the conditions and visibility. Fog contributes to transportation accidents and is a life safety hazard. These accidents can cause multiple injuries and deaths and could have serious implications for human health and the environment if a hazardous or nuclear waste shipment were involved. Dense fog may also delay emergency response vehicles.

This hazard does not occur regularly but has had an impact on the highways.

5.3.13.5 Agricultural Event

Overview

Agriculture in Riverside County must be considered from two standpoints, namely, both as a product producer/exporter and a major economic provider to the County of Riverside. In 2014, Riverside County ranked in the top fourteen leading agricultural counties in California, with an agricultural production value of $1.36 billion. Major agricultural industries include milk, nursery products, citrus and avocado, grapes, vegetables and hay.

Riverside County is divided into two general agriculture regions (Desert and Western Riverside County), with the San Bernardino National Forest acting as a natural dividing line.

Desert - Coachella Valley & Palo Verde Valley

Agriculture is the second largest industry in the Desert Valleys and is primarily crop- related. Over 61% of Riverside County's crop production is grown in the Coachella and Palo Verde Valleys. In addition to crop production, many supporting industries, such as packing and distribution, are located in the desert

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

area. The Coachella Valley produces 95% of all dates grown in the United States and the annual fruit crop exceeds 40 million pounds. The Desert's list of agriculture-related products includes:

- Vegetable & Melon Crops (Bell Peppers, Lettuce, Corn, Watermelon, etc.)
- Nursery Stock
- Turf/Sod Producers
- Field Crops (Hay, Cotton, Wheat, etc.)
- Citrus
- Tree & Vine Crops (Table Grapes, Dates)

Western Riverside County (WR)

Agriculture in the Western Riverside County region is an ever-changing industry. With the large increase in housing in this area of the County over the past few years, there has been a reduction of several agriculture-related industries. This reduction is primarily in the poultry and dairy industries. The Western Riverside County list of agriculture-related products includes:

- Dairy Cattle
- Nursery Stock
- Beef Cattle
- Poultry and Eggs
- Citrus Crops
- Tree and Vine Crops (Avocado, Wine Grapes)
- Field Crops (Wheat, Hay, Green Chop)
- Vegetable Crops (Potatoes, etc.)
- Fish Hatcheries (for domestic and international distribution)

Statistics for Riverside County Agriculture

Table 11: USDA statistics for Riverside County Agriculture for 2012 show the following:

Payroll	$16 million
Farms	3,440
Farm Acreage	344,044
Crop Value Production	$1.03 billion +
Livestock, poultry value including production	$146 million +
Dairy cows	42,954
Sheep and Lambs	36,846
20 week old and older layers	4,127,452
Wheat for Grain Acreage	6,400

United States Department of Agriculture, National Agricultural Statistics Service reports listed the following as the Top 5 commodities in 2015.

Table 12: Top 5 Commodities

Milk Products	$165,124 million
Table Grapes	$143,988 million
Nursery Stock	$137,707 million
Lemons	$120,557 million
Hay	$81,760 million

History

Table 13: Agriculture-related disasters in Riverside County:

Riverside County Agriculture Disasters

Year	Disaster	Commodity	Damages	Region
1979-80	Wind	Avocado and Citrus	$40,000.00	
1979-80	Rain/Floods (El Nino)	Olive Trees (4,200)	$319,494.00	WR.
1979-80	Rain/Floods	Sugar beets, Barley &	$182,711.00	WR.
1979-	Rain/Floods	Potato Crop	$2,000,000.00	WR.
1979-80	Rain/Floods	Dairy and Livestock	$211,900.00	WR.
1982-1983	Rain/Floods (El Nino)	All agriculture		Countywide

2007	Drought	Grain Crops, Livestock	$3.8 Million +	WR
2008	Wildfires	All Agricultural		WR
2009	Drought	Grain Crops, Livestock	$5.0 Million +	WR
2010	Earthquake	Agricultural Buildings		Coachella Valley
2010	Winter Storms – Flooding, Debris Flow,	All Agricultural Commodities		Countywide
2013-2016	Drought	Crops damaged due to		County Wide

*Denotes a locally declared disaster

Risk *Assessment*

When considering Agriculture the County factored in both crops and animals/livestock. Both groups have a three day window before serious damages occur (aside from physical damages that may happen due to earthquake or floods).

Animals

Most beef and dairy ranches, chicken ranches, swine farms, and other agricultural animal facilities usually only have a 2-to-3 day supply of feed on-site. Most of the large feed providers in the County do not have more than a 3-to-5 day supply. Restocking of feed supplies is done primarily by rail to the feed providers and then by truck to the local ranches.

In addition to providing feed for the animals, the impact on the dairy farms would be immense. The time factor for the dairy farms would be almost immediate. Not being able to move milk to the milk house was a major concern. Dairy cows have to be milked and without the ability to transport the milk off property, that milk has to be disposed of in some way so as not to contaminate the soil or create a positive host for insects.

Crops

Although many crops are time sensitive and there is a limited amount of storage space in local packing houses, transportation issues vary based on the time of year and crop season.

Water Related Hazards

Many crops are not as water-dependent as animals are, though some ground and vine crops have a very short lifespan without an adequate supply. Short-term water supplies can be provided to animals through the use of water trucks; however, water trucks cannot support large crop areas with an adequate level of water.

Water-related issues included:

1. Local water supply (wells, holding ponds, etc.) contamination occurring either naturally or from man-made causes
2. Loss of water supply due to pipeline or aqueduct damage from an earthquake.

Hazmat Incidents – On-Property and Off-Property

The definition for an On-Property Hazmat incident relates to the improper use of chemicals, crop-dusting accidents or errors, accidental chemical spills into the ground, and other similar incidents. Off-Property Hazmat events relate to the typical transportation Hazmat incident. Both groups (animal-related and crop-related) were very concerned about the impact of an On-Property event. There was a higher level of concern about the impact of an Off-Property event for animals than for crops. Both groups rated the probability of either type of event occurring as low.

Transportation Events

Transportation events were listed as either short-term (less than 3 days) or long-term (over 3 days) and included:

1. Railroad accidents interrupting the delivery of products into the County;
2. Railroad accidents interrupting the movement of products out of the County;
3. A railroad or trucking strike; and

4. A disruption in transportation lines due to an earthquake, flood, fire, or another event.

Both animals and crops viewed the 3-day point as critical from both an economic and operational standpoint, with the crop group indicating that the 3-day window could be reduced based on whether or not it was picking season.

Insect infestation and Disease to Crops and Vines

There is an ever-changing potential for damage to local crops and vines from disease and insect infestation. The County has been attacked by a wide variety of pests, insects, and diseases, and because of the diversity of the types of crops in the County, maintaining a pro-active approach has been difficult. Studies and history show that should there be a disease outbreak or contamination of crops/vines, the economic impact would be enormous. Recent events in other states have shown the potential for bans on importation of cattle/dairy products from affected states.

One of the primary concerns of the producers in the County is the illegal or uninspected importation of plants into this region. The majority of insect, pest, and disease issues in the County can be attributed to this problem.

Table 37: Primary Crop-related Insect Infestations for Riverside County

The table below shows the primary crop-related insect infestations in the County over the past twenty years:

NAME
AFRICANIZED HONEY BEE
BARK BEETLE
CITRUS LEAFMINER
GLASSY-WINGED SHARPSHOOTER

Ophelimus mastielli	Gall Wasp	Q	1
Bambusaspis miliaris	Bamboo Pit Scale	Q	1

Animal Diseases

There have not been recent incidents of catastrophic outbreaks of disease in the cattle/dairy industry. This is due in part to excellent precluding efforts on behalf of the cattle/dairy industry. Studies and history show that if there is an outbreak of cattle/dairy- related disease, the economic impact would be enormous. Recent events in other states have shown the potential for bans on importation of cattle/dairy products from affected states. In a short period of time, the inability to export products from the County would have wide-ranging economic effects.

The poultry industry is particularly vulnerable to the spread of disease because many fowl are kept in residential back yards and are therefore hard to monitor. Diseases can be spread by mosquitoes and/or ranch service operations that often serve more than one farm, increasing the odds of infection being spread. Outbreaks of the Exotic Newcastle Disease in the poultry industry in 2003 have resulted in the necessary depopulation of 3.16 million chickens in the County. This disease required the quarantine of a large area of Southern California, including all of Riverside County. The economic loss to the ranchers and County as a whole was estimated to be 161 million.

Diseases of primary concern to the area are:

- Avian Influenza
- Exotic Newcastle Disease
- Fowl Pox
- Hoof-and-Mouth Disease
- Transmissible Spongiform Encephalopathies

Loss of Electrical Power

The loss of electrical power is becoming more of a concern to all areas of agriculture. Depending on the season, the loss of electrical supply to a poultry ranch can be devastating within 2-to-4 hours because of the inability to keep the chickens cool. The loss of electrical power for over a 12 hour period can be devastating to a dairy farmer who cannot milk dairy cows.

Hazard Definition

Transportation hazards are incidents involving air, rail, or highway transport of goods or passenger travel resulting in property damage, death, or serious injury. The incidents can be caused by transportation of hazardous materials, earthquake, hazardous weather, or other hazardous conditions affecting the uninterrupted flow of transportation and/or public safety.

Five major transportation systems operate within Riverside County.

1. Highways
2. Railroads
3. Air traffic
4. High-pressure petroleum and gas lines
5. Aqueducts.

Pipelines and aqueducts are treated separately in following sections of this LHMP.

History

Highways. The traffic density on the freeway and highway systems in the western part of the County is of particular concern. The population and economic growth in this area have caused increased demand on these networks.

Although the seasons do not have a large impact on Riverside County, there is the threat of poor visibility due to winter fog. Adding to this problem is the fact that one out of every ten trucks on the freeway carries some sort of hazardous materials. (In addition, California Highway Patrol statistics show that 20 – 25 percent of them are usually driven in an unsafe mechanical condition.)

Rail Lines. Major rail transport lines through Riverside County include Union Pacific and the Burlington Northern Santa Fe (BNSF) Railway Companies. Rails, cars, supporting bridges, overpasses, and electrically-operated switching mechanisms are susceptible to damage.

Union Pacific and the BNSF Railway Companies lines enter the Coachella Valley from Imperial County along the eastern shore of the Salton Sea.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Major population centers affected by railroad transportation are vulnerable to the impact of a wide variety of hazardous materials transported by these carriers. Additionally, there are lines running east and west that carry significant tonnage daily. Some of these lines are in remote areas, but that does not lessen the overall seriousness of their impact.

Airlines / Airports.

The western part of Riverside County has some of the busiest air traffic areas in the United States. Commercial, as well as military traffic, is very heavy. The number of near misses reported by pilots underscores the increasing possibility of a mid-air collision over the County.

There are two major airports in Riverside County: March Air Reserve Base and Palm Springs International. There are also numerous smaller municipal and commercial airports and private air strips:

- Banning Airport
- Bermuda Dunes Airport
- Blythe Airport
- Chiriaco Summit Airport
- Corona Municipal Airport
- Desert Center Airport
- Flabob Airport
- French Valley Airport
- Hemet- Ryan Airport
- Lake Elsinore/Skylark Airport
- Perris Valley Airport
- Rancho California Airport
- Riverside Municipal Airport
- Jacqueline Cochran Regional Airport

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

In addition, there are five major out-of-county airports operating in the vicinity of Riverside County with significant flight-paths over the County:

1. John Wayne Airport (Orange County)
2. Long Beach Airport (Los Angeles County)
3. Los Angeles International (LAX) Airport
4. Ontario Airport (San Bernardino County)
5. Chino Airport (Airport Influence Area extends into Riverside County)
6. San Diego International Airport (SAN) San Diego County

Risk Assessment

The possibility for a transportation hazard to occur is ongoing. There have been railway incidents in the recent past, although they have not been numerous and have not caused extensive damage. Semi-trucking incidents are not uncommon and could result in a hazardous spill at any time, although notable events have not occurred in recent history. There has not been a serious airline accident in the area in the recent past.

- **Effects on people and housing.** As the historical events in Riverside County show, people may be evacuated when a transportation emergency occurs. Relative to some of the other natural hazards assessed earlier in this LHMP, the numbers of people affected by transportation emergencies are usually less. However, a transportation accident on Interstate 10 during a period of high heat can result in hundreds (or more) of commuters being stranded on the highway with little resources for an extended period of time.

- **Effects on commercial and industrial structures**. There may be economic consequences due to transportation emergencies, but the damage is generally limited to clean-up of facilities and grounds or simply interruption of business due to evacuation.

- **Effects on infrastructure.** Transportation emergencies may result in downed power lines. Also, Hazmat materials released in a transportation emergency may impact waterways and drainage systems, and incidents can lead to the evacuation of schools, business districts, and residential areas.

- **Effects on agriculture**. Transportation is essential to the agricultural industry.

For all elements of agriculture other than those that are dairy-related, any incident that affects transportation for more than three days is "major." For the dairy segment of the agricultural industry, any incident that affects the ability to transport product by more than 12 hours is considered "major."

Risk Assessment Conclusion.

In general, transportation hazards are not cataclysmic in terms of widespread property damage and loss of life. Existing emergency operations should be equipped to handle almost of any transportation hazard that may occur.

However, because Riverside County has an agricultural production value of over $1 billion, any transportation emergency that affects the ability of agriculture to conduct its routine business (importing supplies and exporting production) can have severe economic consequences for the County.

Relationship to Other Hazards – Cascading Effects

Depending on the location of the incident, the cascading effects of transportation emergencies are generally limited to those of Hazmat incidents, Fires or Extreme Weather (if the incident occurs in the desert when the temperatures are very high, citizens in vehicles stopped for several hours can suffer from the heat and lack of conveniences). In all cases, health and life may be threatened.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

5.3.15 Dam Failure

Severity: 3

Probability: 1

Risk Score: 0.38

OA Jurisdictions Affected by Dam Failure

- Norco
- Eastvale
- Corona
- Lake Elsinore
- Wildomar
- Murrieta
- Temecula
- Perris
- Menifee
- Riverside
- Jurupa Valley
- Hemet
- Moreno Valley
- San Jacinto
- Various Portions of unincorporated areas in the West County

Hazard Definition

The term "dam failure" encompasses a wide variety of circumstances. Potential causes of a dam failure are numerous and can be attributed to deficiencies in the original design of the dam, the quality of construction, the maintenance of the dam and operation of the appurtenances while the dam is in operation, and acts of nature including precipitation in excess of the design, flood, and damage from earthquakes. Water over topping the dam crest is a common cause of failure in earth dams.

Overtopping will cause erosion of the dam crest and eventual dam breach. Piping of earth dams is another common form of failure. Piping is a form of erosion that occurs underground caused by rodent burrowing and the presence of extensive root systems from vegetation growing on and around the dam.

Flooding of the area below the dam may occur as the result of structural failure of the dam, overtopping, or a seiche. The primary danger associated with a dam failure is the swift, unpredictable flooding of those areas immediately downstream of the dam.

There are three general types of dams: earth and rock fill, concrete arch or hydraulic fill, and concrete gravity. Each of these types of dams has different failure characteristics. The earth/rock fill dam will fail gradually due to the erosion of the breach; a flood wave will build gradually to a peak and then decline until the reservoir is empty. A concrete arch or hydraulic fill dam will fail almost instantaneously; with a very rapid build-up to a peak and then a gradual decline. A concrete gravity dam will fail somewhere in between instantaneous and gradual, with the corresponding build-up of flood wave.

History

Historically, Riverside County has not experienced any significant dam failure incidents, although there are several major dams in the County of both the earthen and steel reinforced concrete type

Risk Assessment

The County of Riverside is subject to potential flooding from several local dams, reservoirs, streams, rivers, and washes. These include but are not limited to, Lake Elsinore, the Colorado River, and the San Jacinto River. Seasonal flooding with the failure of run-off storage reservoirs, canals, and levees could seriously compound the situation, particularly in or near urban population centers. From the time of complete failure to inundation could be as little as 5-to-10 minutes.

Portions of Riverside County along the Colorado River corridor could suffer from a catastrophic failure of dams that are located far outside the borders of Riverside County. These dams include Palo Verde Diversion Dam, Headgate Rock Dam, Parker Dam, Davis Dam, and Hoover Dam. If there were a catastrophic dam failure, it is estimated that it would take a minimum of 23 hours before the flood waters reach the City of Blythe.

With major disruptions in power and communications systems, a warning may not be received from dam or reservoir sites in time to initiate an organized evacuation or broadcast warnings via emergency radio stations. If a credible prediction is initiated, then preparation for a damaging earthquake could begin and residents and business owners within dam inundation areas could be directed to assembly areas to wait for official word regarding safe re-entry. This method of direction and control could substantially reduce potential loss of life, if enough warning were available.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

- **Effects on Agriculture** can be catastrophic, both for crops and for animals. Loss of property is a real risk, as well.

Risk Assessment Conclusion.

Although dam failure incidents have not historically been a problem in Riverside County, the County's location with respect to earthquake fault lines presents the very real danger of dam failure due to quakes. If this were to occur, the effects could be catastrophic. Also, as noted above, seasonal flooding with the failure of run-off storage reservoirs, canals, and levees could seriously compound the risks of dam failure and additional flooding.

Relationship to Other Hazards – Cascading Effects

Dam failure obviously causes downstream flooding. It may also lead to power failures and downed power lines. The secondary effects of dam failure can include the disruption of the local and state economies by damage to buildings and roads, the severance of communications, the disruption of supply and delivery mechanisms, additional welfare, and emergency aid to the recovering economy.

Descriptions of the dams, their inundation impact on the County, and a delineation of response efforts are outlined in the 2015 Draft version of the Flood and Dam Inundation Plan, maintained by Riverside County Transportation and Land Management Agency.

Map 18: Riverside County Dam Inundation Risks

5.3.16 Aqueduct

Severity: 3

Probability: 2

Risk Score: 0.38

OA Jurisdictions Affected by Aqueduct Failure

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

An Aqueducts is an artificial channel to transport water. There are two major Aqueducts that traverse Riverside County:

- California Aqueduct
- Colorado River Aqueduct.

The California Aqueduct is a 444-mile long, artificially river shaped facility that is a crucial component of the State Water Project. The California Department of Water Resources states that the Project includes 34 storage facilities, reservoirs and lakes; 20 pumping plants; 4 pumping-generating plants; 5 hydroelectric power plants; and about 701 miles of open canals and pipelines. It travels from Sacramento into San Bernardino County and finally ends in western Riverside County. The East Branch is the portion of the Aqueduct that transports water for storage into Lake Perris.

The Colorado River Aqueduct stretches 242 miles across Arizona and California. According to the American Society of Civil Engineers, it consists of more than 90 miles of tunnels, nearly 55 miles of cut-and-cover conduit, almost 30 miles of siphons, and five pumping stations. More than a billion gallons of water travel through it a day. It travels from Arizona into San Bernardino County, enters the eastern portion of Riverside County and travels the length of the County until it ends near the City of Riverside. It was built and is currently maintained by the Metropolitan Water District of Southern California.

Figure 41: California Aqueducts

Source: 2013 (SHMP)

History of Events

Riverside County has not experienced a large scale Aqueduct incident.

Risk Assessment

An earthquake or landslide could severely damage the two main aqueducts that travel through the county, possibly render them out of service. In this event the water supply to the County would be greatly affected.

Long periods of droughts have been known to damage aqueduct infrastructure. Wells have needed to work harder to pump low levels of water. This has resulted in many irrigation districts to raise the sides of canals to encourage gravitational water flow. However, this tactic can negatively affect bridges.

- **Effects on people and housing.** There is a low impact on housing unless the aqueduct was to flood a residential area. The impact to people can range from minor to disastrous. A failure could greatly impact the County's water supply leaving the County to source water elsewhere until the damages to the aqueduct can be remedied. It can also impact the economy in the event that crops are damaged and farmers lose valuable product.

- **Effects on commercial and industrial structures**. There is a low impact on commercial and industrial structures.

- **Effects on infrastructure.** There is a low impact on infrastructure.

- **Effects on agriculture.** In the event of an aqueduct failure crops could be devastatingly impacted.

Risk Assessment Conclusion

This hazard has a low probability but has the potential to have catastrophic impacts to the county.

Relationship to Other Hazards – Cascading Effects

An Aqueduct failure could lead to water supply contamination or disruption and flooding. It could also increase the effects of a drought.

5.3.17 Tornado

Severity: 2

Probability: 1

Risk Score: 0.25

OA Jurisdictions Affected by Tornados

- Hemet
- Perris
- Desert Center
- Coachella Valley
- Mecca
- Homeland

Hazard Definition

Tornados

Tornadoes are spawned when there is warm, moist air near the ground, cool air aloft, and winds that speed up and change direction. An obstruction, such as a house, in the path of the wind, causes it to change direction. This change increases pressure on parts of the house, and the combination of increased pressures and fluctuating wind speeds creates stresses that frequently cause structural failures.

In order to measure the intensity and wind strength of a tornado, Dr. T. Theodore Fujita developed the Fujita Tornado Damage Scale. This scale compares the estimated wind velocity with the corresponding amount of suspected damage. The scale measures six classifications of tornadoes with increasing magnitude from an "F0" tornado to an "F6+" tornado.

Tornados, like those that occur every year in the Midwest and Southeast parts of the United States, are a rare phenomenon in most of California, with most tornado-like activity coming from micro-bursts.

The chart below depicts the Fujita Tornado Damage Scale:

Table 39: Fujita Tornado Damage Scale

Scale	Wind Estimate (mph)	Typical Damage
F0	< 73	**Light damage.** Some damage to chimneys and TV antennas; breaks twigs off trees; pushes over shallow-rooted trees.
F1	73-112	**Moderate damage.** Peels surface off roofs; windows broken; light trailer houses pushed or overturned; some trees uprooted or snapped; moving automobiles pushed off the road. 74 mph is the beginning of hurricane wind speed.
F2	113-157	**Considerable damage.** Roofs torn off frame houses leaving strong upright walls; weak buildings in rural areas demolished; trailer houses destroyed; large trees snapped or uprooted; railroad boxcars pushed over; light object missiles generated; cars blown off highway.
F3	158-206	**Severe damage.** Roofs and some walls torn off frame houses; some rural buildings completely demolished; trains overturned; steel-framed hangar-warehouse-type structures torn; cars lifted off the ground; most trees in a forest uprooted snapped, or leveled.
F4	207-260	**Devastating damage.** Whole frame houses leveled, leaving piles of debris; steel structures badly damaged; trees debarked by small flying debris; cars and trains thrown some distances or rolled considerable distances; large missiles generated.
F5	261-318	**Incredible damage.** Whole frame houses tossed off foundations; steel-reinforced concrete structures badly damaged; automobile-sized missiles generated; trees debarked; incredible phenomena can occur.
F6-F12	319 to sonic	**Inconceivable damage.** Should a tornado with the maximum wind speed in excess of F5 occur, the extent and types of damage may not be conceived. A number of missiles such as iceboxes, water heaters, storage tanks, automobiles, etc. will create serious secondary damage on structures.
Source: http://weather.latimes.com/tornadoFAQ.asp		

Microbursts

Unlike tornados, microbursts are strong, damaging winds that strike the ground and often give the impression a tornado has struck. They frequently occur during intense thunderstorms. The origin of a microburst is downward moving air from a thunderstorm's core. But unlike a tornado, they affect only a rather small area.

University of Chicago storm researcher Dr. Ted Fujita first coined the term “downburst” to describe strong, downdraft winds flowing out of a thunderstorm cell that he believed were responsible for the crash of Eastern Airlines Flight 66 in June of 1975.

A downburst is a straight-direction surface wind in excess of 39 mph caused by a small-scale, strong downdraft from the base of convective thundershowers and thunderstorms. In later investigations into the phenomena, he defined two sub-categories of downbursts: the larger macro bursts and small microbursts.

Macro bursts are downbursts with winds up to 117 mph that spread across a path greater than 2.5 miles wide at the surface and which last from 5 to 30 minutes. The microburst, on the other hand, is confined to an even smaller area, less than 2.5 miles in diameter from the initial point of downdraft impact. An intense microburst can result in damaging winds near 270 km/hr (170 mph) and often last for less than five minutes.

“Downbursts of all sizes descend from the upper regions of severe thunderstorms when the air accelerates downward through either exceptionally strong evaporative cooling or by very heavy rain which drags dry air down with it. When the rapidly descending air strikes the ground, it spreads outward in all directions, like a fast-running faucet stream hitting the sink bottom.

When the microburst wind hits an object on the ground such as a house, garage or tree, it can flatten the buildings and strip limbs and branches from the tree. After striking the ground, the powerful outward running gust can wreak further havoc along its path. Damage associated with a microburst is often mistaken for the work of a tornado, particularly directly under the microburst. However, damage patterns away from the impact area are characteristic of straight-line winds rather than the twisted pattern of tornado damage.”

History

The history table demonstrates the high number of tornados and microbursts that have occurred in the County.

Source:http://www.homefacts.com/tornadoes/California/Riverside-County/Riverside.html

Map 19: Past Riverside Count Tornadoes

Source: http://www.tornadohistoryproject.com/tornado/California/Riverside/map

Risk Assessment

- **Effects on people and housing.** Tornadoes are very dangerous and can destroy homes and injure or kill Riverside County residents. The county has been fortunate in the past because we have not experienced loss of life and very few injuries caused by tornadoes or airborne debris.

- **Effects on commercial and industrial structures.** Industrial structures could house Hazardous Materials that have to potential to be released if the facility is damaged. Workers could be trapped under debris if the tornado hits during business hours.

- **Effects on infrastructure.** Infrastructures could be damaged by high winds at building failure points such as rook joist or wall stud- bottom plate intersections. Flying debris can also cause damages.

- **Effects on agriculture.** Tornadoes have the power to destroy crops or tools/structures needed by the farmer to tend his crops. It can also lead to the death of livestock.

Risk Assessment Conclusion

Riverside County's "Tornado Alley" spans from the 15 Corridor to desert center and is highly susceptible to microburst and tornados that result is high dollar recovery costs.

Relationship to Other Hazards – Cascading Effects

Tornados can destroy powerlines causing disruption in power to residents and commercial properties. They can damage critical facilities and devastate homes.

Hazard Definition

Insect infestation occurs when an undesirable type of insect inhabits an area in a manner that causes serious harm to: cash crops, livestock, or poultry; wild land trees, plants, or animals; or humans. Countless insects live on, in, and around plants, animals, and humans in all environments. Many are harmless, while others can cause fatal damage. Under some conditions, insects that have been present and relatively harmless can become hazardous. For example, severe drought conditions can weaken trees and make them more susceptible to destruction from insect attacks.

The major forms of insects are:

- **Chewing insects** are defoliating insects. They generally strip plants of green matter such as leaves. Caterpillars and beetles make up the largest proportion of chewing insects. Under normal conditions, trees can usually bounce back from an attack of these defoliators, though repeat infestation will weaken a tree and can eventually kill it by starving it of energy.

- **Boring, or tunneling, insects** cause damage by boring into the stem, roots, or twigs of a tree. Some lay eggs that then hatch and the larvae burrow more deeply into the wood, blocking off the water-conducting tissues of the tree. Boring insects generally feed on the vascular tissues of the tree. If the infestation is serious, the upper leaves are starved of nutrients and moisture, and the tree can die. Signs of borer infestation include entry/exit holes in the bark, small mounds of sawdust at the base, and sections of the crown wilting and dying.

- **Sucking insects** do their damage by sucking out the liquid from leaves and twigs. Many sucking insects are relatively immobile, living on the outside of a plant and forming a hard protective outer coating while they feed on the plant's juices. Quite often they will excrete a sweet, sticky substance known as honeydew which contains unprocessed plant material. Honeydew can cause sooty mold to form on leaves and can become a nuisance. Signs of infestation include scaly formations on branches, dieback of leaves, and honeydew production.

In conjunction with the above outlined problems, insects can carry and spread or vector disease to plants, animals, and people.

Definition of Vector Control

Vector Control Programs are responsible for providing services that reduce the risk of illness caused by any organism transporting a pathogen. Some examples of these organisms and some of the pathogens they can carry are:

- Mosquito - West Nile Virus, St. Louis Encephalitis, Western Equine Encephalitis
- Rodent Fleas - Plague

- Western Black Legged Tick - Lyme Disease
- Rodents - Hantavirus

Riverside County actually has three vector control agencies. There are two Vector Control Districts and the County Vector Control Program operating through the Department of Environmental Health. The Coachella Valley Mosquito and Vector Control District manages these services for a portion of the desert community around the Coachella Valley. The Northwest Mosquito and Vector Control District provides services in the northwest portion of the county. The County Vector Control program covers the unincorporated areas of the County and other areas such as contracted cities that may fall outside of the two other vector district boundaries.

History

Presently - Parts of Riverside County (Moreno Valley, Indio, Rancho Mirage, Palm Desert, Bermuda Dunes, and Palm Springs) are under quarantine by state and federal officials to stop the spread of Red Imported Fire Ants. The quarantine limits the movement of plants and soil and requires commercial nursery growers to take steps to ensure their products are free of Red Imported Fire Ants. It is believed that the infestations in Southern California may stem from the shipment of infested nursery stock from the southeastern states.

2012 - Polyphagous Shot-Hole Borer, an insect pest that attacks over 200 types of agricultural and landscape trees, became widespread in Southern California. By 2015, this insect pest was established in Western Riverside County. This insect pest is detrimental to the avocado industry and landscape ornamental trees in California.

2009 - A portion of Riverside County (Coachella Valley) was placed under quarantine for Asian Citrus Psyllid (ACP). In 2011, the quarantine area was expanded to include Western Riverside County. The quarantine limits the movement of nursery stock and citrus from the quarantine area. Growers must take steps to ensure their products are free from ACP prior to movement.

2003 -Governor Gray Davis proclaimed a State of Emergency in Riverside, San Bernardino, and San Diego Counties where hundreds of thousands of trees were dead and dying after being weakened by drought and attacked by an infestation of bark beetles. Trees on more than 150,000 acres died and an estimated 75,000 residents were threatened by catastrophic wildfire, injury, and property damage from falling trees.

1999-2000, an insect-spread disease (Pierce's Disease spread by Glassy-winged Sharpshooter) caused over $16 million damage to wine grapes in the west County area. Riverside County is under quarantine by state officials to stop the spread of

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Glassy-winged Sharpshooter and Pierce's Disease. The quarantine limits the movement of nursery stock, bulk grapes, bulk citrus and requires inspection and certification of these commodities by the local Agricultural Commissioner prior to movement from the infested area.

1991-1994 - Africanized Honey Bees entered California near Blythe. Since 1994, they have spread to all counties in Southern California (Imperial, San Diego, Orange, Los Angeles, Riverside, San Bernardino, Ventura and Kern). In 1993-94 and 1990, Med-fly infestations damaged fruit Countywide. In 1991, a whitefly infestation damaged melons, squash, and cucumbers Countywide.

Risk Assessment

Riverside County has a demonstrated vulnerability to insect infestation. The climate makes it possible for insects to reproduce with little natural hindrance to their proliferation.

Programs for monitoring Encephalitis in Riverside County have been in effect for more than two decades in a cooperative effort with the California Department of Public Health (CDPH), the University of California, the Mosquito and Vector Control Association of California, and the Riverside County Public Health Department. Since its introduction to Southern California in 2003, West Nile Virus surveillance has been a primary focus. This type of surveillance is driven by live mosquito trapping and processing for virus detection. The dead bird surveillance program is also headed up by CDPH where the public can report dead birds via their website (www.westnile.ca.gov) or a telephone hotline (1-877-WNV-BIRD). If CDPH staff determines that a dead bird is deemed acceptable for testing, Vector Control offices are notified for collection and testing. Another aspect of this program consists of sentinel chicken flocks being placed in areas where high populations of Culex tarsalis, the western encephalitis mosquito, are known to exist and where such areas infringe on local communities. Blood samples are sent to the CDPH Viral & Rickettsial Disease Laboratory where they are analyzed for the antibodies to the viruses. All of these disease indicators allow programs to focus their vector control efforts. Since 2006, at least seventy three cases of West Nile virus human infections have been reported within Riverside County with ten fatalities. Horses have also been infected and succumbed to this disease.

In Riverside County, Plague is associated with animal disease outbreaks in populations of California Ground Squirrels. The vector is the Squirrel Flea. In 1979 during a disease outbreak among California ground squirrels in Silent Valley, located south of the City of Banning, a boy contracted Plague. It was properly diagnosed and he recovered. This incident provided impetus to start the Plague Surveillance Program and eventually establish the County's Vector Control Program. Over the course of the past several

decades surveillance activities have isolated Plague endemic areas in the San Jacinto Mountain range.

- **Effects on people and housing.** In the case of the Bark Beetle, the fire hazard it creates can cause the loss of homes and life as demonstrated in the fall fires of 2003. In the case of certain mosquitoes, West Nile Virus has infected humans and horses.

- **Effects on agriculture, and commercial and industrial structures.** If a given insect is particularly hazardous to forests, crops, or property, it can cost the County millions of dollars in lost revenue and eradication and replacement.

Risk Assessment Conclusion.

Insect infestation is an ongoing threat to agriculture and public health in Riverside County. The effects on people and property can be disastrous and costly.

The County and independent vector control special districts have aggressive programs utilizing:

- Disease surveillance such as certified personnel, insect/rodent traps, lab testing capacities, and Sentinel chicken flocks.
- Vector control equipment and approved pesticides.
- Public outreach.

Relationship to Other Hazards – Cascading Effects

The Bark Beetle infestation is a classic example of cascading effects. The insect killed hundreds of thousands of trees, increasing the wildfire hazard, which resulted in the unfortunate devastation of the fall fires of 2003.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

5.3.19 Jail/Prison Event

Severity: 2

Probability: 1

Risk Score: -0.13
OA Jurisdictions Affected by Jail or Prison Events

- Blythe
- Riverside
- Norco
- Banning
- Indio
- Murrieta

Hazard Definition

There are numerous State of California Correctional Institutions and County correctional facilities in Riverside County. Law enforcement is tasked with maintaining order in the facilities and preventing inmates from escaping into the community.

Chuckawalla Valley State Prison in Blythe provides long-term housing and services for male felons classified as medium and low-medium custody inmates.

Ironwood State Prison in Blythe provides services for minimum and medium custody inmates through academic education, vocational instruction, and support services. The prison also has the Institutional Hearing Program (IHP) which prepares inmates who are illegal immigrants for release to United States Immigration and Naturalization Service custody and the return to their native country.

The California Rehabilitation Center (CRC) in Norco is a medium Level II correctional facility and that only accommodates male inmates since April 2007. The CRC inmate population consists of felon commitments as well as Civil Addicts.

The California Institution for Woman (CIW) in Chino accommodates all custody levels of female inmates and functions as a reception/processing center for incoming female inmates. In addition to its large general population, CIW houses inmates with special

needs such as pregnancy, psychiatric care, methadone, and medical problems such as HIV infection.

The California Institution for Men in Chino consists of four separate facilities under the administration of one warden. Located three miles south of the city of Chino, the facilities provide housing for minimum through medium custody inmates. The reception centers receive and process newly committed male felons from several southern California counties. The California Youth Authority operates a facility in Chino. While all of these facilities are in the County of San Bernardino, their close proximity to Riverside County and the City of Corona necessitate their inclusion here as facilities of concern to Riverside County.

In addition, there are five correctional facilities within the County, namely:

1. Robert Pressley Detention Center
2. Blythe Jail
3. Indio Jail
4. Southwest County Jail (Murrieta)
5. Larry D. Smith Correctional Facility

History

Historically, the threat to society has been low. Law enforcement has demonstrated an overall capability to maintain the incarcerated population in a manner that does not pose an immediate threat to the general population.

Risk Assessment

It is important that law enforcement remains in a state of readiness for any incidents that could precipitate a threatening situation.

The passing of Assembly Bill 109 (2011) has shifted state prison populations back into the county jail populations as a way to stop state prison overcrowding. The effects of this change are just now being seen. Time will tell what the overall impact to Riverside County and its citizens will actually be.

Riots within the facilities generally do not pose a direct threat to the public on the outside. Occasionally an inmate has escaped correctional facilities. The danger involved in their escape is predicated on the escapee's criminal characteristics.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Riverside County Regional Medical Center provides medical care to both state and local inmates in an area designated as a prison ward, which could have a severe impact on health care delivery at the facility during and immediately after a prison ward incident. The degree of disruption would, of course, depend on the extent of the incident.

- **Effects on people and housing.** Relatively speaking, the risks are minimal. However, violent offenders escaping custody in a disaster could lead to residents in the surrounding areas being at risk of harm.
- **Effects on commercial and industrial structures**. The risks are minimal.
- **Effects on infrastructure.** The risks are minimal.
- **Effects on agriculture.** The risks are minimal.

Risk Assessment Conclusion.

Relatively speaking, the risks of jail and prison incidents will remain a minimal threat to the County. It is important that law enforcement remains in a state of readiness for any incidents that could precipitate a threatening situation.

Relationship to Other Hazards – Cascading Effects

In the event that Interstate 10 becomes damaged, it could affect evaluation routes and essential supplies from getting into the prison or jail.

Risks are minimal but have the potential to decrease responder availability during disasters if a facility is damaged. Another possible drain on resources would be in the event of inmate relocation due to damaged facilities or the potential damage to a facility.

5.3.20 Pipeline Disruption

Severity: 3

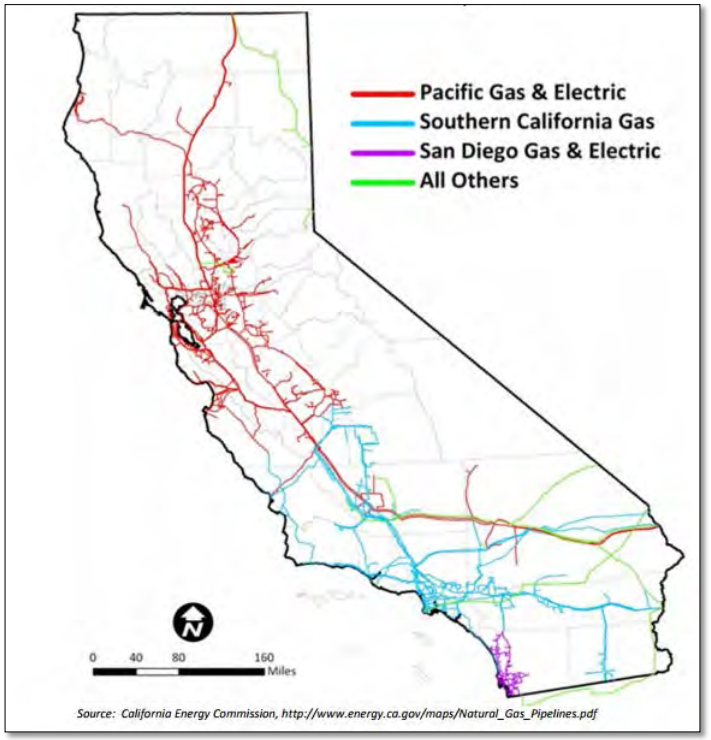
Probability: 2

Risk Score: -0.38

OA Jurisdictions Affected by Pipeline Incidents

- Desert Water Agency
- Western Municipal Water District
- City of Banning
- City of Beaumont
- City of Corona
- City of Palm Springs
- City of Temecula
- Riverside Community College District
- San Gorgonio Memorial Hospital

Hazard Definition



There are many pipeline distribution systems that transit Riverside County, including systems for water, natural gas, and petroleum products.

Identifying Natural Gas Pipeline Hazards (SHMP)

The United States is heavily dependent on transmission pipelines to distribute energy and fuel sources. Virtually all natural gas, which accounts for about 28 percent of the energy consumed annually, is transported by transmission pipelines. Energy demand in the United States continues to increase. Although California is a leader in exploring and implementing alternative energy sources such as the wind and solar, the expansion of traditional energy sources, such as natural gas, continues. Increased urbanization is resulting in more people living and working close to existing gas transmission pipelines that were placed prior to government agencies adopting and implementing land use and other pipeline safety regulations.

Compounding the potential risk is the age and gradual deteriorating of the gas transmission system due to natural causes. Significant failure, including pipe breaks and explosions, can result in loss of life, injury, property damage, and environmental impacts. Causes of and contributors to pipeline failures include construction errors, material defects, internal and external corrosion, operational errors, control system malfunctions, outside force damage, subsidence, and seismicity. Growth in population, urbanization, and land development near transmission pipelines, together with the addition of new facilities to meet new demands, may increase the likelihood of pipeline damage due to human activity and the exposure of people and property to pipeline failures.

Figure 43: California Gas Lines

Major water conveyance systems consist of the Colorado River Aqueduct operated by Metropolitan Water District (MWD) of Southern California, the California Aqueduct operated by the State Department of Water Resources (DWR), and water distribution lines operated by MWD.

A major pipeline carrying natural gas parallels Interstate 10 and Highway 60 throughout the County. This pipeline brings gas from the southwestern states into Southern California.

Petroleum products are stored and distributed at many major areas throughout the County. Of particular interest are the aviation fuel tanks and pipelines located at March Air Reserve Base. Although under the control of the U.S. Government, their potential for impact on the surrounding area is of interest to the County.

History

Fortunately, Riverside County has not experienced a large scale pipeline disruption. However, there are multiple small incidents on a yearly basis that are handled by the respective resource provider.

Risk Assessment

A rupture of the main line with a major release could have serious effects in terms of flooding and property damage. A gas line rupture could explode causing serious property damage and loss of life.

- **Effects on people and housing.** The consequences to people and housing from pipeline disruption can range from flooding to explosion, both could be quite severe.
- **Effects on commercial and industrial structures.** Similarly, the effects on commercial and industrial structures from flooding or explosion could be severe.
- **Effects on agriculture.** In the same way, the effects on agriculture from flooding or explosion could be severe.

Risk Assessment Conclusion.

Pipelines are vulnerable to especially with the possibility of an earthquake, causing significant breakage. The degree of damage county-wide for a given rupture would be minimal, even though there might be significant injuries, loss of life and property in the

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

immediate area of the incident, depending on what kind of pipe ruptures and where the rupture occurs.

Relationship to Other Hazards – Cascading Effects

Pipeline incidents may lead to flooding, fires and air, water and land contamination. Incidents with natural gas or petroleum product pipelines may lead to explosion and fire.

5.3.21 Landslide

Severity: 3

Probability: 3

Risk Score: -0.58

OA Jurisdictions Affected by Landslide Incidents

- Most mountain areas within the County

Hazard Definition

Like its earthquake-generating faults, California's mountainous terrain is also a consequence of dynamic geologic processes in operation as the North American Plate grinds past the Pacific Plate. More than one-third of California is mountainous terrain that generally trends parallel to the coast, forming a barrier that captures moisture from offshore storms originating in the Gulf of Alaska and Mexico. Steep topography, weak rocks, heavy winter rains, and occasional earthquakes all lead to slope failures more frequently than would otherwise occur under gravity alone.

A landslide is the breaking away and gravity-driven downward movement of hill slope materials, which can travel at speeds ranging from fractions of an inch per year to tens of miles per hour depending on the slope steepness and water content of the rock/soil mass.

Landslides range from the size of an automobile to a mile or more in length and width and, due to their sheer weight and speed, can cause serious damage and loss of life. Their secondary effects can be far reaching; for example, catastrophic flooding can result from the sudden release of river water impounded by landslide debris or slope failure of an earthen dam.

Although the area affected by a single landslide is less than that of earthquakes, landslides are pervasive in California's mountainous terrain and occur far more often, resulting in cumulative losses approaching $200 million in a given year. Average annual landslide losses in California are estimated at about $100 million. Because landslides occur as isolated events in both time and location, and there is presently no systematic means in place for documenting their losses, landslide hazard is often underestimated or goes unrecognized in the policy arena, even though landslides continue to cause millions of dollars in cumulative damage to California's homes, businesses, and infrastructure.

A landslide is a geologic hazard where the force of gravity combines with other factors to cause earth material to move or slide down an incline. Some landslides move slowly and cause damage gradually, whereas others move so rapidly that they can destroy property and take lives suddenly and unexpectedly. Slopes with the greatest potential for sliding

are between 34 degrees and 37 degrees. Although steep slopes are commonly present where landslides occur, it is not necessary for the slopes to be long.

Landslides, rock falls, and debris flows occur continuously on all slopes; some processes act very slowly, while others occur very suddenly, often with disastrous results. As human populations expand over more of the land surface, these processes become an increasing concern.

The most common types of landslides are (U.S. Department of the Interior, U.S. Geological Survey, Fact Sheet 2004-3072, July 2004):

Slides - Although many types of mass movements are included in the general term "landslide," the more restrictive use of the term refers only to mass movements, where there is a distinct zone of weakness that separates the slide material from the more stable underlying material.

Falls - Abrupt movements of masses of geologic materials, such as rocks and boulders that become detached from steep slopes or cliffs.

Topples - Toppling failures are distinguished by the forward rotation of a unit or units about some pivotal point, below or low in the unit, under the actions of gravity and forces exerted by adjacent units or by fluids in cracks.

Flows – There are five basic categories of flows that differ from one another in fundamental ways.

a. Debris flows: A debris flow is a form of rapid mass movement in which a combination of loose soil, rock, organic matter, air, and water mobilize as a slurry that flows downslope.
b. Debris avalanche: This is a variety of very rapid to extremely rapid debris flow.
c. Earthflow: The slope material liquefies and runs out, forming a bowl or depression at the head. The flow itself is elongate and usually occurs in fine-grained materials or clay-bearing rocks on moderate slopes and under saturated conditions. However, dry flows of granular material are also possible.
d. Mudflow: A mudflow is an earthflow consisting of material that is wet enough to flow rapidly and that contains at least 50 percent sand-, silt-, and clay-sized particles. In some instances, for example in many newspaper reports, mudflows and debris flows are commonly referred to as "mudslides."
e. Creep: Creep is the imperceptibly slow, steady, downward movement of slope-forming soil or rock.

Lateral Spreads - Lateral spreads are distinctive because they usually occur on very gentle slopes or flat terrain. The dominant mode of movement is lateral extension accompanied by shear or tensile fractures. The failure is caused by liquefaction, the process whereby saturated, loose, cohesionless sediments (usually sands and silts) are transformed from a solid into a liquefied state.

The geologic setting of southern California locally is conducive to slope failures and slope-failure deposits (landslides) that can be a hazard to human life and property. These hazards are created when geologic materials are displaced down a topographic slope under the influence of gravity. Factors that determine slope-failure occurrence include:

1. Slope angle
2. Geologic materials (substrate)
3. Climatic conditions
4. Earthquake shaking
5. Debris Flows

Sudden "mudslides" gushing down rain-sodden slopes and gullies are widely recognized by geologists as a hazard to human life and property. Most "mudslides" are localized in small gullies, threatening only those buildings and roadways in their direct path. They can burst out of the soil on almost any rain-saturated hill when rainfall is heavy enough. Often they occur without warning in localities where they have never been seen before.

There are predictable relationships between local geology and landslides, rockfalls and debris flows. Knowledge of these relationships can improve planning and reduce vulnerability. Slope stability is dependent on many factors and their interrelationships, including rock type, pore water pressure, slope steepness, and natural or man-made undercutting.

Riverside County has a history of landslides during seasons of high precipitation.

History

January, 2016 – Landslides near Banning resulted from a low 4.3 magnitude earthquake.

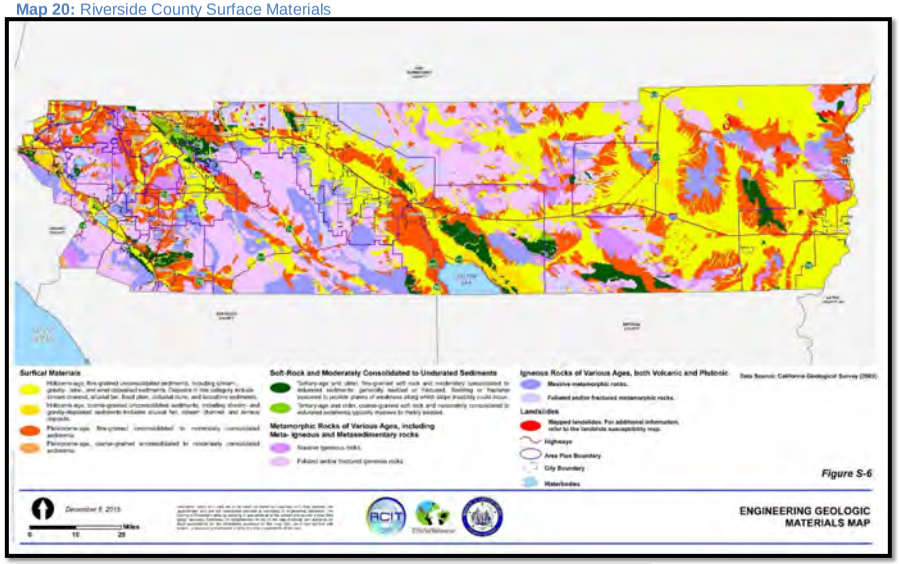
December, 2014 – Mud Flow in Gilman Springs, San Jacinto.

2002 – Landslide on Highway 60 in San Timoteo Badlands

Risk Assessment

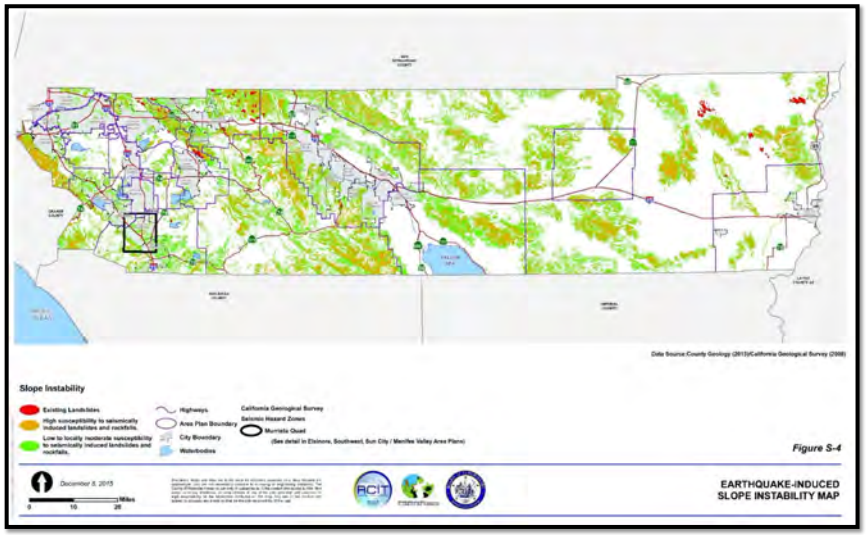
There is a continuing risk of landslides during seasons of high precipitation. In addition, earthquakes could also cause significant landslides. The County has a great deal of hilly and mountainous terrain increasing the likelihood of a landslide incident.

- **Effects on people and structures**. Landslides constitute a threat to property, road safety, and life. Small landslides would not pose a serious risk. However, there is a possibility that a severe landslide in a populated area could cause significant damage and risk to life.
- **Effects on infrastructure**. Landslides can cause disruptions in power supply pipelines, power and telephone poles, and County roads and highways.
- **Effect on Critical Facilities**. An initial review of known landslide locations and the location of critical facilities indicates that there does not appear to be any of these facilities in close proximity to a Landslide Management Zone.
- **Effects on agriculture**. Similar to the threats to people and structures, small landslides would not pose a serious risk. However, there is the possibility that a severe landslide could cause significant damage and risk of life to elements of the agricultural industry.



Risk Assessment Conclusion

Landslides are a continuing risk in Riverside County, especially during seasons of high precipitation. History has shown also that many landslides occur in areas where landslides have not been predicted.



Relationship to Other Hazards – Cascading Effects

As noted, landslides can be the result of an earthquake or severe weather. The starting mechanism for a landslide will determine some of the cascading events. The end result is if a landslide occurs in a populated area, or area used by people, earth materials can cover or impede the area as described above. If a landslide were to impact power lines or other utility systems a cascading effect could be power, utility or sewer loss.

Map 20: Riverside County Surface Materials

Map 21: Riverside County Slope Instability Map

5.3.22 Hazardous Materials Incident

Severity: 3

Probability: 4

Risk Score: -0.75

OA Jurisdictions Affected by Hazardous Materials Incidents

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

Hazardous materials (Hazmat), consist of substances that by their nature, lack of containment, and reactivity, have the capability for inflicting harm. Hazmat poses a threat to health and the environment when improperly managed. Hazmat can be toxic, corrosive, flammable, explosive, reactive, an irritant, or a strong sensitizer. Hazmat substances also include certain infectious agents, radiological materials, oxidizers, oil, used oil, petroleum products, and industrial solid waste substances.

Hazardous materials can pose a threat where they are manufactured, stored, transported or used. They are used in almost every manufacturing operation and by retailers, service industries, and homeowners.

Hazardous material incidents are one of the most common threats to public health and the environment. Incidents may occur as the result of natural disasters, human error, terrorism, and/or accident.

Hazmat incidents typically take five forms:

1. Fixed facility incidents
    - Laws require those facilities to notify state and local authorities about what is being used or produced there and incidents with the materials can be planned for.
2. Transportation incidents
    - Transportation incidents are more difficult to prepare for because it is impossible to know what material(s) could be involved until an accident actually happens.

3. Pipeline incidents
    - Pipelines carry natural gas and petroleum. Breakages in pipelines carry differing amounts of danger, depending on where and how the break occurs, and what is in the pipe.
4. Terrorism incidents (or suspected Terrorism)
    - Intentional acts involving violence and/ or the threat of violence. Similar to transportation incidents, these occurrences are more difficult to prepare for due to unknown locations and substances.
5. Illegal Disposal / Abandonment
    - Similar to transportation incidents, these occurrences are more difficult to prepare for due to unknown locations and substances.

History

Many forms of hazardous materials are present in both the rural and urban areas of Riverside County. They are present in permanent storage locations, roadway and railway transport mediums, long-distance pipelines, and at various industrial and agricultural application sites. The County's location, with its rail and highway transportation routes, and various industries, has a growing potential for serious hazardous materials incidents. Interstates 10, 15 and 215, and State Highways 60 and 91 are all heavily traveled by trucks. Those trucks carry a wide variety of hazardous materials including gasoline, corrosives, oxidizers, pesticides, and radioactive materials.

The railroad lines traveling throughout the County also carry some extremely hazardous cargoes. Fortunately, the railroads have a good safety record with regard to the transportation of hazardous materials.

Traffic on railroads is not as prevalent as on truck routes in Riverside County, but poses a much greater problem when an accident is involved due to the volumes of hazardous materials on board.

There is a great deal of air traffic along the airways above Riverside County with the March Air Reserve Base Palm Springs International Airport, French Valley Airport, Hemet-Ryan Airport, Riverside Municipal Airport, Jacqueline Cochran Regional Airport and Bermuda Dunes Airport all operating within the County. The potential for a hazardous materials incident exists, especially with respect to military operations.

There are many pipeline distribution systems that traverse the County. These are discussed in Section 5.3.20.

Table 41: History of Hazmat Incidents in 2016

Riverside County Department of Environmental Health Hazmat Incidents July 1, 2015 to June 30, 2016	
HAZARDOUS MATERIALS INCIDENT TYPE	TOTAL NUMBER
General Emergency Response (do not fit other categories)	28
Drug Labs	23
Drug Dumps	3
Facility Incidents	122
Roadway Incidents	119
Aircraft Incidents	3
Railroad Incidents	7
Mercury Incidents	5
Dielectric Fluid Incidents	40
Radiological Incidents	0
Pesticide Incidents	2
Medical Waste Incidents	9
Noxious Odor Incidents	39
Illegal Disposal of Substances	207
Transportation/Manifesting Violations	0
Suspected Terrorism	4
TOTAL Hazardous Materials Incidents:	**611**

The Riverside County Department of Environmental Health Hazardous Materials Emergency Response Program handled over 611 incidents in fiscal year (FY15/16) often in conjunction with Cal Fire countywide except for a few cities that handled Haz Mat incidents within their jurisdiction. The incidents cover all areas described in the definition section.

In 2016 The Riverside County Fire department responded to 613 Hazardous Materials Incidents.

The administering agencies within Riverside County are responsible for the control of fixed hazardous materials facilities, including the Participating Agencies of Riverside Fire Department and Corona Fire Department.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Risk Assessment

The amount of hazardous materials transported over rail and roadways on a daily basis is unknown, but estimated to be steadily increasing as our economy grows. There is the potential for a hazardous materials incident almost anywhere on the numerous highways and roads that crisscross Riverside County. The greatest concern focuses on the 10, 15, 60, 91, and 215 freeways. The most vulnerable areas along these routes are considered to be the on/off ramps and interchanges.

A major concern with the trucking industry is the safe operation of their trucks. With the deregulation of the trucking industry, spot checks of trucks in many states, including California, have shown that a large percentage of trucks currently in service are not in safe enough condition to be operated on public highways.

Many industries are moving into the County. Many facilities exist today, with more construction forecast. To support these industries, the County is likely to realize a large increase in the transportation of toxic, flammable, and corrosive materials into and out of the County. With the increased use of hazardous materials, there is an increased need for safe hazardous waste management and disposal. There will be the increased transportation of hazardous materials waste to proper disposal sites located outside of Riverside County.

Illegal dumping and clandestine drug labs are also a hazardous materials problem. Although not exclusive to Riverside County, the County is a target for these activities due to its accessibility in the outlying areas and the open living conditions in the mountain and desert areas.

No Class I landfills are operated in Riverside County. Seven Class III landfills are active in Riverside County. All accept only non-hazardous solid wastes and are located in unincorporated areas. Six of these landfills are operated by the Riverside County Waste Resources Department, while one (El Sobrante) is privately owned and operated. The El Sobrante, Badlands, Lamb Canyon, and Blythe landfills currently accept waste from outside of Riverside County. Blythe however, only takes small loads or may refuse to accept waste because it is a relatively small facility.

Hazardous waste generators include food and beverage processors as well as battery, semi- conductor, and metal container manufacturers, as well as automobile repair facilities, munition manufacturers, utility districts, and other industries. Although hazardous waste generators are scattered throughout Riverside County, most of the large generators of hazardous waste are located in the western portion of the County, including in the cities of Corona, Jurupa Valley, Riverside, and Temecula.

Nearly all of Riverside County residents have some type of hazardous materials in their homes. Examples include motor oil, paints, cleaners, aerosols, and pesticides. Household hazardous materials pose serious health issues for people who improperly use or dispose of these materials. Adverse environmental impacts can occur when household hazardous materials are disposed of in unlined sanitary landfills, where these materials may leach through the soil and contaminate groundwater.

Medical facilities, including clinics, hospitals, professional offices, blood and plasma centers, and medical research facilities generate a wide variety of hazardous substances. These substances may include contaminated medical equipment or supplies, infectious biological matter, prescription medicines, and radioactive materials used in medical procedures. The disposal of medical waste is achieved by on-site autoclaving of red-bagged waste (any medical waste that could possibly transmit a pathogen) and subsequently transported to a Class III landfill, or to a permitted incinerator. The Riverside County Department of Environmental Health has regulatory control over the disposal of medical and biological waste.

- **Effects on people and housing.** Historical events in Riverside County have necessitated evacuations when a Hazmat incident occurs. Relative to some of the other natural hazards assessed earlier in this LHMP, the numbers of people affected by Hazmat incidents are usually less.

- **Effects on commercial and industrial structures.** There may be economic consequences due to Hazmat incidents, but the damage is generally limited to clean-up of facilities and grounds, or simply an interruption of business due to evacuation.

- **Effects on infrastructure.** Hazmat incidents involving transportation may result in downed power lines. Also, Hazmat materials may impact waterways and drainage systems, and incidents can lead to the evacuation of schools, business districts, and residential areas.

- **Effects on agriculture.** As noted previously, there is a long history of agricultural production in Riverside County. Agricultural activities typically include the storage and periodic application of pesticides, herbicides, and fertilizers, as well as the storage and use of toxic fuels and solvents. The infiltration of these substances may leach into local groundwater supplies, presenting an elevated risk of groundwater contamination.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Risk Assessment Conclusion

Although Hazmat incidents can have serious property damage and even loss of life, Hazmat accidents do not generally affect extremely large areas. Hazmat incidents present a real danger and are highly unpredictable in terms of determining when or where they will occur, but generally do not pose a serious threat to the ability of Riverside County to respond. Reasonable preparation by law enforcement, fire department, and medical community enables the County to deal with the majority of likely events. Many emergency workers prepare for Hazmat events as part of their ongoing training. Agencies and facilities are also routinely equipped to deal with most events that might occur.

Relationship to Other Hazards – Cascading Effects

Besides the immediate effect of a hazardous materials incident at the scene of the emergency, there are ancillary effects as well. For instance, there may be impacts on waterways and drainage systems, and the evacuation of schools, business districts, and residential areas.

5.3.23 Water Supply Disruption/Contamination

Severity: 2

Probability: 3

Risk Score: -1.50

OA Jurisdictions Affected by Hazardous Materials Incidents

- All incorporated cities of Riverside County
- Unincorporated areas of Riverside County

Hazard Definition

People exposed to water supply disruption or toxic pollutants caused by contaminations may be threatened by a number of health risks:

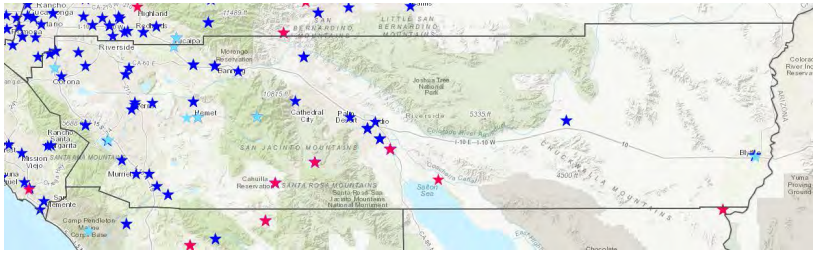
- Dehydration, hepatitis, and cancer
- Eating contaminated food products, such as fish from contaminated waters; meat, milk, or eggs from animals that fed on contaminated plants; and fruits and vegetables grown in contaminated soil
- Drinking water contaminated by toxic pollutants
- Ingesting contaminated soil. Young children are especially vulnerable because they often ingest soil from their hands or from objects they place in their mouths
- Touching (making skin contact with) contaminated soil, dust, or water (for example, during recreational use of contaminated water bodies)

Risk Assessment

According to the Environmental Protection Agency, there are four major types of drinking water contamination; physical, chemical, biological, and radiological.

Physical contaminants primarily impact the physical appearance or other physical properties of water. Examples of physical contaminants are sediment or organic material suspended in the water of lakes, rivers and streams from soil erosion.

Chemical contaminants are elements or compounds. These contaminants may be naturally occurring or man-made. Examples of chemical contaminants include nitrogen,



bleach, salts, pesticides, metals, toxins produced by bacteria, and human or animal drugs.

Biological contaminants are organisms in water. They are also referred to as microbes or microbiological contaminants. Examples of biological or microbial contaminants include bacteria, viruses, protozoan, and parasites.

Radiological contaminants are chemical elements with an unbalanced number of protons and neutrons resulting in unstable atoms that can emit ionizing radiation. Examples of radiological contaminants include cesium, plutonium and uranium.

Source: https://www.epa.gov/ccl/types-drinking-water-contaminants

Ground water contamination is also a major threat because of its use for drinking water and irrigation. Potential groundwater contaminants include; storage tanks, septic systems, hazardous waste, landfills, chemicals and road salts, and littering.

Source: waterboards.maps.arcgis.com

Map illustrated water systems in Riverside County. Blue stars represent in compliance water systems, red stars are systems out of compliance as of July 2017.

- **Effects on people and housing.** The effect on housing is relatively low, but the effect on people may be devastating. Though the County encourages residents to store at least 72 hours of water for their household, the reality is only a small percentage actual partake in that practice. This means that in the event of disruption or contamination that renders usable water sources limited, people may become dehydrated and suffer from other serious health issues such as cancer. In the event that contamination happens during the summer months when temperatures reach 90-105, the population is at an even higher risk.

- **Effects on commercial and industrial structures.** The effect to structures is relatively low.
- **Effects on infrastructure.** The effect to structures is relatively low.
- **Effects on agriculture.** Water contamination could devastate agriculture in Riverside County. The contaminant could be poisonous to crops and livestock. Depending on the level of exposure, entire field could be damaged to the point of total loss.

History

March 2, 2017 – 198 residents were exposed to water contaminated with uranium in the unincorporated area of Pinyon Pines.

Risk Assessment Conclusion

Due to high levels of monitoring and preparedness within water agencies, the threat of water contamination is fairly low. However, it could greatly impact the county if it is caused by a cascading event such as an earthquake.

Relationship to Other Hazards – Cascading Effects

The loss of water could drastically affect other man-made and natural hazards. In the event of an earthquake and pipelines are damaged, it could greatly reduce the amount of water available to fight fires. The amount of water available to residents would also be drastically reduced.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Section 6.0 – Community Rating System

The County of Riverside and all cities within the County participate in the National Flood Insurance Program (NFIP). Riverside County Ordinance NO. 458 Regulating Special Flood Hazard Areas and Implementing the National Flood Insurance Program was last updated on August 14, 2014.

Riverside County also participates in the Community Rating System (CRS). The rating system is a voluntary NFIP program that aims to reduce flood damages to insurable property, strengthen and support the insurance aspects of the NFIP, and encourage a comprehensive approach to floodplain management. In addition to the county, four cities participate in CRS: Lake Elsinore, Moreno Valley, Murrieta, and Palm Springs.

The most active in the Community Rating System within the County is Palm Springs. Their high scores in the system allow the city to offer the highest discount off of flood insurance (20% for SFHA and 10% for Non-SFHA).

Community Number	Community Name	CRS Entry Date	Current Effective Date	Current Class	% Discount for SFHA	% Discount for Non-SFHA	Status
060245	Riverside County*	10/01/10	05/01/16	7	15	5	C
060636	Lake Elsinore	10/01/09	05/01/14	8	10	5	C
065074	Moreno Valley	10/01/91	10/01/96	8	10	5	C
060751	Murrieta	10/01/97	10/01/97	9	5	5	C
060257	Palm Springs	10/01/92	05/01/11	6	20	10	C

Note: SFHA, Special Flood Hazard Areas

6.1 Repetitive Loss Properties

Areas which have flooded in the past are highly likely to experience recurring flooding. The repetitive nature of flood damage is cause for concern. FEMA, in coordination with the state, identifies California's top Repetitive Loss (RL) Communities. Riverside County is not a top Repetitive Loss community. Riverside County unincorporated areas only have eleven identified repetitive loss properties. That is an increase of four properties since the 2012 plan. Two of the eleven repetitive loss properties have been mitigated and the Riverside County Flood Control District is investigating ways to mitigate the remaining five properties so as to avoid future flooding incidents. Options being considered are both structural and non-structural mitigation measures.

Table 42: Riverside County Repetitive Loss Properties

City	Mitigated?	Insured?	Date of Loss	Date of Loss	Total Paid
LAKE ELSINORE	YES	NO	02/14/1980	01/05/1979	$91,618.83

6.2 National Flood Insurance Program

Public Law 90-448 of 1968, known as the National Flood Insurance Act, established the National Flood Insurance Program (NFIP) which provides for federal government underwriting of flood insurance policies sold by private companies. Supported by a national mapping system showing boundaries for 100- and 500-year floodplains, the NFIP encourages local governments to direct development away from floodplain areas or mitigate flood risks through local floodplain management regulations. Through the Community Rating Service (CRS), the NFIP provides for financial incentives in the form of lower insurance rates for local communities encouraging mitigation of flood hazards in a manner parallel to rate incentives related to private fire insurance and enforced by the mortgage industry. The National Flood Insurance Act was modified in 1994 to provide for flood hazard mitigation planning and project grants.

The unincorporated community of Riverside County joined the NFIP on April 15, 1980. Currently, unincorporated Riverside County is one of 30 local communities that participate in the NFIP. Please refer to the table on the following page for participating jurisdictions.

Table 46: Fiscal Mitigation Capabilities

Financial Resources	Accessible/Eligible to Use (Yes/No)	Comments
Community Development Block Grants	Yes	Must meet eligibility requirements
Capital improvements project funding	Yes	Funds set aside for fiscal year 11/12 per Board of Supervisor's district
Authority to levy taxes for specific purposes	Yes	With voter approval
Impact fees for new development	Yes	Planning, Fire, Building & Safety
Incur debt through general obligation bonds	Yes	With voter approval
Incur debt through special tax bonds	Yes	With voter approval
Pre-Hazard Mitigation Grants	Yes	
Post-Mitigation Grants	Yes	

7.4 Funding Opportunities

The Hazard Mitigation Grant Program (HMGP) is authorized by Section 404 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended (the Stafford Act), Title 42, United States Code (U.S.C.) 5170c. The key purpose of HMGP is to take critical mitigation measures to reduce the risk of loss of life and property from future disasters during the reconstruction process following a disaster. HMGP is available, when authorized under a Presidential major disaster declaration, in the areas requested by the California Governor. The amount of HMGP funding available to the Applicant is based upon the total Federal assistance to be provided by FEMA for disaster recovery under the Presidential major disaster declaration.

The Flood Mitigation Assistance (FMA) program is authorized by Section 1366 of the National Flood Insurance Act of 1968, as amended (NFIA), 42 U.S.C. 4104c, with the goal of reducing or eliminating claims under the National Flood Insurance Program (NFIP).

The Pre-Disaster Mitigation (PDM) program is authorized by Section 203 of the Stafford Act, 42 U.S.C. 5133. The PDM program is designed to assist States, Territories, Tribal governments, and local communities in implementing a sustained pre-disaster hazard mitigation program to reduce the overall risk to the population and structures from future hazard events, while also reducing Federal disaster response expense.

Table 47: Grant Funding Opportunities for Mitigation

Grant Name	Agency	Purpose	Contact
Pre-Disaster Mitigation Program **(PDM)**	U.S. Department of Homeland Security, Federal Emergency Management Agency	To provide funding for States, and communities for cost-effective hazard mitigation activities which complement a comprehensive hazard mitigation program to reduce injuries, loss of life, property damage, and reconstruction of property.	FEMA 500 C. Street, SW Washington, DC 20472 Phone: (202) 646-4621 www.fema.gov
Hazard Mitigation Grant Program	U.S. Department of Homeland Security, Federal Emergency Management Agency	To prevent future losses of lives property due to disasters; to implement State of local hazard mitigation plans; to enable mitigation measures to be implemented during immediate recovery from a disaster; and to provide funding for previously identified mitigation measures to benefit the disaster area.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov
Flood Mitigation Assistance (FMA)	U.S. Department of Homeland Security, Federal Emergency Management Agency	To help States and communities plan and carry out activities designed to reduce the risk of flood damage to structures insurable under the NFIP.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov

Emergency Management Performance Grants (EMPG)	U. S. Department of Homeland Security; Federal Emergency Management Agency	To encourage the development of comprehensive emergency management at the State and local level and to improve emergency management planning, preparedness, mitigation, response and recovery capabilities.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov
Community Development Grant Program (CDBG)	U.S. Department of Housing and Urban Development	To develop viable urban communities by providing decent housing and a suitable living environment. Principally for low-to-moderate income individuals.	HUD 451 7th Street, S. W. Washington, DC 20410-7000 Phone: (202) 708-3587 www.hud.gov
Public Assistance Program (PA)	U.S. Department of Homeland Security, Federal Emergency Management Agency	To provide supplemental assistance to States, local governments, and certain private nonprofit organizations to alleviate suffering and hardship resulting from major disasters or emergencies declared by the President. Under Section 406, Public Assistance funds may be used to mitigate the impact of future disasters.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Emergency Watershed Protection	U.S. Department of Agriculture, Natural Resource Conservation Service	To provide emergency technical and financial assistance to install or repair structures that reduce runoff and prevent soil erosion to safeguard life and property.	NRCS PO BOX 2890 Washington, DC 20013 Phone: (202) 720-3527 www.nrcs.usda.gov
Land and Water Conservation Fund Grants	U. S. Department of the Interior, National Park Service	To acquire and develop outdoor recreation areas and facilities for the general public, to meet current and future needs.	NPS PO Box 37217 Washington, DC 20013-7127 Phone: (202) 565-1200 www.nps.gov
Disaster Mitigation and Technical Assistance Grants	U.S. Department of Commerce, Economic Development Administration	To help States and localities to develop and /or implement a variety of disaster mitigation strategies.	EDA Herbert C. Hoover Building Washington, DC 20230 Phone: (800) 345-1222 www.eda.gov
Watershed Surveys and Planning	U.S. Department of Agriculture, Natural Resource Conservation Service	To provide planning assistance to Federal, State, and local agencies for the development of coordination water and related land resources programs in watersheds and river basins	NRCS PO Box 2890 Washington, DC 20013 Phone: (202) 720-3527 www.nrcs.usda.gov

National Earthquake Hazards Reduction Program (NEHRP)	U.S. Department of Homeland Security, Federal Emergency Management Agency	To mitigate earthquake losses that can occur in many parts of the nation providing earth science data and assessments essential for warning of imminent damaging earthquakes, land-use planning, engineering design, and emergency preparedness decisions.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov
Assistance to Firefighters Grant	U. S. Department of Homeland Security, Federal Emergency Management Agency	Competitively awarded project grants to provide direct assistance, on a competitive basis, to fire departments for the purpose of protecting the health and safety of the public and firefighting personnel against fire and fire-related hazards	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov
Fire Management Assistance Grants	U. S. Department of Homeland Security, Federal Emergency Management Agency	To provide project grants and the provision of specialized services for the mitigation, management, and control of fires that would constitute a major disaster.	FEMA 500 C Street S.W. Washington, DC 20472 Phone (202) 646-4621 www.fema.gov

Engineering for Natural Hazards	National Science Foundation	Supports fundamental research that advances knowledge for understanding and mitigating the impact of natural hazards on constructed civil infrastructure	National Science Foundation Phone: (703) 292-7024 https://www.nsf.gov

7.5 Mitigation Outreach and Partnerships

In addition to the capabilities and funding sources listed in sections 7.1 – 7.4, Riverside County provides training, exercises, workshops and volunteer management to non-profit organizations, faith-based organizations, businesses, and other local municipalities and programs to better accomplish mitigation.

Various communities as well as County of Riverside Emergency Management Department provides Community Emergency Response Team (CERT) training to the public and county employees. Following a major disaster, first responders who provide fire and medical assistance will not be able to immediately meet all of the demands for their services. The Community Emergency Response Team (CERT) Program provides for community and employee self-sufficiency in order to meet the general public's urgent life-saving and sustenance needs until emergency personnel arrive. The Community Emergency Response Team (CERT) Program educates people about disaster preparedness and trains them in basic response skills, such as fire safety, light search and rescue, and disaster medial operations. CERT members assist their fellow citizens/coworkers in their community or workplace following a disaster. CERT members take an active role in their community by preparing for a disaster, thus reducing their own impact risk.

There are currently Twenty (22) jurisdictions supporting CERT Programs within the County: Riverside County EMD, Beaumont, Corona, Indio, La Quinta, Lake Elsinore, Cathedral City, Moreno Valley, Murrieta, Palm Springs, Perris, Riverside, Temecula, San Jacinto, Menifee, Wildomar, Canyon Lake, Rancho Mirage, Desert Hot Springs, Palm Desert, Blythe and the town of Idyllwild.

In addition to the volunteer program, EMD coordinates the Radio Amateur Civil Emergency Service (RACES), a group of licensed radio amateurs who operate during declared emergencies. Once activated by local, county or State jurisdictions, RACES may assist any agency to provide emergency communications support as requested by the County of Riverside. RACES members trains volunteers how to operate amateur radios to mitigate communication failures. RACES members conduct radio tests to ensure critical facilities, including hospitals, maintain redundant communications in case of a failure. The County manages the Medical Reserve Corps (MRC) which coordinates the skills of practicing and retired physicians, nurses and other health professionals as well as other citizens interested in health issues. MRC focuses on these specific personnel who are eager to volunteer in order to address their community's ongoing public health needs and to help their community during large-scale emergency situations. MRC volunteers may also serve a vital role by assisting their communities with ongoing public

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

health needs through public awareness of disease outbreaks, immunizations, screenings, health and nutrition education and volunteering in community health centers and local hospitals.

EMD joins forces with the Riverside University Health System – Public Health (RUHS-PH) by providing a flu clinic for community members to receive their flu shot free of charge. This clinic provides a means for the County to mitigate pandemic flu as a hazard by vaccinating more people, reducing the impact or risk of a pandemic flu outbreak.

EMD coordinates with RUHS-PH, the Riverside Emergency Medical Services Agency (REMSA), hospitals, local health care facilities, and other disciplines to develop the annual Statewide Medical Health Exercise (SWMHE). Each year the state selects a scenario focusing on testing objectives designed to improve understanding of response procedures, building collaborative relationships, and identify areas of improvement. The SWMHE plays a critical role in the on-going support to Public Health and Medical preparedness and mitigation efforts by local, regional, and State agencies. Participation in the exercise allows hospitals, ambulance providers, law enforcement, and fire to test and validate policies, plans, procedures, training, equipment, and agreements. In addition, it helps clarify and train personnel in roles and responsibilities, improve interagency coordination, identify gaps in resources and response plans, strengthen relationships among all participating agencies, meet various requirements from regulatory and accreditation agencies.

EMD provides a Healthcare Operations Decontamination (HCO-D) course to train hospital staff and county first responders to improve their abilities, mitigating hazmat incidents. This course allows healthcare workers to improve their response capabilities, reducing the impact of the hazmat incident on patients, community members and their facilities.

Workshops and trainings on plan developing are offered by EMD staff to assist jurisdictions create plans that can address mitigation actions for affecting hazards. For example, Point of Dispensing (POD) trainings and workshops are provided to cities and other disciplines in Riverside County to allow them to be prepared and diminish the effect of a disease outbreak. With the help of EMD, the jurisdictions can create an approved plan that will list some of the actions they have or would like to have in place to prevent their community members from being affected by emergent diseases.

EMD administers the Hospital Preparedness Program (HPP) grant. The grant provides funds to purchase emergency equipment, ensuring hospitals, clinics, and long-term facilities throughout the county are equipped with the proper supplies to help prevent and

mitigate the effects of disasters. The grant also funds training for healthcare workers to increase their skills and abilities in mitigating hazards.

Citizen Corps Councils have additionally been established in the Temecula, Lake Elsinore, Wildomar and Jurupa Valley. These provide a cadre of credentialed volunteers for the jurisdiction to utilize during a disaster response.

Riverside County has an established General Plan that was updated and adopted in December 2015. According to the County's Transportation & Land Management Agency (TLMA), the plan is designed to ensure that the County retains its core identity by guiding future growth. This growth should respect the diversity of the region and configure development in relation to the land it occupies and ensures that its various parts relate. It is the County's over-arching policy to document for land use matters. It also determines housing needs, need for roads, and locations for commercial and industrial use will be better suited throughout the County for the next 20 years and beyond. The overall implementation process of the LHMP can be supported by the General Plan through the incorporation of mitigation actions, goals, or polices.

The Zoning Ordinance for Riverside County administers the County's General Plan. TLMA states that while the General Plan identifies land use designations in the long-term, the Zoning Ordinance identifies specific and immediate uses for land. The General Plan's successful implementation can only occur if the County of Riverside Zoning Ordinance is updated and consistent with the plan as state law mandates General Plan-Zoning consistency and is able to implement the long-term intent of the Plan. Implementation of mitigation actions that include improving structures can be accomplished by adopting them into this Ordinance.

The Subdivision Ordinance for Riverside County is mandated by State law to conduct a local approval of land subdivision via the Subdivision Map Act. TLMA implies that local review of proposed subdivisions and parcel maps includes assessment of consistency with, and implementation of, the County's General Plan. This ordinance can have the ability to support the implementation of mitigation objectives and policies stated in the LHMP.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Section 8.0 – Goals and Strategies

8.1 Goals and Objectives

Goal 1: Reduce Loss of Life and Injuries

Objective 1.1: Provide timely notification and direction to the public in preparation for imminent and potential hazards.

Objective 1.2: Protect public health and safety through mitigation, preparing for, responding to, and recovering from the effects of natural, technological or man-made disasters.

Objective 1.3: Reduce hazard impacts and protect life, property and the environment from damages.

Objective 1.4: Improve understanding of the type, location and effects of hazards and vulnerabilities, as well as measures needed to protect life.

Goal 2: Reduce Hazard Related Property Losses

Objective 2.1: Encourage new development to occur in locations that avoid or minimize exposure to hazards. Continue to utilize County Ordinance 458, in concerns to NFIP and flood hazard areas and County Ordinance 460, in concerns to land use.

Objective 2.2: Reduce hazard related property losses by enforcing strong building codes.

Objective 2.3: Reduce repetitive losses for fire, flood, and earthquakes by encouraging protective measures and by anticipating future events.

Objective 2.4: Reduce hazard impacts to critical facilities, utilities and services through the implementation of low cost mitigation strategies.

Objective 2.5: Continue to strengthen land use regulations in high hazard areas.

Goal 3: Protect the Environment

Objective 3.1: Mitigate the impact of recurring drought conditions that impact both ground water supply and the agricultural industry.

Objective 3.2: Reduce hazards that adversely impact habitats, especially in regions with endangered species.

Goal 4: Maintain Coordination of Disaster Planning and Integrated Public Policy

Objective 4.1: Incorporate changes within Cal OES and FEMA that may affect public policy and planning.

Objective 4.2: Incorporate mitigation related activities into other disaster planning mechanisms, such as the Riverside County General Plan and Capital Improvement Plan.

Goal 5: Improve Community and Agency Awareness

Objective 5.1: Increase public threat awareness in concerns to the nature and extent of hazards they may be exposed to and where they can occur.

Objective 5.2: Improve mitigation and hazard related outreach to businesses, county departments, and stakeholders to increase their understanding of the threats within the county and actions they can take to reduce those hazard impacts.

8.2 Prioritizing Strategies

For the 2017 LHMP, the County assessed each strategy based on the goals and objectives in the LHMP and the General Plan. The process used by the County to prioritize goals and their respective objectives consisted of an evaluation of the hazards and their threat from the 2012 LHMP reviewing any events that occurred 2012 to 2017, and evaluating these against potential impacts. The participating Cities and Special Districts have identified their mitigation strategies in their stand-alone Annexes that are specific to their area of authority or jurisdiction.

8.3 Future and Current Mitigation Strategies

The Riverside County General Plan, adopted in December 2015, includes the following policies and recommendations for new construction and proposals in Safety Element 4:

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Earthquake Hazards:

S 1.1 Mitigate hazard impacts through adoption and strict enforcement of current building codes, which will be amended as necessary when local deficiencies are identified.

S 1.2 Enforce state laws aimed at identification, inventory, and retrofit of existing vulnerable structures.

S 2.1 Minimize fault rupture hazards through enforcement of Alquist-Priolo Earthquake Fault Zoning Act provisions and the following policies: (AI 80, 91)

a. Require geologic studies or analyses for critical structures, lifeline, high-occupancy, schools, and high-risk structures within 0.5 miles of all Quaternary historic faults shown on the Earthquake Fault Studies Zones map.
b. Require geologic trenching studies within all designated Earthquake Fault Studies Zones, unless adequate evidence, as determined and accepted by the Riverside County Engineering Geologist, is presented. The County of Riverside may require geologic trenching of non-zoned faults for especially critical or vulnerable structures or lifelines.
c. Require that lifelines be designed to resist, without failure, their crossing of a fault, should fault rupture occur.
d. Support efforts by the California Department of Conservation, California Geological Survey to develop geologic and engineering solutions in areas of ground deformation due to faulting and seismic activity, in those areas where a through-going fault cannot be reliably located.

S 2.2 Require geological and geotechnical investigations in areas with potential for earthquake-induced liquefaction, landsliding or settlement, for any building proposed for human occupancy and any structure whose damage would cause harm, except for accessory buildings.

S 2.5 Require that engineered slopes be designed to resist seismically- induced failure. For lower-risk projects, slope design could be based on pseudo-static stability analyses using soil engineering parameters that are established on a site-specific basis. For higher-risk projects, the stability analyses should factor in the intensity of expected ground shaking, using a Newmark-type deformation analysis.

S 2.6 Require that cut and fill transition lots be over-excavated to mitigate the potential of seismically-induced differential settlement.

S 2.7 Require a 100% maximum variation of fill depths beneath structures to mitigate the potential of seismically-induced differential settlement.

Flood Hazards:

S 4.1 For new construction and proposals for substantial improvements to residential and nonresidential development within 100-year floodplains as mapped by FEMA or as determined by site specific hydrologic studies for areas not mapped by FEMA, Riverside County shall apply a minimum level of acceptable risk; and disapprove projects that cannot mitigate the hazard to the satisfaction of the Building Official or other responsible agency.

S 4.2 The County shall enforce provisions of the Building Code in conjunction with the following guidelines: (AI 25)

a. All residential, commercial and industrial structures shall be flood-proofed from the mapped 100-year storm flow. This may require that the finished floor elevation be constructed at such a height as to meet this requirement. Non-residential (commercial or industrial) structures may be allowed with a "flood-proofed" finished floor below the Base Flood Elevation (i.e., 100-year flood surface) to the extent permitted by state, federal and local regulations. New critical facilities shall be constructed above grade to the satisfaction of the Building Official, based on federal, state, or other reliable hydrologic studies. To the extent that residential, commercial, or industrial structures cannot meet these standards, they shall not be approved.
b. Critical facilities shall not be permitted in floodplains unless the project design ensures that there are two routes for emergency egress and regress, and minimizes the potential for debris or flooding to block emergency routes, either through the construction of dikes, bridges, or large-diameter storm drains under roads used for primary access.
c. Development using, storing, or otherwise involved with substantial quantities of onsite hazardous materials shall not be permitted within a 100-year floodplain or dam inundation zone, unless all standards for evaluation, anchoring, and flood-proofing have been satisfied; and hazardous materials are stored in watertight containers, not capable of floating, to the extent required by state and federal laws and regulations.
d. Specific flood-proofing measures may require: use of paints, membranes, or mortar to reduce water seepage through walls; installation of water tight doors, bulkheads, and shutters; installation of flood water pumps in structures; and proper modification and protection of all electrical equipment, circuits, and

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

appliances so that the risk of electrocution or fire is eliminated. However, fully enclosed areas that are below finished floors shall require openings to equalize the forces on both sides of the walls.

S 4.3 Prohibit construction of permanent structures for human housing or employment to the extent necessary to convey floodwaters without property damage or risk to public safety. Agricultural, recreational, or other low intensity uses are allowable if flood control and groundwater recharge functions are maintained.

S 4.4 Prohibit alteration of floodways and channelization unless alternative methods of flood control are not technically feasible or unless alternative methods are utilized to the maximum extent practicable. The intent is to balance the need for protection with prudent land use solutions, recreation needs, and habitat requirements, and as applicable to provide incentives for natural watercourse preservation, including density transfer programs as may be adopted. (AI 25, 60) a. Prohibit the construction, location, or substantial improvement of structures in areas designated as floodways, except upon approval of a plan which provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood discharge. b. Prohibit the filling or grading of land for nonagricultural purposes and for non-authorized flood control purposes in areas designated as floodways, except upon approval of a plan which provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood discharge.

S 4.5 Prohibit substantial modification to watercourses, unless modification does not increase erosion or adjacent sedimentation, or increase water velocities, so as to be detrimental to adjacent property, nor adversely affect adjacent wetlands or riparian habitat.

S 4.6 Direct flood control improvement measures toward the protection of existing and planned development.

S 4.7 Any substantial modification to a watercourse shall be done in the least environmentally damaging manner practicable in order to maintain adequate wildlife corridors and linkages and maximize groundwater recharge.

S 4.8 Allow development within the floodway fringe, if the proposed structures can be adequately flood-proofed and will not contribute to property damage or risks to public safety.

S 4.9 Within the floodway fringe of a floodplain as mapped by FEMA or as determined by site specific hydrologic studies for areas not mapped by FEMA, require development to be capable of withstanding flooding and to minimize use of fill. However, some development may be compatible within flood plains and floodways, as may some other land uses. In such cases, flood proofing would not be required. Compatible uses shall not, however, obstruct flows or adversely affect upstream or downstream properties with increased velocities, erosion backwater effects, or concentrations of flows.

S 4.10 Require all proposed projects anywhere in the county to address and mitigate any adverse impacts that it may have on the carrying capacity of local and regional storm drain systems.

S 4.11 Encourage neighboring jurisdictions to require development occurring adjacent to the County to consider the impact of flooding and flood control measures on properties within unincorporated Riverside County.

Fire Hazards:

S 5.1 Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:

a. All proposed development and construction within Fire Hazard Severity Zones shall be reviewed by the Riverside County Fire and Building and Safety departments.
b. All proposed development and construction shall meet minimum standards for fire safety as defined in the Riverside County Building or County Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.
c. In addition to the standards and guidelines of the California Building Code and California Fire Code fire safety provisions, continue to implement additional standards for high-risk, high occupancy, dependent, and essential facilities where appropriate under the Riverside County Fire Code (Ordinance No. 787) Protection Ordinance. These shall include assurance that structural and nonstructural architectural elements of the building will not impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor hinder evacuation from fire, including potential blockage of stairways or fire doors
d. Proposed development and construction in Fire Hazard Severity Zones shall provide secondary public access, in accordance with Riverside County Ordinances.

e. Proposed development and construction in Fire Hazard Severity Zones shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the Riverside County Fire Chief.
f. Proposed development and construction in Fire Hazard Severity Zones shall provide a defensible space or fuel modification zones to be located, designed, and constructed that provide adequate defensibility from wildfires.

S 5.2 Encourage continued operation of programs for fuel breaks, brush management, controlled burning, revegetation and fire roads.

S 5.3 Monitor fire-prevention measures (such as fuel reduction) through a site specific fire-prevention plan to reduce long-term fire risks in the Fire Hazard Severity Zones.

S 5.4 Limit or prohibit development or activities in areas lacking water and access roads.

S 5.5 Encourage proposed development in Fire Hazard Severity Zones to develop where fire and emergency services are available or planned.

S 5.6 Demonstrate that the proposed development can provide fire services that meet the minimum travel times identified in Riverside County Fire Department Fire Protection and EMS Strategic Master Plan.

S 5.7 Minimize pockets of flammable vegetation that increase likelihood of fire spread through conceptual landscaping plans to be reviewed by Planning and Fire Departments in the Fire Hazard Severity Zones. The conceptual landscaping plan of the proposed development shall at a minimum include:

a. Plant palette suitable for high fire hazard areas to reduce the risk of fire hazards.
b. Retention of existing natural vegetation to the maximum extent feasible.
c. Removal of onsite combustible plants.

S 5.8 Design to account for topography of a site and reduce the increased risk from fires in the Fire Hazard Severity Zones located near ridgelines, plateau escarpments, saddles, hillsides, peaks, or other areas where the terrain or topography affect its susceptibility to wildfires by:

a. Providing fuel modification zones with removal of combustible vegetation, but minimizing visual impacts and limiting soil erosion.
b. Replacing combustible vegetation with fire resistant vegetation to stabilize slopes.
c. Submitting topographic map with site specific slope analysis.

d. Submitting erosion and sedimentation control plans.
e. Providing a minimum 30 foot of setback from the edge of the fuel modification zones.
f. Minimizing disturbance of 25% or greater natural slopes.

S 5.9 Reduce fire threat and strengthen fire-fighting capability so that the County could successfully respond to multiple fires. (AI 88)

S 5.10 Require automatic natural gas shutoff earthquake sensors in high-occupancy industrial and commercial facilities, and encourage them for all residences.

S 5.11 Utilize ongoing brush clearance fire inspections to educate homeowners on fire prevention tips by implementing annual countywide weed abatement program

S 5.12 Conduct and implement long-range fire safety planning, including stringent building, fire, subdivision, and municipal code standards, improved infrastructure, and improved mutual aid agreements with the private and public sector.

S 5.13 Develop a program to utilize existing reservoirs, tanks, and water wells in the county for emergency fire suppression water sources.

S 5.14 Periodically review inter-jurisdictional fire response agreements, and improve firefighting resources as recommended in the Riverside County Fire Department Fire Protection Plan and EMS Strategic Master Plan to keep pace with development, including construction of additional high-rises, mid-rise business parks, increasing numbers of facilities housing immobile populations, and the risk posed by multiple ignitions, to ensure that (AI 4, AI 88):

- Fire reporting and response times do not exceed the goals listed in the Riverside County Fire Department Fire Protection Plan and EMS Strategic Master Plan identified for each of the development densities described.
- Fire flow requirements (water for fire protection) are consistent with Riverside County Ordinance 787.
- The planned deployment and height of aerial ladders and other specialized equipment and apparatus are sufficient for the intensity of development desired.

S 5.15 Continue to utilize the Riverside County Fire Department Fire Protection Plan and EMS Strategic Master Plan as the base document to implement the goals and objectives of the Safety Element.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

S 5.16 Encourage property owners to utilize clustering and Transfer of Development Rights (TDR) program when developing lands within Fire Hazard Severity Zones by:

- Restricting the development of a property through placement of conservation easement.
- Acquiring the conservation easements similar to that of MSHCP Program.

S 5.17 Identify, map, and update on an as-needed continual basis, the Fire Hazard Severity Zone maps.

S 5.18 Ensure that the Fire Department has appropriate municipal staffing and fire protection planning staff that meet the needs of development pressure and adequately respond to long range fire safety planning.

S 5.19 Implement a coordination program with fire protection and emergency service providers to reassess fire hazards after wildfire events and to adjust fire prevention and suppression needs, as necessary.

S 5.20 Implement a regional coordination program to increase support for coordination among fire protection and emergency service providers.

S 5.21 Implement a long-term training and education program among government agencies and communities about fire protection.

Wind Hazards:

S 3.11 Require studies that address the potential of this hazard on proposed development within “High” and “Very High” wind erosion hazard zones as shown on Figure S-8, Wind Erosion Susceptibility Map.

S 3.12 Include a disclosure about wind erosion susceptibility on property title for those properties located within “High” and “Very High” wind erosion hazard zones as shown on Figure S-8, Wind Erosion Susceptibility Map.

S 3.13 Require buildings to be designed to resist wind loads.

S 3.14 Educate builders about the wind environment and encourage them to design projects accordingly

8.4 Ongoing Mitigation Strategies

8.4.1 Earthquake Strategies

Retrofitting Against Earthquake:

Earthquake retrofitting measures include removing masonry overhangs that will fall onto the street during shaking. Bracing the building provides structural stability, but can be very expensive. Less expensive approaches may be more cost effective for an area like that faces a relatively low earthquake threat. These include tying down appliances, water heaters, bookcases and fragile furniture so they won't fall over during a quake and installing flexible utility connections that will not break when shaken.

8.4.2 Flood Strategies

Generally, natural, man-made, and technological hazards impact people and improved property the most. Vacant space may incur damages as well, but the threat to life and property is greatly decreased. In some cases, properties can be modified so the hazard does not reach the damage-prone improvements. Flooding is the one of those hazards that can be kept away from a structure. There are five common methods to do this:

- Retrofit the building
- Create a barrier between the building and the source of flooding
- Move the building out of the flood-prone area
- Elevate the building above the flood level
- Demolish the building.

Retrofitting Against Flooding:

Flood retrofitting measures include dry flood proofing where all areas below the flood protection level are made watertight. Walls are coated with waterproofing compounds or plastic sheeting. Openings (doors, windows, and vents) are closed, either permanently, with removable shields, or with sandbags. Dry flood proofing of new and existing nonresidential buildings in the regulatory floodplain is permitted under State, FEMA and local regulations. Dry flood proofing of existing residential buildings in the floodplain is also permitted as long as the building is not substantially damaged or being substantially improved. Owners of buildings located outside the regulatory floodplain can always use dry flood proofing techniques.

The alternative to dry flood proofing is wet flood proofing: water is let in and everything that could be damaged by a flood is removed or elevated above the flood level. Structural components below the flood level are replaced with materials that are not subject to water

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

damage. This is the approach used for the first floor of the elevated homes. For example, concrete block walls are used instead of wooden studs and gypsum wallboard. The furnace, water heater, and laundry facilities are permanently relocated to a higher floor. Where the flooding is not deep, these appliances can be raised on blocks or platforms.

Barriers:

An effective way of keeping flood water away from a structure is to construct a barrier. This barrier can be built of dirt or soil, berms, concrete, steel, a floodwall or through a simple sand-bagging operation. In areas subject to flash flooding, deep waters, or other high hazard, relocation and evacuation is often the only safe and responsible approach.

Careful design is needed so as not to create flooding or drainage problems on neighboring properties. Depending on how porous the ground is, if floodwaters will stay up for more than an hour or two, the design needs to account for leaks, seepage of water underneath, and rainwater that falls inside the perimeter. This is usually done with a sump and/or drain to collect the internal groundwater and surface water and a pump and pipe to pump the internal drainage over the barrier.

Barriers can only be built so high. They can be overtopped by higher than expected flood waters. Barriers made of earth are susceptible to erosion from rain and floodwaters if not properly sloped, covered with grass, and maintained. A berm can settle over time, lowering its protection level. A floodwall can crack, weaken, and lose its watertight seal. Therefore, barriers need careful design and maintenance (and insurance on the building, in case of failure).

Relocation:

Moving a structure to higher ground is the surest and safest way to protect it from flooding. While almost any building can be moved, the cost goes up for heavier structures, such as those with exterior brick and stone walls, and for large or irregularly shaped buildings. However, experienced building movers can handle most job.

In areas subject to flash flooding, deep waters, or other high hazard, relocation is often the only safe approach. Relocation is also preferred for large lots that include buildable areas outside the floodplain or where the owner has a new flood-free lot (or portion of the existing lot) available.

Elevation:

Raising a building above the flood level can be almost as effective as moving it out of the floodplain. Water flows under the building, causing little or no damage to the structure or its contents.

Raising a building above the flood level is cheaper than moving it and can be less disruptive to a neighborhood. Elevation has proven to be an acceptable and reasonable means of complying with floodplain regulations that require new, substantially improved, and substantially damaged buildings to be elevated above the base flood elevation.

One concern with elevation is that it may expose the structure to greater impacts from other hazards. If not braced and anchored properly, an elevated building may have less resistance to the shaking of an earthquake and the pressures of high winds.

Demolition:

Some buildings, especially heavily damaged or repetitively flooded ones, are not worth the expense to protect them from future damage. It is cheaper to demolish them and either replace them with new, flood protected structures ("pilot reconstruction"), or relocate the occupants to a safer site. Demolition is also appropriate for buildings that are difficult to move—such as larger, slab foundation, or masonry structures—and for dilapidated structures that are not worth protecting. Generally, demolition projects are undertaken by a government agency, so the cost is not borne by the property owner, and the land is converted to public open space use, such as a park.

One potential problem is sometimes an acquisition and demolition project is a "checkerboard" pattern in which nonadjacent properties are acquired. This can occur when some owners, especially those who have and prefer a waterfront location, prove reluctant to leave. Creating such an acquisition pattern in a community simply adds to the maintenance costs that taxpayers must support.

8.4.3 Fire Strategies

Wildfire:

One way to lessen the threat of a fire is by keeping fuel away from buildings. This is called the concept of "defensible space." Defensible space involves providing sufficient space between the structure and flammable vegetation.

Within this space, the fire service has room to battle the wildfire before it reaches the structure or to stop a structural fire before it ignites the wildland vegetation. With sufficient

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

defensible space, the structure even has a chance to survive on its own when fire service personnel and equipment are not available, as often happens during a significant wildfire.

The 2003 Fire Siege was perhaps the worst fire disaster in Southern California history. The firestorm that raged through the region consisted of 14 major fires that quickly exhausted resources and lasted for multiple weeks. The lessons from that fire season served as a warning for everyone living in areas prone to fire danger and resulted in stronger fire prevention and mitigation efforts.

In January 2005 a new state law became effective that extended the defensible space clearance around homes and structures from 30 feet to 100 feet. Proper clearance to 100 feet dramatically increases the chance of your house surviving a wildfire. This defensible space also provides for firefighter safety when protecting homes during a wildland fire. Riverside County Ordinance No. 859 Water Efficient Landscape Requirements mentions the use of defensible space and avoiding the use of fire-prone plant materials. Ordinance No. 695 Abatement of Hazardous Vegetation effective July 16, 2009 states "a one hundred (100) foot wide strip of land around structure(s) located on an adjacent improved parcel"

Riverside County has a Fire Protection contract with Cal Fire and utilizes many of their materials to educate individuals on why they should maintain a proper defensible space.

Public Fire Education:

Family Escape Plan:

In a County as fire prone as Riverside, you can never be too fire safe. Throughout Southern California, wildfire danger is a year-around threat. Our goal is to make each and every home more fire safe. We ask residents to make sure they have a fire escape plan, and that they practice what to do in an emergency.

Smoke Alarms:

Over ninety-three percent of all homes in the United States have at least one smoke alarm. The bad news is that one third of them are not working. The County encourages residents to make sure their smoke alarms are operating correctly by testing them regularly.

8.4.4 All Hazard Strategies

Facility Audits:

One of the first things we can do to reduce loss of structures within the County of Riverside is to evaluate all critical facilities' that are exposed to potential damage from the hazards. We should include a review of insurance coverage and identify where more information can be found on the property protection measure(s) recommended by the audit. Typically property protection measures are used to modify buildings or property that has a greater potential to damage. Property protection measures fall under three approaches:

- Modify the site to keep the hazard from reaching the building
- Modify the building so it can withstand the impacts of the hazard
- Insure the property owner receives the opportunity for financial relief after the damage has occurred, This is usually received under the owners insurance policies or technical and financial assistance can be provided by a government agency

Other measures:

- Burying utility lines is a retrofitting measure that addresses earthquakes, winds from tornadoes, thunderstorms, and the ice that accompanies winter storms.
- Installing or incorporating backup power supplies minimizes the effects of power losses caused by downed lines.
- Roofs can be replaced with materials less susceptible to damage by hazards, such as modified asphalt or formed steel shingles and other fireproof materials
- Wildfire mitigation in residential properties can include installing spark arrestors on chimneys.
- Winter storm retrofitting measures include improving insulation on older buildings, relocating water lines from outside walls to interior spaces, and insulating water lines in crawlspaces and under elevated buildings.
- Windows can be sealed or covered with an extra layer of glass (storm windows) or plastic sheeting.

8.5 Mitigation Actions

County Hazard Mitigation Goals and Actions:

The Agency Inventory Document and Mitigation Strategies and Goals, were used by the county and each participating city and special district to review the possible mitigation

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

actions that would be appropriate for that agency to work on. This is based on how the Riverside County planning area can reduce the vulnerability of people, property, infrastructure, and natural and cultural resources to future disaster losses. Only those actions where the County is the lead jurisdiction are detailed further in Section 4.3. Actions specific to other participating jurisdictions are detailed in the jurisdictional annexes.

It is important to note that Riverside County and the participating jurisdictions have numerous existing, detailed action descriptions, which include benefit-cost estimates, in other planning documents, such as the General Plan, community wildfire protection plans and capital improvement budgets and reports. These actions are considered to be part of this plan, and the details, to avoid duplication, should be referenced in their original source document. The Riverside County planning area also realizes that new needs and priorities may arise as a result of a disaster or other circumstances and reserves the right to support new actions, as necessary, as long as they conform to the overall goals of this plan.

This page intentionally left blank.

Section 9.0 Plan Implementation and Maintenance Process

Implementation and maintenance of the plan is critical to the overall success of hazard mitigation planning. This section provides an overview of the overall strategy for plan implementation and maintenance. It also outlines the method and proposed schedule for monitoring, updating, and evaluating the plan. The chapter will discusses incorporating the plan into existing planning mechanisms and how to address continued public involvement.

9.1 Implementation

The Riverside County Operational Area Multi-Jurisdiction Local Hazard Mitigation Plan is a partnership between the jurisdictions involved. Implementation prioritization is determined during the planning process and after taking funding into consideration. Economic constraints make low or no-cost actions most easily accomplished in plan implementation.

A highly effective and low cost implementation mechanism is the incorporation of our hazard mitigation plan recommendations into Operational Area and other planning efforts discussed in more detail below. Another strategy is for participating jurisdictions to assimilate mitigation strategies into their day-to-day functions and priorities. This effort will be achieved by monitoring agenda, attending stakeholder meetings, and review of programs and policies for coordination and opportunities to implement mitigation strategies. Riverside County Operational Area will also monitor funding opportunities to facilitate the implementation of more costly recommended actions. The County will assist in the identification of specialized pre- and post- disaster funds, state and federal earmarked funds, and other grant programs for opportunities to implement mitigation actions and identified projects.

The primary duty of the participating jurisdictions is to participate in reporting to their community governing boards and the public on the status of their plan implantation and mitigation opportunities and keep the County of Riverside EMD updated of changes to the status of their recommended actions or priorities. The primary duty of the County will be to promote mitigation action funding opportunities, organize Steering Committee meetings for plan evaluation and potential updates on a yearly basis and post any relevant information on the County website and others as appropriate.

9.2 Role of Hazard Mitigation Steering Committee

With the adoption of this plan, the participating jurisdictions will be responsible for the plan implementation and maintenance. The participating jurisdictions, led by County of Riverside Emergency Management Department will work to maintain a Hazard Mitigation Steering Committee to:

- Disseminate hazard mitigation activities and opportunities to all participants;
- Pursue the implementation of high-priority, low-cost mitigation actions;
- Monitor and identify cost-share and funding opportunities to support the community and recommended actions;
- Monitor and assist in implementation and evaluate updates of this plan;
- Support and assist ALL jurisdictions not included in the Multi-Jurisdictional Plan to develop their own stand-alone local hazard mitigation plans;
- Report on plan progress and changes to participating jurisdictions

9.3 Incorporation into Existing Planning Mechanisms

Incorporation of the hazard mitigation plan recommendations into other County and jurisdictional plans and policies is part of our implementation plan.

Plans include:

- County and City General Plans
- County and City Emergency Operations Plans
- County and City Ordinances
- Flood and Storm-water Management Master Plans
- Wildfire Protection Plans
- Capital Improvement Plans and Budgets

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

- Other plans and policies outlined in the capability assessments in the jurisdictional annexes
- Other plans, regulation, and practices with a mitigation focus.

9.4 Maintenance

Plan maintenance will be an annual process by both the County and participating jurisdictions to monitor and evaluate the plans' implementation and to update the plan as progress, changes in actions or priorities, or changing circumstances are recognized. The County will notify Cal OES and FEMA with plan updates to ensure they have the most current version of a participating jurisdiction's plan.

County of Riverside Emergency Management Department, Preparedness Division, is responsible for initiating plan reviews, consulting and organizing a Hazard Mitigation Steering Committee Meeting and facilitating coordination with participating jurisdictions. In order to evaluate progress and update mitigation strategies identified in the plan, the County of Riverside EMD and the participating jurisdictions will review the plan annually and following a large scale event. County of Riverside EMD and participating jurisdictions will submit a five-year written update to Cal OES and FEMA Region IX, unless disaster or other circumstance (e.g., changing regulations) require a change to this schedule.

Maintenance Evaluation Process

The yearly review of the plan will be presented and discussed at our annual Operational Area Planning Committee, Disaster Council Meeting held in January. The assessment will address whether:

- The goals and objectives address current and expected conditions.
- The nature, magnitude, and/or type of risks have changed.
- The current resources are appropriate for implementing the plan.
- There are implementation problems, such as technical, political, legal, or coordination issues with other agencies.
- The outcomes have occurred as expected (a demonstration of progress).
- The agencies and other partners participated as originally proposed.

Updates to this plan will:

- Consider changes in vulnerability due to action implementation;
- Document and highlight instances where mitigation efforts have proven effective;
- Document new hazards and identify any hazards that were previously overlooked;
- Incorporate any new data or studies on identified hazards and risks;
- Incorporate growth and development-related changes to infrastructure inventories; and
- Incorporate any new action recommendations or changes in action or risk prioritization.

County of Riverside Emergency Management Department, Preparedness Division, will conduct a plan update 18 months prior to plan expiration. In addition, Riverside County EMD will seek grant funding to support the coordination and development of the plan update. Upon notice of the HMPG funding opportunity, Riverside will apply for any available HMGP funding. After plan adoption, the LHMP Steering Committee in coordination with the EMD Planning team will conduct an annual review of the plan, flagging any sections in the plan that will require further updates. The sections flagged for revision will be included in the next LHMP update. Additional meetings will occur annually throughout the five-year cycle. Changes will be made to the plan to accommodate for actions that are no longer relevant due to shifting agendas, funding or no longer considered feasible.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

10.0 Continued Public Involvement

The Riverside County Operational Area Multi-Jurisdiction Hazard Mitigation Plan update process has provided an opportunity to solicit participation from new and existing stakeholders, publicize successful mitigation strategies and actions, and seek public comments.

The County will continue its efforts to involve the public during the annual maintenance process and after any major events that lead to revisions in the plan.

The Riverside County Emergency Management Department and participating jurisdictions will be responsible for facilitating continued public and stakeholder involvement for their plan updates. They will do this through: input from the Hazard Mitigation Steering Committee, public outreach meetings, web and social media postings, press releases and public hearings for the plan's maintenance.

There are also opportunities for participating jurisdictions to obtain and share information with their stakeholders by participating in the Operational Area Planning Committee and the Disaster Council meetings.

Riverside, CA 92505

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the City of Banning is submitting this letter of commitment to confirm that the City of Banning has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; the City of Banning agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The City of Banning understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and

99 E. Ramsey St. • P.O. Box 998 • Banning, CA 92220-0998 • (951) 922-3101 • Fax (951) 922-3128

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I Michael Rock, City Manager, commit the City of Banning to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department:

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the City of Hemet is submitting this letter of commitment to confirm that City of Hemet has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; the City of Hemet agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The City of Hemet understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process; attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and

Riverside County Emergency Management Department
Kim Saruwatari, Director
Page 2
June 13, 2016

- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I, Alexander P. Meyerhoff, commit the City of Hemet to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the City of San Jacinto is submitting this letter of commitment to confirm that the City of San Jacinto has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; The City of San Jacinto agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The City of San Jacinto understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and
- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I, Robert Johnson, commit the City of San Jacinto to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

The Ramona Band of Cahuilla ("Band"), a federally recognized tribe, is submitting this letter of commitment to confirm that the Band has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

The Federal Emergency Management Agency's ("FEMA") Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans, and the Band's participation will allow for a more comprehensive evaluation of hazards and proposed mitigation measures through the coordination at the county, regional, or watershed level.

The Band agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The Band understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and

- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Band's Multi-Jurisdictional Hazard Mitigation Plan by the Band's governing body.

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I, Joseph D. Hamilton, Chairman, commit the Ramona Band of Cahuilla to participation in the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Please feel free to contact the Band's administrative offices at (951)763-4105 if you have any questions or wish to discuss this matter further.

Respectfully,

Joseph D. Hamilton
Chairman, Ramona Band of Cahuilla

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the High Valleys Water District is submitting this letter of commitment to confirm that the High Valleys Water District has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; the High Valleys Water District agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The High Valleys Water District understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and
- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I, Ernest B. Wright, commit the High Valleys Water District to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the Idyllwild Fire Protection District (IFPD) is submitting this letter of commitment to confirm that the IFPD has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; the IFPD agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The IFPD understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings,

Page **1** of **2**

contributing research, data, or other information, commenting on drafts of the plan, etc.); and
- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I, Patrick Reitz, Fire Chief, commit the Idyllwild Fire Protection District to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Executed this 9th day of June, 2016.

Riverside, CA 92505

SUBJECT: LETTER OF COMMITMENT AS PARTICIPATING JURISDICTION IN RIVERSIDE COUNTY OPERATIONAL AREA MULTI-JURISDICTIONAL HAZARD MITIGATION PLANNING

Dear Ms. Saruwatari:

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the Rancho California Water District (RCWD/District) is submitting this letter of commitment to confirm that RCWD has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; RCWD agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

The District understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department:

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the San Jacinto Unified School District (SJUSD) is submitting this letter of commitment to confirm that SJUSD has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; SJUSD agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department to complete the plan in conformance with FEMA requirements.

SJUSD understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.)
- Documentation of an effective process to maintain and implement the plan
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan and by adoption of resolution from the Board of Trustees (attached), I commit San Jacinto Unified School District to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Sincerely,

Diane Perez

Re: Letter of Commitment as Participating Jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Ms. Saruwatari:

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, the Santa Ana Watershed Project Authority (SAWPA) is submitting this letter of commitment to confirm that SAWPA has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; SAWPA agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

SAWPA understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction;
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.);
- Documentation of an effective process to maintain and implement the plan; and
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Re: Letter of Commitment as participating jurisdiction in Riverside County Operational Area Multi-Jurisdictional Hazard Mitigation Planning

Dear Riverside County Emergency Management Department,

As the Federal Emergency Management Agency's (FEMA) Local Mitigation Plan requirements under 44 CFR §201.6 specifically identify criteria that allow for multi-jurisdictional mitigation plans and that many issues are better resolved by evaluating hazards more comprehensively by coordinating at the county, regional, or watershed level, Western Municipal Water District is submitting this letter of commitment to confirm that Western Municipal Water District has agreed to participate in the County of Riverside Emergency Management Department's Multi-Jurisdictional Hazard Mitigation Planning.

Further, as a condition to participating in the mitigation planning; Western Municipal Water District agrees to meet the requirements for mitigation plans identified in 44 CFR §201.6 and to provide such cooperation as necessary and in a timely manner to the County of Riverside Emergency Management Department's to complete the plan in conformance with FEMA requirements.

Western Municipal Water District understands that it must engage in the following planning process, as described in FEMA's *Local Multi-Hazard Mitigation Planning Guidance* dated July 1, 2008, including, but not limited to:

- Identification of hazards unique to the jurisdiction and not addressed in the master planning document;
- The conduct of a vulnerability analysis and an identification of risks, where they differ from the general planning area;
- The formulation of mitigation goals responsive to public input and development of mitigation actions complementary to those goals. A range of actions must be identified specific for each jurisdiction.
- Demonstration that there has been proactive participation in the planning process by all community stakeholders (examples of participation include relevant involvement in any

14205 Meridian Parkway, Riverside, CA 92518 • (951) 571-7100 • wmwd.com

planning process, attending meetings, contributing research, data, or other information, commenting on drafts of the plan, etc.); and
- Documentation of an effective process to maintain and implement the plan; and,
- Formal adoption of the Multi-Jurisdictional Hazard Mitigation Plan by the jurisdiction's governing body (each jurisdiction must officially adopt the plan).

Therefore, with a full understanding of the obligations incurred by participating in the FEMA hazard mitigation planning process as a participant in a multi-jurisdictional plan; I John V. Rossi, commit Western Municipal Water District to the County of Riverside Emergency Management Department Multi-Jurisdictional Hazard Mitigation Planning effort.

Executed this 4th day of June 2016,

John V. Rossi, General Manager

APPENDIX C – Mitigation Action Table

2012 Plan Strategies Updated Status

Mitigation Actions Table

Type of Hazard	Mitigation Actions	Departments/ Jurisdictions	Status Update
ALL	Incorporate Updated Local Hazard Mitigation Plan into Riverside County General Plan	Transportation, Land Management Agency and Riverside Office of Emergency Services	Recently updated and approved on December 2015 by Board of Supervisors. Adopted 2015, which includes a new reference to implement the Local Hazard Mitigation Plan within the Safety Element.
DROUGHT	Construct reservoirs and water tanks to increase water storage	Water Conservation, Agriculture and County Fire	On-going, no update has been made
EARTHQUAKE	CREWS Earthquake Mitigation Project	County-wide	Ongoing process of recruiting non-participating cities in the Coachella Valley area into the early earthquake warning program.
FIRE	Purchase Masticator to remove vegetation and brush in heavily populated areas prone to fires.	Riverside County Fire	No change. Project still on hold due to lack of funding during budget cuts. Potential future purchase
FIRE	Shake Shingle Roof Replacement Project	Idyllwild	In 2013 Mountain Communities Fire Safe Council was awarded a FEMA grant to replace hazardous shake/wood shingle roofs in the San Jacinto WUI (Wildland Urban Interface) One hundred homes were reroofed with Class A roofing material. The grant was completed in October 2016.

FIRE	Single Tree Removal – removed dying and dead trees.	Idyllwild	Ongoing - Nearing Closeout: dead and dying trees are continuously monitored and removed as needed.
FIRE	Hazard Abatement- Fuel treatment program to remove 1120 acres of natural fuel	Mountain Communities Fire Safe Council Program - Idyllwild	Reducing fuels on private property in the San Jacinto WUI is an on-going activity of Mountain Fire Safe Council. To date, more than 1,600 acres have been treated with the financial help of grant funds awarded to MCFSC
FLOOD	Norco Storm Drain This project is an underground storm drain which will address flooding along Pedley Avenue/Sixth Street.	Riverside County Flood Control	Project completed on 04/05/2011.
FLOOD	Santa Ana River, Norco Bluffs [Corps Project] – Stabilization Project is a Corps of Engineers project that consists of a soil cement to protection structure constructed to the 100-year flood level at the base of the bluff.	Riverside County Flood, Transportation Land Management Agency and Riverside County Fire	The bluff stabilization work was completed in 2004. The District is continuing to work with the Corps on wrapping up the project, including completion of a Project Operation and Maintenance Manual. Once the Corps approves the O&M Manual, the project can be transferred to the District for ownership, operation and maintenance.
FLOOD	Temescal Creek-Foster Road Storm Drain (2-8-00493-01) - This project is an underground storm drain in Foster Road extending from Interstate 15 to Temescal Creek.	Riverside-Corona Resource Conservation District Riverside County Flood Control	Project completed on 09/01/2015
FLOOD	Dillon Road – State Hwy 62 Road Project to clear debris. Road has 25 dips that cause flooding during storms.	Transportation, Land, Management Agency Riverside County Fire	Ongoing; The current action plan is to barricade the low dip sections when they are flooded and remove the storm debris when the water recedes.
FLOOD	Underground storm drain which will extend	Flood Control and City of Norco	Finished approximately in Spring 2011

	approximately 1,300 feet south in Pedley Avenue from Norco MDP Line NA in Sixth Street. This project will address localized flooding along Pedley Avenue.		
FLOOD	Restore 100 yr level flood protection to the three million residents within the floodplain downstream, the Corps proposes to increase both the storage capacity of Prado Dam, and its outlet discharge capacity. The embankment will be raised 30 feet, while the spillway sill will be raised 20 feet and the gated discharge capacity will be tripled.	Flood Control	**Part 1** of this project involving Riverside County Flood Control and TLMA was completed **Part 2** of this project involving only Riverside County Flood Control is still pending approval
FLOOD	Ultimate channel improvements for the existing interim channel from 6th Street to the terminus near Rose Court.	City of Norco	Project has not started. No estimation on start date. The District is currently working on 60% design plans and anticipates 90% design plans will be completed by next year (2017). FEMA processing will be necessary to revise the currently mapped floodplain once the construction is completed.
FLOOD	Ultimate improvements to the existing channel between Parkridge Avenue and River Road. The channel is planned as a concrete lined open channel	City of Norco and Riverside County Transportation Land Management Agency	Project began Circa 7/2013 and was finished Circa 2/2014. Lead Agency was RCFC & WCD
FLOOD	Underground storm drain extending from the existing Stage 1 near Pedley Avenue, east in 7th Street to California Avenue then south in California approximately 800 feet to a sump.	Transportation, Land, & Management Agency and Flood Control	Project completed on 04/05/2011

FLOOD	Collection of "mitigation" charges from builders in Mockingbird Canyon with the intention of providing relief to flood prone properties in the lower canyon	Mockingbird Canyon	In process of collecting funds. Charging investors $500 per lot. Talks about whether to keep this project or abandon it. Considered a “mini” ADP (Area Drainage Project)
FLOOD	Storm Drain Last portion will be constructed as part of the same contract as the Ontario Avenue Storm Drain project	City of Corona	Project completed on 04/24/2012, Project revised on 04/25/2012.
FLOOD	A 1,050-foot drain to de-water a sump in Frank Avenue in the south Mira Loma area	Riverside County Flood Control and City of Eastvale	Project completed on 01/31/2012
FLOOD	The original project consisted of a 54 acre-foot debris basin at the southerly end of Smith Road and a concrete rectangular channel extending northerly to Cajalco Road. Mitigation required for the basin project includes removal of non-native vegetation, debris and remnants of abandoned structures as well as re-grading and establishment of native vegetation.	Riverside County Flood Control	Project completed on 01/10/2006
FLOOD	Underground storm drain in the City of Corona extending from East Grand Boulevard north in Joy Street to Temescal Creek Channel. Design began on this project in 2003 at which time it was discovered during a field check of the preliminary drawings that a recently installed Edison conduit in Joy Street overlapped the only viable alignment for the storm drain. The street is so heavily laden with utilities here is no longer room to install a drain.	City of Corona	Designed Phase Schedule for advertisement in March 2017

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

FLOOD	Underground storm drain in Ontario Avenue extending upstream from the District's existing El Cerrito Channel at El Cerrito Road about 3,000 feet to State Street just west of Interstate 15.	Riverside County Flood Control and Transportation Land & Management Agency	Project revised on 04/25/2012
FLOOD	Underground storm drain in Foster Road extending from Interstate 15 to Temescal Creek	Temescal Creek-Foster Road Storm Drain	Construction began in January 2015 and was completed in September 2015.
FLOOD	Multi-year plan to construct the ultimate levee system (approximately 1,200 feet river bottom width) between the existing Corps of Engineers' levee 9,500 feet upstream of State Street, and a point about 8,200 feet downstream of Sanderson Avenue, a distance of about 5 miles. Floodwalls on piles are required to be constructed over the Metropolitan Water District facilities just east of State Street.	San Jacinto and Transportation and Land Management	Funding was received in November 2015 - the levee was included in a suite of projects that received Proposition 84 grant funding from the California Department of Water Resources. The Prop 84 contribution is anticipated to be about $3.5 million.
FLOOD	Project to build MDP extending from South W. Esplanade to east Midway Street to South San Jacinto Street to collect flows from the larger Park Hill basin watershed	City of San Jacinto	Construction for the project began on April 25, 2014 and was completed on July 2, 2015.
FLOOD	Construction of an underground storm drain that extends from a proposed detention basin at the intersection of Potter Road and De Anza Drive then southwest in De Anza to Young Street. The City of San Jacinto is administering the project.	City of San Jacinto and Transportation and Land Management	Project still pending

FLOOD	Underground storm drain from an outlet north of Holland Road southerly in Hawthorne Avenue to a collection system south of Craig Avenue	City of Menifee and Transportation and Land Management	Project Completed 3/01/2011
FLOOD	Project is an underground storm drain that extends from near Yale Street east on Stetson Avenue approximately 1 mile to Dartmouth Street	City of Hemet	Project completed on 09/04/2007
FLOOD	Project is an underground storm drain on Whittier Boulevard extending from the existing storm drain at Palm Avenue east to San Jacinto Street	Riverside County Flood Control and City of Hemet	Project completed on 08/23/2016
FLOOD	Underground storm drain extending from an existing storm drain in Meridian Street near Berkeley venue south in Meridian Street to Whittier Avenue.	Riverside County Flood Control and City of Hemet	Stage 1 completed on 06/21/2016. Stage 2 still pending approval.
FLOOD	Project is for major flood control project to extend from the San Jacinto River near Goetz Road east approximately 6 miles to Juniper Flats Road and incorporates both lined and unlined open channel, underground storm drains and two major detention basins.	City of Menifee and Transportation, Land and Management Agency	Project built in 4 stages. Some stages have been completed, but others still not finished.
FLOOD	Open channel along Nuevo Road from Dunlap Drive to Perris Valley Channel	City of Perris, Riverside County Transportation and Flood Control	Under new contract: Starting Jan. 2017 and will range about 2.5 yrs. for this entire project to be completed; first part will take about 180 days to complete, but time frame will be extended.

FLOOD	East Ironwood Avenue to Petit Street. Part of the work the City of Moreno Valley is doing in association with improvements to the Moreno Beach Drive & 60 freeway interchange.	City of Moreno Valley and Transportation and Land Management	Storm Drain Line K-1 – City completed design in 2014. Currently seeing construction funding of approximately $2.5m.
FLOOD	Project is an open channel extending from Nason Basin northeasterly approximately 2,500 feet to Ironwood Avenue	City of Moreno Valley and Transportation and Land Management Agency	Storm Drain Line K from Ironwood to the Nason Basin – RCFC&WCD secured an easement in 2014 to receive flows from Line K-1 noted above. Action completed in 2014.
FLOOD **EARTHQUAKE**	Norco Streambank Stabilization. Project consists of a soil cement toe protection structure constructed to the 100-year flood level at the base of the bluff, and a stable earthen buttress fill constructed to the top of the bluff from I-15 Bridge to Center Avenue	Riverside County Flood Control and Transportation Land & Management Agency	Project Completed
FLOOD **EARTHQUAKE**	Stabilization of Interstate 15 near Alhambra Street, as a part of the Prado Dam enlargement feature of the Santa Ana River Mainstream Project at no cost to the District. The project involves the construction of a toe-protection-only structure from Hamner Avenue downstream to approximately 5th Street	Transportation Land Management Agency	Project still pending
LANDSLIDE **EARTHQUAKE** **FLOOD**	Proposed improvements include installation of slope protection along the Green River Mobile Home Park, as well as the exposed slopes adjacent to the Green River Homeowners Association and Highway 91 just downstream of Highway 71.	Transportation and Land Management Agency	**Phase 2A-The** District has completed its acquisition of the necessary easements and fee interests from Riverside County and private lands. Acquisition of the necessary easements and fee interests from Caltrans is ongoing. Construction of Phase 2A was completed in Fiscal Year

			2015/2016.**Phase 2B-Construction** of this segment was completed in Fiscal Year 2014/2015.

2017 New Mitigation Strategies

2017 Mitigation Actions Table

Type of Hazard	Mitigation Actions	Departments/ Jurisdictions	Status Update/Timeframe	Potential Funding Source
All Hazards	CERT Training and retention	Riverside County Emergency Management Department	July 2018 – Ongoing On-going for the life of the current plan (yrs. 2018-2023). There will be one training in each of the county districts per year to ensure community members throughout the county get the opportunity to refresh and reinforce their CERT skills. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Homeland Security Program (SHSP)
All Hazards	Continue to utilize the Safety Element of the Riverside County General Plan and the Riverside County FD Master Plan as base documents to implement goals, objectives, and mitigation actions	All Riverside County Departments	On-going for the life of the current plan (yrs. 2018-2023). The Safety Element in the General Plan is continuously updated as new information and changes arise. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Earthquake	Working with CalOES & FEMA to revise the Southern California Catastrophic Earthquake Response Plan	All Cities in Riverside County	On-going for the life of the current plan (yrs. 2018-2023). Riverside County will continue to collaborate with Cal OES/ FEMA to improve and update this plan as needed. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

Earthquake	Reviewed Office of Statewide Health Planning and Development (OSHPD), Structural Performance Categories and Nonstructural Performance Categories (SPC/NPC) Ratings of Acute Care Hospital Buildings and reported the findings at EM Healthcare Coalition	Riverside County Emergency Management Department & Riverside County Hospitals	On-going for the life of the current plan (yrs. 2018-2023).These reports will continuously be reviewed to make sure they are up to date and consistent with any changes. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	Hospital Preparedness Program (HPP) Grant
Earthquake	Worked with local City Emergency Manager (EM) to address '08 Golden Guardian Riverside County Shake Out Scenario/Assumptions	Riverside County Emergency Management Department	On-going for the life of the current plan (yrs. 2018-2023). County will continuously work with City EM to update and inform of changes or thoughts to improve the annual Shake Out Scenario and help the community increase their preparedness skills. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Earthquake	Mitigate potential seismic hazards through adoption and strict enforcement of current building codes	Riverside County Transportation, Land, Management Agency	On-going for the life of the current plan (yrs. 2018-2023). The codes will be revised and updated to be consistent with emergency measures that can help prevent earthquake impacts in county buildings. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Pandemic Flu	Provide training on immunization techniques	Riverside University Health System-Public Health	On-going for the life of the current plan (yrs. 2018-2023). Continue training to teach any new techniques, strategies, and to ensure all staff are proficient. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	Public Health Emergency Preparedness Grant (PHEP)

Pandemic Flu	Participated and conducted a Non-Medical Intervention Tabletop Exercise	Riverside County Emergency Management Department & Riverside University Health System-Public Health	Completed on 09/28/2015	Pan Flu Grant PHEP Grant
Pandemic Flu	Participated and conducted a Flu vaccination exercise	Riverside County Emergency Management Department & Riverside University Health System-Public Health	Completed on 11/10/2016	Pan Flu Grant PHEP Grant
Pandemic Flu	Generate a draft Crisis Care Plan	Riverside County Emergency Management Department & Riverside University Health System-Public Health	Completed 08/30/2016	Pan Flu Grant PHEP Grant HPP Grant
Pandemic Flu	Training Medical Reserve Corp (MRC) in hospital surge exercises	Riverside County Emergency Management Department	Started in 2011 and is on-going for the life of the current plan (yrs. 2018-2023). Continue training to keep updating and informing volunteers to increase their skills. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	HPP Grant State Homeland Security Program (SHSP)
Pandemic Flu	Training Medical Reserve Corp. (MRC) volunteers in Alternate Care Site	Riverside County Emergency Management Department	Completed in 2014	HPP Grant State Homeland Security Program (SHSP)Pan Flu Grant
Wildland Fire	Create wildfire protection zones that reduce the risks to citizens and firefighters from fire dangers	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continuously update and develop protection zones that can help decrease wildfire risks in the community. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Strengthen defensible space inspections in fire prone areas	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continue inspections in locations that are susceptible to fires. This action will be reassessed during	State Mission and/or Grant funding

			the monitoring and update phase of the County's 2017 LHMP.	
Wildland Fire	Continue maintenance of existing fire roads throughout the county to provide fire department access	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continue keeping the roads well paved and easy to have fire trucks be able to drive on. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Fuel reduction projects throughout the county to reduce fire potential	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continuously improve and develop projects to lower the impact of fires in the county. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Develop and enforce construction and design standards that ensure the development incorporates fire prevention features	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continuously enforce and update measures to prevent fire hazards. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Conduct and implement long range fire safe planning through code adoption/policies consistent with the Safety Element of the General Plan	Riverside County Fire Department & CAL Fire & Riverside County Transportation, Land, Management Agency (Planning Division)	On-going for the life of the current plan (yrs. 2018-2023). Continuously implement code policies to integrate them into the Safety Element as they are developed/updated and approved. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Ben Clark Training Center to provide wildland fire protection related classes to fire personnel	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continuously make sure that this center is available to provide wildland fire protection classes to fire staff to improve their skills on fire mitigation and preparedness. This action will be reassessed during the monitoring	State Mission and/or Grant funding

			and update phase of the County's 2017 LHMP.	
Wildland Fire	Continue wildland fire suppression/preparedness to maintain a state of readiness throughout the year	Riverside County Fire Department & CAL Fire	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide skills training to the community to be prepared for disasters. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Rapid intervention, identification and mitigation of Goldspot Oak Bore Beetle (GSOB) trees at various infestation levels on State Responsibility Area (SRA) lands throughout the county. Herbicide or tree removal if necessary	CAL Fire Unit Forester	On-going for the life of the current plan (yrs. 2018-2023).Continuously monitor infestation levels of GSOB trees to continue removing infested trees if necessary. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Rapid intervention, identification and mitigation of Pine Bark Beetle infestation, epidemic during times of drought. Removal of trees that are symptomatic or the use of pesticide when applicable	CAL Fire Unit Forester	On-Going for the life of the current plan (yrs. 2018-2023).Continuously monitor infestation levels of Pine Bark Beetle to continue removing infested trees or to continue using pesticides if necessary. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Wildland Fire	Continue Truck Trail and road maintenance to provide access for fire suppression vehicles and personnel.	CAL Fire Unit Forester	On-Going for the life of the current plan (yrs. 2018-2023). Continuously preserve and improve Truck Trail and roads, if needed, for rapid available access to fire suppression vehicles. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding

Wildland Fire	Continue Fire Road maintenance of culverts and road prisms in open space areas on SRA land to allow for adequate drainage.	CAL Fire Unit Forester	On-Going for the life of the current plan (yrs. 2018-2023). Continuously preserve and improve culverts and road prisms, if needed, for sufficient drainage. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	State Mission and/or Grant funding
Electrical Failure	Coordinated with Southern California Edison to be included in their power outage notifications	Riverside County Emergency Management Department	On-going for the life of the current plan (yrs. 2018-2023). EMD joined SoCal Edison's recipient list as of Dec. 2016 to continuously be informed of any emergency notifications to help prevent electrical failure impacts. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Emergent Disease/ Contamination	Drafted a Region VI Highly Contagious Disease Transportation Plan	Riverside County Emergency Management Department	Completed on 12/08/2016	HPP Grant Ebola Grant
Emergent Disease/ Contamination	Facilitated a Region VI Highly Contagious Disease Transportation Tabletop Exercise	Riverside County Emergency Management Department	Completed on 09/29/2016 The situation manual for this was completed on 11/14/2016	HPP Grant Ebola Grant
Emergent Disease/ Contamination	Drafted a Riverside County Viral Hemorrhagic Fever Preparedness and Response Plan (VHF Plan)	Riverside County Emergency Management Department & Riverside University Health System-Public Health	Completed on 11/2016	HPP Grant Ebola Grant
Cyber Attack	**Enterprise Intrusion Prevention System (IPS)** Protects the county network from Internet-based threats and attacks (~140,000 attacks/day on average)	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continue to update and maintain the IPS network to protect the county from any form of cyber-attacks or threats. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Cyber Attack	**Enterprise Breach Detection System** Inspects all internal/lateral county network traffic for indicators of compromise (IOCs) enabling the ISO to rapidly detect, respond to, contain, and prevent cyber-attacks, malware outbreaks, network reconnaissance, data exfiltration, and C2 (command & control) and botnet activities	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continuously inspect the county network to detect forms of threats or attacks. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Cyber Attack	**Albert Sensor** Monitors and reports to the Center for Internet Security (CIS) Multi-State Information Sharing and Analysis Center (MS-ISAC) all Domain Name System (DNS) and NetFlow traffic for correlation with the Department of Homeland Security's threat intelligence database for real-time alerting of malicious network connections to blacklisted IP address on the Internet	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continuously maintain the Albert Sensor in order keep having the association with the Department of Homeland Security's database on alerting network threats for the county. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

Cyber Attack	**Countywide Security Awareness Training** SANS Securing The Human information security and privacy training modules deployed on county learning management system (LMS) Educates our workforce on how to be extra vigilant and things to look out for to avoid falling victim to a targeted attack	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide training to the county's workforce on signs of cyber-attacks and prevent them from being a victim of these attacks. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Cyber Attack	**Enterprise Security Information Event Management (SIEM)** Serves as the county's centralized security event log management repository and correlation engine	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continue to maintain the SIEM to monitor and prevent security threats. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Cyber Attack	**Enterprise Internet Proxy (Web Filter)** Prevents county employees and malware from accessing compromised/malicious websites and C2 (command & control) servers, in addition to non-county authorized websites based on category/content filtration policies/rules	Riverside County Technology Information	May 2017 – December 2018 Product (Blue Coat Proxy Advance Secure Gateway (ASG)) has been procured and is in the process of being deployed.	County General Fund

Cyber Attack	**Governance, Risk, & Compliance (GRC) Software Suite** Platform on which our security operations (active network monitoring, breach detection, incident response, business impact analysis, threat containment/eradication, alerting/reporting, process workflow automation, security audits, risk assessments/register, regulatory compliance checks) will be carried out	Riverside County Technology Information	Implementation estimated to begin in June 2017 – July 2018. Product (RSA Archer GRC) has been procured and is in the process of being deployed.	County General Fund
Cyber Attack	**Security Operations Center (SOC)** Planning phase completed, construction estimated to begin in September 2017	Riverside County Information Technology	September 2017 – September 2018. The County's Cyber Security Operations Center (SOC) is under construction.	County General Fund
Cyber Attack	**Information Security Forum (ISF)** Convene on a quarterly basis with department information security officers/liaisons to discuss key security topics, risk trends, and other related matters, including: Formation of a Critical Security Incident Response Team (CSIRT)	Riverside County Information Technology	October 2018 – ongoing This forum will be on-going for the life of the current plan (yrs. 2018-2023). Will continue to conduct constant security incident/breach simulations and tabletop exercises that can help prevent cyber-attacks in the future. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP. The ISO is in the process of identifying members to serve on the Critical Security Incident	County General Fund

	Conducting security incident/breach simulations and tabletop exercises		Response Team (CSIRT). Estimated timeline for formation and initial kickoff meeting is October 2018.	
Terrorist Event	SWAT team trained to respond to terrorism events	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide training to reflect personnel attrition and train on new tactics. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Terrorist Event	Hazard Device Team trained to respond to terrorism events	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide training to reflect personnel attrition and train on new tactics and trends. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Terrorist Event	Sheriff Emergency Response Team trained to respond to terrorism events	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide training to reflect personnel attrition and train on new trends. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Terrorist Event	Sheriff personnel are assigned to the Joint Terrorism Task Force	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Continuously integrate new sheriff personnel to improve this group's structure and capabilities. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Terrorist Event	Ben Clark Training Center provides terrorism related classes for Law	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Classes are funded each year through the State Homeland Security Program (SHSP) to	County General Fund

	Enforcement and First Responders.		continuously educate and train personnel on new skills and improve their abilities. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	
Terrorist Event	Tactical response training	Riverside County Sheriff & Riverside County Fire Department	On-going for the life of the current plan (yrs. 2018-2023). Continuously train and improve on tactical response. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Communications Failure	**County of Riverside Network (CORNET)** Redundant Internet connections Backbone links are configured with a mesh topology to provide full redundancy	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continuously configure links to prevent the termination of internet connections. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund
Communications Failure	**Enterprise Voice Network (VoIP)** Centralized SIP trunking for ingress/egress PSTN access via 8 geographically separated locations Carrier failover protection for inbound voice traffic Enterprise call processing for VoIP Endpoints are logically and physically separated into 3 datacenters ensuring a High-	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide accessibility to phone carrier connection and call processing. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

	Availability solution Remote site routers configured for SRST; in times of WAN outages, local IP Phones will re-register to local equipment, providing inter-site calling and access to the PSAP via carrier provided analog circuits			
Communications Failure	**Enterprise Best Practices** Internal escalation contact list for all essential personal readily available 24x7 On-Call staffing availability for both Voice and Data Networks Vendor support available at 24x7x4 for all critical Network and Voice equipment Regular professional staff training on emerging technologies Frequent equipment configuration backups to SAN Critical Enterprise level equipment is located at facilities with full battery and generator backup power	Riverside County Technology Information	On-going for the life of the current plan (yrs. 2018-2023). Continue to update contact list when staff support is needed in case of emergencies. Continue to train staff on technologies that arise and equip facilities with power backup supplies. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

Communications Failure	**Enterprise Emergency Notification System** InformaCast Advanced on-premise notification solution for immediate reach to the County's 20,000+ VoIP endpoints InformaCast Mobile cloud-based notification solution to extend the County's reach off-network to mobile devices such as cellular phones and tablets	Riverside County Technology Information	On-Premise solution has been rolled out to all County VoIP endpoints. Mobile Solution has been rolled out to EMD. Mobile solution is ready to be rolled out to other departments as requested. On-going for the life of the current plan (yrs. 2018-2023). Continue to have a notification system to be able to have the ability to connect with off-network devices in case of a communications failure, including Wi-Fi. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund Department Funds; departments who wish to take advantage of this service will be billed back to the departments based on how many users
Communications Failure	**Network Connectivity** Use of Cellular based redundant WAN links for critical county locations. Introduction of MPLS technologies to provide alternate network paths for County locations	Riverside County Technology Information	Several locations have purchased a Cellular based redundant WAN link . Solution can be purchased by other departments. Installation can take up to 6 weeks to install, based on equipment availability. On-going for the life of the current plan (yrs. 2018-2023). Continue to provide alternate network paths for County locations in the case of a communication failure. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund Department Funds; billable by the cellular carrier to requesting departments

Flood	**University Wash Channel, Stage 3 Project No. 221-1-8-00120-03-12** This project will increase public safety and improve local economics by retrofitting an older, built-out commercial/industrial area with drainage infrastructure to alleviate repeated flood damage to existing businesses. The project will also address street and intersection flooding	Riverside County Flood Control and Water Conservation District	Notice To Proceed 2/21/17 Completed 11/14/17	Riverside County Flood Control funds Cost: $3,044,500
Flood	**Monroe MDP – Monroe Channel Project No. 1-8-00071 Stage 4** At request of the City of Riverside, replacement of City's existing open channel with underground reinforced concrete box with 10-year storm capacity. Project limits are from California Avenue upstream to Magnolia Avenue	Riverside County Flood Control and Water Conservation District	Expected to be advertise in 4th Quarter 2016 Notice to Proceed 8/30/17 Completed 5/01/18	Riverside County Flood Control funds Cost:$2,489,067
Flood	**Jurupa – Pyrite MDP Line A-2 Project No. 1-8-00234 Stage 1** Master planned lateral stormdrain to Jurupa Channel. Project is east-west drain crossing	Riverside County Flood Control and Water Conservation District	30% Plans & R/W Acquisition as of 1/10/17 Projected Start: 9/2018 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $338,332

	Agate Street about 1,000 feet south of Jurupa Road. Outlet point at Jurupa Channel is unimproved and likely to remain so			
Flood	**University MDP Line 3 Project No. 1-8-09020 Stage 1** The MDP proposes Line 3 as approximately 2,900 feet of 30" RCP east in Blaine Street then northeast to Blaine Street Retention Basin. The Blaine Street Retention Basin is located 600 feet north of Blaine Street between Valencia Hill Drive and Mt. Vernon Avenue. Budgeted for scoping study and evaluation of FEMA map floodplain limits only	Riverside County Flood Control and Water Conservation District	Pending approval Projected Start: 12/2020 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $2,926,028
Flood	**Santa Ana River Stabilization Project No. 1-8-00010 Stg. 90** The USACE is expected to initiate restoration of the federally constructed reach of the Santa Ana River Levee system downstream of San Bernardino County line to Tequesquite. Exact form of	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $10,685,000

	project not set. Work will likely include repair of groins and toe protection			
Flood	**Box Springs Dam – Outlet Modification Project No. 1-8-00041** Reconstruct outlet structure to prevent blockage from sediment accumulation	Riverside County Flood Control and Water Conservation District	Pending until Woodcrest Dam is complete 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $981,842
Flood	**Sycamore Dam – Outlet Structure Modifications Project No. 1-8-00042** This project will upgrade the level of safety and serviceability. Initial project components include the repair/reinforcement of the existing outlet channel; construction of a new debris rack structure; erosion controls on the embankment of the dam; construction of a safer access road into the facility; design for a safer routing of flood waters from the emergency spillway to Central Avenue; and the installation of a control section to measure outflow from the outlet pipe	Riverside County Flood Control and Water Conservation District	Pending until Woodcrest Dam is complete 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $1,854,991

	of the dam. Completion of this project is planned to follow the Woodcrest Dam Outlet Modification project.			
Flood	**Alessandro Dam Outlet Modification Project No. 1-8-00043** Reconstruct outlet structure to prevent blockage from sediment accumulation	Riverside County Flood Control and Water Conservation District	Pending until Woodcrest Dam is complete 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $907,682
Flood	**Prenda Dam Outlet Modification Project No. 1-8-00044** Reconstruct outlet structure to prevent blockage from sediment accumulation	Riverside County Flood Control and Water Conservation District	Pending until Woodcrest Dam is complete 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $1,238,312
Flood	**Woodcrest Dam Outlet Modification Project No. 1-8-00045** This project will upgrade the level of safety and serviceability. The approved Project Charter identifies the primary scope of work for the project as follows: design and construction of a new inlet structure to reduce potential for clogging of the outlet works;	Riverside County Flood Control and Water Conservation District	Development of design plans and specifications on hold until latest Geotechnical investigation is complete Projected Start: March 2019 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $2,216,529

	rehabilitation of the existing outlet gate assembly and control stem; implementation of an automated gate control system; rehabilitation of the outlet pipe; restoration of the outlet channel; and installation of surficial erosion controls on the surface of the dam embankment. Once completed, this project will serve as an example for performing similar upgrades to the remaining Riverside Reservoirs			
Flood	**North Norco Channel Stage 10 Project No. 222-2-8-00140-10-12** The project is located just upstream of River Road within the city of Norco in Riverside County, California. This project consists of approximately 550 lineal feet of triple cell reinforced concrete box and 125 lineal feet of open concrete channel transition, will replace the existing interim dirt channel. The project remedies ongoing flooding	Riverside County Flood Control and Water Conservation District	Completed 9/9/14	Riverside County Flood Control funds

	problems in the area thus resulting in positive impacts to residents and businesses			
Flood	**Corona MDP Line 5 Stage 1 Project No. 2-8-00280** This project includes the construction of an underground storm drain beginning in Sherman Avenue south of Railroad Street and extending down Railroad Street westerly to Smith Street. The City is willing to undertake the design and construction of this project using District funding.	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $1,397,201
Flood	**Corona MDP Line 52 Stage 1 Project No. 2-8-00350** An underground storm drain extending north from Third Street along E. Grand Boulevard then under the 91 Freeway to Temescal Creek Channel	City Of Corona	Notice to Proceed 7/29/17 Expected Completion: Summer 2018	Riverside County Flood Control funds City of Corona Funds Cost: $4,522,000
Flood	**Coldwater Canyon Structural Improvements Project 2-8-00505** Proposed conceptual improvements include 1) reducing	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $6,005,806

	flood risk and nuisance to traveling public on Temescal Canyon Road at the intersection of Glen Ivy Road; and 2) an armored berm along the east bank of Coldwater Wash downstream of the intersection of Temescal Canyon Road and Glen Ivy Road. The armored berm would prevent the migration of the active Coldwater Wash Channel, thereby protecting the west side of the Mountain Cove Development. Conceptual improvements are pending friendly acquisition of the underlying parcels needed for the project			
Flood	**Coldwater Canyon Floodplain Acquisition Project No. 2-8-00505** Funded portion of project includes a hydrologic and geomorphologic assessment of Coldwater Canyon Wash from Glen Ivy Road to Temescal Wash. Study will evaluate the stability of Coldwater Canyon	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: included in the $6,005,806 amount for Coldwater Canyon Structural Improvement project listed above

	Wash and recommend potential minimalist interventions, if necessary, to protect Squaw Mountain Bridge and prevent erosion of Painted Hills development canyon slopes along Coldwater Canyon Wash. Balance of funds would support potential interventions recommended by the report including floodplain buyout			
Flood	**Southeast Compton Wash At Corona Sanitary landfill Project No. 2-8-09054** Riverside County Waste Management District has requested assistance solving ongoing flooding and erosion problems along the southeast side of the landfill	Riverside County Waste Management District**	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $500,000

Flood	**Lake Mathews Estates Water Quality Pond Project No. 2-8-09058** Proposed in the "Drainage Water Quality Management Plan for the Lake Matthews Watershed", this roughly 10-acre project is to be located on the south side of Cajalco Road about ¾-mile west of Wood Road. The project will capture first flush runoff from Cajalco Creek and carry it to an off-channel pond to be treated and/or infiltrated	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $2,794,983
Flood	**Temescal Wash Floodplain Project No. 2-8-00052** Acquisition of floodplain area for flood protection, water conservation and habitat mitigation banking	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $23,534,000
Flood	**Arroyo Del Toro Channel Stage 1 Project No. 223-3-8-00170-01-12** This project collects flows that pass under Interstate 15, flow through the cemetery and flood the intersection of Riverside Drive	Riverside County Flood Control and Water Conservation District	Completed 6/16/15	Riverside County Flood Control funds

	and Collier Avenue. The flows will now be collected in a channel and conveyed via an underground storm drain system to the Collier Marsh area			
Flood	**Ortega Channel Retrofit Project No. 3-8-00070** Project will replace a portion of the clog-prone storm drain with a more easily accessible and maintainable open channel	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $1,628,761
Flood	**LITTLE LAKE MDP LINE B, STG 1 STETSON AVENUE CHANNEL, STG 7 aka HEMET MDP LINE D Project Nos. 224-4-8-00265-01-12 224-4-8-00211-07-12** The District constructed a segment of the District's Little Lake MOP Line B. This infrastructure will diminish neighborhood flooding and damage to private property and businesses and improve the safety of the traveling public during storm events. This new drain will also permanently reduce	Riverside County Flood Control and Water Conservation District	Stage 1 Completed 06/21/16 Stage 2 Pending approval Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $6,398,777

	flood-related street maintenance and repair costs for the City of Hemet. Little Lake MDP Line B Stage 1 is located primarily within the City of Hemet, with small portions extending into the City of San Jacinto and unincorporated Riverside County beginning approximate 300 feet north of Berkley Ave and terminating approximately 200 feet south of Florida			
Flood	**Homeland MDP Line 2, Stage 2 Project No. 224-4-8-00337-02-12** The District constructed a segment of drainage infrastructure described in the District's Romoland Master Drainage Plan as Romoland MOP Line A, Stages 4, 5 and 6, Romoland MOP Lines A-2 and A-3, Stage 1, and Briggs Basin. In conjunction with the District's Homeland MDP Line 1, Stage 1, completion of this drainage infrastructure will reduce the	Riverside County Flood Control and Water Conservation District	Completed 6/5/12	Riverside County Flood Control funds

	floodplain by approximately 1, 762 acres and enable revisions to the FEMA Flood Insurance Rate Maps that result in a significant reduction in flood insurance premiums. The District's Homeland MDP Line 1, Stage 1 project is currently ongoing with an anticipated completion in February 2017			
Flood	**Sunnymead MDP Line P-6 Stage 2 Project No. 224-4-8-00716-02-12** The District constructed a segment of drainage infrastructure described in the District's Sunnymead Master Drainage Plan which remedies ongoing flooding problems in the area thus resulting in positive impacts toresidents and businesses.	Riverside County Flood Control and Water Conservation District	Completed 3/25/2014	Riverside County Flood Control funds
Flood	**San Jacinto MDP Line C, Stage 2, Lines C-4, C-5 & B Project No. 224-4-8-00124-02-12** The District constructed a segment of drainage	Riverside County Flood Control and Water Conservation District	Completed 6/30/15	Riverside County Flood Control funds

	infrastructure described in the District's San Jacinto Master Drainage Plan, which remedies the ongoing flooding problems at the intersections of San Jacinto Avenue and Menlo Avenue, San Jacinto Avenue and Midway Street, and Santa Fe Street and Midway Street. Consequently, the removal of ponding water at these intersections during storm events improves traffic and pedestrian safety and public access to the businesses along San Jacinto and Menlo Avenues. The District partnered with the City of San Jacinto to further improve normal residential traffic safety by replacing and reconstructing Midway Street between San Jacinto Avenue and Santa Fe Street			
Flood	**West End Moreno MDP Line LL Project No. 224-4-8-00783-01-12** The District constructed a segment of drainage infrastructure described in the	Riverside County Flood Control and Water Conservation District	Completed 5/12/15	Riverside County Flood Control funds

	District's West End Moreno MDP which remedies ongoing flooding problems in the area, thus resulting in positive impacts to residents and businesses			
Flood	**Romoland MDP Line A, STGS 4,5,6, Homeland MDP Line 1 Briggs Basin, Romoland MDP Lines A-2 and A-3 Project No. 224-4-8-00310-04-12** The District constructed a segment of drainage infrastructure described in the District's Romoland Master Drainage Plan as Romoland MOP Line A, Stages 4, 5 and 6, Romoland MOP Lines A-2 and A-3, Stage 1, and Briggs Basin. In conjunction with the District's Homeland MDP Line 1, Stage 1, completion of this drainage infrastructure will reduce the floodplain by approximately 1, 762 acres and enable revisions to the FEMA Flood Insurance Rate Maps that result in a significant	Riverside County Flood Control and Water Conservation District	Completed 8/23/16	Riverside County Flood Control funds

	reduction in flood insurance premiums. The District's Homeland MDP Line 1, Stage 1 project is currently ongoing with an anticipated completion in February 2017			
Flood	**Little Lake MDP Line B Stage 2 Project No. 4-8-00265** An underground storm drain from just south of Florida Avenue, southerly in Meridian Street to Whittier Avenue.	Riverside County Flood Control and Water Conservation District	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $6,804,257
Flood	**San Jacinto River Stage 3 Project No. 4-8-00020** "Stage 3" covers the nearly 10-mile river reach beginning at the entrance to Railroad Canyon and ending upstream at the Ramona Expressway crossing near the Bernasconi Hills. This environmentally and fiscally challenged project has been through several evolutions and has been essentially dormant for nearly a decade. Funding shown is for intensive planning/engineering study of options for managing future development. Goal is to develop a viable project for the San Jacinto River from Ramona Expressway to Railroad Canyon considering flood management, transportation, environmental and other opportunities and constraints	Riverside County Flood Control and Water Conservation District	Pending approval Projected Start: 11/2019 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds ADP (Area Drainage Plan) Funds Cost: $70,000,000

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

Flood	**Gilman Home Channel Lateral A Stage 3 Gilman Home Channel Stage 90 Project No. 225-5-8-00171-03-12** The District constructed a segment of drainage infrastructure described in the District's Banning Master Drainage Plan which remedies ongoing flooding problems in the area, thus resulting in positive impacts to residents and businesses. Moreover, this project will enable revision of the FEMA Flood Insurance Rate Maps in the impacted area resulting in a significant reduction in flood insurance premiums. Many	Riverside County Flood Control and Water Conservation District	Completed 9/22/15	Riverside County Flood Control funds

	owners with federally insured home loans will realize savings of several thousands of dollars per year			
Flood	**Beaumont MDP Line 16 Stage 1 Project No. 5-8-00201** Project would build MDP Line 16 in Grand Avenue from Beaumont Cherry Valley Water District (BCVWD) infiltration ponds easterly to Bellflower Avenue as an element of a cooperative project with the BCVWD to provide both flood control and storm water capture to recharge groundwater	Riverside County Flood Control and Water Conservation District	Pending approval Projected Start: 12/2020 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $5,353,074
Flood	**Eagle Canyon Dam Stage 1 Project No. 6-8-00190** The District constructed a segment of drainage infrastructure described in the District's Palm Springs Master Drainage Plan. Construction of this project also includes remediation of potentially hazardous and nonhazardous illegally dumped	Riverside County Flood Control and Water Conservation District	Completed 11/17/15	Riverside County Flood Control funds

	materials and remedies ongoing flooding problems in the area, thus resulting in positive impacts to residents and businesses. Additionally, Palm Springs MDP Line 43 and Lateral 43A, the underground dam outlet, is currently under construction and completion is anticipated for February 2016. Completion of the underground infrastructure will enable revisions to the FEMA Flood Insurance Rate Maps in the impacted area immediately downstream of Eagle Canyon and will result in a significant reduction in flood insurance premiums			
Flood	**Palm Springs MDP Line 43 and Lateral 43A Project No. 226-6-8-00163-01-12** The District constructed a segment of drainage infrastructure described in the District's Palm Springs Master Drainage Plan as Palm Springs MOP Line 43 and Lateral	Riverside County Flood Control and Water Conservation District	Completed 3/15/16	Riverside County Flood Control funds

	43A. Construction of this project serves as the underground outlet to the District's Eagle Canyon Dam facility that was completed on September 21, 2015 with the Notice of Completion accepted by the Board as Agenda Item Number 11-1 on November 17, 2015. Completion of both District facilities will enable revisions to the FEMA Flood Insurance Rate Maps in the impacted area immediately downstream of Eagle Canyon Dam and will result in a significant reduction in flood insurance premiums			
Flood	**Murrieta Creek Channel (Phase II & III) Project No. 7-8-00021** Murrieta Creek Flood Control Project from Old Town Temecula to Elm Street in Murrieta	Riverside County Flood Control and Water Conservation District/United States Army Corps of Engineers*	Pending approval 5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $82,000,000
Flood	**Whitewater River Levee Restoration Project No. 6-8-00250** Restoration work to increase freeboard and bring levee	Riverside County Flood Control and Water Conservation District	Pending – Full scope of restoration work not yet established but funding figure shown is based on preliminary engineer's estimate	Riverside County Flood Control funds Cost:1,260,000

	adjacent to Cimarron Golf Resort into compliance with FEMA certification guidelines		5 year CIP (Capital Improvement Plan) Projected start and end: during the life of the plan (2018-2023)	
Flood	**Palm Canyon Wash – Cherley Creek Levee Restoration Stage 90 Project No. 6-8-00040** Major construction to bring levee serving small tributary upstream of South Palm Canyon Wash into compliance with FEMA certification guidelines. Project will be combination of RSP and soil-cement lined channel and levee	Riverside County Flood Control and Water Conservation District	Expected Advertise Date: 2nd Quarter 2018 Projected Start: 08/2019 Projected End: during the life of the plan (2018-2023)	Riverside County Flood Control funds Cost: $6,187,021
Flood	**Banning MDP Line D-2 Stage 1 Project No. 5-8-00169** This project is over one mile of underground storm drain that connects to the existing Ramsey Street Storm Drain at the intersection of Hargrave Street and Ramsey Street. It includes Line D-2, Stage 1 which will continue northerly along Hargrave Street for approximately 5,250 feet before terminating at Indian School	RCFC/City of Banning	Notice to Proceed: 5/15/17 Completed: 2/27/18	Riverside County Flood Control funds

	Lane. Line D-2A, Stage 1 will tie into Line D-2 at the intersection of Hargrave Street and Theodore Street. Line D-2A will continue westerly along Theodore Street for approximately 600 feet before terminating at Florida Street.			
Civil Disorder	Trained and equipped Mobile Field Force Teams throughout the county	Riverside County Sheriff	On-going for the life of the current plan (yrs. 2018-2023). Continuously provide training to reflect personnel attrition; Less-lethal equipment acquired. This action will be reassessed during the monitoring and update phase of the County's 2017 LHMP.	County General Fund

July 2018

Public Outreach Presentations and Updates

Date	Name of Meeting, Location	Type of Presentation	Number Attending	Hours
6/22/2016	Western Riverside Emergency Council (WREC) Meeting, Riverside	Informed Council of upcoming Plan update and encouraged participation	19	20 mins.
7/14/2016	Operational Area Planning Committee (OAPC) Meeting, Beaumont	Informed OA on upcoming Plan to update	163	15 mins
9/19/2016	Palo Verde COMM. Meeting, Blythe, CA.	LHMP discussion, Local Hazard Mitigation Plan update process, encouraged East County participation and Public Outreach	16	1
9/29/2016	Email Distribution #1	Email blast, Distributed contact verification emails for partnering jurisdictions and agencies. Provided LHMP informational guides and resources.	–	–
10/6/2016	Local Hazard Mitigation Plan Steering Committee Kick-Off for County Departments	Overview of Hazard Mitigation FEMA 2011 LHMP Review Guide Update Process County Inventory Checklist County Risk Assessment Participants, New, Returning, and Not Participating	19	2
10/11/2016	Emergency Management Project Committee	Project Overview, LHMP introduction, planning process	34	10 mins.
10/13/2016	Operational Area Planning Committee (OAPC) Meeting, Beaumont	Updated OA on progress of update, offered participants opportunity to reach out to county for technical support, offered public opportunity to ask questions and provide comment (no comments made)	64	2

10/19/2016	Steering Committee Email Distribution #1	Informed the members of the google drive that contains LHMP documentation for additional support Informed about the next steps and what about the next meeting date Provided contact information for EMD LHMP staff	–	–
12/1/2016	Email Distribution #2	Invitation to LHMP Template workshop, update on county hazard identification/ranking, and general information on where they should be in the update process	–	–
12/6/2016	Tribal Workshop, Riverside	Overview of Hazard Mitigation FEMA 2011 LHMP Review Guide County Update Process and Progress Mitigation Websites and Resources Technical Support	7	1
12/8/2016	City Workshop, Riverside	Overview of Hazard Mitigation FEMA 2011 LHMP Review Guide County Update Process and Progress Mitigation Websites and Resources Technical Support	15	2
12/8/2016	Mountain Emergency Communications COMM. Meeting, Idyllwild, CA	LHMP discussion, Local Hazard Mitigation Plan update process	7	2
12/13/2016	Special District Workshop, Riverside	Overview of Hazard Mitigation FEMA 2011 LHMP Review Guide County Update Process and Progress Mitigation Websites and Resources Technical Support	8	1
12/15/2016	School District Workshop, Riverside	Overview of Hazard Mitigation FEMA 2011 LHMP Review Guide County Update Process and Progress Mitigation Websites and Resources Technical Support	7	2.5
12/15/2016	Northwest COMM. Meeting, Jurupa Valley, CA	LHMP discussion, Local Hazard Mitigation Plan update process	12	2

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

12/20/2016	Southwest COMM. Meeting, Murrieta, CA	LHMP discussion, Local Hazard Mitigation Plan update process	6	2
12/29/2016	Steering Committee Email Distribution #2	Sent each member questions about specific hazards that pertained to the department they work for	–	–
1/4/2017	Email Distribution #3	Informed LHMP participants of additional LHMP workshops that will be hosted to provide further assistance	–	–
1/11/2017	Local Hazard Mitigation Plan Steering Committee, Riverside	Group Discussion, Hazard Identification/Ranking Final Review, Mitigation Actions and Strategies Brainstorm	16	2
1/12/2017	Operational Area Planning Committee (OAPC) Meeting, Beaumont	Updated OA on progress of update, offered participants opportunity to reach out to county for technical support, offered public opportunity to ask questions and provide comment (no comments made)	74	2
1/19/2016	Steering Committee Email Distribution #3	Thanked all members for participating in the previous meeting Provided the risk scores of the hazards that were discussed at the previous meeting Provided the most current updates for the mitigation actions from 2012 & asked for each of them to provide new actions for current county hazards Informed about the next meeting date	–	–
2/7/2017	City Workshop, Riverside	Answered LHMP questions & concerns Provided additional assistance if needed Reviewed LHMP drafts if needed	10	1
2/8/2017	School District Workshop, Riverside	Answered LHMP questions & concerns Provided additional assistance if needed Reviewed LHMP drafts if needed	2	1
2/9/2017	Special District Workshop, Riverside	Answered LHMP questions & concerns Provided additional assistance if needed Reviewed LHMP drafts if needed	4	1

2/14/2017	Email Distribution #4	Informed LHMP participants about the final 2017 LHMP County Hazard Ranking. Talked about a possible LHMP Training that EMD is deciding on hosting. Informed about the Senate Bills 1000 & 379. Provided a link to help participants obtain maps for their jurisdiction if they are having trouble with Hazus	–	–
2/23/2017	Email Distribution #5	Informed LHMP participants about the cancellation of the April workshops due to the substation of having the LHMP FEMA Training Informed about the confirmation of the FEMA G-318 Training that will be hosted April 3-4 and provided the sign-up link Informed that the June workshops are still going to be held to provide any additional assistance on the plan	–	–
3/1/2017	Steering Committee Reminder Email	Reminded members that the date for submitting new mitigation actions for the current top 10 county hazards was approaching	–	–
3/15/2017	Palo Verde COMM. Meeting, Blythe, CA	LHMP discussion, Local Hazard Mitigation Plan update process	18	1.5
4/21/2017	Steering Committee Email Blast #4	Provided minutes from previous meeting, informed about reviewing LHMP mitigation actions and goals/objectives, sent calendar invite for next meeting	–	–
4/24/2017	Steering Committee Email	Sent selected committee members to provide input on LHMP hazard profiles depending on the hazard that corresponds to the department they represent	–	–
6/5/2017	Tribal Workshop, Riverside	Answered LHMP questions & concerns Provided additional assistance if needed Reviewed LHMP drafts if needed	4	1

Riverside Operational Area

APPENDIX E – Inventory Template

RIVERSIDE COUNTY MULTI-JURISDICTIONAL LOCAL HAZARD MITIGATION AGENCY 2016 INVENTORY WORKSHEETS

Insert Jurisdiction/Agency Name
Insert Date

TABLE OF CONTENTS

Introduction: These documents are meant to be discussed, used and reviewed by a multi-disciplinary team. The Participation by a wide range of stakeholders who play a role in identifying and implementing mitigation actions is required.

SPECIAL CONCERNS:

1. *Has the completed Letter of Commitment been returned to EMD? EMD must forward this completed Letter of Commitment to CAL OES.*
2. *Has the completed Letter of Participation been returned to EMD?*

1. Local Jurisdiction Contact Information	Page 3
2. Hazard Identification Questionnaire	Pages 4-6
3. Specific Hazards Summary	Page 7
4. Jurisdiction Vulnerability Worksheet	Pages 8-9
5. Jurisdiction Mitigation Strategies and Goals	Pages 10-14
6. Local Jurisdiction Proposed Mitigation Action and Strategy Proposal	Pages 14-16
7. Local Jurisdiction Development Trends	Pages 17-18
8. Appendix A-Plan Review Tool	Pages A1-10

Appendix A the Plan Review Tool for your reference. This is the document Cal OES and FEMA will utilize to verify that all of the required information is in the submitted documents. Please refer to the document for information.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

1. LOCAL JURISDICTION CONTACT INFORMATION

The information on this page identifies:

- Jurisdiction and the contact person
- Jurisdiction's service area size and population
- EOP Plan and a Safety Element of their General Plan

PLEASE PROVIDE THE FOLLOWING INFORMATION:

Agency/Jurisdiction:				
Type Agency/Jurisdiction:				
Contact Person:	Title:			
First Name:		Last Name:		
Agency Address:	Street:			
	City:			
	State:			
	Zip:			
Contact Phone			FAX	
E-mail				
Population Served		Square Miles Served		
Does your organization have a general plan?				
Does your organization have a safety component to the general plan?				
What year was your plan last updated?				
Does your organization have a disaster/emergency operations plan?				
What year was your plan last updated?				
Do you have a recovery annex or section in your plan?				
Do you have a terrorism/WMD annex or section in your plan?				

2. Hazard Identification Questionnaire

The purpose of the questionnaire is to help identify the hazards within your service area. The list was developed from the first round of meetings with the various working groups in the 2012 plan creation, and from the hazards listed in the County's General Plan. Each hazard is discussed in detail in the 2012 LHMP. The information will be used as the basis for each jurisdiction to evaluate its capabilities, determine its needs, and to assist in developing goals and strategies. The information identifies:

a) What hazards can be identified within or adjacent to the service area of the jurisdiction.
b) Which of those hazards have had reoccurring events
c) What specific hazards and risks are considered by the jurisdiction to be a threat specifically to the jurisdiction? (These locations should be identified by name and location for inclusion in the Specific Hazard Summary Table).
    a. Specific types of facilities owned and operated by the jurisdiction.
    b. Locations damaged from prior disasters or hazard causing events.
d) Information about the jurisdiction's EOC

With your Multi-Disciplinary Planning Team:

a. Instructions for Updating Jurisdictions, with your planning team: Review your old Questionnaire for accuracy and relevance, mark changes.

b. Instructions for New Jurisdictions and Special Districts, with your planning team, meet and go over the questionnaire. Fill in YES, NO or NA on the Questionnaire.

HAZARD IDENTIFICATION QUESTIONNAIRE

DOES YOUR ORGANIZATION HAVE:	
AIRPORT IN JURISDICTION	
AIRPORT NEXT TO JURISDICTION	
DAIRY INDUSTRY	
POULTRY INDUSTRY	
CROPS/ORCHARDS	
DAMS IN JURISDICTION	
DAMS NEXT TO JURISDICTION	
LAKE/RESERVOIR IN JURISDICTION	
LAKE/RESERVOIR NEAR JURISDICTION	
JURISDICTION IN FLOOD PLAIN	
CONTROLLED FLOOD CONTROL CHANNEL	
UNCONTROLLED FLOOD CONTROL CHANNEL	
EARTHQUAKE FAULTS IN JURISDICTION	
EARTHQUAKE FAULTS NEXT TO JURISDICTION	
MOBILE HOME PARKS	
NON-REINFORCED FREEWAY BRIDGES	
NON-REINFORCED BRIDGES	
BRIDGES IN FLOOD PLAIN	
BRIDGES OVER OR ACROSS RIVER/STREAM	
ROADWAY CROSSING RIVER/STREAM	
NON REINFORCED BUILDINGS	
FREEWAY/MAJOR HIGHWAY IN JURISDICTION	
FREEWAY/MAJOR HIGHWAY NEXT TO JURISDICTION	
FOREST AREA IN JURISDICTION	
FOREST AREA NEXT TO JURISDICTION	
WITHIN THE 50 MILES SAN ONOFRE EVACUATION ZONE	
MAJOR GAS/OIL PIPELINES IN JURISDICTION	
MAJOR GAS/OIL PIPELINES NEXT TO JURISDICTION	
RAILROAD TRACKS IN JURISDICTION	
RAILROAD TRACKS NEXT TO JURISDICTION	
HAZARDOUS WASTE FACILITIES IN JURISDICTION	
HAZARDOUS WASTE FACILITIES NEXT TO JURISDICTION	
HAZARDOUS STORAGE FACILITIES IN JURISDICTION	
HAZARDOUS STORAGE FACILITIES NEXT TO JURISDICTION	
DOES YOUR ORGANIZATION OWN OR OPERATE A FACILITY	
IN A FLOOD PLAIN	
NEAR FLOOD PLAIN	
NEAR RAILROAD TRACKS	
NEAR A DAM	
UPSTREAM FROM A DAM	
DOWNSTREAM FROM A DAM	
DOWNSTREAM OF A LAKE	
DOWNSTREAM FROM A RESERVOIR	
NEAR A CONTROLLED FLOOD CONTROL CHANNEL	
NEAR UNCONTROLLED FLOOD CONTROL CHANNEL	
ON AN EARTHQUAKE FAULT	
NEAR AN EARTHQUAKE FAULT	
WITHIN THE 50 MILE SAN ONOFRE EVACUATION ZONE	
IN A FOREST AREA	
NEAR A FOREST AREA	
NEAR A MAJOR HIGHWAY	

A HAZARDOUS WASTE FACILITY	
NEAR A HAZARDOUS WASTE FACILITY	
A HAZARDOUS STORAGE FACILITY	
NEAR A HAZARDOUS STORAGE FACILITY	
NON REINFORCED BUILDINGS	
A MAJOR GAS/OIL PIPELINE	
NEAR A MAJOR GAS/OIL PIPELINE	
DOES YOUR ORGANIZATION HAVE ANY LOCATIONS THAT:	
HAVE BEEN DAMAGED BY EARTHQUAKE AND NOT REPAIRED	
HAVE BEEN DAMAGED BY FLOOD	
HAVE BEEN DAMAGED BY FLOOD MORE THAN ONCE	
HAVE BEEN DAMAGED BY FOREST FIRE	
HAVE BEEN DAMAGED BY FOREST FIRE MORE THAN ONCE	
HAVE BEEN IMPACTED BY A TRANSPORTATION ACCIDENT	
HAVE BEEN IMPACTED BY A PIPELINE EVENT	
EMERGENCY OPERATIONS INFORMATION	
DOES YOUR ORGANIZATION HAVE AN EOC	
IS YOUR EOC LOCATED IN A FLOOD PLAIN	
NEAR FLOOD PLAIN	
NEAR RAILROAD TRACKS	
NEAR A DAM	
UPSTREAM FROM A DAM	
DOWNSTREAM FROM A DAM	
DOWNSTREAM OF A LAKE	
DOWNSTREAM FROM A RESERVOIR	
NEAR A CONTROLLED FLOOD CONTROL CHANNEL	
NEAR UNCONTROLLED FLOOD CONTROL CHANNEL	
ON AN EARTHQUAKE FAULT	
NEAR AN EARTHQUAKE FAULT	
WITHIN THE 50 MILE SAN ONOFRE EVACUATION ZONE	
IN A FOREST AREA	
NEAR A FOREST AREA	
NEAR A MAJOR HIGHWAY	
A HAZARDOUS WASTE FACILITY	
NEAR A HAZARDOUS WASTE FACILITY	
A HAZARDOUS STORAGE FACILITY	
NEAR A HAZARDOUS STORAGE FACILITY	
NON REINFORCED BUILDINGS	
A MAJOR GAS/OIL PIPELINE	
NEAR A MAJOR GAS/OIL PIPELINE	
OTHER FACILITY INFORMATION ARE THERE LOCATIONS WITHIN YOUR JURISDICTION THAT:	
COULD BE CONSIDERED A TERRORIST TARGET	
COULD BE CONSIDERED A BIO-HAZARD RISK	

With your planning team, list the “Yes” answers and discuss. Use the information as a group to summarize your jurisdiction's hazards and vulnerabilities.

3. SPECIFIC HAZARDS SUMMARY

This table helps to identify the information (name, owner, location, etc.) about the specific hazards identified in the Hazard Questionnaire.

In the Summary Table, list the basic information of the hazards identified by the jurisdiction in the Hazard Identification Questionnaire as a potential threat. These specific hazards were used in the development of response plans, maps, and other analysis data.

a. Instructions for Updating Jurisdictions and Special Districts: With your planning team, review the "Yes" answers and see if there were any changes, if so summarize why there is a difference from the 2012.

b. Instructions for New Jurisdictions and Special Districts: With your planning team, review the "Yes" answers and discuss. Use the information as a group to summarize your jurisdiction's hazards and vulnerabilities.

SPECIFIC HAZARDS SUMMARY

Jurisdiction	Hazard Type	Hazard Name	In Jurisdiction?	Adjacent to Jurisdiction?

4. JURISDICTION VULNERABILITY WORKSHEET

This table is a listing of the primary hazards identified by the 2012 LHMP working groups. Each jurisdiction was asked to evaluate the potential for an event to occur in their jurisdiction by hazard. They were also asked to evaluate the potential impact of that event by hazard on their jurisdiction. The impact potential was determined based on:

1. Economic loss and recovery
2. Physical loss to structures (residential, commercial, and critical facilities)
3. The loss or damage to the jurisdictions infrastructure
4. Their ability to continue with normal daily governmental activities
5. Their ability to quickly recover from the event and return to normal daily activities
6. The loss of life and potential injuries from the event.

The jurisdictions were asked to rate the potential and severity using a scale of between 0 and 4 (4 being the most severe). The jurisdictions were also asked to rank the listed hazards as they relate to their jurisdiction from 1 to 20 (1 being the highest overall threat to their jurisdiction).

With the assistance of the RCIP Plan and County Departments, Riverside County OES conducted an extensive evaluation of the severity and probability potential for the county as a whole. The hazards were also ranked for the County. These numbers and rankings were provided to the jurisdictions as a comparison guide.

A separate table was created to address the hazards relating to agriculture and was assessed by the agriculture working group.

a. Instructions for Updating Jurisdictions and Special Districts: Please review the table, determine if your ranking from the 2012 LHMP remains the same.
b. Instructions for New Jurisdictions and Special Districts: Please evaluate the potential for an event to occur in your jurisdiction by hazard. Then, evaluate the potential impact of that event by hazard on your jurisdiction according to #1-6 from the potential impact list above.

NOTE: Under Medical, Pandemic was added. This was a result of the H1N1 and other incidents.

NAME:	AGENCY:	DATE :

	COUNTY		LOCAL JURISDICTION		
HAZARD	**SEVERITY 0 - 4**	**PROBABILITY 0 - 4**	**SEVERITY 0 - 4**	**PROBABILITY 0 - 4**	**RANKING 1 - 20**
1. EARTHQUAKE					
2. WILDLAND FIRE					
3. FLOOD

16. NUCLEAR ACCIDENT					
17. TERRORISM					
18. CIVIL UNREST					
19. JAIL/PRISON EVENT					
MEDICAL					
20. PANDEMIC					

5. JURISDICTION MITIGATION STRATEGIES AND GOALS

This comprehensive table is a listing of the various mitigation strategies, goals, and objectives developed by the 2012 LHMP working groups. The jurisdictions were also given the opportunity to list additional strategies, goals, and objectives specific to either their jurisdiction or their workgroup (i.e. the hospitals, agriculture, etc.).

LOCAL JURISDICTION MITIGATION STRATEGIES AND GOALS

With your Planning Team

a. Instructions for Updating Jurisdictions and Special Districts: please review the table; determine if your ranking from the 2012 LHMP remains the same.

b. Instructions for New Jurisdictions and Special Districts: please follow below:

Please evaluate the priority level for each listed mitigation goal identified below as it relates to your jurisdiction or facility. If you have any additional mitigation goals or recommendations, please list them at the end of this document.

Place an H (High), M (Medium), L (Low), or N/A (Not Applicable) for your priority level for each mitigation goal in the box next to the activity.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

	EARTHQUAKE
	Aggressive public education campaign in light of predictions
	Generate new literature for dissemination to:
	◊ Government employees
	◊ Businesses
	◊ Hotel/motel literature
	◊ Local radio stations for education
	◊ Public education via utilities
	◊ Identify/create television documentary content
	Improve the Emergency Alert System (EAS)
	◊ Consider integration with radio notification systems
	◊ Upgrade alerting and warning systems for hearing impaired
	◊ Training and maintenance
	Procure earthquake-warning devices for critical facilities
	Reinforce emergency response facilities
	Provide training to hospital staffs
	Require earthquake gas shutoffs on remodels/new construction
	Evaluate re-enforcing reservoir concrete bases
	Evaluate EOCs for seismic stability
	Install earthquake cutoffs at reservoirs
	Install earthquake-warning devices at critical facilities
	Develop a dam inundation plan for new Diamond Valley Reservoir
	Earthquake retrofitting
	◊ Bridges/dams/pipelines
	◊ Government buildings/schools
	◊ Mobile home parks
	Develop educational materials on structural reinforcement and home inspections **(ALREADY DEVELOPED)**
	Ensure Uniform Building Code compliance
	◊ Update to current compliance when retrofitting
	Insurance coverage on public facilities
	Funding for non-structural abatement (Earthquake kits, etc.)
	Pre - identify empty commercial space for seismic re-location
	Electrical co-generation facilities need retrofitting/reinforcement (Palm Springs, others?)
	Mapping of liquefaction zones
	Incorporate County geologist data into planning
	Backup water supplies for hospitals
	Evaluate pipeline seismic resiliency
	Pre-positioning of temporary response structures
	Fire sprinkler ordinance for all structures

	Evaluate adequacy of reservoir capacity for sprinkler systems
	Training/standardization for contractors performing retrofitting
	Website with mitigation/contractor/retrofitting information
	◊ Links to jurisdictions
	◊ Alerting information
	◊ Volunteer information
	Evaluate depths of aquifers/wells for adequacy during quakes
	Evaluate hazmat storage regulations near faults
	COMMUNICATIONS IN DISASTER ISSUES
	Communications Interoperability
	Harden repeater sites
	Continue existing interoperability project
	Strengthen/harden
	Relocate
	Redundancy
	Mobile repeaters
	FLOODS
	Update development policies for flood plains
	Public education on locations of flood plains
	Develop multi-jurisdictional working group on floodplain management
	Develop greenbelt requirements in new developments
	Update weather pattern/flood plain maps
	Conduct countywide study of flood barriers/channels/gates/water dispersal systems
	Required water flow/runoff plans for new development
	Perform GIS mapping of flood channels, etc.
	Install vehicular crossing gates/physical barriers for road closure
	Maintenance of storm sewers/flood channels
	Create map of flood channels/diversions/water systems etc.
	Require digital floor plans on new non-residential construction
	Upgrade dirt embankments to concrete
	Conduct countywide needs study on drainage capabilities
	Increase number of pumping stations
	Increase sandbag distribution capacities
	Develop pre-planned response plan for floods
	◊ Evacuation documentation
	◊ Re-examine historical flooding data for potential street re-design
	Training for city/county PIOs about flood issues
	Warning systems - ensure accurate information provided
	◊ Publicize flood plain information (website?)
	◊ Install warning/water level signage

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

	◊ Enhanced public information
	◊ Road closure compliance
	◊ Shelter locations
	◊ Pre-event communications
	Look at County requirements for neighborhood access
	◊ Secondary means of ingress/egress
	Vegetation restoration programs
	Ensure critical facilities are hardened/backed up
	Hardening water towers
	Terrorism Surveillance - cameras at reservoirs/dams
	Riverbed maintenance
	Evaluate existing lift stations for adequacy
	Acquisition of property for on-site retention
	Evaluate regulations on roof drainage mechanism
	Erosion-resistant plants
	Traffic light protection
	Upkeep of diversionary devices
	Install more turn-off valves on pipelines
	Backup generation facilities
	Identify swift water rescue capabilities across County
	WILDFIRES
	Aggressive weed abatement program
	◊ Networking of agencies for weed abatement
	Develop strategic plan for forest management
	Public education on wildfire defense
	Encourage citizen surveillance and reporting
	Identify hydrants with equipment ownership information
	Enhanced firefighting equipment
	Fire spotter program/red flag program
	◊ Expand to other utilities
	Research on insect/pest mitigation technologies
	Volunteer home inspection program
	Public education program
	◊ Weather reporting/alerting
	◊ Building protection
	◊ Respiration
	Pre-identify shelters/recovery centers/other resources
	Roofing materials/defensive spacing regulations
	Community task forces for planning and education
	Fuel/dead tree removal

	Strategic pre-placement of firefighting equipment
	Establish FEMA coordination processes based on ICS
	Brush clearings around repeaters
	Research new technologies for identifying/tracking fires
	Procure/deploy backup communications equipment
	"Red Tag" homes in advance of event
	Provide fire-resistant gel to homeowners
	Involve insurance agencies in mitigation programs
	Clear out abandoned vehicles from oases
	Code enforcement
	Codes prohibiting fireworks
	Fuel modification/removal
	Evaluate building codes
	Maintaining catch basins
OTHER HAZARDS	
	Improve pipeline maintenance
	Wetlands mosquito mitigation (West Nile Virus)
	Insect control study
	Increase County Vector Control capacities
	General public drought awareness
	◊ Lawn watering rotation
	Develop County drought plan
	Mitigation of landslide-prone areas
	Develop winter storm sheltering plan
	Ease permitting process for building transmission lines
	Evaluate restrictions on dust/dirt/generating activities during wind seasons
	Rotational crop planning/soil stabilization
	Enhance agricultural checkpoint enforcement
	Agriculture - funding of detection programs
	Communications of pipeline maps (based on need to know)
	Improved notification plan on runaway trains
	Improve/maintain blackout notification plan.
	Support business continuity planning for utility outages
	Terrorism training/equipment for first responders
	◊ Terrorism planning/coordination
	◊ Staffing for terrorism mitigation
	Create a SONGS regional planning group
	◊ Include dirty bomb planning
	Cooling stations - MOUs in place
	Fire Ant eradication program

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

	White Fly infestation abatement/eradication program
	Develop plan for supplemental water sources
	Public education on low water landscaping
	Salton Sea desalinization
	Establish agriculture security standards (focus on water supply)
	ID mutual aid agreements
	Vulnerability assessment on fiber-optic cable
	Upgrade valves on California aqueduct
	Public education
	◊ Bi-lingual signs
	◊ Power Outage information
	Notification system for rail traffic - container contents
	Control and release of terrorism intelligence
	Develop prison evacuation plan (shelter in place?)

Use the list and rankings to narrow down or identify "your" strategies. The mitigation strategy serves as the long-term blueprint for reducing the potential losses identified in the risk assessment. The mitigation strategy includes the development of goals, objectives, and prioritized mitigation actions.

Goals are general guidelines that explain what you want to achieve. They are broad policy statements and are usually long-term and represent global visions, such as "Protect Existing Property."

Objectives define strategies or implementation steps to attain the identified goals. Unlike goals, objectives are specific, measurable, and may have a defined completion date. Objectives are more specific, such as "Increase the number of buildings protected from flooding."
The development of effective goals and objectives enables the planning team to evaluate the merits of alternative mitigation actions and the local conditions in which these activities would be pursued. A potential mitigation action that would support the goal and objective goal example above is "Acquire repetitive flood loss properties in the Acadia Woods Subdivision."

In the 2012 LHMP, each jurisdiction was required to develop a Mitigation Strategy Proposal based on one of the following:

1. The strategy, goal, or objective rating "High Priority" on the Local Jurisdiction Mitigation Strategies and Goals (WORKSHEET ABOVE)
2. A specifically identified strategy, goal, or objective that was developed as part of one of the working groups planning sessions such as the hospitals or agriculture
3. A specifically identified strategy, goal, or objective that was developed as part of one of the jurisdiction's internal working group planning sessions

6. LOCAL JURISDICTION PROPOSED MITIGATION ACTION AND STRATEGY PROPOSAL

a. Instructions for Updating Jurisdictions and Special Districts: With your planning team, please review the table from # 5, and determine if your ranking from the 2012 LHMP remains the same.

Review the chosen Mitigation Strategy that your jurisdiction submitted. The updated plan **must** identify the completed, deleted, or deferred actions or activities from the previously approved plan as a benchmark for progress.

If the mitigation actions or activities remain unchanged from the previously approved plan, the updated plan **must** indicate why changes are not necessary. Further, the updated plan **shall** include in its prioritization any new mitigation actions identified since the previous plan was approved or through the plan update process.

b. Instructions for New Jurisdictions and Special Districts: With your planning team, Use the "High Priority" rated strategy, goal or objective as a starting point to determine your Mitigation Strategy Proposal.

LOCAL JURISDICTION PROPOSED MITIGATION ACTION AND STRATEGY PROPOSAL

Jurisdiction:
Contact:
Phone:

MITIGATION STRATEGY INFORMATION

Proposal Name:

Proposal Location:

Proposal Type

Place an "X" by the type of mitigation strategy (one or more may apply)

- [ ] Flood and mud flow mitigation
- [ ] Fire mitigation
- [ ] Elevation or acquisition of repetitively damaged structures or structures in high hazard areas
- [ ] Mitigation Planning (i.e. update building codes, planning develop guidelines, etc.)
- [ ] Development and implementation of mitigation education programs
- [ ] Development or improvement of warning systems
- [ ] Additional Hazard identification and analysis in support of the local hazard mitigation plan
- [ ] Drinking and/or irrigation water mitigation
- [ ] Earthquake mitigation
- [ ] Agriculture - crop related mitigation
- [ ] Agriculture - animal related mitigation
- [ ] Flood inundation/Dam failure
- [ ] Weather/Temperature event mitigation

DESCRIPTION OF THE PROPOSED MITIGATION STRATEGY

Proposal/Event History	List any previous disaster related events (dates, costs, etc.)
Description of Mitigation Goal Narrative:	Give a detailed description of the need for the proposal, any history related to the proposal. List the activities necessary for its completion in the narrative section below, including estimated timeline. (how long will it take)

Does your jurisdiction have primary responsibility for the proposal? If not, what agency does?

Yes	X	No		Responsible Agency:

FUNDING INFORMATION

Place an "X" by the proposed source of funding for this proposal

- [ ] Unfunded proposal - funds are not available for the proposal at this time
- [ ] Local jurisdiction General Fund
- [ ] Local jurisdiction Special Fund (road tax, assessment fees, etc.)
- [ ] Non-FEMA Hazard Mitigation Funds
- [ ] Local Hazard Mitigation Grant Funds - Future Request
- [ ] Hazard Mitigation Funds

- [ ] Has your jurisdiction evaluated this mitigation strategy to determine its cost benefits?
(i.e. has the cost of the mitigation proposal been determined to be beneficial in relationship to the potential damage or loss using the attached Cost/Benefit Analysis Sheet or another internal method)

As part of this process, each Submitting Jurisdiction is required to perform a cost-benefit analysis. They were required to answer the question at the bottom of the Proposal page that asks if they had conducted a Cost-Benefit Analysis of some type. This analysis was conducted either by completing a Cost Benefit form or by some other approved method. Many of the jurisdictions used the cost-effective analysis approach outlined in the FEMA publication, *Cost and Benefits of Natural Hazards Mitigation.* This cost-benefit analysis was not restricted to natural hazards.

In some cases, the jurisdiction or working group identified a proposal that highlighted a life- safety issue over a standard hazard proposal. This was done when there was either historical data or other sources of information indicating that the life-safety issue needed to be emphasized or brought to the public's attention.

7. LOCAL JURISDICTION DEVELOPMENT TRENDS QUESTIONNAIRE

LAND USE ISSUES - COMPLETE THE INFORMATION BELOW

This questionnaire identifies a comparison of specific land use issues between 2012, 2017 and 2022. The questionnaire also identifies the specific threat potential to the jurisdiction in relationship to residential and commercial structures along with critical facilities. This threat potential is focused on structural loss rather than dollar-value loss as it relates to the three main natural hazards – earthquakes, floods, and wildland fires. The determination of dollar-value loss relating to commercial and critical facilities was found to be very limited and a difficult task to establish. This issue will be addressed in future updates of the Plan.

The questionnaire also requires the jurisdiction to identify the process it will use to maintain their portion of the Plan.

LOCAL JURISDICTION DEVELOPMENT TRENDS QUESTIONNAIRE 2011

LAND USE ISSUES - COMPLETE THE INFORMATION BELOW

JURISDICTION:	DOES YOUR AGENCY HAVE RESPONSIBILITY FOR LAND USE AND/OR DEVELOPMENT ISSUES WITHIN YOUR JURISDICTIONAL BOUNDARIES? YES NO			
	2012 DATA	2017 DATA		2022
Current Population in Jurisdiction or Served			Projected Population in Jurisdiction or Served - in 2022	
Current Sq Miles in Jurisdiction or Served			Projected Sq Miles in Jurisdiction or Served - in 2022	
Does Your Jurisdiction have any ordinances or regulations dealing with disaster mitigation, disaster preparation, or disaster response?			If yes, please list ordinance or regulation number.	
What is the number one land issue your agency will face in the next five years				
Approximate Number of Homes/Apts/etc.			Projected Number of Homes/Apts/etc. - in 2022	
Approximate Total Residential Value			Projected Residential Total Value - in 2022	
Approximate Number of Commercial Businesses			Projected Number of Commercial Businesses - in 2022	
Approximate Percentage of Homes/Apts/etc in flood hazard zones			Approximate Percentage of Homes/Apts/etc in flood hazard zones - in 2022	
Approximate Percentage of Homes/Apts/etc in earthquake hazard zones			Approximate Percentage of Homes/Apts/etc in earthquake hazard zones - in 2022	
Approximate Percentage of Homes/Apts/etc in wildland fire hazard zones			Approximate Percentage of Homes/Apts/etc in wildland fire hazard zones - in 2022	
Approximate Percentage of Commercial Businesses in flood hazard zones			Approximate Percentage of Commercial Businesses in flood hazard zones - in 2022	
Approximate Percentage of Commercial Businesses in earthquake hazard zones			Approximate Percentage of Commercial Businesses in earthquake hazard zones - in 2022	
Approximate Percentage of Commercial Businesses in wildland fire hazard zones			Approximate Percentage of Commercial Businesses in wildland fire hazard zones - in 2022	
Number of Critical Facilities in your Jurisdiction that are in flood hazard zones			Projected Number of Critical Facilities in your Jurisdiction that are in flood hazard zones - in 2022	
Number of Critical Facilities in your Jurisdiction that are in earthquake hazard zones			Number of Critical Facilities in your Jurisdiction that are in earthquake hazard zones - in 2022	
Number of Critical Facilities in your Jurisdiction that are in wildland fire hazard zones.			Number of Critical Facilities in your Jurisdiction that are in wildland fire hazard zones - in 2022	
Does your jurisdiction plan on participating in the County's on-going plan maintenance program every two years as described in Part I of the plan?			If not, how will your jurisdiction do plan maintenance?	
Will a copy of this plan be available for the various planning groups within your jurisdiction for use in future planning and budgeting purposes?				Yes or No

APPENDIX A:
LOCAL MITIGATION PLAN REVIEW TOOL

The *Local Mitigation Plan Review Tool* demonstrates how the Local Mitigation Plan meets the regulation in 44 CFR §201.6 and offers States and FEMA Mitigation Planners an opportunity to provide feedback to the community.

- The Regulation Checklist provides a summary of FEMA's evaluation of whether the Plan has addressed all requirements.
- The Plan Assessment identifies the plan's strengths as well as documents areas for future improvement.
- The Multi-jurisdiction Summary Sheet is an optional worksheet that can be used to document how each jurisdiction met the requirements of the each Element of the Plan (Planning Process; Hazard Identification and Risk Assessment; Mitigation Strategy; Plan Review, Evaluation, and Implementation; and Plan Adoption).

The FEMA Mitigation Planner must reference this *Local Mitigation Plan Review Guide* when completing the *Local Mitigation Plan Review Tool*.

Plan Approved		

SECTION 1: REGULATION CHECKLIST

INSTRUCTIONS: The Regulation Checklist must be completed by FEMA. The purpose of the Checklist is to identify the location of relevant or applicable content in the Plan by Element/sub-element and to determine if each requirement has been 'Met' or 'Not Met.' The 'Required Revisions' summary at the bottom of each Element must be completed by FEMA to provide a clear explanation of the revisions that are required for plan approval. Required revisions must be explained for each plan sub-element that is 'Not Met.' Sub-elements should be referenced in each summary by using the appropriate numbers (A1, B3, etc.), where applicable. Requirements for each Element and sub-element are described in detail in this *Plan Review Guide* in Section 4, Regulation Checklist.

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	**Location in Plan** (section and/or	**Met**	**Not Met**
ELEMENT A. PLANNING PROCESS			
A1. Does the Plan document the planning process, including how it was prepared and who was involved in the process for each jurisdiction? (Requirement §201.6(c)(1))			
A2. Does the Plan document an opportunity for neighboring communities, local and regional agencies involved in hazard mitigation activities, agencies that have the authority to regulate development as well as other interests to be involved in the planning process? (Requirement §201.6(b)(2))			
A3. Does the Plan document how the public was involved in the planning process during the drafting stage? (Requirement §201.6(b)(1))			
A4. Does the Plan describe the review and incorporation of existing plans, studies, reports, and technical information? (Requirement §201.6(b)(3))			
A5. Is there discussion of how the community(ies) will continue public participation in the plan maintenance process? (Requirement §201.6(c)(4)(iii))			

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	**Location in Plan** (section and/or	**Met**	**Not Met**
A6. Is there a description of the method and schedule for keeping the plan current (monitoring, evaluating and updating the mitigation plan within a 5-year cycle)? (Requirement §201.6(c)(4)(i))			
ELEMENT A: REQUIRED REVISIONS			
ELEMENT B. HAZARD IDENTIFICATION AND RISK ASSESSMENT			
B1. Does the Plan include a description of the type, location, and extent of all natural hazards that can affect each jurisdiction(s)? (Requirement §201.6(c)(2)(i))			
B2. Does the Plan include information on previous occurrences of hazard events and on the probability of future hazard events for each jurisdiction? (Requirement §201.6(c)(2)(i))			
B3. Is there a description of each identified hazard's impact on the community as well as an overall summary of the community's vulnerability for each jurisdiction? (Requirement §201.6(c)(2)(ii))			
B4. Does the Plan address NFIP insured structures within the jurisdiction that have been repetitively damaged by floods? (Requirement §201.6(c)(2)(ii))			
ELEMENT B: REQUIRED REVISIONS			
ELEMENT C. MITIGATION STRATEGY			
C1. Does the plan document each jurisdiction's existing authorities, policies, programs and resources and its ability to expand on and improve these existing policies and programs? (Requirement §201.6(c)(3))			
C2. Does the Plan address each jurisdiction's participation in the NFIP and continued compliance with NFIP requirements, as appropriate? (Requirement §201.6(c)(3)(ii))			
C3. Does the Plan include goals to reduce/avoid long-term vulnerabilities to the identified hazards? (Requirement §201.6(c)(3)(i))			

1. REGULATION CHECKLIST **Regulation** (44 CFR 201.6 Local Mitigation Plans)	Location in Plan (section and/or	Met	Not Met
C4. Does the Plan identify and analyze a comprehensive range of specific mitigation actions and projects for each jurisdiction being considered to reduce the effects of hazards, with emphasis on new and existing buildings and infrastructure? (Requirement §201.6(c)(3)(ii))			
C5. Does the Plan contain an action plan that describes how the actions identified will be prioritized (including cost benefit review), implemented, and administered by each jurisdiction? (Requirement §201.6(c)(3)(iv)); (Requirement §201.6(c)(3)(iii))			
C6. Does the Plan describe a process by which local governments will integrate the requirements of the mitigation plan into other planning mechanisms, such as comprehensive or capital improvement plans, when appropriate? (Requirement §201.6(c)(4)(ii))			
ELEMENT C: REQUIRED REVISIONS			
ELEMENT D. PLAN REVIEW, EVALUATION, AND IMPLEMENTATION (applicable to plan updates only)			
D1. Was the plan revised to reflect changes in development? (Requirement §201.6(d)(3))			
D2. Was the plan revised to reflect progress in local mitigation efforts? (Requirement §201.6(d)(3))			
D3. Was the plan revised to reflect changes in priorities? (Requirement §201.6(d)(3))			
ELEMENT D: REQUIRED REVISIONS			
ELEMENT E. PLAN ADOPTION			
E1. Does the Plan include documentation that the plan has been formally adopted by the governing body of the jurisdiction requesting approval? (Requirement §201.6(c)(5))	Plan Adoption/ Resolution Page 4 all plans		
E2. For multi-jurisdictional plans, has each jurisdiction requesting approval of the plan documented formal plan adoption? (Requirement §201.6(c)(5))	Plan Adoption/ Resolution Page 4 all plans		
ELEMENT E: REQUIRED REVISIONS			
ELEMENT F. ADDITIONAL STATE REQUIREMENTS (OPTIONAL FOR STATE REVIEWERS ONLY; NOT TO BE COMPLETED BY FEMA)			
F1.

SECTION 2:
PLAN ASSESSMENT

INSTRUCTIONS: The purpose of the Plan Assessment is to offer the local community more comprehensive feedback to the community on the quality and utility of the plan in a narrative format. The audience for the Plan Assessment is not only the plan developer/local community planner, but also elected officials, local departments and agencies, and others involved in implementing the Local Mitigation Plan. The Plan Assessment must be completed by FEMA. The Assessment is an opportunity for FEMA to provide feedback and information to the community on: 1) suggested improvements to the Plan; 2) specific sections in the Plan where the community has gone above and beyond minimum requirements; 3) recommendations for plan implementation; and 4) ongoing partnership(s) and information on other FEMA programs, specifically RiskMAP and Hazard Mitigation Assistance programs. The Plan Assessment is divided into two sections:

1. Plan Strengths and Opportunities for Improvement
2. Resources for Implementing Your Approved Plan

Plan Strengths and Opportunities for Improvement is organized according to the plan Elements listed in the Regulation Checklist. Each Element includes a series of italicized bulleted items that are suggested topics for consideration while evaluating plans, but it is not intended to be a comprehensive list. FEMA Mitigation Planners are not required to answer each bullet item, and should use them as a guide to paraphrase their own written assessment (2-3 sentences) of each Element.

The Plan Assessment must not reiterate the required revisions from the Regulation Checklist or be regulatory in nature, and should be open-ended and to provide the community with suggestions for improvements or recommended revisions. The recommended revisions are suggestions for improvement and are not required to be made for the Plan to meet Federal regulatory requirements. The italicized text should be deleted once FEMA has added comments regarding strengths of the plan and potential improvements for future plan revisions. It is recommended that the Plan Assessment be a short synopsis of the overall strengths and weaknesses of the Plan (no longer than two pages), rather than a complete recap section by section.

Resources for Implementing Your Approved Plan provides a place for FEMA to offer information, data sources and general suggestions on the overall plan implementation and maintenance process. Information on other possible sources of assistance including, but not limited to, existing publications, grant funding or training opportunities, can be provided. States may add state and local resources, if available.

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

A. Plan Strengths and Opportunities for Improvement

This section provides a discussion of the strengths of the plan document and identifies areas where these could be improved beyond minimum requirements.

Element A: Planning Process

How does the Plan go above and beyond minimum requirements to document the planning process with respect to:

- *Involvement of stakeholders (elected officials/decision makers, plan implementers, business owners, academic institutions, utility companies, water/sanitation districts, etc.);*
- *Involvement of Planning, Emergency Management, Public Works Departments or other planning agencies (i.e., regional planning councils);*
- *Diverse methods of participation (meetings, surveys, online, etc.); and*
- *Reflective of an open and inclusive public involvement process.*

Element B: Hazard Identification and Risk Assessment

In addition to the requirements listed in the Regulation Checklist, 44 CFR 201.6 Local Mitigation Plans identifies additional elements that should be included as part of a plan's risk assessment. The plan should describe vulnerability in terms of:

1) *A general description of land uses and future development trends within the community so that mitigation options can be considered in future land use decisions;*
2) *The types and numbers of existing and future buildings, infrastructure, and critical facilities located in the identified hazard areas; and*
3) *A description of potential dollar losses to vulnerable structures, and a description of the methodology used to prepare the estimate.*

How does the Plan go above and beyond minimum requirements to document the Hazard Identification and Risk Assessment with respect to:

- *Use of best available data (flood maps, HAZUS, flood studies) to describe significant hazards;*
- *Communication of risk on people, property, and infrastructure to the public (through tables, charts, maps, photos, etc.);*
- *Incorporation of techniques and methodologies to estimate dollar losses to vulnerable structures;*
- *Incorporation of Risk MAP products (i.e., depth grids, Flood Risk Report, Changes Since Last FIRM, Areas of Mitigation Interest, etc.); and*
- *Identification of any data gaps that can be filled as new data became available.*

Element C: Mitigation Strategy

How does the Plan go above and beyond minimum requirements to document the Mitigation Strategy with respect to:

- *Key problems identified in, and linkages to, the vulnerability assessment;*
- *Serving as a blueprint for reducing potential losses identified in the Hazard Identification and Risk Assessment;*
- *Plan content flow from the risk assessment (problem identification) to goal setting to mitigation action development;*
- *An understanding of mitigation principles (diversity of actions that include structural projects, preventative measures, outreach activities, property protection measures, post-disaster actions, etc);*
- *Specific mitigation actions for each participating jurisdictions that reflects their unique risks and capabilities;*
- *Integration of mitigation actions with existing local authorities, policies, programs, and resources; and*
- *Discussion of existing programs (including the NFIP), plans, and policies that could be used to implement mitigation, as well as document past projects.*

Element D: Plan Update, Evaluation, and Implementation (*Plan Updates Only*)

How does the Plan go above and beyond minimum requirements to document the 5-year Evaluation and Implementation measures with respect to:

- *Status of previously recommended mitigation actions;*
- *Identification of barriers or obstacles to successful implementation or completion of mitigation actions, along with possible solutions for overcoming risk;*
- *Documentation of annual reviews and committee involvement;*
- *Identification of a lead person to take ownership of, and champion the Plan;*
- *Reducing risks from natural hazards and serving as a guide for decisions makers as they commit resources to reducing the effects of natural hazards;*
- *An approach to evaluating future conditions (i.e. socio-economic, environmental, demographic, change in built environment etc.);*
- *Discussion of how changing conditions and opportunities could impact community resilience in the long term; and*
- *Discussion of how the mitigation goals and actions support the long-term community vision for increased resilience.*

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

B. Resources for Implementing Your Approved Plan

Ideas may be offered on moving the mitigation plan forward and continuing the relationship with key mitigation stakeholders such as the following:

- *What FEMA assistance (funding) programs are available (for example, Hazard Mitigation Assistance (HMA)) to the jurisdiction(s) to assist with implementing the mitigation actions?*
- *What other Federal programs (National Flood Insurance Program (NFIP), Community Rating System (CRS), Risk MAP, etc.) may provide assistance for mitigation activities?*
- *What publications, technical guidance or other resources are available to the jurisdiction(s) relevant to the identified mitigation actions?*
- *Are there upcoming trainings/workshops (Benefit-Cost Analysis (BCA), HMA, etc.) to assist the jurisdictions(s)?*
- *What mitigation actions can be funded by other Federal agencies (for example, U.S. Forest Service, National Oceanic and Atmospheric Administration (NOAA), Environmental Protection Agency (EPA) Smart Growth, Housing and Urban Development (HUD) Sustainable Communities, etc.) and/or state and local agencies?*

SECTION 3:
MULTI-JURISDICTION SUMMARY SHEET (OPTIONAL)

INSTRUCTIONS: For multi-jurisdictional plans, a Multi-jurisdiction Summary Spreadsheet may be completed by listing each participating jurisdiction, which required Elements for each jurisdiction were 'Met' or 'Not Met,' and when the adoption resolutions were received. This Summary Sheet does not imply that a mini-plan be developed for each jurisdiction; it should be used as an optional worksheet to

Riverside Operational Area

JURISDICTION:	DOES YOUR AGENCY HAVE RESPONSIBILITY FOR LAND USE AND/OR DEVELOPMENT ISSUES WITHIN YOUR JURISDICTIONAL BOUNDARIES? YES			
	2012 DATA	2017 DATA		2022
Current Population in Jurisdiction or Served	2,196,137	2,329,256	Projected Population in Jurisdiction or Served - in 2022	2,506,739
Current Sq Miles in Jurisdiction or Served	6,375	7,295.6	Projected Sq Miles in Jurisdiction or Served - in 2022	7,295.6
Does Your Jurisdiction have any ordinances or regulations dealing with disaster mitigation, disaster preparation, or disaster response?	Yes	Yes	If yes, please list ordinance or regulation number.	
What is the number one land issue your agency will face in the next five years	N/A			
Approximate Number of Homes/Apts/etc.	696,290	700,413	Projected Number of Homes/Apts/etc.- in 2022	955,853
Approximate Total Residential Value	N/A	362,066	Projected Residential Total Value - in 2022	
Approximate Number of Commercial Businesses	N/A	N/A	Projected Number of Commercial Businesses - in 2022	N/A
Approximate Percentage of Homes/Apts/etc. in flood hazard zones	12%		Approximate Percentage of Homes/Apts/etc. in flood hazard zones - in 2022	N/A
Approximate Percentage of Homes/Apts/etc. in earthquake hazard zones	5%		Approximate Percentage of Homes/Apts/etc. in earthquake hazard zones - in 2022	N/A
Approximate Percentage of Homes/Apts/etc. in wildland fire hazard zones	34%		Approximate Percentage of Homes/Apts/etc. in wildland fire hazard zones - in 2022	N/A
Approximate Percentage of Commercial Businesses in flood hazard zones	N/A	N/A	Approximate Percentage of Commercial Businesses in flood hazard zones - in 2022	N/A
Approximate Percentage of Commercial Businesses in earthquake hazard zones	N/A	N/A	Approximate Percentage of Commercial Businesses in earthquake hazard zones - in 2022	N/A
Approximate Percentage of Commercial Businesses in wildland fire hazard zones	N/A	N/A	Approximate Percentage of Commercial Businesses in wildland fire hazard zones - in 2022	N/A
Number of Critical Facilities in your Jurisdiction that are in flood hazard zones	41	1,298	Projected Number of Critical Facilities in your Jurisdiction that are in flood hazard zones - in 2022	N/A
Number of Critical Facilities in your Jurisdiction that are in earthquake hazard zones	21		Number of Critical Facilities in your Jurisdiction that are in earthquake hazard zones - in 2022	N/A
Number of Critical Facilities in your Jurisdiction that are in wildland fire hazard zones.	69		Number of Critical Facilities in your Jurisdiction that are in wildland fire hazard zones - in 2022	N/A
Does your jurisdiction plan on participating in the County's on-going plan maintenance program every year as described in Part I of the plan?	N/A	N/A	If not, how will your jurisdiction do plan maintenance.	
Will a copy of this plan be available for the various planning groups within your jurisdiction for use in future planning and budgeting purposes?				Yes

APPENDIX H – Mitigation Cost Analysis Guidelines

COUNTY OF RIVERSIDE
OFFICE OF THE
AUDITOR-CONTROLLER

County Administrative Center
4080 Lemon Street, 11th Floor
P.O. Box 1326
Riverside, CA 92502-1326
(951) 955-3800
Fax (951) 955-3802

Paul Angulo, CPA
Auditor-Controller

Auditor-Controller Review of Rates/Fees

Pursuant to Board of Supervisors Policy B-4 and B-28, County departments wishing to establish a rate/fee, or revise an existing rate/fee for service provided to other County departments, other public agencies, organizations, or individuals, are required to obtain approval by the County Executive Office and be reviewed by the (ACO) Auditor-Controller's Office prior to submitting their rate/fee request to the Board of Supervisors.

Federal (OMB) Office of Management and Budget Circular A-87 provides guidance for determining costs that may be recovered in rates/fees.

Rate/Fee packages submitted for review to the ACO must include the following:

1. A narrative fully explaining the methodology used (i.e., the purpose of the rate/fee, how it was developed, how each rate/fee was calculated, and who will be charged the rate/fee).

2. Electronic copies of spreadsheets created to calculate the rate/fee. Please provide notes to explain where the information was derived and clearly identify if changes have been made to the original data. Ensure multiple tabs are correctly linked and pertinent data is highlighted.

3. Supporting documentation validating all expenditure and revenue amounts used, full disclosure of all calculations, and clear identification of overhead calculations and application of the overhead to all the department's divisions/functions.

ACO Documentation Requirements

1. Direct salary/benefits costs by classification; including hourly rate of pay & benefits rate;
2. Direct costs by line item included in the rate/fee (non-salary/benefit);
3. Departmental administrative overhead costs included in rate/fee, as well as the total administrative cost applied to all divisions/functions;
4. Departmental indirect costs by line item included in rate;
5. Countywide overhead costs;
6. Schedule of fixed asset amortization;
7. Copy of (ICRP) Indirect Cost Rate Proposal, if applicable;
8. Copy of last year's budget for the function;

9. Time studies, if applicable;
10. Methodology for Productive hourly rate computations, if applicable;
11. Government Code reference for statutorily set rates/fees;
12. Related off-setting revenues;
13. County Ordinance reference, if applicable;
14. ISF retained earnings information;
15. Summary showing current rates/fees and revised rates/fees;
16. Completed Form 11; and
17. Copy of the annual productivity and efficiency report.

The above list is not all inclusive and additional documentation may be required in support of submitted rates/fees.

If you have any questions in regards to the rate/fee review process or the required documentation, please contact Principal Accountant, Russell Dominski at 955-8136.

Thank you in advance for your cooperation.

APPENDIX I – Acronyms

This list contains acronyms commonly used in Emergency Management and those specific to Riverside County.

AC	Area Command
ADA	Americans with Disabilities Act
ALS	Advanced Life Support
ARC	American Red Cross
ARES	Amateur Radio Emergency Services
CALDAP	California Disaster Assistance Program
CAL FIRE	California Department of Forestry and Fire Protection
CAL-TRANS	California Department of Transportation
CALWAS	California Warning System
CAR	Corrective Action Report
CBO	Community Based Organization
CBRNE	Chemical, Biological, Radiological, Nuclear or High-Yield Explosive
CCC	California Conservation Corps
CDC	Centers for Disease Control, U.S. Public Health Service
CDF	California Department of Forestry
CEPEC	California Earthquake Prediction Evaluation Council
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
CERT	Community Emergency Response Team
CESFRS	California Emergency Service Fire Radio System
CESRS	California Emergency Services Radio System
CFR	Code of Federal Regulations
CHP	California Highway Patrol
CLEMARS	California Law Enforcement Mutual Aid Radio System
CLERS	California Law Enforcement Radio System

CLETS	California Law Enforcement Telecommunications System
COG	Continuity of Government
DA	Damage Assessment
DAP	Disaster Assistance Programs
DCS	Disaster Communications Service
DFCO	Deputy Federal Coordinating Officer
DFO	Disaster Field Office
DHA	Disaster Housing Assistance
DHS	Department of Homeland Security
DMAT	Disaster Medical Assistance Team
DMORT	Disaster Mortuary Operational Response Team
DOC	Department Operations Center
DOD	Department of Defense
DOI	Department of Interior
DOJ	Department of Justice
DOL	Department of Labor
DOS	Department of State
DOT	Department of Transportation
DRC	Disaster Recovery Center
DRC	Disaster Resource Center
DSA	Division of the State Architect (California)
DWR	California Department of Water Resources
EAS	Emergency Alert System
EDD	Employment Development Department
EDIS	Emergency Digital Information System
EMAC	Emergency Management Assistance Compact
EMD	Emergency Management Department
EMI	Emergency Management Institute
EMIS	Emergency Management Information System (Los Angeles County)

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

EMMA	Emergency Managers Mutual Aid
EMP	Electromagnetic Pulse
EMPG	Emergency Management Performance Grant
EMS	Emergency Medical Services
EMSA	Emergency Medical Services Authority
EMT	Emergency Medical Technician
EOC	Emergency Operations Center
EOP	Emergency Operations Plan
EPA	Environmental Protection Agency
EPI	Emergency Public Information
EPIC	Emergency Public Information Center
ERT	Emergency Response Team
ESA	California Emergency Services Act
ESC	Emergency Services Coordinator
ESF	Emergency Support Functions
EST	Emergency Support Team
FAA	Federal Aviation Administration
FBI	Federal Bureau of Investigation
FCC	Federal Communications Commission
FCO	Federal Coordinating Officer
FEMA	Federal Emergency Management Agency
FFY	Federal Fiscal Year
FHWA	Federal Highway Administration
FIA	Federal Insurance Administration
FIRESCOPE	Firefighting Resources of Calif. Organized for Potential Emergencies
FOG	Field Operations Guide
FTS	Field Treatment Sites
GAR	Governor's Authorized Representative
GSA	General Services Administration

HAZMAT	Hazardous Materials
HEW	U.S. Department of Health, Education and Welfare
HHS	Department of Health and Human Services
HMC	Hazard Mitigation Coordinator
HMDA	Hazard Mitigation and Disaster Assistance
HMGP	Hazard Mitigation Grant Program
HMO	Hazard Mitigation Officer
HMT	Hazard Mitigation Team
HSAS	Homeland Security Advisory System
HSC	Homeland Security Council
HSEEP	Homeland Security Exercise Evaluation Program
HSOC	Homeland Security Operations Center
HSPD	Homeland Security Presidential Directive
HSPD-5	Homeland Security Presidential Directive-5
HUD	Housing and Urban Development Program
IA	Individual Assistance
IAC	Incident Advisory Council
IAP	Incident Action Plan
IC	Incident Commander
IC	Incident Command
ICP	Incident Command Post
ICS	Incident Command System
IDE	Initial Damage Estimate
IID	Imperial Irrigation District
IMT	Incident Management Team
IRS	U.S. Internal Revenue Service
JDIC	Justice Data Interface Controller
JFO	Joint Field Office
JIC	Joint Information Center

Riverside Operational Area
Multi-Jurisdictional Local Hazard Mitigation Plan (LHMP)

July 2018

JIS	Joint Information System
JOC	Joint Operations Center
JPA	Joint Powers Agreement
JTTF	Joint Terrorism Task Force
LNO	Liaison Officer
MACS	Multi-Agency Coordination System
MARAC	Mutual Aid Regional Advisory Committee
MMRS	Metropolitan Medical Response Team
MOA	Memorandum of Agreement
MOU	Memorandum of Understanding
MTA	Metropolitan Transit Authority
NAWAS	National Warning System
NDAA	California Natural Disaster Assistance Act
NDMS	National Disaster Medical System
NEP	National Exercise Program
NFA	National Fire Academy
NFIP	National Flood Insurance Program
NGO	Nongovernmental Organization (See PNP, NVOAD, VOAD)
NHC	National Hurricane Center
NHPA	National Historic Preservation Act
NIMS	National Incident Management System
NOAA	National Oceanic and Atmospheric Administration
NOC	National Operations Center
NOI	Notice of Interest
NRC	Nuclear Regulatory Commission
NRF	National Response Framework
NSC	National Security Council
NVOAD	National Voluntary Organizations Active in Disaster (See NGO, PNP, VOAD)
NWS	National Weather Service

OA	Operational Area
OASIS	Operational Area Satellite Information System
OEM	Office of Emergency Management
OES	Office of Emergency Services
OSA	California Office of the State Architect
OSHA	Occupational Safety and Health Administration
PA	Public Assistance
PA/O	Public Assistance Officer
PDD	Presidential Decision Directive
PFO	Principal Federal Officer
PFO	Principal Federal Official
PIO	Public Information Officer
PIS	Public Information System
PNP	Private Nonprofit Organization (see NGO, NVOAD, VOAD)
POC	Point of Contact
POLREP	Pollution Report
PUC	California Public Utilities Commission
PVO	Private Voluntary Organizations
PW	Project Worksheet
R&D	Research and Development
RACES	Radio Amateur Civil Emergency Services
RCOE	Riverside County Office of Education
RCSD	Riverside County Sheriff's Department
REOC	Regional Emergency Operations Center (State OES Region)

RESOLUTION ADOPTING 2020 UWMP AND WSCP

RESOLUTION NO. 2021-04

A RESOLUTION OF THE BOARD OF DIRECTORS OF THE CHINO BASIN DESALTER AUTHORITY ADOPTING THE CHINO BASIN DESALTER AUTHORITY URBAN WATER MANAGEMENT PLAN 2020

WHEREAS, the Chino Basin Desalter Authority ("CDA") prepared that certain draft Chino Basin Desalter Authority Urban Water Management Plan 2020, dated June 2021 ("2020 UWMP"), in accordance with the requirements of the Urban Water Management Planning Act, California Water Code Section 10610, *et seq.*; and

WHEREAS, in accordance with California Water Code Section 10642, CDA encouraged public participation with respect to the preparation of the 2020 UWMP by making the 2020 UWMP available for review by the public online, at *www.chinodesalter.org*, on May 20, 2021; and

WHEREAS, on June 3, 2021, the CDA Board of Directors held a public hearing to receive public testimony and comments regarding the 2020 UWMP; and

WHEREAS, notice of the time and place of the June 3, 2021 public hearing was published on May 11, 2021 and May 18, 2021 in the Inland Valley Daily Bulletin and May 12, 2021 and May 19, 2021 in the Riverside Press Enterprise, in accordance with California Government Code Section 6066; and

WHEREAS, the CDA Board of Directors considered all public comments and testimony presented at the public hearing relating to the 2020 UWMP; and

WHEREAS, the CDA Board of Directors now desires to adopt the 2020 UWMP.

NOW, THEREFORE, BE IT RESOLVED, the Board of Directors of the Chino Basin Desalter Authority hereby declares, finds, and determines as follows:

1. The recitals set forth above are true and correct.

2. The 2020 UWMP is hereby approved and adopted.

3. The Chairperson or the Chairperson's designee, the General Manager or the General Manager's designee, and any other proper officer of CDA, are each hereby authorized and directed to execute and deliver any and all documents and instruments and to do and cause to be done any and all acts and things necessary or proper to implement the 2020 UWMP.

4. The 2020 UWMP shall be placed on file with the General Manager or another officer of CDA, as directed from time to time by the General Manager. The General Manager is hereby directed to transmit copies of the 2020 UWMP to the California Department of Water Resources, the California State Library, and each city and county within which CDA provides water supplies, all within thirty (30) days following the date of adoption of this Resolution.

5. The CDA Board of Directors hereby finds and determines that, pursuant to California Water Code Section 10652, the adoption of the 2020 UWMP does not constitute a "project" within the meaning of the California Environmental Quality Act, Public Resources Code Section 21000, *et seq.*

6. This Resolution shall take effect immediately upon adoption.

PASSED AND ADOPTED this 3rd day of June, 2021.

Kenneth McLaughlin
Chairperson

RESOLUTION NO. 2021-05

A RESOLUTION OF THE BOARD OF DIRECTORS OF THE CHINO BASIN DESALTER AUTHORITY ADOPTING THE CHINO BASIN DESALTER AUTHORITY WATER SHORTAGE CONTINGENCY PLAN 2020

WHEREAS, the Chino Basin Desalter Authority ("CDA") is an urban water supplier that is required to adopt an Urban Water Management Plan pursuant to Water Code Sections 10620 et seq.; and

WHEREAS, CDA adopted the Chino Basin Desalter Authority Urban Water Management Plan 2020 ("2020 UWMP") on June 3, 2021 in accordance with the requirements of the Urban Water Management Planning Act, California Water Code Section 10610, *et seq.*; and

WHEREAS, CDA is also required to prepare and adopt a Water Shortage Contingency Plan (2020 WSCP) that consists of certain elements prescribed by Water Code Section 10632, and to make the Plan available to the California State Library, the California Department of Water Resources, and to any city or county within which CDA supplies water no later than 30 days after adoption of the Plan and no later than July 1, 2021, as a required component of the Urban Water Management Plan; and

NOW, THEREFORE, BE IT RESOLVED, the Board of Directors of the Chino Basin Desalter Authority hereby declares, finds, and determines as follows:

1. The recitals set forth above are true and correct.

2. The 2020 Water Shortage Contingency Plan for the Chino Basin Desalter Authority is hereby approved and adopted.

3. This Resolution shall take effect immediately upon adoption.

PASSED AND ADOPTED this 1st day of July 2021.

CHAPTER 1 INTRODUCTION AND LAY DESCRIPTION

1.1 REGULATORY BACKGROUND

In 1983, the California Legislature enacted the Urban Water Management Planning Act (Act). The Act is codified in California Water Code (CWC or Water Code) Sections 10610 - 10657. The Act requires an urban water supplier (Supplier) that is providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet (AF) of water annually to adopt an Urban Water Management Plan (UWMP) and update it every five years for the purpose of demonstrating water supply reliability in normal, single dry, and multiple dry years. The Act requires each Supplier to submit their UWMP to the California Department of Water Resources (DWR). DWR staff then reviews the submitted plans to make sure they have satisfied the requirements identified in the Act, including subsequent revisions. DWR will then submit a report to the State Legislature summarizing the status of the UWMPs.

In order for an urban water supplier to be eligible for any water grant or loan administered by DWR, the supplier must have a current UWMP on file that DWR has determined met the current Act requirements. A current UWMP must also be maintained by the supplier throughout the term of any grant or loan administered by DWR. Depending on the conditions that are specified in the funding guidelines, a current UWMP may also be required in order to be eligible for other State funding sources.

With the adoption of the Water Conservation Act of 2009, also known as SB X7-7 (Senate Bill 7 of the Senate's 7th Extraordinary Session), the State is required to reduce urban per-person water use by 20 percent by the year 2020. SB X7-7 is codified in CWC sections 10608 – 10608.64. To achieve this goal, each Supplier that prepares an UWMP is required to also develop an urban water use target to help the state collectively achieve a 20-percent reduction in water use by 2020.

Since 2015, the Act has been expanded and revised significantly in response to prolonged drought, groundwater overdraft, regulatory revisions, and changing climatic conditions. Although the exact changes in the Water Code are too numerous to list here, the significant new requirements for the 2020 UWMPs are:

- Water reliability assessment for a drought lasting five consecutive years;
- Drought Risk Assessment for a five-year period from 2021 to 2025;
- Seismic risk assessment of water system facilities and a mitigation plan;
- Water Shortage Contingency Plan (WSCP) with action items for a drought or catastrophic supply interruption;
- Consistency with Groundwater Sustainability Plans that are currently being prepared in certain groundwater basins; and
- A lay description of the fundamental conclusions of the UWMP, especially regarding water service reliability, challenges ahead, and strategies for managing reliability risks.

OUR MISSION

To provide high quality water service, sewer disposal, trash, and fire mitigation services at the best value for our customers.

The Rubidoux Community Services District (RCSD or "District") is a public retail urban water supplier. It is the stated goal of RCSD to deliver high-quality water supply service at the best value for its customers. The purpose of the 2020 UWMP is to outline progress toward conservation and supply reliability goals since the District's 2015 UWMP was prepared, as well to outline future long-term opportunities to meet projected water demands while also assessing the impact of long-term drought and climate change. The identification of future opportunities for water supplies in the UWMP neither commits RCSD to any stated endeavor, nor precludes them from exploring a different project that is not identified in the UWMP.

Another purpose of this document is to inform the local wholesale water provider of RCSD's projected population and projected need for water supplies. This includes Western Municipal Water District (WMWD or "Western"). The District currently does not obtain water from a wholesale water supplier, and recycled water is not currently available to the District.

This document also intends to communicate forecasted growth to the wastewater treatment agency that provides sewer service to the District. This includes the City of Riverside Public Utilities Department and the Regional Water Quality Control Plant (RWQCP).

Albert A. Webb Associates (WEBB) was contracted to prepare this document on behalf of RCSD under their staff advisement and approval. The RCSD Board of Directors held a public hearing on June 17, 2021 and adopted the 2020 UWMP, which includes the 2020 Water Shortage Contingency Plan in chapter 8 on June 17, 2021 as recorded in RCSD Resolution Nos. 2021-878 and 2021-879 which are provided in **Appendix A**. This document was amended on April 21, 2022, to reflect the findings of the District's Water Master Plan dated 2022. Please refer to **Appendix Q** for copies of amendment resolutions and noticing**.**

1.2 SIMPLE LAY DESCRIPTION OF THE 2020 UWMP FINDINGS

RCSD's 2020 Urban Water Management Plan (UWMP) has been prepared in compliance with the California Water Code (CWC or Water Code). This description satisfies the requirement in the Water Code Section 10630.5 to include a simple lay description of water service reliability and the reasonably foreseeable challenges and corresponding solutions anticipated for the next 20 years.

Rubidoux Community Services District (RCSD or District) was organized in 1952 as the first Community Services District in the State of California. Currently, the entire District service area covers approximately 5,167 acres; however, 329 acres receive water service from West Valley Water District and is therefore not a part of this UWMP. The District provides water service to approximately 4,907 acres (7.7 square miles). The District's water supply comes entirely from local groundwater and is delivered to 6,335 service connections via 70 miles of water pipelines. RCSD has always been able to provide its customers with the water they need and fully expects that it will continue to do so for the foreseeable future based on the analysis herein.

Since the adoption of the 2015 Urban Water Management Plan, RCSD has been successful in meeting the goals and intent of the Urban Water Management Planning Act of 1983 and the Water Conservation Act of 2009. The District has accomplished the following items, which are discussed further in this document:

- Supplied in calendar year (CY) 2020, 4,770 acre-feet (AF) of drinking water to 6,335 metered connections, including residential, commercial, industrial, governmental, losses, and hydrant meters.[1]

- Supplied in CY 2020, 417 AF of non-potable water to 10 meters used for irrigation and construction water.

- Met the 2020 water use target pursuant to the Water Conservation Act of 2009 (SB X7-7) of 166 gallons per capita per day (GPCD) with an actual CY 2020 water use rate of 126 GPCD.

- Obtained a grant award of $300,000 from California Office of Emergency Services' Community Power Resiliency Program to install fixed generators at Well 1A, Well 2, and Mission Booster Station to improve system reliability during power outages.

- Rehabilitated Well 18 and added additional treatment systems to remove PFAS at Wells 1A, 2, 4, 6, 8, and 18 and the Thompson Water Treatment Facility.

- Prepared and submitted validated water loss audits to the State Department of Water Resources each year.

- Began conversion of customer meters to Automatic Meter Reading (AMR) system, which provides real-time information on water use that can help identify leaks or meter tampering. Require all new housing developments in the future to have AMR meters.

- Replaced approximately 2,000 water meters that were damaged or failed and conducted about 30 field tests of meters between 2016 and 2020.

- Adopted a gradual water rate increase beginning in 2020 through fiscal year 2023/2024 in accordance with Proposition 218 and compliant with AB 3030.

- Reduced potable water losses each year since 2017.

[1] One acre-foot of water is the same as 325,851.43 gallons.

- Remained a member of the California Water Efficiency Partnership (CalWEP) and the Emergency Response Network of the Inland Empire (ERNIE).

- Obtained corrosion and seismic/structural/safety engineering evaluations for the District's four active water storage tanks.

- Annexed the Agua Mansa Commerce Park Specific Plan area into the District. Began the process to annex and detach other areas along the District boundary so that the service area only includes areas served by RCSD.

- Annexed into the District a portion of the future Shadow Rock development.

- Consumed approximately 3.1 million kWh of electricity in CY 2020 to operate the production, treatment, distribution, conveyance, and other elements of the water distribution system that are within RCSD's operational control. Generated approximately 1,570 kWh with solar panels on the reservoir tanks.

- Made a commitment in 2021-2022 to update the RCSD Water Master Plan, Sewer Master Plan, and the RCSD Emergency Response Plan and Operations Plan, and prepare a Risk and Resilience Plan pursuant to the American Water Infrastructure Act.

Water Supplies

RCSD obtains all of its water supply from the local groundwater basin. This basin is identified as the "Riverside South Basin" and has been historically stable and sufficient to meet the needs of the District. Recorded groundwater levels show the basin is resilient to short-term and long-term drought conditions. The water quality in the basin however is impacted and requires treatment prior to distribution unless it is used for irrigation from a non-potable well. RCSD is currently adding additional treatment systems to meet current state notification limits for a new group of emerging contaminants called PFAS. With these additional treatment systems, the District will continue meeting state and federal limits to provide safe drinking water to all residents. In the event of a catastrophic event that would cut off water supplies to at least some but not likely all of the District, RCSD is prepared to bring in water from neighboring agencies, utilize water in storage reservoirs, use backup generators, and reroute water to bring the system back online as quickly as possible.

For the future, the District is planning to add several well fields and treatment facilities over the next 20 years to replace aging wells and meet the needs of future customers. Within the next five years, the District is planning to make a connection with a neighboring agency in order to bring imported water supplies into the drinking water distribution system, of which one purpose is to reduce the concentration of total dissolved solids (TDS, or salts) in the District's wastewater (sewage). Bringing recycled water to RCSD customers is currently cost-prohibitive.

Models predict that over the next 20 years the potential effects of climate change to this region of the state will result in a general increase in temperature and decrease in rainfall, with rainfall occurring in more intense but shorter events. This may affect how much groundwater is available and change how much water customers use outdoors to keep lawns and landscaping thriving in the hotter temperatures.

Water Use

The majority of RCSD customers are residential with a small commercial / industrial / governmental sector. It is estimated that there are 36,827 people living within the District's water service boundary as of CY 2020. The District population is projected to increase to 66,100 people in a mid-range density scenario and up to 83,400 people in a maximum-density scenario as properties develop according to the City's current land use plan. Buildout of the District, or rather when all the properties are developed as planned by the City of Jurupa Valley, is estimated to be reached by about 2049 and at that time, ultimate potable water use is expected to be 11,049 AF per year (not including any water sold to JCSD or others, which is currently estimated at an additional 2,000 AF per year).

Fundamental Determinations of the Plan

The water supplies that are currently available to the District are projected to remain a reliable source of water to meet the demands of customers regardless of foreseeable potential constraints including drought and water quality. Additional water supplies will be brought online to meet the projected demands of future residents through buildout of the service area. The projections of reliability considered the potential effects of climate change, impacted water quality, water shortage, the effectiveness of water conservation and emergency water supplies,

and the effects of five-consecutive-year drought periods. The District is improving its metering system to more closely monitor water use and address infrastructure and water quality constraints by replacing and upgrading aging facilities. The District will continue to evaluate preparedness to respond to the effects of long-term drought and lessen the impacts of catastrophic events to the distribution system and supply sources.

Remainder of this page left blank.

CHAPTER 2 PLAN PREPARATION

2.1 PLAN PREPARATION

Pursuant to Water Code Section 10620(b), every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier. RCSD prepared and adopted an UWMP beginning in 1985 and every five years thereafter.

This Plan follows the report organization outlined in the State UWMP Guidebook (Final March 2021). DWR has provided tables that are required to be completed by the District as part of the UWMP. Because RCSD is a retail water supplier and not a "wholesale" water supplier, the tables and information provided in the UWMP follow the requirements for "retail" water suppliers. The required UWMP tables provided by DWR are in shades of blue and titled "Submittal Table 2-1," for example. The additional tables created during the writing of this report that are not required for DWR are numbered using the chapter number in alphabetical order such as "Table 2A," for example. The required DWR tables pertaining to Baselines and Targets (Chapter 5) begin with "SB X7-7 Table…" and are shaded brown and green. A checklist to ensure compliance of this Plan with the UWMP Act requirements is provided in **Appendix B**.

The Water Code requires that the water use and planning data for the entire year of 2020 is used, and because RCSD reports on a calendar year (CY) basis, data included in this UWMP is through December 31, 2020. During CY 2020, RCSD supplied 4,770 acre-feet (AF) of potable water to 6,335 potable meters and 417 AF of non-potable water to 10 non-potable meters, as shown in **Submittal Table 2-1**. The District has just one Public Water System (PWS). Each PWS is assigned a number and they are regulated by the State Water Resources Control Board (SWRCB or State Water Board), Division of Drinking Water.

Submittal Table 2-1 Retail Only: Public Water Systems			
Public Water System Number	Public Water System Name	Number of Municipal Connections 2020	Volume of Water Supplied 2020 *
Add additional rows as needed			
CA3310044	Rubidoux Community Services District	6335	4,770
	TOTAL	6,335	4,770
**** Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*			
NOTES: From RCSD Annual Production Summary 2020. CY 2020, units in AF, potable water only. Non-potable water supplied in CY2020 was 417 AF through 10 connections.			

DWR suggests that water suppliers engage in *regional* planning to reduce inefficiencies when many agencies are sharing the same water supply source. Although the Water Code provides mechanisms for participating in regional urban water management planning, RCSD has chosen "Individual Reporting" for its UWMP, as identified in **Submittal Table 2-2**.

Submittal Table 2-2: Plan Identification			
Select Only One	**Type of Plan**		**Name of RUWMP or Regional Alliance** *if applicable* (select from drop down list)
☑	**Individual UWMP**		
	☐	Water Supplier is also a member of a RUWMP	
	☐	Water Supplier is also a member of a Regional Alliance	
☐	**Regional Urban Water Management Plan (RUWMP)**		
NOTES:			

Suppliers must report their water data in the same units consistently throughout the UWMP. **Submittal Table 2-3** confirms that RCSD is a retailer with the data provided herein on a calendar year (CY) basis and all units of measure in this UWMP are in acre-feet (AF).

Submittal Table 2-3: Supplier Identification	
Type of Supplier (select one or both)	
☐	Supplier is a wholesaler
☑	Supplier is a retailer
Fiscal or Calendar Year (select one)	
☑	UWMP Tables are in calendar years
☐	UWMP Tables are in fiscal years
Units of measure used in UWMP * (select from drop down)	
Unit	AF
**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*	
NOTES:	

2.2 PLAN COORDINATION

RCSD does not currently receive water supplies from a wholesale supplier. However, RCSD is within the service area of Western Municipal Water District (WMWD or "Western") and could receive wholesale water supplies from Western in the future. Another reason RCSD has coordinated with Western is that Western is a court-appointed member of the Western-San Bernardino Watermaster, which is responsible for implementing the court's adjudication of the groundwater basin that RCSD utilizes. This includes reporting to the court all groundwater production and recharge activities by all pumpers in the basin, including RCSD.

RCSD received a request from Western on March 23, 2021 for the District's projected imported water needs, local supplies, and total District water demand. RCSD provided said information to Western on April 12, 2021 for use in its respective UWMP as documented in **Submittal Table 2-4**. Copies of all coordination with the wholesaler, other agencies, and land use authorities are provided in **Appendix C**.

Submittal Table 2-4 Retail: Water Supplier Information Exchange
The retail Supplier has informed the following wholesale supplier(s) of projected water use in accordance with Water Code Section 10631.
Wholesale Water Supplier Name
Add additional rows as needed
Western Municipal Water District
NOTES:

The Water Code also requires Suppliers to coordinate the preparation of the UWMP with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable (CWC section 10620(d)(3)). Further, the Water Code requires notices to be sent at least 60 days prior to the public hearing to any city or county within the District's service area (CWC section 10621(b)). The District's water service area is contained entirely within the City of Jurupa Valley. A small area of unincorporated San Bernardino County is technically within the District boundary, but water service is not provided there. RCSD notified and solicited input from the following pertinent agencies for preparation of this Plan:

- City of Jurupa Valley
- City of Riverside Public Utilities
- City of Riverside Regional Water Quality Control Plant
- County of Riverside
- County of San Bernardino
- Cucamonga Valley Water District
- Inland Empire Utilities Agency
- Jurupa Community Services District
- Jurupa Unified School District
- Santa Ana River Water Company
- Western Municipal Water District
- Western-San Bernardino Watermaster
- West Valley Water District
- City of Colton Water Department
- Riverside Highland Water Company
- Santa Ana Watershed Project Authority

RCSD sent a letter to the entities listed above on March 10, 2021 notifying of the District's intent to update the 2015 UWMP including the Water Shortage Contingency Plan. The District sent a second notice to the same entities dated April 28, 2021 with details on the public hearing for the UWMP and Water Shortage Contingency Plan. Copies of all notices are included in **Appendix D**. No responses to the letters were received by the District. Chapter 10 includes detailed information on notifications and plan adoption proceedings.

2.2.1 Land Use Agency Coordination

As described in further detail in Chapter 3, RCSD and WEBB met with Planning Department staff from the City of Jurupa Valley on March 11, 2021 pursuant to CWC Section 10631(a). A copy of the meeting request letter is located in Appendix C. This meeting was held for the specific purpose of coordinating on the most appropriate land use data to use for the 2020 UWMP. The City staff provided current information on demographics, land use plan updates, and accessory dwelling unit (ADU) applications.

Although a portion of the District is within unincorporated San Bernardino County currently, the District does not provide water service to that area and therefore did not consult with San Bernardino County on land use data as part of this UWMP update.

Remainder of Page Left Blank

This Page Intentionally Left Blank

CHAPTER 3 SYSTEM DESCRIPTION

3.1 GENERAL DESCRIPTION

RCSD was organized on November 24, 1952 in accordance with the State of California Community Services District Law (Government Code Section 60000 et seq) for the purpose of providing certain public services including domestic water service. RCSD is California's first community services district (CSD). The District is empowered to manage water resources and to construct, operate, maintain, repair, and replace water system facilities as needed to provide water service in compliance with applicable standards and regulations. The District routinely constructs, maintains, and replaces facilities as necessary to maintain adequate, reliable, and safe water service to its customers.

The District is a public entity and governed by a five-member Board of Directors elected at-large. Each member resides within the District and is elected to a four-year term. The role of the Board of Directors is to provide oversight and establish the governing policies of the District. The District's General Manager oversees the day-to-day operations. The Board of Directors conduct regular Board meetings on the first and third Thursday of every month at 4:00 pm at the District Office.

3.2 SERVICE AREA BOUNDARY

The RCSD boundary encompasses an area of approximately 5,369 acres that are mostly within the City of Jurupa Valley in northwest Riverside County. The District is bounded by San Bernardino County to the north, the Jurupa Mountains and Pedley Hills to the southwest, the City of Jurupa Valley to the west, the Santa Ana River to the south and the City of Riverside to the east. Refer to **Figure 3-1 – Vicinity Map** (all figures are located at the end of each chapter).

RCSD provides water service to approximately 5,048 acres. Approximately 329 acres of the District is not served water by RCSD, as shown in **Figure 3-2 – Water Service Area**. West Valley Water District (WVWD or West Valley) serves water to approximately 206 acres within the City of Jurupa Valley and approximately 123 acres of unincorporated San Bernardino County that are technically within the RCSD boundary. Because this area in the upper northeast corner of the District is served by another supplier, which has been serving the area

for some time, and the area is slated for detachment from the District in the very near future, this 329-acre area is not considered as part of the District for purposes of the UWMP.

3.2.1 Annexations

In 2020, RCSD annexed the area of the future Agua Mansa Commerce Park Specific Plan for the purpose of providing water service in the future. This added approximately 291 acres of the former Riverside Cement Plant, which received water from a private, onsite well. The specific plan will include a 4.4 million square foot logistics center with 70 acres of open space. Otherwise, there have been no other changes to the District's service area boundary since the 2015 UWMP.

The District is actively working on several annexations to add land and remove land from its service area in the future for the purposes of (1) incorporating properties that have been served water by the District for some time, but are technically outside the service area; (2) detaching properties from the District service area that are served by other water suppliers; (3) incorporating property that is owned by the District but is outside the service area; (4) incorporating property that is within a District pressure zone but outside of the current service area; and (5) incorporating properties to be served by the District in the future as a result of new development applications. These efforts will make the service area more contiguous and remedy some longstanding inconsistencies. The neighboring water suppliers are shown in **Figure 3-3 – Surrounding Water Suppliers.**

3.2.2 Potable Water System and Pressure Zones

All water delivered by the District is produced from groundwater wells and all groundwater is treated prior to distribution. The District currently has six active potable wells (i.e., Wells 1A, 2, 4, 6, 8, and 18) and Well 5 for emergency use only with a combined maximum pumping capacity of approximately 9,950 gallons per minute (gpm). In CY 2020, only wells 1A, 2, 6, and 8 were used, with Well 8 providing the majority of total potable production (53%), followed by Well 1A (27%), Well 2 (19%), and Well 6 (1%). Well 18 is currently being repaired and Well 4 was put back into service in 2021 following improvements to the treatment system. All wells are located within the RCSD boundary and draw from the Riverside South Groundwater Basin. Water from Wells 4 and 6 is treated at the District's Anita B. Smith (Smith) Nitrate Removal

Facility to reduce the concentration of nitrate before it enters the distribution system. The Smith Plant has a treatment capacity of approximately 4.9 million gallons per day (MGD) (3,400 gpm) based on current year 2020 water quality and well production. Water from the other wells is treated at the District's Leland J. Thompson (Thompson) Water Treatment Plant. The Thompson Plant has a treatment capacity of approximately 7.2 MGD (5,000 gpm). Water from the Thompson Plant is then blended with water from Well 2 before it enters the distribution system. Prior to blending, water from Well 2 is currently being treated for removal of 1,2,3-trichloropropane (1,2,3-TCP). A third water treatment facility, the LaVerne J. Mahnke (Mahnke) Manganese Removal Facility, is currently not used. The District also operates three booster pumping plants (i.e., Goldenwest, Mission, and Skyloft) with a combined online capacity of approximately 2,210 gpm, four active water storage reservoirs and a fifth not in service (i.e., Atkinson, Hunter No. 1, Hunter No. 2, Watson, and Perrone) with a combined capacity of 6.4 million gallons (MG), and approximately 74 miles of potable water pipelines.

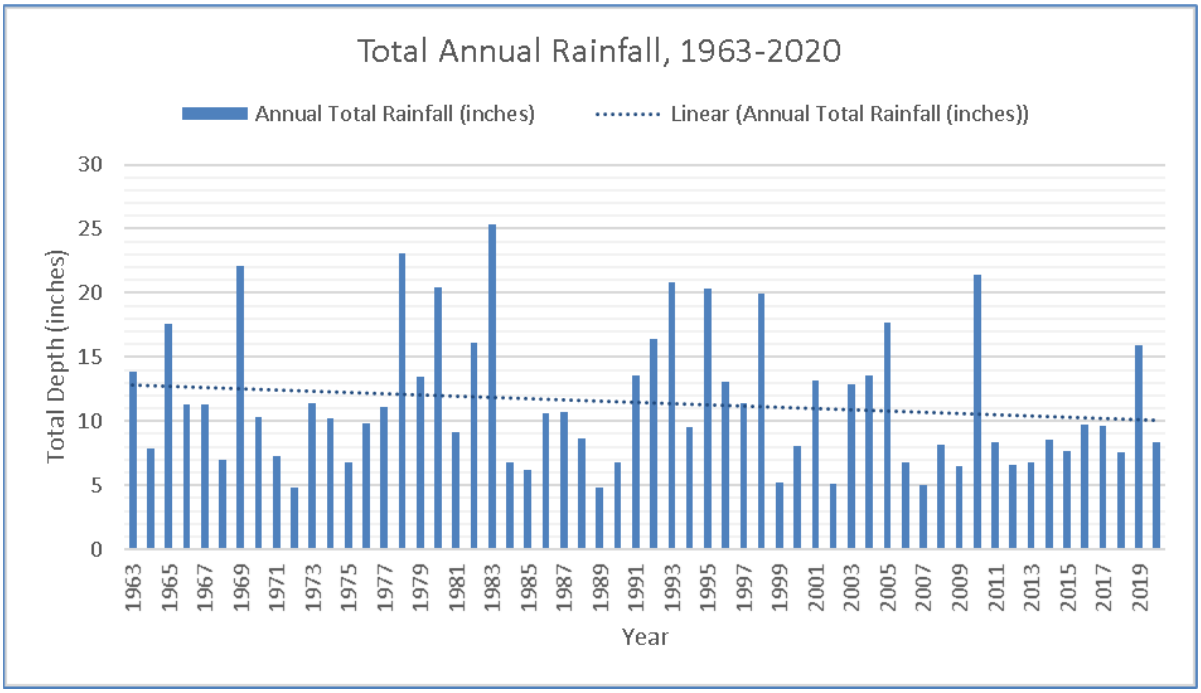
RCSD is currently completing projects to add treatment systems to the active wells to remove perfluorooctanic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) that are in the PFAS family of chemicals using a combination of ion-exchange (IX) at Wells 1A, 8, and 18 and granulated activated carbon (GAC) at Wells 2, 4 and 6 (DM 2021-10).

RCSD received a grant in March 2021 from the California Governor's Office of Emergency Services (CalOES) "Community Power Resiliency Program" to offset most of the costs for fixed generators at Well 1A, Well 2, and Mission Booster Station. The generators will help mitigate the effect of power disruptions and have been placed where they would be most beneficial for increased system reliability (DM 2021-17).

The District's potable water system contains two large and one small water pressure zones (PZ); Atkinson PZ, Hunter PZ, and Ridgeline PZ, respectively. The Ridgeline PZ is served by the Skyloft Booster Pumping Plant, which includes a hydropneumatic system to serve elevations above the upper limit of the Hunter PZ. Most of the water delivered by the District is used within the Atkinson PZ. The District is currently updating its *2015 Water Master Plan*, which is expected to be completed by 2022 and will provide detailed information on the District's water distribution facilities.

3.2.3 Non-Potable Water System

The District has six non-potable wells (i.e., Well Nos. 3, 7, 11, 14, and 19/20). In CY 2020, the District operated four non-potable wells (i.e., Wells 3, 11, and 19/20) with a combined pumping capacity of 1,200 gpm. Well 3 supplies hydrants with non-potable construction water, Well 11 supplies the Jurupa Hills Golf Course, and Well 19/20 supplies non-potable water for irrigating street median landscaping along Mission Boulevard as well as hydrants and landscaping at an animal hospital. The District also maintains nominal lengths of non-potable pipelines that are associated with each non-potable well. In CY 2020, Well 11 provided 89% of non-potable water supplies, with the remainder provided by Well 19 and Well 3. Wells 7 and 14 can be available for non-potable use with a combined pumping capacity of 700 gpm.



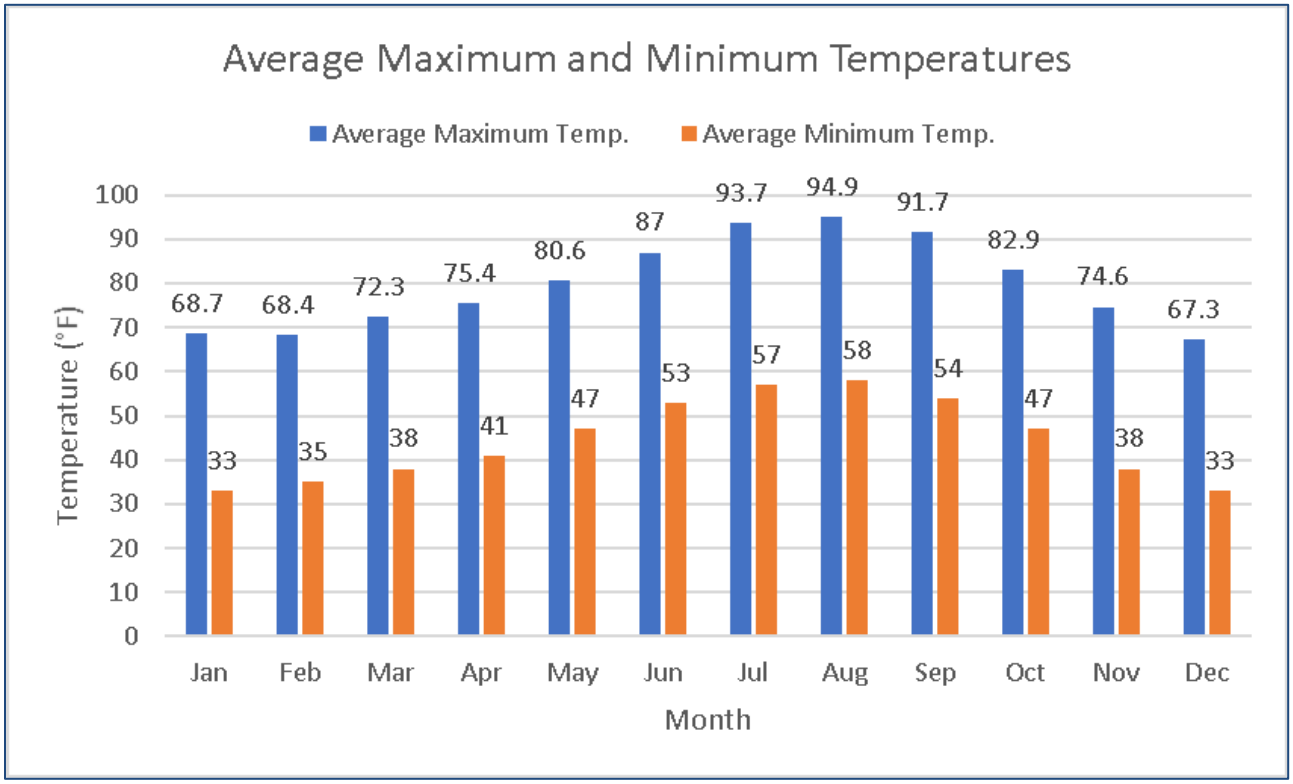
3.3 SERVICE AREA CLIMATE

Like much of inland Southern California, climate in the District's service area is characteristically Mediterranean with short, mild winters and hot, dry summers.

3.3.1 Rainfall

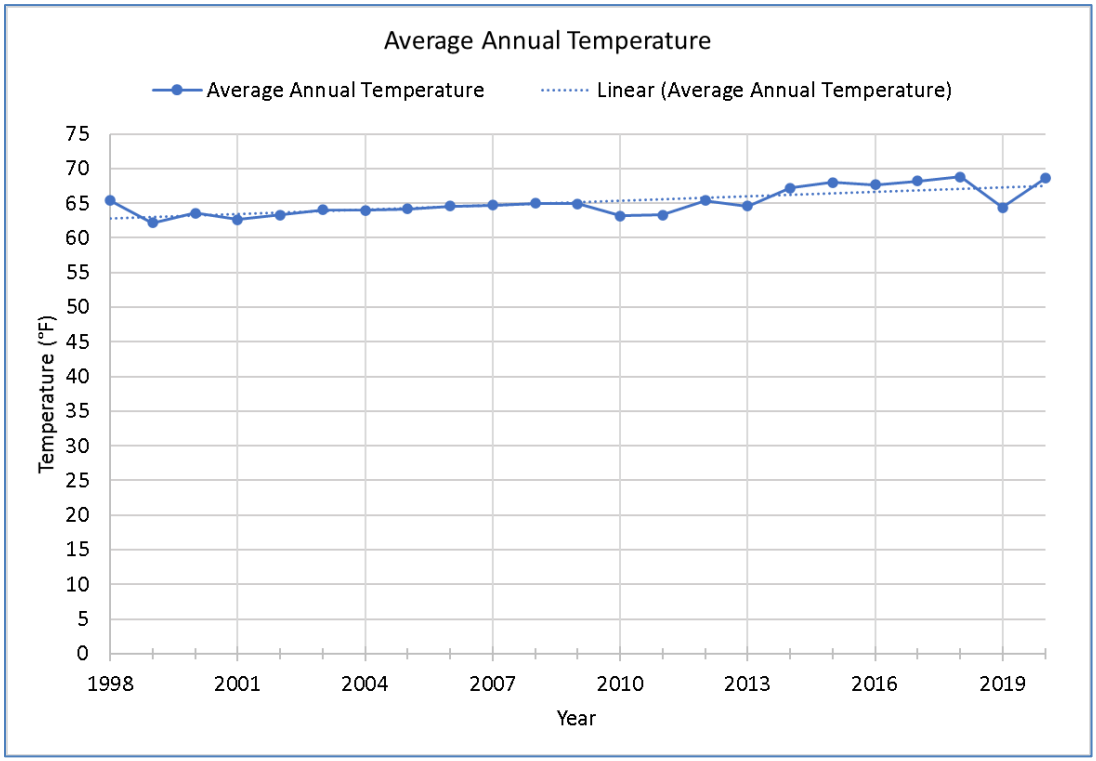
Precipitation in the District occurs between fall and spring, with the majority occurring in winter months. Based on 57 years of data, the District receives an annual average of 11.4 inches (RCFC(a)). Yearly rainfall data for the District from 1963 through 2020 is shown in **Chart 3-1**, which was obtained from the Riverside County Flood Control and Water Conservation District (RCFC) Station No. 178 ("Riverside North"). This station is located at their district headquarters approximately 2 miles east of RCSD offices.

Chart 3-1: Total Annual Rainfall 1963-2020 (inches) at Riverside Stn. 178 (Source: RCFC(a))



As shown in Chart 3-1, the maximum recorded rainfall was 25.3 inches in 1983 and the least was 4.8 inches in 1972. The linear trendline shows a slight decrease in total annual rainfall over the time period.

3.3.2 Temperature



Like most of inland Southern California, temperatures in the RCSD service area are typically mild, with cool winters and hot summers. Maximum temperatures occur in summer months, with a maximum average of approximately 95ºF in August based on the last 22 years of data, as shown in **Chart 3-2.** Minimum temperatures occur in winter months with average minimums at 33°F in December and January. The temperature data shown here was recorded at the Riverside Airport located approximately five miles south of RCSD offices.

Chart 3-2: Monthly Average Maximum and Minimum Temperatures at Riverside Airport, 1998-2020 (Source: AgACIS)

Average annual temperatures for the service area over the last 22 years are shown in **Chart 3-3**. The trendline suggests a gradual increase in the average annual temperature.

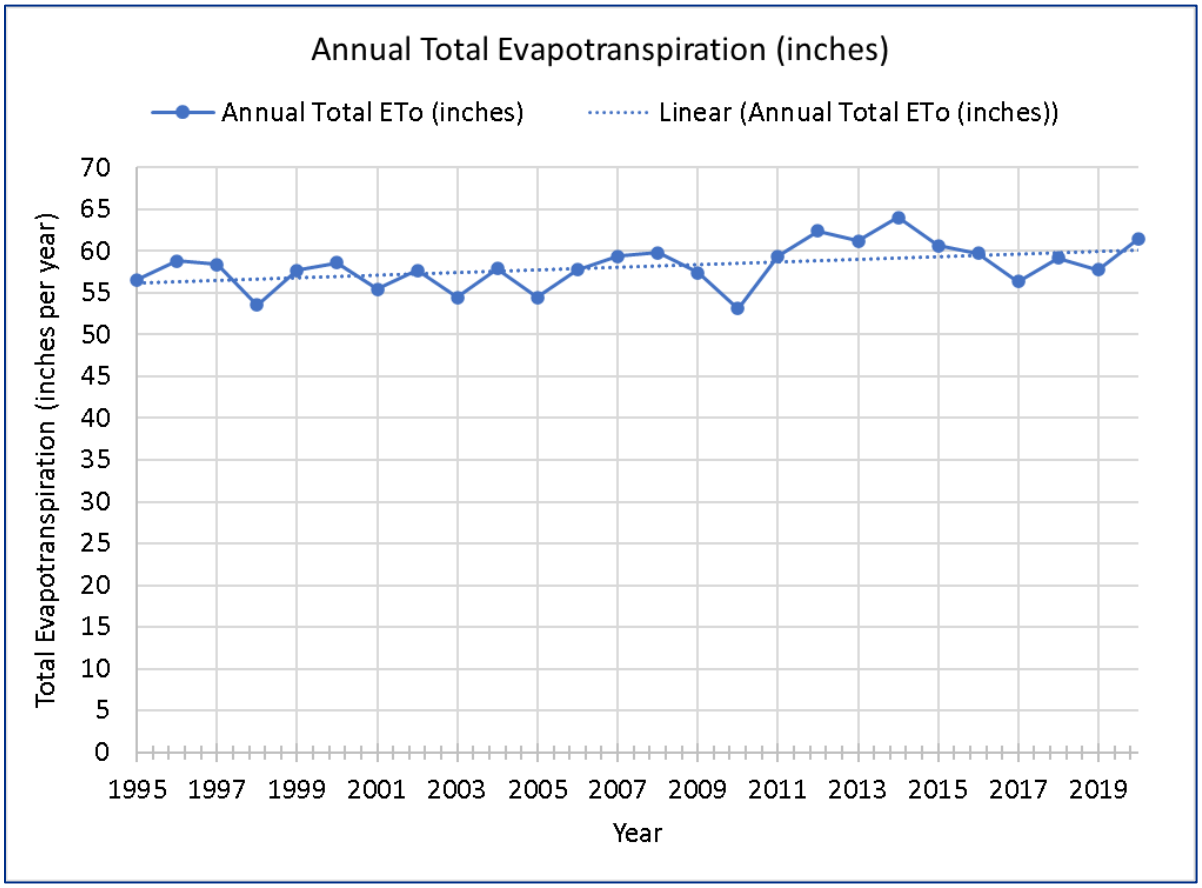


Chart 3-3: Annual Average Temperature at Riverside Airport, 1998-2020 (Source: AgACIS)

3.3.3 Evapotranspiration

Evapotranspiration (ET) is the combination of processes when water is lost from the soil surface by evaporation and lost from plants by transpiration. The evaporation power of the atmosphere is expressed by the reference crop evapotranspiration (ET_o) in units of depth of water over time (e.g., inches/day). The greater the ET rate, the more water needed to satisfy plant demands. Total annual ET_o values from 1995 to 2020 measured in proximity to the District service area are shown in **Chart 3-4**.

Chart 3-4: Total Annual Evapotranspiration (inches), 1995-2020 (Source: Valley Soil)

The annual average ET_o rate for this time period is 58.2 inches/year. The highest total annual ET_o was measured in 2014 at 64.0 inches and the lowest total ET_o was in 2010 at 53.1 inches. The linear trendline suggests an increase in ET_o over the time period.

3.3.4 Summary of Potential Climate Changes

Several sections of the Water Code have been revised since the 2015 UWMP cycle to require that water suppliers account for the impacts of climate change on water supplies and supply reliability in their 2020 UWMPs. Although the Water Code does not specify the technical nor general methods for how to consider climate change in UWMPs, DWR provides guidance on common approaches that can be used. Detailed discussions of the potential effects of climate change on District water demands, water supplies, and water reliability are provided in Chapter 4 – Water Use Characterization, Chapter 6 – Water Supply Characterization, and Chapter 7 –

Water Service Reliability Assessment. The following is a summary of the anticipated climate changes or scenarios within the District.

This discussion is guided by the "Urban Water Management Plan Guidebook 2020" and relies, in part, on the tools and resources available on the Cal-Adapt Website (https://cal-adapt.org/), which synthesizes volumes of downscaled climate change projections and climate impact research from California's scientific community. The default visualizations in the Cal-Adapt projections shown herein are based on the average values from a variety of models and are projections of future climate. They are not weather predictions and should not be treated as such.[1]

Climate projections cannot tell us what will happen on a given date in the future. But they can tell us what to expect from our future climate in general and how much more often (or less often) extreme events such as heat waves and heavy rainfall are likely to occur in the future. However, they cannot predict when those events will actually occur.

The Cal-Adapt climate models presented here make predictions for the period of 2006 to 2100 and recreate the historical climate for the period 1950 to 2005. Two future climate projections using medium and high greenhouse gas and aerosol emissions scenarios are presented here. These scenarios are known as Representative Concentration Pathways (RCP). Each RCP represents a standardized set of assumptions of humanity's trajectory in the coming years. Cal-Adapt does not provide data for a "low" greenhouse gas emissions scenario.

The Medium Emissions Scenario (RCP 4.5) represents a mitigation scenario where global carbon dioxide (CO_2) emissions peak by 2040 and then decline. Statewide, temperature is projected to increase 2-4 Celsius (°C) for this scenario by the end of this century.

The High Emissions Scenario (RCP 8.5) represents a scenario where CO_2 emissions continue to rise throughout the 21st century. Statewide, temperature is projected to increase 4-7 °C for this scenario by the end of this century.

[1] Weather is the behavior of the atmosphere over short periods, such as days and weeks. Climate is the long-term behavior of the atmosphere, and it is almost always expressed in averages—for example, average annual temperature, average monthly rainfall, or average water equivalent of mountain snowpack at a given time of year. In other words, climate is the statistics of weather.

Cal-Adapt's "Local Climate Change Snapshot" tool provides the following climate projections for temperature, precipitation, and wildfire for the District's service area. The City of Jurupa Valley was selected as the representative location of the District's service area.

As discussed further in Chapter 4, Western Municipal Water District (WMWD or Western) conducted an analysis of climate change data as part of Western's 2020 UWMP and provided the results to its member agencies, including RCSD, on April 22, 2021 (WMWD(a)). The source data were climate models gathered by DWR for water resources planning. Because Western's analysis does not provide a summary of anticipated climate changes for the service area, the following projections of temperature and precipitation trends from Cal-Adapt for the City of Jurupa Valley are included herein for reference. Said trends from Cal-Adapt of increasing temperatures and decreasing rainfall do not conflict with Western's analysis.

Cal-Adapt Temperature Projections

Overall temperatures are projected to rise in California during the 21st century. While the entire state will experience temperature increases, the local impacts will vary greatly. Four separate climate indicators are reported by Cal-Adapt for temperature changes: 1) Annual Average Maximum Temperature, 2) Annual Average Minimum Temperature, 3) Extreme Heat Days, and 4) Warm Nights.

Annual Average Maximum Temperature reports the average of all the hottest daily temperatures in a year. The most likely outcome and range of future projections of Annual Average Maximum Temperature in the Jurupa Valley area are shown in **Chart 3-5**.

Chart 3-5– Cal-Adapt Projections for Annual Average Maximum Temperature (°F)
(Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley)

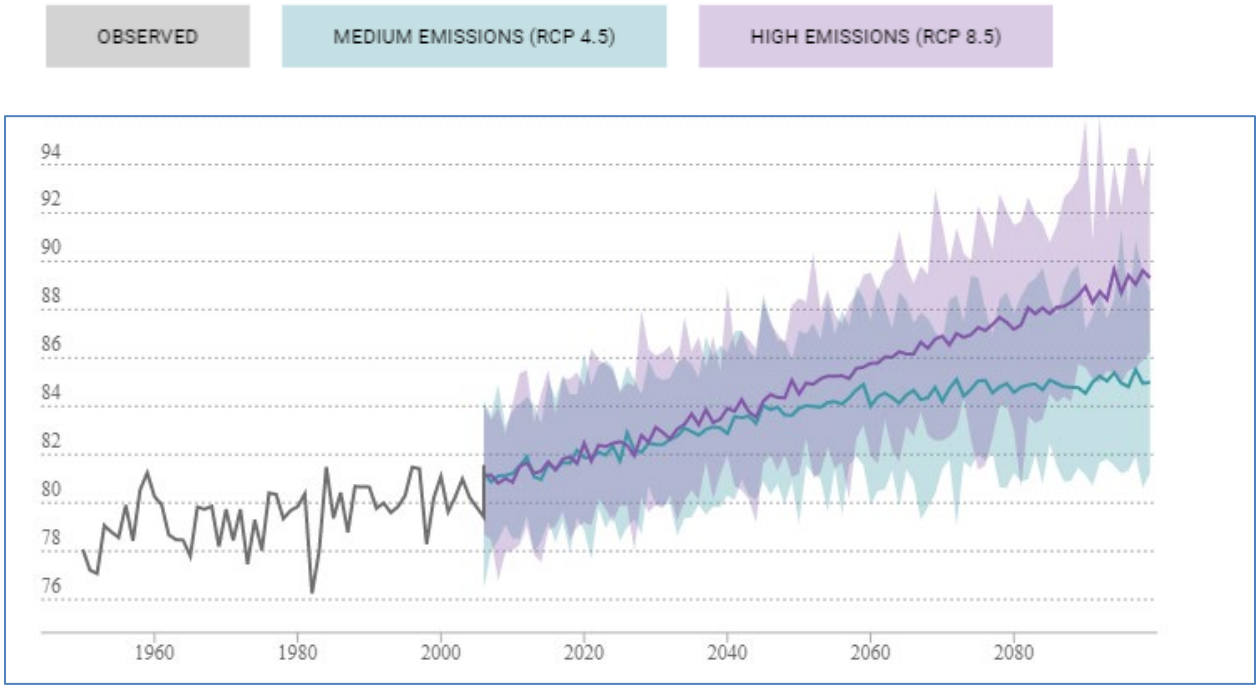

Table 3A below provides a summary of Cal-Adapt projections for Annual Average Maximum Temperature for baseline (1961-1990) and mid-century (2035-2064) time periods in the Jurupa Valley area.

Table 3A - Cal-Adapt Projections for Annual Average Maximum Temperature

Time Period	Change from Baseline	30-year Average	30-year Range
Baseline (1961-1990)	--	79.3 °F	78.9 - 79.7 °F
Mid-century (2035-2064)			
RCP 4.5	+4.5 °F	83.8 °F	81.6 - 86.3 °F
RCP 8.5	+5.4 °F	84.7 °F	82.1 - 87.0 °F

Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley.
RCP: representative concentration pathway; 4.5: medium emissions scenario; 8.5: high emissions scenario.

Annual Average Minimum Temperature reports the average of all the coldest daily temperatures in a year. Shown on **Chart 3-6** is the most likely outcome and range of future projections of Annual Average Minimum Temperature in the Jurupa Valley area.

Chart 3-6 – Cal-Adapt Projections for Annual Average Minimum Temperature (°F)
(Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley)

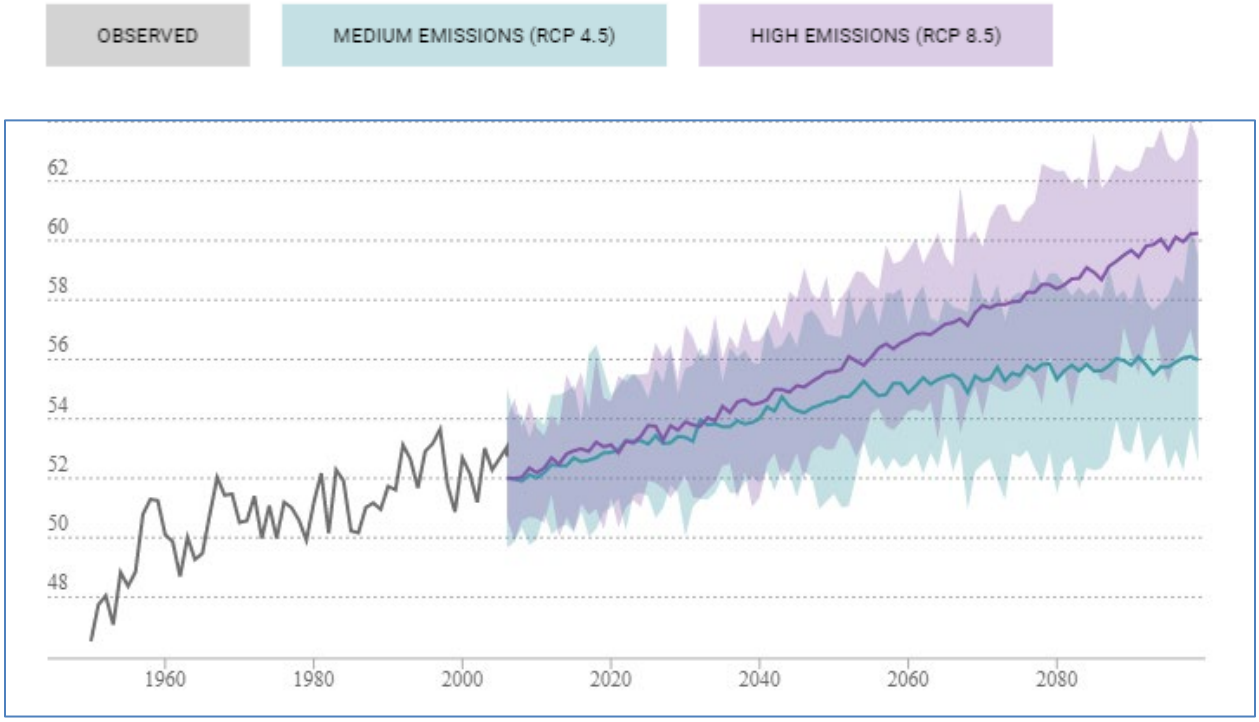

Table 3B below provides a summary of Cal-Adapt projections for Annual Average Minimum Temperature for baseline and mid-century time periods in the Jurupa Valley area.

Table 3B - Cal-Adapt Projections for Annual Average Minimum Temperature

Time Period	Change from Baseline	30-year Average	30-year Range
Baseline (1961-1990)	--	50.7 °F	50.4 – 50.9 °F
Mid-century (2035-2064)			
RCP 4.5	+3.9 °F	54.6 °F	52.9 – 56.0 °F

Cal-Adapt Precipitation Projections

California's climate varies between wet and dry years. Research suggests that for much of the state, wet years will become wetter, and the dry years will become drier. Dry years are also likely to be followed by dry years, thus increasing the risk of drought. While California does not see the average annual precipitation changing significantly in the next 50-75 years, precipitation will likely be delivered in more intense storms and within a shorter wet season.

Three separate climate indicators are reported for precipitation changes: 1) Maximum 1-day Precipitation, 2) Maximum Length of Dry Spell, and 3) Annual Precipitation.

The Maximum 1-Day Precipitation amount for each year is the greatest amount of daily rain or snow (over a 24-hour period) for each year. **Chart 3-9** shows the most likely outcome and range of future projections of Maximum 1-day Precipitation in the Jurupa Valley area.

Chart 3-9 – Cal-Adapt Projections for Maximum 1-day Precipitation
(Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley)

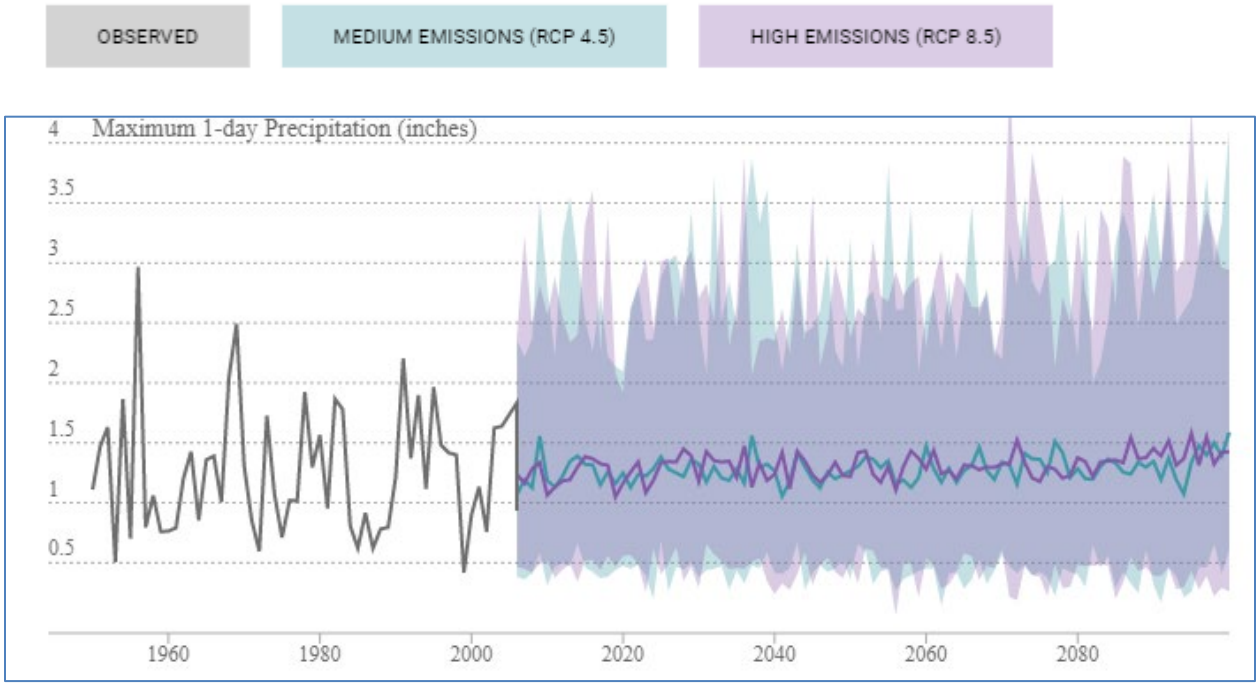

Table 3E, below provides a summary of Cal-Adapt's projections for Maximum 1-day Precipitation for baseline (1961-1990) and mid-century (2035-2064) time periods for the Jurupa Valley Area.

Table 3E– Cal-Adapt Projections for Maximum 1-Day Precipitation

Time Period	Change from Baseline	30-year Average	30-year Range
Baseline (1961-1990)	--	1.205 inches	1.014 – 1.359 inches
Mid-century (2035-2064)			
RCP 4.5	+0.058 inches	1.263 inches	1.038 – 1.426 inches
RCP 8.5	+0.079 inches	1.284 inches	1.063 – 1.516 inches

Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley
RCP: representative concentration pathway; 4.5: medium emissions scenario; 8.5: high emissions scenario.

Maximum Length of Dry Spell is the maximum length of dry spell for each year. In other words, the maximum number of consecutive days with precipitation less than one millimeter for each

year. **Chart 3-10** shows the most likely outcome and range of future projections of Maximum Length of Dry Spell in the Jurupa Valley area.

Chart 3-10 – Cal-Adapt Projections for Maximum Length of Dry Spell
(Source: Cal-Adapt, Local Climate Snapshot for Jurupa Valley)

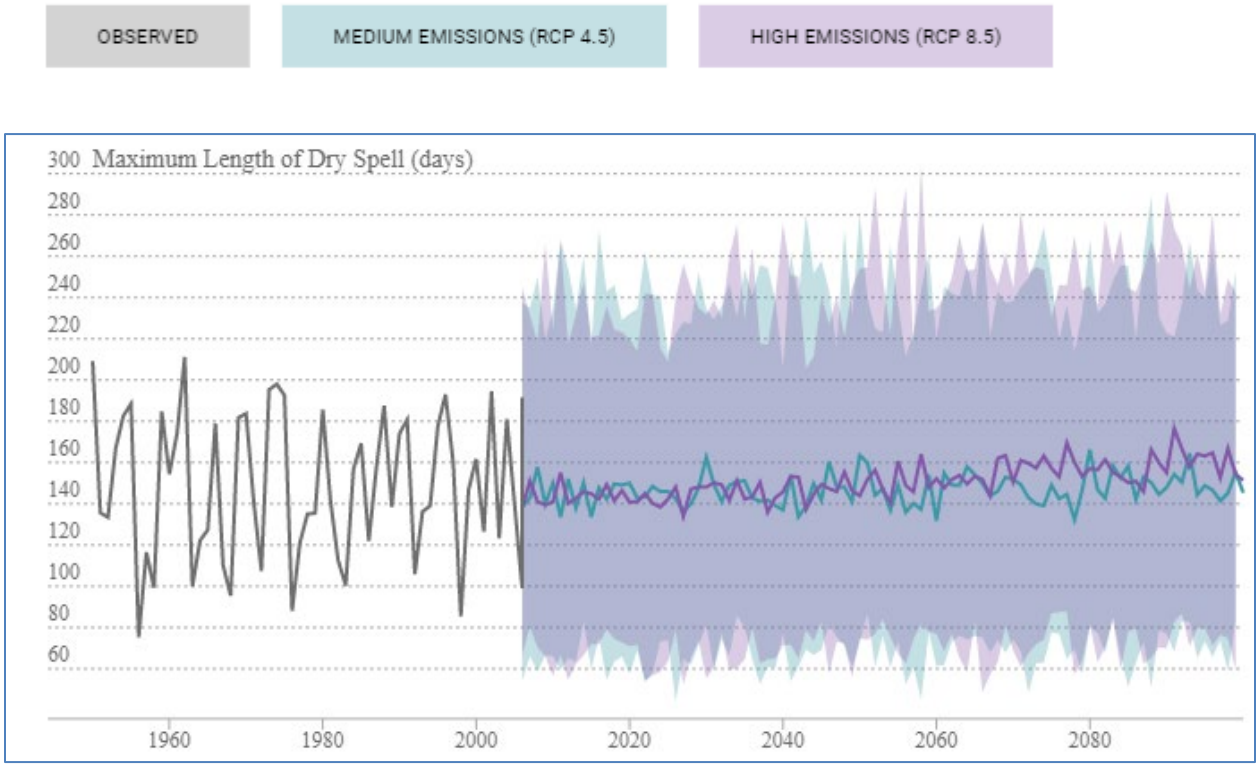

Table 3F, below provides a summary of Cal-Adapt projections for Maximum Length of Dry Spell for baseline and mid-century time periods in the Jurupa Valley area.

Table 3F – Cal-Adapt Projections for Maximum Length of Dry Spell

Time Period	Change from Baseline	30-year Average	30-year Range
Baseline (1961-1990)	--	138 days	123 – 156 days
Mid-century (2035-2064)

Cal-Adapt Wildfire Projections

The frequency, severity, and impacts of wildfire are sensitive to climate change as well as many other factors, including development patterns, temperature increases, wind patterns, precipitation change, and pest infestations. Therefore, it is more difficult to predict exactly where and how fires will burn. Instead, climate models estimate increased risk of wildfires.

The Cal-Adapt information presented here (Annual Average Area Burned) can help inform at a high level if wildfire activity is likely to increase. However, this information is not complete—many regions across the state have no projections (such as regions outside combined fire state and federal protection responsibility areas), and more detailed analyses and projections are needed for local decision-making. These projections are most robust for the Sierra Nevada given model inputs. However, as we have seen in recent years, much of California can expect an increased risk of wildfire, with a wildfire season that starts earlier, runs longer, and features more extreme fire events.

The Cal-Adapt average of the area projected to be at risk to burning in a year for the modeled baseline (1961-1990) time period for the City of Jurupa Valley is approximately 42 acres. By the mid-century (2035-2064) time period, the annual average risk of wildfire is projected to decrease to 8.5 acres in the City of Jurupa Valley. The areas within and near the District service area that are most at risk of wildfire are the Jurupa Mountains and Pedley Hills. Also, brush fires have taken place along the Santa Ana Riverbed which borders the District to the southeast (JVGP, p. 8-16).

Uncertainty of Cal-Adapt Projections

Climate projections provided by Cal-Adapt are approximations of future climate, but as with any statement about the future, there is no way to be certain they are accurate. One source of uncertainty in future climate projections is human greenhouse gas emissions. Projected climate data may not prove to be accurate if the actual emissions pathway differs from the scenarios used to make the projections.

Another source of uncertainty in climate projections is the fact that different climate models—the tools used to simulate the climate system and produce future climate data—may produce different outcomes. There are more than 30 global climate models developed by climate

modeling centers around the world, and they have different ways of representing aspects of the climate system. In addition, some aspects of the climate system are less well understood than others. Climate scientists are constantly working to improve the theories of the climate system and its representation in climate models. In the meantime, one way to account for model differences is to look at projections from as many different models as possible to get a range of possible outcomes. An average of the values can be taken across the different models, and this average value is a more likely outcome than the value from any single model.

It is important to note that here the term "uncertainty" is being used in the scientific sense, to acknowledge that there is a range in possible future outcomes. That climate change is occurring and is caused by human activity is the consensus of the overwhelming majority of scientists engaged with the issue. What is less certain is the extent to which the climate will change in the future, and precisely how the changes will affect natural and human systems.

3.4 SERVICE AREA POPULATION AND DEMOGRAPHICS

3.4.1 Service Area Population

The District currently serves a population of approximately 36,827 people, which does not include the portion served by West Valley Water District. The current District population was generated using DWR's online Population Tool, which was developed specifically for UWMPs and updated for the 2020 cycle. The Population Tool calculates current and past populations using U.S. Census year data (1990, 2000, 2010) with the total number of meters from the RCSD Annual Reports to the SWRCB to calculate a person-per-connection ratio.[4] To calculate the 2020 population, the total number of connections is entered (6,335 meters) and the Population Tool multiplies that by a calculated person-per-connection ratio of 5.18. Results of the Population Tool are provided in **Appendix E**.

The current and future projected population of the District are shown in **Submittal Table 3-1**.

[4] U.S. Census data from the 2020 Census was not available in time for use in the DWR Population Tool.

Submittal Table 3-1 Retail: Population - Current and Projected						
Population Served	2020	2025	2030	2035	2040	2045*(opt)*
	36,827	40,542	51,303	54,996	58,955	63,199
NOTES: 2020 population from DWR Population Tool. Average annual growth rate of 1.4% (from U.S. Census Bureau) with addition of 7,842 persons in 2030 from estimated completion of the Rio Vista Specific Plan (1,307 DU and 6 people/DU). Mid-range density buildout estimated by 2049 at 66,100 persons, which includes 20% increase in people/unit for certain residential land uses to account for potential future ADUs.						

The population projections from 2025-2045 that are shown in Submittal Table 3-1 were calculated using the City's current land use plan, the average annual growth rate for the City from 2009-2019 from U.S. Census Bureau data, and two persons per dwelling unit factors including a higher factor to account for additional potential accessory dwelling units (ADUs). ADUs are discussed below in Section 3.4.2.

U.S. Census Bureau data from 2009 to 2019 suggests the annual population growth rate for the City of Jurupa Valley is 1.4% over that time period (USCB). U.S. Census Bureau "Quickfacts" 2015-2019 data estimates 4.21 persons per dwelling unit and the DWR Population Tool estimates 5.81 persons per dwelling unit for 2020. The average of the two sources is 5 persons per dwelling unit, which is used for the population projection of residential land uses that do not typically accommodate ADUs.

The Rio Vista Specific Plan is a significant housing project that may be developed and incorporated into the District's service area by 2030 (see Section 3.5 below for more details). The project proposes 1,307 dwelling units. Conservatively assuming 6 persons per dwelling unit, which is a 20% increase to account for potential ADUs that may be built, the population projection in Submittal Table 3-1 assumes 7,842 persons are added to the District population by 2030.

The buildout population for the District is calculated assuming full buildout of the City of Jurupa Valley's current General Plan Land Use Map (updated March 2021) and the District's current water service area boundary. See buildout calculations in **Appendix F**. The City's residential land use types have a minimum and maximum allowable density and typically, development

occurs at the mid-point between the minimum and the maximum. Therefore, this plan estimates mid-range density and maximum density buildout scenarios. The mid-range density population is estimated at 66,100 persons and the maximum density buildout population is estimated at 83,400 persons taking into account 20% more people for the residential land use types that allow ADUs (see Section 3.4.2) (Appendix F).

Using the calculated growth rate of 1.4%, 5 or 6 persons per dwelling unit (depending on the land use type), the additional estimated population from the Rio Vista project, a mid-range buildout population of 66,100 persons, and a starting 2020 population of 36,827 persons, the portion of Jurupa Valley that is within RCSD's service area may achieve mid-range density buildout of 66,100 persons by year 2049.

3.4.2 Accessory Dwelling Units

Accessory dwelling units (ADUs) are also known as "granny flats," second units, or in-law units. They can be for one or more people and can be detached, attached, existing space converted into an independent living unit, or a Junior ADU contained entirely within an existing or proposed single-family residence. ADUs are being encouraged by the State to increase residential infill and help meet the increasing statewide demand for affordable housing. Because the ADU laws (Gov. Code 65852.2) change each year, readers should refer to the California Department of Housing and Community Development (www.hcd.ca.gov) for the latest changes to the law.

An increase in ADUs in existing residential areas may densify them more than what had been planned for previously by the District. Particularly in areas that are considered currently "built-out" with infrastructure that is already sized at "ultimate" design capacity, an increase in ADUs may trigger capital projects to upsize existing pipes or replace degrading infrastructure earlier than expected.

RCSD and WEBB met with the City of Jurupa Valley Planning Department staff for the purposes of this UWMP. As a result, the City of Jurupa Valley shared that between 2016 and 2020, they have received two building permit applications for attached ADUs within the District's boundary: one in 2019 and one in 2020. Both were applications to convert existing garage space (Personal Communication, A. Tam, 4/13/21).

The Jurupa Valley City Council adopted Ordinance No. 2020-18 on November 5, 2020 to amend the Zoning Ordinance pertaining to ADUs and junior ADUs. It is hard to gauge how the ADU laws will play out in the RCSD service area. Residential properties in Jurupa Valley tend to have the space needed for attached and detached ADUs. However, several census block groups within Jurupa Valley have median household incomes that meet the threshold for "disadvantaged" and "severely disadvantaged" communities (see Section 3.4.4, below).

For the planning purposes of this UWMP, an estimate has been made assuming each dwelling unit has 5 persons and half of the residential properties where ADUs are allowed may develop an ADU and each ADU would have 2 persons, which results in a 20% population increase. Therefore, the potential future impact of ADU's in residential areas is accounted for in two ways: (1) the number of people per dwelling unit was increased by 20%, from 5.0 to 6.0, but only for those residential land uses with densities up to and including medium high density residential (Appendix F); (2) the water demand projections in Chapter 4 are increased 20% for the same residential land uses. It is assumed ADUs are not feasible for high density residential to highest density residential land uses. The 20% increase in population for certain land use types that allow ADUs is embedded in the population projections in Submittal Table 3-1.

The District plans to address ADUs in the future to ensure consistency with the State regulations, including when a separate connection is required and to correctly assess and collect appropriate fees.

3.4.3 Other Social, Economic, and Demographic Factors

The City of Jurupa Valley (City) encompasses approximately 45 square miles in western Riverside County. According to U.S. Census Bureau "QuickFacts" data, the City has a 2019 population estimate of 109,527 people and a 2019 median household income of $70,642 (USCB). According to the City's 2017 General Plan, Jurupa Valley has a large blue-collar population with most employees working in the transportation, warehousing, and retail trade and manufacturing industries (p. 11-3). The City is comprised of nine distinct communities; three of which are in the District (i.e., Rubidoux, Belltown, and Crestmore Heights). Rubidoux is the largest and most densely developed of the nine communities with a variety of land uses (*ibid,* p. 9-3); however, unemployment rates are higher in this area compared to county and state averages (*ibid,* p. 11-3). The Belltown area is largely suburban or small town with

equestrian trails, while Crestmore Heights is mostly semi-rural and low density in character (*ibid,* p. 2-1).

Land use in the City is predominantly single-family residential consisting of a mix of medium- and low-density units, with concentrations in the older neighborhoods of low-cost rental housing (ibid, p. 5-40). The City strives to maintain a small-town feel and the equestrian lifestyle, while also incorporating a mix of retail commercial, office, and industrial uses. The City in general is currently experiencing growth in residential and industrial uses. The City has potential for significant growth and redevelopment in all urban land use types, especially historic town centers.

RCSD's service area consists mainly of single-family residential customers, but also includes some commercial, industrial, institutional, and landscape connections. The number of potable water meters from 2016 to 2020 are shown in **Table 3H.** Over this time period, the number of service connections for single-family residential have consistently accounted for 94% of all customer meters. Service connections for multi-family residential customers make up 6% of all meters, commercial/institutional meters are 0.3%, and industrial has been 0.03% of the total.

Table 3H - RCSD Metered Connections, 2016-2020

Customer Meter	2016	2017	2018	2019	2020
Single-Family Residential	6,115	6,165	6,265	5,548	5,558
Multi-Family Residential	385	385	385	385	385
Commercial /Institutional	20	20	20	384	389
Industrial	2	2	2		
Potable Hydrants	-	-	-	4	3
Non-Potable	3	3	3	13	10
Total Active Connections	**6,525**	**6,575**	**6,675**	**6,334**	**6,345**

Source: RCSD *Large Water System Annual Report to the Drinking Water Program [Section 116530 Health & Safety Code]* for years ending December 31, 2016-2020.

3.4.4 Disadvantaged Communities

U.S. Census data is gathered at three levels of precision: Census Designated Place (CDP), Census Tracts, and Census Block Groups. CDPs are at the broadest level for unincorporated

areas. Census Tracts are made up of Block Groups. According to U.S. Census data collected from 2014 to 2018 by DWR's Disadvantaged Communities (DAC) Mapping Tool, some Community Tracts and Block Groups within the RCSD service area qualify as "disadvantaged" and "severely disadvantaged" as shown in **Figure 3-4 – Disadvantaged Community by Census Block**.

California Code of Regulations Section 596.1(b)(2) defines a "disadvantaged community (DAC)" as: "A community with an annual median household income (MHI) that is less than 80 percent of the statewide annual MHI." The statewide MHI according to the Census American Community Survey (ACS) 2014-2018 dataset is $71,228; thus, 80 percent and 60 percent of that value represents the DAC and Severely DAC (SDAC) thresholds, respectively. Therefore, a community where the MHI is less than $56,982 meets the DAC threshold and a MHI less than $42,737 meets the SDAC threshold (ACS).

The DWR DAC Mapping Tool is an online reference to assist local agencies to evaluate DAC status, using the definition provided by Proposition 84 Guidelines. Having areas in its service area that qualify as a DAC opens the District to the possibility of applying for State grant funding to assist with the implementation, planning, and DAC involvement efforts through Proposition 1 (Water Quality, Supply, and Infrastructure Improvement Act of 2014), and potentially grant funding through Proposition 84, Chapter 2 (Integrated Regional Water Management). In the event RCSD proceeds with either grant application process, additional research beyond what is provided herein per the grant requirements may be necessary.

3.5 LAND USES WITHIN SERVICE AREA

The District does not have land use authority within its service area; rather, that authority rests with the City of Jurupa Valley. The City incorporated on July 1, 2011 and adopted its first locally prepared General Plan on September 7, 2017. The best guide for future land use within any city or county is that jurisdiction's General Plan Land Use Element; thus, as mentioned previously, the basis for land use and population projections herein is the current General Plan Land Use Map (updated March 2021).

Pursuant to Water Code Section 10631(a), RCSD sent a letter to the City of Jurupa Valley on February 4, 2021 requesting a meeting to coordinate with the City on the most appropriate

land use information to use for water resources planning (a copy of said letter is located in Appendix C). RCSD and WEBB met with the City on March 11, 2021 to coordinate on land use information specifically for the UWMP. The District did not meet with San Bernardino County because it does not serve water to that area and is in the process of detaching the area from its service area. A summary of said coordination meeting with Jurupa Valley is below:

- RCSD and WEBB met via teleconference with the City of Jurupa Valley on March 11, 2021. Attendees included: Annette Tam, Principal Planner for the City of Jurupa Valley; Ted Beckwith, Director of Engineering from RCSD; and Autumn DeWoody, Senior Environmental Analyst and Brad Sackett, Senior Engineer from WEBB. As a result of the meeting, the City provided the current land use plan (current as of March 2021), data on recent ADU applications, and information on large projects planned within and adjacent to the District.

The City is currently implementing its 5th-Cycle Housing Element Housing Program, which addresses the City's regional housing needs from 2013 to 2021. On June 4, 2019, the City's 5th-Cycle Housing Element was certified by the State. The certification was contingent upon the City's inclusion of a Housing Program that established a zoning implementation plan to rezone at least 16 acres with minimum densities of 25 dwelling units per acre anywhere suitable within the City. This involved several General Plan Amendments and Zone Changes. The land use map used for this UWMP which includes these General Plan Amendments to address the City's regional housing needs allocation is shown in **Figure 3-5 – Land Use Designations.**

There are three areas within the District that are undeveloped/underdeveloped that are anticipated to develop in the next 5-20 years; this includes the Agua Mansa Commerce Park Specific Plan, Rio Vista Specific Plan, Emerald Meadows Ranch Specific Plan, and Shadow Rock (**Figure 3-6 – Future Large Developments)**.

Agua Mansa Commerce Park Specific Plan

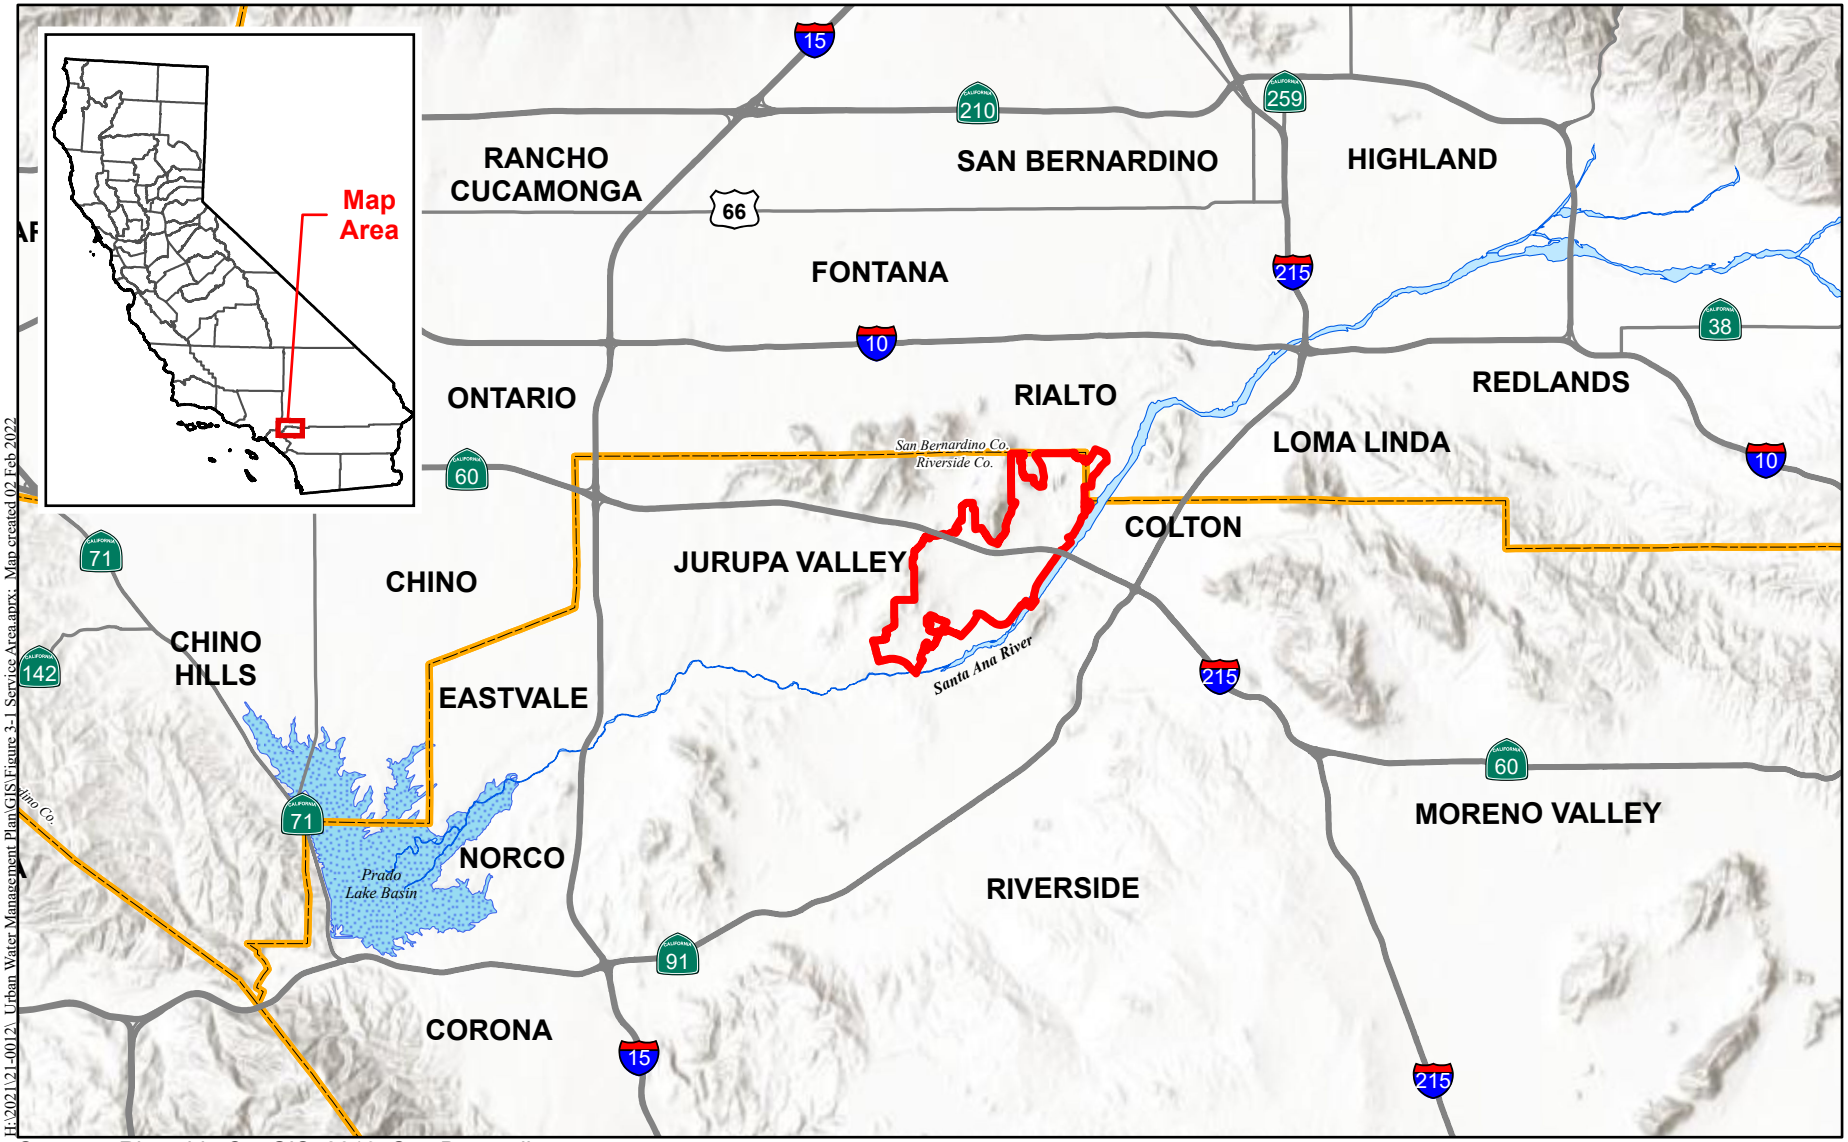
The Agua Mansa Commerce Park is a fully entitled 4.4 million square foot logistics center on 291 acres formerly used by the Riverside Cement Plant. Construction of Phase I has commenced consisting of five buildings and 3.6 million square feet of warehouse buildings, and 70 acres of open space. The District prepared a Water Supply Assessment (WSA) for the project dated December 2016 pursuant to Senate Bill (SB) 610. This WSA estimated the water

demand of the project to be 50 AF per year (RCSD(a), p. II-1), which is included in the water demand projections in Chapter 4 beginning in 2025. The Specific Plan area was annexed into the District in 2020. Because this is not a residential project, this project does not contribute to the population projections in Submittal Table 3-1.

Rio Vista Specific Plan

The Rio Vista Specific Plan currently proposes 1,307 dwelling units on 917 acres, with a 14-acre school site and 600 acres of parks and open space. If entitled, this plan would supersede and replace the existing Rio Vista Specific Plan previously adopted by the County prior to City incorporation. The District prepared a WSA for the project dated July 2018 pursuant to SB 610. This WSA determined that the water use for the project is 2,000 AF per year (RCSD(b), p. II-1), which is included in the water demand projections in Chapter 4 beginning in 2030. The Specific Plan area is currently vacant and within the District's sphere of influence; annexation into the District would be required. Because this has a residential component, this project's proposed additional population was added to the population projections in Submittal Table 3-1 beginning in 2030.

Emerald Meadows Ranch Specific Plan



The Emerald Meadows Ranch Specific Plan was adopted in 2006 by the County Board of Supervisors and provides for various densities of residential neighborhoods, school, park, and church sites, and a commercial site at Rubidoux Blvd. and the State Route 60 Freeway. To date, the City Council has not approved changes to the 2006 land use plan. The Specific Plan property is currently vacant and within the District's service area. Because the land uses of this Specific Plan are already shown in the City's land use plan, the population projections in Submittal Table 3-1 include the potential population of this Specific Plan beginning in 2025.

Shadow Rock

The Shadow Rock project (formerly, the Highland Park project) is a residential development currently under construction partly within RCSD's service area and partly within JCSD's service area. The portion of the project within RCSD is approximately 127 acres of previously vacant land with no prior water demand that is slated for approximately 275 homes and a projected population of 1,064 residents. A Plan of Services dated May 4, 2018 estimates this water

demand at 216 AFY (POS, 2018). The water demand and population projections herein include this project beginning in 2025.

CHAPTER 4 WATER USE CHARACTERIZATION

This chapter describes how the water that is produced, purchased, and sold within the District is then used, and how water is projected to be used through the year 2045. Demands for potable water and non-potable water are accounted for separately.

4.1 PAST WATER USE

The District provides potable water to its urban retail customers and non-potable irrigation water for parks, school fields, and construction. Up until 2017, RCSD supplied potable water to a neighboring agency, JCSD. The District's metered water deliveries from 2015 to 2020 are shown in **Table 4A**. The District reports single-family residential and multi-family residential combined, and commercial, institutional (governmental), and industrial are combined as well. Water lost during the process of distribution due to leaks, metering inaccuracies, and theft are reported as water losses. Water use values are reported each year by RCSD to the State Water Board.

Table 4A RCSD Metered Water Deliveries (AF), 2016-2020

Water Use Sectors	2015[1]	2016	2017	2018	2019	2020[4]
Single-Family Residential & Multi-Family Residential	3,151	2,942	3,213	3,313.2	3,321.1	3,623

[3] Sales to Jurupa Community Services District stopped in 2017.
[4] Source: RCSD meter data from CY 2020.
AF = acre-feet

Table 4A suggests that residential customers continue to use the majority of water in the District—from 40% of total water used in 2015 to 72% of total demand in 2019—and that the number of acre-feet used by residential customers has been relatively consistent over this time. Commercial/Institutional/Industrial has consumed on average 16% of total water use, and water losses constituted 9% of total use on average between the years of 2016 and 2019. Before sales of water to JCSD stopped at the end of 2017 due to water quality concerns, that demand was approximately 30% of the District's water demand between 2015 and 2017.

4.2 CURRENT WATER USE

As of December 31, 2020, RCSD consumed 4,770 AF of potable water and 417 AF of non-potable water for a total of 5,187 AF. For reference, the District's 2015 UWMP estimated a total demand volume of 6,552 AF for CY 2020. As shown in **Submittal Table 4-1** (next page), the actual metered water use is reported in groups, with single-family residential combined with multi-family residential, and commercial, industrial, and institutional (governmental) combined into one sector.

Other Potable	Commercial, industrial, and institutional/governmental combined	Drinking Water	969
Other Potable	Hydrant Meters	Drinking Water	83
Other Potable	District facilities (unbilled)	Drinking Water	4
Losses	Potable	Drinking Water	91
Other Non-Potable	Hydrants	Raw Water	4
Landscape	Non-potable irrigation	Raw Water	382
Losses	Non-Potable	Raw Water	31
		TOTAL	5,187
**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*			
NOTES: Units in acre-feet (AF). From CY 2020 RCSD meter data.			

The non-potable irrigation demand is satisfied with non-potable well water, which is separate from the potable system. The potable and non-potable water losses shown in Submittal Table 4-1 are estimates for CY 2020 and calculated by subtracting total demand from total supply.

4.3 PROJECTED WATER USE

Estimating future demand for water is essential for the District to manage its water supply and appropriately plan its infrastructure investments. In general, the District expects residential customers to continue being the majority of water use. The water use projections made herein are based on buildout of the City's current land use plan (updated March 2021) being reached by 2049 using updated (2020) water duty factors (aka, unit water demand factors) that were calculated for this UWMP and the forthcoming RCSD Water Master Plan. The water duty factors are based on actual metered water usage from 2018 through 2020.

As described in Chapter 3, the City's current land use plan already includes the approved land uses of the Emerald Meadows Ranch Specific Plan, therefore it was not added manually herein. The additional demand from the future Shadow Rock residential development of 216 AFY and Agua Mansa Commerce Park Specific Plan of 50 AFY were manually added into the District's future demands beginning in 2025. Likewise, the additional water demand expected from the future Rio Vista Specific Plan of 2,000 AFY was manually added into the District's future demands beginning in 2030.

Projected usage by type is based on the proportion of total potable use in CY 2020, which was 76% residential, 20% non-residential, 2% potable hydrant meters, 0.1% District meters, and 2% losses. Future sales of potable water to JCSD are considered separate from the urban retail demands and have been held steady at 2,000 AF per year.

To project the non-potable demands from 2025-2045, an average annual growth rate of 1.7% was calculated based on the difference in non-potable production volumes between 2020 and 2010. Non-potable water use has varied significantly over the past 10 years from as little as 301 AF in 2013 to 700 AF in 2016. Non-potable use is dominated by one golf course customer and there is a very limited distribution system; therefore, it is possible that peak usage of non-potable water could be reached before 2045. Projected usage by type is based on the proportion of total non-potable use in CY 2020, which was 92% irrigation, 7% losses, and 1% hydrant meters. RCSD potable and non-potable water demand projections are shown in **Submittal Table 4-2**.

Submittal Table 4-2 Retail: Use for Potable and Non-Potable Water - Projected

Use Type Drop down list May select each use multiple times These are the only Use Types that will be recognized by the WUEdata online submittal tool	Additional Description (as needed)	Projected Water Use* *Report To the Extent that Records are Available*				
		2025	2030	2035	2040	2045 (opt)

	TOTAL	8,182	10,914	11,649	12,388	13,130

**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*

NOTES: Units in acre-feet (AF). Potable demands increase by 138 AFY to reach population buildout in 2049, with Shadow Rock (216 AFY), Agua Mansa (50 AFY) added to potable demand in 2025 and Rio Vista (2000 AFY) added to potable demand in 2030. Potable usage by type based on proportion of total use in CY 2020 (i.e., 76% residential, 20% non-residential, 2% hydrants, 0.1% District use, 2% losses). Sales are held constant and separate from projection methodology. Total non-potable demand based on 1.7% average annual growth rate (from non-potable production from 2010-2020). Non-potable usage by type based on proportion of total non-potable use in CY 2020 (i.e., 1% hydrants, 92% irrigation, and 7%

Future water savings (or "Passive Savings") from codes, standards, ordinances, or transportation and land use plans are not included in the District's demand projections. Total water demand for RCSD beginning with current demand and projected through 2045 is summarized in **Submittal Table 4-3**. There is currently no recycled water demand and no recycled water was put into long-term storage (see Chapter 6).

Submittal Table 4-3 Retail: Total Water Use (Potable and Non-Potable)						
	2020	2025	2030	2035	2040	2045 (opt)
Potable Water, Raw, Other Non-potable *From Tables 4-1R and 4-2 R*	5,187	8,182	10,914	11,649	12,388	13,130
Recycled Water Demand[1] *From Table 6-4*	0	0	0	0	0	0
Optional Deduction of Recycled Water Put Into Long-Term Storage[2]						
TOTAL WATER USE	5,187	8,182	10,914	11,649	12,388	13,130
[1] Recycled water demand fields will be blank until Table 6-4 is complete *[2] Long term storage means water placed into groundwater or surface storage that is not removed from storage in the same year. Supplier **may** deduct recycled water placed in long-term storage from their reported demand. This value is manually entered into Table 4-3.*						
NOTES: Units in acre-feet (AF).						

4.4 DISTRIBUTION SYSTEM WATER LOSSES

Distribution system water loss is the water lost to the system between the point of production and the point of delivery to customers. It includes “real” losses or those attributed to leaks, breaks, and overflows, and “apparent” losses, which include metering inaccuracies, data handling errors, and water theft. Water loss is considered a demand and is shown in Table 4A and Submittal Tables 4-1 and 4-2 as part of the District’s past, current, and future water demands. **Submittal Table 4-4** summarizes the District’s total losses from CY 2016 to CY 2020.

Submittal Table 4-4 Retail: Last Five Years of Water Loss Audit Reporting	
Reporting Period Start Date (mm/yyyy)	Volume of Water Loss [1,2]
01/2016	439.8
01/2017	553.7
01/2018	502.4
01/2019	319.5
01/2020	91
[1] Taken from the field "Water Losses" (a combination of apparent losses and real losses) from the AWWA worksheet. *[2] **Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*	
NOTES: Units in acre-feet (AF). Potable water only. 2016-2019 data comes from validated water loss audits. 2020 data is estimated from meter data as total potable production minus total potable consumption.	

California Senate Bill No. 1420 (SB 1420) requires water utilities that submit UWMPs to calculate annual system water losses in a water loss audit. Copies of the District's validated water loss audits from 2016-2019 are included in **Appendix G**. A validated audit for CY 2020 data was not required to be prepared prior to adoption of this UWMP. The efforts to decrease water loss are described in Chapter 9 – Demand Management Measures.

4.4.1 Future Water Loss Performance Standard

Water Code Section 10608.34, subdivision (i) (Senate Bill 555, 2015) requires the State Water Resources Control Board to adopt volumetric performance standards for water loss for urban retail water suppliers. Pursuant to this law, urban retail water suppliers have been annually submitting water loss audits to DWR since October 2017. Copies of RCSD validated water audits are located in Appendix G.

Additionally, urban retail water suppliers are required to calculate an urban water use objective that includes indoor, outdoor, commercial, industrial, and institutional irrigation uses and allowed water loss by 2024 (AB 1668 and SB 606, 2018). These standards are still in the pre-rulemaking process and have not been adopted to-date. However, the Water Code requires

data to be included in this 2020 UWMP that demonstrates whether the District will meet its water loss performance standard, even though it has yet to be determined. Therefore, to demonstrate that RCSD is expected to meet its forthcoming water loss performance standard, the reader should refer to Submittal Table 4-4 and the 2017-2019 audits located in Appendix G that show losses on the decline from 2017-2020. This is a result of a larger effort by RCSD to replace old pipelines and dedicate more staff effort towards repairing leaks and improving data management. In addition, the District will start calibrating and testing meters and installing an automatic meter reading (AMR) system within the next few years such that all meters could be part of an AMR system by 2028 when the State expects to start assessing compliance for the forthcoming water loss standard. Chapter 9 discusses these efforts in more detail. Because RCSD's CY 2019 validated water loss audit shows "real" loss at 37.96 gallons per connection per day, the District may be required to submit responses to the forthcoming state questionnaires on water loss-specific information and may have to further reduce water loss (SWRCB Fact Sheet, pp. 1-2). However, considering the preliminary potable losses for CY 2020 are just 91 AF as shown in Submittal Table 4-4, the District may not be required to further reduce water loss. Regardless of the forthcoming standards, the District is leading a concerted effort to improve the efficiency of the distribution system, which will help reduce water loss.

4.5 WATER USE FOR LOWER INCOME HOUSEHOLDS

California Senate Bill No. 1087 (SB 1087) requires the water use projections of an UWMP to include the water demands for affordable housing as identified in the housing element of any city, county, or city and county in the service area of the supplier. SB 1087 builds on an existing statutory priority for providing water and sewer services to affordable housing developments.

The City of Jurupa Valley General Plan Housing Element was approved in 2017 and addresses the City's housing needs from 2013 to 2021. The next update will address the period from 2021 to 2029. On June 4, 2019, the City's Fifth-Cycle Housing Element (2013-2021) was certified by the State; however, it was contingent upon the City developing a Housing Program that rezoned at least 16 acres with minimum densities of 25 units per acre anywhere suitable within the City. (JV(a), pp. 1-4)

The City Council initiated the amendments to the General Plan Land Use Map and the Zoning Map to implement said Housing Program in March of 2019. In March 2021, the City Council approved the rezoning of approximately 35 acres on 13 individual parcels of land distributed throughout the community, which will allow an estimated 595 units and meet the State's requirement (JV(a), pp. 1-4). The land use plan used for this UWMP and includes said General Plan Amendments is shown in Chapter 3, Figure 3-5.

RCSD has a civic and legal responsibility to provide water for the health and safety of the service area. RCSD serves all residential customers equally regardless of income level and RCSD does not deny service to non-delinquent accounts. Because the residential water use projections provided herein are based on the aforementioned changes to the City General Plan land use plan, which includes residential designations of all types including designations that allow for low-income housing and included to help the City meet its regional housing needs allocation, the water use projections in Submittal Table 4-3 include water use for housing needed for lower-income households as verified by **Submittal Table 4-5**.

Submittal Table 4-5 Retail Only: Inclusion in Water Use Projections

If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, or otherwise are utilized in demand projections are found.	
Are Lower Income Residential Demands Included In Projections? *Drop down list (y/n)*	Yes

4.6 CLIMATE CHANGE CONSIDERATIONS FOR WATER USE

Beginning in the 2020 UWMP, the Water Code requires the District to consider the impacts of climate change in its water use projections, which are shown in Submittal Table 4-2. The District's considerations for climate change impacts began with using the *Climate Change Vulnerability Screening Form for Urban Water Management Planning* included with the DWR Guidebook for 2020 UWMPs. Pursuant to Water Code, the District's planning for climate change impacts was commensurate with the number of customers served and the volume of

water supplied. The type and degree to which climate change impacts were considered in the District's water use projections, and the basis for those assumptions are described below.

Western prepared a Technical Memorandum dated April 22, 2021 describing an analysis performed as part of its Drought Contingency Plan and Climate Change Vulnerability Assessment and made the results available for use by RCSD and other retail agencies within Western's service area to use in their UWMPs (WMWD(a)). A copy of said memo is located in **Appendix H**. The results of the analysis generated factors that its retail agencies can apply to water demand and supply projections to represent the projected effects of climate change within Western's service area. RCSD has used these factors herein where noted (see **Table 4B**, next page). The results of the analysis that pertain to water demands are provided below:

> *The impacts of climate change on outdoor water demand are projected to be similar during normal and drought years over the next two decades. This is because climate change datasets show that temperatures are projected to increase over time, regardless of hydrologic conditions. These projected increases in temperature are estimated to increase ET rates for landscaping, irrigated agriculture, and native vegetation. For all year types, outdoor water use is projected to increase by about 3 percent during the next two decades. The water demand change factors are applied to outdoor water uses, which have been adjusted for future population growth and conservation measures. Indoor water uses are assumed to respond to future population growth and conservation as well but are not sensitive to climate change.* (WMWD(a), p. 13)

Table 4B - Water Demand Climate Change Factors for Outdoor Water Uses[1]

Beginning Year	Normal Year	Single-Dry Year	Five-Year Dry Period
2020	100.0%	100.0%	100.0%
2025	100.6%	100.6%	99.8%
2030	101.2%	101.3%	101.2%
2035	101.8%	101.9%	101.8%
2040	102.4%	102.5%	102.4%
2045	103.1%	103.2%	103.0%

Source: Western Municipal Water District, *Technical Memorandum: Western Drought Contingency Plan – Climate Change Vulnerability Assessment*, April 22, 2021 (WMWD(a), p. 13), located in Appendix H.

(1) 2020 is baseline year. Because the District is unable to tease out indoor from outdoor water use for most of its customers at this time, the factors have been applied to all demands. Factors that are greater than 100% will increase the demand and factors that are less than 100% will decrease the demand.

To account for the potential effects of climate change to projected water demands, RCSD has conservatively applied the normal year factors from Western's analysis in Table 4B to the demand projections of Submittal Table 4-2 beginning in 2025 through 2045, even though some of that demand is indoor use that is not sensitive to climate change. The results are shown below in **Table 4C**.

Table 4C Potential Effect of Climate Change to Projected Normal Year Demands

	2025	2030	2035	2040	2045
TOTAL DEMANDS From Table 4-2[1]	8,182	10914	11,649	12,388	13,130
Normal Year Water Demand Climate Change Factor[2]	100.6%	101.2%	101.8%	102.4%	103.1%
TOTAL DEMANDS with Climate Change Factor (AF)	8,231	11,045	11,858	12,685	13,538
Potential Increase in Water Demand from Climate Change (AF) [3]	49	131	210	297	407

Notes: Units in acre-feet (AF).

(1) From Table 4-2.

(2) Factors from Table 4B (WMWD(a)).

(3) Difference between total demands and total demands with climate change factor.

According to the Cal-Adapt projections provided in Chapter 3 and Western's technical memorandum and climate change analysis, higher temperatures and less rainfall are anticipated to occur as a result of climate change, and these are the factors that may affect water demand the most. Customer demands increase in summer; therefore, an increase in average annual temperatures and the frequency and duration of heat waves as the result of climate change is expected to increase existing customer demands for water, particularly outdoor use. Based on past events, the District anticipates additional restrictions on outdoor water use will occur through Water Code changes and County, City, or District ordinance changes. Because RCSD primarily serves urban water demand and does not have an agricultural customer base, such restrictions are expected to result in changes to the urban environment, such as improvements to indoor water use (i.e., replacing inefficient appliances/fixtures), or changes in public and private landscaping that incorporates more drought-tolerant plant species and/or zero irrigation.

The District's demand projections herein have conservatively assumed no reductions in future water use from codes, ordinances, or other water conservation policies. Water demands across all customer sectors are projected to increase over the 20-year period. This is a conservative approach given that future development and redevelopment projects will have the latest water conservation mandates such as more efficient fixtures and drought-tolerant plant species. For example, the aforementioned large development projects (i.e., Agua Mansa, Rio Vista, Emerald Meadows, Shadow Rock) will include water-efficient features that may reduce the currently estimated water demands for these projects.

The District plans to continue managing demand by using tiered water rates (see Chapter 9). Currently the lowest tier of 1 to 5 hundred cubic feet (HCF) is $1.18/unit.[1] The highest tier, 30 HCF and greater is $3.03/unit. This tiered rate structure has created demand hardening where the annual demand per connection is averaging approximately 0.63 AFY (205,286 gallons or approximately 3 HCF) (per electronic Annual Reports Years 2017 and 2018 filed with the Division of Drinking Water).

[1] 1 HCF = 748.8 gallons

CHAPTER 5 SB X7-7 BASELINES AND TARGETS

With the adoption of the Water Conservation Act of 2009, also known as Senate Bill (SB) X7-7, the State is required to reduce urban per capita water use by 20 percent by the year 2020. To help the State reach this legislative requirement, each retail urban water supplier (Supplier), including RCSD, is required to also reduce their respective urban per capita (per person) water use by 20 percent. SB X7-7 required each Supplier to determine their baseline water use (Water Use Baseline) during the baseline period and their target water use for the years 2015 (Interim Water Use Target) and 2020 (2020 Water Use Target). The cumulative efforts of each Supplier to meet their respective target water use would result in the State achieving the legislative water reduction requirement by 2020.

In the 2010 UWMP, RCSD calculated the Water Use Baseline, the Interim Water Use Target, and the 2020 Water Use Target using the best available census data at the time, which was the 2000 U.S. Census. In the District's 2015 UWMP, the baselines and targets were updated and recalculated using DWR's Population Tool which included the 2010 U.S. Census. The 2015 Interim Water Use Target was 187 gallons per capita per day (GPCD) and the 2020 Water Use Target was 166 GPCD.[1] Because the District's actual water use was 181 GPCD in 2015, the 2015 UWMP determined that RCSD met the Interim Water Use Target and was on track to meet the 2020 Water Use Target by year end 2020. Compliance with the Interim Water Use Target was verified by DWR reviewing the SB X7-7 Verification Forms submitted with the District's 2015 UWMP. The complete set of SB X7-7 Verification Forms is provided in **Appendix I.**

In this UWMP, RCSD must demonstrate that they met its 2020 Water Use Target by completing the SB X7-7 2020 Compliance Form which are also provided in Appendix I. Please note the tables from the SB X7-7 Verification Forms and the SB X7-7 2020 Compliance Form that are shown in this Chapter differ from the UWMP tables in the rest of this Plan as they are colored green and brown and begin with the title "SB X7-7 Table …"

[1] Two terms are often used interchangeably; "Daily per Capita Water Use" and "Gallons per Capita per Day" (GPCD). Daily per Capita Water Use is the amount of water used per person per day. In the UWMP, this is total water use within a service area, divided by population and is measured in gallons. GPCD is Daily per Capita Water Use measured in gallons. These are different from R-GPCD, which is solely the residential water use divided by population and is used in drought reporting to the SWRCB.

5.1 RECALCULATION OF BASELINES AND TARGETS

There are some situations where the per-person daily water use baselines and targets must, or may be, recalculated including availability of better data, certain service area expansions, contractions, or annexations of already developed areas.

The District's 2015 service area boundary increased by approximately 127 acres in 2018 with annexation of the Shadow Rock residential project and another 291 acres in 2020 with annexation of the Agua Mansa Commerce Park Specific Plan area (see Figure 3-6). The site of the future Shadow Rock development is undeveloped and did not receive water service from the District until after the end of 2020. The future Agua Mansa project is on the site of a former cement plant surrounded by open space that relied on a private onsite well for water service and the District did not provide water service to the site until after the end of 2020. Because the annexed land was not receiving water service from a supplier prior to the annexation and did not receive supplies from RCSD before the end of 2020, and these annexations are due solely to new construction, no revisions to the District's Water Use Baseline, Interim Water Use Target, and 2020 Water Use Target from the 2015 UWMP were made herein consistent with *Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use* (Feb. 2016) (*Methodologies*).

5.2 BASELINE AND TARGETS

The District's Water Use Baseline, Interim Water Use Target, and the 2020 Water Use Target calculated in the 2015 UWMP are summarized here, and the complete set of tables are provided in Appendix I.

Since RCSD does not deliver recycled water, the 10-year baseline or the "Baseline GPCD" period began in 1999 and ended in 2008. The 5-year baseline or the "Target Confirmation" period began in 2003 and ended in 2007, as shown in **SB X7-7 Table -1**.

SB X7-7 Table-1: Baseline Period Ranges

Baseline	Parameter	Value	Units
10- to 15-year baseline period	2008 total water deliveries	6,511	Acre Feet
	2008 total volume of delivered recycled water	-	Acre Feet
	2008 recycled water as a percent of total deliveries	0.00%	Percent
	Number of years in baseline period[1, 2]	10	Years
	Year beginning baseline period range	1999	
	Year ending baseline period range[3]	2008	
5-year baseline period	Number of years in baseline period	5	Years
	Year beginning baseline period range	2003	
	Year ending baseline period range[4]	2007	

[1] *If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled water delivered in 2008 is 10 percent or greater, the first baseline period is a continuous 10- to 15-year period.* [2] *The Water Code requires that the baseline period is between 10 and 15 years. However, DWR recognizes that some water suppliers may not have the minimum 10 years of baseline data.*

[3] *The ending year must be between December 31, 2004 and December 31, 2010.*

[4] *The ending year must be between December 31, 2007 and December 31, 2010.*

NOTES:

Once the baseline periods are set, the baseline GPCD is calculated by dividing the volume of water into the system for each baseline year by the service area population in that year (population as calculated by the DWR Population Tool). The 10-year and 5-year baseline GPCD calculations are shown below in **SB X7-7 Table 5,** which has not changed from the 2015 UWMP.

SB X7-7 Table 5: Gallons Per Capita Per Day (GPCD)

10-15 Year Baseline GPCD	2020 Target GPCD
208	166

NOTES:

5.3 2020 SERVICE AREA POPULATION

To correctly calculate the compliance year (2020) GPCD, the population served in 2020 was determined by using DWR's online Population Tool (Appendix E). The Population Tool was also used for the 2015 UWMP.

The DWR Population Tool utilizes U.S. Census year (i.e., 1990, 2000, and 2010)[2] population data, electronic boundary maps of the District service area for each census year, and the number of meter connections from the District's *Annual Report to the Drinking Water Program*. The Population Tool then calculates the population for the non-census years as shown in **SB X7-7 Table 3**.

[2] The U.S. Census 2020 decennial data was not available at the time of the 2020 UWMPs.

SB X7-7 Table 3: 2020 Service Area Population	
2020 Compliance Year Population	
2020	36,827
NOTES: Source DWR Population Tool	

The 2020 Water Use Target year population of 36,827 is considered a reasonable estimate because it is commensurate with the estimated population of 36,400 persons in the District's 2015 *Water Master Plan* (K&S(b), p.II-2).

5.4 2020 GROSS WATER USE

Gross water use is a measure of water that enters the distribution system of the Supplier over a 12-month period (calendar year) with certain allowable exclusions. These exclusions are:

- Recycled water delivered within the service area;
- Indirect recycled water;
- Water placed into long term storage (surface or groundwater);
- Water conveyed to another Supplier;
- Water delivered for agricultural use; or
- Process water.

The above exclusions do not apply to RCSD. Therefore, no exclusions to gross water use will be made for 2020 GPCD calculations.

Gross water use reported for the year 2020 was calculated using *Methodology 1: Gross Water* of the *Methodologies* document, consistent with the way the water use was calculated in the 2015 UWMP for the baseline periods. A 12-month calendar calculation period was used, the water distribution area was delineated and includes District-produced and purchased water. **SB X7-7 Table 4-A** below shows the water entering RCSD's distribution system (both potable and non-potable water) in the year 2020. Approximately 5,187 AFY of groundwater was

produced from RCSD's own wells (i.e., "The Supplier's own water source"). No potable water was purchased from other sources (i.e., "A purchased or imported source").

SB X7-7 Table 4-A: 2020 Volume Entering the Distribution System(s), Meter Error Adjustment

	5,187	-	5,187

[1] ***Units of measure (AF, MG , or CCF)*** *must remain consistent throughout the UWMP, as reported in SB X7-7 Table 0 and Submittal Table 2-3.*

[2] ***Meter Error Adjustment*** *- See guidance in Methodology 1, Step 3 of Methodologies Document*

NOTES: Source 2020 Annual Report to the Drinking Water Program for Year Ending December 31, 2020.

RCSD does not have any other water sources, therefore the total annual gross water use shown in SB X7-7 Tables 4-A and in **SB X7-7 Table 4** below are the same. The District's gross water use for CY 2020 is 5,187 AFY. No deductions were made for exported water, change in the distribution system storage, indirect recycled water, water delivered for agricultural use, or process water.

SB X7-7 Table 4: 2020 Gross Water Use

* **Units of measure (AF, MG , or CCF)** must remain consistent throughout the UWMP, as reported in SB X7-7 Table 0 and Submittal Table 2-3.							
NOTES:							

5.5 2020 COMPLIANCE DAILY PER CAPITA WATER USE (GPCD)

Based on the 2020 population estimate and 2020 gross water use, RCSD's 2020 daily per capita water use is estimated as 126 GPCD as shown in **SB X7-7 Table 5A, below.**

SB X7-7 Table 5: 2020 Gallons Per Capita Per Day (GPCD)		
2020 Gross Water *Fm SB X7-7 Table 4*	2020 Population *Fm SB X7-7 Table 3*	2020 GPCD
5,187	36,827	**126**
NOTES:		

Because the calculated 2020 Water Use Target was 166 GPCD (SB X7-7 Table 7-A, above), and the actual 2020 GPCD is 126 GPCD, the District achieved its target and is compliant with SB X7-7, as shown in **SB X7-7 Table 9**. Pursuant to Water Code Section 10608.24, the District may adjust the actual 2020 GPCD if factors outside the Supplier's control or if special situations occurred. RCSD has determined that no adjustments due to extraordinary events, weather normalization, or economics were warranted.

SB X7-7 Table 9: 2020 Compliance

Actual 2020 GPCD[1]	Optional Adjustments to 2020 GPCD (Enter "0" if Adjustment Not Used)			TOTAL Adjustments[1]	Adjusted 2020 GPCD [1] *(Adjusted if applicable)*	2020 Confirmed Target GPCD [1, 2]	**Did Supplier Achieve Targeted Reduction for 2020?**
	Extraordinary Events[1]	Weather Normalization[1]	Economic Adjustment[1]				
126	-	-	-	-	126	166	**YES**

[1] *All values are reported in GPCD*

[2] ***2020 Confirmed Target GPCD*** *is taken from the Supplier's SB X7-7 Verification Form Table SB X7-7, 7-F.*

NOTES:

The complete calculations are located in Appendix I. In summary, RCSD has met the water use reduction goal of SB X7-7 and successfully met its 2020 Water Use Target.

Remainder of Page Intentionally Left Blank

This Page Intentionally Left Blank

CHAPTER 6 WATER SUPPLY CHARACTERIZATION

RCSD currently obtains its water supply from groundwater pumped from the Riverside County portion of the Riverside-Arlington Subbasin, which is referred to as "Riverside South Basin" within the larger Upper Santa Ana Valley Groundwater Basin (**Figure 6-1 – Groundwater Basins** located at the end of the chapter). The District service area overlies a portion of the Riverside South Basin. The District currently does not purchase water from another agency.

In the future, the District could rely on the Riverside South Basin for all of its water supply, and it plans to construct new wells and water treatment facilities to fully utilize this source; however, to increase potable supply redundancy and lower native total dissolved solids (TDS) concentrations in wastewater, the District is currently planning a connection to a neighboring agency that can supply imported water from a State Water Project Contractor.

6.1 PURCHASED OR IMPORTED WATER

RCSD currently does not purchase water from other local water entities or imported water supplies from the State Water Project.[1] RCSD is within the service area of Western Municipal Water District (Western), which is a member agency of The Metropolitan Water District of Southern California (Metropolitan) who is a State Water Project Contractor. Western can sell wholesale supplies of imported water that it purchases from Metropolitan to agencies within its service area. Because RCSD is within the service area of Western, the District could purchase water supplies from Western in the future contingent on several factors including whether a physical pipeline connection can be made.

RCSD's neighbor to the north, West Valley Water District, can also sell imported State Water Project water that it receives from San Bernardino Valley Municipal Water District, a State Water Project Contractor. With development of an interconnection, and execution of various agreements to transfer water from one Contractor's service area to another, the District could utilize imported water from this source.

State Water Project water comes from Northern California in the Sacramento/San Joaquin Delta. State Water Project Contractors receive an annual allocation from DWR that can change

[1] In this plan, the term "imported water" refers only to State Water Project water; it does not refer to any other sources.

[2] Measured as the average extractions from 1959 – 1963 (WSBW(c), p. 86).

several times each year depending on several factors, including rainfall/snowpack, biological constraints, and various ongoing regulations. In dry years, Contractors can use water held in storage facilities and a variety of flexible programs to store and transfer water so that when DWR's SWP water allocation is low, supply can continue to be available.

Imported water supplies tend to have a low concentration of TDS, which can be used to blend with other water sources to decrease the overall TDS concentration in drinking water. TDS affects the taste and appearance of water so it is typically not a health hazard for consumption, but higher concentrations of TDS in the wastewater impairs the ability of the wastewater treatment operator to meet its discharge permit requirements.

6.2 GROUNDWATER

The District's water supply currently consists entirely of groundwater from the Riverside South Basin (see Figure 6-1). The District operates wells and treatment facilities for potable water and wells for non-potable (raw) water for irrigation, as described below.

6.2.1 Basin Description

The District's water supply comes from the Riverside-Arlington Subbasin (DWR Bulletin 118 Basin No. 8-2.03, aka "Riverside Basin"), which is part of the Upper Santa Ana Valley Groundwater Basin (DWR Bulletin 118 Basin No. 8.2). The Riverside Basin encompasses a surface area of 58,600 acres (92 square miles) within portions of Riverside and San Bernardino Counties. The Riverside Basin underlies part of the Santa Ana River Watershed and is bounded by impermeable rocks of Box Springs Mountains to the southeast, Arlington Mountain to the south, La Sierra Heights and Mount Rubidoux to the northwest, and the Jurupa Mountains to the north (K&S(a), p. 5-2). The Riverside County portion of the Riverside Basin is referred to as "Riverside South Basin" for purposes of its adjudication and is the focus of the discussion herein. See Figure 6-1 for basin locations.

6.2.2 Groundwater Management

The Riverside Basin is adjudicated by two Judgments; first, the Judgment in Case No. 117628, Orange County Water District vs. City of Chino, et al., entered April 17, 1969 ("Orange County Judgment"), which is provided in **Appendix J**. Second, the pumping rights to the San

Bernardino, Colton and Riverside Groundwater Basins are set forth in the Judgment in Case No. 78426-County of Riverside, Western Municipal Water District of Riverside County et al., v. East San Bernardino County Water District et al., entered April 17, 1969 ("Western-San Bernardino Judgment"). A copy of the Western-San Bernardino Judgment is provided in **Appendix K** and will be the focus of the remainder of this section.

The Western-San Bernardino Judgment provides a physical solution that establishes the entitlements and obligations of the two major water districts overlying said basins, namely San Bernardino Valley Municipal Water District (Valley District) and Western. The court appointed a Watermaster, composed of one person nominated from Valley District and one person nominated from Western to administer and enforce all instruction and orders of the court. (WSBW(c), pp. 1, 5)

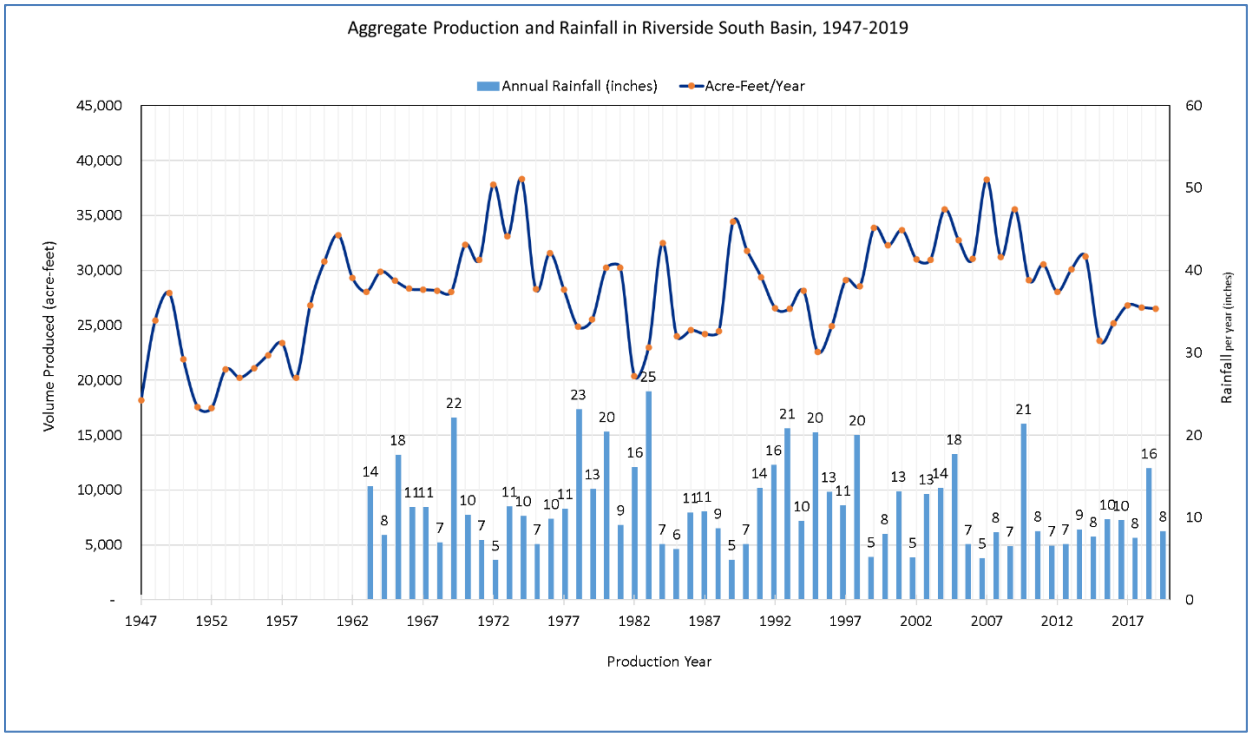
Compliance with the Judgment requires an annual accounting of groundwater and surface water flows and diversions within the various basins in order that the Watermaster may properly report to the court the comparisons of the year-by-year operations with the verified entitlements and an accounting as to the replenishment obligations or credits indicated by such comparison (WSBW(c), p. 5).

Section IX(b) of the Judgment, below, describes the aggregate pumping limit:

> *Over any five year period, there may be extracted from such Basin Area, without replenishment obligation, an amount equal to five times such annual average for the Basin Area; provided, however, that if extractions in any year exceed such average by more than 30 percent, Western* [Municipal Water District] *shall provide replenishment in the following year equal to the excess extractions over such 20 percent peaking allowance.*

The Judgment does not specify the volume of water in the Riverside Basin that the District can extract or is limited to. The base period average production from 1959-1963 in the Riverside South Basin was 29,633 acre-feet and this is the base right for use in the basin.[2] If annual production exceeds 20% of this average, or if a five-year period production exceeds five times the amount of 29,633 acre-feet, then Western shall provide replenishment. Pumping in the

[2] Measured as the average extractions from 1959 – 1963 (WSBW(c), p. 86).



Riverside Basin has not exceeded the base right since the Judgment was entered into. Because the Judgment allows under-extractions to count as credits (and potential increase in storage or base flow) and over-extractions to count as obligations (and potential decline in storage or base flow), Western has a credit of 544,221 AF as of 2019 that can be used to offset future obligations (WSBW(c), p. 119). In the event Western is required to provide replenishment water to the Riverside Basin and no credits were available to offset the obligation, then the District may be responsible for some of the cost of that replenishment, along with other users.

As of 2019, total extractions from the Riverside South Basin area were 26,500 AF, which is compared to total extractions in the base period of 1959-1963 at 29,633 AF. Accumulated credits as of 2019 totaled 719,796 AF and accumulated obligations totaled 175,575 AF for a net credit of 544,221 AF (to Western) as of 2019 (WSBW(c), p. 167). Because aggregate production in the adjudicated area remains below the base right, and credits available to offset obligations are roughly ten times the base right, ample supply in the basin is expected.

6.2.3 Recorded Groundwater Pumping and Sufficiency of Supply

Total recorded groundwater production from 1947 to 2019 for all producers in the Riverside South Basin as recorded by the Watermaster is provided in **Chart 6-1**, which includes annual rainfall from the Riverside area beginning in 1963 (see Chart 3-1).

Chart 6-1 - Aggregate Groundwater Production in Riverside South Basin from 1947-2019 and Total Annual Rainfall in Riverside Area 1963-2019
(Source: WSBW(a); RCFC(b))

(1) "Filing" production amounts were used for years 1947-1958 and 1964-1969. "Verified" production amount was used for all other years.
(2) Total amount produced based on these records is 2,046,427 acre-feet (AF).

The data in Chart 6-1 suggests total production in the basin has hovered around 30,000 AF per year since the adjudication was developed. For example, aggregate production in 2019 was about the same as aggregate production in 1959. During the low rainfall years, an increase in pumping is observed and in wetter years pumping tends to decline. However, the opposite is observed during the statewide drought from 2013-2017; pumping decreased significantly in 2015 with low rainfall, which is assumably a result of demand-reduction efforts and conservation. The total volume produced by all the various entities and wells over this 72-year period is approximately 2.05 million acre-feet.

The District's recorded groundwater production data from just District wells beginning in 1970 through 2020 are provided in **Table 6A**. The average annual growth rate for production from 1970 to 2015 is approximately 3%; however, between 2016 and 2020 the average annual rate is -7%.

Table 6A - RCSD Groundwater Production Records

Year	Total Annual Groundwater Production (AF)
1970	1,900
1980	3,000
1990	5,100

2020 from District records.
AF = acre-feet.

The total annual groundwater produced by RCSD from 2016-2020 is provided in **Submittal Table 6-1.** Sufficient water supplies have been available from the Riverside South Basin to meet the District's needs over the past five years.

Submittal Table 6-1 Retail: Groundwater Volume Pumped

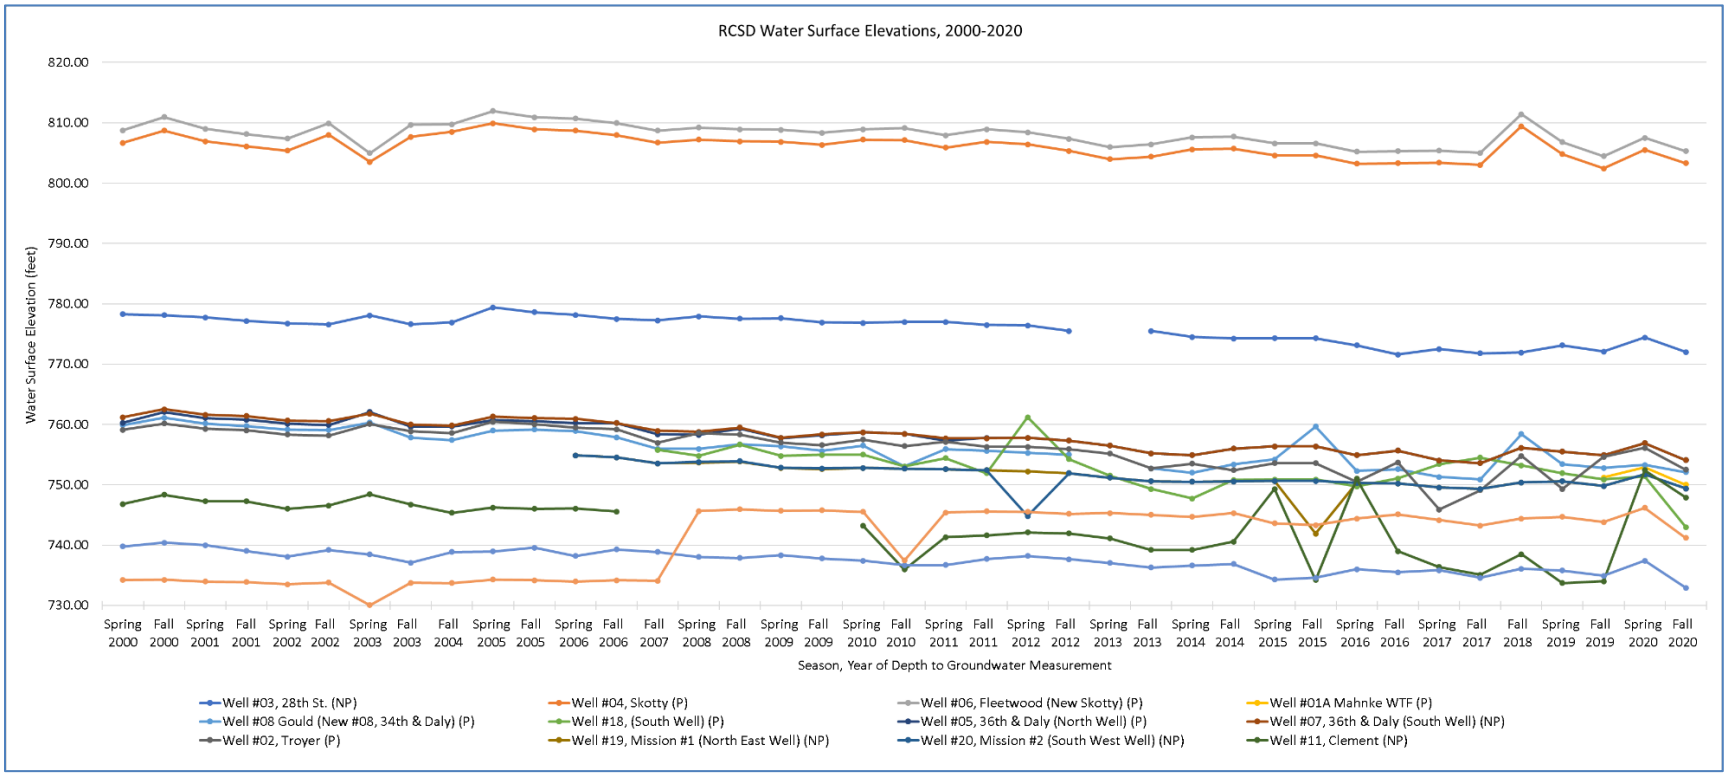
	TOTAL	7,329	7,636	5,256	4,717	5,187
**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES: Volumes in AF. Source: 2016-2019 from Western-San Bernardino Watermaster Production Data by Basin. 2020 data from RCSD.						

From 2016-2020, the average annual production volume of potable and non-potable water produced was 5,542 AF and 483 AF, respectively. The average annual rate of change for potable and non-potable production was -6% and -11%, respectively (Submittal Table 6-1).

The District's groundwater supply has been sufficient in drought years to meet its needs. The District has not been impacted by seasonal or year-to-year climatic changes, nor subject to short-term water shortages resulting from drought conditions.



The Riverside Basin is adjudicated as described previously. An adjudicated water right has perhaps the most substantial indicia of reliability of any water right that currently exists in California. An adjudicated right is based upon long-term studies whose purpose it is to protect the long-term functionality of the water source. These rights are coordinated in an established

and binding manner with all the other users of the basin and are overseen by a Watermaster which has the authority to mandate and proscribe activities whose purpose is to protect the water source and maximize its long-term beneficial use.

RCSD's ability to pump water in an amount necessary to meet customer demands is sanctioned and protected by the aforementioned Judgment. Groundwater replenishment by Western is required if the annual extractions exceed the amount allowed by the Judgment. The Western-San Bernardino Watermaster has documented in its *Annual Report for Calendar Year 2020*, "during the five-year period 2015 through 2019, Plaintiffs did not exceed the allowable extractions and that Western [Municipal Water District] credits exceed obligations and therefore is not required to provide replenishment (WSBW, p. iii)." To date, replenishment has not been required. Because of certain constraints on supply, such as water quality discussed further in Chapter 7, the sufficiency of groundwater pumped by RCSD has been a matter more of cost than of physical supply.

As part of the annual *Cooperative Well Measuring Program,* the District provides the Watermaster its data from well measurements taken in the fall and spring that include depth to water so that the water surface elevation can be measured. The first Cooperative Well Measuring Report was for Spring of 1964 as part of the adjudication court filings. The Fall 2020 report shown in **Chart 6-2** (next page) shows groundwater surface elevations in District wells beginning in June of 2000 through Fall 2020 (WSBW(b), Jan. 18, 2021). Two readings are taken each year, one in the spring when groundwater tends to rise from winter rains and one in the fall when groundwater tends to be lower after a dry summer and greater groundwater extraction during the summer months. A higher water surface elevation indicates the water is closer to the ground surface. As shown in Chart 6-2, the water surface elevations in District wells stay generally constant over the past 20 years and have not changed by more than 20 feet between measurements. During the drought of 2013-2017, and specifically in the fall of 2015, water levels decreased in two non-potable wells by several feet (Wells 11 and 19) while the water surface elevation in Wells 2 and 8 actually rose after the summer of 2015. This data suggests the water surface elevations in District wells do not respond to changes in weather in the same way consistently and there are likely other factors to consider such as inflow from upgradient parts of the basin.

Chart 6-2 - RCSD Groundwater Surface Elevations in Active Wells, 2000-2020
(Source: Cooperative Well Measuring Program, Fall 2020 Report (WSBW(b))

(P) and (NP) indicate potable and non-potable.

Gaps indicate either missing data, the time before the well started, or the time after well stopped.

All readings from Spring 2018 were removed because water surface elevation equaled the ground surface elevations and therefore erroneous.

6.3 SURFACE WATER

RCSD does not use surface water as part of its supply, nor does it have plans to expand supply sources by using surface water.

The Santa Ana River (Reach 4) is the one major surface water body nearest the District service area. The river is managed in various ways by other entities and is not a part of the District's activities.

6.4 STORMWATER

Riverside County Flood Control and Water Conservation District has the authority to manage stormwater and divert flow for beneficial use, such as groundwater recharge. RCSD does not have this authority.

Communities are increasingly implementing opportunities to beneficially use stormwater for things like habitat, recharge, and irrigation. New developments and significant redevelopment projects are often required to capture all of the runoff on their site to provide treatment, slow the speed of runoff, and sometimes facilitate infiltration and recharge. RCSD welcomes the use of stormwater capture systems developed by other parties.

6.5 WASTEWATER AND RECYCLED WATER

RCSD is the responsible agency for collecting and conveying the municipal wastewater generated within its service area. RCSD does not use recycled water nor has plans to do so in the future. All wastewater in the District is sent to the following wastewater treatment plant:

- City of Riverside Regional Water Quality Control Plant (RWQCP) located at 5950 Acorn Street, Riverside, CA 92504.

The RWQCP's National Pollutant Discharge Elimination System (NPDES) Permit limits the concentration of TDS in treated effluent that is discharged to the Santa Ana River to be at or less than 650 mg/L (milligrams per liter). Currently, the District's TDS exceeds this limit and is delivering wastewater to the City with a TDS concentration averaging 720 mg/L. The City has

taken certain actions to require the District to reduce the level of TDS in the wastewater sent to RWQCP (DM 2021-18).

6.5.1 Recycled Water Coordination

Recycled water is currently produced and distributed from the RWQCP for beneficial use in the City of Riverside, which is outside of the District boundary (see **Figure 6-2 – Wastewater Treatment and Discharge**). RCSD is entitled to the recycled water produced from its share of wastewater flows delivered to the RWQCP, less any plant losses and the District's proportionate share of any discharge obligation to the Santa Ana River pursuant to the 1969 Judgment. RCSD currently does not use or distribute recycled water. The District has investigated the potential for providing recycled water generated by the RWQCP within its service area (K&S(a)). Because the RWQCP is located downgradient and across the Santa Ana River from the District, the infrastructure that would be required to move and deliver recycled water to the District where it can be best put to use has been determined to be cost-prohibitive. Therefore, the availability of recycled water to RCSD without substantial outside funding and logistical support is not anticipated over the next 25 years.

6.5.2 Wastewater Collection, Treatment, and Disposal

RCSD's wastewater system consists of collection and trunk sewer pipelines, lift stations and force mains. All wastewater from the District is sent to the City of Riverside RWQCP, which is operated by the City of Riverside Public Utilities and located outside of the District boundary. The District through a series of agreements with the City of Riverside has 3.055 MGD of capacity rights in the treatment facilities. The District is responsible for approximately 68 miles of gravity sewer pipelines and six wastewater lift stations each with associated force mains. The District is currently preparing an update to its *2015 Wastewater Facilities Master Plan* by early 2022.

The RWQCP provides preliminary, primary, secondary, and tertiary treatment and meets all Title 22 requirements for recycled water. It has a rated capacity of 46 MGD. Treated effluent from RWQCP is discharged to the Santa Ana River or distributed for reuse as described above. In CY2020, the District sent approximately 1,900 AF (1.7 MGD) to the RWQCP as shown in **Submittal Table 6-2.**

Submittal Table 6-2 Retail: Wastewater Collected Within Service Area in 2020						
☐	There is no wastewater collection system. The supplier will not complete the table below.

Rubidoux Community Services District	Metered	1,900	City of Riverside	Regional Water Quality Control Plant	No	No
Total Wastewater Collected from Service Area in 2020:		1,900				
**** Units of measure (AF, CCF, MG)*** *must remain consistent throughout the UWMP as reported in Table 2-3* **.**						
NOTES: Volume in AF. From RCSD records.						

No wastewater is treated or disposed of within the District's service area, therefore the District will not complete DWR Submittal Table 6-3 – Wastewater Treatment and Discharge Within Service Area in 2020.

6.5.3 Recycled Water System

RCSD does not provide a recycled water system at this time. Recycled water is not used and is not planned for use within the District's service area, therefore the District will not complete DWR Submittal Table 6-4 – Recycled Water Direct Beneficial Uses Within Service Area.

6.5.4 Potential, Current, and Projected Recycled Water Uses

As described previously, the potential for recycled water being distributed by RCSD without substantial outside funding and logistical support is very low and not anticipated to occur over the 20-year planning horizon. Recycled water was not used in 2015 nor projected for use in

2020; therefore the District will not complete DWR Submittal Table 6-5 – 2015 UWMP Recycled Water Use Projection Compared to 2020 Actual.

6.5.5 Actions to Encourage and Optimize Future Recycled Water Use

Recycled water could offset potable water currently being used for irrigation, or potable water supplies planned for irrigation, thus freeing up potable supplies for the District. RCSD is entitled to its share of flows to the RWQCP, less any plant losses and the District's proportionate share of any discharge obligation to the Santa Ana River. However, RCSD has investigated the feasibility of providing recycled water to its customers and determined that implementation of such actions, at this time, is cost-prohibitive, given the high estimated project costs and high unit cost of recycled water when compared to the District's current unit cost of potable and non-potable groundwater (K&S(a)). Federal, state, and local funding, if available, could offset the cost incurred during project construction which typically makes the project cost-prohibitive. Obtaining funding can also help build community support for a project because it results in reduced taxpayer contribution. The District does not plan to expand recycled water use in the future, therefore the District will not complete DWR Submittal Table 6-6 – Methods to Expand Future Recycled Water Use.

6.6 DESALINATED WATER OPPORTUNITIES

RCSD does not currently desalinate its water supplies as part of its treatment processes (i.e., remove salts), nor does the District have plans currently to provide or partner on desalination facilities. The proposed Water Master Plan update will explore this issue and may propose desalination facilities on its local well supply to reduce the TDS loading in its wastewater. This master plan update is anticipated by 2022.

6.7 WATER EXCHANGES OR TRANSFERS

RCSD has an agreement to transfer water to JCSD and, in turn, purchase water from JCSD if needed. The District has no other exchange or transfer programs. The District does plan to purchase imported water supplies in the future as described in Section 6.1, but this is not considered an exchange or transfer. The District does maintain emergency interties, which are addressed in Chapter 7.

6.8 FUTURE WATER SUPPLY PROJECTS

Expected future water supply projects or programs that will have a quantifiable increase in water supply to RCSD and can reasonably be expected to be implemented within the 20-year timeframe of the UWMP are summarized in **Submittal Table 6-7**. The District's current project to add treatment systems is not shown in Submittal Table 6-7 because it will not result in additional supply. Narrative descriptions of each project (or group of projects) follow in timeline order after the table.

Submittal Table 6-7 Retail: Expected Future Water Supply Projects or Programs

☐	No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below.
☐	Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format.
	Provide page location of narrative in the UWMP

Name of Future Projects or Programs	Joint Project with other suppliers?		Description (if needed)	Planned Implementation Year	Planned for Use in Year Type *Drop Down List*	Expected Increase in Water Supply to Supplier* *This may be a range*
	Drop Down List (y/n)	*If Yes, Supplier Name*				
Add additional rows as needed						
New Wells 21 and 22 & Expansion of Thompson WTP.	No		New wells 21, 22; expansion of Thompson WTP to 7500 gpm.	2025	All Year Types	2,400
New Wells 23 and 24	No		New wells 23 and 24	2030	All Year Types	2,400
New Well 25	No		Replace Well 2 (currently at 900 gpm) with 1,500 gpm	2030	All Year Types	480
New Well 27	No		Replace Well 4 (currently at 1,250 gpm) with 1,500 gpm	2040	All Year Types	200
Agency Connection	Yes	Western Municipal Water District and City of Riverside Public Utilities (RPU); or West Valley Water District (WVWD)	Interconnect	2025	All Year Types	1,200 - 2,000

***Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*

NOTES: Units in acre-feet (AF). Supply volume assumes pump run time of 50%. Water treatment facilities will expand as necessary along with increased number of wells.

- Agency Connection Project.

  By 2025, the District plans to finalize agreements with Western or West Valley Water District to purchase imported potable water supplies (i.e., State Water Project water) pending final agreements. A connection to Western's system would be via the forthcoming Mission Avenue Bridge Project. The County of Riverside Transportation Department is undertaking the Mission Avenue Bridge Project in cooperation with the Cities of Riverside and Jurupa Valley to replace the existing Mission Boulevard Bridge over the Santa Ana River by 2025 and expand it to approximately 88 feet wide and 1,100 feet long and include space for additional pipelines. One use of imported water would be to blend its lower TDS concentrations with the District's water that has higher TDS concentrations so that the District's wastewater delivered to RWQCP meets the TDS threshold concentration of 650 mg/L. A connection to West Valley's system would be via a new interconnect at the shared boundary between the districts. Anticipated demand for imported water is approximately 1,200 AFY to 2,000 AFY at buildout. Because Metropolitan has determined imported water to be reliable in normal, single-dry, and multiple-dry years (WMWD(a)), this supply is assumed to be available to RCSD in normal, single-dry, and multiple-dry years.

- Wells 21 and 22.

  Future Wells 21 and 22 may be located between 34th Street and the 60 Freeway near the Santa Ana River coming online in the near-term of approximately 2025. Wells 21 and 22 would convey to the District's Mahnke Manganese Treatment Facility and Thompson Water Treatment Facility, respectively prior to distribution. Each well would have a pumping capacity of 1,500 gpm each, which translates to 2,400 AFY assuming 50% well run time. This supply would be available in normal, single-dry, and multiple-dry years. The Thompson Water Treatment Plant would be expanded from 5,000 gpm to 7,500 gpm to treat water produced from not only Wells 17 and 18 but also from new wells 21, 22, 23 and 24 (see next bullet).

- Wells 23 and 24.

  Future wells 23 and 24 may be located between 34th Street and the 60 Freeway near the Santa Ana River coming online in the near-term of approximately 2030. These wells would convey to the District's Thompson Water Treatment Facility prior to distribution. Each well would have a pumping capacity of 1,500 gpm each, which translates to 2,400 AFY assuming 50% well run time. This supply would be available in normal, single-dry, and multiple-dry years.

- Well 25.

  Future Well 25 would replace existing Well 2, which currently has a maximum production rate of 900 gpm. Because future Well 25 would have a pumping rate of 1,500 gpm, this results in a net gain in water supply of approximately 600 gpm (480 AFY). This supply is expected to come online by 2030 and would be available in normal, single-dry, and multiple-dry years.

- Well 27.

  Future Well 27 would replace existing Well 4, which currently has a maximum production rate of 1,250 gpm. Because future Well 27 would have a pumping rate of 1,500 gpm, this results in a net gain in water supply of approximately 250 gpm (200 AFY). This supply is expected to come online by 2040 and would be available in normal, single-dry, and multiple-dry years.

6.9 SUMMARY OF EXISTING AND PLANNED SOURCES OF WATER

The water supplies utilized by the District in CY 2020 are provided in **Submittal Table 6-8.** Potable and non-potable supplies are shown, and each come from the same groundwater basin.

Submittal Table 6-8 Retail: Water Supplies — Actual

	Total	10,582	14,302	14,345	14,592	14,643
***Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES: Volumes in acre-feet (AF). Build-out year assumed to be 2049. Groundwater supply volume assumes pump run time of 50%.						

The projected potable water supplies in Submittal Table 6-9 include the annual sale of potable water to JCSD, potable supply projects in Submittal Table 6-7, and utilization of the District's existing active wells. Imported water supplied from the "Agency Connection" project is assumed to be reliable in average and drought years (see Section 6.10.1, below). The non-potable water supply is expected to grow steadily over the next 20 years. The supply amounts shown in Submittal Table 6-9 are within the existing pumping capacity of the District's non-potable wells.

6.10 SPECIAL CONDITIONS

6.10.1 Climate Change Effects

Beginning in the 2020 UWMP, the Water Code requires the District to consider the impacts of climate change in its water supply projections, which are shown in Submittal Table 6-9. Considerations for climate change impacts began with using the *Climate Change Vulnerability Screening Form for Urban Water Management Planning* located in the appendices to the DWR Guidebook for 2020 UWMPs (March 2021). Pursuant to Water Code, the District's planning for climate change impacts anticipated supply availability under a normal water year, single-dry year, and droughts lasting at least five years, as described below.

The water supply change factors from Western's Technical Memorandum dated April 22, 2021 were applied to RCSD's projected supplies (WMWD(a), p. 11; Appendix H). The water supply factors developed by Western and used herein are provided in **Table 6B**, below. The factors demonstrate Western's findings:

> *For normal years, precipitation and natural recharge are initially projected to decrease during the first decade before stabilizing during the second decade. The maximum projected range of decrease for normal year values is 1.7 percent. However, the projections show that droughts will initially be less severe from the perspective of local rainfall and recharge for the single dry year with increases of up to 1 percent. Recharge during 5-year droughts is projected to decrease by up to 2.3 percent by 2045*. (WMWD(a), p. 11)

Table 6B – Water Supply Climate Change Factors for Precipitation and Natural Recharge

Beginning Year	Normal Year	Single-Dry Year	Five-Year Dry Period
2020[1]	100.0%	100.0%	100.0%
2025	99.1%	100.5%	99.5%
2030	98.3%	101.0%	98.9%
2035	98.5%	100.8%	98.5%
2040	98.7%	100.7%	98.1%
2045	98.9%	100.5%	97.7%

Source: Western Municipal Water District, *Technical Memorandum: Western Drought Contingency Plan – Climate Change Vulnerability Assessment*, April 22, 2021 (WMWD(a), p. 11; Appendix H).

(1) 2020 is baseline year.

To account for the potential effects of climate change to water supplies, and the uncertainty therein, RCSD has conservatively applied the normal year factors from Western's factors for precipitation and natural recharge in Table 6B to the groundwater supply projections of Submittal Table 6-9 beginning in 2025 through 2045, even though the District's groundwater supply has not been responsive to drought in the past. The results are shown below in **Table 6C**.

Table 6C – Potential Effect of Climate Change to Normal Year Projected Supplies

	2025	2030	2035	2040	2045
TOTAL SUPPLY From Table 6-9 (AF)[1]	10,582	14,302	14,345	14,592	14,643
Water Supply Climate Change Factor[2]	99.1%	98.3%	98.5%	98.7%	98.9%
TOTAL SUPPLY with Climate Change Factors (AF)	10,487	14,059	14,130	14,402	14,482
Potential Decrease in Total Supply from Climate Change (AF)	95	243	215	190	161

Notes: Units in acre-feet (AF).
(1) From Table 6-9.
(2) Climate change factors from WMWD(a).

6.10.2 Regulatory Conditions and Project Development

Constraints to the District's water supplies are discussed in Chapter 7.1.2. In summary, additional regulations for yet-to-be determined emerging contaminants in water are expected to continue influencing existing and future water supplies to some degree. Said effects could include how future well sites are located and what wellhead treatment(s) and/or blending are needed and subsequent costs to do so. The District expects to be able to provide the necessary treatment(s) for the next 20 years so that the water continues to meet federal and state standards.

6.10.3 Other Locally Applicable Criteria

As discussed previously in Chapter 6.2, groundwater production in adjudicated basins is not unlimited. Although production from the basin is currently well below the base right and well below the trigger for requiring replenishment water from Western, changes to the terms of the adjudication could affect how the District characterizes this supply source. This would be an example of other locally applicable criteria that is entirely outside of the District's control but could dictate to some degree how much can be produced from the Riverside South Basin. This constraint is discussed further in Chapter 7.1.2.

As discussed previously in Chapter 6.8, the imported water supply that is expected to become available to the District in the future is assumed to be reliable in normal, single-dry, and multiple-dry years. However, the District remains prepared to fully utilize its local supplies and treatment systems to meet demand if imported supplies are decreased or temporarily suspended.

6.11 ENERGY USE

Energy is required to operate a water supply system, including the energy needed to pump, treat, store, and deliver water to the end consumer. Beginning in 2020, UWMPs must report estimates of the energy used for its water distribution system that is within its operational control (Water Code Section 10631.2(a)). RCSD obtained electricity usage data from its electricity supplier, Southern California Edison for calendar year 2020 for each electrical meter located at each of the District's facilities. This includes RCSD water wells, booster stations, reservoirs, treatment systems, and pressure reducing stations. Total electricity used for the water distribution system in CY 2020 is provide in **Table O-1B**. This includes 2,357,910 kWh for potable wells and booster stations, 169,091 kWh for non-potable wells, 576,902 kWh for water treatment plants and 1,570 kWh generated by solar power at reservoirs.[3]

Each of the District's four active reservoirs are solar powered with a total of five solar panels. Each solar panel has a peak power of 160 watts (W) and a battery backup. If the battery voltage drops too low before the sun rises, then electricity is provided by Edison. Assuming

[3] A kilowatt-hour (kWh) equals the amount of energy used by keeping a 1,000-watt appliance running for one hour.

average peak sun of 5.38 hours per day for 365 days, approximately 1,570 kWh can be generated and used by the solar tanks each year (www.turbinegenerator.org).

CHAPTER 7 WATER SERVICE RELIABILITY AND DROUGHT RISK ASSESSMENT

This chapter describes RCSD's ability to meet the water needs of its customers with its water supplies under varying conditions. Assessing water service reliability takes into consideration a number of factors, including plausible changes in supplies, regulatory and legal constraints, climate change, and expected growth, among others. This chapter also includes a near-term assessment of a severe drought period lasting for the next five consecutive years from 2021 to 2025.

7.1 WATER SERVICE RELIABILITY ASSESSMENT

Pursuant to Water Code, this reliability assessment will compare the total water supply sources available to the District with the long-term projected water use over the next 20 years, in five-year increments during normal, single-dry, and multiple-dry (five consecutive) water years. This assessment marries the findings in Chapter 4 – Water Use Characterization and Chapter 6 – Water Supply Characterization to help direct management actions for the future.

7.1.1 Summary of Water Use and Water Supply

As described in Chapter 4, past water use from 2015 to 2020 indicates residential customers are the dominate consumer of water at approximately 70% of annual water use on average, followed by commercial, institutional, and industrial customers consuming approximately 20% of total water use, with the remainder being attributable to dedicated irrigation and construction uses, and system losses. When RCSD was able to sell water to its neighboring agency JCSD up until the end of 2017, those sales could make up roughly 30% of the District's total annual water demands. Potable water loss has fluctuated but is on the decline as improvements are made to the system (see Table 4A). Current water use shows metered water deliveries in CY 2020 consisted of 4,770 AF of potable water and 417 AF of non-potable water for a total of 5,187 AF (Table 4-1). This is an increase from the total water use in 2019 but still lower than 2018 consumption. Residential customers were the majority consumer. The amount of water lost each year due to leaks, theft, or metering inaccuracies has been decreasing since 2017 with CY 2020 losses at just 91 AF. Future water use is projected to increase gradually for each use type from 2025 to 2049 to reach ultimate demand of 10,800 AFY for potable water, 2,000 AFY for sales of potable water to JCSD, and approximately 680

AFY for non-potable water (assuming a linear 1.7% per year increase). Buildout of the District is projected to be reached by 2049. Refer to Submittal Tables 4-1, 4-2, 4-3, and 4-4 for current (2020) and future (2025-2045) water use, as well as water losses.

As described in Chapter 6, RCSD relies on groundwater for its water supply, which has been historically reliable and sufficient to meet demands; however, use of the water for potable purposes requires all wells to have treatment systems. The District relies on the Riverside South Basin located in the Riverside-Arlington Subbasin of the Upper Santa Ana River Basin. The Riverside South Basin is adjudicated by two court Judgments, one of which appointed the Western-San Bernardino Watermaster to administer and enforce all instruction and orders of the court (Appendix K). The Judgment establishes an aggregate pumping limit criteria for the Riverside South Basin; for example, if the total pumping in any one year from all producers exceeds the limit, then Western must provide replenishment water the following year on behalf of all producers in the basin, the costs of which may be shared by all producers. To date, replenishment water has not been needed. Historic aggregate annual production volumes are shown in Chart 6-1. The District operates potable and non-potable wells, treatment facilities, booster stations, four storage reservoirs, and approximately 74 miles of water pipelines.

Past groundwater production by the District has increased over the past 40 years from 1,900 AFY in 1970 to a high of 7,801 AFY in 2015 to meet customer demands (Table 6A). Current groundwater production in CY 2020 is 4,770 AF of potable water and 417 AF of non-potable water (Submittal Table 6-1). Future groundwater production by the District will have the capability to increase with the addition of several new well fields and treatment systems; in addition, the District plans to purchase imported water supplies within the next five years to dilute the concentration of TDS in wastewater (Submittal Table 6-7). The District does not currently use desalinated water nor has intentions to use surface water, stormwater, or recycled water for water supplies. The Riverside South Basin has proven to be a stable and reliable water source, even when environmental conditions are exceptionally dry (see Chart 6-2 for recorded RCSD groundwater surface elevations). Refer to Submittal Table 6-7 for planned supply projects, Submittal Table 6-8 for current (2020) supplies, and Submittal Table 6-9 for projected supplies through 2045.

7.1.2 Constraints to Water Supply

Four factors can affect the availability of groundwater for the District: sufficient production capacity (e.g., wells, pumps, pipes, etc.); sustainability of the groundwater to meet pumping demand on a renewable basis; quality of the water; and outages resulting from catastrophic events including earthquake, fire, and power loss.

Production Capacity Constraints

The District has a total of six potable wells (and one backup emergency well) with a total potential pumping capacity of 9,950 gpm. As of 2020, four wells are used to meet demands with a total potential pumping capacity 6,250 gpm; a fifth well is available if needed with 1,100 gpm pumping capacity. Within a year, the sixth potable well which is currently offline due to clogging will be usable again with 1,500 gpm pumping capacity.

The District has a total of seven non-potable wells with a total pumping capacity of 2,300 gpm; however, one well with 400 gpm capacity will be staying inactive. As of 2020, three non-potable wells are used to meet demands with a total pumping capacity of 1,000 gpm. The other three wells with a total of 900 gpm capacity are currently not connected to the system but could be reconnected in the future for non-potable supply.

The current production capacities do not constrain the potable or non-potable water supply. Current average day demand is approximately 13 AF per day, which would require approximately 3,100 gpm to produce. Because the District has a potable pumping capacity of more than twice that (i.e., 6,250 gpm), there is currently no constraint on water supply from insufficient pumping capacity. It has been recommended for the future, however, to increase production capacity to establish more reserve capacity (K&S, p. II-9). The District is undertaking an update to its 2015 Water Facilities Master Plan which is expected by 2022 to identify improvements to the system to ensure the District meets recommended design criteria.

Water Quality Constraints

The District's water supply could be constrained in the event wells are shut down because of contaminants appearing at concentrations exceeding the drinking water standards. The District maintains treatment systems to specifically lower the concentrations of nitrate, manganese,

1,2,3-TCP, and perchlorate. The Anita B. Smith Water Treatment Plant was constructed in 1995 to reduce the concentration of nitrate in water produced by Wells 4 and 6. Constructed in 1996, the Mahnke Water Treatment Plant reduces the concentration of manganese in water produced by Well 8; however, this plant is not currently in use to meet potable demands. The third treatment plant operated by the District, the Thompson Water Treatment Plant came online in 2013 to reduce manganese from water supplied by Wells 17 (now decommissioned) and 18. The District also blends water from different wells in order to deliver water that meets the drinking water standards.

The District is currently adding treatment systems to reduce PFOA and PFOS (part of the PFAS family of chemicals) to below the notification levels. Notification levels are nonregulatory, precautionary health-based measures for concentrations in drinking water that warrant notification and further monitoring and assessment. Public water systems are encouraged to test their water for contaminants with notification levels, and in some circumstances may be ordered by the state to test. If the systems do test, they are required to report exceedances to their governing boards and the SWRCB and are urged to report this information to customers via the Consumer Confidence Report. The RCSD 2019 Consumer Confidence Report (CCR) reported average concentrations of PFOA and PFOS at 10.98 parts-per-trillion (ppt) and 10.13 (ppt), respectively, which exceed the current notification levels for PFOA and PFOS which are 5.1 ppt and 6.5 ppt, respectively. The District's most recent CCR describing the results of water quality testing performed in 2019 is provided in **Appendix L.**

The Riverside South Basin has higher concentrations of TDS than typical of water imported from Northern California. As reported in the District's CCRs published from 2016 to 2019, TDS concentrations in the water supply delivered to customers have averaged 505 milligrams per liter (mg/L) with a range of detection from 460 mg/L to 550 mg/L. TDS is regulated by a secondary drinking water standard, meaning it affects the taste, odor, or appearance of drinking water but consuming it does not affect human health at the standards level. The secondary drinking water standard for TDS is 1,000 mg/L.

Although all of the District's potable well supplies require some level of treatment prior to distribution, and all future potable wells are expected to require treatment as well, the water quality of the District's well water has not constrained the quantity of water available to RCSD

in the past. With the additional treatment systems being installed currently and ongoing testing, the District does not expect water quality to constrain supplies in the future.

Water Supply Constraints

The District's groundwater supply could be constrained in the event of declining groundwater levels. In that case, the cost of production would increase to pump at deeper depths or at new locations or purchase supplies from other sources. However, this is unlikely according to the groundwater data submitted from the District and verified by the Watermaster. As of 2019, total extractions from the Riverside South Basin area were 26,500 AF, which is compared to total extractions in the base period of 1959-1963 at 29,633 AF. Accumulated credits as of 2019 totaled 719,796 AF and accumulated obligations totaled 175,575 AF for a net credit of 544,221 AF (to Western) as of 2019 (WSBW(c), p. 167). Because aggregate production in the adjudicated area remains below the base right, and credits available to offset obligations are roughly ten times the base right, ample supply in the basin is expected. Further, records show relatively stable groundwater elevations for RCSD wells over the past 20 years. Refer to Chart 6-1 in Chapter 6 for recorded annual aggregate production volumes and refer to Chart 6-2 for recorded RCSD groundwater surface elevations.

As described in Section 6.8, the District is pursuing an imported water supply via a future Agency Connection. Imported water supplies may be constrained due to regulatory, legal, biological, and structural constraints on the State Water Project supplies from the Sacramento/San Joaquin Delta in Northern California. To address reliability of imported water supplies for its retail agencies, which includes RCSD, Western prepared a Technical Memorandum describing the results of its Climate Change Vulnerability Assessment (dated April 22, 2021) (Appendix H). It states, "The current (November 2020) draft of Metropolitan's 2020 UWMP Drought Risk Assessment indicates that no service reliability concerns are projected for imported water during normal and drought periods before 2045. For purposes of the UWMP, imported water supplies to Western can be assumed to be unchanged during normal years, single dry years, and five-year droughts" (p. 3). Therefore, RCSD will also assume that projected imported water supplies from the future Agency Connection will be available in normal and drought years.

Catastrophic Events and Interties

Catastrophic events including electrical outages, earthquakes, fire, or any other natural disaster could constrain water supplies. In the event of such an emergency, the District is prepared to purchase emergency water supplies from neighboring agencies over the time required to get the District's system functioning again.

The District and JCSD share two interties and a mutual aid agreement that can be activated in an emergency to flow in either direction (i.e., RCSD Intertie South and Jewel Street Intertie). Currently, West Valley and RCSD are actively working together to develop a connection. The District is actively working with the City of Riverside to make a connection to the City's distribution system in order to receive imported water supplies from Western. In an emergency, this may be another option to satisfy demands until the repairs can be made.

The District has one natural gas portable generator, diesel backup generators at three potable wells, and backup generators at the Mahnke, Thompson, and Smith Water Treatment Plants to provide emergency water in the event of a widespread power failure. The non-potable irrigation wells do not have backup power onsite. As of March 2021, the District secured grant funding to purchase fixed generators at two potable wells and a booster station for the purpose of increased system reliability and mitigate power disruptions to service (DM 2021-17).

In 2020, the District retained Harper & Associates Engineering, Inc. to conduct corrosion investigations and seismic, structural, and safety engineering evaluations of the District's four active water storage tanks (HAE(a), HAE(b), HAE(c), HAE(d)). The results of the seismic analyses portion of the reports are provided in Chapter 8 under the seismic assessment and mitigation discussion. These reports provide the District action items they can undertake to improve system reliability in an earthquake emergency.

7.1.3 Reliability by Type of Year

RCSD has had a reliable water supply to meet demands during normal, single-dry, and multiple-dry years and to-date has not experienced a water shortage. Further, the District had sufficient water supplies during the statewide drought from 2012 to 2017. The Water Code requires each water supplier to determine three types of years and how much supply was

available for each: normal (or average),[1] single-dry,[2] and multiple-dry years for five years.[3] As shown in **Submittal Table 7-1**, the District expects all of its average supply to be available regardless of the year type, including future imported water supplies.

Submittal Table 7-1 Retail: Basis of Water Year Data (Reliability Assessment)			
Year Type	**Base Year** If not using a calendar year, type in the last year of the fiscal, water year, or range of years, for example, water year 2019-2020, use 2020	**Available Supplies if Year Type Repeats**	
		☐	Quantification of available supplies is not compatible with this table and is provided elsewhere in the UWMP. Location _____
		☑	Quantification of available supplies is provided in this table as either volume only, percent only, or both.
		Volume Available *	**% of Average Supply**
Average Year	2010		100%
Single-Dry Year	2018		100%
Consecutive Dry Years 1st Year	2012		100%
Consecutive Dry Years 2nd Year	2013		100%
Consecutive Dry Years 3rd Year	2014		100%
Consecutive Dry Years 4th Year	2015		100%
Consecutive Dry Years 5th Year	2016		100%
Supplier may use multiple versions of Table 7-1 if different water sources have different base years and the supplier chooses to report the base years for each water source separately. If a Supplier uses multiple versions of Table 7-1, in the "Note" section of each table, state that multiple versions of Table 7-1 are being used and identify the particular water source that is being reported in each table.			
***Units of measure (AF, CCF, MG**) must remain consistent throughout the UWMP as reported in Table 2-3.*			
NOTES: % average supply is 100% for both potable and non-potable supplies during the years shown.			

The selected base years were selected on rainfall data collected by Riverside County Flood Control and Water Conservation District from five stations scattered around western Riverside

[1] A year, or an averaged range of years, that most closely represents the average water supply available to the agency. The UWMP Act uses the term “normal”.
[2] The single-dry year is the year that represents the lowest water supply available to the agency.
[3] The multiple-dry year period that represents the lowest average water supply availability to the agency for a consecutive multiple year period (three years or more).

County (i.e., Riverside, Corona, Elsinore, Hemet/San Jacinto, and Perris/Moreno Valley). Each year, the Flood Control District determines whether that year was, on average, a very dry, dry, normal, wet, very wet, or record wet year by converting annual total rainfall as a percentage of normal, where normal is calculated as the average per station. Records from these stations range from 64 to 128 years of rainfall data; therefore, it is considered robust. Flood Control's data as of fiscal year 2019/2020 suggests 2010 was considered a "normal" rainfall year for western Riverside County; 2018 was "very dry" year between two "wet" years (2017 and 2019); and 2012 to 2016 were five consecutive "dry" years (RCFC(a)).

A second version of Submittal Table 7-1 showing the hydrological conditions for imported water supplies was not prepared because, according to Western and Metropolitan, imported water supplies will be reliable in all year types (WMWD(a), p. 3).

7.1.4 Normal Year Reliability

Normal Year. This condition represents the water supplies a supplier considers available during normal conditions.

Water use is described in Chapter 4 and projections of future water use during a normal year are provided in Submittal Table 4-3. RCSD water supplies are presented in Chapter 6 and water supply projections during a Normal Year are provided in Submittal Table 6-9. The Normal Year supply and demand projections are compared in **Submittal Table 7-2**, below**.**

Submittal Table 7-2 Retail: Normal Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045 *(Opt)*
Supply totals *(autofill from Table 6-9)*	10,582	14,302	14,345	14,592	14,643
Demand totals *(autofill from Table 4-3)*	8,182	10,914	11,649	12,388	13,130
Difference	2,400	3,388	2,696	2,204	1,512
NOTES: Volume in acre-feet (AF). Includes potable and non-potable water in a normal year scenario with future supply projects from Table 6-7. Assumes pump run time of 50%.					

As shown in Submittal Table 7-2, during an average rainfall year occurring between 2025 and 2045, sufficient water supplies will be available to meet demands to the year 2045.

The following assumptions have been made to estimate supply and demand during a normal year:

- Supply includes the future supply projects from Submittal Table 6-7, which are: (1) future Agency Connection project beginning 2025 at 1,200 AFY growing to 2,000 AFY by 2030; (2) Wells 21 and 22 beginning 2025 at 2,400 AFY; (3) Wells 23 and 24 beginning 2030 at 2,400 AFY; (4) Well 25 beginning 2030 at an additional 480 AFY; and (5) Well 27 beginning 2040 at an additional 200 AFY.

- Demands include annual growth with additional demands from the Shadow Rock, Agua Mansa Specific Plan (50 AFY) and Rio Vista Specific Plan (2,000 AFY) projects beginning in 2025 and 2030. Demand also includes sales of potable water to JCSD at 2,000 AFY beginning 2025 (this amount is held constant through 2045).

- Submittal Table 7-2 does not include potential effects of climate change.

Table 7A shows a comparison of climate-adjusted normal year water supplies and demands for the 20-year planning horizon to compare with the non-climate adjusted values in Submittal Table 7-2.

Table 7A: Comparison of Climate Change-Adjusted Normal Year Supply and Demand

	2025	2030	2035	2040	2045
TOTAL SUPPLY with Climate Change Factors for Groundwater Supplies (AF)[1]	10,487	14,059	14,130	14,402	14,482
TOTAL DEMANDS with Climate Change Factor for Outdoor Demands (AF)[2]	8,008	10,814	11,621	12,441	13,285
Difference (AF)	2,479	3,245	2,508	1,962	1,196

Notes: Units in acre-feet (AF).
(1) From Table 6C.

(2) From Table 4C.

The normal year climate change factors reflect modeling projections of increasing outdoor water demand and decreasing precipitation and recharge. As shown in Table 7A, comparing the climate change-adjusted supply and demand projections in a normal year suggests sufficient supply will be available for the District with the addition of at least one of the new well fields listed in Submittal Table 6-7 (i.e., Wells 21 and 22 or Wells 23 and 24) slated for completion by 2025 and 2030, and/or operating existing wells at an average pump run time greater than 50%. However, it should be noted that the demand factor was applied to all demands (indoor and outdoor), when only outdoor demands are expected to increase in response to climate change effects. If the new wells are not included in total supplies beginning in 2030, then a small shortfall in supply is observed and in order to make supply equal demand in this scenario, future supplies from the existing well field would need to be approximately 20% higher starting from around 2030, which can be met with the existing operating capacity of the wells.

7.1.5 Single-Dry Year Reliability

Single Dry Year. The year that represents the lowest water supply available to the Supplier.

The District's Single Dry Year supply and demand comparisons are provided in **Submittal Table 7-3**, which show the expectation that water supply will meet expected demand through 2045. Although 2018 was a single-dry year, the District observed no decrease in its available supply, and customer demand actually rose approximately 10 percent from 2017 urban retail demand (which does not include demand from sales to JCSD).

Submittal Table 7-3 Retail: Single Dry Year Supply and Demand Comparison					
	2025	2030	2035	2040	2045 (Opt)
Supply totals*	10,582	14,302	14,345	14,592	14,643
Demand totals*	8,182	10,914	11,649	12,388	13,130
Difference	2,400	3,388	2,696	2,204	1,512
***Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*					
NOTES: Units in acre-feet (AF). Single dry year conditions of base year 2018 are assumed (approximately half the normal rainfall).					

The following assumptions have been made to estimate supply and demand during a single-dry year:

- There will be no decline in the non-potable and potable groundwater supplies from District wells as compared to a normal year supply.
- Imported water supplies from future Agency Connection will be unchanged.
- There will be no decline in customer water use compared to a normal year.
- The District will prohibit water waste and encourage efficient use of water supplies.
- Customers will continue to voluntarily conserve water unless a water shortage condition occurs that would trigger the response actions listed in the Water Shortage Contingency Plan (located in Chapter 8, herein).
- Water losses are included in future potable water demands at 2% of annual demand.
- The potential effects of climate change during a single-dry year are shown in **Table 7B.**

Table 7B: Comparison of Climate Change-Adjusted Single-Dry Year Supply and Demand

	2025	2030	2035	2040	2045
Single-Dry Year Supply from Table 7-3 (AF))	10,582	14,302	14,345	14,592	14,643
Water Supply Climate Change Factors for Single Dry Year(1)	100.5%	101.0%	100.8%	100.7%	100.5%
Single-Dry Year Supply with Climate Change Factors (AF)	10,635	14,445	14,460	14,694	14,716
Single-Dry Year Demand from Table 7-3 (AF)	8,182	10,914	11,649	12,388	13,130
Water Demand Climate Change Factors for Single Dry Year(2)	100.6%	101.3%	101.9%	102.5%	103.2%
Single-Dry Year Demand with Climate Change Factors (AF)	8,231	11,056	11,870	12,697	13,551
Difference (AF)	**2,404**	**3,389**	**2,590**	**1,997**	**1,165**

Notes: Units in acre-feet (AF). (1) From Table 6B (WMWD(a)).
(2) From Table 4B (WMWD(a)).

Table 7B suggests that although climate models predict precipitation and natural recharge may increase during a single-dry year in 2025, the increase in outdoor water use due to higher temperatures may outpace that prediction. However, because the District cannot separate indoor from outdoor use, the assumption made in Tables 7A and 7B is that all water demand is being treated as outdoor demand and that indoor and outdoor demands will respond equally. Therefore, climate-change adjusted demand in these tables is likely overstated. With the addition of future supply, no shortfall is observed in Table 7B. To make up the shortfall without the future supply projects so that supply equals demand in this scenario, future supplies may need to be increased from 0.1% to 4% higher to account for potential increases in outdoor water demand and decreases in precipitation and natural recharge starting from around 2025 to 2045. The increases are within the normal operating capacities of the wells.

7.1.6 Multiple-Dry Year Reliability

Five-Consecutive-Year Drought. The driest five-year historical sequence for the Supplier.

The District selected the five-year base period from 2012-2016 to represent conditions during a multiple-dry year scenario. The District's Multiple-Dry Year supply and demand comparisons are provided in **Submittal Table 7-4**. Because the District observed little to no decrease in its water supplies during the drought period of 2012-2016, supply and demand are consistent with normal year Submittal Table 7-2.

Submittal Table 7-4 Retail: Multiple Dry Years Supply and Demand Comparison						
		2025*	2030*	2035*	2040*	2045* (Opt)
First year	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
Second year	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
Third year	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
Fourth year	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
Fifth year	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
Sixth year *(optional)*	Supply totals	10,582	14,302	14,345	14,592	14,643
	Demand totals	8,182	10,914	11,649	12,388	13,130
	Difference	2,400	3,388	2,696	2,204	1,512
***Units of measure (AF, CCF, MG)** must remain consistent throughout the UWMP as reported in Table 2-3.*						
NOTES: Units in acre-feet (AF).						

The following assumptions are made to estimate supply and demand during a consecutive five-year multiple-dry year period (drought stages are described in detail in Chapter 8):

- There will be no decline of the non-potable and potable groundwater supplies from District wells as compared to a normal year supply.
- Imported water supplies from future Agency Connection will be unchanged.
- There will be no decline in customer water use compared to a normal year.
- The District will prohibit water waste and encourage efficient use of water resources.
- Customers will continue to voluntarily conserve water unless a water shortage condition occurs that triggers shortage response actions from the Water Shortage Contingency Plan (located in Chapter 8, herein).
- Water losses are included in future potable water demands at 2% of annual demand.
- The potential effects of climate change to the multiple-dry year supply and demand comparison are not embedded in Submittal Table 7-4. The potential climate change effects of decreasing precipitation and natural recharge and the effect of increasing outdoor water demand are reflected in Years 1-5 as shown below.

	2025*	2030*	2035*	2040*	2045* (Opt)
Supply totals	10,529	14,145	14,130	14,315	14,306
Demand totals	8,166	11,045	11,858	12,685	13,524
Difference	2,363	3,100	2,271	1,630	782

7.1.7 Management Tools and Options for Reliability

As shown in the tables above, RCSD anticipates having adequate water supplies to meet future demands during normal, single-dry, and multiple-dry years through the 20-year planning period. This is mainly because of the reliability of the District's primary water source in the Riverside South Basin and the ability of customers to conserve when needed. Periodic drought

has not affected the groundwater levels to the point where the District's water supply is reduced and requires demand management or supply augmentation. In the event of a significant water shortage, the District will utilize its existing tiered water rate structure to encourage water conservation by reducing the quantity use range of each tier.

RCSD will continue efforts to maximize the use of local water resources and minimize the need to import water. District actions such as increased groundwater treatment systems, implementation of demand management measures to reduce losses and increase system efficiency are anticipated. Imported water supplies are necessary at this time to reduce TDS concentrations in sewage and meet wastewater discharge requirements.

Demand management measures implemented by RCSD over the past five years and planned for the next five years are outlined in Chapter 9 and are designed to help RCSD meet its future water use reduction targets. Although the District has achieved the 2020 water use target for water conservation pursuant to SB X7-7, it is understood that drought conditions are likely ongoing in the foreseeable future. Therefore, water conservation efforts are planned to continue and expand to optimize potable water use to the maximum extent practicable. To encourage water use reductions during water shortages, RCSD has developed a multi-level Water Shortage Contingency Plan, as discussed in detail in Chapter 8 of this UWMP.

Remainder of Page Intentionally Blank

7.2 DROUGHT RISK ASSESSMENT

The Drought Risk Assessment (DRA) is a new requirement beginning with the 2020 UWMP. The DRA can be updated before the next UWMP cycle (i.e., 2025); however, the notification and approval procedures in Chapter 10 of the UWMP would be required for any interim changes to the DRA. An update to the DRA may be needed as result from new information becoming available, water supply or water use changes, or in the event of unforeseen circumstances.

The DRA is based on the five driest consecutive years on record taking into account any extra effects to water supplies from plausible changes in climate, regulations, and other locally applicable criteria. If there is a shortage, the DRA identifies what the effects to the shortage would be from increasing supply and/or reducing demand. The DRA differs from the supply and demand comparisons in Tables 7-3 and 7-4 in that climate change effects have been taken into account. Water Code requires that the DRA include a description of the data and methods used, the basis for the supply shortage conditions, determination of the reliability of each source, and comparison of total water supplies and uses during the drought, which are described below.

7.2.1 Data, Methods, and Basis for Water Shortage Conditions

Supply conditions for the District wells during the five driest years (2012-2016) were consistent with non-drought years. Although typical seasonal fluctuations occur in individual wells, overall groundwater level contours from 2000 through 2020 have remained stable as shown in Chart 6-2 (Chapter 6). Therefore, a water shortage from a prolonged drought, including one occurring in the next five years (2021-2025) is not anticipated. However, a water shortage as a result of a catastrophic event such as an earthquake is foreseeable. Although the tank ages range from 60 years to 30 years old and have endured many major earthquakes, at least three of them are due for a seismic upgrade or replacement, according to the District's seismic analysis (HAE(a), HAE(b), HAE(c), HAE(d)). Therefore, the water shortage conditions are based the hypothetical failure of at least one tank reservoir resulting from a significant earthquake.

Imported State Water Project water may become available to the District in the near future as described in Chapter 6 (Submittal Table 6-7). Although there is inherent uncertainty in the

consistent availability of this water supply source, this DRA has assumed that imported water supplies will be reliable following the determination of Metropolitan in its draft 2020 UWMP.

7.2.2 Individual Water Source Reliability

The following are characterizations of the expected quantity of supply and reliability of the supply during the first year of a drought beginning in 2021.

- Drought Year 1: 2021
    - Total water consumption increases from 2020 by approximately 3% due to urban growth (3.0% increase in potable water and 1.7% increase for non-potable demand).
    - No decline to customer water use as compared to 2020. Water waste prohibition remains in effect.
    - No decline in water supply from District non-potable or potable well water as compared to 2020.
    - Repairs to Well 18 (potable) will be completed and back online at 1,500 gpm. Well 4 (potable) at 1,100 gpm was not used in 2020 but it can be used in 2021.
- Drought Year 2: 2022
    - Total water consumption increases from 2021 by approximately 3% due to urban growth (3% increase in potable use and 1.7% increase in non-potable use).
    - No decline to customer water usage as compared to 2020, unless there is a statewide conservation mandate to reduce water use, or a decline in groundwater supplies, or an emergency water shortage not caused by drought.
    - No decline in water supply from non-potable or potable well water as compared to 2020.

- Repairs to Well 18 (potable) will be completed and it will be back online at 1,500 gpm. Well 4 (potable) at 1,100 gpm was not used in 2020 but it can be used in 2021.

- Drought Year 3: 2023
  - Total water consumption increases from 2022 by approximately 3% due to urban growth (3% increase in potable water use and 1.7% increase in non-potable use).
  - No decline to customer water usage as compared to 2020, unless there is a statewide conservation mandate to reduce water use, or a decline in groundwater supplies, or an emergency water shortage not caused by drought.
  - No decline in water supply from non-potable or potable well water as compared to 2020.

- Drought Year 4: 2024
  - Total water consumption increases from 2023 by approximately 3% due to urban growth (3% increase in potable water use and 1.7% increase in non-potable water use).
  - No decline in customer water usage as compared to 2020, unless there is a statewide conservation mandate to reduce water use, or a decline in groundwater supplies, or an emergency water shortage not caused by drought.
  - No decline in water supply from non-potable or potable well water as compared to 2020.

- Drought Year 5: 2025
  - Agency Connection Project will come online to deliver approximately 1,200 AFY of imported potable water supplies to help dilute the TDS concentration in the District's wastewater.

- Sales of potable water to JCSD using the existing interties will begin again at approximately 2,000 AFY.
- Shadow Rock and Agua Mansa Commerce Center Specific Plan expected completion year with additional 216 AFY and 50 AFY water demand, respectively.
- Total water consumption increases from 2024 by approximately 38% due to urban growth (2.6%), Shadow Rock project (216 AFY), Agua Mansa project (50 AFY), sales to JCSD (2,000 AFY) and 1.7% increase in non-potable use).
- No decline in customer water usage as compared to 2020, unless there is a statewide conservation mandate to reduce water use, or an inexplicable decline in groundwater supplies, or an emergency water shortage not caused by drought.
- No decline in water supply from non-potable or potable well water as compared to 2020.

One source of uncertainty in the aforementioned assumptions is timing of when the future imported water supply will be completed and when deliveries will start, and whether the drought affects the amount delivered. Likewise, timing for completion of the Agua Mansa project is uncertain. Another source of uncertainty is whether non-potable water demand will increase and whether the District will be forced to mandate water conservation as a result of a statewide drought declaration or as a result of an unforeseen interruption of service from an earthquake or other hazard.

7.2.3 Total Water Supply and Use Comparison

When a water supplier cannot meet the demand of its customers for whatever reason, this DRA assumes two things can happen: the supplier can mandate customers to conserve water, thus reducing demand; and/or the supplier can augment or supplement its normal supplies with an emergency and temporary source of water.

RCSD customers were responsive to the water conservation mandate in 2015. The District is in the process of developing an updated and thorough water conservation ordinance which will

help clarify expectations and authorities. Water demands are expected to gradually increase as the service area builds out by about 2049 and a couple of large development projects are annexed into the District (see Chapter 4).

Supply augmentation for RCSD comes from the District's ability to fully utilize production capabilities and produce additional water from the Riverside South Basin consistent with the Judgment (Appendix K). Emergency supplies can be obtained from the intertie and mutual aid agreement with JCSD, and the District is actively working with West Valley Water District to develop a connection.

Assuming the next five years, 2021 through 2025, are a five-consecutive-year drought, and taking into account the assumptions in Section 7.2.2, the District's potential water supply surplus (or shortage) is provided in **Submittal Table 7-5** (next page)**.** If there is a shortage, then the benefit of a supply augmentation or use reduction action is shown to address the shortage. Because Western's climate change factors show 100% of supply and demand beginning in 2020, no climate change effects have been added to the calculations in Submittal Table 7-5.

WSCP - use reduction savings benefit	
Revised Surplus/(shortfall)	0
Resulting % Use Reduction from WSCP action	0%

2025	Total
Total Water Use	8,182
Total Supplies	8,182
Surplus/Shortfall w/o WSCP Action	0
Planned WSCP Actions (use reduction and supply augmentation)	
WSCP - supply augmentation benefit	
WSCP - use reduction savings benefit	
Revised Surplus/(shortfall)	0
Resulting % Use Reduction from WSCP action	0%

As shown in Submittal Table 7-5, supply is expected to equal demand in each year from 2021 to 2025 assuming each year is a drought year primarily because the supplies from District wells have not decreased in previous long-term drought periods to such a degree that demand management actions or supply augmentation is required to respond to a supply shortage.

Remainder of This Page Intentionally Left Blank

CHAPTER 8 WATER SHORTAGE CONTINGENCY PLAN

This Water Shortage Contingency Plan (WSCP) details RCSD's actions in the event of an actual water shortage scenario. A water shortage means that the water supply that is available is insufficient to meet the normally expected customer water use at a given point in time. In 2018, the Legislature modified the UWMP laws to require a WSCP with the specific elements contained herein. The District may modify this WSCP at any time independent of updates to the UWMP; however, the same steps to notify and hold a public hearing are required with each modification as described herein. This chapter is written as a stand-alone document and therefore repeats many elements from the other chapters in the UWMP.

Original WSCP Adoption Resolution No. 2021-879 on June 17, 2021. The WSCP was amended April 21, 2022 (Adoption Resolution No. 2022-887) to modify water shortage response actions and update emergency response actions in conjunction with the adoption of Ordinance No. 2022-130 (Establishing the Program for Implementing the Water Shortage Contingency Plan) (a copy of which is provided in **Appendix Q** and completion of the District's 2021 Emergency Response Plan. With adoption of Ordinance No. 2022-130, Ordinance No. 111 (Landscape Water Use Efficiency Program) was rescinded to remove any conflict with the City of Jurupa Valley's Water Efficient Landscape Design Requirements.

8.1 WATER SUPPLY RELIABILITY ANALYSIS

Pursuant to Water Code Section 10632(a)(1), the following is a summary of the Water Service Reliability Assessment and Drought Risk Assessment located in Chapter 7 of this UWMP.

The District has assessed the reliability of its water service during normal, single-dry, and multiple-dry years by comparing total projected water supplies with total projected water demand over the next 20 years, in five-year increments. Future water supplies for RCSD include all reasonably foreseeable and quantifiable future water supply projects that the District is either currently undertaking or is in the process of implementing. Future water demands for RCSD reflect a land-use based approach assuming mid-range density buildout of the District's service area and updated water duty factors from 2018-2020 customer meter data prepared separately for each land use type in the District. In summary, the groundwater supply available to the District has been and is projected to continue to be sufficient to meet projected pumping demands with water treatment systems and given the relatively stable groundwater elevations

and resiliency of the basin. Therefore, the District is projected to have sufficient water supplies to meet expected customer demands in normal years, single-dry years, and multiple-dry years occurring anytime between 2025 and 2045.

The District has prepared a five-consecutive-year Drought Risk Assessment (DRA) for a drought beginning in 2021 and continuing through 2025. The DRA assumes a nominal reduction in customer water use with each passing year to reflect voluntary conservation. These projected reductions in water use are deemed realistic given the observed reductions RCSD customers made during the five-year drought from 2013 to 2017. Further, the DRA assumes imported water supplies would be available to the District beginning in drought year one (2021) through drought year five (2025) (WMWD(a), p. 3). Local groundwater supplies from District wells are assumed to be reliable in all years of the DRA, which is consistent with what was observed during the five-year drought from 2013 to 2017.

Groundwater reliability is based on the well reporting and monitoring programs performed by the Western-San Bernardino Watermaster. Records of aggregate production rates show that pumping has decreased in recent years and was well below the limit where replenishment by others may be required (UWMP, Chart 6-1). Further, records of the District's groundwater surface elevations shows relatively stable elevations that are not consistently responsive to drought conditions; for example, during the drought of 2013-2017, some well elevations actually rose (UWMP, Chart 6-2). With treatment systems, the District has always had a reliable groundwater supply. A water shortage resulting from drought conditions is not foreseeable. Further, the District's ability to produce water pursuant to the Western-San Bernardino Judgment of 1969 is projected to be sufficient to meet demands through the next five years if it were five consecutive drought years.

The ability to produce water from the Riverside South Basin has been constrained in the last couple of years by the sudden and unexpected appearance of a newly regulated family of contaminants (i.e., PFAS). Several of the District's wells are undergoing new wellhead treatments as a result. The difference in groundwater production has been made up by the District's other wells. It is plausible that there will be more contaminants being regulated in the future that the District currently is not aware of and unable to fully prepare for. However, the District is currently addressing the known impairments with a plan of targeted projects to keep

wells online. Because of the District's efforts to expand treatment capabilities, add several new well fields and treatment plants over the next 20 years coupled with efforts to make the system more efficient with closer monitoring capabilities including Advanced Metering Infrastructure coming online over the next few years, the DRA has assumed that availability of groundwater supplies will not be reduced due to water quality constraints.

8.2 ANNUAL WATER SUPPLY AND DEMAND ASSESSMENT PROCEDURES

Beginning in 2022, the District will prepare an annual water supply and demand assessment (or, Annual Assessment) and submit an Annual Water Shortage Assessment Report to the California Department of Water Resources (DWR). The Annual Assessment is a determination of the near-term outlook for supplies and demands and how a perceived shortage may relate to WSCP shortage stage response actions in the next 12-month period; this determination is based on known circumstances and information available to RCSD at the time of analysis.

The Annual Water Shortage Assessment will be due by July 1 of each year pursuant to Water Code Section 10632.1. DWR is currently developing a stand-alone guidance document to help suppliers develop their own procedures but it will not be available before the deadline for this document, which is July 1, 2021. Therefore, the decision-making process and key data inputs for the Annual Assessment shown below are interim and subject to change when the DWR guidance document becomes available.

8.2.1 Decision-Making Process for Annual Assessment

The Annual Assessment and related reporting are to be conducted based on the District's procedures described in the WSCP. At this time, the Annual Assessment is anticipated to be primarily based on the District's ongoing water supply and water demand monitoring process, the results and analysis of which is presented monthly to the Board of Directors. The Annual Assessment will involve examination of developing demand and supply conditions for the next 12 months, as well as considerations for potential actions consistent with the WSCP. In June when an Annual Assessment is presented to the Board of Directors, it may include a request to trigger specific shortage response actions. Upon approval, RCSD staff will then submit the Annual Assessment to DWR by July 1.

8.2.2 Data and Methodologies for Annual Assessment

The primary data sources that could be used by the District to evaluate the water reliability for the current year and one dry year are detailed below pursuant to Water Code Section 10632(a)(2). The Annual Assessment determination will be based on considerations of available water supplies, unconstrained demand, and infrastructure considerations.[1] Because the WSCP shortage stages are defined in terms of shortage percentages, shortage percentages for current year and one dry year conditions would be calculated for the Annual Assessment. The characteristics of "one dry year" according to the District will be at the discretion of the District, which may be refined and changed over time based on ongoing data collection. The 2020 UWMP suggests the conditions of a single-dry year would be consistent with average rainfall in 2018, which was approximately half of average (47%) with average being 11 inches per year (UWMP Table 7-1). The District will focus the Annual Assessment based on actual forecasted near-term water supply conditions to ensure appropriate shortage response actions are triggered in a timely manner with expected outcomes.

1. **Evaluation Criteria.**

   For each Annual Assessment, the District will characterize current year and one dry year scenarios based on best-available data. RCSD will consult with the Western-San Bernardino Watermaster with regard to any limitations on groundwater extractions. The District will consult with Jurupa Community Services District (JCSD) to confirm their anticipated purchases of water. Said consultations will focus on estimates for the next 12 months and estimates if a single-dry year condition occurs where rainfall is half of average. The District will make an estimation of available core supplies and unconstrained demands for the next 12-month period and a dry-year scenario to calculate shortage percentages. These findings will be given additional context and

[1] For the Annual Assessment and WSCP, Water Code Section 10632(a)(2)(B)(i) directs the District to use current year "unconstrained demand" when assessing water supply reliability. Unconstrained demand is defined as expected water use in the upcoming year, based on recent water use, and before any projected shortage response actions that may be taken under the WSCP. Unconstrained demand may be differentiated from observed demand, which may be constrained by preceding, ongoing, or future actions, such as emergency actions taken as part of a multi-year drought. Routine activities such as ongoing conservation programs and regular operational adjustments are not considered as constraints on demands.

influenced by infrastructure considerations (discussed below) which will differ from year to year.

2. Water Supply.

For each Annual Assessment, the District will quantify each source of water supply for the next 12 months and in a single-dry year condition based at least in part on the consultations described in step 1 (Evaluation Criteria). Quantification of supplies will differentiate the District's water supplies in Table 8-3 that are expected to be used in a supply augmentation situation.

3. Current Year Unconstrained Customer Demand.

For each Annual Assessment, the District will gather data to forecast near-term demands, and may take into consideration historical usage trends, weather trends, and water-use efficiency trends. This data may include the number of service availability letters issued recently to gauge future demand. Because these would be "constrained" observed demands rather than unconstrained demands, the District would adjust its near-term demand forecast for the Annual Assessment to account for extraordinary demand management measures that the District may intend to or have already put into effect for the current year.

4. Current Year Available Supply.

For each Annual Assessment, the District will make two estimates of the available annual water supply using (1) current year conditions for the next 12 months and (2) one dry year conditions. Because the definition of one dry year is at the discretion of the District, RCSD will be able to refine and update its assumptions for a dry-year scenario in each Annual Assessment as information becomes available.

5. Infrastructure Considerations.

For each Annual Assessment, the District will describe infrastructure constraints that would influence the ability to obtain the water supply as expected and/or the ability to distribute normally to customers. Projects in the next 12 months that would influence

capabilities would be quantified with the volume of water becoming available or unavailable and the duration of projects/constraints.

Each year, RCSD regularly carries out preventive and corrective maintenance of its facilities to inspect and repair pipelines and facilities and support capital improvement projects. These shutdowns involve a high level of planning and coordination; they are scheduled to ensure that major portions of the distribution system are not out of service at the same time. Operational flexibility within RCSD's system allows shutdowns to be successfully completed while continuing to meet customer demands.

6. Other Factors.

For each Annual Assessment, the District can describe locally applicable factors that can influence or disrupt supplies, along with other unique local considerations that are considered to be part of the Annual Assessment.

8.3 SIX STANDARD WATER SHORTAGE STAGES

The Water Code requires six standard water shortage stages in the WSCP that correspond to progressive ranges of up to 10%, 20%, 30%, 40%, and 50% shortages and greater than 50% shortage. Each stage represents an increasing gap between RCSD's supplies and demands as determined in the Annual Assessment. As described above, shortage percentages will be calculated as percent shortfall of supplies against demands for anticipated current year conditions and assumed dry-year conditions. Shortage levels also apply to catastrophic interruption of water supplies, including but not limited to a regional power outage or earthquake. The District's shortage response actions for each shortage level are shown in **Submittal Table 8-1** and described below.

Submittal Table 8-1
Water Shortage Contingency Plan Levels

Shortage Level	Percent Shortage Range	Shortage Response Actions (*Narrative description*)
1	Up to 10%	RCSD has adequate supplies to cover 10% shortage. Effort at this stage is to encourage voluntary conservation.
2	Up to 20%	RCSD has adequate supplies to cover up to a 20% shortage. Effort at this stage is to encourage voluntary conservation.
3	Up to 30%	RCSD produces from a historically stable groundwater basin and has not in the past or currently received imported water to meet potable demand. The goal in this stage is to encourage voluntary conservation through onsite surveys to reduce obvious water waste for the highest users.
4	Up to 40%	In addition to actions taken in Stages 1, 2, and 3, RCSD will make the following restrictions mandatory: outdoor irrigation is limited to two days per week between the hours of 8:00 PM and 8:00 AM, and all public water uses that are not required for health and safety are prohibited. District may augment rebate amounts to entice greater utilization.
5	Up to 50%	In addition to the actions taken in Stages 1, 2, 3, and 4, RCSD may engage conservation drought fees according to the current rate schedule.
6	>50%	In addition to Stages 1, 2, 3, 4, and 5, RCSD may engage in conservation drought fees according to the current rate schedule.
NOTES: Depending on the nature of the shortage, RCSD may be able to augment supply through the intertie with JCSD at any stage. Water waste prohibitions are in-effect at all times as stated in the District's ordinance for implementing the WSCP.		

On October 15, 2009 the RCSD Board of Directors adopted Ordinance No. 111 to establish the Landscape Water Use Efficiency Program which provided compliance measures in support of the State Water Conservation in Landscaping Act (State Landscape Model Ordinance [AB 1881, 2006]).

On June 8, 2015, RCSD adopted Resolution No. 2015-820 declaring a modified stage 2 drought contingency pursuant to the District's 2015 Water Shortage Contingency Plan for compliance with State Water Resources Control Board (SWRCB) requirements.

On November 7, 2019, the RCSD Board of Directors adopted Resolution No. 2019-858 to rescind Resolution No. 2015-820; however, the water conservation practices mandated by Resolution 2015-820 continue to be encouraged as stated in section F of Resolution No. 2019-858. These rescissions were based on improvements to the District's water supplies and repeal by the SWRCB of various water conservation regulations and requirements that were put into effect in 2015 due to statewide drought conditions. Copies of Resolution No. 2019-858 and Ordinance No. 111 are located in **Appendix M.**

8.4 WATER SHORTAGE RESPONSE ACTIONS

The water shortage response actions the District can take that align with the defined shortage levels in Table 8-1 include demand reduction actions, supply augmentation actions, operational changes, and additional mandatory prohibitions. The authority to determine shortage conditions and to select appropriate shortage response actions remains with the District.

8.4.1 Demand Reduction

There are generally two ways to respond to a water shortage—through either demand reduction actions (i.e., conservation) or supply augmentation. RCSD Resolution No. 2019-858 states, "To promote ongoing water conservation practices by customers, the District Board of Directors encourages customers avoid use of water in the following manner except where necessary to address an immediate health and safety need or comply with a term or condition of a permit issued by a state or federal agency."

1. Outdoor watering of ornamental landscapes or turf between the hours of 10:00 AM and 6:00PM
2. Outdoor watering of ornamental landscapes or turf of more than two (2) days per week
3. Outdoor watering of ornamental landscapes or turf of more than thirty (30) minutes per station for drip irrigation systems, and twenty (20) minutes per station for stream irrigation systems
4. Outdoor watering of ornamental landscapes or turf during or within forty-eight (48) hours after measurable rainfall
5. Watering of outdoor landscapes that cause runoff such that water flows onto adjacent property, non-irrigated areas, private or public walkways, roadways, parking lots, or structures
6. Using hoses that dispense potable water, except where the hose is fitted with a shut-off nozzle or device attached to it that causes it to cease dispensing water immediately when not in use
7. Using potable water in a fountain or decorative water feature, unless the water is recirculated
8. Draining or refilling swimming pools (maintaining water level is acceptable) without the written approval of the District's General Manager
9. Not covering a swimming pool when not in use
10. Swimming pool construction without the written approval of the District's General Manager
11. Serving of drinking water other than upon request in eating or drinking establishments, including but not limited to restaurants, hotels, cafes, cafeterias, bars, or other public places where food or drinks are served and/or purchased
12. Washing of driveways & sidewalks.

Excerpt from RCSD Resolution No. 2019-858, Section F – District Water Conservation Measures.

The District's demand reduction actions for this WSCP are provided in **Submittal Table 8-2,** including the estimated proportion of the shortage gap that the demand reduction action is expected to meet at each level. If the demand reduction action does not meet the entire shortage gap, then the difference is made up by supply augmentation shown below.

Submittal Table 8-2: Demand Reduction Actions				
Shortage Level	Demand Reduction Actions ***Drop down list*** *These are the only categories that will be accepted by the WUE data online submittal tool. Select those that apply.*	How much is this going to reduce the shortage gap? *Include units used (volume type or percentage)*	Additional Explanation or Reference *(optional)*	Penalty, Charge, or Other Enforcement? ***For Retail Suppliers Only*** *Drop Down List*
Add additional rows as needed				
1	Expand Public Information Campaign	1 to 3%; District has adequate supplies to cover 10% shortage. Effort at this stage is to encourage voluntary conservation.		No
2	Expand Public Information Campaign	1 to 3%; District has adequate supplies to cover 20% shortage. Effort at this stage is to encourage voluntary conservation.		No
3	Offer Water Use Surveys	4 to 7%; District produces from a historically stable groundwater basin and has not in the past or currently received imported water to meet potable demand. Goal in this stage is to encourage voluntary conservation through onsite surveys of the highest water users to reduce obvious water waste.		No
4	Provide Rebates on Plumbing Fixtures and Devices	10%; In addition to actions taken in Stages 1, 2,& 3, the District may augment rebate amount to entice greater utilization.		No
4	Landscape - Other landscape restriction or prohibition	20%; outdoor watering is limited to two days per week between the hours of 8:00 PM and 8:00 AM, and all public water uses that are not required for health and safety are prohibited.		Yes
5	Implement or Modify Drought Rate Structure or Surcharge	40%; In addition to Stages 1, 2, 3 & 4, engage conservation drought fees according to the current rate structure.		Yes
6	Implement or Modify Drought Rate Structure or Surcharge	50%; In addition to actions taken in Stages 1 through 5, engage conservation drought fees according to the current rate structure.		Yes
NOTES: During a water shortage, a combination of supply augmentation actions (Table 8-3) and these demand reduction actions will be used in concert to continue water service. Water waste prohibitions are in-effect at all times as stated in the District's ordinance for implementing the WSCP.				

RCSD customers are always encouraged to utilize the rebates available for purchases of water conservation devices (e.g., smart irrigation controllers, premium high-efficiency toilets, turf replacement, rain barrels, high-efficiency clothes washers, etc.). Links to available rebate programs are located on the RCSD website.

8.4.2 Supply Augmentation

The District can augment or supplement its water supplies by utilizing its full pumping capabilities in the Riverside South Basin and depending on the nature of the shortage, utilize the intertie shared with JCSD for potable water. These augmentation actions would not be redundant to the supplies discussed in UWMP Chapter 6 because these actions are above and

beyond a normal water supply scenario. Pursuant to the Judgment, the District can pump what is needed to meet customer needs (Appendix K).

The District's supply augmentation actions are listed in **Submittal Table 8-3**.

Submittal Table 8-3: Supply Augmentation and Other Actions

Shortage Level	Supply Augmentation Methods and Other Actions by Water Supplier *Drop down list* *These are the only categories that will be accepted by the WUEdata online submittal tool*	How much is this going to reduce the shortage gap? *Include units used (volume type or percentage)*	Additional Explanation or Reference *(optional)*
Add additional rows as needed			
All Levels	Expand Public Information Campaign	1-5%	
All Levels	Transfers	Will vary depending on need and availability	Intertie with JCSD or emergency interties with WVWD or Western.
All Levels	Other Purchases	Will vary depending on need and availability	Purchase additional imported water from Western when connection to RPU is completed (see UWMP Table 6-7).
1	Other Actions (describe)	5%	Utilize full pumping ability in the Basin
2	Other Actions (describe)	10%	Utilize full pumping ability in the Basin
3	Other Actions (describe)	20%	Utilize full pumping ability in the Basin
4	Other Actions (describe)	20%	Utilize full pumping ability in the Basin
5	Other Actions (describe)	10%	Utilize full pumping ability in the Basin
6	Other Actions (describe)	10%	Utilize full pumping ability in the Basin

NOTES: JCSD = Jurupa Community Services District; WVWD = West Valley Water District; Western = Western Municipal Water District; RPU = City of Riverside Public Utilities

8.4.3 Operational Changes

The operational actions that would be undertaken during a water shortage are shown in Submittal Table 8-2 and Submittal Table 8-3. The District already has a program to monitor, analyze, and track customer usage rates and has budgeted a pipeline replacement program.

8.4.4 Additional Mandatory Restrictions

All mandatory restrictions developed by the District in addition to any state-mandated prohibitions are listed in Submittal Table 8-2. No additional mandatory restrictions are in effect other than a prohibition against water waste; however, the Board of Directors has the discretion to develop in the future locally appropriate restrictions as conditions dictate.

8.4.5 Emergency Response Plan

RCSD prepared and submitted to the State an updated Emergency Response Plan (ERP) dated December 2021 (revised 2022). The prior ERP was dated March 26, 2008. Applicable

excerpts from the document are included herein where noted; the document in its entirety is kept by the District

RCSD developed the ERP to facilitate resumption of normal operation of its facilities after an emergency including catastrophic supply interruptions. As stated in the ERP, "The core business processes to keep functioning during a recovery process include: treatment processes, water production wells and water transmission pipelines, booster pump stations, reservoirs, and sewage lift stations" (p. 6). The District's priorities for use of available water during a water shortage are, in order of priority, as follows: (1) fire protection, health, and welfare emergency uses; (2) indoor water for residential customers; (3) indoor water for public buildings and schools; (4) indoor water for commercial and industrial; (5) non-landscaping outdoor water for commercial and industrial; (6) other uses including exterior residential use.

The ERP conducted a threat evaluation for the following natural hazards: earthquakes, floods, waterborne diseases, pandemic and drought (p. 2). Human-caused threats evaluated by the ERP include: vandalism, terrorism, system neglect, cross-connections, backflow conditions, construction accidents, chemical spills, sewage spills, power outages, fires, water supply interruption, and cyberattack (pp. 2-4). The ERP determined that the disaster threat with the highest risk is an earthquake and "the most probable risks to RCSD's facilities are earthquake, fire, hazardous chemical release, vandalism, and terrorism" (p.6).

The ERP contains disaster response procedures and flow charts for the various types of disaster. The District follows the Standard Emergency Management System (SEMS) Incident Command System approach to manage an incident that is outside of normal day to day operations. The ERP describes three levels of incidents: Level 1 (small chemical spill), Level 2 (major line break requiring additional pumps, contractors, or rental equipment; hazardous materials release that does not threaten public health) and Level 3 (the most severe incidents when off-site emergency services are needed, including but not limited to structural earthquake damage) (p.17). Once the incident level is determined, the Emergency Operation Center (EOC) is established (p. 19). The ERP also provides guidelines for Disaster Response, Search and Rescue, Fire Response, Earthquake Response, Hazardous Materials Release/Response, Aircraft Crash Response, and Terrorism Response, as well as evacuation and medical emergency procedures.

During a water shortage scenario resulting from natural or man-made causes, the District can receive emergency water supplies through the existing interties with JCSD, and the District is actively working with West Valley Water District to develop a connection. These interconnections would provide water service in the event of a catastrophic outage while the District is making repairs or taking other steps needed to bring service back online. The District has adequate backup power at each of its water treatment plants and at several sites to provide emergency water service (indoor domestic use only) to its customers in the event of a widespread power failure (K&S(a), p. 6-8). Portable standby generators are available for use where needed in an emergency.

RCSD is a member of the Emergency Response Network of the Inland Empire (ERNIE), which facilitates public agency preparedness for, response to, and recovery from local and regional disasters. Agencies volunteer to enter into an agreement to provide mutual aid and assistance to other member agencies. ERNIE assists agencies with trainings, communication, documentations for reimbursement, concept of emergency operations, and writing after-action reports and corrective action plans. RCSD is not a member of the California Water/Wastewater Agency Response Network (CalWARN).

8.4.6 Seismic Risk Assessment and Mitigation Plan[2]

Pursuant to Water Code Section 10632.5, beginning January 1, 2020, the UWMP shall include a seismic risk assessment and mitigation plan to assess the vulnerability of each of the various facilities of a water system and mitigate those vulnerabilities. The District may comply with this requirement by submitting a copy of the most recent local hazard mitigation plan (LHMP) prepared under the federal Disaster Mitigation Act of 2000 if the LHMP addresses seismic risk (a copy of the LHMP is located in **Appendix N**).

Local Hazard Mitigation Plan

The City of Jurupa Valley maintains an active LHMP. The City of Jurupa Valley *2018 Local Hazard Mitigation Plan* was prepared pursuant to the Disaster Mitigation Act of 2000.[3] RCSD

[2] Pursuant to Water Code section 10632.5, the assessment herein is based on other sources, as described herein. Albert A. Webb Associates is not qualified to make its own independent seismic risk assessments or recommend mitigation actions and assumes no responsibility for those recommended herein.
[3] City of Jurupa Valley 2018 Local Hazard Mitigation Plan: https://www.jurupavalley.org/181/Local-Hazard-Mitigation-Plan

participated in the preparation process of the LHMP as a special district. The LHMP does address seismic risk.

According to the City's LHMP, "The most prominent hazard…are a major earthquake, flooding potential from 100-year storm events in winter months along the Santa Ana River bank, and windstorms causing power outages" (p. 13). Further, "Earthquake risk is very high in western Riverside County (which includes Jurupa Valley), due to the presence of two of California's most active faults: the San Andreas and San Jacinto" (p. 13). The LHMP lists among the "critical facilities" one regional treatment plant, 11 water well/tank sites, three water distribution plants, and one sewer lift station (p. 16). An assessment and ranking of risks are included in the LHMP including flood, earthquake, wildfire, severe weather (heat/wind/cold), technical hazards, drought severity, and agricultural hazards (pp. 20-21).

The LHMP lists the following mitigation action that has been implemented by the District to address earthquake risk (p. 26):

- *The separate water service agencies have installed auxiliary power sources on various municipal water wells and sewer lift stations.*

  Priority: High
  Responsible Dept: JCSD / RCSD
  Timeframe: completed
  Funding/Cost: Unknown – funded by other agencies
  Hazard: structural (earthquake)

The LHMP lists the following mitigation action addressing seismic risk and designated it as the responsibility of RCSD (p. 29):

7.3 ON-GOING MITIGATION STRATEGY PROGRAMS

Rubidoux Community Services District is currently designing a new $2.8 million dollar 6MG water storage tank, a $10 million dollar sewage conveyance facilities damaged during the 2005 flood, and a $150,000 water service replacement project.

Priority: High

Responsible Dept: **Rubdioux Community Services District (separate agency)**

Timeframe: ongoing

Funding/cost: RCSD water restricted capital fund (outside agency)

Hazard: Structural (earthquake), fire

Project #1-Reduce the level of risk to loss of life, personal injury, public and private property damage, economic and social dislocation, and disruption of vital community services that would result from earthquake.

Goal 1: Adopt all of Riverside County Ordinances and Resolution including Land Ordinances. The City has completed this part of the process by adopting and implementing Ordinance No. 2011-01. Additional ordinances are adopted as needed on an ongoing basis to address issues that arise.

Objective: Amend the Building and Zoning Codes to incorporate specific standards for siting, seismic design, and review of Critical Facilities.

Action: Require all new developments, existing critical facilities and structures to comply with the most recent California Building Code seismic design standards.

Priority: High

Responsible Dept: Planning and Building Departments

Timeframe: Ongoing for the life of the plan 2018-2022. This action will be reevaluated during the updating stage of the plan

Funding/cost: Current funding; cost unknown

Hazard: Earthquake

Excerpt from City of Jurupa Valley Local Hazard Mitigation Plan, p. 29.

Tank Seismic Analysis

For the purpose of assessing and developing a plan to mitigate seismic risks specific to the needs of the District, RCSD contracted with Harper & Associates Engineering, Inc. (HAE) in

2020 to prepare reservoir tank seismic analyses for the District's four active tanks: Atkinson, Hunter 1, Perrone, and Watson.

HAE's analyses on the tank structures "was analyzed to assess adequacy for seismic overturning, sloshing, and uplift. Hoop stresses caused by seismic loads were also analyzed as part of this study" (HAE(a), p. 2). Further, "the seismic analysis was performed using the procedures outlined in AWWA-D 100" (p. 2). The key results of said assessment reports prepared for each tank represent future mitigation actions for RCSD to address seismic risks. In summary, for the Atkinson, Hunter No. 1, and Perrone Tanks, HAE recommends due to the ages of the reservoirs, that each tank undergo either a seismic upgrade (including various elements) or the tank be replaced ((HAE(a), p. 5), (HAE(b), p. 4), (HAE(c), p. 3). For the Watson Tank, HAE recommends a change in the locations of all pipe penetrations through the bottom of the tank (HAE(d), p. 3).

8.4.7 Shortage Response Action Effectiveness

The District's response actions are shown in Table 8-2 and Table 8-3. Each response action listed has a corresponding percentage of the shortage gap that the action is expected to meet. The percentages in Table 8-2 are based on the observed effectiveness of demand reduction actions undertaken during the last five years, including the drought from 2013-2017. The higher the percentage, the more effective the action is expected to be in reducing demand.

In normal water supply conditions, production figures are recorded daily in the District's computerized database. Total production and consumption by all categories of customers are reported monthly to District management and Board of Directors. (K&S(a), p. 7-12)

During drought periods, the RCSD Operations Department reports weekly production figures to the General Manager (or, daily or hourly reports depending on severity of shortage), who then prepares a monthly report to the Board of Directors on progress toward the water conservation target. In doing so, the District does analyze the efficacy of response actions on at least a monthly basis.

The effectiveness of the supply augmentation actions shown in Table 8-3 have not been needed to-date because the District has not experienced a supply shortage. Therefore, the

effectiveness is estimated based on a thorough understanding of pumping capacity, well locations, and expected production rates based on long-term records. Because the District's system has been designed to fully utilize the groundwater basin, the supply augmentation actions in Table 8-3 are estimated to close the water shortage gap by any proportion that is not met by customer conservation efforts.

8.5 COMMUNICATION PROTOCOLS

The District will regularly, and not less than once per year, communicate to all customers that water waste is prohibited. Within ten (10) days following the declaration of a shortage level (or declaration of the end of a shortage level), the District will publish a copy of the resolution, or an easy-to-read summary of the resolution with a link to the complete resolution in the newspaper used for publication of official notices. In addition, the District will provide the information on the District's website, at the District office, and to each customer by mail. The notices will include details as to how much reduction in water use is requested and provide suggested means to achieve that. During a disaster when prior notice of water shortage response actions may not be possible, noticing procedures will be dictated by the District's ERP.

The District's 2021 ERP describes the process of communication that is expected by staff during an emergency. In general, the District's Public Information Officer will "have the responsibility of developing and releasing information about the incident to the news media, to incident personnel, and to other appropriate organizations and agencies" (p. 13). Public notification channels can include the RCSD Web site, local radio and television stations, and Social Media (Facebook, Twitter, LinkedIn, Instagram, etc.).

8.6 COMPLIANCE AND ENFORCEMENT

Pursuant to Water Code Section 10632(a)(6), the WSCP should explain the customer compliance, enforcement, appeal, and exemption procedures for triggered shortage response actions as determined by the WSCP.

The District's tiered water rate structure has proven to be an effective way to motivate customers to reduce their water consumption. Refer to Ordinance No. 2022-130 that describes compliance, enforcement, appeal, and exemption procedures consistent with the WSCP. As

shown in Submittal Table 8-2, the demand reduction actions in Shortage Levels 1-3 are voluntary and not associated with an enforceable penalty. The actions taken in Shortage Levels 4-6 would be enforceable according to the water conservation ordinance.

8.7 LEGAL AUTHORITIES

As discussed in Section 8.3, the RCSD Board of Directors has adopted ordinances and resolutions in response to declared drought conditions, which establish legal authority for implementing demand reduction actions and enforcement. RCSD maintains legal authority to implement the shortage response actions in Section 8.4, and to enforce them relative to Section 8.6 by way of declarations made by the Board of Directors and the District's water conservation ordinance.

The following statements have been included herein to demonstrate consistency with Water Code Section 10632(a)(7):

1. Water Code Section Division 1, Section 350 - Declaration of a water shortage emergency condition.

The governing body of the Rubidoux Community Services District shall declare a water shortage emergency condition to prevail within the area served by the Rubidoux Community Services District whenever it finds and determines that the ordinary demands and requirements of water consumers cannot be satisfied without depleting the water supply of the Rubidoux Community Services District to the extent that there would be insufficient water for human consumption, sanitation, and fire protection.

2. California Government Code, California Emergency Services Act (Article 2, Section 8558).

The Rubidoux Community Services District shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency.

The following is a list of contacts for all cities and counties for which the District provides service that can be used in the event of a local emergency as defined in subpart (c) of Gov. Code Section 8558:

a. County of Riverside Emergency Management Dept. (951) 358-7100

b. City of Jurupa Valley City Manager's Office (951) 332-6161

8.8 FINANCIAL CONSEQUENCES OF THE WSCP

The District's primary revenue source is water sales. Surplus revenues are placed in the District's reserve, which is used to fund emergency repairs and water system capital improvements. The District maintains a financial reserve that is adequate to address the costs of multiple plant repairs. (K&S(a), p. 7-13)

With implementation of the WSCP, RCSD's response actions would include demand management, supply augmentation, and operational flexibility, all of which could impact RCSD financially. Financial consequences would include a decrease in revenue due to a decrease in water use, an increase in costs to augment supply, as well as an increase in administrative costs for recording, monitoring, reporting, and enforcing the District's response actions to implement the WSCP.

Upon implementation of the WSCP, RCSD would use its financial resources to mitigate the impacts of water shortages. Mitigation actions that would be initiated to address revenue reductions and expense increases associated with shortage response actions include use of a tiered rate structure that becomes more restrictive and enforceable in Shortage Levels 4-6 (Section 8.6, above). Penalties collected under this policy will be used to implement and enforce water conservation measures. In addition, RCSD would consider a reduction of operation and maintenance expenses, deferral of capital improvement projects and use of the District's operations reserve fund as needed to mitigate any short-term revenue shortfalls.

8.8.1 Additional Costs from Discouraging Excessive Water Use During a Drought Emergency

During a drought emergency, the District is required to prohibit excessive water use pursuant to Water Code Section 365 et al. Reporting the actions undertaken by the District to do so

does not need to be reported in this UWMP; however, reporting the cost of compliance with Section 365 et al. is a required component of this UWMP, pursuant to Water Code Section 10632(a)(8)(C).

For reference, Water Code Section 367 states there are three types of drought emergencies: (1) declared statewide drought emergency; (2) suppliers move to a local stage of requiring mandatory reductions (as part of the WSCP); and (3) declared local drought emergency. During any one of these three types of drought emergencies, Water Code Section 366 states that excessive water use must be prohibited by using either a rate structure or an excessive water use ordinance.

RCSD prohibits excessive water use and water waste by all customers at all times, which includes declared statewide and local drought emergencies, with violations of said prohibition subject to the penalties described therein. Further, each drought response level declared by the District includes the prohibition of excessive water use, also subject to the penalties described therein.

The costs of discouraging excessive water use during a drought emergency would include increased staffing costs for recording and monitoring water use, issuing customer notifications, providing increased customer education, issuing enforcement warnings, and conducting enforcement actions associated with excessive water use.

8.9 MONITORING AND REPORTING

The District will monitor and report on implementation of this WSCP based on key water use metrics to meet state reporting requirements. The District monitors all activities in the water distribution system through a dynamic system control and data acquisition (SCADA) system. The District will monitor and contact high water users to offer water audits and investigate potential water waste during a drought declaration. The Operations Department will continue to monitor the system daily and weekly with regular reporting to the General Manager. Reports are provided monthly to the Board of Directors as to the status of water supplies and water demands. At such time the State Water Board provides the regulations for monthly reporting along with associated enforcement metrics, these will be reviewed and incorporated herein as appropriate.

8.10 REFINEMENT PROCEDURES

Water Code Section 10632(a)(10) requires a description of how this WSCP will be reevaluated and improved upon to ensure water shortage risk tolerance is adequate and appropriate water shortage mitigation strategies are implemented as needed.

The WSCP will be periodically reevaluated to ensure that its shortage response actions are effective and up-to-date based on lessons learned from implementing the WSCP. The plan will be revised and updated during the UWMP five-year cycle to incorporate new information. For example, new demand reduction and/or supply augmentation actions may be added. If significant revisions are warranted, then the WSCP will be updated outside of the UWMP five-year update cycle. In the course of preparing the forthcoming Annual Assessments each year, RCSD staff can routinely analyze the functionality of the WSCP and prepare recommendations to modify the WSCP to the Board of Directors for the purpose of improving effectiveness in meeting the intent and goals of the WSCP.

8.11 SPECIAL WATER FEATURE DISTINCTION

Pursuant to Water Code Section 10632(b), water features that are not for human recreation are analyzed and defined separately from swimming pools and spas.

Non-Swimming Pool and Non-Spa Water Features

Water features that are not used for the purpose of human recreation are referred to as “decorative water features” in RCSD Ordinance No.2022-130. During a drought declaration, these features must use recirculated water. Water waste that is found to be related to such features may be enforced pursuant to the District’s water waste prohibition. Said water waste can be reported to the District by email and telephone, as well as by staff. The District will also be able to spot a malfunctioning meter or water waste through its forthcoming AMR system. Additional demand reduction actions that are triggered during declared droughts can be developed to address decorative water features and incorporated herein during the next update to the WSCP.

Swimming Pools and Spas

Swimming pools and spas that are intended for human recreation must use potable water for health and safety considerations. RCSD ordinances do not address swimming pools and spas specifically. Water waste that is found to be related to pools and spas may be enforced pursuant to the District's water waste prohibition. Said water waste can be reported to the District via email and telephone, as well as by staff. The District will also be able to spot a malfunctioning meter or water waste through its forthcoming AMR system. Additional demand reduction actions that are triggered during declared droughts can be developed to address swimming pools and spas and incorporated herein during the next update to the WSCP.

8.12 PLAN ADOPTION, SUBMITTAL, AND AVAILABILITY

The following are the steps to adopt, submit, implement, and amend the WSCP. The WSCP may be amended independently of the UWMP, as needed.

8.12.1 WSCP Adoption or Amendment

To adopt a WSCP or amend an adopted WSCP, the District will provide two required notices to customers and each city and county within which it provides service: (1) notice of a public hearing at least 60 days prior to the public hearing stating that the WSCP is being reviewed and adoption (or amendment) of the WSCP is being considered; (2) notice of the time and place of the public hearing including where the draft document is available for public viewing. Per Government Code Chapter 17.5 (commencing with Section 7290) of Division 7 of Title 1, the District must hold the public hearing consistent with the Dymally-Alatorre Bilingual Services Act. Determination of whether language assistance is needed is at the discretion of the District (per Gov. Code Section 7293). The District shall also place the notice containing the date and location of the public hearing and location of where the plan is available for public viewing in a newspaper once a week for two successive weeks (per Gov. Code Section 6066).

The public hearing for the WSCP may take place at the same meeting as the adoption hearing of the Board of Directors; however, the meeting agenda must include the public hearing as an agenda item. Before the District can submit the WSCP to DWR, the Board of Directors must formally adopt the WSCP. The adoption resolution should be included with the WSCP, either as an attachment or Web address where it can be found online.

8.12.2 WSCP Submittal and Availability

The WSCP (or amended WSCP) must be submitted to DWR within 30 days of adoption. Submittal must be done electronically using the Water Use Efficiency (WUE) data online submittal tool located at: https://wuedata.water.ca.gov/. Within 30 days of submitting the adopted WSCP to DWR, the District must make the plan available for public review during normal business hours. This can be accomplished by placing a hardcopy at the front desk or by posting copies on the District Web site.

The WSCP (or amended WSCP) must also be submitted to the California State Library within 30 days of adoption. Submittal must be done via compact disc (CD) or hardcopy and mailed to:

California State Library
Government Publications Section
Attn: Coordinator, Urban Water Management Plans
P.O. Box 942837
Sacramento, CA 94237-0001

(If delivered by courier or overnight carrier, the street address should be used instead: 900 N Street, Sacramento, CA 95814.)

The WSCP (or amended WSCP) must also be submitted to each city or county to which the District provides water within 30 days of adoption. It may be submitted in an electronic format.

This Page Left Intentionally Blank

CHAPTER 9 DEMAND MANAGEMENT MEASURES

Demand management is an integral part of water resources management. Because the demand for water tends to increase as communities grow and available water supplies can change over time, having water-use demand management measures (DMMs) that help lower demands for water can improve water service reliability. This chapter provides a comprehensive description of the water conservation programs that RCSD has implemented, is currently implementing, and plans to implement to meet future urban water-use reduction targets.

9.1 DEMAND MANAGEMENT MEASURES FOR RETAIL AGENCIES

The section of the Water Code that addresses DMMs was significantly modified in 2014 to simplify, clarify, and update DMM reporting requirements. The state legislature enacted streamlining of the retail agency requirements from 14 measures to six general requirements plus an "other" category, as follows (CWC §10631(1)(B)):

1. Water waste prevention ordinances;
2. Metering;
3. Conservation pricing;
4. Public education and outreach;
5. Programs to assess and manage distribution system real loss;
6. Water conservation program coordination and staffing support; and
7. Other demand management measures that have a significant impact on water use as measured in gallons per capita per day, including innovating measures, if implemented.

Pursuant to the Water Code, each DMM description below includes how the measure has been implemented over the past five years, and how future projects will help the District to meet future water use targets.

9.1.1 Water Waste Prevention Ordinances

On May 16, 1996, the RCSD Board of Directors adopted Resolution No. 657 establishing a policy for the utilization of District wells producing non-potable water for construction water purposes.

On October 15, 2009, the RCSD Board of Directors adopted Ordinance No. 111 to establish the Landscape Water Use Efficiency Program which provided compliance measures in support of the State Water Conservation in Landscaping Act (State Landscape Model Ordinance [AB 1881, 2006]). Ordinance No. 111 includes efficient water management measures and water waste prevention practices which include, but are not limited to, limiting watering hours, prohibiting excessive water flow or runoff, prohibiting washing down hard or paved surfaces, and customers' obligation to fix leaks, breaks, or malfunctions. Ordinance No. 111 applies to customers with landscape areas one acre or greater in size and customers with properties with dedicated landscape irrigation meters. A copy of Ordinance No. 111 is located in **Appendix M**.

On June 8, 2015, RCSD adopted Resolution No. 2015-820 declaring a modified stage 2 drought contingency pursuant to the District's 2015 Water Shortage Contingency Plan for compliance with State Water Board requirements.

On November 7, 2019, the RCSD Board of Directors adopted Resolution No. 2019-858 to rescind Resolution No. 657 and rescind Resolution No. 2015-820; however, the water conservation practices mandated by Resolution 2015-820 continue to be encouraged as stated in section F of Resolution No. 2019-858. These rescissions were based on improvements to the District's water supplies and repeal by the SWRCB of various water conservation regulations and requirements that were put into effect in 2015 due to statewide drought conditions. By rescinding Resolution No. 657, construction water can be obtained from either potable water hydrant meters or non-potable wells. By rescinding Resolution No. 2019-858, the aforementioned Resolution No. 111 remains the District's enforceable water waste prevention ordinance. A copy of Resolution No. 2019-858 is located in Appendix M.

- **Implementation Over the Past Five Years**

  RCSD operated under the requirements of District Resolution Nos. 657, 2015-820, 2019-858, and Ordinance No. 111. The District has provided and will continue to

provide water conservation advice via the District's website at www.rcsd.org/water-conservation. Additionally, the District's main lobby refers customers to www.iefficient.com which is a website developed by water agencies and cities throughout the Inland Empire to share rebates, tips, and tools to conserve water.

- **Planned Implementation to Achieve Future Water Use Targets**

  RCSD will continue to operate under the requirements of District Resolution No. 2019-858 and Ordinance No. 111. However, as a result of preparing this UWMP the District is looking into updating its water conservation ordinance. Although the District will continue to provide water conservation advice via the District's website, bill inserts, and referring customers to www.iefficient.com, they plan to partner with Western and Metropolitan so that customers may take advantage of water conservation rebate programs offered by those agencies.

9.1.2 Metering

RCSD service connections are fully metered, and all future connections will also be metered. RCSD does not currently calibrate its supply or customer meters. RCSD is in the process of converting to Automatic Meter Reading (AMR) meters and AMR technology for all of its service connections. The conversion does not include calibration. AMR technology automatically collects consumption data from water meters and transfers that data to a central database for billing, troubleshooting, and analysis. AMR technology can reduce the cost of meter reading, provide real-time information, reduce billing errors, monitor tampering, and promote conservation with time-of-use consumption.

As of 2020, RCSD has approximately four dedicated landscape meters. A dedicated landscape meter, also known as an outdoor irrigation meter, is a water meter that exclusively meters water used for outdoor watering and irrigation. These dedicated landscape meters are usually used at parks, road medians, and playing fields. More recently it has become common practice to install a separate meter in homeowner's associations to measure irrigation use in common landscaping. RCSD continues its efforts to increase the number of dedicated landscape meters to monitor irrigation demand.

- **Implementation Over the Past Five Years**

  Since 2015, RCSD has replaced approximately 2,000 residential and non-residential (potable and non-potable) water meters. Meters are replaced when they stop registering or become damaged. In rare instances, if a customer believes the meter is malfunctioning, RCSD conducts a field test and installs a replacement if the meter is under- or over-registering. Approximately 30 field tests have been performed since 2015, which averages to approximately five to six field tests a year.

- **Planned Implementation to Achieve Future Water Use Targets**

  Over the next five years, the District will install AMR meters, starting with 85 units in the immediate future. The District's annual budget will include funds to replace a portion of existing meters with AMR meters. Moreover, new housing developments in the District will be required in the future to install AMR meters. For example, the Shadow Rock project will include AMR meters.

  As indicated in its water loss audits, RCSD will work with vendors to begin regular calibrations of its well and booster pump meters annually and regularly calibrate a percentage of customer meters.

  The District will continue its efforts to ensure that all service connections are fully metered and become a part of its AMR system. Further, dedicated landscape meters will be installed where feasible. All meters will continue to be updated, replaced, and repaired as needed.

9.1.3 Conservation Pricing

Conservation pricing incentivizes customers regarding their water use. For example, the rates might be tiered at progressively higher prices to encourage efficient water use. Like a water waste ordinance, a conservation pricing structure is always in place and is not dependent upon a water shortage for implementation, although a conservation rate structure could include a drought rate structure that has surcharges implemented during drought declarations.

The District currently implements a tiered rate structure for water services, which is a form of conservation pricing. Each tier is defined by a range of water usage (Tier 1: 0- 5 units, Tier 2: 6-

12 units, Tier 3: 13-20 units, Tier 4: 21-29 units, and Tier 5: 30 units and greater). One unit is equal to 100 cubic feet or 748 gallons of water. The District does not implement a drought rate structure.

- **Implementation Over the Past Five Years**

  Since 2015, the District maintained a tiered rate structure and, in accordance with Proposition 218 and compliant with AB 3030, has increased rates each year except for 2019. The District adopted Ordinance No. 2020-126 on June 18, 2020, approving an annual 6 percent "Pass Through" charge to water rates in accordance with Proposition 218 and compliant with AB 3030. A copy of Ordinance No. 2020-126 is located in **Appendix O.**

- **Planned Implementation to Achieve Future Water Use Targets**

  With the adoption of Ordinance 2020-126, the District will continue to increase water rates, in accordance with Proposition 218 and compliant with AB 3030, not to exceed 6 percent annually through fiscal year (FY) 2023-2024. The new water rates were effective January 1, 2021. The District may prepare a Cost of Services Study depending on the results of the forthcoming water and wastewater master plan updates that are expected by 2022.

9.1.4 Public Education and Outreach

The District promotes water conservation education to its customers by providing water conservation tips via the District's website at www.rcsd.org/water-conservation. The water conservation tips were prepared by Metropolitan. Additionally, the District's main lobby refers customers to www.iefficient.com, which is a website developed by water agencies and cities throughout the Inland Empire to share rebates, tips, and tools to conserve water.

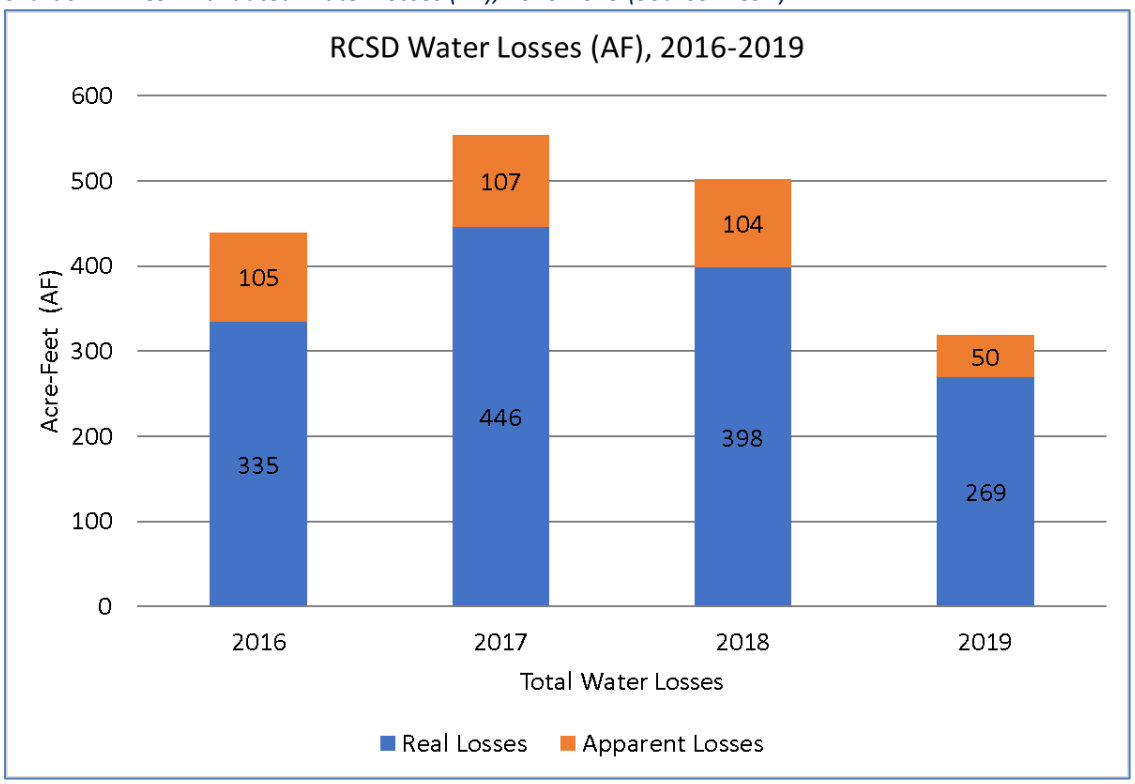
- **Implementation Over the Past Five Years**

  RCSD offered water conservation education to customers through its website at www.rcsd.org/water-conservation and by referring customers to www.iefficient.com. RCSD was provided two towable electronic signs that were driven around the District when the statewide water conservation mandates were in effect. Messages were

displayed that encouraged and explained to customers how to conserve because of the statewide drought.

- **Planned Implementation to Achieve Future Water Use Targets**

  The District is planning to develop a partnership with Western to gain access to Metropolitan's rebate programs and make those rebates available to its customers. The District will also seek a qualified consultant to assist with development and execution of a water conservation program for the District.



9.1.5 Programs to Assess and Manage Distribution System Real Loss

The average production losses from the years 2016 to 2019 are estimated at 9 percent based on the RCSD Water Loss Audits described in Chapter 4 (copies of the District's validated water loss audits from 2016 to 2019 are located in Appendix G). Meter data for CY 2020 suggests potable losses were reduced to 1.9%; however, this is pending confirmation with a validated water loss audit to be submitted to DWR by October 1, 2021. Most leaks occur on water service laterals (i.e., the line between the meter and the main line), which are a type of real loss and replaced completely instead of repaired. System leaks are detected visually and reported by employees and customers. The District periodically replaces water mains as part of its capital improvement program.

- **Implementation Over the Past Five Years**

  Water Code section 10608.34(i) (Senate Bill 555, 2015) directs the State Water Board to "adopt rules requiring urban retail water suppliers to meet performance standards for the volume of water losses." Pursuant to this law, urban retail water suppliers including RCSD have been annually submitting water loss audits to DWR since October 2017 (refer to Chapter 4). Results of the water loss audits from 2016 to 2019 are shown in **Chart 9-1**, with real losses being the dominant type.

Chart 9-1 – RCSD Validated Water Losses (AF), 2016-2019 (Source: RCSD)

Losses for 2020 are preliminarily estimated at 91 AF and will be confirmed with a validated water loss audit to be submitted to DWR by October 1, 2021.

The meter and main repairs performed by the District for the past five years are detailed in **Table 9A** as evidence of RCSD's ongoing efforts to detect leaks quickly and minimize water loss.

Table 9A - RCSD Meter and Main Repairs, 2016-2020

Calendar Year	Service Connection (Meter) Breaks or Leaks	Main Breaks or Leaks
2016	144	9
2017	94	8
2018	109	10
2019	69	8
2020[(1)]	117	5

Source: RCSD *Large Water System Annual Report to the Drinking Water Program [Section 116530 Health & Safety Code for the years ending December 31, 2016- 2019*.

[(1)] RCSD *Complaints Total for 2020.*

- **Planned Implementation to Achieve Future Water Use Targets**

  As suggested during the annual water loss audit validation process, RCSD will work with vendors to begin regular calibrations of its well and booster pump meters and regularly calibrate a percentage of customer meters. The District is currently reviewing all systems for reliability in preventing water loss and will conduct a system-wide condition assessment to identify issues before they become problems.

9.1.6 Water Conservation Program Coordination and Staffing Support

Currently the District does not have a water conservation coordinator, nor does it have a water conservation program in place. However, the District plans on assigning a customer service representative to manage a water conservation program once one is established by the District.

- **Implementation Over the Past Five Years**

  The District does not have a conservation coordinator, nor does it have a water conservation program in place. The District's water conservation efforts were namely to educate customers by providing water conservation tips via its website at www.rcsd.org/water-conservation and via a third-party website at www.iefficient.com.

- **Planned Implementation to Achieve Future Water Use Targets**

  The District plans on developing a water conservation program and possibly assigning a customer service representative to manage a water conservation program once one is established by the District. The District is planning to develop a partnership with Western to gain access to Western's rebate programs and make those available to RCSD customers. The customer service representative would answer questions and coordinate rebate submittals with customers.

9.1.7 Other Demand Management Measures

RCSD does not have other DMMs that have a significant impact on water use.

9.2 ALLIANCE FOR WATER EFFICIENCY AND CALIFORNIA WATER EFFICIENCY PARTNERSHIP

Prior to 2018, RCSD was a member of the California Urban Water Conservation Council (CUWCC), the goal of which was to increase efficient water use statewide through partnerships among urban water agencies, public interest organizations and private entities. CUWCC helped to integrate urban water conservation Best Management Practices into the planning and management of California's water resources.

In March 2018, the CUWCC was reorganized to reflect a new era in water use efficiency. The new organization is comprised of two separate sections: the California Water Efficiency Partnership (CalWEP) and its national partner, the Alliance for Water Efficiency (AWE). RCSD is a member of CalWEP. CalWEP's mission is to maximize urban water efficiency and conservation throughout California by supporting and integrating innovative technologies and practices; encouraging effective public policies; advancing research, training, and public education; and building collaborative approaches and partnerships.

9.3 FUTURE WATER USE OBJECTIVES

In 2018, Assembly Bill 1668 (AB1668) and Senate Bill 606 (SB606) were signed into law to develop a new framework for statewide long-term water conservation. Together, the programs of these laws are organized around four goals: to use water more wisely; eliminate water waste; strengthen local drought resilience; and improve agricultural water use efficiency and drought planning. Notably, the 2018 legislation applies to the actions of DWR, SWRCB, and water suppliers; it does not set any standards or rules for individual customer use.

DWR and SWRCB developed a handbook for the 2018 legislation entitled, *Making Water Conservation a California Way of Life – Primer of 2018 Legislation on Water Conservation and Drought Planning, Senate Bill 606 (Hertzberg) and Assembly Bill 1668 (Friedman)* (November 2018). To fully plan, develop and implement the new framework, DWR and the SWRCB will work closely together over the next few years to develop new standards for indoor residential water use, outdoor residential water use, CII water use for landscape irrigation with dedicated meters, and water loss.

Pursuant to the 2018 legislation, this UWMP includes a Water Shortage Contingency Plan and a Drought Risk Assessment that is due July 1, 2021 and every five years thereafter. The District will submit to DWR an annual water shortage assessment report beginning June 1, 2022. Beginning November 1, 2023 and annually thereafter, RCSD will submit a report to DWR on urban water use objectives, actual urban water use, implementation of CII water use performance measures, and progress toward an urban water use objective (yet to be determined). Lastly, by January 1, 2024 the District will submit to DWR a supplement to the 2020 UWMP that describes how demand management measures are implemented to achieve its yet-to-be-determined urban water use objective.

Remainder of This Page Intentionally Blank

CHAPTER 10 PLAN ADOPTION, SUBMITTAL & IMPLEMENTATION

This chapter provides guidance to address the Water Code (CWC) requirements for a public hearing, the Plan adoption process, submitting an adopted Plan to DWR, Plan implementation, and the process for amending an adopted Plan.

Beginning in 2020, the Water Code requires that the Water Shortage Contingency Plan (WSCP) must have the same process for public hearing, adoption, submittal, and amendments as the UWMP.

10.1 INCLUSION OF ALL 2020 DATA

The Water Code requires current year water use and planning data to be included in the UWMP. Since RCSD is reporting on a calendar year basis, this UWMP and WSCP includes data through calendar year 2020 (January 1 through December 31). As such, this UWMP and WSCP could not be completed until after the end of calendar year 2020.

10.2 NOTICE OF PUBLIC HEARING

Water Code requires that a public hearing must be held by the District prior to adopting the UWMP and/or WSCP. All public input shall be considered by the Board of Directors. There are two audiences within the service area that are required to be noticed for the public hearing: cities and counties, and the general public.

10.2.1 Notice to Cities and Counties

60-Day Notification

All cities and counties within which the District provides water supplies must be notified that the District will be reviewing the UWMP and considering amendments or changes to the Plan. This notice must be sent at least 60 days prior to the public hearing. In order to provide ample opportunity to participate in the UWMP process.

RCSD sent the first notice on March 10, 2021 notifying interested entities of the District's intention to review and update the UWMP including the WSCP, well in advance of the required 60 days prior to the public hearing. Copies of all notifications are located in **Appendix D**. (CWC § 10621(b) and §10642)

Notice of Public Hearing

The District delivered a second notice to cities, the county, and interested entities on April 28, 2021, to confirm the time and place of the public hearing. The notice also reaffirmed that the Draft UWMP and Draft WSCP would be publicly available for viewing at the District website (www.rcsd.org) and a printed hardcopy at the District Headquarters no less than two weeks prior to the public hearing. The draft documents were posted on the District website and the District Headquarters beginning on June 3, 2021. Copies of all notifications are located in Appendix D. Required notifications to the cities and the county within the District service area are listed in **Submittal Table 10-1** to confirm receipt of a 60-day notice and notice of public hearing.

Submittal Table 10-1 Retail: Notification to Cities and Counties

City Name	60 Day Notice	Notice of Public Hearing
Add additional rows as needed		
Jurupa Valley	Yes	Yes
County Name *Drop Down List*	**60 Day Notice**	**Notice of Public Hearing**
Add additional rows as needed		
Riverside County	Yes	Yes
San Bernardino County	Yes	Yes

In addition to the city and the county, RCSD also notified the following list of interested entities.

- City of Jurupa Valley
- City of Riverside Public Utilities
- City of Riverside Water Quality Control Plant
- County of Riverside
- County of San Bernardino
- Cucamonga Valley Water District
- Inland Empire Utilities Agency
- Jurupa Community Services District
- Jurupa Unified School District
- Santa Ana River Water Company
- Western-San Bernardino Watermaster
- Western Municipal Water District
- West Valley Water District

- City of Colton Water Dept.
- Riverside Highland Water Company
- Santa Ana Watershed Project Authority

10.2.2 Notice to the Public

The public was notified of the public hearing and availability to review the draft UWMP and draft WSCP in the local newspaper (*The Press Enterprise)* once a week for two successive weeks pursuant to Government Code section 6066, on June 3 and June 10, 2021. RCSD also placed an announcement on its website. The draft UWMP and draft WSCP were posted on the District website and at the District Headquarters beginning on Thursday, June 3, 2021. Copies of all notifications are located in Appendix D. (CWC §10642)

10.3 PUBLIC HEARING AND ADOPTION

Pursuant to the Water Code, the RCSD Board of Directors held a public hearing on Thursday, June 17, 2021 to receive public comment on the draft UWMP and the draft WSCP (CWC §10608.26(a)). The public hearing was included as an agenda item, which is included in Appendix A.

The Water Code requires the public hearing to accomplish all of the following in order to comply with the Water Conservation Act of 2009 (SB X7-7):

- Allow community input on the District's implementation plan;[1]
- Consider the economic impacts of the District's implementation plan; and
- Adopt a method for determining the District's urban water use target.[2]

Therefore, the public hearing provided information on the District's baseline values, water use targets and compliance, and implementation plan required in the Water Conservation Act of 2009 (SB X7-7).

[1] The term "implementation plan" as mentioned in the Water Conservation Act of 2009 (SB X7-7) is not defined. But according to DWR staff, it is meant to suggest the District's plans, as described in the UWMP, to continue meeting its water conservation target.
[2] The method chosen by RCSD to calculate the 2020 water use target has been, *Method 1: Eighty percent of the water supplier's baseline per capita water use,* as defined in CWC Section 10608.20(a)(1).

10.3.1 Document Adoption

The 2020 UWMP and WSCP were formally adopted by the RCSD Board of Directors on June 17, 2021 following a public hearing on June 17, 2021 (CWC § 10642). Copies of the adoption resolutions are included in **Appendix A**.

10.4 PLAN SUBMITTAL

10.4.1 Document Submittal to DWR

The 2020 UWMP, including the WSCP must be submitted to DWR within 30 days of adoption and by July 1, 2021 (CWC §10621(e)). Document submittal to DWR is done electronically through WUEdata. After the UWMP and WSCP are submitted, DWR will review the plan utilizing the checklist provided in Appendix B and decide as to whether or not the documents address the requirements of the Water Code. The DWR reviewer will contact RCSD as needed during the review process. Upon completion of the Plan review, DWR will issue a letter to the District with results of the review.

Proof of submittal to DWR is located in **Appendix P.**

10.4.2 Electronic Data Submittal

DWR developed an online submittal tool, WUEdata, which was used for the 2015 UWMPs. This tool has been updated for submitting the 2020 UWMPs. The tool accepts complete UWMPs, as well as tabular data from all the data tables. The WUE data online submittal tool is online at https://wuedata.water.ca.gov/. (CWC § 10644(a)(2))

10.4.3 Submittal to the California State Library

No later than 30 days after adoption, RCSD shall submit a CD or hardcopy of the adopted 2020 UWMP, including the adopted WSCP, to the California State Library (CWC § 10644(a)(1)) located at:

California State Library
Government Publications Section
Attention: Coordinator, Urban Water Management Plans
P.O. Box 942837

Sacramento, CA 94237-0001

Or by courier or overnight carrier to the State Library at:

California State Library
Government Publications Section
Attention: Coordinator, Urban Water Management Plans
900 N Street
Sacramento, CA 95814

Proof of submittal to the State Library is located in **Appendix P.**

10.4.4 Submittal to Cities and Counties

No later than 30 days after adoption of the 2020 UWMP, including the WSCP, the District shall submit a hard or electronic copy of the documents to the County of Riverside (CWC §10635(c)).

Proof of submittal to the City of Jurupa Valley and County of Riverside is located in **Appendix P.**

10.5 PUBLIC AVAILABILITY

The adopted 2020 UWMP, including the adopted WSCP, are available for public review at RCSD Headquarters, located at 3590 Rubidoux Boulevard, Jurupa Valley, California, 92509 during normal business hours Monday through Friday 7:00 AM to 5:00 PM. In addition, a copy of the adopted UWMP and WSCP can be found on RCSD's website (www.rcsd.org) for public viewing anytime. (CWC § 10645(a) and 10645(b))

Proof of public availability is located in **Appendix P.**

10.6 NOTIFICATION TO PUBLIC UTILITIES COMMISSION

Pursuant to Water Code, those water suppliers that are regulated by the California Public Utilities Commission (CPUC) must submit their UWMP and WSCP to the CPUC as part of its general rate case filings. Because RCSD is not regulated by the CPUC, the District will not be submitting their documents to the CPUC. (CWC §10621(c))

10.7 AMENDING AN ADOPTED PLAN

If RCSD decides to amend the adopted 2020 UWMP, then each of the steps for notification, public hearing, adoption, and submittal must also be followed for the amended plan. This includes providing copies of amendments or changes to the plan to DWR, California State Library, and any city or county within which the supplier provides water within 30 days of adoption. (CWC §10644(a)(1))

10.7.1 Amending a Water Shortage Contingency Plan

If RCSD decides to revise the adopted 2020 WSCP after DWR approves the 2020 UWMP, then RCSD must submit to DWR an electronic copy through the WUE Data Portal of its revised WSCP within 30 days of its adoption. (CWC § 10644(b))

10.7.2 Amendment List

- The first amendment to this UWMP and the first amendment to the WSCP were adopted by the District Board of Directors on April 21, 2022 after a public hearing was held on April 7, 2022. Notices to the City of Jurupa Valley, County of Riverside, and San Bernardino County were provided via email on February 3, 2022 (more than 60 days in advance). Draft documents were made publicly available beginning February 10, 2022. Notices of the public hearing were posted in English and Spanish language newspapers once a week for two weeks in early March 2022. Within 30 days of adoption, the adopted plans were made available on the District's website, www.rcsd.org and notices sent to the City and Counties containing an electronic link to download the adopted reports. In addition, a CD was mailed to the California State Library with the amended plans. Copies of all resolutions, notices, and documents related to this amendment are located in **Appendix Q**.

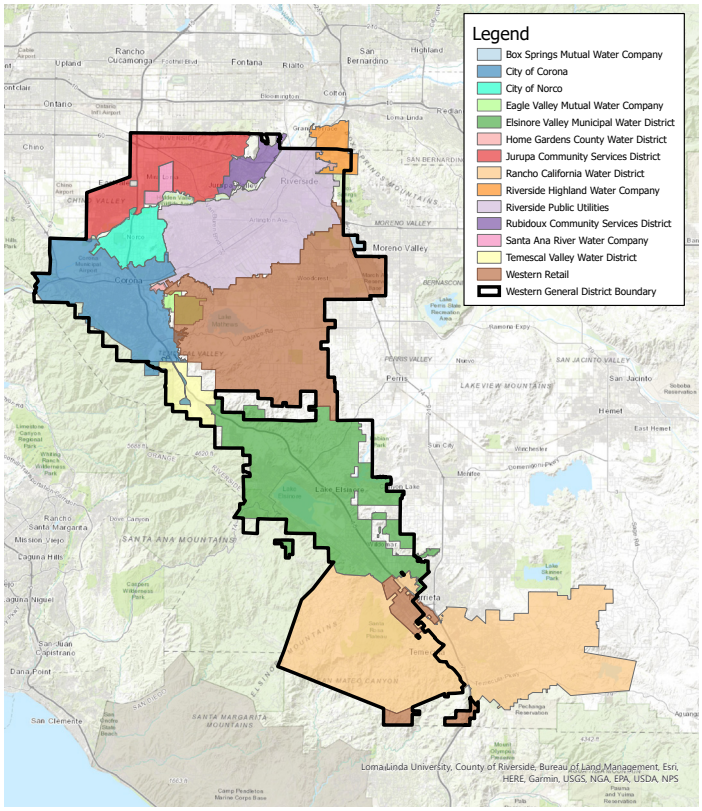
Providing Water Security to Western Riverside County for over 60 years



Western is a regional leader for safe, reliable, and affordable water supply.

The Western Municipal Water District (Western) was formed in 1954 to bring supplemental water to the growing western Riverside county. Today, Western provides water supply, wastewater treatment and disposal, and water resource management to nearly one million people in a service area covering roughly 527-square miles in western Riverside County.

Western serves approximately 25,000 retail and fourteen (14) wholesale customers with water from the Colorado River, State Water Project, recycled water and local groundwater.

Western Retail serves retail customers directly in Orangecrest, Mission Grove, El Sobrante, Eagle Valley, Temescal Canyon, Woodcrest, Lake Mathews, portions of Mead Valley and Perris, and March Air Reserve Base.

As a member agency of the Metropolitan Water District of Southern California (Metropolitan), Western Wholesale provides supplemental water to the cities of Corona, Norco, and Riverside and the water agencies serving Box Springs, Eagle Valley, Elsinore Valley, Temescal Valley, and Temecula.

One document that describes Western's water vision.

Water agencies in California that serve more than 3,000 customers or 3,000 acre-feet (AF) annually are required by California law to prepare an Urban Water Management Plan (UWMP or Plan) every five years. The Plan supports Western's long-term resource planning to ensure that adequate water supplies are available to meet existing and future water needs. The Plan integrates local and regional land use planning, regional water supply, infrastructure, and demand management projects, as well as statewide issues of concern like climate change and regulatory requirements.

The Plan includes sections for Western Wholesale and Western Retail, and focuses on the following topics:

Supply and Demand – A detailed analysis of current and future water use and sources of supply over a 25-year planning horizon

Water Supply Reliability – A detailed assessment of water supply reliability

Drought Risk Assessment – An analysis of drought risk assuming a five consecutive year drought

Water Use Efficiency and Conservation – A summary of water use efficiency and conservation programs

Water Shortage Contingency Plan – A summary of planned responses in the event of a water shortage

Outreach and Engagement – A summary of the outreach, communication and engagement that was conducted in support of the Plan

Western is both a water wholesaler (Western Wholesale) and retailer (Western Retail), and the 2020 UWMP covers both roles separately.

The 2020 UWMP is an Important Part of Water Planning in the Region

The UWMP integrates with many other regional and local planning efforts for planning consistency.

This UWMP is just one of many interrelated local and regional planning efforts Western is either leading or coordinating with to secure water supplies for customers within its service area. For more information on the specific scope and content of each of the plans shown below, refer to Figure 1-2 in the UWMP. The 2020 UWMP was prepared in parallel with a Drought Contingency Plan (DCP) that is being developed for the entire Western Wholesale service area.

REGIONAL PLANS	WESTERN'S PLANS	LOCAL PLANS
Metropolitan Integrated Resources Plan and 2020 UWMP	Western Retail Facilities Master Plans	Retail Agency UWMPs
One Water One Watershed (OWOW) Plan	**Western's 2020 UWMP**	Local Hazard Mitigation Plan

Connecting with Stakeholders and the Public

Western is committed to informing and engaging stakeholders and the general public.

Western is committed to engaging its customers and stakeholders in a proactive and collaborative way to assist in its water planning efforts. The various groups involved with the UWMP and their role are summarized in the graphics below. Western implemented a tiered engagement plan that included local, regional, state and national participation, including the general public and Western's own Board of Directors.

DROUGHT TASK FORCE MEMBER ORGANIZATIONS

ENVIRONMENTAL AND CONSERVATION GROUPS

- Inland Empire Resource Conservation District
- Inland Empire Waterkeeper
- Riverside-Corona Resource Conservation District
- Santa Ana Watershed Project Authority

ENVIRONMENT AND SOCIAL JUSTICE

- Center for Community Action and Environmental Justice

REGIONAL GOVERNMENT (6%)

- Riverside County Flood Control and Water Conservation District
- Western Riverside Council of Governments

RESEARCH

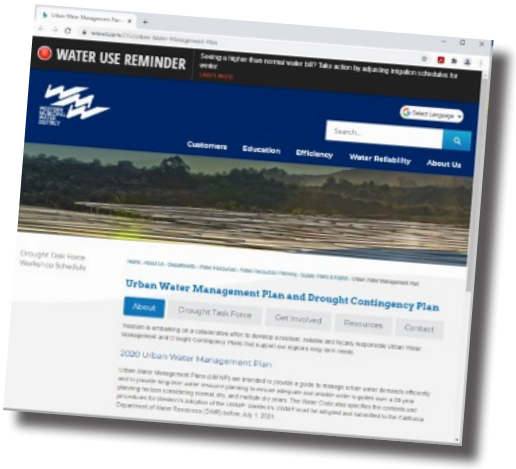
- University of California, Riverside
- Water Resources Institute

LOCAL GOVERNMENT

- City of Murrieta

TRIBAL REPRESENTATIVES

- Pechanga Tribal Government



RETAIL: CUSTOMER STAKEHOLDER

- Altman Plants
- March Air Reserve Base
- Vons/Kroger
- Woodcrest MAC
- Woodcrest MAC/Riverside County

WATER AGENCY: REGIONAL

- Eastern Municipal Water District
- Metropolitan Water District of Southern California
- San Bernardino Valley Municipal Water District
- Box Springs Mutual Water Company
- City of Corona
- City of Norco
- Elsinore Valley Municipal Water District
- Jurupa Community Services District
- Rancho California Water District
- Riverside Highland Water Company
- Riverside Public Utilities
- Rubidoux Community Services District
- Temescal Valley Water District

Western formed a Drought Task Force that includes diverse perspectives to inform development of the UWMP and the DCP that will be completed in 2022.

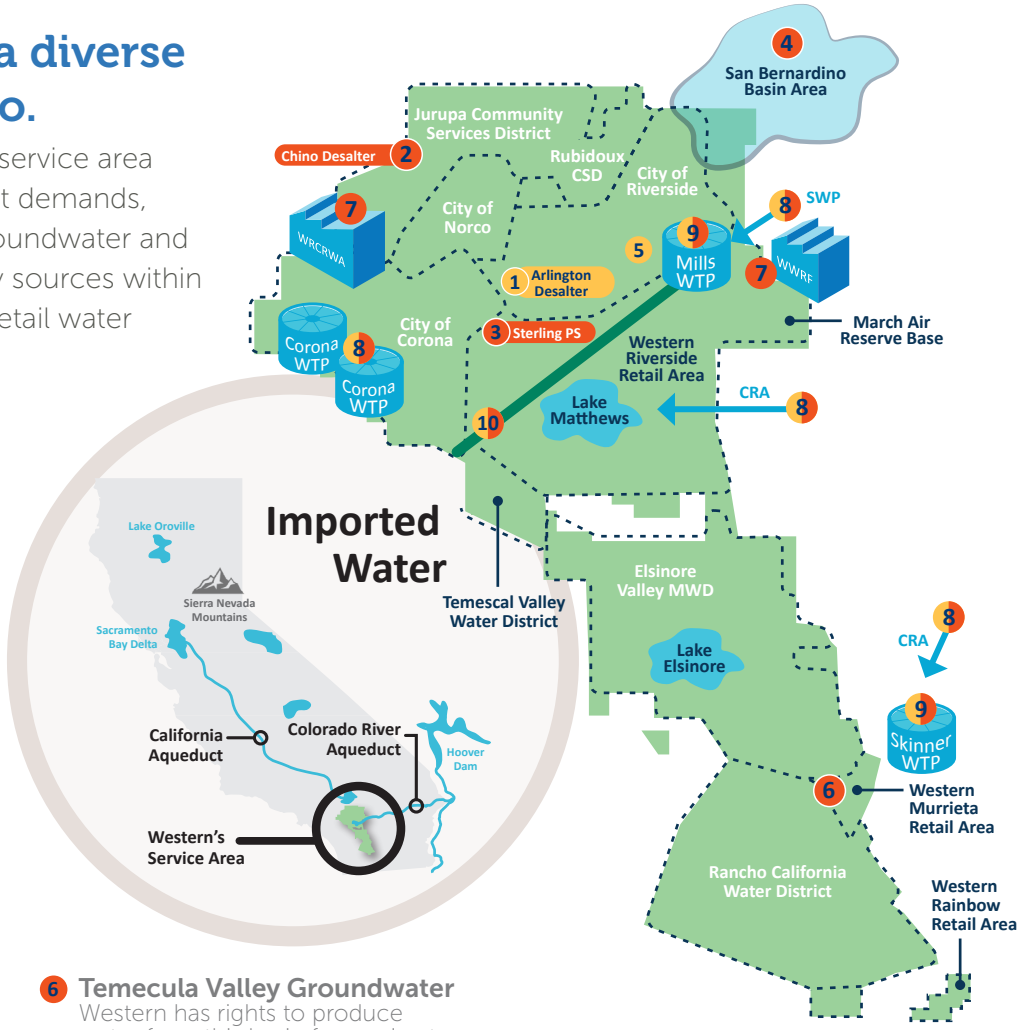
Western created a webpage to provide another opportunity for interested individuals or organizations to learn more about the UWMP, view the Drought Task Force participants and workshop schedules, subscribe to project updates, review and comment on the Plan and access related resources.

Where Western's Water Comes From

The region relies on a diverse water supply portfolio.

Retail water agencies in Western's service area rely on a variety of sources to meet demands, including imported water, local groundwater and recycled water. Many of the supply sources within the region are shared by multiple retail water agencies, including Western Retail.

SUPPLIES AND INFRASTRUCTURE



1 Arlington Desalter and Victoria Recharge Basin
Produces drinking water by treating local non-potable groundwater using reverse osmosis to remove salt and other matter. This process also helps clean up the groundwater basin and improve the quality over time. The new Victoria Recharge Basin captures stormwater from precipitation and runoff and percolates into the groundwater basin where it is later used by the Arlington Desalter, increasing local supply reliability.

2 Chino Desalter
Western partners with several other water agencies to treat local non-potable groundwater using reverse osmosis to create a new high quality drinking water supply.

3 Sterling Pump Station and La Sierra Pipeline
The recently completed Sterling pump Station and La Sierra Pipeline connect the Chino and Arlington Desalters to and allow Western to deliver both water sources to many different locations, increasing regional reliability.

4 San Bernardino Basin (SBBA)
Western owns rights to pump local potable groundwater from the SBBA and has a long term lease with Meeks & Daley Water Company to use additional water from the SBBA.

5 City of Riverside
Western has an agreement with Riverside to purchase their surplus local groundwater. Riverside also pumps and delivers Western's water from the SBBA to Western Retail at interconnections using their existing facilities.

6 Temecula Valley Groundwater
Western has rights to produce water from this basin for service to Western's Murrieta Retail system.

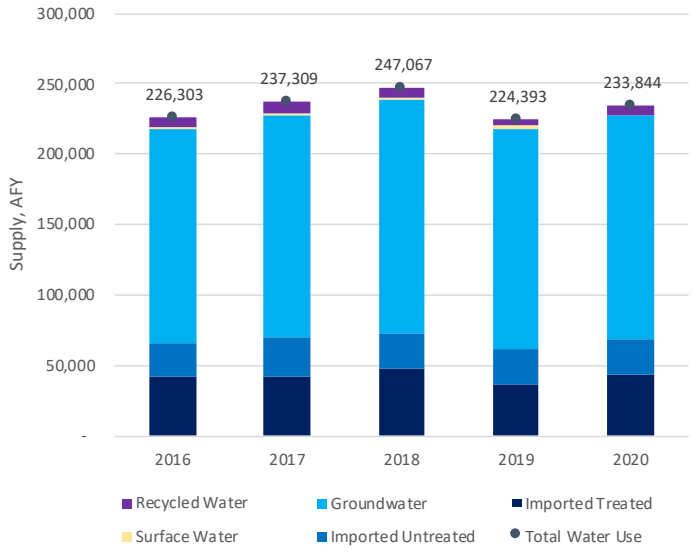
7 Recycled Water a Local Drought Proof Supply
Western provides recycled water and non-potable groundwater to meet non-potable irrigation water needs, preserving the potable supplies for domestic use.

8 Imported Water
Western Wholesale obtains potable and nonpotable imported water supply from the SWP and CRA through Metropolitan at various locations and delivers it to Western Retail and other wholesale customers in their service area. Some Western Wholesale customers receive raw imported water directly from Metropolitan pipelines and use the water for groundwater recharge or treat it at their own treatment plants for potable use.

9 Mills and Skinner Water Treatment Plants (WTP)
Metropolitan treats imported water at their Mills and Skinner WTPs and provides potable imported water to Western to distribute to Western Retail and other wholesale customers.

10 Mills Gravity Line
Deliver treated imported water from the Mills WTP to Western Retail and several Western Wholesale customers.

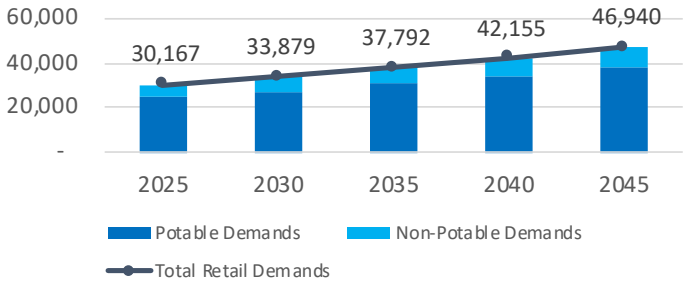
Wholesale
Retail
Wholesale & Retail



CRA - Colorado River Aqueduct
SWP - State Water Project

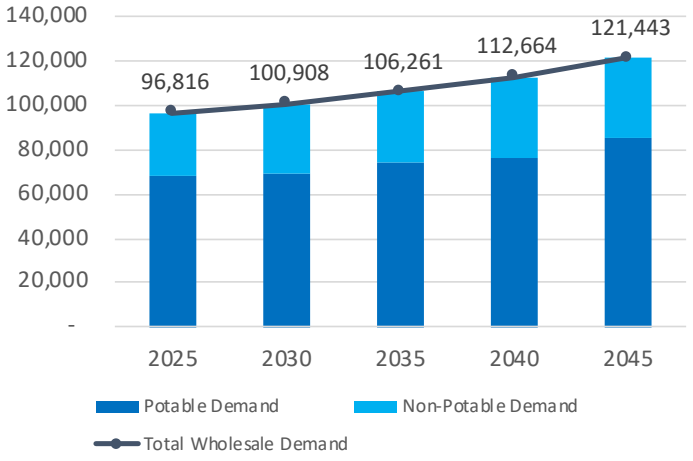
Total Water Use within Western's Service Area

Western's retail agencies rely on a mix of supplies, and not all supply comes from Western.



Total water use within Western's service area has ranged from approximately 220,000 AF to more than 245,000 AF in the last five years, including Western Retail. In 2020, approximately 31% of the total water used within Western's service area was provided by Western Wholesale. In addition to wholesale water purchased from Western, most of the water purveyors within Western's service area also deliver local surface and groundwater and/or recycled water within their respective service areas and some rely solely on local water supplies.

TOTAL WATER USE IN WESTERN'S SERVICE AREA FROM 2016 THROUGH 2020.

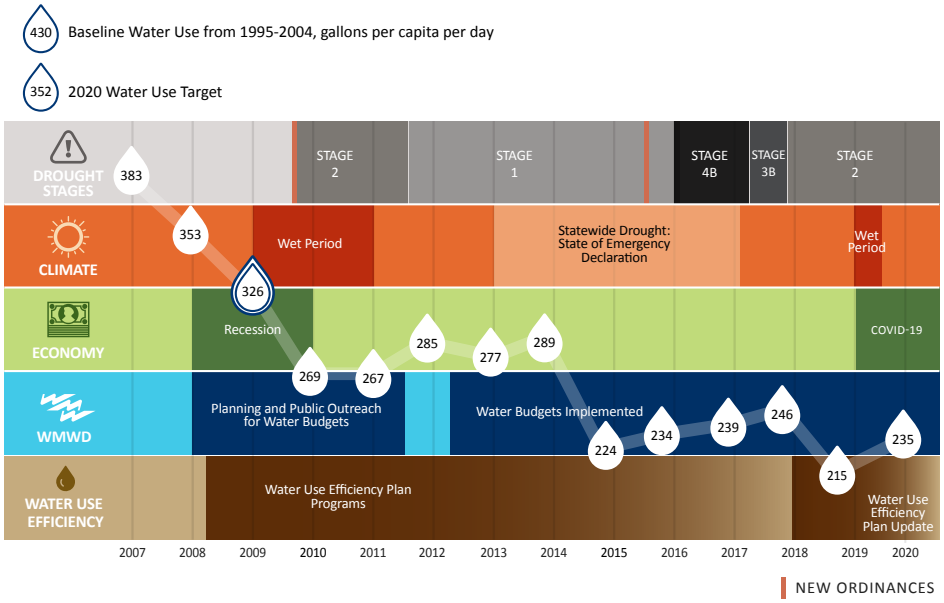


Western Wholesale delivers potable and non-potable supplies to its wholesale customers. Western Wholesale's total demand is expected to increase from 74,927 AF in 2020 to over 121,000 AF in 2045.

PROJECTED RETAIL DEMAND, AFY.

PROJECTED WHOLESALE DEMAND, AFY, INCLUDING WESTERN RETAIL DEMANDS.

Using Water Wisely



Western is an active and visible advocate and resource for wise water use in the region.

Western has been a leader in water use efficiency for many years and actively collaborates with local and regional agencies and the communities it serves to implement innovative programs and drive reductions in water usage. Western staff also serves in a leadership role for the California Water Efficiency Partnership (CalWEP) whose mission is to maximize urban water efficiency and conservation throughout California by supporting and integrating innovative technologies and practices; encouraging effective public policies; advancing research, training, and public education; and building collaborative approaches and partnerships.

20% BY 2020

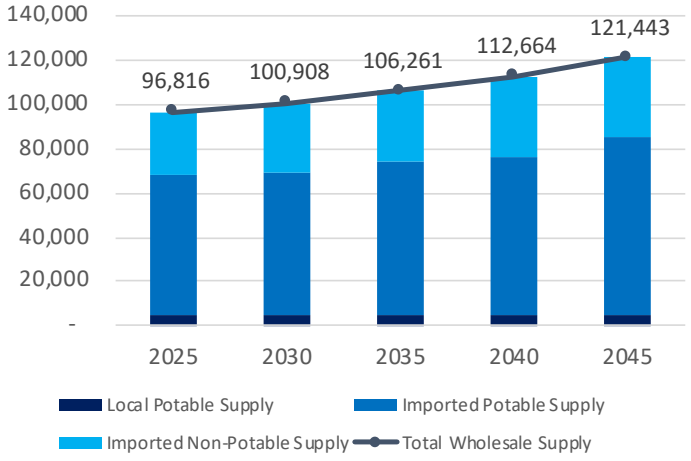
By 2009, Western Retail had met their target to reduce per capita water consumption by 20% by 2020 and went on to achieve a reduction of more than 45% by 2020.

Activities that have affected retail water usage in Western Municipal Water District.

Water use efficiency is a core business component in Western's customer partnership with both wholesale and retail customers.

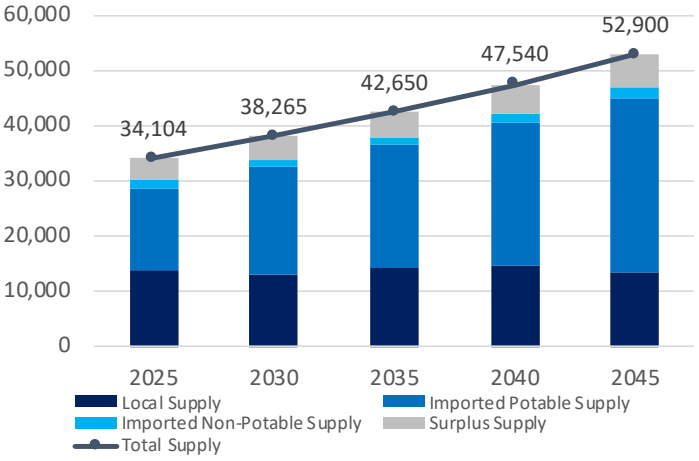
Revised 3/30/2022

Western's Supplies are Reliable, Even in Drought



Western's diverse supplies and continued investments provide reliable water for the region.

Western evaluates the reliability of its supplies considering short and long-term variations in weather and climate patterns, including the impacts of climate change. Additionally, Western's supply sources may be impacted by water quality and legal restrictions, environmental and/or ecological constraints, as well as potential for interruption of supply driven by catastrophic events.



To address these risks, Western and Metropolitan invest in a variety of projects and programs to enhance water supply reliability. These include investing in water conservation and development of local supplies, as well as storage, transfer and exchange programs, and improvements in regional infrastructure. Metropolitan is also pursuing solutions in enhance reliability of SWP supplies through long-term investments in the Sacramento-San Joaquin Delta (Bay-Delta). The net effect is a very robust and reliable supply, even under extended drought conditions.

Western evaluated supply reliability during a single dry year, multiple dry years, and a multiple year drought that could potentially occur within the next five years (2021-2025). In all cases, Western's supplies were sufficient to meet demand without any supply shortages.

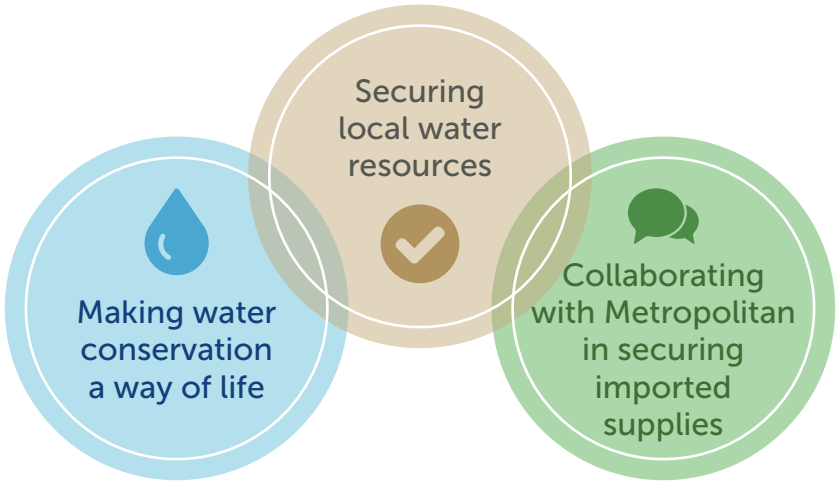
PROJECTED WESTERN WHOLESALE SUPPLIES IN A SINGLE DRY YEAR, AFY

PROJECTED WESTERN RETAIL SUPPLIES IN A SINGLE DRY YEAR, AFY

What Happens if Supplies are Interrupted?

Western's Water Shortage Contingency Plan (WSCP) describes how Western is preparing for and may respond to potential water shortage.

A water shortage occurs when water supply available is insufficient to meet the normally expected customer water use at a given point in time. A shortage may occur due to several reasons, such as water supply quality changes, climate change, drought, regional power outage, and catastrophic events (e.g., earthquake). Additionally, the State may declare a statewide drought emergency and mandate that water suppliers reduce demands, as occurred in 2014. The WSCP serves as the operating manual that Western will use to prevent catastrophic service disruptions through proactive, rather than reactive, mitigation of water shortages. The Western WSCP provides a process for an annual water supply and demand assessment and structured steps designed to respond to actual conditions. Although Western does not foresee implementing water shortage levels for Western Wholesale or Western Retail unless determined by Metropolitan, this level of detailed planning and preparation provide accountability and predictability and help Western maintain reliable supplies and reduce the impacts of any supply shortages and/or interruptions.



Looking to the Future – Delivering Long-term Water Security

Western is poised for continued leadership to support the region's long-term water security.

Western has ongoing programs to continue its mission of providing safe, reliable, environmentally sensitive, and financially responsible water resources for its customers.

Additionally, Western is currently partnering with the Drought Task Force to prepare a Drought Contingency Plan (DCP) that takes a deeper dive into drought planning and preparedness across Western's entire service area, including an in-depth evaluation of the potential range of impacts of climate change on Western's long-term supplies.

STAY INFORMED AND INVOLVED

Tap into education, advocacy and awareness by staying involved with Western.

Part 1

Introduction

WESTERN MUNICIPAL WATER DISTRICT

1 Introduction

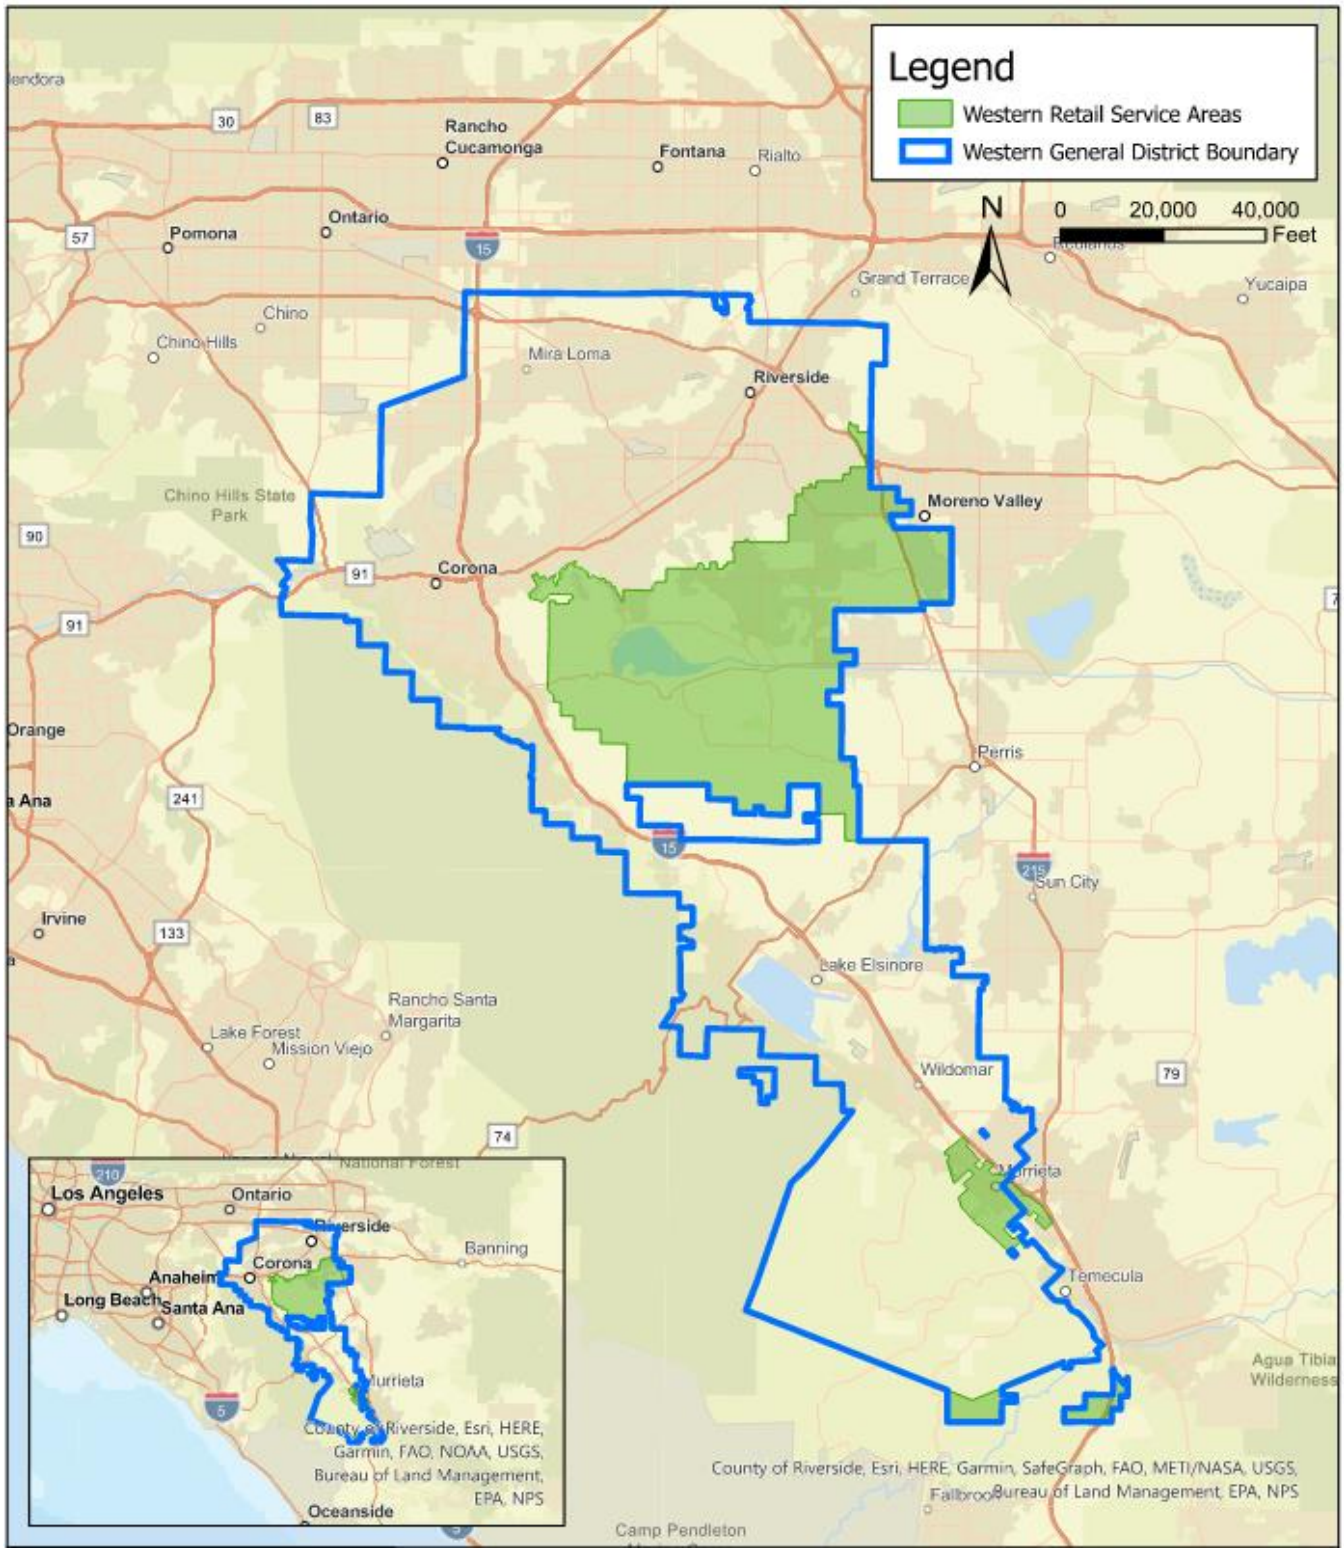
This chapter provides a brief overview of Western Municipal Water District (Western) and the purpose of this Urban Water Management Plan (UWMP). It also describes how the UWMP is organized and how it relates to other local and regional planning efforts that Western is involved in.

This document presents the 2020 UWMP for Western. Western supplies water on both a wholesale (Western Wholesale) and a retail (Western Retail) basis and this document addresses the UWMP requirements for each in separate sections. The Western Wholesale system also includes Western Retail as a customer.

Western is a public agency headquartered in Riverside, California. Western was formed in 1954 to provide water to the growing western Riverside County through local and imported sources.

IN THIS SECTION

- About Western
- Purpose of the Plan
- Plan Organization
- Relation to Other Documents



Today, Western provides water supply, wastewater treatment and disposal, and water resource management to nearly one million people in a service area covering roughly 527-square miles, shown in **Figure 1-1**. In total, Western sells approximately 80,000 acre-feet (AF) of water each year and operates two wastewater treatment plants and a groundwater desalination plant.

As a member agency of the Metropolitan Water District of Southern California (Metropolitan), Western Wholesale provides wholesale water to the region within its service area, which includes the cities of Corona, Norco and Riverside and the water agencies serving Box Springs, Eagle Valley, Elsinore Valley, Temescal Valley, and Temecula.

Western Retail also directly serves water to approximately 25,000 retail customers in the unincorporated areas of El Sobrante, Eagle Valley Temescal Creek, Woodcrest, Lake Mathews, March Air Reserve Base and Rainbow, as well as portions of the cities of Riverside and Murrieta.

Western is one of the five member agencies of the Santa Ana Watershed Project Authority (SAWPA), a joint powers authority that conducts regional water resources planning and project implementation within the Santa Ana River Watershed.

Figure 1-1. Western Wholesale and Western Retail Service Area Boundaries

1.1 Urban Water Management Plan Purpose

In 1983, the State of California Legislature (Legislature) enacted the Urban Water Management Planning Act (UWMP Act). The law required an urban water supplier, providing water for municipal purposes to more than 3,000 customers or serving more than 3,000 AF annually, to adopt an Urban Water Management Plan every five years demonstrating water supply reliability under normal as well as drought conditions. The UWMP Act applies to wholesale and retail suppliers. In 2020, Western Wholesale provided nearly 75,000 AF of water to its wholesale customers (including Western Retail). In 2020, Western Retail delivered over 25,000 AF of water to nearly 25,000 service connections throughout its retail service areas. Therefore, Western Wholesale and Western Retail are required to prepare an UWMP so Western's UWMP must meet the requirements for both.

Since the original UWMP Act was passed, it has undergone significant expansion to address a broad range of issues that impact the water supply reliability of each water supplier, including prolonged droughts, groundwater overdraft and changing climatic conditions. The current UWMP Act requirements are found in Sections 10610-10657 and 10608 of the California Water Code.

DWR provides guidance on preparing an UWMP to meet and understand the requirements in the California Water Code by developing an UWMP Guidebook, conducting workshops, developing tools, and providing program staff to help water suppliers prepare comprehensive and useful water management plans, and implement water conservation programs. Suppliers prepare their own UWMPs in accordance with the requirements and submit them to DWR. DWR then reviews the plans to make sure they have addressed the requirements identified in the California Water Code for completeness and submits a report to the Legislature summarizing the status of the plans for each five-year cycle.

The purpose of this UWMP is for water suppliers to evaluate their long-term resource planning and establish management measures to ensure adequate water supplies are available to meet existing and future demands. The UWMP provides a framework to help water suppliers maintain efficient use of urban water supplies, continue to promote conservation programs and policies, ensure that sufficient water supplies are available for future beneficial use, and provide a mechanism for response during drought conditions or other water supply interruptions.

The UWMP is a valuable planning tool used for multiple purposes including:

- Provides a standardized methodology for water utilities to assess their water resource needs and availability.
- Serves as a resource to the community and other interested parties regarding water supply and demand, conservation and other water related information.
- Provides a key source of information for cities and counties when considering approval of proposed new developments and preparing regional long-range planning documents such as city and county General Plans.
- Informs other regional water planning efforts.

California Water Code Section 10632 also includes updated requirements for suppliers to prepare a Water Shortage Contingency Plan (WSCP). The WSCP documents a supplier's plans to manage and mitigate an actual water shortage condition, should one occur because of drought or other impacts on water supplies. In the 2015 UWMP cycle, the WSCP was part of the UWMP. For the 2020 update, the WSCP is required to be a standalone document so that it can be updated independently of the UWMP but must be referenced in and attached to the 2020 UWMP. An overview of the WSCP requirements are described in the body of this UWMP and the standalone WSCP is attached as **Appendix A**.

1.2 Plan Organization

This document was prepared in compliance with the California Water Code and the 2020 guidelines established by DWR and constitutes Western's 2020 UWMP for both Western Wholesale and Western Retail.

The 2020 UWMP is organized in four parts:

PART 1: INTRODUCTION

Chapter 1 – Introduction

Chapter 2 – Outreach and Engagement

Chapter 3 – Service Area Description

PART 2: WESTERN WHOLESALE

Chapter 4 – Wholesale Water Supply

Chapter 5 – Wholesale Water Use

Chapter 6 – Wholesale Water Service Reliability and Drought Risk Assessment

Chapter 7 – Wholesale Demand Management Measures

Chapter 8 – Wholesale Water Shortage Contingency Plan

PART 3: WESTERN RETAIL

Chapter 9 – Retail Water Supply

Chapter 10 – Retail Water Use

Chapter 11 – Retail Water Service Reliability and Drought Risk Assessment

Chapter 12 – Retail Demand Management Measures

Chapter 13 – Retail Water Shortage Contingency Plan

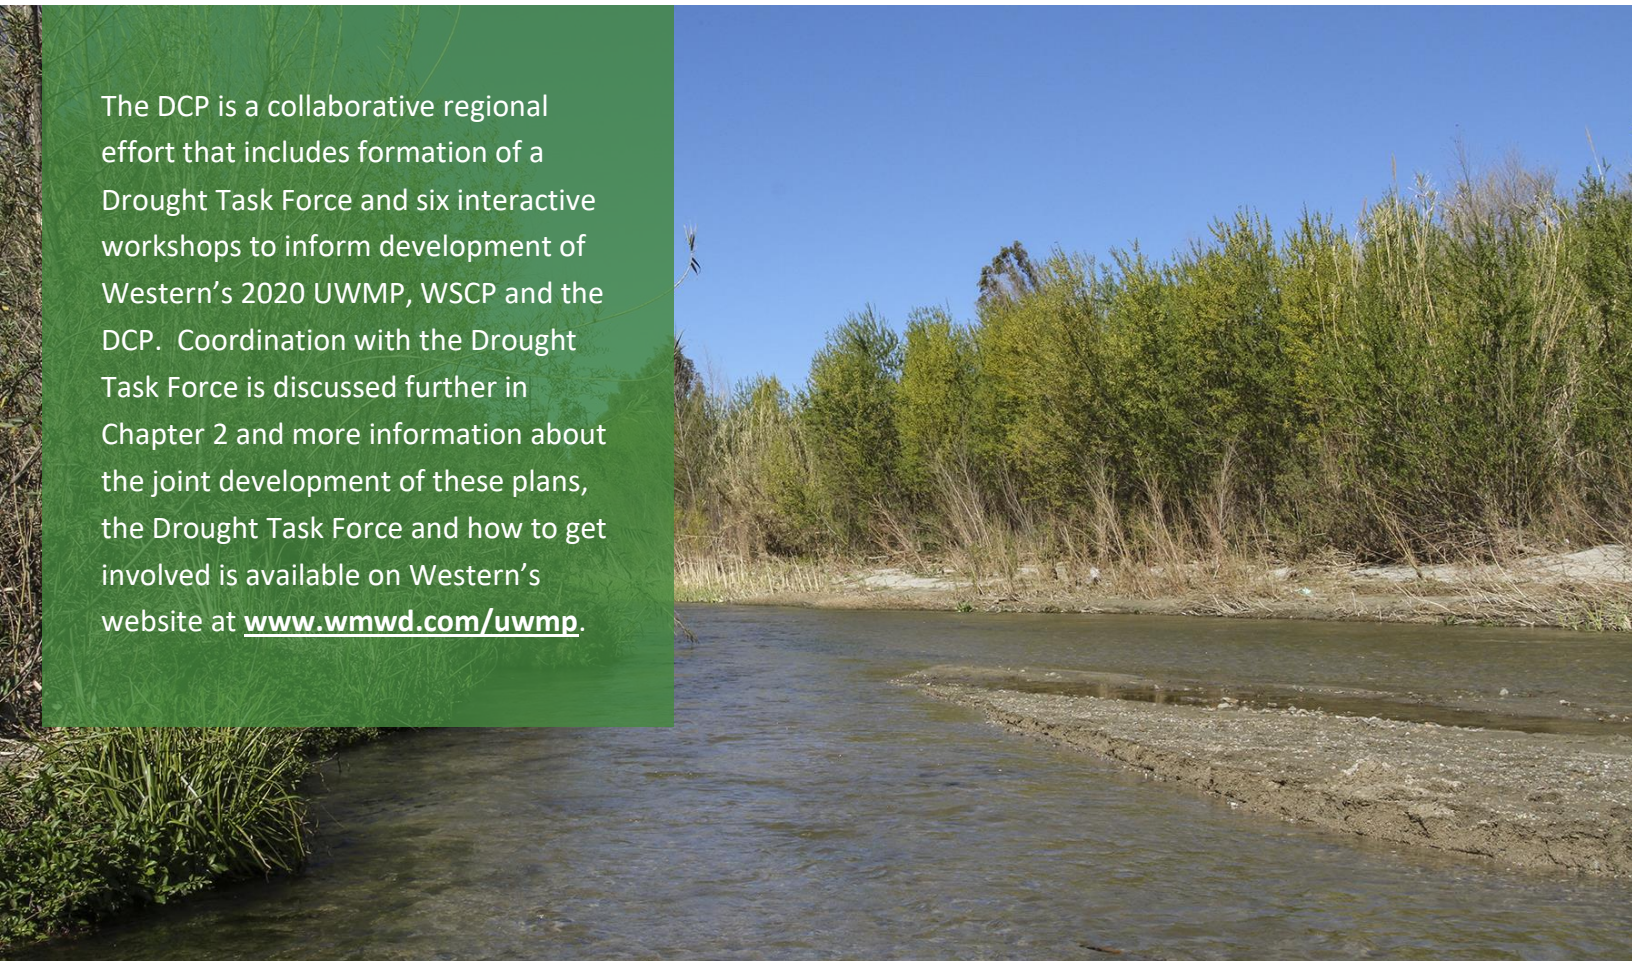
PART 4: SUPPORTING INFORMATION

References

Appendices

Throughout this report, water volume is represented in units of acre-feet (AF). Data is presented on a calendar year basis.

1.3 Relation to Other Efforts



In addition to the 2020 UWMP, Western is involved in several other internal and external planning efforts and collaborates with a variety of stakeholders to achieve coordination and consistency between the various planning documents, especially those prepared by Western.

Figure 1-2 provides an overview of the many related planning efforts and how they integrate with the various elements of Western's 2020 UWMP. Elements of other plans that directly inform the development of this UWMP are shaded in gray.

1.3.1 Western Drought Contingency Plan

Western received a grant from the United States Bureau of Reclamation (Reclamation) to prepare a Drought Contingency Plan (DCP) consistent with Reclamation's Drought Response Program Framework. The Drought Response Framework provides assistance to water users and managers to conduct drought contingency planning, including consideration of risks and uncertainties related to changing hydrologic conditions, and to take actions that will build long-term resiliency to drought.

The DCP has many elements in common with elements of the UWMP and WSCP, such as supply and demand analysis, climate change vulnerability and water shortage response actions. Therefore, the two plans are being prepared in parallel as a joint project with a coordinated schedule and approach. This allows Western to capture efficiencies in simultaneous development of the documents and to fully align the analysis and recommendations of both plans. The DCP will be prepared over a two-year timeframe and will be completed by the end of 2022, but some elements that inform the 2020 UWMP were escalated in the DCP schedule to meet the earlier UWMP submittal deadline of July 1, 2021.

The DCP is a collaborative regional effort that includes formation of a Drought Task Force and six interactive workshops to inform development of Western's 2020 UWMP, WSCP and the DCP. Coordination with the Drought Task Force is discussed further in Chapter 2 and more information about the joint development of these plans, the Drought Task Force and how to get involved is available on Western's website at **www.wmwd.com/uwmp**.

2 WESTERN MUNICIPAL WATER DISTRICT
Outreach and Engagement

This chapter describes the outreach and engagement activities conducted by Western during preparation of the 2020 UWMP, the various stakeholders involved in preparation of this UWMP along with the public review and adoption process.

Throughout preparation of this UWMP, Western actively engaged with stakeholders, including cities, counties, water agencies, and the public to inform them of Western's efforts and activities, gather the best available data for use in developing this UWMP, and coordinate planning activities with other related regional plans and initiatives.

Western employed a combination of outreach efforts, which were designed to educate decision-makers and customers about key plan decisions and engagement activities, which are designed to influence the development of the UWMP by curating the perspective of select stakeholders at key plan milestones.

Details regarding the key outreach and engagement efforts conducted by Western as part of the UWMP development are presented in this chapter.

IN THIS SECTION

- Outreach and Engagement Overview
- Stakeholders
- Plan Review, Adoption, and Submittal

2.1 Stakeholders

Western actively engaged with diverse stakeholder groups throughout the development of the UMWP. The various stakeholder groups involved with the UWMP and their role is summarized below in **Table 2-1**. Each stakeholder group and the methods of outreach and engagement are described in the following sections.

Table 2-1. Key Stakeholders and Roles

	ROLE FOR UWMP

Drought Task Force	X	X	X	
Engineering, Operations, Water Resources (EOWR) Committee	X	X	X	
Western Board of Directors				X
General Public	X	X		

OUTREACH
One-way communication to educate, inform

ENGAGEMENT
Multi-directional communication to inform plan decisions

2.1.1 Drought Task Force

As described in **Chapter 1**, the UWMP was developed in parallel with a Drought Contingency Plan. As part of this combined effort, Western recruited, convened and engaged a Drought Task Force comprised of 29 organizations represented by knowledgeable community leaders who can offer diverse, informed perspectives to support effective drought contingency planning as well as inform Western's UWMP and WSCP. The members of the Drought Task Force organized by stakeholder segment group are presented in **Table 2-2**. All of the retail water agencies in Western's service area are represented on the Drought Task Force.

During the UWMP preparation, the Task Force members participated in two interactive workshops to share their perspectives to inform development of elements of the UWMP, WSCP and DCP, and will continue to participate in approximately four more workshops to complete the development of the DCP by the end of 2022.

2.1.2 Western Engineering, Operations and Water Resources (EOWR) Committee

Western's EOWR Committee serves as an advisor to UWMP development. To keep the Committee informed and provide opportunity for input on key plan milestones, Western staff provided project updates at EOWR public meetings spanning the UWMP development. The EOWR Committee was provided the opportunity to review and provide comment on the draft UWMP.

2.1.3 Western Board of Directors

Western's Board of Directors (Board) is the formal decision-making body that adopts the UWMP and recommends it for submittal to DWR. To keep the Board informed, Western staff provided periodic updates at public Board meetings, spanning the UWMP development.

2.1.4 General Public

To reach all customers within Western's service area, Western created a specific web page for the UWMP and DCP, available at **https://wmwd.com/UWMP**. This webpage provides another opportunity for interested individuals to learn about the UWMP and DCP planning efforts, view the Drought Task Force participants and workshop schedules, subscribe to project updates, review and comment on both plans, and links to past resources or plans.

In addition to the project website, Western staff distributed timely informational notices to the public to raise awareness about the project and encourage participation in public comment periods through email bulletins, social media posts and newspaper publications.

The Draft UWMP was made available for public review in mid-May, 2021.

The Western Board conducted a public hearing on June 16, 2021 to receive public comments and consider adoption of the Draft UWMP and Draft WSCP. The public comment period and public hearing was noticed twice in local English and Spanish newspapers:

English language: Press Enterprise notices published on April 15 and April 22, 2021

Spanish language: La Prenza notices published on April 16 and April 23, 2021

The hearing notices are attached as **Appendix B**.

2.1.5 Other Stakeholder Outreach

60-Day Notices

To fulfill the requirements of Water Code Section 10621(c), Western sent letters of notification of preparation of the 2020 UWMP to all cities and counties within Western's service area 60 days prior to the public hearing. All organizations that were provided the 60-day notification letter were notified a second time about the availability of the draft 2020 UWMP and public hearing scheduled for June 16, 2021. Copies of the 60-day notification letters are attached as **Appendix C**.

The following agencies were notified:

- Box Springs Mutual Water Company
- City of Corona
- City of Corona, Department of Water and Power
- City of Eastvale
- City of Jurupa Valley
- City of Lake Elsinore
- City of Murrieta
- City of Norco
- City of Riverside
- City of Temecula
- County of Riverside
- Eagle Valley Mutual Water Company
- Elsinore Valley Municipal Water District
- Home Gardens County Water District
- Home Gardens Sanitary District
- Jurupa Community Services District
- Metropolitan Water District of Southern California
- Rancho California Water District
- Riverside Highland Water Company
- Riverside Public Utilities
- Rubidoux Community Services District
- Temescal Valley Water District

Metropolitan and Retail Agency Coordination

Western coordinated with Metropolitan to provide information on projected supplies and demands within Western's wholesale service area. Metropolitan prepared estimates of Western Wholesale's demand for imported water and provided its estimates to Western.

Western also coordinated with each of the retail water agencies in its service area to obtain updated supply and demand projections for inclusion in the Western Wholesale supply reliability analysis.

2.2 Plan Adoption, and Submittal

Western made the draft 2020 UWMP available on-line at **https://wmwd.com/UWMP** and at Western's headquarters for public review on in mid-May 2021.

The final 2020 UWMP was formally adopted by Western on June 16, 2021. A copy of the Adoption Resolution is included in **Appendix D**. The WSCP was also adopted on June 16, 2021, as described in the WSCP, attached in **Appendix A**.

Copies of the final 2020 UWMP and 2020 WSCP were sent to the California State Library, DWR (electronically using the WUEdata reporting tool), and all cities and counties within Western's service area within 30 days of adoption.

Western made copies of the final UWMP and WSCP available on its website and at its office within 30 days after the adoption.

WESTERN MUNICIPAL WATER DISTRICT

3 Service Area Description

This chapter describes Western's wholesale and retail service areas, customers, and land uses, as well as population, demographics, and climate features.

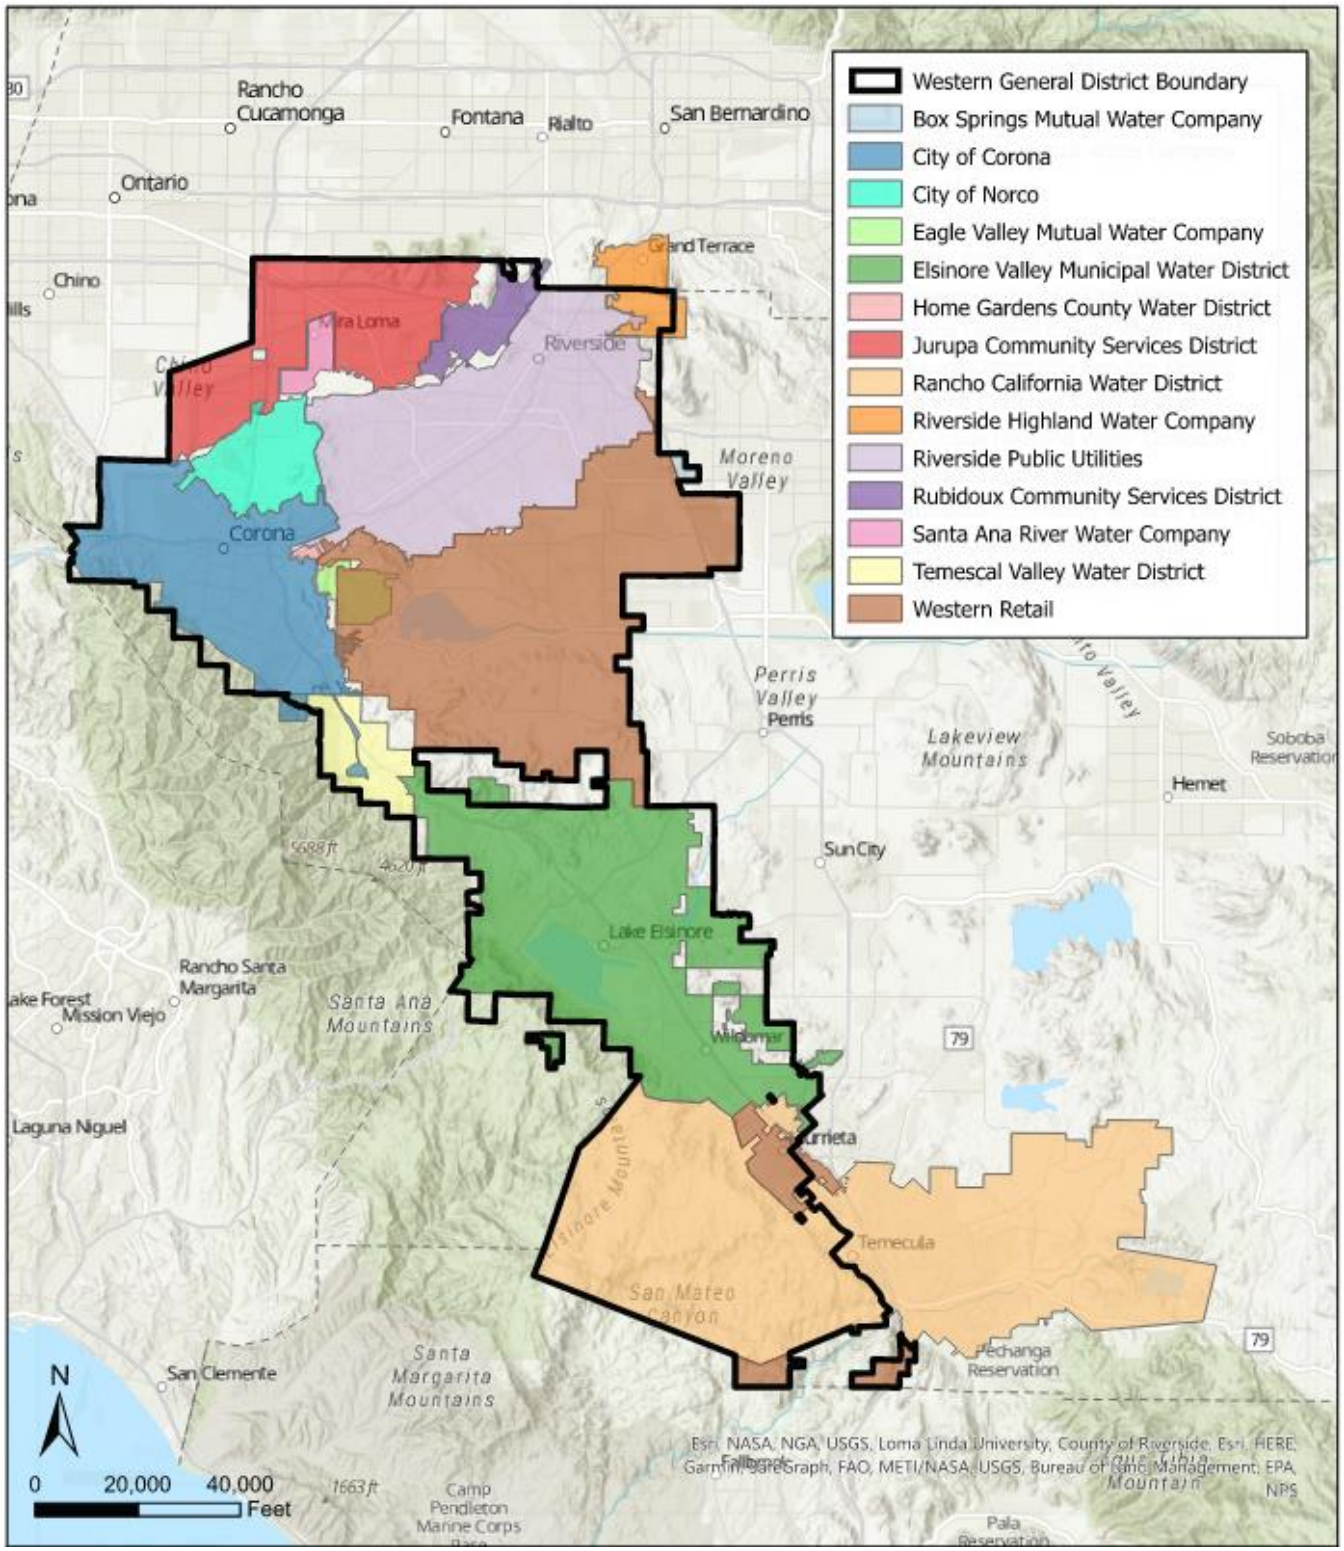
IN THIS SECTION

- Western Service Areas
- Population and Demographics
- Climate

3.1 Western Wholesale Service Area

The Western Wholesale service area encompasses 527 square miles that spans from the northern Riverside County boundary to the southern Riverside County boundary. Western's wholesale service area is also bounded by the Riverside County line to the west and by Eastern Municipal Water District to the east. As a member agency of Metropolitan, Western provides wholesale supplemental water to the region within its service area. In total, there are fourteen (14) retail water agencies, shown on the following page, within Western Wholesale's service area, including Western Retail, that currently receive or can receive water from Western. **Figure 3-1** illustrates its respective service areas within the Western Wholesale boundary.

Retail Water Agencies in Western Wholesale Service Area



Box Springs Mutual Water District
City of Corona
City of Norco
Eagle Valley Mutual Water Company
Elsinore Valley Municipal Water District
Home Gardens County Water District
Jurupa Community Services District
Rancho California Water District
Riverside Highlands Water Company
Riverside Public Utilities
Rubidoux Community Services District
Santa Ana River Water Company
Temescal Valley Water District
Western Retail

Of the retail water agencies in the Western Wholesale service area, eight received wholesale water from Western Wholesale in 2020. These agencies are referred to as wholesale customers in this Plan. Western considers Western Retail a wholesale customer and is therefore included in wholesale system descriptions throughout this Plan. In addition to purchasing both wholesale treated and untreated water from Western Wholesale, most of these retail agencies also deliver local surface and groundwater and/or recycled water within their respective service areas.

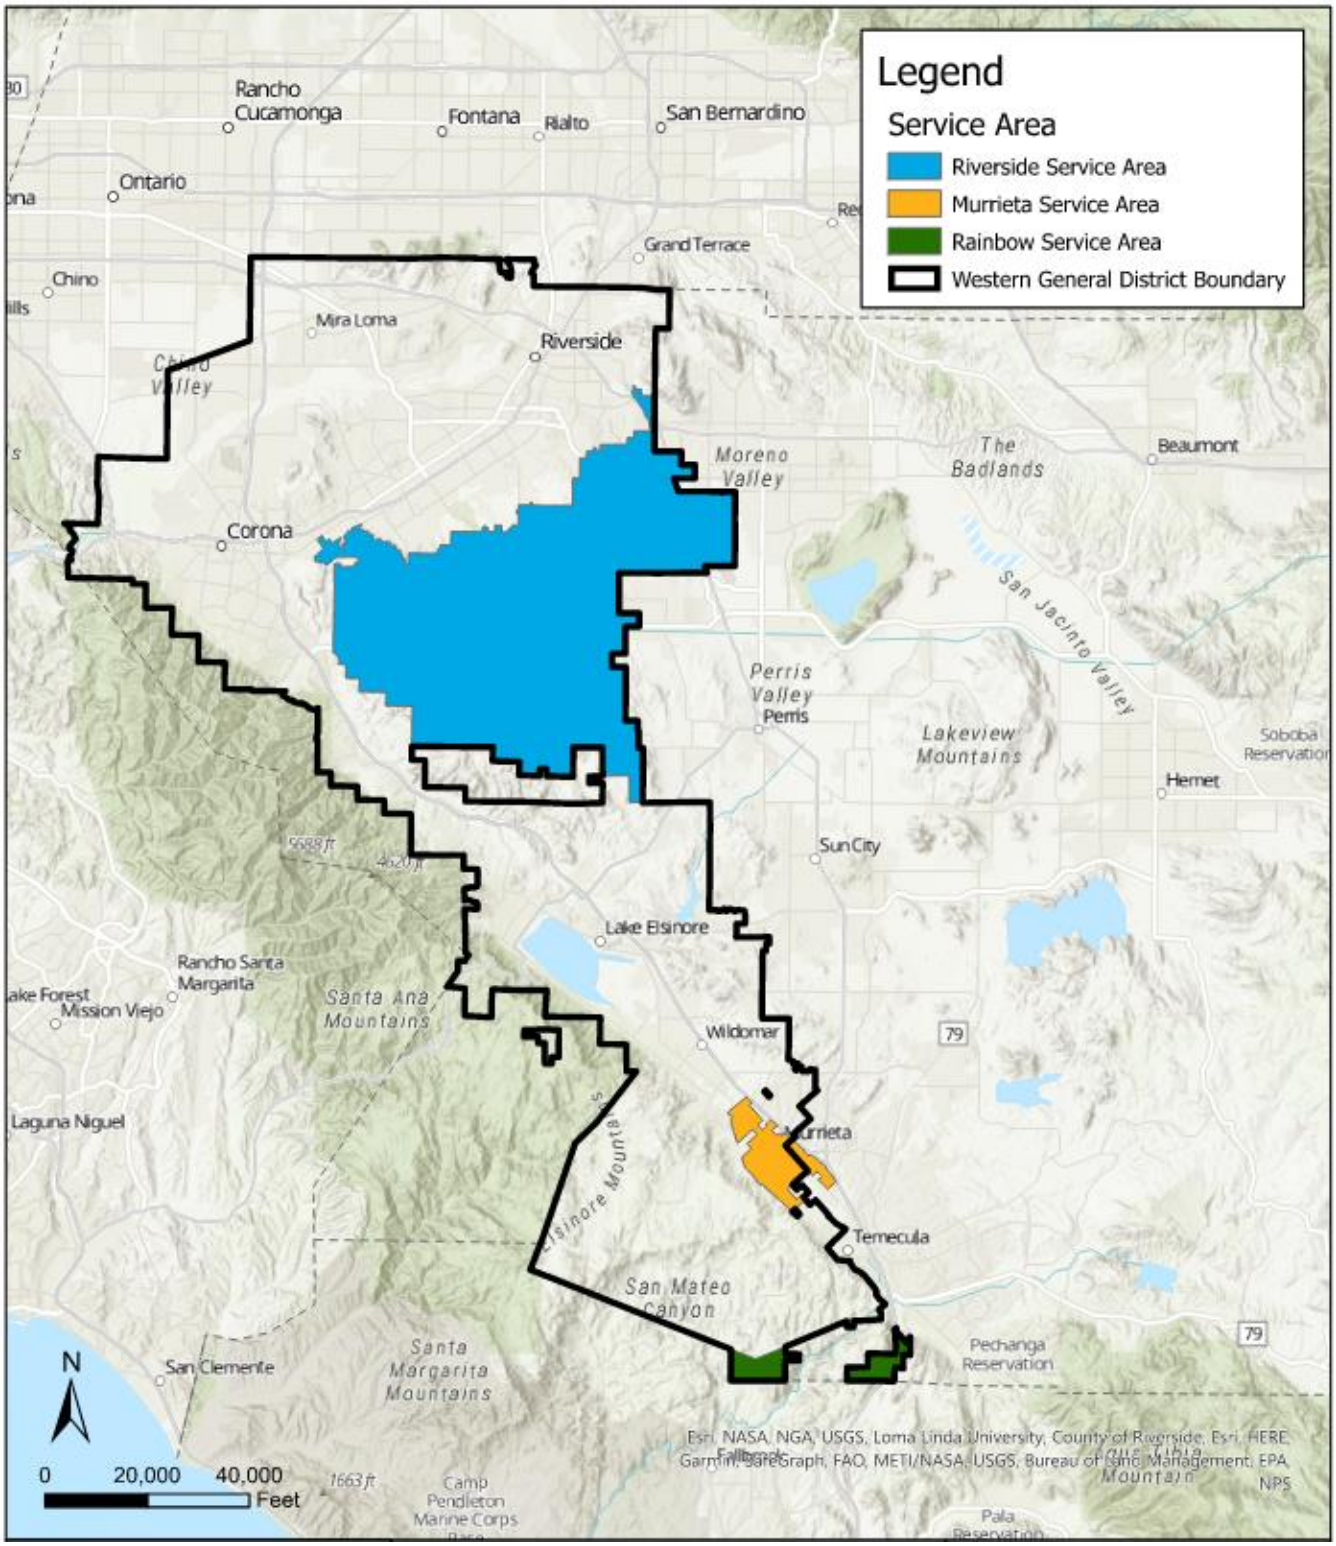
The remaining six retail agencies currently utilize solely local supplies. It is anticipated that some of these six may utilize Western wholesale supplies in the future as the region grows (refer to **Chapter 4,** Wholesale Water Supply).

Figure 3-1. Western Wholesale Service Area and Customers

3.2 Western Retail Service Area

Western provides water to nearly 25,000 customer connections, such as single-family residences or commercial businesses, within its retail service area, including the Riverside Retail System, Murrieta Retail System, and Rainbow Retail System, as shown in **Table 3-1**. These three service areas are collectively referred to as Western Retail and cover a total of 104 square miles and serve water to an estimated population of nearly 100,000.

Table 3-1. Western Retail System Connections



WESTERN RETAIL SYSTEM	NUMBER OF RETAIL CONNECTIONS IN 2020
Riverside Retail System	21,657
Murrieta Retail System	2,946
Rainbow Retail System	42
TOTAL	**24,645**

The Riverside Service Area includes a portion of the City of Riverside and unincorporated areas of Riverside County, including the communities of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Matthews, and March Air Reserve Base.

In 2005, Western took ownership of the Murrieta County Water District as a separate retail service area, now called the Murrieta Service Area. The entire area lies within the city of Murrieta.

Western Retail also serves a very small area, called the Rainbow Service Area, in an area just south of the City of Temecula in the unincorporated portion of Riverside County.

Figure 3-2. Western Retail Service Areas

3.3 Service Area Population and Demographics

Western provides service to nearly one million people in both a wholesale and retail capacity. A summary of population by service area is provided in the following section.

3.3.1 Service Area Population

Population estimates for Western's wholesale service area was developed using demographic projections from the Southern California Association of Governments (SCAG) Connect SoCal: The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy (September 2020). SCAG routinely forecasts population, housing, and employment estimates as well as develops transportation plans to support growing population and housing needs throughout the region.

SCAG provided updated population, housing, and employment estimates for 2020, 2035, and 2045. This data is organized by Transportation Analysis Zones (TAZ). Because TAZ do not align with Western's service area, a geographical analysis in ArcGIS was used to determine the growth that is projected to occur within Western's service area. For intermediate years, the average annual rate of growth was determined and applied to find the population for 2025, 2030, and 2040. Estimates for 2020 and future year population are provided in **Table 3-2**. The population estimates for Western Wholesale include Western Retail.

Population within Western retail was estimated using a 2.2% increased and is based on growth rates established in recent master planning efforts. Modifications to Western retail population were made to better represent recent trends in growth that are anticipated to continue. SCAG growth estimates for Western's retail service areas did not appear to accurately represent near term future growth when compared to project development and permitting records.

Western's retail service area does not experience substantial seasonal changes in population. Some slight changes are observable in the area adjacent to the University of California Riverside campus in the northern portion of the Riverside Service Area.

Table 3-2. Population Projections for Western Wholesale

	2020	2025	2030	2035	2040	2045
WESTERN WHOLESALE[1]	**979,634**	**1,025,334**	**1,077,603**	**1,131,288**	**1,177,721**	**1,225,915**
WESTERN RETAIL	**94,898**	**105,865**	**118,100**	**131,749**	**146,976**	**163,958**
Riverside	79,044	87,652	97,260	107,981	120,293	134,013

Rainbow	178	202	231	262	294	324

[1] Western Wholesale includes Western Retail population and represents the total population within Western's general district boundary.

3.3.2 Other Social, Economic, and Demographic Factors

Based on 2015-2019 data, the United States Census Bureau (Census) estimates that households within Riverside County are composed of 3.28 people per household and approximately 74% of households are single-family residences. Approximately 54% of households are composed of married-couples with families. The median age of a resident within Riverside County is approximately 35 years old. Based on 2015-2019 Census data, approximately 82% of people 25 years or older had at least graduated from high school and 22% obtained a bachelor's degree or higher. It was estimated that 18% of people did not complete high school.

Throughout Riverside County, approximately 55% of the working population (people ages 16 and over) were employed. Approximately 78% held a private wage or salary position, and 15% were employed by the federal, state, or local government. Educational services, health care and social assistance (21%) is the most common industry that Riverside County Residents work in, followed by a retail trade (13%). The median household income was approximately $67,005, while the median earnings for a full-time, year-round worker was $46,825 (United States Census Bureau, n.d.).

It was estimated that 14% of people within Riverside County were in poverty. Nearly 9.3% of households participated in government programs, such as the Supplemental Nutrition Assistance Program (SNAP). Of the households that received SNAP, 67% had children under the age of 18 and 31% had one or more people over the age of 60 within the household. (United States Census Bureau, n.d.).

Riverside County is a relatively diverse area. Census data reported that of the people identifying as one race alone, 60% were White. Approximately 4.4% identified as two or more races. Of the total population, an estimated 35.3% identified as White non-Hispanic and 48.9% as Hispanic. It was estimated that 41% of people at least 5 years or older spoke a language other than English at home. In addition to English, Spanish was the most common language and was spoken by 34% of people 5 years or older. 15% of people stated that they did not speak English "very well" (United States Census Bureau, n.d.).

According to research from UC Riverside School of Business Center for Economic Forecasting and Development, before the COVID-19 pandemic, employment in the Inland Empire was expanding at a steady pace, based on data from California's Employment Development Department. From October 2018 to October 2019, the region added 30,900 nonfarm jobs, a 2.0% increase. This surpassed the 1.8% gains in the state and the 1.4% gains in the nation. Although pre-pandemic the employment growth for the Inland Empire remained steady, growth has slowed compared with recent years; total nonfarm employment grew 3.0% from October 2017 to October 2018 and 3.8% from October 2016 to October 2017 (University of California, Riverside School of Business, 2020).

The Inland Empire's labor market has continued to recover from the COVID-19 pandemic, adding 93,100 jobs since lows in April 2020. Despite ongoing employment recovery, year-over-year employment fell 7.1%. However, it is estimated that employment growth throughout the Inland Empire is outpacing that of the entire state (University of California, Riverside School of Business, 2020).

3.4 Land Uses within Service Area

SCAG prepares demographic forecasts based on land use data through an extensive process that emphasizes input from local planners in coordination with local or regional land use authorities, incorporating essential information to reflect anticipated future populations and land uses. SCAG's projections undergo extensive local review, incorporate zoning information from city and county general plans, and are supported by Environmental Impact Reports. Using SCAG's regional land use dataset, the existing land use within Western's wholesale service area is shown in Table 3-3 and the projected land use (based general plan land use designations) is shown in Table 3-4.

Table 3-3. Existing Land Uses within Western's General Service Area

LAND USE	ACREAGE	PERCENTAGE OF TOTAL SERVICE AREA
Single Family Residential	61,055	18%
Multi-Family Residential	3,330	1%
Mixed Residential	180	0%

Other	36,020	11%
TOTAL	**331,955**	**100%**

3.5 Service Area Climate

Western's climate is characterized by typical hot, dry summers, and mild winters. **Table 3-5** presents average climate data for the service area, including temperature, rainfall, and reference evapotranspiration (ETo). As shown in **Table 3-5**, the warmest month of the year is August with an average temperature of 85.0 degrees Fahrenheit (°F), while the coldest month of the year is December with an average temperature of 59.8°F.

The annual average precipitation within Western's boundary is about 8.8 inches. As shown in **Table 3-5**, the majority of rainfall occurs in the months of December through March. December is typically the wettest month with an average rainfall of approximately 2.3 inches.

Table 3-5. Historical Climate Data

	AVERAGE TEMPERATURE (°F) [1]	AVERAGE PRECIPITATION (IN.) [1]	AVERAGE STANDARD ETO (IN.) [1]
January	61.2	1.84	2.84
February	61.5	1.48	3.39
March	65.2	1.19	5.08
April	68.8	0.67	6.36
May	71.3	0.27	6.98
June	78.0	0.01	7.80
July	83.7	0.20	8.30
August	85.0	0.21	8.09
September	82.4	0.26	6.37
October	75.0	0.39	4.62
November	66.3	0.83	3.21
December	59.8	2.34	2.53

[1]CIMIS weather station 44 at UC Riverside; https://cimis.water.ca.gov/. Data from 2010 through 2020.

3.5.1 Climate Change

As part of this UWMP, Western considered the impacts of climate change on future water supplies and demands and water supply reliability. There are several studies that evaluate the potential impacts of climate change within the Western Wholesale and Retail areas.

Santa Ana Watershed Basin Study

SAWPA and the United States Bureau of Reclamation (USBR) completed the Santa Ana Watershed Basin Study (Basin Study) in 2013 as a complementary study to SAWPA's Integrated Regional Water Management planning process for the Santa Ana Watershed. As part of the Basin Study, USBR prepared a Climate Change Analysis for the Santa Ana River Watershed, included as **Appendix E**. The analysis evaluated frequently asked questions reading impacts to climate change on the Santa Ana River Watershed. The key findings most relevant to Western's water supply reliability are (U.S Department of the Interior Bureau of Reclmanation, August 2013):

- Annual surface water is likely to decrease over future periods;
- Precipitation shows somewhat long-term decreasing trends;
- Temperature will increase, which is likely to cause increased water demand and reservoir evaporation;
- More precipitation will fall as rain instead of snow;
- Projected decreases in precipitation and increases in temperature will decrease natural recharge throughout the basin;
- Management actions such as reducing municipal and industrial water demands or increasing recharge will be required to maintain current groundwater levels.

Metropolitan 2020 UWMP

In its Draft 2020 UWMP, Metropolitan addresses the uncertainties of climate change on water supply planning, identifying several areas of concern:

- Reduction in Sierra Nevada snowpack;
- Increased intensity and frequency of extreme weather events;
- Prolonged drought periods;
- Water quality issues associated with increase in wildfires;
- Changes in runoff pattern and amount; and
- Rising sea levels resulting in:
    - Impacts to coastal groundwater basins due to seawater intrusion;
    - Increased risk of damage from storms, high-tide events, and the erosion of levees; and
    - Potential pumping cutbacks on the SWP

Hydrologic variability, potential climate change, and regulatory risk are embedded in Metropolitan's modeling efforts. Metropolitan's modeling utilizes historical hydrologic conditions from 1992 to 2017 to simulate expected demands on Metropolitan supplies, as well as capacities and constraints of its storage facilities and supply program. The Water Reliability Assessment and the Drought Risk Assessment in Metropolitan's Draft 2020 UWMP demonstrates that Metropolitan is able to mitigate the challenges posed by hydrologic variability, potential climate change, and regulatory risk on its imported supply sources through the significant storage capabilities it has developed over the last two decades, both dry-year and emergency storage (Metropolitan Water District of Southern California, 2021).

Metropolitan's 2020 IRP, which is currently under development, is further addressing ways to account for and mitigate the uncertainties associated with climate change.

Western Drought Contingency Plan – Climate Change Vulnerability Assessment

As part of the DCP that is currently being developed, a Climate Change Vulnerability Assessment (CCVA) for the Western service area was prepared to improve the understanding of climate change impacts on future water demand and local water supplies within Western's wholesale service area during normal and drought periods (GEI Consultants, April 2021). The CCVA technical memorandum provides details on the climate model data sources, climate analysis approach, calculation of the various supply and demand change factors. The complete CCVA is provided in **Appendix F**.

DWR has developed statewide climate change datasets to for use in the water resource planning that depict climate conditions in California under historical and future climate conditions. The DWR climate data used in the CCVA was assembled from 20 global climate models, to best represent anticipated climate conditions in California. The CCVA analysis was based on the median projected change from the majority of the selected climate models. DWR's California specific data is broken down into grid cells that are approximately 1/16th degree (approximately 3.75 miles) for the entire state. Each grid cell contains monthly time series based on 1915 to 2011 used to forecast future precipitation and evapotranspiration (ET) under 2030 and 2070 climate conditions.

Based on the timeseries data, climate change factors pertaining to supply and demand for normal, single dry, and 5-year dry periods were determined. The change factors represent the ratio of a simulated future value to the corresponding simulated historical value. The time series for precipitation and corresponding change factor can be used to estimate changes in supply while the time series for evapotranspiration and corresponding change factor can be used to estimate changes in demand. The results of the CCVA show:

- Decreases in water supplies from the Santa Ana and Santa Margarita River basins under normal and drought conditions
- Decreases in precipitation and increases in surface water evaporation resulting from increased temperatures
- Smaller decreases in precipitation and natural groundwater recharge under normal and multi-year drought conditions. Results for a single-dry year anticipate slightly wetter future conditions compared to the 2020 baseline
- Precipitation will occur during shorter rainy seasons at a higher intensity
- Increases in outdoor water use under normal and drought conditions resulting from increased temperatures and higher ET rates

Western is proactively planning to adapt to and mitigate the effects of climate change. Western is involved in various efforts to recharge local groundwater basins, which will help mitigate the effects of expected declines in natural groundwater recharge. Western also has an industry leading conservation program to promote water use efficiency across its wholesale and retail service areas. Western will continue to prioritize actions to adapt to and mitigate climate change to minimize impacts to supply reliability therefore, the climate change factors developed in the CCVA were not applied directly to the supply and demand projections in this UWMP.

As part of the ongoing DCP development, Western plans to analyze the extreme climate scenarios developed by DWR to characterize the range of potential impacts of climate change for the purposes of developing drought response and mitigation measures for the DCP, which will be completed in 2022.

Climate change can also impact water resources indirectly. For example, wildfire hazards are projected to increase in southern California with climate change. Wildfires can impact water resources by increasing water requirements for firefighting, changing surface vegetation and runoff patterns in burn areas, causing debris flows, and increasing siltation of reservoirs and hydraulic structures.

Part 2

Western Wholesale

4 WESTERN MUNICIPAL WATER DISTRICT
Wholesale Water Supply

This chapter describes the water supplies Western Wholesale uses to meet wholesale demands, which include desalinated local groundwater and imported water from Metropolitan. In addition, a summary of the total water use and various water sources within the region is provided.

The retail water agencies within Western's general service area boundary use a variety of local groundwater, surface water, and recycled water sources to meet customer demands. In addition, Western Wholesale provides desalinated groundwater and imported water as supplemental supplies to its wholesale customers.

IN THIS SECTION

- Regional Water Sources
- Water Supply Characterization
- Energy Intensity

In 2020, Western provided approximately 31% of the total water supply to the region.

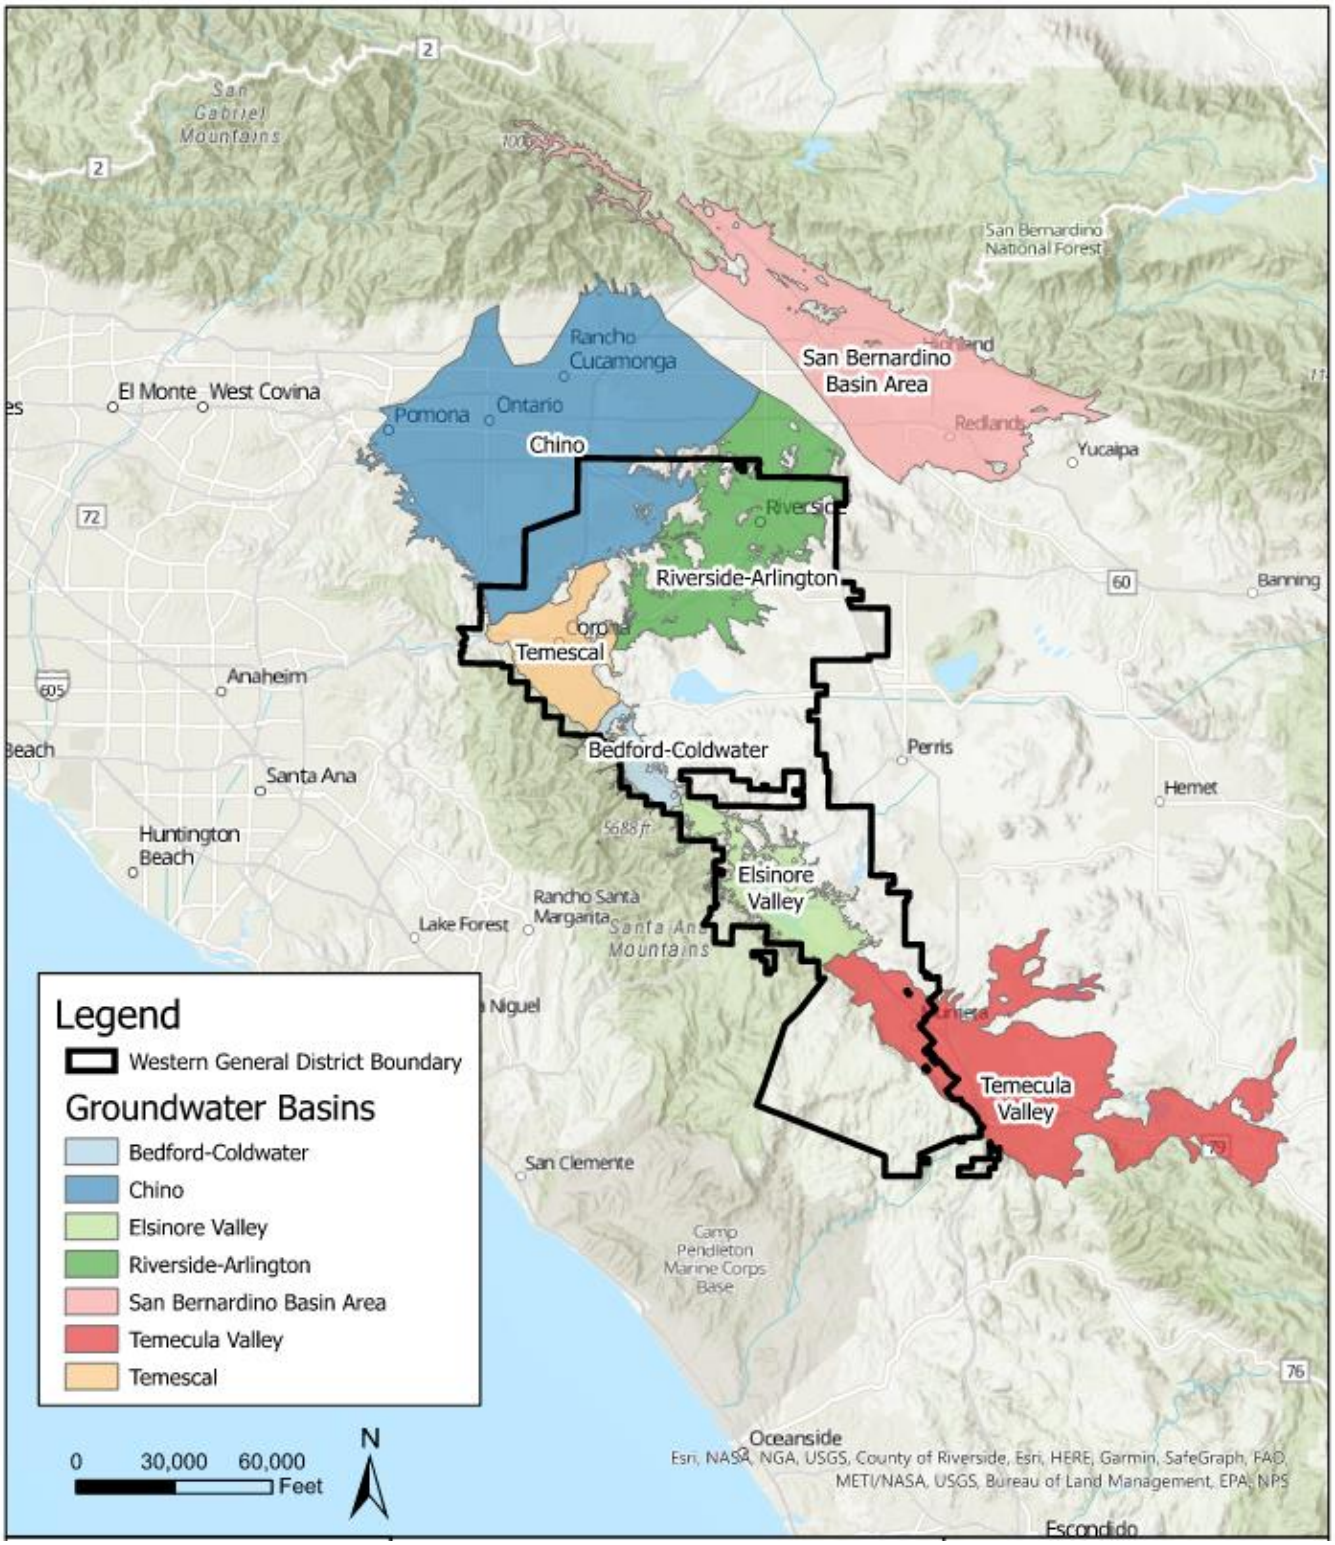
4.1 Regional Supplies

This section summarizes all of the water supplies available to the region within the Western Wholesale boundary, including local and imported water supplies.

4.1.1 Imported Water

Western purchases imported water from Metropolitan and sells to wholesale customers within Western's service area, including Western Retail. Metropolitan imports water from the State Water Project (SWP), which conveys water from the Bay-Delta to Southern California via the California Aqueduct, and from the Colorado River through the Colorado River Aqueduct (CRA). The supply mix varies depending on the availability of SWP supplies, which varies every year, much more significantly than the Colorado River supply. During the recent drought, water allocations from SWP were significantly reduced, leading to a greater proportion of Colorado River supplies in Metropolitan's supply mix.

Additional wholesalers within the region include Eastern Municipal Water District (Eastern), who also provides imported water to the portion of Rancho California Water District (RCWD) that falls within Eastern' s wholesale service area and to Western's Murrieta Retail System.



4.1.2 Groundwater

The region also uses local groundwater from seven different groundwater basins, San Bernardino Basin Area (SBBA), Chino Basin, Riverside-Arlington Basin, Temescal Basin, Bedford-Coldwater Basin, Elsinore Valley Basin, and Temecula Valley Basin. The locations of these basins are shown in **Figure 4-1**. Each of these basins is either adjudicated and managed by a Watermaster or managed by a Groundwater Sustainability Agency to ensure long term reliably supply, even in dry years.

Western Wholesale uses supply from the Riverside-Arlington Basin, which is described in detail in Section 4.2.2.

Western Retail uses supply from the SBBA, Chino Basin and Temecula Valley Basin, which are described in more detail in Section 9.2.2.

Figure 4-1. Local Groundwater Basins

4.1.3 Recycled Water

Several retail water agencies in the region, including Western Retail, also use recycled water to meet non-potable demands. Recycled water sources in the region include:

- Western Water Recycling Facility (WWRF)
- Western Riverside County Regional Wastewater Treatment Plant (WRCRWTP), operated by Western and owned by Western Riverside County Regional Wastewater Authority (WRCRWA), a joint powers authority (JPA) composed of the cities of Norco and Corona, Jurupa Community Services District, Home Gardens Sanitary District, and Western
- City of Corona water reclamation facilities WRF1, WRF2 and WRF3
- EVMWD Regional Water Recycling Facility
- EVMWD Railroad Canyon Water Recycling Facility
- EVMWD Horsethief Canyon Water Recycling Facility
- Santa Rosa Water Recycling Facility, overseen by Western, EVMWD, and RCWD through a JPA
- City of Riverside Water Quality Control Plant
- Temecula Valley Water Reclamation facility, owned and operated by Temescal Valley Water District

Western Retail has access to recycled water supply from the WWRF and WRCRWA plants, which are described in detail in Section 9.2.4.

4.1.4 Surface Water

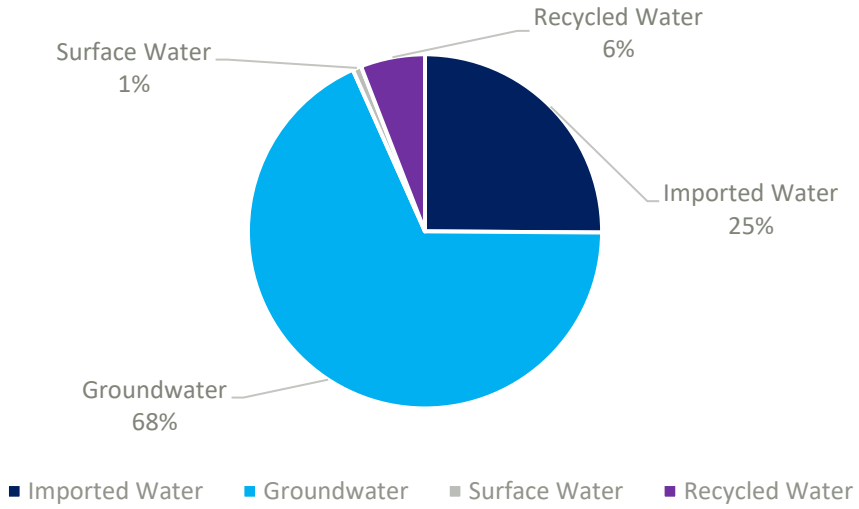
EVMWD uses surface water from Canyon Lake, also referred to as Railroad Canyon Reservoir. Recently, Canyon Lake has experienced water quality issues and is currently not an active supply source for EVMWD. EVMWD is working to install a treatment system to recover the supply and anticipates resuming use by 2025.

4.1.5 Stormwater

Capturing stormwater for supplemental groundwater recharge is a key strategy in the region to increase local supplies, enhance long term sustainability of local groundwater basins and help mitigate the effects of climate change on local supplies.

There are various stormwater capture facilities throughout the region and additional projects are currently under development, including the Riverside North Aquifer Storage and Recovery (ASR) Project. The Riverside North ASR project is a partnership between Western, San Bernardino Valley Municipal Water District (Valley District) and RPU. The project consists of proposed in-channel and off-channel recharge along the Santa Ana River. The proposed off-channel recharge facility location is along the west side of the Santa Ana River and proposes the construction of up to eight individual recharge basins encompassing approximately 25 acres. The in-channel recharge basin proposes construction of an inflatable dam across the Santa Ana River channel, which can be raised and lowered depending on the amount of water flowing in the river. This project is estimated to recharge an average of approximately 6,000 acre-feet of water per year. The in-channel and off-channel water captured will be recharged into the Riverside North sub basin of the Riverside-Arlington Basin and a portion of the retained water will be diverted to the Riverside Canal pipeline for direct use. The project is currently in the environmental and permitting phase and is anticipated to be constructed by 2025.

4.1.6 Regional Water Sources Summary



Each water agency in the region uses a unique mix of supplies and not all supply comes from Western Wholesale. An overview of the water sources used by each agency within Western's service area is shown in Table 4-1. Based on the historical water use for each of Western's retail agencies from 2017-2019, almost half of Western's retail agencies rely on imported water as a major supply source, but local groundwater is the largest source of supply for the region, as shown in Figure 4-2.

Table 4-1. Current Water Sources by Agency

Agency	Imported Water	Groundwater	Surface Water	Recycled Water[1]
Western Wholesale	X	X		
Western Retail	X	X		X
Box Springs Mutual Water District	X	X

[1] Includes recycled water sources that are not currently used but may be in the future.

Figure 4-2. Percent Regional Water Use by Source

Total water use within Western's service area has ranged from approximately 220,000 AF to nearly 250,000 AF in the last five years, including Western Retail. In 2020, approximately 31% of the total water used within Western's service area was provided by Western Wholesale.

Figure 4-3. 2016-2020 Regional Water Use by Source, AFY

4.2 Western Wholesale Supply

To meet the supplemental supply needs of its wholesale customers, Western Wholesale uses desalinated local groundwater and imported water from Metropolitan.

On overview of the sources of supply and key infrastructure for both Western Wholesale and Western Retail is shown on the following page.

Where Western's Water Comes From

Western has a diverse supply portfolio used to meet wholesale and retail demands, including imported water, local groundwater and recycled water. Western has made significant investments in local water supplies to reduce reliance on imported water, increase reliability and reduce costs. A robust network of infrastructure provides flexibility to route supplies to various locations, providing additional reliability to Western's wholesale and retail customers.

Supplies and Infrastructure

1 Arlington Desalter and Victoria Recharge Basin
Produces drinking water by treating local non-potable groundwater using reverse osmosis to remove salt and other matter. This process also helps clean up the groundwater basin and improve the quality over time. The new Victoria Recharge Basin captures stormwater from precipitation and runoff and percolates into the groundwater basin where it is later used by the Arlington Desalter, increasing local supply reliability.

2 Chino Desalter
Western partners with several other water agencies to treat local non-potable groundwater using reverse osmosis to create a new high quality drinking water supply.

3 Sterling Pump Station and La Sierra Pipeline
The recently completed Sterling pump Station and La Sierra Pipeline connect the Chino and Arlington Desalters to and allow Western to deliver both water sources to many different locations, increasing regional reliability.

4 San Bernardino Basin (SBBA)
Western owns rights to pump local potable groundwater from the SBBA and has a long term lease with Meeks & Daley Water Company to use additional water from the SBBA.

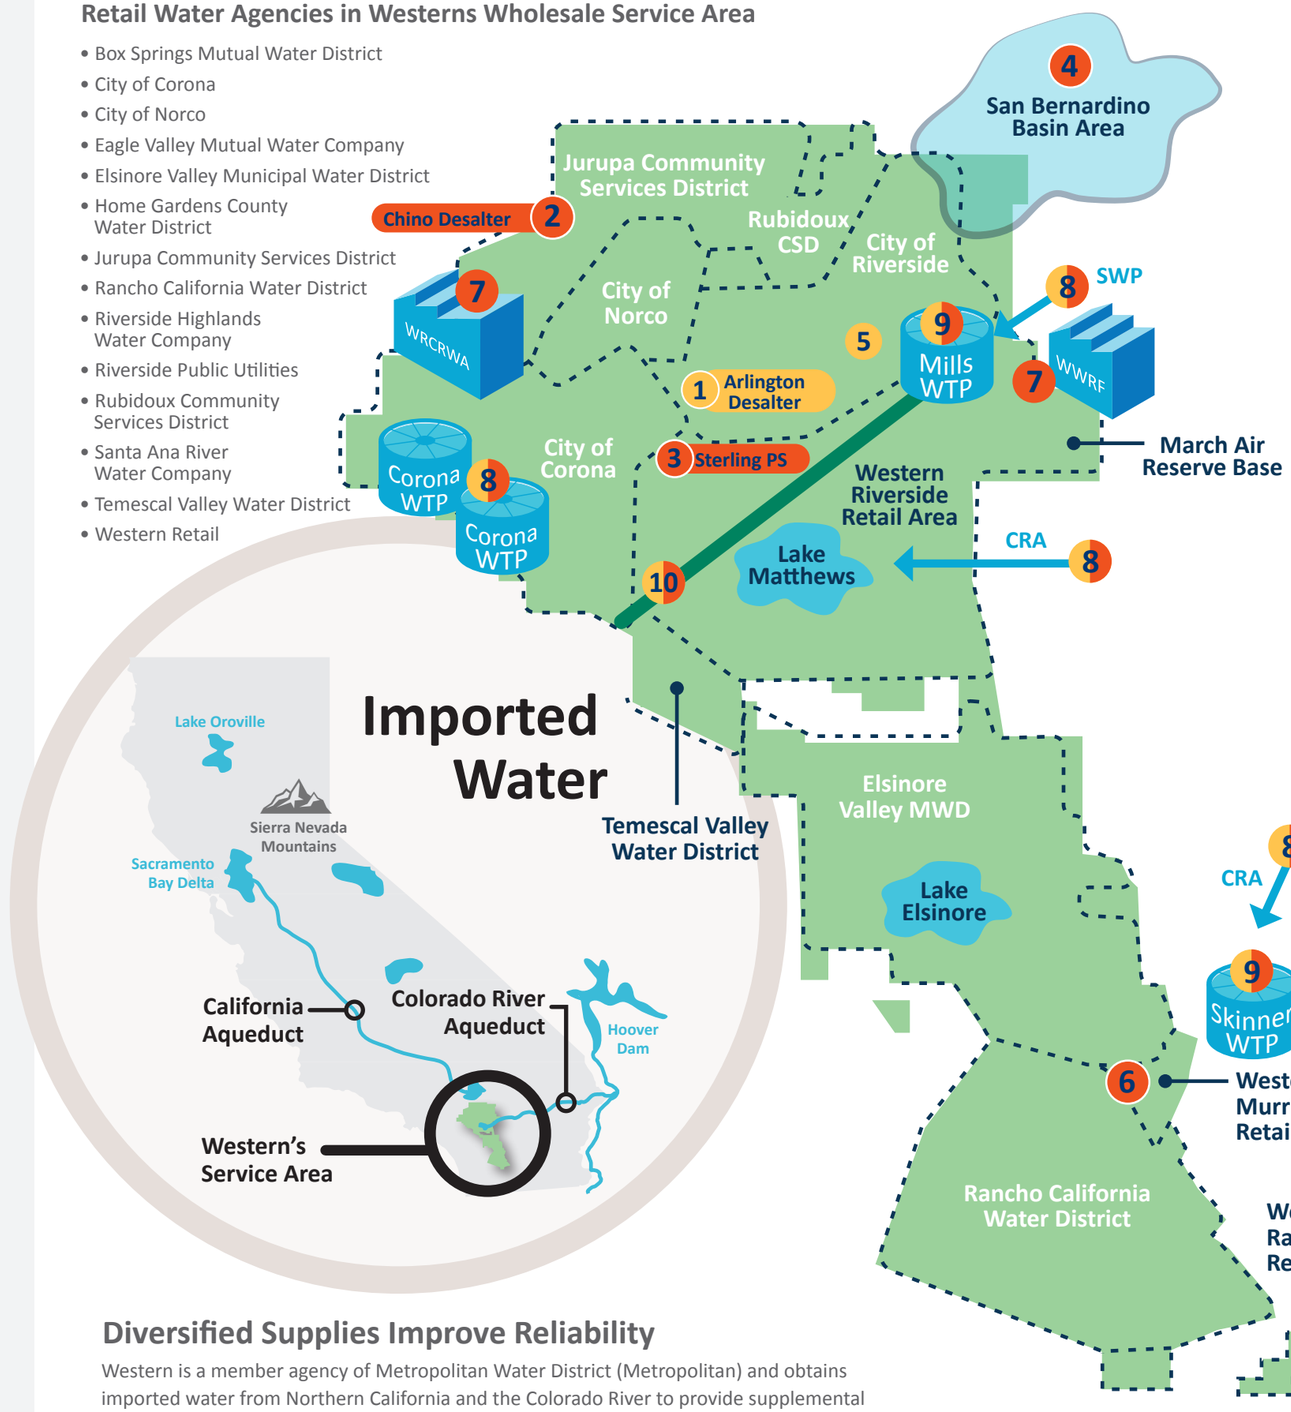
5 City of Riverside
Western has an agreement with Riverside to purchase their surplus local groundwater. Riverside also pumps and delivers Western's water from the SBBA to Western Retail at interconnections using their existing facilities.

6 Temecula Valley Groundwater
Western has rights to produce water from this basin for service to Western's Murrieta Retail system.

7 Recycled Water a Local Drought Proof Supply
Western provides recycled water and non-potable groundwater to meet non-potable irrigation water needs, preserving the potable supplies for domestic use.

8 Imported Water
Western Wholesale obtains potable and nonpotable imported water supply from the SWP and CRA through Metropolitan at various locations and delivers it to Western Retail and other wholesale customers in their service area. Some Western Wholesale customers receive raw imported water directly from Metropolitan pipelines and use the water for groundwater recharge or treat it at their own treatment plants for potable use.

9 Mills and Skinner Water Treatment Plants (WTP)
Metropolitan treats imported water at their Mills and Skinner WTPs and provides potable imported water to Western to distribute to Western Retail and other wholesale customers.



10 Mills Gravity Line
Deliver treated imported water from the Mills WTP to Western Retail and several Western Wholesale customers.

Diversified Supplies Improve Reliability

Western is a member agency of Metropolitan Water District (Metropolitan) and obtains imported water from Northern California and the Colorado River to provide supplemental supplies within its service area. Imported water is an important part of Western's supply portfolio but is more costly and more prone to interruptions than local supplies due to the long distance it must travel to reach the region and other factors. Western has focused on diversifying its water supply to reduce reliance on imported water by developing local supplies.

4.2.1 Purchased and Imported Water

Western Wholesale's primary supply is imported water from Metropolitan. Approximately 75 percent of the wholesale supply was obtained from Metropolitan in 2020.

Metropolitan was formed in 1928 to develop, store, and distribute water for domestic and municipal purposes to the residents of Southern California. Today, the Metropolitan service area stretches across the Southern California coastal plain, serves 26 member agencies, and includes portions of Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties.

Metropolitan is a wholesale water provider and has no retail customers. It provides treated and untreated water directly to its member agencies. Over the last ten years, Metropolitan has provided between 50 % and 60 % of the municipal, industrial, and agricultural water used in its nearly 5,200-square mile service area. The remaining water is provided through local resources and other sources of imported water.

Western is one of the 26 member agencies that make up Metropolitan, which include 14 cities, 10 other municipal water districts and one county water authority. Western, like other member agencies, receives deliveries at different points in the system and pays for the service through a rate structure made up of multiple components. Each year, member agencies advise Metropolitan of how much water they anticipate they will need during the next five years. Metropolitan then works with member agencies to develop forecasts of long-term future water supply.

Metropolitan delivers supply to member agencies from two sources, the Colorado River Aqueduct (CRA), which it owns and operates, and the State Water Project (SWP), owned and operated by DWR. The supply mix varies depending on the availability of SWP supplies, which varies every year, much more significantly than the Colorado River supply. During the recent drought, water allocations from SWP were significantly reduced, leading to a greater proportion of Colorado River supplies in Metropolitan's supply mix. Additional information about Metropolitan is provided in Metropolitan' 2020 UWMP.

Western Wholesale receives treated imported water from Metropolitan's Mills Water Treatment Plant (WTP) and Skinner WTP, in addition to raw water which is delivered directly to wholesale customers from various connections to Metropolitan's system. Western Wholesale also owns and operates the Mills Gravity Line, which distributes treated water from the Mills WTP to the Western Retail Riverside system and several other wholesale customers.

Western has a ten-year purchase agreement with Metropolitan for a Tier 1 annual maximum of 105,783 AFY with a minimum Purchase Order Commitment for 70,522 AFY, effective January 1, 2015 to December 31, 2024. Western can purchase additional water beyond the purchase agreement maximum at Metropolitan's higher Tier 2 rate. A copy of the Purchase Order Commitment is provided in **Appendix G**. Western plans to renew the purchase order agreement in the future and the annual maximum and minimum will be revised as needed to meet anticipated use at that time.

Metropolitan does not provide supply projections for each member agency. Instead, Metropolitan uses a regional approach to developing projections. Metropolitan calculates the demand for the entire region, as discussed in its UWMP. Using information about existing and proposed local projects, Metropolitan then determines the amount of imported water supply and demand. Throughout the preparation of the 2020 UWMP, Western has provided information about local supply and projects and population projections to Metropolitan. Based on this information and information provided by other member agencies, Metropolitan has determined it is able to meet the demands of all member agencies through 2045, with significant surplus supplies.

4.2.2 Groundwater

Western extracts groundwater from the Riverside-Arlington basin and operates the Arlington Desalter, a reverse-osmosis groundwater treatment facility. The estimated supply available from the Arlington Desalter is approximately 5,000 AFY. The Arlington Desalter provides a local source of potable water for Western wholesale customers.

4.2.2.1 Riverside-Arlington Basin

The Riverside-Arlington Basin (classified as subbasin in DWR's Bulletin 118: DWR 8-02.03) underlies part of the Santa Ana River Valley in northwest Riverside County and southwest San Bernardino County, and stores water in alluvial deposits. The subbasin is part of the Upper Santa Ana Valley Groundwater Basin (DWR 8-02). It is bordered by the Box Springs Mountains on the southeast, Arlington Mountain on the south, La Sierra Heights and Mount Rubidoux on the northwest, and the Jurupa Mountains on the north. It is also bordered by the Rialto-Colton fault to the northeast, and a groundwater divide beneath the community of Bloomington along a portion of its northern boundary. The Riverside-Arlington Basin is replenished by infiltration from Santa Ana River flow (in the northern portion of the subbasin), underflow past the Rialto-Colton fault, intermittent underflow from the Chino subbasin, return irrigation flow, and deep percolation of precipitation.

Within the Riverside-Arlington Basin lies a subbasin called the Arlington Groundwater Basin, which is a shallow, alluvial-filled valley. Groundwater quality in the Arlington Subbasin has historically been degraded by elevated concentrations of TDS, nitrate, and other contaminants from industrial sources. To utilize Arlington Basin groundwater, Western operates the Arlington Desalter, a reverse-osmosis groundwater treatment facility that began operation in 1990. The Arlington Desalter is located at the western (down-gradient) end of the Arlington Basin, along with five nearby production wells. The Arlington Desalter serves two purposes, providing a local source of potable water and decreasing subsurface outflow of low-quality groundwater to the Temescal Basin. The capacity was recently expanded to provide additional potable supply.

The Arlington Basin is not adjudicated. Western has adopted the Arlington Basin Groundwater Management Plan (Western, 2012), which includes actions to mitigate overdraft and replenish groundwater levels, as well as protect and improve groundwater quality. The Riverside-Arlington Subbasin is classified as a low priority basin, but proactive management will continue to ensure its reliability into the future. The Riverside-Arlington Subbasin Groundwater Sustainability Agency (GSA) is currently developing a Groundwater Sustainability Plan (GSP) to achieve this goal. The GSP will develop water budgets, assess groundwater storage, develop sustainable management criteria, undesirable results, and minimum thresholds to protect the basin for future supply. The GSP also considers how the Riverside-Arlington subbasin interacts with adjacent basins in the area. The ongoing GSP will result in a plan and identify projects needed to ensure future sustainability of supplies from this basin.

The historic production from Arlington Desalter from 2016 to 2020 is shown in **Table 4-2**.

Table 4-2. DWR 6-1W Groundwater Volume Pumped, AFY

All or part of the groundwater described below is desalinated.

GROUNDWATER TYPE	LOCATION OR BASIN NAME	2016	2017	2018	2019	2020
Alluvial Basin	Riverside-Arlington	4,880	4,754	5,433	4,449	4,814
	TOTAL:	**4,880**	**4,754**	**5,433**	**4,449**	**4,814**

The City of Norco is the primary user of Arlington Desalter as a supply source, but water can also be delivered to the City of Corona or Jurupa Community Services District. The City of Corona has purchased water from the Arlington Desalter in the past and may do so again in the future.

Victoria Recharge Basin

In 2019, Western completed construction of the Victoria Recharge Basin near the intersection of Victoria Avenue and Jackson Street in Riverside (Victoria site). This site will be used to replenish the Riverside-Arlington groundwater basin with up to 1,800 acre-feet of water per year. The project benefits include:

- The Victoria Recharge Basin increases groundwater storage through the capture and recharge of stormwater that would otherwise be lost.
- The project improves groundwater quality and water management of the Arlington Basin, increasing the groundwater supply enabling the Arlington Desalter to operate at capacity.
- The project will provide a local water source to help decrease the region's reliance on imported water from Northern California.
- Locally-sourced water provides system reliability in the event of imported water disruption.

At this time, there are no other recharge sites planned; however, Western continues to explore additional recharge sites to continue to increase local supply reliability.

Victoria Recharge Basin

4.2.3 Surface Water

Western does not utilize any local surface water sources for its wholesale system. However, Western is a partner in developing stormwater recharge projects to supplement local supplies as described in **Section 4.1.5**.

4.2.4 Wastewater and Recycled Water

Western's recycled water sources are discussed in **Section 4.1.3**. Western Retail uses the recycled water produced at the Western WRF and is entitled to its portion of the recycled water produced at WRCWRA but does not have infrastructure in place to use the recycled water. Recycled water supplies for Western Retail are discussed in **Chapter 9**.

Recycled Water Coordination

Western Wholesale does not currently use recycled water to meet wholesale customer demands but is coordinating with other regional agencies to evaluate opportunities for future use of recycled water from WRCWRA.

4.2.5 Water Exchanges and Transfers

Western Wholesale does not currently have any exchanges or transfers with other water agencies.

Emergency Interties

Western has interties with Eastern Municipal Water District (Eastern) and EVMWD for mutual aid and as an emergency supply source. Western also has interconnections with the cities of Riverside and Corona.

4.2.6 Future Water Projects

4.2.6.1 Santa Ana River Conservation and Conjunctive Use Program (SARCCUP)

The five regional water agencies in the Santa Ana River Watershed have identified a watershed scale project, the Santa Ana River Conservation and Conjunctive Use Program (SARCCUP), a cooperative program between Metropolitan, Western and other agencies in the Santa Ana Watershed to store imported water during wet years for use during dry years.

The group includes representatives from the following regional water agencies:

- Western Municipal Water District
- Eastern Municipal Water District
- Inland Empire Utilities Agency (IEUA)
- Orange County Water District
- San Bernardino Valley Municipal Water District

The program goals of SARCCUP include:

- Providing watershed-wide benefits based upon regional collaboration
- Creating significant new dry-year yield

- Increasing the resiliency and reliability of the water supply

The SARCCUP includes multiple separate groundwater banks located in different groundwater basins within the Santa Ana Watershed, including the Chino, Elsinore, Orange County, Riverside-Arlington, San Bernardino and San Jacinto groundwater basins. The total storage proposed for SARCCUP is about 137,000 acre-feet (AF). The combined extraction capacity is 45,667 AFY. Because the participants are sharing the benefits equally, each agency receives 25% (1/4) of the total capacity (IEUA does not currently have any storage capacity), resulting in each of the SARCCUP agencies receiving 11,417 AFY of new dry-year yield. This may require transfers, in lieu, or exchanges between the agencies in both wet and dry years.

Western's SARCCUP facilities include the Sterling Pump Station and La Sierra Pipeline, Cannon Campbell Pump Station, Riverside-Arlington Well and Transmission Main and Elsinore Wells.

In early 2016, SAWPA was formally notified that it had been awarded $64,268,000 by DWR for its Proposition 84 2015 IRWM grant proposal, which included the SARCCUP. From the grant, SAWPA governance designated $55 million for SARCCUP implementation. The SARCCUP Proposition 84 grant award includes the development of a Decision Support Model which was used to help refine the proposed facilities and that identified additional facilities that could be included in future phases of the program. The total cost of Phase 1 of the SARCCUP program is approximately $150 million.

Construction of the SARCCUP facilities is ongoing and is estimated to be complete by 2023. The SARCCUP agencies will continue work to finalize all of the individual agreements needed for operations of the facilities and water purchases. This includes an agreement between the SARCCUP agencies and Metropolitan to allow the purchase of water made available under the program and special conditions associated with use of the water during droughts and emergencies.

4.2.7 Summary of Existing and Planned Sources of Water

Western plans to continue to provide water from the Arlington Desalter and imported water from Metropolitan to meet the demands of its wholesale customers. Western continues to evaluate additional local projects to decrease dependence on imported water and increase regional reliability. The total volume of water supplied from various sources in 2020 is summarized in **Table 4-3**.

Table 4-3. Actual Water Supplies

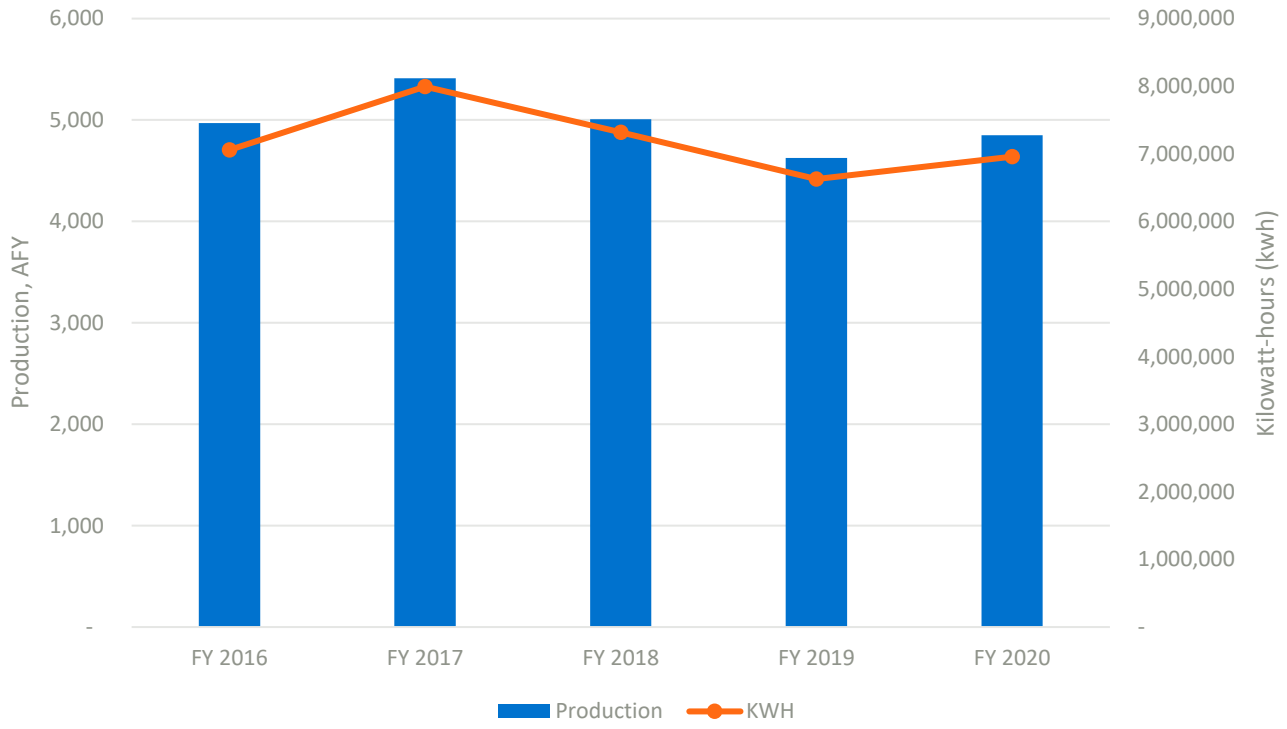
SUPPLY SOURCE	2020 VOLUME, AFY
POTABLE	**47,631**
Metropolitan Imported Treated Water	42,817
Arlington Desalter	4,814
NON-POTABLE	**25,151**
Metropolitan Untreated Water	25,151
TOTAL	**72,782**

Western plans to continue prioritizing use of the local groundwater supply from the Arlington Desalter.

According to the information provided in Metropolitan's 2020 UWMP, Metropolitan has determined that they can meet all demands in normal, dry, and multiple dry years with existing supplies and storage. Metropolitan's UWMP also shows significant excess supply available under all conditions so additional water is available if needed. More detail can be found in Metropolitan's 2020 UWMP.

Western will only purchase imported supplies as needed to meet demands. Therefore, projected imported water supplies are equal to projected imported water demands, less the supply from the Arlington Desalter. Additional imported water is available from Metropolitan if needed. Western Wholesale projected supplies are shown in **Table 4-4**.

Table 4-4. Projected Water Supplies, AFY



SUPPLY SOURCE	2025	2030	2035	2040	2045
Metropolitan Imported Water[1]	91,816	95,908	101,261	107,664	116,443
Arlington Desalter	5,000	5,000	5,000	5,000	5,000
TOTAL	**96,816**	**100,908**	**106,261**	**112,664**	**121,443**

[1]Metropolitan imported water may serve both potable and non-potable demands.

4.2.8 Energy Intensity

Western monitors energy usage at the Arlington Desalter. On average, Western uses 1,445 kilowatt-hours (kwh) for every AF of water produced (1,445 kwh/AF) from the Arlington Desalter. Energy usage includes pumping from the various Arlington Desalter wells and desalter treatment. A summary of energy used for production in 2016 through 2020 is provided in **Figure 4-4**.

Figure 4-4. Past Energy Used at the Arlington Desalter

5 Wholesale Water Use Characterization

This chapter describes Western's historical, current, and projected wholesale water uses. Wholesale water use projections were developed by Western's wholesale customers and provided to Western for inclusion in the 2020 UWMP.

Western provides both potable and non-potable wholesale water to the region within its service area. Western's wholesale supplies are described in **Chapter 4**.

IN THIS SECTION

- Wholesale Customers
- Past, Current, and Projected Water Use

Colorado River Aqueduct

5.1 Western Wholesale Customers

In total, there are fourteen (14) retail water agencies within Western's wholesale service area, including Western Retail, that currently receive or can receive water from Western. Eight of the agencies received either local or imported wholesale water from Western in 2020 and an additional three are planning for future wholesale water supplies from Western, if needed. In addition to wholesale water purchased from Western, most of the water purveyors also deliver local surface and groundwater and/or recycled water within their respective service areas and some rely solely on local water supplies. Regional supplies are briefly discussed in **Chapter 4**.

Table 5-1 shows which retail agencies are current Western Wholesale customers and which are planning to obtain wholesale water from Western in the future.

Table 5-1. Current and Future Wholesale Customers

RETAIL AGENCY	CURRENT WESTERN WHOLESALE CUSTOMER	POTENTIAL FUTURE WESTERN WHOLESALE CUSTOMER

Western Retail	✓	

5.2 Past and Current Wholesale Water Use

A summary of past deliveries to Western Wholesale customers is provided in **Table 5-2**. Total deliveries varied from 2016 to 2019, which was likely driven primarily by local weather conditions. In 2019, the region received above average rainfall, which reduced outdoor water use.

Table 5-2. Western's Wholesale Historical and Current Water Use by Customer, AFY

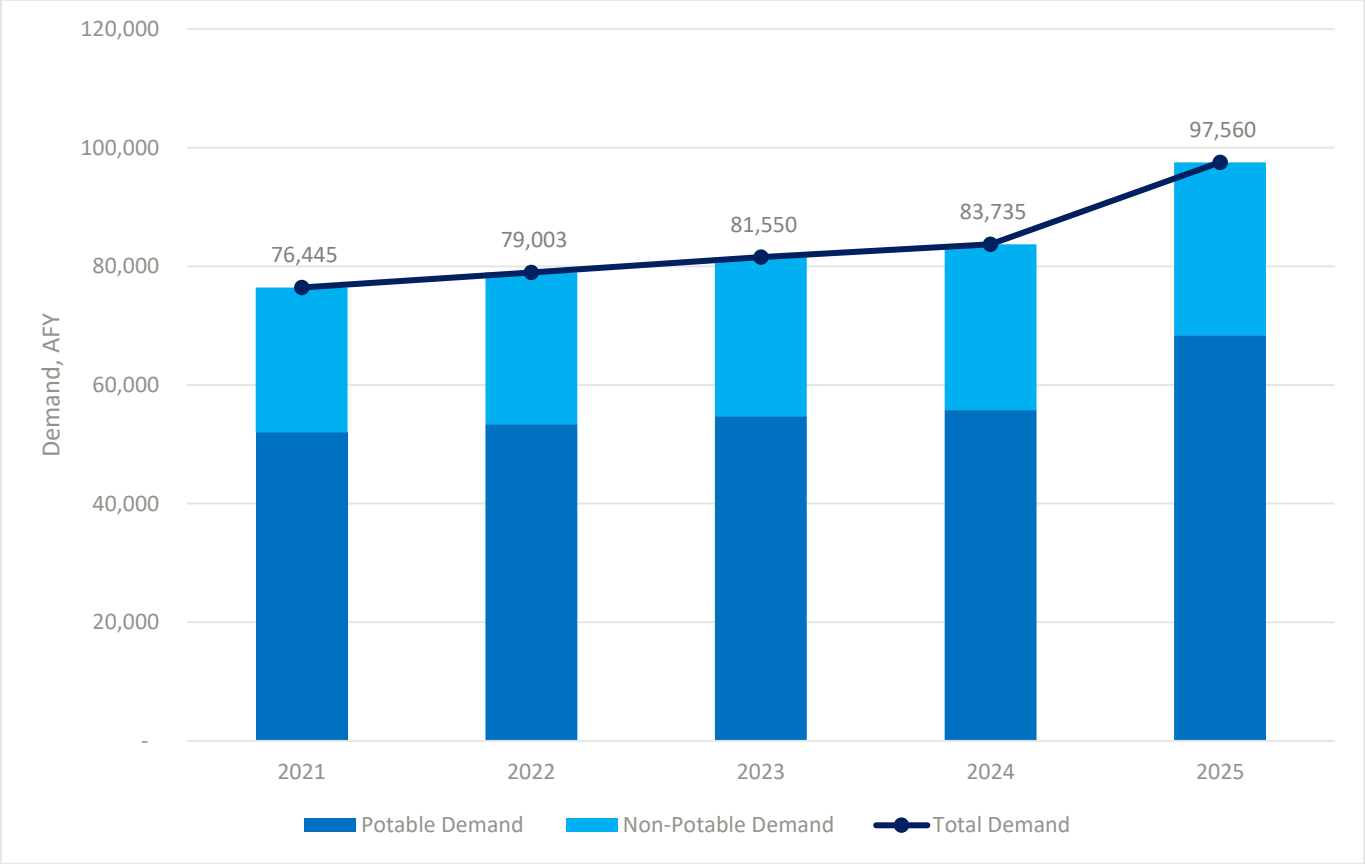
5.3.1 Characteristic Five-Year Water Use



In addition to past and projected uses, the UWMP more closely analyzes anticipated conditions for the next five years (2021 – 2025). Demands for the next five years are provided in **Table 5-5** and **Figure 5-2**. The demand projections established in this chapter assume typical, unconstrained demand, free from other influential factors like conservation mandates.

Details on analysis for the next five years are discussed in **Chapter 6**.

6 Wholesale Water Service Reliability and Drought Risk Assessment

This section describes the reliability of Western's wholesale water supplies, which reflects Western's ability to meet the water needs of its customers with water supplies under varying conditions. The essential findings are that Western can reliably meet its wholesale demands with existing and future supply sources based on demand and supply projections.

Every urban water supplier is required to assess the reliability of its water service to its retail agencies under normal, dry, and multiple-dry years for at least the next 20 years, and specifically assesses the drought risk over the next five years. There are various factors that may impact reliability of supplies such as legal, environmental, water quality, and climatic, which are discussed below. These factors can result in immediate (facility failures), near-term (SWP limitations), or long-term (climate change) impacts to reliability and must therefore be considered in future planning.

The impacts of these factors on reliability increase under single-dry and multiple-dry year hydrologic patterns. Western's work to expand and further diversify its supply portfolio is an important step toward improving the reliability of supplies. Western has also prepared a comprehensive Water Shortage Contingency Plan to provide reliability in the event of a water shortage, presented in **Appendix A**. Expected water supply reliability for normal, single dry year, and multiple-dry years through 2045 is discussed in this chapter followed a drought risk assessment for 2021 to 2025.

IN THIS SECTION

- Supply Constraints
- Water Service Reliability Assessment
- Drought Risk Assessment

6.1 Constraints on Water Sources

Western's sources of wholesale supply are imported water purchased from Metropolitan and local groundwater treated at the Arlington Desalter. These two supply sources may be impacted by climatic and hydrologic conditions, water quality, and legal restrictions, as well as potential for interruption of supply driven by catastrophic events.

6.1.1 Imported Water Supply Reliability

The majority of Western's supplies are imported water purchased from Metropolitan, and as described below, Western's supply reliability analysis follows the analysis and data developed by Metropolitan as presented in Metropolitan's 2020 UWMP. Metropolitan described several challenges in providing adequate, reliable, and high-quality supplemental water supplies along with potential management measures in the Metropolitan 2020 UWMP.

Potential constraints to Metropolitan supplies and associated supply reliability include:

Drought

The water conditions that the region faced leading up to 2020 were characterized by alternating scarcity and abundance. While investments in storage and flexible operations have prepared Metropolitan to capitalize on available supplies in wet years and manage through drought years, drought challenges remain. The Colorado River Basin has historically experienced large swings in annual hydrologic conditions and has exhibited a drying trend over the last 21 years. Changes in this period have been mitigated by actions taken by Metropolitan in cooperation with the Bureau of Reclamation and the other Basin States to maintain system storage, avoiding a shortage declaration. At the close of 2020, however, system storage was at or near its lowest since 2000, so there is less water available to buffer future dry conditions. The Sacramento-San Joaquin Delta (Bay-Delta) has suffered reduced flows and rising temperatures and SWP supplies have been significantly reduced at times, with a record low allocation of 5 percent in 2014.

Environmental/Ecological Needs (Operational Constraints)

Sensitive species in the Bay-Delta system require base flows for survival; these flows are threatened by drought and other factors, reducing the volume of water available for pumping to the SWP. As species become further stressed, environmental demands on Bay-Delta water may increase. Operational constraints will likely continue until a long-term solution to the problems in the Bay-Delta is identified and implemented.

Climate Change

Climate change is anticipated to increase the frequency and intensity of droughts and flooding, reduce Sierra Nevada snowpack, change runoff pattern and amount, raise average temperatures, and raise sea levels. These effects may reduce the availability of supplies in the Bay-Delta and Colorado River systems. Sea level rise poses a significant challenge to the salt balance in the Bay-Delta and could result in pumping restrictions. Sea level rise also increases the vulnerability of the Bay-Delta supply to seismic events.

Threats to Infrastructure

Metropolitan's imported supplies must travel across large distances to reach turnouts where local agencies are able to access the water. California is a seismically active state and prone to wildfires, which could damage imported water infrastructure anywhere along the SWP or Colorado River Aqueduct in such a manner as to disrupt supply availability. California is also a large state with a large economy, housing some major industries and defense installations. This makes it a potential target for acts of terrorism, including potential threats to its water supplies and infrastructure.

Water Quality

Water quality challenges, such as salinity, algae toxins, disinfection byproduct precursors, nutrients, and the identification of constituents of emerging concern, have the potential to impact imported water supplies. To date, Metropolitan has not identified any water quality risks that cannot be mitigated. Salinity, particularly Colorado River supplies, is a significant issue, but Metropolitan anticipates the only constraint will be the need to blend Colorado River water with SWP supplies to meet salinity needs.

Metropolitan's 2020 UWMP describes a variety of past and ongoing actions to address these water supply challenges to maintain water reliability within its service area.

Metropolitan's proactive measures include:

Continuing Water Conservation

Metropolitan supports financial incentives, education, outreach programs and appliance/plumbing standards at both the regional and local level. Metropolitan also works with member and local agencies, including Western, to help identify opportunities and procure grant funding for conservation programs.

Increasing Local Resources

Since 1982, Metropolitan has assisted local agencies in the development of water recycling and groundwater recovery under the Local Resources Program (LRP). The LRP program has been expanded to provide incentives for on-site recycled water retrofit costs and development of other water resources including seawater desalination and stormwater.

Augmenting Water Supplies

Augmenting water supplies through water transfers and exchanges is an element of Metropolitan's Integrated Resources Plan (IRP) to mitigate water shortages during dry periods.

Increasing Storage Programs

Metropolitan has a number of storage programs with water agencies along the California Aqueduct that would allow it to store SWP supplies during surplus conditions and to have stored water returned when needed. Metropolitan has invested in infrastructure to allow more effective use of stored water when needed and has also developed additional storage programs.

Modifying Metropolitan's Distribution System

Driven by the historic low SWP allocation in 2014, Metropolitan and several member agencies have made operational and system modifications to enhance operational flexibility and efficient delivery of Colorado River, SWP, and in-region supplies within Metropolitan's service area. Within Western's service area, the Inland Feeder-Lakeview Pipeline Intertie, which was completed in 2016 and allows for delivery of water from Diamond Valley Lake to Mills WTP, increases Western's imported water supply reliability. This intertie enables the Mills WTP to withstand an extended interruption of supplies from the California Aqueduct East Branch. The intertie also provides delivery flexibility to handle any required repairs by DWR to the Santa Ana Valley Pipeline north segment.

Implementing Shortage Response Actions (when needed)

Metropolitan developed a Water Shortage Contingency Plan (WSCP) to be consistent with elements of the existing Metropolitan Water Surplus and Drought Management Plan (WSDM) and Water Supply Allocation Plan (WSAP). If needed, Metropolitan will implement shortage response actions to distribute limited imported supplies and preserve storage reserves.

Pursuing Long-term Solutions in the Bay-Delta

Metropolitan adopted a Delta action plan in June 2007 that includes a long-term Delta Plan. The long-term action plan recognizes three basic elements that must be addressed: Delta ecosystem restoration, water supply conveyance, and flood control protection and storage development.

Maintaining Water Quality

Metropolitan responds to water quality concerns by protecting the quality of the source water, developing water management programs that maintain and enhance water quality, and changing water treatment protocols or blending.

Planning for Climate Change

In addition to many other activities related to climate change, Metropolitan is currently developing an updated 2020 Integrated Resources Plan (IRP), which recognizes risks and uncertainties from climate change and other sources. Metropolitan has established an intensive, comprehensive technical process to identify key vulnerabilities to regional reliability, including climate change. This Robust Decision Making (RDM) approach was used with both the 2015 and 2010 IRP Updates. This methodology can show how vulnerable the region's reliability is to longer-term risks such as climate change and can also establish "signposts" that can be monitored to see when critical changes may be happening.

To maintain a reliable source of imported water supply for its member agencies, Metropolitan has and will continue to contend with these considerable challenges. After learning from the droughts of 1977-78 and 1989-92, Metropolitan, in conjunction with its member agencies, instituted a resource planning process that is based on diversification of the region's water supply portfolio and continued efficient water use. This integrated resource planning process has recognized that only through a mix of imported and member agency local supplies, along with aggressive implementation of water conservation, can the Metropolitan service area attain overall reliability of water supply.

This integrated planning effort has resulted in the following documents:

1996, 2004, 2010, 2015, and 2020 Integrated Resources Plans (IRP)

Metropolitan's IRP process assessed potential future regional demand projections based upon anticipated population and economic growth as well as conservation potential. The IRP also includes regional supply strategies and implementation plans to better manage resources, meet anticipated demand, increase overall system reliability, and adapt to the effects of climate change. Metropolitan is currently preparing the 2020 IRP.

1999 Water Surplus and Drought Management Plan

The Water Surplus and Drought Management Plan provides the policy guidance to manage the region's water supplies by integrating the operating activities of supply surplus and shortage to achieve the reliability goals of the IRP.

Water Supply Allocation Plan

The Water Supply Allocation Plan, last updated in 2014, includes the specific formula for calculating member agency supply allocations and the key implementation elements needed for administering the allocation. The need for the Water Supply Allocation Plan arose after the 2008 Bay- Delta biological opinions and rulings that limited SWP supplies to its contractors including Metropolitan. The Water Supply Allocation Plan formula seeks to balance the impacts of a shortage at the retail level while maintaining equity on the wholesale level for shortages of Metropolitan supplies up to 50 percent.

All these planning documents recognize that the reliability of the Metropolitan service area is dependent on improving the reliability of imported supplies from the Colorado River and State Water Project as well as the successful implementation of future local supplies and conservation. This dependence on an integrated approach to water reliability and diversification of supplies has been the foundation of DWR's State Water Plan, through its last several updates and is the cornerstone of Governor Newsom's California Water Resilience Portfolio. Some of the most significant factors affecting reliability for imported water supplies include legal, environmental, water quality and climatic changes. Successful implementation of Metropolitan's UWMP is dependent on the continued successful implementation of local supply projects by local agencies, including Western and its wholesale customers.

6.1.2 Groundwater Supply Reliability

The reliability of Western's groundwater supply will be proactively managed by Western and its local partners through the Riverside-Arlington Subbasin Groundwater Sustainability Agency. Development of the GSP is ongoing and expected to be completed in 2021. The GSP will determine the sustainable water budget for the basin, accounting for the effects of climate change, develop sustainable management criteria, undesirable results, and minimum thresholds to evaluate groundwater conditions, and implement a monitoring network and identify supplemental projects to ensure the basin is reliable and can support demands throughout the future.

6.2 Water Service Reliability Assessment

This section presents Western's expected water supply reliability for a normal year, single dry year, and five consecutive dry years, including projections for 2025, 2030, 2035, 2040, and 2045.

The primary constraint on the available of water supplies has been in extreme drought conditions. As described above, Metropolitan has made substantial investments to increase imported water supply reliability during periods of extended drought. As a result, Metropolitan's 2020 UWMP projects the ability to meet all imported water demands under normal, single dry year, and multiple dry year conditions, with excess supplies.

Through implementation of the Arlington GSP, Western expects the Riverside-Arlington water supply to be stable and does not anticipate any reduction to supplies in dry years.

The basis of the reliability assessment is presented in this section.

6.2.1 Year Type Characterization

The water service reliability and Drought Risk Assessment analyze supply over several water years: normal, single dry, and multiple dry years. DWR defines these years as:

Normal Year

The normal year represents the water supplies a supplier considers available during normal conditions. Metropolitan uses an average from 1922 to 2017 to establish normal year supply availability. To remain consistent, Western utilizes the same period for analyzing imported water availability since majority of the wholesale system is supplied by imported Metropolitan water.

Single Dry Year

The single dry year is recommended to be the year that represents the lowest water supply available. Metropolitan has identified 1977 as the single driest year.

Five-consecutive Dry Year

The driest five-year historical sequence for the Supplier, which may be the lowest average water supply available for five years in a row. Metropolitan has identified 1988 through 1992 as the greatest 5-year drought period.

Table 6-1. DWR 7-1W Basis of Water Year Data (Reliability Assessment)

		AVAILABLE SUPPLY IF YEAR TYPE REPEATS
YEAR TYPE	BASE YEAR	PERCENT OF AVERAGE SUPPLY
Average Year	1922-2017	
Single-Dry Year	1977	99%
Consecutive Dry Years 1st Year	1988	100%
Consecutive Dry Years 2nd Year	1989	100%
Consecutive Dry Years 3rd Year	1990	100%
Consecutive Dry Years 4th Year	1991	100%
Consecutive Dry Years 5th Year	1992	100%

6.2.2 Water Service Reliability

Normal year supply and demand projections for the wholesale system were developed in **Chapter 4** and **Chapter 5** and form the basis of this reliability analysis. Western wholesale customers provided their own assumptions for demand changes during single and multiple dry years, which are incorporated into this analysis.

Western obtains both Potable and Non-Potable imported water from Metropolitan. For this analysis, it was assumed that non-potable supplies were equal to non-potable demands and potable supplies were equal to potable demands. However, it is important to note that Western is not limited to a particular volume of imported water and that Metropolitan's 2020 UWMP shows a substantial surplus of supplies under all conditions. Metropolitan has made substantial investments in storage projects to ensure reliability in dry years. Therefore, Western expects to have access to additional imported water supplies, if needed.

Results of the reliability analysis for normal, single dry, and 5-consecutive dry years are shown in the following sections. This analysis applies only to Western Wholesale supplies. Other regional supplies that are used by Western's wholesale customers agencies are discussed in **Chapter 4**.

Water Service Reliability – Normal Year

Table 6-2. Normal Year Supply and Demand Comparison, AFY

	2025	2030	2035	2040	2045
POTABLE

	DIFFERENCE	**0**	**0**	**0**	**0**	**0**

6.2.3 Description of Management Tools and Options

Most of the water supplied by Western's wholesale system is imported water from Metropolitan. As a member agency of Metropolitan, Western coordinates with Metropolitan through planning processes such as the 2020 IRP to ensure a consistent and reliable supply is available. In addition, Western continues to explore local projects to increase supply to the wholesale system and continues to promote conservation and educational programs to increase drought awareness and conservation actions throughout the region.

6.3 Drought Risk Assessment

The Drought Risk Assessment (DRA) is a new requirement to the UWMP that focuses analysis on the next five years (2021 - 2025). To estimate demands for 2021 through 2025, a straight-line interpolation was applied from the 2020 actual demand to the 2025 projected demand.

6.3.1 Data, Methods, and Basis for Water Shortage Condition

The data, methods, and basis for a water shortage condition were identified using typical normal year supply and demand, as developed in **Chapter 4** and **Chapter 5**.

The DRA provides a snapshot of the anticipated surplus or deficit if a drought were to occur in the next five years. If Western estimates a greater demand than supply available, estimated shortage response actions savings from the WSCP may be entered into the DRA. WSCP savings can fall under supply augmentation or demand reduction estimates that Western would expect to achieve during a water shortage.

The demands for the DRA's five-consecutive dry years were based on the normal demand. Normal year demands represent "unconstrained demand". Unconstrained demand is water demand absent any water supply restrictions. This exercise allows an agency to get an indication of the potential amount of conservation that may be required to reduce demands.

6.3.2 DRA Water Source Reliability

As described in Metropolitan's 2020 UWMP and DRA, Metropolitan's near-term assessment reveals that its supply capabilities are expected to exceed its projected water use for years 2022, 2024, and 2025. However, estimates of projected water supply and use reveals that there could be a possible shortfall of core supplies in 2021 and 2023. This shortfall is largely triggered by the assumed repeat of the historical 1988 and 1990 low supply conditions from the SWP to predict supply availability for 2021 and 2023. Actual supply conditions for 2021 and 2023 may prove different from historic supply conditions (Metropolitan Water District of Southern California, 2021).

Metropolitan's DRA illustrates its potential shortage response actions if such shortfall were to happen. As detailed in Metropolitan's 2020 UWMP (**Section 2.5** and **Appendix 4**), Metropolitan has in place a robust WSCP and comprehensive shortage response plan that includes demand reduction measures and supply augmentation actions. In Metropolitan's DRA, years 2021 and 2023 are estimated to have shortage levels within 10% of water use, corresponding to its WSCP Level 1 Shortage. Metropolitan has a range of response actions that it can take in a Level 1 Shortage, including take from Storage, execute Flexible Supplies, implement Voluntary Demand Reduction, and implement its Water Supply Allocation Plan. Metropolitan's DRA anticipates taking from its storage during these shortfall years to augment its supply and meet its demand. As of January 1, 2021, Metropolitan has 3.2 million AF in storage that may be used for dry-year needs within multiple reservoirs to mitigate any potential shortage in 2021 and 2023. In addition, Metropolitan may also take from its water banking programs in the Central Valley, draw from in-region conjunctive use programs, pursue additional supplies through SWP transfers, or exercise any combination of supply augmentation actions.

With a potential surplus estimated for years 2022, 2024, and 2025, no water service reliability concern is anticipated, and no shortfall mitigation measures are expected to be exercised. Metropolitan will periodically revisit its representation of both individual supply sources and of the gross water use estimated for each year and will revise its DRA if needed.

This DRA assumes that Western will be able to purchase sufficient supplies to meet demands based on the results of Metropolitan's DRA. As shown in **Table 6-5**, Western's supplies are anticipated to be reliable, and no supply shortfalls are expected from 2021 to 2025 when assuming the next five years are similar to the driest five years. Western does not anticipate the need to implement shortage response actions in its wholesale WSCP in the next five years, unless Metropolitan implements a WSAP, which is not expected based on Metropolitan's DRA analysis.

Table 6-5. Wholesale DRA Results, AFY

	2021	2022	2023	2024	2025
POTABLE					
Gross Water Use	52,015	53,401	54,774	55,782	68,426
Total Supply	52,015	53,401	54,774	55,782	68,426
DIFFERENCE	**0**	**0**	**0**	**0**	**0**
NON-POTABLE					
Gross Water Use	24,431	25,601	26,775	27,954	29,134
Total Supply	24,431	25,601	26,775	27,954	29,134
DIFFERENCE	**0**	**0**	**0**	**0**	**0**

7 WESTERN MUNICIPAL WATER DISTRICT
Wholesale Demand Management Measures

This chapter describes Western's implementation of wholesale demand management measures (DMMs) intended to promote water use efficiency in partnership with retail agencies to support sustainable management of regional water supplies.

Western has been a leader in water use efficiency for many years and actively collaborates with local and regional agencies and the communities it serves to implement innovative programs and drive reductions in water usage. Western staff also serves in a leadership role for the California Water Efficiency Partnership (CalWEP) whose mission is to maximize urban water efficiency and conservation throughout California by supporting and integrating innovative technologies and practices; encouraging effective public policies; advancing research, training, and public education; and building collaborative approaches and partnerships. Western leverages these partnerships, tools, and resources within its service area.

Details on Western's wholesale DMMs are provided in the following sections. DMMs implemented for Western Retail are described in **Chapter 12**.

IN THIS SECTION

- Metering
- Outreach and Public Education
- Water Conservation Program Coordination and Staffing
- Asset Management

7.1 Metering

All of Western's wholesale customers are fully metered and billed volumetrically each month.

Western has 14 wholesale agencies in its service area (see **Chapter 3**, System Description), eight of which received raw and treated water supplies from Western in 2020, served through 20 meters. Metropolitan owns and maintains all but three of these meters. Western's operations staff performs annual meter calibrations on all wholesale meters.

7.2 Outreach and Public Education

As a wholesaler, Western implements Public Education and Outreach programs within its general service area, described in more detail below.

7.2.1 Public Outreach

Western's Strategic Communications department provides extensive public outreach to the communities it serves, with at least quarterly contact. Water-use efficiency is promoted through press releases and events, paid advertising, bill inserts, customer newsletter, landscape water conservation media campaigns, website program brochures, speaker's bureau, and cooperative partnerships with other retail agencies and other area partners.

Western's outreach programs deliver the following key messages:

- Imported water supplies are unreliable at times;
- Demand for quality water has increased over time;
- Conservation efforts and efficient use are highly effective means to stretch and extend water resources; and
- Western has incentive programs and support mechanisms that will increase water efficiency and benefit customers.

In addition, Western has converted its office landscaping to drought-tolerant plants to encourage public acceptance, desire for, and use of water-efficient landscapes. The local chapter of the Master Gardeners of Riverside County also helps facilitate regular workshops to promote environmentally responsible and sustainable horticultural practices. Details on the Master Gardeners of Riverside County are provided in **Chapter 12**, Retail Demand Management Measures.

7.2.2 School Education Programs

Western sponsors a regional school education program in its general service area. Western has been a leader in the field of water education since 1982. Western partners with its retail water agencies to implement programs for schools throughout Western's general service area. Western's School Program is designed to encourage and assist educators as they teach students about water supply, distribution, reclamation, conservation, and the future of water supplies. The material and services offered meet the requirements of the California Science Framework Addendum and are provided at no charge to participating teachers, schools, and students, public and private. Western conducts class presentations and teacher workshops, and offers materials including student workbooks, water cycle bracelets, earth balls, water story rocks, assembly-related material, teachers' guides, videos, speakers, and field trips. Complete class water education units are also distributed. A total of

157 public schools are eligible to participate in Western's education program; 143 of these schools are located within Western's wholesale service area (exclusive of those schools in Western's retail service area).

Western has also established free, virtual tools to support teachers and engage students in response to the COVID-19 pandemic. The "Lighten Your Load" program provides water education support for teachers. Teachers can sign up for a one-on-one planning session with Western's water education experts and will receive individualized advice and access to resources for use within a virtual classroom environment while meeting the California State and Next Generation Standards. Western has also developed a new video game to help students learn about California's water system and Western's distribution system. The game's beta version debuted at the 2020 Science and Technology Education Partnership (STEP) Conference. This interactive game will help students learn about where their water comes from (Western Municipal Water District, 2020).

Since 1995, Western has offered programs to fund creative classroom projects that further a better understanding of water and the vital role it plays in the community. Western also offers grants for educators under the Lois B. Krieger Water Project Grants for Educators fund. Teachers within Western's general service area can apply to receive up to $1,000 in classroom funding for water education projects (both virtual and in-classroom). In 2020, 21 teachers received grant awards totaling more than $14,000 for projects pertaining to water quality testing, hydroponic gardening, and sensory water exploration. All teachers in Western's District, in both private and public schools in grades K–12, are eligible to apply for these grants.

Western also offers limited scholarships for students residing in its service area who are studying fields related to water (water policy, public administration and management, environmental geology, water management, water conservation) at local universities, including California State University San Bernardino, University of California Riverside, Riverside City College, and Norco College.

7.3 Water Conservation Program Coordination and Staffing

Western has maintained a full-time water conservation coordinator position since 1990. The water conservation coordinator implements wholesale and retail area programs.

7.4 Asset Management

Western maintains and implements upgrades to its distribution system, including facilities, equipment, and infrastructure, through regular operation and maintenance activities. Western's Operations Department implements maintenance and repairs of Western's system.

7.5 Wholesale Supplier Assistance Program

Western provides financial and technical assistance and helps build partnerships with its retail agencies to promote conservation. Western participates in Metropolitan's Member Agency Administered (MAA) funding for projects that are not included in Metropolitan's regular rebate program. Western receives $748,000 in every two-year Metropolitan budget cycle for conservation projects.

In the past, Western and its wholesale customers have used the MAA funding for the following projects:

- High-efficiency toilet installations
- High-efficiency sprinkler nozzle distributions
- Weather-based irrigation controller distributions
- Hot Water Recirculating Pump distributions
- Swimming pool cover rebates
- Utility-side Leak Detection equipment purchases
- Customer-side leak detection and flow monitoring rebates
- Analysis of customer-side leak detection devices
- Drinking water education programs
- Water-use-efficiency customer workshops
- Educational video game development
- Smart Irrigation equipment installation
- Multi-family toilet sensor installations
- Study of color-retention in warm season turf grasses with University of California Riverside
- Partnership with SoCalGas to install water saving devices

Western continues to promote conservation throughout its entire service area and supports its wholesale customers' conservation programs.

8

WESTERN MUNICIPAL WATER DISTRICT

Wholesale Water Shortage Contingency Plan

The WSCP is a strategic plan that Western uses to prepare for and respond to foreseeable and unforeseeable water shortages. This chapter provides an overview of the portions of Western's Water Shortage Contingency Plan that are applicable to Western Wholesale. The standalone Water Shortage Contingency Plan is included in Appendix A.

The California Water Code Section 10632 requires that every urban water supplier that serves more than 3,000 acre-feet per year or has more than 3,000 connections to prepare and adopt a standalone Water Shortage Contingency Plan (WSCP) as part of its UWMP. Western Wholesale and Western Retail are subject to the WSCP requirements and a single WSCP has been developed to meet the requirements for both systems. This chapter provides an overview of the portions of the WSCP that are applicable to Western Wholesale. **Chapter 13** provides an overview of the portions of the WSCP that are applicable to Western Retail. Western's WSCP is included as **Appendix A** and will be separately submitted to DWR by July 1, 2021. The WSCP is developed separately from Western's 2020 UWMP and can be amended, as needed, without amending the UWMP.

IN THIS SECTION

- WSCP Outline
- Wholesale WSCP Requirements Overview

The WSCP is a strategic plan that Western uses to prepare for and respond to foreseeable and unforeseeable water shortages. A water shortage occurs when water supply available is insufficient to meet the normally expected customer water use at a given point in time. A shortage may occur due to a number of reasons, such as water supply quality changes, climate change, drought, regional power outage, and catastrophic events (e.g., earthquake). Additionally, the State may declare a statewide drought emergency and mandate that water suppliers reduce demands, as occurred in 2014. The WSCP serves as the operating manual that Western will use to prevent catastrophic service disruptions through proactive, rather than reactive, mitigation of water shortages. The Western WSCP provides a process for an annual water supply and demand assessment for the wholesale system and structured steps designed to respond to actual conditions. This level of detailed planning and preparation provide accountability and predictability and will help Western maintain reliable supplies and reduce the impacts of any supply shortages and/or interruptions.

The WSCP must be updated based on new requirements every five years and will be adopted as a current update for submission to the California Department of Water Resources by July 1, 2021.

8.1 Water Shortage Contingency Plan Outline

Western's WSCP is organized into six sections:

- **Section 1** - Overview of the WCSP
- **Section 2** - Western Wholesale Water Shortage Contingency Plan
- **Section 3** - Western Retail Water Shortage Contingency Plan
- **Section 4** - Emergency Response, Seismic Risk Assessment and Mitigation
- **Section 5** - WSCP Refinement Procedures
- **Section 6** - Plan Adoption, Submittal and Availability

All sections are applicable to Western Wholesale except Section 3, which is applicable to Western Retail only.

8.2 Overview of the Wholesale Requirements of the WSCP

The Water Code establishes several prescriptive elements which must be included in a wholesale water supplier's WSCP. Each element and its location within the WSCP is described below.

Water Supply Reliability Analysis: Summarizes Western Wholesale's water supply reliability and identifies any key issues that may trigger a shortage condition. This requirement is addressed in Section 2 of the WSCP.

Annual Water Supply and Demand Assessment Procedures: Describes the key data inputs, evaluation criteria, and methodology for assessing the Western Wholesale system's reliability for the coming year and the steps to formally declare any water shortage levels and response actions. This requirement is addressed in Section 2 of the WSCP.

Shortage Stages: Establishes water shortage levels to clearly identify and prepare for shortages. This requirement is addressed in Section 2 of the WSCP.

Shortage Response Actions: Describes the response actions that may be implemented or considered for each stage to reduce gaps between supply and demand. This requirement is addressed in Section 2 of the WSCP.

Communication Protocols: Describes communication protocols under each stage to ensure customers, the public, and government agencies are informed of shortage conditions and requirements. This requirement is addressed in Section 2 of the WSCP.

Legal Authority: Lists the legal documents that grant Western the authority to declare a water shortage and implement and enforce response actions. This requirement is addressed in Section 2 of the WSCP.

Financial Consequences of WSCP Implementation: Describes the anticipated financial impact of implementing water shortage stages and identifies mitigation strategies to offset financial burdens. This requirement is addressed in Section 2 of the WSCP.

WSCP Refinement Procedures: Describes the factors that may trigger updates to the WSCP and outlines how to complete an update. This requirement is addressed in Section 5 of the WSCP.

Plan Adoption, Submittal, and Availability: Describes the process for the WSCP adoption, submittal, and availability after each revision. This requirement is addressed in Section 6 of the WSCP.

Part 3

Western Retail

9

WESTERN MUNICIPAL WATER DISTRICT

Retail Water Supply

Western retail utilizes a variety of supply sources, including imported water and local groundwater from various basins. Potential future water supply sources focus on local projects to increase regional reliability and reduce dependence on imported water.

IN THIS SECTION

- Water Supply Overview
- Water Supply Characterization
- Energy Intensity

9.1 Water Supply Overview

Western has invested in local supply sources to reduce dependence on imported water and maintain reasonable costs for its customers. Western's supply sources are expected to meet projected demands and are sustainably managed to be drought resilient. However, to protect local sources and offset financial impacts from imported water, Western will continue to promote conservation and enhance local reliability.

The Riverside service area uses local groundwater from potable and non-potable sources, potable and non-potable imported water and recycled water.

The Murrieta service area uses local groundwater. In recent years, imported water from Eastern has also been used.

The Rainbow service area uses only imported water.

9.2 Retail Water Supply Characterization

As mentioned, Western's retail system uses a variety of supply sources and are detailed below.

9.2.1 Purchased or Imported Water

Imported Water from Metropolitan

In 2020, Western retail obtained approximately 60 percent of its total supply as imported water from Metropolitan. The Riverside service area receives treated imported water from the Mills WTP, delivered through the Mills Gravity Line. Western may also purchase untreated water from Metropolitan to serve non-potable uses.

The Murrieta system uses imported water, delivered by Eastern through the Los Alamos interconnection, to supplement local groundwater supplies.

The Rainbow system relies solely on treated imported water from Metropolitan.

Western uses imported water to meet the balance of demands not met by local sources. Western strives to utilize local sources prior to Metropolitan water to minimize costs.

City of Riverside

In 2017, the City of Riverside and Western executed a Cooperative Agreement for Long-Term Wheeling and Surplus Water Sales (2017 Agreement), attached in **Appendix H**. The 2017 Agreement provides Western up to 2,000 AFY of City of Riverside surplus water until 2027 (which may continue after 2027 with both party's approval). The 2017 Agreement also provides the wheeling of up to 4,600 AFY of Meeks and Daley Water Company water to Western (described below). Currently, Western takes delivery of this water at two locations; the Mockingbird and Whitegates interconnections. Western is currently in design for two additional connections with the City of Riverside to add redundancy, flexibility, and potentially additional deliveries in the future.

Western also purchases non-potable water from the Riverside-Arlington basin from the City of Riverside, which is delivered through the Riverside Canal. Through coordination with Riverside, non-potable supplies from the RPU are expected to continue to be available to Western in the future.

Meeks and Daley Water Company

Western and EVMWD have a contractual agreement for Western to use EVMWD's Meeks and Daley Water Company (Meeks and Daley) rights within the SBBA. These rights are owned by EVMWD and leased to Western in exchange for capacity in the Mills Gravity Line that EVMWD uses for imported Metropolitan water. The purchase agreement between Western and EVMWD is provided in **Appendix I**. Western obtains 4,680 AFY for its retail system through this agreement. Western also owns shares in Meeks and Daley that entitle them to 226.52 AFY from the SBBA, which is shown in **Section 13.2.2**.

Since Western does not own or operate infrastructure that can directly extract water from the SBBA basin, the City of Riverside pumps and delivers this water to Western through system interconnections under the 2017 Agreement as the "long-term wheeling" portion of the agreement. Each year, Western and Riverside develop an operating plan to establish the expected delivery schedule for that year for the Riverside surplus water and Western's total Meeks & Daley water supply. A copy of the 2021 Operating Plan is provided in **Appendix J**. Western has the ability to move up to 7,208 AFY to its Retail system under this agreement.

EVMWD

Western also purchases non-potable water from the Riverside-Arlington basin from EVMWD's Palm Well, which is delivered through the Riverside Canal. Through coordination with EVMWD, non-potable supplies from the Palm Well area expected to continue to be available to Western in the future.

Riverside Highland Water Company

In the past, Western has also entered into 1-year lease agreements with RHWC to acquire up to 1,500 AFY from RHWC's adjusted groundwater rights from the SBBA. Western may enter into such agreements again in the future; however, since no current agreement is in place, leased RHWC shares are not included in Western's supply estimates for this UWMP.

Chino Desalter

The Chino Sub basin is an adjudicated basin managed by the Chino Basin Watermaster. The Chino Sub basin lies in the southwest corner of San Bernardino County and is bordered to the east by the Rialto-Colton fault. In the other three directions, the Chino Sub basin is ringed by impermeable mountain rock, the San Gabriel Mountains to the north, the Jurupa Mountains and Puente Hills to the south and southwest.

On January 2, 1975, several Chino Basin producers filed suit in California State Superior Court for San Bernardino County (the "Court") to settle the problem of allocating water rights in the Chino Basin. On January 27, 1978, the Court entered a judgment in Chino Basin Municipal Water District v. City of Chino et al. adjudicating water rights in the Chino Basin and establishing the Chino Basin Watermaster. The Judgment adjudicated all groundwater rights in Chino Basin and contains a physical solution to meet the requirements of water users having rights in or dependent upon the Chino Basin. The Judgment also appointed the Watermaster to account for and implement the management of the Chino Basin. The Judgment declared that the initial operating safe yield of the Chino Basin is 145,000 AFY. The Basin is managed through implementation of the Chino Optimum Basin Management Plan.

Portions of the Chino Basin have been degraded by elevated concentrations of TDS and nitrate. Similar to the Arlington Desalter, Chino Desalter facilities have been constructed to provide a local source of potable water and decreasing subsurface outflow of low-quality groundwater to the Santa Ana River.

The Chino Basin Desalter Authority (CDA) oversees operation of the Chino Desalter facilities. The Chino Desalter is comprised of two facilities: Chino I and Chino II. These facilities remove salts from brackish groundwater extracted from the Chino Basin. Chino I is located in Chino and began operation in 2000, with an initial capacity of 9,000 AFY. It is operated and maintained by Inland Empire Utilities Agency (IEUA) and treats brackish groundwater through reverse osmosis (RO) and ion exchange technologies (IX).

JCSD operates and maintains the Chino II facility in Jurupa Valley. Chino II began operation in 2006 and initially treated up to 11,820 AFY. In 2016, the Chino II facility was expanded to treat up to 21,000 AFY (2). The Chino II Desalter also utilizes RO and IX to treat the brackish groundwater.

Western Retail owns 3,534 AFY of capacity in the Chino II Desalter. However, Western Retail does not currently use this source and as a result leases it to Jurupa Community Services District.

9.2.2 Groundwater

As discussed previously, Western owns shares in Meeks and Daley that entitle them to produce 226.52 AFY from the SBBA, which is conveyed by the City of Riverside and used in the Riverside retail system.

Western directly extracts groundwater for its retail customers in the Murrieta service area from the Temecula Valley Basin.

Total groundwater extractions from 2016 through 2020 are provided in **Table 9-1**. Descriptions of these basins are provided in **Chapter 4**.

Table 9-1. Groundwater Extractions, AFY

BASIN	2016	2017	2018	2019	2020
Temecula Valley	398	423	398	370	399
San Bernardino Basin Area[1]	226.52	226.52	226.52	226.52	226.52
TOTAL	**624**	**650**	**624**	**596**	**626**

[1]The City of Riverside pumps this groundwater on Western's behalf. Western owns 226.52 AFY of Meeks and Daley water rights within the San Bernardino Basin Area.

Temecula Valley Basin

The Temecula Valley Basin (DWR designated Basin 9.005) lies under several valleys within the southwest portion of Riverside County and parts of northern San Diego County. The Temecula Valley Basin is bound by nonwater-bearing crystalline rocks of the Peninsular Ranges. The overlying valleys are drained by Wilson, Temecula, Murrieta, Warm Springs, and Pechanga Creeks to the Santa Margarita River, which flows west out of the Temecula Valley. The Pechanga Indian Reservation also overlies portions of the southwestern part of the basin. The Temecula Valley Basin typically receives 7 to 15 inches of rainfall each year (California Department of Water Resources).

The Temecula-Murrieta subbasin is an alluvial basin within the Temecula Valley Basin. Within the Temecula-Murrieta Basin lie two aquifers: the Pauba aquifer and the Temecula aquifer, the latter of which underlies the former. The Pauba aquifer covers approximately 18 square miles and the Temecula aquifer extends over an area of approximately 100 square miles.

As part of the Santa Margarita River system, surface water and groundwater supporting surface water (defined as being in the older and younger alluvium) within the Temecula-Murrieta Basin have been under some form of court jurisdiction since 1928. Rights to utilize surface water and groundwater determined to be contributing to the Santa Margarita River are governed by the Modified Final Judgment and Decree entered on April 6, 1966 by the U.S. District Court in United States v. Fallbrook Public Utility District, et al. (Civil No. 1247-SD-T) (provided in **Appendix K**). A Watermaster was appointed in March 1989 to administer and enforce the provisions of the judgment and subsequent orders of the Court. A Steering Committee, currently comprising representatives from the United States, Eastern Municipal Water District (Eastern), Western, Fallbrook Public Utility District (Fallbrook PUD), Metropolitan, the Pechanga Tribe, and RCWD, was also appointed. The purpose of the Steering Committee is to assist the Court and the Watermaster in administering the water rights (Santa Margarita River Watershed Watermaster Report, 2013). The following presents a summary of the groundwater management agencies in the Temecula-Murrieta Basin:

- **Santa Margarita River Watershed Watermaster** – Court approved Watermaster for oversight and administration of water rights
- **Santa Margarita River Watershed Steering Committee** – Assist the Court and the Watermaster in administering the water rights
- **Rancho California Water District** – Prepares Groundwater Audit and Recommended Groundwater Production Report for operation of District groundwater wells and recharge facilities

The Groundwater Audit and Recommended Groundwater Production Report (RGPR) sets limits for producers in the Temecula-Murrieta Basin. The amount of groundwater that can be produced varies due to such factors as rainfall, recharge area, and amount and location of well pumping capacity.

San Bernardino Basin Area

The San Bernardino Basin Area (SBBA) was defined and adjudicated in gross by the Western-San Bernardino Judgment (Western Judgment) in 1969. The SBBA has a surface area of approximately 141 square miles and lies between the San Andreas and San Jacinto faults. The basin is bordered on the northwest by the San Gabriel Mountains and Cucamonga fault zone; on the northeast by the San Bernardino Mountains and San Andreas fault zone; on the east by the Banning fault and Crafton Hills; and on the south by a low, east-facing escarpment of the San Jacinto fault and the San Timoteo Badlands. Alluvial fans extend from the base of the mountains and hills that surround the valley and coalesce to form a broad, sloping alluvial plain in the central part of the valley. The SBBA encompasses the Bunker Hill sub basin (DWR designated Basin 8.02-06) also includes a small portion of the Yucaipa Basin (DWR designated Basin 8-02.07) and Rialto-Colton Basin (DWR designated Basin 8-02.04).

It was determined in the Western Judgment that the Plaintiffs (Riverside County agencies) have a 64,862 AFY share of the safe yield, which equates to 27.95% of the safe yield. The Plaintiffs include the City of Riverside (the successor to the Riverside Water Company and the Gage Canal Company), Riverside Highland Water Company, Meeks & Daley Water Company, and Regents of the University of California. Non-plaintiffs are agencies in San Bernardino County represented by San Bernardino Valley Municipal Water District and are entitled to 72.05% of the safe yield, or 167,238 AF. The Riverside County agencies may not exceed their allocation unless they participate in "New Conservation" (explained below).

The Western Judgment contemplates that the parties will undertake "new conservation" which is defined as any increase in replenishment from natural precipitation which results from operation of works and facilities not in existence as of 1969, other than works installed to offset losses from flood control channelization. The Western Judgment specifies that the parties to the Judgment have the right to participate in any new conservation projects, provided they pay the appropriate share of the cost. The net effect of new conservation is an increase in pumping rights by the Plaintiffs and "credits" for the non-Plaintiffs.

In 2013, both the Plaintiffs and Non-Plaintiffs agreed to participate in the cost to capture water that historically flowed to the ocean. This New Conservation was due to the construction and operation of the Seven Oaks Dam. The 2015 Annual Report for the Western-San Bernardino Annual Report increases the rights for both Parties, as shown in Table 9-2.

Table 9-2. Adjusted SBBA Rights Due to New Conservation Allocation

PARTIES	PERCENTAGE	SAFE YIELD ALLOCATION (AF)	NEW CONSERVATION ALLOCATION (AF)	ADJUSTED RIGHT (AF)
NON-PLAINTIFFS (SAN BERNARDINO COUNTY AGENCIES)	**72.05%**	**167,238**	**5,507**	**172,745**
PLAINTIFFS (RIVERSIDE COUNTY AGENCIES)	**27.95%**	**64,862**	**2,136**	**66,998**
City of Riverside		52,199	1,719	53,918
Riverside Highland Water Company		4,294	141	4,435
Agua Mansa and Meeks and Daley Water Company		7,833	258	8,091
Regents of the University of California		536	18	554
TOTAL SUM OF EXTRACTIONS	**100%**	**232,100**	**7,643**	**239,743**

Riverside-Arlington Basin

Western is planning to construct a new non-potable well in the Riverside Arlington Basin to supplement non-potable supplies available from the Riverside Canal from RPU and the EVMWD Palm Well.

The Riverside-Arlington Basin is described in Section 4.2.2.1.

9.2.3 Surface Water and Stormwater

Western does not directly utilize any surface water or stormwater sources for its retail system. However, Western represents the Riverside County agencies as the Watermaster for the SBBA and participates in regional projects to capture stormwater to enhance the long-term sustainability of the SBBA and help mitigate the effects of climate change on local supplies. As a shareholder of Meeks and Daley Water Company, Western Retail benefits.

9.2.4 Wastewater and Recycled Water

As described in **Section 4.1.3**, There are two wastewater treatment plants that provide recycled water to Western Retail: the Western WRF and the WRCRWA Treatment Plant. Recycled water is used in the Riverside Service Area only. Western leverages the recycled water program to increase supply reliability and reduce the amount of imported water.

Recycled Water Coordination

Western adopted its "Western Strategic Plan" in 2012 to respond to on-going water resource issues in Southern California. Of the five goals developed in the plan, the first, Source Water Reliability, is to develop a water supply reliability portfolio while determining the financial feasibility of projects. In December 2009, Western prepared a Recycled Water Master Plan (RWMP), which was updated in June 2014 (Albert A. Webb Associates for Western Municipal Water District, June 2014). Western coordinated with multiple agencies to provide input during development of the original, including Riverside Public Utilities, Gage Canal Company, and Riverside Unified School District to determine potential recycled water demands.

Wastewater Collection, Treatment, and Disposal

The Western WRF and WRCRWA provide wastewater collection and treatment services for Western's Riverside Retail Service Area. Western operates the WRCRWA Treatment Plant, which is a regional wastewater treatment facility owned by WRCRWA, a joint powers authority composed of the cities of Norco and Corona, Jurupa Community Services District, Home Gardens Sanitary District, and Western.

Western also owns and operates the Western WRF, formerly the March Wastewater Treatment Plant. The WWRF was expanded in 2011 to a capacity of 3 MGD tertiary treatment. Recycled water is then distributed to customers including the Riverside National Cemetery, General Archie Old Golf Course, schools, parks, groves, and nurseries.

Wastewater treatment in Western's other retail areas is provided by EMWD at the Temecula Valley Regional Water Reclamation Facility and Rancho California Water District at the Santa Rosa Water Reclamation Facility. Both EMWD and Rancho California Water District already utilize flows from their wastewater plants to create recycled water. Because these facilities already produce recycled water, flows to these two plants do not have the potential to provide additional recycled water to Western.

WRCRWA Treatment Plant

The WRCRWA Treatment Plant is a 14 MGD tertiary facility that currently discharges all flows to the Santa Ana River. A recent Change of Use Petition has been granted to enable future re-use of recycled water from the WRCWRA Treatment Plan. There are no existing recycled water facilities to deliver the WRCWRA water to Western's service area so Western is exploring other opportunities to make beneficial use of its share of the recycled water.

From 2017 to 2019, the average WRCWRA flow generated by Western retail customers was 0.73 MGD (about 820 AFY) and is expected to increase to 1.6 MGD (about 1,800 AFY) at buildout.

Western Water Recycling Facility

Western operates the WWRF, which treats domestic wastewater from March Air Reserve Base and the north-central portion of the Riverside Service Area. The plant was upgraded in 2014 to produce 2,200 AFY of tertiary treated wastewater, which is discharged to an impoundment and then pumped to supply the recycled water system. The recycled water is provided to the Riverside National Cemetery, General Old Golf Course, and various landscaping, agricultural and commercial use sites. When supply exceeds demand, such as during wet winter months, excess recycled water is stored in the on-site impoundment until needed. If recycled water demands exceed supply, March Air Force Base's Expanded Groundwater Extractions and Treatment System (EGETS) may operate and send groundwater flows to blend with recycled water in Western's on-site storage ponds at the WWRF. If there is a large discrepancy between recycled water demand and recycled water supply, excess recycled water from the WWRF can be placed in Western's existing sewer collection system for conveyance and treatment to WRCRWA, where it is eventually discharged to the Santa Ana River.

The volume of influent to the WWRF, and new demand for recycled water is dependent on new development in the Riverside Service Area. Increasing the available supply of recycled water will allow customers who currently use non-potable water from the CRA to switch to a more drought- proof local supply for their non-potable water needs.

Recycled Water System Description

As mentioned, Western utilizes recycled water in the Riverside Service Area only. The recycled water system consists of nearly 56 miles of pipeline ranging from 4 to 42 inches in diameter; eight pump stations with 25 pumps and a combined rating of 5,175 horsepower; and a storage capacity of 1.3 MG in five tanks and one open reservoir. Western has an additional two open reservoirs, but they are not currently used in normal operation and not included in the storage totals outlined in the RWMP (Albert A. Webb Associates for Western Municipal Water District, June 2014).

Recycled water from the WWRF is provided to the Riverside National Cemetery and General Archie Old Golf Course as well as various parks, schools, groves, and nurseries. Recycled water is a drought-proof supply as it stems from wastewater by customers within Western's service area.

Potential, Current, and Projected Recycled Water Uses

Recycled water provided by Western is used by a limited number of customers, primarily those with large outdoor irrigation needs. Western anticipates future recycled water use to expand to additional customers, who will be able to reduce their outdoor use of potable water. Western is currently updating its Riverside Facilities Master Plan for the non-potable system and is investigating opportunities to expand recycled water service to existing and future customers.

Current Use

In 2020, Western delivered 1,758 AFY tertiary treated recycled water to its retail customers. This exceeds the volume anticipated in the 2015 UWMP.

Potential Users

Western has been working with commercial, residential, and institutional developments in the retail area to ensure that recycled water can be used to the fullest extent possible. Potential users within Western's service area include all industrial, commercial, and agricultural users that currently utilize potable and non-potable supply from the Riverside Canal and the CRA. Specific areas identified in the RWMP for potential expansion include the Orangecrest and Mission Grove areas and the Meridian Business Park. Western is flexible and open to additional developments and interest in recycled water use. Three Riverside Unified School District (RUSD) and one Val Verde Unified School District schools have been plumbed or retrofitted for recycled water. All new residential projects will be conditioned to install recycled water systems for parks and common areas. Additional recycled water users are identified in the RWMP. Total existing and future demand is anticipated to be approximately 8,000 AFY (Albert A. Webb Associates for Western Municipal Water District, June 2014).

Actions to Encourage and Optimize Future Recycled Water Use

The primary means by which Western encourages recycled water use is through its water rate structure. Non-potable and recycled water customer rates are substantially lower than potable water. In addition, recycled water use is mandated by Ordinance 377 in those areas where recycled water is available and can be used properly. Industrial and commercial developers near non-potable distribution pipelines are required to plan for future use of recycled water, including installing proper piping and facilities to minimize economic impacts when recycled water becomes available at the use site. This is implemented through the plan check process, where plans are not approved until the required recycled water facilities are designed.

As mentioned, Western is in the process of updating its Riverside Facilities Master Plan. This effort will continue to analyze future recycled water use and assess infrastructure needs to promote additional recycled water use and offset potable demand.

9.2.5 Desalinated Water Opportunities

As described above, Western is already pursuing the use of desalinated groundwater as part of its long-term water supply. Western is a member agency of the Chino Basin Desalter Authority and owns 3,534 AFY of capacity. The Chino Basin Desalter treats brackish groundwater to potable quality and may be expanded in the future. Currently, Western's shares are sold to the City of Norco.

Western's service area is located on the other side of the Santa Ana Mountains from the Pacific Ocean. Seawater desalination, as a source of supply for Western, would require development of a coastal desalination facility and either construction of a conveyance pipeline and associated appurtenances from the coast inland and over the mountains to Western's service area, or development of an exchange agreement with another agency to trade desalted water for Metropolitan supplies.

The development of (or participation in) a new water supply using a seawater desalination technique, while costly, is being investigated by other wholesale and retail water agencies in Southern California. Because Western is an inland area, desalination would only work if Western joined with other water purveyors in the development of a coastal desalination facility, and then received water from the SWP supplies of other participants via an exchange. It is not cost effective nor environmentally sound for Western to receive direct delivery of desalted ocean water due to the distance and the topography between Western and the Pacific Ocean.

9.2.6 Water Exchanges and Transfers

Western does not currently have any exchange or transfer agreements aside from agreements already discussed that pertain to local groundwater and purchases.

Emergency Interties

Western has interties with Eastern and EVMWD for use as an emergency supply source. Western also has interconnections with the cities of Riverside and Corona.

9.2.7 Future Water Projects

Eastern, a neighboring agency of Western, has developed the North Perris Groundwater Basin Program to remediate contamination within the North Perris Groundwater Basins, protect non-contaminated areas of the basin, develop a local source of supply, including a secondary, secure potable supply for MARB, as well as provide long-term remediation of rising groundwater levels within MARB. Because of potential issues with serving MARB, Western and Eastern have entered into an interagency agreement for the Perris North Project, headed by Eastern. The interagency agreement, attached in **Appendix M** allows Western to purchase Perris North Project water in accordance with the Maximum Allocation Schedule if and when MARB demands increase in the future. The project is expected to produce approximately 6,750 AFY of total supply, with Western initially purchasing 500 AFY following completion of the project then increasing up to 1,500 AFY by 2040.

Table 9-3. Future Water Supply Projects

FUTURE SUPPLY PROJECT	DESCRIPTION	PLANNED IMPLEMENTATION YEAR	PLANNED FOR USE IN YEAR TYPE	EXPECTED INCREASE IN SUPPLY
Perris North Project	Joint Project with Eastern Municipal Water District	2025	All Year Types	500 – 1,500 AFY

9.2.8 Summary of Existing and Planned Sources of Water

As described throughout this chapter, Western has worked to develop a variety of local and imported water supplies to meet its customer demands. Western will continue to work to secure local supplies and increase reliability, while promoting conservation and/or recycled water use. **Table 9-4** summaries the various supplies used in 2020 and **Table 9-5** and **Figure 9-1** summarize projected supply through 2045.

Table 9-4. 2020 Water Supply, AFY

SUPPLY SOURCE	SUPPLY, AFY
POTABLE	**21,834**
Metropolitan	12,004
Groundwater (San Bernardino Basin, Western Meeks and Daley)	226.52
Groundwater (San Bernardino Basin, Leased Meeks and Daley)	4,208
Groundwater (RPU Surplus)	3,163
Groundwater (Temecula Valley Basin)	399
Eastern (Murrieta)	1,834
NON-POTABLE	**4,909**
Metropolitan	1,819
EVMWD (Riverside-Arlington Groundwater)	944
RPU (Riverside-Arlington Groundwater)	388
WWRF	1,758
TOTAL SUPPLY	**26,743**

Table 9-5. Projected Supply, AFY

[1]Available supply from Metropolitan determined as the remaining demand not met by local supply sources with a 10% buffer.

[2]Western's shares of the Chino Desalter, currently leased to Jurupa Community Services District.

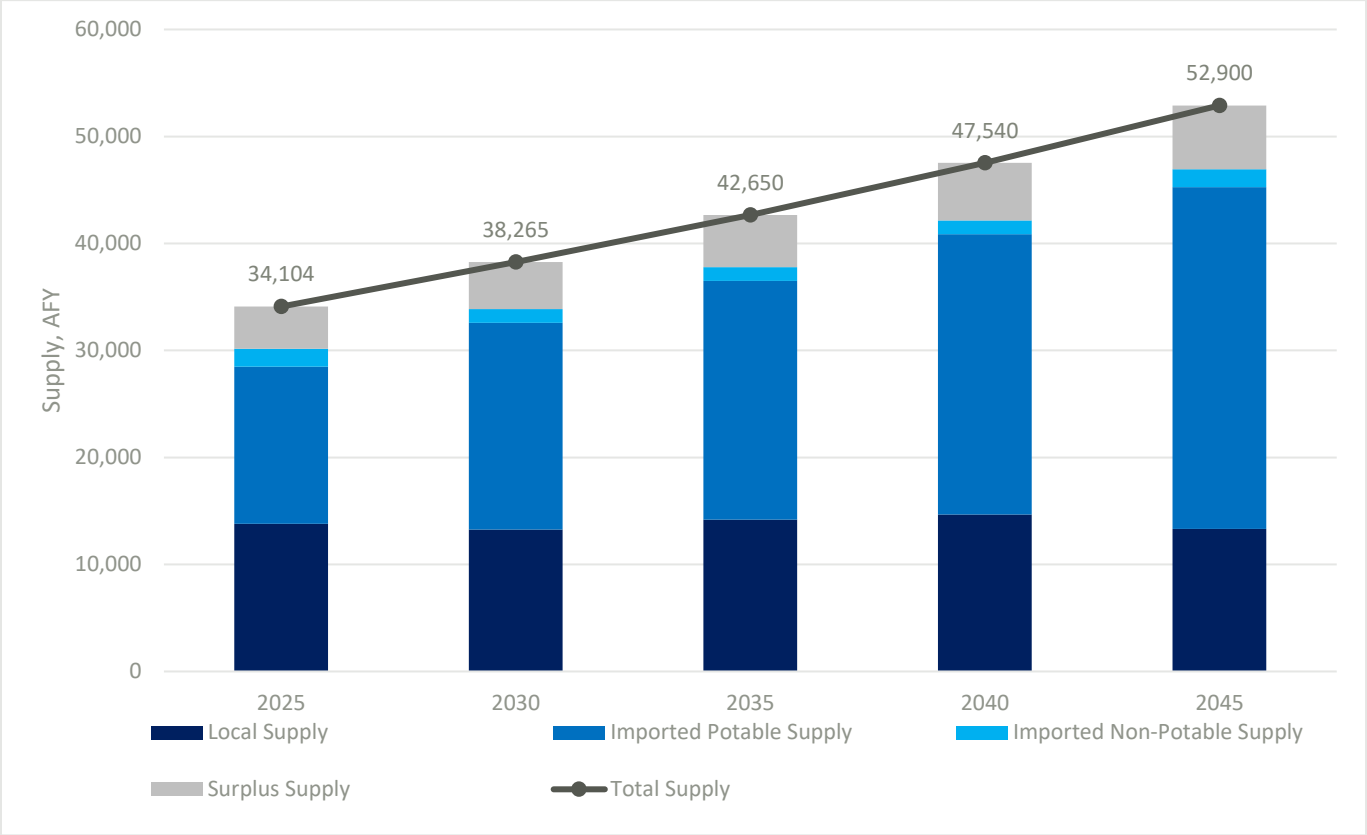
[3]Planned groundwater extractions to serve the Murrieta service area.

[4]Agreement with EVMWD to lease Meeks and Daley groundwater rights.

[5]Western-owned Meeks and Daley groundwater rights.

[6]Based on the 2017 Agreement, surplus water sales. Additional surplus supply may be available in the future but is not guaranteed.

[7]Eastern Perris North Project.



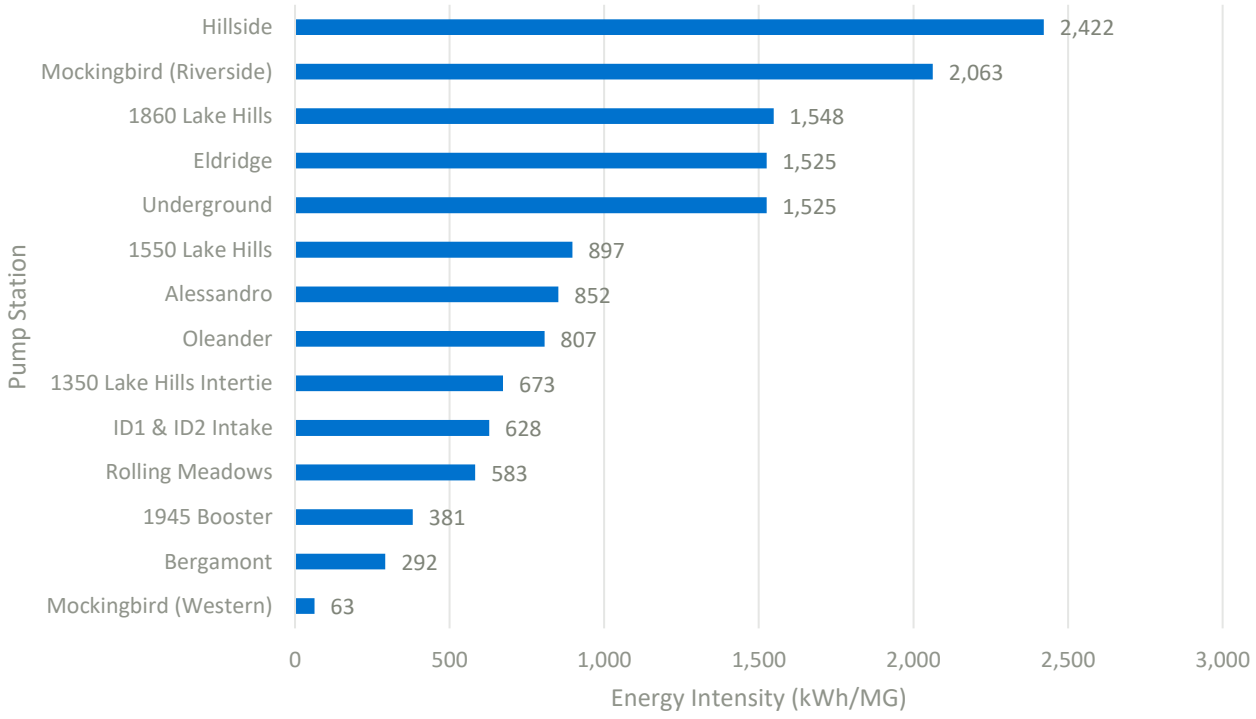
[8] Non-potable supply from Metropolitan is assumed to meet the remaining demand not met by local supply sources.

[9]Expected supply used from local non-potable groundwater and delivered through the Riverside Canal, including Western's planned non-potable well and purchases from RPU and EVMWD's Palm Well.

[10]Projected 2030 WWRF effluent determined in the Riverside Non-Potable Facilities Master Plan. The rate of growth was calculated between 2030 and average 2017-2019 data (2018 used to determine rate of growth) and applied for years 2025 and 2030-2045. Based on this growth rate, the WWRF is expected to reach buildout between 2035 and 2040.

[11]WRCWRA supply is not currently available to Western Retail customers as no infrastructure currently exists to convey recycled water from the plant to Western Retail. This supply is currently considered surplus supply but Western is evaluating opportunities to make use of it.

Figure 9-1. Projected Retail Supply, AFY



9.3 Energy Intensity

Western contracted with Hansen Allen & Luce, Inc. (HAL) to complete a Water System Optimization Study (Optimization Study) in 2018 and identify how Western could best align hydraulic performance, water quality, and energy efficiency for its Riverside service area. The Optimization Study more specifically analyzed overall hydraulic performance, storage utilization, pump station operation, energy efficiency, and water quality. Western's existing hydraulic model and energy usage for 2014 through 2017 was used as the basis for the optimization analysis.

In addition to electricity, Western uses natural gas to operate its system. The Holcomb Pump Station is powered by natural gas from the Shell Energy Company. Other areas of the Riverside service area are powered from natural gas provided by the Southern California Gas Company (SoCal Gas). Both electricity and natural gas exhibit similar usage patterns, with peaks during the summer months that mimic water demand trends.

The Optimization Study estimated the expected energy intensity for each pump station, as shown in **Figure 9-2** (Hansen Allen & Luce, Inc. for Western Municipal Water District, October 2018). Overall, the study estimated that the average energy intensity for the Riverside service area is approximately 3,700 kWh/MG (kilo-watt-hours per million gallons). This value does not include the energy intensity from imported water or water purchased from other agencies.

Figure 9-2. Estimated Energy Consumed by Pump Station (Hansen Allen & Luce, Inc. for Western Municipal Water District, October 2018)

10 WESTERN MUNICIPAL WATER DISTRICT Retail Water Use

This chapter describes historical, current, and projected water uses for Western's retail service areas.

Western provides potable water to customers within the Riverside, Murrieta, and Rainbow service areas. In addition, Western provides non-potable water to customers in the Riverside service area.

Between 2016 – 2020, Western retail customers used an average of 23,000 AFY of water.

IN THIS SECTION

- Non-Potable and Potable Water Use
- Past, Current, and Projected Water Use
- SBX7-7 Baselines, Targets, and Compliance

10.1 Non-Potable and Potable Water Use

Western's Riverside retail service area uses water for both potable and non-potable uses. Potable uses include agriculture, commercial, single-family residential, multi-family residential, landscape, industrial, military, temporary, and Fireline uses. Temporary connections include meters issued for construction water use.

Non-potable water is also used for agriculture and landscape and is tracked separately. The non-potable system uses a blend of recycled water, non-potable groundwater, and non-potable imported water.

The Murrieta and Rainbow retail service areas use potable water for a variety of uses, including single-family, multi-family, commercial, landscape, and others. These systems do not currently use non-potable water.

10.2 Past, Current, and Projected Water Use by Sector

Past, current, and projected water uses for Western's retail system is discussed in the following sections. In 2020, the largest customer category was single-family customers that used approximately 60% of the total water consumed.

10.2.1 Past Water Use

Water use in Western's retail systems has varied from 2013 to 2020. There was a notable decline in 2015 following the State's 2014 declaration of a drought emergency and implementation of statewide mandatory demand reductions. After the statewide restrictions ended in 2016, demands rebounded slightly but have not returned to 2013 levels, despite adding nearly 1,600 new customer connections from 2013 to 2020. Western also implemented water budget rates for indoor and outdoor uses which has helped to limit total consumption and conserve water. This is an indication that Western's aggressive conservation program has been effective at achieving some permanent demand reductions. Note that for non-potable customers, Western's billing data does not differentiate recycled water use from other non-potable use so recycled water use is included. A summary of the water use for each retail service area is provided in **Figure 10-1**, **Figure 10-2**, and **Figure 10-3**. Total Western retail use is summarized in **Figure 10-4** and **Table 10-1**.

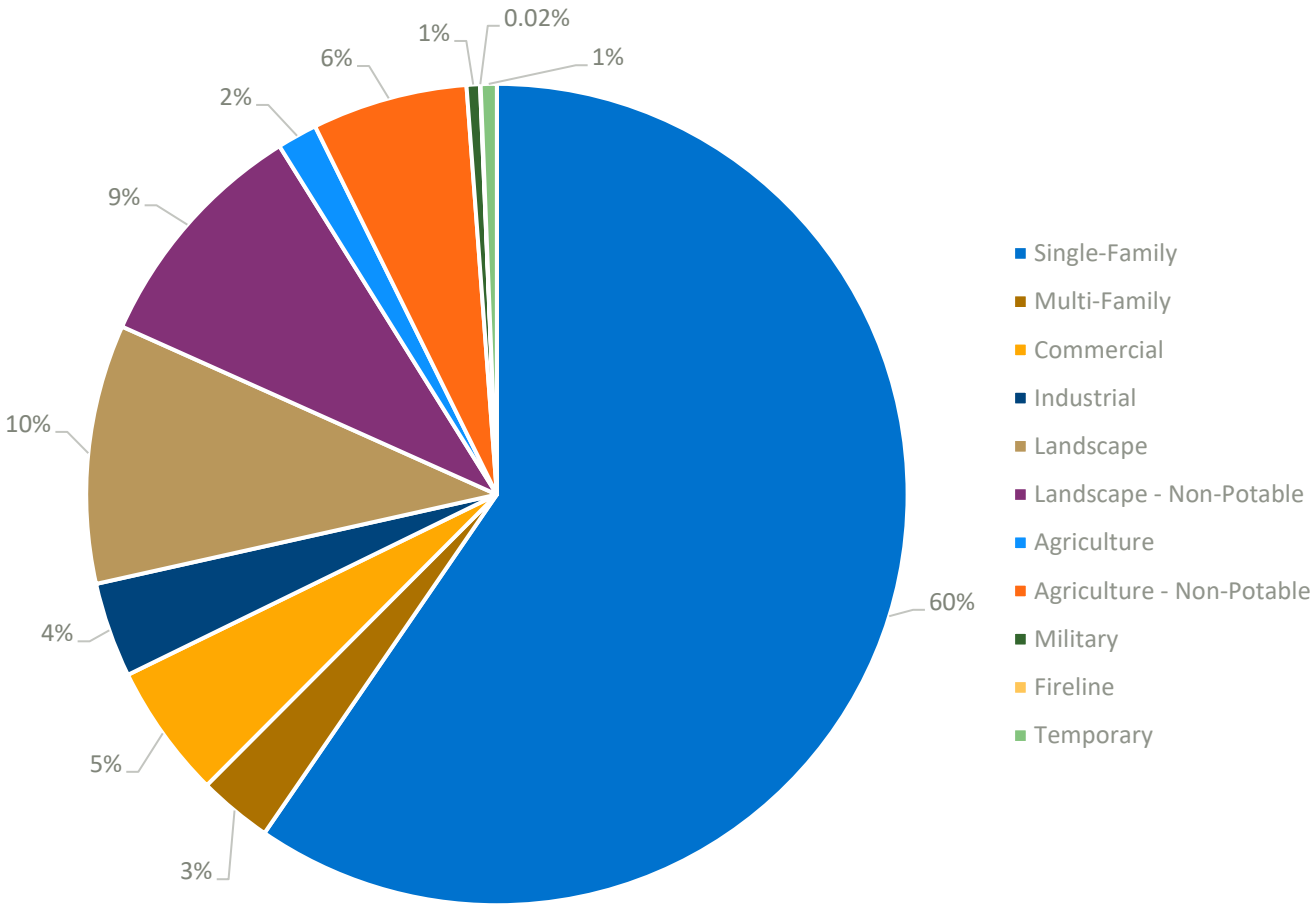

Figure 10-4. Western Retail Historical and Current Water Use, AFY

10.2.2 Current Water Use

In 2020, Western Retail (Riverside, Murrieta, and Rainbow service areas combined) used 25,134 AF of water. Single family residences consumed 60% of the total water used. The second largest customer category was landscape, using 10% of the total water demand. The breakdown of water use by customer category is illustrated in **Figure 10-5**.

Figure 10-5. Western Retail 2020 Water Use by Customer Category

10.2.3 Distribution System Water Losses

There are two types of water losses considered in the water loss audit, apparent losses, and real losses. Apparent losses are losses attributed to meter inaccuracies or data management (e.g., losses due to how water is accounted for or measured), while real losses are physical losses of water. Sources of distribution system water loss include:

- Leaks from water lines - Leakage from water pipes is a common occurrence in water systems. A significant number of leaks remain undetected over long periods of time as they are very small; however, these small leaks contribute to the overall water loss. Aging pipes typically have more leaks.
- Water used for flushing and fire hydrant operations
- Unauthorized uses or theft of water
- Meter Inaccuracies - meters can under-represent actual consumption in the water system.
- Unrecorded water uses when reservoirs overflow

Western has completed annual water loss audits for the Riverside retail system since 2015 following the procedures outlined by AWWA to identify and quantify system losses. These reports are submitted to the State each year by October 1. Western also prepares a water loss calculation for the Murrieta and Rainbow systems on an annual basis for internal use in managing water losses.

Historical water loss for each system is summarized in **Table 10-2**. The 2020 AWWA Water loss audit for Riverside system will not be available until October 1 per State requirements so an estimated water loss is shown based on the difference between total water supplied to the system and total water billed to the customers.

Table 10-2. Historical Water Losses for Retail Service Areas, AFY and Percent of Consumption

	2016	2017	2018	2019	2020
Riverside	3,236 (20%)	1,378 (8%)	1,262 (7%)	1,226 (7%)	1,495 (6%)
Murrieta	3 (<1%)	245 (11%)	27 (1%)	21 (1%)	99 (4.4%)
Rainbow	12 (33%)	9 (26%)	11 (30%)	7 (25%)	16 (34%)

Water losses for the Riverside service area have been trending down, likely due to recent replacement of water meters throughout the system; however, meters along the Mills Gravity Line may exhibit meter inaccuracies during low flow periods. The Murrieta system maintains consistently low water loss. The Rainbow service area exhibits high water losses due to all water being delivered through a single Metropolitan turnout (meter WR-13) and a handful of customers with relatively low use. Meter inaccuracies, especially during low flow periods, are expected to be the primary driver for the relatively high water loss in the Rainbow system.

The State Water Board is currently preparing performance standards for distribution system water loss. These standards are still being reviewed and finalized with stakeholder input. Western is committed to managing system water losses to reduce water waste and will endeavor to meet the future water loss performance standard once adopted by the State Water Board. A discussion of current and planned programs to manage water loss are included in **Chapter 15**, Retail Demand Management Measures.

For the purposes of projecting future demands, the Riverside system is assumed to maintain a 4% loss, the Murrieta system is assumed to maintain a 3% loss and the Rainbow system is assumed to maintain a 25% loss.

10.2.4 Projected Water Use

To estimate future potable water use, Western explored several demand projection methodologies based on SCAG and Department of Finance (DOF) projections, recent buildout studies, and ongoing master planning efforts. The growth rates projected by SCAG and DOF for the Riverside and Murrieta retail service areas indicated relatively low annual growth rates, which is not representative of the growth Western expects based on knowledge of planned developments. While these projections were not used as the sole basis for Western's population and demand projections, they were used as baseline comparisons.

Western also analyzed previous buildout studies for the Murrieta and Riverside service areas that were prepared in 2018 and 2019, respectively. These buildout studies included a parcel land-use based approach to determine the future buildout demand. The buildout studies informed demands for the ongoing Murrieta Water Facilities Master Plan and the ongoing Riverside Water Facilities Master Plan. Both master plans have more closely analyzed development that is expected to occur within the next 10 years, between 2020 and 2030. A comparison of 2020 actual demands and the 2030 projected demands in the Water Facilities Master plans yields an annual average growth rate of approximately 2.2%. Western anticipates that a similar trend may continue through 2045. To be consistent with the land use and development-based analysis prepared for the Water Facilities Master plans, Western elected to utilize a uniform 2.2% growth rate for the Riverside and Murrieta service areas.

Western's Rainbow service area has remained relatively constant in terms of growth and water use and minimal future growth is expected, which is consistent with the SCAG projections for this service area. To forecast demands for the Rainbow service area, the SCAG growth rate was applied to existing demand. Based on this analysis, demands within the Rainbow service area are estimated to increase by 6 AFY in 2045, compared to 2020 actual demand.

To project potable demands for each system, a linear interpolation for each service area was applied using the various growth rates described above. To estimate future water, use for each customer category, the percentage of total 2020 use was applied to total future demand. The estimated water loss percent was then applied for each system to determine the total projected water use.

To project Riverside retail non-potable demands, a similar approach was used. A comparison of 2020 actual non-potable demands and the 2030 projected non-potable demands in the Water Facilities Master plan yields an annual average growth rate of approximately 3%. After 2030, Western anticipates that non-potable use will continue to grow but at a slower rate. Non-potable demands after 2030 are anticipated to grow at 2.2%, the same rate as the potable system. Estimated water losses within the non-potable system were assumed to be 23%, the average non-potable water loss from 2016 through 2020. Over the last five years, water losses within the non-potable system have ranged from 20 to 26%. Within the non-potable system, water is typically loss at the Jefferson Pump station. The Jefferson Pump station diverts water from the Riverside Canal, but due to operational constraints, some non-potable water flows to the River.

Table 10-3 summarizes the demand by service area while **Figure 10-6** and **Table 10-4** summarize the total projected Western Retail demand by customer class, in AFY.

Table 10-3. Projected Retail Water Demand by Service Area, AFY

SERVICE AREA	2025	2030	2035	2040	2045
Riverside	27,674	31,101	34,695	38,705	43,178
Riverside Potable	22,119	24,675	27,527	30,709	34,258

NON-POTABLE*					
Agriculture – Non-potable	1,779	2,058	2,296	2,561	2,857
Landscape – Non-potable	2,737	3,166	3,532	3,940	4,396
Losses – Non-potable	1,039	1,202	1,340	1,495	1,668
TOTAL NON-POTABLE	**5,555**	**6,426**	**7,168**	**7,997**	**8,921**
TOTAL DEMAND	**30,167**	**33,879**	**37,792**	**42,155**	**46,940**

*Non-potable demands include demand met by recycled water. Western cannot distinguish between recycled water and non-potable deliveries as its system is combined.

Although Western's non-potable system includes recycled water, for the purposes of demand projection and future recycled water reporting, the estimated percentage of total non-potable demands met by recycled water was determined based on the 2020 supply ratio between recycled water and non-potable sources. In 2020, WWRF produced approximately 36% of the total non-potable supply that was used. As a result, it was assumed that 36% of non-potable demands were met by recycled water. To forecast future demands, it was assumed that recycled water supply from the WWRF would be used prior to local or imported non-potable water. Future non-potable demands are summarized in **Table 10-5** below.

Table 10-5. Non-Potable Demand, AFY

	2025	2030	2035	2040	2045

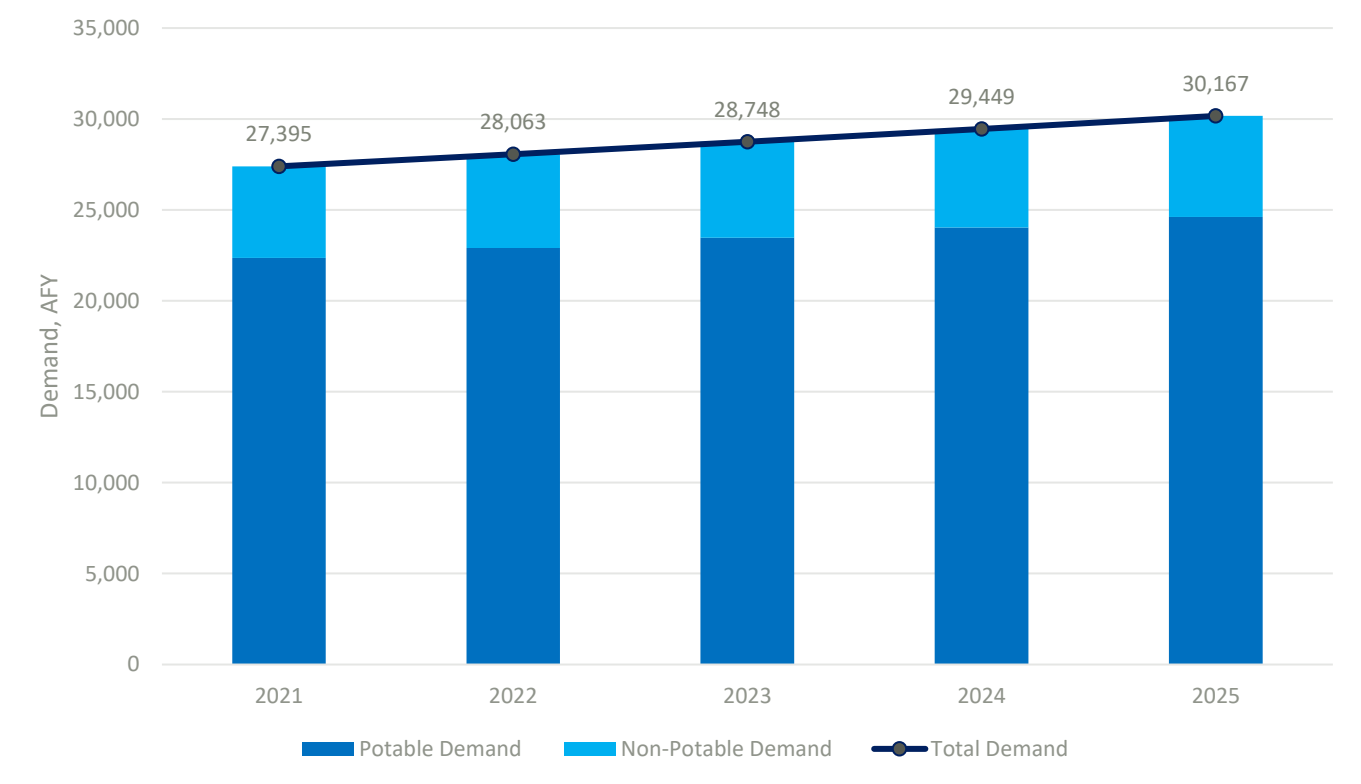
Estimating Future Water Savings

In 2018, the legislature enacted SB 606 and AB 1668, which provide for implementation of a water budget-based approach to establishing new urban water use objectives for water suppliers. The series of water use efficiency standards that will inform calculation of Western's new water use objective are still under development and will take effect in 2023. Once the new standards have been established, Western will reevaluate customer demands and identify approaches to comply with the new standard, which will be incorporated into the next UWMP prepared in 2025. Western is committed to promoting water use efficiency and will continue to implement a comprehensive set of programs intended to reduce customer demands and support sustainable use of regional water supplies.



10.2.5 Characteristic Five-Year Water Use

In addition to past and projected uses, the UWMP more closely analyzes anticipated conditions for the next five years (2021 – 2025). Demands for the next five years are provided in **Table 10-6** and **Figure 10-7**. The demand projections established in this chapter assume typical, unconstrained demand, free from other influential factors like conservation savings. Based on the projections established above, Western anticipates that retail demands may increase by approximately 12% from actual 2020 use to projected use in 2025. Projected use in 2025 was determined using growth rates developed as part of master planning efforts. Details on an analysis for the next five years is discussed in **Chapter 13**.

Table 10-6. Projected Retail System Demand for the Next Five Years (2021-2025), AFY

	2021	2022	2023	2024	2025
Potable	22,364	22,906	23,461	24,030	24,612
Non-Potable	5,032	5,158	5,287	5,419	5,555
TOTAL DEMAND	**27,395**	**28,063**	**28,748**	**29,449**	**30,167**

Figure 10-7. Projected Retail Demand for the Next Five Years (2021-2025), AFY

10.3 Water Use for Lower Income Households

California Water Code 10631.1 requires that water use projections of an UWMP include the projected water use for low-income households as identified in the housing element of any city, county, or city and county in the service area of the supplier. Western retail areas fall within the city of Riverside, unincorporated Riverside County, and the city of Murrieta. Mapping showed that none of the low-income areas of the city of Riverside falls within Western's retail service areas.

The County of Riverside's 2014 Housing Element of its General Plan estimates that approximately 37.9 percent of all households in the western portion of Riverside County are "very low" or "low" income. The city of Murrieta's 2013 Housing Element of its General Plan estimates that 25 percent of all households in the city are "extremely low", "very low", or "low-income".

The GIS analysis completed as preparation for Western's 2015 UWMP showed that the portion of low-income households within Western's retail service areas are lower than county- or city-wide (RMC for Western Municipal Water District, June 2016). There are no low-income communities identified in the Rainbow Service Area, and small populations in both the Murrieta and Riverside Service Areas. The GIS analysis found that only 18 percent of the Riverside Service Area, and only 12 percent of the Murrieta Service Area qualifies as DAC using 2010-2014 American Community Survey (ACS) data.

The low-income household demands were calculated using Western's projections for single-family and multi-family water use and the percentage of the total retail service area that met the criteria for DACs based on the 2010-2015 ACS data, as shown in **Table 10-7**.

Table 10-7. Low Income Demands, AFY

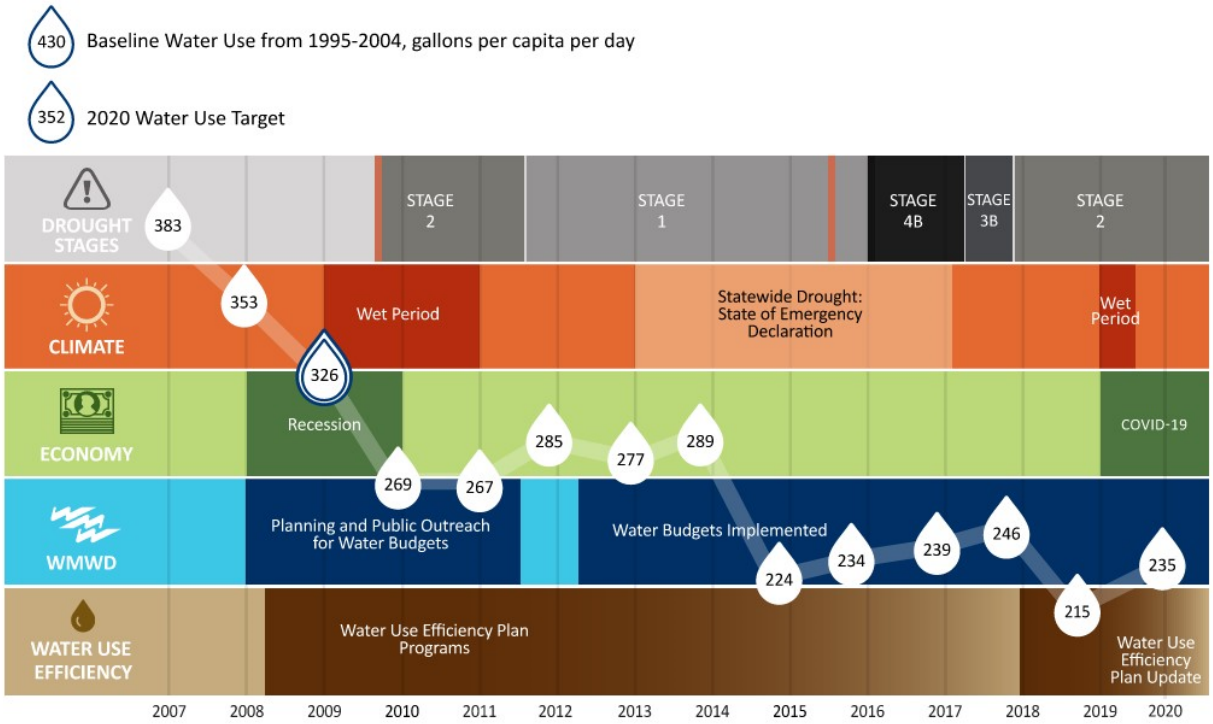
	2025	2030	2035	2040	2045
Low Income Demand, AFY	3,068	3,091	3,117	3,145	3,170

10.4 SBX7-7 Baseline and Targets

Senate Bill x 7-7 (SB7) was incorporated into the Urban Water Management Planning Act (UWMP Act) in 2009 and requires that all water suppliers increase water use efficiency with the overall goal to decrease per-capita water consumption within the state by 20 percent by the year 2020. SB7 required the California Department of Water Resources (DWR) to develop certain criteria, methods, and standard reporting forms through a public process that could be used by water suppliers to establish their baseline water use and determine their water conservation targets. SB7 and the Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use (SB7 Guidebook) (California Department of Water Resources, February 2016) specify methodologies for determining the baseline water demand, 2015 interim urban water use target and the 2020 urban water use target for Western. Western utilized a 10-year baseline period from 1995 to 2004 and a five-year baseline period from 2003 to 2007 to determine the 2020 water use target. Western's baseline and 2020 target was calculated in the 2015 UWMP and has not changed for this plan. More details on the development of the baselines and target can be found in the 2015 UWMP and **Appendix N**. Western's final 2020 target water use was calculated as 352 GPCD.

Table 10-8. SBX7-7 Baseline and Targets Summary

BASELINE PERIOD	START YEAR	END YEAR	AVERAGE BASELINE GPCD*	CONFIRMED 2020 TARGET *
10-15 Year	1995	2004	430	352
5 Year	2003	2007	370	352



*All values are in Gallons per Capita per Day (GPCD)

10.4.1 2020 Compliance Daily Per-Capita Water Use (GPCD)

The calculated gpcd for 2020 is 235 gpcd, which meets Western's target of 352 gpcd by 2020. This is based on 2020 total potable and non-potable retail water use of 24,986 AFY and a 2020 population estimate of 94,898 based on DWR's Population Tool.

By 2009, Western Retail had met its target to reduce per capita water consumption by 20% by 2020 and went on to achieve a reduction of more than 45% by 2020.

Activities that have affected retail water usage in Western Municipal Water District.

11 Retail Water Service Reliability and Drought Risk Assessment

WESTERN MUNICIPAL WATER DISTRICT

This chapter describes the reliability of Western's retail water supplies, which reflects Western's ability to meet the water needs of its retail customers with water supplies under varying conditions. The essential findings are that Western can reliably meet its retail demands with existing and future supply sources based on demand and supply projections.

Similar to **Chapter 6**, which focused on Western wholesale, this chapter describes the expected Western retail water supply reliability for normal, single dry year, and multiple-dry years through 2045 followed by a drought risk assessment for 2021 to 2025.

Western's work to expand and further diversify its retail supply portfolio is an important step toward improving the reliability of retail supplies. Western has also prepared a comprehensive Water Shortage Contingency Plan to provide reliability in the event of a water shortage, presented in **Appendix A**.

IN THIS SECTION

- Supply Constraints
- Water Service Reliability Assessment
- Drought Risk Assessment

11.1 Constraints on Water Sources

As described in **Chapter 10**, Western has various water supply sources available (groundwater, imported water, and recycled water) to meet retail demands during normal, single-dry, and multiple-dry years. These supply sources may be impacted by climatic and hydrologic conditions, water quality, and legal restrictions, as well as potential for interruption of supply driven by catastrophic events.

11.1.1 Imported Water Supply Reliability

Western retail obtains imported water supplies from Western wholesale. Imported water supply constraints are discussed in **Chapter 6,** Wholesale Water Service Reliability and Drought Risk Assessment.

11.1.2 Groundwater Supply Reliability

Western retail obtains groundwater supplies from several local groundwater basins. Each of the groundwater sources are adjudicated and closely managed by Watermasters and/or Groundwater Sustainability Agencies. Western plays a key role in the management of the groundwater basins it relies on to meet retail demands and participates in ongoing water conservation measures and regional recharge projects to enhance and protect the reliability of local groundwater.

Potential constraints to groundwater supply reliability include:

Drought

The effects of a local drought are not immediately recognized since the local groundwater basins have substantial storage capacity to support continued use during dry periods. However, groundwater supply availability does become threatened when long term recharge and inflow decreases.

Overdraft

Under extended supply pressures, groundwater basins can enter overdraft conditions, which can have a series of consequences including subsidence. Overdraft can also exacerbate or create water quality issues by reducing the assimilative capacity of the basin or requiring wells to tap into lower quality water that may be present in other parts of the basin.

Climate Change

Climate change could increase the potential for overdraft by increasing demand, reducing other sources of supply, and reducing natural recharge and inflows from surface water and precipitation.

Regional Growth

Population growth could increase demands on groundwater supplies, potentially creating risk of overdraft. Regional growth could also increase the amount of contaminants entering groundwater basins, either as a result of increased urban runoff or industrial or other activities. Growth can also impact recharge areas by expanding impervious surfaces into areas that would otherwise represent entry points for surface water recharging local aquifers.

Water Quality

Some water quality issues are naturally occurring, while others are a result of human actions. Decreased quality of groundwater poses threats to supplies that can be mitigated but require additional costs to treat. Based on current conditions, water quality is not expected to affect Western retail's supply reliability.

Due to the availability of groundwater storage and the sustainable management of local groundwater sources, Western's groundwater supplies are generally considered reliable, even in the face of the constraints identified here.

11.1.3 Recycled Water Supply Reliability

Western's recycled water supply is not expected to be affected by climatic factors because source wastewater flows coming from indoor use are generally not impacted by temperature and precipitation. Recycled water supplies will increase with growth; however, reduced urban water use standards currently under development could result in reduced recycled water supplies.

11.2 Water Service Reliability Assessment

This section presents Western's expected retail water supply reliability for a normal year, single dry year, and five consecutive dry years, including projections for 2025, 2030, 2035, 2040, and 2045.

11.2.1 Year Type Characterization

The water service reliability and Drought Risk Assessment analyze supply over several water years: normal, single dry, and multiple dry years. Local groundwater and recycled water supplies are not expected to change under the various year types, so Western has elected to use the same years identified by Metropolitan for normal, single-dry, and multiple-dry years for both imported and local supplies in this retail supply reliability analysis. DWR defines these years as:

Normal Year

This represents the water supplies a supplier considers available during normal conditions. This could be a single year or averaged range of years that most closely represents the average water supply available. Metropolitan uses an average from 1922 to 2017 to establish normal year supply availability.

Single Dry Year

The single dry year is recommended to be the year that represents the lowest water supply available. Metropolitan has identified 1977 as the single driest year.

Five-consecutive Dry Year

This represents the driest five-year historical sequence for the Supplier, which may be the lowest average water supply available for five years in a row. Metropolitan has identified 1988 through 1992 as the greatest 5-year drought period.

Due to Western's aggressive and highly successful conservation program, demands are assumed to be nominal in single and multiple dry years. As discussed in **Chapter 10**, Western retail can purchase additional imported water from Western wholesale if needed.

Table 11-1. DWR 7-1R Basis of Water Year Data (Reliability Assessment)

		AVAILABLE SUPPLY IF YEAR TYPE REPEATS
YEAR TYPE	BASE[1] YEAR	PERCENT OF AVERAGE SUPPLY
Average Year	1922-2017	
Single-Dry Year	1977	100%
Consecutive Dry Years 1st Year	1988	100%
Consecutive Dry Years 2nd Year	1989	100%
Consecutive Dry Years 3rd Year	1990	100%
Consecutive Dry Years 4th Year	1991	100%
Consecutive Dry Years 5th Year	1992	100%

[1]Applies to both imported and local supplies

11.2.2 Water Service Reliability

Normal supply and demand projections were developed in **Chapter 9** and **Chapter 10** and form the basis of this reliability analysis.

As described in this UWMP, Western prioritizes the use of local supply sources and uses imported water to meet the remaining retail water demands that are not met by local supplies. Retail potable demands exceed local supplies so imported water is used to meet the balance of retail demands. Western retail also does not currently use water from the Chino Desalter, as that water is currently leased to Jurupa Community Services District and is therefore shown as retail surplus within this chapter. It is anticipated that Western retail's shares of the Chino Desalter will continue to be leased to Jurupa Community Services District over the planning period.

For the retail non-potable system, Western's local non-potable supplies are projected to exceed the projected non-potable demand in 2030 through 2040. In 2025 and 2045, non-potable demands are projected to exceed local non-potable supplies so imported water will be used the meet the difference. Western retail may theoretically obtain water from WRCWRA; however, no existing infrastructure exists to convey recycled water from WRCWRA to retail service areas and WRCWRA supply is included in the surplus non-potable supply amounts. In the future, Western anticipates leasing WRCWRA recycled water to other interested agencies.

Local groundwater and recycled water supplies are not expected to be reduced in dry years. As discussed in **Chapter 4**, Metropolitan's 2020 UWMP projects the ability to meet projected imported water demands under normal, single dry year, and multiple dry year conditions and Western wholesale projects a surplus of imported water supplies that are available to Western retail if needed. **Table 11-2**, **Table 11-3** and **Table 11-4** demonstrate that Western anticipates adequate supplies for years 2025 to 2045 to meet retail demand under normal, single dry and multiple-dry year conditions.

Water Service Reliability – Normal Year

11.2.3 Description of Management Tools and Options

Western has made significant investments in local supply sources to reduce reliance on imported water, improve reliability and reduce costs associated with imported water. Western will remain committed to increasing retail water reliability through investments in local supplies and implementation of a comprehensive conservation program.

11.3 Drought Risk Assessment

The retail Drought Risk Assessment (DRA) focuses on a drought scenario that could potentially occur within the next five years (2021-2025).

11.3.1 Data, Methods, and Basis for Water Shortage Condition

The data, methods, and basis for a water shortage condition were identified using typical normal year supply and demand, as developed in **Chapter 9** and **Chapter 10**. To estimate demands for 2021 through 2025, a straight-line interpolation was applied from the 2020 demand to the 2025 projected demand. The demands for the DRA's five-consecutive dry years were based on the normal demand and assume that demands will not increase in dry years due to Western's aggressive and highly successful conservation program.

The DRA provides a snapshot of the anticipated surplus or deficit if a drought were to occur in the next five years.

11.3.2 DRA Water Source Reliability

As mentioned in this chapter, local resources are not expected to reduce in dry years and will continue to meet the majority of Western's retail demand. Imported water will be used to meet the balance of demands. As described in **Chapter 6**, Metropolitan anticipates a potential shortage in 2021 and 2023 and will implement response actions, including drawing water from storage, to meet anticipated demands. With a potential surplus estimated for years 2022, 2024, and 2025, no water service reliability concern is anticipated, and no shortfall mitigation measures are expected to be exercised by Metropolitan. Based on the results of Metropolitan's DRA, this DRA assumes that Western retail will be able to purchase sufficient supplies to meet retail demands in excess of local supplies. Western does not anticipate the need to implement shortage response actions in its retail WSCP in the next five years, unless Metropolitan implements a WSAP, which is not expected based on Metropolitan's DRA analysis.

Table 11-5. Retail DRA Results, AFY

	2021	2022	2023	2024	2025
POTABLE

DIFFERENCE	**2,220**	**2,220**	**2,220**	**2,220**	**2,220**

12 WESTERN MUNICIPAL WATER DISTRICT Retail Demand Management Measures

This chapter describes Western's implementation of retail demand management measures (DMMs) intended to promote water-use efficiency and partner with local communities to support sustainable use of regional water supplies.

Western has actively implemented a conservation program since 2009 and is a regional leader for advancing water efficiency. Western actively collaborates with local and regional agencies and the communities it serves to implement innovative programs and drive change. Western staff also serves in a leadership role for the California Water Efficiency Partnership (CalWEP) whose mission is to maximize urban water efficiency and conservation throughout California by supporting and integrating innovative technologies and practices; encouraging effective public policies; advancing research, training, and public education; and building collaborative approaches and partnerships. Western leverages these partnerships, tools, and resources within its service area.

In order to meet the future demand for water in Western's service area, implementation of new supply projects must be coupled with an expectation of greater water use efficiency by all retail customers. Water use efficiency has become a core business component in Western's customer partnership, with the understanding that water efficiency enables continued economic development and maintenance of the local living environment.

IN THIS SECTION

- Water Waste Prevention Ordinance
- Public Education and Outreach
- Rebates
- Implementation over the Last Five Years

In response to growing concerns regarding the reliability of imported water supplies and the need for increased water-use efficiency, Western first developed and implemented a Water Use Efficiency Master Plan (WUEMP) in 2008 and revised it in 2018. The 2018 WUEMP is included in **Appendix O**. The plan outlines potential programs, partnerships, and messaging research to raise customer awareness about water-use efficiency. It assists customers within Western's retail service area in becoming water efficient and embeds water-use efficiency into Western's policies and customer behavior.

The majority of Western's urban water use is for landscape and outdoor irrigation; therefore, Western has focused its water conservation activities on this sector for the largest and most cost-effective savings.

Western implements a comprehensive set of retail DMMs intended to reduce customer demands and help Western maintain supply reliability. The DMMs also help Western achieve its water use efficiency targets. Details on Western's retail DMMs are provided in the following sections. DMMs implemented for Western's wholesale system is described in **Chapter 7**.

2020 Landscape Contest Winner

12.1 Water Waste Prevention Ordinances

In February 2015, Western's Board of Director's adopted Ordinance No. 384, which updated the Water Supply Shortage Contingency Program. The update established permanent water use prohibitions to be in effect at all times under Stage 1 – Water Supply Watch, unless otherwise declared by the Board. Under a Stage 1 condition, customers are encouraged to use water efficiently and all uses of water must be reasonable and beneficial. It also prohibits waste, unreasonable use, unreasonable method of use, or unreasonable method of diversion of water. These prohibitions remain in effect under all levels of water shortage contingency declaration in addition to the specific requirements of each level. Each level of the Water Supply Shortage Contingency Program increases in stringency, providing for increasing water conservation during time of water supply shortage. Western's Water Shortage Contingency Plan includes a detailed description of all water waste prohibitions established in Ordinance No. 384. The WSCP is attached as **Appendix A** and summarized in **Chapter 13**.

12.1.1 Metering

All of Western's connections are metered and billed monthly with a water budget rate structure. Western adopted a water budget rate structure in 2011. Water budgets are designed for each customer and include an indoor daily gallons per capita component, as well as an outdoor volume based on landscaped area and parameters established in the State Landscape Model Ordinance.

Western also has a meter testing and replacement policy consisting of the following three parts:

Western uses the customer billing system to track all installed meters by size, type, date installed, customer account type, and warranty information.

Western has a yearly testing program of all meters for the wholesale division and all large meters over 3-inch. These meters are tested annually, and all necessary repairs are performed to maintain AWWA accuracy, based on meter calibration results.

Western periodically samples its residential meter stock to ensure accuracy. As a result of the most recent sampling, it was determined that meters over 15 years old should be replaced. Starting in 2020, Western replaced over half of its residential meters with AMI enabled meters and will have replaced nearly all residential meters by the end of 2021. Western has also implemented a project to install a Meter Data Management System to aid in meter data analysis and a customer portal to help customers track their use.

12.1.2 Conservation Pricing

Western charges water budget rates for all its connections. When customers regularly remain under their water budget, they are billed at the lowest rates available. Customers who use water in excess of their water budgets are billed at higher rate tiers. Western works closely with customers who exceed their water budgets to reduce their water use and associated costs.

12.2 Public Education and Outreach

Western implements a comprehensive Public Education and Outreach program within its retail service area.

12.2.1 Public Outreach

Western's Strategic Communications department provides informational materials to customers through its website, media events, landscape conservation campaigns, and other educational programs. Western also communicates with its customers through newspaper articles, paid advertising, bill inserts, its website (**http://www.wmwd.com/**) and public service announcements. Conservation messages are also included on customer water bills.

As part of the Water-Use Efficiency Master Plan, Western has developed several high-quality outreach pieces to help customers. The first is the SoCal Yard Transformation book, a comprehensive guide to everything you need to know to replace your lawn with drought-tolerant plants. As a companion piece, Western developed the Landscape Style Guide, a coffee table book of designs to help customers choose the style of their yard. Western also developed a Customer Welcome Packet that goes out to all new or move-in customers. The packet welcomes customers to Western and provides everything they need to know about their rates, bills, and water sources.

12.2.2 School Education Programs

Western implements school education programs for its retail area in conjunction with its wholesale area programs, as described in **Chapter 7**. Programs include presentations, field trips and assemblies for grades K-12. Any materials distributed comply with state standards. The materials distributed to students in grades K-6 include a water cycle bracelet, an earth ball, water story rock, and assembly-related material. Students in grades 7-12 receive scout badges, sponsorships, and assembly program-related material. Within Western's retail service are 14 public schools which are eligible to participate in the education programs offered. Western partners with the Discovery Science Center (**http://www.discoverycube.org/**) for its Water Education Assembly Programs for fourth and fifth graders. Western also funds water-related class field trips (virtual and in person) to the Chino Wetlands and the Santa Ana River.

12.3 Programs to Assess and Manage Distribution System Real Losses

Western repairs all reported leaks and breaks to the extent cost effective. In FY 2010, Western started calibrating all large commercial customers with meters 3" and above. In FY 2014, Western started a formal system audit, leak detection and repair program within its retail service area.

Western has completed annual water loss audits since 2015, in accordance with the AWWA guidelines. A copy of past water audits is provided in **Appendix P**.

Western's Finance department carefully tracks water losses each year. This data is used in the annual water loss audits and is also used to determine whether additional water loss interventions are warranted and whether a component analysis is needed.

12.4 Water Conservation Program Coordinating and Staffing

Western has maintained a full-time water conservation coordinator position since 1990. The water conservation coordinator implements retail area programs.

12.5 Other Demand Management Measures – Rebate Programs

Western offers various programs to its residential customers to help them reduce and manage their water use. Western offers rebates to its residential customers through Metropolitan's SoCal WaterSmart program. Additional information on the residential rebates provided by the SoCal WaterSmart Program can be found at **https://socalwatersmart.com/en/residential/** or through Western's website at **https://www.wmwd.com/411/Rebates**. Western also publishes an Annual Rebate Report for each fiscal year that summarizes the number of rebates and cost to implement as well as the expected annual and lifetime savings resulting from each rebate.

Landscape Evaluations (Norris Evaluations)

Shortly following the adoption of the District's WUEMP in 2008, Western began offering retail water customers a free landscape evaluation through a contract with Tim Norris Consulting. Mr. Norris, who holds a degree in irrigation science from Cal Poly Pomona, is highly knowledgeable in the science of proper irrigation system design and very adept at the art of communicating with customers at a level that is easily understood.

The evaluation program has become the foundation of Western's programmatic offering and serves to funnel water users to the other opportunities for increased water use efficiency, such as turf replacement or the regional rebate programs administered by Metropolitan.

The evaluation program has become an extension of both the customer service and the efficiency teams. Customers concerned with a high-water bill or simply seeking to ensure they remain within their water budget can request a free evaluation by contacting Customer Service. Staff provide customer contact information and historic water use data to Norris Consulting. The contractor then schedules an appointment at a time when the customer can be present at their home. During the scheduled appointment, the contractor reviews the irrigation system looking for errors in irrigation scheduling and watering issues. The most common issues observed and reported to customers have been incorrect irrigation scheduling and irrigation problems such as a damaged sprinkler heads and broken irrigation lines. Recommendations provided in the written report for these issues include adjusting the irrigation schedule according to season or current weather conditions and performing

monthly system checks to minimize the time an issue remains uncorrected. The public relations value of this program is immeasurable.

Norris evaluations comprise of two components: Irrigated landscape area measurement and an irrigation and landscape audit. Under the irrigated landscape area measurement, the consultant, Norris, confirms meter number on meter lid and GPS meter location, uses a measure wheel to measure irrigated landscape, photographs the site and visually estimates percent of turf, trees, shrubs, and hardscape, obtains customer related information like persons per household (PPH) and slopes, and provides the customer a Water Budget adjustment form, if applicable.

The irrigation and landscape audit is a more detailed evaluation based on procedures published using the Irrigation Training and Research Center and the Irrigation Association. Norris confirms meter number on meter lid and GPS meter location, documents controller type, station, and schedule, and turns on valves from controllers, identify and document system issues: leaks, broken, misaligned, mismatched heads, pressure problems, spray deflection, sunken heads, plugged equipment, dry spots, wrong sized heads or emitters. In addition, Norris takes photos, identify microclimate, plant material, soil type, and slopes. Norris logs the irrigated areas, measures the square footage by vegetation type, estimates distribution uniformity, and measures pressure at head using a pitot tube. The end result is a generated seasonal irrigation schedule and a list of system issues.

For July 1, 2019 – December 31, 2019, 12 customers participated in a landscape evaluation, with an estimated cost to WMWD of $1,575 and estimated average acre-feet (AF) of water saved over a 5-year lifetime of 4 AF. Due to COVID-19, January 1, 2020 – June 30, 2020 had less participation in physical evaluations. Virtual audits were offered, but the water savings attributed to a virtual audit is unknown and has been excluded from this analysis. Participation numbers for January 1, 2020 – June 30, 2020 were not available at the time of this report.

Toilets (HET)

A premium high-efficiency toilet is a toilet that uses less water than what used to be considered a water-saving toilet. These toilets flush at a rate of 1.1 gallons per flush (gpf) or less. Eligible toilets must replace existing toilets using 1.6 gallons per flush or more. Premium high-efficiency toilets use almost 20% less water than the WaterSense standard and flush the same amount of waste just as, if not more effectively.

Water savings from high-efficiency toilets can save over $800 on a customer's water bill over the lifetime of the product. When combined with SoCal Water$mart rebates, premium high-efficiency toilet upgrades can pay for themselves. The qualifying premium high-efficiency models available for a rebate have been performance tested and certified through MaP testing, an independent testing program.

For FY 2019 – 2020, 4 high efficiency toilet rebates were paid, with an estimated cost of $360 and estimated average acre-feet (AF) of water saved over a 10-year lifetime of 5 AF. Two of the high efficiency toilet rebates were obtained by customers in the Murrieta Service Area.

High Efficiency Clothes Washer (HECW)

As a Metropolitan Water District of Southern California's Member Agency, customers in Western Municipal Water District (WMWD) service area can receive high-efficiency clothes washer rebate for their residential homes. Rebates are limited to a single rebate per installation address.

SoCal Water$mart manages the rebate program, and they state that a high-efficiency clothes washer uses 55% less water than standard clothes washers, reducing water use by over 11,000 gallons a year. Other benefits are that these washers last longer and are energy efficient.

For FY 2019 – 2020, 88 high efficiency clothes washer rebates were paid, with an estimated cost to Metropolitan of $7,480 and estimated average acre-feet (AF) of water saved over a 10-year lifetime of 73 AF. 18 of the high efficiency clothes washer rebates were obtained by customers in the Murrieta Service Area.

Weather Based Irrigation Controllers (WBIC)

Weather-based irrigation controllers (WBICs), also known as "smart sprinkler controllers," allow for more accurate, customized irrigation by automatically adjusting a customer's landscape irrigation schedule and water use in response to changing conditions. State-of-the-art WBIC technology allows customers to tailor their irrigation schedule to meet a landscape's specific design, soil conditions and plant types, while also responding to local changing weather conditions.

For FY 2019 – 2020, 117 weather-based controller rebates were paid, with an estimated cost to MWD of $11,062 and estimated average acre-feet (AF) of water saved over a 10-year lifetime of 77 AF. Twenty-six of the weather-based controller rebates were obtained by customers in the Murrieta Service Area.

Turf Replacement

Starting in 2009, Western Municipal Water District offered its retail customers an opportunity to participate in a Turf Replacement Program. The Turf Replacement Program was designed to help customers offset the costs associated with converting turfgrass to a climate appropriate landscape.

The program took part in three phases, where from 2009 to 2014, the rebate offered ranged from $0.40-$1.00/square foot (sqft), and from 2014 to 2015, the rebate offered was $2.00/sqft. The rebate amount available in 2019 was $3.00/sqft.

To have qualified for the program, customers needed to be the property owner and in good standing with Western for at least twelve (12) months. Landscape that qualified for the conversion needed to have living turfgrass lawn before the removal.

To receive their incentive payment, all sites needed to be inspected and approved prior to the landscape conversion and after the conversion was complete. The program also did not apply retroactively.

The program provided guidelines for what would count as a climate appropriate landscape. At a minimum, thirty-five percent (35%-50%) of the site must be landscaped and/or mulched with at least a two (2) inch layer of organic or inorganic mulch. The remaining portion must be covered with permeable materials.

Participants were also provided with a list of pre-approved climate appropriate plants. Participants were required to convert irrigation systems to drip, microspray, and/or bubblers.

In addition, the rebate could only be used for documented material costs, such as those expenses for the purchase of plant materials, mulch, and irrigation components which are documented with detailed store receipts. All other expenses such as design services, labor, transportation, etc. were ineligible.

The Turf Replacement Program currently is offered at $2/sqft from MET and an additional $1/sqft from Western for FY 2019 – 2020. 30 turf rebates were paid out, $46,559 from Western and $93,946 from MET for a total of $140,505. Approximately 46,973 square feet of turf was removed.

12.5.1 Past Rebate Programs

Large Landscape Program

The Large Landscape Program, a direct installation program, was designed to utilize a Western contractor for direct installation of smart controllers and high efficiency nozzles at residential sites with irrigated landscapes greater than 1 acre.

This component was designed to target Western's highest residential water use customers through use of GIS mapping to identify parcels. Program staff was to compare parcel size with usage information to pinpoint the sites with the highest potential for savings.

The contractor was responsible for marketing the program to targeted customers, auditing the irrigated landscape, and installing the product. A follow-up site visit by the contractor or Western was to be conducted. The purpose of the site visit was to verify the installation, therefore ensuring that water savings are maximized, and customer issues reduced.

Smart Yard

In 2010, Western began implementing Smart Yard™, a community water conservation program designed to achieve more sustainable water use throughout Western's retail customer base.

Western's overall goals of the program was to reduce the water consumption of the Smart Yard™ participants and overall save more than one billion gallons of water over a 10-year period. To accomplish this, Western partnered with HydroPoint Data Systems, Inc., provider of the WeatherTRAK® Smart Water Management solution, to manage the innovative water conservation program.

The program provided homeowners with a landscape water audit and installation of a customized WeatherTRAK smart controller. Research in 23 agency studies found that this controller was proven to conserve water. Western rebated 50 percent of product and installation costs, ranging from $599 to $1,139 per home, depending on the smart controller model required for the landscape. Participating homeowners had to pay the balance with zero-interest financing from Western, which placed a fixed fee starting at $9.99 on their monthly water bills for 5 years. Western's Smart Yard program was designed to save customers significantly more money in water costs than they pay in the monthly fee.

The primary targets were residential homeowners with between 0.25 and 0.99 acre lots, high water use accounts, both commercial and residential, within the direct retail service area.

12.5.2 Commercial, Industrial, and Institutional Programs

Western offers a variety of programs to its Commercial, Industrial, and Institutional customers to help manage and reduce their demands. Many of these programs overlap with residential programs or provide the same or similar services.

Commercial, industrial, and institutional rebate programs include:

- Premium high-efficiency toilets
- Ultra-low and zero water urinals
- Plumbing flow control valves
- Weather-based irrigation controllers (WBICs)
- Rotating nozzles for pop-up spray heads
- Large rotary nozzles
- In-stem flow regulators
- Soil moisture sensor systems
- Turf replacement

12.5.3 Regional Programs

In addition to the programs offered specifically to individual customers, Western supports several regional programs.

Master Gardeners of Riverside County

Master Gardener volunteers are trained by the University of California Cooperative Extension to provide the gardeners of Riverside County with research-based information to promote environmentally responsible and sustainable horticultural practices. The Master Gardeners hold free monthly workshops fall through spring at Western.

Green Plumbers

Green Plumbers is an innovative, national training and accreditation program that assists plumbers in understanding their role in the environment and public health. The organization's goal is to train and deploy a green army of thousands of plumbers to promote the benefits of water conservation and the reduction of GHG emissions. The focus is on changing consumer and plumbing behavior through the use of energy efficient and water saving technologies.

Qualified Water Efficient Landscaper Program - QWEL

The Qualified Water Efficient Landscaper Program (QWEL) trains landscapers in water-wise landscape practices. QWEL provides approximately 20 hours of education focused on water efficient principles including irrigation system and landscape design with proper plat selection for the region's climate. Details are available at **https://www.qwel.net/**.

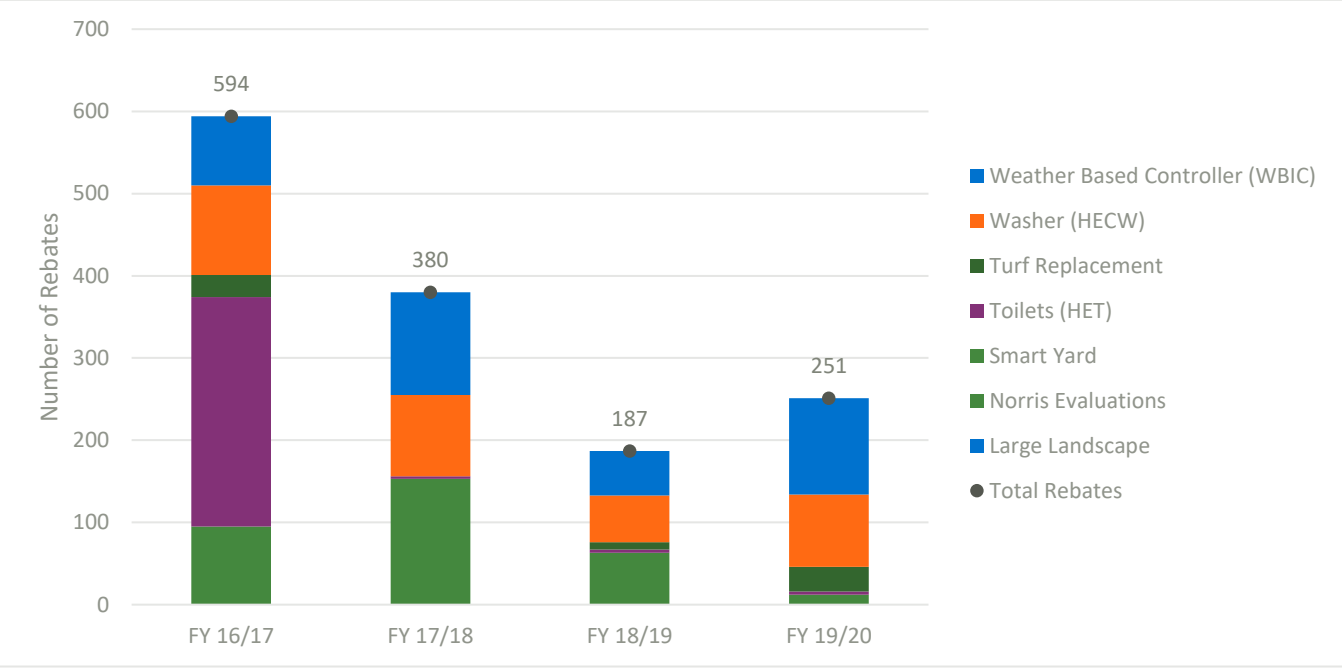
12.5.4 Large Landscape Conservation Programs and Incentives

In the fall of 2011, Western adopted a budget-based water rate structure which includes a component for outdoor water use based on landscaped area and parameters established in the State Landscape Model Ordinance.

In 2009, Western, in partnership with the Riverside County Water Task Force, developed the Riverside County Landscape Water Use Efficiency Ordinance. As of January 2010, this ordinance had been adopted by the County of Riverside and the Cities of Corona, Canyon Lake, Lake Elsinore, Menifee, Moreno Valley, Murrieta, Perris, Riverside, and Temecula. This ordinance was updated in 2015 and Western will continue to encourage its adoption. The ordinance:

- Establishes a structure for planning, designing, installing, maintaining, and managing water-efficient landscapes in new construction and rehabilitated projects;
- Requires that landscapes not exceed a maximum water demand of fifty percent of its reference evapotranspiration (ETo) or any lower percentage as may be required by water purveyor policy or state legislation;
- Requires setting a Maximum Applied Water Allowance for new construction and existing landscapes, based on reference evapotranspiration.
- The water-efficient landscape requirements contained in this Ordinance shall be applicable to all rehabilitated landscapes associated with residential uses (including single family and multi-family units/projects) with a total landscape area equal to or greater than 2,500 square feet which require a discretionary permit and/or approval; all new landscapes associated with residential uses (including single family and multi-family projects) which require a discretionary permit and/or approval; and all new and rehabilitated landscapes associated with commercial or industrial uses which require a discretionary permit and/or approval.

Dedicated irrigation meters have had water budgets since October 2011 and have been charged using an allocation-based water pricing structure since implementation. Western continues to:



- Target non-dedicated irrigation meter accounts;
- Establish water budgets for those accounts with dedicated irrigation meters;
- Establish an allocation-based conservation water pricing structure.

12.6 Implementation over the Past Five Years

To date, there have been over 7,363 rebates paid to Western's retail customers and over $3.4 million invested in rebates.

In FY 2019/2020, Western achieved water savings of approximately 33 AFY from rebate programs. Western estimates that this equates to a lifetime savings of 249 AF, bringing the cumulative lifetime water savings total to 9,091 AF for all water efficiency rebate activities Western has implemented since 2009 (Western Municipal Water District, 2020). The number of rebate programs utilized in the past five years is summarized in **Figure 12-1**.

Figure 12-1. Past Rebate Information

12.7 Implementation to Achieve Water Use Targets

For decades, Western has valued and promoted conservation and will continue to do so. As a result, Western's customers continue to decrease their water use. Western will continue to pave the way for regional conservation and continue to implement existing conservation programs and explore additional programs to avoid substantial increases in demands.

12.8 Water Use Objectives (Future Requirements)

Western will continue to help its customers become water efficient and reduce their gallons per capita per day (gpcd) consumption. Western will evaluate additional measures if needed once future water use efficiency standards are established.

13 WESTERN MUNICIPAL WATER DISTRICT Retail Water Shortage Contingency Plan

The WSCP is a strategic plan that Western uses to prepare for and respond to foreseeable and unforeseeable water shortages. This chapter provides an overview of the portions of Western's Water Shortage Contingency Plan that are applicable to Western Retail. The standalone Water Shortage Contingency Plan is included in Appendix A.

The California Water Code Section 10632 requires that every urban water supplier that serves more than 3,000 acre-feet per year or has more than 3,000 connections to prepare and adopt a standalone Water Shortage Contingency Plan (WSCP) as part of its UWMP. Western Wholesale and Western Retail are subject to the WSCP requirements and a single WSCP has been developed to meet the requirements for both systems.

IN THIS SECTION

- WSCP Outline
- Retail WSCP Requirements Overview

This chapter provides an overview of the portions of the WSCP that are applicable to Western Retail. Chapter 10 provides an overview of the portions of the WSCP that are applicable to Western Wholesale. Western's WSCP is included as **Appendix A** and will be separately submitted to DWR by July 1, 2021. The WSCP is developed separately from Western's 2020 UWMP and can be amended, as needed, without amending the UWMP.

The WSCP is a strategic plan that Western uses to prepare for and respond to foreseeable and unforeseeable water shortages. A water shortage occurs when water supply available is insufficient to meet the normally expected customer water use at a given point in time. A shortage may occur due to a number of reasons, such as water supply quality changes, climate change, drought, regional power outage, and catastrophic events (e.g., earthquake). Additionally, the State may declare a statewide drought emergency and mandate that water suppliers reduce demands, as occurred in 2014. The WSCP serves as the operating manual that Western will use to prevent catastrophic service disruptions through proactive, rather than reactive, mitigation of water shortages.

The Western WSCP provides a process for an annual water supply and demand assessment for the retail system and structured steps designed to respond to actual conditions. This level of detailed planning and preparation provide accountability and predictability and will help Western maintain reliable supplies and reduce the impacts of any supply shortages and/or interruptions.

The WSCP must be updated based on new requirements every five years and will be adopted as a current update for submission to the California Department of Water Resources by July 1, 2021.

13.1 Water Shortage Contingency Plan Outline

Western's WSCP is organized into six sections:

Section 1 - Overview of the WCSP

Section 2 - Western Wholesale Water Shortage Contingency Plan

Section 3 - Western Retail Water Shortage Contingency Plan

Section 4 - Emergency Response, Seismic Risk Assessment and Mitigation

Section 5 - WSCP Refinement Procedures

Section 6 - Plan Adoption, Submittal and Availability

All sections are applicable to Western Retail except Section 2, which is applicable to Western Wholesale only.

13.2 Overview of the Retail Requirements of the WSCP

The Water Code establishes several prescriptive elements which must be included in a retail water supplier's WSCP. Each element and its location within the WSCP is described below.

Water Supply Reliability Analysis: Summarizes Western Retail's water supply reliability and identifies any key issues that may trigger a shortage condition. This requirement is addressed in Section 3 of the WSCP.

Annual Water Supply and Demand Assessment Procedures: Describes the key data inputs, evaluation criteria, and methodology for assessing the Western Retail system's reliability for the coming year and the steps to formally declare any water shortage levels and response actions. This requirement is addressed in Section 3 of the WSCP.

Shortage Stages: Establishes water shortage levels to clearly identify and prepare for shortages. This requirement is addressed in Section 3 of the WSCP.

Shortage Response Actions: Describes the response actions that may be implemented or considered for each stage to reduce gaps between supply and demand. This requirement is addressed in Section 3 of the WSCP.

Communication Protocols: Describes communication protocols under each stage to ensure customers, the public, and government agencies are informed of shortage conditions and requirements. This requirement is addressed in Section 3 of the WSCP.

Compliance and Enforcement: Defines compliance and enforcement actions available to administer demand reductions. This requirement is addressed in Section 3 of the WSCP.

Legal Authority: Lists the legal documents that grant Western the authority to declare a water shortage and implement and enforce response actions. This requirement is addressed in Section 3 of the WSCP.

Financial Consequences of WSCP Implementation: Describes the anticipated financial impact of implementing water shortage stages and identifies mitigation strategies to offset financial burdens. This requirement is addressed in Section 3 of the WSCP.

Monitoring and Reporting: Summarizes the monitoring and reporting techniques to evaluate the effectiveness of shortage response actions and overall WSCP implementation. Results are used to determine if additional shortage response actions should be activated or if efforts are successful and response actions should be reduced. This requirement is addressed in Section 3 of the WSCP.

WSCP Refinement Procedures: Describes the factors that may trigger updates to the WSCP and outlines how to complete an update. This requirement is addressed in Section 5 of the WSCP.

Plan Adoption, Submittal, and Availability: Describes the process for the WSCP adoption, submittal, and availability after each revision. This requirement is addressed in Section 6 of the WSCP.

WESTERN MUNICIPAL WATER DISTRICT

Water Shortage Contingency Plan

The Water Shortage Contingency Plan (WSCP) is a strategic plan that Western Municipal Water District (Western) uses to prepare for and respond to foreseeable and unforeseeable water shortages. A water shortage occurs when water supply available is insufficient to meet the normally expected customer water use at a given point in time. A shortage may occur due to a number of reasons, such as water supply quality changes, climate change, drought, regional power outage, and catastrophic events (e.g., earthquake).

Additionally, the State may declare a statewide drought emergency and mandate that water suppliers reduce demands, as occurred in 2014. The WSCP serves as the operating manual that Western will use to prevent catastrophic service disruptions through proactive, rather than reactive, mitigation of water shortages. The Western WSCP provides a process for an annual water supply and demand assessment and structured steps designed to respond to actual conditions. This level of detailed planning and preparation provide accountability and predictability and will help Western maintain reliable supplies and reduce the impacts of any supply shortages and/or interruptions.

This WSCP was prepared in conjunction with Western's 2020 Urban Water Management Plan (UWMP) and is a standalone document that can be modified as needed. This document is compliant with the California Water Code (CWC) Section 10632 and incorporates guidance from the State of California Department of Water Resources (DWR) UWMP Guidebook 2020 (California Department of Water Resources, 2021). This WSCP is required to be updated based on new requirements every five years and will be adopted as a current update for submission to the California Department of Water Resources by July 1, 2021.

IN THIS SECTION

- Overview of the WSCP
- Western Wholesale WSCP
- Western Retail WSCP

1.1 Overview of the WSCP

Western serves water to both wholesale and retail customers and this WSCP addresses Western's response to shortages in both its wholesale and retail systems, in separate sections. Some elements of the WSCP do not apply to the wholesale system and are noted below.

The WSCP describes the following:

Water Supply Reliability Analysis

Summarizes Western's water supply analysis and reliability and identifies any key issues that may trigger a shortage condition.

Annual Water Supply and Demand Assessment Procedures

Describes the key data inputs, evaluation criteria, and methodology for assessing the system's reliability for the coming year and the steps to formally declare any water shortage levels and response actions.

Shortage Stages

Establishes water shortage levels to clearly identify and prepare for shortages.

Shortage Response Actions

Describes the response actions that may be implemented or considered for each stage to reduce gaps between supply and demand.

Communication Protocols

Describes communication protocols under each stage to ensure customers, the public, and government agencies are informed of shortage conditions and requirements.

Compliance and Enforcement

Defines compliance and enforcement actions available to administer demand reductions.

Legal Authority

Lists the legal documents that grant Western the authority to declare a water shortage and implement and enforce response actions.

Financial Consequences of WSCP Implementation

Describes the anticipated financial impact of implementing water shortage stages and identifies mitigation strategies to offset financial burdens.

Monitoring and Reporting

Summarizes the monitoring and reporting techniques to evaluate the effectiveness of shortage response actions and overall WSCP implementation. Results are used to determine if additional shortage response actions should be activated or if efforts are successful and response actions should be reduced.

WSCP Refinement Procedures

Describes the factors that may trigger updates to the WSCP and outlines how to complete an update.

Special Water Features Distinctions

Identifies exemptions for decorative features aside from pools and spas.

Plan Adoption, Submittal, and Availability

Describes the process for the WSCP adoption, submittal, and availability after each revision.

1.2 Western Wholesale Water Shortage Contingency Plan

This section of the WSCP describes how Western will respond to a wholesale water shortage.

As a member agency of Metropolitan Water District (Metropolitan), Western provides wholesale imported water to various retail agencies in the region. Western has also secured local groundwater supplies to supplement imported supplies, which provides additional reliability and flexibility in the event of a water shortage.

Not all retail agencies within Western's service area purchase wholesale water from Western; as such, the Wholesale WSCP only applies to Western's wholesale customers, which currently include:

- Box Springs Mutual Water Company
- City of Corona
- City of Norco
- Eagle Valley Mutual Water Company
- Elsinore Valley Municipal Water District
- Temescal Valley Water District
- Rancho California Water District
- Western Retail

Additional information on Western's wholesale customers can be found in Western's 2020 UWMP.

1.2.1 Background

Metropolitan Reliability Planning and Water Supply Allocation Plan

The majority of Western's wholesale supplies are imported via Metropolitan and are subject to availability of Metropolitan supplies. Metropolitan, in coordination with its member agencies, has conducted extensive reliability planning, including the 1996 Integrated Water Resources Plan (IRP) and its three updates in 2004, 2010, and 2015; the 2020 IRP currently in development; the Water Surplus and Drought Management (WSDM) Plan; and the Water Supply Allocation Plan (WSAP).

- The IRP is Metropolitan's evolving long-term plan to secure adequate water supplies for Southern California.
- The WSDM Plan provides policy guidance for managing regional water supplies during surplus and shortage conditions. Similar in concept to the WSCP, the WSDM Plan provides an overall vision for operational supply management and characterizes a flexible sequence of actions to minimize the probability of severe shortages and reduce the likelihood of extreme shortages.
- The WSAP is Metropolitan's policy and formula for equitably allocating available water supplies to member agencies during extreme water shortages when Metropolitan determines it is unable to meet all its demands. Metropolitan's WSAP identifies 10 levels of shortage designed to reduce demands by up to 50%. The WSAP does not prescribe demand reduction or limit the available supply but incentivizes reductions through higher fees for use over the allocation amount.

Additional reliability planning efforts by Metropolitan include its Emergency Storage Objective and its Seismic Risk Assessment and Mitigation Plan. More information on all planning efforts listed above can be found in Metropolitan's' 2020 UWMP and WSCP.

Metropolitan's WSCP acknowledges that WSAP allocation is a costly shortage response action that places acute burdens upon member agencies and the public. Other shortage response actions are generally preferred to the extent practicable. Metropolitan's overall strategy considers WSAP allocations to be a fallback option to address any remaining shortages when supply augmentation actions and other demand management measures are insufficient to meet demand reduction objectives. Metropolitan's WSAP in included as Attachment 1.

Western has aligned its water shortage policies with Metropolitan's with respect to imported water supplies.

Western Drought Allocation Plan

Western has adopted a Drought Allocation Plan (DAP) that passes through Metropolitan's WSAP actions for imported water shortages to Western wholesale customers. The DAP was prepared by Western in conjunction with its retail agencies and mirrors the 10 stages of Metropolitan's WSAP. The DAP establishes a means to allocate limited imported water supplies among Western's imported water agencies if Metropolitan implements various stages of its WSAP. Initially developed in 2008, the DAP was updated in 2015 to reflect changes from Metropolitan and the potential impacts of future droughts. The allocation methodology in the DAP was updated for consistency with Metropolitan's WSAP and agreed upon by Western's wholesale customers. A copy of Western's DAP is included as Attachment 1.

The DAP establishes water allocations based on several variables including base period demand, conservation, growth, regional shortage, availability of local supplies, retail water agency dependence on imported supplies, and conservation demand hardening. The allocation method was designed to be equitable on the wholesale level, while helping to minimize hardships experienced by retail agencies and the customers they serve throughout the region.

As with Metropolitan's WSAP, the DAP does not prescribe how Western's wholesale customers reduce demands during shortage, rather the DAP incentivizes conservation through fees for excessive use. Metropolitan charges penalties for use above an allocation established by implementing one of the 10 stages of its WSAP. At the end of the 12-month allocation year, any allocation surcharges or penalties incurred through excessive use of Metropolitan supplies will be passed along to Western's wholesale customers, prorated to reflect each agency's contribution towards penalty and fee accrual.

Metropolitan's WSAP was incorporated into its WSCP but was not modified as part of Metropolitan's WSCP development. Similarly, Western's DAP is incorporated into this Wholesale WSCP, but has not been changed since it was last updated and adopted in 2015. A copy of Metropolitan's WSAP is included as Attachment 2.

1.2.2 Wholesale Water Supply Reliability Analysis

Understanding water supply reliability, factors that could contribute to water supply constraints, availability of alternative supplies, and what effect these have on meeting customer demands provides Western with a solid basis on which to develop appropriate and feasible response actions in the event of a water shortage. In the 2020 UWMP, Western conducted a Water Reliability Assessment to compare the total water supply sources available to long-term projected water use over the next 25 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. Western also conducted a Drought Risk Assessment to evaluate a drought period that lasts five consecutive water years starting from the year following when the assessment is conducted.

The primary constraint on the available of water supplies has been in extreme drought conditions. As described in Metropolitan's 2020 UWMP, Metropolitan has made substantial investments to increase imported water supply reliability during periods of extended drought. As a result, Metropolitan's 2020 UWMP projects the ability to meet all imported water demands under normal, single dry year, and multiple dry year conditions, with excess supplies.

Through implementation of the Arlington GSP, Western expects its local wholesales supply from the Riverside-Arlington groundwater basin water to be stable and does not anticipate any reduction to supplies in dry years.

An analysis of both assessments determined that Western is reliable and anticipates that sufficient local and imported supplies will be available to meet demands, even in dry years, based on Metropolitan's 2020 UWMP.

1.2.3 Wholesale Annual Water Supply and Demand Assessment

As an urban water supplier, Western must prepare and submit an Annual Water Supply and Demand Assessment for its wholesale system (Wholesale Annual Assessment). The Wholesale Annual Assessment is an evaluation of the near-term outlook for supplies and demands to determine whether the potential for a supply shortage exists and whether there is a need to trigger a WSCP shortage stage and response actions in the current calendar year to maintain supply reliability. This process will take place at the same time each year based on known circumstances and information available to Western at the time of analysis and can be updated or revised at any time if circumstances change. Starting in 2022, the Wholesale Annual Assessment will be due by July 1 of every year, as indicated by CWC Section 10632.1.

As a member agency of Metropolitan, Western's protocols for evaluating water supply and demands and implementing shortage restrictions are integrated with Metropolitan's.

Western will establish and convene a WSCP Team to conduct the Wholesale Annual Assessment each year. The WSCP Team may include the following Western staff:

- Director of Water Resources
- Deputy Director of Water Resources
- Director of Finance
- Director of Strategic Communications
- Water Resources Specialist
- Operations Manager

Western's Wholesale Annual Assessment procedure, including key data inputs, evaluation criteria and responsible staff is summarized in Table 1.

Table 1. Wholesale Annual Assessment Timeline

TIMING	ASSESSMENT ACTIVITIES	PROCEDURE, KEY DATA INPUTS, EVALUATION CRITERIA AND OTHER CONSIDERATIONS	WESTERN STAFF RESPONSIBLE
MARCH	Estimate unconstrained demands for coming year	Each year in July, Metropolitan requests "Member Agency Demand Estimate Surveys" from each of their member agencies as part of their annual budgeting process. Western wholesale customers submit a 5-year demand estimate, subtotaled by imported water source (potable or non-potable) and by delivery point (for the following 12-months only). Western will use the estimates provided the previous July. For other Western wholesale supplies, Western coordinates with wholesale customers each year at budget time (March) to establish demands for the following year.	Water Resources Specialist Director of Water Resources
MARCH	Estimate available supplies for the year, considering the following year will be dry	Western anticipates that sufficient imported supplies will be available to meet demands, even in dry years, based on Metropolitan's 2020 UWMP. If Metropolitan has declared a WSAP stage (typically done in spring of a given year if needed), water use above the WSAP allocation will be charged a penalty rate. The Arlington Basin Groundwater Sustainability Plan (GSP) framework will be used to estimate available supplies from the Arlington Desalter.	Director of Water Resources
MARCH	Consider potential infrastructure constraints that may impact supply delivery	Identify any known Metropolitan or Western infrastructure issues that may pertain to near-term water supply reliability, including repairs, construction, and environmental mitigation measures that may temporarily constrain capabilities, as well as any new projects that may add to system capacity. Identify any facilities out of service due to water quality problems, equipment failure, etc. that may impact normal water deliveries.	Operations Manager
APRIL	Convene WSCP Team to conduct Wholesale Annual Assessment	Compare supplies and demands and discuss any infrastructure constraints that may impact supply delivery. If the potential for a shortage exists or if Metropolitan has enacted a WSAP stage, determine which Western shortage response stage and actions are recommended to reduce/eliminate the shortage or to pass through the Metropolitan WSAP.	WSCP Team

TIMING	ASSESSMENT ACTIVITIES	PROCEDURE, KEY DATA INPUTS, EVALUATION CRITERIA AND OTHER CONSIDERATIONS	WESTERN STAFF RESPONSIBLE
MAY	Engineering, Operations and Water Resources (EOWR) Committee Update	If a shortage stage and response actions are recommended by the WSCP Team, or if Metropolitan has enacted a WSAP stage, provide an update to the EOWR Committee with the findings of the Wholesale Annual Assessment and planned actions. Western's DAP gives the General Manager the authority to implement the DAP in response to Metropolitan implementing its WSAP without further Board action.	Director of Water Resources
JUNE	Western Board of Directors Update	If a shortage stage and response actions are recommended by the WSCP Team, or if Metropolitan has enacted a WSAP stage, provide an update to the Board of Directors with the findings of the Wholesale Annual Assessment and planned actions. Western's DAP gives the General Manager the authority to implement the DAP in response to Metropolitan implementing its WSAP without further Board action.	Director of Water Resources
ON-GOING	Implement WSCP actions, if needed	Relevant members of Western staff will implement shortage response actions if needed.	WSCP Team
PRIOR TO JULY 1	Submit Wholesale Annual Assessment	Send Final Wholesale Annual Assessment to DWR.	Water Resources Specialist

1.2.4 Wholesale Water Shortage Levels and Response Actions

With the exception of a catastrophic failure of the Mills Gravity Line or other infrastructure failure of similar magnitude, Western does not foresee implementing water shortage levels except under Metropolitan's direction and according to Metropolitan's WSAP. If a potential water supply shortage is identified in the Wholesale Annual Assessment, this section provides information on the wholesale water shortage levels and response actions that Western may implement. It is important to note that Western's system is complex and the ultimate actions taken by Western will depend on the unique issues of each particular condition and the opportunities available during a particular shortage condition.

Western has aligned its Wholesale WSCP shortage levels with the six standard water shortage levels outlined in the Water Code. Shortage levels indicate the gap in supply compared to normal year availability. The six standard water shortage levels correspond to progressively increasing estimated shortage conditions (up to 10-, 20-, 30-, 40-, 50-percent, and greater than 50-percent shortage compared to the normal reliability condition) and align with the response actions that Western would implement to meet the severity of the impending shortages.

Western will evaluate the water shortage conditions on a case-by-case basis and determine which response actions are appropriate to maintain water supply reliability or mitigate potential impacts. In collaboration with its wholesale customers, Western's response to potential shortages may include increased public outreach throughout the region, exploration of additional supply sources, changes to typical operations, and promoting voluntary actions to reduce demands. If Metropolitan implements its WSAP, Western will implement its DAP to align with Metropolitan. Western's six water Shortage Levels and corresponding response actions that could be implemented by Western are summarized in Table 2. The following subsections describe Western's potential response actions in more detail.

Western may also implement additional actions not listed in Table 2. Western may implement a combination of the actions specified below, as appropriate, but not necessarily all six actions for each level. Selected actions will depend on the nature of water shortage conditions at a given time.

Table 2. Wholesale Water Shortage Levels and Potential Response Actions

WHOLESALE WATER SHORTAGE LEVELS[1]	ONGOING WATER USE EFFICIENCY	PUBLIC OUTREACH	SUPPLY AUGMENTATION	OPERATIONAL CHANGES	VOLUNTARY DEMAND REDUCTIONS	IMPLEMENT DROUGHT ALLOCATION PLAN[2]
Normal Conditions	✓	✓				
Level 1 (Up to 10%)	✓	✓	✓	✓	✓	✓
Level 2 (Up to 20%)	✓	✓	✓	✓	✓	✓
Level 3 (Up to 30%)	✓	✓	✓	✓	✓	✓
Level 4 (Up to 40%)	✓	✓	✓	✓	✓	✓
Level 5 (Up to 50%)	✓	✓	✓	✓	✓	✓
Level 6 (Above 50%)	✓	✓	✓	✓	✓	✓

[1]Percentages represent supply shortage compared to normal conditions.

[2]Western DAP is only triggered in response to Metropolitan WSAP allocations

Ongoing Water Use Efficiency

Western has been a leader in water use efficiency for many years and actively collaborates with local and regional agencies and the communities it serves to implement innovative programs and drive change. As described in Western's 2020 UWMP, Western implements a variety of wholesale demand management measures (DMMs) on a routine basis intended to promote water use efficiency and partner with its wholesale customers to support sustainable management of regional water supplies.

Communication Plan

During a water shortage condition, including short term supply constraints caused by infrastructure impacts, Western collaborates with its wholesale customers to provide enhanced and coordinated public outreach to communicate current conditions, potential impacts to water service and actions that are being taken by Western and its wholesale customers, and actions the public is being asked to take to help reduce water use during the shortage.

Supply Augmentation

In the event of a shortage in normally available supplies, Western may be able to augment supplies through other local groundwater sources and storage programs, if available at the time of the shortage. Such augmentation actions would be short-term and do not overlap with the normal supplies.

Operational Changes

During shortage conditions, operations may be affected by supply augmentation or demand reduction responses. Western will consider its operational procedures at the time of a shortage to identify changes that can be implemented to address water shortage on a short-term basis. In addition, Western and its neighboring agencies have mutual aid agreements and assist each other, if possible, in emergency situations.

Voluntary Demand Reductions

If Metropolitan implements a WSAP allocation, Western will implement its DAP to align. The WSAP and DAP does not require Western's wholesale customers reduce demands during shortage, rather they incentivize demand reduction through fees for excessive use. Metropolitan charges penalties for use above an allocation established by implementing one of the 10 stages of its WSAP and Western passes any penalties charged through to the respective wholesale customers that contributed to accruing the penalties. Demand reductions are voluntary and supplies beyond the allocation can still be purchased at higher penalty rates.

Additional Mandatory Restrictions

Western does not impose mandatory restrictions on its wholesale customers.

Shortage Response Action Effectiveness

Western is committed to working with its wholesale customers to mitigate the impacts of potential supply shortages. Western expects to address any supply shortages through a combination of public outreach, supply augmentation, operational changes, voluntary demand reductions, and implementation of the DAP. The range of potential supply shortage reductions that could be achieved from each response action is summarized in Table 3.

Table 3. Potential Supply Shortage Reduction for Response Actions

RESPONSE ACTION	POTENTIAL SUPPLY SHORTAGE REDUCTION	DESCRIPTION
Ongoing Water Use Efficiency	N/A	Western supports the water use efficiency programs of its wholesale customers but does not directly track resulting water savings from wholesale customers.
Public Outreach	Supports effectiveness of other actions	Anticipated shortages will involve an appropriately sized outreach campaign to address the targeted demand reduction, which depends on the combined effectiveness of other shortage response actions.
Supply Augmentation	0-100%	Supply augmentation actions consisting of stored water and as-needed flexible supplies are expected to address between 0 to 100 percent of anticipated shortages for any shortage level, depending on availability of those supplies; in lesser WSCP shortage levels, it is more likely that shortages can be completely addressed through supply augmentation.
Voluntary Demand Reductions	0-100 %	Efficacy of demand reduction efforts is difficult to estimate or predict and water savings are a function of the extent to which public information campaigns reach water users and the degree of consumer response to those messages, as well as the response of Western wholesale customers and their ability to utilize other supplies.
Implement Drought Allocation Plan	0-50%	Metropolitan's WSAP is designed to reduce demands by up to approximately 50 percent of the WSAP's calculated base demand.

1.2.5 Communication Protocols

Western routinely communicates with local water agencies through quarterly general manager meetings. General managers of all the local water agencies meet and discuss regional and agency specific issues, which may include impacts or changes to wholesale supplies and demands.

In the event of water supply shortage, Western will use this forum for ongoing communication about supply shortages and response actions. The region's general managers can also utilize these meetings to help coordinate consistent regional messaging in times of drought.

1.2.6 Legal Authorities

Western obtains legal authority to implement its DAP though Ordinance 385, which was approved and adopted on May 20, 2015, by Western's Board after a public hearing. A copy of Ordinance 385 is included as Attachment 3.

Western shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency, as defined in Section 8558 of the Government Code.

1.2.7 Financial Consequences of WSCP

As mentioned above, in times of extreme shortage, Metropolitan may elect to implement its WSAP and Western will implement its DAP in response. The WSAP reduces allocations to Metropolitan's member agencies, including Western. If Western's wholesale agencies consume more water than their allocation, Metropolitan charges Western penalties based on the percentage of use over the allocation amount. Western will pass along any penalties or surcharges incurred to Western's wholesale customers, prorated to reflect each agency's contribution towards penalty and fee accrual.

In the event of a wholesale water shortage, Western anticipates that revenues will decrease as wholesale customers shift to using other supplies, whether in response to short term outages or the WSAP/DAP penalty pricing, if implemented.

1.3 Western Retail Water Shortage Contingency Plan

Western Retail refers to customers that directly purchase and use water from Western, such as single-family residences or commercial businesses. Western provides water to nearly 25,000 connections within the retail service area, including the Riverside Retail Service Area, Murrieta Retail Service Area, and Rainbow Retail Service Area. These three service areas are collectively referred to as Western Retail and cover a total of 104 square miles and serve water to an estimated population of nearly 100,000.

The Riverside Service Area includes a portion of the City of Riverside and unincorporated areas of Riverside County, including the communities of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Matthews and March Air Reserve Base. In 2005, Western took ownership of the Murrieta County Water District as a separate retail service area, now called the Murrieta Service Area. The entire area lies within the city of Murrieta. Western also serves a very small area, called the Rainbow Service Area, in an area just south of the City of Temecula in the unincorporated portion of Riverside County.

Western Retail currently obtains approximately 60% of its supply from Metropolitan and 40% of its supply from local groundwater sources. Note that Western treats its retail system as a wholesale customer as it relates to imported water supplies and demands.

1.3.1 Retail Water Supply Reliability Analysis

Understanding water supply reliability, factors that could contribute to water supply constraints, availability of alternative supply sources, and the effect these have on Western's ability to meet customer demands provide Western with a solid understanding used to develop appropriate and feasible response actions in the event of a water shortage. In the 2020 UWMP, Western conducted a Water Reliability Assessment to compare the total water supply sources available to long-term projected water use over the next 25 years, in five-year increments, for a normal water year, a single dry water year, and a drought lasting five consecutive water years. Western also conducted a Drought Risk Assessment to evaluate a drought period that lasts five consecutive water years starting in 2021. An analysis of both assessments determined that Western is reliable and anticipates meeting retail demands through local and imported water sources.

As described in Section 1.2.2, Western Wholesale expects to have sufficient supplies available to meet the demands of Western Retail and its other wholesale customers, even in dry years, based on Metropolitan's 2020 UWMP.

Western Retail also obtains groundwater supplies from several local groundwater basins. Each of the groundwater sources are adjudicated and closely managed by Watermasters and/or Groundwater Sustainability Agencies. Western plays a key role in the management of the groundwater basins it relies on to meet retail demands and participates in ongoing water conservation measures and regional recharge projects to enhance and protect the reliability of local groundwater.

Western Retail's recycled water supply is not expected to be affected by climatic factors because source wastewater flows coming from indoor use are generally not impacted by temperature and precipitation

Western Retail is reliable and anticipates that sufficient local and imported supplies will be available to meet demands, even in dry years.

1.3.2 Retail Annual Water Supply and Demand Assessment

As an urban water supplier, Western must prepare and submit an Annual Water Supply and Demand Assessment for its retail system (Retail Annual Assessment). The Retail Annual Assessment is an evaluation of the near-term outlook for supplies and demands to determine whether the potential for a supply shortage exists and whether there is a need to trigger a WSCP shortage level and response actions in the current calendar year to maintain supply reliability. Starting in 2022, the Retail Annual Assessment will be due by July 1 of every year, as indicated by CWC Section 10632.1. Western's Retail Annual Assessment procedure, including key data inputs, evaluation criteria and responsible staff is summarized in Table 4.

Western will establish and convene a WSCP Team to conduct the Retail Annual Assessment each year. The WSCP Team may include the following Western staff:

- Director of Water Resources
- Deputy Director of Water Resources
- Director of Finance
- Director of Strategic Communications
- Water Resources Specialist
- Operations Manager

Table 4. Retail Annual Assessment Procedure

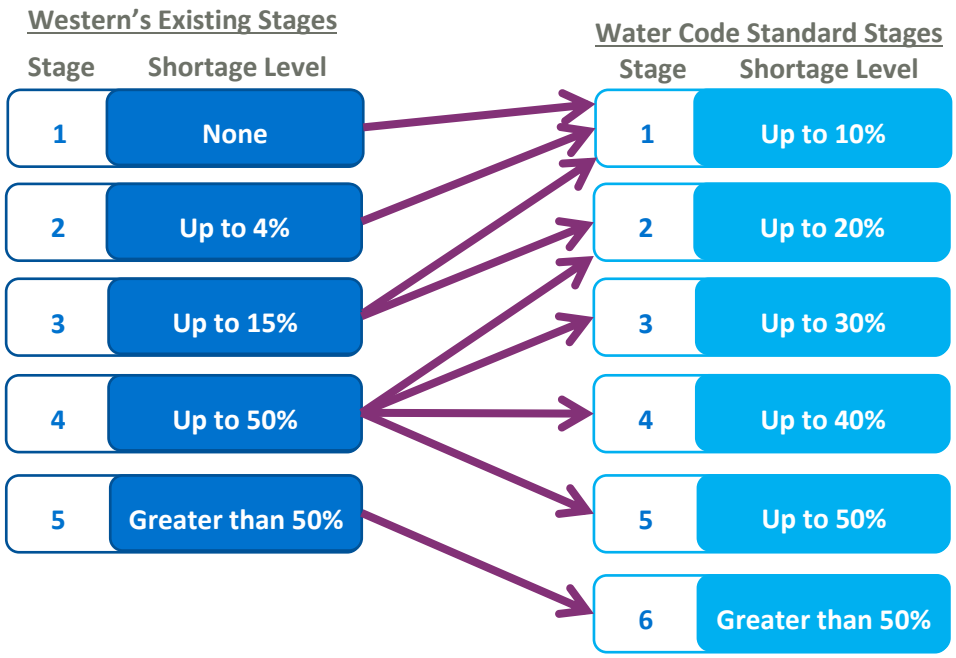
TIMING	ASSESSMENT ACTIVITIES	PROCEDURE, KEY DATA INPUTS, EVALUATION CRITERIA AND OTHER CONSIDERATIONS	WESTERN STAFF RESPONSIBLE
MARCH	Estimate unconstrained demands for coming year	Western has several potential approaches to estimate demand for the coming year, including a demand climate model that uses a time series regression analysis, estimates developed by the Finance Department based on historical use, and a California Data Collaborative (CaDC) tool. Western tracks demand estimates from multiple approaches compared to actual demand to refine its estimates over time.	Water Resources Specialist Finance Manager
MARCH	Estimate available supplies for the year, considering the following year will be dry	Western anticipates that sufficient imported supplies will be available to meet demands, even in dry years, based on Metropolitan's 2020 UWMP. If Metropolitan declares a WSAP stage (typically done in spring of a given year if needed), normal quantities of water will still be available, but will be charged at penalty rate above the allocation. Western's local supplies are from groundwater basins that are sustainably managed to provide long term supply reliability and are not anticipated to be impacted in dry years. In the unlikely event that local supplies are reduced, Western will coordinate with the groundwater management groups in the respective basins to identify any supply reductions. Western plays an active role in these groups to help ensure long term water supply reliability for Western Retail customers.	Director of Water Resources
MARCH	Consider potential infrastructure constraints that may impact supply delivery	Identify any known Metropolitan or Western infrastructure issues that may pertain to near-term water supply reliability, including repairs, construction, and environmental mitigation measures that may temporarily constrain capabilities, as well as any new projects that may add to system capacity. Identify any facilities out of service due to water quality problems, equipment failure, etc. that may impact normal water deliveries.	Operations Manager
APRIL	Convene WSCP Team to conduct Retail Annual Assessment	Compare supplies and demands and discuss any infrastructure constraints that may impact supply delivery. If the potential for a shortage exists or if Metropolitan has enacted a WSAP stage, determine which Western shortage response level and actions are recommended to reduce/eliminate the shortage or to reduce demands on Metropolitan. Additionally, if the State declares a drought state of emergency and requires demand reductions, the WSCP Team will determine which water shortage level and response actions are needed to comply with the State mandate.	WSCP Team
MAY	Engineering, Operations and Water Resources (EOWR) Committee	If the potential for a shortage exists, if Metropolitan has enacted a WSAP stage or if the State has mandated demand reductions, the results of the Retail Annual Assessment will be presented to EOWR Committee, including the recommended shortage level and response actions.	Director of Water Resources

TIMING	ASSESSMENT ACTIVITIES	PROCEDURE, KEY DATA INPUTS, EVALUATION CRITERIA AND OTHER CONSIDERATIONS	WESTERN STAFF RESPONSIBLE
JUNE	Western Board of Directors	If the potential for a shortage exists, if Metropolitan has enacted a WSAP stage or the State has mandated demand reductions, the results of the Retail Annual Assessment will be presented to the Western Board of Directors, including the recommended shortage level and response actions. The Board of Directors may order the implementation of a shortage level and will adopt a resolution declaring the applicable water shortage level.	Director of Water Resources Western Board of Directors
ON-GOING	Implement WSCP actions, if needed	Relevant members of Western staff will implement shortage response actions associated with the declared water shortage level.	WSCP Team
PRIOR TO JULY 1	Submit Retail Annual Assessment	Send Final Retail Annual Assessment to DWR.	Water Resources Specialist

1.3.3 Retail Water Shortage Levels

With the exception of a catastrophic failure of the Mills Gravity Line or other infrastructure failure of similar magnitude, Western does not foresee imposing a retail water shortage level except under the State's direction, as occurred in 2014. If a potential water supply shortage is identified in the Retail Annual Assessment, this section provides information on the retail water shortage levels and response actions that Western may implement.

Western Retail uses five (5) shortage stages to identify and respond to water shortage emergencies. At a minimum, Western encourages baseline conservation efforts year-round, regardless of a shortage emergency.



The Water Code outlines six standard water shortage levels that correspond to a gap in supply compared to normal year availability. The six standard water shortage levels correspond to progressively increasing estimated shortage conditions (up to 10-, 20-, 30-, 40-, 50-percent, and greater than 50-percent shortage compared to the normal reliability condition) and align with the response actions that a water supplier would implement to meet the severity of the impending shortages.

The Water Code allows suppliers with an existing Water Shortage Contingency Plan that uses different water shortage levels to comply with the six standard levels by developing and including a cross-reference relating its existing shortage categories to the six standard water shortage levels. Western Retail is maintaining the current five shortage stages for this WSCP, as shown in Table 5. A cross reference to the six standard stages is shown in Figure 1.

Table 5. Western Retail Water Shortage Contingency Plan Levels

SHORTAGE LEVEL	PERCENT SHORTAGE RANGE	WATER SHORTAGE CONDITION
1	At all times	Water Supply Watch
2	Up to 4%	Water Supply Alert
3	Up to 15%	Targeting Waste Reduction
4	Up to 50%	Targeting Outdoor Reductions
5	Greater than 50%	Mandatory Targeted Indoor/Outdoor Reductions – Catastrophic Failure or "Immediate Emergency"

Figure 1. Western's Shortage Stages in Relation to DWR's Six Standard Shortage Stages

1.3.4 Shortage Response Actions

Western expects to mitigate supply shortages through a variety of response actions including various supply sources, demand reduction actions, conservation, operational changes, outreach, and if necessary, mandatory prohibitions.

Supply Augmentation

Western currently maintains interconnections with the cities of Riverside and Corona, Eastern Municipal Water District and Elsinore Valley Municipal Water District. During water shortage emergencies, Western may be able to obtain supplemental water supply though these connections, if available.

Western Retail may also purchase additional imported or local groundwater supply from Western Wholesale.

Supply augmentation actions are summarized in Table 6.

Table 6. Supply Augmentation

SHORTAGE LEVEL	SUPPLY AUGMENTATION METHOD	HOW MUCH IS THIS GOING TO REDUCE THE SHORTAGE GAP?	ADDITIONAL EXPLANATION OR REFERENCE
All	Purchased or Imported Water	Up to 100%	Depends on supply availability from neighboring agencies or Western Wholesale

Demand Reduction

Western has identified a variety of demand reduction actions to offset supply shortages. These actions include, but are not limited to conservation and rebate programs, leak detection and repair, limitations on irrigation and other voluntary actions to reduce customer demand. Demand reduction actions are summarized in Table 7.

The Water Code Section 10623 (b) now requires that suppliers analyze and define water features that are artificially supplied with water, including ponds, lakes, waterfalls, and fountains, separately from swimming pools and spas, as defined in subdivision (a) of Section 115921 of the Health and Safety Code. Non-pool or non-spa water features may use or be able to use recycled water, whereas pools and spas must use potable water for health and safety considerations so limitations to pools and spas may require different considerations compared to non-pool or non-spa water features. Western's Ordinance 384 includes a demand reduction response action that applies to both water features and swimming pools, requiring them to be equipped with recirculating pumps. While this response action is appropriate for both water features and pools and spas, Western will consider these features separately when the WSCP Ordinance is updated.

Table 7. Demand Reduction Actions

SHORTAGE LEVEL	DEMAND REDUCTION ACTIONS	HOW MUCH IS THIS GOING TO REDUCE THE SHORTAGE GAP? (AFY)	ADDITIONAL EXPLANATION OR REFERENCE	PENALTY, CHARGE, OR OTHER ENFORCEMENT
All	Landscape - Other landscape restriction or prohibition	480	Adjust automatic irrigation timers for weather patterns and landscape requirements; Texas Living Waters (Texas Living Waters Project, 2018)	Yes
All	Other - Require automatic shut of hoses			Yes
All	Landscape - Limit landscape irrigation to specific times	4,800	Texas Living Waters (Texas Living Waters Project, 2018)	Yes
All	Other water feature or swimming pool restriction		Features and pools shall be equipped with re-circulating pumps.	Yes
All	Other - Customers must repair leaks, breaks, and malfunctions in a timely manner	6,000	EPA Cases in Water Conservation: How Efficiency Programs Help Water Utilities Save Water and Avoid Costs (United States Environmental Protection Agency, Office of Water, 2002)	Yes
All	Landscape - Restrict or prohibit runoff from landscape irrigation			Yes
3 and Up	Implement or Modify Drought Rate Structure or Surcharge		Eliminate Adjustments to outdoor water budgets; Eliminate Tier in rates	Yes
4 and Up	Other		No new potable service connections, temporary meters, or permanent meters	No
4 and Up	Landscape - Other landscape restriction or prohibition		No new landscapes unless irrigated with recycled water.	No
5 and Up	Landscape - Prohibit all landscape irrigation			Yes

Operational Changes

During shortage conditions, operations may be affected by supply augmentation or demand reduction responses. Western will consider its operational procedures at the time of a shortage to identify changes that can be implemented to address water shortage on a short-term basis.

Additional Mandatory Restrictions

Western has identified additional mandatory restrictions to implement in a water shortage emergency. Such restrictions will first be evaluated on the type of shortage condition and needs to close the gap between supply and demand needs.

Potential restrictions include, but are not limited to:

- Restricting watering to the hours of 8:00 pm to 8:00 am.
- No potable water for washing hard surfaces except to alleviate immediate fire or sanitation hazards, and then only by the use of certain water saving equipment.
- No runoff from irrigation or leaks.
- No installation of new landscapes unless irrigated with recycled water.
- No potable water for construction and dust control, except as necessary for public health, safety, and welfare.

Shortage Response Action Effectiveness

Western has estimated the effectiveness of shortage response actions when data pertaining to such actions is available. Estimates of the effectiveness for actions are included in Table 6 and Table 7. It is expected that response actions effectiveness is also a result of successful communication and outreach efforts, described below.

1.3.5 Communication Protocols

Western prioritizes effective communication, especially in times of a water shortage emergency. Western provides details on droughts, shortage stages and restrictions on its website at https://www.wmwd.com/391/Drought-Restrictions.

Western also has a Community Affairs Office that oversees public affairs, legislative programs, and initiatives. The Community Affairs Office also develops programs and information about Western's efficiency programs, water reliability initiatives, and other educational programs. Western staff members also engage with their customers through presentations to community service organizations and other groups.

The Community Affairs team created a strategic outreach plan that provides the framework for customer outreach as needed for Stage implementation for the Water Supply Shortage Contingency Plan.

It will be imperative to swiftly communicate with Western Retail customers as to what will be required and how to achieve the required water efficiency results. The following methods may be used to communicate information about stages to retail customers:

- **Bill message** – bill messages would be placed directly on customer bills and note key information about the specific Stage.
- **Bill insert** – inserts go out in Western's monthly water bills. Bill inserts would contain key information about the specific Stage.
- **Direct mail postcard** – postcards would feature specific information about the specific Stage and be mailed directly to customers.
- **Auto-call greeting/message** – telephonic, recorded message highlighting key information about the specific Stage would be sent to customers.
- **Website content** – website content containing key information about the specific Stage would be posted on Western's website.
- **Social media posts** – social media posts containing key information about the specific Stage would go on the District's Facebook and Twitter accounts; each Stage would utilize roughly 10 posts.
- **Fact sheet** – a fact sheet for each Stage with key information would be used within District offices, at community events, etc.
- **News release and/or advisory** – news release with key information and messages on each specific Stage would be provided to the media.

1.3.6 Compliance and Enforcement

Western always discourages excessive water consumption. Western may issue various penalties, charges, and other enforcement actions in response to violation of prohibitions in effect at a given time and/or stage. Western's tiered-rate structure promotes conservation and discourages excessive use during all stages and is modified as more severe stages are enacted to act as a penalty for exceeding the water restrictions set by a stage. Enforcement measures in the WSCP are organized as:

- Violations and remedies
- Notices
- Administrative compliance orders and fines and/or penalties
- Over-budget water use penalties
- Recovery of costs

Violations and Remedies

Violations of the WSCP may result in a variety of responses, including declaration of criminal violation, issuance of a cease-and-desist order, civil actions, or a combination of the three. Violations are considered on-going, as described below.

Criminal Violation

It is unlawful for any person to willfully violate the provisions of the WSCP. Any violation of the WSCP is a misdemeanor, unless made an infraction by the prosecutor, subject to imprisonment in the county jail for not more than 30 days or by fine not to exceed $1,000, or by both as provided in California Water Code section 377.

Civil Action

In addition to any other remedies provided in the WSCP, any violation of the WSCP may be enforced by civil action brought by Western and the imposition of administrative fines and/or penalties. In any such action, Western may seek, and the court may grant, as appropriate, any or all of the following remedies:

- a temporary and/or permanent injunction
- assessment of the violator for the costs of enforcement of the violation and for the reasonable costs of preparing and bringing legal action under the WSCP
- assessments under this subsection shall be paid to Western to be used exclusively for costs associated with implementing or enforcing the water supply shortage and regulatory provisions of the WSCP.

Cease-and-Desist Order

Western's General Manager may issue a cease-and-desist order directing the Property Owner, or occupant, or other Person in charge of day-to-day operations of any property, and/or any other Person responsible for a violation of the WSCP to immediately discontinue any prohibited use of water pursuant to Ordinance 384 and immediately cease any activity not in compliance with the terms, conditions, and requirements of this Ordinance 384.

Cumulative

All remedies provided in the WSCP shall be cumulative and not exclusive.

On-going

A Person shall be deemed guilty of a separate offense for every day or portion thereof during which any violation of any provision of the WSCP is committed, continued, or permitted.

Notices

If enforcement of the WSCP is required, Western will issue notices as appropriate. Any notice, notice of violation, cease-and-desist order, and administrative compliance order shall be served pursuant to the requirements of set in Ordinance 384. In addition to or in conjunction with the notice of violation, Western will provide notices as required for administrative compliance orders.

After one written notice of violation, Western may order a special meter reading or readings to ascertain whether wasteful or unreasonable use of water is occurring and may impose a meter reading fee for each meter reading it conducts.

Administrative Compliance Order and Fines and/or Penalties

Separate from, in addition to, or in combination with a notice of violation or cease and desist order, Western may issue an administrative compliance order against the Property Owner and/or occupant of the property where a violation of the WSCP occurred and/or any other Person responsible for a violation of the WSCP. Issuance of a notice of violation or a cease-and-desist order is not a prerequisite to the issuance of an administrative compliance order. The administrative compliance order shall allege the act(s) or failure(s) to act that constitute violations of the WSCP and shall set forth the penalty for the violation(s).

Western may impose administrative monetary fines and/or penalties, in addition to other appropriate action requirements and measures as described in the WSCP and summarized in Table 8.

Table 8. Administrative Compliance Actions

	METERS SMALLER THAN 2"		METERS 2" OR LARGER	
VIOLATION NUMBER	STAGES 1 & 2	STAGES 3, 4, & 5	STAGES 1 & 2	STAGES 3, 4, & 5
First	First written notice identifying violation, potential penalties, and compliance requirements		First written notice identifying violation, potential penalties, and compliance requirements	
Second[1]	Second written notice with copy of WSSCP, potential penalties, and compliance requirements		Second written notice with copy of WSSCP, potential penalties, and compliance requirements	
Third[1]	Fine of $100/day for each day of the violation	Fine of $200/day for each day of the violation	Fine of $100/day for each day of the violation	Fine of $300/day for each day of the violation
Fourth[1]	Fine of $200/day for each day of the violation	Fine of $400/day for each day of the violation	Fine of $300/day for each day of the violation	Fine of $600/day for each day of the violation
Fifth, and subsequent	Installation of flow-restricting device or termination of service; requires compliance and payment of fees prior to restoration of service		Installation of flow-restricting device or termination of service; requires compliance and payment of fees prior to restoration of service	

[1]Within the preceding 12 calendar months.

Over-Budget Water Use Penalties

Any funds collected by Western as penalties for use of water in excess of a property's allocated water budget during a declared water shortage will be deposited in designated special funding accounts, for uses summarized in Table 9.

Table 9. Allowable Uses of Collected Penalties

CONSERVATION PENALTY ACCOUNT	SUPPLY PENALTY ACCOUNT
• Water conservation programs • Outreach and education for water conservation, decreasing water waste, or water awareness. • Enforcement of the WSCP	• Additional water supplies • Operations and maintenance • Revenue shortfalls from operation and maintenance, budgeted and actual for Tiers 1 and 2 • Payments of allocation exceedance penalties to Metropolitan • Payment of other costs associated with water deliveries or service during water curtailment, shortage emergency, or immediate emergency

Recovery of Costs

Western will provide an invoice for costs to the Property Owner and/or occupant, or any other responsible party who is subject to an enforcement action. Additional fines, penalties, or fees, as determined by Western's Board, may also be applied. These charges may include costs for:

- Visits of an Enforcement Officer or other staff for time incurred for meter reading, follow-up visits, or the installation or removal of a flow- restricting device.
- Monitoring, inspection, and surveillance procedures pertaining to enforcement of the WSCP.
- Enforcing compliance with any term or provision of the WSCP.
- Re-initiating service at a property where service has been discontinued pursuant to the WSCP.
- Processing any fees necessary to carry out the provisions of the WSCP

1.3.7 Legal Authorities

Ordinance 384 was adopted and approved on February 18, 2015, by Western's Board of Directors. Ordinance 384 established Western's WSCP and declared that water resources shall be put to beneficial use to the fullest extent possible. Ordinance 384 provides Western with the authority to implement conservation programs and restrict water in emergencies or during droughts. Ordinance 384, included as Attachment 4, continues to serve as the legal foundation for Western's Retail WSCP.

Western shall coordinate with any city or county within which it provides water supply services for the possible proclamation of a local emergency, as defined in Section 8558 of the Government Code.

1.3.8 Financial Consequences of WSCP

Western anticipates that revenues will decrease as customers comply with the WSCP and any potential declared shortage stage. A three-point program (in order of preference) has been developed to meet the fiscal shortfall from reduced revenues:

- Reduce operation, maintenance, and administration expenses.
- Defer selected capital improvement projects that are non-critical.
- Utilize reserves where needed to offset impact of reduced revenues.

Since most of the rate charged for water delivered to customers is used to pay for the cost of supply (e.g., local supplies purchased from neighboring agencies or imported water purchased from Metropolitan), the net impact from reduced water sales is the loss of revenue contributed by the Operations & Maintenance (O&M) component in the water rate. The O&M component in the water rate is used to help pay for a portion of the cost to provide water service to customers (e.g., water quality testing, maintenance and repairs, meter reading, customer billing, etc.). Revenue from the O&M component can be considered the "net revenue" received from water sales.

In addition, the penalties for excess water use beyond a customer's water budget have encouraged conservation, thereby reducing net revenues from water sales. While penalties incurred for violation of the WSCP can be used to cover the O&M funding shortfall created by the reduced sales, penalties generally provide only a small amount of revenue. If the water shortage is deemed temporary, a rate increase may not be required. However, for long-term shortages, rate increases and/or drought surcharges applied to the water rate would be considered to make up for reduced net revenue. A consequence of increasing the commodity cost may be further conservation by customers. Fixed monthly service charges that are not commodity-based are not expected to significantly change due to a water shortage. These charges would continue to provide revenue to pay for O&M expenditures.

Water shortages may also impact construction activities, especially during Stage 4 and 5, when water use for construction is heavily restricted, and a moratorium is in place for new meters and approval of new service. A reduction in construction activities will reduce fees collected by Western from developers, such as capacity charges, as well as engineering related fees, such as plan check fees and annexation fees.

As consumption decreases and additional conservation programs and/or efforts are implemented, purchased water, and purchased power expenses will decrease. However, some expenditures are expected to increase. Staff costs and other costs for community education, enforcement of ordinances, monitoring and evaluation of water use, drought planning, and assisting with customer questions and complaints are expected to rise. If construction is drastically reduced, staff may not be required for certain functions, but it is expected that the increased workload to deal with water shortage issues will more than offset the reduced workload for construction support. Table 10 summarizes general estimates of potential impacts to revenues and expenditures related to water shortage.

Table 10. Revenue and Expenditure Impacts

REVENUE/EXPENDITURE IMPACT	ESTIMATED DEGREE OF IMPACT
Reduced Sales	Decrease in water sales could range from 10 to 30%.
Reduced Development	Reduction in fees collected during planning and construction activities.
Increased Staff Cost	Existing staff will be used where available, but additional temporary staff may be needed.
Increased O&M Cost	Other non-purchased water/power O&M costs could increase by 1 to 5%, including identifying and quickly repairing all system water leaks.
Increased Cost of Supply	Only if assessed penalties from Metropolitan for exceeding drought determined water allocation.

Western has developed reserve funds to sustain the revenue and expenditure impacts of a short- term water shortage. Reserve funds could be used for a 1- to 2-year period to cover the impact of reduced water sales. However, these reserves will need to be restored to minimum levels after the water shortage. If the water shortage is long-term, rate increases, and drought surcharges are expected to be considered to mitigate the financial impact. Long-term water shortages may also require reducing capital expenditures by delaying projects for major facilities construction, upgrade, or replacement, limiting new connections to decrease operational expenditures and to decrease the likelihood of exceeding imported water allocations, and evaluating methods to reduce administrative overhead. Summaries of measures to overcome revenue and expenditure impacts are provided in Table 11.

Table 11. Mitigation to Financial Impacts

BUDGET SOURCE	POTENTIAL MEASURES
Reserves	Use of reserves may provide short-term rate stabilization but will require delays in capital expenditures and require rebuilding reserves after the water shortage.
Decrease Capital Expenditures	Delay major construction projects for facilities as well as upgrades and replacements.
Reduce O&M and Overhead	Defer maintenance where feasible. Defer overhead expenses where possible. If staff reductions are required, service level will be impacted.

1.3.9 Monitoring and Reporting

Water savings from implementation of the WSCP will be determined by consumption and production meter readings. Customer meters will be read every month in Stages 1, 2, and 3, and weekly in Stages 4 and 5. If necessary, Western may read customer meters more often, especially for customers that exceed their water budget. Western will monitor production meters on a weekly basis.

Under normal conditions, Western monitors sales and deliveries on a monthly and daily basis. All of Western's water sales are metered and all connections are read monthly. Water orders are scheduled daily with water deliveries recorded daily. Water deliveries and transfers at booster stations can be monitored through Western's Supervisory Control and Data Acquisition (SCADA) system to determine usage in various portions of the retail area. Western prepares monthly sales and delivery reports that are reviewed and compared to previous reports and statistics for prior months and seasons. Under shortage conditions, Western may prepare these reports daily. In addition, billing reports may be reviewed to identify users who are exhibiting high water use so that Western may work with them to reduce their demand.

1.4 Emergency Response, Seismic Risk Assessment and Mitigation

1.4.1 Emergency Response Plan

In the event of a catastrophic supply interruption, Western would follow its Emergency Response Plan (ERP) in addition to the WSCP.

In 2020, Western completed a Risk and Resilience Assessment (RRA) and Emergency Response Plan (ERP) in accordance with America's Water Infrastructure Act (AWIA) of 2018. The purpose of the RRA and ERP is to meet the AWIA compliance requirements and plan for long-term resilience of Western's infrastructure. The RRA assessed Western's water system in order to identify critical assets and processes that may be vulnerable to human and natural hazards, and to identify measures that can be taken to reduce risk and enhance resilience from service disruption for the benefit of customers. The RRA identifies and characterizes both infrastructure-specific and system-wide vulnerabilities and threats and quantifies the consequences of disruption. The RRA also identifies various options (and constraints) in addressing and mitigating risk. The RRA, is conjunction with the ERP, charts a course for water system resilience. The RRA also provided various recommendations to increase reliability of Western's system. Since critical pieces of infrastructure and specific vulnerabilities are detailed in the RRA and ERP, the contents of the document are confidential and for use by Western staff only.

1.4.2 Seismic Risk Assessment and Mitigation Plan

Per the Water Code Section 10632.5, suppliers are required to assess seismic risk to water supplies as part of their WSCP. Western published a Local Hazard Mitigation Plan (LHMP) in 2017 that identified relevant local hazards, reviewed and assessed past disasters, estimated the probability of future disaster occurrences, and set goals to mitigate potential risks and reduce or eliminate longer-term risks to people and property from both natural and man-made hazards. The LHMP identified risks pertaining to earthquakes, floods, wildfires, landslides, pandemics, high winds, drought, power outages, hazardous materials, terrorism, and several others. On a scale of 0 to 4, the LHMP identified the probability of an earthquake occurring and its severity as a 3. An earthquake was ranked as the 6th most important hazard to plan for, after a pipeline issue, power outage, extreme summer or winter weather, drought, and a severe wind event (Western Municipal Water District, 2017).

Historically, Western has experienced a couple of large earthquakes. The most significant earthquakes in the region both occurred in June 1992 and were the Landers earthquake with a 7.3 magnitude, and the Big Bear earthquake with a 6.4 magnitude (the Big Bear earthquake was an aftershock to the Landers earthquake). Both earthquakes were over 40 miles from Western and did not cause any significant damage to Western's infrastructure (Western Municipal Water District, 2017). It is expected that faults within Western's region could generate an earthquake with an 8.2 magnitude or greater and would severely impact Western's infrastructure.

- The LHMP identified various projects Western has planned to mitigate seismic risks and impacts, including:
- Study to determine if the installation of seismically activated valves for drinking and/or irrigation water would be operationally and fiscally beneficial to maintain water supply and service after an earthquake.
- Acquiring debris removal equipment for use after a disaster. Western can perform typical pipeline repairs and debris removal but may require more robust equipment to remove large amounts of debris after a disaster.
- Develop a staff team trained to evaluate the safety of Emergency Operations Center locations immediately following an earthquake. Project includes training in post-earthquake structural evaluation.

- Purchase a greater variety of materials and sizes for pipeline repair. Items may include PVC pipe, steel pipe, ductile iron fittings, air vacs, and valves. Materials would be stockpiled throughout Western's service area to be readily available after an earthquake.
- Provide additional back-up power for use during large scale power failures at all pump stations.
- Map and possibly relocate pipeline alignments near creeks or areas subject to ground movement such as landslide and rock areas.
- Perform a seismic evaluation of entire water distribution system to determine priority of retrofit projects.
- Perform seismic analysis and retrofits to older tanks that were constructed to past seismic standards.
- Install Compressed Natural Gas (CNG) tanks at natural gas-powered facilities as several transmission mains within Western's service area are powered by natural gas.

1.5 WSCP Refinement Procedures

The WSCP is best prepared and implemented as an adaptive management plan. Western will use results obtained from its monitoring and reporting program to evaluate any needs for revisions. Potential changes to the WSCP that would warrant an update include, but are not limited to, any changes to trigger conditions, changes to the shortage stage structure, changes to rate structures or development of water budgets, and/or changes to customer reduction actions.

Any prospective changes to the WSCP would need to be presented to Western's Board of Directors (Board) for approval. Western will hold a public hearing, obtain any comments, and formally adopt the updated WSCP. Notices for refinement and the public hearing date will be published in the local newspaper in advance of any public meetings.

1.6 Plan Adoption, Submittal, Availability

The WSCP will be presented for adoption to Western's Board at a public meeting. The Board and members of the public may submit any comments prior to approval and adoption. The WSCP will be submitted to DWR at the same time as the 2020 Urban Water Management Plan.

The WSCP will be made available to all staff, customers, and any affected cities, counties, or other members of the public through Western's website, located under the Water Reliability, Drought and Restrictions section.

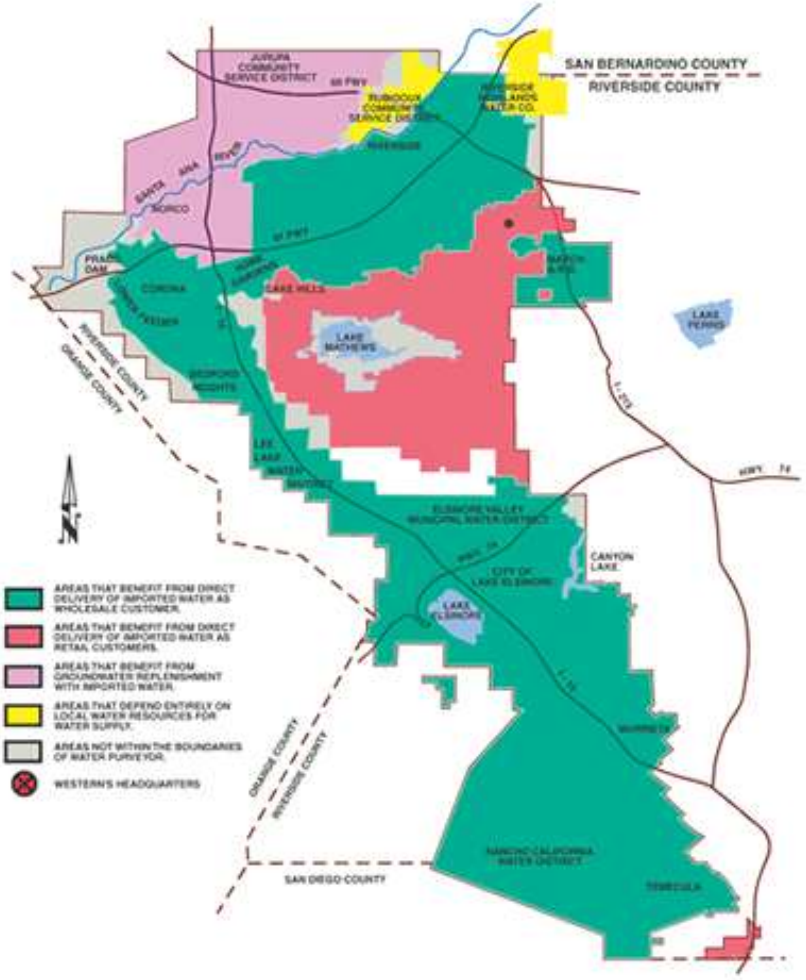
Appendix A Wholesale Customer Allocation by Shortage Level



Appendix B Overview of the Metropolitan Water District Shortage Allocation Plan

Section 1 Introduction

The purpose of the Drought Allocation Plan (DAP) is to provide Western Municipal Water District of Riverside County (Western) and its wholesale customers with a means of allocating limited imported water supplies from the Metropolitan Water District of Southern California (Metropolitan) under various shortage conditions. The DAP is intended to help the region minimize the impacts of shortages and ensure an equitable allocation of imported water supplies.

The DAP will be used to allocate water for retail municipal, industrial, and agricultural purposes among the following agencies:

- Box Springs Mutual Water Company
- City of Corona
- City of Norco
- Eagle Valley Mutual Water Company
- Elsinore Valley Municipal Water District
- Lee Lake Water District
- Rancho California Water District
- Western Municipal Water District Retail Customers

Section 2 Drought Allocation Plan Preparation

A fourth year of dry climate conditions throughout the state and uncertainty about water availability from the State Water Project have increased the possibility that Metropolitan may not have access to the supplies necessary to meet total firm demands at some point in the future and may have to allocate shortages in supplies to its member agencies. To prepare for this possibility, Metropolitan staff worked jointly with member agencies to develop an updated Water Shortage Allocation Plan (WSAP) for 2015 and beyond. This plan, which addresses the principles adopted by the Metropolitan Board of Directors in the 1999 *Water Surplus and Drought Management Plan* (WSDM Plan), was adopted by Metropolitan's Board of Directors in December 2014. A summary of the 2007 plan and the 2014 update is included in Appendix B, attached.

To facilitate implementation of Metropolitan's plan at the local level, Western has developed this DAP. The DAP identifies the methods that will be used to allocate limited imported supplies among Western's wholesale customers, if and when Metropolitan implements its WSAP.

Wholesale Customer Coordination

In 2008, the initial preparation and implementation of a DAP for the Western service area required input from Western's wholesale customers. Recognizing the importance of wholesale customer involvement for the first-of-its-kind plan document, Western created a workgroup, made up of staff from Western and the potentially affected wholesale customers. For this update, Western staff simply modified the allocation methodology so that it was consistent with Metropolitan's recently updated WSAP plan. These changes in methodology were presented to wholesale customer representatives at a regular meeting hosted by Western's general manager in January 2015. As these changes, which are explained in Section 3, did not substantially change the plan outcome, the need for formal workshops was unnecessary to gain support for this update.

Section 3 DAP Supply Allocation Methodology

This section includes a description of the updated supply allocation methodology developed following the 2014 modification of Metropolitan's WSAP. The goal of the DAP is to provide an equitable means of apportioning imported supplies during periods where Metropolitan implements the various shortage levels of its WSAP. This allocation methodology is consistent with the approach defined within Metropolitan's plan and has been adjusted for local needs and conditions. Appendix A, attached, includes estimated retail agency allocations based on the following methodology.

Base Period Calculations

The first step in estimating retail demands and wholesale water needs in the allocation year is to establish a base period with established water supply and delivery data that approximates a base operating condition within Western's service area. **The base period for each of the different categories of demands and supplies is calculated using data from the two most recent non-allocation years (Fiscal Years 2012-13 and 2013-14)**; exceptions to this methodology are noted in the following descriptions of base period calculations.

The following are the components of the Base Period calculation:

Base Period Total Demand: Total water demands for the base period are calculated by adding the Base Period Import Supplies (the demands on Western), and the Base Period Local Supplies.

Base Period Local Supplies: Local supplies for the base period are calculated using the two-year average of groundwater production, groundwater recovery, surface-water production, and other imported supplies. Non-potable recycled water production is not included in this calculation. (This is to address the impact of demand hardening due to recycled water use.)

Base Period Wholesale Demands: Firm demands on Western for the base period are calculated using the two-year average of retail Municipal & Industrial (M&I) demands.

Base Period Gallons per Capita Daily (*GPCD):* Conservation Demand Hardening occurs at the retail water use level as consumers install more conservation-saving devices and participate in available programs. In order to estimate conservation savings, Metropolitan requires each member agency to establish an historical baseline GPCD calculated in a manner consistent with California Senate Bill SBx7-7. Western's 10-year GPCD base period for this plan is 1999 through 2008. The calculated regional Base Period GPCD is 362. Reductions from the Base Period GPCD to the Allocation Year are the basis used to calculate the equivalent conservation savings in acre-feet.

Allocation Year Calculations

The next step in estimating water demands in the allocation year is to adjust the base period estimates of retail demand for population or economic growth, and to adjust for changes in local supplies.

Allocation Year Demand Adjustment: Total retail demands for the allocation year are calculated by adjusting the Base Period Retail Demands for growth.

Growth Adjustment: The lesser of 159.4 GPCD (value provided by Metropolitan), or the calculated base period for each agency, is applied to the change in population from the base period to the allocation year.

Allocation Year Local Supplies: Allocation year local supplies are estimated using the base period local supplies and should include any adjustments for gains and losses of local supply, and extraordinary increases in production over the base period. These adjustments are made to give a more accurate estimate of actual supplies in the allocation year, and in turn, more accurately reflect an agency's demand for supplies from Western.

Gain of Local Supply Adjustment: This adjustment accounts for planned or scheduled gains in local supply production above the base period, which are not due to extraordinary actions to increase water supply in the allocation year. These previously-scheduled increases in supply programs or local production should be added to the base period local supplies.

Loss of Local Supply Adjustment: This adjustment accounts for losses of local supply production from the base period. Losses of local supply, due to such things as hydrology or water quality, should be subtracted from the Base Period Local Supplies.

Extraordinary Increased Production Adjustment: This adjustment accounts for extraordinary increases in local supplies above the base period. Extraordinary increases in production include such efforts as purchasing transfers or mining of groundwater basins. In order not to discourage such extraordinary efforts, only a percentage of the yield from these supplies is added back to Allocation Year Local Supplies. This has the effect of "setting aside" the majority of the yield for the agency who procured the supply. The following table shows the percentages of the extraordinary increases in local supply that are counted in each level of supply allocation:

Regional Shortage Level (%)	Percentage Counted in Local Supply
1 (5%)	0%
2 (10%)	0%
3 (15%)	15%
4 (20%)	20%
5 (25%)	25%
6 (30%)	30%
7 (35%)	35%
8 (40%)	40%
9 (45%)	45%
10 (50%)	50%

Allocation Year Wholesale Demands: Demands on Western for the allocation year are calculated by subtracting the Allocation Year Local Supplies from the Allocation Year Retail Demands.

Allocation Formula and Accounting

The following table contains the elements used in the allocation formula. The formula was designed to be equitable on the wholesale level while helping to minimize hardships experienced by individuals and by the regional economy at the retail level.

(1) Regional Shortage Level	(2) Regional Shortage Percentage	(3) Wholesale Minimum Allocation	(4) Retail Impact Adjustment Maximum
1	5%	92.5%	0%
2	10%	85.0%	5.0%
3	15%	77.5%	7.5%
4	20%	70.0%	10.0%
5	25%	62.5%	12.5%
6	30%	55.0%	15.0%
7	35%	47.5%	17.5%
8	40%	40.0%	20.0%
9	45%	32.5%	22.5%
10	50%	25.0%	25.0%

Shortage Levels(1): The formula allocates shortages of Western supplies over ten levels: from 5 to 50 percent, in 5 percent increments.

Shortage Percentage(2): The maximum total regional shortage percentage of Western's available supplies when compared to the sum of the demands in the allocation year.

Wholesale Minimum Allocation(3): The Wholesale Minimum Allocation is established to ensure a minimum level of wholesale water service (Western supplies) at the wholesale customer level, and sets the target for recognizing a wholesale customer's ongoing investment in Western's system. The Wholesale Minimum Allocation ensures that wholesale customers will not experience shortages on the wholesale level that are greater than one-and-a-half times the percentage shortage of Western's regional water supplies. The Wholesale Minimum Allocation is equal to 100 percent minus one-and-a-half times the shortage level.

Retail Impact Adjustment Maximum(4): The Retail Impact Adjustment Maximum is the factor used to address major differences in retail level shortages associated with across-the-board cuts. The purpose of this adjustment is to ensure that agencies with a high level of dependence on Western do not experience highly disparate shortages compared to other agencies when faced with a reduction in wholesale water supplies. The Retail Impact Adjustment Maximum factor is calculated as the difference between the Regional Shortage Percentage and the Wholesale Minimum Allocation. The amount of the adjustment each wholesale customer receives is prorated on a linear scale, based on its dependence on Western at the retail level. The prorated amount of allocation is referred to as the Retail Impact Adjustment Allocation. For agencies that are 100 percent dependent on Western, this method will result in an allocation of Western supplies that, at the retail level, will result in a shortage equal to the Regional Shortage Percentage. In other words, through this allocation, no agency will experience a greater percentage shortage than the regional shortage percentage.

Conservation Demand Hardening Credit: The Conservation Demand Hardening Credit is calculated at the regional level in Metropolitan's WSAP. The value of the regional conservation credit is divided proportionally among the agencies within Western's service area that purchased imported water during the Base Period. The individual agency's volume of imported water is compared to the total of all agency purchases of imported water. The Conservation Demand hardening credit will be based on an initial 10 percent of the GPCD-based Conservation savings plus an additional 5 percent for each level of Regional Shortage set by the Board of Directors during implementation of the WSAP. The credit will also be adjusted for:

- overall percentage reduction in retail water demand, and
- Western's dependence on Metropolitan.

This provides a base demand hardening credit equal to 10 percent of conservation savings and increases the credit as deeper shortages occur, which is when conservation demand hardening has a bigger impact on the retail consumer. The credit also increases based on the percentage of an agency's demand that was reduced through conservation. This accounts for increased hardening that occurs as increasing amounts of conservation are implemented. Lastly, the credit is scaled to the member agency's dependence on Metropolitan to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in Metropolitan supply.

M&I Allocation: The allocation of Western supplies to an agency for its retail demand is the sum of the Wholesale Minimum Allocation, the Retail Impact Adjustment, and the Conservation Demand Hardening Credit.

Allocation Example – Calculating Base Period Information to Determine Allocation Year Needs

The following example gives a step-by-step description of how the recommended formula would be used to calculate an allocation of Western's imported supplies to its wholesale customers and retail service area. This example is based on a Fiscal Year 2015-16 allocation using the average of Fiscal Year 2012-13 and Fiscal Year 2013-14 as the base period. The data used for this example was provided by each agency in late 2014.

Step 1: *Calculate Base Period Retail Demand*

The first step in developing an agency's allocation is to estimate the agency's retail level water needs. Two pieces of information are required to calculate retail level water needs:

(1) The amount of local supplies that were produced in the base period, and
(2) The amount of demands on Western in the base period.

Base Period Local Supplies are calculated using the average of production data from Fiscal Year 2012-13 and Fiscal Year 2013-14 for groundwater, groundwater recovery, surface water, and/or other non-Western imported supplies.

Base Period Wholesale Demands on Western are calculated using the same averaged time period as the Base Period Local Supplies.

Base Period Retail Demand can be calculated once the information described above has been determined. The sum of the Base Period Local Supplies and the Base Period Wholesale Demands equals the Base Period Retail Demand.

Step 2: *Adjust Base Period Retail Demand for Growth*

The second step in developing an agency's allocation is to adjust the Base Period Retail Demand for growth that occurred since the Base Period. Based on Department of Finance statistics, the projected population growth in Riverside County was 1.12 percent for the period 2011 through 2013. The Base Period population is adjusted by 1.12 percent for each year between the Base Period and the allocation year. The change in the demand for water is calculated by multiplying the change in population by the lesser of 159.4 gallons per capita daily or the calculated base period GPCD for each agency.

Agency within Western	Applied GPCD
Box Springs Mutual Water Company	104.0
City of Corona	159.4
City of Norco	159.4
Eagle Valley Mutual Water Company	-
Elsinore Valley Municipal Water District	159.4
Lee Lake Water District	138.0
Metropolitan Water District	-
Rancho California Water District	159.4
Western Municipal Water District Retail	159.4

Allocation Year Retail Demand is the result of applying the growth adjustment to the Base Period Retail Demand. It represents a reasonable estimate of the total amount of firm water that an agency needs at the retail level in the year of allocation.

Step 3: *Adjustment for changes in local supply from the Base Period*

The third step in calculating each agency's allocation is to calculate the agency's local supply production in the year of the allocation. This is done by using Base Period Local Supplies that were calculated in Step 1 as a base estimate, and adding back any gains or losses in Base Period Local Supplies that are occurring in the allocation year. If an agency has undertaken extraordinary efforts to secure alternative supplies, this Extraordinary Increase in Local Supplies would also be added here.

Allocation Year Local Supplies are the result from adjusting the Base Period Local Supply for all of the changes listed above.

Step 4: *Calculate Wholesale Water Needs in the Allocation Year*

Now that both the Allocation Year Retail Demands and the Allocation Year Local Supplies have been estimated, the agency's Allocation Year Wholesale Demand can be calculated.

Allocation Year Wholesale Demands on Western are calculated by subtracting the Allocation Year Local Supplies from the Allocation Year Retail Demands. Any demand that is remaining after the agency's local supplies are accounted for represents demand for wholesale supplies from Western.

Dependence on Western is calculated as the percentage of an agency's retail need that is met by Western wholesale supplies.

Step 5: *Apply Base Period Conservation Demand Hardening Credit*

The Conservation Demand Hardening Credit is calculated at the regional level in Metropolitan's WSAP. The value of the regional conservation credit is divided proportionally between the agencies within Western's service area that purchased imported water in the Base Period. The individual agency's volume of imported water is compared to the total of all agencies purchases of imported water.

Allocation Example – Calculating a Supply Allocation in a Regional Shortage Level 3

This example will follow the allocation formula accounting, through a Regional Shortage Level 3 (15%). The table below shows the essential elements of the allocation formula under a Regional Shortage Level 3.

(1) Regional Shortage Level	(2) Regional Shortage Percentage	(3) Wholesale Minimum Allocation	(4) Retail Impact Adjustment Maximum
3	15%	77.5%	7.5%

Step 1: *Calculate Wholesale Minimum Allocation*

The Wholesale Minimum Allocation is calculated by multiplying the agency's Allocation Year Wholesale Demand by the Wholesale Minimum Allocation percentage from the allocation table.

Step 2: *Calculate Retail Impact Adjustment Allocation*

The next step in determining this agency's allocation is to calculate the Retail Impact Adjustment Allocation. Recall from the allocation table, the Retail Impact Adjustment Maximum factor is the difference between the Wholesale Minimum Allocation and the Regional Shortage Percentage. Under a Regional Shortage Level 3 (15 percent), the Retail Impact Adjustment Maximum factor available to any agency is 7.5 percent. Each agency's Retail Impact Adjustment factor is calculated by multiplying the 7.5 percent Retail Impact Adjustment Maximum factor by the agency's Dependence of Western, which was calculated in a previous step.

Step 3: *Apply the Conservation Hardening Credit*

Step 4: *Add the Wholesale Minimum Allocation, the Retail Impact Adjustment Allocation, and the Conservation Hardening Credit to get the final M&I agency allocation.*

The Wholesale Minimum Allocation, the Retail Impact Adjustment Allocation, and the Conservation Hardening Credit are added together to total to the M&I allocation.

Step 5: *Add Unallocated Supplies*

After each agency's M&I allocation is calculated, each agency's M&I allocation is added together to determine the total M&I allocation for all of Western's wholesale customers. As with the example above, if the total M&I allocation is lower than the allocation that Western is receiving from Metropolitan, the surplus is allocated among the wholesale customers based on the proportion of each agency's Wholesale Minimum Allocation to the Western's total Wholesale Minimum Allocation. If the amount is greater than

the allocation from Metropolitan, then the next regional shortage level will be applied until the total M&I allocation is equal or less than allocation from Metropolitan.

Step 6: *Total Allocation*

The final step in calculating this agency's allocation of Western supplies is to sum up all of the elements of the allocation formula that were calculated above.

Section 4 Estimate of Retail Agency Allocation under Drought Allocation Plan

Western (retail) and the retail water suppliers within Western's general service area are, to varying degrees, dependent upon Metropolitan for imported water supply. The following table summarizes the estimated impact of the Metropolitan Board of Directors-adopted (December 2014) WSAP process for the allocation of water supplies to Western's general service area during ten levels of water supply shortage. The water supply available to Western is further allocated between the retail water suppliers in a fashion similar to the Metropolitan process.

MWD WATER SUPPLY ALLOCATION PLAN - 2014 UPDATE			
Regional Shortage Level	MWD Declared Shortage	Import Water Available[1]	Regional Reduction Level[2]
0	-	-	-
1	-5.0%	72,689	-5.1%
2	-10.0%	72,689	-5.1%
3	-15.0%	71,496	-6.7%
4	-20.0%	69,489	-9.3%
5	-25.0%	67,482	-11.9%
6	-30.0%	65,475	-14.5%
7	-35.0%	63,469	-17.2%
8	-40.0%	61,462	-19.8%
9	-45.0%	59,455	-22.4%
10	-50.0%	57,488	-25.0%

FY 2014 Import Demand = 76,614 acre feet.

1. The total *Imported Water Available* subject to change based on the certification of local production at the end of a fiscal year.
2. *Regional Reduction Level* percentages are based on FY 2014 imported water demands, not the base period demands. The reduction levels also apply to the region as a whole, not to the individual retail agencies.

Appendix B includes an overview of Metropolitan's WSAP methodology for shortage allocations. Western will use a process similar to that of Metropolitan to allocate imported water supplies among the retail water agencies within Western's general service area. Agencies that purchased water in the Metropolitan base period (Fiscal Years 2012-13 and 2013-14) share in the allocation of imported water. These agencies include: Box Springs Mutual Water Company, the City of Corona Department of Water and Power, Eagle Valley Mutual Water Company, Elsinore Valley Municipal Water District, Lee Lake Water District, Metropolitan, the City of Norco, Rancho California Water District, and Western Municipal Water District for its retail water service area. The following agencies within Western's general service area did not purchase imported water during Metropolitan's base period and, therefore, are not included in the allocation of imported water supplies: Home Gardens County Water District, Jurupa Community Services District, the City of Riverside Public Utilities, Riverside Highlands Water Company, and Rubidoux Community Services District.

The following table summarizes the estimated imported water supply available to the retail water suppliers within Western's general service area at each of Metropolitan's shortage levels 1 through 10. These values are estimates as the actual volumes of water available to each agency are dependent on the production of local

supplies throughout Western's imported agency region and is reconciled at the completion of each fiscal year during which a Metropolitan water allocation is in place.

Shortage Level	Box Springs MWC	City of Corona	Eagle Valley MWC	Elsinore Valley MWD	Lee Lake WD	MWD	City of Norco	Rancho California WD	Western MWD (Retail)	Total
1	88	14,643	488	16,734	3,104	11	171	17,797	19,646	72,689
2	88	14,643	488	16,734	3,104	11	171	17,797	19,646	72,689
3	84	14,275	437	16,639	3,098	10	154	17,455	19,339	71,496
4	81	13,799	411	16,230	3,037	9	143	16,946	18,828	69,489
5	77	13,323	385	15,822	2,976	9	133	16,436	18,317	67,482
6	74	12,847	360	15,413	2,915	8	122	15,927	17,806	65,475
7	70	12,371	334	15,005	2,855	7	111	15,417	17,294	63,469
8	66	11,896	308	14,596	2,794	7	101	14,907	16,783	61,462
9	63	11,420	283	14,188	2,733	6	90	14,398	16,272	59,455
10	59	10,944	257	13,780	2,672	6	80	13,888	15,760	57,488

Appendix A includes spreadsheets detailing the calculation of retail agency allocations under Metropolitan shortage allocation levels 1 through 10.

Section 5 Allocation Plan Implementation Elements

The following are the implementation elements that are necessary for administering an allocation during a time of shortage. These elements cover the processes needed to declare a shortage level as well as providing a penalty rate structure for enforcing each agency's allocation.

Implementing an Allocation of Supplies
At this time, it is anticipated that the only time Western would allocate imported supplies from Metropolitan is if Metropolitan is forced to allocate its supplies through its WSAP process.

Setting the Shortage Level
Should Metropolitan implement the WSAP, Western staff will determine the appropriate Shortage Level so that supplies allocated at the Western service area level are equal to or less than the Metropolitan allocation. Simultaneously, Western will determine whether any appeals need to be filed with Metropolitan.

Allocation Period
The allocation period for the DAP will be consistent with the period defined within Metropolitan's WSAP. This allocation period covers twelve consecutive months, typically from July of a given year through the following June. This period was selected by Metropolitan so as to minimize the impacts of varying State Water Project allocations. It was also selected to provide wholesale customers with sufficient time to implement their outreach strategies and rate modifications. Metropolitan has indicated that it is their intention when possible to set allocations through the declaration of a shortage level at the April Board of Directors' meeting preceding the next fiscal year.

Determination of Penalties
At the end of the allocation year, Metropolitan will bill Western for any accrued penalties. Penalties will be based on the water rates in effect the last day of June of the allocation year. Western will bill its agencies for penalties based on its penalty rate structure. Any excess funds collected will be refunded proportionately to those agencies that paid penalties.

Allocation Surcharge
At the end of each allocation year, Metropolitan will bill Western for any accrued Allocation Surcharges ("surcharges") based on Metropolitan's adopted WSAP. Western will pass-through Metropolitan's surcharges to its retail agencies (which includes Western's own retail customers) based on Metropolitan's allocation surcharge rate structure described at the end of this section.

If Western exceeds its total allocation from Metropolitan for the year, the underutilization of any individual retail agency's allocation will be reallocated that year to other retail agencies that exceed their allocation in accordance with the same methodology used when Western exceeds its total Metropolitan Tier 1 Maximum. This methodology is described in Western's Board of Directors-adopted "Determining Water Rates and Charges for Water User Agencies" Resolution (this Resolution changes from time to time and is currently Resolution 2876). Only retail agencies that had Metropolitan water deliveries in the WSAP base year, and thus contributed to the amount of Metropolitan water allocated to Western, will be included in the underutilization reallocation calculation described in this paragraph.

No billing or assessment of surcharges to retail agencies will take place until the end of the twelve-month allocation year unless Western at its sole discretion determines that significant surcharges are probable. In this latter case, Western will use an equitable method of invoicing all or a portion of such anticipated surcharges to

retail agencies exceeding their individual allocation. This invoicing will be done prior to the end of the allocation year. At the end of the allocation year and after being assessed any surcharges by Metropolitan, Western will reconcile any collected surcharge revenue and issue invoices or credit memos to retail agencies accordingly, with invoice payment terms consistent with those described in the current applicable Resolution (referenced in the previous paragraph). The purpose of this latter provision is to reduce Western's risk from collecting significant receivable amounts after the end of the allocation year. If at the end of the allocation year Western does not incur any surcharges from Metropolitan, then individual retail agencies will not be invoiced for surcharges (or will be refunded any surcharges paid in advance of year-end).

Metropolitan's surcharge is based on the costs that Metropolitan and its member agencies are incurring to implement outdoor water use reductions through turf removal programs. The surcharge is designed to provide a price signal based on the marginal conservation costs incurred to reduce water use in dry and shortage years. Any revenues collected by Metropolitan from the surcharge would be used to fund the implementation of the Turf Removal Program, or other similar programs designed to conserve water and reduce future demands.

Metropolitan is currently paying $2 per square foot of turf removed. The estimated water savings is 44 gallons per year for each square foot of turf removed for a period of ten years. Based on this savings rate, the estimated cost of the program is $1,480 per acre-foot. Water use between 100 percent and 115 percent of a member agency's water supply allocations would be charged with a surcharge of $1,480 per acre-foot. Water use greater than 115 percent would be charged two times the surcharge or $2,960 per acre-foot. Two times the surcharge would allow the funding of additional turf removal and conservation programs to conserve additional water and further reduce demand or, if appropriate, allow for a higher per square foot incentive payment. The surcharge rates are assessed in addition to the normal rates for Metropolitan water purchases. The penalty rate structure is summarized in the table below:

Water Use	Allocation Surcharge In Addition to Cost of Water
100% of Allocation	$0
Between 100% & 115%	$1,480
Greater than 115%	$2,960

Below are three potential scenarios related to the assessment of the surcharge:

Scenario 1: Retail agency water deliveries are less than Western's Metropolitan allocation. The result after the allocation year would be that retail agencies would not owe any surcharges even if agencies are over their individual allocation.

Scenario 2: Retail agency water deliveries are over Western's Metropolitan allocation, but less than 115 percent. The $1,480 per acre-foot surcharge would be assessed only to retail agencies that exceed their individual allocation after taking into consideration the proration of underutilized allocation.

Scenario 3: Retail agency water deliveries are over Western's Metropolitan allocation by more than 115 percent with individual agencies' exceedance varying. First, underutilized allocation would be prorated to the water deliveries that are over by 100 and 115 percent, with the balance assessed a surcharge of $1,480 per acre-foot. Any water remaining that exceeds 115 percent would be assessed a surcharge of $2,960 per acre-foot (two times $1,480).

Appendix A Wholesale Customer Allocation by Shortage Level

1. The MWD Retail Impact Adjustment Credit, when applied to the individual water agencies within Western's general service area, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such the amount of water over allocated is subtracted from the total Demand Hardening Credit.
2. The MWD Conservation Demand Hardening Credit methodology, when applied to the various GPCD values and GPCD changes at the local level with significantly lower water demands, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such, the wholesale Demand Hardening Credit has been divided among the urban retail water suppliers in proportion to the base period demand for imported water relative to the total imported water demand for all urban retail water suppliers.

The table above illustrates the calculation of the estimated import water supply available to each water supplier within Western's service area during DAP Shortage Level 1. All values are estimates as the actual volumes of water available to each agency are ultimately dependent on the certified production of local supplies throughout Western's import agency region. The final allocation will be reconciled at the completion of each fiscal year during which a water allocation is in place.

1. The MWD Retail Impact Adjustment Credit, when applied to the individual water agencies within Western's general service area, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such the amount of water over allocated is subtracted from the total Demand Hardening Credit.
2. The MWD Conservation Demand Hardening Credit methodology, when applied to the various GPCD values and GPCD changes at the local level with significantly lower water demands, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such, the wholesale Demand Hardening Credit has been divided among the urban retail water suppliers in proportion to the base period demand for imported water relative to the total imported water demand for all urban retail water suppliers.

The table above illustrates the calculation of the estimated import water supply available to each water supplier within Western's service area during DAP Shortage Level 5. All values are estimates as the actual volumes of water available to each agency are ultimately dependent on the certified production of local supplies throughout Western's import agency region. The final allocation will be reconciled at the completion of each fiscal year during which a water allocation is in place.

1. The MWD Retail Impact Adjustment Credit, when applied to the individual water agencies within Western's general service area, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such the amount of water over allocated is subtracted from the total Demand Hardening Credit.
2. The MWD Conservation Demand Hardening Credit methodology, when applied to the various GPCD values and GPCD changes at the local level with significantly lower water demands, results in individual agency allocations that exceed the total wholesale allocation from MWD. As such, the wholesale Demand Hardening Credit has been divided among the urban retail water suppliers in proportion to the base period demand for imported water relative to the total imported water demand for all urban retail water suppliers.

The table above illustrates the calculation of the estimated import water supply available to each water supplier within Western's service area during DAP Shortage Level 10. All values are estimates as the actual volumes of water available to each agency are ultimately dependent on the certified production of local supplies throughout Western's import agency region. The final allocation will be reconciled at the completion of each fiscal year during which a water allocation is in place.

Appendix B Overview of the Metropolitan Water District Shortage Allocation Plan

Metropolitan's WSAP is the basis for allocation of shortages in supplies to member agencies should Metropolitan be unable to meet total firm demands. The first WSAP was prepared in 2007 due to dry conditions and uncertainty about future pumping operations from the State Water Project caused by fishery protection measures in the Sacramento-San Joaquin Bay-Delta. Since 2007, Metropolitan staff worked jointly with the member agency managers and staff to revise the plan. In December of 2014, the Metropolitan Board of Directors adopted the revisions as described later in this appendix.

The WSAP is based upon the 1999 Water Surplus and Drought Management Plan (WSDM Plan), which introduced the concept of using a base period to estimate water needs under an allocation.

Water Surplus and Drought Management Plan
The WSDM is the drought management plan that Metropolitan currently operates under which addresses both drought actions and water surplus actions. However, a water allocation methodology in the event "rationing" becomes necessary is not included in the WSDM Plan.

The following are the guiding principle, supporting principles and implementation goals of the WSDM Plan:

Guiding Principle

- Metropolitan will encourage storage of water during periods of surplus and work jointly with its Member Agencies to minimize the impacts of water shortages on the region's retail consumers and economy during periods of shortage.

Supporting Principles

- Maintain an ongoing coordinated effort among Metropolitan and its Member Agencies to encourage efficient water use and cost-effective local resource.
- Encourage local and regional storage during periods of surplus and use of storage during periods of shortage.
- Manage and operate Metropolitan's regional storage and delivery system in coordination with local facilities to capture and store surplus water in local groundwater and surface reservoirs.
- Arrange for secure sources of additional water from outside the region for use during periods of shortage.
- Call upon sources of additional water from outside the region and water stored locally to meet the needs of consumers and protect the economy during periods of shortage.

WSDM Plan Implementation Goals

- Avoid mandatory import water allocations to the extent practicable.
- Equitably allocate imported water on the basis of agencies' needs. Considerations to create an equitable allocation of imported water may include:

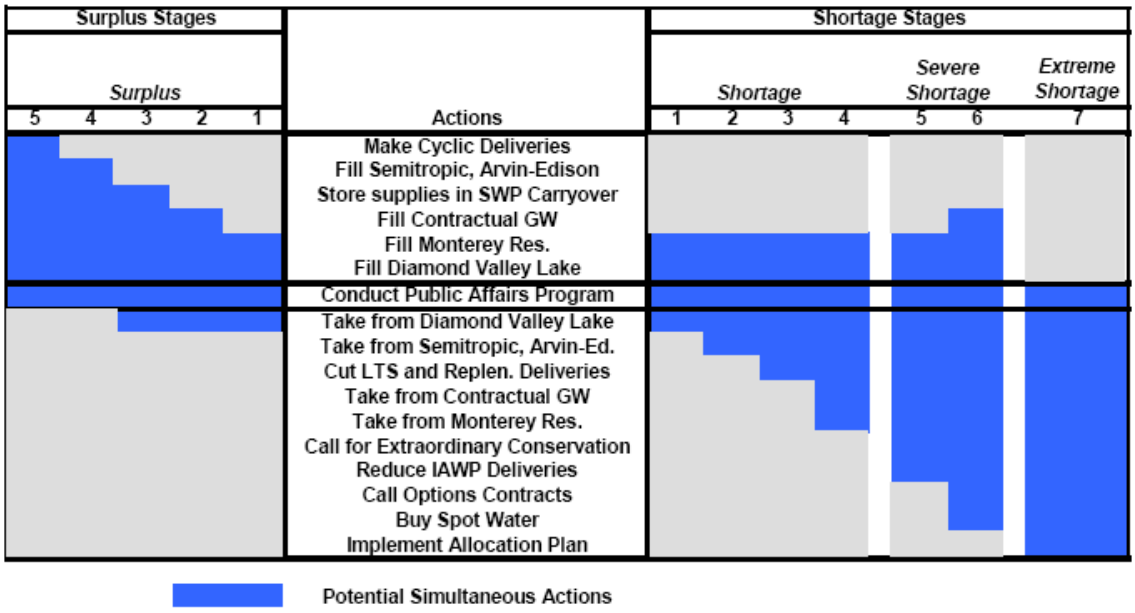
  - Impact on retail consumers and economy
  - Reclamation/Recycling
  - Conservation
  - Population and economic growth
  - Investment in local resources
  - Change and/or loss of local supply
  - Participation in Metropolitan's Non-firm (interruptible) Programs
  - Investment in Metropolitan's facilities

- Encourage storage of surplus supplies to mitigate shortages and improve water quality.[9]

Although an allocation method was not adopted, a draft plan was devised and specific concepts of an allocation are laid out in the WSDM Plan. These concepts include an overall policy objective of the allocation method as follows: "…to minimize the impacts to any one agency and the region as a whole. To meet that objective, the method of allocating firm imported supply will account for each agency's:

- demands on Metropolitan,
- local resources, and
- total retail demands."[10]

Water sales to an agency up to the amount allocated will be at the prevailing full service rate. Deliveries for water use from 100 to 102 percent of the allocation would be charged the prevailing full service rate plus $175 per acre-foot (this cost is similar to the cost of Governors Water Bank water offered for sale in the 1987–92 drought). Water deliveries in excess of 102 percent of the target amount would be charged three times the full service rate.



The WSDM Plan has four resource stages in which actions fall. These resource stages are:

- **Surplus:** Supplies are sufficient to allow Metropolitan to meet Full Service demands, make deliveries to all interruptible programs (replenishment, long-term seasonal storage, and agricultural deliveries), and deliver water to regional and local facilities for storage.
- **Shortage:** Supplies are sufficient to allow Metropolitan to meet Full Service demands and make partial or full deliveries to interruptible programs, sometimes using stored water and voluntary water transfers.
- **Severe Shortage:** Supplies are insufficient and Metropolitan is required to make withdrawals from storage, call on its water transfers, and possibly call for extraordinary drought conservation and reduce deliveries under the IAWP.
- **Extreme Shortage:** Supplies are insufficient and Metropolitan is required to allocate available imported supplies.[11]

Based on the resource stage that Metropolitan is in, varying actions may occur. These actions are shown in Figure 1, below, as developed by Metropolitan. The matrix acts as a "framework." Actual response would be based on conditions at the time of need.

Figure 3-1: Sequence of WSDM Plan Water Resource Management Steps

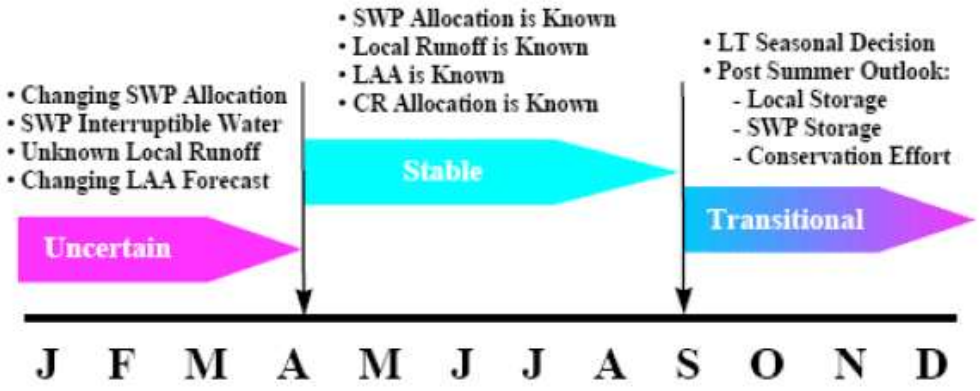


Figure 1: Sequence of WSDM Plan Water Resource Management Steps

The matrix is read from the center of the "Actions" column to the right or left. If Metropolitan is in a surplus stage, it would be read from the center up and to the left. If Metropolitan is in shortage stages, it would be read from the center down and to the right. Metropolitan's General Manager has authority to act on all surplus actions and shortage actions 1 through 4. Metropolitan's Board of Directors must approve actions 5 through 7.

The timeline below, from the WSDM Plan, shows a hypothetical shortage year.[12]

Figure 3-2: Shortage Year Timeline

From January through April, supplies are uncertain. The State Water Project (SWP) allocation is changing based on hydrology as well as the Los Angeles Aqueduct. From May through the end of September, supplies are known and actions have been taken in response to those known supplies. From October through December, a transitional period develops where there is uncertainty on the availability of supplies for the following period, and a decision is made on whether to offer long-term storage deliveries to member agencies as well as assess local storage, SWP storage and conservation efforts that have occurred.

A Drought Program Officer (DPO) will administer the public outreach programs. The DPO will be responsible for coordinating the various activities during a drought.

2007 Metropolitan Shortage Allocation Plan

Metropolitan's November 20, 2007 Board of Directors letter on the Draft Metropolitan Proposed Shortage Allocation Plan identifies the following central objectives of the Plan:

1. Address retail demands and wholesale water needs in the allocation year;
2. Adjust for factors such as population or economic growth, demand hardening, conservation savings, local investment, and the need for wholesale imported water; and
3. Employ an allocation formula that is as equitable as possible on the wholesale level while helping minimize hardships experienced by individuals and by the regional economy at the retail level.

The Plan employs a "two promise method" for supply allocation to ensure that:

1. On a retail level, shortages do not exceed the total Metropolitan percentage shortage (Retail Promise).
2. On a wholesale level, shortages do not exceed one and a half times the total Metropolitan percentage shortage (Wholesale Promise).

Key elements of the plan include:

- **Base Period –** Use of historical data is needed to estimate retail demands, local supplies, and wholesale water needs. The Plan uses a three-year average historical period as its base, with the initial period being 2004 through 2006. It is understood that this base period will be updated or adjusted as time progresses.
- **Growth Adjustment –** Estimates of retail demands need to be adjusted for growth that occurred between an allocation year and the base period. The Proposal uses county-level estimates of average annual growth in population as a proxy for member agency growth. Agencies will also have a choice to use a weighted average of population and job growth instead of just population.
- **Local Supply Adjustment –** Estimates of local supplies need to be adjusted for gains, losses, and extraordinary increases. These adjustments are critical to having reasonable estimates of total retail water needs.

- **Demand Hardening –** The Plan recognizes that significant increases in non-potable recycling and conservation savings devices can harden demands, and make additional reductions in water use more difficult to achieve. To address hardening due to non-potable recycling, non-potable recycling deliveries and the associated demands are not included in the allocation formula, thereby making all elements of the plan applicable to potable water uses only. To address hardening due to conservation, the Plan provides a credit based on the amount of conservation savings within a member agency and the regional shortage level declared by Metropolitan.
- **Depth of Shortage –** The Plan treats shallow shortages, defined as regional shortages up to ten percent, differently than deeper shortages. In shallow shortages, reductions in Metropolitan supplies will be done on an across-the-board basis, with adjustments for conservation demand hardening. This means that severely disparate impacts at a retail level are not addressed until regional shortages are greater than ten percent. At that point, the Plan employs an allocation formula that is equitable on the wholesale level while helping to minimize impacts to the regional economy from disparate shortages at the retail level.

Allocation Procedure

The shortage allocation formula has been developed for ten shortage levels from 5 to 50 percent.

1	5%	92.50%	0.00%	30%
2	10%	85.00%	0.00%	30%
3	15%	77.50%	7.50%	40%
4	20%	70.00%	10.00%	50%
5	25%	62.50%	12.50%	75%
6	30%	55.00%	15.00%	90%
7	35%	47.50%	17.50%	100%
8	40%	40.00%	20.00%	100%
9	45%	32.50%	22.50%	100%
10	50%	25.00%	25.00%	100%

Allocation Period
The allocation period covers twelve consecutive months, from July of a given year through the following June. This period was selected by Metropolitan so as to minimize the impacts of varying SWP allocations. It was also selected to provide member agencies with sufficient time to implement their outreach strategies and rate modifications.

Setting the Regional Shortage Level
Metropolitan staff shall be responsible for recommending a Regional Shortage Level for Board consideration. The final recommendation shall be based on water supply availability and Metropolitan water supply management actions, storage, and transfer operations that are consistent with those outlined in the WSDM Plan adopted by the Board in 1999, and the monthly status reports provided to the Water Planning and Stewardship Committee. Metropolitan's Board of Directors, through the Water Planning and Stewardship Committee, shall be responsible for approving the final Regional Shortage Level at its April meeting. By the April meeting, the majority of the winter snowfall accumulation period will have passed, and will allow staff to make an allocation based on a stable supply picture. Barring

unforeseen large-scale circumstances, the shortage level will be put in place for the entire allocation period without change. This will allow a stable planning platform for the agencies.

Allocation Appeals Process
An appeals process will be necessary for the administration of any changes or corrections to an agency's allocation. Metropolitan shall designate an Appeals Liaison as the official point of contact for all information and inquiries regarding appeals. Basis for appeals claims can include but are not limited to:

- Adjusting erroneous historical data used in base year calculations
- Adjusting for unforeseen loss or gain in local supply
- Adjusting for extraordinary increases in local supply

Small appeals, defined as those that would change an agency allocation by a threshold of less than 10 percent and less than 5,000 acre-feet, shall be evaluated and approved or denied by Metropolitan staff determination. For process transparency, Metropolitan staff shall provide a report to the Board of Directors on all submitted appeals, including the basis for determination of the outcome of the appeal. Member Agencies may request to forward appeals that are denied by Metropolitan staff to the Board of Directors through the Water Planning and Stewardship Committee for final resolution. For large appeals, defined as those that would change an agency allocation by a threshold of 10 percent and at least 5,000 acre-feet, Metropolitan staff shall refer the appeal to the Board of Directors through the Water Planning and Stewardship Committee for approval.

Allocation Penalty Rates
Member agency allocations shall be enforced through a penalty rate structure. The recommended penalty rate structure is an ascending block structure. This structure provides a lower penalty for minor overuse of allocations, and a higher penalty for major overuse of allocations.

Changes since the 2007 Plan

The WSAP has undergone a series of updates since the plan was first developed in 2007 and implemented in 2009. The most recent update approved in December of 2014 includes the following changes:

- Replaced the WSAP Base Period with the Fiscal Years ending 2013 and 2014 and included a credit process for mitigating for reduced local demands as a result of restrictions in place during the new Base Period;
- Replaced the method for calculating Conservation Demand Hardening;
- Added a separate allocation for drought-impacted groundwater basins; and
- Replaced the WSAP Penalty Rates with an Allocation Surcharge based on the marginal costs of water conservation programs.

Updated Base Period
The WSAP "Base Period" is used to determine the retail consumptive water demands for each member agency. The Base Period retail demand is adjusted for growth in population, conservation savings, and non-potable recycling production occurring from the base period to the year in which an allocation is declared (Allocation Year). The recent update replaces the WSAP Base Period of 2004–2006 with Fiscal Years ending 2013 and 2014. The change provides a more up-to-date estimate of current retail consumptive water demand.

Western's complete general water service area Base Period consumptive water demands at the time of Metropolitan Board adoption are summarized in the following table.

Local Supplies		MWD Purchases		Retail Demand		Allocation Year 2015		
FY 2012-2013	FY 2013-2014	FY 2012-2013	FY 2013-2014	FY 2012-2013	FY 2013-2014	Retail Demand	Local Supply	WSAP Baseline
186,497	183,858	68,457	75,910	260,997	259,768	261,793	183,858	77,934

Demand Hardening Methodology
Conservation Demand Hardening occurs at the retail water use level as consumers install more conservation saving devices and participating in available programs. In order to estimate conservation savings, each member agency will establish a historical baseline GPCD calculated in a manner consistent with California Senate Bill SBx7-7. Reductions from the baseline GPCD to the Allocation Year would be the basis used to calculate the equivalent conservation savings in acre-feet. The Conservation Demand Hardening credit will be based on an initial 10 percent of the GPCD-based Conservation savings plus an additional 5 percent for each level of Regional Shortage set by the Board of Directors during implementation of the WSAP. The credit will also be adjusted for:

- overall percentage reduction in retail water demand, and
- Western's dependence on Metropolitan.

This provides a base demand hardening credit equal to 10 percent of conservation savings and increases the credit as deeper shortages occur, which is when conservation demand hardening has a bigger impact on the retail consumer. The credit also increases based on the percentage of an agency's demand that was reduced through conservation. This accounts for increased hardening that occurs as increasing amounts of conservation are implemented. Lastly, the credit is scaled to the member agency's dependence on Metropolitan to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in Metropolitan supply.

Separate Allocation for Drought-Impacted Groundwater Basins
Groundwater basins help provide vital local supplies that can buffer the region from short-term drought impacts. Longer droughts can result in reductions to the many sources of water that replenish groundwater basins, resulting in lower basin levels and potential impacts to the overlying consumptive demands. Limited imported deliveries under these conditions may help avoid impacts to the basins that may be drawn out of their normal operating range or subject to water quality or regulatory impacts. Metropolitan provides a limited allocation for drought impacted groundwater basins based on the following framework:

- Metropolitan staff will meet with a requesting member agency and the appropriate groundwater basin manager to document whether the basin is in one of the following conditions:
  - Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or
  - Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries.
- Metropolitan will provide an allocation based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would then be reduced by the declared WSAP Regional Shortage Level (5 percent for each Regional Shortage Level).
- Any allocation provided under this provision for drought impacted groundwater basins is intended to help support and maintain groundwater production for consumptive use. As such, a member agency receiving an allocation under this provision will be expected to maintain groundwater production levels equivalent to the average pumping in the Base Period. Any adjustments to a member agency's M&I allocation due to lower groundwater production would be reduced by deliveries made under this provision.
- Agencies for which this allocation does not provide sufficient supplies for the needs of the groundwater basin may use the WSAP Appeals Process to request additional supply (subject to Board approval). The appeal should include a Groundwater Management Plan that documents the need for additional supplies according to the following tenets:
  - Maintenance of groundwater production levels;
  - Maintenance of, or reducing the further decline of, groundwater levels;
  - Maintenance of key water quality factors/indicators;
  - Avoidance of permanent impacts to groundwater infrastructure or geologic features, and;
  - Consideration of severe and/or inequitable financial impacts.

Final amounts and allocations will be determined following consultation with groundwater basin managers and member agencies.

WSAP Penalty Rates

The Allocation Surcharge is based on the costs that Metropolitan and its member agencies are incurring to implement outdoor water use reductions through turf removal programs. The Allocation Surcharge is designed to provide a price signal based on the marginal conservation costs incurred to reduce water use in dry and shortage years. Any revenues collected from the Allocation Surcharge would be used to fund the implementation of the Turf Removal program or other similar programs designed to conserve water and reduce future demands.

- The Allocation Surcharge is based on Metropolitan's current cost of the turf removal program. Metropolitan is currently paying $2 per square foot of turf removed. The estimated water

savings is 44 gallons per year for each square foot of turf removed for a period of ten years. Based on this savings rate, the estimated cost of the program is $1,480 per acre-foot.

- Water use between 100 percent and 115 percent of WSAP supply allocations is charged with the Allocation Surcharge of $1,480 per acre-foot. Water use greater than 115 percent of WSAP supply allocations is charged two times the Allocation Surcharge or $2,960 per acre-foot. Two times the Allocation Surcharge provides funding for additional turf removal and conservation programs to conserve additional water and further reduce demand or, if appropriate, allow for a higher per square foot incentive payment.

AF – Acre-feet
CUP – Groundwater Conjunctive Use Program
CWD – County Water District
DWP – Drought Management Plan
IAWP – Interim Agricultural Water Program Reductions and Rates
IICP – Incremental Interruption and Conservation Plan
IRP – Integrated Resources Plan
GPCD – Gallons per Capita per Day
M&I – Municipal and Industrial
MWD – Municipal Water District
RUWMP – Regional Urban Water Management Plan
SWP – State Water Project
WSAP – Water Supply Allocation Plan
WSDM – Water Surplus and Drought Management

Definitions

Extraordinary Supplies- Deliberate actions taken by member agencies to augment the total regional water supply only when Metropolitan is allocating supplies through the WSAP.

Groundwater Recovery- The extraction and treatment of groundwater making it usable for a variety of applications by removing high levels of chemicals and/or salts.

In-lieu deliveries- Metropolitan-supplied water bought to replace water that would otherwise be pumped from the groundwater basins.

Seawater Barrier- The injection of fresh water into wells along the coast to protect coastal groundwater basins from seawater intrusion. The injected fresh water acts like a wall, blocking seawater that would otherwise seep into groundwater basins as a result of pumping.

Section 1: Introduction

Calendar Year 2007 introduced a number of water supply challenges for the Metropolitan Water District of Southern California (Metropolitan) and its service area. Critically dry conditions affected all of Metropolitan's main supply sources. In addition, a ruling in the Federal Courts in August 2007 provided protective measures for the Delta Smelt in the Sacramento-San Joaquin River Delta which brought uncertainty about future pumping operations from the State Water Project. This uncertainty, along with the impacts of dry conditions, raised the possibility that Metropolitan would not have access to the supplies necessary to meet total firm demands[1] and would have to allocate shortages in supplies to the member agencies.[2]

In preparing for this possibility, Metropolitan staff worked jointly with the member agency managers and staff to develop a Water Supply Allocation Plan (WSAP). The WSAP includes the specific formulas for calculating member agency supply allocations and the key implementation elements needed for administering an allocation should a shortage be declared. The WSAP became the foundation for the urban water shortage contingency analysis required under Water Code Section 10632 and was incorporated into Metropolitan's 2010 Regional Urban Water Management Plan (RUWMP).

Section 2: Development Process

Member Agency Input

Between July 2007 and February 2008, Metropolitan staff worked cooperatively with the member agencies through a series of member agency manager meetings and workgroups to develop a formula and implementation plan to allocate supplies in case of shortage. These workgroups provided an arena for in-depth discussion of the objectives, mechanics, and policy aspects of the different parts of the WSAP. Metropolitan staff also met individually with fifteen member agencies for detailed discussions of the elements of the recommended proposal. Metropolitan introduced the elements of the proposal to many nonmember retail agencies in its service area by providing presentations and feedback to a number of member agency caucuses, working groups, and governing boards. The discussions, suggestions, and comments expressed by the member agencies during this process contributed significantly to the development of this WSAP.

Board of Directors Input

Throughout the development process Metropolitan's Board of Directors was provided with regular progress reports on the status of this WSAP, with oral reports in September, October, and December 2007, an Information Board of Directors Letter with a draft of the WSAP in November 2007, and a Board of Directors Report with staff recommendations in January 2008. Based on Water Planning and Stewardship Committee discussion of the staff recommendations and further review of the report by

[1] Firm demands are also referred to as uninterruptable demands; likewise non-firm demands are also called interruptible demands.
[2] See Appendix A: Metropolitan Member Agencies.

the member agencies, refinements were incorporated into the WSAP for final consideration and action in February 2008. The WSAP was adopted at the February 12, 2008 Board of Directors meeting.[3]

The 12-Month Review Process

When the Board adopted the WSAP in February 2008, the decision specified a formal revisit of the WSAP commencing in February 2010. The scheduled revisit was meant to ensure the opportunity for Metropolitan staff and the member agencies to re-evaluate the WSAP and recommend appropriate changes to the Board of Directors.

In April 2009, the Board voted to implement the WSAP for the first time. The WSAP was implemented at a Level 2 allocation level, and was in effect for the period of July 1, 2009, through June 30, 2010. Since implementation of the 2009/10 WSAP began in July 2009, a number of practical issues relating to the WSAP were identified by staff and the member agencies for further consideration during the 12-Month Review Process. Metropolitan staff engaged with the member agencies in a formal review of the WSAP from January through May 2010. During the review process the member agency managers participated in a series of six workshops. The focus of these workshops was to facilitate in-depth discussion on WSAP-related issues and lessons learned since the WSAP was implemented in July 2009. The proposed adjustments to the WSAP developed during the review process were adopted at the August 17, 2010 Board of Directors meeting[4].

The Three-Year Review Process

The Board action to adopt of the WSAP in February 2008 also directed staff to review the WSAP formula three years after the February 2008 adoption. February 2011 marked the three-year anniversary since the adoption of the WSAP. Similar to the 12-Month Review Process, the purpose of the Three-Year Review Process was to provide an opportunity for Metropolitan staff and the member agencies to re-evaluate the plan and recommend appropriate changes for board consideration.

Metropolitan staff met with the member agencies in a formal review of the WSAP from February through August 2011. Staff and member agency managers participated in a series of eleven workshops. Proposed adjustments to the WSAP developed during the process were adopted at the September 13, 2011 Board of Directors meeting.[5]

[3] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix B: Water Supply Allocation Plan Process Timeline.

[4] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix C: 12-Month Review Process and Results.

[5] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix D: Three-Year Review Process and Results.

2014 Review Process

In 2014, California was challenged with a third year of severe drought.[6] Metropolitan managed its operations through significant use of regional storage reserves. It was anticipated that end of year total dry storage reserves would approach levels similar to those when the WSAP was last implemented in 2009.

Following discussion at the June 2014 Water Planning and Stewardship Committee, Metropolitan staff convened a member agency working group to revisit the WSAP. The purpose of the working group was to collaborate with member agencies to identify potential revisions to the WSAP in preparation for mandatory supply allocations in 2015. There were eight working group meetings and three discussions at the monthly Member Agency Managers' Meetings.

The process focused on three areas of the WSAP: the Base Period, the Allocation Formula, and the Allocation enforcement mechanism. Proposed adjustments to the WSAP developed during the process were adopted at the December 9, 2014 Board of Directors meeting. [7]

[6] The Governor of California proclaimed a State of Emergency due to drought conditions on January 17, 2014 and, on April 24, 2014 issued an Executive Order proclaiming a continued State of Emergency noting drought conditions have persisted for the last three years and authorizing adoption and implementation of emergency regulations.

[7] A complete listing of member agency meetings and Board of Directors reporting activities is contained in Appendix E: 2014 Review Process and Results.

Section 3: Review of Historical Shortage Plans[8]

The WSAP incorporates key features and principles from the following historical shortage allocation plans but will supersede them as the primary and overarching decision tool for water shortage allocation.

Interruptible Water Service Program

As part of the new rate structure implemented in 1981, Metropolitan's Board of Directors adopted the Interruptible Water Service Program (Interruptible Program) which was designed to address short-term shortages of imported supplies. Under the Interruptible Program, Metropolitan delivered water for particular types of use to its member agencies at a discounted rate. In return for this discounted rate, Metropolitan reserved the right to interrupt delivery of this Interruptible Program water so that available supplies could be used to meet municipal and industrial demands.

Incremental Interruption and Conservation Plan

The ability to interrupt specific deliveries was an important element of Metropolitan's strategy for addressing shortage conditions when it adopted the Incremental Interruption and Conservation Plan (IICP) in December 1990. Reductions in IICP deliveries were used in concert with specific objectives for conservation savings to meet needs during shortages. The IICP reduced Interruptible Service deliveries in stages and provided a pricing incentive program to insure that reasonable conservation measures were implemented.

1995 Drought Management Plan

The 1995 Drought Management Plan (DMP) was a water management and allocation strategy designed to match supply and demand in the event that available imported water supplies were less than projected demands. Adopted by the Metropolitan Board of Directors in November 1994, the 1995 DMP was a short-term plan designed to provide for the 1995 calendar year only. The primary objective of the 1995 DMP was to identify methods to avoid implementation of mandatory reductions. The 1995 DMP included various phases and a step-by-step strategy for evaluating supply and demand conditions and utilizing Metropolitan's available options, with the final phase being implementation of the revised IICP.

1999 Water Surplus and Drought Management Plan

Metropolitan staff began work on the Water Surplus and Drought Management (WSDM) Plan in March 1997 as part of the Integrated Water Resources Plan (IRP), which was adopted by Metropolitan's Board of Directors in January 1996. The IRP established regional water resource targets, identifying the need for developing resource management policy to guide annual operations. The WSDM Plan defined Metropolitan's resource management policy by establishing priorities for the use of regional resources to achieve the region's reliability goal identified in the IRP. In April 1999, Metropolitan's Board of Directors adopted the WSDM Plan.

[8] A summary of the key elements in the following allocation plan is found in Appendix F: Summary of Historical Shortage Plans.

The WSDM Plan also included a set of principles and considerations for staff to address when developing specific allocation methods. The WSDM Plan stated the following guiding principle to be followed in developing any future allocation scheme:

> *"Metropolitan will encourage storage of water during periods of surplus and work jointly with its member agencies to minimize the impacts of water shortages on the region's retail consumers and economy during periods of shortage."*[9]

This principle reflects a central desire for allocation methods that are both equitable and minimize regional hardship to retail water consumers. The specific considerations postulated by the WSDM Plan to accomplish this principle include the following:[10]

- The impact on retail customers and the economy
- Allowance for population and growth
- Change and/or loss of local supply
- Reclamation/Recycling
- Conservation
- Investment in local resources
- Participation in Metropolitan's interruptible programs
- Investment in Metropolitan's facilities.

Section 4: Water Supply Allocation Formula

Based on the guiding principle and considerations described in the WSDM Plan, Metropolitan staff and the member agencies developed a specific formula for allocating water supplies in times of shortage. The formula seeks to balance the impacts of a shortage at the retail level while maintaining equity on the wholesale level, and takes into account growth, local investments, changes in supply conditions and the demand hardening[11] aspects of non-potable recycled water use and the implementation of conservation savings programs. The formula, described below, is calculated in three steps: base period calculations, allocation year calculations, and supply allocation calculations.[12] The first two steps involve standard computations, while the third section contains specific methodology developed for this WSAP.

Base Period Calculations

The first step in calculating a water supply allocation is to estimate water supply and demand using a historical base period with established water supply and delivery data. The base period for each of the different categories of demand and supply is calculated using data from the fiscal years (July through June) ending 2013 and 2014.[13]

[9] WSDM Plan, p. 1. Emphasis added.
[10] WSDM Plan, p. 2.
[11] Demand hardening is the effect that occurs when all low-cost methods of decreasing overall water demand have been applied (e.g., low-flow toilets, water recycling) and the remaining options to further decrease demand become increasingly expensive and difficult to implement.
[12] Detailed operational elements of these objectives and a numerical example are discussed in Appendix G: Water Supply Allocation Formula Example.
[13] Exceptions to this methodology are noted in the descriptions of base period calculations.

Base Period Local Supplies: Local supplies for the base period are calculated using a two-year average of groundwater production, groundwater recovery, Los Angeles Aqueduct supply, surface water production, and other imported supplies. Non-potable recycling production is not included in this calculation due to its demand hardening effect.

Base Period Wholesale Demands: Demands on Metropolitan for the base period are calculated using a two-year average of firm purchases and in-lieu deliveries to long-term groundwater replenishment, conjunctive use, cyclic, and supplemental storage programs.

Base Period Retail Demands: Total retail-level municipal and industrial (M&I) demands for the base period are calculated by adding the Base Period Wholesale Demands and the Base Period Local Supplies. This estimates an average total demand for water from each agency.

Base Period Mandatory Conservation Credit: Metropolitan allows a consultation process that enables member agencies to describe mandatory water use restrictions and/or rationing restrictions that were in place within their service areas during the Base Period. Restrictions may vary among agencies but include restricted water uses, fines, and water budget or penalty based rate structures that are enacted by the governing body of the member agency or retail agency. Following the consultation process, Metropolitan staff will recommend adjustments based on evidence of reduced GPCD. To qualify for an adjustment, GPCD reductions would have to be observed that are beyond those expected from the agency's ongoing conservation efforts and trends.

Allocation Year Calculations

The next step in calculating the water supply allocation is estimating water needs in the allocation year. This is done by adjusting the base period estimates of retail demand for population or economic growth and changes in local supplies.

Allocation Year Retail Demands: Total retail M&I demands for the allocation year are calculated by adjusting the Base Period Retail Demands for baseline inflation and growth.

Baseline Inflation Adjustment: Baseline inflation occurs when non-potable recycling or conservation is developed after the Base Period. The development of these supplies reduces actual demands for water in the Allocation Year. Because non-potable-recycling and conservation are excluded from the WSAP formula, the actual need for water in the Allocation year is overestimated. The Baseline Inflation Adjustment removes increases in non-potable recycling and conservation annually from the Base Period forward to better reflect the true need for water in the Allocation Year.

Growth Adjustment: The growth adjustment is calculated using the estimated actual annual rate of population growth at the county level, as generated by the California Department of Finance, whenever possible. For years without complete data, the growth rate is calculated using an average of the three most recent years available. Growth will be allocated based on historical per capita water use during the Base Period, with a cap equal to Metropolitan's IRP Target for Water Use Efficiency. For

allocation years up to and including 2014, the cap will be 163 GPCD, and for allocation years 2015-2020 the cap will reduce linearly from 163 to 145 GPCD. On an appeals basis, member agencies may request that their adjustment be calculated using member agency level population growth. A weighted combination of actual population and actual employment growth rates may also be requested.

Allocation Year Local Supplies: Allocation Year Local Supplies include groundwater production, groundwater recovery, Los Angeles Aqueduct supply, surface water production, seawater desalination, and other imported supplies. Estimates of Allocation Year Local Supplies are provided by the member agencies upon implementation of a WSAP. If estimates are not provided, Metropolitan will use the sum of the Base Period Local Supplies and Base Period In-Lieu Deliveries as a default. Agencies may provide updated estimates at any time during the Allocation Year to more accurately reflect their demand for Metropolitan supplies.

Extraordinary Supplies: Under the WSAP formula, local supply production in the Allocation Year can either be designated as a "planned" supply, or as an "extraordinary" supply.[14] This is an important designation for a member agency because the two types of supplies are accounted for differently in the WSAP formula. Local supplies classified at Extraordinary Supply are only partially included (scaled depending on the WSAP Level) as local supplies. This has the effect of providing significantly more benefit to the member agency in terms of total water supply that is available to the retail customer.[15]

Allocation Year Wholesale Demands: Demands on Metropolitan for the allocation year are calculated by subtracting the Allocation Year Local Supplies from the Allocation Year Retail Demands.

Water Supply Allocation Calculations

The final step is calculating the water supply allocation for each member agency based on the allocation year water needs identified in Step 2. The following table displays the elements that form the basis for calculating the supply allocation. Each element and its application in the allocation formula are discussed below.

Table 1: Shortage Allocation Index

(a) Regional Shortage Level	(b) Wholesale Minimum Percentage	(c) Maximum Retail Impact Adjustment Percentage
1	92.5%	2.5%
2	85.0%	5.0%
3	77.5%	7.5%
4	70.0%	10.0%

[14] Appendix H: Board Policy Principles on Determining the Status of Extraordinary Supply lists the key Board principles used in determining if a supply qualifies as an Extraordinary Supply.

[15] See Appendix G: Water Supply Allocation Formula Example for specific allocation formulae.

5	62.5%	12.5%
6	55.0%	15.0%
7	47.5%	17.5%
8	40.0%	20.0%
9	32.5%	22.5%
10	25.0%	25.0%

Regional Shortage Level: The WSAP formula allocates shortages of Metropolitan supplies over ten levels.

Wholesale Minimum Allocation: The Wholesale Minimum Allocation ensures a minimum level of Metropolitan supplied wholesale water service to each member agency.

Maximum Retail Impact Adjustment: The purpose of this adjustment is to ensure that agencies with a high level of dependence on Metropolitan do not experience disparate shortages at the retail level compared to other agencies when faced with a reduction in wholesale water supplies. The Maximum Retail Impact Percentage is prorated on a linear scale based on each member agency's dependence on Metropolitan at the retail level. This percentage is then multiplied by the agency's Allocation Year Wholesale Demand to determine an additional allocation.

Conservation Demand Hardening Credit: The Conservation Demand Hardening Credit addresses the increased difficulty in achieving additional water savings at the retail level that comes as a result of successful implementation of water conserving devices and conservation savings programs. To estimate conservation savings, each member agency will establish a historical baseline Gallons Per Person Per Day (GPCD) calculated in a manner consistent with California Senate Bill SBx7-7.[16] Reductions from the baseline GPCD to the Allocation Year are used to calculate the equivalent conservation savings in acre-feet. The Conservation Demand Hardening Credit is based on an initial 10 percent of the GPCD-based Conservation savings plus an additional 5 percent for each level of Regional Shortage set by the Board during implementation of the WSAP. The credit will also be adjusted for:

- The overall percentage reduction in retail water demand
- The member agency's dependence on Metropolitan

The credit is calculated using the following formula:

Conservation Demand Harding Credit = Conservation Savings x (10% + Regional Shortage Level Percentage) x (1 +((Baseline GPCD – Allocation Year GPCD)/Baseline GCPD)) x Dependence on MWD Percentage

[16] California Department of Water Resources, February 2011, "Methodologies for Calculating Baseline and Compliance Urban Per Capita Water Use. Available at: http://www.water.ca.gov/wateruseefficiency/sb7/docs/MethodologiesCalculatingBaseline_Final_03_01_2011.pdf

This provides a base demand hardening credit equal to 10 percent of conservation savings and increases the credit as deeper shortages occur, which is when conservation demand hardening has a bigger impact on the retail consumer. The credit also increases based on the percentage of an agency's demand that was reduced through conservation. This accounts for increased hardening that occurs as increasing amounts of conservation are implemented. Lastly, the credit is scaled to the member agency's dependence on Metropolitan to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in Metropolitan supply.

Minimum Per-Capita Water Use Credit: This adjustment creates a minimum per capita water use threshold. Member agencies' retail-level water use is compared to two different thresholds. The proposed minimum thresholds are based upon compliance guidelines established under Senate Bill X7-7.

- 100 GPCD total water use
- 55 GPCD residential water use

Agencies that fall below either threshold under the WSAP will receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. If an agency qualifies under both thresholds, the one resulting in the maximum allocation adjustment will be given.[17] To qualify for this credit, member agencies must provide documentation of the total agency level population and the percent of retail level demands that are residential; no appeal is necessary.

Total WSAP Allocation: The allocation to an agency for its M&I retail demand is the sum of the Wholesale Minimum Allocation, the Retail Impact Adjustment, the Conservation Demand Hardening Credit, and the Minimum Per-Capita Water Use Credit.[18]

Total Metropolitan Supply Allocations: In addition to the WSAP Allocation described above, agencies may also receive separate allocations of supplies for and seawater barrier and groundwater replenishment demands. Allocations of supplies to meet seawater barrier demands are to be determined by the Board of Directors independently but in conjunction with the WSAP. Separating the seawater barrier allocation from the WSAP allocation allows the Board to consider actual barrier requirements in the Allocation Year and address the demand hardening issues associated with cutting seawater barrier deliveries. According to the principles outlined for allocating seawater barrier demands, allocations should be no deeper than the WSAP Wholesale Minimum Percentage implemented at that time.

The WSAP also provides a limited allocation for drought-impacted groundwater basins based on the following framework:[19]

[17] See Appendix J: Per Capita Water Use Minimum Example for specific minimum per-capita water use credit formulae and example.
[18] See Appendix G: Water Supply Allocation Formula Example for specific allocation formulae.
[19] See Appendix L: Groundwater Replenishment Allocation for more information.

1. Metropolitan staff will hold a consultation with the requesting member agency and the appropriate groundwater basin manager to document whether the basin is in one of the following conditions:
    a. Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or
    b. Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries
2. An allocation is provided based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would then be reduced by the declared WSAP Regional Shortage Level.

Section 5: WSAP Implementation

The WSAP will take effect if a regional shortage is declared by the Board of Directors. The following implementation elements are necessary for administering the WSAP during a time of shortage. These elements cover the processes needed to declare a regional shortage level as well as provide information pertaining to the allocation surcharge.

Allocation Period

The allocation period covers twelve consecutive months, from July of a given year through the following June. This period was selected to minimize the impacts of varying State Water Project (SWP) allocations and to provide member agencies with sufficient time to implement their outreach strategies and rate modifications.

Setting the Regional Shortage Level

Metropolitan staff is responsible for recommending a Regional Shortage Level for the Board of Directors' consideration. The recommendation shall be based on water supply availability, and the implementation of Metropolitan's water management actions as outlined in the WSDM Plan. Metropolitan staff will keep the Board of Directors apprised to the status of water supply conditions and management actions through monthly reports to the Water Planning and Stewardship Committee. To further facilitate staff in the development of a recommended regional shortage level, member agency requests for local supply adjustments shall be submitted by April 1st.

Metropolitan's Board of Directors, through the Water Planning and Stewardship Committee, is responsible for approving the final Regional Shortage Level at its April meeting. By the April meeting, the majority of the winter snowfall accumulation period will have passed and will allow staff to make an allocation based on more stable water supply estimates. Barring unforeseen large-scale circumstances, the Regional Shortage Level will be set for the entire allocation period, which will provide the member agencies an established water supply level for their planning.

Exit Strategy

While the Board ultimately has discretion to implement or lift and allocation at any point of time during the year; the WSAP includes a two-part exit strategy that is meant to streamline the WSAP implementation decision making process.

- If the Board decides to implement the WSAP, then any current WSAP allocation would remain in place until the end of the Allocation Year.
- If the Board decides not to implement the WSAP, then any current WSAP allocation would be terminated concurrent with the Board decision.

Allocation Appeals Process

An appeals process is necessary for the administration of any changes or corrections to an agency's allocation. Metropolitan's General Manager will designate, subsequent to a declaration of an allocation by the Board of Directors, an Appeals Liaison as the official point of contact for all information and inquiries regarding appeals. All member agency General Managers will be notified in writing of the name and contact information of the Appeals Liaison. Only appeals that are made through the Appeals Liaison and in accordance with the provisions outlined in Appendix N: Allocation Appeals Process will be evaluated. Basis for appeals claims can include but are not limited to:

- Adjusting erroneous historical data used in base period calculations
- Adjusting for population growth rates
- Determining if a local supply qualifies as Extraordinary Supply

Additional details and a checklist for the appeals process are available in Appendix N: Allocation Appeals Process and Appendix O: Appeals Submittal Checklist.

Allocation Surcharge

Member agency allocations are supported by an Allocation Surcharge. The Allocation Surcharge is charged to water use above the Member Agency allocation and is charged in addition to Metropolitan's standard rates for water service. Allocation Surcharges will only be assessed to the extent that an agency's total annual usage exceeds its total annual allocation. Any revenues collected through the Allocation Surcharge will be applied towards Metropolitan's Water Management Fund, which is used to in part to fund expenditures in dry-year conservation. No billing or assessment of allocation surcharges rates will take place until the end of the twelve-month allocation period.

Allocation Surcharge: The application of the Allocation Surcharge structure is a two tier structure that provides a lower level of Allocation Surcharge for minor overuse of allocations and a higher level of Allocation Surcharge for major overuse of allocations. The structure and applicable Allocation Surcharges are listed in Table 2.

Table 2: Allocation Surcharge			
Water Use	**Base Water Rate[20]**	**Allocation Surcharge[21]**	**Total Rate**
100% of Allocation	Tier 1	0	Tier 1
Between 100% and 115%	Tier 1	$1,480	Tier 1 + ($1,480)
Greater than 115%	Tier 1	$2,960	Tier 1 + ($2,960)

Qualifying Income-Based Rate Allocation Surcharge Adjustment:[22] Any Allocation Surcharges incurred by a member agency under the WSAP will be adjusted to reflect the extent to which retail customers within a member agency's service area are served under a "lifeline" or similar qualified discounted rate program based on income or ability to pay ("Income-Based Rate").

Any member agency who is assessed Allocation Surcharges under the WSAP may submit an acre-foot equivalent of water used by retail customers served under a qualifying Income-Based Rate.[23] This amount of water use would be multiplied by the percentage of retail-level reduction in allocation year demand necessary for that member agency to avoid exceeding its WSAP allocation. The monetary amounts resulting from these acre feet are subtracted from the total monetary amounts incurred by an agency for exceeding its allocation. In the case that the monetary amounts associated with the Income-Based Rate are greater than the total Allocation Surcharges an agency incurs, no Allocation Surcharges will be incurred. The end result of this adjustment is that the member agency will not be subject to Allocation Surcharges for the use of water by their retail customers served under a qualifying Income-Based Rate.

Growth Rate Allocation Surcharge Adjustment": In recognition of member agency differences in geography and climate, a Growth Rate Allocation Surcharge Adjustment will be given to any agency that exceeds its WSAP Allocation. The Allocation Surcharge reduction will be based on the difference in acre-feet between the Growth Adjustment applied at Metropolitan's IRP planning goal rate, and the greater of the following:

- The IRP planning goal rate adjusted for the member agency's ETo, or
- The member agency's certified and documented 20x2020 targeted GPCD

If both of these alternatives result in a lower growth adjustment than the IRP planning goal, no Allocation Surcharge reduction will be made.

[20] The base water rate shall be the applicable water rate for the water being purchased. In most cases, it will be the Tier 1 rate (plus Treatment Surcharge for treated water deliveries). However, it is possible that the water being purchased would be in the amount that would put an agency beyond its Tier 1 limit. In that case, the base water rate will be the Tier 2 rate (plus Treatment Surcharge for treated water deliveries).

[21] Allocation Surcharge is applied to water use in excess of an agency's WSAP allocation.

[22] See Appendix K: Qualifying Income-Based Rate Allocation Surcharge Adjustment Example for specific penalty adjustment formulae and example.

[23] Appropriate documentation and certification will be required.

Tracking and Reporting

Subsequent to a declared regional shortage by the Board of Directors, Metropolitan staff will produce monthly reports of each member agency's water use compared to its allocations based on monthly delivery patterns to be submitted by the member agency. In order to produce these reports, member agencies are requested to submit their local supply use on a monthly basis and certify end of allocation year local supply use. These reports and comparisons are to be used for the purposes of tracking and communicating potential underage/overage of an agency's annual allocations.

Key Dates for Water Supply Allocation Implementation

The timeline for implementation of an allocation is shown in Table 3. A brief description of this timeline follows:

January to March: Water Surplus and Drought Management reporting occurs at Metropolitan's Water Planning and Stewardship Committee meetings. These reports will provide updated information on storage reserve levels and projected supply and demand conditions.

April: Member agencies report their projected local supplies for the coming allocation year. This information is incorporated in staff analysis of storage reserves and projected supply and demand conditions in order to provide an allocation recommendation to the Board. Metropolitan's Board will consider whether an allocation is needed. A declaration of an allocation will include the level of allocation to be in effect for the allocation year. Likewise, member agencies will report their projected demands and local supplies needed to meet seawater barrier and groundwater replenishment requirements for the allocation year. Metropolitan's Board will consider whether allocations for seawater barrier demands and groundwater replenishment demands are needed independently from the WSAP allocation decision.**July 1st**: If the Board declared an allocation in April, then it will be effective starting July 1st. The allocation level will be held through June 30th, barring unforeseen circumstances. Member agencies will now be requested to submit their local supply use on a monthly basis and certify end of allocation year local supply use. Local production data must be reported to Metropolitan by the end of the month following the month of use (use in July must be reported by the end of August). This information will be combined with Metropolitan sales information in order to track retail water use throughout Metropolitan's service area. Each month Metropolitan will report on member agency water sales compared to their allocation amounts.

June 30th: The allocation year is complete.

July: Member agency local supplies must be certified for the month of June, the last month of the previous allocation year.

August: Metropolitan will calculate each member agency's total potable water use based on local supply certifications and actual sales data for the allocation year of July through June. Allocation surcharges will be assessed for usage above a given member agency's final adjusted allocation (reflecting the actual local supply and imported water use that occurred in the allocation year).

Appendix C: 12-Month Review Process and Results

January 2010

- WSAP 12-Month Review Process workshop #1
    - Focused discussion of WSAP issues identified by Metropolitan staff and by member agencies since the July 2009 implementation began.

February 2010

- WSAP 12-Month Review Process workshop #2
    - Continuation of focused discussion
- WSAP 12-Month Review Process workshop #3
    - Continuation of focused discussion

March 2010

- WSAP 12-Month Review Process workshop #4
    - Continuation of focused discussion
- MWD Board of Directors information item
    - Review of potential modifications to the WSAP definition of Extraordinary Supply

April 2010

- WSAP 12-Month Review Process workshop #5
    - Recap of identified issues and discussion of Metropolitan staff proposals for adjustments to the WSAP
- Member Agency Managers Meeting
    - Update on the 12-Month Review Process
- WSAP 12-Month Review Process workshop #6
    - Discussion of WSAP issues related to groundwater replenishment
- Member Agency Managers conference call
    - Clarification of WSAP definition for Extraordinary Supply

May 2010

- Member Agency Managers Meeting
    - Discussion of proposed Extraordinary Supply policy principles and WSAP Local Supply certification process.
- Member Agency Managers conference call
    - Discussion of proposed Extraordinary Supply policy principles

June 2010

- MWD Board of Directors action item

July 2010

- MWD Board of Directors information item
    - Review of proposed adjustments to the WSAP developed in the 12-Month Review Process

August 2010

- MWD Board of Directors action item

Resulting Changes

- Removed references to Gains and Losses of Local Supply
    - Removed references in the WSAP to "gains and losses of local supplies" in order to better facilitate the accounting of historical base year and allocation year local supplies. This change did not affect the WSAP formula or allocations.
- Removed references to the Regional Shortage Percentage
    - Removed references to the "Regional Shortage Percentage" in the WSAP to reduce unintended confusion between calculation factors and shortage amounts. This change did not affect the WSAP formula or allocations.
- Included the Retail Impact Adjustment in all shortage levels
    - Included the Retail Impact Adjustment for Regional Shortage Levels 1 and 2. This change results in additional allocations to Metropolitan-dependent agencies under Level 1 and Level 2 regional shortages.
- Revised the accounting of Extraordinary Supplies
    - Revised the methodology for accounting of Extraordinary Supply in the WSAP formula by:
        - Removing the Base Period Local Supply threshold provision,
        - Removing the sliding-scale sharing mechanism from the formula, and
        - Including the full amount of the Extraordinary Supply in the calculation of the Retail Impact Adjustment.
- Included a Minimum Per Capita Water Use Threshold
    - Developed a minimum water use credit based on two GPCD water use thresholds. Member agencies would receive additional Metropolitan allocation for an acre-foot equivalent of GPCD below the minimum threshold. Member agency water use, on a gallon per capita per day (GPCD) basis, is compared to the following minimum thresholds established under Senate Bill X7-7 (Water Conservation Act of 2009)
        - 100 GPCD total use or
        - 55 GPCD residential indoor use
- Excluded Seawater Barrier from the WSAP Formula
    - Excluded seawater barrier supplies from the WSAP Base Period and Allocation Year local supply calculations. This allows the Board to determine allocations for seawater barrier demands separately from the WSAP.

Appendix D: Three-Year Review Process and Results

February 2011

- WSAP 3-Year Review Process workshop #1
    - Review of the existing WSAP policy formula; review of the process timeline; and focused discussion of WSAP issues identified by Metropolitan staff and by member agencies since the WSAP's adoption in February 2008

March 2011

- WSAP 3-Year Review Process workshop #2
    - Discussion of issues related to local supplies and baseline inflation due to adjustments for recycling in the WSAP formula
- WSAP 3-Year Review Process workshop #3
    - Continuation of prior workshop

April 2011

- WSAP 3-Year Review Process workshop #4
    - Discussion of issues and alternatives related to base period selection and baseline inflation in the WSAP formula
- WSAP 3-Year Review Process workshop #5
    - Discussion of recommendations to address baseline inflation in the WSAP formula

May 2011

- WSAP 3-Year Review Process workshop #6
    - Discussion of issues and alternatives for the growth adjustment methodology in the WSAP formula
- WSAP 3-Year Review Process workshop #7
    - Continuation of prior workshop

June 2011

- WSAP 3-Year Review Process workshop #8
    - Continuation of prior workshop, discussion of WSAP implementation exit strategy
- WSAP 3-Year Review Process workshop #9
    - Continuation of exit strategy discussion, discussion of baseline inflation due to conservation and related conservation demand hardening issues

July 2011

- WSAP 3-Year Review Process workshop #9
    - Continued discussion of baseline inflation and conservation issues, and discussion of sharing allocations between agencies with common local resources

August 2011

- WSAP 3-Year Review Process workshop #10
    - Discussion of WSAP Allocation Year timing vs. Tier 1-Tier 2 rate cycle timing, discussion of approaches for encouraging completion of WSAP local supply certifications
- Review WSAP at Member Agency Managers Meeting
    - Discussion of proposed WSAP adjustments to address baseline inflation issues, revise the growth adjustment methodology, and establish a WSAP exit strategy

September 2011

- MWD Board of Directors action item

Resulting Changes

- Baseline Inflation Adjustment
    - Removed non-potable recycling and conservation from the WSAP baseline
        - Increases in recycling and conservation will be subtracted annually from the Base Period forward
        - The annual population growth rate will be applied after deducting the annual increases in recycling and conservation
        - If an agency ends up in allocation penalty, a penalty reduction will be applied in an amount equal to the Code-Based and rate Structure conservation savings that were removed from the WSAP baseline
- Changed the Growth Adjustment methodology
    - Growth will be allocated at historical per capita rate capped at the 2010 Integrated Water Resource Plan (IRP) Target for Water Use Efficiency
        - For years up to and including 2014, the cap will be 163 GPCD
        - For years 2015-2020, the cap will reduce linearly from 163 to 145 GPCD
    - If an agency exceeds its allocation, a penalty reduction will be applied based on either:
        - The differential Evapotranspiration (ETo) of its service area compared to the MWD average, or
        - Certified and documented 20 x 2020 targeted GPCD
- Exit Strategy
    - Clarified the course of action for an existing WSAP allocation when Metropolitan's Board makes a declaration decision for the following WSAP year
        - If there is an allocation for the next year, then the current allocation stays in place
        - If there is no allocation for the next year, then the current allocation is lifted concurrent with the April decision

Appendix E: 2014 Review Process and Results

July 2014

- WSAP Workgroup Meeting #1
  - First meeting of the 2014 WSAP Review process; review of the existing WSAP policy and formula; review of the process timeline; began discussion of issues related to base period selection
- WSAP Workgroup Meeting #2
  - Discussion of base period selection

August 2014

- WSAP Workgroup Meeting #3
  - Continuation of prior workshop discussion; comparison of base period alternatives

September 2014

- WSAP Workgroup Meeting #4
  - Discussion of a base period proposal; discussion of replenishment issues in the WSAP; discussion of 2015 water supply scenarios
- Review WSAP at Member Agency Managers Meeting
  - Review of WSAP workgroup process; discussion on issues related to base period, demand hardening, and local resources development
- WSAP Workgroup Meeting #5
  - Review of base period recommendation; discussion of issues regarding agencies in mandatory conservation during a base period; discussion on replenishment in the WSAP

October 2014

- WSAP Workgroup Meeting #6
  - Continuation of prior workshop discussion; discussion of alternative methods for conservation demand hardening credit; discussion of new and existing local supplies
- Review WSAP at Member Agency Managers Meeting
  - Review of WSAP workgroup process; discussion of issues related to base period and demand hardening

November 2014

- WSAP Workgroup Meeting #7
  - Review and discussion of issues and potential methods for base period selection and adjustment, replenishment allocation, and conservation demand hardening credit; review of estimated effects of potential WSAP changes at the regional level
- WSAP Workgroup Meeting #8
  - Review of proposed recommendations for the WSAP based on workgroup discussion
- Review WSAP at Member Agency Managers Meeting
  - Review of proposed recommendations for the WSAP based on workgroup discussion

Resulting Changes

- Base Period Update to FY2013 and FY2014
    - Changed the WSAP Base Period from calendar years 2004-2006 to fiscal years ending July 2013 and 2014
    - Mandatory Conservation Adjustment
        - Agencies with mandatory conservation in effect during the base period (FY 2013 and/or FY 2014) may qualify for a demand hardening adjustment, adjustment is subject to a consultation process that includes consideration historical demand and GPCD information

- Modify Conservation Demand Hardening Credit
    - Replaced device calculation-based estimates of conservation savings with a GPCD-based method
        - Conservation savings are calculated by comparing GPCD from a historical baseline to the Allocation Year; the difference is converted to acre-feet using the Allocation Year population.
            - Baseline GCPD is 10-year average ending between 2004 and 2010, with gross water, using gross water use minus non-potable recycled water production and documented historical population
    - Replaced formula for calculating the credit for each Regional Shortage Level
    - Conservation Demand hardening credit will be based on an initial 10 percent of GPCD-based conservation savings plus an additional 5 percent for each level of Regional Shortage; the credit will also be adjusted for the overall percentage reduction in retail water demand and the member agency's dependence on Metropolitan.
- Allocation Surcharge
    - Replaced the WSAP Penalty Rate with an Allocation Surcharge based on the estimated cost of Turf Replacement conservation programs

Appendix F: Summary of Historical Shortage Plans

These five elements incorporated into the WSAP have, in four out of five instances, been used in previous shortage plans. Both the IICP and the 1995 DMP used a historical base period calculation, adjusted for growth, made local supply adjustments, and used conservation hardening credits in their formulations. The retail impact adjustment is the only feature of the WSAP that has not been used historically.

Table 5: Historical Shortage Plan Overview

Plan Element	1991 IICP	1995 DMP	WSAP
Historical Base Period	√	√	√
Growth Adjustment	√	√	√
Local Supply Adjustment	√	√	√
Conservation Hardening Credit	√	√	√
Retail Impact Adjustment			√

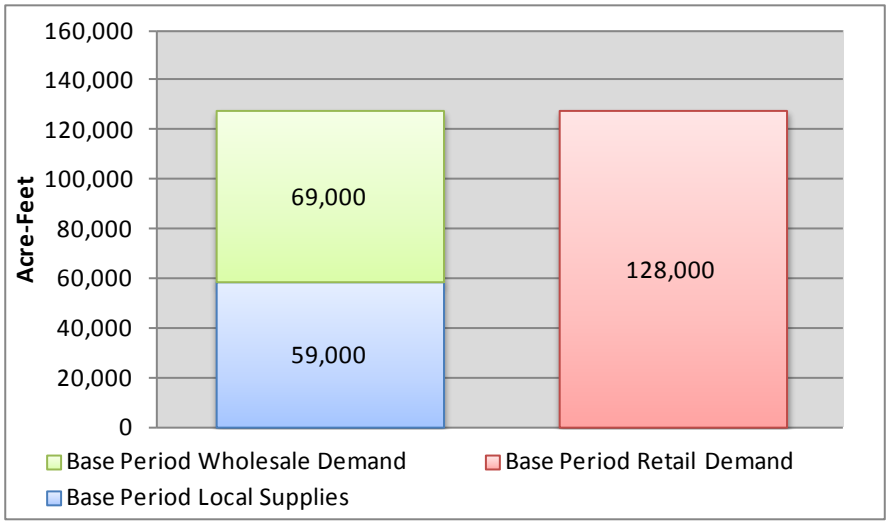
Appendix G: Water Supply Allocation Formula Example

The following example gives a step-by-step description of how the formula would be used to calculate an allocation of Metropolitan supplies for a hypothetical member agency. All numbers are hypothetical for the purpose of the example and do not reflect any specific member agency.

Step 1: Calculate Base Period Retail Demand

Base Period Local Supplies: Calculated using a two-year average of groundwater (gw), groundwater recovery (gwr), Los Angeles Aqueduct supply (laa), surface water (sw), seawater desalination (sd), and other non-Metropolitan imported supplies (os). For the purpose of this example, assume that the two year average is 59,000 af.

$$[(gw1+gwr1+laa1+sw1+sd1+os1) + (gw2+gwr2+laa2+sw2+sd2+os2)] \div 2 = 59{,}000 \text{ af}$$



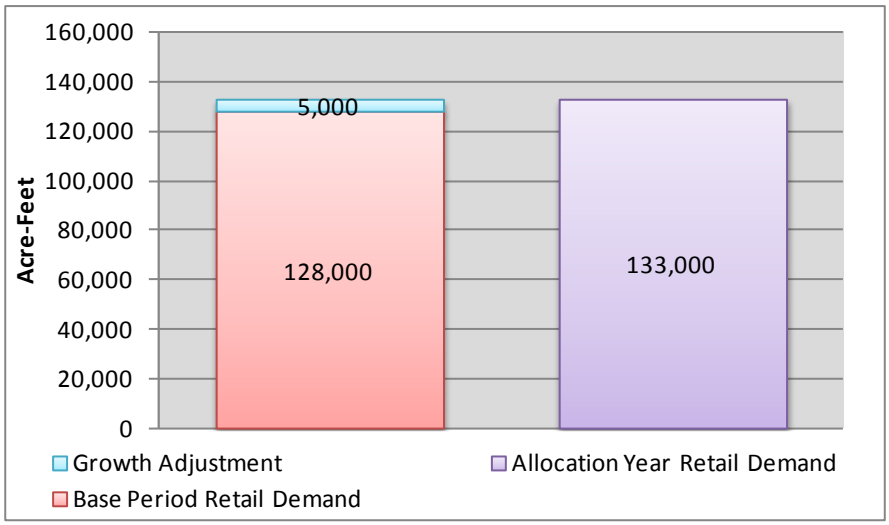
Base Period Wholesale Demands: Calculated using the same two-year time period as the Base Period Local Supplies. The Base Period Wholesale Demands include firm purchases (fp) and in-lieu deliveries to long-term groundwater replenishment (il), conjunctive use (cup), cyclic (cyc), and supplemental storage programs (ss). For the purpose of this example, assume that the two year average is 69,000 af.

$$[(fp^1{+}{+}il^1{+}cup^1{+}cyc^1{+}ss^1) + (fp^2{+}il^2{+}cup^2{+}cyc^2{+}ss^2)] \div 2 = 69{,}000 \text{ af}$$

Base Period Retail Demands: Calculated as the sum of the Base Period Local Supplies and Base Period Wholesale Demand.

$$59{,}000 + 69{,}000 = 128{,}000 \text{ af}$$

Figure 1: Base Period Retail Demand Calculation



Calculate Adjustment for Base Period Mandatory Rationing (if applicable): The hypothetical agency used in this example is assumed not to qualify for the Base Period Mandatory Rationing Adjustment. A detailed discussion of the adjustment methodology can be found in Appendix I: Base Period Rationing Adjustment Example.

Step 2: Calculate Allocation Year Retail Demand

Allocation Year Retail Demand: Calculated by adjusting the Base Period Retail Demand for any baseline inflation and growth that occurred since the Base Period.

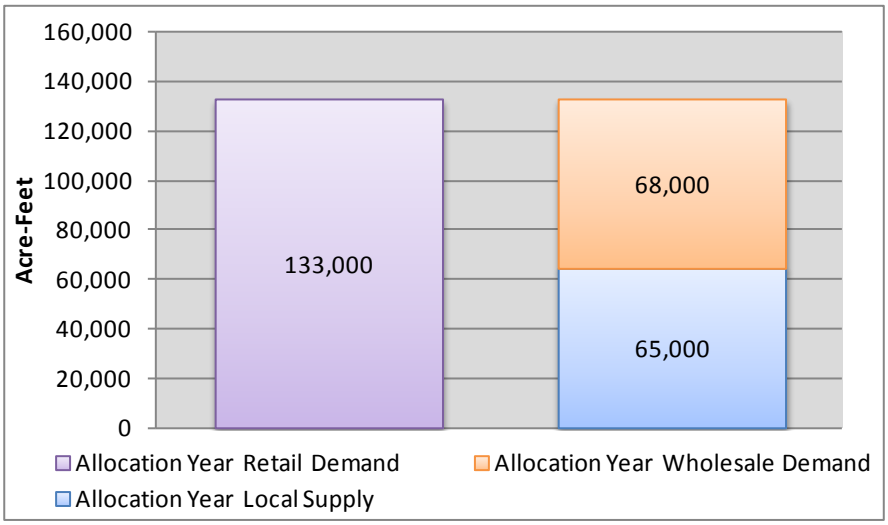
128,000 af + 5,000 af (net adjustment to retail demand) = 133,000 af

Figure 2: Allocation Year Retail Demand Calculation

Step 3: Calculate Allocation Year Wholesale Demand

Allocation Year Local Supplies: Estimates of Allocation Year Local Supplies are provided by the member agencies upon implementation of a WSAP. If estimates are not provided, Metropolitan will use the sum of the Base Period Local Supplies and Base Period In-Lieu Deliveries as a default. Agencies may provide updated estimates at any time during the Allocation Year to more accurately reflect their demand for Metropolitan supplies. For this example assume that the Allocation Year Local Supplies total 65,000 acre-feet.

Allocation Year Local Supplies = 65,000 af



For this example assume also that this agency has an additional 5,000 acre-feet of supplies that meet the determinations for Extraordinary Supply. These supplies are withheld from the allocation formula except for in calculating the Retail Impact Adjustment Allocation.

Extraordinary Local Supplies = 5,000 af

Allocation Year Wholesale Demands: Calculated by subtracting the Allocation Year Local Supplies (65,000 af) from the Allocation Year Retail Demands (133,000 af).

133,000 af - 65,000 af = 68,000 af

Figure 3: Allocation Year Wholesale Demand Calculation

Step 4: Calculate the Wholesale Minimum Allocation

Wholesale Minimum Percentage: Calculate from Table 1 for Regional Shortage Level 4.

Table 1: Shortage Allocation Index		
(a) Regional Shortage Level	(b) Wholesale Minimum Percentage	(c) Maximum Retail Impact Adjustment Percentage
4	70.0%	10.0%

Wholesale Minimum Allocation: Calculated by multiplying the agency's Allocation Year Wholesale Demand (68,000 af) by the Wholesale Minimum Percentage (70%) from the Table 1 for Regional Shortage Level 4.

68,000 af * 70% = 47,600 af

Step 5: Calculate the Retail Impact Adjustment Allocation

Maximum Retail Impact Adjustment Percentage: Calculate from Table 1 for Regional Shortage Level 4.

Retail Impact Adjustment Allocation: Calculated first by determining the agency's dependence on Metropolitan by dividing the Allocation Year Wholesale Demand (68,000 af) minus the Extraordinary Supply (5,000 af) by the Allocation Year Retail Demand (133,000 af) and multiplying by 100.

[(68,000 af - 5,000 af)/ 133,000 af] * 100 = 47%

Next, this percentage dependence on Metropolitan (47%) is multiplied by the Maximum Retail Impact Percentage for Shortage Level 4 (10%).

47% * 10% = 4.7%

This percentage is now multiplied by the Allocation Year Wholesale Demand (68,000 af) for the Retail Impact Adjustment Allocation.

68,000 af * 4.7% = 3,221 af

Step 7: Calculate the Conservation Demand Hardening Adjustment

Calculate Baseline GPCD: To estimate conservation savings, each member agency will establish a historical baseline GPCD calculated in a manner consistent with California Senate Bill SBx7-7, using a 10 or 15-year average ending between 2004 and 2010, using gross water use minus non-potable recycle water production and documented historical population. For this example assume that the Baseline GPCD is 154 GPCD

Baseline GPCD = 154 GPCD

Calculate Allocation Year GPCD: Next, calculate the allocation year GPCD by converting the Allocation Year Retail Demand to GPCD and dividing by the Allocation Year Population from the WSAP. For this example the Allocation Year Retail Demand is 133,000 AF (see Step 2 above) and assume the Allocation Year Population is 905,000 persons. The resulting GPCD is 131 GPCD.

Allocation Year GPCD = 133,000 af/year * 325,851 gallons/af ÷ 365 days/year ÷ 905,000 persons = 131 GPCD

Calculate Reduction in GPCD: Subtract Allocation Year GPCD from Baseline GPCD to determine the GPCD Reduction.

GPCD Reduction = 154 GPCD – 131 GPCD = 23 GPCD

Calculate Conservation Savings: Convert the GPCD Reduction to the equivalent annual conservation savings in acre-feet, using the Allocation Year Population.

$$\text{Conservation Savings} = \frac{(\text{GPCD Reduction}) \times 365 \text{ days/yr} \times \text{Population})}{325{,}851 \text{ gallons/af}}$$

Conservation Savings = 23 x 365 x 905,000 ÷ 325,851 = 23,316 af

Multiply by Regional Shortage Level Percentage: Multiply the Conservation Savings by 10 percent plus an additional 5 percent for each level of Regional Shortage (see Step 4 above). This example assumes a Regional Shortage Level of 4. This scales the hardening credit by the level of regional shortage, thereby increasing the credit as deeper shortages occur when demand hardening has a larger impact on the retail consumer.

23,316 af x (10% + (4 x 5%) = 6,995 af

Multiply by Conservation Savings Percentage: Next, multiply by the percentage of an agency's demand that was reduced through conservation. This scales the hardening by the total percentage reduction to recognize that increased hardening occurs as increasing amounts of conservation are implemented.

Conservation Savings Percentage = 1 + ((Baseline GPCD – Allocation Year GPCD)/Baseline GPCD)

Conservation Savings Percentage = 1+ ((154 GPCD – 131 GPCD)/154 GPCD) = 115%

6,995 af x 115% = 8,044 af

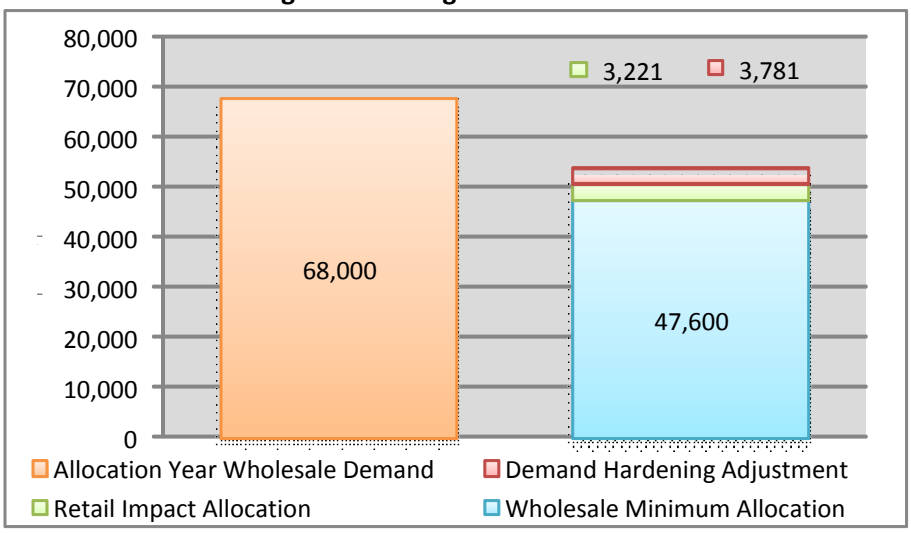
Multiply by Dependence on MWD: Next, multiply by the agency's percentage dependence on MWD as shown in Step 5 above. This scales the credit to the member agency's dependence on MWD to ensure that credits are being applied to the proportion of water demand that is being affected by reductions in MWD's supply. For this example, dependence on MWD is 47%.

8.044 af x 47% = 3,781 af

Summary: The Conservation Demand Hardening Adjustment calculation is summarized by the following formula:

Conservation Demand Hardening Adjustment = Conservation Savings x (10% + Regional Shortage Level %) x (1+Conservation%) x Dependence on MWD %

Conservation Demand Hardening Adjustment = 23,316 af x (10% + (4 x 5%)) x (115%) x (47%) = 3,781 af



Step 8: Calculate the Low Per-Capita Adjustment Allocation: The hypothetical agency used in this example is assumed not to qualify for the Low Per-Capita Adjustment. A detailed discussion and example of the Low Per-Capita Adjustment calculation can be found in Appendix J: Per Capita Water Use Minimum Example.

Step 9: Calculate the total WSAP Allocation

WSAP Allocation: Calculated by adding the Wholesale Minimum Allocation (47,600 af), the Maximum Retail Impact Adjustment (3,221 af), the Demand Hardening Adjustment (3,781 af), and the Low Per-Capita Adjustment (0 af).

47,600 af + 3,221 af + 3,781 af + 0 af = 54,602 af

Figure 4: WSAP Allocation Regional Shortage Level 4

Step 10: Calculate total retail level reliability

Retail level reliability: Calculated by adding the WSAP Allocation (54,602 af), the Allocation Year Local Supply (65,000 af) and the Extraordinary Local Supply (5,000 af) and dividing by the Allocation Year Retail Demand (133,000 af).

(54,602 af + 65,000 af + 5,000 af) ÷ 133,000 af = 93.7%

Total Metropolitan Supply Allocations: In addition to the WSAP Allocation described above, agencies may also receive separate allocations of supplies for groundwater replenishment and seawater barrier demands. More information on the groundwater replenishment allocation is located in Appendix L: Groundwater Replenishment Allocation.

Appendix H: Board Policy Principles on Determining the Status of Extraordinary Supply

At the June 8, 2010 Water Planning and Stewardship Committee meeting Metropolitan's Board of Directors adopted the following policy principles to guide staff in determining the Extraordinary Supply status of future member agency supply programs.

No Negative Impacts to Other Member Agencies

A potential Extraordinary Supply for a member agency should not decrease the amount of Metropolitan water supply that would be available to the other member agencies in a WSAP. Programs that utilize Metropolitan supplies as a primary or in-lieu source or as a means of payback or future replenishment may have the effect of decreasing supplies, available to other agencies, if designated as Extraordinary Supply.

Provides Supply in Addition to Existing Regional Supplies

A potential Extraordinary Supply should provide a water supply that increases the overall water supplies that are available to the region in a WSAP. A program that is designed to move existing regional supplies from year to year would not qualify.

Specifically Designed Program or Supply Action

A potential Extraordinary Supply must be intentionally created and operated to provide additional supply yield. Normal variations in existing and planned local supply programs would not qualify.

Intended for Consumptive Use in a WSAP

A potential Extraordinary Supply should be designed with the primary intention to deliver water supply to a member agency only at a time when Metropolitan is allocating supplies. Programs designed to deliver water on a regular basis would not qualify. Exceptions for reasonable use of a supply program for emergency or other extenuating local circumstances should be considered.

Fully Documented Resource Management Actions

A potential Extraordinary Supply should have a full description as to the source, transmission, distribution, storage, and delivery of the water supply.

These principles are intended to identify deliberate actions taken by member agencies to augment supplies only when Metropolitan is allocating supplies through the WSAP. Production from existing local supplies, programs that are operated on an ongoing basis, and incidental increases in water supply would not qualify as Extraordinary Supply. The intent of the Extraordinary Supply designation is to recognize programs and actions that are additive to the total regional water supply as the region continues to confront the water supply challenges from drought and regulatory conditions. To that end, any supply actions taken after the initial implementation of the WSAP in July 2009 that utilize Metropolitan supplies either as a primary source, or to refill or replenish an incurred obligation or deficit at a future date would not qualify as Extraordinary Supply.

Appendix I: Base Period Mandatory Rationing Adjustment

Agencies that were under mandatory water use restrictions during the Base Period may have water use that is lower due to the mandatory actions already taken. Without adjusting for this, those agencies could be required to enforce even higher levels of restrictions under an allocation than those agencies that had not started mandatory restrictions.

To qualify for a Base Period Mandatory Rationing Adjustment, the member agency must provide Metropolitan staff with the following information:

- Time period when the mandatory conservation was in effect; it must be in effect during the Base Period
- A statement, with documentation, of how drought restrictions comply with the following Mandatory Conservation qualifications:
    - Governing Body-authorized or enacted
    - Includes mandatory demand reduction actions, restrictions or usage limitations including penalty-backed water budgets
    - Enforced by assessing penalties, fines, or rates based upon violating restrictions or exceeding usage limitations
- If the agency in question is a retail subagency, then the retailer's base period water demands during the Base Period in order to determine proportion to the member agency's total demand
- Historical data to construct GPCD base and trend for the consultation

Calculating the Base Period Rationing Adjustment involves following steps:

- Use the Baseline GPCD 10 or 15-year period selected by member agency for the Conservation Demand Hardening Adjustment calculation.
- Interpolate from the GPCD value of the midpoint of the Baseline GPCD period to the average GPCD of the two years preceding the agency's mandatory conservation
- Extrapolate to the WSAP Base Period (FY2013 and FY2014)
- Calculate the difference between estimated and observed GPCD for FY2013 and FY2014
- Convert to Acre-Feet and add to the member agency's Base Period Retail Demands

Appendix J: Per-Capita Water Use Minimum Example

This adjustment creates a minimum per capita water use threshold. Member agencies' retail-level water use under the WSAP is compared to two different thresholds. The minimum water use levels are based on compliance guidelines for total and residential water use established under Senate Bill X7-7.

Total Retail Level Use: 100 GPCD
Residential Retail Level Use: 55 GPCD

Agencies that fall below either threshold under the WSAP would receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. To qualify for this credit, member agencies must provide documentation of the total agency level population and the percent of retail level demands that are residential; no appeal is necessary.

The following example gives a step-by-step description of how the Low Per-Capita Water Use Adjustment would be calculated for a hypothetical member agency. All numbers are hypothetical for the purpose of the example and do not reflect any specific member agency. This example was calculated using the following assumptions:

Allocation Year Retail Demand: 50,000 acre-feet
Allocation Year Local Supplies: 25,000 acre-feet;
Allocation Year Wholesale Demand: 25,000 acre-feet
Base Period Conservation: 5,000 acre-feet
Agency Population: 375,000
Percent of Retail Demands that are Residential: 60%

Step 1: Calculate Total Retail-Level Allocation Year Supplies

Table 6 shows the Allocation Year Local Supply, WSAP Allocation, and the total Allocation Year Supplies for the example agency at each Regional Shortage Level. The WSAP Allocation was calculated using the methodology detailed in Appendix G: Water Supply Allocation Formula Example and the assumptions listed above.

Table 6: Total Retail Level Allocation Year Supplies			
Regional Shortage Level	**Allocation Year Local Supply**	**WSAP Allocation**	**Total Allocation Year Supply**
1	25,000	23,594	48,594
2	25,000	22,188	47,188
3	25,000	20,781	45,781
4	25,000	19,375	44,375
5	25,000	17,969	42,969
6	25,000	16,563	41,563
7	25,000	15,156	40,156
8	25,000	13,750	38,750
9	25,000	12,344	37,344
10	25,000	10,938	35,938

Step 2: Calculate the Equivalent Total and Residential GPCD

The next step is to calculate the equivalent water use in gallons per capita per day (GPCD) for the Total Allocation Year Supply. The following equation shows the GPCD calculation under Regional Shortage Level 10.

35,938 af * 325,851 gallons ÷ 375,000 people ÷ 365 days = 85.6 GPCD

The residential per-capita water use is calculated in the same manner. Based on the assumption that 60% of the agency demands are residential, the following equation shows the residential GPCD calculation under Regional Shortage Level 10.

35,938 af * 60% * 325,851 gallons ÷ 375,000 people ÷ 365 days = 51.3 GPCD

Step 3: Compare the Total and Residential GPCD to the Minimum Water Use Thresholds

The next step is to compare the total GPCD water use to the 100 GPCD total water use threshold. In a Regional Shortage Level 10, the WSAP results in an allocation that is 14.4 GPCD below the minimum threshold.

100 GPCD – 85.6 GPCD = 14.4 GPCD

Likewise the residential GPCD water use is compared to the 55 GPCD residential water use threshold.

55 GPCD – 51.3 GPCD = 3.7 GPCD

Step 4: Determine the Allocation Adjustment in Acre-Feet

The final step is to calculate the acre-foot equivalent of the GPCD that fell below the minimum threshold. In a Regional Shortage Level 10, the adjustment provides 6,068 acre-feet of additional allocation to the agency; the results for Shortage Levels 1-10 are shown in Table 7.

14.4 GPCD ÷ 325,851 gallons * 375,000 people * 365 days = 6,068 acre-feet

Table 7: Total Per-Capita Water Use Adjustment				
Regional Shortage Level	**Allocation Year Supply**	**Equivalent GPCD**	**GPCD Below Threshold**	**Allocation Adjustment**
1	48,594	115.7	0	0
2	47,188	112.3	0	0
3	45,781	109.0	0	0
4	44,375	105.6	0	0
5	42,969	102.3	0	0
6	41,563	98.9	1.1	443
7	40,156	95.6	4.4	1,849
8	38,750	92.3	7.7	3,255
9	37,344	88.9	11.1	4,662
10	35,938	85.6	14.4	6,068

Again, this step is repeated for the residential water use. In a Regional Shortage Level 10, the adjustment provides 1,540 acre-feet of additional allocation to the agency; the residential water use results for Regional Shortage Levels 1-10 are shown in Table 8.

3.7 GPCD ÷ 325,851 gallons * 375,000 people * 365 days = 1,540 acre-feet

Table 8: Residential Per-Capita Water Use Adjustment				
Regional Shortage Level	**Allocation Year Supply**	**Equivalent GPCD**	**GPCD Below Threshold**	**Allocation Adjustment**
1	29,156	69.4	0	0
2	28,313	67.4	0	0
3	27,469	65.4	0	0
4	26,625	63.4	0	0
5	25,781	61.4	0	0
6	24,938	59.4	0	0
7	24,094	57.4	0	0
8	23,250	55.4	0	0
9	22,406	53.3	1.7	697
10	21,563	51.3	3.7	1,540

Agencies that fall below either threshold under the WSAP would receive additional allocation from Metropolitan to bring them up to the minimum GPCD water use level. If an agency qualifies under both thresholds, the one resulting in the maximum allocation adjustment would be given. Under this example the agency would receive 6,068 acre-feet of additional allocation in a Regional Shortage Level 10.

Appendix K: Qualifying Income-Based Rate Allocation Surcharge Adjustment Example

The following example provides a step by step description of how the qualifying income-based rate allocation surcharge adjustment is calculated. To qualify for this adjustment, member agencies must provide documentation showing the amount of retail demands that are covered by a qualifying income-based rate; no appeal is necessary.

The following list summarizes the allocation year demands, local supplies, and allocation as calculated in Appendix G: Water Supply Allocation Formula Example for a hypothetical agency under a Level 4 Regional Shortage. For detailed instructions on how to calculate these figures, reference Appendix G: Water Supply Allocation Formula Example.

Allocation Year Retail Demand: 133,000 acre-feet
Allocation Year Local Supplies: 68,000 acre-feet;
Level 4 WSAP Allocation: 52,735 acre-feet

Step 1: Allocation Surcharge Calculation

(a) **Water Use above Allocation:** The first step in calculating the income-based rate Allocation Surcharge adjustment is to calculate the agency's total Allocation Surcharge under the WSAP. If the agency did not incur any Allocation Surcharge from the allocation year, the income-based rate allocation surcharge adjustment would not apply. For the purpose of this example, the agency used 61,000 acre-feet of MWD supplies in the allocation year. This represents 8,265 acre-feet of use above the water supply allocation.

WSAP Allocation	52,735 af
Actual MWD Water Use	61,000 af
Use Above WSAP Allocation	8,265 af

(b) **Total Allocation Surcharge:** In this example the agency used 115.7% of its water supply allocation. 7,910 of the 8,265 acre-feet of use above the allocation would be assessed the Allocation Surcharge at an amount of $1,480 per acre-foot and 354 of the 8,265 acre-feet of use above the allocation would be assessed the Allocation Surcharge at an amount of $2,960.

Between 100% and 115% of Allocation	7,910 af	$1,480/af	$11,706,800
Greater than 115% of Allocation	354 af	$2,960/af	$1,047,840
Total	8,265 af		$12,754,640

Step 2: Effective Income-Based Rate Cutback

(a) **Calculate Retail Cutback:** The second step in calculating the income-based rate allocation surcharge adjustment is to calculate the amount of supply cutback that would have been expected from qualifying income-based rate customers under the WSAP. Using the water supply allocation that was calculated above, the total retail level impact on the agency can be

determined. In this example the agency receives a retail level cutback of 15,265 acre-feet, or 11.5% of their retail level demand.

WSAP Allocation + Allocation Year Local Supplies	117,735 af
Allocation Year Retail Demand	133,000 af
Effective Cutback	**15,265 af (11.5%)**

(b) Income-based Rate Customer Retail Cutback: To calculate the effective income-based rate cutback, the amount of demand covered by a qualifying income-based rate is multiplied by the effective retail level cutback. For this example assume that the agency has 10,000 acre-feet of qualifying demands.

Qualifying Income-Based Rate Demand	10,000 af
Effective Cutback Percentage	11.5%
Effective Income-Based Rate Cutback	**1,148 af**

(c) Income-based Rate Cutback Allocation Surcharge: Once the effective cutback has been calculated, the amount of Allocation Surcharge that is associated with qualifying income-based rate customers can be determined.

Between 100% and 115% of Allocation	794 af	$1,480/af	$1,175,120
Greater than 115% of Allocation	354 af	$2,960/af	$1,047,840
Total	**1,148 af**		**$2,222,960**

(d) Adjusted Allocation Surcharge Calculation: Finally, the Allocation Surcharge attributable to qualifying income-based rate customers is subtracted from the total Allocation Surcharge that was calculated above to determine the qualifying income-based rate adjusted allocation surcharge. In the case that the monetary amounts associated with the Income-Based Rate are greater than the total amounts an agency incurs, no Allocation Surcharge will be incurred.

Total Allocation Surcharge	$12,754,640
Qualifying Income-Based Rate Allocation Surcharge	$2,222,960
Qualifying Income-Based Rate Adjusted Allocation	**$10,531,680**

Appendix L: Groundwater Replenishment Allocation

Groundwater basins help provide vital local supplies that can buffer the region from short-term drought impacts. Longer droughts can result in reductions to the many sources of water that replenish groundwater basins, resulting in lower basin levels and potential impacts to the overlying consumptive demands. Limited imported deliveries under these conditions may help avoid impacts to the basins that may be drawn out of their normal operating range or subject to water quality or regulatory impacts. To this end, Metropolitan provides a limited allocation for drought impacted groundwater basins based on the following framework:

a) Staff hold a consultation with qualifying member agencies who have taken groundwater replenishment deliveries since 2010 and the appropriate groundwater basin managers to document whether their basins are in one of the following conditions:
    i. Groundwater basin overdraft conditions that will result in water levels being outside normal operating ranges during the WSAP allocation period; or
    ii. Violations of groundwater basin water quality and/or regulatory parameters that would occur without imported deliveries.
b) Provide an allocation based on the verified need for groundwater replenishment. The allocation would start with a member agency's ten-year average purchases of imported groundwater replenishment supplies (excluding years in which deliveries were curtailed). The amount would then be reduced by the declared WSAP Regional Shortage Level (5 percent for each Regional Shortage Level).
c) Any allocation provided under this provision for drought impacted groundwater basins is intended to help support and maintain groundwater production for consumptive use. As such, a member agency receiving an allocation under this provision will be expected to maintain groundwater production levels equivalent to the average pumping in the Base Period. Any adjustments to a member agency's M&I allocation due to lower groundwater production would be reduced by deliveries made under this provision.
d) Agencies for which this allocation does not provide sufficient supplies for the needs of the groundwater basin may use the WSAP Appeals Process to request additional supply (subject to Board approval). The appeal should include a Groundwater Management Plan that documents the need for additional supplies according to the following tenets:
    i. Maintenance of groundwater production levels;
    ii. Maintenance of, or reducing the further decline of, groundwater levels;
    iii. Maintenance of key water quality factors/indicators;
    iv. Avoidance of permanent impacts to groundwater infrastructure or geologic features; and
    v. Consideration of severe and/or inequitable financial impacts.

Final amounts and allocations will be determined following the consultations with groundwater basin managers and member agencies.

Appendix M: Water Rates, Charges, and Definitions

Table 9: Water Rates and Charges Dollars per acre-foot (except where noted)			
Rate	**Effective 1/1/2014**	**Effective 1/1/2015**	**Effective 1/1/2016**
Tier 1 Supply Rate	$148	$158	$156
Tier 2 Supply Rate	$290	$290	$290
System Access Rate	$243	$257	$259
Water Stewardship Rate	$41	$41	$41
System Power Rate	161	$126	$138
Tier 1	$593	$582	$594
Tier 2	$735	$714	$728
Treatment Surcharge	$297	$341	$348
Full Service Treated Volumetric Cost			
Tier 1	$890	$923	$942
Tier 2	$1,032	$1,055	$1,076
Readiness-to-Serve Charge (millions of dollars)	$166	$158	$153
Capacity Charge (dollars per cubic foot second)	$8,600	$11,100	$10,900

Definitions:

(1) **Tier 1 Supply Rate -** recovers the cost of maintaining a reliable amount of supply.

(2) **Tier 2 Supply Rate** - set at Metropolitan's cost of developing additional supply to encourage efficient use of local resources**.**

(3) **System Access Rate** – recovers a portion of the costs associated with the delivery of supplies.

(4) **System Power Rate** – recovers Metropolitan's power costs for pumping supplies to Southern California.

(5) **Water Stewardship Rate** – recovers the cost of Metropolitan's financial commitment to conservation, water recycling, groundwater clean-up and other local resource management programs.

(6) **Treatment Surcharge** – recovers the costs of treating imported water.

(7) **Readiness-to-Serve Charge -** a fixed charge that recovers the cost of the portion of system capacity that is on standby to provide emergency service and operational flexibility.

(8) **Capacity Charge** – the capacity charge recovers the cost of providing peak capacity within the distribution system.

Appendix N: Allocation Appeals Process

Step 1: Appeals Submittal

All appeals shall be submitted to the Appeals Liaison in the form of a written letter signed by the member agency General Manager. Each appeal must be submitted as a separate request, submittals with more than one appeal will not be considered. The appeal request is to include:

- A designated member agency staff person to serve as point of contact.
- The type of appeal (erroneous baseline data, loss of local supply, etc.).
- The quantity (in acre-feet) of the appeal.
- A justification for the appeal which includes supporting documentation.

A minimum of 60 days are required to coordinate the appeals process with Metropolitan's Board process.

Step 2: Notification of Response and Start of Appeals Process

The Appeals Liaison will phone the designated member agency staff contact within 3 business days of receiving the appeal to provide an initial receipt notification, and schedule an appeals conference. Subsequent to the phone call, the Liaison will send an e-mail to the Agency General Manager and designated staff contact documenting the conversation. An official notification letter confirming both receipt of the appeal submittal, and the date of the appeals conference, will be mailed within 2 business days following the phone contact

Step 3: Appeals Conference

All practical efforts will be made to hold an appeals conference between Metropolitan staff and member agency staff at Metropolitan's Union Station Headquarters within 15 business days of receiving the appeal submittal. The appeals conference will serve as a forum to review the submittal materials and ensure that there is consensus understanding as to the spirit of the appeal. Metropolitan staff will provide an initial determination of the size of the appeal (small or large) and review the corresponding steps and timeline for completing the appeals process.

Steps 4-7 of the appeals process differ depending upon the size of the appeal

Small Appeals

Small appeals are defined as those that would change an agency's allocation by less than 10 percent, or are less than 5,000 acre-feet in quantity. Small appeals are evaluated and approved or denied by Metropolitan staff.

Step 4: Preliminary Decision

Metropolitan staff will provide a preliminary notice of decision to the member agency within 10 business days of the appeals conference. The preliminary decision timeline may be extended to accommodate requests for additional information, data, and documentation. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the preliminary decision and the rationale for approving or denying the appeal.

Step 5: Clarification Conference

Following the preliminary decision the Appeals Liaison will schedule a clarification conference. The member agency may choose to decline the clarification conference if they are satisfied with the preliminary decision. Declining the clarification conference serves as acceptance of the preliminary decision, and the decision becomes final upon approval by Metropolitan's executive staff.

Step 6: Final Decision

Metropolitan staff will provide a final notice of decision to the member agency within 10 business days of the clarification conference, pending review by Metropolitan's executive staff. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the final decision and the rationale for the decision. A copy of the letter will also be provided to Metropolitan executive staff.

Step 6a: Board Resolution of Small Appeal Claims

Member agencies may request to forward appeals that are denied by Metropolitan staff to the Board of Directors through the Water Planning and Stewardship Committee for final resolution. The request for Board resolution shall be submitted to the Appeals Liaison in the form of a written letter signed by the member agency General Manager. This request will be administered according to Steps 6 and 7 of the large appeals process.

Step 7: Board Notification

Metropolitan staff will provide a report to the Board of Directors, through the Water Planning and Stewardship Committee, on all submitted appeals including the basis for determination of the outcome of the appeal.

Large Appeals

Large appeals are defined as those that would change an agency's allocation by more than 10 percent, and are larger than 5,000 acre-feet. Large appeals are evaluated and approved or denied by the Board of Directors.

Step 4: Preliminary Recommendation

Metropolitan staff will provide a preliminary notice of recommendation to the member agency within 10 business days of the appeals conference. The preliminary decision timeline may be extended to accommodate requests for additional information, data, and documentation. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the preliminary recommendation and the rationale for the recommendation. A copy of the draft recommendation will also be provided to Metropolitan executive staff.

Step 5: Clarification Conference

Following the preliminary recommendation the Appeals Liaison will schedule a clarification conference. The member agency may choose to decline the clarification conference if the satisfied with preliminary recommendation. Declining the clarification conference signifies acceptance of the preliminary recommendation, and the recommendation becomes final upon approval by Metropolitan's executive staff.

Step 6: Final recommendation

Metropolitan staff will provide a final notice of recommendation to the member agency within 10 business days of the clarification conference, pending review by Metropolitan executive staff. The Appeals Liaison will mail a written letter to the member agency staff contact and General Manager, stating the final recommendation and the rationale for the recommendation. A copy of the final recommendation will also be provided for Metropolitan executive review.

Step 7: Board Action

Metropolitan staff shall refer the appeal to the Board of Directors through the Water Planning and Stewardship Committee for approval.

Appendix O: Appeals Submittal Checklist

Appeal Submittal

- ☐ Written letter (E-mail or other electronic formats will not be accepted)
- ☐ Signed by the Agency General Manager

Mailed to the appointed Metropolitan Appeals Liaison

Contact Information

- ☐ Designated staff contact
  - o Name
  - o Address
  - o Phone Number
  - o E-mail Address
- ☐ General Manager
  - o Name
  - o Address
  - o Phone Number
  - o E-mail Address

Type of Appeal

- ☐ State the type of appeal
  - o Erroneous historical data used in base period calculations
    - Metropolitan Deliveries
    - Local Production
    - Growth adjustment
    - Conservation savings
  - o Exclusion of physically isolated areas
  - o Extraordinary supply designation
  - o Groundwater Replenishment Allocation
  - o Base Period Mandatory Rationing Adjustment
  - o Other

Quantity of Appeal

- ☐ State the quantity in acre-feet of the appeal

Justification and Supporting Documentation

- ☐ State the rationale for the appeal
- ☐ Provide verifiable documentation to support the stated rationale
  - o Examples of verifiable documentation Include, but are not limited to:
    - Billing Statements
    - Invoices for conservation device installations
    - Basin Groundwater/Watermaster Reports
    - California Department of Finance economic or population data
    - California Department of Public Health reports

Attachment 3 -
Western Ordinance 385

ORDINANCE 385

ORDINANCE OF THE BOARD OF DIRECTORS OF THE WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ADOPTING A DROUGHT ALLOCATION PLAN

WHEREAS, Western Municipal Water District ("Western") was formed by the voters in 1954 for the purpose of importing water supplies from the Metropolitan Water District of Southern California ("Metropolitan"); and

WHEREAS, Western delivers these imported water supplies, from the State Water Project and the Colorado River Aqueduct and treated at Metropolitan's Henry J. Mills and Robert A. Skinner Filtration Plants, to communities on a wholesale basis to augment their own supplies; and

WHEREAS, Western serves a population of more than 70,000 people directly on a retail basis and over 880,000 people through its member agencies with State Water Project water and various locally-produced supplies; and

WHEREAS, Metropolitan has adopted the 1999 Water Surplus and Drought Management Plan ("WSDM Plan"). The guiding principle of the WSDM Plan is to encourage storage of water during periods of surplus and to work jointly with its member agencies, such as Western, to minimize impacts on the retail consumers and the economy during periods of shortage; and

WHEREAS, recent dry conditions and uncertainty about future pumping operations from the State Water Project have brought about the possibility that Metropolitan may not have access to the supplies necessary to meet total firm demands in the near future and may have to allocate shortages in supplies to its member agencies, such as Western. To prepare for this possibility, Metropolitan adopted an updated Water Supply Shortage Allocation Plan ("WSAP") in December of 2014, which

addresses the principles adopted pursuant to the WSDM Plan; and

WHEREAS, Western desires to adopt this Ordinance in order to adopt a Drought Allocation Plan ("DAP") which is required in order to plan for, and implement, the reduced Metropolitan water deliveries which will result if certain provisions of the WSAP are implemented. The DAP identifies the method that will be used to allocate limited imported supplies among Western's retail agencies if Metropolitan implements said provisions of the WSAP; and

WHEREAS, on April 15, 2015, Western's Board of Directors adopted Resolution 2904, setting a public hearing regarding the proposed adoption of this Ordinance and the DAP; and

WHEREAS, Water Code sections 71640 et seq. authorize Western to restrict the use of Western water during any emergency caused by drought, or other threatened or existing water shortage; and

WHEREAS, Water Code sections 375 et seq. provide that Western may, by a majority vote of the members of the Board of Directors after holding a public hearing upon notice, adopt and enforce a water conservation program, such as the DAP, to reduce the quantity of water used by its customers for the purpose of conserving the water supplies of Western; and

WHEREAS, Western has the power and authority to enact a water conservation program, such as the DAP, pursuant to Water Code sections 375 et seq. and 71640 et seq.

NOW, THEREFORE, BE IT ORDAINED BY THE BOARD OF DIRECTORS OF WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY AS FOLLOWS:

Section 1. Notice and Public Hearing. The Board of Directors conducted a public hearing on May 20, 2015 at 14205 Meridian Parkway, Riverside, California in order for customers to have the opportunity to be heard to protest against, and to present their respective needs to the Board of Directors regarding the proposed adoption of this Ordinance 385 and the DAP. Pursuant to Water Code section 376, notice of the public hearing was published on May 12, 2015 in the Riverside Press-Enterprise, a newspaper printed, published, and circulated within the area in which the subject water supply is distributed. Said notice was published at least seven (7) days prior to the date of the hearing;

Section 2. Adoption of Drought Allocation Plan.

(a) Western hereby adopts and authorizes the implementation of the DAP attached hereto as Exhibit "A" and incorporated herein by reference. The General Manager, or his/her designee, are hereby authorized and directed to immediately implement the applicable provisions of this Ordinance and the DAP upon the effective date hereof.

(b) The DAP includes a supply allocation methodology which was patterned after the Metropolitan WSAP methodology and in collaboration with Western's retail agencies. The goal of said methodology is to provide an equitable means of apportioning imported municipal and industrial supplies during periods when Metropolitan implements its WSAP. As further described in the DAP, Western staff and designated wholesale customer representatives have

collectively agreed to the allocation methodology described in the DAP.

(c) The Allocation Plan Implementation Elements shall be implemented at the time, and in the manner, as set forth in the DAP and therefore, shall not require any further action by Western's Board of Directors before being implemented by Western's General Manager, or his/her designee, as set forth in the DAP. For example, and not by way of limitation, it is anticipated that the allocation of imported supplies under the DAP shall be implemented at the time that Metropolitan allocates its supplies through its WSAP process. Should Metropolitan implement its WSAP, Western's General Manager, or his/her designee, will determine the appropriate shortage level, as set forth in the DAP, so that supplies allocated at the Western service area level are equal to or less than the Metropolitan allocation.

Section 3. Application of the DAP. The provisions of the DAP and this Ordinance shall apply to the allocation of water for retail municipal and industrial purposes among the following agencies:

(a) Box Springs Mutual Water Company;
(b) City of Corona;
(c) City of Norco;
(d) Eagle Valley Mutual Water Company;
(e) Elsinore Valley Municipal Water District;
(f) Lee Lake Water District;
(g) Rancho California Water District;
(h) Western Municipal Water District Retail Customers

Section 4. Severability. If any provision, section, subsection, sentence, clause, or phrase of this Ordinance or

the application of same to any person or set of circumstances is held to be unconstitutional, void, or invalid, such decision shall not affect the remaining portions of this Ordinance which shall remain in full force and effect, and all provisions of this Ordinance are declared to be severable for that purpose.

Section 5. Incompatible Provisions. To the extent any provision of this Ordinance is incompatible with or at variance with any other Western policy or rules and regulations, the provisions of this Ordinance shall be controlling, and all other Western policies and rules and regulations shall be interpreted to harmonize with and not change the provisions of this Ordinance.

Section 6. Exemption From California Environmental Quality Act. The Board of Directors determines that the adoption of the DAP and this Ordinance, for the purpose of addressing water shortages and allocation of supplies, are exempt from the requirements of the California Environmental Quality Act ("CEQA") pursuant to Section 15269(c) of the State CEQA Guidelines. Section 15269(c) provides that actions necessary to prevent or mitigate for an emergency are exempt from CEQA. The Board of Directors finds that the adoption of the DAP is necessary to mitigate for the emergency water shortages that may result in the near future if Metropolitan implements its WSAP. The Board of Directors hereby directs staff to prepare and file a Notice of Exemption within five (5) working days of adoption of this Ordinance.

Section 7. Effective Date. This Ordinance shall be effective immediately upon adoption and shall be presumed to continue in effect unless or until a contrary finding is made by applicable action of the Board of Directors. Within fifteen

(15) days from the date of adoption, a summary of this Ordinance shall be published one time in the Riverside Press-Enterprise with the names of those Board members voting for and against. A certified copy of this Ordinance shall be posted in the District offices along with the names of those Board members voting for and against.

Section 8. Prior Ordinances. This Ordinance shall supersede and otherwise control over the provisions of Ordinance 371. As of the effective date of this Ordinance 385, Ordinance 371 shall be of no further force or effect.

Section 9. Incorporation of Recitals. All of the foregoing Recitals are true and correct and the Board of Directors so finds and determines. The Recitals set forth above are incorporated herein and made an operative part of this Ordinance.

ADOPTED AND APPROVED this 20th day of May, 2015 by the Board of Directors of the Western Municipal Water District of Riverside County.

DONALD D. GALLEANO
President

May 20, 2015

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of Ordinance 385 adopted by the Board of Directors of Western Municipal Water District of Riverside County at a duly-noticed regular meeting held on May 20, 2015.

THOMAS D. EVANS
Secretary-Treasurer

Attachment 4 -
Western Ordinance 384

ORDINANCE 384

AN ORDINANCE OF THE WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ESTABLISHING AN UPDATED RETAIL CUSTOMER WATER SUPPLY SHORTAGE CONTINGENCY PROGRAM

WHEREAS, California Constitution article X, section 2 and California Water Code section 100 provide that because of conditions prevailing in the State of California, it is the declared policy of the State that the general welfare requires that the water resources of the State shall be put to beneficial use to the fullest extent of which they are capable, the waste or unreasonable use of water shall be prevented, and the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and the public welfare; and

WHEREAS, pursuant to California Water Code section 106, it is the declared policy of the State that the use of water for domestic use is the highest use of water and that the next highest use is for irrigation; and

WHEREAS, pursuant to California Water Code section 71610.5, the District may undertake a water conservation program to reduce water use and may require, as a condition of new service, that reasonable water-saving devices and water reclamation devices be installed to reduce water use; and

WHEREAS, pursuant to California Water Code section 71640, the District may restrict the use of District water during any emergency caused by drought, or other threatened or existing water shortage, and may prohibit the waste of District water or the use of District water during such periods for any purpose other than those that the District determines to be necessary. The District may also prohibit

use of District water during such periods for specific uses which it finds to be nonessential. Pursuant to Water Code section 71641, the District may prescribe and define by ordinance the restrictions, prohibitions, and exclusions referred to in section 71640; and

WHEREAS the Board of Directors recognizes continued long term challenges to the region and the state. The District's Mediterranean climate typically exhibits hot, dry summers and mild, wet winters. Annual precipitation totals vary substantially from year to year, averaging 10.24 to 12.06 inches depending on the region. Climate change impacts are predicted to increase the uncertainty of water supplies. Additionally, regulatory restrictions on pumping from the Bay-Delta region affecting State Water Project ("SWP") deliveries will continue to impact the District's supply reliability. The District relies heavily on SWP supplies, obtaining approximately up to 75 percent of its total supply through imported water sources from MWD; and

WHEREAS, because of the prevailing conditions in the State and the declared policy of the State that the District manage its water resources for the general welfare to ensure their beneficial use to the fullest extent of which they are capable, the District hereby finds and determines that it is necessary and appropriate for the District to adopt, implement, and enforce a Water Supply Shortage Contingency Program (the "Program") to reduce the quantity of water used by consumers within the District to ensure that there is sufficient water for human consumption, sanitation, and fire protection; and

WHEREAS, pursuant to California Water Code section 350, the Board of Directors is authorized to declare a Water Shortage Emergency to prevail within its jurisdiction

when it finds and determines that the District will not be able to or cannot satisfy the ordinary demands and requirements of water consumers without depleting the water supply of the District to the extent that there would be insufficient water for human consumption, sanitation, and fire protection, and as more fully set forth in this Ordinance; and

WHEREAS, the Board of Directors hereby finds and determines that in the event the District determines that it is necessary to declare that a Water Shortage Emergency exists, the District will be authorized pursuant to this Ordinance to implement supply shortage response measures to regulate water consumption activities within the District and ensure that the water delivered in the District is put to beneficial use for the greatest public benefit, with particular regard to domestic use, including human consumption, sanitation, and fire protection, and that the waste or unreasonable use of water is prevented; and

WHEREAS, the Board of Directors is authorized and hereby finds and determines that it is necessary to prescribe and define by ordinance restrictions, prohibitions, and exclusions for the use of water during a threatened or existing water shortage and adopt and enforce a water supply shortage contingency program to: (i) prohibit the waste of District water or the use of District water during such period; (ii) prohibit use of water during such periods for specific uses which the District may from time to time find nonessential; and (iii) reduce and restrict the quantity of water used by Persons within the District; and

WHEREAS, the Board of Directors hereby finds and determines that the District shall: (i) implement water supply shortage response measures; (ii) regulate the water

consumption activities of Persons within the District for the purposes of conserving and protecting the District's water supplies, reducing the quantity of water consumed, and deterring and preventing the waste or unreasonable use or unreasonable method of use of valuable water resources; and (iii) establish and collect regulatory fees and impose fines and/or penalties as set forth herein to accomplish these purposes and recover the costs of the District's water conservation and regulatory program; and

WHEREAS, the Board of Directors hereby finds that the District's five (5) Tier water budget-based rate structure is an effective method of managing demand through price signals and eliminating inefficient usage while maintaining revenue stability and proportionately allocate the costs of service to those who place the greatest demands on the District's water system and limited water supplies; and

WHEREAS, the Board of Directors hereby finds and determines that it is desirable to adopt the Program in order to codify the rules and regulations governing its actions, and the actions of Persons using and consuming water within the District, particularly during declared water shortages and water shortage emergencies, to protect the general welfare and the District's water supplies, and to reduce water consumption all in accordance with the declared policies and laws of the State; and

WHEREAS, the Board of Directors hereby further finds and determines that this Ordinance and the Program set forth herein are in the public interest and serve the public purpose of the District; and

WHEREAS, California Constitution Article XIII D, Section 6 ("Article XIII D")requires that prior to imposing any increase to the District's water service fees, the District shall provide written notice (the "Notice") by

mail of: (1) the proposed increases to such rates and charges to the record owner of each parcel upon which the rates and charges are proposed for imposition and any tenant directly liable for payment of the rates and charges; (2) the amount of the rates and charges proposed to be implemented on each parcel; (3) the basis upon which the rates and charges were calculated; (4) the reason for the rates and charges; and (5) the date, time, and location of a public hearing (the "Hearing") on the proposed rates and charges; and

WHEREAS, pursuant to Article XIII D such Notice is required to be provided to the affected property owners and any tenant directly liable for the payment of the rates and charges not less that forty-five (45) days prior to the Hearing on the proposed rate and charges; and

WHEREAS, the District did provide such Notice to the affected property owners and tenants of the proposed rates for the water service fees in compliance with Article XIII D; and

WHEREAS, at the Hearing held on February 18, 2015, the Board heard and considered all oral testimony, written materials, and written protests concerning the establishment and imposition of the proposed rates and charges for the water service fees, and at the close of the Hearing the District did not receive written protests against the establishment of and imposition of the proposed Water Shortage Contingency Program and associated Drought Pricing for the water service fees from a majority of the affected property owners and tenants directly liable for the payment of water service fees; and

WHEREAS, due to the fiscal impacts referenced above, the Board has determined that it is in the best interests of the District to adopt the proposed Water Supply Shortage

Contingency Program identified herein and as more particularly described and set forth herein; and

NOW, THEREFORE, BE IT ORDAINED by the Board of Directors of the Western Municipal Water District of Riverside County as follows:

Section 1. Recitals

The Board of Directors hereby finds and determines that the above recitals are true and correct and incorporated herein.

Section 2. Findings and intent

(A) The Board of Directors finds and determines that because of the prevailing conditions in the state, and the declared policy of the State, it is necessary and appropriate for the District to adopt, implement, and enforce this Program to reduce the quantity of water used by Persons within the District to ensure that there is sufficient water for human consumption, sanitation, and fire protection. The District further finds and determines that during periods of drought, water shortages, and water shortage emergencies the general welfare requires that the District maximize the beneficial use of its available water resources to the extent that it is capable, and that the waste or unreasonable use, or unreasonable method of use of water shall be prevented and the conservation of water is to be extended with the view to the reasonable and beneficial use thereof in the interests of the people of the District and for the public health, safety, and welfare.

(B) This Ordinance adopts the Program which establishes water waste restrictions, supply shortage response measures, regulations, structural pricing changes, and administrative fines and/or penalties to be implemented during declared water supply shortage stages.

(C) This Ordinance adopts the Program which establishes five (5) water supply shortage stages with sub-stages in Stages 3, 4, and 5 and supply shortage response measures to be implemented by the District, with increasing restrictions on water use and administrative fines and/or penalties for water waste in response to decreasing water supplies and/or worsening drought conditions.

(D) The water supply shortage stages may be caused by, but are not limited to, any or all of the following circumstances or events:

(1) A regional water supply shortage exists;

(2) Delivery infrastructure such as storage reservoirs, pipes, pumps, filtration devices or groundwater wells are inoperable or unusable (such as by power outages, mechanical failure, or contamination);

(3) Alternative water supplies are limited or unavailable;

(4) Groundwater levels or groundwater quality is approaching levels which may require augmentation of the groundwater basin or other actions necessary to protect the groundwater basin as prescribed by the California Department of Water Resources, the Regional Water Quality Control Board, Riverside County, or some other regulatory body; or

(5) MWD's Water Surplus and Drought Management Plan stages and the MWD Water Supply Allocation Plan stages and corresponding actions have been implemented.

Section 3. Purpose and scope

(A) The purposes of the provisions of this Ordinance and Program are to assure the highest beneficial use of District water supplies and to provide sufficient

water supplies to meet the basic needs of human consumption, sanitation, and fire protection within the District's direct retail service area.

(B) This Ordinance is not intended to repeal, abrogate, annul, impair or in any way interfere with the free use of property by covenant, deed, or other private agreement or with restrictive covenants running with the land to which the District provides water services.

(C) The provisions of this Ordinance shall apply to all Persons within the District's direct retail service area and all property served in a retail capacity by the District wherever situated.

(D) Nothing in this Ordinance is intended to affect or limit the ability of the District to respond to an emergency, including an emergency that affects the ability of the District to supply water.

Section 4. Definitions

For the purposes of this Ordinance, the following words, terms, and phrases shall have the following meanings:

"Appellant" means the Person appealing a decision of the Approving Authority, General Manager or other District official.

"Approving Authority" means the General Manager of the District, or his or her designee, charged with approving or denying written applications for Relief.

"Base Period" means a period of time similar to a Customer's Billing Period in both fiscal year 2012-2013 and fiscal year 2013-2014. For the purposes of determining historical water use for a Billing Period, the average is calculated using the similar Billing Period from both fiscal year 2012-2013 and fiscal year 2013-2014.

"Billing Period" means the billing period in which a Customer's water use is measured for purposes of calculating the amount of the water service fees that shall be collected for the water service provided.

"Billing Tier" means the volume of water within a defined and adopted rate.

"Board of Directors" means the Board of Directors of the District.

"Conservation Offset" means the implementation of proven conservation techniques which, when installed, will result in a reduction equal to the demand of a new or proposed use, or the payment of a fee (a "Conservation Offset Fee") in an amount established by the District to cover the cost of implementing such conservation techniques or acquiring alternative water sources to offset the demand of the new or proposed use.

"District" means the Western Municipal Water District.

"Enforcement Officer" means any individual employed or otherwise charged by the District to inspect or enforce codes, ordinances, mandates, regulations, resolutions, rules or other laws adopted by the Board of Directors or other regulatory bodies.

"General Manager" means the General Manager of the District or his or her authorized designee.

"Immediate Emergency" means a breakage or failure of a dam, pump, pipeline or conduit, a disaster or other disruption of the District's water supply.

"Medical Adjustment" means an adjustment to the residential indoor water allocation based on medical needs. Medical adjustments must be approved by the District and are not subject to mandatory residential indoor water allocation reductions in any stage. The District will

consider a request for medical adjustment at any time and at any stage. The adjustment shall be removed with any changes to the account holder.

"MWD" means the Metropolitan Water District of Southern California.

"Non-Potable Water" means water that is not of drinking water quality, but which may still be used for purposes other than for human consumption.

"Person" means any natural person, firm, joint venture, joint stock company, partnership, public or private association, club, company, corporation, business trust, organization, public or private agency, government agency or institution, school district, college, university, any other user of water provided by the District, or the manager, lessee, agent, servant, officer or employee of any of them or any other entity which is recognized by law as the subject of rights or duties.

"Program" means the Water Supply Shortage Contingency Program adopted pursuant to this Ordinance.

"Property Owner" means the owner of a parcel whose name and address appears on the last Riverside County equalized secured property tax assessment roll, or in the case of any public entity, the State of California, or the United States, means the representative of that public entity at the address of that entity known to the District.

"Recycled Water" means municipal wastewater that has been treated to meet all applicable Federal, State and local standards for use in approved applications, including, but not limited to, agricultural and landscape irrigation.

"Relief" means excuse from compliance with the regulations and restrictions on water use contained in this Ordinance.

"State" means the State of California.

"Water Budget" means a Customer's total water billing allocation for indoor and outdoor water use. The specific indoor and outdoor allocation of water depends on the type of Customer (Customer sector) and the specific characteristics of the Customer's site. Use in excess of the allocation is charged at incrementally higher rates.

"Water Customer" or "Customer" means a Person who, according to the District's records, receives water service to a parcel of property.

"Water Shortage Emergency" means a condition existing within the District in which the ordinary water demands and requirements of Persons within the District cannot be satisfied without depleting the water supply of the District to the extent that there would be insufficient water for human consumption, sanitation, and fire protection. A Water Shortage Emergency includes both an Immediate Emergency, in which the District is unable to meet current water needs of Persons within the District, as well as a threatened water shortage, in which the District determines that its supply cannot meet an increased future demand.

"Water Supply Allocation Plan" or "WSAP" means the Plan developed by MWD to calculate member agencies' supply allocations should a shortage be declared.

"Water Surplus and Drought Management" Plan or "WSDM" means the 1999 Plan that MWD uses to direct its resource operations to ensure that shortage allocations of imported water supplies are not required.

Section 5. Stage Implementation

(A) The General Manager shall monitor the projected supply of and demand for water within the retail water service area of the District during periods of a

water shortage or supply shortage and shall recommend to the Board of Directors the extent of the demand reduction required through the implementation and/or termination of particular water supply shortage stages or sub-stages to prudently plan and supply water to water Customers. Thereafter, the Board of Directors may order the implementation or termination of the appropriate stage or sub-stage.

(B) The declaration of any stage or sub-stage beyond Stage 1 shall be made by resolution of the Board of Directors. Within ten (10) calendar days of the adoption of the resolution declaring the applicable stage or sub-stage, the District shall make a public announcement and provide notice of the applicable water supply shortage stage. Such declaration and notice shall provide the extent, terms, and conditions as well as the associated water budget allocations and fines and/or penalties respecting the use and consumption of water in accordance with the applicable water supply shortage stage as provided in this Ordinance. Upon such declaration and publication of such notice, due and proper notice shall be deemed to have been given to each and every Person supplied water within the District.

(C) The water supply shortage stage designated shall become effective immediately upon announcement.

(D) Except in the event of an Immediate Emergency, the declaration of a Water Shortage Emergency during any water supply shortage stage shall be made in accordance with California Water Code sections 350 *et seq.*

(E) Notwithstanding any other provision of this Ordinance, if an Immediate Emergency occurs and the Board of Directors cannot meet in time to act to protect the public interest, the General Manager is hereby authorized and directed to implement any necessary rules and

regulations upon his or her written determination that the District cannot adequately supply water to meet the ordinary demands of water consumers, and that such implementation is necessary to protect the public health and safety.

(1) The General Manager's written determination of an Immediate Emergency shall be:

(a) filed with the District Secretary;

(b) posted on the District's website;

(c) delivered to the Board of Directors; and

(d) subsequently considered by the Board of Directors at a general or special meeting for review, revocation, or ratification.

(2) The implementation of any rules and regulations during an Immediate Emergency shall take effect immediately upon making a posting of the determination of the Immediate Emergency on the District's website.

(3) The Board of Directors' meeting shall be held on the earliest date that a quorum of the Board of Directors is available. At the Board of Directors meeting, the General Manager shall update the Board of Directors on the severity and length of the Immediate Emergency.

Section 6. Stage 1 – Water Supply Watch

(A) Stage 1 is also referred to as a "Water Supply Watch" and applies during periods when the District is able to meet all of the water demands of its Customers. Stage 1 and the permanent prohibitions set forth herein shall be in effect at all times unless the Board of Directors otherwise declares that another stage is in effect pursuant to this Ordinance and such stage establishes more stringent prohibitions on the use of water during the particular stage.

Under Stage 1, Customers are encouraged to use water efficiently and take advantage of the District's water use efficiency programs. Stage 1 also mandates the implementation of several permanent water waste prohibitions, even when there is no foreseeable threat of a water shortage. Water waste is in violation of California Law at any stage. California's water law and policy, Article X, Section 2 of the California Constitution, requires that all uses of the State's water be both reasonable and beneficial and places a significant limitation on water rights by prohibiting the waste, unreasonable use, unreasonable method of use, or unreasonable method of diversion of water. The permanent prohibitions shall be continually in effect at all levels of water shortage declarations in addition to the requirements specific to each level. All normal water efficiency programs and water conservation regulations of the District will be in full force and effect during Stage 1. The permanent shortage response measures include:

(1) All irrigators shall ensure automatic irrigation timers are adjusted according to changing weather patterns and landscape requirements.

(2) All open hoses shall be equipped with automatic, positive shut-off nozzles.

(3) Watering of lawns and/or groundcovers and irrigating landscaping is permitted only between the hours of 8:00 p.m. and 8:00 a.m.

(4) All swimming pools, spas, ponds, and fountains shall be equipped with re-circulating pumps.

(5) All plumbing leaks, improperly adjusted sprinklers, or other water conduits/fixtures that require repair or adjustment shall be corrected to the satisfaction

of the District within ninety-six (96) hours of notification by the District.

(6) No Person shall use water to wash down sidewalks, driveways, parking areas, tennis courts, patios, or other paved or hard surface areas, except to alleviate immediate fire or sanitation hazards, and then only by use of: a hand-held bucket or similar container, a hand-held hose equipped with an automatic, positive self-closing shut-off device, or a low volume, high-pressure cleaning machine.

(7) No Person shall allow water to leave his or her property by drainage onto adjacent properties or public or private roadways or streets due to excessive irrigation and/or uncorrected leaks.

(8) The washing of automobiles, trucks, trailers, boats, airplanes and other types of mobile equipment, is permitted at any time with a hand-held bucket or a hand-held hose equipped with an automatic, positive shut-off nozzle. Provided, however, such washing may be done at any time on the immediate premises of a commercial car wash, a commercial service station or car dealership with commercial car washing equipment, or by a licensed mobile detailing/car wash professional using low volume, high pressure washing equipment. Further, such washings are exempted from these regulations where the health, safety, and welfare of the public is contingent upon frequent vehicle cleanings, such as garbage trucks and vehicles used to transport food and perishables.

(9) Construction operations receiving water from a construction meter, hydrant meter, or water truck shall not use water for any purpose other than those required by regulatory agencies. Construction projects requiring watering for new landscaping materials shall

adhere to the designated irrigation requirements set forth in Section 6(A) hereof.

(B) The District will attempt to contact Customers by telephone, mail, email and/or printed "door-hanger" to alert of a required repair, adjustment, or violation. All Customers shall ensure that the District has current telephone and email contact information. The District is not responsible for incorrect phone numbers or email addresses.

Section 7. Stage 2 – Water Supply Alert

(A) Stage 2 is also referred to as a "Water Supply Alert" and applies during periods when a reasonable probability exists that the District will not be able to meet all of the water demands of its Customers. This may correlate to MWD's WSDM Plan stage of "Water Supply Watch" or "Water Supply Alert" Conditions.

(B) The objective of Stage 2 is to affect a moderate reduction in water use up to 4% through voluntary actions and may be adjusted depending on supply conditions via a Board approved Resolution.

(C) Voluntary conservation measures will be called upon during this stage. The District shall develop a public information campaign to provide Customers with options for achieving the Stage 2 demand reduction goal. The District shall explore increased Customer incentives for conservation measures.

Section 8. Stage 3 – Targeting Waste Reduction

(A) Stage 3 is also referred to as a "Mandatory Waste Reduction" stage. The intent of Stage 3 is to target and eliminate excessive water waste and water use in the District's three budget-based water rates penalty Tiers 3, 4, and 5. Stage 3 applies during periods when a reasonable probability exists that the District will not be able to

meet all of the water demands of its Customers. This may correlate to MWD's Shortage Allocation Plan Shortage Levels 1 through 3.

(B) The objective of the measures undertaken in Stage 3 is to reduce water system consumption within the District by five to fifteen percent (5 to 15%).

(C) Stage 3 does not apply to the use of non-potable or recycled water. The use of non-potable or recycled water is permitted pursuant to the specific rules and regulations that govern its use.

(D) Potable water Customers in areas directly served by the District that do not have Water Budgets shall reduce their water use by five to fifteen percent (5 to 15%) from the Base Period during declarations of any Stage 3 sub-stage.

(E) Stage 3 has three sub-stages – Stage 3(a), Stage 3(b), and Stage 3(c). The following provisions shall apply during Stage 3:

(1) Stage 3(a). The District shall eliminate all adjustments to existing residential Customers' outdoor Water Budgets including, but not limited to, increases for landscape size, and/or swimming pool, spa, or pond maintenance adjustments. New water using features or expanded landscapes shall not qualify for a Water Budget adjustment. The provisions of this Section 8(E)(1) shall also apply during any other stage or sub-stage other than Stage 1 and Stage 2.

(2) Stage 3(b). Tier 4 water rates shall be eliminated. Customers with Water Budgets, and whose water use exceeds one hundred and twenty-five percent (125%) of their total Water Budget during a Billing Period will be charged the applicable Tier 5 water rates. The provisions of this Section 8(E)(2)shall also apply during Stage 3(c).

(3) Stage 3(c). Tier 3 water rates shall be eliminated. Customers who have Water Budgets, and whose water use exceeds one hundred percent (100%) of their total Water Budget during a Billing Period, shall be charged the applicable Tier 5 water rates.

(F) Voluntary conservation measures will be called upon during this stage. The District shall develop a public information campaign to provide Customers with options for achieving the Stage 3 demand reduction goal and complying with their applicable water allocation. The District shall explore increased Customer incentives for conservation measures.

Section 9. Stage 4 - Targeting Outdoor Reductions

(A) Stage 4 is also referred to as a "Mandatory Outdoor Reductions" stage. The intent of this stage and the related sub-stages is to strategically reduce the demand for water though targeted outdoor reduction actions. Stage 4 applies during periods when the District will not be able to meet all of the water demands of its Customers. This may correlate to any of MWD's WSAP Regional Shortage Levels 4 through 10.

(B) The objective of the measures undertaken in Stage 4 is to reduce water system consumption within the District by sixteen to fifty percent (16 to 50%).

(C) Except as otherwise provided in this Section 9, all supply shortage response measures of Stages 1 through 3 shall be in full force and effect during Stage 4.

(D) Stage 4 does not apply to non-potable or recycled water. The use of non-potable or recycled water is permitted pursuant to the specific rules and regulations that govern their use.

(E) If the District Board of Directors declares a Water Shortage Emergency during a Stage 4, no new potable

water service connections shall be provided, no new temporary meters or permanent meters shall be provided, and no statements of immediate ability to serve or provide potable water service (such as will serve letters, certificates, or letters of availability) shall be issued, except under the following circumstances:

(1) a valid, unexpired building permit has been issued for the project; or

(2) the project is necessary to protect the public's health, safety, and welfare; or

(3) the applicant provides a Conservation Offset or pays a Conservation Offset Fee established by the District in an amount necessary to cover the cost of implementing such conservation techniques or acquiring alternative water sources, to offset the new demand. The fee will be based on the Conservation Offset required to meet the projected demand of the proposed project. Such fee shall apply to residential as well as commercial and industrial buildings, and may be adjusted from time to time as determined by the District. The existence and application of a Conservation Offset, and the amount of the Conservation Offset Fee and other terms and conditions for any Conservation Offset, shall be determined at the District's sole discretion. The existence and application of any such water meter moratorium or other similar restrictions shall be determined by separate and subsequent action of the Board of Directors; or

(4) where an existing service connection exists and an existing water meter is inoperable and cannot be repaired. In such an instance, the size of the new water meter shall be the same or smaller than the water meter being replaced.

(F) Stage 4 has three sub-stages — Stage 4(a), Stage 4(b), and Stage 4(c). The following provisions shall apply during Stage 4:

(1) Stage 4(a).

(i) All landscape Water Budgets shall be reduced by ten percent (10%). Residential Customers who have Water Budgets, and whose water use exceeds one hundred percent (100%) of their Tier 1 and ninety percent (90%) of their Tier 2 Water Budgets during a Billing Period, shall be charged at the applicable Tier 5 water rates. Landscape Customers who have Water Budgets, and whose water use exceeds ninety percent (90%) of their Water Budget during a Billing Period, shall be charged the applicable Tier 5 water rates.

(ii) Commercial or industrial Customers who are served through mixed-use meters, and who have Water Budgets, shall reduce landscape and non-essential outdoor water use by twenty-five percent (25%).

(iii) Potable water Customers in areas directly served by the District and who do not have Water Budgets shall reduce their outdoor water use by ten percent (10%) from the base Period.

(2) Stage 4(b).

(i) All outdoor Water Budgets shall be reduced by forty percent (40%). Residential Customers who have Water Budgets, and whose water use exceeds one hundred percent (100%) of their Tier 1 and forty percent (40%) of their Tier 2 Water Budgets during a Billing Period, shall be charged at the applicable Tier 5 water rates. Landscape Customers who have Water Budgets, and whose water use exceeds forty percent (40%) of their Water Budget during a Billing Period, shall be charged the applicable Tier 5 water rates.

(ii) Commercial or industrial Customers who are served through dedicated or mixed-use meters, and who have Water Budgets, shall reduce their water consumption by ten percent (10%).

(iii) Potable water Customers in areas directly served by Western, and who do not have Water Budgets, shall reduce their outdoor water use by forty percent (40%) from the Base Period.

(3) Stage 4(c).

(i) All outdoor Water Budgets shall be reduced by sixty-five percent (65%). Residential Customers who have Water Budgets, and whose water use exceeds one hundred percent (100%) of their Tier 1 (indoor) Water Budget and thirty-five percent (35%) of their Tier 2 (outdoor) Water Budget during a Billing Period, shall be charged at the applicable Tier 5 water rates. Landscape Customers who have Water Budgets, and whose water use exceeds thirty-five (35%) of their total Water Budget during a Billing Period, shall be charged the applicable Tier 5 rate.

(ii) Installation of new landscapes shall be prohibited unless irrigated with recycled water. Exceptions may be provided for projects with prior approval by the appropriate jurisdiction.

(iii) Commercial and industrial Customers who are served through dedicated or mixed-use meters, and who have Water Budgets, shall reduce their water consumption by twenty percent (20%).

(iv) Potable water Customers in areas directly served by the District who do not have Water Budgets shall reduce their outdoor water use by sixty-five percent (65%).

(v) No new construction or hydrant meters will be issued. Potable water shall not be used for earth work, road construction purposes, dust control, compaction, or trenching jetting. Construction projects necessary to maintain the health, safety, and welfare of the public are exempt from these regulations.

(G) The District shall develop a public information campaign to provide Customers with options for achieving the Stage 4 demand reduction goals and complying with their applicable allocation. The District may explore increased Customer incentives for conservation measures.

Section 10. Stage 5 – Mandatory Targeted Indoor/Outdoor Reductions – Catastrophic Failure or "Immediate Emergency"

(A) Stage 5 is also referred to as a "Mandatory Indoor/Outdoor Reductions" stage. The intent of this stage and the related sub-stages is to substantially reduce the demand for water though indoor actions in addition to the elimination of landscape and non-essential outdoor water use. Stage 5 applies during periods when the District will not be able to meet all of the water demands of its Customers. This shortage level may correlate to MWD's WSAP Regional Shortage Levels 9, 10, or greater. Stage 5 may be declared during an Immediate Emergency. A Stage 5 declaration may also be accompanied by a Board Resolution declaring a Water Shortage Emergency under California Water Code sections 350 *et seq*.

(B) The objective of the measures undertaken in Stage 5 is to significantly reduce water consumption within the District to protect public health, safety, and fire flow.

(C) Except as otherwise provided in this Section 10, all water supply shortage response measures of Stages 1 through 4 shall be in full force and effect during Stage 5.

(D) Stage 5 does not apply to non-potable or recycled water, although there is no guarantee of availability. The use of non-potable or recycled water is permitted pursuant to the specific rules and regulations that govern their use and availability.

(E) All landscape and non-essential outdoor water use for all Customers in all areas of the District's retail water service area shall be prohibited.

(F) Except as to property for which a building permit has been heretofore issued, no new water meter(s) shall be provided, except in the following circumstances:

(1) for projects necessary to protect the public's health, safety, and welfare; or

(2) when using recycled water.

(G) Stage 5 has three sub-stages — Stage 5(a), Stage 5(b), and Stage 5(c). The following provisions shall apply during Stage 5:

(1) Stage 5(a).

(a) All indoor residential Water Budgets shall be reduced by ten percent (10%) to fifty-four (54) gallons per person per day. Residential Customers who have Water Budgets, and whose water use exceeds ninety percent (90%) of their modified Tier 1 Water Budget and zero percent (0%) of Tier 2 Water Budget during a Billing Period, or fifty four gallons per person per day total, shall be charged at the applicable Tier 5 water rates.

(b) Commercial and industrial Customers who are served through dedicated or mixed-use meters, and who have Water Budgets, shall reduce their water consumption by thirty percent (30%).

(c) Potable water Customers in areas directly served by Western that do not have Water Budgets shall reduce their indoor water use by ten percent (10%).

(2) Stage 5(b).

(a)All residential indoor Water Budgets shall be reduced by fifteen percent (15%) to fifty-one (51) gallons per person per day. Residential Customers who have Water Budgets, and whose water use exceeds eighty-five percent (85%) of their Tier 1 modified Water Budget and zero percent (0%) of Tier 2 Water Budget during a Billing Period, or fifty-one (51) gallons per person per day total, shall be charged at the applicable Tier 5 water rates.

(b) Commercial and industrial Customers who are served through dedicated or mixed-use meters, and who have Water Budgets, shall reduce their water consumption by forty percent (40%).

(c) Potable water Customers in areas directly served by the District who do not have Water Budgets shall reduce their indoor water use by fifteen percent (15%) from the Base Period. All non-essential outdoor and landscape water use shall be prohibited.

(3) Stage 5(c).

(a)All residential Customers who have Water Budgets shall have their indoor Water Budgets reduced by twenty percent (20%) to forty-eight (48) gallons per person per day. Residential Customers who have Water Budgets, and whose water use exceeds eighty percent (80%) of their Tier 1 modified Water Budget and zero percent (0%) of Tier 2 Water Budget during a Billing Period, or forty-eight (48) gallons per person per day total, shall be charged at the applicable Tier 5 rates.

(b) Commercial and industrial Customers who are served through dedicated or mixed-use

meters, and who have Water Budgets, shall be reduce their water consumption by fifty percent (50%).

(c) Potable water Customers in areas directly served by the District who do not have Water Budgets shall reduce their indoor water use by twenty percent (20%) from the Base period.

(H) The use of water for commercial, manufacturing, or processing purposes may be further reduced in volume than is indicated in the sub-stages of this section if it is determined to be in the best interest of the health, sanitation, and fire flow protection in the communities served by the District. This determination may be made by the Board of Directors, the General Manager or his or her authorized designee as provided for in Section 5(E).

(I) All dedicated irrigation meters will be locked off by District personnel.

(J) Customers with a District authorized Medical Adjustment to their Tier 1 allocation will be permitted 100 percent (100%) of their Tier 1 Water Budget.

(K) The District shall develop a public information campaign to provide Customers with options for achieving the Stage 5 demand reduction goals and complying with their allocation. The District may explore increased Customer incentives for conservation measures.

Section 11. Violations and remedies

(A) Criminal Violation. It shall be unlawful for any Person to willfully violate the provisions of this Ordinance. Any violation of the provisions of this Ordinance shall be a misdemeanor, unless made an infraction by the prosecutor, subject to imprisonment in the county jail for not more than thirty (30) days or by fine not to

exceed $1,000, or by both as provided in California Water Code section 377.

(B) Cease and Desist Order. The General Manager may issue a cease and desist order directing the Property Owner, or occupant, or other Person in charge of day-to-day operations of any property, and/or any other Person responsible for a violation of this Ordinance to:

(1) immediately discontinue any prohibited use of water pursuant to this Ordinance; and

(2) immediately cease any activity not in compliance with the terms, conditions, and requirements of this Ordinance.

(C) Civil Action. In addition to any other remedies provided in this Ordinance, any violation of this Ordinance may be enforced by civil action brought by the District and the imposition of administrative fines and/or penalties. In any such action, the District may seek, and the court may grant, as appropriate, any or all of the following remedies:

(1) a temporary and/or permanent injunction;

(2) assessment of the violator for the costs of enforcement of the violation and for the reasonable costs of preparing and bringing legal action under this Ordinance; and

(3) assessments under this subsection shall be paid to the District to be used exclusively for costs associated with implementing or enforcing the water supply shortage and regulatory provisions of this Ordinance.

(D) Cumulative. All remedies provided herein shall be cumulative and not exclusive.

(E) On-going. A Person shall be deemed guilty of a separate offense for each and every day or portion

thereof during which any violation of any provision of this Ordinance is committed, continued, or permitted.

Section 12. Notices

(A) Any notice, notice of violation, cease and desist order, and administrative compliance order shall be served pursuant to the requirements of this Ordinance and shall:

(1) identify the provision(s) of this Ordinance and any State law, if applicable, alleged to have been violated; and

(2) state that continued noncompliance may result in civil, criminal, or administrative enforcement actions against the Person who committed the violation, or the Property Owner and/or occupant of the property where the violation occurred; and

(3) state a compliance date that must be met by the Person who committed the violation, or the Property Owner and/or occupant of the property where the violation occurred; and

(4) order remediation work, where applicable, that must be taken by the Property Owner and/or occupant of the property; and

(5) state that the recipient has a right to appeal the matter as set forth in this Ordinance; and

(6) include the address of the affected property and be addressed to the Property Owner as shown on the most recently issued equalized assessment roll or as may otherwise appear in the current records of the District. If the order applies to a responsible party who is not the Property Owner, or if the event is not related to a specific property, the notice may be sent to the last known address of the responsible party; and

(7) be deemed served ten (10) business days after posting on the property, if the Property Owner or occupant of the affected property cannot be located after the reasonable efforts of the General Manager or his or her authorized designee.

(B) Any notice, notice of violation, cease and desist order, and administrative compliance order may be sent by regular mail. Service by regular mail is effective on the date of mailing.

(C) The notice of violation may include, where deemed applicable by the General Manager or his or her authorized designee, the following terms and conditions:

(1) specific steps or actions and time schedules for compliance as reasonably necessary to prevent future violations of this Ordinance; and

(2) any other terms, conditions, or requirements reasonably calculated to prevent continued or threatened future violations of this Ordinance, including, but not limited to, discontinuing or limiting water service with the installation of a flow-restricting device.

(D) In addition to or in conjunction with the notice of violation, for a first violation of any provision of this Ordinance, within two (2) weeks of the violation:

(1) the District may provide notice to the Property Owner or occupant of the property where the violation occurred to advise such Person of:

(a) the water supply shortage stage then in effect and the provisions of this Ordinance relating thereto;

(b) water supply shortage response measures that are required and may be implemented pursuant to this Ordinance;

(c) possible consequences and actions which may be taken by the District for future violations of this Ordinance, including discontinuance of water service; and

(d) fines and/or penalties that may be imposed for the specific violation and any future violations of this Ordinance;

(2) if the General Manager or his or her authorized designee deem it to be appropriate, the District may order the installation of a flow-restricting device on the service line for any Person who violates any term or provision of this Ordinance.

(E) In addition to or in conjunction with the notice of violation, for a second or any subsequent violation of this Ordinance, within two (2) weeks of the violation:

(1) the District may provide notice to the property where the violation occurred to notify the Property Owner or occupant of the property where the violation occurred to advise such Person of:

(a) the water supply shortage stage then in effect and the provisions of this Ordinance relating thereto;

(b) the water supply shortage response measures that are required and may be implemented by such Person; and

(c) possible consequences which may occur in the event of any future violations of this Ordinance;

(2) if the General Manager or his or her authorized designee deem it to be appropriate, the District may order the installation of a flow-restricting device on

the service line for any Person who violates any term or provision of this Ordinance;

(3) if the General Manager or his or her authorized designee deem it to be appropriate, the District may discontinue water service at the location where the violation occurred.

(F) The District may, after one (1) written notice of violation, order that a special meter reading or readings be made in order to ascertain whether wasteful or unreasonable use of water is occurring. The District may impose a meter reading fee for each meter reading it conducts pursuant to this Ordinance.

Section 13. Administrative compliance order and fines and/or penalties

(A) Separate from, in addition to, or in combination with a notice of violation or cease and desist order, the General Manager or his or her authorized designee may issue an administrative compliance order against the Property Owner and/or occupant of the property where a violation of this Ordinance occurred and/or any other Person responsible for a violation of this Ordinance who violates any provision of this Ordinance. Issuance of a notice of violation or a cease and desist order is not a prerequisite to the issuance of an administrative compliance order. The administrative compliance order shall allege the act(s) or failure(s) to act that constitute violations of this Ordinance and shall set forth the penalty for the violation(s).

(B) The General Manager may impose the following administrative monetary fines and/or penalties, in addition to other appropriate action requirements and measures:

(1) For water meters smaller than two inches (2") in size:

(a) For the first violation during any water supply shortage stage by any Person of any provision of this Ordinance, the District may issue a written notice to the Person which sets forth the facts surrounding the violation and additional information such as the required compliance and potential fines and/or penalties for noncompliance;

(b) For a second violation during any water supply shortage stage by any Person of any provision of this Ordinance within the preceding twelve (12) calendar months, the District may issue a written notice to the Person which sets forth a complete copy of this Ordinance or summary document of the District's Water Supply Shortage Contingency Program as well as additional information such as the required compliance and potential fines and/or penalties for noncompliance.

(c) For a third violation during Stages 1 and 2 by any Person of any of the provisions of this Ordinance within the preceding twelve (12) calendar months, the District may impose a monetary penalty in the amount of one hundred dollars ($100.00) per day for each day a Person violates any provision of this Ordinance. During Stages 3, 4, and 5 the District may impose a monetary penalty in the amount of two hundred dollars ($200.00) per day for each day a Person violates any provision of this Ordinance.

(d) For a fourth violation during Stages 1 and 2 by any Person of any of the provisions of this Ordinance within the preceding twelve (12) calendar months, the District may impose a monetary penalty in the amount of two hundred dollars ($200.00) per day for each day a Person violates any provision of this Ordinance. During Stages 3, 4, and 5 the District may impose a

monetary penalty in the amount of four hundred dollars ($400.00) per day for each day a Person violates any provision of this Ordinance.

(e) For a fifth and any subsequent violation, the District may install a flow-restricting device of two and one-half gallons per minute (2.5 GPM) capacity for services up to one and one-half inch (1-1/2") size and comparatively sized restrictors for larger services or terminate a Person's service in accordance with the District's applicable rules and regulations. These measures are in addition to any monetary fines and/or penalties provided for herein.

(f) Any such restricted or terminated service may be restored in accordance with the District's applicable rules and regulations and only upon a showing that the Person is in compliance with this Ordinance. Prior to any restoration of service, the Customer shall pay all District charges for any restriction or termination of service and its restoration as provided for in the District rules governing water service, including, but not limited to payment of all past due bills and fines and/or penalties and any other amounts which may be due and owing under this Ordinance.

(2) For water meters two inches (2") and larger:

(a) For the first violation during any water supply shortage stage by any Person of any provision of this Ordinance, the District may issue a written notice to the Person which sets forth the facts surrounding the violation and additional information such as the required compliance and potential fines and/or penalties for noncompliance.

(b) For a second violation during any water supply shortage stage by any Person of any provision of this Ordinance within the preceding twelve (12) calendar months, the District may issue a written notice to the Person which sets forth a complete copy of this Ordinance or summary document of the District's Water Shortage Contingency Program as well as additional information such as the required compliance and potential fines and/or penalties for noncompliance.

(c) For a third violation during water supply shortage Stages 1 and 2 by any Person of any of the provisions of this Ordinance within the preceding twelve (12) calendar months, the District may impose a monetary fine and/or penalty in the amount of one hundred dollars ($100.00) per day for each day a Person violates any provision of this Ordinance. During Stages 3, 4, and 5 the District may impose a monetary fine and/or penalty in the amount of three hundred dollars ($300.00) per day for each day a Person violates any provision of this Ordinance.

(d) For a fourth violation during water supply shortage Stages 1 and 2 by any Person of any of the provisions of this Ordinance within the preceding twelve (12) calendar months, the District may impose a monetary fine and/or penalty in the amount of three hundred dollars ($300.00) per day for each day a Person violates any provision of this Ordinance. During Stages 3, 4, and 5, the District may impose a monetary fine and/or penalty in the amount of six hundred dollars ($600.00) per day for each day a Person violates any provision of this Ordinance.

(e) For a fifth and any subsequent violation, the District may install a flow restricting device or terminate a Person's service in accordance with the District's applicable rules and regulations, in

addition to the monetary fines and/or penalties provided for herein.

(f) Any such restricted or terminated service may be restored in accordance with the District's applicable rules and regulations and only upon a showing that the Person is in compliance with this Ordinance. Prior to any restoration of service, the Customer shall pay all District charges for any restriction or termination of service and its restoration as provided for in the District rules governing water service, including, but not limited to, payment of all past due bills and fines and/or and any other amounts which may be due and owing under this Ordinance.

(3) An amount that shall not exceed one thousand dollars ($1,000.00) per day for each day on which a Person violates any provision of this Ordinance. Unless timely appealed, an administrative compliance order shall be effective and final as of the date it is issued by the General Manager.

(C) The amount of any fines and/or penalties imposed pursuant to this Section 13 may be collected by including said amount on the Customer's water bill. The amount of any fines and/or penalties imposed pursuant to this Section 13 which have remained delinquent for a period of sixty (60) calendar days shall constitute a lien against the real property of the Person violating this Ordinance. The lien provided herein shall have no force and effect until recorded with the Riverside County Recorder and when recorded shall have the force and effect and priority of a judgment lien and continue for ten (10) years from the time of recording unless sooner released, and shall be renewable in accordance with the provisions of sections 683.110 to

683.220, inclusive, of the California Code of Civil Procedure.

(D) All moneys collected under this Section 13 shall be deposited in a special account of the District and shall be made available for enforcement of this Ordinance and enhanced water conservation incentive programs.

(E) The District may, at its option, elect to petition the Superior Court to confirm any order establishing administrative fines and/or penalties and enter judgment in conformity therewith in accordance with the provisions of sections 1285 to 1287.6, inclusive, of the California Code of Civil Procedure.

Section 14. Over-Budget Water Use Penalties

(A) All penalty moneys collected from over-budget water use during a declared water shortage stage in excess of the applicable Tier 2 rate, shall be deposited in the existing special funding accounts designated for conservation penalty and/or supply penalty as appropriate and may be allocated to or used for any of the following as determined by the District:

1. Conservation Penalty Account:

(a) Enhanced conservation programs designed to reduce water demands;

(b) Outreach and Education Programs designed to reduce water demands, decrease water waste, or generally raise water awareness;

(c) Enforcement of any provision of this Ordinance;

2. Supply Penalty Account:

(a) Purchase, acquisition, delivery, or wheeling of additional water supplies;

(b) General operations and maintenance expenses, including those incurred as a result of reduced water sales;

(c) The difference between budgeted revenue expected from the operations and maintenance component in the water rates of Tier 1 and 2 and actual revenue received from this component;

(d) Payment of penalty expenses incurred as a result of exceeding a MWD water supply allocation;

(e) Payment of any other incremental cost of service associated with providing water deliveries and/or water service during any water curtailment, water shortage emergency, or "Immediate Emergency" pursuant to Water Code sections 350 *et seq.*

Section 15. Recovery of costs

(A) The General Manager shall serve an invoice for costs upon the Property Owner and/or occupant of any property, or any other responsible Person who is subject to a notice of violation, a cease and desist order, or an administrative compliance order. An invoice for costs shall be immediately due and payable to the District. If any Property Owner or Person in charge of day-to-day operations, Customer, or responsible party, or any other Person fails to either pay the invoice for costs or appeal successfully the invoice for costs in accordance with this Ordinance, then the District may institute collection proceedings. The invoice for costs may include reasonable attorneys' fees.

(B) The District shall impose any other fines and/or penalties or regulatory fees, as fixed from time to time by the Board of Directors, for a violation or enforcement of this Ordinance.

(C) In order to recover the costs of the water supply shortage program set forth in this Ordinance, the Board of Directors may, from time to time, fix and impose fees and charges. The District fees and charges may include, but are not limited to fees and charges for:

(1) any visits of a Enforcement Officer or other District staff for time incurred for meter reading, follow-up visits, or the installation or removal of a flow-restricting device;

(2) monitoring, inspection, and surveillance procedures pertaining to enforcement of this Ordinance;

(3) enforcing compliance with any term or provision of this Ordinance;

(4) re-initiating service at a property where service has been discontinued pursuant to this Ordinance;

(5) processing any fees necessary to carry out the provisions of this Ordinance.

Section 16. Appeals

Any Person subject to a notice of violation, cease and desist order, or administrative compliance order may file a written appeal of such order or notice to the General Manager within thirty (30) calendar days of the date of service of the order or notice. An appeal shall be made in accordance with the following procedures:

(1) The Appellant shall complete and submit in writing a form provided by the District for such purpose and shall state in such form the grounds for his or her appeal. All appeals shall be submitted to the District Secretary within thirty (30) calendar days of the date of

the notice of violation, cease and desist order, or administrative compliance order.

(2) The General Manager or his or her authorized designee shall review the appeal and any related information provided, and, if necessary, cause an investigation and report to be made concerning the request for Relief. The General Manager or his or her authorized designee shall have fifteen (15) calendar days from the submission of the appeal to render a decision on whether to grant the appeal and mail notice thereof to the Appellant. If the General Manager or his or her authorized designee grants the appeal, then within fifteen (15) calendar days of such determination the General Manager or his or her authorized designee shall give written notice thereof to the Appellant.

(3) The decision of the General Manager or his or her authorized designee may be appealed by the Appellant to the Board of Directors. Such appeal must be submitted in writing and filed with the District Secretary within fifteen (15) calendar days of the date of decision of the General Manager or his or her authorized designee. The Board of Directors shall conduct a hearing on such appeal at its next regularly scheduled Board of Directors meeting; provided, however, the Board of Directors shall have received the notice of appeal at least fifteen (15) calendar days prior to such meeting. If the appeal is not submitted within at least fifteen (15) calendar days prior to a regularly scheduled Board of Directors meeting, then the Hearing shall be held at the following regularly scheduled meeting of the Board of Directors. A notice of the Hearing shall be mailed to the Appellant at least ten (10) calendar days before the date fixed for the Hearing.

The Board of Directors shall review the appeal de novo. The determination of the Board of Directors shall be conclusive and shall constitute a final order. Notice of the determination by the Board of Directors shall be mailed to the Appellant within ten (10) calendar days of such determination and shall indicate whether the appeal has been granted in whole or in part and set forth the terms and conditions of the appeal, if any, granted to the Appellant. If the appeal is denied, the Appellant shall comply with all terms and conditions of this Ordinance and the applicable stage then in effect.

(4) All adjustments to water budget allocations shall follow the procedure established by the District.

(5) Until the conclusion of the appeal process, all provisions and decisions under appeal shall remain in full force and effect until the conclusion of the appeal process.

Section 17. Relief from compliance

Consideration of written applications for Relief from compliance regarding the regulations and restrictions on water use set forth in this Ordinance may be made by the District.

(A) Written applications for Relief shall be accepted, and may be granted or denied, by the Approving Authority, at his or her sole discretion, or by his or her designee at his or her sole discretion. The application shall be in a form prescribed by the District and shall be accompanied by a non-refundable processing fee in an amount as determined by the Board of Directors for the purpose of defraying the costs incidental to the proceedings.

(B) The grounds for granting or conditionally granting Relief are:

(1) due to unique circumstances, a specific requirement of this Ordinance would result in undue hardship to a Person using District water or to property upon which District water is used, that is disproportionate to the impacts to other District water users generally or to similar property or classes of water users; or

(2) failure to grant Relief would adversely affect the health, sanitation, fire protection, or safety of the applicant or the public.

(C) The application for Relief shall be accompanied, as appropriate, with photographs, maps, drawings, and other information substantiating the applicant's request, including a statement of the applicant.

(D) An application for Relief shall be denied unless the Approving Authority finds, based on the information provided in the application, supporting documentation, or such other additional information as may be requested, and on water use information for the property as shown by the records of the District, all of the following:

(1) That the Relief does not constitute a grant of special privilege inconsistent with the limitations upon other District Customers;

(2) That because of special circumstances applicable to the property or its use, the strict application of this Ordinance would have a disproportionate impact on: (a) the property or use that exceeds Customers generally; or (b) the applicant's health that exceeds Customers generally;

(3) That the authorization of such Relief will not be of substantial detriment to adjacent properties, will not materially affect the ability of the District to effectuate the purposes of this Ordinance, and will not be detrimental to the public interest; and

(4) That the condition or situation of: (a) the subject property or the intended use of the property for which the Relief is sought is not common, recurrent, or general in nature; or (b) the applicant's health or safety is not common, recurrent, or general in nature.

(E) The denial or grant of a Relief shall be acted upon within fifteen (15) business days of the submittal of the complete application, including any photographs, maps, drawings, and other information substantiating the applicant's request and the statement of the applicant. The application may be approved, conditionally approved, or denied. The decision of the Approving Authority shall be prepared in writing, include terms and conditions, if any, and promptly sent to the applicant.

(F) The denial of a request for Relief may be appealed in writing to the General Manager. An appeal shall be made in accordance with the following procedures:

(1) The Appellant shall complete and submit in writing a form provided by the District for such purpose and shall state in such form the grounds for his or her appeal. All appeals shall be submitted to the District Secretary within thirty (30) calendar days of the date of the notice of the denial of the request for Relief.

(2) The General Manager or his or her authorized designee shall review the appeal and any related information provided, and, if necessary, cause an

investigation and report to be made concerning the request for Relief. The General Manager or his or her authorized designee shall have fifteen (15) calendar days from the submission of the appeal to render a decision on whether to grant the appeal and mail notice thereof to the Appellant. If the General Manager or his or her authorized designee grants the appeal and determines that the request for Relief shall be granted, then within fifteen (15) calendar days of such determination the General Manager or his or her authorized designee shall give written notice thereof to the Appellant.

(3) The decision of the General Manager or his or her authorized designee may be appealed by the Appellant to the Board of Directors. Such appeal must be submitted in writing and filed with the District Secretary within fifteen (15) calendar days of the date of decision of the General Manager or his or her authorized designee. The Board of Directors shall conduct a hearing on such appeal at its next regularly scheduled Board of Directors meeting; provided, however, the Board of Directors shall have received the notice of appeal at least fifteen (15) calendar days prior to such meeting. If the appeal is not submitted within at least fifteen (15) calendar days prior to a regularly scheduled Board of Directors meeting, then the Hearing shall be held at the following regularly scheduled meeting of the Board of Directors. A notice of the Hearing shall be mailed to the Appellant at least ten (10) calendar days before the date fixed for the Hearing. The Board of Directors shall review the appeal de novo. The determination of the Board of Directors shall be conclusive and shall constitute a final order. Notice of the determination by the Board of Directors shall be mailed to the Appellant within ten (10) calendar days of such

determination and shall indicate whether the appeal has been granted in whole or in part and set forth the terms and conditions of the Relief, if any, granted to the Appellant. If the appeal is denied, the Appellant shall comply with all terms and conditions of this Ordinance and the applicable stage then in effect.

(4) All adjustments to Tier 1 water budget allocations shall follow the procedure established by the District.

(5) Until the conclusion of the appeal process, all provisions and decisions under appeal shall remain in full force and effect until the conclusion of the appeal process.

Section 18. Conflicting Provisions

If provisions of this Ordinance are in conflict with each other, other rules and regulations of the District, any other resolution or ordinance of the District, or any State law or regulation, the more restrictive provisions shall apply.

Section 19. Severability

If any provision, section, subsection, sentence, clause or phrase or sections of this Ordinance, or the application of same to any Person or set of circumstances, is for any reason held to be unconstitutional, void or invalid, the invalidity of the remaining portions of sections of this Ordinance shall not be affected, it being the intent of the Board of Directors in adopting this Ordinance that no portions, provisions, or regulations contained herein shall become inoperative, or fail by reason of the unconstitutionality of any other provision hereof and all provisions of this Ordinance are declared to be severable for that purpose.

Section 20. Effective Date and Publication

This Ordinance shall be effective upon adoption. Within ten (10) days after its adoption, the District Secretary shall cause this Ordinance to be published once pursuant to California Government Code section 6061 in full in a newspaper of general circulation which is printed, published, and circulated in the District. If there is no such newspaper, the Ordinance shall be posted within the District after its adoption in three public places.

ADOPTED AND APPROVED this 18th day of February 2015 by the Board of Directors of the Western Municipal Water District.

DONALD D. GALLEANO
President

February 18, 2015

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of Ordinance 384 adopted by the Board of Directors of the Western Municipal Water District of Riverside County at the scheduled Public Hearing held February 18, 2015.

THOMAS P. EVANS
Secretary-Treasurer

Attachment 5 -
Adoption Resolution 3155

RESOLUTION 3155

RESOLUTION OF THE BOARD OF DIRECTORS OF WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ADOPTING THE WATER SHORTAGE CONTINGENCY PLAN

WHEREAS, The California Urban Water Management Planning Act, Water Code Section 10610 et seq. (the Act), mandates that every urban supplier of water providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare and adopt, in accordance with prescribed requirements, a water shortage contingency plan (WSCP); and

WHEREAS, the Act specifies the requirements and procedures for adopting such Water Shortage Contingency Plans; and

WHEREAS, pursuant to recent amendments to the Act, urban water suppliers are required to adopt and electronically submit their WSCPs to the California Department of Water Resources by July 1, 2021; and

WHEREAS, pursuant to the Water Conservation Act of 2009, also referred to as SB X7-7 (Water Code section 10608 et seq.), an "urban retail water supplier" is defined as a water supplier that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes, and an "urban wholesale water supplier" is defined as a water supplier that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes; and

hearing online, or virtually, as there was no public location for attending in person. The public hearing was live streamed online at wmwd.com in order to provide members of the public and other interested entities with the opportunity to be heard in connection with proposed adoption of the WSCP and issues related thereto; and

WHEREAS, pursuant to said public hearing on Western's WSCP, Western, among other things, encouraged the active involvement of diverse social, cultural, and economic members of the community within Western's service area with regard to the preparation of the Plan, encouraged community input regarding Western's Water Shortage Contingency Plan; and

WHEREAS, the Board of Directors has reviewed and considered the purposes and requirements of the Act and SB X7-7, the contents of the WSCP, and the documentation contained in the administrative record in support of the WSCP, and has determined that the factual analyses and conclusions set forth in the WSCP are legally sufficient; and

WHEREAS, Section 10652 of the California Water Code provides that the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of a water shortage contingency plan as part of an urban water management plan pursuant to California Water Code Section 10632; and

WHEREAS, the Board of Directors desires to adopt the WSCP in order to comply with the Act and SB X7-7.

to provide that portion of the WSCP prepared pursuant to Water Code Section 10635(a) to any city or county within which Western provides water supplies no later than sixty (60) days after submitting a copy of the WSCP with the California Department of Water Resources;

7. Western finds and determines that this resolution is not subject to CEQA pursuant to Water Code Section 10652 because CEQA does not apply to the preparation and adoption of a water shortage contingency plan or to the implementation of the actions taken pursuant to such plans. Because this resolution comprises Western's water shortage contingency plan and involves its implementation, no CEQA review is required;

8. Pursuant to CEQA, Western directs staff to file a Notice of Exemption with the Riverside County Clerk's office within five (5) working days of adoption of this resolution;

9. The document and materials that constitute the record of proceedings on which this resolution and the above findings have been based are located at Clerk of the Board of Directors of Western Municipal Water District. The custodian for these records is the Clerk of the Board of Western;

10. The General Manager is hereby authorized and directed to implement the WSCP in accordance with the Act and SB X7-7 and to provide recommendations to the Board of Directors regarding the necessary budgets, procedures, rules, regulations or further actions to carry out the effective and equitable implementation of the WSCP.

Legal Notice

APN: 285-060-042-5 TS No: CA05000214-16-4 TO No: 191180931-CA-VOI NOTICE OF TRUSTEE'S SALE (The above statement is made pursuant to CA Civil Code Section 2923.3(d)(1). The Summary will be provided to Trustor(s) and/or vested owner(s) only, pursuant to CA Civil Code Section 2923.3(d)(2).) YOU ARE IN DEFAULT UNDER A DEED OF TRUST DATED March 31, 2008. UNLESS YOU TAKE ACTION TO PROTECT YOUR PROPERTY, IT MAY BE SOLD AT A PUBLIC SALE. IF YOU NEED AN EXPLANATION OF THE NATURE OF THE PROCEEDINGS AGAINST YOU, YOU SHOULD CONTACT A LAWYER. On June 1, 2021 at 09:00 AM, at the bottom of the stairway to the building located at 849 W. Sixth Street, Corona, CA 92882, MTC Financial Inc. dba Trustee Corps, as the duly Appointed Trustee, under and pursuant to the power of sale contained in that certain Deed of Trust recorded on April 7, 2008 as Instrument No. 2008-0170997, of official records in the Office of the Recorder of Riverside County, California, executed by LLOYD B. BRYANT AND PATRICIA J. BRYANT, HUSBAND AND WIFE AS JOINT TENANTS, as Trustor(s), in favor of MFS INVESTMENTS, INC. DBA METRO FINANCIAL as Beneficiary, WILL SELL AT PUBLIC AUCTION TO THE HIGHEST BIDDER, in lawful money of the United States, all payable at the time of sale, that certain property situated in said County, California describing the land therein as: AS MORE FULLY DESCRIBED IN SAID DEED OF TRUST The property heretofore described is being sold "as is". The street address and other common designation, if any, of the real property described above is purported to be: 15871 RAWHIDE LANE, RIVERSIDE, CA 92504 The undersigned Trustee disclaims any liability for any incorrectness of the street address and other common designation, if any, shown herein. Said sale will be made without covenant or warranty, express or implied, regarding title, possession, or encumbrances, to pay the remaining principal sum of the Note(s) secured by said Deed of Trust, with interest thereon, as provided in said Note(s), advances if any, under the terms of the Deed of Trust, estimated fees, charges and expenses of the Trustee and of the trusts created by said Deed of Trust. The total amount of the unpaid balance of the obligations secured by the property to be sold and reasonable estimated costs, expenses and advances at the time of the initial publication of this Notice of Trustee's Sale is estimated to be $352,889.01 (Estimated). However, prepayment premiums, accrued interest and advances will increase this figure prior to sale. Beneficiary's bid at said sale may include all or part of said amount. In addition to cash, the Trustee will accept a cashier's check drawn on a state or national bank, a check drawn by a state or federal credit union or a check drawn by a state or federal savings and loan association, savings association or savings bank specified in Section 5102 of the California Financial Code and authorized to do business in California, or other such funds as may be acceptable to the Trustee. In the event tender other than cash is accepted, the Trustee may withhold the issuance of the Trustee's Deed Upon Sale until funds become available to the payee or endorsee as a matter of right. The property offered for sale excludes all funds held on account by the property receiver, if applicable. If the Trustee is unable to convey title for any reason, the successful bidder's sole and exclusive remedy shall be the return of monies paid to the Trustee and the successful bidder shall have no further recourse. Notice to Potential Bidders If you are considering bidding on this property lien, you should understand that there are risks involved in bidding at a Trustee auction. You will be bidding on a lien, not on the property itself. Placing the highest bid at a Trustee auction does not automatically entitle you to free and clear ownership of the property. You should also be aware that the lien being auctioned off may be a junior lien. If you are the highest bidder at the auction, you are or may be responsible for paying off all liens senior to the lien being auctioned off, before you can receive clear title to the property. You are encouraged to investigate the existence, priority, and size of outstanding liens that may exist on this property by contacting the county recorder's office or a title insurance company, either of which may charge you a fee for this information. If you consult either of these resources, you should be aware that the same Lender may hold more than one mortgage or Deed of Trust on the property. Notice to Property Owner The sale date shown on this Notice of Sale may be postponed one or more times by the Mortgagee, Beneficiary, Trustee, or a court, pursuant to Section 2924g of the California Civil Code. The law requires that information about Trustee Sale postponements be made available to you and to the public, as a courtesy to those not present at the sale. If you wish to learn whether your sale date has been postponed, and, if applicable, the rescheduled time and date for the sale of this property, you may call In Source Logic at 702-659-7766 for information regarding the Trustee's Sale or visit the Internet Website www.insourcelogic.com for information regarding the sale of this property, using the file number assigned to this case, CA05000214-16-4. Information about postponements that are very short in duration or that occur close in time to the scheduled sale may not immediately be reflected in the telephone information or on the Internet Website. The best way to verify postponement information is to attend the scheduled sale. Notice to Tenant NOTICE TO TENANT FOR FORECLOSURES AFTER JANUARY 1, 2021 You may have a right to purchase this property after the trustee auction pursuant to Section 2924m of the California Civil Code. If you are an "eligible tenant buyer," you can purchase the property if you match the last and highest bid placed at the trustee auction. If you are an "eligible bidder," you may be able to purchase the property if you exceed the last and highest bid placed at the trustee auction. There are three steps to exercising this right of purchase. First, 48 hours after the date of the trustee sale, you can call 702-659-7766, or visit this internet website www.insourcelogic.com, using the file number assigned to this case CA05000214-16-4 to find the date on which the trustee's sale was held, the amount of the last and highest bid, and the address of the trustee. Second, you must send a written notice of intent to place a bid so that the trustee receives it no more than 15 days after the trustee's sale. Third, you must submit a bid so that the trustee receives it no more than 45 days after the trustee's sale. If you think you may qualify as an "eligible tenant buyer" or "eligible bidder," you should consider contacting an attorney or appropriate real estate professional immediately for advice regarding this potential right to purchase. Date: April 2, 2021 MTC Financial Inc. dba Trustee Corps TS No. CA05000214-16-4 17100 Gillette Ave Irvine, CA 92614 Phone: 949-252-8300 TDD: 866-660-4288 Dalaysia Ramirez, Authorized Signatory SALE INFORMATION CAN BE OBTAINED ON LINE AT www.insourcelogic.com FOR AUTOMATED SALES INFORMATION PLEASE CALL: In Source Logic AT 702-659-7766 Trustee Corps may be acting as a debt collector attempting to collect a debt. Any information obtained may be used for that purpose. Order Number 74399, Pub Dates: 4/8/2021, 4/15/2021, 4/22/2021, PRESS ENTERPRISE MORENO VALLEY EDITION

Legal Notice

NOTICE TO BIDDERS

The **County of Riverside** ("County") will receive sealed bids for the **Construction Management - Multi-Prime Bid – Riverside County Law Library HVAC Replacement Project– All Bid Categories (see Bid Category List Below).**

Bids must be received no later than **2:00 PM** on **Thursday, May 6th, 2021** (the "Bid Deadline") at **3612 Mission Inn Ave. Riverside, CA 92501** (entrance and parking located on Orange St.)

The Project consists of replacement of wet & dry HVAC system with electrical, switchgear and transformer upgrades within a 35,000 SF building as further described in the bid and contract documents ("County Documents"). The pre-qualified Bidders shall review the County Documents for more complete information regarding the Project and submission of bids. The architect's/engineer's construction cost estimate for this Project is **$3,200,000.**

Bid Documents will be available on **April 8th, 2021** via Smartbid by contacting Tilden-Coil Constructors at 951-684-5901. **Bidders shall submit all documents for bidding as provided for in the Instruction to Bidders. Bids will only be accepted from bidders who have previously pre-qualified with the County of Riverside. Bidders viewing plans online are responsible for contacting Melanie Lopez – mlopez@tilden-coil.com (951) 684-5901 Tilden-Coil Constructors and requesting to be included on the Plan holders List. Bidders are responsible for confirmation that they have viewed all addenda prior to the bid deadline and will be required to acknowledge addenda on their bid form.**

A **mandatory** pre-bid meeting and job walk for prime contractors will be held on **April 14, 2021** at **3535 Tenth St. - Riverside, CA 92501. RSVP is required, please RSVP using this link. https://bit.ly/3ubznL3**

The deadline to submit a request for information is **April 22, 2021.** RFI's may be submitted to rkahrs@tilden-coil.com.

Only Pre-qualified contractors are allowed to bid. Bids must be submitted to the County on the County's bid forms. **All bids must be addressed, sealed in an envelope, and received by the County no later than the Bid Deadline.** All bids will be publicly opened immediately after the Bid Deadline. Bids received after the Bid Deadline shall be rejected. County reserves the right to reject any or all bids and to waive any informality or irregularity in any bid received.

Bids shall be valid for **one hundred twenty (120) days** after the Bid Deadline. Bids must be accompanied by cash, a certified or cashier's check, or a bid bond in favor of the County in an amount not less than ten percent (10%) of the submitted total bid price. The successful bidder will be required to furnish a performance bond and a payment bond, each in the amount of one hundred percent (100%) of the total bid price in the manner described in the Contract Documents. Bidders shall comply with California Public Contract Code Section 4108 with respect to subcontractor bond requirements.

Bidders shall possess one or more of the following California Contractor's license(s) at the time of the bid opening in order to perform the work:

Category #	Description	License
1	HVAC	C20
2	Electrical & Low Voltage	C10
3	General Package	B

Contractors wishing to bid on select trades must have been previously pre-qualified by the County prior to release of this Notice. Subcontractors must possess the appropriate licenses for each specialty subcontracted.

Bid Form . If Alternates are included in the Bidding Documents, then a Bid amount for each and every such Alternate shall be included in the spaces provided in the Bid Form for that purpose. If the Bidder determines that the Alternate does not affect the amount of its Base Bid, then the Bidder shall enter "No Change" in the Bid Form.

Basis for Award . Where the Bidding Documents include Allowances; the Lowest Bid Price is the Total Bid Amount identified on the Bid Form and shall include the Base Bid plus all Allowances. In the event of Alternate Bids, Alternate Bids shall not be included in the Total Bid Amount. If applicable the Alternate Bids shall be listed separately on the spaces provided on the Bid Form for Alternate Bids.

This Project is a public work for purposes of the California Labor Code, which requires payment of prevailing wages. County has obtained the general prevailing rates, which will be on file with the County's Construction Manager and will be available to any interested party.

A contractor or subcontractor shall not be qualified to bid on, be listed in a bid proposal, subject to the requirements of Section 4104 of the Public Contract Code, or engage in the performance of any contract for public work, as defined in the Labor Code, unless registered and qualified to perform public work pursuant to Labor Code section 1725.5.

The contractor and all subcontractors shall furnish certified payroll records as required pursuant Labor Code section 1776 directly to the Labor Commissioner in accordance with Labor Code section 1771.4 at least monthly (or more frequently if required by the County or the Labor Commissioner) and in a format prescribed by the Labor Commissioner. Monitoring and enforcement of the prevailing wage laws and related requirements will be performed by the Labor Commissioner/Department of Labor Standards Enforcement (DLSE), and by the County.

Western Municipal Water District
Public Hearing Notice
2020 Urban Water Management Plan, Water Shortage Contingency Plan, and Addendum to the 2015 Urban Water Management Plan

Notice is hereby given that on **June 16, 2021** at **9:30 a.m.** in the Western Municipal Water District (Western) Boardroom, first floor at 14205 Meridian Parkway, Riverside, CA 92518, the Western Board of Directors will conduct a public hearing to receive public comments and consider adoption of the Draft 2020 Urban Water Management Plan (UWMP), Draft Water Shortage Contingency Plan (WSCP), and Draft Addendum to Western's 2015 UWMP. Following the public hearing, the Western Board of Directors may adopt the Draft 2020 UWMP, Draft WSCP, and Draft Addendum to the 2015 UWMP with recommended modifications as a result of public input.

The Draft 2020 UWMP documents Western's plans to ensure adequate water supplies to meet existing and future demands under a range of water supply conditions, including water shortages. The Draft WSCP documents Western's plans to manage and mitigate an actual water shortage condition, should one occur because of drought or other impacts on water supplies. The Draft Addendum to the 2015 UWMP is a requirement of the Delta Plan for agencies to demonstrate consistency with the Delta Plan policy to reduce reliance on the Delta through improved regional water self-reliance.

A copy of the Draft 2020 UWMP, Draft WSCP, and Draft Addendum to the 2015 Plan will be available for public review beginning on April 30, 2021 and can be downloaded at [www.wmwd.com/uwmp]. Please contact Western if you require special accommodations.

Please provide written comments on the Draft 2020 UWMP documents to board secretary@wmwd.com prior to June 16, 2021.

In an effort to protect public health and prevent the spread of COVID-19 (coronavirus), and in accordance with the Governor's Executive order N-29-20, the public may view the public hearing online, or virtually, as there will be no public location for attending in person. The public hearing will be live-streamed online at wmwd.com. Members of the public who wish to comment on the 2020 Urban Water Management Plan, Water Shortage Contingency Plan, and Addendum to the 2015 Urban Water Management Plan, may make comments virtually during the public hearing, or may submit comments at the following web Address: https://wmwd.com/publiccomments, or directly to boardsecretary@wmwd.com. Comments received before 4:30 p.m., June 15, 2021, will become part of the June 16 2021 public hearing and Board meeting records.

Members of the public may join the live public hearing via Zoom as follows: Join Zoom Meeting: https://wmwd.zoom.us/j/87320624891. Meeting ID: 873 2062 4891. To join the Zoom meeting by telephone only: Dial (669) 219-2599 or (669) 900-6833, Meeting ID: 873 2062 4891.

If you have any questions regarding Western's 2020 UWMP, WSCP, Addendum to the 2015 Plan, or public hearing meeting, please contact Melissa Matlock at 951.571.7260 or mmatlock@wmwd.com.
Press-Enterprise: 4/15, 4/22

GOVERNMENT ACTIONS & THE NEWSPAPER ROLE

Throughout our nation's history, government agencies have been required to alert citizens of certain government activities that may impact a local community, providing citizens with an opportunity to stay informed and take action when necessary. Newspapers have long partnered with government agencies by publishing public notices, enabling the **government to be fully transparent and accountable to citizen taxpayers.**

Publishing public notices in newspapers informs a wide audience in a local community of a government agency's action; reaching citizens that are passive information seekers. Publishing public notices through the local newspaper also serves an important audit role as the newspaper acts as an independent third party able to legally verify that the government agency has given the public notice.

Take a moment and look through the public notices. You may be surprised by what you will learn.

BEST DELIVERY IN THE GAME!
Turn to the Sports section for outstanding coverage of the Dodgers, Angels and ALL local baseball action.

Notificación de Audiencia Pública
Plan de Gestión de Agua Urbana 2020, Plan de Contingencia Para la Escasez de Agua y Anexo al Plan de Gestión de Agua Urbana 2015

Por la presente se notifica que el **16 de junio de 2021** a las **9:30 am** en la sala de juntas de Western Municipal Water District (Western), en el primer piso en 14205 Meridian Parkway, Riverside, CA 92518, la Junta Directiva de Western llevará a cabo una audiencia para recibir comentarios del público y considerar la adopción del Borrador del Plan de Manejo de Agua Urbana (UWMP) 2020, el Borrador del Plan de Contingencia para la Escasez de Agua (WSCP) y el Borrador del Apéndice al UWMP 2015 de Western. Después de la audiencia pública, la Junta Directiva de Western podría adoptar el Borrador del UWMP 2020, el Borrador del WSCP y el Borrador del Apéndice del UWMP 2015 con las modificaciones recomendadas como resultado de los comentarios del público.

El Borrador 2020 del UWMP documenta los planes de Western para garantizar un suministro de agua adecuado para satisfacer las demandas actuales y futuras considerando variaciones en las condiciones de suministro de agua, incluyendo la escasez de agua. El borrador del WSCP documenta los planes de Western para manejar y mitigar una condición real de escasez de agua, en caso de que ocurra debido a sequías u otros impactos en los suministros de agua. El Borrador del Apéndice al UWMP 2015 es un requisito del Plan Delta para que las agencias demuestren coherencia con la política del Plan Delta para reducir la dependencia del Delta a través de una autosuficiencia regional mejorada del agua.

Una copia del Borrador del UWMP 2020, el Borrador del WSCP y el Borrador del Apéndice del Plan 2015 estarán disponibles para revisión pública a partir del 30 de abril de 2021 y se pueden descargar en [www.wmwd.com/uwmp]. Comuníquese con Western si necesita adaptaciones especiales.

Por favor proporcione comentarios por escrito sobre los borradores de los documentos UWMP 2020 enviándolos a board secretary@wmwd.com antes del 16 de junio de 2021.

En un esfuerzo por proteger la salud pública y prevenir la propagación del COVID-19 (coronavirus), y de acuerdo con la Orden Ejecutiva del Gobernador N-29-20, el público puede ver la audiencia pública en línea, o virtualmente, ya que no habrá lugar público para asistir en persona. La audiencia pública se transmitirá en vivo en línea por wmwd.com. Los miembros del público que deseen comentar sobre el Plan de Gestión de Agua Urbana 2020, el Plan de Contingencia para la Escasez de Agua y el Anexo al Plan de Gestión de Agua Urbana 2015 pueden hacer comentarios virtualmente durante la audiencia pública, o pueden enviar comentarios en la siguiente dirección web: https://wmwd.com/publiccomments, o directamente a boardsecretary@wmwd.com. Los comentarios recibidos antes de las 4:30 p.m. del 15 de junio de 2021 pasarán a formar parte de la audiencia pública del 16 de junio de 2021 y los registros de las reuniones de la Junta.

Los miembros del público pueden asistir a la audiencia pública en vivo a través de Zoom de la siguiente manera: Únase a la reunión de Zoom: https://wmwd.zoom.us/j/87320624891. ID de la reunión: 873 2062 4891. Para unirse a la reunión de Zoom solo por teléfono: Marque (669) 219-2599 o (669) 900-6833, ID de reunión: 873 2062 4891.

Si tiene alguna pregunta sobre el UWMP 2020, el WSCP, el Apéndice del Plan 2015 o la audiencia pública de Western, comuníquese con Melissa Matlock al 951.571.7260 o mmatlock@wmwd.com.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

12/11/2020

Mr. Todd Corbin
General Manager
Riverside Public Utilities
3750 University Avenue, 3rd Floor
Riverside, CA 92501

SUBJECT: WESTERN MUNICIPAL WATER DISTRICT'S URBAN WATER MANAGEMENT PLAN UPDATE

Dear Mr. Todd Corbin,

State law requires each urban water supplier to prepare and adopt an Urban Water Management Plan (UWMP) at least once every five years. Western Municipal Water District (Western) is currently preparing an update to its 2015 UWMP. The UWMP documents Western's plans to ensure adequate water supplies to meet existing and future demands under a range of water supply conditions, including water shortages.

In compliance with California Water Code Section 10621(b), Western is notifying Agencies within the County within which Western provides water supplies that the UWMP is being reviewed and updated. We anticipate having a draft 2020 UWMP available for public review in April 2021 and will post the draft plan to Western's website for review. We will notify your agency once the draft plan is posted. Prior to adoption of the updated 2020 UWMP, the Western Board of Directors will hold a public hearing in May 2021 for the purpose of receiving comments, but we also encourage comments to be submitted prior to the public hearing. The final 2020 UWMP will be submitted to the California Department of Water Resources by July 1, 2021.

Melissa Matlock, Western's Water Resource Specialist, is leading the effort. If you have any questions about the Urban Water Management Plan Update, please feel free to contact me at mmatlock@wmwd.com or by phone at (951-571-7260).

Sincerely,

Lisa Lemoine

Subject: Western Municipal Water District 2020 Urban Water Management Plan Update

Western Municipal Water District (Western) is in the process of preparing and updating its 2020 Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009, commonly referred to as SBX7-7. An update of the Western's UWMP is required every five (5) years.

Water Code section 10621(b) requires an urban water supplier updating its UWMP to notify cities and counties within its service area of the update at least sixty (60) days prior to holding a public hearing. This letter serves as Western's notice that it is preparing and updating its 2020 UWMP, to be adopted and submitted to the California Department of Water Resources by the July 1, 2021 deadline. Western will also be adopting its Water Shortage Contingency Plan (WSCP) as part of the 2020 UWMP.

Western is also considering an Addendum to its 2015 UWMP to demonstrate consistency with the Delta Plan Policy to Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (California Code Reg., tit. 23, § 5003). A copy of Western's draft 2020 UWMP, WSCP, and 2015 UWMP Addendum will be available for review on Western's website (www.wmwd.com/uwmp) in spring of 2021, and Western will subsequently hold noticed public hearings on the 2020 UWMP, WSCP, and 2015 UWMP Addendum in advance of their proposed adoption.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum. Western anticipates holding a public comment period in spring 2021, with a public hearing planned during that time.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-7260 or by email at mmatlock@wmwd.com.

Subject: Western Municipal Water District 2020 Urban Water Management Plan Update

Western Municipal Water District (Western) is in the process of preparing and updating its 2020 Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009, commonly referred to as SBX7-7. An update of the Western's UWMP is required every five (5) years.

Water Code section 10621(b) requires an urban water supplier updating its UWMP to notify cities and counties within its service area of the update at least sixty (60) days prior to holding a public hearing. This letter serves as Western's notice that it is preparing and updating its 2020 UWMP, to be adopted and submitted to the California Department of Water Resources by the July 1, 2021 deadline. Western will also be adopting its Water Shortage Contingency Plan (WSCP) as part of the 2020 UWMP.

Western is also considering an Addendum to its 2015 UWMP to demonstrate consistency with the Delta Plan Policy to Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (California Code Reg., tit. 23, § 5003). A copy of Western's draft 2020 UWMP, WSCP, and 2015 UWMP Addendum will be available for review on Western's website (www.wmwd.com/uwmp) in spring of 2021, and Western will subsequently hold noticed public hearings on the 2020 UWMP, WSCP, and 2015 UWMP Addendum in advance of their proposed adoption.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum. Western anticipates holding a public comment period in spring 2021, with a public hearing planned during that time.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-7260 or by email at mmatlock@wmwd.com.

Subject: Western Municipal Water District 2020 Urban Water Management Plan Update

Western Municipal Water District (Western) is in the process of preparing and updating its 2020 Urban Water Management Plan (UWMP) in compliance with the Urban Water Management Planning Act and the Water Conservation Act of 2009, commonly referred to as SBX7-7. An update of the Western's UWMP is required every five (5) years.

Water Code section 10621(b) requires an urban water supplier updating its UWMP to notify cities and counties within its service area of the update at least sixty (60) days prior to holding a public hearing. This letter serves as Western's notice that it is preparing and updating its 2020 UWMP, to be adopted and submitted to the California Department of Water Resources by the July 1, 2021 deadline. Western will also be adopting its Water Shortage Contingency Plan (WSCP) as part of the 2020 UWMP.

Western is also considering an Addendum to its 2015 UWMP to demonstrate consistency with the Delta Plan Policy to Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance (California Code Reg., tit. 23, § 5003). A copy of Western's draft 2020 UWMP, WSCP, and 2015 UWMP Addendum will be available for review on Western's website (www.wmwd.com/uwmp) in spring of 2021, and Western will subsequently hold noticed public hearings on the 2020 UWMP, WSCP, and 2015 UWMP Addendum in advance of their proposed adoption.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum. Western anticipates holding a public comment period in spring 2021, with a public hearing planned during that time.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-7260 or by email at mmatlock@wmwd.com.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

April 15, 2021

Mr. Marcel Lyons, Field Superintendent
Box Springs Mutual Water Company
21740 Dracaea Ave
Moreno Valley, CA 92553

Dear Mr. Lyons:

Subject: Western Municipal Water District 2020 Urban Water Management Plan Public Hearing Notice

In February 2021, Western Municipal Water District (Western) informed all counties, cities, and local water agencies that the District is updating its 2020 Urban Water Management Plan (UWMP), Water Shortage Contingency Plan (WSCP), and considering an Addendum to Western's 2015 UWMP.

Western is pleased to announce that the draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are now posted on Western's website and available for public review. This satisfies California Water Code (CWC) Section 10642 requiring agencies to make their plans available for public inspection prior to adoption. The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-6270 or by email at mmatlock@wmwd.com.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

April 15, 2021

Ms. Joanne Coletta, Community Development Director
City of Corona
400 S. Vicentia Avenue
Corona, CA 92882

Dear Ms. Coletta:

Subject: Western Municipal Water District 2020 Urban Water Management Plan Public Hearing Notice

In February 2021, Western Municipal Water District (Western) informed all counties, cities, and local water agencies that the District is updating its 2020 Urban Water Management Plan (UWMP), Water Shortage Contingency Plan (WSCP), and considering an Addendum to Western's 2015 UWMP.

Western is pleased to announce that the draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are now posted on Western's website and available for public review. This satisfies California Water Code (CWC) Section 10642 requiring agencies to make their plans available for public inspection prior to adoption. The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-6270 or by email at mmatlock@wmwd.com.

Securing Your Water Supply

April 15, 2021

Mr. Tom Moody, General Manager
City of Corona, Department of Water and Power
755 Corporation Yard Way
Corona, CA 92880

Dear Mr. Moody:

Subject: Western Municipal Water District 2020 Urban Water Management Plan Public Hearing Notice

In February 2021, Western Municipal Water District (Western) informed all counties, cities, and local water agencies that the District is updating its 2020 Urban Water Management Plan (UWMP), Water Shortage Contingency Plan (WSCP), and considering an Addendum to Western's 2015 UWMP.

Western is pleased to announce that the draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are now posted on Western's website and available for public review. This satisfies California Water Code (CWC) Section 10642 requiring agencies to make their plans available for public inspection prior to adoption. The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

April 15, 2021

Mr. Gustavo Gonzalez, Planning Manager
City of Eastvale
12363 Limonite Avenue, Ste. 910
Eastvale, CA 91752

Dear Mr. Gonzalez:

Subject: Western Municipal Water District 2020 Urban Water Management Plan Public Hearing Notice

In February 2021, Western Municipal Water District (Western) informed all counties, cities, and local water agencies that the District is updating its 2020 Urban Water Management Plan (UWMP), Water Shortage Contingency Plan (WSCP), and considering an Addendum to Western's 2015 UWMP.

Western is pleased to announce that the draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are now posted on Western's website and available for public review. This satisfies California Water Code (CWC) Section 10642 requiring agencies to make their plans available for public inspection prior to adoption. The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-6270 or by email at mmatlock@wmwd.com.

The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-6270 or by email at mmatlock@wmwd.com.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

April 15, 2021

Mr. Andy Okoro, City Manager
City of Norco
2870 Clark Avenue
Norco, CA 92860

Dear Mr. Okoro:

Subject: Western Municipal Water District 2020 Urban Water Management Plan Public Hearing Notice

In February 2021, Western Municipal Water District (Western) informed all counties, cities, and local water agencies that the District is updating its 2020 Urban Water Management Plan (UWMP), Water Shortage Contingency Plan (WSCP), and considering an Addendum to Western's 2015 UWMP.

Western is pleased to announce that the draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are now posted on Western's website and available for public review. This satisfies California Water Code (CWC) Section 10642 requiring agencies to make their plans available for public inspection prior to adoption. The posted draft documents may be accessed on April 30 using the following link: (www.wmwd.com/uwmp).

Public hearings for Western's draft 2020 UWMP, draft Addendum to the 2015 UWMP, and draft WSCP are scheduled for June 16 as part of Western's Board meeting. As required by CWC Section 10621(b), Western sent 60-day notice letters to the cities and counties on February 4, 2021. The letters were sent to the city managers, the county public works and planning directors, and general managers of Western's member agencies within which Western provides water.

In addition, Western scheduled the publication of the Notice of Public Hearing to satisfy the requirement of CWC Section 10642 and Government Code 6066. CWC Section 10642 now requires that notices must be provided pursuant to Chapter 17.5 of the Government Code, which requires that public notification be provided in any non-English language spoken by a substantial number of the public served by the agency. The notification for public hearing will be published under the following schedule:

- For English language – Press Enterprise newspaper – April 15 and April 22, 2021.
- For Spanish language newspaper – La Prenza – April 16 and April 23, 2021.

Western invites you to submit comments and consult with Western regarding its 2020 UWMP update, WSCP, and 2015 UWMP Addendum to boardsecretary@wmwd.com.

If you have any input for the matters contained in this notice letter, require additional information, or would like to set up a meeting to discuss these issues, please contact me at (951) 571-6270 or by email at mmatlock@wmwd.com.

RESOLUTION OF THE BOARD OF DIRECTORS OF WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ADOPTING THE 2020 URBAN WATER MANAGEMENT PLAN

WHEREAS, The California Urban Water Management Planning Act, Water Code Section 10610 et seq. (the Act), mandates that every urban supplier of water providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan (Plan); and

WHEREAS, the Act generally requires that said Plan be updated and adopted at least once every five years on or before July 1, in years ending in six and one; and

WHEREAS, pursuant to recent amendments to the Act, urban water suppliers are required to update and electronically submit their 2020 Plans to the California Department of Water Resources by July 1, 2021; and

WHEREAS, pursuant to the Water Conservation Act of 2009, also referred to as SB X7-7 (Water Code section 10608 et seq.), an "urban retail water supplier" is defined as a water supplier that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes, and an "urban wholesale water supplier" is defined as a water supplier that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes; and

WHEREAS, Western Municipal Water District of Riverside County (Western) meets the definition of both an

live streamed online at wmwd.com in order to provide members of the public and other interested entities with the opportunity to be heard in connection with proposed adoption of the 2020 Plan and issues related thereto; and

WHEREAS, pursuant to said public hearing on Western's 2020 Plan, Western, among other things, encouraged the active involvement of diverse social, cultural, and economic members of the community within Western's service area with regard to the preparation of the Plan, encouraged community input regarding Western's 2020 Urban Water Management Plan; and

WHEREAS, the Board of Directors has reviewed and considered the purposes and requirements of the Act and SB X7-7, the contents of the 2020 Plan, and the documentation contained in the administrative record in support of the 2020 Plan, and has determined that the factual analyses and conclusions set forth in the 2020 Plan are legally sufficient; and

WHEREAS, Section 10652 of the California Water Code provides that the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of urban water management plans pursuant to this part; and

WHEREAS, the Board of Directors desires to adopt the 2020 Plan in order to comply with the Act and SB X7-7.

NOW THEREFORE BE IT RESOLVED, the Board of Directors of the Western Municipal Water District of Riverside County hereby resolve as follows:

(60) days after submitting a copy of the Plan with the California Department of Water Resources;

7. Western finds and determines that this resolution is not subject to CEQA pursuant to Water Code Section 10652 because CEQA does not apply to the preparation and adoption of an urban water management plan or to the implementation of the actions taken pursuant to such plans. Because this resolution comprises Western's urban water management plan and involves its implementation, no CEQA review is required;

8. Pursuant to CEQA, Western directs staff to file a Notice of Exemption with the Riverside County Clerk's office within five (5) working days of adoption of this resolution;

9. The document and materials that constitute the record of proceedings on which this resolution and the above findings have been based are located at Clerk of the Board of Directors of Western Municipal Water District. The custodian for these records is the Clerk of the Board of Western;

10. The General Manager is hereby authorized and directed to implement the 2020 Plan in accordance with the Act and SB X7-7 and to provide recommendations to the Board of Directors regarding the necessary budgets, procedures, rules, regulations, or further actions to carry out the effective and equitable implementation of the 2020 Plan.

ADOPTED, this 16th day of June 2021.

Brenda Dennstedt
President

RESOLUTION 3155

RESOLUTION OF THE BOARD OF DIRECTORS OF WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ADOPTING THE WATER SHORTAGE CONTINGENCY PLAN

WHEREAS, The California Urban Water Management Planning Act, Water Code Section 10610 et seq. (the Act), mandates that every urban supplier of water providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare and adopt, in accordance with prescribed requirements, a water shortage contingency plan (WSCP); and

WHEREAS, the Act specifies the requirements and procedures for adopting such Water Shortage Contingency Plans; and

WHEREAS, pursuant to recent amendments to the Act, urban water suppliers are required to adopt and electronically submit their WSCPs to the California Department of Water Resources by July 1, 2021; and

WHEREAS, pursuant to the Water Conservation Act of 2009, also referred to as SB X7-7 (Water Code section 10608 et seq.), an "urban retail water supplier" is defined as a water supplier that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes, and an "urban wholesale water supplier" is defined as a water supplier that provides more than 3,000 acre-feet of water annually at wholesale for potable municipal purposes; and

hearing online, or virtually, as there was no public location for attending in person. The public hearing was live streamed online at wmwd.com in order to provide members of the public and other interested entities with the opportunity to be heard in connection with proposed adoption of the WSCP and issues related thereto; and

WHEREAS, pursuant to said public hearing on Western's WSCP, Western, among other things, encouraged the active involvement of diverse social, cultural, and economic members of the community within Western's service area with regard to the preparation of the Plan, encouraged community input regarding Western's Water Shortage Contingency Plan; and

WHEREAS, the Board of Directors has reviewed and considered the purposes and requirements of the Act and SB X7-7, the contents of the WSCP, and the documentation contained in the administrative record in support of the WSCP, and has determined that the factual analyses and conclusions set forth in the WSCP are legally sufficient; and

WHEREAS, Section 10652 of the California Water Code provides that the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) does not apply to the preparation and adoption of a water shortage contingency plan as part of an urban water management plan pursuant to California Water Code Section 10632; and

WHEREAS, the Board of Directors desires to adopt the WSCP in order to comply with the Act and SB X7-7.

to provide that portion of the WSCP prepared pursuant to Water Code Section 10635(a) to any city or county within which Western provides water supplies no later than sixty (60) days after submitting a copy of the WSCP with the California Department of Water Resources;

7. Western finds and determines that this resolution is not subject to CEQA pursuant to Water Code Section 10652 because CEQA does not apply to the preparation and adoption of a water shortage contingency plan or to the implementation of the actions taken pursuant to such plans. Because this resolution comprises Western's water shortage contingency plan and involves its implementation, no CEQA review is required;

8. Pursuant to CEQA, Western directs staff to file a Notice of Exemption with the Riverside County Clerk's office within five (5) working days of adoption of this resolution;

9. The document and materials that constitute the record of proceedings on which this resolution and the above findings have been based are located at Clerk of the Board of Directors of Western Municipal Water District. The custodian for these records is the Clerk of the Board of Western;

10. The General Manager is hereby authorized and directed to implement the WSCP in accordance with the Act and SB X7-7 and to provide recommendations to the Board of Directors regarding the necessary budgets, procedures, rules, regulations or further actions to carry out the effective and equitable implementation of the WSCP.

RESOLUTION 3158

RESOLUTION OF THE BOARD OF DIRECTORS OF WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY ADOPTING AN ADDENDUM TO THE 2015 URBAN WATER MANAGEMENT PLAN

WHEREAS, The California Urban Water Management Planning Act, Water Code Section 10610 et seq. (the Act), mandates that every urban supplier of water providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, prepare an Urban Water Management Plan (Plan); and

WHEREAS, the Act generally requires that said Plan be updated and adopted at least once every five years on or before July 1, in years ending in six and one; and

WHEREAS, pursuant to recent amendments to the Act, urban water suppliers are encouraged by the California Department of Resources (DWR) and the Delta Stewardship Council (DSC) to consider adopting an Addendum to their 2015 Plan to demonstrate consistency with the Delta Plan Policy WR P1 to Reduce Reliance on the Delta through Improved Regional Water Self-Reliance, Cal. Code Regs. tit. 23, § 5003; and

WHEREAS, Western Municipal Water District of Riverside County (Western) meets the definition of an urban retail water supplier for purposes of the Act; and

WHEREAS, Western has prepared an Addendum to Western's 2015 Plan in accordance with Delta Plan Policy WR P1, and in accordance with applicable legal requirements, has undertaken certain coordination, notice, public

WHEREAS, pursuant to said public hearing on Western's Addendum to the 2015 Plan, Western, among other things, encouraged the active involvement of diverse social, cultural, and economic members of the community within Western's service area with regard to the preparation of the Plan, encouraged community input regarding Western's Addendum to the 2015 Urban Water Management Plan; and

WHEREAS, the Board of Directors has reviewed and considered the purposes and requirements of the Act and Delta Plan Policy WR P1, the contents of the Addendum to the 2015 Plan, and the documentation contained in the administrative record in support of the Addendum, and has determined that the factual analyses and conclusions set forth in the Addendum are legally sufficient; and

WHEREAS, the Board of Directors desires to adopt the Addendum to the 2015 Plan prior to July 1, 2021 in order to comply with the Act and Delta Plan Policy WR P1.

NOW THEREFORE BE IT RESOLVED, the Board of Directors of the Western Municipal Water District of Riverside County hereby resolve as follows:

1. The Addendum to Western's 2015 Urban Water Management Plan to demonstrate consistency with the Delta Plan Policy to Reduce Reliance on the Delta Through Improved Regional Water Self-Reliance is hereby adopted as amended by changes incorporated by the Board of Directors as a result of input received (if any) at the public hearing and ordered filed with the Secretary of the Board of Directors;

ADOPTED, this 16th day of June 2021.

BRENDA DENNSTEDT
President

June 16, 2021

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of Resolution 3158 adopted by the Board of Directors of Western Municipal Water District of Riverside County at its regular meeting held on June 16, 2021.

August 2013

Mission Statements

The mission of the Department of the Interior is to protect and provide access to our Nation's natural and cultural heritage and honor our trust responsibilities to Indian Tribes and our commitments to island communities.

The mission of the Bureau of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public.

Executive Summary

The Santa Ana Watershed Basin Study (Basin Study) is a collaborative effort by the Santa Ana Watershed Project Authority (SAWPA) and the Bureau of Reclamation (Reclamation), authorized under the Sustain and Manage America's Resources for Tomorrow SECURE Water Act (Title IX, Subtitle F of Public Law 111-11). The study began in 2011 and was completed in the spring of 2013. The Basin Study complements SAWPA's Integrated Regional Water Management (IRWM) planning process, also known as the "One Water One Watershed" (OWOW) Plan, and refines the watershed's water projections, and identifies potential adaptation strategies, in light of projected effects of climate change. This climate change analysis for the Santa Ana River Watershed (SARW) is a contributing section to the Basin Study.

This report explains the methods used to develop an analysis of potential implications of the changing climate, and how those implications might affect issues of importance to the Santa Ana River Watershed. Chapter 1 provides an introduction to the project and the study area, along with a summary of relevant previous studies. The development of climate projections and hydrology models used can be found in Chapter 2. Chapter 3 provides projections for water supply and demand in the SARW. An impact analysis was conducted focusing on key areas of importance to the SARW, the results of which can be found in Chapter 4. A tool to evaluate demand management is presented in Chapter 5, along with a case study of potential adaptation strategies. Chapter 6 addresses uncertainties in climate change analysis.

In light of climate change, prolonged drought conditions, growth, and population projections, a strong concern exists to ensure there will be adequate water supplies to meet future water demand. The findings of this Basin Study will be used to update the OWOW Plan, evaluate the implications of climate change, assess increased energy demand, and ensure that future water quality and supply needs are met. Goals of the study include: incorporating existing regional and local planning studies within the watershed; sustaining the innovative "bottom up" approach to regional water resources management planning; ensuring an integrated, collaborative approach; using science and technology to assess climate change and greenhouse emissions effects; facilitating watershed adaptation planning; and expanding outreach to all major water uses and stakeholders.

Future water supply was analyzed for the Santa Ana River Watershed using the Variable Infiltration Capacity (VIC) hydrologic model (Liang et al., 1994; Liang et al., 1996; Nijssen et al., 1997) to project streamflow using 112 different projections of future climate. Projected climate variables, including daily precipitation, minimum temperature, maximum temperature, and wind speed,

came from the Bias Corrected and Spatially Downscaled Coupled Model Intercomparison Project Phase 3 (BCSD-CMIP3) archive. Historical VIC model simulations over the period 1950-1999 were conducted using historical meteorological forcings (factors affecting the climate of the earth that drive or "force" the climate to change) developed by Maurer et al., (2002), and subsequent extensions. The VIC hydrologic model solves the water balance for each of a series of 1/8° by 1/8° (~12km x 12 km) grid cells, which represent the watershed. Daily climate projections span the time period January 1, 1950 to December 31, 2099 and exist for each grid cell. Grid based outputs of daily runoff and baseflow generated by the VIC hydrologic model are routed to select sites throughout the watershed to produce daily streamflow projections. Through coordination with SAWPA and local water agencies, 36 key locations in the basin were determined, so that sub-basins could be delineated. Change factors were developed by calculating decade mean (reference decade – 1990s; three future decades – 2020s, 2050s, and 2070s) total precipitation and temperature, then calculating percent change, and finally calculating the median change for all the 112 projections. Final products include data sets at key locations for precipitation, temperature, evapotranspiration, April 1st Snow Water Equivalent (SWE), and streamflow.

These data sets were used to answer frequently asked questions regarding impacts of climate change on the Santa Ana River Watershed. The questions and key findings can be found below.

Will surface water supply decrease?

- Annual surface water is likely to decrease over future periods.
- Precipitation shows somewhat long term decreasing trends.
- Temperature will increase, which is likely to cause increased water demand and reservoir evaporation.
- April 1st SWE will decrease.

Will groundwater availability be reduced?

- Groundwater currently provides approximately 54% of total water supply in an average year, and groundwater use is projected to increase over the next 20 years.
- Projected decreases in precipitation and increases in temperature will decrease natural recharge throughout the basin.
- Management actions such as reducing municipal and industrial water demands or increasing trans-basin water imports and recharge will be required in order to maintain current groundwater levels.
- A basin-scale groundwater screening tool was developed to facilitate analysis of basin-scale effects of conservation, increasing imported supply, changing agricultural land use, and other factors on basin-scale groundwater conditions.

Is Lake Elsinore in danger of drying up?

- Lake Elsinore has less than a 10% chance of drying up (2000-2099).
- In the 2000-2049 period, Lake Elsinore has a greater than 75% chance of meeting the minimum elevation goal of 1,240 ft.
- In the future period 2050-2099, Lake Elsinore has less than a 50% chance of meeting the minimum elevation goal of 1,240 ft.
- There is less than a 25% chance that Lake Elsinore will drop below low lake levels (1,234 ft) in either period.
- The Elsinore Valley Municipal Water District (EVMWD) project does aid in stabilizing lake levels; however, for the period 2050-2099 additional measures will likely be required to help meet the minimum elevation goal of 1,240 ft.

Will the region continue to support an alpine climate and how will the Jeffrey Pine ecosystem be impacted?

- Warmer temperatures will likely cause Jeffrey pines to move to higher elevations and may decrease their total habitat.
- Forest health may also be influenced by changes in the magnitude and frequency of wildfires or infestations.
- Alpine ecosystems are vulnerable to climate change because they have little ability to expand to higher elevations.
- Across the State it is projected that alpine forests will decrease in area by 50-70% by 2100.

Will skiing at Big Bear Mountain Resorts be sustained?

- Simulations indicate significant decreases in April 1st snowpack that amplify throughout the 21st century.
- Warmer temperatures will also result in a delayed onset and shortened ski season.
- Lower elevations are most vulnerable to increasing temperatures.
- Both Big Bear Mountain Resorts lie below 3,000 m and are projected to experience declining snowpack that could exceed 70% by 2070.

How many additional days over 95°F are expected in Anaheim, Riverside and Big Bear City?

- All the climate projections demonstrate clear increasing temperature trends.
- Increasing temperatures will result in a greater number of days above 95°F in the future.

- The number of days above 95°F gets progressively larger for all cities advancing into the future.
- By 2070 it is projected that the number of days above 95°F will quadruple in Anaheim (4 to 16 days) and nearly double in Riverside (43 to 82 days). The number of days above 95°F at Big Bear City is projected to increase from 0 days historically to 4 days in 2070.

Will floods become more severe and threaten flood infrastructure?

- Simulations indicate a significant increase in flow for 200-year storm events in the future.
- The likelihood of experiencing what was historically a 200-year event will nearly double (i.e. the 200-year historical event is likely to be closer to a 100-year event in the future).
- Findings indicate an increased risk of severe floods in the future, though there is large variability between climate simulations.

How will climate change and sea level rise affect coastal communities and beaches?

- Climate change will contribute to global sea level rise (SLR) through melting of glaciers and ice caps and thermal expansion of ocean waters, both of which increase the volume of water in the oceans.
- Regional SLR may be higher or lower than global SLR due to effects of regional ocean and atmospheric circulation.
- Average sea levels along the Southern California coast are projected to rise by 5-24 inches by 2050 and 16-66 inches by 2100.
- SLR is likely to inundate beaches and coastal wetlands and may increase coastal erosion. Effects on local beaches depend on changes in coastal ocean currents and storm intensity, which are highly uncertain at this time.
- SLR will increase the area at risk of inundation due to a 100-year flood event.
- Existing barriers are sufficient to deter seawater intrusion at Talbert and Alamitos gaps under a 3-foot rise in sea levels. However, operation of barriers under SLR may be constrained by shallow groundwater concerns.

As climate science continues to evolve, periodic reanalysis and evaluation will be needed to inform the decision-making process.

1.0 Introduction

1.1 Purpose, Scope, and Objective of Study

The Santa Ana Watershed Basin Study (Basin Study) is a collaborative effort by the Santa Ana Watershed Project Authority (SAWPA) and the Bureau of Reclamation (Reclamation), authorized under the Sustain and Manage America's Resources for Tomorrow SECURE Water Act (Title IX, Subtitle F of Public Law 111-11). The study began in 2011 and was completed in the spring of 2013. The Basin Study complements SAWPA's Integrated Regional Water Management (IRWM) planning process, also known as their "One Water One Watershed" (OWOW) Plan, and refines the watershed's water projections, and identifies potential adaptation strategies, in light of projected effects of climate change. This climate change analysis for the Santa Ana River Watershed is a contributing section to the Basin Study.

SAWPA is a joint powers authority that represents five major water resource agencies. SAWPA's area includes over 350 water, wastewater and groundwater management, flood control, environmental, and other nongovernmental organizations. These entities work together collaboratively and focus on the region's OWOW Plan.

In light of climate change, prolonged drought conditions, growth, and population projections, a strong concern exists to ensure there will be adequate water supplies to meet future water demand. The findings of this Basin Study will be used to update the OWOW Plan, evaluate the implications of climate change, and ensure that future water quality and supply needs are met. Goals of the study include: incorporating existing regional and local planning studies within the watershed; sustaining the innovative "bottom up" approach to regional water resources management planning; ensuring an integrated, collaborative approach; using science and technology to assess climate change and greenhouse emissions affects; facilitating watershed adaptation planning; and expanding outreach to all major water uses and stakeholders.

1.1.1 Location and Description of Study Area

The Santa Ana River Watershed (also referred to as SARW, or 'Watershed') is home to over 6 million people, within an area of 2,650 square miles in southern California. The regional population is projected to grow to almost ten million within the next 50 years (U.S. Census Bureau, 2010). The watershed includes much of Orange County, the northwestern corner of Riverside County, the southwestern corner of the San Bernardino County, and small portions of Las Angeles County. The watershed is bounded on the south by the Santa Margarita watershed, on the east by the Salton Sea and Southern Mojave watersheds, and on the northwest by the Mojave and San Gabriel watersheds. SAWPA has five member agencies: Eastern Municipal Water District (EMWD), Inland Empire

Utilities Agency (IEUA), Orange County Water District (OCWD), San Bernardino Valley Municipal Water District (SBVMWD), and Western Municipal Water District (WMWD). shown below in Figure 1.

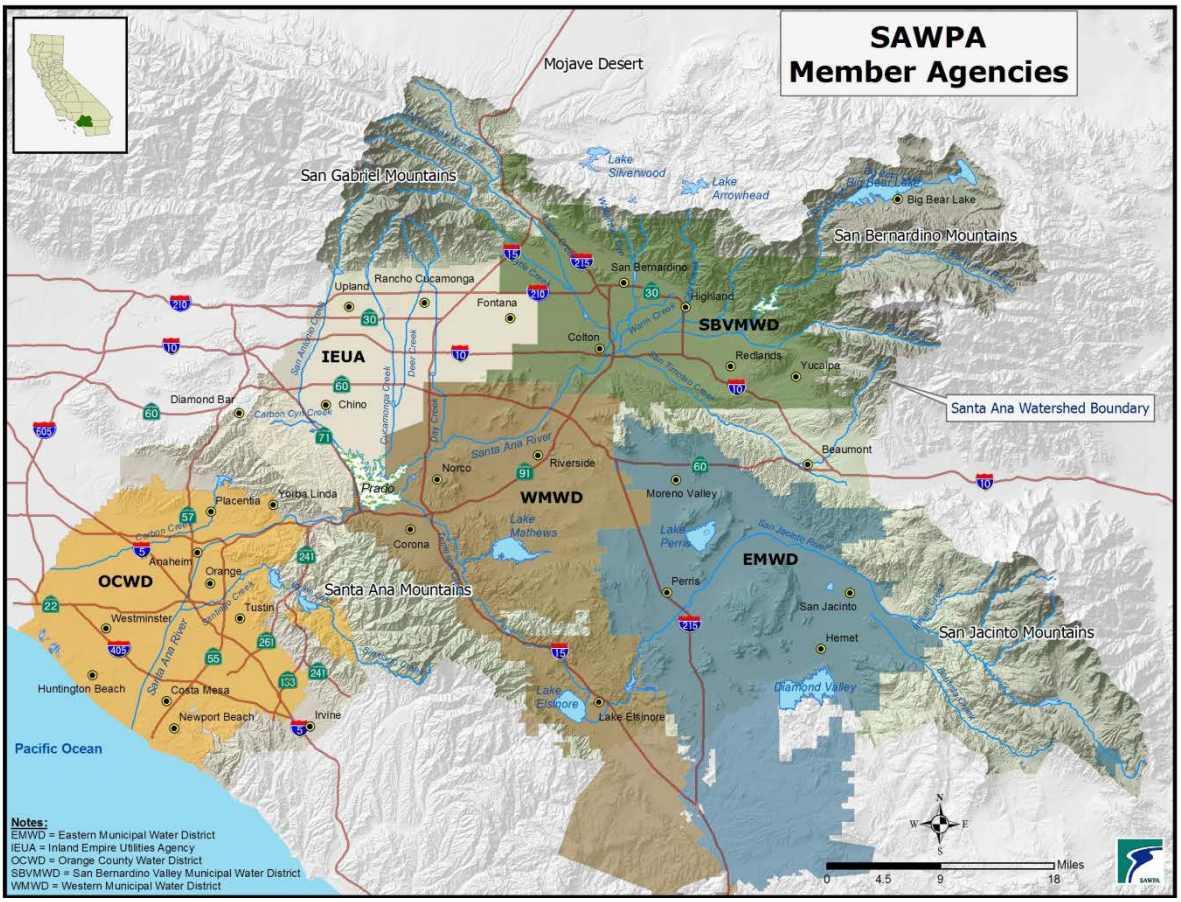

Figure 1: SAWPA member agencies

The climate and geography of the State of California present a unique challenge to the management and delivery of water. While most of the State's precipitation falls on the northern portion of the State, most of California's population resides in the semi-arid, southern portion of the State. Water is diverted, stored, and then transferred from the water-rich north to the more arid central and southern sections of the state through the California State Water Project (SWP), the Central Valley Project, and the Los Angeles Aqueduct. In addition to the projects that transport water from the north to the south, the southern coastal area relies on water imported through The Metropolitan Water District of Southern California's (Metropolitan) Colorado River Aqueduct. The Bureau of Reclamation and seven basin states manage the Colorado River system under the authority of the Secretary of the Interior and for the benefit of the seven basin states. Over-allocation of this resource, along with a U.S Supreme Court Decision (Arizona v. California, 1964) and population and economic growth, led to the recent California "4.4 Plan" and Quantification Settlement Agreement (QSA). The QSA

limits California's share of the Colorado River water supply to 4.4 million acre-feet (MAF). As a result of these actions, Metropolitan's supply from the Colorado River was significantly reduced, especially during extended dry periods. In the past, a buffer supply was developed by constructing new facilities, such as dams and/or aqueducts, to provide water supply for future growth. Today, the gap between supply and demand has closed and increasing emphasis is placed on conservation and development of local supplies. Building new facilities is costly and such projects face strict environmental review before they can be approved. This has caused California to seek more creative and sustainable solutions to water resource management.

1.2 Summary of Previous and Current Studies

A large body of research has been conducted over the past ten or more years on climate change and its potential impacts on the western United States. Most of this research has focused on large scale implications (for example, over the western United States), while providing limited regional scale information. The following section summarizes research that is relevant to the Watershed, and shows that although these results are applicable, additional research was required, through this Basin Study, to evaluate smaller scale, site specific, climate change impacts. For additional information on previous and current climate change studies, not directly related to the Watershed, please see Reclamation's Literature Synthesis on Climate Change Implications for Water and Environmental Resources (http://www.usbr.gov/research/docs/climatechangelitsynthesis.pdf).

1.2.1 Historical Trends

California's historical temperature has increased by about 1.7°F over the past 116 years (Moser et al., 2012), while showing declines in spring snowpack and a shift to earlier spring runoff (Knowles et al., 2007; Regonda et al., 2005; Peterson et al., 2008; Stewart et al., 2009). It is difficult to distinguish long-term climate change from natural climate variability, although many studies have tried to distinguish between the two (Bonfils et al., 2007; Cayan et al., 2001; Gershunov et al., 2009). It is likely that the historical temperature trends are due to a combination of anthropogenic climate change and natural climate variability (Reclamation, 2011k).

A study by Gershunov et al., (2012) shows that generally, there is a positive trend (1950-2010) in heat wave activity over the entire California region that is expressed most strongly and clearly in nighttime rather than daytime temperature extremes. This trend in nighttime heat wave activity has intensified markedly since the 1980s and especially since 2000. The two most recent nighttime heat waves were also strongly expressed in extreme daytime temperatures. Circulations associated with great regional heat waves advect hot air into the region. This air can be dry or moist, depending on whether a moisture source is available, causing heat waves to be expressed preferentially during day or night.

A remote moisture source centered within a marine region west of Baja California has been increasing in prominence because of gradual sea surface warming and a related increase in atmospheric humidity. Adding to the very strong synoptic dynamics during the 2006 heat wave were a prolonged stream of moisture from this southwestern source, and despite the heightened humidity, an environment in which afternoon convection was suppressed, keeping cloudiness low and daytime temperatures high.

Vermeera and Rahmstorf (2009) suggest a simple relationship linking global sea-level variations to temperature. This relationship is tested on synthetic data from a global climate model for the past millennium and the next century. When applied to observed data of sea level and temperature for 1880–2000, and taking into account known anthropogenic hydrologic contributions to sea level, the correlation explains 98% of the variance.

Trends in historical precipitation are more sporadic making it difficult to attribute them to climate change (Hoerling et al., 2010). A series of regression analyses, conducted by Dettinger and Cayan (1995), indicate that runoff timing responds equally to the observed decadal-scale trends in winter temperature and interannual temperature variations of the same magnitude, suggesting that the trend in temperature is sufficient to explain the increasingly early runoff. However, this trend is not immediately distinguishable from natural atmospheric variability.

A well-documented shift towards earlier runoff can be attributed, in part, to more precipitation falling as rain instead of snow (Regonda et al., 2005; Pierce et al., 2008; Das et al., 2009; Hidalgo et al., 2009; Lindquist et al., 2009). Knowles et al., (2007) showed a regional trend during the period 1949–2001 toward smaller ratios of winter-total snowfall water equivalent (SWE) to winter-total precipitation, with the most pronounced reductions occurring in the Sierra Nevada and the Pacific Northwest, with more varied changes (but still predominantly reductions) in the Rockies. The trends in this ratio correspond to shifts toward less SWE rather than to changes in overall precipitation, except in the Southern Rockies, where both snowfall and precipitation have increased. The trends toward reduced SWE are a response to warming across the region, with the most significant reductions occurring where winter-average wet-day minimum temperature changes have been less than +3°C over the course of the study period. The observed trends in hydroclimatology over the western United States will likely have significant impacts on water resources planning and management.

There have been preliminary efforts by agencies managing California's water resources to incorporate climate change research into their planning and management tools, including preliminary modeling studies of potential impacts of climate change to operations of the State Water Project and Central Valley Project, Delta water quality and water levels, flood forecasting and evapotranspiration rates (Anderson et al., 2008).

1.2.2 Climate Projections

The Intergovernmental Panel on Climate Change (IPCC) projections of future climate have been utilized in assessing climate over California. Projections indicate the rate of increase in global mean annual temperature nearly doubles before 2100, and that increases in summer temperatures are greater than winter (IPCC, 2007). There is less confidence in projections of future precipitation than temperature (Reclamation, 2011). However, precipitation projections show less snowfall and more rainfall, less snowpack development and earlier runoff, more intense and heavy rainfall interspersed with longer dry periods (Congressional Budget Office, 2009; Lundquist et al., 2009; Moser et al., 2009; Rauscher et a l2008; Maurer et al.,2007).

1.2.3 Hydrological Projections

The changing climate will likely result in lower stream flow, lower reservoir storage, and decreased water supply deliveries and reliability later in the 21st century throughout California (Vicuna and Dracup, 2007). Drought in the Southwest may no longer be driven by precipitation, but rather by temperature (Hoerling and Eischeid, 2007).

Two hydrologic impacts, in which there is high confidence, are increasing winter streamflow and decreasing late spring and summer flow (Maurer, 2007). There is also high confidence in reduced snowpack at the end of winter, and earlier arrival of the annual peak flow volume, which has important implications for California's water management. The shift to earlier peak streamflow timing, and the decline in end-of-winter snow pack, results in more extreme impacts under higher emissions scenarios in all cases. This indicates that future emissions scenarios play a significant role in the degree of impacts to water resources in California.

The potential effects of climate change on the hydrology and water resources of the Sacramento–San Joaquin River Basin were evaluated by Van Rheenen et al., (2004) using an ensemble of climate projections generated by the U.S. Department of Energy and National Center for Atmospheric Research Parallel Climate Model (DOE/NCAR PCM). From these global simulations, transient monthly temperature and precipitation sequences were statistically downscaled to produce continuous daily hydrologic model forcings, which drove a macro-scale hydrology model (VIC) of the Sacramento–San Joaquin River Basins at a 1/8° spatial resolution, and produced daily streamflow sequences for each climate projection. Each streamflow scenario was used in a water resources system model that simulated current and predicted future performance of the system. Results from the water resources system model indicated that achieving and maintaining status quo system performance in the future would be nearly impossible, given the altered hydrologic projections.

1.2.4 Climate Change Impacts

With respect to management, a number of studies have investigated the implications of climate change on water management in the region, suggesting management of reservoir systems will become more challenging (Vicuna and Dracup, 2007). The impacts are expected to be expensive, but not catastrophic for California (Harou et al., 2010).

Subtle changes in hydrology due to climate change can alter wetlands, resulting in a positive biotic feedback, contributing methane and carbon dioxide to the atmosphere (Burkett and Kusler, 2007). Policy options for minimizing the adverse impacts of climate change on wetland ecosystems include the reduction of current anthropogenic stresses, allowing for inland migration of coastal wetlands as sea-level rises, active management to preserve wetland hydrology, and a wide range of other management and restoration options.

Ficke et al. (2007) summarizes the general effects of climate change on freshwater systems to be increased water temperatures, decreased dissolved oxygen levels, and the increased toxicity of pollutants. Altered hydrologic regimes and increased groundwater temperatures could affect the quality of fish habitat. Eutrophication may be exacerbated and stratification will likely become more pronounced. Model predictions indicate that global climate change will continue even if greenhouse gas emissions decrease or cease. Therefore, proactive management strategies such as removing other stressors from natural systems will be necessary to sustain our freshwater fisheries.

Projected temperature and carbon dioxide increases may extend growing seasons, stimulate weed growth, increase pests, and may impact pollination (Baldocchi and Wong 2006). Stream temperatures in many areas are increasing due to increases in air temperature and reduced summer flows that make streams more sensitive to warmer air temperatures (Haak et al., 2010).

1.3 Identification of Interrelated Activities

1.3.1 Federal – WaterSMART

The WaterSMART Program, established by the Secretary of the Interior under Secretarial Order 3297, addresses an increasing set of water supply challenges, including chronic water supply shortages due to increased population growth, climate variability and change, and heightened competition for finite water supplies. The WaterSMART Program was developed as means of implementing the SECURE Water Act of 2009 (Public Law 111-11). The WaterSMART Program provides the scientific and financial tools and the collaborative environment needed to help balance water supply and demand through the efficient use of current supplies and the development of new supplies. Through WaterSMART, Reclamation is making use of the best available science in the assessments it conducts and the policies it employs. WaterSMART science has

and will continue to inform the real-time decisions of water managers who need reliable estimates of current conditions in the hydrologic cycle and projections of supply and demand in watersheds throughout the nation. Many examples of best available science are being developed through the WaterSMART Program. Much of that science can be accessed through the WaterSMART Clearinghouse, an online collaborative site where best practices and cost-effective technologies for water conservation and sustainable water strategies are shared with the public (http://www.doi.gov/watersmart/html/index.php).

1.3.2 State – Proposition 84 and IRWM

California's Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Prop 84) authorizes $5.388 billion in general obligation bonds to fund safe drinking water, water quality and supply, flood control, waterway and natural resource protection, water pollution and contamination control, state and local park improvements, public access to natural resources, and water conservation efforts.

Integrated Regional Water Management (IRWM) is a collaborative effort to manage all aspects of water resources in a region. IRWM crosses jurisdictional, watershed, and political boundaries; involves multiple agencies, stakeholders, individuals, and groups; and attempts to address the issues and differing perspectives of all the entities involved through mutually beneficial solutions. The California Department of Water Resources is currently working to ensure that IRWM planning is continued and expanded throughout the State; better align state and federal programs, polices, and regulations to support IRWM; identify stable and sufficient funding for IRWM; and further support regional water management groups.

1.3.3 Local – OWOW

The Santa Ana Watershed Project Authority is a planning and implementation agency that was formed in 1972 with the goal of building facilities to protect the water quality of the Watershed. Their planning efforts have expanded and, in 2006, SAWPA's One Water One Watershed (OWOW) plan was adopted. The OWOW plan is a comprehensive view of the watershed and water issues. The plan encompasses all sub-regions, political jurisdictions, water agencies and non-governmental stakeholders (private sector, environmental groups, and the public at large) in the watershed. All types of water (imported, local surface and groundwater, stormwater, and wastewater effluent) are viewed as components of a single water resource, inextricably linked to land use and habitat, and the plan tries to limit impacts of water use and climate change on natural hydrology.

2.0 Climate Projections and Hydrology Models

2.1 Climate Projections

Projected changes in climate (including both anthropogenic changes and natural variability), and their influence on streamflow and basin water supply, have been studied by several researchers in recent years, as described in Chapter 1. Future projections from global climate models (GCMs) indicate that the climate may exhibit trends and increased variability over the 21st century, beyond what has occurred historically. Downscaled GCM projections are one way to consider plausible future conditions.

Downscaled GCM projections are produced by internationally recognized climate modeling centers around the world and make use of greenhouse gas (GHG) emissions scenarios, which include assumptions of projected population growth and economic activity. GCM projections used in this study are spatially downscaled to 12 km grids to make them relevant for regional climate change impacts analysis. This process is illustrated in Figure 2. The downscaled GCM projections used in the Basin Study are based on the Coupled Model Intercomparison Project Phase 3 (CMIP3). These projections were the basis for analysis in the IPCC Fourth Assessment Report (IPCC, 2007).The emission scenarios used in the downscaled GCM projections based on CMIP3 are A2 (high), A1b (medium), and B1 (low), and reflect a range of future GHG emissions. The A2 scenario is representative of high population growth, slow economic development, and slow technological change. It is characterized by a continuously increasing rate of GHG emissions, and features the highest annual emissions rates of any scenario by the end of the 21st Century. The A1B scenario features a global population that peaks mid-century and rapid introduction of new and more efficient technologies balanced across both fossil- and non-fossil intensive energy sources. As a result, GHG emissions in the A1B scenario peak around mid-century. Last, the B1 scenario describes a world with rapid changes in economic structures toward a service and information economy. GHG emission rates in this scenario peak prior to mid-century and are generally the lowest of the scenarios.

Emission scenarios exist that have both higher and lower GHG emissions than those considered in this Basin Study (e.g. A1fi). However, the three scenarios included in the analysis span a wide range of projected GHG, and there are more GCM projections available based on these three emissions scenarios than any others.

This Study used the downscaled CMIP3 climate projections; however, new projections from the CMIP5 were recently published in May 2013. CMIP5 climate projections are based on emission scenarios referred to as representative concentration pathways (RCPs; Taylor, 2011). Even though CMIP5 projections are more current, it has not been determined that they are a more reliable source of climate projections compared to existing CMIP3 climate projections. At this time, CMIP5 projections should be considered an addition to (not a replacement for) the existing CMIP3 projections, unless the climate science community can offer an explanation as to why CMIP5 should be favored over CMIP3.

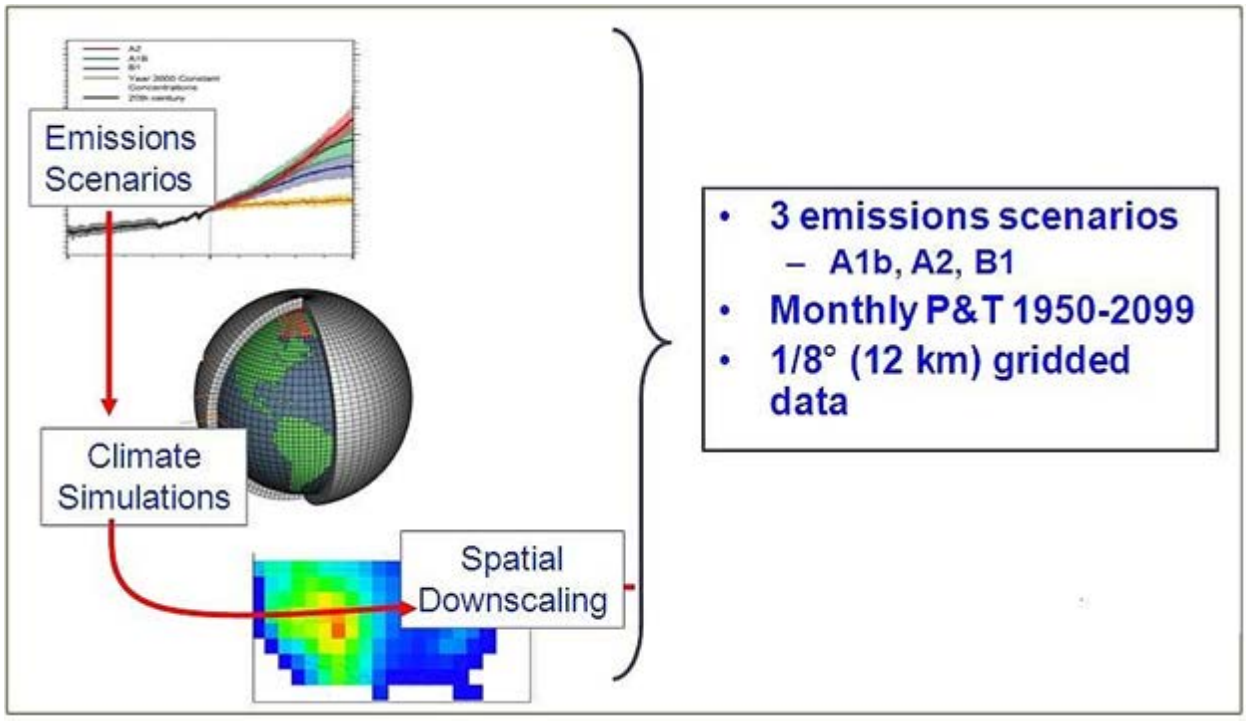

Figure 2: Downscaled GCM key elements figure

2.2 Hydrology Models for the Santa Ana River Watershed

2.2.1 Surface Water

Surface water hydrology projections for the Watershed were developed using the Variable Infiltration Capacity (VIC) model (Liang et al., 1994; Liang et al., 1996; Nijssen et al., 1997) as part of Reclamation's SECURE report on surface water hydrology projections (Reclamation, 2011).

The VIC model is a spatially distributed hydrology model that solves the water balance at each model grid cell. The model initially was designed as a land-surface model to be incorporated in a GCM so that land-surface processes could

be more accurately simulated. However, the model now is run almost exclusively as a stand-alone hydrology model (not integrated with a GCM) and has been widely used in climate change impact and hydrologic variability studies. For climate change impact studies, VIC is run in what is termed the water balance mode that is less computationally demanding than an alternative energy balance mode, in which a surface temperature that closes both the water and energy balances is solved for iteratively. A schematic of the VIC hydrology and energy balance model is given in Figure 3.

The VIC model may be implemented at any spatial resolution, adhering to a latitude-longitude grid. For this Basin Study, and for consistency with Reclamation's West-Wide Climate Risk Assessment, the model was implemented over the study area at 1/8° or ~12 km resolution. Physical characteristics of each cell are predefined within the study area to simulate runoff and other water/land/atmosphere interactions at each grid cell. The VIC hydrology model uses daily weather data (precipitation, maximum temperature, minimum temperature and wind) along with land cover, soils, and elevation information at 1/8° grid scale to simulate hydrologic processes.

VIC provides a wide array of hydrologic outputs, typically including runoff, snow-water equivalent and evapotranspiration, which are routinely analyzed to assess climate change impacts on watershed hydrology. Also, note that all these outputs are produced at the native VIC grid cell resolution of 1/8° or ~12 km. Analysis of these hydrologic variables for the watershed is described in Chapter 3.

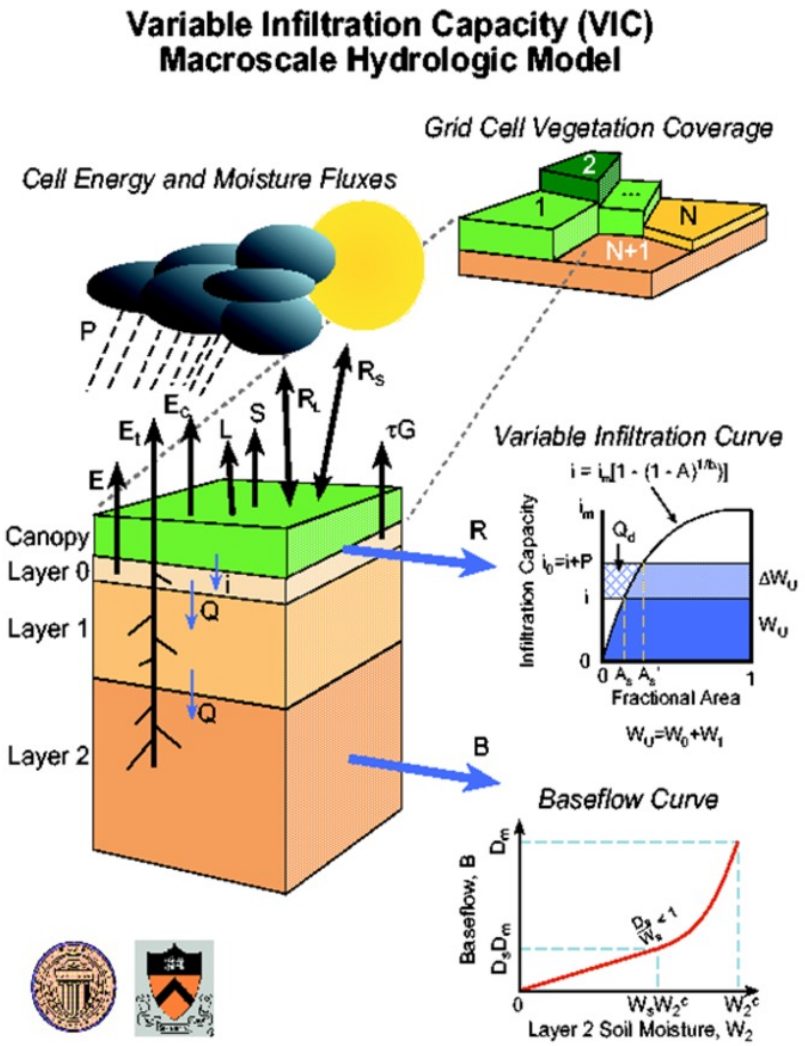

Figure 3: VIC macroscale hydrologic model

However, to analyze streamflow, gridded runoff was routed (Figure 4) to 36 gage locations (Table 1; Figure 5) within the Watershed using the Lohmann et al., (1998) routing model. Additional inputs to the routing model, developed for this Basin Study include, a routing network derived from 15 arc-second (~450 meters) Digital Elevation Model (DEM), flow accumulation, and flow direction data available from the United States Geological Survey (USGS) HydroSHEDS (hydrological data and maps based on Shuttle Elevation Derivatives at Multiple Scales) archive using ArcGIS™. The result of this approach is 112 unique sequences of natural flow under future climate projections. Further details on the development and choice of using the VIC model are available from Reclamation's West-Wide Climate Risk Assessments: Bias-Corrected and Spatially Downscaled Surface Water Projections (2011) report.

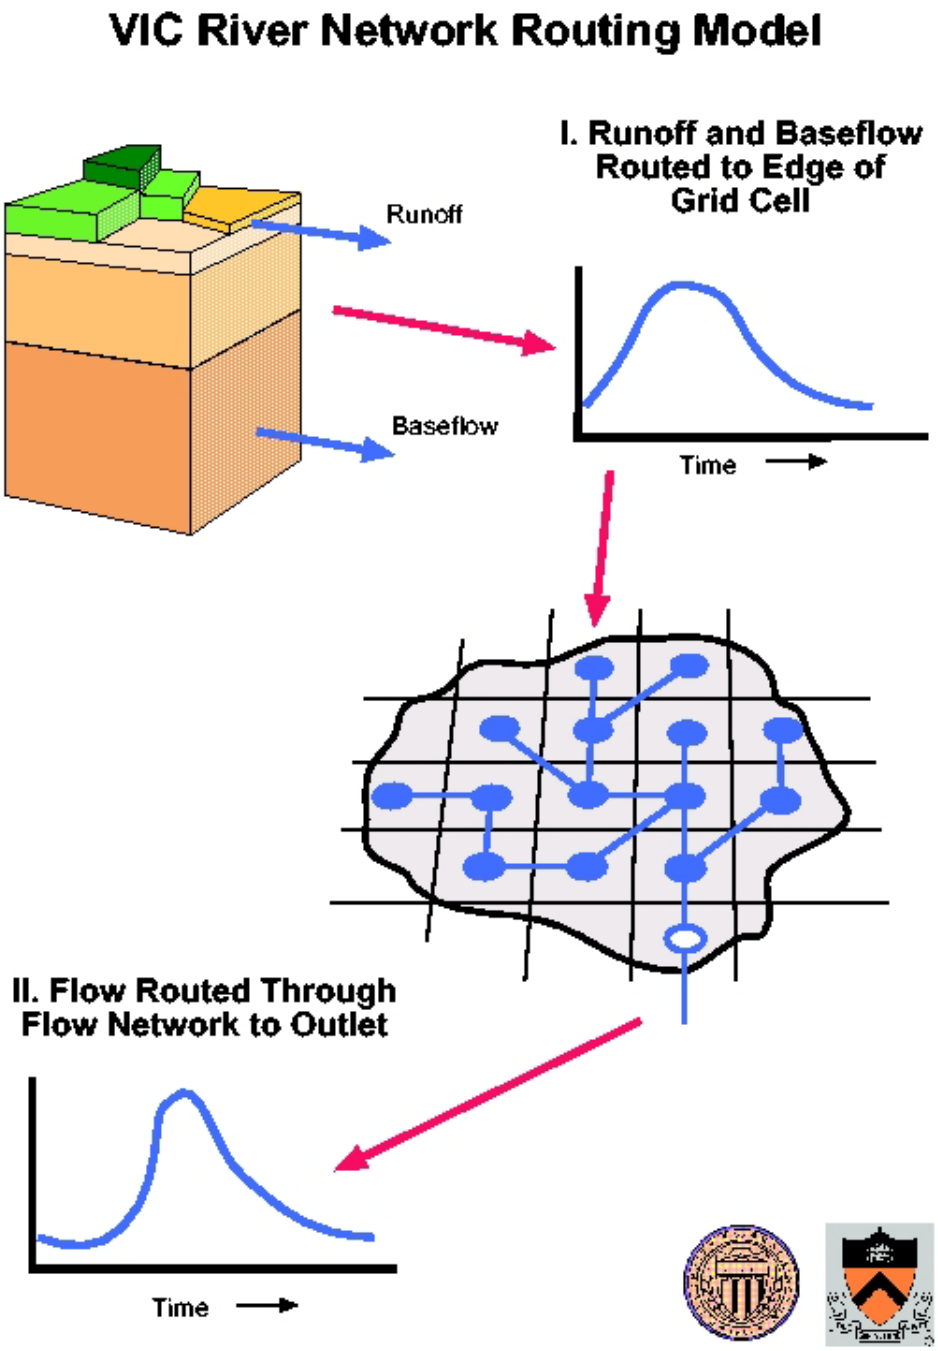

Figure 4: VIC routing model

2.2.2 Groundwater

Changes in climate, population, land use, water management practices, and other natural and anthropogenic factors may affect the quantity and quality of future groundwater resources within the Watershed. Groundwater currently provides approximately 54% of total water supply in the watershed during an average year, and groundwater use is projected to increase over the next 20 years, according to the first OWOW plan (2010). The potential effects of natural and anthropogenic changes on future groundwater resources—including the potential effects of climate change—are therefore a critical component of water resources planning in the Watershed.

Changes in precipitation and temperature directly affect hydrologic processes at the land surface, including groundwater recharge. Changes in precipitation and temperature may also affect groundwater storage and discharge indirectly through changes in water demands. Accurately projecting the potential effects of climate change on groundwater resources within the Watershed, however, is a significant challenge due to the many local factors that govern groundwater recharge and use throughout the watershed. The Watershed encompasses 17 individual groundwater basins and sub-basins; however, only 4 have consistent historical data available, as shown in Figure 6 (California Department of Water Resources [DWR] Bulletin 118). Effects of changes in precipitation and temperature on

groundwater resources are likely to vary substantially between groundwater basins due to differences in local hydrologic, geologic, and topographic conditions, as well as differences in local water supplies, water demands, and water management practices between basins.

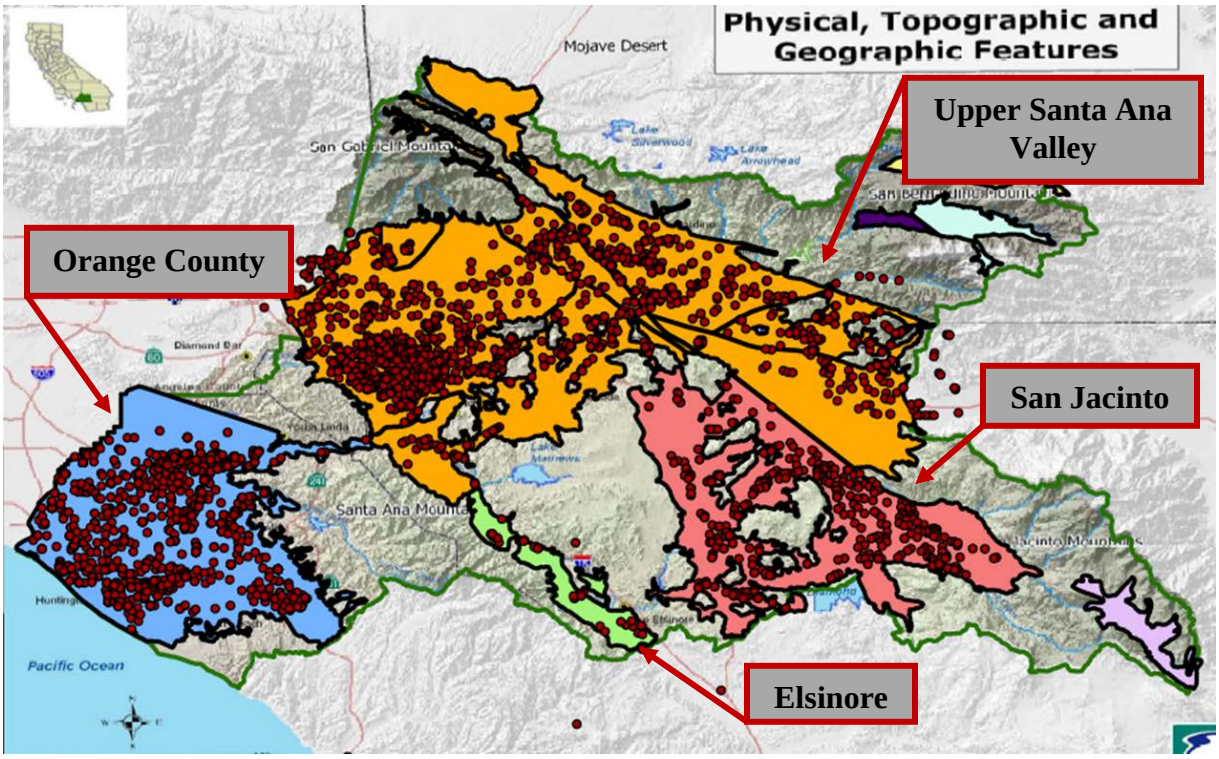

Figure 6: Groundwater basins and monitoring well locations (illustrated by red dots)

The effects of climate change on groundwater resources are commonly evaluated using a spatially distributed numerical model of the groundwater flow system in question, which may consist of a single aquifer or unit, multiple aquifers, or an entire groundwater basin or sub-basin. A numerical model of the groundwater flow system is constructed to represent the relevant physical properties of the system, including its geographic extent and orientation, the porosity and permeability of subsurface materials, and the location and extent of key features affecting groundwater flow such as faults, aquitards, and aquicludes. Historical inflows and outflows from the groundwater system are estimated from available data and formatted as model inputs, including spatially distributed recharge from precipitation, focused recharge from stream and canal seepage losses or deep percolation of irrigation water, groundwater abstraction by pumping, and other inflows and outflows. The model is then calibrated and verified with respect to available observations. A second set of groundwater inflows and outflows is then developed based on projected future climate conditions, and is again formatted as model inputs. Finally, the model is used to simulate groundwater flow and storage under historical and projected climate conditions and the resulting model

outputs are compared to evaluate the effects of climate change on groundwater resources.

The use of spatially-distributed numerical models to evaluate climate change impacts on groundwater is both data intensive and computationally intensive, and requires explicit representation of the many local factors that affect groundwater recharge and use. As a result, this approach generally bears a large cost and long timeline. Moreover, the use of spatially-distributed numerical models to evaluate climate change impacts on groundwater resources in the Watershed would require development of separate models for individual groundwater basins and sub-basins. The cost of such an analysis is therefore prohibitive at the watershed scale.

In order to evaluate basin-scale groundwater conditions in the Watershed under future climate, population, land use, and water management scenarios, a basin-scale groundwater screening tool was developed based on a simplified representation of individual groundwater basins. The groundwater screening tool estimates fluctuations in basin-scale groundwater levels in response to natural and anthropogenic drivers, including climate and hydrologic conditions, agricultural land use, municipal water demand, and trans-basin water imports. The tool allows users to quickly estimate basin-scale groundwater conditions under a broad range of future scenarios and provides insight into the primary factors driving basin-scale groundwater fluctuations.

A basin-scale groundwater screening tool was developed to facilitate evaluation of groundwater conditions within the Watershed under future climate, population, land use, and water management scenarios. The tool estimates fluctuations in average groundwater levels over a given groundwater basin, at a monthly time scale, in response to natural and anthropogenic drivers, including climate and hydrologic conditions, agricultural land use, municipal water demand, and trans-basin water imports. The tool allows users to quickly estimate changes in basin-average groundwater levels in response to projected changes in future climate, and provides insight into the primary factors driving basin-scale groundwater fluctuations.

In groundwater basins where groundwater is a primary source of water supply, fluctuations in basin-averaged groundwater level depend on both water availability and water demands. In general, higher than average water availability from precipitation, local streamflow, and imported water contributes to increased recharge and/or decreased groundwater pumping, resulting in rising groundwater levels. By contrast, higher than average water demands for municipal and agricultural uses and higher than average evaporative demand from native and landscaped vegetation contribute to decreased recharge and/or increased groundwater pumping, resulting in declining groundwater levels. In addition to supply and demand, large-scale management objectives in some groundwater basins such as pressurization of hydraulic barriers against sea water intrusion and

dewatering for hydraulic control of groundwater discharge may also affect basin-average groundwater levels.

The competing influences of water availability, water demand, and large-scale groundwater management objectives on basin-scale groundwater elevations are illustrated schematically in Figure 7, which forms the conceptual model for the basin-scale groundwater screening tool. This conceptual model considers fluctuations in basin-average groundwater elevations as a function of basin-scale drivers. As a result, use of the groundwater screening tool does not require detailed information regarding local hydrologic, geologic, climatic, and anthropogenic factors that may affect local groundwater fluctuations; however, it should be noted that as a result of this basin-scale approach, the groundwater screening tool is primarily applicable at the scale of individual groundwater basins or sub-basins, where the effects of local-scale conditions are largely averaged out and where subsurface inflows and outflows from surrounding areas are negligible.

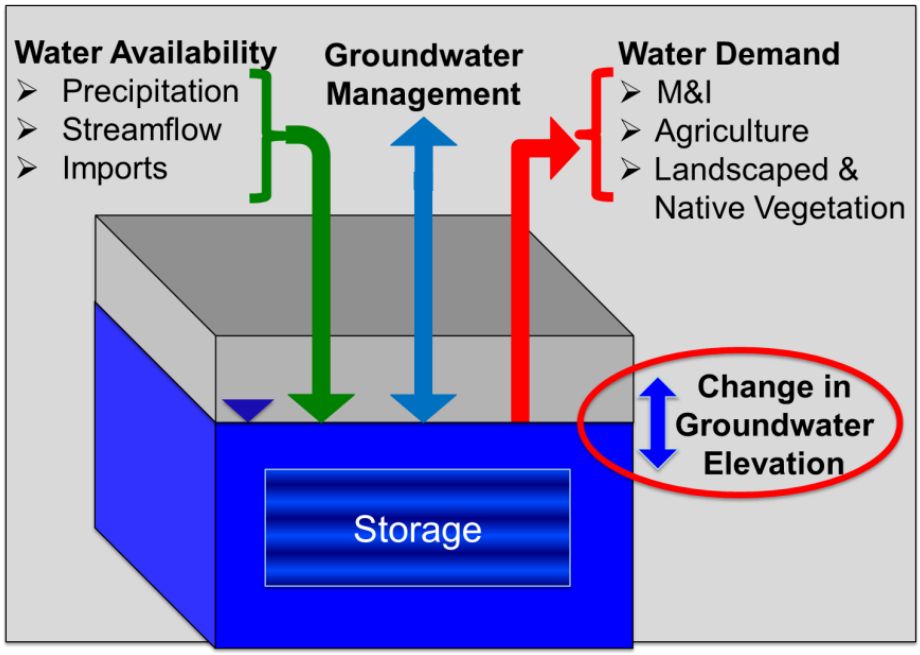

Figure 7: Conceptual model of basin-scale groundwater fluctuations used in developing the groundwater screening tool

In the basin-scale groundwater screening tool, fluctuations in groundwater elevation are estimated as a function of three inputs that characterize water availability (precipitation, local streamflow, and trans-basin imports), three inputs that characterize water demand (municipal and industrial demand, agricultural land use [irrigated acreage], and evaporative demand), and an optional exogenous input that represents groundwater management objectives that affect basin-scale groundwater levels. The functional relationship is implemented in the form of a multi-variate linear regression equation (Equation 1):

$$\frac{\Delta h}{\Delta t} = (C_1 \cdot P_t) + (C_2 \cdot E_t) + (C_3 \cdot Q_t) + (C_4 \cdot M_t) + (C_5 \cdot A_t) + (C_6 \cdot I_t) + (C_7 \cdot X_t) \quad \text{..... Eq. 1}$$

Where:

$\frac{\Delta h}{\Delta t}$ is the change in basin-averaged groundwater elevation (t is in months)

P_t is total precipitation over the groundwater basin

Q_t is streamflow at a representative location that reflects surface water availability in the basin

I_t is the volume of trans-basin water imports to the groundwater basin

M_t is municipal and industrial demand within the basin

E_t is evaporative demand from native and landscaped (non-agricultural) vegetation

A_t is agricultural water demand (applied water demand)

X_t is a timeseries of values representing the effect of a specific large-scale water management practice on groundwater levels within the basin

C_i are linear regression coefficients

Variables P_t, Q_t, and I_t represent the available water supplies within the groundwater basin during the given time period, whereas variables M_t, E_t, and A_t represent the primary water demands within the basin during the same period. Variable X_t is optional and can be used to reflect specific large-scale management activities that affect groundwater levels throughout the basin. Coefficients C_i are determined via linear regression (i.e., by fitting Equation 1 to historical observations). After the coefficient values have been determined, the groundwater screening tool uses Equation 1 to estimate future groundwater elevations under various future scenarios. For example, the tool can be used to estimate future groundwater elevations under climate change by modifying inputs P_t, Q_t, and E_t to reflect projected future climate conditions.

In addition to reduced data and computational requirements, implementation of the basin-scale conceptual model via linear regression provides broad flexibility in the development of inputs to the groundwater screening tool. The conceptual model represents the large-scale mass balance of groundwater in a given basin. However, accurate and comprehensive data for many of the inflow and outflow terms in the conceptual model are often unavailable for most groundwater basins.

For example, evaporative demand for native and landscaped vegetation generally is not readily available for most groundwater basins. The regression-based approach used here allows the user to substitute a related variable in place of the missing data. In the case of evaporative demand, the user may substitute temperature data for evaporative demand as temperature is strongly correlated with evaporative demand. As long as fluctuations in the substituted dataset (in this case temperature) are strongly correlated with fluctuations in the primary input variable (in this case evaporative demand), discrepancies in magnitudes of two variables are accounted for by the regression coefficient on this term.

Development of Groundwater Model Inputs

As detailed above, the groundwater screening tool estimates changes in basin-averaged groundwater levels over time as a function of seven natural and anthropogenic factors that govern groundwater recharge and discharge: precipitation, local streamflow, trans-basin water imports, municipal and industrial water demands, agricultural water demand, evaporative demand from native and landscaped vegetation (non-agricultural), and an optional exogenous input that represents groundwater management objectives that affect basin-scale groundwater levels. The regression-based approach used in the groundwater screening tool allows substitution of related datasets where accurate data for one or more model input is not available. This section summarizes the development of inputs to the groundwater screening tool for groundwater basins within the Watershed.

Historical Input Data (1990-2009)

Historical data were used to fit the regression coefficients in Equation 1 and to evaluate model performance over the historical period (1990-2009). For each groundwater basin, historical inputs are required for the six primary input variables to Equation 1. Additional inputs may be provided for the optional exogenous variable if desired. No exogenous inputs were developed for groundwater basins within the Watershed; however, exogenous inputs may be incorporated by water resources planners and decision makers in the watershed based on knowledge of management operations relevant to individual groundwater basins.

Groundwater Elevation (h_t)

The groundwater screening tool requires an input timeseries representative of historical monthly groundwater elevations within the basin for the period 1990-2009. For this study, a database of historical groundwater elevations from more than 4,000 monitoring wells within the Watershed was obtained from SAWPA. Monitoring well locations are shown in Figure 6. Well records were evaluated to determine the period of record, completeness of record, and occurrence of outlier or spurious values. Wells exhibiting records shorter than 10 consecutive years or exhibiting a high frequency of missing values were excluded from this analysis. For each well identified as having a sufficient period of record and sufficient sampling frequency, monthly mean groundwater elevations were calculated from the available instantaneous measurements. For months containing more than one

measurement, the monthly average was computed as the unweighted arithmetic average of the available measurements. For months with a single measurement, the single measurement was assumed to reflect average conditions during that month. It should be noted that individual outlier points were excluded from averaging; outliers likely reflect measurement errors, data transcription errors, or measurements taken during or after permeability testing was carried out (i.e., during or after a slug test or pump test). Lastly, monthly averages were linearly interpolated to develop a complete timeseries of monthly mean groundwater elevations over the period of record. Accuracy of monthly timeseries was evaluated by sub-sampling and cross-validation. Interpolated monthly timeseries were shown to accurately reflect raw measurements.

Monthly timeseries of basin-averaged groundwater elevations were then developed for each of the individual groundwater basins and sub-basins (defined by DWR) in the Watershed. Steps were required to avoid two sources of bias in calculating basin-average groundwater elevations: variations in the period of record between wells, and outlier wells that are not representative of large-scale groundwater fluctuations within a basin. These steps are described below.

Very few wells in the database used here exhibit complete monthly timeseries for the full historical period (1990-2009). As a result, simply taking the arithmetic average of well records over each groundwater basin results in a biased estimate of basin-average groundwater elevations. This bias occurs due to differences in the period of record of wells within a given basin: if the basin average for different months is based on a different sub-set of wells, and each well has a different mean groundwater elevation, then the resulting average reflects variations in the sub-set of well used. To minimize biases associated with varying record lengths, averaging was carried out based on monthly deviations rather than monthly groundwater elevations. This was done by computing monthly deviations (anomalies) for each record (i.e. for each well), where monthly deviations are calculated as the difference between the monthly mean value and the long-term average value for that month.

In addition to differences in record length, potential biases may occur in cases where individual well records reflect unique local conditions that are not broadly representative of groundwater fluctuations within the basin. This situation might occur when groundwater pumping throughout a basin is not driven primarily by municipal and industrial demand, but is driven by agricultural demand in one small area of the basin. Groundwater fluctuations in the agricultural portion of the basin are likely to exhibit substantially different behavior than groundwater fluctuations throughout the rest of the basin. In basins where a large number of monitoring wells are available, individual outliers have little effect on the basin-scale average and therefore do not need to be excluded from analysis. Where a small number of samples are available, however, individual outliers can disproportionately impact the basin average, resulting in potentially significant bias.

For this study, a correlation-based clustering procedure was developed to group wells into sub-sets exhibiting similar behavior. In basins and sub-basins where a large number of monitoring records were available, the majority of wells fell into a single cluster. For the purposes of this analysis, the largest cluster was assumed to reflect basin-average conditions, and basin-average groundwater elevations were calculated based on wells in this cluster. In basins and sub-basins where, only a small number of records were available, wells generally fell into a small number of similar size clusters. For the purposes of this analysis, these clusters were assumed to represent conditions in different portions of the basin where groundwater fluctuations were subject to different primary stressors. In these cases, averages were computed for each cluster and were evaluated separately. This report only presents results for basins where the majority of groundwater records fell into a single cluster.

Precipitation (P_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly precipitation over the groundwater basin for the period 1990-2009. Precipitation input may be basin-averaged monthly precipitation calculated from multiple gage records or from a gridded precipitation dataset. Alternatively, precipitation input may be derived from gage data at a single location or selected locations that represent key areas within the groundwater basin, such as areas of significant recharge or runoff. For this study, basin-average monthly precipitation was calculated for each groundwater basin based on the historical gridded daily precipitation dataset developed by Maurer et al. (2002), the same dataset used to derive the surface water projections. Area-weighted monthly total precipitation was computed for each basin based on groundwater basin polygons developed by DWR.

Evaporative Demand (E_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly evaporative demand from native and landscaped (non-agricultural) vegetation over the groundwater basin for the period 1990-2009. Because evaporative demand is generally not measured directly, monthly mean temperature or calculated monthly potential evapotranspiration (PET) may be used as surrogates for evaporative demand. For this study, basin-average monthly-mean temperature was calculated for each groundwater basin based on the historical gridded daily temperature dataset developed by Maurer et al. (2002), the same dataset used to derive the surface water hydrology projections. Area-weighted monthly-mean temperature was computed for each basin based on groundwater basin polygons developed by DWR.

Streamflow (Q_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly streamflow that contributed to water supply in the groundwater basin for the period 1990-2009. This streamflow excludes that

which is provided by trans-basin imported water. Locations selected for the streamflow inputs for the four basins can be seen in Figure 8; the latitude and longitude for each point can be found in Table 2. Locations were chosen to be representative of streamflow in the basin. The San Jacinto and Elsinore Basins are able to share a stream flow point because the point is representative of water leaving the San Jacinto Basin and water entering the Elsinore Basin. Streamflow input may be based on a single gage that is representative of natural streamflow conditions within the basin, or may be estimated natural flow in the absence of storage and trans-basin diversions (i.e., naturalized streamflow). For this study, simulated historical natural flow at a representative point was used for each basin, development of which is described in section 2.2.1.

Table 2: Streamflow locations for groundwater basins

Groundwater Basin	Latitude (decimal degree)	Longitude (decimal degree)
Orange County	33.85640444	-117.80088930
Upper Santa Ana Valley	33.88916667	-117.56194444
Elsinore/San Jacinto	33.66411200	-117.29397600

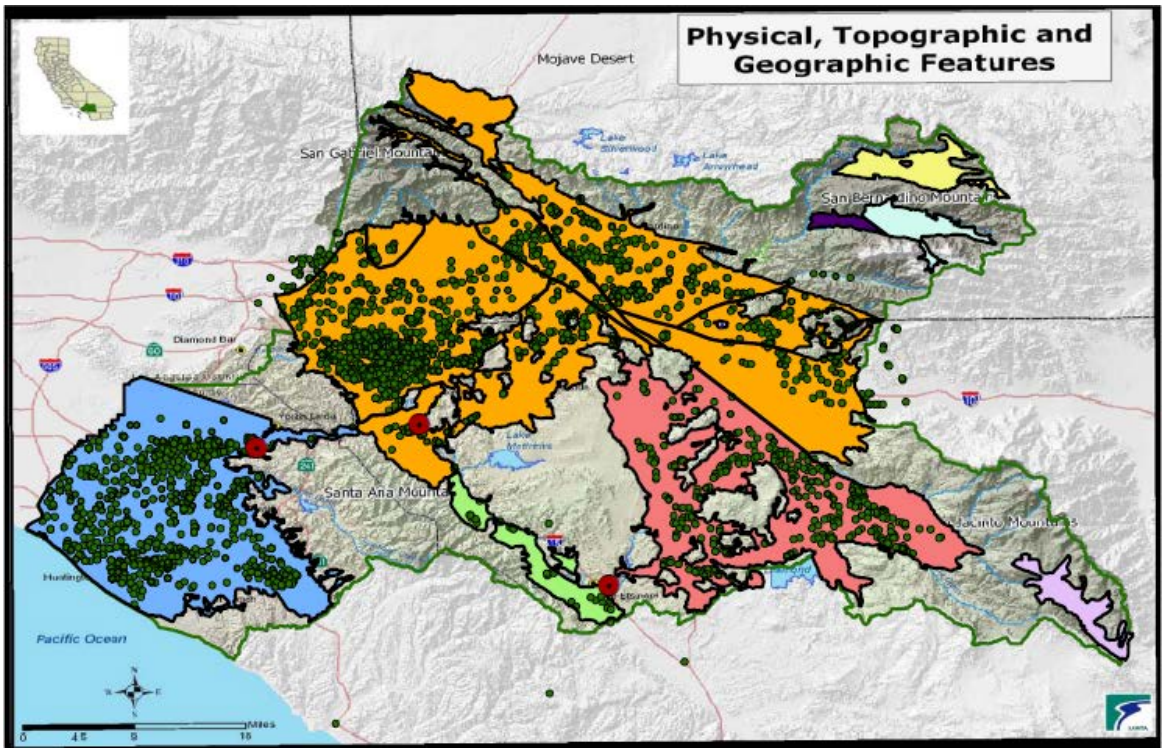

Figure 8: Locations for streamflow inputs (represented by red dots)

Municipal and Industrial Demand (M_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly municipal and industrial water demand within the groundwater basin for the period 1990-2009. Where municipal and industrial demand data are not directly available, demand may be estimated from available population and per capita water use data, interpolated as needed to obtain monthly data for the period 1990-2009. For this study, population within each groundwater basin was calculated from census tract data for years 1990, 2000, and 2010, and were interpolated to obtain monthly values. Data for annual per capita water use were obtained from urban water management plans for SAWPA member agencies and other water providers within each basin, and were similarly interpolated to obtain monthly values. Municipal and industrial demand was then estimated as the product of population and per capita use.

Agricultural Demand (A_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly agricultural water demand within the groundwater basin for the period 1990-2009. Accurate and consistent data on agricultural water use is not available for the groundwater basins within the Watershed. For this study, agricultural land area (irrigated acreage) was used as a surrogate for agricultural demand. For each groundwater basin, irrigated acreage was calculated from available land use datasets developed by the Southern California Association of Governments (SCAG). Available values were interpolated to obtain estimates of monthly values over the period 1990-2009. Where cropping patterns and irrigation practices are reasonably constant, agricultural acreage is strongly correlated with agricultural demand.

Trans-basin Imported Water (I_t)

The groundwater screening tool requires an input timeseries that is representative of historical monthly trans-basin water imported into the groundwater basin for the period 1990-2009. For this study, import data were obtained from SAWPA member agencies and associated, to the extent possible, with the corresponding groundwater basin. Initial analysis revealed that trans-basin imports are generally small compared to precipitation and natural streamflow for most groundwater basins in the watershed; as a result, uncertainties associated with the historical trans-basin import data used in this analysis is considered negligible.

Exogenous Variable (X_t)

The simplified approach used by the groundwater screening tool does not represent many of the complex and dynamic processes that may affect groundwater fluctuations within a given basin. For this purpose, the tool allows for an optional exogenous input, which provides the user an opportunity to account for a key driver that is not explicitly represented by the above inputs. Key drivers may include groundwater injection operations for a hydraulic barrier against sea water intrusion, dewatering for hydraulic control of groundwater

discharge, or other management objectives that affect groundwater levels. No exogenous variable was used in this study.

Projected (Future) Input Data (2010-2099)

The groundwater screening tool estimates future groundwater elevations over the period 2010-2099 based on input data reflecting projected water supply, water demand, and water management conditions over this period. Future inputs are required for each of the primary input variables to the screening tool. If an exogenous variable is used for the historical period, projected values of the same exogenous variable are required for the future period. As noted above, no exogenous inputs were developed for groundwater basins within the Watershed. It should also be noted that projected groundwater elevations are calculated by the screening tool; groundwater elevation is not an input for the future period.

Precipitation (P_t)

The groundwater screening tool allows users to provide up to 250 projections of future precipitation for a given basin. Consideration of multiple future projections provides insight into the range of future conditions corresponding to uncertainties in projected future climate. For this study, projected basin-average monthly precipitation for the period 2010-2099 was calculated based on an ensemble of 112 bias corrected and spatially disaggregated climate projections (see Section 2.2.1). For each projection, input timeseries were developed by calculating the area-weighted monthly total precipitation for groundwater basin polygons developed by DWR.

Evaporative Demand (E_t)

Similar to precipitation, the groundwater screening tool allows users to provide up to 250 projections of future evaporative demand for a given basin. For consistency with historical inputs, basin-average monthly-mean temperature was used to represent monthly evaporative demand over the future period. Projected basin-average monthly average temperature inputs were calculated for each groundwater basin based on an ensemble of 112 BCSD climate projections (see Section 2.2.1). For each projection, input timeseries were developed by calculating the area-weighted monthly average temperature for groundwater basin polygons developed by DWR.

Streamflow (Q_t)

Similar to precipitation and temperature, the groundwater screening tool allows users to provide up to 250 projections of streamflow for a given basin. For this study, projected natural flow at a representative point for the period 2010-2099 was used for each basin (see Section 2.2.1).

Municipal and Industrial Demand (M_t)

The groundwater screening tool requires a single timeseries input representing projected municipal and industrial demand for the future period. For the purposes of this study, it was assumed that future municipal and industrial demand will

remain at current levels. However, the tool allows water resources planners and decision makers to input alternative projections of future municipal and industrial demand based on various scenarios and planning objectives related to individual groundwater basins.

Agricultural Demand (A_t)

The groundwater screening tool requires a single timeseries input representing projected agricultural demand for the future period. For consistency with historical inputs, agricultural land area (irrigated acreage) was used to represent agricultural water demand in the future. For the purposes of this study, it was assumed that future agricultural land area will remain at current levels. However, the tool allows water resources planners and decision makers to input alternative projections of future agricultural demand based on various scenarios and planning objectives related to individual groundwater basins.

Trans-basin Imported Water (I_t)

The groundwater screening tool requires a single timeseries input representing projected trans-basin imported water for the future period. For the purposes of this study, it was assumed that future water imports will remain at the average historical level, calculated as the average over the period 1990-2009. However, the tool allows water resources planners and decision makers to input alternative projections of future water imports based on various scenarios and planning objectives related to individual groundwater basins.

Exogenous Variable (X_t)

As for the historical period, no exogenous variable was used in this study for the future period.

The methods described in this chapter were used to project hydroclimate conditions including surface water and groundwater supplies, which are presented in Chapter 3 along with projected demand.

3.0 Water Supply and Demand Projections

3.1 Water Supply

Future water supply projections were made using the CMIP3 projections and the VIC hydrology model. The CMIP3 archive provides a downscaled 12 kilometer resolution grid on a monthly time-series of precipitation and temperature from 1950-2099 for 112 climate projections.

3.1.1 Hydroclimate Projections

Timeseries Plots

This set includes projection specific annual timeseries plots for six hydroclimate indicator variables covering the period 1950–2099 (water years 1951-2099). The six variables are:

- Annual Total Precipitation
- Annual Mean Temperature
- April 1st Snow Water Equivalent
- Annual Runoff
- December–March Runoff
- April–July Runoff

The three variables—annual total precipitation, annual mean temperature, and April 1st SWE—vary spatially (at 1/8° or ~ 12-km-grid resolution) across the basins. To estimate total annual precipitation for the basin, basin-wide average precipitation (average across the grid cells in the basin) was first calculated for each month of the years 1950–2099. These basin average monthly precipitation values then were summed for each water year 1951-2099 to obtain the annual total precipitation.

To estimate basin mean temperature, average monthly temperature was calculated from all the grid cells in the basin for each month of the water years 1951–2099. These monthly temperatures for any given year next were averaged across the grid cells in the basin to estimate the basin-wide annual mean temperature.

SWE on April 1st of a given year is a widely used measure to assess snowpack and subsequent spring–summer runoff conditions in the snowmelt dominated basins of the western United States. SWE is one possible output from the VIC hydrology model. For each of the simulation water years, April 1st SWE was

saved from the simulations for each model grid cell in the basin. Gridded SWE on April 1st was averaged over all the grid cells for the given basin to calculate the basin-wide April 1st SWE for water years, 1950–2099.

Runoff for each of the 36 site locations (Table 1) was calculated for the annual timescale and for two seasonal timescales December–March (DJFM) total runoff depicting winter season runoff conditions and April–July (AMJJ) total runoff depicting spring–summer runoff conditions. For each of the simulation years 1950–2099, monthly runoff was aggregated on a water year basis to calculate water year specific total annual runoff, DJFM runoff, and AMJJ runoff.

The annual time series plots for the six hydrologic indicator variables for all 112 projections were calculated, and the results are presented to reflect ensemble central tendency and ensemble spread. The central tendency is measured using the ensemble median. The 5th and 95th percentiles from the 112 projections provide the lower and upper uncertainty bounds in the envelope of projections through time.

Figure 9 shows the projection ensemble for six hydroclimate indicators for the site Santa Ana River at Adams Street Gage (most downstream location): annual total precipitation (top left), annual mean temperature (top right), April 1st SWE (middle left), annual runoff (middle right), DJFM runoff season (bottom left), and AMJJ runoff season (bottom right). The heavy black line is the annual time series of 50th percentile values (i.e., ensemble-median). The shaded area is the annual time series of 5th to 95th percentiles.

The annual total precipitation over the basin shows a somewhat declining trend over the transient period going out to 2099. The uncertainty envelope does not appear to expand or contract over time. The mean annual temperature over the basin shows a monotonically increasing trend and a diverging uncertainty envelope over time. April 1st SWE also shows a decreasing trend. The annual runoff follows the long-term declining trend pattern similar to precipitation. The winter season DJFM runoff shows a declining trend, so does the AMJJ summer season runoff.

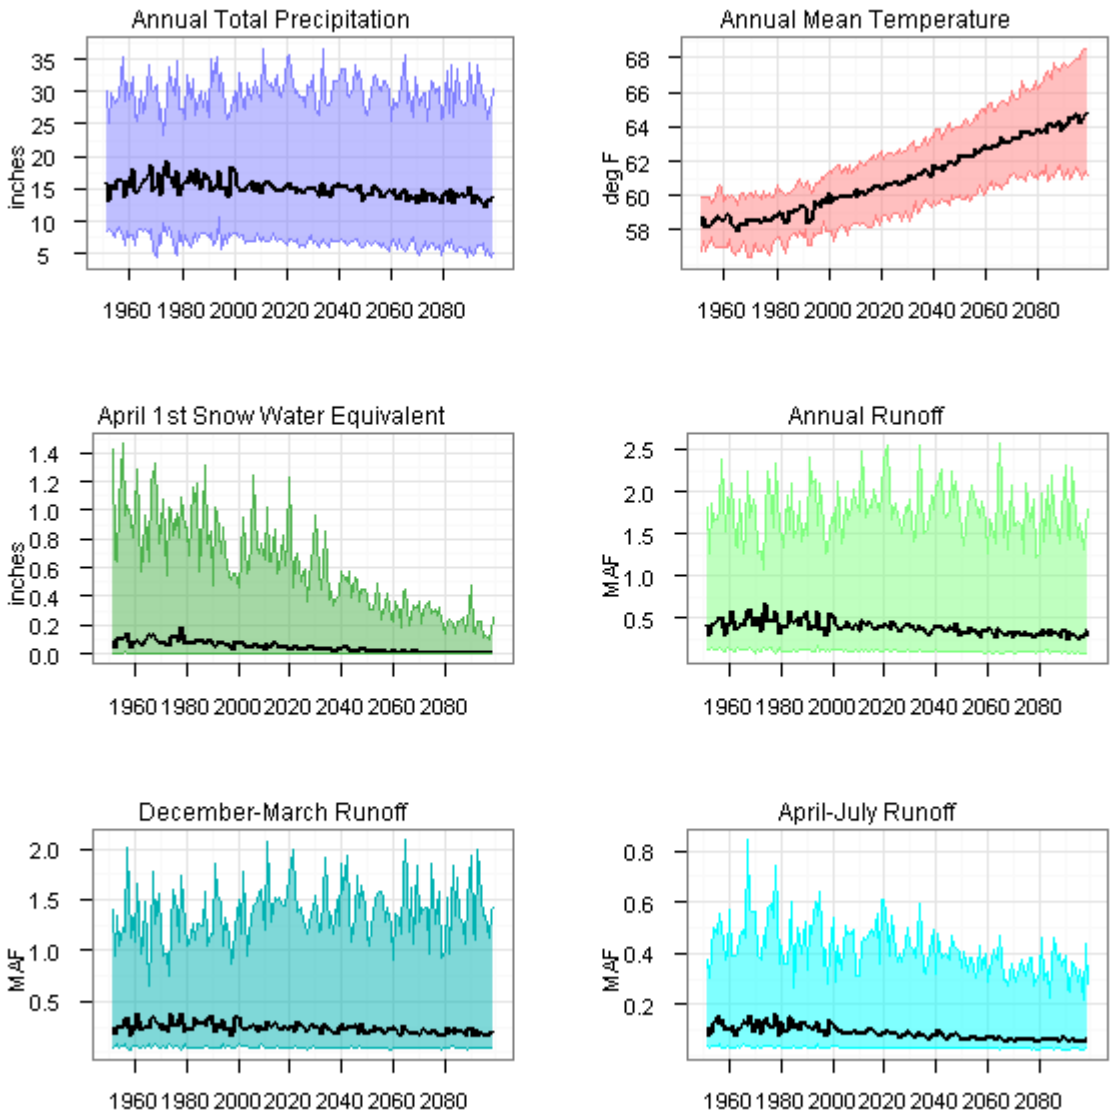

Figure 9: Projection ensemble for six hydroclimate indicators for the site Santa Ana River at Adams Street Gage

Spatial Plots

The next set of plots includes spatial plots of decade-mean precipitation, and temperature. These plots show the spatial distribution for the variables across the contributing basin. The spatial plots were developed on a water year basis for the reference decade of the 1990s (water years 1990–1999).

Spatial distribution of precipitation for the 1990s decade is presented as an ensemble median of the 112 projections. At each grid cell in the basin and for

each of the 112 projections, average total precipitation was calculated by averaging total precipitation from the 10 water years, 1990–1999. Next, for each grid cell, the ensemble median of the decade average total precipitation was calculated and used in developing the spatially varying precipitation plot.

Precipitation changes in each of the future decades – 2020s (represented by water years, 2020-2029), 2050s (represented by water years, 2050-2059), and 2070s (represented by water years, 2070-2079) – were calculated as follows. At each grid cell in the basin and for each of the 112 projections, average total precipitation was calculated by averaging total precipitation from the 10 water years in the respective future decades. Then, for a given projection and at a given grid cell, the percentage difference in average total precipitation between a given future decade and the reference 1990s decade was calculated. This percentage difference for a given cell was calculated only if the 1990's average total precipitation for that cell was greater than 0.01 millimeter. This step is necessary to threshold division by a small value, which would result in a numerically large change magnitude. Positive percentage change implies wetter conditions, while negative percentage change implies drier conditions from the 1990s reference decade.

After all projection-specific changes were calculated for a given future decade, the median change from the 112 projections was calculated. The median or 50th percentile change provides a measure of the central tendency of change in decade average total precipitation for a given future decade compared with the reference 1990s decade (Figure 10).

The 2020s decade shows some increase in the upper elevation parts of the watershed from the 1990s reference decade, but for the subsequent two decades – 2050s and 2070s – the precipitation shows consistent decline throughout the watershed.

The calculations for the spatial distribution of mean temperature are similar to the spatial distribution of precipitation calculation for the 1990s reference decade. The difference being, in case of temperature, mean annual temperature is first calculated from the 12 monthly values (in case of precipitation, it is the total precipitation) for each of the 10 water years, and subsequently, averaged to calculate the decade average mean annual temperature. The changes in mean annual temperature for the future decades are presented as magnitude changes and not as percentage change (as computed for precipitation). The median or 50th percentile change from the 112 projections represents the central tendency in decade-mean temperature distribution.

Figure 11 shows the spatial distribution of simulated decadal temperature. These results show that the watershed is expected to get hotter through the successive decades (2020s, 2050s and 2070s) compared with the 1990s reference decade.

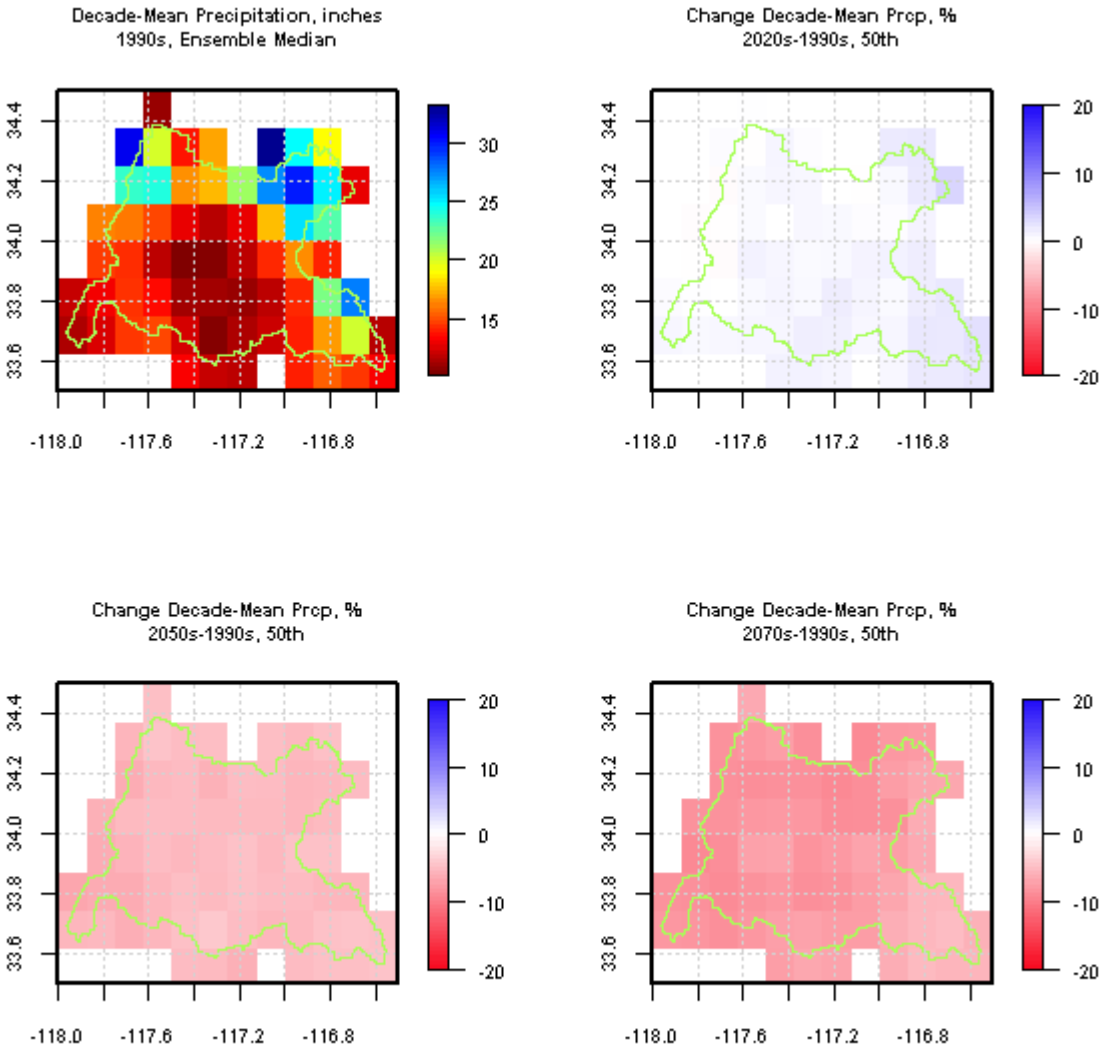

Figure 10: Spatial distribution of simulated decadal precipitation. The vertical axis represent latitude, the horizontal axis represent longitude

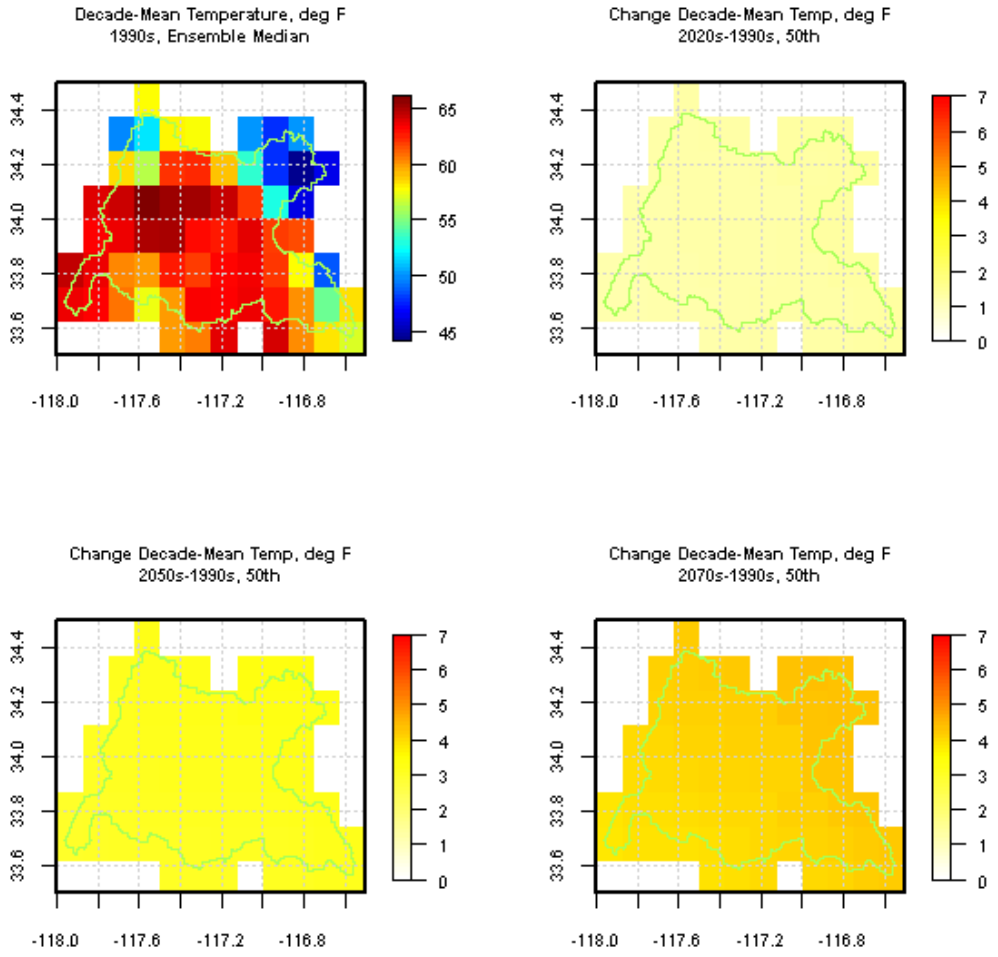

Figure 11: Spatial distribution of simulated decadal temperature. The vertical axis represent latitude, the horizontal axis represent longitude

3.1.2 Impacts on Runoff Annual and Seasonal Cycles

Similar to the calculations of precipitation and temperature changes, annual and seasonal runoff changes were calculated for all 36 sites listed in Table 1. Figure 12 shows mean annual and mean-seasonal runoff change for the site, Santa Ana River at Adams Street Gage (most downstream location). Changes in mean runoff (annual or seasonal) were calculated for the three future decades – 2020s, 2050s and 2070s – from the reference 1990s decade. For the 2050s and 2070s decade, there is a decline in the mean annual and seasonal runoff from the 1990s decade; for the 2020s decade the change in runoff is nominal. Similar change in runoff patterns was observed for all sites across the basin, as can be seen in Table 3.

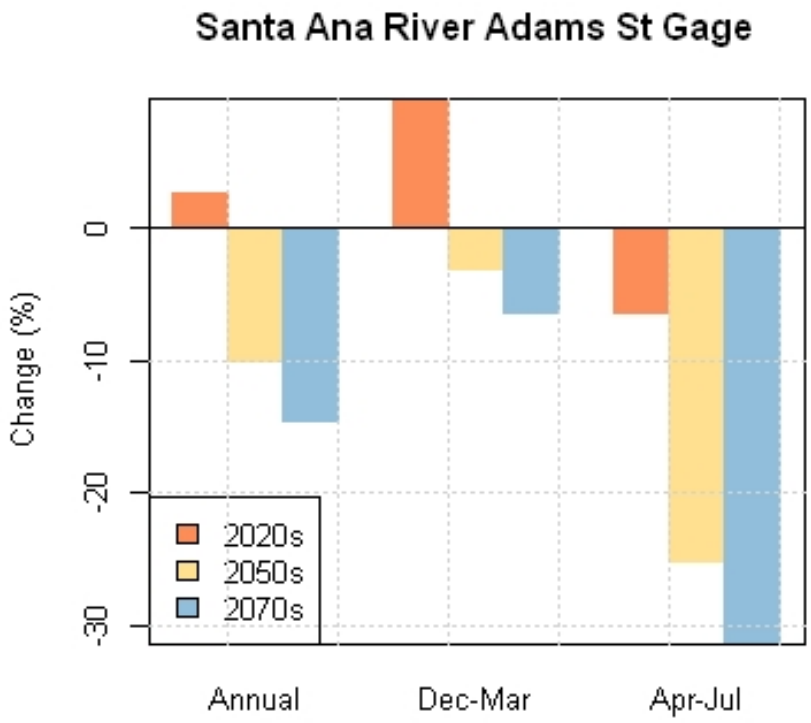

Figure 12: Simulated mean annual and mean-seasonal runoff change

Table 3: Percent change from 1990s for annual, DJFM, and AMJJ runoff

3.1.3 Groundwater Impacts

The groundwater screening tool was applied to four groundwater basins (Orange County, Upper Santa Ana Valley, San Jacinto, and Elsinore) within the Watershed where sufficient data were available, including observed groundwater elevations, municipal and industrial demands, agricultural acreage, and trans-basin imported water.

Figure 13 illustrates observed and simulated monthly changes in groundwater elevation for the Orange County Coastal Plain groundwater basin for the period 1990-2009, as well as observed and simulated monthly basin-averaged groundwater elevations. Figure 13a shows that the groundwater screening tool realistically simulates the timing of month-to-month changes in groundwater elevation, but does not capture the peak magnitudes of drawdown and rise. Similarly, Figure 13c shows that the tool accurately simulates seasonal fluctuations in groundwater elevation as well as trends in groundwater elevation over the past two decades, but does not capture interannual variations in groundwater elevation, including the groundwater decline of the early 1990s and subsequent rebound during the late 1990s and early 2000s. Interannual fluctuations may be driven by local-scale non-linear processes that are not represented in the basin-scale screening tool, or by management objectives that are not included in this analysis. The correlation between simulated and observed changes in groundwater elevation is 0.618 (R^2 = 0.382), and correlation between simulated and observed groundwater elevation is 0.884 (R^2 = 0.782).

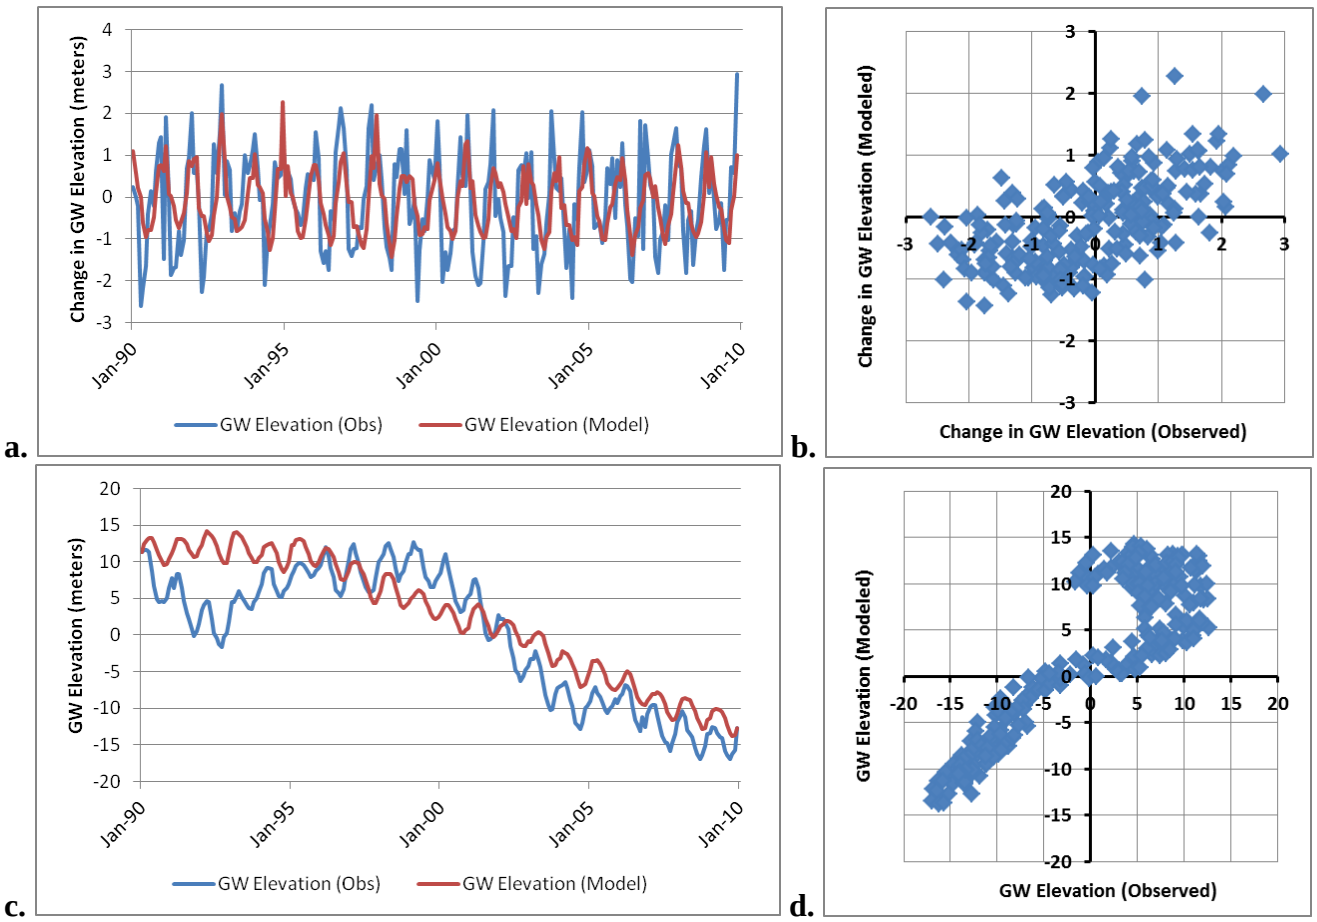

Figure 13: (a) Timeseries of observed and simulated fluctuations in monthly groundwater elevation for the period 1990-2009; (b) scatter plot of simulated monthly change in groundwater elevation as a function of observed change groundwater elevation; (c) Timeseries of observed and simulated monthly groundwater elevation for the period 1990-2009 (zero represents mean sea level); (d) scatter plot of simulated monthly groundwater elevation as a function of observed groundwater elevation (all plots are for Orange County groundwater basin)

Future groundwater availability in the Watershed will depend on future recharge from precipitation, stream seepage, and managed infiltration facilities, as well as future groundwater withdrawals to for municipal, industrial, and agricultural uses. Projected increases in temperature and decreases in precipitation will result in increased water demands and decreased groundwater recharge, respectively. Management actions will be required to protect groundwater resources under projected future climate conditions. Figure 14 illustrates the observed range of basin-averaged groundwater levels in the Orange County groundwater basin for 1990-2009, along with simulated groundwater levels under projected climate conditions. In the absence of groundwater management actions, groundwater levels are projected to decline significantly over the 21st century. It should be noted that projected declines are not constrained by the physical limits of the aquifer; for example, projected declines may exceed the actual amount of usable groundwater in the basin.

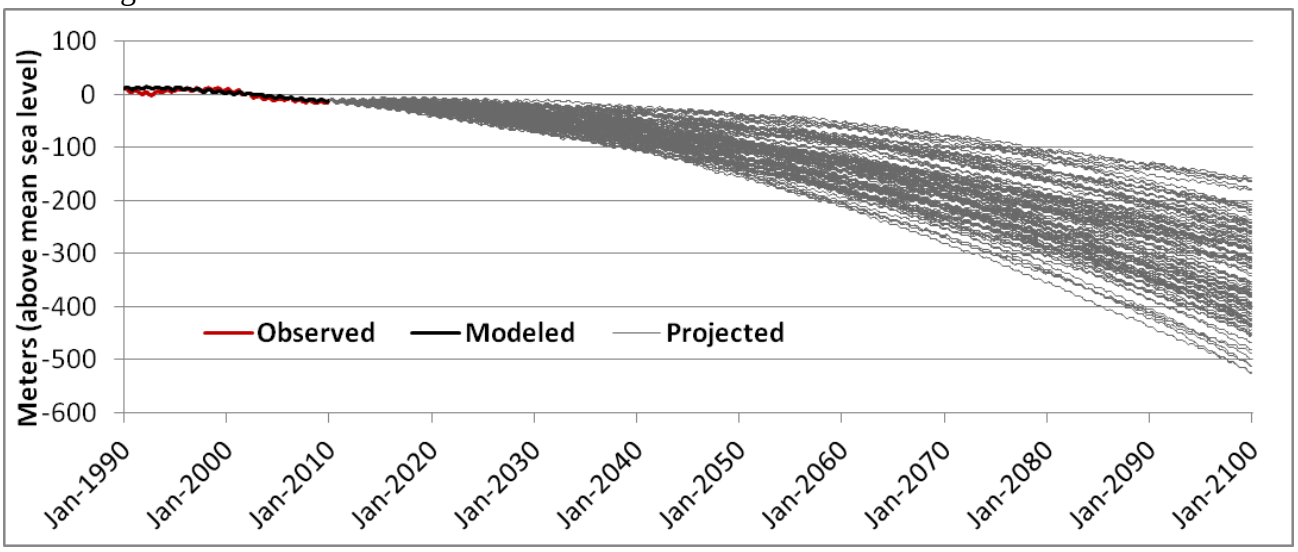

Figure 14: Projected groundwater elevations for Orange County for a no action scenario

The groundwater screening tool, developed by Reclamation for this Basin Study, can be used to evaluate potential deficiencies in future supplies and to develop sustainable management alternatives. As an example, potential actions to avoid projected water level declines in Orange County are listed below. Each alternative listed will protect against groundwater declines through 2060.

- Reduce M&I demand, gradual reduction of approx. 15% by 2020 (i.e., reduce per capita use from ~175 gallons per day in 2010 to ~150 gallons per day by 2020).
- Increase imports from the Colorado River Aqueduct and State Water Project gradually from ~30,000 acre-ft per year to ~105,000 acre-ft per

year (this may not be feasible due to cost, greenhouse gas emissions, or availability).

- Increase local water supplies by ~75,000 acre-ft per year through recycled water treatment capacity, development of seawater desalination capacity, and increase storm water capture efficiency.

Figures 15, 16, and 17 show the projected groundwater elevations for a no action scenario for the Upper Santa Ana Valley, San Jacinto, and Elsinore respectively. The groundwater screening tool can be used to develop and compare additional management alternatives in order to meet the projected growing demands that are discussed in the next section.

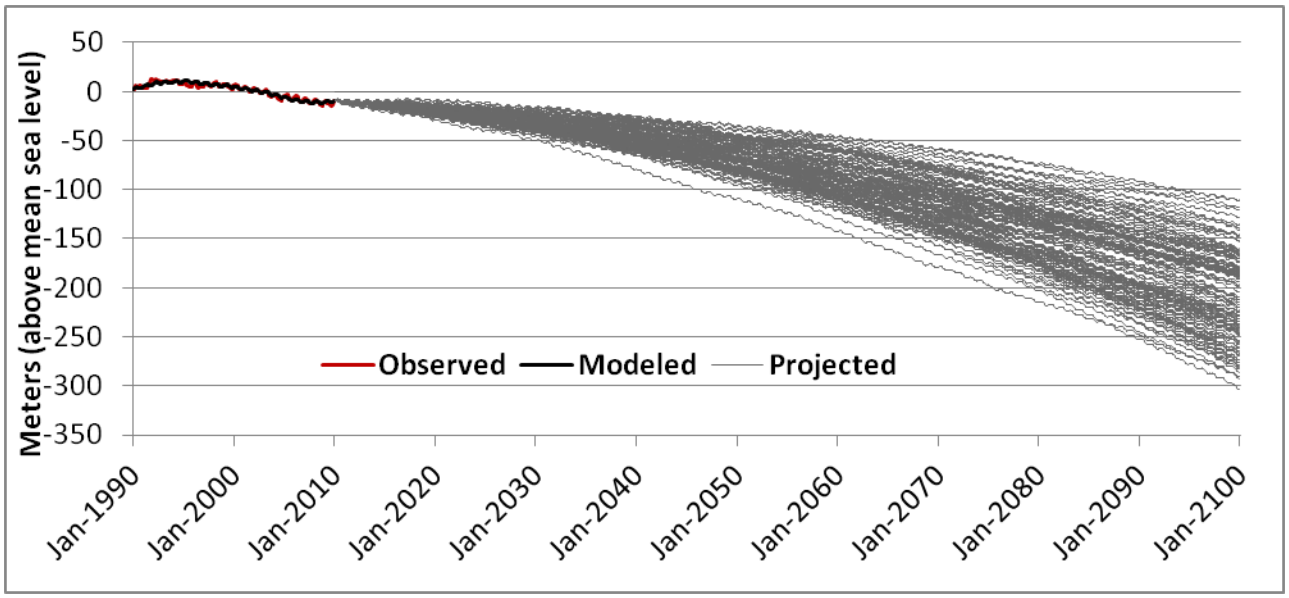

Figure 15: Projected groundwater elevations for Upper Santa Ana Valley for a no action scenario

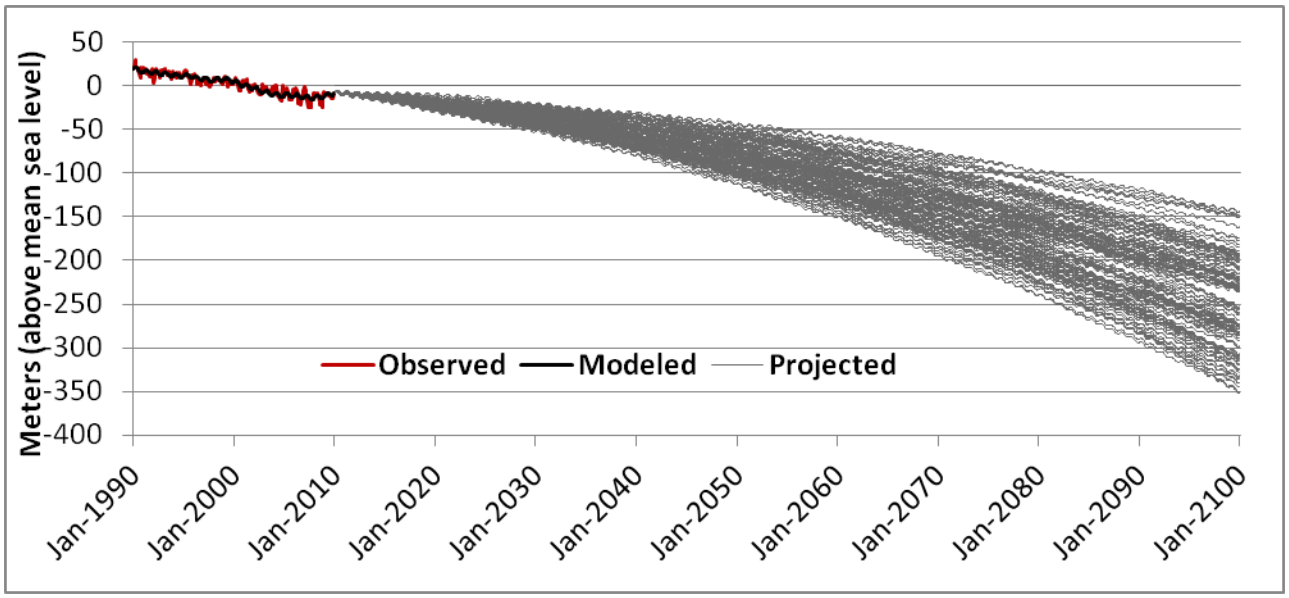

Figure 16: Projected groundwater elevations for San Jacinto for a no action scenario

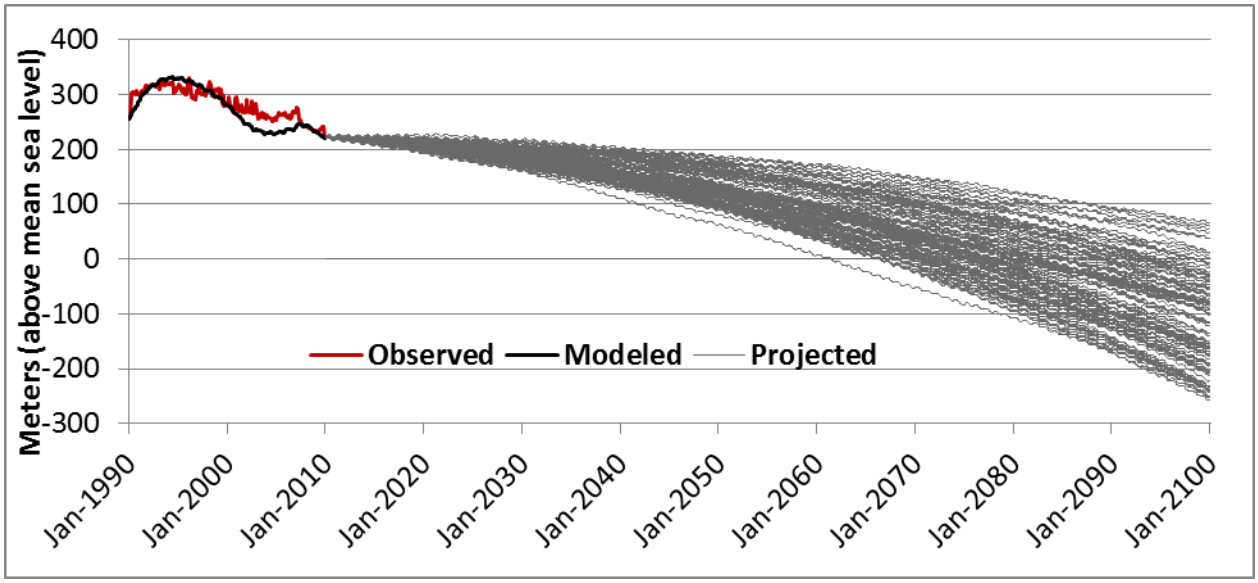

Figure 17: Projected groundwater elevations for Elsinore for a no action scenario

Note: The Elsinore groundwater basin projections, shown in Figure 17, are not as representative of what is actually happening in the basin as the other three basins. This is because the basin average groundwater timeseries is based on four wells, three of which are missing a fair amount of data, resulting in a poor model fit. More representative results could be obtained if a more complete input dataset were developed.

3.2 Water Demands

Many factors affect future water demands such as population growth, hydrologic conditions, public education, and economic conditions, among others. In 1990, 4.2 million people lived in the Watershed. In the 1990s, the population grew by 17.6%, and continued to grow to the present population of approximately 6.1 million, as shown in Figure 18. By 2050, the population is projected to reach 9.9 million (Santa Ana Integrated Watershed Plan, 2002).

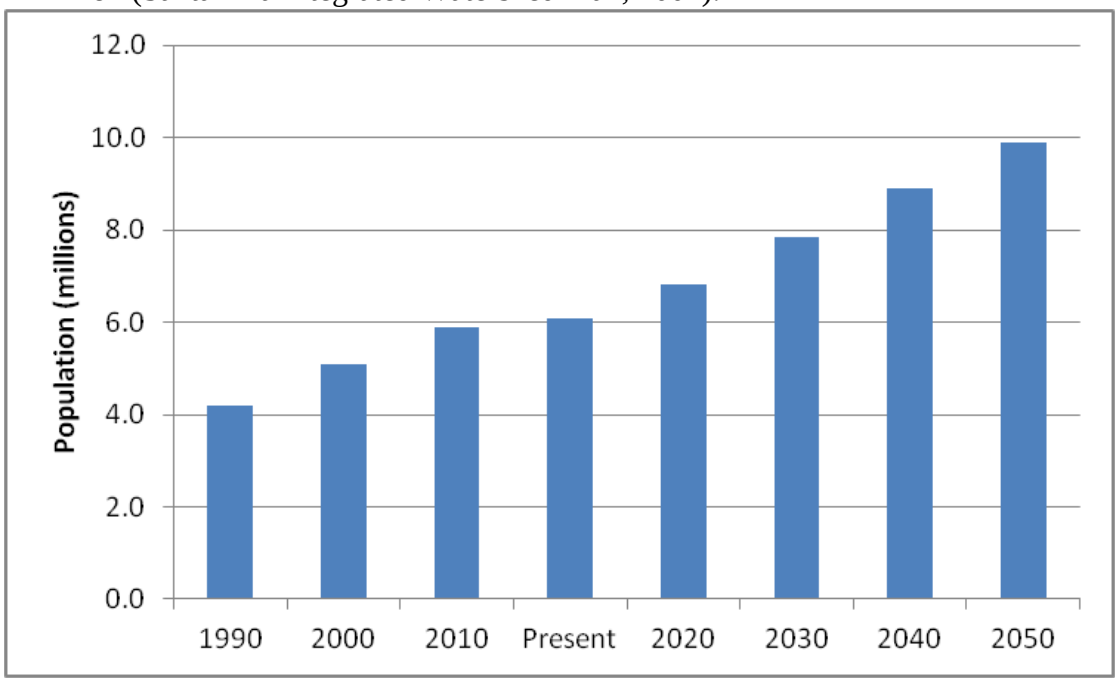

Figure 18: Population for the Santa Ana River Watershed

3.2.1 Water Demand Projections

Projected water demands out to 2050 were obtained from the various water resource plans for each of the individual member agencies. The projections, shown in Figure 19, include direct water demand for residential, municipal, commercial, and agricultural uses, but do not include recharge. Conservation is not taken into account in the projected demand. Aggressive conservation can drastically reduce the projected water demand, an example of which is shown in Chapter 5.

For the purpose of this study, the demand was calculated for the watershed, as a whole, every ten years from 1990-2050 (see Chapter 5 for a description of the tool used). The population projections from Figure 18 were used to determine the demand, and conservation was not taken into account. The results, found in Figure 20, are very similar (1% difference in 2050) to the demand projections calculated by the member agencies in Figure 16.

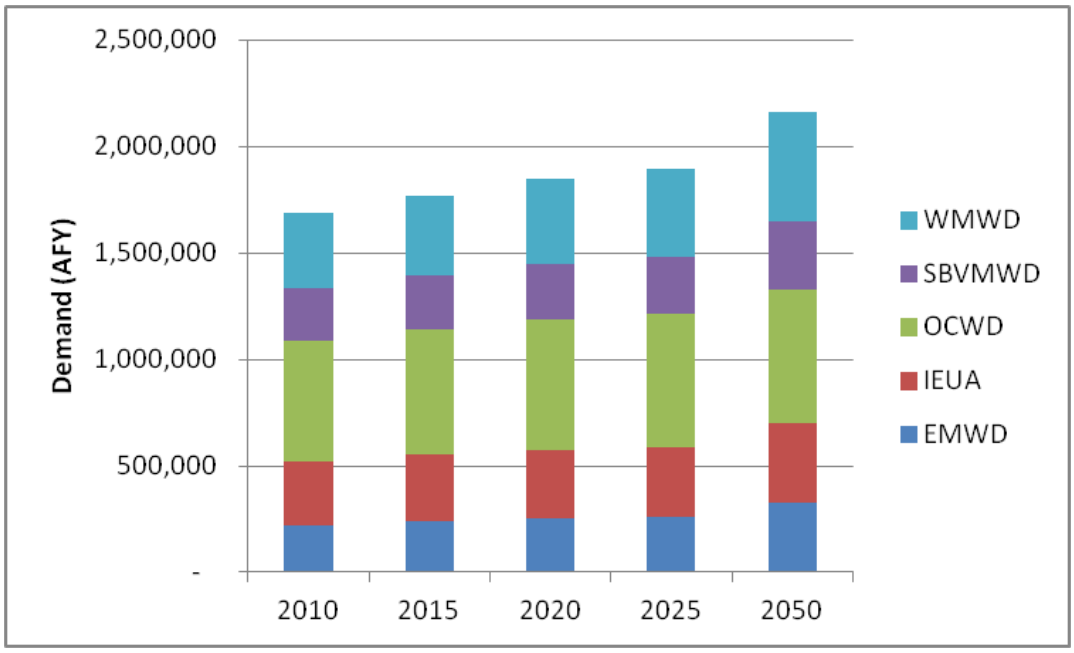

Figure 19: Water demand by member agency (Western Municipal Water District (WMWD); San Bernardino Valley Municipal Water District (SBVMWD); Orange County Water District (OCWD); Inland Empire Utilities Agency (IEUA); Eastern Municipal Water District (EMWD))

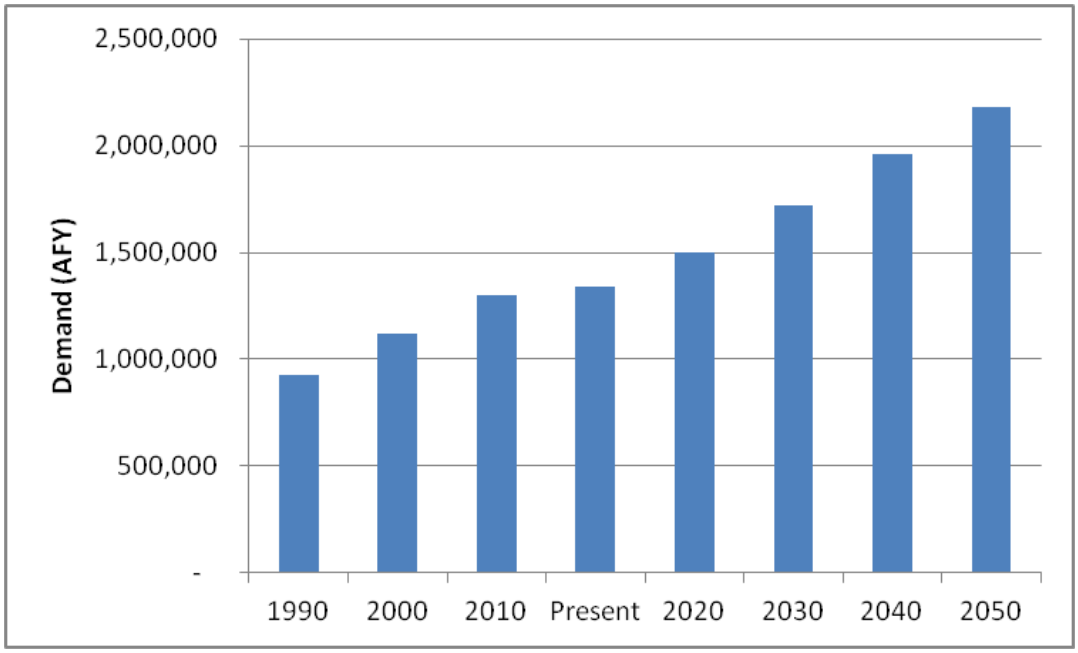

Figure 20: Santa Ana Watershed water demand calculated for this study

3.3 Supply and Demand Summary

Table 4 shows a summary of the project effects of climate change on a variety of hydroclimate metrics for three future periods (above the most downstream location, Adams St. Bridge). Table 5 shows a summary of projected water demands out to 2050.

Table 4: Summary of Effects of Climate Change on Supply

Hydroclimate Metric (change from 1990s)	2020s	2050s	2070s
Precipitation (%)	0.67	-5.41	-8.09
Mean Temperature (°F)	1.22	3.11	4.1
April 1st SWE (%)	-38.93	-80.4	-93.07
Annual Runoff (%)	2.6	-10.08	-14.61
Dec-Mar Runoff (%)	9.82	-3.01	-6.38
Apr-Jul Runoff (%)	-6.35	-25.24	-31.39

Table 5: Summary of Water Demand for the Santa Ana River Watershed

	1990	2000	2010	Present	2020	2030	2040	2050
Demand (MAFY)	**0.924**	**1.121**	**1.298**	**1.339**	**1.503**	**1.723**	**1.958**	**2.178**

Imported water for the SARW will also likely be affected by the changing climate. The 2011 SWP Reliability report projects a temperature increase of 1.3° to 4.0 °F by mid-century and 2.7° to 8.1° F by the end of the 21st century. It predicts that increased temperatures will lead to less snowfall at lower elevations and decreased snowpack. By mid-century they predict that Sierra Nevada snowpack will reduce by 25% to 40% of its historical average. Decreased snowpack is projected to be greater in the northern Sierra Nevada, closer to the origin of SWP water, than in the southern Sierra Nevada. Furthermore, an increase in "rain on snow" events may lead to earlier runoff. Given these changes, a water shortage worse than the 1977 drought could occur one out of every six to eight years by the middle of the 21st century and one out of every two to four years by the end of 21st century. Also, warmer temperatures might lead to increased demand. This factor, combined with declining flows, will likely lead to decreased carryover storage from year to year. Alternative water supply options such as recycled water, rainwater harvesting, and desalination may need to be relied upon in order to meet the continually growing demand.

4.0 Decision Support and Impact Assessment

The analyses presented in this chapter were performed using the climate and hydrological projections and models described in Chapter 3.

4.1 Impacts on Recreation in Lake Elsinore

4.1.1 Background

Lake Elsinore, shown in Figure 21, is southern California's largest natural lake and is situated at the bottom of the San Jacinto Watershed. Because Lake Elsinore is a terminal lake, historically fed only by rain and natural runoff, it has been impacted by low lake levels. As the climate continues to change it is likely that these impacts will become more severe. Lake Elsinore is used for recreation and is currently not considered a water supply source.

In 2005, Elsinore Valley Municipal Water District (EVMWD) began a two-year pilot project to introduce recycled water into Lake Elsinore to stabilize lake levels. Soon thereafter, a discharge permit was granted to EVMWD by the Santa Ana Regional Water Quality Control Board to allow recycled water to be delivered to the lake. In 2008, a 36-inch-diameter pipeline was constructed to deliver recycled water from EVMWD's Regional Wastewater Treatment Plant, funded by the State of California Proposition 40 Water Bond and the Lake Elsinore and San Jacinto Watersheds Authority. The project delivers approximately 5 million gallons per day (MGD) of recycled water to Lake Elsinore, and includes repair and retrofit of three local, shallow groundwater wells that deliver approximately 1 MGD. As part of the Basin Study, an analysis was done to determine if these measures would be enough to meet the minimum goal volume of 41,704 acre-ft (elevation 1,240 ft), avoid low lake levels (below 24,659 acre-ft, elevation 1,234 ft), and prevent the lake from drying up altogether (as occurred in the 1930s) under a changing climate.

Figure 21: Lake Elsinore and VIC model grid cell used to determine data for Lake Elsinore analysis

4.1.2 Methodology

Monthly streamflow and open water evaporation values from 1950-2099 were determined by using BCSD-CMIP3 climate projections and the VIC macro-scale hydrology model. Gridded daily meteorological forcings from Maurer et al., (2002) were used to simulate historical conditions from 1950-1999. The model accounted for the upstream contributing basin, the San Jacinto River subwatershed, feeding the inlet of Lake Elsinore, excluding the effect of any upstream regulation.

A mass balance analysis of Lake Elsinore was conducted, resulting in a natural volume, unregulated by upstream reservoirs. Change values were determined for each future period using modeled observed average annual volume applied to historic annual average volume. The operations of Canyon Lake, a reservoir upstream from Lake Elsinore, were not taken into account in this analysis.

4.1.3 Results

Figure 22 shows the distribution of projected average annual volume for two future periods, 2000-2049 and 2050-2099, based on 112 different climate change projections. The two future periods were also analyzed with the addition of the EVMWD project. For the 2000-2049 period there is greater than a 50% chance that the average annual lake level will meet the minimum goal; adding in the EVMWD project brings that likelihood up to above 75%. For the 2050-2099 period there is less than a 5% chance that the minimum goal will be met; adding the EVMWD project brings that likelihood to almost 50%. Both periods are likely to stay above low lake level, with the 2050-2099 period having less than a 10% chance of drying up completely.

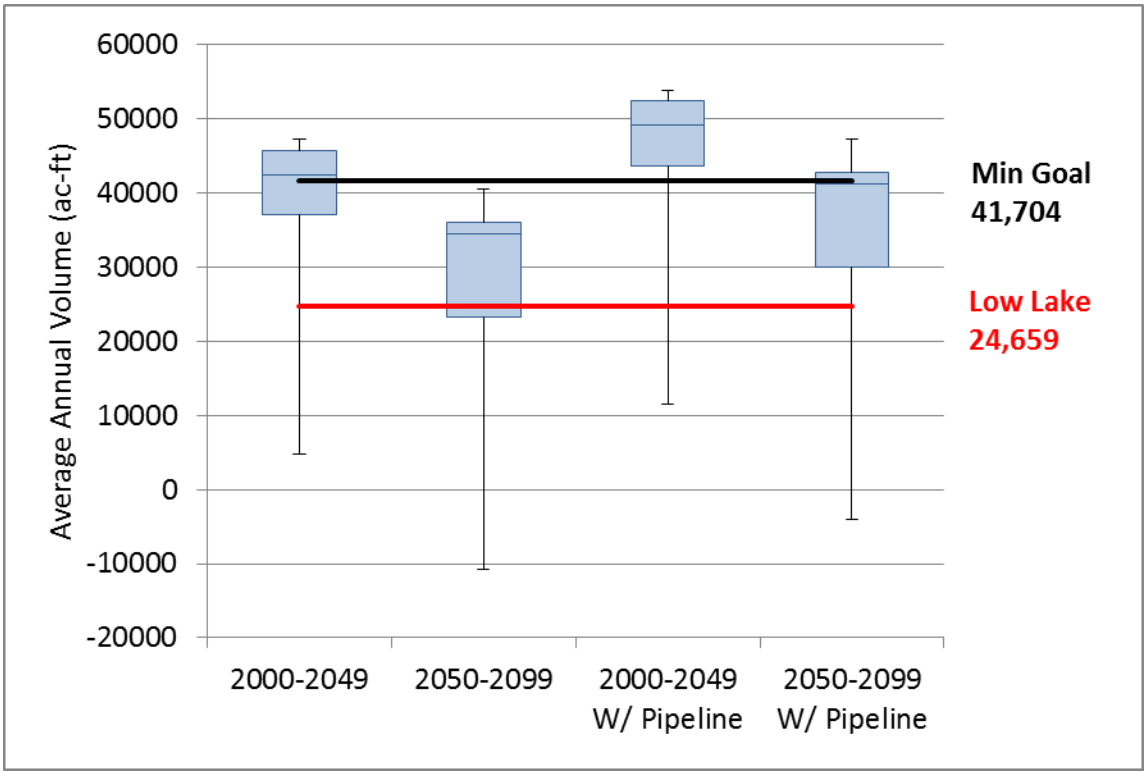

Figure 22: Projected average annual volumes for Lake Elsinore for two future periods, with and without EVMWD project

4.2 Alpine Climate Impacts

4.2.1 Background

An alpine climate is defined as the average weather for the region above the tree line. Climate change impacts could harm alpine recreation such as skiing. The Big Bear Mountain Resorts (Big Bear) are located in the San Bernardino Mountains within the SARW. They consist of two ski areas, Bear Mountain and Snow Summit, and provide nearly 750 skiable acres. They range in elevation from roughly 2,180 m to more than 2,600 m. Although Big Bear has the ability to cover 100% of its terrain with manmade snow using water from Big Bear Lake, there are still concerns about rising temperatures and decreased natural snowfall.

Member agencies of SAWPA extend to the San Bernardino Mountain, the San Gabriel Mountains, the San Jacinto Mountains and the Santa Ana Mountains. As such, potential climate change impacts to alpine ecosystems and recreational activities are an area of concern. In general, alpine ecosystems are characterized by cold temperatures and harsh growing conditions. One species of particular importance is the Jeffrey Pine. Jeffrey Pines are a coniferous species common to the area and extend through the Sierra Nevadas up to Oregon. They are a high altitude pine species that have the ability to grow in a diverse range of climates.

They can do well in harsh settings and infertile sites because they require a shorter growing season than some other species (Moore, 2006).

4.2.2 Methodology

Impacts to skiing near Big Bear Lake were analyzed by considering projected changes for April 1st SWE. April 1st SWE values from 1950 to 2099 were generated for 112 CMIP3 climate projections using the VIC model forced with downscaled (BCSD) climate variables. Each climate projection consists of 1/8° x 1/8° degree (~12 km x 12km) grid cell daily forcings. For this analysis, the locations of the Bear Mountain and Snow Summit ski areas were mapped to the single grid cell that contained them. Results shown in Section 4.2.3 summarize the median change (taken from the 112 projections) in April 1st SWE compared to the 1990s.

For comparison, results were also summarized from a study of climate change impacts in California by Hayhoe et al. (2004). They used climate forcing data generated with two GCMs of low (Parallel Climate Model, PCM) and medium (Hadley Center Climate Model version 3, HadCM3) sensitivity, forced using two emissions scenarios, one lower (B1) and one higher (A1fi). SWE results were generated using the VIC model forced with the BCSD temperature and precipitation. Results are provided in Section 4.2.3 on a statewide basis grouped by elevation.

Quantitative analysis of ecosystem impacts was not conducted as part of this work. Rather a literature review of existing climate change impact studies was conducted and the relevant findings are provided here.

4.2.3 Results

Recreation at Big Bear

It is likely that future snowpack at Big Bear will be significantly less than what is currently normal and accumulated snowpack will remain on the ground for a shorter season. Figures 23 and 24 illustrate future changes in April 1st SWE. Projected declines are between 30% and 40% by the 2020s, and are generally projected to be greater than 70% by the 2070s. These changes are largely a result of increased winter temperatures and potential declines in winter precipitation. Warmer temperatures will result in a delayed onset of the ski season, as well as earlier spring melting. Future precipitation is much more uncertain but many projections show decreased winter precipitation. Lower altitudes will likely be the most sensitive to increased temperature because small temperature changes can result in precipitation falling as rain rather than snow. Hayhoe et al. (2004) note that reductions in SWE are most pronounced below 3,000 m where roughly 80% of California's snowpack storage currently occurs. The Bear Mountain and Snow Summit ski areas both fall between roughly 2,100 and 2,600 m, making them vulnerable to increased temperatures.

While there is general consensus for a projected decrease in snowpack, it is also important to note that there is significant variability between climate projections. For example, the low sensitivity, low emissions scenario in Figure 24 projects only a 20% decrease in snowpack by 2070, while the other scenarios as well as the median, shown in Figure 23, project a greater than 70% decrease. Also, the grid resolution for both methodologies is 1/8° which is much larger than either ski area. As such, results include surrounding areas that are at lower elevations and beyond ski area itself. However, the overall findings in Figures 23 and 24 are consistent.

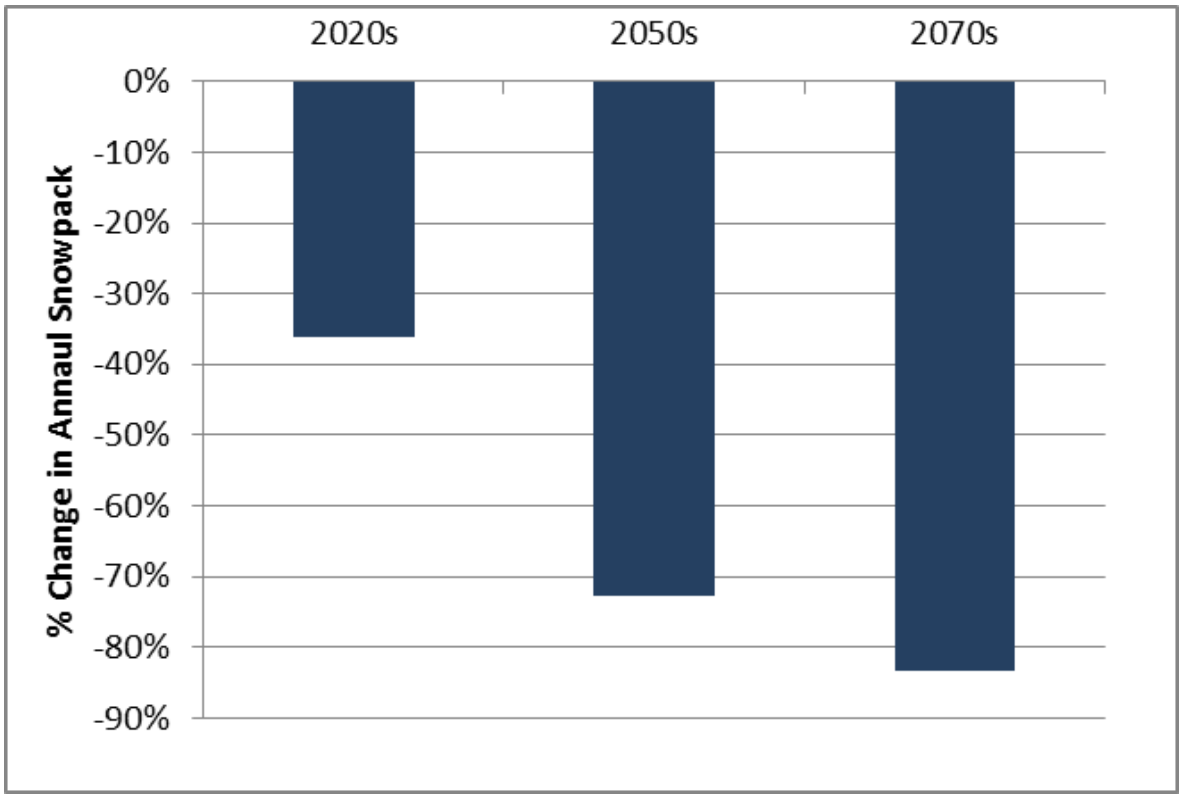

Figure 23: Median percent change (from 112 climate projections) in April 1st SWE for the grid cells containing the Bear Mountain and Snow Summit ski areas

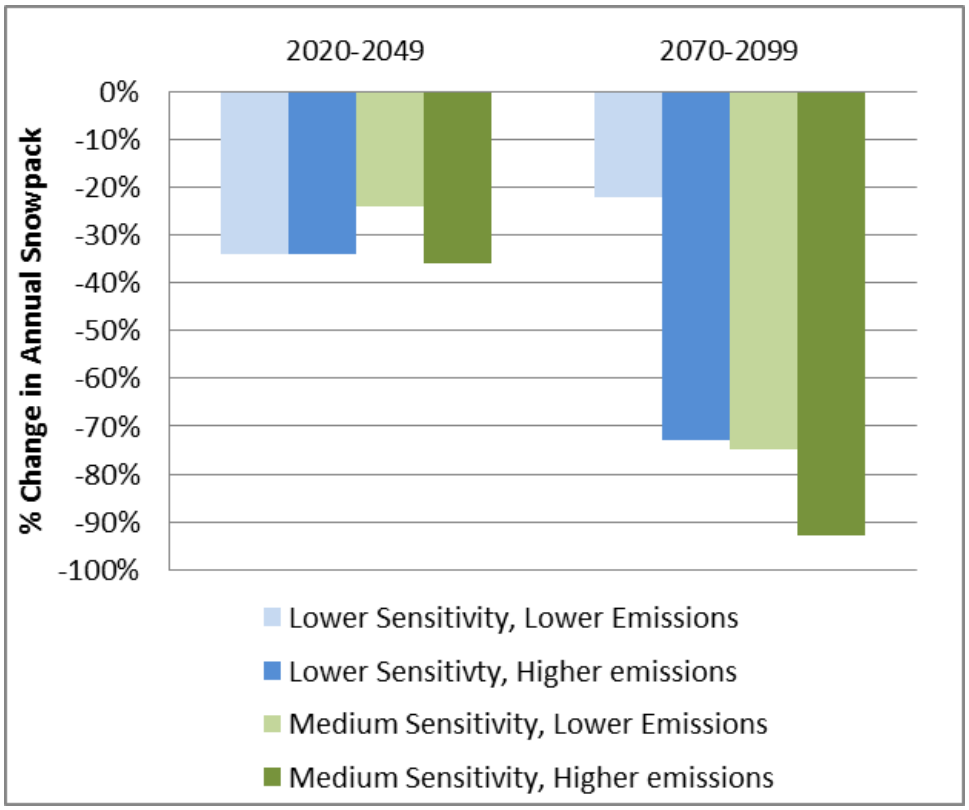

Figure 24: Percent change in April 1st SWE from Hayhoe et al. (2004) for areas of 2,000 to 3,000 m elevation

Jeffrey Pine Ecosystem

Predicting climate change impacts on ecosystems is very difficult because of the interconnections and dependencies among the large numbers of species present in any system. This is further complicated by uncertainty about future climate. For example, there is significant uncertainty about the role of increased carbon dioxide levels on forest productivity. In general, predictions about forest productivity are uncertain and will rely mainly on future precipitation. While there is variability among climate change scenarios, especially with respect to precipitation, all projections include increased temperature and increased levels of atmospheric carbon dioxide.

Based on projected climate, it is expected that warmer temperatures will cause trees to move northward and to higher elevations. Lenihan et al. (2008) project changes in total forest cover for the state of California will range from a 25% decrease to a 23% increase by 2100. Species with the smallest geographical and climate ranges are expected to be the most vulnerable to change because they will have limited ability to migrate. Alpine ecosystems are particularly vulnerable to increased temperatures because their habitat is already limited with little opportunities to shift to higher elevations. Lenihan et al. (2008) project that Alpine and subalpine forests will decrease in area by 50-70% by 2100, as shown in Figure 25.

Consistent with other tree species, it is likely that the Jeffery Pines (found at elevations of 2000-3100 m) will migrate to higher elevation and some lower elevation forest area will be lost. Several studies predict that warming temperatures will result in the displacement of evergreen conifer forests by mixed evergreen forests across California (Hayhoe et al., 2004; California, 2010). This trend is also shown by the decrease in conifer forests in Figure 25.

Figures 26 and 27 show projected change in viable Jeffery Pine habitat in southern California for three emissions scenarios looking out to 2030 and 2090, respectively (Crookston, 2009). The plots, generated using the Moscow Forestry Sciences Laboratory website http://forest.moscowfsl.wsu.edu/climate/species/speciesDist/Jeffrey-pine/, show significant decrease in viable Jeffery Pine habitat for many scenarios, and some of the most severe (e.g. A2 emission scenario) show no Jeffrey Pine habitat within the Watershed by 2090.

In addition to changes in forest area, warmer temperatures may also impact forest health. For example, extended droughts and earlier snowmelt could cause fire seasons to start earlier and last longer (California, 2010). Also, temperature increases may change the frequency and magnitude of infestations by pests, such as the pine beetle.

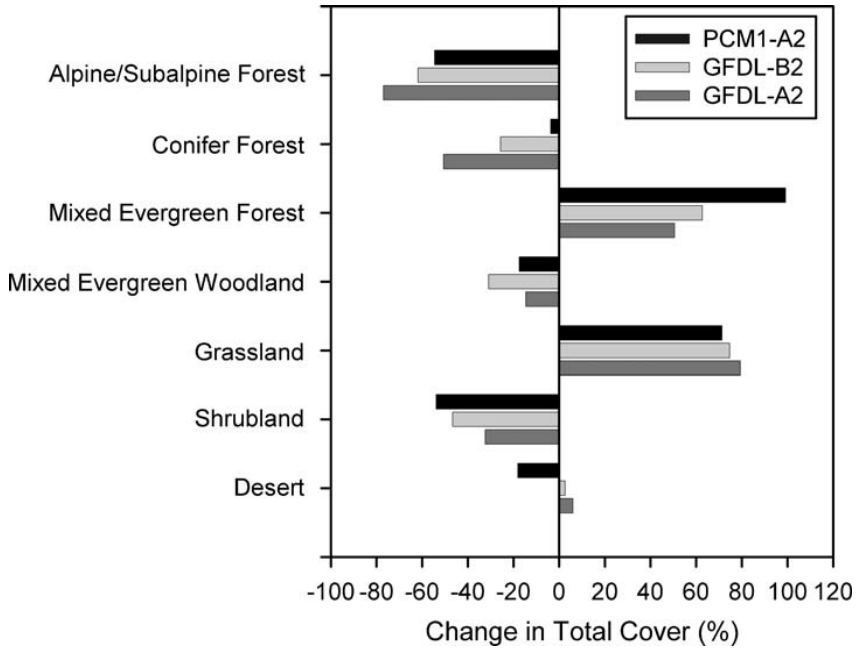

Figure 25: Fig. 4 from Lenihan et al., (2008). Percent change in total land cover for vegetation classes by 2100 for three climate change scenarios predicted using the MC1 Dynamic Vegetation Model

4.3 Extreme Temperature Impacts

4.3.1 Background

There is no standard definition of an extreme heat event, commonly known as a "heat wave." It is most commonly defined as a period with more than three consecutive days of maximum temperatures at or above 90°F. However, temperature is only one component of heat, which also depends on humidity, wind speed and radiant load. Climate change is resulting in more frequent and severe heat waves (Dia, 2011). The increased heat could lead to additional air pollution in urban areas, bringing increased health risks.

In 2007, the IPCC concluded that "hot extremes" and "heat waves" are very likely (>90% probability of occurrence) to increase as our climate continues to change. This predicted temperature increase is particularly pronounced for night temperatures, resulting in reduced night-time relief from the heat. These changing weather conditions are a growing concern for individuals and communities in the Watershed.

4.3.2 Methodology

Daily maximum temperature values came from the BCSD-CMIP3 archive for 112 climate projections. Each projection has 1/8° x 1/8° (~12 km x 12 km) grid cell daily forcings that start on January 1, 1950 and run through December 31, 2099. For this analysis, the location of each city was matched to the single VIC grid cell that contains it. The data was analyzed and days with maximum temperatures over 95°F were considered to contribute to the results, found in Section 4.3.3, which summarize temperature trends for all 112 projections from 1950 to 2099 for the selected grid cell.

4.3.3 Results

Figure 28 shows the distribution of the annual number of days above 95°F from 1950-2099 for each of the cities (Anaheim, Riverside, and Big Bear City) for all 112 climate projections. As shown here, there is a clear, increasing trend in the number of days above 95°F for all three locations, with Riverside in the lead, followed by Anaheim. Big Bear City has the least number of days with a median of zero for all years prior to about 2030. The shaded area in Figure 28 shows the range of the 112 climate projections and demonstrates a large spread in projected results. Table 6 summarizes the median number of days above 95°F for each location for the historical time period (1951-1999) and three 30-year future time periods centered around 2020, 2050 and 2070. As shown in Table 6, the number of days increases for all stations advancing into the future. Changes are quite significant; for example, the median value for Anaheim quadrupled from 4 to 16 days between the historical time period and 2070. Similarly, the median value for Riverside nearly doubled between the historical time period and 2070 going from 43 to 82 days.

A study of warming trends in and around the city of Los Angeles also had similar findings (Hall et al., 2012). For this study they statistically and dynamically downscaled GCMs outputs for two emission scenarios ("Business as usual" RCP8.5 and "mitigation" RCP2.6) and compared results between a baseline period of 1981-2000 and future a future period from 2041-2060. Overall, they reported two to three times as many extreme days (i.e. greater than 95 °F) in coastal areas and within the Los Angeles Basin. Inland areas were noted to have three to five times the number of extremely hot days. Although the trends are the same, there are some differences between this report and the results presented in Table 6.

For example, in the Los Angeles study, they report that Riverside had a historical average of 9.6 day extreme heat days per year, while Table 6 reports 43 days. This difference is likely a result of differences in historical time periods (1981-2000 vs. 1950-1999), as well as differences in downscaling methodology. For example, the methodology used for this analysis did not include any bias correcting to match downscaled results to observed temperature gages. Similarly the future estimates provided in the Los Angeles report for Riverside range from 17 to 59 which is less than the 72 days reported in Table 6. Results for Big Bear are very similar between the reports because temperatures are much lower in Big Bear so the number of extreme days remains close to zero in all cases. However, in the Los Angeles report, they also repeated the extreme day analysis with locally derived temperature thresholds. For Big Bear, the local temperature threshold was set to 76.8 °F. Given this lower threshold, it was found that the number of extreme days increased from 7.3 days historically up to a range of 9 to 78 days by 2050. Anaheim was not covered in the Los Angeles report and so cannot be directly compared.

Table 6: Median annual number of days above 95°F for one historical (1951-1999), and three future (2005-2034, 2035-2064, 2055-2084) time periods

	Historical	2020	2050	2070
Anaheim	4	7	12	16
Riverside	43	58	72	82
Big Bear City	0	0	2	4

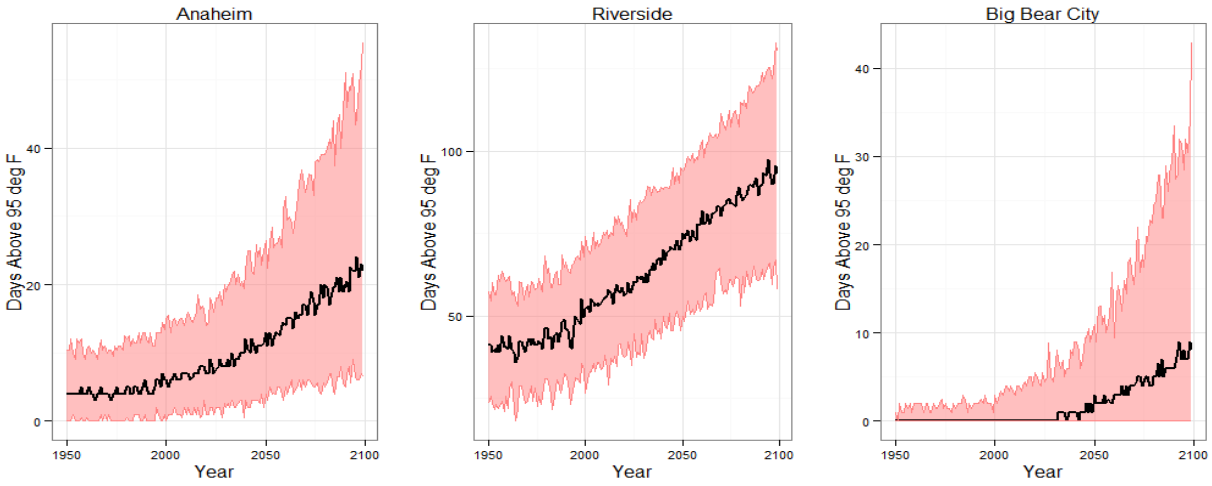

Figure 28: Projected annual number of days above 95°F. Solid black line is the median and the red shading denotes the 5th and 95th percentile bounds

4.4 Flood Impacts

4.4.1 Background

The Santa Ana River has a long history of flooding. In 1862, more than 30 days of rain resulted in flooding across California and destroyed the state capital (Hiltner, 2010). During this flood, it is estimated that the Santa Ana River flowed at roughly 320,000 cfs, about half the flow of the Mississippi River (Hiltner, 2010). Subsequently in 1916, flooding occurred along the Santa Ana River and Santiago Creek, washing out bridges and causing other damages (City of Santa Ana, 2006). In 1938 a flash flood inundated 68,400 acres, resulting in 19 fatalities and leaving 2,000 homeless (City of Santa Ana, 2006). This event led the U.S. Army Corps of Engineers to declare the Santa Ana River the biggest flood hazard west of the Mississippi (Hiltner, 2010). It also helped motivate the construction of Prado Dam and paved the way for a post-World War II construction boom that developed large agricultural areas (City of Santa Ana, 2006). Subsequently, another flood in 1969 caused extensive damage along tributaries. Most recently in 2005, an extended wet period put stress on Prado Dam. No flooding occurred, but the dam began to crack and downstream residents were temporarily evacuated.

As a result of historical floods, there have been a number of efforts to improve flood safety in the basin. In 1964, the Santa Ana River Mainstem Project (SARP) was initiated with a goal of providing flood protection to communities along 75 miles of the Santa Ana River in Orange, Riverside and San Bernardino counties. Today it provides increased flood protection to about 3.35 million people through improvement projects such as channel lining and dam construction (SARP, 2013). Although the flood control system has greatly improved safety, it's important to

note that increased development in the area has also increased impervious area and decreased the effectiveness of existing infrastructure.

Generally, the goal of flood frequency analysis is to determine the probability of occurrence for a range of flood values. Often this is expressed in terms of return periods (equal to the inverse of the threshold exceedance probability). If the probability of a given flood magnitude occurring in a given year is 1%, then the return interval is equal to 100-years (assuming every year is an independent sample from all years and that events are equally likely). There are two main approaches to flood frequency analysis. The extreme value approach uses historical flood data to generate a probability distribution that can be used to predict the flood magnitude for any number of return intervals. Alternatively, flood process can be modeled directly using physically-based hydrodynamic models driven by meteorological forcings. For this analysis we combine both approaches; first we simulate floods using a physically based hydrologic model, then we fit an extreme value distribution to the results.

Extreme value functions are designed to capture the distribution of extremes drawn from other distributions. Pearson Type III and Generalized Extreme Value (GEV) are two of the most commonly used distributions. The Gumbel and Weibul distributions are special cases of the GEV distribution that are commonly applied in hydrology. For this work we use the Log Pearson Type III distribution following the standard United States Government methodology presented in Bulletin 17B, "Guidelines for Determining Flood Flow Frequency" (Bulletin 17B, 1982).

Once an extreme value function has been chosen, the next task is to fit it to the observed data. There are three main approaches: plotting positions, method of moments, and maximum likelihood. Plotting positions is the simplest approach; it's based on visualizing the observed data and fitting a distribution visually or by minimizing errors (e.g. using least squares fitting). Although this method is very straightforward, it is not very commonly used because it is problematic when dealing with limited data. Also, when using least squares to fit, the errors are minimized between sample values and distribution values, but the error that should in fact be considered is frequency not value (FEMA, 2007).

To improve upon this, the method of moments fits distributions using the various moments of the observed data (e.g. mean, variance, skew, kurtosis) rather than the values themselves. For example, one can simply compute sample moments and distribution moments and solve for distribution parameters. This approach can also be difficult, because simple moments may not exist for a given distribution and higher order moments may be limited by sample size (FEMA, 2007). Probability-weighted moments and linear moments (L-Moments) can address these issues (Hosking and Wallis, 1997). Finally, the maximum likelihood approach calculates the likelihood of a sample given the assumed distribution. Parameters are determined by trying to maximize the likelihood or often (log

likelihood) for a chosen distribution. Once again following the standard methodology recommended in Bulletin 17B, we will fit distributions using the methods of moments for this analysis.

Before applying flood frequency analysis, it is important to understand key underlying assumptions. All extreme value distributions assume that annual max floods are independent samples from a population. Also the distribution approach assumes point data. If data is available from multiple sites, regional frequency analysis can be used to improve parameter estimation. Finally, most extreme value approaches, including the methodology used here, assume that the distribution that is fit to the observed data remains stationary throughout time. This assumption can be problematic in the face of changing climate in which we might expect increased frequency of extreme events. To address this issue, a number of studies have explored the use of non-stationary extreme value distributions in which distribution parameters are allowed to vary as a function of covariates such as time, precipitation or temperature (Katz and Naveau, 2002; Graffis and Stedinger, 2007). For this study, we fit the traditional stationary models. However, we do account for climate change through the physical modeling step by applying non-stationary climate forcings to simulate future floods.

4.4.2 Methodology

As previously noted, for this analysis we used a combined physical and statistical modeling approach. First, floods are modeled using the VIC physical model forced with climate data from 112 climate simulations. Next, Log Pearson distributions are fit to the annual maximum flood values for each simulation for a range of historical and future time periods. We consider three locations along the Santa Ana: Prado Dam, Seven Oaks Dam, and the Adams Street gage near the river outlet. Three 30-year periods are considered centered around: 2020, 2050 and 2070. The historical period spans 50 years from 1950 to 1999.

Annual maximum one-day flood values are calculated from the VIC outputs for each of the 112 150-year simulations. Flood frequencies are estimated following the standard United States Government method outlined in Bulletin 17-B. For each analysis time period (one historical and three 30-year futures) and climate scenario, a Log Pearson III distribution is fit to the annual maximum values using the L-moments approach. Note that each time period is treated separately. For example, each future period will have 30 values with which to fit the distribution. Using the parameters for the Log-Pearson III distributions, the 200-year return period flow values are estimated for every climate simulation and analysis period. The 200-year storm was used in order to fill the requirements set forth in the California Department of Water Resources' Climate Change Handbook for Regional Water Planning (Appendix B). The distribution is also used to calculate the return period for the median historical 200-year flood for each climate simulation and future time period.

4.4.3 Results

Figures 29 through 31 show results for the three analysis locations: Prado Dam, Seven Oaks Dam, and the Adams Street gage. The boxplots on the left show the distribution of 200-year flood flows estimated using the distributions fit to the 112 scenarios for each time period. The boxplots on the right show the simulated return period of the historical median 200-year flood flow. Tables 7 and 8 summarize the data presented in the boxplots. Table 7 provides the median and interquartile range of 200-year flood flow values. Table 8 provides similar information for the future return periods of the historical median flood flows.

For all stations, there is a clear trend of increasing median 200-year flood flow for each subsequent future analysis period. However, there is also large variability in the future flood projections. Still, in all cases, the bottom of the historical interquartile range (designated by the shaded box) falls below the projected future interquartile range. As would be expected, this results in a decreased return interval for the median historical 200-year flood (as shown in the figures on the right). On average, projections indicate that what was historically the 200-year flood may be closer to a 70-year flood.

Comparing results from station to station, the trends are very similar, increasing flood volumes and decreasing return intervals. This trend is most pronounced for the Seven Oaks Dam site where there is a clear increasing trend in 200-year flood volumes and dramatic decrease in return periods. Seven Oaks Dam also shows a clear decrease in the upper interquartile range for return periods in later future periods.

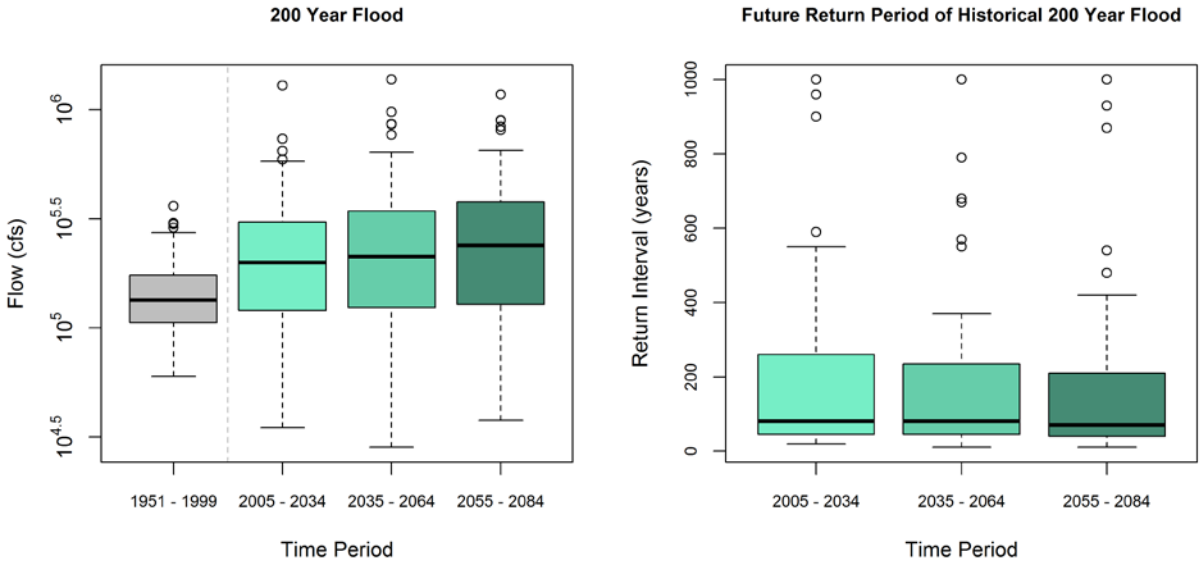

Figure 29: Station 8 Prado Dam - boxplots of 200-year flood volumes and future return periods for the median historical 200-year flood

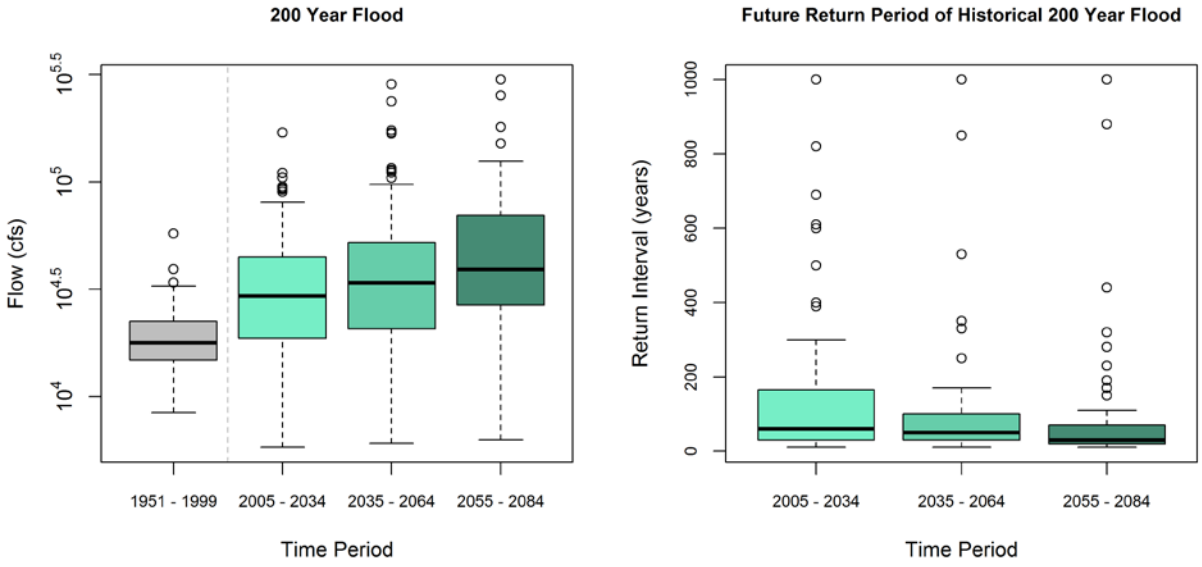

Figure 30: Station 34 Seven Oaks Dam - boxplots of 200-year flood volumes and future return periods for the median historical 200-year flood

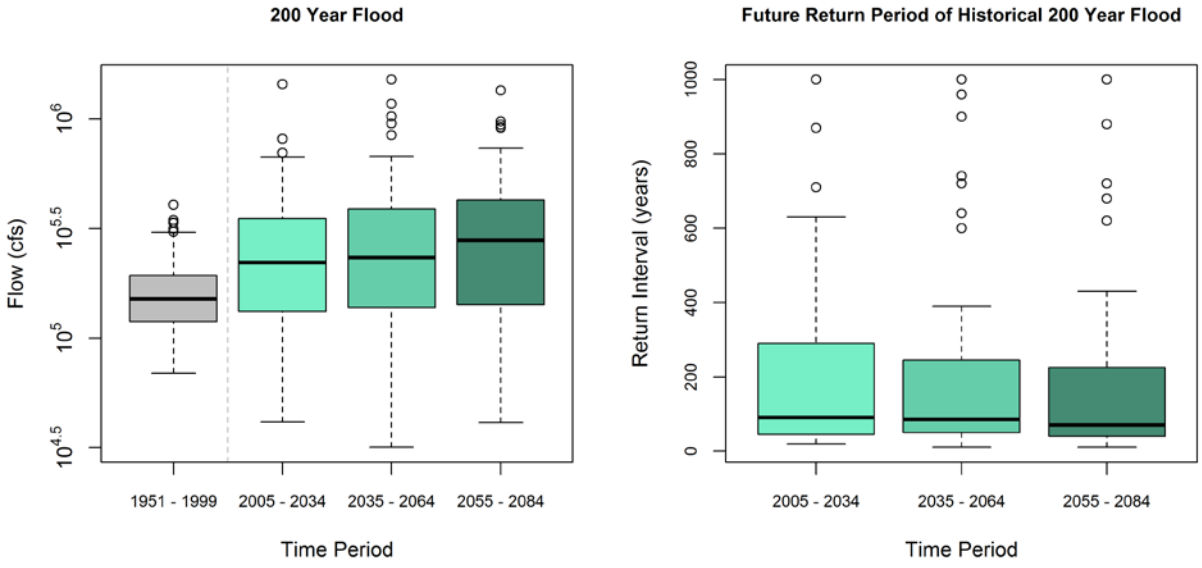

Figure 31: Station 21 Adams Street Gage - boxplots of 200-year flood volumes and future return periods for the median historical 200-year flood

Table 7: Summary of 200-year flood flows (cfs)

Station	Time Period	Percentile		
		25%	50%	75%
Prado Dam	Historical	106,289	134,170	174,018
	2020	120,616	199,623	302,401
	2050	124,369	212,392	335,621
	2070	129,706	239,359	377,660
Seven Oaks Dam	Historical	14,805	17,786	22,428
	2020	18,821	29,394	44,474
	2050	20,730	33,813	52,073
	2070	26,765	39,099	69,724
Adams Street Gage	Historical	119,084	151,084	192,357
	2020	132,923	221,375	347,943
	2050	137,749	232,974	385,438
	2070	142,980	279,004	424,881

Table 8: Summary of return periods, in years, for the median 200-year historical flood

Station	Time Period	Percentile		
		25%	50%	75%
Prado Dam	2020	48	80	260
	2050	48	80	233
	2070	40	70	205
Seven Oaks Dam	2020	30	60	163
	2050	30	50	100
	2070	20	30	70
Adam Street Gage	2020	48	90	285
	2050	50	85	243
	2070	40	70	223

Results from this analysis indicate increased risk of flooding in the future. This is demonstrated by increased 200-year flood magnitudes as well as decreased recurrence intervals for what was historically considered a 200-year flood. While these results show clear trends, it is also important to note that there is large variability between climate simulations. For the purposes of this analysis, it is assumed that all future scenarios are equally likely. Variability in the results reflects large underlying uncertainties with GCM outputs and downscaling methodologies. Additionally, the quality of results is necessarily limited by the ability of the VIC model to accurately generate flood flows from forcing data. While these constraints are acknowledged, it should be noted that this analysis follows standard methodologies and utilizes the best available input data.

4.5 Sea Level Rise Impacts

4.5.1 Background

Climate change will contribute to global sea level rise (SLR) through melting of glaciers and ice caps and thermal expansion of ocean waters, both of which increase the volume of water in the oceans. Regional SLR may be higher or lower than global SLR due to effects of regional ocean and atmospheric circulation.

California's 2,000 miles of coastline has experienced just under eight inches of sea level rise over the past decade (Cayan et al., 2009), a number that is likely to increase drastically as the climate continues to change. Critical infrastructure, such as roads, hospitals, schools, emergency facilities, wastewater treatment plants, power plants, and more will also be at increased risk of inundation, as are vast areas of wetlands and other natural ecosystems.

Flooding and erosion already pose a threat to communities along the California coast and there is compelling evidence that these risks will increase in the future. In areas where the coast erodes easily, sea level rise will likely accelerate shoreline recession due to erosion. Erosion of some barrier dunes may expose previously protected areas to flooding.

4.5.2 Methodology

Orange County Water District (OCWD) conducted a study to evaluate the potential effects of projected sea level rise on coastal Orange County groundwater conditions. Two locations were selected near the Talbert and Alamitos injection barriers, shown in Figure 32.

Projected sea level rise scenarios were developed by the California Climate Change Center (Cayan et al., 2009). For this analysis, the moderate projected sea level rise along the California coast was used. The projected time horizon or year is not critical for the model runs (described below), but rather just the sea level rise amount. Therefore, to bracket the entire range of projected moderate case sea

level rise values, OCWD chose to model a low end of 0.5 feet and an upper end of 3 feet. Separate model runs were conducted for these two sea level rise cases, both for the Talbert Barrier area using the basin model and for the Alamitos Barrier area using the Alamitos Barrier flow model.

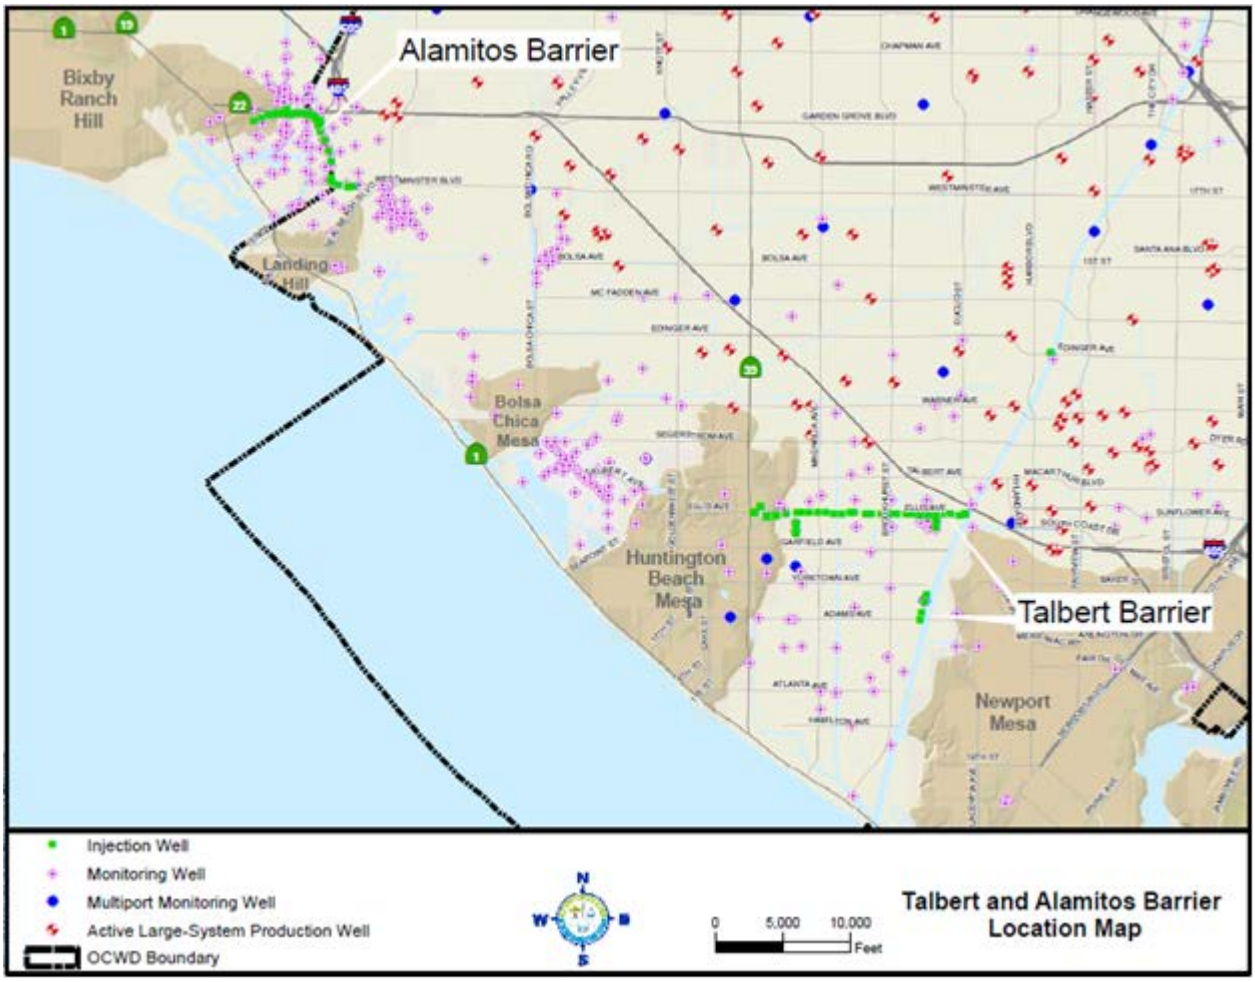

Figure 32: Locations selected for OCWD analysis

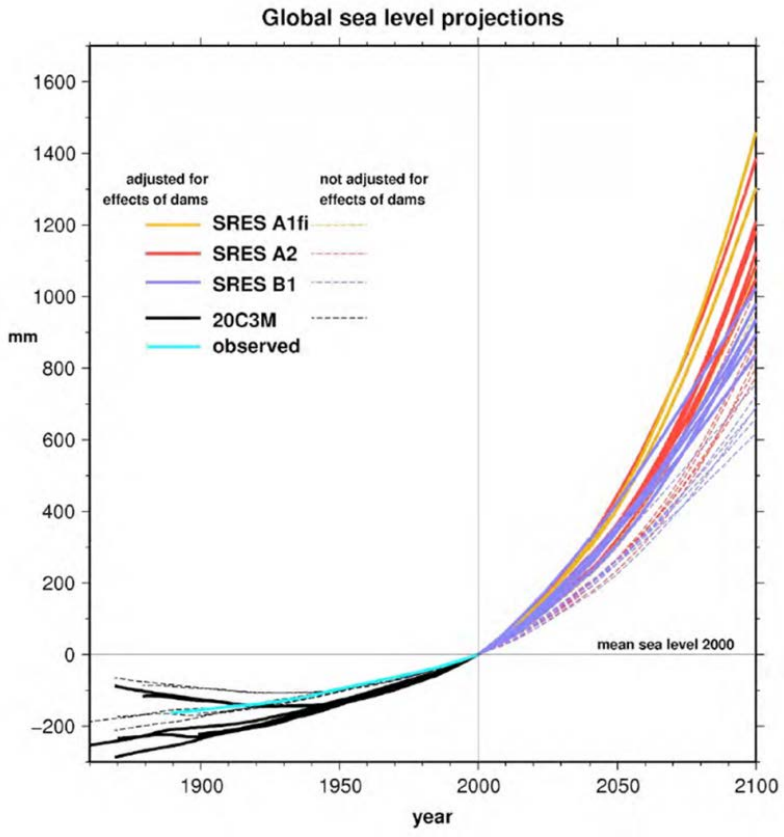
The model encompasses the entire basin and extends approximately three miles west into the Central Basin of Los Angeles County. The model grid cells are 500 by 500 feet and have vertical dimensions ranging from approximately 50 to 1,800 feet, depending on the thickness of each model layer at that grid cell location. The model accounts for time varying specified head boundaries, pumping rates, and recharge rates.

Model input data were obtained from well logs, aquifer pump tests, groundwater elevation measurements, hand-drawn contour maps, geologic cross sections, water budget spreadsheets, and other data stored in the OCWD Water Resources Management System (WRMS) database. The basin model was calibrated to transient conditions to achieve an acceptable match between simulated and actual observed conditions using monthly flow and water level data for the period 1990-1999.

4.5.3 Results

Increasing temperatures will melt ice sheets and glaciers and cause thermal expansion of ocean water, both of which will increase the volume of water in the oceans and thus contribute to global mean SLR. Regional SLR may be higher or lower than global mean SLR due to regional changes in atmospheric and ocean circulation patterns. Figure 33 shows the range of projected global mean SLR by 2100. Regional mean sea level along the Southern California coast is projected to rise by 40-300 mm (1.5-12 in) by 2030, 125-610mm (5-24 in) by 2050, and 405-1675 mm (16-66 in) by 2100.



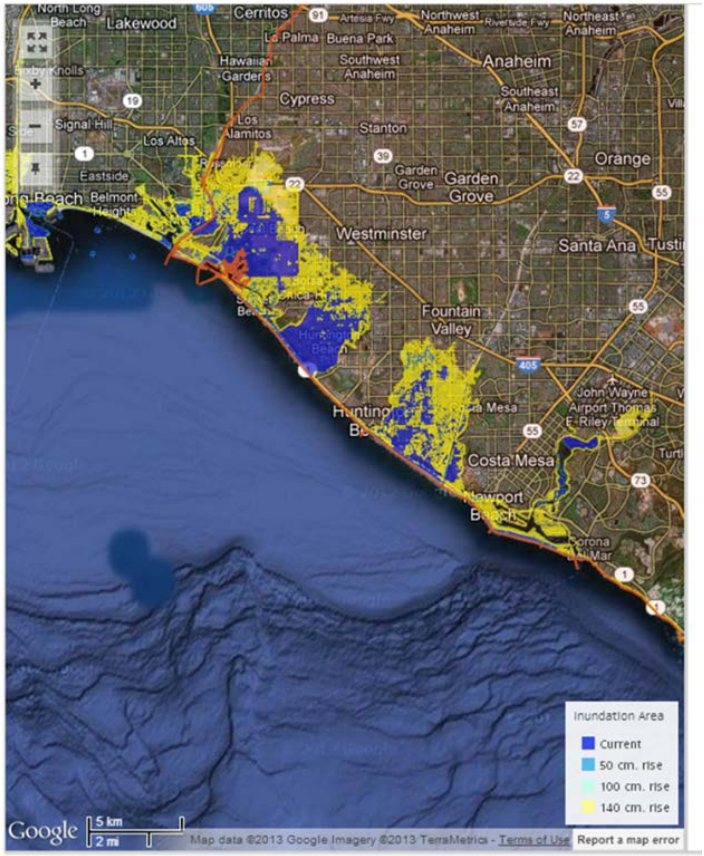


Figure 33: Projections of global mean sea level rise

Inundation due to SLR is likely to reduce the area of beaches and wetlands along the Southern California coast. In addition, SLR is likely to increase erosion of sea cliffs, bluffs, sand bars, dunes, and beaches along the California coast. However, the overall effects of climate change on local beaches will depend on changes in coastal ocean currents and storm intensities, which are less certain at this time. SLR is likely to increase the coastal area vulnerable to flooding during storm events. Figure 34 shows the areas of Orange County that are currently vulnerable to inundation due to a 100-year flood event (blue) and areas that will be vulnerable to inundation with a 1400 mm (55 in) rise in mean sea level (source: http://cal-adapt.org/sealevel/).

Detailed analysis carried out by Orange County Water District found that the Talbert Barrier would be effective at preventing seawater intrusions through the Tablert Gap under a 3-foot sea level rise. In the case of the Alamitos Barrier, seawater intrusion through the Alamitos Gap would likely be prevented once current plans to construct additional injection wells are implemented. At both barriers, however, shallow groundwater concerns could limit injection rates and thus reduce the effectiveness of barriers at preventing seawater intrusion under rising sea levels.

Source: http://cal-adapt.org/sealevel

Figure 34: Area at risk of inundation from 100-year flood event under current conditions (blue) and under 1400 mm sea level rise (yellow)

Average sea levels along the Southern California coast are projected to rise by 5 to 24 inches by 2050 and 16 to 66 inches by 2100. SLR is likely to inundate beaches and coastal wetlands and may increase coastal erosion. Effects on local beaches depend on changes in coastal ocean currents and storm intensity, which are highly uncertain at this time.

SLR will increase the area at risk of inundation due to a 100-year flood event. Existing barriers are sufficient to deter seawater intrusion at Talbert and Alamitos gaps under a 3-foot rise in sea levels. However, operation of barriers under SLR may be constrained by shallow groundwater concerns.

4.6 Decision Support and Impact Assessment Summary

A set of frequently asked questions (FAQs) were answered using the previous analyses. Those questions and the key findings are summarized below.

Will surface water supply decrease?

- Annual surface water is likely to decrease over future periods.
- Precipitation shows somewhat long-term decreasing trends.
- Temperature will increase, which is likely to cause increased water demand and reservoir evaporation.
- April 1st SWE will decrease.

Will groundwater availability be reduced?

- Groundwater currently provides approximately 54% of total water supply in an average year, and groundwater use is projected to increase over the next 20 years.
- Projected decreases in precipitation and increases in temperature will decrease natural recharge throughout the basin.
- Management actions such as reducing municipal and industrial water demands or increasing trans-basin water imports and recharge will be required in order to maintain current groundwater levels.
- A basin-scale groundwater screening tool was developed to facilitate analysis of basin-scale effects of conservation, increasing imported supply, changing agricultural land use, and other factors on basin-scale groundwater conditions.

Is Lake Elsinore in danger of drying up?

- Lake Elsinore has less than a 10% chance of drying up (2000-2099).
- In the 2000-2049 period, Lake Elsinore has a greater than 75% chance of meeting the minimum elevation goal of 1,240 ft.
- In the future period 2050-2099, Lake Elsinore has less than a 50% chance of meeting the minimum elevation goal of 1,240 ft.
- There is less than a 25% chance that Lake Elsinore will drop below low lake levels (1,234 ft) in either period.
- The Elsinore Valley Municipal Water District (EVMWD) project does aid in stabilizing lake levels; however, for the period 2050-2099 additional measures will likely be required to meet the minimum elevation goal of 1,240 ft.

Will the region continue to support an alpine climate and how will the Jeffrey Pine ecosystem be impacted?

- Warmer temperatures will likely cause Jeffrey pines to move to higher elevations and may decrease their total habitat.
- Forest health may also be influenced by changes in the magnitude and frequency of wildfires or infestations.
- Alpine ecosystems are vulnerable to climate change because they have little ability to expand to higher elevations.
- Across the State it is projected that alpine forests will decrease in area by 50-70% by 2100.

Will skiing at Big Bear Mountain Resorts be sustained?

- Simulations indicate significant decreases in April 1st snowpack that amplify throughout the 21st century.
- Warmer temperatures will also result in a delayed onset and shortened ski season.
- Lower elevations are most vulnerable to increasing temperatures.
- Both Big Bear Mountain Resorts lie below 3,000 m and are projected to experience declining snowpack that could exceed 70% by 2070.

How many additional days over 95°F are expected in Anaheim, Riverside and Big Bear City?

- All the climate projections demonstrate clear increasing temperature trends.
- Increasing temperatures will result in a greater number of days above 95°F in the future.
- The number of days above 95°F gets progressively larger for all cities advancing into the future.
- By 2070 it is projected that the number of days above 95°F will quadruple in Anaheim (4 to 16 days) and nearly double in Riverside (43 to 82 days). The number of days above 95°F at Big Bear City is projected to increase from 0 days historically to 4 days in 2070.

Will floods become more severe and threaten flood infrastructure?

- Simulations indicate a significant increase in flow for 200-year storm events in the future.
- The likelihood of experiencing what was historically a 200-year event will nearly double (i.e. the 200-year historical event is likely to be closer to a 100-year event in the future).
- Findings indicate an increased risk of severe floods in the future, though there is large variability between climate simulations.

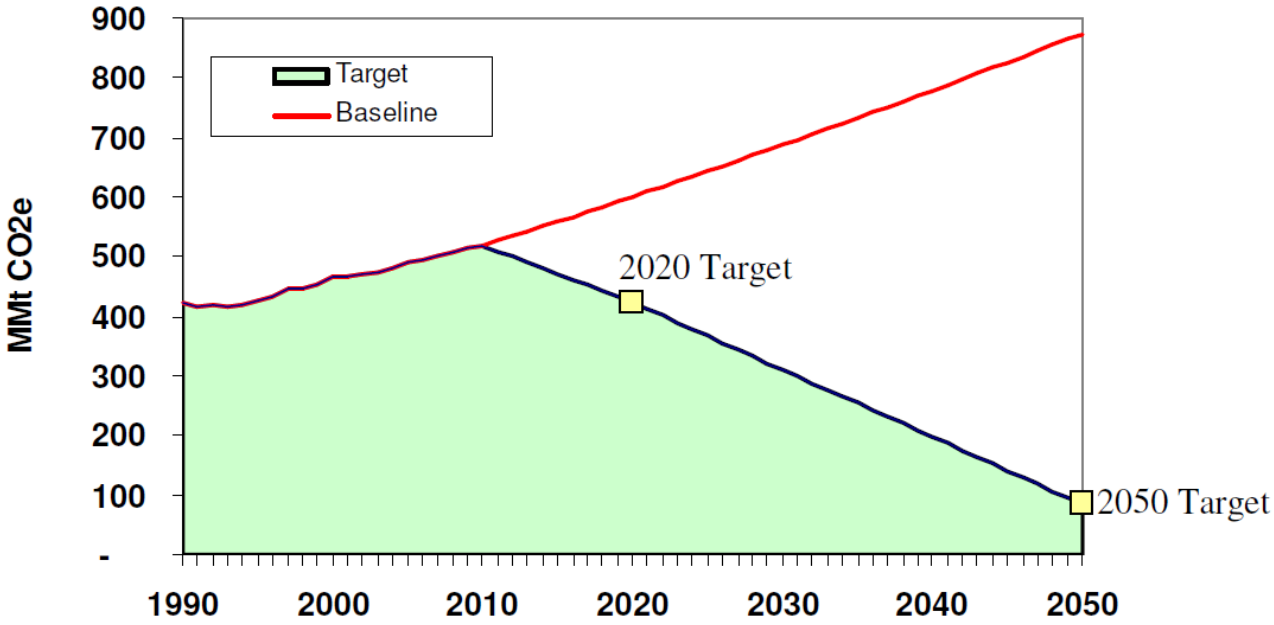
How will climate change and sea level rise affect coastal communities and beaches?

- Climate change will contribute to global sea level rise (SLR) through melting of glaciers and ice caps and thermal expansion of ocean waters, both of which increase the volume of water in the oceans.
- Regional SLR may be higher or lower than global SLR due to effects of regional ocean and atmospheric circulation.
- Average sea levels along the Southern California coast are projected to rise by 5 to 24 inches by 2050 and 16 to 66 inches by 2100.
- SLR is likely to inundate beaches and coastal wetlands and may increase coastal erosion. Effects on local beaches depend on changes in coastal ocean currents and storm intensity, which are highly uncertain at this time.
- SLR will increase the area at risk of inundation due to a 100-year flood event.
- Existing barriers are sufficient to deter seawater intrusion at Talbert and Alamitos gaps under a 3-foot rise in sea levels. However, operation of barriers under SLR may be constrained by shallow groundwater concerns.

In order to adapt to the impacts of climate change described in this chapter, water managers need tools that enable them to make informed decisions. Reclamation has developed a tool, the Greenhouse Gas (GHG) Emissions Calculator, which can be used to inform adaptive strategies. This tool was used to conduct a demand management case study for Orange County. The tool and case study are presented in Chapter 5.

5.0 Demand Management to Inform Adaptive Strategies

5.1 Background



Water resource managers are currently being challenged to develop sustainable methods for adaptation and mitigation to climate change. Demands for treatment and transportation of water are increasing globally due to developments in industrial, agricultural and domestic water use, and water quality regulation (King and Webber, 2008). Large increases in energy use in the water sector are being driven by rising demand for food and bio-fuels, and their international trade, driving up irrigated cropland and cropping intensity (DOE, 2006). This estimate excludes the effects of climate change, which in many cases will put further pressure on water resources (IPCC, 2008). With increased irrigation, further development of ground water is highly likely. Declining ground water will compound energy use, as deeper wells require more carbon-intensive electric-driven pumps.

Growing populations are creating a higher water demand. In areas where water is already scarce, accelerated research will be required in order to develop sustainable mitigation and adaptation scenarios to climate change, while still meeting the demand. Consideration of alternative water supply systems, treatment technologies, or water allocation may have a tendency to overlook the carbon cost. This is particularly the case in the absence of regulatory pressure. The passing of California's Assembly Bill 32: The Global Warming Solutions Act (AB 32) is the first in a series of legislation forcing this issue to be addressed.

Climate change threatens California's natural environment, economic prosperity, public health, and quality of life (California Energy Commission, 2005; AB 32, 2006). Recognizing the need for action, California has put in place ambitious emission reduction goals in the form of AB 32. By requiring in law a reduction in GHG emissions, California has set the stage to transition to a sustainable, clean energy future, and put climate change mitigation on the national agenda, spurring action by many other states. AB 32 directly links anthropogenic GHG emissions and climate change, provides a timeline for statewide GHG emissions reduction, requires quantitative accounting of GHG emissions, and enforces disclosure of GHG emissions from ever major sector in the state.

AB 32 requires that every major sector in California reduce its GHG emissions to the 1990 levels by 2020, and to 80% below the 1990 levels by 2050, shown in Figure 35. These targets were developed from the levels of reduction climate

scientists agree is required to stabilize our climate (IPCC, 2008). The red line in Figure 35 represents the projected GHG emissions out to 2050, if no action is taken. In order to reach the GHG emissions target set by AB 32 for 2020, a reduction of approximately 30% is required from the no action scenario.

Source: http://ethree.com/documents/GHG6.10/CA_2050_GHG_Goals.pdf

Figure 35: AB 32 GHG Emission Reduction Targets

5.2 Methods

The methods used account for embodied energy and the subsequent GHG emissions of water consumption in a study area. Figure 36 illustrates the different energy consuming processes involved in the delivery and treatment of water. End-use of water is not considered in this analysis; for example, energy used for heating water in the home. The energy intensity of each of these processes, and the volume of water passing through each, will need to be known in order to accurately inventory emissions associated with water consumption. The degree to which each of the processes used to deliver water is identified, and the energy intensity of each of those processes is known, will define the accuracy of the methods for determining the GHG emissions from water consumption. Water conveyance can be the most impactful element in California. Communities in the south draw significant amounts of water from vast distances over elevated terrain.

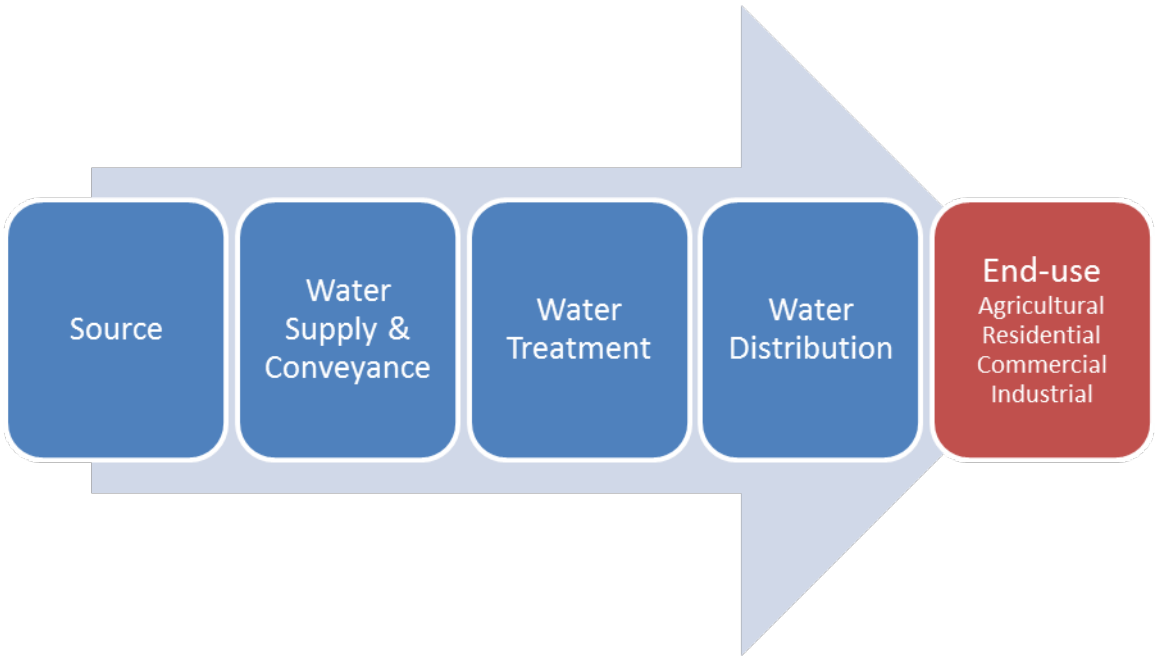


Figure 36: Energy Consuming Process in the Delivery and Treatment of Water (red not included in analysis)

Study area specific energy consumed per unit of water for each process of the water system is utilized. If site specific information is not available, southern California defaults are used. Default utility specific emission factors were obtained from the California Climate Action Registry Power/Utility Protocol reports. Annual average electricity emission factors came from the California Air Resources Board Greenhouse Gas Inventory (2007), and eGRID (2009).

Equation 2 depicts how total annual CO_2e emissions are calculated:

Annual CO_2e emissions = Extraction + Conveyance + Treatment + Distribution…….**Eq. 2**

Where:

Extraction =

$$\Sigma\,(\text{Source Percentage} * \text{Population} * \text{per capita Use} * \text{Process Energy Intensity}_{\text{GW Extraction}}) * \text{Energy Emissions Factor} * \text{Unit Conversions}$$

$$\text{Conveyance} = \Sigma\left(\text{Source Percentage} * \text{Population} * \text{per capita Use} * \text{Process Energy Intensity}_{\text{Conveyance}}\right) * \text{Energy Emissions Factor} * \text{Unit Conversions}$$

$$\text{Treatment} = \Sigma\left(\text{Source Percentage} * \text{Population} * \text{per capita Use} * \text{Process Energy Intensity}_{\text{Treatment}}\right) * \text{Energy Emissions Factor} * \text{Unit Conversions}$$

$$\text{Distribution} = \Sigma\left(\text{Source Percentage} * \text{Population} * \text{per capita Use} * \text{Process Energy Intensity}_{\text{Distribution}}\right) * \text{Energy Emissions Factor} * \text{Unit Conversions}$$

A GHG Emissions Calculator was developed by Reclamation to allow users to implement this method in order to easily and quickly evaluate how their water management decisions affect their water demand, energy use, and GHG emissions. A full technical report on the GHG Emissions Calculator will be published by fall 2013.

5.3 Application

In February 2008, California Governor Schwarzenegger directed state agencies to develop a plan to reduce statewide per capita urban water use by 20% by the year 2020. The GHG Emissions Calculator was used to evaluate whether this conservation measure alone would be enough to meet AB 32 targets (shown in Figure 35) in Orange County. The results show that a 20% reduction by the year 2020 allows Orange County to meet the 2020 target (back to 1990 levels), but do not meet the 2050 target of 80% below 1990 levels, as shown in Figure 37.

A 20% reduction in per capita water use every 10 years from 2020 to 2050 was evaluated in the GHG Emissions Calculator. These additional conservation measures only reach 50% below the 1990 GHG emission levels, as shown in Figure 38. In order to reach the AB 32 2050 target of 80% below the 1990 levels of GHG emissions through conservation alone, a per capita water use reduction of an additional 10% each decade would need to be achieved, results of which are shown in Figure 39. This level of conservation, shown in Table 9, may not be feasible for the area. In Figure 40, the three conservation scenarios described above are compared to the no action scenario, a task easily accomplished by the GHG Emissions Calculator. The GHG Emissions Calculator can also be used to

evaluate additional measures to reduce GHG emissions including changes to water supply portfolio, graywater reuse, and rainwater harvesting among many others. It is likely that a combination of measures will be required to meet the GHG emission reduction targets laid out in AB 32.

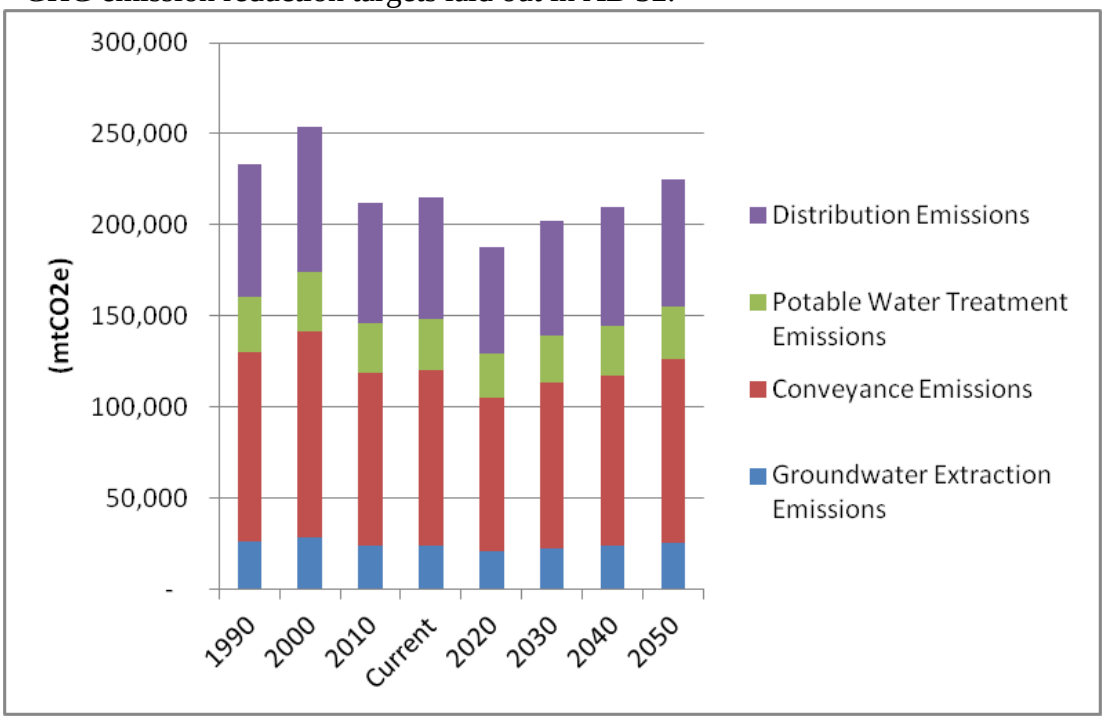

Figure 36: Conservation for Orange County to meet a 20% reduction in GHG emissions by 2020 (also referred to as 20x2020)

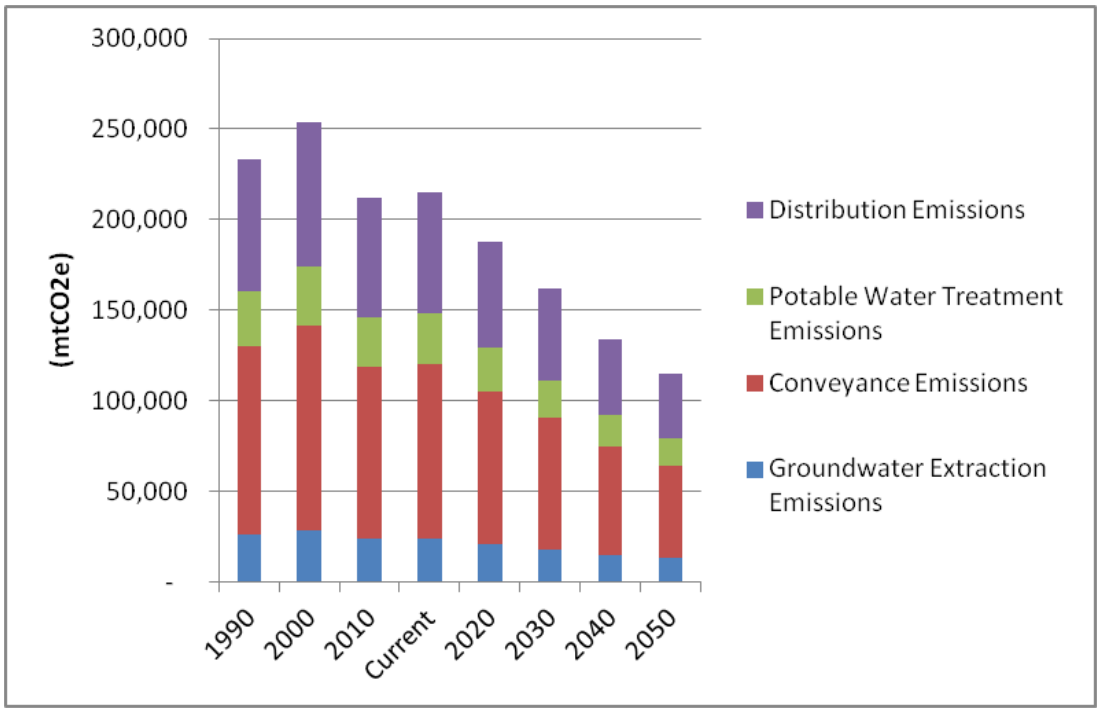

Figure 37: GHG emissions resulting from a 20% reduction in per capita water use every 10 years from 2020 to 2030 for Orange County

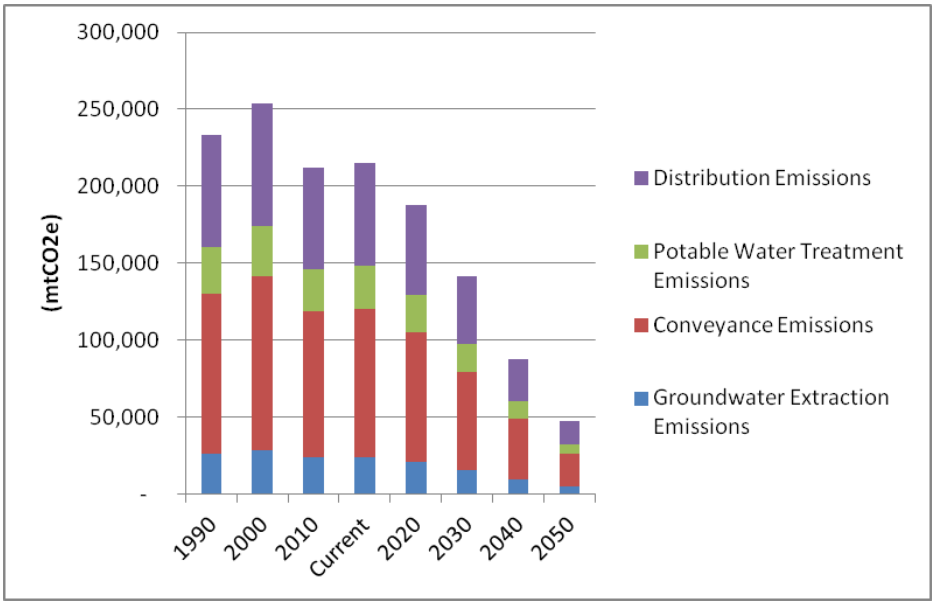

Figure 38: GHG emissions resulting from reductions in per capita water use shown in Table 9 for Orange County

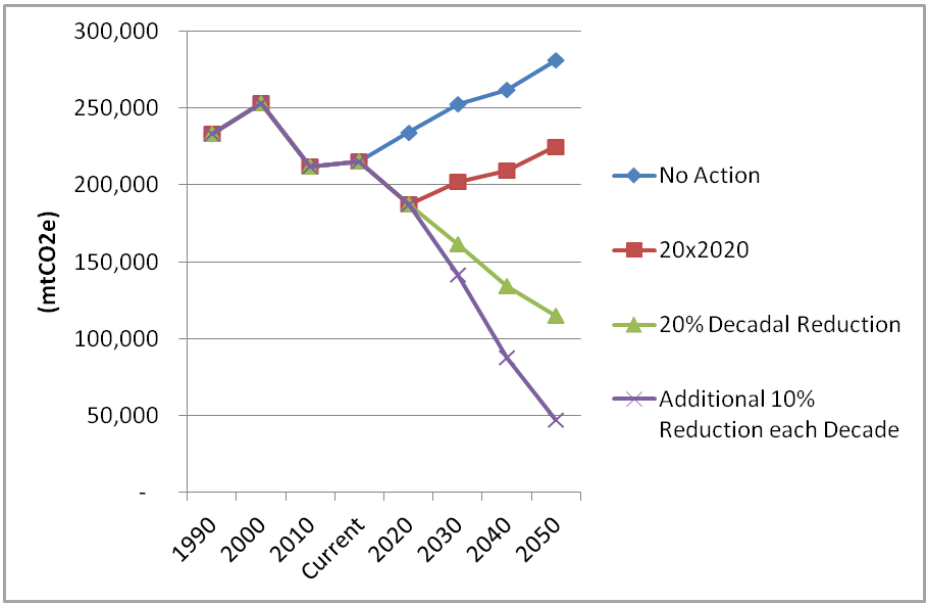

Figure 39: Comparison of GHG emissions resulting from conservation scenarios

Table 9: Conservation measures required to meet AB 32 2050 target

Historical and Projected Per Capita Water Use							
	1990	2000	2010	2020	2030	2040	2050
Per Capita Water Use (gpd)	240	221	175	140	98	59	29
Decadal Conservation Rate		-8%	-21%	-20%	-30%	-40%	-50%

6.0 Uncertainties

This analysis was designed to take advantage of best available datasets and modeling tools and to follow methodologies documented in peer-reviewed literature. However, there are a number of analytical uncertainties that are not reflected in study results, including uncertainties associated with the following analytical areas that can be grouped under two categories: climate projection information and assessing hydrologic impacts that inform many of the Basin Study FAQs.

6.1 Climate Projection Information

6.1.1 Global Climate Forcing

Although surface water hydrologic projections often consider future climate projections representing a range of future greenhouse emission paths, the uncertainties associated with these pathways are often not explored. Such uncertainties include those introduced by assumptions about technological and

economic developments, globally and regionally; how those assumptions translate into global energy use involving GHG emissions; and biogeochemical analysis to determine the fate of GHG emissions in the oceans, land, and atmosphere. Also, not all the uncertainties associated with climate forgings are associated with GHG assumptions. Considerable uncertainty remains associated with natural forcings, with the cooling influence of aerosols being regarded as the most uncertain on a global scale (e.g., figure SPM-2 in IPCC 2007).

6.1.2 Global Climate Simulations

While the activity presented in this report considers climate projections produced by state-of-the-art coupled ocean-atmosphere climate models, there are still uncertainties about the scientific understanding of physical processes that affect climate. For example, how to represent such processes in GCMs (e.g., atmospheric circulation, clouds, ocean circulation, deep ocean heat update, ice sheet dynamics, sea level, land cover effects from water cycle, vegetative, and other biological changes); and how to do so in a mathematically efficiently manner, given computational limitations. Still, these models have shown an ability to simulate the influence of increasing GHG emissions on global climate (IPCC 2007).

6.1.3 Climate Projection Bias Correction

Surface water hydrologic projections inherit GCM biases toward being too wet, too dry, too warm, or too cool. Such systematic biases in GCMs should be identified and accounted for through bias-correction of climate projections, prior to use in impacts studies. Bias correction of climate projections data affects results on incremental runoff and water supply response.

6.1.4 Climate Projection Spatial Downscaling

The Basin Study uses projections that have been spatially disaggregated on a monthly time step (following GCM bias correction on a monthly time step). Although this technique has been used to support numerous water resources impacts studies (e.g., Van Rheenan et al., 2004; Maurer, 2007; Anderson et al., 2008; Reclamation, 2008; Reclamation, 2010; Elsner et al., 2010), uncertainties remain about the limitations of empirical downscaling methodologies. One potential limitation relates to how empirical methodologies require historical reference information use on spatial climatic patterns at the downscaled spatial resolution. These finer-grid patterns are implicitly related to historical large-scale atmospheric circulation patterns, which presumably would change somewhat with global climate change. Application of the historical finer-grid spatial patterns to guide downscaling of future climate projections implies an assumption that the historical relationship between finer-grid surface climate patterns and large-scale atmospheric circulation is still valid under the future climate. In other words, the relationship is assumed to have statistical stationarity, meaning the joint probability distribution does not change when shifted in time or space. In actuality, it is possible that such stationarity will not hold at various space and time scales, over various locations, and for various climate variables. However,

the significance of potential non-stationarity in empirical downscaling methods, and the need to utilize alternative downscaling methodologies remains not well understood.

6.2 Assessing Hydrologic Impacts

6.2.1 Generating Weather Sequences Consistent with Climate Projections

The temporal disaggregation method developed first by Wood et al., (2002), was used in this Basin Study to translate monthly BCSD climate projections into daily VIC weather forcings. However, other techniques might have been considered. Choice of weather generation technique depends on aspects of climate change that are being targeted in a given study. Preference among available techniques remains to be established. Various characteristics, such as that the resampling approach, does not allow daily temperature ranges to vary from those selected with the sample, make the disaggregation approach unsuitable for studies focusing on potential changes in the diurnal range of temperature. In contrast, it may be sufficient for monthly time step hydrological assessments if the disaggregation is performed with thoughtful sampling constraints.

6.2.2 Natural Runoff Response

This Basin Study analyzes natural runoff response to changes in precipitation, temperature, and change in natural vegetation PET while holding other watershed features constant. Other watershed features might be expected to change as climate changes and affects runoff (e.g., vegetation affecting evapotranspiration and infiltration, etc.). On the matter of land cover response to climate change, the runoff models' calibrations would have to change if land cover changed, because the models were calibrated to represent the historical relationship between weather and runoff as mediated by historical land cover. Adjustment to watershed land cover and model parameterizations are difficult to consider due to lack of available information to guide such an adjustment. Eco-hydrological frameworks, perhaps involving dynamic vegetation response, may be suitable to represent such land surface changes for studies in which such sensitivities are important.

6.2.3 Hydrologic Modeling

The hydrology model used in the Basin Study excludes ground water interaction with surface water systems. The fate of precipitation is modeled as loss only to runoff and evapotranspiration; and loss of precipitation to deep percolation and return flows to stream channel networks are not considered in the VIC hydrology model. The groundwater impacts in the basin are simulated using a simplified tool.

6.2.4 Bias and Calibration

Where the VIC applications have been calibrated, they can reproduce historical natural streamflow with little bias. Where the VIC applications have not been

calibrated, they can exhibit significant bias. The location-specific implications of calibration, or lack thereof, on the conclusions of the study have not been quantified.

6.2.5 Time Resolution of the Applications

Simulations were conducted at daily time steps, while the applications were calibrated to reproduce monthly and annual runoff characteristics at a subset of locations in the basin. For this reason, users should cautiously interpret the daily hydrologic information coming from these simulations. The daily runoff information is physically consistent with assumed weather forcings and hydrologic model structure; however, there could be significant simulation biases at the submonthly level.

Appendix F Climate Change Vulnerability Assessment Technical Memorandum

WESTERN MUNICIPAL WATER DISTRICT
Securing Your Water Supply

Technical Memorandum

To: Drought Contingency Plan Task Force

From: Drought Contingency Plan Development Team

CC: Melissa Matlock, Western Municipal Water District

Date: 4/22/2021

Re: Western Drought Contingency Plan – Climate Change Vulnerability Assessment

---

Executive Summary

This technical memorandum (memo) describes the retrieval and analysis of climate data provided by the California Department of Water Resources (DWR) to project the impact of climate change on future water supplies and demands within Western Municipal Water District's (Western) service area. The DWR climate data is assembled from the results of 20 global climate models, which best represent California's climate processes. Biases in the climate model results have been adjusted using historical hydrologic data in the state. DWR projected climate change data is most appropriate for this analysis because it is the only climate projection dataset specifically developed to meet the requirements of water resources planners in California. Western is making this memo available to its retail agencies for their use in their respective water resource planning efforts to reduce the data processing burden on individual agencies. The results are intended for use by Western and its member agencies as they prepare the 2020 updates to their Urban Water Management Plan (UWMP) and a regional Drought Contingency Plan (DCP). This technical memo provides:

- A description of the area subject to the vulnerability assessment
- A description of the analysis approach and data sources chosen for the analysis
- Narrative discussions of the climate change factors calculated for local supply and demand conditions in multiple scenarios
- Discussion of the water supply and demand projections resulting from the vulnerability assessment

Summary of Findings

Projected changes in future water supplies and water demand are analyzed during a normal year, a single dry year and multi-year (5-year) droughts over the next 20 years, using climate projections developed for the water resources planning by DWR. This analysis of future climate impacts on water supplies and demands is based on the median projected change from the majority of the climate models selected for water resources planning in California. The results of this analysis show:

- Projected decreases in water supplies from Santa Ana and Santa Margarita River basins under normal and drought conditions relative to baseline conditions in 2020, due to projected decreases

in precipitation and projected increases in surface water evaporation caused by increasing temperatures.

- Smaller decreases in projected precipitation and natural recharge under normal and multi-year drought years. However, the single dry year was slightly wetter under future conditions compared to the baseline. Precipitation will occur during shorter rainy seasons with higher intensity.
- Outdoor water uses are projected to increase under normal, single dry, and multi-year drought conditions, caused by projected temperature increases, which lead to higher evapotranspiration (ET) rates for landscaping, irrigated crops, and native vegetation.

This technical memo also includes worksheets for using the vulnerability assessment results with Western's water supplies and growth-adjusted water demand forecasts for the Western's wholesale service area.

1. INTRODUCTION

The study of climate change impacts on water resources is continuously yielding new models and updated local and regional datasets. This continuous improvement makes it necessary to narrow the selection of data sources and methods of data analysis most applicable to local conditions. The scope of this vulnerability assessment is limited to improving our understanding of climate change impacts on future water demand in Western's wholesale service area and the sources of Western's water supplies during normal and drought periods.

The following section provides the background information for the requirements of both the DCP and the UWMP, a general description of the impacts analyzed in the vulnerability assessment, and information about Western's sources of information used in the assessment.

1.1 DCP and UWMP Requirements for Climate Change Analysis

In accordance with Sections 10610 to 10657 of the California Water Code, the UWMP requires the consideration of climate change impacts for drought planning because of the significant duration of recent droughts in California. This includes an analysis of projected future uses and the reliability of anticipated water supplies during a normal year, a single dry year and drought lasting 5 consecutive dry water years. This drought risk assessment (DRA) compares projected water supply sources with projected water use over the next 20-years, in 5-year increments.

A vulnerability assessment is required as part of the DCP to understand the characteristics and potential risk of future droughts and to develop appropriate mitigation and response actions. Since future droughts cannot be predicted by observed past drought information, the inclusion of a climate change analysis is needed to provide the incorporation of historic and future climate projections to assess the hydrological impacts of climate change on drought conditions, thereby creating a more effective plan. The DCP requires either a qualitative and/or quantitative assessment of a range of potential drought conditions derived from climate change information to determine potential the risk to critical resources.

Imported water projections are also required for preparing both the UWMP and DCP. However, the imported water projections for Western's service area are being developed by Metropolitan Water District (Metropolitan) as part of their 2020 UWMP Drought Risk Assessment and the 2020 Integrated Resources Plan (IRP). The current (November 2020) draft of Metropolitan's 2020 UMWP Drought Risk Assessment indicates that no service reliability concerns are projected for imported water during normal and drought periods before 2045. For purposes of the UWMP, imported water supplies to Western can be assumed to be unchanged during normal years, single dry years and 5-year droughts.

However, the 2020 IRP considered a range of more extreme potential future scenarios, which include: low demands with stable imported supplies, high demand with stable imported supplies, low demand with reduced imported supplies, and high demand with reduced imported supplies. The analysis found that service reliability issues could occur more frequently and generate increasingly more severe deficits of imported supplies under the high future demand scenarios. Options for managing these imported water supplies deficits will be explored more extensively as part of regional analysis for the DCP.

1.2 Prior Climate Studies

Climate change is primarily caused by increasing global concentrations of greenhouse gases which lead to increases in temperature, disruption of the hydrologic cycle, and increased variability of precipitation. The regional impacts of climate change analyzed in two previous studies for the region, California's Fourth Climate Change Assessment and the United States Bureau of Reclamation (USBR) Santa Ana Watershed Study, are summarized in this section.

The state of California produces periodic assessments on the potential impacts of climate change in the state and reports on potential adaptation responses as required by Executive Order #S-03-05. California's Fourth Climate Change Assessment includes a Statewide Summary Report (Bedsworth et al., 2018), nine regional summary reports, a climate justice summary report, and over 40 technical reports which translate climate science into actionable adaptation and resilience policies and plans. The Los Angeles Regional Report (Hall et al., 2018) summarizes climate science, impacts, and adaptation information for Ventura, Los Angeles, Orange, and the western parts of San Bernardino and Riverside Counties. This study projects regional increases in average maximum temperatures of around four to five degrees Fahrenheit (° F) by the mid-21st century, and five to eight ° F by the late 21st century. The hottest days of the year could become up to 10° F warmer for many locations in the region by the late 21st century.

California's report also projects small changes in average annual precipitation, and in the recurrence of extreme dry and wet years. However, rainfall intensification could result in more severe atmospheric river events and rainfall increases of up to 25 to 30% on the wettest days of the year. While these assessments provide information on the magnitude of regional climate impacts, they do not provide information about climate change impacts at a scale that is directly applicable to local watersheds, water supplies, and demands.

The USBR conducted a study of local climate change impacts in the Santa Ana River Watershed (USBR, 2013). The study used a groundwater screening tool to simulate monthly water balance changes in the Orange County, Upper Santa Ana Valley, and Elsinore/San Jacinto groundwater basins. Historical monthly time series of precipitation over the groundwater basin as well as municipal and industrial

water demand were analyzed for the period 1990-2009. Future water supply was analyzed for the Santa Ana River Watershed using a hydrologic model to simulate streamflow using 112 different future climate conditions. The results show future increases in water demand and reservoir evaporation due to increased temperature. Smaller, long-term decreases in precipitation are also projected. The combined impacts of these changes include decreases in annual available surface water and increased reliance on groundwater. In the 2013 USBR study, groundwater was estimated to provide approximately 54% of total water supply.

The 2013 USBR study does not account for analysis methods instituted for studying and avoiding adverse impacts under California's Sustainable Groundwater Management Act (SGMA) which was passed by the state legislature in 2014. In particular, the 2013 USBR study used a transient climate change analysis method to generate a continuous future projection from the present through end of century. The results of a such a transient climate analysis cannot be used to analyze extreme events such as a single dry year or a multi-year drought as required under the UWMP regulations.

In summary, prior studies which include statewide and regional climate assessments provide relevant background information. However, they do not provide information on climate change impacts on local water supplies and demands within the Santa Margarita basin and other service areas outside of the Santa Ana basin or on the changing severity of future drought periods. This climate change vulnerability assessment aims to provide a uniform analysis of climate impacts for all areas of Western's service area for use in regional water supply and drought planning.

1.3 Study Objectives

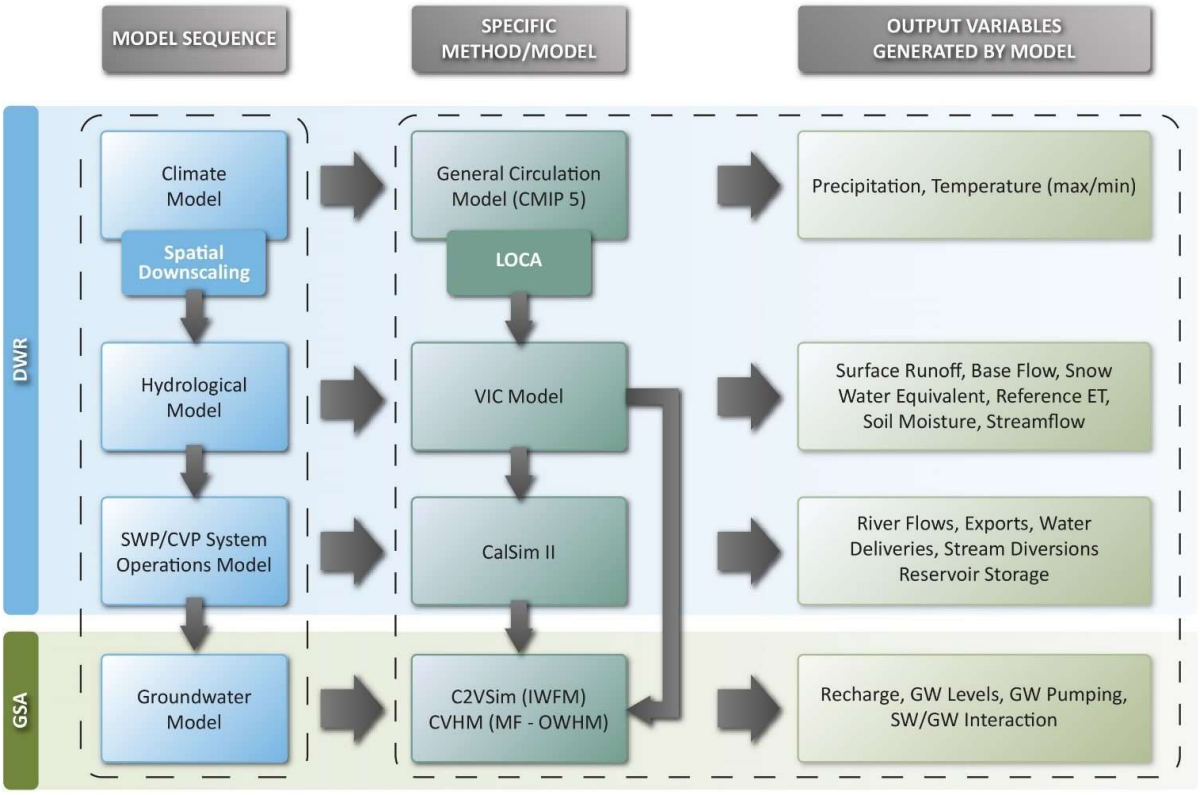
The objectives of this vulnerability study are to:

1. Identify the appropriate datasets for use in this analysis,
2. Project the magnitude of climate-driven changes in water supply and demand for Western's service area, and
3. Estimate the projected future impacts using the climate change factors applied to the water supply sources and water demands in the service area.

Temperatures increases and changes in precipitation patterns with climate change are expected to shift the balance between local water supply and demand within Western's service area and other parts of the state. Increases in temperature lead to increases in consumptive water use for irrigated agriculture and to maintain landscaping for residential, commercial, and recreational use. This increase in consumptive water use is compounded by increases in the portion of rainfall that is evaporated back into the atmosphere from open spaces and water bodies and consumed by native vegetation outside of urban areas. In addition, population growth within the plan area could also lead to expansion of demand.

Annual precipitation in southern California is highly variable and a significant portion of the regional rainfall is concentrated in winter months from November to April. There are typically years with much greater than average precipitation and years with much less than average precipitation. During wet years, seasonal precipitation replenishes aquifers, streams, rivers, and reservoirs which are the sources of water supply. During dry years, there is increased extraction of groundwater reserves to make up the

deficit. Climate change is expected to increase the year-to-year variability in precipitation within the region as well as in other parts of the state from which imported water is sourced. The second objective of this vulnerability study is to estimate the severity of future water supply and demand changes during drought years for use in drought management and mitigation planning for Western's service area.



1.4 Description of Data Sources

DWR has developed statewide climate change datasets to for use in the water resource planning. The datasets depict climate conditions in California under historical and future climate conditions which are defined as follows:

- Year 2030 future condition with projected climate and sea level conditions for a 30-year period, centered at 2030
- Year 2070 future condition with projected climate and sea level conditions for a 30-year period, centered at 2070
- Year 1995 historical condition with climate and sea level conditions for a 30-year period, centered at 1995

The 2030 and 2070 climate projections are based on an ensemble of 20 global climate projections selected by the DWR Climate Change Technical Advisory Group (CCTAG) as the most appropriate projections for California water resources evaluation and planning (DWR CCTAG, 2015). The datasets are provided at a spatial resolution of 1/16th degree (approximately 3.75-mile grid cells) over California for each calendar month from 1915 through 2011.

Figure 1 shows an overview of the modeling processes used by DWR (highlighted with a blue background) in creating the statewide climate datasets which are used in this study. The lower section of the image (highlighted with a green background) shows how individual groundwater sustainability agencies are expected to use the data in groundwater models to model groundwater conditions as they collaborate to attain sustainability objectives.

DWR: Department of Water Resources; GSA: Groundwater Sustainability Agency; SWP: State Water Project; CVP: Central Valley Project; LOCA: Localized Constructed Analogs; VIC: Variable Infiltration Capacity; CalSim: SWP & CVP Operations Model; C2VSim: California Central Valley Groundwater - Surface Water Simulation Model; IWFM: Integrated Water Flow Model; CVHM: Central Valley Hydrologic Model; MF - OWHM: MODFLOW One Water Hydrologic Flow Model; ET: Evapotranspiration, SW: Surface Water; GW: Groundwater; CMIP 5: Coupled Model Intercomparison Project

Figure 1: Overview of Modeling Processes Used by DWR in Creating the Statewide Climate Datasets (SOURCE: DWR, 2018).

DWR has also run the climate datasets run through a hydrologic model called the Variable Infiltration Capacity (VIC) model to simulate future hydrologic conditions and route runoff to the outlet of subbasins defined by each eight-digit Hydrologic Unit Code (HUC) in California. Streamflow change projections from the VIC model are provided as monthly time series from 1915 through 2011 for each eight-digit HUC subbasin. As illustrated in Figure 2, the VIC model takes input climate variables such as precipitation and temperature, and it performs a series of hydrologic computations within each cell to output variables such as soil moisture, evapotranspiration, and surface runoff within each cell. The RVIC routing algorithm is then used to route runoff from each cell to its associated subbasin outlet.

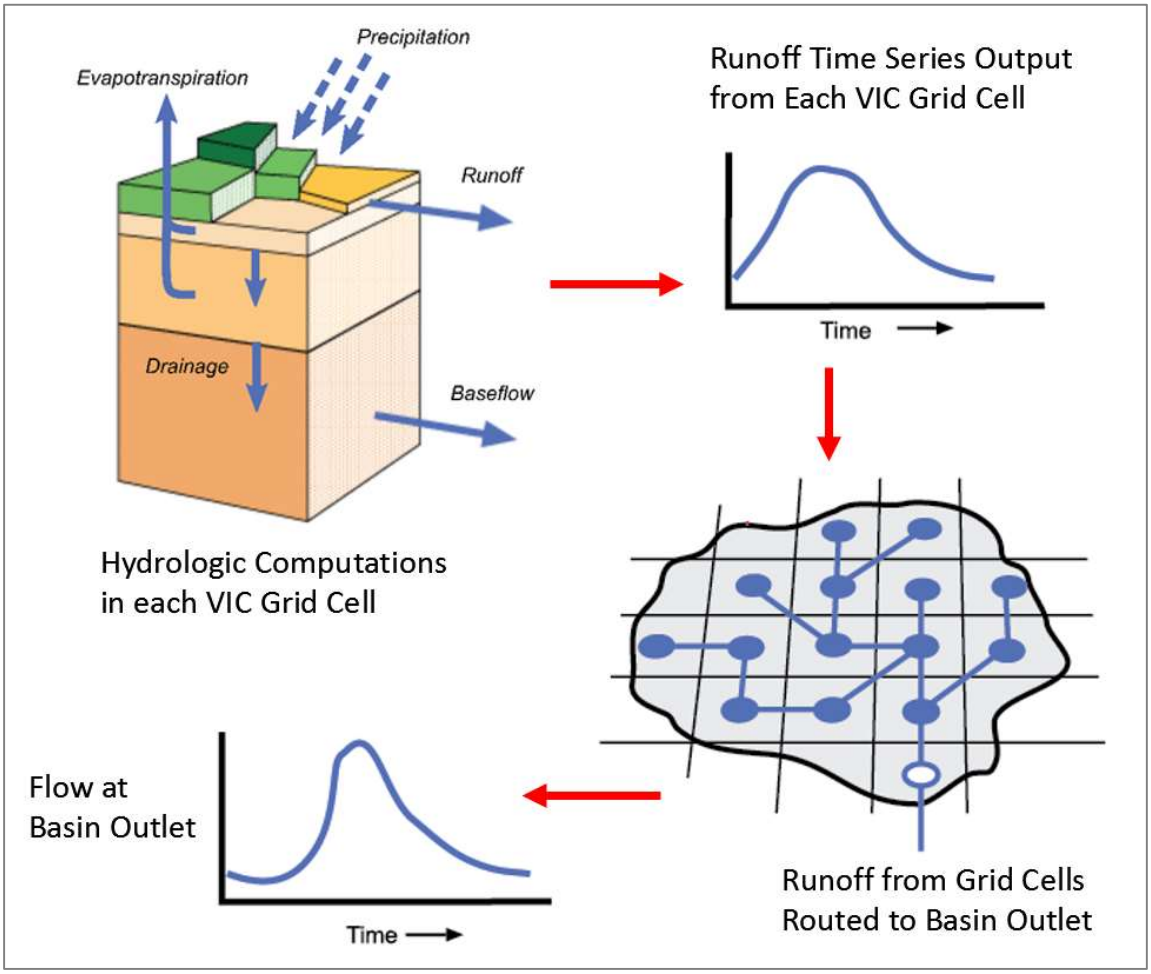


Figure 2: Schematic of the VIC Model Showing Hydrologic Computations Within Each Grid Cell and Runoff Routing

DWR has applied the VIC model to perform hydrologic simulations under historical climate conditions and under projected future climate conditions in 2030 and 2070 over 8,000 grid cells statewide. Runoff from these grid cells have also been routed to the outlet of each eight-digit HUC watersheds in the state for use in the water resource planning.

As previously shown in Figure 1, climate assessments are performed with a chain of models, each of which introduces some biases in the modeling process and derived products. To minimize the impact of such biases in decision processes, DWR presents the simulated climate projections in terms of relative change from historical conditions rather than as absolute values. For example, each monthly precipitation value simulated under 2030 conditions is divided by the precipitation value simulated for the same month under historical conditions, using the same chain of models. The resulting ratio of a simulated future value to the corresponding simulated historical value is referred to as a change factor. DWR has computed monthly time series of change factors for precipitation and evapotranspiration in each VIC grid cell and the streamflow for each HUC-8 watershed. The resulting change factor datasets are available for retrieval and use in water resources planning from the publicly accessible SGMA Data Viewer (https://sgma.water.ca.gov/webgis/?appid=SGMADataViewer). A more complete description

of methods used in computing the climate datasets is provided in a publication entitled "Guidance for Climate Change Data Use During Groundwater Sustainability Plan Development" (California DWR, 2018).

2. CLIMATE ANALYSIS APPROACH

2.1. Preprocessing Data for Western's Service Area

The statewide climate datasets include 57 grid cells each with a spatial resolution of 1/16th degree (approximately 3.75-mile) for Western's service area are shown in Figure 3.

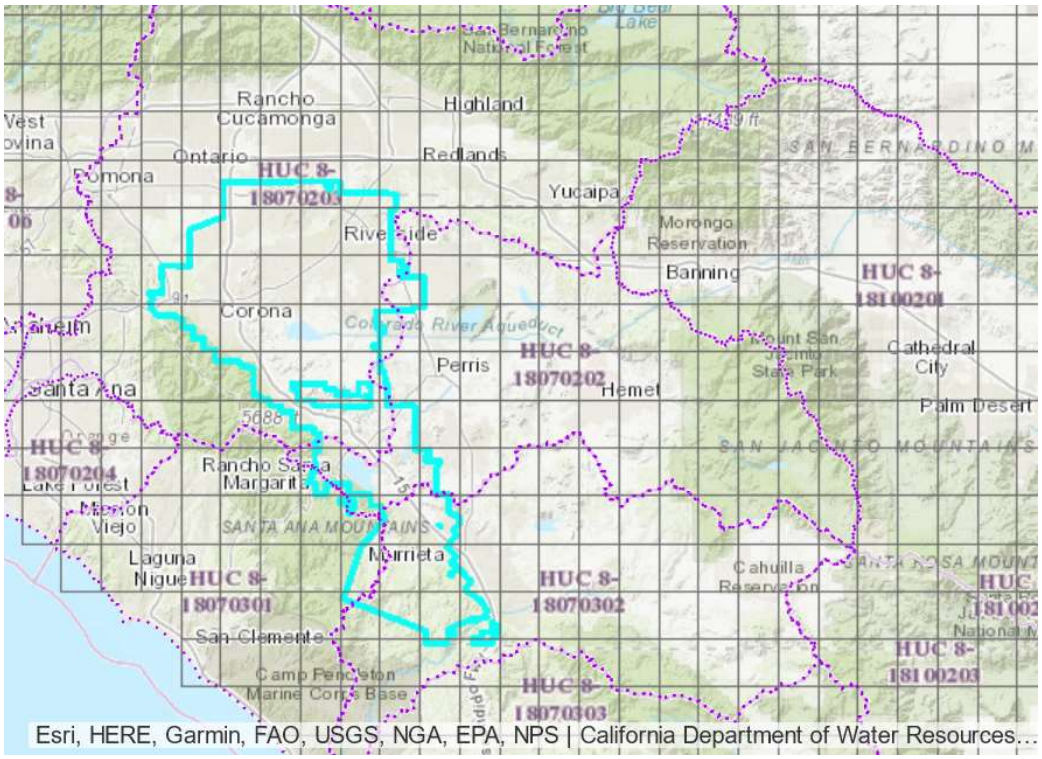

Figure 3: Climate Grid Cells and Watersheds Covering Western's service area.

Each grid cell contains 97 years of monthly time series (1915 to 2011) showing projected precipitation and evapotranspiration changes under 2030 and 2070 climate conditions relative to 1995 conditions. The area of each grid cell which falls within the service area is estimated by spatially intersecting feature layers of the climate grid and Western's service area boundary. Regional time series of projected precipitation and evapotranspiration changes are computed from the cell time series by using an area-weighted average of data from grid cells which fall wholly or partially within the service area. Projections of future streamflow change were also retrieved for the Santa Ana River (HUC- 18070203) and the Santa Margarita River (HUC- 18070302) basins which provide surface water supplies to portions of the service area.

2.2. Analysis of Normal, Single, and Multi-Year Drought Periods

Every urban water supplier is required to assess water service reliability in normal year, single-dry year, and multiple-dry years lasting 5-years. For imported water supplies, the normal and dry years used by Metropolitan are adopted for Western since it is the largest source of imported water. For local water supplies, year types are selected by reviewing time series data at two local precipitation gauges with long time historical records. The monthly time series for the gauge at Riverside Fire Station 3 are available online in the California DWR Bulletin 195 from back as far back as 1882 but were last updated in 2007. The CIMIS #44 gauge has more current data available from 1986 to present. For this analysis, the Riverside FS3 gauge is used because it has full coverage of the normal period of record (1922 to 2004) used in the imported water analysis.

Table 1: Analysis Periods for Normal, Single and Multi-Year Droughts

Year Type	Imported Supplies	Riverside FS3 Gauge	CIMIS #44 Gauge
Normal	1922 - 2004	1922 - 2004	1986 - 2020
Single Dry-Year	1977	1989	2007
Five-Year Drought	1988 - 1992	1971 - 1975	2005 - 2009

The results shown in Table 1 indicate that 1989 was the single driest year locally, while 1977 was the driest year for imported water. The driest 5-year period for local supplies was from 1971 to 1975, while imported water supplies were lowest from 1988 to 1992. Year types for the CIMIS #44 gauge are also provided in the table for reference.

2.3. Computing Water Supply Change Factors

Local water sources used within Western's service area include local groundwater from 12 different groundwater basins, surface water supplies from Santa Ana River and the Santa Margarita River basins, recycled water from indoor water use, and reclaimed groundwater. Groundwater systems are recharged through a variety of water sources. These sources of recharge can be described as:

- Natural recharge is the portion of precipitation that infiltrates to the underlying aquifer within the same grid cell in which precipitation occurs. Changes in natural recharge are directly related to changes in precipitation in the grid cell.
- Artificial recharge (including injection systems)) is water that is diverted from rivers and streams for the purpose of replenishing the underlying aquifer. Since artificial recharge relies on surface water and other remotely sourced water supplies, it is influenced by accumulative flow changes in the source watersheds.

Supplies of recycled water and reclaimed water which are sourced from indoor uses are largely insensitive to changes in climate. For this analysis, three different sets of climate change results are

computed for use with natural recharge, the Santa Ana River, and the Santa Margarita River sources, respectively.

For characterization of future changes in natural recharge, precipitation change projections from the DWR-provided climate change dataset is used. The 97-year monthly time series of precipitation for Western's service area is used to compute Water Supply Change Factors which show percentage changes in mean monthly and mean annual precipitation under future 2030 and 2070 climate conditions relative to historical conditions under 1995 conditions. The 2030 and 2070 Water Supply Change Factors for natural recharge are computed for normal year, single dry year, and 5-year drought periods.

Characterization of future changes in the Santa Ana and Santa Margarita River basins are based on streamflow projections from the VIC model under 2030 and 2070 climate conditions. The streamflow projections are used to compute Water Supply Change Factors which show percentage changes in mean monthly and mean streamflow under future 2030 and 2070 climate conditions relative to historical conditions under 1995 conditions. Change factors are similarly computed for normal year, single dry year, and 5-year drought periods.

Each set of Water Supply Change Factors is interpolated at 5-year intervals from 2020 to 2045. The 1995 to 2011 conditions are used to project climate change conditions out to 2030. Linear interpolation is used to determine the climate change factors between 2020 and 2030, based on the historic conditions from 2011 and the projected conditions for 2030. Different climate change conditions are anticipated between 2030 and 2070 because of the implementation of policies and practices that are expected to influence the rate of climate change further out in time. For the years between 2030 and 2070, linear interpolation is used for the 5-year increments based on the difference in projected conditions at 2030 and the projected conditions at 2070. Time series of Water Supply Change Factors are similarly interpolated at 5-year intervals for normal year, single dry year, and 5-year drought periods for application to local water sources for 2020 to 2045.

2.4 Computing Water Demand Change Factors

Indoor and outdoor water uses are computed separately when considering climate impacts. Outdoor water use, particularly landscape irrigation, is sensitive to changes in climate while indoor water use is generally not sensitive. Plants require more water to sustain growth in a warmer climate, and users respond to increases in temperature by increasing landscape irrigation to keep their plants alive and flourishing. This increase in water requirement is characterized in climate models using the rate of evapotranspiration which represents total amount of water released from soil, plants, and water bodies from the land surface to the atmosphere through evaporation and transpiration.

The DWR datasets includes 57 grid cells each with a spatial resolution of 1/16th degree (approximately 3.75-mile) for Western's service area. Each grid cell contains 96 years of monthly time series (1915 to 2011) showing projected evapotranspiration changes under 2030 and 2070 climate conditions. An area-weighted average of the evapotranspiration data from the 57 cells is first computed to generate a single time series for Western's service area. The regional time series is used to compute Water Demand Change Factors which show percentage changes in mean monthly and mean annual evapotranspiration under future 2030 and 2070 climate conditions relative to historical conditions under 1995 conditions.

Similar values of 2030 and 2070 Water Demand Change Factors are computed for normal year, single dry year, and 5-year drought periods.

The Water Demand Change Factors are computed for 5-year intervals from 2020 to 2045 by interpolation. The 1995 to 2011 conditions are used to project climate change conditions out to 2030. Linear interpolation is used to determine the climate change factors between 2020 and 2030, based on the historic conditions from 2011 and the projected conditions for 2030. Different climate change conditions are anticipated between 2030 and 2070 because of the implementation of policies and practices that are expected to influence the rate of climate change further out in time. For the years between 2030 and 2070, linear interpolation is used for the 5-year increments based on the difference in projected conditions at 2030 and the projected conditions at 2070. The 5-year time series of Water Demand Change Factors are similarly interpolated for normal year, single dry year, and 5-year drought periods for application to growth adjusted indoor water use projections for 2020 to 2045.

3. LOCAL CLIMATE CHANGE RESULTS

3.1. Water Supply Change Factor Results

The water supply change factors for precipitation and natural recharge are shown in Table 2. For normal years, precipitation and natural recharge are initially projected to decrease during the first decade before stabilizing during the second decade. The maximum projected range of decrease for normal year values is 1.7 percent. However, the projections show that droughts will initially be less severe from the perspective of local rainfall and recharge for the single dry year with increases of up to 1 percent. Recharge during 5-year droughts is projected to decrease by up to 2.3 percent by 2045.

Table 2: Water Supply Change Factors for Precipitation and Natural Recharge with 2020 as the Baseline Year

Year	Normal	Dry	5-year Dry
2020	100.0%	100.0%	100.0%
2025	99.1%	100.5%	99.5%
2030	98.3%	101.0%	98.9%
2035	98.5%	100.8%	98.5%
2040	98.7%	100.7%	98.1%
2045	98.9%	100.5%	97.7%

Table 3 shows the effects climate change on water supply change factors for use with the Santa Ana River basin water supplies using 2020 as the baseline year. Flows are projected to decrease for normal,

single dry, and multi-year periods. Normal year flows are projected to gradually decrease by up to 3.1 percent by 2045. Flow decreases of up to 7.2 percent during single dry years and 5.5 percent during multi-year droughts are projected by 2045.

Table 3: Water Supply Change Factors for the Santa Ana River Flows with 2020 as the Baseline Year

Year	Normal	Dry	5-year Dry
2020	100.0%	100.0%	100.0%
2025	99.6%	99.6%	99.0%
2030	99.1%	99.2%	98.1%
2035	98.4%	97.1%	96.9%
2040	97.6%	94.9%	95.7%
2045	96.9%	92.8%	94.5%

Table 4 shows the effects climate change on water supply change factors for the Santa Margarita River basin supplies using 2020 as the baseline year. The projected changes in normal year flows are very similar to those in the Santa Ana River basin with decreases reaching 3.6 percent by 2045. Flow decreases of up to 5 percent during single dry years and 5-year droughts are projected by 2045.

Table 4: Water Supply Change Factors for the Santa Margarita River Flows with 2020 as the Baseline Year

Year	Normal	Dry	5-year Dry
2020	100.0%	100.0%	100.0%
2025	99.7%	99.9%	99.5%
2030	99.3%	99.8%	98.9%
2035	98.4%	98.2%	97.6%
2040	97.4%	96.6%	96.3%
2045	96.4%	95.0%	95.0%

These water supply change projections indicate that as climate change progresses, local water systems which rely on natural recharge are likely to become more reliable water supply sources, while river supplies that are water sources for artificial recharge are likely to become less reliable. Natural groundwater recharge will still occur in normal and dry year, but the timing of available water will change as precipitation will increasingly fall during a shorter rainy season with a longer dry season each year. Furthermore, the increase in temperatures over time will also lead to increases in evaporation from surface water bodies and land surface which will decrease the volume of water available for diversion from rivers. diversions from rivers. Increased attention should be paid to understanding the adequacy and operational constraints of natural and artificial recharge systems in the service area.

3.2 Water Demand Change Factors Results

Table 5 shows water demand change factors for outdoor water uses for Western's service area. The impacts of climate change on outdoor water demand are projected to be similar during normal and drought years over the next two decades. This is because climate change datasets show that temperatures are projected to increase over time, regardless of hydrologic conditions. These projected increases in temperature are estimated to increase ET rates for landscaping, irrigated agriculture, and native vegetation. For all year types, outdoor water use is projected to increase by about 3 percent during the next two decades.

Table 5: Water Demand Change Factors for Outdoor Water Uses with 2020 as the Baseline Year

Year	Normal	Dry	5-year Dry
2020	100.0%	100.0%	100.0%
2025	100.6%	100.6%	99.8%
2030	101.2%	101.3%	101.2%
2035	101.8%	101.9%	101.8%
2040	102.4%	102.5%	102.4%
2045	103.1%	103.2%	103.0%

The water demand change factors are applied to outdoor water uses, which have been adjusted for future population growth and conservation measures. Indoor water uses are assumed to respond to future population growth and conservation as well but are not sensitive to climate change.

4. APPLYING RESULTS TO LOCAL WATER ANALYSIS

4.1. Computing Future Water Supply and Demand

Climate change impacts on future water supplies and demands must be considered by Western and its retail agencies when preparing the 2020 updates to their respective UWMPs, in accordance with California Water Code requirements, and will also inform development of the DCP.

This technical memo provides Western and its retail agencies with the ability to utilize the data in the DWR climate change projections and methods of climate change analysis for Western's service area to evaluate the impacts of climate change either qualitatively or quantitatively. If quantitative methods are used, computations needed to convert the percent change results presented in this memo into quantitative estimates of future water supply and demand are provided as worksheets included as Appendix A of this report. The worksheets consist of the following six tables:

- Table A1: Normal Year Water Supply Projections
- Table A2: Single Dry Year Water Supply Projections
- Table A3: Multi-Year Drought Water Supply Projections
- Table A4: Normal Year Water Demand Projections
- Table A5: Single Dry Year Water Demand Projections
- Table A6: Multi-Year Drought Water Demand Projections

If an agency desires to use these worksheets, an agency would enter its baseline water supply and demand values in Section 1 of each table. Section 2 of each table is prepopulated with the regional water supply and demand change factor results. Instruction for finalizing future water supply and demand values by multiplying values from section 1 with corresponding values from Section 2 of each table are includes in the "Notes" column of each table.

While not required for preparing the UWMPs, monthly change factors are useful for understanding how seasonal changes are contributing to the annual changes discussed in Section 3 of this report. Monthly values are also useful for planning management actions and mitigation actions in the DCP. Monthly water supply and demand change factors computed for the service area are presented in Appendix B which consists of the following six tables:

- Table B1: Monthly Water Supply Change Factors for Normal Year
- Table B2: Monthly Water Supply Change Factors for Single Dry Year
- Table B3: Monthly Water Supply Change Factors for Multi-Year Drought
- Table B4: Monthly Water Demand Change Factors for Normal Year
- Table B5: Monthly Water Demand Change Factors for Single Dry Year
- Table B6: Monthly Water Demand Change Factors for Multi-Year Drought

4.2. Constraints and Limitations

This technical memo presents planning-level projections of climate impacts on water supplies and demand for Western's service area during normal and drought periods. The results are intended for

use by Western in preparing climate-impacted water supply and demand projections for its wholesale UWMP and the regional DCP. This memo is also available for Western's retail agencies to use in their respective 2020 UWMPs if they choose to use the DWR climate change factors rather than another method of estimating projected climate change impacts to supply and demand. These agencies are required to develop adaptive management actions and projects as part of their 2020 UWMPs to address any deficits in future supply relative to future demand.

This analysis of future climate impacts on water supplies and demands is based on the median projected change from the majority of the climate models selected for water resources planning in California. DWR has also developed two more extreme climate scenarios for 2070, which were not used in the analysis presented in this technical memo. The first extreme scenario uses future projections from the 10 global climate models with least warming and least precipitation while the second extreme scenario using the 10 global models with the most warming and highest precipitation. These extreme scenarios have not been used in this round of planning. However, it would be prudent to analyze the extreme scenarios when preparing longer range plans and projects beyond mid-century.

The results are not intended for use in other applications such as flood resilience planning, infrastructure design, or for making decisions about operating any specific structure. Flood resilience planning requires analysis of daily or finer temporal resolution using statistical methods to fit frequency distributions to extreme values. Infrastructure design and operations applications require more detailed analysis and ground-truthing of site-specific characteristics, operations and regulations that are not considered in this report.

Climate change can also impact water resources indirectly. For example, wildfire hazards are projected to increase in southern California with climate change. Wildfires can impact water resources by increasing water requirements for firefighting, changing surface vegetation and runoff patterns in burn areas, causing debris flows, and increasing siltation of reservoirs and hydraulic structures. Such secondary impacts of climate change on water resource are not captured in this study.

Future water supplies and demands can also be impacted by policy and regulatory decisions made at the local, state, and federal level. It is difficult to anticipate and quantify the impacts of policy and regulatory considerations that have not yet been made. Therefore, it is not the intention of this report to anticipate future policy or regulatory decisions and their impacts to future water supplies or demands.

4.3. Next Steps

The next step in the planning process is for Western and its member agencies to use the change factors and analysis provided in this technical memorandum, if desired, to compute quantitative estimates of future supplies and demands during normal and drought years, incorporating the effects of climate change. The net change in future water supply for each member agency will depend on the percentage of their local water supply that is sourced from the direct precipitation and natural recharge, Santa Margarita, or Santa Ana basins. Similarly, the net change in future water demand will depend on the percentage of outdoor water use and projections of future growth within each member agency's service area. The difference between net future water supply and net future water demand, if any, is the net water deficit that the agency will need to address by developing new management actions and

projects. A calculated deficit, if any, would represent the minimum gap that would need to be addressed; however, it is prudent for water managers to consider additional management actions and projects to prepare for uncertain future conditions.

This technical memo provides Western and its retail agencies with the ability to utilize the data in the DWR climate change projections and methods of climate change analysis for Western's service area to evaluate the impacts of climate change either qualitatively or quantitatively. Should a retail agency choose to use the analysis presented in this technical memo, the agency may use the forms provided in Appendices A and B to compute quantitative estimates of their future water supplies, demands and deficits. For use in the DCP, the projections used in each agency's UWMP will be aggregated and quantitative estimations of the magnitude and location of regional water supplies, demands and deficits. The aggregated regional quantitative results would be discussed during future workshops to inform development of the DCP, regional project planning, and estimation of import requirements.

2c	Single Dry Year	Water Supply Change Factor for Santa Margarita River						From Memo Results
3a	Single Dry Year	Future Water Supply from Natural Recharge (AFY)	100.5%	101.0 %	100.8%	100.7%	100.5%	Multiply Row 1a by Row 2a
3b	Single Dry Year	Future Water Supply from Santa Ana River (AFY)	99.6%	99.2%	97.1%	94.9%	92.8%	Multiply Row 1b by Row 2b
3c	Single Dry Year	Future Water Supply from Santa Margarita River (AFY)	99.9%	99.8%	98.2%	96.6%	95.0%	Multiply Row 1c by Row 2c
4	**Single Dry Year**	**Total Future Water Supply from Local Sources (AFY)**						**Sum of Rows 3a, 3b and 3c**

Table A3: Multi-Year Drought Water Supply Projections

Agency: _____

Notes: _____

Row	Year Type	Variable	2025	2030	2035	2040	2045	Notes
1a	5-Year Drought	Current Water Supply from Natural Recharge (AFY)						Repeat 2020 Value for all Years
1b	5-Year Drought	Current Water Supply from Santa Ana River (AFY)						Repeat 2020 Value for all Years
1c	5-Year Drought	Current Water Supply from Santa Margarita River (AFY)						Repeat 2020 Value for all Years
2a	5-Year Drought	Water Supply Change Factor for Natural Recharge	99.5%	98.9%	98.5%	98.1%	97.7%	From Memo Results
2b	5-Year Drought	Water Supply Change Factor for Santa Ana River	99.0%	98.1%	96.9%	95.7%	94.5%	From Memo Results
2c	5-Year Drought	Water Supply Change Factor for Santa Margarita River	99.5%	98.9%	97.6%	96.3%	95.0%	From Memo Results
3a	5-Year Drought	Future Water Supply from Natural Recharge (AFY)						Multiply Row 1a by Row 2a
3b	5-Year Drought	Future Water Supply from Santa Ana River (AFY)						Multiply Row 1b by Row 2b
3c	5-Year Drought	Future Water Supply from Santa Margarita River (AFY)						Multiply Row 1c by Row 2c
4	**5-Year Drought**	**Total Future Water Supply from Local Sources (AFY)**						**Sum of Rows 3a, 3b and 3c**

Table A4: Normal Year Water Demand Projections

Agency: _____

Notes: _____

Row	Year Type	Variable	2025	2030	2035	2040	2045	Notes
1a	Normal Year	Growth-Adjusted Outdoor Water Demand (AFY)						Different for Each Year
1b	Normal Year	Growth-Adjusted Indoor Water Demand (AFY)						Different for Each Year
2a	Normal Year	Water Demand Change Factor for Outdoor Use	100.6%	101.2%	101.8%	102.4%	103.1%	From Memo Results
3a	Normal Year	Climate-Adjusted Future Water Demand (AFY)						(Row 1a * Row 2a) + Row1b
3b	Normal Year	Climate-Adjusted Future Water Demand (AFY)						(Row 1a * Row 2a) + Row1b
4	**Normal Year**	**Total Climate-Adjusted Water Demand**						**Sum of Rows 3a, 3b and 3c**

Table A5: Single Dry Year Water Demand Projections

Agency: _____

Notes: _____

Row	Year Type	Variable	2025	2030	2035	2040	2045	Notes
1a	Single Dry Year	Growth-Adjusted Outdoor Water Demand (AFY)						Different for Each Year
1b	Single Dry Year	Growth-Adjusted Indoor Water Demand (AFY)						Different for Each Year
2a	Single Dry Year	Water Demand Change Factor for Outdoor Use	100.6%	101.3%	101.9%	102.5%	103.2%	From Memo Results
3a	Single Dry Year	Climate-Adjusted Future Water Demand (AFY)						(Row 1a * Row 2a) + Row1b
3b	Single Dry Year	Climate-Adjusted Future Water Demand (AFY)						(Row 1a * Row 2a) + Row1b
4	**Single Dry Year**	**Total Climate-Adjusted Water Demand**						**Sum of Rows 3a, 3b and 3c**

Table A6: Multi-Year Drought Water Demand Projections

Agency: _____

Notes: _____

Row	Year Type	Variable	2025	2030	2035	2040	2045	Notes
1a	Multi-Year Drought Year 1	Growth-Adjusted Outdoor Water Demand (AFY)						Enter Future Demand
1b	Multi-Year Drought Year 2	Growth-Adjusted Outdoor Water Demand (AFY)						Enter if Different from 1a
1c	Multi-Year Drought Year 3	Growth-Adjusted Outdoor Water Demand (AFY)						Enter if Different from 1a
1d	Multi-Year Drought Year 4	Growth-Adjusted Outdoor Water Demand (AFY)						Enter if Different from 1a
1e	Multi-Year Drought Year 5	Growth-Adjusted Outdoor Water Demand (AFY)						Enter if Different from 1a
1f	Normal Year	Growth-Adjusted Indoor Water Demand (AFY)						Enter Future Demand
2a	5-Year Drought	Water Demand Change Factor	99.8%	101.2%	101.8%	102.4%	103.0%	From Memo Results
3a	Multi-Year Drought Year 1	Climate-Adjusted Future Water Demand (AFY)						(Row 1a * Row 2a) + Row 1f
3b	Multi-Year Drought Year 2	Growth-Adjusted Outdoor Water Demand (AFY)						(Row 1b * Row 2a) + Row 1f
3c	Multi-Year Drought Year 2	Growth-Adjusted Outdoor Water Demand (AFY)						(Row 1c * Row 2a) + Row 1f
3d	Multi-Year Drought Year 2	Growth-Adjusted Outdoor Water Demand (AFY)						(Row 1d * Row 2a) + Row 1f
3e	Multi-Year Drought Year 2	Growth-Adjusted Outdoor Water Demand (AFY)						(Row 1e * Row 2a) + Row 1f

Appendix G Metropolitan Purchase Order

PURCHASE ORDER FOR SYSTEM WATER TO BE PROVIDED BY THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

PURCHASER: WESTERN MUNICIPAL WATER DISTRICT OF RIVERSIDE COUNTY	**TERM** 10 years: January 1, 2015 – December 31, 2024
INITIAL BASE PERIOD DEMAND: 117,537 acre-feet	**EFFECTIVE DATE:** January 1, 2015
INITIAL TIER 1 MAXIMUM—Annual Average: 105,783 acre-feet	**INITIAL TIER 1 MAXIMUM—Cumulative:** 1,057,830 acre-feet
PURCHASE ORDER COMMITMENT—Annual Average: 70,522 acre-feet	**PURCHASE ORDER COMMITMENT—Cumulative:** 705,220 acre-feet

Definitions of capitalized terms used in this Purchase Order are provided in Attachment 1. Terms used in this Purchase Order and not defined in Attachment 1 are defined in Metropolitan's Administrative Code.

COMMITMENT TO PURCHASE:

In consideration of Purchaser's commitment to purchase System Water pursuant to this Purchase Order, Metropolitan agrees to sell such System Water to Purchaser during the Term at the Tier 1 Supply Rate in an amount up to the Tier 1 Maximum—Cumulative. All System Water sold to Purchaser during the Term in an amount greater than the Tier 1 Maximum—Cumulative shall be sold to the Purchaser at the Tier 2 Supply Rate. In connection with the purchase of System Water, the Purchaser also agrees to pay all other applicable rates and charges, as established by Metropolitan from time to time. The rates and charges applicable to System Water as of the Effective Date are shown in Attachment 2.

If Purchaser's applicable System Water purchases during the Term exceed Purchaser's Tier 1 Maximum, Purchaser may elect to:

a.) Subject to the provisions of paragraph c) below, pay any Tier 2 Supply Rate obligations at the end of the Term, in an amount equal to the difference between the Purchaser's applicable System Water purchases and the Tier 1 Maximum—Cumulative during the Term times the average of the Tier 2 Supply Rate in effect during the Term; or,

b.) Pay any Tier 2 Supply Rate obligations annually as purchases are incurred, in an amount equal to the difference between the Purchaser's applicable annual System Water purchases and the Tier 1 Maximum—Annual times the Tier 2 Supply Rate in effect during the calendar year. A true-up at the end of the Term will be performed to ensure that the Purchaser has received all Tier 1 Maximum—Cumulative purchases allowed by the Purchase Order.

c.) If, after the end of the first five years, Purchaser has accrued a cumulative Tier 2 Supply Rate obligation, Purchaser may elect to pay the initial five year cumulative Tier 2 Supply Rate obligation (i) in full at the end of year five of the Term, (ii) amortize it in five equal installments over the remaining five calendar years of the Term, or (iii) pay it at the end of the Term. Commencing in year 6 of the Term, Purchaser shall pay any additional Tier 2 Supply Rate obligation annually.

Purchaser agrees to purchase System Water from Metropolitan during the Term in an amount not less than the Purchase Order Commitment. If Purchaser's applicable System Water purchases during the Term are less than the Purchase Order Commitment, each acre-foot of unmet commitment will be reduced by the amount of production from a local resource project, measured in acre-feet, that commences operation on or after January 1, 2014. A local resource project includes any project type as approved by the Board.

Purchaser agrees to pay Metropolitan an amount equal to the difference between the sum total in acre-feet of water of the Purchase Order Commitment (minus the amount reduced by the amount of production from a local resource project) and the sum total in acre-feet of water of Purchaser's applicable System Water purchases during the Term, times the average of the Tier 1 Supply Rate in effect during the Term.

Purchaser agrees to pay all amounts owing to Metropolitan, whether to satisfy a Purchase Order Commitment or a Tier 2 Supply Rate obligation, within the next regular billing cycle following the reconciliation of all certifications for special programs that the Purchaser may participate in. The Purchaser may elect to pay such amount in twelve equal monthly payments over the course of the next twelve months beginning with the first regular billing cycle following the reconciliation of all outstanding certifications for special programs. If the Purchaser elects to pay such amount over the course of the next twelve months following the regular billing cycle any outstanding balance shall bear interest at Metropolitan's then current investment portfolio average yield. All other amounts payable under this Purchase Order shall be billed and paid in accordance with the Administrative Code.

WATER SERVICE:

Conditions of water service by Metropolitan to the Purchaser, including but not limited to (i) delivery points, (ii) water delivery schedules, and (iii) water quality, will be determined in accordance with Chapter 5 (Section 4500 through 4514, inclusive, as applicable) of Metropolitan's Administrative Code.

In accordance with its Administrative Code, Metropolitan shall use its reasonable best efforts to supply System Water in the quantities requested by the Purchaser, but is not obligated to dedicate any portion of System capacity for the conveyance, distribution, storage or treatment of System Water for the benefit of the Purchaser or any other member agency. Metropolitan shall use its reasonable best efforts to deliver the System Water when needed by the Purchaser during the Term; provided however, there shall be no default under this Purchase Order if Metropolitan fails to deliver water to the Purchaser in accordance with any such schedule of deliveries during the Term.

By execution of this Purchase Order, the Purchaser recognizes and agrees that it acquires no interest in or to any portion of the System or any other Metropolitan facilities or supplies, or any right to receive water delivered through the System, excepting the right to purchase up to Purchaser's Tier 1 Maximum—Cumulative at the Tier 1 Supply Rate provided that System Water is available. This Purchase Order governs pricing of the System Water delivered to the Purchaser pursuant to this Purchase Order and does not confer any entitlement to receive System Water.

System Water provided to the Purchaser under the terms of this Purchase Order shall be subject to reduction in accordance with the shortage allocation provisions of the Water Surplus and Drought Management Plan (the “WSDM Plan”) or other such policies and principles governing the allocation of System Water as adopted by the Board.

In the event that Metropolitan's Board or General Manager determines to reduce, interrupt or suspend deliveries of System Water, any outstanding balance of the Purchase Order Commitment at the end of the Term shall be reduced by the Purchase Order Commitment—Annual Average for each and every fiscal or calendar year that a reduction, interruption or suspension occurred.

MISCELLANEOUS:

This Purchase Order will be interpreted, governed and enforced in accordance with the laws of the State of California.

This Purchase Order will apply to and bind the successors and assigns of the Purchaser and Metropolitan.

No assignment or transfer of the rights of the Purchaser under this Purchase Order will be valid and effective against Metropolitan or the Purchaser without the prior written consent of Metropolitan and the Purchaser.

If at any time during the Term, by reason of error in computation or other causes, there is an overpayment or underpayment to Metropolitan by the Purchaser of the charges provided for under this Purchase Order, which overpayment or underpayment is not accounted for and corrected in the annual re-determination or reconciliation of said charges, the amount of such overpayment or underpayment shall be credited or debited, as the case may be, to the Purchaser. Metropolitan will notify the Purchaser in writing regarding the amount of such credit or debit, as the case may be. In no case will credits or debits for charges provided for under this Purchase Order be administered beyond the limit for billing adjustments as specified in Metropolitan's Administrative Code.

IN WITNESS WHEREOF, this Purchase Order is executed by the duly authorized officers of the Metropolitan Water District of Southern California and Western Municipal Water District of Riverside County, as of December __, 2014.

Attachment 1
Purchase Order for System Water
DEFINITIONS

"Act" means the Metropolitan Water District Act, California Statutes 1969, Chapter 209, as amended and supplemented from time to time.

"**Demand**" means the Purchaser's purchases of System Water supplies, including full service, seasonal shift, Conjunctive Use Program, Surface Storage Operating Agreement water, Recharge and Recovery Operating Agreement water, or any other water program deemed to be a purchase of System Water.

"**Effective Date**" means the effective date of this Purchase Order as specified above.

"Metropolitan" means The Metropolitan Water District of Southern California.

"Purchase Order Commitment" means:

i). if the Purchaser elects option a) under the Base Period Demand as defined in section 4122 of the Administrative Code, then 60% of the Purchaser's Initial Base Firm Demand times 10; or

ii). if the Purchaser elects option b) under the Base Period Demand, then 60% of the Purchaser's highest fiscal year Demand during the period from fiscal year 2002/03 through fiscal year 2013/14, times 10.

"Purchase Order" means this Purchase Order for System Water.

"Purchaser" means the member public agency specified above, a duly organized [city/water district/county water authority] of the State of California.

"System" means the properties, works and facilities operated and/or financed by Metropolitan necessary for the supply, development, storage, conveyance, distribution, treatment or sale of water.

"System Water" means water supplies developed by Metropolitan and delivered to the Purchaser through the System or other means (e.g. conjunctive use storage).

"Term" means the term of this Purchase Order as specified above.

"Tier 1 Maximum—Annual" means an amount equal to 90% of the Base Period Demand.

"Tier 1 Maximum—Cumulative" means an amount equal to the sum of the Tier 1 Maximum—Annual amounts during the Term.

"Tier 1 Supply Rate" means Metropolitan's per-acre-foot Tier 1 Supply Rate, as determined from time to time by Metropolitan's Board of Directors. The Tier 1 Rate effective January 1, 2015, is $158/AF.

"Tier 2 Supply Rate" means Metropolitan's per-acre-foot Tier 2 Supply Rate, as determined from time to time by Metropolitan's Board of Directors. The Tier 2 Rate effective January 1, 2015, is $290/AF.

"Water Surplus and Drought Management Plan (WSDM)" means Metropolitan's policy and procedures for managing supplies and drought conditions as adopted by the Board from time to time.

Attachment 2
Purchase Order for System Water
RATES AND CHARGES

	Effective January 1, 2015	Effective January 1, 2016
Tier 1 Supply Rate ($/AF)	$158	$156
Tier 2 Supply Rate ($/AF)	$290	$290
System Access Rate ($/AF)	$257	$259
System Power Rate ($/AF)	$126	$138
Water Stewardship Rate ($/AF)	$41	$41
Full Service Untreated Rate ($/AF):		
Tier 1	$582	$594
Tier 2	$714	$728
Treatment Surcharge ($/AF)	$341	$348
Full Service Treated Rate ($/AF):		
Tier 1	$923	$942
Tier 2	$1,055	$1,076
Readiness-to-Serve Charge ($ millions)	$158	$153
Capacity Charge ($/cfs)	$11,100	$10,900

RIVERSIDE – WESTERN

2017 COOPERATIVE AGREEMENT FOR

LONG-TERM WHEELING AND SURPLUS WATER SALES

1. **PARTIES:** This Cooperative Agreement for Long-Term Wheeling and Surplus Water Sales ("Agreement") is made and entered into this _____ day of _____, 2017, by and between the **City of Riverside** ("Riverside"), a California charter city and municipal corporation, and the **Western Municipal Water District** ("Western"), a public agency. Both parties are organized and existing under the laws of the State of California and are hereinafter sometimes referred to jointly as the "Parties" or individually as a "Party."

2. **RECITALS:**

2.1 Riverside operates a municipal utility providing wholesale water and electric services to entities located within and outside of its service territory, and retail water and electric service to its customers located within its service territory.

2.2 Western operates a municipal water district providing wholesale and retail water and wastewater services to entities located within its service territory.

2.3 Each Party is subject to the terms of the judgment in *Western Municipal Water District v. East San Bernardino County Water District* (Riverside County Superior Court No. 78426) governing, among other things, the Parties' respective rights and obligations related to the beneficial use and maintenance of the Bunker Hill Basin, Rialto/Colton Basin, Riverside North Basin, and Riverside South Basin (collectively, the "Water Basins").

2.4 Pursuant to periodic agreement between Western and the Riverside Highland Water Company, Western has from time to time in the recent past secured the right to produce and export groundwater annually from the Bunker Hill Basin. Western is seeking to secure a long-term agreement and to make said supply available for the production, treatment, and conveyance services under this Agreement.

2.5 Pursuant to an August 23, 2001 "Reciprocal Use Agreement" between Western and the Elsinore Valley Municipal Water District, Western has the right to produce and export groundwater annually from the Bunker Hill Basin.

2.6 Western, from time to time, may have access to additional water which may or may not be stored or conserved groundwater in the Water Basins and would be subject to the production, treatment and/or conveyance services under this Agreement.

2.7 Riverside, from time to time, may have unused capacity in its groundwater production, treatment, water transmission, and/or water distribution facilities.

2.8 On March 30, 2009, the Parties entered into that certain Cooperative Agreement for Water Production and Conveyance ("2009 Agreement"), wherein Riverside agreed to operate its unused capacity in its groundwater production, treatment, water transmission, and/or water distribution facilities to produce and convey Western's annually allocated, stored, or conserved groundwater in the Water Basins to points of interconnection between the Parties' water utility systems. The Parties hereby agree that except for provisions in the 2009 Agreement, as amended, which apply to non-potable water, the balance of the provisions of the 2009 Agreement are amended and restated by this Agreement, meaning that the potable water provisions in the 2009 Agreement, as amended, shall be of no further force or effect.

2.9 Western, from time to time, may request that Riverside provide Production Services, Treatment Services and/or Conveyance Services, and Riverside shall provide such services using its water extraction, treatment and conveyance facilities to the extent that the provision of such services will not, in Riverside's sole judgment which shall not be unreasonably exercised, (i) adversely affect the quality, reliability or cost of service related to water deliveries by Riverside to its retail or wholesale customers and/or (ii) cause Riverside to violate the terms of any binding obligations existing as of the date of this Agreement with respect to the production, treatment or delivery of water.

2.10 The Parties desire to enter into this Agreement in order to: (a) provide for a new long-term wheeling agreement for the production, treatment and conveyance of a firm annual volume of Western-acquired water by Riverside (referred to herein as "wheeling"); (b) develop the pricing of Riverside's adjusted annual water right from the San Bernardino Basin Area ("SBBA") which is determined to be surplus to Riverside's retail needs (referred to herein as "Surplus Water Sales"); and (c) obtain system capacity to move local groundwater to Western customers.

2.11 The Parties agree to begin investigating ways to develop and deliver supplies from the Riverside Basin, as provided for in the 1969 Judgment, to maximize the benefit for users within Western while ensuring all provisions of the 1969 Judgment are up-held.

2.12 The Parties agree to meet and confer, in good faith, as to the provision of recycled water and non-potable water by Riverside to Western.

3. AGREEMENT: In consideration of the foregoing Recitals that are incorporated herein by this reference and the mutual terms and conditions herein, the Parties agree as follows:

4. DEFINITIONS: Terms used herein with initial capitalization, whether in singular or plural, shall have the following meanings:

4.1 1969 Judgment: The judgment rendered by the court in *Western Municipal Water District v. East San Bernardino County Water District* (Riverside County Superior Court No. 78426) and governing, among other things, the Parties' respective rights and obligations related to the beneficial use and maintenance of the Bunker Hill Basin, Rialto/Colton Basin, Riverside North Basin and Riverside South Basin.

4.2 AFY: Acre-feet per year.

4.3 Authorized Representative: The representative or their designee identified by each Party, in accordance with Section 12, to act on such Party's behalf with respect to those matters specified herein to be the functions of such Authorized Representative.

4.4 Bunker Hill Basin: The groundwater basin so defined and described in the 1969 Judgment.

4.5 Bunker Hill Export Allocation: Riverside's annual volumetric export right of groundwater from the Bunker Hill Basin as defined in the 1969 Judgment as amended from time to time.

4.6 Capital Recovery Component: The component of the Service Rate intended to recover Riverside's capital cost of providing Production, Treatment, and/or Conveyance Services along the flow path to Western.

4.7 Conveyance Services: Riverside's use of its water treatment, transmission and distribution systems to convey water from a Point of Receipt to a Point of Delivery.

4.8 Commodity Price: This term shall have the meaning set forth in Section 10.2.

4.9 Curtailment: Any shortage of water delivery relative to the Operating Plan as defined in Section 4.18. Curtailment is measured on a monthly basis and is assigned to Riverside (if unable to deliver water) or Western (if unable to receive water). The Curtailments for both Parties are summed at the end of the calendar year. Western's annual obligation to receive water is reduced by Riverside's Curtailment, and vice-versa. In any given month, where feasible and practical, Riverside may deliver more water and Western may receive more water than what is specified in the Operating Plan. These excesses are summed and will reduce any applicable Curtailment. If Riverside and Western agree to Make-Up water as defined in Section 4.38, any applicable Curtailment will be reduced by that amount.

4.10 Curtailment Payment: If Western has a Curtailment for any given year, Western shall make payment to Riverside as set forth in Sections 6.1.2 and 6.2.2.

4.11 Delivery Month: A month for which Western has requested Production, Treatment, Conveyance and/or Services in the Operating Plan.

4.12 Fiscal Year: The twelve (12) month period commencing each July 1 during the term of this Agreement and ending the following June 30.

4.13 Make-Up Water: By mutual consent of the Operating Committee, up to 500 AFY of Western Water and/or Riverside Water that is not delivered in the current calendar year may be eligible to be delivered the following calendar year. Make-up water is intended to be used during the following calendar year. Make-up water shall not be available in consecutive years unless approved by Riverside. Make-up water is not subject to Curtailment Payment. Non-delivered Western water shall be used for Make-Up Water before non-delivered Riverside Water, unless the Parties mutually agree otherwise for any given year.

4.14 MWD: The Metropolitan Water District of Southern California.

4.15 MWD Tier 1 cost: The published volumetric rate charged by MWD for full-service potable water supply. If MWD amends its rates such that the MWD Tier 1 cost is no longer applicable to the pricing under this Agreement, the parties agree to meet and confer and amend this Agreement to include an appropriate pricing reference.

4.16 Operation & Maintenance Component: The component of the Service Rate intended to recover Riverside's operating and maintenance cost of providing Production, Treatment, and/or Conveyance Services.

4.17 Operating Committee Meeting: The work group referenced in Section 6.4.

4.18 Operating Plan: The written plan, developed collaboratively by Western and Riverside, as set forth in Section 6.3. Attached hereto as Exhibit A and incorporated herein by reference is an example Operating Plan.

4.19 Point of Delivery: The Point of Interconnection where water is delivered to Western by Riverside in connection with Conveyance Services provided hereunder.

4.20 Point of Interconnection: A point where the water transmission and/or distribution systems of Riverside and Western interconnect.

4.21 Point of Receipt: The Point of Interconnection where water is delivered to Riverside by Western, or on Western's behalf, in connection with Conveyance Services provided hereunder. With respect to Riverside's simultaneous provision of both Production

Services and Conveyance Services, the well head discharge block valve shall be deemed to be the Point of Receipt.

4.22 Production Services: Riverside's extraction of groundwater for the benefit of Western using Riverside's water well(s) in the Water Basins.

4.23 Prudent Utility Practice: Any of the practices, methods, and acts which, in the exercise of reasonable judgment in light of the facts (including but not limited to the practices, methods, and acts engaged in or approved by a significant portion of the water utility industry prior thereto) known at the time the decision was made, which would have been expected to accomplish the desired result at the lowest reasonable cost consistent with good business practices, reliability, safety, and expedition, taking into account the fact that Prudent Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be a spectrum of possible practices, methods, or acts which could have been expected to accomplish the desired result. Prudent Utility Practice includes due regard for manufacturers' warranties and requirements of agencies of competent jurisdiction.

4.24 Rialto/Colton Basin: The groundwater basin so defined and described in the 1969 Judgment.

4.25 Riverside North Basin: The groundwater basin so defined and described in the 1969 Judgment.

4.26 Riverside South Basin: The groundwater basin so defined and described in the 1969 Judgment.

4.27 Riverside Water: The portion of Riverside's Bunker Hill Basin Export Allocation under the 1969 Judgment that in Riverside's sole judgment, which shall not be unreasonably exercised, is surplus to Riverside's retail and wholesale customer demand which is made available for purchase by Western.

4.28 SBBA: The groundwater basin defined and described in the 1969 Judgment.

4.29 Service Rate: The rate, expressed in dollars per acre-foot and rounded to nearest cent, to be paid by Western to Riverside in connection with Riverside's provision of Production, Treatment, and/or Conveyance Services.

4.30 Shared Benefit Methodology: This methodology shall have the meaning set forth in Exhibit D, attached hereto and incorporated by reference.

4.31 Storage Services: The retention and storage of water using Riverside's reservoir capability for later delivery of such water to Western.

4.32 Surplus Water Sales: This term shall have the meaning set forth in Section 2.12 herein.

4.33 Treatment Services: The use and operation of water treatment such as, but not limited to, ion exchange, granular activated carbon, membrane filtration, and/or blending to achieve compliance with State drinking water standards.

4.34 Uncontrollable Force: Any cause or event which is beyond the control of the Party affected, including, but not restricted to, failure of or threat of failure of facilities, flood, earthquake, storm, fire, lightning, epidemic, war, riot, civil disturbance or disobedience, labor dispute or strike, labor or material shortage, sabotage, restraint by court order or public authority and action or non-action by or failure to obtain the necessary authorizations or approvals from any governmental agency or authority which by exercise of due diligence such Party could not reasonably have been expected to avoid and which by exercise of due diligence it shall be unable to overcome.

4.35 Water Basins: This term shall have the meaning set forth in Section 2.3 herein.

4.36 Western Water: Any water secured by Western through separate agreement that is intended to be produced, treated and/or conveyed through Riverside's system.

4.37 Willful Misconduct: This term shall have the meaning set forth in Section 13.4 herein.

5. EFFECTIVE DATE AND TERM:

5.1 This Agreement shall be effective July 1, 2017. The terms of this Agreement pertaining to the production, treatment and/or conveyance of Western Water shall remain in effect until June 30, 2037, and the terms of this Agreement pertaining to Riverside Water shall remain in effect until June 30, 2027, unless earlier terminated as follows:

5.1.1 Upon advance written notice by either Party at least two (2) years prior to the specified date of termination; or

5.1.2 Upon ten (10) days advance written notice by the non-defaulting Party to the defaulting Party following a material breach of this Agreement.

5.2 Obligations incurred hereunder but not satisfied prior to termination of this Agreement shall survive such termination until fully discharged, including any payments due by one Party to the other Party hereunder.

5.3 Beginning upon expiration/termination of the terms of this Agreement pertaining to Riverside Water, Riverside shall make a reasonable good faith effort, subject to governing body approvals, to deliver up to 2,000 AFY of Riverside Water to Western in times of emergency shortage that may be caused by drought or infrastructure outage that negatively impacts Western's imported water supply. The price of this water will be based on the "Shared Benefit Methodology" described in this Agreement.

6. PRODUCTION, TREATMENT AND CONVEYANCE SERVICES:

6.1 Western Water:

6.1.1 Riverside shall utilize its water production, treatment and conveyance facilities during each Delivery Month as required to deliver Western Water to Western in accord with the duly approved Operating Plan established pursuant to Section 6.3. Riverside shall provide up to 5,408 AFY of Western Water over the next 20 years. For each acre-foot of Western Water so delivered by Riverside to Western, Western shall pay Riverside at the rate calculated in Section 10.

6.1.2 Western shall have the right to curtail delivery of the Western Water at any time and of the duration specified by Western by providing 30-days' notice for non-emergency curtailments and notice as soon as practically possible for emergency curtailments. However, Western agrees that if delivery is curtailed by Western, Western shall pay Riverside a Curtailment Payment equal to the Capital Recovery Component, as defined in 10.1.3, multiplied by the acre-feet of curtailed Western Water as compensation to Riverside for Riverside's commitment to annually provide to Western up to 5,408 AFY of production, treatment and conveyance capacity. Make-Up Water may be applied towards the amount of deliveries curtailed by Western in order to reduce or eliminate the amount of the Curtailment Payment. Should Riverside be unable to deliver any portion of the 5,408 AFY of Western Water during any year of this Agreement, Western shall not be obligated to such curtailment payment for that portion of the Western Water that Riverside is not able to deliver for that year.

6.1.3 Western is working to secure long-term arrangements for 5,408 AFY of Western Water. Should Western be unable to secure Western Water equal to 5,408 AFY for the term of this Agreement, Western agrees to notify Riverside in advance of an annual Operating Committee Meeting and the applicable Operating Plan shall reflect the actual volume of secured Western Water. Riverside agrees to modify the Curtailment Payment provision to match the actual volume of secured Western Water for the following calendar year and beyond.

6.1.4 In any calendar year, all Western Water shall be conveyed prior to any Riverside Water.

6.2 <u>Riverside Water:</u>

6.2.1 Riverside shall deliver a minimum of 2,000 AFY of Riverside Water to Western, over the next ten-years. If, in its sole judgment, Riverside has additional water in excess of the 2,000 AFY in a given year, Riverside will notify Western prior to the development of the Operating Plan. If Western is interested in purchasing some or all of the excess supplies and has the ability to receive it, those excess supplies will be incorporated

into the Operating Plan. The Western Water to be delivered to Western under this Agreement shall take delivery priority over Riverside Water, as set forth in the applicable Operating Plan. Supplies in excess of 2,000 AFY will not be subject to the curtailment payment set forth in Section 6.2.2. Delivery of Riverside Water in excess of 2,000 AFY will not require modification or amendment of this Agreement. For each acre-foot of Riverside Water extracted by Riverside on Western's behalf, Western shall pay Riverside the rate determined in accordance with Section 10.

6.2.2 Western shall have the right to curtail delivery of the Riverside Water at any time and of the duration specified by Western by providing 30-days' notice for non-emergency curtailments and notice as soon as practically possible for emergency curtailments. However, Western agrees that if delivery is curtailed, Curtailment Payment shall be equal to the Commodity Price, as defined in Section 10.2, multiplied by acre-feet of Curtailed Riverside Water, as compensation for Riverside's commitment to annually provide to Western a minimum of 2,000 AFY of production, treatment and conveyance capacity. Make-Up Water may be applied towards the amount of deliveries curtailed by Western in order to reduce or eliminate the amount of the Curtailment Payment. Should Riverside be unable to deliver any portion of the 2,000 AFY of Riverside Water during any year of this Agreement, Western shall not be obligated to such curtailment payment for that portion of the Western Water that Riverside is not able to deliver for that year.

6.2.3 Riverside Water shall not be subject to Curtailment Payment until January 1, 2018.

6.3 Operating Plan:

6.3.1 Western and Riverside will work collaboratively to develop a mutually agreeable Operating Plan, in the format of the example in Exhibit A. Two (2) original copies of the initial Operating Plan setting forth the services requested, signed by Western's Authorized Representative, shall be submitted to Riverside's Authorized Representative no

later than November 1 of each year for the following calendar year and shall specify the services requested by Western, including, but not limited to, the date(s) of service, the quantities of water involved, the origin of any water to be conveyed by Riverside, the groundwater basin of origin in the case of Production Services, and the Points of Receipt and Points of Delivery. The Operating Plan can be adjusted monthly by mutual agreement.

6.3.2 If Riverside's Authorized Representative reasonably determines that Western's initial proposed Operating Plan is feasible and consistent with Prudent Utility Practice and the operation of Riverside's water extraction, transmission, distribution and treatment systems, Riverside's Authorized Representative shall countersign both copies of the proposed Operating Plan and return one (1) fully executed copy to Western. Unless otherwise communicated in writing to Western, Riverside shall provide the Production, Treatment and Conveyance Services specified in the fully executed Operating Plan, subject to the terms of this Agreement. In the event Riverside reasonably determines that an Operating Plan is not feasible and/or is not consistent with Prudent Utility Practice, Riverside shall provide such notice to Western within 30 days and the Parties shall then engage in good faith negotiations to resolve said issues and to develop a mutually agreeable Operating Plan. The failure of Riverside to provide an executed copy of the Plan, or to provide notice within 30 days that a Plan is infeasible, shall constitute Riverside's approval of the Plan.

6.3.3 If an Operating Plan has not been countersigned by Riverside in accordance with Section 6.3.2, and Riverside has sent the notice in accordance with section 6.3.2, the General Managers from Western and Riverside will meet and confer to forge a compromise by January 1. Should the General Managers be unable to reach a resolution by January 1, both Parties agree to mediation and shall share the expense of mediation equally. Such mediation shall be completed by March 1, unless the Parties mutually agree to an extension.

6.3.4 Riverside shall provide Production, Treatment and Conveyance Services from October 1 through May 31 and shall make diligent good faith efforts to provide such services every month of the year.

6.4 Operating Committee Meetings: The Authorized Representatives shall annually conduct at least one coordination meeting during the term of this Agreement. It is anticipated that said meeting will take place in the fall of each year prior to November 1 and may include, for example and not by way of limitation, the following agenda items:

(a) Actual energy and Operations and Maintenance costs as well as reconciliation of payments for the previous year;

(b) Calculation of the Commodity Charge for Riverside Water;

(c) Operational challenges of the past year;

(d) Projected costs for the upcoming year;

(e) Operational planning for the upcoming year;

(f) A 5-year projection of capital improvements that may be necessary to fulfill deliveries to Western;

(f) Review components of and the cost calculation of the Capital Recovery Component; and

(g) Other items necessary to ensure successful fulfilment of the terms of this Agreement as determined in the discretion of each Party.

7. MEASUREMENT OF WATER PRODUCED OR CONVEYED:

7.1 Any metering devices used to measure the delivery of water under this Agreement at a Point of Interconnection shall be owned by Riverside and shall be installed, operated, calibrated, and maintained in accordance with Riverside's standard requirements. Any such metering devices shall be maintained directly by Riverside or by agents or subcontractors directly under Riverside's control.

7.2 Riverside shall inspect and test the metering devices at least once per calendar year, unless more frequent testing and inspection is appropriate as a result of repairs to or replacements of a metering device. Riverside shall provide reasonable advance notice to Western of any such testing or inspection in order to permit a representative of Western to witness such activities, and shall provide Western with copies of any periodic or special inspection or testing reports relating to the metering devices upon request by Western. Western, at its own expense, may request in writing that Riverside initiate additional testing and inspection of the metering devices, and Riverside shall comply with any such request as soon as practical after the request is made.

7.3 As part of this agreement, Riverside shall recalibrate or replace all existing metering devices prior to December 1, 2017.

8. [RESERVED]

9. <u>CONTINUITY OF SERVICE:</u>

9.1 Riverside reserves the right to curtail Production, Treatment and Conveyance Services hereunder; (i) upon reasonable advance notice to Western to make repairs, replacements, modifications, or to perform maintenance work, all for the purpose of maintaining continuity of Production, Treatment and Conveyance Services, or (ii) without notice to Western because of an existing or impending Uncontrollable Force, as determined in Riverside's sole judgment which shall not be unreasonably exercised.

9.2 Notwithstanding the provisions of Section 9.1, Riverside may interrupt or curtail Production, Treatment, and Conveyance Services to the extent that the continued provision of such services could, in Riverside's sole judgment which shall not be unreasonably exercised, (i) adversely affect the quality, reliability or cost of service related to water deliveries by Riverside to its retail customers, (ii) cause Riverside to violate the terms of any rule, regulation, or binding obligation it may otherwise have with respect to the production, treatment or delivery of water, (iii) Riverside experiences a significant loss of extraction capacity, export rights,

treatment capacity, and/or conveyance capacity in any portion of its water system, or (iv) in accordance with Prudent Utility Practice.

10. RATES AND CHARGES:

10.1 Western Water: For Western Water Production, Treatment and Conveyance Services rendered by Riverside to Western hereunder, Western shall pay the following rate(s) per acre-foot of water, or portion thereof, applicable to the service provided.

10.1.1 Energy Component: The Energy Component of the rates for Western Water Services shall be in accord with the pricing sheets referenced in Section 10.6 below. For fiscal year 2017-18, a single average energy unit cost of $115 per acre-foot will be used for the monthly energy costs. Prior to each November 1 of the Agreement term, the actual costs per Section 10 shall be reconciled against the prior invoiced costs and the difference shall be invoiced or credited in accordance with Section 10.4. Each subsequent year, the prior year's actual average unit costs for energy will be used in the monthly billing for the following 12-months until a new reconciliation occurs.

10.1.2 O&M Component: The O&M Component of the rates for Western Water shall be in accord with the pricing sheets referenced in Section 10.6 below. For fiscal year 2017-18, a single average O&M unit cost of $142 per acre foot will be used for the monthly O&M costs. Prior to each November 1 of the Agreement term, the actual costs per Section 10 shall be reconciled against the prior invoiced costs and the difference shall be invoiced or credited in accordance with Section 10.4. Each subsequent year, the prior year's actual average unit costs for O&M will be used in the monthly billing for the following 12-months until a new reconciliation occurs.

10.1.3 Capital Recovery Component: The Capital Recovery Component of the rates for Western Water shall be in accord with the pricing sheets referenced in Section 10.6 below. The Capital Recovery Component will be comprised of costs for the conveyance of Western Water, including but not limited to Riverside's Waterman Wells,

Waterman Supply Transmission Pipeline, Distribution System Transmission Lines, and Booster Stations, as further described and identified on the schematic illustration included in Exhibit C and incorporated herein by reference. For fiscal year 2017-18, an average blended rate of $260 per acre-foot will be used. The Capital Recovery Component shall be annually adjusted to reflect the percentage increase, if any, in the Consumer Price Index for all Urban Consumers for the Los Angeles-Anaheim-Riverside area published by the United States Department of Labor, Bureau of Labor Statistics (1982/84=100) ("CPI"). The Parties agree to annually review the cost elements and, if warranted by mutual consent of the Parties, reset the Capital Recovery Component to reflect then current costs. New or upgraded facilities that are constructed after the date of this agreement, which are clearly shown to benefit the Production, Treatment and Conveyance Services provided to Western, will be added to and incorporated into the Capital Recovery Component. Riverside shall only include costs for new or upgraded facilities which are used to convey water to Western.

10.2 Riverside Water: Western agrees to pay Riverside the Energy, O&M, and Capital Recovery Component charges, as described in Section 10.1, and a Commodity Price. Both Parties agree to use a "Shared Benefit Methodology" to calculate the Commodity Price of the Riverside Water and the savings to Western in relation to the MWD Tier 1 cost. The Shared Benefit Methodology is intended to establish an all-inclusive price that equally splits the difference between Riverside's rate to deliver Western Water, less Western's weighted average transmission and delivery costs at all current and future interconnections, and the MWD Tier 1 cost for that applicable year. The difference between the calculated all-inclusive price and Riverside's rate to deliver Western Water will be deemed to be the commodity price ("Commodity Price"). An example of said calculation and escalation is set forth below:

10.2.1 Example - If Riverside's cost to deliver Western Water is $517 per acre-foot, Western's pumping cost is $60 per acre-foot and the MWD Tier 1 cost is $979 per acre-foot, then the total cost to deliver Riverside Water to Western would be ($517 - $60 +

$979) / 2) = $718. MWD Tier 1 cost for the applicable year is _____.

10.2.2 The price would be set for fiscal year 2017-18 and calculated annually prior to November 1, through 2026 based on the cost structure described above.

10.2.3 Reconciliation: Prior to each November 1 of the Agreement term, the actual Commodity Price will be determined based on actual costs per Section 10.2 and the costs shall be reconciled against the prior invoiced costs and the difference shall be invoiced or credited in accordance, with Section 10.4. Each subsequent year, the prior year's actual average unit costs for energy and O&M, along with the Capital Recovery Component and the published MWD Tier 1 costs for the coming year will be used in the monthly billing for the following 12-months; or, until a new reconciliation occurs.

10.3 Basis of Billing: All costs shall be accrued based on the reading of Riverside's meter(s); all water produced and conveyed through Riverside's water system shall be billed based on the meter reading at the Point of Interconnection.

10.4 Invoicing and Reconciliation of Costs: For each monthly billing cycle, Riverside shall invoice Western in accordance with Section 11 of this Agreement for the costs detailed in this Section 10. Prior to each November 1 of the Agreement term, the actual costs per Section 10 shall be reconciled against the prior invoiced costs and the difference shall be invoiced or credited. Each subsequent year, the prior year's actual average unit costs for energy and O&M will be used in the monthly billing for the following 12-months; or, until a new reconciliation occurs.

10.5 Pricing Sheets: The pricing sheet for the Energy, Operations & Maintenance ("O&M") and Capital Recovery components to be charged by Riverside are set forth in Exhibit "B" attached hereto and incorporated herein by reference. The pricing sheet for the Western Water and the Riverside Water, including the Shared Benefit Methodology to be charged by Riverside, are set forth in Exhibit "D" attached hereto and incorporated herein by reference.

11. BILLING AND PAYMENT:

11.1 Riverside shall bill Western for charges due hereunder by the fifteenth (15^{th}) day of each month for services rendered during the prior month, including any required adjustments to bills previously paid by Western. Western shall pay such bills not later than the fifth (5^{th}) day of the month following the month in which bill is issued, or on the first business day thereafter if the fifth (5^{th}) day falls on a Saturday, Sunday, or holiday. Payments which are not made in full by said due dates shall thereafter accrue interest at the lesser of (i) one percent (1%) per month of the unpaid balance, or (ii) the maximum rate otherwise permitted by law applicable to this Agreement, prorated by days until payment is sent by Western.

11.2 In the event any portion of any bill is disputed, Western shall pay the bill, including the disputed amount, under protest when due. If the protested portion of the payment is found to be incorrect, Riverside shall promptly refund the protested portion, including interest at the lesser of (i) one percent (1%) per month, or (ii) the maximum rate otherwise permitted by law applicable to this Agreement, prorated by days from the date of payment by Western to the date the refund check is sent or the refund payment is otherwise made by Riverside.

11.3 If Western does not dispute in writing any billing within one hundred eighty (180) days after the bill was rendered by Riverside, Western shall be deemed to have waived any further or continuing right to dispute such bill.

11.4 Unless otherwise agreed by the Authorized Representatives, bills shall be rendered and remittances made by their submission to the following addresses:

Bills rendered by Riverside to Western:

Western Municipal Water District
14205 Meridian Parkway
Riverside, CA 92518

Payments made by Western to Riverside:

City of Riverside
Accounts Receivable
3900 Main Street
Riverside, CA 92522

11.5 If the Parties are each required to pay an amount to each other in the same calendar month under this Agreement, then such amounts with respect to each Party may be aggregated and the Parties may discharge their obligations to pay through netting of the respective amounts due, in which case the Party, if any, owing the greater aggregate amount may pay to the other Party the difference between the amounts owed.

11.6 The Parties shall conduct an audit at least once every five (5) years during the term of this Agreement in order to determine the accuracy of the calculations required to be performed for the costs and cost escalators under this Agreement. The Parties shall each pay one-half of the cost of said audits.

12. **AUTHORIZED REPRESENTATIVES:** The Parties warrant that their Authorized Representatives have the authority to bind the respective Party to all relevant commitments under this Agreement. Initially, the Parties' Authorized Representatives shall be the individuals holding the positions set forth in the notice provisions of Section 29. Any Party may at any time change the designation of its Authorized Representative by written notice to the Authorized Representatives of the other Party. Each Party's Authorized Representative is authorized to act on its behalf in the implementation of this Agreement and with respect to those matters contained herein which are the functions and responsibilities of the Authorized Representatives. Each Authorized Representative may delegate actual performance of such functions and responsibilities; provided, that any agreement of the Authorized Representatives required to be in writing shall be signed by the Authorized Representatives.

13. **LIABILITY AND INDEMNIFICATION:**

13.1 Limitation of Liability: Except as to the gross negligence or Willful

Misconduct of a Party, each Party shall release and hold harmless the other Party from and against any and all liability, loss, damage, and expense arising from, alleged to arise from, in connection with, or incident to the services rendered under this Agreement.

13.2 Limitation on Damages: No Party shall be liable for any consequential, incidental, punitive, special, or exemplary damages or lost opportunity costs, lost profit, or other business interruption damages, by statute or in tort or contract, under any provision of this Agreement.

13.3 Indemnification: Notwithstanding Section 13.1, each Party shall indemnify, defend, and hold harmless the other Party, its directors, members, officers, employees, and agents from and against any and all third-party claims, suits, or actions instituted on account of personal injuries or death of any person (including but not limited to workers and the public) or physical damage to property resulting from or arising out of the indemnitor's Willful Misconduct or grossly negligent act or omission while engaged in the performance of obligations or exercise of rights under this Agreement.

13.4 Definition of Willful Misconduct: For purposes of this Agreement, Willful Misconduct shall be defined as:

13.4.1 Action taken or not taken by a Party at the direction of its directors or other governing body, officers, or employees having management or administrative responsibility affecting its performance under this Agreement, which:

13.4.1.1 Is knowingly or intentionally taken or not taken with conscious indifference to the consequences thereof or with intent that injury or damage would result or would probably result therefrom;

13.4.1.2 Has been determined by final arbitration award or judgment or judicial decree to be a material default under this Agreement, and which action occurs or continues beyond the time specified in such arbitration award or judgment or judicial decree for curing such default, or, if no time to cure is specified therein, occurs or continues

thereafter beyond a reasonable time to cure such default; or

13.4.1.3 Is knowingly or intentionally taken or not taken with the knowledge that such action taken or not taken is a material default under this Agreement.

13.4.2 As used in this definition:

13.4.2.1 Willful Misconduct does not include any act or failure to act which is merely involuntary, accidental, or negligent.

13.4.2.2 The phrase "employees having management or administrative responsibility" means those employees of a Party who are responsible for one or more of the executive functions of planning, organizing, coordinating, directing, controlling, and supervising such Party's performance under this Agreement, with responsibility for results.

14. **RELATIONSHIP OF THE PARTIES:** The covenants, obligations, and liabilities of the Parties are intended to be several and not joint or collective, and nothing herein contained shall ever be construed to create an association, joint venture, trust, or partnership, or to impose a trust or partnership covenant, obligation, or liability on or with regard to any Party. Each Party shall be individually responsible for its own covenants, obligations, and liabilities as herein provided. No Party shall be under the control of or shall be deemed to control the other Party. Neither Party shall be the agent of or have a right or power to bind the other Party without such other Party's express written consent, except as provided in this Agreement.

15. **UNCONTROLLABLE FORCES:** If the existence of an Uncontrollable Force disables a Party from performing its obligations under this Agreement (except for such Party’s obligations to make payments hereunder), such Party shall not be considered to be in default in the performance of any such obligations while such disability of performance exists. A Party rendered unable to fulfill any of its obligations under this Agreement by reason of an Uncontrollable Force shall exercise due diligence to remove such inability with all reasonable dispatch. Nothing contained herein shall be construed so as to require a Party

to settle any strike or labor dispute in which it may be involved.

16. **AUDITS:** Each Party shall have the right to audit any costs, payments, settlements, or other supporting information pertaining to this Agreement. Any such audit shall be undertaken by the requesting Party or its representative at reasonable times and in conformance with generally accepted auditing standards. The audited Party shall fully cooperate with any such audit, the cost of which shall be paid by the requesting Party. The right to audit a billing shall extend for a period of three (3) years following the rendering of the bill. Each Party shall retain all necessary records or documentation for the entire length of such three (3) year period and shall, to the extent permitted by law, take all steps reasonably available to assure the confidentiality of the audited Party's accounting records and supporting documents.

17. **THIRD PARTY BENEFICIARIES:** Unless otherwise specified in this Agreement, there are no third party beneficiaries to this Agreement. This Agreement shall not confer any right or remedy upon any person or entity other than the Parties and their respective successors and assigns permitted under Section 19. This Agreement shall not release or discharge any obligation or liability of any third party to any Party or give any third party any right of subrogation or action over or against any Party.

18. **DISPUTE RESOLUTION:**

18.1 The Parties' Authorized Representatives shall attempt to amicably and promptly resolve any dispute arising between the Parties under this Agreement. Nothing in this Agreement shall preclude either Party from taking any lawful action it deems appropriate to enforce its rights under this Agreement.

18.2 Any action at law or in equity brought by either of the parties hereto for the purpose of enforcing a right or rights provided for by this Agreement shall be tried in the Superior Court of the County of Riverside, State of California, and the parties hereby waive all provisions of law providing for a change of venue in such proceedings to any other

county. This agreement shall be governed, construed, and enforced in accordance with the laws of the State of California, without regard to its conflict of laws rules.

18.3 In the event either party hereto shall bring suit to enforce any term of this Agreement or to recover any damages for and on account of the breach of any term or condition of this Agreement, it is mutually agreed that each party will bear their own attorneys' fees and costs.

19. **ASSIGNMENT OF INTERESTS:**

19.1 Neither Party shall assign this Agreement without the prior written consent of the other Party, which consent shall not be unreasonably withheld or delayed. Western expressly understands and agrees that it shall not be unreasonable for Riverside to withhold or delay its consent to any proposed or purported assignment by Western to any person or entity ("Assignee") that has not demonstrated to Riverside's reasonable satisfaction that Riverside's interests as contemplated herein will not be adversely effected thereby.

19.2 Any assignment by a Party of its interest in this Agreement which is made without the prior written consent of the other Party shall not relieve the assigning Party from primary liability for any of its duties and obligations under this Agreement, and in the event of any such assignment, the assigning Party shall continue to remain primarily liable for payment of any and all money due the other Party as provided under this Agreement, and for the performance and observance of all covenants, duties, and obligations to be performed and observed under this Agreement by the Party to the same extent as though no assignment had been made.

19.3 Whenever an assignment of a Party's interest in this Agreement is made with the written consent of the other Party, the assigning Party's assignee shall expressly assume in writing the duties and obligations under this Agreement of the assigning Party and, within thirty (30) days after any such assignment and assumption of duties and obligations, the assigning Party shall furnish, or cause to be furnished, to the other Party a true and correct

copy of such assignment and assumption of duties and obligations. Upon the effective date of such assignment, the assigning Party shall be relieved of its obligations and duties under this Agreement.

19.4 Subject to the foregoing restrictions on assignment, this Agreement shall be binding upon, inure to the benefit of and be enforceable by the Parties and their respective successors and assigns.

20. **NO DEDICATION OF FACILITIES:** Any undertaking by a Party to the other Party under this Agreement shall not constitute the dedication of the system, or any portion thereof, of that Party to the public or to the other Party, nor affect the status of that Party as an independent system.

21. **COMPLETE AGREEMENT:** This Agreement contains the entire agreement and understanding between the Parties as to the subject matter of this Agreement and supersedes all prior commitments, representations, and discussions between the Parties.

22. **CONSTRUCTION OF AGREEMENT:** Ambiguities or uncertainties in the wording of this Agreement shall not be construed for or against either Party, but shall be construed in a manner that most accurately reflects the intent of the Parties when this Agreement was executed and is consistent with the nature of the rights and obligations of the Parties with respect to the matter being construed.

23. **NONDISCRIMINATION:** During the performance of this Agreement, neither Party shall deny the Agreement's benefits to any person, nor shall either Party discriminate unlawfully against any employee or applicant for employment, on the ground or because of race, color, creed, national origin, ancestry, age, sex, sexual orientation, marital status, or disability including the medical condition of Acquired Immune Deficiency Syndrome (AIDS) or any condition related thereto. Each Party shall insure that the evaluation and treatment of employees and applicants for employment are free of such discrimination.

24. **EVENTS OF DEFAULT:** In the event that a Party shall materially default in the

performance of its obligations under this Agreement, the Authorized Representative of the non-defaulting Party may give written notice of the default to the Authorized Representative of the defaulting Party. If within thirty (30) days after the non-defaulting Party's Authorized Representative shall have given such written notice to the defaulting Party's Authorized Representative, the defaulting Party shall have failed to cure the default in its performance of this Agreement, or if such default requires more than thirty (30) days to cure and the defaulting Party fails to commence such cure and diligently prosecute such cure to completion, in addition to any other remedies provided by law, the non-defaulting Party may terminate this Agreement by written notice of termination as provided for in Section 5.2.2. In addition to any other cause of default arising hereunder, a Party shall be in default if:

24.1 It becomes insolvent; or

24.2 It makes a general assignment of substantially all of its assets for the benefit of its creditors, files a petition for bankruptcy or reorganization or seeks other relief under any applicable insolvency laws; or

24.3 It has filed against it a petition for bankruptcy, reorganization or other relief under any applicable insolvency laws and such petition is not dismissed within sixty (60) days after it is filed.

25. **AMENDMENTS:** This Agreement may be modified, supplemented or amended only by a writing duly executed by the Parties.

26. **WAIVERS:** Any waiver at any time by any Party of its rights with respect to a default under this Agreement, or with respect to any other matter arising in connection with this Agreement, shall not be deemed a waiver with respect to any subsequent default or other matter arising in connection therewith. Any delay, short of the statutory period of limitation in asserting or enforcing any right, shall not be deemed a waiver of such right.

27. **SECTION HEADINGS:** All captions and headings appearing in this Agreement are inserted to facilitate reference and shall not govern, except where logically necessary, the

interpretations of the provisions hereof.

28. **GOVERNING LAW:** This Agreement shall be interpreted, governed by, and construed under the laws of the State of California or the laws of the United States as applicable, as if executed and to be performed wholly within the state of California.

29. **NOTICES:**

29.1 Any notice, demand or request provided for in this Agreement, or served, given or made in connection with it, shall be in writing and shall be deemed properly served, given or made if delivered in person or sent by United States mail, postage prepaid, to the persons specified below, unless otherwise provided for in this Agreement:

To City of Riverside:	**To Western:**
City of Riverside Public Utilities Department 3750 University Ave., 3rd floor Riverside, CA 92501 Attn: General Manager	Western Municipal Water District 14205 Meridian Parkway Riverside, CA 92518 Attn: General Manager

29.2 Either Party may at any time, by written notice to the other Party, change the designation or address of the person so specified as the one to receive notices pursuant to this Agreement.

30. **SIGNATURE CLAUSE:** The signatories hereto represent that they have been appropriately authorized to enter into this Cooperative Agreement for Water Production and Conveyance on behalf of the Party for whom they sign.

RIVERSIDE – WESTERN
2017 COOPERATIVE AGREEMENT FOR
LONG-TERM WHEELING AND SURPLUS WATER SALES

EXHIBIT A

EXAMPLE OPERATING PLAN

CALENDAR YEAR 2018 OPERATING PLAN

FOR

COOPERATIVE AGREEMENT FOR LONG-TERM WHEELING AND SURPLUS WATER SALES

BETWEEN THE CITY OF RIVERSIDE AND WESTERN MUNICIPAL WATER DISTRICT

The Operating Committee, comprised of representatives from the City of Riverside (Riverside) and Western Municipal Water District (Western) agree to the delivery schedule in Table 1 for Calendar Year 2018.

Table 1. Calendar Year 2018 Delivery Schedule (acre-feet)

Source Water	Jan	Feb	Mar	Apr	May	Jun*	Jul*	Aug*	Sep*	Oct	Nov	Dec	TOTAL
Western Water	925	925	925	925	925	*No guaranteed deliveries.				775	-	-	5400
Riverside Water	-	-	-	-	-	*If capacity exists, deliveries may occur.				150	925	925	2000
TOTAL	**925**	**925**	**925**	**925**	**925**					**925**	**925**	**925**	**7408**

Per the Cooperative Agreement, if the delivery schedule above is unattainable, the Operating Committee has the ability to, upon mutual agreement to adjust monthly delivery targets and/or make-up up to 500 acre-feet of deliveries in the next calendar year.

2017 COOPERATIVE AGREEMENT FOR
LONG-TERM WHEELING AND SURPLUS WATER SALES

EXHIBIT B

PRICING SHEETS FOR ELECTRICITY, O&M AND CAPITAL RECOVERY COMPONENTS

EXHIBIT 'B'

EXAMPLE PRICING SHEET FOR THE RIVERSIDE -WESTERN WHEELING & SURPLUS WATER SALES AGREEMENT

(Electricity, O&M, and Capital Recovery Components)

Not Part of the Agreement. For Example Only.

	Escalator	Mockingbird PS (Van Buren Highline)	Whitegates (Green Orchard BS)	Blended Rate
Electricity		$/AF	$/AF	$/AF
Average Electrical Pumping Cost Estimate[1]	Based on Actuals	$94	$157	$115
Operations & Maintenance (O&M)				
Supply Operations Cost[2]		$62	$62	$62
Distribution Operations Cost[3]	Based on	$42	$42	$42
Supply & Distribution Maintenance Cost[4]	Actuals	$2	$2	$2
Average Capitalized Pump & Well Maintenance Cost[5]		$36	$36	$36
O&M Subtotal:		$142	$142	$142
Capital Recovery				
Waterman Wells[6]		$44	$44	$44
Waterman Supply Transmission Pipeline[7]		$105	$105	$105
Distribution System Transmission Lines[8]	ENR LA Metro CCI	$66	$133	$89
Reservoir Storage[9]		$0	$0	$0
Booster Stations[10]		$12	$42	$22
Capital Recovery Subtotal:		$227	$324	$260
Total ($/AF):		$463	$623	$517
AFY to Deliver:		4,908	2,500	

Notes: (Capital Recovery & Maintenance costs related only to RPU Water Facilities along hydraulic path to Western Delivery Points.)

1. Average annual electrical unit cost for water delivery to Mockingbird & Whitegates Western Delivery Points based on actual electrical billings in 2015. Used average electrical cost from Amendment 1 as presented in Energy Cost Sheet.
   Electrical Charge, will be trued up at the end of each year. The previous years information will be used to establish a baseline for the coming year.
   At the end of each year, the costs will be trued-up based on actuals and a debit/credit will be issued.

2. Operations $/AF Unit Cost for Bunker Hill Basin (Waterman Supply Transmission Pipeline) Water Production. Calculated in Operations & Maint. Sheet, under Exhibit C.
   Water Fund Cost Center total spending proportional to share of power cost for water production of Waterman wells for FY 2013-2014.
   FY 2013-2014 Water Fund Cost Center 6200000 (Water Production & Operations) [41, 42, & 88 Only] Less Line Item Accounts:
   a. Settlement Reimbursements b. 422200 (Power Costs) c. 422923 (Capacity/Standby Charges) d. 447100 (Taxes and Assessments)
   The sum of the cost components divided by the total production of Waterman wells (including production associated with Western acquired supplies) will be the basis for the Supply Operations Cost.

3. Operations $/AF Unit Cost for Linden/Evans Reservoir (Potable Water System) Water Distribution. Calculated in Operations & Maint. Sheet, under Exhibit C.
   Water Fund Cost Center total spending proportional to share of power cost for water distribution for FY 2013-2014.
   FY 2013-2014 Water Fund Cost Center 6200000 (Water Production & Operations) [41, 42, & 88 Only] Less Line Item Accounts:
   a. 422200 (Power Costs) b. 422923 (Capacity/Standby Charges) c. 447100 (Taxes and Assessments)
   The sum of the cost components divided by the total potable water sales (including Western acquired supplies) will be the basis for the distribution Operations Cost.

4. Maintenance $/AF Unit Cost for Bunker Hill Basin (Waterman Supply Transmission Pipeline) Production and Linden/Evans Reservoir (Potable Water System) Distribution. Calculated in Operations & Maint. Sheet, under Exhibit C.
   Water Fund Cost Center total spending proportional to RPU retail water sales for FY 2013-2014.
   1a. Total capital replacement cost of Bunker Hill Basin (Waterman Supply Transmission Pipeline) production system divided by total water production from Waterman Wells (including Western acquired supplies)
   2a. Total capital replacement cost of Linden/Evans Reservoirs to 1200 Zone Mockingbird and 1700 Zone Whitegates Deliveries divided by total potable water sales (including Western acquired supplies)
   FY 2013-2014 Water Fund Cost Center 6205000 (PU Water Field Operations/Maintenance) divided by total RPU Water System capital replacement cost, equated to 0.58%
   1b. Resulting capital replacement cost ($/AF) multiplied by 0.58% for apportioned production system maintenance cost
   2b. Resulting capital replacement cost ($/AF) multiplied by 0.58% for apportioned distribution system maintenance cost
   Western's wheeled water flow weighted proportional unit cost obtained from resulting apportioned production & distribution system maintenance cos
   O&M, will be trued up at the end of each year. The previous years information will be used to establish a baseline for the coming year.
   At the end of each year, the costs will be trued-up based on actuals and a debit/credit will be issued.

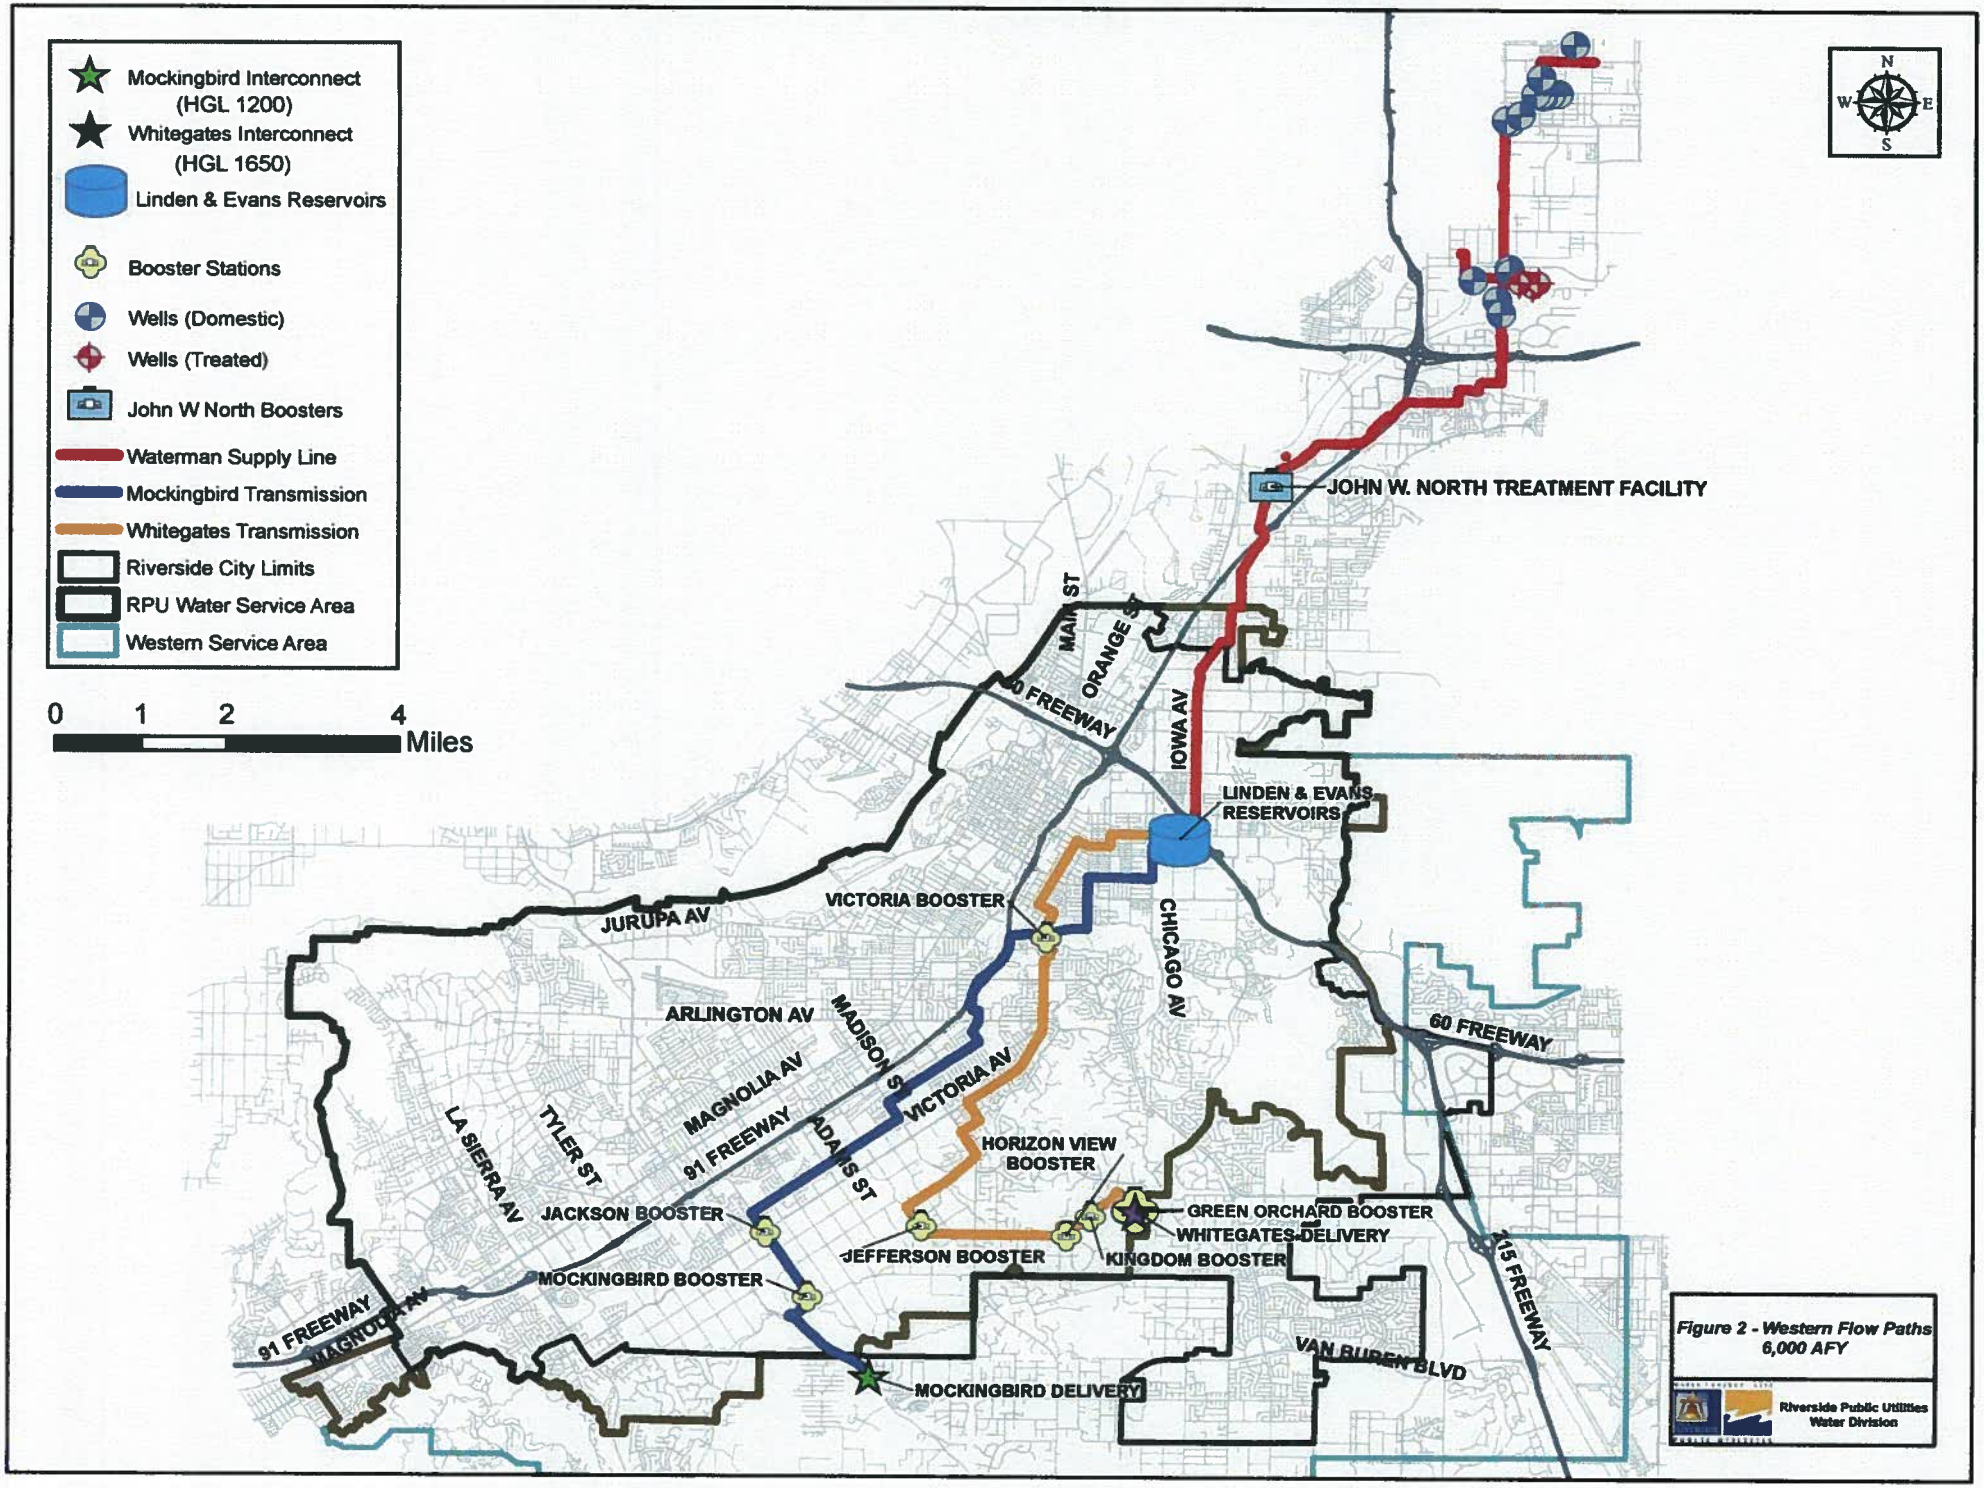
5. Average Capitalized Maintenance Unit Cost for all RPU Pumps & Wells. Calculated in Operations & Maint. Sheet, under Exhibit C.
   FY 2013-2014 Water Fund Cost Center 6200000 (Facility Rehabilitation, 470803).
   Total Facility Rehab cost for FY 2013-2014 divided by the total potable water sales will be the basis for the Pump & Well Maintenance Cost.

6. $/AF Unit cost for replacement of existing RPU wells over 100 year life cycle at 5% interest. Calculated in Capital Recovery Sheets, under Waterman Wells.

7. $/AF Unit cost for replacement of existing RPU Waterman Supply Transmission Pipeline over 120 year life cycle at 5% interest. Calculated in Capital Recovery Sheets, under Waterman Supply Line.

8. $/AF unit cost for replacement of existing RPU Distribution System Transmission waterlines over 120 year life cycle at 5% interest. Calculated in Capital Recovery Sheets, under Distribution System Transmission Lines.

9. Reservoir usage not critical during non-firm deliveries. During high demands, reservoir capacity reserved for RPU Customers. During high demands, reservoir capacity reserved for RPU Customers.



10. $/AF unit cost for replacement of existing RPU Booster Stations over 60 year life cycle at 5% interest. Calculated in Capital Recovery Sheets, under Pump Stations.

Appendix I Meeks and Daley/EVMWD Lease Agreement

AGREEMENT BETWEEN THE ELSINORE VALLEY MUNICIPAL WATER DISTRICT AND THE WESTERN MUNICIPAL WATER DISTRICT REGARDING THE LEASE OF GROUNDWATER RIGHTS EXPORTABLE FROM THE SAN BERNARDINO BASIN AREA

THIS LEASE OF GROUNDWATER RIGHTS ("Lease") is entered into as of the latest date of signatory execution shown in Section 8.8, by and between ELSINORE VALLEY MUNICIPAL WATER DISTRICT ("EVMWD" or "Lessor"), a municipal water district and WESTERN MUNICIPAL WATER DISTRICT ("WESTERN" or "Lessee"), a municipal water district, each a "Party" and collectively referred to herein as "Party" or "Parties." This Lease shall take effect on January 1, 2021 (the "Effective Date").

RECITALS

A. Meeks & Daley Water Company ("MDWC"), a mutual water company and California corporation, or its predecessors in interest, is a party to the judgment known as Western Municipal Water District of Riverside County v. East San Bernardino County Water District. et al., Riverside County Superior Court Case No. 78426 (1969), as amended on February 28, 1992 (the "Judgment").

B. Pursuant to the Judgment, MDWC has 7,833 Acre Feet (AF) of water rights (the "Water Rights") to extract groundwater from the Bunker Hill Basin of the San Bernardino Basin Area (the "SBBA") as the SBBA is defined therein.

C. In 1989, EVMWD purchased the Temescal Water Company, which owned an interest and entitlement to water from MDWC. As a result of that purchase, EVMWD now owns a controlling interest in MDWC's right to produce and export 4,680.6 AF of groundwater (the "Lease Water") each year from the Bunker Hill Basin of the SBBA. Pursuant to the Judgment, the Lease Water shall increase or decrease in quantity as necessary to satisfy the "New Conservation" provision as that term is defined in the Judgment.

D. On August 23, 2001, Lessee and Lessor entered into the agreement entitled *Agreement Between the Western Municipal Water District of Riverside County and the Elsinore Valley Municipal Water District for the Reciprocal Use of Certain Assets Related to the Production and/or Conveyance of Water* (hereinafter "Reciprocal Use Agreement"), whereby Lessee may utilize Lessor's Lease Water in exchange for Lessor's utilization of Lessee's owned capacity in the Mills Gravity Pipeline. From 2001 to 2020, WESTERN received water from the Bunker Hill Basin of the SBBA pursuant to the Reciprocal Use Agreement and EVMWD's rights to MDWC water under the Judgment.

E. Lessee desires to lease the Lease Water from Lessor and Lessor desires to lease the Lease Water to Lessee pursuant to the terms of this Lease.

F. In 2017, Lessee entered into the Water Production, Conveyance and Surplus Sales Agreement (the "Wheeling Agreement") with the City of Riverside ("Riverside") whereby Riverside extracts and conveys to WESTERN both MDWC water and Riverside surplus water that it obtains from the SBBA. Pursuant to the Wheeling Agreement, Riverside will deliver Lease Water to WESTERN until 2037, unless extended.

OPERATIVE PROVISIONS

NOW, THEREFORE, in consideration of the facts set forth above and the covenants, conditions and promises set forth below, the Parties hereto agree as follows:

Section 1. Terms.

1.1 Incorporation of Recitals. The Parties hereby affirm the truth of the facts set forth in the Recitals and incorporate the Recitals as if set forth in full herein.

1.2 Lease of Lease Water. Lessor agrees to lease the Lease Water to Lessee and Lessee agrees to lease the Lease Water from Lessor pursuant to the terms herein.

Section 2. Lease Term.

2.1 Term of Lease. Subject to the early termination provisions in Section 8 below, this Lease shall have a term of twenty (20) years (the "Term") commencing on the Effective Date and terminating automatically on December 31, 2041, unless extended pursuant to Section 2.2.

2.2 Extensions. The Term in Section 2.1 may be extended in five (5) year increments up to four (4) times for an additional twenty (20) years if agreed to in writing by the Parties. Should WESTERN desire to extend the Term, it shall notify EVMWD in writing at least one hundred and eighty (180) days prior to the then applicable expiration date. Upon WESTERN providing written notification to EVMWD requesting a lease extension, EVMWD shall respond to WESTERN within ninety (90) days confirming approval or denial of the request for lease extension.

2.3 No Continuing Obligation to Provide Water Upon Expiration of Term. Lessor shall have no continuing obligation to Lessee: (i) to extend or renew the Term of this Lease, (ii) to lease the Lease Water following the expiration or early termination of this Lease, or (iii) pertaining to the Water Rights whatsoever following the expiration or early termination of this Lease.

Section 3. Rate, Guarantee and Payment.

3.1 Base Rate. In year one of this Lease, Lessee shall pay Lessor one hundred ninety-eight dollars and ninety one cents ($198.91) per acre foot (the "Base Rate") multiplied by 4,680.6 AF (the "Lease Water").

3.2 Guarantee. Unless one of the Payment Exceptions in section 3.5 applies, Lessee shall purchase the entire amount of "Lease Water" from Lessor every year.

3.3 Escalator. Beginning one (1) year after the Effective Date and continuing every year during the Term of this Lease, the Base Rate shall increase according to the non-seasonally adjusted, average Consumer Price Index (CPI-U) for all items and for all urban consumers in Los Angeles-Long Beach-Anaheim, CA, plus one (1) percent (the "Escalator"). However, the Escalator shall not be less than two and one quarter (2.25) percent or greater than four and one quarter (4.25) percent.

3.4 Yearly Escalation of Lease Rate. In the first year of the lease, EVMWD shall increase the Base Rate by the Escalator to determine the lease rate ("Lease Rate"). Every year thereafter, EVMWD shall increase the then current Lease Rate by the Escalator to determine the then current Lease Rate for the following year. Lessor shall calculate the Escalator annually, after the Effective Date, utilizing the August CPI-U. On or before October 1st, during the Term of the Lease, Lessor shall provide written notice to Lessee of the Escalator for the next calendar year based on Section 3.3 and the new Lease Rate

3.5 Payment Exceptions. Payment for Lease Water shall be reduced by the amount of water not delivered or available for delivery as a result of the following limited circumstances (the "Payment Exceptions") only:

3.5.1 Riverside, through no fault of Lessee, is unable or unwilling to deliver all of the Lease Water;

3.5.2 The Safe Yield of the SBBA, as that term is defined in the Judgment, is recalculated or otherwise revised by the Watermaster or a Court of competent jurisdiction, reducing the amount of Lease Water that may be extracted;

3.5.3 The parties to the Judgment agree to reduce extractions and/or exports from the SBBA, or WESTERN and EVMWD agree in writing to reduce extractions from the SBBA;

3.5.4 A court of competent jurisdiction or a regulatory agency with legal authority over the matter directs that the export of Lease Water by Lessee from the SBBA be reduced or curtailed; or

3.5.5 SBBA water quality prevents delivery of some or all of the Lease Water.

The payment for Lease Water shall not be reduced where all of the Lease Water is legally available for export under the Judgment.

3.5.6 Force Majeure

(a). The nonperformance of any of its obligations under the Lease was due to an unforeseen Force Majeure Event as defined in paragraph (b) of this subsection that prevents WESTERN from receiving Lease Water, on condition that the party complies with the conditions in paragraph (c) below.

(b). A Force Majeure Event shall mean an unforeseen act of God; war; riot; act of terrorism, domestic or foreign; embargo; governmental rule, regulation or decree; flood, fire, hurricane, tornado, or other casualty; earthquake; strike, lockout, or other labor disturbance; the unavailability of labor or materials to the extent beyond Lessee's control; pandemics, epidemics, local disease outbreaks, public health emergencies, and quarantines; or any other events or circumstances not within Lessee's reasonable control, whether similar or dissimilar to any of the foregoing.

(c). Upon occurrence of a Force Majeure Event, Lessee shall promptly notify Lessor that a Force Majeure Event has occurred, its anticipated effect on performance, including its expected duration and shall furnish Lessor with periodic reports regarding the progress of the Force Majeure Event. Lessee shall use reasonable diligence to minimize damages and resume performance. Disagreements over the applicability of this section shall be resolved per the Dispute Resolution provision in Section 9.4.

3.6 Payment of Lease Consideration. Lessee shall pay Lessor the Base Rate or the escalated Lease Rate in twelve equal monthly payments on or before the 15th day of the month (the "Due Date") starting in January 2021. It is Lessee's sole obligation to inform Lessor of any applicable Payment Exception pursuant to Section 3.5 above, should one exist, within 60 days of Lessee learning or receiving actual notice that the Payment Exception applies, or such Exception shall be deemed waived. Within 30 days of Lessor receiving notice of a valid Payment Exception, Lessor shall recalculate the amount of lease water to account for the Payment Exception and modify Lessee's monthly payment beginning on the date the Payment Exception was identified to account for the change.

3.7 Late Payment. Payments not submitted in full by said Due Date shall accrue interest at 1% per month multiplied by the unpaid balance applicable to this Agreement, prorated by the number of days between the Due Date and the date EVMWD receives the payment.

3.8 San Bernardino Water Conservation District Assessments. Lessor shall pay the groundwater extraction fee (also referred to as the Groundwater Charge Assessment or "pump tax") of $13.19 per AF of groundwater actually extracted to the San Bernardino Water Conservation District. Lessor acknowledges that the amount of this fee and the entity to which the fee is paid may change from time to time. Lessor and Lessee agree that should the Groundwater Charge Assessment exceed $20.00 per AF, Lessor and Lessee shall split equally the portion of the charge that exceeds $20.00 per AF.

Section 4. Production and Delivery of Lease Water.

4.1 Production and Delivery of Lease Water. Lessee shall be solely responsible for the production, treatment and delivery of the Lease Water.

4.2 Lessor Obligations. Lessor shall have no responsibilities or obligations whatsoever in regard to the extraction, production, treatment, or delivery of the Lease Water.

Section 5. No Warranties or Representations by Lessor.

5.1 Lease Water Leased As Is. Lessee acknowledges that Sections 3.5.5 and 7.6.2 shall be Lessee's only recourse should the quality, potability or fitness of the Lease Water be unacceptable. The Lease Water is being leased to Lessee on an "as is" basis, and Lessee leases such Lease Water from Lessor without reliance upon any representation, promise or inducement by Lessor, or any of its employees, agents or representative, or any other person, concerning the quality, potability, or fitness of the Lease Water, for Lessee's intended use.

5.2 No Representation or Warranty Concerning Lease Water. Lessee acknowledges that neither Lessor, nor any of its employees, agents or representatives, has made any written or oral representation, promise, warranty or statement, whether express or implied, concerning the Lease Water, its availability, its quality or potability, its fitness for Lessee's intended use or any other purpose or use, its value, or any other promise, representation or inducement not expressly set forth in this Lease.

Section 6. Indemnities.

6.1 Lessor and Lessee shall not be liable or accountable at any time or in any manner for any loss, damage, or injury whatsoever to the person or the property of any person or entity whatsoever, including but not limited to any employee, agent or contractor of Lessee, from any cause whatsoever arising out of or in connection with this Lease or the Lease Water, the quality of the Lease Water, the lack of availability of Lease Water, the inability to extract, produce or deliver the Lease Water, or directly or indirectly from any condition of the Lease Water.

6.2 Indemnity by Lessor. Lessor hereby indemnifies and agrees to defend and hold harmless Lessee and its affiliates, officers, employees and directors, from and against any and all demands, claims, actions, proceedings, damages, liabilities, losses, fees, costs or expenses (including without limitation reasonable attorneys' fees and the costs of any investigation) directly or indirectly arising from any lawsuit challenging Lessor's ownership right to the Lease Water including the right to obtain, pump, and control the Lease Water.

6.3 Indemnity by Lessee. Lessee hereby indemnifies and agrees to defend and hold harmless Lessor and its affiliates, officers, employees and directors, from and against any and all demands, claims, actions, proceedings, damages, liabilities, losses, fees, costs or expenses (including without limitation reasonable attorneys' fees and the costs of any investigation) directly or indirectly arising from the production of the Lease Water and the delivery of such water to Lessee's customers pursuant to this Agreement.

6.4 Ownership of Water Rights and Reporting. As part of the material consideration for this Lease, Lessor warrants that it has right, title, and ownership to and in the Water Rights and Lessee hereby covenants and promises never to assail or contest same. Lessor shall report WESTERN's lease of the Lease Water to the Watermaster as attributable to EVMWD's Meeks and Daley Water Rights as identified in the Judgment.

6.5 Compliance with Laws. Lessee shall keep itself fully informed of all existing and future state and federal laws and all county and city ordinances and regulations which in any manner affect the activities or rights of Lessee under this Lease, the storage and delivery of the Lease Water, and of all such orders and decrees of bodies or tribunals having jurisdiction or authority over same. Lessee shall at all times observe and comply with all applicable existing and future laws, ordinances, regulations, orders and decrees, and shall defend, protect and indemnify Lessor and its affiliates, officers, employees and directors from and against any claim or liability arising from or based on the violation of any such law, ordinance, regulation, order or decree, whether by Lessee or any person or entity holding title under Lessee.

6.6 Assignment and Sublease. Lessee shall not, without the prior written consent of Lessor (which shall not be unreasonably withheld) either voluntarily or by operation of law, assign, mortgage, hypothecate, sublease or otherwise transfer this Lease, or any portion of or interest in this Lease.

Section 7 Default and Termination.

7.1 Notice of Non-Compliance. Each Party shall have a reasonable opportunity to assert matters which it believes have not been undertaken in accordance with this Lease, to explain the basis for such assertion, and to receive from the other Party a justification of its position on such matters. If either Party concludes that the other Party has not complied in good faith with the terms of the Lease then such Party may issue a written "Notice of Non-Compliance" ("Notice of Non-Compliance") mailed to the non-complying Party, specifying the grounds therefore and all facts demonstrating such non-compliance. The Party receiving a Notice shall have thirty (30) days to cure or remedy the non-compliance identified in the Notice, or if such cure or remedy is not reasonably capable of being carried out to completion within such thirty (30) day period, to commence to cure or remedy the noncompliance and to diligently and in good faith prosecute such cure or remedy to completion. If the Party receiving the Notice does not believe it is out of compliance, it may contest the Notice of Non-Compliance by responding in writing within thirty (30) days after receipt. If a response to the Notice of Non-Compliance has not been received in the offices of the Party alleging the non-compliance within the prescribed time period, the Notice shall be conclusively presumed to be valid. If a Notice of Non-Compliance is contested, the Parties shall, for a period of not less than fifteen (15) days after receipt of the response, seek to arrive at a mutually acceptable resolution of the matter(s) occasioning such Notice. In the event a cure or remedy is not timely effected or, if the Notice of Non-Compliance is contested and the parties are not able to arrive at a mutually acceptable resolution of the matter(s) by the end of the fifteen (15) day period, the Party alleging the non-compliance may thereupon pursue the remedies provided in Section 7.2. After complying with this Section 7.1, either Party may seek termination of this Lease as set forth herein, and in the event this Lease is appropriately terminated, neither Party shall have any further obligation hereunder.

7.2 Remedies on Default. Should either Party breach this Lease, after complying with the provisions in Section 7.1, the other Party may terminate this Lease in addition to any other remedy provided for by law or in equity.

7.3 Waiver of Breach. The waiver of any breach of any term, covenant, or condition of this Lease shall not be deemed a continuing waiver of such term, covenant or condition, or a waiver of any subsequent breach of the same or any other term, covenant or condition contained in this Lease, unless such waiver is in writing signed by the waiving Party.

7.4 Cumulative Remedies. The remedies in Sections 7.1 and 7.2 above shall not be exclusive, but shall be cumulative and in addition to any and all other remedies now or hereafter allowed by law and the exercise of one or more of said rights, powers, elections or remedies shall not impair a Parties right to exercise any other right, power, election or remedy.

7.5 Right to Terminate Without Cause. Notwithstanding any other provision of this Lease, either Party shall have the right, in its sole and absolute discretion, for any reason, with or without cause, to terminate this Lease prior to its expiration, by giving eighteen (18) months written notice of termination to the other Party.

7.6 Lessee's Right to Terminate For Specified Occurrences. Notwithstanding any other provision of this Lease, Lessee shall have the right to terminate this Lease prior to its expiration, by giving twelve (12) months written notice of termination to Lessor, for any of the following reasons:

7.6.1 The Wheeling Agreement between WESTERN and Riverside is terminated for any reason or WESTERN is not otherwise able to take delivery of the Lease Water through no fault of its own; or

7.6.2 The water quality of the SBBA does not meet Lessee's quality objectives and such water quality deficiencies cannot be cured with reasonably available treatment technologies at a reasonable cost to the Lessee.

Section 8. Miscellaneous.

8.1 Notices. Any notice, payment or instrument required or permitted to be given or delivered by this Lease may be given or delivered by personal delivery, by email, or by depositing same in any reputable overnight mail carrier, postage prepaid, and addressed as follows:

To Lessor: Elsinore Valley Municipal Water District
Attn: General Manager
P.O. Box 3000
31315 Chaney Street
Lake Elsinore, CA 92531
Email: generalmanager@evmwd.net

If to Lessee: Western Municipal Water District
Attn: General Manager
14205 Meridian Parkway
Riverside, CA 92518
Email: generalmanager@wmwd.com

Notice may also be provided to such other person or address as either Party may direct in writing. Except where service is by personal delivery or by registered or certified mail, return receipt requested, service of any instrument or writing shall be deemed completed twenty-four (24) hours after deposit with a reputable overnight mail carrier. The Parties may agree in writing to other acceptable methods of providing notice per this Section, to include delivery of notice by email.

8.2 Warranty of Authority. Each representative of Lessor and Lessee affixing his or her signature to this Lease warrants and represents by such signature that he or she has the full legal authority to bind his or her respective party to all of the terms, conditions and provisions therein, that his or her respective party has the full legal right, power, capacity and authority to enter into

this Lease and perform all of its provisions and obligations, and that no other approvals or consents are necessary in connection therewith.

8.3 Headings. The titles and headings of Sections of this Lease, as herein set forth, have been inserted for the sake of convenience only, and are not to be taken, deemed or construed to be any part of the terms, covenants or conditions of this Lease, or to control, limit or modify any of the terms, covenants or conditions hereof.

8.4 Disputes. The Parties desire to informally resolve all disputes related to this Lease whenever possible, at the lowest possible level, and triggering of the dispute resolution procedures described herein shall only occur where the Parties after complying with the Notice of Non-Compliance provisions in Section 7.1, are unable to resolve matters without invoking formal dispute resolution procedures. Should compliance with Section 7.1 prove unsuccessful, the Parties agree to neutral facilitation/mediation of the dispute as a next step prior to filing a lawsuit or otherwise seeking judicial intervention. Where facilitation/mediation is unable to successfully resolve the dispute, then either Party, upon providing 30 days-notice to the other Party, may initiate judicial proceedings in the Superior Court for the County of Riverside.

In the event that any action is commenced by a Party to this Lease against the other to enforce its rights or obligations arising from this Lease or seeking to interpret this Lease, venue for such action shall be in Riverside County, California, and the prevailing party in such action (whether or not it is prosecuted to judgment), in addition to any other relief and recovery ordered by the court, shall be entitled to recover any applicable statutory costs, plus reasonable attorneys' fees and expert witness fees.

8.5 Integration, Construction and Amendment. This Lease represents the entire understanding of Lessor and Lessee as to those matters contained therein, and no prior oral or written understanding shall be of any force or effect with respect to those matters covered thereby. This Lease shall be governed by the laws of the State of California and construed as if drafted by both Lessor and Lessee. This Lease may not be modified, altered or amended except in writing signed by both Lessor and Lessee.

8.6 Successors. Subject to Section 7.5, all terms, conditions and provisions of this Lease shall inure to the benefit of and be binding on, Lessor, Lessee, and their respective successors and assigns.

8.7 Partial Invalidity. If any term, covenant, condition or provision of this Lease is held by a court of competent jurisdiction to be invalid, void, or unenforceable, the remainder of the provisions hereof shall remain in full force and effect and shall in no way be affected, impaired, or invalidated thereby.

8.8 Counterparts. This Lease may be signed in counterparts, each of which shall constitute an original and which collectively shall constitute one and the same instrument.

IN WITNESS WHEREOF, the parties have executed this Lease to take effect on the Effective Date defined above.

Appendix J City of Riverside and Western 2021 Operating Plan

CALENDAR YEAR 2021 OPERATING PLAN

FOR

COOPERATIVE AGREEMENT FOR LONG-TERM WHEELING AND SURPLUS WATER SALES BETWEEN CITY OF RIVERSIDE AND WESTERN MUNICIPAL WATER DISTRICT

The Operating Committee, comprised of representatives from the City of Riverside (Riverside) and Western Municipal Water District (Western) agree to the estimated delivery targets in Table 1 for Calendar Year 2021. Monthly numbers are intended to be a guide. Actual monthly deliveries will be subject to capacity, system operability, and customer demand. Both Riverside and Western are interested in maximizing the delivery of local supplies and strive to exceed the monthly estimated targets, and thus the Annual Objective in Table 1, below.

Table 1. Calendar Year 2021 Delivery Schedule (acre-feet)

Source Water	Jan	Feb	Mar	Apr	May	Jun*	Jul*	Aug*	Sep*	Oct	Nov	Dec	Annual Objective
Western – M&D LLC	226.52												226.52
Western – M&D/EVMWD	263	525	625	700	700	600	600	600.6					4,680.6
Western – RHWC/Storage									300.88				300.88
Riverside – Surplus									232	625	600	543	2,000
TOTAL	**489.52**	**525**	**625**	**700**	**700**	**600**	**600**	**600.6**	**532.88**	**625**	**600**	**543**	**7,208**

*Riverside cannot guarantee deliveries June through September. IF capacity in RPU's system is available in these months, deliveries will occur.

**The Annual Objective is not intended to be a maximum cap. If more water and capacity are available, and demands exist, more water can be delivered.

Per the Cooperative Agreement, if the delivery schedule above is unattainable, the Operating Committee has the ability to, upon mutual agreement, to adjust delivery targets and/or make up to 500 acre-feet of deliveries in the next calendar year.

Appendix K Santa Margarita Watershed Adjudication

The Santa Margarita Watershed Adjudication

IN THE UNITED STATES DISTRICT COURT

FOR THE SOUTHERN DISTRICT OF CALIFORNIA

SOUTHERN DIVISION

FILED
ENTERED
LODGED
RECEIVED
MAR 13 1989
CLERK, U.S. DISTRICT COURT
SOUTHERN DISTRICT OF CALIFORNIA
BY DEPUTY

UNITED STATES OF AMERICA,

Plaintiff,

vs.

FALLBROOK PUBLIC UTILITY DISTRICT, et al.,

Defendants

Civ. No. 1247-SD-T

ORDER FOR THE APPOINTMENT OF A WATERMASTER; POWERS AND DUTIES.

In 1951, the United States of America brought this case to seek a judicial determination of all respective water rights within the Santa Margarita River watershed. That litigation culminated in this Court's decision United States v. Fallbrook Public Utility District, et al., 193 F.Supp. 342 (S.D.Cal. 1961), aff'd in part and reversed in part 347 F.2d 48 (9th Cir. 1965) and finally in the Modified Final Judgment and Decree, entered April 6, 1966.

During the course of this litigation the Court appointed Lieutenant Colonel A. C. Bowen to collect water consumption data from substantial users within the watershed and to report to the Court on his findings. By Order of January 19, 1975, Colonel Bowen was appointed as Watermaster with broad powers to administer and enforce the provisions of the Court's Modified

MAR 17 1989

Final Judgment and Decree. Colonel Bowen served in this capacity until his death in 1981. No replacement has been appointed.

In June of 1988 the United States of America, Rancho California Water District and Fallbrook Utility District requested that this Court act to appoint a replacement for Colonel Bowen. After a hearing on June 13, 1988, this Court ordered the three parties to advertise for and interview prospective candidates for the position of Watermaster. That process having been completed, notice was given of this hearing for any party[1/] to show cause why this Court should not appoint the candidate recommended by the United States, Rancho California Water District and the Fallbrook Public Utility District. Having received no substantial objection to this candidate it is hereby Ordered, Adjudged and Decreed:

I

APPOINTMENT OF A WATERMASTER

James Jenks is hereby designated by this Court to act as Watermaster for the Santa Margarita River watershed, to administer and enforce the provisions of the Modified Final Judgment and Decree and subsequent instructions and orders of this Court.

1/ For the purpose of this Order, party shall mean any party to the original adjudication and their successors in interest.

FORM OBD-183
MAR. 83

II

REPORTING DUTIES

Promptly after the end of each water year,[2] the Watermaster shall report to the Court, in writing, a summary of his findings and conclusions in accordance with paragraph V of this Order and as follows:

1. A summary of water availability within the Santa Margarita River watershed for the previous water year and, to the extent feasible, a forecast of the same for the upcoming water year. The summary shall include a compilation, by hydrologic sub-unit, of the following water quantities:

a. Surface Water:

1) Surface flow of the Santa Margarita River and its tributaries, with identification by quantity of the specific sources of such surface flow, including water from natural runoff, water imported from outside the watershed, and water from each of the subsurface sources identified in the applicable interlocutory judgments.

2) Diversions of surface water, with identification by quantity of the related consumptive uses, losses, and returns.

3) Water in surface storage on the last day of the previous water year.

b. Subsurface Water:

1) Extractions from each of the subsurface sources identified in the applicable interlocutory judgments, with identification by quantity of the related consumptive uses, losses, and returns.

2) For each such subsurface source, (i) the quantity of water in subsurface storage at the

---

[2] For the purposes of this Order a "water year" shall be defined as that twelve-month period beginning on October 1 and ending September 30.

FORM OUD-183
MAR. 83

end of the previous water year, (ii) the source and quantity of recharge.

c. The source and quantity of water imported for use within the Santa Margarita River watershed.

d. The source and quantity of water exported from the Santa Margarita River watershed.

2. A list of all water users within the Santa Margarita River watershed, including for each a description of vested rights and appropriative priority dates if any.

3. A report on the use of water by each substantial user[3/] within the Santa Margarita River watershed for the previous water year showing for each such user the amount of water diverted, extracted, impounded, or imported and the amount used according to category of use, including: domestic, irrigation, other agricultural, industrial, commercial, public and such other types of uses as the Watermaster may deem appropriate.

4. A list of all unauthorized water use within the Santa Margarita River watershed, along with an explanation of actions taken or recommended to be taken with respect to such use.

5. A statement of conditions and activities which, if continued, may pose a threat to the long-term water supply of the Santa Margarita River watershed.

6. Report on the water quality within the Santa Margarita River watershed by hydrologic sub-unit during the previous water year.

7. An update of the Watermaster's projected tasks, expenditures and requirements over the next five years.

3/ For the purposes of this Order, "substantial user" means any person that claims a right to use water under the orders, judgments or decrees of this Court in the above entitled action, and any person previously designated by this Court or the Watermaster to be a substantial user; any person using water or who claims a right to use water in an amount equal to or greater than or in a manner similar to the uses designated in Exhibit A to this Order; or any person using water within the Santa Margarita River watershed and designated by the Watermaster to be a substantial user.

FORM OBD-183
MAR. 83

8. A proposed budget for the following water year, as more fully described in paragraph III, below.

A copy of the Watermaster's written report shall be mailed to each party listed on the Court approved mailing list, as attached to this Order, and to any party requesting a copy. In addition, five copies of the report will be made available for inspection by the public, during regular business hours, at the Fallbrook Public Utility District, 990 E. Mission Road, Fallbrook, California; at Rancho California Water District, 28061 Diaz Road, Temecula, California and at Anza, California.

Any party that objects to a portion of the Watermaster's report, including the Watermaster's designation of substantial users, may do so by filing written notice of his objection within thirty days of service of the Watermaster's report. Objections filed with this Court must refer to that portion of the Watermaster's report that is objectionable and state specifically the grounds for the objection. Thereafter, the Court may determine a date for hearing the noticed objection. Any party wishing to intervene on behalf of the objecting party or on behalf of the Watermaster may do so within the discretion of the Court.

III

OPERATING BUDGET

The Watermaster shall, within sixty days from the date of this Order, submit for approval by this Court a proposed operating budget for the 1989 water year. The Watermaster shall set forth the estimated expense for discharging his duties as described

FORM OBD-183
MAR. 83

herein, including his recommendations for necessary staff, equipment and supplies. A copy of the proposed budget shall be mailed to each of the parties listed on the Court's approved mailing list and to any party that requests a copy of the proposed budget in writing. Any party may file objections to the proposed budget within thirty days of service. Thereafter the Court will set a date for hearing any objections filed.
If objections to the proposed budget are heard by the Court, then the final budget may be confirmed or adjusted in whole or part as the Court may deem proper.

Within 120 days of this Order the Watermaster shall submit for approval by this Court a proposed operating budget for the 1990 water year. Parties shall be served in accordance with paragraph II, above. Objections shall be filed and a hearing held in accordance with paragraph III, above. Thereafter, the Master shall submit his proposed budget for the following water year as a part of his annual report to the Court.

IV

FEES AND EXPENSES

The fees, compensation and expenses of the Watermaster hereunder initially shall be borne by the parties in the following proportions: One third by the United States; one third by the Fallbrook Public Utility District; and one third by Rancho California Water District. For the 1989 Water Year, the total assessment against the three parties shall not exceed $150,000.00. The Court shall retain the right upon its own

FORM OBD-183
MAR. 83

☆ U.S. GPO: 1988-202-041/84933

motion or the motion of any party to assess any other party using water under the provisions of the applicable judgments, decrees and Orders for the Santa Margarita River watershed for the costs, fees and expenditures of the Watermaster.

Payment of the amount assessed to a party shall be paid 30 days prior to the beginning of the Water Year to which the final budget is applicable.

The Watermaster is directed to use the fund control and payroll services that shall be provided by Fallbrook Public Utility District, and as fully set forth in Exhibit B, for administration of the Watermaster Budget. An interest-bearing account shall be established at a local bank to maintain funds that may be contributed from time to time by the parties. An audit will be conducted annually by an independent auditor and copies of the report will be made available to the parties and provided to the Court.

The Watermaster may apply for appropriate relief from this Court for failure of any party to pay the amount assessed for a particular water year.

V

POWERS AND DUTIES OF THE WATERMASTER

The Watermaster shall have the following powers and duties:

1. To update the list of substantial users contained in Sections A, B and C of Exhibit A to this Order.

2. To collect water consumption data and require monthly reports from the substantial users including, for each such user, the amount of water diverted, extracted, impounded or imported and the amount of water used, as follows:

FORM OBD-183
MAR. 83

☆ U.S. GPO: 1988—202-041/84933

a. To require every water user designated in Section A of Exhibit A to supply in writing the following factual data for each well owned or operated within the watershed:

1. The well owner;

2. The location of the well;

3. The quantity in acre-feet of water pumped during that month and the use by quantity to which the water was put; and

4. The depth in feet to water on or about the last day of that month and designate the zone(s) or aquifer(s) from which well casing perforations permit the production of water.

b. To require every water user designated in Section B of Exhibit A that diverts surface water to supply in writing the following factual data for each designated point of diversion within the watershed:

1. The diverter's name;

2. The location of the point of diversion;

3. The quantity in acre-feet of water diverted for the preceding month; and

c. To require every water user designated in Section C of Exhibit A to supply in writing the following factual data for each designated surface storage reservoir:

1. The reservoir owner;

2. The location of the storage facility;

3. The quantity, in acre-feet of water held in storage in such facility on the last day of the preceding month.

4. The purpose for which such water was stored.

FORM OBD-183
MAR. 83

☆ U.S. GPO: 1988—202-041/84933

d. To require every water importer subject to this Order that imports water to supply in writing the following factual data:

1. The importer's name;

2. The discharge point or point of connection of such imported water;

3. The quantity in acre-feet, of water imported for the preceding month; and

e. To require every water user designated in Section A and B of Exhibit A and every importer of water within the Santa Margarita River Watershed to supply in writing the following factual data:

1. The user's name;

2. The quantity of water devoted to the uses listed below in each hydrologic sub-unit or area designated by the Watermaster:

A. Domestic

B. Agricultural irrigation

C. Other agriculture

D. Industrial

E. Commercial

F. Public

G. Others as Watermaster may deem appropriate.

f. To require every producer of reclaimed waster water subject to this Order to supply in writing the following factual data:

1. the producers' name;

2. The location of use or discharge of reclaimed water;

3. The quantity in acre-feet of reclaimed water produced, delivered and discharged for the preceding month.

FORM OBD-183
MAR. 83
☆ U.S. GPO: 1988—202-041/84933

3. To make all reasonable efforts to collect and reconstruct water consumption data for the periods 1966 to date.

4. To obtain necessary pump efficiency data.

5. To operate and maintain gaging stations, investigate water availability and hydrology, and conduct water quality testing.

6. To perform such duties as are required under the Memorandum of Understanding and Agreement on Operation of Lake Skinner.

7. To take custody of existing records and reports, maintain proper records, and prepare periodic written reports as required by this Court.

8. To locate and investigate unauthorized water appropriations within the Santa Margarita River watershed.

9. To assist in locating, investigating and enjoining water quality violations within the Santa Margarita River Watershed.

10. The Watermaster shall have the authority to enter, upon reasonable notice and at reasonable times, upon the lands of any party to conduct such tests and measurements as he deems necessary to carry out the provisions of this, or any other order of the Court with respect to the duties enumerated above.

11. To the extent not superceded herein, this Order incorporates by reference the powers and duties granted by the Court in its Order filed January 27, 1966, as modified on April 6, 1966.

12. To design, print and distribute the forms necessary to convey the information required by this or any other applicable Order of the Court.

13. To report to the Steering Committee, established pursuant to Court Order, on a quarterly basis regarding the status of the Watermaster's investigation, proposed budget items for the upcoming water year and to respond to questions regarding the progress of any programs established by the Watermaster in implementing this Order.

14. To prepare a written plan within 120 days of the date of this Order stating the methodology and procedures for accomplishing the duties described above, including:

FORM OBD-183
MAR. 83

☆ U.S. GPO: 1988-202-041/84933

a. A timetable for identifying substantial users and characterizing their use;

b. A list of locations, numbers and descriptions of existing and proposed gaging stations;

c. A detailed plan for the conduct of water quality testing to include collecting existing hydrological information and conducting additional tests of both surface and ground water;

The Watermaster shall serve the above-described plan to the parties in accordance with paragraph II, above.

VI

FAILURE TO COMPLY

Failure to comply with this Order in furnishing information and reports required herein may lead to an Order that the party is in default and whatever sanctions are appropriate.

VII

JURISDICTION
