Parent material: Residuum weathered from granite and granodiorite

Typical profile

H1 - 0 to 8 inches: coarse sandy loam
H2 - 8 to 12 inches: weathered bedrock

Properties and qualities

Slope: 9 to 30 percent
Depth to restrictive feature: 4 to 20 inches to paralithic bedrock
Drainage class: Somewhat excessively drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 0.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: D
Ecological site: R019XD060CA - SHALLOW LOAMY (1975)
Hydric soil rating: No

Description of Rock Outcrop

Setting

Landform: Hills

Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex

Typical profile
H1 - 0 to 4 inches: unweathered bedrock

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydrologic Soil Group: D
Hydric soil rating: No

Minor Components

Vista
Percent of map unit: 5 percent

Las posas
Percent of map unit: 5 percent
Hydric soil rating: No

OhC—Olivenhain cobbly loam, 2 to 9 percent slopes

Map Unit Setting
National map unit symbol: hbfb
Elevation: 100 to 600 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 290 to 330 days
Farmland classification: Not prime farmland

Map Unit Composition
Olivenhain and similar soils: 85 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Olivenhain

Setting
Landform: Marine terraces
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Gravelly alluvium derived from mixed sources

Typical profile
H1 - 0 to 10 inches: cobbly loam
H2 - 10 to 42 inches: very cobbly clay
H3 - 42 to 60 inches: cobbly clay loam

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 1.3 inches)

Interpretive groups

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for San Diego County Area, California

Oak Knoll South, Poway, CA

June 8, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 16, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 22, 2018—Aug 31, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
PfC	Placentia sandy loam, thick surface, 2 to 9 percent slopes	0.4	73.4%
VaA	Visalia sandy loam, 0 to 2 percent slopes	0.2	26.6%
Totals for Area of Interest		**0.6**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the

development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

PfC—Placentia sandy loam, thick surface, 2 to 9 percent slo pes

Map Unit Setting

National map unit symbol: hbfn
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 3e

Map Unit Setting

National map unit symbol: hbh2
Elevation: 600 to 1,200 feet
Mean annual precipitation: 15 inches
Mean annual air temperature: 57 degrees F
Frost-free period: 200 to 350 days
Farmland classification: Prime farmland if irrigated and either protected from flooding or not frequently flooded during the growing season

Map Unit Composition

Visalia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Visalia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Riser, flat
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 12 inches: sandy loam
H2 - 12 to 40 inches: fine sandy loam
H3 - 40 to 60 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare

Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 7.8 inches)

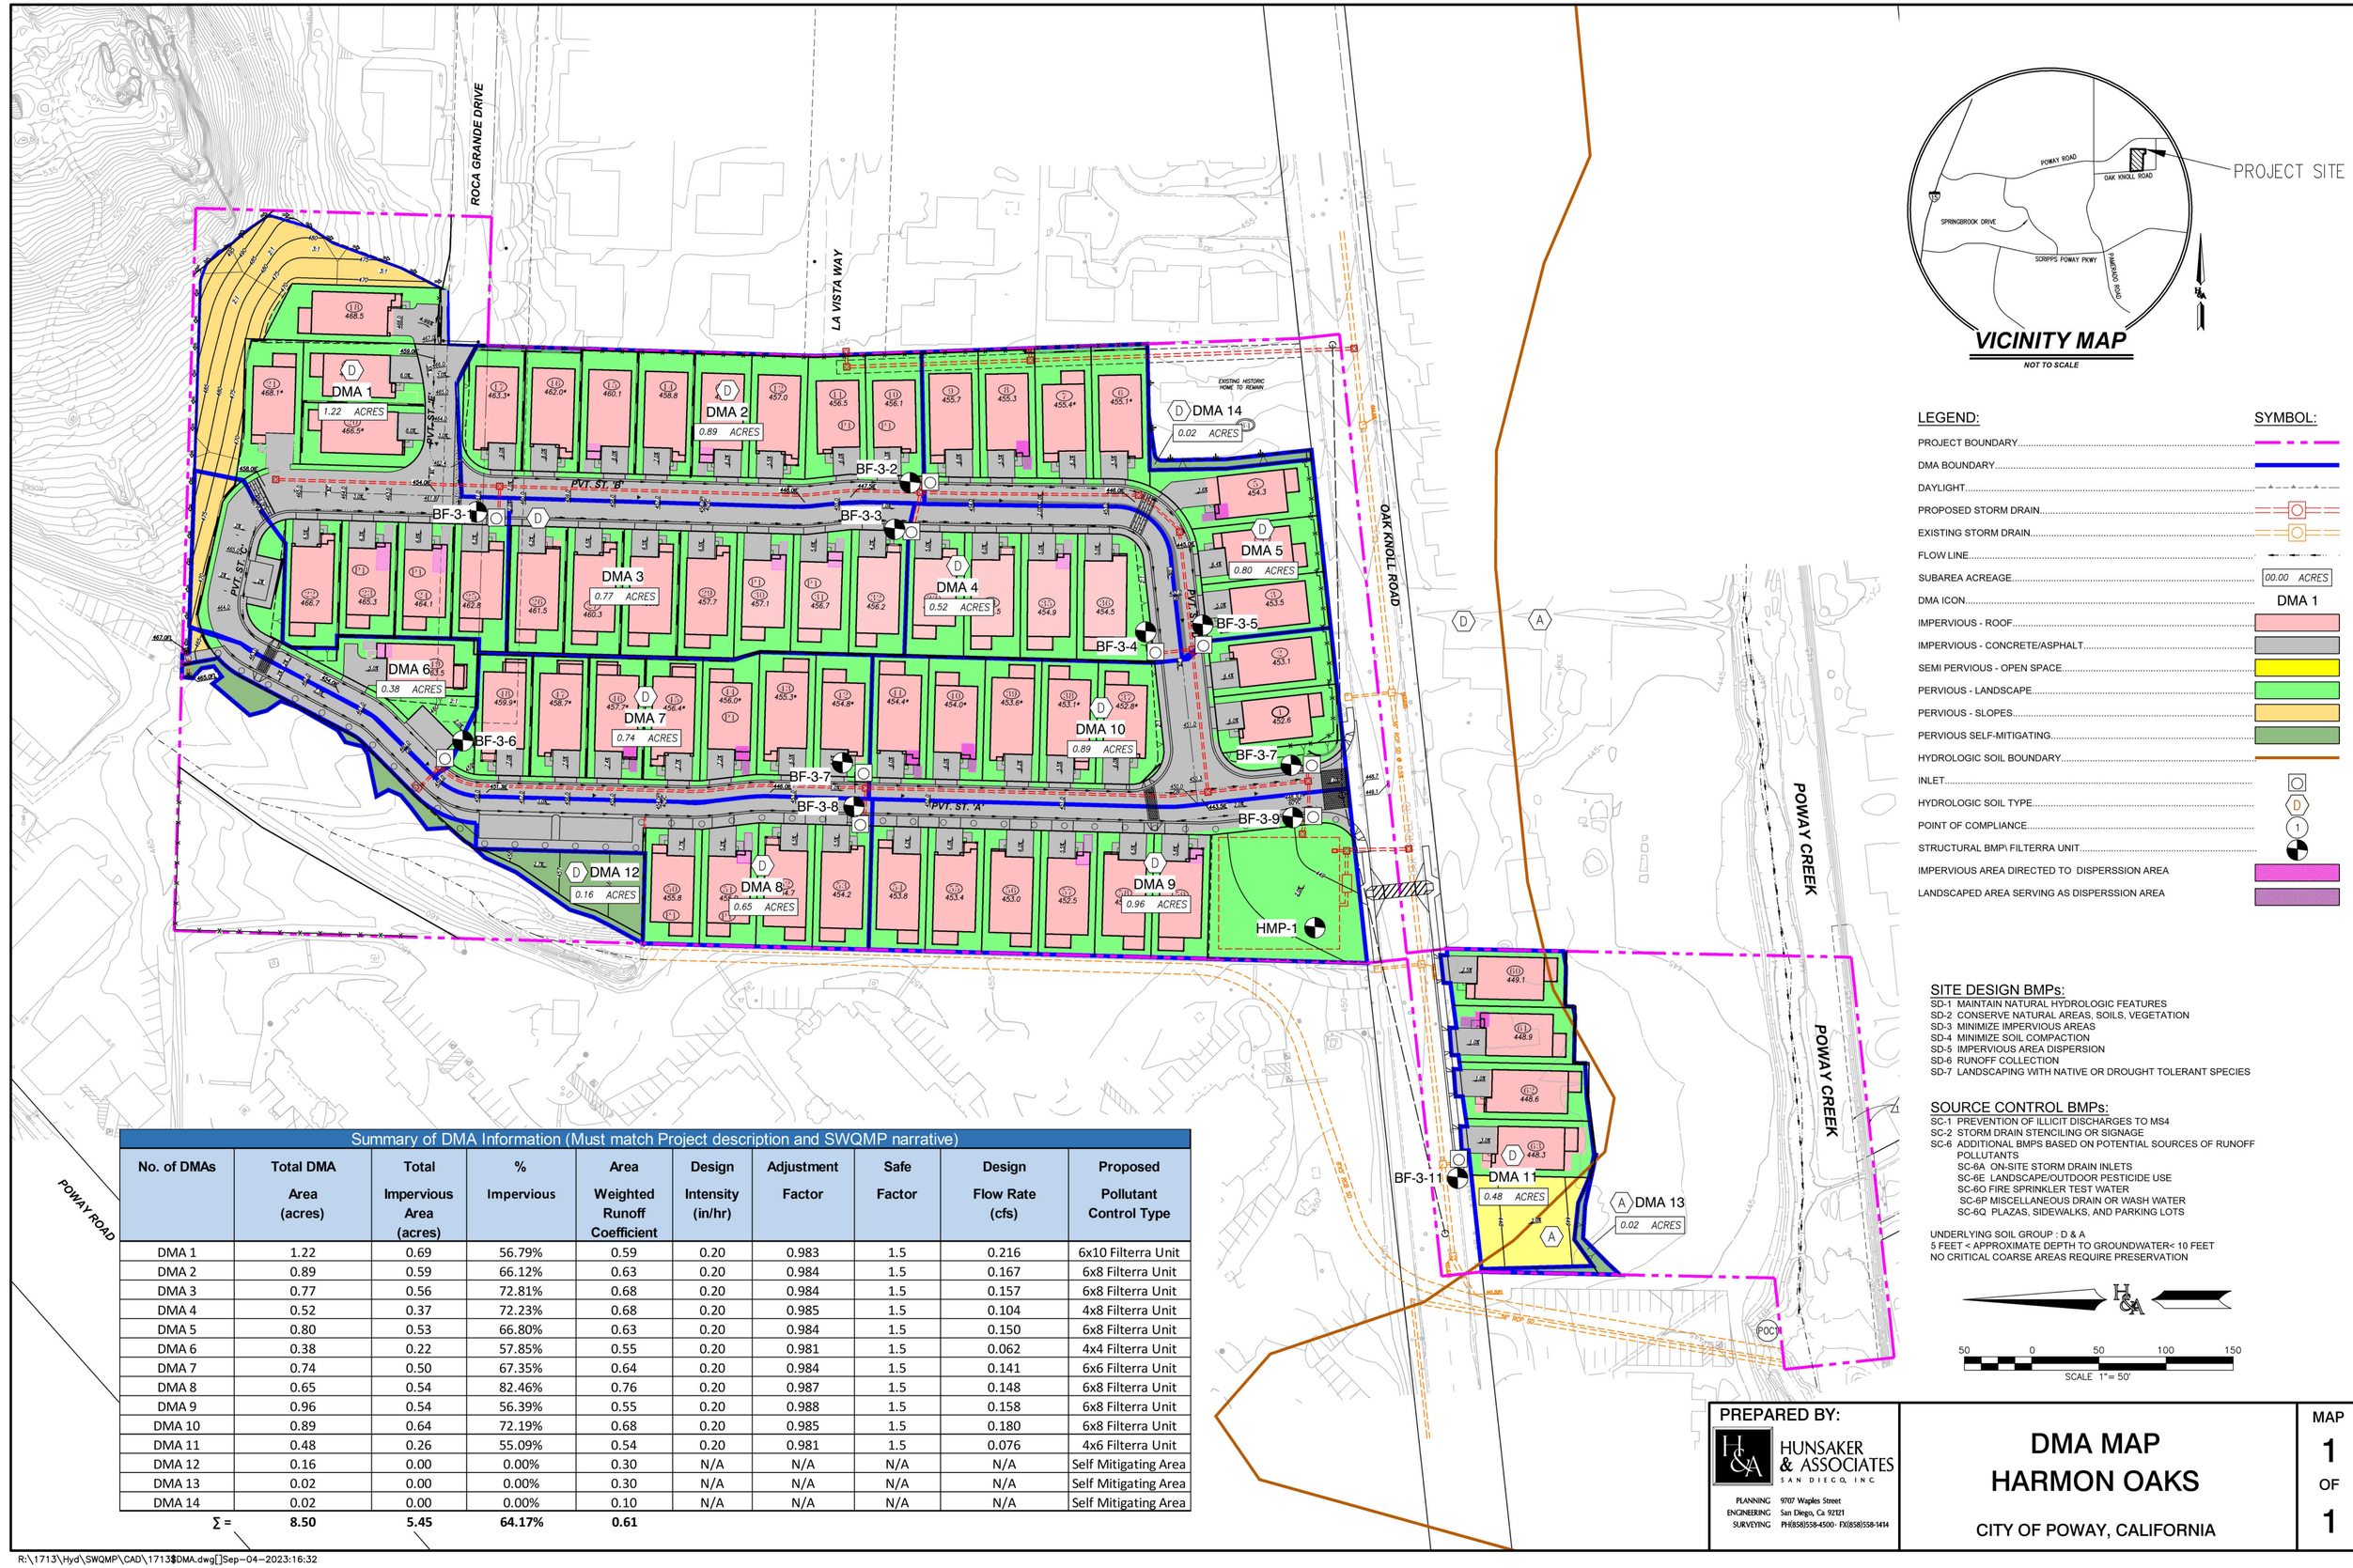
ATTACHMENT 1C

Use this checklist to ensure the required information has been included on the DMA Exhibit. Include checklist in submittal and check all boxes that are applicable. Provide justification for items not included.

The DMA Exhibit must identify:

☒ Underlying hydrologic soil group
☒ Approximate depth to groundwater
☒ Existing natural hydrologic features (watercourses, seeps, springs, wetlands)
☐ Critical coarse sediment yield areas to be protected
☒ Existing topography and impervious areas
☒ Existing and proposed site drainage network and connections to drainage offsite
☐ Proposed demolition
☒ Proposed grading
☒ Proposed impervious features
☒ Proposed design features and surface treatments used to minimize imperviousness
☒ Drainage management area (DMA) boundaries, DMA ID numbers, and DMA areas (square footage or acreage), and DMA type (i.e., drains to BMP, self-retaining, or self-mitigating)
☒ Structural BMPs (identify location, structural BMP ID#, type of BMP, and size/detail)

Justification for items not included in DMA Exhibit:



LEGEND: SYMBOL:

- PROJECT BOUNDARY
- DMA BOUNDARY
- DAYLIGHT
- PROPOSED STORM DRAIN
- EXISTING STORM DRAIN
- FLOW LINE
- SUBAREA ACREAGE — 00.00 ACRES
- DMA ICON — DMA 1
- IMPERVIOUS - ROOF
- IMPERVIOUS - CONCRETE/ASPHALT
- SEMI PERVIOUS - OPEN SPACE
- PERVIOUS - LANDSCAPE
- PERVIOUS - SLOPES
- PERVIOUS SELF-MITIGATING
- HYDROLOGIC SOIL BOUNDARY
- INLET
- HYDROLOGIC SOIL TYPE
- POINT OF COMPLIANCE
- STRUCTURAL BMP\ FILTERRA UNIT
- IMPERVIOUS AREA DIRECTED TO DISPERSSION AREA
- LANDSCAPED AREA SERVING AS DISPERSSION AREA

SITE DESIGN BMPs:

SD-1 MAINTAIN NATURAL HYDROLOGIC FEATURES
SD-2 CONSERVE NATURAL AREAS, SOILS, VEGETATION
SD-3 MINIMIZE IMPERVIOUS AREAS
SD-4 MINIMIZE SOIL COMPACTION
SD-5 IMPERVIOUS AREA DISPERSION
SD-6 RUNOFF COLLECTION
SD-7 LANDSCAPING WITH NATIVE OR DROUGHT TOLERANT SPECIES

SOURCE CONTROL BMPs:

SC-1 PREVENTION OF ILLICIT DISCHARGES TO MS4
SC-2 STORM DRAIN STENCILING OR SIGNAGE
SC-6 ADDITIONAL BMPS BASED ON POTENTIAL SOURCES OF RUNOFF POLLUTANTS
SC-6A ON-SITE STORM DRAIN INLETS
SC-6E LANDSCAPE/OUTDOOR PESTICIDE USE
SC-6O FIRE SPRINKLER TEST WATER
SC-6P MISCELLANEOUS DRAIN OR WASH WATER
SC-6Q PLAZAS, SIDEWALKS, AND PARKING LOTS

UNDERLYING SOIL GROUP : D & A
5 FEET < APPROXIMATE DEPTH TO GROUNDWATER< 10 FEET
NO CRITICAL COARSE AREAS REQUIRE PRESERVATION

NOTES:

1. All materials shown on this sheet shall be supplied by Santa Fe WinWater Company, Santa Fe Springs, CA, except where noted. Pumps shall be SFWW SWP-10, 200 - 240v, 1 phase, 8.8A max. Substitution of any component may void warranty.
2. Locate Pump Controller as required for site conditions or Owner direction. Route power and signal cable conduit to vault from controller accordingly. Connections shall be provided by Contractor.
3. Route 3" pump system outlet pipe as shown on Civil Sheets.
4. Contractor to provide concrete collar around manhole cover suitable for surface loading conditions.
5. Anti-Floatation flange to be provided on pump vault where required for groundwater conditions.
6. Pump performance requirements based on Civil Engineer's design calculations = 137 gpm.

Headloss Calculations		
Fitting	Qty / Length	Headloss
Pipe (2")	21	1.19'
Check Valve	1	1.72'

Harmon Oaks - Poway, CA
Stormwater Treatment
Discharge Pump

SIZE **B** | SHEET 1 OF 1

ATTACHMENT 2 – BACKUP FOR PDP HYDROMODIFICATION CONTROL MEASURES

This is the cover sheet for Attachment 2.

☐ Mark this box if this attachment is empty because the project is exempt from PDP hydromodification management requirements.

Indicate which Items are Included behind this cover sheet:

Attachment Sequence	**Contents**	**Checklist**
Attachment 2a	Flow Control Facility Design, including Structural BMP Drawdown Calculations and Overflow Design Summary (Required) See Chapter 6 and Appendix G of the BMP Design Manual	☐ Included ☒ Submitted as separate stand-alone document
Attachment 2b	Hydromodification Management Exhibit (Required)	☒ Included See Hydromodification Management Exhibit Checklist on the back of this Attachment cover sheet.
Attachment 2c	Management of Critical Coarse Sediment Yield Areas See Section 6.2 and Appendix H of the BMP Design Manual. **(No CCSYAs on or around the site)**	☐ Exhibit depicting onsite and/or upstream sources of critical coarse sediment as mapped by Regional or Jurisdictional approaches outlined in Appendix H.1 AND, ☐ Demonstration that the project effectively avoids and bypasses sources of mapped critical coarse sediment per approaches outlined in Appendix H.2 and H.3. OR, ☐ Demonstration that project does not generate a net impact on the receiving water per approaches outlined in Appendix H.4.
Attachment 2d	Geomorphic Assessment of Receiving Channels (Optional) See Section 6.3.4 of the BMP Design Manual.	☒ Not performed ☐ Included ☐ Submitted as separate stand-alone document
Attachment 2e	Vector Control Plan (Required when structural BMPs will not drain in 96 hours)	☐ Included ☒ Not required because BMPs will drain in less than 96 hours

Attachment 2a

Hydromodification Management Plan

INTRODUCTION

This report summarizes the approach used to model Harmon Oaks project site in the City of Poway to achieve flow control requirements for hydromodification management using the Environmental Protection Agency (EPA) Storm Water Management Model 5.1 (SWMM). SWMM models is provided for the pre and post developed conditions at the site in order to determine if the proposed detention/Hydromodifcatation facility has sufficient storage volume to meet the current Hydromodification Management Plan (HMP) requirements from the Regional Water Quality Control Board (RWQCB).

SWMM MODEL DEVELOPMENT

The Farm development plan proposes the construction of single family homes, and associated. One Point of Compliance (POC) will be analyzed in the SWMM analysis.

The proposed vault is modeled as a storage unit associated with a storage curve. The storm water quality requirements for the project are met by the proposed proprietary biofiltration Filterra Units upstream of the vault, which are not included in the hydromodifcation model as their volume is negligible. The proposed vault is designed for hydromodifcation and detention purposes.

Two SWMM models will be prepared for the POC, one for the pre, and one for the post development.

The inputs required to run a SWMM analysis are rainfall, evaporation rate, area, drainage soil, and any BMP configuration applicable to the project based on the 2018/ revised 2022 BMP DM. The rain gauge used is the Poway Gage as it is the most representative of the area based on location. Evaporation for the project site will be taken from BMP DM for Zone 9 for the monthly average evapotranspiration. Hydrologic soil type D and A will be assumed for the entire site based on the web soil survey.

HMP MODELING

POC 1

POC 1 is located offsite southwest of the southern lot at the discharge location of the existing storm drain (8’ X 5’ RCP) into Poway Creek. Runoff from the site in both pre and post developed conditions is conveyed via stated storm drain and ultimately discharges into Poway Creek. No added imperviousness or increasing in area is proposed to the open channel northeast of the northern lot. The POC receives runoff from Area1-6:

- Area 1- Soil Type D: Project’s Northern lot that will be disturbed in proposed conditions. In existing conditions, the site consists of single-family residential structures, driveways, equipment yard (Construction stage area), northern slope and vacant area. In proposed conditions, the site will be developed with roads, sidewalk, landscaped areas, slopes, open space, single-family homes and driveways. In proposed conditions, runoff from Area1 will be captured

via curb type proprietary biofiltration units (Filterra units or equivalent) to address water quality requirements, and then routed via proposed storm drain to the underground vault, before discharging to POC-1.

• Area 2 - Soil Type D: 2.86 acres (69.1% imperviousness) consists of existing development that will not be disturbed in proposed conditions. It includes offsite development west of the project's northern lot, historical home, and the northern portion of Oak Knoll Road. Runoff from this area is captured by inlets and conveyed via existing 36" RCP public SD that runs in an eastwest direction under Oak Knoll Road, where it comingles with the treated and mitigated discharge from the project area, prior entering the existing 8'X5' RCP storm drain, which routes the total runoff to Poway Creek at POC1.
This area routed directly to POC-1

- Area 3 Soil Type D: Consists of 0.80 acres of northern offsite slope, which drains through the site. Runoff from this area will be bypassed in proposed conditions. 0.18 ac of self-mitigating slopes is added to this area. This area enters the existing 8'X5' RCP storm drain west of the northern lot and travels southerly, where it comingles with the discharge from the existing 36" RCP SD, and continues to discharge into Poway Creek at POC1. This area routed directly to POC-1.

- Area 4- Soil Type D: Offsite existing development that will not be disturbed in proposed conditions and drains southerly ,with the runoff from the project's southern lot, to discharge directly into Poway Creek at POC1. It consists of building structures and driveways east of the project's southern lot. Southern portion of Oaknoll Road was modeled as part of Area 4 as well. This portion drains westerly to be captured via curb inlet and enters the existing 36" RCP storm drain, then to 8'X5' RCP storm drain that discharges into Poway Creek at POC1. This area routed directly to POC-1.

- Area 5- Soil Type-D: The northern portion of project's southern lot that will be developed in the proposed conditions (0.475 ac). In existing conditions, this area is vacant and drains southerly to comingle with Area-6 and Area-4 flows before discharging into Poway Creek at POC1. In proposed conditions, this area drains northerly to Oak Knoll road, where it's captured via proposed curb type proprietary biofiltraton unit (Filterra unit or equivalent) that will address water quality requirements before discharging into the existing 36" RCP SD. This area is routed directly to POC-1. The proposed vault within Area 1 will over detain the flows from Area-1 to account for the unmitigated flows from Area-5 to meet hydromodification requirements.

- Area 6- Soil Type A: Offsite and onsite natural slopes not to be disturbed in proposed conditions. This Area drains southerly to discharge directly into Poway Creek to POC-1

*For Area 2 and Area 4 Pre-developed Conditions per section 6.3.3 from BMP Manual :Runoff from offsite impervious area (not a part of the project disturbed area) that co-mingles with project site runoff prior to discharge to the POC, the offsite impervious area may be modeled as impervious in both the pre- and post- condition models.

BMP MODELING FOR HMP PURPOSES

Vault Discussion:

One detention vault is located within the project's northern lot (Area 1) and is responsible for handling hydromodification requirements for the project. Flow control in the vault is achieved using multiple orifices on the outlet structure located at the downstream end of the vault. The size, number and location of the orifices are presented in the Table 1. The outlet structure contains an emergency overflow opening that is only utilized in storm events equal to or larger than the 100-year storm, such that peak flows can be safely discharged to the receiving storm drain system. Sizing and further peak flow discussion is in the "Drainage Report for Harmon Oaks". One rating curve has been modeled to represent the flows from orifices and spillway weir.

The detention vault has been modeled using the storage unit feature, and the riser structure has been modeled using the outlet feature in SWMM.

It should be noted that detailed outlet structure location and elevations will be shown on the construction plans based on the recommendations of this study.

FLOW DURATION CURVE COMPARISON

The Flow Duration Curves (FDC) for the site were compared at POC-1 by exporting the hourly runoff time series results from SWMM to a spreadsheet. The FDC was compared between 10% of the existing condition Q2 (based on accepting an assumption of high susceptibility for downstream channel erosion as required if no soils tests are completed) up to the existing condition Q10. The Q2 and Q10 were determined using a partial duration statistical analysis of the runoff time series in an Excel spreadsheet. The SWMM Model is a statistical analysis based on the Weibull Plotting Position Method.

The range between 10% of Q2 and Q10 was divided into 100 equal time intervals; the number of hours that each flow rate was exceeded was counted from the hourly series. Additionally, the intermediate peaks with a return period "i" were obtained (Qi with i=3 to 9). For the purpose of the plot, the values were presented as percentage of time exceeded for each flow rate.

The FDC comparison for POC1 is illustrated in Figure 1. POC 1 corresponds with the point located at the discharge point of existing 8' X 5' RCP storm drain into Poway Creek southwest of the project.

As can be seen in Figures 1, the FDC for the proposed condition with vault is within 110% of the curve for the existing condition. The additional runoff volume generated from developing the site will be released to the downstream storm drain at a flow rate equals or below the 10% Q2 lower threshold. Additionally, the project will not increase peak flow rates between the Q2 and the Q10, as shown in the graphic and also in the attached table.

SUMMARY & CONCLUSION

A summary/comparison of existing and proposed areas draining to each point of compliance (POC) are shown in the table below. The model includes onsite project areas and offsite drainage areas. One underground vault is proposed to mitigate increased flow frequencies as a result of development.

AREA SUMMARY		
	Existing (AC)	Proposed (AC)
POC 1	13.68	13.68

The study has demonstrated that the proposed detention vault and riser meet current HMP requirements.

Key Assumptions

1. D & A soils are representative of the entire site.

2. The Proprietary biofiltration units' volume is negligible.

3. The discharge from the low flow orifice will be pumped to the proposed manhole down-stream of the proposed vault. This manhole receives the discharge from the middle, top orifices, and over flow emergency weir flows (outlet riser structure), and discharges into the existing storm drain system. However, for modeling purposes the discharge from the low orifice was used, not the pump discharge rating curve.

Attachment -1 Flow Duration Curve Analysis

Flow duration curve shall not exceed the pre-developed conditions by more than 10% neither in peak flow nor duration.

The figure on the following page illustrates that the flow duration curve in post-development conditions after the proposed BMP is below the existing flow duration curve. The flow duration curve table following the curve shows that if the interval 0.10Q 2 – Q 10 is divided in 100 sub-intervals, then a) the post development divided by pre-development durations are never larger than 110% (the permit allows up to 110%); and b) there are no more than 10 intervals in the range 101%-110% which would imply an excess over 10% of the length of the curve (the permit allows less than 10% of excesses measured as 101-110%).

Consequently, the design passes the hydromodification test.

It is important to note that the flow duration curve can be expressed in the "x" axis as percentage of time, hours per year, total number of hours, or any other similar time variable. As those variables only differ by a multiplying constant, their plot in logarithmic scale is going to look exactly the same and compliance can be observed regardless of the variable selected. The selection of a logarithmic scale in lieu of the normal scale is preferred, as differences between the pre-development and post-development curves can be seen more clearly in the entire range of analysis. Both graphics are presented for reference.

In terms of the "y" axis, the peak flow value is the variable of choice. As an additional analysis performed by H&A, not only the range of analysis is clearly depicted (10% of Q 2 to Q 10) but also all intermediate flows are shown (30% of Q 2 , 50% of Q 2 , Q 2 , Q 3 , Q 4 , Q 5 , Q 6 , Q 7 , Q 8 and Q 9) in order to demonstrate compliance at any range Q x – Q x+1 . It must be pointed out that one of the limitations of both the SWMM and SDHM models is that the intermediate analysis is not performed (to obtain Q i from i = 2 to 10).

The largest "n" peak flows are attached in this appendix, as well as the values of Q_i with a return period "i", from i=2 to 10. The Q i values are also added into the flow-duration plot.

ATTACHMENT 2 - Elevation vs. Area Curves vs. Discharge Curves to be used in SWMM

Elevation vs. Area

For the detention vault, a pond is used to route the hydrographs, the elevation vs area curve in the model is calculated in excel and imported into the model at a 0.10 interval range

Elevation vs Discharge

The total discharge peak flow is imported from an excel spreadsheet that calculated the elevation vs discharge of the multiple outlet system.

The orifice configurations have been selected to maximize their size while restricting flow to conform to the required 10% of the Q2 event flow. While we acknowledge that these orifices are small, to increase the size of these outlets would impact the basins' ability to restrict flow beneath the HMP thresholds, thus preventing the BMP from conforming to HMP requirements.

CITY OF POWAY, CALIFORNIA

ATTACHMENT 4 - SWMM Input and Output Data (pre-deveoped and Proposed Models)

ATTACHMENT 5 - SWMM Explanation of Significant Variables

In the prior section the viewer can view the associated input and output parameters within the EPA-SWMM Model in both pre-development and post-development conditions. Each portion, i.e., sub-catchments, outfalls, storage units, weir as a discharge, and outfalls (point of compliance), are also shown.

Variables for modeling are associated with typical recommended values by the EPA-SWMM model. Recommended values for the SWMM model have been attained from City of Poway BMP Design Manual-Appendix G (San Diego County HMP Permit for the SWMM Model).

Soil characteristics of the existing soils were determined from the USGS sources.

Description of model parameters and assumptions:

N-Imperv – Manning's N for impervious surfaces

0.012 (typical)

N-Perv – Manning's N for pervious surfaces

0.15 (typical)

Dstore-Imperv – Depth of depression storage on impervious area (in)

0.05 (typical)

Dstore-Perv – Depth of depression storage on pervious area (in)

0.1 (typical)

%Zero-Imperv – Percentage of impervious area with no depression storage (%)

25 (typical)

Suction Head – Soil capillary suction head (in)

Conductivity – Soil saturated hydraulic conductivity (in/hr)

-75% of these values if subcatchment has concrete or asphalt

Initial Deficit – Initial moisture deficit (fraction)

Soil Type	Suction Head	Conductivity	Initial Deficit
A	1.5	0.3	0.30
B	3	0.2	0.31
C	6	0.1	0.32
D	9	0.025	0.33

NOTE: These values are based on City Poway's BMP Manual in Appendix G.

EXPLANATION OF SELECTED VARIABLES

Parameters for the pre- and post-developed models include soil types A & D in accordance with the USGS Soil Survey Map (attached at the end of this appendix). Suction head, conductivity and initial deficit corresponds to average values expected for the soil types, according to sources consulted, professional experience, and approximate values obtained by City of Poway BMP Design Manual Appendix G.

Selection of a Kinematic Approach: As the continuous model is based on hourly rainfall, and the time of concentration for the pre-development and post-development conditions is significantly smaller than 60 minutes, precise routing of the flows through the impervious surfaces, the underdrain pipe system, and the discharge pipe was considered unnecessary. The truncation error of the precipitation into hourly steps is much more significant than the precise routing in a system where the time of concentration is much smaller than 1 hour.

Explanation of Significant Variables

Height:
The storage depth variable within the SWMM model is representative of the storage volume provided in the vault.

Seepage Rate:
The seepage rate is directly input from the geotechnical report. Equals to 0 in no infiltration\ closed bottom vault

Orifice Equation:

The general orifice equation can be expressed as:

$$Q = \frac{\pi}{4} c_g \frac{D^2}{144} \sqrt{2g \frac{(H - H_D)}{12}} \qquad (1)$$

where Q is the peak flow in cfs, D is the diameter in inches, c g is the typical discharge coefficient for orifices (0.61-0.63 for thin walls and around 0.75-0.8 for thick walls), g is the acceleration of gravity in ft/s^2, H D is the elevation of the centroid of the orifice in inches, and H is the depth of the water in inches in Equation (1).

Note:
The complete storage and rating curves and the respective explanation is shown at the end of this appendix. A variable area vs. elevation storage curve was used for the proposed model, and a discharge that is a function of the outlet structure in the surface was used also.

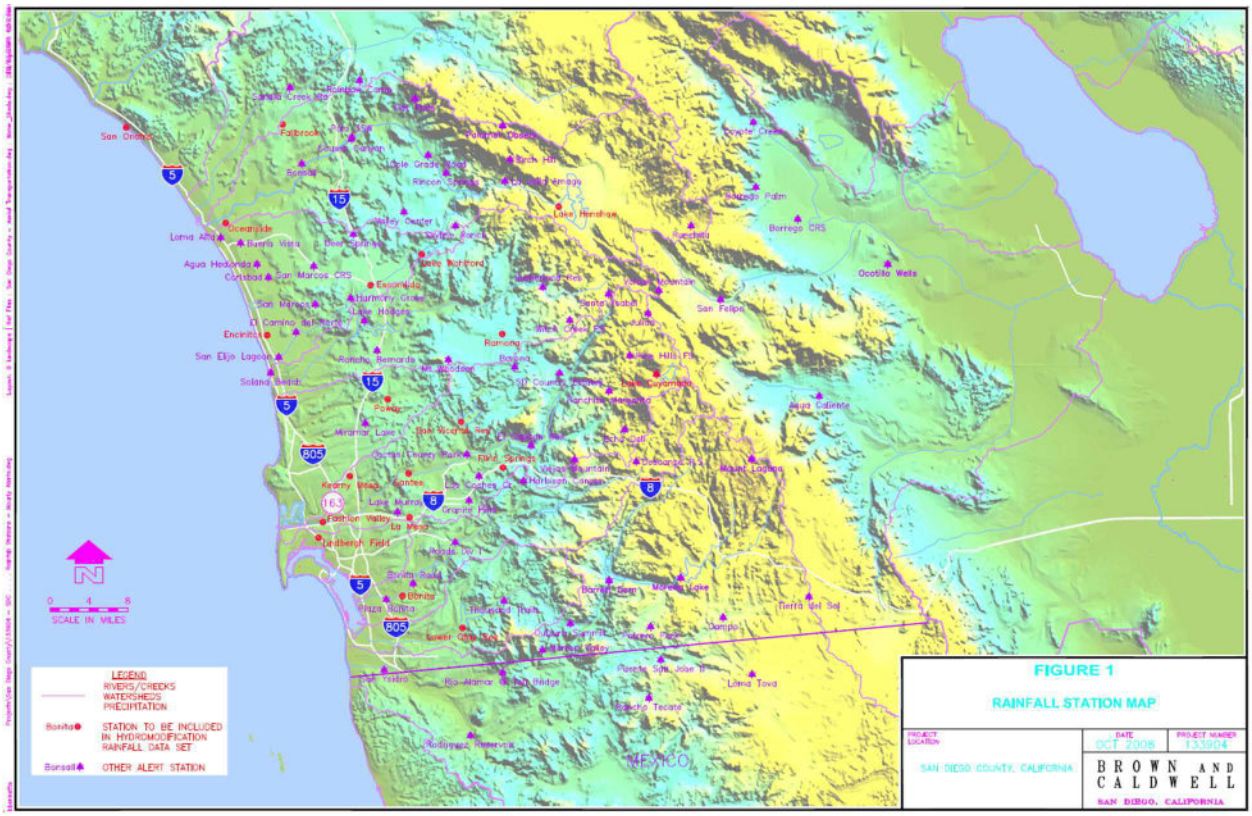

Figure G.1-1: Rainfall Station Map

Project applicants preparing continuous simulation models shall select the most appropriate rainfall data set from the rainfall record files provided on the Project Clean Water website. For a given project location, the following factors should be considered in the selection of the appropriate rainfall data set:

- In most cases, the rainfall data set in closest proximity to the project site will be the appropriate choice (refer to the rainfall station map).
- In some cases, the rainfall data set in closest proximity to the project site may not be the most applicable data set. Such a scenario could involve a data set with an elevation significantly different from the project site. In addition to a simple elevation comparison, the project proponent may also consult with the San Diego County's average annual precipitation isopluvial map, which is provided in the San Diego County Hydrology Manual (2003). Review of this map could provide an initial estimate as to whether the project site is in a similar rainfall zone as compared to the rainfall stations. Generally, precipitation totals in San Diego County increase with increasing elevation.
- Where possible, rainfall data sets should be chosen so that the data set and the project location are both located in the same topographic zone (coastal, foothill, mountain) and major

SWMM Parameter Name	Unit	Range	Use in San Diego
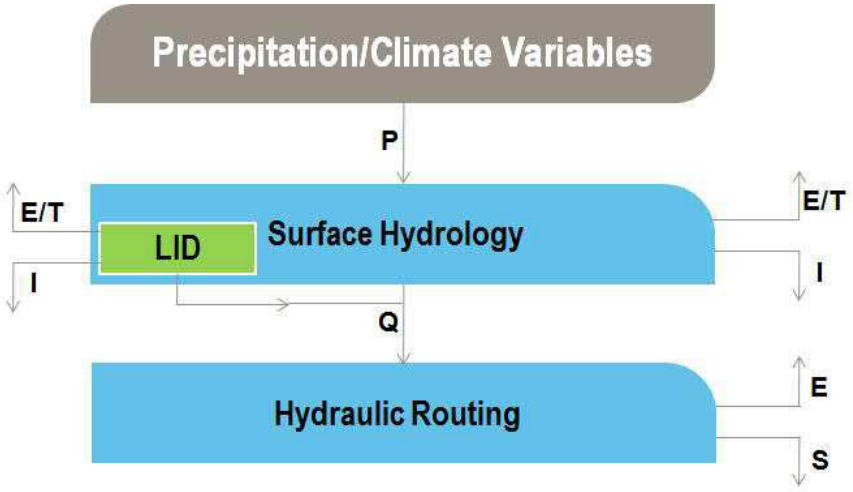
Suction Head (Green-Ampt)	Inches	1.93 – 12.60 presented in Table A.2 of SWMM Manual	Hydrologic Soil Group A: 1.5 Hydrologic Soil Group B: 3.0 Hydrologic Soil Group C: 6.0 Hydrologic Soil Group D: 9.0
Conductivity (Green-Ampt)	Inches per hour	0.01 – 4.74 presented in Table A.2 of SWMM Manual by soil texture class 0.00 – ≥0.45 presented in Table A.3 of SWMM Manual by hydrologic soil group	Hydrologic Soil Group A: 0.3 Hydrologic Soil Group B: 0.2 Hydrologic Soil Group C: 0.1 Hydrologic Soil Group D: 0.025 Note: reduce conductivity by 25% in the post-project condition when native soils will be compacted. Conductivity may also be reduced by 25% in the pre-development condition model for redevelopment areas that are currently concrete or asphalt but must be modeled according to their underlying soil characteristics. For fill soils in post-project condition, see Section G.1.4.3.
Initial Deficit (Green-Ampt)		The difference between soil porosity and initial moisture content. Based on the values provided in Table A.2 of SWMM Manual, the range for completely dry soil would be 0.097 to 0.375	Hydrologic Soil Group A: 0.33 Hydrologic Soil Group B: 0.32 Hydrologic Soil Group C: 0.31 Hydrologic Soil Group D: 0.30 Note: in long-term continuous simulation, this value is not important as the soil will reach equilibrium after a few storm events regardless of the initial moisture content specified.
Groundwater	yes/no	yes/no	NO
LID Controls			Project Specific

SWMM Parameter Name	Unit	Range	Use in San Diego
Snow Pack Land Uses Initial Buildup Curb Length			Not applicable to hydromodification management studies

A schematic of the basic SWMM setup for hydromodification management studies is shown below, with the LID module is shown as a feature within the hydrology computational block. Surface water hydrology is distinguished from groundwater, however the groundwater module is not typically used in hydromodification management studies.

The rainfall and climatology input time series data are used to generate surface runoff which in turn is hydraulically routed through the collection system and storage/treatment facilities. The figure includes the following terms in the water balance equation:

- P = Precipitation
- E/T = Evaporation / Transpiration
- I/S = Infiltration / Seepage
- Q = Runoff



Evapotranspiration was previously addressed above; the remainder of this section discusses the other hydrologic losses and parameters.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 16, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 22, 2018—Aug 31, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Totals for Area of Interest			**10.8**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

ATTACHMENT 6 - Drying Time of the Surface Layer of the Vault

The drying time interval between an elevation yi and another elevation $yi - \Delta y$ can be obtained by:

$$\Delta t_i(hours) = \frac{(Q(yi)+Q(yi-\Delta y))}{7200\ (V(yi)-V(yi-\Delta y))} = \frac{Q_{ave}}{3600\ \Delta V}$$

$$t = \sum_{i=1}^{n} \Delta t_i\ (hours)$$

Q_{ave} represents the average discharge between elevation y_i and y_{i+1} obtained by $\frac{Q(yi)+Q(yi-\Delta y)}{2}$ where ΔV represents the fraction of the volume that must be discharged at a peak flow $Q_{ave}(V(yi) - V(yi - \Delta y))$.

The volume and the discharge change as the elevation changes; the calculation takes into account this change.

ATTACHMENT 2b – Hydromodification Watershed Maps

Use this checklist to ensure the required information has been included on the Hydromodification Management Exhibit. Include checklist in submittal and check all boxes that are applicable. Provide justification for items not included.

The Hydromodification Management Exhibit must identify:

☒ Underlying hydrologic soil group
☒ Approximate depth to groundwater
☒ Existing natural hydrologic features (watercourses, seeps, springs, wetlands)
☐ Critical coarse sediment yield areas to be protected
☒ Existing topography
☒ Existing and proposed site drainage network and connections to drainage offsite
☒ Proposed grading
☒ Proposed impervious features
☒ Proposed design features and surface treatments used to minimize imperviousness
☒ Point(s) of Compliance (POC) for Hydromodification Management
☒ Existing and proposed drainage boundary and drainage area to each POC (when necessary, create separate exhibits for pre-development and post-project conditions)
☒ Structural BMPs for hydromodification management (identify location, type of BMP, and size/detail)

Justification for items not included in Hydromodification Management Exhibit:

ATTACHMENT 3 – STRUCTURAL BMP MAINTENANCE INFORMATION

This is the cover sheet for Attachment 3.

Indicate which Items are Included behind this cover sheet:

Attachment Sequence	**Contents**	**Checklist**
Attachment 3a	Operations and Maintenance Project Summary	☒ Included
Attachment 3b	Structural BMP Maintenance Plan (Required)	☒ Included See Structural BMP Maintenance Information Checklist on the back of this Attachment cover sheet.

ATTACHMENT 3a

Operations and Maintenance – Project Summary	
Project Name	Harmon Oaks
Project/Permit Number(s)	TBD
Project Address	Oak Knoll Road, in between Pomerado Road and Carriage Road
Assessor's Parcel Number(s) (APN(s))	317-501-01-00,317-500-02, 03,09,10,11,12,13,14
Project Watershed (Complete Hydrologic Unit, Area, and Subarea Name with Numeric Identifier)	Penasquitos, Poway, 906.20
Responsible Party for Construction Phase	
Developer's Name	Lennar Homes of California, Inc.
Address	16465 Via Esprillo, Ste 150, San Diego, CA 92127
Email Address	David.Shepherd@lennar.com
Phone Number	(858) 618-4942
Engineer of Work	Alisa S. Vialpando #47945
Engineer's Phone Number	(858) 558-4500
Responsible Party for Ongoing Maintenance	
Owner's Name(s)*	Lennar Homes of California, Inc.
Address	16465 Via Esprillo, Ste 150, San Diego, CA 92127
Email Address	David.Shepherd@lennar.com
Phone Number	(858) 618-4942
*Note: If a corporation or LLC, provide information for principal partner or Agent for Service of Process. If an HOA, provide information for the Board or property manager at time of project closeout.	

ATTACHMENT 3b

Use this checklist to ensure the required information has been included in the Structural BMP Maintenance Information Attachment. Include checklist in submittal and check all boxes that are applicable. Provide justification for items not included.

Attachment 3b must identify:

- ☒ Specific maintenance indicators and actions for proposed structural BMP(s). This must be based on Section 7.7 of the BMP Design Manual and enhanced to reflect actual proposed components of the structural BMP(s)
- ☒ How to access the structural BMP(s) to inspect and perform maintenance
- ☒ Features that are provided to facilitate inspection (e.g., observation ports, cleanouts, silt posts, or other features that allow the inspector to view necessary components of the structural BMP and compare to maintenance thresholds)
- ☒ Manufacturer and part number for proprietary parts of structural BMP(s) when applicable
- ☒ Maintenance thresholds specific to the structural BMP(s), with a location-specific frame of reference (e.g., level of accumulated materials that triggers removal of the materials, to be identified based on viewing marks on silt posts or measured with a survey rod with respect to a fixed benchmark within the BMP)
- ☐ Recommended equipment to perform maintenance
- ☐ When applicable, necessary special training or certification requirements for inspection and maintenance personnel such as confined space entry or hazardous waste management
- ☐ ~~8.5" x 11" Site plan showing BMP locations~~ **(See DMA Map)**
- ☒ 8.5" x 11" Detail Sheets for BMPs – must match details provided on project/permit plans

Justification for items not included in Attachment 3b:

The following inspection and maintenance activities shall be performed and completed as indicated.

Maintenance Program for Inlet Stenciling

Inspection Frequency/Indications:	Regular Maintenance Inspections ❑ Before wet season begins (September); ❑ After wet season (April).
Maintenance Indications	**Maintenance Activities**
❑ Inlet stenciling/signage begins to weather or fade	❑ Re-stamp signage
❑ Broken or damaged structure	❑ Repair or replace signage structure

Maintenance Program for Filterra Biofiltration Units

Inspection Frequency/Indications:	Regular Maintenance Inspections ❑ Monthly during wet season ❑ Annually before wet season (September) Performance Inspection ❑ 72 hrs after rainfall events greater than 0.5 in.
Maintenance Indications	**Maintenance Activities**
❑ Excessive trash, debris, or sediment in unit. (i.e., sump is 85 percent full or sump is 50 percent full during two consecutive monthly inspections)	❑ Remove trash and debris within 15 days. Empty unit when the unit is 85 percent full or 50 percent full during two consecutive monthly inspections, or annually in May.
❑ Presence of trash and debris in weir box.	❑ Remove trash and debris while onsite conducting inspection
❑ When standing water in sump is observed during annual and performance inspection.	❑ If standing water cannot be removed or remains through the wet season, notify vector control.
❑ Minor structural damage (i.e., screen becomes clogged, damaged or loose)	❑ Clean screen, re-fasten screen if appropriate.
❑ Cracked or fatigued neoprene vector seals	❑ Replace damaged seal
❑ Major damage to structures (i.e., holes in screen, large debris, damage to housing or weir box)	❑ Immediately consult with engineer and manufacturer=s representative to develop a course of action and effect repairs prior to the wet season.
Waste Disposal	Sediment, other pollutants, and all other waste shall be properly disposed of in a licensed landfill or by another appropriate disposal method in accordance with local, state, and federal regulations.

Maintenance Program for Detention Vault

Inspection Frequency/Indications:	Regular Inspections ❑ Before wet season begins (September); ❑ After wet season (April). Performance Inspections ❑ After rainfall events greater than 0.5 inches, or any rainfall that fills the basin.
Maintenance Indications	**Maintenance Activities**
❑ Standing water in vault during dry weather; basin does not drain within 72 hours after runoff event.	❑ Drain basin. Determine and resolve problems that are causing the basin to drain improperly. If basin cannot be drained, or if standing water persists, notify vector control.
❑ Evidence of rodent infestation	❑ Abate and control rodents as necessary to maintain the performance of the facility.
❑ Trash, debris, or litter present in basin	❑ Remove trash, debris, and litter
Waste Disposal	Sediment, other pollutants, and all other waste shall be properly disposed of in a licensed landfill or by another appropriate disposal method in accordance with local, state, and federal regulations.

Attachment 3a: Structural BMP Maintenance Plan

Maintenance Program for Pump	
BMP Access: Starlight Place (pvt.Rd.)	
Inspection Frequency/Indications:	Regular Inspections ❑ Before wet season begins (September); ❑ Every 60 days during wet season (September-April); ❑ After wet season (April). Performance Inspections ❑ After rainfall events greater than 0.5 inch
Maintenance Indications Connections	**Maintenance Activities Connections**
❑ Standing water in pump	❑ Check for clogged outlet pipe. ❑ Check that pump is operational, repair/replace pump as necessary.
❑ Trash, debris, and vegetative litter clogging inlets.	❑ Remove trash, debris, and vegetative litter. ❑ Check for clogged inlet pipe.
Waste Disposal	Sediment, other pollutants, and all other waste shall be properly disposed of in a licensed landfill or by another appropriate disposal method in accordance with local, state, and federal regulations.

ATTACHMENT 3b
Maintenance Information for Underground Detention Basin

Maintenance should be conducted during dry weather when no flow is entering the system. Confined space entry is usually required to maintain the Underground Detention Basins. Only personnel that are OSHA Confined Space Entry trained and certified may enter underground structures. Once safety measures such as traffic control have been deployed, the access covers may be removed and the following activities may be conducted to complete maintenance. All access covers will be securely replaced following inspection and/or maintenance

Inspection Activity	Maintenance Indicator(s)	Field Measurement	Minimum Frequency of Inspection	Maintenance Activity	Minimum Maintenance Frequency
Inspect vault twice during the first wet season of operation	N/A	Visual inspection	Post-construction	Set cleaning frequency	Post-construction
Inspect for cracks and inlet/outlet area erosion	Cracks or erosion present	Visual inspection	Semi-annually	Repair cracks/erosion. Consult engineers if immediate solution is not evident.	As needed
Inspect for litter, oil and grease from inlet/outlet areas	Litter, oil or grease present	Visual inspection	Beginning & end of rainy season	Remove litter, oil and grease	Semi-annually
Inspect for accumulated sediment	Sediment on the system floor exceeds 6”	Tape measure	Annually, prior to start of wet season	Remove sediment with vacuum truck. No jetting permitted to loosen sediment.	Bi-annually or as needed
Inspect for trash and debris	Trash and debris present	Visual inspection	Semi-annually	Remove trash and debris (e.g. via vacuum truck)	As needed
Inspect system for movement of modules	Spacing of modules exceeds ¾”	Tape measure	Semi-annually	Consult engineers	As needed
Inspect inlet and outlet for obstruction(s)	Obstruction is present	Visual inspection	Semi-annually	Remove obstruction	Semi-annually or as needed
Report drawdown rate	Drawdown rate exceeds 96 hours	Recording Device (pen & paper, voice recorder, etc.)	96 hours after wet weather	Remove any obstructions. Consult engineers if immediate solution not evident.	As needed

April 2019

STORMTRAP MAINTENANCE MANUAL

1. Introduction

As with any Stormwater system regular inspections are recommended to ensure the long-term function of the system per design. As Stormwater migrates through the system, both sediment and debris could collect or settle within the system invert. Such events would prompt a regular inspection and or maintenance plan. Please call your Authorized StormTrap Representative (877-867-6872) if you have questions regarding the inspection and/or maintenance of the StormTrap system(s). Prior to entry into any underground storm sewer or underground detention systems, appropriate OSHA and local safety regulations and guidelines should be followed.

2. Inspection Schedules

StormTrap Stormwater Management Systems are recommended for inspection whenever the upstream and downstream catch basins and stormwater pipes of the stormwater collection system are inspected and/or maintained. This will economize the cost of the inspection if it is done at the same time the municipal crews are servicing the area.

During the first year of service, StormTrap recommends an accelerated inspection schedule to establish baseline levels of debris and/or sediment within the system. Inspections should be made after each significant rain event or runoff period. We also recommend a quarterly inspection in addition to the event-based inspections for the first 12 months. Based upon the results of the first year of inspections, a more appropriate schedule can be generated.

StormTrap Stormwater Management Systems for a private development are recommended for inspection after construction activities are complete and system is functioning per design and after each major storm water event. Until a cleaning schedule can be established, a quarterly inspection is recommended for the first 12 months. After the first 12 months, a

regular schedule can be implemented. If inspected on a biannual basis, the inspection should be conducted before the stormwater season begins to be sure that everything is functioning properly for the upcoming storm season. If inspected on an annual basis, the inspection should be conducted before the stormwater season begins to be sure that everything is functioning properly for the upcoming storm season.

3. Inspection Process

Inspections should be done such that at least 2-3 days has lapsed since the most recent rain event to allow for complete draining. Visually inspect the system at all manhole locations. Utilizing a sediment pole, measure and document the amount of silt at each manhole location (Figure 1). Inspect each pipe opening to ensure that the silt level or any foreign objects are not blocking the pipes. Be sure to inspect the outlet pipe(s) because this is typically the smallest pipe in the system. It is common that most of the larger materials will be collected upstream of the system in catch basins, and it is therefore important at time of inspections to check these structures for large trash or blockages.

Remove any blockages if you can during the inspection process only if you can do so safely from the top of the system without entering into the system**. Do not go into the system under any circumstances** without proper ventilation equipment and confined space training. Pass any information requiring action onto the appropriate maintenance personnel if you cannot remove the blockages from above during the inspection process. Be sure to describe the location of each manhole and the type of material that needs to be removed.

The sediment level of the system should also be measured and recorded during the inspection process. Recording the sediment level at each manhole is very important in order get a history of sediment that can be graphed over time (i.e. years) in order to estimate when the system will need to be maintained next. It is also important to keep these records to verify that the inspection process was actually performed if anyone asks for your records in the future. ***(Please see Appendix A for reference)***

The sediment level in the underground detention system can be determined from the outside of the system by opening up all the manholes and using a sediment pole to measure the

amount of sediment at each location. Force the stick to the bottom of the system and then remove it and measure the amount of sediment at that location. Again, do not enter into the system under any circumstances without proper ventilation equipment and training. Please see Appendix A for a sample inspection document.

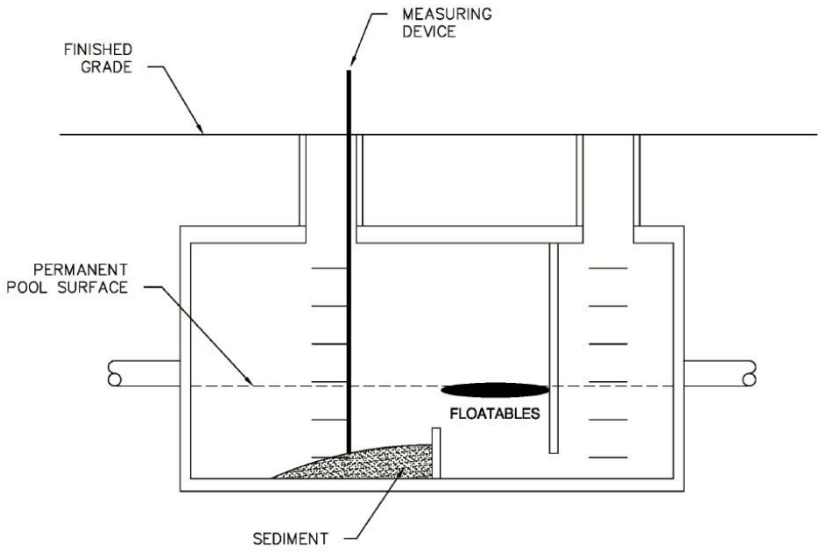

Figure 1. During inspection, measure the distance from finished grade to the top of the sediment inside the system.

4. When to Clean the System

Any blockages should be safely removed as soon as it is safely possible to ensure the StormTrap detention system will fill and drain properly before the next stormwater event.

The dry detention system should be completely cleaned whenever the sediment occupies more than 10% to 15% of the originally designed system's volume. A wet system (sometimes referred to as a wet vault) should be cleaned when the sediment occupies more than 30% or 1/3rd of the originally designed system's volume.

NOTE: Check with your municipality to ensure compliance with local guidelines regarding cleaning criteria, as the allowable sediment before cleaning may different that StormTrap's recommended ranges.

5. How to Clean the StormTrap

StormTrap systems should be completely cleaned back to 100% of the originally designed storage volume whenever the above sediment levels have been reached. Be sure to wait at least 3 days after a stormwater event to be sure that the system is completely drained (if it is a dry detention system), and all the sediments have settled to the bottom of the system (if it is a wet detention system).

There are many maintenance companies that can be contracted to clean your underground stormwater detention systems and water quality units. Please call your StormTrap representative for referrals in your area.

Product Specific Maintenance Recommendations

A. SingleTrap on a Concrete Slab

Maintenance is typically performed using a vacuum truck or jet-vac system. If headroom allows, sediment can be manually gathered near access openings and removed with suction. Shorter systems will require a mobile jet vac system that operates throughout the system to collect and remove sediment.

Sediment should be flushed towards a vacuum hose for thorough removal. For a dry system, remove the manhole cover at the top of the system and lower a vacuum hose into one of the rows of the StormTrap system. If present, open the manhole at the opposite end of the StormTrap and use sewer jetting equipment to force water in the same row from one end of the StormTrap row to the opposite side. The rows of the StormTrap are completely open in one contiguous channel from one end to the other for easy cleaning.

If the system was designed to maintain a permanent pool of water, floatables and any oil should be removed in a separate procedure prior to the removal of all sediment.

The floatable trash is removed first by using a bucket strainer to capture and remove any floating debris.

The floatable oils are then removed off the top of the water by using the vacuum truck to suck off any floatable fluids and liquids.

The next step is to use the vacuum truck to gently remove the clarified water above the sediment layer.

The final step is to clean the sediment for each row as described above. For smaller systems, the vacuum truck can remove all the sediment in the basin without using the sewer jetting equipment because of the smaller space.

B. SingleTrap on Stone

SingleTrap systems on a stone base require a similar cleaning process as a SingleTrap on a concrete slab. However, extra care needs to be taken to make sure the stone base retains levelness. If system headroom allows, manual raking of sediment a debris can be performed. Shorter systems may require jet vac equipment. Adjusting the pressure setting on the jet vac to ensure the stability of the stone base.

Sediment should be flushed towards a vacuum hose for thorough removal. Remove the manhole cover at the top of the system and lower a vacuum hose into one of the rows of the StormTrap system. Access the manhole at the opposite end of the StormTrap and use sewer jetting equipment to force water in the same row from one end of the StormTrap row to the opposite side. The rows of the StormTrap are completely open in one contiguous channel from one end to the other for easy cleaning.

C. DoubleTrap

A DoubleTrap system can be maintained in a similar fashion as a SingleTrap on a concrete slab. Typically, headroom is greater in DoubleTrap systems and access is easier for manual

gathering of sediment and debris. Again, maintenance is typically performed using a vacuum truck or jet-vac system. Sediment can be gathered near access openings and removed with suction. Alternately, a jet vac system that operates throughout the system can be used to remove sediment.

Sediment should be flushed towards a vacuum hose for thorough removal. For a dry system, remove the manhole cover at the top of the system and lower a vacuum hose into one of the rows of the StormTrap system. If present, open the manhole at the opposite end of the StormTrap and use sewer jetting equipment to force water in the same row from one end of the StormTrap row to the opposite side. The rows of the StormTrap are completely open in one contiguous channel from one end to the other for easy cleaning.

If the system was designed to maintain a permanent pool of water, floatables and any oil should be removed in a separate procedure prior to the removal of all sediment.

The floatable trash is removed first by using a bucket strainer to capture and remove any floating debris.

The floatable oils are then removed off the top of the water by using the vacuum truck to suck off any floatable fluids and liquids.

The next step is to use the vacuum truck to gently remove the clarified water above the sediment layer.

The final step is to clean the sediment for each row as described above. For smaller systems, the vacuum truck can remove all the sediment in the basin without using the sewer jetting equipment because of the smaller space.

D. ShallowTrap

A ShallowTrap system can be cleaned in a similar fashion as a Single Trap on a stone base. The headroom limitation will not allow for manual entry removal of sediment. Precautions will need to be taken to ensure the stone base retains levelness. Using a jet vac system to flush out the sediment is the recommended method.

Sediment should be flushed towards a vacuum hose for thorough removal. Remove the manhole cover at the top of the system and lower a vacuum hose into one of the rows of the ShallowTrap system. Access the manhole at the opposite end of the ShallowTrap and use sewer jetting equipment to force water in the same row from one end of the ShallowTrap row to the opposite side. The rows of the ShallowTrap are completely open in one contiguous channel from one end to the other for easy cleaning.

E. SiteSaver

Site Savers have 3 potential components that require maintenance and cleaning. Depending on the specifications of the system, trash nets, oil mats, and sediment removal will all need to be addressed.

Inspections should be done such that a enough time has lapsed since the most recent rain event to allow for a static water condition. Visually inspect the system at all manhole and access opening locations. For debris accumulation, visually inspect the netting or screening basket components (if utilized) to determine the bag or basket capacity. Nets or baskets containing only minor quantities of debris may be retained in place. It is recommended to replace the nets or clean the screening baskets when they appear 1/2 - 2/3 full. Failure to replace nets and/or remove floatables from bypass screening (if applicable) will lead to hydraulic relief, drain down deficiencies, and decrease the long-term functionality of the system.

For sediment accumulation, utilize either a sludge sampler or a sediment pole to measure and document the amount of sediment accumulation. To determine the amount of sediment in the system with a sludge sampler follow the manufacturer's instructions. If utilizing a sediment pole, first insert the pole to the top of the sediment layer and record the depth. Then, insert the pole to the bottom of the system and record the depth. The difference in the two measurements corresponds to the amount of sediment in the system. Finally, inspect the inlet pipe opening to ensure that the silt level or any foreign objects are not blocking the pipe.

Maintenance should be done utilizing proper personal protective equipment such as: safety glasses, hard-hat, gloves, first aid kit, etc. Maintenance should occur only when a sufficient

time has lapsed since the most recent rain event to allow for a static water condition for the duration of the maintenance process.
In the case that only trash and floatables need to be removed, and a netting configuration or a removable screening basket is utilized, a vacuum truck is not required. However, a vacuum truck is required if a fixed screening basket configuration is utilized. If the maintenance event is to include oil removal and or sediment removal a vacuum truck or similar equipment would be needed.

Install a new net assembly by sliding the netting frame down the support frame and ensure the netting lays over the plate assembly such that the netting is not restricted. To order additional disposable nets, contact your local SiteSaver representative. New nets come with tie wraps temporarily holding the net material to the frame component for easy handling and storage. It is not recommended to remove the tie wraps until the net is ready to be installed. The frame is tapered from top (widest part) to bottom, and is also tapered from front (towards the sewer) to back. Cut the tie wraps that secures the netting material to the frame for shipment and lower the net down the guide rails. If debris has accumulated in the net support frame, remove the objects so the new net seats fully in the channel when installed.
When lowering the net, the following details should be exercised when placing the net:

- Watch the lowering to make sure that there are no unexpected entanglements.
- Be careful not to let the toe of the net get caught under the frame when it reaches the bottom of the support frame. This is typically accomplished by holding the toe of the net until after the net has started to prop into place.
- Ensure the netting lays over the plate assembly such that the netting is not restricted.

Access to the netting chamber can be achieved via the square grated opening atop the Site Saver unit. Trash net needs to be removed completely (including the frame) with a service vehicle (crane/hoist/boom truck).

For sediment removal, the SiteSaver is designed with clear access at both the inlet and outlet. A vacuum truck, or similar trailer mounted equipment, can be used to remove the sediment, hydrocarbons, and water within the unit. For more effective removal, it is recommended to use sewer jetting equipment or a spray lance to force the sediment to the vacuum hose. When the floor is sufficiently cleaned, fill the system back to its normal water elevation (to the pipe inverts).

Complete a post maintenance inspection to ensure that all components have been replaced and are properly secured within the SiteSaver device. It is a good practice to take time stamped photographs after every maintenance event to include within maintenance logs. After verifying all components, secure the access openings and ensure proper disposal of all pollutants removed during maintenance per local, state, and federal guidelines.

Proof of inspections and maintenance is the responsibility of the owner. All inspection reports and data should be kept on site or at a location where they will be accessible for years in the future. Some municipalities require these inspection and cleaning reports to be forwarded to the proper governmental permitting agency on an annual basis. Refer to your local and national regulations for any additional maintenance requirements and schedules not contained herein. Inspections should be a part of the standard operating procedure. It is good practice to keep records of rainfall events between maintenance events and the weight of material removed, even if no report is required.

F. Sand Filter

Sand filter beds can crust over and become clogged or partially clogged, for this reason we recommend inspecting the sand filters at least annually. To remove this, the upper layer of clogged and / or hardened sand will need to be broken up with a steel rake or a similar device. After breaking up the top 2-5 inches of contaminated media, the lose sand can be scrapped off and removed via a vacuum truck. Replace and regrade the media with the approved material per the original design.

Various contractors specialize in this work. Maintenance methodologies range from manual replacement and removal to robotic devices that require no human entry into the system. Please consult to local maintenance contractors for additional information.

6. Inspection Reports

Proof of these inspections is the responsibility of the property owner. All inspection reports and data should be kept on site or at a location where they will be accessible for years in the future. Some municipalities require these inspection and cleaning reports to be forwarded to the proper governmental permitting agency on an annual basis.

Refer to your local and national regulations for any additional maintenance requirements and schedules not contained herein. Inspections should be a part of your standard operating procedure. Please see Appendix A for a sample Inspection and Maintenance form.

Local Area Filterra Plant List

Introduction

Thank you for your purchase of the Filterra® Bioretention System. Filterra is a specially engineered stormwater treatment system incorporating high performance biofiltration media to remove pollutants from stormwater runoff. The system's biota (vegetation and soil microorganisms) then further breakdown and absorb captured pollutants. All components of the system work together to provide a sustainable long-term solution for treating stormwater runoff.

The Filterra system has been delivered to you with protection in place to resist intrusion of construction related sediment which can contaminate the biofiltration media and result in inadequate system performance. These protection devices are intended as a best practice and cannot fully prevent contamination. It is the purchaser's responsibility to provide adequate measures to prevent construction related runoff from entering the Filterra system.

Included with your purchase is Activation of the Filterra system by the manufacturer as well as a 1-year warranty from delivery of the system and 1-year of routine maintenance (mulch replacement, debris removal, and pruning of vegetation) up to twice during the first year after activation.

Design and Installation

Each project presents different scopes for the use of Filterra systems. Information and help may be provided to the design engineer during the planning process. Correct Filterra box sizing (by rainfall region) is essential to predict pollutant removal rates for a given area. The engineer shall submit calculations for approval by the local jurisdiction. The contractor is responsible for the correct installation of Filterra units as shown in approved plans. A comprehensive installation manual is available at www.ContechES.com.

Activation Overview

Activation of the Filterra system is a procedure completed by the manufacturer to place the system into working condition. This involves the following items:

- Removal of construction runoff protection devices
- Planting of the system's vegetation
- Placement of pretreatment mulch layer using mulch certified for use in Filterra systems.

Activation MUST be provided by the manufacturer to ensure proper site conditions are met for Activation, proper installation of the vegetation, and use of pretreatment mulch certified for use in Filterra systems.

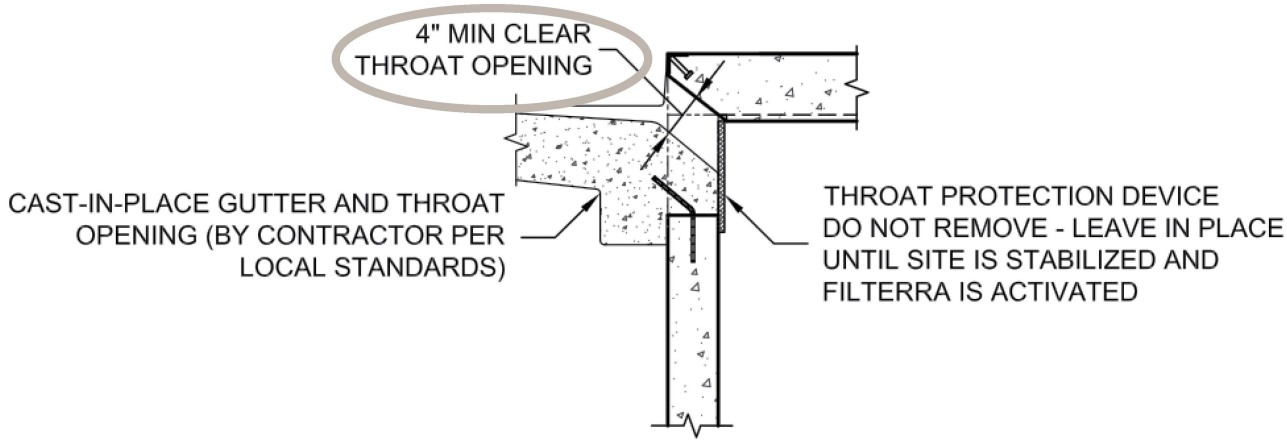
Minimum Requirements

The minimum requirements for Filterra Activation are as follows:

1. The site landscaping must be fully stabilized, i.e. full landscaping installed and some grass cover (not just straw and seed) is required to reduce sediment transport. Construction debris and materials should be removed from surrounding area.

2. Final paving must be completed. Final paving ensures that paving materials will not enter and contaminate the Filterra system during the paving process, and that the plant will receive runoff from the drainage area, assisting with plant survival for the Filterra system.

3. Filterra throat opening should be at least 4" in order to ensure adequate capacity for inflow and debris.



An Activation Checklist is included on page 12 to ensure proper conditions are met for Contech to perform the Activation services. A charge of $500.00 will be invoiced for each Activation visit requested by Customer where Contech determines that the site does not meet the conditions required for Activation.

Filterra Plant Selection Overview

A Plant List has been enclosed with this packet highlighting recommended plants for Filterra systems in your area. Keep in mind that plants are subject to availability due to seasonality and required minimum size for the Filterra system. Plants installed in the Filterra system are container plants (max 15 gallon) from nursery stock and will be immature in height and spread at Activation.

It is the responsibility of the owner to provide adequate irrigation when necessary to the plant of the Filterra system.

The "Planting Requirements for Filterra Systems" document is included as an appendix and discusses proper selection and care of the plants within Filterra systems.

Warranty Overview

Refer to the Contech Engineered Solutions LLC Stormwater Treatment System LIMITED WARRANTY for further information. The following conditions may void the Filterra system's warranty and waive the manufacturer provided Activation and Maintenance services:

- Unauthorized activation or performance of any of the items listed in the activation overview
- Any tampering, modifications or damage to the Filterra system or runoff protection devices
- Removal of any Filterra system components
- Failure to prevent construction related runoff from entering the Filterra system
- Failure to properly store and protect any Filterra components (including media and underdrain stone) that may be shipped separately from the vault

Routine Maintenance Guidelines

With proper routine maintenance, the biofiltration media within the Filterra system should last as long as traditional bioretention media. Routine maintenance is included by the manufacturer on all Filterra systems for the first year after activation. This includes a maximum of 2 visits to remove debris, replace pretreatment mulch, and prune the vegetation. More information is provided in the Operations and Maintenance Guidelines. Some Filterra systems also contain pretreatment or outlet bays. Depending on site pollutant loading, these bays may require periodic removal of debris, however this is not included in the first year of maintenance, and would likely not be required within the first year of operation.

These services, as well as routine maintenance outside of the included first year, can be provided by certified maintenance providers listed on the Contech website. Training can also be provided to other stormwater maintenance or landscape providers.

Why Maintain?

All stormwater treatment systems require maintenance for effective operation. This necessity is often incorporated in your property's permitting process as a legally binding BMP maintenance agreement. Other reasons to maintain are:

- Avoiding legal challenges from your jurisdiction's maintenance enforcement program.
- Prolonging the expected lifespan of your Filterra media.
- Avoiding more costly media replacement.
- Helping reduce pollutant loads leaving your property.

Simple maintenance of the Filterra is required to continue effective pollutant removal from stormwater runoff before discharge into downstream waters. This procedure will also extend the longevity of the living biofilter system. The unit will recycle and accumulate pollutants within the biomass, but is also subjected to other materials entering the inlet. This may include trash, silt and leaves etc. which will be contained above the mulch layer. Too much silt may inhibit the Filterra's flow rate, which is the reason for site stabilization before activation. Regular replacement of the mulch stops accumulation of such sediment.

When to Maintain?

Contech includes a 1-year maintenance plan with each system purchase. Annual included maintenance consists of a maximum of two (2) scheduled visits. Additional maintenance may be necessary depending on sediment and trash loading (by Owner or at additional cost). The start of the maintenance plan begins when the system is activated.

Maintenance visits are scheduled seasonally; the spring visit aims to clean up after winter loads including salts and sands while the fall visit helps the system by removing excessive leaf litter.

It has been found that in regions which receive between 30-50 inches of annual rainfall, (2) two visits are generally required; regions with less rainfall often only require (1) one visit per annum. Varying land uses can affect maintenance frequency; e.g. some fast food restaurants require more frequent trash removal. Contributing drainage areas which are subject to new development wherein the recommended erosion and sediment control measures have not been implemented may require additional maintenance visits.

Some sites may be subjected to extreme sediment or trash loads, requiring more frequent maintenance visits. This is the reason for detailed notes of maintenance actions per unit, helping the Supplier and Owner predict future maintenance frequencies, reflecting individual site conditions.

Owners must promptly notify the (maintenance) Supplier of any damage to the plant(s), which constitute(s) an integral part of the bioretention technology. Owners should also advise other landscape or maintenance contractors to leave all maintenance to the Supplier (i.e. no pruning or fertilizing) during the first year.

Exclusion of Services

Clean up due to major contamination such as oils, chemicals, toxic spills, etc. will result in additional costs and are not covered under the Supplier maintenance contract. Should a major contamination event occur the Owner must block off the outlet pipe of the Filterra (where the cleaned runoff drains to, such as drop inlet) and block off the throat of the Filterra. The Supplier should be informed immediately.

Maintenance Visit Summary

Each maintenance visit consists of the following simple tasks (detailed instructions below).

1. Inspection of Filterra and surrounding area
2. Removal of tree grate and erosion control stones
3. Removal of debris, trash and mulch
4. Mulch replacement
5. Plant health evaluation and pruning or replacement as necessary
6. Clean area around Filterra
7. Complete paperwork

Maintenance Tools, Safety Equipment and Supplies

Ideal tools include: camera, bucket, shovel, broom, pruners, hoe/rake, and tape measure. Appropriate Personal Protective Equipment (PPE) should be used in accordance with local or company procedures. This may include impervious gloves where the type of trash is unknown, high visibility clothing and barricades when working in close proximity to traffic and also safety hats and shoes. A T-Bar or crowbar should be used for moving the tree grates (up to 170 lbs ea.). Most visits require minor trash removal and a full replacement of mulch. See below for actual number of bagged mulch that is required in each media bay size. Mulch should be a double shredded, hardwood variety. Some visits may require additional Filterra engineered soil media available from the Supplier.

Box Length	Box Width	Filter Surface Area (ft^2)	Volume at 3" (ft^3)	# of 2 ft^3 Mulch Bags
4	4	16	4	2
6	4	24	6	3
8	4	32	8	4
6	6	36	9	5
8	6	48	12	6
10	6	60	15	8
12	6	72	18	9
13	7	91	23	12

Maintenance Visit Procedure

Keep sufficient documentation of maintenance actions to predict location specific maintenance frequencies and needs. An example Maintenance Report is included in this manual.

1. Inspection of Filterra and surrounding area

- Record individual unit before maintenance with photograph (numbered). Record on Maintenance Report (see example in this document) the following:

Record on Maintenance Report the following:

Standing Water	yes | no
Damage to Box Structure	yes | no
Damage to Grate	yes | no
Is Bypass Clear	yes | no

If yes answered to any of these observations, record with close-up photograph (numbered).

2. Removal of tree grate and erosion control stones

- Remove cast iron grates for access into Filterra box.
- Dig out silt (if any) and mulch and remove trash & foreign items.

3. Removal of debris, trash and mulch

Record on Maintenance Report the following:

Silt/Clay	yes | no
Cups/ Bags	yes | no
Leaves	yes | no
Buckets Removed	_____

- After removal of mulch and debris, measure distance from the top of the Filterra engineered media soil to the top of the top slab. Compare the measured distance to the distance shown on the approved Contract Drawings for the system. Add Filterra media (not top soil or other) to bring media up as needed to distance indicated on drawings.

Record on Maintenance Report the following:

Distance to Top of Top Slab (inches)	_____
Inches of Media Added	_____

4. Mulch replacement

- Add double shredded mulch evenly across the entire unit to a depth of 3".
- Refer to Filterra Mulch Specifications for information on acceptable sources.
- Ensure correct repositioning of erosion control stones by the Filterra inlet to allow for entry of trash during a storm event.
- Replace Filterra grates correctly using appropriate lifting or moving tools, taking care not to damage the plant.

5. Plant health evaluation and pruning or replacement as necessary

- Examine the plant's health and replace if necessary.
- Prune as necessary to encourage growth in the correct directions

Record on Maintenance Report the following:

Height above Grate	_____ (ft)
Width at Widest Point	_____ (ft)
Health	healthy | unhealthy
Damage to Plant	yes | no
Plant Replaced	yes | no

6. Clean area around Filterra

- Clean area around unit and remove all refuse to be disposed of appropriately.

7. Complete paperwork

- Deliver Maintenance Report and photographs to appropriate location (normally Contech during maintenance contract period).
- Some jurisdictions may require submission of maintenance reports in accordance with approvals. It is the responsibility of the Owner to comply with local regulations.

Maintenance Checklist

Drainage System Failure	Problem	Conditions to Check	Condition that Should Exist	Actions
Inlet	Excessive sediment or trash accumulation.	Accumulated sediments or trash impair free flow of water into Filterra.	Inlet should be free of obstructions allowing free distributed flow of water into Filterra.	Sediments and/or trash should be removed.
Mulch Cover	Trash and floatable debris accumulation.	Excessive trash and/or debris accumulation.	Minimal trash or other debris on mulch cover.	Trash and debris should be removed and mulch cover raked level. Ensure bark nugget mulch is not used.
Mulch Cover	"Ponding" of water on mulch cover.	"Ponding" in unit could be indicative of clogging due to excessive fine sediment accumulation or spill of petroleum oils.	Stormwater should drain freely and evenly through mulch cover.	Recommend contact manufacturer and replace mulch as a minimum.
Vegetation	Plants not growing or in poor condition.	Soil/mulch too wet, evidence of spill. Incorrect plant selection. Pest infestation. Vandalism to plants.	Plants should be healthy and pest free.	Contact manufacturer for advice.
Vegetation	Plant growth excessive.	Plants should be appropriate to the species and location of Filterra.		Trim/prune plants in accordance with typical landscaping and safety needs.
Structure	Structure has visible cracks.	Cracks wider than 1/2 inch or evidence of soil particles entering the structure through the cracks.		Vault should be repaired.
Maintenance is ideally to be performed twice annually.				

Filterra Inspection & Maintenance Log

Filterra System Size/Model:_____ **Location:** _____

Date	Mulch & Debris Removed	Depth of Mulch Added	Mulch Brand	Height of Vegetation Above Grate	Vegetation Species	Issues with System	Comments
1/1/17	*5 – 5 gal Buckets*	*3″*	*Lowe's Premium Brown Mulch*	*4′*	*Galaxy Magnolia*	*- Standing water in downstream structure*	*- Removed blockage in downstream structure*

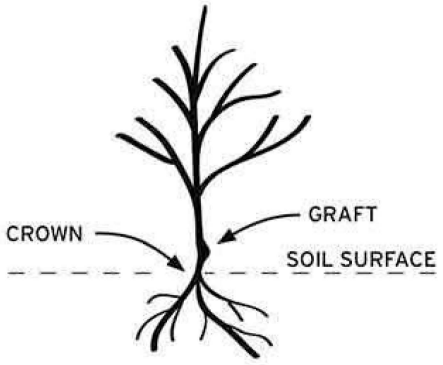
Attach additional sheets as necessary.

NOTE: A charge of $500.00 will be invoiced for each Activation visit requested by Customer where Contech determines that the site does not meet the conditions required for Activation. ONLY Contech authorized representatives can perform Activation of Filterra systems; unauthorized Activations will void the system warranty and waive manufacturer supplied Activation and 1st Year Maintenance.

Signature _____ Date _____

Appendix 2 – Planting Requirements for Filterra® Systems

Plant Material Selection



- Select plant(s) as specified in the engineering plans and specifications.
- Select plant(s) with full root development but not to the point where root bound.
- Use local nursery container plants only. Ball and burlapped plants are not permitted.
- For precast Filterra systems with a tree grate, plant(s) must not have scaffold limbs at least 14 inches from the crown due to spacing between the top of the mulch and the tree grate. Lower branches can be pruned away provided there are sufficient scaffold branches for tree or shrub development.
- For precast Filterra systems with a tree grate, at the time of installation, it is required that plant(s) must be at least 6" above the tree grate opening at installation for all Filterra configurations. This DOES NOT apply to Full Grate Cover designs.
- Plant(s) shall not have a mature height greater than 25 feet.
- For standard 21" media depth, a 7 – 15 gallon container size shall be used. Media less than 21" (Filterra boxes only) will require smaller container plants.
- For precast Filterra systems, plant(s) should have a single trunk at installation, and pruning may be necessary at activation and maintenance for some of the faster growing species, or species known to produce basal sprouts.

Plant Installation

- During transport protect the plant leaves from wind and excessive jostling.
- Prior to removing the plant(s) from the container, ensure the soil moisture is sufficient to maintain the integrity of the root ball. If needed, pre-wet the container plant.
- Cut away any roots which are growing out of the container drain holes. Plants with excessive root growth from the drain holes should be rejected.
- Plant(s) should be carefully removed from the pot by gently pounding on the sides of the container with the fist to loosen root ball. Then carefully slide out. Do not lift plant(s) by trunk as this can break roots and cause soil to fall off. Extract the root ball in a horizontal position and support it to prevent it from breaking apart. Alternatively the pot can be cut away to minimize root ball disturbance.
- Remove any excess soil from above the root flare after removing plant(s) from container.
- Excavate a hole with a diameter 4" greater than the root ball, gently place the plant(s).
- If plant(s) have any circling roots from being pot bound, gently tease them loose without breaking them.
- If root ball has a root mat on the bottom, it should be shaved off with a knife just above the mat line.
- Plant the tree/shrub/grass with the top of the root ball 1" above surrounding media to allow for settling.
- All plants should have the main stem centered in the tree grate (where applicable) upon completion of installation.
- With all trees/shrubs, remove dead, diseased, crossed/rubbing, sharply crotched branches or branches growing excessively long or in wrong direction compared to majority of branches.
- To prevent transplant shock (especially if planting takes place in the hot season), it may be necessary to prune some of the foliage to compensate for reduced root uptake capacity. This is accomplished by pruning away some of the smaller secondary branches or a main scaffold branch if there are too many. Too much foliage relative to the root ball can dehydrate and damage the plant.
- Plant staking may be required.

Mulch Installation

- Only mulch that has been meeting Contech Engineered Solutions' mulch specifications can be used in the Filterra system.
- Mulch must be applied to a depth of 3" evenly over the surface of the media.

Irrigation Requirements

- Each Filterra system must receive adequate irrigation to ensure survival of the living system during periods of drier weather.
- Irrigation sources include rainfall runoff from downspouts and/or gutter flow, applied water through the tree grate or in some cases from an irrigation system with emitters installed during construction.
- At Activation: Apply about one (cool climates) to two (warm climates) gallons of water per inch of trunk diameter over the root ball.
- During Establishment: In common with all plants, each Filterra plant will require more frequent watering during the establishment period. One inch of applied water per week for the first three months is recommended for cooler climates (2 to 3 inches for warmer climates). If the system is receiving rainfall runoff from the drainage area, then irrigation may not be needed. Inspection of the soil moisture content can be evaluated by gently brushing aside the mulch layer and feeling the soil. Be sure to replace the mulch when the assessment is complete. Irrigate as needed**.
- Established Plants: Established plants have fully developed root systems and can access the entire water column in the media. Therefore irrigation is less frequent but requires more applied water when performed. For a mature system assume 3.5 inches of available water within the media matrix. Irrigation demand can be estimated as 1" of irrigation demand per week. Therefore if dry periods exceed 3 weeks, irrigation may be required. It is also important to recognize that plants which are exposed to windy areas and reflected heat from paved surfaces may need more frequent irrigation. Long term care should develop a history which is more site specific.

** Five gallons per square yard approximates 1 inch of water Therefore for a 6' by 6' Filterra approximately 20-60 gallons of water is needed. To ensure even distribution of water it needs to be evenly sprinkled over the entire surface of the filter bed, with special attention to make sure the root ball is completely wetted. NOTE: if needed, measure the time it takes to fill a five gallon bucket to estimate the applied water flow rate then calculate the time needed to irrigate the Filterra. For example, if the flow rate of the sprinkler is 5 gallons/minute then it would take 12 minutes to irrigate a 6' by 6' filter.

PUMP SYSTEMS INSPECTION & MAINTENANCE MANUAL

10244 Freeman Avenue | Santa Fe Springs, CA 90670 | 562-777-9724
sfwsystems.com

PUMP SYSTEM - INSPECTION & MAINTENANCE

Inspection and maintenance of the pump system is vital for the performance and life cycle of the stormwater management system. All local, state, and federal permits and regulations must be followed for system compliance. Manway access locations are provided on each system for ease of ingress and egress for routine inspection and maintenance activities. Stormwater regulations require that all BMPs be inspected and maintained to ensure they are operating as designed and providing protection to receiving water bodies. It is recommended that inspections be performed multiple times during the first year to assess the site-specific conditions. Inspection after the first significant rainfall event and at quarterly intervals is typical. This is recommended because pollutant loading and pollutant characteristics can vary greatly from site to site. Variables such as nearby soil erosion or construction sites, winter sanding on roads, amount of daily traffic and land use can increase pollutant loading on the system. The first year of inspections can be used to set inspection and maintenance intervals for subsequent years to ensure appropriate maintenance is provided. Without appropriate maintenance, a BMP can exceed its storage capacity, become blocked, or damaged, which can negatively affect its continued performance. Pump systems should be inspected at the same time as other components of the stormwater management system.

Inspection Equipment

Following is a list of equipment to allow for simple and effective inspection of the underground pump system:

- Santa Fe Water Systems Inspection and Maintenance Report Form
- Flashlight
- Manhole hook or appropriate tools to access hatches and covers
- Appropriate traffic control signage and procedures
- Measuring pole and/or tape measure
- Protective clothing and eye protection
- Note: Entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections of the system.

Inspection Steps

The key to any successful stormwater BMP maintenance program is routine inspections. The inspection steps required on the pump system are quick and easy. As mentioned above, the first year should be seen as the maintenance interval establishment phase. During the first year more frequent inspections should occur in order to gather loading data and maintenance requirements for that specific site. This information can be used to establish a base for long term inspection and maintenance interval requirements.

The pump system can be inspected though visual observation without entry into the system. All necessary pre-inspection steps must be carried out before inspection occurs, especially traffic control and other safety measures to protect the inspector and nearby pedestrians from any dangers associated with an open access hatch or manhole. Once these access covers have been safely opened the inspection process can proceed:

- Prepare the inspection form by writing in the necessary information including project name, location, date & time, unit number and other information (see inspection form).
- Observe the upstream drainage area and look for sources of pollution, sediment, trash and debris.
- Observe the inside of the system through the access manholes. If minimal light is available and vision into the unit is impaired, utilize a flashlight to see inside the system and all of its modules.
- Look for any out of the ordinary obstructions in the inflow pipe(s). Check pipes for movement or leakage. Write down any observations on the inspection form.
- Observe vault walls for signs of deterioration.
- Through observation and/or digital photographs, estimate the amount of floatable debris accumulated in the system. Record this information on the inspection form. Next, utilizing a tape measure or measuring stick, estimate the amount of sediment accumulated in the system. Record this depth on the inspection form.
- Finalize inspection report for analysis by the maintenance manager to determine if maintenance is required.

Maintenance Indicators

Based upon observations made during inspection, maintenance of the system may be required based on the following indicators:

- Damaged inlet and outlet pipes.
- Obstructions in the system or its inlet(s).
- Excessive accumulation of floatables.
- Excessive accumulation of sediment of more than 6" in depth.
- Damaged joint sealant.

Maintenance Equipment

While maintenance can be done fully by hand, it is recommended that a vacuum truck be utilized to minimize time required to maintain the underground detention, retention, or infiltration system:

- Santa Fe Water Systems Inspection and Maintenance Report Form
- Flashlight

- Manhole hook or appropriate tools to access hatches and covers
- Appropriate traffic control signage and procedures
- Measuring pole and/or tape measure
- Protective clothing and eye protection
- Vacuum truck
- Trash can
- Note: Entering a confined space requires appropriate safety and certification. It is generally not required for routine inspections of the system. Entry into the system will be required if maintenance is required. Some pump systems are sized such that entry is not possible and maintenance will be performed from the surface only.

Maintenance Procedures

It is recommended that maintenance occurs at least three days after the most recent rain event to allow for drain down of the system and any upstream detention systems designed to drain down or pump out over an extended period of time. Maintaining the system while flows are still entering it will increase the time and complexity required for maintenance. Once all safety measures have been set up cleaning of the system can proceed as follows:

- Remove pump(s) and piping components. This may require a hoist or portable crane system depending on pump weight.
- Using an extension on a boom on the vacuum truck, position the hose over the opened manway and lower into the system. Remove all floating debris, standing water (as needed) and sediment from the system. A power washer can be used to assist if sediments have become hardened and stuck to the walls and columns.

If maintenance requires entry into the vault:

- Following rules for confined space entry use a gas meter to detect the presence of any hazardous gases. If hazardous gases are present do not enter the vault. Follow appropriate confined space procedures, such as utilizing venting system, to address the hazard. Once it is determined to be safe, enter utilizing appropriate entry equipment such as a ladder and tripod with harness.
- The last step is to close up and replace all manhole covers and remove all traffic control.
- All removed debris and pollutants shall be disposed of following local and state requirements.

For Pump Maintenance, see provided O&M manual specific to the pump manufacturer.

For Maintenance Services please contact Santa Fe Water Systems at 562-777-9724 for assistance in finding an authorized service provider.

ATTACHMENT 4 – COPY OF PLAN SHEETS

Showing Permanent Storm Water BMPs, Source Control, and Site Design

This is the cover sheet for Attachment 4.

Use this checklist to ensure the required information has been included on the plans. Include checklist in submittal and check all boxes that are applicable. Provide justification for items not included.

The plans must identify:

☒ Structural BMP(s) with ID numbers matching Step 5 Summary of PDP Structural BMPs
☒ The grading and drainage design shown on the plans must be consistent with the delineation of DMAs shown on the DMA exhibit
☒ Details and specifications for construction of structural BMP(s)
☒ Signage indicating the location and boundary of structural BMP(s) as required by City staff
☒ How to access the structural BMP(s) to inspect and perform maintenance
☒ Features that are provided to facilitate inspection (e.g., observation ports, cleanouts, silt posts, or other features that allow the inspector to view necessary components of the structural BMP and compare to maintenance thresholds)
☒ Manufacturer and part number for proprietary parts of structural BMP(s) when applicable
☒ Maintenance thresholds specific to the structural BMP(s), with a location-specific frame of reference (e.g., level of accumulated materials that triggers removal of the materials, to be identified based on viewing marks on silt posts or measured with a survey rod with respect to a fixed benchmark within the BMP)
☒ Recommended equipment to perform maintenance
☒ When applicable, necessary special training or certification requirements for inspection and maintenance personnel such as confined space entry or hazardous waste management
☒ Include landscaping plan sheets showing vegetation requirements for vegetated structural BMP(s)
☒ All BMPs must be fully dimensioned on the plans
☒ When proprietary BMPs are used, site-specific cross section with outflow, inflow, and model number must be provided. Photocopies of general brochures are not acceptable.
☒ Include all source control and site design measures described in Steps 3 and 4 of the SWQMP. Can be included as a separate exhibit as necessary.

Declaration of Responsible Charge

I hereby declare that I am the engineer of work for this project, that I have exercised responsible charge over the design of the project as defined in section 6703 of the business and professions code, and that the design is consistent with current standards.

I understand that the check of project drawings and specifications by City of Poway is confined to a review only and does not relieve me, as engineer of work, of my responsibilities for project design.

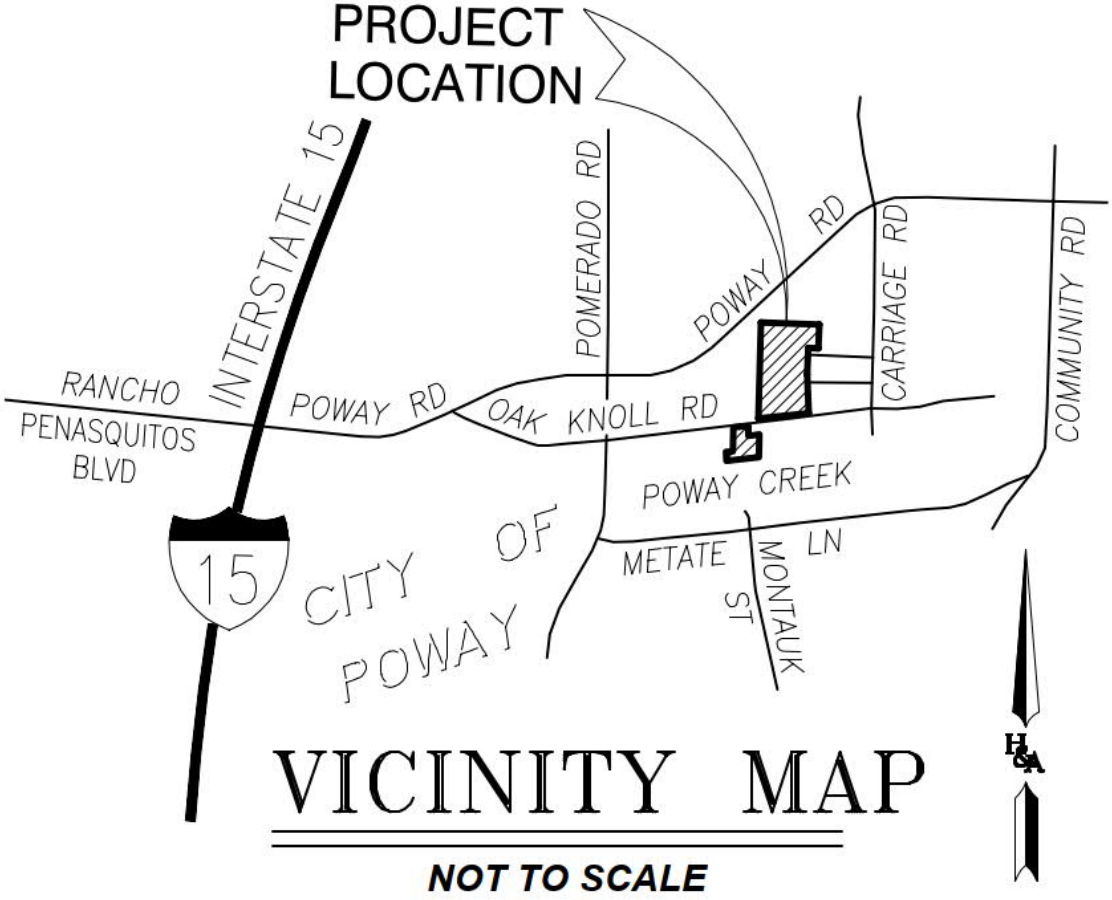
CHAPTER 1 EXECUTIVE SUMMARY

1.1 Introduction

The Harmon Oaks project is located in the City of Poway and is split by Oak Knoll Road, with a portion north of Oak Knoll Road and a smaller portion south of Oak Knoll Road. See below for vicinity map. The development proposes a single-family community with 63 residential lots within 10.77 acres. The site will also include detention underground vault, sidewalks, and parking stalls. The lots are connected by private drives which are accessible via Oak Knoll Road and Roca Grande Drive.



Scope

The scope of this report is to analyze both the existing and proposed hydrologic conditions relative to development of the site and prepare storm drain facilities based on the 100 year flow. Proposed stormwater facilities include storm drain, curb inlets, catch basins, proprietary biofiltration BMPs (curb type Filterra Units or equivalent), underground vault, outlet structure, a pump to pump the hydromodification low flows to the existing storm drain system under Oak Knoll Road, brow ditches, and energy

dissipation devices and will be calculated upon Final Engineering. The proposed proprietary biofiltration units for the site will address the water quality requirements, while the underground vault will address the 100 year peak flows, and flow control hydromodification concerns. A separate report has been prepared which details the proposed treatment and flow control features for the project. Refer to the *Stormwater Quality Management Plan (SWQMP) for Harmon Oaks* prepared by Hunsaker & Associates San Diego, Inc. (June 2022).

Summary of Existing Conditions

The existing condition hydrology map (Exhibit 1) is located in Chapter 5. A portion of the project site is currently occupied by single family building structures, driveways, construction equipment yard, and vacant area north of Oak Knoll Road. There is a vegetated channel runs in a north-south direction along the northwestern border of the site. The remainder of the project site, found south of Oak Knoll Road, is a vacant area in its northern portion, except for a building structure northeast of the southern lot, and densely vegetated area in its southern portion. The total analyzed drainage area (on-site and off-site) is 13.79 acres. The elevation-range of the studied water-shed is between 540 feet down to 438 feet. The average slope across the site from the northeast corner to the southwest corner is approximately 5.3%. The imperviousness of the analyzed watershed in its existing condition is approximately 19% (20% for the onsite and offsite area drains to the northern portion of Oak Knoll Road (Node 1 to Node 5), 63% for the offsite area southeast of the northern portion (Node 3 to Node 5), 24% for onsite area and northwest portion of Oak Knoll Road (Node 6 to Node 8), 90% for Oak Knoll Road paved area (Node 9 to Node 11), 0% for the western slopes to Node 14, 8% for the southern portion at Node 16). Please refer to AES Input Data Table in Chapter 3.

Runoff from the northern portion of the project site with the run-on from the eastern offsite development is conveyed via overland flow towards Oak Knoll Road existing inlet (Node 1 to Node 5), where it is captured and comingled with the offsite flows from the southwestern existing development and northeastern half of Oak Knoll Road (Node 3 to Node 5). Total runoff from Node 5 is routed westerly via existing 36” RCP storm drain system to Node 8 per 801-05-1076. Runoff from the southwestern sub-watershed of northern portion of the project site is conveyed via overland flow towards Oak Knoll Road existing inlet, where it is captured and comingled with the offsite flows from the northwestern half of Oak Knoll Road (Node 6 to Node 8). Existing 36” RCP storm drain system carries the total runoff from Node 8 to Node 11, where it comingles with the captured flow from the southern portion of Oak Knoll Road before continues westerly to Node 15. Run-on from the offsite northern slope is conveyed with the runoff from the northwestern portion of the site via overland flow to enters the existing 8’ X 5’ RCP box culvert through the existing headwall per 801-04-150 sheet 5 (Node 12 to Node 14). The existing 8’X5’ RCP box culvert routes the captured flows southwesterly to Node 15, where it comingles with the discharge from (Node 11) the 36” existing storm drain, and then continues southerly to discharge into Poway Creek at Node 16.

Runoff from southern portion of the site with the adjacent eastern offsite area is also conveyed via overland flow to discharge directly into Poway Creek to Node 16.

Table 1 below summarizes the 100-year existing condition peak flow at the downstream project boundary. A runoff coefficient was calculated for each subarea within the watershed based on soil type and impervious percentage using the following formula in accordance with Section 3.1.2 of San Diego County Hydrology Manual June 2003.

C= 0.90 x (% Impervious) + Cp x (1 - % Impervious)

Cp = Pervious Coefficient Runoff value (Cp=0.35 for Soil D and 0.20 for Soil A per Table 3.1)

Runoff Coefficients

C Factor	Description
0.35 Soil D 0.20 Soil A	Cp= Pervious area per SDC Section 3.1.2 and table 3.1
0.90	Impervious areas (proposed and existing)

The calculations for each weighted run-off coefficient for each sub-area as determined in accordance with Section 3.2.1 are shown in Chapter 3. AES input data tables. Supporting calculations for the data presented in Table 1 is located in Chapter 3 of this report. The corresponding hydrology map (Exhibit 1) is located in Chapter 5.

TABLE 1 - Summary of Existing Flows

1	16	SW of site	13.79	26.85

Summary of Developed Conditions

PROJECT DESCRIPTION

The proposed Harmon Ranch Specific Plan and Tentative Map project site ("Project Site") is located within the southern area of City of Poway, south of Poway Road and east of Pomerado Road. This Project Site is 11.5 acres and is currently designated Residential Single Family 7 (RS-7) in the Poway Comprehensive Plan: General Plan which permits single-family homes on a minimum of 4,500 square foot lots and a maximum density of eight dwelling units per acre. Surrounding land uses include mixed use retail land uses and the Kumeyaay Interpretive Center to the north, Oak Knoll Road, Poway Creek and existing single-family homes to the south and east which are also designated RS-7 and an apartment community to the west.

The current property owner is Harmon Family Trust. The majority of the site has been cleared for several years and was previously used as a construction staging yard for an SDG&E gas line project. The site includes four existing single-family residences. One of the existing homes is a locally designated historic building located at 12702 Oak Knoll Road (APN 317-500-14-00). The historic building was built in 1933 and is constructed of cobblestones. The building is presently designated as City of Poway Historical Site 113 and is documented and known as the "Harmon House." The historic home will be retained in place within a 0.25-acre site as part of the project. The historic home site will be designated Residential – Historic Home within the Specific Plan.

Lennar Homes of California, LLC ("Applicant"), is proposing a residential neighborhood on a 11.5-acre Project Site. The Project site is comprised of approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets and 0.5 acres of public right-of-way (Oak Knoll Road). The Proposed Project would include 64 single family detached homes. The Proposed Project density (8.8 units/acre) is slightly higher than the 8.0 units/acre permitted in the existing RS-7 designation. Primary access to the Project Site is planned via existing Oak Knoll Road. Fifty-nine of the new homes are proposed to front newly constructed private streets, while four homes and an open space/overlook area front existing Oak Knoll Road. The existing historic home has direct access via Oak Knoll Road.

Land Use Summary

Use/Land Use	Approx. Net Acres (AC)	% of Planning Area (%)	Max. Dwelling Units (DU)	Density (DU/AC)[1]
Non-Residential Land Uses				
Open Space (OS-1 & 2) (Floodway)	1.88	16.3%		
Open Space (OS-3 & 4)	0.31	2.7%		
Open Space Recreation (OSR-1 to 7)	0.99	8.6%		
Subtotal Open Space	3.18	27.6%		
Private Internal Residential Streets	1.88	16.3%		
Oak Knoll Road ROW (existing)	0.49	4.3%		
Subtotal Streets	2.37	20.6%		
Subtotal Non-Residential	5.55	48.2%		
Residential (R) Land Use				
Residential Single Family (R-SF) (Lots 1 to 64)	5.96	51.8%	64	
Subtotal Residential	5.96	51.8%	64	
TOTAL Specific Plan Area	11.51	100%	64	8.8

1- Statistics are based upon preliminary design and may vary slightly from Development Plan, Tentative Map, and/or Final Map. Refer to Chapter 7 regarding substantial conformance.

2- Pursuant to State Law, local governments cannot preclude an Accessory Dwelling Unit (ADU) or Junior Accessory Dwelling Units (JADU). An ADU and JADU is an accessory use for the purposes of counting allowable density under general plan and zoning and is therefore not counted as an additional unit. An ADU and JADU shall be permissible in accordance with the PMC or, if the locally adopted ordinance is void, the State Government Code. See Section 3.2.2.G for information regarding ADUs.

3- Open Space areas within the floodway (OS-1 and OS-2) and public street (Oak Knoll Road) and internal private streets are excluded from the density calculation. The following calculation was utilized to determine the net residential density for the project: Residential (5.96 ac) + Open Space Recreation Lots 1-7 (0.99 ac) + Open Space Lots 3 and 4 (0.31 ac) = 7.26 ac. 64 / 7.26 = 8.8.

The Applicant is proposing a Specific Plan and Tentative Map to facilitate development of a 64 single family homes. The Harmon Ranch Specific Plan will establish three land use districts within the Project Site: Residential Single Family (R-SF); Open Space (OS); and Open Space Recreation (OS-R). The Specific Plan will also provide development regulations and permitted uses for each land use district.

The Proposed project is comprised of 64 single-family homes on lots 42-feet wide and 85- to 90-feet deep, with standard two-car garages, 20-foot-deep by 20-foot-wide driveways to accommodate an additional two off-street parking spaces within the private lots and private fenced rear yards. The Proposed Project also includes 40 guest parking spaces along the private streets, approximately 1.0 acres of Open Space Recreation areas, approximately 2.2 acres of natural Open Space areas and a segment of the General Plan Community trail (approximately 1,000 feet) within the Project Site. A potential off-site trail connection to the adjacent retail area located to the north may occur in the future, subject to property owner cooperation but is not part of the proposed project. The "Overlook" area located in the south portion of the Project Site is planned to provide public access and will be privately maintained.

Discretionary actions which require Poway City Council consideration include the following:

- Environmental Impact Report (EIR)
- General Plan Amendment/Zone Change (GPA/ZC) from Residential Single-Family 7 (RS-7) to Planned Community (PC)
- Tentative Map (TM)
- Development Review (DR) Permit
- Final Map

The post-developed condition of the site will include improvements consisting of a single-family residential development including building structures, driveways, access roads, sidewalks, and landscaped areas. The site also proposes proprietary biofiltration facilities to address water quality requirements (Filterra units or alternative), underground vault, storm drains, inlets, and brow ditches sized to collect and convey site runoff through the project area.

The proposed vault will attenuate the 100 year peak flows as well as address flow control hydromodification and pollutant control for water quality. For additional discussion on the proposed water quality and hydromod features of the site, refer to the *Stormwater Quality Management Plan (SWQMP) for Harmon Oaks* (June 2022) prepared by Hunsaker & Associates San Diego, Inc.

Runoff from the northern portion of the proposed development will be routed via street gutters to the proposed on site inlets and proprietary biofiltration units to address water quality requirements, and then travels via private proposed storm drain system southwesterly to the proposed underground vault (Node 50 to Node 74). Discharge from the vault will be controlled by an outlet structure equipped with orifices and weir with varying dimensions and invert elevations to meet current hydromodification requirements and attenuate the proposed 100-year peak flows to be equal or less than existing conditions 100-year peak flow. Due to existing storm drain flow elevation, the low flow orifice can't be routed directly to the downstream storm drain. Therefore, discharge from the low flow orifice will be pumped to the proposed cleanout\ manhole downstream of the vault, where the discharge from the rest of the orifices and weir (Vault outlet structure) will be routed to before discharging into the existing 36" RCP at Oak Knoll Road (Node 8). The proposed vault within northern portion of the project has been sized to provide additional hydromodification and 100-year peak flow control and mitigate impact from this area when measured at the analyzed discharge point (Node 16-POC1).

Runoff from northeastern offsite development -that drains through the site in existing conditions- will be conveyed via proposed ditch to a proposed catch basin west of La Vista Way and then routed vis proposed storm drain to the existing 36" storm drain at Oak Knoll Road (Node 3 to Node 5). Runoff from offsite area southeast of the northern portion of the project will drain similarly to existing conditions via overland flow towards Oak Knoll Road existing inlet (Node 4 to Node 5), where it will be captured and routed via existing 36" RCP storm drain system to Node 8, where it comingles with the discharge from the proposed development and runoff from the northwestern half of Oak Knoll Road (Node 5 to Node 8). Total runoff from Node 8 will be routed westerly

via existing 36" RCP storm drain system to Node 11. Existing 36" RCP storm drain system carries the total runoff from Node 8 to Node 11. Runoff from northern area of southern portion of the project will drain towards Oak Knoll Road gutter and routed westerly to proposed proprietary biofiltration unit (filterra unit or equivalent). The proposed proprietary biofiltration unit will provide water quality pollutant control prior to discharging into the existing storm drain system at Oak Knoll Road Node 11. Total runoff from southern portion of Oak Knoll Road and northern developed area of southern portion of the project will comingle with the total captured flow at Node 11, berfore continues westerly to Node 15.

Runoff from the offsite northern slope will be captured via a brow ditch and conveyed with the runoff from the proposed graded slope northwest of the northern portion of the site via overland flow to enters the existing 8' X 5' RCP box culvert through the existing headwall per 801-04-150 sheet 5 (Node 12 to Node 14). The existing 8'X5' RCP box culvert routes the captured flows southwesterly to Node 15, where it comingles with the discharge from (Node 11) the 36" existing storm drain, and then continues southerly to discharge into Poway Creek at Node 16.

Runoff from southern area of southern portion of the site with the adjacent eastern offsite area will also conveyed via overland flow similarly to existing conditions to discharge directly into Poway Creek to Node 16.

Table 2 below summarizes the 100-year proposed condition peak flow at the downstream project boundary. A runoff coefficient was calculated for each subarea within the watershed based on soil type and impervious percentage using the following formula in accordance with Section 3.1.2 of San Diego County Hydrology Manual June 2003.

C= 0.90 x (% Impervious) + Cp x (1 - % Impervious)

The calculations for each weighted run-off coefficient for each sub-area as determined in accordance with Section 3.2.1 are shown in Chapter 3. AES input data tables. Supporting calculations for the data presented in Table 2 is located in Chapter 3 of this report. The corresponding hydrology map (Exhibit 2) is located in Chapter 5.

TABLE 2 - Summary of Proposed Flows

Exhibit	Node Number on Exhibit	Discharge Location	Drainage Area (ac)	100-Year Peak Flow (cfs) ^	100-Year Peak Flow (cfs)*
1	16	SW of site	13.79	46.65	14.21

^runoff rates before flood attenuation
*runoff rates after flood attenuation

A portion of the site, at the south western corner of the northern portion of the project and northern developed area of the southern portion of the project, is located within Zone AE (within the flood plain for Poway Creek), per the FEMA Firmette found in Chapter 6 and will require a Floodplain Development Permit.

The Proposed Drainage Map in Chapter 5 shows the developed site with its subareas and flow paths. There is only one outfall location from the proposed site, as the proposed and existing storm drain conveys the flows towards Poway Creek, similarly to existing conditions. Due to the increase in impervious area compared with the existing condition, the peak flows generated from the site will be reduced through the proposed vault. Design calculations for the vault attenuation can be found in Chapter 4.

Summary of Results

Development of *Harmon Oaks* site required a storm drain system to capture and convey the Q100 peak flows safely to the existing storm drain system at Oak Knoll Road. See Chapters 3 hydrologic models. The corresponding hydrology maps are located in Chapter 5.

Ten proprietary biofiltraton units (Filterra units or equivalent) are proposed to address water quality requirements, and one underground vault for hydromodification, and peak flow attenuation. Flows from the site are attenuated to be less than the existing flows when measured at the point of compliance southwest of the project (POC-1) to Poway Creek.

Since the proposed vault onsite will mitigate the 100 year flow to below existing conditions, there will be no negative impacts to downstream drainage developments and facilities.

Inlet calculations, brow ditches and storm drain hydraulic will be provided in final engineering.

Table 3 below summarizes the comparison between existing and proposed flow rates from the site.

TABLE 3 – Existing Condition vs. Proposed Condition

Discharge Location	Existing Node	Proposed Node	Existing Condition Area (ac)	Proposed Condition Area (ac)	Existing: 100-Year Peak Flow (cfs)	Proposed: 100-Year Peak Flow (cfs)	Q100 Flow Difference (cfs)
SW of site	16	16	13.79	13.79	26.85	14.21	-12.64

Conclusions

Development of Harmon Oaks site will not alter the drainage patterns, and the proposed improvements will decrease the flows to below existing conditions. Therefore no adverse impacts are expected.

CHAPTER 2 METHODOLOGY

Modified Rational Method Hydrologic Analysis

Computer Software Package – AES-2015

Design Storm - 100- year return interval

Land Use – Single-family Residential

Soil Type – Per the NRCS Web Soil Survey, the existing soil consists of Soil Type D for majority of the site and A for a small portion of the southern area. Group D soils have very slow rates. Consisting chiefly of clay soils with a high swelling potential, soils with a high permanent water table, soils with clay pan or clay layer at or near the surface, and shallow soils over nearly impervious materials, Group D soils have a very slow rate of water transmission. Group A. Soils have a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Runoff Coefficient - In accordance with the County of San Diego standards, runoff coefficients were based on land use and soil type San Diego County Hydrology Manual. Runoff coefficient was calculated for each subarea within the watershed based on soil type and impervious percentage using the following formula in accordance with Section 3.1.2 of San Diego County Hydrology Manual June 2003.
C= 0.90 x (% Impervious) + Cp x (1 - % Impervious)

Cp = Pervious Coefficient Runoff value (Cp=0.35 for Soil D and 0.20 for Soil A per Table 3.1)

Runoff Coefficients

	C Factor	Description
Rainfall	0.35 Soil D 0.20 Soil A	Cp= Pervious area per SDC Section 3.1.2 and table 3.1
	0.90	Impervious areas (proposed and existing)

Intensity- The rainfall intensity is determined per the San Diego County Hydrology Manual based on 6-hour precipitation amounts and calculated time of concentrations. Six-hour precipitations are taken from the San Diego County Hydrology Manual isopluvials.

Method of Analysis – The Rational Method is the most widely used hydrologic model for estimating peak runoff rates. Applied to small urban and semi-urban areas with drainage areas less than 0.5 square miles, the Rational Method relates storm rainfall intensity, a runoff coefficient, and drainage area to peak runoff rate. This relationship is expressed by the equation:

Q = CIA, where:

- Q = The peak runoff rate in cubic feet per second at the point of analysis.
- C = A runoff coefficient representing the area - averaged ratio of runoff to rainfall intensity.
- I = The time-averaged rainfall intensity in inches per hour corresponding to the time of concentration.
- A = The drainage basin area in acres.

To perform a node-link study, the total watershed area is divided into subareas which discharge at designated nodes.

The procedure for the subarea summation model is as follows:

(1) Subdivide the watershed into subareas with the initial subarea being less than 10 acres in size (generally 1 lot will do), and subsequent subareas gradually increasing in size. Assign upstream and downstream nodal numbers to each subarea to correlate calculations to the watershed map.

(2) Estimate an initial T_c by using the appropriate nomograph or overland flow velocity estimation.

(3) Using the initial T_c, determine the corresponding values of I. Then Q = CIA.

(4) Using Q, estimate the travel time between this node and the next by Manning's equation as applied to the particular channel or conduit linking the two nodes. Then, repeat the calculation for Q based on the revised intensity (which is a function of the revised time of concentration)

The nodes are joined together by links, which may be street gutter flows, drainage swales, drainage ditches, pipe flow, or various channel flows. The AES-2003 computer subarea menu is as follows:

SUBAREA HYDROLOGIC PROCESS

1. Confluence analysis at node.
2. Initial subarea analysis (including time of concentration calculation).
3. Pipe flow travel time (computer estimated).
4. Pipe flow travel time (user specified).
5. Trapezoidal channel travel time.
6. Street flow analysis through subarea.
7. User - specified information at node.
8. Addition of subarea runoff to main line.
9. V-gutter flow through area.
10. Copy main stream data to memory bank
11. Confluence main stream data with a memory bank
12. Clear a memory bank

At the confluence point of two or more basins, the following procedure is used to combine peak flow rates to account for differences in the basin's times of concentration. This adjustment is based on the assumption that each basin's hydrographs are triangular in shape.

(1). If the collection streams have the same times of concentration, then the Q values are directly summed,

$Q_p = Q_a + Q_b$; $T_p = T_a = T_b$

(2). If the collection streams have different times of concentration, the smaller of the tributary Q values may be adjusted as follows:

(i). The most frequent case is where the collection stream with the longer time of concentration has the larger Q. The smaller Q value is adjusted by the ratio of rainfall intensities.

$Q_p = Q_a + Q_b \ (I_a/I_b)$; $T_p = T_a$

(ii). In some cases, the collection stream with the shorter time of concentration has the larger Q. Then the smaller Q is adjusted by a ratio of the T values.

$Q_p = Q_b + Q_a \ (T_b/T_a)$; $T_p = T_b$

Underground storm drains are analyzed in a similar way. Flow data obtained from the surface model for inlets and collection points are input into the nodes representing those structures. Design grades and lengths are used to compute the capacity of the storm drains and to model the downstream travel times.

Detention

In order to provide adequate peak flow attenuation, increases in peak flow rates at the outfall location for this site has been mitigated using the design of the proposed vault. Mitigation within the vault has been modeled using SWMM 5.01.

RickRatHydro has been used to generate inflow hydrograph for the vault, based on area, time of concentration, P6 value, runoff coefficient, and peak flow rate for the drainage area (from hydrology analysis).

The inflow hydrograph was then imported into SWMM model as an inflow to the storage unit (representing the vault volume) and was connected to the outfall point by using an outlet link (represent the outlet structure). The vault Stage-Storage curve and Stage-Discharge curve were generated by Excel. Generating Stage-Storage curve is relatively simple for the vertical-sided vault, where volume increases linearly with the stage value. For the Stage-Discharge curve, both weir equation (for partially submerged condition) and orifice flow equation (for fully submerged condition) were adopted to evaluate the riser discharge based on the water depth in front of the orifice and emergency weir. These generated curves were modeled as tabular curves for the storage unit and the outlet link in SWMM to calculate the water surface elevation and outfall flow rate.

Attention: Mr. David Shepherd

Subject: GEOTECHNICAL INVESTIGATION
OAK KNOLL
POWAY, CALIFORNIA

Dear Mr. Shepherd:

In accordance with your request, we have performed a geotechnical investigation for the Oak Knoll project located in Poway, California. The accompanying report presents the findings of our study, and conclusions and recommendations pertaining to the geotechnical aspects of developing the project as presently proposed. Based on the results of this study, it is our opinion that the subject property can be developed as planned provided that the recommendations of this report are followed.

Should you have any questions regarding this report, or if we may be of further service, please contact the undersigned at your convenience.

Very truly yours,

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed Oak Knoll project located in Poway, California (see Vicinity Map, Figure 1). The purpose of our study was to evaluate the soil and geologic conditions on the site and provide geotechnical recommendations pertaining to development of the property as proposed.

The scope of this investigation included a review of the Tentative Map for Oak Knoll, City of Poway, California, Sheets 1 through 3 of 3, prepared by Hunsaker and Associates San Diego, Inc, undated. We also performed a field investigation, conducted laboratory testing to characterize the physical properties of the soils encountered, performed engineering analyses and prepared this report.

We performed an initial field investigation on May 28, 2021, which consisted of drilling 10 hydraulic rotary air percussion borings (generically referenced herein as air-track borings) to evaluate rock rippability in the northeastern portion of the site. On May 18, 2022, we excavated 11 exploratory trenches to evaluate the thickness and condition of surficial deposits requiring remedial grading. We also performed one infiltration test in the area of the proposed stormwater vault to assess the saturated hydraulic conductivity of the underlying soil. Logs of the exploratory trenches, air-track borings, and other details of the field investigation are presented in Appendix A. The locations of the exploratory trenches and borings are presented on the Geologic Map, Figure 2 (map pocket). The infiltration test results are presented in Appendix C.

We performed laboratory testing on selected soil samples obtained during the field investigation to evaluate pertinent physical properties of the soil types encountered. The laboratory information was used in engineering analyses to develop recommendations for geotechnical aspects of site development. Details of the laboratory tests and a summary of the test results are presented in Appendix B.

The recommendations presented herein are based on analysis of the data and observations obtained during field investigations, and our experience with similar soil and geologic conditions. Additional references reviewed to prepare this report are provided in the *List of References*.

2. SITE AND PROJECT DESCRIPTION

The overall site consists of two properties located on either side of Oak Knoll Road, south of Poway Road, east of Pomerado Road, and west of Carriage Road. The northern portion of the site (north of Oak Noll Road) consists of approximately 10-acres of essentially undeveloped land, except for a

single-family residence and several associated structures along the southwestern property boundary. The southern portion (south of the Oak Knoll Road) consists of two parcels of land. The western parcel is undeveloped, and the eastern parcel is occupied by a single-family residence.

Topographically, the southern property is relatively flat with an elevation of approximately 446 feet Mean Sea Level (MSL) to 448 feet MSL and the northern property is level to moderately sloping with elevations ranging from approximately 449 feet MSL to 495 feet MSL. Poway Creek is located along the southern boundary of the southern parcels. A flood elevation of 447 feet MSL is shown on the Tentative Map. A tributary to Poway Creek exists along the northwest property boundary of the northern parcel. The tributary has been channelized and outlets into a storm drain system beneath Oak Knoll Road, constructed as part of the existing residential development to the west. Surface drainage across the northern property is primarily to the south and southwest towards Oak Knoll Road. The southern property drains to the south and southwest into Poway Creek.

Vegetation within the development footprint consists of natural low-lying grasses and some isolated small trees. A large portion of the northern property has been cleared, fenced, and covered with gravel to support an equipment storage yard for a San Diego Gas and Electric subcontractor. Heavy vegetation consisting of large trees and shrubs exist along the southern margin of the south parcels.

Based on review of the Tentative Map, the properties will be developed to create 64 single-family residences, including 60-lots on the northern property and 4-lots on the southern property. The northern development includes a loop road off of Oak Knoll Road that also connects to Roca Grande Drive to the northeast. Associated storm water BMP's, underground utilities, and retaining walls are also planned.

Grading will consist of maximum cut and fill depths of approximately 16 feet and 4 feet, respectively, not considering remedial grading. Cut and fill slopes with maximum heights of approximately 30 feet and 4 feet, respectively, are planned and designed at an inclination of 2:1 (horizontal:vertical) or flatter. Several retaining walls are shown on both properties that range from approximately 1-foot to 6-feet in height. A rear-yard retaining wall is shown along the south development boundary of the southern property to raise building pad elevations above the flood elevation of 447 feet (MSL).

The locations and descriptions of the site and proposed development above are based on our recent and previous field study and review of the project Tentative Map. If development plans differ significantly from those described herein, Geocon Incorporated should be contacted for review and possible revisions to this report.

3. SOIL AND GEOLOGIC CONDITIONS

Four surficial soil types and two geologic formations were encountered during the field investigation. The surficial deposits consist of undocumented fill, alluvium, colluvium, and terrace deposits. The formational units includes the Eocene-age Friars Formation and Cretaceous-age granodiorite (granitic rock). Each of the surficial soils and geologic units encountered are described in order of increasing age. The approximate extent of the surficial deposits and formational materials are shown on the Geologic Map, Figure 2.

3.1 Undocumented Fill (Qudf)

Undocumented fill embankments cover the majority of both properties. The fill is approximately 6-feet thick along the southern boundary of Lots 61 through 64 (adjacent to Poway Creek). However, within the development footprint, these materials generally range from 1 to 2-feet-thick with the exception of the west margin of the northern parcel where the fill may be up to 5-feet-thick. The undocumented fill is unsuitable for support of additional fill or structural loading in its present condition and will require complete removal and compaction within areas of planned development.

3.2 Alluvium (Qal)

Alluvial deposits were encountered in Trench T-1 beneath the undocumented fill. Alluvium may also extend into the proposed roadway area northwest of Lots 23, 49 and 50. These deposits generally consist of very loose, wet, sandy gravel with silt and clay. The alluvium is compressible and will require removal and compaction if encountered in areas of planned development.

3.3 Colluvium (Qc)

Colluvial deposits were encountered in Trenches T-10 and T-11 overlying the granitic rock or terrace deposits. These deposits were up to 10-feet-thick and consist of dry to damp silty/clayey sand with pinhole porosity. The colluvium is considered hydro-compressible and will require removal and compaction.

3.4 Terrace Deposits (Qt)

Terrace deposits were encountered across the majority of both properties as encountered in Trenches T-2 through T-10. These deposits overly granitic rock and Friars Formation and where encountered, were up to 12-feet-thick. The terrace deposits generally consist of damp to moist, medium stiff to very stiff sandy clay and moist to wet, medium dense clayey gravel with cobble. In general, the terrace deposits are currently considered unsuitable for additional fill or structural loading and will require removal and compaction. However, it is possible that a portion of these deposits can be left in-place upon further testing.

3.5 Friars Formation (Tf)

The Eocene-age Friars Formation was encountered beneath the surficial soils across both properties and overlies the granitic rock. This formation typically consists of dense sandstones, hard claystones, and siltstones. The Friars Formation is suitable for support of additional fill or structural loads.

3.6 Granodiorite (Kgd)

Cretaceous-age Granodiorite (granitic rock) underlies the sedimentary deposits and is exposed in the north and northeast portion of the northern property. Based on observations made during the field exploration, site reconnaissance, and rock rippability study, the granitic rock exhibits a variable weathering pattern ranging from highly weathered, decomposed rock to outcrops of slightly weathered, extremely strong rock that will require blasting to excavate. The granitic unit generally exhibits adequate bearing and slope stability characteristics. Cut slopes excavated within the granitic rock should be stable to the proposed heights if free of adversely oriented joints or fractures.

The soils derived from excavations within the decomposed granitic rock are anticipated to consist of low-expansive, silty, medium- to coarse-grained sands and should provide suitable foundation support in either a natural or properly compacted condition. Excavations within the granitic rock may generate boulders and oversize materials (rocks ≥12 inches in nominal dimension) that will require special handling and placement as recommended hereinafter.

4. RIPPABILITY AND ROCK CONSIDERATIONS

We performed a rock rippability evaluation consisting of drilling 10 air-track borings in proposed cut areas. We performed the study with an Ingersoll-Rand ECM 490 equipped with a 4-inch-diameter bit. Drill penetration rates were used to evaluate rock rippability and to estimate the depth at which difficult excavation will occur. Rock rippability is a function of natural weathering processes that can vary vertically and horizontally over short distances depending on jointing, fracturing, and/or mineralogic discontinuities within the bedrock.

A frequently used guideline to equate rock rippability to drill penetration rate is that a penetration rate of approximately 0 to 20 seconds per foot (spf) generally indicates rippable material, 20 to 30 spf indicates marginally to non-rippable material, and greater than 30 spf indicates non-rippable rock. These general guidelines are typically based on drill rates using a rotary percussion drill rig similar to an Ingersoll Rand ECM 360 with a 3½-inch drill bit. The penetration rates (recorded in seconds per foot) for the air track boring are presented in Appendix A, Figures A-12 through A-21.

The rippability designations discussed above are based on the use of a D9 or equivalent bulldozer equipped with a single shank ripper. Rippable materials can be excavated with moderate to heavy

effort. Marginally rippable includes very heavy ripping and isolated zones of probable blasting. Non-rippable materials will require blasting to excavate the rock.

The estimated thickness of rippable material for each air track boring is presented on Figure 2 (map pocket). Perspective contractors should use their own judgment to identify the penetration rate boundary between productive and non-productive ripping and, rippable and non-rippable rock. We used a threshold of 20 spf to indicate the thickness of rippable material next to each boring on the geologic map.

Based on an air track penetration rate of 20 spf, it is expected that the rippability characteristics will vary. The air-track borings indicate that, where fresh rock is not exposed near the surface (e.g., boulders), the granitic rock is characterized by a rippable weathered mantle varying from approximately 4 to 20-feet-thick. Excavations greater than these depths will encounter difficult ripping conditions and may requiring blasting techniques and can be expected to generate oversized rock (rocks ≥12 inches in dimension), which will necessitate typical hard rock handling, sizing, and placement procedures during grading operations. Proposed cuts in the weathered mantle may also generate oversized fragments.

Estimates of the anticipated volume of hard rock materials generated from proposed excavations should be evaluated based on the information from each boring and drill penetration rate criteria acceptable to the contractor. Roadway/utility corridors and lot undercutting criteria should also be considered when calculating the volume of hard rock. In addition, a volumetric evaluation should be performed to determine if there are available fill placement areas considering the rock hold down criteria.

Earthwork construction should be carefully planned to efficiently utilize available rock placement areas. Oversize materials should be placed in accordance with rock placement procedures presented in Appendix D of this report and governing jurisdictions.

5. GROUNDWATER/SEEPAGE

Groundwater/seepage was encountered in the exploratory trenches (T-1 through T-3, T-5 through T-8, and T-11) adjacent to Poway Creek and other areas of the site at depths ranging between 6 feet and 11 feet below the ground surface. It appears that the groundwater is perched above the alluvium/colluvium/terrace deposit contact with the underlying Friars Formation or granitic rock. We encountered seepage in exploratory trenches T-9 and T-10 at depths ranging from 8 feet to 11 feet below the ground surface. We performed the field investigation in May 2022 during a regional drought. The seepage encountered in the trenches was likely associated with previous rain and irrigation.

Groundwater levels in drainage areas can be expected to fluctuate seasonally and may affect grading. In this regard, grading may encounter wet to saturated soils conditions causing excavation and compaction difficulty, particularly if construction is planned during the rainy season. Remedial grading of surficial deposits near the tributary (Trench T-11) or Poway Creek, if any, will encounter shallow groundwater and wet to saturated soils requiring specialized excavation equipment, possible dewatering and drying of the material to facilitate proper compaction.

6. GEOLOGIC HAZARDS

6.1 Ground Rupture

USGS (2016) shows that there are no mapped Quaternary faults crossing or trending toward the property. In addition, the site is not located within a currently established Alquist-Priolo Earthquake Fault Zone.

The nearest known active faults are the Newport-Inglewood/Rose Canyon Fault Zone, located approximately 15 miles west of the subject site. Based on this study, it is our opinion that the risk associated with ground rupture hazard is considered low.

6.2 Seismicity

The San Diego County and Southern California region is seismically active. Considerations important in seismic design include the frequency and duration of motion and the soil conditions underlying the site. Seismic design of structures should be performed in accordance with the California Building Code (CBC) guidelines currently adopted by the local agency. The risk associated with strong ground shaking due to earthquakes at the site is no greater than that for the region.

6.3 Liquefaction

Liquefaction typically occurs when a site is located in a zone with seismic activity, onsite soils are cohesionless, groundwater is encountered within 50 feet of the surface, and soil densities are less than about 70 percent of the maximum dry densities. If all four criteria are met, a seismic event could result in a rapid increase in pore water pressure from the earthquake-generated ground accelerations. The potential for liquefaction at the site is considered to be negligible due to the dense formational material encountered and remedial grading.

6.4 Tsunamis and Seiches

The risk associated with tsunamis and seiches hazard at the project is low due to the site elevation and the absence of an upstream body of water.

6.5 Landslides

We did not encountered landslides within the site or mapped any landslides within the immediate areas influencing the project. In our opinion, the risk associated with landslide hazard is low.

6.6 Flooding

The County of San Diego Multi-Jurisdictional Hazard Mitigation Plan, dated October 2017, indicates that the southern property (Lots 61 through 64) is located within a 500-year floodplain.

A review of the Tentative Map indicates that proposed grades for the southern property will be raised above the 500-year floodplain elevation. Therefore, the risk associated with inundation by flooding is considered low due to the proposed grading.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

7.1.1 No soil or geologic conditions were encountered during this study that would preclude development of the property as presently proposed provided the recommendations of this report are followed.

7.1.2 Undocumented fill, alluvium, colluvium, and terrace deposits are not suitable for the support of fill or structural loading in their present condition and will require removal and compaction in areas of planned development. The suitability of portions of the terrace deposits to be left in place may be evaluated during grading.

7.1.3 Remedial grading along Oak Knoll Road and the existing subdivisions east and west of the northern property will likely be impacted by the proximity of proposed development to existing improvements. These areas will require evaluation on a case-by-case basis and additional recommendations may be necessary where the limits of remedial grading are constrained. Slot cutting may be necessary along the west boundary and oak knoll road where remedial grading will be performed adjacent to the existing wall and roadway.

7.1.4 Hard rock is present within proposed cut area along the northeast property boundary and will require special consideration during site development. Excavations within the granitic rock that extend below the weathered mantle or where fresh core stones are exposed at grade will likely require blasting to facilitate the excavations. We anticipate that excavations performed during grading operations will generate oversize materials (rock fragments >12 inches) that will require special handling and fill placement procedures. Oversize materials should be placed in accordance with grading recommendations presented in Appendix D.

7.1.5 We encountered groundwater/seepage and perched water conditions during the field investigation. Dependent upon seasonal conditions at the time of grading, remedial grading of surficial deposits along the natural drainages may encounter wet to saturated materials and groundwater resulting in possible excavation and fill placement difficulties. Saturated soil conditions and shallow groundwater should be anticipated. Dewatering and/or use of specialized equipment may be required to excavate the surficial deposits. Overly wet soils may require spreading and drying and/or mixing with drier materials to reduce the moisture content so that compaction can be achieved.

7.1.6 An earthwork analysis should be performed to determine if there is an adequate volume of fill area available to accommodate the anticipated volume of blasted/oversize materials. This

study should consider the proposed grading, rippability information contained in this report, rock placement requirements and include proposed undercutting (pads and streets). Rock crushing may be necessary if the amount of oversize rock generated exceeds the available fill volume based on the project rock placement specifications.

7.1.7 An engineering geologist should observe cut slopes during grading to check that the soil and geologic conditions do not differ significantly from those anticipated. Scaling of loose rocks to remain in-place above planned cut slopes may be necessary.

7.1.8 Grading along the western limits of the north property (Lots 51 through 60) is planned next to an existing retaining wall. If during remedial grading the drainage measures for this wall are found to consist of weepholes along the base of the wall, a subdrain system should be constructed in front of the weepholes to maintain wall drainage. This condition may necessitate an easement. The subdrain, if needed, should outlet into the storm drain system to the south. The subdrain should consist of a 4-inch diameter perforated Schedule 40 PVC pipe surrounded by at least 1 cubic foot of ¾-inch crushed rock and wrapped in filter fabric (Mirafi 140N, or equivalent).

7.1.9 Subsurface conditions observed may be extrapolated to reflect general soil/geologic conditions; however, some variations in subsurface conditions between trench locations should be anticipated.

7.2 Excavation and Soil Characteristics

7.2.1 The soils encountered in the field investigation are considered to be both “non-expansive (expansion index [EI] less than 20) and “expansive” (expansion index [EI] of 20 or more) as defined by 2019 California Building Code (CBC) Section 1803.5.3. Table 7.2 presents soil classifications based on the expansion index. The soil materials observed on site are anticipated to have a “very low” to “low” expansion potential (expansion index of 50 or less).

TABLE 7.2
EXPANSION CLASSIFICATION BASED ON EXPANSION INDEX

Expansion Index (EI)	ASTM 4829 Expansion Classification	2019 CBC Expansion Classification
0 – 20	Very Low	Non-Expansive
21 – 50	Low	Expansive
51 – 90	Medium	
91 – 130	High	
Greater Than 130	Very High	

7.2.2 Excavation of the surficial deposits should be possible with light to moderate effort using conventional heavy-duty equipment. Excavating within the granitic rock will generally vary in difficulty with the depth of excavation depending on the degree of weathering. It is anticipated that the majority of the proposed excavations will encounter moderate to heavy ripping with conventional heavy-duty equipment. Blasting will be required where excavations extend beyond the weathered granitic rock mantle and where unweathered boulders or "core" stones are encountered in proposed granitic rock cut areas. Oversize rock (material >12 inches) should be placed in accordance with *Recommended Grading Specifications* (Appendix D) and the requirements of the governing agency. Oversize rock may require breakage to acceptable sizes or exportation from the property. Placement of oversize rock within the area of proposed underground utilities should not be permitted.

7.3 Corrosion

7.3.1 The laboratory test results indicate that the near-surface on-site materials at the locations tested possess *Not Applicable* sulfate severity and *S0* exposure to concrete structures as defined by 2019 CBC Section 1904 and ACI 318-14 Chapter 19. Table 7.3 presents a summary of concrete requirements set forth by 2019 CBC Section 1904 and ACI 318. ACI guidelines should be followed when determining the type of concrete to be used. The presence of water-soluble sulfates is not a visually discernible characteristic; therefore, other soil samples from the site could yield different concentrations. Additionally, over time landscaping activities (i.e., addition of fertilizers and other soil nutrients) may affect the concentration.

TABLE 7.3
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Exposure Class		Water-Soluble Sulfate (SO_4) Percent by Weight	Cement Type (ASTM C 150)	Maximum Water to Cement Ratio by Weight[1]	Minimum Compressive Strength (psi)
S0		SO_4<0.10	No Type Restriction	n/a	2,500
S1		0.10≤SO_4<0.20	II	0.50	4,000
S2		0.20≤SO_4≤2.00	V	0.45	4,500
S3	Option 1	SO_4>2.00	V+Pozzolan or Slag	0.45	4,500
	Option 2		V	0.40	5,000

[1] Maximum water to cement ratio limits do not apply to lightweight concrete

7.3.2 Geocon Incorporated does not practice in the field of corrosion engineering; therefore, further evaluation by a corrosion engineer may be needed to incorporate the necessary

precautions to avoid premature corrosion of underground pipes and buried metal in direct contact with the soils.

7.4 Slope Stability - General

7.4.1 A slope stability analysis for the proposed 30-foot high cut slope was performed utilizing average drained direct shear strength parameters from the laboratory test results and our experience with similar materials. These analyses indicate that the proposed 2:1 cut slopes, constructed of on-site materials, should have calculated factors of safety of at least 1.5 under static conditions for both deep-seated failure and shallow sloughing conditions to heights of at least 30 feet. Generalized slope stability calculations for both deep-seated and surficial slope stability are presented on Figures 3 and 4.

7.4.2 Although rare, the most common mode of instability for rock slopes are shallow wedge failures from intersecting fault planes or clay filled joints/fractures dipping out of slope. In this regard, the structural measurements obtained during our studies did not reveal such conditions. It is recommended, however, that all slope excavations proposed on the site be observed during grading by an engineering geologist to confirm that geologic conditions do not differ significantly from those anticipated. In the event that adverse conditions are observed, stabilization recommendations can be provided.

7.4.3 Fill slopes should be compacted by backrolling with a loaded sheepsfoot roller at vertical intervals not to exceed 4 feet and should be track-walked at the completion of each slope such that the fill soils are uniformly compacted to at least 90 percent relative compaction to the face of the finished sloped. Alternatively, the fill slope may be over-built at least 3 feet and cut back to yield a properly compacted slope face.

7.4.4 Where fill slopes and fill-over-cut slopes are planned, a 15-foot-wide, 2-foot-deep, undrained keyway should be constructed prior to placing compacted fill. The keyway should be constructed with a minimum 5 percent inclination away from the toe of slope.

7.4.5 All slopes should be landscaped with drought-tolerant vegetation, having variable root depths and requiring minimal landscape irrigation. In addition, all slopes should be drained and properly maintained to reduce erosion.

7.5 Grading

7.5.1 All grading should be performed in accordance with the *Recommended Grading Specifications* contained in Appendix D. Where the recommendations of Appendix D conflict with this report, the recommendations of this report should take precedence.

7.5.2 Prior to commencing grading, a preconstruction conference should be held at the site with the owner or developer, grading contractor, civil engineer, and geotechnical engineer in attendance. Special soil handling and the grading plans can be discussed at that time.

7.5.3 Grading should be performed in conjunction with the observation and compaction testing services of Geocon Incorporated.

7.5.4 Site preparation should begin with the removal of existing structures, improvements, deleterious material and vegetation in areas of planned development. The depth of removal should be such that material exposed in cut areas or soils to be used as fill is relatively free of organic matter. Material generated during stripping and/or site demolition should be exported from the site.

7.5.5 All potentially compressible surficial soils (undocumented fill, alluvium, colluvium, and terrace deposits) within areas of planned grading should be removed to formational materials and properly compacted prior to placing additional fill and/or structural loads. The suitability of leaving portions of the terrace deposits in-place should be evaluated during grading.

7.5.6 Where not restricted by property boundaries, protected open space or exiting improvements, removal of compressible surficial soils should extend beyond structural areas a horizontal distance equal to the depth of the removal (see Figure 5 for general information). This condition occurs at the south of Lots 61 through 64. The actual extent of unsuitable soil removals will be determined in the field during grading by the geotechnical engineer and/or engineering geologist.

7.5.7 We expect groundwater/perched water conditions will be encountered in removal areas performed at or near Poway Creek and the other areas noted on the trench logs. Wet to saturated soil and perched water may also be encountered in the surficial deposits located near the natural drainages, especially, if grading is performed during the rainy season. Remedial grading of surficial deposits in these areas will likely result in possible excavation and fill placement difficulties. Dewatering and/or use of specialized equipment may be

required to excavate the alluvium, colluvium, and terrace deposits. Overly wet materials will require spreading and drying and/or mixing with drier materials to reduce the moisture content so that compaction can be achieved.

7.5.8 If complete removal of compressible material cannot be performed at or near the creek or other areas of the site due to groundwater conditions, alternative measures such as surcharge loading with settlement monitoring may be required. Geocon Incorporated will provide alternate recommendations, if needed, based on conditions encountered during grading.

7.5.9 After removal of unsuitable material as recommended above, the base of excavations to receive fill (where practical) should be scarified approximately 12 inches, moisture conditioned, and compacted.

7.5.10 Grading should be conducted so that high expansive soils (EI >90) are placed in the deeper fill areas at least three feet below proposed finish grade elevations and at least 15 feet from the face of fill slopes. Where practical, the upper three feet of graded areas (cut or fill) should consist of properly compacted very low to low (EI $\leq$50) expansive granular soils. Medium expansive soils (EI $\leq$90) may also be used to achieve design grades.

7.5.11 Capping material refers to select material placed within three feet from building pad grade and parkway/roadway grade. This material should consist of soil fill with an approximate maximum particle dimension of 6 inches with a minimum of 40 percent soil passing the ¾-inch sieve and should have at least 20 percent of the soil passing the No. 4 screen. Based on subsurface information presented in Appendix A, most capping material generally can be obtained from the granitic rock and colluvium. Soils with an expansion potential (EI) of greater than 90 are not suitable for capping and should be placed in the deeper fill areas or at least three feet below design grade across the site and 15 feet from face of slopes. The grading contractor should take necessary steps to manage the available soils to cap the project.

7.5.12 Consideration may also be given to over-excavate (mine) the weathered portions of the granitic rock to generate additional capping material and to provide additional areas for disposal of oversize rock material, if needed.

7.5.13 The site should be brought to final subgrade elevations with structural fill compacted in layers. In general, soils native to the site are suitable for re-use as fill if free from vegetation, debris and other deleterious material. Layers of fill should be no thicker than will allow for adequate bonding and compaction. All fill, including backfill and scarified ground surfaces,

should be compacted to at least 90 percent of laboratory maximum dry density at or above optimum moisture content, as determined in accordance with ASTM D1557. Fill materials below optimum moisture content will require additional moisture conditioning prior to placing additional fill.

7.5.14 Recommendations for the handling and disposal of oversized rock in fill areas are presented on Figure 6. In general, structural fill placed and compacted at the site should consist of material that can be classified into four zones:

Zone A: Material placed within 3 feet from building pad grade and, parkways and street grade should consist of soil fill with an approximate maximum particle dimension of 6 inches with a minimum of 40 percent of the soil passing the ¾-inch sieve and should have at least 20 percent of the soil passing the No. 4 sieve.

Zone B: Soil fill with rock up to 1 foot in maximum dimension. See Figure 6 for minimum thickness of zone.

Zone C: Rock fill or soil-rock fill generally consisting of 2 foot minus rock material with occasional rock up to 4 foot in maximum dimension. Alternatively, rock 2 to 4 feet in maximum dimension can be placed in window rows spaced a minimum of 12 feet. The voids around and beneath the rock should be filled with soil possessing a sand equivalent of at least 30. Zone C should terminate at least 2 feet below lowest utility.

Zone D: Soil fill with rock up to 1 foot in maximum dimension. See Figure 6 for minimum thickness of zone.

7.5.15 Blasting of rock material should be performed to maximize breakage to 2-foot minus material. Although not anticipated "rock fill" placement should generally be limited to 2-foot-thick horizontal layers and compacted using rock trucks and bulldozers. Significant volumes of water will be required during rock fill placement.

7.5.16 Based on the Tentative Map, grading will result in fill to formation transitions across several building pads. A transition condition is defined where formation is located within three feet of finish pad grade. To reduce the potential for differential settlement, the formation portion of the transition should be over-excavated (undercut) at least three feet below proposed finish grade and replaced with properly compacted very low to low expansive fill soil. As a minimum, the building pads should be provided with medium expansive soil (EI $\underline{<}$90). Overexcavations should be cut at a gradient toward the deepest fill area or streets to provide drainage for moisture migration along the contact between the formation and compacted fill.

7.5.17 Cut pads exposing granitic rock should be undercut at least three feet and replaced with properly compacted very low to low expansive soil to facilitate excavation of foundations and shallow utilities. As a minimum, fill should consist of medium expansive soil (EI $\leq$90).

7.5.18 Where the streets are located in cut areas composed of granitic rock, roadways should be undercut to a depth of at least 2 feet below the lowest utility.

7.5.19 In order to maintain safety and the stability of adjacent improvements, it is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with the applicable OSHA rules and regulations.

7.5.20 Imported materials (if required), should consist of granular very low to low expansive soils (EI $\leq$50) and, should be free of oversize rock (greater than 6 inches) and construction debris Prior to importing the material, samples from proposed borrow areas should be obtained and subjected to laboratory testing to determine if the material conforms to the recommended criteria. The grading contractor should allow at least four days for completion of the laboratory testing and schedule grading accordingly.

7.6 Seismic Design Criteria

7.6.1 Table 7.6.1 summarizes site-specific design criteria obtained from the 2019 California Building Code (CBC; Based on the 2018 International Building Code [IBC] and ASCE 7-16), Chapter 16 Structural Design, Section 1613 Earthquake Loads. We used the computer program *U.S. Seismic Design Maps*, provided by the Structural Engineers Association (SEA) to calculate the seismic design parameters. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.2.2 of the 2019 CBC and Table 20.3-1 of ASCE 7-16. The values presented herein are for the risk-targeted maximum considered earthquake (MCE_R). Sites designated as Site Class D, E and F may require additional analyses if requested by the project structural engineer and client.

TABLE 7.6.1
2019 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2019 CBC Reference
Site Class	C	Section 1613.2.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	0.798g	Figure 1613.2.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.295g	Figure 1613.2.1(2)
Site Coefficient, F_A	1.2	Table 1613.2.3(1)
Site Coefficient, F_V	1.5*	Table 1613.2.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	0.958g	Section 1613.2.3 (Eqn 16-36)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	0.442g*	Section 1613.2.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	0.639g	Section 1613.2.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.295g*	Section 1613.2.4 (Eqn 16-39)

***** Using the code-based values presented in this table, in lieu of a performing a ground motion hazard analysis, requires the exceptions outlined in ASCE 7-16 Section 11.4.8 be followed by the project structural engineer. Per Section 11.4.8 of ASCE/SEI 7-16, a ground motion hazard analysis should be performed for projects for Site Class "E" sites with Ss greater than or equal to 1.0g and for Site Class "D" and "E" sites with S1 greater than 0.2g. Section 11.4.8 also provides exceptions which indicates that the ground motion hazard analysis may be waived provided the exceptions are followed.

7.6.2 Table 7.6.2 presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-16.

TABLE 7.6.2
ASCE 7-16 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-16 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.342g	Figure 22-7
Site Coefficient, F_{PGA}	1.2	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.41g	Section 11.8.3 (Eqn 11.8-1)

7.6.3 Conformance to the criteria in Tables 7.6.1 and 7.6.2 for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will

not occur in the event of a large earthquake. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

7.6.4 The project structural engineer and architect should evaluate the appropriate Risk Category and Seismic Design Category for the planned structures. The values presented herein assume a Risk Category of II and resulting in a Seismic Design Category D. Table 7.6.3 presents a summary of the risk categories in accordance with ASCE 7-16.

TABLE 7.6.3
ASCE 7-16 RISK CATEGORIES

Risk Category	Building Use	Examples
I	Low risk to Human Life at Failure	Barn, Storage Shelter
II	Nominal Risk to Human Life at Failure (Buildings Not Designated as I, III or IV)	Residential, Commercial and Industrial Buildings
III	Substantial Risk to Human Life at Failure	Theaters, Lecture Halls, Dining Halls, Schools, Prisons, Small Healthcare Facilities, Infrastructure Plants, Storage for Explosives/Toxins
IV	Essential Facilities	Hazardous Material Facilities, Hospitals, Fire and Rescue, Emergency Shelters, Police Stations, Power Stations, Aviation Control Facilities, National Defense, Water Storage

7.7 Foundation and Concrete Slabs-On-Grade Recommendations

7.7.1 The foundation recommendations herein are for proposed one- to three-story residential structures. The foundation recommendations have been separated into three categories based on either the maximum and differential fill thickness or Expansion Index. The foundation category criteria are presented in Table 7.7.1.

TABLE 7.7.1
FOUNDATION CATEGORY CRITERIA

Foundation Category	Maximum Fill Thickness, T (Feet)	Differential Fill Thickness, D (Feet)	Expansion Index (EI)
I	T<20	--	EI≤50
II	20≤T<50	10≤D<20	50<EI≤90
III	T≥50	D≥20	90<EI≤130

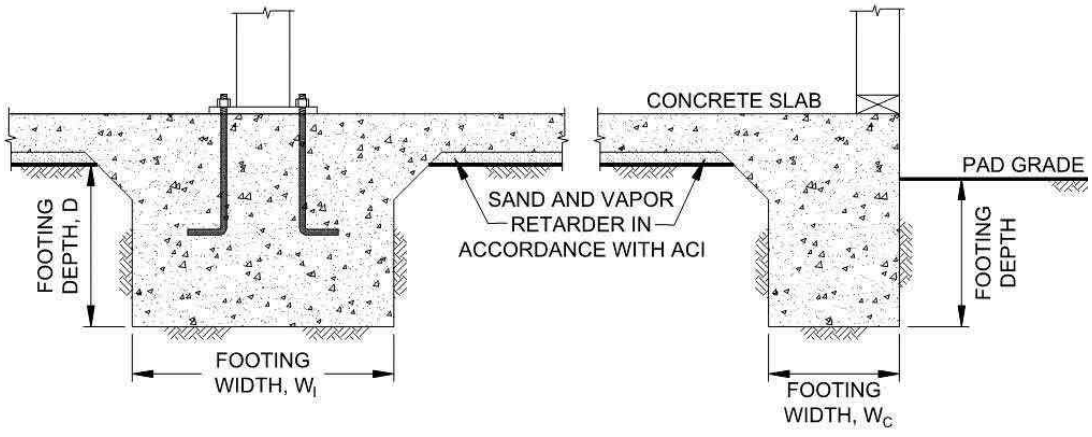
7.7.2 We will provide final foundation categories for each building or lot after finish pad grades have been achieved, the underlying fill-bedrock geometry is evaluated and we perform laboratory testing of the subgrade soil.

7.7.3 Table 7.7.2 presents minimum foundation and interior concrete slab design criteria for conventional foundation systems.

TABLE 7.7.2
CONVENTIONAL FOUNDATION RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Footing Embedment Depth, D (inches)	Minimum Continuous Footing Reinforcement	Minimum Footing Width (Inches)
I	12	Two No. 4 bars, one top and one bottom	12 – Continuous, W_C 24 – Isolated, W_I
II	18	Four No. 4 bars, two top and two bottom	
III	24	Four No. 5 bars, two top and two bottom	

7.7.4 The foundations should be embedded in accordance with the recommendations herein and the Wall/Column Footing Dimension Detail. The embedment depths should be measured from the lowest adjacent pad grade for both interior and exterior footings. Footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope (unless designed with a post-tensioned foundation system as discussed herein).



Wall/Column Footing Dimension Detail

7.7.5 The proposed structures can be supported on a shallow foundation system founded in the compacted fill/formational materials. Table 7.7.3 provides a summary of the foundation design recommendations.

TABLE 7.7.3
SUMMARY OF FOUNDATION RECOMMENDATIONS

Parameter	Value
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

7.7.6 The bearing capacity values presented herein are for dead plus live loads and may be increased by one-third when considering transient loads due to wind or seismic forces.

7.7.7 The concrete slab-on-grades should be a designed in accordance with Table 7.7.4.

TABLE 7.7.4
CONVENTIONAL SLAB-ON-GRADE RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Concrete Slab Thickness (inches)	Interior Slab Reinforcement	Typical Slab Underlayment
I	4	6 x 6 - 10/10 welded wire mesh at slab mid-point	3 to 4 Inches of Sand/Gravel/Base
II	4	No. 3 bars at 24 inches on center, both directions	
III	5	No. 3 bars at 18 inches on center, both directions	

7.7.8 Slabs that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder. The vapor retarder design should be consistent with the guidelines presented in the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06). The vapor retarder used should be specified by the project architect or developer based

on the type of floor covering that will be installed and if the structure will possess a humidity controlled environment.

7.7.9 The bedding sand thickness should be determined by the project foundation engineer, architect, and/or developer. However, we should be contacted to provide recommendations if the bedding sand is thicker than 6 inches. It is common to see 3 inches and 4 inches of sand below the concrete slab-on-grade for 5-inch and 4-inch thick slabs, respectively, in the southern California area. The foundation design engineer should provide appropriate concrete mix design criteria and curing measures to assure proper curing of the slab by reducing the potential for rapid moisture loss and subsequent cracking and/or slab curl. We suggest that the foundation design engineer present the concrete mix design and proper curing methods on the foundation plans. It is critical that the foundation contractor understands and follows the recommendations presented on the foundation plans.

7.7.10 As an alternative to the conventional foundation recommendations, consideration should be given to the use of post-tensioned concrete slab and foundation systems for the support of the proposed structures. The post-tensioned systems (foundation dimensions and embedment depths, slab thickness and steel placement) should be designed by a structural engineer experienced in post-tensioned slab design and design criteria of the Post-Tensioning Institute (PTI) DC 10.5-12 *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive Soils* or *WRI/CRSI Design of Slab-on-Ground Foundations*, as required by the 2019 California Building Code (CBC Section 1808.6.2). Although this procedure was developed for expansive soil conditions, it can also be used to reduce the potential for foundation distress due to differential fill settlement. The post-tensioned design should incorporate the geotechnical parameters presented in Table 7.7.5 for the particular Foundation Category designated. The parameters presented in Table 7.7.5 are based on the guidelines presented in the PTI DC 10.5 design manual.

TABLE 7.7.5
POST-TENSIONED FOUNDATION SYSTEM DESIGN PARAMETERS

Post-Tensioning Institute (PTI) DC10.5 Design Parameters	Foundation Category		
	I	II	III
Thornthwaite Index	-20	-20	-20
Equilibrium Suction	3.9	3.9	3.9
Edge Lift Moisture Variation Distance, e_M (Feet)	5.3	5.1	4.9
Edge Lift, y_M (Inches)	0.61	1.10	1.58
Center Lift Moisture Variation Distance, e_M (Feet)	9.0	9.0	9.0
Center Lift, y_M (Inches)	0.30	0.47	0.66

7.7.11 The foundations for the post-tensioned slabs should be embedded in accordance with the recommendations of the structural engineer. If a post-tensioned mat foundation system is planned, the slab should possess a thickened edge with a minimum width of 12 inches and extend below the clean sand or crushed rock layer.

7.7.12 If the structural engineer proposes a post-tensioned foundation design method other than PTI, DC 10.5:

- The deflection criteria presented in Table 7.7.5 are still applicable.
- Interior stiffener beams should be used for Foundation Categories II and III.
- The width of the perimeter foundations should be at least 12 inches.
- The perimeter footing embedment depths should be at least 12 inches, 18 inches and 24 inches for foundation categories I, II, and III, respectively. The embedment depths should be measured from the lowest adjacent pad grade.

7.7.13 Foundation systems for the lots that possess a foundation Category I and a "very low" expansion potential (expansion index of 20 or less) can be designed using the method described in Section 1808 of the 2019 CBC. If post-tensioned foundations are planned, an alternative, commonly accepted design method (other than PTI) can be used. However, the post-tensioned foundation system should be designed with a total and differential deflection of 1 inch. Geocon Incorporated should be contacted to review the plans and provide additional information, if necessary.

7.7.14 If an alternate design method is contemplated, Geocon Incorporated should be contacted to evaluate if additional expansion index testing should be performed to identify the lots that possess a "very low" expansion potential (expansion index of 20 or less).

7.7.15 Our experience indicates post-tensioned slabs may be susceptible to excessive edge lift from tensioning, regardless of the underlying soil conditions. Placing reinforcing steel at the bottom of the perimeter footings and the interior stiffener beams may mitigate this potential. The structural engineer should design the foundation system to reduce the potential of edge lift occurring for the proposed structures.

7.7.16 During the construction of the post-tension foundation system, the concrete should be placed monolithically. Under no circumstances should cold joints form between the footings/grade beams and the slab during the construction of the post-tension foundation system unless designed by the structural engineer.

7.7.17 Isolated footings outside of the slab area, if present, should have the minimum embedment depth and width recommended for conventional foundations for a particular Foundation Category. The use of isolated footings, which are located beyond the perimeter of the building and support structural elements connected to the building, are not recommended for Category III. Where this condition cannot be avoided, the isolated footings should be connected to the building foundation system with grade beams in both directions. In addition, consideration should be given to connecting patio slabs, which exceed 5 feet in width, to the building foundation to reduce the potential for future separation to occur.

7.7.18 Interior stiffening beams should be incorporated into the design of the foundation system in accordance with the PTI design procedures.

7.7.19 Special subgrade presaturation is not deemed necessary prior to placing concrete; however, the exposed foundation and slab subgrade soil should be moisture conditioned, as necessary, to maintain a moist condition as would be expected in any such concrete placement.

7.7.20 Where buildings or other improvements are planned near the top of a slope 3:1 (horizontal:vertical) or steeper, special foundation and/or design considerations are recommended due to the tendency for lateral soil movement to occur.

- For fill slopes less than 20 feet high or cut slopes regardless of height, footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.
- When located next to a descending 3:1 (horizontal:vertical) fill slope or steeper, the foundations should be extended to a depth where the minimum horizontal distance is equal to H/3 (where H equals the vertical distance from the top of the fill slope to the base of the fill soil) with a minimum of 7 feet but need not exceed 40 feet. The horizontal distance is measured from the outer, deepest edge of the footing to the face of the slope. A post-tensioned slab and foundation system or mat foundation system can be used to reduce the potential for distress in the structures associated with strain softening and lateral fill extension. Specific design parameters or recommendations for either of these alternatives can be provided once the building location and fill slope geometry have been determined.
- If swimming pools are planned, Geocon Incorporated should be contacted for a review of specific site conditions.
- Swimming pools located within 7 feet of the top of cut or fill slopes are not recommended. Where such a condition cannot be avoided, the portion of the swimming pool wall within 7 feet of the slope face be designed assuming that the adjacent soil provides no lateral support. This recommendation applies to fill slopes up to 30 feet in height, and cut slopes regardless of height. For swimming pools located near the top of fill slopes greater than 30 feet in height, additional

recommendations may be required and Geocon Incorporated should be contacted for a review of specific site conditions.

- Although other improvements, which are relatively rigid or brittle, such as concrete flatwork or masonry walls, may experience some distress if located near the top of a slope, it is generally not economical to mitigate this potential. It may be possible, however, to incorporate design measures which would permit some lateral soil movement without causing extensive distress. Geocon Incorporated should be consulted for specific recommendations.

7.7.21 The recommendations of this report are intended to reduce the potential for cracking of slabs and foundations due to expansive soil (if present), differential settlement of fill soil with varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.7.22 Concrete slabs should be provided with adequate crack-control joints, construction joints and/or expansion joints to reduce unsightly shrinkage cracking. The design of joints should consider criteria of the American Concrete Institute when establishing crack-control spacing. Additional steel reinforcing, concrete admixtures and/or closer crack control joint spacing should be considered where concrete-exposed finished floors are planned.

7.7.23 Geocon Incorporated should be consulted to provide additional design parameters as required by the structural engineer.

7.7.24 We should observe the foundation excavations prior to the placement of reinforcing steel to check that the exposed soil conditions are similar to those expected and that they have been extended to the appropriate bearing strata. If unexpected soil conditions are encountered, foundation modifications may be required.

7.8 Concrete Flatwork

7.8.1 The following recommendations apply to exterior flatwork where near surface soils are low to medium expansive (EI less than 90). Exterior slabs not subjected to vehicular traffic should be a minimum of 4 inches thick and reinforced with 6 x 6-6/6 welded wire mesh. The mesh should be placed in the middle of the slab. Proper mesh positioning is critical to future performance of the slabs. The contractor should take extra measures to provide proper mesh

placement. Prior to construction of slabs, the upper 12 inches of subgrade soils should be moisture conditioned at or slightly above optimum moisture content and compacted to at least 90 percent of the laboratory maximum dry density per ASTM 1557.

7.8.2 Where highly expansive soils (EI greater than 90) are present near finish grade, the following recommendations apply. Exterior slabs should be at least 5 inches thick and reinforced with No. 3 steel bars spaced 18 inches on center each direction positioned at the slab midpoint. Driveways should be constructed with a 6-inch deep slab edge (measured from the bottom of the slab). Slabs should be doweled to the building foundation where they abut the stem wall. Sidewalks should be doweled to the curbs. Prior to construction of slabs, the upper 12 inches of subgrade soils should scarified and moisture conditioned to **a minimum of 3% above optimum moisture content** just prior to placing the concrete. Moisture conditioning should be observed and checked by a representative of Geocon Incorporated.

7.8.3 Consideration should be given to adding concrete cut-off walls beneath exterior flatwork supported by highly expansive soils (EI greater than 90). The cut-off walls are recommended where any water (e.g. landscape) may migrate laterally beneath the flatwork and cause adverse soil movement. The cut-off walls should be located along the perimeter of the concrete slab adjacent to landscaping areas and extend at least 6-inches into the soil subgrade.

7.8.4 Concrete flatwork should be provided with crack control joints to reduce and/or control shrinkage cracking. Crack control spacing should be determined by the project structural engineer based upon the slab thickness and intended usage. Criteria of the American Concrete Institute (ACI) should be taken into consideration when establishing crack control spacing. A 4-inch-thick slab should have a maximum joint spacing of 10 feet. Subgrade soil for exterior slabs not subjected to vehicle loads should be compacted in accordance with criteria presented above prior to concrete placement. Subgrade soil should be properly compacted and the moisture content of subgrade soil should be checked prior to placing concrete.

7.8.5 Even with the incorporation of the recommendations within this report, the exterior concrete flatwork has a likelihood of experiencing some settlement due to potentially compressible and liquefiable soil beneath grade; therefore, the welded wire mesh should overlap continuously in flatwork to reduce the potential for vertical offsets within flatwork. Additionally, flatwork should be structurally connected to the curbs, where possible, to reduce the potential for offsets between the curbs and the flatwork.

7.8.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to expansive soil (if present), differential settlement of existing soil or soil with varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. Periotic maintenance such as slab replacement and/or grinding of elevated slab margins may be necessary due to the highly expansive soils. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.9 Conventional Retaining Walls

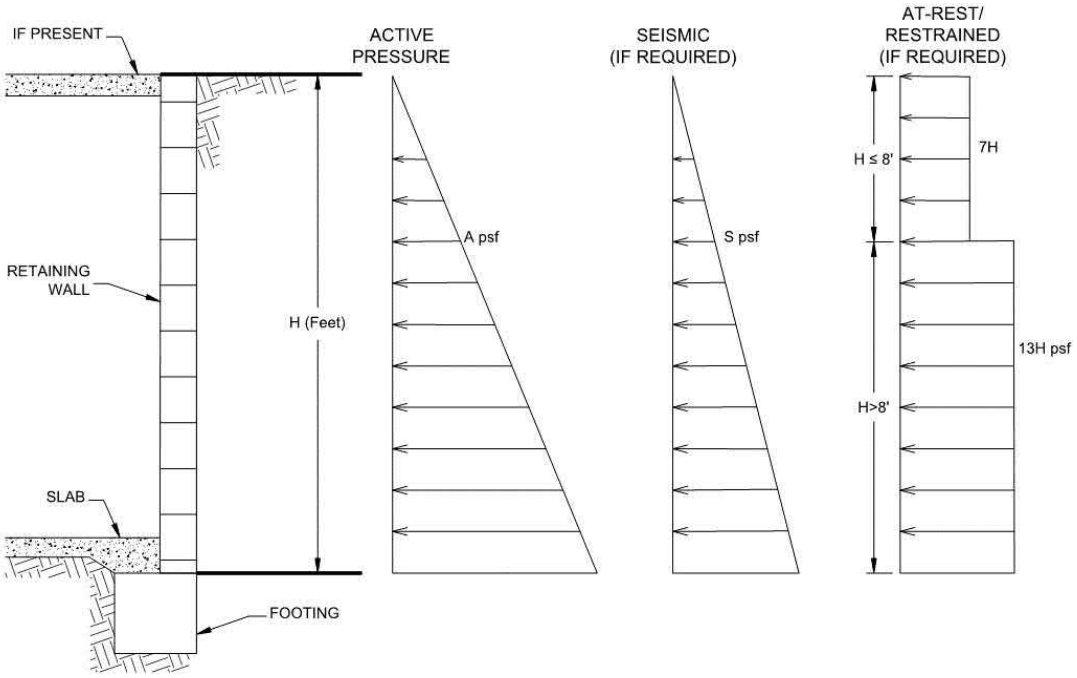
7.9.1 Retaining walls should be designed using the values presented in Table 7.9.1. Soil with an expansion index (EI) of greater than 50 should not be used as backfill material behind retaining walls.

TABLE 7.9.1
RETAINING WALL DESIGN RECOMMENDATIONS

Parameter	ValueP
Active Soil Pressure, A (Fluid Density, Level Backfill)	35 pcf
Active Soil Pressure, A (Fluid Density, 2:1 Sloping Backfill)	50 pcf
Seismic Pressure, S	18H psf
At-Rest/Restrained Walls Additional Uniform Pressure (0 to 8 Feet High)	8H psf
At-Rest/Restrained Walls Additional Uniform Pressure (8+ Feet High)	12H psf
Expected Expansion Index for the Subject Property	EI≤50

H equals the height of the retaining portion of the wall

7.9.2 The project retaining walls should be designed as shown in the Retaining Wall Loading Diagram.



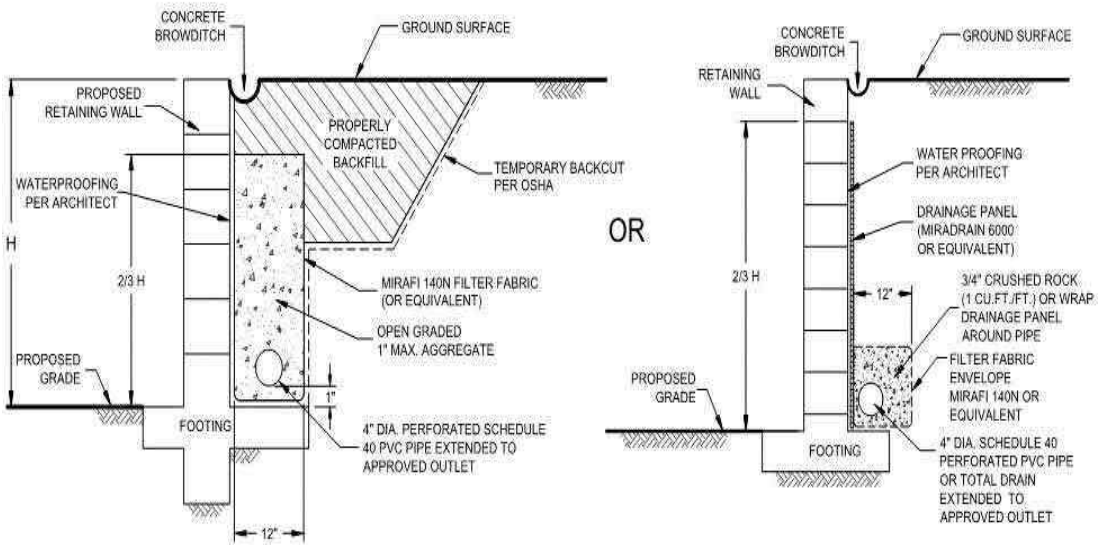
Retaining Wall Loading Diagram

7.9.3 Unrestrained walls are those that are allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall) at the top of the wall. Where walls are restrained from movement at the top (at-rest condition), an additional uniform pressure should be applied to the wall. For retaining walls subject to vehicular loads within a horizontal distance equal to two-thirds the wall height, a surcharge equivalent to 2 feet of fill soil should be added.

7.9.4 The structural engineer should determine the Seismic Design Category for the project in accordance with Section 1613.3.5 of the 2019 CBC or Section 11.6 of ASCE 7-16. For structures assigned to Seismic Design Category of D, E, or F, retaining walls that support more than 6 feet of backfill should be designed with seismic lateral pressure in accordance with Section 1803.5.12 of the 2019 CBC. The seismic load is dependent on the retained height where H is the height of the wall, in feet, and the calculated loads result in pounds per square foot (psf) exerted at the base of the wall and zero at the top of the wall.

7.9.5 Retaining walls should be designed to ensure stability against overturning sliding, and excessive foundation pressure. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, it is not necessary to consider active pressure on the keyway.

7.9.6 Drainage openings through the base of the wall (weep holes) should not be used where the seepage could be a nuisance or otherwise adversely affect the property adjacent to the base of the wall. The recommendations herein assume a properly compacted granular (EI of 90 or less) free-draining backfill material with no hydrostatic forces or imposed surcharge load. The retaining wall should be properly drained as shown in the Typical Retaining Wall Drainage Detail. If conditions different than those described are expected, or if specific drainage details are desired, Geocon Incorporated should be contacted for additional recommendations.



Typical Retaining Wall Drainage Detail

7.9.7 The retaining walls may be designed using either the active and restrained (at-rest) loading condition or the active and seismic loading condition as suggested by the structural engineer. Typically, it appears the design of the restrained condition for retaining wall loading may be adequate for the seismic design of the retaining walls. However, the active earth pressure combined with the seismic design load should be reviewed and also considered in the design of the retaining walls.

7.9.8 In general, wall foundations should be designed in accordance with Table 7.9.2. The proximity of the foundation to the top of a slope steeper than 3:1 could impact the allowable soil bearing pressure. Therefore, retaining wall foundations should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.

TABLE 7.9.2
SUMMARY OF RETAINING WALL FOUNDATION RECOMMENDATIONS

Parameter	Value
Minimum Retaining Wall Foundation Width	12 inches
Minimum Retaining Wall Foundation Depth	12 Inches
Minimum Steel Reinforcement	Per Structural Engineer
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

7.9.9 The recommendations presented herein are generally applicable to the design of rigid concrete or masonry retaining walls. In the event that other types of walls (such as mechanically stabilized earth [MSE] walls) are planned, Geocon Incorporated should be consulted for additional recommendations.

7.9.10 Unrestrained walls will move laterally when backfilled and loading is applied. The amount of lateral deflection is dependent on the wall height, the type of soil used for backfill, and loads acting on the wall. The retaining walls and improvements above the retaining walls should be designed to incorporate an appropriate amount of lateral deflection as determined by the structural engineer.

7.9.11 Soil contemplated for use as retaining wall backfill, including import materials, should be identified in the field prior to backfill. At that time, Geocon Incorporated should obtain samples for laboratory testing to evaluate its suitability. Modified lateral earth pressures may be necessary if the backfill soil does not meet the required expansion index or shear strength. City or regional standard wall designs, if used, are based on a specific active lateral earth pressure and/or soil friction angle. In this regard, on-site soil to be used as backfill may or may not meet the values for standard wall designs. Geocon Incorporated should be consulted to assess the suitability of the on-site soil for use as wall backfill if standard wall designs will be used.

7.10 Lateral Loading

7.10.1 Table 7.10 should be used to help design the proposed structures and improvements to resist lateral loads for the design of footings or shear keys. The allowable passive pressure assumes a horizontal surface extending at least 5 feet, or three times the surface generating the passive pressure, whichever is greater. The upper 12 inches of material in areas not protected by floor slabs or pavement should not be included in design for passive resistance.

TABLE 7.10
SUMMARY OF LATERAL LOAD DESIGN RECOMMENDATIONS

Parameter	Value
Passive Pressure Fluid Density	300 pcf
Coefficient of Friction (Concrete and Soil)	0.35
Coefficient of Friction (Along Vapor Barrier)	0.2 to 0.25*

*Per manufacturer's recommendations.

7.10.2 The passive and frictional resistant loads can be combined for design purposes. The lateral passive pressures may be increased by one-third when considering transient loads due to wind or seismic forces.

7.11 Mechanically Stabilized Earth (MSE) Retaining Walls

7.11.1 Mechanized stabilized earth (MSE) retaining walls can be used on the property. MSE retaining walls are alternative walls that consist of modular block facing units with geogrid reinforced earth behind the block. The reinforcement grid attaches to the block units and is typically placed at specified vertical intervals and embedment lengths. The grid length and spacing will be determined by the wall designer.

7.11.2 The geotechnical parameters listed in Table 7.11 can be used for preliminary design of the MSE walls. Soil with an expansion index (EI) of greater than 50 should not be used as backfill material behind retaining walls. In addition, some wall designers request soil with a plasticity index greater than 20, a liquid limit greater than 40 and a fines content greater than 35 percent should not be used for soil within the reinforcing zone. This may require import of select materials for the wall backfilling operations or selectively stockpiling of granular soils. Once the backfill source has been determined, laboratory testing should be performed to check that the shear strength parameters used in the design of the MSE walls meet or exceed the required strength within the reinforced zone.

TABLE 7.11
GEOTECHNICAL PARAMETERS FOR MSE WALLS

Parameter	Reinforced Zone	Retained Zone	Foundation Zone
Angle of Internal Friction	30 degrees	30 degrees	30 degrees
Cohesion	0 psf	0 psf	0 psf
Wet Unit Density	125 pcf	125 pcf	125 pcf

7.11.3 The soil parameters presented in Table 7.17 are based on our experience with MSE wall contractors on previous projects. The wet unit density values presented in Table 7.17 can be used for design but actual in-place densities may range from approximately 110 to 135 pounds per cubic foot. Geocon has no way of knowing which materials will actually be used as backfill behind the wall during construction. It is up to the wall designers to use their judgment in selection of the design parameters. As such, once backfill materials have been selected and/or stockpiled, sufficient shear tests should be conducted on samples of the proposed backfill materials to check that they conform to actual design values. Results should be provided to the designer to re-evaluate stability of the walls. Dependent upon test results, the designer may require modifications to the original wall design (e.g., longer reinforcement embedment lengths and/or steel reinforcement).

7.11.4 The foundation zone is the area where the footing is embedded, the reinforced zone is the area of the backfill that possesses the reinforcing fabric, and the retained zone is the area behind the reinforced zone.

7.11.5 Wall foundations having a minimum depth and width of one foot may be designed for an allowable soil bearing pressure of 2,000 psf. The MSE walls should be designed for a total and differential static settlement of 1-inch and ½-inch in 40 feet, respectively.

7.11.6 Backfill materials within the reinforced zone should be compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content in accordance with ASTM D 1557. This is applicable to the entire embedment width of the reinforcement. Typically, wall designers specify no heavy compaction equipment within 3 feet of the face of the wall. However, smaller equipment (e.g., walk-behind, self-driven compactors or hand whackers) can be used to compact the materials without causing deformation of the wall. If the designer specifies no compactive effort for this zone, the materials are essentially not properly compacted and the reinforcement grid within the uncompacted zone should not be relied upon for reinforcement, and overall embedment lengths will have to be increased to account for the difference.

7.11.7 The wall should be provided with a drainage system sufficient to prevent excessive seepage through the wall and the base of the wall, thus preventing hydrostatic pressures behind the wall.

7.11.8 Geosynthetic reinforcement must elongate to develop full tensile resistance. This elongation generally results in movement at the top of the wall. The amount of movement is dependent upon the height of the wall (e.g., higher walls rotate more) and the type of reinforcing grid used. In addition, over time the reinforcement grid has been known to exhibit creep (sometimes as much as 5 percent) and can undergo additional movement. Given this condition, the owner should be aware that structures and pavement placed within the reinforced and retained zones of the wall may undergo movement.

7.11.9 The MSE wall contractor should provide the estimated deformation of wall and adjacent ground in associated with wall construction. The calculated horizontal and vertical deformations should be determined by the wall designer. The estimated movements should be provided to the project structural engineer to determine if the planned improvements can tolerate the expected movements.

7.11.10 The MSE wall designer/contractor should review this report, including the slope stability requirements, and incorporate our recommendations as presented herein. We should be provided the plans for the MSE walls to check if they are in conformance with our recommendations prior to issuance of a permit and construction.

7.12 Preliminary Pavement Recommendations

7.12.1 We calculated the preliminary flexible pavement sections in general conformance with the *Caltrans Method of Flexible Pavement Design* (Highway Design Manual, Section 608.4) using estimated Traffic Indices (TI's) of 4.5, 5.0, 6.0 and 7.0 for the interior roadways. The project civil engineer and owner should review the pavement designations to determine appropriate locations for pavement thickness. We have assumed an R-Value of 10 and 78 for the subgrade soil and base materials, respectively, for the purposes of this preliminary analysis. The final pavement sections should be based on the R-Value of the subgrade soil encountered at final subgrade elevation once site grading and utility trench backfill is completed. Table 7.12.1 presents the preliminary flexible pavement sections.

TABLE 7.12.1
PRELIMINARY FLEXIBLE PAVEMENT SECTION

Location	Assumed Traffic Index	Assumed Subgrade R-Value	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Parking Stalls	4.5	10	3	7
Interior Roadways (light-duty)	5.0	10	3	9
Interior Roadways (medium duty)	6.0	10	3.5	12.5
Interior Roadways (heavy duty)	7.0	10	4	14.5

7.12.2 Prior to placing base materials, the upper 12 inches of the subgrade soil should be scarified, moisture conditioned as necessary, and recompacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content as determined by ASTM D 1557. Similarly, the base material should be compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Asphalt concrete should be compacted to a density of at least 95 percent of the laboratory Hveem density in accordance with ASTM D 2726.

7.12.3 Base materials should conform to Section 26-1.02B of the *Standard Specifications for The State of California Department of Transportation (Caltrans)* with a ¾-inch maximum size aggregate. The asphalt concrete should conform to Section 203-6 of the *Standard Specifications for Public Works Construction (Greenbook).*

7.12.4 The base thickness can be reduced if a reinforcement geogrid is used during the installation of the pavement. Geocon should be contact for additional recommendations, if required.

7.12.5 A rigid Portland cement concrete (PCC) pavement section should be placed in driveway entrance aprons, cross-gutters and trash bin loading/storage areas. The concrete pad for trash truck areas should be large enough such that the truck wheels will be positioned on the concrete during loading. We calculated the rigid pavement section in general conformance with the procedure recommended by the American Concrete Institute report ACI 330R-08 *Guide for Design and Construction of Concrete Parking Lots* using the parameters presented in Table 7.12.2.

TABLE 7.12.2
RIGID PAVEMENT DESIGN PARAMETERS

Design Parameter	Design Value
Modulus of subgrade reaction, k	50 pci
Modulus of rupture for concrete, M_R	500 psi
Traffic Category, TC	A and B
Average daily truck traffic, ADTT	10 and 25

7.12.6 Based on the criteria presented herein, the PCC pavement sections should have a minimum thickness as presented in Table 7.12.3.

TABLE 7.12.3
RIGID PAVEMENT RECOMMENDATIONS

Location	Portland Cement Concrete (inches)
Medium Duty Areas (TC=B)	6.0
Heavy Duty Areas (TC=C)	7.0

7.12.7 The PCC pavement should be placed over subgrade soil that is compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. This pavement section is based on a minimum concrete compressive strength of approximately 3,000 psi (pounds per square inch). Base materials will not be required beneath concrete improvements including cross-gutters, curb and gutters, and sidewalks.

7.12.8 A thickened edge or integral curb should be constructed on the outside of concrete slabs subjected to wheel loads. The thickened edge should be 1.2 times the slab thickness or a minimum thickness of 2 inches, whichever results in a thicker edge, and taper back to the recommended slab thickness 4 feet behind the face of the slab (e.g., a 7.5-inch-thick slab would have a 9.5-inch-thick edge). Reinforcing steel will not be necessary within the concrete for geotechnical purposes with the possible exception of dowels at construction joints as discussed herein.

7.12.9 To control the location and spread of concrete shrinkage cracks, crack-control joints (weakened plane joints) should be included in the design of the concrete pavement slab. Crack-control joints should not exceed 30 times the slab thickness with a maximum spacing of 15 feet for slabs 6 inches and thicker and should be sealed with an appropriate sealant to prevent the migration of water through the control joint to the subgrade materials. The depth of the crack-control joints should be determined by the referenced ACI report. The depth of

the crack-control joints should be at least ¼ of the slab thickness when using a conventional saw, or at least 1 inch when using early-entry saws on slabs 9 inches or less in thickness, as determined by the referenced ACI report discussed in the pavement section herein. Cuts at least ¼ inch wide are required for sealed joints, and a ⅜ inch wide cut is commonly recommended. A narrow joint width of $^1/_{10}$ to $^1/_8$-inch wide is common for unsealed joints.

7.12.10 Concrete curb/gutter should be placed on soil subgrade compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Cross-gutters should be placed on subgrade soil compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Base materials should not be placed below the curb/gutter, cross-gutters, or sidewalk so water is not able to migrate from the adjacent parkways to the pavement sections.

7.12.11 The performance of pavement is highly dependent on providing positive surface drainage away from the edge of the pavement. Ponding of water on or adjacent to the pavement and subgrade will likely result in pavement distress and subgrade failure. Drainage from landscaped areas should be directed to controlled drainage structures. Landscape areas adjacent to the edge of asphalt pavements are not recommended due to the potential for surface or irrigation water to infiltrate the underlying permeable aggregate base and cause distress. Where such a condition cannot be avoided, consideration should be given to incorporating measures that will significantly reduce the potential for subsurface water migration into the aggregate base. If planter islands are planned, the perimeter curb should extend at least 6 inches below the level of the base materials.

7.13 Low Impact Development (Bioswales, Bio-retention systems)

7.13.1 At the completion of grading the site will be underlain by compacted fill over dense/hard formation materials. Based on soils encountered during the field investigation, we anticipate that the compacted fill will consist of sandy clay and clayey gravel, and mixtures of angular gravel and boulders generated from blasting operations in granitic rock. Infiltrating into compacted fill generally results in settlement of granular soils, heaving of expansive soils, and distress to improvements placed over the compacted fill; as well as slope instability. It is our opinion the compacted fill is unsuitable for infiltration of storm water runoff due to the potential for adverse settlement and potential for water to daylight. The formational materials (Friars Formation and granitic rock) are also sufficiently dense and impermeable that infiltration water would be expected to perch on the surface.

7.13.2 Bio-retention basins, bioswales and bio-remediation areas should be designed by the project civil engineer and reviewed by Geocon Incorporated. Typically, bioswales consist of a surface

layer of vegetation underlain by clean sand. A subdrain should be provided beneath the sand layer. Prior to discharging into the storm drain pipe, a seepage cutoff wall should be constructed at the interface between the subdrain and storm drain pipe. The concrete cut-off wall should extend at least 6 inches beyond the perimeter of the gravel-packed subdrain system.

7.13.3 To minimize adverse impacts to existing or planned improvements, we recommend that proposed LID systems be provided with a waterproof liner, such as 30-mil HDPE, or equivalent, to prevent water infiltration and saturation of compacted fill soil and formational materials. This recommendation is intended to reduce potential negative impacts to public and private improvements due to water infiltration. Downstream properties may be subjected to seeps, springs, slope instability, raised groundwater, movement of foundations and slabs, or other impacts as a result of water infiltration. Saturating compacted fills typically results in induced hydraulic settlement of the fills potentially impacting adjacent surface improvements supported by the fill. Bioswale systems when located adjacent to pavements often enable water to migrate beneath pavements saturating subgrade soils and aggregate base, which can lead to premature pavement distress. Also, water may enter underground utility pipe zones and impact improvements down gradient from the site.

7.13.4 A storm water vault is shown on the Tentative Map. If this vault allows water to migrate into the subgrade soils, the design should include an impermeable liner, as discussed in Appendix C.

7.13.5 As plans progress and details for LID systems are available for our review, we can provide additional recommendations. Temporary detention basins in areas where improvements have not been constructed do not need to be lined.

7.13.6 Appendix C presents storm water management for the subject project in accordance with City of Poway Storm Water BMP Design Manual. Recommendations for the planned drainage management areas (DMA) are presented in Appendix C.

7.13.7 The landscape architect should be consulted to provide the appropriate plant recommendations for use with LID systems. If drought resistant plants are not used, irrigation may be required.

7.14 Site Drainage and Moisture Protection

7.14.1 Adequate site drainage is critical to reduce the potential for differential soil movement, erosion and subsurface seepage. Under no circumstances should water be allowed to pond adjacent to footings. The site should be graded and maintained such that surface drainage is

directed away from structures in accordance with 2019 CBC 1804.3 or other applicable standards. In addition, surface drainage should be directed away from the top of slopes into swales or other controlled drainage devices. Roof and pavement drainage should be directed into conduits that carry runoff away from the proposed structure.

7.14.2 Underground utilities should be leak free. Utility and irrigation lines should be checked periodically for leaks, and detected leaks should be repaired promptly. Detrimental soil movement could occur if water is allowed to infiltrate the soil for prolonged periods of time.

7.14.3 Landscaping planters adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Area drains to collect excess irrigation water and transmit it to drainage structures or impervious above-grade planter boxes can be used. In addition, where landscaping is planned adjacent to the pavement, construction of a cutoff wall along the edge of the pavement that extends at least 6 inches below the bottom of the base material should be considered.

7.15 Slope Maintenance

7.15.1 Slopes that are steeper than 3:1 (horizontal:vertical) may, under conditions that are both difficult to prevent and predict, be susceptible to near-surface (surficial) slope instability. The instability is typically limited to the outer 3 feet of a portion of the slope and usually does not directly impact the improvements on the pad areas above or below the slope. The occurrence of surficial instability is more prevalent on fill slopes and is generally preceded by a period of heavy rainfall, excessive irrigation, or the migration of subsurface seepage. The disturbance and/or loosening of the surficial soils, as might result from root growth, soil expansion, or excavation for irrigation lines and slope planting, may also be a significant contributing factor to surficial instability. It is therefore recommended that, to the maximum extent practical: (a) disturbed/loosened surficial soils be either removed or properly recompacted, (b) irrigation systems be periodically inspected and maintained to eliminate leaks and excessive irrigation, and (c) surface drains on and adjacent to slopes be periodically maintained to preclude ponding or erosion. Although the incorporation of the above recommendations should reduce the potential for surficial slope instability, it will not eliminate the possibility and, therefore, it may be necessary to rebuild or repair a portion of the project's slopes in the future.

7.16 Grading and Foundation Plan Review

7.16.1 Geocon Incorporated should review the grading plans and foundation plans for the project prior to final design submittal to evaluate whether additional analyses and/or recommendations are required

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

2. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon Incorporated should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon Incorporated.

3. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

4. The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The initial field investigation was performed on May 28, 2021, and consisted of a visual site reconnaissance and drilling 10 air-track borings in anticipated cut areas. On May 18, 2022, eleven exploratory trenches were excavated to evaluate the thickness and condition of surficial soils requiring remedial grading. The approximate locations of the exploratory trenches and air-track borings are shown on the Geologic Map, Figure 2.

The exploratory trenches were performed using a John Deere 310L rubber tire backhoe equipped with a 24-inch-wide bucket. We collected bulk soil samples for laboratory testing. The air-track borings were advanced using an Ingersoll-Rand ECM 490 drill rig with 4-inch diameter bit.

The soil conditions encountered in the excavations were visually classified and logged in general accordance with American Society for Testing and Materials (ASTM) practice for Description and Identification of Soils (Visual Manual Procedure D 2844) and, where applicable, in general conformance with current Caltrans Soil and Rock Logging, Classification and Presentation Manual. Logs of the backhoe trenches depicting the soil and geologic conditions encountered and the depth at which samples were obtained are presented on Figures A-1 through A-11. Air-track boring logs are presented as Figures A-12 through A-21.

APPENDIX B

LABORATORY TESTING

We performed laboratory testing on select soil samples in accordance with generally accepted test methods of the American Society for Testing and Materials (ASTM) or other suggested procedures.

Selected disturbed bulk samples were tested for maximum dry density and optimum moisture content, shear strength characteristics, expansion potential, and water-soluble sulfate content. The results of our laboratory tests are presented in Tables B-1 through B-IV.

TABLE B-I
SUMMARY OF LABORATORY MAXIMUM DRY DENSITY AND OPTIMUM MOISTURE CONTENT TEST RESULTS ASTM D 1557

Sample No.	Description	Maximum Dry Density (pcf)	Optimum Moisture Content (% dry wt.)
T1-1	Brown, Silty/Clayey SAND with gravel and cobble (includes 14 percent rock correction)	137.3	6.7
T5-1/T8-1	Dark brown, Sandy CLAY with trace gravel	123.5	11.4
T10-1/T11-1	Reddish-brown, Silty/Clayey, fine to medium SAND	130.0	9.0
T11-2	Light brown, Silty, fine to medium SAND with trace gravel	134.2	8.3

TABLE B-II
SUMMARY OF LABORATORY DIRECT SHEAR TEST RESULTS ASTM D 3080

Sample No.*	Dry Density (pcf)	Moisture Content (%)		Unit Cohesion (psf) Peak	Angle of Shear Resistance (degrees)
		Initial	Final		
T1-1	120.6	8.0	12.6	450	33
T5-1/T8-1	109.6	13.0	23.8	300	26
T10-1/T11-1	116.8	9.3	13.9	580	30
T11-2	121.5	8.0	13.0	490	33

*Soil samples remolded to 90 percent of laboratory maximum dry density at near optimum moisture content. Ultimate values are shown.

TABLE B-III
SUMMARY OF LABORATORY EXPANSION INDEX TEST RESULTS
ASTM D 4829

Sample No.	Moisture Content (%)		Dry Density (pcf)	Expansion Index	ASTM Classification (per 2019 CBC)
	Before Test	After Test			
T1-1	7.6	15.2	118.8	61	Medium
T5-1/T8-1	10.9	26.2	105.7	112	High
T10-1/T11-1	8.6	15.3	115.1	3	Very Low

TABLE B-IV

APPENDIX C

APPENDIX C

STORM WATER MANAGEMENT

FOR

OAK KNOLL
POWAY, CALIFORNIA

PROJECT NO. G2746-32-02

APPENDIX C

STORM WATER MANAGEMENT INVESTIGATION

We understand storm water management devices are being proposed in accordance with the *2016 City of Poway BMP Design Manual,* commonly referred to as the *Storm Water Standards* (SWS). If not properly constructed, there is a potential for distress to improvements and properties located hydrologically down gradient or adjacent to these devices. Factors such as the amount of water to be detained, its residence time, and soil permeability have an important effect on seepage transmission and the potential adverse impacts that may occur if the storm water management features are not properly designed and constructed. We have not performed a hydrogeological study at the site. If infiltration of storm water runoff occurs, downstream properties may be subjected to seeps, springs, slope instability, raised groundwater, movement of foundations and slabs, or other undesirable impacts as a result of water infiltration.

Hydrologic Soil Group

The United States Department of Agriculture (USDA), Natural Resources Conservation Services, possesses general information regarding the existing soil conditions for areas within the United States. The USDA website also provides the Hydrologic Soil Group. Table C-1 presents the descriptions of the hydrologic soil groups. In addition, the USDA website also provides an estimated saturated hydraulic conductivity for the existing soil.

TABLE C-1
HYDROLOGIC SOIL GROUP DEFINITIONS

Soil Group	Soil Group Definition
A	Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.
B	Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.
C	Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.
D	Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high-water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

The northern property is underlain by three units identified as Cieneba rocky coarse sandy loam (CmE2), Olivehain cobbly loam (OhC), and Placentia sandy loam (PfC). Table C-2A presents the information from the USDA NRCS website for the subject property.

TABLE C-2A
USDA WEB SOIL SURVEY – HYDROLOGIC SOIL GROUP (NORTH PROPERTY)

Map Unit Name	Map Unit Symbol	Approximate Percentage of Property	Hydrologic Soil Group	k_{SAT} of Most Limiting Layer (inches/hour)
Cieneba rocky coarse sandy loam	CmE2	1	D	1.98 – 5.95
Olivehain cobbly loam	OhC	20	D	0.0 – 0.06
Placentia sandy loam	PfC	79	D	0.0 – 0.06

The southern property is underlain by Placentia sandy loam (PfC) and Visalia sandy loam (VaA). Table C-2B presents the information from the USDA NRCS website for the subject property.

TABLE C-2B
USDA WEB SOIL SURVEY – HYDROLOGIC SOIL GROUP (SOUTH PROPERTY)

Map Unit Name	Map Unit Symbol	Approximate Percentage of Property	Hydrologic Soil Group	k_{SAT} of Most Limiting Layer (inches/hour)
Placentia sandy loam	PfC	73	D	0.0 – 0.06
Visalia sandy loam	VaA	27	A	1.98 – 5.95

In-Situ Testing

The infiltration rate, percolation rates and saturated hydraulic conductivity are different and have different meanings. Percolation rates tend to overestimate infiltration rates and saturated hydraulic conductivities by a factor of 10 or more. Table C-3 describes the differences in the definitions.

TABLE C-3
SOIL PERMEABILITY DEFINITIONS

Term	Definition
Infiltration Rate	The observation of the flow of water through a material into the ground downward into a given soil structure under long term conditions. This is a function of layering of soil, density, pore space, discontinuities and initial moisture content.
Percolation Rate	The observation of the flow of water through a material into the ground downward and laterally into a given soil structure under long term conditions. This is a function of layering of soil, density, pore space, discontinuities and initial moisture content.
Saturated Hydraulic Conductivity (k_{SAT}, Permeability)	The volume of water that will move in a porous medium under a hydraulic gradient through a unit area. This is a function of density, structure, stratification, fines content and discontinuities. It is also a function of the properties of the liquid as well as of the porous medium.

The degree of soil compaction or in-situ density has a significant impact on soil permeability and infiltration. Based on our experience and other studies we performed, an increase in compaction results in a decrease in soil permeability.

We performed one constant head, borehole Infiltration Test, I-1, at location shown on the attached Geologic Map, Figure 2. The test boring was 4 inches in diameter. The results of the tests provide parameters for the saturated hydraulic conductivity characteristics of on-site soil and geologic units. Table C-4 presents the results of the estimated field saturated hydraulic conductivity and estimated infiltration rates obtained from the borehole percolation test. The test results are also attached herein. We applied a feasibility factor of safety of 2 to the field results for use in preparation of Worksheet C.4-1. The results of the testing indicate adjusted soil infiltration rates of 0.0 inches per hour after applying a Factor of Safety of 2.

TABLE C-4
FIELD PERMEAMETER INFILTRATION TEST RESULTS

Test No.	Geologic Unit	Test Depth (feet)	Field-Saturated Hydraulic Conductivity, k_{sat} (inch/hour)	Worksheet[1] Saturated Hydraulic Conductivity, k_{sat} (inch/hour)
I-1	Qt	2.7	0.071	0.036

[1] Using a factor of safety of 2 for Worksheet C.4-1.

STORM WATER MANAGEMENT CONCLUSIONS

The Geologic Map, Figure 2, depicts the existing property, proposed development, the approximate lateral limits of the geologic units, the locations of the field excavations and the in-situ infiltration test locations.

Soil Types

Proposed Compacted Fill – Compacted fill will be placed across the entire property during site development. Proposed remedial grading will consist of removing the surficial soils and replacement as compacted fill. The proposed storm water BMP's will be founded in compacted fill placed above Friars Formation or granitic rock. The compacted fill will be comprised of on-site sandy clay and clayey gravel. The fill will be compacted to a dry density of at least 90 percent of the laboratory maximum dry density. In our experience, compacted fill does not possess infiltration rates appropriate for infiltration BMP's. Hazards that occur as a result of fill soil saturation include a potential for hydro-consolidation of the granular fill soils, heaving of expansive soils, long term fill settlement, differential fill settlement, and lateral movement associated with saturated fill relaxation. The potential for lateral water migration to adversely impact existing or proposed structures, foundations, utilities, and roadways, is high. Therefore, full infiltration should be considered infeasible.

Section D.4.2 of the *2016 Storm Water Standards* (SWS) provides a discussion regarding fill materials used for infiltration. The SWS states:

- *For engineered fills, infiltration rates may still be quite uncertain due to layering and heterogeneities introduced as part of construction that cannot be precisely controlled.* Due to these uncertainties, full and partial infiltration should be considered geotechnically infeasible and liners and subdrains should be used in areas where infiltration BMP's are founded in compacted fill.

- *Where possible, infiltration BMPs on fill material should be designed such that their infiltrating surface extends into native soils*. Full and partial infiltration should be considered geotechnically infeasible within the compacted fill and liners and subdrains should be used. If the infiltration BMP's extended below the compacted fill, partial infiltration may be feasible.

- *Because of the uncertainty of fill parameters as well as potential compaction of the native soils, an infiltration BMP may not be feasible.* Therefore, full infiltration should be considered geotechnically infeasible. Partial infiltration may be feasible if the infiltration BMP extends below the compacted fill.

Infiltration Rates

The results of the infiltration test (including the feasibility factor of safety of 2) obtained within the Terrace Deposits was 0.036 inches per hour (iph). Based on the results of the infiltration testing, the test does not meet the minimum threshold for full or partial infiltration; therefore, full and partial infiltration is considered infeasible.

Groundwater Elevations

Groundwater was encountered during the field investigation and is expected to be a constraint.

Soil or Groundwater Contamination

Based on our review of the Geotracker website, no soil contamination exists or is known to exist on-site.

New or Existing Utilities

Existing utilities are present within right of ways adjacent to the existing streets, generally beneath public sidewalks and roadways. Full infiltration near existing or proposed utilities should be avoided to prevent lateral water migration into the permeable trench backfill materials. Any infiltration BMP's should be setback at least 10 feet from closest utility.

Existing and Planned Structures

Proposed storm water BMP's are shown throughout the development. Any proposed storm water BMP's adjacent to existing or proposed structures should include a horizontal setback of at least 10 feet.

Slopes

The northern property moderately to steeply slopes to the south. Proposed cut and fill slopes of approximately 30 feet and 4 feet high, respectively, are proposed. Proposed storm water BMP's adjacent to existing or proposed cut and fill slopes should include a horizontal setback of H and 1.5H, respectively. For example, considering a 30 foot high cut slope and 4 foot high fill slope, a horizontal setback of 30 feet and 6 feet, respectively, should be used.

Recommendations

Due to the low infiltration rate obtained in the Terrace Deposits, and considering the entire site will be underlain with compacted fill over dense granitic rock or hard Friars Formation, full and partial infiltration of storm water is considered geotechnically infeasible and the proposed development exhibits a "*No Infiltration*" condition. Liners and subdrains should be incorporated into the design and construction of the planned storm water devices. The liners should be impermeable (e.g. High-density polyethylene, HDPE, with a thickness of about 30 mil or equivalent Polyvinyl Chloride, PVC) to prevent water migration. The subdrains should be perforated within the liner area, installed at the base and above the liner, be at least 4 inches in diameter and consist of Schedule 40 PVC pipe. The subdrains outside of the liner should consist of solid pipe. Seams and penetrations of the liners should be properly waterproofed. The subdrains should be connected to a proper outlet. The devices should also be installed in accordance with the manufacturer's recommendations.

Storm Water Standard Worksheets

The SWS requests the geotechnical engineer complete the *Categorization of Infiltration Feasibility Condition* (Worksheet C.4-1 or I-8) worksheet information to help evaluate the potential for infiltration on the property. The attached Worksheet C.4-1 presents the completed information for the submittal process.

The regional storm water standards also have a worksheet (Worksheet D.5-1 or Form I-9) that helps the project civil engineer estimate the factor of safety based on several factors. Table C-5 describes the suitability assessment input parameters related to the geotechnical engineering aspects for the factor of safety determination.

TABLE C-5
SUITABILITY ASSESSMENT RELATED CONSIDERATIONS
FOR INFILTRATION FACILITY SAFETY FACTORS

Consideration	High Concern – 3 Points	Medium Concern – 2 Points	Low Concern – 1 Point
Assessment Methods	Use of soil survey maps or simple texture analysis to estimate short-term infiltration rates. Use of well permeameter or borehole methods without accompanying continuous boring log. Relatively sparse testing with direct infiltration methods	Use of well permeameter or borehole methods with accompanying continuous boring log. Direct measurement of infiltration area with localized infiltration measurement methods (e.g., Infiltrometer). Moderate spatial resolution	Direct measurement with localized (i.e. small-scale) infiltration testing methods at relatively high resolution or use of extensive test pit infiltration measurement methods.
Predominant Soil Texture	Silty and clayey soils with significant fines	Loamy soils	Granular to slightly loamy soils
Site Soil Variability	Highly variable soils indicated from site assessment or unknown variability	Soil boring/test pits indicate moderately homogenous soils	Soil boring/test pits indicate relatively homogenous soils
Depth to Groundwater/ Impervious Layer	<5 feet below facility bottom	5-15 feet below facility bottom	>15 feet below facility bottom

Based on our geotechnical investigation and the information in Table C-5, Table C-6 presents the estimated factor values for the evaluation of the factor of safety. This table only provides the suitability assessment safety factor (Part A) of the worksheet. The project civil engineer should evaluate the safety factor for design (Part B) and use the combined safety factor for the design infiltration rate.

TABLE D-6
FACTOR OF SAFETY WORKSHEET DESIGN VALUES – PART A[1]

Suitability Assessment Factor Category	Assigned Weight (w)	Factor Value (v)	Product (p = w x v)
Assessment Methods	0.25	3	0.75
Predominant Soil Texture	0.25	3	0.75
Site Soil Variability	0.25	1	0.25
Depth to Groundwater/ Impervious Layer	0.25	2	0.50
Suitability Assessment Safety Factor, $S_A = \sum p$			2.25

[1] The project civil engineer should complete Worksheet D.5-1 or Form I-9 using the data on this table. Additional information is required to evaluate the design factor of safety.

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for San Diego County Area, California

Oak Knoll North, Poway

June 8, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 16, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 22, 2018—Aug 31, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CmE2	Cieneba rocky coarse sandy loam, 9 to 30 percent slopes, eroded	0.1	1.2%
OhC	Olivenhain cobbly loam, 2 to 9 percent slopes	1.5	19.8%
PfC	Placentia sandy loam, thick surface, 2 to 9 percent slo pes	5.8	79.0%
Totals for Area of Interest		**7.4**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate

pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

CmE2—Cieneba rocky coarse sandy loam, 9 to 30 percent slopes, eroded

Map Unit Setting

National map unit symbol: hb9t
Elevation: 500 to 4,000 feet
Mean annual precipitation: 8 to 35 inches
Mean annual air temperature: 45 to 64 degrees F
Frost-free period: 110 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Cieneba and similar soils: 60 percent
Rock outcrop: 30 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cieneba

Setting

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Residuum weathered from granite and granodiorite

Typical profile

H1 - 0 to 8 inches: coarse sandy loam
H2 - 8 to 12 inches: weathered bedrock

Properties and qualities

Slope: 9 to 30 percent
Depth to restrictive feature: 4 to 20 inches to paralithic bedrock
Drainage class: Somewhat excessively drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 0.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: D
Ecological site: R019XD060CA - SHALLOW LOAMY (1975)
Hydric soil rating: No

Description of Rock Outcrop

Setting

Landform: Hills

Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex

Typical profile
H1 - 0 to 4 inches: unweathered bedrock

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydrologic Soil Group: D
Hydric soil rating: No

Minor Components

Vista
Percent of map unit: 5 percent
Hydric soil rating: No

Las posas
Percent of map unit: 5 percent
Hydric soil rating: No

OhC—Olivenhain cobbly loam, 2 to 9 percent slopes

Map Unit Setting
National map unit symbol: hbfb
Elevation: 100 to 600 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 290 to 330 days
Farmland classification: Not prime farmland

Map Unit Composition
Olivenhain and similar soils: 85 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Olivenhain

Setting
Landform: Marine terraces
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Gravelly alluvium derived from mixed sources

Typical profile
H1 - 0 to 10 inches: cobbly loam
H2 - 10 to 42 inches: very cobbly clay
H3 - 42 to 60 inches: cobbly clay loam

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 1.3 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

Minor Components

Diablo

Percent of map unit: 4 percent
Hydric soil rating: No

Linne

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, ponded

Percent of map unit: 2 percent
Landform: Depressions
Hydric soil rating: Yes

Huerhuero

Percent of map unit: 2 percent
Hydric soil rating: No

PfC—Placentia sandy loam, thick surface, 2 to 9 percent slo pes

Map Unit Setting

National map unit symbol: hbfn
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)

PfC	Placentia sandy loam, thick surface, 2 to 9 percent slo pes	0.4	73.4%
VaA	Visalia sandy loam, 0 to 2 percent slopes	0.2	26.6%
Totals for Area of Interest		**0.6**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the

development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

PfC—Placentia sandy loam, thick surface, 2 to 9 percent slo pes

Map Unit Setting

National map unit symbol: hbfn
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

Minor Components

Ramona

Percent of map unit: 5 percent

Hydric soil rating: No

Bonsall

Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, ponded

Percent of map unit: 1 percent
Landform: Depressions
Hydric soil rating: Yes

VaA—Visalia sandy loam, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hbh2
Elevation: 600 to 1,200 feet
Mean annual precipitation: 15 inches
Mean annual air temperature: 57 degrees F
Frost-free period: 200 to 350 days
Farmland classification: Prime farmland if irrigated and either protected from flooding or not frequently flooded during the growing season

Map Unit Composition

Visalia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Visalia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Riser, flat
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 12 inches: sandy loam
H2 - 12 to 40 inches: fine sandy loam
H3 - 40 to 60 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare

Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): 1
Land capability classification (nonirrigated): 2c
Hydrologic Soil Group: A
Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: No

Minor Components

Grangeville

Percent of map unit: 5 percent
Hydric soil rating: No

Greenfield

Percent of map unit: 5 percent
Hydric soil rating: No

Placentia

Percent of map unit: 2 percent
Hydric soil rating: No

Tujunga

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed

Percent of map unit: 1 percent
Landform: Flood plains
Hydric soil rating: Yes

APPENDIX D

APPENDIX D

RECOMMENDED GRADING SPECIFICATIONS

FOR

OAK KNOLL
POWAY, CALIFORNIA

PROJECT NO. G2746-32-02

RECOMMENDED GRADING SPECIFICATIONS

1. GENERAL

1.1 These Recommended Grading Specifications shall be used in conjunction with the Geotechnical Report for the project prepared by Geocon. The recommendations contained in the text of the Geotechnical Report are a part of the earthwork and grading specifications and shall supersede the provisions contained hereinafter in the case of conflict.

1.2 Prior to the commencement of grading, a geotechnical consultant (Consultant) shall be employed for the purpose of observing earthwork procedures and testing the fills for substantial conformance with the recommendations of the Geotechnical Report and these specifications. The Consultant should provide adequate testing and observation services so that they may assess whether, in their opinion, the work was performed in substantial conformance with these specifications. It shall be the responsibility of the Contractor to assist the Consultant and keep them apprised of work schedules and changes so that personnel may be scheduled accordingly.

1.3 It shall be the sole responsibility of the Contractor to provide adequate equipment and methods to accomplish the work in accordance with applicable grading codes or agency ordinances, these specifications and the approved grading plans. If, in the opinion of the Consultant, unsatisfactory conditions such as questionable soil materials, poor moisture condition, inadequate compaction, and/or adverse weather result in a quality of work not in conformance with these specifications, the Consultant will be empowered to reject the work and recommend to the Owner that grading be stopped until the unacceptable conditions are corrected.

2. DEFINITIONS

2.1 **Owner** shall refer to the owner of the property or the entity on whose behalf the grading work is being performed and who has contracted with the Contractor to have grading performed.

2.2 **Contractor** shall refer to the Contractor performing the site grading work.

2.3 **Civil Engineer** or **Engineer of Work** shall refer to the California licensed Civil Engineer or consulting firm responsible for preparation of the grading plans, surveying and verifying as-graded topography.

2.4 **Consultant** shall refer to the soil engineering and engineering geology consulting firm retained to provide geotechnical services for the project.

2.5 **Soil Engineer** shall refer to a California licensed Civil Engineer retained by the Owner, who is experienced in the practice of geotechnical engineering. The Soil Engineer shall be responsible for having qualified representatives on-site to observe and test the Contractor's work for conformance with these specifications.

2.6 **Engineering Geologist** shall refer to a California licensed Engineering Geologist retained by the Owner to provide geologic observations and recommendations during the site grading.

2.7 **Geotechnical Report** shall refer to a soil report (including all addenda) which may include a geologic reconnaissance or geologic investigation that was prepared specifically for the development of the project for which these Recommended Grading Specifications are intended to apply.

3. MATERIALS

3.1 Materials for compacted fill shall consist of any soil excavated from the cut areas or imported to the site that, in the opinion of the Consultant, is suitable for use in construction of fills. In general, fill materials can be classified as *soil* fills, *soil-rock* fills or *rock* fills, as defined below.

3.1.1 **Soil fills** are defined as fills containing no rocks or hard lumps greater than 12 inches in maximum dimension and containing at least 40 percent by weight of material smaller than ¾ inch in size.

3.1.2 **Soil-rock fills** are defined as fills containing no rocks or hard lumps larger than 4 feet in maximum dimension and containing a sufficient matrix of soil fill to allow for proper compaction of soil fill around the rock fragments or hard lumps as specified in Paragraph 6.2. **Oversize rock** is defined as material greater than 12 inches.

3.1.3 **Rock fills** are defined as fills containing no rocks or hard lumps larger than 3 feet in maximum dimension and containing little or no fines. Fines are defined as material smaller than ¾ inch in maximum dimension. The quantity of fines shall be less than approximately 20 percent of the rock fill quantity.

3.2 Material of a perishable, spongy, or otherwise unsuitable nature as determined by the Consultant shall not be used in fills.

3.3 Materials used for fill, either imported or on-site, shall not contain hazardous materials as defined by the California Code of Regulations, Title 22, Division 4, Chapter 30, Articles 9

and 10; 40CFR; and any other applicable local, state or federal laws. The Consultant shall not be responsible for the identification or analysis of the potential presence of hazardous materials. However, if observations, odors or soil discoloration cause Consultant to suspect the presence of hazardous materials, the Consultant may request from the Owner the termination of grading operations within the affected area. Prior to resuming grading operations, the Owner shall provide a written report to the Consultant indicating that the suspected materials are not hazardous as defined by applicable laws and regulations.

3.4 The outer 15 feet of *soil-rock* fill slopes, measured horizontally, should be composed of properly compacted *soil* fill materials approved by the Consultant. *Rock* fill may extend to the slope face, provided that the slope is not steeper than 2:1 (horizontal:vertical) and a soil layer no thicker than 12 inches is track-walked onto the face for landscaping purposes. This procedure may be utilized provided it is acceptable to the governing agency, Owner and Consultant.

3.5 Samples of soil materials to be used for fill should be tested in the laboratory by the Consultant to determine the maximum density, optimum moisture content, and, where appropriate, shear strength, expansion, and gradation characteristics of the soil.

3.6 During grading, soil or groundwater conditions other than those identified in the Geotechnical Report may be encountered by the Contractor. The Consultant shall be notified immediately to evaluate the significance of the unanticipated condition.

4. CLEARING AND PREPARING AREAS TO BE FILLED

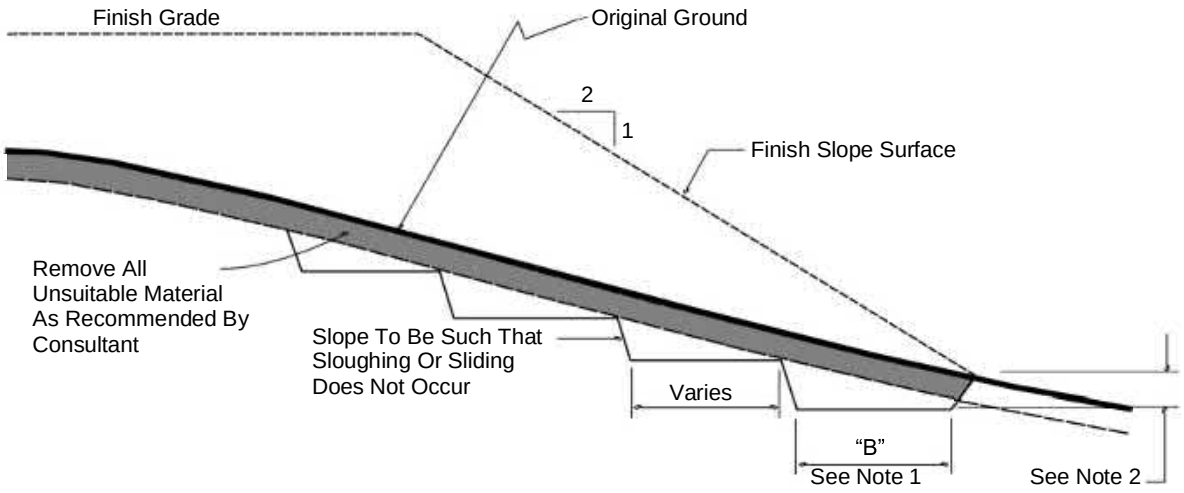
4.1 Areas to be excavated and filled shall be cleared and grubbed. Clearing shall consist of complete removal above the ground surface of trees, stumps, brush, vegetation, man-made structures, and similar debris. Grubbing shall consist of removal of stumps, roots, buried logs and other unsuitable material and shall be performed in areas to be graded. Roots and other projections exceeding 1½ inches in diameter shall be removed to a depth of 3 feet below the surface of the ground. Borrow areas shall be grubbed to the extent necessary to provide suitable fill materials.

4.2 Asphalt pavement material removed during clearing operations should be properly disposed at an approved off-site facility or in an acceptable area of the project evaluated by Geocon and the property owner. Concrete fragments that are free of reinforcing steel may be placed in fills, provided they are placed in accordance with Section 6.2 or 6.3 of this document.

4.3 After clearing and grubbing of organic matter and other unsuitable material, loose or porous soils shall be removed to the depth recommended in the Geotechnical Report. The depth of removal and compaction should be observed and approved by a representative of the Consultant. The exposed surface shall then be plowed or scarified to a minimum depth of 6 inches and until the surface is free from uneven features that would tend to prevent uniform compaction by the equipment to be used.

4.4 Where the slope ratio of the original ground is steeper than 5:1 (horizontal:vertical), or where recommended by the Consultant, the original ground should be benched in accordance with the following illustration.

TYPICAL BENCHING DETAIL



No Scale

DETAIL NOTES:

(1) Key width "B" should be a minimum of 10 feet, or sufficiently wide to permit complete coverage with the compaction equipment used. The base of the key should be graded horizontal, or inclined slightly into the natural slope.

(2) The outside of the key should be below the topsoil or unsuitable surficial material and at least 2 feet into dense formational material. Where hard rock is exposed in the bottom of the key, the depth and configuration of the key may be modified as approved by the Consultant.

4.5 After areas to receive fill have been cleared and scarified, the surface should be moisture conditioned to achieve the proper moisture content, and compacted as recommended in Section 6 of these specifications.

5. COMPACTION EQUIPMENT

5.1 Compaction of *soil* or *soil-rock* fill shall be accomplished by sheepsfoot or segmented-steel wheeled rollers, vibratory rollers, multiple-wheel pneumatic-tired rollers, or other types of acceptable compaction equipment. Equipment shall be of such a design that it will be capable of compacting the *soil* or *soil-rock* fill to the specified relative compaction at the specified moisture content.

5.2 Compaction of *rock* fills shall be performed in accordance with Section 6.3.

6. PLACING, SPREADING AND COMPACTION OF FILL MATERIAL

6.1 *Soil* fill, as defined in Paragraph 3.1.1, shall be placed by the Contractor in accordance with the following recommendations:

6.1.1 *Soil* fill shall be placed by the Contractor in layers that, when compacted, should generally not exceed 8 inches. Each layer shall be spread evenly and shall be thoroughly mixed during spreading to obtain uniformity of material and moisture in each layer. The entire fill shall be constructed as a unit in nearly level lifts. Rock materials greater than 12 inches in maximum dimension shall be placed in accordance with Section 6.2 or 6.3 of these specifications.

6.1.2 In general, the *soil* fill shall be compacted at a moisture content at or above the optimum moisture content as determined by ASTM D 1557.

6.1.3 When the moisture content of *soil* fill is below that specified by the Consultant, water shall be added by the Contractor until the moisture content is in the range specified.

6.1.4 When the moisture content of the *soil* fill is above the range specified by the Consultant or too wet to achieve proper compaction, the *soil* fill shall be aerated by the Contractor by blading/mixing, or other satisfactory methods until the moisture content is within the range specified.

6.1.5 After each layer has been placed, mixed, and spread evenly, it shall be thoroughly compacted by the Contractor to a relative compaction of at least 90 percent. Relative compaction is defined as the ratio (expressed in percent) of the in-place dry density of the compacted fill to the maximum laboratory dry density as determined in accordance with ASTM D 1557. Compaction shall be continuous over the entire area, and compaction equipment shall make sufficient passes so that the specified minimum relative compaction has been achieved throughout the entire fill.

6.1.6 Where practical, soils having an Expansion Index greater than 50 should be placed at least 3 feet below finish pad grade and should be compacted at a moisture content generally 2 to 4 percent greater than the optimum moisture content for the material.

6.1.7 Properly compacted *soil* fill shall extend to the design surface of fill slopes. To achieve proper compaction, it is recommended that fill slopes be over-built by at least 3 feet and then cut to the design grade. This procedure is considered preferable to track-walking of slopes, as described in the following paragraph.

6.1.8 As an alternative to over-building of slopes, slope faces may be back-rolled with a heavy-duty loaded sheepsfoot or vibratory roller at maximum 4-foot fill height intervals. Upon completion, slopes should then be track-walked with a D-8 dozer or similar equipment, such that a dozer track covers all slope surfaces at least twice.

6.2 *Soil-rock* fill, as defined in Paragraph 3.1.2, shall be placed by the Contractor in accordance with the following recommendations:

6.2.1 Rocks larger than 12 inches but less than 4 feet in maximum dimension may be incorporated into the compacted *soil* fill, but shall be limited to the area measured 15 feet minimum horizontally from the slope face and 5 feet below finish grade or 3 feet below the deepest utility, whichever is deeper.

6.2.2 Rocks or rock fragments up to 4 feet in maximum dimension may either be individually placed or placed in windrows. Under certain conditions, rocks or rock fragments up to 10 feet in maximum dimension may be placed using similar methods. The acceptability of placing rock materials greater than 4 feet in maximum dimension shall be evaluated during grading as specific cases arise and shall be approved by the Consultant prior to placement.

6.2.3 For individual placement, sufficient space shall be provided between rocks to allow for passage of compaction equipment.

6.2.4 For windrow placement, the rocks should be placed in trenches excavated in properly compacted *soil* fill. Trenches should be approximately 5 feet wide and 4 feet deep in maximum dimension. The voids around and beneath rocks should be filled with approved granular soil having a Sand Equivalent of 30 or greater and should be compacted by flooding. Windrows may also be placed utilizing an "open-face" method in lieu of the trench procedure, however, this method should first be approved by the Consultant.

6.2.5 Windrows should generally be parallel to each other and may be placed either parallel to or perpendicular to the face of the slope depending on the site geometry. The minimum horizontal spacing for windrows shall be 12 feet center-to-center with a 5-foot stagger or offset from lower courses to next overlying course. The minimum vertical spacing between windrow courses shall be 2 feet from the top of a lower windrow to the bottom of the next higher windrow.

6.2.6 Rock placement, fill placement and flooding of approved granular soil in the windrows should be continuously observed by the Consultant.

6.3 *Rock* fills, as defined in Section 3.1.3, shall be placed by the Contractor in accordance with the following recommendations:

6.3.1 The base of the *rock* fill shall be placed on a sloping surface (minimum slope of 2 percent). The surface shall slope toward suitable subdrainage outlet facilities. The *rock* fills shall be provided with subdrains during construction so that a hydrostatic pressure buildup does not develop. The subdrains shall be permanently connected to controlled drainage facilities to control post-construction infiltration of water.

6.3.2 *Rock* fills shall be placed in lifts not exceeding 3 feet. Placement shall be by rock trucks traversing previously placed lifts and dumping at the edge of the currently placed lift. Spreading of the *rock* fill shall be by dozer to facilitate *seating* of the rock. The *rock* fill shall be watered heavily during placement. Watering shall consist of water trucks traversing in front of the current rock lift face and spraying water continuously during rock placement. Compaction equipment with compactive energy comparable to or greater than that of a 20-ton steel vibratory roller or other compaction equipment providing suitable energy to achieve the required compaction or deflection as recommended in Paragraph 6.3.3 shall be utilized. The number of passes to be made should be determined as described in Paragraph 6.3.3. Once a *rock* fill lift has been covered with *soil* fill, no additional *rock* fill lifts will be permitted over the *soil* fill.

6.3.3 Plate bearing tests, in accordance with ASTM D 1196, may be performed in both the compacted *soil* fill and in the *rock* fill to aid in determining the required minimum number of passes of the compaction equipment. If performed, a minimum of three plate bearing tests should be performed in the properly compacted *soil* fill (minimum relative compaction of 90 percent). Plate bearing tests shall then be performed on areas of *rock* fill having two passes, four passes and six passes of the compaction equipment, respectively. The number of passes required for the *rock* fill shall be determined by comparing the results of the plate bearing tests for the *soil* fill and the *rock* fill and by evaluating the deflection

variation with number of passes. The required number of passes of the compaction equipment will be performed as necessary until the plate bearing deflections are equal to or less than that determined for the properly compacted *soil* fill. In no case will the required number of passes be less than two.

6.3.4 A representative of the Consultant should be present during *rock* fill operations to observe that the minimum number of "passes" have been obtained, that water is being properly applied and that specified procedures are being followed. The actual number of plate bearing tests will be determined by the Consultant during grading.

6.3.5 Test pits shall be excavated by the Contractor so that the Consultant can state that, in their opinion, sufficient water is present and that voids between large rocks are properly filled with smaller rock material. In-place density testing will not be required in the *rock* fills.

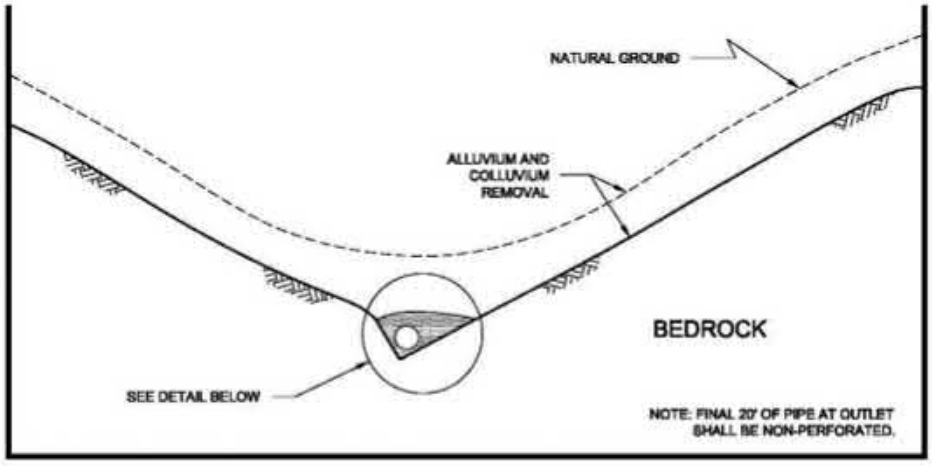
6.3.6 To reduce the potential for "piping" of fines into the *rock* fill from overlying *soil* fill material, a 2-foot layer of graded filter material shall be placed above the uppermost lift of *rock* fill. The need to place graded filter material below the *rock* should be determined by the Consultant prior to commencing grading. The gradation of the graded filter material will be determined at the time the *rock* fill is being excavated. Materials typical of the *rock* fill should be submitted to the Consultant in a timely manner, to allow design of the graded filter prior to the commencement of *rock* fill placement.

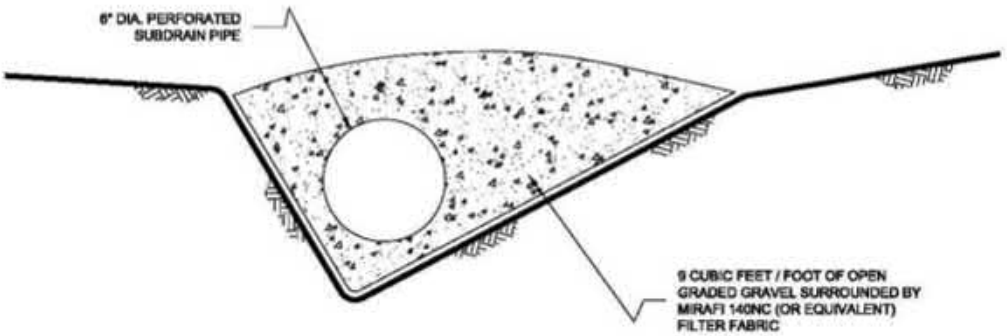
6.3.7 *Rock* fill placement should be continuously observed during placement by the Consultant.

7. SUBDRAINS

7.1 The geologic units on the site may have permeability characteristics and/or fracture systems that could be susceptible under certain conditions to seepage. The use of canyon subdrains may be necessary to mitigate the potential for adverse impacts associated with seepage conditions. Canyon subdrains with lengths in excess of 500 feet or extensions of existing offsite subdrains should use 8-inch-diameter pipes. Canyon subdrains less than 500 feet in length should use 6-inch-diameter pipes.

TYPICAL CANYON DRAIN DETAIL





NOTES:

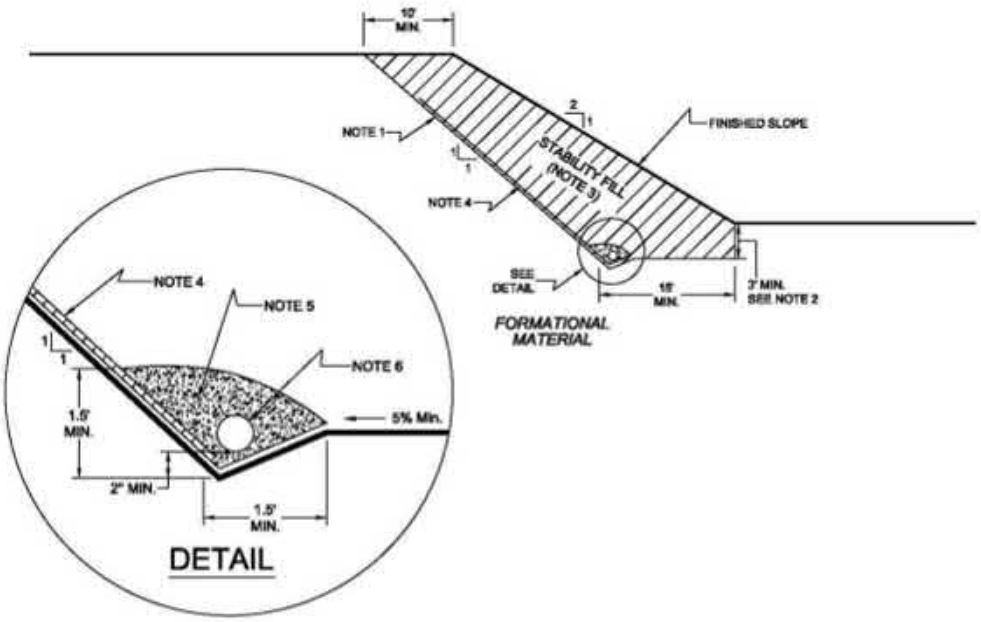
1.....8-INCH DIAMETER, SCHEDULE 80 PVC PERFORATED PIPE FOR FILLS IN EXCESS OF 100-FEET IN DEPTH OR A PIPE LENGTH OF LONGER THAN 500 FEET.

2.....6-INCH DIAMETER, SCHEDULE 40 PVC PERFORATED PIPE FOR FILLS LESS THAN 100-FEET IN DEPTH OR A PIPE LENGTH SHORTER THAN 500 FEET.

NO SCALE

7.2 Slope drains within stability fill keyways should use 4-inch-diameter (or lager) pipes.

TYPICAL STABILITY FILL DETAIL



NOTES:

1.....EXCAVATE BACKCUT AT 1:1 INCLINATION (UNLESS OTHERWISE NOTED).

2.....BASE OF STABILITY FILL TO BE 3 FEET INTO FORMATIONAL MATERIAL, SLOPING A MINIMUM 5% INTO SLOPE.

3.....STABILITY FILL TO BE COMPOSED OF PROPERLY COMPACTED GRANULAR SOIL.

4.....CHIMNEY DRAINS TO BE APPROVED PREFABRICATED CHIMNEY DRAIN PANELS (MIRADRAIN G200N OR EQUIVALENT) SPACED APPROXIMATELY 20 FEET CENTER TO CENTER AND 4 FEET WIDE. CLOSER SPACING MAY BE REQUIRED IF SEEPAGE IS ENCOUNTERED.

5.....FILTER MATERIAL TO BE 3/4-INCH, OPEN-GRADED CRUSHED ROCK ENCLOSED IN APPROVED FILTER FABRIC (MIRAFI 140NC).

6.....COLLECTOR PIPE TO BE 4-INCH MINIMUM DIAMETER, PERFORATED, THICK-WALLED PVC SCHEDULE 40 OR EQUIVALENT, AND SLOPED TO DRAIN AT 1 PERCENT MINIMUM TO APPROVED OUTLET.

NO SCALE

7.3 The actual subdrain locations will be evaluated in the field during the remedial grading operations. Additional drains may be necessary depending on the conditions observed and the requirements of the local regulatory agencies. Appropriate subdrain outlets should be evaluated prior to finalizing 40-scale grading plans.

7.4 *Rock* fill or *soil-rock* fill areas may require subdrains along their down-slope perimeters to mitigate the potential for buildup of water from construction or landscape irrigation. The subdrains should be at least 6-inch-diameter pipes encapsulated in gravel and filter fabric. *Rock* fill drains should be constructed using the same requirements as canyon subdrains.

7.5 Prior to outletting, the final 20-foot segment of a subdrain that will not be extended during future development should consist of non-perforated drainpipe. At the non-perforated/ perforated interface, a seepage cutoff wall should be constructed on the downslope side of the pipe.

SIDE VIEW

NOTE: HEADWALL SHOULD OUTLET AT TOE OF FILL SLOPE OR INTO CONTROLLED SURFACE DRAINAGE

NO SCALE

7.7 The final grading plans should show the location of the proposed subdrains. After completion of remedial excavations and subdrain installation, the project civil engineer should survey the drain locations and prepare an "as-built" map showing the drain locations. The final outlet and connection locations should be determined during grading operations. Subdrains that will be extended on adjacent projects after grading can be placed on formational material and a vertical riser should be placed at the end of the subdrain. The grading contractor should consider videoing the subdrains shortly after burial to check proper installation and functionality. The contractor is responsible for the performance of the drains.

8. OBSERVATION AND TESTING

8.1 The Consultant shall be the Owner's representative to observe and perform tests during clearing, grubbing, filling, and compaction operations. In general, no more than 2 feet in vertical elevation of *soil* or *soil-rock* fill should be placed without at least one field density test being performed within that interval. In addition, a minimum of one field density test should be performed for every 2,000 cubic yards of *soil* or *soil-rock* fill placed and compacted.

8.2 The Consultant should perform a sufficient distribution of field density tests of the compacted *soil* or *soil-rock* fill to provide a basis for expressing an opinion whether the fill material is compacted as specified. Density tests shall be performed in the compacted materials below any disturbed surface. When these tests indicate that the density of any layer of fill or portion thereof is below that specified, the particular layer or areas represented by the test shall be reworked until the specified density has been achieved.

8.3 During placement of *rock* fill, the Consultant should observe that the minimum number of passes have been obtained per the criteria discussed in Section 6.3.3. The Consultant should request the excavation of observation pits and may perform plate bearing tests on the placed *rock* fills. The observation pits will be excavated to provide a basis for expressing an opinion as to whether the *rock* fill is properly seated and sufficient moisture has been applied to the material. When observations indicate that a layer of *rock* fill or any portion thereof is below that specified, the affected layer or area shall be reworked until the *rock* fill has been adequately seated and sufficient moisture applied.

8.4 A settlement monitoring program designed by the Consultant may be conducted in areas of *rock* fill placement. The specific design of the monitoring program shall be as recommended in the Conclusions and Recommendations section of the project Geotechnical Report or in the final report of testing and observation services performed during grading.

8.5 We should observe the placement of subdrains, to check that the drainage devices have been placed and constructed in substantial conformance with project specifications.

8.6 Testing procedures shall conform to the following Standards as appropriate:

8.6.1 Soil and Soil-Rock Fills:

8.6.1.1 Field Density Test, ASTM D 1556, *Density of Soil In-Place By the Sand-Cone Method.*

8.6.1.2 Field Density Test, Nuclear Method, ASTM D 6938, *Density of Soil and Soil-Aggregate In-Place by Nuclear Methods (Shallow Depth).*

8.6.1.3 Laboratory Compaction Test, ASTM D 1557, *Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-Pound Hammer and 18-Inch Drop.*

8.6.1.4. Expansion Index Test, ASTM D 4829, *Expansion Index Test*.

9. PROTECTION OF WORK

9.1 During construction, the Contractor shall properly grade all excavated surfaces to provide positive drainage and prevent ponding of water. Drainage of surface water shall be controlled to avoid damage to adjoining properties or to finished work on the site. The Contractor shall take remedial measures to prevent erosion of freshly graded areas until such time as permanent drainage and erosion control features have been installed. Areas subjected to erosion or sedimentation shall be properly prepared in accordance with the Specifications prior to placing additional fill or structures.

9.2 After completion of grading as observed and tested by the Consultant, no further excavation or filling shall be conducted except in conjunction with the services of the Consultant.

10. CERTIFICATIONS AND FINAL REPORTS

10.1 Upon completion of the work, Contractor shall furnish Owner a certification by the Civil Engineer stating that the lots and/or building pads are graded to within 0.1 foot vertically of elevations shown on the grading plan and that all tops and toes of slopes are within 0.5 foot horizontally of the positions shown on the grading plans. After installation of a section of subdrain, the project Civil Engineer should survey its location and prepare an *as-built* plan of the subdrain location. The project Civil Engineer should verify the proper outlet for the subdrains and the Contractor should ensure that the drain system is free of obstructions.

10.2 The Owner is responsible for furnishing a final as-graded soil and geologic report satisfactory to the appropriate governing or accepting agencies. The as-graded report should be prepared and signed by a California licensed Civil Engineer experienced in geotechnical engineering and by a California Certified Engineering Geologist, indicating that the geotechnical aspects of the grading were performed in substantial conformance with the Specifications or approved changes to the Specifications.

1 Introduction and Background

This assessment was conducted to address potential noise impacts from the proposed The Harmon Ranch Project (proposed project), a residential subdivision with a variety of open spaces to be located in the City of Poway (City). The assessment includes examination of noise generation from project construction and project related traffic, and also evaluates future potential noise exposure levels at sample locations of proposed future residences. Construction activity vibration is also evaluated as part of this assessment.

Project Description

The Harmon Ranch project entails the development of 63-single family dwelling units on a currently vacant site in the City of Poway that is currently designated Residential Single Family 7 (RS-7). The Proposed Project is located north of Oak Knoll Road, south of Poway Road, and in between Pomerado Road and Carriage Road. Proposed amenities will include approximately 2.2 acres of natural open space, approximately 1 acre of open space recreational and a trail approximately 1,000 feet in length connecting to the existing commercial center north of the site for residents to utilize.

Noise Characteristics

Sound is mechanical energy transmitted by pressure waves in a compressible medium, such as air. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired. The sound pressure level (SPL) has become the most common descriptor used to characterize the loudness of an ambient sound level. The unit of measurement of sound pressure is a decibel (dB). Under controlled conditions in an acoustics laboratory, the trained, healthy human ear is able to discern changes in sound levels of 1 dB when exposed to steady, single-frequency signals in the mid-frequency range. Outside such controlled conditions, the trained ear can detect changes of 2 dB in normal environmental noise. It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3 dB. A change of 5 dB is readily perceptible, and a change of 10 dB is perceived as twice or half as loud (Caltrans 2013a). A doubling of sound energy results in a 3-dB increase in sound, which means that a doubling of sound energy (e.g., doubling the number of daily trips along a given road) would result in a barely perceptible change in sound level.

Sound may be described in terms of level or amplitude (measured in decibels), frequency or pitch (measured in hertz, or cycles per second), and duration (measured in seconds or minutes). Because the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale is used to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against low and very high frequencies in a manner approximating the sensitivity of the human ear.

Several descriptors of noise (noise metrics) exist to help predict average community reactions to the adverse effects of environmental noise, including traffic-generated noise. These descriptors include the equivalent noise level over a given period (L_{eq}), the statistical sound level (L_n), the day–night average noise level (L_{dn}), and the Community Noise Equivalent Level (CNEL). Each of these descriptors uses units of dBA.

L_{eq} is a sound level energy-averaged over a specified time period, represented by a single constant value equivalent to the variable sound energy received at a location. For example, a 1-hour L_{eq} measurement would represent the average amount of energy contained in all the noise that occurred in that hour. L_{eq} is an effective noise descriptor because it allows convenient comparison of time-varying sound levels at different locations. L_{max} is the greatest sound level measured during a designated time interval or event.

Unlike the L_{eq} metrics, L_{dn} and CNEL metrics always represent 24-hour periods. L_{dn} and CNEL also differ from L_{eq} because they apply a time-weighted factor designed to emphasize noise events that occur during the evening and nighttime hours (when speech and sleep disturbance is of more concern). “Time weighted” refers to the fact that

L_{dn} and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m. to 7:00 p.m.) receives no penalty. Noise during the evening hours (7:00 p.m. to 10:00 p.m.) is penalized by adding 5 dB to the measured or predicted L_{eq} values, and nighttime (10:00 p.m. to 7:00 a.m.) noise is penalized by adding 10 dB. L_{dn} differs from CNEL in that the daytime period is defined as 7:00 a.m. to 10:00 p.m., thus eliminating the evening period. L_{dn} and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5–1 dB, and are thus often considered comparable or even equivalent and interchangeable by many jurisdictions.

Vibration is the oscillatory movement of solid mass. Like sound, it is described in terms of frequency and amplitude, which can be expressed as displacement, velocity, or acceleration. For purposes of this analysis and consistent with environmental assessment, vibration is presented and discussed herein as units of velocity (inches per second [ips]) and their decibel equivalents as appropriate. Vibration impacts to buildings are generally discussed in terms of peak particle velocity (PPV), while human annoyance or disturbance is often discussed with root-mean-square (RMS) vibration velocity levels that are converted to decibels (VdB). But for purposes of this analysis, PPV will be used to describe all vibration for ease of reading and comparison. Vibration can impact people, structures, and sensitive equipment or processes (Caltrans 2020). Common sources of vibration within communities include construction activities and railroad operations. Groundborne vibration generated by construction projects exhibits highest amplitudes during pile driving, rock blasting, soil compacting, jack hammering, and demolition-related activities that involve sudden impacts or other transient impulses of energy delivered to soil and rock strata. Vibration can also be more regularly occurring or even continuous in nature, such as the steady operation of mechanical equipment featuring reciprocating or rotating components that are slightly imbalanced. The maximum vibration level standard used by the California Department of Transportation (Caltrans) for the prevention of structural damage to typical residential buildings is 0.3 ips PPV (Caltrans 2020).

2 Regulatory Setting

Federal

Federal Transit Administration

In its Transit Noise and Vibration Impact Assessment guidance manual, the Federal Transit Administration (FTA) recommends a daytime construction noise level threshold of 80 dBA L_{eq} over an 8-hour period (FTA 2018) when "detailed" construction noise assessments are performed to evaluate potential impacts to community residences surrounding a project. Although this FTA guidance is not a regulation, it can serve as a quantified standard in the absence of such limits at the State and local jurisdictional levels.

State

California Code of Regulations, Title 24

Title 24 of the California Code of Regulations sets standards which new development in California must meet. According to Title 24, interior noise levels are not to exceed 45 dB CNEL for new multifamily residences, hotels, and other attached residences.

Title 24 also requires that an interior acoustical study demonstrating that interior noise levels due to exterior sources will be less than or equal to 45 CNEL be performed for affected multifamily structures and hotels that are exposed to exterior noise levels in excess of 60 CNEL.

California Department of Health Services Guidelines

The State Department of Health Services has developed guidelines of community noise acceptability for use by local agencies (OPR 2003). Selected relevant levels are listed here:

- Below 60 dBA CNEL: normally acceptable for low-density residential use
- 50 to 70 dBA: conditionally acceptable for low-density residential use
- Below 65 dBA CNEL: normally acceptable for high-density residential use and transient lodging
- 60 to 70 dBA CNEL: conditionally acceptable for high-density residential, transient lodging, churches, educational, and medical facilities.

The normally acceptable exterior noise level for transient lodging use is up to 65 dBA CNEL. Conditional acceptable exterior noise levels range up to 70 dBA CNEL for transient lodging.

California Department of Transportation

In its Transportation and Construction Vibration Guidance Manual, Caltrans recommends a vibration velocity threshold of 0.2 ips PPV (Caltrans 2020) for assessing "annoying" vibration impacts to occupants of residential structures. Although this Caltrans guidance is not a regulation, it can serve as a quantified standard in the absence of such limits at the local jurisdictional level. Similarly, thresholds to assess building damage risk due to construction vibration vary with the type of structure and its fragility but tend to range between 0.3 ips and 0.4 ips PPV for typical residential structures (Caltrans 2020).

Local

City of Poway Noise Municipal Code

Section 8.08.040 and 8.08.100 of the Poway Municipal Code establishes sound level limits within the City and describes regulations on construction equipment, respectively. These sections are reproduced or summarized below.

8.08.040 Sound Level Limits

Unless a variance has been applied for and granted pursuant to this chapter, it is unlawful for any person to cause or allow the creation of any noise to the extent that the one-hour average sound level, at any point on or beyond the boundaries of the property on which the sound is produced, exceeds the applicable limits set forth below, except that construction noise level limits shall be governed by PMC 8.08.100. In addition, the Noise Element addresses nuisance noise and states that it should be unlawful for any person to make or continue any loud, unnecessary noise that causes annoyance to any reasonable person of normal sensitivity.

Zone or Land Use Designation	Allowable Time	Applicable Limit One-Hour Average Sound Level (In decibels)
OS-RM, OS, OS/1du, RR-A, RR-B, RR-C, RS-2, RS-3, RS-4, RS-7, and Specific Plan, PRD and PC regulations with a density of 11 dwelling units or less per acre	10:00 p.m. to 7:00 a.m.	40
	7:00 a.m. to 10:00 p.m.	50
PF, RA, RC, MHP, and Specific Plan, PRD and PC regulations with a density of 11 or more dwelling units per acre	7:00 a.m. to 7:00 p.m.	55
	7:00 p.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	45
SPC, MU, CO, CN, CB, CG, TC, A/GC and HC	7:00 a.m. to 7:00 p.m.	60
	7:00 p.m. to 10:00 p.m.	55
	10:00 p.m. to 7:00 a.m.	50
MRE, SC, LI, LI/S and IP	Anytime	70

The sound level limit at a location on a boundary between two zoning districts is the arithmetic mean of the respective limits for the two districts

Fixed location public utility distribution or transmission facilities located on or adjacent to a property line shall be subject to the noise level limits of this section, measured at or beyond six feet from the boundary of the easement upon which the equipment is located.

8.08.100 Construction Equipment

Except for emergency work, it is unlawful for any person, including the City, to operate any single or combination of powered construction equipment at any construction site, except as outlined in subsections A and B of this section:

A. It is unlawful for any person, including the City, to operate any single or combination of powered construction equipment at any construction site before 7:00 a.m. or after 5:00 p.m. on Mondays through Saturdays or at any time on a Sunday or holiday except as provided below. For purposes of this section, "construction" does not include minor home repairs, lawn mowing, gardening and similar types of routine maintenance as identified in PMC 8.08.170(D).

1. The City Engineer may permit, in writing, the use of powered construction equipment during specific hours before 7:00 a.m. or after 5:00 p.m. Monday through Saturday, or any time on a Sunday or holiday, if he or she determines that such operations are not detrimental to the health, safety, or welfare of the surrounding community, that the conduct of the activity is limited by the nature of the work, and that it is in the best interest of the public to perform the work outside of normal hours and days of work.
2. A residential property owner constructing a single-family residence, or constructing an addition to, or otherwise modifying, a single-family residence for personal occupancy may operate powered construction equipment on Sundays or holidays between the hours of 10:00 a.m. and 5:00 p.m. in compliance with the requirements of subsection B of this section; provided, that:
    a. The type of equipment used is limited to handheld construction equipment or equipment powered by small electrical motors, including, but not limited to, small cement mixers, table saws, and similar small equipment; and
    b. The construction is not carried out for profit or livelihood. Upon request of the City, a property owner shall provide documentation, to the satisfaction of the Director of Development Services, of personal occupancy of the residence, or the intent to personally occupy the residence.

B. No such equipment, or combination of equipment regardless of age or date of acquisition, shall be operated so as to cause noise at a level in excess of 75 decibels for more than eight hours during any 24- hour period when measured at or within the property lines of any property which is developed and used either in part or in whole for residential purposes. These sound levels shall be corrected for time duration in accordance with the following table:

Total Duration in 24 Hours	Decibel Level Allowance	Total Decibel Level
Up to 15 Minutes	+15	90
Up to 30 Minutes	+12	87
Up to 1 Hour	+9	84
Up to 2 Hours	+6	81
Up to 4 Hours	+3	78
Up to 8 Hours	0	75

In the event that lower noise limit standards are established for construction equipment pursuant to State or Federal law, said lower limits shall be used as a basis for revising and amending the noise level limits specified in subsection B of this section.

Poway General Plan

The General Plan EIR Section 5.10 establishes the following mitigation measure related to noise. Development within the City of Poway, including the Specific Plan planning area, is subject to these measures: "6. The City of Poway shall ensure a safe and pleasant acoustical environment for the residents of Poway through site planning, zoning regulations, architectural design standards, and building construction regulations."

3 Existing Conditions

Noise measurements were conducted on and near the project site on May 4, 2022, to quantify and help characterize the existing pre-project outdoor sound environment. Table 1 provides the locations, date, and times these noise measurements were performed. The noise measurements were taken using a Rion NL-52 sound level meter equipped with a 0.5-inch, pre-polarized condenser microphone with pre-amplifier. The sound level meter meets the current American National Standards Institute standard for a Type 1 (Precision Grade) sound level meter. The accuracy of the sound level meter was verified using a field calibrator before and after the measurements, and the measurements were conducted with the microphone positioned approximately 5 feet above the ground.

The four short-term (ST) noise measurement locations were selected to represent existing noise-sensitive receivers on and near the project site. These locations are depicted as receivers ST1–ST4 on Figure 3, Noise Measurement and Modeling Locations. The measured energy-averaged (L_{eq}) and maximum (L_{max}) noise levels at these field survey locations are provided in Table 1.

Table 1. Measured Community Outdoor Noise Levels

Receptor	Location/Address	Date (mm/dd/yy)	Time (hh:mm)	L_{eq} (dBA)	L_{max} (dBA)
ST1	North of 12643 Oak Knoll Rd, Poway, CA 92064	05/04/22	09:10–09:20 a.m.	58.5	76.2
ST2	South of 12710 La Vista Way, Poway, CA 92064	05/04/22	09:30–09:40 a.m.	51.1	70.6
ST3	Eastern property line of Countryside Apartments	05/04/22	09:50–10:00 a.m.	56.9	65.7
ST4	Southern Property line of Poway Towne Center Shopping Mall, approximately 200 feet south of Poway Road	05/04/22	10:10–10:20 a.m.	53.8	66.3

Source: Appendix A.
Notes: L_{eq} = equivalent continuous sound level (time-averaged sound level); L_{max} = maximum sound level during the measurement interval; dBA = A-weighted decibels; ST = short-term noise measurement locations.

The primary noise sources at the sites identified during the noise measurements presented in Table 1 consisted of traffic along adjacent roadways and unrelated construction activity. The sounds of rustling leaves, aircraft overflights, distant conversation, and birdsong were also documented but to a lesser degree. As shown in Table 1, the measured sound levels ranged from approximately 51.1 dBA L_{eq} at ST2 to 58.5 dBA L_{eq} at ST1. More details of the collected noise measurement data can be found in Appendix A, Noise Measurement Field Data.

4 Thresholds of Significance

The following significance criteria are based on Appendix G of the California Environmental Quality Act Guidelines (14 CCR 15000 et seq.) and will be used to determine the significance of potential noise impacts. Impacts to noise would be significant if the proposed project would result in:

a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

b. Generation of excessive groundborne vibration or groundborne noise levels.

c. Expose people residing or working in the project area to excessive noise levels (for a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public airport or public use airport).

5 Impact Discussion

a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Short-Term Construction

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations performed, and the distance between the source and receptor.

Equipment that would be in use during the proposed project construction would include, in part, graders, backhoes, rubber-tired dozers, loaders, cranes, forklifts, cement mixers, pavers, rollers, and air compressors. The typical maximum noise levels for various pieces of construction equipment at a distance of 50 feet are presented in Table 2. The listed maximum noise levels in Table 2 are, when downwardly adjusted by 6 dB to account for doubling the assessment distance to 100 feet, all compliant with the City's 85 dBA at 100 feet criterion per General Plan Noise Element.

It is anticipated that construction activities associated with the proposed project would take place primarily within the allowable hours of the City of Poway (7:00 a.m. and 5:00 p.m. Monday through Saturday). In the event that construction is required to extend beyond these times, extended hours permits would be required and would be obtained by the applicant.

Note that the equipment noise levels presented in Table 2 are maximum noise levels. Usually, construction equipment operates in alternating cycles of full power and low or no power, producing average noise levels over time that are less than the maximum noise level. This is accounted for through the use of an "acoustical usage factor", expressing the percentage of time a piece of equipment is typically operational. The sound level produced by the construction activity also depends on where the equipment actually operates onsite and the intensity of construction activities.

Note: L_{max} = maximum sound level; dBA = A-weighted decibels.

Aggregate noise emission from proposed project construction activities, broken down by sequential phase, was predicted at two distances to the nearest existing noise-sensitive receptor: 1) from the nearest position of the construction site boundary and 2) from the geographic center of the construction site, which serves as the time-averaged location or geographic *acoustical centroid* of active construction equipment for the phase under study. The intent of the former distance is to help evaluate anticipated construction noise from a limited quantity of equipment or vehicle activity expected to be at the boundary for some period of time, which would be most appropriate for phases such as site preparation, grading, and paving. At the site boundary distance, the analysis assumes that up to only one piece of equipment, for each listed type per phase, will be involved in the construction activity for a limited portion of the 8-hour period. In other words, at such proximity along the boundary of the site, the operating equipment cannot "stack" or crowd the vicinity and still be able to operate.

The distance to the acoustical centroid is used in a manner similar to the general assessment technique as described in the FTA guidance for construction noise assessment (FTA 2018), where the location of individual equipment for a given construction phase is uncertain and where construction equipment is anticipated to operate over some extent of the construction site, near and far. For the acoustical centroid case, which intends to be a geographic average position for all equipment during the indicated phase, this analysis assumes that the equipment may be operating up to all 8 hours per day. Table 3 summarizes these distances to the apparent closest noise-sensitive receptor for each of the seven sequential construction phases.

Table 3. Estimated Distances between Construction Activities and the Nearest Noise-sensitive Receptors

Construction Phase (and Equipment Types Involved)	Distance from Nearest Noise-Sensitive Receptor to Construction Site Boundary (Feet)	Distance from Nearest Noise-Sensitive Receptor to Acoustical Centroid of Site (Feet)
Demolition (concrete saw, excavator, dozer)	25	160
Site Preparation (dozer, backhoe)	25	160
Grading (excavator, grader, dozer, backhoe)	25	160
Building construction (crane, man-lift, generator, backhoe, welder)	25	160
Paving (paver, roller, concrete mixer truck)	25	160
Architectural Coating (compressor)	25	160

A Microsoft Excel–based noise prediction model, emulating and using reference data from the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at the nearest occupied noise-sensitive land use. (Although the RCNM was funded and promulgated by the FHWA, it is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are often used for other types of construction.) Input variables for the predictive modeling consist of the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment, and the distance from the noise-sensitive receiver. The RCNM has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical construction activity patterns. Those default duty-cycle values were used for this noise analysis, which are detailed in Appendix B, Construction Noise Modeling Input and Output. Conservatively, no topographical or structural shielding was assumed in the construction noise modeling. The predicted results from the construction noise modeling for the proposed project are displayed in Table 4.

Table 4. Predicted Construction Noise Levels per Activity Phase

Construction Phase (and Equipment Types Involved)	8-Hour Leq at Nearest Noise-Sensitive Receptor to Construction Site Boundary (dBA)	8-Hour Leq at Nearest Noise-Sensitive Receptor to Acoustical Centroid of Site (dBA)
Demolition (concrete saw, excavator, dozer)	84.9	73.1
Site Preparation (dozer, backhoe)	79.4	70.8
Grading (excavator, grader, dozer, backhoe)	84.2	71.5
Building construction (crane, man-lift, generator, backhoe, welder)	78.2	66.7
Paving (paver, roller, concrete mixer truck)	83.6	70.8
Architectural Coating (compressor)	78.7	59.1

Notes: L_{eq} = equivalent noise level; dBA = A-weighted decibels.

As presented in Table 4, the estimated construction noise levels are predicted to be as high as 85 dBA equivalent continuous sound level (L_{eq}) over an 8-hour period at the nearest existing residences (as close as 25 feet away) when demolition activities take place near the project boundary. Construction equipment noise levels for other activity phases are modeled to range from approximately 78 to 84 dBA L_{eq8h} at the nearest existing noise-sensitive receptor when construction operations take place near the project boundary. Note that these estimated noise levels

at a source-to-receiver distance of 25 feet with the assumption that the heavy equipment associated with each phase is operating along the project boundary for a cumulative period of 2 hours a day with equipment performing work at more distant location or simply not operating the remaining time during the day. As such, this would result in an exceedance of the City of Poway construction noise limit of 75 dBA L_{eq8h}.

In order to avoid potentially significant construction noise impacts upon existing residences in the project vicinity, mitigation measure **MM-NOI-1** shall be implemented as indicated site conditions may warrant. Proper application of temporary noise barriers, or comparable sound abatement, that may arise as a result of **MM-NOI-1** implementation has the ability to realize a reduction in noise levels of 10 dB or more, that would correspondingly reduce the predicted 85 dBA eight-hour L_{eq} for the construction phases to a level of 75 dBA L_{eq8h} or less, and thus compliant with the 75 dBA threshold. With implementation of **MM-NOI-1**, impacts would be reduced to being **less than significant**.

Long-Term Operational

Off-Site Traffic Noise Exposure

Less-Than-Significant Impact. The proposed project would result in the creation of additional vehicle trips on local arterial roadways, which could result in increased traffic noise levels at adjacent noise-sensitive land uses. Appendix C, Traffic Noise Modeling Input and Output, contains a spreadsheet with traffic volume data (average daily traffic). In particular, the proposed project would create additional traffic along Oak Knoll Road, which according to the Traffic Impact Assessment prepared for the proposed project (Intersecting Metrics, 2022) would add 640 total average daily trips adjacent to the project site.

According to Caltrans, a 3 dB change in sound is the beginning at which humans generally notice a barely perceptible change in sound, a 5 dB change is generally readily perceptible, and a 10 dB increase is perceived by most people as a doubling of the existing noise level (Caltrans 2013a). Due to the existing and proposed urban setting of the project area, a readily perceptible change in traffic noise levels (5 dBA change) would be the appropriate threshold to determine significant increases in traffic noise.

Potential noise effects from vehicular traffic were assessed using the Federal Highway Administration's Traffic Noise Model version 2.5 (FHWA 2004). Information used in the model included the roadway geometry, existing (year 2022), existing plus project, near-term (opening day) and near-term (opening day) plus project traffic volumes and posted vehicular speed limits. Traffic noise levels were modeled at representative noise-sensitive receivers ST1 through ST4, as shown in Figure 3. The receivers were modeled to be 5 feet above the local ground elevation. The noise model results are summarized in Table 5. Based on results of the model, implementation of the proposed project would not result in readily perceptible increases in traffic noise.

Table 5. Traffic Noise Modeling Results

Modeled Receiver No.	Modeled Traffic Noise Levels (dBA CNEL)				Maximum Project-Related Noise Level Increase (dB)
	Existing (2022)	Existing (2022) with Project	Near-Term (Opening Day) without Project	Near-Term (Opening Day) with Project	
ST1	58.7	59.4	59.3	59.7	0.7
ST2	46.3	46.6	47.0	46.0	0.3
ST3	50.6	50.7	51.2	51.2	0.1
ST4	58.8	58.8	59.4	59.4	0

Source: Appendix C.
Notes: dBA = A-weighted decibel; CNEL = community noise equivalent level; dB = decibel.

Table 5 shows that at all four listed representative receivers, the addition of proposed project's traffic to the roadway network would result in an increase of less than 3 dB CNEL, which is below the perceptible level of change for the average healthy human ear. Thus, long-term traffic noise increases associated with the proposed project, affecting existing residences in the vicinity would be a **less-than-significant** impact.

On-site Traffic Interior Noise Exposure

The City and the state require that interior noise levels not exceed a CNEL of 45 dB within residences. Typically, with the windows open, building shells provide approximately 15 dB of noise reduction; with windows closed, residential construction generally provides a minimum of 25 dB attenuation. Therefore, rooms exposed to an exterior CNEL not greater than 60 dB would result in an interior CNEL of 45 dB or less even with windows open. But when exterior CNEL values range from 60-70 dBA, the windows would need to be closed and thus require that the occupied structure feature mechanical ventilation for interior comfort.

The FHWA TNM model was further implemented to determine the future exterior noise levels at a representative sample of the proposed new homes on lots parallel with Oak Knoll Road. The receivers corresponding to the exterior building façade of the proposed new homes were calculated at modeled building positions B1, B3, B5, B23, B62, and B64, as shown below in Table 6 and on Figure 3.

Table 6. Future Traffic Noise Levels at Residential Facades

Building	Noise Level (CNEL)	
	1st Floor	2nd Floor
B1	56.1	56.4
B3	56.9	57.1
B5	56.2	56.5
B23	53.9	57.3
B62	58.8	58.9
B64	58.8	58.8

Traffic noise results displayed in Table 6 indicate that future traffic noise exposure levels at the closest building facades to Oak Knoll would all be under the maximum exterior noise level threshold for single-family residences (60 CNEL dBA) and would consequently be anticipated to result in an interior CNEL of 45 dB or less, even with the windows open (i.e., 59 dBA CNEL minus 15 dB = 44 dBA CNEL). Therefore, future roadway traffic noise levels at the interior of the proposed residences would be a **less-than-significant** impact.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Construction activities may expose persons to excessive groundborne vibration or groundborne noise, causing a potentially significant impact. Caltrans has collected groundborne vibration information related to construction activities (Caltrans 2020). Information from Caltrans indicates that continuous vibrations with a PPV of approximately 0.2 ips is considered "annoying." For context, heavier pieces of construction equipment, such as a bulldozer that may be expected on the project site, have peak particle velocities of approximately 0.089 ips or less at a reference distance of 25 feet (DOT 2006).

Groundborne vibration attenuates rapidly—even over short distances. And when groundborne vibration encounters a building foundation, a coupling loss occurs depending on the mass and design. For typical wood-framed houses, like those near the proposed project, this coupling loss is 5 vibration velocity decibels according to FTA guidance (FTA 2006). The attenuation of groundborne vibration as it propagates from source to receptor through intervening

soils and rock strata can be estimated with expressions found in FTA and Caltrans guidance. By way of example, for a bulldozer operating on site and as close as the western project boundary (that is 25 feet from the nearest receiving sensitive land use) the estimated vibration velocity level would be 0.089 ips and thus no greater than the annoyance threshold recommended by Caltrans. Therefore, vibration-induced annoyance to occupants of nearby existing homes would be **less-than-significant**.

Construction vibration, at sufficiently high levels, can also present a building damage risk. However, anticipated construction vibration from conventional heavy equipment associated with this proposed project would not yield levels that surpass this risk. Per Caltrans, the recommended PPV threshold for newer residential structures is 0.5 ips and 0.3 ips for older residential structures—both of which are less stringent that the aforementioned threshold to annoy occupants of such structures; thus vibration damage risk to nearby structures is considered **less-than-significant.**

Once operational, the proposed project is not anticipated to include major producers of groundborne vibration. On this basis, vibration due to proposed project operation should be **less than significant**.

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less-Than-Significant Impact. There are no private airstrips within the vicinity of the project site. The closest airport to the proposed project site is the Marine Corps Air Station Miramar, approximately 6.75 miles northeast of the site and would therefore not expose people residing or working in the project area to excessive noise levels. Impacts would be **less than significant**.

6 Mitigation Measures

The following mitigation measures would be implemented to reduce potentially significant impacts to less than significant.

MM-NOI-1 Prior to the issuance of a Construction Permit, the project applicant/owner or construction contractor shall prepare and submit to the City of Poway Planning Division for its review and approval a Construction Noise Management Plan (CNMP). Prior to the issuance of a Construction Permit, construction plans shall also include a note indicating compliance with the CNMP is required. The CNMP shall be prepared or reviewed by a qualified acoustician (retained at the project applicant/owner or construction contractor's expense) and feature the following:

1) A detailed construction schedule, at daily (or weekly, if activities during each day of the week are typical) resolution and correlating to areas or zones of on-site project construction activities and the anticipated equipment types and quantities involved. Information shall include expected hours of actual operation per day for each type of equipment per phase and indication of anticipated concurrent construction activities on site.

2) Suggested locations for noise level monitoring, attended by a qualified acoustician or another party under his/her supervision or direction, at which sample outdoor ambient noise levels will be measured and collected over a sufficient sample period and subsequently analyzed to ascertain compliance with the eight-hour City of Poway threshold of 75 dBA equivalent noise level. Sampling shall be performed, at a minimum, on the first (or otherwise considered typical construction operations) day of each distinct construction phase (e.g., each of the six listed phases in Table 3, Construction Phase Distance to Nearest Pre-Existing Noise-Sensitive Receptors).

3) If sample collected noise level data indicates that the eight-hour noise threshold has or will be exceeded, construction work shall be suspended (for the activity or phase of concern) and the project applicant/owner or construction contractor shall implement one or more of the following measures as detailed or specified in the CNMP:

    a) Administrative controls (e.g., reduce operating time of equipment and/or prohibit usage of equipment type[s] within certain distances of noise-sensitive receptors).

    b) Engineering controls (upgrade noise controls, such as install better engine exhaust mufflers, silencers, engine bay dampening, etc.).

    c) Install noise abatement on the project site boundary fencing (or within the project site, as practical and appropriate) in the form of sound blankets or comparable temporary barriers to occlude construction noise transmission between the project site (or specific equipment operation as the situation may define) and the noise-sensitive receptor(s) of concern.

The implemented measure(s) shall be reviewed or otherwise inspected and approved by the qualified acoustician (or another party under his/her supervision or direction) prior to resumption of the construction activity or process that caused the measured noise of concern or need for noise mitigation. Noise levels shall be re-measured, after installation of said measures, to ascertain post-mitigation compliance with the noise threshold. As needed, this process shall be repeated and refined until noise level compliance is demonstrated and

documented. A report of this implemented mitigation and its documented success shall be provided to the City of Poway Planning Division.

4) The project applicant/owner or construction contractor shall make available a telephone hotline so that concerned neighbors in the community may call to report noise complaints. The CNMP shall include a process to investigate these complaints and, if determined to be valid, detail efforts to provide a timely response and resolution to the complainant—with copy of resolution provided to the City of Poway Planning Division.

7 Summary of Findings

This noise report was conducted for the proposed project. The results indicate that potential impacts during construction would be **less than significant with mitigation**. Noise impacts due to long-term operation of the proposed project (including traffic noise) would be a **less than significant** impact. No further mitigation beyond what has been described herein for construction noise is anticipated at this time.

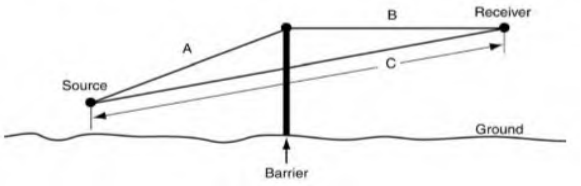
$Source_{elev}$	5.0	A_{horiz}	24.0	A	25.0
$Receiver_{elev}$	10.0	B_{horiz}	38.0	B	38.1
C	62.2	C_{horiz}	62.0		
P	0.85				
$Barrier_{elev}$	12				
Abarr	12.3				

The above calculations, refering to inputs from the figure at right, helps a user estimate what barrier attenuation (Abarr) to expect (i.e., up to 15 per formula to right) based upon source height (above grade), barrier height, and receiver height, and the horizontal distances between the source and receiver to the barrier. The FTA-based formula in the worksheets use these path length (P) and Abarr values to determine the barrier's insertion loss.

Barrier Parameter P
P= A+B-C



For all other barriers, and for protrusion of terrain above the line of sight:	$A_{barrier} = \min\left\{15 or\left[20\times\log\left(\frac{2.51\sqrt{P}}{\tanh\left[4.46\sqrt{P}\right]}\right)+5\right]\right\}$
Barrier Insertion Loss	$IL_{barrier} = \max\left\{0 or\left[A_{barrier} - 10(G_{NB} - G_B)\log\left(\frac{D}{50}\right)\right]\right\}$

D = closest distance between the receiver and the source, in feet
P = path length difference, in feet (see figure below)
G_{NB} = Ground factor G computed *without barrier* (see Figure 6-5)
G_B = Ground factor G computed *with barrier* (see Figure 6-5)

† The term "tanh(variable)" stands for hyperbolic tangent, available on many scientific calculators. If "tanh" is not available, then compute E = exp(variable), and set tanh(variable) = (E - 1/E) / (E + 1/E), where exp(variable) is the "exponential" function, also written as e^x on calculator keypads.

Executive Summary

The purpose of this Local Transportation Assessment (LTA) is to identify and document any substantial effects that the proposed Harmon Ranch project (Proposed Project) will have on the surrounding transportation network, and to recommend potential improvements, as necessary.

ES.1 Project Setting

The proposed project is approximately 11.5 acres and includes a total of 63 new single-family homes and associated site improvements and retention of the existing historic home (see Figure 1-1, Site Plan). The project proposes approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The proposed project would include 63 single-family detached homes plus the 1 existing historic home on site for a total of 64 lots within the Specific Plan boundary. The proposed density is 8.8 dwelling units/acre (64 total residential lots/7.26-acre net project area not including private streets), which is just over the existing RS-7 designation density. The proposed project is located in the southern portion of the City, along Oak Knoll Road, south of Poway Road and west of Carriage Road.

A total of 40 public parking spaces will be provided, including 24 parallel and 16 perpendicular spaces, in addition to the two car parking garages and driveways provided for each unit.

The Proposed Project is anticipated to generate a total of 630 daily trips, with 51 trips (15-in & 36-out) generated during the AM peak hour and 63 trips (44-in & 19-out) during the PM peak hour.

ES.2 Project Study Area

Based on the Proposed Project trip assignment and the City's *Transportation Master Element* Policies C.1 and C.2, the following facilities are included within the project study area:

Roadway Segments:

- Poway Road west of Oak Knoll Road
- Poway Road between Oak Knoll Road and Pomerado Road
- Pomerado Road north of Poway Road
- Pomerado Road between Poway Road and Oak Knoll Road
- Pomerado Road south of Oak Knoll Road
- Oak Knoll Road between Poway Road and Pomerado Road
- Carriage Road between Poway Road and Oak Knoll Road

Intersections:

1. Oak Knoll Road / Poway Road
2. Pomerado Road / Poway Road
3. Pomerado Road / Oak Knoll Road
4. Oak Knoll Road / Project Driveway (Analyzed under "Plus Project" conditions only)
5. Oak Knoll Road / Carriage Road

ES.3 Substantial Effects to the Transportation Network

This section summarizes the analysis results under each analysis scenario.

Existing Conditions

The following summarizes the analysis results and findings under Existing conditions.

Roadway Analysis

- All study roadway segments currently operate within their design thresholds.

Intersection Analysis

- All study area intersections currently operate at acceptable LOS D or better.

Near-Term Conditions

The following summarizes the analysis results and findings under Near-Term conditions.

Roadway Analysis

- All study roadway segments are projected to operate within their design thresholds under Near-Term Base conditions.
- All study roadway segments are projected to operate within their design thresholds under Near-Term Base with Project conditions.

Intersection Analysis

- All study area intersections are projected to operate at acceptable LOS D or better under Near-Term Base conditions.
- All study area intersections are projected to operate at acceptable LOS D or better under Near-Term with Project conditions.

The Proposed Project is not anticipated to have any substantial effect on the operations of the study area roadway or intersections under Near-Term with Project conditions. Therefore, no additional intersection improvements are needed.

1.0 Introduction

The purpose of this Local Transportation Assessment (LTA) is to identify and document any substantial effects that the proposed Harmon Ranch project (Proposed Project) will have on the surrounding transportation network, and to recommend potential improvements, as necessary.

1.1 Project Description

The proposed project is approximately 11.5 acres and includes a total of 63 new single-family homes and associated site improvements and retention of the existing historic home (see Figure 1-1, Site Plan). The project proposes approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The proposed project would include 63 single-family detached homes plus the 1 existing historic home on site for a total of 64 lots within the Specific Plan boundary. The proposed density is 8.8 dwelling units/acre (64 total residential lots/7.26-acre net project area not including private streets), which is just over the existing RS-7 designation density. The proposed project is located in the southern portion of the City, along Oak Knoll Road, south of Poway Road and west of Carriage Road.

A total of 40 public parking spaces will be provided, including 24 parallel and 16 perpendicular spaces, in addition to the two car parking garages and driveways provided for each unit. The project location is displayed in Figure 1.1.

1.2 Report Organization

Following this Introduction chapter, this report is organized into the following sections:

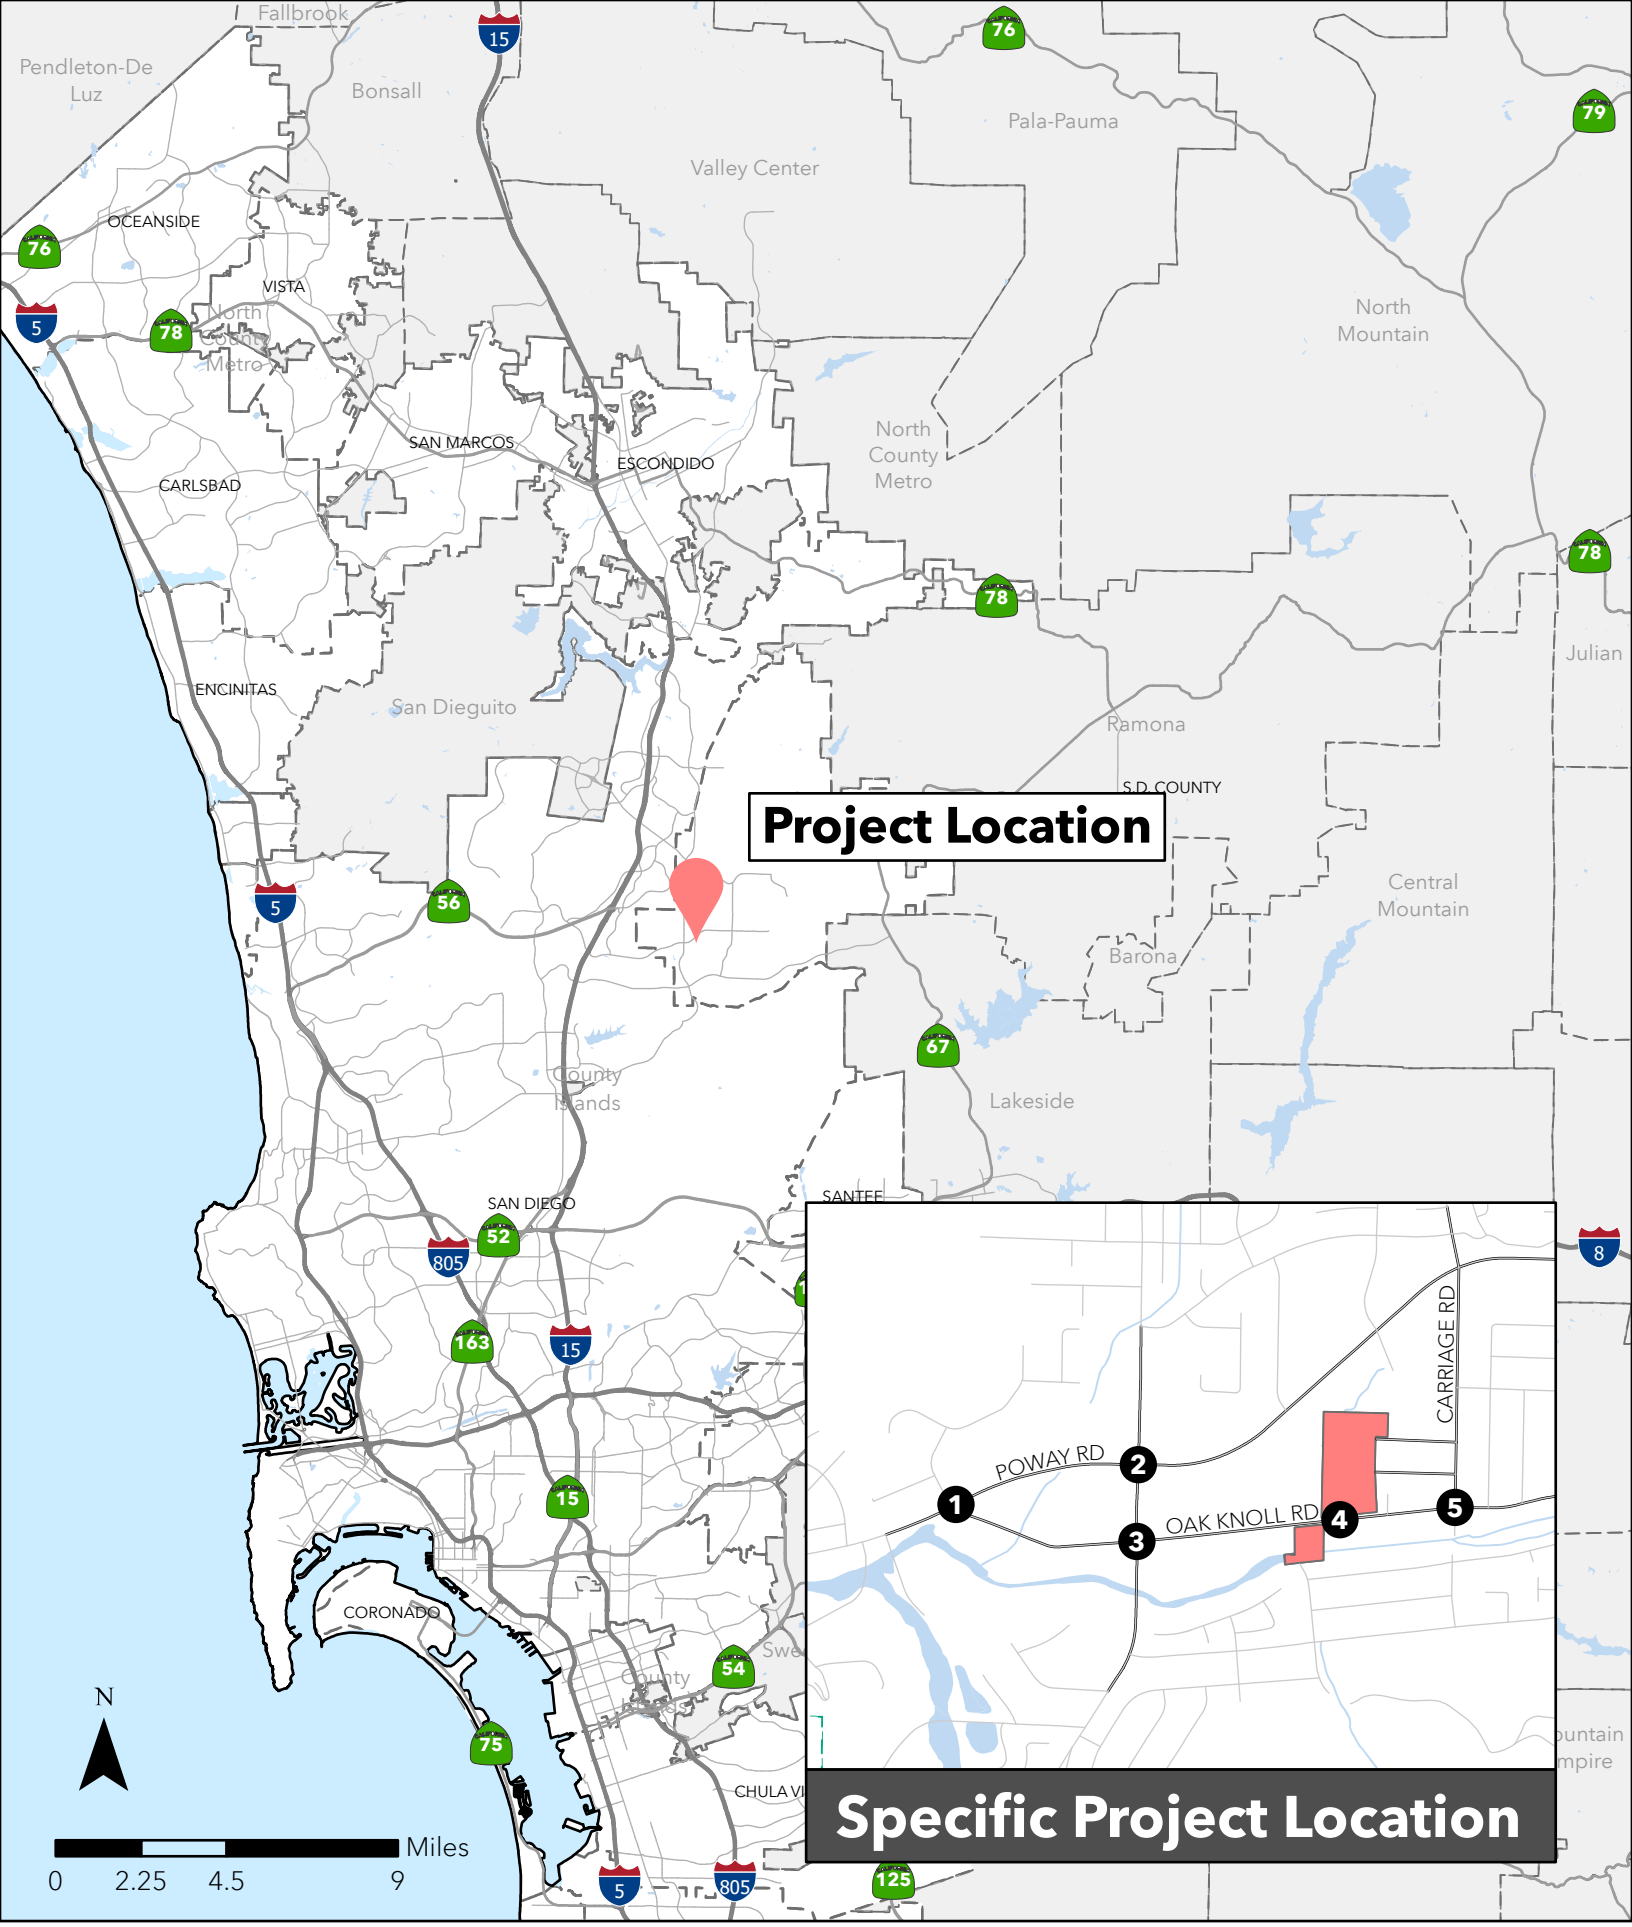
2.0 *Analysis Methodology* - This chapter describes the methodologies and standards utilized to analyze traffic operations and conditions.

3.0 *Proposed Project* - This chapter describes the Proposed Project including project trip generation, trip distribution, trip assignment, and the project study area.

4.0 *Existing Conditions* - This chapter describes the existing traffic network within the study area and provides analysis results for existing traffic conditions.

5.0 *Near-Term Conditions* – This chapter describes near-term developments that are anticipated to generate additional study area trips by the Proposed Project's opening year. Analysis results are provided for the No-Project (Near-Term Base) and Near-Term Plus Project conditions.

6.0 *Site Access* – This chapter addresses access and internal circulation within the project site.



Harmon Ranch

Figure 1.1
Project Location

2.0 Analysis Methodology

Detailed information on intersection analysis methodologies, standards, and thresholds are discussed in the following sections.

2.1 Level of Service Definition

Level of Service (LOS) is a quantitative measure describing operational conditions within a traffic stream, and the motorist's and/or passengers' perception of operations. A LOS definition generally describes these conditions in terms of such factors as delay, speed, travel time, freedom to maneuver, interruptions in traffic flow, queuing, comfort, and convenience. Table 2.1 describes generalized definitions of the various LOS categories (A through F) as applied to roadway operations.

Table 2.1 Level of Service Definitions

LOS Category	Definition of Operation
A	This LOS represents a completely free-flow condition, where the operation of vehicles is virtually unaffected by the presence of other vehicles and only constrained by the geometric features of the highway and by driver preferences.
B	This LOS represents a relatively free-flow condition, although the presence of other vehicles becomes noticeable. Average travel speeds are the same as in LOS A, but drivers have slightly less freedom to maneuver.
C	At this LOS the influence of traffic density on operations becomes marked. The ability to maneuver within the traffic stream is clearly affected by other vehicles.
D	At this LOS, the ability to maneuver is notably restricted due to traffic congestion, and only minor disruptions can be absorbed without extensive queues forming and the service deteriorating.
E	This LOS represents operations at or near capacity. LOS E is an unstable level, with vehicles operating with minimum spacing for maintaining uniform flow. At LOS E, disruptions cannot be dissipated readily thus causing deterioration down to LOS F.
F	At this LOS, forced or breakdown of traffic flow occurs, although operations appear to be at capacity, queues form behind these breakdowns. Operations within queues are highly unstable, with vehicles experiencing brief periods of movement followed by stoppages.

Source: Highway Capacity Manual 6th Edition

2.2 Peak Hour Intersection Level of Service Standards and Thresholds

Unlike other jurisdictions within the region, the City of Poway does not assign a daily LOS to roadway facilities. Instead, the City developed a series daily traffic volume design thresholds for each facility type (Primes, Majors, Collectors, etc.) and for unique individual facilities (Espola Road, Poway Road, Community Road, etc.), which are outlined in Table V-1 of the City of Poway Transportation Master Element, March 2010. To determine if average daily traffic volumes on the study area roadway segments are within the design threshold, the appropriate volumes were compared to the daily design capacity of the roadway segments.

2.3 Peak Hour Intersection Level of Service Standards and Thresholds

This section presents the methodologies used to perform peak hour intersection capacity analysis for signalized and unsignalized intersections. The following assumptions were utilized in conducting all intersection level of service analysis:

- *Peak Hour Factor*: Based on existing peak hour count for existing conditions.
- *Signal Timing*: Based on existing signal timing plans (as of April 2022), provided in Appendix A.

Unsignalized Intersection Analysis

Side-street stop-controlled intersections were analyzed using the Highway Capacity Manual 6th Edition (Section 19) Two-Way Stop-Controlled Intersection analysis methodology. The Synchro Version 11 software supports this methodology and was utilized to produce LOS results. The LOS for a two-way stop-controlled (SSSC) intersection is determined by the computed or measured control delay and is defined for each minor movement. Table 2.2 summarizes the LOS criteria for unsignalized intersections.

Table 2.2 LOS Criteria for Stop-Controlled Unsignalized Intersections

Average Stopped Delay Per Vehicle (sec/veh)	LOS
<10	A
>10 to <15	B
>15 to <25	C
>25 to <35	D
>35 to <50	E
>50	F

Source: Highway Capacity Manual 6th Edition

Signalized Intersection Analysis

The analysis of signalized intersections utilized the operational analysis procedure as outlined in the Highway Capacity Manual (HCM) 6th Edition signalized intersection analysis methodology. This method defines LOS in terms of delay, or more specifically, average stopped delay per vehicle. Delay is a measure of driver and/or passenger discomfort, frustration, fuel consumption and lost travel time. This technique uses 1,900 vehicles per hour per lane (VPHPL) as the maximum saturation volume of an intersection. This saturation volume is adjusted to account for lane width, on-street parking, pedestrians, traffic composition (i.e., percentage trucks) and shared lane movements (i.e., through and right-turn movements originating from the same lane). The LOS criteria used for the analysis of signalized intersections are described in Table 2.3, identifying the thresholds of control delays and the associated LOS. The computerized analysis of intersection operations was performed utilizing the Synchro Version 11 traffic analysis software by Trafficware Ltd.

Table 2.3 Signalized Intersection LOS Operational Analysis Method

Average Stopped Delay Per Vehicle (seconds)	Level of Service (LOS) Characteristics
<10	*LOS A* describes operations with very low delay. This occurs when progression is extremely favorable, and most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
>10– 20	*LOS B* describes operations with generally good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
>20 – 35	*LOS C* describes operations with higher delays, which may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
>35– 55	*LOS D* describes operations with high delay, resulting from some combination of unfavorable progression, long cycle lengths, or high volumes. The influence of congestion becomes more noticeable, and individual cycle failures are noticeable.
>55 – 80	*LOS E* is considered the limit of acceptable delay. Individual cycle failures are frequent occurrences.
>80	*LOS F* describes a condition of excessively high delay, considered unacceptable to most drivers. This condition often occurs when arrival flow rates exceed the LOS D capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes to such delay.

Source: Highway Capacity Manual 6th Edition

2.4 Determination of Substantial Effects

This section outlines the thresholds for determination of substantial project-related effects on study area facilities.

In general, a substantial effect would be identified when the addition of project traffic results in a level of service dropping from LOS D or better to substandard LOS E or F. Table 2.4 summarizes the thresholds for determining substantial effects for facilities operating at substandard level of service with and without the project. These thresholds, as applied to roadway segments, are based upon an acceptable increase in the Volume / Capacity (V/C) ratio.

Table 2.4 Measures of Substantial Project Transportation Effects

	Allowable Change				
	Freeways		Roadway Segments		Intersections
LOS with Project	V/C	Speed (mph)	V/C	Speed (mph)	Delay (sec.)
E & F	0.01	1	0.02	1	2

Source: Guidelines for Transportation Impact Studies in the San Diego Region, May 2019

2.5 Determination of Inconsistencies with Circulation Element

This section outlines City's *Transportation Master Element* policies that are relevant to the Proposed Project. In general, an inconsistency with the *Transportation Master Element* would be identified when the addition of project traffic results in level of service that deviates from the following:

- *Policy C.1:* Avoid approving any development that will increase the traffic on a City roadway above the design capacity threshold unless traffic/roadway design mitigation is available and/or will be implemented to achieve the desired capacity. If no feasible alternates are available, cumulative land use impacts on roadways should be assessed to ascertain the contribution of each new land use being considered.

- *Policy C.2*: Prohibit development which will result in Levels of Service (LOS) exceeding "D" during the two highest peak hours at any intersection unless no feasible alternatives exist and an overriding public need can be demonstrated.

Consistency with these *Transportation Master Element* policies were evaluated in this analysis since they focus on circulation element roadways. The Proposed Project is not proposing any features that are inconsistent with the City's *Transportation Master Element*. It should be noted that the Proposed Project land uses are consistent with those assumed in the City's *Housing Element Update*. Therefore, the roadway operation findings in this study are also consistent with those outlined in the City's *Transportation Master Element*. As a result, the Proposed Project will not change or create any inconsistencies within the City's *Transportation Master Element*.

3.0 Proposed Project

This section describes the Proposed Project including land uses, estimated trip generation, trip distribution, trip assignment and project study area.

3.1 Project Description

The Proposed Project plans to develop 63-single family dwelling units. Proposed amenities will include almost an acre of open space for residents to utilize and a trail connecting to the existing commercial center north of the site. A total of 40 parking spaces will be provided, including 24 parallel and 16 perpendicular spaces, in addition to the two-car parking garages and driveways provided for each unit. The Proposed Project site plan is displayed in Figure 3.1.

3.2 Proposed Project Trip Generation

Table 3.1 displays the Proposed Project's anticipated trip generation. Trip generation rates were derived from *SANDAG's (Not So) Brief Guide of Vehicular Traffic Generation Rates in the San Diego Region, April 2002*.

Table 3.1 Proposed Project Trip Generation

Land Use	Units	Trip Rate	ADT	AM					PM				
				%	Trips	Split	In	Out	%	Trips	Split	In	Out
Single Family	63 Units	10/Units	630	8%	51	(3:7)	15	36	10%	63	(7:3)	44	19

As shown, the Proposed Project is anticipated to generate a total of 630 daily trips, with 51 trips (15-in & 36-out) generated during the AM peak hour and 63 trips (44-in & 19-out) during the PM peak hour.

3.3 Project Trip Distribution & Assignment

The project trip distribution was developed based on the geographical location of the project, the characteristics of the proposed land use, nearest freeway facilities, as well as the location of schools, job centers, and shopping centers. The Proposed Project's trip distribution and trip assignment are displayed in Figure 3.2.

3.4 Project Study Area

Section 7.0 of the *Guidelines for Transportation Impact Studies in the San Diego Region, May 2019* recommends that all, intersection locations where the proposed project will add 50 or more peak-hour trips in either direction to the existing roadway traffic, be included in the study area. As shown in Figure 3.2, the Proposed Project's trip generation will not add more than 50 or more peak hour trips to an intersection; however, a focused LTA was conducted to analyze the following major roadway segments and intersections adjacent to the Proposed Project, as well as the project's driveway:

Roadway Segments:

- Poway Road west of Oak Knoll Road
- Poway Road between Oak Knoll Road and Pomerado Road
- Pomerado Road north of Poway Road
- Pomerado Road between Poway Road and Oak Knoll Road
- Pomerado Road south of Oak Knoll Road
- Oak Knoll Road between Poway Road and Pomerado Road
- Carriage Road between Poway Road and Oak Knoll Road

Intersections:

1. Oak Knoll Road / Poway Road
2. Pomerado Road / Poway Road
3. Pomerado Road / Oak Knoll Road
4. Oak Knoll Road / Project Driveway
5. Oak Knoll Road / Carriage Road

The Proposed Project Study Area is shown in Figure 3.3.

Local Transportation Network

4.0 Existing Conditions

This section describes key study intersections, existing peak hour intersection traffic volumes, and LOS analysis results under Existing conditions.

4.1 Existing Roadway Network

Access to the Proposed Project from the regional transportation network would be provided via Poway Road, Pomerado Road, and Oak Knoll Road. These roadways would either provide a direct connection to the Proposed Project site, via a project driveway on Oak Knoll Road, or would provide a critical link between the Proposed Project and the regional transportation network. Descriptions of these transportation network facilities are described below:

Poway Road is a four-lane east/west roadway that connects I-15 in the west to SR-67 in the east. The roadway has a posted speed limit of 35 miles per hour (mph) and is divided by a raised median. Within the study area, Poway Road provides direct access to commercial centers. Pedestrian sidewalks and bicycle lanes are present on both sides of the roadway. San Diego Metropolitan Transit System (MTS) bus routes 944, 945, and 945A currently provide services on Poway Road, with the closest stop to the project site located on Poway Road and the Countryside Apartments driveway. Poway Road is classified as a Major Arterial by the City's *Transportation Master Element, March 2010*.

Pomerado Road is a four-lane north/south roadway that connects Twin Peaks Road to Spring Canyon Road. Within the study area, this roadway provides a center-left-turn lane median and has a posted speed limit of 45 mph. Pomerado Road is primarily fronted by residential units and provides pedestrian sidewalks and bicycle lanes on both sides of the roadway. San Diego MTS bus routes 945 and 945A currently provide services on Pomerado Road, north of Poway Road. Pomerado Road is classified as a Major Arterial by the City's *Transportation Master Element, March 2010*.

Oak Knoll Road is two-lane roadway that connects Sage View Road to Selier Street. The Proposed Project will take access via side-street stop-controlled intersections on Oak Knoll Road. This roadway is an undivided roadway with a posted speed limit of 25 mph and parallel parking provided on both sides of the roadway. Oak Knoll Road is fronted by residential units and small businesses. Pedestrian sidewalks are provided on both sides of the roadway and sharrow signs are painted on the roadway indicating that Oak Knoll Road is a bicycle route. According to the City's *Transportation Master Element, March 2010*, Oak Knoll Road is a local collector between Poway Road and Pomerado Road and a local road east of Pomerado Road.

Carriage Road is a two-lane roadway that connects Poway Road to Oak Knoll Road. This roadway is an undivided roadway with a posted speed limit of 25 mph and parallel parking provided on both sides of the roadway. Pedestrian sidewalks are provided on both sides of the roadway and bicycle sharrow markings are painted on the roadway indicating that Carriage Road is a bicycle route. Carriage Road is classified as a local collector by the City's *Transportation Master Element, March 2010*.

Figure 4.1 displays the existing functional classifications of the study area roadways, and existing intersection geometrics of the study intersections.

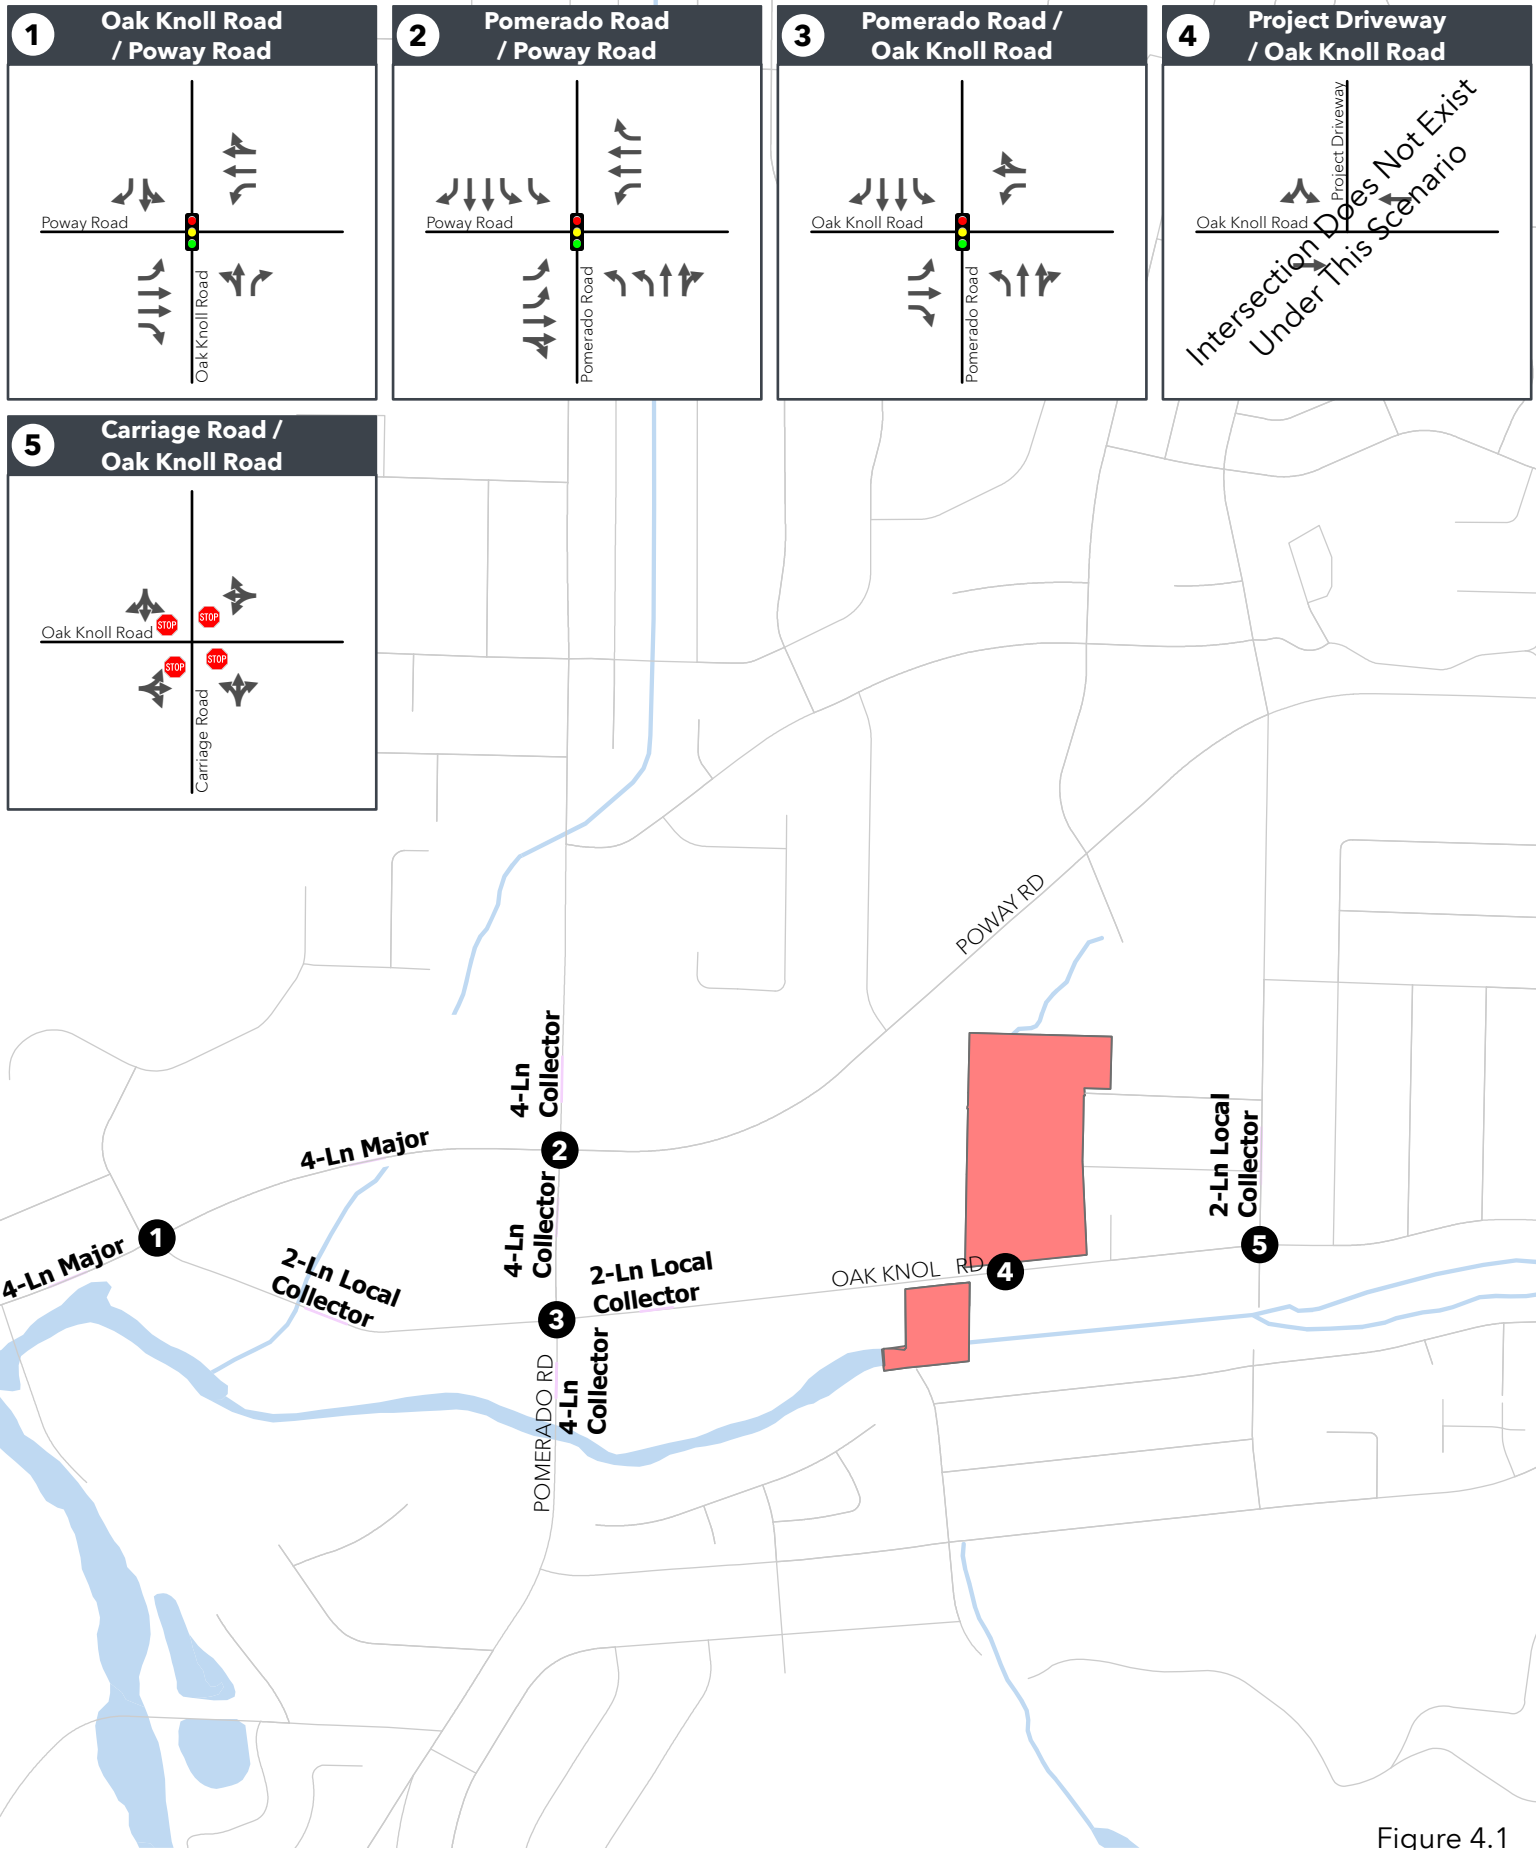

Figure 4.1

Intersection Lane Configurations
Existing Conditions

4.2 Existing Intersection and Roadway Volumes

Figure 4.2 displays the existing AM/PM peak hour turning movements for the study intersections. The roadway segment counts were obtained from recently completed transportation studies and study area intersection traffic counts were conducted in April 2022. Traffic count worksheets are provided in Appendix A.

4.3 Existing Level of Service Analysis

LOS analyses under Existing conditions were conducted using the methodologies described in Chapter 2.0. Roadway segment and intersection LOS analyses results are discussed below.

Roadway Segment Analysis

Table 4.1 displays each study roadway segment's design threshold, Average Daily Traffic (ADT) volume, and whether the roadway segment operates within its design threshold. As shown, all study roadways currently operate within their design threshold.

Table 4.1 Roadway Segment ADT and Thresholds – Existing Conditions

Roadway	Segment	Functional Classification	Design Threshold	ADT	Within Design Threshold?
Poway Rd	West of Oak Knoll Rd	4-Lane Major Arterial	43,000	36,495	Yes
	Oak Knoll Rd to Pomerado Rd	4-Lane Major Arterial	43,000	31,629	Yes
Pomerado Rd	North of Poway Rd	4-Lane Collector	32,000	23,012	Yes
	Poway Rd to Oak Knoll Rd	4-Lane Collector	32,000	16,092	Yes
	South of Oak Knoll Rd	4-Lane Collector	32,000	24,200	Yes
Oak Knoll Rd	Poway Rd to Pomerado	2-Lane Local Collector	10,900	6,900	Yes
	Pomerado Rd to Carriage Rd	2-Lane Local Collector	10,900	4,000	Yes
Carriage Rd	Poway Rd to Oak Knoll Rd	2-Lane Local Collector	10,900	3,359	Yes

Intersection Analysis

Table 4.2 displays intersection LOS and average vehicle delay results for the study area intersections under Existing conditions. LOS calculation worksheets for Existing conditions are provided in Appendix B.

Table 4.2 Peak Hour Intersection LOS Results - Existing Conditions

Intersection	Control	AM		PM	
		Delay	LOS	Delay	LOS
1: Oak Knoll Rd & Poway Rd	Signal	31.1	C	29.9	C
2: Pomerado Rd & Poway Rd	Signal	40.7	D	33.2	C
3: Pomerado Rd & Oak Knoll Rd	Signal	18.6	B	18.7	B
4: Oak Knoll Rd & Project Drwy	SSSC	Does Not Exist Under This Scenario			
5: Oak Knoll Rd & Carriage Rd	AWSC	7.4	A	7.9	A

Note:
SSSC = Side-Street Stop Controlled. For SSSC intersections, the delay shown is the worst delay experienced by any of the approaches.
AWSC = All-Way Stop Controlled

As shown in Table 4.2, all study area intersections currently operate at LOS D or better.

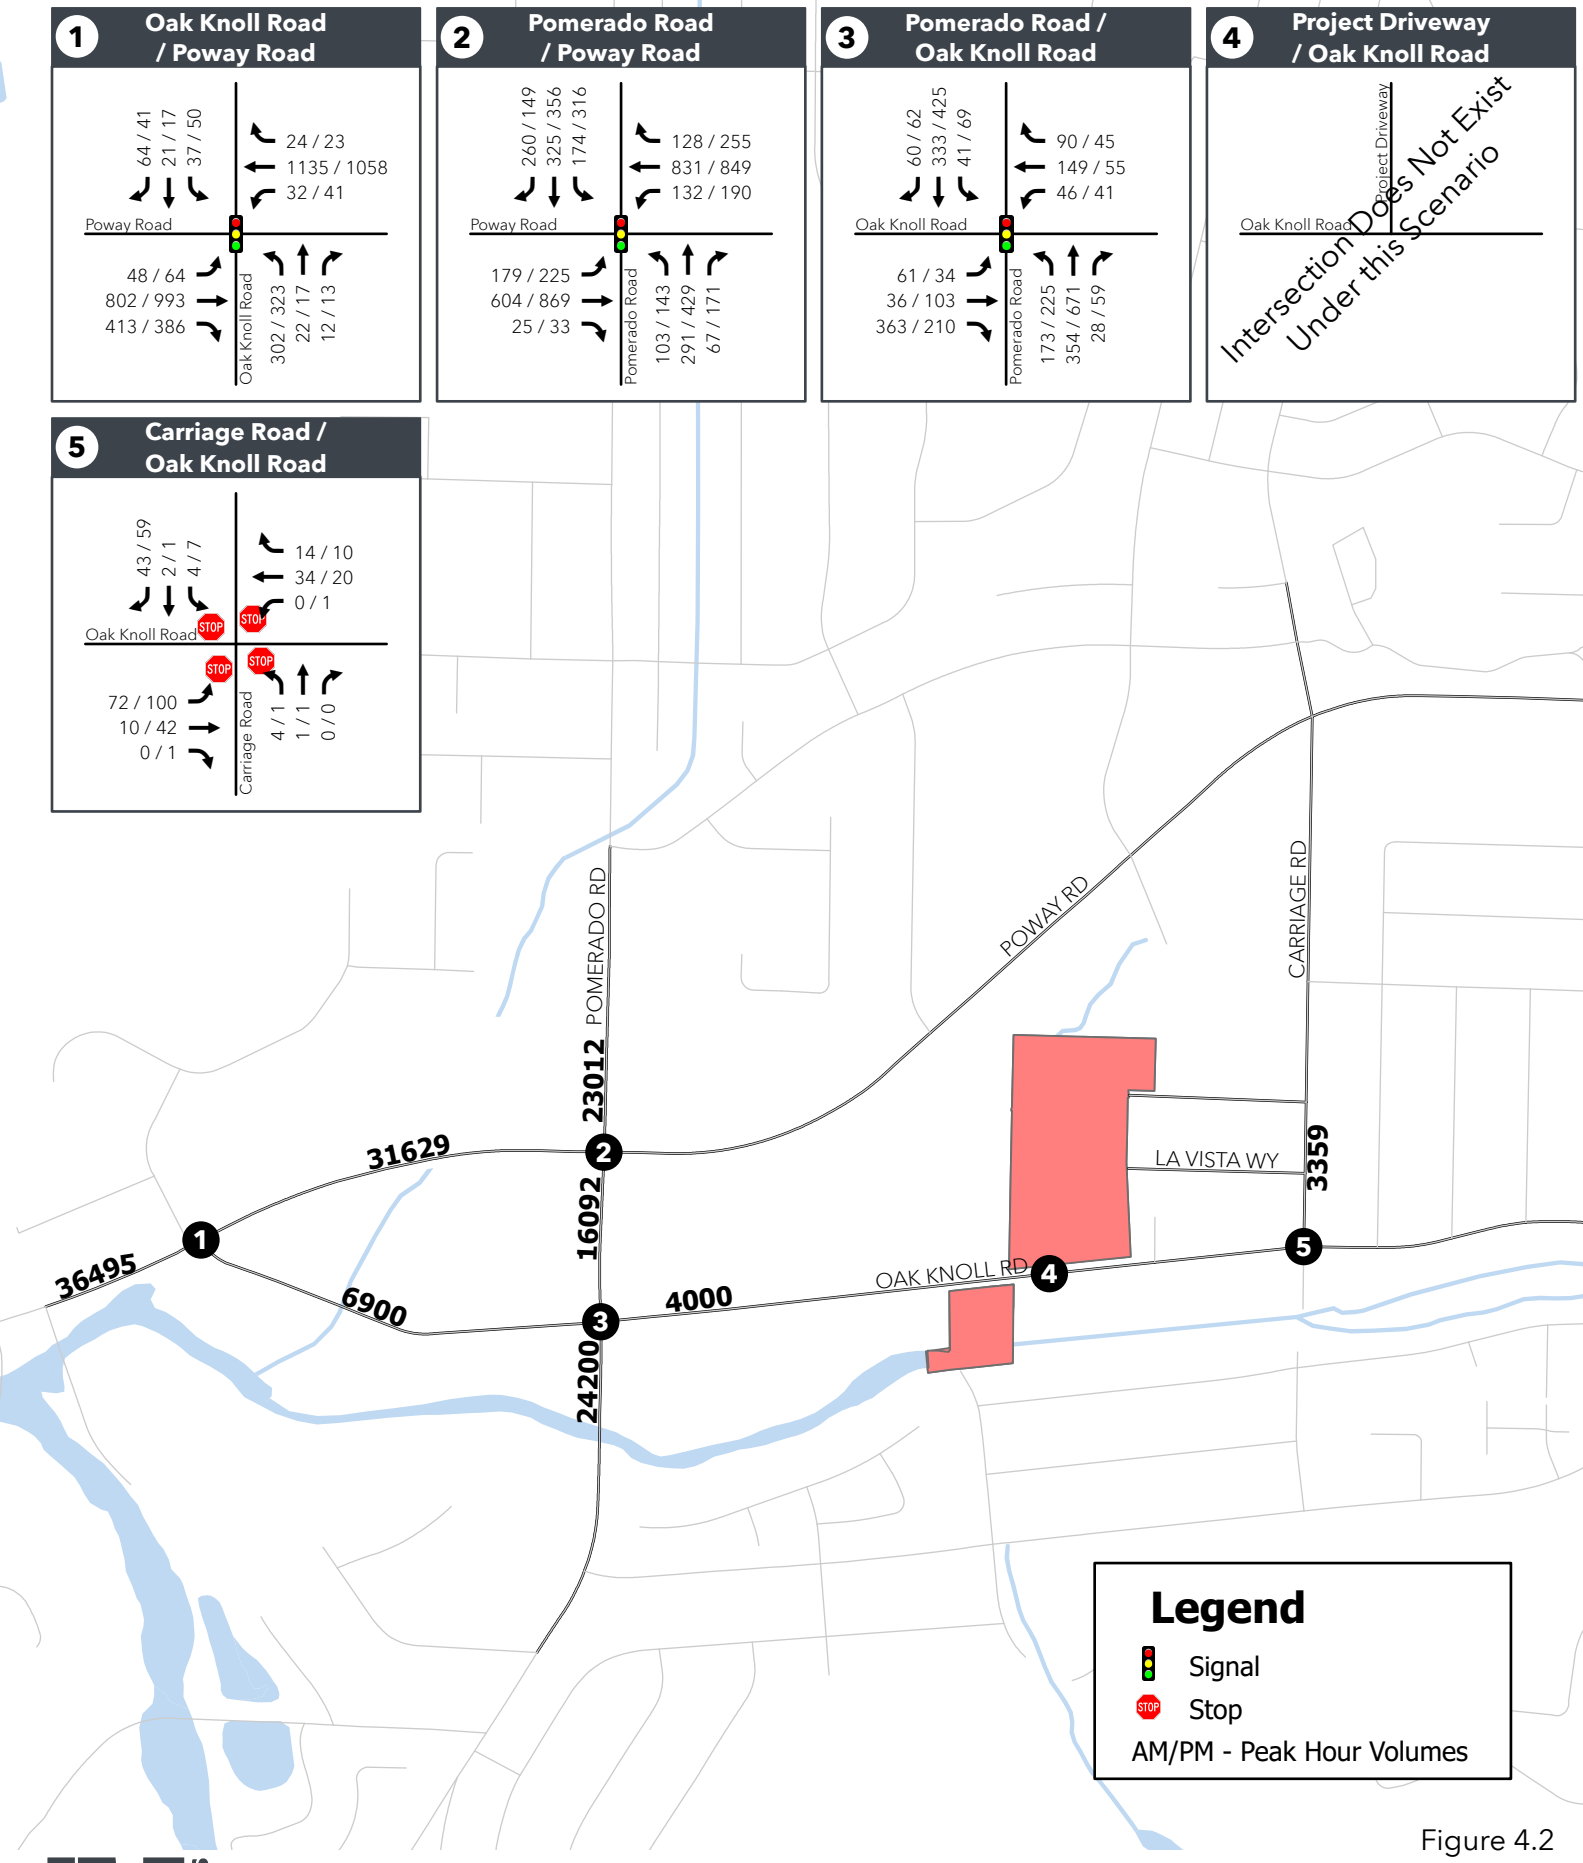

Figure 4.2

Traffic Volumes
Existing Conditions

5.0 Near-Term Conditions

This section provides an analysis of Near-Term Base conditions both with and without the Proposed Project. The scenarios analyzed in this section include:

- Near-Term Base
- Near-Term Plus Proposed Project

5.1 Cumulative Project Traffic

The following two (2) projects were identified by the City of Poway as cumulative projects, since they are anticipated to contribute traffic within the project study area:

1. *Poway Commons*– This project is located on the southwest corner of the Poway Road and Civic Center Drive intersection. It proposed to develop 141 condominium units with 25,000 square feet of specialty retail. The project is anticipated to generate 2,572 average daily trips with 175 trips (65-in / 110-out) during the AM peak hour and 224 trips (138-in / 86-out) during the PM peak hour.

2. *Fairfield* – This project is located at the existing Carriage Center West Shopping Center and recently closed Poway Bowl parcel on 12845 and 12941 Poway Road, respectively. It proposes to replace the existing shopping center and bowling alley with 221 apartments, 4,620 square feet of restaurant, and 3,878 square feet of retail uses. The project is anticipated to generate 2,220 average daily trips with 170 trips (54-in / 116-out) during the AM peak hour and 192 trips (125-in / 67-out) during the PM peak hour.

3. *The Outpost* – This project is located at 13249 – 13253 Poway Road. Is proposed to develop 72 dwelling units and 15,871 square feet of commercial space. The project is anticipated to generate 2,625 average daily trips with 135 trips (63-in / 72-out) during the AM peak hour and 187 trips (108-in / 79-out) during the PM peak hour.

The traffic generated from the projects listed above was included in the Near-Term Base scenario. Table 5.1 displays trip generation for the cumulative projects described above. The respective trip distribution and trip assignment assumptions for each cumulative project was obtained from the either the project's respective traffic impact study. Relevant excerpts from the different sources of information regarding cumulative projects are provided in Appendix C

Table 5.1 Cumulative Projects Trip Generation

Project	Land Use	ADT	AM			PM		
			Total	In	Out	Total	In	Out
Poway Commons[1]	Residential and Retail	2,572	175	65	110	224	138	86
Fairfeild[2]	Residential, Restaurant, and Retail	2,220	170	54	116	192	125	67
The Outpost[3]	Residential and Retail	2,625	135	63	72	187	108	79
Total		7,417	480	182	298	603	371	232

Notes:

[1]Trip generation and distribution was obtained from Meridian Poway Access Analysis Memorandum – Urban Systems Associates, Inc. October 2019

[2]Trip generation and distribution was obtained from Poway Road Mixed Use TIA – Linscott, Law & Greenspan, Engineers. June 2020

[3]Trip generation calculated using the *SANDAG's Not So Brief Guide of Vehicular Traffic Generation Rates in the San Diego Region, April 2002.*

As shown, the cumulative projects are anticipated to generate 7,417 daily trips, with 480 trips during the AM peak hour and 603 trips during the PM peak hour. Figure 5.1 displays the location of the cumulative projects and the cumulative project trip assignment.

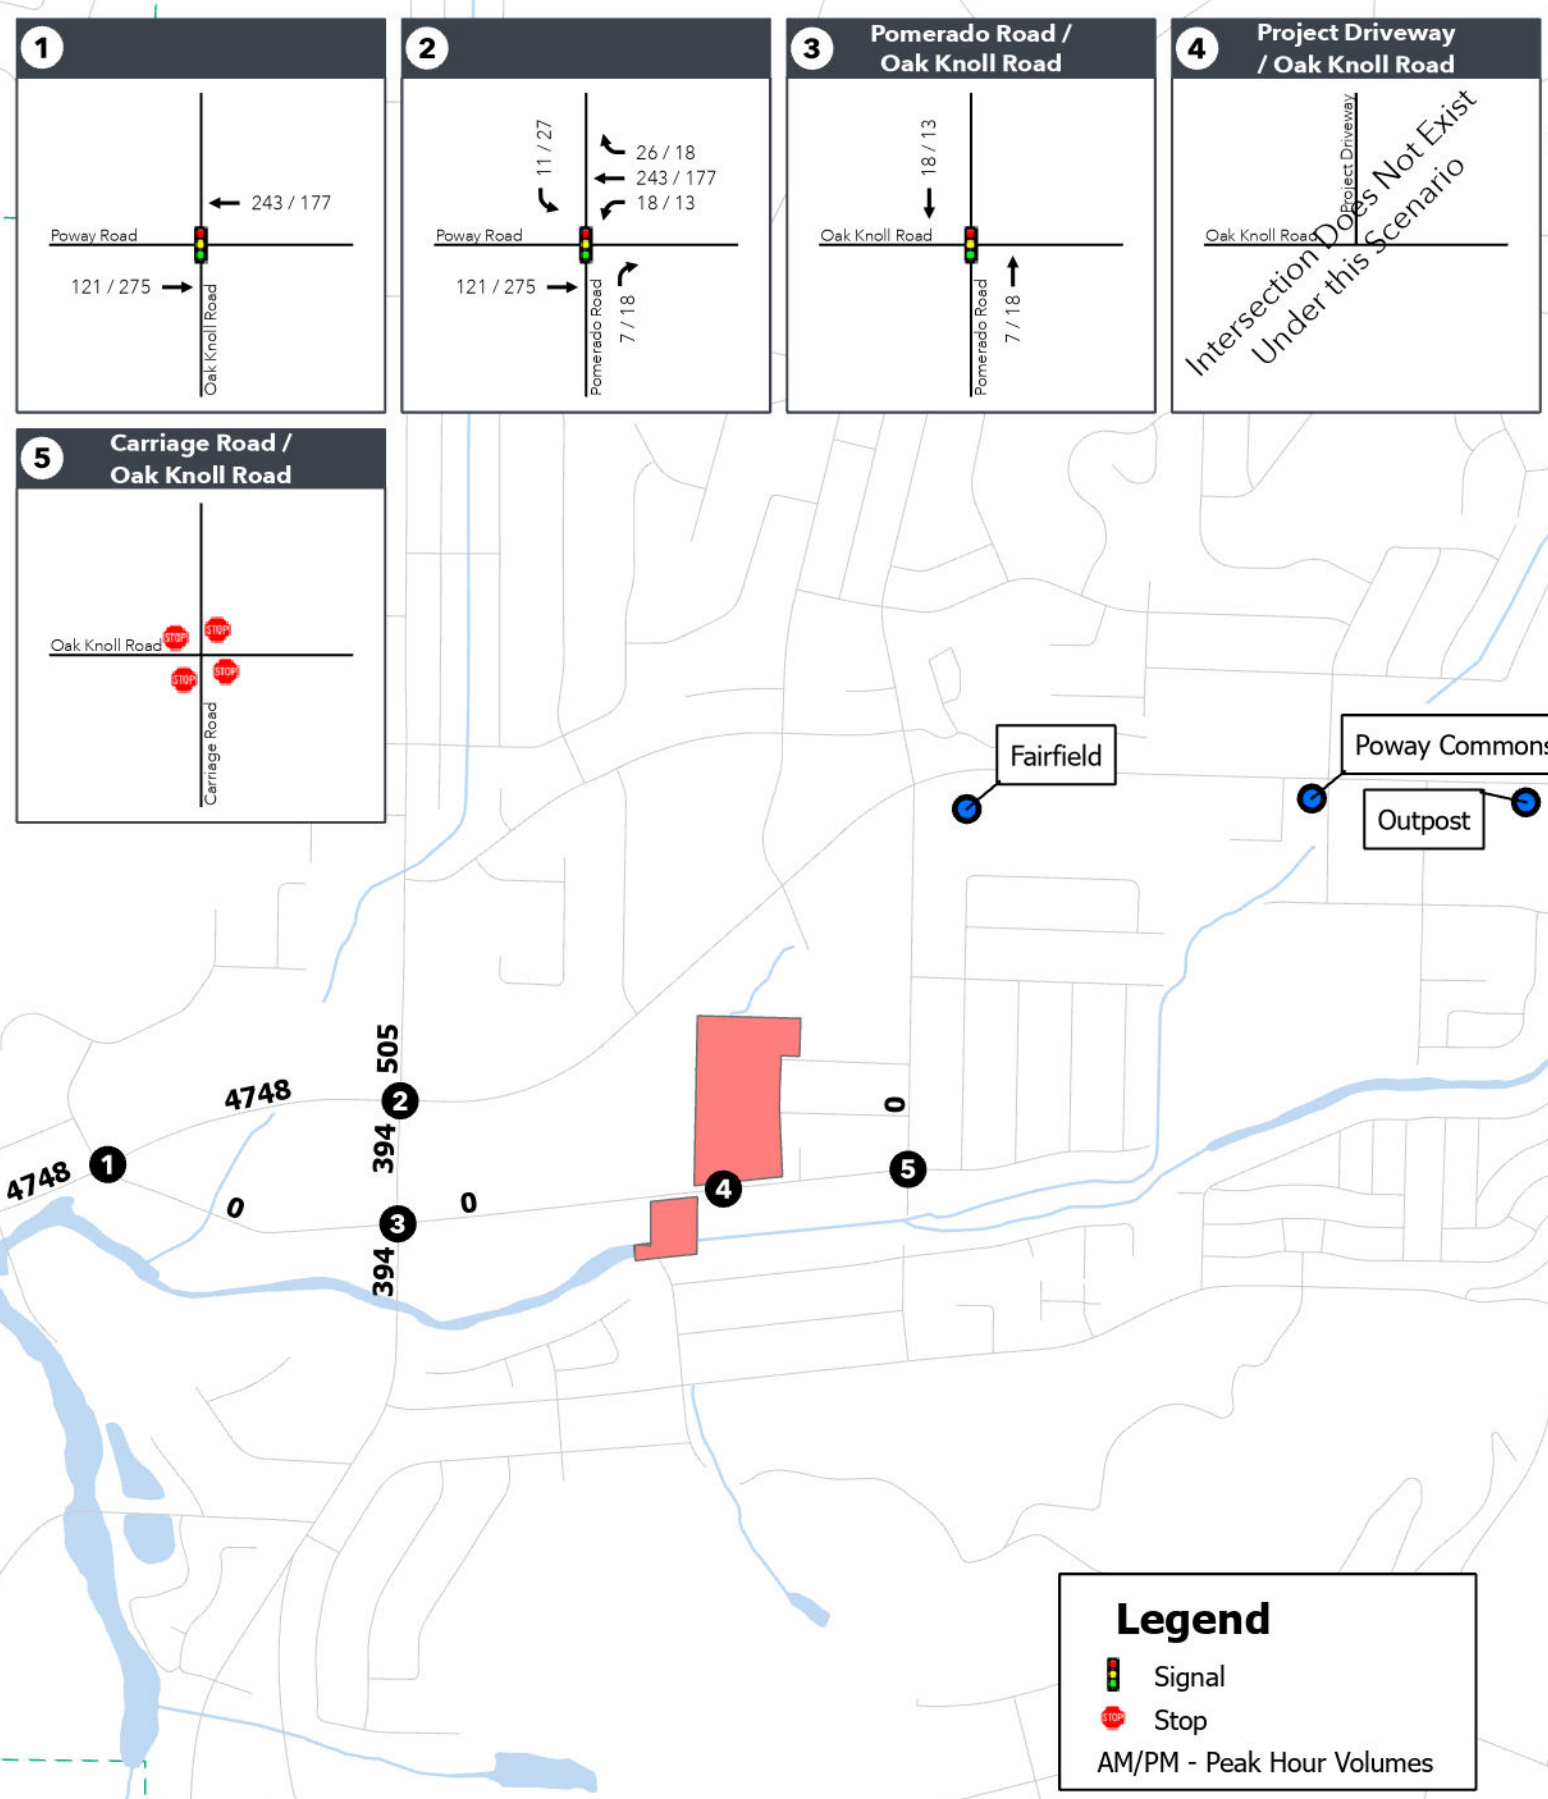

Figure 5.1

Cumulative Projects Locations and Trip Assignment

Harmon Ranch

Intersecting Metrics

5.2 Near-Term Base Roadway Network and Traffic Volumes

The Near-Term Base roadway segment classifications and intersection geometrics for the study area were assumed to be identical to the Existing conditions geometrics, as previously shown in Figure 4.1.

The Near-Term Base scenario traffic volumes were derived by adding the additional trips generated by the cumulative projects listed in Section 5.1 (Figure 5.1) to the existing traffic volumes (Figure 4.2). Figure 5.2 displays the daily roadway segment volume and peak hour intersection volumes for the study roadway segments and intersections, respectively, under the Near-Term Base conditions.

5.3 Near-Term Base Traffic Conditions

LOS analyses for Near-Term Base conditions were conducted using the methodologies described in Chapter 2.0. Roadway segment and intersection LOS analyses results are discussed separately below.

Roadway Segment Analysis

Table 5.2 displays each study roadway segment's design threshold, ADT volume, and whether the roadway segment operates within its design threshold. As shown, all study roadways are anticipated to operate within their design threshold under Near-Term Base conditions.

Table 5.2 Roadway Segment ADT and Thresholds – Near-Term Base Conditions

Roadway	Segment	Functional Classification	Design Threshold	ADT	Within Design Threshold?
Poway Rd	West of Oak Knoll Rd	4-Lane Major Arterial	43,000	41,250	Yes
	Oak Knoll Rd to Pomerado Rd	4-Lane Major Arterial	43,000	36,380	Yes
Pomerado Rd	North of Poway Rd	4-Lane Collector	32,000	23,520	Yes
	Poway Rd to Oak Knoll Rd	4-Lane Collector	32,000	16,490	Yes
	South of Oak Knoll Rd	4-Lane Collector	32,000	24,600	Yes
Oak Knoll Rd	Poway Rd to Pomerado	2-Lane Local Collector	10,900	6,900	Yes
	Pomerado Rd to Carriage Rd	2-Lane Local Collector	10,900	4,000	Yes
Carriage Rd	Poway Rd to Oak Knoll Rd	2-Lane Local Collector	10,900	3,360	Yes

Intersection Analysis

Table 5.3 displays intersection LOS and average vehicle delay results for the key study area intersections under Near-Term Base conditions. LOS calculation worksheets for Near-Term Base conditions are provided in Appendix D.

Table 5.3 Peak Hour Intersection LOS Results - Near-Term Base Conditions

Intersection	Control	AM		PM	
		Delay	LOS	Delay	LOS
1: Oak Knoll Rd & Poway Rd	Signal	35.1	D	32.6	C
2: Pomerado Rd & Poway Rd	Signal	41.1	D	46.9	D
3: Pomerado Rd & Oak Knoll Rd	Signal	19.2	B	19.5	B
4: Oak Knoll Rd & Project Drwy	SSSC	Does Not Exist Under This Scenario			
5. Oak Knoll Rd & Carriage Rd	AWSC	7.4	A	8.1	A

Note:
SSSC = Side-Street Stop Controlled. For SSSC intersections, the delay shown is the worst delay experienced by any of the approaches.
AWSC = All-Way Stop Controlled

As shown in Table 5.2, all study area intersections are projected to operate at LOS D or better under Near-Term Base conditions.

5.4 Near-Term Plus Project Traffic Conditions

LOS analyses were conducted using the methodologies described in Chapter 2.0. Intersection LOS analysis results are discussed separately in the following sections.

Roadway and intersection geometrics under the Near-Term Plus Project conditions were assumed to be identical to Existing geometrics with the addition of the following project driveway:

- *Oak Knoll Road / Project Driveway* – This driveway is located south of the Proposed Project and would allow for full-access. This is an unsignalized intersection, with Oak Knoll Road as uncontrolled and the Project Driveway being stop controlled. This driveway would include one inbound and one outbound lane.

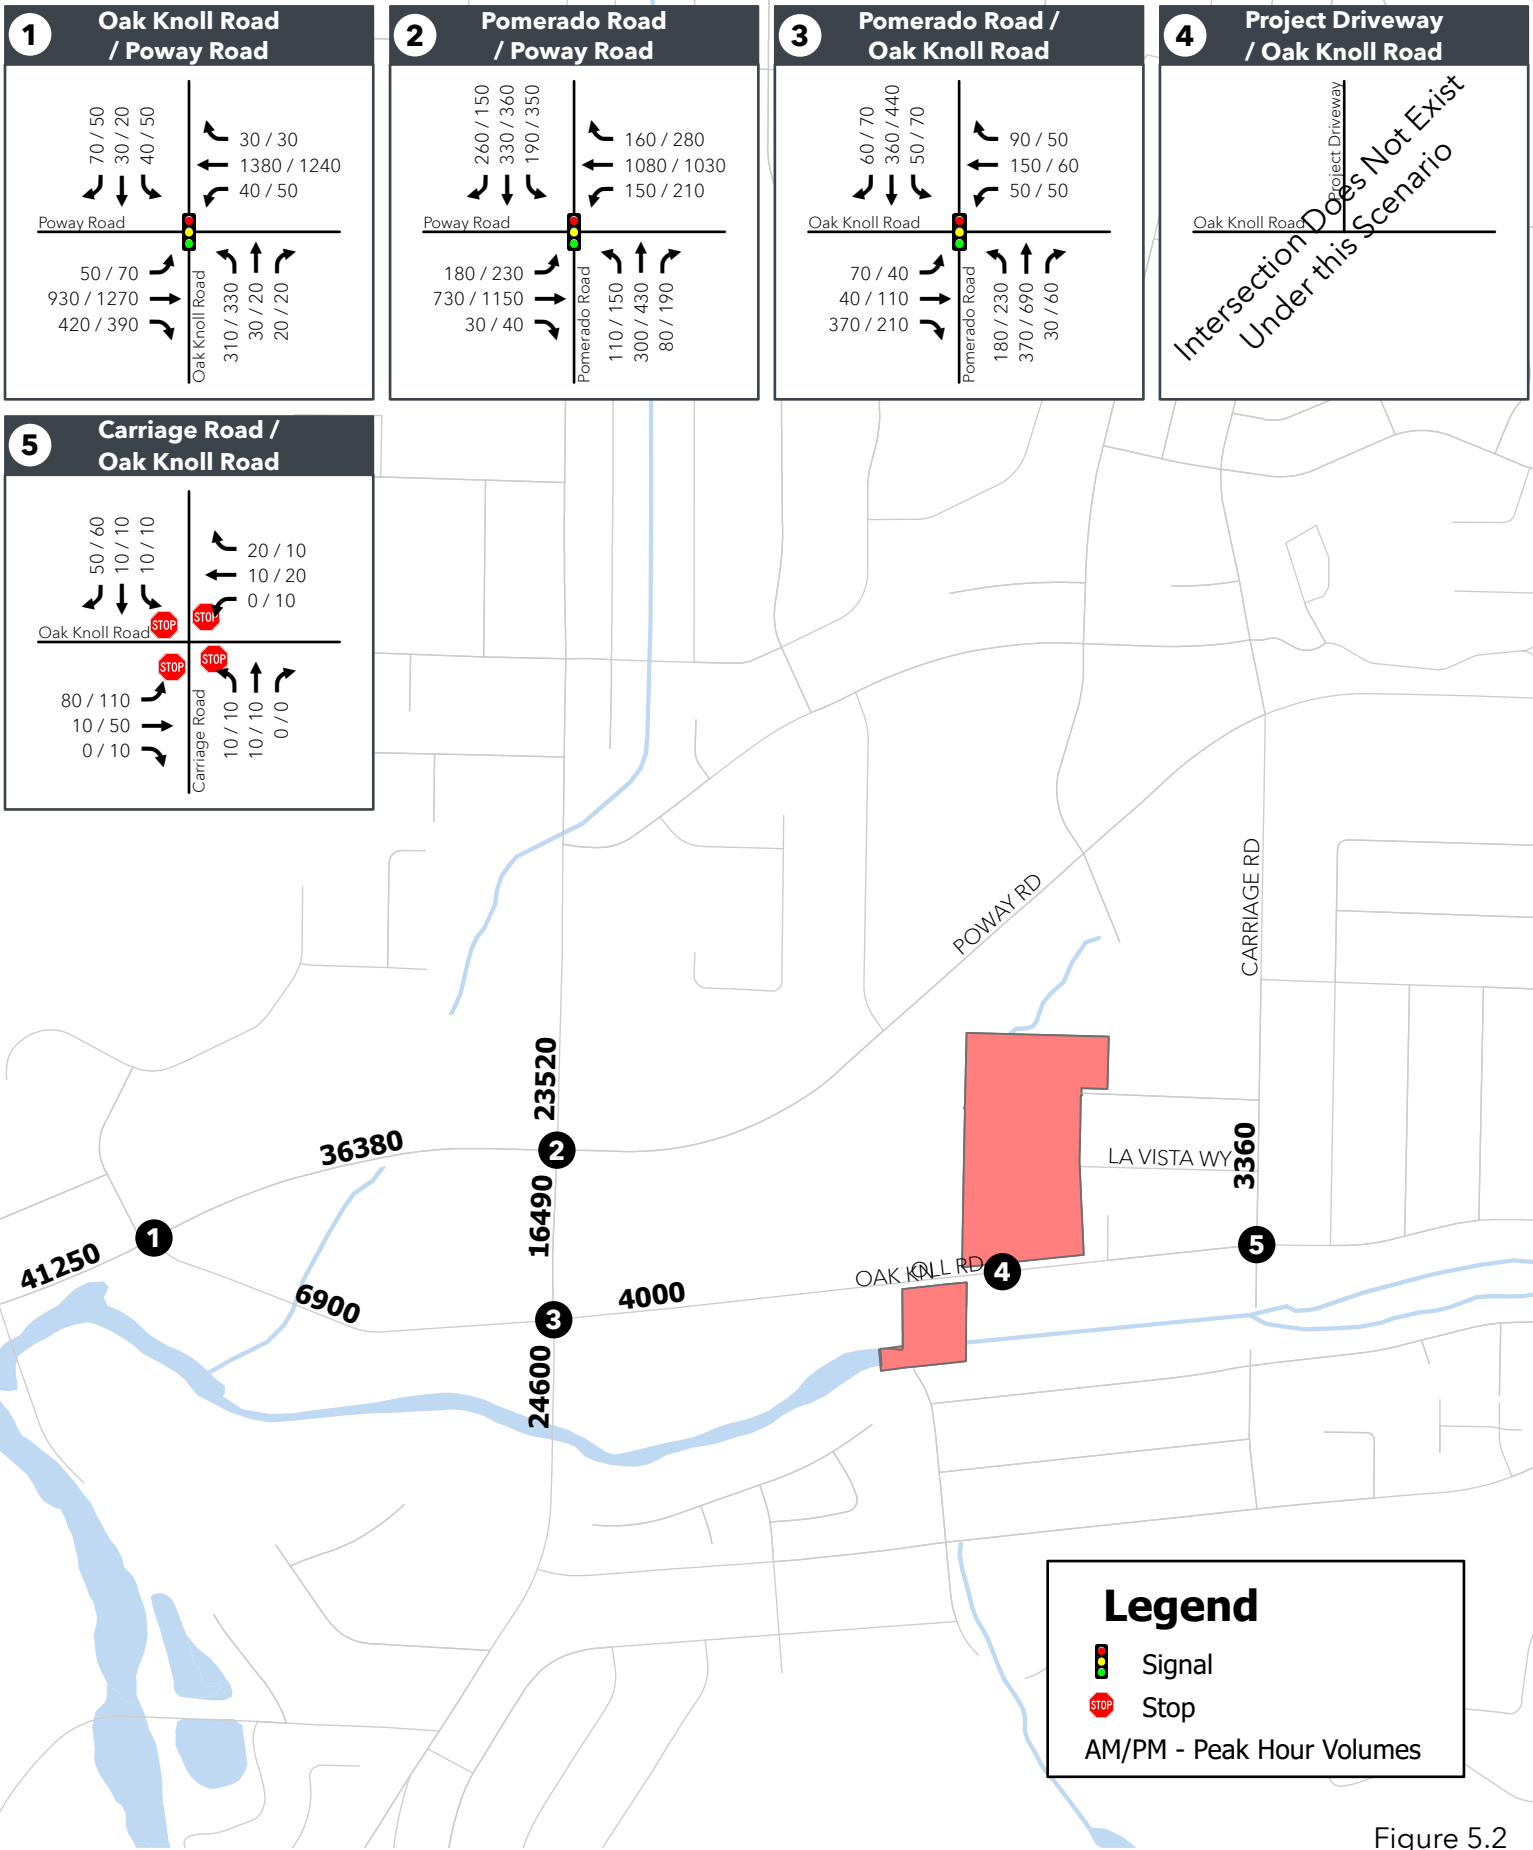

Figure 5.2

Traffic Volumes
Near Term Conditions

Near-Term Plus Project traffic volumes were derived by combining the Near-Term Base traffic volumes (displayed in Figure 5.2) and the project trip assignment volumes (displayed in Figure 3.2). Peak hour intersection volumes for this scenario are displayed in Figure 5.3.

Roadway Segment Analysis

Table 5.3 displays each study roadway segment's design threshold, ADT volume, and whether the roadway segment operates within its design threshold. As shown, all study roadways are anticipated to operate within their design threshold under Near-Term Plus Project conditions.

Table 5.3 Roadway Segment ADT and Thresholds – Near-Term Plus Project Conditions

Roadway	Segment	Functional Classification	Design Threshold	ADT	Within Design Threshold?
Poway Rd	West of Oak Knoll Rd	4-Lane Major Arterial	43,000	41,628	Yes
	Oak Knoll Rd to Pomerado Rd	4-Lane Major Arterial	43,000	36,436	Yes
Pomerado Rd	North of Poway Rd	4-Lane Collector	32,000	23,584	Yes
	Poway Rd to Oak Knoll Rd	4-Lane Collector	32,000	16,610	Yes
	South of Oak Knoll Rd	4-Lane Collector	32,000	24,694	Yes
Oak Knoll Rd	Poway Rd to Pomerado	2-Lane Local Collector	10,900	7,222	Yes
	Pomerado Rd to Carriage Rd	2-Lane Local Collector	10,900	4,536	Yes
Carriage Rd	Poway Rd to Oak Knoll Rd	2-Lane Local Collector	10,900	3,454	Yes

Intersection Analysis

Table 5.4 displays intersection LOS and average vehicle delay results under Near-Term Plus Project conditions. LOS calculation worksheets for Near-Term Plus Project conditions are provided in Appendix E.

Table 5.4 Peak Hour Intersection LOS Results - Near-Term Plus Project Conditions

Intersection	Control	AM		PM		Delay w/o Project (sec) AM/PM	LOS w/o Project AM/PM	Δ Delay (sec)	SE?
		Delay	LOS	Delay	LOS				
1: Oak Knoll Rd & Poway Rd	Signal	37.0	D	33.6	C	35.1 / 32.6	D / C	1.9 / 1.0	N / N
2: Pomerado Rd & Poway Rd	Signal	41.2	D	47.3	D	41.1 / 46.9	D / D	0.1 / 0.4	N / N
3: Pomerado Rd & Oak Knoll Rd	Signal	19.5	B	20.1	C	19.2 / 19.5	B / B	0.3 / 0.6	N / N
4: Oak Knoll Rd & Project Drwy	SSSC	10.5	B	9.8	A	0.0 / 0.0	A / A	10.5 / 9.8	N / N
5. Oak Knoll Rd & Carriage Rd	AWSC	7.4	A	8.2	A	7.6 / 8.1	A / A	0.1 / 0.1	N / N

Notes:
SSSC = Side-Street Stop Controlled. For SSSC intersections, the delay shown is the worst delay experienced by any of the approaches
AWSC = All-Way Stop Controlled
SE = Substantial Effect

As shown in Table 5.4, all study area intersections are anticipated to operate at acceptable LOS D or better under Near-Term Plus Project conditions. As such, the Proposed Project is not anticipated to have a Substantial Effect on its surrounding transportation network, based on standards outlined in Section 2.4.

5.5 Substantial Effects Under Near-Term Conditions

Based upon the criteria of Substantial Effect presented in Sections 2.3 and 2.4 of this report, the addition of Proposed Project traffic would not create a Substantial Effect to any study area intersections.

Roadway Segments

No substantial effects were identified. Therefore, no off-site improvements are recommended.

Intersections

No substantial effects were identified. Therefore, no off-site improvements are recommended.

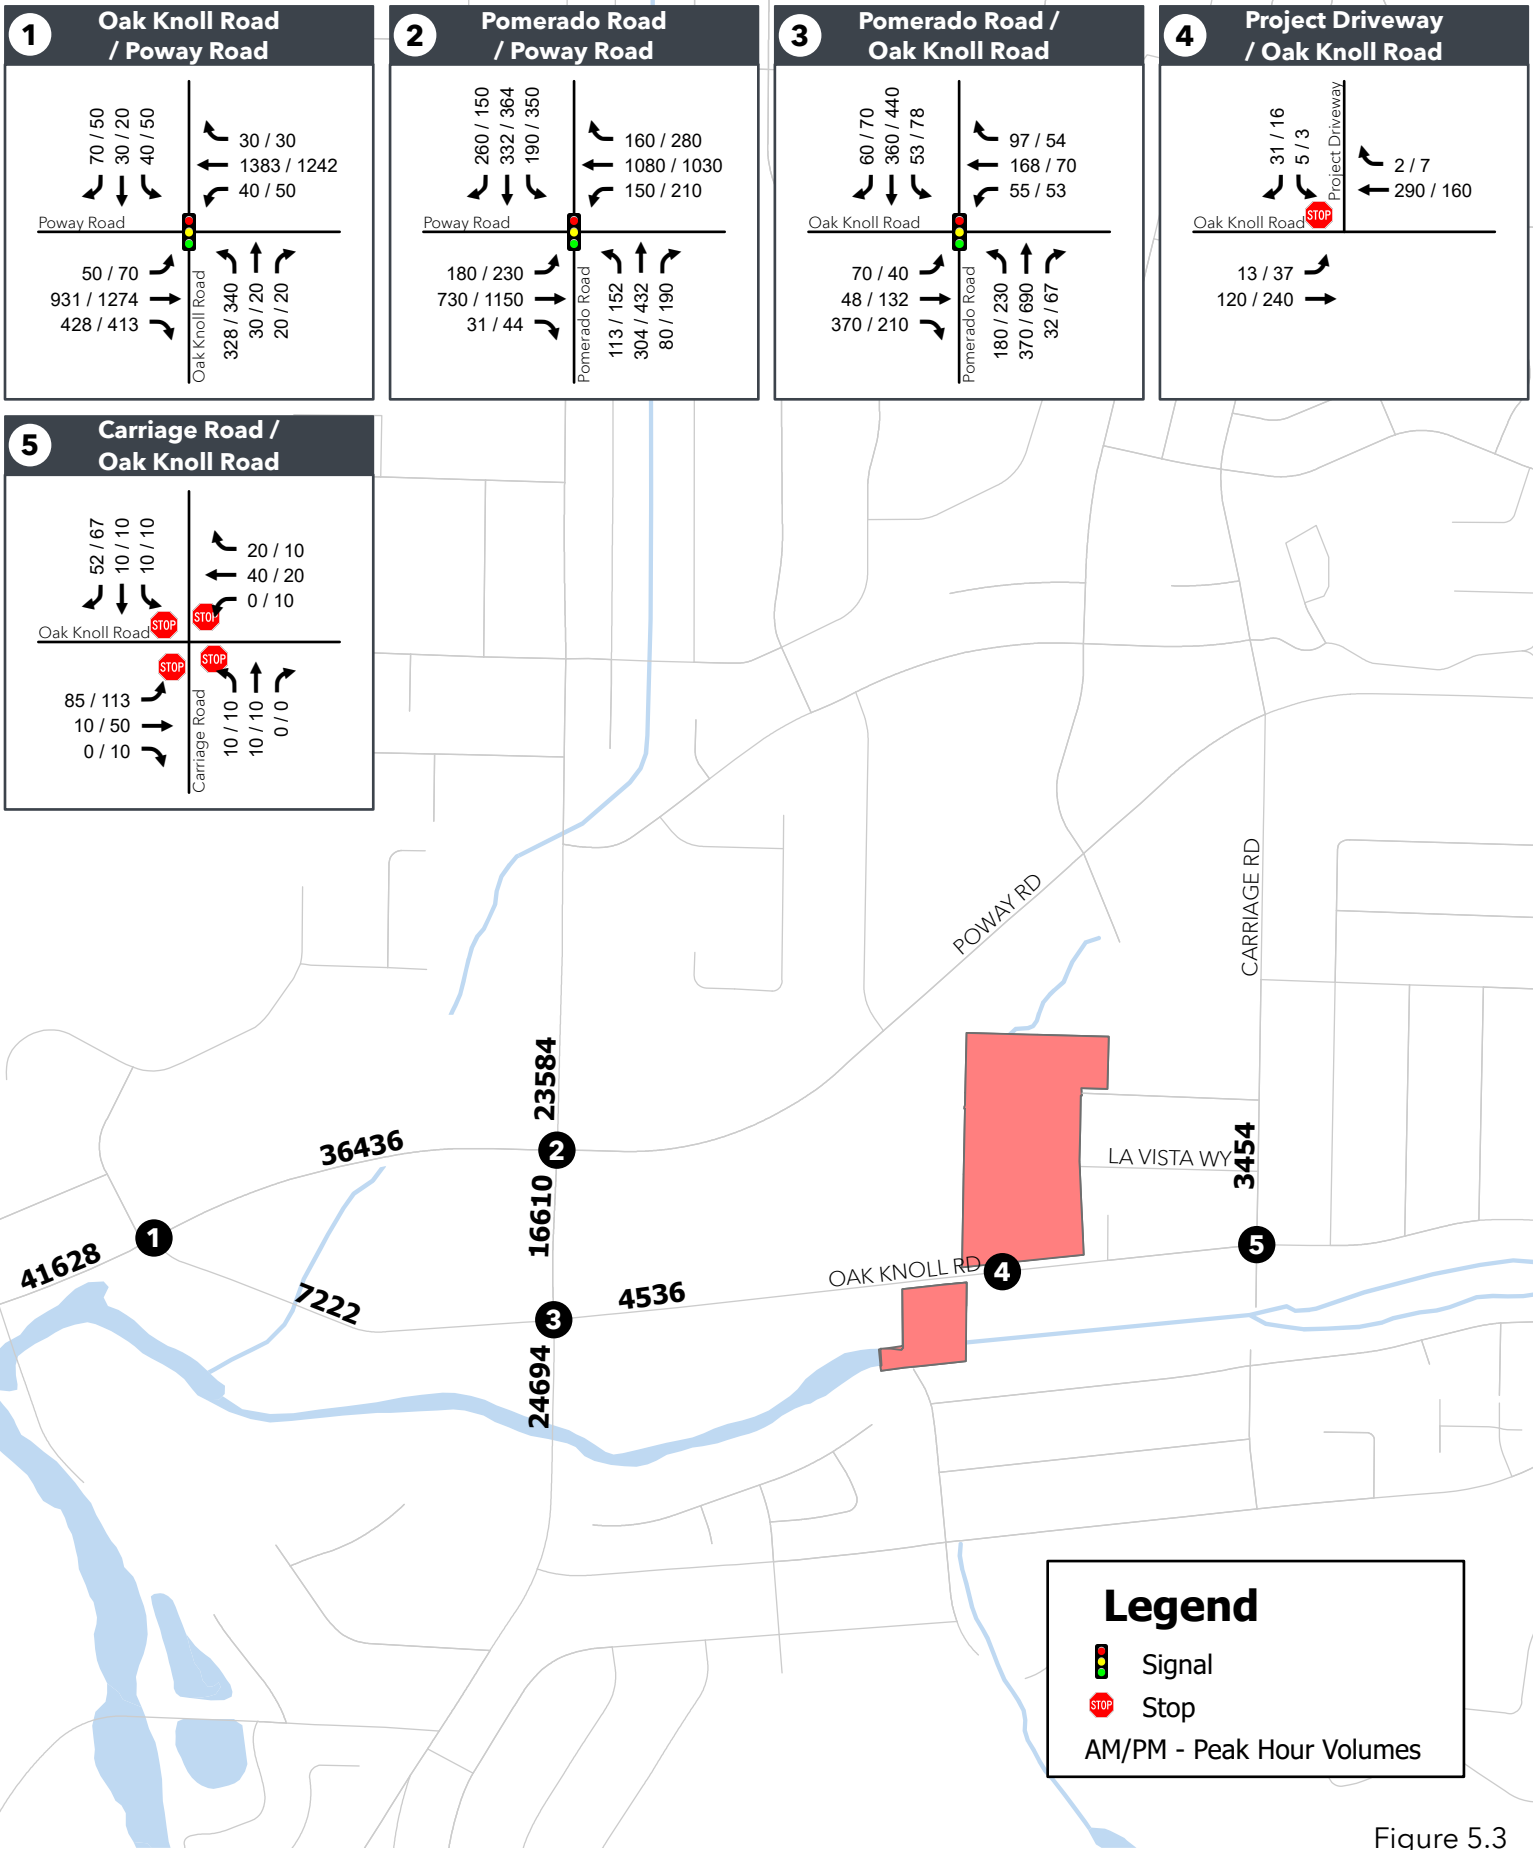

Figure 5.3

Traffic Volumes
Near Term Plus Project Conditions

6.0 Site Access

This chapter addresses access to the project site. Topics discussed include site-access and on-site circulation, and parking.

6.1 On-Site Vehicle Circulation

The Proposed Project will take access via the main driveway located on Oak Knoll Road. The driveway will connect to an internal project roadway which is a north/south loop through the project site. The internal project roadway connects to each dwelling unit's driveway. As shown in the previous section, the Proposed Project Drive is anticipated to operate at LOS A under all analysis scenarios.

The project driveway will be designed to provide adequate corner sight distance for vehicles exiting the project site (see project design plans for further information). There are no sight distance issues anticipated as the project driveway is located on a straight segment of Oak Knoll Road with no vertical or horizontal curvature. Driveway design plans showing the corner sight distance triangles will be submitted as part of the civil design plan set to the City.

6.2 Parking

The Proposed Project will provide two-car parking garages for each unit and 20-foot-deep driveways to accommodate off-street parking. Additionally, the Proposed Project includes 40 guest parking spaces along the private streets on the site. As such, the Proposed Project will provide adequate parking spaces for the residents and their guests. It should be noted that the parking located within the Proposed Project site will only be available to project residents and their guests. Parking spill over from the adjacent neighborhood will not be allowed. It will be the responsibility of the HOA to identify and report violators to the proper authorities.

Intersection Summary		
HCM 6th Ctrl Delay	31.1	
HCM 6th LOS	C	

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR] is excluded from calculations of the approach delay and intersection delay.

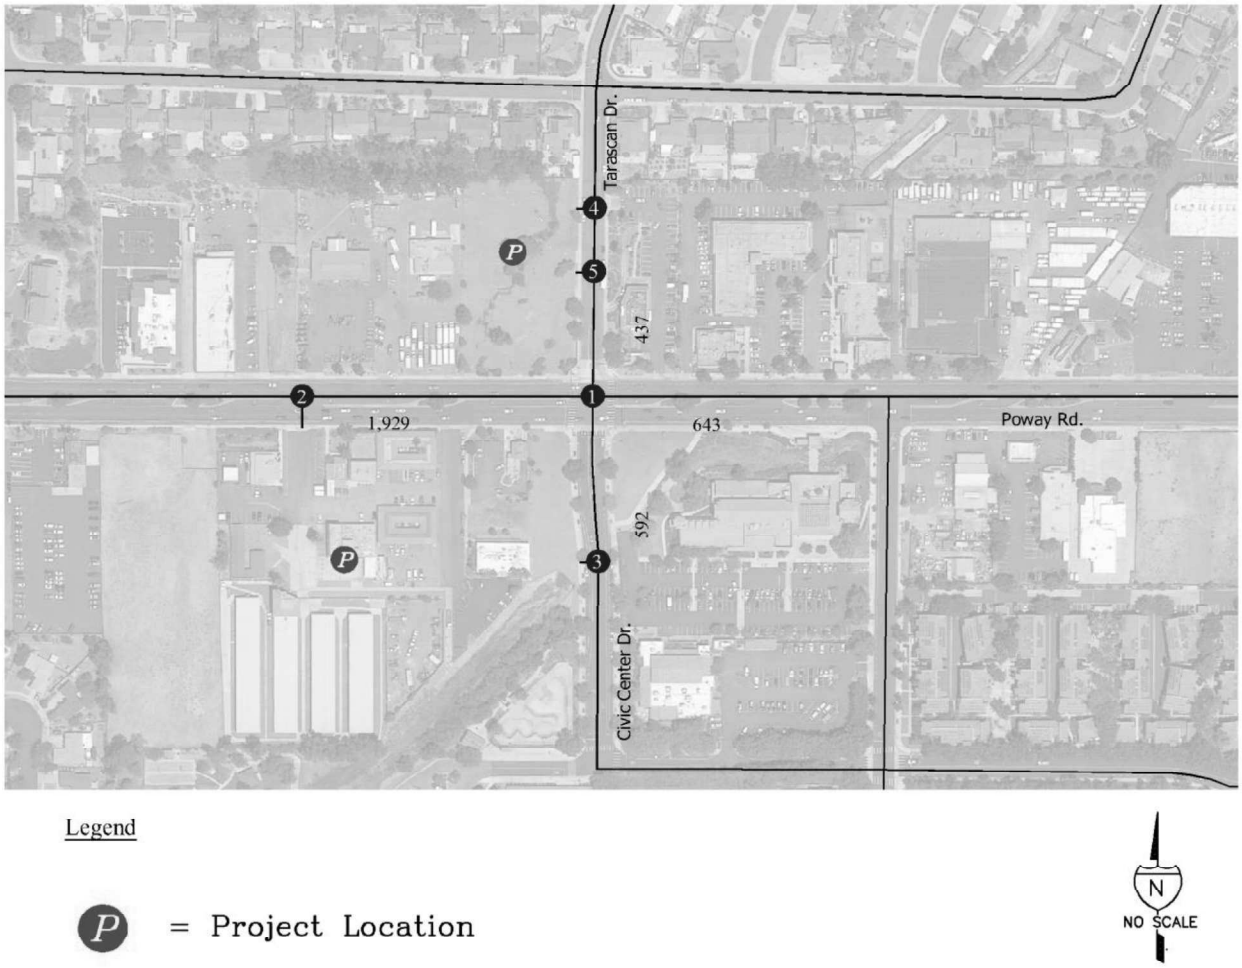
Figure 4: Project Only ADT



7.0 TRIP GENERATION/DISTRIBUTION/ASSIGNMENT

7.1 Trip Generation

7.1.1 *Trip Rates and Reductions*

As described previously in *Section 2.0*, the Project proposes to build 4,620 sf of restaurant, 3,878 sf of retail, and 221 multi-family dwelling units (DU) on a 6.68-acre site (33.1 DU/acre). The Project trip generation for these land uses is calculated using the *SANDAG (Not So) Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region, April 2002.*

SANDAG guidance provides for certain trip rate reductions, including a 5% daily trip reduction for land uses with transit access or near transit stations accessible within ¼ mile and up to 10% daily trip reduction for mixed-use developments where residential and commercial retail are combined.

As described in *Section 3.4*, the Project site is located within ¼ mile of stops serving multiple transit lines and therefore the 5% transit access reduction was applied. Based on the relative mix of residential and commercial uses in the Project and discussion with City of Poway staff, a 5% reduction for mixed land uses was applied.

7.1.2 *Existing On-Site Land Uses*

The site is occupied by a strip commercial-style development including a mix of retail, restaurant and personal services uses which currently remain in operation.

LLG assessed the actual trip generation activity of these existing land uses by conducting three days of counts at the four existing driveways serving the site. A fifth driveway providing access to the existing site parking area is located within close proximity to the Big O Tires tire retailer and servicer, which will remain. Thus, this fifth, easternmost driveway was excluded from the counts.

Two of the four driveways provide dimension which were appropriate for setting road tubes and collecting 24-hour data. The remaining two existing driveways do not provide sufficient depth ("throating") to collect accurate counts using this equipment. These two driveways were manually counted during peak hours (7AM-9AM/ 4PM-6PM). Each driveway was counted for three days (Tuesday, February 18- Thursday, February 20, 2020). The count sheets and summaries are included in ***Appendix E***.

Existing site peak hour volumes for the highest one hour during the commuter peaks were taken directly from the resulting counts. Based on the relationship of peak hour traffic to daily traffic observed at the two driveways where 24-hour counts were completed, daily traffic for the two remaining driveways was extrapolated from the peak hour volumes. For both peak hour and daily traffic, the three-day average volumes were used.

In total, the existing site is observed to generate 1,645 ADT, with 27 total AM peak hour trips (20 inbound/7 outbound) and 101 total PM peak hour trips (35 inbound/66 outbound) on a typical weekday. These existing traffic volumes would be replaced by the Project volumes with completion of the redevelopment. It should be noted that approximately 35% of the existing retail space was vacant at the time of these traffic counts.

7.1.3 *Final Trip Generation*

Table 7–1 presents a summary of the Project's estimated trip generation based on the land use rates described above. The Project's driveway trips are calculated to be 1,998 ADT, with 152 total AM peak hour trips (48 inbound/104 outbound) and 174 total PM peak hour trips (113 inbound/ 61 outbound).

The Project's net external net trips, after removing trips associated with land uses currently operating on the site, are 353 ADT, with 125 total AM peak hour trips (28 inbound/97 outbound) and 73 total PM peak hour trips (78 inbound/-5 outbound).

TABLE 7–1
PROJECT TRIP GENERATION

Land Use	Size	Daily Trip Ends (ADTs)		AM Peak Hour					PM Peak Hour

General Notes:

1. Gross trip generation does not account for mixed-use reductions, transit reductions, or pass-by/diverted-linked reductions.
2. DU = Dwelling Unit
3. KSF = 1,000 square feet

Footnotes:

a. Rate is based on SANDAG's *(Not So) Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region*, April 2002.
b. SANDAG footnote T[1]
c. SANDAG footnote T[2]

7.2 Trip Distribution/Assignment

Project traffic was distributed to the street system based on review of existing traffic data and discussions with City staff. Other factors, such as surrounding land uses and access to Interstate 15, were also considered. In general, regional distribution to/from the Project site was determined to be oriented to/from the west/east at 70%:30%, respectively. Distribution to the major side streets within the overall study area was obtained from existing traffic counts, and reflects destinations such as local schools, local retail centers, and arterial routes to neighboring job centers.

Figure 7–1 shows the regional project traffic distribution.

Figure 7–2 shows the assigned Project traffic.

Figure 7–3 shows Existing + Project traffic volumes.

HCM 6th Ctrl Delay		37.0
HCM 6th LOS		D

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR] is excluded from calculations of the approach delay and intersection delay.

HCM 6th LOS	C

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR] is excluded from calculations of the approach delay and intersection delay.

1.0 Introduction

The purpose of this Transportation Impact Study (TIS) is to identify and document any significant transportation related impacts associated with the Oak Knoll project (Proposed Project), and to recommend mitigation measures for identified impacts, as necessary.

1.1 Project Description

The proposed project is approximately 11.5 acres and includes a total of 63 new single-family homes and associated site improvements and retention of the existing historic home (see Figure 1-1, Site Plan). The project proposes approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The proposed project would include 63 single-family detached homes plus the 1 existing historic home on site for a total of 64 lots within the Specific Plan boundary. The proposed density is 8.8 dwelling units/acre (64 total residential lots/7.26-acre net project area not including private streets), which is just over the existing RS-7 designation density. The proposed project is located in the southern portion of the City, along Oak Knoll Road, south of Poway Road and west of Carriage Road.

A total of 40 public parking spaces will be provided, including 24 parallel and 16 perpendicular spaces, in addition to the two car parking garages and driveways provided for each unit. The project location is displayed in Figure 1.1 and the site plan displayed in Figure 1.2.

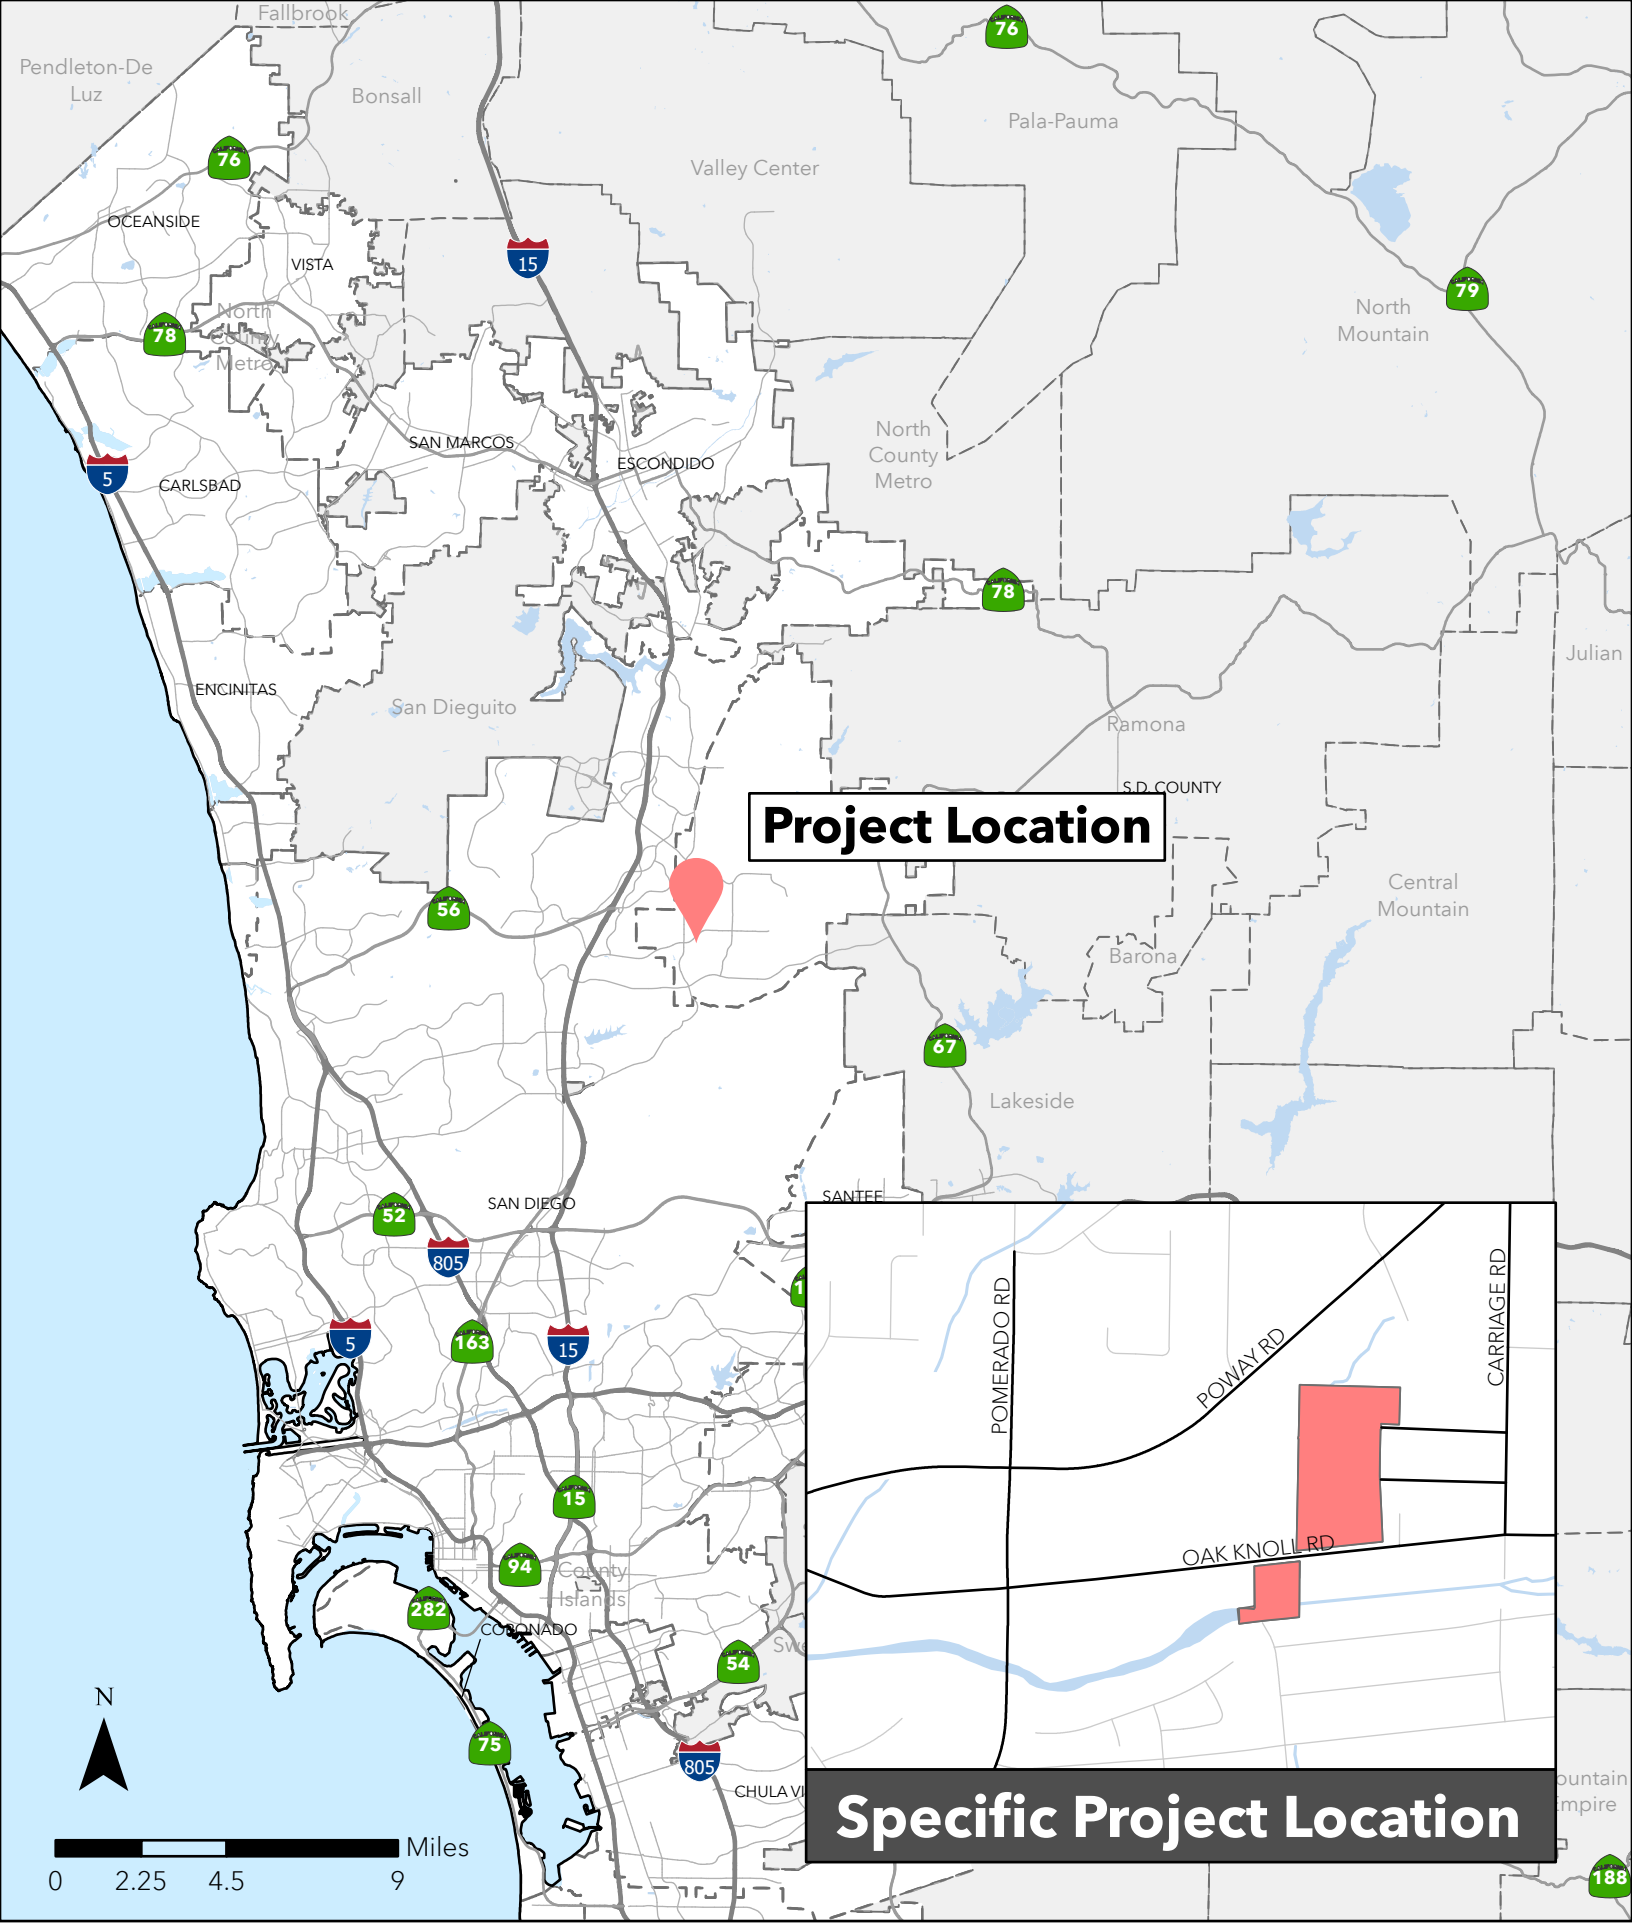
1.2 Proposed Project Trip Generation

Table 1 displays the Proposed Project's anticipated trip generation. Trip generation rates were derived from *SANDAG's (Not So) Brief Guide of Vehicular Traffic Generation Rates in the San Diego Region, April 2002*.

Table 1.1 Proposed Project Trip Generation

Land Use	Units	Trip Rate	ADT	AM					PM				
				%	Trips	Split	In	Out	%	Trips	Split	In	Out
Single Family	63 Units	10/Units	630	8%	51	(3:7)	15	36	10%	63	(7:3)	44	19

As shown, the Proposed Project is anticipated to generate a total of 630 daily trips, with 51 trips (15-in & 36-out) generated during the AM peak hour and 63 trips (44-in & 19-out) during the PM peak hour.



Oak Knoll

Figure 1.1
Project Location

Figure 1.2
Project Site Plan

1.3 Project Setting

Access to the Proposed Project from the regional transportation network would be provided via Poway Road, Pomerado Road, and Oak Knoll Road. These roadways would either provide a direct connection to the Proposed Project site, via a project driveway on Oak Knoll Road, or would provide a critical link between the Proposed Project and the regional transportation network. Descriptions of these transportation network facilities are described below:

Poway Road is a four-lane east/west roadway that connects I-15 in the west to SR-67 in the east. The roadway has a posted speed limit of 35 miles per hour (mph) and is divided by a raised median. Within the study area, Poway Road provides direct access to commercial centers. Pedestrian sidewalks and buffered Class II bicycle lanes are present on both sides of the roadway. San Diego Metropolitan Transit System (MTS) routes 944, 945, and 945A currently provide services on Poway Road, with the closest stop to the project site located on Poway Road and the Countryside Apartments driveway. Poway Road is classified as a Major Arterial by the City's *Transportation Master Element, March 2010*.

Pomerado Road is a four-lane north/south roadway that connects Twin Peaks Road to Spring Canyon Road. Within the study area, this roadway is divided by a center-left-turn lane and has a posted speed limit of 45 mph. Pomerado Road is primarily fronted by residential units and provides pedestrian sidewalks and bicycle lanes on both sides of the roadway. San Diego MTS bus routes 945 and 945A currently provide services on Pomerado Road, north of Poway Road. Pomerado Road is classified as a Major Arterial by the City's *Transportation Master Element, March 2010*.

Oak Knoll Road is two-lane undivided roadway that connects Sage View Road to Selier Street. The Proposed Project will take access via side-street stop-controlled intersection on Oak Knoll Road, as well as single family driveways for the homes on the western parcel. This roadway is an undivided roadway with a posted speed limit of 25 mph. Parallel parking is provided on both sides of the roadway. Oak Knoll Road is fronted by residential units and small businesses. Pedestrian sidewalks are provided on both sides of the roadway and sharrow signs are painted on the roadway indicating that Oak Knoll Road is a bicycle route. According to the City's *Transportation Master Element, March 2010*, Oak Knoll Road is a local collector between Poway Road and Pomerado Road and a local road east of Pomerado Road.

Figure 1.3 display the transportation network around the Proposed Project site.

1.4 Report Organization

Following this Introduction chapter, this report is organized into the following sections:

2.0 *Analysis Methodology* – This chapter describes the methodologies and standards utilized to analyze and identify the transportation related impacts associated with the Proposed Project.

3.0 *Transportation Related Impacts and Mitigation* – This chapter derives and analyzes the projected Vehicle Miles Traveled (VMT) that will be generated by the Proposed Project. This chapter also identifies if the Proposed Project related VMT would create significant project related impacts, as it relates to the standards outlined in the California Environmental Quality Act (CEQA). Finally, the chapter provides recommendations for mitigation measures to reduce the identified transportation related impacts, if necessary, and evaluates the feasibility of the proposed mitigation measures.

Figure 1.3
Local Transportation Network

2.0 Analysis Methodology and Threshold

2.1 Background (SB-743)

On September 27, 2013, Governor Edmund G. Brown, Jr. signed California Senate Bill 743 (SB-743) into law, starting a process that is expected to fundamentally change the way transportation impact analysis is conducted under CEQA. Within the State's CEQA Guidelines, these changes include elimination of auto delay, level of service (LOS), and similar measurements of vehicular roadway capacity and traffic congestion as the basis for determining significant impacts. Note: SB-743 was placed into practice on July 1, 2020.

On December 2018, the Resources Agency certified and adopted the CEQA Guidelines update package, which included the California Natural Resources Agency Guidelines for the Implementation of the California Environmental Quality Act. As a result, the California Governor's Office of Planning and Research (OPR) updated and released the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (Technical Advisory) in December 2018[1]. Based on these updated guidelines, lead agencies had until July 1, 2020, to comply with the updated CEQA revision. Therefore, all lead agencies are now required to comply with the December 2018 CEQA guidelines, as well as the requirements outlined under SB-743.

2.2 CEQA Guidelines Section 15064.3

Section 15064.3(b) of the CEQA Guidelines outlines how transportation related impacts should be evaluated and identified under CEQA. This section was included within December 2018 update to implement the requirements outlined within SB-743:

> (1) *Land Use Projects*. Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact.

As outlined in the section, Vehicle Miles Traveled (VMT) must be used to evaluate the transportation related impacts associated with land use projects.

2.3 Analysis Guidelines and Significance Thresholds

The City has not yet adopted significance thresholds which utilize VMT to assess transportation related impacts, is as required under Section 15064.3(b)(1) of the CEQA Guidelines. Therefore, the methodologies, substantial evidence, and recommended significance thresholds presented OPR's Technical Advisory were used to assess and identify the VMT related impacts that may be associated with the Proposed Project. It should be noted that the *Guidelines for Transportation Impact Studies in the San Diego Region, May 2019* (Regional Guidelines) is an additional resource that can be used to identify and determine VMT related impacts within the San Diego Region. However, the VMT related significance thresholds presented in Regional Guidelines were derived, and are consistent with, OPR's Technical Advisory. Additionally, no jurisdiction within the San Diego Region has officially adopted or indorsed the Regional Guidelines to this point, thus they are only used for information purposes. Therefore, OPR's

[1] https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf

Technical Advisory was used as the primary source in determining the thresholds for the Proposed Project.

2.4 Screening Criteria

OPR's Technical Advisory outlines several screening criteria in which land development can be assumed to have a less than significant VMT related impact and are thus screened out from conducting a detailed VMT analysis. OPR's identified screening criteria includes small project screening (generates less than 110 daily trips), projects located within a VMT efficient area, projects located within a Transit Priority Area (TPA), 100% affordable housing projects, and locally serving uses. The Proposed Project does not meet any of the identified screening criteria, and therefore is required to conduct a detailed VMT analysis.

2.5 Significance Thresholds

As outlined in Section E.2. of OPR's Technical Advisory (Recommended Numeric Thresholds for Residential, Office, and Retail Projects):

> Recommended threshold for residential projects: A proposed project exceeding a level of 15 percent below existing VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita or as city VMT per capita. Proposed development referencing a threshold based on city VMT per capita (rather than regional VMT per capita) should not cumulatively exceed the number of units specified in the SCS for that city and should be consistent with the SCS.

A threshold of 15% below the San Diego region's[2] base year VMT per capita was used to identify VMT related impacts. Based on SANDAG Series 14 Transportation Forecast (Series ID 458), the average VMT per capita for the San Diego Region is 18.9 miles. Therefore, the significance threshold used to evaluate and identify the Proposed Project's VMT related impacts was 16.1 miles [18.9 miles X (100% - 15%)].

2.6 Cumulative Analysis

As outlined in Section C.1. of the Technical Advisory (Recommendations Regarding Methodology):

> A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa.

Since the Proposed Project's VMT related impacts will be assessed utilizing an efficiency-based metric (VMT per capita), the Proposed Project's direct (project) and cumulative impacts can be assumed to be the same, thus, no additional cumulative analysis is required.

2.7 VMT Analysis Tool

As outlined under CEQA Guidelines Section 15064.3(b):

> *(4) Methodology.* A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled, and may revise those estimates to reflect professional

[2] To be conservative, the regional VMT per capita (18.9 miles) was selected for the threshold over the City's VMT per Capita (21.5 miles).

> judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.

The SANDAG Series 14 Regional Growth Forecast (ABM2+)[3] is the most up-to-date transportation forecast within the San Diego region. ABM2+ utilizes a tour-based methodology to calculate both vehicular trip generation and VMT output. This approach is consistent with the recommendations outlined in Section B1 of ORP's Technical Advisory. Based on these findings, the ABM2+ was identified as the most accurate and correct tool to evaluate the Proposed Project's VMT related impacts. As such, the San Diego Region SB-743 VMT Maps[4] was utilized to derive the VMT per capita for the Proposed Project site.

2.8 VMT Reduction / Transportation Demand Management

The quantification of all VMT reductions associated with Transportation Demand Management (TDM) measures were calculated based on the measures and methodologies outlined in the California Air Pollution Control Officers Association's (CAPCOA*) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (GHG Handbook)[5]. The GHG Handbook provides methods to quantify GHG emission reductions from a specified list of measures, primarily focused on project-level actions. The GHG Handbook also includes a method to assess potential benefits of different climate vulnerability reduction measures, as well as measures that can be implemented to improve health and equity, again at the project level. The majority of the measures outlined under the Transportation Section of the GHG Handbook focus on reductions in VMT, as they can be directly associated with reductions in GHG.

CAPCOA's GHG Handbook is an update to CAPCOA's Quantifying Green House Gas Mitigation Measures, August 2010[6], which has been the main resource used within the State of California to calculate VMT reductions for both Transportation and GHG related impacts over the past decade. CAPCOA's GHG Handbook has refined and added to the VMT reduction methodologies included within the Original CAPCOA Manual to best reflect the on-going research that has occurred over the last 10+ years. Therefore, CAPCOA's GHG Handbook provides the best, and most current, substantial evidence to calculate VMT reductions associated with TDM measures.

---

[3] The SANDAG Series 14 Regional Growth Forecast is the long-range forecast of population, housing, and employment that was inputted into ABM2+ for the proposed Plan. The Sustainable Communities Strategy (SCS) land use pattern is a subregional allocation of forecasted growth and development (population, housing, and jobs) based on the Series 14 Regional Growth Forecast. Data used to develop the SCS land use pattern are based on the most recent planning assumptions, considering local general plans and other factors, per California Senate Bill 375 (Steinberg, 2008) (SB 375) (Government Code Section 65080[b][2][B]). A detailed description of how the SANDAG Model calculates VMT is provided at the following location: https://www.sandag.org/uploads/2050RTP/F2050RTPTA15.pdf

3.0 Transportation Impact & Mitigation

This chapter derives and analyzes the projected VMT per capita that will be generated by the Proposed Project. This chapter also identifies if the Proposed Project related VMT per capita would create significant project related impact, based on the thresholds outlined in Section 2.0. Finally, the chapter provides recommendations for mitigation measures that may reduce the Proposed Project's impacts to less than significant levels, and evaluates the feasibility of the proposed mitigation measures, if necessary.

3.1 VMT Impact Analysis

Figure 3.1 displays the ABM2+ VMT output for the Proposed Project site. Table 3.1 evaluates the VMT per capita in which the Proposed Project's site is anticipated to generate. Additionally, the table compares the project VMT to the regional significance threshold to identify if the Proposed Project will have a significant VMT related impact.

Table 3.1 VMT Impact Analysis

Project Site VMT Per Capita (Miles)[1]	Regional VMT Per Capita Threshold (Miles)	Difference (Miles)	Difference (%)	Significant Impact?
20.7	16.1	4.6 miles over	+22.2%	Yes

Note
[1]Source: San Diego Region SB-743 VMT Maps (TAZ 1395)

As shown in the table, the Proposed Project site is anticipated to generate a VMT per capita that is 4.6 miles per resident over the regional the regional threshold, thus resulting in a significant VMT related impact. The Proposed Project would need to reduce its overall VMT generation by 22.2% (4.6 miles / 20.7 miles) to reduce this impact to less than significant.

3.2 Mitigation

As noted in Section 3.1, the Proposed Project is projected to have a significant VMT related impact. To reduce the impact to a less than significant level, TDM measures will need to be implemented to reduce project related VMT. Therefore, a TDM analysis was conducted using CAPCOA's GHG Handbook to provide an understanding of the types and magnitude of TDM related design features and programs the Proposed Project would need to implement to reduce these impacts to less than significant levels.

It should be noted that the CAPCOA GHG Handbook does not include every potential TDM measure that could potentially reduce the Proposed Project's VMT. However, the effectiveness and methods to calculate VMT reductions for TDM measures not included within the CAPCOA GHG Handbook have not been recognized or agreed upon by the State, the San Diego Region, or the City and may be subject to challenge. Therefore, measures outside of the CAPCOA Handbook were not considered as mitigation strategies and their reductions were not considered due to the lack of substantial evidence to support their effectiveness.

Table 3.2 reviews each of the TDM measures included in the CAPCOA GHG Handbook and identifies if the TDM measure would be applicable to the Proposed Project. The reductions that would be associated with each identified feasible measure were then calculated in Section 3.3.

Source: San Diego Region SB743 VMT Maps (arcgis.com)

Figure 3.1

Project Site VMT Generation (VMT per Capita)

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-1	Increase Residential Density	This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of dwelling units (du) compared to the average residential density in the U.S. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose. Increasing residential density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction VMT. This measure is best quantified when applied to larger developments and developments where the density is somewhat similar to the surrounding area due to the underlying research being founded in data from the neighborhood level.	0.0%-30.0% Project VMT	*No* - The Proposed Project will have a net density of 6.8 dwelling units per acre, which is below the residential density of a typical development cited within the CAPCOA Handbook of 9.1 units per acre.
T-2	Increase Job Density	This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of dwelling units (du) compared to the average residential density in the U.S. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose. Increasing residential density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction in VMT. This measure is best quantified when applied to larger developments and developments where the density is somewhat similar to the surrounding area due to the underlying research being founded in data from the neighborhood level.	0.0%-30.0% Project VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-3	Provide Transit-Oriented Development	This measure would reduce project VMT in the study area relative to the same project sited in a non-transit-oriented development (TOD) location. TOD refers to projects built in compact, walkable areas that have easy access to public transit, ideally in a location with a mix of uses, including housing, retail offices, and community facilities. Project site residents, employees, and visitors would have easy access to high-quality public transit, thereby encouraging transit ridership and reducing the number of single-occupancy vehicle trips and VMT.	6.9%-31.0% Project VMT	*N/A* – The nearest existing bus stop to the Proposed Project is on Poway Road. If the proposed multi-use pathway, which will connect the Proposed Project to Poway Road, is secured this stop will be within a ¼ mile walk from the Proposed Project. However, the Proposed Project cannot take a reduction as a TOD because the MTS bus routes along Poway Road operate at 30-minute headways, which means they do not constitute as a high-frequency major route. If the services were increased to 15-minutes or less, the Proposed Project could experience a TOD reduction of up-to 12%; however, the Proposed Project nor City have the authority to increase transit frequency. Therefore, it is not feasible for the Proposed Project to be designed as a TOD.
T-4	Integrate Affordable and Below Market Rate Housing	This measure requires below market rate (BMR) housing. BMR housing provides greater opportunity for lower income families to live closer to job centers and achieve a jobs/housing match near transit. It is also an important strategy to address the limited availability of affordable housing that might force residents to live far away from jobs or school, requiring longer commutes. The quantification method for this measure accounts for VMT reductions achieved for multifamily residential projects that are deed restricted or otherwise permanently dedicated as affordable housing.	0.0%-28.6% Project VMT	*No* - None of the residential homes are BMR housing.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-5	Implement Commute Trip Reduction Program (Voluntary)	This measure will implement a voluntary commute trip reduction (CTR) program with employers. CTR programs discourage single- occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT. Voluntary implementation elements are described in this measure.	0.0%-4.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-6	Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)	This measure will implement a mandatory CTR program with employers. CTR programs discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT.	0.0%-26.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-7	Implement Commute Trip Reduction Marketing	This measure will implement a marketing strategy to promote the project site employer's CTR program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT.	0.0%-4.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-8	Provide Ridesharing Program	This measure will implement a ridesharing program and establish a permanent transportation management association with funding requirements for employers. Ridesharing encourages carpooled vehicle trips in place of single-occupied vehicle trips, thereby reducing the number of trips and VMT.	0.0%-8.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-9	Implement Subsidized or Discounted Transit Program	This measure will provide subsidized or discounted, or free transit passes for employees and/or residents. Reducing the out-of-pocket cost for choosing transit improves the competitiveness of transit against driving, increasing the total number of transit trips and decreasing vehicle trips. This decrease in vehicle trips results in reduced VMT.	0.0%-5.5% Project VMT	*No* – The project is comprised of single family homes which will have individual owners. The Proposed Project will have an HOA; however, since the residents would be the ones paying the HOA fees, they would in turn be subsidizing their own transit passes, thus no actual discount would be experienced.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-10	Provide End-of-Trip Bicycle Facilities	This measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers. The provision and maintenance of secure bike parking and related facilities encourages commuting by bicycle, thereby reducing VMT.	0.1%-4.4% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-11	Provide Employer-Sponsored Vanpool	This measure will implement an employer-sponsored vanpool service. Vanpooling is a flexible form of public transportation that provides groups of 5 to 15 people with a cost-effective and convenient rideshare option for commuting. The mode shift from long-distance, single-occupied vehicles to shared vehicles reduces overall commute VMT.	3.4%-20.4% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-12	Price Workplace Parking	This measure will price onsite parking at workplaces. Because free employee parking is a common benefit, charging employees to park onsite increases the cost of choosing to drive to work. This is expected to reduce single-occupancy vehicle commute trips, resulting in decreased VMT.	0.0%-20.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-13	Implement Employee Parking Cash-Out	This measure will require project employers to offer employee parking cash-out. Cash-out is when employers provide employees with a choice of forgoing their current subsidized/free parking for a cash payment equivalent to or greater than the cost of the parking space. This encourages employees to use other modes of travel instead of single occupancy vehicles. This mode shift results in people driving less and thereby reduces VMT.	0.0%-12.0% Commute VMT	*N/A* - This measure only applies to employment based projects. Therefore, this measure cannot be applied to the Proposed Project since it is only comprised of residential uses.
T-14	Provide Electric Vehicle Charging Infrastructure	This measure is GHG reducing only and does not result in a reduction in VMT.	N/A	*N/A* – Measure does not apply to VMT reductions.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-15	Limit Residential Parking Supply	This measure will reduce the total parking supply available at a residential project or site. Limiting the amount of parking available creates scarcity and adds additional time and inconvenience to trips made by private auto, thus disincentivizing driving as a mode of travel. Reducing the convenience of driving results in a shift to other modes and decreased VMT. Evidence of the effects of reduced parking supply is strongest for residential developments.	0.0%-13.7% Project VMT	*N/A* – The Proposed Project is providing individual private garages and driveways for each single-family dwelling unit. Additional guest parking spaces will also be provided to prevent guest parking from spilling into adjacent neighborhoods. Therefore, reducing the residential parking supply is not feasible.
T-16	Unbundle Residential Parking Costs from Property Cost	This measure will unbundle, or separate, a residential project's parking costs from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost. On the assumption that parking costs are passed through to the vehicle owners/drivers utilizing the parking spaces, this measure results in decreased vehicle ownership and, therefore, a reduction in VMT. Unbundling may not be available to all residential developments, depending on funding sources.	0.0%-15.7% Project VMT	*N/A* – The Proposed Project units are designed to incorporate an attached private garage with each unit. As such, unbundling parking from individual uses is not feasible.
T-17	Improve Street Connectivity	This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of vehicle intersections compared to the average intersection density in the U.S. Increased vehicle intersection density is a proxy for street connectivity improvements, which help to facilitate a greater number of shorter trips and thus a reduction in VMT.	0.0%-30.0% Community VMT	*N/A* – The Proposed Project will not create any additional intersections or roadway segments.
T-18	Provide Pedestrian Network Improvement	This measure will increase the sidewalk coverage to improve pedestrian access. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive. This mode shift results in a reduction in VMT and GHG emissions.	0.0%-6.4% Community VMT	*N/A* – Sidewalks are already provided on Oak Knoll Road along the project frontage. The Proposed Project will include a network sidewalks within the project site. However, these will predominantly serve the project residents and are not anticipated to increase the walking mode split.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-19A	Construct or Improve Bike Facility	This measure will construct or improve a single bicycle lane facility (only Class I, II, or IV) that connects to a larger existing bikeway network. Providing bicycle infrastructure helps to improve biking conditions within an area. This encourages a mode shift on the roadway parallel to the bicycle facility from vehicles to bicycles, displacing VMT. When constructing or improving a bicycle facility, a best practice is to consider local or state bike lane width standards. A variation of this measure is provided as T-19-B, Construct, or Improve Bike Boulevard.	0.0%-0.8% Parallel Roadway VMT	*N/A* – Oak Knoll Road currently provides Class III bicycle sharrows. To implement Class II bike lanes, parking will need to be removed on one side of the roadway. However, parking demand on Oak Knoll Road is high because of the fronting multi-family residential units; so, removing parking on that roadway is not considered a feasible option. Therefore, no additional bicycle improvements are planned to be implemented within the Proposed Project's prevue.
T-19B	Construct or Improve Bike Boulevard	Construct or improve a single bicycle boulevard that connects to a larger existing bikeway network. Bicycle boulevards are a designation within Class III Bikeway that create safe, low-stress connections for people biking and walking on streets. This encourages a mode shift from vehicles to bicycles, displacing VMT. A variation of this measure is provided as T-19-A, Construct or Improve Bike Facility, which is for Class I, II, or IV bicycle infrastructure	0.0%-0.2% Roadway VMT	*N/A* – All bicycle facilities long the Proposed Project frontage have been implemented. Therefore, no additional bicycle improvements are planned to be implemented within the Proposed Project's prevue.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-20	Expand Bikeway Network	This measure will increase the length of a city or community bikeway network. A bicycle network is an interconnected system of bike lanes, bike paths, bike routes, and cycle tracks. Providing bicycle infrastructure with markings and signage on appropriately sized roads with vehicle traffic traveling at safe speeds helps to improve biking conditions (e.g., safety and convenience). In addition, expanded bikeway networks can increase access to and from transit hubs, thereby expanding the "catchment area" of the transit stop or station and increasing ridership. This encourages a mode shift from vehicles to bicycles, displacing VMT. When expanding a bicycle network, a best practice is to consider bike lane width standards from local agencies, state agencies, or the National Association of City Transportation Officials' Urban Bikeway Design Guide.	0.0%-0.5% Community VMT	*N/A* – All bicycle facilities long the Proposed Project frontage have been implemented. Therefore, no additional bicycle improvements are planned to be implemented within the Proposed Project's prevue.
T-21A	Implement Conventional Carshare Program	This measure will increase carshare access in the user's community by deploying conventional carshare vehicles. Carsharing offers people convenient access to a vehicle for personal or commuting purposes. This helps encourage transportation alternatives and reduces vehicle ownership, thereby avoiding VMT. A variation of this measure, electric carsharing, is described in Measure T-21-B, Implement Electric Carshare Program	0.0%-0.15% Community VMT	*N/A* – Public car share programs are not currently available within the City. However, should a car share company want to locate a carshare on the property, the Proposed Project could accommodate its residents. It should be noted that existing rideshare services (Uber & Lyft) would be available to Proposed Project residents. However, they are assumed to be accounted for under the baseline.
T-21B	Implement Electric Carshare Program	The additional GHG reductions associated with this measure, as compared to T-21A do not affect VMT.	N/A	*N/A* – Measure does not apply to VMT reductions.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-22A	Implement Pedal (Non-Electric) Bikeshare Program	This measure will establish a bikeshare program. Bikeshare programs provide users with on-demand access to bikes for short-term rentals. This encourages a mode shift from vehicles to bicycles, displacing VMT. Variations of this measure are described in Measure T-22-B, Implement Electric Bikeshare Program, and Measure T-22-C, Implement Scootershare Program.	0.0%-0.02% Community VMT	*N/A* – See Measure T-22B.
T-22B	Implement Electric Bikeshare Program	This measure will establish an electric bikeshare program. Electric bikeshare programs provide users with on-demand access to electric pedal assist bikes for short-term rentals. This encourages a mode shift from vehicles to electric bicycles, displacing VMT. Variations of this measure are described in Measure T-22-A, Implement Pedal (Non-Electric) Bikeshare Program, and Measure T-22-C, Implement Scootershare Program.	0.0%-0.06% Community VMT	*N/A* – The City does not currently have an electric bikeshare program.
T-22C	Implement Scootershare Program	This measure will establish a scootershare program. Scootershare programs provide users with on-demand access to electric scooters for short-term rentals. This encourages a mode shift from vehicles to scooters, displacing VMT. Variations of this measure are described in Measure T-22-A, Implement Pedal (Non-Electric) Bikeshare Program, and Measure T-22-B, Implement Electric Bikeshare Program	0.0%-0.07% Community VMT	*N/A* – The City does not currently have a scootershare program.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-23	Provide Community-Based Travel Planning	This measure will target residences in the plan/community with community-based travel planning (CBTP). CBTP is a residential-based approach to outreach that provides households with customized information, incentives, and support to encourage the use of transportation alternatives in place of single occupancy vehicles, thereby reducing household VMT.	0.0%-2.3% Community VMT	*Yes* - It is assumed that the Proposed Project HOA will provide alternative modes of transportation information to residents and tenant as a part of the "New Resident" or "New Tenant" package. The HOA will also provide residents with transit schedules within the area, and alert residents when new transit services are added, or services are charged. The HOA will also act as Travel Advisor, providing new residents and tenants with information regarding how members of households can travel in alternative ways that meet their needs.
T-24	Implement Market Price Public Parking (On-Street)	This measure will price all on-street parking in a given community, with a focus on parking near central business districts, employment centers, and retail centers. Increasing the cost of parking increases the total cost of driving to a location, incentivizing shifts to other modes and thus decreasing total VMT to and from the priced areas.	0.0%-30.0% Community VMT	*N/A* – The City does not currently have a parking district or on-street parking meters; therefore, this measure is not applicable.
T-25	Extend Transit Network Coverage or Hours	This measure will expand the local transit network by either adding or modifying existing transit service or extending the operation hours to enhance the service near the project site. Starting services earlier in the morning and/or extending services to late-night hours can accommodate the commuting times of alternative-shift workers. This will encourage the use of transit and therefore reduce VMT.	0.0%-4.6% Community VMT	*N/A* – The operation and deployment of transit routes within the City is under the jurisdiction of MTS. Therefore, the City nor the project applicant have the authority to change or increase the existing transit services.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-26	Increase Transit Service Frequency	This measure will increase transit frequency on one or more transit lines serving the plan/community. Increased transit frequency reduces waiting and overall travel times, which improves the user experience and increases the attractiveness of transit service. This results in a mode shift from single occupancy vehicles to transit, which reduces VMT.	0.0%-11.3% Community VMT	*N/A* – The operation and deployment of transit routes within the City is under the jurisdiction of MTS. Therefore, the City nor the project applicant have the authority to change or increase the existing transit services.
T-27	Implement Transit-Supportive Roadway Treatments	This measure will implement transit-supportive treatments on the transit routes serving the plan/community. Transit-supportive treatments incorporate a mix of roadway infrastructure improvements and/or traffic signal modifications to improve transit travel times and reliability. This results in a mode shift from single occupancy vehicles to transit, which reduces VMT.	0.0%-0.6% Community VMT	*N/A* – There are currently no transit facilities or services located along Oak Knoll Road; therefore, the Proposed Project does not have the prevue to implement Transit-Supportive Roadway Treatments along its frontage.
T-28	Provide Bus Rapid Transit	This measure will convert an existing bus route to a bus rapid transit (BRT) system. BRT includes the following additional components, compared to traditional bus service: exclusive right-of-way (e.g., busways, queue jumping lanes) at congested intersections, increased limited-stop service (e.g., express service), intelligent transportation technology (e.g., transit signal priority, automatic vehicle location systems), advanced technology vehicles (e.g., articulated buses, low-floor buses), enhanced station design, efficient fare-payment smart cards or smartphone apps, branding of the system, and use of vehicle guidance systems. BRT can increase the transit mode share in a community due to improved travel times, service frequencies, and the unique components of the BRT system. This mode shift reduces VMT	0.0%-13.8% Community VMT	*N/A* – The operation and deployment of transit routes within the City is under the jurisdiction of MTS. Therefore, the City nor the project applicant have the authority to implement or operate BRT services.

DRAFT

Table 3.2 VMT Impact Feasible Mitigation

#	Measure	Description	Potential Reduction	Feasible?
T-29	Reduce Transit Fares	This measure will reduce transit fares on the transit lines serving the plan/community. A reduction in transit fares creates incentives to shift travel to transit from single-occupancy vehicles and other traveling modes, which reduces VMT. This measure differs from Measure T-8, Implement Subsidized or Discounted Transit Program, which can be offered through employer-based benefits programs in which the employer fully or partially pays the employee's cost of transit.	0.0%-1.2% Community VMT	*N/A* – The operation and deployment of transit routes within the City is under the jurisdiction of MTS. Therefore, the City nor the project applicant have the authority to change transit fairs.
T-30	Use Cleaner-Fuel Vehicles	This measure is GHG reducing only and does not result in a reduction in VMT.	N/A	*N/A* – Measure does not apply to VMT reductions.

DRAFT

3.3 TDM Program Effectives

As outlined in Table 3.2, the following TDM measures were identified to be feasible for the Proposed Project to include within its design or implement on-site.

T-23: Provide Community-Based Travel Planning

The VMT related reductions associated with each of the measures outlined above are calculated within the following sections:

T-23: Provide Community-Based Travel Planning

GHG Reduction Formula

$$A = \frac{C}{B} \times D \times -E \times F$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from household vehicle travel in plan/community	0–2.3	%	calculated
User Inputs				
B	Residences in plan/community	[ ]	residences	user input
C	Residences in plan/community targeted with CBTP	[ ]	residences	user input
Constants, Assumptions, and Available Defaults				
D	Percent of targeted residences that participate	19	%	MTC 2021
E	Percent vehicle trip reduction by participating residences	12	%	MTC 2021
F	Adjustment factor from vehicle trips to VMT	1	unitless	assumed

It is assumed that the Proposed Project HOA will provide alternative modes of transportation information to residents and tenant as a part of the "New Resident" or "New Tenant" package. The HOA will also provide residents with transit schedules within the area, and alert residents when new transit services are added, or services are charged. The HOA will also act as Travel Advisor, providing new residents and tenants with information regarding how members of households can travel in alternative ways that meet their needs.

Based on US Census data, the average people per household within the City is 2.99. Therefore, the Proposed Project would be anticipated to have a total of 191 residents (2.99 people per household X 64 units). All project residents would be targeted with the CBTP.

$$\frac{\text{191 CBTP Targeted Residents}}{\text{191 Total Residents}} \times 19\% \times 12\% \times 1 = \text{2.3\%VMT Reduction}$$

3.4 Impact After Mitigation

When determining the overall VMT reduction associated with the project, the VMT reduction for each individual strategy should be dampened, which is adjusted to reflect that some of the strategies of the strategies may be redundant or applicable to the same populations. Consequently, if all potential TDM measures identified in the previous section were fully realized, the Proposed Project's VMT would be reduced by 2.3% to 20.22 miles (20.7 miles X (100%-2.3%)). The reduction is not sufficient to reduce the VMT per capita below the regional threshold (16.1 miles). Therefore, the Proposed Project's VMT per capita would result in a significant impact. As outlined in Table 3.2, there are no additional quantifiable VMT reducing measures in which the Proposed Project can feasibility implement. Therefore, the Proposed Project's VMT related impact would be significant and unavoidable.

Harmon Ranch – Water System Analysis

General Policy Statement

This hydraulic analysis is premised upon current criteria. It is not a representation, expressed or implied, that the City of Poway (City) will furnish water at a future date. Applications for water service are governed by separate rules and regulations, and are the subject of separate City proceedings, apart from hydraulic analysis.

Overall demands allow for typical domestic water consumption by residents and estimated consumption by commercial/industrial users, and an allowance for light irrigation. The assumed demands do not consider any high water usage for commercial/industrial processes or for irrigation of orchards and crops unless specifically stated by the Developer/Engineer.

The location of existing improvements and the recommendations of this hydraulic analysis are presented in schematic form only. It is the responsibility of the Developer/Engineer to design the final improvements, including independent investigation of existing conditions.

The results, including the pressures for the fire flows, should be considered approximate and are based upon a hydraulic model of the City's distribution system. In constructing the model, the 24-hour demand patterns are based upon 2020 conditions, and other assumptions were made. Model demands are based on an average meter records from 2017 through 2019. Actual conditions and results may vary from what is assumed in the model. This analysis is only applicable to Harmon Ranch.

Introduction and Purpose

This analysis is for Harmon Ranch (Project) in the City of Poway (City). The Project is a 11.51-ac property consisting of 64 residential lots located along Oak Knoll Road west of Carriage Road (see **Figure 1**).

Approach

Analysis of the proposed facilities is carried out using an InfoWATER® water distribution system computer model originally developed and updated for the City of Poway as part of their 2001 Potable Water Master Plan Update and updated several times during subsequent master plans and other studies. In the model, the water system is characterized by a series of links (pipes) and nodes (connection points). Links and nodes can also represent reservoirs, pump stations, and pressure reducing valves. The turnover analysis is a simple volumetric calculation.

Information describing the proposed project layout is derived from a four-sheet plan set as provided by the City, prepared by Hunsaker & Associates.

There are also several existing pipes that traverse the project site. The pipes will be either removed or abandoned in place, with connections provided to the proposed onsite water system. These connections and abandoned/removed pipes are shown in Figure 2.

Source of Water

The Project is located within the service area known as the 715 Zone. This pressure zone is supplied by gravity from the City's main 865 Zone through several pressure reducing stations and from the 895 Zone to the south. The 1.0-million gallon Celestial Reservoir provides storage for this zone.

Shown schematically in **Figure 2** is a portion of the existing water distribution system for the 715 Zone.

Demands

In conformance with the water demands established in the 2009 Potable Water Master Plan Update, and based on the land use types, lot sizes and development densities, the following unit water demands are employed:

Rural Residential (RR-C): 1.68 gpm/acre

Combining the unit demand with the combined approximate acreage of 11.51 acres, a total average annual water demand of 19.34 gpm is estimated. Peaking factors for Maximum Day Demand (MDD) and Peak Hour Demand (PHD) are included in the daily diurnal pattern for each zone, including the 715 Zone, and are 2.57 and 2.97, respectively.

Project MDD = 19.34 gpm x 2.57 = 49.70 gpm

Project PHD = 19.34 gpm x 2.97 = 57.44 gpm

Design Criteria

The minimum desirable pressure during a maximum day plus fire condition is 20 psi and the maximum velocity is 15 fps in the vicinity of the fire flow demand. Fire sprinkler demands are typically determined by the fire sprinkler designer, and as such, have not been analyzed as part of this study. Minimum pressures for PHD are 40 psi, with a maximum PHD velocity of 7 fps.

The required fire flow for a single-family residential development such as this is 1,500 gpm for a duration of 2 hours. This time typically occurs on the MDD that occurs after a PHD, such that the tanks serving the zone would be at their lowest level of the day.

Results

PHD simulation shows that the vicinity and Project area can provide a minimum of 40 psi pressure at velocities less than 7 fps.

A fire flow of 1,500 gpm was placed at various proposed fire hydrants throughout the Project. Results show that the fire flow design criteria are satisfied with a minimum of 20 psi at nodes in the vicinity of the fire, and a maximum velocity of less than 15 fps throughout the site with all 8-inch piping. No offsite improvements are necessary to service the Project. The model results for each hydrant are listed below in Table 1.

Table 1. Model Results

Run No.	Condition	Minimum Pressure	Maximum Velocity
1	Peak Hour Demand	83.2 psi at Node J706	1.4 fps at Pipe 715-0051
2	MDD + 1,500 gpm Fire at Node J702	75.0 psi at Node J702	6.9 fps at Pipe P775
3	MDD + 1,500 gpm Fire at Node J704	74.7 psi at Node J704	7.2 fps at Pipe P775
4	MDD + 1,500 gpm Fire at Node J716	75.5 psi at Node J716	7.3 fps at Pipe P775
5	MDD + 1,500 gpm Fire at Node J722	77.5 psi at Node J706	7.3 fps at Pipe P775
6	MDD + 1,500 gpm Fire at Node J710	77.1 psi at Node J702	7.1 fps at Pipe P775
7	MDD + 1,500 gpm Fire at Node J714	76.5 psi at Node J702	6.9 fps at Pipe P775

Results for the worst-case fire condition at J104 and PHD condition are provided in the **Appendix**.

Subject: Sewer Service Analysis for the Harmon Ranch Project in the City of Poway

Introduction

This report provides an analysis of sewer service for the Harmon Ranch project. The project is located along Oak Knoll Road, south of Poway Road, and west of Carriage Road in the southwest portion of the City of Poway. Figure 1 provides a vicinity map for the project.

The project encompasses 11.5 acres and includes 64 single family detached dwelling units. Primary access to the project site is planned via existing Oak Knoll Road, and secondary emergency access is planned via Roca Grande Drive. Four of the dwelling units will be located south of Oak Knoll Road and the remaining 60 dwelling units will be located north of Oak Knoll Road. Pad elevations for the project range from 448 feet to 469 feet. Sewer service to the Harmon Ranch project will be provided by the City of Poway.

HARMON RANCH

Sewer System Planning Criteria

The planning criteria used to evaluate the sewer system requirements for the Harmon Ranch project are in accordance with the City of Poway Sanitary Sewer Master Plan, dated February 2013 (City of Poway 2013 Sewer Master Plan).

Gravity Sewers. Public gravity sewer lines are to be 8-inch in diameter minimum and are to be designed for a minimum velocity of 2.0 feet per second at peak flow. Where a velocity of 2.0 feet per second cannot be achieved, a minimum pipe slope of 1.0 percent is recommended. Gravity sewer lines are evaluated using Manning's Equation with a roughness coefficient "n" of 0.013. Gravity sewers that are smaller than 18-inches in diameter are sized to convey peak dry weather flows with a maximum depth-to-diameter (d/D) radio of 0.50 and peak wet weather flows with a maximum depth-to-diameter (d/D) ratio of 0.90.

Sewer Generation and Peaking Factors

Sewer generation for the Harmon Ranch project was estimated using the sewer generation factors provided in the City of Poway 2013 Sewer Master Plan. Table 1 summarizes the sewer generation factor utilized in this study.

TABLE 1
HARMON RANCH
SEWER GENERATION FACTOR

Land Use	Sewer Generation Factor
Single Family Residential	215 gpd/DU

The City of Poway 2013 Sewer Master Plan does not have peaking factor curves. Peaking factors were determined using metering data provided in the City of Poway 2013 Sewer Master Plan as described in the subsections below.

Peak Dry Weather Peaking Factor. To convert average dry weather flow to peak dry weather flow a peaking factor of 1.67 is used. The peaking factor is based on Temporary Meter Basin B flow monitoring data which encompasses the study area of this report. Table 2 presents the calculation of the peak dry weather flow peaking factor of 1.67.

TABLE 2 PEAK DRY WEATHER FLOW (PDWF) PEAKING FACTOR CALCULATION
Average Dry Weather Flow [1] = 1.41 mgd
Peak Dry Weather Flow [2] = 2.35 mgd
PDWF Peaking Factor = 2.35/1.41 = 1.67

[1] City of Poway 2013 Master Plan Table 3-1 (see Appendix A)
[2] City of Poway 2013 Master Plan Table 4-2 (see Appendix A)

Peak Wet Weather Peaking Factor. To convert average dry weather flow to peak wet weather flow a peaking factor of 3.25 is used. Monitoring data for peak wet weather flow were not provided for Temporary Meter Basin B as the metering was short term in nature and did not capture wet weather flows. As such, the peak wet weather flow peaking factor is based on the permanent meter basin in which the study area resides, PO2. Table 3 below presents the calculation of the peak wet weather flow peaking factor of 3.25.

TABLE 3 PEAK WET WEATHER FLOW (PWWF) PEAKING FACTOR CALCULATION
Average Dry Weather Flow [1] = 4.60 mgd
Peak Wet Weather Flow [2] = 14.91 mgd
PWWF Peaking Factor = 14.91/4.60 = 3.25

[1] City of Poway 2013 Master Plan Table 3-2 (see Appendix A)
[2] City of Poway 2013 Master Plan Table 4-3 (see Appendix A)

Harmon Ranch Projected Sewer Flows

Table 4 provides the sewer flow projection for the Harmon Ranch project. As shown, the projected average flow is 13,760 gpd. The resulting projected peak flow for the project is 44,720 gpd (13,760 gpd x 3.25).

TABLE 4
HARMON RANCH
PROJECTED SEWER FLOWS

Land Use	Quantity	Unit Flow Factor	Total Average Dry Weather Flow, gpd
Residential	64 units	215 gpd/unit	13,760
TOTAL	-	-	**13,760**

Existing Sewer System

Figure 2 presents the existing sewer system in the vicinity of the project. Fronting the project in Oak Knoll Road there are existing 8-inch public gravity sewer lines and a 30-inch public trunk sewer. The existing 8-inch public gravity sewer lines convey sewer flows from existing residences along Oak Knoll Road from east to west and tie into the existing 30-inch public trunk sewer. The 30-inch trunk sewer conveys flow west in Oak Knoll Road to Pomerado Road.

Proposed Sewer System

Figure 3 presents the proposed onsite public sewer system for the Harmon Ranch project. As shown in Figure 3, 8-inch public gravity sewer lines are proposed onsite to serve 59 of the 60 dwelling units north of Oak Knoll Road; the last unit north of Oak Knoll Road is an existing Historic Home that will maintain its existing sewer service connection to the existing 8-inch sewer line near the southeast corner of the project in Oak Knoll Road.

The proposed 8-inch public sewer lines onsite will convey sewage south from 59 dwelling units north of Oak Knoll Road to the existing 8-inch public sewer line near the southwest corner of the project in Oak Knoll Road. The 4 lots south of Oak Knoll Road will make individual lateral connections to the same existing 8-inch public sewer line near the southwest corner of the project in Oak Knoll Road. The existing 8-inch public sewer lines near the southeast and southwest corners of the project convey sewage west to the existing 30-inch public trunk sewer in Oak Knoll Road.

Sewer System Analysis

To analyze the impact of the Harmon Ranch project on the existing offsite sewer system the sewer system was analyzed under existing flow conditions and under existing flows plus proposed flow from the Harmon Ranch project. The proposed onsite public sewer lines were not evaluated in this report as improvement plans are not available at this time. The proposed onsite public sewer lines will be designed to maintain a velocity of 2.0 feet per second at peak flow. If 2.0 feet per second cannot be achieved, a minimum pipe slope of 1.0 percent will be provided. Analysis of the existing 30-inch public trunk sewer is outside of the scope of this report.

Existing flows analyzed for the existing system include three single family homes with an estimated average sewer generation of 215 gpd/unit. Existing sewer system as-builts provided in Appendix B were utilized for the analysis.

Existing System Under Existing Flows. Appendix C presents the results of the existing sewer system analysis under existing flows. Exhibit A presents a Manhole Diagram for the system. The results for this analysis show that under existing flows the existing 8-inch public sewer line in Oak Knoll Road has a maximum depth-to-diameter ratio of 0.04. Flow velocities range from 0.6 fps to 0.8 fps.

Existing System Under Existing Plus Project Flows. Appendix D presents the results of the existing and proposed sewer system analysis under existing flow plus project flow. Exhibit A presents a Manhole Diagram for the system. The results for this analysis show that under existing plus project flows the existing 8-inch public sewer line in Oak Knoll Road increase from a maximum depth-to-diameter ratio of 0.04 to a maximum depth-to-diameter ratio of 0.16. Flow velocities in the existing system range from 1.8 fps to 1.9 fps under existing plus project flows.

Based on the results of the sewer analysis, the existing 8-inch public sewer line in Oak Knoll Road has adequate capacity for the Harmon Ranch project.

Conclusions and Recommendations

The following conclusions and recommendations are presented based on the sewer system analysis prepared for the Harmon Ranch project.

1. Sewer service to the Harmon Ranch project will be provided by the City of Poway.

2. The proposed sewer system for the Harmon Ranch project is presented in Figure 2.

3. To serve 59 of the 60 dwelling units north of Oak Knoll Road, 8-inch public gravity sewer lines are proposed onsite; the last unit north of Oak Knoll Road is an existing Historic Home that will maintain its existing sewer service connection to the existing 8-inch sewer line near the southeast corner of the project.

4. The 4 lots south of Oak Knoll Road will make individual lateral connections to the existing 8-inch public sewer line near the southwest corner of the project in Oak Knoll Road.

5. The existing offsite gravity sewer system analysis shows that the existing 8-inch public sewer line in Oak Knoll Road has adequate capacity for the Harmon Ranch project.

6. The proposed public sewer lines onsite shall be designed to meet all City of Poway requirements. Final design will be reflected on the improvement plans to be submitted for review and approval.

Thank you for the opportunity to provide sewer system planning services for this project. Please feel free to contact us to further discuss any aspect of the information presented in this sewer service analysis for the Harmon Ranch project.

Chapter 3 Wastewater Generation Analysis

This chapter provides a description of the wastewater generation including:

- Existing flow meter data summary;
- Methodology for developing unit generation rates;
- Recommended unit generation rates;
- Estimated future wastewater flows; and
- Metro capacity needs.

3.1 Flow Meters

As described in Section 2.6, most of Poway's sewer flows are conveyed within the City of San Diego Metro System for disposal at either the NCWRP and/or the PLWTP. Poway's current contracted conveyance capacity within the Metro System is 5.05 million gallons per day (mgd). Sewage generated in the Pomerado and Old Winery basins are conveyed north westerly into Muni's East Bernardo Trunk Sewer and are ultimately conveyed to HARRF. Poway has 5.894 mgd of contracted treatment capacity within the Metro system, including 0.05 mgd of treatment capacity at HARRF.

The existing sanitary sewer system has one permanent flow meter located at the downstream end of the Poway system (Meter PO-2) and five permanent flow meters where City of San Diego flows are metered into the Poway sanitary sewer system. The permanent meters are maintained by the City of San Diego through their contractor ADS Environmental Services (ADS). To help characterize wastewater flows throughout the system, five temporary flow meters were placed strategically throughout Poway's sanitary sewer system to monitor flows from internal Poway areas. ADS monitored these locations for a 14-day period, from November 11 through November 24, 2011. Table 3-1 summarizes the average daily metered flow at the permanent and the temporary meters with viable data. Figure 3-1 presents the locations of the permanent and temporary meters. The ADS flow metering report and meter data are included in Appendix B.

Table 3-1 Sanitary Sewer Flows by Meter

Meter Name	Monitoring Period	Metered Average Flow (mgd)
PO1	Dec 1, 2010 - Nov 30, 2011	0.44
PO3	Dec 1, 2010 - Nov 30, 2011	0.12
PO5	Dec 1, 2010 - Nov 30, 2011	0.23
PO4	Dec 1, 2010 - Nov 30, 2011	0.15
PO6	Dec 1, 2010 - Nov 30, 2011	0.19
Meter C	Nov 11, 2011 - Nov 24, 2011	0.14
Meter D	Nov 11, 2011 - Nov 24, 2011	0.36
Meter E	Nov 11, 2011 - Nov 24, 2011	0.26
Meter B	Nov 11, 2011 - Nov 24, 2011	1.41
Meter A	Nov 11, 2011 - Nov 24, 2011	0.06
PO2	Dec 1, 2010 - Nov 30, 2011	4.60

mgd = million gallons per day

3.1.1 Metered Sewer Basins

Meter basins were delineated for all of the installed temporary and permanent flow meters and encompass all of Poway's existing connected wastewater customers. Wastewater flows generated within each meter basin were estimated from the average flows observed at each meter. In some basins, this required the deduction of flows from upstream meters. Table 3-2 summarizes the meter basins, the estimated average flow and a description of each basin. Figure 3-2 presents a flow schematic of the meter basins and flow meters in Poway's sanitary sewer system.

Table 3-2 Poway Metered Sewer Flows by Basin

Meter Name	Description	Metered Average Flow (mgd)
San Diego Basin		
PO1	San Diego West (includes La Manda area)	0.44
PO3	San Diego West	0.12
PO4	San Diego West	0.15
PO5	San Diego South	0.23
PO6	San Diego South	0.19
City Metro Basin		
Meter C	Poway Business Park	0.14
Meter D	South East Poway/ Business Park	0.36
Meter E	South East Poway	0.26
Meter B	Pomerado/ North Poway	1.41
Camino del Valle	Camino del Valle LS (pumps to Meter B)	0.62
Meter A	North Poway	0.06
PO2	Central Poway	4.60

mgd = million gallons per day
Note: Flow meter data from November 11-25, 2011.

The study area is comprised of three major sewer basins, shown in Figure 3-3: San Diego flows to Poway (San Diego Basin), Poway flows treated by HARRF (Poway HARRF Basin), and Poway flows to the Metro System (City Metro Basin). The San Diego Basin is monitored by three flow meters along the western portion of Poway (PO-1, PO-3, and PO-5) and two additional meters along the southern boundary of Poway (PO-4 and PO-6). The Poway HARRF Basin is not metered but includes two house count areas for estimating flow contributions, Old Winery and Pomerado. The Poway Metro Basin is monitored at meter PO-2, located on Poway Road west of Poway's boundary prior to entering the City of San Diego's Penasquitos Trunk Sewer.

4.8 Model Calibration

The model was calibrated by refining estimated model parameters under dry and wet weather conditions so that the simulated model flow conditions reasonably approximated the measured flow conditions. Diurnal curves were adjusted for the dry weather calibration such that simulated and recorded wastewater flow and depth hydrographs matched to within a reasonable level of accuracy. Infiltration and routing coefficients were adjusted in the wet weather calibration such that simulated and recorded wastewater peak flows matched to within a reasonable level of accuracy.

4.8.1 Dry Weather Calibration

The model was calibrated to dry-weather meter data recorded during the temporary monitoring period of November 11-25, 2011 at both the permanent and temporary flow meters. November 11, 2011 was chosen for calibration since no rain events were observed and flows were indicative of typical dry weather flow patterns. Peak flow calibration was based on the highest observed flow recorded in that month. Simulated flow hydrographs at each meter location were compared with recorded discharge measurements. The purpose of the comparison was to allow for refinement of estimated model parameters so that the simulated flow conditions reasonably approximated the measured flow conditions. These parameters generally include diurnal curve patterns and peak to average flow ratios (peaking factors).

Results of the dry weather calibration are best presented graphically, and are shown in Figures 4-4 through 4-14. The typical range of sewer volume and peak flows for dry weather model calibration is within +/– 10 percent of field measurements for master planning purposes. Table 4-2 summarizes the results of the dry weather calibration.

Table 4-2 Dry Weather Calibration Summary

Meter Name	Description	Observed Peak Flow (mgd)	Modeled Peak Flow (mgd)
San Diego Basin			
PO1	San Diego West (includes La Manda area)	0.96	0.80
PO3	San Diego West	0.25	0.27
PO4	San Diego West	0.43	0.49
PO5	San Diego South	0.28	0.29
PO6	San Diego South	0.37	0.34
Poway Metro Basin			
Meter C	Poway Business Park	0.13	0.14
Meter D	South East Poway/ Business Park	0.48	0.55
Meter E	South East Poway	0.49	0.46
Meter B	Pomerado/ North Poway	2.35	2.37
Meter A	North Poway	0.09	0.10
PO2	Central Poway	6.89	6.32

mgd = million gallons per day

Table 4-3 Wet Weather Calibration Summary

Meter Name	Description	Observed Peak Flow (mgd)	Modeled Flow (mgd)
PO1	San Diego West (includes La Manda area)	1.22	1.22
PO3	San Diego West	0.30	0.31
PO4	San Diego West	1.11	1.11
PO5	San Diego South	0.33	0.34
PO6	San Diego South	1.31	1.31
PO2	Central Poway	14.91	14.86

mgd = million gallons per day

Based on typical master planning calibration criteria, the hydraulic model is within acceptable ranges when compared to metered flow data and observed rainfall data. The model is considered a calibrated model and can be used for future planning scenarios.

4.9 Capacity Analysis

A capacity analysis of the existing collection system was performed under existing and forecasted dry and wet weather flow conditions. Model simulations were performed for the recommended 2030 wastewater generation, discussed in Chapter 3, in order to identify potential improvement projects. The identified improvement projects were then sized to accommodate the 2050 flow projections. Projects were evaluated under the existing wastewater flows to identify project priority and phasing. Identified improvement projects were also evaluated against operational concerns, such as lift station deficiencies, odor problems, and known high-frequency maintenance areas. These projects and operational concerns are presented in Chapter 5 to form the Capital Improvement Plan presented in Chapter 6.

4.9.1 Lift Stations and Force Mains

The lift stations and force mains owned and operated by Poway were evaluated under existing and projected wastewater flows based upon the criteria listed in Table 4-1. Table 4-4 summarizes the existing and future lift station pump capacities. Table 4-5 summarizes the existing and future lift station force main capacities.

Atkins reviewed lift station SCADA data for the November 11-25, 2011 and December 20-22, 2010 periods to evaluate pump performance and determine the firm pumping capacity of each lift station. Firm capacity is considered to be the maximum pumping capacity observed from SCADA data at a lift station with one pump out of service. Most of the lift stations were found to operate within the expected system head curves; however, the Camino del Valle LS data showed that pumps were operating at nearly twice the design point flows during the storm event. System head curves were compared to pump curves for each lift station and are presented in Appendix E.

FIRE RESPONSE TECHNICAL MEMORANDUM

To:	
From:	Dudek Fire Protection Planning Team, Michael Huff, Principal
Subject:	Harmon Ranch Project Fire and Medical Response Analysis
Date:	February 14, 2023
cc:	N/A
Attachment(s):	1. Poway Fire Department Fire Station 1 Modeled Response Time 2. Poway Fire Department Fire Station 3 Modeled Response Time

The following technical memorandum provides a summary of Dudek's fire service response analysis for the Harmon Ranch Project (Project) in Poway, California. This letter provides a preliminary summary of the existing Poway Fire Department's (PFD) nearby resources, their modeled travel time responses into the Project. The goal is to determine whether the Project can be served within the PFD's internal response time standards.

1 Assignment

Dudek's assignment was to:

- Conduct evaluation of existing, nearby PFD fire station travel times to the project site; and
- Analyze generated information to determine if any of the Project site cannot be reached within the City's response time goal.

2 Project Description

Lennar Homes of California, LLC ("Applicant"), is proposing a residential neighborhood on a 11.5-acre Project Site. The Project site is comprised of approximately 5.7 acres designated for residential development, 3.2 of open space areas, 1.9 acres for private streets and 0.5 acres of public right-of-way (Oak Knoll Road). The Proposed Project would include 64 single family detached homes. The Proposed Project density is consistent with the existing RS-7 designation. Primary access to the Project Site is planned via existing Oak Knoll Road and secondary emergency access is planned via the extension of existing Roca Grande Drive. Sixty of the homes are proposed to front newly constructed private streets, while four homes and an open space/overlook area front existing Oak Knoll Road.

The Project is located within the jurisdiction of the PFD. The fire department provides structural fire protection and advanced life support-level emergency medical services within the City limits; the Poway Fire Department is an all-hazard, all-risk response agency. From three fire stations, 17 personnel respond to emergency and non-emergency

calls for service by staffing three paramedic engines, a paramedic ladder truck, two paramedic ambulances and one incident commander (Fire Battalion Chief). Engine company personnel cross-staff ICS Type III wildland brush engines and provides staffing of a CalOES Type I engine when called upon. The Department maintains response aid agreements with surrounding jurisdictions and participates in the California State Fire & Rescue Mutual Aid System and FEMA's Urban Area Search & Rescue team. The Department's resources are grouped into the Metro Zone area of San Diego County Operational Area and partners with fire departments from San Diego City, Miramar, Chula Vista, National City, Coronado, Imperial Beach, and U.S. Navy Federal. The fire department operates two primary Fire Stations [Stations 1 and 3] that would respond to an incident at the proposed Project site, with first-due response likely from Station 1 given its closer location and greater coverage in a faster timeframe. Station 3 would respond as necessary and also provides fast response throughout the Project. Table 1 presents a summary of the location, equipment, and staffing levels for the two PFD stations responding to the site.

Table 1
Poway Fire Department Responding Fire Stations Summary

Fire Station	Location	Equipment	Staffing
Station 1	1350 Community Road Poway, CA	Paramedic Engine Co. Paramedic ambulance Type III Brush Engine Type I Fire Engine Battalion Chief	On duty: 6
Station 3	14322 Pomerado Road Poway, CA	Paramedic Engine Co. Type III Brush Engine Ladder Truck Company Paramedic Ambulance	On-duty: 8

3 Methods

3.1 Travel Time Response Modeling

Dudek conducted a GIS-based travel time coverage modeling effort in order to determine if the project meets the PFD's response goal. The PFD indicates that the City of Poway does not have a published response time standard but do track response time averages by geography and make appropriate adjustments based on those results. Many jurisdictions have published response time standards and they are typically shorter timeframes for dense, urban areas, and longer timeframes for suburban and rural areas.

Travel time is one part of the overall response time and is based largely on the distance from the fire station to the project. Typically, total response time also includes dispatch and turnout times as a constant i.e., 2 minutes and

30 seconds. The Project's entrance is within 1.5 miles from Fire Station 1. The most remote structure in the Project is within approximately 1.6 miles of the Fire Station.

3.2 GIS Response Travel Time Modeling

Following compilation of all necessary data layers received from project applicant and acquired via publicly available sources, Dudek verified that all data layers were in the correct State Plane Zone coordinate system with units in feet. A network data set was then created utilizing ESRI's Network Analyst extension in the Arc Catalog module. The data set was created by merging the existing centerline street layer with the proposed Harmon Ranch Project centerline street data, provided by project applicants, and assigning parameters to the created data set. Several parameters are available during the creation of a network data set and include elevation constraints, U-turn capabilities, curb approach direction and travel impedance.

Due to the emergency nature of the response scenarios modeled in this analysis, U-turns were permitted on every road. Curb approach determines on which side of the street the vehicle needs to approach and includes three options, left, right, or either. The 'either' option was selected for all roads in this analysis based on the emergency nature of the response situations. Finally, travel impedance was utilized to include the effect of speed limits on response travel time. A custom impedance value was created for each road segment and was a function of road segment distance (miles) divided by speed (mph). This value was utilized in Network Analyst calculations for both modeling types and reflected the time necessary for a vehicle to cover the distance of the road segment. Speed was set at 35 mph, consistent with National Fire Protection Association (NFPA) 1142 Table C.11(b) and the Insurance Services Office (ISO) travel time formula (T=0.65 +1.7D).

Once the network data set parameters were finalized, the route analysis was run using the Network Analyst extension in ArcGIS 10.2.2. This function determines the best route between a minimum of two points based on the parameters chosen. The analysis includes response from PFD Fire Stations 1 and 3 , which are the closest stations to the Project. A route analysis procedure was then run using Network Analyst with each respective fire station as the starting point, and a remote location within the Project as the destination. The maps depicting each Station travel time coverage area are presented in Attachments 1 and 2.

3.3 Modeling Results

As indicated in Table 2 and Attachments 1 and 2, response to the project site from the closest existing PFD fire station (Station 1) would arrive at the Project's primary entrance off Oak Knoll Road within 3 minutes, 13 seconds travel time (5 minutes 49 seconds total response time). The most remote units within the Project are reached within 3 minutes 27 seconds travel time, or 5 minutes 57 seconds total response time. This analysis indicates that the entire Project is within a fast response time from the nearest fire station. For perspective, San Diego County uses a 5 minute travel time (7.5 minute total response time) as their standard. This analysis also indicates that Station 3 also has a fast response time, arriving in 3 minutes, 48 seconds trael at the Project entry (5 minutes 18 seconds total response time) and is an appropriate second-due engine.

Table 2
Poway Fire Department Station Response Time to Project

Call Response Times	Harmon Ranch Response Times from Poway Fire Station.			
	Fire Station 1		*Fire Station 3*	
	Travel Time	*Total Response Time*	*Travel Time*	*Total Response Time*
Less than 5 minutes travel/7.5 minutes Total Response Time	100%	100%	100%	100%

3.4 Response Time Capability Assessment

The Project includes a moderate number of new residential structures. Service level requirements could, in the absence of fire facilities and resources improvements, cause a decline in the PFD response times and capabilities for existing residents. However, it is clear that from a response time perspective, the project does comply with the City's total response time standard. From a call volume perspective, Project provided funding through tax revenues and other fire service fees are expected to offset the potential demand created by the Project's generated emergency calls.

4 Discussion and findings

4.1 Emergency Response

As presented, Stations 1 and 3 are well-within generally accepted response goals for first-in fire engine and medic ambulance to the entire Project site.

6 Recommendations

The following Recommendation is provided based on the preceding analysis:

It is recommended that PFD provide emergency response to the proposed Project from Station 1. Factors supporting this recommendation are the absorbable number of calls that would be anticipated as the Project is built and the response time that is within range of local and national standards.

Please feel free to contact me if you have any questions or need any additional information. I look forward to continuing to work with you on this project's fire safety considerations.

Chapter One - Introduction

Page Left Blank Intentionally

Chapter 1 - Introduction

1.0 Introduction

Poway is one of the premier communities in San Diego County. With high-quality housing surrounded by extensive open space areas, close proximity to jobs and services and an exceptional school district, Poway provides a sought-after lifestyle.

The underutilized 11.5-acre site subject to the Harmon Ranch Specific Plan is located in the southern area of the City of Poway, generally south of Poway Road and east of Pomerado Road. Much of the site was recently utilized by San Diego Gas & Electric Company as a storage and staging area. There are four existing homes within the site including a historic home that would be retained as part of the project. See Exhibit 1.1: Vicinity Map. The Harmon Ranch site creates an opportunity to provide much needed housing within the City of Poway, helping the City meet its Regional Housing Needs Allocation. With existing public street access and utilities available to serve the site, the proposed Harmon Ranch community is well situated to meet Poway's ever-growing need for housing.

Exhibit 1.1: Vicinity Map

1.1 Specific Plan Purpose and Authority

The Harmon Ranch Specific Plan provides a permanent solution to revitalizing and maximizing utility of an underutilized 11.5-acre site located in the heart of an existing residential community. There are 64 homes within the Specific Plan Area: 63 new homes and an existing historic home. The 63 home single family neighborhood and associated improvements will be managed by a newly established Community Association to ensure the private streets and private open space and recreation uses are well maintained and managed, aleviating the City of Poway of maintenance responsibililties.

The Specific Plan establishes development standards and design guidelines to make certain all new development is compatible with the existing residential uses adjacent to the site.

Authorized by California Government Code Section 65450, the Specific Plan allows for specialized regulations, development standards and design guidelines for future development that address the unique characteristics of the site. This tool is utilized to facilitate the creation of distinctive communities and unique places. All subsequent development plans, tentative parcel and/or tract map(s) and/or similar entitlements for the project site within the Specific Plan area shall be consistent with the regulations set forth in the Specific Plan and with other applicable City of Poway regulations. Where the Specific Plan is silent, the Poway Municipal Code shall govern.

In accordance with Government Code Sections 65450-65457, the Harmon Ranch Specific Plan provides the following content and scope:

- A statement of relationship to Poway General Plan – Chapter 1
- A statement of Specific Plan vision, setting and objectives – Chapter 2
- Land use location and distribution and Development Regulations – Chapter 3
- A description of roadways, traffic calming measures and parking – Chapter 4
- A description of grading, utilities and services – Chapter 6
- Implementation, including financing tools, maintenance responsibilities and administrative procedures - Chapter 7

State law also allows Specific Plans to address any other subjects deemed necessary or valuable to achieve city goals. The following additional content is provided to support the Specific Plan Objectives identified in Section 2.3.

- Community Design Guidelines for Open Space and Residential Land Uses– Chapter 5

1.2 Specific Plan Location and Context

Located in northeastern San Diego County, the City of Poway is characterized by hills, scenic viewsheds and vast open space areas. Regional access to Poway is provided via Interstate 15 (I-15) which is located west of the City.

The approximately 11.5-acre Specific Plan area, known as the Harmon Ranch Specific Plan, is located in the southern portion of the City of Poway, approximately two and a half miles east of I-15 as shown in Exhibit 1.1: Vicinity Map.

The Specific Plan Area is bisected by existing Oak Knoll Road, which provides primary access to the site. Surrounding land uses include the Towne Center shopping center and Kumeyaay Ipai Interpretive Center along Poway Road to the north, Oak Knoll Road, Poway Creek and existing single-family homes to the south, existing single-family homes to the east and a multi-family apartment community to the west. See Exhibit 1.2 – Surrounding Land Uses.

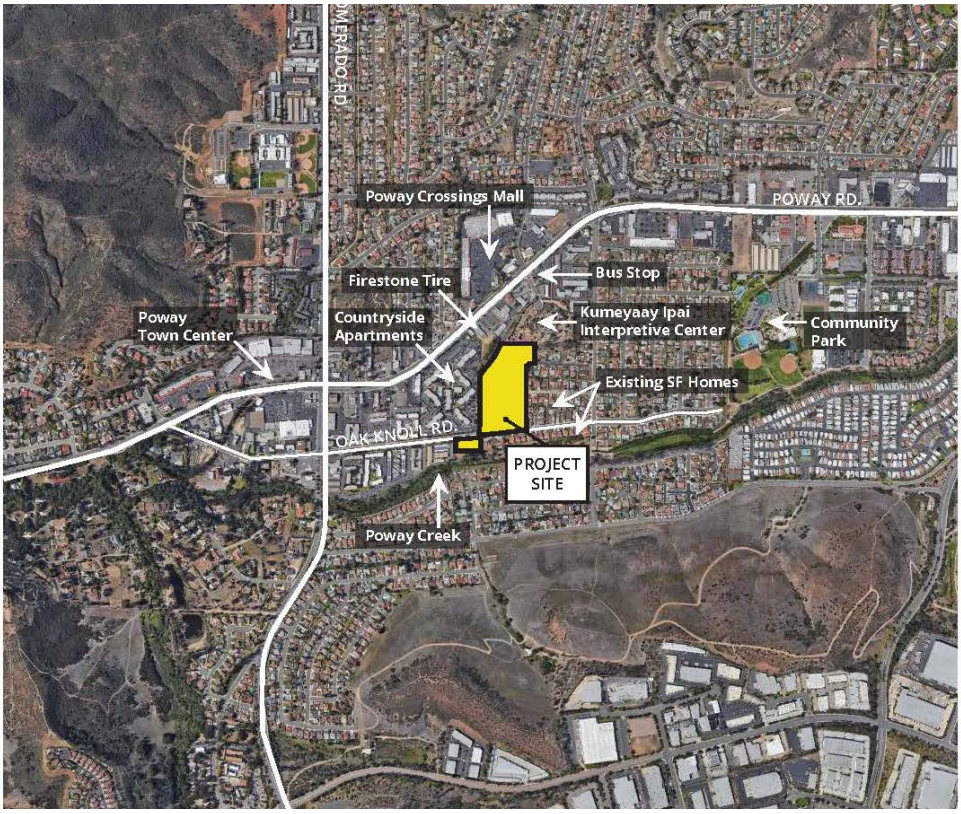

Exhibit 1.2 – Surrounding Land Uses

1.3 Relationship to the General Plan

According to the State of California Office of Planning and Research (OPR), "A Specific Plan is a tool for the systematic implementation of the general plan. It effectively establishes a link between implementing policies of the general plan and the individual development proposals in a defined area." Pursuant to California Government Code Section 65454, a Specific Plan shall be consistent with the local jurisdiction General Plan. Concurrent with this Specific Plan, a General Plan Amendment (GPA) is also proposed, which would change the land use designation of the Specific Plan Area from the existing Residential Single Family 7 (RS-7) General Plan land use designation to the Planned Community (PC) land use designation.

Goal 1 of the Poway General Plan states: It is the goal of the City of Poway to preserve Poway's unique and desirable character as "the City in the Country" and to maintain high quality design and environmental standards in all new development and redevelopment. **Table 1.1: General Plan Consistency Analysis** demonstrates how the proposed residential development would address the applicable policies and goals to comply with the intent of the General Plan. Through implementation of the following applicable General Plan strategies, the project complies with the intent of the respective policies.

Table 1.1: General Plan Consistency Analysis

GENERAL PLAN POLICY	PROJECT RESPONSE
Policy A – Streetscape Seek to develop an attractive streetscape which reflects the rural, small town character of the City.	The entry into the proposed project is located at the intersection of Oak Knoll Road and a planned private street. A community entry wall with signage, lighting and landscaping creates an inviting and attractive entry into the neighborhood, consistent with the rural character of the City. The style, materials and colors planned for the entry monument are compatible with the architectural style of the proposed homes. The proposed project is served by a series of narrow private streets, which minimizes paving, while providing access to all homes. These right-sized streets accommodate street lighting and pedestrian access as well as parking along certain segments. The Community Trail extends through the project, further enhancing pedestrian connectivity to the shopping areas to the north. All new utilities are located underground, consistent with the General Plan strategy. Project CC&Rs will ensure on-going maintenance of private streets, public street frontages, recreation areas, common landscape areas and enforcement of private landscape installation and ongoing maintenance.
Policy B – Subdivision Design Subdivisions should be designed to ensure that future land development supports the goals of the General Plan.	The proposed project includes 63 new homes and retains an existing historic home within the Specific Plan Area. The project density is 8.8 DUs/AC, consistent with the surrounding development and slightly higher than the existing RS-7 zoning designation for the site which permits 8.0 DUs/AC. Lot sizes, spacing, setbacks and building orientation provide for a variety of architectural styles and facades. compatible with the residential character of single family and muti-family neighborhoods adjacent to the Specific Plan Area. By replacing an underutilized, blighted property with a new aesthetically pleasing residential neighborhood, conflicts associated with the existing use of the land will be reduced. Further, the project provides a transition between the higher density apartment community and single-family homes adjacent to the Specific Plan Area and preserves the existing historic home. Each home has an entry element that clearly defines the front of the homes. Since the proposed lots are less than 8,000 SF, lots are primarily rectangular in shape, consistent with the General Plan strategy. On-site significant resources, including a portion of Poway Creek and a tributary to Poway Creek open space areas, are retained in their natural condition. The on-site historical structure is also retained within an 0.25-acre lot within the Specific Plan Area.

GENERAL PLAN POLICY	PROJECT RESPONSE
	The proposed site grading is efficient and avoids potentially hazardous soils conditions.
Policy C – Site Design Attractive, efficient site design shall be required of all development	The design of the site maximizes, to the greatest extent possible, the southern exposure of homes within the project to encourage solar exposure. Based on the Harmon Ranch Tree Inventory and Arborist Report prepared by Dudek (July 2021), one existing tree is subject to the Poway Municipal Code Section 32.170. As required, a 96-inch box tree will be planted at the community entry. Though not required by PMC, the project will also plant up to 42 trees to replace trees impacted by the development. The final number of replacement trees to be determined during preparation of Landscape Improvement Plans. Mailbox locations are shown on the landscape plans in locations that are readily accessible to residents and avoid conflicts with adjacent sidewalks and parking areas. As shown on the site plan and landscape plan, the site design has been coordinated between the Civil and Landscape engineers to improve line-of-sight for both pedestrian and vehicular travel. Single Family homes have been plotted with and without front porches to break-up the building massing and avoid a monotonous line of buildings. With three unique floorplans, four architectural styles and 12 color schemes, the project will create an interesting and vibrant streetscape. Each dwelling unit is provided with private rear yards, consistent with the General Plan strategy.
Policy D – Grading Necessary grading should be done so as to minimize the disturbance to the site and the environmental and aesthetic impacts.	Because the majority of the site is currently disturbed, grading has been minimized to the greatest extent possible. Development is clustered in the disturbed area, while impacts to the most environmentally sensitive areas have been avoided. Except where there are existing rock outcroppings, all exposed graded slopes will be planted with materials compatible with surrounding vegetation, as shown on the project's landscape plan.
Policy E – Interior Circulation and Parking Adequate, safe and efficient on-site circulation and parking areas should be provided for vehicles, which do not conflict with	Through implementation of the following applicable General Plan strategies, the project complies with the intent of Policy E. The project is served by a series of private streets with narrowed paving sections, parallel and head-in parking areas, a sidewalk on one side of the private street and extension of the Community Trail along

GENERAL PLAN POLICY	PROJECT RESPONSE
pedestrian areas or visually dominate the appearance of the development.	Street "A." Traffic calming measures, including the planned community entry, narrow streets, on-street parking, enhanced paving and stop control at the entry all provide for safe vehicular and pedestrian circulation throughout the project. Decorative paving is planned at the community entry and in several additional locations to create a threshold between the public roadway and private streets and at the intersection of Streets "A" and "D" to provide an enhanced pedestrian crossing. A crosswalk at Oak Knoll Road is planned east of the community entry for additional pedestrian connectivity within the Specific Plan Area. Pedestrian crossing signs will be posted and the crosswalk will feature striping and rectangular rapid flashing beacons (RRFBs).
Policy F – Architecture The design of buildings should be aesthetically pleasing and consistent with the City's desire to retain Poway's small town character and image.	The proposed project includes two story home that do not exceed the 35-foot height limit in the General Plan. As described in Chapter 5, Community Guidelines, the project features four architectural styles, Santa Barbara, Ranch, Farmhouse and Monterey –modern interpretations of the old California design theme. A variety of materials and colors will create a cohesive yet interesting streetscape. These designs include trails, trees and front porches, which are compatible with surrounding neighborhoods and Poway's small-town character and image. Roofing materials are also provided in Chapter 5, Community Design, which complement the architectural styles described above.
Policy G – Landscaping Appropriate and well-maintained landscaping should be used to enhance the appearance of development and to modify climatic conditions on site.	All landscaped areas will be maintained pursuant to the community CC&Rs and landscape guidelines, as enforced by the community homeowner's association (HOA). Front yard landscaping will include drought tolerant landscape materials, consistent with City water conservation policies and guidelines. Front yard landscaping will be installed by the developer and maintained by the private homeowner. The developer is also required to install one tree per lot and the HOA will maintain these trees in perpetuity. All landscape plans are subject to review and approval of the HOA to ensure conformance with SP guidelines and City policies and guidelines. The project provides "street trees" within the private homeowner lots, secured with a landscape easement. The community CC&Rs will prohibit homeowners from removing street trees and the HOA will maintain and trim the trees consistent with the General Plan strategy in perpetuity.

General Plan Policy	Project Response
Policy H – Walls and Fencing Walls and fencing should be provided where necessary to ensure privacy or provide noise attenuation.	Along the western boundary, an existing 6-foot-high masonry wall with stucco finish will remain in place separating the proposed single-family homes from the adjacent apartment complex. Though not an arterial roadway, homes along Oak Knoll Road will have a combination block/tubular steel wall at the rear property line. The wall/fence will be broken up by 5-foot-deep recesses that provide space for tree planting. The project includes a combination of retaining walls and 5-foot vinyl fencing and free-standing 5-foot vinyl fencing which provide adequate screening to ensure privacy for the homeowner. There are no sound attenuation walls required within the project.
Policy I – Lighting Lighting should be provided for public convenience and safety but not conflict with the rural nature of the community.	The project includes a conceptual lighting plan that identifies the location of proposed streetlights and landscape lighting which will demonstrate adequate lighting for streets, walkways and parking areas. Landscape lighting will illuminate the community entry and key landscape elements located within the private recreation areas, as appropriate. Architectural lighting detail will be provided as part of the construction documents.

1.4 How to Use This Specific Plan

The Specific Plan is designed to inform future developers, property owners and city staff regarding the permitted uses, regulations, activities and development standards that apply to a particular site within the Specific Plan Area. The intent is to create easily understood rules and guidelines, avoid confusion and conflict when processing future permits and development applications, inform community members about what can occur within the Specific Plan Area and establish a clear process for permit and development applications. The following steps are provided to assist users in finding the necessary information within the Specific Plan:

Step 1: Determine the Applicable Land Use

Refer to Exhibit 3.1: Land Use Plan and Table 3.1: Land Use Summary to determine the permitted land use and intensity. Refer to Table 3.2: Open Space Permitted Land Uses for a list of permissible uses within the Open Space Land Use Districts and Table 3.3: Residential Permitted Land Uses for a list of permissible uses within the Residential Land Use District.

Step 2: Review Regulations and Development Standards

Refer to Section 3.3 for regulations and development standards applicable to the Residential Land Use District. Development standards and regulations for temporary uses, parking, landscaping, lighting, walls and fences and utilities in Chapter 3. Refer to Chapter 4 for street and parking standards.

Step 3: Review Design Guidelines

Refer to the applicable Community Design Guidelines in Chapter 5

Page Left Blank Intentionally

Chapter Two
Vision

Page Left Blank Intentionally

Chapter 2 - Vision

2.0 Introduction

This chapter presents the overall vision for the Harmon Ranch project in the context of existing site conditions, surrounding neighborhood character and the rural nature of Poway.

2.1 Community Vision

The vision for the Harmon Ranch project is to create a new residential neighborhood that is compatible with the surrounding neighborhoods in character and scale, retains the existing historic home as part of the Specific Plan Area, conserves the portion of the site containing sensitive resources, establishes opportunities for active and passive recreation areas for the enjoyment of the residents and provides much needed housing within the City of Poway. This new residential neighborhood will be designed to be aesthetically appealing and compatible with the surrounding residential neighborhoods. The homes will feature high quality architecture that will create an interesting streetscape and pleasing views from the surrounding neighborhoods and public streets. Simplicity in building form with meaningful detailing inspired by natural materials will convey quality and thoughtful designs. Landscaping, lighting, furnishings and the design of outdoor spaces will convey a similar theme through the use of simple designs inspired by natural materials colors and patterns.

Exhibit 2.1: Illustrative Site Plan represents a conceptual design solution that fulfills the vision of the Specific Plan. The Illustrative Site Plan conveys the intended design character and implements the development program permitted by the Specific Plan. The open space recreation areas shown reflect the anticipated land uses and enhance the neighborhood setting envisioned for the project. Recreational uses are distributed throughout the neighborhood and connect to the planned Community Trail to provide ample opportunities for gathering and recreation for neighborhood residents. Floodways are set aside in separate open space lots to ensure they remain in their existing natural condition.

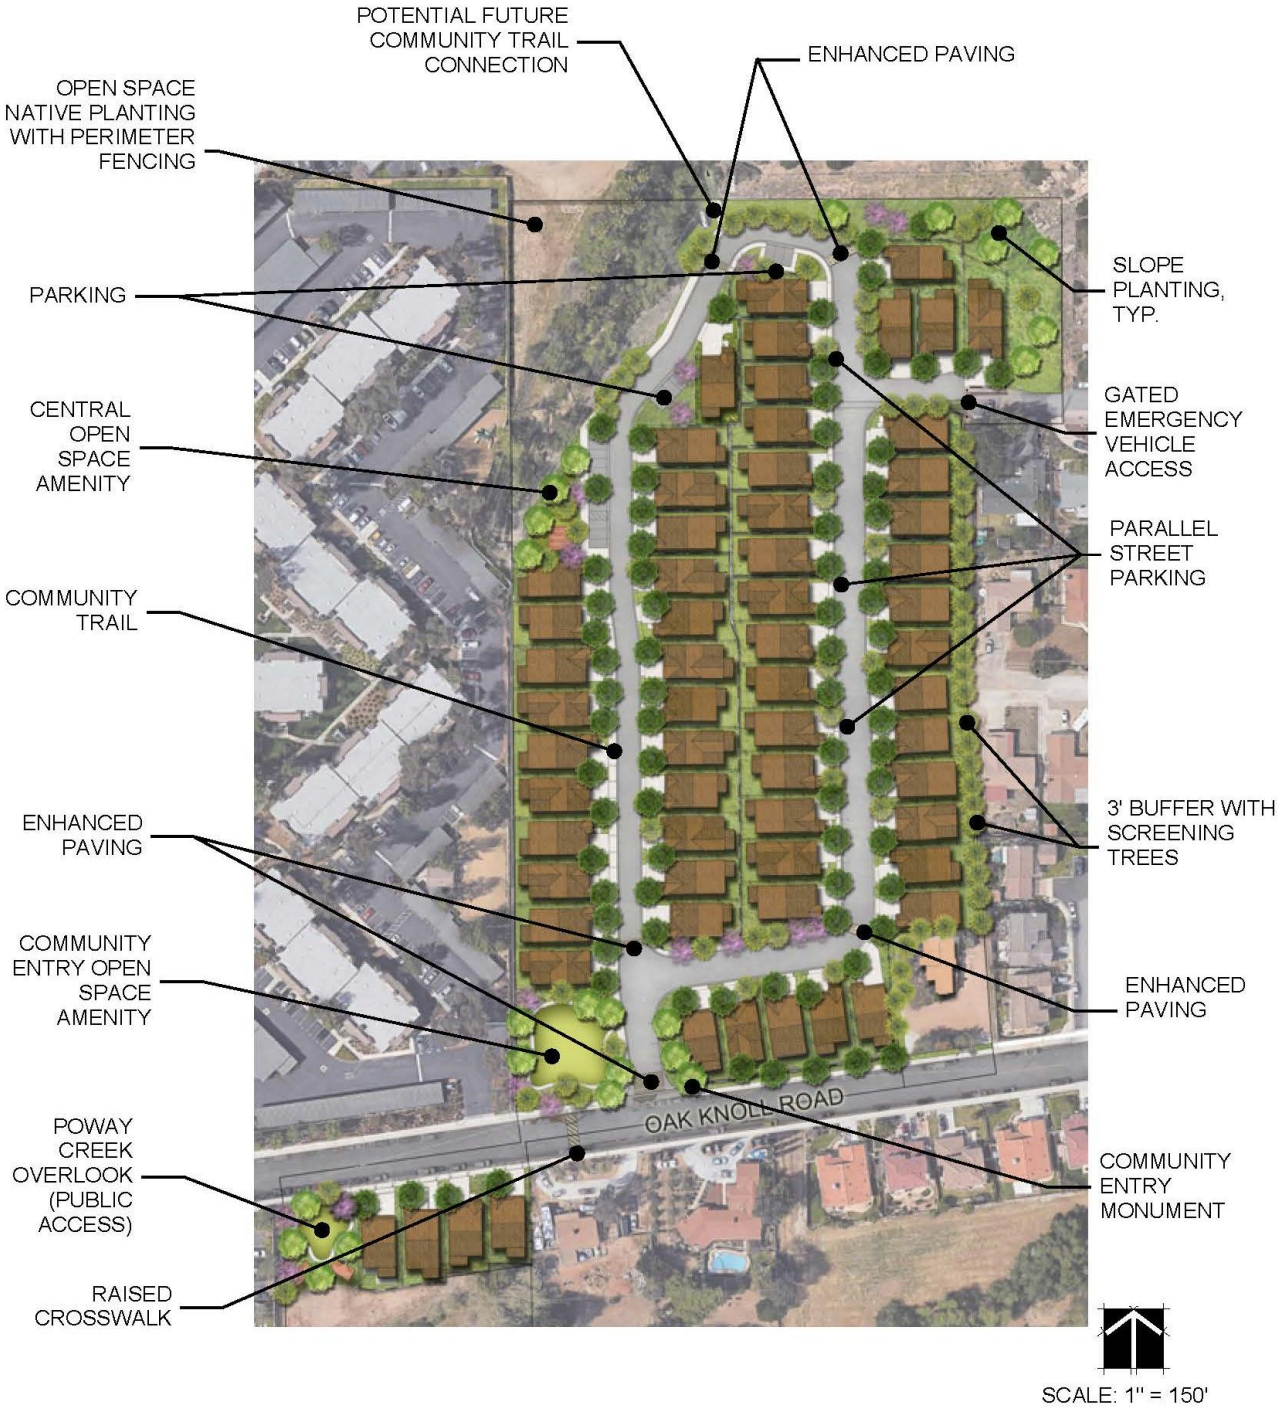

Exhibit 2.1: Illustrative Site Plan

2.2 Setting and Existing Conditions

This Project Site is 11.5 acres and is currently designated Residential Single Family 7 (RS-7) in the Poway Comprehensive Plan General Plan which permits single-family homes on minimum 4,500 square foot sized lots and a maximum density of eight dwelling units per acre. Surrounding land uses include a mix of commercial uses and the Kumeyaay Ipai Interpretive Center to the north, Oak Knoll Road, Poway Creek and existing single-family homes to the south, existing single-family homes to the east and an apartment community to the west.

The Specific Plan would designate approximately 5.7 acres for new residential development, a 0.25-acre site containing an existing historic home, 1.9 acres for private streets and 3.2 acres of open space (natural and private recreation). Approximately 0.5 acres of public right-of-way (Oak Knoll Road) is also included in the Specific Plan boundary. The overall density of the proposed project is 8.8 DUs/Acre, which is slightly higher than the existing RS-7 designation, which permits 8.0 DUs/Acre.

The Specific Plan Area consists of approximately nine acres of disturbed land bisected by existing Oak Knoll Road. The majority of the site is disturbed and was recently utilized as a storage/staging area for San Diego Gas & Electric Company.

The site is relatively flat with an elevation of approximately 446 feet Mean Sea Level (MSL) to 448 MSL. The northern portion of the property is level to moderate sloping with elevations ranging from approximately 449 feet MSL to 495 feet MSL. Poway Creek is located along the southern boundary of the southern parcels. the flood elevation of 447 feet MSL is shown on the Tentative Map. A tributary to Poway Creek exists along the northwest property boundary. The tributary has been channelized and outlets into a storm drain system beneath Oak Knoll Road. Surface drainage across the northern property is generally south and southwest toward Oak Knoll Road, while the southern property drains south and southwest into Poway Creek.

Four surficial soil types and two geologic formations exist on site. The surficial deposits consist of undocumented fill, alluvium, colluvium and terrace deposits. The formational units include the Ecocene-age Friars Formation and the Cretaceous-age granodiorite (granitic rock).

The Biological Resources Technical Report for Harmon Ranch prepared by Dudek (July 2022) included the results of a general biological reconnaissance survey and vegetation mapping conducted in November 2021 and a rare plant survey conducted in April 2002. Based on the survey results, no sensitive plant or wildlife species were observed within the Specific Plan area, and none have a potential to occur. Vegetation communities onsite consist of disturbed wetland, disturbed habitat, urban/developed areas, non-native riparian, Arundo-dominated riparian, southern willow scrub and freshwater. Of these vegetation communities, only southern willow scrub and freshwater are native. The proposed project would focus development in areas which are

currently either disturbed or developed. The Arundo-dominated riparian associated with Poway Creek currently extends over the property line and therefore would need to be trimmed back to the property line resulting in a potential temporary loss of 0.02 acres of this vegetation community. It is anticipated that the vegetation will grow back following construction and therefore no mitigation is proposed for impacts to this invasive plant community.

The Harmon Ranch Tree Inventory and Arborist Report prepared by Dudek (July 2022) included an inventory of existing on-site trees. The arborist identified a total of 58 trees on-site. Of the 58 on-site trees, one oak tree met the City's definition of a "native" tree which would require the replacement of the oak tree with a comparable size (96" box tree) and species. The remaining 57 trees are not protected by the City's ordinance. The project proposed to remove all on-site trees as part of the site development and plant up to 42 replacement trees within the Specific Plan Area, as shown on **Exhibit 5.3: Conceptual Tree Plan**. The final number of trees to be determined during preparation of Landscape Improvement Plans.

There are four existing homes within the project site. According to information obtained from the San Diego County Assessor's office, three of these homes were constructed between 1946 and 1957. There are three homes located within the proposed development area that will be demolished as part of the project. One of the existing homes is a locally designated historic building located at 12702 Oak Knoll Road (APN 317-500-14-00). The historic building was built in 1933 and is constructed of cobblestones. The building is presently designated as City of Poway Historical Site 113 and is documented and known as the "Harmon House." The historic home will be retained in place within a 0.25-acre site as part of the project.

2.3 Specific Plan Objectives

The following objectives have been developed to implement the vision of the Specific Plan and support the goals and policies of the General Plan:

1) Implement applicable goals and policy of the General Plan.
2) Develop a residential neighborhood within an underutilized site with quality architecture and community design aesthetics that respect and enhance the existing neighborhood's appeal and character.
3) Ensure new uses are compatible with the existing surrounding homes by establishing setbacks, design regulations and guidelines that protect the privacy and quality of life for neighboring residents.
4) Contribute new housing units to the City of Poway and the region by providing single family housing.
5) Conserve portions of the Project Site to minimize environmental impacts of the Project and allow for the development of an environmentally sensitive neighborhood.

6) Ensure the retention of the on-site historic home, provide a landscape plan to maintain the historic setting and provide a buffer to ensure the permanent protection of the historic resource during construction.
7) Create an internal network of private streets that minimizes traffic impacts on existing neighborhoods, incorporate a trail connection to the adjacent commercial/industrial land use and provide on-street parking and safe access to homes within the Project.
8) Minimize the environmental impact of new development through best management and low impact development practices, water and energy conservation measures and green construction.
9) Create a land use plan that can realistically be developed within a foreseeable time frame and under projected economic conditions.

Page Left Blank Intentionally

Chapter Three
Land Use & Regulations

Page Left Blank Intentionally

Chapter 3 – Land Use & Regulations

3.0 Introduction

Land Uses are organized to optimize compatibility with the surrounding land uses. The Specific Plan proposed both open space and residential land use districts. The purpose of establishing land use districts is to classify, regulate, and restrict the type of uses and structures permitted within the land use districts.

3.1 Land Use Summary & Plan

Land uses within the Specific Plan Area consist of open space and residential uses as summarized in Table 3.1: Land Use Summary and Exhibit 3.1: Land Use Plan, which describe the distribution and maximum development intensity of uses as permitted in the Specific Plan.

Table 3.1: Land Use Summary[1]

Use/Land Use	Approx. Net Acres (AC)	% of Planning Area	Max. Dwelling Units (DU)[2]	Density (DU/AC)[3]
Non-Residential Land Uses				
Open Space (OS-1 & 2) (Floodway)	1.88	16.3%		
Open Space (OS-3 & 4)	0.31	2.7%		
Open Space Recreation (OSR-1 to 7)	0.99	8.6%		
Subtotal Open Space	**3.18**	**27.6%**		
Private Internal Residential Streets	1.88	16.3%		
Oak Knoll Road ROW (existing)	0.49	4.3%		
Subtotal Streets	**2.37**	**20.6%**		
Subtotal Non-Residential	**5.55**	**48.2%**		
Residential (R) Land Use				
Residential Single Family (R-SF) (Lots 1 to 64)	5.96	51.8%	64	
Subtotal Residential	**5.96**	**51.8%**	**64**	
TOTAL Specific Plan Area[1]	**11.51**	**100%**	**64**	**8.8**

1. Statistics are based upon preliminary design and may vary slightly from Development Plan, Tentative Map, and/or Final Map. Refer to Chapter 7 regarding substantial conformance.
2. Pursuant to State Law, local governments cannot preclude an Accessory Dwelling Unit (ADU) or Junior Accessory Dwelling Units (JADU). An ADU and JADU is an accessory use for the purposes of counting allowable density under general plan and zoning and is therefore not counted as an additional unit. An ADU and JADU shall be permissible in accordance with the PMC or, if the locally adopted ordinance is void, the State Government Code. See Section 3.2.2.G for information regarding ADUs.
3. Open Space areas within the floodway (OS-1 and OS-2) and public street (Oak Knoll Road) and internal private streets are excluded from the density calculation. The following calculation was utilized to determine the net residential density for the project: Residential (5.96 ac) + Open Space Recreation Lots 1-7 (0.99 ac) + Open Space Lots 3 and 4 (0.31 ac) = 7.26 ac. 64 / 7.26 = 8.8.

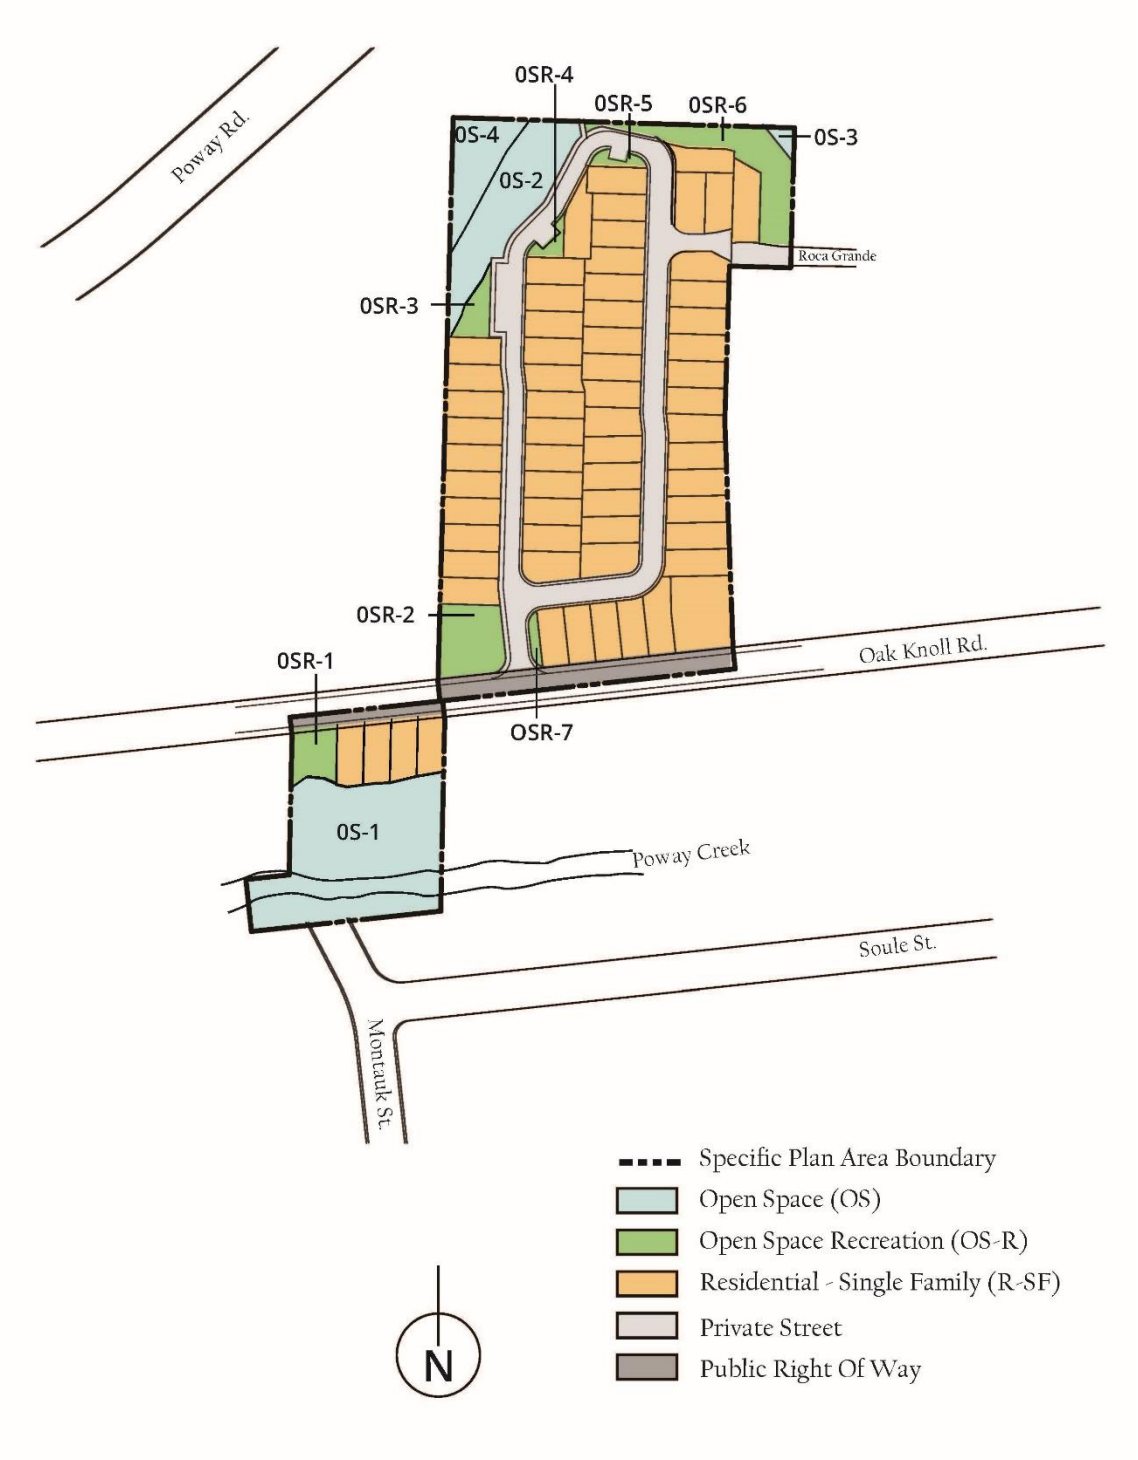

Exhibit 3.1: Land Use Plan

3.2 Open Space Land Use Regulations

Two open space land use districts support the development of the master planned community envisioned by the Specific Plan and would implement the following purpose and intent:

- Open Space (OS) is designed to permanently conserve the on-site open space areas that contain sensitive biological and/or cultural resources. These areas (OS-1 to OS-3) would not be impacted by development of the Project and remain as natural open space areas. Open Space 4 (OS-4) is a disturbed area that is outside of the proposed development area and not accessible from the new residential neighborhood. This area would be secured with perimeter fencing and revegetated with a native hydroseed mix to stabilize the area and deter unauthorized access to the area.

- Open Space – Recreation (OSR) is intended to provide passive and active recreational opportunities and open landscaped areas to support the new residential uses and manufactured slopes within the Specific Plan Area. Recreation amenities shall be provided to support healthy and active lifestyles and encourage community interaction and engagement. These areas include OSR-1 to 7.

Parcels designated OS (OS-1, OS-2, OS-3 and OS-4) shall be deed restricted to ensure that future development is restricted to that specified in the Open Space Land Use Regulations in perpetuity.

3.2.1 Open Space Permitted Uses

Permitted uses within the open space land use districts are listed in Table 3.2: Open Space Permitted Uses.

Table 3.2: Open Space Permitted Uses

Use	OS	OS-R	Additional Requirements
Agriculture			
Specialty and community gardens	X	P	See Section 3.2.3.A
Beekeeping	X	X	
Christmas tree, Halloween pumpkin, or other seasonal sales and other holiday events	X	T	See Section 3.2.3.B and Section 3.2.3.F
Cultivation, delivery or sale of cannabis or cannabis products	X	X	
Recreational Amenities			
Picnic pavilions/Trellis with overhead lighting, tables, benches and BBQ	X	P	
Playgrounds and tot-lots, open play turf areas	X	P	
Trail amenities such as lighting, peeler pole fencing, benches, signage	X	P	
Trails for walking and biking	X	P	See Chapter 4

Use	OS	OS-R	Additional Requirements
Public Art such as sculptures	X	P	See Section 3.2.3.G
Above ground utilities including stealth telecommunication facilities	X	P	Section 3.9
Satellite Dish Antennas	X	P	See PMC
Temporary trailers and offices	X	T	See Section 3.4
Water quality features	X	P	See Section 7.1
Fencing and screening other than trail fencing	X	P	See Sections 3.8 and 5.5
Temporary parking on unimproved surface	X	P/X	Temporary parking permitted within OS-4 only; parking is not permitted within other areas designated OS-R
Other uses that the City Council may determine to be compatible and substantially in conformance with the goals and objectives of this Specific Plan	C	C	

P = Permitted by Right
C = Conditionally Permitted (CUP required)
M = Conditionally Permitted (Minor CUP required)
X = Not Permitted
PMC = Subject to Poway Municipal Code regulations
T = Temporary Use Permit

A. Permitted Deviations and Additional Open Space Standards

The following standards are provided to ensure that maintenance and operation of all open space uses remains compatible with surrounding residential uses:

(1) All structures shall maintain adequate fire access approved by the City of Poway Fire Department and shall be designed to current building and fire code standards.
(2) Hours of operation of any use or activity shall be restricted to between sunrise and 10:00 p.m. weekdays, weekends and holidays unless otherwise specified herein. Any exceptions to these time limits with regard to special events shall be subject to a temporary use permit granted by the Director of Development Services.
(3) All gambling and the sale and consumption of illegal drugs on-site is strictly prohibited. The sale, manufacturing delivery and cultivation of marijuana and cannabis products shall also be prohibited.
(4) The noise level emanating from any use or activity shall not exceed 60 dBA CNEL, as the acceptable outdoor noise exposure level when measured at the exterior boundaries of the Specific Plan area unless otherwise specified herein. This may be achieved through the construction of sound attenuation barriers based upon an approved noise study.
(5) No use shall be permitted which creates offensive odors in such quantities as to be readily detectable beyond the boundaries of any proposed parcel or the exterior boundaries of the Specific Plan Area.

3.3 Residential Land Use Regulations

The Specific Plan includes one residential land use district (Residential-Single Family) that would allow for the development of traditional single-family detached homes on individual deeded legal lots, and address an existing historic home located within the Specific Plan Boundary.

All residential properties shall be deed-restricted to prevent any future increase in residential density in perpetuity.

3.3.1 Residential Permitted Uses (R-SF)

Permissible uses within the R-SF residential land use district are listed in the following table.

Table 3.3: R-SF Permitted Uses

Use	R-SF	Additional Requirements
Existing (Category C) Historic Home	P	Subject to PMC 17.45 Historical Structures
Accessory Buildings	P	
Accessory Dwelling Units	P	See Section 3.3.2.B
Home Occupation	H	
Keeping of animals	P	See PMC
Detached Single-Family Home	P	
Temporary trailers, offices and associated uses	T	See Section 3.4
RV, Truck and Trailer Storage	X	Restricted per Community Association CC&Rs
Outdoor Prefabricated Storage Units/Sheds	P	Subject to Community Association See CC&Rs and must meet minimum setback requirements
Patio Covers, Awnings, Trash Enclosures	P	Subject to Community Association CC&Rs
Pools/Spas	P	See Section 3.3.2(A)(3)
Roof Mounted Solar Panels	P	See PMC
Ground Mounted Solar Panels	X	
Roof Mounted Antennas	X	
Satellite Dish Antennas	P	
Utilities	P	See Section 3.9
Water Quality Features	P	See Section 6.1.3
Other uses that the City Council may determine to be compatible excluding increased housing density and multi-family homes	C	

P = Permitted by Right
C = Conditionally Permitted (CUP required)
M = Conditionally Permitted (Minor CUP required)
X = Not Permitted
PMC = Subject to Poway Municipal Code regulations
T = Temporary Use Permit
H = Home Occupation Permit

3.3.2 Residential Development Standards

Development standards include minimum lot dimensions, minimum setbacks and building separation, maximum building height and minimum private open space requirements.

Residential Single Family (R-SF)

The Residential Single-Family designation consists of the 63 proposed single-family homes and an existing historic home to remain within its existing lot. The 63 new homes planned would include floor plans 1, 2 and 3. Typical setbacks are depicted on **Exhibit 3.2 – Typical Lot Details - Residential Single Family**. Typical plotting provided for reference; however, final plotting to be provided during final engineering. See Development Review Plan for irregular lot setbacks. The setbacks for the existing historic home (Lot 64) are depicted on **Exhibit 3.3: Proposed Historic Home Setbacks** and the proposed historical setting are depicted on **Exhibit 3.4: Proposed Historic Home Setting**. [1]

[1] Lot 64 must comply with PMC 17.45 Historical Structures. Setbacks established on **Exhibit 3.3: Proposed Historic Home Setbacks** (Front 54', side (east) 29', side (west) 35' and rear 6') may not be modified and no further encroachments are permitted. Lot 64 may not be subdivided in the future, except as permitted in the PMC.

Table 3.4: Residential Development Standards (R-SF)

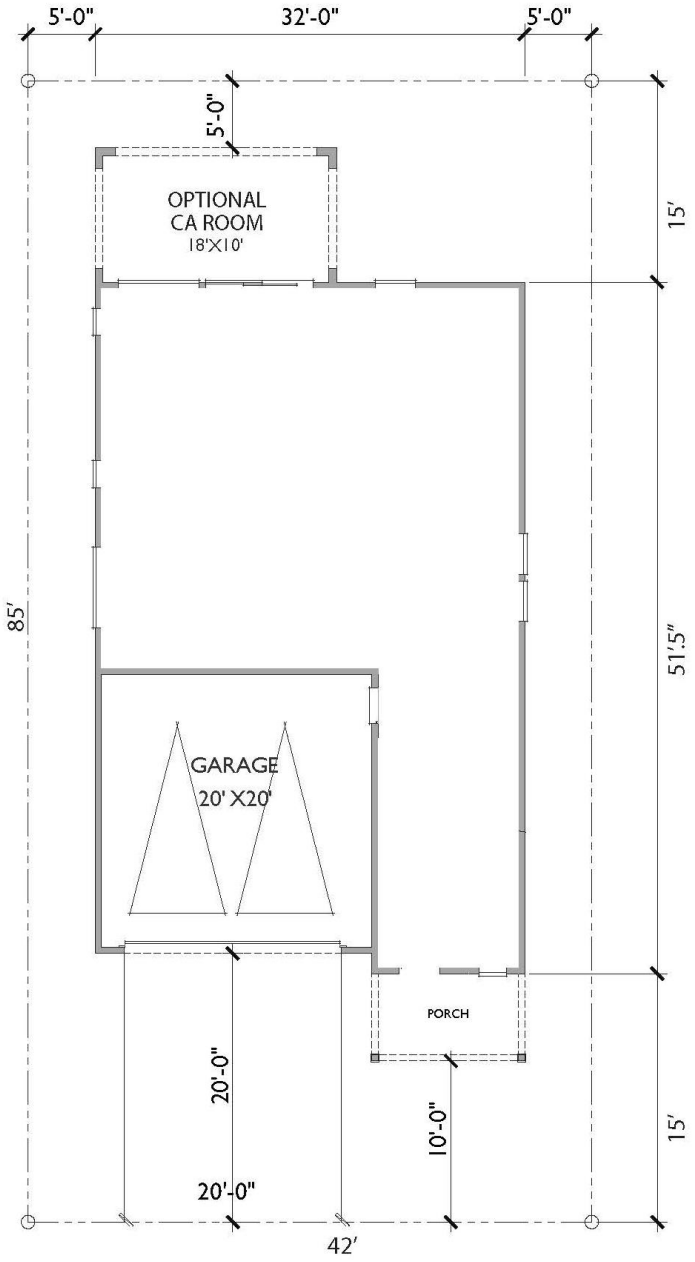
Description	Minimum Requirements
Lot Dimensions	
Lot Size	3,470 SF
Lot Width (Measured at setback)	42 feet
Lot Depth	85 feet
Lot Coverage	55% max
Minimum Building Setbacks[3]	
Front – Garage Door to Property Line	20 feet
Front – Primary Building to Property Line	15 feet
Front – Porch to Property Line	10 feet
Side – Primary Building to Corner @ Property Line	6 feet
Side- Primary Building to Property Line	5 feet
Rear – Primary Building to Property Line	15 feet
Rear – CA Room to Property Line (Max width of CA Room limited to 50% of Primary Building width)	5 feet
Building Separation	10 feet
Building Height	**2 Stories and 35 feet max**
Walls	
Retaining Wall Height (PMC 17.08.240.A)	**6 feet max**
Combo Retaining Wall/Fence Landscape Area (PMC 17.08.240)	**0 to 4 feet max for retaining wall and 5 feet max for fence (varies)**

1 All dimensions are minimum unless otherwise stated and apply to Lots 1-63, except as described below in Note 2.

2 Minimum setbacks apply to typical lot configurations only. Setbacks for irregular shaped lots (Lots 17, 20, 36, 37 and 39) vary and may be reduced, depending on the specific lot conditions, but can't project into setback beyond original footprint. See Development Review Plan (22-0003) for irregular lot setbacks.

3 See Section 3.3.2.A for permitted encroachments into minimum setbacks.

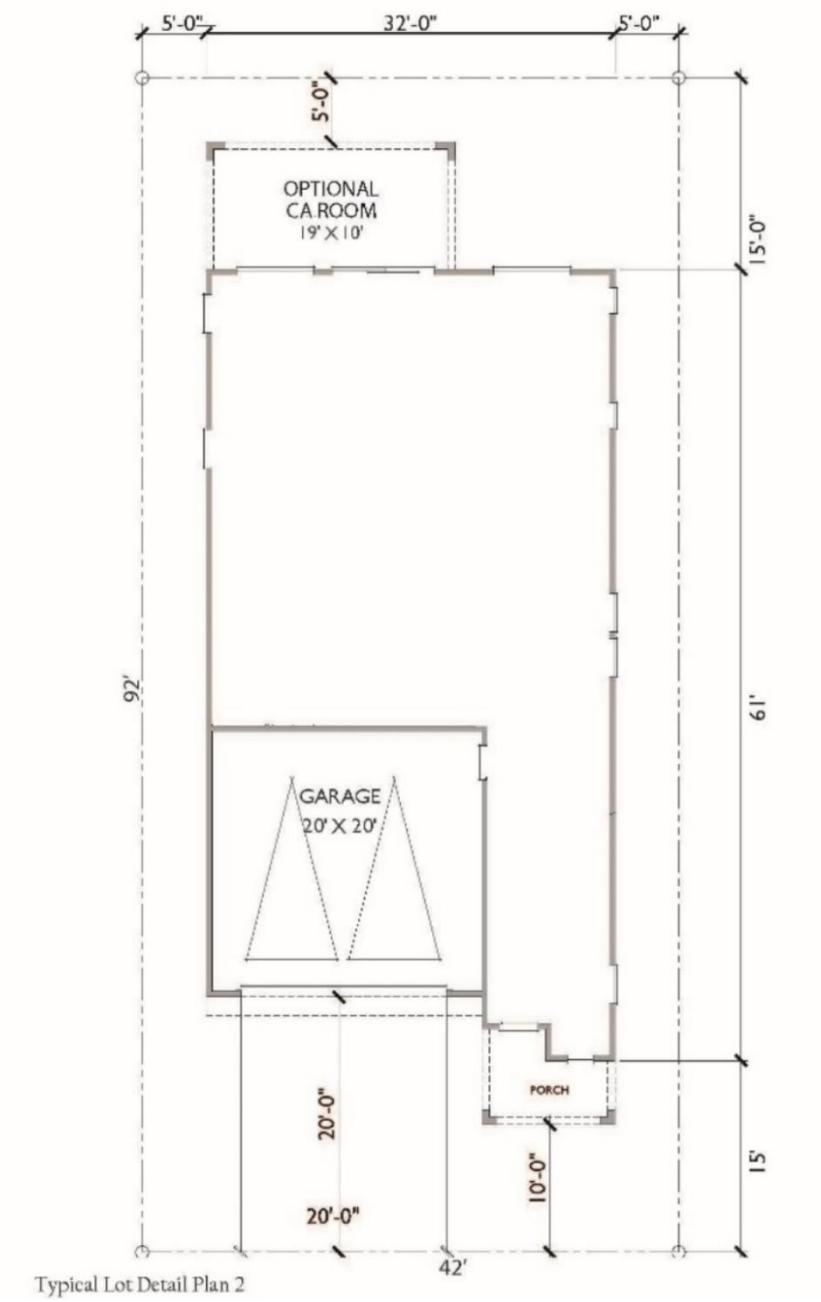
Residential Private Open Space Requirements: Each residential lot shall provide private outdoor open space areas equal to 10 percent of the home square footage. The full rear yard private open space on a typical lot is approximately 620 square feet, which exceeds the 10 percent private open space minimum requirement. Rear yards, including California Rooms, porches and side yard areas located behind side/rear yard fencing shall be counted toward meeting the private open space minimum requirement. Where the California Room is provided, it is included in the minimum rear yard area calculation and shall receive credit toward the 10 percent private open space requirement. Final calculations to be provided during final engineering.



Typical Lot Detail Plan 1

Note: All setbacks are minimum dimensions. Minimum setbacks apply to typical lot configurations only. Setbacks for irregular shaped lots (Lots 17, 20, 36, 37 and 39) vary and may be reduced depending on the specific lot conditions. See Development Review Plan (22-0003) for irregular lot dimensions and setbacks.

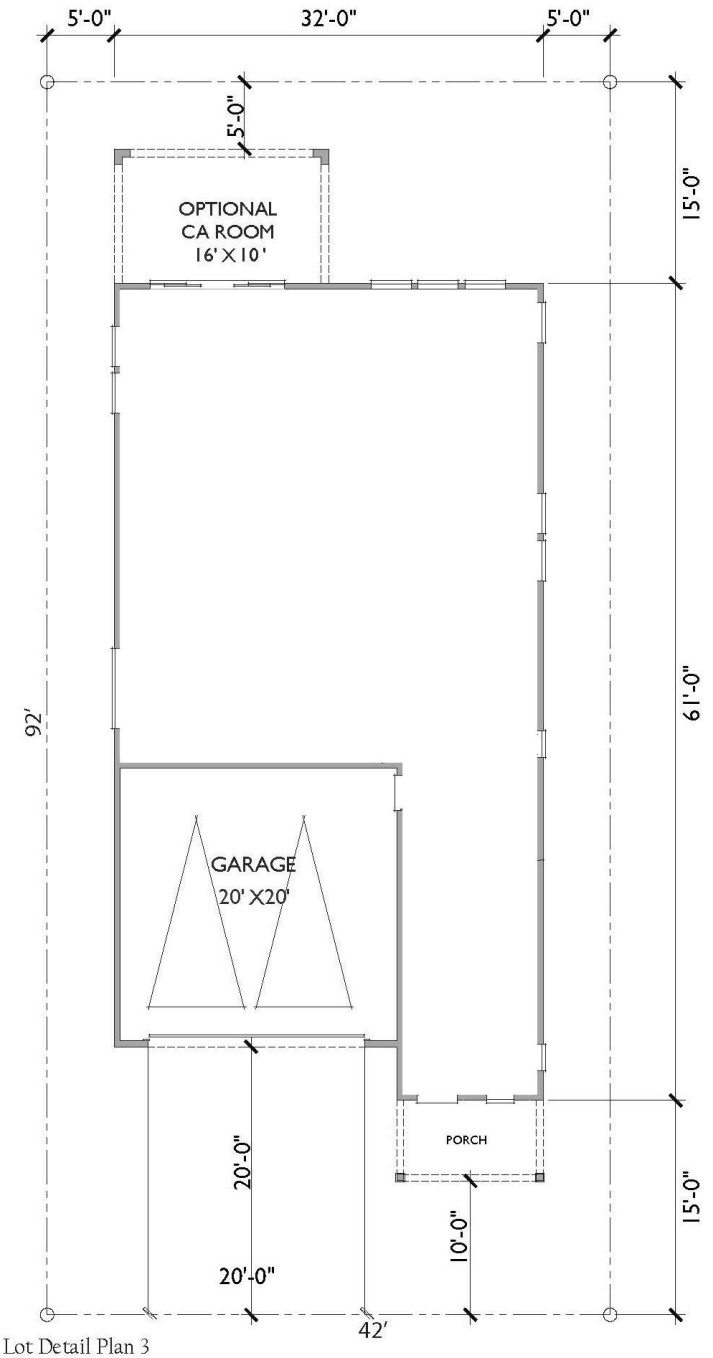
Exhibit 3.2: Typical Lot Details – Residential Single Family



Typical Lot Detail Plan 2

Note: All setbacks are minimum dimensions. Minimum setbacks apply to typical lot configurations only. Setbacks for irregular shaped lots (Lots 17, 20, 36, 37 and 39) vary and may be reduced depending on the specific lot conditions. See Development Review Plan (22-0003) for irregular lot dimensions and setbacks.

Exhibit 3.2: Typical Lot Details – Residential Single Family (continued)



Typical Lot Detail Plan 3

Note: All setbacks are minimum dimensions. Minimum setbacks apply to typical lot configurations only. Setbacks for irregular shaped lots (Lots 17, 20, 36, 37 and 39) vary and may be reduced depending on the specific lot conditions. See Development Review Plan (22-0003) for irregular lot dimensions and setbacks.

Exhibit 3.2: Typical Lot Details – Residential Single Family (continued)

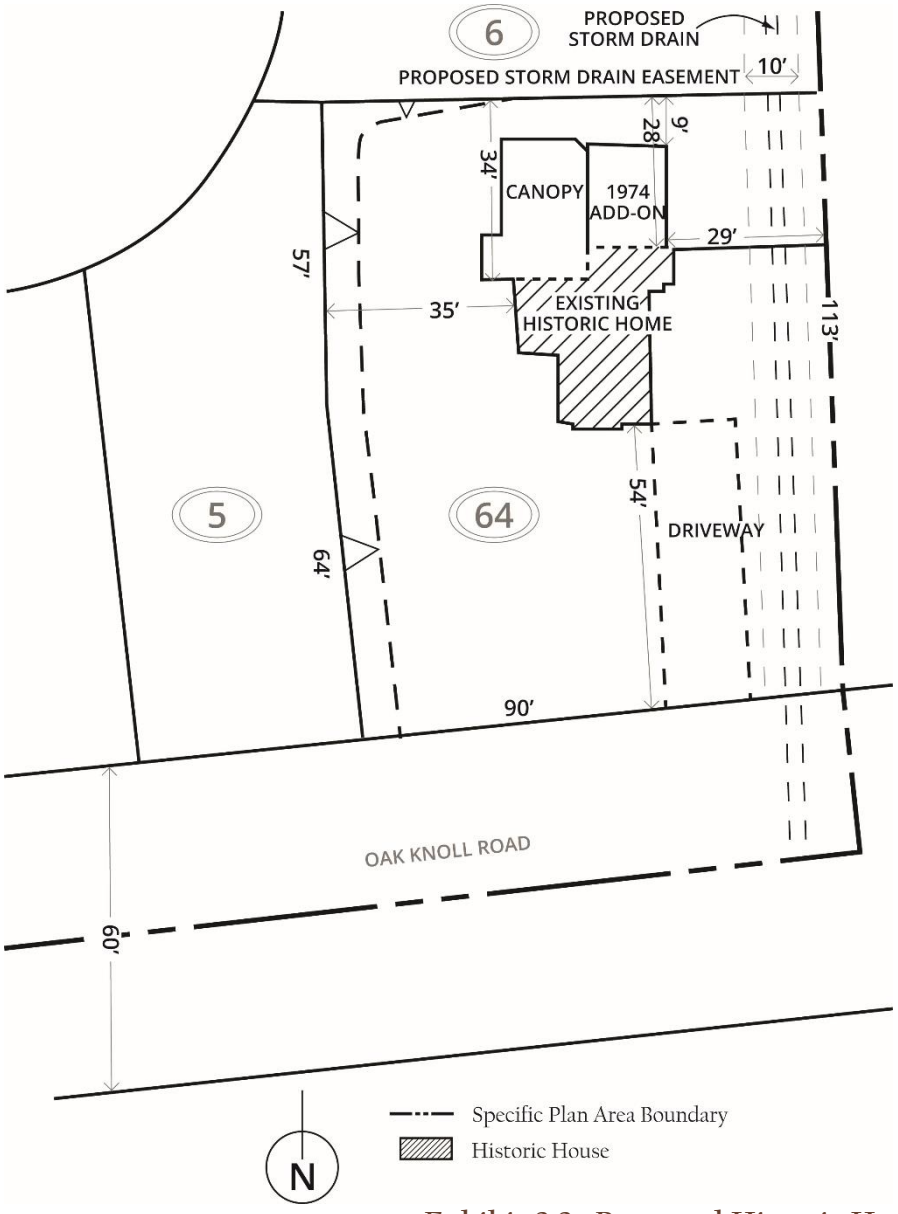


Exhibit 3.3: Proposed Historic Home Setbacks[2]

[2] Lot 64 must comply with PMC 17.45 Historical Structures. Setbacks established on **Exhibit 3.3: Proposed Historic Home Setbacks** (Front 54', side (east) 29', side (west) 35' and rear 6') may not be modified and no further encroachments are permitted. Lot 64 may not be subdivided in the future, except as permitted in the PMC.

Exhibit 3.4: Proposed Historic Home Setting

A. Residential Encroachments

(1) Stoops, steps and architectural features such as eaves, awning, chimneys and balconies, stairways, wing walls and/or bay windows may project not more than four feet into any required front or rear setback area, or into any required side setback area but not more than one-half of said required side setback.
(2) Open front porches may encroach up to five feet into the required front setback and may be counted toward meeting the private open space requirement.
(3) Swimming pools or spas, diving boards, slides and similar devices, shall be located a minimum of three feet from the main residence on the lot and at least three feet from the property line and shall comply with all PMC safety requirements. In no instance shall swimming pools or spas be located within the front yard setback.
(4) Refer to Section 3.3.2.B for permitted accessory structure encroachments, including California Rooms.

B. Residential Accessory Buildings and Structures

Accessory Dwelling Units (ADUs) and Junior Accessory Dwelling Units (JADUs) are permitted on all residential lots to provide opportunities for multi-generational living and rental units that fulfill the need for diverse and more affordable housing options in accordance with PMC Section 17.08.180(A).

California Rooms

California Rooms are transitional spaces that provide indoor-outdoor living space in a partially enclosed room. California Rooms often include built-in lighting, overhead fan, media cabinet and/or similar features designed for relaxation and entertainment. Sliding or folding doors provide access to the home, which can be opened to make interior spaces feel larger and more connected to the rear yard. A California Room is attached to the home and is usually integrated into the home's floor plan and roof plan. All California Rooms shall meet the following requirements, unless otherwise approved by the Director of Development Services:

(1) The square footage of the California Room shall be counted toward meeting the minimum 10 percent private open space requirement.
(2) A minimum of 50 percent of the California Room's walls shall remain open or include operable doors or windows that open to the rear or side yard.
(3) The California Room may extend a maximum of 50 percent of the width of the primary building.
(4) The California Room may extend into the rear yard setbacks up to 10 feet but shall maintain a minimum five-foot rear yard setback.
(5) The size of the California Room may be reduced to ensure conformance with the minimum rear setback requirements.

(6) Th second story living space above the California Room shall adhere to the setback requirements of the primary building.

C. Other Residential Accessory Buildings & Structures

(1) Second story balconies and decks are prohibited on lots adjacent to existing residential lots (Lots 6-17).
(2) Structures including, but not limited to, a trellis, storage building, pool, spa, outdoor kitchen, etc. and trees are not permitted within the storm drain easement located at the rear property line of Lots 6 to 11 and the northeast side of Lot 64.
(3) Overhead trellis or patio covers must be 50 percent open and must meet the minimum side and rear setback requirements.
(4) Storage sheds shall be located a minimum of three feet from the main residence on the lot and at least five feet from the property line. In no instance shall storage sheds be located within the front yard or side yard setback.

3.3.3 Residential Performance Standards

The noise level emanating from any residential use or operation within the Residential (R-SF) Land Use District shall not exceed 60 dBA CNEL as the acceptable outdoor noise exposure level when measured at the property line. The interior noise level shall not exceed 45 dBA CNEL within the R-S Land Use District.

3.4 Temporary Uses

The following temporary uses are permitted throughout the Specific Plan Area:

(1) Religious, patriotic, historic, holiday or similar displays or exhibits are permitted on a temporary basis, within residential front yards or within the OS-R Land Use District in accordance with the PMC.
(2) Prior to initial sale of all residential lots, a subdivision sales office and model home complex shall be permissible, subject to all of the following minimum requirements:
    - A parking lot shall be provided with a sufficient number of parking spaces.
    - Temporary sales offices shall be removed no later than 60 days after the sale of the last house. Annual review by the City for compliance with the conditions of approval may be required.
    - Faithful performance bonding in an amount appropriate to guarantee removal and/or conversion of the sales office and associated facilities shall be required.
    - Other conditions that the Director of Development Services deems necessary to assure that the sales office will not constitute a nuisance or be objectionable to the residential uses in the neighborhood.

(3) Additional uses determined by the PMC or the Director of Development Services to be consistent and comparable with permissible uses in **Table 3.4: Residential Permitted Uses**.

3.5 Parking Regulations

Parking regulations are intended to provide adequate parking with sufficient capacity to minimize impacts to residential streets, provide safe circulation to minimize traffic conflicts and promote public safety and preserve an attractive visual character within and around the Specific Plan Area. Parking shall meet the requirements of the PMC, unless otherwise specified herein. Recreational vehicle and trailer parking is prohibited.

3.5.1 On-Street Parking

As described in **Chapter 4: Mobility & Parking**, on-street parking is provided along certain Private Streets within the neighborhood to serve as additional guest parking for residents. See **Exhibit 4.1 – Conceptual Mobility & Parking Plan** for street sections and parking locations within the Specific Plan Area. The following standards apply to on-street parking:

1) Parallel parking spaces shall provide a minimum dimension of 8 feet x 22 feet.
2) Perpendicular parking spaces shall provide a minimum dimension of 9 feet x 19 feet.
3) Recreational vehicle and trailer parking is prohibited.

3.5.2 Residential Off-Street Parking

Off-street parking for residential uses shall be provided as follows:

(1) A minimum of two side-by-side garage spaces are required. Garage interiors shall provide a minimum dimension of 20 feet x 20 feet interior clear of obstructions.
(2) Residential driveways shall maintain a minimum dimension of 20 feet x 20 feet.
(3) The maximum slope for any residential driveway shall be 20 percent.
(4) Residential driveways and other paved areas available for vehicle parking shall not exceed 600 square feet of the front yard area. A three-car driveway is prohibited.
(5) Parking spaces shall remain free and clear of obstructions.
(6) Each residential garage shall include overhead storage and bicycle racks.
(7) Recreational vehicle and trailer parking are not permitted on private streets or within private driveway areas.
(8) Semi-trucks and trailers, dump trucks, moving vans and other heavy-duty commercial vehicles shall not be parked on any residentially zoned lot for a period longer than eight hours.
(9) Parking restrictions shall be included in the Community Association Covenants, Conditions & Restrictions (CC&Rs).

3.6 Landscape Requirements

For purposes of this section, landscaping may include ornamental and/or native landscape materials.

(1) Landscaping and irrigation of front and street side setback areas (outside of private fenced rear yard areas) shall be installed by the developer and maintained by private homeowners. Landscaping shall consist of trees, plant materials, natural ground cover and decorative rocks, except for necessary walks, drives and fences. Artificially colored decorative rocks and mulch (organic and inorganic) are not permitted; Artificial turf is permitted in front and rear yard areas. Accent paving and hardscape (e.g. boulders, dry streambed, patterned concrete, etc.) is encouraged. No more than 25 percent of landscape areas shall consist of non-living plant materials, including rock, cobble, gravel and decomposed granite, but excluding artificial turf for residential lots and common recreation areas.

(2) Interior side and rear yards within the fenced areas of residential lots shall include groundcover on all bare earth areas within one year of purchase unless specified otherwise by the CC&Rs.

(3) All required landscaping shall be permanently maintained in a healthy and thriving condition, free from weeds, trash, debris. Such maintenance shall be regulated by the community CC&Rs.

(4) Landscaping in parking areas shall include a minimum of one 15-gallon tree for every three parking spaces. Large planting islands provide for every eight to 10 parking spaces are encouraged.

(5) Landscaping shall conform to the City of Poway Landscape and Irrigation Design Manual (March 2018), PMC Chapter 17.41, Landscape Efficiency Standards and Water Conservation Plan; PMC Chapter 8.94, Water Conservation Plan; State of California AB 1881, The Water Conservation in Landscaping Act.

(6) A minimum of fifty percent of landscape areas shall consist of live plant materials.

(7) Street trees shall be planted within each residential lot within a six-foot wide landscape easement established on the Final Map. Trees shall be planted and maintained consistent with the City of Poway Landscape and Irrigation Design Plan (March 2018).

(8) Trees shall be planted in Open Space Recreation areas at an average ratio of one tree per 750 square feet (approximately 60 trees per acre). Trees shall be 15-gallon nursery container size (minimum) and at least 25 percent of the total tree quantity shall be 24-inch box size or larger. The project shall provide (a) one tree every 30 lineal feet of street frontage (24-inch box size minimum); and (b) one tree every 50 lineal feet of trail and community sidewalk. Trees shall be broad-canopy species to provide effective shading within 15 years of planting.

(9) Plant materials shall conform to ANSI Z60 "American Standard for Nursery Stock" (latest edition) regarding condition, tree caliper/height, and other general standards and specifications for nursery container stock.

3.7 Lighting Standards

All lighting within the Specific Plan Area shall comply with Title 24 of the California Code of Regulations. In addition, lighting within the Specific Plan Area shall conform to the following unless otherwise superseded by Title 24 regulations. See **Exhibit 3.5: Lighting Concept Plan** and **Exhibit 3.6: Conceptual Lighting Details** for the conceptual location of streetlights along the private streets and landscape lighting proposed at the community entry and open space areas. The conceptual street and landscape lighting fixtures are provided in **Exhibit 3.6.** See the Harmon Ranch Conceptual Lighting Plan prepared by Visual Concepts Lighting, Inc. (December 2022) for additional details. Final lighting fixture locations and fixtures to be determined during final design/engineering.

(1) All outdoor light fixture, including but not limited to illuminated signage, decorative building or landscape lighting, illuminated recreation areas, and parking areas shall be turned off between the hours of 11:00 p.m. and sunrise, except when used for security purposes, except for lighting of roadways, sidewalks and similar safety-related applications, or when operating hours continue after 11:00 p.m., but only as long as such facility is open.
(2) Automatic timing devices shall be integrated into all new or modified lighting systems to turn off lights at 11:00 p.m.
(3) All exterior lighting shall be shielded, as needed, to avoid light spillage onto adjacent streets and adjoining properties.
(4) Lighting should be integrated into the architecture of the building to the extent feasible.
(5) The intensity of light at the boundary of any property shall not exceed 75 foot-lamberts from the source of reflected light.
(6) Streetlights shall be provided at a minimum spacing of one per 100 lineal feet of street.
(7) Lighting shall comply with "Dark Sky" Policies to the greatest extent feasible.
(8) Trees within Open Space Recreation Areas may be provided with uplighting in the locations shown on **Exhibit 2.1: Illustrative Plan.** The final lighting plan to be provided the during final landscape design phase and may include landscape lighting at the community entry and a portion of the Entry Open Space Areas (OSR-2)/

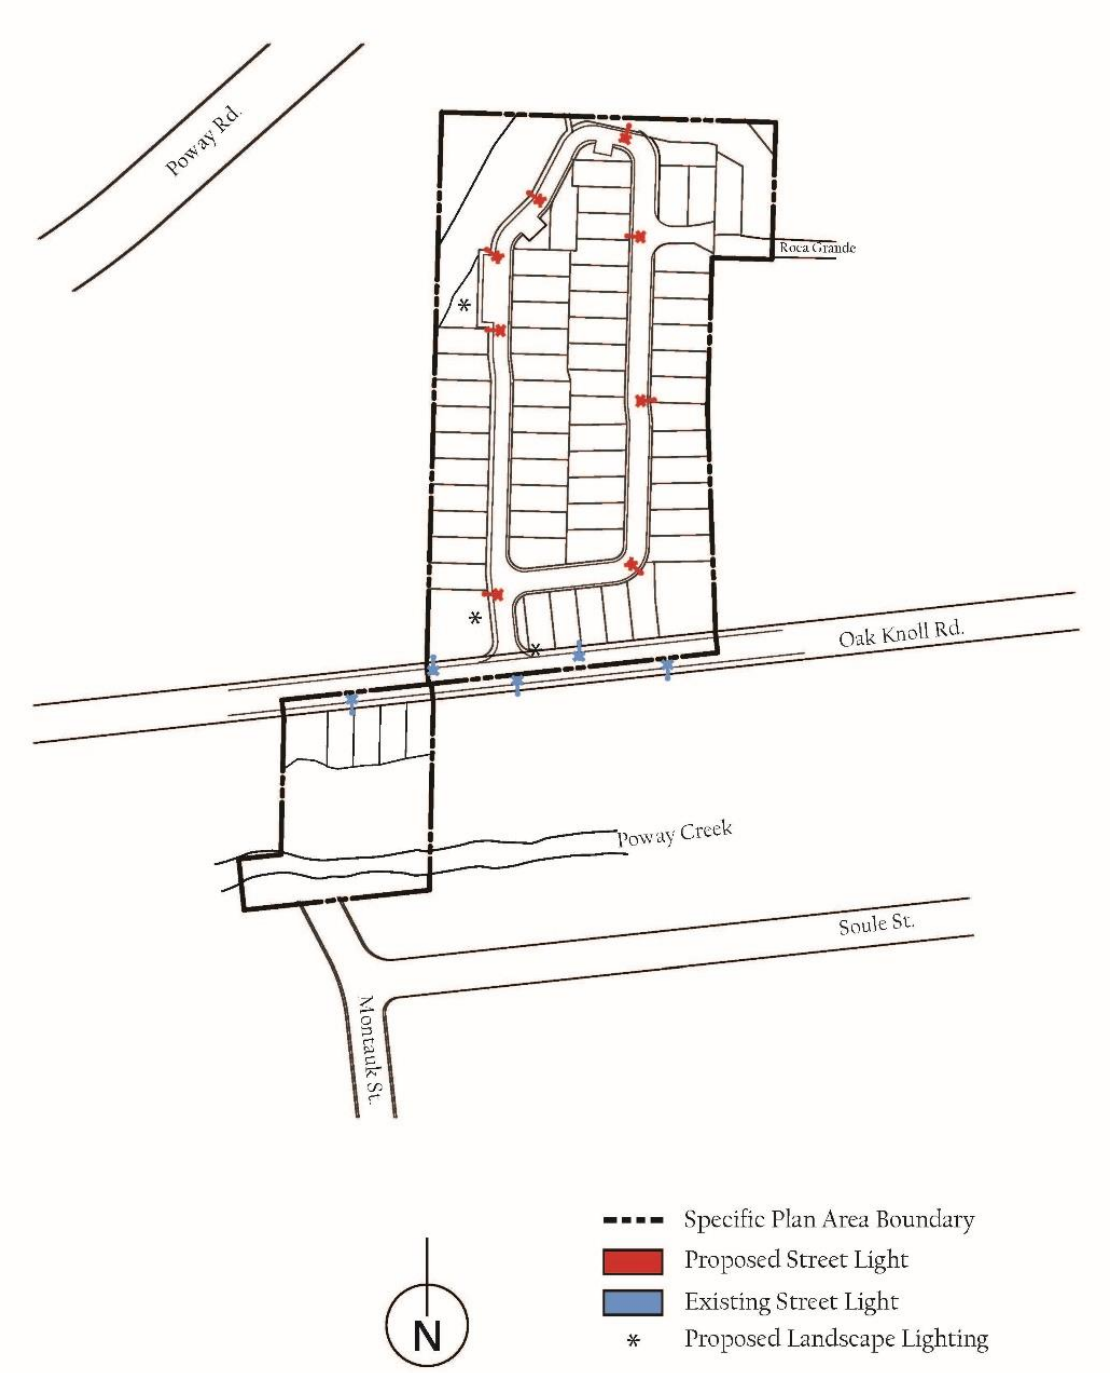

Exhibit 3.5: Lighting Concept Plan

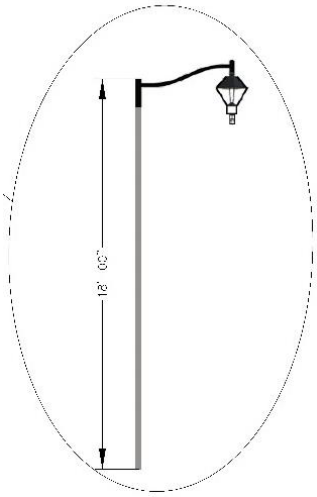
Conceptual Street Lighting

This illustration is provided to depict the lighting aesthetic relates to each architectural style. See **Exhibit 3.5: Conceptual Lighting Plan** for conceptual fixture locations. Ultimate street light spacing and quantity to be finalized during final engineering.



Conceptual Streetlight Fixture

Conceptual Monument and Tree Up-Lighting (OSR)

Conceptual Tree Up- Lighting

Conceptual Monument & Tree Fixture

The conceptual location of tree and community entry lighting and fixture types are shown on the Conceptual Lighting Plan. Ultimate lighting locations, quantities and fixture to be determined during final design.

Exhibit 3.6: Conceptual Lighting Details

3.8 Walls and Fences

Requirements for walls and fences within the Specific Plan Area shall be as follows:

(1) Fence and wall details, including proposed materials and heights are depicted in **Exhibit 3.7: Conceptual Fence and Wall Plan** and **Exhibit 3.8: Conceptual Fence and Wall Details**. See **Exhibit 3.9: Conceptual Retaining Wall & Fence Design** for proposed perimeter and internal retaining wall and fence designs. Final wall/fence heights to be determined during Final Engineering.
(2) A wall or fence located within a street-adjacent front yard shall not exceed three feet in height.
(3) Walls and fences at all roadway and driveway intersections shall comply with site visibility design standards by providing corner cut-offs as required by the PMC.
(4) All fences, walls and retaining walls shall be constructed of attractive new or recycled material such as wood, vinyl, masonry or similar that is compatible with the community theme. Fences and walls shall be installed and constructed in accordance with methods that conform to the requirements of the Uniform Building Code. Additionally, all walls and fences shall be maintained in a state of good repair. Dilapidated, dangerous or unsightly fences, walls and retaining walls shall be repaired or removed.
(5) Fiberglass sheeting, bamboo sheeting or other similar temporary materials shall not be permitted as fencing materials. Barbed wire strands, razor wire or concertina wire (coiled barbed wire) shall not be permitted as fencing material.

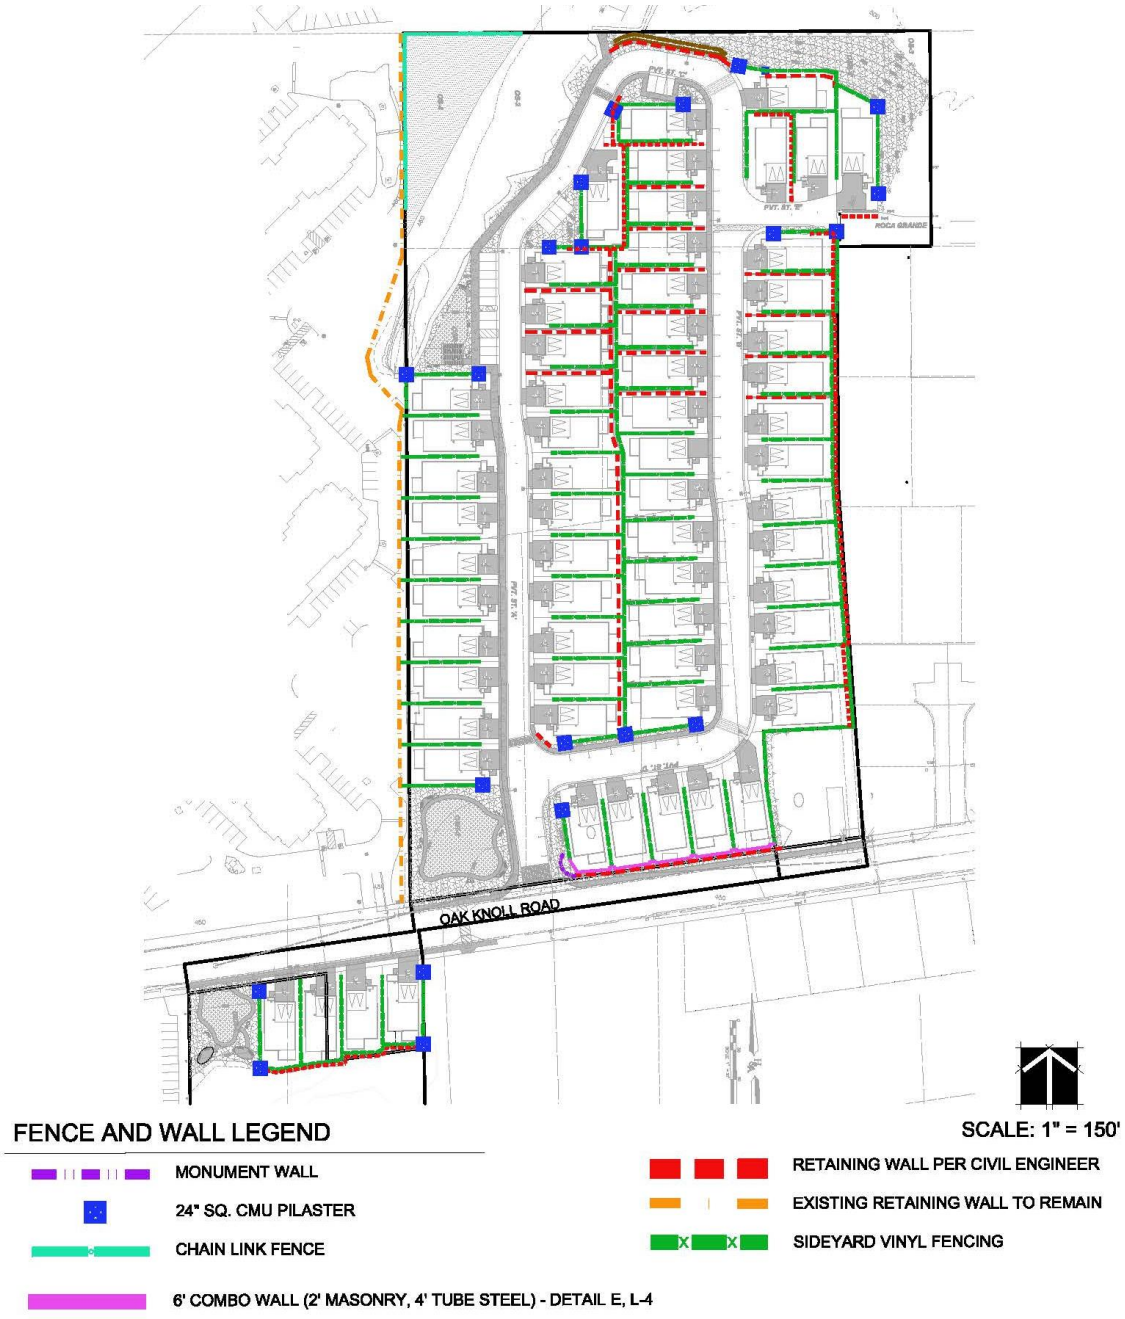


Exhibit 3.7 – Conceptual Fence and Wall Plan

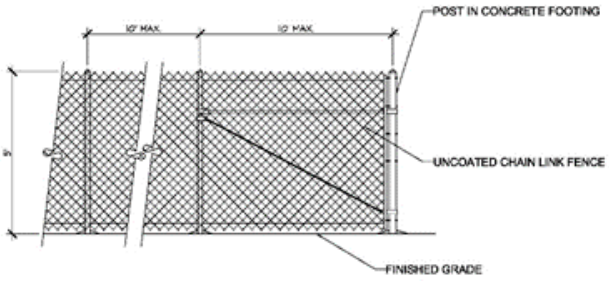
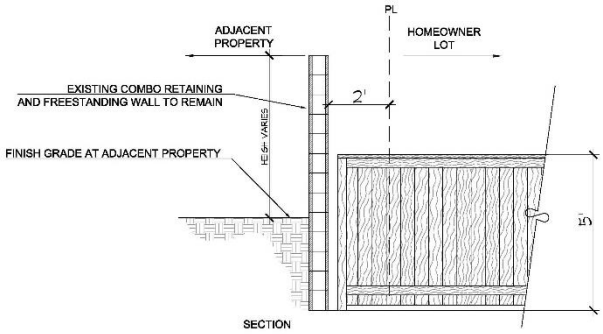
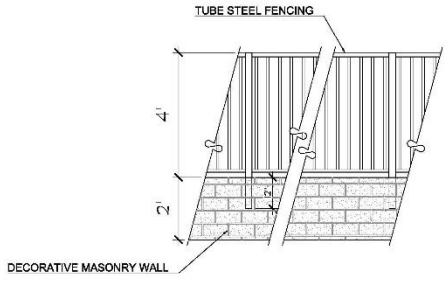
B VINYL FENCING



C CHAIN LINK FENCE



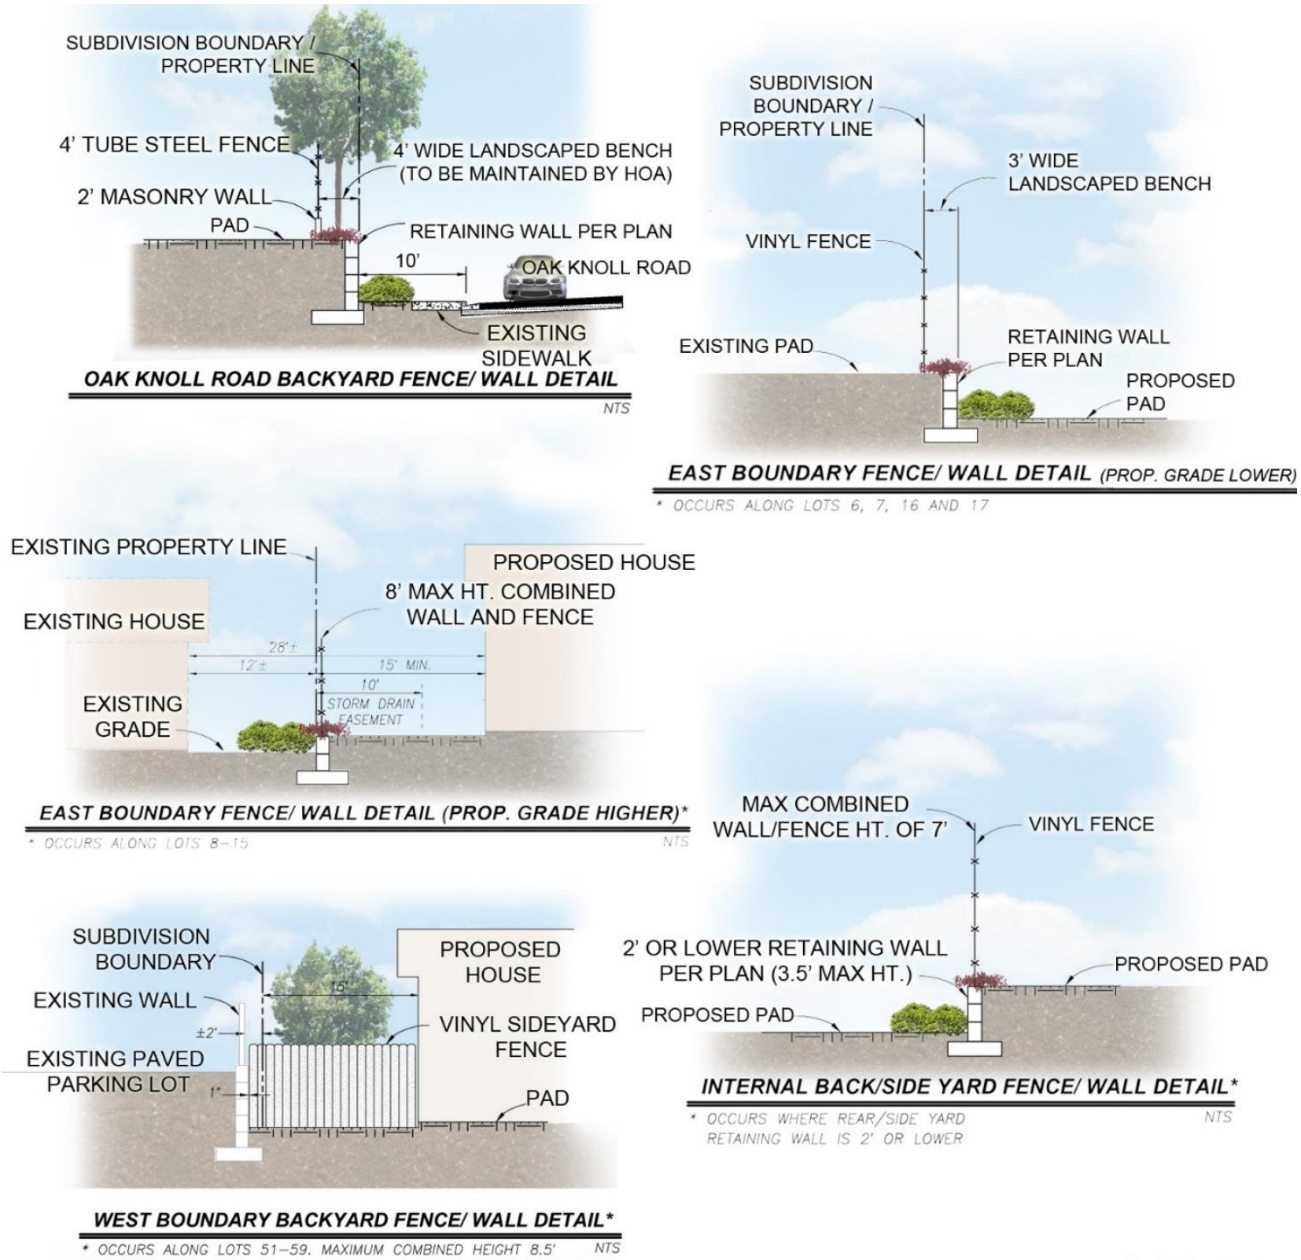
D VINYL FENCING AT EXISTING RETAINING WALL AT WESTERN PROPERTY LINE



E COMBO MASONRY WALL / TUBE STEEL FENCING

Exhibit 3.8: Conceptual Fence and Wall Details

Exhibit 3.9: Conceptual Fence & Retaining Wall Design depict the designs for combination fencing and retaining walls proposed at the perimeter and interior of the site. These designs are intended to be utilized to increase the buildable pad area of the proposed lots and/or provide additional space on the proposed lots to facilitiate additional separation between proposed and existing lots to enhance the privacy of existing homeowners. The project provides 5-foot vinyl fencing in both rear and side yard conditions to provide for privacy between private lots. Where the project is adjacent to existing single family homes, a 6-foot vinyl fence is provided. The Noise Technical Report for The Harmon Ranch Project (Dudek, July 2022) determined that noise attenuation walls are not required to comply with interior or exterior sound limits (per PMC 8.08.040).



Note: See Tentative Map for additional perimeter wall optional designs.

Exhibit 3.9: Conceptual Retaining Wall & Fence Design

Chapter Four
Mobility & Parking Plan

Page Left Blank Intentionally

Chapter 4 – Mobility & Parking Plan

4.0 Introduction

The Mobility & Parking Plan focuses on maintaining the rural character of the surrounding community, promoting an active lifestyle and providing safe and efficient vehicular and pedestrian access throughout the Specific Plan Area. Planned private streets provide access through the Specific Plan area. Access to the Specific Plan area is provided via existing Oak Knoll Road, a local collector road. The project includes a segment of the Community Trail identified in the Poway General Plan which has the potential to connect to the adjacent Towne Center Plaza and MTS local bus stops located on Poway Road. The objectives of the Mobility & Parking Plan include the following:

(1) Provide safe and efficient vehicular access throughout the Specific Plan Area.
(2) Provide adequate on-site resident and guest parking to avoid overflowing into adjacent public streets and neighborhoods.
(3) Provide a segment of the Community Trail through the Specific Plan Area that is open to the public.
(4) Provide safe pedestrian crossings and access to private recreational areas within the Specific Plan Area.

4.1 Street Classifications

As depicted on **Exhibit 4.1: Conceptual Mobility & Parking Plan**, the Specific Plan Area circulation is comprised of three unique private street designs (Streets A & C, B & D and E). Private streets are intentionally designed as low-speed streets to promote pedestrian and bicyclist mobility. A sidewalk or Community Trail is provided on one side of Private Streets A, B, C and D. Travel lane widths are a minimum of 24 feet as required for fire access and curved alignments create a physical condition that reduces driver comfort and forces slower speeds. Low speeds also allow the private streets to be shared with low-speed vehicles and bicycles. The internal street system consists of two types of private streets, private streets with an 8-foot parallel parking lane on one side and private streets without parking. The Community Trail is planned along Street A and a portion of Street C and a sidewalk is provided along Streets B and D. A crosswalk at Oak Knoll Road is planned to provide an enhanced pedestrian crossing within the Specific Plan Area. Pedestrian crossing signs will be posted and the crosswalk will feature striping and RRFBs. A public sewer, water and access easement will be recorded over all private streets.

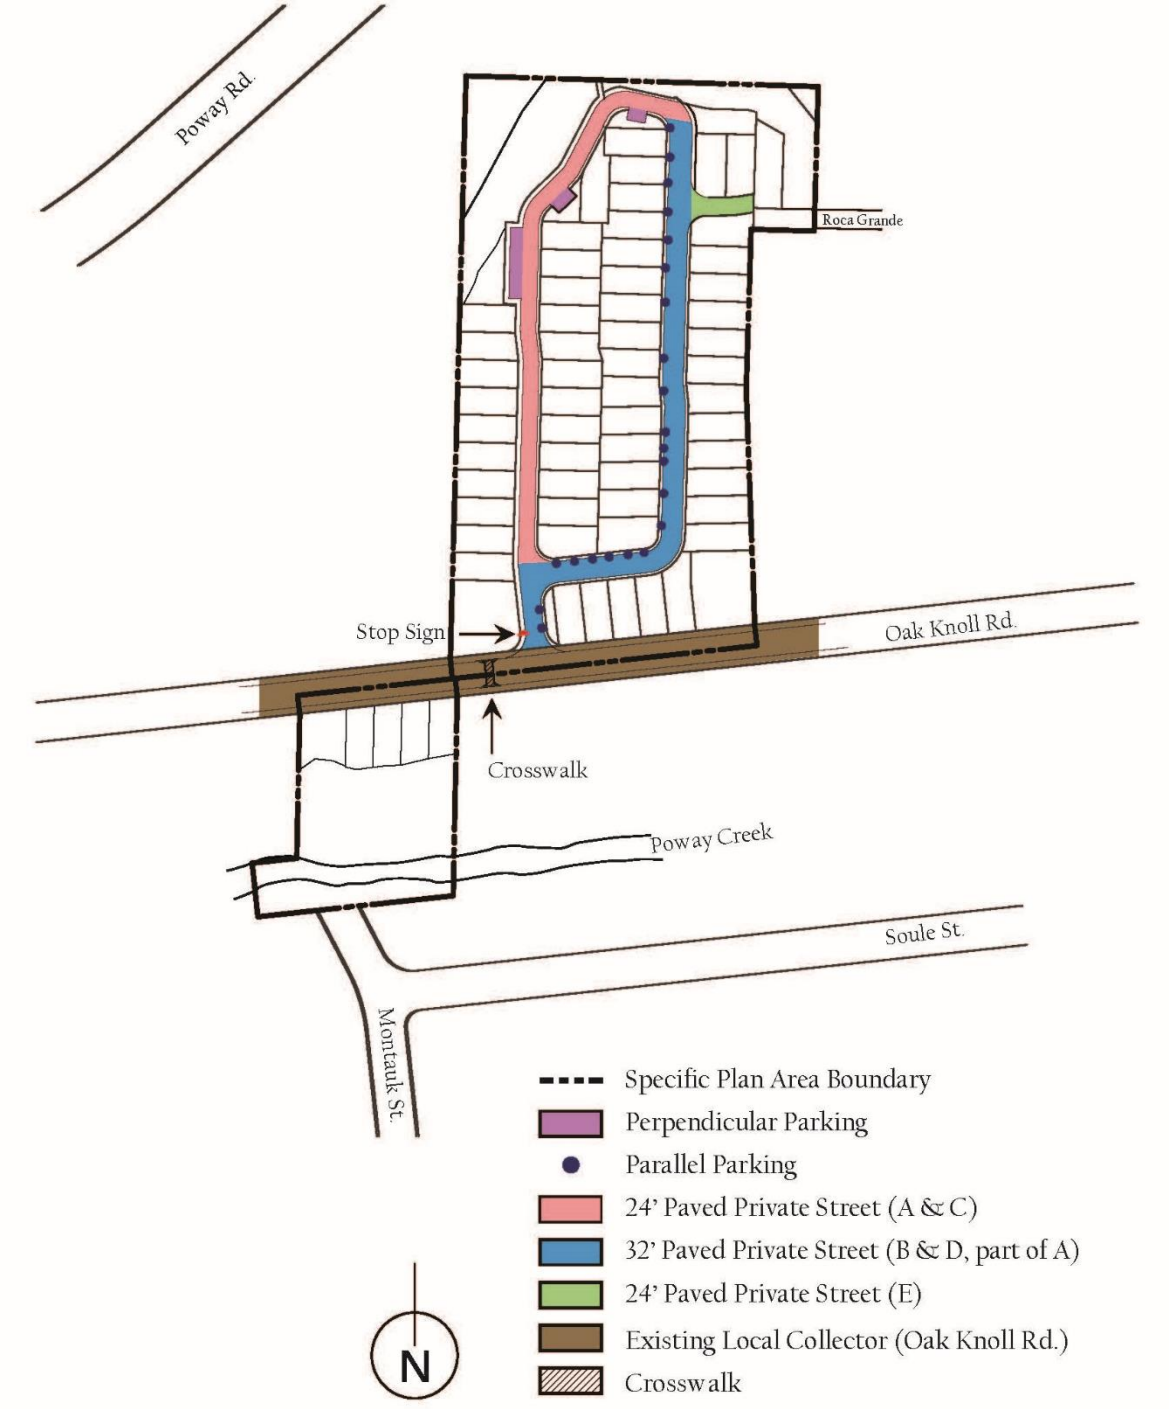


Exhibit 4.1: Conceptual Mobility & Parking Plan

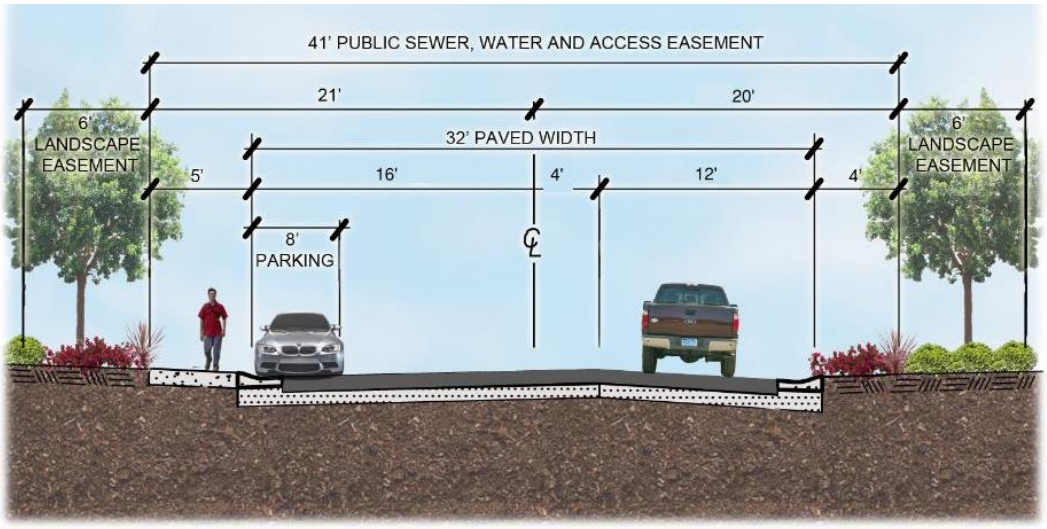
Private Streets with Parking

Private streets with parking (Streets B and D) consist of a 41-foot-wide private road easement (See Exhibit 4.2: Private Street with Parking). The paved section of the roadway includes a 24-foot travel-way (one lane in each direction) plus an eight-foot parking lane on one side for a total dimension of 32 feet from curb to curb. The parking lane is accompanied by a five-foot sidewalk on one side. Shade trees will be planted in the private front yards, protected with a recorded six-foot wide landscape easement.



32' PAVED PRIVATE STREET
STREETS 'B' & 'D' AND PORTION OF 'A' NOT TO SCALE
PARKING PERMITTED ON ONE SIDE OF ROAD
20 MPH DESIGN SPEED

Exhibit 4.2: Private Street with Parking

Private Streets without Parking

Private streets without parking (Streets A and C) consist of a 33-foot-wide private road easement (see Exhibit 4.3: Private Street without Parking). The paved section of the roadway includes a 24-foot travel-way (one lane in each direction) measured from curb to curb. A five-foot sidewalk is provided on one side. Shade trees will be planted in the private front yards, protected with a recorded six-foot wide landscape easement. Please note, Street E is comprised of a 24-foot travel-way (one lane in each direction) with no parking or sidewalk for the short segment serving two residential lots.

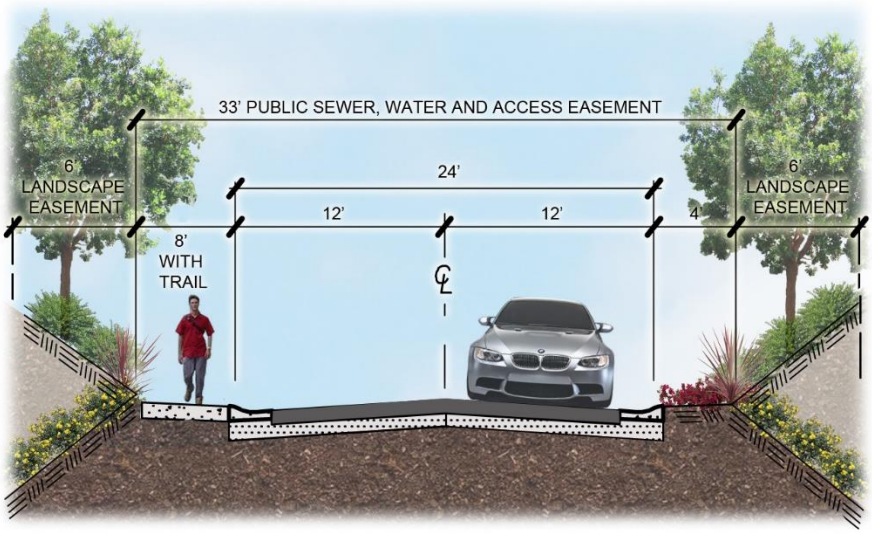


Exhibit 4.3: Private Street without Parking

4.2 On-site Parking

The proposed project is required to provide 126 on-site parking spaces, per PMC 17.08.160. The project exceeds the minimum requirements by 166 spaces, as depicted in **Table 4.1:** Parking Summary.

Table 4.1: Parking Summary

Units	RS-7 Requirement per PMC 17.08.160	Total
63	2 car garage	126

Parking Type	Required Spaces	Provided Spaces
Resident Parking		
2-car Garages[1]	126	126
Private Driveways[2]		126
Subtotal Resident Spaces	**126**	**252**
Guest Parking		
Parallel Spaces[3]		24
Perpendicular Spaces[4]		16
Subtotal Guest Spaces		**40**
Total Parking	**126**	**292**

Notes:

1. 2-car garages are a minimum of 20-feet x 20-feet clear of obstructions.
2. Private Driveways are 20-feet x 20-feet.
3. Parallel parking spaces are located along portions of Streets A, B and C and are 8-feet wide x 22-feet.
4. Perpendicular parking spaces are located along Street C and a portion of Street A and are 9-feet x 19-feet.

4.3 Traffic Calming Plan

The purpose of the Harmon Ranch Traffic Calming Plan is to lower the vehicle speeds on neighborhood streets without restricting access. The overall goals of the Traffic Calming Plan are to:

- Improve the quality of life for residents;
- Reduce impacts of motor vehicles on streets;
- Create safe and attractive streets; and
- Create a friendly environment for pedestrians and bicyclists.

Traffic calming measures are designed to physically force drivers to slow down to avoid an uncomfortable driving experience. Traffic calming measures can also be designed to achieve a desired speed limit which drivers are physically compelled to meet. Design considerations include safety, maintenance, emergency vehicle access, self-enforcement and drainage. There are a variety

of traffic calming measures that are widely used throughout the United States. The Harmon Ranch Traffic Calming Plan includes the traffic calming measures described in Table 4.2: Traffic Calming Measures. The conceptual locations of proposed traffic calming measures are depicted in Exhibit 2.1: Illustrative Site Plan. The final locations of these measures will be determined during final engineering.

Table 4.2: Traffic Calming Measures

Traffic Calming Measure	Description	Benefit/Target
Gateway	Gateway treatments include the use of signs, landscaping, enhanced paving and community identification monuments placed at the entrance to a neighborhood announcing to motorist that they are entering a community where there is a significant change in the driving environment.	• Reduces speed • Improves safety • Enhances community aesthetics
Lane Narrowing	Travel lanes are narrowed by reducing the paving width from standards	• Reduces speed • Improves safety • Provides multi-modal accommodations
On-Street Parking	Striped diagonal parking or parallel parking along one or both sides of a street	• Reduces speed • Improves safety
Enhanced Paving	Physical measures such as colored, patterned and textured pavement within the travel lanes	• Reduces speed • Encourages safe and appropriate driving behavior • Enhances pedestrian safety • Enhances community aesthetic
Mid-Block Crossing	A mid-block crossing is intended to slow traffic and allow enhanced pedestrian crossings mid-block. Physical measures such as pedestrian crossing signage and RRFBs	• Reduces speed • Enhances pedestrian safety • Provide multi-modal accommodations where appropriate

4.4 Community Trail

An eight-foot-wide segment of the Community Trail is planned between Oak Knoll Road and the north portion of the Specific Plan Area. As planned in the Poway General Plan, the Community Trail may connect to the Towne Center Plaza in the future, subject to the adjacent property owner's cooperation. The Community Trail is planned along Street A and a portion of Street C. See Exhibit 2.1: Illustrative Plan for the Community Trail location.

Chapter Five
Community Design Guidelines

Page Left Blank Intentionally

Chapter 5 – Community Design Guidelines

5.0 Introduction

The purpose of this chapter is to establish architectural and landscape guidelines intended to create a harmonious and intimate residential neighborhood, complimentary to the rural character of existing neighborhoods.

5.1 Architectural Design Guidelines

Architectural guidelines will provide the architectural styles, colors, and variety of elevation plotting to create a vibrant streetscape and avoid a street scene that appears repetitive.

Architectural Design Guideline objectives include the following:

- Provide a diverse palette of architectural styles compatible with the rural character of surrounding neighborhoods.
- Promote diversity in the residential street scene and create individuality between homes.
- Avoid a monotonous streetscape by incorporating a variety of architectural elements on the front elevations.
- Utilize a variety of muted colors and quality materials that align with the character and design of the intended architectural styles.

5.1.1 Architectural Styles

To promote diversity in the residential street scene and create an interesting mix of architectural styles which are compatible with the existing rural character of surrounding neighborhoods, the following architectural styles will be implemented within Harmon Ranch:

- Santa Barbara
- Ranch
- Farmhouse
- Monterey

Exhibit 5.1 Conceptual Architectural Elevations

The following section describes each architectural style in greater detail. Styles may be represented as traditional or contemporary interpretations. A summary of Typical Features is intended to identify the minimum characteristics, such as massing, materials and roof form that are needed to successfully express the architectural style. Common Enhancements include features that may be provided but are not required within each particular style of home. Common Enhancements are provided to inspire additional design elements that may be added to further support the expression of the selected style.

A. Santa Barbara

In reference to the Mediterranean and formal Spanish Revival styles, the structural elements of Santa Barbara architecture include long and rectangular forms accentuated by horizontal massing of single-story roof elements utilizing low pitched roofs. The style is marked by the prominent use of smooth plaster (stucco) wall and built-up stucco eaves; clay tile hip, shed, or flat roofs; and arched elements. Other characteristics typically include small porches or balconies, taller windows or fenestrations, window shutters, canvas awnings, decorative patterned tile and iron detailing.

Table 5.1: Santa Barbara Style Characteristics

Element	Typical Features	Common Enhancements[1]
Massing	• Horizontal massing with some vertically accented elements. • Single story roof edges	
Roof	• Shallower roof pitches: 3:12 to 5:12 • Hip and/or gable roof form • Overhang: 6" – 18" eaves with tighter rakes conditions • Built up stucco eave • Barrel or 'S" tile roofing	• Exposed rafters • Boosted roof tiles
Primary Entry Feature	• Front porch with simple arched openings • Rectangular shaped door • Header trim • Surface mounted lighting at entry to complement style	• Decorative tile surround
Windows	• Multi-paned windows on front and highly visible side and rear elevations • Simple window trim accents	• Bay windows • Thickened header trim • Shutters • Window Boxes
Wall Cladding	• Sand finished stucco	
Garages	• Raised panel garage door • Header trim	• Carriage door appearance • Surface mounted lighting complementary to style • Corbels at corners or arch header
Colors	• Body: Light neutral tones • Trim: Darker earth tones • Accents: Light or dark shades in contrast with body color	

[1] Common Enhancements include features that may be provided but are not required within each particular style of home.

B. Farmhouse

The Farmhouse style represents the typical American farmhouse, which can be found throughout the United States. Farmhouses became a symbol of the rural agrarian style, its simplicity, and functionality. Originating during colonial times, early examples of the farmhouse style borrowed design elements from Cape Code and other Colonial styles including dormers, broad and wrapped front porches and symmetrical massing. Modification to the style over time reflected advancements in construction techniques and the availability of local materials. Today a resurgence in popularity of this style is expressed in the Modern Farmhouse, which combines the predominant design features expressed with simplified, contemporary lines and minimal but thoughtful detailing that is rustic and utilitarian in appearance.

Table 5.2: Farmhouse Style Characteristics

Element	Typical Features	Common Enhancements[1]
Massing	• Simple symmetrical or asymmetrical	
Roof	• Steep roof pitch: 6:12 to 12:12 • Gable roof form • Deep overhang: 12" – 16" • Open eaves • Smooth, flat concrete tile (shingle appearance) and/or metal (metal roof materials limited to gabled dormers, cupolas, weather vanes, porches, verandas and accent roofs)	• Gabled dormers • Cupolas • Weather vanes
Primary Entry Feature	• Rectangular shaped door • 2-6 panels and/or glass panes in door • Front porch with simple squared supports and shed roof • Surface mounted lighting at entry to complement style	• Porches • Simple wood railings on porches • Thickened header trim • Porch supports with piers, double squared columns and/or battered columns • Dutch doors
Windows	• Vertical, two-over-two windows on front and highly visible side and rear elevations • Simple window surrounds (minimum 2x4)	• Bay windows • Multi-paned windows • Thickened header trim • Extended sills • Shutters • Window boxes
Wall Cladding	• Horizontal and/or vertical siding (may be combined with stucco) • Changes in material type or direction to create a finished look	
Garages	• Raised panel garage door	• Barn door or carriage door appearance • Surface mounted lighting complementary to the style
Details		• Louvered attic vents
Colors	• Body: Whites or light tinted colors • Trim: Whites or light shades complementary to body color • Accents: Light or dark shades in contrast with body color	

[1] Common Enhancements include features that may be provided but are not required within each particular style of home.

C. Ranch

Inspired by the ranch houses and haciendas built in California during the lates 1800s, architect Cliff May adapted this style in the mid-1930s to meet the needs of large families. The Ranch home incorporates many of the original design concepts including strong indoor-outdoor relationships, low-to-the-ground and horizontal massing and casual living with open floor plans that maximize living space and the enjoyment of California's mild climate. Materials typically include siding, brick and stucco. Although Ranch style homes were predominantly single story, two-story ranch homes focus on maintaining vertical massing through proper roof design and limited or recessed second stories.

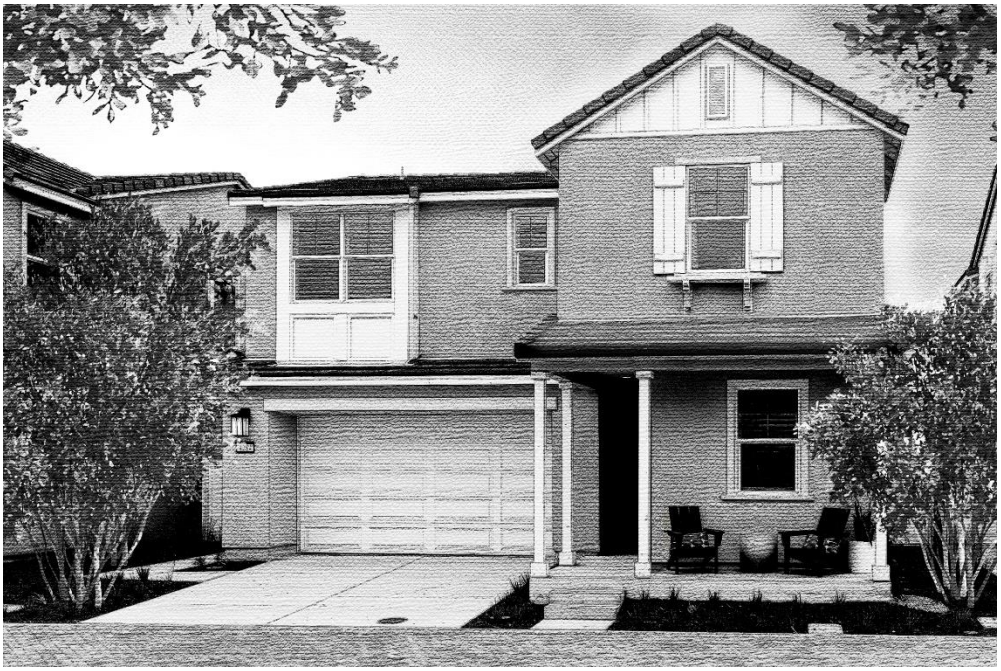

Table 5.3: Ranch Style Characteristics

Element	Typical Features	Common Enhancements[1]
Massing	• Horizontal massing with strong indoor-outdoor connectivity	
Roof	• Steep roof pitch: 4:12 to 5:12 • Hip and/or gable roof form • Deep overhang: 18" – 24" • Open eaves • Smooth, flat concrete tile (shingle appearance)	• Dormers • Deeper overhangs up to 36" • Exposed rafters
Primary Entry Feature	• Rectangular shaped door • 2-6 panels and/or glass panes in door • Simple door surrounds, minimum 2'x6' • Front porch with simple squared supports • Surface mounted lighting at entry to complement style	• Simple wood railings on porches • Side lites • Thickened header trim above door. • Porch supports with double squared columns or thickened square columns
Windows	• Multi-paned windows on front and highly visible side and rear elevations • Simple window surrounds (minimum 2'x6')	• Bay windows • Thickened header trim • Extended sills • Shutters • Window Boxes
Wall Cladding	• Horizontal and/or vertical siding (may be combined with stucco) or stucco with masonry or shingle siding • Changes in material should occur on an inside plane or be separated by a raised horizontal band	
Garages	• Raised panel garage door	• Carriage door appearance • Surface mounted lighting complementary to style
Details		• Masonry chimney and accents • Louvered attic vents
Colors	• Body: Light to dark earth tones • Trim: Off-whites or earth tones to contrast body color • Accents: Light or dark shades in contrast with body color	

[1] Common Enhancements include features that may be provided but are not required within each particular style of home.

D. Monterey

The Monterey Style originated in Southern California while still under Mexican rule. Monterey style homes are easily identified by the second story front balcony that dominates the front elevation. Although Spanish in origin, the Monterey style often incorporates materials such as brick and roof shingles, which are typically expressed in other Spanish architectural styles. This deviation from the typical Spanish palette of materials makes Monterey style highly versatile and complementary to a wide range or other architectural styles.

Table 5.4: Monterey Style Characteristics

Element	Typical Features	Common Enhancements[1]
Massing	• Symmetrical or asymmetrical, rectangular, horizontal	
Roof	• Low to moderate roof pitch: 4:12 to 7:12 • Gable roof form • Shallow to moderate overhang: 12" – 24" • Open eaves • Barrel or 'S" tile roofing	• Dormers • Deeper overhangs up to 36" • Exposed rafter tails and/or beams • Shed roof at single story elements or balcony
Primary Entry Feature	• Rectangular, arched or flat arched shaped door • Planked or paneled appearance; for paneled doors, a minimum of 2-6 panels • Simple door surrounds • Covered stoop or porch • Surface mounted lighting at entry to complement style	• Grates, speak easy or limited lites in door • Rustic hardware such as strap hinges • Thickened and/or shaped header trim at door • Shaped balcony columns, railings and supports
Windows	• Vertical, multi-paned windows on front and highly visible side and rear elevations • "Wood" or stucco on foam window surrounds or recessed windows	• Vertical window groupings • Thickened and/or shaped header trim • Extended sills • Shutters • Deeply recessed windows
Wall Cladding	• Stucco	• Masonry or masonry accents
Garages	• Raised panel garage door	• Carriage door appearance • Surface mounted lighting complementary to style
Details		• Painted arbor or vine trellis • Masonry chimney and accents • Brackets, corbels and/or braces, particular at balcony cantilever • Metal gates, grills and similar accents
Colors	• Body: White or light beige • Trim: Off-whites, rust or light to dark browns • Accents: Greens, blues and reds	

[1] Common Enhancements include features that may be provided but are not required within each particular style of home.

5.1.2 Street Scene Plotting

The primary goal of these guidelines is to create attractive, diverse and interesting street scenes that do not appear as a monotonous pattern of similar homes. To achieve this goal, the proposed community includes three floor plans ranging from 2,638 to 3,135 square feet featuring four bedrooms, three bathrooms and a two-car garage. Four architectural styles will be mixed between the three plans to increase diversity of character and interest throughout the neighborhood. To achieve this goal, the mix of floor plans and elevation styles should seek to achieve the following:

(1) Provide a minimum of three floor plans and elevations.
(2) For each series of elevations, select architectural styles that are noticeably different in appearance to ensure visual variation between homes.
(3) Homes with the same combination of floor plan and elevation should not be plotted immediately adjacent to or face one another.

5.1.3 Roof Forms

The visibility of homes from a distance is influenced by the variety of roof forms and heights. In addition, the roof form is the defining element of architectural style and can serve to greatly reduce the perceived mass and scale of a home from the street. The following guidelines are provided to soften the impact of roof massing on individual homes as well as the overall street scene:

(1) Vary ridge heights, roof forms and roof pitch between adjacent homes to avoid similar silhouettes and achieve undulation in the skyline.
(2) Provide a variety of roof forms such as hipped roofs, gabled roofs, shed roofs, dormers to break up mass, reinforce style and create perceptible differences between adjacent homes.
(3) Design rakes and eaves to reflect the architectural style of individual homes and contribute to the architectural quality of the community.
(4) When provided, exposed rafter tails should measure a minimum of four inches and be painted or stained to match the color scheme of the home.
(5) When appropriate to style, broad eaves are encouraged to provide passive shading and cooling.

5.1.4 Entry Design

The design of the front door entries plays a crucial role in establishing curb-appeal and a pedestrian friendly street scene. The front door represents the interface between the public realm and private living space. Entries should be the primary focus of the front elevation. The following guidelines apply to entry design:

(1) Front doors should be designed to face the street whenever possible.

(2) Entry design should be consistent with the architectural style to include door style, material surrounds, lighting and hardware.
(3) Front entries should be covered by a minimum of 48 inches deep overhang, porch or similar projection to protect residents and visitors from inclement weather conditions.
(4) Incorporate porches or other appropriate elements to primary entrances to enhance primary entries, create a sense of arrival and express the architectural style of the home.
(5) Use color and materials to further enhance entries and convey their importance in the overall composition of the front elevation.

5.1.5 Windows

Windows are a major component of the elevation design and can be used to convey the architectural style of the home. The following guidelines apply to the selection and placement of windows when designing elevations:

(1) Select windows with proportion, shape and size appropriate to the architectural style and overall composition of the elevation.
(2) Placement off windows should reflect interior spaces, consider privacy of neighbors and encourage visual surveillance of the street, open space areas and other public areas.
(3) When provided, multi-paned windows may be achieved by providing true divided lites, insert grids or applied grids.
(4) When provided as appropriate to the architectural style, shutters should appear functional and sized to match the size of the adjacent window.
(5) Window hardware and details such as grates and pot shelves should be appropriate to the architectural style of the home.
(6) Recessed windows should have a minimum depth of 12 inches.
(7) Select high-performance windows in accordance with CalGreen to promote energy conservation and thermal comfort.
(8) Windows may be vinyl-wrapped, fiberglass, wood clad or wood.
(9) When applied to siding, stone or brick, trim materials should consist of wood or have a wood-like appearance. On stucco surfaces, trim may consist of stucco or foam.

5.1.6 Exterior Lighting and Fixtures

Lighting of residential lots should focus on providing safety and security as well as enhancing the street scene. The need for security and safety must be balanced with preserving the rural character of the community. While light should be adequate to create a welcoming appearance from the street, preserving the visibility of the night sky and the privacy and comfort of adjacent homes is important to maintaining harmonious relationships between neighbors and reducing excessive sky glow. Appropriate lighting for residential lots can be achieved as follows:

(1) Provide lighting along walkways and entries to welcome visitors and create safe walking conditions at night. Each home should be provided with at least one light fixture at each entry to the home.
(2) Use lighting to illuminate dark spaces and maximize the visibility of entry points into the home to deter criminals from hiding or breaking in through windows or doors.
(3) All lighting should consider neighboring properties by directing and shielding light downward to avoid spilling onto adjacent residences or into neighbor's windows.
(4) When highlighting architectural or landscape features, opt for lighting designs that achieve security and aesthetics.
(5) Select lighting fixtures that are complementary in style, color and materials to the architecture of home. Consider using lighting fixtures as focal point features where appropriate to reinforce the architectural style.
(6) When lighting is provided in garage soffits, light sources should be recessed and not surface mounted.
(7) Addresses should be illuminated so they are readily visible from the street in accordance with fire department standards.

5.1.7 Colors, Materials and Details

Color, material and detail selections offer an effective method of creating discernibly different homes along a street. Selections should reflect the intended architectural style and should be applied to convey high quality construction as provided in the following guidelines:

(1) Select a varied palette of colors and materials that are consistent with the architectural style of the home and support the rural design vision of the community.
(2) Consider the relationship between the range of colors, hues and material between the individual palettes to ensure that overall street scenes achieve a sense of individuality between residences while still resulting in a harmonious mix of homes.
(3) Select durable roof materials and colors that are consistent with the architectural style and complementary to the selected color schemes.
(4) For each color scheme specify color selections for body, trim and accents. Provide a minimum of three colors per home.
(5) For each front elevation and elevations visible from the public view, provide a minimum of two materials such as stucco, siding, stone, masonry or similar as appropriate to the style. Changes in the direction of siding and/or additional roof materials may be considered an additional material.
(6) Avoid plotting homes with the same color scheme immediately adjacent to or facing one another.

(7) Ensure material and color changes occur on an inside corner such as a porch, media niche or similar architectural pop-out such that the material change is concealed and the material application does not appear to be false.

5.2 Landscape Design Guidelines

The Specific Plan Area includes two open space land use districts – Open Space and Open Space-Recreation. The areas designated "Open Space" will remain natural. The following landscape design guidelines will be implemented within designated "Open Space – Recreation" areas, which includes manufactured slopes, areas adjacent to private streets and areas designed to meet the passive recreation needs of the residents and the public (Poway Creek Overlook). (See **Exhibit 5.2: Landscape Palette**).

In support of a consistent community theme and reinforcement of the rural character of the surrounding neighborhoods, the following plant palette provides a unified list of trees, shrubs, succulents and ground cover for use on internal manufactured slopes, landscaped common areas and Open Space – Recreation areas as well as the Poway Creek Overlook site. Street trees are also designated below.

Street trees and landscaping within common areas to be maintained by the Homeowner's Association, with maintenance requirements related to tree and shrub trimming and maintenance to be included in the community CC&Rs.

PLANT LEGEND

Exhibit 5.2: Landscape Palette

5.2.1 Conceptual Tree Plan

Trees are the backbone of landscape design. Street trees will be provided within the private homeowner lots, secured with a recorded landscape easement to ensure the trees remain in place in perpetuity. Street trees to be maintained by the Homeowners Association, with maintenance requirements provided in the CC&Rs. Additional trees are planned within open space areas distributed throughout the Specific Plan Area. In addition, replacement trees are planned to mimic the existing trees on the historic home site, as depicted on Exhibit 5.3: Conceptual Tree Plan.

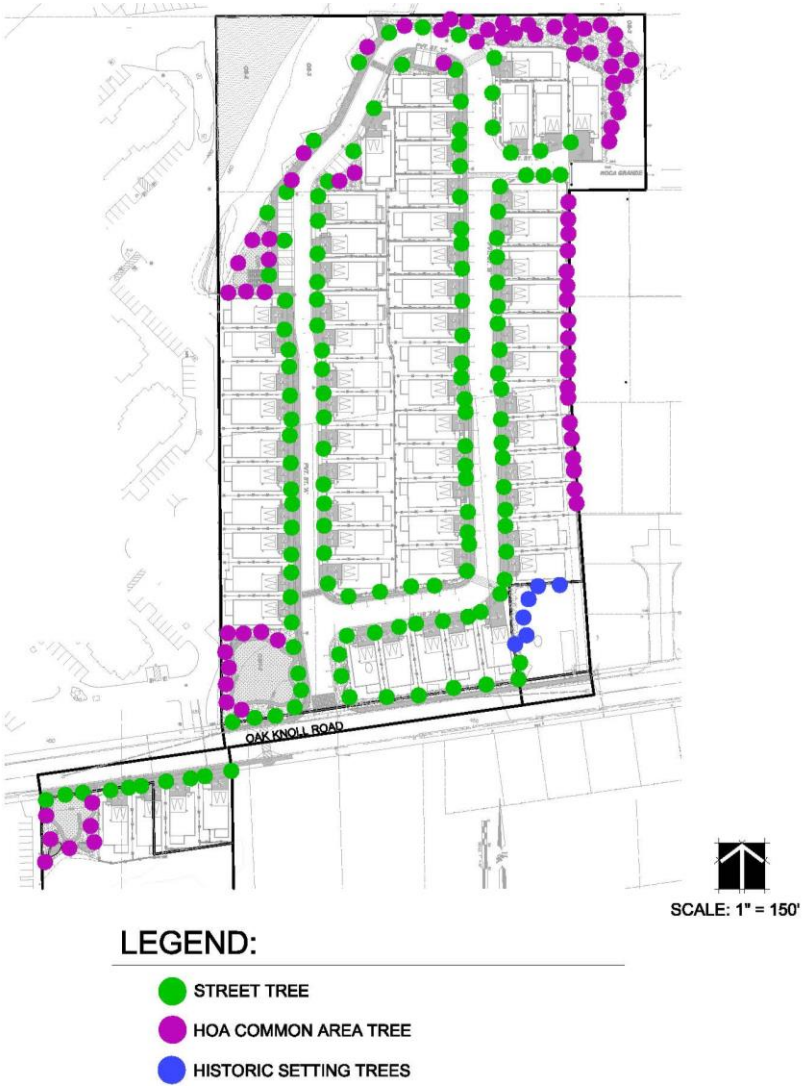

Exhibit 5.3: Conceptual Street Tree Plan

5.2.2 Open Space Landscape Concepts

Thematic landscape is a somewhat refined palette of ornamental and native plants that are emblematic of a rural landscape with year-round appeal. This landscaping theme will be implemented within the planned passive recreation areas identified in the Specific Plan as OS-R (1-8). Detailed descriptions of the OS-R areas planned to provide for passive uses follows.

The overlook planned on the south side of Oak Knoll Road is approximately 5,600 SF and includes an open turf area, two covered seating areas, landscaped planters and an open lawn area. This open space feature will be owned and maintained by the Community Association and open for public access and use. See Exhibit 5.4: Poway Creek Overlook (OSR-1) Conceptual Plan. Please note, the conceptual designs presented below may be modified during final design.

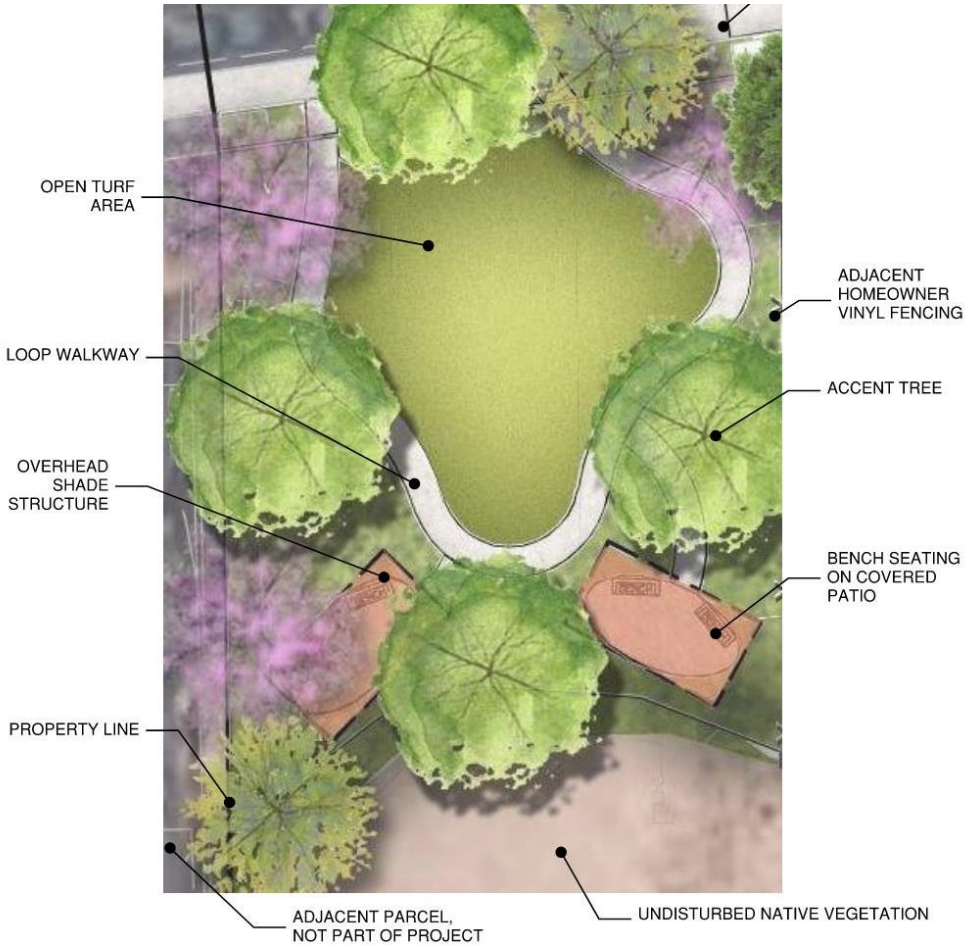

Exhibit 5.4: Poway Creek Overlook (OSR-1) Conceptual Plan

The open space recreation area designated OSR-2 is located adjacent to the community entry. The Entry Open Space Area is approximately 11,358 SF and is planned to provide an open lawn area for informal play and gathering, a looped walkway with bench seating, landscaped planter areas and shade trees. OSR-2 will be owned and maintained by the Community Association for use by residents. See Exhibit 5.5: Entry Open Space Area (OSR-2) Conceptual Plan. Please note, the conceptual design presented below may be modified during final design.

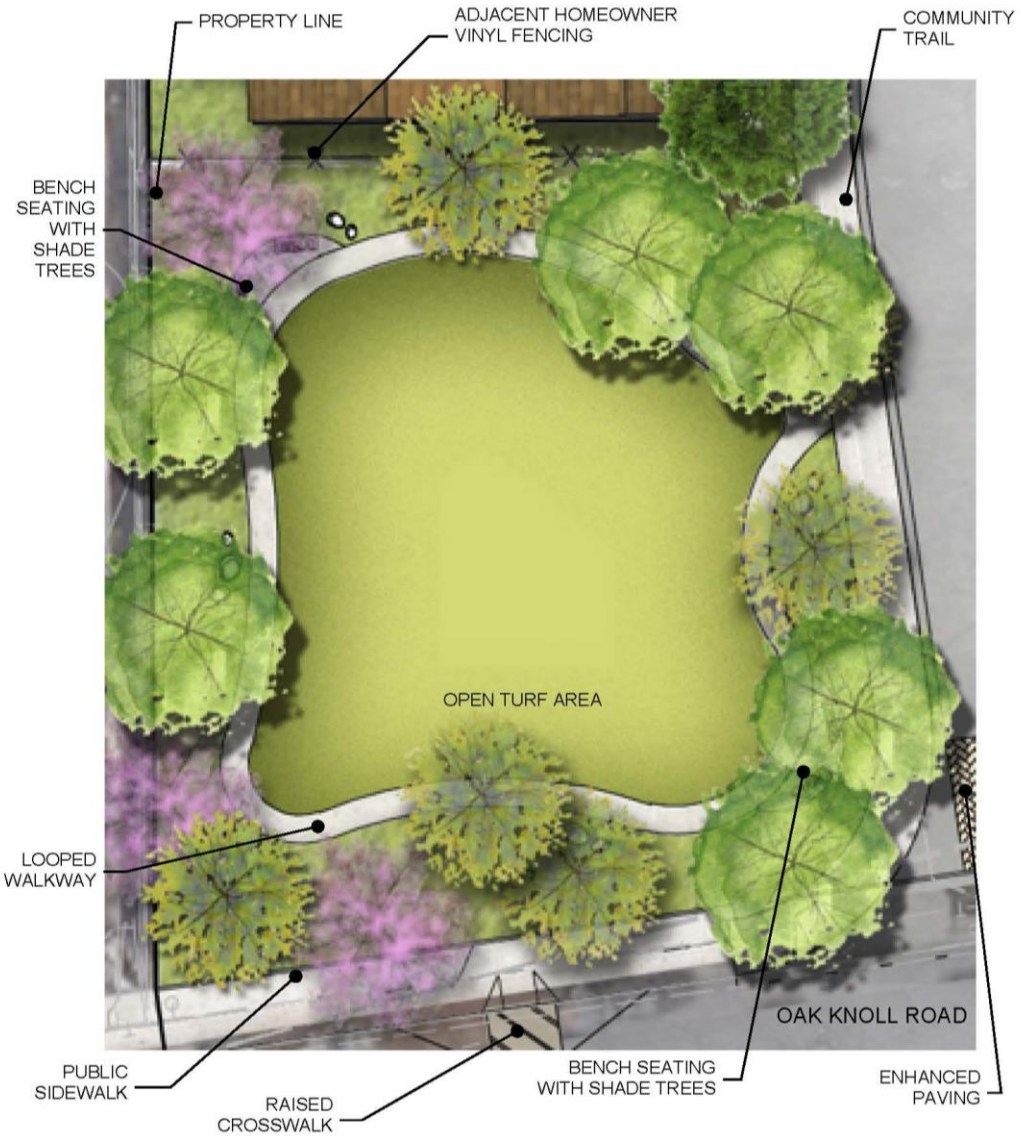

Exhibit 5.5: Entry Open Space Area (OSR-2) Conceptual Plan

The Open Space – Recreation area designated OSR-3 is approximately 4,511 SF and is centrally located along the extension of the Community Trail. This passive recreation area is planned to include an open turf area for casual play and gathering, an overhead shade structure with tables and BBQ, landscape planters and shade trees. See Exhibit 5.6: Central Open Space (OSR-3) Conceptual Plan. Please note, the conceptual design presented below may be modified during final design.

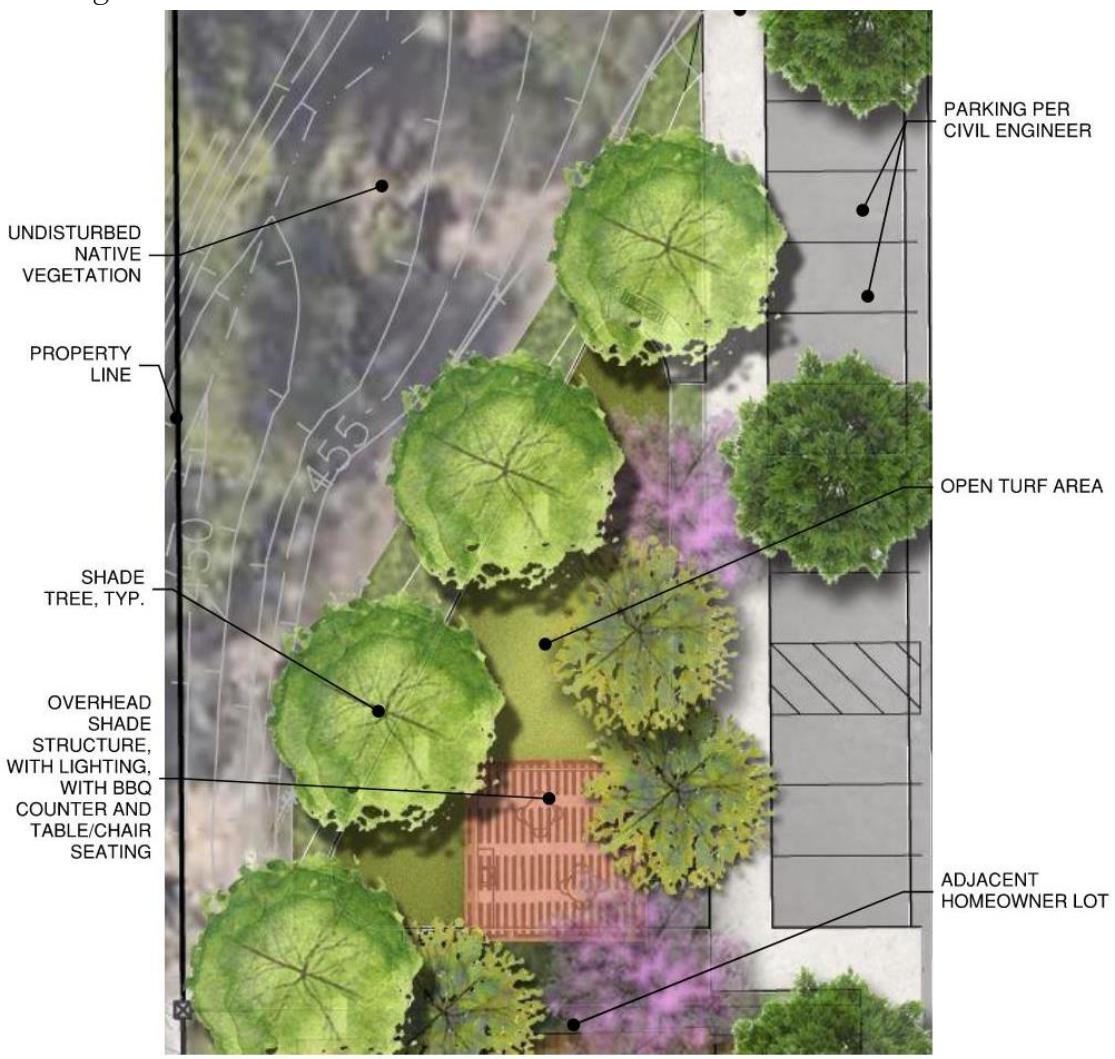

Exhibit 5.6: Central Open Space (OSR-3) Conceptual Plan

5.2.3 Residential Landscape Concept

Installation of front, side and rear yard landscaping shall comply with the requirements in Section 3.6 Landscape Requirements of this Specific Plan. Final designs will be subject to the provisions in the community CC&Rs and associated architectural guidelines.

5.4 Community Entry Monument

A community entry monument is planned at the intersection of Street A and Oak Knoll Road. This entry feature will be incorporated into the retaining wall design and will feature a decorative stone or block face with a decorative masonry cap, raised planter and metal pin mounted lettering. The sign portion of the entry will be illuminated with up-lights. The monument will be approximately 4 feet in height. The final community monument to be refined during final engineering. This simple, yet elegant feature will announce arrival into the Harmon Ranch neighborhood and provide the community with its own identity. The signage shall comply with the standards in the Poway Municipal Code and be subject to a Sign Permit. Please note, the conceptual design may be modified during final design. See Exhibit 5.7: Conceptual Community Entry Monument.

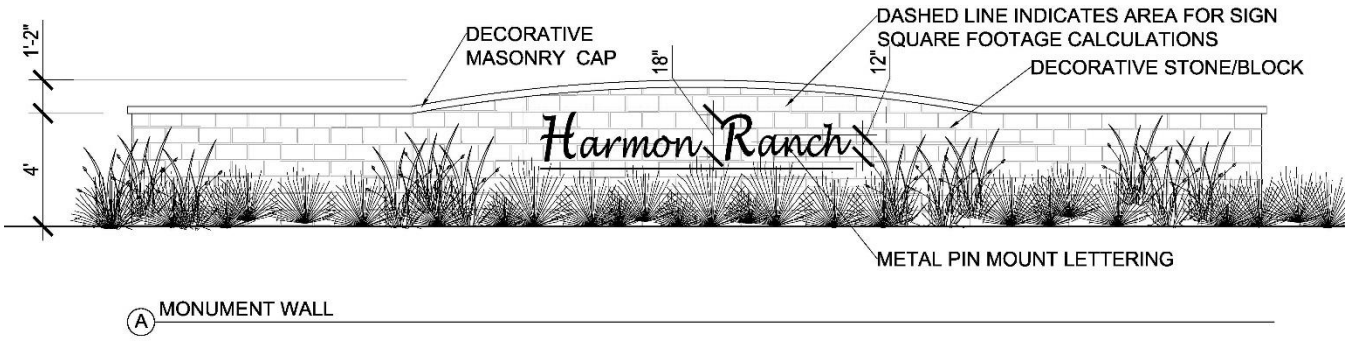

Exhibit 5.7: Conceptual Community Entry Monument

5.5 Wall and Fence Design

Walls and fencing provide safety, privacy and contribute to the community style and theme. Refer to Exhibit 3.7: Conceptual Fence and Wall Plan for proposed wall and fence locations and wall details. Within Harmon Ranch, vinyl fencing is proposed at the rear and side yards. At the perimeter of the project adjacent to Oak Knoll Road and existing homes, a combination of up to three feet of block retaining wall and vinyl fence is proposed to enhance the privacy of neighbors.

5.6 Conformance to Design Guidelines

It shall be the duty of the Community Association to review and approve proposed construction for compliance with Community Design Guidelines. Submittal to the City with Community Association approval constitutes Community Association review and approval of architectural and landscape design. The City has the duty to review proposed construction for conformance with Chapter 6, Community Design Guidelines in addition to ensuring compliance with the PMC and, accept where exempt, all construction requires a building permit.

Page Left Blank Intentionally

Chapter Six
Grading, Utilities & Services

Page Left Blank Intentionally

Chapter 6 - Grading Utilities & Services

6.0 Introduction

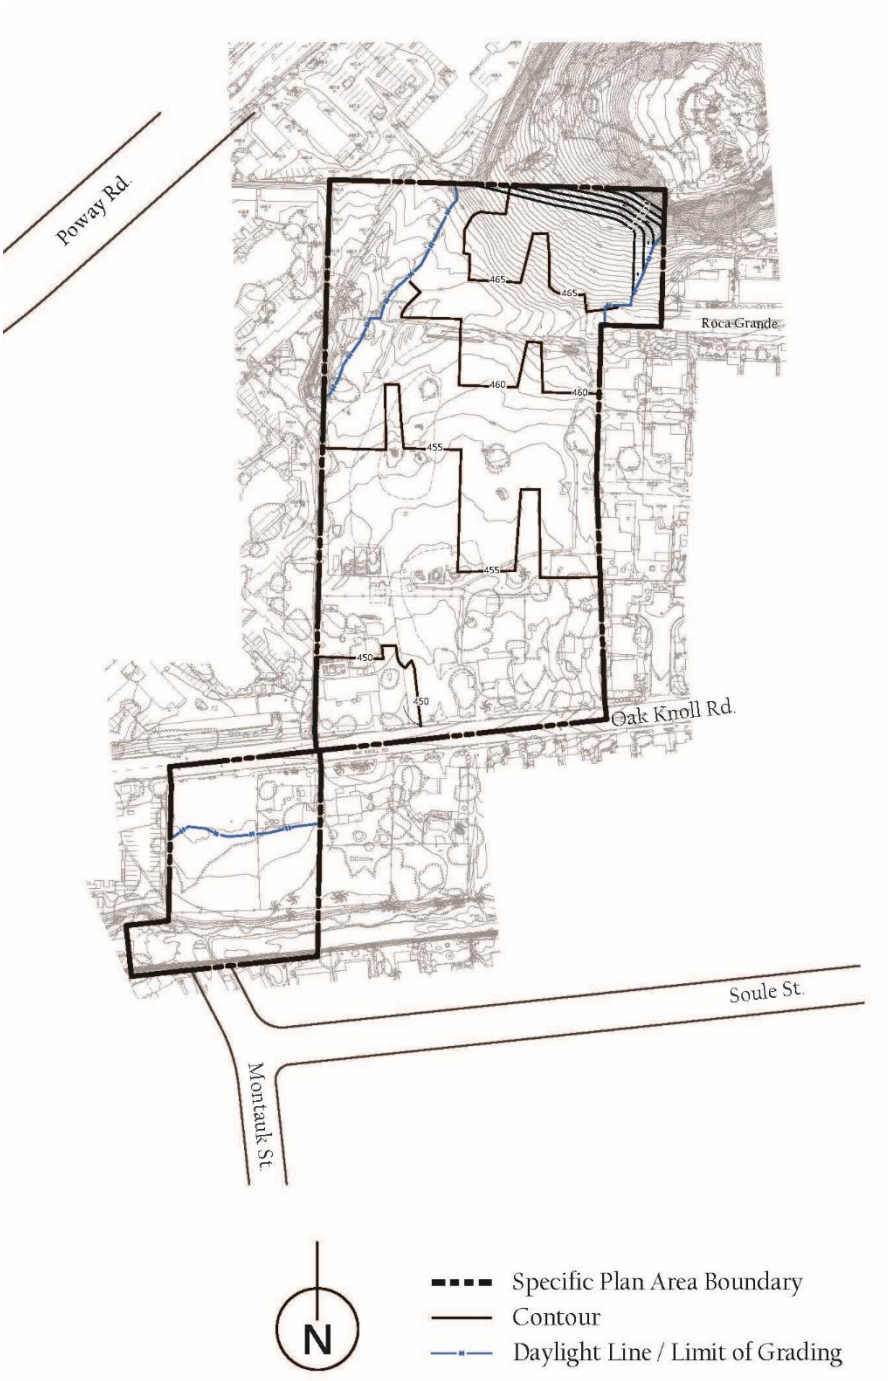
This chapter provides an overview of the grading plan, utility plans and services necessary to support development of the Harmon Ranch project. The intent is to provide the basic utilities and services to ensure the community functions properly but also seeks to conserve onsite resources by implementing best management practices, low impact development practices, water and energy conservation measures and adequate public services such as schools, fire protection and public safety.

6.1 Grading and Drainage

6.1.1 Grading

Grading of the site respects the existing topography to the extent feasible for implementing the plan and adheres to PMC Grading Standards unless otherwise shown and as recommended in the Geotechnical Report prepared by GEOCON dated July 15, 2022. Grading for the site is balanced at 19,250 Cubic Yards of cut and fill to avoid export or import of dirt. **Exhibit 6.1: Conceptual Grading Plan** highlights how dirt will be distributed throughout the site. Cut and fill slopes are designed at a slope ratio of 2:1 maximum, as shown on **Exhibit 6.2: Conceptual Cut and Fill Plan**.

Exhibit 6.1: Conceptual Grading Plan



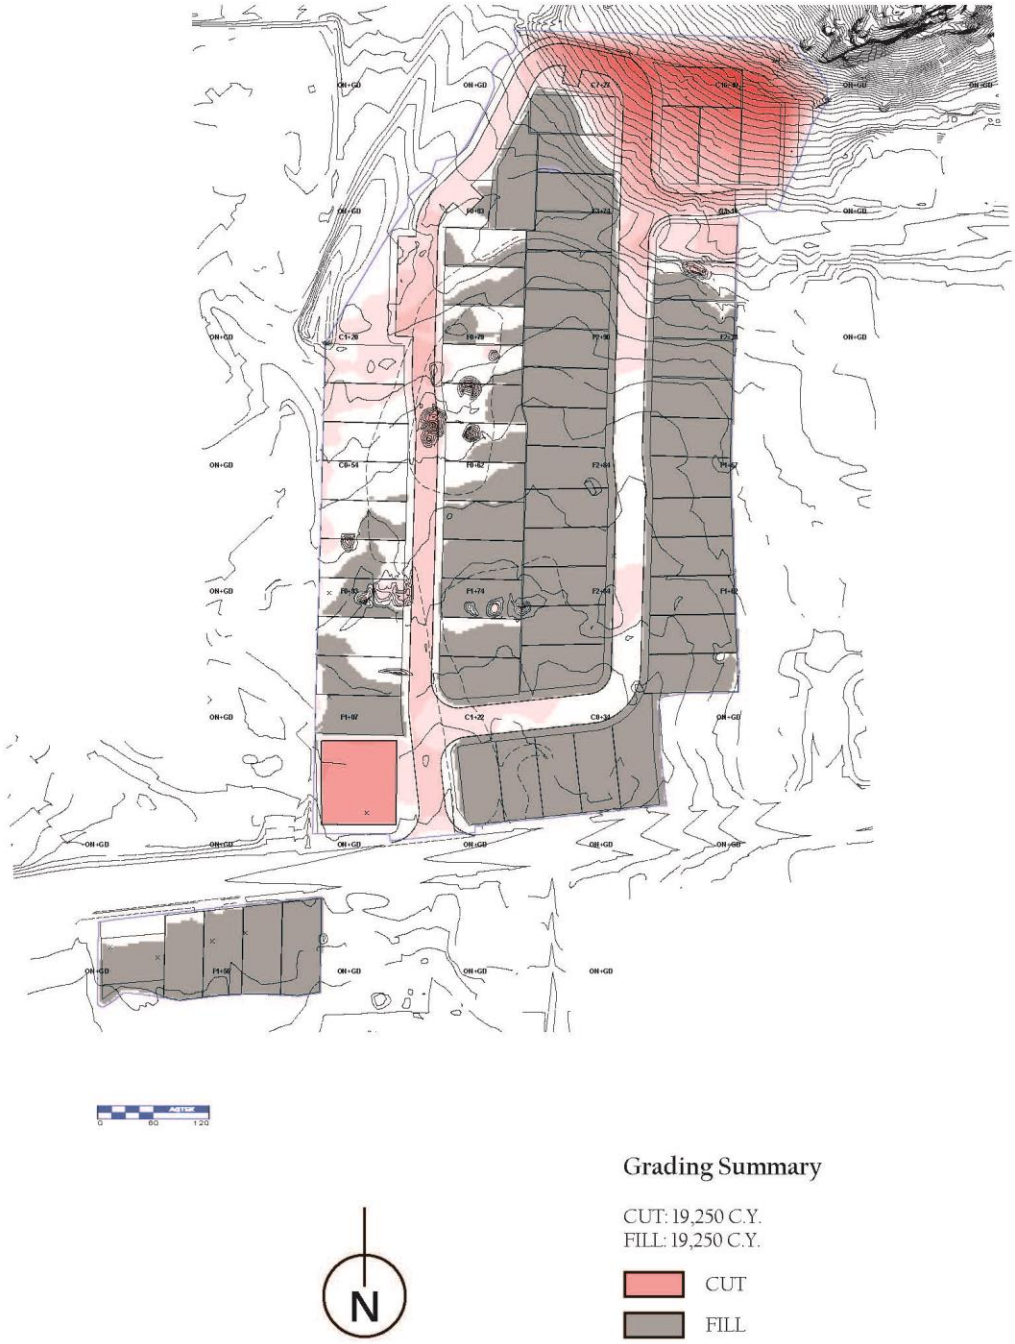


Exhibit 6.2: Conceptual Cut and Fill Plan

6-6.1.2 Drainage

The site drains generally from north to south and discharges to an existing 36" RCP storm drain located in Oak Knoll Road. An existing open channel across the northwestern portion of the site drains southwesterly to the adjacent apartment site. Drainage is conveyed offsite within an 8'x5' Reinforced Concrete Box in a southwesterly direction. The 36" Oak Knoll Road system joins the 8'x5' RCB that discharges to the west of the Specific Plan into Poway Creek.

The southerly portion of the site is within a FEMA AE Zone and will be raised above the flood elevation in accordance with FEMA regulations.

The Specific Plan accepts storm water from adjoining properties to the north and east. The northern drainage bypasses naturally through the site as previously described. Drainage from existing home sites to the east is conveyed in a by-pass storm drain system directly to the existing Oak Knoll Road system (See **Exhibit 6.3: Conceptual Drainage Plan**).

The grading plan is designed to drain all storm water directly to private streets. Once in the street, storm water is collected by catch basin and inlets and a system of private underground storm drain pipes.

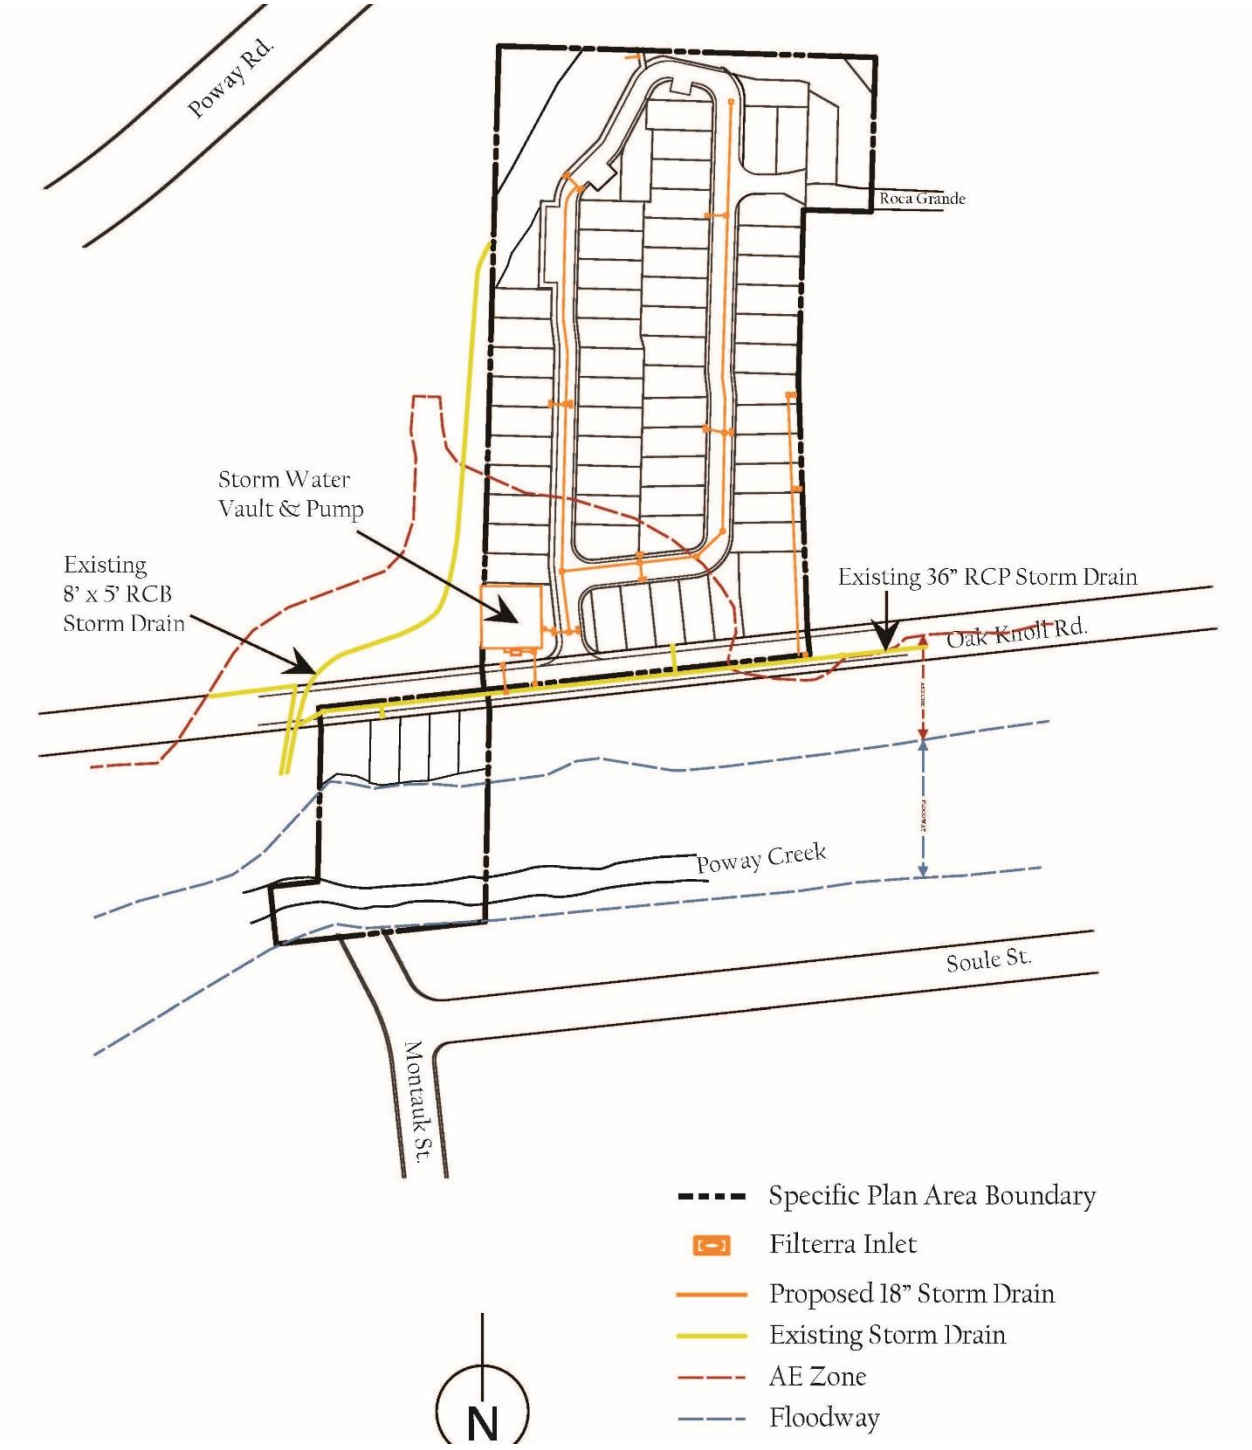

Exhibit 6.3: Conceptual Drainage Plan

6.1.3. Stormwater Treatment

The City's strategy and policy direction is to reduce discharge of pollutants into the stormwater conveyance system through implementation of best management practices (BMPs). Adopted in 2015, the City of Poway Jurisdictional Runoff Management Program includes implementation of BMP requirements, water quality monitoring, educational outreach, municipal maintenance procedures and inspection and enforcement programs. The City conducts annual storm drain facility rehabilitation and replacement projects as needed. Development projects throughout the City are required to implement site-specific storm drain improvements and contribute fees toward regional improvements.

Stormwater runoff collected from the Specific Plan area may contain high sediment loads and many types of pollutants, including oil and grease, chemicals, pesticides, heavy metals, bacteria, viruses and oxygen-demanding compounds. The primary method for treating this stormwater involves a series of bioretention basins. Stormwater is collected and conveyed to these basins via a series of private catch basins and pipes located within private streets. Once collected, the bioretention basins are designed to slow the velocity and volume of water, a process called hydromodification, and treat stormwater through various processes collectively referred to as bioretention.

Hydromodification is important to protecting stormwater quality by preventing flooding, sedimentation and erosion downstream. Flooding of areas that are normally dry can result in chemicals, fuel, trash, bacteria and other potential pollutants entering the natural drainage system. Sedimentation and erosion can also damage the environment by altering the physical characteristics of water bodies that provide habitat for plant and animal species.

Biofiltration is important to protecting stormwater quality by removing potential pollutants within water prior to leaving the site. Biofiltration removes pollutants in a variety of ways:

Evapotranspiration: The process in which water is transferred from the soil by evaporation and from plants by transpiration into the air, leaving the pollutants behind.

Nutrient Cycling: The process in which plants extract nutrients, i.e., organic and inorganic matter that can affect water quality, back into the production of organic matter.

Filtration: The process through which runoff filtrates through grasses, grates and screens that remove pollutants.

Water quality measures require maintenance by the Community Association to ensure they continue to operate properly. Maintenance includes repairing erosion, removing sediment and trash, mowing and managing vegetation and ensuring filters are not blocked and are functioning properly. Post treatment, stormwater is released from basins into bypass pipes

which convey existing ditches, channels or pipes that are part of the City's existing storm drain system.

In addition to treatment methods within the stormwater system, pollution prevention strategies, including the Stormwater Pollution Prevention (SWPP) for construction are specifically designed to protect stormwater from potential contamination.

As further described in the Harmon Ranch Drainage Report (Hunsaker July 2022), the community proposes catch basins and inlets containing Filterra units that provide the required water quality. The stormwater is then conveyed to an underground vault system for storage to meet hydromodification requirements. The vault discharges to the Oak Knoll Road 36" RCP storm drain system. Due to the relatively shallow grade of the exiting storm drain, the storage vault is pumped to the discharge point.

6.2 Domestic Water Source and Supply

The City's Public Works Department will provide domestic water to Harmon Ranch. The San Diego County Water Authority (SDCWA) provides 99 percent of Poway's water in the form of untreated water, with the remaining demand met through recycled water purchased from the City of San Diego. SDCWA is supplied water by the Metropolitan Water District of Southern California (MWD), water transfers from the Imperial Irrigation District and desalinated water from the Carlsbad Desalination Plant. MWD water derives primarily from the State Water Project and the Colorado River. All imported water is treated locally at the City's water treatment plant and then distributed via a complex and comprehensive system of pumps and pipes.

Over the past decade, water in California has become an increasing concern. Severe droughts have resulted in a host of issues related to water quality and adequate supply to serve the state's growing population. Recognizing the importance of conserving and efficiently managing limited water resources, the City adopted the 2015 Urban Water Management Plan (UWMP). The UWMP provides a framework for Poway's long-term water management and provides public information regarding planning efforts to ensure an adequate supply of clean and potable water remains available for existing and future homes and businesses. The UWMP is updated every five years. Any future modification to the Specific Plan's water distribution system shall comply with the most current UWMP.

The Harmon Ranch Specific Plan Area is served by the 715 Zone. The on-site water system proposed for the project consists of a series of 8-inch pipes as illustrated in **Exhibit 6.4: Conceptual Water Plan**, to create a looped system that serves all of the homes within the Specific Plan Area. The internal looped system will connect to the existing 6" line in Roca Grande Road and the existing 10" line in Oak Knoll Road.

The planning criteria used to evaluate the potable water system requirements for the Specific Plan Area are in accordance with the City of Poway Potable Water Master Plan Update, dated June 2008 (City of Poway 2008 Water Master Plan) which outlines minimum and maximum allowable pressures and velocities in the public water system. under different operating conditions. Potable water demand for the Specific Plan Area was estimated using water demand factors provided in the City of Poway 2008 Water Master Plan. The estimated average potable water demand for the project is 18.48 gpm or 26,611 gpd.

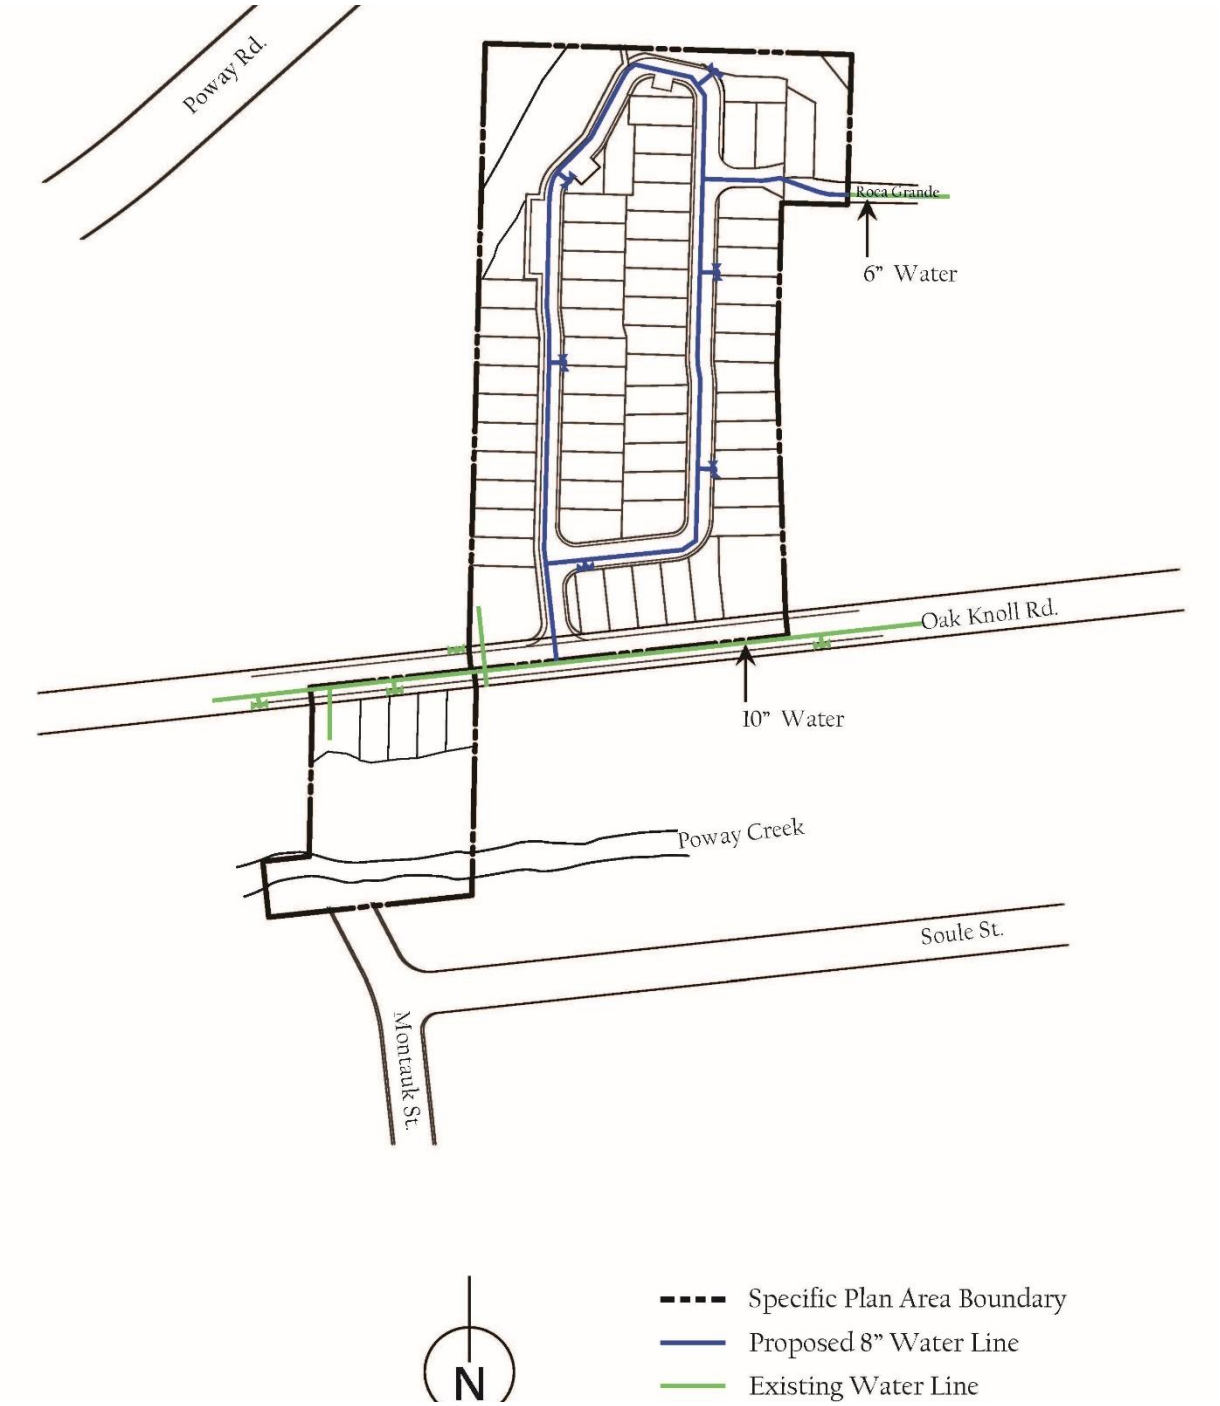

Exhibit 6.4: Conceptual Water Plan

6.3 Wastewater

Wastewater includes water collected from sinks, toilets and showers that is conveyed into the City's sanitary sewer system. The sewer system in the City of Poway is outlined in the City's Sanitary Sewer Master Plan. Wastewater collection and the sewage system are maintained and operated by the City's Public Works Department to ensure sufficient capacity is available for dry weather peak-flow conditions and storm or wet weather events. Wastewater collected in the City's sewage system is conveyed through the City of San Diego's Municipal Wastewater System for conveyance, treatment and disposal at either the North City Water Reclamation Plant or the Point Loma Wastewater Treatment Plant.

City sewer system facilities in the vicinity of the project include existing 8-inch public sewer lines and a 30-inch public trunk sewer within Oak Knoll Road located along the project frontage. The existing 8-inch public gravity sewer lines convey sewer flows from existing residences along Oak Knoll Road from east to west and tie into the existing 30-inch public trunk sewer. The 30-inch trunk sewer conveys flow west in Oak Knoll Road to Pomerado Road.

The proposed onsite public sewer system, as depicted on **Exhibit 6.5: Conceptual Sewer Plan**, includes 8-inch public gravity sewer lines to serve the 59 dwelling units north of Oak Knoll Road. The proposed onsite 8-inch public sewer lines will convey sewage from the 59 dwelling units south to the existing 8-inch public sewer line directly fronting the project's south entrance in Oak Knoll Road. The remaining 4 lots south of Oak Knoll Road will make individual lateral connections to the same existing 8-inch public sewer line in Oak Knoll Road. This existing 8-inch public sewer line will convey flows west to the existing 30-inch public trunk sewer in Oak Knoll Road. The projected average flow is 13,760 gpd. The resulting projected peak flow for the project is 44,720 (13,760 gpd x 3.25).

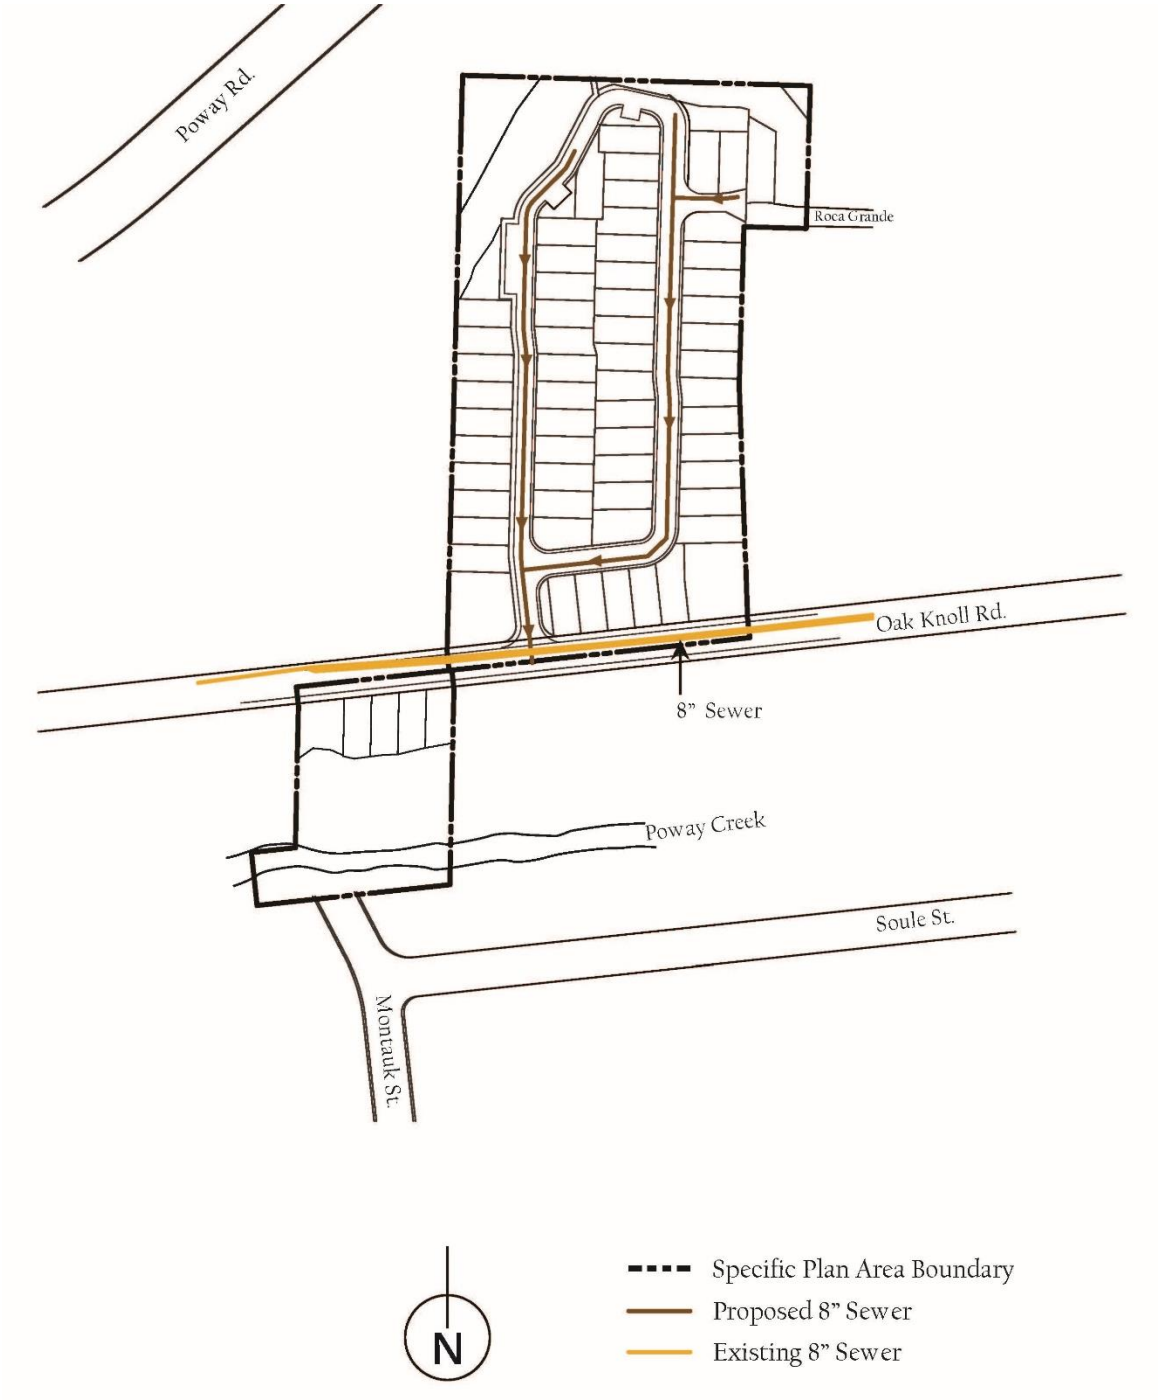

Exhibit 6.5: Conceptual Sewer Plan

6.4 Solid Waste

The City contracts with EDCO, a private hauler, for residential and commercial solid waste and recycling pickup and disposal. As part of Poway's comprehensive waste reduction and recycling program, the solid waste franchisee provides single stream commingled recycling, green waste and biannual self-haul event for bulky items. EDCO currently operates six certified buyback centers, two material recovery facilities (MFRs), six transfer stations and two mixed construction demolition and inert (CDI) processing facilities with the goal of achieving zero waste. In 2017, EDCO diverted over 619,676 tons from the landfill. All development within the Specific Plan Area will comply with City, County, State and CalGreen requirements regarding recycling and waste disposal.

Waste collected from the Specific Plan area will be taken to either the Escondido Resource Recovery (ERR) Center or the Ramona facility. The ERR facility was opened in June 2017 are provides commingled recycling, mixed waste processing and an anaerobic digester. The Romana facilities include an organics facility, transfer station and recycling buyback center.

6.5 Electricity and Natural Gas

Electrical power and natural gas are provided by San Diego Gas and Electric Company. No major improvements to the local distribution networks will be needed to support the growth associated with this Specific Plan. The Project will coordinate with dry utility providers to ensure utility systems have adequate capacity to serve future residential uses.

New development within the Specific Plan Area will be required to meet the California Energy Code (Title 24) and CalGreen requirements. Title 24, Part 6 and CalGreen include the most stringent requirements for energy conservation in the Country. To meet these requirements, all new development within the Specific Plan Area will include rooftop photovoltaic (PV) solar panels, electric vehicle (EV) charging stations, energy efficient lighting and appliances, low-flow fixtures and other design features that conserve energy.

6.6 Broadband and Telecommunications

Broadband and telecommunication services are provided by Cox Communications, Spectrum, AT&T and Windstream Communications. Users have choices and the available systems provide appropriate facilities and services to meet the needs of the Specific Plan Area.

6.7 Public Park Land

In accordance with the PMC, "A ratio of five park acres to 1,000 population, in accordance with the adopted park and recreation element of the City's general plan shall be used to compute the amount of land to be dedicated." Based on Poway's average household size from the 2010 Census, the Department of Finance estimates that Poway's household size in 2019 is approximately 3.12 persons per household (E-5 estimates dated 1/1/2019). **Table 6.1: Estimated Park Land Requirement** illustrates how the park acreage required is calculated, resulting in a total of approximately 0.98 acres.

The project includes 0.99 acres of open space/private recreation amenities distributed across seven sites within the Specific Plan Area. Planned amenities include open turf play areas, family gathering and seating spaces and picnic and BBQ gathering areas. Except for the Poway Creek Overlook, these facilities are to be privately maintained by the community HOA for the exclusive use of residents. The planned Poway Creek Overlook is also maintained by the HOA but is open to the public. Though these community amenities meet the intent of the PMC, they are not eligible for park credit as they do not meet the minimum 2-acre size requirement per PMC 16.38.100. Therefore, the project proposes to satisfy its public park obligation through the payment of the City's park in-lieu fee, per PMC 16.38.040.

Table 6.1: Estimated Parkland Requirement

Household Type	Units	Population / Household	Total Population	Park Land Ratio	Total Park Land Required[1]
Single Family	63	3.12	197	5 AC / 1,000 Pop	0.98 AC

[1] The existing historical home is not included in the total park land required calculation.

6.8 Schools

The Specific Plan Area is within the boundaries of the Poway Unified School District (PUSD). PUSD serves the City of Poway as well as surrounding communities. **Table 6.1: Projected Students** provides an estimate of the number of new students anticipated to be generated by development of 63 homes within the Specific Plan Area. Estimates are based on current information available and may be subject to changes with input from PUSD.

Table 6.2: Projected Students

Education Level	Estimated Student Generation Rate[3]	Projected Students[1]
Elementary (K-5)	0.2463	16
Middle (6-8)	0.1323	8
High (9-12)	0.1815	12
Total		36

[1] Projected student calculation does not include the existing historic home.

The Specific Plan Area is served by Valley Elementary School (grades K-5) located at 3000 Bowron Road. Valley Elementary School had 676 students enrolled in the 2020-21 school year. The proposed project would add an estimated 16 students to Valley Elementary School, for a total of 642 students.

The Specific Plan Area is served by Twin Peaks Middle School (grades 6-8) located at 14640 Tierra Bonita Road. Twin Peaks Middle school had 1,164 students enrolled in the 2020-21 school year. The proposed project would add an estimated 8 students to Twin Peaks Middle School, for a total of 1,172 students.

The Specific Plan Area is served by Poway High School (grades 9-12) located at 15500 Espola Road. Poway High School had 2,251 students enrolled in the 2020-21 school year. The proposed project would add an estimated 12 students to Poway High School for a total of 2,263 students.

Although capacity appears to be available at the schools that would serve students from the proposed project, PUSD will determine which schools will have available capacity to serve the additional 36 students generated by the proposed project.

Schools are funded through the payment of development impact fees pursuant to SB50/Government Code 665995, which would be paid prior to issuance of building permits. Pursuant to Education Code Section 17620(a)(1), the governing board of any school district is authorized to levy a fee, charge, dedication or other requirement against any construction within the boundaries of the District, for the purpose of funding the construction or reconstruction of school facilities. The Applicant would be required to pay SB50 fees, in accordance with SB50 alternative school fees prior to building permit issuance. According to SB50, payment of developer impact fees constitutes adequate mitigation related to school facility impacts.

6.9 Fire Prevention Services

The Poway Fire Department (PFD) would serve the Specific Plan Area. The PFD provides structural fire protection and advanced life support-level emergency medical services within the

[3] Year 2020-21 Student generation rates are used to estimate student population.

City limits; the PFD is an all-hazard, all-risk response agency. From three fire stations, 17 personnel respond to emergency and non-emergency calls for service by staffing three paramedic engines, a paramedic ladder truck, two paramedic ambulances and one incident commander (Fire Battalion Chief). Engine company personnel cross-staff ICS Type III wildland brush engines and provides staffing of a CalOES Type I engine when called upon. The PFD maintains response aid agreements with surrounding jurisdictions and participates in the California State Fire & Rescue Mutual Aid System and FEMA's Urban Area Search & Rescue team. The PFD's resources are grouped into the Metro Zone area of San Diego County Operational Area and partners with fire departments from San Diego City, Miramar, Chula Vista, National City, Coronado, Imperial Beach, and U.S. Navy Federal. The PFD operates two primary Fire Stations (Stations 1 and 3) that would respond to an incident at the proposed Project site, with first-due response likely from Station 1 given its closer location and greater coverage in a faster timeframe. Station 3 would respond as necessary and would also provide fast response throughout the Project.

Response to the proposed community site from the closest existing PFD fire station (Station 1) would arrive at the Project's primary entrance off Oak Knoll Road within 3 minutes, 19 seconds travel time (4 minutes 49 seconds total response time). The most remote homes within the Project are reached within 3 minutes, 27 seconds travel time, or 4 minutes 57 seconds total response time. This analysis indicates that the entire Project is within the PFD's internal response timeframe. This analysis also indicates that Station 3 is not close enough to meet the 6-minute response time, but does arrive in 3 minutes, 48 seconds travel time (5 minutes 18 seconds total response time) and is an appropriate second-due engine.

6.10 Public Safety and Emergency Services

The City of Poway contracts with the San Diego County Sheriff's Department for law enforcement services. The Poway station, located near City Hall in downtown Poway, provides patrol, traffic and investigative services for the entire City. The Poway station consists of 45 sworn personnel, six civilians, 13 reserve deputies and 55 Senior Volunteer patrol personnel. Poway enjoys consistently low crime rates.

Emergency medical services, including ambulance transportation, are provided by the City of Poway as part of the Poway Fire Department operations. Palomar Medical Center is the closest emergency medical facility.

The City of Poway also administers the Community Emergency Response Team (CERT) Program, which educates the residents of Poway and adjacent cities about disaster preparedness. The city of Poway offers a CERT academy once a year. The CERT Program provides training in basic disaster response skills such as fire safety, simple search and rescue and basic first aid, terrorism, emergency preparedness and disaster psychology. Graduates of the program or an equivalent

CERT course are eligible to apply for membership in the Poway CERT Program and are required to attend two training sessions or community events each calendar year. CERT members must be 18 years or older.

Chapter Seven

Implementation & Administration

Page Left Blank Intentionally

Chapter 7 – Implementation & Administration

7.0 Introduction

Implementation of the Harmon Ranch Specific Plan relies upon private investment and the systematic phasing of improvements. This chapter identifies the steps that need to be taken following Specific Plan approval and the financing mechanisms needed for the long-term maintenance of the community. This chapter also provides the City with guidance on proper administration of the Specific Plan, which includes the review of all future development permit applications, enforcement of Specific Plan standards and approved Conditional Use Permits within the Specific plan Area and proposed amendments to the Specific Plan that may occur in the future. Future applications shall be reviewed for consistency with the policies, design guidelines and regulations of the Specific Plan.

7.1 Implementation

Implementation of the Specific Plan requires approval of a General Plan Amendment, Zone Change, Tentative Map, Development Review (DR) Plan and Final Map by the City Council. Once approved and upon review and issuance of a grading permit, the site will be graded in accordance with Chapter 6. Grading is anticipated to begin in early 2024 and will be completed in a single phase. Grading activities are anticipated to be completed in six months. Construction will be phased as depicted in **Exhibit 7.1: Conceptual Phasing Plan** and is anticipated to be completed by June 2026.

7.2 Financing & Maintenance

The physical improvements described in the Harmon Ranch Specific Plan will be financed entirely by private investment. The following sections describe the funding mechanisms that may be utilized to provide long-term maintenance of the Specific Plan Area and provide public services to support the proposed project.

7.2.1 Development Impact Fees

Development Impact Fees (DIF) are imposed by the City of Poway on new development to finance the proportional demand for infrastructure and services created by new development. The Mitigation Fee Act requires that local jurisdictions establish a nexus between proposed fees and new development to ensure that each project pays only its proportional share of the cost. Developers within the Specific Plan Area will pay all DIFs required by the City of Poway

in accordance with the City's approved DIF Schedule. The Developer will also be required to pay impact fees to the Poway Unified School District.

Exhibit 7.1: Conceptual Phasing Plan

7.2.2 Community Association

All properties designated OS and OSR shall be deed restricted to ensure they remain open space in perpetuity and cannot be further developed into residential uses in the future. Maintenance and operation of the community will be financed through a Community Association (Association), which will be responsible for maintenance of all private streets, common utilities, common area landscaping and other commonly held properties and facilities. The Association will also be responsible for enforcement of the community's Covenants, Conditions & Restrictions (CC&Rs) to ensure that privately owned properties comply with the Specific Plan and are properly maintained to protect, preserve and enhance the property values in the community and surrounding neighborhoods. A schedule of fines and penalties shall be included in the CC&Rs to allow Association enforcement. **Exhibit 7.2: Ownership, Maintenance Responsibilities & Public Access** illustrates the anticipated ownership and maintenance responsibilities of non-residential parcels. The exhibit also indicates areas that are anticipated to be available for public access and which areas are to remain private. The Community Trail along Streets A and C and the Poway Creek Overlook are required to be open to the public.

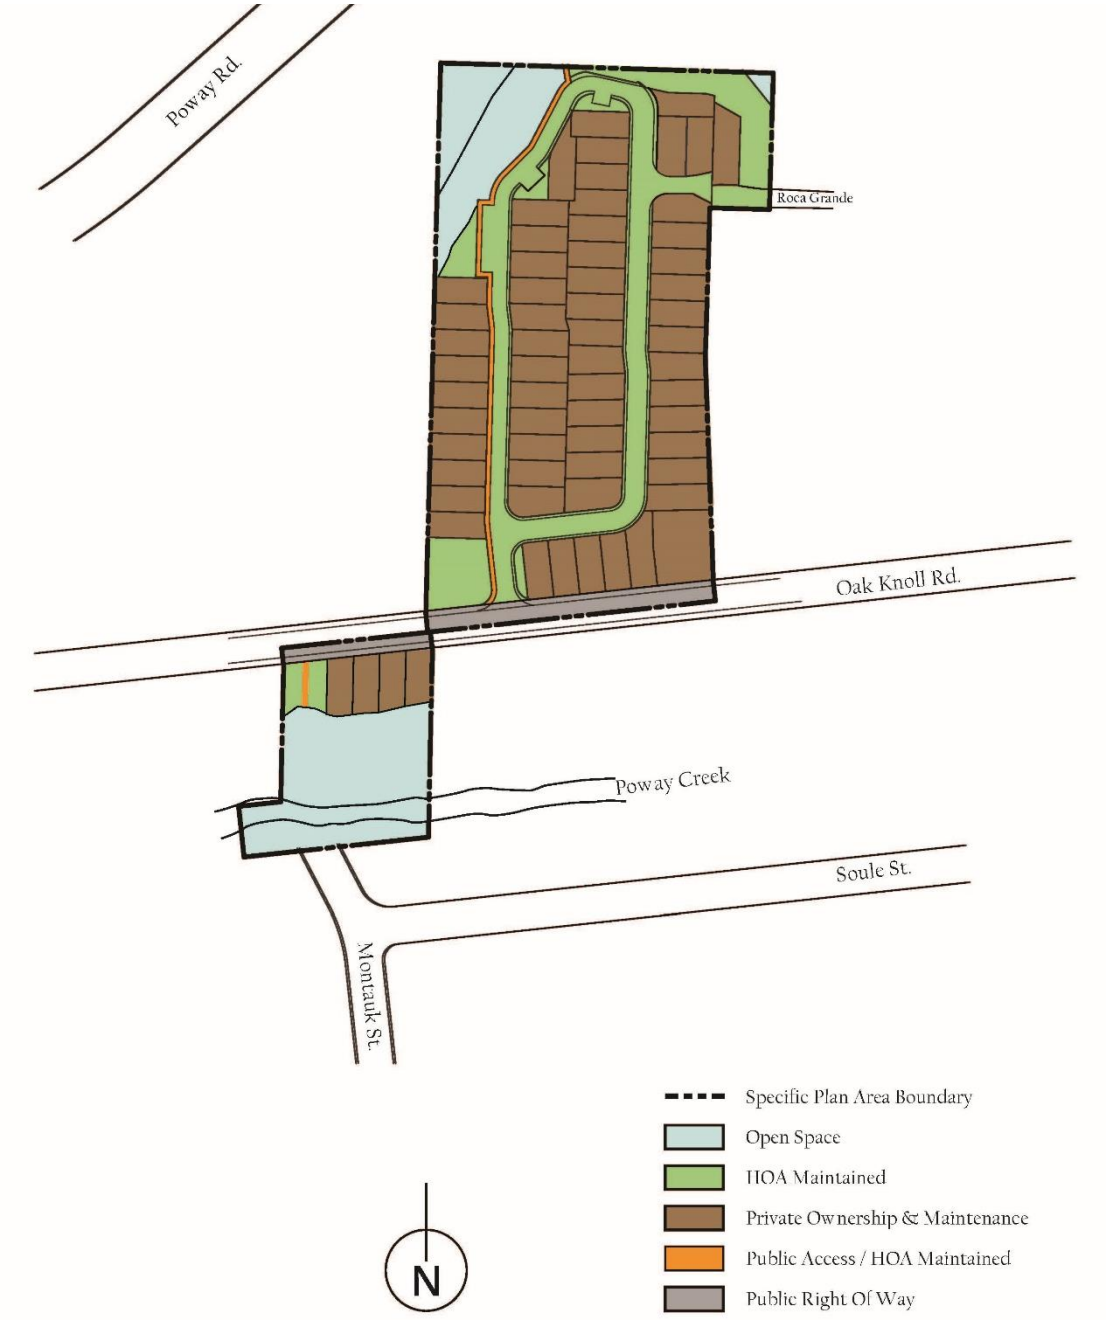

Exhibit 7.2: Ownership, Maintenance Responsibilities & Public Access

The Association shall contract with qualified professional for the long-term care and maintenance of all catch basins, Filterra units and the hydromodification vault to ensure they continue to function properly and comply with the Water Quality Management Plan (WQMP). Maintenance shall occur as required by the City of Poway.

The Community Trail and private streets within the Specific Plan Area will be maintained by the Association. The Community Trail shall remain open for public use.

7.2.3 Exactions

Cities may exact additional fees or in-lieu payment from developers or property owners to finance anticipated impacts. Exactions that may apply to the Specific Plan Area may include affordable housing, public park in-lieu and other fees to offset the impacts that the proposed project has on public services.

7.3 Specific Plan Administration

The Specific Plan serves as the implementation tool for the General Plan by establishing development regulations, permitted uses, performance standards and other standards for the Specific Plan Area. The Specific plan addresses general provisions, permitted uses, development and design standards, design guidelines, mobility and parking improvements and infrastructure. All development proposals within the Specific Plan Area are subject to the procedures established herein and all state and federal requirements. The Specific Plan shall be administered and regulated in accordance with the PMC unless otherwise specified herein.

7.3.1 Interpretation

As specified in the PMC Section 17.02.040 (Clarification of Ambiguity), unless otherwise provided, any ambiguity concerning the content or application of the Specific Plan is resolved by the review authority or the Development Services Director (Director) in a manner consistent with the goals, policies and intent established in this Specific Plan and subsequently the General Plan.

7.3.2 Severability

If any section, subsection, sentence, clause, phase or portion of this Specific Plan, or any future amendments or additions, is for any reason held to be invalid or unconstitutional by the

decision of any court or competent jurisdiction, such decision shall not affect the validity of the remaining portions of this Specific Plan or any further amendments or additions.

7.3.3 Environmental Review

The EIR for the Specific Plan area addresses project-specific environmental review for the project described by the Specific Plan. Future amendments may require additional specific environmental review as necessary if they do not substantially conform with the Specific Plan. This could include targeted studies on one or more identified environmental concerns. The City will make these determinations, and environmental review may be incorporated into the development review process.

7.3.4 Review and Approval Process

All development and uses proposed within Harmon Ranch Specific Plan shall substantially conform with the provisions of this Specific Plan. Chapter 17.52 (Development Review Procedure) of the PMC sets forth development review requirements and process for approval of projects, which shall apply to projects proposed within the Specific Plan Area.

7.3.5 Substantial Conformance

Substantial conformance means that any proposed activity, construction and development complies with the Harmon Ranch Specific Plan, adopted mitigation measures, and project conditions of approval, where no additional homes (except accessory dwelling units), property, or parcels beyond that provided by the Specific Plan or approved map are involved, approved minimum lot sizes are maintained, proposed construction is consistent with the architectural guidelines provided in the Specific Plan, no grading beyond substantial conformance limits is proposed, and no significant environmental impact is created. The Director or their designee shall determine of substantial conformance prior to the issuance of any permits or approval of plans. No written determination is required provided that plans submitted to the City for approval exhibit substantial conformance with the Harmon Ranch Specific Plan. Plans found not to be in substantial conformance shall not be approved and shall be revised or a Specific Plan amendment shall be required.

7.3.6 Administrative Adjustments

The Administrative Adjustment review process allows limited exceptions to certain development standards. An application for an Administrative Adjustment is processed administratively through an Administrative Use Permit (AUP) as described in Section 7.3.7 without the submission of a formal Variance filed on forms provided by the Director and shall include data and plans as required to make an investigation and evaluation of the application. Fees shall be paid as established by City Council resolution. A property owner or authorized

agent of the property owner shall file an Administrative Adjustment application whenever any one of the following deviations from the provisions of this Specific Plan is proposed:

(1) Alteration of a condition of approval for an approved Conditional Use Permit or development agreement.
(2) Reduction of required setbacks by up to 10 percent.
(3) Other Standards. A reduction in any other numeric development standard, excluding density or height, not exceeding 10 percent.

The Director shall reserve the right to refer any proposed alteration, reduction, or other adjustment to the City Council for consideration.

7.3.7 Administrative Adjustments Review and Findings

The Director, or the City Council upon referral, may approve and/or modify an Administrative Adjustment application in whole or in part, with or without conditions, if the applicant can demonstrate that the circumstances of the particular case can justify making the following findings.

(1) The requested adjustment will not interfere with the purpose and intent of the regulations for the land use district in which the property is located.
(2) The approval or conditional approval of the adjustment will not be injurious to adjacent property or the surrounding area.
(3) The approval or conditional approval of the adjustment will promote the general welfare and will not adversely affect the goals and policies of the City of Poway General Plan.
(4) The plans for construction and/or development resulting from approval or conditional approval of the adjustment would result in a superior design solution that enhances the visual quality, use, and function of the site and surrounding area.
(5) Special circumstances exist that justify a deviation in the minimum required standard. Public notice for an Administrative Adjustment may be required at the discretion of the Director. Refer to the PMC for public noticing procedures. Any decision of the Director may be appealed in accordance with PMC Chapter 2.20. Appeals shall be filed on forms provided by the Development Services Department and shall require payment of a fee established by City Council resolution.

7.3.8 Specific Plan Minor Modifications and Amendments

Modifications to the text or exhibits of this Specific Plan may be warranted to accommodate unforeseen conditions or events. The City will process revisions in a manner pursuant to the provisions in this section.

A. Minor Modifications

Minor Modifications to the Specific Plan are processed administratively through a Specific Plan Amendment application with approval by the Director of Development Services and do not require a public hearing or review by the City Council. The Director shall reserve the right to refer any Decision to the City Council. The Director shall have the authority to make modifications to the Specific Plan as follows:

(1) Additions, deletions, or modifications to **Table 3.2: Open Space Permitted Uses** and **Table 3.3: Residential Permitted Uses** which include uses similar to a use already listed and are consistent with the purpose and intent of the particular district and the Environmental Impact Report for the Specific Plan, provided that density, intensity, and traffic, are not increased.
(2) Minor modifications to design guidelines for architectural features and materials, landscape treatments, lighting, and signage which are consistent and compatible with the surrounding area and neighborhoods.
(3) Revisions to exhibits in the Specific Plan that do not (a) substantially change the Specific Plan's Purpose, Authority, Vision or Objectives; (b) reduce development standards to provide visual encroachments into established neighborhoods.
(4) Modifications to the Specific Plan that are of a similar magnitude to those listed above, which are deemed minor by the Director and conform to the Purpose, Authority, Vision and Objectives of this Specific Plan. Public notice for a Minor Modification may also be required at the discretion of the Director. Refer to the PMC for public noticing procedures. Any decision of the Director may be appealed in accordance with PMC Chapter 2.20. Appeals shall be filed on forms provided by the Development Services Department and shall require payment of a fee established by City Council resolution.

B. Amendments

Proposed changes to this Specific Plan that do not meet the criteria for a Minor Modification shall be subject to a formal Specific Plan Amendment process pursuant to Chapter 17.47 (Specific Plan Regulations) of the PMC. All Specific Plan Amendments are required to be found consistent with the Poway General Plan in compliance with Government Code Section 65454. The Development Services Director reserves the right to interpret land uses to substantially conform or to be substantially similar or consistent with one or more of the allowable land uses provided in and/or the purpose and intent of the OSR and OS zoning districts. The Specific Plan may be amended as often as deemed necessary by the City Council in compliance with Government Code Section 65453.

7.3.9 Administrative Use Permit

The Administrative Use Permit process is established to provide for administrative review of certain applications that may require special considerations and imposition of specific conditions because of their unusual characteristics. This review process allows consideration with respect to the objectives of this Specific Plan and potential effects on surrounding properties. To achieve these purposes, the Development Services Director or his/her designee is empowered to grant and to deny applications for Administrative Use Permits for such uses in such land use districts as are prescribed in **Table 3.1: Land Use Summary** of this Specific Plan, and to impose reasonable conditions upon the granting of Administrative Use Permits. Administrative Use Permits are subject to the following:

A. Application and Fees

An application for an Administrative Use Permit shall be filed on forms provided by the Director and shall include the data and plans set forth in PMC Section 17.48.020. Fees shall be paid as established by City Council resolution.

B. Investigation and Report

The Director shall make an investigation of the application and shall prepare a Notice of Decision identifying the proposed action to be taken, as well as any conditions to be applied to the application.

C. Action

Prior to acting to approve, approve with conditions, or deny an application for an Administrative Use Permit, the Director shall provide notice to property owners within 500 feet of the exterior boundaries of the subject property. The notice shall state that the Director will decide whether to approve, conditionally approve, or deny the Administrative Use Permit application on a date specified in the notice, and that a public hearing will be held only if requested in writing by any interested person before the specified date for the decision.

Any written request for a public hearing shall be based on issues of significance directly related to the application. If the Director determines that the evidence has merit and can be properly addressed by a condition(s) added to the Administrative Use Permit approval, the Director may consider the permit in compliance the Findings requirements below and not conduct a public hearing. If a public hearing is requested and the provisions of the paragraph above do not apply, a hearing before the Director shall be scheduled, noticed, and conducted.

D. Required Findings

The Director or City Council shall make all of the following findings before granting or modifying an Administrative Use Permit:

(1) The proposed location size, design and operating characteristics of the proposed use are in conformance with this Specific Plan, the purpose of the land use district in which the site is located, and the City's General Plan.
(2) The location, size, design, and operating characteristics of the proposed use will be compatible with and will not adversely affect or be materially detrimental to adjacent uses, residents, buildings, structures or natural resources.

Quick Reference - Wildfire Preparedness

The Quick Reference Guide provides helpful tips and educational resources, so residents are prepared in the event of a wildland fire evacuation.

Figure 1 illustrates the emergency evacuation routes potentially available to Harmon Ranch Project and surrounding communities. Figure 2 displays the Harmon Ranch Project's vicinity location and Figure 3 is the Project's site plan.

Residents and visitors should know available routes, stay informed, and follow directions provided by law enforcement or fire agencies, news media, and other credible sources. Do not rely on navigation apps that may inadvertently lead persons toward the approaching wildfire. The available and potential evacuation routes for the residents and guests of the Harmon Ranch community are detailed in Section 4 and illustrated in Figure 1.

Register to Receive Emergency Alerts

The City of Poway (City) utilizes Alert San Diego for its Community Emergency Notification System. Alert San Diego is a countywide standard system that is managed as a regional asset by the County of San Diego Office of Emergency Services. In the event of a wildfire within the City limits, the Incident Command (IC) or other City departments will contact the San Diego Sheriff's Department (SDSD). The SDSD has the ability to activate the Alert San Diego system and release an emergency notification (San Diego 2010) to affected populations, and only landlines are automatically registered. Therefore, residents of the Harmon Ranch Project are strongly advised to register their mobile phone numbers and email addresses with Reverse 9-1-1, Alert San Diego system (http://www.readysandiego.org/AlertSanDiego/) in order to receive emergency evacuation instructions. The residents of Harmon Ranch are part of the greater San Diego media market and the media outlets will also be a good source of information, via television and radio, on overall emergency situations and how residents should respond. In addition, the San Diego Emergency Alert System (EAS) is county-wide and broadcasts emergency information via two radio stations: KOGO AM 600 and KLSD AM 1360. Television outlets include: Channel 24 – Cox Communications

- Channel 24 - Time Warner Cable
- Channel 99 - AT&T

Social media provides another outlet for news:

Get Involved in Community Readiness

Residents of the Harmon Ranch Project are encouraged to join the Poway Community Emergency Response Team (CERT) (https://poway.org/436/Community-Emergency-Response-Team-CERT). The Harmon Ranch Homeowner's Association (HOA) will organize annual evacuation education for residents of the community, which should include engaging directly with organizations such as Poway Neighborhood Emergency Corps and Fire Safe Council (PNEC) and the Fire Safe Council of San Diego County, as well as maintaining a fire safe page on the community's website, as possible, including this Wildfire Evacuation Plan and links to important citizen preparedness information.

This Wildfire Evacuation Plan is prepared specifically for the Harmon Ranch Project and focuses on wildland fire evacuations, although many of the concepts and protocols will be applicable to other emergency situations.

Ultimately, this WEP should be used by residents for awareness of evacuation approaches during wildfires and other similar emergencies. It is important for the residents to understand the importance of being prepared, so if/when the time comes where evacuation is necessary, they will be able to calmly implement their personal evacuation plan. Some actions the community residents can do in advance include:

- Follow the "Ready, Set, Go!" model developed for wildfire evacuations.
- Create an escape plan from the residence, as well as an escape route once outside of the home.
- Know your available routes, stay informed and follow directions provided by credible sources.
- Do not rely on navigation apps that may inadvertently lead you toward an approaching fire.
- Create a car emergency kit, including cell phone charger, flashlight, jumper cables, water, and food.
- Gather important paperwork, including birth and marriage certificates, account documents, passports, Social Security cards, and any other important family photos or irreplaceable items and documents.
- As time allows, make sure to secure your home by locking all doors and windows, and unplugging electrical equipment, such as appliances and electronics.

Sample emergency preparedness resources available to the Harmon Ranch residents are provided in Appendix A (Resident "Ready, Set, Go!" Wildland Fire Action Plan) and Appendices B-1 through B-4 (Family Disaster Checklists and Communications Plans), and residents are encouraged to become familiar with the concepts detailed at the following websites:

1. "**Ready, Set, Go!" Personal Action plan:** www.readyforwildfire.org
2. **San Diego County Personal Disaster Plan:** https://www.readysandiego.org/content/oesready/en-us/make-a-plan.html
3. **Red Cross Emergency Planning:** http://www.redcross.org/get-help/how-to-prepare-for-emergencies/make-a-plan

5. **Building a disaster kit:** http://www.redcross.org/get-help/prepare-for-emergencies/be-red-cross-ready/get-a-kit
6. **Making a Plan Checklist:** https://www.ready.gov/make-a-plan
7. **Family Communication Plan:** https://www.fema.gov/media-library-data/1440449346150-1ff18127345615d8b7e1effb4752b668/Family_Comm_Plan_508_20150820.pdf

Evacuation Plan Purpose and Limitations

Wildfire and other emergencies are often dynamic events and the need for evacuations are typically determined by on-scene first responders or by a collaboration between first responders and designated emergency response teams, including Office of Emergency Services and the IC established for larger emergency events. As such, and consistent with all emergency evacuation plans, this Wildfire Evacuation Plan is to be considered a tool that supports existing pre-plans and provides for residents who are familiar with the evacuation protocol but is subservient to emergency event-specific directives provided by agencies managing the event.

1 Introduction

This Wildfire Evacuation Plan (WEP) was prepared based on guidance from the City's Emergency Operations Plan (City of Poway 2021) and the County of San Diego Emergency Operations Plan (EOP) including Annex Q- Evacuation (County of San Diego 2022). The format and content of this report is consistent with the recommendations of the Evacuation Annex. A complete copy of the EOP can be downloaded here:

https://www.sandiegocounty.gov/content/sdc/oes/emergency_management/oes_jl_oparea.html.

Evacuation is a process by which people are moved from a place where there is immediate or anticipated danger, to a place of safety, and offered appropriate temporary shelter facilities. When the threat to safety is gone, evacuees are able to return to their normal activities, or to make suitable alternative arrangements. The overarching goal of evacuation planning in the San Diego County Operational Area (OA) is to maximize the preservation of life while reducing the number of people that must evacuate and the distance they must travel to seek safe refuge (County of San Diego 2018).

This Wildfire Evacuation Plan will outline strategies, procedures, recommendations, and organizational structures that can be used to implement a coordinated evacuation effort in the case of a wildfire emergency effecting the Harmon Ranch Project. It is noted, that the on-set of a wildfire or other emergency is generally unplanned and often, residents and visitors will be faced with decisions that need to be made quickly and determined by on-scene first responders or by a collaboration between first responders and designated emergency response teams. Therefore, this Wildfire Evacuation Plan is to be considered a tool that supports existing pre-plans and provides for residents who are familiar with the evacuation protocol but is subservient to emergency event-specific directives provided by agencies managing the event.

1.1 Project Description

The Project is approximately 11.5 acres and includes a total of 63 new single-family homes and associated site improvements and retention of the existing historic home (Figure 3, Project Site Plan). The Project proposes approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The Project would include 63 single-family detached homes plus the 1 existing historic home on site for a total of 64 lots within the Specific Plan boundary. The proposed density is 8.8 dwelling units/acre, which is just over the existing RS-7 designation density. The Project is located in the southern portion of the City, along Oak Knoll Road, south of Poway Road and west of Carriage Road.

1.2 Applicable Regulations, Standards and Planning Tools

1.2.1 Federal

1.2.1.1 Disaster Mitigation Act

The Disaster Mitigation Act of 2000 requires that a state mitigation plan, as a condition of disaster assistance, add incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans: "Standard" and "Enhanced." States that develop an approved Enhanced State Plan can increase the amount of funding available through the Hazard Mitigation Grant Program. The Disaster Mitigation Act also established a new requirement for local mitigation plans.

1.2.1.2 National Incident Management System (NIMS)

The NIMS guides all levels of government, nongovernmental organizations and the private sector to work together to prevent, protect against, mitigate, respond to and recover from incidents. NIMS provides community members with a shared vocabulary, systems and processes to successfully deliver the capabilities described in the National Preparedness System. The National Preparedness System is a Presidential Policy Directive establishing a common goal to create a secure and resilient nation associated with prevention, protection, mitigation, response and recovery to address the greatest risks to the nation. One core area is fire management and suppression.

NIMS defines operational systems that guide how personnel work together during incidents.

1.2.1.3 Pet Evacuation and Transportation Standards Act

The Pets Evacuation and Transportation Standards Act of 2006 amends the Stafford Act, and requires evacuation plans to take into account the needs of individuals with household pets and service animals, prior to, during, and following a major disaster or emergency.

1.2.2 State

1.2.2.1 Fire Hazard Severity Zones

To assist each fire agency in addressing its responsibility area, California Department of Forestry and Fire (CAL FIRE) uses a severity classification system to identify areas or zones of severity for fire hazards within the state. CAL FIRE is required to map these fire hazard severity zones (FHSZs) for State Responsibility Areas (SRAs) and identify Very High Fire Hazard Severity Zones (VHFHSZ) for Local Responsibility Areas (LRAs). The Project is not located within a FHSZ within an SRA or a VHFHSZ within an LRA.

1.2.2.2 California Wildland-Urban Interface Code

On September 20, 2005, the California Building Standards Commission approved the Office of the State Fire Marshal's emergency regulations amending the California Building Code (CBC) (California Code of Regulations [CCR] Title 24, Part 2). Section 701A of the CBC includes regulations addressing materials and construction methods for exterior wildfire exposure and applies to new buildings located in State Responsibility Areas or Very

High Fire Hazard Severity Zones in Local Response Areas. The Project is not designated as a FHSZ within an SRA or a VHFHSZ within an LRA.

1.2.2.3 California Fire Code

The 2022 California Fire Code (CCR Title 24, Part 9) establishes regulations to safeguard against the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises. The Fire Code also establishes requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the Fire Code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire services features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas. The City has adopted the California Fire Code with amendments as Chapter 15, Article 24 of the City's Municipal Code.

1.2.2.4 California Emergency Services Act

The California Emergency Services Act (California Government Code §8550, et seq., provides for the creation of an Office of Emergency Services, assign and coordinate functions and duties to be performed during an emergency, facilitate mutual aid, and assign resources (including manpower and facilities) throughout the state for dealing with any emergency that may occur.

1.2.2.5 California Office of Emergency Services

The California Office of Emergency Services (OES) is responsible for the coordination of overall state agency response to disasters. Assuring the state's readiness to respond to, recover from all hazards and assisting local governments in their emergency preparedness, response, recovery and mitigation.

1.2.2.5.1 Standardized Emergency Management System (SEMS)

SEMS is the cornerstone of California's emergency response system and the fundamental structure for the response phase of emergency management. The system unifies all elements of California's emergency management community into a single integrated system and standardizes key elements. SEMS incorporates:

- Incident Command System (ICS) - A field-level emergency response system based on management by objectives
- Multi/ Inter-agency coordination - Affected agencies working together to coordinate allocations of resources and emergency response activities
- Mutual Aid - A system for obtaining additional emergency resources from non-affected jurisdictions.
- Operational Area Concept - County and its sub-divisions to coordinate damage information, resource requests and emergency response.

1.2.2.6 Project Consistency with Best Practices/Guidance Documents

The California Office of the Attorney General issued (October 2022) guidance (Guidance) outlining best practices for analyzing and mitigating wildfire impacts of development projects under the California Environmental Quality Act (CEQA)[1]. The Guidance is intended to help local governments' evaluation and approval considerations for development projects in fire-prone areas, and to help project design in a way that minimizes wildfire ignition and incorporates emergency access and evacuation measures. Importantly, the Guidance does not impose additional legal requirements on local governments, nor does it alter any applicable laws or regulations.

The Project site is not located in a FHSZ within an SRA or LRA and is not considered to meet the definition of a wildland urban interface (WUI) area.

Attorney General Provided Best Practices for Analyzing Project's Impacts on Wildfire Risks

Baseline Conditions

The Guidance states that an EIR's discussion of existing environmental (baseline) conditions should include information about open space areas and habitats within the project area that may be fire prone, a discussion of fire history and fuels on the project site and existing available water supplies for fire-fighting. The Project's EIR considers existing wildfire conditions.

Thresholds of Significance

The Guidance encourages local governments to develop and apply thresholds of significance to identify when an increase in wildfire risk is considered a "significant impact" under CEQA. Relevant factors to this determination include: (1) the project's impacts on ignition risk; (2) the likelihood of fire spread; and (3) the extent of exposure for existing and new residents, based on various fire scenarios. The Guidance notes that "wildfire ignitions are primarily human-caused in California." The City of Poway does not currently have thresholds of significance to identify wildfire risk.

Modeling

The Guidance encourages modeling fire scenarios to "quantify" increased wildfire risks resulting from a project adding more people to wildfire prone areas and assessing risks according to the threshold of significance, including fires that start in, near or far from the project site and "extreme weather conditions that exacerbate fire spread". The Guidance states that a conclusion that conversion of wildland vegetation into paved development "reduces or does not increase wildfire risk" is "contrary to existing evidence" and cannot be used to avoid analyzing and modeling wildfire risk. The Project is an infill Project and not within a designated FHSZ; therefore, fire modeling for the Project was not completed.

[1] *Wildfire guidance final (3).pdf (ca.gov)

Qualitative Assessment

The Guidance indicates that complying with CEQA includes an EIR qualitatively assessing relevant variables to quantify the project's impact on the risk of wildfire, specifically:

Project Density – Project density influences how likely a fire is to start or spread and how likely it is that occupants will be in danger. The Guidance states that "Fire spread and structure loss is more likely to occur in low- to intermediate-density developments." The Project is considered a higher density development, converting the developed area to ignition resistant landscapes with no inclusion of unmaintained vegetation within the converted footprint. The buildings are clustered and present one, defensible interface, unlike lower density development which incorporates fuels within and around buildings and multiple building interfaces.

Location in the Landscape – Where a project's structures are placed in the landscape relative to fire environment features (vegetation, topographical features, and wind alignments) it also influences wildfire risk. Terrain including wind corridors or steep slopes may increase risk while flatter terrain and natural fire breaks may reduce risk if the project is "strategically located" should be considered. The Project creates a flat pad on which the Project's structures and infrastructure are placed. Fuels in the Project area are not conducive of extreme fire intensity and terrain varies but does not include extreme steep slopes and has been comprehensively evaluated and confirmed that even under the extreme weather conditions that have been recorded in the area, the provided defensible space and ignition resistant structures are appropriately designed to minimize the potential for structure ignitions. The Project is located at a site that is appropriate for the type of activities that will occur there and is not considered vulnerable to wildfire.

Water Supply and Infrastructure – Water supply and infrastructure needed to address firefighting within the project site should be analyzed as part of evaluating wildfire risk impacts under CEQA. The analysis should consider the potential loss of water pressure or power during a fire. The Project will provide internal waterlines supplying sufficient fire flows and pressure to meet the demands, as required by code.

Mitigating Wildfire Risk – Potential Measures

The Guidance specifies that Project-provided mitigation measures should be combined and tailored to the specifics of the project, the surrounding landscape, and nearby existing uses. The Guidance emphasizes that CEQA requires lead agencies to consider and adopt feasible mitigation measures to avoid or reduce wildfire risk. Potential mitigation measures recommended by the Guidance that may reduce a project's wildfire risk impacts to a less than significant level, include:

Increasing residential density and consolidated project design, relying on higher density infill developments "as much as possible". The Project is higher density infill development and extends existing and ongoing development in a populated area of Poway.

Avoiding and minimizing low-density development patterns or "leapfrog-type" developments with undeveloped wildland between developed areas. The Project is located in a highly developed area, and would be considered infill and is not the first development in the area.

Decreasing a project's "edge" or wildland interface area and creating buffer zones and defensible space measures within and adjacent to the project. The Project minimizes edge by creating a clustered design and does not expose residents to areas of hazardous vegetation.

Siting projects to maximize the role of low-flammability landscape features and limiting development along steep slopes and amidst rugged terrain. The Project occurs within an area that does not include significant topography or fuels.

Undergrounding power lines. The Project's power lines will be undergrounded, eliminating the potential for electrical transmission line-caused fires on the site.

Upgrading building materials and installation techniques beyond applicable building code requirements to increase a structure's resistance to heat, flames and embers (i.e. "fire hardening"), and requiring fire-hardened communication facilities (including internet) to the project site. The Project is not within a FHSZ and is considered infill development; therefore, additional fire protection features would not be required.

Requiring on-site water supply and/or storage to augment ordinary supplies that may be lost during a wildfire. The Project is consistent with this guideline with internal waterlines that will supply sufficient fire flows and pressure to meet the demands for required onsite fire hydrants and interior fire sprinkler systems for all structures.

Parking limitations to ensure access roads are not clogged with parked vehicles. The Project provides roadways that will meet current code requirements for road widths that would accommodate on street parking and allow for fire apparatus access.

Placement of development close to adequate emergency services, existing or planned ingress/egress, and designated evacuation routes. The Project is within an acceptable distance with fast response from nearby fire stations and close to surface streets and highway/freeway corridors.

Evacuation

In addition to evaluating the potential increased risk of ignition, the Guidance states that an EIR or MND for a project located in HFHSZ/ VHFHSZ must analyze the project's impact on evacuation and emergency access. This analysis is relative to the project's particular impacts and risks (e.g., higher density infill projects within developed areas would require less detailed analysis than a new low-density development within a high wildfire risk area and/or surrounded by open space).

Evacuation Analysis

The Guidance states that evacuation modeling and planning should be required for all projects located in HFHSZ/ VHFHSZ that present an increased risk of ignition and/or evacuation impacts. It further states that local jurisdictions should require evacuation modeling and planning to be developed prior to project approval in order to provide maximum flexibility in design modifications necessary to address wildfire risks and impacts. The Project is considered an infill development that will be adjacent to a conserved open space dominated by flashy type fuels that would produce a low-intensity wildfire. Further, the Project provides important road network improvements, including connection of existing dead-end road that will provide secondary fire access for the Project and the neighboring community. These improvements assist Project access as well as provide a public benefit for existing residents by providing an additional route that may be utilized, at the discretion of the fire department/law enforcement, for responder ingress and/or resident egress.

The Guidance further states that evacuation modeling and analysis must augment existing information when necessary to include adequate analysis of the following. The Project includes a Wildfire Evacuation Plan that analyzes the existing and Project population evacuations, road capacities, and evacuation timeframes.

- Evaluation of the capacity of roadways to accommodate project and community evacuation and simultaneous emergency access. This Wildfire Evacuation Plan evaluates the Project's roads as well as existing roads that would be utilized in an evacuation event. The road capacities are conservatively mathematically modeled to arrive at evacuation travel times for the Project as well as for the existing communities with and without the project. The evacuation analysis only considers evacuations using outbound lanes, therefore, the inbound lanes are available for incoming emergency first responders.
- Assessment of the timing for evacuation. This Wildfire Evacuation Plan provides an analysis of evacuation timing in Section 4 and is found to be acceptable for the types of wildfires that may occur in the Project's vicinity. Additionally, evacuation procedures now rely on advanced notification technology which enables phased or sequential evacuations where populations that are threatened are moved first and populations that may be threatened are moved in a phased approach. This method reduces traffic surges and congestion.
- Identification of alternative plans for evacuation. Alternative plans for evacuation would be feasible due to the construction features and the low risk of ignitions and corresponding low fire intensity anticipated and may include using alternate routes, only evacuating particular residents, or enacting a temporary shelter in place.
- Evaluation of the project's impacts on existing evacuation plans. There are no published evacuation plans for the Project area. The Project would utilize primary evacuation routes that would be available to other evacuees, and the potential additional time needed to evacuate is considered insignificant due to the variety of options available to emergency managers that can facilitate early evacuations.
- Consideration of the adequacy of emergency access, including the project's proximity to existing fire services and the capacity of existing services. PFD Station 1 is within 1.5 miles of all Project structures and can respond within 4 ½ minutes travel time. The Project provides access roads meeting code requirements for widths, dead end lengths, and secondary access. There would be acceptable access throughout the site and evacuations would not be expected to interfere with fire response.
- Traffic monitoring to quantify travel times under various likely scenarios. Traffic monitoring data was contemplated for traffic analysis but is not applicable in regards to evacuation planning for the Project, as previously discussed.

In consideration of the above, the AG Guidance encourages local jurisdictions to develop thresholds of significance for evacuation times based on community-wide standards. Any conclusion that an increase in evacuation times is a less than significant impact should be based on a threshold of significance that reflects community-wide goals and standards. Thresholds should also consider consistency with an adopted emergency operations or evacuation plan, a safety element updated to integrate wildfire and evacuation concerns or recommendations developed by CAL FIRE relating to safety of subdivisions. The potential to minimize on-road traffic when it is considered necessary and/or safer by temporarily providing refuge on-site in protected structures offers a contingency not available to all communities/developments and assists in providing flexibility and options for emergency managers.

1.2.3 Local

1.2.3.1 San Diego County Multi-Jurisdictional Hazard Mitigation Plan

The purpose of the County's Multi-Jurisdictional Hazard Mitigation Plan (County of San Diego 2017) is to identify the County's hazards, review and assess past disaster occurrences, estimate the probability of future occurrences, and set goals to mitigate potential risks to reduce or eliminate long-term risk to people and property from natural and human-made hazards. An important San Diego County Multi-Jurisdictional Hazard Mitigation Plan component is the Community Emergency Response Team (CERT), which educates community members about disaster preparedness and trains them in basic response skills, including fire safety.

1.2.3.2 San Diego County Emergency Operations Plan

The 2022 San Diego County Emergency Operations Plan (EOP) describes a comprehensive emergency management system that provides for a planned response to disaster situations associated with natural disasters, technological incidents, terrorism, and nuclear-related incidents. It delineates operational concepts relating to various emergency situations, identifies components of the Emergency Management Organization, and describes the overall responsibilities for protecting life and property and providing for the overall well-being of the population. The plan also identifies the sources of outside support that might be provided (through mutual aid and specific statutory authorities) by other jurisdictions, state and federal agencies, and the private sector.

1.2.3.3 Unified San Diego County Emergency Services Organization and County of San Diego Operational Area Emergency Operations Plan – Evacuation Annex

The Evacuation Annex is intended to be used as a template for the development of jurisdictional evacuation plans and will support or supplement the evacuation plans prepared and maintained by each local jurisdiction. The annex outlines strategies, procedures, recommendations and organizational structures that can be used to implement a coordinated evacuation effort in the San Diego County Operational Area (OA).

1.2.3.4 County of SD Resilience Review Report: Wildland Fires

Prepared by the s Chief Administrative Officer's Resilience Review Working Group, the Resilience Review Report: Wildland Fires provides recommendations for achieving community goals related to actively reducing risk of wildfire and improving efforts to respond and recover from wildfire events. The Working Group recommends 16 principal objectives divided among three focus areas: pre-fire, response, and recovery.

1. Pre-Wildfire: Focus on fire preparedness at the neighborhood-level. Specific community recommendations include:
    - Implementing a cohesive County pre-fire strategy
    - Enhancing pre-fire vegetation management
    - Improving pre-fire emergency planning
    - Strengthening fire safety measures in new construction
    - Reducing loss from wildfires in existing structures

2. Response: Improve fire suppression capabilities and on the ground safety measures including:
   - Increase County Fire's firefighting capabilities
   - Enhancement of accessible transportation services to include the evacuation of at-risk populations and large animals
   - Improved operational communications among response personnel
   - More rapid and efficient restoration of essential services and systems
   - Improved delivery of coordinated, timely, reliable, and actionable information to the whole community during a wildfire
3. Recovery: Enhance fire recovery effort including:
   - The ongoing development of a County Debris Removal Framework
   - Developing administrative tools and processes that improve the speed and efficiency in providing emergency interim housing options to victims of a wildfire
   - Improvements in health and social services capabilities
   - Increased County capacity to coordinate large-scale recovery operations

1.2.3.5 City's Emergency Operations Plan

The City's Emergency Operations Plan (EOP) aims to facilitate effective operations during emergency incidents and disasters and is accordance with the State of California's Standardized Emergency Management System (SEMS), the National Incident Management System (NIMS). The EOP sets up protocol for the control and coordination of on-scene emergency operations including the designation of an Incident Commander (IC), establish Incident Command Posts, conduct response operations according to departmental protocols and SEMS/NIMS principles, request assistance from other City departments for support as needed, and inform senior City officials as appropriate.

1.2.3.6 City of Poway Fire Code

The City has adopted the California Fire Code as Chapter 15, Article 24 of the City's Municipal Code including Appendix Chapter 4 and Appendices B, C, E, F, H, I and O, as published by the International Code Council, except those portions that are deleted, modified, or amended. Provisions of the California Fire Code are described under State Regulations, above.

1.2.3.7 City of Poway Building Regulations

The City's Building Regulations (City Municipal Code Chapter 15, Article 4) are intended to regulate the construction of applicable facilities and encompasses (and formally adopts) associated elements of the CBC. Specifically, this includes regulating the "construction, alteration, replacement, repair, maintenance, moving, removal, demolition, occupancy, and use of any privately owned building or structure or any appurtenances connected or attached to such buildings or structures within this jurisdiction, except work located primarily in a public way, public utility towers and poles, mechanical equipment not specifically regulated in the Building Code, and hydraulic flood control structures."

INTENTIONALLY LEFT BLANK

2 Background

This Harmon Ranch Wildfire Evacuation Plan was prepared based on the City's Emergency Operations Plan (City of Poway 2021), County of San Diego Emergency Operations Plan (EOP) including Annex Q- Evacuation (County of San Diego 2022).

To establish a framework for implementing well-coordinated evacuations, the County, like most California emergency operations agencies, has adopted evacuation procedures in accordance with the State of California's Standardized Emergency Management System (SEMS) and the National Incident Command System (NIMS). Large-scale evacuations are complex, multi-jurisdictional efforts that require coordination between many agencies and organizations. Emergency services and other public safety organizations play key roles in ensuring that an evacuation is effective, efficient, and safe.

Evacuation is a process by which people are moved from a place where there is immediate or anticipated danger, to a safer place, and offered temporary shelter facilities. When the threat passes, evacuees are able to return to their normal activities, or to make suitable alternative arrangements.

Evacuation during a wildfire is not necessarily directed by the fire agency, except in specific areas where fire personnel may enact evacuations on-scene. San Diego County Sheriff's Department or Poway Fire Department have primary responsibility for emergency evacuations and may share responsibilities with others under the IC system for larger events. These agencies work closely within the Unified IC System, with the City's Emergency Operations Center (EOC) and County OES. To that end, the Poway Fire Department (PFD), San Diego County Sheriff's Department (SDSD), Public Works, Planning, Emergency Services Departments, and California Department of Transportation (Caltrans), amongst others, have worked as part of a Pre-Fire Mitigation Task Force to address wildland fire evacuation planning for the County of San Diego.

Every evacuation scenario will include some level of unique challenges, constraints, and fluid conditions that require interpretation, fast decision making, and alternatives. For example, one roadway incident that results in blockage of evacuating vehicles may require short-term or long-term changes to the evacuation process. Risk is considered high when evacuees are evacuating late, and fire encroachment is imminent. This hypothetical scenario highlights the importance of continuing to train responding agencies, model various scenarios, educate the public, provide contingency plans, and take a very conservative approach to evacuation decision timelines.

Equally as important, the evacuation procedures should be regularly updated with lessons learned from actual evacuation events, as they were following the 2003, 2007, and 2014 San Diego County fires. The authors of this Wildfire Evacuation Plan recommend that occasional updates are provided, especially following lessons learned from actual incidents, as new technologies become available that would aid in the evacuation process, and as changing landscapes and development patterns occur within and adjacent to the Project Area that may impact how evacuation is accomplished. At the time of this WEP's preparation, there is no encompassing emergency evacuation plan available for the San Diego region. This Wildfire Evacuation Plan is consistent with the County evacuation planning standards and can be integrated into a regional evacuation plan and other pre-plans when and if the area officials and stakeholders (CAL FIRE, SDFRD, OES, SDSD, SDCFA, and others) complete one.

As demonstrated during large and localized evacuations occurring throughout San Diego County over the last 15 years, an important component to successful evacuation is early assessment of the situation and early notification via managed evacuation declarations. The County utilizes early warning and informational programs to help meet these important factors. Among the methods available to citizens for emergency information are radio, television, social media/internet, neighborhood patrol car, aerial public address notifications, and Reverse 9-1-1 or Alert San Diego. The County instituted Alert San Diego, which is a regional notification system that sends telephone notifications to residents and businesses within San Diego County impacted by, or in danger of being impacted by, an emergency or disaster. Alert San Diego is used by emergency response personnel to notify at risk residents and businesses with information on the event and/or actions (such as evacuation, shelter-in-place, gas leak, missing person, etc.) they are advised to implement. The system utilizes the region's 9-1-1 database, provided by the local telephone company(ies), and thus is able to contact landline telephones whether listed or unlisted. It is TTY/TDD capable.

Please also consider that the major fire events that have occurred in San Diego County in the past 20 years (including the 2003 Cedar Fire and 2007 Witch Fire) have resulted in substantial change in the individual and united approaches between City, County and State agencies, as well as substantial investment in fire-fighting resources. For example, San Diego County Fire Agencies and related partners have developed a robust ability to rationally predict wildfire movement. This is accomplished through pre-fire planning and fire behavior modeling, working with UCSD's WIFIRE lab advanced wildfire behavior projection technology, and SDG&E's nationally renowned weather system network. In addition, more than 500 million dollars has been invested to enhance the County's fire prevention, detection, response, suppression and recovery capabilities since the 2003 Cedar Fire. These efforts have proven effective in managing and responding to wildfire events, such as was accomplished during the successfully managed 2017 Lilac Fire.

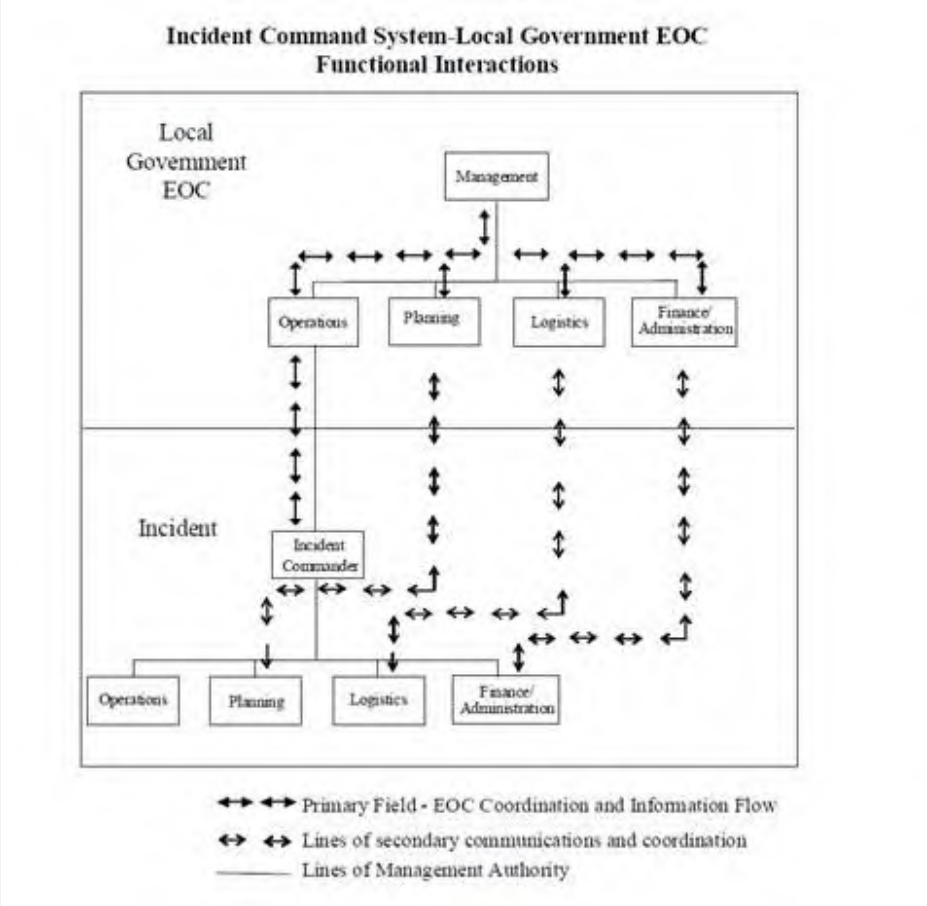
Because the system uses the 9-1-1 database, only landline numbers are in the system. If you have a Voice over IP (VoIP) or cellular telephone and would like to be notified over that device, or if you would like an email notification, you must register those telephone numbers and/or email address for use by the system to receive voice, text, and email messages.

3 San Diego County Evacuation Planning

This Wildfire Evacuation Plan incorporates concepts and protocols practiced throughout the City and San Diego County. The City's EOP follows basic protocols set forth in the County's Operation Area Emergency Operations Plan and the California Master Mutual Aid Agreement, which dictate who is responsible for an evacuation effort and how regional resources will be requested and coordinated. The following overview contains information from the San Diego County Evacuation Annex and is consistent with the City's EOP. A complete copy of the EOP can be downloaded here: https://www.sandiegocounty.gov/content/sdc/oes/emergency_management/oes_jl_oparea.html.

First responders are responsible for determining initial protective actions before EOCs and emergency management personnel have an opportunity to convene and gain situational awareness. Initial protective actions are shared/communicated to local EOCs and necessary support agencies as soon as possible to ensure an effective, coordinated evacuation. Figure 4 summarizes the functional interactions of local government EOCs under the Incident Command System.

Figure 4. Incident Command System Local Government EOC Functional Interactions



During an evacuation effort, the SDSD will declare an evacuation and be assisted by other law enforcement and support agencies. Law enforcement agencies, highway/road/street departments, and public and private transportation providers will conduct evacuation operations. Procurement, regulation, and allocation of resources will be accomplished by those designated. Evacuation operations will be conducted by the following agencies:

- San Diego County Sheriff's Department
- Poway Fire Department
- American Red Cross
- San Diego Humane Society
- San Diego County Department of Animal Services
- City and County Department of Planning and Development Services
- City and County Department of Public Works
- County Department of Environmental Services
- Other City, County and state agencies, as needed

3.1 Evacuation Objectives

The overall objectives of emergency evacuation operations and notifications for the City of Poway are to:

- Expedite the movement of persons from hazardous areas;
- Institute access control measures to prevent unauthorized persons from entering vacated, or partially vacated areas;
- Coordinate evacuation to appropriate transportation points, which may include: temporary evacuation points (TEP), temporary safe refuge areas (TSRA), and/or shelters.
- Coordinate adequate means of transportation for individuals with disabilities and others with access and functional needs, which includes, but is not limited to, older adults, children, and individuals who are transportation disadvantaged.
- Coordinate the procurement, allocation, and use of necessary transportation and law enforcement resources by means of mutual aid or other agreements;
- Coordinate with affected law and enforcement agencies to control evacuation traffic and road closures.
- Account for the needs of individuals with household pets and service animals prior to, during, and following a major disaster or emergency;
- Provide initial notification, ongoing, and repopulation communications to the public through the Joint Information Center (JIC).
- Coordinate the safe repopulation of the evacuated persons.

The SDSD is the lead agency for conducting evacuations of the unincorporated areas of San Diego County and jurisdictions, such as the City, which contract SDSD to provide law enforcement services. The lead agency for evacuating the Harmon Ranch Project area is SDSD. Unified Command assesses and evaluates the need for evacuations with cooperating agencies, and SDSD or local law enforcement orders and conducts evacuations according to established procedures, which are outlined in the County EOP Evacuation annex. Additionally, as part of the Unified Command, the SDSD or local law enforcement will identify available and appropriate evacuation

routes and coordinate evacuation traffic management with the California Department of Transportation (Caltrans), the California Highway Patrol (CHP), other supporting agencies, and jurisdictions.

The decision to evacuate an area is not made lightly and there is a significant impact to public safety and the economy. The following process describes how emergency evacuation decisions within the OA will be coordinated, allowing emergency managers and other supporting response organizations to make collaborative decisions.

3.2 Evacuation Coordination Process

a. If the emergency only impacts the City, the decision to evacuate will be made at the local jurisdiction level. Regional coordination is required for any evacuation impacting multiple jurisdictions. Based on the information gathered, local jurisdictions will generally make the determination on whether to evacuate communities as the need arises, on a case-by-case basis.
b. The decision to evacuate will depend entirely upon the nature, scope, and severity of the emergency; the number of people affected; and what actions are necessary to protect the public.
c. Local jurisdictions may activate their EOC and conduct evacuations according to procedures outline in their EOP.
d. All evacuations from, through, or into a local jurisdiction will be coordinated with that jurisdiction's public safety partners.
e. The OA EOC may make recommendations on whether a jurisdiction should evacuate and may help coordinate the evacuation effort, if requested by the jurisdiction.
f. The Evacuation Annex is automatically activated when an incident occurs requiring an evacuation effort that impacts two or more jurisdictions within the OA or when there is an evacuation in the unincorporated area necessitating response from the County.
g. If the emergency impacts multiple jurisdictions within the OA:
    i. All impacted jurisdictions may activate their EOCs
    ii. The OA EOC may be activated, including the OA EOC JIC
    iii. The OA EOC with begin obtaining situational awareness, understanding the severity of the incident
    iv. Unified Command, which may consist of fire, law enforcement, public health, and other relevant support agencies, will communicate with the OA EOC as to what protective actions have been implemented. The OA EOC will coordinate with jurisdictional emergency management personnel and other public safety personnel.
    v. The Director of Emergency Services or designee or the Policy Group if it is established will coordinate with City Managers and other leaders within the OA to identify strategic decisions that will:
        - Gain regional situational awareness
        - Determine response status
        - Review statis if initial protective actions
        - Consider additional protective actions
        - Evaluate public information needs
        - Determine next steps
        - Establish a schedule for internal and external updates

vi. Evaluate health and welfare of affected residents The OA EOC JIC will coordinate emergency public information to the public in accordance with procedures established in Annex L Emergency Public Information of the OA EOP

vii. The OA EOC may support the evacuation response according to the OA EOP and:

- Coordinate transportation for those who need assistance through the activation of emergency transportation services agreements.
- Coordinate support for individuals with disabilities and others with access and functional needs during the evacuation process, which may include, but is not limited to, the provision of assistance with wayfinding, supervision, and language interpretation.
- Coordinate and communicate with non-governmental organizations including but not limited to the private sector, community-based organizations, and faith-based organizations to utilize services and resources available to support the response.
- Coordinate the provision of accessible care and shelter services.

3.3 P.A.C.E. Evacuation Planning

P.A.C.E. evacuation planning is based on a military concept focused on mitigating risk by developing a strong primary evacuation plan along with three back up plans. If the Primary plan is compromised, the Alternate plan would be triggered. If the Alternate is considered not functional or not safe, the Contingency Plan is implemented. If that does not mitigate the risk, then the evacuation reverts to the Emergency plan. P.A.C.E. Planning is a simple and effective tool used to accomplish evacuations with flexibility and redundant contingencies.

Emergency plan. The PACE Evacuation Plan must be maintained, reviewed, and updated at least every 2 years. The plan provides the following:

1. Based on and includes a documented, facility-based and community-based risk assessment, utilizing hazard analysis approach.
2. Include strategies for addressing emergency events identified by the risk assessment.
3. Address participant population, including, but not limited to, the type of services the PACE organization has the ability to provide in an emergency; and continuity of operations, including delegations of authority.
4. Include a process for cooperation and collaboration with emergency preparedness officials' efforts to maintain an integrated response during a disaster or emergency situation.

Primary: This is the overall preferred plan of action to use based on the most likely and most damaging scenario resulting from hazard analysis.

Alternate: The Alternate plan should be as viable as your Primary plan. That isn't always the case, but that should be the goal whenever possible. Alternate plans are needed because unforeseen circumstances arise during emergency evacuations.

> Developing the Alternate plan includes analyzing the most likely problems that could cause your primary plan to fail and then come up with a plan that fits with your situation that won't be affected by those problems. Whenever possible, come up with a few to several vulnerabilities in your primary plan and find an alternate that's just as good but covers all those bases.

Contingency: The contingency evacuation plan is the action that will be implemented if you cannot implement either the Primary or the Contingency action due to compromised safety. The contingency isn't always (or isn't usually) as preferred as the others, but is a viable option that doesn't rely on the same actions as the Primary and Alternate.

Emergency: This is the action that is implemented if all three of the previous actions fail. In some respects, it is a last resort that is the least preferred option, but is a viable and safe option, nonetheless. The goal is to utilize an Emergency plan that's independent from reliance on the types of actions in the first three options, is a flexible plan, has the highest probability of succeeding, and offers a reliable option with little potential for compromise.

An emergency plan may not be the most convenient or preferred plan and may include components that are uncomfortable to visitors, but it should be as foolproof as possible.

Table 1. P.A.C.E Evacuation Plan for the Harmon Ranch Project

Primary:	Project will evacuate via the primary evacuation route(s) early after receiving evacuation notice utilizing the primary evacuation route(s) as directed by law enforcement/ emergency managers.
Alternate:	Project will follow evacuation instructions which may include an alternate plan to utilize secondary routes or to relocate to nearby urban areas based on congested traffic conditions. Notifications that this alternate plan is being implemented will be provided via the notification systems or on-site emergency personnel, media and social media.
Contingency:	Due to primary and alternate options being compromised or undesirable, the contingency plan of evacuating smaller, highest vulnerability populations will be implemented. For the Project, this includes moving potentially exposed or vulnerable populations in the northern portion of the Project site (nearest to preserved unmaintained off-site fuels) to nearby areas that may serve as Safe Refuge Areas during a wildland fire. Remaining populations will be instructed to remain in their homes. Depending on the nature of the emergency, the contingency option may not be available or safe.
Emergency:	When the wildfire or other emergency dictates that off-site evacuation is not advised by the primary or alternate evacuation routes, and conditions are such that open air exposure would be unhealthy or unsafe, the Harmon Ranch population will be directed to shelter in place in their homes. Sheltering in place is possible due to the construction materials (e.g., Class A roof, stucco walls) and irrigated landscape that creates a fire hardened development. Sheltering in place may also be the preferred option for other emergencies, e.g., active shooter, earthquake. Persons sheltering in place are advised to remain aware of the situation and move out of the building to a designated safe zone if directed to do so or otherwise necessitated.

3.4 Evacuation Response Operations

An evacuation of any area requires significant coordination among numerous public, private, and community/non-governmental organizations. Wildfire evacuations will typically allow time for responders to conduct evacuation notification in advance of an immediate threat to life safety; giving residents time to gather belongings and make arrangements for evacuation. On the other hand, other threats, including wildfires igniting nearby, may occur with little or no notice and certain evacuation response operations will not be feasible (for example, establishing contra flow requires between 24 to 72 hours to be implemented; a no-notice event will not allow for contra flow to be established). Every attempt will be made to assist people with safe evacuation, and risk to first

responders is an additional important consideration. People are encouraged evacuate early and to help their neighbors, friends, and family to evacuate if doing so will not cause danger to themselves or others.

3.4.1 Evacuation Points and Shelters

When SDCD implements an evacuation order, they will coordinate with the Incident Commander and local EOC to decide on a location to use as a Temporary Evacuation Point (TEP). American Red Cross representatives located in the OA EOC and/or ICP, along with the OA EOC Care & Shelter Branch will coordinate the locations to be used as emergency shelters if necessary. The OA EOC staff may assist, as requested, in the coordination of an evacuation in an incorporated city. The SDSD Dispatch Center in conjunction with the OA EOC and JIC will utilize the Alert San Diego system, social media, radio, television, IPAWS, etc. to direct evacuees to the established TEP or shelter. Local jurisdictions all have access to the same alert and warning tools as the OA and should follow their internal protocols for sharing information with the public. Temporary evacuation points will serve as temporary safe zones for evacuees, but they generally do not provide any services, such as food, water, restrooms, etc. Emergency shelters are opened when at least one overnight stay is necessary. Basic services are provided at emergency shelters, which includes meals, accessible shower facilities, dormitory management, health, and behavioral health services. Some temporary evacuation points may be suitable to be converted into an emergency shelter location, if necessary and available. Shelters and assembly areas that can provide at least short-term refuge and that would be designated by emergency managers during an evacuation, and would be determined based on the specific evacuation event.

Other refuge sites are available within urbanized areas surrounding the Project site. If there are residents unable to evacuate or in need of transportation assistance to get to a TEP or shelter, the SDSD may establish transportation points to collect and transport people without transportation resources to evacuation points. These transportation points should be large, well-known sites such as shopping centers, libraries, and schools. Transportation should be accessible to all populations, including people with disabilities and other access and functional needs.

3.4.2 Pet Evacuations

The Pets Evacuation and Transportation Standards Act of 2006 amends the Stafford Act and requires evacuation plans consider the needs of individuals with household pets and service animals, prior to, during, and following a major disaster or emergency.

The San Diego County Department of Animal Services (DAS) has plans in place to transport and shelter pets in a disaster under Annex O of the OA EOP, including the Animal Control Mutual Aid Agreement. Animal Control Officers, the San Diego Humane Society, and private animal care shelters will assist in the rescue, transport, and sheltering of small and large animals. In addition, potential volunteer resources and private groups are identified and tracked in WebEOC by the County. Only non-emergency resources and personnel, such as public and private animal services agencies, will be used to rescue and transport animals during an evacuation effort.

In most cases, DAS and the OA EOC will coordinate and attempt to co-locate animal shelters with people shelters.

3.4.3 Shelter-in-Place (County EOC Discussion)

As stated in the County EOC, sheltering-in-place is the practice of going or remaining indoors during or following an emergency event. This procedure is recommended if there is little time for the public to react to an incident and it is safer for the public to stay indoors for a short time rather than travel outdoors. Sheltering-in-place also has many

advantages because it can be implemented immediately, allowing people to remain in their familiar surroundings, and providing individuals with everyday necessities such as telephone, radio, television, food, and clothing. However, the amount of time people can stay sheltered-in-place is dependent upon availability of food, water, medical care, utilities, and access to accurate and reliable information.

The decision on whether to evacuate or shelter-in-place is carefully considered with the timing and nature of the incident (San Diego County 2022). Sheltering-in-place is the preferred method of protection for people that are not directly impacted or in the direct path of a hazard. This will reduce congestion and transportation demand on the major transportation routes for those that have been directed to evacuate by police or fire personnel. The communities adjacent to the proposed Harmon Ranch Project includes homes built in the 1960s and are in varying states of ignition resistance. Unlike most new master planned communities that incorporate newer construction practices, responding fire and law enforcement personnel may not be able to direct existing residents to temporarily refuge in their homes; however, it would be possible for residents of Harmon Ranch. Homes that are not built to the ignition-resistant standards can be retrofitted to increase their ability to withstand wildfire and ember storms by focusing on roofs, windows, walls, vents, appendages and defensible space. Attention to these components of a home's fire protection system is recommended for existing homeowners within the Project Area.

Options when evacuation is not considered feasible that may be available to responding fire and law enforcement personnel may include temporary refuge/sheltering on site where residents are instructed to remain in their homes while firefighters perform their structure protection function if it is considered unsafe to evacuate. This approach is consistent with San Diego County's (San Diego County 2022) evacuation approach which states, "The concept of shelter-in-place is an available option in those instances where physical evacuation is impractical. This procedure may be effective for residential dwellings in the immediately impacted areas, or for large facilities that house a high percentage of non-ambulatory persons (i.e., hospitals and convalescent homes). Sheltering-in-place attempts to provide a haven within the impacted area."

The surrounding communities do not currently include attributes that would allow a community-wide sheltering in place option, due primarily to the older construction methods and codes that guided construction at the time the homes were built. The structures in the Harmon Ranch community, including the proposed homes would be ignition-resistant materials (e.g., Class A roofs, stucco exterior, interior sprinklers) and defensible, which enables sheltering in place as a contingency option when it is considered safer than evacuation. However, the site is outside of a VHFHSZ; therefore, construction may not be required to use Chapter 7A features. The project would be built to the code level required for its location relative to nearby fire hazard severity zone mapping.

INTENTIONALLY LEFT BLANK

4 Evacuation Road Network

As evidenced by mass evacuations during the 2007 Witch Fire along with other San Diego County evacuations, even with roadways that are designed to the code requirements, it may not be possible, or even the best response, to move large numbers of persons at the same time as part of a mass-evacuation. Instead, informed, phased evacuations enable more streamlined evacuations where those at highest risk are moved first. Road infrastructure throughout the United States, and including San Diego County, is not designed to accommodate a short-notice, mass evacuation without some level of congestion (FEMA 2008). The need for evacuation plans, pre-planning, and tiered or targeted and staggered evacuations becomes very important for improving evacuation effectiveness. Among the most important factors for successful evacuations in urban settings is control of intersections downstream of the evacuation area. If intersections are controlled by law enforcement, barricades, signal control, and other means, potential backups and slowed evacuations can be minimized. Multiple evacuation points enable more evacuees the ability to evacuate with less impact on roadways.

Wildfire risk for the Project site is believed to be from short-duration ember production from a wildfire burning in open spaces within the Project's vicinity. An early evacuation of Harmon Ranch may occur if a wildfire burns closely in the open spaces to the north, south or west of the Project. However, the surrounding terrain does not support aggressive runs at the community, which is separated from the open space by developed areas and wildfires during typical weather conditions are less aggressive and more manageable, rarely resulting in large evacuations. As conducted in past wildfires, an early evacuation of the area may occur several or more hours prior to actual threatening conditions at Harmon Ranch, depending on conditions and fire spread projections.

The Project is located within an area that is subject to occasional wildfires, with the average fire return interval within a 5-mile radius at roughly 2 years, but based on the residential uses surrounding the Project site, the wildfire potential within the Project structures' direct sphere of influence is considered minimal and direct exposure to unmaintained fuels is limited. Similarly, fire intensity would be expected to be low in the riparian area south of the Project site. This reduced fire behavior would be expected to facilitate evacuations as well as potential on-site sheltering for properly constructed residences, if considered safer than a short-notice evacuation.

This approach is consistent with San Diego County's (2022) Evacuation approach which states, "The concept of shelter-in-place is an available option in those instances where physical evacuation is impractical. This procedure may be effective for residential dwellings in the immediately impacted areas, or for large facilities that house a high percentage of non-ambulatory persons (e.g., hospitals and convalescent homes). Sheltering-in-place attempts to provide a haven within the impacted area." Although not a designated shelter-in-place community, the structures at Harmon Ranch would include fire resistant construction materials (e.g., Class A roofs, stucco walls) and landscape maintenance, are defensible against the short duration wildfire exposure anticipated, and would require less resources for protection, which enables these contingency options that may not be available to other nearby communities.

Among the most important factors for successful evacuations at the Project site is control of intersections downstream of the evacuation area. If intersections are controlled by law enforcement, barricades, signal control, firefighters or other means, potential backups and slowed evacuations can be minimized. Another important aspect of successful evacuation is a managed and phased evacuation declaration. Evacuating in phases, based on vulnerability, location, or other factors, enables the subsequent traffic surges on major roadway to be

smoothed over a longer time frame and can be planned to result in traffic levels that flow better than when mass evacuations include large evacuation areas at the same time. This plan defers to Law Enforcement and OES to appropriately phase evacuations and to consider the vulnerability of communities when making decisions. For example, newer development in the area, including Harmon Ranch's structures, will offer a higher level of fire safety onsite, then structures in nearby communities, most of which were built prior to 1990.

Evacuation Routes

Evacuees are anticipated to be considered in a "safe zone" once they are a reasonable distance away from open space and in a dense urbanized area. For this analysis, the I-15 and Poway Road interchange and the Town & Country Plaza were considered the gateways or safe zones for evacuees to seek refuge from the wildfire, although there are many other urbanized areas within Poway that would also provide safety from wildfires. The evacuation areas are anticipated to utilize the following roadway facilities as evacuation routes:

North-South Roadways

Pomerado Road – a four-lane north/south roadway that connects Twin Peaks Road to Spring Canyon Road. Within the study area, this roadway provides a center-left-turn lane median and has a posted speed limit of 45 miles (mph). Pomerado Road is primarily fronted by residential units and open space and provides pedestrian sidewalks and bicycle lanes on both sides of the roadway. San Diego MTS bus routes 945 and 945A currently provide services on Pomerado Road, north of Poway Road. Pomerado Road is classified as a Major Arterial by the City's Transportation Master Element, March 2010. Vehicles evacuating the project and adjacent neighborhoods are anticipated to travel north or south on this roadway to access Poway Road.

East-West Roadways

Poway Road – a four-lane east/west roadway that connects I-15 in the west to SR-67 in the east. The roadway has a posted speed limit of 35 miles per hour (mph) and is divided by a raised median. Within the study area, Poway Road provides direct access to commercial centers. Pedestrian sidewalks and bicycle lanes are present on both sides of the roadway. San Diego Metropolitan Transit System (MTS) bus routes 944, 945, and 945A currently provide services on Poway Road. Poway Road is classified as a Major Arterial by the City's Transportation Master Element, March 2010. Vehicles evacuating the project and adjacent neighborhoods are anticipated to travel east or west on this roadway to access I-15 or the Town & Country Plaza for safety.

Oak Knoll Road -a two-lane roadway that connects Sage View Road to Selier Street. The Proposed Project will take access via side-street stop-controlled intersections on Oak Knoll Road. This roadway is an undivided roadway with a posted speed limit of 25 mph and parallel parking provided on both sides of the roadway. Oak Knoll Road is fronted by residential units and small businesses. Pedestrian sidewalks are provided on both sides of the roadway and sharrow signs are painted on the roadway indicating that Oak Knoll Road is a bicycle route. According to the City's Transportation Master Element, March 2010, Oak Knoll Road is a local collector between Poway Road and Pomerado Road and a local road east of Pomerado Road. Vehicles evacuating the project and adjacent neighborhoods are anticipated to travel east or west on this roadway to access Carriage Road, Pomerado Road, or Poway Road. Roca Grande Drive will be a gated emergency vehicle access that could be used for resident evacuation purposes, at the discretion of PFD.

Evacuation Alternatives

Fires occurring on typical (non-extreme) fire weather days, when humidity is higher and winds are not as high or gusty, have been very successfully controlled at small sizes within minutes of ignition and would not typically trigger a need to evacuate the Harmon Ranch community. Partial evacuation of some dwellings could be an option, particularly those homes that are on the perimeter of the Project site.

If a wildfire ignited closer to the Harmon Ranch community during weather that facilitates fire spread, where multiple hours are not available for evacuation and placing residents on the roads could expose them to wildfire, an alternative evacuation approach would need to be explored. It is preferred to evacuate long before a wildfire is near, and in fact, history indicates that most human fatalities from wildfires are due to late evacuations when they are overtaken on roads. Therefore, it is prudent to consider a contingency option of temporary on-site refuge. For example, if a wildfire is anticipated to encroach upon the community or Oak Knoll Road in a timeframe that is shorter than would be required to evacuate all residents, then evacuations could be significantly impacted and the ability to temporarily shelter residents in their homes is a prudent contingency.

4.1 Evacuation Time Discussion

This analysis was performed in accordance with the requirements of the County of San Diego – Operational Area Emergency Operation Plan – Annex Q (Evacuation), September 2018 for the calculation of evacuation times. To analyze the evacuation events, simulations were conducted by transportation engineering firm INTERSECTING METRICS using Synchro/SimTraffic microsimulation software package (Version 10) by Trafficware Ltd. It considers lane utilization, turn pocket storage lengths, upstream and downstream queue spillbacks, and coordinated signal timings on intersection and roadway operations. Intersection delay/level of service results are based on the SimTraffic results, which are calculated from the simulated vehicles tracked throughout the network. A total of 10 simulations run were conducted to obtain a reasonable sample size, and the results of those runs were averaged to obtain the evacuation travel time (Appendix C).

Simulation Area

The simulation area used for this modeling includes the roadway network bounded by I-15 to the west, Carriage Road to the east, and Oak Knoll to the south. The same intersections analyzed in the Harmon Ranch Draft Local Transportation Analysis (Intersecting Metrics, April 4, 2023) were included in this model, as well as intersections on Poway Road between I-15 to Oak Knoll Road to simulate vehicles traveling to the I-15 and Poway Road interchange and Town & Country Plaza.

The residential neighborhoods included in the evacuation analysis are neighborhoods adjacent to the project site and close proximity to native fuels, which are most likely to be compromised during a wildfire. These neighborhoods include the residential units immediately south, east, and west of the project site, the units north and south of Poway Road, the units along Pomerado Avenue and Sabre Springs Parkway, and the units in the eastern area of the City of Poway. While there are other non-residential uses within the study area, such as business offices and retail centers, trips from those uses were not assumed in the evacuation analysis since the analyses were for late night conditions and those buildings would be closed for operation.

Evacuating Vehicles

The number of vehicles existing the evacuation area was developed based on the American Community Services 2021 data for 21 census block groups in the study area. A portion of residents in several of the census block groups were not assumed to enter the study area based on their closer proximity to other interchanges or major intersections. Therefore, the data for the census block groups were modified to include only the number of residents assumed to travel to the I-15 and Poway Road interchange or the Town & Country Plaza.

Additionally, there are two planned projects in the study area (Poway Road Mixed Use and Meridian Poway) that were assumed in the evacuation analysis. The Harmon Ranch Project's evacuation vehicles were calculated using vehicle ownership per household data for an adjacent census tract multiplied by the number of dwelling units. Therefore, assuming a vehicle ownership rate of 2.04 vehicles per household (per census tract 170.48), the Project would generate 129 evacuating vehicles (2.04 vehicles x 63 dwelling units = 129 evacuating vehicles).

Table 2. Evacuating Vehicles

Scenario	Evacuating Vehicles		
	Adjacent Neighborhoods and Planned Projects	Proposed Project	Total
Fire Driven from East	9,481	129	**9,610**
Fire Driven from West	6,673		**6,802**

As detailed in Appendix C, certain roadway network modifications were assumed in the model to represent potential traffic mitigation for roadways with available capacity and/or deployed traffic personnel directing traffic at key intersections. Additionally, the model assumes that under emergency evacuation conditions, traffic signals would revert to special timing plans and/or traffic personnel will be deployed at key intersections to help regulate traffic flow for primary evacuation approaches. Further, the model was coded to include primarily aggressive drivers, with drivers travelling with faster reaction times and shorter headways. Vehicle speeds would be limited by presumed congested conditions.

Evacuation Scenarios

The evacuation analysis includes the following four scenarios that considered traffic from Proposed Project and as evacuees from the adjacent neighborhoods:

- Opening Year Land Uses with Fire Driven from the East – This scenario estimates the evacuation time of the existing residential areas and planned projects adjacent to the project site. Under this scenario, it is assumed that the wind fire is driven from the east and evacuees are traveling west to the I-15 and Poway Road interchange for refuge.
- Opening Year Land Uses with Fire Driven from the West – This scenario estimates the evacuation time of the existing residential areas and planned projects adjacent to the project site. Under this scenario, it is assumed that the wind fire is driven from the west and evacuees are traveling east to the Town & Country Plaza.
- Opening Year Land Uses with Project With Fire Driven from the East – This scenario estimates the evacuation time of the Proposed Project residents, the existing residential areas adjacent to the project site, as well as the planned projects adjacent to the project site. Under this scenario, it is assumed that the

wind fire is driven from the east and evacuees are traveling west to the I-15 and Poway Road interchange for refuge.

- Opening Year Land Uses with Project With Fire Driven from the West – This scenario estimates the evacuation time of the Proposed Project residents, the existing residential areas adjacent to the project site, as well as the planned projects adjacent to the project site. Under this scenario, it is assumed that the wind fire is driven from the west and evacuees are traveling east to the Town & Country Plaza.

4.1.1 Potential for Project Evacuation Impact

Based on the analysis methodology described in the previous section, Table 2 summarizes the evacuation time for each analysis scenario. The evacuation time does not depict the evacuation time for each population modeled, but rather the time needed to evacuate all populations modeled. Populations located in closer proximity to the safe zone will safely evacuate sooner than the calculated evacuation time. Detailed evacuation travel time analysis information is provided in Attachment D of Appendix C.

Table 3. Evacuation Travel Time

	Total Evacuation Traffic		Evacuation Travel Time		
Safe Zone	Existing Land Uses	Existing Land Uses w/ Project	Existing Land Uses	Existing Land uses w/ Project	Delta
Fire Driven from East	9,481	9,610	118.2 mins (1 hr & 58 mins)	122.9 mins (2 hr & 2 mins)	4.6 mins
Fire Driven from West	6,673	6,802	83.0 mins (1 hr & 23 mins)	86.0 mins (1 hr & 26 mins)	3.0 mins

As shown in Table 2, for a wildfire driven from the east, it is anticipated to take the Proposed Project and the adjacent residential neighborhoods a total of 122.85 minutes to fully evacuate the study area, which is a 4.62-minute increase from the Opening Year conditions. For a wildfire driven from the west, it is anticipated to take the Proposed Project and the adjacent residential neighborhoods 86.04 minutes to evacuate the study area, which is a 3-minute increase from Opening Year conditions.

In addition to reviewing the evacuation travel time, the total intersection delay for the study area was evaluated to see the impact of the Proposed Project's traffic to the overall delay of the intersections along the evacuation routes. Table 3 displays the total intersection delay for the two scenarios. Detailed evacuation intersection delay information is provided in Attachment D of Appendix C.

Table 4. Evacuation Intersection Delay – Total Study Area

	Total Intersection Delay (Seconds)		
Scenario	Opening Year Land Uses	Opening Year Land Uses w/ Project	Delta
Fire Driven from East	725.3 sec (12 min & 05 sec)	367.6 sec (12 min & 12 sec)	6.9 sec
Fire Driven from West	637.6 sec (10 min & 37 sec)	641.0 sec (10 min & 40 sec)	3.3 sec

As shown in Table 3, the average total intersection delay for the study area with the Proposed Project is 732.2 and 640.9 seconds under the wildfire driven from the east and west scenarios, respectively. This is less than a 7 second increase compared to Opening Year conditions under each scenario.

There are currently no significance standards for evacuation travel time for the City of Poway or CEQA. Public safety, not time, is generally the guiding consideration for evaluating impacts related to emergency evacuation. The City considers a Project's impact on evacuation significant if the Project will significantly impair or physically interfere with implementation of an adopted emergency response or evacuation plan; or if the Project will expose people or structures to a significant risk of loss, injury, or death involving wildland fires.

Safely undertaking large-scale evacuations may take several hours or more and require moving people long distances to designated areas. Further, evacuations are fluid and timeframes may vary widely depending on numerous factors, including, among other things, the number of vehicles evacuating, the road capacity to accommodate those vehicles, residents' awareness and preparedness, evacuation messaging and direction, and on-site law enforcement control.

Notwithstanding evacuation challenges and variables, the success rate in the City of Poway in safely managing both mass and targeted evacuations is nearly 100% safe evacuations based on research showing there were no fire-caused deaths during the evacuation of the Witch Fire in 2007. Technological advancements and improved evacuation strategies learned from prior wildfire evacuation events have resulted in a system that is many times more capable of managing evacuations. With the technology in use today in the City, evacuations are more strategic and surgical than in the past, evacuating smaller areas at highest risk and phasing evacuation traffic so that it flows more evenly and minimizes the surges that may slow an evacuation. Mass evacuation scenarios where large populations are all directed to leave simultaneously, resulting in traffic delays, are thereby avoided, and those populations most at risk safely evacuate.

Based on the evacuation simulations above, evacuation traffic generated by the Project would only increase the total evacuation travel time by less than 5 minutes. With proper and effective evacuation managers and traffic control personnel, evacuation flow is anticipated to be able to be effectively managed.

The Project would provide emergency managers the alternative option of recommending residents temporarily seeking refuge on-site in fire-resistant buildings or within the wide, converted landscapes and hardscapes that would not readily facilitate wildfire spread. This would provide emergency managers with a safer alternative to risking a late evacuation. By contrast, the examples of Southern California evacuations that have included loss of life have been the result of residents who did not evacuate when directed, and then attempted a late evacuation with travel through long distances of exposed travel ways as wildfire were overtaking the area. These examples occurred in fire environments that were more aggressive and included less maintenance than would occur at the Project area.

The Project would not cut off or otherwise modify existing evacuation routes. It would, instead, implement certain roadway improvements that would improve evacuation, as discussed under the "Analysis Methodology" section above.

This information will be provided to emergency managers for use in pre-planning scenarios to better inform in the field decisions made pursuant to adopted Emergency Operations Plans. Emergency personnel who issue an evacuation order may take into account these time estimates in determining when and where to issue evacuation orders. In a real evacuation scenario, emergency managers may use alternative actions/options to further expedite evacuation.

Such actions may include providing additional lead time in issuing evacuation orders, providing alternative signal control at downstream intersections, utilizing additional off-site routes or directing traffic to roadways with additional capacity, implementing contra-flow lanes, issuing "shelter-in-place" orders when determined to be safer than evacuation, or considering the possibility of a delayed evacuation where parts of the population could be directed to remain on-site until the fire burns out in the sparse fuels around the evacuation route. These options require "in the field" determinations of when evacuations are needed and how they are phased to maximize efficiency. Overall, safe evacuation of the Project and surrounding community is possible in all modeled scenarios.

4.1.2 Mass Evacuation Vehicle Traffic

Mass evacuation events have become extremely rare as wildfire evacuation technology and capabilities have improved dramatically in the last 20 years. Wildfire evacuations are managed to move smaller populations in a successive phasing to minimize traffic surges. Populated areas are evacuated in phases based on proximity to the event and risk levels. For example, it is anticipated that wildfire evacuations of the Project area will likely include the relocation of perimeter populations that are closest to open space, either to on-site temporary shelter sites or off-site, rather than mass evacuating the entire area. The Project is built to ignition resistant standards and represent fire-safe fuel breaks that provide emergency managers many options that do not all include a mass evacuation. The result of this type of evacuation is that residents that may be in locations that would be closest to a wildfire burning in open space areas are temporarily moved from the vicinity and vehicle congestion on evacuation routes is minimized, enabling a more efficient evacuation. Under this evacuation approach, the evacuation would include a much smaller population and would be implemented in a surgical way. The evacuation time would be even lower and would have very little impact on the existing communities, except for evacuees who decide to leave the area despite not being directed to do so (Sorensen and Vogt 2006).

Phased Evacuation The purpose of a phased evacuation is to reduce congestion and transportation demand on designated evacuation routes by controlling access to evacuation routes in stages and sections. This strategy can also be used to prioritize the evacuation of certain communities that are in proximity to the immediate danger. A phased evacuation effort will need to be enforced by law enforcement agencies and coordinated with the EOC and affected jurisdictions.

Evacuations in San Diego County will soon be managed by a system that enables emergency managers to designate small areas in a surgical approach that can target neighborhoods, blocks or streets for alert messaging. Similarly, numerous cities and counties are implementing similar plans, with one example being an evacuation planning system called Zonehaven. Zonehaven is a software program that uses an algorithm incorporating various factors or inputs affecting disasters or emergency events to produce a digital evacuation map or real-time guide based on numerous, pre-set, community zones vs large swaths of a community. These factors include weather, traffic flows, street design, historical disaster data, geography and more. They are used to build a communitywide (city or county or whatever entity is purchasing the program) baseline digital map of evacuation zones.

First responders use these types of programs to guide decision-making for if, when, and where to order evacuations or evacuation warnings. Residents of affected zones are alerted using a variety of means, including alert systems, Nixle local alerts, social media such as Twitter and Facebook, and door-to-door warnings.

Dept of Homeland Security (2019) provides supporting data for why jurisdictions have moved to the surgical evacuation approach that leverages the power of situation awareness to support decision making. According to their Planning Considerations: Evacuation and Shelter in Place document, they indicate that delineated zones provide benefits to the agencies and community members. Evacuation and shelter-in-place zones promote phased, zone-based evacuation targeted to the most vulnerable areas, which allows jurisdictions to prioritize evacuation orders to the most vulnerable zones first and limit the need to evacuate large areas not under the threat. Zones help:

- Jurisdictions to understand transportation network throughput and capacity, critical transportation and resource needs, estimated evacuation clearance times, and shelter demand.
- Planners to develop planning factors and assumptions to inform goals and objectives.
- Community members to understand protective actions to take during an emergency.
- Shelters to limit traffic congestion and select locations suitable for the evacuated population.

The amount of time needed to evacuate the Project would vary by the type of incident, the number of evacuation routes utilized, the amount of mobilization time, actual areas at risk, and other factors. It has also been established herein that the targeted approach would minimize the size of the area being evacuated and use a phased approach, which may further reduce the evacuation time estimates.

There is no evacuation timeframe threshold that Projects must meet in order to avoid a CEQA impact or to be consistent with codes, regulations or policies. Regardless, the Project has provided a comprehensive evacuation evaluation, and the evacuation time results are comparable to similar sized populations under a mass evacuation.

Further, any additional time does not necessarily generate a greater safety risk. Emergency personnel who issue evacuation orders can consider the additional time needed to implement an evacuation when determining when and where to issue evacuation orders. Risk to nearby development, including the Project or existing communities, is assessed on a regular basis in a wildfire event. Hours or days of lead time may be available to assess risk and make evacuation determinations. Further, peak occupancy conditions like those assumed in the modeling typically do not occur as all residents are not typically at home while maximum occupancy at industrial, commercial and office uses is also occurring. Further, drifting smoke, awareness of the risk, road closures, or other factors result in people avoiding the area in a fire event. Additionally, the Project could allow people to shelter-in-place or take temporary refuge within the Project site, which could reduce evacuating traffic from the site.

The potential occurrence of a large evacuation event including evacuation of existing populations is minimal, but possible. In this case, the existing populations for the Project would be existing residential surrounding the Project site and commercial uses to the north. During a large wildfire moving from east to west, it is most likely, that evacuations would be directed to I-15, depending on the fire location and movement. The vehicle capacity estimates utilized for this evacuation plan are based the current Highway Capacity Manual methodology for calculating adjusted saturation flow rates and are discounted for various assumed traffic-related slowing, such as higher volume and downstream bottlenecks; therefore, estimates include capability to absorb additional vehicles.

In an actual evacuation scenario, a phased evacuation would be implemented where orders are given to evacuate based on vulnerability, location, and/or other factors, which enables the subsequent traffic surges on major roadways to be smoothed over a longer time frame and improve traffic flow. A phased strategy can also be used to prioritize the evacuation of certain communities that are in proximity to the immediate danger. The limitations of

the model used for this analysis are such that it cannot accurately reflect phased evacuation conditions; hence, a worst-case mass evacuation scenario was assumed.

This WEP assumes that law enforcement personnel are controlling downstream intersections to maintain traffic flow out of the area. If traffic flow is not maintained, then the estimated evacuation times would be expected to increase, potentially substantially, as is the case in any urban area. Additionally, this analysis assumes that all existing populations within the Project area and the Project are evacuating simultaneously.

4.2 Evacuation Route Determination

Typically, fire and law enforcement officials will identify evacuation points before evacuation routes are announced to the public. Evacuation routes are determined based on the location and extent of the incident and its spread rate and direction and include as many pre-designated transportation routes as possible. However, field conditions and shifting fire behavior may result in real-time changes to predetermined routes. Having additional evacuation route options is considered critical in these conditions. Under extreme fire weather events, when wildfire is approaching from the north or east, driven by Santa Ana winds, it is unlikely that evacuation would occur to the east, toward the fire, unless there is substantial time until the fire arrival. Therefore, under these conditions, which is the most likely type of wildfire to result in an evacuation, this analysis assumes all traffic, existing and proposed Project related, would be sent west to I-I5.

INTENTIONALLY LEFT BLANK

5 Harmon Ranch Wildfire/ Evacuation Awareness

The Harmon Ranch HOA should be active in its outreach to its residents regarding fire safety and general evacuation procedures. There are aspects of fire safety and evacuation that require a significant level of awareness by the residents and emergency services to reduce and/or avoid problems with an effective evacuation. Mitigating potential impediments to successful evacuations requires focused and repeated information through a strong educational outreach program. The Harmon Ranch HOA should engage residents and coordinate with local fire agencies for fire safety awareness through a variety of methods.

This WEP will be accessible on the HOA's website. Annual reminder notices will be provided to each homeowner encouraging them to review this WEP and be familiar with community evacuation protocols. The HOA will coordinate with local fire agencies to hold an annual fire safety and evacuation preparedness informational meeting. The meeting will be attended by representatives of appropriate fire agencies and important fire and evacuation information will be reviewed. One focus of these meetings and of the HOA's annual message will be on the importance of each resident to prepare and be familiar with their own "Ready, Set, Go!" Action Plan. The "Ready, Set, Go!" program is defined at:

https://poway.org/830/Ready-Set-Go-Wildfire-Readiness , and information about preparing a personalized Action Plan is provided in Appendix A of this document.

The focus of the "Ready, Set, Go!" program is on public awareness and preparedness, especially for those living in the wildland-urban interface (WUI) areas. The program is designed to incorporate the local fire protection agency as part of the training and education process in order to ensure that evacuation preparedness information is disseminated to those subject to the potential impact from a wildfire. There are three components to the program:

- **"READY" – Preparing for the Fire Threat:** Take personal responsibility and prepare long before the threat of a wildfire so you and your home are ready when a wildfire occurs. Create defensible space by planting and maintaining ignition-resistant vegetation near your home. Use only fire-resistant landscaping and maintain the ignition resistance of your home. Assemble emergency supplies and belongings in a safe spot. Confirm you are registered for Reverse 911, Alert San Diego, and Community alert system. Make sure all residents residing within the home understand the plan, procedures and escape routes.
- **"SET" – Situational Awareness When a Fire Starts**: If a wildfire occurs and there is potential for it to threaten Harmon Ranch and surrounding communities, pack your vehicle with your emergency items. Stay aware of the latest news from local media and your local fire department for updated information on the fire. If you are uncomfortable, leave the area.
- **"GO!" – Leave Early!** Following your Action Plan provides you with knowledge of the situation and how you will approach evacuation. Leaving early, well before a wildfire is threatening your community, provides you with the least delay and results in a situation where, if a majority of neighbors also leave early, firefighters are now able to better maneuver, protect and defend structures, evacuate other residents who couldn't leave early, and focus on citizen safety.

"READY SET GO!" is predicated on the fact that being unprepared and attempting to flee an impending fire late (such as when the fire is physically close to your community) is dangerous and exacerbates an already confusing situation. This Harmon Ranch Wildfire Evacuation Plan provides key information that can be integrated into the individual evacuation plans, including the best available routes to use in the event of an emergency evacuation.

Situation awareness requires a reliable information source. One of the most effective public notification methods is Reverse 911. The San Diego OES operates the Reverse 911 notification system that provides a recorded message over land line telephone systems relating to evacuation notices. In addition, OES operates a program known as "Alert San Diego" that has the capability to send emergency notifications over both land lines as well as to cell phones and via text messages. It is up to individual residents to register their cell phones for "Alert San Diego." The registration of cell phones can be done online at www.ReadySanDiego.com. In addition, the San Diego Emergency Alert System (EAS) is county-wide and broadcasts emergency information via two radio stations: KOGO AM 600 and KLSD AM 1360.

Although not relying on this for safe and effective evacuations, as part of the Harmon Ranch resident fire awareness and evacuation readiness program, information will be delivered in a variety of methods (e.g., website, mailers, in-person meetings). The HOA will be responsible for providing access to this Wildfire Evacuation Plan, including materials from the "Ready, Set, Go!" Program.

The HOA, through its CC&R's will actively participate as a partner with the PFD to assist with the coordination and distribution of fire safety and evacuation information to Project residents.

6 Harmon Ranch Evacuation Procedures

6.1 Relocation/Evacuation

It is estimated that the minimum amount of time needed to move the Harmon Ranch population to urbanized and/or designated evacuation areas may require up to approximately 2 hours under varying constraints that may occur during an evacuation. This does not include additional allowances for the time needed to detect and report a fire, for fire response and on-site intelligence, for phone, patrols, and aerial based notifications, and for notifying special needs citizens.

Wolshon and Marchive (2007) simulated traffic flow conditions in a computer derived WUI under a range of evacuation notice lead times and housing densities. To safely evacuate more people, they recommended that emergency managers (1) provide more lead time to evacuees and (2) control traffic levels during evacuations so that fewer vehicles are trying to exit at the same time.

Wildfire emergency response procedures will vary depending on the type of wildfire and the available time in which decision makers (IC, PFD, CAL FIRE, SDSD, and/or County Office of Emergency Management) can assess the situation and determine the best course of action. Based on the Harmon Ranch Project and surrounding communities, its road network, and the related fire environment, the first and primary type of evacuation envisioned is an orderly, pre-planned evacuation process where people are evacuated to more urban areas further from an encroaching wildfire (likely to urban areas north [and west]) well before fire threatens. This type of evacuation must include a conservative approach to evacuating (i.e., when ignitions occur and weather is such that fires may spread rapidly, evacuations should be triggered on a conservative threshold that includes time allowances for unforeseen, but possible, events that would slow the evacuation process).

The second type of evacuation is considered by many to offer the highest level of life protection to the public, but it can result in evacuees being placed in harm's way if the time available for evacuation is insufficient (Cova et al. 2011). An example of this type of evacuation, which is highly undesirable from a public safety perspective, is an evacuation that occurs when fire ignites close to vulnerable communities. This type of situation is inherently dangerous because there is generally a higher threat to persons who are in a vehicle on a road when fire is burning in the immediate area than in a well-defended, ignition-resistant home. Conditions may become so poor that the vehicle drives off the road or crashes into another vehicle, and flames and heat overcome the occupants. A vehicle offers little shelter from a wildfire if the vehicle is situated near burning vegetation or catches fire itself. This type of evacuation must be considered a very undesirable situation by law and fire officials in all but the rarest situations where late evacuation may be safer than seeking temporary refuge in a structure (such as when there are no nearby structures, the structure[s] is/are already on fire, or when there is no other form of refuge). Temporary refuge would be possible within the Harmon Ranch structures, but structures within surrounding communities, as previously discussed, are less desirable due to their higher vulnerability to ignition.

The third potential type of evacuation is a hybrid of the first two. In cases where evacuation is in process and changing conditions result in a situation that is considered unsafe to continue evacuation, it may be advisable to direct evacuees to pre-planned temporary refuge locations, including their own home if it is ignition-resistant and defensible. As with the second type of evacuation discussed above, this situation is considered highly undesirable, but the evacuation

pre-planning must consider these potential scenarios and prepare decision makers at the IC level and at the field level for enacting a contingency to evacuation when conditions dictate.

Indications from past fires and related evacuations, in San Diego County and throughout Southern California, which have experienced increasingly more frequent and larger fires, are that evacuations are largely successful, even with a generally unprepared populace. It then stands to reason that an informed and prepared populace would minimize the potential evacuation issues and related risk to levels considered acceptable from a community perspective.

Evacuation orders or notifications are often triggered based on established and pre-determined model buffers, which are based on topography, fuel, moisture content of the fuels and wind direction. Evacuations are initiated when a wildfire reaches or crosses one of these pre-determined buffers. Evacuations can also be very fluid. The IC, law enforcement and OES would jointly enact evacuations based on fire behavior.

6.2 Harmon Ranch Project Evacuation Baseline

For purposes of this Wildfire Evacuation Plan, the first and most logical choice for all the residents and guests within the boundaries of Harmon Ranch Project is to adhere to the principles and practices of the "Ready, Set, Go!" Program previously mentioned in this document. As part of this program, it is important that each household develop a plan that is clearly understood by all family members and participates in the educational and training programs sponsored by the Harmon Ranch HOA and the PFD. It must be kept in mind that conditions may arise that will dictate a different evacuation route than the normal roads used on a daily basis.

Residents are urged to evacuate as soon as they are notified to do so or earlier if they feel uncomfortable. Directions on evacuation routes will be provided in most cases, but when not provided, residents of the Project will proceed according to known available routes away from the encroaching fire as detailed in Quick Reference section of this report. Residents are cautioned not to rely on navigation aid apps which may inadvertently lead them toward an oncoming fire. Depending on the type of emergency and the resulting evacuation, it could take up to approximately 2 hours or more to complete a community-wide evacuation of the Project and surrounding communities, based on road capacities and competing use of the roads by residents from other areas.

Note: This WEP will require adjustment and continued coordination by the Harmon Ranch HOA and/or developer and fire/law enforcement agencies during each of the construction phases. With each phase, the evacuation routes may be subject to changes with the addition of both primary and secondary evacuation routes.

6.3 Civilian and Firefighter Evacuation Contingency

As of this document's preparation, no community in California has been directed to shelter-in- place during a wildland fire. Even the communities in Rancho Santa Fe, California, which are designed and touted as shelter-in-place communities, were evacuated during the 2007 Witch Creek Fire. This is not to say that people have not successfully sheltered-in-place during wildfire, where there are numerous examples of people sheltering in their homes, in hardened structures, in community buildings, in swimming pools, and in cleared or ignition-resistant landscape open air areas. The preference will always be early evacuation following the "Ready, Set, Go!" model, but there exists the potential for unforeseen civilian evacuation issues, and having a contingency plan will provide direction in these situations that may result in saved lives.

Potential problems during wildfire evacuation from the Harmon Ranch community include:

- Inadequate time to safely evacuate
- Fire evacuations during rush hour traffic or when large events are occurring
- Blocked traffic due to accidents or fallen tree(s) or power pole(s)
- The need to move individuals who are unable to evacuate

It is recommended that local law enforcement and fire agencies conduct concerted pre-planning efforts focusing on evacuation contingency planning for civilian populations when it is considered safer to temporary seek a safer refuge than evacuation. Harmon Ranch structures would allow for the possibility of temporary sheltering while structures in surrounding communities would not typically be considered ignition-resistant and therefore, not appropriate for temporary refuge.

6.3.1 Safety Zones

The International Fire Service Training Association (IFTSA; Fundamentals of Wildland Fire Fighting, 3rd Edition) defines "safety zones" as areas mostly devoid of fuel, which are large enough to assure that flames and/or dangerous levels of radiant heat will not reach the personnel occupying them. Areas of bare ground, burned over areas, paved areas, and bodies of water can all be used as safety zones. The size of the area needed for a safety zone is determined by fuel types, its location on slopes and its relation to topographic features (chutes and saddles) as well as observed fire behavior. Safety zones should never be located in topographic saddles, chutes or gullies. High winds, steep slopes or heavy fuel loads may increase the area needed for a safety zone.

The National Wildland Fire Coordinating Groups (NWFCG), Glossary of Wildland Fire Terminology provides the following definitions for safety zones:

> Safety Zone. An area cleared of flammable materials used for escape in the event the line is outflanked or in case a spot fire causes fuels outside the control line to render the line unsafe. In firing operations, crews progress so as to maintain a safety zone close at hand allowing the fuels inside the control line to be consumed before going ahead. Safety zones may also be constructed as integral parts of fuelbreaks; they are greatly enlarged areas, which can be used with relative safety by firefighters and their equipment in the event of blowup in the vicinity.

According to NWFCG, safety zone(s):

- Must be survivable without a fire shelter
- Can include moving back into a clean burn
- May take advantage of natural features (rock areas, water, meadows)
- Can include constructed sites (clear-cuts, roads, helispots)
- Are scouted for size and hazards
- Consider the topographic location (larger if upslope)
- Should be larger if downwind
- Should not include heavy fuels
- May need to be adjusted based on site-specific fire behavior

The definition for a safety zone includes provisions for separation distance between the firefighter and the flames of at least four times the maximum continuous flame height. Distance separation is the radius from the center of the safety zone to the nearest fuels. The Project is considered infill development with some conserved open space to the north of the Project site, it would be possible to navigate to roadways and structures on the southern portion of the Project site.

Safety zones are available within the Harmon Ranch community, but the Poway Crossings Shopping Mall parking lot, just north of the community offers the best possibility for a safety zone for firefighter use. The Harmon Ranch community will include the ability for firefighters to seek safety zones within the southern portion of the Project site, but identification of other potential safety zones will require additional focused study by PFD and other fire and law enforcement agencies.

6.3.2 Temporary Firefighter Refuge Areas

Firescope California (Firefighting Resources of Southern California Organized for Potential Emergencies) was formed by legislative action to form a partnership between all facets of local, rural, and metropolitan fire departments, CAL FIRE and federal fire agencies. Firescope defines a contingency plan when it is not possible to retreat to a safety zone. This contingency includes establishment of firefighter temporary refuge areas (TRAs), which are defined as:

> A preplanned area where firefighters can immediately take refuge for temporary shelter and short-term relief without using a fire shelter in the event that emergency egress to an established safety zone is compromised.

Examples of a TRA may include the lee side of a structure, inside of a structure, large lawn or parking areas, or cab of a fire engine, amongst others. Differences between a TRA and a Safety Zone is that TRAs are closer to the immediate firefighting area, are considered a contingency to being able to get to a safety zone, do not include a requirement for a large area set back four times the flame lengths of adjacent fuels, and cannot be feasibly pre-planned until firefighters arrive on-scene and size up the situation.

Firescope appropriately notes that although safety zones and viable escape routes shall always be identified in the WUI environment, they may not be immediately available should the fire behavior increase unexpectedly. Often a TRA is more accessible in the WUI environment. A TRA will provide temporary shelter and short-term relief from an approaching fire without the use of a fire shelter and allow the responders to develop an alternate plan to safely survive the increase in fire behavior.

The major difference between a TRA and a safety zone is that a TRA requires another planned tactical action (i.e., TRAs cannot be considered the final action, but must include self-defense and a move out of the area when the fire threat subsides). A TRA should be available and identified on site at a defended structure. TRAs are NOT a substitute for a safety zone. TRA pre-planning is difficult, at best because they are very site- and fire behavior-specific. For the Harmon Ranch community, TRAs would likely include navigating into the densely developed areas where firefighters would be separated from the unmaintained wildland fuels by wide areas including site-wide maintained landscapes, ignition-resistant residences, and wide roads that offer numerous opportunities for TRA.

The entire developed portion of Harmon Ranch development, but especially the interior dwellings, are considered TRAs. This is an important concept because it offers last-resort, temporary refuge of firefighters, and in a worst-case condition, residents. This approach would be consistent with Firescope California (2013), which indicates that firefighters must determine if a safe evacuation is appropriate and if not, to identify safe refuge for those who cannot be evacuated, including civilians.

Each of the Project's residences that can be considered for TRA include the following features:

- Ignition-resistant construction materials (e.g., Class A roofs, stucco exterior)
- Wide roadways with fire hydrants
- Interior fire sprinklers

Because there is the possibility that evacuation of the Project and surrounding communities may be less safe than temporarily refuging on site, such as during a fast-moving, wind-driven fire that ignites nearby, including temporary refuge within some properly designed, constructed and maintained residences onsite is considered a contingency plan for the Harmon Ranch Project. This concept is considered a component of the "Ready, Set, Go!" model as it provides a broader level of "readiness" should the ability to execute an early evacuation be negated by fire, road congestion, or other unforeseen issues.

Note: This approach would be considered a last-resort contingency during wildfire with the primary focus being on early evacuation. The decision for evacuation or temporarily refuging on site will be made by responding law enforcement and/or fire personnel.

6.4 Social Aspects of Wildfire Evacuation

Orderly movement of people is the result of planning, training, education, and awareness, all of which are promoted in San Diego. Evacuation has been the standard term used for emergency movement of people and implies imminent or threatening danger. The term in this Wildfire Evacuation Plan, and under the "Ready, Set, Go!" concept, indicates that there is a perceived threat to persons and movement out of the area is necessary, but will occur according to a pre-planned and practiced protocol, reducing the potential for panic.

Citizen reactions may vary during an evacuation event, although several studies indicate that orderly movement during wildfire and other emergencies is not typically unmanageable. Evacuation can be made even less problematic through diligent public education and emergency personnel training and familiarity. Social science research literature indicates that reactions to warnings follow certain behavior patterns that are defined by people's perceptions (Aguirre 1994; Drabek 1991; Fitzpatrick and Mileti 1994; Gordon 2006; Collins 2004) and are not unpredictable. In summary, warnings received from credible sources by people who are aware (or have been made aware) of the potential risk, have the effect of an orderly decision process that typically results in successful evacuation. This success is heightened when evacuations are not foreign to residents (Quarantelli and Dynes 1977; Lindell and Perry 2004) as will occur within the Project area. Further, in all but the rarest circumstances, evacuees will be receiving information from credible sources during an evacuation. It would be anticipated that law enforcement and/or fire personnel would be on site to help direct traffic and would be viewed by evacuees as knowledgeable and credible. The importance of training these personnel cannot be overstated and annual education and training regarding fire safety and evacuation events will be essential for successful future evacuations.

6.4.1 Evacuation of Special Populations

Vogt (1990 and 1991) defines special populations as those groups of people who, because of their special situations or needs, require different planning strategies from those of the general population. Special needs populations include those in institutions or special facilities, those with disabilities in homes, those who need care, children, and others who cannot provide for their own evacuation if necessitated. The special needs population is concentrated in facilities but is also widespread in terms of facility locations and those who live in residences. Special needs populations in Harmon Ranch include people with disabilities, the hearing or visually impaired, senior citizens, foreign speaking, visitors passing through the area, temporary visitors such as day workers, and the non-ambulatory confined to residences either temporarily or permanently.

6.4.2 Animal Evacuations

Animal evacuations present a host of challenges that may affect the overall successful movement of people and their possessions out of harm's way. For example, livestock owners do not always have the means to load and trailer their livestock out of the area. Further, most wildfire evacuation relief shelters or commercial lodging facilities do not allow people to bring in pets or other animals. Sorensen and Vogt (2006) indicate that an issue receiving increasing attention is what evacuees do with pets or other animals such as livestock when they leave their homes and whether having pets or animals impacts their decision to evacuate.

The Harmon Ranch Project would not accommodate livestock onsite. However, household pets are a common occurrence.

6.4.3 Re-Entry Procedures

An important component of evacuations is the citizen re-entry process. Guidance and procedures to ensure a coordinated, safe, and orderly re-entry into impacted communities following an incident is provided in the County of San Diego Re-Entry Protocol.

Guidance and procedures to ensure a coordinated, safe, and orderly repopulation into impacted communities following an incident is provided in the County of San Diego Evacuation and Repopulation Plans.

Repopulation will be initiated by the Incident Commander/Unified Command of the Incident Management Team, with the support of the Director of Emergency Services, the OA EOC Director, and the Operations Section Chief at the OA EOC. In most cases the OA EOC will remain activated until full repopulation is complete. In the event that the OA EOC has been deactivated, the Incident Commander or the Liaison Officer of the Incident Management Team will initiate repopulation procedures.

The Incident Commander will designate staff to the Evacuation/Repopulation Branch and the Operations Section Chief of the OA EOC will coordinate with and support the Evacuation/Repopulation Branch Coordinator. The Evacuation/Repopulation Coordinator is responsible for coordinating the repopulation procedures with all involved agencies and ensuring effective communication.

The public will be notified of repopulation through various notification measures previously mentioned in this annex, which may include Alert San Diego, the SDEmergency App for smart phones, emergency broadcast radio, television, press releases, informational phone lines such as 2-1-1, community briefings, and informational updates at shelters.

7 Implementing Conditions

1. The Harmon Ranch HOA will include a proactive facility wildfire education program utilizing a multi-pronged approach to fire safety including "Ready, Set, Go!" preparations and individual evacuation plans for residents. To include, but not limited to:
   a. Annual wildfire and evacuation safety awareness meeting in coordination with local fire agencies.
   b. Annual reminder notices will be provided to each homeowner encouraging them to review this WEP and be familiar with community evacuation protocols.
   c. The HOA website will host a webpage dedicated to wildfire and evacuation education and awareness, which should include a copy of this Wildfire Evacuation Plan and the resources provided herein.
2. The HOA will designate a Fire Safety Coordinator(s) to oversee implementation of the wildfire education program. The Fire Safety Coordinator(s) will:
   a. Prepare and distribute the annual reminder notice that shall be provided to each occupant encouraging them to review this WEP and be familiar with community evacuation protocols.
   b. Coordinate with local fire agencies to hold an annual fire safety and evacuation preparedness informational meeting for occupants. The meeting should be attended by representatives of appropriate fire agencies and important fire and evacuation information should be reviewed.
   c. Maintaining fire safety information on the development's website, including the WEP and materials from the "Ready, Set, Go!" Program.
   d. Review and update, if necessary, the P.A.C.E. Evacuation Plan every two years.
3. The Project includes a contingency plan for the rare occurrence that evacuation is not safe that includes residents sheltering in place within onsite structures.

INTENTIONALLY LEFT BLANK

8 Limitations

This Emergency Wildfire Evacuation Plan incorporates concepts and protocols consistent with industry standards and has been developed based on City of Poway and San Diego County wildfire and evacuation standards per the City's EOP and the County's EOP documents and is specifically intended as a guide for evacuations for the Harmon Ranch Project. This Emergency Wildfire Evacuation Plan provides basic evacuation information that will familiarize residents of the Project with the evacuation route options that may be available to them during an emergency. However, because emergencies requiring evacuation have many variables and must be evaluated on a case-by-case basis, real-time law enforcement and fire personnel/agencies' decision-making and direction during an emergency requiring evacuation would supersede this WEP.

This WEP analyzes the existing community's evacuation times currently and with the proposed Harmon Ranch Project. The estimated evacuation times are based on several assumptions as detailed in this WEP. However, actual evacuation times may be faster or slower than the estimates, depending on the type of emergency, the extent of the evacuation, the time of day, and other factors. A collective, community–wide evacuation of existing populations and the proposed population from the Project would include congested roads in its existing condition that are improved, but still congested, with the Harmon Ranch Project. Congested roads are normal in any urban setting when a large evacuation is declared unless it is managed and evacuation areas are staggered to reduce the potential traffic surges that can significantly impact evacuations. Therefore, there would likely still be congestion and delays.

This Wildfire Evacuation Plan promotes the "Ready, Set, Go!" model, adopted by PFD, San Diego County, CAL FIRE, and many fire agencies statewide. The goal is to raise agency and citizen awareness of potential evacuation issues and get a majority of the public "Ready" by taking a proactive stance on preparedness, and evacuation planning efforts. The Harmon Ranch Project populace will be "Set" by closely monitoring the situation whenever fire weather occurs and/or when wildland fire occurs and elevating pre-planned protocol activities and situation awareness. Lastly, officials will implement the plan and mandate that populations "Go" by executing pre-planned evacuation procedures in a conservative manner (i.e., evacuation will occur based on conservative decision points, as proposed in this evacuation plan or when directed by fire and law enforcement personnel, whichever is more conservative). The preferred alternative will always be early evacuation. However, there may be instances when evacuation is not possible, is not considered safe, or is not an option based on changing conditions. For example, should a fire occur and make evacuation from the Project area ill advised, a contingency plan for residents should be available. This contingency would include moving people to pre-designated TRAs until it is safe to evacuate or the threat has been mitigated.

Ultimately, it is the intent of this Wildfire Evacuation Plan to guide the implementation of evacuation procedures such that the process of evacuating people from the Harmon Ranch Project is facilitated in an efficient manner and according to a pre-defined evacuation protocol as well as providing a contingency option of temporarily refuging onsite, if evacuation is considered less safe. The Project's residents should be aware of this Wildfire Evacuation Plan and components of it shall be posted on the HOA's website. It is also recommended that the HOA provide reminders to residents on at least an annual basis. This educational outreach will result in a populace that understands the potential for evacuations and the routes and options that may be presented to them.

During extreme fire weather conditions, there are no guarantees that a given structure will not burn or that evacuations will be successful all the time. Wildfires may occur in the area that could damage property or harm persons. However, successful implementation of the procedures outlined in this Wildfire Evacuation Plan will provide for an informed populace regarding evacuations.

This WEP does not provide a guarantee that all persons will be safe at all times because of the procedures discussed. There are many variables that may influence overall safety. This WEP provides a summary for implementation of standard evacuation protocols and public outreach, which should result in reduced wildfire related risk and hazard. Even then, fire can compromise the procedures through various, unpredictable ways. The goal is to reduce the likelihood that the system is compromised through implementation of the elements of this WEP and regular occurring program maintenance and updates.

It is recommended that the evacuation process is carried out with a conservative approach to fire safety. This approach must include embracing a "Ready, Set, Go!" stance on evacuation. Accordingly, evacuation of the wildfire areas should occur as soon as they receive notice to evacuate, which may vary depending on many environmental and other factors. Fire is a dynamic and somewhat unpredictable occurrence, and it is important for anyone living at the wildland-urban interface to educate themselves on practices that will improve safety.

Limitations

The underlying planning principle for fire preparedness, given the dynamic nature of a fire, is to demonstrate the availability of multiple route alternatives and response strategies to permit emergency professionals to manage their response according to the specific circumstances. The Study Area provides ample route and response alternatives. Emergency responders will coordinate the safest possible evacuation based on the dynamic circumstances of the actual event, including the appropriate phasing of the evacuation, and utilization of the most appropriate ingress and egress routes for area residents and emergency responders.

The breadth of route alternatives and response strategies available to emergency professionals to manage a potential fire in this region cannot and should not be evaluated using the INTERSECTING METRICS' Evacuation Analysis – Technical Memorandum alone. A comprehensive view of Project fire safety is gained by understanding this memo, the Project's Wildfire Evacuation Plan, along with the standard protocols and "in-the-field" decision making of emergency responders.

This Wildfire Evacuation Plan presents a reasonable vehicle travel time estimate based on professional judgments made by INTERSECTING METRICS with input from Dudek. Changing any number of these assumptions can lengthen or shorten the average vehicle travel time.

For instance, a situation could arise in which professionals *may* choose to utilize additional roadways for evacuation not utilized in the Dudek/INTERSECTING METRICS analysis, and *may also* choose to send more vehicle trips to certain evacuation routes, and *may also* choose to guide vehicle trips to more or different route permutations relative to what has been modeled in this the Dudek/INTERSECTING METRICS analysis.

The net result of changing the variables selected could yield an average evacuation travel time shorter or longer than the results detailed in the Dudek/INTERSECTING METRICS analysis. Many factors can shorten or lengthen the vehicle time from the results shown herein. For example:

1. Changing the possible evacuation routes selected would affect the results. For instance, utilizing roads for ingress and/or egress that are not utilized in this analysis could shorten vehicle travel times relative to the results shown herein.
2. Increasing or decreasing the number of path permutations and percentage of the population utilizing each route that leads out of the immediate area could shorten or lengthen vehicle travel time relative to the results shown herein.
3. Emergency professionals electing to reserve certain road lanes for emergency vehicle ingress for portions of time could affect the travel time relative to the results shown herein.
4. Assuming evacuees utilize fewer or more vehicles to evacuate from the Project or surrounding communities relative to the Vehicle Utilization Rate selected in the analysis would shorten or lengthen vehicle travel time relative to the results shown herein.
5. Changing the mix of vehicle trips allocated to each evacuation route could shorten or lengthen vehicle travel time relative to the results shown herein.
6. Assuming a different road capacity adjustment factors could shorten or lengthen the vehicle travel time relative to the results shown herein.
7. Assuming fewer people are at home when the evacuation notice is given would reduce the number of vehicle trips and shorten vehicle travel time relative to the results shown herein. For instance, an evacuation during daytime hours would typically result in fewer outbound trips than assumed in this analysis.
8. Assuming some portion of vehicle trips are made in advance of the evacuation notice would reduce the number of vehicle trips relative to the results shown herein.
9. Assuming some homeowners and their families are not in the Study Area when evacuation notice is given (most likely in a daytime evacuation event), could reduce the number for vehicle trips relative to the results shown herein.

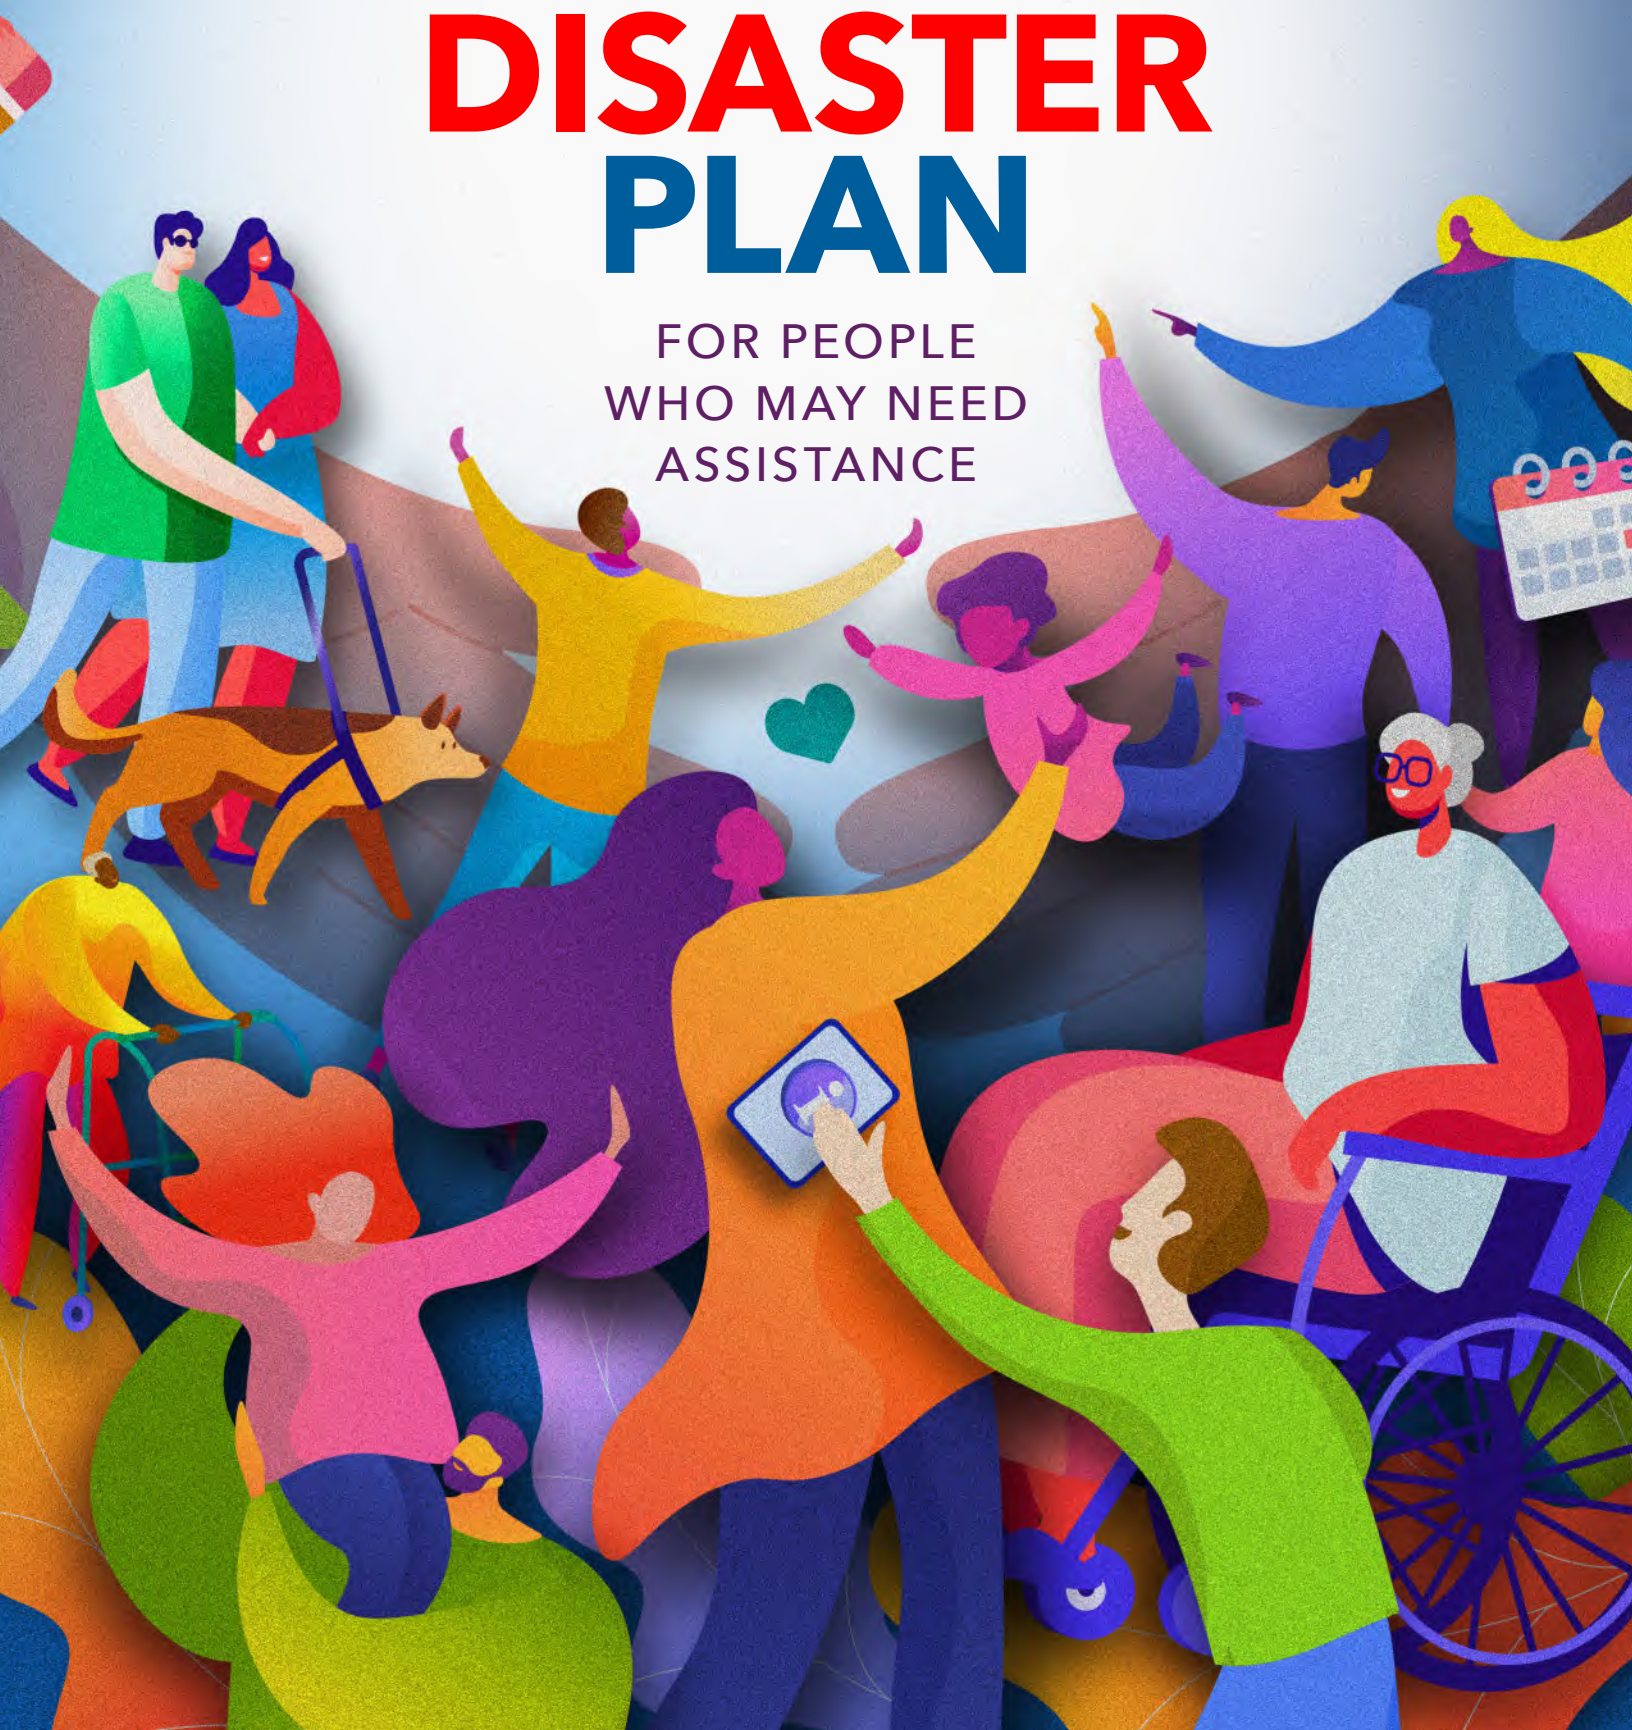
PERSONAL DISASTER PLAN

FOR PEOPLE WHO MAY NEED ASSISTANCE



Introduction

This guide supports older adults, people with disabilities, caregivers, and others who may benefit from help when planning for disasters.

Emergencies can range from falls in the home to fires and earthquakes. Each person has unique abilities and needs during a disaster, and everyone can take steps to prepare.

This guide will help you evaluate your needs and make a personalized emergency plan so that you and your loved ones can be better prepared.

Steps to Prepare for any Emergency

GET CONNECTED

Preparedness is all about people.

Build your support network.

05

MAKE A PLAN

Know where to go, what to do, and who can help.

Share your plan with your support network.

13

GATHER SUPPLIES

Create a Go Kit with supplies you can easily take with you.

Assemble a Home Kit with supplies for sheltering in place.

37

STAY INFORMED

Get alerts and know your local resources.

45

Get Connected
The first step in disaster preparedness is building a support network of people who can help

Preparedness is all about People

Our social connections help us respond better to challenges during emergencies.

Social connections also provide physical and mental health benefits to improve your ability to react to disasters.

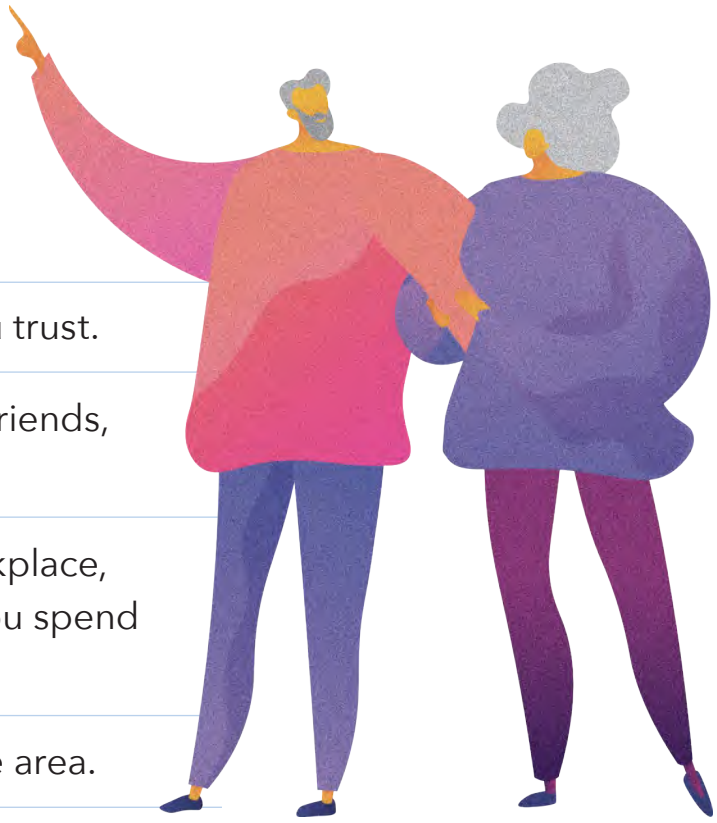
Think about the groups that you already belong to or could join:

- Volunteer groups
- Faith-based groups
- Co-workers
- School-based groups
- Neighborhood groups
- Exercise groups
- Support groups

During an emergency or disaster, you and members of your community can come together to help each other.

Build your Support Network

Your support network can include anyone who can provide help during an emergency.



- Include a minimum of three people you trust.
- Consider family members, neighbors, friends, coworkers, and personal attendants.
- Organize networks for your home, workplace, volunteer sites, and any other places you spend a lot of time.
- Include one contact that lives out of the area.
- Network members should know your capabilities and limitations.
- Disasters can be stressful and overwhelming. Include people that are supportive when you are under stress.

Planning with your Support Network

Communicating with Your Network Members

- Share your disaster plan with your support network.
- Ask your network to notify you when an emergency arises.
- Agree on how you will contact each other during an emergency.
- When possible, text instead of calling during an emergency.
- Consider giving a trusted member of your network keys to your home and car.
- Choose an emergency meeting place where you can reunite.
- Show members of your network how to operate your medical equipment and assistive devices.
- If you have a service animal, make sure it knows and trusts the people in your network.

Your Home

Emergency planning starts in your home

- Install smoke and carbon monoxide detectors on every level of your home and test regularly. If you are deaf or have hearing loss, install a system with flashing lights or vibrations. Call **2-1-1** if you need help installing smoke alarms.
- Know the location of utility valves and learn how to disconnect them during an emergency.

Write down the locations of utilities

Gas Valve: *

Water Valve:

Circuit Breaker:

Garage Door Manual Override:

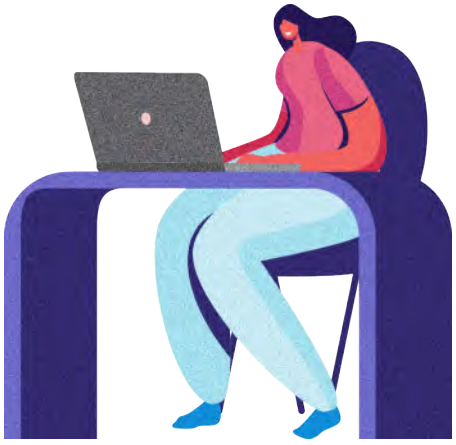
* *If you smell gas, hear a hissing sound, or suspect a leak, turn off the main gas valve, open windows, and leave the area immediately. Do not light candles or strike matches. Only shut off the gas if you suspect a leak, because only the gas company can restore service.*

Insurance Coverage

- Talk with your insurance agent to be sure that you have adequate insurance coverage. Typical homeowner's or renter's insurance may not provide full coverage for all hazards such as flooding, wildfires, or earthquakes.
- Inventory your possessions so you may claim reimbursement in case of loss or damage.

Evacuation Plan

- **Know your evacuation routes.** Find the location of all exits, including doors and windows in each room.
- **Evacuate early.** If you have medical or mobility concerns, or pets or service animals, prepare to leave when an Evacuation Warning is issued instead of waiting for a mandatory Evacuation Order.
- **Plan for unique needs.** Consider the ability of you and your loved ones to evacuate, use stairs, and access transportation. Arrange help from your support network or call **2-1-1** for assistance before an emergency.
- **Meeting places.** Know where you will meet your friends and family after an emergency. Pick two places to meet, one right outside your home and meeting place outside of your neighborhood.



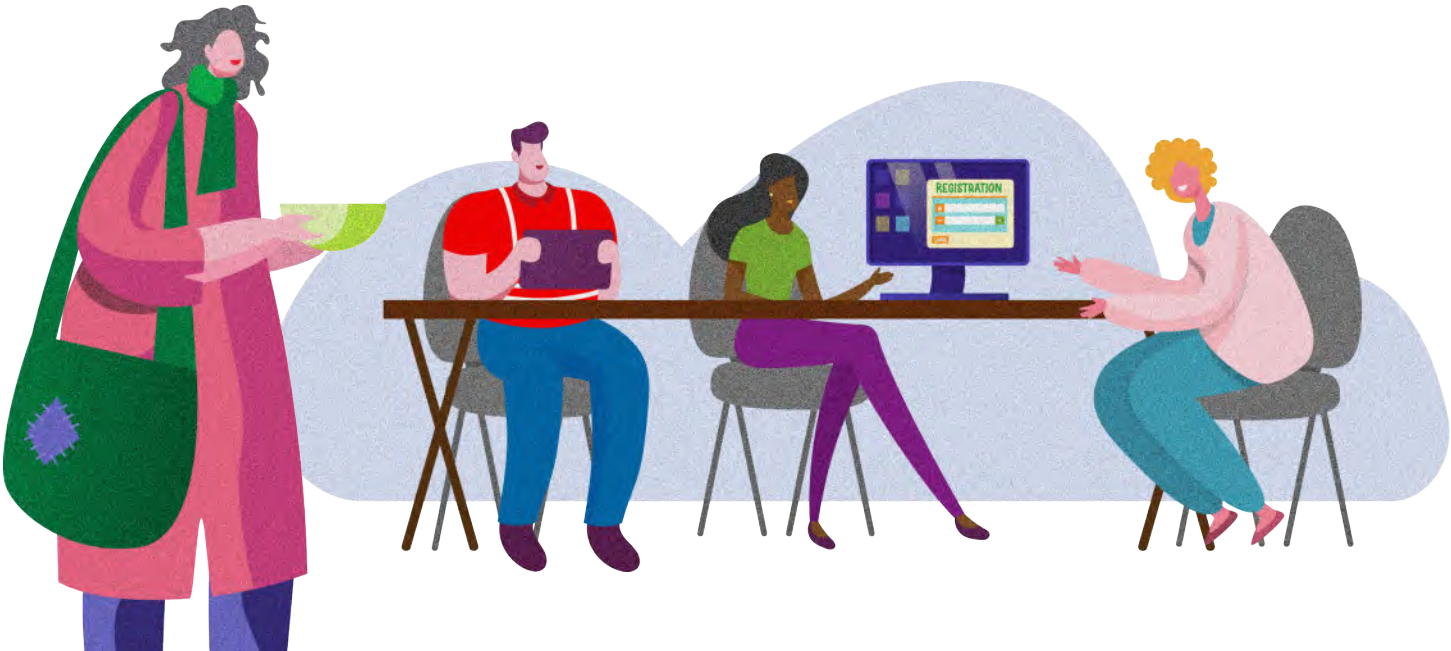
Meeting place close to home:

Meeting place outside of your neighborhood:

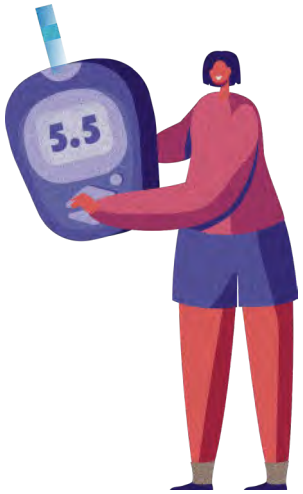
Emergency Shelters

If an emergency requires you to evacuate, consider going to a hotel, a friend or relative's home, or a shelter. Emergency shelters may be set up in schools, community buildings, and places of worship.

- Shelters provide food, water, and basic supplies.
- Bring items you need, including medical equipment.
- Shelters will be accessible and can meet needs of people with different abilities. Service animals are allowed.
- Shelters follow public health safety recommendations, such as social distancing during the COVID-19 pandemic.
- Call **2-1-1** or visit **AlertSD.org** to find a shelter near you.

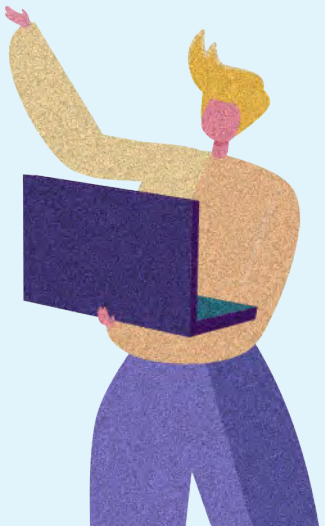


Planning for Your Medical Equipment



- Attach instruction cards on how to use and move each item in case of evacuation.
- Identify critical supplies (such as catheters, colostomy supplies, etc.) that must be taken.
- If you rely on electric medical equipment, ask your medical supply company about a back-up power source, and ask your utility company about programs you may be eligible for.
- If you depend on dialysis or other life-sustaining treatment, know the location of more than one treatment facility.

- To request a free **Vial of LIFE** kit, please call: **1-800-339-4661**
- Fill out the medical information form included on the following pages or for a version with large print and different languages visit **readysandiego.org/make-a-plan/**
- Make copies and store in your wallet or purse. Share a copy with members of your support network.



Vial of LIFE

The **Vial of LIFE** program has saved countless lives by providing emergency responders with life-saving medical information. Store the **Vial of LIFE** envelope on your refrigerator.

Each Vial of LIFE kit includes:

- **A medical information form.** List your medical conditions, medications, emergency contacts, insurance, and hospital preference.
- **A vinyl envelope and magnet.** Place the completed medical form in the envelope and store it on the outside of your refrigerator. Add a copy of your power of attorney for health care and health care directive.
- **A Vial of LIFE sticker.** Place on the door jamb of your front door or a front window. This informs emergency responders that you completed a **Vial of LIFE**.

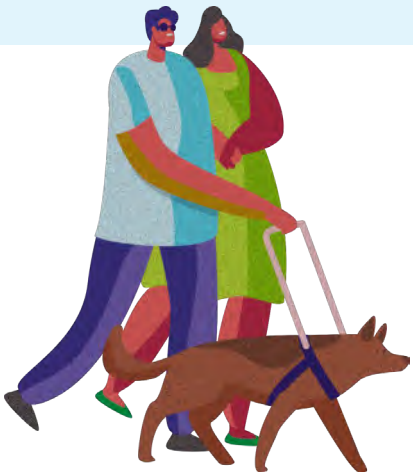
Planning for Different Circumstances

Disasters are challenging for everyone. We benefit from understanding our own needs and the unique needs of our friends, neighbors, and family members. Disaster preparedness is an individual and a community effort. Review the tips below to help prepare for a variety of circumstances.



People with Pets or Service Animals

- Get your pet an ID tag. Ask for a free or discounted microchip.
- Pack food, water, medicine, and proof of immunization.
- Dial **2-1-1** for local animal service resources.

Older Adults

- Clear your home of clutter to prevent falls.
- If you receive home care, ask about their plans for emergencies.
- If you live in a retirement community, learn about their emergency plan.
- Consider getting a medical alert system so you can call for help.

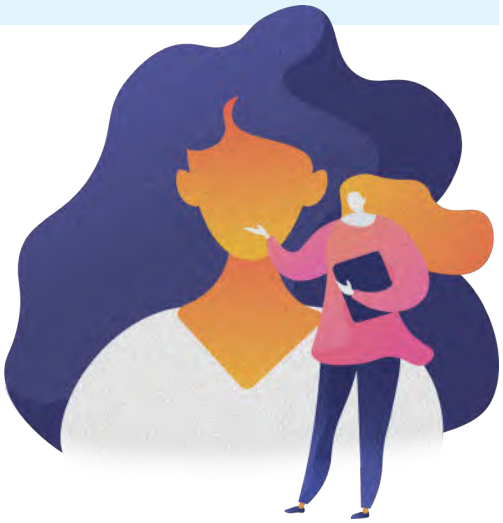
Rural Communities

- Share alerts through phone trees and ham radio networks.
- Meet with neighbors to discuss collaboration.
- Plan for evacuating large animals.

People with Developmental Disabilities

- Practice your disaster plan with your support network to help you feel safe.
- Ask emergency responders to repeat directions if you don't understand.
- Practice how you might quickly describe your disability to a rescuer.

People with Speech/Communication Disabilities



- Carry an instruction card on how to communicate with you.
- Carry communication devices, phrase cards, or picture boards, like on page 43 and 44.
- Know how to replace your assistive device if damaged.

People with Mobility or Other Physical Disabilities

- Identify paratransit or accessible transportation options.
- Plan for damaged ramps, rails, or elevators.
- Bring an extra wheelchair battery, tire repair kit, and seat cushion.

People who are Blind or who have Low Vision

- Mark emergency supplies with Braille or large print.
- Keep a Braille or deaf-blind communication device in your emergency supply kit.
- Keep Braille/text communication cards for two-way communication.

People with Dementia

- Move to a quieter place to avoid agitation. Limit stimulation.
- Redirect the person's attention if he or she becomes upset.
- Find outlets such as taking a walk or engaging in simple tasks.
- Avoid elaborate explanations. Use concrete terms.

Pregnant women and families with infants

- Find out where to get prenatal or well-baby checkups if your doctor's office closes.
- Include baby care supplies in your **Go Kit**.
- Tell shelter staff if you have a baby or have issues with your pregnancy.

Transportation Challenged

- Arrange for rides with neighbors if you must evacuate.
- Call **2-1-1** to identify transportation service providers in your area.
- Ask if public transit or ride share services may be free after a disaster.

People who speak Limited English

- Find trusted community sources to talk to about safety options.
- Call **2-1-1** for information in over 200 languages.
- Ask a bilingual person to share safety steps with you.
- Know which of your media sources provide emergency alerts.

New Californians

- Learn emergency system basics, like dialing **2-1-1** for non-emergencies and **9-1-1** for emergencies.
- Ask your community how disasters here are different.
- Find trusted sources in emergencies beyond the government.

Planning for Different Emergencies

In this section you will find tips on what to do in different disaster situations.

Fires

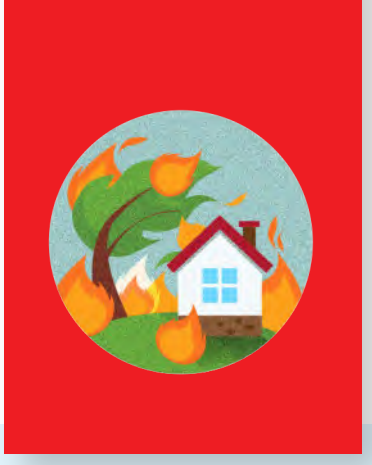
Power Outages

Tsunamis

Floods

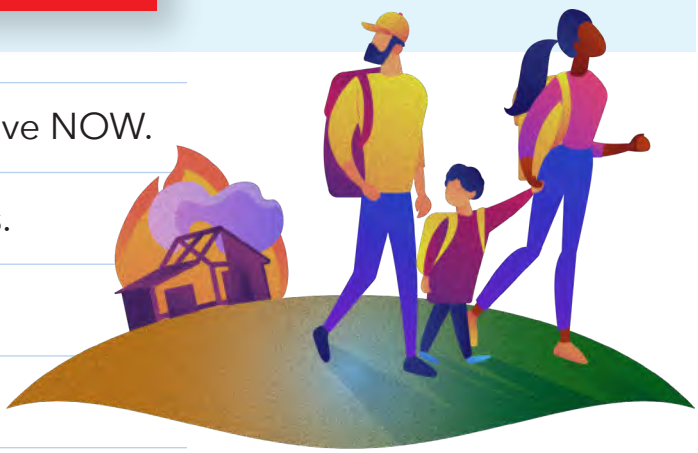
Heat Waves

Earthquakes



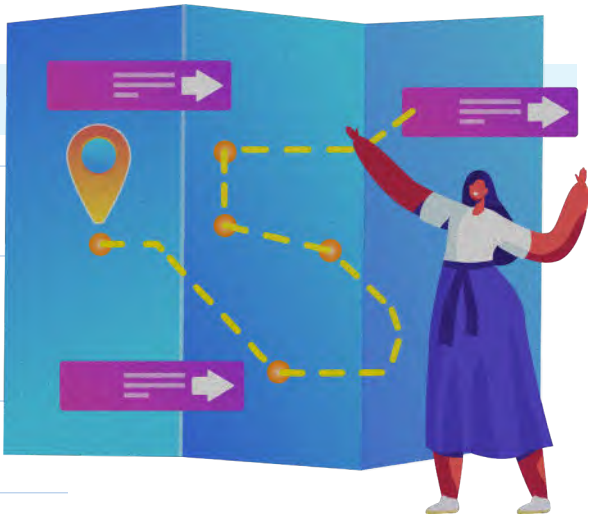
Fires

Before:



- Evacuation warning means prepare to leave NOW.
- Plan for no electricity. Do not use candles.
- Get a bandana or mask to protect lungs.
- Plan escape routes from each room.
- Clean gutters. Remove brush near home. Call **2-1-1** to see if local Fire Safe Councils can assist.

During:



- Evacuation order means you must leave NOW.
- Don't "wait and see." Leave immediately when ordered to evacuate.
- When a door feels hot, do not open it.
- If trapped, close doors and windows to keep smoke out.
- If your clothes are on fire, Stop, Drop and Roll.
- Leave smoky areas quickly. Stay low to the ground as smoke rises.

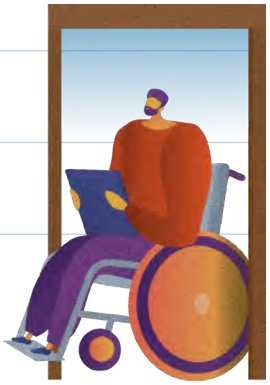
Earthquakes

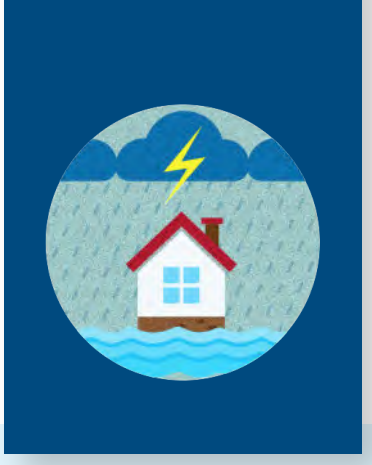
Before:

- Secure furniture to walls.
- Identify safe spots in each room, like sturdy tables and desks.
- Identify dangerous spots near windows, mirrors, and hanging objects.
- Learn how to shut off gas, water, and electricity.

During:

- Don't rush outside. Get under a desk or table.
- If outside, move away from buildings, trees, streetlights, or powerlines.
- If driving, pull over and stop away from buildings and trees.
- Using a wheelchair: Go into a doorway, lock wheels, cover head and neck.
- Be ready for aftershocks.
- Watch for tsunamis on the coast.





Flooding

Before:

- Keep storm pipes and drains clear.
- Move valuables to higher floors.
- Monitor TV and radio for flood watches or warnings.
- Learn best escape routes to higher ground.
- Use sandbags to divert water.

During:

- Don't "wait and see." Leave immediately when ordered to evacuate.
- Never walk, swim, or drive through moving water. Remember, Turn Around, Don't Drown.
- Watch for mudslides.
- Avoid downed powerlines.
- If instructed, turn off water and electricity and unplug appliances.

Power Outages

Before:

- Prepare flashlights – no candles.
- Keep an emergency backup phone charger.
- Buy food that won't spoil and doesn't need cooking.
- Keep car gas tank at least half full.

During:

- Unplug appliances/electronics to prevent damage.
- Leave one light plugged in.
- Keep your refrigerator and freezer door closed.
- Do not use your gas stove for heat.
- Use generators, camp stoves, and grills outdoors.

Be prepared for public safety power shutoff

San Diego Gas & Electric® (SDG&E®) sometimes turns power off in fire-prone areas during adverse weather conditions as a safety precaution. This is known as a **Public Safety Power Shutoff (PSPS).** While these events are more likely to occur in high fire-risk areas, all San Diegans could be affected and should be prepared. **SDG&E** aims to send early notifications via phone calls, text alerts, emails and other means before turning off power.

Stay informed during PSPS

Update Your Contact Information and/or Sign Up for Outage Notifications

Visit **sdge.com/notifications** or call **1-800-411-7343** to update your contact information and/or sign up to receive voice, text and/or email notifications, even if you don't have an **SDG&E** account.

Community Resource Centers

SDG&E may open **Community Resource Centers** near affected communities during a PSPS event. Visitors can receive preparedness materials, ice, water, snacks,

Follow SDG&E on social media and the NewsCenter for updates during a PSPS

Facebook: facebook.com/SanDiegoGasandElectric

Twitter: twitter.com/SDGE

Instagram: instagram.com/sdge

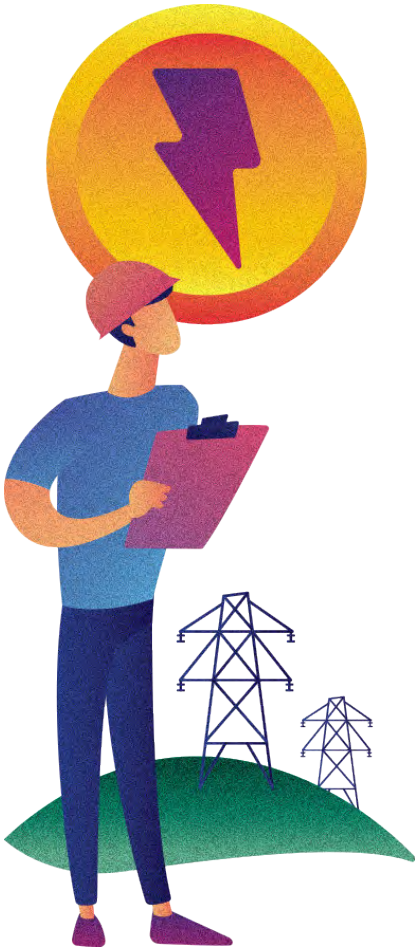
Nextdoor: San Diego Gas & Electric

NewsCenter: sdgenews.com

charging for mobile devices, small solar powered batteries, radios and up-to-date information about the shutoff event. Public health protocols may also be in place including social distancing measures, routine deep cleaning and drive through service. Learn more at **sdge.com/resource-centers**.

Event Duration/Backup Generation

A PSPS event will require power to remain out for as long as a threat to public safety and to the electric system continues. Before power can be restored, crews must inspect power lines and equipment and make any needed repairs.



You are encouraged to explore safe, alternative power sources to operate your critical equipment during PSPS events. For additional information on choosing a generator or an alternative back-up system, please consult a licensed electrician and **SDG&E**. Learn more at **sdge.com/generator**.

Medical Baseline Allowance program

If you or someone in your household has a qualifying medical condition or needs certain in-home medical equipment, you may be eligible for more electricity or natural gas at a lower rate. The person with the qualifying medical condition must live at the address on the application, and the medical equipment must be for home-use only. This program can also help by providing extra notifications in advance of a PSPS event. Learn more at **sdge.com/medicalbaseline**.

CARE and FERA programs

CARE and **FERA** are two **SDG&E** programs that can provide you with a monthly discount on your bill.

- **California Alternate Rates for Energy (CARE)**
  30% or more monthly bill discount.
- **Family Electric Rate Assistance (FERA)**
  18% monthly bill discount. **FERA** is only open to households with three or more people.

Learn more about qualifications, income guidelines, and apply to these programs at **sdge.com/CARE**.

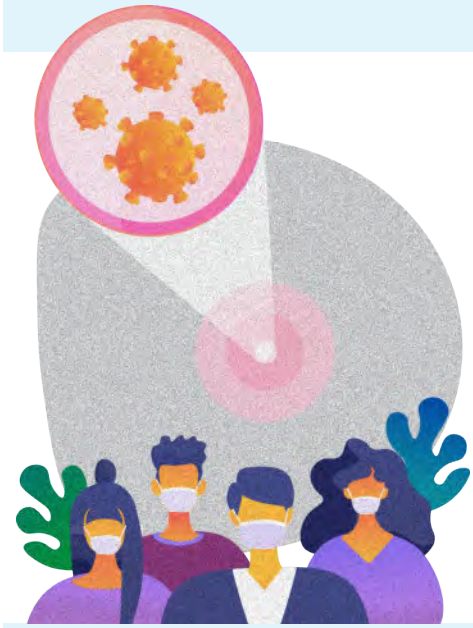
Energy Savings Assistance program

Energy-efficient home improvements can make your home more comfortable, save you money now, and for years to come. You may be eligible to receive low- or no-cost products and installation. Learn more and apply at **sdge.com/ESA**.

Access & Functional Needs (AFN) Resources

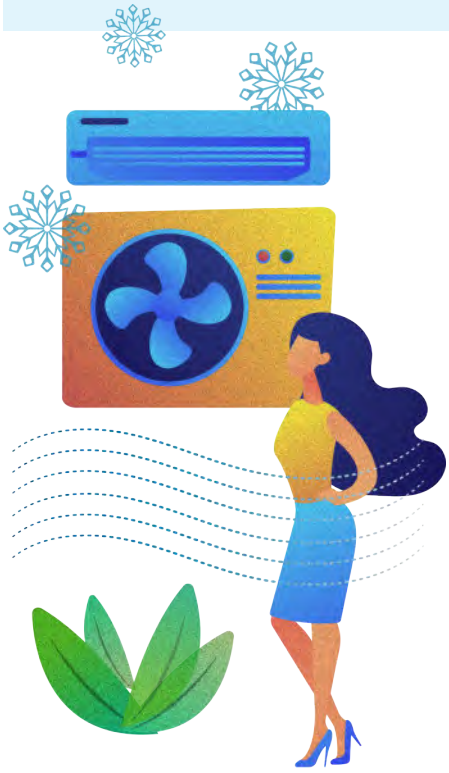
SDG&E and **2-1-1** San Diego partner to support individuals with Access and Functional Needs. Information and services are provided to increase preparedness and self-resilience during PSPS events and emergencies. Services may include assisted transportation, backup power, preparedness items, food security, temporary shelter and welfare checks. Learn more at **211SanDiego.org** or dial **2-1-1**.

Tips for other Emergencies



Pandemics and Public Health Emergencies

- Store a two-week supply of water and food.
- Keep prescription drugs on hand.
- Wash hands frequently.
- Cover coughs or sneezes.
- Stay home if you are sick.



Extreme Heat

- Seek air conditioning or a fan.
- Go to libraries, shopping malls, or call **2-1-1** to find a designated cool zone or visit **coolzones.org**.
- Take a cool bath.
- Drink cool, non-alcoholic, non-caffeinated beverages.
- If you feel ill, call a doctor or **9-1-1** immediately.

Extreme Cold

- Stay indoors.
- Wear warm, comfortable, dry clothing.
- Watch for frostbite, hypothermia, or overexertion.
- Do not use a charcoal or gas grill for heat inside your home.

Tsunami

- Move to higher ground, inland and/or to a higher floor.
- Listen to your radio or TV for emergency instructions.
- Leave immediately if ordered to do so.
- Do not go sightseeing – stay away from the coast.
- Do not return to the hazard zone until local safety officials give the "all clear."

Terrorism

- Report suspicious activities to authorities.
- Do not accept packages from strangers.
- Follow instructions from emergency officials.
- Be ready for instructions to shelter in place or evacuate.
- Remain calm, patient, and contact someone in your personal support network.

For more information on responding to specific emergencies, visit the County's preparedness website: ReadySanDiego.org

Evacuation Warning: The alerting of people in an affected area of potential threat to life and property. An Evacuation Warning considers the probability that an area will be affected in the near future and prepares people for a potential Evacuation Order. Vulnerable populations such as people with disabilities, with access or functional needs, and/or large animals should leave now.

Evacuation Order: Requires immediate movement out of an affected area due to an imminent threat to life.

Shelter in Place: Go inside. Shut and lock doors and windows. Prepare to self-sustain until further notice and/or contacted by emergency officials.

Gather Supplies
MEDICATION LIST
ID CARD
PASSPORT

Go Kit

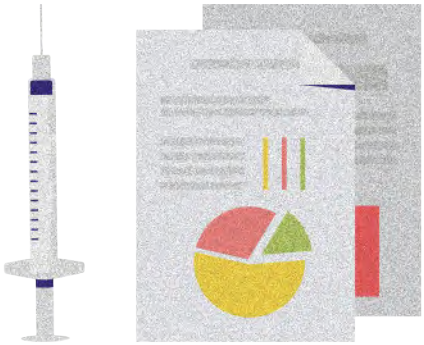
Most disasters are unexpected and happen fast. You might not have time to shop or pack. Pack a "Go Kit" for when you must leave in a hurry.

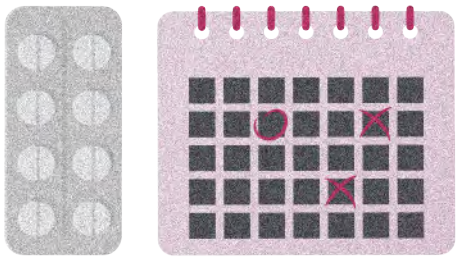
Check off items you have and add those you will need:

- ☐ Bottled water and nonperishable food, such as granola bars
- ☐ Copies and/or a USB flash drive of your important documents in a waterproof container (identification, insurance, photos of family and pets for identification)
- ☐ List of the medications you take, why you take them, and their dosages
- ☐ If any medication needs to be refrigerated, keep an extra ice pack in the freezer
- ☐ Contact information for your household and members of your support network
- ☐ Flashlight, hand-crank or battery-operated AM/FM radio, and extra batteries
- ☐ Cash, in small bills
- ☐ Notepad and pen
- ☐ Antibacterial wipes and hand sanitizer

- ☐ Face mask or bandana
- ☐ Back-up medical equipment (e.g., glasses, batteries) and chargers
- ☐ Aerosol tire repair kits and/or tire inflator to repair flat wheelchair or scooter tires
- ☐ Supplies for your service animal or pet (food, extra water, bowl, leash, cleaning items, vaccination records, and medications)
- ☐ Portable cell phone chargers
- ☐ This guide

Other items you will need:





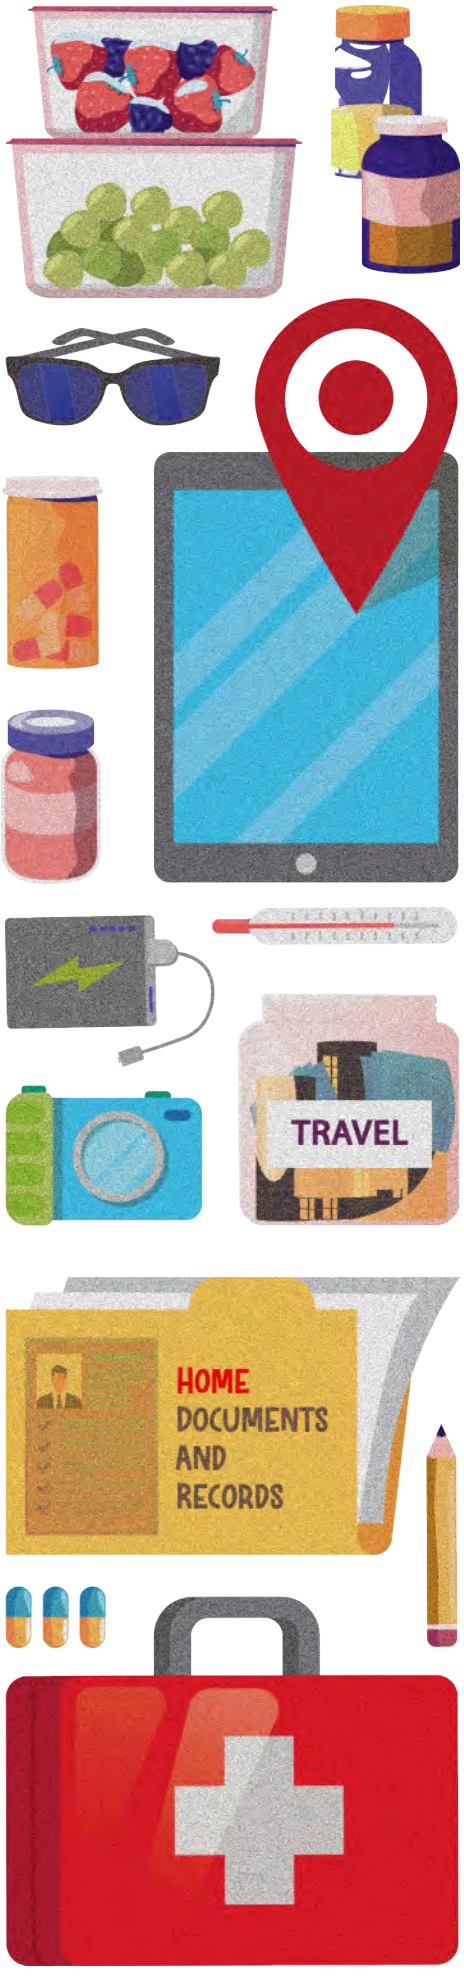
Home Kit

In some emergencies, you may be safer staying at home. You may not have water to drink or be able to flush the toilet. You may not have electricity to keep your food cold, turn on the light, or charge your phone. Prepare a "Home Kit" to survive for at least three days without water or electricity.

Check off items you have and add those you will need:

- ☐ One gallon of drinking water, per person, per day
- ☐ Food that won't spoil, like ready-to-eat canned foods, and a manual can opener
- ☐ First-aid kit
- ☐ Medications, including a list of the medications you take, why you take them, and their dosages
- ☐ Flashlight or battery-powered lantern, battery-operated AM/FM radio, and extra batteries, or wind-up radios that do not require batteries
- ☐ Whistle or bell
- ☐ Back-up medical equipment, if possible (e.g., oxygen, medication, scooter battery, hearing aids, mobility aids, glasses, facemasks, gloves)
- ☐ Style and serial numbers of medical devices (such as pacemakers) and usage instructions

Other personal items:



TIP: Your hot water heater is a source of water. Turn off the power and let the water cool. To get water, place a container underneath and open the drain valve on the bottom of the tank.

Communication Tools

I need a translator

Necesito un traductor

Tôi cần một người phiên dịch

انا بحاجة الى الترجمة

Kailangan ko ng tagasalin

我需要翻

During an emergency, your normal way of communicating may be impacted by changes in environment, noise, service disruptions, or confusion.

If you are blind or have low vision, practice explaining to others how to guide you.

If you are Deaf or hard of hearing, find alternate ways to communicate your needs, such as through gestures, note cards, or text messages. Keep communication cards in your emergency supply kits.

Getting Support

Disasters can be stressful and overwhelming. You may feel irritable, sad, or angry. You may experience headaches or not be able to sleep.

Talk to someone about your feelings, even though it might be difficult.

Look to your support network or seek help from a professional.

San Diego Access and Crisis Line

If you need support, experienced counselors are available 7 days a week/24 hours a day to provide you with a referral to meet your needs and help determine eligibility for mental health or substance use services.

- Call **(888) 724-7240** or visit our web site: **www.sandiegocounty.gov/hhsa/programs/bhs**

National Alliance on Mental Health (NAMI) San Diego

You can connect with a trained crisis counselor to receive free crisis support 24 hours a day.

- Text **NAMI** to **741-741** or call **(888) 523-5933**

National Suicide Prevention Lifeline and Veterans Crisis Line

We can all help prevent suicide. The Lifeline provides 24/7, free and confidential support for people in distress, prevention and crisis resources for you or your loved ones, and best practices for professionals.

- Call **(800) 273-8255** or call **9-8-8**

WILDFIRE IS COMING.
ARE YOU READY?

WILDFIRE ACTION PLAN

BE PREPARED

Wildfires are a fact of life in California. It's not a question of if they will occur, but when. Catastrophic wildfires are increasing in our state, encroaching further into populated areas. It is extremely important that Californians be prepared when wildfire strikes.

By preparing your home and property for wildfire, and knowing what to do if evacuation is necessary, you can dramatically increase your safety and the survivability of your home. It is your responsibility to prepare yourself, your family, and your home for when wildfire strikes.

This guide illustrates the importance of creating and maintaining Defensible Space and hardening your home by retrofitting it with ignition-resistant or noncombustible materials to protect against the threat of flying embers, direct flame contact, and radiant heat exposure. It also provides information about the preparations and precautions to make in order to evacuate early and safely.

If you need more information about preparing for wildfire or any other disaster, contact your nearest fire station or visit us at ReadyforWildfire.org.

These counties receive funding from the state to provide fire protection and prevention services to State Responsibility Area lands within their boundaries.

REA

There are three ways your home can be exposed to wildfire: through flying embers, direct flame contact, and radiant heat exposure.

Embers are the main cause of homes igniting during a wildfire. Wind can blow embers up to a mile ahead of a wildfire. These flying embers can directly ignite materials on, or attached to, a home. They can also ignite vegetation or combustible materials near the home, resulting in a subsequent fire that spreads to the home through direct flame contact or radiant heat.

Direct flame contact to the home can be the result of nearby vegetation or combustible materials catching on fire due to embers, or from the wildfire burning unchecked directly to the building.

Radiant heat exposure occurs when there are materials, vegetation, or other combustibles, that are burning close to the home—for a long enough period of time—and generate enough heat to directly ignite a combustible component of the home.

Getting ready for wildfire begins with two very important efforts: **Home Hardening** and **Defensible Space.** Hardening your home is retrofitting it with fire-resistant materials. Defensible Space is creating and maintaining a buffer between buildings and vegetation to slow wildfire. While not a guarantee that your home will survive a wildfire, these efforts give it the best chance.

HARDENING YOUR HOME

Now is the time to retrofit your home—before a wildfire strikes. California Building Code Chapter 7A requires specific construction materials and methods for the building of new homes in wildfire-prone areas. These same materials and methods are also the minimum standards recommended when retrofitting a home. Retrofitting prepares your home for the exposure it will experience during a wildfire. Here's what you can do to harden your home:

ROOF

Your roof is the most vulnerable part of your home. Homes with wood shake or shingle roofs are at high risk of being destroyed in a wildfire.

- Replace wood shake or shingle roofs with a Class A fire-rated roof, using materials such as composition, metal, or tile.
- Inspect your roof and maintain it by removing debris and plugging gaps.

VENTS

Vents on homes create openings for flying embers.

- Avoid storing combustible items near attic or crawl space vents.
- Inspect vents to ensure they are in good condition with no tears or large openings.
- Cover all vent openings with 1/16 inch to 1/8 inch corrosion-resistant metal mesh screen.
- Consider replacing screened vents with ember and flame-resistant vents.

EAVES AND SOFFITS

Eaves and soffits are a point of entry for flying embers from fires up to a mile away or flames from nearby vegetation or other material burning.

- Plug or caulk gaps greater than 1/8 inch in size with durable caulk.
- Enclose eaves with ignition-resistant or noncombustible materials if possible.

WINDOWS

Heat from a wildfire can cause windows to break before the home ignites, allowing embers to enter and start fires inside. Single-paned and large windows are particularly at risk.

- Install dual or multi-paned windows with at least one pane being tempered glass.
- Consider limiting the size and number of windows that face large areas of vegetation.
- Install metal mesh screens on openable windows to increase ember resistance and reduce radiant heat exposure.

DECKS

Surfaces within 10 feet of the building should be built with ignition-resistant, noncombustible, or other approved materials.

- Remove all combustible items from underneath deck.
- Limit combustible items on top of deck. Bring these items inside the home or move them away from the home when wildfire threatens.

EXTERIOR WALLS

Wood products such as boards, panels, or shingles are common siding materials. However, they are combustible and not good choices for wildfire prone areas.

- Use noncombustible materials such as stucco, metal, or fiber cement, or use ignition-resistant siding.
- Be sure to extend materials from the foundation to the roof.
- Plug or caulk gaps and joints with openings greater than 1/8 inch.

RAIN GUTTERS

Screen or enclose rain gutters with noncombustible corrosion-resistant materials to prevent accumulation of plant debris.

PATIO COVERS

Consider using noncombustible material within eight feet of buildings.

CHIMNEYS

Cover chimney or stovepipe outlet with a noncombustible corrosion-resistant metal mesh screen with openings between 3/8 inch and 1/2 inch in size. Close the fireplace flue during fire season when the fireplace is not in use.

FENCES

Construct fences using noncombustible materials within eight feet of your home.

GARAGES

Install weather stripping to eliminate gaps around garage doors. Add a battery back-up to automatic garage door openers so the garage can easily be opened if the power is out.

DRIVEWAYS

Ensure that access to your home complies with local fire codes.

WATER SUPPLY

Have multiple garden hoses long enough to reach all areas of your house.

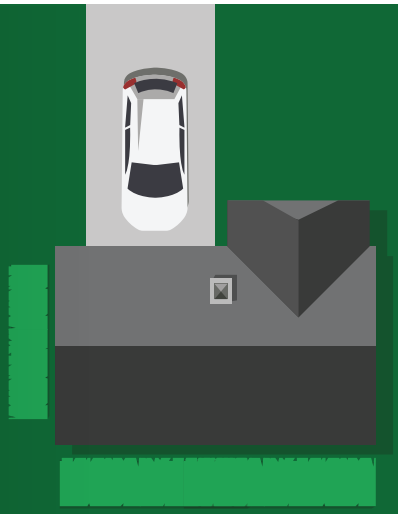
BUILDING MATERIALS LISTING

osfm.fire.ca.gov

DEFENSIBLE SPACE



Creating and maintaining Defensible Space is essential to reducing the impact of wildfire on your home and property. Defensible Space is the buffer created between a building on your property and the plants, brush, trees, or other combustible items in the near vicinity. This buffer helps to keep wildfire away from your home by reducing the fire's intensity and slowing or halting the spread of wildfire. The less there is to burn near your home, the less exposure your home will have to wildfire. Creating this space also provides protection for the firefighters defending your home.

CREATING AND MAINTAINING YOUR DEFENSIBLE SPACE

Within the 100-foot perimeter of a home, there is a need for more intense reduction of wildfire fuels. Start at the home and work your way out 100 feet or to your property line, whichever is closer.

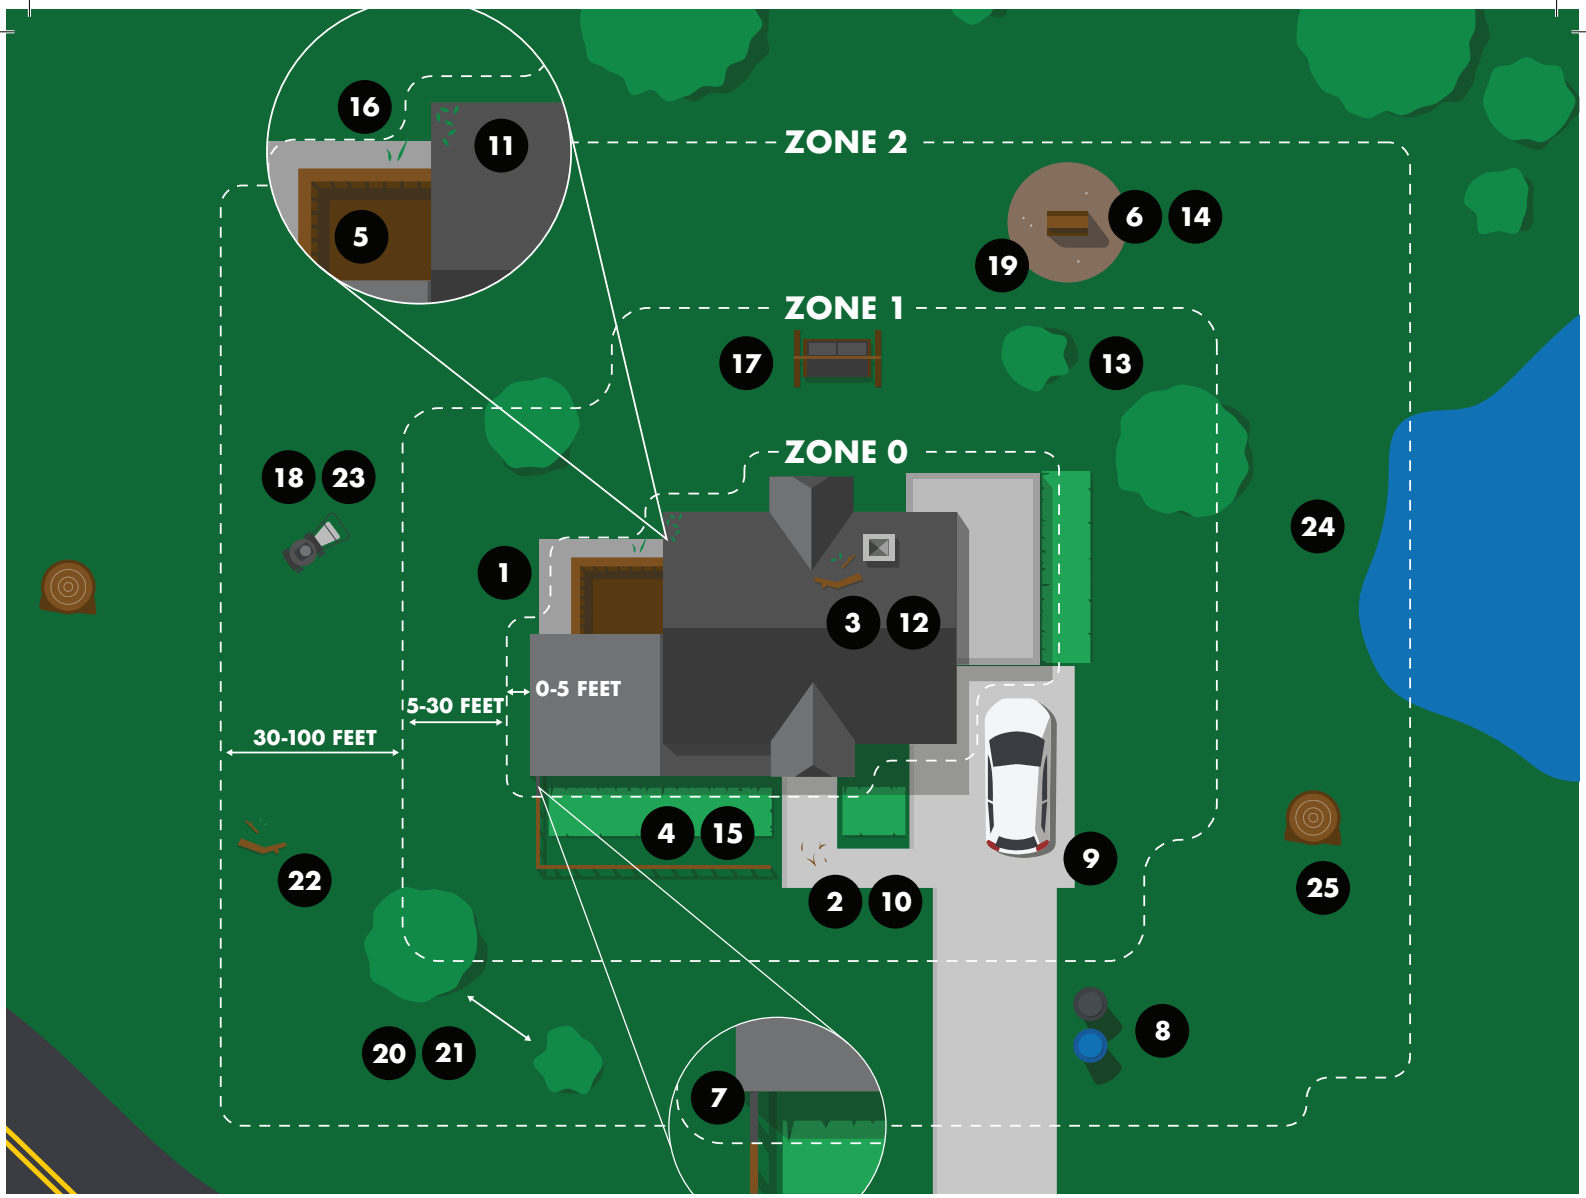
KNOW THE LAW - BE FIRE SMART

One hundred feet of Defensible Space is required under the Public Resources Code (PRC) 4291. Zones 1 and 2 currently make up the 100 feet of Defensible Space required by law. Assembly Bill 3074, passed into law in 2020, requires an ignition-resistant Zone 0 for Defensible Space.

Many local government agencies have ordinances for Defensible Space. These local ordinances will often be more stringent than the state of California's minimum requirement in PRC 4291. Check with your local fire department or fire protection district for any additional Defensible Space requirements. **fire.ca.gov/dspace**

Zone 0 extends from zero to five feet from buildings, structures, decks, etc.

1. Use hardscape like gravel, pavers, concrete, and other noncombustible mulch materials. No combustible bark or mulch.
2. Remove all dead and dying weeds, grass, branches, and vegetative debris. Check your roofs, gutters, decks, porches, stairways, etc.
3. Remove all branches within 10 feet of any chimney or stovepipe outlet.
4. Limit plants in this area to low growing, nonwoody, properly watered, and maintained plants.
5. Limit combustible items (outdoor furniture, planters, etc.) on top of decks.
6. Relocate firewood and lumber to Zone 2.
7. Replace within Zone 0 combustible fencing, gates, and arbors attached to the home with noncombustible alternatives.



8. Relocate garbage and recycling containers outside this zone.
9. Relocate boats, RVs, vehicles, and other combustible items outside this zone.

Zone 1 extends five to 30 feet from buildings, decks, and other structures.

10. Remove all dead plants, grass, and weeds (vegetation).
11. Remove dead or dry leaves and pine needles from your yard, roof, and rain gutters.
12. Remove branches that hang over your roof and keep dead branches 10 feet away from your chimney or stovepipe outlet.
13. Trim trees regularly to keep branches a minimum of 10 feet from other trees.
14. Relocate exposed wood piles outside of Zone 1.
15. Remove or prune flammable plants and shrubs near windows.
16. Remove vegetation and items that could catch fire from around and under decks.
17. Create a separation between trees, shrubs, and items that could catch fire, such as patio furniture, wood piles, swing sets, etc.

Zone 2 extends from 30 feet to 100 feet from buildings, structures, decks, etc.

18. Cut or mow annual grasses to a maximum height of four inches.
19. All exposed wood piles must have a minimum of 10 feet clearance around them, down to bare mineral soil, in all directions.
20. Create horizontal space between shrubs and trees. (See diagram on page 11)
21. Create vertical space between grass, shrubs, and trees. (See diagram on page 11)
22. Remove fallen leaves, needles, twigs, bark, cones, and small branches. However, they may be permitted to a depth of three inches.

All zones

23. Mow before 10 a.m., but never when it's windy or excessively dry.
24. Protect water quality. Do not clear vegetation near waterways to bare soil. Vegetation removal can cause soil erosion—especially on steep slopes.
25. Logs or stumps embedded in the soil must be removed in Zone 0. In Zones1and 2 they need to be removed or isolated from other vegetation.

It takes the combination of both Defensible Space and Home Hardening to give your home and property the best chance of surviving a wildfire. Below are examples of low-risk and high-risk scenarios:

HIGH RISK

UNENCLOSED EAVES

UNSCREENED VENTS

DEFENSIBLE SPACE NONCOMPLIANT

LOW RISK

ENCLOSED EAVES

SCREENED VENTS

DEFENSIBLE SPACE COMPLIANT

FIRE SMART LANDSCAPING

While some plants are characterized as "fire-safe" or "fire-resistant," all plants will burn under the right conditions, regardless of how they are classified. The environment the plant grows in, how it is maintained, and its placement and spacing near other vegetation and combustibles will generally have more influence on the flammability of the plant than how it is characterized. Taking these items into consideration is crucial to reduce the spread of wildfire to your home. Scan the QR code below for more information.

FIRE SMART LANDSCAPING
ReadyforWildfire.org/fire-smart-landscaping

MINIMUM VERTICAL SPACING BETWEEN TREES AND SHRUBS

Eliminate opportunities for a vertical "fire ladder":

- Remove branches beneath large trees for a six-foot minimum clearance.
- Create proper vertical spacing between shrubs and the lowest branches of trees. See adjacent diagrams.

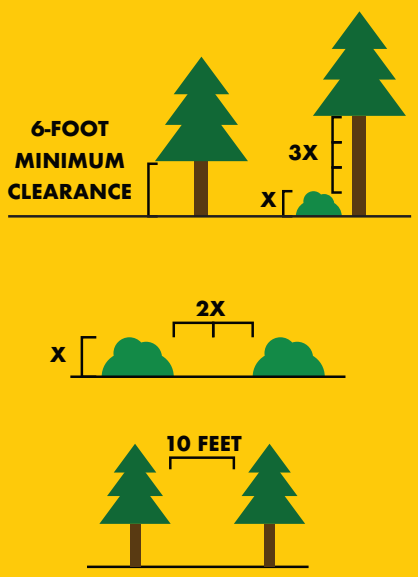
MINIMUM HORIZONTAL SPACING BETWEEN TREES AND SHRUBS

Horizontal spacing depends on the slope of the land and the height of the shrubs or trees. See adjacent diagrams.

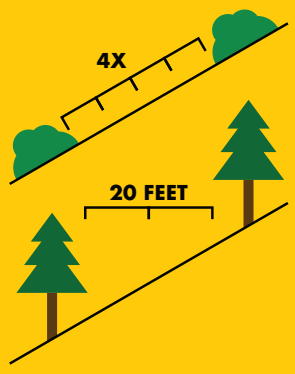
DEAD TREE REMOVAL

If you have dead or dying trees on your property, the entire tree needs to be removed to reduce wildfire risk. Scan the QR code below to learn about permit requirements.

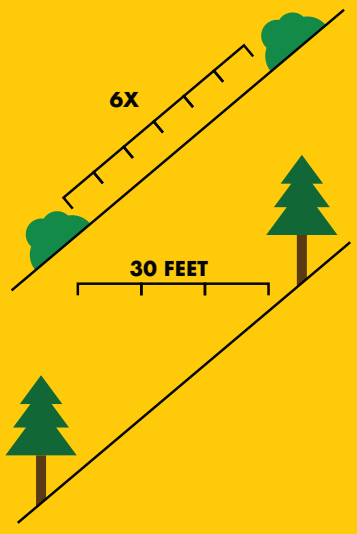
PERMIT REQUIREMENTS
ReadyforWildfire.org/dead-tree-removal



Flat to mild slope (<20%)



Mild to moderate slope (20%–40%)



Moderate to steep slope (>40%)

GET
SET

It is important that you are prepared **before** wildfire strikes. In an emergency it is easy to become confused or panicked.

Getting Set requires three main preparation actions:

- Creating a Wildfire Action Plan
- Creating an Emergency Supply Kit
- Creating a Family Communication Plan

Preparing these items in advance will help keep you focused and able to act quickly when evacuation is anticipated or needed.

Use this guide to complete these actions to prepare in advance of wildfire.

READY FOR WILDFIRE INCIDENT APP

Scan the QR code below to access accurate updates about active wildfires near you with our web-based Ready for Wildfire Incident App.

ACTION PLAN CHECKLIST

CREATE A WILDFIRE ACTION PLAN

Your Wildfire Action Plan must be prepared and familiar to all members of your household well in advance of a wildfire. Use the checklist below to help create your plan. Each family's plan will be different, depending on a variety of issues, needs, and situations.

Create an evacuation plan that includes:

- ○ A designated emergency meeting location outside the fire or hazard area. This is critical to determine who has safely evacuated from the affected area.
- ○ Identification of several different escape routes from your home and community. Practice these routes often so everyone in your family is familiar with them in case of emergency. Go to page 18 to write down your evacuation routes.
- ○ An evacuation plan for pets and large animals such as horses and other livestock.
- ○ A Family Communication Plan that designates an out-of-area friend or relative as a point of contact to act as a single source of communication among family members in case of separation. It is easier to call or message one person and let them contact others than to try and call everyone when phone, cell, and internet systems can be overloaded or limited during a disaster and under a stressful situation. See page 18 for a Family Communication Plan form.

Be prepared:

- ○ Have fire extinguishers on hand and make sure everyone in the family knows how to use them. Many fire extinguishers have expiration dates, so make sure to check yours.
- ○ Ensure you and your family know where the home's gas, electric, and water main shut-off controls are located and how to safely shut them down in an emergency.
- ○ Assemble an Emergency Supply Kit for each person, as recommended by the American Red Cross. See Emergency Supply Kit on page 16 for details.
- ○ Maintain a list of emergency contact numbers in your cell phone, posted near your home phone, and in your Emergency Supply Kit.
- ○ Keep an extra Emergency Supply Kit in your car in case you cannot get to your home because of fire or other emergency.
- ○ Have a portable radio or scanner, or follow the Ready for Wildfire App so you can stay updated on wildfires. Follow local law enforcement notifications for any evacuation information. Visit incidents.ReadyforWildfire.org or scan QR code on page 13 to view the incident app.
- ○ Tell your neighbors about Ready, Set, Go! and your Wildfire Action Plan.

THE SIX Ps

Remember the "Six Ps" and keep them ready in case immediate evacuation is required:

- ○ People and pets
- ○ Papers, phone numbers, and important documents
- ○ Prescriptions, vitamins, and eyeglasses
- ○ Pictures and irreplaceable memorabilia
- ○ Personal computer, hard drive, and disks
- ○ "Plastic" (credit cards, ATM cards) and cash

EMERGENCY SUPPLY KIT

Put together your Emergency Supply Kit—also called a "go bag"—before a wildfire or other disaster occurs and keep it easily accessible so you can take it with you when you evacuate. Backpacks work great for storing these items (except food and water) and are quick to grab. Storing food and water in a tub or chest on wheels will make it easier to transport. Keep it light enough to be able to lift it into your car.

Emergency Supply Kit Contents:

- ○ Face masks or coverings
- ○ Three-day supply of non-perishable food and three gallons of water per person
- ○ Map marked with at least two evacuation routes
- ○ Prescriptions or special medications
- ○ Change of clothing, including a cotton long-sleeved shirt and pants
- ○ Extra eyeglasses or contact lenses
- ○ An extra set of car keys, phone charger, credit cards, cash, or traveler's checks
- ○ First aid kit
- ○ Flashlight
- ○ Battery-powered radio and extra batteries
- ○ Sanitation supplies
- ○ Copies of important documents (birth certificates, passports, insurance, etc.)
- ○ Food, water, and medications for pets
- ○ Can opener

Items to take if time allows:

- ○ Easily carried valuables
- ○ Family photos and other irreplaceable items
- ○ Personal computer information on hard drives and disks
- ○ Extra cell phone chargers, laptops, etc.

Always keep a sturdy pair of shoes and a flashlight near your bed handy in case of a sudden evacuation at night.

OUR FAMILY'S ADDITIONAL SUPPLY KIT MUST HAVES ARE:

BE PREPARED FOR POWER OUTAGES

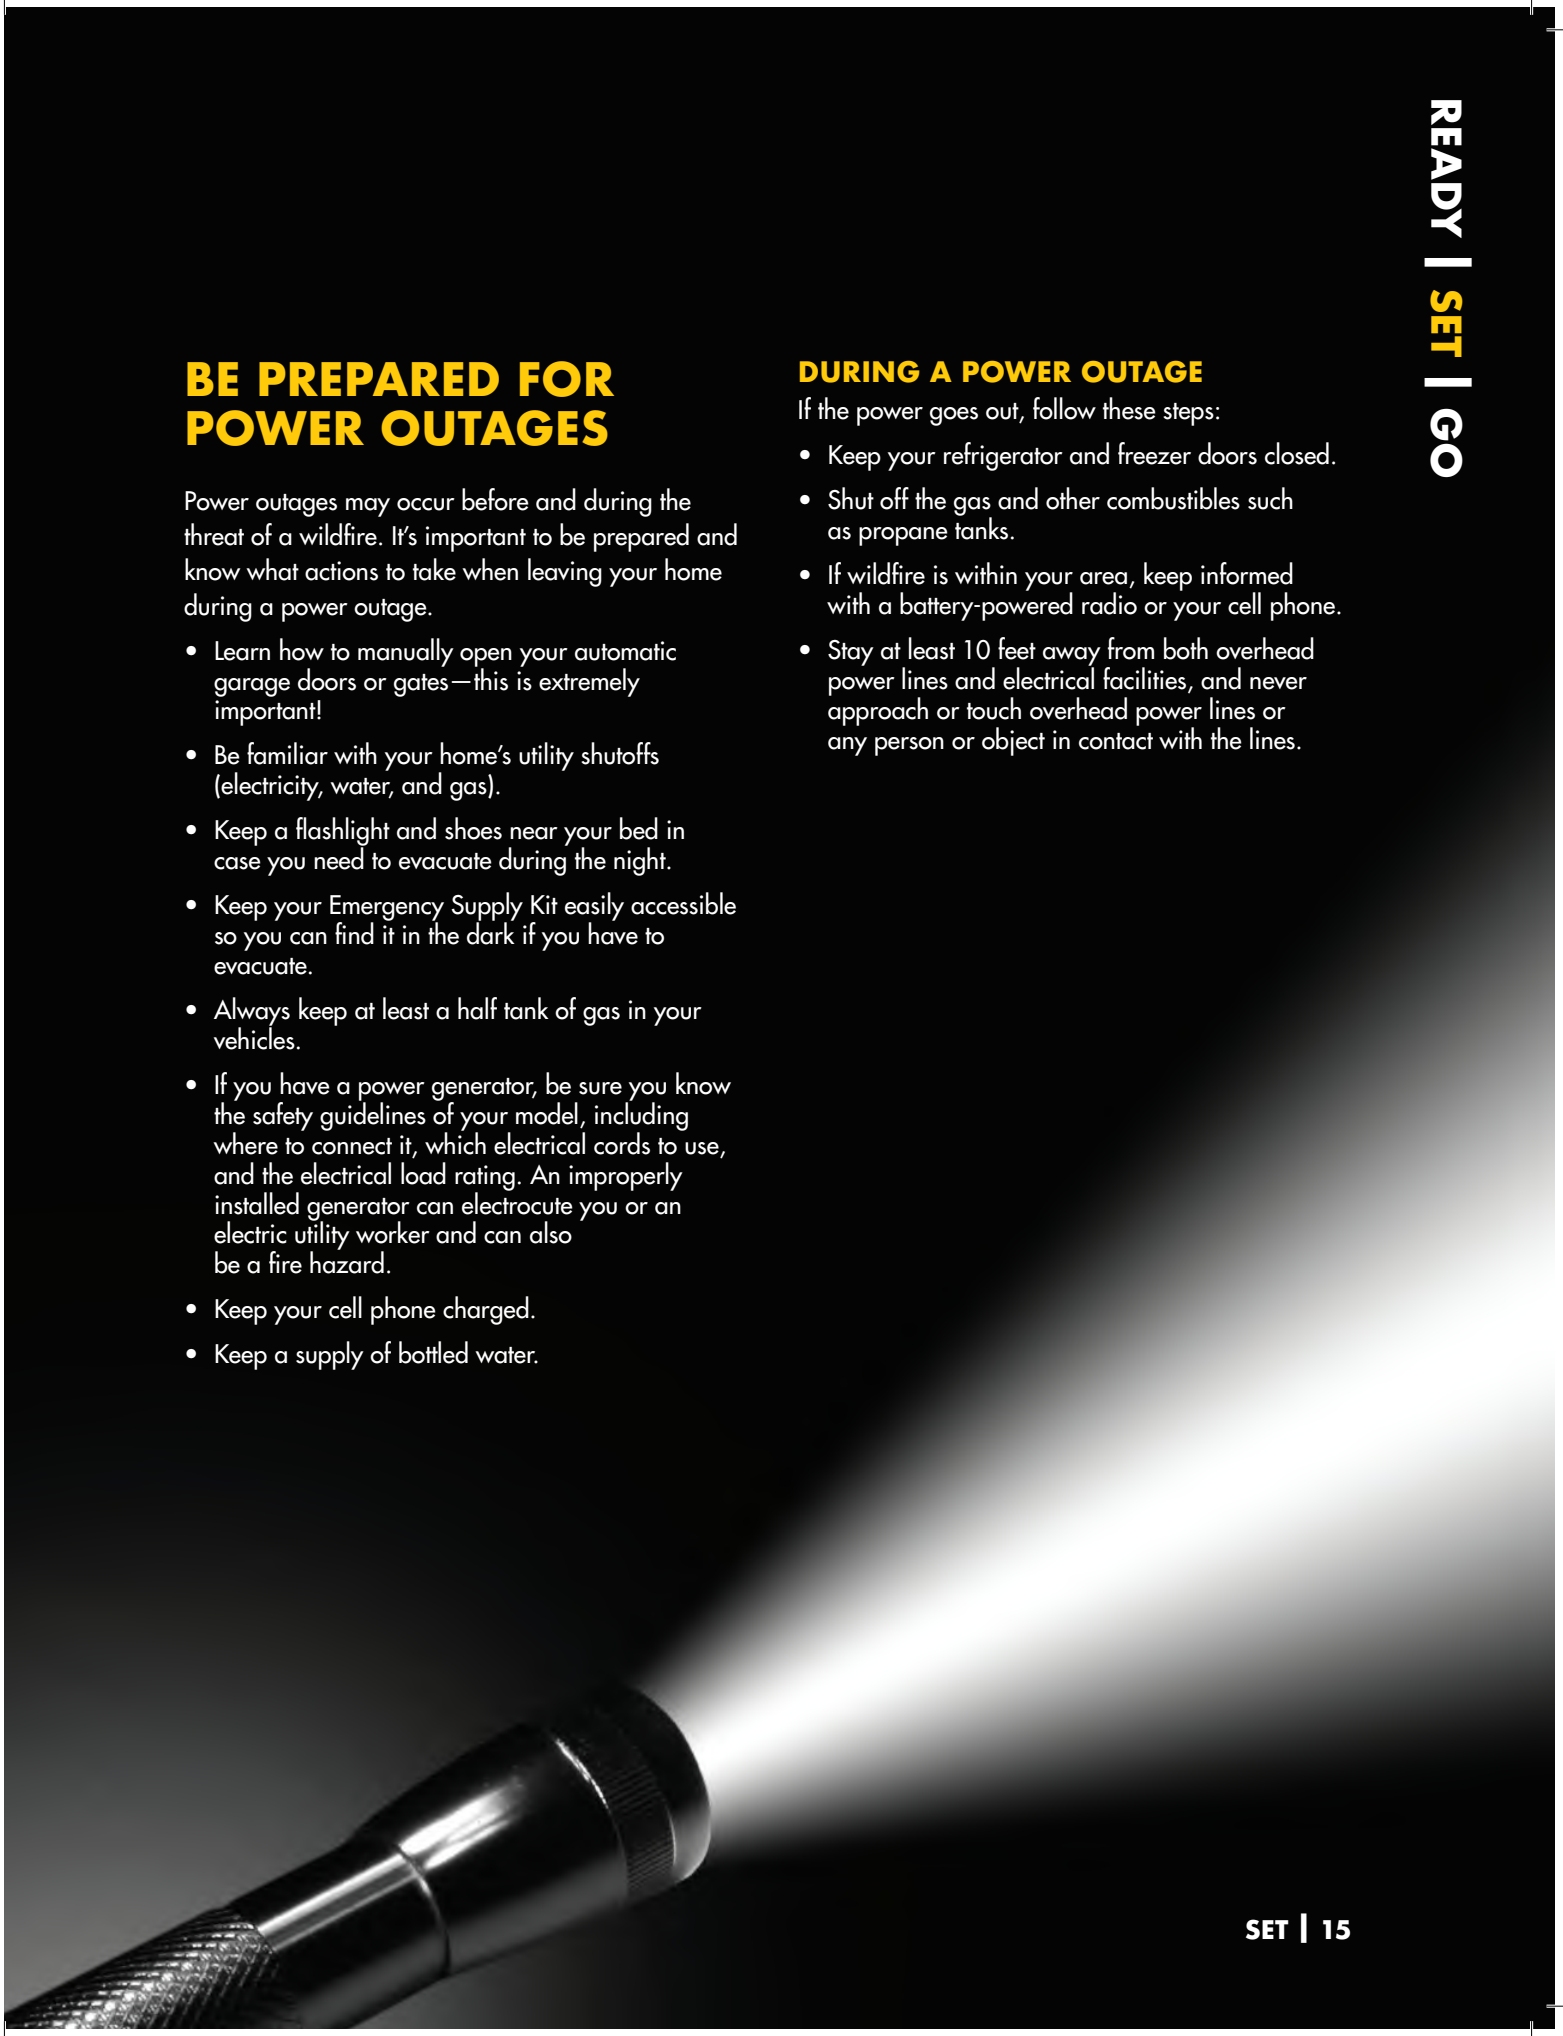
Power outages may occur before and during the threat of a wildfire. It's important to be prepared and know what actions to take when leaving your home during a power outage.

- Learn how to manually open your automatic garage doors or gates—this is extremely important!
- Be familiar with your home's utility shutoffs (electricity, water, and gas).
- Keep a flashlight and shoes near your bed in case you need to evacuate during the night.
- Keep your Emergency Supply Kit easily accessible so you can find it in the dark if you have to evacuate.
- Always keep at least a half tank of gas in your vehicles.
- If you have a power generator, be sure you know the safety guidelines of your model, including where to connect it, which electrical cords to use, and the electrical load rating. An improperly installed generator can electrocute you or an electric utility worker and can also be a fire hazard.
- Keep your cell phone charged.
- Keep a supply of bottled water.

DURING A POWER OUTAGE

If the power goes out, follow these steps:

- Keep your refrigerator and freezer doors closed.
- Shut off the gas and other combustibles such as propane tanks.
- If wildfire is within your area, keep informed with a battery-powered radio or your cell phone.
- Stay at least 10 feet away from both overhead power lines and electrical facilities, and never approach or touch overhead power lines or any person or object in contact with the lines.



SAVE THIS FAMILY COMMUNICATION PLAN

Fill out this form and place it in a location where it can easily be found by everyone in your household. Copy the form and keep it in your Emergency Supply Kit. This will allow all family members to have access to this key information in case you get separated.

WHEN WE HAVE TO EVACUATE, WE WILL MEET AT:

INSURANCE PREPAREDNESS

A home is generally your largest asset. Protect it.

Insurance is the critical back-up plan enabling you to rebuild your home after a wildfire. Follow these tips as part of your Ready, Set, Go! Wildfire Action Plan:

Conduct an annual insurance checkup

- Call your agent or insurance company annually to discuss your policy limits and coverage. Make sure your policy reflects the correct square footage and features in your home. Consider purchasing building code upgrade coverage.

Know what your policy covers

- Know if you have a replacement-cost policy that pays to replace all of your items at current market price, or if you have an actual cash value policy that takes depreciation into account and pays less for aged items.

Update your policy to cover home improvements

- If you make home improvements, be sure to call your agent or company to update your coverage. Make sure your insurer knows about the changes, so that new countertops, floors, rooms, etc., are covered if you must rebuild.

Maintain insurance

- If your home is paid off, be sure to maintain homeowner insurance. Without insurance, costs to repair or replace a home or structure is the responsibility of a homeowner.

Get renters insurance

- Renters can lose everything in a fire and be left to start over. Many insurers bundle renters insurance coverage with an auto insurance policy at affordable prices.

Make a home inventory

- Document the contents of your home before a wildfire occurs. Use your cell phone to video your belongings or a camera to take photos. Store the inventory list and photos at a location away from the property and/or in a cloud internet server. Include the cost of items and note important or expensive items. If possible, keep receipts for major purchases.
- Don't forget to include items inside the home, inside the garage, and outside of the home.

GO

Give your household the best chance of surviving a wildfire by being ready to go and evacuating early.

Being ready to go means following pre-evacuation steps, knowing when to evacuate, preparing possible evacuation routes, and knowing what to do if you become trapped.

Be safe and don't wait until it's too late! Use these checklists to help prepare you and your family to be ready to evacuate if wildfire strikes.

It is also important to learn what to expect after a wildfire and what you should do before returning home. The danger is not over after the flames are put out.

KNOW THE LAW—BE READY TO EVACUATE

California law authorizes officers to restrict access to any area where a menace to public health or safety exists due to a calamity such as flood, storm, fire, earthquake, explosion, accident, or other disaster. Refusal to comply is a misdemeanor. (Penal Code 409.5)

PRE-EVACUATION STEPS

When evacuation is anticipated, follow these checklists (if time allows):

Outside

- ○ Gather flammable items from the exterior of the house and bring them inside (patio furniture, children's toys, door mats, trash cans, etc.) or place them in your pool.
- ○ Turn off propane tanks.
- ○ Move propane BBQ appliances away from structures.
- ○ Connect garden hoses to outside water valves or spigots for use by firefighters. Fill water buckets and place them around the house.
- ○ Turn off sprinklers and running water; leaving them on can affect critical water pressure.
- ○ Leave exterior lights on so your home is visible to firefighters in the smoke or darkness of night.
- ○ Put your Emergency Supply Kit in your vehicle.
- ○ Back your car into the driveway with vehicle loaded and all doors and windows closed. Carry your car keys with you.
- ○ Have a ladder available and place it at the corner of the house for firefighters to quickly access your roof.
- ○ Seal attic and ground vents with pre-cut fire-resistant boards or commercial seals.
- ○ Monitor your property and the fire situation. Don't wait for an evacuation order if you feel threatened and need to leave.
- ○ Check on neighbors and make sure they are preparing to leave.

Inside the House

- ○ Shut all windows and doors, leaving them unlocked.
- ○ Remove flammable window shades and curtains. Close metal shutters.
- ○ Move flammable furniture to the center of the room, away from windows and doors.
- ○ Shut off gas at the meter or tank. Turn off pilot lights.
- ○ Leave your lights on so firefighters can see your house under smoky conditions.
- ○ Shut off the air conditioning or heater.

Animals

- ○ Locate your pets and keep them nearby.
- ○ Prepare livestock for transport and consider moving them to a safe location early.

EVACUATION STEPS

- ○ Review your Evacuation Checklist.
- ○ Ensure your Emergency Supply Kit is in your vehicle.
- ○ Cover up to protect against heat and flying embers. Wear long pants, a long-sleeved shirt, heavy shoes/boots, cap/hat, a dry bandana for face cover, goggles, or glasses. Clothing made of 100% cotton is preferable.
- ○ Locate your pets and take them with you.

WHEN TO EVACUATE

Leave when evacuation is recommended by fire officials to avoid being caught in fire, smoke, or road congestion. You don't need to wait to be ordered by authorities to evacuate. In an intense wildfire, emergency personnel may not have time to knock on every door. If you feel you are in danger, the best course of action is to evacuate. If you are advised to leave, don't hesitate!

Officials will determine the areas to be evacuated and escape routes to use depending upon the fire's location, behavior, winds, terrain, etc.

Law enforcement agencies are typically responsible for enforcing an evacuation order. Follow their directions promptly.

You will be advised of potential evacuations as early as possible. You must take the initiative to stay informed and aware. Listen to your radio/TV for announcements from law enforcement and emergency personnel.

You may be directed to temporary assembly areas to await transfer to a safe location.

The terms "Warning" and "Order" are used to describe evacuation orders. However, local jurisdictions may use other terminology such as "Precautionary" and "Immediate Threat." These terms are used to alert you to the significance of the danger. All evacuation instructions provided by officials should be followed immediately for your safety.

ANIMAL EVACUATION

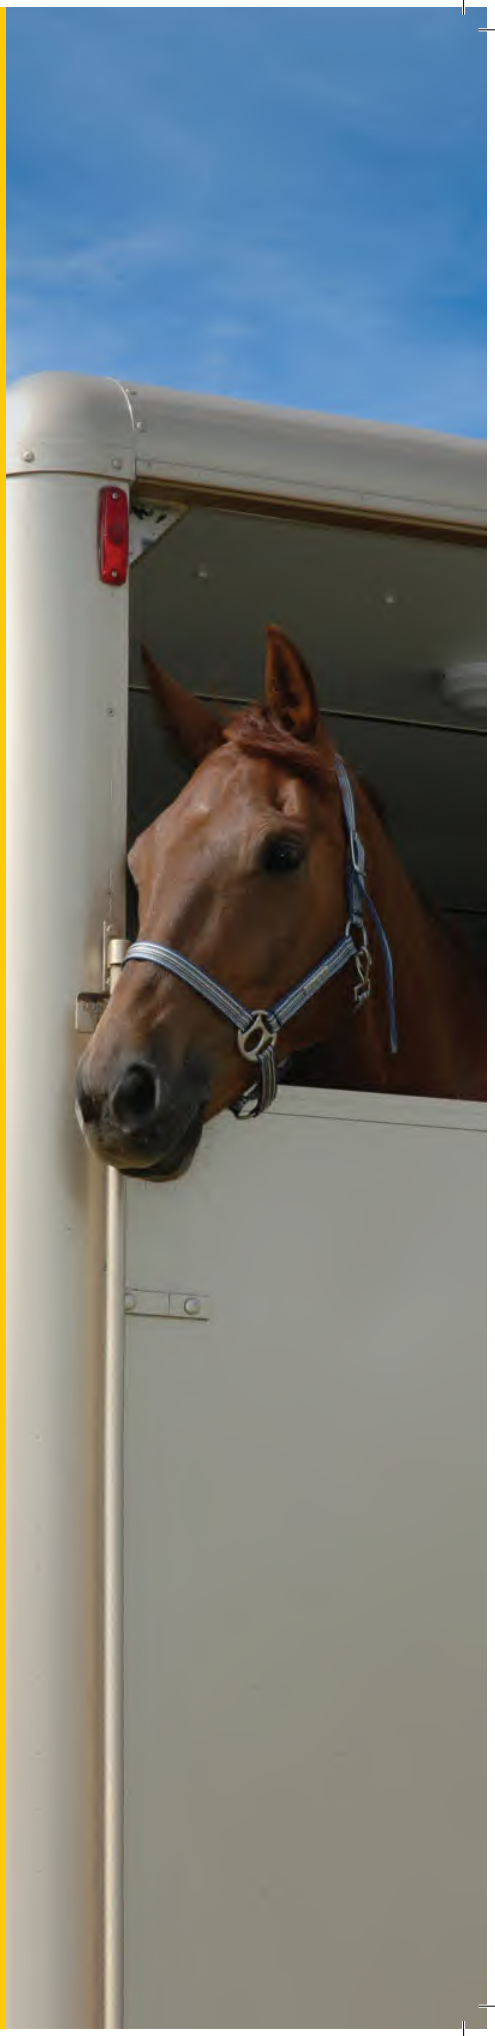
You've taken steps to help keep your family and home fire safe. Don't forget your pets and livestock. With some advanced planning, you can increase their chances of surviving a wildfire.

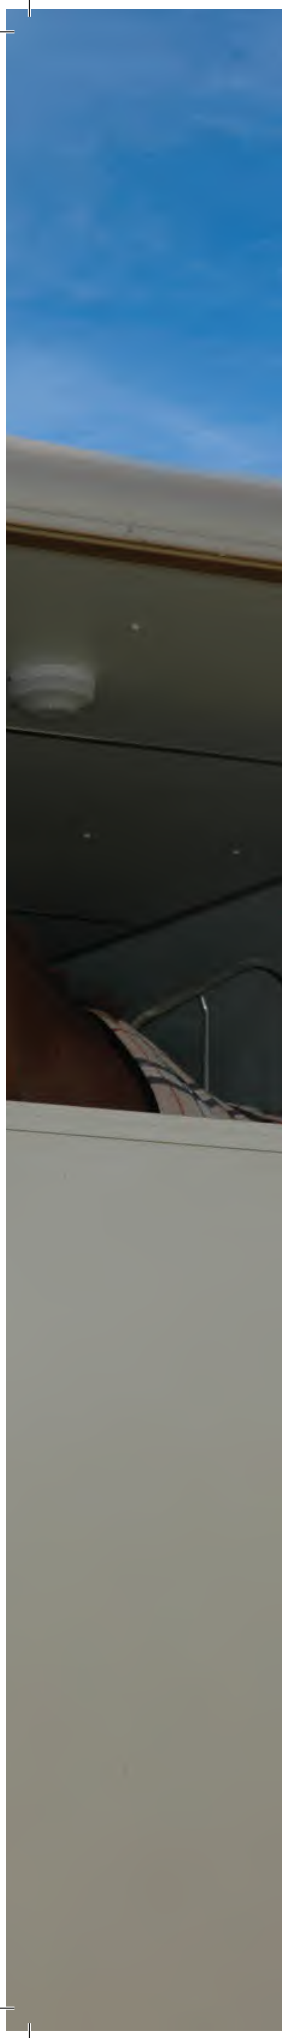
1. Clear Defensible Space around your barns, pastures, and property just as you do your home.
2. Contact your local fairgrounds, stockyards, equestrian centers, friends, etc. about their policies and ability to temporarily take livestock in an emergency.
3. Have vaccination/medical records, registration papers, and photographs of your animals (proof of ownership).
4. If you must leave your animals, leave them in a pre-selected, cleared area. If appropriate, leave enough hay for 48 to 72 hours.
   - Leave water for your animals. Do not rely on automatic watering systems, as a power outage could occur or the water system become compromised.
5. Arrange in advance for a neighbor to check on or transport your pets in case you are not home when disaster strikes.
   - Make sure your neighbors have your contact numbers (cell phone, work, home, etc.).
6. Make sure that each animal has its own pet carrier, as appropriate.
   - Birds, rodents, and reptiles should be transported in cages covered with a light sheet or cloth to minimize their fear.
7. Make sure your pets are always wearing properly fitted collars with personal identification, rabies and license tags.
8. Plan where you will take your pets and select an alternate prearranged location as well.
   - In the event of evacuation, pets may not be allowed inside human emergency shelters.
9. Prepare your livestock disaster preparedness kit.
10. Prepare your pet disaster preparedness kit.

Scan the QR code below to find what items to include in your livestock and pet disaster preparedness kit.

LIVESTOCK AND PET DISASTER PREPAREDNESS KIT INSTRUCTIONS

ReadyforWildfire.org/animal-evacuation





WHAT TO DO IF TRAPPED

WHILE IN YOUR VEHICLE:

- Stay calm.
- Park your vehicle in an area clear of vegetation.
- Close all vehicle windows and vents. If possible, cover inside of windows with a wool or cotton blanket to minimize radiant heat.
- Cover yourself with a wool or cotton blanket or jacket.
- Lie on vehicle floor.
- Use your cell phone to contact officials—**Call 911**

WHILE ON FOOT:

- Stay calm.
- Go to an area clear of vegetation, a ditch, or depression on level ground, if possible.
- Lie face down and cover up your body.
- If near a body of water—pool, creek, pond, lake, etc.—seek safety in the water or use it to keep distance away from the fire. Be careful not to be swept away by moving water or get too deep.
- Use your cell phone to contact officials—**Call 911**

WHILE IN YOUR HOME:

- Stay calm and keep your family together.
- **Call 911** and inform authorities of your location.
- Fill sinks and tubs with cold water.
- Keep doors and windows closed but unlocked.
- Stay inside your house.
- Stay away from outside walls and windows.
- Turn on lights so emergency officials know you are inside.

RETURNING HOME AFTER A WILDFIRE

ALWAYS check with officials before attempting to return to your home after a wildfire. Once home, check for the following:

- ○ **Call 911** if any danger is perceived.
- ○ Before inspecting your home, first check for the smell of gas. Turn off power until you've completed your inspection. Use a battery-powered flashlight to inspect a damaged home.
- ○ Check grounds for hot spots, smoldering stumps, and vegetation.
- ○ Check the roof and exterior areas for sparks or embers.
- ○ Check the attic and throughout your house for any hidden burning sparks or embers.
- ○ Check for fire damage to your home, turn off all appliances, and make sure the meter is not damaged before turning on the main circuit breaker.
- ○ Check the well or pump house to ensure it is in working order.
- ○ Do not drink or use water from the faucet until emergency officials say it is okay.
- ○ Discard any food that has been exposed to heat, smoke, or soot.
- ○ Consult local experts on the best way to restore and plant your land with fire smart landscaping.

Be aware of the following dangers that exist after a wildfire:

- Flash floods are a very real and potentially deadly hazard when rain occurs in heavily burned areas after a wildfire. Stay away from burned forests, storm channels, and natural drainages.
- Use extreme caution around trees, power poles, and other tall objects or structures that may have lost stability during the fire.

Family Disaster Plan and Personal Survival Guide

Family Disaster Plan and Personal Survival Guide

I. PREPARATION

Family Meetings

At least once a year, have a meeting with your family to discuss and update your disaster plan. Determine what additional training, equipment, and supplies are needed to meet your family's needs. Don't forget to practice! Occasional drills can improve reaction time and help to avoid panic in an actual emergency.

A. Know how and where to shut off utilities.

Location of Main Water Valve: _____

Location of Gas Valve*: _____

Location of Wrench: _____

Location of Garage Door Manual Override: _____

Location of Other Utilities: _____

* Do not shut off gas unless you suspect a leak exists.

B. On a separate sheet of paper, draw a floor plan of your home showing the location of exit doors and windows, utility shutoffs, first aid kit, and emergency supplies. Ensure EVERYONE in your household is familiar with it. Show it to babysitters and house guests when you're going away.

C. Reunion locations: Establish two places where you and your family can meet following an emergency. One immediately outside of your home, e.g. a neighbor's mailbox, or community park **AND** another site outside of your immediate community in case you are unable to return home.

Home Location: _____

Away-from-Home Location: _____

D. Out-of-State Contact: Name and telephone number of a person outside of the state for family members to call and report their location and condition. Everyone should memorize this number!

Name: _____

Location: _____ Phone: (_____) _____

E. What is your children's school disaster policy?

_____

_____

_____

Are medical consent forms for your children complete and current? _____

Where are they located? _____

F. Assemble a Home Emergency Supply Kit. Store it in a convenient and accessible location. See Section VII for details on what to put inside your Home Emergency Supply Kit.

Location of Home Emergency Supply Kit: _____

Family Disaster Plan and Personal Survival Guide

II. TRAINING

A. Learn how to protect yourself from falling objects, smoke, fire, toxic fumes, etc.

B. Learn First Aid/CPR

Person(s) Trained:

Name: _____ Date Training Expires: _____

Name: _____ Date Training Expires: _____

III. BEFORE A DISASTER

There are many different kinds of disasters, such as earthquakes, fires, floods, airplane crashes, chemical spills, and explosions, which seldom give warning and can be equally devastating to their victims. Although this guide is primarily about earthquake preparation, the steps you take will help your family prepare for any type of disaster that could strike in your community. For additional information on local disaster preparedness for your home, school, and business visit **www.ReadySanDiego.org**.

A. Register your cell phone, Voice over Internet Protocol (VoIP) phone, and email address with AlertSanDiego*. **Listed and unlisted landlines are already registered. Registering makes it more likely that you will receive an emergency notification. Registration is quick and simple.** **Also available in accessible formats such as American Sign Language.*

B. Download the **SD Emergency App** for Android and iOS devices.

C. Inspect your home. Identify potential hazards and evacuation routes.

D. Secure water heater and tall or heavy furniture to wall studs.

E. Move heavy items to lower shelves in bookcases.

F. Install clips, latches and other locking devices on cabinet doors.

G. Provide strong support and flexible connections on gas appliances.

H. Remove or isolate and secure flammable materials.

I. Review and practice this plan.

IV. DURING AN EARTHQUAKE

A. If you are indoors STAY THERE. Move away from windows, bookcases, and high/overhanging shelves. Get under a sturdy table or desk and hold onto it. Be prepared to move with it and HOLD that position until the shaking stops and it is safe to relocate. If there is no desk or table to get under, brace yourself in an interior corner. Watch for falling, flying and sliding objects, and be especially careful around windows, as they can shatter during an earthquake.

> **NOTE:** *If you are in a mobile home which is resting on A-Frame supports, get on top of the bed or sofa and cover your head and face. If a mobile home slips off the supports they may penetrate the flooring and cause injuries.*

B. If you are outdoors, move to an open area away from buildings, trees, power poles, brick or block walls and other objects that could fall.

C. If you are in an automobile, stop and stay in it until the shaking ends. Avoid stopping near trees and power lines or on or under overpasses or bridges.

D. If you are in a multi-level building, get under a desk and hold on, or crouch next to an interior wall until the shaking stops. **DO NOT USE THE ELEVATOR TO EVACUATE.** Use the stairs.

E. If you are in a store, get under a table or any sturdy object. Avoid stopping under anything that could fall. **DO NOT RUN FOR THE EXIT.** After the shaking has stopped, choose your exit carefully.

Family Disaster Plan and Personal Survival Guide

V. IF YOU EVACUATE

A. Take with you:

- Medicines and first aid kit
- Flashlight, radio and batteries
- Important documents and cash
- Blankets and extra clothes
- Personal sanitary items
- Any additional items you feel are necessary (e.g. photos, heirlooms, jewelry, etc.)

B. Make arrangements for pets. Don't forget food, medications, vaccination records, and other important items.

VI. AFTER A DISASTER

A. Put on heavy shoes immediately to avoid injury from stepping on glass.

B. Locate a light source, such as a flashlight, if necessary.

C. Check for injuries and administer first aid.

D. Check for fires and fire hazards.

- Sniff for gas leaks, starting at the hot water heater. If you smell gas, hear a hissing sound or suspect a leak, turn off the main gas valve, open the windows and carefully leave the house. **DO NOT TURN LIGHTS ON OR OFF. DO NOT STRIKE MATCHES.**

  NOTE: *Do not shut off the gas unless you suspect a leak exists. Only the gas company can restore service.*

- If necessary, turn off the electrical system at the main circuit breaker or fuse box.

E. Check on your neighbors.

F. Visit **www.SDCountyEmergency.com** or the **SD Emergency App** for updates, shelter locations, interactive mapping information (e.g. evacuation areas and hazard perimeters), official social media feeds, and other critical information.

G. Listen for advisories using a battery powered radio. The primary Emergency Alert System station for San Diego County is KOGO AM 600. The secondary station is KLSD AM 1360.

H. Do not use the phone except in emergencies. Only call 9-1-1 for life threatening emergencies. Have a plug-in analog phone in case the power is out, but phone lines are still working.

I. For general and updated disaster information or volunteer opportunities, call 2-1-1.

J. Do not touch downed power lines or objects touching downed wires. Do not stand in water near downed lines.

K. Remove fallen debris that may cause personal injury.

L. Assess house, roof, and chimney for damages.

M. Be prepared for aftershocks.

N. Open closets and cupboards carefully because items may have fallen or become rearranged.

O. Cooperate with public safety officials.

P. Be prepared to evacuate when/if necessary.

Q. DO NOT GO SIGHTSEEING!

PREPAREDNESS STARTS WITH YOU!

Family Disaster Plan and Personal Survival Guide

VII. HOME EMERGENCY SUPPLIES

This list contains items usually available in your home. It is recommended that they be organized and located together for easy access during an emergency. Your emergency supplies should be sufficient to sustain you, your family and pets for a ***minimum of 72 hours***. A two (2) week supply of prescription and necessary over-the-counter medications is recommended**.**

Basic Supplies

- ❒ Water* – minimum of 1 gallon per person per day
- ❒ Non-Perishable Foods*
- ❒ First Aid Kit and Manual
- ❒ Can opener – non-electric
- ❒ Watch or clock – non-electric
- ❒ Plug-in analog telephone
- ❒ Cash
- ❒ Important documents
- ❒ Blankets or sleeping bags for each member of the family
- ❒ Radio – portable, with spare batteries
- ❒ Prescription and over-the-counter medications*
- ❒ Additional equipment – glasses, dentures, hearing aids
- ❒ Flashlight – spare batteries and light bulb
- ❒ Fire extinguisher – multipurpose labeled "ABC"
- ❒ Whistle
- ❒ Dust mask
- ❒ Activity items for adults (e.g. deck of cards) and kids (e.g. coloring books with crayons)

*Rotate food, water, and medications as necessary. Remember to consider household members with unique needs: infants, elderly, disabled, allergies. Avoid salty foods, as they will make you thirsty.

Water Tips

The best option is to store drinking water prior to a disaster, in appropriate containers. If purified water is not available, water should be boiled for 1 full minute, keeping in mind that some water will evaporate. Let the water completely cool before use.

Sanitation Supplies

- ❒ Large plastic trash bags for waste, sanitation, and protection
- ❒ Pre-moistened towelettes
- ❒ Hand soap and liquid detergent
- ❒ Shampoo
- ❒ Toothpaste & toothbrush
- ❒ Feminine supplies
- ❒ Infant supplies
- ❒ Toilet paper and paper towels
- ❒ Deodorant

Cooking Supplies

- ❒ Plastic bags – various sizes, sealable
- ❒ Paper plates, plastic utensils, paper towels
- ❒ Pots (cooking) – at least two
- ❒ Barbecue or gas grill; charcoal and lighter or propane (**for outdoor use only**); Sterno® stove

Family Disaster Plan and Personal Survival Guide

VII. HOME EMERGENCY SUPPLIES (CONTINUED)

Safety Supplies

- ❒ Knife, razor blade, and multipurpose tool
- ❒ Clothes – complete change for each family member (Preferably long pants and long sleeves for protection)
- ❒ Heavy gloves for each adult
- ❒ Heavy shoes for each family member

Pet Supplies

- ❒ Carrier
- ❒ Food
- ❒ Medications
- ❒ Important documents such as vaccination records and license information
- ❒ Collar with ID tag and harness or leash
- ❒ Water
- ❒ Sanitation items – Litter and litter box if appropriate

Car Survival Kit

- ❒ Non-perishable food
- ❒ Flares
- ❒ Bottled water
- ❒ First Aid Kit and Manual
- ❒ Fire extinguisher
- ❒ Blanket
- ❒ Sealable plastic bags
- ❒ Flashlight with batteries
- ❒ Tools and rubber hose
- ❒ Critical medications
- ❒ Pre-moistened towelettes and tissues
- ❒ Extra clothing

VIII. IMPORTANT TELEPHONE NUMBERS

USE "9-1-1" FOR LIFE THREATENING EMERGENCIES ONLY

NON-EMERGENCY FIRE DEPARTMENT: _____

NON-EMERGENCY LAW ENFORCEMENT AGENCY: _____

PRIMARY DOCTOR: _____

GAS COMPANY: _____

ELECTRIC COMPANY: _____

WATER COMPANY: _____

OTHER: _____

PREPAREDNESS STARTS WITH YOU!

Family Disaster Plan and Personal Survival Guide

IX. PRACTICE YOUR PLAN AS A FAMILY

A. Practice helps people feel less disoriented and better organized in case of a disaster – even in the middle of the night.

B. Make sure your family knows where to locate fire extinguishers, gas and water valves, and the main circuit breaker.

C. Update your Family Disaster Plan every year.

- Verify the telephone numbers and personal information of everyone listed in the plan.
- Print updated copies for all the members of your family.

D. In case of emergency, you should know the school's disaster plan.

- Determine what is required to release your child to your representatives if you cannot get there yourself.
- Ensure that the school knows your current contact information and those people authorized to pick up your child.

E. Check the contents of your emergency kits.

- Change the batteries in your flashlights and portable radio; replace spare batteries.
- Replenish your emergency kits. Replace bottled water; ensure that all food is still safe to eat and that medications have not expired.

Every family member should carry a copy of this important information:

EMERGENCY CONTACT INFORMATION

Out-of-State Contact

PREPAREDNESS STARTS WITH YOU!

Appendix B1- B4

Family Disaster Plan and Personal Survival Guide

Additional Items to Consider Adding to an Emergency Supply Kit:

- ❑ **Prescription medications and glasses**
- ❑ **Infant formula and diapers**
- ❑ **Pet food and extra water for your pet**
- ❑ **Important family documents such as copies of insurance policies, identification and bank account records in a waterproof, portable container**
- ❑ **Cash or traveler's checks and change**
- ❑ **Emergency reference material such as a first aid book or information from www.ready.gov**
- ❑ **Sleeping bag or warm blanket for each person. Consider additional bedding if you live in a cold-weather climate.**
- ❑ **Complete change of clothing including a long sleeved shirt, long pants and sturdy shoes. Consider additional clothing if you live in a cold-weather climate.**
- ❑ **Household chlorine bleach and medicine dropper** – When diluted nine parts water to one part bleach, bleach can be used as a disinfectant. Or in an emergency, you can use it to treat water by using 16 drops of regular household liquid bleach per gallon of water. Do not use scented, color safe or bleaches with added cleaners.
- ❑ **Fire Extinguisher**
- ❑ **Matches in a waterproof container**
- ❑ **Feminine supplies and personal hygiene items**
- ❑ **Mess kits, paper cups, plates and plastic utensils, paper towels**
- ❑ **Paper and pencil**
- ❑ **Books, games, puzzles or other activities for children**

Prepare. Plan. Stay Informed.®

Emergency Supply List

FEMA

www.ready.gov

Recommended Items to Include in a Basic Emergency Supply Kit:

- **Water, one gallon of water per person per day for at least three days, for drinking and sanitation**
- **Food, at least a three-day supply of non-perishable food**
- **Battery-powered or hand crank radio and a NOAA Weather Radio with tone alert and extra batteries for both**
- **Flashlight and extra batteries**
- **First aid kit**
- **Whistle to signal for help**
- **Dust mask, to help filter contaminated air and plastic sheeting and duct tape to shelter-in-place**
- **Moist towelettes, garbage bags and plastic ties for personal sanitation**
- **Wrench or pliers to turn off utilities**
- **Can opener for food (if kit contains canned food)**
- **Local maps**

Through its *Ready* Campaign, the Federal Emergency Management Agency educates and empowers Americans to take some simple steps to prepare for and respond to potential emergencies, including natural disasters and terrorist attacks. *Ready* asks individuals to do three key things: get an emergency supply kit, make a family emergency plan, and be informed about the different types of emergencies that could occur and their appropriate responses.

All Americans should have some basic supplies on hand in order to survive for at least three days if an emergency occurs. Following is a listing of some basic items that every emergency supply kit should include. However, it is important that individuals review this list and consider where they live and the unique needs of their family in order to create an emergency supply kit that will meet these needs. Individuals should also consider having at least two emergency supply kits, one full kit at home and smaller portable kits in their workplace, vehicle or other places they spend time.

BE SMART. TAKE PART. CREATE YOUR FAMILY EMERGENCY COMMUNICATION PLAN

Join with others to prepare for emergencies and participate in America's PrepareAthon! | ready.gov/prepare

Creating your *Family Emergency Communication Plan* starts with one simple question: "What if?"

"What if something happens and I'm not with my family?" "Will I be able to reach them?" "How will I know they are safe?" "How can I let them know I'm OK?" During a disaster, you will need to send and receive information from your family.

Communication networks, such as mobile phones and computers, could be unreliable during disasters, and electricity could be disrupted. Planning in advance will help ensure that all the members of your household—including children and people with disabilities and others with access and functional needs, as well as outside caregivers—know how to reach each other and where to meet up in an emergency. Planning starts with three easy steps:

1. COLLECT.

Create a paper copy of the contact information for your family and other important people/offices, such as medical facilities, doctors, schools, or service providers.

2. SHARE.

Make sure everyone carries a copy in his or her backpack, purse, or wallet. If you complete your *Family Emergency Communication Plan* online at ready.gov/make-a-plan, you can print it onto a wallet-sized card. You should also post a copy in a central location in your home, such as your refrigerator or family bulletin board.

3. PRACTICE.

Have regular household meetings to review and practice your plan.

TEXT IS BEST!

If you are using a mobile phone, a text message may get through when a phone call will not. This is because a text message requires far less bandwidth than a phone call. Text messages may also save and then send automatically as soon as capacity becomes available.

The following sections will guide you through the process to create and practice your *Family Emergency Communication Plan*.

HOUSEHOLD INFORMATION

Write down phone numbers and email addresses for everyone in your household. Having this important information written down will help you reconnect with others in case you don't have your mobile device or computer with you or if the battery runs down. If you have a household member(s) who is Deaf or hard of hearing, or who has a speech disability and uses traditional or video relay service (VRS), include information on how to connect through relay services on a landline phone, mobile device, or computer.

SCHOOL, CHILDCARE, CAREGIVER, AND WORKPLACE EMERGENCY PLANS

Because a disaster can strike during school or work hours, you need to know their emergency response plans and how to stay informed. Discuss these plans with children, and let them know who could pick them up in an emergency. Make sure your household members with phones are signed up for alerts and warnings from their school, workplace, and/or local government. To find out more about how to sign up, see *Be Smart. Know Your Alerts and Warnings* at http://1.usa.gov/1BDloze. For children without mobile phones, make sure they know to follow instructions from a responsible adult, such as a teacher or principal.

OUT-OF-TOWN CONTACT

It is also important to identify someone outside of your community or State who can act as a central point of contact to help your household reconnect. In a disaster, it may be easier to make a long-distance phone call than to call across town because local phone lines can be jammed.

EMERGENCY MEETING PLACES

Decide on safe, familiar places where your family can go for protection or to reunite. Make sure these locations are accessible for household members with disabilities or access and functional needs. If you have pets or service animals, think about animal-friendly locations. Identify the following places:

- ☐ *Indoor*: If you live in an area where tornadoes, hurricanes, or other high-wind storms can happen, make sure everyone knows where to go for protection. This could be a small, interior, windowless room, such as a closet or bathroom, on the lowest level of a sturdy building, or a tornado safe room or storm shelter.
- ☐ *In your neighborhood*: This is a place in your neighborhood where your household members will meet if there is a fire or other emergency and you need to leave your home. The meeting place could be a big tree, a mailbox at the end of the driveway, or a neighbor's house.
- ☐ *Outside of your neighborhood*: This is a place where your family will meet if a disaster happens when you're not at home and you can't get back to your home. This could be a library, community center, house of worship, or family friend's home.

- [ ] *Outside of your town or city*: Having an out-of-town meeting place can help you reunite if a disaster happens and:
    - You cannot get home or to your out-of-neighborhood meeting place; or
    - Your family is not together and your community is instructed to evacuate the area.

    This meeting place could be the home of a relative or family friend. Make sure everyone knows the address of the meeting place and discuss ways you would get there.

OTHER IMPORTANT NUMBERS AND INFORMATION

You should also write down phone numbers for emergency services, utilities, service providers, medical providers, veterinarians, insurance companies, and other services.

SHARE

MAKE SURE EVERYONE HAS THE INFORMATION

- [ ] Make copies of your *Family Emergency Communication Plan* for each member of the household to carry in his or her wallet, backpack, or purse. Post a copy in a central place at home. Regularly check to make sure your household members are carrying their plan with them.
- [ ] Enter household and emergency contact information into all household members' mobile phones or devices.
- [ ] Store at least one emergency contact under the name "In Case of Emergency" or "ICE" for all mobile phones and devices. This will help someone identify your emergency contact if needed. Inform your emergency contact of any medical issues or other requirements you may have.
- [ ] Create a group list on all mobile phones and devices of the people you would need to communicate with if there was an emergency or disaster.
- [ ] Make sure all household members and your out-of-town contact know how to text if they have a mobile phone or device, or know alternative ways to communicate if they are unable to text.
- [ ] Read *Be Smart. Know Your Alerts and Warnings* at http://1.usa.gov/1BDloze and sign up to receive emergency information.

NOW IT'S TIME TO PRACTICE!

Once you have completed your *Family Emergency Communication Plan*, made copies for all the members of your household, and discussed it, it's time to practice!

Here are some ideas for practicing your plan:

- [ ] Practice texting and calling. Have each person practice sending a text message or calling your out-of-town contact and sending a group text to your mobile phone group list.
- [ ] Discuss what information you should send by text. You will want to let others know you are safe and where you are. Short messages like "I'm OK. At library" are good.

- [ ] Talk about who will be the lead person to send out information about the designated meeting place for the household.
- [ ] Practice gathering all household members at your indoor and neighborhood emergency meeting places. Talk about how each person would get to the identified out-of-neighborhood and out-of-town meeting places. Discuss all modes of transportation, such as public transportation, rail, and para-transit for all family members, including people with disabilities and others with access and functional needs.
- [ ] Regularly have conversations with household members and friends about the plan, such as whom and how to text or call, and where to go.
- [ ] To show why it's important to keep phone numbers written down, challenge your household members to recite important phone numbers from memory—now ask them to think about doing this in the event of an emergency.
- [ ] Make sure everyone, including children, knows how and when to call 911 for help. You should only call 911 when there is a life-threatening emergency.
- [ ] Review, update, and practice your *Family Emergency Communication Plan* at least once a year, or whenever any of your information changes.

To help start the conversation or remind your family why you are taking steps to prepare and practice, you may want to watch the 4-minute video, *It Started Like Any Other Day*, about families who have experienced disaster, at www.youtube.com/watch?v=w_omgt3MEBs. Click on the closed captioning (CC) icon on the lower right to turn on the captioning.

After you practice, talk about how it went. What worked well? What can be improved? What information, if any, needs to be updated? If you make updates, remember to print new copies of the plan for everyone.

OTHER IMPORTANT TIPS FOR COMMUNICATING IN DISASTERS[1]

- [ ] Text is best when using a mobile phone, but if you make a phone call, keep it brief and convey only vital information to emergency personnel and/or family or household members. This will minimize network congestion, free up space on the network for emergency communications, and conserve battery power. Wait 10 seconds before redialing a number. If you redial too quickly, the data from the handset to the cell sites do not have enough time to clear before you've re-sent the same data. This contributes to a clogged network.
- [ ] Conserve your mobile phone battery by reducing the brightness of your screen, placing your phone in airplane mode, and closing apps you do not need. Limit watching videos and playing video games to help reduce network congestion.
- [ ] Keep charged batteries, a car phone charger, and a solar charger available for backup power for your mobile phone, teletypewriters (TTYs), amplified phones, and caption phones. If you charge your phone in your car, be sure the car is in a well-ventilated area (e.g., not in a closed garage) to avoid life-threatening carbon monoxide poisoning.

[1] Federal Communications Commission, Public Safety and Homeland Security Bureau. (n.d.) *Tips for communicating in an emergency.* Retrieved from http://transition.fcc.gov/pshs/emergency-information/tips.html

- [ ] If driving, do not text, read texts, or make a call without a hands-free device.
- [ ] Maintain a household landline and analog phone (with battery backup if it has a cordless receiver) that can be used when mobile phone service is unavailable. Those who are Deaf or hard of hearing, or who have speech disabilities and use devices and services that depend on digital technology (e.g., VRS, Internet Protocol [IP] Relay, or captioning) should have an analog phone (e.g., TTY, amplified phone, or caption phone) with battery backup in case Internet or mobile service is down.
- [ ] If you evacuate and have a call-forwarding feature on your home phone, forward your home phone number to your mobile phone number.
- [ ] Use the Internet to communicate by email, Twitter, Facebook, and other social media networks. These communication channels allow you to share information quickly with a widespread audience or to find out if loved ones are OK. The Internet can also be used for telephone calls through Voice over Internet Protocol. For those who are Deaf or hard of hearing, or who have speech disabilities, you can make calls through your IP Relay provider.
- [ ] If you do not have a mobile phone, keep a prepaid phone card to use if needed during or after a disaster.
- [ ] Use a pay phone if available. It may have less congestion because these phones don't rely on electricity or mobile networks. In some public places, you may be able to find a TTY that can be used by those who are Deaf or hard of hearing, or who have speech disabilities.

American Red Cross

Family Disaster Plan

Family Last Name(s) or Household Address: **Date:**

Family Member/Household Contact Info (If needed, additional space is provided in #10 below):

Name	Home Phone	Cell Phone	Email:

Pet(s) Info:

Name:	Type:	Color:	Registration #:

Plan of Action

1. The disasters most likely to affect our household are:

2. What are the escape routes from our home?

3. If separated during an emergency, what is our meeting place near our home?

4. If we cannot return home or are asked to evacuate, what is our meeting place outside of our neighborhood?

_____

What is our route to get there and an alternate route, if the first route is impassible?

_____

_____

5. In the event our household is separated or unable to communicate with each other, our emergency contact outside of our immediate area is:

Name	Home Phone	Cell Phone	Email:

After a disaster, let your friends and family know you are okay by registering at "Safe and Well" at https://safeandwell.communityos.org/cms// or by calling 1-800-733-2767. You can also give them a call, send a quick text or update your status on social networking sites.

6. If at school/daycare, our child(ren) will be evacuated to:

Child's Name:	Evacuation Site (address and contact info):

7. Our plan for people in our household with a disability or special need is:

Person's Name:	Plan:

8. During certain emergencies local authorities may direct us to "shelter in place" in our home. An accessible, safe room where we can go, seal windows, vents and doors and listen to emergency broadcasts for instructions, is:

_____

9. Family Member Responsibilities in the Event of a Disaster

Task	Description	Family Member Responsible
Disaster Kit*	Stock the disaster kit and take it if evacuation is necessary. Include items you might want to take to an evacuation shelter. Remember to include medications and eye glasses.	
Be informed	Maintain access to NOAA or local radio, TV, email or text alerts for important and current information about disasters.	
Family Medical Information	Make sure the household medical information is taken with us if evacuation is necessary.	
Financial Information	Obtain copies of bank statements and cash in the event ATMs and credit cards do not work due to power outages. Bring copies of utility bills as proof of residence in applying for assistance.	
Pet Information	Evacuate our pet(s), keep a phone list of pet-friendly motels and animal shelters, and assemble and take the pet disaster kit.	
Sharing and Maintaining the Plan	Share the completed plan with those who need to know. Meet with household members every 6 months or as needs change to update household plan.	

**What supplies and records should go in your disaster kit? Visit www.redcross.org*

10. Other information, if not able to be included above.

Congratulations on completing your family disaster plan! Please tell others: "We've made a family disaster plan and you can, too, with help from the American Red Cross."

Get the facts about what you should do if an emergency or disaster occurs at www.redcross.org
