HARP2 - HRACalc (dated 22118) 6/20/2022 6:20:52 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: All
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 2.417

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0.4170001
2<16 Years Bin: 0
16<30 Years Bin: 0
16 to 70 Years Bin: 0

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: RMP

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4CancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4CancerRiskSumByRec.csv
Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4NCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4NCChronicRiskSumByRec.csv
Calculating acute risk
Acute risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4NCAcuteRisk.csv
Acute risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Oak Knoll\OAK KNOLL\hra\Res-Tier 4NCAcuteRiskSumByRec.csv

San Diego, California 92127

Subject: Biological Resources Technical Report for the Harmon Ranch Project, City of Poway, California

Dear Mr. Shepherd:

This biological resources letter report summarizes the existing biological conditions for the proposed residential development of the Harmon Ranch Project (project) site in the City of Poway, California. This report also describes and analyzes the results of the biological assessment conducted for the site, including general assessment of existing site conditions, vegetation and land cover mapping, rare plant survey, preliminary jurisdictional resources assessment, and an assessment for the presence of suitable habitat for special-status plant and animal species recognized by local, state, or federal wildlife agencies. Additionally, this report provides an analysis of direct and indirect impacts based on the proposed development scenario, analyzes the biological significance of the site with respect to regional biological resource planning, describes the impact controls that will avoid impacts to biological resources, and includes mitigation measures that will reduce significant biological impacts to a less-than-significant level consistent with federal, state, and local regulations. The project and potential impacts to special-status biological resources are analyzed in the context of the Poway Subarea Habitat Conservation Plan/Natural Community Conservation Plan.

1 Project Location

The project site is located along either side of Oak Knoll Road between Pomerado Road, which is slightly west of the site, and Carriage Road, which is slightly east. Poway Road is slightly north of the site, and Poway Creek runs east–west through the southern portion of the site, near the border. The project site is in the City of Poway, California (see Figure 1, Project Location). Much of the site is surrounded by residential development, except commercial development and open space associated with the Kumeyaay Ipai Interpretive Center to the north. The site is located approximately 2.75 miles east of Interstate 15. The project site is located within Township 14S, Range 2 West, and Section 14 on the Poway U.S. Geological Survey 7.5-minute quadrangle map (Figure 1); the approximate centroid of the site is longitude −117.05690° W and latitude 32.95181° N.

1.1 Site Description

The approximately 10.73-acre biological study area is divided into two parts; the larger parcel is located north of Oak Knoll Road and is approximately 8.91 acres and the smaller parcel is located south of Oak Knoll Road and is approximately 1.81 acres. Throughout the site topography ranges from about 440 to 510 feet

above mean sea level. The northern portion of the project site recently contained an San Diego Gas & Electric storage yard and several small, uninhabited buildings. There is also a small drainage that runs through the northwestern corner of the site, which has steep drops at the associated cement culverts at either end; one culvert is along the western project boundary and the other is along the northern project boundary. Also associated with the drainage is disturbed riparian and disturbed wetland habitat. The remainder of the northern portion of the project site consists primarily of disturbed habitat including non-native, invasive, and ornamental plant species.

The southern portion of the project boundary contains a small uninhabited residence and disturbed habitat adjacent to Oak Knoll Road. Further into the site, there are large stands of invasive arundo that surround Poway Creek, which runs east–west through the southern portion of the project site. Also along Poway Creek there is disturbed riparian habitat with a high proportion of non-native invasive plant species.

1.2 Soils

Four soils series are mapped on the project site: Placentia sandy loam, 2% to 9% slopes; Olivenhain cobbly loam, 2% to 9% slopes; Cieneba rocky coarse sandy loam, 9% to 30% slopes, and Visalia sandy loam, 0% to 2% slopes (USDA 2022a). Placentia soils are extensive and are well or moderately well drained, with slow to rapid runoff and very slow permeability. They are also nearly level to moderately sloping and are on fans and terraces at elevations of 50 to 2,500 feet. They formed in alluvium from granite and other rocks of similar composition and texture. Within the site, Placentia soils are located throughout the majority of the northern parcel, as well as most of the northern half of the southern parcel. Olivenhain soils are well drained, with slow or medium runoff and very slow permeability. They are gently sloping to strongly sloping and are on dissected marine terraces at elevations of 100 to 600 feet. Within the site, Olivenhain soils are located within the northern portion of the northern parcel. The Cieneba series consists of very shallow and shallow somewhat excessively drained soils that formed in material weathered from granitic rock. Cieneba soils are at elevations of 500 to 4,000 feet (USDA 2022a). Within the site, Cieneba soils are located in a very small part of the extreme northeastern corner of the northern parcel, which is the highest elevation on site. Visalia sandy loam, also known as Akers series, consists of very deep, well drained soils formed in alluvium derived from granitic rock with negligible runoff and moderate permeability. Akers soils are often found on terraces. Within the site, Visalia soils are found throughout the entire southern portion of the southern parcel around Poway Creek.

2 Project Description

Lennar Homes of California LLC (Applicant) is proposing a residential neighborhood on an approximate 11.5-acre project site (this number is slightly higher than the acreage total used throughout this biological technical report, as the already paved Oak Knoll Road was not included in the developed land cover calculations). The project site is comprised of approximately 5.7 acres designated for residential development, 3.2 acres of open space, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The proposed project would include 63 single-family detached homes. The proposed project density (8.8 units/acre) is slightly higher than the density permitted in the existing RS-7 designation. Primary access to the project site is planned via existing Oak Knoll Road. Of the 63 homes, 59 are proposed to front newly constructed private streets, while 4 homes and an open space/overlook area would front existing Oak Knoll Road.

The Applicant is proposing a Specific Plan and Tentative Map to facilitate development of 63 single-family homes. The Harmon Ranch Specific Plan will establish three land use districts within the project site: Residential Single Family (R-S), Open Space (OS), and Open Space Recreation (OS-R). The Specific Plan will also provide development regulations and permitted uses for each land use district. No development is being proposed within the potential jurisdictional features.

The proposed project is comprised of 63 single-family homes on lots 42 feet wide and 85 to 90 feet deep, with standard two-car garages and 20-foot-deep driveways to accommodate off-street parking within the private lots and private fenced rear yards. The proposed project also includes 40 guest parking spaces along the private streets, approximately 1.0 acre of Open Space Recreation areas, approximately 2.2 acres of natural Open Space areas, and a segment of the General Plan Community Trail (approximately 1,000 feet) connecting the project site to the adjacent retail area located to the north. The overlook area located in the south portion of the project site is planned to provide public access and will be privately maintained.

3 Regulatory Setting

The following federal, state, and city agencies and programs regulate activities within waters, wetlands, and riparian areas throughout California: U.S. Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), Regional Water Quality Control Board (RWQCB), the California Coastal Commission, Multiple Habitat Conservation Program (MHCP), and the City of Poway. The USACE Regulatory Program regulates activities in jurisdictional resources (i.e., wetlands and waters) under Section 404 of the Clean Water Act (CWA). CDFW regulates activities in wetlands and non-wetland waters under Sections 1600–1616 of the California Fish and Game Code. The RWQCB regulates activities in wetlands and non-wetland waters exhibiting surface water under Section 401 of the CWA and the Porter–Cologne Water Quality Control Act (Porter–Cologne Act).

Portions of the site described in this report are subject to resource agency jurisdiction over potential waters of the United States or wetlands associated with features within and adjacent to the project site. Descriptions of resource agency jurisdictions are provided in Sections 3.1 through 3.4.

3.1 U.S. Army Corps of Engineers

USACE regulates "discharge of dredged or fill material" into waters of the United States, which, pursuant to provisions of Section 404 of the CWA, include tidal waters, interstate waters, and all other waters that are part of a tributary system to interstate waters or to navigable waters of the United States, the use, degradation, or destruction of which could affect interstate or foreign commerce. Within rivers and stream systems, the limits of USACE jurisdiction extend to the ordinary high water mark. The USACE-jurisdictional wetlands as defined in the U.S. Army Corps of Engineers Wetland Delineation Manual (USACE 1987), the Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (USACE 2008), and the Rapanos Guidance (USACE and EPA 2008) is determined by the presence of three parameters: (1) supporting a predominance of hydrophytic vegetation, (2) presence of hydric (i.e., anaerobic) soils, and (3) on-site evidence of hydrology.

3.2 California Department of Fish and Wildlife

In accordance with Section 1600 et seq. of the California Fish and Game Code (Streambed Alteration), CDFW regulates activities that "will substantially divert, obstruct, or substantially change the natural flow or bed, channel or bank, of any river, stream, or lake designated by the CDFW in which there is at any time an existing fish or wildlife resource or from which these resources derive benefit." CDFW takes jurisdiction to the top of bank of a stream or the limit of the adjacent riparian vegetation. In Title 14 of the California Code of Regulations, Part 1.72, CDFW defines a "stream" (including creeks and rivers) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation."

Diversion, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife requires authorization from CDFW by means of entering into an agreement pursuant to Section 1602 of the California Fish and Game Code. CDFW may assert jurisdiction to adjacent wetlands areas (i.e., where there is a predominance of hydrophytic vegetation) that provide habitat for native species. Lakes, rivers, and streambeds, including any associated riparian habitat, are subject to regulation by CDFW pursuant to the California Fish and Game Code. Often, CDFW-jurisdictional streambeds and riparian areas are synonymous with waters of the United States, including wetlands, under USACE and RWQCB jurisdiction.

Under Section 3503 of the California Fish and Game Code, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.3 of the California Fish and Game Code prohibits take, possession, or destruction of any birds in the orders Falconiformes (raptors) or Strigiformes (owls), or of their nests and eggs.

3.3 Regional Water Quality Control Board

The RWQCB regulates discharging waste, or proposing to discharge waste, within any region that could affect the waters of the state (California Water Code Section 13260[a]), pursuant to provisions of the Porter–Cologne Act. "Waters of the state" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code Section 13050[e]). Although the Porter–Cologne Act definition of waters of the state may not apply on federally owned land, the RWQCB may still assert jurisdiction over qualifying aquatic resources on land owned by the United States where CWA Section 401 applies.

3.4 Local Regulations

Poway Subarea Habitat Conservation Plan/Natural Community Conservation Plan

The Poway Subarea Habitat Conservation Plan/Natural Community Conservation Plan (Poway Subarea HCP/NCCP) serves two general functions (Ogden 1996):

1. To create a sustainable interconnected network of habitat preserves throughout and ultimately beyond the City, and thus maintain functioning ecosystems and viable populations of biological resources.
2. To mitigate adverse impacts to biological resources from building the Scripps Poway Parkway Extension and implement the Poway General Plan and Paguay Redevelopment Plan.

The Poway Subarea HCP/NCCP is implemented primarily through the City's established land use regulatory process supplemented by new implementation regulations tailored to the plan's conservation objectives. The Poway Subarea HCP/NCCP also defines mitigation requirements for development projects inside and outside of a specified Mitigation Area, and methods for funding land acquisitions and preserve management within the Mitigation Area. The project site does not fall within the Poway Subarea HCP/NCCP Mitigation Area (Ogden 1996).

The project site is not located within the Poway Mitigation Area. This is due to the highly developed surroundings adjacent to the property and its isolation from adjacent undeveloped habitat areas by residential and commercial development. Both of these factors contribute to the project site not being an important wildlife linkage or containing critical habitat for regional species.

The proposed project therefore does not interfere with the City of Poway Subarea HCP, and the project would not interfere with long-range planning efforts.

4 Methods

Data regarding biological resources present in the project area were obtained through field reconnaissance and a review of pertinent literature; both are described in detail in Sections 4.1 through 4.6.

4.1 Literature Review

Special-status biological resources present or potentially present in the site were identified through a literature search conducted in 2021 and 2022 for the project site. The following sources were used during the literature review process.

- U.S. Fish and Wildlife Service National Wetlands Inventory geographic information system (GIS) data (USFWS 2022a) was accessed and reviewed April 2022.
- U.S. Fish and Wildlife Service Critical Habitat and Occurrence Data (USFWS 2022a) was consulted for data within 1 mile of the site.
- California Natural Diversity Database (CDFW 2022a) was queried to compile a list of potentially occurring special-status plants and wildlife in the Poway quadrangle and surrounding eight quadrangles.
- California Native Plant Society (CNPS) Inventory of Rare, Threatened, and Endangered Plants of California, 8th online edition (CNPS 2022), was searched to compose a list of potentially occurring flora in the Poway quadrangle and surrounding eight quadrangles.

4.2 Field Reconnaissance

Dudek Biologist Shana Carey conducted a general biological reconnaissance survey, vegetation mapping, and general jurisdictional assessment on November 30, 2021 (Table 1). No focused surveys were conducted. An additional visit was conducted with Hunsaker surveyors on December 15 to define the boundary of the potentially jurisdictional limits. A rare plant survey was conducted on April 20, 2022, by Charles Adams. Survey dates and conditions are listed in Table 1 and survey methods are described in the following sections.

Table 1. Survey Conditions

Date	Time	Staff	Survey Type	Survey Conditions
11/30/21	0900–1300	Shana Carey	General, reconnaissance survey, vegetation mapping, general jurisdictional assessment	62°F–74°F; 0%–20% cloud cover; 1–3 mph wind
12/15/21	0800–1000	Shana Carey	Jurisdictional resource boundary delineation with Hunsaker	59°F; 10% cloud cover, 0–1 mph winds
04/20/22	0706–1051	Charles Adams	Rare plant survey	65°F–70°F, 0%–10% cc, 0–4 mph winds

Notes: °F = degrees Fahrenheit; mph = miles per hour.

4.3 Vegetation Community and Land Cover Mapping

Vegetation community classifications used in this report follow Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986), as modified by the County and noted in Draft Vegetation Communities of San Diego County (Oberbauer et al. 2008). Land covers on site were mapped in the field directly onto a 100-scale (1 inch = 100 feet) topographic base. Dudek GIS specialists digitized the mapped vegetation communities and jurisdictional resource boundaries into a GIS coverage using ArcGIS software.

The minimum mapping unit (MMU) utilized was 0.25 acres, meaning that breaks in the vegetation under 0.25 acres were not mapped as their own vegetation community. This 0.25-acre MMU is derived from the Survey of California Vegetation Classification and Mapping Standards Mapping, which states that MMUs vary with project size but are typically between 1 and 2 acres, with a 0.25-acre MMU typical for more sensitive communities such as wetlands (CDFW 2020). There are many plant species that can occur within a variety of vegetation communities. Therefore, an MMU helps to establish breaks in the vegetation communities where percent cover and assemblage of plant species result in a vegetation community change. The exception to this MMU was the mapping of riparian vegetation within the project site, which was mapped regardless of size.

4.4 Jurisdictional Aquatic Resources

A general jurisdictional assessment was conducted within the project boundary to identify areas under the jurisdiction of CDFW, pursuant to Section 1602 of the California Fish and Game Code; under the jurisdiction of USACE, pursuant to Section 404 of the federal CWA; and under the jurisdiction of the RWQCB, pursuant to CWA Section 401 and the Porter–Cologne Act.

Two drainages occur within the project site. One occurs in the northwestern corner of the site where water enters from a large cement culvert along the northern border and travels southwest, where it exits the site through another large cement culvert along the western border of the site. The western culvert has riprap installed along the edges of it, but much of the drainage looks to be earthen-bottom and heavily overgrown by thick riparian vegetation.

The other drainage is Poway Creek, which runs through the site east–west parallel to the southern border of the site. At the time of the site visit there was flowing fresh water in the creek. Running parallel to the creek on the south side, there is a flat, open area about 40–70 feet wide with very low growing, disturbed vegetation, which likely functions as a sort of floodplain for the creek during storm events. Immediately south of this is a large concrete

channel wall (approximately 6–7 feet high) that runs parallel to the creek and likely helps to contain the creek during heavy storm events. This is also where the southern site boundary is located. These features may be regulated by USACE, the RWQCB, and CDFW. No development is being proposed within the potential jurisdictional features; therefore, a full jurisdictional delineation was not conducted.

4.5 Plants

All native and naturalized plant species encountered on the project site were identified and recorded. Scientific and common names for plant species with a California Rare Plant Rank (formerly CNPS List) follow the CNPS Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2022). For plant species without a California Rare Plant Rank, scientific names follow the Jepson Interchange List of Currently Accepted Names of Native and Naturalized Plants of California (Jepson Flora Project 2022) and common names follow the U.S. Department of Agriculture Natural Resources Conservation Service Plants Database (USDA 2022b). A cumulative list of plant species observed in the project site is presented in Appendix A. This list is not all-inclusive in that it does not include a comprehensive list of all the ornamental species observed.

4.6 Wildlife

The entire site was surveyed to identify and record all wildlife species, as detected by sight, calls, tracks, scat, or other signs. Binoculars (7×50 power) were used to aid in the identification of observed wildlife. In addition to species observed, expected wildlife use of the site was determined according to known habitat preferences of regional wildlife species and knowledge of their relative distributions in the area. No trapping or focused surveys for special-status or nocturnal species were conducted. Latin and common names of animals follow Crother (2017) for reptiles and amphibians, American Ornithological Society (AOS 2018) for birds, Wilson and Reeder (2005) for mammals, and North American Butterfly Association (NABA 2016) or San Diego Natural History Museum (SDNHM 2002) for butterflies. A cumulative list of wildlife species observed within the site is presented in Appendix B.

5 Special-Status Species and/or Regulated Resources

Special-status biological resources are defined as follows: (1) species that have been given special recognition by federal, state, or local conservation agencies and organizations due to limited, declining, or threatened population sizes; (2) species and habitat types recognized by local and regional resource agencies as special status; (3) habitat areas or vegetation communities that are unique, are of relatively limited distribution, or are of particular value to wildlife; (4) wildlife corridors and habitat linkages; or (5) biological resources that may or may not be considered special status, but are regulated under local, state, and/or federal laws. Appendix C includes a list of special-status plants and their potential to occur on site and Appendix D includes a list of special-status wildlife species and their potential to occur on site.

Dudek conducted a focused survey for sensitive plants. No focused surveys were conducted for sensitive wildlife species such as coastal California gnatcatcher (*Polioptila californica californica*), least Bell's vireo (*Vireo bellii pusillus*), or southwestern willow flycatcher (*Empidonax traillii extimus*) as the proposed development footprint, site conditions, and site surroundings did not warrant them. There were no incidental detections of any sensitive wildlife species, either through sight, calls, tracks, scat, or other signs. A summary of the dates and site conditions for the field efforts performed as part of this biological report are presented above in Table 1. The following sections provide specific details regarding each survey.

5.1 Focused Survey for Sensitive Plants

A focused survey for sensitive plant species was conducted on April 20, 2022, by Dudek Biologist Charles Adams (Table 1). Prior to field surveys, distribution information for sensitive plant species potentially occurring within the project area was reviewed.

Field survey methods and mapping of sensitive plants generally conformed to CNPS Botanical Survey Guidelines (CNPS 2001), General Rare Plant Survey Guidelines (Cypher 2002), and Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

6 Results

6.1 Vegetation Communities and Land Covers

There are a total of seven vegetation communities and land cover types throughout the site. Of these, five are predominantly non-native vegetation communities and land covers, including disturbed habitat, arundo-dominated riparian, non-native riparian, disturbed wetland, and urban/developed. There are two native land covers present within the project site: fresh water (Poway Creek) and southern willow scrub (both of which are assumed regulated by USACE, RWQCB, CDFW, and the City of Poway). Acreages of vegetation communities and land covers are listed in Table 2, and their spatial distribution is depicted in Figure 2, Biological Resources.

Table 2. Vegetation Communities and Land Covers within the Project Site

Vegetation Community/Land Cover	Habitat Code	Acreage
Non-Native Vegetation Communities, Land Covers, and Unvegetated Habitat		
Disturbed Wetland	11200	0.18
Disturbed Habitat	11300	7.94
Urban/Developed	12000	1.45
Non-native Riparian	65000	0.59
Arundo-dominated Riparian	65100	0.40
Native Vegetation Community		
Southern Willow Scrub	63320	0.02
Fresh Water	64140	0.14
	Total	**10.73**

Disturbed Wetland

According to Holland (1986), this habitat type is common throughout San Diego County and includes portions of wetlands with artificial structures such as concrete linings, culverts, barricades, and riprap. It includes areas that are permanently or periodically inundated by water that have been significantly modified by human activity.

Within the site, the area mapped as disturbed wetland habitat is present within the drainage that runs through the northwestern corner of the northern parcel and encompasses approximately 0.18 acres. During the initial site

reconnaissance visit, there was a small amount of water in the drainage. The dominant species within this habitat on site include broadleaf cattail (*Typha latifolia),* Mexican fan palm (*Washingtonia robusta*), willows (*Salix sp.*), and castor bean (*Ricinus communis*).

Disturbed Habitat

Disturbed habitat refers to areas that are not developed but are no longer recognizable as a native or naturalized vegetation association, but continue to retain a soil substrate. This habitat is generally the result of severe or repeated mechanical perturbation, often with heavily disturbed, compacted soils.

Within the site, disturbed habitat is the most common habitat type and encompasses approximately 7.94 acres. It is located around the San Diego Gas & Electric storage yard and the northeastern corner of the northern parcel, as well as the northern and southern portions of the southern parcel. Vegetation in this area contains mostly ruderal, non-native species such as iceplant (*Carpobrotus edulis*), Russian thistle (*Salsola tragus*), white horehound *(Marrubium vulgare*), Australian saltbush *(Atriplex semibaccata*), Scutch grass (*Cynodon dactylon*), fountaingrass (*Pennisetum setaceum*), cheeseweed mallow (*Malva parviflora*), stinkwort (*Dittrichia graveolens*), doveweed (*Croton setiger*), western ragweed (*Ambrosia psilostachya*), horseweed (*Erigeron canadensis*), common dandelion (*Taraxacum officinale*), Maltese star-thistle (*Centaurea melitensis*), shortpod mustard (*Hirschfeldia incana*), and wild oat (*Avena fatua*) and various brome species.

Urban/Developed Land

Developed land consists of areas that have been constructed upon and typically consists of buildings, structures, homes, and maintained areas with paved or other impermeable surfaces. Developed areas do not support native vegetation. Ornamental plantings often tend to occur in and around developments and are therefore included within the developed land cover category.

Within the site, developed areas encompass approximately 1.45 acres and are present throughout the majority of the northern parcel as the San Diego Gas & Electric staging yard and buildings along Oak Knoll Road. Within the southern parcel, developed land is present within the northeastern corner also along Oak Knoll Road.

Fresh Water

According to Holland (1986), this unvegetated habitat type is characterized by year-round water bodies of fresh water that have very low salinity, typically in the form of lakes, streams, ponds, or rivers. There is also minimal vegetative cover (less than 10%) associated with this habitat type.

The area mapped as fresh water occurs within the southern portion of the site as Poway Creek. The creek flows east to west and runs parallel to Oak Knoll Road. There is some vegetation present within and along the edge of the creek including broadleaf cattail; however, during storm events this creek often floods and the high velocity of water frequently uproots, washes away, or flattens vegetation.

Non-Native Riparian

According to Holland (1986), this habitat type is common along major rivers of coastal Southern California and is found in a variety of wetland habitats where there has been previous disturbance. It is characterized by densely vegetated riparian thickets dominated by non-native, invasive species, where these species account for greater than 50% of the total vegetative cover.

Within the site, the area mapped as non-native riparian is about 0.59 acres and includes the area along both sides of the drainage in the northwestern corner of the site, as well as an area adjacent to Poway Creek in the southern portion of the site. The dominant species within this habitat on-site include Mexican fan palm, willows, castor bean, Fremont cottonwood (*Populus fremontii)*, Brazilian peppertree (*Schinus molle*), Peruvian peppertree (*Schinus terebinthifolius*), and pampas grass (*Cortaderia jubata*).

Arundo-Dominated Riparian

According to Holland (1986), arundo-dominated riparian is characterized by densely vegetated riparian thickets dominated almost exclusively by giant reed (*Arundo donax*), often in areas with loose, sandy, or fine alluvium near stream channels. This designation should only be used in environments where this species accounts for at least 50% of the total vegetative cover.

Within the site, arundo-dominated riparian habitat is only present in the southern portion of the site north of Poway Creek but south of the disturbed habitat and encompasses approximately 0.4 acres.

Southern Willow Scrub

According to Holland (1986), southern willow scrub has been described as a dense, broad-leaved, winter-deciduous riparian thicket dominated by several species of willow, with scattered emergent Fremont cottonwood and western sycamore (*Platanus racemosa*). Most stands are too dense to allow much understory development. This habitat is considered seral due to repeated disturbance/flooding and is therefore unable to develop into the taller southern cottonwood–willow riparian forest.

Southern willow scrub on site is limited to the overgrowth of arroyo willows (*Salix lasiolepis*) and red willows (*Salix laevigata*) associated with the adjacent off-site drainage. The canopy of the willows in the off-site drainage extends over the chain-link fence along the northern property boundary and encroaches onto the northern portion of the project site. Beneath the portions of the willow canopy on site, the understory is relatively limited and includes species found in the adjacent disturbed area, such as hottentot fig (*Carpobrotus edulis*). This area totals 0.02 acres on site.

6.2 Plants and Wildlife

A total of 108 species of vascular plants, 41 native and 67 non-native species, were recorded during the biological reconnaissance survey (Appendix B). The diversity of native plant species is low due to the historical use of the site for residential, commercial, and industrial purposes and operations, as well as the urban setting of the vicinity. This list does not include a comprehensive list of all the ornamental species observed.

A total of 18 wildlife species were recorded in the site during the surveys (Appendix C). The wildlife species observed are generally common, disturbance-adapted species typically found in urban and suburban settings, such as Anna's hummingbird (*Calypte anna*), American crow (*Corvus brachyrhynchos*), house finch (*Haemorhous mexicanus*), and mourning dove (*Zenaida macroura*). One mammal species was observed within the site—brush rabbit (*Sylvilagus bachmani*). One reptile species was observed during the survey—western fence lizard (*Sceloporus occidentalis*). There is minimal suitable habitat for small non-avian wildlife species (e.g., reptiles, amphibians, and small mammals) within the site due to the disturbed nature of the site, proximity to residential/urban land cover, and limited connectivity of the surrounding habitat to larger expanses of native lands.

No raptor nests were detected on or adjacent to the project area; however, some of the larger trees on site and along the project boundary could potentially support raptor nests.

6.3 Special-Status Species

A search of CNPS and California Natural Diversity Database records was utilized to develop matrices of special-status plant and wildlife species that may have potential to occur on site due to the presence of suitable habitat (taking into consideration vegetation communities, soils, elevation, and geographic range, life form/blooming period, etc.). These two matrices of special-status plant and wildlife species (i.e., federally, state, or locally listed species), their favorable habitat conditions, and their potential to occur on site based on the findings of the field investigations are presented in Appendices C and D, respectively. Species covered under the San Diego Multiple Species Conservation Plan and MHCP are also included in these appendices.

There is no federally designated critical habitat (USFWS 2022b) located within the project site.

6.3.1 Special-Status Plant Species

No plant species listed or proposed for listing as rare, threatened, or endangered by either CDFW or the U.S. Fish and Wildlife Service were detected on site. No plant species considered special status by CNPS were observed.

Appendix C lists special-status plant species that may occur in the vicinity of the site (CDFW 2022b, 2022c; CNPS 2022; USFWS 2022b) or are covered under the Habitat Conservation Plan/Natural Community Conservation Plan. For each species listed, a determination is made regarding the potential for the species to occur on site based on information gathered during the field reconnaissance including the location of the site, habitats or land covers present, current site conditions, historical land use, soils, and topography. No species were determined to have a moderate or high potential to occur given the lack of suitable habitat and disturbed nature of the site.

6.3.2 Special-Status Wildlife Species

Appendix D lists special-status wildlife species that are known to occur in the vicinity of the site (CDFW 2022d, 2022e; USFWS 2022b) or are covered under the Multiple Species Conservation Plan and/or MHCP. No federally or state-listed species or other special-status species were observed during any of the site visits. No species were determined to have a moderate or high potential to occur given the lack of suitable habitat and disturbed nature of the site.

Other special status species that have not been detected on site, but have a low to moderate potential to occur include Cooper's hawk *(Accipiter cooperii)*, Costa's hummingbird (*Calypte costae*), white-tailed kite (*Elanus leucurus),* vermilion flycatcher (*Pyrocephalus rubinus),* yellow warbler (*Setophaga petechia*), least Bell's vireo, spotted bat (*Euderma maculatum*), western red bat (*Lasiurus blossevillii*), western small-footed myotis (*Myotis ciliolabrum*), long-eared myotis (*Myotis evotis*), Yuma myotis (*Myotis yumanensis*), and San Diegan tiger whiptail (*Aspidoscelis tigris stejnegeri*).

6.4 Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for the migration of animals. Habitat linkages are small patches that join larger blocks of habitat and help reduce the

adverse effects of habitat fragmentation; they may be continuous habitat or discrete habitat islands that function as stepping stones for wildlife dispersal.

The vicinity of the project site is situated between a commercial area and suburban areas consisting of a mix of mid- to high-density residential developments and roadways. The site is not within a Biological Core and Linkage Area and is isolated from areas proposed for preservation under the MHCP. The small amount of riparian habitat on site continues off site, but is composed of a small amount of habitat and is disturbed. Regardless of size, this patch of riparian habitat does attract wildlife, but almost all of the riparian habitat is located off site and is lacking management. Connectivity to the project site is not likely to benefit wildlife movement due the extent of surrounding development and lack of native habitat on site. Therefore, the project site is unlikely to serve as a wildlife corridor. However, the site, since it currently is vacant, may provide stopover function for migrants or a local patch of habitat.

7 Impacts Analysis

This section addresses direct, indirect, and cumulative impacts to biological resources that would result from implementation of the proposed project.

Direct impacts include the permanent loss of on-site habitat and the plant and wildlife species that it contains due to grading and the development of the site (Figure 3, Impacts). Direct permanent impacts were quantified by overlaying the proposed project footprint onto the biological resources map. All biological resources within the impact limits were considered directly and permanently impacted. Direct impacts include permanent impacts to 8.23 acres.

Indirect impacts refer to off-site and on-site effects that are short-term impacts (i.e., temporary) due to project construction or long-term (i.e., permanent) design of the project and the effects it may have on adjacent resources. For the proposed project, it is assumed that the potential indirect impacts resulting from construction activities include dust, noise, and general human presence that may temporarily disrupt species and habitat vitality and construction-related soil erosion and runoff. With respect to these latter factors, however, all project grading will be subject to the typical restrictions (e.g., best management practices) and requirements that address erosion and runoff, including the federal Clean Water Act, National Pollution Discharge Elimination System, and preparation of a stormwater pollution prevention plan.

7.1 Vegetation Communities and Land Covers

Direct impacts to vegetation are shown in Table 3. All biological resources within the impact limits were considered directly impacted. Figure 3 illustrates the distribution of biological resources in the project site and the extent of the proposed impacts.

Table 3. Impacts to Vegetation Communities and Land Covers within the Project Site

Vegetation Community/Land Cover	Habitat Code	Acreage	Impacts (Acres)
Non-Native Vegetation Communities, Land Covers, and Unvegetated Habitat			
Disturbed Wetland	11200	0.18	—
Disturbed Habitat	11300	7.94	6.75
Urban/Developed	12000	1.45	1.45
Non-native Riparian	65000	0.59	—

Table 3. Impacts to Vegetation Communities and Land Covers within the Project Site

Vegetation Community/Land Cover	Habitat Code	Acreage	Impacts (Acres)
Arundo-dominated Riparian	65100	0.40	0.02
Native Vegetation Community			
Southern Willow Scrub	63320	0.02	—
Fresh Water	64140	0.14	—
	Total	**10.73**	**8.22**

Proposed impacts to disturbed habitat and urban/developed land are not considered significant because these land covers are not considered special status; they are non-native and provide little biological resource value. Proposed impacts to arundo-dominated riparian habitat, a highly invasive land cover that provides little biological resource value, would be minimal. The arundo-dominated riparian associated with Poway Creek currently extends over the property line and therefore would need to be trimmed back to the property line resulting in a potential temporary loss of 0.02 acres of this vegetation community. It is anticipated that the vegetation will grow back following construction and therefore no mitigation is proposed for impacts to this invasive plant community. Mitigation measures BIO-1, BIO-2, BIO-4, and BIO-5 would be established to prevent direct and mitigate for indirect impacts to sensitive habitats. After mitigation, these impacts would be considered less than significant.

7.2 Potential Jurisdictional Aquatic Resources

Impacts to 0.02 acres of non-native, invasive, arundo-dominated riparian habitat may occur as a result of project implementation. Since this vegetation is associated with Poway Creek, it is assumed that the vegetation is regulated by USACE, RWQCB, and CDFW, however it should be noted that a formal jurisdictional delineation was not conducted. The impacts would only be to the arundo branches that overhang the fence of the property line. The current fence line/property line is proposed to be maintained as the boundary of the new development. These branches may be preserved as they are tall and most of their stalks are outside of the impact footprint and would likely not be affected by grading or construction activities. Typically, removal of this species (*Arundo donax*) is targeted for restoration projects as it is highly invasive, provides minimal habitat value for wildlife, and often outcompetes native vegetation. Trimming of the vegetation would not trigger permits from USACE or RWQCB since the project would not result in any removal or fill of this resource. As discussed further in Section 7.3, the project has been reviewed with CDFW staff to obtain their concurrence on impact avoidance. Given the disturbed nature of this portion of Poway Creek, the surrounding development and the invasive properties of Arundo, CDFW stated that the minor impacts to 0.02 acres of Arundo would not result in a significant impact from their perspective.

The remainder of the arundo-dominated habitat, disturbed wetland habitat, fresh water, and non-native riparian habitat will be preserved, and no direct impacts are anticipated to occur to the latter habitat types. The only native vegetation community on site, southern willow scrub habitat, is located completely outside of and away from the project grading footprint and will not be affected by project construction.

Indirect impacts to the wetland and riparian habitat could potentially occur and would be significant requiring mitigation. Mitigation measures BIO-1, BIO-2, BIO-4, and BIO-5 would be established to protect and mitigate direct and indirect impacts to jurisdictional resources. After mitigation, these impacts would be less than significant.

7.3 Buffers and Setbacks

The project will not result in any impacts to Poway Creek nor will it impact the unnamed tributary. A minimum of 100 feet from the top of slope is provided to avoid any indirect impacts to Poway Creek which is a USGS blueline stream. A setback from the top of slope for the tributary is not provided as it is not a blueline stream. The proposed project development footprint will avoid all of the wetland habitat and the vast majority of the riparian habitat on site, much of which is already highly disturbed and of limited habitat value and quality for resident and migratory wildlife. Additionally, a 50-foot buffer does not currently exist between the wetland and riparian habitats and many of the existing developments within the surrounding areas. Under the proposed project, no wetland or riparian buffer is warranted due to the already highly disturbed nature of the riparian and wetland habitats on site, and the fact that the site is already situated in a heavily developed area.

Dudek biologists met with representatives from CDFW to review the project on July 22, 2022. During this meeting the proposed avoidance of Poway creek and an unnamed tributary were discussed. CDFW staff concurred that the proposed project provides adequate avoidance of the two waterways and did not suggest or request that the project provide additional buffers beyond what is currently proposed.

7.4 Special-Status Plants and Sensitive Habitat

No special-status plants were detected within the site. The majority of the impact area is disturbed habitat and already developed land covers, although the site does include sensitive riparian and wetland habitat. Due to the extent of vegetative disturbance, existing anthropogenic developments, and lack of suitable substrate, special-status plant species are not expected to occur in this area. Therefore, no significant direct or indirect impacts to special-status plants are anticipated.

Direct Impacts

Direct impacts to non-native, invasive riparian habitat may be significant. Mitigation measures **BIO-1** and **BIO-2** provide for the protection of the majority of the disturbed riparian habitat and all of the disturbed wetland habitat on site through the installation of silt fencing around the sensitive habitat and around the perimeter of the construction/grading footprint. It also requires environmental awareness meetings to discuss and educate about sensitive habitats, as well as construction monitoring to help ensure sensitive habitat is protected. After mitigation, these impacts would be less than significant.

Indirect Impacts

Indirect impacts to sensitive habitat may be significant without mitigation. Construction activities may result in the generation of fugitive dust; changes in hydrology, including sedimentation and erosion; and the release of chemical pollutants. Implementation of mitigation measures **BIO-4** and **BIO-5** would reduce these impacts to less than significant.

7.5 Special-Status Wildlife

No special-status wildlife species were detected within the site. The majority of the impact area consists of disturbed habitat and already developed land covers. Due to the extent of vegetative disturbance and existing and

surrounding anthropogenic developments, very limited special-status species are expected to occur in this area. The following special-status species have not been detected on site but do have a low to moderate potential to occur: Cooper's hawk, white-tailed kite, vermilion flycatcher, yellow warbler, least Bell's vireo, spotted bat, western red bat, and San Diegan tiger whiptail.

There is potential for raptors and other birds to nest on site.

Direct Impacts

Direct impacts to potentially occurring special-status species, including Cooper's hawk, white-tailed kite, vermilion flycatcher, yellow warbler, least Bell's vireo, spotted bat, western red bat, and San Diegan tiger whiptail may be significant. Mitigation measures BIO-1 and BIO-3 state that environmental awareness training and nesting bird surveys are to be conducted prior to construction, and should nests be present, an avoidance buffer will be implemented. Vegetation clearing during the breeding season should avoided unless absolutely necessary, in which case, a qualified biologist shall conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. After mitigation, these impacts would be less than significant.

Indirect Impacts

Special-status wildlife, including Cooper's hawk, white-tailed kite, vermilion flycatcher, yellow warbler, least Bell's vireo, spotted bat, western red bat, and San Diegan tiger whiptail may be indirectly impacted during construction by impacts such as the generation of fugitive dust; changes in hydrology resulting from construction, including sedimentation and erosion; and the release of chemical pollutants. Special-status wildlife may also be indirectly affected in the short and long term by noise and lighting, which can disrupt normal activities and subject wildlife to higher predation risks. Implementation of BIO-4 and BIO-5 would reduce these impacts to less than significant.

The small scale of the habitat loss would not appreciably reduce the population of sensitive species in the area. However, nesting birds can be significantly affected by short-term construction-related noise, resulting in decreased reproductive success or abandonment of an area as nesting habitat. Breeding passerine and raptor species likely utilize the various habitats on site for nest construction and foraging. Indirect impacts from construction-related noise may occur to sensitive wildlife if construction occurs during the breeding season (i.e., February 15 through September 1). Potential impacts, including noise, lighting, and increased human presence and vehicle traffic within the site, could significantly affect nesting birds and would be considered significant. Mitigation measure BIO-3 would be implemented in order to avoid impacts to nesting birds. This mitigation measure would reduce potential impacts to a level that is less than significant.

7.6 Wildlife Corridor and Habitat Linkages

As mentioned, the project site is located in a highly urbanized environment. The site is not within a Poway Mitigation Area and is isolated from areas proposed for preservation under the MHCP. Although Poway Creek in the southern portion of the site may have limited value as a movement corridor for some riparian birds, small mammals, and reptiles, the proposed project would not permanently change the functionality of this area. Therefore, there would be no significant impact to areas facilitating wildlife movement. For upland predominantly disturbed habitat use, the site may function as a stepping stone type habitat linkage. However, the vegetation on site is highly dominated by non-native species and still has remnants of the previous developments. Based on the Poway Subarea Habitat

Conservation Plan, due to the lack of designation as a Focused Planning Area and its location outside of Poway Mitigation Areas, the impacts to wildlife movement would be less than significant.

7.7 Consistency with the Multiple Habitat Conservation Program and Multiple Species Conservation Plan

As mentioned, the project site is not located within or immediately adjacent to any Poway Mitigation Areas, and the majority of impacts will occur to disturbed lands and existing developed land. Therefore, the project will not impact the goals and objectives of the Poway Subarea Habitat Conservation Plan. Minimal impacts will occur to invasive, riparian habitat, and no impacts will occur to existing wetlands or native habitat.

8 Mitigation

This section describes the mitigation measures required to offset and avoid direct and indirect impacts to sensitive vegetation communities, jurisdictional resources, and special-status wildlife in the short and long term. These measures will reduce identified and potentially significant impacts to a level that is less than significant.

BIO-1 Staking and silt fencing shall be installed along the entire perimeter of the construction footprint/area proposed for grading. Additionally, pre-construction environmental awareness educational meetings for the team and crews, as well and biological monitoring during vegetation clearing and grading activities, shall occur. Construction/contractor personnel shall complete a Workers Environmental Awareness Program to ensure compliance with environmental/permit regulations and mitigation measures. Construction-limits staking and biological monitoring shall prevent inadvertent impacts to special-status vegetation or potential special-status wildlife species and their habitat.

BIO-2 Prior to construction permit issuance, grading and building plans shall ensure that the wetland and riparian area is protected with on-site construction fencing. The construction fencing shall be portrayed on the construction plans. The construction plans shall specify that construction fencing shall be maintained for the entire duration of construction activity until the permanent, outer wall proposed for the new development has been constructed, protecting the adjacent riparian and wetland habitats.

BIO-3 In accordance with the Migratory Bird Treaty Act of 1918 and Section 3503.5 of the California Fish and Game Code, to avoid any direct impacts to raptors and/or any native/migratory birds, removal of habitat that supports active nests in the proposed project site should occur outside of the breeding season for these species (February 1 to September 15). If removal of habitat in the proposed area of disturbance must occur during the breeding season, a qualified biologist shall conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. The pre-construction survey shall be conducted not more than 72 hours prior to the start of construction activities (including removal of vegetation). If any active nests are detected, the area will be flagged and mapped on the construction plans along with a 300- to 500-foot (for raptors) avoidance buffer, and will be avoided until the nesting cycle is complete or it

is determined that the nest has failed. Noise monitoring may also be required. The final buffer will be determined by the biologist(s).

BIO-4 Prior to construction permit issuance, grading and building plans shall specify the following:

- Employees shall strictly limit their activities, vehicles, equipment, and construction materials to the fenced project footprint.
- To avoid attracting predators, the project site shall be kept as clean of debris as possible. All food related trash items shall be enclosed in sealed containers and regularly removed from the site.
- Any lighting installed for project construction should be faced away from riparian and wetland habitat.
- Appropriate dust control measures (water trucks) should be implemented to reduce the amount of fugitive dust created by the project.
- Pets of project personnel shall not be allowed on the project site.

BIO-5 All construction activity adjacent to wetland habitat areas shall be required to adhere to measures outlined in the Poway General Plan and Poway Grading Ordinance to avoid degradation to wetland and riparian habitat from erosion. These measures include restrictions on the timing and amount of grading. For example, grading shall be prohibited during the rainy season (October 1st through April 15th) without an approved erosion control plan and program in place. Grading or vegetation removal shall be prohibited adjacent to wetland areas during the rainy season unless determined to be allowable on a site-specific basis with the provision of all necessary erosion control devices, which must be in place and maintained throughout the grading period.

If you have any questions or comments regarding the content of this letter, please do not hesitate to email me at scarey@dudek.com or call me at 760.334.1993.

Sincerely,

Shana Carey

Appendix A

List of Plant Species Detected on Site

Plant Species

Angiosperms: Magnoliids-Piperales

SAURURACEAE – LIZARD'S TAIL FAMILY

Anemopsis californica – yerba mansa

Angiosperms: Eudicots

AIZOACEAE – FIG-MARIGOLD FAMILY

* *Carpobrotus edulis* – hottentot-fig

AMARANTHACEAE – AMARANTH FAMILY

Malosma laurina – laurel sumac

* *Schinus molle* – Peruvian pepper tree
* *Schinus terebinthifolius* – Brazilian pepper tree

APIACEAE – CARROT FAMILY

* *Apium graveolens* – common celery
* *Foeniculum vulgare* – sweet fennel

ASTERACEAE – SUNFLOWER FAMILY

Ambrosia psilostachya – western ragweed
Artemisia douglasiana – Douglas mugwort
Baccharis salicifolia ssp. salicifolia – mule-fat, seep-willow
Baccharis sarothroides – broom baccharis
Brickellia californica – California brickellbush
Deinandra fasciculata – fascicled tarweed
Erigeron canadensis – horseweed
Pseudognaphalium biolettii – bicolor cudweed
Xanthium strumarium – cocklebur

* *Centaurea melitensis* – tocalote
* *Dittrichia graveolens* – stinkwort
* *Helminthotheca echioides* – bristly ox-tongue
* *Hypochaeris glabra* – smooth cat's ear
* *Lactuca serriola* – prickly lettuce
* *Matricaria discoidea* – common pineapple-weed
* *Sonchus oleraceus* – common sow-thistle

Baccharis pilularis – chaparral broom, coyote brush
Hazardia squarrosa – sawtooth goldenbush

* *Hedypnois cretica* – crete hedypnois

BORAGINACEAE – BORAGE FAMILY

Amsinckia intermedia – rancher's fiddleneck
Heliotropium curassavicum var. *oculatum* – salt heliotrope

BRASSICACEAE – MUSTARD FAMILY

Lepidium nitidum – shining peppergrass
* *Brassica nigra* – black mustard
* *Cardamine hirsuta* – hairy bittercress
* *Hirschfeldia incana* – short-pod mustard
* *Raphanus sativus* – wild radish
* *Sisymbrium irio* – London rocket

CARYOPHYLLACEAE – PINK FAMILY

* *Spergularia rubra* – ruby sand-spurrey

CHENOPODIACEAE – GOOSEFOOT FAMILY

Atriplex prostrata – prostrate spearscale
* *Atriplex semibaccata* – Australian saltbush
* *Salsola tragus* – prickly russian-thistle, tumbleweed

CONVOLVULACEAE – MORNING-GLORY FAMILY

Calystegia macrostegia – morning-glory

EUPHORBIACEAE – SPURGE FAMILY

Croton setiger – doveweed
* *Euphorbia maculata* – spotted spurge

FABACEAE – LEGUME FAMILY

* *Acacia longifolia* – sydney golden wattle
* *Lotus tenuis* – slender trefoil
* *Medicago polymorpha* – California burclover
* *Melilotus albus* – white sweetclover
* *Melilotus indicus* – Indian sweetclover
* *Vicia sativa* – spring vetch

FAGACEAE – OAK FAMILY

Quercus agrifolia – coast live oak, encina

GERANIACEAE – GERANIUM FAMILY

* *Erodium cicutarium* – red-stem filaree/storksbill
* *Geranium dissectum* – cut-leaf geranium

LAMIACEAE – MINT FAMILY

* *Marrubium vulgare* – horehound
* *Mentha aquatica* – watermint

MALVACEAE – MALLOW FAMILY

* *Malva parviflora* – cheeseweed

MYRSINACEAE – MYRSINE FAMILY

* *Anagallis arvensis* – scarlet pimpernel, poor man's weatherglass

MYRTACEAE – MYRTLE FAMILY

* *Eucalyptus camaldulensis* – river red gum

OLEACEAE – OLIVE FAMILY

Fraxinus cf. *dipetala* – California ash
* *Fraxinus uhdei* – shamel ash
* *Olea europaea* – olive

ONAGRACEAE – EVENING-PRIMROSE FAMILY

Oenothera elata ssp. *hookeri* – Hooker's evening-primrose

OXALIDACEAE – OXALIS FAMILY

* *Oxalis pes-caprae* – bermuda-buttercup

PAPAVERACEAE – POPPY FAMILY

Eschscholzia californica – California poppy

PLANTAGINACEAE – PLANTAIN FAMILY

* *Plantago lanceolata* – English plantain, rib-grass
* *Plantago major* – common plantain

Antirrhinum nuttallianum – Nuttall's snapdragon

POLYGONACEAE – BUCKWHEAT FAMILY

Persicaria lapathifolia – willow smartweed, willow weed
* *Rumex crispus* – curly dock
* *Polygonum aviculare* – common knotweed, doorweed

ROSACEAE – ROSE FAMILY

Heteromeles arbutifolia – toyon, Christmas berry

Rubus ursinus – California blackberry
* *Rubus armeniacus* – Himalayan blackberry

SALICACEAE – WILLOW FAMILY

Populus fremontii ssp. *fremontii* – western cottonwood
Salix gooddingii – Goodding's black willow
Salix laevigata – red willow
Salix lasiolepis – arroyo willow
Salix exigua – narrow-leaf willow

SAPINDACEAE – SOAPBERRY FAMILY

* *Cupaniopsis anacardioides* – carrotwood

THEOPHRASTACEAE – THEOPHRASTA FAMILY

Samolus parviflorus – water-pimpernel, seaside brookweed

ULMACEAE – ELM FAMILY

* *Ulmus parvifolia* – Chinese elm

URTICACEAE – STINGING NETTLE FAMILY

* *Urtica urens* – dwarf nettle

VITACEAE – GRAPE FAMILY

Vitis girdiana – Southern California wild grape

Angiosperms: Monocots

ALLIACEAE – ONION FAMILY

* *Nothoscordum gracile* – yellow false-garlic

ARECACEAE – PALM FAMILY

* *Washingtonia robusta* – Mexican fan palm

ASPARAGACEAE – ASPARAGUS FAMILY

* *Asparagus asparagoides* – florist's-smilax
* *Asparagus officinalis* ssp. *officinalis* – garden asparagus

CYPERACEAE – SEDGE FAMILY

Bolboschoenus maritimus ssp. *paludosus* – prairie bulrush
Carex spissa – San Diego sedge
Eleocharis palustris – common spike-rush
Schoenoplectus acutus var. *occidentalis* – viscid bulrush
Schoenoplectus americanus – Olney's bulrush

POACEAE – GRASS FAMILY

Distichlis spicata – salt grass
* *Arundo donax* – giant reed
* *Avena fatua* – wild oat
* *Bromus diandrus* – ripgut grass
* *Bromus hordeaceus* – soft chess
* *Bromus madritensis* – compact brome
* *Cortaderia selloana* – selloa pampas grass
* *Cynodon dactylon* – bermuda grass
* *Ehrharta erecta* – panic veldt grass
* *Festuca myuros* – rat-tail fescue
* *Festuca perennis* – perennial rye grass
* *Melinis repens* ssp. *repens* – natal grass
* *Poa annua* – annual blue grass
* *Polypogon monspeliensis* – annual beard grass
* *Polypogon viridis* – water beardgrass
* *Stipa miliacea* var. *miliacea* – smilo grass
* *Cenchrus setaceus* – African fountain grass
* *Hordeum murinum* – barley

TYPHACEAE – CATTAIL FAMILY

Typha latifolia – broad-leaf cattail

* signifies introduced (non-native) species

List of Wildlife Species Detected on Site

Wildlife Species

Birds

Finches

FRINGILLIDAE – FRINGILLINE AND CARDUELINE FINCHES AND ALLIES

Haemorhous mexicanus – house finch

Spinus psaltria – lesser goldfinch

Flycatchers

TYRANNIDAE – TYRANT FLYCATCHERS

Sayornis nigricans – black phoebe

Sayornis saya – Say's phoebe

Hummingbirds

TROCHILIDAE – HUMMINGBIRDS

Calypte anna – Anna's hummingbird

Jays, Magpies and Crows

CORVIDAE – CROWS AND JAYS

Aphelocoma californica – California scrub-jay

Corvus brachyrhynchos – American crow

Pigeons and Doves

COLUMBIDAE – PIGEONS AND DOVES

Zenaida macroura – mourning dove

Wood Warblers and Allies

PARULIDAE – WOOD-WARBLERS

Geothlypis trichas – common yellowthroat

Setophaga coronata – yellow-rumped warbler

Woodpeckers

PICIDAE – WOODPECKERS AND ALLIES

Dryobates nuttallii – Nuttall's woodpecker

Wrens

TROGLODYTIDAE – WRENS

Troglodytes aedon – house wren

New World Sparrows

PASSERELLIDAE – NEW WORLD SPARROWS

Melospiza melodia – song sparrow
Melozone crissalis – California towhee
Pipilo maculatus – spotted towhee
Zonotrichia leucophrys – white-crowned sparrow

Mammals

Hares and Rabbits

LEPORIDAE – HARES AND RABBITS

Sylvilagus bachmani – brush rabbit

Reptiles

Lizards

PHRYNOSOMATIDAE – IGUANID LIZARDS

Sceloporus occidentalis – western fence lizard

Appendix C

Special-Status Plant Species Potential to Occur

Scientific Name	Common Name	Status (Federal/ State/CRPR)	City of San Diego MSCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet above mean sea level)	Potential to Occur
Acanthomintha ilicifolia	San Diego thorn-mint	FT/SE/1B.1	Narrow Endemic	Chaparral, coastal scrub, valley and foothill grassland, vernal pools; clay, openings/annual herb/Apr–June/ 35–3,145	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Acmispon prostratus	Nuttall's acmispon	None/None/1B.1	Covered	Coastal dunes, coastal scrub/annual herb/Mar–June (July)/ 0–35	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Adolphia californica	California adolphia	None/None/2B.1	None	Chaparral, coastal scrub, valley and foothill grassland; clay/perennial deciduous shrub/ Dec–May/35–2,425	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Agave shawii var. *shawii*	Shaw's agave	None/None/2B.1	Narrow Endemic	Coastal bluff scrub, coastal scrub/ perennial leaf/Sep–May/10–395	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ambrosia monogyra	singlewhorl burrobrush	None/None/2B.2	None	Chaparral, Sonoran desert scrub; sandy/ perennial shrub/Aug–Nov/35–1,640	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ambrosia pumila	San Diego ambrosia	FE/None/1B.1	Narrow Endemic	Chaparral, coastal scrub, valley and foothill grassland, vernal pools; alkaline (sometimes), clay (sometimes), disturbed areas (often), sandy (sometimes)/perennial rhizomatous herb/Apr–Oct/65–1,360	Not expected to occur. Although the project site does contain ample disturbed habitat, if this species was present it would have been detected during the rare plant survey.
Aphanisma blitoides	aphanisma	None/None/1B.2	Narrow Endemic	Coastal bluff scrub, coastal dunes, coastal scrub; gravelly (sometimes), sandy (sometimes)/annual herb/Feb–June/ 5–1,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Arctostaphylos glandulosa ssp. *crassifolia*	Del Mar manzanita	FE/None/1B.1	Covered	Chaparral/perennial evergreen shrub/June–Apr/0–1,195	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Artemisia palmeri	San Diego sagewort	None/None/4.2	None	Chaparral, coastal scrub, riparian forest, riparian scrub, riparian woodland; mesic, sandy/perennial deciduous shrub/(Feb) May–Sep/50–3,000	Not expected to occur. Although riparian habitat is present on site, it is highly disturbed and likely does not support this species. If this species was present it would have been detected during the rare plant survey.
Asplenium vespertinum	western spleenwort	None/None/4.2	None	Chaparral, cismontane woodland, coastal scrub; rocky/perennial rhizomatous herb/Feb–June/590–3,280	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Astragalus deanei	Dean's milk-vetch	None/None/1B.1	None	Chaparral, cismontane woodland, coastal scrub, riparian forest/perennial herb/Feb–May/245–2,280	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Astragalus oocarpus	San Diego milk-vetch	None/None/1B.2	None	Chaparral, cismontane woodland/perennial herb/ May–Aug/1,000–5,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Astragalus tener var. *titi*	coastal dunes milk-vetch	FE/SE/1B.1	Narrow Endemic	Coastal bluff scrub, coastal dunes, coastal prairie/ annual herb/Mar–May/5–165	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Atriplex coulteri	Coulter's saltbush	None/None/1B.2	None	Coastal bluff scrub, coastal dunes, coastal scrub, valley and foothill grassland; Alkaline (sometimes), clay (sometimes)/perennial herb/Mar–Oct/10–1,505	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Atriplex pacifica	south coast saltscale	None/None/1B.2	None	Coastal bluff scrub, coastal dunes, coastal scrub, playas/ annual herb/Mar–Oct/0–460	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Atriplex parishii	Parish's brittlescale	None/None/1B.1	None	Chenopod scrub, playas, vernal pools; Alkaline/annual herb/June–Oct/80–6,230	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Baccharis vanessae	Encinitas baccharis	FT/SE/1B.1	Covered	Chaparral, cismontane woodland; sandstone/ perennial deciduous shrub/Aug–Nov/195–2,360	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Bergerocactus emoryi	golden-spined cereus	None/None/2B.2	None	Chaparral, closed-cone coniferous forest, coastal scrub; sandy/perennial stem/May–June/10–1,295	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Bloomeria clevelandii	San Diego goldenstar	None/None/1B.1	Covered	Chaparral, coastal scrub, valley and foothill grassland, vernal pools; clay/perennial bulbiferous herb/Apr–May/165–1,525	Not expected to occur. The project site does not contain the habitat necessary to support this species.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	City of San Diego MSCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet above mean sea level)	Potential to Occur
Brodiaea filifolia	thread-leaved brodiaea	FT/SE/1B.1	Covered	Chaparral, cismontane woodland, coastal scrub, playas, valley and foothill grassland, vernal pools; clay (often)/perennial bulbiferous herb/Mar–June/80–3,670	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Brodiaea orcuttii	Orcutt's brodiaea	None/None/1B.1	Covered	Chaparral, cismontane woodland, Closed-cone coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools; clay, mesic/perennial bulbiferous herb/ May–July/100–5,550	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Calandrinia breweri	Brewer's calandrinia	None/None/4.2	None	Chaparral, coastal scrub; burned areas, disturbed areas, loam (sometimes), sandy (sometimes)/annual herb/ (Jan)Mar–June/35–4,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ceanothus cyaneus	Lakeside ceanothus	None/None/1B.2	Covered	Chaparral, closed-cone coniferous forest/perennial evergreen shrub/Apr–June/770–2,475	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ceanothus otayensis	Otay Mountain ceanothus	None/None/1B.2	None	Chaparral/perennial evergreen shrub/Jan–Apr/1,965–3,605	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ceanothus verrucosus	wart-stemmed ceanothus	None/None/2B.2	Covered	Chaparral/perennial evergreen shrub/Dec–May/5–1,245	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Centromadia parryi ssp. *australis*	southern tarplant	None/None/1B.1	None	Marshes and swamps, valley and foothill grassland, vernal pools/annual herb/May–Nov/0–1,570	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Centromadia pungens ssp. *laevis*	smooth tarplant	None/None/1B.1	None	Chenopod scrub, meadows and seeps, playas, riparian woodland, valley and foothill grassland; Alkaline/annual herb/ Apr–Sep/0–2,095	Not expected to occur. Although riparian habitat is present on site, it is highly disturbed and likely does not support this species. If this species was present it would have been detected during the rare plant survey.
Chaenactis glabriuscula var. *orcuttiana*	Orcutt's pincushion	None/None/1B.1	None	Coastal bluff scrub, coastal dunes/annual herb/Jan–Aug/ 0–330	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Chamaebatia australis	southern mountain misery	None/None/4.2	None	Chaparral/perennial evergreen shrub/Nov–May/985–3,345	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Chloropyron maritimum ssp. *maritimum*	salt marsh bird's-beak	FE/SE/1B.2	Covered	Coastal dunes, marshes and swamps/annual herb (hemiparasitic)/May–Oct (Nov)/0–100	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Chorizanthe orcuttiana	Orcutt's spineflower	FE/SE/1B.1	None	Chaparral, closed-cone coniferous forest, coastal scrub; openings, sandy/annual herb/Mar–May/10–410	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Chorizanthe polygonoides var. *longispina*	long-spined spineflower	None/None/1B.2	None	Chaparral, coastal scrub, meadows and seeps, valley and foothill grassland, vernal pools; clay (often)/annual herb/ Apr–July/100–5,015	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Clarkia delicata	delicate clarkia	None/None/1B.2	None	Chaparral, cismontane woodland; gabbroic (often)/annual herb/Apr–June/770–3,280	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Clinopodium chandleri	San Miguel savory	None/None/1B.2	Covered	Chaparral, cismontane woodland, coastal scrub, riparian woodland, valley and foothill grassland; gabbroic (sometimes), rocky (sometimes)/perennial shrub/Mar–July/395–3,525	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Comarostaphylis diversifolia ssp. *diversifolia*	summer holly	None/None/1B.2	None	Chaparral, cismontane woodland/perennial evergreen shrub/ Apr–June/100–2,590	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Convolvulus simulans	small-flowered morning-glory	None/None/4.2	None	Chaparral, coastal scrub, valley and foothill grassland; clay, seeps, serpentinite/annual herb/Mar–July/100–2,425	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Corethrogyne filaginifolia var. *incana*	San Diego sand aster	None/None/1B.1	None	Chaparral, coastal bluff scrub, coastal scrub/perennial herb/ June–Sep/10–375	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Corethrogyne filaginifolia var. *linifolia*	Del Mar Mesa sand aster	None/None/1B.1	Covered	Chaparral, coastal bluff scrub, coastal scrub; sandy/perennial herb/May–Sep/15–490	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Cylindropuntia californica var. *californica*	snake cholla	None/None/1B.1	Narrow Endemic	Chaparral, coastal scrub/perennial stem/Apr–May/100–490	Not expected to occur. The project site does not contain the habitat necessary to support this species.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	City of San Diego MSCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet above mean sea level)	Potential to Occur
Dichondra occidentalis	western dichondra	None/None/4.2	None	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland/perennial rhizomatous herb/(Jan) Mar–July/ 165–1,640	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Dudleya blochmaniae ssp. *blochmaniae*	Blochman's dudleya	None/None/1B.1	None	Chaparral, coastal bluff scrub, coastal scrub, valley and foothill grassland; clay (often), rocky, serpentinite/perennial herb/Apr–June/15–1,475	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Dudleya brevifolia	short-leaved dudleya	None/SE/1B.1	Narrow Endemic	Chaparral, coastal scrub; sandstone/perennial herb/ Apr–May/100–820	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Dudleya variegata	variegated dudleya	None/None/1B.2	Narrow Endemic	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland, vernal pools; clay/perennial herb/ Apr–June/10–1,900	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Dudleya viscida	sticky dudleya	None/None/1B.2	Covered	Chaparral, cismontane woodland, coastal bluff scrub, coastal scrub; rocky/perennial herb/May–June/35–1,800	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ericameria palmeri var. *palmeri*	Palmer's goldenbush	None/None/1B.1	Covered	Chaparral, coastal scrub; mesic/perennial evergreen shrub/ (July)Sep–Nov/100–1,965	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Eriodictyon sessilifolium	sessile-leaved yerba santa	None/None/2B.1	None	Coastal scrub; volcanic/perennial shrub/July/560–560	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Eryngium aristulatum var. *parishii*	San Diego button-celery	FE/SE/1B.1	Covered	Coastal scrub, valley and foothill grassland, vernal pools; mesic/annual/perennial herb/Apr–June/65–2,030	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Erysimum ammophilum	sand-loving wallflower	None/None/1B.2	Covered	Chaparral, coastal dunes, coastal scrub; openings, sandy/perennial herb/Feb–June(July–Aug)/0–195	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Euphorbia misera	cliff spurge	None/None/2B.2	None	Coastal bluff scrub, coastal scrub, Mojavean desert scrub; rocky/perennial shrub/(Oct)Dec–Aug/35–1,640	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ferocactus viridescens	San Diego barrel cactus	None/None/2B.1	Covered	Chaparral, coastal scrub, valley and foothill grassland, vernal pools/perennial stem/May–June/10–1,475	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Geothallus tuberosus	Campbell's liverwort	None/None/1B.1	None	Coastal scrub, vernal pools/ephemeral liverwort//35–1,965	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Githopsis diffusa ssp. *filicaulis*	Mission Canyon bluecup	None/None/3.1	None	Chaparral/annual herb/Apr–June/1,475–2,295	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Grindelia hallii	San Diego gumplant	None/None/1B.2	None	Chaparral, lower montane coniferous forest, meadows and seeps, valley and foothill grassland/perennial herb/May–Oct/ 605–5,725	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Harpagonella palmeri	Palmer's grapplinghook	None/None/4.2	None	Chaparral, coastal scrub, valley and foothill grassland; clay, openings/annual herb/Mar–May/65–3,130	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Hazardia orcuttii	Orcutt's hazardia	None/ST/1B.1	None	Chaparral, coastal scrub; clay (often)/perennial evergreen shrub/Aug–Oct/260–280	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Heterotheca sessiliflora ssp. *sessiliflora*	beach goldenaster	None/None/1B.1	None	Chaparral, coastal dunes, coastal scrub/perennial herb/ Mar–Dec/0–4,015	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Holocarpha virgata ssp. *elongata*	graceful tarplant	None/None/4.2	None	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland/annual herb/May–Nov/195–3,605	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Horkelia truncata	Ramona horkelia	None/None/1B.3	None	Chaparral, cismontane woodland; clay, gabbroic/perennial herb/May–June/1,310–4,265	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Isocoma menziesii var. *decumbens*	decumbent goldenbush	None/None/1B.2	None	Chaparral, coastal scrub/perennial shrub/Apr–Nov/35–445	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Iva hayesiana	San Diego marsh-elder	None/None/2B.2	None	Marshes and swamps, playas/perennial herb/Apr–Oct/ 35–1,640	Not expected to occur. The project site does not contain the habitat necessary to support this species.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	City of San Diego MSCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet above mean sea level)	Potential to Occur
Juncus acutus ssp. *leopoldii*	southwestern spiny rush	None/None/4.2	None	Coastal dunes, marshes and swamps, meadows and seeps/perennial rhizomatous herb/(Mar)May–June/ 10–2,950	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	None/None/1B.1	None	Marshes and swamps, playas, vernal pools/annual herb/ Feb–June/5–4,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Lathyrus splendens	pride-of-California	None/None/4.3	None	Chaparral/perennial herb/Mar–June/655–5,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Lepechinia cardiophylla	heart-leaved pitcher sage	None/None/1B.2	Covered	Chaparral, cismontane woodland, closed-cone coniferous forest/perennial shrub/Apr–July/1,705–4,490	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	None/None/4.3	None	Chaparral, coastal scrub/annual herb/Jan–July/5–2,900	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Leptosyne maritima	sea dahlia	None/None/2B.2	None	Coastal bluff scrub, coastal scrub/perennial herb/Mar–May/ 15–490	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Monardella hypoleuca ssp. *lanata*	felt-leaved monardella	None/None/1B.2	Covered	Chaparral, cismontane woodland/perennial rhizomatous herb/June–Aug/985–5,165	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Monardella viminea	willowy monardella	FE/SE/1B.1	Covered	Chaparral, coastal scrub, riparian forest, riparian scrub, riparian woodland/perennial herb/June–Aug/165–740	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Myosurus minimus ssp. *apus*	little mousetail	None/None/3.1	None	Valley and foothill grassland, vernal pools/annual herb/ Mar–June/65–2,095	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Navarretia fossalis	spreading navarretia	FT/None/1B.1	Narrow Endemic	Chenopod scrub, marshes and swamps, playas, vernal pools/ annual herb/Apr–June/100–2,145	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Navarretia prostrata	prostrate vernal pool navarretia	None/None/1B.2	None	Coastal scrub, meadows and seeps, valley and foothill grassland, vernal pools/annual herb/Apr–July/10–3,965	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Nemacaulis denudata var. *denudata*	coast woolly-heads	None/None/1B.2	None	Coastal dunes/annual herb/Apr–Sep/0–330	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Ophioglossum californicum	California adder's-tongue	None/None/4.2	None	Chaparral, valley and foothill grassland, vernal pools/perennial rhizomatous herb/Jan–June(Dec)/ 195–1,720	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Orcuttia californica	California Orcutt grass	FE/SE/1B.1	Narrow Endemic	Vernal pools/annual herb/Apr–Aug/50–2,165	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Orobanche parishii ssp. *brachyloba*	short-lobed broomrape	None/None/4.2	None	Coastal bluff scrub, coastal dunes, coastal scrub/perennial herb (parasitic)/Apr–Oct/10–1,000	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Packera ganderi	Gander's ragwort	None/SR/1B.2	None	Chaparral/perennial herb/Apr–June/1,310–3,935	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Pentachaeta aurea ssp. *aurea*	golden-rayed pentachaeta	None/None/4.2	None	Chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, riparian woodland, valley and foothill grassland/annual herb/Mar–July/260–6,065	Not expected to occur. Although riparian habitat is present on site, it is highly disturbed and likely does not support this species. If this species was present it would have been detected during the rare plant survey.
Phacelia stellaris	Brand's star phacelia	None/None/1B.1	None	Coastal dunes, coastal scrub/annual herb/Mar–June/ 5–1,310	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Pogogyne abramsii	San Diego mesa mint	FE/SE/1B.1	Narrow Endemic	Vernal pools/annual herb/Mar–July/295–655	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Pogogyne nudiuscula	Otay Mesa mint	FE/SE/1B.1	Narrow Endemic	Vernal pools/annual herb/May–July/295–820	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Pseudognaphalium leucocephalum	white rabbit-tobacco	None/None/2B.2	None	Chaparral, cismontane woodland, coastal scrub, riparian woodland/perennial herb/(July)Aug–Nov(Dec)/0–6,885	Not expected to occur. Although riparian habitat is present on site, it is highly disturbed and likely does not support this species. If this species was present it would have been detected during the rare plant survey.

Scientific Name	Common Name	Status (Federal/ State/CRPR)	City of San Diego MSCP	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet above mean sea level)	Potential to Occur
Quercus cedrosensis	Cedros Island oak	None/None/2B.2	None	Chaparral, closed-cone coniferous forest, coastal scrub/ perennial evergreen tree/Apr–May/835–3,145	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Quercus dumosa	Nuttall's scrub oak	None/None/1B.1	None	Chaparral, closed-cone coniferous forest, coastal scrub/perennial evergreen shrub/Feb–Apr(May–Aug)/ 50–1,310	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Quercus engelmannii	Engelmann oak	None/None/4.2	None	Chaparral, cismontane woodland, riparian woodland, Valley and foothill grassland/perennial deciduous tree/Mar–June/ 165–4,265	Not expected to occur. Although riparian habitat is present on site, it is highly disturbed and likely does not support this species. If this species was present it would have been detected during the rare plant survey.
Salvia munzii	Munz's sage	None/None/2B.2	None	Chaparral, coastal scrub/perennial evergreen shrub/Feb–Apr/ 375–3,490	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Selaginella cinerascens	ashy spike-moss	None/None/4.1	None	Chaparral, coastal scrub/perennial rhizomatous herb/ N.A./65–2,095	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Senecio aphanactis	chaparral ragwort	None/None/2B.2	None	Chaparral, cismontane woodland, coastal scrub/annual herb/ Jan–Apr (May)/50–2,620	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Sidalcea neomexicana	salt spring checkerbloom	None/None/2B.2	None	Chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, playas/perennial herb/Mar–June/ 50–5,015	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Sphaerocarpos drewei	bottle liverwort	None/None/1B.1	None	Chaparral, coastal scrub/ephemeral liverwort/N.A./ 295–1,965	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Stemodia durantifolia	purple stemodia	None/None/2B.1	None	Sonoran desert scrub/perennial herb/(Jan) Apr–Dec/ 590–985	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Stylocline citroleum	oil neststraw	None/None/1B.1	None	Chenopod scrub, coastal scrub, valley and foothill grassland/annual herb/Mar–Apr/165–1,310	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Suaeda esteroa	estuary seablite	None/None/1B.2	None	Marshes and swamps/perennial herb/(Jan–May) July–Oct/ 0–15	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Tetracoccus dioicus	Parry's tetracoccus	None/None/1B.2	Covered	Chaparral, coastal scrub/perennial deciduous shrub/ Apr–May/540–3,280	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Viguiera laciniata	San Diego County viguiera	None/None/4.3	None	Chaparral, coastal scrub/perennial shrub/Feb–June (Aug)/ 195–2,460	Not expected to occur. The project site does not contain the habitat necessary to support this species.
Xanthisma junceum	rush-like bristleweed	None/None/4.3	None	Chaparral, coastal scrub/perennial herb/Jan–Oct/785–3,280	Not expected to occur. The project site does not contain the habitat necessary to support this species.

Status Legend
Federal
FE: Federally listed as endangered
FT: Federally listed as threatened
State
SE: State listed as endangered
ST: State listed as threatened
CRPR: California Rare Plant Rank
1B: Plants rare, threatened, or endangered in California and elsewhere
2B: Plants rare, threatened, or endangered in California, but more common elsewhere
3: Plants about which more information is needed – A Review List
4: Plants of Limited Distribution – A Watch List
Threat Rank
0.1 – Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
0.2 – Moderately threatened in California (20%–80% occurrences threatened/moderate degree and immediacy of threat)
0.3 – Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

INTENTIONALLY LEFT BLANK

Appendix D

Special-Status Wildlife Species Potential to Occur

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Amphibians					
Anaxyrus californicus	arroyo toad	FE/SSC	Covered	Semi-arid areas near washes, sandy riverbanks, riparian areas, palm oasis, Joshua tree, mixed chaparral and sagebrush; stream channels for breeding (typically third order); adjacent stream terraces and uplands for foraging and wintering	Not expected to occur, outside of range. Riparian habitat is too fragmented and site located within a heavily developed area. This species has extremely specialized habitat needs which do not exist on the site or in the surrounding vicinity.
Spea hammondii	western spadefoot	BCC/SSC	None	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley–foothill woodlands, pastures, and other agriculture	Not expected to occur due to lack of suitable vernal pools or ephemeral wetlands used for reproduction present. Site is highly disturbed and surrounded by anthropogenic development.
Birds					
Accipiter cooperii (nesting)	Cooper's hawk	None/WL	Covered	Nests and forages in dense stands of live oak, riparian woodlands, or other woodland habitats often near water	Low potential to occur. Somewhat suitable but fragmented nesting habitat present in disturbed riparian woodlands near water. This species prefers dense stands of native trees, however the non-native riparian habitat on site is poor quality, highly disturbed, and surrounded by anthropogenic development.
Agelaius tricolor (nesting colony)	tricolored blackbird	None/SSC, ST	Covered	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberry; forages in grasslands, woodland, and agriculture	Not expected to occur. Very minimal cattail reeds on site for nesting habitat which are situated in a riparian area with a high percentage of other non-native vegetation species Site is highly disturbed and surrounded by anthropogenic development.
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow	None/WL	Covered	Nests and forages in open coastal scrub and chaparral with low cover of scattered scrub interspersed with rocky and grassy patches	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Ammodramus savannarum (nesting)	grasshopper sparrow	BCC/SSC	None	Nests and forages in moderately open grassland with tall forbs or scattered shrubs used for perches	Not expected to occur. There is not suitably expansive, open grassland habitat present within the project site to support this species. The site is highly disturbed and surrounded by anthropogenic development.
Aquila chrysaetos (nesting and wintering)	golden eagle	None/FP, WL	Covered	Nests and winters in hilly, open/semi-open areas, including shrublands, grasslands, pastures, riparian areas, mountainous canyon land, open desert rimrock terrain; nests in large trees and on cliffs in open areas and forages in open habitats	Not expected to occur. The project site is surrounded by development and there is no suitable open foraging habitat present to support this species. Site is surrounded by by anthropogenic development.
Artemisiospiza belli belli	Bell's sage sparrow	None/WL	None	Nests and forages in coastal scrub and dry chaparral; typically in large, unfragmented patches dominated by chamise; nests in more dense patches but uses more open habitat in winter	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Asio otus (nesting)	long-eared owl	BCC/SSC	None	Nests in riparian habitat, live oak thickets, other dense stands of trees, edges of coniferous forest; forages in nearby open habitats	Not expected to occur. Riparian habitat on site is highly disturbed and surrounded by anthropogenic development.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	None/SSC	Covered	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	Not expected to occur. The project site is highly disturbed and there is no suitable open habitat present to support this species.
Buteo swainsoni (nesting)	Swainson's hawk	None/ST	Covered	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture	Not expected to occur. The project site is surrounded by development and there is no suitable open foraging habitat present to support this species.

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Calypte costae (nesting)	Costa's hummingbird	BCC/None	None	Nests and forages in desert wash, edges of riparian and valley–foothill riparian, coastal scrub, desert scrub, desert succulent scrub, lower-elevation chaparral, and palm oasis	Low potential to occur. Suitable fragmented habitat is present for nesting and foraging opportunities; however the rest of the site is highly disturbed and surrounded by anthropogenic development.
Campylorhynchus brunneicapillus sandiegensis (San Diego and Orange Counties only)	coastal cactus wren	None/SSC	Covered	Southern cactus scrub patches	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Charadrius montanus (wintering)	mountain plover	BCC/SSC	Covered	Winters in shortgrass prairies, plowed fields, open sagebrush, and sandy deserts	Not expected to occur. There is no suitable habitat present to support this species and the site is highly disturbed and surrounded by anthropogenic development.
Charadrius nivosus nivosus (nesting)	western snowy plover	FT, BCC/SSC	Covered	On coasts nests on sandy marine and estuarine shores; in the interior nests on sandy, barren or sparsely vegetated flats near saline or alkaline lakes, reservoirs, and ponds	Not expected to occur. There is no suitable habitat present to support this species and the site is highly disturbed and surrounded by anthropogenic development.
Chlidonias niger (nesting colony)	black tern	BCC/SSC	None	Freshwater marsh with emergent vegetation; in the Central Valley primarily nests and forages in rice fields and other flooded agricultural fields with weeds and other residual aquatic vegetation	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Coccyzus americanus occidentalis (nesting)	western yellow-billed cuckoo	FT/SE	None	Nests in dense, wide riparian woodlands and forest with well-developed understories	Not expected to occur. No suitable expansive and high-quality riparian habitat is present to support this species. Site is highly disturbed and surrounded by anthropogenic development.
Contopus cooperi (nesting)	olive-sided flycatcher	BCC/SSC	None	Nests in mixed-conifer, montane hardwood–conifer, Douglas-fir, redwood, red fir, and lodgepole pine habitats; usually close to water	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Coturnicops noveboracensis	yellow rail	BCC/SSC	None	Nesting requires wet marsh/sedge meadows or coastal marshes with wet soil and shallow, standing water	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Cypseloides niger (nesting)	black swift	BCC/SSC	None	Nests in moist crevices, caves, and cliffs behind or adjacent to waterfalls in deep canyons; forages over a wide range of habitats	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Dryobates nuttallii	Nuttall's woodpecker	BCC/None	None	Primarily oak woodlands, but also riparian woodland, chaparral, and rarely conifer forests	Not expected to occur. No suitable vegetation present and site is highly disturbed and surrounded by anthropogenic development.
Elanus leucurus (nesting)	white-tailed kite	None/FP	None	Nests in woodland, riparian, and individual trees near open lands; forages opportunistically in grassland, meadows, scrubs, agriculture, emergent wetland, savanna, and disturbed lands	Low potential to occur. Not expected to nest on site. Could use site for foraging. Site and adjacent lands are heavily disturbed and developed.
Empidonax traillii extimus (nesting)	southwestern willow flycatcher	FE/SE	Covered	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	Not expected to occur. There are no records of this species near the site. Also, there is no suitable expansive and high-quality riparian habitat present to support this species.
Falco mexicanus (nesting)	prairie falcon	None/WL	None	Forages in grassland, savanna, rangeland, agriculture, desert scrub, alpine meadows; nest on cliffs or bluffs	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Gavia immer (nesting)	common loon	BCC/SSC	None	Extirpated as a breeder from California; winters in coastal waters such as bays, channels, coves, and inlets; also winters inland at large, deep lakes and reservoirs	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Gelochelidon nilotica (nesting colony)	gull-billed tern	BCC/SSC	None	Nests at the Salton Sea and in estuaries in San Diego County; forages in emergent wetland, lakes, mudflats, cropland, and grassland	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Geothlypis trichas sinuosa	saltmarsh common yellowthroat	BCC/SSC	None	Nests and forages in emergent wetlands including woody swamp, brackish marsh, and freshwater marsh	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Haliaeetus leucocephalus (nesting and wintering)	bald eagle	FPD/FP, SE	Covered	Nests in forested areas adjacent to large bodies of water, including seacoasts, rivers, swamps, large lakes; winters near large bodies of water in lowlands and mountains	Not expected to occur. No suitable habitat present to support this species, and site is highly disturbed and surrounded by anthropogenic development.
Icteria virens (nesting)	yellow-breasted chat	None/SSC	None	Nests and forages in dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush	Not expected to occur. No suitable expansive and high-quality riparian habitat is present to support this species.
Ixobrychus exilis (nesting)	least bittern	None/SSC	None	Nests in freshwater and brackish marshes with dense, tall growth of aquatic and semi-aquatic vegetation	Not expected to occur. No suitable freshwater marsh habitat present to support this species.
Laterallus jamaicensis coturniculus	California black rail	None/FP, ST	None	Tidal marshes, shallow freshwater margins, wet meadows, and flooded grassy vegetation; suitable habitats are often supplied by canal leakage in Sierra Nevada foothill populations	Not expected to occur. No suitable habitat present to support this species.
Limnodromus griseus	short-billed dowitcher	BCC/None	None	Coastal mud flats and brackish lagoons	Not expected to occur. No suitable habitat present to support this species.
Passerculus sandwichensis beldingi	Belding's savannah sparrow	BCC/SE	Covered	Nests and forages in coastal saltmarsh dominated by pickleweed (*Salicornia* spp.)	Not expected to occur. No coastal salt marsh habitat is present in the project site to support this species.
Plegadis chihi (nesting colony)	white-faced ibis	None/WL	Covered	Nests in shallow marshes with areas of emergent vegetation; winter foraging in shallow lacustrine waters, flooded agricultural fields, muddy ground of wet meadows, marshes, ponds, lakes, rivers, flooded fields, and estuaries	Not expected to occur. No suitable habitat present to support a nesting colony of this species.
Polioptila californica californica	coastal California gnatcatcher	FT/SSC	Covered	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet above mean sea level	Not expected to occur. No suitable habitat present to support this species.
Pyrocephalus rubinus (nesting)	vermilion flycatcher	None/SSC	None	Nests in riparian woodlands, riparian scrub, and freshwater marshes; typical desert riparian with cottonwood, willow, mesquite adjacent to irrigated fields, ditches, or pastures	Low potential to occur. Suitable fragmented habitat is present for nesting and foraging opportunities; however the rest of the site is highly disturbed and surrounded by anthropogenic development.
Rallus obsoletus levipes	Ridgway's rail	FE/FP, SE	Covered	Coastal wetlands, brackish areas, coastal saline emergent wetlands	Not expected to occur. No suitable habitat present to support this species.
Rynchops niger (nesting colony)	black skimmer	BCC/SSC	None	Nests on barrier beaches, shell banks, spoil islands, and saltmarsh; forages over open water; roosts on sandy beaches and gravel bars	Not expected to occur. No suitable habitat present to support this species.
Setophaga petechia (nesting)	yellow warbler	None/SSC	None	Nests and forages in riparian and oak woodlands, montane chaparral, open ponderosa pine, and mixed-conifer habitats	Low potential to occur. There is marginally suitable riparian habitat present in the project site. There is more potential for this species to forage within the project site than to nest.
Toxostoma redivivum	California thrasher	BCC/None	None	Primarily chaparral, but also coastal scrub, riparian woodland, oak woodland, piñon and juniper woodland, Joshua tree woodland, lower desert scrub, Great Basin scrub, and mesquite thickets	Not expected to occur. No suitable vegetation present and site is highly disturbed and surrounded by anthropogenic development.
Tringa semipalmata	willet	BCC/None	None	Breeds in and adjacent to wetlands. Overwinters in mudflat, marsh, sandy beach, and rocky coast habitats.	Not expected to occur. Wetland habitat on site is highly disturbed and surrounded by anthropogenic development.
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Covered	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	Low potential to occur. Riparian habitat is disturbed which limits nesting and foraging opportunities; site is surrounded by anthropogenic development. Most recent CNDDB occurrence is from 2017 about 1 mile away from the site.

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Invertebrates					
Branchinecta sandiegonensis	San Diego fairy shrimp	FE/None	Covered	Vernal pools, non-vegetated ephemeral pools	Not expected to occur. There is no vernal pool habitat or other suitable ephemerally-pooling habitat present to support this species.
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	Covered	Vernal pools, non-vegetated ephemeral pools	Not expected to occur. There is no vernal pool habitat or other suitable ephemerally-pooling habitat present to support this species.
Mammals					
Antrozous pallidus	pallid bat	None/SSC	None	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees	Not likely to roost due to lack of suitable rocky areas present on site.
Chaetodipus californicus femoralis	Dulzura pocket mouse	None/SSC	None	Open habitat, coastal scrub, chaparral, oak woodland, chamise chaparral, mixed-conifer habitats; disturbance specialist; 0 to 3,000 feet above mean sea level	Not likely to inhabit. Limited suitable coastal scrub habitat present on site.
Chaetodipus fallax fallax	northwestern San Diego pocket mouse	None/SSC	None	Coastal scrub, mixed chaparral, sagebrush, desert wash, desert scrub, desert succulent shrub, pinyon–juniper, and annual grassland	Not likely to inhabit due to lack of suitable gravelly or rocky soil used for burrows present on site.
Choeronycteris mexicana	Mexican long-tongued bat	None/SSC	None	Desert and montane riparian, desert succulent scrub, desert scrub, and pinyon–juniper woodland; roosts in caves, mines, and buildings	Not expected to roost. Lack of suitable roosting habitat.
Corynorhinus townsendii	Townsend's big-eared bat	None/SSC	None	Mesic habitats characterized by coniferous and deciduous forests and riparian habitat, but also xeric areas; roosts in limestone caves and lava tubes, man-made structures, and tunnels	Not expected to roost. Lack of suitable roosting habitat.
Dasypterus xanthinus	western yellow bat	BCC/SSC	None	Valley–foothill riparian, desert riparian, desert wash, and palm oasis habitats; below 2,000 feet above mean sea level; roosts in riparian and palms.	Not expected to roost. Riparian habitat on site is disturbed, therefore there is a lack of suitable roosting habitat.
Dipodomys stephensi	Stephens' kangaroo rat	FE/ST	None	Annual and perennial grassland habitats, coastal scrub or sagebrush with sparse canopy cover, or in disturbed areas	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Euderma maculatum	spotted bat	None/SSC	None	Foothills, mountains, desert regions of southern California, including arid deserts, grasslands, and mixed-conifer forests; roosts in rock crevices and cliffs; feeds over water and along washes	Low potential to roost. May use buildings for roosting, but site is in a suburban/urban setting which limits foraging opportunities.
Eumops perotis californicus	western mastiff bat	None/SSC	None	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels	Not likely to roost due to lack of suitable rocky canyons and cliffs present on site.
Lasiurus blossevillii	western red bat	None/SSC	None	Forest, woodland, riparian, mesquite bosque, and orchards, including fig, apricot, peach, pear, almond, walnut, and orange; roosts in tree canopy	Low potential to occur. Roosts primarily in trees adjacent to streams and urban areas. Although trees are present, the project site is highly disturbed.
Lepus californicus bennettii	San Diego black-tailed jackrabbit	None/None	None	Arid habitats with open ground; grasslands, coastal scrub, agriculture, disturbed areas, and rangelands	Not expected to occur. No suitable vegetation present and site is highly disturbed and surrounded by anthropogenic development.
Myotis ciliolabrum	western small-footed myotis	None/None	None	Arid woodlands and shrublands, but near water; roosts in caves, crevices, mines, abandoned buildings	Moderate potential to occur. May use adjacent man-made structures for roosting habitat.
Myotis evotis	long-eared myotis	None/None	None	Brush, woodland, and forest habitats from sea level to 9,000 feet above MSL; prefers coniferous habitats; forages along habitat edges, in open habitats, and over water; roosts in buildings, crevices, under bark, and snags; uses caves as night roosts	Moderate potential to occur. May use adjacent man-made structures for roosting habitat.

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Myotis yumanensis	Yuma myotis	None/None	None	Riparian, arid scrublands and deserts, and forests associated with water (streams, rivers, tinajas); roosts in bridges, buildings, cliff crevices, caves, mines, and trees	Moderate potential to occur. May use adjacent man-made structures for roosting habitat.
Neotoma lepida intermedia	San Diego desert woodrat	None/SSC	None	Coastal scrub, desert scrub, chaparral, cacti, rocky areas	Not expected to occur. There is no suitable scrub or chaparral habitat, and the site is highly disturbed and surrounded by anthropogenic development.
Nyctinomops femorosaccus	pocketed free-tailed bat	None/SSC	None	Pinyon–juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oases; roosts in high cliffs or rock outcrops with drop-offs, caverns, and buildings	Not expected to occur. No suitable desert habitat present.
Nyctinomops macrotis	big free-tailed bat	None/SSC	None	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water	Not likely to roost due to lack of suitable rocky outcrops and high cliffs present on site.
Perognathus longimembris pacificus	Pacific pocket mouse	FE/SSC	None	fine-grained sandy substrates in open coastal strand, coastal dunes, and river alluvium	Not likely to inhabit due to lack of suitable open coastal area or coastal dune habitat present on site. Thought to be extirpated except for very close to the coast in a few remaining locations. Closest location is at Camp Pendleton.
Taxidea taxus	American badger	None/SSC	Covered	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	Not expected to occur. There is a small amount of open, undeveloped habitat present within the project site, but this species is not expected to occur in developed areas with high levels of human disturbance.
Reptiles					
Anniella stebbinsi	southern California legless lizard	None/SSC	None	Coastal dunes, stabilized dunes, beaches, dry washes, valley–foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils	Not expected to occur. There is very little suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Arizona elegans occidentalis	California glossy snake	None/SSC	None	Arid scrub, rocky washes, grasslands, chaparral, open areas with loose soil	Not expected to occur. There is very little suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Aspidoscelis hyperythra	orange-throated whiptail	None/WL	Covered	Low-elevation coastal scrub, chaparral, and valley–foothill hardwood	Not expected to occur. There is no suitable coastal sage scrub and very little adjacent open habitat present in the project site to support this species.
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/SSC	None	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	Low potential to occur. There is small amount of disturbed habitat present in the project site. Potential to occur is lower due to the project site being surrounded by anthropogenic development.
Coleonyx variegatus abbotti	San Diego banded gecko	None/SSC	None	Rocky areas within coastal scrub and chaparral	Not expected to occur. There is no suitable rocky habitat present to support this species, and the site is highly disturbed and surrounded by anthropogenic development.
Crotalus ruber	red diamondback rattlesnake	None/SSC	None	Coastal scrub, chaparral, oak and pine woodlands, rocky grasslands, cultivated areas, and desert flats	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.
Diadophis punctatus similis	San Diego ringneck snake	None/None	None	Moist habitats including wet meadows, rocky hillsides, gardens, farmland grassland, chaparral, mixed-conifer forest, and woodland habitats	Not expected to occur. No suitable habitat present and site is highly disturbed and surrounded by anthropogenic development.

Species	Common Name	Status (Federal/ State)	City of San Diego MSCP Subarea Plan	Habitat	Potential to Occur
Phrynosoma blainvillii	Blainville's horned lizard	None/SSC	Covered	Open areas of sandy soil in valleys, foothills, and semi-arid mountains including coastal scrub, chaparral, valley–foothill hardwood, conifer, riparian, pine–cypress, juniper, and annual grassland habitats	Not expected to occur. The project site is disturbed and partially developed, which generally results in high presence of non-native Argentine ants and lack of native harvester ants.
Salvadora hexalepis virgultea	coast patch-nosed snake	None/SSC	None	Brushy or shrubby vegetation; requires small mammal burrows for refuge and overwintering sites	Not expected to occur. There is no suitable coastal sage scrub present, and the site is highly disturbed and surrounded by anthropogenic development.
Thamnophis hammondii	two-striped gartersnake	None/SSC	None	Streams, creeks, pools, streams with rocky beds, ponds, lakes, vernal pools	Not expected to occur. Site is highly disturbed and surrounded by anthropogenic development.

INTENTIONALLY LEFT BLANK

1 Introduction

Dudek evaluated and recorded information about regulated trees for the proposed Harmon Ranch Specific Plan and Tentative Map Project (project) in the City of Poway (City), California, and prepared this tree inventory and arborist report. Specifically, Dudek evaluated and recorded information about native trees as defined by Section 12.32.040 (Definitions) of the City's Municipal Code. Furthermore, this tree inventory and arborist report evaluates project-related impacts and provides recommendations for tree preservation, protection, and mitigation in accordance with the City's Municipal Code (City of Poway 2023). The project site is located in Poway, California, and, as such, this Arborist Report is prepared in accordance Chapter 12.32 of the City's Municipal Code.

Dudek's arborists, certified by the International Society of Arboriculture (ISA), performed various tasks associated with surveying, inventorying, and evaluating the condition of the site's trees, as described in the following sections. The purpose of this tree inventory and arborist report is to present the physical characteristics, mapped locations, impact and preservation totals, and appropriate mitigation for impacts to protected trees, if any occur. The tree quantities and related project impacts were analyzed and are reported in the following sections.

1.1 Site Description

The proposed project site is located within the southern area of the City, south of Poway Road and east of Pomerado Road (Figure 1). The approximately 11.5-acre project site comprises approximately 5.7 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets and 0.5 acres of public right-of-way (Oak Knoll Road). The 11.5-acre project site is currently designated Residential Single Family 7 (RS-7) in the Poway General Plan (City of Poway 1991), which permits single-family homes on a minimum of 4,500-square-foot lots and a maximum density of 8 dwelling units per acre (Figure 2). Surrounding land uses include a mix of retail land uses and the Kumeyaay Interpretive Center to the north; Oak Knoll Road, Poway Creek, and existing single-family homes to the south and east, which are also designated RS-7; and an apartment community to the west.

Throughout the site, topography ranges from about 440 to 510 feet above mean sea level. The northern portion of the project site previously containned a San Diego Gas & Electric storage yard and several small, uninhabited buildings. There is also a small drainage that runs through the northwestern corner of the site, which has steep drops at the associated cement culverts at either end; one culvert is along the western project boundary, and the other is along the northern project boundary. Also associated with the drainage is disturbed riparian and disturbed wetland habitat. The remainder of the northern portion of the project site consists primarily of disturbed habitat including non-native, invasive, and ornamental plant species.

The southern portion of the project boundary contains a small uninhabited residence and disturbed habitat adjacent to Oak Knoll Road. Further into the site, there are large stands of invasive *Arundo donax* that surround Poway Creek,which runs east–west through the southern portion of the project site. Along Poway Creek, there is also disturbed riparian habitat with a high proportion of non-native invasive plant species.

The current property owner is Harmon Family Trust. The majority of the site has been cleared for several years and was previously used as a construction staging yard for a San Diego Gas & Electric gas line project. The site includes four existing single-family residences. One of the existing homes is a locally designated historic building located at 12702 Oak Knoll Road (APN 317-500-14-00). The historic building was built in 1933 and is constructed of cobblestones. The building is presently designated as City of Poway Historical Site 113 and is documented and

known as the "Harmon House." The historic home will be retained in place within a 0.25-acre site as part of the project. The historic home site will be designated Residential – Historic Home within the Specific Plan.

1.2 Project Description

Lennar Homes of California LLC (Applicant) is proposing a residential neighborhood on an approximate 11.55-acre project site. The proposed project would include 64 single-family detached homes. The proposed project density (8.8 units/acre) is slightly higher than the 8.0 units/acre permitted in the existing RS-7 designation. Primary access to the project site is planned via existing Oak Knoll Road. Fifty-nine of the new homes are proposed to front newly constructed private streets, while four homes and an open space/overlook area front existing Oak Knoll Road. The existing historic home has direct access via Oak Knoll Road.

The Applicant is proposing a Specific Plan and Tentative Map to facilitate development of 64 single-family homes. The Harmon Ranch Specific Plan will establish three land use districts within the project site: Residential Single Family (R-SF); Open Space (OS); and Open Space Recreation (OS-R). The Specific Plan will also provide development regulations and permitted uses for each land use district. Appendix D, Land Use Plan, shows the proposed development in detail.

The proposed project is composed of 64 single-family homes on lots 42 feet wide and 85 to 90 feet deep, with standard two-car garages and 20-foot-deep by 20-foot-wide driveways to accommodate an additional two off-street parking spaces within the private lots and private fenced rear yards. The proposed project also includes 40 guest parking spaces along the private streets, approximately 1.0 acre of Open Space Recreation areas, approximately 2.2 acres of natural Open Space areas, and a segment of the General Plan Community Trail (approximately 1,000 feet) within the project site. A potential off-site trail connection to the adjacent retail area located to the north may occur in the future, subject to property owner cooperation, but is not part of the proposed project. The "overlook" area located in the south portion of the project site is planned to provide public access and will be privately maintained. Table 1 describes in detail the allocation of proposed land uses.

Table 1. Land Use Summary

Use/Land Use	Approx. Net Acres (AC)	Percent of Planning Area	Maximum Dwelling Units (DU)1	Density (DU/AC)2
Non-residential Land Uses				
Open Space (OS-1 & 2) (Floodway)	1.88	16.3%	N/A	N/A
Open Space (OS-3 & 4)	0.31	2.7%	N/A	N/A
Open Space Recreation (OSR-1 to 7)	0.99	8.6%	N/A	N/A
Subtotal Open Space	*3.18*	*27.6%*	*N/A*	*N/A*
Private Internal Residential Streets	1.88	16.3%	N/A	N/A
Oak Knoll Road right-of-way (existing)	0.49	4.3%	N/A	N/A
Subtotal Streets	*2.37*	*20.6%*	*N/A*	*N/A*
Subtotal Non-residential	*5.55*	*48.2%*	*N/A*	*N/A*
Residential (R) Land Use				
Residential Single Family (R-SF) (Lots 1 to 64)	5.96	51.8%	64	—
Subtotal Residential	*5.96*	*51.8%*	*64*	—
Total Specific Plan Area3	**11.51**	**100%**	**64**	**8.8**

Notes: N/A = does not apply.

1 Statistics are based upon preliminary design and may vary slightly from Development Plan, Tentative Map, and/or Final Map. Refer to Chapter 7 regarding substantial conformance.

2 Pursuant to State Law, local governments cannot preclude an Accessory Dwelling Unit (ADU) or Junior Accessory Dwelling Units (JADU). An ADU and JADU is an accessory use for the purposes of counting allowable density under general plan and zoning and is therefore not counted as an additional unit. An ADU and JADU shall be permissible in accordance with the PMC or, if the locally adopted ordinance is void, the State Government Code. See Section 3.2.2.G for information regarding ADUs.

3 Open Space areas within the floodway (OS-1 and OS-2) and public street (Oak Knoll Road) and internal private streets are excluded from the density calculation. The following calculation was utilized to determine the net residential density for the project: Residential (5.96 ac) + Open Space Recreation Lots 1-7 (0.99 ac) + Open Space Lots 3 and 4 (0.31 ac) = 7.26 ac. 64 / 7.26 = 8.8.

Discretionary actions that require Poway City Council consideration include the following:

- Environmental Impact Report
- General Plan Amendment/Zone Change from Residential Single-Family 7 (RS-7) to Planned Community (PC)
- Tentative Map
- Development Review Permit
- Final Map

2 Methods

2.1 Individual Tree Evaluation

Consistent with Chapter 12.32 of the City's Municipal Code, this arborist report is based on information compiled through field reconnaissance and a review of appropriate site reference materials, including aerial photography, U.S. Geological Survey topographic maps, and digital ortho-quarter quadrangle data. Dudek ISA Certified Arborists conducted a tree survey on the project site on July 13, 2022.

Chapter 12.32 of the City's Municipal Code protects all "native" trees, as defined in Section 12.32.040. Native trees, according to Section 12.32.040, include any tree of the following species: Coast live oak (*Quercus agrifolia*), Canyon live oak (*Quercus chrysolepis*), Engelmann oak (*Quercus engelmannii*), and California sycamore (*Platanus racemosa*).

All trees meeting the City's definition of "native" located on the project site were assessed, inventoried, mapped, and plotted on a tree location exhibit (Appendix A). No tree tags were placed on the trunks of inventoried trees. Tree ID numbers correspond to the tree locations presented in Appendix A and the tree information matrix in Appendix B.

The location of each mature tree was mapped using a Trimble Pathfinder Pro XH GPS receiver (Appendix A). The Pathfinder has a horizontal accuracy of 1 meter (1 sigma) using differential code positioning techniques. Because tree canopies can sometimes cause loss of satellite lock by blocking the line of sight to satellites, an electronic compass and reflectorless electronic distance measuring device were also used in mapping tree locations. The electronic distance measuring device/compass combination operates in concert with the Pathfinder system to position offsets, and offset information is automatically attached to the GPS position data string.

Concurrent with tree mapping efforts, Dudek arborists collected the following tree attribute data: species, quantity of individual trunks, individual trunk diameters, overall height, canopy extent, and general health and structural conditions. Trunk diameter measurements were collected at 4.6 feet above the ground along the trunk axis, with a few exceptions. In cases where a tree's trunk was located on a slope, the 4.6-foot distance was approximated as the average of the shortest and longest sides of the trunk (i.e., the uphill side and downhill side of a tree's trunk), and the measurement was made of the circumference of the trunk at this point. Tree height measurements were ocular estimates made by experienced field arborists. Tree canopy diameters were typically estimated by "pacing off" the measurement based on the investigator's knowledge of his stride length or by visually estimating the canopy width. Tree-crown diameter measurements were made along an imaginary line intersecting the tree trunk that best approximated the average canopy diameter.

Pursuant to the Guide for Plant Appraisal (ISA 2000), tree health and structure were evaluated with respect to five tree components: roots, trunk(s), scaffold branches, small branches, and foliage. Each component of the tree was assessed for health factors such as insect, fungal, or pathogen damage; fire damage; mechanical damage; presence of decay; presence of wilted or dead leaves; and wound closure. Components were graded as good, fair, poor, or dead, with "good" representing no apparent problems, and "dead" representing a dying or dead tree. This method of tree condition rating is comprehensive and results in ratings that are useful for determining the status of trees based on common standards. Trees in natural settings have important habitat value, even when they are in poor health, as evidenced by numerous cavity nesters and insects that thrive on and within oak trees. However, this assessment focused on tree health and structure to analyze potential project impacts, and, where necessary, to provide recommendations for mitigating potential tree hazards such as weak limb attachments, cavities, rot, or excessive lean.

Upon completion of field data collection and mapping, raw GPS data was post-processed using GPS Pathfinder Office (version 5.4), and individual tree location data was compiled and updated in geographic information system (GIS) software. The digital tree locations were linked to individual tree identification numbers and associated tree attribute data. This data set was then evaluated using ArcGIS (version 10.1) software to determine the position of individual trees related to the proposed project's development areas. Data resulting from this analysis were used to evaluate the individual tree impact totals presented in this report.

2.2 Scope of Work Limitations

No root crown excavations or investigations, aerial evaluations, or internal probing was performed during the tree assessment. Therefore, the presence or absence of internal decay or other hidden inferiorities in individual trees could not be confirmed. It is recommended that any large tree proposed for preservation in an area that receives human use be thoroughly inspected for internal and/or subterranean decay by a qualified ISA Certified Arborist before finalizing preservation plans.

3 Observations

3.1 Individual Trees

There are 157 trees representing 19 different species located within the project tree survey area. The 157 trees comprise one "native" oak tree and 156 non-jurisdictional trees. As Table 2 indicates, a majority (156 trees) of the inventoried trees do not meet the "native" tree criteria established in Chapter 12.32 of the City Municipal Code. Table 2 provides a summary of the 19 individual species mapped and evaluated within the tree survey area. The tree location exhibit in Appendix A presents the location of the individual trees mapped and assessed for the project.

Overall, the trees exhibit growth and structural conditions that are typical of their locations as both landscape and natural trees. The trees include various trunk and branch maladies, as well as varying health and structural conditions. As presented in the tree information matrix in Appendix B, 50.96% (80 trees) of the individually mapped trees exhibit good health condition; 46.5% (73 trees) are in fair health condition; and 2.55% (4 trees) are in poor health condition. The single oak tree was found to be in good health. Structurally, 28.6% (45 trees) of the individually mapped trees are considered to exhibit good structure, 68.15% (107 trees) exhibit fair structure, and 3.18% (5 trees) exhibit poor structure. The single oak tree was found to have good structure. Good condition trees exhibit acceptable vigor, healthy foliage, and adequate structure, and lack of any major maladies. Fair condition trees are typical, with few maladies but declining vigor. Poor condition trees exhibit declining vigor, unhealthy foliage, poor branch structure, and/or excessive lean.

Table 2. Summary of Trees at Project Site

Scientific Name	Common Name	Number of Trees
Eucalyptus camaldulensis	Red gum eucalyptus	21
Eucalyptus polyanthemos	Silver dollar gum eucalyptus	1
Fraxinus uhdei	Shamel ash	2
Grevillea robusta	Silk oak	2
Koelreuteria bipinnata	Chinese flame	1
Melia azedarach	Chinaberry	1
Olea europaea	Olive	4
Phoenix canariensis	Canary Island date palm	1
Pinus halepensis	Aleppo pine	2
Pistacia chinensis	Chinese pistache	4
Platanus acerifolia	London plane	1
Populus fremontii	Fremont cottonwood	3
Quercus agrifolia	Coast live oak	1
Salix gooddingii	Goodding's willow	28
Schinus molle	Peruvian pepper	19
Schinus terebinthifolius	Brazilian pepper	11
Ulmus parvifolia	Chinese elm	2
Ulmus pumila	Siberian elm	1
Washingtonia robusta	Mexican fan palm	52
	Total	**157**

Trees within the tree survey area vary in size and stature according to species and available growing space. The trees on site are primarily single stemmed with trunk diameters ranging from 3 to 32 inches diameter at standard height (DSH). Multi-stemmed trees with 2 to 25 stems (multi-stemmed Brazilian pepper re-sprout) have individual diameters of up to 23 inches DHS. The site's single oak tree has a DSH of 7 inches. Tree heights vary from 4 to 50 feet. Taller trees (40-plus feet) are represented primarily by the site's Mexican fan palms. The site's oak tree is approximately 15 feet tall. Tree crown extents range from 5 feet to nearly 45 feet at their widest points. The site's only oak tree has a crown width of approximately 12 feet.

4 Tree Preservation

4.1 Regulatory Definitions and Requirements

Tree protection, removal, and replacement standards are included in the City's Urban Forestry Ordinance, which is Chapter 12.32 of the City's Municipal Code. The Urban Forestry Ordinance recognizes "native" trees as especially important in the practice of urban forestry. Sections 12.32.010 through 12.32.220 set forth rules and standards related to mature tree removal, protection, and replacement. The following text is taken from the City's Urban Forestry Ordinance (City of Poway 2000).

Section 12.32.040 (Definitions)

1. "Heritage tree" means any mature tree or mature stand of trees designated by the City Council as having historic or cultural significance.
2. "Native tree" means any tree of the following species: Coast Live Oak (Quercus agrifolia), Canyon Live Oak (Quercus chrysolepis), Engelmann Oak (Quercus engelmannii), and California Sycamore (Platanus racemosa).

Section 12.32.150 (Private Tree Removal Permit)

A. The Director of Development Services shall maintain the City's private tree removal permit records and issue such permits.

B. A property owner shall first obtain a private tree removal permit authorizing the removal of a private tree that is a native tree or a heritage tree subject to terms and conditions deemed appropriate by the Director of Development Services or his/her designee. On commercial and industrial property, a permit shall be required for the removal of any living tree greater than three inches in diameter.

C. Applicants shall be expected to replace these types of trees in accordance with PMC 12.32.170; "Replacement of Trees." The Director of Development Services, or his/her designee shall review each private tree removal permit application and make a recommendation as to whether the permit shall be issued or denied. The decision to issue or deny the permit and any terms and conditions of the permit shall be based on the following criteria:

1. The condition of the tree with respect to disease, general health, damage, public nuisance, danger of falling, proximity to existing or proposed structures and interference with utility services, age or remaining life span, and whether or not the tree acts as host for a plant which is parasitic to other species of trees which are in danger of being infested or exterminated by the parasite;
2. The necessity of the requested action to construct improvements, or allow economic or other enjoyment of the property;
3. The topography of the land and the effect of the requested action on erosion, soil retention, water retention, and diversion or increased flow of surface water;

4. The number, species, size, and location of existing trees in the area and the effect of the requested action in terms of providing shade, protection from wind, air pollution reduction, historic or cultural value, and scenic beauty upon the health, safety, aesthetics, and general welfare of the City as a whole;
5. Generally accepted International Society of Arboriculture practices addressing topics such as, but not limited to, the number of healthy trees a given parcel of land will support;
6. Native trees shall be retained unless their removal is absolutely necessary. (Ord. 521 § 1(B), 2000)

4.1.1 Migratory Bird Treaty Act

The Migratory Bird Treaty Act requires that any tree removal or potentially disturbing construction activities occur during certain months to avoid harassment of nesting birds. According to the Migratory Bird Treaty Act, no construction or other disturbing activities can occur within 500 feet of an active bird nest from January through June each year. Biological surveys should be conducted to provide clearance before initiation of project construction.

4.2 Impacts

Tree impacts were determined using GIS technology and spatial locations of trees relative to the proposed project impact areas (limits of grading). Upon determining the individual tree locations in relation to the limits of grading, Dudek evaluated the specific type of work that is proposed to occur within and immediately adjacent to the potentially impacted trees. Impacts were determined based on Dudek's experience with native and non-native trees and their typical reactions to root disturbances from construction activities such as soil compaction, excavation, and remedial grading. The impact analysis results presented herein were used to develop mitigation measures for the proposed project.

Impacts to trees can be classified as either direct or indirect. Direct impacts to trees related to site improvements are typically the result of physical injuries or changes caused by machinery involved with the development process. Direct impacts include tree removal, root damage, soil excavation and compaction, grade changes, loss of canopy, and trunk wounds, among others. Indirect impacts to trees are the result of changes to the site that may cause tree decline, even when the tree is not directly injured. Indirect impacts include alterations to stream flow rates, diversion of groundwater flow, introduction of exotic plant species, and alterations to disturbance regimes. Wider-scale alterations to the area near trees, plus specific changes that occur around the trees, are important considerations.

There is a great deal of variation in tolerance to construction impacts among tree species, ages, and conditions. It is important to know how a certain tree, based on its species, age, and condition, would respond to different types of disturbance. The trees in the project site are of varying ages and conditions. Mature specimens are typically more sensitive to root disturbance and grade changes. In general, healthy trees will respond better to changes in their growing environment. Trees in poor health or stressed conditions may not be vigorous enough to cope with direct or indirect impacts from construction activities.

Impact totals presented herein are based on conceptual disturbance limits as of the date of this tree inventory and arborist report. As such, the actual number of trees that are subject to direct impacts may change as the site planning process proceeds.

4.2.1 Tree Impacts

Based on proposed project development plans, it is estimated that 59 trees on the proposed project site will require removal. Of the 59 trees identified for removal, one is a protected "native" oak, and the remaining 58 trees are non-protected ornamental trees. Details regarding individual tree disposition status can be found in Appendix B and seen in Appendix C, Tree Impacts.

4.3 Mitigation

Section 12.32.170 of the City's Municipal Code identifies tree replacement standards for projects affecting "native" trees. Section 12.32.170 specifically states,

> Any person removing a live tree pursuant to a permit issued by the Director of Development Services or his/her designee shall replace such tree on a one-for-one basis with a tree of the same size of a species and in a location approved by the Director of Development Services or his/her designee. Where the tree to be removed exceeds the size of a 72-inch-box specimen (approximately eight inches in diameter), two 48-inch box specimen trees shall be used as replacements. These requirements may be waived or modified by the Director of Development Services if it is determined that the requirements impose an unreasonable hardship (Ord. 521 Section 1(B), 2000).

Based on proposed project development plans, it is estimated that 59 trees on the proposed project site will require removal. Of the 59 trees identified for removal, one is a "native" oak tree and the remaining 58 are non-jurisdictional. Based on Section 12.32.170 of the City of Poway's Municipal Code, the minimum mitigation planting requirements for the removal of one "native" oak tree is one-for-one basis with a tree of the same size. As such, based on the size of the tree (7 inches in diameter) and the City requirements, Dudek recommends planting one 96-inch box coast live oak tree in the post-construction landscape. Furthermore, to account or the loss of 58 additional non-protected trees, Dudek recommends that as many trees as feasible be replanted on the project sites. Based on a review of the site's available planting area and landscape plan, the site can support up to 42 trees within the specific plan area. As such, Dudek recommends planting, as feasible, 42 15-gallon (or larger) drought-tolerant trees in the post-construction landscape. It should be noted that the City ordinance only requires replacement of the single "native" oak tree and that replacement of the additional 42 trees is not required by the City ordinance.

INTENTIONALLY LEFT BLANK

5 Tree Protection

Based on the proposed project footprint, 98 of the inventoried trees on or adjacent to the proposed project site will be retained. Tree protection is a key component in the continued success of the trees on site, especially those immediately adjacent to the project footprint (encroachment trees). As such, it is recommended that the 87 preserved and 11 encroached-upon trees be protected in accordance with the tree protection measures in Appendix E.

INTENTIONALLY LEFT BLANK

6 Conclusion

Dudek inventoried and evaluated 157 trees on and adjacent to the proposed project site, of which one tree meets the City's definition of protected "native" tree. Based on Section 32.170 of the City's Municipal Code the minimum mitigation planting requirements for the removal of one "native" oak tree is one-for-one with a tree of the same size of a species. As such, based on the size of the tree (7 inches in diameter) and the City requirements, Dudek recommends planting one 96-inch box coast live oak tree in the post-construction landscape. Furthermore, to account or the loss of 58 additional non-protected trees, Dudek recommends that 58 15-gallon drought tolerant trees be planted in the post-construction landscape. It should be noted that the City ordinance only requires replacement of the single "native" oak tree and that replacement of the additional 58 trees is not required by the City ordinance. Furthermore, Dudek recommends that the remaining 11 encroached-upon trees be preserved in accordance with the tree protection measures provided in Appendix E.

INTENTIONALLY LEFT BLANK

7 Disclaimer

This report provides conclusions and recommendations based on a visual examination of the trees and surrounding site by an ISA Certified Arborist and reasonable reliance on the completeness and accuracy of the information provided to the arborist. The examination did not include subterranean or internal examination of the trees.

Arborists are tree specialists who use their education, knowledge, training, and experience to examine trees; recommend measures to enhance the beauty and health of trees; and attempt to reduce the risk of living near them. Although trees provide many benefits to those who live near them, they also include inherent risks from breakage or failure, which can be minimized but not eliminated.

Arborists cannot detect every condition that could possibly lead to the failure of a tree. Trees are living organisms subject to attack by disease, insects, fungi, weather, and other forces of nature, and conditions that lead to failure are often hidden within trees and below ground. There are some inherent risks with trees that cannot be predicted with any degree of certainty, even by a skilled and experienced arborist. Arborists cannot predict acts of nature, including storms of sufficient strength, that can cause even an apparently healthy tree to fail. Additionally, arborists cannot guarantee that a tree will be healthy or safe under all circumstances or for any specific period of time. A tree's condition could change over a short or long period of time due to climatic, environmental, and other conditions. Further, there is no guarantee or certainty that recommendations or efforts to correct unsafe conditions will prevent future breakage or failure of a tree.

To live or work near trees is to accept some degree of risk. Neither the author of this report nor Dudek assumes any responsibility for, nor will they be liable for, any claims, losses, or damages for damage to any tree, death or injury to any person, or any loss of or damage to any personal or real property.

Tree Protection Measures

APPENDIX E
Tree Protection Measures

The following sections are included as general guidelines for tree protection from construction impacts. The measures presented should be monitored by arborists and enforced by contractors and developers for maximum benefit to the trees.

TREE PROTECTION MEASURES PRIOR TO CONSTRUCTION

Prior to any construction activity (drainage, demolition, material removal or delivery), oak and landmark trees with canopies that fall within 30 feet of construction activity shall be protected by fencing and signage. All contractors shall be made aware of the tree protection measures. A project arborist shall be assigned to monitor tree health and construction activity near retained trees on site. The project arborist shall be an International Society of Arboriculture (ISA) Certified Arborist.

Fencing and Signage: A 6-foot high, chain link fence with tree protection signs shall be erected around all trees (or tree groups) with canopies that fall within 30 feet of construction activity. The protective fence should be installed at a distance from the trunk that is equal to the dripline radius plus 5 feet (protected tree zone). For any trees that would be encroached upon by construction activities, fencing shall be placed as far away from trunk of the tree as possible while still allowing the required construction activities to proceed. This fencing will delineate the tree protection zone and prevent unwanted activity in and around the trees in order to reduce soil compaction in the root zones of the trees and other damage from heavy equipment. Fences are to be mounted on two-inch diameter galvanized iron posts, driven into the ground to a depth of at least 2-feet at no more than 10-foot spacing. In areas where fencing is located on paving or concrete that will not be demolished, then the posts may be supported by an appropriate grade level concrete base. Tree protection signs should be attached to every fourth post. The contractor shall maintain the fence to keep it upright, taut, and aligned at all times. Fencing shall be removed only after all construction activities are complete.

Pre-Construction Meeting: A pre-construction meeting shall be held between all contractors and the arborist. The arborist will instruct the contractors on tree protection practices and answer any questions. All equipment operators and spotters, assistants, or those directing operators from the ground, shall provide written acknowledgement of their receiving tree protection training. This training shall include information on the location and marking of protected trees, the necessity of preventing damage, and the discussion of work practices that will accomplish such.

Protection and Maintenance during Construction

Once construction activities have begun the following measures shall be adhered to:

Avoidance: Signs, ropes, cables, or any other items shall not be attached to any tree.

Equipment Operation and Storage: Operating heavy machinery around the root zones of trees will increase soil compaction, which decreases soil aeration and subsequently reduces water penetration in the soil. All heavy equipment and vehicles shall stay out of the fenced tree protection zone, unless where specifically approved in writing by the City Arborist and under the supervision of an ISA Certified Arborist.

Storage and Disposal: Do not store or discard any supply or material, including paint, lumber, concrete overflow, etc. within the fenced tree protection zone. Remove all foreign debris within the fenced tree protection zone; it is important to leave the duff, mulch, chips, and leaves around the retained trees for water retention and nutrients. Avoid draining or leakage of equipment fluids near retained trees. Fluids such as: gasoline, diesel, oils, hydraulics, brake and transmission fluids, paint, paint thinners, and glycol (anti-freeze) should be disposed of properly. Keep equipment parked outside of the fenced tree protection zone of retained trees to avoid the possibility of leakage of equipment fluids into the soil. The effect of toxic equipment fluids on the retained trees could lead to decline and death.

Moving Construction Materials: Care will be taken when moving equipment or supplies near the trees, especially overhead. Avoid damaging the tree(s) when transporting or moving construction materials and working around retained trees (even outside of the fenced tree protection zone). Above ground tree parts that could be damaged (e.g., low limbs, trunks) should be flagged with red ribbon. If contact with the tree crown is unavoidable, prune the conflicting branch(es) using ISA or ANSI A300 standards.

Grade Changes: Grade changes, including adding fill, are not permitted within the tree protection zone, without special written authorization and under supervision by a Certified Arborist. Lowering the grade within this area will necessitate cutting main support and feeder roots, jeopardizing the health and structural integrity of the tree(s). Adding soil, even temporarily, on top of the existing grade will compact the soil further, and decrease both water and air availability to the trees' roots.

Trenching: Unless a Tree Permit has been issued for trenching activity within the fenced tree protection zone, all trenching shall be outside of the fenced tree protection zone. Roots primarily extend in a horizontal direction forming a support base to the tree similar to the base of a wineglass. Where trenching is necessary in areas that contain tree roots, prune the roots using a Dosko root pruner or equivalent. All cuts should be clean and sharp, to minimize ripping, tearing, and fracturing of the root system. The trench should be made no deeper than necessary.

Irrigation: Trees that have been substantially root pruned (30% or more of their root zone) will require irrigation for the first twelve months. The first irrigation should be within 48 hours of root pruning. They should be deep watered every two to four weeks during the summer and once a month during the winter (adjust accordingly with rainfall). One irrigation cycle should thoroughly soak the root zones of the trees to a depth of 3 feet. The soil should dry out between watering; avoid keeping a consistently wet soil. Designate one person to be responsible for irrigating (deep watering) the trees. Check soil moisture with a soil probe before irrigating. Irrigation is best accomplished by installing a temporary above ground micro-spray system that will distribute water slowly (to avoid runoff) and evenly throughout the fenced tree protection zone ***but never soaking the area located within 6- feet of the tree trunk***.

Canopy Pruning: Do not prune any of the trees until all construction is completed. This will help protect the tree canopies from damage. All pruning shall be completed under the direction of an ISA Certified Arborist and using ISA guidelines. Only dead wood shall be removed from tree canopies.

Washing: Periodic washing of the foliage is recommended during construction but no more than once every two weeks. Washing should include the upper and lower leaf surfaces and the tree bark. This should continue beyond the construction period at a less frequent rate with a high-powered hose only in the early morning hours. Washing will help control dirt/dust buildup that can lead to mite and insect infestations.

Inspection: An ISA Certified Arborist shall inspect the trees on at least a monthly basis for the duration of construction activity. A summary report documenting observations and management recommendations shall be submitted to the owner following each inspection. Photographs of representative trees are to be included in each report.

MAINTENANCE AFTER CONSTRUCTION

Once construction is complete the tree protection fencing may be removed and the following measures performed to sustain and enhance the vigor of the preserved trees.

Mulch: Provide a 4-inch mulch layer under the canopy of trees. Mulch should include clean, organic mulch that will provide long-term soil conditioning, soil moisture retention, and soil temperature control.

Pruning: Pruning should *only* be done to maintain clearance and remove broken, dead or diseased branches. Pruning shall only take place following a recommendation by an ISA Certified Arborist and performed under the supervision of an ISA Certified Arborist. No more than 15% of the canopy shall be removed at any one time. All pruning shall conform to ISA or ANSI A300 standards.

Watering: Retained trees on site shall be watered as they were prior to the commencement of construction activity. Supplemental irrigation may be necessary for twelve months following substantial root pruning.

Watering Adjacent Plant Material: All plants near the trees shall be compatible with water requirements of said trees. Watering regime included in the site's landscape plan shall be developed with consideration for the water needs of retained trees.

Spraying: If the trees are maintained in a healthy state, regular spraying for insect or disease control should not be necessary. If a problem does develop, an ISA Certified Arborist should be consulted; the trees may require application of insecticides to prevent the intrusion of bark-boring beetles and other invading pests. All chemical spraying should be performed by a licensed applicator under the direction of a licensed pest control advisor.

Monitoring: All trees within 30 feet of construction activity shall be monitored by an ISA Certified Arborist for the first two years after construction completion. An annual monitoring report shall be submitted to the City Arborist. Each report shall summarize the inspection efforts, document observations and management actions taken, include photographs of each tree, and compare post-construction tree conditions with the original, pre-construction baseline condition. If any retained trees die within this inspection period, they shall be replaced at a ratio approved by the City.

EXECUTIVE SUMMARY

Lennar Homes retained Dudek to complete a built environment inventory, evaluation, and analysis of impacts report for the Harmon Ranch Project (proposed Project). The Project proposes to construct 63 new single-family residences with recreational amenities and preserve one property listed on an approximately 11.5-acre site at 12623, 12624, 12650, 12702 Oak Knoll Road and six additional vacant parcels (Project area).

The purpose of this report is to identify all built environment historical resources, as defined by the California Environmental Quality Act (CEQA), within or adjacent to the Project site, and to determine whether or not the project would result in a significant impact to a historical resource under CEQA.

Four built environment properties requiring survey and evaluation were identified in the Study Area. Four historic age properties were identified inside the Project site and required recordation and evaluation under all applicable significance criteria. Two of these properties are on the Poway Historic Sites list. 12623 Oak Knoll Road was included as PHS 112. A large parcel within the Project site contains a historic age property, the rock house known as the Harmon House associated with the address 12702 Oak Knoll Road. The residence was previously identified and included as PHS 113 on the Poway Historic Sites list.

This report includes the following components: (1) a California Historical Resources Information System (CHRIS) records search conducted at the South Coastal Information Center (SCIC) addressing the Project area plus a 1-mile radius; (2) outreach to local historical societies with local information about cultural resources in the vicinity of the Project; (3) an intensive-level survey of the Project site for built environment resources; (4) review of historic aerial images, and maps; (5) archival and property development research for properties located within the Built Environment Study Area; (6) evaluation results of any historic age properties in accordance with eligibility criteria of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and local landmark and historical resource lists; and (7) analysis of project-related impacts to historical resources in conformance with the California Environmental Quality Act (CEQA) and in consideration of applicable local municipal code and planning documents.

As a result of Dudek's extensive archival research, field survey, record search, and property significance evaluations, no additional historical resources were identified within the Project site, nor were any adjacent historical resources identified that could be indirectly impacted by proposed Project activities.

No evidence was found to support a finding of historical significance for 12623 Oak Knoll Road and the property appears to meet the criteria for a City of Poway Category D building. No evidence was found to support a finding of historical significance for the Harmon House at 12702 Oak Knoll Road. However, following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

THE HISTORICAL RESOURCES MITIGATION MEASURES RECOMMENDED IN THIS REPORT WOULD ENSURE THE PROPER TREATMENT OF THE HARMON HOUSE DURING CONSTRUCTION AND IMPLEMENTATION OF THE PROJECT. WITH PROPER IMPLEMENTATION OF THE PRESCRIBED MEASURES, THE POTENTIAL IMPACT TO HISTORICAL RESOURCES WOULD BE CONSIDERED TO BE LESS THAN SIGNIFICANT. THEREFORE, IMPACTS TO HISTORICAL RESOURCES WOULD BE **LESS THAN SIGNIFICANT WITH MITIGATION**.

1 INTRODUCTION

This chapter provides a detailed description of the proposed Harmon Ranch Project (proposed Project), and includes information about the proposed Project, including, location and setting, existing conditions, records search results, and regulatory setting.

1.1 Project Location

The Project site comprises ten parcels (Assessor's Parcel Numbers 317-500-11; 317-500-12, 317-500-13, 317-500-14, 317-500-02, 317-500-03,317-500-09, 317-500-10, 317-501-01, and 317-501-02) located in the City of Poway, San Diego County (See Figure 1, Project Location Map), and is located on Oak Knoll Road between Pomerado Road and Carriage Road. The Project proposes the development of the 11.5-acre Project site into a residential development within an existing residential neighborhood (Figure 2). The 11.5-acre Project site is located north of Oak Knoll Road. The Project is mapped within Section 14 of Township 14 South, Range 2 West on the U.S. Geological Survey 7.5-minute Poway Quadrangle.

1.2 Project Description

The proposed project is located at 12623, 12624, 12650, and 12702 Oak Knoll Road and six additional vacant parcels within the southern area of the City of Poway, along Oak Knoll Road, south of Poway Road and west of Carriage Road. The project site is 11.5 acres and is currently designated Residential Single Family 7 (RS-7) in the City of Poway General Plan, which permits single-family homes on a minimum of 4,500-square-foot lots and a maximum density of eight dwelling units per acre. Surrounding land uses include a mix of retail land uses and the Kumeyaay Interpretive Center to the north; Oak Knoll Road, Poway Creek, and existing single-family homes to the south and east, which are also designated RS-7; and apartment communities to the west.

The current property owner is Harmon Family Trust. The majority of the site has been cleared for several years and was recently used as a construction staging yard for a San Diego Gas and Electric gas line project. The site includes four existing single-family residences. One of the existing homes is a locally designated historic building located at 12702 Oak Knoll Road (Assessor's Parcel No. 317-500-14-00). The historic building was built in 1933 and is constructed of cobblestones. The building is presently designated as City of Poway Historical Site 113 and is documented and known as the "Harmon House." The historic building would be retained in place. The other three existing single-family homes are not designated as historic and would be demolished prior to project construction.

Lennar Homes of California LLC (Applicant) is proposing a residential neighborhood on the 11.5 acre project site. The project proposes approximately 5.8 acres designated for residential development, a 0.25-acre historic home site, 3.2 acres of open space areas, 1.9 acres for private streets, and 0.5 acres of public right-of-way (Oak Knoll Road). The proposed project would include 63 single-family detached homes plus the 1 existing historic home on site for a total of 64 lots within the Specific Plan boundary. The proposed density is 8.8 dwelling units/acre (64 total residential lots/7.26-acre net project area not including private streets), which is just over the existing RS-7 designation density.

The proposed new 63 single-family homes would be on lots 42 feet wide and 85 to 90 feet deep, with standard two-car garages, 20-foot-deep by 20-foot-wide driveways to accommodate an additional two off-street parking spaces, and private fenced rear yards. The project also includes 40 guest parking spaces along the private streets, approximately 1.0 acre of open space recreation area, approximately 2.2 acres of natural open space areas, and a segment of the General Plan Community trail (approximately 1,000 feet) connecting the project site to the adjacent retail area located to the north along Poway Road. The "overlook" area and passive park located in the south portion of the project site is planned to provide public access and would be privately maintained.

Access to the project site is planned via existing Oak Knoll Road. Fifty-nine of the new homes are proposed to front newly constructed private streets, while four new homes and an open space/overlook area front the south side of Oak Knoll Road. The existing historic home also fronts on Oak Knoll Road.

The Applicant is proposing a Specific Plan and Tentative Map to facilitate development of 63 new single-family homes and associated site improvements and retention of the existing historic home. The Harmon Ranch Specific Plan would establish three land use districts within the project site: Residential Single Family (R-SF), Open Space (OS), and Open Space Recreation (OSR). The Specific Plan would also provide development regulations and permitted uses for each land use district. The Specific Plan serves as both a policy document and a regulatory document for the systematic implementation of the policies and goals of the General Plan. Additionally, the Specific Plan provides a comprehensive plan to ensure the efficient development of the new residential community within the Specific Plan Area. Approval of the Harmon Ranch Specific Plan would allow for deviations from the underlying development standards of the RS-7 zone. The project would conform to the proposed development standards outlined in the Harmon Ranch Specific Plan for the Planned Community (PC).

1.3 Built Environment Study Area

The built environment study area comprises four properties in the Project site, all developed with historic age buildings. The remaining portions of Project site that were not included in the study area are vacant and do not contain historic age buildings. The study area for the Project site was established following field inspection, research into the development history of the Project site vicinity, and review of the proposed Project plans. This study area was established to account for potential impacts on historical resources in the vicinity of the Project. Parcels beyond this study area were not included because the Project would have no potential to directly or indirectly impact identified historical resources or historic age built environment properties on distant parcels or their surrounding setting.

Table 1. Built Environment Study Area

Property	Address	APN	Year Built	Property Type

1.4 Project Personnel

Fieldwork, research, Department of Parks and Recreation (DPR) forms, and preparation of this technical report was conducted by Dudek architectural historians Nicole Frank, MSHP, Katie Ahmanson, MHC, and Claire Cancilla, MSHP. Dudek senior architectural historian Allison Lyons, MSHP, provided quality assurance/quality control of the report. All authors and reviewers meet the Secretary of the Interior's Professional Qualifications Standards (36 CFR Part 61) for history, architectural history, or both. The key preparers' qualifications are located in Appendix B.

1.5 REGULATORY SETTING

1.5.1 Federal

The National Register of Historic Places

While there is no federal nexus for this project, the buildings within the Study Area were evaluated in consideration of NRHP designation criteria. The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks, as well as historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.

In addition to these basic evaluation criteria, the NRHP outlines further criteria considerations for significance. Moved properties; birthplaces; cemeteries; reconstructed buildings, structures, or objects; commemorative properties; and properties that have achieved significance within the past 50 years are generally not eligible for the NRHP. The criteria considerations are exceptions to these rules, and they allow for the following types of resources to be NRHP eligible (NPS 1995, p. 25):

A. a religious property deriving primary significance from architectural or artistic distinction or historical importance;

B. a building or structure removed from its original location, but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event;

C. a birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his or her productive life;

D. a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, from association with historic events;

E. a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived;

F. a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or

G. a property achieving significance within the past 50 years if it is of exceptional importance.

Once the significance of a resource has been determined, the resource then must be assessed for integrity. Integrity is 1) the ability of a property to illustrate history and 2) possession of the physical features necessary to convey the aspect of history with which it is associated (NPS 1995, p. 44). The evaluation of integrity is grounded in an understanding of a property's physical features and how they relate to the property's significance. Historic properties either retain integrity (that is, convey their significance) or they do not. To retain integrity, a property will always possess several, and usually most, of the seven aspects of integrity (NPS 1997, pp. 44–45):

Location is the place where the historic property was constructed or the place where the historic event occurred.

Design is the combination of elements that create the form, plan, space, structure, and style of a property.

Setting is the physical environment of a historic property.

Materials are the physical elements that were combined or deposited during a particular period and in a particular pattern or configuration to form a historic property.

Workmanship is the physical evidence of crafts of a particular culture or people during any given period in history or prehistory.

Feeling is the property's expression of the aesthetic or historic sense of a particular period.

Association is the direct link between an important historic event or person and a historic property.

1.5.2 State

California Register of Historical Resources

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California Public Resources Code Section 5024.1(c) (1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Is associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historical, and tribal cultural resources:

1. California Public Resources Code Section 21083.2(g) defines "unique archaeological resource."
2. California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
3. California Public Resources Code Section 21074(a) defines "tribal cultural resources."
4. California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5© set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
5. California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(b)). An "historical resource" is any site listed or eligible for listing in the CRHR. The CRHR listing criteria are intended to examine whether the resource in question: (a) is associated with events that

have made a significant contribution to the broad patterns of California's history and cultural heritage; (b) is associated with the lives of persons important in our past; (c) embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or (d) has yielded, or may be likely to yield, information important in pre-history or history.

The term "historical resource" also includes any site described in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1(q)).

CEQA also applies to "unique archaeological resources." California Public Resources Code Section 21083.2(g) defines a "unique archaeological resource" as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

All historical resources and unique archaeological resources – as defined by statute – are presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). A site or resource that does not meet the definition of "historical resource" or "unique archaeological resource" is not considered significant under CEQA and need not be analyzed further (California Public Resources Code Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)).

Under CEQA a significant cultural impact results from a "substantial adverse change in the significance of an historical resource [including a unique archaeological resource]" due to the "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California Public Resources Code Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

1.5.3 City of Poway Cultural Resources Guidelines

Poway General Plan

Goal IV of the City of Poway's General Plan (City of Poway 1991) is to preserve the City's cultural resources for the future benefit and enjoyment of its residents. Policy E states that "The historical structures which remain in Poway contribute significantly to the rural small town character of the community and should be preserved" (City of Poway 1991).

Municipal Code

Chapter 17.45 of the City's Municipal Code describes the City's cultural resources regulatory framework (City of Poway 2022). The City's planning goals and policies aim to "protect, enhance and perpetuate historic/cultural resources, sites, and districts that represent or reflect elements of the City's cultural, social, economic, political and architectural history for the public health, safety and welfare of the people of the City" and to "permit historic sites to be identified, documented, and recorded by written and photographic means and allow an opportunity for voluntary preservation of historic sites, all without infringing on the ability and right of a property owner to control the use of property or structures" (City of Poway, Chapter 17.45.010, Ord. 296 § 1, 1989)

Subchapter 17.45.030 of the City's Municipal Code defines four categories of historic/cultural resources ("A," "B," "C" and "D" resources) and establishes the following criteria for evaluating historic/cultural resources. The criteria within each category are numbered below for clarity.

Category A: This category is reserved for those structures, buildings, sites, or objects of major significance. The resource must meet one or more of the following criteria:

1. It is the site of, or reflects special elements or events of the City's cultural, social, economic, political, aesthetic, engineering or architectural history; or
2. It is associated with persons or events important in regional, State or national history; or
3. It is a rare or particularly fine example of a certain architectural style or construction technique associated with a particular period of history; or
4. It is the work or an architect, engineer, or designer who has substantially influenced regional, State, or national trends or the development of the North County region; or
5. Owing to its unique location or singular physical characteristics, it represents an established feature of the neighborhood or City whose removal would adversely affect the appearance or spatial and design relationships of the area.

Category B: Structures, buildings, sites, or objects in this category must have one of the following characteristics:

1. It is associated with important persons, events, or eras in the City, regional, or State history;
2. Its original design, architecture, aspect or function of the resource is significant but has been altered, affecting its integrity;

3. It is a good (but not rare or particularly outstanding) example of certain style or construction technique, or of the work of a prominent architect, engineer, or designer.

Category C: Structures, buildings, sites, or objects in this category must have one of the following characteristics:

1. It is a good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;
2. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

Category D: Structures, buildings, sites, or objects in this category are:

1. Built prior to 1940, and clearly not significant in terms of architectural style, appearance, design, construction, or association with important persons or events in City history.

Further research on any building, structure, site, or object may yield information on their roles in history. This information may warrant their inclusion in a different category. Applications to change the categorization of an identified resource or to add a resource to the survey shall be submitted to the City Development Services Department. The application should contain information which provides justification for adding a historic/cultural resource to the survey or changing its category designation. (Ord. 518, 1999; Ord. 296 § 1, 1989)

Subchapter 17.45.050 states that for a historic/cultural resource to be designated as a Poway historic landmark, additional criteria must be met. Following adoption of a survey of historic/cultural resources, the Development Services Department must act upon an application and may designate historic landmarks by finding that a historic/cultural resource is of local, regional, State, or national significance, and is designated as a category A or B historic/cultural resource. In addition, the Development Services Department shall find that the historic/cultural resource meets one of the following criteria:

1. Its location is the site of a historic event having major significance to the City, State or United States;
2. Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States;
3. Its quality as one of the finest examples in the City of the work of an architect of major importance;
4. Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States;
5. Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship;
6. Its potential of yielding historic/cultural information of major importance;
7. Its integrity as a natural feature that has made a major contribution to the community;
8. Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

The findings shall be supported by substantial evidence presented to the Development Services Department. (Ord. 518, 1999; Ord. 296 § 1, 1989).

Subchapter 17.45.100 outlines procedures for removing landmark designation. Any time a historic/cultural resource has been designated an historic landmark by this chapter, the property owner may apply to the Director of Development Services for removal of the designation by showing that the property will not benefit any further from incentives granted pursuant to PMC 17.45.110 during the landmark designation process. (Ord. 518, 1999; Ord. 296 § 1, 1989). PMC 17.45.110 does not specific incentives, but states:

In order to carry out the purposes of this chapter, the Development Services Department shall develop and recommend to the City Council a program of economic and other incentives to support the preservation, maintenance and appropriate rehabilitation of historic landmarks. These incentives may be granted at any time after an historic/cultural resource is designated as an historic landmark. (Ord. 518, 1999; Ord. 296 § 1, 1989)

INTENTIONALLY LEFT BLANK

2 HISTORIC CONTEXT

2.1 Natural Setting

The majority of the undeveloped area within the northern portion of the Project site has been cleared and is currently being used as a construction staging yard for a SDG&E gas line project. There is an undeveloped steep hillside within the northeast portion of the site south of the Kumeyaay Interpretative Center and west of Roca Grande Drive. Scattered trees and landscaping surround the four historic age residential buildings within the study area. Land use around the Project site is primarily residential.

2.2 Cultural Setting

The study area includes four historic age single-family residences. This section provides the context for the evaluation of these elements of the built environment.

2.2.1 Historical Overview of San Diego

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1846), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican American War, signals the beginning of the American Period when California became a territory of the United States.

Spanish Period (1769–1821)

The Spanish colonization of Alta California began in 1769 with the founding of Mission San Diego de Alcalá by Father Junípero Serra. Concerns over Russian and English interests in California motivated the Spanish government to send an expedition of soldiers, settlers, and missionaries to occupy and secure the northwestern borderlands of New Spain through the establishment of a Presidio, Mission, and Pueblo. The Spanish explorers first camped on the shore of the Bay in the area that is now downtown San Diego. Lack of water at this location, however, led to moving the camp on May 14, 1769, to a small hill closer to the San Diego River and near the Kumeyaay village of Cosoy. Father Junípero Serra arrived in July of the same year to find the Presidio serving mostly as a hospital. The Spanish built a primitive mission and presidio structure on the hill near the river.

Bad feelings soon developed between the native Kumeyaay and the soldiers, resulting in the construction of a stockade that, by 1772, included barracks for the soldiers; a storehouse for supplies; a house for the missionaries; and a chapel, which had been improved. The log and brush huts were gradually replaced with buildings made of adobe bricks. Flat earthen roofs were eventually replaced by pitched roofs with rounded roof tiles. Clay floors were eventually lined with fired brick.

In August 1774, the Spanish missionaries moved the Mission San Diego de Alcalá to its present location 6 miles up the San Diego River valley (modern Mission Valley) near the Kumeyaay village of Nipaguay. Begun as a thatched chapel and compound built of willow poles, logs, and tules, the new mission was sacked and burned in the Kumeyaay uprising of November 5, 1775. The first adobe chapel was completed in October 1776, and the present church was begun the following year. A succession of building programs through 1813 resulted in the final plan that included the church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. Orchards, reservoirs, and other agricultural installations were built to the south on the lower San Diego River alluvial terrace and were irrigated by a dam and aqueduct system. The initial Spanish occupation and mission system brought about profound changes in the lives of the Kumeyaay people. Substantial numbers of the coastal Kumeyaay were forcibly brought into the mission or died from introduced diseases.

As early as 1791, presidio commandants in California were given the authority to grant small house lots and garden plots to soldiers and their families, and sometime after 1800, soldiers and their families began to move down the hill near the San Diego River. Historian William Smythe noted that Don Blas Aguilar, who was born in 1811, remembered at least 15 such grants below Presidio Hill by 1821, of which only five were within the boundaries of what would become Old Town had houses in 1821. These were the retired commandant Francisco Ruiz's adobe (now known as the Carrillo Adobe), another building later owned by Henry Fitch on Calhoun Street, the Ybanes and Serrano houses on Juan Street near Washington Street, and a small adobe house on the main plaza owned by Juan Jose Maria Marron.

Mexican Period (1821–1846)

In 1822, the political situation changed as Mexico won its independence from Spain, and San Diego became part of the Mexican Republic. The Mexican government opened California to foreign trade, began issuing private land grants in the early 1820s, created the rancho system of large agricultural estates, secularized the Spanish missions in 1833, and oversaw the rise of the civilian pueblo. By 1827, as many as 30 homes existed around the central plaza, and in 1835, Mexico granted San Diego official pueblo (town) status. At this time, the town had a population of nearly 500 residents, later reaching a peak of roughly 600. By 1835 the presidio, once the center of life in Spanish San Diego, had been abandoned and lay in ruins. Mission San Diego de Alcalá fared little better. The town and the ship landing area at La Playa were now the centers of activity in Mexican San Diego. However, the new Pueblo of San Diego did not prosper, as some other California towns did during the Mexican Period.

Secularization in what is now San Diego County triggered increased Native American hostilities against the Californios during the late 1830s. The attacks on outlying ranchos, along with unstable political and economic factors, lead to San Diego's population decline to approximately 150 permanent residents by 1840. San Diego's official Pueblo status was removed by 1838, and it was made a subprefecture of the Los Angeles Pueblo. When the Americans took over after 1846, the situation had stabilized somewhat, and the population had increased to roughly 350 non-Native American residents. The Native American population continued to decline, as Mexican occupation brought about continued displacement and acculturation of Native American populations.

American Period (1846–Present)

The American Period began in 1846 when United States military forces occupied San Diego; this period continues today. When United States military forces occupied San Diego in July 1846, the town's residents split on their course

of action. Many of the town's leaders sided with the Americans, but other prominent families opposed the United States' invasion. In December 1846, a group of Californios under Andres Pico engaged United States Army forces under General Stephen Kearney at the Battle of San Pasqual and inflicted many casualties. However, the Californio resistance was defeated in two small battles near Los Angeles, and effectively ended the resistance by January 1847. The Americans assumed formal control with the Treaty of Guadalupe-Hidalgo in 1848, and introduced Anglo culture and society, American political institutions, and American commerce. In 1850, the Americanization of San Diego began to develop rapidly.

On February 18, 1850, the California State Legislature formally organized San Diego County. The first elections were held at San Diego and La Playa on April 1, 1850, for county officers. San Diego grew slowly during the next decade. San Diegans attempted to develop the town's interests through a transcontinental railroad plan and development of a new town closer to the Bay. The failure of these plans, added to a severe drought that crippled ranching and the onset of the Civil War, left San Diego as a remote frontier town. These issues led to a drop in the town's population from 650 in 1850 to 539 in 1860. Not until land speculator and developer Alonzo Horton arrived in 1867 did San Diego begin to develop fully into an active American town.

Alonzo Horton's development of a New San Diego (modern downtown) in 1867 began to swing the community's focus away from Old Town and began the urbanization of San Diego. Expansion of trade brought an increase in the availability of building materials. Wood buildings gradually replaced adobe structures. Some of the earliest buildings to be erected in the American Period were "pre-fab" houses that were built on the east coast of the United States and shipped in sections around Cape Horn and reassembled in San Diego. Development spread from downtown due to a variety of factors, including the availability of potable water and transportation corridors. Factors such as views and access to public facilities affected land values, which in turn affected the character of neighborhoods that developed. During the Victorian Era of the late 1800s and early 1900s, the areas of Golden Hill, Uptown, Banker's Hill, and Sherman Heights were developed. Examples of the Victorian Era architectural styles remain in these communities, and in Little Italy, which developed at the same time. At the time downtown was being built, there began to be summer cottage/retreat development in what are now the beach communities and La Jolla area. The early structures in these areas were not of substantial construction since they were primarily built for temporary vacation housing.

Development also spread to the greater North Park and Mission Hills areas during the early 1900s. The neighborhoods were built as small lots, a single lot at a time; there was no large tract housing development in these neighborhoods. This provided affordable housing away from the downtown area, and development expanded as transportation improved. Barrio Logan began as a residential area, but because of proximity to rail freight and shipping freight docks, the area became more mixed, with conversion to industrial uses. This area was more suitable to industrial uses because land values were not as high. Topographically, the area is more level, and it does not have views like the areas north of downtown. Various ethnic groups settled in the area because of the affordability of land ownership.

San Ysidro began to be developed around the turn of the twentieth century. The early settlers were followers of the Littlelanders colonies movement. There, the pattern of development was designed to accommodate small plots of land for each homeowner to farm as part of a farming/residential cooperative community. Nearby Otay Mesa-Nestor began to be developed by farmers of Germanic and Swiss backgrounds. Some of the prime citrus groves in

California were in the Otay Mesa-Nestor area. In addition, there were grape growers of Italian heritage who settled in the Otay River Valley and tributary canyons who produced wine for commercial purposes.

San Diego State University was established in the 1920s, and the development of the State College area began, including development of the Navajo community as an outgrowth from the college area and from the west. There was farming and ranching in Mission Valley until the middle portion of the twentieth century when the uses were converted to commercial and residential. There were dairy farms and chicken ranches adjacent to the San Diego River where now there are motels, restaurants, office complexes, and regional shopping malls. There was little development north of the San Diego River until Linda Vista was developed as military housing in the 1940s, when the federal government improved public facilities and extended water and sewer pipelines to the area. From Linda Vista, development spread north of Mission Valley to the Clairemont Mesa and Kearny Mesa areas. Development in these communities was mixed-use and residential on moderate-sized lots.

Tierrasanta, previously owned by the U.S. Navy, was developed in the 1970s. It was one of the first planned developments in the area with segregation of uses. Tierrasanta and many of the communities that have developed since, such as Rancho Penasquitos and Rancho Bernardo, represent the typical development pattern in San Diego in the last 25 to 30 years: uses are well segregated, with commercial uses located along the main thoroughfares and residential uses located beyond that. Industrial uses are located in planned industrial parks.

2.2.2 Historical Overview of the City of Poway

Poway was first recorded in 1828 as the valley of “Paguay” in documents from the Mission San Diego de Alcala. The valley owes its name to the tribes of San Diegueno Native Americans who inhabited the valley before the arrival of the Spanish in 1769. The native name of Paguay appeared on maps, such as the Rand McNally Atlases, as late as 1869. During Spanish rule, the valley was used for pasturing mission livestock, and its inhabitants were the Spanish Padres, Mission Indians, and nomadic bands of Native Americans (Poway Historical Book Committee 1981).

The first American settler believed to have established a homestead in Poway was Philip Crosthwaite, who built an adobe house and started a ranch in 1859. However, soon after, Crosthwaite sold his ranch to the Kerran Brothers and a woman known only Mrs. Anderson, who continued to maintain the ranch until 1874. Farmers had begun to settle within the valley and in 1874, the California State Legislature passed the “no-fence” law that required ranchers to keep cattle off farmers’ property, even if the property is not bound by a fence. The Kerran ranch and others in the area were unable to comply with these rules and cattle disappeared from the landscape. Thus, the economy of the valley shifted to agriculture (Poway Historical Book Committee 1981; Granberry 1985).

By 1887, the population increased to 800 people, and the valley had a prosperous farming and dairying industry. The community had established a church, stores, school, and hotel, and there was the possibility two railroads would be built in the valley. This brought an increase in residents. The real-estate firm of Baird and Chapin was drawn to the prospects of the area. The firm planned residential communities around small parks in a subdivision plan called Piermont. However, the railroad never materialized, settlers began to leave the valley, and the subdivision was never completed (Poway Historical Book Committee 1981).

Exhibit A. View of homes in Poway, ca. 1900.

Source: San Diego Historical Society, California Border Region Digitization Project photograph collection

Throughout the early 1900s, inhabitants faced drought and transportation difficulties, but Poway still thrived as a farming community. The valley was known for its peaches, vineyards, grain, and alfalfa. Transportation was limited to wagons and stagecoaches, so seeds were carried by wagon from San Diego using the old Pomerado Grade. The Poway Post Office was established in 1901, and received mail twice a day from two four-horse stagecoaches, one that traveled from Escondido every morning, and another from San Diego (Poway Historical Book Committee 1981; Stuart 1966).

Poway experienced periods of droughts that led to the decline of agriculture in the early 1900s. Although there was a local creek that supplied water fit for agriculture, the lack of easily available drinking water prevented the growth of the town until water districts formed after World War II. By 1954, the Poway Municipal Water District was created to utilize water from the Colorado River Aqueduct, and by 1957, the sewer system was completed and developers began building housing tracts. In 1971, the dam that created Lake Poway was constructed, and it became a stable source of water for the residents. At this time, Poway's economy was no longer supported by agriculture, and it instead became a residential community for people who worked throughout the San Diego Area (Poway City History).

In the 1970s, members of the community decided that Poway should become its own city. They wanted their own City Council so town decisions could be made by locals. A measure to incorporate Poway was put on a ballot in 1976, but voters were concerned that Poway would not have enough financial stability on its own, so they rejected the measure. By 1980, it was determined that Poway would be able to afford the cost of cityhood, and another election was held in November of that year. Over half the voters voted in favor of Poway becoming a city, and on December 1, 1980, it officially became the City of Poway under the motto, "The City in the Country." By 1981, Poway had its own City Council, City Hall, and Civic Center (Gorman 1985; Greeley 1981).

During the 2000s, the population of Poway steadily increased, reaching a peak in 2015 with about 50,000 citizens. Today, the population is comprised of 48,564 citizens, and Poway still maintains its rural identity as a small country city. Although the farming industry never returned, it is still a popular location for residents who work in San Diego (US Census Bureau, 2022).

2.2.3 Relevant Themes

Rock Houses or Big Stone style (1890 - 1940)

Rock houses, either constructed of or clad in rocks, are present throughout California. The type of rock utilized for these homes is dependent on local geographic context, with the typology typically concentrated in areas with abundant accessible natural rocks, stones, and boulders. These residences are most obviously characterized by their simple, usually rectilinear forms with visible rocks on all elevations; rock houses frequently have few other decorative details. While it was common for rock houses to be built without the assistance of a formally trained architect, some of these residences were nonetheless constructed by skilled stonemasons or other tradespeople. Still, other examples, like the rock houses of Poway, are more vernacular and utilitarian, often being built by their original owner out of readily available material. While rock houses can take on a variety of styles and forms depending on location, they are often both influenced by and representative of the Arts and Crafts movement, which emphasized the use of natural materials and harmony with nature. Some of these residences can take on elements of the Mission Revival style. Rock houses were constructed in California beginning in the second half of the nineteenth century, with areas like Poway continuing to construct these homes until circa 1940. (Grimes 2016: 40; McAlester 2013; Smith 1991; Smith 1992; Emerson 2016).

There are numerous rock houses in Poway, largely due to the accessibility of rocks from the area's many streams and hills. Rock houses in Poway are generally referred to as being built in the Big Stone style. Frequently, Big Stone buildings were constructed using boulders and large rocks as their structural systems, but some buildings described as Big Stone in style, like the Harmon House adjacent to the Project site, are simply clad in rock and stone. The 1992 Poway Historical Resources Inventory List includes approximately 21 buildings explicitly identified as Big Stone, including the Harmon House. In Poway, a notable concentration of Big Stone buildings is the Big Stone Lodge complex, a 1.7-acre former resort along Old Pomerado Road that was initially planned in 1920s, but abandoned during the Great Depression. Additional concentrations of Big Stone buildings are located in the Big Stone and Beeler Canyon areas of Poway, along Old Pomerado Road, and along Metate Lane. (Smith 2005; 1991; Smith 1992; SOHO 2018).

Character-defining features include:

- Built of stone or clad in stone (usually locally sourced)
- 1-2 stories in height
- Simple, usually rectilinear footprints
- Minimal decorative ornamentation
- Hipped or gabled roofs with overhanging eaves
- Small, recessed window openings

Ranch Style (1930-1975)

Ranch-style houses in California reflect a national trend of fascination with the "Old West" and were a building style of choice for tract housing in the mid-twentieth century. Ranch homes were originally developed in the western and southwestern United States, but quickly gained national popularity through the dissemination of do-it-yourself manuals and plans in national magazines such as *Sunset, Better Homes and Gardens,* and *House Beautiful.* Ranch houses were also popular as a custom-built type of housing, which was especially popular in the later 1940s and 1950s. Ranch houses were typically built between 1930 and 1975, but peaked in the 1950s, as the most prevalent type of post-World War II suburban tract-style housing, often housing veterans who secured housing with FHA loans.

Ranch style houses are usually one-story, single-family residences. Houses designed in this architectural style include several identifying characteristics such as rambling, elongated plans; a horizontal emphasis; general asymmetry; free-flowing interior spaces; and a designed connection to the outdoors. Features such as low-pitched roofs with wide eaves, a combination of cladding materials including board-and-batten siding, brick and stone chimneys, and large picture windows were commonly applied and evoked an aesthetic that was reminiscent of these past architectural traditions. Decorative features such as wood shutters and dovecotes were often added to enhance the rusticated appearance of Ranch houses (Grimes and Chiang 2009; Horak et.al. 2015; McAlester 2013).

Character-defining features include:

- Rambling, elongated plans with a horizontal emphasis
- 1-2 stories in height
- Low-pitched gabled or hipped roofs with overhanging, open eaves
- General asymmetry
- Free-flowing interior spaces
- Designed connection to the outdoors
- Cladding featuring stucco, board and batten, shingles, clapboard, or a combination of materials
- Brick or stone chimney details
- Attached garages often linked to residence by breezeways
- Combinations of stone, brick, board and batten, clapboard, or horizontal wood siding used for accent on walls, secondary cladding types, and planters
- Functional and non-functional shutters details as trim around windows
- Fenestration may include a picture window

INTENTIONALLY LEFT BLANK

3 BACKGROUND RESEARCH

3.1 Records Search Results

3.1.1 Previously Conducted Cultural Resource Studies

The records search identified 72 previous studies that have been performed within one mile of the Study Area defined for the Project site. Three of these studies overlap portions of the Study Area, and one is within a 1-mile radius. However, the entire Study Area has not been previously surveyed. Table 2 summarizes the previously conducted cultural resources studies within 1 mile of the Study Area.

Table 2. Previously Conducted Cultural Resource Studies

Report ID	Authors	Year	Title
Previous Built Environment Studies Overlapping the Study Area			
SD-03405	Robbins-Wade, Mary and Karlene Leeper	1990	Archaeological and Historical Resources Survey and Assessment for the Oak Knoll Road Parcels
SD-04734	Mason, Roger	1990	Cultural Resource Survey Report for General Plan Amendment/Zone Change 89-04B in The City of Poway, San Diego, CA
SD-07159	Smith, Brian and Kevin Hunt	2000	A Cultural Resource Study for the Silver Lake Archaeological Site/Interpretive Center Project, Poway, California
Previous Cultural Resource Studies Within 1-mile of Study Area			
SD-00163	Berryman, Jady A.	1976	Archaeological Study of Casa Real Poway Mesa, California.

3.1.2 Previously Identified Built Environment Resources

The records search identified sixteen previously identified cultural resources, four of which are built environment resources within one mile of the Study Area, with one that intersects the current Study Area. A brief discussion of the intersecting resource, P-37-016042, is included below. Table 3 summarizes the built environment resources within 1 mile of the Study Area (DeCarlo 2022).

Table 3. Previously Identified Built Environment Resources

Primary ID	Name and Description	Year and Recorded by	CHRS Status Code
Built Environment Resources Intersecting Study Area			
P-37-016042	Abandoned cistern filled with refuse; 12718 Oak Knoll Road	1998 (Brian F. Smith & Associates)	No information on form provided by SCIC
Built Environment Resources Within 1-Mile of Study Area			
P-37-027171	Cylindrical water tank made of steel with a one-million-gallon capacity and is 32 feet tall; 1360 Celestial Road.	2004 (Kathleen A. Crawford)	6Y: Determined ineligible for NR by consensus through Section 106 process – Not evaluated for CR or local listing.
P-37-033470	Dirt road heading toward Lake Cuyamaca through a pass between two hills within Cuyamaca Rancho State Park	2011 (Bonnie Bruce and Sue Wade)	No information
P-37-033557	Old Highway 395; San Diego	2018 (Sarah Stringer-Bowsher, ASM Affiliates, Inc.)	No information

P-37-016042/CA-SDI-14605/H

This resource was identified in 1998 during the grading of an empty lot and consists of a cistern from around 1900-1910 filled with refuse (Kirkish 1998). The refuse included household goods, automobile items, building materials, and personal items. The systematic recovery of cultural material from the feature and trash scatter exhausted the data potential of the site and avoidance of the resource is not necessary. This resource was identified within the current Study Area.

3.2 Building Development Research

The following text provides a summary of additional background research conducted by Dudek to arrive at a general understanding of the settlement and development of the Built Environment Study Area and to gather information on the development of properties evaluated in this study. Dudek completed background research using the sources specified in the following sections.

3.2.1 Archival Research

In addition to the records search results, building development and archival research were conducted for the Project site and the four historic age buildings in an effort to establish a thorough and accurate historic context for the significance evaluations and to confirm the building development history of these properties. These additional sources are summarized below.

Built Environment Resource Directory (BERD)

The Built Environment Resources Directory (BERD) files provide information, organized by county, regarding non-archaeological resources in the Office of Historic Preservation's (OHP) inventory. The OHP inventory contains information only for cultural resources that have been processed through the office. This includes resources reviewed for eligibility to the National Register of Historic Places and the California Historical Landmarks programs through federal and state environmental compliance laws, and resources nominated under federal and state registration programs. Dudek reviewed the BERD file for San Diego County. None of the properties within the study area were listed in the BERD as of July 22, 2022.

Poway Branch Library, San Diego County Library

Research was conducted in person at the Poway Branch Library, San Diego County Library on May 4, 2022. Dudek requested and reviewed available information on the history of Poway, historic photographs, biographical information, and building history pertaining to all four properties in the study area.

Poway Historical Society

Dudek contacted the Poway Historical Society on June 21, 2022 for information on the two listed Poway Historic Sites: 12702 Oak Knoll Road and 12623 Oak Knoll Road. As of the date of this report, no response has been received.

City of Poway

On June 6, 2022 Dudek contacted the Development Services department of the City of Poway to obtain information related to the listing of 12702 Oak Knoll Road (PHS 113) and 12623 Oak Knoll Road (PHS 112) and the development history, including building permits, for all properties in the study area. In response, City Planner David De Vries sent Dudek the City's general plan and relevant chapters and ordinances related to historical resources. Mr. De Vries advised Dudek to contact Brian Smith to obtain information on the designations of 12702 Oak Knoll Road (see Consultation with Brian Smith, below). The City shared the list of Poway Historical Sites prepared by Brian F. Smith and Associates. No evaluations of these properties were available in document form. Information relating to building permit records or water and sewer connection records was not available from the City of Poway or County of San Diego Assessor's Office.

Consultation with Brian Smith

On December 6, 2022, Dudek contacted Brian Smith by email to inquire about the Harmon House. The correspondence is attached to this report in Appendix C.

ParcelQuest

On June 6, 2022, ParcelQuest was used to access San Diego County Assessor's information about the properties located within the study area. Information regarding dates of construction and current owner name(s), if noted, was used in the preparation of the evaluations of significance and historic context.

San Diego County Digital Library

Dudek borrowed several books and researched historical photographs available from the San Diego County Digital Library. All available information obtained from the library was used in the preparation of the historic context and evaluations of significance for the properties in the study area.

Historical Newspaper Review

Newspapers related to the properties and Project site were reviewed at www.newspapers.com (Newspapers 2022) and ProQuest Historical Newspapers at www.proquest.com. Dudek reviewed historical newspapers from San Diego and surrounding cities in an effort to understand the development of the City of Poway, the Project site, and the subject properties at Property A: 12702 Oak Knoll Road (APN 317-500-14-00), Property B: 12650 Oak Knoll Road (APN 317-500-13-00), Property C: 12624 (APN 317-500-11-00), and Property D: 12623 Oak Knoll Road (APN 317-501-02-00).

3.2.2 Historical Aerial Photographs and Sanborn Fire Insurance Maps

A review of historical aerial photographs was conducted as part of the archival research effort from the following years: 1939, 1949, 1964, 1966, 1967, 1968, 1978, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2002, 2003, 2005, 2009, 2010, 2012, 2014, 2016, 2018. The Built Environment Study Area was reviewed on City of Poway Sanborn Fire Insurance Maps for the years 1887, 1888, 1906, 1921, 1940, and 1956. The study area is not visible on any Sanborn maps. Table 4 discusses the development of the Built Environment Study Area (NETR 2022; UCSB 2022).

Table 4. Historic Aerial Photographs and Historic Maps

Photograph Year	Observations and Findings
1939	This is the earliest aerial photograph of the Study Area. The area is mostly divided into agricultural uses. The Harmon House (**Property A)** and the house at 12623 Oak Knoll Road (**Property B**) are visible. There are three structures visible to the east of **Property A** and orchards to the west**.**
1949	There are no discernible changes to the buildings since 1939. The orchards that appeared west of **Property A** have been removed.
1964	The four residences included in the Study are visible on their parcels. Oak Knoll Road is visible with scattered single-family homes among undeveloped land to the north and south of the street.

	The surrounding region appears to include residential developments to the east on the east side of Carriage Road, and to the south along Soule Street, where development is separated from the Study Area by Poway Creek and a visible green belt.
1966	No discernable changes to the Study Area.
1967	No discernable changes to the Study Area.
1968	No discernable changes to the Study Area.
1978	Oak Knoll Road appears to have been widened and developed. Residential development appears east and west of the Study Area. **12624 Oak Knoll Road (Property C)** – Changes include the addition of a rectangular ancillary building on the northeast side of the property, a rectangular shaped addition on the northwest side of the primary residence, and a pool on the southwest side of the backyard, directly behind the residence.
1980	No discernable changes to the Study Area.
1981	No discernable changes to the Study Area.
1982	No discernable changes to the Study Area.
1983	No discernable changes to the Study Area.
1984	No discernable changes to the Study Area.
1985	Construction begins on an apartment complex on the north side of Oak Knoll Road, just west of **Property C**.
1986	Construction on the apartment complex appears to be complete.
1987	No discernable changes to the Study Area.
1988	No discernable changes to the Study Area.
1989	No discernable changes to the Study Area.
1990	No discernable changes to the Study Area.
1991	No discernable changes to the Study Area.
1993	No discernable changes to the Study Area.
1994	**Property D** - There appears to be the addition of a rectangular ancillary building on the southeast side of the property.
1995	No discernable changes to the Study Area.
1996	No discernable changes to the Study Area.
1997	The neighboring building east of **Property A** is demolished.
1998	The site east of **Property A** is cleared.
1999	A tract of single-family houses with similar footprints appears on the property east of **Property A**.
2000	No discernable changes to the Study Area.

2002	Construction begins on the parcels on the south side of Oak Knoll Road, across from **Property A** and **Property B**, east of **Property C**. **Property B** - There appears to be a small rectangular addition to the rear of the building.
2003	Single-family houses with similar footprints appear on the south side of Oak Knoll Road across from **Property A** and **Property B**.
2005	No discernable changes to the Study Area.
2009	**Property C** - The rectangular ancillary building on the northwest side of the property is moved to the northeast side, and the pool appears to be removed.
2010	Residential development appears to infill the previously undeveloped land on the south side of Oak Knoll Road, west of **Property D**.
2012	No discernable changes to the Study Area.
2014	**Property C** - A front addition is added to the ancillary building on the northeast side of the property, giving the building an irregular shape.
2016	No discernable changes to the Study Area.
2018	No discernable changes to the Study Area.

4 FIELD SURVEY

4.1 Field Survey Methods

The Dudek project team responsible for this report and/or the fieldwork and analysis supporting this report Dudek included Architectural Historians Claire Cancilla, MSHP, Katie Ahmanson, MHC, and Nicole Frank, MSHP. The report was reviewed for quality assurance/quality control by Dudek Senior Architectural Historian Allison Lyons, MSHP, Historic Built Environment Lead and Task Manager Sarah Corder, MFA. All authors and reviewers meet the Secretary of the Interior's Professional Qualifications Standards (36 CFR Part 61) for architectural history, history, or both. The preparers' qualifications are located in Appendix A.

4.2 Field Survey Results

Four historic age properties are located within the Built Environment Study Area for this project: Property A: 12702 Oak Knoll Road (APN 317-500-14-00), Property B: 12650 Oak Knoll Road (APN 317-500-13-00), Property C: 12624 (APN 317-500-11-00), and Property D: 12623 Oak Knoll Road (APN 317-501-02-00) (Figure 2).

The properties were documented and evaluated in consideration of NRHP and CRHR and integrity requirements as part of this study. Section 4.3 below provides a general physical description, photograph, history of ownership, and any alterations identified. Dates and details of construction and alterations were not available from the City of Poway records or the San Diego County Planning & Development Services Department and instead, have been estimated from aerial photographs and survey observations.

4.3 Descriptions of Surveyed Resources

Property A: 12702 Oak Knoll Road (APN 317-500-14-00)

Property Description

Property A is a one-story, single-family Rock House style house constructed circa 1933-1940 (Smith 1991: 16). The residence has an L-shaped plan, with the original rectangular rock-clad portion to the south (facing Oak Knoll Road) and a 1974 single-story wood frame rectangular addition clad in wood shake shingles extending to the north. According to a 1990 structural report on the property, the original rock portion of the property is of wood frame construction with a concrete base; this report indicates that the rocks on the original portion of the house do not appear to be structural (Smith 1991: 14). The rocks are larger at the base of the wall, becoming smaller as the wall ascends. The property has a low-pitched cross-gabled roof clad in non-original composite shingles with slight overhanging wood eaves. Gable ends on multiple elevations of the original rock portion of the house are clad in stucco, separating the rock from the roof. There is a large stone chimney at the southeast corner of the residence.

Property A's primary (south) elevation, facing Oak Knoll Road, has a single-leaf wood door with four raised panels flanked by identical replacement slider windows and covered by a projecting gabled overhang. Additional fenestration on the original rock portion of the house was largely obscured from view at the time of the intensive

survey but appears to consist of a small rectangular wood frame single pane window and a four-light wood frame window on its east side elevation and a replacement slider window on its west side elevation. Fenestration on the 1974 addition is comprised of wood frame single-pane or slider windows and a partially glazed wood door. There is a concrete patio and non-original single-story ancillary shed clad in wood siding located several feet northwest of the house.

Exhibit B. 12702 Oak Knoll Road. Primary (south) elevation, looking north. The 1974 addition is located at the north rear of the building and is clad in wood shingles rather than the stone north end of the elevation.

Source: DSC01712

Identified Alterations

The following list of known alterations to Property A was compiled through archival research, during the intensive survey, and from the previous 1991 report on the property by Brian S. Smith & Associates. Unless indicated, the date of these alterations is unknown:

- A 1974 single-story rectangular addition clad in wood shingles on the property's north elevation. The 1991 report notes that the date of the addition was inscribed in the concrete foundation outside the addition (1974; Smith 1991: 18).
- Replacement of wood roof shingles with composite shingles (observed, unknown date; Smith 1991: 15).
- Addition of an ancillary shed to the northwest of the residence (observed, the shed was present by 1991; Smith 1991: 17).
- Replacement of windows on the primary (south) and west side elevations (observed, no date)
- Likely replacement of main entrance door on primary (south) elevation (observed, no date)

Property History

There is one house on Property A: 12702 Oak Knoll Road. The rock house has one major addition at its north rear from 1974.

According to the San Diego County Assessor, the 1,117 square-foot single-family residence was constructed circa 1933 on the same rectangular parcel that exists today (ParcelQuest 2022). However, this date has not been definitively confirmed and other sources offer different dates of construction ranging from 1933 to the 1940s. A report prepared by Affinitis in 1990 identified the house as being constructed sometime in the 1930s. The 1991 Smith & Associates report notes that "the age of the structure is not greater than 60 years and is more likely in the range of 45 to 55 years," giving a construction date of circa-1940s (Smith 1991: 16). The property's listing on the Poway Historical Sites List includes a date of construction as circa-1940s. (Smith 1991: 16; Smith 1992).

A history of the property's owners was unobtainable from the San Diego County recorder. Table 5, below lists the ownership history information that was identified from previous reports, historic newspapers from www.newspapers.com, information on ancestry.com, and conveyance information provided by the current property owners (Smith 1991; NETR 2022; Ancestry 2022). The original owners appear to have been John and Joe Markwalder, brothers who immigrated to the United States from Switzerland around 1919 and worked as farmers. Smith reports that the brothers purchased land in 1927. While they were listed in Poway directories as of 1933, no address is included in the listing. The 1930 US Federal Census record for John Markwalder lists his residence as Escondido and his occupation as grain farmer. John Markwalder's World War II draft registration card lists his address in 1942 as 1145 10th Street in San Diego and his brother Joe's address as Escondido. John worked for Consolidated Aircraft Corporation during the war (Smith 1991: 16; Ancestry 2022). Joe appears to have returned to Poway by the mid-1950s; an article from 1956 mentions Joe and his wife as living on Oak Knoll, but does not have a specific address (Times-Advocate 1956: 5.)

Table 5. List of Ownership for Property A*

Years owned/occupied	Name	Acquisition Date	Reference Source
Circa 1927	Joe and John Markwalder	1927 (land)	Smith 1991: 16
Unknown	Mrs. Caine**	Unknown	Smith 1991: 16

Table 5. List of Ownership for Property A*

Years owned/occupied	Name	Acquisition Date	Reference Source
Unknown	Mrs. Cook (Mrs. Caine's niece) **	Unknown	Smith 1991: 16
1974	Mr. and Mrs. Richard Miller	Unknown	Times-Advocate 1974

*Obtained from research on newspapers.com and ancestry.com and previous reports on Property A
**These names come from the 1991 Smith & Associates report; there are no first names provided and Dudek's research has not identified the first names of these owners.

Architect and Builder

No architect or builder could be identified for Property A. The 1991 Smith & Associates report on the property states that it was originally owned by brothers Joe and John Markwalder, who also constructed another rock house to the east of the subject property. That rock house was located at 12718 Oak Knoll Road and was known as the Markwalder House (demolished). The report notes that the brothers may have built Property A as well, although this could not be definitively confirmed by Dudek's research (Smith 1991: 16).

Previous Evaluations

Property A has been previously evaluated:

- 1990: a property inspection report was completed by the Murray Company, which focused on a partial inspection to determine the property's structural adequacy. This report found that the house was constructed of wood frame, post and pier foundation, and rock fascia. The report stated that the rock finish does not serve a structural function. The report found Property A to be in "a poor state of repair" largely due to due to severe sloping in the western end of the original structure and in the northwest corner of the addition. Dudek does not have a copy of this report; its results were summarized in a 1991 report from Smith & Associates (Smith 1991: 14).
- 1990: The property was evaluated by Affinitis. Dudek does not have a copy of this report, but it is referenced in a later 1991 study by Brian Smith & Associates (Smith 1991).
- 1991: Brian Smith & Associates wrote a cultural report which discussed some of the research from the 1990 study by Affinitis and supplemented it with additional research and evaluation. This report found that while the home met the minimum criteria as a Category C building as an example of the rock house / Big Stone typology, it was a "poor" example of the type due to compromised integrity from both the 1974 addition and material deterioration (Smith 1991: 3, 18).
- 1991: Property A is also listed on Poway's Historical Sites List (listed as PHS-113), where it is described as a Big Stone house constructed of cobblestone and called the Harmon House (Smith 1992: 6).

Property B: 12650 Oak Knoll Road (APN 317-500-13-00)

Property Description

The subject property is a one-story, single-family house constructed in 1957 (San Diego County Assessor). The house has elements of the Minimal Ranch style. The building has an L-shaped plan with a low-pitched, cross-hipped roof clad in composition shingles, with open eaves and exposed rafters. The main (south) elevation features a two-bay wide projection (west side). Cladding on the main elevation is divided along a horizontal line. On the east side, this is vertical wood board cladding along the top half of the wall and horizontal wood board cladding on the bottom half. Fenestration is a sliding, aluminum sash window. A recessed entrance is centrally located at the intersection of the two masses of the L-shape plan. The entrance is a single panel door. The second, or western, mass of the L-shape is two bays wide and protrudes south with vertical wood board cladding along the top half of the wall and smooth stucco along the bottom half. A sliding aluminum frame entrance is on the east side of the elevation. The two-material cladding continues on the east side elevation. The east side elevation features two sliding windows with an aluminum sash. The west side elevation is clad in smooth stucco and includes a multi-light casement window. The property is located in the middle of the block and is set back on its parcel with a grass lawn and concrete driveway. Alterations to the appear to include the replacement of the original window sash with vinyl (dates unknown).

Exhibit C. 12650 Oak Knoll Road. Primary (south) elevation, looking northeast.

Source: DSC04607

Identified Alterations

The following list of known alterations to Property B was compiled through archival research and during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Replacement vinyl windows, multiple elevations (observed, no date)
- Addition to the rear (observed, 2002)

Property History

There is one house on Property B: 12650 Oak Knoll Road. According to the San Diego County Assessor, the 1,441 square-foot single-family residence was constructed circa 1957 on the same rectangular parcel that exists today (ParcelQuest 2022). The Minimal Ranch-style home has no major additions, though it has been altered. Ownership information was unobtainable from the San Diego County recorder. The earliest ownership information available identified Richard and Helen Wexeberg as the owners of the property in 1964. The next known residents of the property were James and Joan French in 1971, Katie B. Carter in 1975, and Eugene and Barbara Pendell in 1976, followed by Thomas J. Kerr in 1998. Table 6, below lists the ownership history information that was found in historic newspapers from www.newspapers.com, and information on ancestry.com (NETR 2022; Ancestry 2022).

Table 6. List of Ownership for Property B*

Architect and Builder

No architect or builder could be identified for Property B.

Previous Evaluations

The property has not been previously evaluated for historical significance.

Property C: 12624 Oak Knoll Road (APN 317-500-11-00)

Property Description

The subject property is a one-story, single-family house constructed in 1959, with two ancillary buildings on the rear of the parcel (San Diego County Assessor). The house has elements of the Minimal Ranch style. The building has a rectangular plan with a low-pitched, side-gabled roof clad in composition shingles, with open eaves, exposed rafters, and an overhang that extends above the entry porch. Cladding is rough textured stucco with vertical wood board cladding along the central entrance porch. The main (south) elevation is divided into five bays. A double-light sliding window is featured within the first bay. A brick-clad chimney with a concrete cap extends above the roofline in the second bay where the roofline extends over the porch. Within the porch, there is a large centrally placed, five-over-five square light wood sash window and single main entry door, obscured by a security door. The entrance porch is accessed by stone concrete to the east of the porch foundation. Wood posts along the perimeter of the porch support the overhang above. To the east of the entrance is a small double-hung window and multi-light sliding window, in the fourth and fifth bays, respectively. A multipaneled wood garage door is featured on the far east side of the main elevation and leads to the attached garage. A wood picket fence extends from the west side of the main elevation to the property line. The west side elevation is clad in rough textured stucco and includes two double light sliding windows, as well as a centrally located decorative vent beneath the pitch of the gable. On the east side elevation is a single, central multi-light fixed window. The two ancillary buildings sit on the east side of the northeast rear of the property. One furthest south features a vertical wood board clad rectangular mass topped by a side gable, wood shingle roof with open eaves, exposed rafters, and a wide overhang supported by wood posts to cover a surrounding porch. The other is just north of the first ancillary building and has a modular composition with a side gable and shed roof. The property is located in the center of a primarily residential block, and set back on its parcel with an open lawn, and a concrete driveway leading to the attached garage. Alterations to the residence appear to be the replacement of the original garage door, and the replacement of the original window sash with vinyl (dates unknown).

Exhibit D. 12624 Oak Knoll Road. Primary (south) elevation, looking northwest.

Source: DSC04603

Identified Alterations

The following list of known alterations to Property C was compiled through archival research and during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Replacement vinyl windows, multiple elevations (observed, no date)
- Addition of a rectangular ancillary building on the northeast side of the property (observed, 1978)
- Addition of a rectangular ancillary building on the northwest side (observed, 1978)
- Addition of a pool on the southwest side of the backyard, directly behind the residence (observed, 1978)
- Replacement of original garage door (observed, 2014)
- Front addition to the ancillary building on the northeast side of the property (observed, 2014)
- Replacement of wood fence (observed, 2015)

Property History

There is one house presently on Property C: 12624 Oak Knoll Road. According to the San Diego County Assessor, the 1,634 square-foot single-family residence was constructed circa 1959 on the same rectangular parcel that exists today (ParcelQuest 2022). The Minimal Ranch-style home has no major additions, though it has been altered. Ownership information was unobtainable from the San Diego County recorder. No information could be found on the McMahan family. The property has been owned by the Harmon family since 1966. Edward K. Harmon was born in Arkansas in 1928. Joyce Juanita Harmon was born in Arkansas in 1931. The couple moved to Poway in 1966 and appear to have resided at 12624 Oak Knoll Road for several decades. Edward Harmon served in the US Navy, reaching the rank of Commander before retiring in 1978. Joyce and Edward Harmon worked in real estate and were active members of many local clubs and organizations. Joyce passed away in 2000 and Edward died in 2015. The couple had three daughters (North County Times 2000). Table 7, below lists the ownership history information that was found in historic newspapers from www.newspapers.com, and information on ancestry.com (NETR 2022; Ancestry 2022).

Table 7. List of Ownership for Property C*

Years owned/occupied	Name	Acquisition Date	Reference Source
1963	Mr. and Mrs. Everett P. McMahan	Unknown	Times Advocate, 1963

Architect and Builder

No architect or builder could be identified for Property C.

Previous Evaluations

The property has not been previously evaluated for historical significance.

Property D: 12623 Oak Knoll Road (APN 317-501-02-00)

Property Description

The subject property is a one-story, single-family residence with an ancillary building to the rear of the property. It was constructed in 1946 (San Diego County Assessor). The residence is divided into two masses with an L-shaped plan. The front mass (long side of the L) is clad with a vertical wood board and batten. The front mass is topped by a flat roof with closed eaves. A side gable roof clad in corrugated metal with open eaves tops the second mass. The main (north) elevation is seven bays wide and features three wood sash multilight double casement windows; a centrally located entry door obscured by an iron security door accessed by two concrete steps; and a single wood sash multilight double casement window in the sixth bay, centered between the fifth and seventh bays. The west side elevation spans four bays and includes three sliding windows in the second and fourth bays, while the east side elevation does not have fenestration. Side elevations are clad in wood board and batten. The residence is slightly raised on a concrete block foundation. A chain-link fence surrounds the property, and an unpaved driveway leads from the street to another chain-link fence that encompasses the backyard (east of the residence). The ancillary building sits on the southeast side of the property with a shed roof clad with composition shingles and double doors on the main (north) elevation (NETR, 1994). The property is in the middle of the block and the residence is set back on its parcel with an open grass lawn. Alterations to the residence appear to include the addition of fencing (date unknown), and a security door to the entry (NETR, 1994). The glazing has been removed from the wood sash window adjacent to the entrance.

Source: DSC04599

Exhibit F. 12623 Oak Knoll Road. Primary (north) elevation and west elevation, looking southeast.

Source: DSC04597

Identified Alterations

The following list of known alterations to Property D was compiled through archival research and during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Glazing removed from the wood sash window adjacent to the entrance (observed, no date)
- Addition of a rectangular ancillary building on the southeast side of the property (observed, 1994)
- Addition of security door to front entry door (observed, 2014)

Property History

There is one house presently on Property D: 12623 Oak Knoll Road. According to the San Diego County Assessor, the 625 square-foot single-family residence was constructed circa 1946 on the same rectangular parcel that exists today (ParcelQuest 2022). A building or structure appears on the earliest available aerial photographs of the area from 1939. There is no permit history available for the building and the precise year of construction for the extant building on the site could not be confirmed. The home has been altered. Ownership information prior to 1971 was

unobtainable from the San Diego County recorder, and could not be identified through research of historic newspapers or available documents on ancestry.com.

Table 8. List of Ownership for Property D*

Years owned/occupied	Name	Acquisition Date	Reference Source
1971	Terry L. and Verba Cruise	unknown	Haines Criss-Cross Directory, 1971
1975	Rhonda L. Esh	unknown	Haines Criss-Cross Directory, 1971
1979	vacant	unknown	Haines Criss-Cross Directory, 1971

*obtained from Haines Criss-Cross Directory and current owner's records

Architect and Builder

No architect or builder could be identified for Property D.

Previous Evaluations

Property D has been previously evaluated:

- 1991: Property D is listed on Poway's Historical Sites List (listed as PHS-112), where it is described as a House constructed of Lath and board constructed c. 1920 (Smith 1992: 6).

INTENTIONALLY LEFT BLANK

5 SIGNIFICANCE EVALUATIONS

5.1 Property A: 12702 Oak Knoll Rd

Property A: 12702 Oak Knoll Road (APN: 317-500-14-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district, as demonstrated below.

Subchapter 17.45.050 of the City of Poway Municipal Code states that for a historic/cultural resource to be designated as a Poway historic landmark, it must meet the requirements of a Category A or B historic/cultural resource. In addition, the Development Services Department shall find that the historic/cultural resource meets one of the eight criteria for local landmark designation. 12702 Oak Knoll Road does not meet the requirements of a Category A or B historic/cultural resource and further does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. Therefore, Property A is not eligible for listing as a local landmark and should not be considered a historical resource for the purposes of CEQA.

Although Property A is not eligible as a landmark, it appears to fulfill the minimum requirements of a Category C building as a good example of a period of architecture design or construction with a commonplace design and appears to be an important resource with substantial alterations that have severely compromised its historic, cultural, or architectural significance.

No evidence was found to support a finding of historical significance for the Harmon House; however, following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property A did not find any associations with events that made a significant contribution to the broad patterns of history. Although the date of construction for Property A could not be definitively confirmed, it appears to have been constructed circa 1940. The property's original owners, Joe and John Markwalder, were farmers who likely constructed the property themselves. Poway was a primarily agrarian area beginning circa 1859. While Property A appears to have been constructed by farmers during this agricultural period and prior to the real estate boom in the 1950s that contributed to the area's increased residential suburbanization following the establishment of a water district, there is no indication that the construction of this specific residence marked a pivotal movement in the history of the neighborhood or city. Rather, it appears to have been constructed as a continuation of the agricultural, ranching, and residential functions in Poway that existed for decades. Property A was neither the first nor the last rock house to be constructed in Poway. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway, California, or the United States; therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national or state, level. The earliest ownership information available identified John and Joe Markwalder, farmers who immigrated to the United States from Switzerland around 1919, as the original owners of Property A. While research did not identify substantive information on subsequent owners, it appears that the house was later owned by a Mrs. Caine, who passed ownership to her niece, Mrs. Cook. The dates of occupancy for these individuals are unknown. The most recent identified occupants, from 1974, were Mr. and Mrs. Richard Miller. The property is owned by the Harmon family, and known as the Harmon House. However, research did not indicate the house was historically the residence of anyone with the name Harmon. Research did not identify information on the lives of each of the property owners or residents that would indicate they are individuals considered significant. Due to a lack of identified significant associations with important persons in history, Property A does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property A is a vernacular rock house constructed circa 1933-1940 with a 1974 addition at its rear north elevation. The property still visually reads as a rock house when viewed from the public-right-of way on Oak Knoll Drive, retaining its character-defining rock exterior cladding on its south, east, and west elevations. The 1974 addition on its north elevation, however, has affected the property's integrity, as elaborated upon in the "Integrity Discussion" below. As a result of this addition and smaller alterations such as window replacements on the south and west elevations, Property A's ability to convey the distinctive characteristics of its type or period has been diminished as it no longer appears to be a rock house from all elevations. In contrast to some rock houses in Poway, which use large boulders as their structural system, Property A is of wood frame construction clad in stone and rocks and does not appear to be distinctive or represent an innovative or noteworthy method of construction for rock houses.

Although an original building permit was not located, there is no indication that a master architect or firm designed the property. The residence may have been built by its original owners, John and Joe Markwalder, who were farmers. The property further does not appear to possess high artistic values by articulating a particular concept of design to the extent that it expresses an aesthetic ideal. Other than its rock cladding, the residence does not have notable design elements and it does not appear to be a unique example of its type in Poway.

The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property A does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties of the same construction period or type in the area. Therefore, Property A does not appear eligible NRHP Criterion C or CRHP Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo in 2022.

Integrity Discussion

Property A has not been moved and retains integrity of location. The earliest identified aerial photograph of the property shows that there was agricultural development directly surrounding the property; by 1978, however, extensive residential development was extant to the north of the property and today there are many houses adjacent to Property A (NETR 2022). Consequently, the property's integrity of setting has been diminished. In 1974, an addition was added to the north rear elevation of the original rock house. The addition is clad in wood shake shingles rather than stone and this addition may have necessitated the demolition or removal of part of the property's original north wall and rock cladding. The windows on the property's primary south elevation and its east elevation have also been replaced. These alterations, most significantly the rear addition, have diminished the property's integrity of design, materials, and workmanship. These changes have also diminished the property's integrity of feeling. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. In summation, Property A retains its integrity of location, but lacks integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property B: 12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below.

Although Property A is not eligible as a landmark, it appears to still fulfill the minimum requirements of a Category C building. A Category C building must meet one of two minimum requirements (City of Poway, Subchapter 17.45.030, 1989):

i. A good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City

ii. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance

In 1991, Smith & Associates identified Property A as meeting the minimum requirements of a Category C building. The report stated that Property A was an example of Big Stone architecture but was a "poor example" of its type (Smith 1991: 3). Dudek concurs with the finding that Property A meets the minimum requirements of a Category C building, as it does embody some the character-defining feature of the rock house typology but its integrity has been diminished due to the 1974 addition at the north rear and other smaller alterations, such as window replacements.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property A is related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property A does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property A was a location associated with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, Property A does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, Property A does not appear to have been designed by an architect or firm of major importance; it appears the building was constructed by its original owners. Therefore, Property A does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property A was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property A does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property A does not appear to exhibit an extraordinary class of architectural design, detail, materials, or craftsmanship. Property A is an example of a vernacular rock house but has been substantially altered so that its integrity of design, materials, and craftsmanship have been diminished. Therefore, Property B does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property A does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property A does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property A is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark, which has made a major contribution to the community. Therefore, Property A does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property A does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that

promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property A does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

12702 Oak Knoll Road (APN: 317-500-14-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Subchapter 17.45.050 of the City of Poway Municipal Code states that for a historic/cultural resource to be designated as a Poway historic landmark, it must meet the requirements of a Category A or B historic/cultural resource. In addition, the Development Services Department shall find that the historic/cultural resource meets one of the eight criteria for local landmark designation. 12702 Oak Knoll Road does not meet the requirements of a Category A or B historic/cultural resource and further does not meet any of the criteria for landmark listing by the City of Poway.

Property A (12702 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As a previously identified Poway Historic Site, the property appears to meet the requirements to be eligible as a City of Poway Category C building that possesses one the following characteristics:

1. It is a good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;

2. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

Following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

5.2 Property B: 12650 Oak Knoll Rd

Property B: 12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district, as demonstrated below.

Property B further does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. As a building constructed in 1957 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. The recommended status code is 6Z: Found ineligible for NRHP, CRHR or Local designation through survey evaluation.

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are association with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property B did not find any associations with events that made a significant contribution to the broad patterns of history. The property was completed in 1957, during a real estate boom brought on by a new sewer system that provided residences with access to a stable source of water. Despite the property reflecting the trend of Poway's residential growth during the late 1950s, there is no indication that the construction of this specific

residence marked a pivotal movement in the history of the neighborhood or city. It was neither the first nor the last type and was merely following a continuous pattern of residential development that continued through the 1980s after Poway became a city. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway; therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national, state, or local level and Property B. The earliest ownership information available identified Richard and Helen Wexeberg as the owners of the property in 1964. The next known residents of the property were James and Joan French in 1971, Katie B. Carter in 1975, and Eugene and Barbara Pendell in 1976, followed by Thomas J. Kerr in 1998. Research found little additional information on the lives of each of the property owners that would indicate they are individuals considered significant in our past. Due to a lack of identified significant associations with important persons in history, Property B does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property B does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1950s Ranch-style residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of the Minimal Ranch style and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the property could not be found. There is no known architect or firm associated with the design or development of Property B. There is no indication that the property is a distinguished example of work that was designed by an architect or firm recognized as unique in the field of Ranch house design or single-family residential development. Property B does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property B does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, Property B is not significant under Criterion C/3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo 2022.

Integrity Discussion

Property B contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been altered since the 1957 residence was

constructed. The integrity of setting has been diminished due to continued development in the area, particularly in the 1990s and early 2000s. The replacement of its original windows and the rear addition impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. Property B retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property B: 12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property B is related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property B does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property B was a location associated with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, Property B does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, the building identified on Property B does not exemplify a fine example of the Minimal Ranch style in the City of Poway. No original building permit could be located for Property B. Property B does not appear to be the work of an architect of major importance. Therefore, Property B does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property B was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property B does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property B does not appear to exhibit an extraordinary class of architectural design, detail, materials, or craftsmanship. It is a typical example of a ubiquitous Minimal Ranch House design. Therefore, Property B does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property B does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property B does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property B is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark, which has made a major contribution to the community. Therefore, Property B does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property B does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property B does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

Property B (12650 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As such, the property is not considered a CEQA historical resource.

5.3 Property C: 12624 Oak Knoll Rd

Property C: 12624 Oak Knoll Road (APN: 317-500-11-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district, as demonstrated below.

Property C further does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. As a building constructed in 1959 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. The recommended status code is 6Z: Found ineligible for NRHP, CRHR or Local designation through survey evaluation.

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are association with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property C did not reveal any associations with events that made a significant contribution to the broad patterns of history. The property was completed in 1959, during a real estate boom brought on by a new sewer system that provided residences with access to a stable source of water. Despite the property reflecting the trend of Poway's residential growth during the late 1950s, there is no indication that the construction of this specific residence marked a pivotal movement in the history of the neighborhood or city. It was neither the first nor the last type and was merely following a continuous pattern of residential development that continued through the 1980s

after Poway became a city. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway, therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national, state, or local level and Property C. The earliest ownership information identified that Mr. and Mrs. Everett P. McMahan owned the property in 1963. The next known owners of the property were Edward K. Harmon and Joyce Juanita Harmon. The property has been owned by the Harmon family since 1966. Edward K. Harmon was born in Arkansas in 1928. Joyce Juanita Harmon was born in Arkansas in 1931. The couple moved to Poway in 1966 and appear to have resided at 12624 Oak Knoll Road for several decades. Edward Harmon served in the US Navy, reaching the rank of Commander before retiring in 1978. Joyce and Edward Harmon worked in real estate and were active members of many local clubs and organizations. Joyce passed away in 2000 and Edward died in 2015. Despite the Harmons' role as prominent and active members of their community, research did not reveal information that would indicate Edward and Joyce Harmon are individuals considered significant in our past. Due to a lack of identified significant associations with important persons in history, Property C does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property C does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1950s Ranch-style residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style, and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the property could not be found. There is no known architect or firm associated with the design or development of Property C. There is no indication that the property is a distinguished example of work that was designed by an architect or firm recognized as unique in the field of Ranch house design or single-family residential development. Property C does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property C does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, Property C is not significant under Criterion C/3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo 2022.

Integrity Discussion

Property C contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been by continued development in the area, particularly in the 1990s and early 2000s, changing the setting of the 1959 residence. The replacement of its original windows, addition of ancillary buildings, addition of a pool, and replacement of the garage door and fence impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. Property C retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property C: 12624 Oak Knoll Road (APN: 317-500-11-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property C was related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property C does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property C was identified with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or the United States. The earliest ownership information identified that Mr. and Mrs. Everett P. McMahan owned the property in 1963. The next known owners of the property were Edward K. Harmon and Joyce Juanita Harmon. The property has been owned by the Harmon family since 1966. Edward K. Harmon was born in Arkansas in 1928. Joyce Juanita Harmon was born in Arkansas in 1931. The couple moved to Poway in 1966 and appear to have resided at 12624 Oak Knoll Road for several decades. Edward Harmon served in the US Navy, reaching the rank of Commander before retiring in 1978. Joyce and Edward Harmon worked in real estate and were active members of many local clubs and organizations. Joyce passed away in 2000 and Edward died in 2015. Despite the Harmons' role as prominent and active members of their community, research did not reveal information that would indicate Edward and Joyce Harmon are individuals considered significant in our past. Therefore, Property C does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, the building identified on Property C does not exemplify a fine example of the Minimal Ranch style in the City of Poway. No original building permit was found and there is no indication the residence is the work of an architect of major importance. Therefore, Property C does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property C was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property C does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property C does not appear to exhibit an extraordinary class of architectural design, detail, materials or craftsmanship. It is a typical example of a ubiquitous Minimal Ranch House design. Therefore, Property C does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property C does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property C does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property C is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark has made a major contribution to the community. Therefore, Property C does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property C does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property C does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

Property C (12624 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As such, the property is not considered a CEQA historical resource.

5.4 Property D: 12623 Oak Knoll Rd

Property D: 12623 Oak Knoll Road (APN: 317-501-02-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district, as demonstrated below.

12623 Oak Knoll Road does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. The building was previously identified as Poway Historic Site 112 (Smith 1992: 6). In this identification, the

property is described as a house of lath and board construction from the 1920s. The building currently on the property is a wood, board-and-batten house, which indicates the building has been substantially altered since its identification on the Poway Historic Sites list.

The San Diego County Assessor recorded the year of construction as 1946, but a building appears on the earliest available historic aerial photographs of the property from 1939. It is not known if the building present in 1939 is the building currently present on the property. It is possible that the property fulfills the minimum requirements of a City of Poway Category D building, which includes properties built prior to 1940 that are clearly not significant in terms of architectural style, appearance, design, construction, or association with important persons or events in City history. Therefore, Property D is of historic age, but does not appear to have significance as a historical resource. The building does not appear eligible for listing as a historical resource. The recommended status code is 6Z: Found ineligible for NRHP, CRHR or Local designation through survey evaluation.

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are association with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property D did not find any associations with events that made a significant contribution to the broad patterns of history. The property is a nondescript wood frame building. There is no indication the property is associated with significant events in the City's early agricultural development, though it appears to have been constructed in the first half of the twentieth century when the area was primarily agricultural. There is no indication the property has an important association with an event or historic trends in Poway, such as post-World War II residential development. Therefore, Property D does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not identify any of the previous property owners and there is no indication the property has any direct association with individuals that are known to be historic figures at the national, state, or local level. Due to a lack of identified significant associations with important persons in history, Property D does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property D does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a single-family residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style, and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the property could not be found. There is no known architect or firm associated with the design or development of Property D. There is no indication that the property is a distinguished example of work

that was designed by an architect or firm recognized as unique in the field of house design or single-family residential development. Property D does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property D does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, Property D is not significant under Criterion C/3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo 2022.

Integrity Discussion

Property D contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been altered since the 1946 residence was constructed with continued development in the area, particularly in the 1990s and early 2000s , so it does not retain integrity of setting. The replacement of its original windows, addition of an ancillary building, and addition of a security door to the front entry door impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with people or events in the City of Poway, thus it does not retain integrity of association. Property D retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property D: 12623 Oak Knoll Road (APN: 317-501-02-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property D was related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property D does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property D was identified with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, Property D does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, the building identified on Property D does not exemplify a fine example of an architectural style in the City of Poway. No original building permit was found and the architect who designed the residence is unknown. There is no indication the property is the work of an architect of major importance. Therefore, Property D does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property D was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property D does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property D does not appear to exhibit an extraordinary class of architectural design, detail, materials or craftsmanship. It is not an example of an architectural style. Therefore, Property B does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property D does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property D does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property D is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark not a natural feature that has made a major contribution to the community. Therefore, Property B does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property D does not exhibit elements of historic preservation that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property B does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

Property D (12623 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As such, the property is not considered a CEQA historical resource.

6 CEQA Impacts Analysis

6.1 Built Environment

Table 9. Built Environment Historical Resources in Project Area

Property	Address	APN	Year Built	NRHP/ CRHR/ City of Poway Significance Criteria	City of Poway Category	CHRS Status Code
A	12702 Oak Knoll Road	317-500-14-00	c. 1933-1940s	Not Eligible	C	6Z
B	12650 Oak Knoll Road	317-500-13-00	1957	Not Eligible	Not Applicable	6Z
C	12624 Oak Knoll Road	APN 317-500-11-00	1959	Not Eligible	Not Applicable	6Z
D	12623 Oak Knoll Road	317-501-02-00	1946	Not Eligible	D	6Z

6.1.1 Historic-Age Properties Not CEQA Historical Resources

Property B: 12650 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Property B further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1957 (after 1940), it does not meet the minimum requirements for a category of historical resource within the City of Poway. Therefore, 12650 Oak Knoll Road is not a CEQA historical resource.

Property C: 12624 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Property C further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1959 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. Therefore, 12624 Oak Knoll Road is not a CEQA historical resource.

Property D: 12623 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. The property appears to meet the minimum requirements of a City of Poway Category D building, which includes properties built prior to 1940 that are clearly

not significant in terms of architectural style, appearance, design, construction, or association with important persons or events in City history. Property D is of historic age, but does not appear to have significance as a historical resource. Therefore, 12624 Oak Knoll Road is not a CEQA historical resource.

Properties and sites that are not considered historical resources under CEQA do not merit further consideration of potential impacts.

6.1.2 CEQA Historical Resources

Property A (12702 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As a previously identified Poway Historic Site, the property appears to meet the requirements to be eligible as a City of Poway Category C building that possesses one the following characteristics:

1. It is a good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;
2. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

Following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

The CEQA Guidelines provide that a project that demolishes or alters those physical characteristics of an historical resource that conveys its historical significance (i.e., its character-defining features) can be considered to materially impair the resource's significance. Such impacts are called substantial adverse changes. Substantial adverse change includes demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired (PRC § 5020.1(q)). Demolition and destruction are examples of the most visible significant impacts; however, changes, alterations and relocation of historical resources may also be considered substantial adverse change.

6.2 Physical Impacts of the Proposed Project

The Harmon House is located within the Project site and is potentially subject to:

1. Direct impacts to the historic setting as a result of changes to the original, undeveloped setting of area north of the Harmon House
2. Direct impacts to the structural stability of the Harmon House as a result of vibration from the blasting, grading, fill, and construction activities planned to the north and east of the Harmon House.

Should the project be implemented, the changes to the undeveloped setting, may result in a substantial adverse change to the Harmon House's setting. As a Category C building, the Harmon House has diminished integrity that has compromised its historic, cultural, or architectural significance. Construction to the east of the property diminished its integrity of setting. The project would further diminish the integrity of setting by developing vacant land to the north and west of the property. This land was not fully visible from the property due to a line of trees along the rear, northern boundary of the Harmon House's immediate vicinity.

The second potential impact of the proposed project are impacts from construction-related vibration. While excavation and grading will fall outside the immediate vicinity of the Harmon House and should not have any physical impact on stones that characterize the house as an example of a Rock Houses or Big Stone style, it is possible that the construction activities may result in vibration-related impacts to unreinforced structural systems of the Harmon House.

6.3 Analysis of Potential Adverse Changes

The proposed project activities were analyzed in consideration of the substantial adverse change examples provided in CEQA Guidelines Section 15064.5(b). Below is a discussion of the adverse changes that may result from the proposed project on the Harmon House, a Poway Historic Sites listed property and City of Poway Category C building.

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

No adverse change. The Harmon House is not eligible for include on the California Register. Property A: 12702 Oak Knoll Road (APN: 317-500-14-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. The property is a City of Poway Category C building that possesses one the following characteristics:

1. It is a good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;
2. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

Commonplace design and alterations that have compromised its historic, cultural, or architectural significance do not justify its inclusion in, or eligibility for, inclusion in the California Register.

2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant;

Potential adverse change. The Harmon House was included in the Poway Historic Sites list as an example of a Rock Houses style or Big Stone style. Potential vibration impacts to the stone cladding resulting in a loss of materials comprising the cladding of the Harmon House have the potential to cause an adverse change to the Harmon House by diminishing a physical characteristic that account for its inclusion in a local register. The project has the potential to materially alter the structure of the rock house through construction-related vibration impacts. Such changes would result in an adverse change to the physical characteristics of the historical resource, namely the materials, design, and workmanship of the Harmon House, that convey its diminished historical significance as a good

example of a commonplace period of architecture design or construction in the City of Poway and as an important resource with substantial alterations that have severely compromised its historic, cultural, or architectural significance. Therefore, the proposed project has the potential to cause a significant adverse change to Harmon House due to the potential change to the stone cladding material that conveys its historic significance.

The integrity of setting for the Harmon House has been diminished due to the changes caused by adjacent single-family home construction to the east, south, and west of the property; however, the relatively unaltered vacant area to the north was a visual component of the resource's integrity of setting since its construction c. 1933-1940. Due to the current diminished setting, maintaining or losing integrity of setting will not have an impact on the Harmon House's diminished ability to convey its historical significance.

3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

No adverse change. The City of Poway is the lead agency for the purposes of CEQA. The Harmon House has not been identified as eligible for inclusion on the California Register by the City of Poway.

6.4 Mitigation Measures

California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for historical resources.

Vibration-Related Impacts Mitigation

Potential construction-related vibration impacts may be reduced to a less than significant level with the following mitigation incorporated. Dudek proposes the following mitigation measure to reduce project impacts from vibration to a less than significant level.

MM CUL-1 The project proponent shall inform construction personnel of the location and significance of Harmon House, and of the avoidance and protective measures that shall be implemented when working near the Harmon House. The Harmon House shall be avoided and protected during all phases of construction of the proposed project.

Prior to the start of work, a qualified architectural historian, meeting the Secretary of the Interior's Professional Qualifications Standards for architectural history (U.S. Department of the Interior, 2008) (Qualified Architectural Historian), shall be retained to develop a plan of action for avoidance and protection of the Harmon House, in coordination with the City of Poway, and the project proponent. The plan shall include at a minimum:

(1) Procedure to review all construction plans to ensure there is a notation of the Harmon House's location on all construction plans;

(2) Initial testing for potential vibration impacts. Should any potential vibration impacts to stone cladding materials be identified as part of the initial testing, construction

methods and equipment uses will be reassessed to ensure that no element of the house is damaged due to construction related ground-borne vibration activities;

(3) Details and timeline to conduct a preconstruction survey to document the existing condition of the Harmon House prior to the start of any ground disturbing work adjacent to the house;

(4) Procedures and timing for the placement and removal of a protective barrier(s) for the Harmon House property;

(5) A detailed plan for monitoring of the installation and removal of protective barriers, as well as notification procedures and monitoring for all project-related work within 20 feet of the Harmon House, by the Qualified Architectural Historian, or his or her designee;

(6) Details and timeline to conduct a post-construction survey to document the condition of the Harmon House after completion of work described in the project description

The plan shall include details and a deadline for the preparation of a technical memorandum documenting the pre-construction and post-construction conditions of the Harmon House and compliance with protective measures. The plan shall comply with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) and shall be memorialized in a technical memorandum, which shall be submitted to the City of Poway for review and approval. The final approved plan shall be submitted to the City of Poway no later than 30 days prior to the start of work. The plan shall be provided to the construction foreman at a project kick-off meeting. The technical memorandum documenting the pre-construction and post-construction conditions shall be submitted to the City of Poway within 30 days of completion of work within 20 feet of the Harmon House and removal of the protective barriers.

View and Vista Impact Mitigation

Potential view and vista impacts and changes to setting may be reduced to a less than significant level with the following mitigation incorporated. Dudek proposes the following mitigation measure to reduce impacts to setting to a less than significant level.

MM CUL-2 In consultation with a qualified architectural historian, meeting the Secretary of the Interior's Professional Qualifications Standards for architectural history (U.S. Department of the Interior, 2008) (Qualified Architectural Historian), the project proponent will develop and implement a landscape plan for the northern boundary of the Harmon House property. This landscape plan shall include trees that will create a visual screen between the Harmon House and the new development proposed to the north of the property. The implementation of this plan shall be documented in the technical memorandum documenting the pre-construction and post-construction conditions described in MM CUL-1.

6.5 Conclusions

The mitigation measures would ensure the proper treatment of any built environment historical resources. With the proper implementation of the prescribed measures, the potential impact to historical resources is considered to be less then significant. Therefore, impacts to historical resources would be **less than significant with mitigation**.

7 FINDINGS AND CONCLUSIONS

7.1 Findings

The Built Environment Study Area contains four historic age properties, three within the Project site and one historic age property immediately adjacent to the Project site. None of the properties have been previously found eligible for the NRHP and CRHR. Property A (12702 Oak Knoll Road) and Property D (12623 Oak Knoll Road) were previously identified on the Poway Historical Sites list as historic age buildings (Smith 1992). According to the introduction that accompanies the Poway Historical Sites list, additional research, survey, and thorough evaluation of historic age buildings on this list should be completed to determine if these properties are eligible for designation. Dudek prepared evaluations in consideration of NRHP, CRHR, and City of Poway criteria for all four historic age properties in the study area. All four properties were also assessed for integrity.

Property A: 12702 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Property A was previously found to meet the minimum criteria as a City of Poway Category C building. As a Category C building, Property A is:

- A good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;
- An important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

Property A is a City of Poway Category C building that does not meet the criteria for listing as a landmark, which require a property to be Category A or B. However, following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

Property B: 12650 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Property B further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1957 (after 1940), it does not meet the minimum requirements for a category of historical resource within the City of Poway. Therefore, 12650 Oak Knoll Road is not a CEQA historical resource.

Property C: 12624 Oak Knoll Road does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a eligible or designated historic district. Property C further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1959 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. Therefore, 12624 Oak Knoll Road is not a CEQA historical resource.

Property D: 12623 Oak Knoll Road was not classified as a category A, B, C, or D previously as part of its inclusion on the Poway Historical Sites list. Research could not verify the year of construction for the property, but it appears likely that it was constructed prior to 1940. Therefore, Property D fulfills the minimum requirements of a Category D building, which includes properties built prior to 1940 that are clearly not significant in terms of architectural style, appearance, design, construction, or association with important persons or events in City history. Therefore,

Property D is of historic age, but does not appear to have significance as a historical resource. The building does not appear eligible for listing as a historical resource. Therefore, 12623 Oak Knoll Road is not a CEQA historical resource.

As a result of the current evaluation, Dudek found all four properties in the built environment study area ineligible for listing under NRHP, CRHR, and City of Poway designation criteria. The recommended status codes and categories are summarized in Table 9 below.

Table 10. Summary of Historic Built Environment Findings

Property	Address	APN	Year Built	NRHP/ CRHR/ City of Poway Significance Criteria	City of Poway Category	CHRS Status Code	CEQA Finding
A	12702 Oak Knoll Road	317-500-14-00	c. 1933-1940s	Not Eligible	C	6Z	Historical resource for the purposes of CEQA – less than significant impact with mitigation
B	12650 Oak Knoll Road	317-500-13-00	1957	Not Eligible	Not Applicable	6Z	Not considered a historical resource for the purposes of CEQA – no impact
C	12624 Oak Knoll Road	APN 317-500-11-00	1959	Not Eligible	Not Applicable	6Z	Not considered a historical resource for the purposes of CEQA - no impact
D	12623 Oak Knoll Road	317-501-02-00	1946	Not Eligible	D	6Z	Not considered a historical resource for the purposes of CEQA – no impact

7.2 Conclusions

No historical resources were identified within or adjacent to the Project site as a result of the BERD search, extensive archival research, an SCIC records search, field survey, and property evaluations of significance. Dudek evaluated four historic age properties in accordance with Section 15064.5 (a)(2)-(3) of California Environmental Quality Act (CEQA) Guidelines and using the criteria outlined in Section 5024.1 of the California Public Resources Code. Dudek concludes that none of the four properties appears to be eligible for listing in the NRHP, CRHR, or as a City of Poway landmark due to a lack of significance. However, following consultation with the City of Poway and Brian Smith, as a Category C building, the Harmon House is CEQA historical resource.

No other buildings on or immediately adjacent to the Project site appear to be historical resources under CEQA. Further, no potential indirect impacts to historical resources were identified as the proposed Project has no potential to impact the built environment beyond the three properties evaluated within this study.

Analysis of project-related impacts found that vibration-related impacts and view and vista impacts to the Harmon House could be mitigated to a less-than-significant level with mitigation incorporated. Therefore, the finding for the project related to built environment historical resources is that a **less-than-significant level with mitigation incorporated**.

12702 Oak Knoll Road is a one-story, single-family rock house constructed circa 1933-1940 (Smith 1991: 16). The residence has an L-shaped plan, with the original rectangular rock-clad portion to the south (facing Oak Knoll Road) and a 1974 single-story wood frame rectangular addition clad in wood shake shingles extending to the north. According to a 1990 structural report on the property, the original rock portion of the property is of wood frame construction with a concrete base; this report indicates that the rocks on the original portion of the house do not appear to be structural (Smith 1991: 14). Period of Significance Ca. 1933-1940 **Property Type** Single-family residence **Applicable Criteria** N/A
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Property A: 12702 Oak Knoll Road (APN: 317-500-14-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district, as demonstrated below.

Subchapter 17.45.050 of the City of Poway Municipal Code states that for a historic/cultural resource to be designated as a Poway historic landmark, it must meet the requirements of a Category A or B historic/cultural resource. In addition, the Development Services Department shall find that the historic/cultural resource meets one of the eight criteria for local landmark designation. 12702 Oak Knoll Road does not meet the requirements of a Category A or B historic/cultural resource and further does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. Therefore, Property A is not eligible for listing as a local landmark and should not be considered a historical resource for the purposes of CEQA. Although Property A is not eligible as a landmark, it appears to fulfill the minimum requirements of a Category C building as a good example of a period of architecture design or construction with a commonplace design and appears to be an important resource with substantial alterations that have severely compromised its historic, cultural, or architectural significance. [See **Continuation Sheet**]

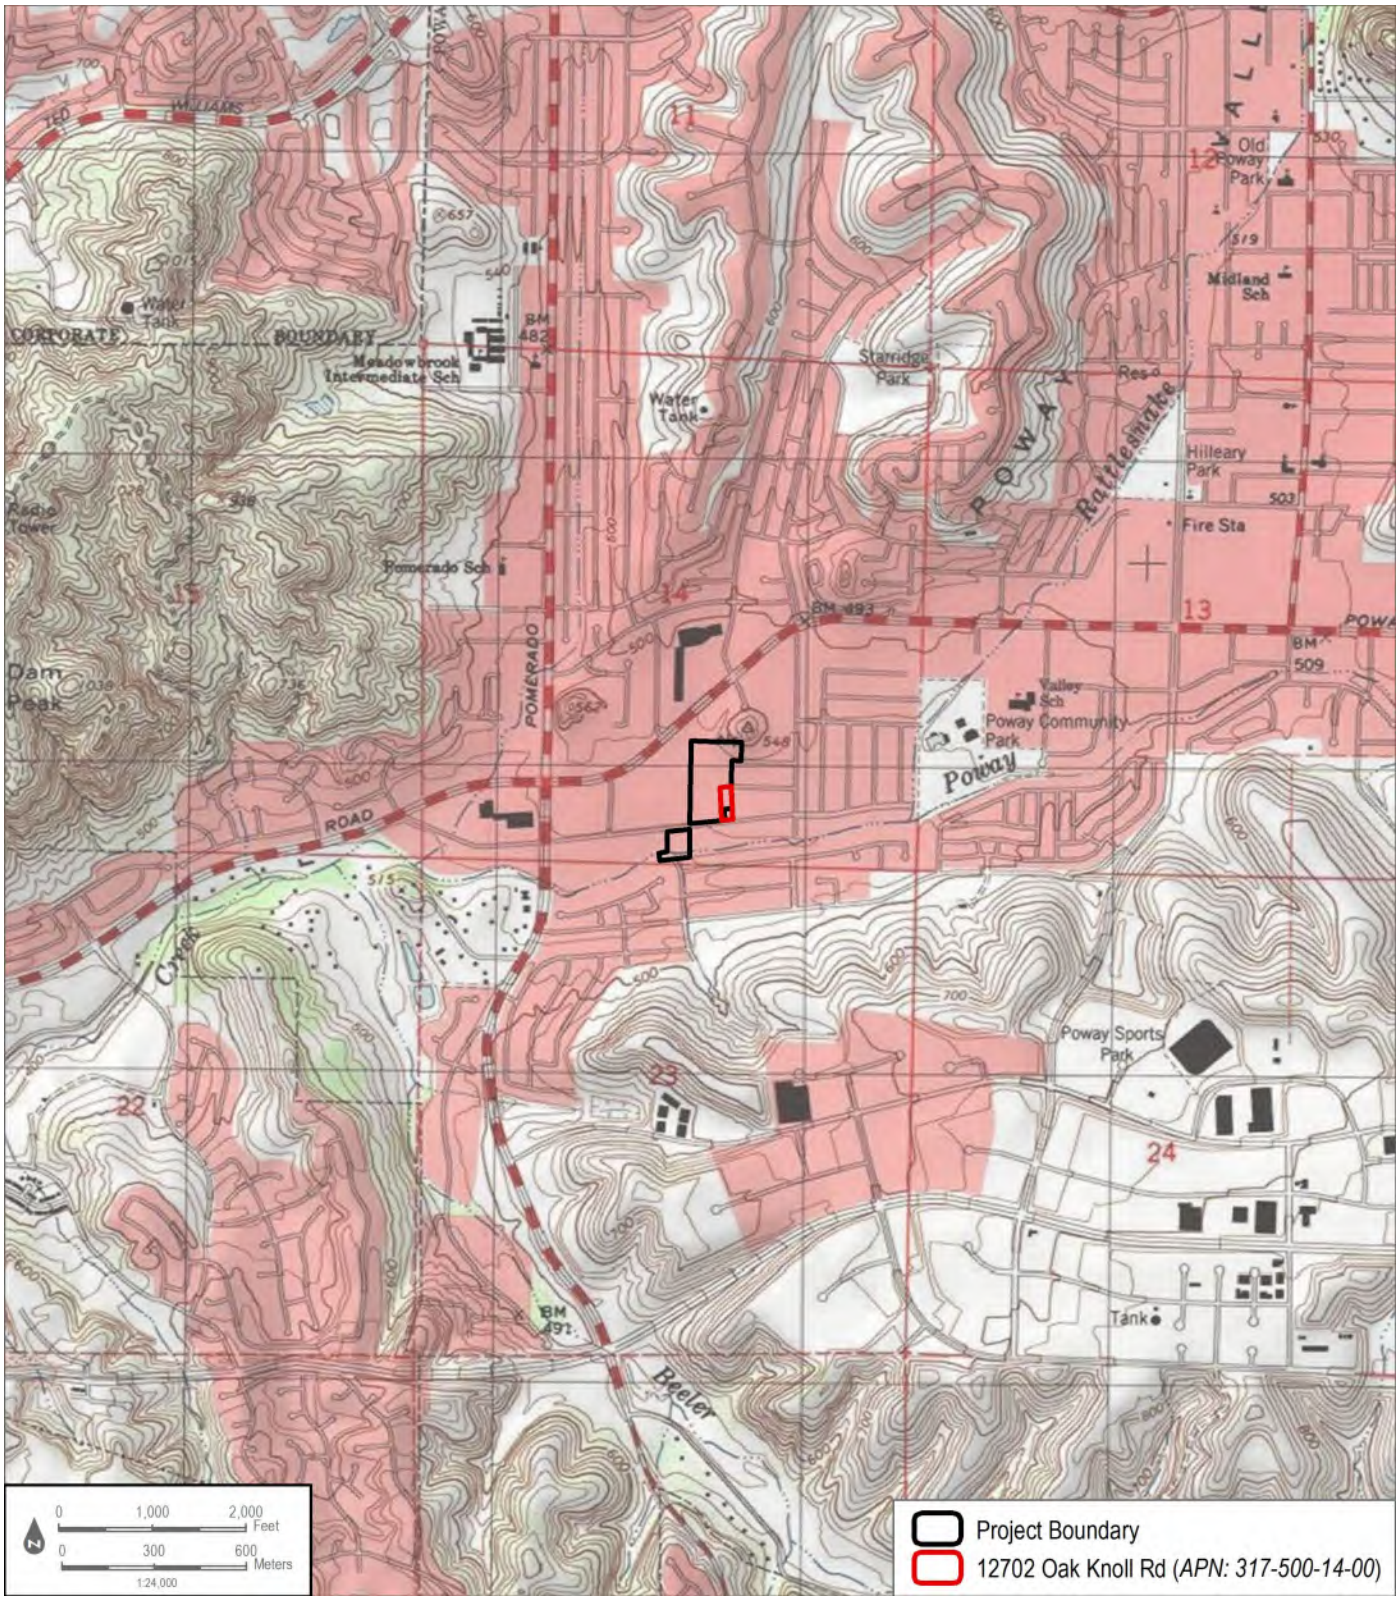
***Scale:** 1:24,000 ***Date of map:** 2022



***P3a. Description**:
The rocks are larger at the base of the wall, becoming smaller as the wall ascends. The property has a low-pitched cross-gabled roof clad in non-original composite shingles with slight overhanging wood eaves. Gable ends on multiple elevations of the original rock portion of the house are clad in stucco, separating the rock from the roof. There is a large stone chimney at the southeast corner of the residence.

12703 Oak Knoll's primary (south) elevation, facing Oak Knoll Road, has a single-leaf wood door with four raised panels flanked by identical replacement slider windows and covered by a projecting gabled overhang. Additional fenestration on the original rock portion of the house was largely obscured from view at the time of the intensive survey but appears to consist of a small rectangular wood frame single pane window and a four-light wood frame window on its east side elevation and a replacement slider window on its west side elevation. Fenestration on the 1974 addition is comprised of wood frame single-pane or slider windows and a partially glazed wood door. There is a concrete patio and non-original single-story ancillary shed clad in wood siding located several feet northwest of the house.

***B6. Construction History** *(continued from page 2):*
The following list of known alterations to 12702 Oak Knoll Road was compiled through archival research, during the intensive survey, and from the previous 1991 report on the property by Brian S. Smith & Associates. Unless indicated, the date of these alterations is unknown:

- A 1974 single-story rectangular addition clad in wood shingles on the property's north elevation. The 1991 report notes that the date of the addition was inscribed in the concrete foundation outside the addition (1974; Smith 1991: 18).
- Replacement of wood roof shingles with composite shingles (observed, unknown date; Smith 1991: 15).
- Addition of an ancillary shed to the northwest of the residence (observed, the shed was present by 1991; Smith 1991: 17).
- Replacement of windows on the primary (south) and west side elevations (observed, no date)
- Likely replacement of main entrance door on primary (south) elevation (observed, no date)

***B10. Significance** *(continued from page 2):*

Historic Context
Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1846), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

Spanish Period (1769–1821)

The Spanish colonization of Alta California began in 1769 with the founding of Mission San Diego de Alcalá by Father Junípero Serra. Concerns over Russian and English interests in California motivated the Spanish government to send an

expedition of soldiers, settlers, and missionaries to occupy and secure the northwestern borderlands of New Spain through the establishment of a Presidio, Mission, and Pueblo. The Spanish explorers first camped on the shore of the Bay in the area that is now downtown San Diego. Lack of water at this location, however, led to moving the camp on May 14, 1769, to a small hill closer to the San Diego River and near the Kumeyaay village of Cosoy. Father Junípero Serra arrived in July of the same year to find the Presidio serving mostly as a hospital. The Spanish built a primitive mission and presidio structure on the hill near the river.

Bad feelings soon developed between the native Kumeyaay and the soldiers, resulting in the construction of a stockade that, by 1772, included barracks for the soldiers; a storehouse for supplies; a house for the missionaries; and a chapel, which had been improved. The log and brush huts were gradually replaced with buildings made of adobe bricks. Flat earthen roofs were eventually replaced by pitched roofs with rounded roof tiles. Clay floors were eventually lined with fired brick.

In August 1774, the Spanish missionaries moved the Mission San Diego de Alcalá to its present location 6 miles up the San Diego River valley (modern Mission Valley) near the Kumeyaay village of Nipaguay. Begun as a thatched chapel and compound built of willow poles, logs, and tules, the new mission was sacked and burned in the Kumeyaay uprising of November 5, 1775. The first adobe chapel was completed in October 1776, and the present church was begun the following year. A succession of building programs through 1813 resulted in the final plan that included the church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. Orchards, reservoirs, and other agricultural installations were built to the south on the lower San Diego River alluvial terrace and were irrigated by a dam and aqueduct system. The initial Spanish occupation and mission system brought about profound changes in the lives of the Kumeyaay people. Substantial numbers of the coastal Kumeyaay were forcibly brought into the mission or died from introduced diseases.

As early as 1791, presidio commandants in California were given the authority to grant small house lots and garden plots to soldiers and their families, and sometime after 1800, soldiers and their families began to move down the hill near the San Diego River. Historian William Smythe noted that Don Blas Aguilar, who was born in 1811, remembered at least 15 such grants below Presidio Hill by 1821, of which only five were within the boundaries of what would become Old Town had houses in 1821. These were the retired commandant Francisco Ruiz's adobe (now known as the Carrillo Adobe), another building later owned by Henry Fitch on Calhoun Street, the Ybanes and Serrano houses on Juan Street near Washington Street, and a small adobe house on the main plaza owned by Juan Jose Maria Marron.

Mexican Period (1821–1846)

In 1822, the political situation changed as Mexico won its independence from Spain, and San Diego became part of the Mexican Republic. The Mexican government opened California to foreign trade, began issuing private land grants in the early 1820s, created the rancho system of large agricultural estates, secularized the Spanish missions in 1833, and oversaw the rise of the civilian pueblo. By 1827, as many as 30 homes existed around the central plaza, and in 1835, Mexico granted San Diego official pueblo (town) status. At this time, the town had a population of nearly 500 residents, later reaching a peak of roughly 600. By 1835 the presidio, once the center of life in Spanish San Diego, had been abandoned and lay in ruins. Mission San Diego de Alcalá fared little better. The town and the ship landing area at La Playa were now the centers of activity in Mexican San Diego. However, the new Pueblo of San Diego did not prosper, as some other California towns did during the Mexican Period.

Secularization in what is now San Diego County triggered increased Native American hostilities against the Californios

during the late 1830s. The attacks on outlying ranchos, along with unstable political and economic factors, lead to San Diego's population decline to approximately 150 permanent residents by 1840. San Diego's official Pueblo status was removed by 1838, and it was made a subprefecture of the Los Angeles Pueblo. When the Americans took over after 1846, the situation had stabilized somewhat, and the population had increased to roughly 350 non-Native American residents. The Native American population continued to decline, as Mexican occupation brought about continued displacement and acculturation of Native American populations.

American Period (1846–Present)

The American Period began in 1846 when United States military forces occupied San Diego; this period continues today. When United States military forces occupied San Diego in July 1846, the town's residents split on their course of action. Many of the town's leaders sided with the Americans, but other prominent families opposed the United States' invasion. In December 1846, a group of Californios under Andres Pico engaged United States Army forces under General Stephen Kearney at the Battle of San Pasqual and inflicted many casualties. However, the Californio resistance was defeated in two small battles near Los Angeles, and effectively ended the resistance by January 1847. The Americans assumed formal control with the Treaty of Guadalupe-Hidalgo in 1848, and introduced Anglo culture and society, American political institutions, and American commerce. In 1850, the Americanization of San Diego began to develop rapidly.

On February 18, 1850, the California State Legislature formally organized San Diego County. The first elections were held at San Diego and La Playa on April 1, 1850, for county officers. San Diego grew slowly during the next decade. San Diegans attempted to develop the town's interests through a transcontinental railroad plan and development of a new town closer to the Bay. The failure of these plans, added to a severe drought that crippled ranching and the onset of the Civil War, left San Diego as a remote frontier town. These issues led to a drop in the town's population from 650 in 1850 to 539 in 1860. Not until land speculator and developer Alonzo Horton arrived in 1867 did San Diego begin to develop fully into an active American town.

Alonzo Horton's development of a New San Diego (modern downtown) in 1867 began to swing the community's focus away from Old Town and began the urbanization of San Diego. Expansion of trade brought an increase in the availability of building materials. Wood buildings gradually replaced adobe structures. Some of the earliest buildings to be erected in the American Period were "pre-fab" houses that were built on the east coast of the United States and shipped in sections around Cape Horn and reassembled in San Diego. Development spread from downtown due to a variety of factors, including the availability of potable water and transportation corridors. Factors such as views and access to public facilities affected land values, which in turn affected the character of neighborhoods that developed. During the Victorian Era of the late 1800s and early 1900s, the areas of Golden Hill, Uptown, Banker's Hill, and Sherman Heights were developed. Examples of the Victorian Era architectural styles remain in these communities, and in Little Italy, which developed at the same time. At the time downtown was being built, there began to be summer cottage/retreat development in what are now the beach communities and La Jolla area. The early structures in these areas were not of substantial construction since they were primarily built for temporary vacation housing.

Development also spread to the greater North Park and Mission Hills areas during the early 1900s. The neighborhoods were built as small lots, a single lot at a time; there was no large tract housing development in these neighborhoods. This provided affordable housing away from the downtown area, and development expanded as transportation improved. Barrio Logan began as a residential area, but because of proximity to rail freight and shipping freight docks, the area became more mixed, with conversion to industrial uses. This area was more suitable to industrial uses because land values were not

as high. Topographically, the area is more level, and it does not have views like the areas north of downtown. Various ethnic groups settled in the area because of the affordability of land ownership.

San Ysidro began to be developed around the turn of the twentieth century. The early settlers were followers of the Littlelanders colonies movement. There, the pattern of development was designed to accommodate small plots of land for each homeowner to farm as part of a farming/residential cooperative community. Nearby Otay Mesa-Nestor began to be developed by farmers of Germanic and Swiss backgrounds. Some of the prime citrus groves in California were in the Otay Mesa-Nestor area. In addition, there were grape growers of Italian heritage who settled in the Otay River Valley and tributary canyons who produced wine for commercial purposes.

San Diego State University was established in the 1920s, and the development of the State College area began, including development of the Navajo community as an outgrowth from the college area and from the west. There was farming and ranching in Mission Valley until the middle portion of the twentieth century when the uses were converted to commercial and residential. There were dairy farms and chicken ranches adjacent to the San Diego River where now there are motels, restaurants, office complexes, and regional shopping malls. There was little development north of the San Diego River until Linda Vista was developed as military housing in the 1940s, when the federal government improved public facilities and extended water and sewer pipelines to the area. From Linda Vista, development spread north of Mission Valley to the Clairemont Mesa and Kearny Mesa areas. Development in these communities was mixed-use and residential on moderate-sized lots.

Tierrasanta, previously owned by the U.S. Navy, was developed in the 1970s. It was one of the first planned developments in the area with segregation of uses. Tierrasanta and many of the communities that have developed since, such as Rancho Penasquitos and Rancho Bernardo, represent the typical development pattern in San Diego in the last 25 to 30 years: uses are well segregated, with commercial uses located along the main thoroughfares and residential uses located beyond that. Industrial uses are located in planned industrial parks.

Historical Overview of the City of Poway

Poway was first recorded in 1828 as the valley of “Paguay” in documents from the Mission San Diego de Alcala. The valley owes its name to the tribes of San Diegueno Native Americans who inhabited the valley before the arrival of the Spanish in 1769. The native name of Paguay appeared on maps, such as the Rand McNally Atlases, as late as 1869. During Spanish rule, the valley was used for pasturing mission livestock, and its inhabitants were the Spanish Padres, Mission Indians, and nomadic bands of Native Americans (Poway Historical Book Committee 1981).

The first American settler believed to have established a homestead in Poway was Philip Crosthwaite, who built an adobe house and started a ranch in 1859. However, soon after, Crosthwaite sold his ranch to the Kerran Brothers and a woman known only Mrs. Anderson, who continued to maintain the ranch until 1874. Farmers had begun to settle within the valley and in 1874, the California State Legislature passed the “no-fence” law that required ranchers to keep cattle off farmers’ property, even if the property is not bound by a fence. The Kerran ranch and others in the area were unable to comply with these rules and cattle disappeared from the landscape. Thus, the economy of the valley shifted to agriculture (Poway Historical Book Committee 1981; Granberry 1985).

By 1887, the population increased to 800 people, and the valley had a prosperous farming and dairying industry. The community had established a church, stores, school, and hotel, and there was the possibility two railroads would be built in the valley. This brought an increase in residents. The real-estate firm of Baird and Chapin was drawn to the prospects of the area. The firm planned residential communities around small parks in a subdivision plan called Piermont. However, the

railroad never materialized, settlers began to leave the valley, and the subdivision was never completed (Poway Historical Book Committee 1981).

Throughout the early 1900s, inhabitants faced drought and transportation difficulties, but Poway still thrived as a farming community. The valley was known for its peaches, vineyards, grain, and alfalfa. Transportation was limited to wagons and stagecoaches, so seeds were carried by wagon from San Diego using the old Pomerado Grade. The Poway Post Office was established in 1901 and received mail twice a day from two four-horse stagecoaches, one that traveled from Escondido every morning, and another from San Diego (Poway Historical Book Committee 1981; Stuart 1966).

Poway experienced periods of droughts that led to the decline of agriculture in the early 1900s. Although there was a local creek that supplied water fit for agriculture, the lack of easily available drinking water prevented the growth of the town until water districts formed after World War II. By 1954, the Poway Municipal Water District was created to utilize water from the Colorado River Aqueduct, and by 1957, the sewer system was completed and developers began building housing tracts. In 1971, the dam that created Lake Poway was constructed, and it became a stable source of water for the residents. At this time, Poway's economy was no longer supported by agriculture, and it instead became a residential community for people who worked throughout the San Diego Area (Poway City History).

In the 1970s, members of the community decided that Poway should become its own city. They wanted their own City Council so town decisions could be made by locals. A measure to incorporate Poway was put on a ballot in 1976, but voters were concerned that Poway would not have enough financial stability on its own, so they rejected the measure. By 1980, it was determined that Poway would be able to afford the cost of cityhood, and another election was held in November of that year. Over half the voters voted in favor of Poway becoming a city, and on December 1, 1980, it officially became the City of Poway under the motto, "The City in the Country." By 1981, Poway had its own City Council, City Hall, and Civic Center (Gorman 1985; Greeley 1981).

During the 2000s, the population of Poway steadily increased, reaching a peak in 2015 with about 50,000 citizens. Today, the population is comprised of 48,564 citizens, and Poway still maintains its rural identity as a small country city. Although the farming industry never returned, it is still a popular location for residents who work in San Diego (US Census Bureau 2022).

Rock Houses or Big Stone style (1890 - 1940)

Rock houses, either constructed of or clad in rocks, are present throughout California. The type of rock utilized for these homes is dependent on local geographic context, with the typology typically concentrated in areas with abundant accessible natural rocks, stones, and boulders. These residences are most obviously characterized by their simple, usually rectilinear forms with visible rocks on all elevations; rock houses frequently have few other decorative details. While it was common for rock houses to be built without the assistance of a formally trained architect, some of these residences were nonetheless constructed by skilled stonemasons or other tradespeople. Still other examples, like the rock houses of Poway, are more vernacular and utilitarian, often being built by their original owner out of readily available material. While rock houses can take on a variety of styles and forms depending on location, they are often both influenced by and representative of the Arts and Crafts movement, which emphasized the use of natural materials and harmony with nature. Some of these residences can take on elements of the Mission Revival style. Rock houses were constructed in California in beginning in the second half of the nineteenth century, with areas like Poway continuing to construct these homes until circa 1940. (Grimes 2016: 40; McAlester 2013; Smith 1991; Smith 1992; Emerson 2016).

There are numerous rock houses in Poway, largely due to the accessibility of rocks from area's many streams and hills.

Rock houses in Poway are generally referred to as being built in the Big Stone style. Frequently, Big Stone buildings were constructed using boulders and large rocks as their structural systems, but some buildings described as Big Stone in style, like the Harmon House on the Project Site, are simply clad in rock and stone. The 1992 Poway Historical Resources Inventory List includes approximately 21 buildings explicitly identified as Big Stone, including the Harmon House. In Poway, a notable concentration of Big Stone buildings is the Big Stone Lodge complex, a 1.7-acre former resort along Old Pomerado Road that was initially planned in 1920s, but abandoned during the Great Depression. Additional concentrations of Big Stone buildings are located in the Big Stone and Beeler Canyon areas of Poway, along Old Pomerado Road, and along Metate Lane. (Smith 2005; 1991; Smith 1992; SOHO 2018).

Character-defining features include:

- Built of stone or clad in stone (usually locally sourced)
- 1-2 stories in height
- Simple, usually rectilinear footprints
- Minimal decorative ornamentation
- Hipped or gabled roofs with overhanging eaves
- Small, recessed window openings

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property A did not find any associations with events that made a significant contribution to the broad patterns of history. Although the date of construction for Property A could not be definitively confirmed, it appears to have been constructed circa 1940. The property's original owners, Joe and John Markwalder, were farmers who likely constructed the property themselves. Poway was a primarily agrarian area beginning circa 1859. While Property A appears to have been constructed by farmers during this agricultural period and prior to the real estate boom in the 1950s that contributed to the area's increased residential suburbanization following the establishment of a water district, there is no indication that the construction of this specific residence marked a pivotal movement in the history of the neighborhood or city. Rather, it appears to have been constructed as a continuation of the agricultural, ranching, and residential functions in Poway that existed for decades. Property A was neither the first nor the last rock house to be constructed in Poway. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway, California, or the United States; therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national or state, level. The earliest ownership information available identified John and Joe Markwalder, farmers who immigrated to the United States from Switzerland around 1919, as the original owners of Property A. While research did not identify substantive information on subsequent owners, it appears that the house was later owned by a Mrs. Caine, who passed ownership to her niece, Mrs. Cook. The

dates of occupancy for these individuals are unknown. The most recent identified occupants, from 1974, were Mr. and Mrs. Richard Miller. The property is owned by the Harmon family, and known as the Harmon House. However, research did not indicate the house was historically the residence of anyone with the name Harmon. Research did not identify information on the lives of each of the property owners or residents that would indicate they are individuals considered significant. Due to a lack of identified significant associations with important persons in history, Property A does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property A is a vernacular rock house constructed circa 1933-1940 with a 1974 addition at its rear north elevation. The property still visually reads as a rock house when viewed from the public-right-of way on Oak Knoll Drive, retaining its character-defining rock exterior cladding on its south, east, and west elevations. The 1974 addition on its north elevation, however, has affected the property's integrity, as elaborated upon in the "Integrity Discussion" below. As a result of this addition and smaller alterations such as window replacements on the south and west elevations, Property A's ability to convey the distinctive characteristics of its type or period has been diminished as it no longer appears to be a rock house from all elevations. In contrast to some rock houses in Poway, which use large boulders as their structural system, Property A is of wood frame construction clad in stone and rocks and does not appear to be distinctive or represent an innovative or noteworthy method of construction for rock houses.

Although an original building permit was not located, there is no indication that a master architect or firm designed the property. The residence may have been built by its original owners, John and Joe Markwalder, who were farmers. The property further does not appear to possess high artistic values by articulating a particular concept of design to the extent that it expresses an aesthetic ideal. Other than its rock cladding, the residence does not have notable design elements and it does not appear to be a unique example of its type in Poway.

The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property A does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties of the same construction period or type in the area. Therefore, Property A does not appear eligible NRHP Criterion C or CRHP Criterion 3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the Cultural Resource Inventory Report for the Oak Knoll Property Project prepared by DeCarlo in 2022.

Integrity Discussion

Property A has not been moved and retains integrity of location. The earliest identified aerial photograph of the property shows that there was agricultural development directly surrounding the property; by 1978, however, extensive residential development was extant to the north of the property and today there are many houses adjacent to Property A (NETR 2022). Consequently, the property's integrity of setting has been diminished. In 1974, an addition was added to the north rear elevation of the original rock house. The addition is clad in wood shake shingles rather than stone and this addition may

have necessitated the demolition or removal of part of the property's original north wall and rock cladding. The windows on the property's primary south elevation and its east elevation have also been replaced. These alterations, most significantly the rear addition, have diminished the property's integrity of design, materials, and workmanship. These changes have also diminished the property's integrity of feeling. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. In summation, Property A retains its integrity of location, but lacks integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property B: 12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below.

Although Property A is not eligible as a landmark, it appears to still fulfill the minimum requirements of a Category C building. A Category C building must meet one of two minimum requirements (City of Poway, Subchapter 17.45.030, 1989):

i. A good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City

ii. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance

In 1991, Smith & Associates identified Property A as meeting the minimum requirements of a Category C building. The report stated that Property A was an example of Big Stone architecture but was a "poor example" of its type (Smith 1991: 3). Dudek concurs with the finding that Property A meets the minimum requirements of a Category C building, as it does embody some the character-defining feature of the rock house typology but its integrity has been diminished due to the 1974 addition at the north rear and other smaller alterations, such as window replacements.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property A is related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property A does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property A was a location associated with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, Property A does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, Property A does not appear to have been designed by an architect or firm of major importance; it appears the building was constructed by its original owners. Therefore, Property A does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property A was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property A does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property A does not appear to exhibit an extraordinary class of architectural design, detail, materials, or craftsmanship. Property A is an example of a vernacular rock house but has been substantially altered so that its integrity of design, materials, and craftsmanship have been diminished. Therefore, Property B does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property A does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property A does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property A is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark, which has made a major contribution to the community. Therefore, Property A does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property A does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property A does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

Property A (12702 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As such, the property is not considered a CEQA historical resource.

12702 Oak Knoll Road (APN: 317-500-14-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district. Subchapter 17.45.050 of the City of Poway Municipal Code states that for a historic/cultural resource to be designated as a Poway historic landmark, it must meet the requirements of a Category A or B historic/cultural resource. In addition, the Development Services Department shall find that the

historic/cultural resource meets one of the eight criteria for local landmark designation. 12702 Oak Knoll Road does not meet the requirements of a Category A or B historic/cultural resource and further does not meet any of the criteria for landmark listing by the City of Poway.

Although 12702 Oak Knoll Road is not eligible as a landmark, it appears to fulfill the minimum requirements of a Category C building as a good example of a period of architecture design or construction with a commonplace design and appears to be an important resource with substantial alterations that have severely compromised its historic, cultural, or architectural significance

12650 Oak Knoll Road is a one-story, single-family house constructed in 1957 (San Diego County Assessor). The house has elements of the Minimal Ranch style. The building has an L-shaped plan with a low-pitched, cross-hipped roof clad in composition shingles, with open eaves and exposed rafters. The main (south) elevation features a two-bay wide projection (west side). Cladding on the main elevation is divided along a horizontal line. On the east side, this is vertical wood board cladding along the top half of the wall and horizontal wood board cladding on the bottom half. [See Continuation Sheet]

Significance summary

12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district. It further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1957 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. The recommended status code is 6Z: Found ineligible for NR, CR or Local designation through survey evaluation. [**See Continuation Sheet**]

***P3a. Description:**

Fenestration is a sliding, aluminum sash window. A recessed entrance is centrally located at the intersection of the two masses of the L-shape plan. The entrance is a single panel door. The second, or western, mass of the L-shape is two bays wide and protrudes south with vertical wood board cladding along the top half of the wall and smooth stucco along the bottom half. A sliding aluminum frame entrance is on the east side of the elevation. The two-material cladding continues on the east side elevation. The east side elevation features two sliding windows with aluminum sash. The west side elevation is clad in smooth stucco and includes a multi-light casement window. The property is located in the middle of the block and is set back on its parcel with a grass lawn and concrete driveway. Alterations to the appear to include the replacement of the original window sash with vinyl (dates unknown).

***B6. Construction History** *(continued from page 2):*

The following list of known alterations to 12650 Oak Knoll Road was compiled through archival research, during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Replacement vinyl windows, multiple elevations (observed, no date)
- Addition to the rear (observed, 2002)

***B10. Significance** *(continued from page 2):*

Historic Context

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1846), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

Spanish Period (1769–1821)

The Spanish colonization of Alta California began in 1769 with the founding of Mission San Diego de Alcalá by Father Junípero Serra. Concerns over Russian and English interests in California motivated the Spanish government to send an expedition of soldiers, settlers, and missionaries to occupy and secure the northwestern borderlands of New Spain through the establishment of a Presidio, Mission, and Pueblo. The Spanish explorers first camped on the shore of the Bay in the area that is now downtown San Diego. Lack of water at this location, however, led to moving the camp on May 14, 1769, to a small hill closer to the San Diego River and near the Kumeyaay village of Cosoy. Father Junípero Serra arrived in July of the same year to find the Presidio serving mostly as a hospital. The Spanish built a primitive mission and presidio structure on the hill near the river.

Bad feelings soon developed between the native Kumeyaay and the soldiers, resulting in the construction of a stockade

that, by 1772, included barracks for the soldiers; a storehouse for supplies; a house for the missionaries; and a chapel, which had been improved. The log and brush huts were gradually replaced with buildings made of adobe bricks. Flat earthen roofs were eventually replaced by pitched roofs with rounded roof tiles. Clay floors were eventually lined with fired brick.

In August 1774, the Spanish missionaries moved the Mission San Diego de Alcalá to its present location 6 miles up the San Diego River valley (modern Mission Valley) near the Kumeyaay village of Nipaguay. Begun as a thatched chapel and compound built of willow poles, logs, and tules, the new mission was sacked and burned in the Kumeyaay uprising of November 5, 1775. The first adobe chapel was completed in October 1776, and the present church was begun the following year. A succession of building programs through 1813 resulted in the final plan that included the church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. Orchards, reservoirs, and other agricultural installations were built to the south on the lower San Diego River alluvial terrace and were irrigated by a dam and aqueduct system. The initial Spanish occupation and mission system brought about profound changes in the lives of the Kumeyaay people. Substantial numbers of the coastal Kumeyaay were forcibly brought into the mission or died from introduced diseases.

As early as 1791, presidio commandants in California were given the authority to grant small house lots and garden plots to soldiers and their families, and sometime after 1800, soldiers and their families began to move down the hill near the San Diego River. Historian William Smythe noted that Don Blas Aguilar, who was born in 1811, remembered at least 15 such grants below Presidio Hill by 1821, of which only five were within the boundaries of what would become Old Town had houses in 1821. These were the retired commandant Francisco Ruiz's adobe (now known as the Carrillo Adobe), another building later owned by Henry Fitch on Calhoun Street, the Ybanes and Serrano houses on Juan Street near Washington Street, and a small adobe house on the main plaza owned by Juan Jose Maria Marron.

Mexican Period (1821–1846)

In 1822, the political situation changed as Mexico won its independence from Spain, and San Diego became part of the Mexican Republic. The Mexican government opened California to foreign trade, began issuing private land grants in the early 1820s, created the rancho system of large agricultural estates, secularized the Spanish missions in 1833, and oversaw the rise of the civilian pueblo. By 1827, as many as 30 homes existed around the central plaza, and in 1835, Mexico granted San Diego official pueblo (town) status. At this time, the town had a population of nearly 500 residents, later reaching a peak of roughly 600. By 1835 the presidio, once the center of life in Spanish San Diego, had been abandoned and lay in ruins. Mission San Diego de Alcalá fared little better. The town and the ship landing area at La Playa were now the centers of activity in Mexican San Diego. However, the new Pueblo of San Diego did not prosper, as some other California towns did during the Mexican Period.

Secularization in what is now San Diego County triggered increased Native American hostilities against the Californios during the late 1830s. The attacks on outlying ranchos, along with unstable political and economic factors, lead to San Diego's population decline to approximately 150 permanent residents by 1840. San Diego's official Pueblo status was removed by 1838, and it was made a subprefecture of the Los Angeles Pueblo. When the Americans took over after 1846, the situation had stabilized somewhat, and the population had increased to roughly 350 non-Native American residents. The Native American population continued to decline, as Mexican occupation brought about continued displacement and acculturation of Native American populations.

American Period (1846–Present)

The American Period began in 1846 when United States military forces occupied San Diego; this period continues today. When United States military forces occupied San Diego in July 1846, the town's residents split on their course of action. Many of the town's leaders sided with the Americans, but other prominent families opposed the United States' invasion. In December 1846, a group of Californios under Andres Pico engaged United States Army forces under General Stephen Kearney at the Battle of San Pasqual and inflicted many casualties. However, the Californio resistance was defeated in two small battles near Los Angeles, and effectively ended the resistance by January 1847. The Americans assumed formal control with the Treaty of Guadalupe-Hidalgo in 1848, and introduced Anglo culture and society, American political institutions, and American commerce. In 1850, the Americanization of San Diego began to develop rapidly.

On February 18, 1850, the California State Legislature formally organized San Diego County. The first elections were held at San Diego and La Playa on April 1, 1850, for county officers. San Diego grew slowly during the next decade. San Diegans attempted to develop the town's interests through a transcontinental railroad plan and development of a new town closer to the Bay. The failure of these plans, added to a severe drought that crippled ranching and the onset of the Civil War, left San Diego as a remote frontier town. These issues led to a drop in the town's population from 650 in 1850 to 539 in 1860. Not until land speculator and developer Alonzo Horton arrived in 1867 did San Diego begin to develop fully into an active American town.

Alonzo Horton's development of a New San Diego (modern downtown) in 1867 began to swing the community's focus away from Old Town and began the urbanization of San Diego. Expansion of trade brought an increase in the availability of building materials. Wood buildings gradually replaced adobe structures. Some of the earliest buildings to be erected in the American Period were "pre-fab" houses that were built on the east coast of the United States and shipped in sections around Cape Horn and reassembled in San Diego. Development spread from downtown due to a variety of factors, including the availability of potable water and transportation corridors. Factors such as views and access to public facilities affected land values, which in turn affected the character of neighborhoods that developed. During the Victorian Era of the late 1800s and early 1900s, the areas of Golden Hill, Uptown, Banker's Hill, and Sherman Heights were developed. Examples of the Victorian Era architectural styles remain in these communities, and in Little Italy, which developed at the same time. At the time downtown was being built, there began to be summer cottage/retreat development in what are now the beach communities and La Jolla area. The early structures in these areas were not of substantial construction since they were primarily built for temporary vacation housing.

Development also spread to the greater North Park and Mission Hills areas during the early 1900s. The neighborhoods were built as small lots, a single lot at a time; there was no large tract housing development in these neighborhoods. This provided affordable housing away from the downtown area, and development expanded as transportation improved. Barrio Logan began as a residential area, but because of proximity to rail freight and shipping freight docks, the area became more mixed, with conversion to industrial uses. This area was more suitable to industrial uses because land values were not as high. Topographically, the area is more level, and it does not have views like the areas north of downtown. Various ethnic groups settled in the area because of the affordability of land ownership.

San Ysidro began to be developed around the turn of the twentieth century. The early settlers were followers of the Littlelanders colonies movement. There, the pattern of development was designed to accommodate small plots of land for each homeowner to farm as part of a farming/residential cooperative community. Nearby Otay Mesa-Nestor began to be developed by farmers of Germanic and Swiss backgrounds. Some of the prime citrus groves in California were in the Otay Mesa-Nestor area. In addition, there were grape growers of Italian heritage who settled in the Otay River Valley and tributary canyons who produced wine for commercial purposes.

San Diego State University was established in the 1920s, and the development of the State College area began, including development of the Navajo community as an outgrowth from the college area and from the west. There was farming and ranching in Mission Valley until the middle portion of the twentieth century when the uses were converted to commercial and residential. There were dairy farms and chicken ranches adjacent to the San Diego River where now there are motels, restaurants, office complexes, and regional shopping malls. There was little development north of the San Diego River until Linda Vista was developed as military housing in the 1940s, when the federal government improved public facilities and extended water and sewer pipelines to the area. From Linda Vista, development spread north of Mission Valley to the Clairemont Mesa and Kearny Mesa areas. Development in these communities was mixed-use and residential on moderate-sized lots.

Tierrasanta, previously owned by the U.S. Navy, was developed in the 1970s. It was one of the first planned developments in the area with segregation of uses. Tierrasanta and many of the communities that have developed since, such as Rancho Penasquitos and Rancho Bernardo, represent the typical development pattern in San Diego in the last 25 to 30 years: uses are well segregated, with commercial uses located along the main thoroughfares and residential uses located beyond that. Industrial uses are located in planned industrial parks.

Historical Overview of the City of Poway

Poway was first recorded in 1828 as the valley of "Paguay" in documents from the Mission San Diego de Alcala. The valley owes its name to the tribes of San Diegueno Native Americans who inhabited the valley before the arrival of the Spanish in 1769. The native name of Paguay appeared on maps, such as the Rand McNally Atlases, as late as 1869. During Spanish rule, the valley was used for pasturing mission livestock, and its inhabitants were the Spanish Padres, Mission Indians, and nomadic bands of Native Americans (Poway Historical Book Committee 1981).

The first American settler believed to have established a homestead in Poway was Philip Crosthwaite, who built an adobe house and started a ranch in 1859. However, soon after, Crosthwaite sold his ranch to the Kerran Brothers and a woman known only Mrs. Anderson, who continued to maintain the ranch until 1874. Farmers had begun to settle within the valley and in 1874, the California State Legislature passed the "no-fence" law that required ranchers to keep cattle off farmers' property, even if the property is not bound by a fence. The Kerran ranch and others in the area were unable to comply with these rules and cattle disappeared from the landscape. Thus, the economy of the valley shifted to agriculture (Poway Historical Book Committee 1981; Granberry 1985).

By 1887, the population increased to 800 people, and the valley had a prosperous farming and dairying industry. The community had established a church, stores, school, and hotel, and there was the possibility two railroads would be built in the valley. This brought an increase in residents. The real-estate firm of Baird and Chapin was drawn to the prospects of the area. The firm planned residential communities around small parks in a subdivision plan called Piermont. However, the railroad never materialized, settlers began to leave the valley, and the subdivision was never completed (Poway Historical Book Committee 1981).

Throughout the early 1900s, inhabitants faced drought and transportation difficulties, but Poway still thrived as a farming community. The valley was known for its peaches, vineyards, grain, and alfalfa. Transportation was limited to wagons and stagecoaches, so seeds were carried by wagon from San Diego using the old Pomerado Grade. The Poway Post Office was established in 1901 and received mail twice a day from two four-horse stagecoaches, one that traveled from Escondido every morning, and another from San Diego (Poway Historical Book Committee 1981; Stuart 1966).

Poway experienced periods of droughts that led to the decline of agriculture in the early 1900s. Although there was a local

creek that supplied water fit for agriculture, the lack of easily available drinking water prevented the growth of the town until water districts formed after World War II. By 1954, the Poway Municipal Water District was created to utilize water from the Colorado River Aqueduct, and by 1957, the sewer system was completed and developers began building housing tracts. In 1971, the dam that created Lake Poway was constructed, and it became a stable source of water for the residents. At this time, Poway's economy was no longer supported by agriculture, and it instead became a residential community for people who worked throughout the San Diego Area (Poway City History).

In the 1970s, members of the community decided that Poway should become its own city. They wanted their own City Council so town decisions could be made by locals. A measure to incorporate Poway was put on a ballot in 1976, but voters were concerned that Poway would not have enough financial stability on its own, so they rejected the measure. By 1980, it was determined that Poway would be able to afford the cost of cityhood, and another election was held in November of that year. Over half the voters voted in favor of Poway becoming a city, and on December 1, 1980, it officially became the City of Poway under the motto, "The City in the Country." By 1981, Poway had its own City Council, City Hall, and Civic Center (Gorman 1985; Greeley 1981).

During the 2000s, the population of Poway steadily increased, reaching a peak in 2015 with about 50,000 citizens. Today, the population is comprised of 48,564 citizens, and Poway still maintains its rural identity as a small country city. Although the farming industry never returned, it is still a popular location for residents who work in San Diego (US Census Bureau 2022).

Ranch Style (1930-1975)

Ranch-style houses in California reflect a national trend of fascination with the "Old West" and were a building style of choice for tract housing in the mid-twentieth century. Ranch homes were originally developed in the western and southwestern United States, but quickly gained national popularity through the dissemination of do-it-yourself manuals and plans in national magazines such as *Sunset, Better Homes and Gardens,* and *House Beautiful.* Ranch houses were also popular as a custom-built type of housing, which was especially popular in the later 1940s and 1950s. Ranch houses were typically built between 1930 and 1975, but peaked in the 1950s, as the most prevalent type of post-World War II suburban tract-style housing, often housing veterans who secured housing with FHA loans.

Ranch style houses are usually a one-story, single-family residence. Houses designed in this architectural style include several identifying characteristics such as rambling, elongated plans; a horizontal emphasis; general asymmetry; free-flowing interior spaces; and a designed connection to the outdoors. Features such as low-pitched roofs with wide eaves, a combination of cladding materials including board-and-batten siding, brick and stone chimneys, and large picture windows were commonly applied and evoked an aesthetic that was reminiscent of these past architectural traditions. Decorative features such as wood shutters and dovecotes were often added to enhance the rusticated appearance of Ranch houses (Grimes and Chiang 2009; Horak et.al. 2015; McAlester 2013).

Character-defining features include:

- Rambling, elongated plans with a horizontal emphasis
- 1-2 stories in height
- Low-pitched gabled or hipped roofs with overhanging, open eaves
- General asymmetry
- Free-flowing interior spaces
- Designed connection to the outdoors

- Cladding featuring stucco, board and batten, shingles, clapboard, or a combination of materials
- Brick or stone chimney details
- Attached garages often linked to residence by breezeways
- Combinations of stone, brick, board and batten, clapboard, or horizontal wood siding used for accent on walls, secondary cladding types, and planters
- Functional and non-functional shutters details as trim around windows
- Fenestration may include a picture window

NRHP/CRHR Evaluation of Significance

Criterion A/1: *That are associated with events that have made a significant contribution to the broad patterns of our history.*

Archival research of 12650 Oak Knoll Road did not find any associations with events that made a significant contribution to the broad patterns of history. The property was completed in 1957, during a real estate boom brought on by a new sewer system that provided residences with access to a stable source of water. Despite the property reflecting the trend of Poway's residential growth during the late 1950s, there is no indication that the construction of this specific residence marked a pivotal movement in the history of the neighborhood or city. It was neither the first nor the last type and was merely following a continuous pattern of residential development that continued through the 1980s after Poway became a city. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway; therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: *That are associated with the lives of persons significant in our past.*

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national, state, or local level and 12650 Oak Knoll Road. The earliest ownership information available identified Richard and Helen Wexeberg as the owners of the property in 1964. The next known residents of the property were James and Joan French in 1971, Katie B. Carter in 1975, and Eugene and Barbara Pendell in 1976, followed by Thomas J. Kerr in 1998. Research found little additional information on the lives of each of the property owners that would indicate they are individuals considered significant in our past. Due to a lack of identified significant associations with important persons in history, 12650 Oak Knoll Road does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: *That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.*

12650 Oak Knoll Road does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1950s Ranch-style residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of the Minimal Ranch style, and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the property could not be found. There is no known architect or firm associated with the design or development of 12650 Oak Knoll Road. There is no indication that the property is a distinguished

example of work that was designed by an architect or firm recognized as unique in the field of Ranch house design or single-family residential development. 12650 Oak Knoll Road does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. 12650 Oak Knoll Road does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, 12650 Oak Knoll Road is not significant under Criterion C/3.

Criterion D/4: *That have yielded or may be likely to yield information important in prehistory or history.*

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project Site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo in 2022.

Integrity Discussion

12650 Oak Knoll Road contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been altered since the 1957 residence was constructed. The integrity of setting has been diminished due to continued development in the area, particularly in the 1990s and early 2000s. The replacement of its original windows and the rear addition impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. 12650 Oak Knoll Road retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at 12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1. *Its location is the site of a historic event having major significance to the City, State or United States.*

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that 12650 Oak Knoll Road is related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 1.

2. *Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.*

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that 12650 Oak Knoll Road was a location associated with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 2.

3. *Its quality as one of the finest examples in the City of the work of an architect of major importance.*

As discussed in NRHP/CRHR Criterion C/3, the building identified on 12650 Oak Knoll Road does not exemplify a fine example of the Minimal Ranch style in the City of Poway. No original building permit could be located for 12650 Oak Knoll Road. 12650 Oak Knoll Road does not appear to be the work of an architect of major importance. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 3.

4. *Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.*

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that 12650 Oak Knoll Road was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 4.

5. *Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.*

As discussed in NRHP/CRHR Criteria C/3, 12650 Oak Knoll Road does not appear to exhibit an extraordinary class of architectural design, detail, materials, or craftsmanship. It is a typical example of a ubiquitous Minimal Ranch House design. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 5.

6. *Its potential of yielding historic/cultural information of major importance.*

As discussed in NRHP/CRHR Criteria D/4, 12650 Oak Knoll Road does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project Site, please see DeCarlo 2022. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 6.

7. *Its integrity as a natural feature that has made a major contribution to the community.*

12650 Oak Knoll Road is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark, which has made a major contribution to the community. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 7.

8. *Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.*

12650 Oak Knoll Road does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, 12650 Oak Knoll Road does not appear significant under City of Poway Criterion 8.

Summary of Findings

12650 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing in the NRHP or CRHR, either

individually or as part of a potential or existing historic district. It further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1957 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. The recommended status code is 6Z: Found ineligible for NR, CR or Local designation through survey evaluation.

12624 Oak Knoll Road is a one-story, single-family house constructed in 1959, with two ancillary buildings on the rear of the parcel (San Diego County Assessor). The house has elements of the Minimal Ranch style. The building has a rectangular plan with a low-pitched, side-gabled roof clad in composition shingles, with open eaves, exposed rafters, and an overhang that extends above the entry porch. Cladding is rough textured stucco with vertical wood board cladding along the central entrance porch. The main (south) elevation is divided into five bays. [See Continuation Sheet]

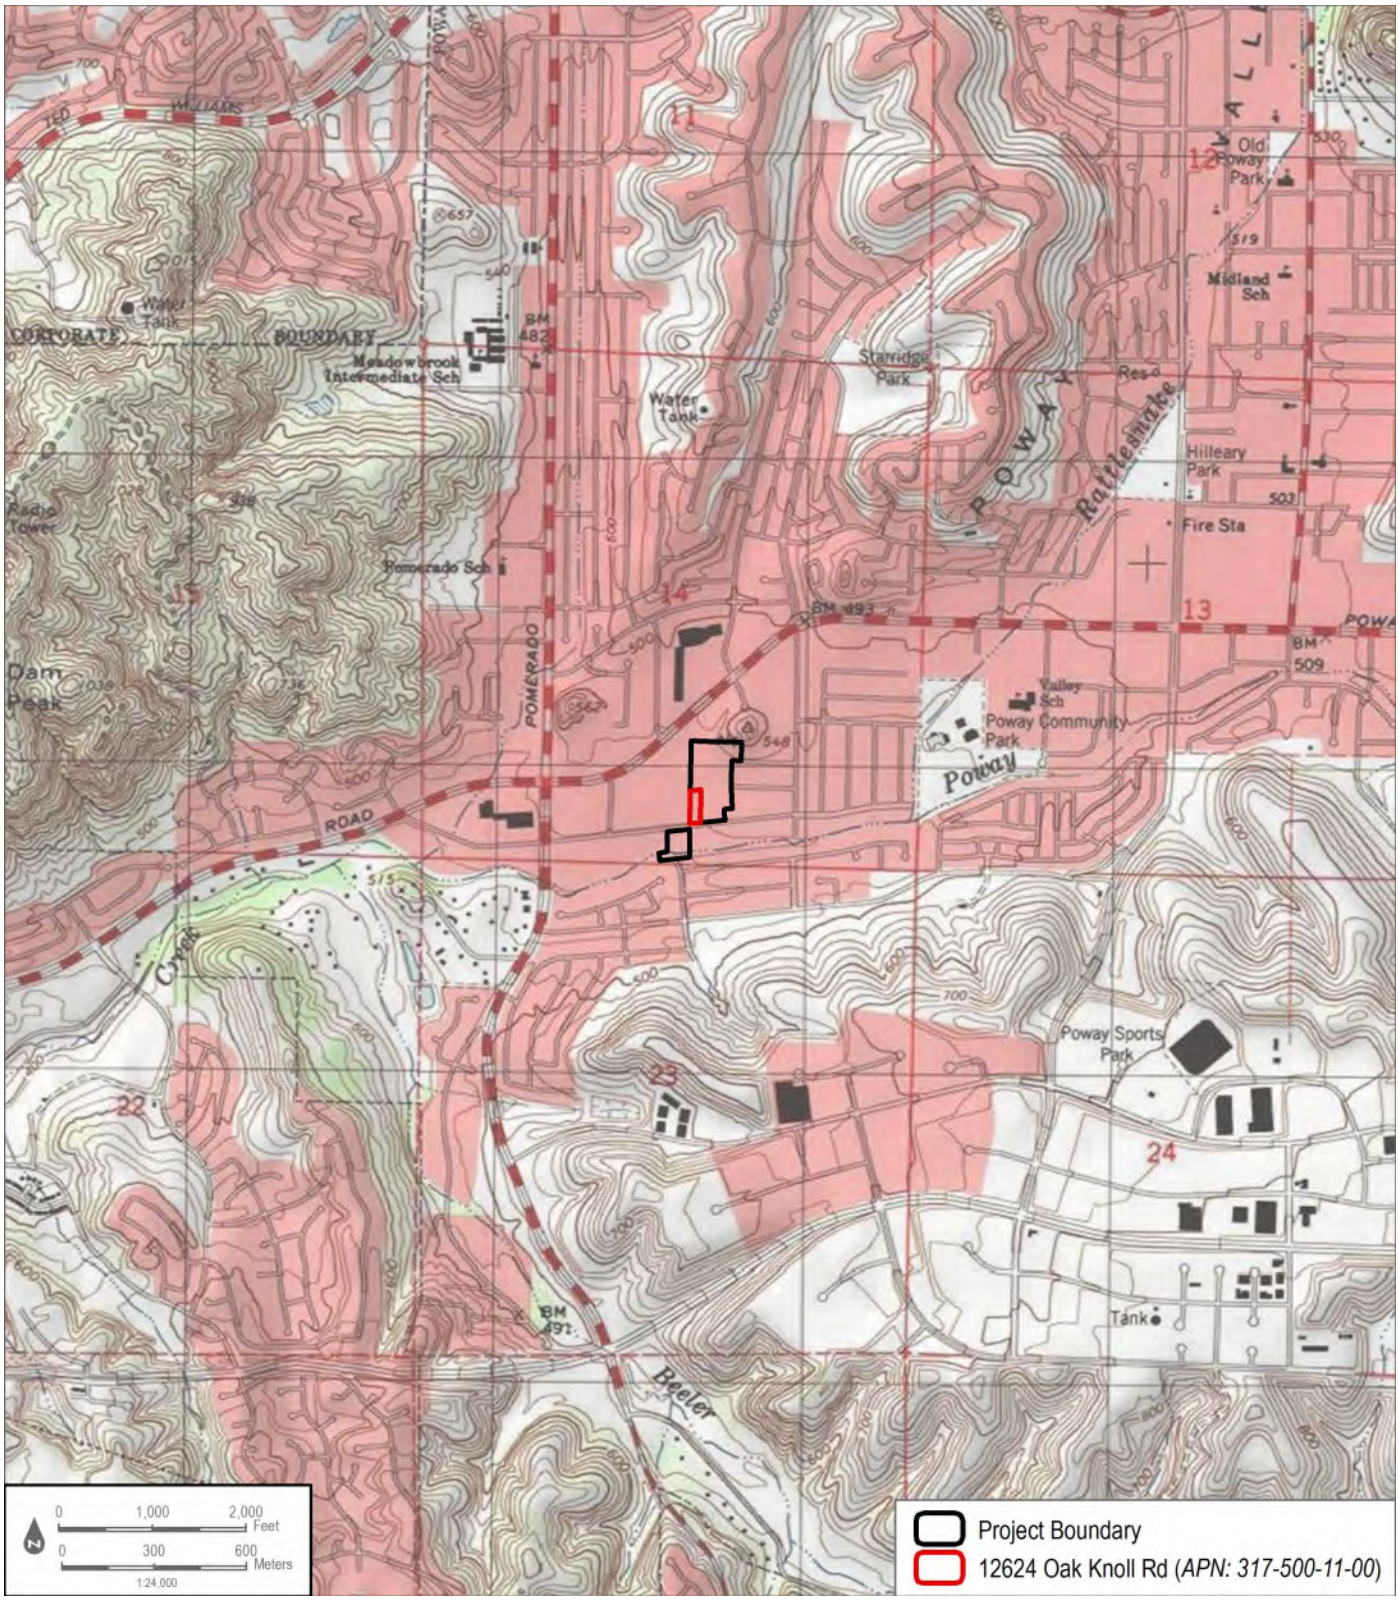
***Resource Name or #** (Assigned by recorder) 12624 Oak Knoll Road

***Map Name:** Poway, CA

***Scale:** 1:24,000 ***Date of map:** 2022



***P3a. Description:**

A double-light sliding window is featured within the first bay. A brick-clad chimney with a concrete cap extends above the roofline in the second bay where the roofline extends over the porch. Within the porch, there is a large centrally placed, five-over-five square light wood sash window and single main entry door, obscured by a security door. The entrance porch is accessed by stone concrete to the east of the porch foundation. Wood posts along the perimeter of the porch support the overhang above. To the east of the entrance is a small double-hung window and multi-light sliding window, in the fourth and fifth bays, respectively. A multipaneled wood garage door is featured on the far east side of the main elevation and leads to the attached garage. A wood picket fence extends from the west side of the main elevation to the property line. The west side elevation is clad in rough textured stucco and includes two double light sliding windows, as well as a centrally located decorative vent beneath the pitch of the gable. On the east side elevation is a single, central multi-light fixed window. The two ancillary buildings sit on the east side of the northeast rear of the property. One furthest south features a vertical wood board clad rectangular mass topped by a side gable, wood shingle roof with open eaves, exposed rafters, and a wide overhang supported by wood posts to cover a surrounding porch. The other is just north of the first ancillary building and has a modular composition with a side gable and shed roof. The property is located in the center of a primarily residential block and set back on its parcel with an open lawn, and a concrete driveway leading to the attached garage. Alterations to the residence appear to be the replacement of the original garage door, and the replacement of the original window sash with vinyl (dates unknown).

***B6. Construction History** *(continued from page 2):*

The following list of known alterations to 12624 Oak Knoll Road was compiled through archival research and during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Replacement vinyl windows, multiple elevations (observed, no date)
- Addition of a rectangular ancillary building on the northeast side of the property (observed, 1978)
- Addition of a rectangular ancillary building on the northwest side (observed, 1978)
- Addition of a pool on the southwest side of the backyard, directly behind the residence (observed, 1978)
- Replacement of original garage door (observed, 2014)
- Front addition to the ancillary building on the northeast side of the property (observed, 2014)
- Replacement of wood fence (observed, 2015)

***B10. Significance** *(continued from page 2):*

Historic Context

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1846), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period

when California became a territory of the United States.

Spanish Period (1769–1821)

The Spanish colonization of Alta California began in 1769 with the founding of Mission San Diego de Alcalá by Father Junípero Serra. Concerns over Russian and English interests in California motivated the Spanish government to send an expedition of soldiers, settlers, and missionaries to occupy and secure the northwestern borderlands of New Spain through the establishment of a Presidio, Mission, and Pueblo. The Spanish explorers first camped on the shore of the Bay in the area that is now downtown San Diego. Lack of water at this location, however, led to moving the camp on May 14, 1769, to a small hill closer to the San Diego River and near the Kumeyaay village of Cosoy. Father Junípero Serra arrived in July of the same year to find the Presidio serving mostly as a hospital. The Spanish built a primitive mission and presidio structure on the hill near the river.

Bad feelings soon developed between the native Kumeyaay and the soldiers, resulting in the construction of a stockade that, by 1772, included barracks for the soldiers; a storehouse for supplies; a house for the missionaries; and a chapel, which had been improved. The log and brush huts were gradually replaced with buildings made of adobe bricks. Flat earthen roofs were eventually replaced by pitched roofs with rounded roof tiles. Clay floors were eventually lined with fired brick.

In August 1774, the Spanish missionaries moved the Mission San Diego de Alcalá to its present location 6 miles up the San Diego River valley (modern Mission Valley) near the Kumeyaay village of Nipaguay. Begun as a thatched chapel and compound built of willow poles, logs, and tules, the new mission was sacked and burned in the Kumeyaay uprising of November 5, 1775. The first adobe chapel was completed in October 1776, and the present church was begun the following year. A succession of building programs through 1813 resulted in the final plan that included the church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. Orchards, reservoirs, and other agricultural installations were built to the south on the lower San Diego River alluvial terrace and were irrigated by a dam and aqueduct system. The initial Spanish occupation and mission system brought about profound changes in the lives of the Kumeyaay people. Substantial numbers of the coastal Kumeyaay were forcibly brought into the mission or died from introduced diseases.

As early as 1791, presidio commandants in California were given the authority to grant small house lots and garden plots to soldiers and their families, and sometime after 1800, soldiers and their families began to move down the hill near the San Diego River. Historian William Smythe noted that Don Blas Aguilar, who was born in 1811, remembered at least 15 such grants below Presidio Hill by 1821, of which only five were within the boundaries of what would become Old Town had houses in 1821. These were the retired commandant Francisco Ruiz's adobe (now known as the Carrillo Adobe), another building later owned by Henry Fitch on Calhoun Street, the Ybanes and Serrano houses on Juan Street near Washington Street, and a small adobe house on the main plaza owned by Juan Jose Maria Marron.

Mexican Period (1821–1846)

In 1822, the political situation changed as Mexico won its independence from Spain, and San Diego became part of the Mexican Republic. The Mexican government opened California to foreign trade, began issuing private land grants in the early 1820s, created the rancho system of large agricultural estates, secularized the Spanish missions in 1833, and oversaw the rise of the civilian pueblo. By 1827, as many as 30 homes existed around the central plaza, and in 1835, Mexico granted San Diego official pueblo (town) status. At this time, the town had a population of nearly 500 residents,

later reaching a peak of roughly 600. By 1835 the presidio, once the center of life in Spanish San Diego, had been abandoned and lay in ruins. Mission San Diego de Alcalá fared little better. The town and the ship landing area at La Playa were now the centers of activity in Mexican San Diego. However, the new Pueblo of San Diego did not prosper, as some other California towns did during the Mexican Period.

Secularization in what is now San Diego County triggered increased Native American hostilities against the Californios during the late 1830s. The attacks on outlying ranchos, along with unstable political and economic factors, lead to San Diego's population decline to approximately 150 permanent residents by 1840. San Diego's official Pueblo status was removed by 1838, and it was made a subprefecture of the Los Angeles Pueblo. When the Americans took over after 1846, the situation had stabilized somewhat, and the population had increased to roughly 350 non-Native American residents. The Native American population continued to decline, as Mexican occupation brought about continued displacement and acculturation of Native American populations.

American Period (1846–Present)

The American Period began in 1846 when United States military forces occupied San Diego; this period continues today. When United States military forces occupied San Diego in July 1846, the town's residents split on their course of action. Many of the town's leaders sided with the Americans, but other prominent families opposed the United States' invasion. In December 1846, a group of Californios under Andres Pico engaged United States Army forces under General Stephen Kearney at the Battle of San Pasqual and inflicted many casualties. However, the Californio resistance was defeated in two small battles near Los Angeles, and effectively ended the resistance by January 1847. The Americans assumed formal control with the Treaty of Guadalupe-Hidalgo in 1848, and introduced Anglo culture and society, American political institutions, and American commerce. In 1850, the Americanization of San Diego began to develop rapidly.

On February 18, 1850, the California State Legislature formally organized San Diego County. The first elections were held at San Diego and La Playa on April 1, 1850, for county officers. San Diego grew slowly during the next decade. San Diegans attempted to develop the town's interests through a transcontinental railroad plan and development of a new town closer to the Bay. The failure of these plans, added to a severe drought that crippled ranching and the onset of the Civil War, left San Diego as a remote frontier town. These issues led to a drop in the town's population from 650 in 1850 to 539 in 1860. Not until land speculator and developer Alonzo Horton arrived in 1867 did San Diego begin to develop fully into an active American town.

Alonzo Horton's development of a New San Diego (modern downtown) in 1867 began to swing the community's focus away from Old Town and began the urbanization of San Diego. Expansion of trade brought an increase in the availability of building materials. Wood buildings gradually replaced adobe structures. Some of the earliest buildings to be erected in the American Period were "pre-fab" houses that were built on the east coast of the United States and shipped in sections around Cape Horn and reassembled in San Diego. Development spread from downtown due to a variety of factors, including the availability of potable water and transportation corridors. Factors such as views and access to public facilities affected land values, which in turn affected the character of neighborhoods that developed. During the Victorian Era of the late 1800s and early 1900s, the areas of Golden Hill, Uptown, Banker's Hill, and Sherman Heights were developed. Examples of the Victorian Era architectural styles remain in these communities, and in Little Italy, which developed at the same time. At the time downtown was being built, there began to be summer cottage/retreat development in what are now the beach communities and La Jolla area. The early structures in these areas were not of substantial construction since they were primarily built for temporary vacation housing.

Development also spread to the greater North Park and Mission Hills areas during the early 1900s. The neighborhoods were built as small lots, a single lot at a time; there was no large tract housing development in these neighborhoods. This provided affordable housing away from the downtown area, and development expanded as transportation improved. Barrio Logan began as a residential area, but because of proximity to rail freight and shipping freight docks, the area became more mixed, with conversion to industrial uses. This area was more suitable to industrial uses because land values were not as high. Topographically, the area is more level, and it does not have views like the areas north of downtown. Various ethnic groups settled in the area because of the affordability of land ownership.

San Ysidro began to be developed around the turn of the twentieth century. The early settlers were followers of the Littlelanders colonies movement. There, the pattern of development was designed to accommodate small plots of land for each homeowner to farm as part of a farming/residential cooperative community. Nearby Otay Mesa-Nestor began to be developed by farmers of Germanic and Swiss backgrounds. Some of the prime citrus groves in California were in the Otay Mesa-Nestor area. In addition, there were grape growers of Italian heritage who settled in the Otay River Valley and tributary canyons who produced wine for commercial purposes.

San Diego State University was established in the 1920s, and the development of the State College area began, including development of the Navajo community as an outgrowth from the college area and from the west. There was farming and ranching in Mission Valley until the middle portion of the twentieth century when the uses were converted to commercial and residential. There were dairy farms and chicken ranches adjacent to the San Diego River where now there are motels, restaurants, office complexes, and regional shopping malls. There was little development north of the San Diego River until Linda Vista was developed as military housing in the 1940s, when the federal government improved public facilities and extended water and sewer pipelines to the area. From Linda Vista, development spread north of Mission Valley to the Clairemont Mesa and Kearny Mesa areas. Development in these communities was mixed-use and residential on moderate-sized lots.

Tierrasanta, previously owned by the U.S. Navy, was developed in the 1970s. It was one of the first planned developments in the area with segregation of uses. Tierrasanta and many of the communities that have developed since, such as Rancho Penasquitos and Rancho Bernardo, represent the typical development pattern in San Diego in the last 25 to 30 years: uses are well segregated, with commercial uses located along the main thoroughfares and residential uses located beyond that. Industrial uses are located in planned industrial parks.

Historical Overview of the City of Poway

Poway was first recorded in 1828 as the valley of “Paguay” in documents from the Mission San Diego de Alcala. The valley owes its name to the tribes of San Diegueno Native Americans who inhabited the valley before the arrival of the Spanish in 1769. The native name of Paguay appeared on maps, such as the Rand McNally Atlases, as late as 1869. During Spanish rule, the valley was used for pasturing mission livestock, and its inhabitants were the Spanish Padres, Mission Indians, and nomadic bands of Native Americans (Poway Historical Book Committee 1981).

The first American settler believed to have established a homestead in Poway was Philip Crosthwaite, who built an adobe house and started a ranch in 1859. However, soon after, Crosthwaite sold his ranch to the Kerran Brothers and a woman known only Mrs. Anderson, who continued to maintain the ranch until 1874. Farmers had begun to settle within the valley and in 1874, the California State Legislature passed the “no-fence” law that required ranchers to keep cattle off farmers’ property, even if the property is not bound by a fence. The Kerran ranch and others in the area were unable to comply with these rules and cattle disappeared from the landscape. Thus, the economy of the valley shifted to agriculture (Poway

Historical Book Committee 1981; Granberry 1985).

By 1887, the population increased to 800 people, and the valley had a prosperous farming and dairying industry. The community had established a church, stores, school, and hotel, and there was the possibility two railroads would be built in the valley. This brought an increase in residents. The real-estate firm of Baird and Chapin was drawn to the prospects of the area. The firm planned residential communities around small parks in a subdivision plan called Piermont. However, the railroad never materialized, settlers began to leave the valley, and the subdivision was never completed (Poway Historical Book Committee 1981).

Throughout the early 1900s, inhabitants faced drought and transportation difficulties, but Poway still thrived as a farming community. The valley was known for its peaches, vineyards, grain, and alfalfa. Transportation was limited to wagons and stagecoaches, so seeds were carried by wagon from San Diego using the old Pomerado Grade. The Poway Post Office was established in 1901 and received mail twice a day from two four-horse stagecoaches, one that traveled from Escondido every morning, and another from San Diego (Poway Historical Book Committee 1981; Stuart 1966).

Poway experienced periods of droughts that led to the decline of agriculture in the early 1900s. Although there was a local creek that supplied water fit for agriculture, the lack of easily available drinking water prevented the growth of the town until water districts formed after World War II. By 1954, the Poway Municipal Water District was created to utilize water from the Colorado River Aqueduct, and by 1957, the sewer system was completed and developers began building housing tracts. In 1971, the dam that created Lake Poway was constructed, and it became a stable source of water for the residents. At this time, Poway's economy was no longer supported by agriculture, and it instead became a residential community for people who worked throughout the San Diego Area (Poway City History).

In the 1970s, members of the community decided that Poway should become its own city. They wanted their own City Council so town decisions could be made by locals. A measure to incorporate Poway was put on a ballot in 1976, but voters were concerned that Poway would not have enough financial stability on its own, so they rejected the measure. By 1980, it was determined that Poway would be able to afford the cost of cityhood, and another election was held in November of that year. Over half the voters voted in favor of Poway becoming a city, and on December 1, 1980, it officially became the City of Poway under the motto, "The City in the Country." By 1981, Poway had its own City Council, City Hall, and Civic Center (Gorman 1985; Greeley 1981).

During the 2000s, the population of Poway steadily increased, reaching a peak in 2015 with about 50,000 citizens. Today, the population is comprised of 48,564 citizens, and Poway still maintains its rural identity as a small country city. Although the farming industry never returned, it is still a popular location for residents who work in San Diego (US Census Bureau 2022).

Ranch Style (1930-1975)

Ranch-style houses in California reflect a national trend of fascination with the "Old West" and were a building style of choice for tract housing in the mid-twentieth century. Ranch homes were originally developed in the western and southwestern United States, but quickly gained national popularity through the dissemination of do-it-yourself manuals and plans in national magazines such as *Sunset, Better Homes and Gardens,* and *House Beautiful.* Ranch houses were also popular as a custom-built type of housing, which was especially popular in the later 1940s and 1950s. Ranch houses were typically built between 1930 and 1975, but peaked in the 1950s, as the most prevalent type of post-World War II suburban tract-style housing, often housing veterans who secured housing with FHA loans.

Ranch style houses are usually a one-story, single-family residence. Houses designed in this architectural style include

several identifying characteristics such as rambling, elongated plans; a horizontal emphasis; general asymmetry; free-flowing interior spaces; and a designed connection to the outdoors. Features such as low-pitched roofs with wide eaves, a combination of cladding materials including board-and-batten siding, brick and stone chimneys, and large picture windows were commonly applied and evoked an aesthetic that was reminiscent of these past architectural traditions. Decorative features such as wood shutters and dovecotes were often added to enhance the rusticated appearance of Ranch houses (Grimes and Chiang 2009; Horak et.al. 2015; McAlester 2013).

Character-defining features include:

- Rambling, elongated plans with a horizontal emphasis
- 1-2 stories in height
- Low-pitched gabled or hipped roofs with overhanging, open eaves
- General asymmetry
- Free-flowing interior spaces
- Designed connection to the outdoors
- Cladding featuring stucco, board and batten, shingles, clapboard, or a combination of materials
- Brick or stone chimney details
- Attached garages often linked to residence by breezeways
- Combinations of stone, brick, board and batten, clapboard, or horizontal wood siding used for accent on walls, secondary cladding types, and planters
- Functional and non-functional shutters details as trim around windows
- Fenestration may include a picture window

NRHP/CRHR Evaluation of Significance

Criterion A/1: *That are associated with events that have made a significant contribution to the broad patterns of our history.*

Archival research of 12624 Oak Knoll Road did not reveal any associations with events that made a significant contribution to the broad patterns of history. The property was completed in 1959, during a real estate boom brought on by a new sewer system that provided residences with access to a stable source of water. Despite the property reflecting the trend of Poway's residential growth during the late 1950s, there is no indication that the construction of this specific residence marked a pivotal movement in the history of the neighborhood or city. It was neither the first nor the last type and was merely following a continuous pattern of residential development that continued through the 1980s after Poway became a city. The property is not known to be directly associated with events that have made a significant contribution to the history of Poway, therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: *That are associated with the lives of persons significant in our past.*

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national, state, or local level and 12624 Oak Knoll Road. The earliest ownership information identified that Mr. and Mrs. Everett P. McMahan owned the property in 1963. The next known owners of the property were Edward K. Harmon and Joyce Juanita Harmon. The property has been owned by the

Harmon family since 1966. Edward K. Harmon was born in Arkansas in 1928. Joyce Juanita Harmon was born in Arkansas in 1931. The couple moved to Poway in 1966 and appear to have resided at 12624 Oak Knoll Road for several decades. Edward Harmon served in the US Navy, reaching the rank of Commander before retiring in 1978. Joyce and Edward Harmon worked in real estate and were active members of many local clubs and organizations. Joyce passed away in 2000 and Edward died in 2015. Despite the Harmons' role as prominent and active members of their community, research did not reveal information that would indicate Edward and Joyce Harmon are individuals considered significant in our past. Due to a lack of identified significant associations with important persons in history, 12624 Oak Knoll Road does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: *That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.*

12624 Oak Knoll Road does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1950s Ranch-style residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style, and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the 12624 Oak Knoll Roadould not be found. There is no known architect or firm associated with the design or development of 12624 Oak Knoll Road. There is no indication that the property is a distinguished example of work that was designed by an architect or firm recognized as unique in the field of Ranch house design or single-family residential development. 12624 Oak Knoll Road does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. 12624 Oak Knoll Road does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, 12624 Oak Knoll Road is not significant under Criterion C/3.

Criterion D/4: *That have yielded or may be likely to yield information important in prehistory or history.*

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project Site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo in 2022.

Integrity Discussion

12624 Oak Knoll Road contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been by continued development in the area, particularly in the 1990s and early 2000s, changing the setting of since the 1959 residence. The replacement of its original windows, addition of ancillary buildings, addition of a pool, and replacement of the garage door and fence impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with significant people or events in the City of Poway, thus it does not retain integrity of association. 12624 Oak Knoll Road retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property 12624 Oak Knoll Road (APN: 317-500-13-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1. *Its location is the site of a historic event having major significance to the City, State or United States.*

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that 12624 Oak Knoll Road was related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 1.

2. *Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.*

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that 12624 Oak Knoll Road was identified with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or the United States. The earliest ownership information identified that Mr. and Mrs. Everett P. McMahan owned the property in 1963. The next known owners of the property were Edward K. Harmon and Joyce Juanita Harmon. The property has been owned by the Harmon family since 1966. Edward K. Harmon was born in Arkansas in 1928. Joyce Juanita Harmon was born in Arkansas in 1931. The couple moved to Poway in 1966 and appear to have resided at 12624 Oak Knoll Road for several decades. Edward Harmon served in the US Navy, reaching the rank of Commander before retiring in 1978. Joyce and Edward Harmon worked in real estate and were active members of many local clubs and organizations. Joyce passed away in 2000 and Edward died in 2015. Despite the Harmons' role as prominent and active members of their community, research did not reveal information that would indicate Edward and Joyce Harmon are individuals considered significant in our past. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 2.

3. *Its quality as one of the finest examples in the City of the work of an architect of major importance.*

As discussed in NRHP/CRHR Criterion C/3, the building identified on 12624 Oak Knoll Road does not exemplify a fine example of the Minimal Ranch style in the City of Poway. No original building permit was found and there is no indication the residence is the work of an architect of major importance. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion

4. *Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.*

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that 12624 Oak Knoll Road was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 4.

5. *Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.*

As discussed in NRHP/CRHR Criteria C/3, 12624 Oak Knoll Road does not appear to exhibit an extraordinary class of architectural design, detail, materials or craftsmanship. It is a typical example of a ubiquitous Minimal Ranch House design. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 5.

6. *Its potential of yielding historic/cultural information of major importance.*

As discussed in NRHP/CRHR Criteria D/4, 12624 Oak Knoll Road does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project Site, please see DeCarlo 2022. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 6.

7. *Its integrity as a natural feature that has made a major contribution to the community.*

12624 Oak Knoll Road is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark has made a major contribution to the community. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 7.

8. *Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.*

12624 Oak Knoll Road does not exhibit elements of historic preservation practices that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, 12624 Oak Knoll Road does not appear significant under City of Poway Criterion 8.

Summary of Findings

12624 Oak Knoll Road (APN: 317-500-11-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district. It further does not meet any of the criteria for landmark listing by the City of Poway. As a building constructed in 1959 (after 1940), it does not meet the minimum requirements for any category of historical resource within the City of Poway. The recommended status code is 6Z: Found ineligible for NR, CR or Local designation through survey evaluation.

12623 Oak Knoll Road is a one-story, single-family residence with an ancillary building to the rear of the property. It was constructed in 1946 (San Diego County Assessor). The residence is divided into two masses with an L-shaped plan. The front mass (long side of the L) is clad with a vertical wood board and batten. The front mass is topped by a flat roof with closed eaves. A side gable roof clad in corrugated metal with open eaves tops the second mass. [See Continuation Sheet]

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Property D: 12623 Oak Knoll Road (APN: 317-501-02-00) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district, as demonstrated below. 12623 Oak Knoll Road further does not meet any of the criteria for landmark listing by the City of Poway as demonstrated below. The building was previously identified as Poway Historic Site 112 (Smith 1992: 6). In this identification, the property is described as a house of lath and board construction from the 1920s. The building currently on the property is a wood, board-and-batten house, which indicates the building has been substantially altered since its identification on the Poway Historic Sites list. The San Diego County Assessor recorded the year of construction as 1946, but a building appears on the earliest available historic aerial photographs of the property from 1939. It is not known if the building present in 1939 is the building currently present on the property. It is possible that the property fulfills the minimum requirements of a Category D building, which includes properties built prior to 1940 that are clearly not significant in terms of architectural style, appearance, design, construction, or association with important persons or events in City history. Therefore, Property D is of historic age, but does not appear to have significance as a historical resource. The building does not appear eligible for listing as a historical resource. The recommended status code is 6Z: Found ineligible for NRHP, CRHR or Local designation through survey evaluation. [**See Continuation Sheet**]

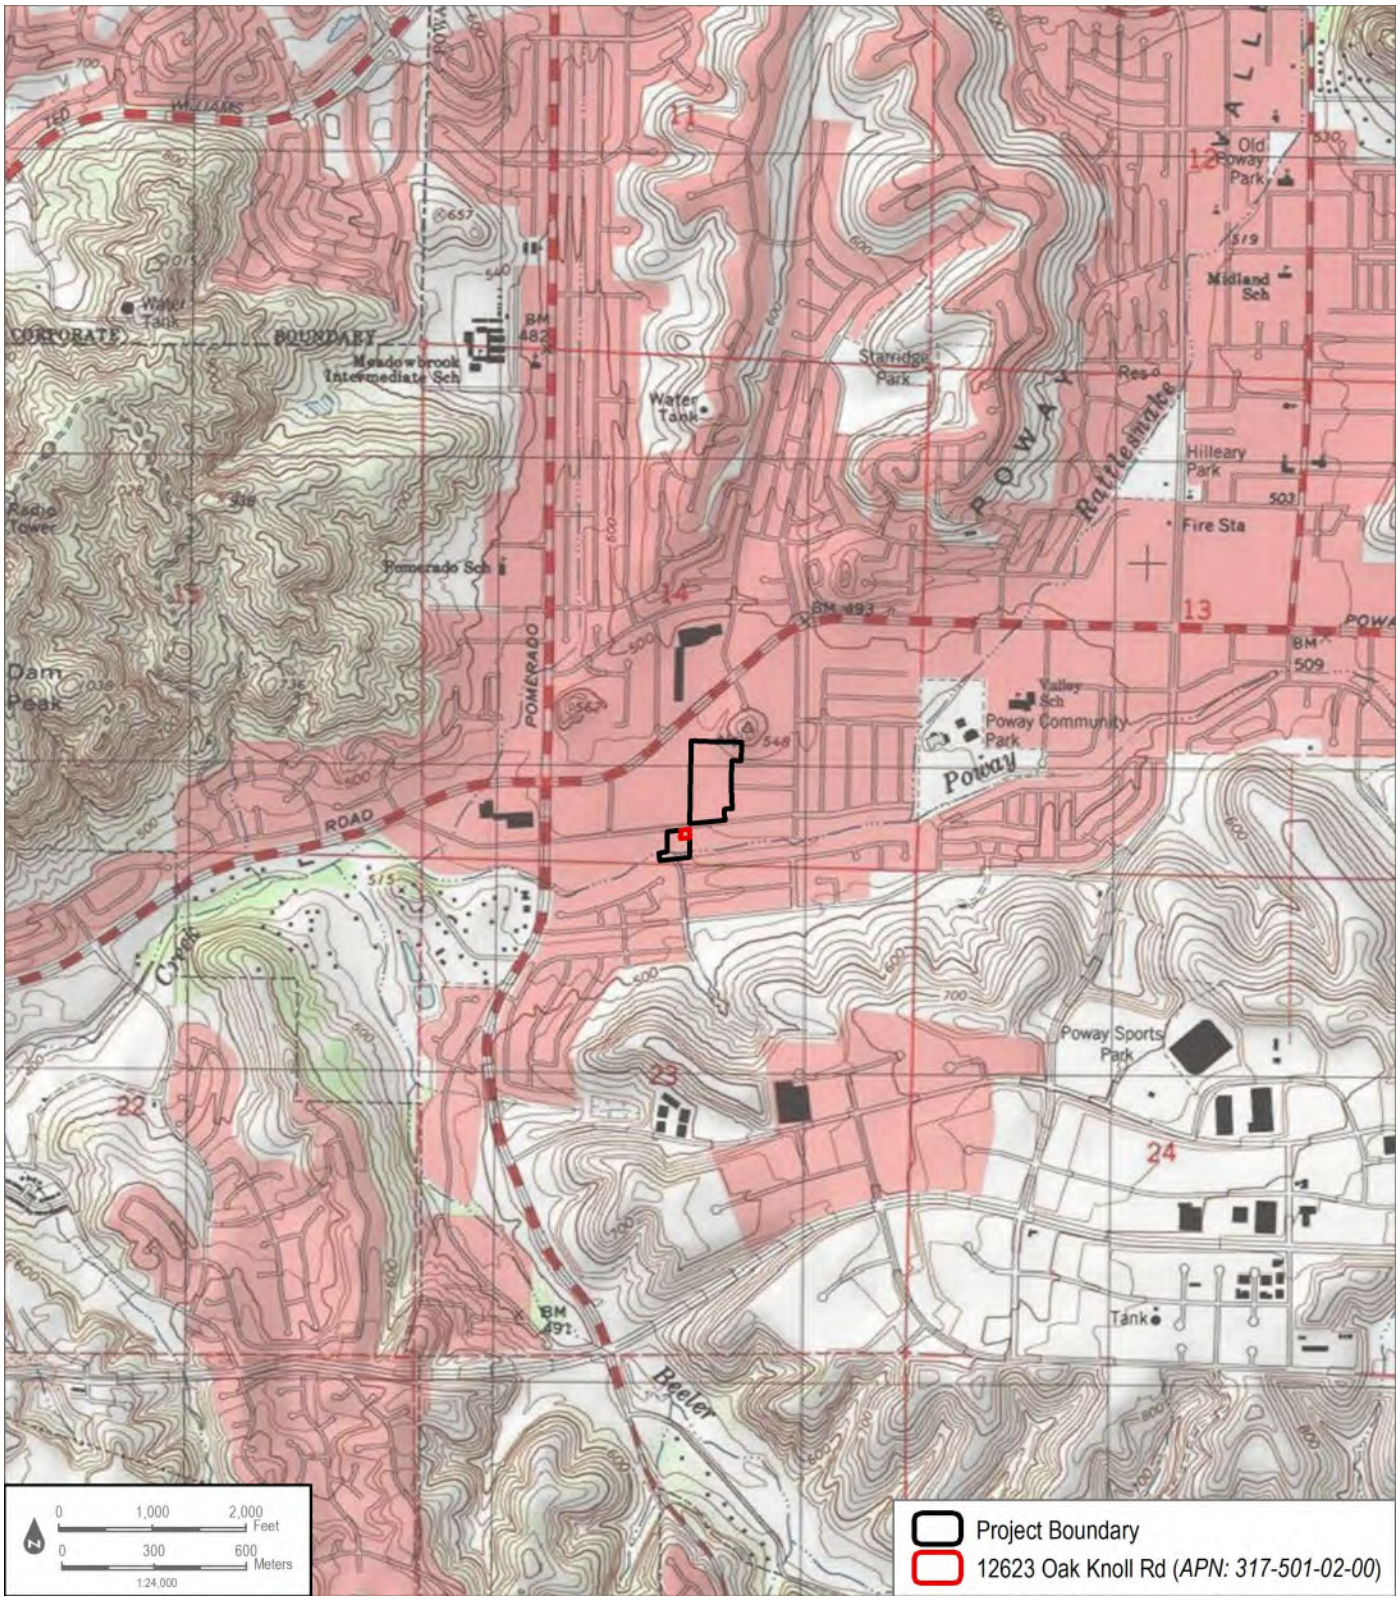
***Map Name:** Poway, CA

***Resource Name or #** (Assigned by recorder) 12623 Oak Knoll Road
***Scale:** 1:24,000 ***Date of map:** 2022



***P3a. Description:**

The main (north) elevation is seven bays wide and features three wood sash multilight double casement windows; a centrally located entry door obscured by an iron security door accessed by two concrete steps; and a single wood sash multilight double casement window in the sixth bay, centered between the fifth and seventh bays. The west side elevation spans four bays and includes three sliding windows in the second and fourth bays, while the east side elevation does not have fenestration. Side elevations are clad in wood board and batten. The residence is slightly raised on a concrete block foundation. A chain-link fence surrounds the property, and an unpaved driveway leads from the street to another chain-link fence that encompasses the backyard (east of the residence). The ancillary building sits on the southeast side of the property with a shed roof clad with composition shingles and double doors on the main (north) elevation (NETR, 1994). The property is in the middle of the block and the residence is set back on its parcel with an open grass lawn. Alterations to the residence appear to include the addition of fencing (date unknown), and a security door to the entry (NETR, 1994). The glazing has been removed from the wood sash window adjacent to the entrance.

***B6. Construction History** *(continued from page 2):*

The following list of known alterations to 12623 Oak Knoll Road was compiled through archival research and during the intensive survey. Unless indicated, the date of these alterations is unknown:

- Glazing removed from the wood sash window adjacent to the entrance (observed, no date)
- Addition of a rectangular ancillary building on the southeast side of the property (observed, 1994)
- Addition of security door to front entry door (observed, 2014)

***B10. Significance** *(continued from page 2):*

Historic Context

Post-Contact history for the State of California is generally divided into three periods: the Spanish Period (1769–1821), Mexican Period (1821–1846), and American Period (1846–present). Although Spanish, Russian, and British explorers visited the area for brief periods between 1529 and 1769, the Spanish Period in California begins with the establishment in 1769 of a settlement at San Diego and the founding of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain in 1821 marks the beginning of the Mexican Period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, signals the beginning of the American Period when California became a territory of the United States.

Spanish Period (1769–1821)

The Spanish colonization of Alta California began in 1769 with the founding of Mission San Diego de Alcalá by Father Junípero Serra. Concerns over Russian and English interests in California motivated the Spanish government to send an expedition of soldiers, settlers, and missionaries to occupy and secure the northwestern borderlands of New Spain through the establishment of a Presidio, Mission, and Pueblo. The Spanish explorers first camped on the shore of the Bay in the area that is now downtown San Diego. Lack of water at this location, however, led to moving the camp on May 14, 1769, to a small hill closer to the San Diego River and near the Kumeyaay village of Cosoy. Father Junípero Serra arrived in July of

the same year to find the Presidio serving mostly as a hospital. The Spanish built a primitive mission and presidio structure on the hill near the river.

Bad feelings soon developed between the native Kumeyaay and the soldiers, resulting in the construction of a stockade that, by 1772, included barracks for the soldiers; a storehouse for supplies; a house for the missionaries; and a chapel, which had been improved. The log and brush huts were gradually replaced with buildings made of adobe bricks. Flat earthen roofs were eventually replaced by pitched roofs with rounded roof tiles. Clay floors were eventually lined with fired brick.

In August 1774, the Spanish missionaries moved the Mission San Diego de Alcalá to its present location 6 miles up the San Diego River valley (modern Mission Valley) near the Kumeyaay village of Nipaguay. Begun as a thatched chapel and compound built of willow poles, logs, and tules, the new mission was sacked and burned in the Kumeyaay uprising of November 5, 1775. The first adobe chapel was completed in October 1776, and the present church was begun the following year. A succession of building programs through 1813 resulted in the final plan that included the church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. Orchards, reservoirs, and other agricultural installations were built to the south on the lower San Diego River alluvial terrace and were irrigated by a dam and aqueduct system. The initial Spanish occupation and mission system brought about profound changes in the lives of the Kumeyaay people. Substantial numbers of the coastal Kumeyaay were forcibly brought into the mission or died from introduced diseases.

As early as 1791, presidio commandants in California were given the authority to grant small house lots and garden plots to soldiers and their families, and sometime after 1800, soldiers and their families began to move down the hill near the San Diego River. Historian William Smythe noted that Don Blas Aguilar, who was born in 1811, remembered at least 15 such grants below Presidio Hill by 1821, of which only five were within the boundaries of what would become Old Town had houses in 1821. These were the retired commandant Francisco Ruiz's adobe (now known as the Carrillo Adobe), another building later owned by Henry Fitch on Calhoun Street, the Ybanes and Serrano houses on Juan Street near Washington Street, and a small adobe house on the main plaza owned by Juan Jose Maria Marron.

Mexican Period (1821–1846)

In 1822, the political situation changed as Mexico won its independence from Spain, and San Diego became part of the Mexican Republic. The Mexican government opened California to foreign trade, began issuing private land grants in the early 1820s, created the rancho system of large agricultural estates, secularized the Spanish missions in 1833, and oversaw the rise of the civilian pueblo. By 1827, as many as 30 homes existed around the central plaza, and in 1835, Mexico granted San Diego official pueblo (town) status. At this time, the town had a population of nearly 500 residents, later reaching a peak of roughly 600. By 1835 the presidio, once the center of life in Spanish San Diego, had been abandoned and lay in ruins. Mission San Diego de Alcalá fared little better. The town and the ship landing area at La Playa were now the centers of activity in Mexican San Diego. However, the new Pueblo of San Diego did not prosper, as some other California towns did during the Mexican Period.

Secularization in what is now San Diego County triggered increased Native American hostilities against the Californios during the late 1830s. The attacks on outlying ranchos, along with unstable political and economic factors, lead to San Diego's population decline to approximately 150 permanent residents by 1840. San Diego's official Pueblo status was removed by 1838, and it was made a subprefecture of the Los Angeles Pueblo. When the Americans took over after 1846, the situation had stabilized somewhat, and the population had increased to roughly 350 non-Native American residents.

The Native American population continued to decline, as Mexican occupation brought about continued displacement and acculturation of Native American populations.

American Period (1846–Present)

The American Period began in 1846 when United States military forces occupied San Diego; this period continues today. When United States military forces occupied San Diego in July 1846, the town's residents split on their course of action. Many of the town's leaders sided with the Americans, but other prominent families opposed the United States' invasion. In December 1846, a group of Californios under Andres Pico engaged United States Army forces under General Stephen Kearney at the Battle of San Pasqual and inflicted many casualties. However, the Californio resistance was defeated in two small battles near Los Angeles, and effectively ended the resistance by January 1847. The Americans assumed formal control with the Treaty of Guadalupe-Hidalgo in 1848, and introduced Anglo culture and society, American political institutions, and American commerce. In 1850, the Americanization of San Diego began to develop rapidly.

On February 18, 1850, the California State Legislature formally organized San Diego County. The first elections were held at San Diego and La Playa on April 1, 1850, for county officers. San Diego grew slowly during the next decade. San Diegans attempted to develop the town's interests through a transcontinental railroad plan and development of a new town closer to the Bay. The failure of these plans, added to a severe drought that crippled ranching and the onset of the Civil War, left San Diego as a remote frontier town. These issues led to a drop in the town's population from 650 in 1850 to 539 in 1860. Not until land speculator and developer Alonzo Horton arrived in 1867 did San Diego begin to develop fully into an active American town.

Alonzo Horton's development of a New San Diego (modern downtown) in 1867 began to swing the community's focus away from Old Town and began the urbanization of San Diego. Expansion of trade brought an increase in the availability of building materials. Wood buildings gradually replaced adobe structures. Some of the earliest buildings to be erected in the American Period were "pre-fab" houses that were built on the east coast of the United States and shipped in sections around Cape Horn and reassembled in San Diego. Development spread from downtown due to a variety of factors, including the availability of potable water and transportation corridors. Factors such as views and access to public facilities affected land values, which in turn affected the character of neighborhoods that developed. During the Victorian Era of the late 1800s and early 1900s, the areas of Golden Hill, Uptown, Banker's Hill, and Sherman Heights were developed. Examples of the Victorian Era architectural styles remain in these communities, and in Little Italy, which developed at the same time. At the time downtown was being built, there began to be summer cottage/retreat development in what are now the beach communities and La Jolla area. The early structures in these areas were not of substantial construction since they were primarily built for temporary vacation housing.

Development also spread to the greater North Park and Mission Hills areas during the early 1900s. The neighborhoods were built as small lots, a single lot at a time; there was no large tract housing development in these neighborhoods. This provided affordable housing away from the downtown area, and development expanded as transportation improved. Barrio Logan began as a residential area, but because of proximity to rail freight and shipping freight docks, the area became more mixed, with conversion to industrial uses. This area was more suitable to industrial uses because land values were not as high. Topographically, the area is more level, and it does not have views like the areas north of downtown. Various ethnic groups settled in the area because of the affordability of land ownership.

San Ysidro began to be developed around the turn of the twentieth century. The early settlers were followers of the Littlelanders colonies movement. There, the pattern of development was designed to accommodate small plots of land for

each homeowner to farm as part of a farming/residential cooperative community. Nearby Otay Mesa-Nestor began to be developed by farmers of Germanic and Swiss backgrounds. Some of the prime citrus groves in California were in the Otay Mesa-Nestor area. In addition, there were grape growers of Italian heritage who settled in the Otay River Valley and tributary canyons who produced wine for commercial purposes.

San Diego State University was established in the 1920s, and the development of the State College area began, including development of the Navajo community as an outgrowth from the college area and from the west. There was farming and ranching in Mission Valley until the middle portion of the twentieth century when the uses were converted to commercial and residential. There were dairy farms and chicken ranches adjacent to the San Diego River where now there are motels, restaurants, office complexes, and regional shopping malls. There was little development north of the San Diego River until Linda Vista was developed as military housing in the 1940s, when the federal government improved public facilities and extended water and sewer pipelines to the area. From Linda Vista, development spread north of Mission Valley to the Clairemont Mesa and Kearny Mesa areas. Development in these communities was mixed-use and residential on moderate-sized lots.

Tierrasanta, previously owned by the U.S. Navy, was developed in the 1970s. It was one of the first planned developments in the area with segregation of uses. Tierrasanta and many of the communities that have developed since, such as Rancho Penasquitos and Rancho Bernardo, represent the typical development pattern in San Diego in the last 25 to 30 years: uses are well segregated, with commercial uses located along the main thoroughfares and residential uses located beyond that. Industrial uses are located in planned industrial parks.

Historical Overview of the City of Poway

Poway was first recorded in 1828 as the valley of “Paguay” in documents from the Mission San Diego de Alcala. The valley owes its name to the tribes of San Diegueno Native Americans who inhabited the valley before the arrival of the Spanish in 1769. The native name of Paguay appeared on maps, such as the Rand McNally Atlases, as late as 1869. During Spanish rule, the valley was used for pasturing mission livestock, and its inhabitants were the Spanish Padres, Mission Indians, and nomadic bands of Native Americans (Poway Historical Book Committee 1981).

The first American settler believed to have established a homestead in Poway was Philip Crosthwaite, who built an adobe house and started a ranch in 1859. However, soon after, Crosthwaite sold his ranch to the Kerran Brothers and a woman known only Mrs. Anderson, who continued to maintain the ranch until 1874. Farmers had begun to settle within the valley and in 1874, the California State Legislature passed the “no-fence” law that required ranchers to keep cattle off farmers’ property, even if the property is not bound by a fence. The Kerran ranch and others in the area were unable to comply with these rules and cattle disappeared from the landscape. Thus, the economy of the valley shifted to agriculture (Poway Historical Book Committee 1981; Granberry 1985).

By 1887, the population increased to 800 people, and the valley had a prosperous farming and dairying industry. The community had established a church, stores, school, and hotel, and there was the possibility two railroads would be built in the valley. This brought an increase in residents. The real-estate firm of Baird and Chapin was drawn to the prospects of the area. The firm planned residential communities around small parks in a subdivision plan called Piermont. However, the railroad never materialized, settlers began to leave the valley, and the subdivision was never completed (Poway Historical Book Committee 1981).

Throughout the early 1900s, inhabitants faced drought and transportation difficulties, but Poway still thrived as a farming community. The valley was known for its peaches, vineyards, grain, and alfalfa. Transportation was limited to wagons and

stagecoaches, so seeds were carried by wagon from San Diego using the old Pomerado Grade. The Poway Post Office was established in 1901 and received mail twice a day from two four-horse stagecoaches, one that traveled from Escondido every morning, and another from San Diego (Poway Historical Book Committee 1981; Stuart 1966).

Poway experienced periods of droughts that led to the decline of agriculture in the early 1900s. Although there was a local creek that supplied water fit for agriculture, the lack of easily available drinking water prevented the growth of the town until water districts formed after World War II. By 1954, the Poway Municipal Water District was created to utilize water from the Colorado River Aqueduct, and by 1957, the sewer system was completed and developers began building housing tracts. In 1971, the dam that created Lake Poway was constructed, and it became a stable source of water for the residents. At this time, Poway's economy was no longer supported by agriculture, and it instead became a residential community for people who worked throughout the San Diego Area (Poway City History).

In the 1970s, members of the community decided that Poway should become its own city. They wanted their own City Council so town decisions could be made by locals. A measure to incorporate Poway was put on a ballot in 1976, but voters were concerned that Poway would not have enough financial stability on its own, so they rejected the measure. By 1980, it was determined that Poway would be able to afford the cost of cityhood, and another election was held in November of that year. Over half the voters voted in favor of Poway becoming a city, and on December 1, 1980, it officially became the City of Poway under the motto, "The City in the Country." By 1981, Poway had its own City Council, City Hall, and Civic Center (Gorman 1985; Greeley 1981).

During the 2000s, the population of Poway steadily increased, reaching a peak in 2015 with about 50,000 citizens. Today, the population is comprised of 48,564 citizens, and Poway still maintains its rural identity as a small country city. Although the farming industry never returned, it is still a popular location for residents who work in San Diego (US Census Bureau 2022).

NRHP/CRHR Evaluation of Significance

Criterion A/1: That are association with events that have made a significant contribution to the broad patterns of our history.

Archival research of Property D did not find any associations with events that made a significant contribution to the broad patterns of history. The property is a nondescript wood frame building. There is no indication the property is associated with significant events in the City's early agricultural development, though it appears to have been constructed in the first half of the twentieth century when the area was primarily agricultural. There is no indication the property has an important association with an event or historic trends in Poway, such as post-World War II residential development. Therefore, Property D does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not identify any of the previous property owners and there is no indication the property has any direct association with individuals that are known to be historic figures at the national, state, or local level. Due to a lack of identified significant associations with important persons in history, Property D does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

Criterion C/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

Property D does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a single-family residence. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style, and is executed in common materials. An individual or firm may be defined as a master based on scholarship recognizing its work as unique or trendsetting within the discipline. The original building permit for the property could not be found. There is no known architect or firm associated with the design or development of Property D. There is no indication that the property is a distinguished example of work that was designed by an architect or firm recognized as unique in the field of house design or single-family residential development. Property D does not possess high artistic values. The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. Property D does not appear likely to contribute to a potential historic district, due to the lack of a cohesive grouping of intact properties in the area. Therefore, Property D is not significant under Criterion C/3.

Criterion D/4: That have yielded, or may be likely to yield information important in prehistory or history.

Criterion D was not considered in the evaluation, because it generally applies to archaeology resources. For more information on the archaeological resources associated with this Project site, please see the *Cultural Resource Inventory Report for the Oak Knoll Property Project* prepared by DeCarlo 2022.

Integrity Discussion

Property D contains one residence that has not been moved or relocated, thus it retains integrity of location. However, the surrounding neighborhood and streetscape have been altered since the 1946 residence was constructed with continued development in the area, particularly in the 1990s and early 2000s , so it does not retain integrity of setting. The replacement of its original windows, addition of an ancillary building, and addition of a security door to the front entry door impact its integrity of design, materials, and workmanship. The property no longer retains integrity of feeling due to the effect of these changes alterations. Research did not reveal that the property has an association with people or events in the City of Poway, thus it does not retain integrity of association. Property D retains integrity of location, but longer retains integrity of setting, design, materials, workmanship, feeling, and association.

City of Poway Statement of Significance

The property at Property D: 12623 Oak Knoll Road (APN: 317-501-02-00) does not meet any of the criteria for listing by the City of Poway as demonstrated below.

1 Its location is the site of a historic event having major significance to the City, State or United States.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that Property D was related to historical events significant to the City of Poway and does not reflect elements associated with a historic event having major significance to the City of Poway, North San Diego County, the State of California or the United States. Therefore, Property D does not appear significant under City of Poway Criterion 1.

2 Its identification with a person or persons who have made a significant social, cultural or scientific contribution to the City, region, State or the United States.

As discussed in NRHP/CRHR Criterion B/2, archival research did not reveal that Property D was identified with a person or persons who made a significant social, cultural or scientific contribution to the City of Poway, North San Diego County, the State of California or United States. Therefore, Property D does not appear significant under City of Poway Criterion 2.

3 Its quality as one of the finest examples in the City of the work of an architect of major importance.

As discussed in NRHP/CRHR Criterion C/3, the building identified on Property D does not exemplify a fine example of an architectural style in the City of Poway. No original building permit was found and the architect who designed the residence is unknown. There is no indication the property is the work of an architect of major importance. Therefore, Property D does not appear significant under City of Poway Criterion 3.

4 Its identification as the work of a person or persons whose work has exerted a major influence on the heritage of the City, region, State or the United States.

As discussed in NRHP/CRHR Criteria A/1 and C/3, archival research did not reveal that Property D was identified with the work of a person or persons whose work has exerted a major influence on the heritage of the City of Poway, North San Diego County, the state of California or the United States. Therefore, Property D does not appear significant under City of Poway Criterion 4.

5 Its exemplification of an extraordinary class of architectural design, detail, materials or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, Property D does not appear to exhibit an extraordinary class of architectural design, detail, materials or craftsmanship. It is not an example of an architectural style. Therefore, Property B does not appear significant under City of Poway Criterion 5.

6 Its potential of yielding historic/cultural information of major importance.

As discussed in NRHP/CRHR Criteria D/4, Property D does not appear to have the potential to yield historic/cultural information of major importance. However, for more information on the archaeological resources associated with this Project site, please see DeCarlo 2022. Therefore, Property D does not appear significant under City of Poway Criterion 6.

7 Its integrity as a natural feature that has made a major contribution to the community.

Property D is a man-made building and does not contain a natural feature, such as a historic tree or important natural landmark not a natural feature that has made a major contribution to the community. Therefore, Property B does not appear significant under City of Poway Criterion 7.

8 Other attributes of the historic/cultural resource which are consistent with the Secretary of the Interior's Standards.

Property D does not exhibit elements of historic preservation that are consistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties. This property does not appear to exhibit elements that promote historic preservation best practices developed to protect our nation's irreplaceable cultural resources. Therefore, Property B does not appear significant under City of Poway Criterion 8.

Summary of Eligibility

Property D (12623 Oak Knoll Road) does not appear to meet NRHP, CRHR, or local City of Poway criteria for historical significance. As such, the property is not considered a CEQA historical resource.

Appendix B
Preparers' Qualifications

Katie Ahmanson, MA

ARCHITECTURAL HISTORIAN

Katie Ahmanson (*KAY-tee AH-mun-son; she/her)* is an architectural historian with two years' experience in the field of architectural history and heritage conservation. She has experience with Historic Cultural Monument and National Register of Historic Places (NRHP) nominations, historic context statements, building descriptions, and California Department of Parks and Recreation (DPR) 523 forms. Ms. Ahmanson has familiarity with environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act.

Education

University of Southern California School of Architecture
MA, Heritage Conservation, 2022

Claremont McKenna College
BA, Art History, 2019

Project Experience

Los Angeles County Florence-Firestone Community Plan Area Historic Resources Survey, Los Angeles County, California. Dudek was retained by the County of Los Angeles Department of Regional Planning to prepare a Historic Context Statement and conduct a Historic Resources Survey for the Community Plan Area of Florence-Firestone. The goal of the project is to document the development history of the community from the rancho period to the present, identify important themes, events, patterns of development, and describes the different property types, styles, builders, and architects associated with these important periods and themes. The document will also provide registration requirements and recommendations for future study/action by the County of Los Angeles to facilitate and streamline the historic preservation program. As an architectural historian, Ms. Ahmanson completed field work and contributed to a Historic Resources Survey report. (2022)

Oak Knoll Road, Poway, San Diego County, California. Dudek was retained to complete a historical resources evaluation for a residential development project in the City of Poway. The Project proposes the development of the 10.72-acre property into a residential development within an existing residential neighborhood. As an architectural historian, Ms. Ahmanson co-authored the technical report, wrote building descriptions and significance evaluations, and completed archival research for the project. (2022)

Relevant Previous Experience

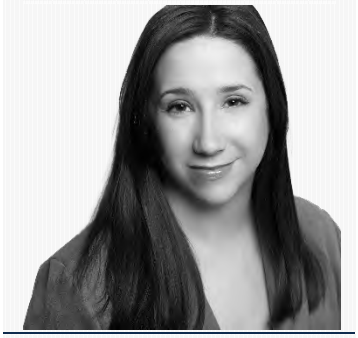
Preservation Intern, Hollywood Heritage, Hollywood, California. As an intern, managed general office administrative work, maintained and regularly updated the Preservation Sub-Committee to-do and watch lists, set the weekly Admin meeting and monthly Preservation Committee meeting and agendas, and recorded the meeting minutes. Additionally, organized developer and resident meetings, monitored and tracked relevant public hearings and schedules for Hollywood Heritage issues, and attended public hearings and meetings on behalf of Hollywood Heritage. Assisted residents and concerned parties seeking to designate historic resources and helped prepare nominations for city, state and national designations, such as the Historic Cultural Monument nomination for the Home Savings and Loans on 1500 Vine St. in Hollywood, which passed as a designated monument June 2, 2022. (2021–2022)

Architecture Research Assistant, SPF: Architects, Culver City, California. As a research assistant, researched and collected information about projects and wrote for the company website. In addition, organized content about past and ongoing projects, digitally archived old plans and documents, organized contact lists, and composed press releases for new projects and firm announcements. Aided in making architecture models and model accessories. (2019–2020)

Intern, Frederick Fisher and Partners, Los Angeles, California. As the office intern, archived old plans and documents and scanned documents and digitally archived published materials. In addition, worked with the marketing team to organize contact lists and research competing firms. Also assisted the front desk with answering the phone, welcoming guests, and office cleanup and organization. (2018)

Claire Cancilla, MSHP

ARCHITECTURAL HISTORIAN



Claire Cancilla (KLAIR *Kan-sil-uh; she/her*) is an Architectural Historian with 3 years' professional experience that encompasses a wide variety of project types in varied geographic locations, including Los Angeles, Laguna Beach, Agoura Hills, Baldwin Park, Poway, Riverside, San Diego, Glendale, Pasadena, Sequoia National Park, New York City, and Venice, Italy. She has completed historic significance evaluations in consideration of the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), and local designation criteria for single-family residences, commercial properties, educational institutions, warehouse and industrial properties, and municipal facilities. Additional project experience includes writing national register and local register nominations, conducting historic archival research, performing conditions assessments and reconnaissance surveys, conducting CEQA impacts analyses, preparing environmental impact report (EIR) sections, and conducting design reviews under the Secretary of the Interior's Standards. She meets the Secretary of the Interior's Professional Qualification Standards for Architectural History.

Education

Columbia University
MS, Historic Preservation, 2020

Occidental College
BA, History, 2016

Dudek Project Experience

Los Angeles County Metro Area Plan Project, Los Angeles County, California. Dudek was retained by the County of Los Angeles Department of Regional Planning to prepare a Historic Context Statement (HCS) in support of the Metro Area Plan (MAP) project. The goal of the HCS component of the project is to inform, enhance, and streamline the larger MAP project as it pertains to historical resources. The communities included within the MAP HCS include East Los Angeles, East Rancho Dominguez, Florence–Firestone, Walnut Park, West Athens–Westmont, West Rancho Dominguez–Victoria, and Willowbrook. The HCS documents the development history of the communities from the rancho period to the present; identifies important themes, events, and patterns of development; and describes the different property types, styles, builders, and architects associated with these important periods and themes. The document will also provide registration requirements and recommendations for future study/action by the County of Los Angeles to facilitate and streamline the historic preservation program. Responsibilities include report section preparation and archival research. (2021–Present)

Kaiser Baldwin Park Medical Center Project, Top Commercial Realty, Baldwin Park California. Dudek was retained to complete a Built Environment Inventory and Evaluation Report for a proposed project involving the development of the Kaiser Baldwin Park Medical Center. Ms. Cancilla co-authored a Built Environment Inventory and Evaluation Report for a 1970s vernacular commercial building. (2022).

Arlington Avenue Historic Resources Technical Report, Foulger Pratt, Riverside, California. Dudek was retained to complete a Historic Resources Technical Report on a Mid-Century Modern former Sears Department Store in the city of Riverside, California for a proposed redevelopment. Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022).

Oak Knoll Road, Poway, San Diego County, California. Dudek was retained to complete a historical resources evaluation for a residential development project in the City of Poway. The Project proposes the development of the 10.72-acre property into a residential development within an existing residential neighborhood. As an architectural historian, Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022)

Relevant Previous Experience

Mayfield Junior School Historic Resource Assessment, City of Pasadena, California. Primary author of a historic resource assessment (HRA) for two mid-century educational buildings on the Mayfield Junior School campus. Work involved archival research, survey and documentation of the buildings and campus, and an evaluation of both buildings' eligibility under local, state, and federal criteria. (2022)

Silver Lake Reservoir Complex Master Plan EIR, City of Los Angeles, California. Conducted a site survey of the Silver Lake Reservoir, documenting character-defining features of the complex and conducting a direct, indirect, and cumulative impacts analysis for a proposed master plan. Work involved identifying all previously recorded historic built environment resources within 0.25-mile of the complex's perimeter for the impacts analysis. (2022)

Project Crossings Redevelopment HRA and EIR Section, Apple Inc., Los Angeles and Culver City, California. Primary author of an HRA for three industrial buildings, located on the boundary between Los Angeles and Culver City. All buildings were evaluated under both cities' local evaluation criteria. Conducted a direct, indirect, and cumulative impacts analysis, analyzing potential effects of the proposed redevelopment on adjacent built environment resources and prepared an EIR section for the project (2021–2022)

Heritage Park Rehabilitation Project, City of San Diego, California. Conducted research and updated Department of Parks and Recreation (DPR) forms for seven Victorian-era buildings located in San Diego's Heritage Park in anticipation of a forthcoming rehabilitation project. The residences were moved to the park in the 1970s and 1980s due to their impending demolition. (2022)

446 26th Street DPR Form, San Diego Unified School District, San Diego California. Conducted research and completed DPR forms for a 1970 vacant former hospital facility in San Diego. Documented the history of the building and its various owners and functions and analyzed the building within the context of the federal Model Cities Program, which provided funding for the building's original construction. (2022)

2720 Monte Mar Terrace Historical Consulting Services, Confidential Client, Los Angeles, California. Conducted research on the history and development of 1920s Tudor Revival residence and provided consulting services to the homeowners to help guide a potential new addition to the residence. (2022)

7 Oakmont Drive Character-Defining Features Analysis, Confidential Client, Los Angeles, California. Conducted a site visit at the Paul Revere Williams Los Angeles Historic-Cultural Monument (LAHCM) residence, photographically documenting all elevations to identify character-defining features of the residence. Compiled a table of character-defining features and provided preservation recommendations and treatments in anticipation of a rehabilitation and exterior addition to the residence. (2021)

Kun House II LAHCM, Confidential Client, Los Angeles, California. Co-authored an LAHCM nomination for a Richard Neutra-designed residence. Kun House II is located across the street from Kun House I, another Neutra-deigned home for the same client. Work involved conducting archival research at the University of California Los Angeles, surveying the residence, and contextualizing the home within the body of Neutra's residential work to argue for the home being an excellent example of Neutra's small-scale residential design. (2021)

989 Cliff Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California. Authored an HRA for a 1920s Mediterranean Revival beach house that was identified in Laguna Beach's historic resources survey. Research involved an extensive alteration history using plans from renovations and historic photographs, a site visit, and research on the development of the area and the house's inhabitants. Further conducted a direct and indirect impacts analysis for a proposed garage renovation and addition on the project site. (2021)

28307 Agoura Road HRA and HABS III Documentation, Confidential Client, Agoura Hills, California. Authored an HRA on a 1940s vernacular commerical property in Agoura Hills. Researched the rural character and history of Agoura Hills, conducted research at the Agoura Hills Library and Bulding Division, identified occupants, and assessed eligiblity. Upon completion of the HRA, assisted HABS III documentation for the property prior to its redevelopment. (2021)

Marine Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California. Authored an HRA for a single-family 1920s Craftsman residence on Marine Drive. Researched the original property owner, who was a founder of the Orange County Register, and the early beachfront development of Laguna Beach, and conducted an integrity analysis of the home using historic photographs and on-site observation. (2021)

Edgemont Street Los Angeles Historic Cultural Monument Nomination, Confidential Client, Los Angeles, California. Drafted an LAHCM nomination for an American Colonial Revival courtyard garden apartment complex located on the boundary between Los Feliz and East Hollywood. Contextualized the apartment complex within the courtyard apartment typology and as an example of the work of a prolific construction company that designed several other courtyard apartment buildings in Los Angeles. (2021).

5654 Fountain Avenue HRA, Confidential Client, Los Angeles, California. Primary author of an HRA for an American Colonial Revival residential duplex in Hollywood constructed in 1919. Documented the building's history; conducted extensive reserach on the building, its site, and neighbohrood development; and analyzed the building's material and design integirty. (2021)

Powers Street Mosque National Register Nomination, Williamsburg, Brooklyn, New York. Authored a National Register nomination for the Powers Street Mosque, the oldest extant mosque in New York City. The mosque, originally constructed as an Episcopalian church, was founded in 1931 by the American Mohammed Society, formed by Lipka Tatar Muslims, many of whom immigrated to Brooklyn from Lithuania. Researched the property's history, both before its use as a mosque and after; interviewed the mosque's caretaker whose family was involved in the mosque's founding; and conducted photographic documentation. (2020)

Victoria Theatre Historic Resource Report, Confidential Client, Harlem, New York. Authored a historic resource report documenting the development history of the Victoria Theatre, located on 125th Street in Harlem, New York and designed by architect Thomas Lamb. Conducted research trips to archival repositories to document the theater's history, analyzed the theater within the context of Harlem's historical development, and identified additional theaters in the area designed by Lamb. The report provided the basis for an interpretive exhibit in the theater's lobby. (2020)

Awards

Zabar Family Scholarship, Preservation League of New York State, 2020.

Cleo and James Marston Fitch Prize, Columbia University Preservation Alumni, 2019.

Avery Scholarship, Columbia University Graduate School of Architecture, Planning, and Preservation, 2018–2020.

Nicole Frank, MSHP

ARCHITECTURAL HISTORIAN

Nicole Frank (*nih-COHL FRAYNK; she/her*) is an architectural historian with 4 years' experience in the historic preservation field. Ms. Frank's professional experience encompasses a variety of projects for local agencies, private developers, and homeowners in both highly urbanized and rural areas. Projects have included reconnaissance-level surveys, preparation of resource-appropriate and citywide historic contexts, and historical significance evaluations in consideration of the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), and local designation criteria. Ms. Frank has experience conducting historic research, writing landmark designations, performing conditions assessments, and working hands-on in building restoration projects throughout the United States. Ms. Frank also has governmental experience with the City of San Francisco's Planning Department and the City of Chicago's Landmark Designations Department.

Ms. Frank meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to Title 36, Part 61, of the Code of Federal Regulations, Appendix A.

Selected Experience

Coronado Citywide Historic Resources Inventory and Historic Context Statement, City of Coronado, California. Dudek is currently in the process of preparing a historic context statement and historic resources inventory survey for all properties at least 50 years old within City of Coronado limits. Following current professional methodology standards and procedures developed by the California Office of Historic Preservation and the National Park Service, Dudek will develop a detailed historic context statement for the City that identifies and discusses the important themes, patterns of development, property types, and architectural styles prevalent throughout the City. Dudek will also conduct a reconnaissance-level survey of all properties within City limits that are at least 50 years old to identify individual properties and groupings of properties (i.e., historic districts) with potential for historical significance under City Criterion C (properties that possess distinctive characteristics of an architectural style; are valuable for the study of a type, period, or method of construction; and have not been substantially altered) Acting as architectural historian, authored the historic context statement and conducted reconnaissance-level surveys of properties within City limits. (2019–Present)

As-Needed Historic Research Consulting Services, City of Coronado, California. Dudek was retained by the City of Coronado to provide as-needed historic consulting services for various projects. Each evaluation involved the creation of an occupancy timeline, supplemental research on occupants, building development research (including architects, builders, and property), a pedestrian survey of the project area, creation of a description of the surveyed resource, and completion of a historical significance evaluation report in consideration of designation criteria and integrity requirements. Acting as project manager and architectural historian, authored

historical resource evaluation reports for the following properties: 936 J Avenue, 310 2nd Street, 718 B Avenue, 1027-1029 Orange Avenue, 735 Margarita Avenue, 519 Ocean Boulevard, 1901 Monterey Avenue, 269 Palm Avenue, 1113 Adella Avenue, 1519 4th Street, 745 A Avenue, 451–55 Alameda Boulevard, 503 10th Street, 121 G Avenue, 1152 Glorietta Boulevard, 711 Tolita Avenue, 951 G Avenue, 817 A Avenue, 625 B Avenue, 260 D Avenue, 761 I Avenue, and 816 1st Street. (2019–Present)

Senior Residences at Hillcrest Project, DFA Development, San Diego, California. Dudek was retained by DFA Development to prepare a Historic Properties Inventory Report for the project, which proposes to develop a 68-unit, affordable senior housing community located in the Hillcrest neighborhood of San Diego. The project site is partially developed with existing buildings for preschool services associated with the adjacent University Christian Church and a parking lot. The project is proposing to receive U.S. Department of Housing and Urban Development project vouchers issued to the San Diego Housing Commission and is therefore required to undergo a National Environmental Policy Act (NEPA) analysis for receiving federal funding. Acting as architectural historian, co-authored the technical report and conducted a pedestrian survey of the site. (2020–2021)

Sycuan Fee to Trust Project, Sycuan Band of the Kumeyaay Nation Reservation, Unincorporated San Diego County, California. The Sycuan Band of the Kumeyaay Nation Reservation retained Dudek to complete a Historic Properties Inventory and Evaluation Report for the proposed project, located within the vicinity of El Cajon, California, in unincorporated San Diego County. The project proposes a fee-to-trust transfer of five parcels that cumulatively total approximately 40 acres. The transfer of land from the Sycuan Band to the Bureau of Indian Affairs (the federal lead agency) would include several parcels. Dudek's report included development of a project APE map; the relevant results of a California Historical Resources Information Systems records search and background research; a pedestrian survey of the APE for built environment resources; and a historical significance evaluation of all properties more than 50 years of age within the APE, in consideration of potential adverse effects to historic properties under Section 106 of the National Historic Preservation Act. The evaluation found that Properties 1, 2, 4, and 5 were not eligible for the NRHP at the individual level or as part of a larger historic district. As a result, no historic properties were identified within the APE, and Dudek recommends a finding of No Historic Properties Affected. As architectural historian, conducted background research and a pedestrian survey. (2021)

Southern First Aqueduct Structures Rehabilitation Project, San Diego County Water Authority, California. Dudek was retained by the San Diego County Water Authority to conduct a Phase I Cultural Resources (including both archaeological and built environment) Inventory for the Southern First Aqueduct Rehabilitation Project, located along a 21-mile stretch of the First San Diego Aqueduct, east of Interstate 15 from the City of Escondido in the north to the Goodan Ranch/Sycamore Canyon County Preserve west of San Vicente Reservoir. As part of this effort, the San Diego Water Authority will be applying for a Letter of Permission under its Programmatic Master Plan Permit with the United States Army Corps of Engineers, pursuant to Section 404 of the Clean Water Act. The United States Army Corps of Engineers is the federal lead agency responsible for overseeing compliance with Section 106 of the National Historic Preservation Act, as this project is exempt from review under CEQA. Acting as architectural historian, co-authored the Phase I Cultural Resources Inventory Report and authored the analysis of potential adverse effects. (2021)

Enclave at Ivanhoe Ranch Project, Vance & Associates, Rancho San Diego, California. Dudek was retained by Vance & Associates to complete a Historical Resources Technical Report in support of the proposed project, a residential development project. The project site totals approximately 121.9 acres in Rancho San Diego. Included in the project site is a historic-era complex of horse ranch buildings and accompanying residences, located at 3256, 3261, 3263, 3267, and 3269 Ivanhoe Ranch Road (APNs 518-030-41, 518-030-43, 518-030-44, and 518-030-45), which were evaluated for historical significance. This study was conducted in accordance with Section 15064.5(a)(2)-(3) of CEQA guidelines, and the project site was evaluated in consideration of NRHP, CRHR,

and County of San Diego Historic Preservation Ordinance and resource protection ordinance requirements. Acting as architectural historian, co-authored the technical report and conducted a pedestrian survey of the site. (2020)

Shawnee/CG7600 Master Plan Redevelopment Project, Palmer Mission Gorge Properties, LP, San Diego, California. Dudek was retained by Palmer Mission Gorge Properties, LP, to conduct a Potential Historical Resource Review (in accordance with Information Bulletin 580) for four properties more than 45 years old within the City of San Diego. Acting as architectural historian, conducted a photographic survey of the four properties within the project site. Updated three 2011 DPR Series 523 Forms and created a new DPR form for a previously unrecorded property within the project site. (2020)

University of California (UC) San Diego, Future College Living and Learning Neighborhood, UC San Diego Campus Planning Office, California. Dudek was retained by UC San Diego Campus Planning Office to conduct a visual analysis for the proposed project, which would consist of five housing buildings providing an additional 2,000 beds to serve the student population of the UC San Diego campus. As architectural historian, conducted a field visit to gain a better understanding of the visual environment of the project site and surrounding area. (2020)

Historic Context Statement for Reservoirs, City of San Diego Public Utilities Department, California. Dudek was retained by the City of San Diego Public Utilities Department to complete a survey and historic context statement for the City's surface water storage system, including 10 dam complexes and the Dulzura Conduit. Dudek also prepared detailed impacts assessments for proposed modification to dams, as required by the Department of Safety of Dams. The project involves evaluation of 10 dam complexes and conduit for historical significance in consideration of NRHP, CRHR, and City designation criteria and integrity requirements. The evaluation required extensive archival research and a pedestrian survey. Acting as architectural historian, evaluated five resources, including the Dulzura Conduit, Upper Otay Dam, Murray Dam, Sutherland Dam, and Miramar Dam. (2020)

Mira Mesa Community Plan Area Historic Context Statement and Focused Reconnaissance Survey, City of San Diego, California. Dudek was retained by the City of San Diego to prepare a historic context statement identifying the historical themes and associated property types important to the development of Mira Mesa, accompanied by a reconnaissance-level survey report focused on the master-planned residential communities within the Mira Mesa Community Plan Area (CPA). This study was completed as part of the comprehensive update to the Mira Mesa CPA and Programmatic Environmental Impact Report. While the historic context statement addressed all development themes and property types within the community, the scope of the survey was limited to residential housing within the CPA constructed between 1969 and 1990. Acting as architectural historian, co-authored and completed the historic context statement, the survey document, and all associated archival research efforts. (2020–Present)

University CPA Historic Context Statement and Focused Reconnaissance Survey, City of San Diego, California. Dudek was retained by the City of San Diego to prepare a historic context statement identifying the historical themes and associated property types important to the development of the University CPA, accompanied by a reconnaissance-level survey report focused on the master-planned residential communities within the University CPA. This study was completed as part of the comprehensive update to the University CPA and Programmatic Environmental Impact Report. While the historic context statement addressed all development themes and property types within the community, the scope of the survey was limited to residential housing within the CPA constructed between the 1960s and 1990s. Acting as architectural historian, co-authored and completed the historic context statement, the survey document, and all associated archival research efforts. (2020–Present)

Allison Lyons, MSHP

SENIOR ARCHITECTURAL HISTORIAN

Education

Columbia University, MS, Historic Preservation, 2010

Scripps College, BA, European Studies, 2006

Allison Lyons (*AL-ih-suhn LYE-ons; she/her*) is an architectural historian with 12 years' experience throughout the western United States in all elements of cultural resources management. Her expertise includes the preparation of environmental compliance documents in accordance with the California Environmental Quality Act (CEQA) and Section 106 of the National Historic Preservation Act, focusing on the evaluation of historical resources and analysis of project impacts. As a historic preservation consultant, she has been involved in the preparation of numerous large-scale historic resources surveys, Historic American Buildings Survey/Historic American Engineering Record recordation, Federal Rehabilitation Tax Credit and Mills Act Historic Property Contract applications, local landmark nominations, and evaluations of eligibility for a wide variety of projects and property types throughout California. She is highly experienced in writing National Register of Historic Places (NRHP) nominations and historic context statements for local governments.

Ms. Lyons meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to Title 36, Part 61, of the Code of Federal Regulations, Appendix A.

Selected Experience

City of Coronado Historic Context Statement and Historic Resources Inventory, City of Coronado, California. Dudek is currently in the process of preparing a historic context statement and historic resources inventory survey for all properties at least 50 years old within City of Coronado limits. Following current professional methodology standards and procedures developed by the California Office of Historic Preservation and the National Park Service, Dudek developed a detailed historic context statement for the City that identifies and discusses the important themes, patterns of development, property types, and architectural styles prevalent throughout the City. Dudek also conducted a reconnaissance-level survey of all properties within City limits that are at least 50 years old to identify individual properties and groupings of properties (i.e., historic districts) with potential for historical significance under City Criterion C (properties that possess distinctive characteristics of an architectural style; are valuable for the study of a type, period, or method of construction; and have not been substantially altered). This document also developed registration requirements for resource evaluation that are specific to Coronado, in consideration of both historical significance and integrity requirements. Acting as senior architectural historian, reviewed and authored sections of the historic context statement. (2019–Present)

As-Needed Historic Research Consultant On Call Services, Coronado, California. Dudek is currently working with the City of Coronado Community Development Department to provide historic preservation services on an as-needed basis. Services scoped under the current contract include historic resources surveys; archival research; preparation of evaluation reports in consideration of National Register of Historic Places, California Register of Historical Resources, and City of Coronado designation criteria; attendance at Historic Resource Commission and City Council hearings; and review of projects for conformance with the Secretary of the Interior's Standards for Rehabilitation. Since January 2019, Dudek has completed 20 work orders for the city. Ms. Lyons serves as a

senior architectural historian for the historical resource evaluation task orders and is responsible for quality assurance/quality control of specific deliverables. (2021–Present)

Los Angeles Department of Water and Power Century Trunk Line, Los Angeles Department of Water and Power, City of Los Angeles, California. Dudek was retained by Los Angeles Department of Water and Power to prepare an Avoidance and Protection Plan for Air Raid Siren No. 150. The resource is eligible for the NRHP and California Register of Historical Resources and as a City of Los Angeles Historic-Cultural Monument under Criteria A/1/1 and C/3/3 for its association with World War II and Cold War military infrastructure, and is a historical resource under CEQA. Ms. Lyons is serving as a senior architectural historian, providing quality assurance/quality control for the Post-Construction Monitoring Report. (2021–Present)

8730 Sunset Boulevard Billboard Project Historical Resource Assessment Report, City of West Hollywood, California. The 8730 Sunset Boulevard Billboard Project consists of installation and operation of a new billboard and associated façade improvements at the existing "Sunset Towers" building. The Sunset Towers building at 8730 Sunset Boulevard was constructed in the 1950s and 1960s over the course of two phases. A smaller building was constructed on the northern portion of the parcel between 1957 and 1959. Dudek was retained by the City of West Hollywood to complete this Historic Resource Assessment, an intensive-level evaluation, as part of the environmental review of the proposed project in compliance with CEQA. This study included an intensive survey of the exterior of the Sunset Towers building by a qualified architectural historian; building development and archival research; development of an appropriate historic context; and evaluation of the Sunset Towers building for historical significance and integrity in consideration of NRHP, CRHR, and City of West Hollywood Cultural Heritage Preservation Ordinance designation criteria. Ms. Lyons served as a senior architectural historian and main author of the Historic Resource Assessment of the Sunset Towers building. (2021)

676 Moss Street Redevelopment Site Historical Resource Evaluation and Impacts Analysis (for CEQA), Chula Vista, California. Ms. Lyons completed a historical resource evaluation and impacts analysis for a redevelopment site of industrial buildings in Chula Vista. She also identified the potential for the project to cause indirect and/or cumulative impacts to adjacent historical resources. (2020)

North Beach Historic District National Register of Historic Places Nomination and Plaque Program, San Clemente, California. Founded in 1925, San Clemente was one of the first new master-planned towns in California. The North Beach Historic District occupies a prominent location as the historic northern tip of the City of San Clemente along North El Camino Real. The North Beach Historic District was listed on the National Register of Historic Places at the local level of significance under Criterion A in the areas of Community Planning and Development and Entertainment/Recreation. The district features five historic contributing resources designed in the Spanish Colonial Revival style with a period of significance between 1927-1946. Ms. Lyons served as project manager for the National Register of Historic Places nomination of the district and a concurrent, Certified Local Government (CLG) grant-funded project with the City of San Clemente to create content and designs for signage across the district and informational postcards featuring historic images. (2020)

Athens Park Aquatics Facility Renovation Project Historical Resource Treatment Plan and Impacts Analysis (Secretary of the Interior's Standards Compliance Review), Los Angeles, California. The County of Los Angeles proposed a rehabilitation project at the Aquatics Facility at Athens Park, a park determined eligible for listing in the National Register of Historic Places. Ms. Lyons worked with the architect for the project on two phases of work. In advance of the development of project plans, Ms. Lyons prepared a Preservation Plan for the Aquatics Facility to establish the opportunities and constraints for the rehabilitation. After project plans were prepared, Ms. Lyons reviewed the project plans for compliance with the Secretary of the Interior's Standards for Rehabilitation and made recommendations for modifications to ensure the project plans complied with the Standards. (2020–2021)

Long Beach Airport Section 106 Review, Historic Property Evaluation Report, Long Beach, California. The Long Beach Airport Terminal Area Improvement Project is a multi-phase project that includes the construction of buildings and structures surrounding the existing passenger Terminal Building. The project includes the rehabilitation of the Terminal Building in compliance with the Secretary's Standards for the Treatment of Historic Properties. Ms. Lyons prepared a Historic Property Evaluation Report for Long Beach Airport Terminal Building, seeking State Historic Preservation Officer concurrence on the Area of Potential Effects (APE) for airport and assessment of impacts for the rehabilitation of the historic Terminal Building. Additional work in subsequent phases of the project included additional assessment of impacts for the Quick-Turnaround rental car lot. (2018–2020)

SurveyLA, Los Angeles Citywide Historic Context Statement, Los Angeles, California. Los Angeles's citywide historic context statement provides the framework for identifying and evaluating the City's historic resources. The document, created as part of SurveyLA, identifies important themes in the City's history and development. In addition to work on the fieldwork surveys, Ms. Lyons conducted research and authored several themes within the context. She was the lead author for two themes addressing architectural styles and all sub-themes: "Period Revival, 1919-1950" and "Late 19th and Early 20th Century Residential Architecture, 1865-1950." She also contributed to themes developed for two ethnic and cultural communities in Los Angeles. For the "African-Americans in Los Angeles" theme she wrote sub-themes on "Health and Medicine" and "Social Clubs." For the theme addressing "Jews in Los Angeles," she wrote sub-themes on "Religion and Spirituality," "Social Clubs," and the "Entertainment Industry." Ms. Lyons also peer-reviewed "American Colonial Revival, 1895-1960." During Group 1 surveys she identified and named a sub-theme "Asian Eclectic, 1920-1980," which was later developed for the "Exotic Revival, 1900-1980" theme. (2015–2019)

Angel's Landing Redevelopment Site Historical Resource Evaluation and Impacts Analysis (for CEQA), Los Angeles, California. Ms. Lyons worked with attorneys for the development team behind Angel's Landing, a proposed 64-story skyscraper and a 42-story high-rise located between Bunker Hill and the Historic Core of downtown Los Angeles. Ms. Lyons prepared a historic resource evaluation and impacts analysis for the vacant project site. The evaluation involved the identification of historical resources in the vicinity and assessment of impacts on numerous adjacent historical resources and historic districts listed on the NRHP, including Angel's Flight funicular railway and the Broadway Theater and Commercial District. (2018–2020)

Artisan, 1520 Ivar Avenue Redevelopment Site Historical Resource Evaluation and Impacts Analysis (for CEQA), Los Angeles, California. The Artisan project involved the construction of a 25-story residential and commercial tower in the center of Hollywood. The project site was mostly a vacant surface parking lot. Ms. Lyons verified that the project site did not contain historic resources and would not have a significant impact on adjacent properties identified as historic resources. Ms. Lyons prepared a Historic Resource Evaluation Report and analysis of project impacts using the Secretary of the Interior's Standards. She also participated in public outreach with Hollywood Heritage. (2018–2021)

Vista Irrigation District Reservoirs E2 and F Historical Resource Evaluation Historical Resource Evaluation Report, Vista, California. Ms. Lyons evaluated components of a historic irrigation district in northern San Diego County. Two concrete reservoirs dating to the early twentieth century were recorded and evaluated for historical significance. The significance evaluation included conducting fieldwork and archival research for the reservoirs and completion of a historic context. The reservoirs were evaluated for historical significance and determined not eligible for inclusion in the National Register of Historic Places, California Register of Historic Resources, or the County Register. (2015)

James K. Van de Kamp (La Loma Road) Bridge Rehabilitation Historic American Engineering Record (HAER)-like documentation, Pasadena, California. Ms. Lyons prepared a Historic American Engineering Record (HAER) report

for the historic La Loma Road bridge in the Arroyo Parks and Recreation National Register Historic District. The report was completed as mitigation in compliance with Section 106. Ms. Lyons' contributions included the preparation of a written historical and descriptive data report as well as coordinating the photographic documentation. Since renamed the John K. Van de Kamp Bridge, the project received a Preservation Design Award from the California Preservation Foundation and a Historic Preservation Awards from the City of Pasadena's Historic Preservation Commission. (2015)

Sunkist Building Historical Resource Treatment Plan and Impacts Analysis (Secretary of the Interior's Standards Compliance Review), Los Angeles, California. The Sunkist Building was designed by the master architecture firm A.C. Martin and Associates in 1970. The distinctive brutalist building is shaped like an inverted pyramid and surrounded by expansive surface parking lots. As part of a proposed residential development for the parking lots, Ms. Lyons completed a historic resource evaluation of the Sunkist Building and analyzed the impacts of new buildings proposed as part of the site redevelopment plan. Ms. Lyons participated in substantial design collaboration with the development team. (2013–2015)

Subject: Re: Historical Resources Impacts for 12702 Oak Knoll Rd, Poway

Hello Allison, nice to meet you. (And Hello again to Ranie and Chuck — have not talked with you two in a long time!)

Of course, I am not a branch of the Poway Planning Department, but I am flattered that David directed you to me for an opinion. Based on the historic structure inventory we did for the City 30 + years ago, we know that the Big Stone and Cobblestone architectural styles are significant to the historic fabric of Poway. Even in a modified state, most cobblestone structures built following the Great Depression have sufficient commonality in characteristics that they contribute to a poorly-defined historical district in the southwest portion of the City. I'm not sure I understand if you have made a determination about the historic significance of the structure, but I would certainly regard it as important and a contributing element to the City's history. Regarding the question about sufficient buffer between the historic structure and a new development, the key is the potential to impact the integrity of setting. If another multi-story apartment complex is planned directly behind the residence, then you would need to address the loss of integrity of setting. Any proposed buffer is subjective, but I would suggest that a visual buffer of trees might separate the structure from the new mass of building that I assume is planned.

If Lennar (David Shepherd) would like to retain BFSA to assist with any City discussions or provide additional assistance with the historic issue, just let me know. Always glad to help.

Regards,

Brian

Caution! This message was sent from outside your organization. Allow sender | Block sender

Brian,

David De Vries asked Dudek to reach out to you about next steps for a project that includes a Poway Historic Site List property: the Harmon House or Stone House, located at 12702 Oak Knoll Rd. The building was constructed 1933-1940. A rear addition was constructed c. 1974. We are trying to determine an appropriate buffer or distance from the rear addition to proposed new construction.

Dudek evaluated the property and found that it meets City of Poway **Category C**: Structures, buildings, sites, or objects in this category must have one of the following characteristics:

1. It is a good example of a period of architecture design or construction; however, the design is more commonplace and there are many similar structures, buildings, sites or objects in the City;
2. It is an important resource; however, substantial alterations have severely compromised its historic, cultural, or architectural significance.

David De Vries has advised us to notify you and the Poway Historical Society of our finding.

Our understanding is that Category C corresponds to a status code of **6Z**. If so, we do not need to review project plans for impacts to a historical resource (as there are no historical resources). Can you please let us know if you have availability to discuss next steps for our project review?

Thank you,

Allison Lyons

Subject: Cultural Resource Inventory Report for the Harmon Ranch Project, City of Poway, California

Dear Mr. Shepherd,

This letter documents the positive cultural resources inventory conducted by Dudek for the Harmon Ranch Project (Project), located in the City of Poway, San Diego County, California (Figure 1, Project Location). The City of Poway (City) is the Lead Agency for compliance with the California Environmental Quality Act (CEQA). This report was prepared by Dudek Archaeologist Matthew DeCarlo, MA, who meets the Secretary of the Interior's standards for archaeology.

Dudek previously completed a cultural resources constraints analysis for the Project (DeCarlo et al. 2021), the results of which were used to construct this cultural resources inventory. A South Coastal Information Center records search (June 2021) identified that two previously recorded cultural resources have been recorded within the Project's area of potential effect (APE). The records search revealed that both resources within the Project APE have been previously evaluated and found not significant under CEQA. Neither a Native American Heritage Commission (NAHC) Sacred Lands File search nor Native American outreach letters indicate the presence of any specific tribal cultural resources (TCRs) or sacred sites within the Project APE. An intensive pedestrian survey in April 2022 did not identify any archaeological resources within the Project APE; however, four historic age buildings constructed over 45 years ago are within or directly adjacent to the Project APE. Due to the age of the four identified buildings, they are potentially historical resources and will be evaluated in a separate built environment report.

Though the Project APE has been highly disturbed and the NAHC and pedestrian survey were negative for archaeological resources or TCRs, the records search revealed that two resources intersect the Project APE: P-37-008245 and P-37-016042. Both resources were archaeologically tested and found to be not significant under CEQA within the Project APE. Though recommended not significant with the Project APE, there is an increased potential that ground disturbance will encounter buried cultural resources. As such, Dudek recommends cultural monitoring during initial ground disturbing activities.

Project Description and Location

The Project proposes the development of a 11.5-acre property into a residential development with 64 single-family detached homes (Figure 2, Project Site). The Proposed Project also includes 40 guest parking spaces along the private streets, approximately 0.9 acres of Open Space Recreation areas, approximately 2.2 acres of natural Open Space areas and a segment of the General Plan Community trail (approximately 1,000 feet) connecting the

Project Site to the adjacent retail area located to the north. The "Overlook" area located in the south portion of the Project Site is planned to provide public access and will be privately maintained. Primary access to the Project Site is planned via existing Oak Knoll Road and emergency access is planned via the extension of existing Roca Grande Drive. Sixty of the homes are proposed to front newly constructed private streets, while four homes and an open space/overlook area front existing Oak Knoll Road. The Applicant is proposing a Specific Plan and Tentative Map to facilitate development of a 64 single family homes. The Harmon Ranch Specific Plan will establish three land use districts within the Project Site: Residential Single Family (R-S); Open Space (OS); and Open Space Recreation (OS-R). The Specific Plan will also provide development regulations and permitted uses for each land use district.

The current property owner is Harmon Family Trust. The majority of the site has been cleared for several years and was previously used as a construction staging yard for an SDG&E gas line project. The site includes four existing single-family residences. One of the existing homes is a locally designated historic building located at 12702 Oak Knoll Road (APN 317-500-14-00). The historic building was built in 1933 and is constructed of cobblestones. The building is presently designated as City of Poway Historical Site 113 and is documented and known as the "Harmon House." The historic building will be retained in place outside of the Specific Plan Area. Because the historic home is currently within the legal parcel proposed as part of the Specific Plan, the Applicant and Property Owner will concurrently process a Lot Line Adjustment Plat with the Specific Plan and Tentative Map to separate the 0.25-acre historic home site from the Specific Plan Area boundary.

The Project APE is located in the City of Poway, San Diego County, and is located on Oak Knoll Road between Pomerado Road and Carriage Road. The 10.72-acre Project APE is divided into two parts; the larger parcel is located north of Oak Knoll Road and the smaller parcel is located south of Oak Knoll Road. The Project APE is mapped within Section 14 of Township 14 South, Range 2 West on the U.S. Geological Survey 7.5-minute Poway Quadrangle.

Regulatory Background

The City is the Lead Agency for compliance with CEQA. This study is compliant with cultural resource regulations that apply to the Project APE including provisions for the California Register of Historic Resources (CRHR), the California Native American Graves Protection and Repatriation Act, CEQA, California Health and Safety Code Section 7050.5, Senate Bill 18 (SB 18), Assembly Bill 52 (AB 52), and the City's General Plan.

State Level Regulations

The California Register of Historic Resources (California Public Resources Code Section 5020 et seq.)

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code Section 5020.1[j]). In 1992, the California legislature established CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1[a]). A resource is eligible for

listing in the CRHR if the State Historical Resources Commission determines that it is a significant resource and that it meets any of the following National Register of Historic Places (NRHP) criteria (California Public Resources Code Section 5024.1[c]):

1. Associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Resources less than 50 years old are not considered for listing in the CRHR, but may be considered if it can be demonstrated that sufficient time has passed to understand the historical importance of the resource (see 14 CCR 4852[d][2]).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing on the NRHP are automatically listed on the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys. The State Historic Preservation Officer maintains the CRHR.

Native American Historic Cultural Sites (California Public Resources Code Section 5097 et seq.)

State law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. In addition, the Native American Historic Resource Protection Act makes it a misdemeanor punishable by up to 1 year in jail to deface or destroy a Native American historic or cultural site that is listed or may be eligible for listing in the CRHR.

California Environmental Quality Act

As described further below, the following CEQA Statute and Guidelines are of relevance to the analysis of archaeological and historic resources:

1. California Public Resources Code Section 21083.2(g): Defines "unique archaeological resource."

   California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define historical resources. In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource;" it also defines the circumstances when a project would materially impair the significance of a historical resource.

2. California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5(e): Set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.

3. California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4: Provide information regarding the mitigation framework for archaeological and historic resources, including options of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; 14 CCR 15064.5[b]). If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1[q]), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; 14 CCR 15064.5[a]). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; 14 CCR 15064.5[a]).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5[b][1]; California Public Resources Code Section 5020.1[q]). In turn, the significance of a historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County coroner has examined the remains (Section 7050.5b). If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Section 7050.5c). The NAHC will notify the most likely descendant. With the permission of the landowner, the most likely descendant may inspect the site of discovery. The inspection must be completed within 24 hours of notification of the most likely descendant by the NAHC. The most likely descendant may

recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Senate Bill 18

Senate Bill 18 amended Section 65351 of the Government Code and dictates the following:

During the preparation or amendment of the general plan, the planning agency shall provide opportunities for the involvement of citizens California Native American Indian tribes, public agencies, public utility companies, and civic, education, and other community groups, through public hearings and any other means the city or county deems appropriate.

Assembly Bill 52

California Assembly Bill 52, which took effect July 1, 2015, establishes a consultation process between California Native American tribes and lead agencies in order to address tribal concerns regarding project impacts and mitigation to TCRs. California Public Resources Code Section 21074(a) defines TCRs and states that a project that has the potential to cause a substantial adverse change to a TCR is a project that may have an adverse effect on the environment. A TCR is defined as a site, feature, place, cultural landscape, sacred place, and object with cultural value to a California Native American tribe that is either:

1. listed or eligible for listing in the CRHR or a local register of historical resources, or
2. determined by a lead agency to be a TCR.

Traditional Cultural Properties

Native American Heritage Values

Federal and state laws mandate that consideration be given to the concerns of contemporary Native Americans with regard to potentially ancestral human remains, associated funerary objects, and items of cultural patrimony. Consequently, an important element in assessing the significance of the study site has been to evaluate the likelihood that these classes of items are present in areas that would be affected by the proposed Project.

Also potentially relevant to prehistoric archaeological sites is the category of traditional cultural properties in discussions of cultural resource management performed under federal auspices. According to Parker and King (1998), “traditional” in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property is derived from the role the property plays in a community’s historically rooted beliefs, customs, and practices. Examples of properties possessing such significance include:

1. A location associated with the traditional beliefs of a Native American group about its origins, its cultural history, or the nature of the world;
2. A rural community whose organization, buildings and structures, or patterns of land use reflect the cultural traditions valued by its long-term residents;
3. An urban neighborhood that is the traditional home of a particular cultural group, and that reflects its beliefs and practices;

4. A location where Native American religious practitioners have historically gone, and are known or thought to go today, to perform ceremonial activities in accordance with traditional cultural rules of practice; and
5. A location where a community has traditionally carried out economic, artistic, or other cultural practices important in maintaining its historic identity.

Guidelines for Determining Significance

According to CEQA (Section 15064.5b), a project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. CEQA defines a substantial adverse change as the following:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

The significance of an historical resource is materially impaired when a project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR; or
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

Section 15064.5(c) of CEQA applies to effects on archaeological sites and contains the following additional provisions regarding archaeological sites:

- When a project will impact an archaeological site, a lead agency shall first determine whether the site is an historical resource, as defined in subsection (a).
- If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of Section 21084.1 of the Public Resources Code, and this section, Section 15126.4 of the Guidelines, and the limits contained in Section 21083.2 of the Public Resources Code do not apply.
- If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the Public Resources Code, the site shall be treated in accordance with the provisions of section 21083.2. The time and cost limitations described in Public Resources Code Section 21083.2 (c–f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.

- If an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment. It shall be sufficient that both the resource and the effect on it are noted in the Initial Study or Environmental Impact Report (EIR), if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

Sections 15064.5(d) and (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

> When an initial study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the Native American Heritage Commission as provided in Public Resources Code SS5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the Native American Heritage Commission. Action implementing such an agreement is exempt from:
>
> 1. The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5); and
> 2. The requirement of CEQA and the Coastal Act.

Under CEQA, an EIR is required to evaluate any impacts on unique archaeological resources (California Public Resources Code Section 21083.2.) A "unique archaeological resource" is defined as (California Public Resources Code Section 21083.2[g]):

> An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
>
> 1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
> 2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
> 3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

An impact to a non-unique archaeological resource is not considered a significant environmental impact and such non-unique resources need not be further addressed in the EIR (California Public Resources Code Section 21083.2[a]; 14 CCR 15064.5[c][4]).

As stated above, CEQA contains rules for mitigation of "unique archaeological resources." For example:

> if it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. Examples of that treatment, in no order of

preference, may include, but are not limited to, any of the following (California Public Resources Code Section 21083.2[b][1]-[4]):

1. Planning construction to avoid archaeological sites.
2. Deeding archaeological sites into permanent conservation easements.
3. Capping or covering archaeological sites with a layer of soil before building on the sites.
4. Planning parks, greenspace, or other open space to incorporate archaeological sites.

California Public Resources Code Section 21083.2(d) states that "excavation as mitigation shall be restricted to those parts of the unique archaeological resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a unique archaeological resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource, if this determination is documented in the environmental impact report."

The rules for mitigating impacts to archaeological resources that qualify as "historic resources" are slightly different. According to CEQA Guidelines Section 15126.4(b), "public agencies should, whenever feasible, seek to avoid damaging effects on any historic resource of an archaeological nature. The following factors shall be considered and discussed in an EIR for a project involving such an archaeological site:

A. Preservation in place is the preferred manner of mitigating impacts to archaeological sites. Preservation in place maintains the relationship between artifacts and the archaeological context. Preservation may also avoid conflict with religious or cultural values of groups associated with the site.
B. Preservation in place may be accomplished by, but is not limited to, the following:
    1. Planning construction to avoid archaeological sites;
    2. Incorporation of sites within parks, greenspace, or other open space;
    3. Covering the archaeological sites with a layer of chemically stable soil before building tennis courts, parking lots, or similar facilities on the site[; and]
    4. Deeding the site into a permanent conservation easement."

Thus, although Section 21083.2 of the California Public Resources Code, in addressing "unique archaeological sites," provides for specific mitigation options "in no order of preference," CEQA Guidelines Section 15126.4(b), in addressing "historical resources of an archaeological nature," provides that "preservation in place is the preferred manner of mitigating impacts to archaeological sites."

Under CEQA, "when data recovery through excavation is the only feasible mitigation," the lead agency may cause to be prepared and adopt a "data recovery plan" prior to any excavation being undertaken. The data recovery plan must make "provision for adequately recovering the scientifically consequential information from and about the historic resource" (14 CCR 15126.4[b][3][C]). The data recovery plan also "must be deposited with the California Historical Resources Regional Information Center" (14 CCR 15126.4[b][3][C]). Further, "if an artifact must be removed during project excavation or testing, curation may be an appropriate mitigation" (14 CCR 15126.4[b][3][C]). However, "data recovery shall not be required for an historical resource if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the archaeological or historic resource, provided that determination is documented in the EIR and that the studies are deposited with the California Historical Resources Regional Information Center" (14 CCR 15126.4[b][3][D]).

City of Poway Cultural Resources Guidelines

Poway General Plan

Goal IV of the City of Poway's General Plan (City of Poway 1991) is to preserve the City's cultural resources for the future benefit and enjoyment of its residents. Policy D states that "Archaeological resources are an important part of our heritage and should be preserved and protected." Strategies include the following (City of Poway 1991):

1. Archaeological guidelines for the treatment of archaeological resources discovered during the environmental review process shall be implemented. These guidelines are on file at the City of Poway.
2. The City shall require that all artifacts recovered from sites within Poway during environmental impact studies be presented to the City for permanent curation. This is also recommended for the sphere of influence. The City shall designate a repository for the artifacts or direct that a suitable structure be built or converted within the City boundaries to house the collections. The City shall ensure the proper treatment of the artifacts by selecting an archaeologist historian to define the necessary elements for curation of specimens as outlined by the National Park Service. If the City cannot designate a facility to curate the artifacts, then an agreement could be reached with the Poway Historical Society or the San Diego Archaeological Society to temporarily curate the artifacts.
3. Consider mitigation alternatives which include "in kind" measures that provide unusual or more beneficial results than the mitigation measures listed in the City archaeological/historical guidelines.
4. Maintain a listing of significant prehistoric sites and document the locations of all open space easements that include archaeological sites. These easements have been granted to protect resources however without acknowledging the locations of such easements the success of the use of such easements for resource protection cannot be assured. The City should conduct a research effort to determine where easements for archaeological sites are located especially those easements which were inherited from the County of San Diego when the city was incorporated.

Municipal Code

Chapter 17.45 of the City's Municipal Code describes the City's cultural resources regulatory framework (City of Poway 2022). The City's planning goals and policies aim to "protect, enhance and perpetuate historic/cultural resources, sites, and districts that represent or reflect elements of the City's cultural, social, economic, political and architectural history for the public health, safety and welfare of the people of the City" and to "permit historic sites to be identified, documented, and recorded by written and photographic means and allow an opportunity for voluntary preservation of historic sites, all without infringing on the ability and right of a property owner to control the use of property or structures" (City of Poway 2022).

South Coastal Information Center Records Search

Dudek requested a records search of data on file at the South Coastal Information Center for the Project APE and a 1-mile buffer on June 8, 2021. The purpose of the records search is to identify any previously recorded cultural resources that may be located within the property. In addition to a review of previously prepared EIRs, permit application packages, site records, and reports, the records search also reviewed historical maps of the Project APE and vicinity, ethnographies, the NRHP, the CRHR, the Built Environment Resources Directory, and the lists of

California State Historical Landmarks, California Points of Historical Interest, and Archaeological Determinations of Eligibility. Dudek received the results of the records search on June 10, 2021. The results of the records search are included in Confidential Appendix A.

Previously Recorded Cultural Resources

The records search identified 16 cultural resources within 1 mile of the Project APE, two of which intersect the current Project APE. Brief discussions of these two intersecting resources, P-37-008245 and P-37-016042, are included below. Table 1 summarizes the cultural resources within 1 mile of the Project APE.

Table 1. Cultural Resources Previously Identified within 1 Mile of Project APE

Primary No	Trinomial	Era	Description
Intersects Project APE			
P-37-008245	CA-SDI-8245	Prehistoric	Milling station and campsite
P-37-016042	CA-SDI-14605/H	Historic	Cistern filled with refuse
Within 1-Mile of Project APE			
P-37-000012	CA-SDI-2	Prehistoric	Bedrock milling and artifact scatter
P-37-000592	CA-SDI-592	Prehistoric	Bedrock milling, petroglyphs, and artifact scatter
P-37-004512	CA-SDI-4512	Prehistoric	Bedrock milling, hearths, and artifact scatter
P-37-004633	CA-SDI-4633	Prehistoric	Bedrock milling, hearths, and artifact scatter
P-37-006083	CA-SDI-6083	Prehistoric	Bedrock milling and artifact scatter
P-37-006665	CA-SDI-6665	Prehistoric	Artifact scatter
P-37-006666	CA-SDI-6666	Prehistoric	Bedrock milling and lithic scatter
P-37-011481	CA-SDI-11481	Prehistoric	Bedrock milling feature and lithic scatter
P-37-018285	CA-SDI-15547	Prehistoric	Habitation site
P-37-027171	—	Historic	Water tank
P-37-033470	—	Historic	Dirt road
P-37-033481	CA-SDI-21057	Prehistoric	Bedrock milling
P-37-033557	—	Historic	Old Highway 395
P-37-035873	—	Historic	Structure refuse

P-37-008245/CA-SDI-8245

This site was originally recorded by Gary Fink in 1975 as a "knoll top milling station and campsite." Fink (1975) recorded extensive midden concentrated near the top of the east side of the knoll but noted "midden scatter" on parts of the knoll's slopes. The original record identified seven mortar holes, three slicks, two basins, one "mini-mortar, and scattered flakes and tools. A portion of the site was tested by Affinis in 1990 by excavating an undisclosed number of shovel test pits, which found archaeological deposits extending below 60 centimeters (Affinis 1990). Affinis noted that the portion of the resource that is now within the current Project APE was previously farmed and highly disturbed.

In 1991, Brian F. Smith and Associates evaluated P-37-008245 with a series of excavated trenches. Finding the resource significant, a data recovery program was initiated that included excavation of two 3 x 3 meter block units

and four 1 x 1 meter units within the current Project APE. Brian F. Smith and Associates reported that the data recovery program resulted in the successful excavation of a representative sample of the site, determined the site function, curated nearly 3,000 artifacts for future study, and "generally exhausted the research potential" of the portion of the resource within the current Project APE. Brian F. Smith and Associates recommended that a cultural resource monitoring program be implemented during construction grading.

Though P-37-008245 is considered significant under CEQA and intersects the current Project APE, the portion of the resource that intersects the APE has previously undergone data recovery to mitigate potentially adverse impacts to the periphery of the resource mitigation. The portion of P-37-008245 that intersects the Project APE lacks research potential and is unlikely to pose any substantial archaeological constraint to the Project.

P-37-016042/CA-SDI-14605/H

This resource was identified in 1998 during the grading of an empty lot and consists of a historic cistern filled with refuse (Kirkish 1998). The refuse included household goods, automobile items, building materials, and personal items. A few prehistoric artifacts were also identified on the lot but appeared to have been displaced from fill soils used during the construction of the previous residence. The systematic recovery of cultural material from the feature and trash scatter exhausted the data potential of the site and avoidance of the resource is not necessary. This resource was identified within the current Project APE.

Previous Cultural Resource Studies

The records search identified 72 previous studies that have been performed within 1 mile of the Project APE. Five of these studies have addressed at least a portion of the Project APE; however, the entire Project APE has not been previously surveyed. These previous studies were conducted between 1990 and 2000 and are not considered current. One study, SD-2207, encompasses all of the Project APE north of Oak Knoll Road, the findings of which are discussed below. Table 2 in Confidential Appendix A summarizes all 72 previous cultural resources studies within 1 mile of the Project APE.

SD-02207

Brian F. Smith and Associates (1991) conducted evaluation testing and a data recovery program for portions of archaeological site P-37-008245/CA-SDI-8245. As described above, P-37-008245 consists of prehistoric bedrock milling, artifact scatter, and rich midden soil located primarily on a knoll top. This data recovery program was conducted to mitigate potentially adverse impacts to the periphery of the resource. The portions of P-37-008245 that were tested by Brian F. Smith and Associates are the same portions of the resource that are within the current Project APE.

Brian F. Smith and Associates' (1991) site testing included the excavation of a series of subsurface trenches to assess the size and depth of the archaeological deposit. This testing determined that the site was "important," but that the portions of the site within the current Project APE were a small element of the main occupation. The testing also revealed that the integrity of P-37-008245 within the current Project APE is poor due to modern disturbances.

After the testing phase, a data recovery program for the portions of P-33-008245 with poor integrity (within the current Project APE) was carried out and consisted of two block units measuring 3 x 3 meters and four additional 1 x 1 meter test units. Brian F. Smith and Associates proclaimed that the data recovery program resulted in the

successful excavation of a representative sample of the site, determined the site function, curated nearly 3,000 artifacts for future study, and "generally exhausted the research potential" of the portion of the resource within the current Project APE. Brian F. Smith and Associates (1991) recommended that a cultural resource monitoring program be implemented during construction grading.

Archival Research

Historic topographic maps and aerial photographs of the Project APE were reviewed at historicaerials.com (NETR 2021) in order to assess land use and development changes over time, particularly related to historical resources and the known archaeological sites. Historic photographs are available since 1953. The 1953 aerial photograph shows that the property was undeveloped except for the stone house located in the southeastern corner of the Project APE at 12702 Oak Knoll Road. By 1964, two more residences were constructed in the southern portion of the Project APE, one north and one south of Oak Knoll Street. By 1978, a residential development was constructed along the eastern boundary of the Project APE and several dirt paths or roads were established within the northern Project APE. The aerial photograph from 1990 appears to show grading or mowing of the northern portion of the Project APE. Additional grading occurred in the central portion of the Project APE in 2010 and a San Diego Gas and Electric staging yard now occupies the northern portion of the Project APE. The historic aerial photographs show that the Project APE has been surrounded by development since the late 1950s or early 1960s and was subject to repeated, though not complete, disturbances in the form of grading and dirt roads. Any surface cultural resources that may have been present are likely disturbed but intact archaeological deposits are possible.

Native American Heritage Commission and Native American outreach letters

Dudek requested an NAHC search of the Sacred Lands File on April 15, 2022, for the proposed Project APE and a 1-mile buffer. The Sacred Lands File consists of a database of known Native American resources. These resources may not be included in the South Coastal Information Center database. The NAHC replied on May 19, 2022, and reported that the Sacred Lands File did not identify any known Native American cultural resources within the Project APE or the surrounding 1-mile buffer (Appendix B, Tribal Correspondence). The NAHC additionally provided a list of Native American tribes and individuals/organizations with traditional geographic associations that might have knowledge of cultural resources in this area.

Outreach letters were mailed on May 27, 2022, to all Native American group representatives included on the NAHC contact list (Appendix B). These letters attempted to solicit additional information relating to Native American resources that may be impacted by the Project. Native American representatives were requested to define a general area where known resources intersect the Project APE. Four responses to these requests have been received.

Barona Band of Mission Indians stated that because the Project is astride a creek and ethnographic village of Paqui, there is an increased cultural sensitivity. Barona recommended an intensive pedestrian survey and construction monitoring. Jamul Indian Village stated that they consulted their database and have concerns that the Project area is sensitive for cultural resources. They stated that they would consult with the City. Likewise, San Pasqual Band of Mission Indians stated that the Project is in their Traditional Use Area, and they would like to

engage in formation government to government consultation. Viejas Band of Kumeyaay Indians stated that the Project area was significant to Viejas, and they requested that a Kumeyaay Cultural Monitor be on site during any ground disturbing activities.

Senate Bill 18 and Assembly Bill 52 Consultation

In compliance with Senate Bill (SB 18) and Assembly Bill 52 (AB 52), the City, as lead agency, is responsible for conducting government to government consultation with pertinent tribal entities. The City requested a Tribal Consultation List from the Native American Heritage Commission (NAHC) and received a list of 16 tribal representative from the NAHC. The City mailed separate SB 18 and AB 52 letters to the 16 tribal representatives on November 8, 2022. These notification letters included a description of the Project, lead agency contact information, and a statement that the tribe had 90 days to request consultation under SB 18 and 30 days to request consultation under AB 52.

Four tribal entities responded to the SB 18 and AB 52 notification letters. Barona Band of Mission Indians, Jamul Indian Village, and Viejas Band of Kumeyaay Indians requested that a Kumeyaay Native American monitor be present during ground disturbing construction activities. San Pasqual Band of Mission Indians requested a Project site visit, after which they would make recommendations. Consultation with San Pasqual Band of Mission Indians is considered ongoing. Consultation with all other tribes is considered concluded.

Intensive Pedestrian Survey

Dudek Archaeologist Javier Hernandez conducted a survey of the Project APE on April 22, 2022. Native American monitor Logovii Sialo from Saving Sacred Sites Inc., a Luiseño owned company, participated in the pedestrian survey. The Project APE consists of two vacant lots bisected by Oak Knoll Road that border existing residential neighborhoods. The larger parcel north of Oak Knoll Road has been previously disturbed as evidenced by two residences with outbuildings, trimmed vegetation, heavy machinery grading, and the presence of a construction staging yard. The staging yard has been heavily disturbed by commercial equipment and vehicle storage. It occupies the majority of parcel, leaving an unfenced area approximately 160 by 60 meters on the north half of the parcel. This area was densely vegetated with a row of trees aligning a drainage on the western APE boundary. The thick grass made surface visibility poor on the southwest facing knoll. The second smaller parcel south of Oak Knoll Road has also been heavily disturbed as evidenced by road gravels and trimmed grass. The southernmost extent of the APE bordering Poway Creek was heavily vegetated by trees and brush and the northern bank of Poway Creek was too steep to access for surveying. The northern portion of the southern lot was heavily vegetated by grass making surface visibility poor. Though currently undeveloped, the Project is immediately adjacent to residential and commercial development. Pedestrian survey was conducted utilizing formal transects at 15-meter intervals, except as noted above. Deviations from transects also occurred to inspect animal burrows and other locations of exposed sediments and rock outcrops. No cultural resources were identified within the Project.

Summary and Management Considerations

Though the Project APE has been highly disturbed and the NAHC Sacred Lands File search, Native American outreach, and pedestrian survey were negative for archaeological resources and TCRs, the records search

revealed that two resources intersect the Project APE: P-37-008245 and P-37-016042. Both resources were archaeologically tested and found to be not significant under CEQA within the Project APE. Though recommended not significant with the Project APE, there is an increased potential that ground disturbance will encounter buried cultural resources associated with these resources. As such, Dudek recommends cultural monitoring during initial ground disturbing activities.

Should human remains be discovered, work will halt in that area and procedures set forth in the California Public Resources Code (Section 5097.98) and California Health and Safety Code (Section 7050.5) will be followed, beginning with notification of the County Coroner. If Native American remains are present, the County Coroner will contact the NAHC to designate a most likely descendant, who will provided recommendations for the dignified disposition and treatment of the remains.

Should you have any questions relating to this report and its findings please do not hesitate to contact Dudek directly.

Respectfully Submitted,

Re: Lennar Oak Knoll Project, San Diego County

Dear Mr. DeCarlo:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Subject: Information Request for the Oak Knoll Project, City of Poway, California

Dear Mr. Christman,

A private developer has proposed the development of a vacant lot into residential development in the City of Poway, California. The project area is located within an existing residential development on Oak Knoll Road. The area falls within Section 14 within Township 14S/ Range 2W of the Poway, CA 1:24,000 USGS map (Figure 1).

The Native American Heritage Commission conducted a Sacred Lands file search. The results were negative for Native American cultural resources within or adjacent to the project area. I am writing as part of the cultural inventory process in order find out if you, or your tribal community, have any knowledge of cultural resources or places that may be impacted by the proposed project. This letter does not constitute formal government to government consultation pursuant to Assembly Bill 52.

If you have any information or concerns pertaining to such information, please contact me.

Respectfully,

Matthew H. DeCarlo

To: Matthew DeCarlo

Subject: Oak Knoll Project, City of Poway

Dear Mr. DeCarlo,

In response to your letter of May 27, 2022 concerning the above project, I am responding on behalf of the Barona Band of Mission Indians, which is a small federally-recognized Indian tribe whose federal Indian reservation is a bit to the east of Poway. I serve as the Tribe's Tribal Attorney and respond to many cultural resource issues under the direction of Chairman Raymond Welch and the Tribal Council.

The site of this project is astride a creek and in the vicinity of the village of Paqui. It is also relatively flat. Therefore, there is an increased likelihood that known or unknown cultural resources are on or buried on the property, despite the negative cultural resources records search. Therefore, the Barona Band requests that the City conduct at least a walk-over of the parcel by a qualified archaeologist to see if any signs of cultural resources are present, and to view any earth-disturbing activities, with the ability to stop them if such resources are discovered, until they can be properly evaluated.

Thank you for your attention to this request.

Sincerely,

Art Bunce

Tribal Attorney

RE: Oak Knoll Project

Dear Mr. DeCarlo,

The San Pasqual Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of Desiree M. Whitman THPO Officer and San Pasqual Band of Mission Indians.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognized San Pasqual Indian Reservation. It is, however, within the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Furthermore, we would like to engage in formal government to government consultation so that San Pasqual can have a voice in developing the measures that will be taken to protect these sites and mitigate any adverse impacts.

We would appreciate being given access to any cultural resource reports that have been or will be generated during the environmental review process so we can contribute most effectively to the consultation process.

We appreciate your involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone at 760-803-5648 or by e-mail at Angelinag@sanpasqualtribe.org

Respectfully,

Angelina Gutierrez

POWAY, CALIFORNIA

Dear Mr. Shepherd:

In accordance with your request, we have performed a geotechnical investigation for the Oak Knoll project located in Poway, California. The accompanying report presents the findings of our study, and conclusions and recommendations pertaining to the geotechnical aspects of developing the project as presently proposed. Based on the results of this study, it is our opinion that the subject property can be developed as planned provided that the recommendations of this report are followed.

Should you have any questions regarding this report, or if we may be of further service, please contact the undersigned at your convenience.

Very truly yours,

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed Oak Knoll project located in Poway, California (see Vicinity Map, Figure 1). The purpose of our study was to evaluate the soil and geologic conditions on the site and provide geotechnical recommendations pertaining to development of the property as proposed.

The scope of this investigation included a review of the Tentative Map for Oak Knoll, City of Poway, California, Sheets 1 through 3 of 3, prepared by Hunsaker and Associates San Diego, Inc, undated. We also performed a field investigation, conducted laboratory testing to characterize the physical properties of the soils encountered, performed engineering analyses and prepared this report.

We performed an initial field investigation on May 28, 2021, which consisted of drilling 10 hydraulic rotary air percussion borings (generically referenced herein as air-track borings) to evaluate rock rippability in the northeastern portion of the site. On May 18, 2022, we excavated 11 exploratory trenches to evaluate the thickness and condition of surficial deposits requiring remedial grading. We also performed one infiltration test in the area of the proposed stormwater vault to assess the saturated hydraulic conductivity of the underlying soil. Logs of the exploratory trenches, air-track borings, and other details of the field investigation are presented in Appendix A. The locations of the exploratory trenches and borings are presented on the Geologic Map, Figure 2 (map pocket). The infiltration test results are presented in Appendix C.

We performed laboratory testing on selected soil samples obtained during the field investigation to evaluate pertinent physical properties of the soil types encountered. The laboratory information was used in engineering analyses to develop recommendations for geotechnical aspects of site development. Details of the laboratory tests and a summary of the test results are presented in Appendix B.

The recommendations presented herein are based on analysis of the data and observations obtained during field investigations, and our experience with similar soil and geologic conditions. Additional references reviewed to prepare this report are provided in the *List of References*.

2. SITE AND PROJECT DESCRIPTION

The overall site consists of two properties located on either side of Oak Knoll Road, south of Poway Road, east of Pomerado Road, and west of Carriage Road. The northern portion of the site (north of Oak Noll Road) consists of approximately 10-acres of essentially undeveloped land, except for a

single-family residence and several associated structures along the southwestern property boundary. The southern portion (south of the Oak Knoll Road) consists of two parcels of land. The western parcel is undeveloped, and the eastern parcel is occupied by a single-family residence.

Topographically, the southern property is relatively flat with an elevation of approximately 446 feet Mean Sea Level (MSL) to 448 feet MSL and the northern property is level to moderately sloping with elevations ranging from approximately 449 feet MSL to 495 feet MSL. Poway Creek is located along the southern boundary of the southern parcels. A flood elevation of 447 feet MSL is shown on the Tentative Map. A tributary to Poway Creek exists along the northwest property boundary of the northern parcel. The tributary has been channelized and outlets into a storm drain system beneath Oak Knoll Road, constructed as part of the existing residential development to the west. Surface drainage across the northern property is primarily to the south and southwest towards Oak Knoll Road. The southern property drains to the south and southwest into Poway Creek.

Vegetation within the development footprint consists of natural low-lying grasses and some isolated small trees. A large portion of the northern property has been cleared, fenced, and covered with gravel to support an equipment storage yard for a San Diego Gas and Electric subcontractor. Heavy vegetation consisting of large trees and shrubs exist along the southern margin of the south parcels.

Based on review of the Tentative Map, the properties will be developed to create 64 single-family residences, including 60-lots on the northern property and 4-lots on the southern property. The northern development includes a loop road off of Oak Knoll Road that also connects to Roca Grande Drive to the northeast. Associated storm water BMP's, underground utilities, and retaining walls are also planned.

Grading will consist of maximum cut and fill depths of approximately 16 feet and 4 feet, respectively, not considering remedial grading. Cut and fill slopes with maximum heights of approximately 30 feet and 4 feet, respectively, are planned and designed at an inclination of 2:1 (horizontal:vertical) or flatter. Several retaining walls are shown on both properties that range from approximately 1-foot to 6-feet in height. A rear-yard retaining wall is shown along the south development boundary of the southern property to raise building pad elevations above the flood elevation of 447 feet (MSL).

The locations and descriptions of the site and proposed development above are based on our recent and previous field study and review of the project Tentative Map. If development plans differ significantly from those described herein, Geocon Incorporated should be contacted for review and possible revisions to this report.

3. SOIL AND GEOLOGIC CONDITIONS

Four surficial soil types and two geologic formations were encountered during the field investigation. The surficial deposits consist of undocumented fill, alluvium, colluvium, and terrace deposits. The formational units includes the Eocene-age Friars Formation and Cretaceous-age granodiorite (granitic rock). Each of the surficial soils and geologic units encountered are described in order of increasing age. The approximate extent of the surficial deposits and formational materials are shown on the Geologic Map, Figure 2.

3.1 Undocumented Fill (Qudf)

Undocumented fill embankments cover the majority of both properties. The fill is approximately 6-feet thick along the southern boundary of Lots 61 through 64 (adjacent to Poway Creek). However, within the development footprint, these materials generally range from 1 to 2-feet-thick with the exception of the west margin of the northern parcel where the fill may be up to 5-feet-thick. The undocumented fill is unsuitable for support of additional fill or structural loading in its present condition and will require complete removal and compaction within areas of planned development.

3.2 Alluvium (Qal)

Alluvial deposits were encountered in Trench T-1 beneath the undocumented fill. Alluvium may also extend into the proposed roadway area northwest of Lots 23, 49 and 50. These deposits generally consist of very loose, wet, sandy gravel with silt and clay. The alluvium is compressible and will require removal and compaction if encountered in areas of planned development.

3.3 Colluvium (Qc)

Colluvial deposits were encountered in Trenches T-10 and T-11 overlying the granitic rock or terrace deposits. These deposits were up to 10-feet-thick and consist of dry to damp silty/clayey sand with pinhole porosity. The colluvium is considered hydro-compressible and will require removal and compaction.

3.4 Terrace Deposits (Qt)

Terrace deposits were encountered across the majority of both properties as encountered in Trenches T-2 through T-10. These deposits overly granitic rock and Friars Formation and where encountered, were up to 12-feet-thick. The terrace deposits generally consist of damp to moist, medium stiff to very stiff sandy clay and moist to wet, medium dense clayey gravel with cobble. In general, the terrace deposits are currently considered unsuitable for additional fill or structural loading and will require removal and compaction. However, it is possible that a portion of these deposits can be left in-place upon further testing.

3.5 Friars Formation (Tf)

The Eocene-age Friars Formation was encountered beneath the surficial soils across both properties and overlies the granitic rock. This formation typically consists of dense sandstones, hard claystones, and siltstones. The Friars Formation is suitable for support of additional fill or structural loads.

3.6 Granodiorite (Kgd)

Cretaceous-age Granodiorite (granitic rock) underlies the sedimentary deposits and is exposed in the north and northeast portion of the northern property. Based on observations made during the field exploration, site reconnaissance, and rock rippability study, the granitic rock exhibits a variable weathering pattern ranging from highly weathered, decomposed rock to outcrops of slightly weathered, extremely strong rock that will require blasting to excavate. The granitic unit generally exhibits adequate bearing and slope stability characteristics. Cut slopes excavated within the granitic rock should be stable to the proposed heights if free of adversely oriented joints or fractures.

The soils derived from excavations within the decomposed granitic rock are anticipated to consist of low-expansive, silty, medium- to coarse-grained sands and should provide suitable foundation support in either a natural or properly compacted condition. Excavations within the granitic rock may generate boulders and oversize materials (rocks ≥12 inches in nominal dimension) that will require special handling and placement as recommended hereinafter.

4. RIPPABILITY AND ROCK CONSIDERATIONS

We performed a rock rippability evaluation consisting of drilling 10 air-track borings in proposed cut areas. We performed the study with an Ingersoll-Rand ECM 490 equipped with a 4-inch-diameter bit. Drill penetration rates were used to evaluate rock rippability and to estimate the depth at which difficult excavation will occur. Rock rippability is a function of natural weathering processes that can vary vertically and horizontally over short distances depending on jointing, fracturing, and/or mineralogic discontinuities within the bedrock.

A frequently used guideline to equate rock rippability to drill penetration rate is that a penetration rate of approximately 0 to 20 seconds per foot (spf) generally indicates rippable material, 20 to 30 spf indicates marginally to non-rippable material, and greater than 30 spf indicates non-rippable rock. These general guidelines are typically based on drill rates using a rotary percussion drill rig similar to an Ingersoll Rand ECM 360 with a 3½-inch drill bit. The penetration rates (recorded in seconds per foot) for the air track boring are presented in Appendix A, Figures A-12 through A-21.

The rippability designations discussed above are based on the use of a D9 or equivalent bulldozer equipped with a single shank ripper. Rippable materials can be excavated with moderate to heavy

effort. Marginally rippable includes very heavy ripping and isolated zones of probable blasting. Non-rippable materials will require blasting to excavate the rock.

The estimated thickness of rippable material for each air track boring is presented on Figure 2 (map pocket). Perspective contractors should use their own judgment to identify the penetration rate boundary between productive and non-productive ripping and, rippable and non-rippable rock. We used a threshold of 20 spf to indicate the thickness of rippable material next to each boring on the geologic map.

Based on an air track penetration rate of 20 spf, it is expected that the rippability characteristics will vary. The air-track borings indicate that, where fresh rock is not exposed near the surface (e.g., boulders), the granitic rock is characterized by a rippable weathered mantle varying from approximately 4 to 20-feet-thick. Excavations greater than these depths will encounter difficult ripping conditions and may requiring blasting techniques and can be expected to generate oversized rock (rocks ≥12 inches in dimension), which will necessitate typical hard rock handling, sizing, and placement procedures during grading operations. Proposed cuts in the weathered mantle may also generate oversized fragments.

Estimates of the anticipated volume of hard rock materials generated from proposed excavations should be evaluated based on the information from each boring and drill penetration rate criteria acceptable to the contractor. Roadway/utility corridors and lot undercutting criteria should also be considered when calculating the volume of hard rock. In addition, a volumetric evaluation should be performed to determine if there are available fill placement areas considering the rock hold down criteria.

Earthwork construction should be carefully planned to efficiently utilize available rock placement areas. Oversize materials should be placed in accordance with rock placement procedures presented in Appendix D of this report and governing jurisdictions.

5. GROUNDWATER/SEEPAGE

Groundwater/seepage was encountered in the exploratory trenches (T-1 through T-3, T-5 through T-8, and T-11) adjacent to Poway Creek and other areas of the site at depths ranging between 6 feet and 11 feet below the ground surface. It appears that the groundwater is perched above the alluvium/colluvium/terrace deposit contact with the underlying Friars Formation or granitic rock. We encountered seepage in exploratory trenches T-9 and T-10 at depths ranging from 8 feet to 11 feet below the ground surface. We performed the field investigation in May 2022 during a regional drought. The seepage encountered in the trenches was likely associated with previous rain and irrigation.

Groundwater levels in drainage areas can be expected to fluctuate seasonally and may affect grading. In this regard, grading may encounter wet to saturated soils conditions causing excavation and compaction difficulty, particularly if construction is planned during the rainy season. Remedial grading of surficial deposits near the tributary (Trench T-11) or Poway Creek, if any, will encounter shallow groundwater and wet to saturated soils requiring specialized excavation equipment, possible dewatering and drying of the material to facilitate proper compaction.

6. GEOLOGIC HAZARDS

6.1 Ground Rupture

USGS (2016) shows that there are no mapped Quaternary faults crossing or trending toward the property. In addition, the site is not located within a currently established Alquist-Priolo Earthquake Fault Zone.

The nearest known active faults are the Newport-Inglewood/Rose Canyon Fault Zone, located approximately 15 miles west of the subject site. Based on this study, it is our opinion that the risk associated with ground rupture hazard is considered low.

6.2 Seismicity

The San Diego County and Southern California region is seismically active. Considerations important in seismic design include the frequency and duration of motion and the soil conditions underlying the site. Seismic design of structures should be performed in accordance with the California Building Code (CBC) guidelines currently adopted by the local agency. The risk associated with strong ground shaking due to earthquakes at the site is no greater than that for the region.

6.3 Liquefaction

Liquefaction typically occurs when a site is located in a zone with seismic activity, onsite soils are cohesionless, groundwater is encountered within 50 feet of the surface, and soil densities are less than about 70 percent of the maximum dry densities. If all four criteria are met, a seismic event could result in a rapid increase in pore water pressure from the earthquake-generated ground accelerations. The potential for liquefaction at the site is considered to be negligible due to the dense formational material encountered and remedial grading.

6.4 Tsunamis and Seiches

The risk associated with tsunamis and seiches hazard at the project is low due to the site elevation and the absence of an upstream body of water.

6.5 Landslides

We did not encountered landslides within the site or mapped any landslides within the immediate areas influencing the project. In our opinion, the risk associated with landslide hazard is low.

6.6 Flooding

The County of San Diego Multi-Jurisdictional Hazard Mitigation Plan, dated October 2017, indicates that the southern property (Lots 61 through 64) is located within a 500-year floodplain.

A review of the Tentative Map indicates that proposed grades for the southern property will be raised above the 500-year floodplain elevation. Therefore, the risk associated with inundation by flooding is considered low due to the proposed grading.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

7.1.1 No soil or geologic conditions were encountered during this study that would preclude development of the property as presently proposed provided the recommendations of this report are followed.

7.1.2 Undocumented fill, alluvium, colluvium, and terrace deposits are not suitable for the support of fill or structural loading in their present condition and will require removal and compaction in areas of planned development. The suitability of portions of the terrace deposits to be left in place may be evaluated during grading.

7.1.3 Remedial grading along Oak Knoll Road and the existing subdivisions east and west of the northern property will likely be impacted by the proximity of proposed development to existing improvements. These areas will require evaluation on a case-by-case basis and additional recommendations may be necessary where the limits of remedial grading are constrained. Slot cutting may be necessary along the west boundary and oak knoll road where remedial grading will be performed adjacent to the existing wall and roadway.

7.1.4 Hard rock is present within proposed cut area along the northeast property boundary and will require special consideration during site development. Excavations within the granitic rock that extend below the weathered mantle or where fresh core stones are exposed at grade will likely require blasting to facilitate the excavations. We anticipate that excavations performed during grading operations will generate oversize materials (rock fragments >12 inches) that will require special handling and fill placement procedures. Oversize materials should be placed in accordance with grading recommendations presented in Appendix D.

7.1.5 We encountered groundwater/seepage and perched water conditions during the field investigation. Dependent upon seasonal conditions at the time of grading, remedial grading of surficial deposits along the natural drainages may encounter wet to saturated materials and groundwater resulting in possible excavation and fill placement difficulties. Saturated soil conditions and shallow groundwater should be anticipated. Dewatering and/or use of specialized equipment may be required to excavate the surficial deposits. Overly wet soils may require spreading and drying and/or mixing with drier materials to reduce the moisture content so that compaction can be achieved.

7.1.6 An earthwork analysis should be performed to determine if there is an adequate volume of fill area available to accommodate the anticipated volume of blasted/oversize materials. This

study should consider the proposed grading, rippability information contained in this report, rock placement requirements and include proposed undercutting (pads and streets). Rock crushing may be necessary if the amount of oversize rock generated exceeds the available fill volume based on the project rock placement specifications.

7.1.7 An engineering geologist should observe cut slopes during grading to check that the soil and geologic conditions do not differ significantly from those anticipated. Scaling of loose rocks to remain in-place above planned cut slopes may be necessary.

7.1.8 Grading along the western limits of the north property (Lots 51 through 60) is planned next to an existing retaining wall. If during remedial grading the drainage measures for this wall are found to consist of weepholes along the base of the wall, a subdrain system should be constructed in front of the weepholes to maintain wall drainage. This condition may necessitate an easement. The subdrain, if needed, should outlet into the storm drain system to the south. The subdrain should consist of a 4-inch diameter perforated Schedule 40 PVC pipe surrounded by at least 1 cubic foot of ¾-inch crushed rock and wrapped in filter fabric (Mirafi 140N, or equivalent).

7.1.9 Subsurface conditions observed may be extrapolated to reflect general soil/geologic conditions; however, some variations in subsurface conditions between trench locations should be anticipated.

7.2 Excavation and Soil Characteristics

7.2.1 The soils encountered in the field investigation are considered to be both “non-expansive (expansion index [EI] less than 20) and “expansive” (expansion index [EI] of 20 or more) as defined by 2019 California Building Code (CBC) Section 1803.5.3. Table 7.2 presents soil classifications based on the expansion index. The soil materials observed on site are anticipated to have a “very low” to “low” expansion potential (expansion index of 50 or less).

TABLE 7.2
EXPANSION CLASSIFICATION BASED ON EXPANSION INDEX

Expansion Index (EI)	ASTM 4829 Expansion Classification	2019 CBC Expansion Classification
0 – 20	Very Low	Non-Expansive
21 – 50	Low	Expansive
51 – 90	Medium	
91 – 130	High	
Greater Than 130	Very High	

7.2.2 Excavation of the surficial deposits should be possible with light to moderate effort using conventional heavy-duty equipment. Excavating within the granitic rock will generally vary in difficulty with the depth of excavation depending on the degree of weathering. It is anticipated that the majority of the proposed excavations will encounter moderate to heavy ripping with conventional heavy-duty equipment. Blasting will be required where excavations extend beyond the weathered granitic rock mantle and where unweathered boulders or "core" stones are encountered in proposed granitic rock cut areas. Oversize rock (material >12 inches) should be placed in accordance with *Recommended Grading Specifications* (Appendix D) and the requirements of the governing agency. Oversize rock may require breakage to acceptable sizes or exportation from the property. Placement of oversize rock within the area of proposed underground utilities should not be permitted.

7.3 Corrosion

7.3.1 The laboratory test results indicate that the near-surface on-site materials at the locations tested possess *Not Applicable* sulfate severity and *S0* exposure to concrete structures as defined by 2019 CBC Section 1904 and ACI 318-14 Chapter 19. Table 7.3 presents a summary of concrete requirements set forth by 2019 CBC Section 1904 and ACI 318. ACI guidelines should be followed when determining the type of concrete to be used. The presence of water-soluble sulfates is not a visually discernible characteristic; therefore, other soil samples from the site could yield different concentrations. Additionally, over time landscaping activities (i.e., addition of fertilizers and other soil nutrients) may affect the concentration.

TABLE 7.3
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Exposure Class		Water-Soluble Sulfate (SO_4) Percent by Weight	Cement Type (ASTM C 150)	Maximum Water to Cement Ratio by Weight[1]	Minimum Compressive Strength (psi)
S0		SO_4<0.10	No Type Restriction	n/a	2,500
S1		0.10≤SO_4<0.20	II	0.50	4,000
S2		0.20≤SO_4≤2.00	V	0.45	4,500
S3	Option 1	SO_4>2.00	V+Pozzolan or Slag	0.45	4,500
	Option 2		V	0.40	5,000

[1] Maximum water to cement ratio limits do not apply to lightweight concrete

7.3.2 Geocon Incorporated does not practice in the field of corrosion engineering; therefore, further evaluation by a corrosion engineer may be needed to incorporate the necessary

precautions to avoid premature corrosion of underground pipes and buried metal in direct contact with the soils.

7.4 Slope Stability - General

7.4.1 A slope stability analysis for the proposed 30-foot high cut slope was performed utilizing average drained direct shear strength parameters from the laboratory test results and our experience with similar materials. These analyses indicate that the proposed 2:1 cut slopes, constructed of on-site materials, should have calculated factors of safety of at least 1.5 under static conditions for both deep-seated failure and shallow sloughing conditions to heights of at least 30 feet. Generalized slope stability calculations for both deep-seated and surficial slope stability are presented on Figures 3 and 4.

7.4.2 Although rare, the most common mode of instability for rock slopes are shallow wedge failures from intersecting fault planes or clay filled joints/fractures dipping out of slope. In this regard, the structural measurements obtained during our studies did not reveal such conditions. It is recommended, however, that all slope excavations proposed on the site be observed during grading by an engineering geologist to confirm that geologic conditions do not differ significantly from those anticipated. In the event that adverse conditions are observed, stabilization recommendations can be provided.

7.4.3 Fill slopes should be compacted by backrolling with a loaded sheepsfoot roller at vertical intervals not to exceed 4 feet and should be track-walked at the completion of each slope such that the fill soils are uniformly compacted to at least 90 percent relative compaction to the face of the finished sloped. Alternatively, the fill slope may be over-built at least 3 feet and cut back to yield a properly compacted slope face.

7.4.4 Where fill slopes and fill-over-cut slopes are planned, a 15-foot-wide, 2-foot-deep, undrained keyway should be constructed prior to placing compacted fill. The keyway should be constructed with a minimum 5 percent inclination away from the toe of slope.

7.4.5 All slopes should be landscaped with drought-tolerant vegetation, having variable root depths and requiring minimal landscape irrigation. In addition, all slopes should be drained and properly maintained to reduce erosion.

7.5 Grading

7.5.1 All grading should be performed in accordance with the *Recommended Grading Specifications* contained in Appendix D. Where the recommendations of Appendix D conflict with this report, the recommendations of this report should take precedence.

7.5.2 Prior to commencing grading, a preconstruction conference should be held at the site with the owner or developer, grading contractor, civil engineer, and geotechnical engineer in attendance. Special soil handling and the grading plans can be discussed at that time.

7.5.3 Grading should be performed in conjunction with the observation and compaction testing services of Geocon Incorporated.

7.5.4 Site preparation should begin with the removal of existing structures, improvements, deleterious material and vegetation in areas of planned development. The depth of removal should be such that material exposed in cut areas or soils to be used as fill is relatively free of organic matter. Material generated during stripping and/or site demolition should be exported from the site.

7.5.5 All potentially compressible surficial soils (undocumented fill, alluvium, colluvium, and terrace deposits) within areas of planned grading should be removed to formational materials and properly compacted prior to placing additional fill and/or structural loads. The suitability of leaving portions of the terrace deposits in-place should be evaluated during grading.

7.5.6 Where not restricted by property boundaries, protected open space or exiting improvements, removal of compressible surficial soils should extend beyond structural areas a horizontal distance equal to the depth of the removal (see Figure 5 for general information). This condition occurs at the south of Lots 61 through 64. The actual extent of unsuitable soil removals will be determined in the field during grading by the geotechnical engineer and/or engineering geologist.

7.5.7 We expect groundwater/perched water conditions will be encountered in removal areas performed at or near Poway Creek and the other areas noted on the trench logs. Wet to saturated soil and perched water may also be encountered in the surficial deposits located near the natural drainages, especially, if grading is performed during the rainy season. Remedial grading of surficial deposits in these areas will likely result in possible excavation and fill placement difficulties. Dewatering and/or use of specialized equipment may be

required to excavate the alluvium, colluvium, and terrace deposits. Overly wet materials will require spreading and drying and/or mixing with drier materials to reduce the moisture content so that compaction can be achieved.

7.5.8 If complete removal of compressible material cannot be performed at or near the creek or other areas of the site due to groundwater conditions, alternative measures such as surcharge loading with settlement monitoring may be required. Geocon Incorporated will provide alternate recommendations, if needed, based on conditions encountered during grading.

7.5.9 After removal of unsuitable material as recommended above, the base of excavations to receive fill (where practical) should be scarified approximately 12 inches, moisture conditioned, and compacted.

7.5.10 Grading should be conducted so that high expansive soils (EI >90) are placed in the deeper fill areas at least three feet below proposed finish grade elevations and at least 15 feet from the face of fill slopes. Where practical, the upper three feet of graded areas (cut or fill) should consist of properly compacted very low to low (EI $\leq$50) expansive granular soils. Medium expansive soils (EI $\leq$90) may also be used to achieve design grades.

7.5.11 Capping material refers to select material placed within three feet from building pad grade and parkway/roadway grade. This material should consist of soil fill with an approximate maximum particle dimension of 6 inches with a minimum of 40 percent soil passing the ¾-inch sieve and should have at least 20 percent of the soil passing the No. 4 screen. Based on subsurface information presented in Appendix A, most capping material generally can be obtained from the granitic rock and colluvium. Soils with an expansion potential (EI) of greater than 90 are not suitable for capping and should be placed in the deeper fill areas or at least three feet below design grade across the site and 15 feet from face of slopes. The grading contractor should take necessary steps to manage the available soils to cap the project.

7.5.12 Consideration may also be given to over-excavate (mine) the weathered portions of the granitic rock to generate additional capping material and to provide additional areas for disposal of oversize rock material, if needed.

7.5.13 The site should be brought to final subgrade elevations with structural fill compacted in layers. In general, soils native to the site are suitable for re-use as fill if free from vegetation, debris and other deleterious material. Layers of fill should be no thicker than will allow for adequate bonding and compaction. All fill, including backfill and scarified ground surfaces,

should be compacted to at least 90 percent of laboratory maximum dry density at or above optimum moisture content, as determined in accordance with ASTM D1557. Fill materials below optimum moisture content will require additional moisture conditioning prior to placing additional fill.

7.5.14 Recommendations for the handling and disposal of oversized rock in fill areas are presented on Figure 6. In general, structural fill placed and compacted at the site should consist of material that can be classified into four zones:

Zone A: Material placed within 3 feet from building pad grade and, parkways and street grade should consist of soil fill with an approximate maximum particle dimension of 6 inches with a minimum of 40 percent of the soil passing the ¾-inch sieve and should have at least 20 percent of the soil passing the No. 4 sieve.

Zone B: Soil fill with rock up to 1 foot in maximum dimension. See Figure 6 for minimum thickness of zone.

Zone C: Rock fill or soil-rock fill generally consisting of 2 foot minus rock material with occasional rock up to 4 foot in maximum dimension. Alternatively, rock 2 to 4 feet in maximum dimension can be placed in window rows spaced a minimum of 12 feet. The voids around and beneath the rock should be filled with soil possessing a sand equivalent of at least 30. Zone C should terminate at least 2 feet below lowest utility.

Zone D: Soil fill with rock up to 1 foot in maximum dimension. See Figure 6 for minimum thickness of zone.

7.5.15 Blasting of rock material should be performed to maximize breakage to 2-foot minus material. Although not anticipated "rock fill" placement should generally be limited to 2-foot-thick horizontal layers and compacted using rock trucks and bulldozers. Significant volumes of water will be required during rock fill placement.

7.5.16 Based on the Tentative Map, grading will result in fill to formation transitions across several building pads. A transition condition is defined where formation is located within three feet of finish pad grade. To reduce the potential for differential settlement, the formation portion of the transition should be over-excavated (undercut) at least three feet below proposed finish grade and replaced with properly compacted very low to low expansive fill soil. As a minimum, the building pads should be provided with medium expansive soil (EI $\underline{\leq}$90). Overexcavations should be cut at a gradient toward the deepest fill area or streets to provide drainage for moisture migration along the contact between the formation and compacted fill.

7.5.17 Cut pads exposing granitic rock should be undercut at least three feet and replaced with properly compacted very low to low expansive soil to facilitate excavation of foundations and shallow utilities. As a minimum, fill should consist of medium expansive soil (EI $\leq$90).

7.5.18 Where the streets are located in cut areas composed of granitic rock, roadways should be undercut to a depth of at least 2 feet below the lowest utility.

7.5.19 In order to maintain safety and the stability of adjacent improvements, it is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with the applicable OSHA rules and regulations.

7.5.20 Imported materials (if required), should consist of granular very low to low expansive soils (EI $\leq$50) and, should be free of oversize rock (greater than 6 inches) and construction debris Prior to importing the material, samples from proposed borrow areas should be obtained and subjected to laboratory testing to determine if the material conforms to the recommended criteria. The grading contractor should allow at least four days for completion of the laboratory testing and schedule grading accordingly.

7.6 Seismic Design Criteria

7.6.1 Table 7.6.1 summarizes site-specific design criteria obtained from the 2019 California Building Code (CBC; Based on the 2018 International Building Code [IBC] and ASCE 7-16), Chapter 16 Structural Design, Section 1613 Earthquake Loads. We used the computer program *U.S. Seismic Design Maps*, provided by the Structural Engineers Association (SEA) to calculate the seismic design parameters. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.2.2 of the 2019 CBC and Table 20.3-1 of ASCE 7-16. The values presented herein are for the risk-targeted maximum considered earthquake (MCE_R). Sites designated as Site Class D, E and F may require additional analyses if requested by the project structural engineer and client.

TABLE 7.6.1
2019 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2019 CBC Reference
Site Class	C	Section 1613.2.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	0.798g	Figure 1613.2.1(1)

Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	0.958g	Section 1613.2.3 (Eqn 16-36)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	0.442g*	Section 1613.2.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	0.639g	Section 1613.2.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.295g*	Section 1613.2.4 (Eqn 16-39)

***** Using the code-based values presented in this table, in lieu of a performing a ground motion hazard analysis, requires the exceptions outlined in ASCE 7-16 Section 11.4.8 be followed by the project structural engineer. Per Section 11.4.8 of ASCE/SEI 7-16, a ground motion hazard analysis should be performed for projects for Site Class "E" sites with Ss greater than or equal to 1.0g and for Site Class "D" and "E" sites with S1 greater than 0.2g. Section 11.4.8 also provides exceptions which indicates that the ground motion hazard analysis may be waived provided the exceptions are followed.

7.6.2 Table 7.6.2 presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-16.

TABLE 7.6.2
ASCE 7-16 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-16 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.342g	Figure 22-7
Site Coefficient, F_{PGA}	1.2	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.41g	Section 11.8.3 (Eqn 11.8-1)

7.6.3 Conformance to the criteria in Tables 7.6.1 and 7.6.2 for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will

not occur in the event of a large earthquake. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

7.6.4 The project structural engineer and architect should evaluate the appropriate Risk Category and Seismic Design Category for the planned structures. The values presented herein assume a Risk Category of II and resulting in a Seismic Design Category D. Table 7.6.3 presents a summary of the risk categories in accordance with ASCE 7-16.

TABLE 7.6.3
ASCE 7-16 RISK CATEGORIES

Risk Category	Building Use	Examples
I	Low risk to Human Life at Failure	Barn, Storage Shelter
II	Nominal Risk to Human Life at Failure (Buildings Not Designated as I, III or IV)	Residential, Commercial and Industrial Buildings
III	Substantial Risk to Human Life at Failure	Theaters, Lecture Halls, Dining Halls, Schools, Prisons, Small Healthcare Facilities, Infrastructure Plants, Storage for Explosives/Toxins
IV	Essential Facilities	Hazardous Material Facilities, Hospitals, Fire and Rescue, Emergency Shelters, Police Stations, Power Stations, Aviation Control Facilities, National Defense, Water Storage

7.7 Foundation and Concrete Slabs-On-Grade Recommendations

7.7.1 The foundation recommendations herein are for proposed one- to three-story residential structures. The foundation recommendations have been separated into three categories based on either the maximum and differential fill thickness or Expansion Index. The foundation category criteria are presented in Table 7.7.1.

TABLE 7.7.1
FOUNDATION CATEGORY CRITERIA

Foundation Category	Maximum Fill Thickness, T (Feet)	Differential Fill Thickness, D (Feet)	Expansion Index (EI)
I	T<20	--	EI≤50
II	20≤T<50	10≤D<20	50<EI≤90
III	T≥50	D≥20	90<EI≤130

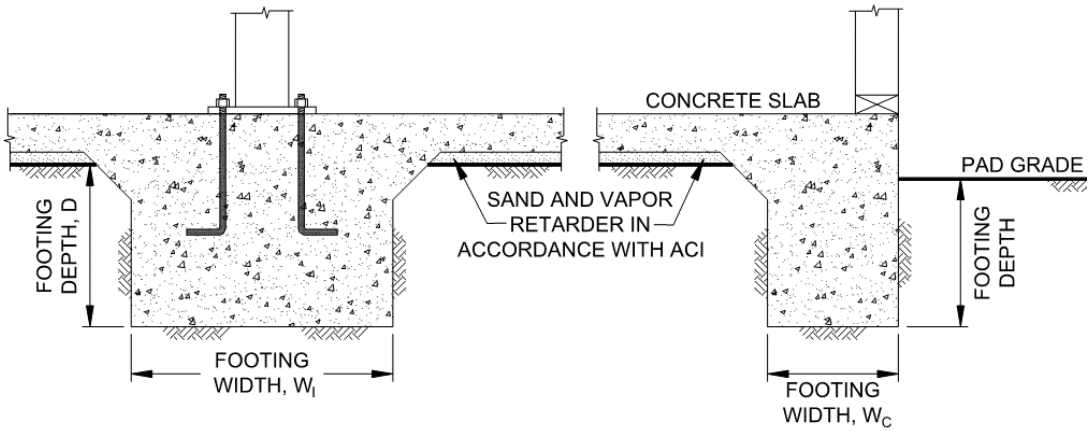
7.7.2 We will provide final foundation categories for each building or lot after finish pad grades have been achieved, the underlying fill-bedrock geometry is evaluated and we perform laboratory testing of the subgrade soil.

7.7.3 Table 7.7.2 presents minimum foundation and interior concrete slab design criteria for conventional foundation systems.

TABLE 7.7.2
CONVENTIONAL FOUNDATION RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Footing Embedment Depth, D (inches)	Minimum Continuous Footing Reinforcement	Minimum Footing Width (Inches)
I	12	Two No. 4 bars, one top and one bottom	12 – Continuous, W_C 24 – Isolated, W_I
II	18	Four No. 4 bars, two top and two bottom	
III	24	Four No. 5 bars, two top and two bottom	

7.7.4 The foundations should be embedded in accordance with the recommendations herein and the Wall/Column Footing Dimension Detail. The embedment depths should be measured from the lowest adjacent pad grade for both interior and exterior footings. Footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope (unless designed with a post-tensioned foundation system as discussed herein).



Wall/Column Footing Dimension Detail

7.7.5 The proposed structures can be supported on a shallow foundation system founded in the compacted fill/formational materials. Table 7.7.3 provides a summary of the foundation design recommendations.

TABLE 7.7.3
SUMMARY OF FOUNDATION RECOMMENDATIONS

Parameter	Value
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

7.7.6 The bearing capacity values presented herein are for dead plus live loads and may be increased by one-third when considering transient loads due to wind or seismic forces.

7.7.7 The concrete slab-on-grades should be a designed in accordance with Table 7.7.4.

TABLE 7.7.4
CONVENTIONAL SLAB-ON-GRADE RECOMMENDATIONS BY CATEGORY

Foundation Category	Minimum Concrete Slab Thickness (inches)	Interior Slab Reinforcement	Typical Slab Underlayment
I	4	6 x 6 - 10/10 welded wire mesh at slab mid-point	3 to 4 Inches of Sand/Gravel/Base
II	4	No. 3 bars at 24 inches on center, both directions	
III	5	No. 3 bars at 18 inches on center, both directions	

7.7.8 Slabs that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder. The vapor retarder design should be consistent with the guidelines presented in the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06). The vapor retarder used should be specified by the project architect or developer based

on the type of floor covering that will be installed and if the structure will possess a humidity controlled environment.

7.7.9 The bedding sand thickness should be determined by the project foundation engineer, architect, and/or developer. However, we should be contacted to provide recommendations if the bedding sand is thicker than 6 inches. It is common to see 3 inches and 4 inches of sand below the concrete slab-on-grade for 5-inch and 4-inch thick slabs, respectively, in the southern California area. The foundation design engineer should provide appropriate concrete mix design criteria and curing measures to assure proper curing of the slab by reducing the potential for rapid moisture loss and subsequent cracking and/or slab curl. We suggest that the foundation design engineer present the concrete mix design and proper curing methods on the foundation plans. It is critical that the foundation contractor understands and follows the recommendations presented on the foundation plans.

7.7.10 As an alternative to the conventional foundation recommendations, consideration should be given to the use of post-tensioned concrete slab and foundation systems for the support of the proposed structures. The post-tensioned systems (foundation dimensions and embedment depths, slab thickness and steel placement) should be designed by a structural engineer experienced in post-tensioned slab design and design criteria of the Post-Tensioning Institute (PTI) DC 10.5-12 *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive Soils* or *WRI/CRSI Design of Slab-on-Ground Foundations*, as required by the 2019 California Building Code (CBC Section 1808.6.2). Although this procedure was developed for expansive soil conditions, it can also be used to reduce the potential for foundation distress due to differential fill settlement. The post-tensioned design should incorporate the geotechnical parameters presented in Table 7.7.5 for the particular Foundation Category designated. The parameters presented in Table 7.7.5 are based on the guidelines presented in the PTI DC 10.5 design manual.

TABLE 7.7.5
POST-TENSIONED FOUNDATION SYSTEM DESIGN PARAMETERS

Post-Tensioning Institute (PTI) DC10.5 Design Parameters	Foundation Category		
	I	II	III
Thornthwaite Index	-20	-20	-20
Equilibrium Suction	3.9	3.9	3.9
Edge Lift Moisture Variation Distance, e_M (Feet)	5.3	5.1	4.9
Edge Lift, y_M (Inches)	0.61	1.10	1.58
Center Lift Moisture Variation Distance, e_M (Feet)	9.0	9.0	9.0
Center Lift, y_M (Inches)	0.30	0.47	0.66

7.7.11 The foundations for the post-tensioned slabs should be embedded in accordance with the recommendations of the structural engineer. If a post-tensioned mat foundation system is planned, the slab should possess a thickened edge with a minimum width of 12 inches and extend below the clean sand or crushed rock layer.

7.7.12 If the structural engineer proposes a post-tensioned foundation design method other than PTI, DC 10.5:

- The deflection criteria presented in Table 7.7.5 are still applicable.
- Interior stiffener beams should be used for Foundation Categories II and III.
- The width of the perimeter foundations should be at least 12 inches.
- The perimeter footing embedment depths should be at least 12 inches, 18 inches and 24 inches for foundation categories I, II, and III, respectively. The embedment depths should be measured from the lowest adjacent pad grade.

7.7.13 Foundation systems for the lots that possess a foundation Category I and a "very low" expansion potential (expansion index of 20 or less) can be designed using the method described in Section 1808 of the 2019 CBC. If post-tensioned foundations are planned, an alternative, commonly accepted design method (other than PTI) can be used. However, the post-tensioned foundation system should be designed with a total and differential deflection of 1 inch. Geocon Incorporated should be contacted to review the plans and provide additional information, if necessary.

7.7.14 If an alternate design method is contemplated, Geocon Incorporated should be contacted to evaluate if additional expansion index testing should be performed to identify the lots that possess a "very low" expansion potential (expansion index of 20 or less).

7.7.15 Our experience indicates post-tensioned slabs may be susceptible to excessive edge lift from tensioning, regardless of the underlying soil conditions. Placing reinforcing steel at the bottom of the perimeter footings and the interior stiffener beams may mitigate this potential. The structural engineer should design the foundation system to reduce the potential of edge lift occurring for the proposed structures.

7.7.16 During the construction of the post-tension foundation system, the concrete should be placed monolithically. Under no circumstances should cold joints form between the footings/grade beams and the slab during the construction of the post-tension foundation system unless designed by the structural engineer.

7.7.17 Isolated footings outside of the slab area, if present, should have the minimum embedment depth and width recommended for conventional foundations for a particular Foundation Category. The use of isolated footings, which are located beyond the perimeter of the building and support structural elements connected to the building, are not recommended for Category III. Where this condition cannot be avoided, the isolated footings should be connected to the building foundation system with grade beams in both directions. In addition, consideration should be given to connecting patio slabs, which exceed 5 feet in width, to the building foundation to reduce the potential for future separation to occur.

7.7.18 Interior stiffening beams should be incorporated into the design of the foundation system in accordance with the PTI design procedures.

7.7.19 Special subgrade presaturation is not deemed necessary prior to placing concrete; however, the exposed foundation and slab subgrade soil should be moisture conditioned, as necessary, to maintain a moist condition as would be expected in any such concrete placement.

7.7.20 Where buildings or other improvements are planned near the top of a slope 3:1 (horizontal:vertical) or steeper, special foundation and/or design considerations are recommended due to the tendency for lateral soil movement to occur.

- For fill slopes less than 20 feet high or cut slopes regardless of height, footings should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.

- When located next to a descending 3:1 (horizontal:vertical) fill slope or steeper, the foundations should be extended to a depth where the minimum horizontal distance is equal to H/3 (where H equals the vertical distance from the top of the fill slope to the base of the fill soil) with a minimum of 7 feet but need not exceed 40 feet. The horizontal distance is measured from the outer, deepest edge of the footing to the face of the slope. A post-tensioned slab and foundation system or mat foundation system can be used to reduce the potential for distress in the structures associated with strain softening and lateral fill extension. Specific design parameters or recommendations for either of these alternatives can be provided once the building location and fill slope geometry have been determined.

- If swimming pools are planned, Geocon Incorporated should be contacted for a review of specific site conditions.

- Swimming pools located within 7 feet of the top of cut or fill slopes are not recommended. Where such a condition cannot be avoided, the portion of the swimming pool wall within 7 feet of the slope face be designed assuming that the adjacent soil provides no lateral support. This recommendation applies to fill slopes up to 30 feet in height, and cut slopes regardless of height. For swimming pools located near the top of fill slopes greater than 30 feet in height, additional

recommendations may be required and Geocon Incorporated should be contacted for a review of specific site conditions.

- Although other improvements, which are relatively rigid or brittle, such as concrete flatwork or masonry walls, may experience some distress if located near the top of a slope, it is generally not economical to mitigate this potential. It may be possible, however, to incorporate design measures which would permit some lateral soil movement without causing extensive distress. Geocon Incorporated should be consulted for specific recommendations.

7.7.21 The recommendations of this report are intended to reduce the potential for cracking of slabs and foundations due to expansive soil (if present), differential settlement of fill soil with varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.7.22 Concrete slabs should be provided with adequate crack-control joints, construction joints and/or expansion joints to reduce unsightly shrinkage cracking. The design of joints should consider criteria of the American Concrete Institute when establishing crack-control spacing. Additional steel reinforcing, concrete admixtures and/or closer crack control joint spacing should be considered where concrete-exposed finished floors are planned.

7.7.23 Geocon Incorporated should be consulted to provide additional design parameters as required by the structural engineer.

7.7.24 We should observe the foundation excavations prior to the placement of reinforcing steel to check that the exposed soil conditions are similar to those expected and that they have been extended to the appropriate bearing strata. If unexpected soil conditions are encountered, foundation modifications may be required.

7.8 Concrete Flatwork

7.8.1 The following recommendations apply to exterior flatwork where near surface soils are low to medium expansive (EI less than 90). Exterior slabs not subjected to vehicular traffic should be a minimum of 4 inches thick and reinforced with 6 x 6-6/6 welded wire mesh. The mesh should be placed in the middle of the slab. Proper mesh positioning is critical to future performance of the slabs. The contractor should take extra measures to provide proper mesh

placement. Prior to construction of slabs, the upper 12 inches of subgrade soils should be moisture conditioned at or slightly above optimum moisture content and compacted to at least 90 percent of the laboratory maximum dry density per ASTM 1557.

7.8.2 Where highly expansive soils (EI greater than 90) are present near finish grade, the following recommendations apply. Exterior slabs should be at least 5 inches thick and reinforced with No. 3 steel bars spaced 18 inches on center each direction positioned at the slab midpoint. Driveways should be constructed with a 6-inch deep slab edge (measured from the bottom of the slab). Slabs should be doweled to the building foundation where they abut the stem wall. Sidewalks should be doweled to the curbs. Prior to construction of slabs, the upper 12 inches of subgrade soils should scarified and moisture conditioned to **a minimum of 3% above optimum moisture content** just prior to placing the concrete. Moisture conditioning should be observed and checked by a representative of Geocon Incorporated.

7.8.3 Consideration should be given to adding concrete cut-off walls beneath exterior flatwork supported by highly expansive soils (EI greater than 90). The cut-off walls are recommended where any water (e.g. landscape) may migrate laterally beneath the flatwork and cause adverse soil movement. The cut-off walls should be located along the perimeter of the concrete slab adjacent to landscaping areas and extend at least 6-inches into the soil subgrade.

7.8.4 Concrete flatwork should be provided with crack control joints to reduce and/or control shrinkage cracking. Crack control spacing should be determined by the project structural engineer based upon the slab thickness and intended usage. Criteria of the American Concrete Institute (ACI) should be taken into consideration when establishing crack control spacing. A 4-inch-thick slab should have a maximum joint spacing of 10 feet. Subgrade soil for exterior slabs not subjected to vehicle loads should be compacted in accordance with criteria presented above prior to concrete placement. Subgrade soil should be properly compacted and the moisture content of subgrade soil should be checked prior to placing concrete.

7.8.5 Even with the incorporation of the recommendations within this report, the exterior concrete flatwork has a likelihood of experiencing some settlement due to potentially compressible and liquefiable soil beneath grade; therefore, the welded wire mesh should overlap continuously in flatwork to reduce the potential for vertical offsets within flatwork. Additionally, flatwork should be structurally connected to the curbs, where possible, to reduce the potential for offsets between the curbs and the flatwork.

7.8.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to expansive soil (if present), differential settlement of existing soil or soil with varying thicknesses. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade placed on such conditions may still exhibit some cracking due to soil movement and/or shrinkage. Periotic maintenance such as slab replacement and/or grinding of elevated slab margins may be necessary due to the highly expansive soils. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.9 Conventional Retaining Walls

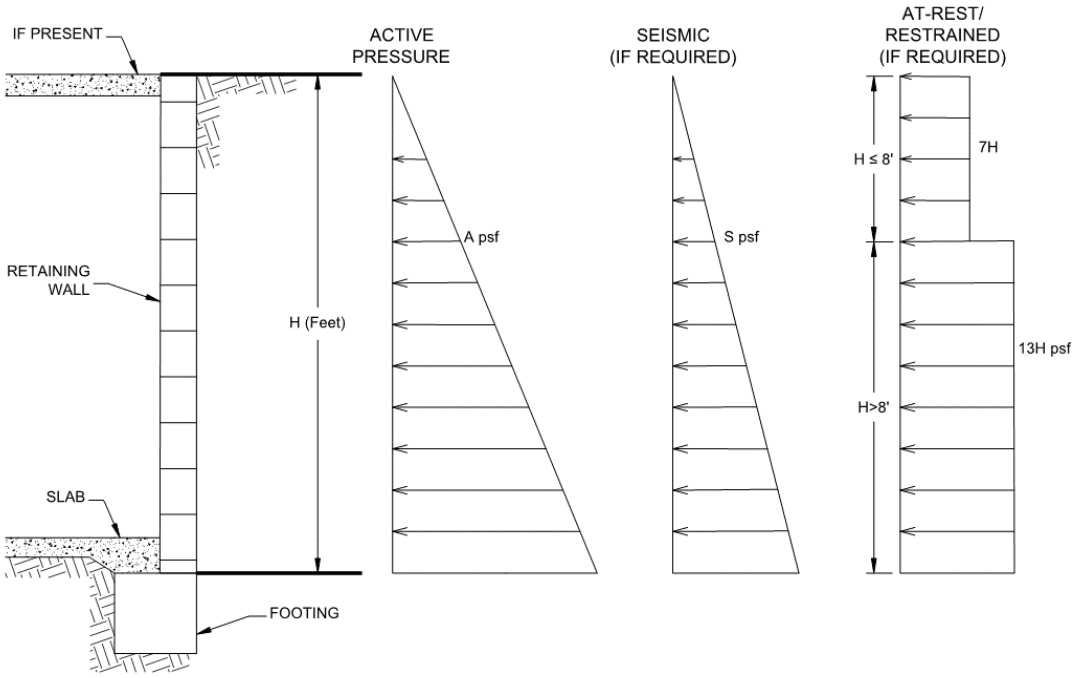
7.9.1 Retaining walls should be designed using the values presented in Table 7.9.1. Soil with an expansion index (EI) of greater than 50 should not be used as backfill material behind retaining walls.

TABLE 7.9.1
RETAINING WALL DESIGN RECOMMENDATIONS

Parameter	ValueP
Active Soil Pressure, A (Fluid Density, Level Backfill)	35 pcf
Active Soil Pressure, A (Fluid Density, 2:1 Sloping Backfill)	50 pcf
Seismic Pressure, S	18H psf
At-Rest/Restrained Walls Additional Uniform Pressure (0 to 8 Feet High)	8H psf
At-Rest/Restrained Walls Additional Uniform Pressure (8+ Feet High)	12H psf
Expected Expansion Index for the Subject Property	EI≤50

H equals the height of the retaining portion of the wall

7.9.2 The project retaining walls should be designed as shown in the Retaining Wall Loading Diagram.



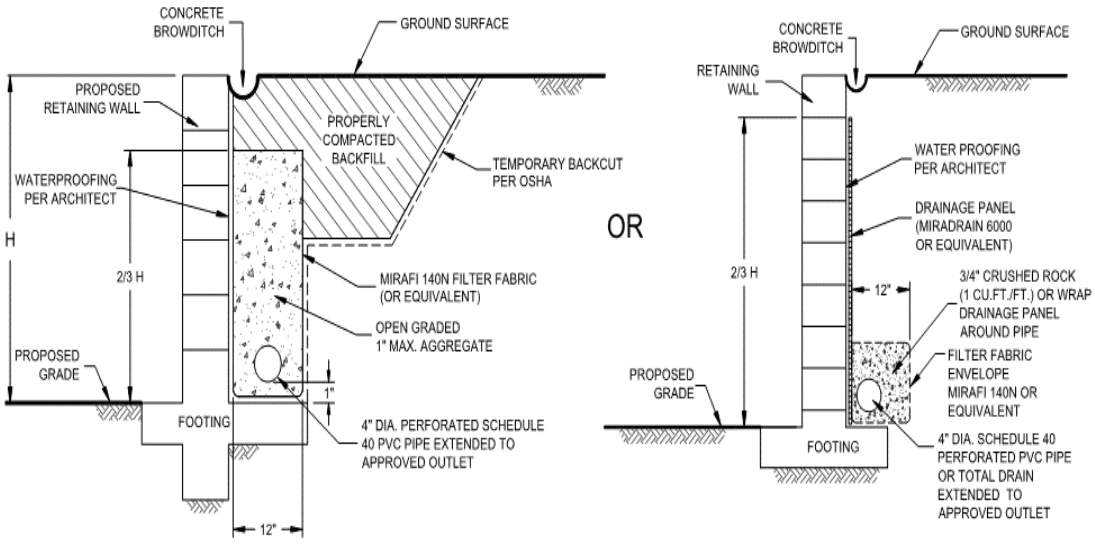
Retaining Wall Loading Diagram

7.9.3 Unrestrained walls are those that are allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall) at the top of the wall. Where walls are restrained from movement at the top (at-rest condition), an additional uniform pressure should be applied to the wall. For retaining walls subject to vehicular loads within a horizontal distance equal to two-thirds the wall height, a surcharge equivalent to 2 feet of fill soil should be added.

7.9.4 The structural engineer should determine the Seismic Design Category for the project in accordance with Section 1613.3.5 of the 2019 CBC or Section 11.6 of ASCE 7-16. For structures assigned to Seismic Design Category of D, E, or F, retaining walls that support more than 6 feet of backfill should be designed with seismic lateral pressure in accordance with Section 1803.5.12 of the 2019 CBC. The seismic load is dependent on the retained height where H is the height of the wall, in feet, and the calculated loads result in pounds per square foot (psf) exerted at the base of the wall and zero at the top of the wall.

7.9.5 Retaining walls should be designed to ensure stability against overturning sliding, and excessive foundation pressure. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, it is not necessary to consider active pressure on the keyway.

7.9.6 Drainage openings through the base of the wall (weep holes) should not be used where the seepage could be a nuisance or otherwise adversely affect the property adjacent to the base of the wall. The recommendations herein assume a properly compacted granular (EI of 90 or less) free-draining backfill material with no hydrostatic forces or imposed surcharge load. The retaining wall should be properly drained as shown in the Typical Retaining Wall Drainage Detail. If conditions different than those described are expected, or if specific drainage details are desired, Geocon Incorporated should be contacted for additional recommendations.



Typical Retaining Wall Drainage Detail

7.9.7 The retaining walls may be designed using either the active and restrained (at-rest) loading condition or the active and seismic loading condition as suggested by the structural engineer. Typically, it appears the design of the restrained condition for retaining wall loading may be adequate for the seismic design of the retaining walls. However, the active earth pressure combined with the seismic design load should be reviewed and also considered in the design of the retaining walls.

7.9.8 In general, wall foundations should be designed in accordance with Table 7.9.2. The proximity of the foundation to the top of a slope steeper than 3:1 could impact the allowable soil bearing pressure. Therefore, retaining wall foundations should be deepened such that the bottom outside edge of the footing is at least 7 feet horizontally from the face of the slope.

TABLE 7.9.2
SUMMARY OF RETAINING WALL FOUNDATION RECOMMENDATIONS

Parameter	Value
Minimum Retaining Wall Foundation Width	12 inches
Minimum Retaining Wall Foundation Depth	12 Inches
Minimum Steel Reinforcement	Per Structural Engineer
Allowable Bearing Capacity	2,000 psf
Bearing Capacity Increase	500 psf per Foot of Depth
	300 psf per Foot of Width
Maximum Allowable Bearing Capacity	4,000 psf
Estimated Total Static Settlement*	1 Inch
Estimated Differential Static Settlement*	½ Inch in 40 Feet

7.9.9 The recommendations presented herein are generally applicable to the design of rigid concrete or masonry retaining walls. In the event that other types of walls (such as mechanically stabilized earth [MSE] walls) are planned, Geocon Incorporated should be consulted for additional recommendations.

7.9.10 Unrestrained walls will move laterally when backfilled and loading is applied. The amount of lateral deflection is dependent on the wall height, the type of soil used for backfill, and loads acting on the wall. The retaining walls and improvements above the retaining walls should be designed to incorporate an appropriate amount of lateral deflection as determined by the structural engineer.

7.9.11 Soil contemplated for use as retaining wall backfill, including import materials, should be identified in the field prior to backfill. At that time, Geocon Incorporated should obtain samples for laboratory testing to evaluate its suitability. Modified lateral earth pressures may be necessary if the backfill soil does not meet the required expansion index or shear strength. City or regional standard wall designs, if used, are based on a specific active lateral earth pressure and/or soil friction angle. In this regard, on-site soil to be used as backfill may or may not meet the values for standard wall designs. Geocon Incorporated should be consulted to assess the suitability of the on-site soil for use as wall backfill if standard wall designs will be used.

7.10 Lateral Loading

7.10.1 Table 7.10 should be used to help design the proposed structures and improvements to resist lateral loads for the design of footings or shear keys. The allowable passive pressure assumes a horizontal surface extending at least 5 feet, or three times the surface generating the passive pressure, whichever is greater. The upper 12 inches of material in areas not protected by floor slabs or pavement should not be included in design for passive resistance.

TABLE 7.10
SUMMARY OF LATERAL LOAD DESIGN RECOMMENDATIONS

Parameter	Value
Passive Pressure Fluid Density	300 pcf
Coefficient of Friction (Concrete and Soil)	0.35
Coefficient of Friction (Along Vapor Barrier)	0.2 to 0.25*

*Per manufacturer's recommendations.

7.10.2 The passive and frictional resistant loads can be combined for design purposes. The lateral passive pressures may be increased by one-third when considering transient loads due to wind or seismic forces.

7.11 Mechanically Stabilized Earth (MSE) Retaining Walls

7.11.1 Mechanized stabilized earth (MSE) retaining walls can be used on the property. MSE retaining walls are alternative walls that consist of modular block facing units with geogrid reinforced earth behind the block. The reinforcement grid attaches to the block units and is typically placed at specified vertical intervals and embedment lengths. The grid length and spacing will be determined by the wall designer.

7.11.2 The geotechnical parameters listed in Table 7.11 can be used for preliminary design of the MSE walls. Soil with an expansion index (EI) of greater than 50 should not be used as backfill material behind retaining walls. In addition, some wall designers request soil with a plasticity index greater than 20, a liquid limit greater than 40 and a fines content greater than 35 percent should not be used for soil within the reinforcing zone. This may require import of select materials for the wall backfilling operations or selectively stockpiling of granular soils. Once the backfill source has been determined, laboratory testing should be performed to check that the shear strength parameters used in the design of the MSE walls meet or exceed the required strength within the reinforced zone.

TABLE 7.11
GEOTECHNICAL PARAMETERS FOR MSE WALLS

Parameter	Reinforced Zone	Retained Zone	Foundation Zone
Angle of Internal Friction	30 degrees	30 degrees	30 degrees
Cohesion	0 psf	0 psf	0 psf
Wet Unit Density	125 pcf	125 pcf	125 pcf

7.11.3 The soil parameters presented in Table 7.17 are based on our experience with MSE wall contractors on previous projects. The wet unit density values presented in Table 7.17 can be used for design but actual in-place densities may range from approximately 110 to 135 pounds per cubic foot. Geocon has no way of knowing which materials will actually be used as backfill behind the wall during construction. It is up to the wall designers to use their judgment in selection of the design parameters. As such, once backfill materials have been selected and/or stockpiled, sufficient shear tests should be conducted on samples of the proposed backfill materials to check that they conform to actual design values. Results should be provided to the designer to re-evaluate stability of the walls. Dependent upon test results, the designer may require modifications to the original wall design (e.g., longer reinforcement embedment lengths and/or steel reinforcement).

7.11.4 The foundation zone is the area where the footing is embedded, the reinforced zone is the area of the backfill that possesses the reinforcing fabric, and the retained zone is the area behind the reinforced zone.

7.11.5 Wall foundations having a minimum depth and width of one foot may be designed for an allowable soil bearing pressure of 2,000 psf. The MSE walls should be designed for a total and differential static settlement of 1-inch and ½-inch in 40 feet, respectively.

7.11.6 Backfill materials within the reinforced zone should be compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content in accordance with ASTM D 1557. This is applicable to the entire embedment width of the reinforcement. Typically, wall designers specify no heavy compaction equipment within 3 feet of the face of the wall. However, smaller equipment (e.g., walk-behind, self-driven compactors or hand whackers) can be used to compact the materials without causing deformation of the wall. If the designer specifies no compactive effort for this zone, the materials are essentially not properly compacted and the reinforcement grid within the uncompacted zone should not be relied upon for reinforcement, and overall embedment lengths will have to be increased to account for the difference.

7.11.7 The wall should be provided with a drainage system sufficient to prevent excessive seepage through the wall and the base of the wall, thus preventing hydrostatic pressures behind the wall.

7.11.8 Geosynthetic reinforcement must elongate to develop full tensile resistance. This elongation generally results in movement at the top of the wall. The amount of movement is dependent upon the height of the wall (e.g., higher walls rotate more) and the type of reinforcing grid used. In addition, over time the reinforcement grid has been known to exhibit creep (sometimes as much as 5 percent) and can undergo additional movement. Given this condition, the owner should be aware that structures and pavement placed within the reinforced and retained zones of the wall may undergo movement.

7.11.9 The MSE wall contractor should provide the estimated deformation of wall and adjacent ground in associated with wall construction. The calculated horizontal and vertical deformations should be determined by the wall designer. The estimated movements should be provided to the project structural engineer to determine if the planned improvements can tolerate the expected movements.

7.11.10 The MSE wall designer/contractor should review this report, including the slope stability requirements, and incorporate our recommendations as presented herein. We should be provided the plans for the MSE walls to check if they are in conformance with our recommendations prior to issuance of a permit and construction.

7.12 Preliminary Pavement Recommendations

7.12.1 We calculated the preliminary flexible pavement sections in general conformance with the *Caltrans Method of Flexible Pavement Design* (Highway Design Manual, Section 608.4) using estimated Traffic Indices (TI's) of 4.5, 5.0, 6.0 and 7.0 for the interior roadways. The project civil engineer and owner should review the pavement designations to determine appropriate locations for pavement thickness. We have assumed an R-Value of 10 and 78 for the subgrade soil and base materials, respectively, for the purposes of this preliminary analysis. The final pavement sections should be based on the R-Value of the subgrade soil encountered at final subgrade elevation once site grading and utility trench backfill is completed. Table 7.12.1 presents the preliminary flexible pavement sections.

TABLE 7.12.1
PRELIMINARY FLEXIBLE PAVEMENT SECTION

Location	Assumed Traffic Index	Assumed Subgrade R-Value	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Parking Stalls	4.5	10	3	7
Interior Roadways (light-duty)	5.0	10	3	9
Interior Roadways (medium duty)	6.0	10	3.5	12.5
Interior Roadways (heavy duty)	7.0	10	4	14.5

7.12.2 Prior to placing base materials, the upper 12 inches of the subgrade soil should be scarified, moisture conditioned as necessary, and recompacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content as determined by ASTM D 1557. Similarly, the base material should be compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Asphalt concrete should be compacted to a density of at least 95 percent of the laboratory Hveem density in accordance with ASTM D 2726.

7.12.3 Base materials should conform to Section 26-1.02B of the *Standard Specifications for The State of California Department of Transportation (Caltrans)* with a ¾-inch maximum size aggregate. The asphalt concrete should conform to Section 203-6 of the *Standard Specifications for Public Works Construction (Greenbook).*

7.12.4 The base thickness can be reduced if a reinforcement geogrid is used during the installation of the pavement. Geocon should be contact for additional recommendations, if required.

7.12.5 A rigid Portland cement concrete (PCC) pavement section should be placed in driveway entrance aprons, cross-gutters and trash bin loading/storage areas. The concrete pad for trash truck areas should be large enough such that the truck wheels will be positioned on the concrete during loading. We calculated the rigid pavement section in general conformance with the procedure recommended by the American Concrete Institute report ACI 330R-08 *Guide for Design and Construction of Concrete Parking Lots* using the parameters presented in Table 7.12.2.

TABLE 7.12.2
RIGID PAVEMENT DESIGN PARAMETERS

Design Parameter	Design Value
Modulus of subgrade reaction, k	50 pci
Modulus of rupture for concrete, M_R	500 psi
Traffic Category, TC	A and B
Average daily truck traffic, ADTT	10 and 25

7.12.6 Based on the criteria presented herein, the PCC pavement sections should have a minimum thickness as presented in Table 7.12.3.

TABLE 7.12.3
RIGID PAVEMENT RECOMMENDATIONS

Location	Portland Cement Concrete (inches)
Medium Duty Areas (TC=B)	6.0
Heavy Duty Areas (TC=C)	7.0

7.12.7 The PCC pavement should be placed over subgrade soil that is compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. This pavement section is based on a minimum concrete compressive strength of approximately 3,000 psi (pounds per square inch). Base materials will not be required beneath concrete improvements including cross-gutters, curb and gutters, and sidewalks.

7.12.8 A thickened edge or integral curb should be constructed on the outside of concrete slabs subjected to wheel loads. The thickened edge should be 1.2 times the slab thickness or a minimum thickness of 2 inches, whichever results in a thicker edge, and taper back to the recommended slab thickness 4 feet behind the face of the slab (e.g., a 7.5-inch-thick slab would have a 9.5-inch-thick edge). Reinforcing steel will not be necessary within the concrete for geotechnical purposes with the possible exception of dowels at construction joints as discussed herein.

7.12.9 To control the location and spread of concrete shrinkage cracks, crack-control joints (weakened plane joints) should be included in the design of the concrete pavement slab. Crack-control joints should not exceed 30 times the slab thickness with a maximum spacing of 15 feet for slabs 6 inches and thicker and should be sealed with an appropriate sealant to prevent the migration of water through the control joint to the subgrade materials. The depth of the crack-control joints should be determined by the referenced ACI report. The depth of

the crack-control joints should be at least ¼ of the slab thickness when using a conventional saw, or at least 1 inch when using early-entry saws on slabs 9 inches or less in thickness, as determined by the referenced ACI report discussed in the pavement section herein. Cuts at least ¼ inch wide are required for sealed joints, and a ⅜ inch wide cut is commonly recommended. A narrow joint width of $^1/_{10}$ to $^1/_8$-inch wide is common for unsealed joints.

7.12.10 Concrete curb/gutter should be placed on soil subgrade compacted to a dry density of at least 90 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Cross-gutters should be placed on subgrade soil compacted to a dry density of at least 95 percent of the laboratory maximum dry density near to slightly above optimum moisture content. Base materials should not be placed below the curb/gutter, cross-gutters, or sidewalk so water is not able to migrate from the adjacent parkways to the pavement sections.

7.12.11 The performance of pavement is highly dependent on providing positive surface drainage away from the edge of the pavement. Ponding of water on or adjacent to the pavement and subgrade will likely result in pavement distress and subgrade failure. Drainage from landscaped areas should be directed to controlled drainage structures. Landscape areas adjacent to the edge of asphalt pavements are not recommended due to the potential for surface or irrigation water to infiltrate the underlying permeable aggregate base and cause distress. Where such a condition cannot be avoided, consideration should be given to incorporating measures that will significantly reduce the potential for subsurface water migration into the aggregate base. If planter islands are planned, the perimeter curb should extend at least 6 inches below the level of the base materials.

7.13 Low Impact Development (Bioswales, Bio-retention systems)

7.13.1 At the completion of grading the site will be underlain by compacted fill over dense/hard formation materials. Based on soils encountered during the field investigation, we anticipate that the compacted fill will consist of sandy clay and clayey gravel, and mixtures of angular gravel and boulders generated from blasting operations in granitic rock. Infiltrating into compacted fill generally results in settlement of granular soils, heaving of expansive soils, and distress to improvements placed over the compacted fill; as well as slope instability. It is our opinion the compacted fill is unsuitable for infiltration of storm water runoff due to the potential for adverse settlement and potential for water to daylight. The formational materials (Friars Formation and granitic rock) are also sufficiently dense and impermeable that infiltration water would be expected to perch on the surface.

7.13.2 Bio-retention basins, bioswales and bio-remediation areas should be designed by the project civil engineer and reviewed by Geocon Incorporated. Typically, bioswales consist of a surface

layer of vegetation underlain by clean sand. A subdrain should be provided beneath the sand layer. Prior to discharging into the storm drain pipe, a seepage cutoff wall should be constructed at the interface between the subdrain and storm drain pipe. The concrete cut-off wall should extend at least 6 inches beyond the perimeter of the gravel-packed subdrain system.

7.13.3 To minimize adverse impacts to existing or planned improvements, we recommend that proposed LID systems be provided with a waterproof liner, such as 30-mil HDPE, or equivalent, to prevent water infiltration and saturation of compacted fill soil and formational materials. This recommendation is intended to reduce potential negative impacts to public and private improvements due to water infiltration. Downstream properties may be subjected to seeps, springs, slope instability, raised groundwater, movement of foundations and slabs, or other impacts as a result of water infiltration. Saturating compacted fills typically results in induced hydraulic settlement of the fills potentially impacting adjacent surface improvements supported by the fill. Bioswale systems when located adjacent to pavements often enable water to migrate beneath pavements saturating subgrade soils and aggregate base, which can lead to premature pavement distress. Also, water may enter underground utility pipe zones and impact improvements down gradient from the site.

7.13.4 A storm water vault is shown on the Tentative Map. If this vault allows water to migrate into the subgrade soils, the design should include an impermeable liner, as discussed in Appendix C.

7.13.5 As plans progress and details for LID systems are available for our review, we can provide additional recommendations. Temporary detention basins in areas where improvements have not been constructed do not need to be lined.

7.13.6 Appendix C presents storm water management for the subject project in accordance with City of Poway Storm Water BMP Design Manual. Recommendations for the planned drainage management areas (DMA) are presented in Appendix C.

7.13.7 The landscape architect should be consulted to provide the appropriate plant recommendations for use with LID systems. If drought resistant plants are not used, irrigation may be required.

7.14 Site Drainage and Moisture Protection

7.14.1 Adequate site drainage is critical to reduce the potential for differential soil movement, erosion and subsurface seepage. Under no circumstances should water be allowed to pond adjacent to footings. The site should be graded and maintained such that surface drainage is

directed away from structures in accordance with 2019 CBC 1804.3 or other applicable standards. In addition, surface drainage should be directed away from the top of slopes into swales or other controlled drainage devices. Roof and pavement drainage should be directed into conduits that carry runoff away from the proposed structure.

7.14.2 Underground utilities should be leak free. Utility and irrigation lines should be checked periodically for leaks, and detected leaks should be repaired promptly. Detrimental soil movement could occur if water is allowed to infiltrate the soil for prolonged periods of time.

7.14.3 Landscaping planters adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Area drains to collect excess irrigation water and transmit it to drainage structures or impervious above-grade planter boxes can be used. In addition, where landscaping is planned adjacent to the pavement, construction of a cutoff wall along the edge of the pavement that extends at least 6 inches below the bottom of the base material should be considered.

7.15 Slope Maintenance

7.15.1 Slopes that are steeper than 3:1 (horizontal:vertical) may, under conditions that are both difficult to prevent and predict, be susceptible to near-surface (surficial) slope instability. The instability is typically limited to the outer 3 feet of a portion of the slope and usually does not directly impact the improvements on the pad areas above or below the slope. The occurrence of surficial instability is more prevalent on fill slopes and is generally preceded by a period of heavy rainfall, excessive irrigation, or the migration of subsurface seepage. The disturbance and/or loosening of the surficial soils, as might result from root growth, soil expansion, or excavation for irrigation lines and slope planting, may also be a significant contributing factor to surficial instability. It is therefore recommended that, to the maximum extent practical: (a) disturbed/loosened surficial soils be either removed or properly recompacted, (b) irrigation systems be periodically inspected and maintained to eliminate leaks and excessive irrigation, and (c) surface drains on and adjacent to slopes be periodically maintained to preclude ponding or erosion. Although the incorporation of the above recommendations should reduce the potential for surficial slope instability, it will not eliminate the possibility and, therefore, it may be necessary to rebuild or repair a portion of the project's slopes in the future.

7.16 Grading and Foundation Plan Review

7.16.1 Geocon Incorporated should review the grading plans and foundation plans for the project prior to final design submittal to evaluate whether additional analyses and/or recommendations are required

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

2. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon Incorporated should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon Incorporated.

3. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

4. The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The initial field investigation was performed on May 28, 2021, and consisted of a visual site reconnaissance and drilling 10 air-track borings in anticipated cut areas. On May 18, 2022, eleven exploratory trenches were excavated to evaluate the thickness and condition of surficial soils requiring remedial grading. The approximate locations of the exploratory trenches and air-track borings are shown on the Geologic Map, Figure 2.

The exploratory trenches were performed using a John Deere 310L rubber tire backhoe equipped with a 24-inch-wide bucket. We collected bulk soil samples for laboratory testing. The air-track borings were advanced using an Ingersoll-Rand ECM 490 drill rig with 4-inch diameter bit.

The soil conditions encountered in the excavations were visually classified and logged in general accordance with American Society for Testing and Materials (ASTM) practice for Description and Identification of Soils (Visual Manual Procedure D 2844) and, where applicable, in general conformance with current Caltrans Soil and Rock Logging, Classification and Presentation Manual. Logs of the backhoe trenches depicting the soil and geologic conditions encountered and the depth at which samples were obtained are presented on Figures A-1 through A-11. Air-track boring logs are presented as Figures A-12 through A-21.

APPENDIX B

LABORATORY TESTING

We performed laboratory testing on select soil samples in accordance with generally accepted test methods of the American Society for Testing and Materials (ASTM) or other suggested procedures.

Selected disturbed bulk samples were tested for maximum dry density and optimum moisture content, shear strength characteristics, expansion potential, and water-soluble sulfate content. The results of our laboratory tests are presented in Tables B-1 through B-IV.

TABLE B-I
SUMMARY OF LABORATORY MAXIMUM DRY DENSITY AND OPTIMUM MOISTURE CONTENT TEST RESULTS
ASTM D 1557

Sample No.	Description	Maximum Dry Density (pcf)	Optimum Moisture Content (% dry wt.)
T1-1	Brown, Silty/Clayey SAND with gravel and cobble (includes 14 percent rock correction)	137.3	6.7
T5-1/T8-1	Dark brown, Sandy CLAY with trace gravel	123.5	11.4
T10-1/T11-1	Reddish-brown, Silty/Clayey, fine to medium SAND	130.0	9.0
T11-2	Light brown, Silty, fine to medium SAND with trace gravel	134.2	8.3

TABLE B-II
SUMMARY OF LABORATORY DIRECT SHEAR TEST RESULTS
ASTM D 3080

Sample No.*	Dry Density (pcf)	Moisture Content (%)		Unit Cohesion (psf) Peak	Angle of Shear Resistance (degrees)
		Initial	Final		
T1-1	120.6	8.0	12.6	450	33
T5-1/T8-1	109.6	13.0	23.8	300	26
T10-1/T11-1	116.8	9.3	13.9	580	30
T11-2	121.5	8.0	13.0	490	33

*Soil samples remolded to 90 percent of laboratory maximum dry density at near optimum moisture content. Ultimate values are shown.

TABLE B-III
SUMMARY OF LABORATORY EXPANSION INDEX TEST RESULTS
ASTM D 4829

Sample No.	Moisture Content (%)		Dry Density (pcf)	Expansion Index	ASTM Classification (per 2019 CBC)
	Before Test	After Test			
T1-1	7.6	15.2	118.8	61	Medium
T5-1/T8-1	10.9	26.2	105.7	112	High
T10-1/T11-1	8.6	15.3	115.1	3	Very Low

TABLE B-IV
SUMMARY OF LABORATORY WATER-SOLUBLE SULFATE TEST RESULTS
CALIFORNIA TEST NO. 417

Sample No.	Water-Soluble Sulfate (%)	Sulfate Exposure Class*	Exposure Rating (severity)
T1-1	0.012	Not Applicable	S0
T5-1/T8-1	0.035	Not Applicable	S0

APPENDIX C

STORM WATER MANAGEMENT

FOR

OAK KNOLL
POWAY, CALIFORNIA

PROJECT NO. G2746-32-02

APPENDIX C

STORM WATER MANAGEMENT INVESTIGATION

We understand storm water management devices are being proposed in accordance with the *2016 City of Poway BMP Design Manual*, commonly referred to as the *Storm Water Standards* (SWS). If not properly constructed, there is a potential for distress to improvements and properties located hydrologically down gradient or adjacent to these devices. Factors such as the amount of water to be detained, its residence time, and soil permeability have an important effect on seepage transmission and the potential adverse impacts that may occur if the storm water management features are not properly designed and constructed. We have not performed a hydrogeological study at the site. If infiltration of storm water runoff occurs, downstream properties may be subjected to seeps, springs, slope instability, raised groundwater, movement of foundations and slabs, or other undesirable impacts as a result of water infiltration.

Hydrologic Soil Group

The United States Department of Agriculture (USDA), Natural Resources Conservation Services, possesses general information regarding the existing soil conditions for areas within the United States. The USDA website also provides the Hydrologic Soil Group. Table C-1 presents the descriptions of the hydrologic soil groups. In addition, the USDA website also provides an estimated saturated hydraulic conductivity for the existing soil.

TABLE C-1
HYDROLOGIC SOIL GROUP DEFINITIONS

Soil Group	Soil Group Definition
A	Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.
B	Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.
C	Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.
D	Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high-water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

The northern property is underlain by three units identified as Cieneba rocky coarse sandy loam (CmE2), Olivehain cobbly loam (OhC), and Placentia sandy loam (PfC). Table C-2A presents the information from the USDA NRCS website for the subject property.

TABLE C-2A
USDA WEB SOIL SURVEY – HYDROLOGIC SOIL GROUP (NORTH PROPERTY)

Map Unit Name	Map Unit Symbol	Approximate Percentage of Property	Hydrologic Soil Group	k_{SAT} of Most Limiting Layer (inches/hour)
Cieneba rocky coarse sandy loam	CmE2	1	D	1.98 – 5.95
Olivehain cobbly loam	OhC	20	D	0.0 – 0.06
Placentia sandy loam	PfC	79	D	0.0 – 0.06

The southern property is underlain by Placentia sandy loam (PfC) and Visalia sandy loam (VaA). Table C-2B presents the information from the USDA NRCS website for the subject property.

TABLE C-2B
USDA WEB SOIL SURVEY – HYDROLOGIC SOIL GROUP (SOUTH PROPERTY)

Map Unit Name	Map Unit Symbol	Approximate Percentage of Property	Hydrologic Soil Group	k_{SAT} of Most Limiting Layer (inches/hour)
Placentia sandy loam	PfC	73	D	0.0 – 0.06
Visalia sandy loam	VaA	27	A	1.98 – 5.95

In-Situ Testing

The infiltration rate, percolation rates and saturated hydraulic conductivity are different and have different meanings. Percolation rates tend to overestimate infiltration rates and saturated hydraulic conductivities by a factor of 10 or more. Table C-3 describes the differences in the definitions.

TABLE C-3
SOIL PERMEABILITY DEFINITIONS

Term	Definition
Infiltration Rate	The observation of the flow of water through a material into the ground downward into a given soil structure under long term conditions. This is a function of layering of soil, density, pore space, discontinuities and initial moisture content.
Percolation Rate	The observation of the flow of water through a material into the ground downward and laterally into a given soil structure under long term conditions. This is a function of layering of soil, density, pore space, discontinuities and initial moisture content.
Saturated Hydraulic Conductivity (k_{SAT}, Permeability)	The volume of water that will move in a porous medium under a hydraulic gradient through a unit area. This is a function of density, structure, stratification, fines content and discontinuities. It is also a function of the properties of the liquid as well as of the porous medium.

The degree of soil compaction or in-situ density has a significant impact on soil permeability and infiltration. Based on our experience and other studies we performed, an increase in compaction results in a decrease in soil permeability.

We performed one constant head, borehole Infiltration Test, I-1, at location shown on the attached Geologic Map, Figure 2. The test boring was 4 inches in diameter. The results of the tests provide parameters for the saturated hydraulic conductivity characteristics of on-site soil and geologic units. Table C-4 presents the results of the estimated field saturated hydraulic conductivity and estimated infiltration rates obtained from the borehole percolation test. The test results are also attached herein. We applied a feasibility factor of safety of 2 to the field results for use in preparation of Worksheet C.4-1. The results of the testing indicate adjusted soil infiltration rates of 0.0 inches per hour after applying a Factor of Safety of 2.

TABLE C-4
FIELD PERMEAMETER INFILTRATION TEST RESULTS

Test No.	Geologic Unit	Test Depth (feet)	Field-Saturated Hydraulic Conductivity, k_{sat} (inch/hour)	Worksheet[1] Saturated Hydraulic Conductivity, k_{sat} (inch/hour)
I-1	Qt	2.7	0.071	0.036

[1] Using a factor of safety of 2 for Worksheet C.4-1.

STORM WATER MANAGEMENT CONCLUSIONS

The Geologic Map, Figure 2, depicts the existing property, proposed development, the approximate lateral limits of the geologic units, the locations of the field excavations and the in-situ infiltration test locations.

Soil Types

Proposed Compacted Fill – Compacted fill will be placed across the entire property during site development. Proposed remedial grading will consist of removing the surficial soils and replacement as compacted fill. The proposed storm water BMP's will be founded in compacted fill placed above Friars Formation or granitic rock. The compacted fill will be comprised of on-site sandy clay and clayey gravel. The fill will be compacted to a dry density of at least 90 percent of the laboratory maximum dry density. In our experience, compacted fill does not possess infiltration rates appropriate for infiltration BMP's. Hazards that occur as a result of fill soil saturation include a potential for hydro-consolidation of the granular fill soils, heaving of expansive soils, long term fill settlement, differential fill settlement, and lateral movement associated with saturated fill relaxation. The potential for lateral water migration to adversely impact existing or proposed structures, foundations, utilities, and roadways, is high. Therefore, full infiltration should be considered infeasible.

Section D.4.2 of the *2016 Storm Water Standards* (SWS) provides a discussion regarding fill materials used for infiltration. The SWS states:

- *For engineered fills, infiltration rates may still be quite uncertain due to layering and heterogeneities introduced as part of construction that cannot be precisely controlled.* Due to these uncertainties, full and partial infiltration should be considered geotechnically infeasible and liners and subdrains should be used in areas where infiltration BMP's are founded in compacted fill.

- *Where possible, infiltration BMPs on fill material should be designed such that their infiltrating surface extends into native soils*. Full and partial infiltration should be considered geotechnically infeasible within the compacted fill and liners and subdrains should be used. If the infiltration BMP's extended below the compacted fill, partial infiltration may be feasible.

- *Because of the uncertainty of fill parameters as well as potential compaction of the native soils, an infiltration BMP may not be feasible*. Therefore, full infiltration should be considered geotechnically infeasible. Partial infiltration may be feasible if the infiltration BMP extends below the compacted fill.

Infiltration Rates

The results of the infiltration test (including the feasibility factor of safety of 2) obtained within the Terrace Deposits was 0.036 inches per hour (iph). Based on the results of the infiltration testing, the test does not meet the minimum threshold for full or partial infiltration; therefore, full and partial infiltration is considered infeasible.

Groundwater Elevations

Groundwater was encountered during the field investigation and is expected to be a constraint.

Soil or Groundwater Contamination

Based on our review of the Geotracker website, no soil contamination exists or is known to exist on-site.

New or Existing Utilities

Existing utilities are present within right of ways adjacent to the existing streets, generally beneath public sidewalks and roadways. Full infiltration near existing or proposed utilities should be avoided to prevent lateral water migration into the permeable trench backfill materials. Any infiltration BMP's should be setback at least 10 feet from closest utility.

Existing and Planned Structures

Proposed storm water BMP's are shown throughout the development. Any proposed storm water BMP's adjacent to existing or proposed structures should include a horizontal setback of at least 10 feet.

Slopes

The northern property moderately to steeply slopes to the south. Proposed cut and fill slopes of approximately 30 feet and 4 feet high, respectively, are proposed. Proposed storm water BMP's adjacent to existing or proposed cut and fill slopes should include a horizontal setback of H and 1.5H, respectively. For example, considering a 30 foot high cut slope and 4 foot high fill slope, a horizontal setback of 30 feet and 6 feet, respectively, should be used.

Recommendations

Due to the low infiltration rate obtained in the Terrace Deposits, and considering the entire site will be underlain with compacted fill over dense granitic rock or hard Friars Formation, full and partial infiltration of storm water is considered geotechnically infeasible and the proposed development exhibits a "*No Infiltration*" condition. Liners and subdrains should be incorporated into the design and construction of the planned storm water devices. The liners should be impermeable (e.g. High-density polyethylene, HDPE, with a thickness of about 30 mil or equivalent Polyvinyl Chloride, PVC) to prevent water migration. The subdrains should be perforated within the liner area, installed at the base and above the liner, be at least 4 inches in diameter and consist of Schedule 40 PVC pipe. The subdrains outside of the liner should consist of solid pipe. Seams and penetrations of the liners should be properly waterproofed. The subdrains should be connected to a proper outlet. The devices should also be installed in accordance with the manufacturer's recommendations.

Storm Water Standard Worksheets

The SWS requests the geotechnical engineer complete the *Categorization of Infiltration Feasibility Condition* (Worksheet C.4-1 or I-8) worksheet information to help evaluate the potential for infiltration on the property. The attached Worksheet C.4-1 presents the completed information for the submittal process.

The regional storm water standards also have a worksheet (Worksheet D.5-1 or Form I-9) that helps the project civil engineer estimate the factor of safety based on several factors. Table C-5 describes the suitability assessment input parameters related to the geotechnical engineering aspects for the factor of safety determination.

TABLE C-5
SUITABILITY ASSESSMENT RELATED CONSIDERATIONS
FOR INFILTRATION FACILITY SAFETY FACTORS

Consideration	High Concern – 3 Points	Medium Concern – 2 Points	Low Concern – 1 Point
Assessment Methods	Use of soil survey maps or simple texture analysis to estimate short-term infiltration rates. Use of well permeameter or borehole methods without accompanying continuous boring log. Relatively sparse testing with direct infiltration methods	Use of well permeameter or borehole methods with accompanying continuous boring log. Direct measurement of infiltration area with localized infiltration measurement methods (e.g., Infiltrometer). Moderate spatial resolution	Direct measurement with localized (i.e. small-scale) infiltration testing methods at relatively high resolution or use of extensive test pit infiltration measurement methods.
Predominant Soil Texture	Silty and clayey soils with significant fines	Loamy soils	Granular to slightly loamy soils
Site Soil Variability	Highly variable soils indicated from site assessment or unknown variability	Soil boring/test pits indicate moderately homogenous soils	Soil boring/test pits indicate relatively homogenous soils
Depth to Groundwater/ Impervious Layer	<5 feet below facility bottom	5-15 feet below facility bottom	>15 feet below facility bottom

Based on our geotechnical investigation and the information in Table C-5, Table C-6 presents the estimated factor values for the evaluation of the factor of safety. This table only provides the suitability assessment safety factor (Part A) of the worksheet. The project civil engineer should evaluate the safety factor for design (Part B) and use the combined safety factor for the design infiltration rate.

TABLE D-6
FACTOR OF SAFETY WORKSHEET DESIGN VALUES – PART A[1]

Suitability Assessment Factor Category	Assigned Weight (w)	Factor Value (v)	Product (p = w x v)
Assessment Methods	0.25	3	0.75
Predominant Soil Texture	0.25	3	0.75
Site Soil Variability	0.25	1	0.25
Depth to Groundwater/ Impervious Layer	0.25	2	0.50
Suitability Assessment Safety Factor, $S_A = \sum p$			2.25

[1] The project civil engineer should complete Worksheet D.5-1 or Form I-9 using the data on this table. Additional information is required to evaluate the design factor of safety.

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for San Diego County Area, California

Oak Knoll North, Poway

June 8, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 16, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 22, 2018—Aug 31, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
CmE2	Cieneba rocky coarse sandy loam, 9 to 30 percent slopes, eroded	0.1	1.2%
OhC	Olivenhain cobbly loam, 2 to 9 percent slopes	1.5	19.8%
PfC	Placentia sandy loam, thick surface, 2 to 9 percent slo pes	5.8	79.0%
Totals for Area of Interest		**7.4**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate

pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

CmE2—Cieneba rocky coarse sandy loam, 9 to 30 percent slopes, eroded

Map Unit Setting

National map unit symbol: hb9t
Elevation: 500 to 4,000 feet
Mean annual precipitation: 8 to 35 inches
Mean annual air temperature: 45 to 64 degrees F
Frost-free period: 110 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Cieneba and similar soils: 60 percent
Rock outcrop: 30 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cieneba

Setting

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Residuum weathered from granite and granodiorite

Typical profile

H1 - 0 to 8 inches: coarse sandy loam
H2 - 8 to 12 inches: weathered bedrock

Properties and qualities

Slope: 9 to 30 percent
Depth to restrictive feature: 4 to 20 inches to paralithic bedrock
Drainage class: Somewhat excessively drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 0.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: D
Ecological site: R019XD060CA - SHALLOW LOAMY (1975)
Hydric soil rating: No

Description of Rock Outcrop

Setting

Landform: Hills

Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex

Typical profile
H1 - 0 to 4 inches: unweathered bedrock

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydrologic Soil Group: D
Hydric soil rating: No

Minor Components

Vista
Percent of map unit: 5 percent
Hydric soil rating: No

Las posas
Percent of map unit: 5 percent
Hydric soil rating: No

OhC—Olivenhain cobbly loam, 2 to 9 percent slopes

Map Unit Setting
National map unit symbol: hbfb
Elevation: 100 to 600 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 290 to 330 days
Farmland classification: Not prime farmland

Map Unit Composition
Olivenhain and similar soils: 85 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Olivenhain

Setting
Landform: Marine terraces
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Gravelly alluvium derived from mixed sources

Typical profile
H1 - 0 to 10 inches: cobbly loam
H2 - 10 to 42 inches: very cobbly clay
H3 - 42 to 60 inches: cobbly clay loam

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 1.3 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

Minor Components

Diablo

Percent of map unit: 4 percent
Hydric soil rating: No

Linne

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, ponded

Percent of map unit: 2 percent
Landform: Depressions
Hydric soil rating: Yes

Huerhuero

Percent of map unit: 2 percent
Hydric soil rating: No

PfC—Placentia sandy loam, thick surface, 2 to 9 percent slo pes

Map Unit Setting

National map unit symbol: hbfn
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)

Custom Soil Resource Report for San Diego County Area, California

Oak Knoll South, Poway, CA

June 8, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
PfC	Placentia sandy loam, thick surface, 2 to 9 percent slopes	0.4	73.4%
VaA	Visalia sandy loam, 0 to 2 percent slopes	0.2	26.6%
Totals for Area of Interest		**0.6**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the

development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

San Diego County Area, California

PfC—Placentia sandy loam, thick surface, 2 to 9 percent slo pes

Map Unit Setting

National map unit symbol: hbfn
Elevation: 50 to 2,500 feet
Mean annual precipitation: 12 to 18 inches
Mean annual air temperature: 61 to 63 degrees F
Frost-free period: 200 to 300 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Placentia and similar soils: 85 percent
Minor components: 11 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placentia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Base slope, rise
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 13 inches: sandy loam
H2 - 13 to 34 inches: clay

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Very slightly saline to moderately saline (2.0 to 8.0 mmhos/cm)
Sodium adsorption ratio, maximum: 25.0
Available water supply, 0 to 60 inches: Very low (about 2.7 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: D
Ecological site: R019XD061CA - CLAYPAN (1975)
Hydric soil rating: No

Minor Components

Ramona

Percent of map unit: 5 percent

Hydric soil rating: No

Bonsall

Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, ponded

Percent of map unit: 1 percent
Landform: Depressions
Hydric soil rating: Yes

VaA—Visalia sandy loam, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hbh2
Elevation: 600 to 1,200 feet
Mean annual precipitation: 15 inches
Mean annual air temperature: 57 degrees F
Frost-free period: 200 to 350 days
Farmland classification: Prime farmland if irrigated and either protected from flooding or not frequently flooded during the growing season

Map Unit Composition

Visalia and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Visalia

Setting

Landform: Alluvial fans
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Riser, flat
Down-slope shape: Linear
Across-slope shape: Convex
Parent material: Alluvium derived from granite

Typical profile

H1 - 0 to 12 inches: sandy loam
H2 - 12 to 40 inches: fine sandy loam
H3 - 40 to 60 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare

Frequency of ponding: None
Available water supply, 0 to 60 inches: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): 1
Land capability classification (nonirrigated): 2c
Hydrologic Soil Group: A
Ecological site: R019XG911CA - Loamy Fan
Hydric soil rating: No

Minor Components

Grangeville

Percent of map unit: 5 percent
Hydric soil rating: No

Greenfield

Percent of map unit: 5 percent
Hydric soil rating: No

Placentia

Percent of map unit: 2 percent
Hydric soil rating: No

Tujunga

Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed

Percent of map unit: 1 percent
Landform: Flood plains
Hydric soil rating: Yes

APPENDIX D

APPENDIX D

RECOMMENDED GRADING SPECIFICATIONS

FOR

OAK KNOLL
POWAY, CALIFORNIA

PROJECT NO. G2746-32-02

RECOMMENDED GRADING SPECIFICATIONS

1. GENERAL

1.1 These Recommended Grading Specifications shall be used in conjunction with the Geotechnical Report for the project prepared by Geocon. The recommendations contained in the text of the Geotechnical Report are a part of the earthwork and grading specifications and shall supersede the provisions contained hereinafter in the case of conflict.

1.2 Prior to the commencement of grading, a geotechnical consultant (Consultant) shall be employed for the purpose of observing earthwork procedures and testing the fills for substantial conformance with the recommendations of the Geotechnical Report and these specifications. The Consultant should provide adequate testing and observation services so that they may assess whether, in their opinion, the work was performed in substantial conformance with these specifications. It shall be the responsibility of the Contractor to assist the Consultant and keep them apprised of work schedules and changes so that personnel may be scheduled accordingly.

1.3 It shall be the sole responsibility of the Contractor to provide adequate equipment and methods to accomplish the work in accordance with applicable grading codes or agency ordinances, these specifications and the approved grading plans. If, in the opinion of the Consultant, unsatisfactory conditions such as questionable soil materials, poor moisture condition, inadequate compaction, and/or adverse weather result in a quality of work not in conformance with these specifications, the Consultant will be empowered to reject the work and recommend to the Owner that grading be stopped until the unacceptable conditions are corrected.

2. DEFINITIONS

2.1 **Owner** shall refer to the owner of the property or the entity on whose behalf the grading work is being performed and who has contracted with the Contractor to have grading performed.

2.2 **Contractor** shall refer to the Contractor performing the site grading work.

2.3 **Civil Engineer** or **Engineer of Work** shall refer to the California licensed Civil Engineer or consulting firm responsible for preparation of the grading plans, surveying and verifying as-graded topography.

2.4 **Consultant** shall refer to the soil engineering and engineering geology consulting firm retained to provide geotechnical services for the project.

2.5 **Soil Engineer** shall refer to a California licensed Civil Engineer retained by the Owner, who is experienced in the practice of geotechnical engineering. The Soil Engineer shall be responsible for having qualified representatives on-site to observe and test the Contractor's work for conformance with these specifications.

2.6 **Engineering Geologist** shall refer to a California licensed Engineering Geologist retained by the Owner to provide geologic observations and recommendations during the site grading.

2.7 **Geotechnical Report** shall refer to a soil report (including all addenda) which may include a geologic reconnaissance or geologic investigation that was prepared specifically for the development of the project for which these Recommended Grading Specifications are intended to apply.

3. MATERIALS

3.1 Materials for compacted fill shall consist of any soil excavated from the cut areas or imported to the site that, in the opinion of the Consultant, is suitable for use in construction of fills. In general, fill materials can be classified as *soil* fills, *soil-rock* fills or *rock* fills, as defined below.

3.1.1 **Soil fills** are defined as fills containing no rocks or hard lumps greater than 12 inches in maximum dimension and containing at least 40 percent by weight of material smaller than ¾ inch in size.

3.1.2 **Soil-rock fills** are defined as fills containing no rocks or hard lumps larger than 4 feet in maximum dimension and containing a sufficient matrix of soil fill to allow for proper compaction of soil fill around the rock fragments or hard lumps as specified in Paragraph 6.2. **Oversize rock** is defined as material greater than 12 inches.

3.1.3 **Rock fills** are defined as fills containing no rocks or hard lumps larger than 3 feet in maximum dimension and containing little or no fines. Fines are defined as material smaller than ¾ inch in maximum dimension. The quantity of fines shall be less than approximately 20 percent of the rock fill quantity.

3.2 Material of a perishable, spongy, or otherwise unsuitable nature as determined by the Consultant shall not be used in fills.

3.3 Materials used for fill, either imported or on-site, shall not contain hazardous materials as defined by the California Code of Regulations, Title 22, Division 4, Chapter 30, Articles 9

and 10; 40CFR; and any other applicable local, state or federal laws. The Consultant shall not be responsible for the identification or analysis of the potential presence of hazardous materials. However, if observations, odors or soil discoloration cause Consultant to suspect the presence of hazardous materials, the Consultant may request from the Owner the termination of grading operations within the affected area. Prior to resuming grading operations, the Owner shall provide a written report to the Consultant indicating that the suspected materials are not hazardous as defined by applicable laws and regulations.

3.4 The outer 15 feet of *soil-rock* fill slopes, measured horizontally, should be composed of properly compacted *soil* fill materials approved by the Consultant. *Rock* fill may extend to the slope face, provided that the slope is not steeper than 2:1 (horizontal:vertical) and a soil layer no thicker than 12 inches is track-walked onto the face for landscaping purposes. This procedure may be utilized provided it is acceptable to the governing agency, Owner and Consultant.

3.5 Samples of soil materials to be used for fill should be tested in the laboratory by the Consultant to determine the maximum density, optimum moisture content, and, where appropriate, shear strength, expansion, and gradation characteristics of the soil.

3.6 During grading, soil or groundwater conditions other than those identified in the Geotechnical Report may be encountered by the Contractor. The Consultant shall be notified immediately to evaluate the significance of the unanticipated condition.

4. CLEARING AND PREPARING AREAS TO BE FILLED

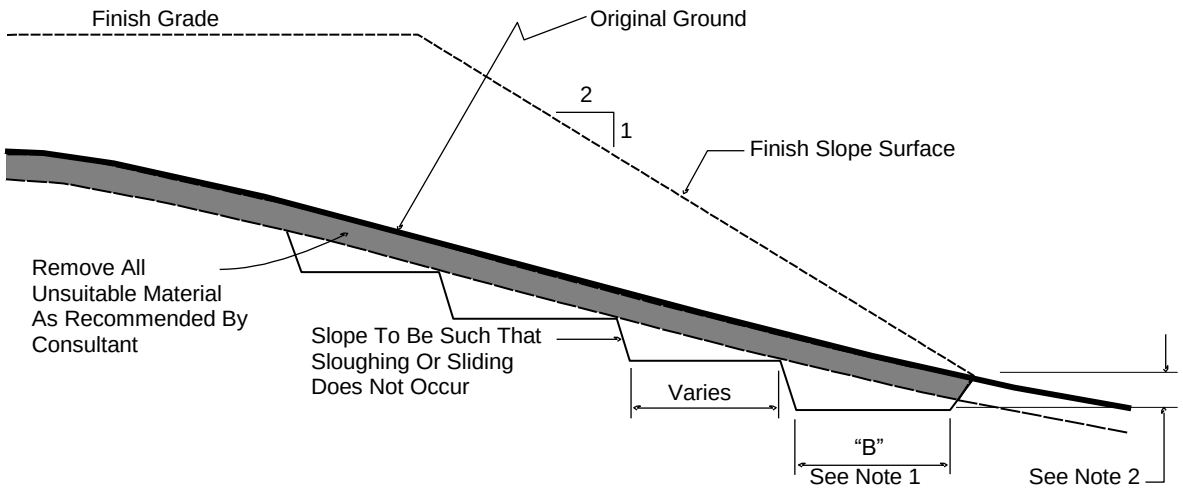
4.1 Areas to be excavated and filled shall be cleared and grubbed. Clearing shall consist of complete removal above the ground surface of trees, stumps, brush, vegetation, man-made structures, and similar debris. Grubbing shall consist of removal of stumps, roots, buried logs and other unsuitable material and shall be performed in areas to be graded. Roots and other projections exceeding 1½ inches in diameter shall be removed to a depth of 3 feet below the surface of the ground. Borrow areas shall be grubbed to the extent necessary to provide suitable fill materials.

4.2 Asphalt pavement material removed during clearing operations should be properly disposed at an approved off-site facility or in an acceptable area of the project evaluated by Geocon and the property owner. Concrete fragments that are free of reinforcing steel may be placed in fills, provided they are placed in accordance with Section 6.2 or 6.3 of this document.

4.3 After clearing and grubbing of organic matter and other unsuitable material, loose or porous soils shall be removed to the depth recommended in the Geotechnical Report. The depth of removal and compaction should be observed and approved by a representative of the Consultant. The exposed surface shall then be plowed or scarified to a minimum depth of 6 inches and until the surface is free from uneven features that would tend to prevent uniform compaction by the equipment to be used.

4.4 Where the slope ratio of the original ground is steeper than 5:1 (horizontal:vertical), or where recommended by the Consultant, the original ground should be benched in accordance with the following illustration.

TYPICAL BENCHING DETAIL



No Scale

DETAIL NOTES:

(1) Key width "B" should be a minimum of 10 feet, or sufficiently wide to permit complete coverage with the compaction equipment used. The base of the key should be graded horizontal, or inclined slightly into the natural slope.

(2) The outside of the key should be below the topsoil or unsuitable surficial material and at least 2 feet into dense formational material. Where hard rock is exposed in the bottom of the key, the depth and configuration of the key may be modified as approved by the Consultant.

4.5 After areas to receive fill have been cleared and scarified, the surface should be moisture conditioned to achieve the proper moisture content, and compacted as recommended in Section 6 of these specifications.

5. COMPACTION EQUIPMENT

5.1 Compaction of *soil* or *soil-rock* fill shall be accomplished by sheepsfoot or segmented-steel wheeled rollers, vibratory rollers, multiple-wheel pneumatic-tired rollers, or other types of acceptable compaction equipment. Equipment shall be of such a design that it will be capable of compacting the *soil* or *soil-rock* fill to the specified relative compaction at the specified moisture content.

5.2 Compaction of *rock* fills shall be performed in accordance with Section 6.3.

6. PLACING, SPREADING AND COMPACTION OF FILL MATERIAL

6.1 *Soil* fill, as defined in Paragraph 3.1.1, shall be placed by the Contractor in accordance with the following recommendations:

6.1.1 *Soil* fill shall be placed by the Contractor in layers that, when compacted, should generally not exceed 8 inches. Each layer shall be spread evenly and shall be thoroughly mixed during spreading to obtain uniformity of material and moisture in each layer. The entire fill shall be constructed as a unit in nearly level lifts. Rock materials greater than 12 inches in maximum dimension shall be placed in accordance with Section 6.2 or 6.3 of these specifications.

6.1.2 In general, the *soil* fill shall be compacted at a moisture content at or above the optimum moisture content as determined by ASTM D 1557.

6.1.3 When the moisture content of *soil* fill is below that specified by the Consultant, water shall be added by the Contractor until the moisture content is in the range specified.

6.1.4 When the moisture content of the *soil* fill is above the range specified by the Consultant or too wet to achieve proper compaction, the *soil* fill shall be aerated by the Contractor by blading/mixing, or other satisfactory methods until the moisture content is within the range specified.

6.1.5 After each layer has been placed, mixed, and spread evenly, it shall be thoroughly compacted by the Contractor to a relative compaction of at least 90 percent. Relative compaction is defined as the ratio (expressed in percent) of the in-place dry density of the compacted fill to the maximum laboratory dry density as determined in accordance with ASTM D 1557. Compaction shall be continuous over the entire area, and compaction equipment shall make sufficient passes so that the specified minimum relative compaction has been achieved throughout the entire fill.

6.1.6 Where practical, soils having an Expansion Index greater than 50 should be placed at least 3 feet below finish pad grade and should be compacted at a moisture content generally 2 to 4 percent greater than the optimum moisture content for the material.

6.1.7 Properly compacted *soil* fill shall extend to the design surface of fill slopes. To achieve proper compaction, it is recommended that fill slopes be over-built by at least 3 feet and then cut to the design grade. This procedure is considered preferable to track-walking of slopes, as described in the following paragraph.

6.1.8 As an alternative to over-building of slopes, slope faces may be back-rolled with a heavy-duty loaded sheepsfoot or vibratory roller at maximum 4-foot fill height intervals. Upon completion, slopes should then be track-walked with a D-8 dozer or similar equipment, such that a dozer track covers all slope surfaces at least twice.

6.2 *Soil-rock* fill, as defined in Paragraph 3.1.2, shall be placed by the Contractor in accordance with the following recommendations:

6.2.1 Rocks larger than 12 inches but less than 4 feet in maximum dimension may be incorporated into the compacted *soil* fill, but shall be limited to the area measured 15 feet minimum horizontally from the slope face and 5 feet below finish grade or 3 feet below the deepest utility, whichever is deeper.

6.2.2 Rocks or rock fragments up to 4 feet in maximum dimension may either be individually placed or placed in windrows. Under certain conditions, rocks or rock fragments up to 10 feet in maximum dimension may be placed using similar methods. The acceptability of placing rock materials greater than 4 feet in maximum dimension shall be evaluated during grading as specific cases arise and shall be approved by the Consultant prior to placement.

6.2.3 For individual placement, sufficient space shall be provided between rocks to allow for passage of compaction equipment.

6.2.4 For windrow placement, the rocks should be placed in trenches excavated in properly compacted *soil* fill. Trenches should be approximately 5 feet wide and 4 feet deep in maximum dimension. The voids around and beneath rocks should be filled with approved granular soil having a Sand Equivalent of 30 or greater and should be compacted by flooding. Windrows may also be placed utilizing an "open-face" method in lieu of the trench procedure, however, this method should first be approved by the Consultant.

6.2.5 Windrows should generally be parallel to each other and may be placed either parallel to or perpendicular to the face of the slope depending on the site geometry. The minimum horizontal spacing for windrows shall be 12 feet center-to-center with a 5-foot stagger or offset from lower courses to next overlying course. The minimum vertical spacing between windrow courses shall be 2 feet from the top of a lower windrow to the bottom of the next higher windrow.

6.2.6 Rock placement, fill placement and flooding of approved granular soil in the windrows should be continuously observed by the Consultant.

6.3 *Rock* fills, as defined in Section 3.1.3, shall be placed by the Contractor in accordance with the following recommendations:

6.3.1 The base of the *rock* fill shall be placed on a sloping surface (minimum slope of 2 percent). The surface shall slope toward suitable subdrainage outlet facilities. The *rock* fills shall be provided with subdrains during construction so that a hydrostatic pressure buildup does not develop. The subdrains shall be permanently connected to controlled drainage facilities to control post-construction infiltration of water.

6.3.2 *Rock* fills shall be placed in lifts not exceeding 3 feet. Placement shall be by rock trucks traversing previously placed lifts and dumping at the edge of the currently placed lift. Spreading of the *rock* fill shall be by dozer to facilitate *seating* of the rock. The *rock* fill shall be watered heavily during placement. Watering shall consist of water trucks traversing in front of the current rock lift face and spraying water continuously during rock placement. Compaction equipment with compactive energy comparable to or greater than that of a 20-ton steel vibratory roller or other compaction equipment providing suitable energy to achieve the required compaction or deflection as recommended in Paragraph 6.3.3 shall be utilized. The number of passes to be made should be determined as described in Paragraph 6.3.3. Once a *rock* fill lift has been covered with *soil* fill, no additional *rock* fill lifts will be permitted over the *soil* fill.

6.3.3 Plate bearing tests, in accordance with ASTM D 1196, may be performed in both the compacted *soil* fill and in the *rock* fill to aid in determining the required minimum number of passes of the compaction equipment. If performed, a minimum of three plate bearing tests should be performed in the properly compacted *soil* fill (minimum relative compaction of 90 percent). Plate bearing tests shall then be performed on areas of *rock* fill having two passes, four passes and six passes of the compaction equipment, respectively. The number of passes required for the *rock* fill shall be determined by comparing the results of the plate bearing tests for the *soil* fill and the *rock* fill and by evaluating the deflection

variation with number of passes. The required number of passes of the compaction equipment will be performed as necessary until the plate bearing deflections are equal to or less than that determined for the properly compacted *soil* fill. In no case will the required number of passes be less than two.

6.3.4 A representative of the Consultant should be present during *rock* fill operations to observe that the minimum number of "passes" have been obtained, that water is being properly applied and that specified procedures are being followed. The actual number of plate bearing tests will be determined by the Consultant during grading.

6.3.5 Test pits shall be excavated by the Contractor so that the Consultant can state that, in their opinion, sufficient water is present and that voids between large rocks are properly filled with smaller rock material. In-place density testing will not be required in the *rock* fills.

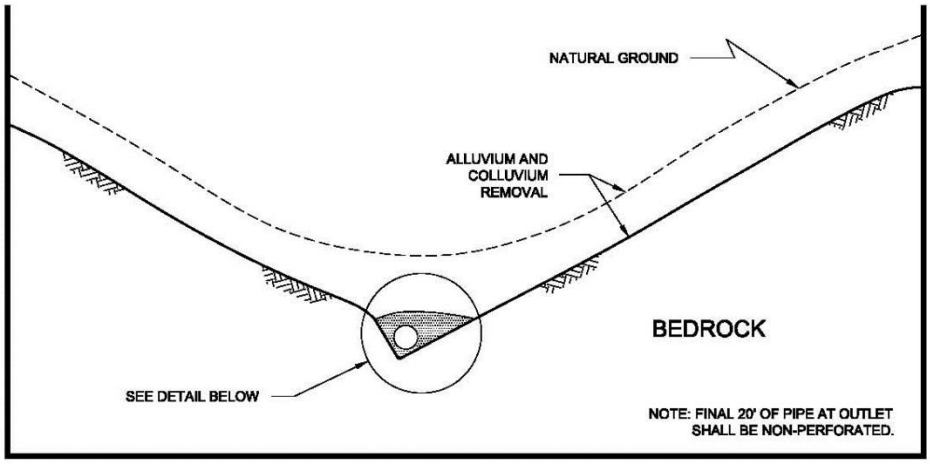
6.3.6 To reduce the potential for "piping" of fines into the *rock* fill from overlying *soil* fill material, a 2-foot layer of graded filter material shall be placed above the uppermost lift of *rock* fill. The need to place graded filter material below the *rock* should be determined by the Consultant prior to commencing grading. The gradation of the graded filter material will be determined at the time the *rock* fill is being excavated. Materials typical of the *rock* fill should be submitted to the Consultant in a timely manner, to allow design of the graded filter prior to the commencement of *rock* fill placement.

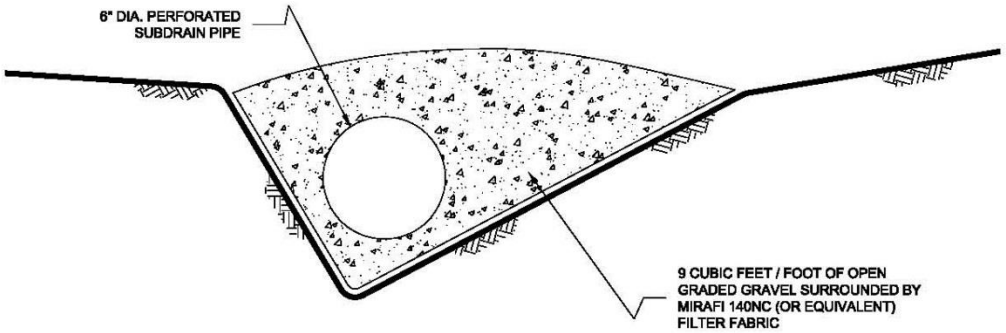
6.3.7 *Rock* fill placement should be continuously observed during placement by the Consultant.

7. SUBDRAINS

7.1 The geologic units on the site may have permeability characteristics and/or fracture systems that could be susceptible under certain conditions to seepage. The use of canyon subdrains may be necessary to mitigate the potential for adverse impacts associated with seepage conditions. Canyon subdrains with lengths in excess of 500 feet or extensions of existing offsite subdrains should use 8-inch-diameter pipes. Canyon subdrains less than 500 feet in length should use 6-inch-diameter pipes.

TYPICAL CANYON DRAIN DETAIL





NOTES:

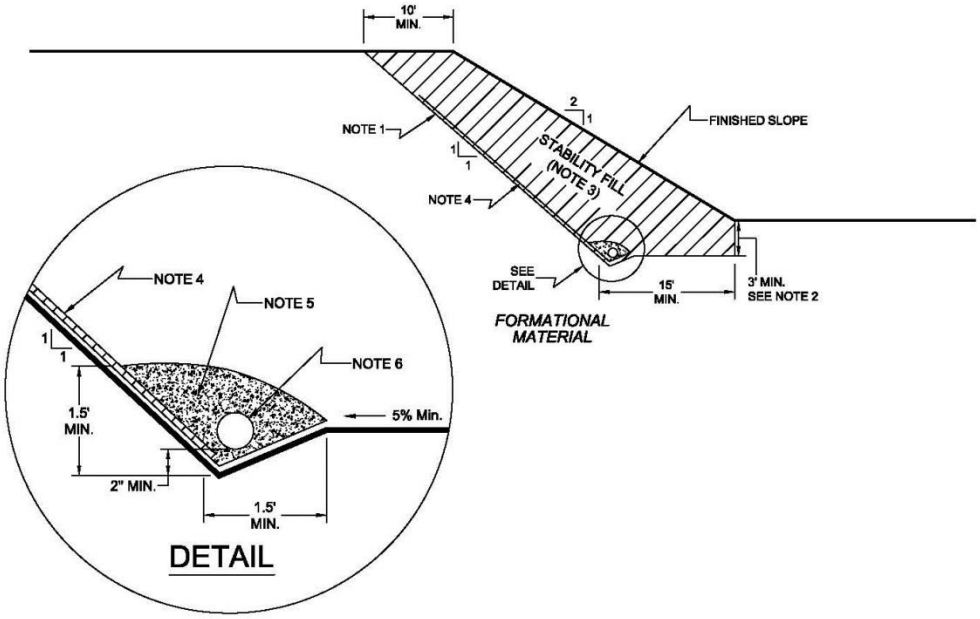
1.....6-INCH DIAMETER, SCHEDULE 80 PVC PERFORATED PIPE FOR FILLS
IN EXCESS OF 100-FEET IN DEPTH OR A PIPE LENGTH OF LONGER THAN 500 FEET.

2.....6-INCH DIAMETER, SCHEDULE 40 PVC PERFORATED PIPE FOR FILLS
LESS THAN 100-FEET IN DEPTH OR A PIPE LENGTH SHORTER THAN 500 FEET.

NO SCALE

7.2 Slope drains within stability fill keyways should use 4-inch-diameter (or lager) pipes.

TYPICAL STABILITY FILL DETAIL



NOTES:

1.....EXCAVATE BACKCUT AT 1:1 INCLINATION (UNLESS OTHERWISE NOTED).

2.....BASE OF STABILITY FILL TO BE 3 FEET INTO FORMATIONAL MATERIAL, SLOPING A MINIMUM 5% INTO SLOPE.

3.....STABILITY FILL TO BE COMPOSED OF PROPERLY COMPACTED GRANULAR SOIL.

4.....CHIMNEY DRAINS TO BE APPROVED PREFABRICATED CHIMNEY DRAIN PANELS (MIRADRAIN G200N OR EQUIVALENT) SPACED APPROXIMATELY 20 FEET CENTER TO CENTER AND 4 FEET WIDE. CLOSER SPACING MAY BE REQUIRED IF SEEPAGE IS ENCOUNTERED.

5.....FILTER MATERIAL TO BE 3/4-INCH, OPEN-GRADED CRUSHED ROCK ENCLOSED IN APPROVED FILTER FABRIC (MIRAFI 140NC).

6.....COLLECTOR PIPE TO BE 4-INCH MINIMUM DIAMETER, PERFORATED, THICK-WALLED PVC SCHEDULE 40 OR EQUIVALENT, AND SLOPED TO DRAIN AT 1 PERCENT MINIMUM TO APPROVED OUTLET.

NO SCALE

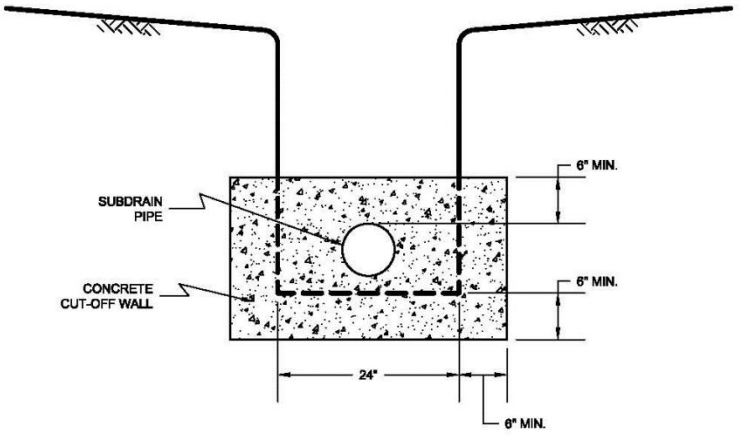
7.3 The actual subdrain locations will be evaluated in the field during the remedial grading operations. Additional drains may be necessary depending on the conditions observed and the requirements of the local regulatory agencies. Appropriate subdrain outlets should be evaluated prior to finalizing 40-scale grading plans.

7.4 *Rock* fill or *soil-rock* fill areas may require subdrains along their down-slope perimeters to mitigate the potential for buildup of water from construction or landscape irrigation. The subdrains should be at least 6-inch-diameter pipes encapsulated in gravel and filter fabric. *Rock* fill drains should be constructed using the same requirements as canyon subdrains.

7.5 Prior to outletting, the final 20-foot segment of a subdrain that will not be extended during future development should consist of non-perforated drainpipe. At the non-perforated/ perforated interface, a seepage cutoff wall should be constructed on the downslope side of the pipe.

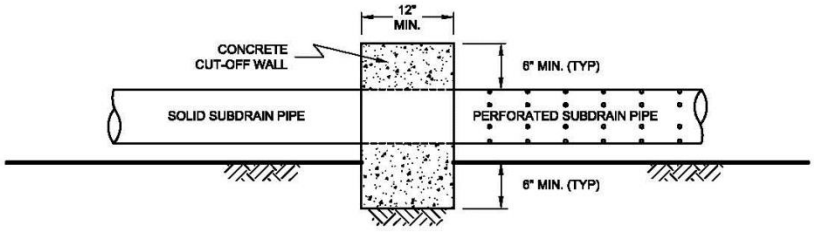
TYPICAL CUT OFF WALL DETAIL

FRONT VIEW



NO SCALE

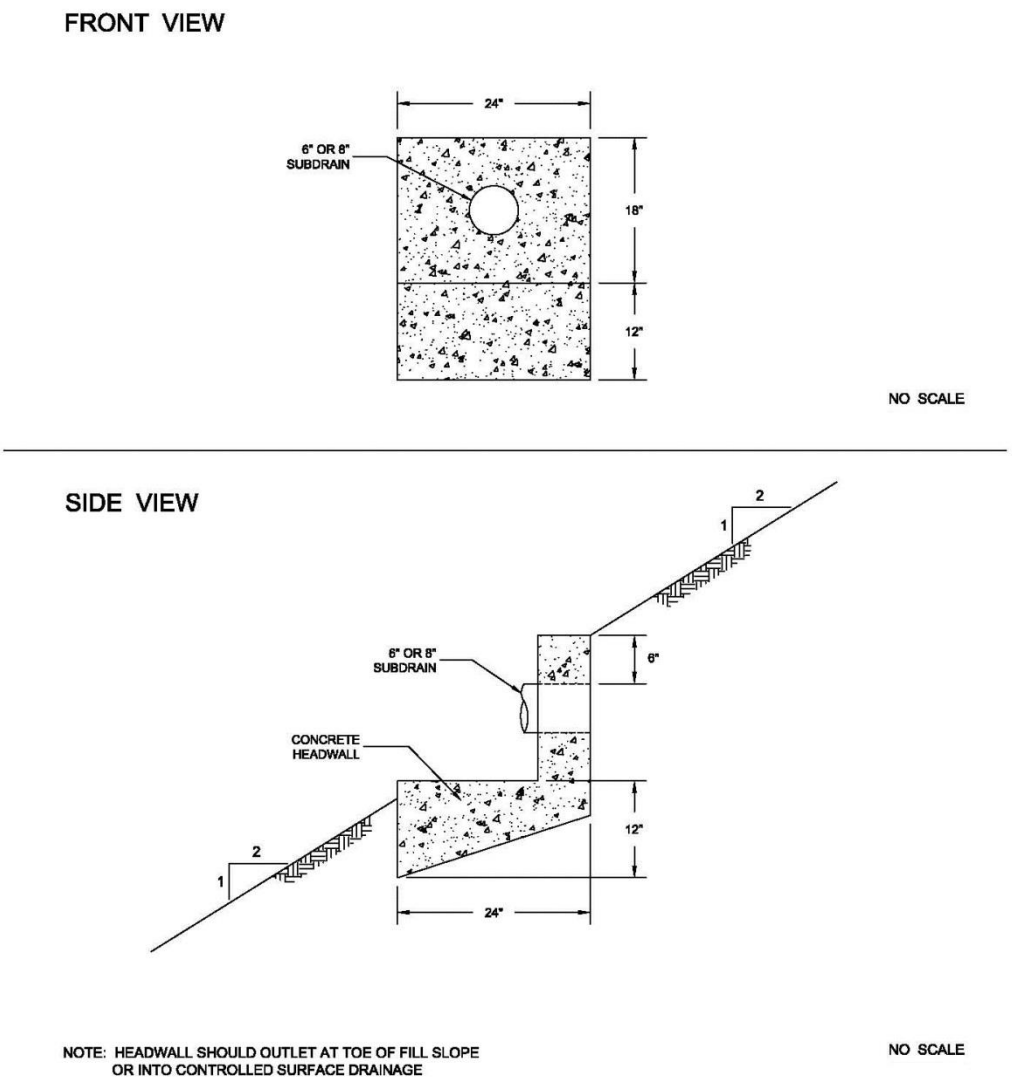
SIDE VIEW



NO SCALE

7.6 Subdrains that discharge into a natural drainage course or open space area should be provided with a permanent headwall structure.

TYPICAL HEADWALL DETAIL



7.7 The final grading plans should show the location of the proposed subdrains. After completion of remedial excavations and subdrain installation, the project civil engineer should survey the drain locations and prepare an "as-built" map showing the drain locations. The final outlet and connection locations should be determined during grading operations. Subdrains that will be extended on adjacent projects after grading can be placed on formational material and a vertical riser should be placed at the end of the subdrain. The grading contractor should consider videoing the subdrains shortly after burial to check proper installation and functionality. The contractor is responsible for the performance of the drains.

8. OBSERVATION AND TESTING

8.1 The Consultant shall be the Owner's representative to observe and perform tests during clearing, grubbing, filling, and compaction operations. In general, no more than 2 feet in vertical elevation of *soil* or *soil-rock* fill should be placed without at least one field density test being performed within that interval. In addition, a minimum of one field density test should be performed for every 2,000 cubic yards of *soil* or *soil-rock* fill placed and compacted.

8.2 The Consultant should perform a sufficient distribution of field density tests of the compacted *soil* or *soil-rock* fill to provide a basis for expressing an opinion whether the fill material is compacted as specified. Density tests shall be performed in the compacted materials below any disturbed surface. When these tests indicate that the density of any layer of fill or portion thereof is below that specified, the particular layer or areas represented by the test shall be reworked until the specified density has been achieved.

8.3 During placement of *rock* fill, the Consultant should observe that the minimum number of passes have been obtained per the criteria discussed in Section 6.3.3. The Consultant should request the excavation of observation pits and may perform plate bearing tests on the placed *rock* fills. The observation pits will be excavated to provide a basis for expressing an opinion as to whether the *rock* fill is properly seated and sufficient moisture has been applied to the material. When observations indicate that a layer of *rock* fill or any portion thereof is below that specified, the affected layer or area shall be reworked until the *rock* fill has been adequately seated and sufficient moisture applied.

8.4 A settlement monitoring program designed by the Consultant may be conducted in areas of *rock* fill placement. The specific design of the monitoring program shall be as recommended in the Conclusions and Recommendations section of the project Geotechnical Report or in the final report of testing and observation services performed during grading.

8.5 We should observe the placement of subdrains, to check that the drainage devices have been placed and constructed in substantial conformance with project specifications.

8.6 Testing procedures shall conform to the following Standards as appropriate:

8.6.1 Soil and Soil-Rock Fills:

8.6.1.1 Field Density Test, ASTM D 1556, *Density of Soil In-Place By the Sand-Cone Method.*

8.6.1.2 Field Density Test, Nuclear Method, ASTM D 6938, *Density of Soil and Soil-Aggregate In-Place by Nuclear Methods (Shallow Depth).*

8.6.1.3 Laboratory Compaction Test, ASTM D 1557, *Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-Pound Hammer and 18-Inch Drop*.

8.6.1.4. Expansion Index Test, ASTM D 4829, *Expansion Index Test*.

9. PROTECTION OF WORK

9.1 During construction, the Contractor shall properly grade all excavated surfaces to provide positive drainage and prevent ponding of water. Drainage of surface water shall be controlled to avoid damage to adjoining properties or to finished work on the site. The Contractor shall take remedial measures to prevent erosion of freshly graded areas until such time as permanent drainage and erosion control features have been installed. Areas subjected to erosion or sedimentation shall be properly prepared in accordance with the Specifications prior to placing additional fill or structures.

9.2 After completion of grading as observed and tested by the Consultant, no further excavation or filling shall be conducted except in conjunction with the services of the Consultant.

10. CERTIFICATIONS AND FINAL REPORTS

10.1 Upon completion of the work, Contractor shall furnish Owner a certification by the Civil Engineer stating that the lots and/or building pads are graded to within 0.1 foot vertically of elevations shown on the grading plan and that all tops and toes of slopes are within 0.5 foot horizontally of the positions shown on the grading plans. After installation of a section of subdrain, the project Civil Engineer should survey its location and prepare an *as-built* plan of the subdrain location. The project Civil Engineer should verify the proper outlet for the subdrains and the Contractor should ensure that the drain system is free of obstructions.

10.2 The Owner is responsible for furnishing a final as-graded soil and geologic report satisfactory to the appropriate governing or accepting agencies. The as-graded report should be prepared and signed by a California licensed Civil Engineer experienced in geotechnical engineering and by a California Certified Engineering Geologist, indicating that the geotechnical aspects of the grading were performed in substantial conformance with the Specifications or approved changes to the Specifications.

Attention: David Shepherd

Subject: PHASE I & II ENVIRONMENTAL SITE ASSESSMENT REPORT
OAK KNOLL
POWAY, CALIFORNIA

Dear Mr. Shepherd:

In accordance with your request and our Proposal No. LE-21259 dated May 20, 2021, and our change order dated November 30, 2021, we have performed a Phase I & II Environmental Site Assessment (ESA) of the property and improvements at 12624 through 12702 Oak Knoll Road (the Site) in Poway, California. We performed the Phase I & II ESA to provide information regarding the potential for existing hazardous substances (notably persistent pesticides) and/or petroleum product impacts at the Site as part of Lennar's due diligence prior to purchasing the Site.

This report summarizes the findings of the Phase I & II ESA including the potential presence of recognized environmental conditions as defined by the American Society for Testing and Materials *Designation E1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.*

We appreciate the opportunity to have performed this Phase I & II ESA for Lennar. Please contact us if you have any questions concerning this report or if we may be of further service.

Very truly yours,

GEOCON INCORPORATED

PHASE I & II ENVIRONMENTAL SITE ASSESSMENT REPORT

1. INTRODUCTION

We have performed a Phase I & II Environmental Site Assessment (ESA) of the Oak Knoll property located west of the Oak Knoll and Carriage Road intersection (the Site) in Poway, California. Lennar (the Client) requested the Phase I ESA to provide information regarding the potential for existing hazardous substances and/or petroleum product impacts at the Site as part of their due diligence. The Phase II ESA was performed to assess the shallow soil of the Site for persistent pesticides and arsenic (commonly associated with pesticides) related to the former agricultural use of the Site. This report describes the methodology and procedures and present the findings of the Phase I & II ESA.

1.1 Purpose and Objectives

The purpose of the Phase I ESA was to identify evidence or indications of 'recognized environmental conditions' (RECs) as defined by the American Society for Testing and Materials (ASTM) *Designation E 1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. Section 1.1.1 of *ASTM Designation E 1527-13* defines an REC as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions." De minimis conditions are those that generally do not present a threat to human health or the environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies.

ASTM *Designation E 1527-13* also defines 'Historical' and 'Controlled' RECs. They define an 'Historical REC' (HREC) as "A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)." ASTM defines a 'Controlled REC' (CREC) as "a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)." An HREC is not an REC if a property meets current standards for unrestricted residential use. A CREC remains an REC by definition when the property does not meet the unrestricted residential use requirements unconditionally.

We also conducted the Phase I ESA in general accordance with the requirements of 40 Code of Federal Regulations (CFR) Part 312 titled *Standards and Practices for All Appropriate Inquiries*, as required under Sections 101(35)(B)(ii) and (iii) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The purpose of conducting an all appropriate inquiries investigation into the previous ownership and uses of a property is to meet the provisions necessary for the landowner, contiguous property owner, and/or bona fide prospective purchaser to qualify for certain landowner liability protections under CERCLA.

The following principles are an integral part of ASTM *Designation E1527-13*:

- **"Uncertainty Not Eliminated -** No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property, and this practice recognizes reasonable limits of time and cost."

- **"Not Exhaustive -** All Appropriate Inquiries does not mean an exhaustive assessment of a property. There is a point at which the cost of information obtained or the time required to gather it outweighs the usefulness of the information and, in fact, may be a material detriment to the orderly completion of transactions. One of the purposes of this practice is to identify a balance between the competing goals of limiting the costs and time demands inherent in performing an environmental site assessment and the reduction of uncertainty about unknown conditions resulting from additional information."

- **"Level of Inquiry is Variable -** Not every property will warrant the same level of assessment. Consistent with good commercial and customary practice, the appropriate level of environmental site assessment will be guided by the type of property subject to assessment, the expertise and risk tolerance of the user, and the information developed in the course of the inquiry."

1.2 Scope of Services

We performed the scope of services outlined in our Proposal No. LE-21259 dated May 20, 2021, with the exception that we did not review Sanborn fire insurance maps, as Environmental Data Resources, Inc. (EDR) indicated that there are none available for the Site or surrounding vicinity. The main components of the Phase I ESA and their objectives, as specified by the referenced standards, include the following:

- **Physical Setting Review:** we reviewed physical setting references for information concerning the topographic, geologic, and hydrogeologic characteristics of the Site and vicinity. Such information may be indicative of pathways (i.e., direction and/or extent) that a contaminant could migrate along in the event of a spill or release.

- **Regulatory Agency Records Review:** we reviewed publicly available Federal, State, and local regulatory agency records for information regarding the use, storage, and disposal of hazardous substances and/or petroleum products at the Site and facilities and properties adjoining or within ¼ mile of the Site. Such records may identify RECs at or potentially affecting the Site.

- **Site History Review:** we reviewed information regarding the historical uses of the Site and adjoining and nearby facilities and properties back to the Site's and other properties' first use or 1940, whichever is earlier, that could have led to RECs on or near the Site. Historical sources reviewed included aerial photographs, topographic maps, and city directories. In addition, we conducted interviews with persons who were expected to be reasonably knowledgeable about historical and/or current conditions at and uses of the Site.

- **Site Reconnaissance:** we performed a site reconnaissance to observe site conditions and activities for evidence of RECs. The site reconnaissance was for the Site only. We viewed offsite properties and features solely from the vantage of the Site and public thoroughfares.

1.3 Report Limitations

We prepared this Phase I ESA report exclusively for the Client. The information obtained is only relevant for the dates of the records reviewed and the latest site visit. Therefore, the information contained herein is only valid as of the date of the report and may require an update after 180 days to reflect updated records and another reconnaissance to assess current site conditions.

The Client should recognize that a Phase I ESA is not a comprehensive site characterization and should not be construed as such. The findings and conclusions presented in this report are predicated on the site reconnaissance, information in the specified regulatory records, and information regarding the historical usage of the Site, as presented in this report. The Client should also understand that wetlands, asbestos-containing building materials, lead-containing paint, lead in drinking water, radon, mercury related to mining activities, methane, and mold surveys were not included in the scope of services for this Phase I & II ESA. Assessment for potential naturally occurring hazards such as asbestos and arsenic was also not included.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the Phase I & II ESA is implied within this report or any subsequent reports, correspondence or consultation, either express or implied. We strived to conduct the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

1.4 Data Gaps

A data gap is defined by ASTM *Designation E 1527-13* as "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." Data gaps could include such things as insufficient historical information, the inability to interview persons with direct site knowledge (e.g., the owner(s), past owner(s), tenants, workers, etc.) or the lack of access to all parts of a site during the site reconnaissance. As indicated in Section 1.2, we did not review Sanborn fire insurance maps for the Site and surrounding vicinity because there are none for the Site and vicinity. In addition, we were not granted full access to the three residential

structures and sheds currently on the property. We do not consider these items significant data gaps due to other available information and observations made during our reconnaissance.

2. SITE DESCRIPTION

This section provides information regarding the location and physical characteristics of the Site including its size, topography, geologic, soil, and hydrogeologic conditions.

2.1 Location and Legal Description

The 10.87-acre Site is located at 12624, 12650 and 12702 Oak Knoll Road in Poway, California (Figure 1). The San Diego County assessor's parcel numbers (APNs) for the Site are 317-501-01, 317-500-02, 317-500-03, and 317-500-09 through -14. A copy of the parcel maps are in Appendix A.

The Site is depicted in the southeastern quarter of Section 14 of Township 14 South, Range 2 West, San Bernardino Base and Meridian on the United States Geological Survey's (USGS) *Poway, California,* 7.5-minute topographic map (USGS, 2015).

2.2 Site and Vicinity General Characteristics

The Site is developed with two single-family residences. The surrounding vicinity includes single- and multi-family residences, commercial office and retail development. Figure 2 depicts the site boundaries and features and surrounding properties. Further site description is provided in Sections 2.4 and 6.

2.2.1 Topography

The topography of the site vicinity consists of a hill with gentle to moderate slopes, as well as a relatively flat-lying area. The Site generally slopes to the south towards Poway Creek. The USGS *Poway, California,* 7.5-minute topographic map (USGS, 2015), depicts the elevation of the Site as ranging from approximately 450 to 500 feet above mean sea level.

2.2.2 Geologic and Soil Conditions

The Site is located in the Peninsular Ranges geomorphic province of Southern California (Norris and Webb, 1990). This geomorphic province extends approximately 900 miles from its northern terminus against the Transverse Ranges and Los Angeles Basin, south to the tip of Baja California. In general, the province is characterized by rugged mountains in Mesozoic igneous and metamorphic rocks to the east, with a dissected coastal plain on Cenozoic sediments to the west. The Peninsular Ranges vary in width from approximately 30 to 100 miles, and are traversed fault zones trending roughly northwest-southeast.

Information concerning the surficial geologic conditions at and in proximity to the Site from the *Geologic Map of the San Diego 30' X 60' Quadrangle, California* (USGS, 2005) indicates that the Site is underlain by Holocene and late-Pleistocene flood plain deposits, which are typically poorly consolidated, poorly sorted, and permeable.

Information concerning the soil conditions at and in proximity to the Site from the United States Department of Agriculture, Natural Resources Conservation Service, Web Soil Survey (http://websoilsurvey.nrcs.usda.gov/app/HomePage.htm) indicates that site soil is Placentia sandy loam and Olivenhain cobbly loam, which are both well drained and have low infiltration rates.

2.2.3 Hydrologic and Hydrogeologic Conditions

Groundwater quality and occurrence information available from the California Department of Water Resources and the California State Water Resources Control Board (SWRCB) indicates that the Site is located in the Poway Hydrologic Area (906.20) of the Penasquitos Hydrologic Unit (906.00). Groundwater in the Poway Hydrologic Area has existing beneficial use designations for municipal, agricultural, and potential beneficial use for industrial supply purposes (SWRCB, 2020).

In an effort to assess local groundwater conditions, we reviewed reports available on the SWRCB's GeoTracker online database (http://geotracker.waterboards.ca.gov) for nearby facilities with a groundwater monitoring well array. Nine groundwater monitoring wells were installed west of the Site in 2006 related to assessment of County of San Diego Department of Environmental Health (DEH) Leaking Underground Storage Tank (LUST) case H05705-001 (described further in Section 4.1.1). The depth to groundwater within these wells was reported to range approximately between 7 feet and 18 feet with groundwater flow towards the west-southwest.

2.3 Current and Planned Uses of the Site

The current use of the Site is residential. In addition, the central portion of the Site is currently being leased to a general contractor working on a San Diego Gas & Electric (SDG&E) high pressure gas line replacement project. The Client reported that they plan to redevelop the majority of the Site for residential use. Further description of the Site is provided in Section 6.

2.4 Descriptions of Structures, Roads, Other Improvements on the Site

The Site is improved with two residential homes. Further description of the Site is provided in Section 6.3.

2.5 Current Uses of Adjoining Properties

Current uses of adjoining properties are primarily residential to the east, south, and west, with commercial use to the north of the Site. Further information regarding adjoining properties is provided in Section 6.4.

3. USER–PROVIDED INFORMATION

This section summarizes site information provided by the Client – the "user" of this Phase I ESA. Also provided are responses to inquiries to the Client via a "user" questionnaire for information pertaining to the Site. David Shepherd with Lennar completed the questionnaire (Appendix B).

3.1 Title, Appraisal and Sale Agreement Records

Mr. Shepherd indicated that he will send a title report, appraisal, or sales agreement upon receipt from the Seller. We were not provided with any of those documents at this time.

3.2 Environmental Liens or Activity and Use Limitations

Mr. Shepherd indicated that he has no knowledge of environmental liens on or activity and use limitations for the Site.

3.3 Specialized Knowledge

Mr. Shepherd indicated he has no specialized knowledge of the Site.

3.4 Commonly Known or Reasonably Ascertainable Information

Mr. Shepherd indicated he is not aware of commonly known or reasonably ascertainable information pertaining to the Site.

3.5 Owner, Property Manager, and Occupant Information

Mr. Shepherd indicated the Site is owned by the Harmon Family Trust.

3.6 Valuation Reduction for Environmental Issues

According to Mr. Shepherd, the monetary value of the Site has not been reduced due to environmental issues.

3.7 Reason for Performing the Phase I ESA

The Phase I ESA was requested to provide information regarding the potential for existing hazardous substance and/or petroleum product impacts at the Site for pre-acquisition due diligence purposes.

4. RECORDS REVIEW

This section summarizes information we obtained from readily available agency records for the Site and properties and facilities in the surrounding vicinity.

4.1 Standard Environmental Record Sources

EDR searched federal, state, and local databases regarding the use, storage, disposal, or release of hazardous substances and/or petroleum products for the Site and area within one mile of the Site. The databases that list the Site and/or properties/facilities within one mile of the Site and the number of properties/facilities listed are summarized in the table below. A copy of *The EDR Radius Map™ Report with GeoCheck*, dated May 21, 2021, is in Appendix C.

Database Name	Search Radius (Mile)	Number of Listings
FEDERAL DATABASES		
RCRA-LQG (Resource Conservation and Recovery Act - Large Quantity Generators)	¼	1
RCRA-SQG (Small Quantity Generators)	¼	4
STATE AND LOCAL DATABASES		
CA ENVIROSTOR (Department of Toxic Substance Control Database)	1	1
SAN DIEGO CO. SAM (Diego County Site Assessment and Mitigation Program)	½	15
LUST (Leaking Underground Storage Tanks)	½	17
CA SLIC (Spills, Leaks, Investigation, and Cleanup Program)	½	7
CA UST (Underground Storage Tanks)	¼	2
CA AST (Aboveground Storage Tanks)	¼	4
CA SWEEPS UST (Statewide Environmental Evaluation and Planning System)	¼	5
CA HIST UST (Historical Underground Storage Tanks)	¼	1
RCRA-NonGen (Resource Conservation and Recovery Act – Non-Generators)	½	41

EDR HIGH RISK HISTORICAL DATABASES AND EDR RECOVERED GOVERNMENT ARCHIVES		
EDR Historical Cleaner	¼	1

4.1.1 Site

The Site is not listed on any of the databases searched by EDR.

4.1.2 Offsite Properties

The following table summarizes information provided in the EDR report for listed properties/facilities that are located less than ¼ mile from the Site and are listed on various release-related databases[1]. Properties/facilities located within a ¼ mile and not listed on a release-related database[1] are not included in the table below and are unlikely to have caused an REC at the Site. Distances reported by EDR may differ from actual distances.

Property Name and Address	Approximate Distance, Direction, and Hydraulic Gradient Position	Databases	Pertinent Information
Firestone Complete Auto Care / L&M Tire Company Inc. / Express Tire / Eagle Tire Company 12619 Poway Road	78 feet north Up-gradient	US Brownfields FINDS RCRA NonGen / NLR LUST San Diego Co. SAM San Diego Co. HMMD SWEEPS UST CORTESE HIST CORTESE HWTS CERS HAZ WASTE HAZNET San Diego Co. LOP CERS	These listings are in reference to DEH case #H16311-001 which was opened when a 500-gallon waste oil tank was removed from the property on June 5, 1987. Soil sampling in April of 1991 revealed TRPH levels at 11.1 ppm at 7' below grade in the former tank excavation area. Concentrations of BTXE, PCB, and organic lead in soil were all below the laboratory detection limits. Depth to groundwater was reported to be between 16-17 feet below grade. The closed regulatory status of the LUST case indicate that this facility is unlikely to have caused an REC at the Site.
Quality Care Cleaners 12636 Poway Road	401 feet north Up-gradient	DRYCLEANERS EDR Historical Cleaner HWTS	These listings indicate that this facility was operated as a drycleaner from the years 1989 to 2005. The distance from the Site and lack of evidence of any unauthorized releases suggest that this facility is unlikely to have caused an REC at the Site.

[1] "Release" refers to an unauthorized release of a petroleum product or hazardous substance to the environment - i.e. the ground surface, soil, soil vapor, groundwater, or surface water on a property. "Release-related database" refers to those which provide information regarding an unauthorized release. "Non-release-related database" refers to those that may report use, storage, or disposal of hazardous substances and/or petroleum products or other environmental conditions, but do not report releases of such.

Property Name and Address	Approximate Distance, Direction, and Hydraulic Gradient Position	Databases	Pertinent Information
Regent Oil / Chiefs' Regent / APRO LLC DBA United Oil 23 12462 Poway Road	931 feet northwest Up-gradient	LUST San Diego Co. HMMD San Diego Co. SAM San Diego Co. LOP UST RCRA NonGen / NLR FINDS US Brownfields CERS HAZNET CERS TANKS CERS HAZ WASTE HWTS CORTESE HIST CORTESE EMI SWEEPS UST	These listings are in reference to DEH case #H03486-001 in which two 10,000-gallon gasoline USTs, a 10,000-gallon diesel UST, and a 250-gallon used oil UST were removed in December 1998. Soil samples taken after the removal of the tanks revealed petroleum hydrocarbons near the excavation area. Groundwater monitoring and soil sampling was performed on the Site from 1999 to 2015 when the California Regional Water Quality Control Board granted case closure. The HMMD listing provides information regarding inspection violations at this facility including failure of the pressurized piping to meet one or more of the regulatory requirements, failure of the leak detection equipment to be properly programmed or properly operated, failure to notify the CUPA the prescribed number of hours prior to testing, and failure to properly label hazardous waste accumulation containers with the required information. The distance from the Site and the closed regulatory status of the LUST case suggest that this facility is unlikely to have caused an REC at the Site.
Oak Knoll Square 12759 Poway Road	999 feet northeast Up-gradient	US Brownfields FINDS San Diego Co. SAM RCRA NonGen / NLR	These listings make reference to a closed DEH Site Assessment & Mitigation case #H39706-001. No pertinent information about this case is provided. A Phase I ESA is reported to have been performed at this facility in 2006, and the current property owner is listed as Paula Mogavero. No other pertinent information is provided. The distance from the Site and lack of evidence of any unauthorized releases suggest that this facility is unlikely to have caused an REC at the Site.

Property Name and Address	Approximate Distance, Direction, and Hydraulic Gradient Position	Databases	Pertinent Information
Perry Ford of Poway 12740 Poway Road	1078 feet northeast Up-gradient	RCRA-SQG LUST San Diego Co. SAM AST US Brownfields San Diego Co. HMMD CERS HAZ WASTE SWEEPTS UST CERS TANKS FINDS ECHO HIST CORTESE NPDES San Diego Co. LOP CIWQS CERS HWTS CORTESE HAZNET	These listings are in reference to DEH case #H13170-001 in which two USTs were removed on January 13, 1987 and three USTs on July 13, 1993. Soil and groundwater samples taken at this facility indicated that petroleum hydrocarbons including diesel, gasoline, and waste oil had impacted the soil and groundwater. Soil borings and monitoring wells were installed to determine the extent of contamination. A corrective action plan was implemented with 1,620 cubic yards of contaminated soil and 44,500 gallons of contaminated groundwater being removed from the facility. Approximately 585 cubic yards of contaminated soil remains at this facility in selected areas. Oxygen Releasing Compound was injected in selected locations within the contaminated area. These efforts greatly reduced the amount of contamination at this facility, and the DEH granted regulatory closure in December of 2003. The distance from the Site and closure of the LUST case suggest that this facility is unlikely to have caused and REC at the Site.
Tune Craft / Poway City Redevelop 12430 Poway Road	1083 feet west Up-gradient	HWTS ENVIROSTOR LUST San Diego Co. SAM CPS-SLIC San Diego Co. HMMD SWEEPS UST CORTESE San Diego Co. LOP CERS US Brownfields FINDS	These listings are in reference to DEH case #H13442-001 which was opened due to elevated levels of gasoline detected in boring samples performed for a Phase II ESA. This property formerly had a 550-gallon waste oil UST; however, it was removed in April of 2000 with no evidence of significant contamination. Further investigation revealed that the groundwater contamination was linked to a nearby plume from a APRO station to the east of the Site at 12340 Poway Road. Trace amounts of TPH were detected in the soil estimated to be approximately five cubic yards. The DEH granted regulatory closure to the case in May of 2006. The distance from the Site and the closure of the LUST case suggest that this facility is unlikely to have caused and REC at the Site.

Property Name and Address	Approximate Distance, Direction, and Hydraulic Gradient Position	Databases	Pertinent Information
Conroy's Flowers 12775 Poway Road	1132 feet northeast Up-gradient	San Diego Co. SAM San Diego Co. HMMD San Diego Co. LOP CPS-SLIC CERS US Brownfields FINDS	These listings are in reference to DEH case #H32109-001. Information provided suggest that the contamination at this facility likely originated from four other off-site USTs listed under case numbers H20710-001 and H13170-001. No on-site uses of contaminants of concern are noted. The closed regulatory status of the LUST case and lack of evidence of contamination originating from this facility suggest that it is unlikely to have caused an REC at the Site.
Chevron 12410 Poway Road	1314 feet west Up-gradient	San Diego Co. SAM San Diego Co. HMMD San Diego Co. LOP UST SWEEPS UST CORTESE RCRA NonGen / NLR RCRA-SQG US Brownfields FINDS ECHO HIST UST LUST CERS HAZ WASTE CERS TANKS EMI HIST CORTESE CERS	These listings are in reference to DEH case #H05705-001 which was opened in February of 1994 after dissolved phase gasoline constituents were discovered in a monitoring well on a sidewalk adjacent to the Chevron station. Soil samples indicated that contaminated soil is present near the former western dispenser area, near current USTs, and at the former UST area and dispenser area in the southwest corner of the Site. The contamination is present at depths of 14 to 22 feet bgs. An estimated 318 cubic yards of contaminated soil is estimated to remain onsite. Nine groundwater monitoring wells were installed as part of the site investigation. A Corrective Action Plan for the facility was prepared, with the recommended remediation being natural attenuation. Trend analyses conducted by the consultant indicate that the concentrations of benzene should decay by natural attenuation to reach the MCL of I microgram per liter (ug/l) in 37 years, ethylbenzene should reach the MCL of 300 ug/l in 60 years, MTBE should reach the MCL of 13 ug/l in 22 years, and that concentrations of TBA should be below the State Notification limit in 60 years. The DEH concurred with the client and granted closure to this case in July of 2013. The distance from the Site and closure of the LUST case suggest that this facility is unlikely to have caused an REC at the Site.

[1] "Release" refers to an unauthorized release of a petroleum product or hazardous substance to the environment - i.e. the ground surface, soil, soil vapor, groundwater, or surface water on a property. "Release-related database" refers to those which provide information regarding an unauthorized release. "Non-release-related database" refers to those that may report use, storage, or disposal of hazardous substances and/or petroleum products or other environmental conditions, but do not report releases of such.

Other properties and facilities within 1/4-mile of Site are listed on various non-release-related databases[1] and therefore are not anticipated to have caused an REC at the Site.

4.1.3 Orphan Summary

EDR's Orphan Summary identifies properties with incomplete address information and therefore cannot be accurately plotted. Seven properties are listed but because none of them are listed on any release-related databases, none are suspected of having caused an REC at the Site.

4.2 Additional Environmental Record Sources

This section summarizes information from additional, readily available environmental record sources regarding the Site and properties/facilities within one mile from the Site.

4.2.1 GeoTracker and EnviroStor Databases

We reviewed GeoTracker and the California Department of Toxic Substance Control's (DTSC) EnviroStor online database (http://www.envirostor.dtsc.ca.gov/public/) for information regarding the Site and nearby properties/facilities that are within ¼ mile of the Site. GeoTracker lists three LUST properties/facilities within ¼ mile of the Site all three of which have been granted regulatory closure. Information regarding these three LUST facilities is summarized in Section 4.1.2. EnviroStor lists one facility within ¼ mile of the Site, which is summarized in Section 4.1.2.

4.2.2 State of California Department of Conservation, Geologic Energy Management Division

We reviewed the California Geologic Energy Management Division (CalGem) website (https://maps.conservation.ca.gov/doggr/wellfinder) to evaluate the potential for existing/former oil, gas, or geothermal wells on the Site or properties proximal to the Site. CalGem information indicates that no former or current wells are or were located within one mile of the Site.

4.2.3 County of San Diego Department of Agriculture, Weights and Measures

We submitted a request to the County of San Diego, Department of Agriculture, Weights and Measures (DAWM), Pesticide Use Enforcement Division regarding possible use of restricted pesticides/herbicides at the Site. That office maintains such records for approximately 4 years. The DAWM indicated that no record of restricted pesticide/herbicide use was reported for the site APNs for the period of 2017 through 2021.

4.2.4 San Diego Air Pollution Control District

We submitted a request to the San Diego Air Pollution Control District (APCD) for records pertaining to the Site. The APCD indicated that no records are on file for the site APNs.

4.2.5 County of San Diego Department of Environmental Health

We submitted a request to the DEH for records pertaining to the Site. The DEH indicated that no records are on file for the site APNs.

4.2.6 San Diego Gas and Electric Company

No transformers were observed onsite or were likely on the Site previously. Therefore, San Diego Gas & Electric Company was not contacted as part of this assessment.

5. HISTORICAL USE

This section summarizes information obtained from a variety of sources regarding the historical uses of the Site in an effort to identify those uses that could have led to RECs. The sources of information included historical aerial photographs, historical topographic maps, and an abstract of city directories provided by EDR.

5.1 Aerial Photographs

We reviewed historical aerial photographs for the years 1939, 1949, 1953, 1964, 1966, 1970, 1979, 1985, 1989, 1996, 2002, 2005, 2009, 2012 and 2016 (Appendix D) for indications of past land uses that had the potential to have impacted the Site through the use, storage or disposal of hazardous substances and/or petroleum products. The following table summarizes our observations of the Site and adjacent properties.

Year	Observations	
	Site	**Adjacent Properties**
1939 (1” = 500’)	The Site appears to have been used for agricultural purposes. A stream appears to run to the southwest in the northwestern portion of the Site. Poway Creek is present along the southern boundary of the Site.	The adjacent properties to the north and west appear to have been undeveloped land. A stream is located is present that flows from the adjacent property to the north, across the Site. The adjacent property to the east appears to have been used for agricultural purposes, while the adjacent property to the south appears to have been used as residential.

Year	Observations	
	Site	**Adjacent Properties**
1949 (1” = 500’)	Conditions appear to have been similar to those observed on the 1939 aerial photograph with the exception that the agricultural use of the Site appears to have been ceased.	Conditions appear to have been similar to those observed on the 1939 aerial photograph with the exception that the property adjacent to the east appears to have been developed with a large covered structure.
1953 (1” = 500’)	Conditions appear to have been similar to those observed on the 1949 aerial photograph.	Conditions appear to have been similar to those observed on the 1949 aerial photograph.
1964 (1” = 500’)	Conditions appear to have been similar to those observed on the 1953 aerial photograph with the exception that the stream which was depicted flowing to the southwest is no longer present. Two residential structures are depicted on the southern portion of the Site, north of Oak Knoll Road. A dirt road is depicted bisecting the northern portion of the Site.	Conditions appear to have been similar to those observed on the 1953 aerial photograph with the exception that the property adjacent to the west of the Site appears to have begun grading activities. The adjacent properties to the south appear to have been developed with more residential houses. A single structure is depicted on the adjacent property to the north of the Site.
1966 (1” = 500’)	Conditions appear to have been similar to those observed on the 1964 aerial photograph.	Conditions appear to have been similar to those observed on the 1964 aerial photograph.
1970 (1” = 500’)	Conditions appear to have been similar to those observed on the 1966 aerial photograph.	Conditions appear to have been similar to those observed on the 1966 aerial photograph with the exception that the adjacent properties to the east appear to have been developed with residential homes.
1979 (1” = 500’)	Conditions appear to have been similar to those observed on the 1970 aerial photograph.	Conditions appear to have been similar to those observed on the 1970 aerial photograph with the exception that the adjacent property to the north appears to have been developed with multiple commercial facilities.
1985 (1” = 500’)	Conditions appear to have been similar to those observed on the 1979 aerial photograph.	Conditions appear to have been similar to those observed on the 1979 aerial photograph with the exception that the property adjacent to the west appears to have been developed with an apartment complex.
1989 (1” = 500’)	Conditions appear to have been similar to those observed on the 1985 aerial photograph.	Conditions appear to have been similar to those observed on the 1985 aerial photograph.
1996 (1” = 500’)	Conditions appear to have been similar to those observed on the 1989 aerial photograph.	Conditions appear to have been similar to those observed on the 1989 aerial photograph.
2002 (1” = 500’)	Conditions appear to have been similar to those observed on the 1996 aerial photograph.	Conditions appear to have been similar to those observed on the 1996 aerial photograph.

Year	Observations	
	Site	Adjacent Properties
2005 (1" = 500')	Conditions appear to have been similar to those observed on the 2002 aerial photograph.	Conditions appear to have been similar to those observed on the 2002 aerial photograph with the exception that 13 additional residential homes appear to have been developed on the adjacent property to the south of the Site.
2009 (1" = 500')	Conditions appear to have been similar to those observed on the 2005 aerial photograph.	Conditions appear to have been similar to those observed on the 2005 aerial photograph.
2012 (1" = 500')	Conditions appear to have been similar to those observed on the 2009 aerial photograph.	Conditions appear to have been similar to those observed on the 2009 aerial photograph.
2016 (1" = 500')	Conditions appear to have been similar to those observed on the 2012 aerial photograph.	Conditions appear to have been similar to those observed on the 2012 aerial photograph.

The past agricultural use of the Site prior to 1949 suggests that persistent pesticides may have been used on the Site. If so, persistent pesticides and arsenic (commonly associated with pesticides) may be present in soil on the Site. Therefore, we performed a Phase II ESA to assess for pesticides and arsenic at the Site, and the results of our Phase II ESA are described in Section 8.

5.2 Topographic Maps

We reviewed historical topographic maps for the years 1903, 1930, 1942, 1952, 1967, 1975, 1996 and 2012 (Appendix E). The following table summarizes observations of the Site and adjacent properties on the historical topographic maps.

Year	Observations	
	Site	Adjacent Properties
1903 (1:62,500)	No structures or land use are depicted on the Site.	No structures or land use are depicted on the adjacent properties.
1930 (1:62,500)	Conditions are similar to those depicted on the 1903 topographic map.	Conditions are similar to those depicted on the 1903 topographic map.
1942 (1:31,680)	Conditions are similar to those depicted on the 1930 topographic map with the exception that a single structure is depicted on the southeastern portion of the Site. A stream is depicted flowing to the southwest across the northwestern portion of the Site.	Conditions are similar to those depicted on the 1930 topographic map with the exception that a structure is depicted on the adjacent property to the east, as well as three structures on the property adjacent to the south of the Site.

Year	Observations	
	Site	Adjacent Properties
1952 (1:24,000)	Conditions are similar to those depicted on the 1942 topographic map.	Conditions are similar to those depicted on the 1942 topographic map with the exception that the adjacent property to the north is depicted with a single structure.
1967 (1:24,000)	Conditions are similar to those depicted on the 1952 topographic map with the exception that three structures are now depicted in the southern portion of the Site.	Conditions are similar to those depicted on the 1952 topographic map with the exception that the adjacent property to the east is depicted with three structures.
1975 (1:24,000)	Conditions are similar to those depicted on the 1967 topographic map.	Conditions are similar to those depicted on the 1967 topographic map with the exception that the adjacent properties to the north and east are now shaded pink indicating an urban environment.
1996 (1:24,000)	Conditions are similar to those depicted on the 1975 topographic map with the exception that the Site is shaded pink indicating an urban environment. Structures are no longer depicted.	Conditions are similar to those depicted on the 1975 topographic map with the exception that all the adjacent properties are shaded pink indicating an urban environment. Structures are no longer depicted.
2012 (1:24,000)	No shading or structures are depicted.	No shading or structures are depicted.

The historical topographic maps depict no conditions, structures, or uses on the Site or adjacent properties that would suggest the presence of RECs.

5.3 City Directories

EDR prepared an abstract of city directories including city, cross-reference, and telephone directories summarized in the *EDR-City Directory Image Report* dated May 26, 2021. The directories were reviewed at approximately 5-year intervals, if available, from 1971 to 2017. A copy of the EDR city directory abstract including information regarding offsite facilities is in Appendix F. The Site is listed on the City Directory from the years 1971 to 2017 under the name of Edward K. Harmon from 1971 to 2014. The Site is listed under the name Don L. Urena for the year of 2017. The names of residents on adjacent properties are also listed in the City Directory, none of which are suspected of having caused an REC at the Site.

6. SITE RECONNAISSANCE

This section summarizes observations of the Site and surrounding properties made during the site reconnaissance.

6.1 Methodology and Limiting Conditions

Cole E. Mikesell, Staff Geologist with Geocon, performed the site reconnaissance accompanied by Troy K. Reist, Senior Geologist with Geocon, on November 30, 2021, by walking the Site. Mr. Mikesell performed the offsite survey by observing adjacent properties from the Site and adjacent public streets. Weather on the day of the site reconnaissance was clear with temperatures in the mid-70s. Photographs of various site features and offsite properties are appended. Figure 2 is a Site Plan illustrating selected site features.

6.2 General Site Setting

The Site is located in an area of predominantly residential use, with nearby commercial use. The Site is adjacent to undeveloped land to the north.

6.3 Onsite Survey

The majority of the Site is relatively flat to gently sloping to the south with a hill present in the northeastern portion of the property. The southern portion of the Site is developed with three single-family residences (Photographs 1 through 3) and several storage sheds are located throughout the backyards of the residential homes (Photographs 4 and 5). A gas meter was observed in the front yard of the southwestern residence (Photograph 6). The central portion of the Site is currently being leased by a general contractor working on a SDG&E high pressure gas line replacement project, which is being used to store equipment, construction materials and supplies (Photographs 7 through 11). The northern portion of the Site is vacant of any structures (Photographs 12 and 13). The southwestern portion of the Site, south of Oak Knoll Road, slopes towards Poway Creek (Photograph 14).

We observed no odors, pools of liquid, significantly stained soil or distressed vegetation on the Site. We observed no evidence of RECs on the Site.

6.4 Offsite Survey

Properties within the site vicinity include:

- **North:** Undeveloped land and nearby commercial facilities (Photograph 15).
- **South:** Single-family residential (Photograph 16).
- **East:** Single-family residential (Photograph 17).
- **West:** Multi-family residential (Photograph 18).

We observed no evidence of RECs on the surrounding properties.

7. INTERVIEWS

The current property owner representative, Sherry Urena, reported via a site owner/occupant questionnaire (Appendix B) that a portion of the Site is currently being leased to SDG&E for equipment staging until approximately March 2022. Mrs. Urena reported that two of the three single-family residences are also occupied by tenants on a month-to-month rental agreement. Mrs. Urena noted that pits, ponds, and/or lagoons exist or have previously existed onsite. Inspection of historical photographs revealed that a creek was present in the northwestern portion of the Site, however, no standing water was observed throughout the Site during our reconnaissance. Mrs. Urena reported that a well was installed behind the residence at 12624 Oak Knoll Road in the late 1970's but was never used. An archeological study has been conducted at the Site, but nothing of historical significance was discovered. The owner/occupant questionnaire identifies no environmental concerns.

8. PHASE II ESA

We performed a Phase II ESA to assess the proposed development areas of the Site for the potential presence of organochlorine pesticides (OCPs) and arsenic in the shallow soil due to the former agricultural use.

8.1 Scope of Investigation

The scope of the Phase II ESA consisted of the following tasks:

- Retaining Enthalpy Analytical, LLC, a state-certified laboratory, to perform laboratory analysis of soil samples and planned soil sample locations;
- Collecting soil samples within the proposed development areas of the Site;
- Performing laboratory analysis of soil samples; and
- Presenting our assessment and laboratory test results.

8.2 Soil Sample Collection and Analysis

On November 30, 2021, we collected 9 discrete soil samples (S-1 through S-9) at depths between 0 to 6 inches at the approximate locations shown on Figure 3. We collected the soil samples using a decontaminated trowel then transferred the soil into laboratory-provided 4-ounce jars. The jars were capped with Teflon-lined lids, labeled, and placed in a chilled cooler for transport to the laboratory under chain-of-custody protocol. The samples were analyzed for OCPs by USEPA Test Method 8081A and arsenic by USEPA Method 6010B. No obvious field indicators of apparent contamination (i.e. staining, odors, buried debris, etc.) were noted during the field sampling activities.

8.3 Analytical Test Results

A copy of the laboratory analysis report of the soil samples is in Appendix G and the results have been summarized below.

OCPs

No OCPs were detected at concentrations exceeding the laboratory reporting limits in the composite soil samples collected, except for the following. The OCPs, Dichlorodiphenyldichloroethylene (DDE), Dichlorodiphenyldichloroethane (DDD) and Dichlorodiphenyltrichloroethane (DDT) were detected in the composite sample made from Samples S4 through S6 at concentrations of 7.4, 8.2 and 39 micrograms per kilogram (µg/kg) respectively, none of which exceed the San Francisco Bay Regional

Water Quality Control Board Environmental Screening Levels (ESLs) for DDE, DDD, or DDT in residential soil of 1,800, 2,700, and 1,900 µg/kg respectively.

Arsenic

Arsenic was detected in the three discrete soil samples analyzed at concentrations ranging between 1.8 and 3.3 milligrams per kilogram (mg/kg). Naturally occurring or "background" concentrations in California soils typically range from 0.6 to 12 mg/kg and much higher in some areas depending on the mineralogy of the soil's parent material. Therefore, regulatory agencies allow comparison of arsenic concentrations in soil to naturally occurring background arsenic concentrations instead of calculated screening levels. The arsenic concentrations detected in the discrete samples do not exceed the naturally occurring arsenic concentrations of California soils of 12 mg/kg.

9. SUMMARY OF FINDINGS

The following table summarizes our findings and opinions regarding the Site, including known or suspect RECs, CRECs, HRECs, and de minimis environmental conditions.

Assessment Category	Observed (Y/N)	(REC/ CREC/ HREC/ DM or None)	Recommended Actions	Report Section(s)
Hazardous Substances/Petroleum Products	N	N	NFA	
Hazardous Wastes	N	N	NFA	
Non-Hazardous Wastes	N	N	NFA	
Aboveground/Underground Storage Tanks	N	N	NFA	
Unidentified Substance Containers	N	N	NFA	
Equipment Potentially Containing PCBs	N	N	NFA	
Wastewater Systems	N	N	NFA	
Evidence of Releases	N	N	NFA	
Pools of Liquid, Pits, Ponds, Lagoons	**Y**	**N**	**NFA**	**5.1, 5.2, 7**
Wells	**Y**	**N**	**AA**	**7**
Other Site Issues	N	N	NFA	
Nearby Properties	N	N	NFA	
Historical Land Use – Site	**Y**	**N**	**NFA**	**5.1, 8**
Historical Land Use – Nearby Properties	N	N	NFA	

Recommended Action:
AA = Additional action recommended.
NFA = No further action required at this time.
DM = De minimis condition where additional activities do not appear warranted at this time.

We observed no evidence of RECs or de minimis environmental conditions at the Site.

As described in Section 5.1, the Site has been utilized for agricultural use, which suggests that pesticides may have been used on the property. However, our Phase II ESA found no evidence of pesticides exceeding the established screening levels in the shallow soil and arsenic was detected within normal "background" concentrations. Therefore, there is no evidence or indication that further investigation is warranted at this time associated with the previous agricultural use of the Site.

As described in Section 7, a well was installed behind the residence at 12624 Oak Knoll Road in the late 1970's but was never used. Although not considered an environmental concern, we recommend properly abandoning this well prior to redevelopment of the Site.

10. CONCLUSIONS AND RECOMMENDATIONS

We have performed a Phase I & II ESA, in general conformance with the scope and limitations of ASTM E 1527-13, of the 10.87-acre property located at 12624, 12650, and 12702 Oak Knoll Road in Poway, California. The San Diego County assessor's parcel numbers (APNs) for the Site are 317-501-01, 317-500-02, 317-500-03, and 317-500-09 through -14.

This Phase I & II ESA identified no evidence of RECs in connection with the Site. Therefore, additional environmental assessment does not appear to be warranted at this time.

Although not anticipated, if soil staining or petroleum odors are observed during the grading operations, we recommend contacting Geocon Incoporated to observe and possibly sample areas of potential impact to determine if further action is warranted. Additionally, any undocumented subsurface structures or areas of apparent contamination encountered during site redevelopment activities including septic tanks, USTs, wells, etc. should be properly abandoned/removed in accordance with San Diego County regulatory requirements.

12. QUALIFICATIONS

This Phase I & II ESA report was prepared by Cole E. Mikesell with oversight by Troy K. Reist, CEG. We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR Part 312. We have the specific qualifications based on education, training, and experience, to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Mr. Mikesell has a BS degree in Geology with an emphasis in Environmental Geosciences. Mr. Mikesell is a certified Geologist-In-Training in the State of California. Mr. Mikesell has 5 years of experience in the geotechnical and environmental consulting industry. He has performed exploratory drilling, infiltration testing, foundation and earthworks observation, and prepared Phase I and Phase II ESAs throughout southern California.

Mr. Reist is a Professional Geologist and Certified Engineering Geologist, with a BS degree in Geology and has over 23 years of experience in the geotechnical and environmental consulting industry in California. Mr. Reist investigates, remediates and manages geotechnical and environmental issues on residential, commercial, industrial, and agricultural properties throughout southern California.

CLIENT–PROVIDED INFORMATION FOR THE SITE

Site: Oak Knoll, Poway, CA; Project No. G2746-62-01

***Please elaborate on any question answered "yes." If the question does not apply to the site, please answer "N/A".**

1. If possible, please provide us with the title, appraisal, or sale agreement records to review and discuss in the Phase I ESA. Will send upon receipt from Seller.

2. Are you aware of any environmental liens or activity and use limitations associated with the Site?
   No.

3. Do you have any specialized knowledge of the Site?
   No.

4. Please provide any commonly known or reasonably ascertainable information about the Site.
   Unknownl

5. Who currently owns, manages, and operates the Site?
   Harmon Family Trust

6. Has the monetary value of the Site been reduced due to environmental issues associated with the Site or adjacent properties?
   No

7. Why are you requesting a Phase I ESA for the Site?
   Part of due diligence for potential acquisition of the property.

Answers to disclosure questions which required additional space

1. A portion of the property's acreage is currently being leased by SDG&E for equipment staging. It will be occupied until approximately March 2022. Two of the three houses on the property are currently occupied by tenants on a month-to-month rental agreement. The main house at 12624 is unoccupied with the exception of a small office which is maintained by trustee Sherry Urena and husband Don Urena.

2. The family home at 12624 Oak Knoll Road was acquired in 1966. The adjoining acreage and rental houses were acquired at a later time, but I'm unsure of the dates of acquisition.

3. N/A. The property was inherited by way of a trust, it is not my primary residence.

4. I do not know the exact year the houses on the property were built. The houses at 12624 Oak Knoll and 12650 Oak Knoll were likely built in the early 1960's. The rock house at 12702 Oak Knoll was likely built in the early 1930's. An archeological study was conducted on the rock house several years ago which determined it is of little historical significance.

5. I do not have that information. The property was unfenced open fields when my parents moved there in 1966.

6. Water and sewer are provided by the city of Poway. Gas and electric are supplied by SDG&E. Trash service is through EDCO.

7. 12624 has gas central heating and electric central AC.
   12650, no central heat or AC
   12702, no central heat or AC

24. No, a well was installed behind the main house at 12624 Oak Knoll Road in The late 1970's, but was never used.

PROPERTY BACKGROUND INFORMATION QUESTIONNAIRE FOR SITE OWNER, OCCUPANT, OR REPRESENTATIVE

Site: Oak Knoll, Poway, CA; Project No. G2746-62-01

*Please elaborate on any question answered "yes." If the question does not apply to the site, please answer "N/A".

1) Describe the current uses of the Site. See attached page.

2) How long has the Site been used for these purposes? See attached page.

3) How long have you occupied the Site? See attached page

4) List the existing structures on the property and their age. See attached page.

5) Describe the past uses, owners, and operators of the Site. (Be as detailed as possible and note approximate time periods.) See attached page.

6) Utilities including electricity, natural gas, water, sewer, and trash removal are provided to the Site by which utility/companies. See attached page.

Water -
Sewer -
Electricity -
Natural Gas -
Trash –

7) What type of heating, ventilating, and air conditioning (HVAC) system is located at the Site and how is the HVAC system powered? See attached page.

8) Have the Site or adjoining properties been used for industrial activities, such the following? (Please note that an adjoining property is a property that is contiguous with, or directly across the street from the Site.)

Gasoline Station	[ ] Yes [ ] (No)
Printing Facility	[ ] Yes [ ] (No)
Metal Plating Manufacturing	[ ] Yes [ ] (No)
Landfill	[ ] Yes [ ] (No)
Motor Repair Facility	[ ] Yes [ ] (No)
Dry Cleaners	[ ] Yes [ ] (No)
Junkyard	[ ] Yes [ ] (No)
Waste Treatment	[ ] Yes [ ] (No)
Storage, Disposal, or Recycling Facility	[ ] Yes [ ] (No)

Describe other industrial activities, if any. None

9) Have any hazardous substances, petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or other waste materials been dumped aboveground, buried, or burned on the Site?

[ ] Yes [ ] No

10) Have any of the following items been stored on the Site in containers greater than 5 gallons?

Paint [ ] Yes [ ] No
Chemicals [ ] Yes [ ] No
Pesticides [ ] Yes [ ] No

11) Are hazardous wastes generated at the Site? If yes, describe the means of disposal and frequency of disposal.

[ ] Yes [ ] No

12) Have petroleum products been stored on the Site or transferred across the Site in pipelines, either above or belowground?

[ ] Yes [ ] No

13) Has fill dirt been brought onto the Site from an offsite source?

[ ] Yes [ ] No

14) Is there evidence that the fill dirt in Question 13 may be contaminated?

[ ] Yes [ ] No

15) Are there currently any pits, ponds, or lagoons on the Site?

[ ] Yes [ ] No

16) Have any pits, ponds, or lagoons previously existed on the Site?

[ ] Yes [ ] No

17) Are there currently areas on the Site with stained soil?

[ ] Yes [ ] No

18) Have stained soils previously existed on the Site?

[ ] Yes [ ] (No)

19) Do chemical-containing underground or aboveground storage tanks exist, or have they existed previously on the Site?

[ ] Yes [ ] (No)

20) Do fill pipes, vent pipes, or access ways indicating the presence of current or former underground storage tanks exist on the Site?

[ ] Yes [ ] (No)

21) Have fill pipes or vent pipes which may indicate the presence of a current or former underground storage tank been removed from the Site?

[ ] Yes [ ] (No)

22) Are floor drains stained with anything other than water in any area on the Site?

[ ] Yes [ ] (No)

23) Do floor drains on the Site emit foul odors?

[ ] Yes [ ] (No)

24) Is the Site served by a private well or a non-public water source?

[ ] Yes [ ] (No) see attached page

25) Are contaminants known to exist in any private well or non-public water system serving the Site?

[ ] Yes [ ] (No)

26) Does the Site discharge wastewater, other than domestic wastewater or storm water, into the sewer?

[ ] Yes [ ] (No)

27) Other than permission for domestic hookup, have any city, county, or local permits for wastewater discharge been issued to the Site? No

[ ] Yes [ ] No

28) Does a septic tank exist, or has one existed previously on the Site?

[ ] Yes [ ] No Not sure

29) Do cesspools or cisterns currently exist on the Site?

[ ] Yes [ ] (No)

30) Have cesspools or cisterns previously existed on the Site?

[ ] Yes [ ] (No)

31) Other than storm water, does the Site discharge waste water onto the neighboring Site?

[ ] Yes [ ] (No)

32) Is there a transformer or capacitor that may contain PCBs on the Site?

[ ] Yes [ ] (No)

33) Is there hydraulic equipment such as automobile lifts or elevators on the Site?

[ ] Yes [ ] (No)

34) Are PCBs contained in hydraulic oil associated with hydraulic equipment located on the Site?

[ ] Yes [ ] (No)

35) Has an asbestos and/or lead-based paint survey been conducted at the Site? If so, what were the findings?

[ ] Yes [ ] (No)

36) Other than small quantities of legal pesticides used for landscape maintenance (e.g., Roundup), have pesticides, herbicides, or insecticides been applied on the Site?
[ ] Yes [ ] (No)

37) Are you aware of any environmental liens against the Site that are filed or recorded under federal, tribal, state, or local law? No

[ ] Yes [ ] No

38) Have any environmental violations or citations associated with activities conducted on the Site been issued?

[ ] Yes [ ] No

39) Has the Site been included in other environmental assessments? If so, can copies of the reports be provided?

[ ] Yes [ ] No Archaeological study

40) Have other environmental assessments identified hazardous substances or petroleum products that exist, or may have existed on the Site?

[ ] Yes [ ] No

41) Are there any pending lawsuits that involve the release or threatened release of hazardous substances associated with the Site?

[ ] Yes [ ] No

42) Are you aware of any activity and land use limitations, such as engineering controls, land use restrictions or institutional controls that are in place on the Site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

[ ] Yes [ ] No

43) Are you aware of any commonly known or reasonably ascertainable information about the Site that would help the environmental professional to identify conditions indicative of hazardous substance releases or threatened hazardous substance releases?

[ ] Yes [ ] No

44) Do you have any specialized knowledge or experience related to the Site or nearby properties, including the knowledge of the chemicals and processes used by this type of business?

[ ] Yes [ ] No

45) Based in your knowledge or experience related to the Site, are there any obvious indicators that point to the presence or likely presence of contamination at the Site?

[ ] Yes [ ] No

46) If the purchase price of the Site was below fair market value, did this occur because contamination was/is known or believed to be present on the Site?

[ ] Yes [ ] No [ ] N/A

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

12624 OAK KNOLL ROAD
POWAY, CA 92064

COORDINATES

Latitude (North):	32.9520510 - 32° 57' 7.38''
Longitude (West):	117.0564740 - 117° 3' 23.30''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	494721.5
UTM Y (Meters):	3645781.8
Elevation:	467 ft. above sea level

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/22/2021 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

RITE AID #5637 EPA ID:: CAL000379873	12666 POWAY RD	N 1/8 - 1/4 (0.223 mi.)	O99	589

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 4 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information

that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/25/2021 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 2 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 5 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/22/2021 has revealed that there are 41 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EPA ID:: CAL000452408

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 12/17/2020 has revealed that there are 12 Cortese sites within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
