- - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    40 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =   2035210.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_2.5
```

```
 **Model Calculates  2 Short Term Average(s) of:   1-HR  24-HR
    and Calculates PERIOD Averages

 **This Run Includes:     40 Source(s);       4 Source Group(s); and     528
Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:     39 VOLUME source(s)
                and:      1 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   198.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.8 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   OntarioEuclid_P2Ops_PM2_5.err

 **File for Summary of Results:   OntarioEuclid_P2Ops_PM2_5.sum

Quantification of GHG Reduction from New Development 39

Introduction

The 2022 Ontario Community Climate Action Plan (2022 CCAP), adopted unanimously by the City Council on August 16, 2022, is the strategic plan for how the City of Ontario (City) will reduce greenhouse gas (GHG) emissions and foster a sustainable community through 2050 and beyond. It is an update to Ontario's 2014 CCAP and accounts for recent statewide climate change legislation and targets, most notably Senate Bill (SB) 32, which provides statewide targets to reduce GHG emissions to 40 percent below 1990 levels by 2030. The 2022 CCAP is consistent with The Ontario Plan (TOP) 2050, as updated and approved by City Council on August 16, 2022, and with the California Environmental Quality Act (CEQA) Guidelines for Plans for the Reduction of Greenhouse Gas Emissions (California Code of Regulations Section 15183.5). This allows the 2022 CCAP to support and streamline environmental review of GHG emissions for future development projects in the city.

Reductions related to transportation, water, solid waste, offroad equipment, energy, and renewable energy sources all play a crucial part in gaining the level of efficiency needed within the new development across Ontario.

The purpose of this document, GHG Emissions Screening Tables, is to provide guidance on how to analyze project level GHG emissions and determine the significance of those emissions during the discretionary review of proposed development projects in Ontario. The analysis, methodology, and significance determination (thresholds) presented in the screening tables and guidance herein, are based on the 2022 CCAP. Results of the quantification analysis in the CCAP show that implementation of community-wide GHG reduction measures would result in emissions savings of up to 205,960 metric tons of carbon dioxide (CO_2) equivalent ($MTCO_2e$) (0.51 per capita $MTCO_2e$) in 2030 and 770,620 $MTCO_2e$ (1.09 $MTCO_2e$) in 2050.

Mitigation of GHG emissions impacts through the Development Review Process (DRP) provides one of the most substantial reduction strategies for reducing community-wide GHG emissions associated with new development. Development projects subject to discretionary review will have the option of preparing a project-specific technical analysis to quantify and mitigate GHG emissions or completing the performance review checklist (GHG Emissions Screening Table) to demonstrate compliance with performance standards.

The City's 2022 CCAP includes performance standards that will reduce GHG emissions from new development by 54,069 $MTCO_2e$ per year in 2030 and 302,803 $MTCO_2e$ in 2050 as compared to emissions levels in 2019, prior to the adoption of the 2022 CCAP. CEQA requires the assessment of environmental impacts for proposed projects including the impacts of GHG emissions. The DRP procedures for evaluating GHG impacts and determining significance under CEQA will be streamlined by utilizing the performance standard review checklist to mitigate project GHG emissions and by demonstrating compliance with the 2022 CCAP. The levels of GHG emissions reductions in the Screening Tables are consistent with the City's adopted targets in the 2022 CCAP.

The City can use the Screening Tables to review development projects to ensure that the specific reduction strategies in the 2022 CCAP are implemented as part of the CEQA process for

development projects. The Screening Tables provide a menu of options that ensures both implementation of the reduction strategies and flexibility on how development projects would implement the reduction strategies to achieve an overall reduction of emissions, consistent with the reduction targets of the 2022 CCAP.

California Environmental Quality Act

CEQA Mandates for Analysis of Impacts

CEQA requires that Lead Agencies inform decision-makers and the public regarding the following: potential significant environmental effects of proposed projects; feasible ways that environmental damage can be avoided or reduced through the use of feasible mitigation measures and/or project alternatives; and the reasons why the Lead Agency approved a project if significant environmental effects are involved (CEQA Guidelines § 15002). CEQA also requires Lead Agencies to evaluate potential environmental effects based upon the fullest extent possible scientific and factual data (CEQA Guidelines§ 15064[b]). A determination of whether or not a particular environmental impact would be significant shall be based on substantial evidence, which includes facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts (CEQA Guidelines § 15064f[5]).

The recently amended CEQA Guidelines § 15064.4[a] [b] explicitly require Lead Agencies to evaluate GHG emissions during CEQA review of potential environmental impacts generated by a proposed project. To assist in this effort, two questions were added to Appendix G of the CEQA Guidelines:

- Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

Finally, under the "rule of reason," an Environmental Impact Report (EIR) is required to evaluate impacts to the extent that is reasonably feasible (CEQA Guidelines § 15151; San Francisco Ecology Center v. City and County of San Francisco [1975] 48 Cal.App.3rd 584). While CEQA does require Lead Agencies to make a good faith effort to disclose what they reasonably can do, CEQA does not demand what is not realistically possible (Residents at Hawks Stadium Committee v. Board of Trustees [1979] 89 Cal.App.3rd 274, 286).

Greenhouse Gas Impact Determination

Statewide or Regional Thresholds of Significance

There are currently no published statewide thresholds of significance for measuring the impact of GHG emissions generated by a proposed project. CEQA Guidelines § 15064.7(b) indicates "each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects." Jurisdictions within the South Coast Air Quality Management District (AQMD) boundary can refer to the

AQMD's air quality thresholds in the absence of locally adopted thresholds and GHG mitigation plans. Ontario's 2022 CCAP addresses cumulative GHG emissions by establishing citywide emission reduction targets that reduce the cumulative GHG impacts to less than significant, provides a set of recommended GHG reduction measures that collectively achieve the emission targets, and provides an implementation plan to implement the reduction measures. This document provides guidance on how to address project level GHG emissions in CEQA analysis and determine the significance of project-generated GHG emissions.

Quantitative Analysis Relative to the Climate Action Plan

Methodology Overview

To address the State's requirement to reduce GHG emissions, the City adopted the 2022 CCAP with citywide GHG emission reduction targets of 40 percent below 1990 levels of emissions by 2030 and 80 percent below 1990 levels of emissions by 2050. Ontario's targets are consistent with State laws in effect at the time of the adoption, including SB 32, and ensure that the City is providing GHG reductions locally that will complement State and international efforts of stabilizing climate change.

Because the 2022 CCAP addresses GHG emissions reduction consistent with SB 32, and international efforts to address global climate change, and includes specific local requirements that would substantially lessen the cumulative problem, compliance with the 2022 CCAP would fulfill the description of mitigation found in CEQA Guidelines § 15130(a)(3) and § 15183.5.

GHG emissions have long-term, cumulative impacts on the climate, both locally and globally. Therefore, the focus of the analysis is on determining whether incremental contributions of GHGs present a considerable, cumulative contribution to climate change. The 2022 CCAP includes a set of GHG reduction measures designed to substantially lessen local cumulative impacts associated with GHG emissions as described in CEQA Guidelines § 15130(a)(3), in determining if a project's effects would result in significant impacts. The 2022 CCAP has the following components that fulfill cumulative mitigation for GHG emissions:

1. Provides a community-wide GHG emissions reduction target that would substantially lessen the cumulative impact.
2. Provides measures that new development projects shall follow in order to implement the 2022 CCAP, help achieve the City's reduction targets, and substantially lessen the cumulative impact of local GHG emissions.
3. Provides a set of GHG analyses that quantitatively demonstrate how the GHG reduction measures within the 2022 CCAP meet the citywide targets that substantially lessen the cumulative impact; and
4. Provides an implementation matrix to help track and monitor progress to ensure that the citywide emissions reduction targets are met.

The 2022 CCAP satisfies the first condition by adopting targets of reducing GHG emissions within the City by 40 percent below 1990 levels of emissions by 2030 and 80 percent below 1990

levels by 2050. The 2030 reduction target is compliant with SB 32 and provides a pathway to make substantial progress towards the State's goal to achieve carbon neutrality by 2045.

The 2022 CCAP satisfies the second condition through the Screening Tables. This document supplies the specific criteria that new development shall follow to ensure that the reduction measures associated with new development are implemented and the reduction targets are met.

The 2022 CCAP satisfies the third criterion by providing a set of community-wide GHG emissions inventories, forecasts, and quantification of GHG emissions savings resulting from implementation of the GHG reduction measures. The community-wide inventories provide existing conditions and demonstrate change in emissions over time between 2008, 2016, and 2019. Community-wide forecasts provide a snapshot of future GHG emissions levels in 2030 and 2050.

Finally, state reductions and quantification analyses demonstrate the impact of state and local actions, respectively, on community-wide emissions levels in 2030 and 2050, compared with business as usual (BAU) scenarios in the 2030 and 2050 emissions forecasts. These technical analyses in the 2022 CCAP provide quantitative evidence to demonstrate that the implementation of GHG reduction measures can achieve the citywide emission reduction targets. These community-wide GHG emission analyses are summarized in **Appendix A** of the 2022 CCAP.

The Development Plan Review (DPR)

The City encourages all new development to integrate the reduction measures of the 2022 CCAP into project design and operation. Projects subject to the City's DPR are required to demonstrate their consistency with the 2022 CCAP. **Appendix A** of this document contains a flow chart that diagrams this development review process. To determine if specific strategies from the 2022 CCAP are required and if the preparation of the Screening Table is needed, project applicants must answer the following question(s).

1. **Question 1: Is the proposed activity a discretionary project?**

   If yes, proceed with the Screening Tables.

   If no, proceed to the next question.

2. **Question 2: Does the proposed activity meet or exceed the project size thresholds?** **Table 1** contains a Land Use Development Table which identifies the maximum project size for new residential and new non-residential development that is exempt from the Screening Table requirements.

   If yes, proceed with the Screening Tables.

   If no, the project falls below the project size threshold, and no further action is required concerning GHG emissions in the development review process.

Table 1. Project Size Thresholds for Land Use Development 1

Project Type	Project Size Threshold for Screening Table
Single Family Residential (Single Family Detached)	60 units
Apartments/Condominiums/Townhouse	20 units
Retirement Community (Senior Housing Age 50 or older)	50 units
General Commercial/Retail/Office	20,000 square feet
Supermarket/Grocery/Discount Club	36,000 square feet
Restaurants (sit down)	8,200 square feet
Fast-Food Restaurants (Fast Food with or without /Drive Thru)	5,300 square feet
Gas Station	7,200 square feet
Logistics/Warehouse	45,000 square feet
Passive Park	200 acres
Active Park	60 acres

Options for Calculation of GHG Emissions

Analysis of development projects can either be done through emissions calculations, using a tool such as CalEEMod[1] or a similar tool following the guidance below, or by using the Screening Tables as described below. Projects that do not use the GHG Screening Tables to demonstrate consistency with the 2022 CCAP must follow the guidance in this document and demonstrate consistency with the City's GHG reduction targets and reduction strategies as adopted in the 2022 CCAP.

Total GHG emissions are the sum of emissions from both direct and indirect sources. Direct sources include mobile sources, such as construction equipment, motor vehicles, landscape equipment, and stationary sources, such as cooling and heating equipment. Indirect sources comprise electrical and potable water use, and the generation of solid waste and wastewater. The project team for the CCAP assessed separate GHG reductions for the years 2030 and 2050, and further separated GHG reductions for the Screening Tables for "existing" (constructed 2019 or before) and "new" (constructed in 2020 or after)" development. This is consistent with the recommendations outlined in *Golden Door Properties, LLC v. County of San Diego/Sierra Club, LLC v. County of San Diego (2018) 27 Cal.App.5th*.

Analysis of development projects not using the Screening Tables should use the emission factors provided by state and regional agencies and utility providers. Refer to the emission factors and data sources used for the 2022 CCAP quantification of GHG reduction strategies presented in **Table 2**, Emission Factors and Data Sources, Accounting for Statewide Actions. Quantification of emissions from electricity used for potable water treatment and transportation as well as wastewater transport and treatment can be found in the California Energy Commission (CEC) document titled Refining Estimates of Water-Related Energy Use in California (CEC 2006).

Analysis of development projects not using the Screening Tables should use one or both of the following GHG inventory guidelines:

1. The United States Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions (U.S. Community Protocol), which was first developed in 2012 and updated in 2019. The California Governor's Office of Planning and Research encourages cities and counties in California to follow the U.S. Community Protocol for community-wide GHG emissions.
2. The Global Protocol for Community-Scale Greenhouse Gas Inventories (Global Protocol) was first developed in 2014 for preparing international community-scale GHG inventories. It contains additional guidance and resources to support a wider range of activities in other countries, including guidance on how to assess GHG emissions from sources that are not covered in the U.S. Community Protocol.

[1] https://www.caleemod.com/

Table 2. Emission Factors and Data Sources, Accounting for Statewide Actions

CC	Unit	2019	2030	2050	Source
SCE electricity	$MTCO_2e$/ kWh	0.000208	0.000149	0.000000	SCE
Natural gas	$MTCO_2e$/ therm	0.005272	0.005272	0.005272	US Community Protocol
On-road transportation (light and medium-duty vehicles)	$MTCO_2e$/ mile	0.000348	0.000277	0.000253	EMFAC 2021 v1.0.2, California Air Resources Board
On-road transportation (heavy duty vehicles)	$MTCO_2e$/ mile	0.001256	0.001070	0.000734	EMFAC 2021 v1.0.2, California Air Resources Board
On-road transportation (total)	$MTCO_2e$/ mile	0.000434	0.000353	0.000298	EMFAC 2021 v1.0.2, California Air Resources Board
Solid waste (municipal solid waste)	$MTCO_2e$/ ton	0.286062	0.234502	0.234488	CalRecycle
Solid waste (alternative daily cover)	$MTCO_2e$/ ton	0.247191	0.246418	-	CalRecycle

As noted above, the work prepared for the CCAP includes level of reductions from both existing and new development, and from residential and nonresidential development, to achieve the adopted targets. There are also separate targets for projects completed by 2030, and those completed between 2031 and 2050, consistent with the CCAP target years. Projects that do not use the Screening Tables will need to demonstrate that they will generate annual GHG emissions that do not exceed the following thresholds:

1. For residential development completed between 2020 and 2030, the project shall not produce GHG emissions greater than **5.85 $MTCO_2e$/dwelling unit**.
2. For residential development completed after 2030, the project shall not produce GHG emissions greater than **1.53 $MTCO_2e$/dwelling unit**.

3. For nonresidential developments of all types completed between 2020 and 2030, the project shall not produce GHG emissions greater than **8.84 MTCO$_2$e/2,500 square feet of conditioned space**.
4. For nonresidential developments of all types completed after 2030, the project shall not produce GHG emissions greater than **3.61 MTCO$_2$e/2,500 square feet of conditioned space**.

For projects that include both residential and nonresidential space, the residential and nonresidential components must be assessed separately against their respective applicable thresholds.

Accordingly, GHG emissions from residential space must be assessed separately from GHG emissions from nonresidential space. The residential thresholds assume that one dwelling unit is home to an average of 3.48 people by 2030, and 3.30 people by 2050. The nonresidential thresholds assume that 2,500 square feet of conditioned space employs an average of 2.31 people by 2030 and 2.83 people by 2050.

To demonstrate compliance the following information is to be provided: 1) quantitative analysis, including project-specific modeling; 2) table of all assumptions utilized and additional measures incorporated; and 3) narrative of CCAP compliance and associate measures.

Screening Tables

The purpose of the Screening Tables is to provide guidance in measuring the reduction of GHG emissions attributable to certain design and construction measures incorporated into development projects. The analysis, methodology, and significance determination (thresholds) are based upon the 2022 CCAP, which includes GHG emission inventories for 2008, 2016, and 2019; forecasts for years 2030 and 2050; emission targets for 2030 and 2050; and the strategies to reach the targets. **Appendix B** of this document sets forth the methodology for the development and application of the Screening Tables and uses the California Air Pollution Control Officers Association (CAPCOA) guidance on quantifying project-level GHG reductions (CAPCOA 2022).

Instructions for Residential, Commercial, or Industrial Projects

This document contains four Screening Tables designed for different development projects, listed below:

- **Table 3** is the Screening Table for multi-family development projects.
- **Table 4** is the Screening Table for single-family development projects.
- **Table 5** is the Screening Table for warehouse non-residential development projects.
- **Table 6** is the Screening Table for all other non-residential development projects, including commercial, office, medical, hotel, fitness, industrial, and retail development.

The Screening Tables assign points for each option incorporated into a project as mitigation or a project design feature (collectively referred to as "feature"). The point values correspond to the

minimum emissions reduction expected from each feature. The menu of features allows flexibility and options for how development projects can implement the GHG reduction measures. The point levels are based upon improvements compared to 2019 emission levels for new development projects. Projects that achieve at least 100 points per applicable Screening Table will be consistent with the reduction quantities consistent with the 2022 CCAP. Consistent with CEQA Guidelines, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

Instructions for Mixed-Use Projects

Mixed-use projects provide additional opportunities to reduce emissions by combining complementary land uses in a manner that can reduce vehicle trips. Mixed-use projects also have the potential to complement energy-efficient infrastructure in a way that reduces emissions. For mixed-use projects, all applicable Screening Tables shall be filled out. Measures can be used to satisfy the requirements of more than one Screening Table as appropriate to reflect the building's mix of uses, and the project must achieve 100 points for each use to comply with the 2022 CCAP.

Nothing in this guidance shall be construed as limiting the City's authority to adopt a statement of overriding considerations for projects that require the preparation of an EIR due to significant GHG impacts.

The following tables provide a menu of performance standards/options related to GHG mitigation measures and design features that can be used to demonstrate consistency with the reduction measures and GHG reduction quantities in the 2022 CCAP.

Table 3. Screening Table for Implementing GHG Performance Standards for Multi-family Residential Development 2030 (Circle Applicable Project Points, 100 points minimum)

Description	Feature	Project Points
Reduction Measure 1: Building Electrification		
Replacement of gas appliance with efficient electric appliance (select all that apply)	Electric space heater	6
	Electric water heater	8
	Electric stove	5
	Electric dryer	1
Additional electric appliance measures, if applicable (select all that apply)	Electric pool heater (if applicable)	1
	Electric spa heater (if applicable)	1
Lack of natural gas infrastructure	Project site does not have any natural gas infrastructure.	10
	Total for measure	*32*
Reduction Measure 2: Green Roofs		
Installation of a roof with a planted layer of vegetation over a waterproof surface for multi-family residential buildings	Medium Green Roof – Total vegetated area makes up 25% or more of combined multi-family residential unit area (in square feet).	3
	Total for measure	*3*
Reduction Measure 3: Urban Cooling		
On-site tree planting (select one option)[2]	1 tree per each required on-site vehicle parking space.	6
	2 trees per each required on-site vehicle parking space.	12
	3 trees per each required on-site vehicle parking space.	18
	Total for measure	*18*

[2] This strategy specifies the ratio of additional trees per required vehicle parking spaces. Based upon total on-site vehicle parking spaces required per the City of Ontario Development Code for the project, the Applicant will calculate the number of trees required to meet this measure and obtain points. The landscape plan will show onsite trees and the tree matrix shall identify all trees associated with the Urban Cooling Measure compliance. The City code requires trees onsite and within paved areas to reduce the associated heat build-up from development. The Landscape Planning Division will consider these trees in the calculation to be counted toward the Urban Cooling Measure.

Description	Feature	Project Points
Reduction Measure 4: Transit Oriented Communities (TOCs)		
New development is located in a transit-oriented community (TOC)	Development site is located within ½ mile radius of one or more of the following: a Bus Rapid Transit (BRT) stop, bus transit center, light rail station, the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods, and/or High-Quality Transit Corridor defined as a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.[3]	10
	Total for measure	*10*
Reduction Measure 5: Increase Transit Ridership		
Provision of free transit passes for onsite residents or tenants for a period of 5 years after completion of construction[4] (select one option)	One 50% discounted annual transit pass for every two parking spaces, or one per residential unit, whichever is greater.	2
	One 100% discounted (free) annual transit pass for every two parking spaces or one per residential unit, whichever is greater.	6
	One 100% discounted (free) annual transit pass per parking space or one per residential bedroom, whichever is greater.	12
	Total for measure	*12*
Reduction Measure 6: Vehicle Electrification[5]		
Installation of EV charging stations for resident vehicle parking spaces (select one option)	Installation of Level 2 EV or higher charging stations at a rate of 5-10% of required vehicle parking spaces.	10
	Installation of Level 2 EV or higher charging stations at a rate of 11-29% of required vehicle parking spaces.	20
	Installation of Level 2 EV or higher charging stations at a rate of 30% or more of required vehicle parking spaces.	30
	Total for measure	*30*

[3] A project shall be considered to be within one-half mile of a major transit stop or high-quality transit corridor if all parcels within the project have no more than 25 percent of their area farther than one-half mile from the stop or corridor and if not more than 10 percent of the residential units or 100 units, whichever is less, in the project are farther than one-half mile from the stop or corridor.

[4] Provision for annual transit passes to be incorporated into CC&R's/HOA bylaws, as appropriate.

[5] EV charging station levels are defined in the California Green Building Standards or CALGreen Code, accessed at https://www.dgs.ca.gov/BSC/CALGreen. Charging stations also refer to charging ports.

Description	Feature	Project Points
Reduction Measure 7: Active Transportation		
Installation or improvement of bicycle facilities (select all that apply)	Bicycle parking facilities with 1:1 ratio of bicycle parking to guest vehicle parking space.	3
	Construct or improve a single bicycle lane facility (only Class I, II, or IV) that 1) connects to a larger existing bikeway network or 2) closes an existing bikeway network gap that is at least 0.5 miles long.	6
Installation or improvement of pedestrian facilities (select one option)	Two or three pedestrian infrastructure improvements to street design on private streets, including, but not limited to curb extensions, raised crosswalks, speed humps/bumps, street tree plantings in parkways or street medians, and elevated pavement markings.	3
	Four or more pedestrian infrastructure improvements to street design, including, but not limited to curb extensions, raised crosswalks, speed humps/bumps, street tree plantings in parkways or street medians, and elevated pavement markings.	6
	Total for measure	*15*
Reduction Measure 8: Parking Policy		
Require that some or all of resident vehicle parking spaces be purchased at an additional cost. This does not include guest vehicle parking spaces (select one option) [6]	Unbundle, or separate, half (50%) of parking costs of a residential project from property costs, requiring those who wish to purchase an additional parking space to do so at an additional cost.	1
	Unbundle, or separate, 100% of residential project's parking costs from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost.	2
	Total for measure	*2*
Reduction Measure 9: Electric construction equipment[7]		
Use zero emission or electric construction equipment (select one option)	One-third (33%) of construction equipment used for construction (during building phase, not including grading phase), measured by number of hours of operation, is zero emission equipment.	4

[6] Provision for unbundled parking to be incorporated into CC&R's bylaws or separate parking agreement, as appropriate.

[7] Electric construction equipment includes electric compact excavators, electric motors, electric generators, and mobile charging equipment.

Description	Feature	Project Points
	Half (50%) of construction equipment used for construction (during the building phase, not including the grading phase), measured by the number of hours of operation, is zero emission equipment.	8
	Two-thirds (66%) or more of construction equipment used for construction (during the building phase, not including the grading phase), measured by number of hours of operation, is zero emission equipment.	12
	Total for measure	*12*
Reduction Measure 10: Waste diversion		
Design and plan multi-family housing developments to include onsite areas for municipal compost/green waste and recycling bins/containers	Site design allocates sufficient space for storage and collection of green waste, organic waste, and recyclables.	33
	Total for measure	*33*
Reduction Measure 11: Water conservation		
Implement indoor water efficiency measures (select all that apply)	Implement water efficient showerheads and faucets.	1
	Install on-demand water circulators on all showers/baths[8].	2
Incorporate outdoor water efficiency measures	Design and plan outdoor landscapes planted with drought-tolerant, low maintenance plants with a 1) drip irrigation system or 2) sprinkler irrigation system with a weather-based irrigation controller.	4
	Total for measure	*7*
	Multi-family Total for all measures	***174***
	Multi-family Project Points Subtotal	
Additional Recommended Measures		
AR-1: Meet CalGreen	CalGreen Tier 1 compliance.	5
	CalGreen Tier 2 compliance.	10

[8] According to CALGreen, a hot water recirculation system is one which includes "a thermostat that will automatically shut off the recirculation pump when the water temperature reaches a preset level at the point of use."

Description	Feature	Project Points
voluntary tiers (select one option)		
AR-2: Generate energy from on-site solar PV (4 stories and higher buildings only, select one option)	Solar PV that generates 30%-49% of residential energy needs on multifamily residential buildings that are 4 stories in height or taller.	5
	Solar PV that generates 50%-79% of residential energy needs on multifamily residential buildings that are 4 stories in height or taller.	10
	Solar PV that generates 80% or more of residential energy needs on multifamily residential buildings that are 4 stories in height or taller.	15
AR-3: Energy Storage	If the building is 3 stories in height or less, install battery energy storage systems that meet the same performance standards as an energy storage system that would be required by the building code in a comparable building 4 stories in height or taller.	5
AR-4: Recycled Water	Use recycled water for at least 80% of outdoor water needs.	4
AR-5: Reflective Paving	Use high-reflectivity pavement for all hardscaped areas, including parking areas, walking paths, and patios.	4
AR-6: Building Orientation	Orient the building along a north-south alignment.	3
AR-7: Building Shading	Shade at least 90% of south-facing glazing by vegetation or overhangs at noon on June 21.	2
AR-8: Building Daylight	Provide daylighting in all rooms.	1
	Total additional recommended measures	***44***
	Multi-family Project Points Subtotal	
	Total Multi-family Points Possible	***218***

Reduction Measure 2: Solar Energy Systems for New Warehouse Development only *(solar energy system required for warehouse development)*		
Installation of rooftop solar energy systems at new warehouse/logistics facilities. (select one option)	Installation of rooftop solar energy system which generates enough electricity to meet 45% of annual warehouse electricity demand.	22
	Installation of rooftop solar energy system which generates enough electricity to meet 90% of annual warehouse electricity demand.	44
	Installation of rooftop solar energy system which generates enough electricity to meet 100% of annual warehouse electricity demand.	48
Installation of battery storage at new warehouse/logistics facilities (select one option)	Solar battery storage installation with a capacity of 200-599 kW (DC).	3
	Solar battery storage installation with a capacity of 600-799 kW (DC).	6
	Solar battery storage installation with a capacity of 800-1200 kW (DC).	11
	Total for measure	*59*
Reduction Measure 3: Green Roofs		
Installation of a roof with a planted layer of vegetation over a waterproof surface for non-residential buildings (select one option)	Medium Green Roof – Total vegetated area makes up 50% of combined non-residential floor area (in square feet).	1
	Large Green Roof – Total vegetated area makes up 100% or more of combined non-residential floor area (in square feet).	2
	Total for measure	*2*
Reduction Measure 4: Urban Cooling		
On-site tree planting	1 tree per each required on-site employee/visitor vehicle parking space.	4
	2 trees per each required on-site employee/visitor vehicle parking space.	8

Description	Feature	Project Points
(select one option)[13]	3 trees per each required on-site employee/visitor vehicle parking space.	15
	Total for measure	*15*
Reduction Measure 5: Transit Oriented Communities (TOCs)		
New development is located in a transit-oriented community (TOC)	The development site is located within ½ mile radius of one or more of the following: a Bus Rapid Transit (BRT) stop, bus transit center, light rail station, the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods, and/or High-Quality Transit Corridor defined as a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.[14]	7
	Total for measure	*7*
Reduction Measure 6: Increase Transit Ridership		
Provision of free transit passes in a quantity equivalent to the expected number of employees at the non-residential building. Transit passes shall be provided for a period of 5 years after completion of construction. [15]	One free annual transit pass for every employee.	6

[13] This strategy specifies the ratio of additional trees per required employee/visitor vehicle parking spaces. Based upon total on-site vehicle parking spaces required per the City of Ontario Development Code for the project, the Applicant will calculate the number of trees required to meet this measure and obtain points. The landscape plan will show onsite trees and the tree matrix shall identify all trees associated with the Urban Cooling Measure compliance. The City code requires trees onsite and within paved areas to reduce the associated heat build-up from development. The Landscape Planning Division will consider these trees in the calculation to be counted toward the Urban Cooling Measure.

[14] A project shall be considered to be within one-half mile of a major transit stop or high-quality transit corridor if all parcels within the project have no more than 25 percent of their area farther than one-half mile from the stop or corridor and if not more than 10 percent of the residential units or 100 units, whichever is less, in the project are farther than one-half mile from the stop or corridor.

[15] Provision for annual transit passes to be incorporated into CC&R's bylaws, as appropriate.

Description	Feature	Project Points
	Total for measure	6
Reduction Measure 7: Vehicle Electrification[16]		
Installation of EV charging stations for truck parking spaces (select one option)[17]	Installation of Level 2 or higher EV charging stations at a rate of 5-9% of planned truck parking spaces.	2
	Installation of Level 2 or higher EV charging stations at a rate of 10-19% of planned truck parking spaces.	4
	Installation of Level 2 or higher EV charging stations at a rate of 20-29% of planned truck parking spaces.	6
	Installation of Level 2 or higher EV charging stations at a rate of 30-49% of planned truck parking spaces.	10
	Installation of Level 2 or higher EV charging stations at a rate of 50% or more of planned truck parking spaces.	15
	Total for measure	*15*
Reduction Measure 8: Active Transportation		
Installation or improvement of bicycle facilities (select all that apply)	Bicycle parking facilities with 1:20 ratio of bicycle parking to employee vehicle parking space.	2
	Construct or improve a single bicycle lane facility (only Class I, II, or IV) that 1) connects to a larger existing bikeway network or 2) closes an existing bikeway network gap that is at least 0.5 miles long.	3
Installation or improvement of pedestrian facilities (select one option)	Two or three pedestrian infrastructure improvements to street design on private streets, including, but not limited to curb extensions, raised crosswalks, speed humps/bumps, street tree plantings in parkways or street medians, and elevated pavement markings.	2
	Four or more pedestrian infrastructure improvements to street design on private streets, including, but not limited to private property curb extensions, raised crosswalks, speed humps/bumps, elevated pavement markings, and public property street tree plantings in parkways or street medians.	4
	Total for measure	9

[16] EV charging station levels 1-3 are defined in the California Green Building Standards or CALGreen Code, accessed at https://www.dgs.ca.gov/BSC/CALGreen.

[17] Reduction Measure 7 refers to EV charging stations for two-axle trucks.

Description	Feature	Project Points
Reduction Measure 9: Parking Policy		
Require that employee vehicle parking spaces be purchased at an additional cost. This does not include client/visitor vehicle parking spaces [18]	Unbundle, or separate, 100% of non-residential project's parking costs from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost.	1
	Total for measure	*1*
Reduction Measure 10: Electric construction equipment[19]		
Use electric construction equipment for a portion of the construction project (select one option)	One-third (33%) of construction equipment used for construction (during building phase, not including grading phase), measured by number of hours of operation, is zero emission equipment.	3
	Half (50%) of construction equipment used for construction (during the building phase, not including the grading phase), measured by the number of hours of operation, is zero emission equipment.	5
	Two-thirds (66%) or more of construction equipment used for construction (during the building phase, not including the grading phase), measured by number of hours of operation, is zero emission equipment.	8
	Total for measure	*8*
Reduction Measure 11: Waste diversion		
Site design for non-residential warehouse development includes site(s) for green waste/ organics and recycling collection bins	Site design allocates sufficient space for storage and collection of green waste, organic waste, and recyclables.	20
	Total for measure	*20*
Reduction Measure 12: Water conservation		
Implement indoor water efficiency measures (select all	Install water-efficient faucets and showerheads.	1
	Install on-demand water circulators on commercial sinks or dishwashing equipment.[20]	2

[18] Provision for unbundling parking to be incorporated into CC&R's bylaws or separate parking agreement, as appropriate.

[19] Electric construction equipment includes electric compact excavators, electric motors, electric generators, and mobile charging equipment.

[20] According to CALGreen, a hot water recirculation system is one which includes "a thermostat that will automatically shut off the recirculation pump when the water temperature reaches a preset level at the point of use."

Description	Feature	Project Points
that apply)		
Incorporate outdoor water efficiency measures	Design and plan outdoor landscapes planted with drought-tolerant, low maintenance plants with a 1) drip irrigation system or 2) sprinkler irrigation system with a weather-based irrigation controller.	4
	Total for measure	*7*
	Warehouse Total for measures	***172***
	Warehouse Project Points Subtotal	
Additional Recommended Measures		
AR-1: Charging stations for large trucks (select one option)	Installation of conduit for charging stations for zero emission trucks larger than two-axles (class 8 and 9, and semi-trucks) so that facilities are prepared for the transition to electric trucks.	4
	Installation of 1-4 charging stations for zero emission trucks larger than two-axles (class 8 and 9, and semi-trucks)	8
	Installation of 5-9 charging stations for zero emission trucks larger than two-axles (class 8 and 9, and semi-trucks)	12
	Installation of 10 or more charging stations zero emission trucks larger than two-axles (class 8 and 9, and semi-trucks)	24
AR-2: Meet CalGreen voluntary tiers (select one option)	CalGreen Tier 1 compliance	5
	CalGreen Tier 2 compliance	10
AR-3: Installation of EV charging stations for employee vehicle parking spaces (select one option)	Installation of Level 2 or higher EV charging stations at a rate of 5-9% of planned employee vehicle parking spaces.	4
	Installation of Level 2 or higher EV charging stations at a rate of 10-19% of planned employee vehicle parking spaces with Level 2 EV charging stations.	6
	Installation of Level 2 or higher EV charging stations at a rate of 20% or more of planned employee vehicle parking spaces Level 2 EV charging stations.	12
AR-4: Recycled Water	Use recycled water for at least 80% of outdoor water needs.	2
AR-5: Reflective Paving	Use high-reflectivity pavement for all hardscaped areas, including parking areas, walking paths, and patios.	4
AR-6: Zero Emission Cargo Equipment	Use of zero emission cargo handling equipment for a minimum of 50% of all operations.	4
AR-7: Alternative Fueling	Installation of alternative fuel facilities, such as CNG, biofuels, or hydrogen fueling stations.	10
	Total additional recommended measures	***66***

GHG DEVELOPMENT REVIEW PROCESS FLOW CHART DIAGRAM[28]

[28] For Option 2, to determine whether project satisfies 2030 emissions reductions per dwelling unit (for residential projects) or per 2,500 square feet of nonresidential conditioned space (for nonresidential projects), reference Tables A-1 and A-2 in Appendix A. These tables show emissions totals for new residential and nonresidential development by 2030 per residential unit or building square footage with 2022 CCAP GHG reduction measures.

Table A-1. 2030 Emissions Totals (in $MTCO_2e$) for New Residential Development with GHG Reduction Measures from 2022 CCAP

Sector	Subsector	2030[29]	2050[30]
Residential Energy	Residential electricity	8,560	0
	Residential natural gas	16,030	530
Transportation	Pre-CCAP Community-wide light duty VMT (total minus light-duty municipal VMT)	61,100	65,050
Off-Road Equipment	Agricultural Equipment	N/A	N/A
	Airport Ground Support	N/A	N/A
	Construction and Mining	14,380	14,990
	Industrial	N/A	N/A
	Lawn and Garden	N/A	N/A
	Light Commercial	N/A	N/A
	Pleasure Craft	N/A	N/A
	Portable Equipment	N/A	N/A
	Recreational	N/A	N/A
	Transportation Refrigeration Units	N/A	N/A
Solid Waste	Municipal solid waste	6,490	32,370
	Alternative daily cover	90	370
	Transform waste	40	130
Waste and Wastewater	Indirect water energy	1,010	0
	Indirect wastewater energy	140	0
	Direct wastewater plant emissions	330	3,420
Sequestration	Development activities	490	1,230
	Street tree sequestration	-1,090	-1,820
Agriculture	Enteric fermentation	N/A	N/A
	Fertilizer application	N/A	N/A
	Manure management	N/A	N/A
Total (including land use/sequestration)		**107,570**	**116,270**
$MTCO_2e$ per new residential unit		**5.85**	**1.53**
NOTE: Population per new residential unit		*3.48*	*3.30*

[29]Total $MTCO_2e$ for 2030 signifies the level of GHG emissions reductions for new development that are consistent with the City's GHG emission target of 6.0 $MTCO_2e$ per person (service population) in 2030.

[30]Total $MTCO_2e$ for 2050 signifies the level of GHG emissions reductions for new development that are consistent with the City's GHG emission target of 2.0 $MTCO_2e$ per person (service population) in 2050.

Table A-2. Emissions Totals (in $MTCO_2e$) for New Non-residential Development with GHG Reduction Measures from 2022 CCAP

Sector	Subsector	2030[31]	2050[32]
Nonresidential Energy	Non-residential electricity	11,820	0
	Non-residential natural gas	22,050	15,700
Transportation	Light-duty municipal vehicles	170	280
	Community-wide light-duty vehicles	46,680	79,400
	Heavy-duty municipal vehicles	160	200
	Community-wide heavy-duty VMT (total minus light-duty municipal VMT)	20,330	32,180
Off-Road Equipment	Agricultural Equipment	0	0
	Airport Ground Support	0	0
	Construction and Mining	11,010	10,820
	Industrial	0	0
	Lawn and Garden	0	0
	Light Commercial	0	0
	Pleasure Craft	0	0
	Portable Equipment	0	0
	Recreational	0	0
	Transportation Refrigeration Units	0	0
Solid Waste	Municipal solid waste	4,970	23,360
	Alternative daily cover	70	260
	Transform waste	30	100
Waste and Wastewater	Indirect water energy	170	0
	Indirect wastewater energy	60	0
	Direct wastewater plant emissions	260	2,470
Sequestration	Development activities	380	890
	Street tree sequestration	-2,600	-5,590
Agriculture	Enteric fermentation	N/A	N/A
	Fertilizer application	N/A	N/A
	Manure management	N/A	N/A
	Total (including land use/sequestration)	**115,560**	**160,070**
	$MTCO_2e$ per 2,500 sq ft nonresidential space	**8.84**	**3.61**
	Note: Jobs per 2,500 sq ft nonresidential space	*2.31*	*2.83*

[31]Total $MTCO_2e$ for 2030 signifies the level of GHG emissions reductions for new development that are consistent with the City's GHG emission target of 6.0 $MTCO_2e$ per person (service population) in 2030.

[32]Total $MTCO_2e$ for 2050 signifies the level of GHG emissions reductions for new development that are consistent with the City's GHG emission target of 2.0 $MTCO_2e$ per person (service population) in 2050.

Sample Project Sizes by Land Use Category that are below Project Size Threshold

Definitions:	
Single Family Residential Single-Family Detached homes on individual lots typical of a suburban subdivision	
Apartments/Condominiums/Townhouse	
Apartments High Rise:	High-rise apartments are units located in rental buildings that have more than 10 levels and most likely have one or more elevators.
Apartments Low Rise:	Low-rise apartments are units located in rental buildings that have 1-3 levels.
Apartments Mid Rise:	Mid-rise apartments in rental buildings that have between 4 and 10 levels.
Condo/Townhouse:	These are ownership units that have at least one other owned unit within the same building structure.
Retirement Community Senior Housing (Age 50 or older) These communities provide multiple elements of senior adult living. Housing options may include various combinations of senior adult housing single family and/or multi-family, in support of assisted living, and skilled nursing care aimed at allowing the residents to live in one community as their medical needs change.	
General Commercial/Retail/Office (refrigeration not to exceed 10% of total sf) Home Improvement Super Store, Auto Care Center, Electronic Superstore, Hardware store, Pharmacy/Drugstore with & without drive thru, General Office Building, Bank with & without drive thru, Civic Center, Medical Office, Office Park, Health Club, and Strip Mall (small strip shopping centers contain a variety of retail shops and specialize in quality apparel, hard goods and services such as real estate offices, dance studios, florists and small restaurants) or Convenience Store not to exceed 5,000 sf.	
Supermarket/Grocery/Discount Club (refrigeration exceed 10% of total sf) Supermarkets: free-standing retail stores selling a complete assortment of food: food preparation and wrapping materials; and household, cleaning items. Supermarkets may also contain the following products and services: ATMs, automobile supplies, bakeries, books and magazines, dry cleaning, floral arrangements, greeting cards, limited-service banks, photo centers, pharmacies, and video rental areas. Discount Club: a discount or warehouse store where shoppers pay a membership fee in order to take advantage of discounted prices on a wide variety of items such as food, clothing, tires and appliances. Many items are sold in large quantities or in bulk.	
Restaurants (sit down) Full-service eating establishments with typical turnover rates of at least one hour or longer. Patrons commonly wait to be seated, are served by a waiter, order from menus and pay for meals after they eat.	

Definitions:
Fast-Food Restaurants (with or without /Drive Thru) Patrons generally order at a cash register and pay before they eat.
Gas Station Gas Station includes the building square footage and excludes the canopy. Gas/Service Station Projects that include "One building" with two to three ancillary uses: Fast Food w/Drive Thru, Convenience Market 24hr.
Warehouse Industrial Warehouse with or without refrigeration, storage, and logistics.
Wireless Communication Towers Cell Towers-freestanding
Passive Park Amenities that include tot lots, picnic table, non-programmed open space.
Active Park Amenities include one of the following: game fields lighted, pool facility and community center (as per the Comprehensive Recreation and Parks Master Plan).

Appendix B:

METHODOLOGY FOR THE DEVELOPMENT AND APPLICATION OF THE SCREENING TABLES

The point values in the Screening Tables were derived from the projected emissions reductions that would be achieved by each of the reduction measures associated with new development in Ontario in 2030 and 2050 with implementation of the 2022 CCAP. The points are allocated to each GHG reduction strategy using separate 100-point scales, representing the full potential for GHG emissions reductions for each land use type. The points were determined by disaggregating growth in activity data and GHG emissions by land use type to estimate the relative contribution of newly constructed residential and non-residential buildings to growth in consumption of energy, water, fuels, and other activities that generate GHG emissions in the City limit. Growth in activity was estimated by subtracting the activity level in the baseline year, 2019 from the activity level in the forecasted year, such as 2030. For example, to find the net increase in the Vehicle Miles Traveled (VMT) between 2019 and 2030, take the annual number of miles traveled in 2030 and subtract the annual number of miles traveled in 2019.

The points for each Screening Table were derived by estimating the share of community-wide activity occurring in residential and non-residential land uses. The Screening Table calculations use a demographic based assumption to simplify calculations. It was assumed that the relative share of activity data attributed to residential land uses is equal to the ratio of resident population to the service population. Similarly, it was assumed that the relative share of activity data attributed to non-residential land uses is equal to the ratio of the worker population to the service population. The service population is the sum of the resident and worker populations in the community.

Once disaggregated into residential and non-residential activity, the new activity was multiplied by the appropriate emission factor (the same used in the preparation of the 2022 CCAP) to determine the GHG emissions produced in $MTCO_2e$ by both residential and non-residential new developments by 2030 and 2050. The sum of the emissions produced by newly constructed residential and non-residential land uses equals the total emissions produced by all new buildings constructed in the City limits during the time period. The points derived from GHG emission reductions are applicable to project level by applying the percent of community wide emissions reductions achieved by each strategy to each residential unit or square footage of commercial/industrial uses. Refer to **Table B-1** and **Table B-2** for the disaggregated activity and emissions reductions, respectively, resulting from the 2022 CCAP for new residential development in 2030 and 2050. **Table B-3** and **Table B-4** present disaggregated activity and emissions reductions, respectively, resulting from the 2022 CCAP for new non-residential development in 2030 and 2050.

Note that the Screening Tables and point values are best used for typical development projects processed by the City. Examples of typical development projects include residential subdivisions, multi-family residential apartments, condominiums, and townhouses, retail commercial, big box retail, office buildings, business parks, and warehousing. Mixed-use

projects can use the instructions at the beginning of the Screening Tables. Transit-oriented development (TOD) and infill projects can use the Screening Tables.

However, more unusual types of industrial projects, such as cement manufacturing, metal foundries, refrigerant manufacturing, electric generating stations—including large alternative energy electric generation, and oil refineries, cannot use the Screening Tables because the emission sources for those types of uses were not accounted for in the 2022 CCAP.

Quantification of GHG Reduction from New Development

The 2022 CCAP's central goal is to achieve GHG reductions to meet Ontario's adopted 2030 and 2050 reduction targets. To identify these reductions, the 2022 CCAP project built upon existing GHG reduction strategies in the City's 2014 CCAP and added new strategies to address new and emerging issues not covered in the 2014 CCAP.

The project team developed 28 GHG reduction strategies and 106 recommended implementation actions. These strategies include a mix of education and outreach programs to encourage GHG reduction activities, financial subsidies, and other enticements to incentivize GHG reductions, and mandates to require GHG efforts. These 28 strategies are organized into 10 categories:

1. Energy
2. Transportation
3. Off-road
4. Waste
5. Water
6. Agriculture
7. Wastewater
8. Leadership
9. Carbon Sequestration
10. Economic Development

The results of quantifying GHG reduction potential of Ontario's existing and planned local strategies show that, with successful implementation of the strategies, Ontario can meet its 2030 and 2050 emissions per capita reduction targets. Collectively, local strategies are forecast to reduce emissions by 0.51 $MTCO_2e$ per capita by 2030 and 1.09 $MTCO_2e$ per capita by 2050 in addition to the reductions achieved by existing state, regional, and local accomplishments. The City's 2022 CCAP includes performance standards that will reduce GHG emissions from new development by 54,069 $MTCO_2e$ per year in 2030 and 302,803 $MTCO_2e$ in 2050 as compared to emissions levels in 2019 prior to the adoption of the 2022 CCAP. This total can be broken down into the following GHG emissions reductions by land use type:

- New residential development: 24,432 $MTCO_2e$ in 2030 and 215,414 $MTCO_2e$ in 2050.
- New nonresidential development: 29,637 $MTCO_2e$ in 2030 and 87,389 $MTCO_2e$ in 2050.

Table B-1 and **B-2** present the activity and emissions reductions which are responsible for the GHG reductions achieved by new residential development in compliance with the 2022 CCAP. Table **B-3** and **B-4** present the activity and emissions reductions which are responsible for the GHG reductions achieved by new non-residential development in compliance with the 2022 CCAP.

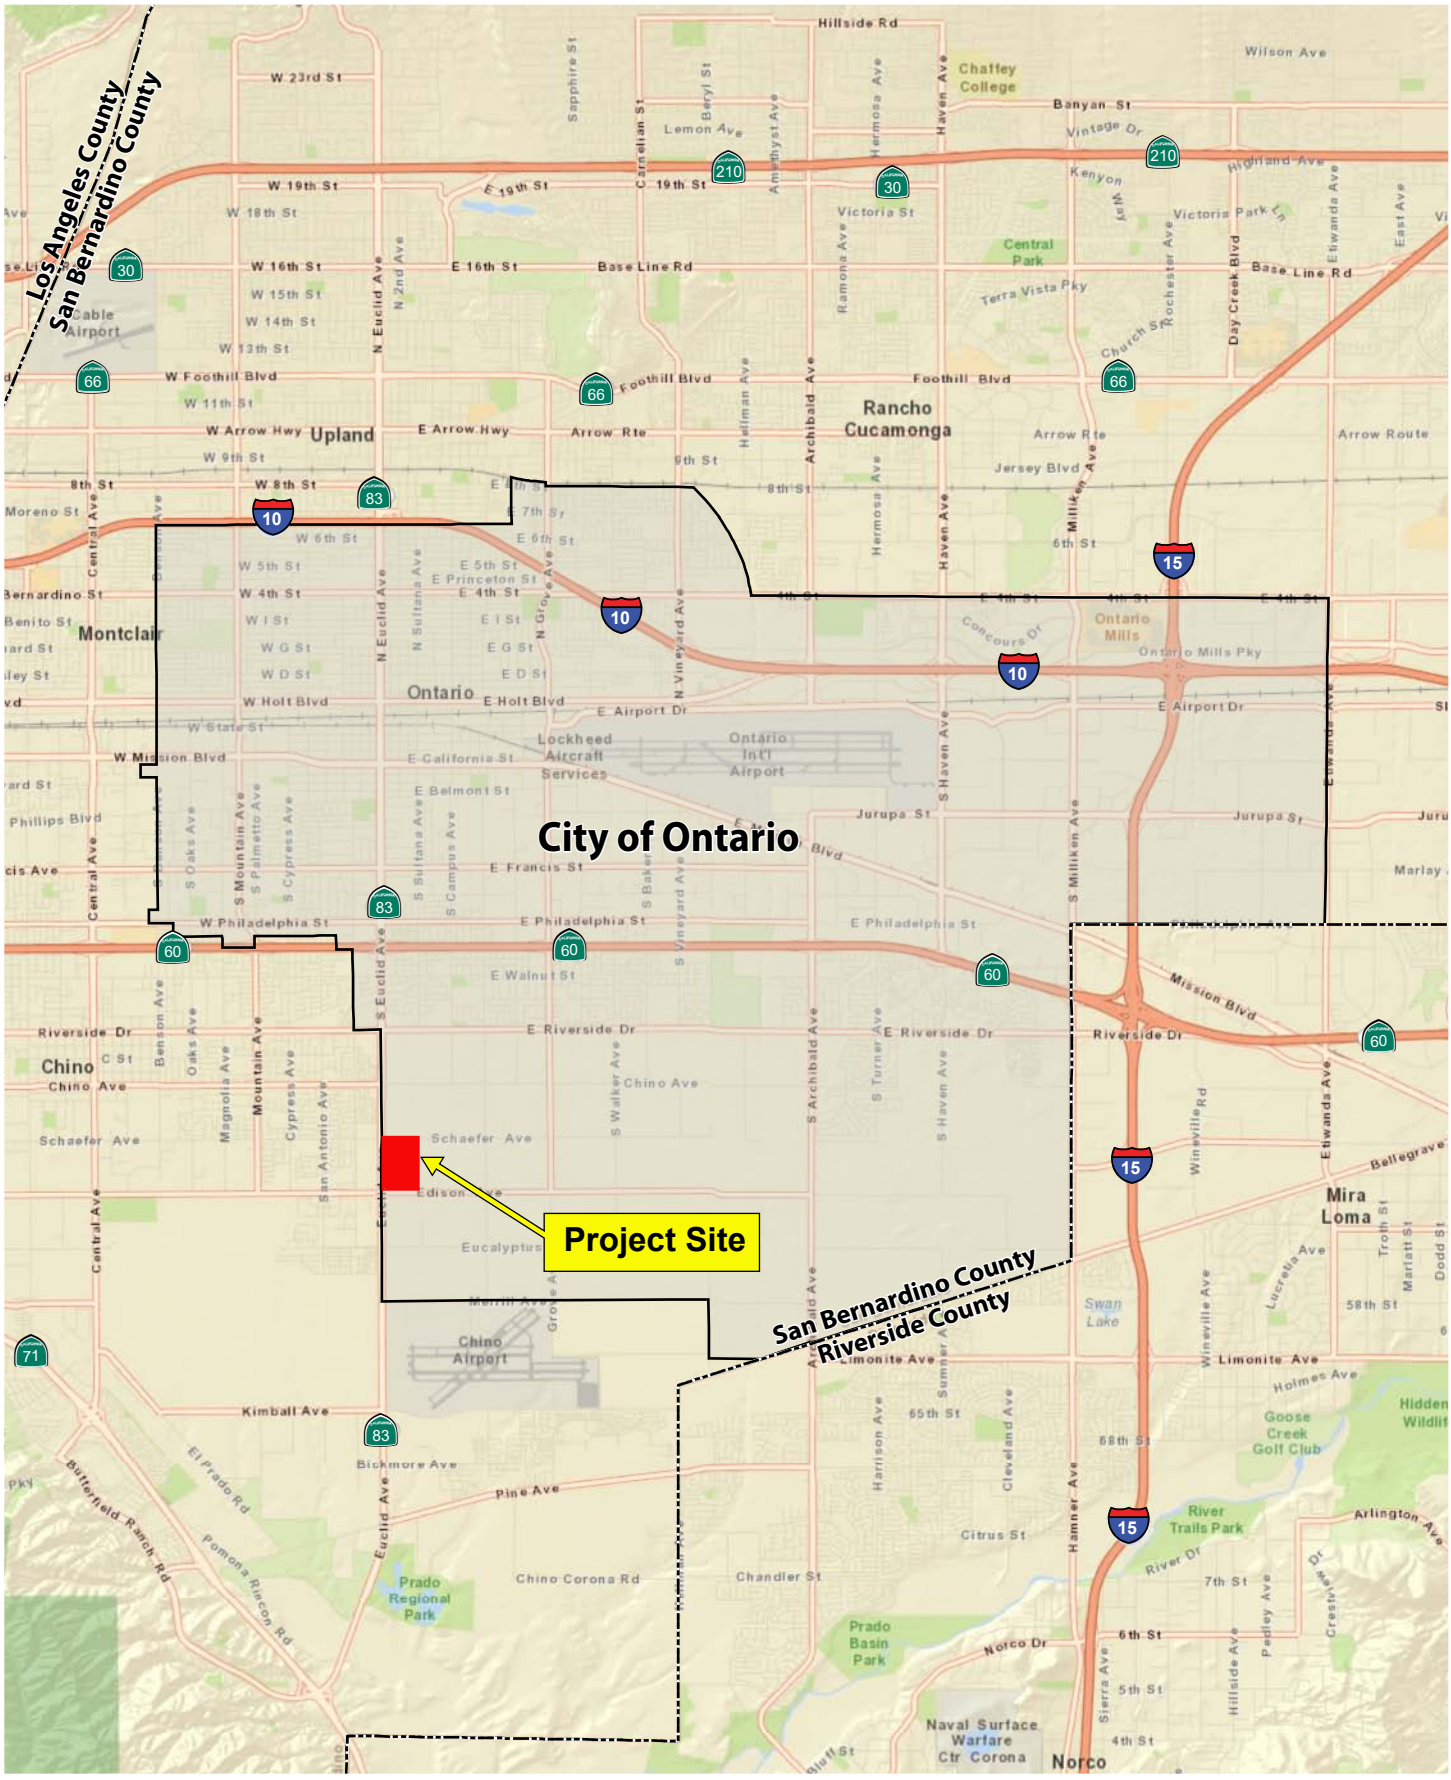
INTRODUCTION

The following biological resources technical report describes a detailed assessment of potential sensitive natural resources located within and/or immediately adjacent to the 94.22-acre "Euclid Mixed-Use Specific Plan" project (Specific Plan Boundary). The report has been prepared to support compliance with the California Environmental Quality Act (CEQA) documentation including the preparation of an Initial Study (IS), Environmental Impact Report (EIR) and environmental review process conducted by the City of Ontario. As discussed below, the assessment included a thorough literature review, site reconnaissance characterizing existing conditions (including floral, faunal and dominant vegetation communities), impact analysis, and applicable standards and regulations to ensure impacts remain at a level below significance.



PROJECT LOCATION

The 70.04-acre project site (Project Site), 59.98-acres onsite, Assessor Parcel Numbers (APNs) 1053-071-01, -02, -03, -04, 1053-211-01, -02, 1053-281-08, 1053-081-01, -03, -04, and 10.06-acres offsite assessment area (right of ways) is located within the southwestern region of the City of Ontario, San Bernardino County, California, as shown in Figure 1, *Regional Location Map*, and Figure 2, *Project Site Map*. Specifically, the Euclid Mixed-Use Specific Plan extends north of Ontario Ranch Road, east of Euclid Avenue, south of Schaefer Avenue and west of Sultana Avenue.

The remaining parcels totaling 24.18-acres, located within the southwest region of the Specific Plan Boundary including APN's 1053-211-05, 1053-281-01, -02, -03, -04, and -07 were analyzed programmatically (Programmatic Assessment Area) based on aerial photographs and assessments from the parcel boundaries as shown in Figure 2, *Project Site Map*. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in the un-surveyed portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction, **CM BIO-6** Programmatic Assessment Area CEQA Analysis.

PROJECT DESCRIPTION

The proposed action includes the development of thirteen (13) warehouse buildings totaling 957,595 square feet including associated offices, employee parking, and 365 trailer stalls (RGA, Office of Architectural Design).

METHODOLOGY

The following section details the methods implemented prior to and during the reconnaissance survey conducted throughout the Project Site.

LITERATURE REVIEW

Existing biological resource conditions within and adjacent to the Project Site were initially investigated through review of pertinent scientific literature. Federal register listings, protocols, and species data provided by the United States Fish and Wildlife Service (USFWS) were also reviewed in conjunction with anticipated federally listed species potentially occurring within the region of the Project Site. The California Natural Diversity Database (CNDDB) (CDFW 2022a), a California Department of Fish and Wildlife (CDFW) Natural Heritage Division species account database, was also reviewed for all pertinent information regarding the locations of known occurrences of sensitive species in the vicinity of the property. In addition, numerous regional floral and faunal field guides were utilized in the identification of species and suitable habitats. Combined, the reviewed sources provided an excellent baseline from which to inventory the biological resources potentially occurring in the area. Other CDFW reports and publications consulted include the following:

- Special Animals (CDFW 2022b);
- State and Federally Listed Endangered and Threatened Animals of California (CDFW 2022c);
- Endangered, Threatened, and Rare Plants of California (CDFW 2022d); and
- Special Vascular Plants and Bryophytes List (CDFW 2022e).

FIELD SURVEY

A reconnaissance survey of the Project Site was conducted by Ruben Ramirez of Cadre Environmental on October 7th, 2022 in order to characterize and identify potential sensitive plant and wildlife habitats, and to establish the accuracy of the data identified in the literature search. Geologic and soil maps were examined to identify local soil types that may support sensitive taxa. Aerial photograph, topographic maps, vegetation and rare plant maps prepared for previous studies in the region were used to determine community types and other physical features that may support sensitive plants/wildlife, uncommon taxa, or rare communities that occur within or adjacent to the Project Site. Habitat assessments were conducted for, but not limited to, the following target species/groups.

- Delhi sands flower loving fly – Federally Endangered (FE)
- Coastal California gnatcatcher – Federally Threatened (FT)/State Species of Special Concern (SSC)
- Burrowing owl - SSC
- San Bernardino kangaroo rat – FE/SSC
- Common and sensitive bat species
- Sensitive plants

Vegetation Communities/Habitat Classification Mapping

Natural community names and hierarchical structure follows the "*Manual of California Vegetation*" (Sayer and Keeler-Wolf 2009) classification system, which has been refined and augmented where appropriate to better characterize the habitat types observed onsite. A general plant survey was conducted throughout the Project Site during the reconnaissance in a collective effort to identify all species occurring onsite.

All plants observed during the survey efforts were either identified in the field or collected and later identified using taxonomic keys. Plant taxonomy follows Hickman (1993). Scientific nomenclature and common names used in this report generally follow Roberts et al. (2004) or Baldwin et al. (2012) for updated taxonomy. Scientific names are included only at the first mention of a species; thereafter, common names alone are used.

Wildlife Resources Inventory

All animals identified during the reconnaissance survey by sight, call, tracks, scat, or other characteristic sign were documented. In addition to species actually detected, expected use of the site by other wildlife was derived from the analysis of habitats on the site, combined with known habitat preferences of regionally occurring wildlife species. Vertebrate taxonomy followed in this report is according to the Center for North American Herpetology (2022 for amphibians and reptiles), the American Ornithologists' Union (1988 and supplemental) for birds, and Baker et al. (2003) for mammals. Both common and scientific names are used during the first mention of a species; common names only are used in the remainder of the text.

Jurisdictional Resources Assessment

The Project Site was assessed for the presence/absence of United States Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), and Regional Water Quality Control Board (RWQCB) jurisdictional resources. Non-wetland waters of the United States were assessed based on the limits of the Ordinary High-Water Mark (OHWM) as determined by erosion, the deposition of vegetation or debris, and changes in vegetation and soil characteristics. The assessment utilized the methodology for routine wetland determination according to the methods outlined in the USACE Wetland Delineation Manual (Environmental Laboratory 1987) and the Arid West Wetland Delineation Supplement and updated regulatory guidance letters (USACE 2008). Wetlands are identified by the presence of three characteristics: hydrophytic vegetation, wetland hydrology, and hydric soils. If any of these criteria were met, one or more transects were run to determine the extent of the wetland. Specifically, the presence of wetland hydrology was evaluated throughout the Project Site by recording the extent of observed surface flows, depth of inundation, depth to saturated soils, and depth to free water in the soil pits, where applicable. In addition, indicators of wetland or riverine hydrology were recorded, including water marks, drift lines, rack, debris, and sediment deposits, as warranted. Any indicators of hydric soils, such as redoximorphic features, buried organic matter, organic streaking, reduced soil conditions, gleyed or low-chroma soils, or sulfidic odor were also recorded.

The following section presents the existing conditions of the Project Site. The Project Site is characterized as 70.04-acres of heavily disturbed active dairy and agricultural facilities as shown in Figure 3, *Vegetation Communities Map*, Figures 4 to 8, *Current Project Site Photographs,* and outlined in Table 1, *Project Site Vegetation Community Acreages*. The Project Site is completely bordered by high traffic roads, commercial/residential development and active dairy and agricultural facilities.

The Soil Survey of the San Bernardino County Area has the following soils mapped within the boundary of the Project Site as shown on Figure 9, *Soils Association Map*:

- Hr – Hilmar loamy fine sand
- TuB – Tujunga loamy sand 0 to 5 percent slopes.

VEGETATION COMMUNITIES

Active Dairy

Approximately half of the Project Site has and continues to be utilized as an active dairy including dry lots, milking parlors/feed storage facilities and housing (Venegas Family Farm). These areas are either devoid of vegetation or dominated by ornamental, ruderal non-native and native species commonly detected in disturbed habitats including Palmer's amaranth (*Amaranthus palmeri*), summer cypress (*Bassia scoparia*), horseweed (*Erigeron canadensis*), Russian thistle (*Salsola tragus*), prostate knotweed (*Polygonum aviculare*), cheeseweed (*Malva parviflora*), red-stemmed filaree (*Erodium cicutarium*), castor bean (*Ricinus communis*), prickly lettuce (*Lactuca serriola*), Bermuda grass (*Cynodon dactylon*), barnyard grass (*Echinochloa crus-galli*), goose grass (*Eleusine indica*), wild oat (*Avena fatua*), foxtail barley (*Hordeum murinum*), ripgut brome (*Bromus diandrus*), Peruvian peppertree (*Schinus molle*), Bougainvillea (*Bougainvillea* sp.), pine (*Pinus* sp.), Mexican fan palm (*Washingtonia robusta*), and jacaranda (*Jacaranda* sp.). Several dairy effluent retention ponds are located onsite and are either devoid of vegetation or inundated with discharge. No riparian scrub, forest or woodland habitat is associated with these ponds.

Active Agriculture

Approximately half of the Project Site has and continues to be actively farmed including the current production of pumpkin (*Cucurbita* sp.) and field corn *(Zea mays*).

Disturbed

Disturbed regions of the Project Site are either devoid of vegetation (dirt roads and fallow fields) or dominated by the following species including golden crown beard (*Verbesina encelioides*), London rocket (*Sisymbrium irio*), milk thistle (*Silybum marianum*), Australian saltbush (*Atriplex semibaccata*), big saltbush (*Atriplex lentiformis*), spiny cocklebur (*Xanthium spinosum*), field bindweed (*Convolvulus arvensis*), common sow thistle (*Sonchus oleraceus*), and annual sunflower (*Helianthus annus*).

Developed

Developed regions of the Project Site include the existing roadways within the rights-of-way.

Ornamental (Eucalyptus)

Several blue gum (*Eucalyptus globulus*) and red gum trees (*Eucalyptus camaldulensis*) are located adjacent to the northeast and western Project Site boundaries.

Table 1.
Project Site Vegetation Community Acreages

Vegetation Community	Onsite Acres	Offsite Acres	Total Acres
Active Dairy	31.17	2.69	33.86
Active Agriculture	25.71	1.62	27.33
Disturbed	3.02	4.04	7.06
Developed	--	1.18	1.18
Ornamental (Eucalyptus)	0.08	0.53	0.61
TOTAL	**59.98**	**10.06**	**70.04**

Source: Cadre Environmental 2022.

GENERAL PLANT & WILDIFE SPECIES

All plant species documented within the Project Site are presented and listed in the previous section.

General wildlife species documented on site include white-faced ibis (*Plegadis chihi*), red-winged blackbird (*Agelaius phoeniceus*), red-tailed hawk (*Buteo jamaicensis*), turkey vulture (*Cathartes aura*), rock dove (*Columba livia*), American kestrel (*Falco sparverius*), northern mockingbird (*Mimus polyglottos*), Anna's hummingbird (*Calypte anna*), mourning dove (*Zenaida macroura*), black phoebe (*Sayornis nigricans*), Say's phoebe (*Sayornis saya*), western meadowlark (*Sturnella neglecta*), cliff swallow (*Petrochelidon pyrrhonota*), American crow (*Corvus brachyrhynchos*), Brewer's blackbird (*Euphagus cyanocephalus*), brown-headed cowbird (*Molothrus ater*), European starling (*Sturnus vulgaris*), house finch (*Haemorhous mexicanus*), white-crowned sparrow (*Zonotrichia leucophrys*) house sparrow (*Passer domesticus*), and desert cottontail rabbit (*Sylvilagus audubonii*).

JURISDICTIONAL WETLAND RESOURCES

No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site. The artificially created unvegetated dairy effluent retention ponds are isolated located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland vegetation including but not limited to riparian scrub, forest or woodland habitat.

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan (WQMP), Storm Water Pollution Prevention Plan (SWPPP) and compliance with National Pollutant Discharge Elimination System (NPDES) permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions.

SENSITIVE BIOLOGICAL RESOURCES

The following discussion describes the plant and wildlife species present, or potentially present within the property boundaries, that have been afforded special recognition by federal, state, or local resource conservation agencies and organizations, principally due to the species' declining or limited population sizes, usually resulting from habitat loss. Also discussed are habitats that are unique, of relatively limited distribution, or of particular value to wildlife. Protected sensitive species are classified by state and/or federal resource management agencies, or both, as threatened or endangered, under provisions of the state and federal endangered species act. Vulnerable or "at-risk" species that are proposed for listing as threatened or endangered (and thereby for protected status) are categorized administratively as "candidates" by the USFWS. CDFW uses various terminology and classifications to describe vulnerable species.

Sensitive biological resources are habitats or individual species that have special recognition by federal, state, or local conservation agencies and organizations as endangered, threatened, or rare. The CDFW, USFWS, and special groups like the California Native Plant Society (CNPS) maintain watch lists of such resources. For the purpose of this assessment sources used to determine the sensitive status of biological resources are:

Plants: USFWS (2022), CNDDB (CDFW 2022a), CDFW (2022d, 2022e), CNPS (2022), and Skinner and Pavlik (1994),

Wildlife: California Wildlife Habitat Relationships (2008), USFWS (2022), CNDDB (CDFW 2022a), and CDFW (2022b, 2022c).

Habitats: CNDDB (CDFW 2022a, 2022f).

FEDERAL PROTECTION AND CLASSIFICATIONS

The Federal Endangered Species Act of 1973 (FESA) defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its

range...” Threatened species are defined as “any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.” Under provisions of Section 9(a)(1)(B) of the FESA it is unlawful to “take” any listed species. “Take” is defined as follows in Section 3(18) of the FESA: “...harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.” Further, the USFWS, through regulation, has interpreted the terms “harm” and “harass” to include certain types of habitat modification as forms of a “take.” These interpretations, however, are generally considered and applied on a case-by-case basis and often vary from species to species. In a case where a property owner seeks permission from a federal agency for an action that could affect a federally listed plant and animal species, the property owner and agency are required to consult with USFWS. Section 9(a)(2)(b) of the FESA addresses the protections afforded to listed plants. Recently, the USFWS instituted changes in the listing status of former candidate species. Former C1 (candidate) species are now referred to simply as candidate species and represent the only candidates for listing. Former C2 species (for which the USFWS had insufficient evidence to warrant listing at this time) and C3 species (either extinct, no longer a valid taxon or more abundant than was formerly believed) are no longer considered as candidate species. Therefore, these species are no longer maintained in list form by the USFWS, nor are they formally protected. However, some USFWS field offices have issued memoranda stating that former C2 species are henceforth to be considered Federal Species of Concern. This term is employed in this document but carries no official protections. All references to federally protected species in this report (whether listed, proposed for listing or candidate) include the most current published status or candidate category to which each species has been assigned by USFWS. For purposes of this assessment, the following acronyms are used for federal status species:

FE	Federal Endangered
FT	Federal Threatened
FPE	Federal Proposed Endangered
FPT	Federal Proposed Threatened
FC	Federal Candidate for Listing

The designation of critical habitat can also have a significant impact on the development of land designated as “*critical habitat*.” The FESA prohibits federal agencies from taking any action that will “*adversely modify or destroy*” critical habitat (16 U.S.C. § 1536(a)(2)). This provision of the FESA applies to the issuance of permits by federal agencies. Before approving an action affecting critical habitat, the federal agency is required to consult with the USFWS who then issues a biological opinion evaluating whether the action will “*adversely modify”* critical habitat. Thus, the designation of critical habitat effectively gives the USFWS extensive regulatory control over the development of land designated as critical habitat.

The Migratory Bird Treaty Act of 1918 (MBTA) makes it unlawful to “*take*” any migratory bird or part, nest, or egg of such bird listed in wildlife protection treaties between the United States and Great Britain, the Republic of Mexico, Japan, and the Union of Soviet States. For purposes of the MBTA, “*take*” is defined as to pursue, hunt, capture, kill, or possess or attempt to do the same.

The Bald Eagle and Golden Eagle Protection Act explicitly protects the bald eagle and golden eagle and imposes its own prohibition on any taking of these species. As defined in this act, take means to pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, or molest or disturb. Current USFWS policy is not to refer the incidental take of bald eagles for prosecution under the Bald Eagle and Golden Eagle Protection Act (16 U.S.C. 668-668d).

STATE PROTECTION AND CLASSIFICATIONS

California's Endangered Species Act (CESA) defines an endangered species as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." The State defines a threatened species as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the commission as rare on or before January 1, 1985 is a threatened species." Candidate species are defined as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the commission has published a notice of proposed regulation to add the species to either list." Candidate species may be afforded temporary protection as though they were already listed as threatened or endangered at the discretion of the Fish and Game Commission. Unlike FESA, CESA does not include listing provisions for invertebrate species.

Article 3, Sections 2080 through 2085, of CESA addresses the taking of threatened or endangered species by stating "No person shall import into this state, export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts, except as otherwise provided..." Under CESA, "take" is defined as "...hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Exceptions authorized by the state to allow "take" require "...permits or memorandums of understanding..." and can be authorized for "...endangered species, threatened species, or candidate species for scientific, educational, or management purposes." Sections 1901 and 1913 of the California Fish and Game Code provide that notification is required prior to disturbance.

Additionally, some sensitive mammals and birds are protected by the State as Fully Protected Mammals or Fully Protected Birds, as described in the California Fish and Game Code, Sections 4700 and 3511, respectively. SSC ("special" animals and plants) listings include special status species, including all state and federal protected and candidate taxa, Bureau of Land Management (BLM) and US Forest Service (USFS) sensitive species, species considered to be declining or rare by the CNPS or National Audubon Society, and a selection of species which are considered to be under population stress but are not formally proposed for listing. This list is primarily a working document

for the CDFW's CNDDB project. Informally listed taxa are not protected per se, but warrant consideration in the preparation of biotic assessments. For some species, the CNDDB is only concerned with specific portions of the life history, such as roosts, rookeries, or nest sites.

For the purposes of this assessment, the following acronyms are used for State status species:

SE	State Endangered
ST	State Threatened
SCE	State Candidate Endangered
SCT	State Candidate Threatened
SFP	State Fully Protected
SP	State Protected
SR	State Rare
SSC	California Species of Special Concern
CWL	California Watch List

Nesting birds, including raptors, are protected under California Fish and Game Code Section 3503, which reads, “It is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto.” In addition, under California Fish and Game Code Section 3503.5, “it is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto”. Passerines and non-passerine land birds are further protected under California Fish and Game Code 3513. As such, CDFW typically recommends surveys for nesting birds that could potentially be directly (e.g., actual removal of trees/vegetation) or indirectly (e.g., noise disturbance) impacted by project-related activities. Disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered “take” by CDFW.

The CNPS is a private plant conservation organization dedicated to the monitoring and protection of sensitive species in the State. This organization has compiled an inventory comprised of the information focusing on geographic distribution and qualitative characterization of rare, threatened, or endangered vascular plant species of California (Tibor 2001). The list serves as the candidate list for listing as threatened and endangered by CDFW. The CNPS has developed five categories of rarity (CRPR):

CRPR 1A	Presumed extinct in California
CRPR 1B	Rare, threatened, or endangered in California and elsewhere
CRPR 2A	Plants presumed extirpated in California but common elsewhere

CRPR 2B	Plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3	Plants about which we need more information – a review list
CRPR 4	Species of limited distribution in California (i.e., naturally rare in the wild), but whose existence does not appear to be susceptible to threat

As stated by the CNPS:

> "*Threat Rank is an extension added onto the California Rare Plant Rank and designates the level of endangerment by a 1 to 3 ranking with 1 being the most endangered and 3 being the least endangered. A Threat Rank is present for all California Rare Plant Rank 1B's, 2's, 4's, and the majority of California Rare Plant Rank 3's. California Rare Plant Rank 4 plants are seldom assigned a Threat Rank of 0.1, as they generally have large enough populations to not have significant threats to their continued existence in California; however, certain conditions exist to make the plant a species of concern and hence be assigned a California Rare Plant Rank. In addition, all California Rare Plant Rank 1A (presumed extinct in California), and some California Rare Plant Rank 3 (need more information) plants, which lack threat information, do not have a Threat Rank extension."* (CNPS 2022)

0.1	Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2	Fairly threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3	Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

LOCAL PROTECTION AND CLASSIFICATIONS

The following Local Protection and Classifications sections are excerpted from The Ontario Plan 2050 (Placeworks 2022).

The City of Ontario Plan Environmental Resources Element contains goals and policies which pertain to the protection of biological resources in the City of Ontario:

Goal ER5 Protected high value habitat and farming and mineral resource extraction activities that are compatible with adjacent development.

Policy ER5-1 Habitat Conservation Areas. We support the protection of biological resources through the establishment restoration, and conservation of high-quality areas.

Policy ER5-2 Entitlement and Permitting Process. We comply with state and federal regulations regarding protected species.

Policy ER5-4 Transition of Farms. We protect both existing farms and sensitive uses around them as agricultural areas transition to urban uses.

City of Ontario Municipal Codes

Municipal Code, Volume II, Chapter 2

Title 10, Parks and Recreation, Chapter 2, Parkway Trees, of the City's Municipal Code provides provisions on the preservation, regulation on the maintenance and removal of parkway trees, and establishes types and the locations for planting parkway trees. Parkway is defined as "…that portion of any public street right-of-way between the right-of-way boundary line and the curb line, and also the area enclosed within the curb lines of a medial divider."

The property owner abutting a public right-of-way is responsible for watering any tree in the parkway and for trimming that can be done from the ground to preserve the neat appearance and non-obstructed use of the parkway; the City is responsible for all major pruning. Removal or relocation of any parkway tree requires prior authorization from the City Public Works Agency through a permit process, and planting a replacement tree, whenever feasible, is a condition on any permit issued by the City for the removal of a parkway tree. Alternatively, an in-lieu deposit may be accepted as an alternate to the actual planting of any required parkway tree based on a fair value established by the Public Facilities Manager (The Ontario Plan 2022).

Municipal Code, Section 6.05.020

Section 6.05.020, Tree Preservation Policy and Protection Measures, of the Ontario Development Code establishes policies and measures that will further the preservation, protection, and maintenance of established and healthy heritage trees within the City. A Heritage Tree is one that is designated for preservation as a tree of historic or cultural significance, or a tree of importance to the community due to any one of the following factors:

- It is one of the largest or oldest trees of species located within the City and has a trunk diameter of 18 inches or greater when measured at 54 inches above grade;
- It has a historical significance due to association with a historic building, site, street, person, or event;
- It is a defining landmark or significant outstanding feature of a neighborhood or district, typical of early Ontario Landscapes. This includes Camphor Tree (*Cinnamomum camphora*), Deodar Cedar (*Cedrus deodara*), London Planetree (*Platanus acerifolia*), Cork Oak (*Quercus suber*), Holly Oak (*Quercus ilex*), and California Pepper (*Schinus molle*);
- It is a Native Tree. This means that it is one of the following California native tree species with a trunk diameter of more than 8 inches, measured at 54 inches above natural grade: California Sycamore (*Platanus racemose*), Torrey Pine (*Pinus torreyana*), Coast Live Oak (*Quercus agrifolia*), Engelmann Oak (*Quercus engelmannii*), Valley Oak (*Quercus lobata*), or California Bay (*Umbellularia californica*).

Healthy Heritage Trees that are approved for removal shall be replaced with new trees with a total trunk diameter equal to the tree(s) removed, or as deemed appropriate by the Approve Authority based on lot size and available planting space. Replacement trees are to be in addition to the quantity of trees required for landscaping. The Approving Authority is responsible for reviewing the landscape plan and approving appropriate species for tree replacement (The Ontario Plan 2022).

A tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request.

The Tree Inventory and Preservation Plan shall show all existing on-site trees, and those existing trees on abutting lots and public rights-of-way with a canopy or root zone that extends onto the site or within 8 feet of a construction, staging or storage area, or graded site. Furthermore, the Tree Inventory and Preservation Plan shall identify Tree Protection Areas and trees requested to be removed, and shall show replacement trees as required by this Division.

Sphere of Influence General Plan Amendment, Final EIR, and Settlement Agreement

In January 1998, the Ontario City Council approved a general plan amendment (GPA) and associated Final EIR for the sphere of influence (SOI), which is now known as the Ontario Ranch (previously the New Model Colony (NMC)). The GPA designated Ontario Ranch for a range of urban and suburban uses, including residential, commercial, business park, industrial, and open space. Most of Ontario Ranch was then in agricultural use. The Final EIR for the GPA assessed the impacts on biological resources of the conversion of Ontario Ranch from agricultural uses to developed urban and suburban uses. Before mitigation, significant impacts were identified for waterfowl and waterfowl habitat, raptors and raptor habitat, and the Delhi Sands Flower-Loving Fly (DSFLF) Ontario Recovery Unit. The EIR included three mitigation measures for impacts to biological resources:

- Mitigation Measure BR-1 modified the general plan to require the creation of new waterfowl habitat and specified a mitigation ratio of 2:1 for each acre of such habitat lost. This is off-site mitigation in the Prado Basin.
- Mitigation Measure BR-2 stipulated that the City shall create a Waterfowl and Raptor Conservation Area (WRCA), and included requirements and definitions for it; mitigation is off-site in the Prado Basin.

- Mitigation Measure BR-3 required the City to cooperate with the USFWS in taking specified actions to mitigate impacts to the Delhi Sands Flower-Loving Fly Recovery Unit.

Subsequent to the 1998 adoption of the SOI GPA and EIR, a lawsuit was filed against the City of Ontario by the Endangered Habitats League and the Sierra Club, challenging the City's CEQA compliance and approval of the SOI GPA. A Settlement Agreement was reached and agreed to by all parties that set forth revised mitigation measures for potential impacts in the New Model Colony (referred to as Annexation Area 163 in the agreement) to the burrowing owl, the DSFLF, raptor foraging and wildlife habitat, loss of open space, actual and potential habitat and agricultural land, and sensitive (listed and non-listed) species. These measures will be in effect until all the developable acres in the Ontario Ranch reach full buildout, as determined by the City.

- Prior to issuance of grading permits, Ontario shall impose a $4,320 per net acre mitigation fee on proposed developments in Annexation Area 163 that require discretionary approval or permitting from the City.
- Ontario, in consultation with CDFW, will identify, through CEQA review, lands occupied by burrowing owl and suitable as long-term habitat. The City will require avoidance of those lands to maintain a viable territory and require long-term maintenance through dedication in fee or grant of easement to the Land Trust. If the site is not viable long-term habitat, the developer shall pay the mitigation fee and make provisions for relocation of the owls.
- Since habitat that benefits DSFLF can be expected to benefit burrowing owl, up to 25 percent of the mitigation fee maybe used by the City for DSFLF recovery.
- All mitigation fees collected shall be used for the above-described purposes and may be used to purchase property, conservation easements, or other land with long-term conservation value for the environmental impacts; enhance/restore lands with such values; maintain and operates these lands; and pay for related administrative costs (not to exceed 10 percent of the total fees).
- Land/easements dedicated, conveyed, or purchased to benefit wildlife, waterfowl, raptors, and/or burrowing owl must have long-term conservation value for those species and must be managed by the land trust. The parcels must be in the habitat area designated as part of the settlement agreement. Unacceptable properties are those that would otherwise be purchased by another entity or group as open space mitigation for environmental impacts.

City of Ontario Biological Resources Habitat Mitigation Fee

Since the Settlement Agreement, the City has established a habitat mitigation fee to cover potential environmental impacts to the Burrowing Owl, DSFLF, raptor foraging, loss of open space, and agricultural lands. Development impact fees for new development in Ontario Ranch were adopted on June 23, 2003, by the City Council. The Ontario Ranch development impact fees include a habitat mitigation fee of $4,320 per net acre for proposed residential, commercial, hotel and restaurant, office, and industrial development. Mitigation fees have been collected by the City and have been deposited into a trust fund to be used for the acquisition, restoration, rehabilitation, and maintenance of lands deemed to have long-term conservation value. Up to $500 of the fees may be used for DSFLF. In addition, current City procedure is to require a habitat assessment to

determine existing habitat and biological resources on proposed development sites. If the assessment determines that there is potential habitat for sensitive species, focused protocol surveys are required. If potential DSFLF habitat is present, two-year (consecutive) protocol surveys per the USFWS Interim General Survey Guidelines for DSFLF are required (The Ontario Plan 2022).

The land use plan for Ontario Ranch originally provided for establishment of the WRCA, a wetlands and habitat area near the confluence of the Cucamonga Creek and the Lower Deer Creek Channels. Creation of the WRCA as part of Ontario Ranch was intended to provide a concentrated area for wetlands that would receive storm drainage from the west. Funding for the environmental restoration of the existing 85-acre Lower Cucamonga flood control basin under the WRCA would have been provided through the USACE with matching funds from the City of Ontario. This conservation area plus acquisition of 145 acres of off-site mitigation land were intended to provide mitigation for impacts resulting from development of Ontario Ranch. However, under the conditions of the settlement agreement, the WRCA is no longer proposed (The Ontario Plan 2022).

In 2010, the Ontario City Council approved the selection of the Riverside Land Conservancy (today known as River and Land Conservancy) as the administrator of the habitat mitigation fees and to create a habitat program pursuant to the requirements of the Settlement Agreement between the City of Ontario, the Endangered Habitats League, and the Sierra Club. However, due to the economic downturn shortly after 2010, the contract between the City and the Riverside Land Conservancy was never ratified. It was anticipated that once development in Ontario Ranch began to commence, the City would ratify the contract (The Ontario Plan 2022).

In 2022, the City will be going out with a Request for Proposals (RFP) to select a non-profit land trust and/or organization specializing in habitat conservation. The selected non-profit and/or organization will be responsible for the administration of the habitat mitigation fees and creation of a habitat program pursuant to the requirements of the Settlement Agreement between the City of Ontario, the Endangered Habitats League, and the Sierra Club. In partnership with the CDFW, the City will work with the selected non-profit and/or organization to maintain an interactive mapping and current inventory of the burrowing owl occurrences and in the selection of adequate lands for passive relocation (The Ontario Plan 2022).

SENSITIVE HABITATS

As stated by CDFW:

> "*One purpose of the vegetation classification is to assist in determining the level of rarity and imperilment of vegetation types. Ranking of alliances according to their degree of imperilment (as measured by rarity, trends, and threats) follows NatureServe's Heritage Methodology, in which all alliances are listed with a G (global) and S (state) rank. For alliances with State ranks of S1-S3, all associations within them are also considered to be highly imperiled*". (CDFW 2022f)

No sensitive or undisturbed native habitats were documented within the Project Site. The Project Site is characterized as 70.04-acres of heavily disturbed active dairy and agricultural facilities

SENSITIVE PLANTS

Based on a review of the CNDDB, The Ontario Plan 2050 and existing conditions within and adjacent to the Project Site, a total of thirteen (13) sensitive plant species have potential to occur within the vicinity of the Project Site as presented in Table 2, *Sensitive Plant Species Assessment*.

Table 2.
Sensitive Plant Species Assessment

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
Nevin's barberry (*Berberis nevinii*) FE/SE CRPR 1B.1	Perennial evergreen shrub which generally blooms from February to June within chaparral, cismontane woodland, coastal scrub, and riparian scrub in sandy, gravelly substrates (CNPS 2022).	Not detected.
Plummer's mariposa-lily (*Calochortus plummerae*) CRPR 4.2	Perennial bulbiferous herb which generally blooms from May to June within chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and grassland habitats with granite and rocky substrates (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Lucky morning glory (*Calystegia felix*) CRPR 1B.1	Annual rhizomatous herb generally blooming from March to September within meadows, seeps and riparian scrub habitat (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Parry's spineflower (*Chorizanthe parryi var. parryi*) CRPR 1B.1	Annual herb which generally blooms from April to June within chaparral, cismontane woodland, coastal scrub and grassland habitats with sandy and/or rocky openings. (CNPS 2022)	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
Slender-horned spineflower (*Dodecahema leptoceras*) CRPR 1B.1 FE/SE	Annual herb which generally blooms from April to June within chaparral, cismontane woodland and coastal scrub (alluvial fan) with sandy substrates. (CNPS 2022)	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Mesa horkelia (*Horkelia cuneata ssp. puberula*) CRPR 1B.1	Perennial herb which generally blooms from February to September within chaparral (maritime), cismontane woodland and coastal scrub with sandy or gravelly substrates. (CNPS 2022)	Not detected.
Robinson's pepper-grass (*Lepidium virginicum var. robinsonii*) CRPR 4.3	Annual herb which generally blooms from January to July within chaparral and coastal sage scrub habitats (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Prostate vernal pool navarretia (*Navarretia prostrata*) CRPR 1B.2	Annual herb generally blooming from April to July within coastal scrub, meadows and seeps, valley and foothill grasslands and vernal pools (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Brand's star phacelia (*Phacelia stellaris*) CRPR 1B.1	Annual herb generally blooming from March to June within coastal sage scrub and dune habitats (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
White rabbit tobacco (*Pseudognaphalium leucocephalum)* CRPR 2B.2	Perennial herb generally blooming from July to December within chaparral, cismontane woodland, coastal scrub and riparian woodland habitats (CNPS 2022).	Not detected.
Salt spring checkerbloom (*Sidalcea neomexicana*) CRPR 2.2	Perennial herb which generally blooms from March to June within chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, and playas within alkaline/mesic gravelly substrates (CNPS 20202.	Not detected.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
San Bernardino aster (*Symphyotrichum defoliatum*) CRPR 1B.2	Perennial rhizomatous herb generally blooming from July to December within various vegetation communities in associating with wetland substrates (ditches, streams and springs) (CNPS 2022).	Not detected.
Rigid fringepod (*Thysanocarpus rigidus*) CRPR 1B.2	Annual herb generally blooming from February to May within pinyon and juniper woodland habitats (CNPS 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.

California Native Plant Society (CNPS): California Rare Plant Rank (CRPR)
CRPR 1A – plants presumed extinct in California
CRPR 1B – plants rare, threatened, or endangered in California, but more common elsewhere
CRPR 2A – plants presumed extirpated in California but common elsewhere
CRPR 2B – plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3 – plants about which we need more information, a review list
CRPR 4 – plants of limited distribution, a watch list
.1 – Seriously endangered in California
.2 – Fairly endangered in California
.3 – Not very endangered in California

Federal (USFWS) Protection and Classification
FE – Federally Endangered
FT – Federally Threatened
FC – Federal Candidate for Listing

State (CDFW) Protection and Classification
SE – State Endangered
ST – State Threatened

No suitable habitat for sensitive plant species including those listed as federal or state threatened/endangered was documented within the Project Site. No sensitive plant species listed in Table 2, *Sensitive Plant Species Assessment* or undisturbed native habitats were documented or expected to occur within the Project Site. The Project Site is characterized as 70.04-acres of heavily disturbed active dairy and agricultural facilities.

SENSITIVE WILDLIFE

Based on a review of the CNDDB, The Ontario Plan 2050 and existing site conditions, a total of fifty (50) sensitive invertebrate and wildlife species have the potential of occurring within the vicinity of the Project Site as presented in Table 3, *Sensitive Wildlife Species Assessment*.

Table 3.
Sensitive Wildlife Species Assessment

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
INVERTEBRATES		
Crotch bumble bee (*Bombus crotchii*) SC	Inhabits grasslands and shrublands and requires a hotter and drier environment than other bumblebee species (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable food sources.
Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*) FE	Restricted to Delhi sand formations in Riverside and San Bernardino Counties.	No Potential. No Delhi soils mapped onsite, as shown in Figure 9, *Soils Association Map*.
AMPHIBIANS		
Western spadefoot (*Spea hammondii*) SSC	Primary habitat for this species includes suitable breeding habitat below 1500 meters (i.e., vernal pools or other standing water that is free of exotic species) with secondary habitats including adjacent chaparral, sage scrub, grassland, and alluvial scrub habitats.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed soils and continuous agricultural activities conducted throughout the Project Site.
REPTILES		
Southern California legless lizard (*Anniella stebbinsi*) SSC	Broadleaved upland forest, chaparral, coastal dunes, and coastal scrub. Occurs in sandy or loose loamy soils under sparse vegetation, generally in moist, loose soil (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
California glossy snake (*Arizona elegans occidentalis*) SSC	Generalist reported from a range of scrub and grassland habitats, often with loose or sandy soils (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Coastal western whiptail (*Aspidoscelis tigris stejnegeri*) SSC	The coastal western whiptail occurs in a wide variety of habitats including coastal sage scrub, desert scrub, Riversidean alluvial fan scrub, woodlands, grasslands, playas, and respective ecotones between these habitats.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
San Bernardino ringneck snake (*Diadophis punctatus modestus*)	Chaparral, coastal sage scrub, grassland, riparian, and woodlands (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Western pond turtle (*Actinemys marmorata*) SSC	The western pond turtle inhabits slow moving permanent or intermittent streams, small ponds, small lakes, reservoirs, abandoned gravel pits, permanent and ephemeral shallow wetlands, stock ponds, and sewage treatment lagoons (Rathbun *et al*., 1992; Holland, 1994). Pools are the preferred habitat within streams (Bury, 1972,)	Not Detected. Not expected to occur onsite based on a lack of suitable undisturbed basking sites and permanent water.
Coast horned lizard (*Phrynosoma blainvillii*) SSC	Open areas of sandy soil with coastal sage scrub, chaparral, grassland, riparian, and washes and watercourses (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Coast patch-nosed snake (*Salvadora hexalepis virgultea*) SSC	The coast patch-nosed snake prefers brushy coastal sage scrub/ chaparral habitats.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation or soils.
Two-striped gartersnake (*Thamnophis hammondii*) SSC	Marsh and swamp, riparian scrub, riparian woodland, and wetland. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation, soils or permanent water.
BIRDS		
Cooper's hawk (*Accipiter cooperii*) SSC	Cooper's hawk is most commonly found within or adjacent to riparian/oak forest and woodland habitats. This uncommon resident of California increases in numbers during winter migration.	Low Potential – May occasionally forage onsite and breed within the mature Eucalyptus trees.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
Sharp-shinned hawk (*Accipiter striatus*) CWL	Potential habitat for the sharp-shinned hawk includes montane coniferous forest for potential breeding areas and riparian scrub, woodland, and forest habitat, oak woodland and forest, chaparral, coastal sage scrub, desert scrub, and Riversidean alluvial fan sage scrub for foraging.	Low Potential – May occasionally forage onsite.
Tri-colored blackbird (*Agelaius tricolor*) ST/SSC	Marshes and grasslands. Breeding colonies require nearby water, nesting substrate, and open range foraging habitat of natural grassland, woodland, or agricultural cropland (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of nesting habitat (cattail, rushes, and willows) within or adjacent to the Project Site.
Golden eagle (*Aquila chrysaetos*) CWL, SFP	Within southern California, the species prefers grasslands, brushlands (coastal sage scrub and chaparral), deserts, oak savannas, open coniferous forests, and montane valleys (Garrett and Dunn 1981)	Low Potential – May occasionally forage onsite.
Great egret (*Ardea alba*) Nesting Colony	Wet areas, fields, margins of open water.	Moderate Potential – Expected to occasionally forage onsite but not breed.
Great blue heron (*Ardea herodias*) Nesting Colony	Wet areas, fields, margins of open water.	Moderate Potential – Expected to occasionally forage onsite but not breed.
Burrowing owl (*Athene cunicularia)* SSC	The burrowing owl uses predominantly open land, including grassland, agriculture, playa, sparse coastal sage scrub, desert scrub habitats. Some breeding burrowing owls are year-round residents and additional individuals from the north may winter throughout the region.	Low Potential – Suitable burrows larger than 4 inches in diameter and foraging habitat documented within and east of the Project Site.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
Ferruginous hawk (*Buteo regalis*) CWL	Grasslands and other open terrain of the plains and foothills. Wintering species. Primarily open fields with low vegetation (Placeworks 2022).	Low Potential – May occasionally forage onsite.
Swainson's hawk (*Buteo swainsoni*) ST	Grasslands and other open terrain (Placeworks 2022).	Low Potential – May occasionally forage onsite.
Mountain plover (*Charadrius montanus*) SSC	Dry upland prairies and plains, semidesert, bare dirt fields (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation.
Northern harrier (*Circus cyaneus*) SSC	The northern harrier frequents open wetlands, wet/lightly grazed pastures, fields, dry uplands/prairies, mesic grasslands, drained marshlands, croplands, meadows, grasslands, open rangelands, fresh and saltwater emergent wetlands.	Observed.
Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) FT/SE	Riparian. Uncommon to rare summer resident of valley foothill and desert riparian habitats (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed riparian scrub, forest or woodland vegetation.
Snowy egret (*Egretta thula*) Nesting Colony	Wet areas, fields, margins of open water (Placeworks 2022).	Moderate Potential – Expected to occasionally forage onsite but not breed.
White-tailed kite (*Elanus leucurus*) SFP	The white-tailed kite is found in riparian, oak woodlands adjacent to large open spaces including grasslands, wetlands, savannahs and agricultural fields. This non-migratory bird species occurs throughout the lower elevations of California and commonly nests in coast live oaks (Unitt 2004).	Low Potential – May occasionally forage onsite.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
California horned lark (*Eremophila alpestris actia*) CWL	Variety of open habitats, usually where trees and large shrubs are absent (Placeworks 2022).	Moderate Potential – Expected to occasionally forage and breed onsite.
Merlin (*Falco columbarius*) CWL	Grasslands, coastal sage scrub and estuaries, windrows, open fields (Placeworks 2022).	Low Potential – May occasionally forage onsite.
Prairie falcon (*Falco mexicanus*) CWL	Habitat use of the prairie falcon includes annual grasslands to alpine meadows. The prairie falcon is associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields during the winter season, and desert scrub areas, all typically dry environments of western North American where there are cliffs or bluffs for nest sites (Brown and Amadon 1968)	Low Potential – May occasionally forage onsite.
American peregrine falcon (*Falco peregrinus anatum*) SFP	Throughout the species' range, peregrine falcons are found in a large variety of open habitats, including tundra, marshes, seacoasts, savannahs and high mountains (AOU 1998)	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed vegetation.
Loggerhead shrike (*Lanius ludovicianus*) SSC	This species of shrike hunts in open or grassy areas and nests in large chaparral shrubs such as ceanothus and lemonade berry.	Low Potential – May occasionally forage onsite.
California gull (*Larus californicus*) CWL	Nearly all types of fresh and salt water, cropland, landfills, refuse areas, open lawns (Placeworks 2022).	Moderate Potential – Expected to occasionally forage onsite.
California black rail (*Laterallus jamaicensis coturniculus*) ST/SFP	Brackish marsh, freshwater marsh, marsh and swamp, salt marsh, wetland. Inhabits freshwater marshes, wet meadows and shallow margins of saltwater	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
	marshes bordering large bays (Placeworks 2022).	
Long-billed curlew (*Numenius americanus*) CWL	Coastal estuaries, upland herbaceous areas,5 croplands, wet areas, open fields, shores of open water (Placeworks 2022).	Moderate Potential – Expected to occasionally forage onsite.
Double-crested cormorant (*Nannopterum auritum*) CWL	Lakes, fresh, salt, and estuarine waters (Placeworks 2022).	Moderate Potential – Expected to occasionally forage onsite.
White-faced ibis (*Plegadis chihi*) CWL	Freshwater marshes and brackish areas (Placeworks 2022).	Observed.
Coastal California gnatcatcher (*Polioptila californica californica*) FT/SSC	The coastal California gnatcatcher is a non-migratory bird species that primarily occurs within sage scrub habitats in coastal southern California dominated by California sagebrush.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats including coastal sage scrub and associations.
MAMMALS		
Pallid bat (*Antrozous pallidus*) SSC	Chaparral, coastal scrub, desert wash, Great Basin grassland, Great Basin scrub, Mojavean desert scrub, riparian woodland, Sonoran desert scrub, upper montane coniferous forest, and valley and foothill grassland. Oak and grassland ecotones. Prefers foraging in the open. Roosts in attics or rock cracks; in the open, near foliage at night (Placeworks 2022).	Low Potential. Expected to occasionally forage onsite.
Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*) SSC	The northwestern San Diego pocket mouse occurs in coastal sage, upland sage scrubs, and alluvial fan sage scrub, sage scrub/grassland ecotones, chaparral, and desert scrubs at all elevations up to 6,000 feet.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats including coastal sage scrub and associations.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
Townsend's big-eared bat (*Corynorhinus townsendii*) SSC	A wide variety of habitats including woodlands and arid grasslands. Roosts in mines and caves (Placeworks 2022).	Low Potential. Expected to occasionally forage onsite.
San Bernardino kangaroo rat (*Dipodomys merriami parvus*) FE/SSC	Prefers alluvial scrub, coastal sage scrub habitats with sandy and gravelly substrates.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats including Riversidean alluvial fan sage scrub and associations.
Stephens' kangaroo rat (*Dipodomys stephensi*) FE/ST	The Stephens' kangaroo rat is found almost exclusively in open grasslands or sparse shrublands with cover of less than 50 percent during the summer.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Western mastiff bat (*Eumops perotis californicus*) SSC	Roosts in rocky areas and forages in grassland, shrublands, and woodlands.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Western yellow bat (*Lasiurus xanthinus*) SSC	Roosts in the skirts of palm trees and forages in adjacent habitats.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
San Diego black-tailed jackrabbit (*Lepus californicus bennettii*) SSC	The San Diego black-tailed jackrabbit in open habitats, primarily including grasslands, sage scrub, alluvial fan sage scrub, and Great Basin sage scrub.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Western small-footed myotis (*Myotis ciliolabrum*)	Feeds among trees or over brush. Roosts in caves, mines, and in cliff or rock openings (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Yuma myotis (*Myotis yumanensis*)	Water and wooded canyon bottoms. Roosts in caves and abandoned buildings (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
San Diego desert woodrat (*Neotoma lepida intermedia*) SSC	Riversidean and coastal sage scrub, chaparral and nonnative grasslands. Shrub and desert habitats, primarily associated with rock outcroppings, boulders, cacti, or areas of	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.

Species Name (*Scientific Name*) Status	**Habitat Description**	**Comments**
	dense undergrowth (Placeworks 2022).	
Pocketed free-tailed bat (*Nyctinomops femorosaccus*) SSC	Desert habitats. Roosts in rock crevices in cliffs (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Big free-tailed bat (*Nyctinomops macrotis*) SSC	Desert habitats. Roosts in rock crevices in cliffs (Placeworks 2022).	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.
Los Angeles pocket mouse (*Perognathus longimembris brevinasus*) SSC	Low elevation grassland alluvial sage scrub and coastal sage scrub habitats.	No Potential. Not expected to occur onsite based on a lack of suitable undisturbed habitats.

Federal (USFWS) Protection and Classification
FE – Federally Endangered
FT – Federally Threatened
FC – Federal Candidate for Listing

State (CDFW) Protection and Classification
SE – State Endangered
SSC – State Species of Special Concern
CWL – California Watch List
SFP – State Fully Protected
SC – State Candidate for Listing

No suitable breeding habitat for federal or state threatened/endangered species was documented within the Project Site. However, the 70.04-acres of heavily disturbed active dairy and agricultural facilities provide primarily low to moderate likelihood of occurrence (foraging habitat) for the following sensitive or locally monitored species:

- Cooper's hawk (*Accipiter cooperii*), SSC
- Sharp-shinned hawk (*Accipiter striatus*), CWL
- Golden eagle (*Aquila chrysaetos*), CWL, SFP
- Great egret (*Ardea alba*), Nesting Colony
- Great blue heron (*Ardea herodias*), Nesting Colony
- Burrowing owl (*Athene cunicularia),* SSC
- Ferruginous hawk (*Buteo regalis*), CWL
- Swainson's hawk (*Buteo swainsoni*), ST
- Northern harrier (*Circus cyaneus*), SSC
- Snowy egret (*Egretta thula*), Nesting Colony
- White-tailed kite (*Elanus leucurus*), SFP
- California horned lark (*Eremophila alpestris actia*), CWL
- Merlin (*Falco columbarius*), CWL
- Prairie falcon (*Falco mexicanus*), CWL
- Loggerhead shrike (*Lanius ludovicianus*), SSC

- California gull (*Larus californicus*), CWL
- Long-billed curlew (*Numenius americanus*), CWL
- Double-crested cormorant (*Nannopterum auritum*), CWL
- White-faced ibis (*Plegadis chihi*), CWL
- Pallid bat (*Antrozous pallidus*), SSC
- Townsend's big-eared bat (*Corynorhinus townsendii*), SSC
- Western mastiff bat (*Eumops perotis californicus*), SSC

The Project Site does not occur within or adjacent to a USFWS designated critical habitat for any federally listed threatened or endangered species.

JURISDICTIONAL WETLAND RESOURCES

No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site. The artificially created unvegetated dairy effluent retention ponds are isolated, located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland vegetation including but not limited to riparian scrub, forest or woodland habitat.

Impacts to water quality would be less than significant during both construction and operation following preparation of a WQMP, SWPPP and compliance with NPDES permit and San Bernardino County Regional MS4 code provisions.

ENVIRONMENTAL IMPACTS

The following section includes an analysis of the direct and/or indirect impacts of the proposed action on sensitive biological resources. This analysis characterizes the project related activities that are anticipated to adversely impact the species, and when feasible, quantifies such impacts. Direct effects are defined as actions that may cause an immediate effect on the species or its habitat, including the effects of interrelated actions and interdependent actions. Indirect effects are caused by or result from the proposed actions, are later in time, and are reasonably certain to occur. Indirect effects may occur outside of the area directly affected by the proposed action.

THRESHOLD OF SIGNIFICANCE

The environmental impacts relative to biological resources are assessed using impact significance criteria which mirror the policy statement contained in the CEQA at Section 21001 (c) of the Public Resources Code. This section reflects that the legislature has established it to be the policy of the state to:

> "*Prevent the elimination of fish and wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities*…"

The following definitions apply to the significance criteria for biological resources:

- "*Endangered*" means that the species is listed as endangered under state or federal law.

- "*Threatened*" means that the species is listed as threatened under state or federal law.

- "*Rare*" means that the species exists in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens.

- "*Region*" refers to the area within southern California that is within the range of the individual species.

- "*Sensitive habitat*" refers to habitat for plants and animals (1) which plays a special role in perpetuating species utilizing the habitat on the property, and (2) without which there would be substantial danger that the population of that species would drop below self-perpetuating levels.

- "*Substantial effect*" means significance loss or harm of a magnitude which, based on current scientific data and knowledge, (1) would cause a species or a native plant or animal community to drop below self-perpetuating levels on a statewide or regional basis or (2) would cause a species to become threatened or endangered.

Also, the determination of impacts has been made according to the federal definition of "*take*". FESA prohibits the "*taking*" of a member of an endangered or threatened wildlife species or removing, damaging, or destroying a listed plant species by any person (including private individuals and private or government entities). FESA defines "*take*" as "*to harass, harm, pursue, hunt, shoot, would, kill, trap, capture or collect*" an endangered or threatened species, or to attempt to engage in these activities.

DIRECT IMPACTS

Specifically, the biological resources assessment report addresses the following CEQA Environmental Checklist items.

Environmental Issues	**Potentially Significant Impact**	**Less than Significant with Mitigation**	**Less than Significant Impact**	**No Impact**
Would the Project:				
a) Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?		**X**		

Environmental Issues	Potentially Significant Impact	Less than Significant with Mitigation	Less than Significant Impact	No Impact
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?		**X**		
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				**X**
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		**X**		
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?		X		
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Native Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				**X**

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?

Less than Significant with Mitigation. The 70.04-acre proposed project would not have a substantial adverse effect, either directly or through habitat modifications, on any plant species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. No native undisturbed suitable habitat, soils or sensitive plant species observations were documented or expected to occur within the Project Site as outlined in Table 2. *Sensitive Plant Species Assessment*. Therefore, no mitigation is required or proposed.

The 70.04-acre proposed project may result in a substantial adverse effect, either directly or through habitat modifications, on wildlife species identified as a candidate, sensitive,

or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS outlined in Table 3, *Sensitive Wildlife Species Assessment*. Specifically, two sensitive species including the northern harrier (SSC) and white-faced ibis (CWL) were documented within the Project Site. Potential impacts to foraging and nesting habitat for these species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM BIO-3**: Nesting Bird and Raptor Preconstruction Surveys.

Suitable foraging and nesting habitat for the Cooper's hawk (SSC) was documented within the Project Site. Potential impacts to foraging and nesting habitat for this species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM BIO-3**: Nesting Bird and Raptor Preconstruction Surveys.

Suitable foraging habitat for the sharp-shinned hawk (CWL), golden eagle (CWL, SFP), great egret, great blue heron, ferruginous hawk (CWL), snowy egret, white-tailed kite (SFP), California horned lark (CWL), Swainson's hawk (ST), merlin (CWL), prairie falcon (CWL), loggerhead shrike (SSC), California gull (CWL), long-billed curlew (CWL), and double-crested cormorant (CWL) was documented onsite within the agricultural fields and artificially created unvegetated dairy effluent retention ponds. Potential impacts to foraging habitat for these species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM BIO-3**: Nesting Bird and Raptor Preconstruction Surveys.

Suitable burrows larger than 4-inches in diameter and foraging habitat for the burrowing owl (SSC) were documented within and adjacent (east) of the Project Site. Potential impacts to refugia, nesting and foraging habitat for this species would be mitigated to a level of less than significant following implementation of Conservation Measure **CM-BIO-4:** Preconstruction Burrowing Owl Surveys.

Suitable foraging and roosting habitat for the following bat species including pallid bat (SSC), Townsend's big-eared bat (SSC), and western mastiff bat (SSC) was documented onsite. Potential impacts to foraging habitat for these species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-5**: Focused Bat Survey.

b) *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS*?

Less than Significant with Mitigation. A total of 70.04 acres of vegetation communities will be directly impacted as a result of project implementation as summarized in Table 4, Project Site *Vegetation Community Impacts,* and illustrated on Figure 10*, Vegetation Communities Impact Map*. No riparian (scrub, forest, woodland), sensitive or undisturbed native/natural habitats were documented within or adjacent to the Project Site. The Project Site is characterized as heavily disturbed active dairy and agricultural facilities. Several artificially created dairy effluent retention ponds are located onsite and are either

devoid of vegetation of inundated with discharge. No riparian scrub, forest or woodland habitat is associated with these ponds. Permanent impacts to agricultural lands and artificially created dairy effluent retention ponds would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee.

Table 4.
Project Site Vegetation Community Impacts

Vegetation Community	Onsite Acres	Offsite Acres	Total Acres	Impacts Acres
Active Dairy	31.17	2.69	33.86	33.86

c) *Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

No Impact. No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site. The artificially created unvegetated dairy effluent retention ponds are isolated, located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland, riparian scrub, forest or woodland habitats.

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan, Storm Water Pollution Prevention Plan and compliance with National Pollutant Discharge Elimination System permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions. Therefore, no mitigation is required or proposed.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less than Significant with Mitigation. The Project Site is completely bordered by high traffic roads, commercial/residential development, active dairy/agricultural facilities and does not represent a wildlife movement corridor or route between open space habitats. Therefore, no mitigation is required or proposed.

The Project Site possess vegetation including trees and shrubs expected to potentially provide nesting habitat for raptors and migratory birds protected under the CDFG Codes. Measures for potential direct/indirect impacts to common and sensitive bird and raptor species will require compliance with the CDFG Code Section 3503. Construction outside the nesting season (between September 1st and January 31st) does not require preconstruction nesting bird surveys. However, if construction is proposed between

February 1st and August 31st, a qualified biologist will conduct a preconstruction nesting bird and raptor survey(s) no more than three (3) days prior to initiation of grading to document the presence or absence of nesting birds or raptors within or directly adjacent (200 feet, up to 500 feet for raptors) to the Project Site.

Loss of an active nest would be considered a potentially significant impact. Impacts to raptor foraging and potential nesting bird habitat would be reduced to less than significant with the implementation of Conservation Measure **CM BIO-3**: Nesting Bird and Raptor Preconstruction Surveys.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant with Mitigation. Several mature trees are located within and adjacent to the Project Site. Therefore, a tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request. Permanent impacts to Heritage Trees would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-2**: Tree Inventory and Preservation Plan.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Native Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. The Project Site is not located within or adjacent to a Conservation Program Area. Therefore, implementation of the project would not result in a conflict with the provisions of an adopted habitat conservation plan and no impact would occur. Therefore, no mitigation is required or proposed.

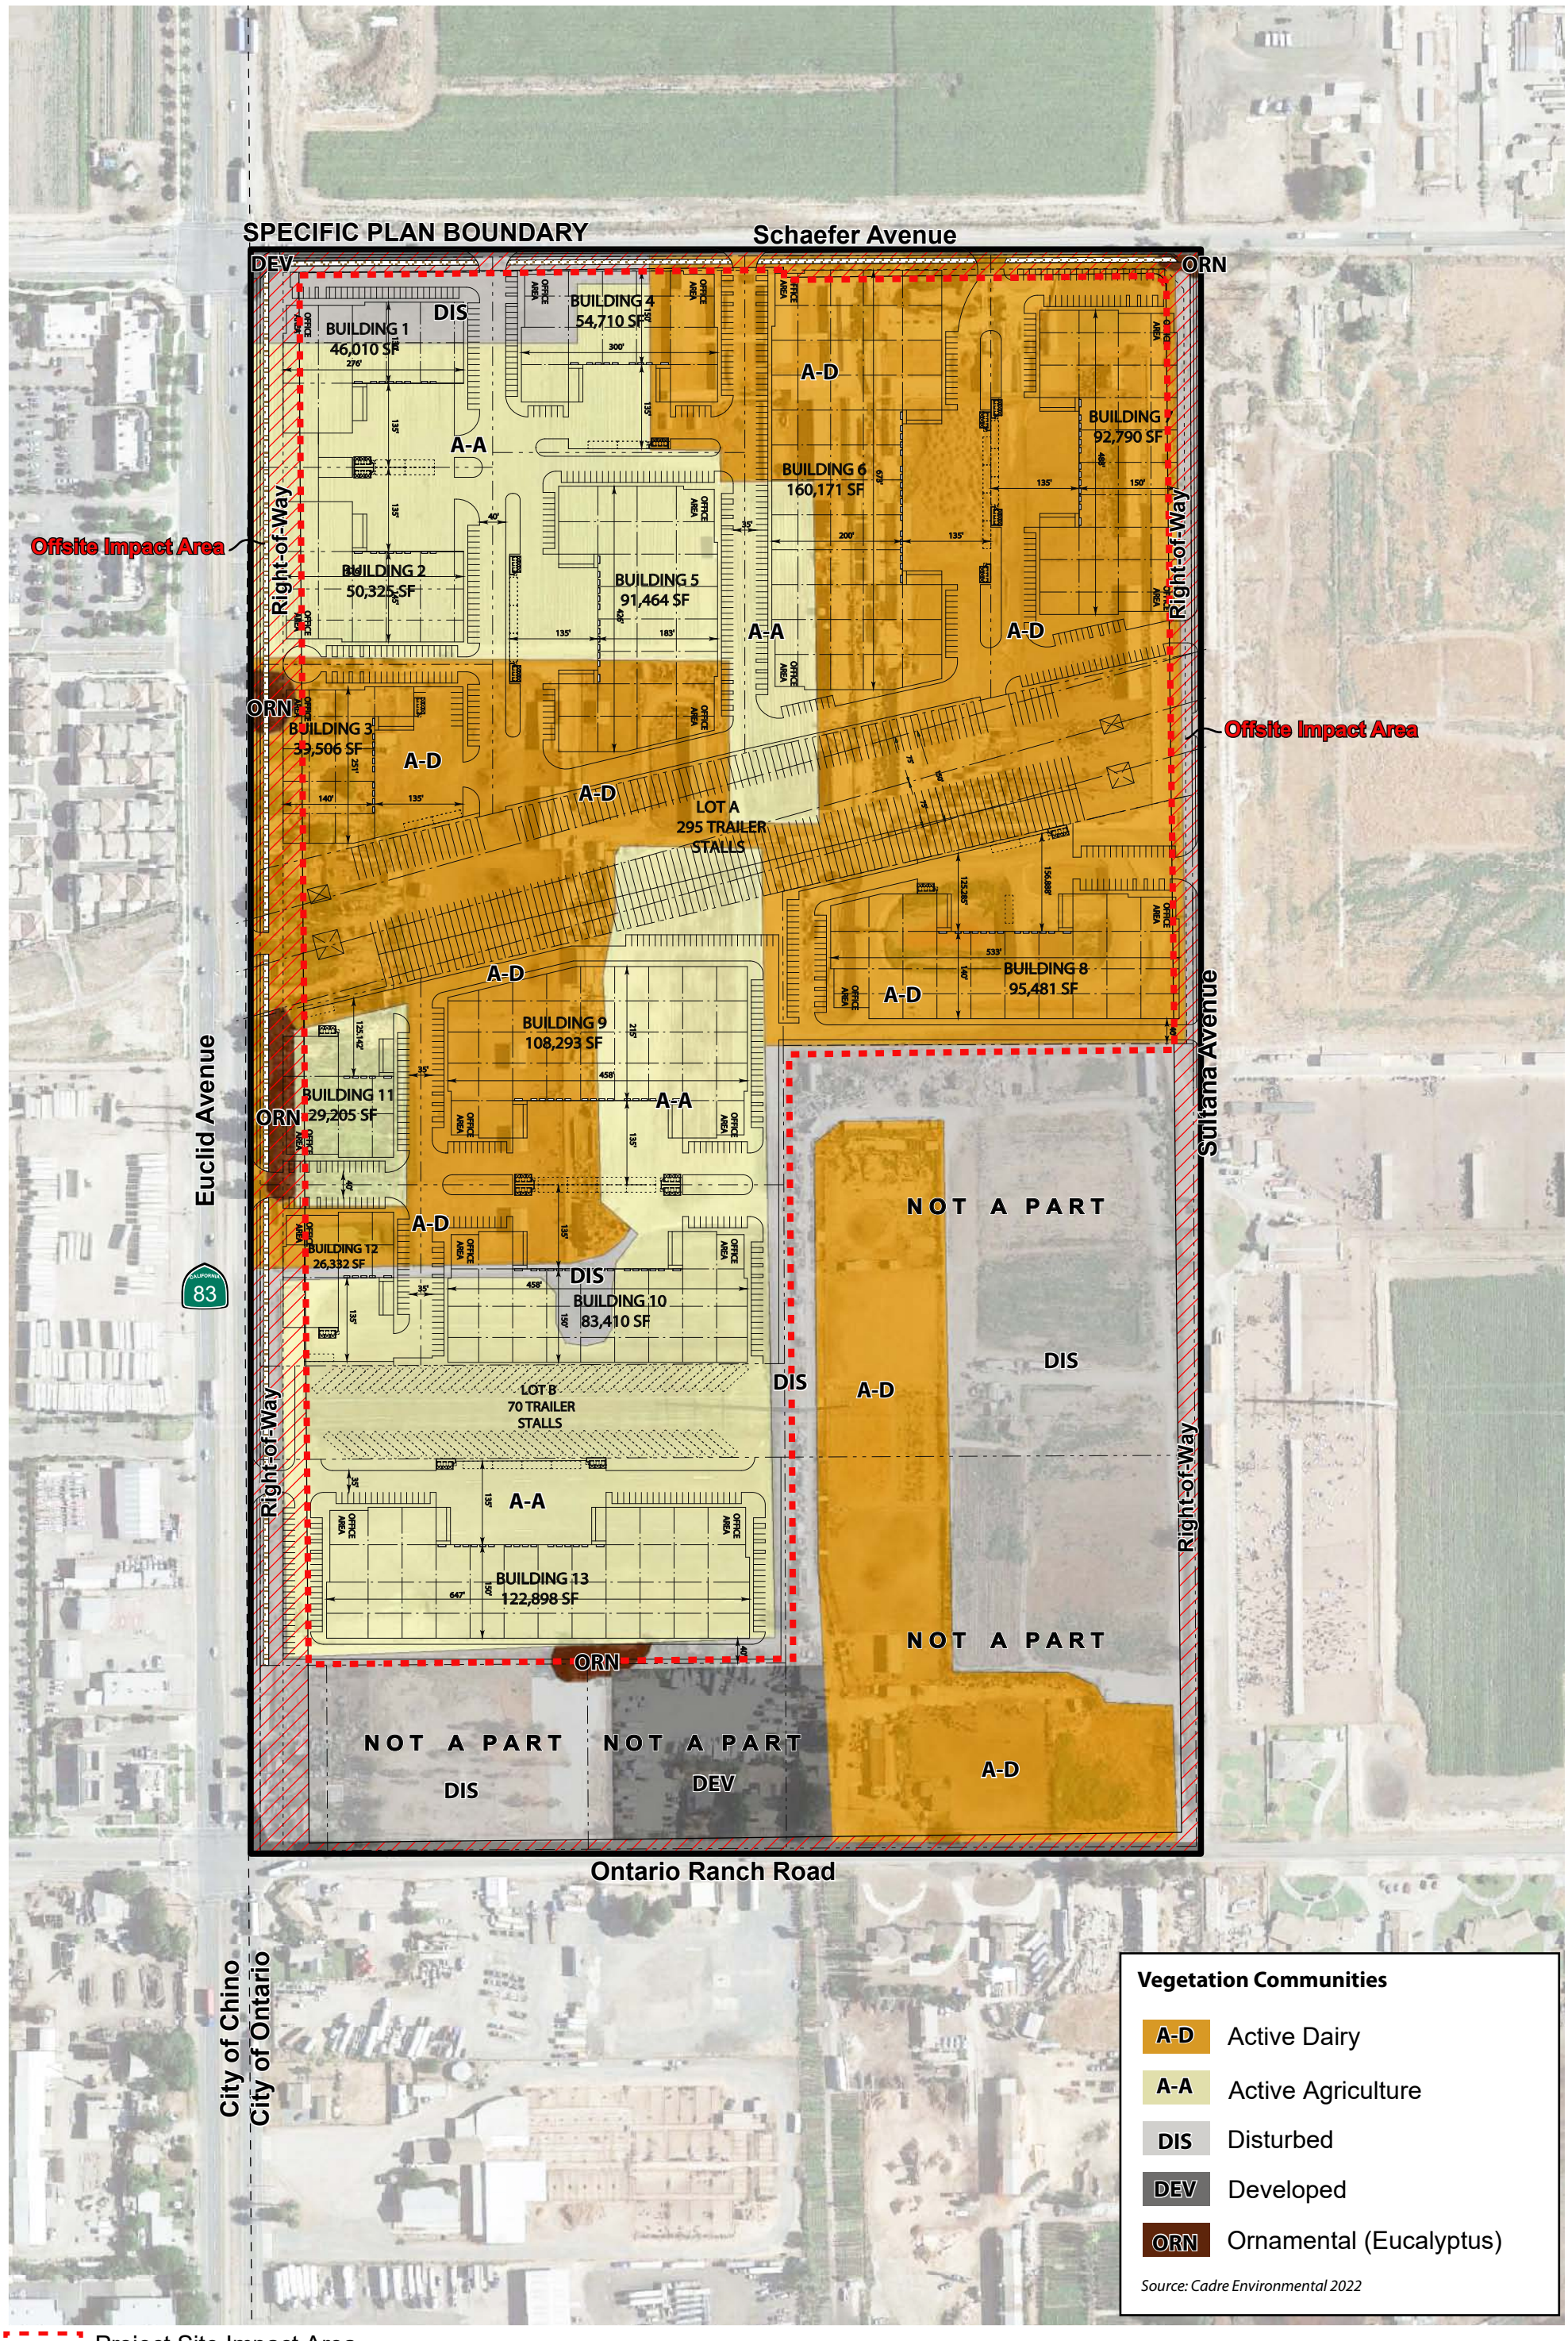

Figure 10 - Vegetation Communities Impact Map
Biological Resources Technical Report
Euclid Mixed Use Specific Plan, City of Ontario, California

CADRE Environmental

N

1 inch = 250 feet

INDIRECT IMPACTS

Potential indirect impacts include hydrological modification, discharges, lighting, and construction noise.

Water Quality

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan, Storm Water Pollution Prevention Plan and compliance with National Pollutant Discharge Elimination System permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions. Therefore, no mitigation is required or proposed.

Toxics

Toxic sources within the Project Site would be limited to those commonly associated with commercial developments such as pesticides, insecticides, herbicides, fertilizers, and vehicle emissions. In order to mitigate for the potential effects of these toxics, the project will incorporate structural BMPs, as required in association with compliance with the NPDES permit system as warranted, in order to reduce the level of toxins introduced into the drainage system. Water quality measures will be implemented and no significant impacts are anticipated.

Lighting

No impacts related to lighting would occur during both construction and operation. The Project Site is not located adjacent to any open space habitats or sensitive biological resources. No impact.

Noise

Noise and vibration associated with the use of heavy equipment during project construction has the potential to disrupt bird nesting, foraging and breeding behavior within or adjacent to the Project Site. Conservation Measure **CM BIO-3:** Nesting Bird and Raptor Preconstruction Survey has been incorporated into the project to collectively contribute to reducing potential indirect noise impacts to nesting bird species located within or adjacent to the Project Site. No impact anticipated.

CUMULATIVE IMPACTS

The direct and/or indirect impacts of the project would not result in significant cumulative impacts (CEQA Section 15310) to environmental resources within the region of the Project Site. Cumulative impacts refer to incremental effects of an individual project when assessed with the effects of past, current, and proposed projects. The project represents the development of 70.04-acres of disturbed agricultural habitat, surrounded by agricultural, commercial, residential development and high traffic roads, and therefore will not result in an adverse cumulative impact to sensitive resources. Impacts related to buildout of the City and Sphere of Influence are anticipated to be less than significant if projects comply with Ontario Ranch mitigation measures and The Ontario Plan 2050

policies and standard conditions. Following implementation of the following mitigation and conservation measures, the proposed action would not conflict with the general plan policies and standard conditions for the protection of sensitive resources.

MITIGATION & CONSERVATION MEASURES

The following biological mitigation and conservation measures (Conditions of Approval) are relevant to the protection of biological resources to the extent practicable as part of ensuring all potential impacts to sensitive or regulated biological resources are in compliance with CEQA.

MM BIO-1: City of Ontario Biological Resources Habitat Mitigation Fee

The City of Ontario has established a habitat mitigation fee to cover potential environmental impacts to the burrowing owl, DSFLF, raptor foraging, loss of open space, and agricultural lands. Development impact fees for new development in Ontario Ranch were adopted on June 23rd, 2003, by the City Council. The Ontario Ranch development impact fees include a habitat mitigation fee of $4,320 per net acre for proposed residential, commercial, hotel and restaurant, office, and industrial development. Mitigation fees have been collected by the City of Ontario and have been deposited into a trust fund to be used for the acquisition, restoration, rehabilitation, and maintenance of lands deemed to have long-term conservation value.

MM BIO-2: Tree Inventory and Preservation Plan

A tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request.

The Tree Inventory and Preservation Plan shall show all existing on-site trees, and those existing trees on abutting lots and public rights-of-way with a canopy or root zone that extends onto the site or within 8 feet of a construction, staging or storage area, or graded site. Furthermore, the Tree Inventory and Preservation Plan shall identify Tree Protection Areas and trees requested to be removed, and shall show replacement trees as required by this Division.

CM BIO-3: Nesting Bird & Raptor Preconstruction Survey

Regulatory requirement for potential direct/indirect impacts to nesting common and sensitive bird and raptor species will require compliance with the CDFG Code Section

3503. Construction outside the nesting season (between September 1st and January 31st) do not require pre-removal nesting bird surveys. If construction is proposed between February 1st and August 31st, a qualified biologist will conduct a nesting bird survey(s) no more than three (3) days prior to initiation of grading to document the presence or absence of nesting birds within or directly adjacent (200 feet, up to 500 feet for raptors) to the Project Site.

The survey(s) will focus on identifying any raptors and/or bird nests that are directly or indirectly affected by construction activities. If active nests are documented, species-specific measures will be prepared by a qualified biologist and implemented to prevent abandonment of the active nest. At a minimum, grading in the vicinity of a nest will be postponed until the young birds have fledged. The perimeter of the nest setback zone will be fenced or adequately demarcated with stakes and flagging at 20-foot intervals, and construction personnel and activities restricted from the area. A survey report by a qualified biologist verifying that no active nests are present, or that the young have fledged, will be submitted to the City of Ontario for review and approval prior to initiation of grading in the nest-setback zone.

The qualified biologist will serve as a construction monitor during those periods when construction activities occur near active nest areas to ensure that no inadvertent impacts on these nests occur. A final monitoring report of the findings, prepared by a qualified biologist, will be submitted to the City of Ontario documenting compliance with the CDFG Code. Any nest permanently vacated for the season would not warrant protection pursuant to the CDFG Code.

CM BIO-4 Preconstruction Burrowing Owl Surveys

A 14-day burrowing owl preconstruction survey will be conducted immediately prior to the initiation of ground-disturbing construction to ensure protection for this species. The survey will be conducted in compliance with CDFW guidelines (CDFW 2012). A report of the findings prepared by a qualified biologist shall be submitted to the City of Ontario prior to any permit or approval for ground disturbing activities.

If burrowing owls are detected onsite during the focused surveys or 14-day preconstruction survey efforts, during the breeding season (February 1st to August 31st) then construction activities shall be limited to beyond 300 feet of the active burrows until a qualified biologist has confirmed that nesting efforts are compete or not initiated. In addition to monitoring breeding activity, if construction is proposed to be initiated during the breeding season or active relocation is proposed, a burrowing owl relocation plan will be developed and approved by the City of Ontario, CDFW and USFWS.

CM BIO-5 Focused Bat Survey

Prior to implementation of Project activities, a qualified biologist shall be retained to determine whether potential roosting sites for bats may be affected. For large ornamental trees suitable for bat roosting/nursery, exit counts and acoustic surveys shall be performed prior to initial ground disturbance, vegetation or structure removal to determine whether the Project Site and a 300-foot buffer supports a nursery or roost, and by which

species. This work will occur between late -spring and late summer and/or in the fall (generally mid-March through late October).

If the results of the bat survey find a total of a single roosting individual of a special status bat species or 25 or more individuals of a non-special status bat species with potential to be present in the Project Site (i.e., western Mastiff bat, big free-tailed bat, or pallid bat), a Bat Management Plan shall be developed to ensure mortality to bats does not occur. For each location confirmed to be occupied by bats, the plan will provide details both in text and graphically where exclusion devises/and or staged tree removal will need to occur, the timing for exclusion work and the timeline and methodology needed to exclude the bats. The plan will need to be reviewed and approved by CDFW prior to disturbance of the root(s).

CM BIO-6 Programmatic Assessment Area CEQA Analysis

The 24.18-acre Programmatic Assessment Area located within the southwest region of the Specific Plan Boundary including APN's 1053-211-05, 1053-281-01, -02, -03, -04, and -07 was not evaluated for biological resources as part of this analysis. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in the un-surveyed portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction.

August 18, 2023

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to Kimley-Horn to complete a Cultural Resources Assessment of the proposed Euclid Mixed Use Specific Plan in the City of Ontario (City), San Bernardino County, California. A cultural resources records search, additional research, intensive-level pedestrian field survey, California Register of Historical Resources (California Register) eligibility evaluations, Native American Heritage Commission (NAHC) Sacred Lands File Search, and vertebrate paleontological resources overview were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The current study partially relies on *The City of Ontario's Historic Context for the New Model Colony Area* by Galvin & Associates (2004) for historical context.

The records search has revealed that 10 previous cultural resources studies have taken place, and two cultural resources have been recorded within one half-mile of the project site. Two of the previous studies have assessed small portions of the project site for cultural resources resulting in one cultural resource (a transmission alignment designated P-36-25440) previously recorded within its boundaries. During the research and field survey, six resources were identified, recorded, and evaluated for California Register listing eligibility (i.e. significance under CEQA). These include the historic-period Grant Dairy at 13813 Euclid Avenue, a rural-residential property at 14095 Euclid Avenue, an unnamed historic-period dairy at 7275 Schaefer Avenue, a rural-residential property at 7218 & 7226 Edison Avenue, an unnamed historic-period dairy at 7244 & 7260 Edison Avenue, and a historic-period transmission alignment designated P-36-25440. California Register listing eligibility recommendations are summarized in the below table.

Property Type	Address	California Register Eligibility
Historic-Period Grant Dairy	13813 Euclid Avenue	Recommended Eligible
Historic-Period Rural Residential	14095 Euclid Avenue	Recommended Not Eligible
Historic-Period Dairy	7275 Schaefer Avenue	Recommended Eligible
Historic-Period Rural Residential	7218 & 7226 Edison Avenue	Recommended Not Eligible
Historic-Period Dairy	7244 & 7260 Edison Avenue	Recommended Eligible
Historic-Period Transmission Alignment	P-36-25440	Recommended Not Eligible

Non-Significant Properties. The historic-period rural residential property at 14095 Euclid Avenue, the historic-period rural residential property at 7218 & 7226 Edison Avenue, and the transmission alignment designated P-36-25440 have been evaluated and are recommended not eligible for California Register eligibility. They do not warrant further consideration.

Significant Properties. The Historic-Period Grant Dairy at 13813 Euclid Avenue comprises a Streamline Moderne-style milk parlor, two residences and several ancillary buildings, and other dairy features. The dairy is recommended eligible for California Register listing under Criterion 1, 2, and 3. The property is therefore considered a "historical resource" under CEQA. However, the two residences, ancillary buildings, and other features have been modified outside the historic period. They do not contribute to the overall significance of the Grant Dairy and as such do not warrant preservation. The milk parlor is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It

features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof.

The historic-period dairy at 7275 Schaefer Avenue comprises a Streamline Moderne-style milk parlor, a second milk parlor (c1965), and two residences as well as outbuildings, several goat barns, hay storage structures, and an effluent pond to the south. Of these elements, only the Streamline Moderne-style milk parlor is eligible because it is an important local property type under Criterion 3 of the California Register. It has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows that curve around a corner, and a flat clay tile roof. The property is therefore considered a "historical resource" under CEQA, based on the significance of the milk parlor (which warrants preservation). The other buildings lack significance and do not warrant preservation under CEQA.

The historic-period dairy at 7244 & 7260 Edison Avenue comprises a historic-period residence to the west, a historic-period residence to the east, and a historic-period Streamline Moderne-style milking parlor at the center. This dairy is recommended eligible for California Register listing under Criterion 1, 2, and 3. The property is therefore considered a "historical resource" under CEQA. However, the two residences do not contribute to the overall significance of the historic-period dairy and as such do not warrant preservation. The milk parlor is an excellent example of a Streamline Moderne-style milk parlor, which has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It features design elements such as the smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof, and it warrants preservation under CEQA.

Preservation Mitigation. Preservation in place is the preferred manner of mitigating impacts to historical resources under CEQA. Based on results of the current study, the Streamline Moderne-style milk parlors described above merit preservation. If preservation is feasible, no other cultural resources work or monitoring is recommended for portions of the project site that have been subject to inventory. The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource. Where preservation is not an option, a data collection mitigation program has been developed in which potential adverse effects of any proposed demolition would be reduced.

Data Collection Mitigation. Prior to any project-related impacts to significant resources, the City would complete or require the completion of Historic American Building Survey (HABS) *style* photographic documentation of the subject property. While the photographs would meet HABS standards, only local curation (and no federal curation or involvement) would be necessary. The photographic documentation will be provided to the City (and any required local repositories) for curation. However:

> In most cases the use of drawings, photographs, and/or displays does not mitigate the physical impact on the environment caused by demolition or destruction of an

> historical resource (14 CCR § 15126.4(b)). However, CEQA requires that all feasible mitigation be undertaken even if it does not mitigate below a level of significance. In this context, recordation serves a legitimate archival purpose. The level of documentation required as a mitigation should be proportionate with the level of significance of the resource (http://ohp.parks.ca.gov/?page_id=21727).

Through this mitigation measure, impacts to the project site would be reduced. However, it may not be possible to reduce impacts of demolition below a level of significance.

Accidental Discoveries. If previously undocumented cultural resources are identified during earthmoving activities associated with development of the project site, a qualified archaeologist should be contacted to assess the nature and significance of the find, diverting construction excavation if necessary. The current study attempted to determine whether significant archaeological deposits were present on the proposed project site. Although none were yielded during the records search and field survey, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist should have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register of Historic Places (National Register), plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- Historic-period artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- Historic-period structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- Prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- Groundstone artifacts, including mortars, pestles, and grinding slabs;
- Dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;
- Human remains.

Sacred Lands File Search. Findings were negative during the Sacred Lands File search with the NAHC. The results of the Sacred Lands File search are provided in Appendix C. The State Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any

California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns.

Paleontological Resources. According to CEQA Guidelines, projects subject to CEQA must determine if a project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix F has recommended that:

> The geologic units underlying the project area are mapped primarily as young alluvial deposits from the Holocene and late Pleistocene epochs (Morton and Miller 2006). Holocene alluvial units are considered to be of high preservation value, but material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, Pleistocene alluvial units are considered to be highly paleontologically sensitive. The Western Science Center does not have localities within the project area or within a 1-mile radius. However, this is likely due to the project area's distance from the museum and should not be taken as indicative of paleontological sensitivity; other repositories may have localities in the area. Any fossil specimen from the Euclid Mixed Use Specific Plan Project would be scientifically significant. Excavation activity associated with the development of the project area would impact the paleontologically sensitive Pleistocene alluvial units, and it is the recommendation of the Western Science Center that a paleontological resource mitigation program be put in place to monitor, salvage, and curate any recovered fossils associated with the study area.

Field Survey Limits. Six parcels in the south and southeastern portion of the Specific Plan Area were not accessible during the field survey. These include Assessor Parcel Numbers 1053-281-01, -02, -03, -04, -05, and -07. Prior to any project-related developments, these parcels will require systematic field inventory to determine whether any cultural resources (including historic-period architectural resources, or historic-period or prehistoric archaeological resources) are present. All cultural resources work should take place under the supervision of a cultural resources professional that meets the U.S. Secretary of the Interior Professional Qualification Standards for Archaeology and Architectural History.

Human Remains. If human remains are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are prehistoric, the Coroner will notify the NAHC to determine a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

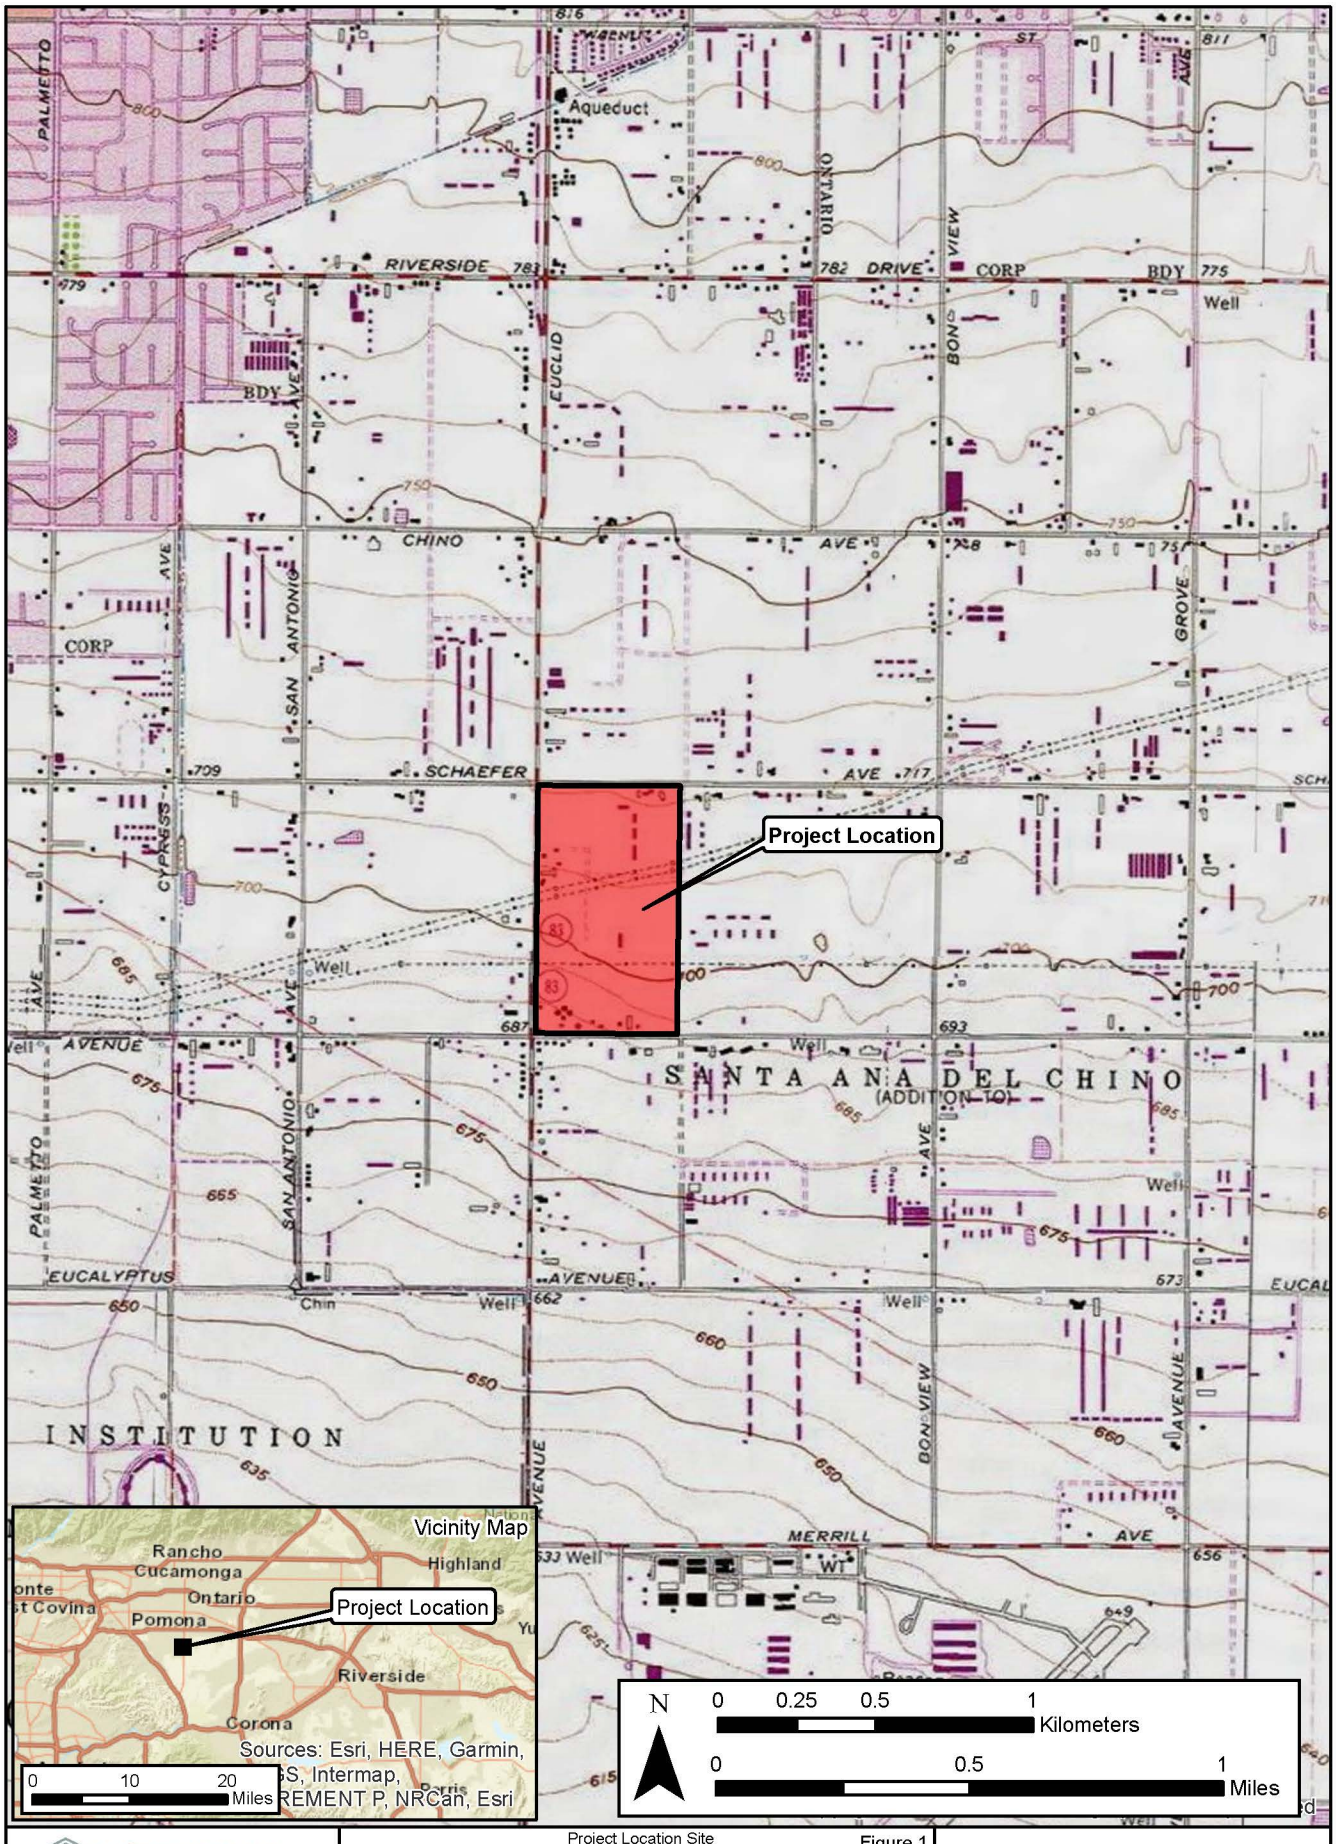
INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to Kimley-Horn to complete a Cultural Resources Assessment of the proposed Euclid Mixed Use Specific Plan Project in the City of Ontario (City), San Bernardino County, California. The project occupies approximately 84 acres and is bounded by dairies and undeveloped land to the north, east, south, and residential properties and commercial properties to the west. A cultural resources records search, additional research, intensive-level pedestrian field survey, California Register of Historical Resources (California Register) eligibility evaluations, Native American Heritage Commission (NAHC) Sacred Lands File Search, and vertebrate paleontological resources overview were conducted for the project pursuant to the California Environmental Quality Act (CEQA). The project site is located in non-sectioned Township 2 South, Range 7 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *Ontario, California* (1981) and *Prado Dam, California* (1981) 7.5-minute topographic quadrangles (Figure 1).



Regulatory Setting

The California Environmental Quality Act. CEQA applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations 14(3), § 15002(i)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (Cal. Code Regs. tit. 14(3), § 15064.5(b)). State CEQA Guidelines section 15064.5(a) defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or eligible for listing in, the California Register of Historical Resources (California Register)
- Listed in a local register of historical resources (as defined at Cal. Public Res. Code § 5020.1(k))
- Identified as significant in a historical resource survey meeting the requirements of § 5024.1(g) of the Cal. Public Res. Code
- Determined to be a historical resource by a project's lead agency (Cal. Code Regs. tit. 14(3), § 15064.5(a))

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California…Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing in the California Register of Historical Resources" (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)).

The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of

significant impacts must lessen or eliminate the physical impact that the project will have on the resource. Section 5024.1 of the Cal. Public Res. Code established the California Register. Generally, a resource is considered by the lead agency to be "historically significant" if the resource meets the criteria for listing in the California Register (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)). The eligibility criteria for the California Register are similar to those of the National Register of Historic Places (National Register), and a resource that meets one or more of the eligibility criteria of the National Register will be eligible for the California Register. The California Register program encourages public recognition and protection of resources of architectural, historical, archaeological, and cultural significance, identifies historical resources for state and local planning purposes, determines eligibility for state historic preservation grant funding and affords certain protections under CEQA. Criteria for Designation:

1. Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). Fifty years is normally considered sufficient time for a potential historical resource, and in order that the evaluation remain valid for a minimum of five years after the date of this report, all resources older than 45 years (i.e. resources from the "historic-period") will be evaluated for California Register listing eligibility, or CEQA significance. The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Finally, CEQA requires that significant effects on unique archaeological resources be considered and addressed. CEQA defines a unique archaeological resource as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

CEQA Guidelines Section 15064.5 Appendix G includes significance criteria relative to archaeological and historical resources. These have been utilized as thresholds of significance here, and a project would have a significant environmental impact if it would:

a) cause a substantial adverse change in the significance of a historical resource as defined in section 10564.5;

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 10564.5;

c) Disturb any human remains, including those interred outside of formal cemeteries.

City of Ontario Designation Criteria. In addition to evaluation for California Register listing eligibility, the City of Ontario Development Code Article 26: Historic Preservation (Section 9-1.2615) provides the following designation criteria for a property to qualify as a City Historic Landmark:

a. It exemplifies or reflects special elements of the City's history;

b. It is identified with persons or events significant in local, state, or national history;

c. It is representative of the work of a notable builder, designer, architect, or artist;

d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;

e. It is a noteworthy example of the use of indigenous materials or craftsmanship;

f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;

g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or

h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

Cultural resources would be subject to evaluation for the above City Historic Landmark designation criteria.

Tribal Cultural Resources. The Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is

traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff are available to answer questions and address comments as necessary.

Paleontological Resources. CEQA provides guidance relative to significant impacts on paleontological resources, indicating that a project would have a significant impact on paleontological resources if it disturbs or destroys a unique paleontological resource or site or unique geologic feature. Section 5097.5 of the California Public Resources Code specifies that any unauthorized removal of paleontological remains is a misdemeanor. Further, California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources. CEQA documentation prepared for projects would be required to analyze paleontological resources as a condition of the CEQA process to disclose potential impacts. Please note that as of January 2018 paleontological resources are considered in the geological rather than cultural category. Therefore, paleontological resources are not summarized in the body of this report. A paleontological overview completed by the Western Science Center is provided as Appendix F.

NATURAL SETTING

The project is located in the Chino Valley, which is bounded on the west by the San Jose Hills, on the south by the Chino Hills, on the north by the foothills of the San Gabriel Mountains, and on the east by La Sierra and the Jurupa Mountains (USGS 1981). Local rainfall ranges from 5 to 15 inches annually (Jaeger and Smith 1971:36-37). The area containing the project site exhibits a gradual southerly slope, and lies on a flood plain that feeds the Santa Ana River approximately five miles to the south (USGS 1981). The native biology of the region is difficult to reconstruct due to recent and historical agricultural, municipal, and industrial impacts. However, the project site is situated in the Upper Sonoran Life Zone, which is locally present between approximately 500 and 5,000 feet AMSL. This zone typically comprises cismontane valleys and low mountain slopes dominated by mixed coastal sage scrub and chaparral vegetation communities (Williams 2008).

CULTURAL SETTING

Prehistoric Context

The project site is located within the traditional boundaries of the Gabrielino (Bean and Smith 1978; Kroeber 1925). The Gabrielino probably first encountered Europeans when Spanish explorers reached California's southern coast during the 15th and 16th centuries (Bean and Smith 1978; Kroeber 1925). The first documented encounter, however, occurred in 1769 when Gaspar de Portola's expedition crossed Gabrielino territory (Bean and Smith 1978). Other brief encounters took place over the years and are documented in McCawley 1996 (citing numerous sources). The Gabrielino name has been attributed by association with the Spanish mission of San Gabriel, and refers to a subset of people sharing speech and customs with other Cupan speakers (such as the Juaneño/Luiseño/Ajachemem) from the greater Takic branch of the Uto-Aztecan language family (Bean and Smith 1978). Gabrielino villages occupied the watersheds of various rivers (locally including the Santa Ana) and intermittent streams. Chiefs were usually descended through the male line and

often administered several villages. Gabrielino society was somewhat stratified and is thought to have contained three hierarchically ordered social classes which dictated ownership rights and social status and obligations (Bean and Smith 1978:540-546). Plants utilized for food were heavily relied upon and included acorn-producing oaks, as well as seed-producing grasses and sage. Animal protein was commonly derived from rabbits and deer in inland regions, while coastal populations supplemented their diets with fish, shellfish, and marine mammals (Boscana 1933, Heizer 1968, Johnston 1962, McCawley 1996). Dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles were specifically not utilized as a food source (Kroeber 1925:652).

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the region in 1772. Searching for San Diego Presidio deserters, Fages had traveled through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought further diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that continue to this day (Beattie and Beattie 1974; Cleland 1941).

Ontario (see also Appendix B for references). In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold

Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014:7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Local Dairies (see also Appendix B for references). The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) has documented the local dairy industry, establishing periods of significance and a detailed framework for evaluation. The summary below draws from the context and other sources to provide sufficient historical framework to orient readers; the more comprehensive 2004 context may be consulted for additional detail.

Ontario and Chino are located in the Chino Valley basin of southwestern San Bernardino County. Dairy cows came to California with American settlers during the Gold Rush, and by 1876, a State Dairyman's Association had been organized. Dairies were first established in Chino Valley in the 1890s. The first dairy was most likely the Steel and Green Dairy, comprised of adobe buildings on the site of the Battle of Chino. The industry was based on free grazing during this era, and the availability of large tracts of fertile and inexpensive pastureland drew dairy farmers from Los Angeles County. However, most dairies in the region remained closer to Los Angeles population centers for several decades and citrus groves dominated the landscape through the end of the 1940s. Through 1930, the dairies in the region were small family businesses. Yet, by 1915, milk shipments already totaled over 6,000 pounds out of Chino. As Los Angeles County grew in population, so did the regional dairy industry. In the 1920s, many Dutch immigrants started dairy farms near Los Angeles. In the 1930s, to optimize milk production, dairies began switching from free grazing to dry-lot dairying and mechanized milking (Chino Champion 1977).

In the early years, the milking equipment was sanitized with steam tanks heated by oil burners. By 1920, dairy health and sanitation laws were established. Milk was originally filtered through cloth into the cans it was shipped in. The new laws required that a milk house had to be at least sixty feet from the barn, milkers must wear clean clothes before each milking, and milk house drains were constantly flushed with water. New ammonia cooling systems were also created. After World War I, many cows in California had tuberculosis, thus pasteurization became a requirement. The Dairy Herd Improvement Association (DHIA), formerly the Cow Testing Association, was also created to improve the quality of the milk cattle (Chino Champion 1977). The association was started in the United States in 1906 by Danish immigrant Helmer Rabild and a small group of dairy farmers in Michigan. The Diary Division of the U.S. Department of Agriculture was the biggest supporter of the DHIA. By 1926, over one-hundred associations were established across the country (Arnold 1956).

During and after World War II, the Los Angeles Basin grew as a metropolitan area, pushing dairies to peripheral areas such as Chino Valley. In 1949, Chino dairies produced one-third of the total dairy production in San Bernardino County (Chino Champion 1950). In 1950, there were 79 dairies with an average of 145 cows to a herd in the Chino area (Chino Champion 1950). Suburbanization in Los Angeles County allowed dairymen, many of whom were Dutch, to purchase larger acreage and build bigger homes in Chino Valley. During this era, local dry lot operations (which purchased all feed) began to replace traditional dairy farms, which grew some or all cattle feed. By 1957, there were more than 135 dairies in Chino Valley. The late 1950s and early 1960s dairies established in Chino Valley were the most technologically sophisticated in the US, capable of milking 450 cows a day for each worker. Herringbone milking parlors, in which cows were raised on a platform so milkers did

not have to kneel, became popular during this era to control labor costs. In 1960, an agricultural dairy preserve was established to protect the land from development, and by 1965, there were around 350 dairies in Chino Valley (Chino Champion 1977). In 1979, sixty percent of milk produced in California was from Chino Valley (Galvin & Associates 2004). Dairy products became California's number one agricultural commodity in 1993, and the state continued to lead the country in milk production into the twenty-first century (California Dairy Press Room & Resources 2023).

Streamline Moderne Milking Parlors

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) identified an unusual building type that characterizes historic-era dairies in the Ontario area, stating that the survey area has one of the largest concentrations of this building type in California. These milk parlors (also called milk houses or milk plants) are two-part buildings: a long, narrow shed with milking stalls for cows connected to a small cooling and processing building near a circular drive. The large utilitarian area where the cows are milked (historically referred to as the milking barn or milking parlor) has concrete masonry unit walls with large unglazed openings for ventilation and gabled roof. Floors are concrete for easy cleaning; stalls for cows are likewise designed for sanitation of concrete with metal stanchions. The processing/cooling/storage section of this building type (historically called the milk house or milk room) was not designed to be entered by cows or milkers. The milk houses are more visible from the public right-of-way than the barns, and thus more attention was paid to their aesthetic design. Many early examples, as documented in the Historic Context, exhibit simple Streamline Moderne architectural features including smooth symmetrical massing, stucco cladding, flat roofs with coping, curvilinear corners, and glass block windows. Larger and more elaborate examples have projecting center volumes, some with glass block at the curved corner.

The Historic Context theorized that these buildings would "most likely" have been constructed between 1920 and 1940, stating that more decorative Art Deco-style examples with geometric and angular edges as well as decorative chevrons or zigzags would have been constructed between 1920 and 1930, and that dairy owners transitioned to the Streamline Moderne style as described above between 1930 and 1940. Although revision of the 2004 Historic Context is outside the scope of the current study, some of the more serious flaws and inconsistencies within its discussion of this property type must be addressed to evaluate examples of this building type. The Context accurately describes the building type and correctly states that the Ontario/Chino area appears to boast the largest concentration of the property type in the state. However, the Context does not provide any photographic examples of the more decorative Art Deco-style milk parlors that it states would have been constructed before 1930, nor have recent field investigations revealed any dairy buildings with ornamental features that directly reference Art Deco architecture; the existence of dairy buildings with strongly Art Deco ornament appears to have been conjectural. A careful reading of the Historic Context and a review of its bibliography reveal that no sources on Art Deco or Streamline Moderne architecture were cited (in contrast to its extensive bibliography on Ranch Style architecture). Nor does the bibliography include sources focused on the architecture of dairies, the development of dairy building typology over the twentieth century, the technical requirements of twentieth century dairy buildings, or contemporaneous trade journals that discuss best practices for dairy building construction.

Furthermore, pages 44-48 of the Context have no citations whatsoever. Thus, close examination reveals that its preparers developed the 1920-1940 period of significance based on the widely understood fact that the Art Deco/Streamline Moderne architectural movement was popular during this era and that Streamline Moderne grew out of Art Deco during the Great Depression. However reasonable this assumption may have been, it was not based on evidence. As demonstrated below, these buildings were not developed between 1920 and 1940.

The use of glass block is virtually ubiquitous in these milk plants and is one of the most important character-defining features of the building type. Glass block construction was pioneered in the US for a New York hotel built in 1928. Production of glass block began about 1932 and the material was featured at the 1933-1934 Chicago Century of Progress International Exhibition and the 1939 World's Fair in New York, helping to popularize it. The height of its use was from the late 1930s through the 1940s. It became an essential element of the Streamline Moderne style since it could be incorporated into curving wall surfaces (Fagan 2015). The development history of this material definitively demonstrates that Streamline Moderne milking parlors could not have been constructed in the Chino Valley prior to 1933 at the absolute earliest. In 1925, the University of California College of Agriculture published recommendations for milk house design and construction. Although concern for sanitary conditions had led to a recommendation for the use of concrete flooring for milking parlors and milk houses during this era, best practice continued to advise wood-frame wall construction with wood sheathing and double-hung wood sash windows with screens. In the 1920s, glass block and concrete masonry units were not yet being recommended as building materials by organizations promoting progressive dairying (Belton 1925).

Although glass block was in production by the mid-1930s and theoretically could have been utilized, its use for dairy buildings would have been unlikely, since building materials trends begin in urban areas and arrive later to farming operations, where utilitarian considerations are more important than style. Review of historic aerial photographs provides further evidence that the building type was not in local use during the 1920s and 1930s. Review of historic aerial photographs for a roughly two square mile area (including the current project area) has revealed that it eventually held at least 17 of these buildings. Only two milking parlors that fit the typology had been constructed by 1949 and by 1953 there were still only two in the study area (USDA Aerial Photographs 1949, 1953, 1975). Furthermore, review of local newspapers reveals few if any new dairies established during the 1930s, and expansion of existing operations appears to have been modest during these Great Depression years. Extensive comparative research has revealed no existing California cultural resource reports or academic papers that have analyzed the building type. Several historic photographs of Los Angeles County dairies were discovered, and these demonstrate that the property type was in use in areas like Bellflower and Artesia during the 1940s and 1950s; the oldest dated photograph of a Streamline Moderne milking parlor in Artesia is from 1940. The Streamline Moderne milking parlor appears to have traveled from Los Angeles County to Ontario in the 1940s as dairymen began to move their operations to western San Bernardino County, and the trend accelerated rapidly in the mid-1950s along with the continued migration of dairies to Chino Valey. A 1940 article in the Chino Champion describes the Abacherli Dairy at the intersection of Walnut and San Antonio avenues as a

state-of-the-art local dairy plant. Although the article does not include photographs, a milk house of concrete construction with concrete floors is described and may have been an early example of the typology (Chino Champion 1940). By 1947, the Journal of Dairy Science was recommending glass block for use in milk processing plants because it provided illumination without allowing dirt to infiltrate like an open window. The same publication also praises its “modern look” (Nelson 1947). Other dairy-oriented publications also recommended use of the glass block and masonry construction in the late 1940s (University of Wisconsin 1949). And the extant Streamline Moderne milk parlor at the Grant Dairy (in the current study area) is known to have been built in 1947 or 1948.

The local popularity of glass block in milking parlors appears to have peaked in the 1950s, when many local examples of this building type were constructed. Glass blocks were heavily advertised in dairy trade journals throughout the 1950s, and construction of the building typology continued into the 1960s. A Streamline Moderne milking parlor appears in a 1956 article contrasting “modern dairy plants” with the large wooden barns of the early twentieth century (Chino Champion 1956). (Although its construction date is not specifically mentioned, it would be unlikely for a local newspaper to tout a building as “modern” if it were more than two or three years old.) Although documents that substantiate exact dates for construction of Streamline Moderne milk parlors in Ontario have not been discovered, available evidence indicates that most were constructed between 1940 and 1965. Since we have demonstrated that the actual construction of this building type did not take place within the Art Deco era (1920-1940) this study will use Streamline Moderne Milk Parlor in reference to this building type and will consider the period of significance 1940-1965.

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study. Mr. Brunzell meets the United States Secretary of the Interior Professional Qualification Standards for Archaeology and Architectural History. Mr. Brunzell wrote the technical report with contributions from Principal Architectural Historian, Kara Brunzell, M.A., BCR Consulting Archaeological Field Director, Joseph Orozco, M.A, RPA. and BCR Consulting Archaeological Crew Chief Tim Blood, M.S. Mr. Orozco, Mr. Blood, and BCR Consulting Staff Archaeologist Doug Kazmier, B.A. completed the pedestrian survey. Mr. Brunzell, Ms. Brunzell, Mr. Kazmier, and Mr. Blood completed the Department of Park and Recreation (DPR) 523 forms. Ms. Brunzell completed additional research, architectural descriptions, and historic-period built environment eligibility evaluations.

METHODS

This work was completed pursuant to CEQA, the Public Resources Code (PRC) Chapter 2.6, Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5. The work is also completed pursuant to City Development Code Article 26: Historic Preservation. The pedestrian cultural resources survey was intended to locate and document previously recorded or new cultural resources, including archaeological sites, features, isolates, and historic-period buildings, that exceed 45 years in age within defined project boundaries. The project site was examined using 15-meter transect intervals, where accessible. This study is intended to determine whether cultural resources are located within the project boundaries, whether any cultural resources are significant pursuant to the above-

referenced regulations and standards, and to develop specific mitigation measures that will address potential impacts to existing or potential resources. Tasks pursued to achieve that end include:

- Cultural resources records search to review the results of any studies conducted within a half-mile radius of the project boundaries;
- Additional research through various local and regional resources;
- Systematic pedestrian survey of the entire accessible project site;
- California Register eligibility evaluation for resources identified;
- Development of recommendations and mitigation measures for cultural resources documented within the project boundaries, following CEQA;
- Completion of DPR 523 forms for any discovered cultural resources.

Research

Records Search. On November 17th, 2022 a records search was conducted at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one half-mile of the project site. Additional resources reviewed included the National Register, the California Register, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Additional Research. BCR Consulting performed additional research through City of Ontario permit records, the Robert E. Ellingwood Model Colony History Room of the Ontario Library, the San Bernardino County Historical Archives, and through various internet resources. The research focused on land-use history, and on acquiring and consulting primary and secondary sources such as building permits, property title documents, census records, birth and death records, newspaper articles, scholarly journal articles, and biographical sources.

Field Survey

An intensive-level cultural resources field survey of the project site was conducted on October 31, 2022, February 8, 2023, and on May 22, 2023. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across the accessible project site. The following Assessor Parcel Numbers were not accessible: 1053-281-01, -02, -03, -04, -05, and -07 (see Appendix E). Also, inaccessible areas such as fenced yards, building interiors, and livestock enclosures and feeding areas were not subject to systematic survey. However, inaccessible parcels were photographed from the public right of way, and as a result, built environment resources could be assessed and evaluated on these properties. Cultural Resources were recorded on DPR 523 forms. Digital photographs were taken at various points within the project site. These included overviews as well as detail photographs of all cultural resources. Cultural resources were recorded per the California OHP *Instructions for Recording Historical Resources* in the field using:

- Detailed note taking for entry on DPR Forms (see Appendix B)

- Hand-held Garmin Global Positioning systems for mapping purposes
- Digital photographic overviews and photographs of all cultural resources (see Appendix B and D).

RESULTS

Research

Records Search. Data from the SCCIC revealed that 10 previous cultural resources studies have taken place, and two cultural resources have been recorded within one half-mile of the project site. Two of the previous studies have assessed small portions of the project site for cultural resources resulting in one cultural resource (a transmission alignment designated P-36-25440) previously recorded within its boundaries. Records search results are summarized in Table A, and a records search bibliography is provided in Appendix A.

Table A. Cultural Resources and Reports Within One Half-Mile of the Project Site

USGS 7.5 Min Quad	Cultural Resources Within One Half-Mile of Project Site	Studies W/in One Half-Mile
Ontario (1981), *Prado Dam* (1981), *California*	P-36-25440: Historic-Period Chino-Mira Loma No.1 Transmission Alignment (Crosses Project Site) P-36-26725: Historic-Period Building (1/2 Mile SW)	SB-1499, 2623, 2678, 3012, 3688, 4402, 4404*, 6095*, 7898, 7968

*Previously assessed a portion of the project site.

Additional Research. Additional research was performed for the project site to provide the background for the historic-period cultural properties within its boundaries (see also Field Survey Results, below). Please note that references and figures for this section are provided in Appendix B.

13813 Euclid Ave (APNs 1053-071-01, -02, and -03). The subject property was part of Mexican land grant Rancho Santa Ana del Chino. Austin A. Grant (1888 – 1953) purchased seven lots totaling 45 acres from potato farmer Charles E. Stinson. Grant started the first dairy on the property in 1922; at that time much of the land in the neighborhood was devoted to citrus orchards and row crops. Grant had come to California from his native Nova Scotia in 1903, and married Florence Tully (1890 – 1966) in 1911. Like Grant, Tully was Canadian; both of their fathers had been clergymen. The couple moved to Imperial County, where Austin Grant established a dairy. A daughter, Jessie, was born in 1914, and a son, Andrew (named after Florence's father) in 1919 (US Census records Imperial County 1920). In 1922, they relocated their young family to Ontario, purchasing property at Euclid and Schaefer Avenues where they made their home and built a model dairy business. The family apparently moved into the primary residence on the property, which appears to have been constructed during the early twentieth century, possibly by its previous owner. However, the specific construction date of the main residence on the property is unknown, and the Grants may have constructed it shortly after they purchased the dairy. Hay barns, silos, sheds, and corrals all appear to have been constructed by the Grant family beginning in the 1920s. They also planted eucalyptus along property boundaries as windbreaks. Florence Grant was active in the Methodist church as well as the clubs and charity organizations typical for elite women of the era. Her father Rev. Andrew Tully, who at this point was in his 70s, lived with the family during their early years on the property.

The Grant Dairy house and barns were sited on six-acre Lot 17 and the lots to the north and south were used for crops and pasture. In 1929, a public health survey performed by a Stanford student was reprinted in the Chino Champion; it called the Grant Dairy “one of the best equipped and one of the most sanitary.” Grant allocated 25 acres to alfalfa and 15 to corn for silage to feed his herd of 80 Jersey cows (65 of which would typically be milkers). Five acres of the property were utilized for the house, farm buildings, corrals, etc. In its early days, the dairy produced 185 gallons of raw milk a day, which was bottled and sent to Ontario for distribution; excess was delivered to a creamery. The milk barn had a concrete floor and 20 stanchions, half of which would be in use while the other half were being cleaned. It had screened windows and doors, was kept extremely clean, and there was a concrete walk between the barn and the milk house. The cows were washed and wiped clean before milking. The milk was poured into the milk house by milkers who did not enter it in order to avoid contamination, after which it was filtered through cotton cloth and cooled. The Grant Dairy had its own ice plant adjacent to the milk house as well as a boiler so hot water could be used at milkings (not a universal practice at the time). Grant closely supervised the process, and the result was milk with high butterfat and low bacteria (Chino Champion 1929).

Austin Grant was active in local lodges and clubs as well as the San Bernardino County Farm Bureau, joining its Dairy Committee shortly after establishing his Chino dairy (Pomona Progress 1924). His herd was consistently high-producing compared to others in the region; for instance, it was first in butterfat percentage at the 1937 cow testing (Chino Champion 1937). At a time when many cows had tuberculosis, Grant took extra care of his cows to ensure they were healthy and tuberculosis free (Chino Champion 1977). In 1940, Grant was elected president of the Dairy Herd Improvement Association, which was composed of local dairymen who aimed to improve their herds (Chino Champion 1940). At some point in the late 1930s or early 1940s, Grant constructed a long, narrow barn to the east of the older buildings. Research has not revealed photographs of the building, which had been demolished by the mid-1970s, but its size and footprint indicate that it was probably used for hay storage. Aerial photographs demonstrate that the current Streamline Moderne milking parlor was constructed in 1947 or 1948. Grant was a progressive dairymen who was interested in quality and sanitation throughout his career, and this milk parlor was part of the early wave of this building type in the Chino Valley and the oldest known local example of the building type. The Grants did not expand much over the years operation; in 1950, the dairy had 70 cows (which was by that time below average locally) and had added some Guernseys to its Jersey herd (Chino Champion 1950).

Jessie Grant attended business College in Los Angeles after high school graduation in the early 1930s, and after she married in 1938 continued to reside there and work as a stenographer. Andrew Grant, who was several years younger, served in the Army during World War II, and by the end of the war had become an officer. He married Doris Bird, who had grown up on a neighboring dairy, and after the war they settled on the Grant Dairy near his parents where he worked with his father. The small house south of the milk parlor appears to have been built in the late 1940s about the same time as the Streamline Moderne milking parlor, and it is likely that Andrew and Doris Grant lived there with their children.

During the 1950s and 1960s, the citrus and walnut orchards near the Grant Dairy were converted to dairies. Andrew Grant left the dairy business after his father's death in 1953 and by the late 1950s had moved off the property (US Census record San Bernardino County 1950). In 1963, Florence Grant sold the property to Alfred Fikse Jr. of Artesia (San Bernardino County Sun 1963). Fikse raised beef cattle on the property (Lake Elsinore Valley Sun Tribune 1968).

By 1973, Harm and Zwaantina “Swannie” Te Velde owned the property. Born in the Netherlands, the couple married in 1936 and came to California. They started a dairy farm, Artevel Farms, on the property (Chino Champion 1970, Chino Valley News 1983, Chino Champion 1986). Harm gained recognition by the Holstein-Friesian Association of America for his milk cows (Chino Champion 1977). In 1985, the Te Velde Trust owned the property, and it continued to pass among the eight Te Velde children. Ralph Te Velde led the farm after his father, until his death in 1998 (Chino Valley News 1979, Chino Champion 1998). In 1981, before his death, Ralph Te Velde purchased the neighboring farm, the Grassland Dairy Farm at 7275 Shaeffer Avenue, for the second Artevel Farms location (Chino Champion 1981). In 1990, Harm Te Velde died after living in Chino for 21 years (Chino Valley News 1990). In 2008, Artevel Farms became Artevel of California, LLC. In 2013, Swannie Te Velde died, leaving 116 family members. In 2023, it was the Venegas and Sons Dairy.

14095 Euclid Avenue (APNs 4053-281-04 and -05). The property was part of Mexican land grant Rancho Santa Ana del Chino. The current small parcel near the intersection was part of Lot 34 of Section 18, a roughly 300' x 900' parcel. The first known owners of Lot 34 were Byron C. Fulton (1860-1939) and his wife,Mary Jane Bailey (San Bernardino County Sun 1906). They moved from North Dakota to Chino in 1892. They purchased a large ranch property and established their home on the southeast corner of Euclid and Edison Avenues (Chino Champion 1939). They bought and sold a number of portions of their original property and other properties in Chino. In 1899, the Fulton house burned down and they moved a new house from Ontario to the northeast corner of Euclid and Edison Avenues, current address 14095 Euclid Avenue. The Fulton family appears to have stayed in the house until at least 1930. In the early 1930s, John Ephas Clapp (1876-1944) purchased all of Lot 34. Clapp was a cattle dealer and had a dairy in Chino Hills. He apparently lived on Lot 34 in a house facing Edison that was constructed about 1924 (see DPR 523 form for 7218 and 7226 Edison Avenue) with his wife, Ida Belle Clapp, and their son, Frank Clapp (Chino Champion 1941). (Since house numbers were not in use area during this period, available documents cannot definitively confirm which house they resided in.) Around 1940, the lot was divided, separating 14095 Euclid Avenue and 7218 Edison Avenue. In the 1940s, dairy farmers Mr. and Mrs. S. C. Iest, lived in the turn-of-the-century house (Chino Champion 1935, 1948). Historic aerial photographs demonstrate that the remainder of the parcel was an orchard through the middle decades of the twentieth century, and although people involved in the dairy business lived on the property at times, the parcel was never utilized as a dairy. The orchard trees were gradually replaced with large tanks for what appears to have been some type of industrial use, but research has not revealed its details.
In the 1970s, Richard Clark Madole owned the property. He married Judy Southfield in 1971 and they had a son, Richard Madole Jr. Madole worked as a hay dealer (Chino Champion 1971). Madole, Paul Abatti, and Richard Van Dyke co-owned Schafer Service in Chino

(Chino Champion 1973). In 1973, Madole started R & R Commodities, Inc. on the property (Chino Champion 1973). Madole sold it to Gregory Lyon and Paula Lyon (1948-2015). In the late 1970s, the property was home of the Euclid Decorative Rock company, owned by Gregory Lyon (b.1947) and his father-in-law, Carl Bomgardner (Chino Champion 1976). In 1977, the Lyons had their son, Andrew Gregory, while living on the property (Chino Champion 1977). In the 1980s, the property was the home of Sterling Truck Equipment and Repair, Inc. (Chino Champion 1987). In 2004, the Lyons sold the property to AB & G Cattle Company. In 2010, Suresh and Shilpa Patel purchased the property. The Patels purchased the Foss mini mart in Chino in 2004, and renamed it Mars Market (Chino Champion 2004, 2005).

7275 Schaefer Ave (APNs 1053-071-04, -01, and -03). The subject property was part of Mexican land grant Rancho Santa Ana del Chino. In the early twentieth century, the subject property (Lots 1 and 18 of Section 18 in Figure 1) was part of a larger ranch that totaled about 40 acres. By 1917, George Washington Bird (1873-1944) owned the property with his wife Birchie (U.S. Directories San Bernardino County 1917). George Bird was born in Missouri and Birchie was born in Iowa. In 1920, they were living on the ranch with seven of their children; a decade later they had five children left at home and Birchie's father was also living with them (US Census Records 1920, 1930). Bird was a contractor who built oil rigs; he apparently also operated the subject property as some type of a farm, perhaps a dairy or chicken ranch. There were some small buildings on the subject parcel during this era, but none of the current buildings had been constructed. The family home was not located on the subject property but was in a group of buildings and trees clustered along a driveway near the line of eucalyptus that marked the western border of Lot 8 (see Figures 1 and 2). The Birds had to mortgage the property during the Depression and were apparently unable to make the payments; they also had trouble meeting your property tax obligations, and an auction of all four lots was announced in 1933 (San Bernardino County Sun 1933). The family somehow managed to hang on to the property through the end of the decade, but it was finally auctioned at a trustee's sale in 1940. They moved to Upland, where George Bird died in 1944 (Pomona Progress Bulletin 1944).

Alba Lee and Frances Holmes acquired the property about 1940. Alba Lee Holmes (1913-2002) and Frances Pedley (1916-2000) had been married in 1938 and Alba worked as a machinist before they purchased the ranch (Pomona Progress Bulletin 1938). They eventually had four children (Chino Champion 2000). By 1950, Alba Lee and Frances Holmes and children Stephen, Karen, and Jeffrey apparently lived on the ranch (U.S. Census Records 1950). Presumably, they were living in the Bird house on Lot 8 which was extant at that time, but the location of their residence cannot be definitively determined because addresses were not in wide use in the area during this period. After they moved to the subject property, Alba, who usually went by Lee, listed his occupation as a farmer. Aerial photographs indicate that the western Streamline Moderne milking parlor was constructed c1958; a long narrow building probably used as a storage was constructed southeast of the milk parlor about the same time, and corrals for cattle were also built.

A second milk parlor was constructed c1965, apparently by the Holmes family. It is a virtually exact copy of the neighboring Floris Ykema Dairy's milk parlor (about a half mile directly to the south, constructed c1960) which apparently served as a template. The dairy

operation on this property made little impact on the historic record and little is known about Lee Holmes' professional life. Frances Holmes worked in the estate and planning department of Pomona College and was a longtime member of the Christian Women's Club in Chino (Chino Champion 2000). The family appears to have lived on the property until at least 1964. The east half of the property appears to have been sold during the mid-1960s.

The TeVelde family purchased the property about 1973; they also acquired the Grant Dairy to the west. Born in the Netherlands, Harm and Swannie TeVelde were married in 1936 and came to the area in 1969; they may have rented the property before purchasing it. They named the properties at Euclid and Schaefer Artevel Farms (Chino Champion 1970, Chino Valley News 1983, Chino Champion 1986). Harm gained recognition by the Holstein-Friesian Association of America for his milk cows (Chino Champion 1977). The TeVeldes had eight children. The TeVelde family purchased the Grassland Dairy Farm at 7275 Shaeffer Avenue (the subject property), which comprised the second Artevel Farms location (Chino Champion 1981). Harm and Swannie's son, John TeVelde lived on Schaefer Ave with his family starting in 1969 (Chino Champion 1969). The two residential buildings on the property were constructed after 1980. Research has not revealed when the original 40-acre Bird Ranch was subdivided, but the eastern 20 acres were under separate ownership by 1987. In 1990, Harm Te Velde died after living in Chino for 21 years (Chino Valley News 1990). In 2008, Artevel Farms became Artevel of California, LLC. In 2013, Swannie TeVelde died, leaving 116 family members. In the 2010s, the property was purchased by Daniel Drake and used as the Drake Family Farms Artisan Farmstead, for the production of goat cheese. Drake Family Farms sold their goat cheese at local farmers markets (Los Angeles Times 2012).

The subject property has no extant buildings constructed prior to the 1950s, it therefore has no potential association with the following historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area: 1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 3.1930-1949 - Dry Lot Dairying with Mechanization. Since the two milking parlors on the property were constructed during the 1950s and 1960s, it is a potential example of 4. Post-1950 - Scientific, Large Capacity Dairies, although it does not meet the minimum characteristics as analyzed in greater detail below.

7218 & 7226 Edison Ave (APNs 1053-281-01 and -02). The property was part of Mexican land grant Rancho Santa Ana del Chino. The current small parcel near the intersection was part of Lot 34 of Section 18, a roughly 300' x 900' parcel. The first known owners of Lot 34 were Byron C. Fulton (1860-1939) and his wife, Mary Jane Bailey (San Bernardino County Sun 1906). They moved from North Dakota to Chino in 1892. They purchased a large ranch property and established their home on the southeast corner of Euclid and Edison Avenues (Chino Champion 1939). They bought and sold a number of portions of their original property and other properties in Chino. In 1899, the Fulton house burned down and they moved a new house from Ontario to the northeast corner of Euclid and Edison Avenues, current address 14095 Euclid Avenue. The Fulton family appears to have stayed in the house until at least 1930. In the early 1930s, John Ephas Clapp (1876-1944) purchased all of Lot 34. Clapp was a cattle dealer and had a dairy in Chino Hills. He apparently lived on Lot 34 in the house facing Edison that was constructed about 1924 (7218 Edison Avenue) with his wife, Ida Belle Clapp, and their son, Frank Clapp (Chino Champion 1941). (Since

house numbers were not in use area during this period, available documents cannot definitively confirm which house they resided in.) The Clapps may also have operated a dairy across the street from the subject parcel. Around 1940, the lot was divided, separating 14095 Euclid Avenue and 7218 Edison Avenue. Historic aerial photographs demonstrate that the remainder of the parcel was an orchard through the middle decades of the twentieth century, and although people involved in the dairy business lived on the property at times, the parcel was never utilized as a dairy. The orchard trees were gradually replaced with large tanks for what appears to have been some type of industrial use, but research has not revealed its details.

In 1936, Claudie E. Waggoner (1913-2000) married Faye Maxwell (1915-1998) and they moved to Ontario, living at first on Grove. Around 1950, they appear to have moved onto 7218 Edison Avenue with their son, Rex and daughters Donna and Rita. They used the property as a walnut farm (Chino Champion 1963). Previously, Claudie Waggoner worked for Lucas Dairy Company. The Waggoners son, Rex Waggoner, studied soil science and agronomy at Cal Poly San Luis Obispo. After graduating, he worked as a soil scientist with the U.S. soil conservation service near Placerville. He also volunteered in the Peace Corps in Guatemala for two years, where he worked in livestock management and farming, and taught nutrition (Chino Champion 1963).

In 1957, a second house was built on the property, apparently for the Waggoner ‘s daughter Donna. In 1958, Peter S. Vander Meulen (1933-2011), Donna Waggoner Vandermuelen, and their three children lived at 7226 Edison Avenue. Starting in 1955, Vander Meulen worked as a heavy equipment operator with Blue Diamond Materials for thirty-five years. In the late 1960s, Rex Waggoner moved into the house at 7226 Edison Avenue, directly adjacent to his parents’ house at 7218 Edison Avenue. In 1971, Rex Waggoner and his wife had a son, Steven Lee (Chino Champion 1971). Faye Waggoner died in Chino in 1998 and Claudie Waggoner died four years later (U.S. Social Security Death Index 2000). After their deaths, their oldest children, Rex Waggoner and Donna Vandermeulen (1938-2021), inherited the property.

In 2003, Roger and Jennie Camping purchased the property. Roger Camping (b.1952) and his two brothers owned Eagle Livestock in Chino (Chino Champion 1989; Progress Bulletin 1972). Roger Camping raised cows to sell for beef (Chino Champion 1986). In 2020, the property was purchased by Richard and Lisa Gentry.

7244 & 7260 Edison Avenue (APNs 1053-281-01, 1053-211-05). The dairy at 7260 and 7244 Edison Avenue was Lots 19 & 36 of Section 18 of Mexican land grant Rancho Santa Ana del Chino. The roughly 18 acres of farmland changed hands several times during the first decades of the twentieth century; although there was a small building set well back from Edison Avenue near the western parcel boundary by the 1930s, there is no indication that any of its early owners lived on the property. Nor has research revealed specific information about its early agricultural use.

The older house at 7244 Edison Avenue was constructed about 1950. The first known operators of a dairy on the property were Floris and Harriet Ykema. Born in Iowa, Floris Ykema (1920-1986) married his wife, Harriet, in 1942 and they moved to California in 1945

after he served in World War II. He worked for a dairy before starting his own in Chino. In 1954, the Chino Champion reported that the property was a new dairy operated by Floris Ykema (Chino Champion 1954). Floris and Harriet moved into the house with their young daughters Alicia, Ruth Ann, and Gladys. The family attended the First Christian Reformed Church in Chino and Floris served on the board for the Ontario Christian School. The second residence at 7260 Edison Avenue was built in 1957, and the family moved into the new Ranch-style house. The Streamline Moderne milking parlor was built between the residences about the same time, and corrals for the cows as well as pole shade structures were developed to the north of the buildings.

Ykema became an industry leader in the area; in his first year of local operation, Ykema's herd had the highest butterfat average for October (Chino Champion 1954). Ykema became the president of the District 10 of the American Dairy Association of California, and the chairman of the California Milk Advisory board (Chino Champion 1973). He became an outspoken advocate for the industry and was frequently quoted in newspapers across California. The Ykema dairy operation continued to grow, and by the 1970s he was considered a major producer. He also purchased two other diaries in Chino and leased a dairy in Hanford (Chino Champion 1979). In 1979, Ykema was elected Dairyman of the Year.

In the early 1970's, the property was also home to Jim Visser (b.1944), and Thelma DeBoer Visser (b.1944) in 1966. They moved into 7244 Edison Avenue about 1970, the year their twin sons were born. Their sons, Jarrod and Arlan Visser, died after a gasoline fire in their garage in 1972 (Chino Champion 1972). The Vissers stayed on the property until at least 1974. In 1981, the Ykemas sold the property at 7260 Edison Avenue to Donald and Wilma Van Dam. They owned an additional dairy in El Mirage, the Van Dam Dairy (Chino Champion 1979). They remained in the dairy business, with property on Edison Avenue until 2005, when their family and dairy moved to New Mexico (Chino Champion 2005). In 1985, Gordon and Jo Ann Vander Meulen lived at 7260 Edison Avenue with their daughter. The same year, Norman Sterkel and Lori Lindholm lived at 7244 Edison Avenue, with their daughter Emily Ann (Chino Champion 1985). In 2008, Eugene Cellier III lived at 7260 Edison Avenue. In 2007, Cellier started the company Bottoms Up Hooftrimming in Chino. The following year he purchased Central Mower Service in Chino from the previous owner, Charles Douma.

Field Survey

BCR Consulting Archaeological Field Director Joseph Orozco, M.A., R.P.A, Crew Chief Timothy Blood, M.S. and Staff Archaeologist Doug Kazmier, B.A. completed the field survey on October 31, 2022. The project site has been completely disturbed by historic-period and modern dairy and agricultural developments, and by the installation of public utility alignments. Vegetation at the time of survey included a seasonal pumpkin patch on the northern portion of the project site and seasonal grasses were seen throughout the project area. Average visibility was approximately 50 percent and sediment comprised sandy silt with very few rocks. Two historic-period dairies and one historic-period transmission alignment were recorded during the survey and are described in detail below.

13813 Euclid Avenue. The subject property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of urbanized Chino, with multi-family residential development across the street to the west and dairies to the east and south. The subject property is occupied by a historic-period (c1915) residence to the north, a historic-period (late 1940s) residence to the south, and a Streamline milking parlor (c1948) with a circular driveway, as well as pole structures, sheds, and outbuildings. Historic buildings are clustered on APNs 1053-071-01 and -02. These parcels are at the heart of the historic Grant Dairy with pasture and crop land on other parcels to the north and south. The primary residence, which appears to have been constructed about 1915, is at the northwest corner of 1053-071-02 near the road and is enclosed by a low concrete masonry unit wall with a brick cap. Landscaping is untended with several mature trees and palms near the house. The house is rectangular in plan with a medium-pitch multi-gabled roof with exposed rafter tails. It is clad in stucco. There is a partial width porch with a hip roof that wraps around the main (west) and south elevations. It is supported by five paired turned wood posts atop a solid brick balustrade that has been stuccoed. It shelters the main entrance. A second entrance to the right of the porch is sheltered by a projecting shed roof. Fenestration consists of double hung wood sash windows; many are boarded up. There is a bay window on the right side of the north elevation. The building is abandoned and in poor condition with windows and doors boarded up and some sagging roofs.

Adjacent wood and metal sheds (age unknown) are northeast of the residence. The wooden shed is severely dilapidated with sections of the building falling away and a collapsed roof. The metal shed is in good condition with shed roof and aluminum windows. There is a small windowless utility structure north of the sheds.

The Streamline Moderne milking parlor (c1948) is south of the main house behind a circular driveway; there are also mature trees in its vicinity. It is rectangular in plan. The front portion of the building (the milk house/milk room) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners, glass block, and a shaped parapet with decorative clay tile roofing. The main entrance on the primary (west) elevation is fitted with paneled wood doors and accessed by a wide concrete step. Fenestration consists of glass block windows and replacement sliding vinyl windows at the sides.

The back section of the building is an open-air facility (the milking parlor/milking barn) with a gabled metal roof with exposed rafter tails. The roof is supported by square wood posts that rest on a half-height solid stucco wall. The main entrance on the north elevation is a sliding metal door accessed by a concrete ramp connected to the front portion of the building. The building is in fair condition and appears to be in use. There is a small metal shed south of the milking parlor that also appears to be in fair condition.

The late 1940s residence is irregular in plan with a cross-gabled roof with vents on the gable ends. It is clad in stucco. A projecting shed roof on the main (north) elevation shelters the main entrance, which faces north (rather than west toward the street) and is fitted with a screen door and paneled wood door. Fenestration consists of double hung wood sash windows. There is a one-car garage to the north of the house connected via a breezeway.

Its vehicle entrance, on the west elevation, is fitted with a roll-up metal door. The building is in good condition and appears to be occupied. There is a simple corrugated metal shed between the garage and the milking parlor.

14095 Euclid Avenue. The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is a 0.34-acre lot occupied by a historic-period (c1905/1940) residence at the west of the parcel at 14095 Euclid Avenue. A shed to the northeast of the residence is on a separate parcel, APN 1053-281-05, which is completely surrounded by APN 1053-281-04and apparently holds only a well and the shed enclosing it. The residence faces Euclid Avenue near its intersection with Edison Avenue. The small front yard is minimally landscaped and used primarily for parking and the area behind the house to the east is enclosed in a tall board fence. There are a few mature trees and palms near the house. The house is irregular in plan with a steeply-pitched cross-gabled roof with metal vents on the gable ends. Some sections of the house have minimal enclosed eaves while others have wider open eaves with exposed rafter tails. It is clad in stucco. There is a partial width porch with a projecting low-pitch shed roof on the main (west) elevation that is supported by four square wood posts. The porch shelters the main entrance, which is at the northern edge of the main façade and fitted with a metal security screen door. Fenestration consists of double-hung wood sash and aluminum replacement windows; there is also a large picture multiple-light window adjacent to the main entrance. The house is in fair condition.

7275 Schaefer Avenue. The subject property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It currently comprises four parcels (1053-071-04, 1053-081-01, and 1053-081-03, 1053-081-02) occupied by two historic-era milk parlors and two residences as well as outbuildings, several goat barns, hay storage structures, and an effluent pond to the south. The hay storage structures and goat barns (which were not constructed during the historic era) are near the western boundary of 1053-081-01 and overlap onto an adjacent parcel, which is currently co-owned along with the subject property but was historically part of the Grant Dairy. The milk parlors and residential buildings all face Schaefer Avenue and are clustered on APNs 1053-081-01 and 1053-081-03. The western Streamline Moderne milking parlor (c1958) is about 130 feet east of the parcel boundary behind a circular driveway. The front portion of the building (the milk house/milk room) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners with glass block, and a shaped parapet with decorative clay tile roofing. Fenestration consists of glass block and steel casement windows. A shed-roofed addition supported by metal posts and clad in plywood obscures the original primary façade of the building. The back section of the building is an open-air facility (the milking parlor/milking barn) featuring a gabled metal roof with exposed rafter tails. It appears to be in fair-good condition, although additions and adjacent structures mostly obscure it from view.

The simple building east of the c1958 milking parlor (c1980) is apparently a storage building for farm vehicles with a residential section at its west end. It is rectangular in plan with a

corrugated metal gable roof with exposed rafter tails. It is clad in stucco with vertical groove plywood at the rear. Fenestration consists of aluminum sliding-sash. The smaller building to its east (c1990) is a prefabricated residence with cross-gabled roof and plywood cladding. Both of these non-historic buildings are in fair condition.

The eastern milk parlor (c1965) is about 20 feet east of the western parcel boundary of 1053-081-03. It has a flat roof and is clad in stucco and features eaves with moderate overhang. It is accessed from the front via three partially glazed aluminum doors that are centered in the north elevation. It features mid-century modern industrial design elements including a flat roof with overhanging eves, large windows, and horizontal massing. It is in poor-fair condition with broken and boarded up windows, rusted wall vents, and other evidence of deterioration.

7218 & 7226 Edison Avenue. The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is a 2.06-acre lot occupied by a c1924 residence to the west at 7218 Edison Avenue and a c1957 residence to the east at 7226 Edison Avenue. The residences are in the south portion of the parcel near the road and enclosed by chain link fences. Landscaping consists of several mature trees and palms near the houses. The c1957 Ranch-style house is irregular in plan with a medium-pitch multi-gabled roof with metal vents on the gable ends. It is clad in stucco. There is a partial width porch with a gable roof on the main (south) elevation that is supported by two square wood post. It shelters the main entrance, which faces east rather than toward the street and is fitted with a wood paneled door. The porch is accessed by two wide concrete steps. Fenestration consists of replacement vinyl sliding windows. There is a garage to the east of the house, which is connected to the house by a breezeway. The garage is also clad in stucco with a gable roof and features a metal roll-up garage door.

The c1924 residence to the east of the larger c1957 residence is at the southeast corner of the parcel and exhibits the basic characteristics of Craftsman architecture. It is roughly L-shaped in plan with a jerkinhead gable roof and exposed rafter tails. It is clad in horizontal wood siding. There is a projecting partial-width porch on the main (south) elevation that is supported by two square wood posts and shelters the main entrance, which is centered and fitted with a paneled wood door and is accessed by a set of two wide concrete steps. Fenestration consists of vinyl replacement windows. There is a garage to the east of the house, which has the same roof form and pitch as the house, horizontal wood siding, and a metal roll-up garage door. The garage is connected to the house by a hyphen with clerestory windows on its main façade that appears to be a later addition.

7244 & 7260 Edison Avenue. The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is an 18-acre historic-era dairy with its main buildings on the 9-acre parcel (1053-281-01) adjacent to Edison Avenue and open space with some small

buildings to the north on another 9-acre parcel (1053-211-05). 1053-281-01 is occupied by a historic-period (c1950) residence to the west, a historic-period (1957) residence to the east, and a historic-period (c1958) milking parlor at the center. The residence at 7244 Edison Avenue on the west side of the parcel near the road has untended landscaping with several mature trees near the house. The Ranch-style house is irregular in plan with a medium-pitch cross-gabled roof. It is clad in horizontal wood siding with vertical roof plywood on its south elevation. The main entrance on the east elevation is left of center and sheltered only by the roof eaves. It is fitted with a metal security screen door and accessed by three concrete steps. There is a large brick chimney on the east elevation. Fenestration consists of replacement sliding sash. The building is in fair condition, with peeling paint and the south elevation is boarded up. There is a detached garage to the north of the residence. It is rectangular in plan with a gable roof with louvered vents on the gable ends. It is clad in horizontal wood siding and is fitted with a roll-up metal garage door.

The second residence at 7260 Edison Avenue is on the southeast portion of the parcel near the road. It has untended landscaping and is enclosed by a metal chain link fence. The house is rectangular in plan with a gable roof with vents on the gable ends and exposed rafter tails. It is clad in stucco. The main entrance on the main (south) elevation is centered and fitted with a metal security screen door. It is sheltered only by the roof eaves, which project slightly at the entrance. There is a second entrance on the west elevation with is sheltered by a small projecting shed roof. Primary fenestration consists of metal sliding sash with a large picture window on the main side. There is a garage attached to the west elevation; it is fitted with a metal accordion garage door. It appears to be occupied and is in good condition.

The milking parlor at the center of the parcel is accessed by a semi-circular driveway. It is rectangular in plan. The front portion of the building (the milk parlor) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners, and a shaped parapet with decorative clay tile roofing. The main entrance is centered on the main (south) elevation and is boarded up. Fenestration consists of glass block. The back portion of the building is an open-air facility (the milking parlor/milking barn) with a gabled metal roof with exposed rafter tails. The roof is supported by square wood posts that rest on a half-height solid stucco wall. The building is in fair condition.

P-36-25540. The Southern California Edison Company Chino-Mira Loma No.1 Transmission passes through the project area in a north-westerly direction and has two sets of towers within the project boundary. One set is a steel-lattice tower with three parallel lines and the other is a larger steel-lattice tower with three sets of two parallel lines stacked on one another.

SIGNIFICANCE EVALUATIONS

During the field survey, three historic-period dairies, two historic-period rural-residential properties, and one historic-period transmission alignment were identified. CEQA calls for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California

Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, or designation under a local ordinance. The dairies and rural-residential properties are evaluated for significance below. The Chino-Mira Loma Transmission Line, designated P-36-25540, was previously evaluated and determined to be ineligible for nomination to the National Register and the California Register (Tinsley-Becker 2010). The transmission alignment does not warrant further consideration as a potential historical resource for the current study.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion on the California Register or as a City Landmark, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local, California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

City of Ontario Designation Criteria. In addition to evaluation for California Register listing eligibility, the City of Ontario Development Code Article 26: Historic Preservation (Section 9-1.2615) provides the following designation criteria for a property to qualify as a City Historic Landmark:

a. It exemplifies or reflects special elements of the City's history;
b. It is identified with persons or events significant in local, state, or national history;
c. It is representative of the work of a notable builder, designer, architect, or artist;
d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;
e. It is a noteworthy example of the use of indigenous materials or craftsmanship;
f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;
g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or

h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

Evaluations

13813 Euclid Avenue California Register Evaluation. Potential contextual associations are described below, followed by evaluations under California Register criteria.

Potential Contextual Associations

The Grant Dairy is potentially associated with two significant historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area, which identifies building typologies connected to historic contexts significant to the development of the dairy industry in Chino Valley. It is an example of 1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940 – 1965) as discussed above.

1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties minimum characteristics according to Historic Context:

   a residence that dates to the period 1900-1930 in an architectural style that exhibits little alteration, a barn (either a crib barn, large barn with loft, or early milking parlor, or one of each), a circular driveway, and open space to the rear of the property. The property could have a detached one car garage, but this characteristic is not essential.

The Grant Dairy features a residence constructed during the period of significance, but it is not a recognizable example of an architectural style from the era, nor does it exhibit little alteration. Although research has not revealed historic-era photographs of the house, it has some modest features of both late Victorian-era architecture (turned porch posts, tall double-hung windows) and some features associated with Craftsman architecture, such as its medium pitch gabled roof. Other features of the house, such as stucco cladding over original wood or brick and enclosure of the front porch appear to have been modifications after 1950. The property does have a circular driveway and open space at the rear of the property, but does not possess a barn, single car garage, or other building constructed during the period of significance for this context, and it has at least three buildings constructed after 1930. Therefore, it possesses only two of four required minimum characteristics and also has disqualifying (according to the Historic Context) newer buildings. Furthermore, at 45 acres in 1922, the Grant Dairy was far larger than typical for this property type, defined in the Historic Context as being 9 acres or less. Thus, although it was established during the period and its house dates from this era, according to the definitions of the Historic Context it has low integrity and does not exhibit the minimum characteristics of a property identified as having an association to this context. Therefore, the property does not convey its association as a pre-1930 dairy property.

2. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

> modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The Grant Dairy Milk Parlor exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described and identified the building type as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context within a 1940-1965 period of significance.

California Register Criteria

Criterion 1: The property at 13813 Euclid Avenue was constructed within the context of residential and agricultural development in Ontario and has important associations with the historic development of the dairy industry in the Chino Valley. It was an early example of a commercially viable dairy that, while utilizing traditional practices such as growing feed, also adopted the latest technology for keeping cows healthy and producing high-quality, low-bacteria milk. Austin Grant was considered a leader in the regional dairy world, and over his three decades on the property, his dairy was singled out as exemplary. He gave many public talks about best practices in the industry, served in leadership of dairy industry boards, and consistently won awards for the high butterfat content of Grant Dairy milk. The property appears to be one of the oldest extant dairies in the region and one of the longest-operating properties of its type. It was among the first dairies in the neighborhood to construct a modern milk house with the concrete floor and walls and glass block windows associated during that era with progressive dairying and good sanitation. It is therefore recommended eligible for the National Register and the California Register under Criterion 1.

Criterion 2: Substantial research has linked the subject property with individuals who have been notable in local history. Austin Grant was a pioneer in the dairy industry in the Ontario and Chino area. He appears to have made a lasting impact on local history, actively promoting industry best practices, sharing knowledge, and encouraging young people (including his own son) to seek careers in the dairy business. Grant lived and worked on the property for over three decades of his productive life. Therefore, the property is significantly associated with the life of an important person in our history. For these reasons, it is recommended eligible for the National Register and California Register under Criterion 2.

Criterion 3: The two residences are not significant for their architecture and the original residence has been modified outside the historic period; therefore, they do not contribute to the architectural significance of the property. The milking parlor is an excellent example of an Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the

rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof. Constructed between 1947 and 1948, it was one of the first buildings of its kind in the neighborhood and a prototype for the increasing popularity of Streamline Moderne Milk parlors during the 1950s. Therefore, the property embodies the distinctive characteristics of a type of construction specifically developed for the dairy industry. For these reasons, it is recommended eligible for the National Register and California Register under Criterion 3.

Criterion 4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion 4. 13813 Euclid Ave is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

Integrity

Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

Historic photographs of the property and documentary evidence indicate that there have not been any significant modifications to the milking parlor and its Streamline Moderne milk house (which are the most important character-defining features of the historic property) since its original construction. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the Grant Dairy has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remains mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

The loss of associated features such as the silos and deterioration of the main house has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a late 1940s milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. It also retains landscape features such as a circular drive and the historic spatial relationship between dairy buildings and open space. These essential and defining features allow the building to strongly evoke the feeling of a Streamline Moderne milking parlor and convey its historic identity. It therefore retains integrity of feeling.

The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940-1965 milk parlor. It therefore retains integrity of association.

The Grant Dairy milking parlor retains sufficient integrity to convey its identity as a historic dairy building.

The subject property and its c1948 milk parlor are therefore recommended eligible for listing on the California Register, and as such qualifies as a historical resource under CEQA.

13813 Euclid Avenue City of Ontario Designation Criteria. The property meets the requirements for designation under the following criteria:

a. The property exemplifies/reflects special elements of the City's dairy history.
b. It is identified with Austin Grant-a pioneer in the dairy industry.
d. The milk parlor embodies distinguishing architectural characteristics.
h. The milk parlor is one of the few remaining examples in the region of its type.

14095 Euclid Avenue California Register Evaluation. This property was never used as a dairy and therefore has no associations with the New Model Colony.

California Register Criteria

Criterion 1: The property at 14095 Euclid Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the Chino Valley. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the California Register under Criterion 1.

Criterion 2: The property is not associated with the life of persons important to our history. Some of the families who lived on the property were involved in the dairy industry of Ontario but were not significant contributors to the area's development, and research has revealed no important professional accomplishments or lasting impact on local history or on agriculture. The house provided shelter for ordinary working people: farmers and business owners. Therefore, the property lacks the association required for eligibility under Criterion B/2. The property is recommended not eligible to the California Register under Criterion 2.

Criterion 3: The residence is not significant for its architecture. Research did not reveal an architect or important builder associated with its construction. The building is an unremarkable example of a turn-of-the-century dwelling that has been severely altered over the decades with multiple additions, stucco cladding, window replacement, and other modifications. It lacks decorative features or references to a particular architectural style, nor is it an outstanding example of vernacular architecture. For these reasons, it lacks the significance and integrity required for historic listing and is recommended not eligible for the California Register under Criterion 3.

Criterion 4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion 4. 14095 Euclid Avenue is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

14095 Euclid Avenue City of Ontario Designation Criteria. The property does not meet any of the eight City Designation Criteria, and as such does not qualify as a City Historic Landmark.

7275 Schaefer Avenue California Register Evaluation. Potential contextual associations are described below, followed by evaluations under California Register criteria.

Potential Contextual Associations

As analyzed below, it is an example of 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940-1965).

3. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

   modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The subject property exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described it and identified it as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context.

4. Post-1950 – Scientific, Large Capacity Dairies minimum characteristics according to Historic Context:

   at least one large residence that dates to this period in the Ranch architectural style that exhibits little alteration, a large “herringbone style” milking parlor designed in the Ranch style, a circular driveway, numerous geometrically spaced rows of pole structures and other related dairy facilities, and a vast expanse of open space to the rear of the property. The property may have multiple large residences and a few smaller workers’ residences.

The subject property has two milking parlors that date from this era, and its c1965 milking parlor appears to exhibit the later herringbone style as required for significance under the Historic Context; it also has circular driveways. However, the current property at 20 acres is only half the size of the original ranch and not close to the average 40-acre size of properties within this context. Furthermore, the subject property lacks a large Ranch-style residence, and has no residential buildings constructed within the 1950 – 1969 period of significance for this context. Although it has numerous geometrically spaced rows of pole structures and other agricultural buildings, all were constructed well outside the historic era and appear to have been purpose-built for the current goat dairy, and therefore do not fit within this context. There has also been an addition of a prefabricated dwelling and a combination residence/vehicle storage building in a prominent location near the street and between the milking parlors outside the historic era. Buildings constructed after 1969 and the addition of manufactured homes are specifically mentioned in the Historic Context as factors that would render a dairy property developed during this era low integrity. Therefore,

according to the standards set forth by the Historic Context, the property no longer conveys its historic association as a post-1950 dairy property.

Since the property qualifies as a high integrity example of a Streamline Moderne Milk parlor is eligible for local listing under Context 2 but ineligible under the other contexts as set forth in the Historic Context.

California Register Criteria

Criterion 1: The property at 7275 Schaefer Avenue was constructed within the general context of agricultural and residential development in Ontario, however, research has revealed no significant association with important events related to the founding of that municipality, with development of the region, postwar residential expansion, the development of the dairy business, or with any other important historic context. It was one of many dairies established in the area during the twentieth century. It is therefore recommended not eligible for the National Register or the California Register under Criterion 1.

Criterion 2: Substantial research has not linked the subject property with individuals who have been notable in local, state, or national history. Its early owners were ordinary people; no houses were located on the subject property within the historic era, so it had no residents. Therefore, it lacks association with the lives of important persons in our history. For these reasons, it is recommended not eligible for the National Register or California Register under Criterion 2.

Criterion 3: The western milking parlor is an example of an important local property type. The building is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows that curve around a corner, and a flat clay tile roof. It was constructed c1958, within the revised period of significance recommended for Streamline Moderne milk parlors. Although the eastern milking parlor was also constructed within the historic era, it is a lesser example of a Midcentury modern milk parlor and has also suffered alterations such as having windows boarded up; it therefore lacks the architectural significance and integrity required for historic listing. For these reasons, the western milk parlor alone is recommended eligible for the National Register or California Register under Criterion 3.

Criterion 4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion 4. The subject property is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

Integrity

Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

Although additions to its façade have obscured it from view, the original historic fabric of the milk parlor appears intact beneath these additions. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the subject property has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remain mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

Intrusion of non-historic-era buildings near the milking parlor has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a c1958 milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. These essential and defining features would allow the building to strongly evoke the feeling of a Streamline Moderne milk parlor if additions were removed. The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940 – 1965 milking parlor. It therefore retains integrity of association.

The western milking parlor retains sufficient integrity to convey its identity as a c1958 dairy building.

The subject property and its constituent c1958 milking parlor are therefore recommended eligible for listing on the California Register, and as such qualifies as a historical resource under CEQA.

7275 Schaefer Avenue City of Ontario Designation Criteria. The property meets the requirements for designation under the following criteria:

a. The property exemplifies/reflects special elements of the City's dairy history.
d. The milk parlor embodies distinguishing architectural characteristics.
h. The milk parlor is one of the few remaining examples in the region of its type.

7218 & 7226 Edison Avenue California Register Evaluation. This property was never used as a dairy and therefore has no associations with this local historic context.

California Register Criteria

Criterion 1: The property at 7218 and 7226 Edison Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the Chino Valley. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the California Register under Criterion 1.

Criterion 2: The property is not associated with the life of persons important to our history. The families who lived on the property were not significant contributors to the area's development, and research has revealed no important professional accomplishments or lasting impact on local history or on agriculture. The houses provided shelter for ordinary working people: farmers and business owners. Therefore, the property lacks the strength of

association required for eligibility under Criterion 2. The property is recommended not eligible to the California Register under Criterion 2.

Criterion 3: The two residences are not significant for their architecture. Research did not reveal any architects or important builders associated with their construction. The buildings are unremarkable examples of modest-sized 1920s and 1950s houses in Ontario. Although the older house has some basic elements of Craftsman architecture and the newer house is Ranch-style, neither is an outstanding example of an architectural movement. Furthermore, both have been altered outside the historic period with window replacement and other unsympathetic changes. For these reasons, they lack the significance and integrity required for historic listing and are recommended not eligible for the California Register under Criterion 3.

Criterion 4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion 4. 7218 and 7266 Edison Ave are examples of well understood types of construction and do not appear to be a principal source of important information in this regard.

7218 & 7226 Edison Avenue City of Ontario Designation Criteria. The property does not meet any of the eight City Designation Criteria, and as such does not qualify as a City Historic Landmark.

7244 & 7260 Edison Avenue California Register Evaluation. Potential contextual associations are described below, followed by evaluations under California Register criteria.

Potential Contextual Associations

The subject property has no extant buildings constructed prior to the 1950s, it therefore has no potential association with the following historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area:

1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 3.1930-1949 - Dry Lot Dairying with Mechanization. Since two milking parlor on the property was constructed during the 1950s, it is a potential example of 4. Post-1950 - Scientific, Large Capacity Dairies, although it does not meet the minimum characteristics as analyzed in greater detail below.

As analyzed below, it is an example of 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940 – 1965).

2. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

   modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as

described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The subject property exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described it and identified it as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context.

4. Post-1950 - Scientific, Large Capacity Dairies minimum characteristics according to Historic Context:

   at least one large residence that dates to this period in the Ranch architectural style that exhibits little alteration, a large “herringbone style” milking parlor designed in the Ranch style, a circular driveway, numerous geometrically spaced rows of pole structures and other related dairy facilities, and a vast expanse of open space to the rear of the property. The property may have multiple large residences and a few smaller workers’ residences.

The subject property has one Streamline Moderne milking parlors that date from this era, but it lacks a Ranch-style milking parlor exhibiting the later herringbone style as required for significance under the Historic Context; it also has a circular driveway. However, the current property at 18 acres is not close to the average 40-acre size of properties within this context. Furthermore, the subject property lacks a large Ranch-style residence. In the other facilities development during the 1950s such as the large pole structures to the north of the houses and no hardware have been demolished. Therefore, according to the standards set forth by the Historic Context, the property no longer conveys its historic association as a post-1950 Scientific, Large Capacity dairy property.

Since the property qualifies as a high integrity example of a Streamline Moderne Milk parlor is eligible for local listing under Context 2 but ineligible under the other contexts as set forth in the Historic Context.

<u>California Register Criteria</u>
Criterion 1: The property at 7244 & 7260 Edison Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the dairy industry in the Chino Valley. Its owner and developer was Floris Ykema, a dairy industry leader who made the property an exemplary dairy almost as soon as it was established, it is significant within historic context of development of the dairy industry. Therefore, the property is recommended eligible to the California Register under Criterion 1.

Criterion 2: The property is associated with the life of a person important to our history. Floris Ykema was a leader in the industry, who began winning prizes for quality the year the property was established. He was active in the community, serving on the school board as

well as in elected positions representing the industry throughout California. Although he expanded his operation over the decades, he continued to live on the subject property for most of his productive life. Therefore, the property exhibits the association required for eligibility under Criterion B/2. The property is recommended eligible to the California Register under Criterion 2.

Criterion 3: The two residences are not significant for their architecture and do not contribute to the architectural significance of the property. Research did not reveal any architects or important builders associated with their construction. The buildings are unremarkable examples of 1950s residences in Ontario and have also been altered outside the historic era. However, the c1957 milking parlor is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof. For these reasons, it is recommended eligible for the California Register under Criterion 3.

Criterion 4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion 4. 7244 & 7260 Edison Ave are examples of well-understood types of construction and do not appear to be a principal source of important information in this regard.

Integrity

Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

The original historic fabric of the milk parlor appears intact despite the entrance being boarded up. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the subject property has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remain mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

Intrusion of non-historic-era buildings near the milking parlor has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a c1957 milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. These essential and defining features would allow the building to strongly evoke the feeling of a Streamline Moderne milk parlor if additions were removed. The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940 – 1965 milking parlor. It therefore retains integrity of association.

The milking parlor retains sufficient integrity to convey its identity as a c1957 dairy building.

The subject property and its constituent c1957 milking parlor are therefore recommended eligible for listing on the California Register, and as such qualifies as a historical resource under CEQA.

7244 & 7260 City of Ontario Designation Criteria. The property meets the requirements for designation under the following criteria:

a. The property exemplifies/reflects special elements of the City's dairy history.
b. It is identified with Floris Ykema-a prominent leader in the dairy industry.
d. The milk parlor embodies distinguishing architectural characteristics.
h. The milk parlor is one of the few remaining examples in the region of its type.

RECOMMENDATIONS

BCR Consulting conducted a cultural resources assessment of the Euclid Ave Mixed Use Specific Plan Project in the City of Ontario, San Bernardino County, California. During the research and field survey, six resources were identified, recorded, and evaluated for California Register listing eligibility (i.e. significance under CEQA). These include the historic-period Grant Dairy at 13813 Euclid Avenue, a historic-period rural-residential property at 14095 Euclid Avenue, an unnamed historic-period dairy at 7275 Schaefer Avenue, a historic-period rural-residential property at 7218 & 7226 Edison Avenue, an unnamed historic-period dairy at 7244 & 7260 Edison Avenue, and a historic-period transmission alignment designated P-36-25440. California Register listing eligibility recommendations are summarized in the below table.

Property Type	Address	California Register Eligibility
Historic-Period Grant Dairy	13813 Euclid Avenue	Recommended Eligible
Historic-Period Rural Residential	14095 Euclid Avenue	Recommended Not Eligible
Historic-Period Dairy	7275 Schaefer Avenue	Recommended Eligible
Historic-Period Rural Residential	7218 & 7226 Edison Avenue	Recommended Not Eligible
Historic-Period Dairy	7244 & 7260 Edison Avenue	Recommended Eligible
Historic-Period Transmission Alignment	P-36-25440	Recommended Not Eligible

Non-Significant Properties. The historic-period rural residential property at 14095 Euclid Avenue, the historic-period rural residential property at 7218 & 7226 Edison Avenue, and the transmission alignment designated P-36-25440 have been evaluated and are recommended not eligible for California Register eligibility. They do not warrant further consideration.

Significant Properties. The Historic-Period Grant Dairy at 13813 Euclid Avenue comprises a Streamline Moderne-style milk parlor, two residences and several ancillary buildings, and other dairy features. The dairy is recommended eligible for California Register listing under Criterion 1, 2, and 3. The property is therefore considered a "historical resource" under CEQA. However, the two residences, ancillary buildings, and other features have been modified outside the historic period. They do not contribute to the overall significance of the Grant Dairy and as such do not warrant preservation. The milk parlor is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It

features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof. The Streamline Moderne milk parlor warrants preservation.

The historic-period dairy at 7275 Schaefer Avenue comprises a Streamline Moderne-style milk parlor, a second milk parlor (c1965), and two residences as well as outbuildings, several goat barns, hay storage structures, and an effluent pond to the south. Of these elements, only the Streamline Moderne-style milk parlor is eligible because it is an important local property type under Criterion 3 of the California Register. It has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows that curve around a corner, and a flat clay tile roof. The property is therefore considered a "historical resource" under CEQA, based on the significance of the milk parlor (which warrants preservation). The other buildings lack significance and do not warrant preservation under CEQA.

The historic-period dairy at 7244 & 7260 Edison Avenue comprises a historic-period residence to the west, a historic-period residence to the east, and a historic-period Streamline Moderne-style milking parlor at the center. This dairy is recommended eligible for California Register listing under Criterion 1, 2, and 3. The property is therefore considered a "historical resource" under CEQA. However, the two residences do not contribute to the overall significance of the historic-period dairy and as such do not warrant preservation. The milk parlor is an excellent example of a Streamline Moderne-style milk parlor, which has been previously identified in a historic context statement as an important local property type (Galvin & Associates 2004). It features design elements such as the smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof, and it warrants preservation under CEQA.

Preservation Mitigation. Preservation in place is the preferred manner of mitigating impacts to historical resources under CEQA. Based on results of the current study, the Art Deco Milk Parlor located at the Grant Dairy merits preservation. If preservation of the Art Deco Milk Parlor is feasible, no other cultural resources work or monitoring is recommended for the portions of the project site that have been subject to inventory. The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource. Where preservation is not an option, a data collection mitigation program has been developed in which potential adverse effects of any proposed demolition would be reduced.

Data Collection Mitigation. Prior to any project-related impacts to significant resources, the City would complete or require the completion of Historic American Building Survey (HABS) *style* photographic documentation of the subject property. While the photographs would meet HABS standards, only local curation (and no federal curation or involvement) would be necessary. The photographic documentation will be provided to the City (and any required local repositories) for curation. However:

> In most cases the use of drawings, photographs, and/or displays does not mitigate the physical impact on the environment caused by demolition or destruction of an historical resource (14 CCR § 15126.4(b)). However, CEQA requires that all feasible mitigation be undertaken even if it does not mitigate below a level of significance. In this context, recordation serves a legitimate archival purpose. The level of documentation required as a mitigation should be proportionate with the level of significance of the resource (http://ohp.parks.ca.gov/?page_id=21727).

Through this mitigation measure, impacts to the project site would be reduced. However, it may not be possible to reduce impacts of demolition below a level of significance.

Accidental Discoveries. If previously undocumented cultural resources are identified during earthmoving activities associated with development of the project site, a qualified archaeologist should be contacted to assess the nature and significance of the find, diverting construction excavation if necessary. The current study attempted to determine whether significant archaeological deposits were present on the proposed project site. Although none were yielded during the records search and field survey, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist should have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register of Historic Places (National Register), plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- Historic-period artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- Historic-period structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- Prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- Groundstone artifacts, including mortars, pestles, and grinding slabs;
- Dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;
- Human remains.

Sacred Lands File Search. Findings were negative during the Sacred Lands File search with the NAHC. The results of the Sacred Lands File search are provided in Appendix C. The State Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and

conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

Paleontological Resources. According to CEQA Guidelines, projects subject to CEQA must determine whether the project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix F has recommended that:

> The geologic units underlying the project area are mapped primarily as young alluvial deposits from the Holocene and late Pleistocene epochs (Morton and Miller 2006). Holocene alluvial units are considered to be of high preservation value, but material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, Pleistocene alluvial units are considered to be highly paleontologically sensitive. The Western Science Center does not have localities within the project area or within a 1-mile radius. However, this is likely due to the project area's distance from the museum and should not be taken as indicative of paleontological sensitivity; other repositories may have localities in the area. Any fossil specimen from the Euclid Mixed Use Specific Plan Project would be scientifically significant. Excavation activity associated with the development of the project area would impact the paleontologically sensitive Pleistocene alluvial units, and it is the recommendation of the Western Science Center that a paleontological resource mitigation program be put in place to monitor, salvage, and curate any recovered fossils associated with the study area.

Human Remains. If human remains are encountered during any project activities, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

c. Address: 13813 Euclid Ave City: Ontario Zip: 91762
d. UTM: Zone: N/A mE/ Elevation: 2,250' AMSL
e. Other Locational Data: The property is on the east side of Euclid Avenue, just outside of Chino, in the southwest section of the city of Ontario.

***P3a. Description:** The subject property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of urbanized Chino, with multi-family residential development across the street to the west and dairies to the east and south. The subject property is occupied by a historic-period (c1915) residence to the north, a historic-period (late 1940s) residence to the south, and a Streamline milking parlor (c1948) with a circular driveway, as well as pole structures, sheds, and outbuildings. Historic buildings are clustered on APNs 1053-071-01 and -02. These parcels are at the heart of the historic Grant Dairy with pasture and crop land on other parcels to the north and south. The primary residence, which appears to have been constructed about 1915, is at the northwest corner of 1053-071-02 near the road and is enclosed by a low concrete masonry unit wall with a brick cap. Landscaping is untended with several mature trees and palms near the house. The house is rectangular in plan with a medium-pitch multi-gabled roof with exposed rafter tails. It is clad in stucco. There is a partial width porch with a hip roof that wraps around the main (west) and south elevations. It is supported by five paired turned wood posts atop a solid brick balustrade that has been stuccoed. It shelters the main entrance. A second entrance to the right of the porch is sheltered by a projecting shed roof. Fenestration consists of double hung wood sash windows; many are boarded up. There is a bay window on the right side of the north elevation. The building is abandoned and in poor condition with windows and doors boarded up and some sagging roofs.

Adjacent wood and metal sheds (age unknown) are northeast of the residence. The wooden shed is severely dilapidated with sections of the building falling away and a collapsed roof. The metal shed is in good condition with shed roof and aluminum windows. There is a small windowless utility structure north of the sheds.

The Streamline Moderne milking parlor (c1948) is south of the main house behind a circular driveway; there are also mature trees in its vicinity. It is rectangular in plan. The front portion of the building (the milk house/milk room) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners, glass block, and a shaped parapet with decorative clay tile roofing. The main entrance on the primary (west) elevation is fitted with paneled wood doors and accessed by a wide concrete step. Fenestration consists of glass block windows and replacement sliding vinyl windows at the sides. (Continued on Continuation Sheet, page 3).

P3A. (Continued from page 1)

The back section of the building is an open-air facility (the milking parlor/milking barn) with a gabled metal roof with exposed rafter tails. The roof is supported by square wood posts that rest on a half-height solid stucco wall. The main entrance on the north elevation is a sliding metal door accessed by a concrete ramp connected to the front portion of the building. The building is in fair condition and appears to be in use. There is a small metal shed south of the milking parlor that also appears to be in fair condition.

The late 1940s residence is irregular in plan with a cross-gabled roof with vents on the gable ends. It is clad in stucco. A projecting shed roof on the main (north) elevation shelters the main entrance, which faces north (rather than west toward the street) and is fitted with a screen door and paneled wood door. Fenestration consists of double hung wood sash windows. There is a one-car garage to the north of the house connected via a breezeway. Its vehicle entrance, on the west elevation, is fitted with a roll-up metal door. The building is in good condition and appears to be occupied. There is a simple corrugated metal shed between the garage and the milking parlor.

Ontario

The Gabrielino Native American group inhabited the area before the arrival of Spanish missionaries in the late eighteenth century. In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the

Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014: 7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Dairy Industry

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) has documented the local dairy industry, establishing periods of significance and a detailed framework for evaluation. The summary below draws from the context and other sources to provide sufficient historical framework to orient readers of these DPR 523 forms; the more comprehensive 2004 context may be consulted for additional detail.

Ontario and Chino are located in the Chino Valley basin of southwestern San Bernardino County. Dairy cows came to California with American settlers during the Gold Rush, and by 1876, a State Dairyman's Association had been organized. Dairies were first established in Chino Valley in the 1890s. The first dairy was most likely the Steel and Green Dairy, comprised of adobe buildings on the site of the Battle of Chino. The industry was based on free grazing during this era, and the availability of large tracts of fertile and inexpensive pastureland drew dairy farmers from Los Angeles County. However, most dairies in the region remained closer to Los Angeles population centers for several decades and citrus groves dominated the landscape through the end of the 1940s. Through 1930, the dairies in the region were small family businesses. Yet, by 1915, milk shipments already totaled over 6,000 pounds out of Chino. As Los Angeles County grew in population, so did the regional dairy industry. In the 1920s, many Dutch immigrants started dairy farms near Los Angeles. In the 1930s, to optimize milk production, dairies began switching from free grazing to dry-lot dairying and mechanized milking (Chino Champion 1977).

In the early years, the milking equipment was sanitized with steam tanks heated by oil burners. By 1920, dairy health and sanitation laws were established. Milk was originally filtered through cloth into the cans it was shipped in. The new laws required that a milk house had to be at least sixty feet from the barn, milkers must wear clean clothes before each milking, and milk house drains were constantly flushed with water. New ammonia colling systems were also created. After World War I, many cows in California had tuberculosis, thus pasteurization became a requirement. The Dairy Herd Improvement Association (DHIA), formerly the Cow Testing Association, was also created to improve the quality of the milk cattle (Chino Champion 1977). The association was started in the United States in 1906 by Danish immigrant Helmer Rabild and a small group of dairy farmers in Michigan. The Diary Division of the U.S. Department of Agriculture was the biggest supporter of the DHIA. By 1926, over one-hundred associations were established across the country (Arnold 1956).

During and after World War II, the Los Angeles Basin grew as a metropolitan area, pushing dairies to peripheral areas such as Chino Valley. In 1949, Chino dairies produced one-third of the total dairy production in San Bernardino County (Chino Champion 1950). In 1950, there were 79 dairies with an average of 145 cows to a herd in the Chino area (Chino Champion 1950). Suburbanization in Los Angeles County allowed dairymen, many of whom were Dutch, to purchase larger acreage and build bigger homes in Chino Valley. During this era, local dry lot operations (which purchased all feed) began to replace traditional dairy farms, which grew some or all cattle feed. By 1957, there were more than 135 dairies in Chino Valley. The late 1950s and early 1960s dairies established in Chino Valley were the most technologically sophisticated in the US, capable of milking 450 cows a day for each worker. Herringbone milking parlors, in which cows were raised on a platform so milkers did not have to kneel, became popular during this era to control labor costs. In 1960, an agricultural dairy preserve was established to protect the land from development, and by 1965, there were around 350 dairies in Chino Valley (Chino Champion 1977). In 1979, sixty percent of milk produced in California was from Chino Valley (Galvin & Associates 2004). Dairy products became California's number one agricultural commodity in 1993, and the state continued to lead the country in milk production throughout the twenty-first century (California Dairy Press Room & Resources 2023).

Streamline Moderne Milking Parlors

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) identified an unusual building type that characterizes historic-era dairies in the Ontario area, stating that the survey area has one of the largest concentrations of this building type in California. These milk parlors (also called milk houses or milk plants) are two-part buildings: a long, narrow shed with milking stalls for

cows connected to a small cooling and processing building near a circular drive. The large utilitarian area where the cows are milked (historically referred to as the milking barn or milking parlor) has concrete masonry unit walls with large unglazed openings for ventilation and gabled roof. Floors are concrete for easy cleaning; stalls for cows are likewise designed for sanitation of concrete with metal stanchions. The processing/cooling/storage section of this building type (historically called the milk house or milk room) was not designed to be entered by cows or milkers. The milk houses are more visible from the public right-of-way than the barns, and thus more attention was paid to their aesthetic design. Many early examples, as documented in the Historic Context, exhibit simple Streamline Moderne architectural features including smooth symmetrical massing, stucco cladding, flat roofs with coping, curvilinear corners, and glass block windows. Larger and more elaborate examples have projecting center volumes, some with glass block at the curved corner.

The Historic Context theorized that these buildings would "most likely" have been constructed between 1920 and 1940, stating that more decorative Art Deco-style examples with geometric and angular edges as well as decorative chevrons or zigzags would have been constructed between 1920 and 1930, and that dairy owners transitioned to the Streamline Moderne style as described above between 1930 and 1940. Although revision of the 2004 Historic Context is outside the scope of the current study, some of the more serious flaws and inconsistencies within its discussion of this property type must be addressed in order to evaluate examples of this building type. The Context accurately describes the building type and correctly states that the Ontario/Chino area appears to boast the largest concentration of the property type in the state. However, the Context does not provide any photographic examples of the more decorative Art Deco-style milk parlors that it states would have been constructed before 1930, nor have recent field investigations revealed any dairy buildings with ornamental features that directly reference Art Deco architecture; the existence of dairy buildings with strongly Art Deco ornament appears to have been conjectural. A careful reading of the Historic Context and a review of its bibliography reveal that no sources on Art Deco or Streamline Moderne architecture were cited (in contrast to its extensive bibliography on Ranch Style architecture). Nor does the bibliography include sources focused on the architecture of dairies, the development of dairy building typology over the twentieth century, the technical requirements of twentieth century dairy buildings, or contemporaneous trade journals that discuss best practices for dairy building construction. Furthermore, pages 44 – 48 of the Context have no citations whatsoever. Thus, close examination reveals that its preparers developed the 1920 – 1940 period of significance based on the widely understood fact that the Art Deco/Streamline Moderne architectural movement was popular during this era and that Streamline Moderne grew out of Art Deco during the Great Depression. However reasonable this assumption may have been, it was not based on evidence. As demonstrated below, these buildings were not developed between 1920 and 1940.

The use of glass block is virtually ubiquitous in these milk plants and is one of the most important character-defining features of the building type. Glass block construction was pioneered in the US for a New York hotel built in 1928. Production of glass block began about 1932 and the material was featured at the 1933 – 1934 Chicago Century of Progress International Exhibition and the 1939 World's Fair in New York, helping to popularize it. The height of its use was from the late 1930s through the 1940s. It became an essential element of the Streamline Moderne style since it could be incorporated into curving wall surfaces (Fagan 2015). The development history of this material definitively demonstrates that Streamline Moderne milking parlors could not have been constructed in the Chino Valley prior to 1933 at the absolute earliest. In 1925, the University of California College of Agriculture published recommendations for milk house design and construction. Although concern for sanitary conditions had led to a recommendation for the use of concrete flooring for milking parlors and milk houses during this era, best practice continued to advise wood-frame wall construction with wood sheathing and double-hung wood sash windows with screens. In the 1920s, glass block and concrete masonry units were not yet being recommended as building materials by organizations promoting progressive dairying (Belton 1925).

Although glass block was in production by the mid-1930s and theoretically could have been utilized, its use for dairy buildings would have been unlikely, since building materials trends begin in urban areas and arrive later to farming operations, where utilitarian considerations are more important than style. Review of historic aerial photographs provides further evidence that the building type was not in local use during the 1920s and 1930s. Review of historic aerial photographs for a roughly two square mile area (including the current project area) has revealed that it eventually held at least 17 of these buildings. Only two milking parlors that fit the typology had been constructed by 1949 and by 1953 there were still only two in the study area (USDA Aerial Photographs 1949, 1953, 1975). Furthermore, review of local newspapers reveals few if any new dairies established during the 1930s, and expansion of existing operations appears to have been modest during these Great Depression years. Extensive comparative research has revealed no existing California cultural resource reports or academic papers that have analyzed the building type. Several historic photographs of Los Angeles County dairies were discovered, and these demonstrate that the property type was in use in areas like Bellflower and Artesia during the 1940s and 1950s; the oldest dated photograph of a Streamline Moderne milking parlor in Artesia is from 1940. The Streamline Moderne milking parlor appears to have traveled from Los Angeles County to Ontario in the 1940s as dairymen began to move their operations to western San Bernardino County, and the trend accelerated rapidly in the mid-1950s along with the continued migration of dairies to Chino Valey. A 1940 article in the Chino Champion describes the Abacherli Dairy at the intersection of Walnut and San Antonio avenues as a state-of-the-art local dairy plant. Although the article does not include photographs, a milk house of concrete construction with concrete floors is described and may have been an early example of the typology (Chino Champion 1940). By 1947, the Journal of Dairy Science was recommending glass block for use in milk processing plants because it provided illumination without allowing dirt to infiltrate like an open window. The same publication also praises its "modern look" (Nelson: 1947). Other dairy-oriented publications also recommended use of the glass block and masonry construction in the late 1940s (University of Wisconsin: 1949). And the extant Streamline Moderne milk parlor at the Grant Dairy (in the current study area) is known to have been built in 1947 or 1948.

The local popularity of glass block in milking parlors appears to have peaked in the 1950s, when many local examples of this building type were constructed. Glass blocks were heavily advertised in dairy trade journals throughout the 1950s, and construction of the building

typology continued into the 1960s. A Streamline Moderne milking parlor appears in a 1956 article contrasting "modern dairy plants" with the large wooden barns of the early twentieth century (Chino Champion 1956). (Although its construction date is not specifically mentioned, it would be unlikely for a local newspaper to tout a building as "modern" if it were more than two or three years old.) Although documents that substantiate exact dates for construction of Streamline Moderne milk parlors in Ontario have not been discovered, available evidence indicates that most were constructed between 1940 and 1965. Since we have demonstrated that the actual construction of this building type did not take place within the Art Deco era (1920 – 1940) this study will use Streamline Moderne Milk Parlor in reference to this building type and will consider the period of significance 1940 – 1965.

Subject Property History

The subject property was part of Mexican land grant Rancho Santa Ana del Chino. Austin A. Grant (1888 – 1953) purchased seven lots totaling 45 acres from potato farmer Charles E. Stinson. Grant started the first dairy on the property in 1922; at that time much of the land in the neighborhood was devoted to citrus orchards and row crops. Grant had come to California from his native Nova Scotia in 1903, and married Florence Tully (1890 – 1966) in 1911. Like Grant, Tully was Canadian; both of their fathers had been clergymen. The couple moved to Imperial County, where Austin Grant established a dairy. A daughter, Jessie, was born in 1914, and a son, Andrew (named after Florence's father) in 1919 (US Census records Imperial County 1920). In 1922, they relocated their young family to Ontario, purchasing property at Euclid and Schaefer Avenues where they made their home and built a model dairy business. The family apparently moved into the primary residence on the property, which appears to have been constructed during the early twentieth century, possibly by its previous owner. However, the specific construction date of the main residence on the property is unknown, and the Grants may have constructed it shortly after they purchased the dairy. Hay barns, silos, sheds, and corrals all appear to have been constructed by the Grant family beginning in the 1920s. They also planted eucalyptus along property boundaries as windbreaks. Florence Grant was active in the Methodist church as well as the clubs and charity organizations typical for elite women of the era. Her father Rev. Andrew Tully, who at this point was in his 70s, lived with the family during their early years on the property.

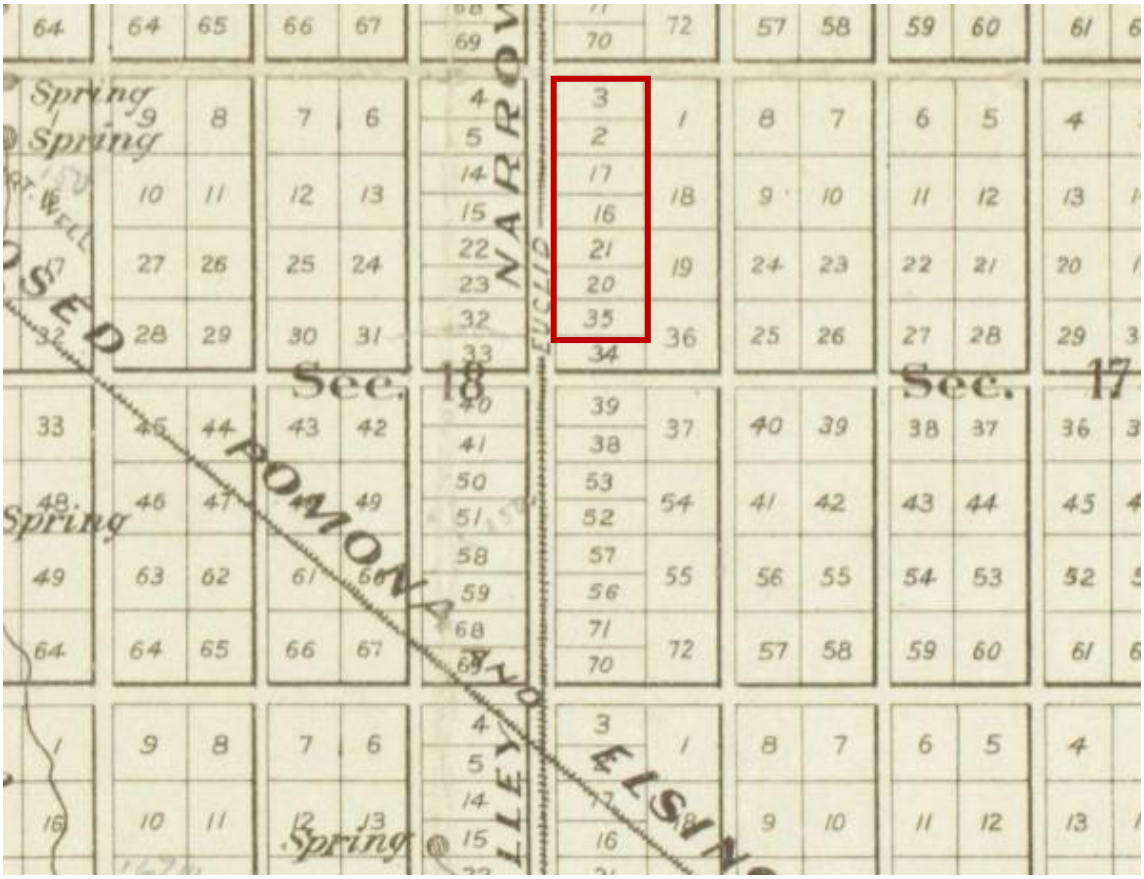

Figure 1: Britton & Rey Map of Subdivision of Rancho Santa Ana del Chino, 1889, Grant property outlined in red.

The Grant Dairy house and barns were sited on six-acre Lot 17 and the lots to the north and south were used for crops and pasture. In 1929, a public health survey performed by a Stanford student was reprinted in the Chino Champion; it called the Grant Dairy "one of the best equipped and one of the most sanitary." Grant allocated 25 acres to alfalfa and 15 to corn for silage to feed his herd of 80 Jersey cows (65 of which would typically be milkers). Five acres of the property were utilized for the house, farm buildings, corrals, etc. In its early days, the dairy produced 185 gallons of raw milk a day, which was bottled and sent to Ontario for distribution; excess was delivered to a creamery. The milk barn had a concrete floor and 20 stanchions, half of which would be in use while the other half were being cleaned. It had screened

windows and doors, was kept extremely clean, and there was a concrete walk between the barn and the milk house. The cows were washed and wiped clean before milking. The milk was poured into the milk house by milkers who did not enter it in order to avoid contamination, after which it was filtered through cotton cloth and cooled. The Grant Dairy had its own ice plant adjacent to the milk house as well as a boiler so hot water could be used at milkings (not a universal practice at the time). Grant closely supervised the process, and the result was milk with high butterfat and low bacteria (Chino Champion 1929).

Figure 2: Grant Dairy with primary residence near street, three rows or orchard trees south of house, and original dairy buildings (no longer extant) southeast of house, USDA Aerial, 1936.

Austin Grant was active in local lodges and clubs as well as the San Bernardino County Farm Bureau, joining its Dairy Committee shortly after establishing his Chino dairy (Pomona Progress 1924). His herd was consistently high-producing compared to others in the region; for instance, it was first in butterfat percentage at the 1937 cow testing (Chino Champion 1937). At a time when many cows had tuberculosis, Grant took extra care of his cows to ensure they were healthy and tuberculosis free (Chino Champion 1977). In 1940, Grant was elected president of the Dairy Herd Improvement Association, which was composed of local dairymen who aimed to improve their herds (Chino Champion 1940). At some point in the late 1930s or early 1940s, Grant constructed a long, narrow barn to the east of the older buildings. Research has not revealed photographs of the building, which had been demolished by the mid-1970s, but its size and footprint indicate that it was probably used for hay storage. Aerial photographs demonstrate that the current Streamline Moderne milking parlor was constructed in 1947 or 1948. Grant was a progressive dairymen who was interested in quality and sanitation throughout his career, and this milk parlor was part of the early wave of this building type in the Chino Valley and the oldest known local example of the building type. The Grants did not expand much over the years operation; in 1950, the dairy had 70 cows (which was by that time below average locally) and had added some Guernseys to its Jersey herd (Chino Champion 1950).

Jessie Grant attended business College in Los Angeles after high school graduation in the early 1930s, and after she married in 1938 continued to reside there and work as a stenographer. Andrew Grant, who was several years younger, served in the Army during World War II, and by the end of the war had become an officer. He married Doris Bird, who had grown up on a neighboring dairy, and after the war they settled on the Grant Dairy near his parents where he worked with his father. The small house south of the milk parlor appears to have been

built in the late 1940s about the same time as the Streamline Moderne milking parlor, and it is likely that Andrew and Doris Grant lived there with their children.

Figure 3: Grant Dairy with primary residence near street, three rows or orchard trees are still south of house with no Streamline Moderne milking parlor, original dairy buildings remain southeast of house, and a long barn has been constructed east of the older dairy buildings, USDA Aerial, 1946.

Figure 4: Grant Dairy with original residence northernmost building, Streamline Moderne milking parlor (blue arrow) has replaced third row of orchard trees, and secondary residence has been constructed to the south (orange arrow), USDA Aerial, 1949.

During the 1950s and 1960s, the citrus and walnut orchards near the Grant Dairy were converted to dairies. Andrew Grant left the dairy business after his father's death in 1953 and by the late 1950s had moved off the property (US Census record San Bernardino County 1950). In 1963, Florence Grant sold the property to Alfred Fikse Jr. of Artesia (San Bernardino County Sun 1963). Fikse raised beef cattle on the property (Lake Elsinore Valley Sun Tribune 1968).

Figure 5: Grant Dairy milking parlor, late 1940s (No date, Ancestry.com)

Figure 6: Austin Grant with his dairy herd on the property (No date, Ancestry.com)

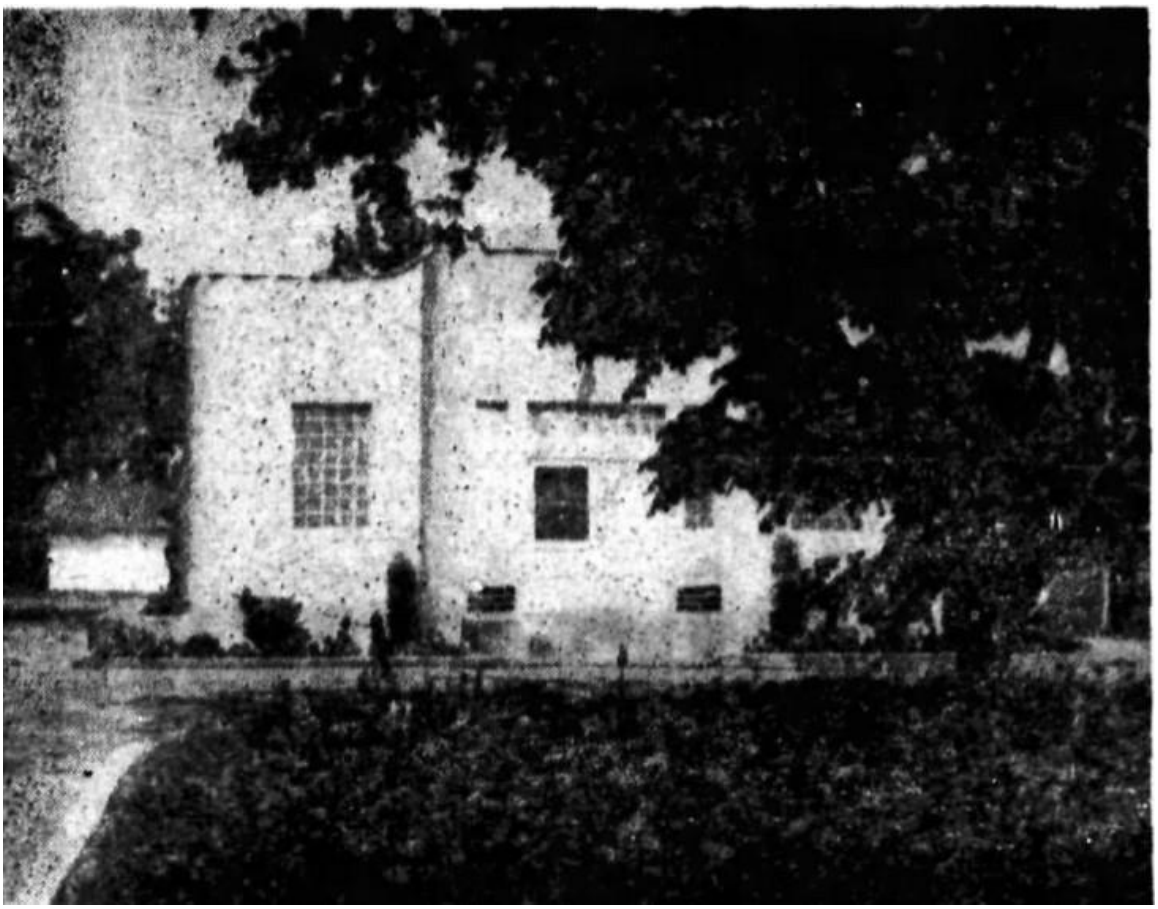

Figure 7: Grant Dairy milking parlor (June 16, 1950, Chino Champion).

By 1973, Harm and Zwaantina "Swannie" Te Velde owned the property. Born in the Netherlands, the couple married in 1936 and came to California. They started a dairy farm, Artevel Farms, on the property (Chino Champion 1970, Chino Valley News 1983, Chino Champion 1986). Harm gained recognition by the Holstein-Friesian Association of America for his milk cows (Chino Champion 1977). In 1985, the Te Velde Trust owned the property, and it continued to pass among the eight Te Velde children. Ralph Te Velde led the farm after his father, until his death in 1998 (Chino Valley News 1979, Chino Champion 1998). In 1981, before his death, Ralph Te Velde purchased the neighboring farm, the Grassland Dairy Farm at 7275 Shaeffer Avenue, for the second Artevel Farms location (Chino Champion 1981). In 1990, Harm Te Velde died after living in Chino for 21 years (Chino Valley News 1990). In 2008, Artevel Farms became Artevel of California, LLC. In 2013, Swannie Te Velde died, leaving 116 family members. In 2023, it was the Venegas and Sons Dairy.

Evaluation of New Model Colony Area Associations

The Grant Dairy is potentially associated with two significant historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area, which identifies building typologies connected to historic contexts significant to the development of the dairy industry in Chino Valley. It is an example of 1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940 – 1965) as discussed above.

1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties minimum characteristics according to Historic Context:

> a residence that dates to the period 1900-1930 in an architectural style that exhibits little alteration, a barn (either a crib barn, large barn with loft, or early milking parlor, or one of each), a circular driveway, and open space to the rear of the property. The property could have a detached one car garage, but this characteristic is not essential.

The Grant Dairy features a residence constructed during the period of significance, but it is not a recognizable example of an architectural style from the era, nor does it exhibit little alteration. Although research has not revealed historic-era photographs of the house, it has some modest features of both late Victorian-era architecture (turned porch posts, tall double-hung windows) and some features associated with Craftsman architecture, such as its medium pitch gabled roof. Other features of the house, such as stucco cladding over original wood or brick and enclosure of the front porch appear to have been modifications after 1950. The property does have a circular driveway and open space at the rear of the property, but does not possess a barn, single car garage, or other building constructed during the period of significance for this context, and it has at least three buildings constructed after 1930. Therefore, it possesses only two of four required

minimum characteristics and also has disqualifying (according to the Historic Context) newer buildings. Furthermore, at 45 acres in 1922, the Grant Dairy was far larger than typical for this property type, defined in the Historic Context as being 9 acres or less. Thus, although it was established during the period and its house dates from this era, according to the definitions of the Historic Context it has low integrity and does not exhibit the minimum characteristics of a property identified as having an association to this context. Therefore, the property does not convey its association as a pre-1930 dairy property.

2. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

> modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The Grant Dairy Milk Parlor exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described and identified the building type as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context within a 1940 – 1965 period of significance.

National Register and California Register Evaluation

The National Register of Historic Places and California Register of Historical Resources require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of our history; (B/2) it is associated with the lives of persons important in our past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]).

Criterion A/1: The property at 13813 Euclid Avenue was constructed within the context of residential and agricultural development in Ontario and has important associations with the historic development of the dairy industry in the Chino Valley. It was an early example of a commercially viable dairy that, while utilizing traditional practices such as growing feed, also adopted the latest technology for keeping cows healthy and producing high-quality, low-bacteria milk. Austin Grant was considered a leader in the regional dairy world, and over his three decades on the property, his dairy was singled out as exemplary. He gave many public talks about best practices in the industry, served in leadership of dairy industry boards, and consistently won awards for the high butterfat content of Grant Dairy milk. The property appears to be one of the oldest extant dairies in the region and one of the longest-operating properties of its type. It was among the first dairies in the neighborhood to construct a modern milk house with the concrete floor and walls and glass block windows associated during that era with progressive dairying and good sanitation. It is therefore recommended eligible for the National Register and the California Register under Criterion A/1.

Criterion B/2: Substantial research has linked the subject property with individuals who have been notable in local history. Austin Grant was a pioneer in the dairy industry in the Ontario and Chino area. He appears to have made a lasting impact on local history, actively promoting industry best practices, sharing knowledge, and encouraging young people (including his own son) to seek careers in the dairy business. Grant lived and worked on the property for over three decades of his productive life. Therefore, the property is significantly associated with the life of an important person in our history. For these reasons, it is recommended eligible for the National Register and California Register under Criterion B/2.

Criterion C/3: The two residences are not significant for their architecture and the original residence has been modified outside the historic period; therefore, they do not contribute to the architectural significance of the property. The milking parlor is an excellent example of an Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof. Constructed between 1947 and 1948, it was one of the first buildings of its kind in the neighborhood and a prototype for the increasing popularity of Streamline Moderne Milk parlors during the 1950s. Therefore, the property embodies the distinctive characteristics of a type of construction specifically developed for the dairy industry. For these reasons, it is recommended eligible for the National Register and California Register under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 13813 Euclid Ave is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

Integrity. Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

Historic photographs of the property and documentary evidence indicate that there have not been any significant modifications to the milking parlor and its Streamline Moderne milk house (which are the most important character-defining features of the historic property) since its original construction. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the Grant Dairy has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remains mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

The loss of associated features such as the silos and deterioration of the main house has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a late 1940s milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. It also retains landscape features such as a circular drive and the historic spatial relationship between dairy buildings and open space. These essential and defining features allow the building to strongly evoke the feeling of a Streamline Moderne milking parlor and convey its historic identity. It therefore retains integrity of feeling.

The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940 – 1965 milk parlor. It therefore retains integrity of association.

The Grant Dairy milking parlor retains sufficient integrity to convey its identity as a historic dairy building.

The subject property and its c1948 milk parlor are therefore recommended eligible for listing on the National Register or the California Register, and as such qualifies as a historical resource under the California Environmental Quality Act (CEQA). Thus, BCR Consulting recommends the National Register of Historic Places Status Code "3S".

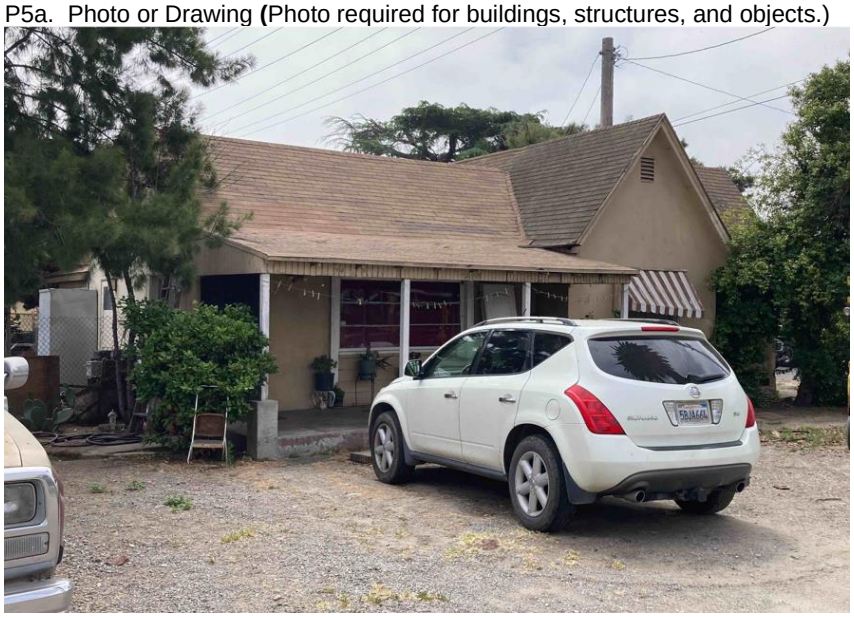
d. UTM: Zone: N/A mE/ Elevation:



e. Other Locational Data: The property is on the north side of Edison Avenue and the east side of Euclid Avenue, just outside of Chino, in the southwest section of the city of Ontario.

***P3a. Description:** The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is a 0.34-acre lot occupied by a historic-period (c1905/1940) residence at the west of the parcel at 14095 Euclid Avenue. A shed to the northeast of the residence is on a separate parcel, APN 1053-281-05, which is completely surrounded by APN 1053-281-04 and apparently holds only a well and the shed enclosing it. The residence faces Euclid Avenue near its intersection with Edison Avenue. The small front yard is minimally landscaped and used primarily for parking and the area behind the house to the east is enclosed in a tall board fence. There are a few mature trees and palms near the house. The house is irregular in plan with a steeply-pitched cross-gabled roof with metal vents on the gable ends. Some sections of the house have minimal enclosed eaves while others have wider open eaves with exposed rafter tails. It is clad in stucco. There is a partial width porch with a projecting low-pitch shed roof on the main (west) elevation that is supported by four square wood posts. The porch shelters the main entrance, which is at the northern edge of the main façade and fitted with a metal security screen door. Fenestration consists of double-hung wood sash and aluminum replacement windows; there is also a large picture multiple-light window adjacent to the main entrance. The house is in fair condition.

Ontario

The Gabrielino Native American group inhabited the area before the arrival of Spanish missionaries in the late eighteenth century. In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014: 7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and

warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Subject Property History

The property was part of Mexican land grant Rancho Santa Ana del Chino. The current small parcel near the intersection was part of Lot 34 of Section 18, a roughly 300' x 900' parcel. The first known owners of Lot 34 were Byron C. Fulton (1860-1939) and his wife,Mary Jane Bailey (San Bernardino County Sun 1906). They moved from North Dakota to Chino in 1892. They purchased a large ranch property and established their home on the southeast corner of Euclid and Edison Avenues (Chino Champion 1939). They bought and sold a number of portions of their original property and other properties in Chino. In 1899, the Fulton house burned down and they moved a new house from Ontario to the northeast corner of Euclid and Edison Avenues, current address 14095 Euclid Avenue. The Fulton family appears to have stayed in the house until at least 1930. In the early 1930s, John Ephas Clapp (1876-1944) purchased all of Lot 34. Clapp was a cattle dealer and had a dairy in Chino Hills. He apparently lived on Lot 34 in a house facing Edison that was constructed about 1924 (see DPR 523 form for 7218 and 7226 Edison Avenue) with his wife, Ida Belle Clapp, and their son, Frank Clapp (Chino Champion 1941). (Since house numbers were not in use area during this period, available documents cannot definitively confirm which house they resided in.) Around 1940, the lot was divided, separating 14095 Euclid Avenue and 7218 Edison Avenue. In the 1940s, dairy farmers Mr. and Mrs. S. C. Iest, lived in the turn-of-the-century house (Chino Champion 1935, 1948). Historic aerial photographs demonstrate that the remainder of the parcel was an orchard through the middle decades of the twentieth century, and although people involved in the dairy business lived on the property at times, the parcel was never utilized as a dairy. The orchard trees were gradually replaced with large tanks for what appears to have been some type of industrial use, but research has not revealed its details.

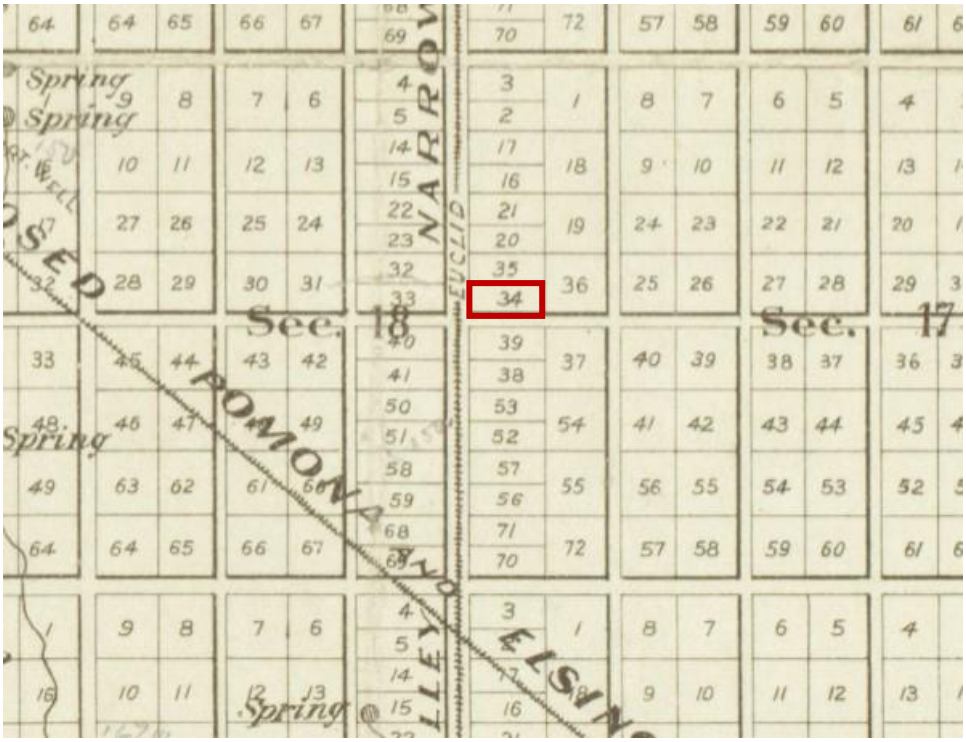

Figure 1: Britton & Rey Map of Subdivision of Rancho Santa Ana del Chino, 1889, Subject property outlined in red.

Figure 2: Subject property with a residence at the west corner (no longer extant), rows of orchard trees, and the residences at 7218 Edison Avenue to the east, USDA Aerial, 1936.

Figure 3: Subject property with multiple residences at the west corner, tanks in the middle, and two residences to the east, USDA Aerial, 1960.

In the 1970s, Richard Clark Madole owned the property. He married Judy Southfield in 1971 and they had a son, Richard Madole Jr. Madole worked as a hay dealer (Chino Champion 1971). Madole, Paul Abatti, and Richard Van Dyke co-owned Schafer Service in Chino (Chino Champion 1973). In 1973, Madole started R & R Commodities, Inc. on the property (Chino Champion 1973). Madole sold it to Gregory Lyon and Paula Lyon (1948-2015). In the late 1970s, the property was home of the Euclid Decorative Rock company, owned by Gregory Lyon (b.1947) and his father-in-law, Carl Bomgardner (Chino Champion 1976). In 1977, the Lyons had their son, Andrew Gregory, while living on the property (Chino Champion 1977). In the 1980s, the property was the home of Sterling Truck Equipment and Repair, Inc. (Chino Champion 1987). In 2004, the Lyons sold the property to AB & G Cattle Company. In 2010, Suresh and Shilpa Patel purchased the property. The Patels purchased the Foss mini mart in Chino in 2004, and renamed it Mars Market (Chino Champion 2004, 2005).

Evaluation of New Model Colony Area Associations
Lot 34 was never used as a dairy and therefore has no associations with this local historic context.

Evaluation
The National Register of Historic Places and California Register of Historical Resources require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of our history; (B/2) it is associated with the lives of persons important in our past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]).

Criterion A/1: The property at 14095 Euclid Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the Chino Valley. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the NRHP or CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. Some of the families who lived on the property were involved in the dairy industry of Ontario but were not significant contributors to the area's development, and research has revealed no important professional accomplishments or lasting impact on local history or on agriculture. The house provided shelter for ordinary working people: farmers and business owners. Therefore, the property lacks the association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: The residence is not significant for its architecture. Research did not reveal an architect or important builder associated with its construction. The building is an unremarkable example of a turn-of-the-century dwelling that has been severely altered over the decades with multiple additions, stucco cladding, window replacement, and other modifications. It lacks decorative features or references to a particular architectural style, nor is it an outstanding example of vernacular architecture. For these reasons, it lacks the significance and integrity required for historic listing and is recommended not eligible for the National Register or California Register under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 14095 Euclid Avenue is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

P1. Other Identifier: 7275 Shaefer Ave; 7275 Shafer Street; 7271 Shaefer Ave; APNs 1053-071-04, 1053-081-01, 1053-081-02, and 1053-081-03

c. Address: 7275 Schaefer Ave City: Ontario Zip: 91762
d. UTM: Zone: N/A mE/ Elevation: 690' AMSL
e. Other Locational Data: The property is on the south side of Schaefer Avenue, just outside of Chino, in the southwest section of the city of Ontario.

***P3a. Description:** The subject property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It currently comprises four parcels (1053-071-04, 1053-081-01, and 1053-081-03, 1053-081-02) occupied by two historic-era milk parlors and two residences as well as outbuildings, several goat barns, hay storage structures, and an effluent pond to the south. The hay storage structures and goat barns (which were not constructed during the historic era) are near the western boundary of 1053-081-01 and overlap onto an adjacent parcel, which is currently co-owned along with the subject property but was historically part of the Grant Dairy. The milk parlors and residential buildings all face Schaefer Avenue and are clustered on APNs 1053-081-01 and 1053-081-03. The western Streamline Moderne milking parlor (c1958) is about 130 feet east of the parcel boundary behind a circular driveway. The front portion of the building (the milk house/milk room) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners with glass block, and a shaped parapet with decorative clay tile roofing. Fenestration consists of glass block and steel casement windows. A shed-roofed addition supported by metal posts and clad in plywood obscures the original primary façade of the building. The back section of the building is an open-air facility (the milking parlor/milking barn) featuring a gabled metal roof with exposed rafter tails. It appears to be in fair-good condition, although additions and adjacent structures mostly obscure it from view.

The simple building east of the c1958 milking parlor (c1980) is apparently a storage building for farm vehicles with a residential section at its west end. It is rectangular in plan with a corrugated metal gable roof with exposed rafter tails. It is clad in stucco with vertical groove plywood at the rear. Fenestration consists of aluminum sliding-sash. The smaller building to its east (c1990) is a prefabricated residence with cross-gabled roof and plywood cladding. Both of these non-historic buildings are in fair condition.

The eastern milk parlor (c1965) is about 20 feet east of the western parcel boundary of 1053-081-03. It has a flat roof and is clad in stucco (cont. p. 3).

***B10 (continued from page 2).**

Ontario

The Gabrielino Native American group inhabited the area before the arrival of Spanish missionaries in the late eighteenth century. In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014: 7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Dairy Industry

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) has documented the local dairy industry, establishing periods of significance and a detailed framework for evaluation. The summary below draws from the context and other sources to provide sufficient historical framework to orient readers of these DPR 523 forms; the more comprehensive 2004 context may be consulted for additional detail.

Ontario and Chino are located in the Chino Valley basin of southwestern San Bernardino County. Dairy cows came to California with American settlers during the Gold Rush, and by 1876, a State Dairyman's Association had been organized. Dairies were first established in Chino Valley in the 1890s. The first dairy was most likely the Steel and Green Dairy, comprised of adobe buildings on the site of the Battle of Chino. The industry was based on free grazing during this era, and the availability of large tracts of fertile and inexpensive pastureland drew dairy farmers from Los Angeles County. However, most dairies in the region remained closer to Los Angeles population centers for several decades and citrus groves dominated the landscape through the end of the 1940s. Through 1930, the dairies in the region were small family businesses. Yet, by 1915, milk shipments already totaled over 6,000 pounds out of Chino. As Los Angeles County grew in population, so did the regional dairy industry. In the 1920s, many Dutch immigrants started dairy farms near Los Angeles. In the 1930s, to optimize milk production, dairies began switching from free grazing to dry-lot dairying and mechanized milking (Chino Champion 1977).

In the early years, the milking equipment was sanitized with steam tanks heated by oil burners. By 1920, dairy health and sanitation laws were established. Milk was originally filtered through cloth into the cans it was shipped in. The new laws required that a milk house had to be at least sixty feet from the barn, milkers must wear clean clothes before each milking, and milk house drains were constantly flushed with water. New ammonia colling systems were also created. After World War I, many cows in California had tuberculosis, thus pasteurization became a requirement. The Dairy Herd Improvement Association (DHIA), formerly the Cow Testing Association, was also created to improve the quality of the milk cattle (Chino Champion 1977). The association was started in the United States in 1906 by Danish immigrant Helmer Rabild and a small group of dairy farmers in Michigan. The Diary Division of the U.S. Department of Agriculture was the biggest supporter of the DHIA. By 1926, over one-hundred associations were established across the country (Arnold 1956).

During and after World War II, the Los Angeles Basin grew as a metropolitan area, pushing dairies to peripheral areas such as Chino Valley. In 1949, Chino dairies produced one-third of the total dairy production in San Bernardino County (Chino Champion 1950). In 1950, there were 79 dairies with an average of 145 cows to a herd in the Chino area (Chino Champion 1950). Suburbanization in Los Angeles County allowed dairymen, many of whom were Dutch, to purchase larger acreage and build bigger homes in Chino Valley. During this era, local dry lot operations (which purchased all feed) began to replace traditional dairy farms, which grew some or all cattle feed. By 1957, there were more than 135 dairies in Chino Valley. The late 1950s and early 1960s dairies established in Chino Valley were the most technologically sophisticated in the US, capable of milking 450 cows a day for each worker. Herringbone milking parlors, in which cows were raised on a platform so milkers did not have to kneel, became popular during this era to control labor costs. In 1960, an agricultural dairy preserve was established to protect the land from development, and by 1965, there were around 350 dairies in Chino Valley (Chino Champion 1977). In 1979, sixty percent of milk produced in California was from Chino Valley (Galvin & Associates 2004). Dairy products became California's number one agricultural commodity in 1993, and the state continued to lead the country in milk production throughout the twenty-first century (California Dairy Press Room & Resources 2023).

Streamline Moderne Milking Parlors

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) identified an unusual building type that characterizes historic-era dairies in the Ontario area, stating that the survey area has one of the largest concentrations of this building type in California. These milk parlors (also called milk houses or milk plants) are two-part buildings: a long, narrow shed with milking stalls for cows connected to a small cooling and processing building near a circular drive. The large utilitarian area where the cows are milked (historically referred to as the milking barn or milking parlor) has concrete masonry unit walls with large unglazed openings for ventilation and gabled roof. Floors are concrete for easy cleaning; stalls for cows are likewise designed for sanitation of concrete with metal stanchions. The processing/cooling/storage section of this building type (historically called the milk house or milk room) was not designed to be entered by cows or milkers. The milk houses are more visible from the public right-of-way than the barns, and thus more attention was paid to their aesthetic design. Many early examples, as documented in the Historic Context, exhibit simple Streamline Moderne architectural features including smooth symmetrical massing, stucco cladding, flat roofs with coping, curvilinear corners, and glass block windows. Larger and more elaborate examples have projecting center volumes, some with glass block at the curved corner.

The Historic Context theorized that these buildings would "most likely" have been constructed between 1920 and 1940, stating that more decorative Art Deco-style examples with geometric and angular edges as well as decorative chevrons or zigzags would have been constructed between 1920 and 1930, and that dairy owners transitioned to the Streamline Moderne style as described above between 1930 and 1940. Although revision of the 2004 Historic Context is outside the scope of the current study, some of the more serious flaws and inconsistencies within its discussion of this property type must be addressed in order to evaluate examples of this building type. The Context accurately describes the building type and correctly states that the Ontario/Chino area appears to boast the largest concentration of the property type in the state. However, the Context does not provide any photographic examples of the more decorative Art Deco-style milk parlors that it states would have been constructed before 1930, nor have recent field investigations revealed any dairy buildings with ornamental features that directly reference Art Deco architecture; the existence of dairy buildings with strongly Art Deco ornament appears to have been conjectural. A careful reading of the Historic Context and a review of its bibliography reveal that no sources on Art Deco or Streamline Moderne architecture were cited (in contrast to its extensive bibliography on Ranch Style architecture). Nor does the bibliography include sources focused on the architecture of dairies, the development of dairy building typology over the twentieth century, the technical requirements of twentieth century dairy buildings, or contemporaneous trade journals that discuss best practices for dairy building construction. Furthermore, pages 44 – 48 of the Context have no citations whatsoever. Thus, close examination reveals that its preparers developed the 1920 – 1940 period of significance based on the widely understood fact that the Art Deco/Streamline Moderne architectural movement was popular during this era and that Streamline Moderne grew out of Art Deco during the Great Depression. However reasonable this assumption may have been, it was not based on evidence. As demonstrated below, these buildings were not developed between 1920 and 1940.

The use of glass block is virtually ubiquitous in these milk plants and is one of the most important character-defining features of the building type. Glass block construction was pioneered in the US for a New York hotel built in 1928. Production of glass block began about 1932 and the material was featured at the 1933 – 1934 Chicago Century of Progress International Exhibition and the 1939 World's Fair in New York, helping to popularize it. The height of its use was from the late 1930s through the 1940s. It became an essential element of the Streamline Moderne style since it could be incorporated into curving wall surfaces (Fagan 2015). The development history of this material definitively demonstrates that Streamline Moderne milking parlors could not have been constructed in the Chino Valley prior to 1933 at the absolute earliest. In 1925, the University of California College of Agriculture published recommendations for milk house design and construction. Although concern for sanitary conditions had led to a recommendation for the use of concrete flooring for milking parlors and milk houses during this era, best practice continued to advise wood-frame wall construction with wood sheathing and double-hung wood sash windows with screens. In the 1920s, glass block and concrete masonry units were not yet being recommended as building materials by organizations promoting progressive dairying (Belton 1925).

Although glass block was in production by the mid-1930s and theoretically could have been utilized, its use for dairy buildings would have been unlikely, since building materials trends begin in urban areas and arrive later to farming operations, where utilitarian considerations are more important than style. Review of historic aerial photographs provides further evidence that the building type was not in local use during the 1920s and 1930s. Review of historic aerial photographs for a roughly two square mile area (including the current project area) has revealed that it eventually held at least 17 of these buildings. Only two milking parlors that fit the typology had been constructed by

1949 and by 1953 there were still only two in the study area (USDA Aerial Photographs 1949, 1953, 1975). Furthermore, review of local newspapers reveals few if any new dairies established during the 1930s, and expansion of existing operations appears to have been modest during these Great Depression years. Extensive comparative research has revealed no existing California cultural resource reports or academic papers that have analyzed the building type. Several historic photographs of Los Angeles County dairies were discovered, and these demonstrate that the property type was in use in areas like Bellflower and Artesia during the 1940s and 1950s; the oldest dated photograph of a Streamline Moderne milking parlor in Artesia is from 1940. The Streamline Moderne milking parlor appears to have traveled from Los Angeles County to Ontario in the 1940s as dairymen began to move their operations to western San Bernardino County, and the trend accelerated rapidly in the mid-1950s along with the continued migration of dairies to Chino Valey. A 1940 article in the Chino Champion describes the Abacherli Dairy at the intersection of Walnut and San Antonio avenues as a state-of-the-art local dairy plant. Although the article does not include photographs, a milk house of concrete construction with concrete floors is described and may have been an early example of the typology (Chino Champion 1940). By 1947, the Journal of Dairy Science was recommending glass block for use in milk processing plants because it provided illumination without allowing dirt to infiltrate like an open window. The same publication also praises its “modern look” (Nelson: 1947). Other dairy-oriented publications also recommended use of the glass block and masonry construction in the late 1940s (University of Wisconsin: 1949). And the extant Streamline Moderne milk parlor at the Grant Dairy (in the current study area) is known to have been built in 1947 or 1948.

The local popularity of glass block in milking parlors appears to have peaked in the 1950s, when many local examples of this building type were constructed. Glass blocks were heavily advertised in dairy trade journals throughout the 1950s, and construction of the building typology continued into the 1960s. A Streamline Moderne milking parlor appears in a 1956 article contrasting “modern dairy plants” with the large wooden barns of the early twentieth century (Chino Champion 1956). (Although its construction date is not specifically mentioned, it would be unlikely for a local newspaper to tout a building as “modern” if it were more than two or three years old.) Although documents that substantiate exact dates for construction of Streamline Moderne milk parlors in Ontario have not been discovered, available evidence indicates that most were constructed between 1940 and 1965. Since we have demonstrated that the actual construction of this building type did not take place within the Art Deco era (1920 – 1940) this study will use Streamline Moderne Milk Parlor in reference to this building type and will consider the period of significance 1940 – 1965.

Subject Property History

The subject property was part of Mexican land grant Rancho Santa Ana del Chino. In the early twentieth century, the subject property (Lots 1 and 18 of Section 18 in Figure 1) was part of a larger ranch that totaled about 40 acres. By 1917, George Washington Bird (1873-1944) owned the property with his wife Birchie (U.S. Directories San Bernardino County 1917). George Bird was born in Missouri and Birchie was born in Iowa. In 1920, they were living on the ranch with seven of their children; a decade later they had five children left at home and Birchie’s father was also living with them (US Census Records 1920, 1930). Bird was a contractor who built oil rigs; he apparently also operated the subject property as some type of a farm, perhaps a dairy or chicken ranch. There were some small buildings on the subject parcel during this era, but none of the current buildings had been constructed. The family home was not located on the subject property but was in a group of buildings and trees clustered along a driveway near the line of eucalyptus that marked the western border of Lot 8 (see Figures 1 and 2). The Birds had to mortgage the property during the Depression and were apparently unable to make the payments; they also had trouble meeting your property tax obligations, and an auction of all four lots was announced in 1933 (San Bernardino County Sun 1933). The family somehow managed to hang on to the property through the end of the decade, but it was finally auctioned at a trustee's sale in 1940. They moved to Upland, where George Bird died in 1944 (Pomona Progress Bulletin 1944).

CONTINUATION SHEET

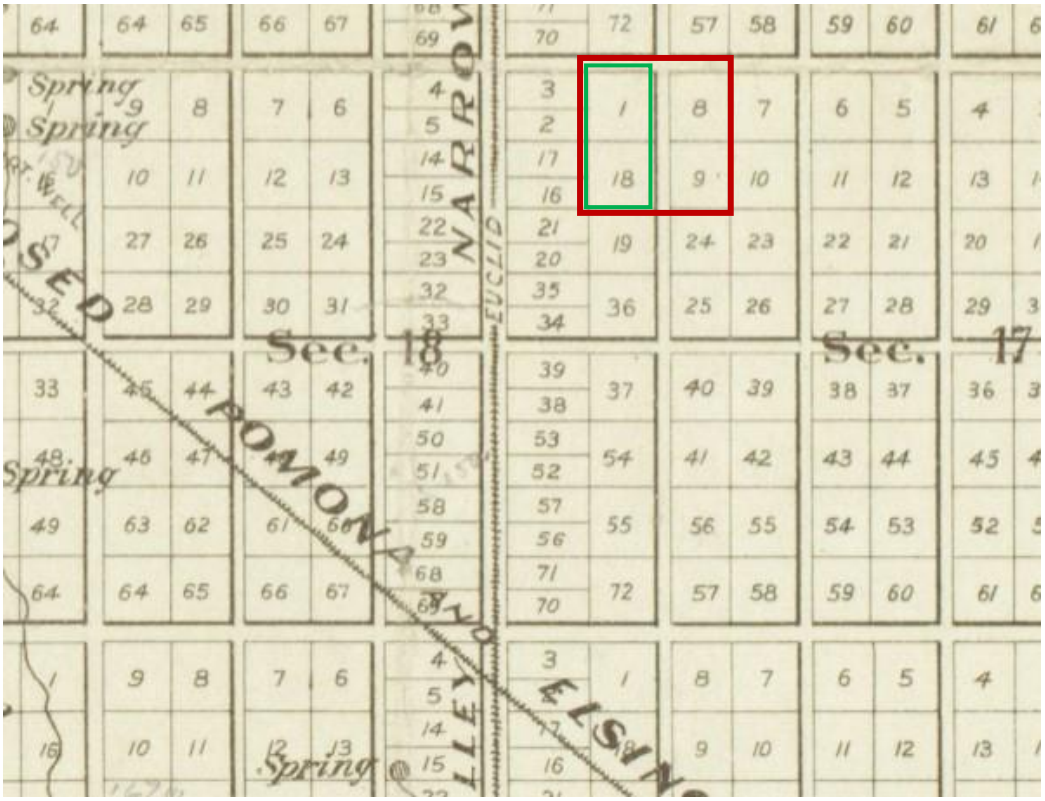

Figure 1: Britton & Rey Map of Subdivision of Rancho Santa Ana del Chino, 1889, Bird Ranch property outlined in red with portion surveyed for current study outlined in green.

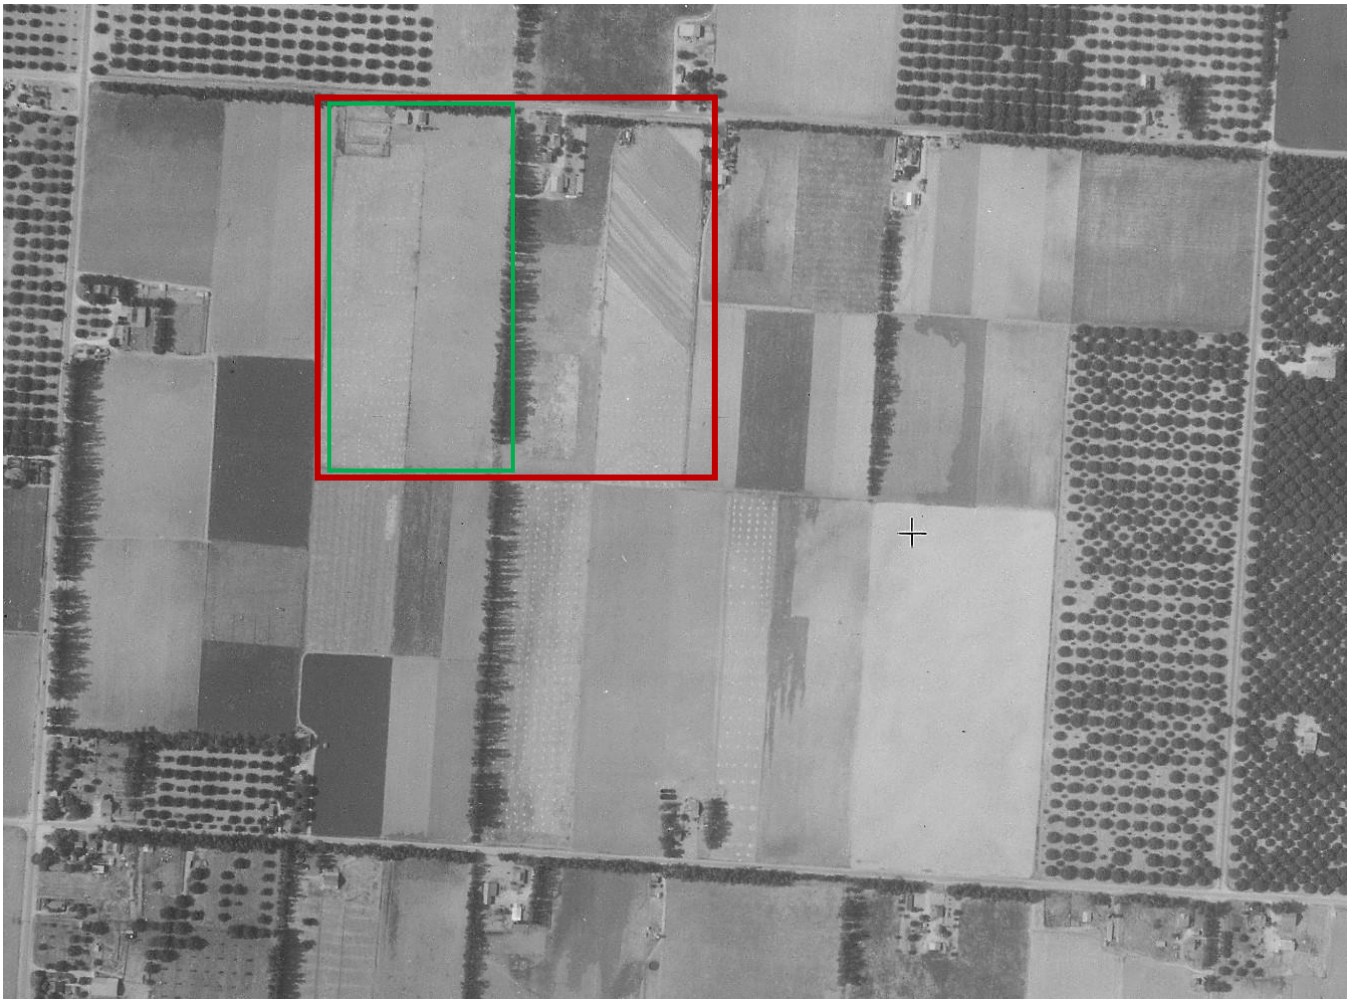

Figure 2: Bird Ranch outlined in red with area surveyed for current study outlined in green, original ranch buildings (no longer extant) near Schaeffer at center of survey area, Bird Ranch residential area east of survey area, USDA Aerial, 1936.

Alba Lee and Frances Holmes acquired the property about 1940. Alba Lee Holmes (1913-2002) and Frances Pedley (1916-2000) had been married in 1938 and Alba worked as a machinist before they purchased the ranch (Pomona Progress Bulletin 1938). They eventually had four children (Chino Champion 2000). By 1950, Alba Lee and Frances Holmes and children Stephen, Karen, and Jeffrey apparently lived on the ranch (U.S. Census Records 1950). Presumably, they were living in the Bird house on Lot 8 which was extant at that time, but the location of their residence cannot be definitively determined because addresses were not in wide use in the area during this period. After they moved to the subject property, Alba, who usually went by Lee, listed his occupation as a farmer. Aerial photographs indicate that the western Streamline Moderne milking parlor was constructed c1958; a long narrow building probably used as a storage was constructed southeast of the milk parlor about the same time, and corrals for cattle were also built.

Figure 3: Bird Ranch outlined in red with portion surveyed for current study outlined in green, original ranch buildings (no longer extant) near Schaeffer at center of survey area, Bird Ranch residential area east of survey area, USDA Aerial, 1946.

Figure 4: Subject property in the late 1940s; no new buildings have been constructed on the property since the mid-1930s, USDA Aerial, 1949.

Figure 5: Subject property in the early 1950s; no new buildings have been constructed on the property since the mid-1930s, USDA Aerial, 1953.

Figure 6: Subject property, blue arrow showing c1958 Milk Parlor constructed during Holmes ownership, USDA Aerial, 1959.

A second milk parlor was constructed c1965, apparently by the Holmes family. It is a virtually exact copy of the neighboring Floris Ykema Dairy's milk parlor (about a half mile directly to the south, constructed c1960) which apparently served as a template. The dairy operation on this property made little impact on the historic record and little is known about Lee Holmes' professional life. Frances Holmes worked in the estate and planning department of Pomona College and was a longtime member of the Christian Women's Club in Chino (Chino Champion 2000). The family appears to have lived on the property until at least 1964. The east half of the property appears to have been sold during the mid-1960s.

The TeVelde family purchased the property about 1973; they also acquired the Grant Dairy to the west. Born in the Netherlands, Harm and Swannie TeVelde were married in 1936 and came to the area in 1969; they may have rented the property before purchasing it. They named the properties at Euclid and Schaefer Artevel Farms (Chino Champion 1970, Chino Valley News 1983, Chino Champion 1986). Harm gained recognition by the Holstein-Friesian Association of America for his milk cows (Chino Champion 1977). The TeVeldes had eight children. The TeVelde family purchased the Grassland Dairy Farm at 7275 Shaeffer Avenue (the subject property), which comprised the second Artevel

Farms location (Chino Champion 1981). Harm and Swannie's son, John TeVelde lived on Schaefer Ave with his family starting in 1969 (Chino Champion 1969). The two residential buildings on the property were constructed after 1980. Research has not revealed when the original 40-acre Bird Ranch was subdivided, but the eastern 20 acres were under separate ownership by 1987. In 1990, Harm Te Velde died after living in Chino for 21 years (Chino Valley News 1990). In 2008, Artevel Farms became Artevel of California, LLC. In 2013, Swannie TeVelde died, leaving 116 family members. In the 2010s, the property was purchased by Daniel Drake and used as the Drake Family Farms Artisan Farmstead, for the production of goat cheese. Drake Family Farms sold their goat cheese at local farmers markets (Los Angeles Times 2012).

Figure 7: Subject property, blue arrow showing c1958 Milk Parlor orange arrow showing c1965 Milk Parlor constructed during Holmes ownership, USDA Aerial, 1976.

Evaluation of New Model Colony Area Associations

The subject property has no extant buildings constructed prior to the 1950s, it therefore has no potential association with the following historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area: 1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 3.1930-1949 - Dry Lot Dairying with Mechanization. Since the two milking parlors on the property were constructed during the 1950s and 1960s, it is a potential example of 4. Post-1950 - Scientific, Large Capacity Dairies, although it does not meet the minimum characteristics as analyzed in greater detail below.

As analyzed below, it is an example of 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940 – 1965).

2. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

> modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The subject property exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described it and identified it as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context.

4. Post-1950 - Scientific, Large Capacity Dairies minimum characteristics according to Historic Context:

> at least one large residence that dates to this period in the Ranch architectural style that exhibits little alteration, a large "herringbone style" milking parlor designed in the Ranch style, a circular driveway, numerous geometrically spaced rows of pole structures and other related dairy facilities, and a vast expanse of open space to the rear of the property. The property may have multiple large residences and a few smaller workers' residences.

The subject property has two milking parlors that date from this era, and its c1965 milking parlor appears to exhibit the later herringbone style as required for significance under the Historic Context; it also has circular driveways. However, the current property at 20 acres is only half the size of the original ranch and not close to the average 40-acre size of properties within this context. Furthermore, the subject property lacks a large Ranch-style residence, and has no residential buildings constructed within the 1950 – 1969 period of significance for this context. Although it has numerous geometrically spaced rows of pole structures and other agricultural buildings, all were constructed well outside the historic era and appear to have been purpose-built for the current goat dairy, and therefore do not fit within this context. There has also been an addition of a prefabricated dwelling and a combination residence/vehicle storage building in a prominent location near the street and between the milking parlors outside the historic era. Buildings constructed after 1969 and the addition of manufactured homes are specifically mentioned in the Historic Context as factors that would render a dairy property developed during this era low integrity. Therefore, according to the standards set forth by the Historic Context, the property no longer conveys its historic association as a post-1950 dairy property.

Since the property qualifies as a high integrity example of a Streamline Moderne Milk parlor is eligible for local listing under Context 2 but ineligible under the other contexts as set forth in the Historic Context.

Evaluation

The National Register of Historic Places and California Register of Historical Resources require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of our history; (B/2) it is associated with the lives of persons important in our past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]).

Criterion A/1: The property at 7275 Schaefer Avenue was constructed within the general context of agricultural and residential development in Ontario, however, research has revealed no significant association with important events related to the founding of that municipality, with development of the region, postwar residential expansion, the development of the dairy business, or with any other important historic context. It was one of many dairies established in the area during the twentieth century. It is therefore recommended not eligible for the National Register or the California Register under Criterion A/1.

Criterion B/2: Substantial research has not linked the subject property with individuals who have been notable in local, state, or national history. Its early owners were ordinary people; no houses were located on the subject property within the historic era, so it had no residents. Therefore, it lacks association with the lives of important persons in our history. For these reasons, it is recommended not eligible for the National Register or California Register under Criterion B/2.

Criterion C/3: The western milking parlor is an example of an important local property type. The building is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows that curve around a corner, and a flat clay tile roof. It was constructed c1958, within the revised period of significance recommended for Streamline Moderne milk parlors. Although the eastern milking parlor was also constructed within the historic era, it is a lesser example of a Midcentury modern milk parlor and has also suffered alterations such as having windows boarded up; it therefore lacks the architectural significance and integrity required for historic listing. For these reasons, the western milk parlor alone is recommended eligible for the National Register or California Register under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. The subject property is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

Integrity. Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

Although additions to its façade have obscured it from view, the original historic fabric of the milk parlor appears intact beneath these additions. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the subject property has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remain mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

Intrusion of non-historic-era buildings near the milking parlor has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a c1958 milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. These essential and defining features would allow the building to strongly evoke the feeling of a Streamline Moderne milk parlor if additions were removed. The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940 – 1965 milking parlor. It therefore retains integrity of association.

The western milking parlor retains sufficient integrity to convey its identity as a c1958 dairy building.

The subject property and its constituent c1958 milking parlor are therefore recommended eligible for listing on the National Register or the California Register, and as such qualifies as a historical resource under the California Environmental Quality Act (CEQA). Thus, BCR Consulting recommends the National Register of Historic Places Status Code "3S ".

 *__Resource Name or #:__ 7218 & 7226 Edison Avenue

2P1. Other Identifier: APN 1053281020000

***P2. Location:** ☐ **Not for Publication** ☑ **Unrestricted** ***a. County:** San Bernardino
and (P2b and P2c or P2d. Attach a Location Map as necessary.)
***b. USGS 7.5' Quad:** Ontario, CA **Date:** 1967 **T** 2S; **R** 7W; Section 18**;** SBBM
c. Address: 7218 Edison Ave and 7226 Edison Avenue City: Ontario Zip: 91762
d. UTM: Zone: N/A mE/ Elevation:
e. Other Locational Data: The property is on the north side of Edison Avenue, just outside of Chino, in the southwest section of the city of Ontario.

***P3a. Description:** The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is a 2.06-acre lot occupied by a c1924 residence to the west at 7218 Edison Avenue and a c1957 residence to the east at 7226 Edison Avenue. The residences are in the south portion of the parcel near the road and enclosed by chain link fences. Landscaping consists of several mature trees and palms near the houses. The c1957 Ranch-style house is irregular in plan with a medium-pitch multi-gabled roof with metal vents on the gable ends. It is clad in stucco. There is a partial width porch with a gable roof on the main (south) elevation that is supported by two square wood post. It shelters the main entrance, which faces east rather than toward the street and is fitted with a wood paneled door. The porch is accessed by two wide concrete steps. Fenestration consists of replacement vinyl sliding windows. There is a garage to the east of the house, which is connected to the house by a breezeway. The garage is also clad in stucco with a gable roof and features a metal roll-up garage door.

The c1924 residence to the east of the larger c1957 residence is at the southeast corner of the parcel and exhibits the basic characteristics of Craftsman architecture. It is roughly L-shaped in plan with a jerkinhead gable roof and exposed rafter tails. It is clad in horizontal wood siding. There is a projecting partial-width porch on the main (south) elevation that is supported by two square wood posts and shelters the main entrance, which is centered and fitted with a paneled wood door and is accessed by a set of two wide concrete steps. Fenestration consists of vinyl replacement windows. There is a garage to the east of the house, which has the same roof form and pitch as the house, horizontal wood siding, and a metal roll-up garage door. The garage is connected to the house by a hyphen with clerestory windows on its main façade that appears to be a later addition.

Ontario

The Gabrielino Native American group inhabited the area before the arrival of Spanish missionaries in the late eighteenth century. In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014: 7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Subject Property History

The property was part of Mexican land grant Rancho Santa Ana del Chino. The current small parcel near the intersection was part of Lot 34 of Section 18, a roughly 300' x 900' parcel. The first known owners of Lot 34 were Byron C. Fulton (1860-1939) and his wife, Mary Jane Bailey (San Bernardino County Sun 1906). They moved from North Dakota to Chino in 1892. They purchased a large ranch property and established their home on the southeast corner of Euclid and Edison Avenues (Chino Champion 1939). They bought and sold a number of portions of their original property and other properties in Chino. In 1899, the Fulton house burned down and they moved a new house from Ontario to the northeast corner of Euclid and Edison Avenues, current address 14095 Euclid Avenue. The Fulton family appears to have stayed in the house until at least 1930. In the early 1930s, John Ephas Clapp (1876-1944) purchased all of Lot 34. Clapp was a cattle dealer and had a dairy in Chino Hills. He apparently lived on Lot 34 in the house facing Edison that was constructed about 1924 (7218 Edison Avenue) with his wife, Ida Belle Clapp, and their son, Frank Clapp (Chino Champion 1941). (Since house numbers were not in use area during this period, available documents cannot definitively confirm which house they resided in.) The Clapps may also have operated a dairy across the street from the subject parcel. Around 1940, the lot was divided, separating 14095 Euclid Avenue and 7218 Edison Avenue. Historic aerial photographs demonstrate that the remainder of the parcel was an orchard through the middle decades of the twentieth century, and although people involved in the dairy business lived on the property at times, the parcel was never utilized as a dairy. The orchard trees were gradually replaced with large tanks for what appears to have been some type of industrial use, but research has not revealed its details.

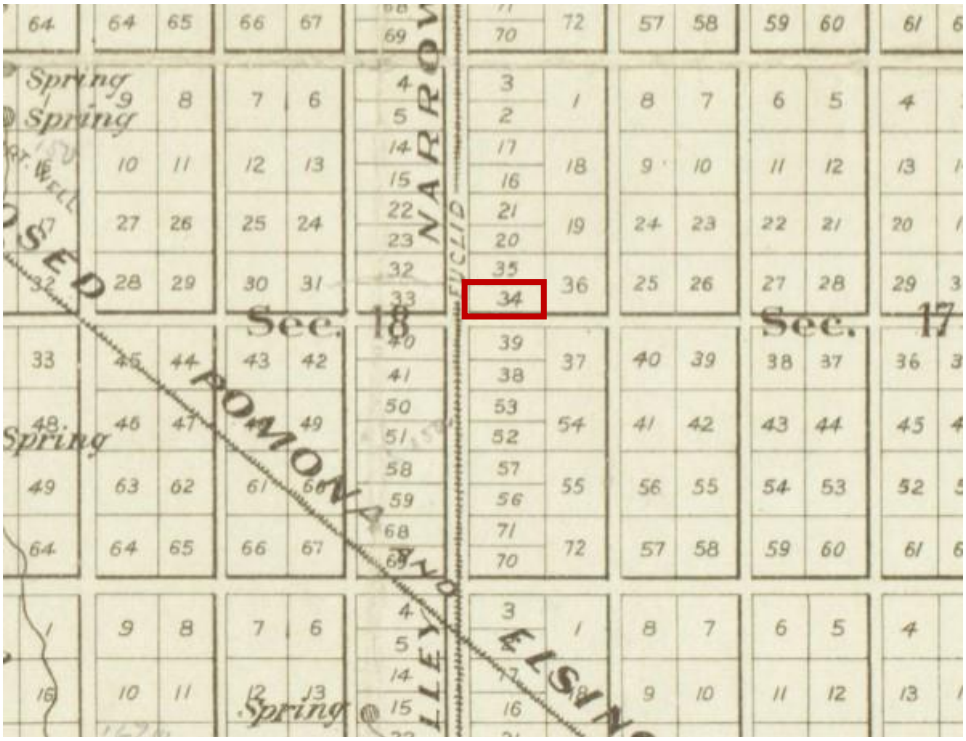

Figure 1: Britton & Rey Map of Subdivision of Rancho Santa Ana del Chino, 1889, Subject property outlined in red.

In 1936, Claudie E. Waggoner (1913-2000) married Faye Maxwell (1915-1998) and they moved to Ontario, living at first on Grove. Around 1950, they appear to have moved onto 7218 Edison Avenue with their son, Rex and daughters Donna and Rita. They used the property as a walnut farm (Chino Champion 1963). Previously, Claudie Waggoner worked for Lucas Dairy Company. The Waggoners son, Rex Waggoner, studied soil science and agronomy at Cal Poly San Luis Obispo. After graduating, he worked as a soil scientist with the U.S. soil conservation service near Placerville. He also volunteered in the Peace Corps in Guatemala for two years, where he worked in livestock management and farming, and taught nutrition (Chino Champion 1963).

In 1957, a second house was built on the property, apparently for the Waggoner ‘s daughter Donna. In 1958, Peter S. Vander Meulen (1933-2011), Donna Waggoner Vandermuelen, and their three children lived at 7226 Edison Avenue. Starting in 1955, Vander Meulen worked as a heavy equipment operator with Blue Diamond Materials for thirty-five years. In the late 1960s, Rex Waggoner moved into the house at 7226 Edison Avenue, directly adjacent to his parents’ house at 7218 Edison Avenue. In 1971, Rex Waggoner and his wife had a son, Steven Lee (Chino Champion 1971). Faye Waggoner died in Chino in 1998 and Claudie Waggoner died four years later (U.S. Social Security Death Index 2000). After their deaths, their oldest children, Rex Waggoner and Donna Vandermeulen (1938-2021), inherited the property.

In 2003, Roger and Jennie Camping purchased the property. Roger Camping (b.1952) and his two brothers owned Eagle Livestock in Chino (Chino Champion 1989; Progress Bulletin 1972). Roger Camping raised cows to sell for beef (Chino Champion 1986). In 2020, the property was purchased by Richard and Lisa Gentry.

Figure 2: Subject property with a residence at the west corner (no longer extant), rows of orchard trees and the house to the east at 7218 Edison Avenue, USDA Aerial, 1936.

Figure 3: Subject property with multiple residences at the west corner, water tanks, and the two houses to the east at 7218 and 7266 Edison Avenue, USDA Aerial, 1960.

Evaluation of New Model Colony Area Associations
Lot 34 was never used as a dairy and therefore has no associations with this local historic context.

Evaluation
The National Register of Historic Places and California Register of Historical Resources require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of our history; (B/2) it is associated with the lives of persons important in our past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]).

Criterion A/1: The property at 7218 and 7226 Edison Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the Chino Valley. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the NRHP or CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. The families who lived on the property were not significant contributors to the area's development, and research has revealed no important professional accomplishments or lasting impact on local history or on agriculture. The houses provided shelter for ordinary working people: farmers and business owners. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: The two residences are not significant for their architecture. Research did not reveal any architects or important builders associated with their construction. The buildings are unremarkable examples of modest-sized 1920s and 1950s houses in Ontario. Although the older house has some basic elements of Craftsman architecture and the newer house is Ranch-style, neither is an outstanding example of an architectural movement. Furthermore, both have been altered outside the historic period with window replacement and other unsympathetic changes. For these reasons, they lack the significance and integrity required for historic listing and are recommended not eligible for the National Register or California Register under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 7218 and 7266 Edison Ave are examples of well understood types of construction and do not appear to be a principal source of important information in this regard.

e. Other Locational Data: The property is on the north side of Edison Avenue, just outside of Chino, in the southwest section of the city of Ontario.

***P3a. Description:** The property is located in a remnant of the once expansive Chino Valley dairy country, most of which was gradually developed for residential tracts beginning in the 1970s beginning in the 1970s. It is now located on the edge of Ontario, with multi-family residential development across the street to the west and dairies to the east and north. The subject property is an 18-acre historic-era dairy with its main buildings on the 9-acre parcel (1053-281-01) adjacent to Edison Avenue and open space with some small buildings to the north on another 9-acre parcel (1053-211-05). 1053-281-01 is occupied by a historic-period (c1950) residence to the west, a historic-period (1957) residence to the east, and a historic-period (c1958) milking parlor at the center. The residence at 7244 Edison Avenue on the west side of the parcel near the road has untended landscaping with several mature trees near the house. The Ranch-style house is irregular in plan with a medium-pitch cross-gabled roof. It is clad in horizontal wood siding with vertical roof plywood on its south elevation. The main entrance on the east elevation is left of center and sheltered only by the roof eaves. It is fitted with a metal security screen door and accessed by three concrete steps. There is a large brick chimney on the east elevation. Fenestration consists of replacement sliding sash. The building is in fair condition, with peeling paint and the south elevation is boarded up. There is a detached garage to the north of the residence. It is rectangular in plan with a gable roof with louvered vents on the gable ends. It is clad in horizontal wood siding and is fitted with a roll-up metal garage door.

The second residence at 7260 Edison Avenue is on the southeast portion of the parcel near the road. It has untended landscaping and is enclosed by a metal chain link fence. The house is rectangular in plan with a gable roof with vents on the gable ends and exposed rafter tails. It is clad in stucco. The main entrance on the main (south) elevation is centered and fitted with a metal security screen door. It is sheltered only by the roof eaves, which project slightly at the entrance. There is a second entrance on the west elevation with is sheltered by a small projecting shed roof. Primary fenestration consists of metal sliding sash with a large picture window on the main side. There is a garage attached to the west elevation; it is fitted with a metal accordion garage door. It appears to be occupied and is in good condition.

The milking parlor at the center of the parcel is accessed by a semi-circular driveway. It is rectangular in plan. The front portion of the building (the milk parlor) has a flat roof and is clad in stucco. It features simple references to Streamline Modern architecture including a projecting center section, curved corners, and a shaped parapet with decorative clay tile roofing. The main entrance is centered on the main (south) elevation and is boarded up. Fenestration consists of glass block. The back portion of the building is an open-air facility (the milking parlor/milking barn) with a gabled metal roof with exposed rafter tails (cont. p. 3).

Ontario

The Gabrielino Native American group inhabited the area before the arrival of Spanish missionaries in the late eighteenth century. In 1839, after Mexico gained independence from Spain, the Mexican government granted the 12,000-acre Rancho de Cucamonga to Tiburcio Tapia. Americans began settling in California in large numbers during the Gold Rush in the 1840s, and California statehood in 1850 accelerated the process statewide. In 1881, George and William Chaffey purchased part of Rancho Cucamonga in order to develop Etiwanda, where they tested their ground-breaking irrigation and town planning ideas. That same year, the brothers purchased 6,000 acres (along with water rights) west of Etiwanda, which became the cities of Ontario and Upland. In 1883, the Chaffeys added the Kincaid Ranch at the mouth of San Antonio Canyon to their holdings. They established the Ontario Land Company and subdivided the land into 10-acre farm lots, all of which had street frontage (Emick 2011:17, 20; Clucas 2009:7).

The Chaffeys set aside a town site for Ontario as well as land for an agricultural college, making water available to each parcel in order to encourage farmers to settle there. George Chaffey laid out a boulevard named Euclid, which stretched from the Southern Pacific Depot to the mesa at the north end of their holdings. The Chaffey brothers sold off their acreage and left California for Australia in 1886. Charles Frankish had moved to Ontario from Riverside that year to participate in the Chaffeys' "Model Colony," and invested in undeveloped land along Euclid Avenue. He recruited a group of investors and formed the Ontario Land and Improvement Company, which bought the Chaffey brothers' land holdings in 1886. Frankish acted as Manager and later President, and actively participated in the sale of real estate as well as planning and developing Ontario. Frankish carried out many of the Chaffey brothers' ideas. He extended Euclid past the depot to the south end of the company's holdings, platting the street grid and planting trees. In 1887, he organized the Ontario and San Antonio Heights Railroad Company (O&SA) as a subsidiary of the land company. In the 1890s, the O&SA constructed a hydro-electric plant at the mouth of San Antonio Canyon and electrified the system, making it the first electrified trolley west of Chicago. Ontario officially incorporated as a city in 1891. In 1912, Frankish bought the land company's Ontario-area assets and formed the Frankish Company. Frankish installed electric streetlights in Ontario, established its first bank, and was involved in nearly every aspect of local commerce and planning until his abrupt departure from the area in 1927 (Ontario City Library 2014: 7, 8, 17, 18; Swett 1969:13, 19).

Aviation interests were introduced to Ontario in 1923 when Waldo Waterman and Archie Mitchell established Latimer Field in the city limits. As more people moved to Ontario, its urban growth forced aviators eastward until they established an airport at the current location of Ontario International Airport. During World War II, Ontario's airport brought many to the area for its pilot training facilities. It was about this time that the citrus industry that had contributed to Ontario's nascent years of growth started to experience a broad decline. Land

values increased as more and more Americans began moving westward and settling in the area. In subsequent years and decades, farmers sold their land to incoming residential developers. The population of Ontario swelled, and by the late 1950s, the city's residential area had expanded south and east. Manufacturing, defense, and dairy industries began to take the place of citrus as the local economic staples drawing in new residents. By the late twentieth century, manufacturing had waned and was replaced by service industries and warehousing. Today, the city has expanded to a population of more than 166,000 people living within a 50 square-mile area. The city's economic base is now heavily dependent on industrial and manufacturing, and with three freeways, three major railroads, and Ontario International Airport, the region is rich in transportation resources (City of Ontario; Galvin & Associates 2004:40-41).

Dairy Industry

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) has documented the local dairy industry, establishing periods of significance and a detailed framework for evaluation. The summary below draws from the context and other sources to provide sufficient historical framework to orient readers of these DPR 523 forms; the more comprehensive 2004 context may be consulted for additional detail.

Ontario and Chino are located in the Chino Valley basin of southwestern San Bernardino County. Dairy cows came to California with American settlers during the Gold Rush, and by 1876, a State Dairyman's Association had been organized. Dairies were first established in Chino Valley in the 1890s. The first dairy was most likely the Steel and Green Dairy, comprised of adobe buildings on the site of the Battle of Chino. The industry was based on free grazing during this era, and the availability of large tracts of fertile and inexpensive pastureland drew dairy farmers from Los Angeles County. However, most dairies in the region remained closer to Los Angeles population centers for several decades and citrus groves dominated the landscape through the end of the 1940s. Through 1930, the dairies in the region were small family businesses. Yet, by 1915, milk shipments already totaled over 6,000 pounds out of Chino. As Los Angeles County grew in population, so did the regional dairy industry. In the 1920s, many Dutch immigrants started dairy farms near Los Angeles. In the 1930s, to optimize milk production, dairies began switching from free grazing to dry-lot dairying and mechanized milking (Chino Champion 1977).

In the early years, the milking equipment was sanitized with steam tanks heated by oil burners. By 1920, dairy health and sanitation laws were established. Milk was originally filtered through cloth into the cans it was shipped in. The new laws required that a milk house had to be at least sixty feet from the barn, milkers must wear clean clothes before each milking, and milk house drains were constantly flushed with water. New ammonia colling systems were also created. After World War I, many cows in California had tuberculosis, thus pasteurization became a requirement. The Dairy Herd Improvement Association (DHIA), formerly the Cow Testing Association, was also created to improve the quality of the milk cattle (Chino Champion 1977). The association was started in the United States in 1906 by Danish immigrant Helmer Rabild and a small group of dairy farmers in Michigan. The Diary Division of the U.S. Department of Agriculture was the biggest supporter of the DHIA. By 1926, over one-hundred associations were established across the country (Arnold 1956).

During and after World War II, the Los Angeles Basin grew as a metropolitan area, pushing dairies to peripheral areas such as Chino Valley. In 1949, Chino dairies produced one-third of the total dairy production in San Bernardino County (Chino Champion 1950). In 1950, there were 79 dairies with an average of 145 cows to a herd in the Chino area (Chino Champion 1950). Suburbanization in Los Angeles County allowed dairymen, many of whom were Dutch, to purchase larger acreage and build bigger homes in Chino Valley. During this era, local dry lot operations (which purchased all feed) began to replace traditional dairy farms, which grew some or all cattle feed. By 1957, there were more than 135 dairies in Chino Valley. The late 1950s and early 1960s dairies established in Chino Valley were the most technologically sophisticated in the US, capable of milking 450 cows a day for each worker. Herringbone milking parlors, in which cows were raised on a platform so milkers did not have to kneel, became popular during this era to control labor costs. In 1960, an agricultural dairy preserve was established to protect the land from development, and by 1965, there were around 350 dairies in Chino Valley (Chino Champion 1977). In 1979, sixty percent of milk produced in California was from Chino Valley (Galvin & Associates 2004). Dairy products became California's number one agricultural commodity in 1993, and the state continued to lead the country in milk production throughout the twenty-first century (California Dairy Press Room & Resources 2023).

Streamline Moderne Milking Parlors

The City of Ontario's Historic Context for the New Model Colony Area (Galvin & Associates 2004) identified an unusual building type that characterizes historic-era dairies in the Ontario area, stating that the survey area has one of the largest concentrations of this building type in California. These milk parlors (also called milk houses or milk plants) are two-part buildings: a long, narrow shed with milking stalls for cows connected to a small cooling and processing building near a circular drive. The large utilitarian area where the cows are milked (historically referred to as the milking barn or milking parlor) has concrete masonry unit walls with large unglazed openings for ventilation and gabled roof. Floors are concrete for easy cleaning; stalls for cows are likewise designed for sanitation of concrete with metal stanchions. The processing/cooling/storage section of this building type (historically called the milk house or milk room) was not designed to be entered by cows or milkers. The milk houses are more visible from the public right-of-way than the barns, and thus more attention was paid to their aesthetic design. Many early examples, as documented in the Historic Context, exhibit simple Streamline Moderne architectural features including smooth symmetrical massing, stucco cladding, flat roofs with coping, curvilinear corners, and glass block windows. Larger and more elaborate examples have projecting center volumes, some with glass block at the curved corner.

The Historic Context theorized that these buildings would "most likely" have been constructed between 1920 and 1940, stating that more decorative Art Deco-style examples with geometric and angular edges as well as decorative chevrons or zigzags would have been constructed between 1920 and 1930, and that dairy owners transitioned to the Streamline Moderne style as described above between 1930 and 1940. Although revision of the 2004 Historic Context is outside the scope of the current study, some of the more serious flaws

and inconsistencies within its discussion of this property type must be addressed in order to evaluate examples of this building type. The Context accurately describes the building type and correctly states that the Ontario/Chino area appears to boast the largest concentration of the property type in the state. However, the Context does not provide any photographic examples of the more decorative Art Deco-style milk parlors that it states would have been constructed before 1930, nor have recent field investigations revealed any dairy buildings with ornamental features that directly reference Art Deco architecture; the existence of dairy buildings with strongly Art Deco ornament appears to have been conjectural. A careful reading of the Historic Context and a review of its bibliography reveal that no sources on Art Deco or Streamline Moderne architecture were cited (in contrast to its extensive bibliography on Ranch Style architecture). Nor does the bibliography include sources focused on the architecture of dairies, the development of dairy building typology over the twentieth century, the technical requirements of twentieth century dairy buildings, or contemporaneous trade journals that discuss best practices for dairy building construction. Furthermore, pages 44 – 48 of the Context have no citations whatsoever. Thus, close examination reveals that its preparers developed the 1920 – 1940 period of significance based on the widely understood fact that the Art Deco/Streamline Moderne architectural movement was popular during this era and that Streamline Moderne grew out of Art Deco during the Great Depression. However reasonable this assumption may have been, it was not based on evidence. As demonstrated below, these buildings were not developed between 1920 and 1940.

The use of glass block is virtually ubiquitous in these milk plants and is one of the most important character-defining features of the building type. Glass block construction was pioneered in the US for a New York hotel built in 1928. Production of glass block began about 1932 and the material was featured at the 1933 – 1934 Chicago Century of Progress International Exhibition and the 1939 World's Fair in New York, helping to popularize it. The height of its use was from the late 1930s through the 1940s. It became an essential element of the Streamline Moderne style since it could be incorporated into curving wall surfaces (Fagan 2015). The development history of this material definitively demonstrates that Streamline Moderne milking parlors could not have been constructed in the Chino Valley prior to 1933 at the absolute earliest. In 1925, the University of California College of Agriculture published recommendations for milk house design and construction. Although concern for sanitary conditions had led to a recommendation for the use of concrete flooring for milking parlors and milk houses during this era, best practice continued to advise wood-frame wall construction with wood sheathing and double-hung wood sash windows with screens. In the 1920s, glass block and concrete masonry units were not yet being recommended as building materials by organizations promoting progressive dairying (Belton 1925).

Although glass block was in production by the mid-1930s and theoretically could have been utilized, its use for dairy buildings would have been unlikely, since building materials trends begin in urban areas and arrive later to farming operations, where utilitarian considerations are more important than style. Review of historic aerial photographs provides further evidence that the building type was not in local use during the 1920s and 1930s. Review of historic aerial photographs for a roughly two square mile area (including the current project area) has revealed that it eventually held at least 17 of these buildings. Only two milking parlors that fit the typology had been constructed by 1949 and by 1953 there were still only two in the study area (USDA Aerial Photographs 1949, 1953, 1975). Furthermore, review of local newspapers reveals few if any new dairies established during the 1930s, and expansion of existing operations appears to have been modest during these Great Depression years. Extensive comparative research has revealed no existing California cultural resource reports or academic papers that have analyzed the building type. Several historic photographs of Los Angeles County dairies were discovered, and these demonstrate that the property type was in use in areas like Bellflower and Artesia during the 1940s and 1950s; the oldest dated photograph of a Streamline Moderne milking parlor in Artesia is from 1940. The Streamline Moderne milking parlor appears to have traveled from Los Angeles County to Ontario in the 1940s as dairymen began to move their operations to western San Bernardino County, and the trend accelerated rapidly in the mid-1950s along with the continued migration of dairies to Chino Valey. A 1940 article in the Chino Champion describes the Abacherli Dairy at the intersection of Walnut and San Antonio avenues as a state-of-the-art local dairy plant. Although the article does not include photographs, a milk house of concrete construction with concrete floors is described and may have been an early example of the typology (Chino Champion 1940). By 1947, the Journal of Dairy Science was recommending glass block for use in milk processing plants because it provided illumination without allowing dirt to infiltrate like an open window. The same publication also praises its "modern look" (Nelson: 1947). Other dairy-oriented publications also recommended use of the glass block and masonry construction in the late 1940s (University of Wisconsin: 1949). And the extant Streamline Moderne milk parlor at the Grant Dairy (in the current study area) is known to have been built in 1947 or 1948.

The local popularity of glass block in milking parlors appears to have peaked in the 1950s, when many local examples of this building type were constructed. Glass blocks were heavily advertised in dairy trade journals throughout the 1950s, and construction of the building typology continued into the 1960s. A Streamline Moderne milking parlor appears in a 1956 article contrasting "modern dairy plants" with the large wooden barns of the early twentieth century (Chino Champion 1956). (Although its construction date is not specifically mentioned, it would be unlikely for a local newspaper to tout a building as "modern" if it were more than two or three years old.) Although documents that substantiate exact dates for construction of Streamline Moderne milk parlors in Ontario have not been discovered, available evidence indicates that most were constructed between 1940 and 1965. Since we have demonstrated that the actual construction of this building type did not take place within the Art Deco era (1920 – 1940) this study will use Streamline Moderne Milk Parlor in reference to this building type and will consider the period of significance 1940 – 1965.

Subject Property History

The dairy at 7260 and 7244 Edison Avenue was Lots 19 & 36 of Section 18 of Mexican land grant Rancho Santa Ana del Chino. The roughly 18 acres of farmland changed hands several times during the first decades of the twentieth century; although there was a small building set well back from Edison Avenue near the western parcel boundary by the 1930s, there is no indication that any of its early owners lived on the property. Nor has research revealed specific information about its early agricultural use.

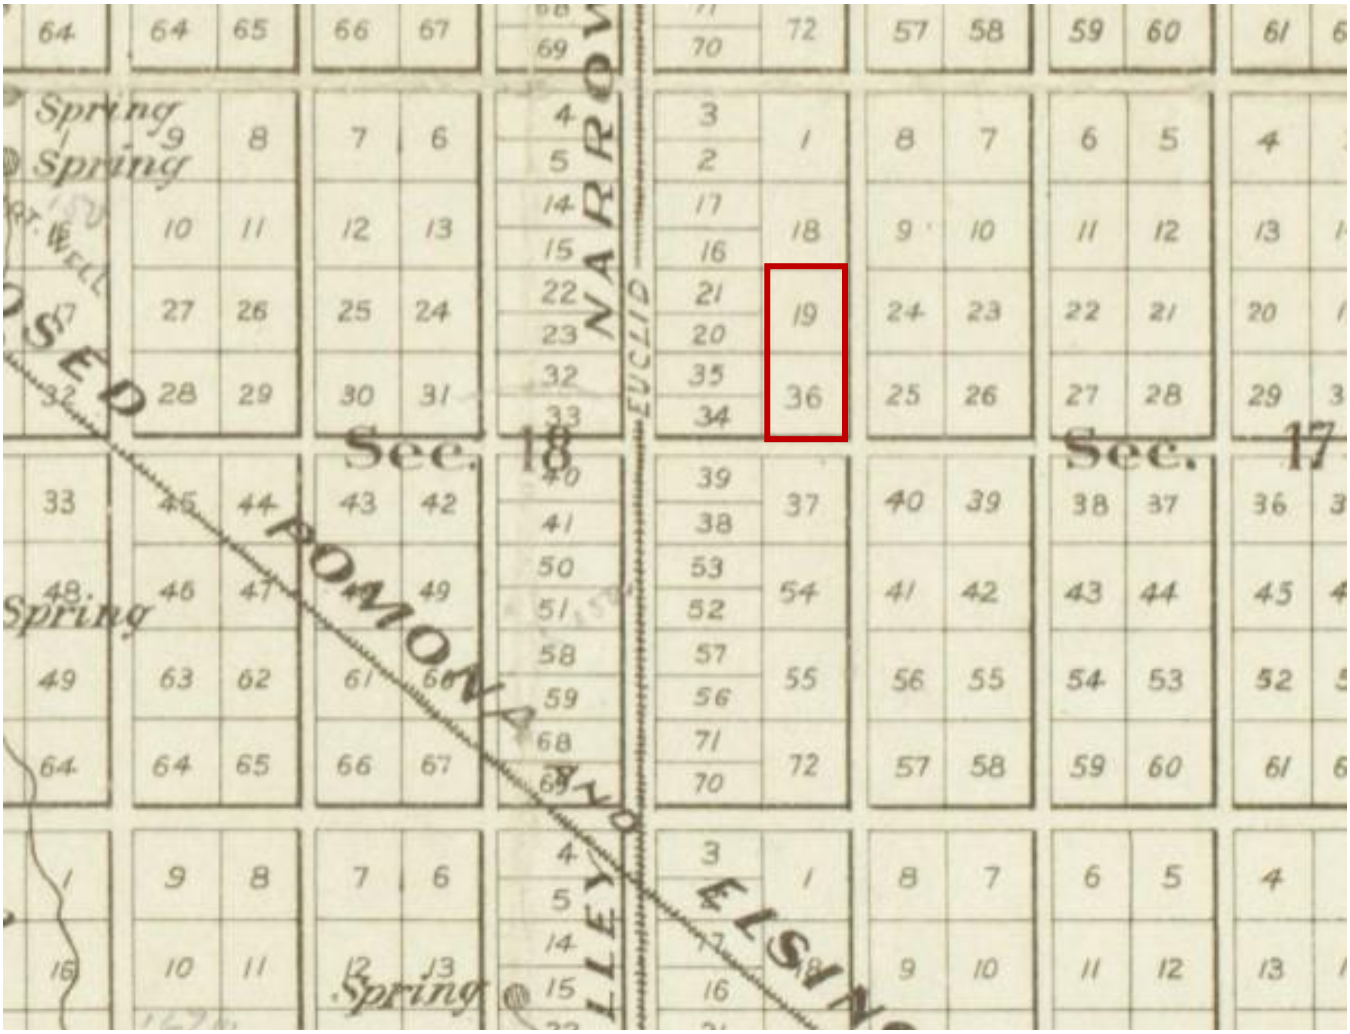

Figure 1: Britton & Rey Map of Subdivision of Rancho Santa Ana del Chino, 1889, Subject property outlined in red.

Figure 2: Lots 18 & 36 outlined in red prior to development of current buildings, USDA Aerial, 1936.

The older house at 7244 Edison Avenue was constructed about 1950. The first known operators of a dairy on the property were Floris and Harriet Ykema. Born in Iowa, Floris Ykema (1920-1986) married his wife, Harriet, in 1942 and they moved to California in 1945 after he served in World War II. He worked for a dairy before starting his own in Chino. In 1954, the Chino Champion reported that the property was a new dairy operated by Floris Ykema (Chino Champion 1954). Floris and Harriet moved into the house with their young daughters Alicia, Ruth Ann, and Gladys. The family attended the First Christian Reformed Church in Chino and Floris served on the board for the Ontario Christian School. The second residence at 7260 Edison Avenue was built in 1957, and the family moved into the new Ranch-style house. The Streamline Moderne milking parlor was built between the residences about the same time, and corrals for the cows as well as pole shade structures were developed to the north of the buildings.

Figure 3: Subject property with blue arrow showing original residence (c1950) at 7244 Edison Avenue, USDA Aerial, 1953.

Figure 4: Subject property, blue arrow showing c1957 Milk Parlor and house with corrals to the north, USDA Aerial, 1959.

Ykema became an industry leader in the area; in his first year of local operation, Ykema's herd had the highest butterfat average for October (Chino Champion 1954). Ykema became the president of the District 10 of the American Dairy Association of California, and the chairman of the California Milk Advisory board (Chino Champion 1973). He became an outspoken advocate for the industry and was frequently quoted in newspapers across California. The Ykema dairy operation continued to grow, and by the 1970s he was considered a major producer. He also purchased two other diaries in Chino and leased a dairy in Hanford (Chino Champion 1979). In 1979, Ykema was elected Dairyman of the Year.

In the early 1970's, the property was also home to Jim Visser (b.1944), and Thelma DeBoer Visser (b.1944) in 1966. They moved into 7244 Edison Avenue about 1970, the year their twin sons were born. Their sons, Jarrod and Arlan Visser, died after a gasoline fire in their garage in 1972 (Chino Champion 1972). The Vissers stayed on the property until at least 1974.

In 1981, the Ykemas sold the property at 7260 Edison Avenue to Donald and Wilma Van Dam. They owned an additional dairy in El Mirage, the Van Dam Dairy (Chino Champion 1979). They remained in the dairy business, with property on Edison Avenue until 2005, when their family and dairy moved to New Mexico (Chino Champion 2005).

In 1985, Gordon and Jo Ann Vander Meulen lived at 7260 Edison Avenue with their daughter. The same year, Norman Sterkel and Lori Lindholm lived at 7244 Edison Avenue, with their daughter Emily Ann (Chino Champion 1985). In 2008, Eugene Cellier III lived at 7260 Edison Avenue. In 2007, Cellier started the company Bottoms Up Hooftrimming in Chino. The following year he purchased Central Mower Service in Chino from the previous owner, Charles Douma.

Evaluation of New Model Colony Area Associations

The subject property has no extant buildings constructed prior to the 1950s, it therefore has no potential association with the following historic contexts identified in the City of Ontario Historic Context for the New Model Colony Area: 1. Pre-1930 Rural Residential or Free-Grazing Dairy Properties and 3.1930-1949 - Dry Lot Dairying with Mechanization. Since two milking parlor on the property was constructed during the 1950s, it is a potential example of 4. Post-1950 - Scientific, Large Capacity Dairies, although it does not meet the minimum characteristics as analyzed in greater detail below.

As analyzed below, it is an example of 2. Art Deco or Streamline Moderne Milk Parlors. New facts uncovered during the current study indicate that Context 2 should be revised to Streamline Moderne Milk Parlors (1940 – 1965).

2. Art Deco or Streamline Moderne Milk Parlors minimum characteristics according to Historic Context:

> modestly sized, rectangular, two part, one story milking parlor designed in the Art Deco or Streamline Moderne architectural styles. The property must exhibit those character-defining features that are generally recognized with these styles, as described above. The property also must include a circular driveway in front of the building. It may include landscaping features, but these are not essential.

The subject property exhibits the minimum characteristics of the building type according to the Historic Context. (As discussed at length above, although the Historic Context incorrectly dated this building typology, it accurately described it and identified it as significant.) Since the milking parlor retains its circular drive, glass block windows on the primary elevation, and other architectural features of the style as well as the utilitarian back section for milking, it qualifies as a high integrity example of this historic building typology and is therefore eligible for local listing according to the Historic Context.

4. Post-1950 - Scientific, Large Capacity Dairies minimum characteristics according to Historic Context:

> at least one large residence that dates to this period in the Ranch architectural style that exhibits little alteration, a large "herringbone style" milking parlor designed in the Ranch style, a circular driveway, numerous geometrically spaced rows of pole structures and other related dairy facilities, and a vast expanse of open space to the rear of the property. The property may have multiple large residences and a few smaller workers' residences.

The subject property has one Streamline Moderne milking parlors that date from this era, but it lacks a Ranch-style milking parlor exhibiting the later herringbone style as required for significance under the Historic Context; it also has a circular driveway. However, the current property at 18 acres is not close to the average 40-acre size of properties within this context. Furthermore, the subject property lacks a large Ranch-style residence. In the other facilities development during the 1950s such as the large pole structures to the north of the houses and no hardware have been demolished. Therefore, according to the standards set forth by the Historic Context, the property no longer conveys its historic association as a post-1950 Scientific, Large Capacity dairy property.

Since the property qualifies as a high integrity example of a Streamline Moderne Milk parlor is eligible for local listing under Context 2 but ineligible under the other contexts as set forth in the Historic Context.

National Register and California Register Evaluation

The National Register of Historic Places and California Register of Historical Resources require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible. A resource is eligible if (A/1) it is associated with events that have made a significant contribution to the broad patterns of our history; (B/2) it is associated with the lives of persons important in our past; (C/3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (D/4) it has yielded or is likely to yield information important in prehistory or history. The California Register

also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]).

Criterion A/1: The property at 7244 & 7260 Edison Avenue was constructed within the context of residential and agricultural development in Ontario and is generally associated with the development of the dairy industry in the Chino Valley. Its owner and developer was Floris Ykema, a dairy industry leader who made the property an exemplary dairy almost as soon as it is established, it is significant within historic context of development of the dairy industry. Therefore, the property is recommended eligible to the NRHP or CRHR under Criterion A/1.

Criterion B/2: The property is associated with the life of a person important to our history. Floris Ykema was a leader in the industry, who began winning prizes for quality the year the property was established. He was active in the community, serving on the school board as well as in elected positions representing the industry throughout California. Although he expanded his operation over the decades, he continued to live on the subject property for most of his productive life. Therefore, the property exhibits the association required for eligibility under Criterion B/2. The property is recommended eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: The two residences are not significant for their architecture and do not contribute to the architectural significance of the property. Research did not reveal any architects or important builders associated with their construction. The buildings are unremarkable examples of 1950s residences in Ontario and have also been altered outside the historic era. However, the c1957 milking parlor is an excellent example of a Streamline Moderne milk parlor, which has been previously identified in a historic context statement as an important local property type. It features design elements such as the rounded corners of the facades, a shaped parapet, glass block windows, and a flat clay tile roof. For these reasons, it is recommended eligible for the National Register or California Register under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 7244 & 7260 Edison Ave are examples of well-understood types of construction and do not appear to be a principal source of important information in this regard.

Integrity. Eligible resources must retain integrity sufficient to convey that eligibility and to qualify as significant resources under CEQA. Integrity is measured by the degree to which a resource retains its historic location, design, setting, materials, workmanship, feeling, and/or association. The property has not been moved and thus retains integrity of location.

The original historic fabric of the milk parlor appears intact despite the entrance being boarded up. Therefore, the property retains integrity of design, materials, and workmanship.

Although the neighborhood around the subject property has become more heavily developed over the decades, the immediate vicinity of the property including adjacent parcels remain mostly open and undeveloped land, and there are several other historic-era dairies in the immediate vicinity. Therefore, the property retains integrity of setting.

Intrusion of non-historic-era buildings near the milking parlor has resulted in some erosion of integrity of feeling. However, the property retains character-defining features that strongly evoke the feeling of a c1957 milking parlor: smooth stucco finish, projecting center volume, rounded corners, shaped parapet, and decorative clay tile roof. These essential and defining features would allow the building to strongly evoke the feeling of a Streamline Moderne milk parlor if additions were removed. The physical features that characterized the original building are sufficiently intact to convey its historic character as a 1940 – 1965 milking parlor. It therefore retains integrity of association.

The milking parlor retains sufficient integrity to convey its identity as a c1957 dairy building.

The subject property and its constituent c1957 milking parlor are therefore recommended eligible for listing on the National Register or the California Register, and as such qualifies as a historical resource under the California Environmental Quality Act (CEQA). Thus, BCR Consulting recommends the National Register of Historic Places Status Code "3S ".

Re: Euclid Mixed Use Specific Plan Project (KIM2223), San Bernardino County

Dear Mr. Brunzell:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

PALEONTOLOGICAL RESOURCES OVERVIEW

WESTERN SCIENCE CENTER

October 25th, 2022

BCR Consulting, LLC
Joseph Orozco
505 W. 8th St.
Claremont, CA 91711

Dear Mr. Orozco,

This letter presents the results of a record search conducted for the Euclid Mixed Use Specific Plan Project located in the city of Ontario, San Bernardino County, CA. The project site is north of Edison Avenue, south of Schaefer Avenue, and east of Euclid Avenue on Township 2 South, Range 7 West, in an unsectioned portion of the *Ontario, CA* and *Prado Dam, CA* USGS 7.5 minute quadrangles.

The geologic units underlying the project area are mapped primarily as young alluvial deposits from the Holocene and late Pleistocene epochs (Morton and Miller 2006). Holocene alluvial units are considered to be of high preservation value, but material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, Pleistocene alluvial units are considered to be highly paleontologically sensitive. The Western Science Center does not have localities within the project area or within a 1 mile radius. However, this is likely due to the project area's distance from the museum and should not be taken as indicative of paleontological sensitivity; other repositories may have localities in the area.

Any fossil specimen from the Euclid Mixed Use Specific Plan Project would be scientifically significant. Excavation activity associated with the development of the project area would impact the paleontologically sensitive Pleistocene alluvial units, and it is the recommendation of the Western Science Center that a paleontological resource mitigation program be put in place to monitor, salvage, and curate any recovered fossils associated with the study area.

If you have any questions, or would like further information, please feel free to contact me at bstoneburg@westerncentermuseum.org.

Sincerely,

Brittney Elizabeth Stoneburg, MSc
Collections Manager

HISTORIC RESOURCE RELOCATION FEASIBILIITY STUDY

November 17, 2023

Jason Lee
V.P. RCCD Inc.
jasonl@rccdinc.com

Reference: **RELOCATION OF MILKING PARLORS – FEASIBILITY STUDY**
VENEGAS FARM (13813 EUCLID AVE) AND DRAKE FARM (7275 SCHAEFER AVE)
ONTARIO, CALIFORNIA
[S.F. PROJECT #23278]

Dear Jason:

We have completed our feasibility study for the relocation of two historic milking parlors located on the Venegas Farm (13813 Euclid Ave.) and the Drake Farm (7275 Schaefer Ave.) in Ontario, CA. Our findings are based on visual observations made while on both sites on October 25, 2023. Art Venegas, the owner of the Venegas Farm, accompanied us on the site visit. No existing building drawings or backgrounds were provided for our use, and no exploratory demolition or materials investigation was performed as part of the site visit.

Building Description

The two milking parlor buildings are rectangular in plan and have several similarities. Both buildings are separated into a smaller front portion and a larger back portion.

The front portion of both buildings is an enclosed space that is approximately thirty-six (36) feet wide by fifteen (15) feet deep and contains storage tanks for the milk product, washrooms, and storage rooms. Wood framed stud walls are supported on concrete (or possibly concrete block) stem walls. Several glass block infill windows are in the wood stud walls. The ceiling and roof are wood framed.

The back portion of both buildings is much larger with the same width (approximately 36 feet) but extends more than three times the depth of the front portion. The back portion of the building is a covered pole structure with open air sides above an approximately four (4) foot tall stem wall. Four lines of steel pipe posts (two on the perimeter and two interior lines) support the wood joist and corrugated metal roof. Animal stalls and equipment for milking operations fill this portion of the building.

Foundations for the buildings are not visible but are presumed to be concrete spread footings below the stem walls and pipe posts.

There are some differences between the two buildings (Venegas parlor and Drake parlor).

1. The concrete (or concrete block) stem walls below the wood framed walls at the front portion of the parlor are between two (2) feet and three (3) feet tall in the Drake parlor. The height of the stem walls in the Venegas parlor was difficult to measure but they are much taller – potentially full height to the ceiling framing.

2. The back portion of parlors are different in depth. The Drake parlor depth is approximately fifty-two (52) feet, and the Venegas parlor was originally approximately one hundred (100) feet deep.

3. The back portion of the Venegas parlor has been modified with the removal of the two (2) interior lines of steel pipe posts. Modifications to the roof framing were made to allow the roof to span the width of the building.

Site Visit Observations

The Drake parlor is in relatively good condition and is functioning as a working parlor. The Venegas parlor is also functioning as a working parlor, but the wood and corrugated metal roof on the back portion is in bad condition. Approximately twenty (20) feet at the back of the building has been demolished, and the back twenty (20) feet of the existing building is severely deteriorated and in danger of collapsing. Shoring the back deteriorated portion was recommended while on site.

Conclusions

It is our opinion that it is feasible to relocate the Drake parlor to a receiver site. The front portion of the parlor can be separated from the back portion to facilitate the building relocation. The wood framed walls in the front portion could be detached and lifted off the stem walls. New foundations and stem walls would need to be constructed at the receiver site to support the relocated wood portion. The back portion could be lifted at the four (4) lines of steel pipe posts for relocation of the posts and roof. The perimeter stem wall and animal stalls would need to be rebuilt at the receiver site.

The Venegas parlor would be much more challenging to relocate. The front portion of the parlor could be separated and lifted off the stem walls. But the stem walls are much taller than the Drake parlor, so the portion lifted would basically be the wood roof framing. In addition, the back portion of the parlor has been modified and is severally deteriorated. Relocating the back portion is not feasible.

Summary

Drake Parlor - It **is** feasible to relocate the building in its entirety (with the exception of the stem walls in the front and back portion of the parlor and the animal stalls in the back portion of the parlor).

Venegas Parlor – The roof of the front portion of the building could be lifted and relocated. It **is not** feasible to relocate the remainder of the front portion and the entire back portion of the building.

Thank you very much for the opportunity to work with you on this challenging and interesting project. If you have any questions, please feel free to contact us at your convenience.

Sincerely,
STRUCTURAL FOCUS

Russell Kehl, S.E.
Principal, President

APPENDIX D3

NATIVE AMERICAN CONSULTATION

NAHC CONSULTATION

NATIVE AMERICAN HERITAGE COMMISSION

Governor's Office of Planning & Research

FEB 17 2023

STATE CLEARING HOUSE

February 14, 2023

Edmelynne V. Hutter
City of Ontario
303 East B Street
Ontario, CA 91764

Re: 2023020281, Euclid Mixed Use Specific Plan Project, San Bernardino County

Dear Ms. Hutter:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).

2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.

3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).

4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:

- **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
- **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:

- **a.** If part or all of the APE has been previously surveyed for cultural resources.
- **b.** If any known cultural resources have already been recorded on or adjacent to the APE.
- **c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
- **d.** If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.

- **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
- **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cameron.Vela@nahc.ca.gov.

Sincerely,

Cameron Vela

Converse Project No. 21-81-154-00 (02)

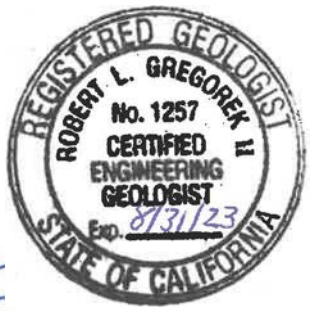
Dear Mr. Lee:

Converse Consultants (Converse) is pleased to submit this Preliminary Geotechnical Investigation and Organic Soil/Manure Evaluation Report to assist with the proposed Euclid Mixed Use Specific Plan business park development located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, San Bernardino County, California. This report was prepared in accordance with our proposal dated January 4, 2021 and your approval of our proposal dated January 5, 2022.

Based upon our field investigation, laboratory data, and analyses, the project site is considered feasible from a geotechnical standpoint, provided the recommendations presented in this report are incorporated into the design and development of the project.

We appreciate the opportunity to be of service to Euclid Land Investments. Should you have any questions, please do not hesitate to contact us at 909-796-0544.

CONVERSE CONSULTANTS



Hashmi S. E. Quazi, PhD, GE, PE
Principal Engineer

Dist.: 1/Addressee (e-mail)

PROFESSIONAL CERTIFICATION

This report has been prepared by the individuals whose seals and signatures appear herein.

The findings, recommendations, specifications, or professional opinions contained in this report were prepared in accordance with generally accepted professional engineering, engineering geologic principles, and practice in this area of Southern California. There is no warranty, either expressed or implied.

Catherine Nelson, GIT
Senior Staff Geologist

Robert Gregorek, PG, CEG

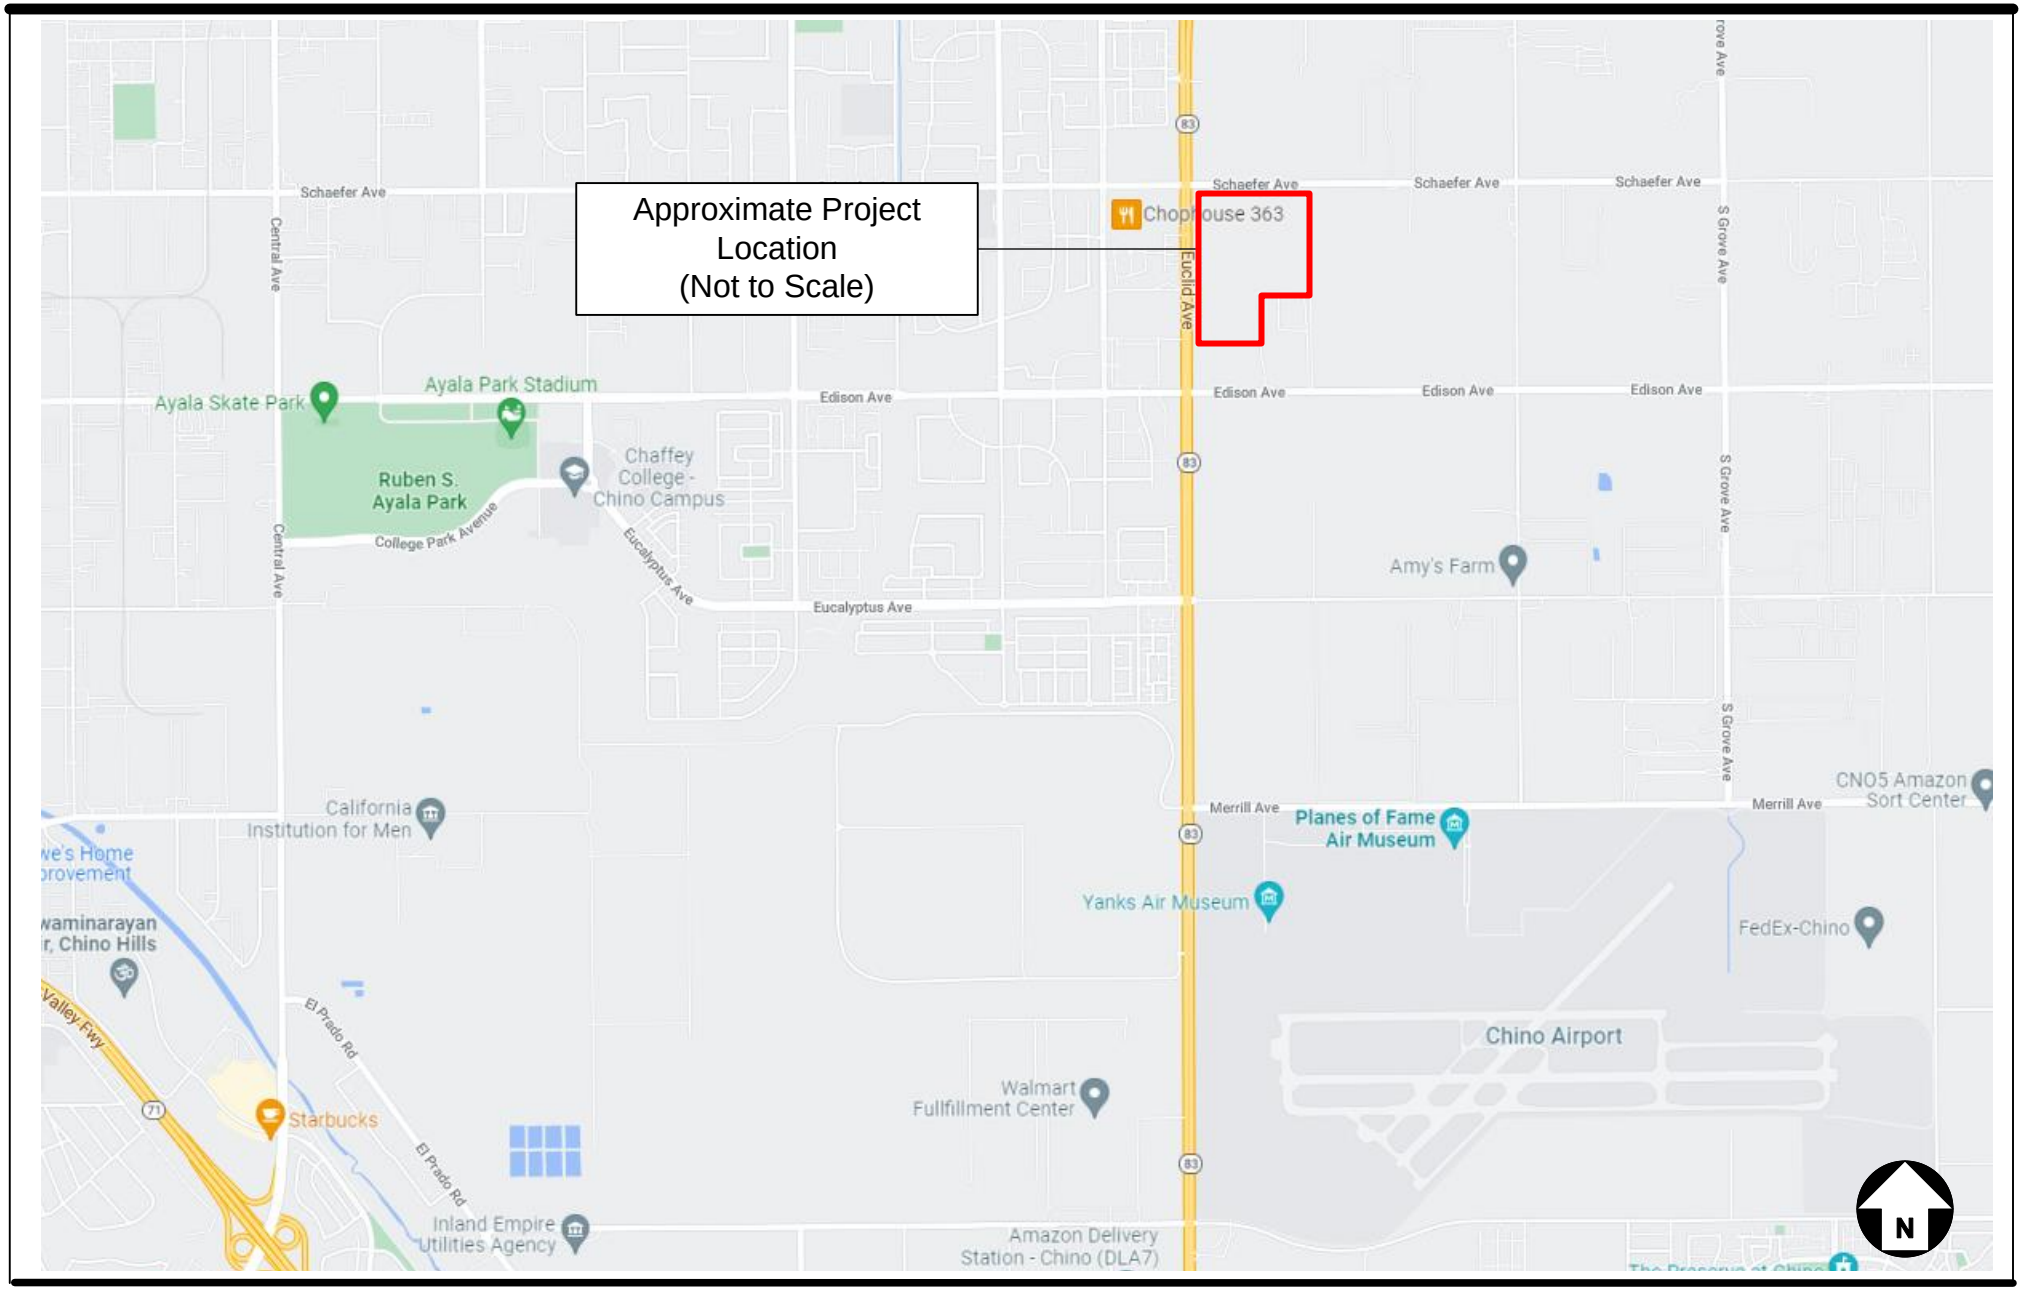
1.0 INTRODUCTION

This preliminary geotechnical investigation, organic soil/manure evaluation prepared by Converse for the 59.6-acre L-shaped shaped active dairy and agricultural site located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, San Bernardino County, California. The approximate location of the proposed project is shown in Figure No. 1, *Approximate Project Location Map.*

The purpose of this investigation was to evaluate the current nature and engineering properties of the subsurface soils and groundwater conditions and to provide geotechnical recommendations for the proposed residential development.

This report was prepared for the project described herein and is intended for use solely by Euclid Land Investments and their authorized agents. This report may be made available to the prospective bidders for bidding purposes. However, the bidders are responsible for their own interpretation of the site conditions between and beyond the boring locations, based on factual data contained in this report. This report may not contain sufficient information for use by others and/or other purposes.

2.0 PREVIOUS SITE INVESTIGATIONS



The referenced geotechnical evaluation of a soil stockpile at the subject site was performed Converse Consultants in 2021, with the data incorporated into this report. To the best of our knowledge no other previous geotechnical investigations or reports were prepared for the development of the site at this time.

3.0 SITE DESCRIPTION AND BACKGROUND

The 59.6-acre L-shaped shaped active dairy and agricultural site is located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, San Bernardino County, California. The property is bounded to the north by Schaefer Avenue, to the west by Euclid Avenue, to the south and east by existing active and abandoned dairies.

The site slopes gently from the northeast to the southwest and south. Drainage appears to flow south and southwest. Site elevations range from approximately 730 feet above mean sea level (msl) in the northeast portion of the site to approximately 690 feet above msl in the southwest portion of the site.

The present site conditions are depicted in Photographs Nos. 1 through 5.

Project: Euclid Mixed Use Specific Plan Project
Location: Southeast Corner of Euclid Avenue and Schaefer Avenue

4.0 PROJECT DESCRIPTION

Based on conversations with Mr. Jason Lee of Euclid Land Investments the property will be developed for business park use. No development or grading plans are available, at this time. However, grading is anticipated to have cuts and fills of up to 5 feet to 10 feet or less. The structures will likely be one to two-story tilt up buildings founded on shallow footings with slab-on-grade with concrete wall, steel and possible block wall construction. Associated with the development will likely be above and below ground utilities, access roads, and interior streets.

5.0 SCOPE OF WORK

The scope of Converse's investigation is described in the following sections.

5.1 Project Set-up

The project set-up consisted of the following tasks.

- Review of existing plans, reports, and data relevant to the project.
- Conducted a site reconnaissance to mark the exploration locations and to verify drill rig/backhoe access to the proposed locations were available.
- Notified Underground Service Alert (USA) at least 48 hours prior to conducting field work to clear the exploration locations of any conflict with existing underground utilities.

- Engaged a drill rig company to conduct exploratory borings and a backhoe company to excavate exploratory test pits.

5.2 Subsurface Exploration

Six exploratory borings (BH-01 through BH-06) were drilled using a truck-mounted CME 75 drill rig equipped with 8-inch diameter hollow-stem augers to investigate the subsurface conditions on January 20, 2022. The borings were drilled to depths ranging from 16.5 feet to 51.5 feet below the existing ground surface (bgs).

Thirteen exploratory test pits (TP-01 through TP-13) were excavated using a backhoe equipped with 24-inch-wide bucket to investigate the subsurface conditions on January 21 and 24, 2022. The test pits were excavated between 4.0 feet and 11.5 feet below the existing ground surface (bgs).

In addition, 8 exploratory test pits (TP-01 through TP-8) were previously excavated using a backhoe equipped with 24-inch-wide bucket to solely investigate the subsurface conditions of a soil stockpile on July 28, 2021, and obtain samples for organic content, expansion potential and corrosivity tests. The test pits were excavated from approximately 9.0 feet to 12.0 feet below the existing ground surface (bgs). Detailed logs of these previous test pits were not performed except for documenting the type of soil and the depth of fill soils.

The approximate locations of the current exploratory borings and test pits are shown on Figure No. 2, *Approximate Boring, Test Pit, and Overexcavation Locations Map*. A detailed discussion of the subsurface exploration is presented in Appendix A, *Field Exploration*.

5.3 Laboratory Testing

Representative samples of the site soils were tested in the laboratory to aid in soil classification, and to evaluate relevant engineering properties. These tests included the following.

- *In-situ* moisture contents and dry densities (ASTM D2216 and D2937)
- Organic Content (ASTM D2974, Methods A and C)
- Expansion Index (ASTM D4829)
- R-value (California Test 301)
- Soils Corrosivity (CTM 643, 422, 417, 532)
- Collapse (ASTM D5333)
- Grain size analysis (ASTM D6913)
- Maximum dry density and optimum-moisture content (ASTM D1557)
- Direct shear (ASTM D3080)
- Consolidation (ASTM D2435)

For *in-situ* moisture and dry density data, see the logs of boring in Appendix A, *Field Exploration*. For a description of the laboratory test methods and test results, see Appendix B, *Laboratory Testing Program*.

5.4 Analysis and Report Preparation

Data obtained from the field exploration and laboratory testing program was assembled and evaluated. Geotechnical analyses of the compiled data were performed, followed by the preparation of this report to present our findings, conclusions, and recommendations for the project.

6.0 SITE CONDITIONS

A general description of the subsurface conditions, various materials and groundwater conditions encountered at the site during our field exploration is discussed below.

6.1 Subsurface Profile

Based on our field exploration and laboratory test results, the subsurface soil at the project site consisted primarily of manure, organic artificial fill soil, topsoil, alluvium and older alluvium.

The various subsurface profiles and description of the earth material soils encountered are discussed below.

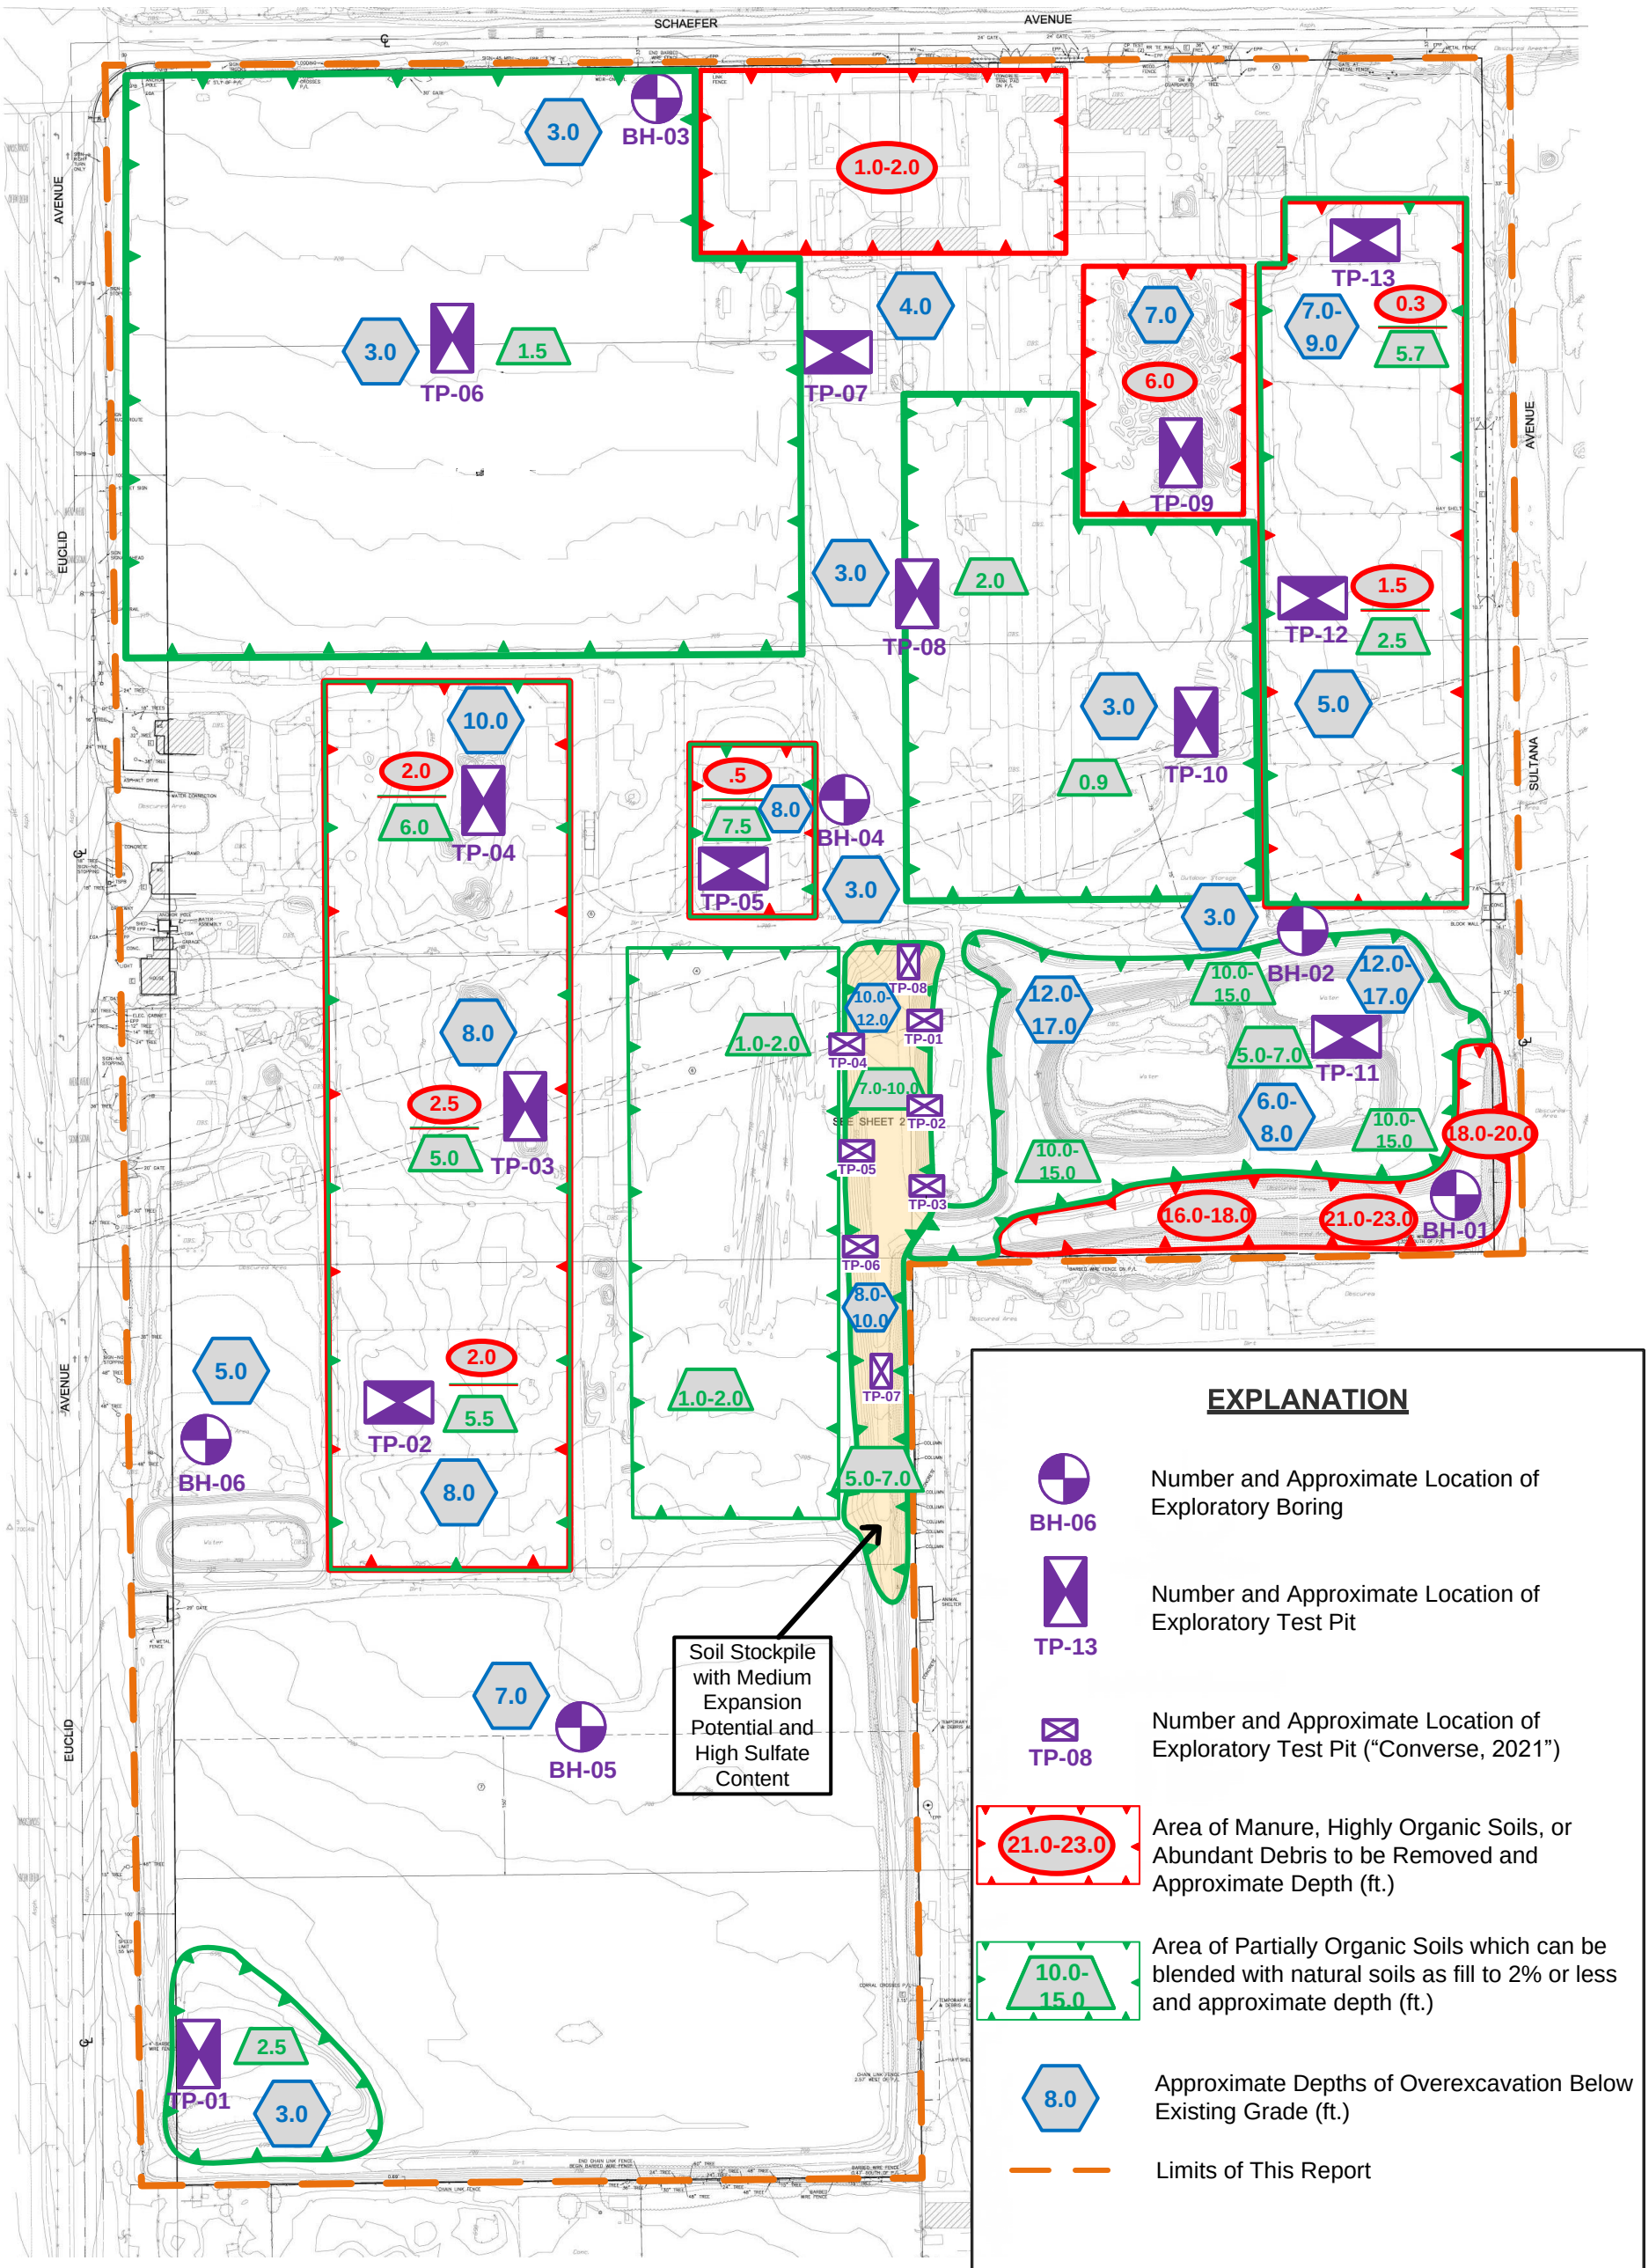
Manure/Highly Organic Soil: The site is partially covered by generally approximately 0.3 foot to 6.0 feet and locally, within the fill berm within the central eastern portion of the site, as much as 16.0 feet to 23.0 feet of manure or highly organic soils due to the site being on an active dairy farm. This manure and highly organic soils will need to be removed from the site prior to any developing. The approximate locations and depth of this material is shown on Figure No. 2, *Approximate Boring, Test Pit, and Overexcavation Locations Map*.

Organic Artificial Fill Soil: Due of the current dairy and agricultural use the surface of the majority of the project site is generally partially covered by up to approximately 0.9 foot to 10.0 feet of partially organic artificial fill soil. The average depth is approximately 5.0 feet. This material was encountered within some of the exploratory excavations and was generally comprised of silty sand, which was fine to coarse-grained, with trace to few gravel to 1.5-inches maximum dimension with occasional scattered cobbles to 10-inches maximum dimension, trace clay, some desiccation, some localized debris, some roots and rootlets, contained trace to few organics, medium dense to dense, moist and various shades of brown and orange. However, in the fill stockpile area within the central portion of the site these artificial fill soils were generally comprised of a mixture of silty sand, clayey sand, sandy silt and sandy clay and silty clay, which were fine to

coarse-grained, with trace to few organics/manure, loose to medium dense, moist to wet and various shades of brown, yellow, gray and black. In addition, the fill stockpile approximate locations and depths of this material is shown on Figure No. 2, *Approximate Boring, Test Pit, and Overexcavation Locations Map*.

Topsoil: Topsoil was encountered at the surface or below the artificial fill within some of the exploratory excavations at depths ranging from approximately 4.0 feet to 8.0 feet bgs. This material was generally comprised of silty sand and sandy silt, which was fine to coarse-grained, with scattered gravel to 1-inch maximum dimension, trace clay, slightly to very desiccated, trace to few organics, some roots and rootlets, medium dense/stiff, moist and various shades of brown, yellow, gray and green. Based on exploratory excavations the topsoil ranged from up to about 2.0 feet to 5.0 feet thick

Alluvium: Holocene alluvium was encountered below the artificial fill and topsoil in the majority of the exploratory excavations at depths ranging from approximately 0.9 feet to 7.5 feet bgs. Where observed, this material was generally comprised of sand, silty sand, clayey sand, sandy silt and some sandy clay, which was fine to medium-grained, with trace gravel to 1-inch maximum dimension, slightly to very desiccated, some oxidation staining, some pinhole pores, locally micaceous, medium dense to very dense/medium stiff to very stiff, moist and various shades of brown, orange, green and gray. Based on some of the exploratory borings the alluvium ranged from up to about 6.0 feet to 16.5 feet thick. Portions of the upper 0.5 foot to 2.0 feet are low in density.



Older Alluvium: Early Holocene to late Pleistocene older alluvium was encountered at depths ranging from approximately 11.0 feet to 15.0 feet bgs. Where observed, this material was generally comprised of sand, silty sand and sandy clay, which was fine to coarse-grained, with trace to few gravel to 1-inch maximum dimension, slightly to very desiccated, moderate oxidation staining, medium dense to very dense/medium stiff to stiff and various shades of brown, orange, and red.

For a detailed description of the subsurface materials encountered in the exploratory borings and test pits, see the logs, Drawing Nos. A-2 through A-20*,* in Appendix A, *Field Exploration.*

6.2 Groundwater

Groundwater was not encountered during our field investigation explored of 51.5 feet.

For comparison, regional groundwater data from the GeoTracker database (SWRCB, 2021) was reviewed to evaluate the current and historical groundwater levels. No site with groundwater data was identified within a 1.0-mile radius of the project site.

Approximate Boring, Test Pit, and Overexcavation Locations Map

Project No.
21-81-154-02

Converse Consultants

Figure No.
2

The National Water Information System (USGS, 2021) was reviewed for current and historical groundwater data from sites within an approximately 1.0-mile radius of the project site and no groundwater data was identified.

The California Department of Water Resources database (DWR, 2021) was reviewed for historical groundwater data from sites within a 1.0-mile radius of the project site. One site was identified within a 1.0-mile radius of the project site that contained groundwater elevation data. Details of that record are listed below.

- Well Name CHINO-1208672 (Station 340045N1176407W001), located approximately 1,650 feet east of the Project site, reported groundwater at depths ranging from 137.01 to 145.74 feet bgs between 2011 and 2021.

Based on the available data and the findings of our investigation, the historical high groundwater level and the current groundwater level is estimated to be deeper than 137 feet bgs. Groundwater is not expected to be encountered during construction of the proposed project. It should be noted that the groundwater level could vary depending upon the seasonal precipitation and possible groundwater pumping activity in each site vicinity. Perched water layers at depth may be present locally, particularly following high precipitation and irrigation events.

6.3 Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Depending on the extent and location below finish subgrade, expansive soils can have a detrimental effect on structures.

Based on the 2 current laboratory tests conducted during this investigation and the 2 previous laboratory tests conducted during our previous geotechnical evaluation of the 9 feet to 10-foot-high soil stockpile, in the central portion of the site. The expansion index of the upper 5.0 feet to 9.0 feet of the general site soils was 0 to 4, corresponding to a very low potential and of the stockpiled soils was 53 to 79 corresponding to a medium expansion potential. The estimated location of the medium expansion potential soils is indicated on Figure No. 2, *Approximate Boring, Test Pit and Overexcavation Locations Map*.

6.4 Collapse Potential

Soil deposits subjected to collapse/hydro-consolidation generally exist in regions of moisture deficiency. Collapsible soils are generally defined as soils that have potential

to suddenly decrease in volume upon increase in moisture content even without an increase in external loads. Moreover, some soils may have a different degree of collapse/hydro-consolidation based on the amount of proposed fill or structure loads. Soils susceptible to collapse/ hydro-consolidation include wind-blown silt, weakly cemented sand, and silt where the cementing agent is soluble (e.g., soluble gypsum, halite), alluvial or colluvial deposits within semi-arid to arid climate, and certain weathered bedrock above the groundwater table.

Granular soils may have a potential to collapse upon wetting in arid climate regions. Collapse/hydro-consolidation may occur when the soluble cements (carbonates) in the soil matrix dissolve, causing the soil to densify from its loose/low density configuration from deposition.

The degree of collapse of a soil can be defined by the collapse potential value, which is expressed as a percent of collapse of the total sample using the Collapse Potential Test (ASTM D4546). According to the ASTM guideline, the severity of collapse potential is commonly evaluated by the following Table No. 1, *Collapse Potential Values*.

Table No. 1, Collapse Potential Values

Collapse Potential Value (%)	Severity of Problem
0	None
0.1 to 2	Slight
2.1 to 6.0	Moderate
6.0 to 10.0	Moderately Severe
>10	Severe

Two collapse tests were conducted for this project. Based on the laboratory test result a collapse potential of 0.1 percent at a depth of 3.0 feet bgs in boring BH-03 was measured. A collapse potential of 0.2 percent at a depth of 2.5 feet bgs in boring BH-04 was measured. Two consolidation tests were conducted for this project. A collapse potential of 0.1 percent at a depth of 5.0 feet bgs in boring BH-02 was measured. No collapse potential at a depth of 8.0 feet bgs in boring BH-08 was measured. These indicate only a slight problem at the site. Collapse potential distress is typically considered a concern when collapse potential is over 2% (LA County, 2013).

6.5 Excavatability

The subsurface materials of the project are expected to be excavatable by conventional heavy-duty earth moving and trenching equipment.

The phrase “conventional heavy-duty excavation equipment” is intended to include commonly used equipment such as excavators, scrapers, and trenching machines. It does not include hydraulic hammers (“breakers”), jackhammers, blasting, or other

specialized equipment and techniques used to excavate hard earth materials. Selection of an appropriate excavation equipment models should be done by an experienced earthwork contractor.

6.6 Subsurface Variations

Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface soil conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and depositional characteristics of the earth material, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations.

6.7 Caving

Caving was not encountered in any of the exploratory borings or test pits. Localized caving may occur in excavations that extend into granular soils that are encountered on-site.

7.0 ENGINEERING GEOLOGY

The regional and local geology within the proposed project area is discussed below.

7.1 Regional Geology

The project site is located within the northern Peninsular Ranges Geomorphic Province of Southern California. The Peninsular Ranges Geomorphic Province consists of a series of northwest-trending mountain ranges and valleys bounded on the north by the San Bernardino and San Gabriel Mountains, on the west by the Los Angeles Basin, and on the south by the Pacific Ocean.

The province is a seismically active region characterized by a series of northwest-trending strike-slip faults. The most prominent of the nearby fault zones include the San Jacinto, Cucamonga, and San Andreas Fault Zones, all of which have been known to be active during Quaternary time.

Topography within the province is generally characterized by broad alluvial valleys separated by linear mountain ranges. This northwest-trending linear fabric is created by the regional faulting within the granitic basement rock of the Southern California Batholith. Broad, linear, alluvial valleys have been formed by erosion of these principally granitic mountain ranges.

The project site is located within the Chino Basin between the Chino Hills to the southwest and San Gabriel Basin to the north. The Elsinore Fault Zone is located approximately four miles south of the project site. This fault is a north to northwest

trending reverse fault that dips steeply towards the southwest. The Chino-Central Avenue Fault acts as a groundwater barrier along the western margin of the Chino Basin.

7.2 Local Geology

The project site is primarily underlain by Young alluvial-fan deposits, (Middle Holocene), consisting of slightly to moderately consolidated silt, sand, and coarse-grained sand to alluvial-fan deposits with boulders, having slightly to moderately dissected surfaces.

8.0 FAULTING AND SEISMICITY

The location of the site with respect to active faults and associated seismicity is discussed below.

8.1 Faulting

The project site is situated in a seismically active region. As is the case for most areas of Southern California, ground-shaking resulting from earthquakes associated with nearby and more distant faults may occur at the project site. During the life of the project, seismic activity associated with active faults can be expected to generate moderate to strong ground shaking at the site. Review of recent seismological and geophysical publications indicates that the seismic hazard for the project is high.

The project site is not located within a currently mapped State of California or San Bernadino County Earthquake Fault Zone for surface fault rupture.

Table No. 2, *Summary of Regional Faults,* summarizes selected data of known faults capable of seismic activity within 100 kilometers of the proposed pump station (coordinate 34.0018N and 117.6480W). The data presented below was calculated using the National Seismic Hazard Maps Database and other published geologic data.

Table No. 2, Summary of Regional Faults

8.2 Seismic Design Parameters

Seismic parameters based on the 2019 California Building Code (CBSC, 2019) and ASCE 7-16 are provided in the following table. These parameters were determined using the coordinate (33.9265N and 117.6052W) and the Seismic Design Maps ATC online tool.

Table No. 3, CBC Seismic Design Parameters

Seismic Parameters	
Site Coordinates	34.0018N and 117.6480W
Site Class	D*
Risk Category	II
Mapped Short period (0.2-sec) Spectral Response Acceleration, S_s	1.621g
Mapped 1-second Spectral Response Acceleration, S_1	0.582g
Site Coefficient (from Table 11.4-1), F_a	1.000
Site Coefficient (from Table 11.4-2), F_v	1.718
MCE 0.2-sec period Spectral Response Acceleration, S_{MS}	1.621g
MCE 1-second period Spectral Response Acceleration, SM_1	0.999g
Design Spectral Response Acceleration for short period S_{DS}	1.081g
Design Spectral Response Acceleration for 1-second period, S_{D1}	0.666g
Site Modified Maximum Peak Ground Acceleration, PGA_M	0.735g

** Stiff Soil Classification*

8.3 Secondary Effects of Seismic Activity

In general, secondary effects of seismic activity include surface fault rupture, soil liquefaction, landslides, lateral spreading, and settlement due to seismic shaking, tsunamis, seiches, and earthquake-induced flooding. The site-specific potential for each of these seismic hazards is discussed in the following sections.

Surface Fault Rupture: No portion of the project site is located within a currently designated State of California or San Bernadino County Earthquake Fault Zone (CGS, 2007and San Bernadino County, 2021). The potential for surface rupture resulting from the movement of nearby or distant faults is not known with certainty but is considered very low.

Liquefaction: Liquefaction is defined as the phenomenon in which a cohesionless soil mass within the upper 50 feet of the ground surface suffers a substantial reduction in its shear strength, due the improvement of excess pore pressures. During earthquakes,

excess pore pressures in saturated soil deposits may develop as a result of induced cyclic shear stresses, resulting in liquefaction.

Soil liquefaction generally occurs in submerged granular soils and non-plastic silts during or after strong ground shaking. There are several general requirements for liquefaction to occur and they are as follows.

- Soils must be submerged.
- Soils must be loose to medium-dense.
- Ground motion must be intense.
- Duration of shaking must be sufficient for the soils to lose shear resistance.

Based on review of hazard maps, the site is located within a State of California or San Bernadino County designated zone of liquefaction susceptibility (CGS, 2007; San Bernadino County, (2021). Based groundwater being deeper than approximately 137 feet bgs we estimate that the liquefaction induced settlement of the site is negligible.

Seismic Settlement: Dynamic dry settlement may occur in loose, granular, unsaturated soils during a large seismic event. Based on dense soil conditions, site-specific boring logs, soil types, soil conditions and blow counts, dry seismic settlement is expected to be minimal.

Landslides: Seismically induced landslides and slope failures are common occurrences during or soon after large earthquakes. Due to the flat nature of the project site, the potential for seismically induced landslides affecting the pump station is considered to be very low.

Lateral Spreading: Seismically induced lateral spreading involves primarily lateral movement of earth materials over underlying materials which are liquefied due to ground shaking. It differs from the slope failure in that complete ground failure involving large movement does not occur due to the relatively smaller gradient of the initial ground surface. Lateral spreading is demonstrated by near-vertical cracks with predominantly horizontal movement of the soil mass involved. Generally due to the negligible risk for liquefaction and flat nature of project site, the risk of lateral spreading is considered low.

Tsunamis: Tsunamis are large waves generated in open bodies of water by fault displacement or major ground movement. Due to the inland location of the project site, tsunamis are not considered to be a risk.

Seiches: Seiches are large waves generated in enclosed bodies of water in response to ground shaking. There are no enclosed bodies of water near the project site, therefore, seiching is not considered to be a risk during construction.

Earthquake-Induced Flooding: Dams or other water-retaining structures may fail as a result of large earthquakes. The project site is not located within a designated dam inundation area (DSOD, 2021).

9.0 LABORATORY TEST RESULTS

Laboratory testing was performed to determine the physical and chemical characteristics and engineering properties of the subsurface soils. Current physical test results are included in Appendix A, *Field Exploration* and Appendix B, *Laboratory Testing Program*. Discussions of the various test results are presented below.

9.1 Physical Testing

- *In-situ* Moisture and Dry Density: *In-situ* dry densities and moisture contents of the site soils were determined in accordance with ASTM Standard D2216 and D2937. Dry densities of the soils in borings BH-02 to BH-06 ranged from 81 to 121 pounds per cubic foot (pcf) with moisture contents of 8 to 34 percent. Dry densities of the manure and highly organic soils in boring BH-01 ranged from 47 to 71 pounds per cubic foot (pcf) with moisture contents of 23 to 97 percent. Results are presented on the Log of Borings and Test Pits in Appendix A, *Field Exploration.*

- Organic Content: Twelve organic content tests were performed during the current geotechnical investigation and eight organic content tests were performed during the previous geotechnical evaluation of the soil stockpile, within the central portion of the site, in accordance with ASTM Standard D2974 on representative bulk soil samples. The amount of organic material present in the organic artificial fill soils ranged from 0.8 to 8.7% and in the undisturbed natural soils ranged from 1.5 to 2.2%

- Expansion Index: Two representative bulk soil samples were tested during the current geotechnical investigation of the general site soils to evaluate the expansion potential in accordance with ASTM Standard D4829. The test results indicated an expansion index of 0 to 4, corresponding to very low expansion potential.

  In addition, two representative bulk soil samples were tested during the previous geotechnical evaluation of the soil stockpile, within the central portion of the site, to evaluate the expansion potential in accordance with ASTM Standard D4829. The test results indicated an expansion index of 53 to 79, corresponding to medium expansion potential.

- R-Value: One representative bulk sample was tested in accordance with Caltrans Test Method 301. The result of the R-value test was 65.

- Collapse Potential: Two representative samples were tested to determine the collapse potential in accordance with the ASTM Standard D4596. The test results of 0.1 and 0.2 percent, corresponds to a slight collapse potential.

- Grain Size Analysis: Three representative samples were tested to determine the relative grain size distribution in accordance with the ASTM Standard D6913. Test results are graphically presented in Drawing No. B-1, *Grain Size Distribution Results.* Based on the test results, soils are typically silty sand and sandy silt.

- Maximum Dry Density and Optimum Moisture Content: Two typical moisture-density relationships of representative soil samples were tested, in accordance with ASTM Standard D1557, with the results presented in Drawing No. B-2, *Moisture-Density Relationship Results*, in Appendix B, *Laboratory Testing Program.* The laboratory maximum dry densities were 117.0 and 120.2 pounds per cubic feet (pcf), with optimum moisture contents of 13.7 and 10.3 percent, respectively.

- Direct Shear: Two direct shear tests were performed in accordance with ASTM Standard D3080. One test was performed on relatively undisturbed samples and one test was performed on a sample remolded to 90 percent of the maximum dry density under soaked moisture condition in accordance with ASTM Standard D3080. The results of the direct shear tests are presented in Drawing Nos. B-3 through B-4, *Direct Shear Test Results* in Appendix B, *Laboratory Testing Program*.

- Consolidation Test – Two consolidation tests were performed on relatively undisturbed samples of the site soil, in accordance with ASTM Standard D2435. The test results are shown on Drawing No. B-5 and B-6, *Consolidation Test Results,* in Appendix B, *Laboratory Testing Program.*

9.2 Chemical Testing - Corrosivity Evaluation

One representative soil sample was tested during the current geotechnical investigation and four representative soil samples were tested during the previous geotechnical evaluation of the soil stockpile, within the central portion of the site, to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of these tests was to determine the corrosion potential of site soils when placed in contact with common pipe materials. The tests were performed by AP Engineering and Testing, Inc. (Pomona, CA) in accordance with California Test Methods 643, 422, and 417. The current and previous test results are presented in Appendix B, *Laboratory Testing Program and* are summarized in below.

- The pH measurements of the samples tested ranged from 8.1 to 8.7.

- The sulfate contents of the samples tested ranged from 43 ppm to 3,872 ppm (0.043 percent to 0.3872 percent by weight), respectively.
- The chloride concentrations of the samples tested ranged from 25 ppm to 227 ppm.
- The minimum electrical resistivities when saturated ranged from 300 ohm-cm and 1,703 ohm-cm.

10.0 EARTHWORK AND SITE GRADING RECOMMENDATIONS

Earthwork for the project will include grading, trench excavation, pipe subgrade preparation, pipeline bedding placement and trench backfill, as well as roadway pavement construction. Recommendations for earthwork are presented in the following subsections. General Earthwork Specifications are presented in Appendix C*, Earthwork Specifications.*

10.1 General

This section contains our general recommendations regarding earthwork for the proposed mixed use business park development of Euclid Mixed Use Specific Plan in the City of Ontario, San Bernardino County, California.

These recommendations are based on the results of our field exploration and laboratory testing as well as our experience with similar projects, and data evaluation as presented in the preceding sections. These recommendations may require modification by the geotechnical consultant based on observation of the actual field conditions during remedial grading.

Prior to the start of construction, all underground existing utilities and appurtenances should be located at the project site. Such utilities should either be protected in-place or removed and replaced during construction as required by the project specifications. All excavations should be conducted in such a manner as not to cause loss of bearing and/or lateral support of existing structures or utilities.

All existing structures, debris, deleterious material and surficial soils containing roots and perishable materials should be stripped and removed from the project site. Deleterious material, including manure, significant organics, highly organic disturbed fill soils, concrete, and debris generated during excavation, should not be placed as fill.

It should be the responsibility of the contractor to maintain safe working conditions during all phases of construction.

10.2 Private Sewage System Abandonment

From a geotechnical standpoint, any seepage pits, other private sewage systems, and/or other subsurface structures that may be encountered should be located, mapped on the grading plans, removed and/or properly abandoned. Abandonment and/or removal of septic systems that may exist should be in accordance with local codes and recommendations by Converse. Seepage pits, if abandoned in-place, should be pumped clean, backfilled with gravel or clean sand jetted into place, and then capped with a minimum of 2 feet of a 2-sack or greater slurry or concrete for a minimum distance of 2 feet outside the edge of the seepage pit. The top of the slurry or concrete cap should be at a minimum 10 feet below proposed grade.

10.3 Overexcavation

The site is generally underlain by approximately 3.0 to 9.0 feet of potentially compressible soils (artificial fill, topsoil and the upper low-density portions of the alluvium), and locally as much as 10.0 feet to 17.0 feet in fill stockpile areas, which may be prone to future settlement under the surcharge of foundation, improvements and/or fill loads. Therefore, these materials should be over-excavated to competent alluvium, within all areas of proposed structures and other improvements, and replaced with compacted fill soils. Within the entire level portions of the building pad areas, over-excavations should also extend at least 5.0 feet below proposed pad grade, or at least 3.0 feet below the lowest proposed footings, within the proposed building areas, whichever is deeper. Within any proposed wall footings areas over-excavation should also be a minimum of 5.0 feet below proposed pad grade or 2.0 feet below the proposed wall footings areas, whichever is deeper. All over-excavations should extend at least 5.0 feet or equal to the depth of over-excavation, whichever is greater, outside the entire level portions of the building pad area.

The final bottom surfaces of all excavations should be observed and approved by the project geotechnical consultant prior to placing any fill or structures. However, localized, deeper over-excavation could be encountered, based on findings in subsurface explorations and testing by the geotechnical consultant during grading of the final bottom surfaces of all excavations.

The estimated locations and approximate depths of over-excavation of unsuitable, compressible soil materials are indicated on Figure No. 2, *Approximate Boring, Test Pit and Overexcavation Locations Map*.

If isolated pockets of very soft, loose, eroded, or pumping soil are encountered, the unstable soil should be excavated as needed to expose undisturbed, firm, and unyielding soils.

The contractor should determine the best manner to conduct the excavations, such that there are no losses of bearing and/or lateral support to the existing structures or utilities (if any).

Areas to receive fill and/or other surface improvements should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition, and recompacted to at least 90 percent relative compaction (based on ASTM Test Method D1557).

10.4 Cut and Shallow Fill Under Building Pad Areas

Fill building pads with shallow cut and fill areas should be capped with a minimum of 5.0 feet of engineered structural fill, so that all footings for structures and walls are founded into engineered fill with a minimum of 3.0 feet of fill below footings for proposed structures and 2.0 feet below footings for proposed walls. Over-excavation should extend to the entire level portions of the building pad area with proposed structures or walls, to the depth of fill.

10.5 Cut/Fill Transition and Fill Differentials

To mitigate distress to structures related to the potential adverse effects of excessive differential settlement, cut/fill transitions should be eliminated from all level portions of the building pad areas. This should be accomplished by overexcavating the entire “cut” portion of the building pad area by at least 5.0 feet below proposed grade and replacing the excavated materials as properly compacted fill, so that all footings for structures and walls are founded into engineered fill with a minimum of 3.0 feet of fill below footings for proposed structures and 2.0 feet below footings for proposed walls. Recommended depths of over-excavation are provided in the following table.

Table No. 4, Overexcavation Depth for Cut/Fill Transitions

Depth of Fill (“Fill” Portion)	Depth of Overexcavation (“Cut” Portion)
Up to 5.0 feet	5.0 feet
Greater than 5.0 feet	One-third the maximum thickness of fill placed on the “fill” portion (15 feet maximum)

10.6 Engineered Fill

No fill should be placed until excavations and/or natural ground preparation have been observed by the geotechnical consultant. The native soils encountered within the project sites are generally considered suitable for re-use as compacted fill. Excavated soils should be processed, including removal of roots and debris, removal of oversized particles, mixing, and moisture conditioning, before placing as compacted fill. On-sites soils used as fill should meet the following criteria.

- No particles larger than 8 inches in largest dimension.
- Rocks larger than 4 inches should not be placed within the upper 12 inches of subgrade soils.
- Free of all significant organic matter, debris, or other deleterious material.
- Expansion index of 50 or less.
- Sand Equivalent greater than 15 (greater than 30 for pipe bedding).
- Contain less than 30 percent by weight retained in 3/4-inch sieve.
- Contain less than 40 percent fines (passing #200 sieve).

Based on field investigation and laboratory testing results, on-sites soils may be suitable as fill materials.

Imported materials, if required, should meet the above criteria prior to being used as compacted fill. Any imported fills should be tested and approved by geotechnical representative at least 72 hours prior to delivery to the site.

10.7 Organic Content

Based on the laboratory test results of the approximately the upper 0.9 foot to 10.0 feet of the partially organic fill soils on portions of the site has about 0.8 percent to 8.7 percent of organic content. This would be an average organic content of about 4.8 percent, for an average depth of approximately 5.0 feet, in the subject areas. Laboratory testing also indicated that generally the undisturbed natural soils below these depths (alluvium) had natural organic contents of about 1.5 percent to 2.1 percent. Therefore, these partially organic should be blended with undisturbed natural soils or removed from the site.

Fill materials should contain no more than 2 percent overall organics. The partially organic soils can be blended with the on-site natural soils at a ratio of at least 3 to 1 (natural soils/clean imported soils to partially organic soils) and placed as compacted fill, provided they are completely mixed during fill placement. The type of equipment and method of placement; blending and mixing of the partially organic materials with onsite natural soils or clean imported soils to be utilized by the grading contractor, should be reviewed and accepted by the geotechnical consultant prior to implementation. A possible method of placement that could be considered would be to place the partially organic materials at an angle to the pattern of the placement of the onsite natural soils or clean imported soils. The testing frequency for verifying the percent organic content should be established by the geotechnical consultant prior to fill placement once the method of blending, placement, and mixing of the partially organic materials with onsite natural soils or clean imported soils. The estimated locations and approximate depths of partially organic to be removed from the site or blended are also indicated on Figure No. 2, *Approximate Boring, Test Pit and Overexcavation Locations Map*.

10.8 Compacted Fill Placement

All surfaces to receive structural fills should be scarified to a depth of 12 inches. The soil should be moisture conditioned to within ±3 percent of optimum moisture content for coarse soils and 0 to 2 percent above optimum moisture content for fine soils. The scarified soils should be recompacted to at least 90 percent of the laboratory maximum dry density.

Fill soils should be thoroughly mixed, and moisture conditioned to within ±3 percent of optimum moisture content for coarse soils and 0 to 2 percent above optimum moisture content for fine soils. Fill soils should be evenly spread in horizontal lifts not exceeding 8 inches in uncompacted thickness.

Fill soils should be thoroughly mixed, and moisture conditioned to at least 0 to 2 percent above optimum moisture content. Fill soils should be evenly spread in horizontal lifts not exceeding 8 inches in uncompacted thickness.

All fill placed at the site should be compacted to at least 90 percent of the laboratory maximum dry density as determined by ASTM Standard D1557 test method unless a higher compaction is specified herein. The upper 12 inches of subgrade soils underneath pavements intended to support vehicle loads should be scarified, moisture conditioned, and compacted to at least 95 percent of the laboratory maximum dry density.

Fill materials should not be placed, spread or compacted during unfavorable weather conditions. When site grading is interrupted by heavy rain, filling operations should not resume until the geotechnical consultant approves the moisture and density conditions of the previously placed fill.

Observations and field tests should be performed by the project soils consultant to confirm that the required degree of compaction has been obtained. Where compaction is less than that specified, additional compactive effort should be made with adjustment of the moisture content as necessary, until the specified compaction is obtained.

Additional expansion index and corrosion testing should be completed after all fill has been placed and compacted at the site in order to confirm the soil properties and revise the foundation design parameters if necessary.

10.9 Backfill Recommendations Behind Walls

Compaction of backfill adjacent to retaining walls, which may be proposed, can produce excessive lateral pressures. Improper types and locations of compaction equipment and/or compaction techniques may damage the walls. The use of heavy compaction equipment should not be permitted within a horizontal distance of 5 feet from the wall.

Backfill behind any structural walls within the recommended 5-foot zone should be compacted using lightweight construction equipment such as handheld compactors to avoid overstressing the walls.

10.10 Shrinkage and Subsidence

The volume of excavated and recompacted soils will decrease as a result of grading. The shrinkage would depend on, among other factors, the depth of cut and/or fill, and the grading method and equipment utilized. Based on our exploration as well as previous experience in the other projects in close vicinity of this site, for the preliminary estimation, shrinkage factors for various units of earth material at the site may be taken as presented below.

- The shrinkage factor (defined as a percentage of soil volume reduction when moisture conditioned and compacted to the average of 92 percent relative compaction) for the upper 15 feet of soils is estimated to range from approximately 0 to 14 percent. An average value of 6 percent to 10 percent may be used for preliminary earthwork planning.
- Subsidence (defined as the settlement of native materials from the equipment load applied during grading and proposed fill loads) would depend on the construction methods including type of equipment utilized. Ground subsidence is estimated to be approximately 0.20 foot to 0.25 foot.

Although these values are only approximate, they represent our best estimates of the factors to be used to calculate lost volume that may occur during grading. If more accurate shrinkage and subsidence factors are needed, it is recommended that field-testing using the actual equipment and grading techniques be conducted.

10.11 Site Drainage

Adequate positive drainage should be provided away from the structures and excavation areas to prevent ponding and to reduce percolation of water into the foundation soils. A desirable drainage gradient is 1 percent for paved areas and 2 percent in landscaped areas. Surface drainage should be directed to suitable non-erosive devices.

10.12 Utility Trench Backfill

The following sections present earthwork recommendations for utility trench backfill, including subgrade preparation and trench zone backfill.

Open cuts adjacent to existing roadways or structures are not recommended within a 1:1 (horizontal: vertical) plane extending down and away from the roadway or structure perimeter (if any).

Soils from the trench excavation should not be stockpiled more than 6 feet in height or within a horizontal distance from the trench edge equal to the depth of the trench. Soils should not be stockpiled behind the shoring, if any, within a horizontal distance equal to the depth of the trench, unless the shoring has been designed for such loads.

10.12.1 Pipeline Subgrade Preparation

The final subgrade surface should be level, firm, uniform, and free of loose materials and properly graded to provide uniform bearing and support to the entire section of the pipe placed on bedding material. Protruding oversize particles larger than 2 inches in dimension, if any, should be removed from the trench bottom and replaced with compacted on-site materials.

Any loose, soft and/or unsuitable materials encountered at the pipe subgrade should be removed and replaced with an adequate bedding material. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom for as near its full length as is practicable.

10.12.2 Pipe Bedding

Bedding is defined as the material supporting and surrounding the pipe to 1 foot above the pipe. Recommendations for pipe bedding are provided below.

To provide uniform and firm support for the pipe, compacted granular materials such as clean sand, gravel or ¾-inch crushed aggregate, or crushed rock may be used as pipe bedding material. Typically, soils with sand equivalent value of 30 or more are used as pipe bedding material. The pipe designer should determine if the soils are suitable as pipe bedding material.

The type and thickness of the granular bedding placed underneath and around the pipe, if any, should be selected by the pipe designer. The load on the rigid pipes and deflection of flexible pipes and, hence, the pipe design, depends on the type and the amount of bedding placed underneath and around the pipe.

Bedding materials should be vibrated in-place to achieve compaction. Care should be taken to densify the bedding material below the spring line of the pipe. Prior to placing the pipe bedding material, the pipe subgrade should be uniform and properly graded to provide uniform bearing and support to the entire section of the pipe placed on bedding material. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom for as near its full length as is practicable.

Based on the design groundwater depth, migration of fines from the surrounding native and/or fill soils may not be considered in selecting the gradation of any imported bedding material.

10.12.3 Trench Zone Backfill

The trench zone is defined as the portion of the trench above the pipe bedding extending up to the final grade level of the trench surface. Excavated sites soil free of oversize particles and deleterious matter may be used to backfill the trench zone. Detailed trench backfill recommendations are provided below.

- Trench excavations to receive backfill should be free of trash, debris or other unsatisfactory materials at the time of backfill placement.
- Trench zone backfill should be compacted to at least 90 percent of the laboratory maximum dry density as per ASTM D1557 test method. At least the upper 1 foot of trench backfill underlying pavement should be compacted to at least 95 percent of the laboratory maximum dry density as per ASTM D1557 test method.
- Particles larger than 1 inch should not be placed within 12 inches of the pavement subgrade. No more than 30 percent of the backfill volume should be larger than ¾-inch in the largest dimension. Gravel should be well mixed with finer soil. Rocks larger than 3 inches in the largest dimension should not be placed as trench backfill.
- Trench backfill should be compacted by mechanical methods, such as sheepsfoot, vibrating or pneumatic rollers or mechanical tampers to achieve the density specified herein. The backfill materials should be brought to within ± 3 percent of optimum moisture content for coarse-grained soil, and between optimum and 2 percent above optimum for fine-grained soil, then placed in horizontal layers. The thickness of uncompacted layers should not exceed 8 inches. Each layer should be evenly spread, moistened or dried as necessary, and then tamped or rolled until the specified density has been achieved.
- The contractor should select the equipment and processes to be used to achieve the specified density without damage to adjacent ground, structures, utilities and completed work.
- It should be the responsibility of the contractor to maintain safe working conditions during all phases of construction.
- The field density of the compacted soil should be measured by the ASTM D1556 (Sand Cone) or ASTM D6938 (Nuclear Gauge) or equivalent.
- Trench backfill should not be placed, spread or rolled during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations should not resume until field tests by the project's geotechnical consultant indicate that the moisture content and density of the fill are in compliance with project specifications.

11.0 DESIGN RECOMMENDATIONS

Design recommendations for the structures are provided in the following section.

11.1 General Evaluation

The various design recommendations provided in this section are based on the laboratory testing as well as the assumption that in preparing the site, the earthwork recommendations provided in this report will be implemented.

11.2 Preliminary Shallow Foundation Design Parameters

The proposed one- and two-story concrete tilt up buildings and possible retaining walls may be supported on continuous or isolated spread footings founded completely within in competent compacted fill. The design of the shallow foundations should be based on the recommended parameters presented in the table below.

Table No. 5, Recommended Foundation Parameters

Parameter	1-Story Value	2-Story Value
Minimum continuous width (interior and exterior)	12 inches	15 inches
Minimum continuous or isolated footing depth of embedment below lowest adjacent grade (interior and exterior)	15 inches	18 inches
Allowable net bearing capacity	3,000 psf	3,300 psf

Isolated interior and exterior footings should be at least 24 inches wide. The footing dimensions and reinforcement should be based on structural design. The allowable bearing capacity can be increased by 500 pounds per square foot (psf) with each foot of additional embedment and 100 psf with each foot of additional width up to a maximum of 4,000 psf.

The net allowable bearing values indicated above are for the dead loads and frequently applied live loads and are obtained by applying a factor of safety of 3.0 to the net ultimate bearing capacity. If normal code requirements are applied for design, the above vertical bearing value may be increased by 33 percent for short duration loadings, which will include loadings induced by wind or seismic forces.

11.3 Lateral Earth Pressures and Resistance to Lateral Loads

In the following subsections, the lateral earth pressures and resistance to lateral loads are estimated by using on-site native soils strength parameters obtained from laboratory testing.

11.3.1 Active Earth Pressures

The active earth pressure behind any buried walls or foundation depends primarily on the allowable wall movement, type of backfill materials, backfill slopes, wall or

foundation inclination, surcharges, and any hydrostatic pressures. The lateral earth pressures for the project site are presented in the following table.

Table No. 6, Active and At-Rest Earth Pressures

Loading Conditions	Lateral Earth Pressure[1] (psf)	Lateral Earth Pressure[2] (psf)
	Level backfill	2:1 backfill
Active earth conditions (wall is free to deflect at least 0.001 radian)	40	60
At-rest (wall is restrained)	60	110

These pressures assume no surcharge and no hydrostatic pressure. If water pressure is allowed to build up behind the structure, the active pressures should be reduced by 50 percent and added to a full hydrostatic pressure to compute the design pressures against the structure.

11.3.2 Passive Earth Pressure

Resistance to lateral loads can be assumed to be provided by a combination of friction acting at the base of foundations and by passive earth pressure. A coefficient of friction of 0.35 between formed concrete and soil may be used with the dead load forces. An allowable passive earth pressure of 250 psf per foot of depth may be used for the sides of footings poured against recompacted soils. A factor of safety of 1.5 was applied in calculating passive earth pressure. The maximum value of the passive earth pressure should be limited to 2,500 psf for compacted fill.

Vertical and lateral bearing values indicated above are for the total dead loads and frequently applied live loads. If normal code requirements are applied for design, the above vertical bearing and lateral resistance values may be increased by 33 percent for short duration loading, which will include the effect of wind or seismic forces.

Due to the low overburden stress of the soil at shallow depth, the upper 1 foot of passive resistance should be neglected unless the soil is confined by pavement or slab.

11.4 Retaining Walls Drainage

The recommended lateral earth pressure values do not include lateral pressures due to hydrostatic forces. Therefore, wall backfill should be free draining and provisions should be made to collect and dispose of excess water that may accumulate behind earth retaining structures. Behind wall drainage may be provided by free-draining gravel surrounded by synthetic filter fabric or by prefabricated, synthetic drain panels or weep holes. In either case, drainage should be collected by perforated pipes and directed to a sump, storm drain, or other suitable location for disposal. We recommend drain rock

should consist of durable stone having 100 percent passing the 1-inch sieve and less than 5 percent passing the No. 4 sieve. Synthetic filter fabric should have an equivalent opening size (EOS), U.S. Standard Sieve, of between 40 and 70, a minimum flow rate of 110 gallons per minute per square foot of fabric, and a minimum puncture strength of 110 pounds.

11.5 Slabs-on-Grade

Slabs-on-grade should be supported on properly compacted fill. Compacted fill used to support slabs-on-grade should be placed and compacted in accordance with Section 10.8 *Compacted Fill Placement*.

Slabs should be designed and constructed as promulgated by the American Concrete Institute (ACI) and the Portland Cement Association (PCA). Care should be taken during concrete placement to avoid slab curling. Prior to the slab pour, all utility trenches should be properly backfilled and compacted.

Concrete floors should be underlain with a moisture-vapor retarder consisting of a 10-mil thick vapor barrier. Laps within the membrane should be sealed and overlapped at least 6 inches. Two (2) inches or more of clean sand should be placed above and below the membrane. These recommendations must be confirmed (and/or modified) by the foundation engineer with our concurrence, based upon the performance expectations of the foundation. It is the responsibility of the contractor to ensure that the moisture/vapor barrier systems are placed in accordance with the project plans and specifications, and that the moisture/vapor retarder materials are free of tears and punctures prior to concrete placement. Additional moisture reduction and/or prevention measures may be needed, depending on the performance requirements of future interior floor coverings.

In hot weather, the contractor should take appropriate curing precautions after placement of concrete to minimize cracking or curling of the slabs. The potential for slab cracking may be lessened by the addition of fiber mesh to the concrete and/or control of the water/cement ratio (maximum 0.45).

Concrete should be cured by protecting it against loss of moisture and rapid temperature change for at least 7 days after placement. Moist curing, waterproof paper, white polyethylene sheeting, white liquid membrane compound, or a combination thereof may be used after finishing operations have been completed. The edges of concrete slabs exposed after removal of forms should be immediately protected to provide continuous curing.

11.6 Expansion Potential

Based on the results of the expansion testing of representative site soils, the general on-site soils have an expansion index of 0 to 4 for an expansion potential of **Very Low**, however based on the laboratory test results portions of the subject stockpiled fill soil

materials, in the central portion of the site exhibited have expansion index of 53 to 79 for an expansion potential of **Medium**, in accordance with 2019 CBC. Based on experience in the area the majority of soils on the site are anticipated to be sandier and exhibit expansion potentials of **Very Low** to possibly **Low**. Therefore, consideration should be made to place these stockpiled fill soils in deeper fills (at least 5 feet below proposed grade), landscape areas or non-structural fills or blended with sandier soils on site, outside of the subject fill stockpile, to reduce the expansion potential, of the stockpiled soils. The estimated location of the medium expansion potential soils is indicated on Figure No. 2, *Approximate Boring, Test Pit and Overexcavation Locations Map*.

The expansion indices of the final finish-grade soils will vary from the results obtained during our current and previous investigations. The expansion potential of the finish-grade soils should be tested at the completion of grading.

11.6.1 Very Low Expansion Potential

The following are additional recommendations where foundation soils exhibit **Very Low** expansion potential (E.I. of 0 to 20) as classified in accordance with 2019 CBC.

Slabs-on-grade should have a minimum thickness of 5 inches for support of nominal live loads and reinforced with No. 3 bars spaced 24 inches or less on-centers, both ways. Slab reinforcement should be supported on concrete chairs so that the desired placement is properly placed per the design engineer. Structural design elements of slabs-on-grade, including but not limited to thickness, reinforcement, joint spacing of more heavily loaded slabs will be dependent upon the anticipated loading conditions and the modulus of subgrade reaction (200 kcf) of the supporting materials and should be designed by a structural engineer.

Subgrade for slabs-on-grade should be firm and uniform. All loose or disturbed soils including under-slab utility trench backfill should be recompacted. Prior to placing concrete, the subgrade soils below all floor slabs should be pre-watered to achieve a moisture content that is equal to 100% of the optimum moisture content of the subgrade soils. The moisture content should penetrate to a minimum depth of 12 inches. This should promote uniform curing of the concrete and minimize the development of shrinkage cracks.

11.6.2 Low Expansion Potential

The following are additional recommendations where foundation soils exhibit **Low** expansion potential (E.I. of 21 to 50) as classified in accordance with 2019 CBC.

Slabs-on-grade should have a minimum thickness of 5 inches for support of nominal live loads and reinforced with No. 3 bars spaced 18 inches or less on-centers, both ways. Slab reinforcement should be supported on concrete chairs so that the desired

placement is properly placed per the design engineer. Structural design elements of slabs-on-grade, including but not limited to thickness, reinforcement, joint spacing of more heavily loaded slabs will be dependent upon the anticipated loading conditions and the modulus of subgrade reaction (200 kcf) of the supporting materials and should be designed by a structural engineer.

Subgrade for slabs-on-grade should be firm and uniform. All loose or disturbed soils including under-slab utility trench backfill should be recompacted. Prior to placing concrete, the subgrade soils below all floor slabs should be pre-watered to achieve a moisture content that is equal to 110% of the optimum moisture content of the subgrade soils. The moisture content should penetrate to a minimum depth of 12 inches. This should promote uniform curing of the concrete and minimize the development of shrinkage cracks.

11.7 Settlement

The total settlement of shallow footings, designed as recommended above, from static structural loads and short-term settlement of properly compacted fill is anticipated to be 0.5 inch or less. The static differential settlement can be taken as equal to one-half of the static total settlement over a lateral distance of 40 feet.

11.8 Pipe Design for Underground Utilities

Structural design of pipes requires proper evaluation of all possible loads acting on pipes. The stresses and strains induced on buried pipes depend on many factors, including the type of soil, density, bearing pressure, angle of internal friction, coefficient of passive earth pressure, and coefficient of friction at the interface between the backfill and native soils. The recommended values of the various soil parameters for the pipe design are provided in Table No. 7, *Soil Parameters for Pipe Design*.

Where pipes are connecting to rigid structures near, or at its lower levels, and then are subjected to significant loads as the backfill is placed to finish grade, we recommend that provisions be incorporated in the design to provide support of these pipes where they exit the structure. Consideration can be given to flexible connections, concrete slurry support beneath the pipes where they exit the structures, overlaying and supporting the pipes with a few inches of compressible material, (i.e., Styrofoam, or other materials), or other techniques. Automatic shutoffs should be installed to limit the potential leakage from seismic event related damage.

Table No. 7, Soil Parameters for Pipe Design

Soil Parameters	Parameters
Total unit weight of compacted backfill (assuming 92% average relative compaction), γ	122 pcf

Soil Parameters	Parameters
Angle of internal friction of soils, ϕ	31º
Soil cohesion, c	195 psf
Coefficient of friction between concrete and native soils, fs	0.35
Coefficient of friction between pipe and native soils, fs	0.25 for metal or HDPE pipe 0.30 for CML&C pipe
Bearing pressure against Compacted Fill or Natural Soils	3,000 psf
Coefficient of passive earth pressure, Kp	3.12
Coefficient of active earth pressure, Ka	0.32
Modulus of Soil Reaction, E'	1,500 psi

11.9 Soil Corrosivity

The results of chemical testing of representative site soils with respect to common construction materials such as concrete and steel are presented in Appendix B, *Laboratory Testing Program*, and a general discussion are presented below.

The sulfate contents of the sampled *of the general site soils* correspond to American Concrete Institute (ACI) exposure category S0 for these sulfate concentrations (ACI 318-14, Table 19.3.1.1). No concrete type restrictions are specified for exposure category S0 (ACI 318-14, Table 19.3.2.1). A minimum compressive strength of 2,500 psi is recommended.

However, the sulfate content of *the soil stockpile, within the central portion of the site*, tested correspond to American Concrete Institute (ACI) exposure category S2 for this sulfate concentration (ACI 318-14, Table 19.3.1.1). ACI recommends a minimum compressive strength of 4,500 psi for exposure category S2 in ACI 318-14, Table 19.3.2.1. A minimum compressive strength of 4,500 psi is recommended. A maximum water cement ratio of 0.40 is recommended. Cementitious materials should be Type V. of the stockpiled soils was 53 to 79 corresponding to a medium expansion potential. Therefore, consideration should be made to place these stockpiled fill soils in deeper fills (at least 5 feet below proposed grade), landscape areas or non-structural fills or blended with other soils on site, outside of the subject fill stockpile, to reduce the high sulfate potential, of the stockpiled soils. The estimated location of the high sulfate content soils is indicated on Figure No. 2, *Approximate Boring, Test Pit and Overexcavation Locations Map*.

We anticipate that concrete structures such as footings, slab, and concrete pad will be exposed to moisture from precipitation and irrigation. Based on the site locations and the results of chloride testing of the sites soils, we do not anticipate that concrete structures will be exposed to external sources of chlorides, such as deicing chemicals,

salt, brackish water, or seawater. ACI specifies exposure category C1 where concrete is exposed to moisture, but not to external sources of chlorides (ACI 318-14, Table 19.3.1.1). ACI provides concrete design recommendations in ACI 318-14, Table 19.3.2.1, including a compressive strength of at least 2,500 psi and a maximum chloride content of 0.3 percent.

According to Romanoff, 1957, the following table provides general guideline of soil corrosion based on electrical resistivity.

Table No. 8, Correlation Between Resistivity and Corrosion

Soil Resistivity (ohm-cm) per Caltrans CT 643	Corrosivity Category
Over 10,000	Mildly corrosive
2,000 – 10,000	Moderately corrosive
1,000 – 2,000	corrosive
Less than 1,000	Severe corrosive

The measured value of the minimum electrical resistivities when saturated ranged from 300 Ohm-cm to 1,703 Ohm-cm. This indicates that the soils tested are corrosive to severely corrosive to ferrous metals in contact with the soil (Romanoff, 1957). Metal piping should be corrosion-protected, or consideration should be given to using plastic piping metal. Converse does not practice in the area of corrosion consulting. A qualified corrosion consultant should provide appropriate corrosion mitigation measures for ferrous metals in contact with the site soils.

11.10 Asphalt Concrete Pavement

One soil sample was tested by Converse to determine the R-value of the subgrade soils. Based on laboratory testing, the R-value was 65. For pavement design, we have utilized a maximum design R-value of 50, and City of Ontario designated design Traffic Indices (TIs) ranging from 5.0 to 10.0.

Based on the above information, asphalt concrete and aggregate base thickness results are presented using the Caltrans Highway Design Manual (Caltrans, 2020), Chapter 630 with a safety factor of 0.2 for asphalt concrete/aggregate base section and 0.1 for full depth asphalt concrete section. Preliminary asphalt concrete pavement sections are presented in the following table below. City of Ontario minimum asphalt pavement and aggregate base thickness requirements were also considered in the pavement designs.

Table No. 9, Recommended Preliminary Pavement Sections

R-value	Traffic Index (TI)	Pavement Section		
		Option 1		Option 2
		Asphalt Concrete (inches)	Aggregate Base (inches)	Full AC Section (inches)
50	5.0 (alleys)	4.0	6.0	4.5
	5.5 (interior street)	4.0	6.0	5.0
	8.0 (exterior street)	6.0	8.0	8.0
	10.0 (exterior street)	7.0	8.0	10.0

At or near the completion of grading, subsurface samples should be tested to evaluate the actual subgrade R-value for final pavement design.

Prior to placement of aggregate base, at least the upper 12 inches of finish grade should be scarified, moisture-conditioned if necessary, and recompacted to at least 95 percent of the laboratory maximum dry density as defined by ASTM Standard D1557 test method.

Base materials should conform with Section 200-2.2,"*Crushed Aggregate Base*," of the current Standard Specifications for Public Works Construction (SSPWC; Public Works Standards, 2018) and should be placed in accordance with Section 301.2 of the SSPWC.

Asphaltic concrete materials should conform to Section 203 of the SSPWC and should be placed in accordance with Section 302-5 of the SSPWC.

11.11 Concrete Flatwork

Except as modified herein, concrete walks, driveways, access ramps, curb and gutters should be constructed in accordance with Section 303-5, *Concrete Curbs, Walks, Gutters, Cross-Gutters, Alley Intersections, Access Ramps, and Driveways*, of the Standard Specifications for Public Works Construction (Public Works Standards, 2018).

The subgrade soils under the above-mentioned improvements should consist of compacted fill placed as described in section 10.8 of this report. Prior to placement of concrete, the upper 12 inches of finish grade should be moisture conditioned to within 3 percent of optimum moisture content for coarse-grained soils and 0 and 2 percent above optimum for fine-grained soils.

The thickness of driveways for passenger vehicles should be at least 4 inches, or as required by the civil or structural engineer. Transverse control joints for driveways should be spaced not more than 10 feet apart. Driveways wider than 12 feet should be provided with a longitudinal control joint.

Concrete walks subjected to pedestrian and bicycle loading should be at least 4 inches thick, or as required by the civil or structural engineer. Transverse joints should be spaced 15 feet or less and should be cut to a depth of one-fourth the slab thickness.

Positive drainage should be provided away from all driveways and sidewalks to prevent seepage of surface and/or subsurface water into the concrete base and/or subgrade.

12.0 CONSTRUCTION RECOMMENDATIONS

Temporary sloped excavation recommendations are presented in the following sections.

12.1 General

Prior to the start of construction, all existing underground utilities (if any) should be located at the project site. Such utilities should either be protected in-place or removed and replaced during construction as required by the project specifications.

Vertical braced excavations can be considered for the foundations. Sloped excavations may not be feasible in locations adjacent to existing utilities, pavement, or structure (if any). Recommendations pertaining to temporary excavations are presented in this section.

Excavations near existing structures may require vertical side wall excavation. Where the side of the excavation is a vertical cut, it should be adequately supported by temporary shoring to protect workers and any adjacent structures.

All applicable requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act, and the Construction Safety Act should be met. The soils exposed in cuts should be observed during excavation by the geotechnical consultant and the competent person designated by the contractor. If potentially unstable soil conditions are encountered, modifications of slope ratios for temporary cuts may be required.

12.2 Temporary Sloped Excavations

Temporary open-cut trenches may be constructed with side slopes as recommended in the following table. Temporary cuts encountering soft and wet fine-grained soils; dry loose, cohesionless soils or loose fill from trench backfill may have to be constructed at a flatter gradient than presented below.

Table No. 10, Slope Ratios for Temporary Excavations

Soil Type	OSHA Soil Type	Depth of Cut (feet)	Recommended Maximum Slope (Horizontal:Vertical)[1]
Silty Sand (SM)	C	0-10	1.5:1

[1] Slope ratio assumed to be uniform from top to toe of slope.

For shallow excavations up to 4 feet bgs can vertical. For steeper temporary construction slopes or deeper excavations, or unstable soil encountered during the excavation, shoring or trench shields should be provided by the contractor to protect the workers in the excavation. Design recommendations for temporary shoring are provided in the following section.

Surfaces exposed in slope excavations should be kept moist but not saturated to retard raveling and sloughing during construction. Adequate provisions should be made to protect the slopes from erosion during periods of rainfall. Surcharge loads, including construction materials, should not be placed within 5 feet of the unsupported slope edge. Stockpiled soils with a height higher than 6 feet will require greater distance from trench edges.

13.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

The project geotechnical consultant should review plans and specifications as the project design progresses. Such review is necessary to identify design elements, assumptions, or new conditions which require revisions or additions to our geotechnical recommendations.

The project geotechnical consultant should be present to observe conditions during construction. Geotechnical observation and testing should be performed as needed to verify compliance with project specifications. Additional geotechnical recommendations may be required based on subsurface conditions encountered during construction.

14.0 CLOSURE

This report is prepared for the project described herein and is intended for use solely by Euclid Land Investments and their authorized agents, to assist in the development of the proposed project. Our findings and recommendations were obtained in accordance with generally accepted professional principles practiced in geotechnical engineering. We make no other warranty, either expressed or implied.

Converse Consultants is not responsible or liable for any claims or damages associated with interpretation of available information provided to others. Site exploration identifies actual soil conditions only at those points where samples are taken, when they are taken. Data derived through sampling and laboratory testing is extrapolated by Converse employees who render an opinion about the overall soil conditions. Actual conditions in areas not sampled may differ. In the event that changes to the project occur, or additional, relevant information about the project is brought to our attention, the recommendations contained in this report may not be valid unless these changes and additional relevant information are reviewed, and the recommendations of this report are modified or verified in writing. In addition, the recommendations can only be finalized by observing actual subsurface conditions revealed during construction. Converse cannot be held responsible for misinterpretation or changes to our recommendations made by others during construction.

As the project evolves, a continued consultation and construction monitoring by a qualified geotechnical consultant should be considered an extension of geotechnical investigation services performed to date. The geotechnical consultant should review plans and specifications to verify that the recommendations presented herein have been appropriately interpreted, and that the design assumptions used in this report are valid. Where significant design changes occur, Converse may be required to augment or modify the recommendations presented herein. Subsurface conditions may differ in some locations from those encountered in the explorations, and may require additional analyses and, possibly, modified recommendations.

Design recommendations given in this report are based on the assumption that the recommendations contained in this report are implemented. Additional consultation may be prudent to interpret Converse's findings for contractors, or to possibly refine these recommendations based upon the review of the actual site conditions encountered during construction. If the scope of the project changes, if project completion is to be delayed, or if the report is to be used for another purpose, this office should be consulted.

Appendix A

Field Exploration

APPENDIX A

FIELD EXPLORATION

Our field investigation included a site reconnaissance and a subsurface exploration program consisting of drilling exploratory borings and excavating test pits. During the site reconnaissance, the surface conditions were noted, and the test pit and boring locations were marked in the field using the referenced topographic maps and from approximate distances from local streets as a guide and should be considered accurate only to the degree implied by the method used to locate them. Description of the field investigation method is presented below.

Exploratory Borings

Six exploratory borings (BH-01 through BH-06) were drilled on January 20, 2022, within the project site to investigate the subsurface conditions. The borings were drilled to depths ranging from 16.5 to 51.5 feet (bgs).

The borings were advanced using a truck-mounted drill rig equipped with 8-inch diameter hollow-stem augers for soils sampling. Encountered materials were continuously logged by a Converse geologist and classified in the field by visual classification in accordance with the Unified Soil Classification System. Where appropriate, the field descriptions and classifications have been modified to reflect laboratory test results.

Relatively undisturbed samples were obtained using California Modified Samplers (2.4 inches inside diameter and 3.0 inches outside diameter) lined with thin sample rings. The steel ring sampler was driven into the bottom of the borehole with successive drops of a 140-pound driving weight falling 30 inches. Blow counts at each sample interval are presented on the boring logs. Samples were retained in brass rings (2.4 inches inside diameter and 1.0 inch in height) and carefully sealed in waterproof plastic containers for shipment to the Converse laboratory. Representative bulk samples were collected from selected depths and placed in large plastic bags for delivery to our laboratory.

Standard Penetration Testing (SPT) were also performed in borings (BH-04 and BH-05) in accordance with the ASTM Standard D1586 using a standard (1.4 inches inside diameter and 2.0 inches outside diameter) split-barrel sampler. The mechanically driven hammer for the SPT sampler was 140 pounds, falling 30 inches for each blow. The recorded blow counts for every 6 inches for a total of 1.5 feet of sampler penetration are shown on the Logs of Borings.

Following completion of logging and sampling, borings BH-01 through BH-06 were backfilled with excavated soil cuttings and compacted by pushing down with the auger using the weight of the drill rig. If construction is delayed the ground surface at the boring locations may settle over time. We recommend the owner monitor the boring locations

and backfill any depressions that occur or provide protection around the boring locations to prevent trip and fall injuries from occurring.

Test Pits

Thirteen exploratory test pits (TP-01 through TP-13) were excavated using a backhoe equipped with 24-inch-wide bucket to investigate the subsurface conditions on January 21, 2022 and January 24, 2022. The test pits were excavated between 4.0 feet and 11.0 feet below the existing ground surface (bgs).

During exploration, encountered materials were continuously logged by a Converse geologist and classified in the field by visual classification in accordance with the Unified Soil Classification System. Where appropriate, the field descriptions and classifications have been modified to reflect laboratory test results.

Representative bulk samples were collected from selected depths and placed in large plastic bags for delivery to our laboratory.

Test pits were backfilled in lifts with excavated soil, tamped, and then wheel rolled at the surface using the bucket under the weight of the backhoe. If construction is delayed the ground surface at the test pit locations may settle over time. We recommend the owner monitor the test pit locations and backfill any depressions that occur or provide protection around the test pit locations to prevent trip and fall injuries from occurring.

For a key to soil symbols and terminology used in the test pit and boring logs, refer to Drawing Nos. A-1a and A-1b, *Unified Soil Classification and Key to Boring Log and Test Pit Symbols*. For logs of Borings and Test Pits, see Drawings No. A-2 through A-20, *Logs of Borings and Test Pits*.

SOIL CLASSIFICATION CHART

MAJOR DIVISIONS			SYMBOLS GRAPH	SYMBOLS LETTER	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS	GRAVEL AND GRAVELLY SOILS	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	WELL-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES

CONSISTENCY OF COHESIVE SOILS

Descriptor	Unconfined Compressive Strength (tsf)	SPT Blow Counts	Pocket Penetrometer (tsf)	CA Sampler	Torvane (tsf)	Field Approximation
Very Soft	<0.25	< 2	<0.25	<3	<0.12	Easily penetrated several inches by fist
Soft	0.25 - 0.50	2 - 4	0.25 - 0.50	3 - 6	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	5 - 8	0.50 - 1.0	7 - 12	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	9 - 15	1.0 - 2.0	13 - 25	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	16 - 30	2.0 - 4.0	26 - 50	1.0 - 2.0	Readily indented by thumbnail
Hard	>4.0	>30	>4.0	>50	>2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS

Descriptor	SPT N_{60}- Value (blows / foot)	CA Sampler
Very Loose	<4	<5
Loose	4- 10	5 - 12
Medium Dense	11 - 30	13 - 35
Dense	31 - 50	36 - 60
Very Dense	>50	>60

MOISTURE

Descriptor	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OF PROPORTION OF SOILS

Descriptor	Criteria
Trace (fine)/ Scattered (coarse)	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE

Descriptor		Size
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS

Descriptor	Criteria
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION/ Induration

Descriptor	Criteria
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptions and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), Section 2, for tables of additional soil description components and discussion of soil description and identification.

Appendix B

Laboratory Testing Program

APPENDIX B

LABORATORY TESTING PROGRAM

Tests were conducted in our laboratory on representative soil samples for the purpose of classification and evaluation of their physical properties and engineering characteristics. The amount and selection of tests were based on the geotechnical parameters required for this project. Test results are presented herein and on the Logs of Borings and Test Pits, in Appendix A, *Field Exploration*. The following is a summary of the various laboratory tests conducted for this project.

In-Situ Moisture Content and Dry Density

In-situ dry density and moisture content tests were performed on relatively undisturbed ring samples, in accordance with ASTM Standard D2216 and D2937 to aid in soils classification and to provide qualitative information on strength and compressibility characteristics of the site soils. For test results, see the Logs of Borings and Test Pits in Appendix A, *Field Exploration*.

Organic Content

Tests were performed on twelve select samples during the current geotechnical investigation and eight select samples during the previous geotechnical evaluation tests were performed of the soil stockpile, within the central portion of the site, to determine the organic content, in accordance with the ASTM Standard D2974 test, Methods A and C. Test results are summarized in the table below.

Table No. B-1, Summary of Organic Content Test Results

Test Pit No.	Depth (feet)	Soil Description	Total Organic Content (%)
TP-01	0.0-1.3	Silty Sand (SM), Fill	8.3
TP-02	2.0-7.5	Silty Sand (SM), Fill	6.0
TP-03	2.5-4.5	Silty Sand (SM), Fill	8.2
TP-04	2.0-6.0	Silty Sand (SM), Fill	5.4
TP-05	0.5-5.0	Silty Sand (SM), Fill	1.9
TP-06	0.0-1.5	Silty Sand (SM), Fill	8.7
TP-06	4.8-10.0	Sandy Silt (SM), Native	2.1
TP-08	0.0-2.0	Silty Sand (SM), Fill	7.7
TP-08	3.0-5.0	Sand (SP), Native	1.5
TP-10	0.0-0.9	Silty Sand (SM), Fill	7.4
TP-11	0.0-2.0	Silty Sand (SM), Fill	2.1

Test Pit No.	Depth (feet)	Soil Description	Total Organic Content (%)
TP-12	1.5-4.0	Silty Sand (SM), Fill	2.5

Table No. B-1a, Summary of Organic Content Test Results (Stockpile, Converse, 2021)

Test Pit No.	Depth (feet)	Soil Description	Total Organic Content (%)
TP-01	0.0-7.0	Silty Sand /Sandy Silt (SM/ML), trace clay, Fill	1.7
TP-02	0.0-7.5	Silty Sand /Sandy Silt (SM/ML), trace clay, Fill	2.0
TP-03	0.0-8.0	Silty Sand (SM), trace clay, Fill	0.8
TP-04	0.0-7.0	Silty Sand/Clayey Sand (SM/SC), Fill	4.2
TP-05	0.0-7.5	Silty Sand/Clayey Sand (SM/SC), Fill	4.2
TP-06	0.0-10.0	Silty Clay (CL), Fill	2.8
TP-07	0.0-9.0	Sandy Clay (CL), Fill	5.6
TP-08	0.0-5.0	Silty Sand (SM), trace clay, Fill	4.2

Expansion Index

Two representative bulk samples were tested during the current geotechnical investigation and two bulk samples were tested during the previous geotechnical evaluation of the soil stockpile, within the central portion of the site, to evaluate the expansion potential of materials encountered at the site in accordance with ASTM D4829 Standard. The test results are presented in the following table.

Table No. B-2, Expansion Index Test Results

Test Pit No.	Depth feet)	Soil Description	Expansion Index	Expansion Potential
BH-03	3.0-9.0	Silty Sand/Sandy Silt (SM/ML)	4	Very Low
TP-10	3.0-5.0	Silty Sand (SM)	0	Very Low

Table No. B-2a, Expansion Index Test Results (Stockpile, Converse, 2021)

Test Pit No.	Depth feet)	Soil Description	Expansion Index	Expansion Potential
TP-06	0.0-10.0	Silty Clay (CL)	79	Medium
TP-07	0.0-9.0	Sandy Clay (CL)	53	Medium

R-value

One representative bulk soil sample was tested for resistance value (R-value) in accordance with California Test Method CT301. This test provides a relative measure of soil strength for use in pavement design. The test result is presented in the table below.

Table No. B-3, R-Value Test Result

Test Pit No.	Depth (feet)	Soil Classification	Measured R-value
BH-03	3.0-9.0	Silty Sand/Sandy Silt (SM/ML)	65

Soil Corrosivity

Two representative soil samples were tested during the current geotechnical investigation and four bulk samples were tested during the previous geotechnical evaluation of the soil stockpile, within the central portion of the site, to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of this test was to determine the corrosion potential of site soils when placed in contact with common construction materials. The tests were performed by AP Engineering and Testing, Inc. (Pomona, CA) in accordance with Caltrans Test Methods 643, 422 and 417. Test results are presented in the following table.

Table No. B-4, Summary of Soil Corrosivity Test Results

Boring No.	Depth (feet)	pH	Soluble Sulfates (CA 417) (ppm)	Soluble Chlorides (CA 422) (ppm)	Min. Resistivity (CA 643) (Ohm-cm)
BH-03	3.0-9.0	8.7	43	25	1,703

Table No. B-4a, Soil Corrosivity Test Result (Stockpile, Converse, 2021)

Boring No.	Depth (feet)	pH	Soluble Sulfates (CA 417) (ppm)	Soluble Chlorides (CA 422) (ppm)	Min. Resistivity (CA 643) (Ohm-cm)
TP-01	0.0-7.0	8.6	289	48	1,031
TP-04	0.0-7.0	8.3	2,073	95	233
TP-05	0.0-7.5	8.6	2,759	146	300
TP-07	0.0-9.0	8.1	3,872	227	322

Collapse

To evaluate the moisture sensitivity (collapse/swell potential) of the encountered soils, two collapse tests were performed in accordance with the ASTM Standard D4546 laboratory procedure. The samples were loaded to approximately 2 kips per square foot (ksf), allowed to stabilize under load, and then submerged. The test results are presented in the following table.

Table No. B-5, Collapse Test Results

Boring No.	Depth (feet)	Soil Classification	Percent Swell (+) Percent Collapse (-)	Collapse Potential
BH-03	3.0-4.5	Sandy Silt (ML)	-0.1	Slight
BH-04	2.5-4.0	Silty Sand (SM)	-0.2	Slight

Grain-Size Analysis

To assist in soil classification, mechanical grain-size analyses was performed on three select samples in accordance with the ASTM Standard D6913 test method. Grain-size distribution is summarized in the table below and plotted in Drawing No. B-1, *Grain Size Distribution Results*.

Table No. B-6, Grain Size Distribution Test Results

Test Pit No.	Depth (ft)	Soil Classification	% Gravel	% Sand	%Silt	%Clay
BH-04	0.0-4.0	Silty Sand (SM), trace gravel	4.0	56.6	39.4	
BH-04	15.0-16.5	Silty Sand (SM), few gravel	6.0	60.5	33.5	
BH-04	25.0-26.5	Silty Sand (SM)	0.0	68.9	31.1	

Maximum Dry Density and Optimum Moisture Content

Laboratory maximum dry density-optimum moisture content relationship tests were performed on two representative bulk samples. These tests were conducted in accordance with the ASTM Standard D1557 test method. The test results are presented in Drawing No. B-2, *Moisture-Density Relationship Results,* and is summarized in the following table.

Table No B-7, Summary of Moisture-Density Relationship Results

Test Pit No.	Depth (feet)	Soil Description	Optimum Moisture (%)	Maximum Density (lb./cft)
BH-05	0.0-4.0	Silty Sand (SM), Dark Brown	13.7	117.0
BH-05	7.0-13.0	Silty Sand (SM), Grayish Brown	10.3	120.2

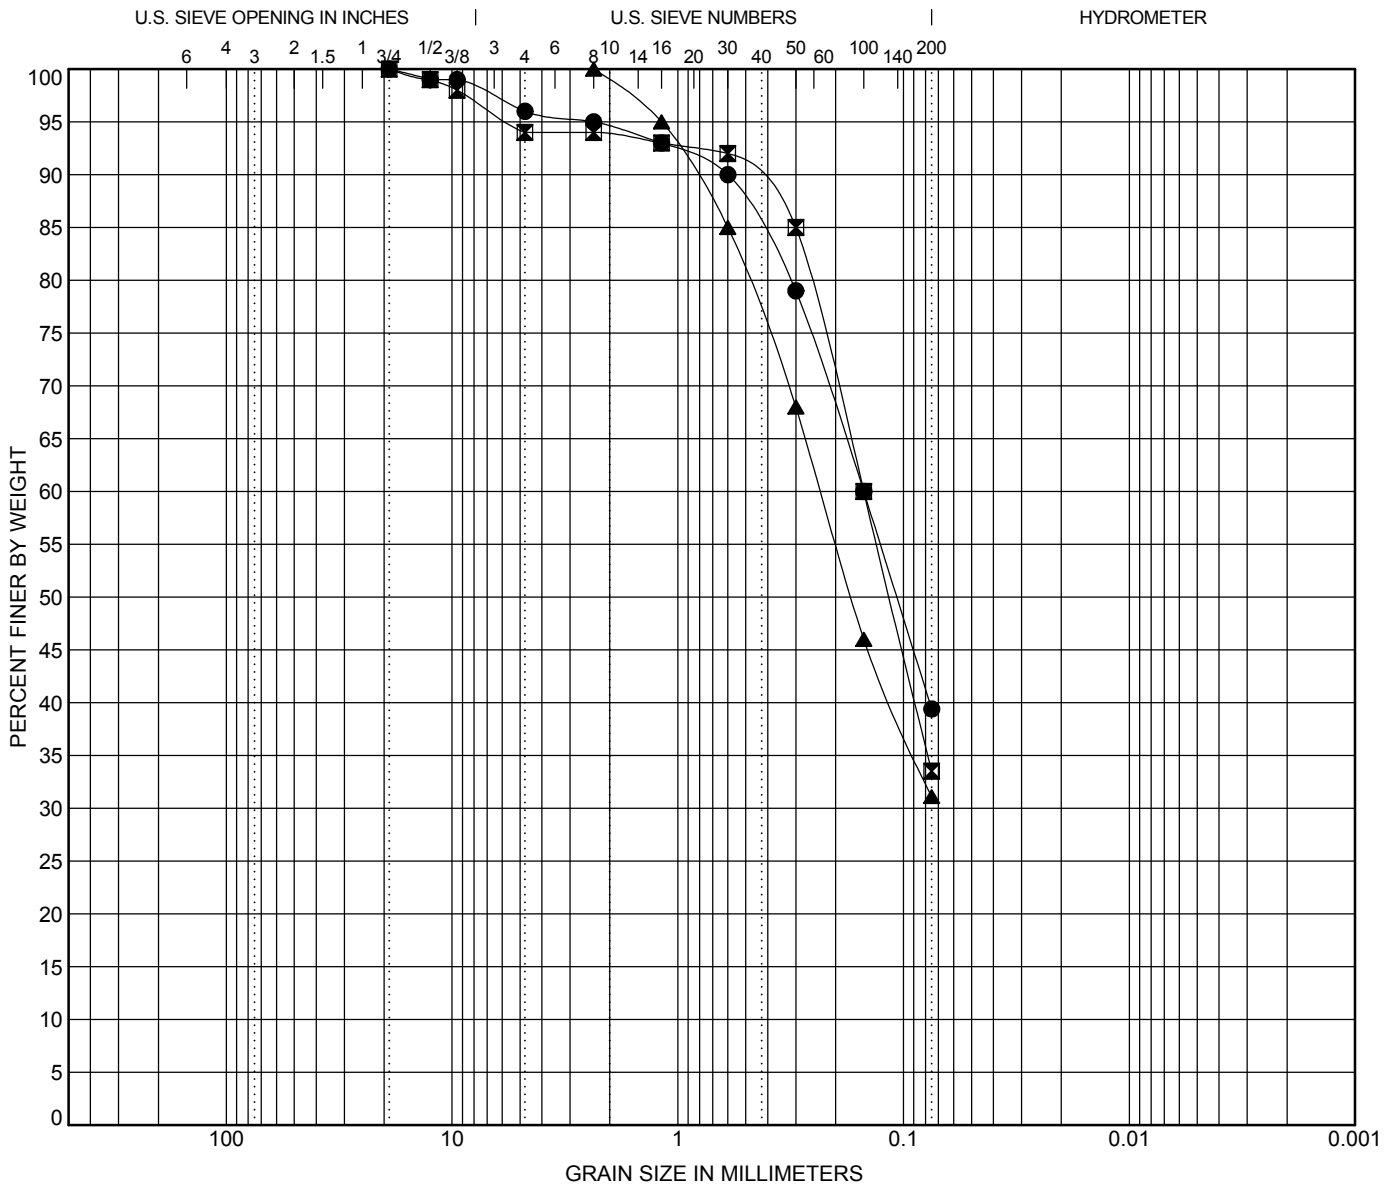
Direct Shear

Two direct shear tests were performed; one direct shear tests were performed on relatively undisturbed samples and one direct shear test was performed on a sample remolded to 90% of the maximum dry density under soaked moisture conditions in accordance with ASTM D3080. For each test, three samples contained in brass sampler rings were placed, one at a time, directly into the test apparatus and subjected to a range of normal loads appropriate for the anticipated conditions. The samples were then sheared at a constant strain rate of 0.02 inch/minute. Shear deformation was recorded until a maximum of about 0.25-inch shear displacement was achieved. Ultimate strength was selected from the shear-stress deformation data and plotted to determine the shear strength parameters. For test data, including sample density and moisture content, see Drawings No. B-3 and B-4*, Direct Shear Test Results,* and the following table.

Table No. B-8, Summary of Direct Shear Test Results

Test Pit No.	Depth (feet)	Soil Description	Peak Strength Parameters	
			Friction Angle (degrees)	Cohesion (psf)
BH-04	5.0-6.5	Silty Sand (SM)	33	220
*BH-05	0.0-4.0	Silty Sand (SM)	29	160

*Remolded to 90% of the maximum dry density



Consolidation

Two consolidation tests were conducted in accordance with ASTM Standard D2435 method. Data obtained from the test performed on relatively undisturbed ring samples were used to evaluate the settlement characteristics of the on-site soils under load. Preparation for these tests involved trimming the sample, placing it in a 1-inch-high brass ring, and loading it into the test apparatus, which contained porous stones to

accommodate drainage during testing. Normal axial loads were applied to one end of the sample through the porous stones, and the resulting deflections were recorded at various time periods. The load was increased after the sample reached a reasonable state of equilibrium. Normal loads were applied at a constant load-increment ratio, successive loads being generally twice the preceding load. For test results, including sample density and initial moisture content, see Drawings No. B-5 and B-6, *Consolidation Test Results*.

Sample Storage

Soil samples presently stored in our laboratory will be discarded 30 days after the date of this report, unless this office receives a specific request to retain the samples for a longer period.

Appendix C

Earthwork Specifications

APPENDIX C

EARTHWORK SPECIFICATIONS

C1.1 Scope of Work

The work includes all labor, supplies and construction equipment required to construct the building pads in a good manner, as shown on the drawings and herein specified. The major items of work covered in this section include the following.

- Site Inspection
- Authority of Geotechnical Engineer
- Site Clearing
- Excavations
- Preparation of Fill Areas
- Placement and Compaction of Fill
- Observation and Testing

C1.2 Site Inspection

1. The Contractor should carefully examine the site and make all inspections necessary in order to determine the full extent of the work required to make the completed work conform to the drawings and specifications. The Contractor should satisfy himself as to the nature and location of the work, ground surface and the characteristics of equipment and facilities needed prior to and during prosecution of the work. The Contractor should satisfy himself as to the character, quality, and quantity of surface and subsurface materials or obstacles to be encountered. Any inaccuracies or discrepancies between the actual field conditions and the drawings, or between the drawings and specifications must be brought to the Owner's attention in order to clarify the exact nature of the work to be performed.

2. This *Geotechnical Investigation and Organic Soil/Manure Evaluation Report* by Converse Consultants may be used as a reference to the surface and subsurface conditions on this project. The information presented in this report is intended for use in design and is subject to confirmation of the conditions encountered during construction. The exploration logs and related information depict subsurface conditions only at the particular time and location designated on the boring logs. Subsurface conditions at other locations may differ from conditions encountered at the exploration locations. In addition, the passage of time may result in a change in subsurface conditions at the exploration locations. Any review of this information should not relieve the Contractor from performing such independent investigation

and evaluation to satisfy himself as to the nature of the surface and subsurface conditions to be encountered and the procedures to be used in performing his work.

C1.3 Authority of the Geotechnical Engineer

1. The Geotechnical Engineer will observe the placement of compacted fill and will take sufficient tests to evaluate the uniformity and degree of compaction of filled ground.
2. As the Owner's representative, the Geotechnical Engineer will (a) have the authority to cause the removal and replacement of loose, soft, disturbed and other unsatisfactory soils and uncontrolled fill; (b) have the authority to approve the preparation of native ground to receive fill material; and (c) have the authority to approve or reject soils proposed for use in building areas.
3. The Civil Engineer and/or Owner will decide all questions regarding (a) the interpretation of the drawings and specifications, (b) the acceptable fulfillment of the contract on the part of the Contractor and (c) the matters of compensation.

C1.4 Site Clearing

1. Clearing and grubbing should consist of the removal from areas to be graded: all existing pavement, utilities, and vegetation.
2. Organic and inorganic materials resulting from the clearing and grubbing operations should be hauled away from the areas to be graded.

C1.5 Excavations

Based on observations made during our field explorations, the surficial soils can be excavated with conventional earthwork equipment.

C1.6 Preparation of Fill Areas

1. All highly organic soils, manure and debris should be removed from the proposed foundation, improvements and/or fill areas.
2. After the required removals have been made, the exposed earth materials (undocumented artificial fill, topsoil and the upper low-density portions of the alluvium), should be overexcavated to provide a zone of structural fill for the support of footings, slabs-on-grade, and exterior flatwork or proposed improvements. All loose, soft or disturbed earth materials should be removed from the bottom of excavations before placing structural fill. Any structures will require

a minimum of 3.0 feet of compacted fill beneath building footings and 2.0 feet below any proposed wall footings or 5.0 feet blow proposed grade, whichever is deeper

3. The subgrade in all areas to receive fill should be scarified to a minimum depth of 6 inches. Scarification may be terminated on moderately hard to hard, cemented earth materials with the approval of the Geotechnical Engineer. The soil moisture should be adjusted to at least 2 percent above optimum for fine-grained soils and within 3 percent of optimum moisture content for granular soils, and then compacted to at least 90 percent of the laboratory maximum dry density as determined by ASTM Standard D1557 test method.
4. Compacted fill may be placed on native soils that have been properly scarified and recompacted as discussed above.
5. All areas to receive compacted fill will be observed and approved by the Geotechnical Engineer before the placement of fill.

C1.7 Placement and Compaction of Fill

1. Compacted fill placed for the construction of the embankment or for any planned structures will be considered structural fill. Structural fill may consist of approved on-site soils or imported fill that meets the criteria indicated below.
2. Fill consisting of selected on-site earth materials or imported soils approved by the Geotechnical Engineer should be placed in layers on approved earth materials. Soils used as compacted structural fill should have the following characteristics:
    a. All fill soil particles should not exceed 8 inches in nominal size and should not have an organic content greater than 2%, as well as free of matter and miscellaneous inorganic debris and inert rubble.
    b. Imported fill materials should have an Expansion Index (EI) less than 20. All imported fill should be compacted to at least 90 percent of the laboratory maximum dry density (ASTM Standard D1557) at about 2 percent above optimum moisture for fine-grained soils, and within 3 percent of optimum for granular soils.
3. Fill exceeding 5 feet in height should not be placed on native slopes that are steeper than 5:1 horizontal:vertical (H:V). Where native slopes are steeper than 5:1 H:V, and the height of the fill is greater than 5 feet, the fill should be benched into competent materials. The height and width of the benches should be at least 2 feet.
4. Representative samples of materials being used, as compacted fill will be analyzed in the laboratory by the Geotechnical Engineer to obtain information on their physical properties. Maximum laboratory density of each soil type used in the

compacted fill will be determined by the ASTM Standard D1557 compaction method.

5. Fill materials should not be placed, spread or compacted during unfavorable weather conditions. When site grading is interrupted by heavy rain, filling operations should not resume until the Geotechnical Engineer approves the moisture and density conditions of the previously placed fill.
6. It should be the Grading Contractor's obligation to take all measures deemed necessary during grading to provide erosion control devices in order to protect slope areas and adjacent properties from storm damage and flood hazard originating on this project. It should be the Contractor's responsibility to maintain slopes in their as-graded form until all slopes are in satisfactory compliance with job specifications, all berms have been properly constructed, and all associated drainage devices meet the requirements of the Civil Engineer.

C1.8 Fill Slope Construction

1. Fill slopes placed above existing surfaces or cut slopes should be constructed with keyways.
2. Where fill is placed against existing slopes steeper than 5:1 H:V, the new fill slopes should be keyed and benched to provide increased lateral support after removal of the unsuitable surficial soils, when present.

C1.9 Observation and Testing

1. During the progress of grading and trench backfill, the Geotechnical Engineer will provide observation of the fill placement operations.
2. Field density tests of all compacted fill will be made during grading and trench backfill to provide an opinion on the degree of compaction being obtained by the Contractor. Where compaction of less than specified herein is indicated, additional compactive effort with adjustment of the moisture content should be made as necessary, until the required degree of compaction is obtained.
3. A sufficient number of field density tests will be performed to provide an opinion to the degree of compaction achieved. In general, density tests will be performed on each one-foot lift of fill, but not less than one for each 500 cubic yards of fill placed.

Converse Consultants
Geotechnical Engineering, Environmental & Groundwater Science, Inspection & Testing Services

March 27, 2023

Mr. Jason Lee
Vice President
Euclid Land Investments
c/o RCCD, Inc.
8101 E. Kaiser Boulevard, Suite 140
Anaheim Hills, California 92808

Subject: **UPDATED GEOTECHNICAL SEISMIC DESIGN PARAMETERS**
Euclid Mixed Use Specific Plan Project
Southeast Corner of Euclid Avenue and Schaefer Avenue
City of Ontario, County of San Bernardino, California
Converse Project No. 21-81-154-02

Reference: Converse Consultants, 2022, Preliminary Geotechnical Investigation and Organic Soil/Manure Report, Euclid Mixed Use Specific Plan Project, Southeast Corner of Euclid Avenue and Schaefer Avenue, City of Ontario, County of San Bernardino, California, Converse Project No. 21-81-154-02, dated March 30, 2022.

Dear Mr. Lee:

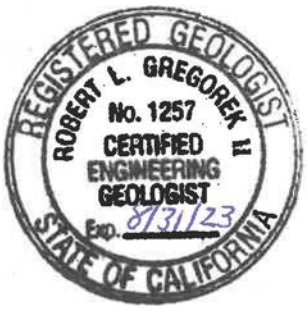
Pursuant to your request, Converse Consultants (Converse) has prepared this updated geotechnical foundation design parameters letter for the Euclid Mixed Use Specific Plan Project, located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, San Bernardino County, California. This letter provides updated geotechnical seismic design parameters, to the current 2022 CBC, for the proposed mixed use business park development.

The seismic design soil parameters are presented below in Table No. 1.

CBC SEISMIC DESIGN PARAMETERS

Seismic parameters based on the 2022 California Building Code (CBC, 2022) and ASCE 7-16 are provided in the following table. These parameters were determined using the coordinate (33.9265N and 117.6052W) and the Seismic Design Maps ATC online tool.

Table No. 1, CBC 2022 Seismic Design Parameters



Seismic Parameters	
Site Coordinates	34.0018N and 117.6480W
Site Class	D
Risk Category	II
Mapped Short period (0.2-sec) Spectral Response Acceleration, S_s	1.621g
Mapped 1-second Spectral Response Acceleration, S_1	0.583g
Site Coefficient (from Table 11.4-1), F_a	1.0
Site Coefficient (from Table 11.4-2), F_v	2.5
MCE 0.2-sec period Spectral Response Acceleration, S_{MS}	1.161g
MCE 1-second period Spectral Response Acceleration, SM_1	1.455g
Design Spectral Response Acceleration for short period S_{DS}	1.081g
Design Spectral Response Acceleration for 1-second period, S_{D1}	0.970g
Maximum Peak Ground Acceleration, PGA_M	0.735g

We appreciate the opportunity to provide continuing geotechnical services on this project to Euclid Land Investment. If you have any questions, or if we can provide any additional assistance, please call the undersigned at 909-796-0544.

.

APPENDIX E2

GEOTECHNICAL EVALUATION REPORT OF SOIL STOCKPILE

Converse Consultants
75 Years of Dedication in Geotechnical Engineering & Consulting, Environmental & Groundwater Science, Materials Testing & Inspection Services

October 20, 2021

Mr. Jason Lee
Vice President
RCCD, Inc.
8101 E. Kaiser Boulevard, Suite 140
Anaheim Hills, California 92808

Subject: **GEOTECHNICAL EVLUATION REPORT OF SOIL STOCKPILE**
ARTEVAL Property
Southeast Corner of Euclid Avenue and Schaefer Avenue
City of Ontario, San Bernardino County, California
Converse Project No. 20-81-154-01

Dear Mr. Lee:

Converse Consultants (Converse) is pleased to submit the results of our geotechnical evaluation of the soil stockpile at the subject site for the proposed commercial and residential development. This letter report was prepared in accordance with our Agreement for Geotechnical Services dated March 30, 2020. and your signed Authorization of Agreement, dated June 22, 2021.

SITE LOCATION AND CURRENT CONDITIONS

The soil stockpile in located within the central potion of an approximately 59.56-acre L-shaped dairy site, which is located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, San Bernardino, California. The entire property is bounded to the north by Schaefer Avenue, to the west by Euclid Avenue, to the south and east by existing active and abandoned dairies. The approximate location of the site is shown in Figure No. 1, Approximate Soil Stockpile and Test Pit Locations Map.

The soil stockpile is approximately 420 feet 430 feet long, 70 feet to 80 feet wide and 5 feet to 10 feet high. A light growth of weeds and grasses are present on portions of the soil stockpile. Some scattered localized debris and trash is present on the surface.

PROPOSED DEVELOPMENT AND GRADING

Based on conversations with Mr. Jason Lee of RCCD, Inc. the property will be developed for mixed residential and commercial use. No development or grading plans are available at this time.

Project: ARTEVAL Property
Location: Southeast Corner of Euclid Avenue and Schaefer Avenue
City of Ontario, San Bernardino County, California

For: RCCD, Inc.

Converse Consultants

Figure
1

SCOPE OF WORK

The scope of Converse's investigation is described in the following sections.

Project Set-up

The project set-up consisted of the following tasks.

- Conducted a site reconnaissance to mark the site for exploration and to verify backhoe access to the proposed locations were available.
- Notified Underground Service Alert (USA) at least 48 hours prior to conducting field work to clear the test pit locations of any conflict with existing underground utilities.
- Engaged a backhoe company to excavate exploratory test pits.

Subsurface Exploration

Eight exploratory test pits (TP-01 through TP-08) were excavated using a backhoe equipped with 24-inch-wide bucket to investigate the subsurface conditions on July 28, 2021. The test pits were excavated from approximately 9 feet to 12 feet below the existing ground surface (bgs).

Laboratory Testing

Representative samples of the stockpiled soils were tested in the laboratory to aid in evaluating the suitability of the use of the soil for future development. These tests included the following.

- *In-situ* moisture contents (ASTM D2216)
- Organic Content (ASTM D2974, Methods A and C)
- Expansion Index (ASTM D4829)
- Soils Corrosivity (CTM 643, 422, 417, 532)

SUBSURFACE PROFILE

Based on the test pits, and previous laboratory test results, the subsurface soil within the stockpile consisted primarily of partially organic artificial fill. Based on observations and exploration the approximate depth of these fill soils is estimated to range in depth from about 5.0 foot to 10.0 feet. These partially organic artificial fill soils were generally comprised of a mixture of silty sand, clayey sand, sandy silt and sandy clay and silty clay, which were fine to coarse-grained, moist to wet and various shades of brown, yellow, gray and black, with some organics/manure.

LABORATORY TEST RESULTS

Laboratory testing was performed to determine the physical and chemical characteristics and engineering properties of the subsurface soils. Current physical test results are included in Appendix A, *Laboratory Testing Results*. Discussions of the various test results are presented below.

Physical Testing

- In-situ Moisture: *In-situ* moisture contents of the stockpiled soils were determined in accordance with ASTM Standard D2216. Moisture contents of the soils ranged from 11 to 31 percent.
- *Organic Content*: Six organic content tests were performed in accordance with ASTM Standard D2974 on representative bulk soil samples. The amount of organic material present in the stockpiled soils ranged from 0.8% to 5.6%.
- *Expansion Index:* Two representative bulk soil samples were tested to evaluate the expansion potential stockpiled soils in accordance with ASTM Standard D4829. The test results indicated expansion index is 53 and 79, corresponding to medium expansion potential.

Chemical Testing - Corrosivity Evaluation

Four representative soil samples were tested to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of this test was to determine the corrosion potential of site soils when placed in contact with common pipe materials. The test was performed by AP Engineering and Testing, Inc. (Pomona, CA) in accordance with California Test Methods 643, 422, and 417. The test result is presented in Appendix A, *Laboratory Testing Results and* is summarized in below.

- The pH measurement of the samples tested ranged from 8.1 to 8.6.
- The sulfate content of the samples tested ranged from 289 ppm to 3672 ppm (0.0289 percent to 0.3672 percent by weight).
- The chloride concentration of the samples tested ranged from 46 ppm to 227 ppm.
- The minimum electrical resistivity when saturated was 332 ohm-cm to 1,031 ppm.

RECOMMENDATIONS

General

This section contains our general recommendations regarding the use of the subject stockpiled soil material as engineered fill during future development.

These recommendations are based on the results of our field sampling and laboratory testing as well as our experience with similar projects in the area and data evaluation as presented in the preceding sections. Based on observations of excavations and laboratory test results a portion of the stockpiled fill soils appear to be imported from sources outside of the surrounding area. These recommendations may require modification by the geotechnical consultant based on observations and laboratory testing during grading.

Moisture Content

Based on the laboratory test results portions of the subject stockpiled fill soils are clayey with a very high moisture content that would require drying back prior to use as compacted fill. Fill soils should be thoroughly mixed, and moisture conditioned to within ±3 percent of optimum moisture content for coarse soils and 0 to 2 percent above optimum moisture content for fine soils. Fill soils should be evenly spread in horizontal lifts not exceeding 8 inches in uncompacted thickness.

Organic Content

Based on the laboratory test results of the partially organic soils indicated the subject stockpiled fill soils has organic contents of about 0.8 percent to 5.6 percent. This would be an average organic content of about 3.2 percent. Therefore, these stockpiled soils consisting of partially organic artificial fill should be blended with undisturbed natural soils or removed from the site.

Fill materials should contain no more than 2 percent overall organics. The partially organic soils can be blended with the on-site natural soils at a ratio of 2 to 1 (natural soils/clean imported soils to partially organic soils) and placed as compacted fill, provided they are completely mixed during fill placement. The type of equipment and method of placement; blending and mixing of the partially organic materials with onsite natural soils or clean imported soils to be utilized by the grading contractor, should be reviewed and accepted by the geotechnical consultant prior to implementation. A possible method of placement that could be considered would be to place the partially organic materials at an angle to the pattern of the placement of the onsite natural soils or clean imported soils. The testing frequency for verifying the percent organic content should be established by the geotechnical consultant prior to fill placement once the method of blending, placement, and mixing of the partially organic materials with onsite natural soils or clean imported soils.

Soil Expansion

Based on the laboratory test results portions of the subject stockpiled fill soil materials exhibited an expansion potential of Medium, in accordance with 2019 CBC. Based on experience in the area the majority of soils on the site are anticipated to be sandier and exhibit expansion potentials of Very low to Low. Therefore, consideration should be made to place these stockpiled fill soils in deeper fills (at least 5 feet below proposed grade), landscape areas or non-structural fills or blended with sandier soils on site, outside of the subject fill stockpile, to reduce the expansion potential. Testing of the soil during rough grading should be performed to determine the actual pad-by-pad expansion potential.

Soil Corrosivity

The results of chemical testing of representative stockpiled fill soils are presented in Appendix A, *Laboratory Testing Results*, and a general discussion are presented below.

The sulfate content of the soils tested correspond to American Concrete Institute (ACI) exposure category S2 for this sulfate concentration (ACI 318-14, Table 19.3.1.1). ACI recommends a minimum compressive strength of 4,500 psi for exposure category S2 in ACI 318-14, Table 19.3.2.1. A minimum compressive strength of 4,500 psi is recommended. A maximum water cement ratio of 0.40 is recommended. Cementitious materials should be Type V.

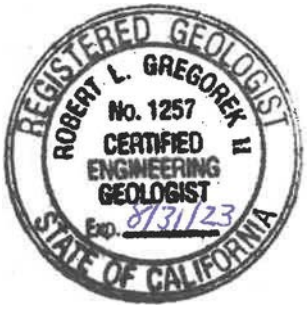
We anticipate that concrete structures such as footings, slab, and concrete pad will be exposed to moisture from precipitation and irrigation. Based on the site location and the results of chloride testing of the stockpiled fill soils, we anticipate that concrete structures will be exposed to external sources of chlorides, such as deicing chemicals, salt, brackish water, or seawater. ACI specifies exposure category C1 where concrete is exposed to moisture, but not to external sources of chlorides (ACI 318-14, Table 19.3.1.1). ACI provides concrete design recommendations in ACI 318-14, Table 19.3.2.1, including a compressive strength of at least 2,500 psi and a maximum chloride content of 0.3 percent.

The measured value of the minimum electrical resistivities when saturated ranged from 300 Ohm-cm to 1,031 Ohm-cm. This indicates that the soils tested are corrosive to severely corrosive to ferrous metals in contact with the soil (Romanoff, 1957). Metal piping should be corrosion-protected, or consideration should be given to using plastic piping metal. Converse does not practice in the area of corrosion consulting. A qualified corrosion consultant should provide appropriate corrosion mitigation measures for ferrous metals in contact with the site soils.

Therefore, consideration should be made to place these stockpiled fill soils in deeper fills (at least 5 feet below proposed grade), landscape areas or non-structural fills or

blended with on-site soils, outside of the subject fill stockpile, to reduce the high corrosion potentials.

.



Testing of the soil during rough grading should be performed to determine the pad-by-pad soil corrosivity to common construction materials.

CLOSING

This letter report is prepared for the project described herein and is intended for use solely by RCCD, Inc and their authorized agents, to assist in the development of the site. Our findings and recommendations were obtained in accordance with generally accepted professional principles practiced in geotechnical engineering. We make no other warranty, either expressed or implied.

We appreciate the opportunity to be of service to RCCD, Inc. If you have any questions, please do not hesitate to contact us at 909-796-0544.

Appendix A

Laboratory Testing Results

APPENDIX A

LABORATORY TESTING RESULTS

Tests were conducted in our laboratory on representative soil samples for the purpose of classification and evaluation of their physical properties and engineering characteristics. The amount and selection of tests were based on the geotechnical parameters required for this project. Test results are presented herein. The following is a summary of the various laboratory tests conducted for this project.

In-Situ Moisture Content

In-situ moisture content tests were performed on disturbed bulk samples, in accordance with ASTM Standard D2216 to aid in soils classification and to provide moisture characteristics of the stockpiled fill soils. Test results are summarized in the table below.

Table No. A-1, Summary of In-Situ Moisture Content Test Results

Test Pit No.	Depth (feet)	Soil Description	Moisture Content (%)
TP-01	0.0-7.0	Silty Sand /Sandy Silt (SM/ML), trace clay	17
TP-02	0.0-7.5	Silty Sand /Sandy Silt (SM/ML), trace clay	16
TP-03	0.0-8.0	Silty Sand (SM), trace clay	15
TP-04	0.0-7.0	Silty Sand/Clayey Sand (SM/SC)	12
TP-05	0.0-7.5	Silty Sand/Clayey Sand (SM/SC)	12
TP-06	0.0-10.0	Silty Clay (CL)	20
TP-07	0.0-9.0	Sandy Clay (CL)	31
TP-08	0.0-5.0	Silty Sand (SM), trace clay	11

Organic Content

Tests were performed on eight select samples of stockpiled fill soils to determine the organic content, in accordance with the ASTM Standard D2974 test, Methods A and C. Test results are summarized in the table below.

Table No. A-2, Summary of Organic Content Test Results

Test Pit No.	Depth (feet)	Soil Description	Total Organic Content (%)
TP-01	0.0-7.0	Silty Sand /Sandy Silt (SM/ML), trace clay	1.7
TP-02	0.0-7.5	Silty Sand /Sandy Silt (SM/ML), trace clay	2.0
TP-03	0.0-8.0	Silty Sand (SM), trace clay	0.8
TP-04	0.0-7.0	Silty Sand/Clayey Sand (SM/SC)	4.2
TP-05	0.0-7.5	Silty Sand/Clayey Sand (SM/SC)	4.2
TP-06	0.0-10.0	Silty Clay (CL)	2.8
TP-07	0.0-9.0	Sandy Clay (CL)	5.6
TP-08	0.0-5.0	Silty Sand (SM), trace clay	4.2

Expansion Index

Two representative bulk sample was tested to evaluate the expansion potential of materials encountered in the stockpiled fill soils in accordance with ASTM D4829 Standard. The test result is presented in the following table.

Table No. A-3, Expansion Index Test Result

Test Pit No.	Depth feet)	Soil Description	Expansion Index	Expansion Potential
TP-06	0.0-10.0	Silty Clay (CL)	79	Medium
TP-07	0.0-9.0	Sandy Clay (CL)	53	Medium

Soil Corrosivity

Four representative soil sample was tested to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of this test was to determine the corrosion potential of sites soils when placed in contact with common construction materials. The test was performed by AP Engineering and Testing, Inc. (Pomona, CA) in accordance with Caltrans Test Methods 643, 422 and 417. Test result is presented in the following table.

Table No. A-4, Soil Corrosivity Test Result

Boring No.	Depth (feet)	pH	Soluble Sulfates (CA 417) (ppm)	Soluble Chlorides (CA 422) (ppm)	Min. Resistivity (CA 643) (Ohm-cm)
TP-01	0.0-7.0	8.6	289	48	1,031
TP-04	0.0-7.0	8.3	2,073	95	233
TP-05	0.0-7.5	8.6	2,759	146	300
TP-07	0.0-9.0	8.1	3,872	227	322

Executive Summary

The following is an Executive Summary of the Phase I Environmental Site Assessment (Phase I ESA) that was conducted by Converse Consultants (Converse). Please refer to the appropriate sections of the report for a complete discussion of these issues. In the event of a conflict between this Executive Summary and the report, or an omission in the Executive Summary, the report shall prevail.

This report presents the results of the Converse Phase I ESA performed for 60-acres of agricultural land at the southeast corner of Euclid Avenue and Schaefer Avenue in the City of Ontario, San Bernardino County, California, referred to as the Property in this report. Converse was retained by RCCD, Inc. to conduct this Phase I ESA. Our study has been conducted in order to identify, to the extent practical within the scope of an ESA, Recognized Environmental Conditions (RECs) in connection with the Property.

Converse has compiled and reviewed information that was obtained from interviews, document research, and on-site and area reconnaissance to identify potential environmental conditions at the Property in conformance with the ASTM Standard E: 1527-13 Environmental Site Assessment Standard Practice (ASTM Standard: E1527-13). This Phase I ESA was conducted during the period of June 22, 2021 to July 29, 2021.

This assessment has revealed no evidence of RECs in connection with the Property except for the following:

- Agricultural use from as early as 1938 is a REC due to potential residual contamination from agricultural chemical use.
- On-site dairy operations and associated chemicals, manure and equipment from as early as 1946 are RECs.

Based on this assessment, Converse has the following recommendations:

- Soil sampling over the Property. Areas to be assessed should include the farmland, catch basins, maintenance areas, AST (and drain underneath AST) & UST areas, and livestock/manure areas.
- Containers of hazardous materials, equipment, and tires should be removed from the Property prior to acquisition. If these items are left on-site, they will need to be disposed of in accordance to applicable regulations.
- A methane assessment in accordance with the City of Ontario requirements should be conducted.

1.0 Introduction

1.1 Purpose and Scope of Services

This report presents the results of the Converse Consultants (Converse) Phase I Environmental Site Assessment (ESA) performed for 60-acres of agricultural land generally located at the southeast corner of Euclid Avenue and Schaefer Avenue in the City of Ontario, San Bernardino County, California, referred to as the Property in this report. Converse was retained by RCCD, Inc. to conduct this Phase I ESA. Our study has been conducted in order to identify, to the extent practical, Recognized Environmental Conditions (RECs) in connection with the Property. The term Recognized Environmental Conditions is defined in Section 1.1.1 of the American Society of Testing and Materials (ASTM) Standard Practice as the presence or likely presence of any hazardous substances or petroleum products in, at or on a property due to any release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.

This Phase I ESA was completed in accordance with our proposal dated March 30, 2021. Our work consisted of the following and was completed in general conformance with the scope and limitations of the ASTM Practice E1527-13 and complies with standards and practices set forth in 40 Code of Federal Regulations (CFR) Part 312 for AAI.

- Interviews with the Property owner representatives
- Property and vicinity reconnaissance
- Review of regulatory agency records
- Description of physical setting
- Historical review
- Interviews with public agency personnel
- Preparation of this report

1.2 Non-Scope Considerations

There are a number of non-scope issues which are sometimes assessed concurrently with a Phase I ESA. Unless specifically agreed in the contract proposal documents, these non-scope considerations are not included as part of the Phase I ESA. Examples of non-scope issues include:

- Asbestos-containing Building Materials
- Biological Agents
- Cultural & Historic Resources
- Diffuse Anthropogenic Pollution
- Ecological Resources
- Emerging Chemicals/Contaminates
- Endangered Species
- Health & Safety
- Indoor Air Quality
- Industrial Hygiene
- Lead-base Paint
- Lead in Drinking Water
- Mold
- Non-liquid Polychlorinated Biphenyls
- Polyfluoroalkyl Substances
- Radon
- Regulatory Compliance
- Wetlands

Copyright 2021 Converse Consultants

No Non-Scope issues were addressed in this report.

1.3 Significant Assumptions

No assumptions were made for this assessment that need to be noted as significant.

1.4 Limitations and Expectations

The following limitations and exceptions were encountered during the course of this assessment:

- There was no access to various storage containers for dairy equipment throughout the central and northeastern portions of the Property, within the Art Venegas Dairy tenant space (13835 Euclid Avenue).
- Converse did not access the residential structures at 13835 Euclid Avenue (Art Venegas Dairy) or the Drake Family Farm (7235, 7255 & 7277 Schaefer Avenue).
- Former storage/maintenance structures with fire damage adjacent to the Venegas milking barn were not accessed, but limited views of the interior were obtainable.
- A vacant former dairy facility on the northeastern portion of the Property (Photograph No. 33, Drake tenant space) was not accessible.
- Due to vegetative cover, observation of the ground surface was limited underneath dairy equipment/vehicles, including discarded vehicles, observed throughout storage areas on the central and northeastern Property portions within the Venegas Dairy tenant space. Please refer to Figure 3 for the general location of equipment storage areas.

1.5 Special Terms and Conditions

No special terms or conditions were identified by the User.

1.6 Reliance

This report is for the sole benefit and exclusive use of RCCD, Inc. in accordance with the terms and conditions under which these services have been provided. Its preparation has been in accordance with generally accepted environmental practices. No other warranty, either express or implied, is made. The Scope of Services associated with the report was designed solely in accordance with the objectives, schedule, budget, and risk-management preferences of RCCD, Inc.

This report should not be regarded as a guarantee that no further contamination, beyond that which could be detected within the scope of this assessment, is present at the Property. Converse makes no warranties or guarantees as to the accuracy or completeness of information provided or compiled by others. It is possible that information exists beyond the scope of this assessment. It is not possible to absolutely confirm that no hazardous materials and/or substances exist at the Property. If none are identified as part of a limited scope of work, such a conclusion should not be construed as a guaranteed absence of such materials, but merely the results of the evaluation of the property at the time of the assessment. Also, events may occur after the Property visit, which may result in contamination of the Property. Additional information, which

was not found or available to Converse at the time of report preparation, may result in a modification of the conclusions and recommendations presented.

Any reliance on this report by Third Parties shall be at the Third Party's sole risk. Should RCCD, Inc. wish to identify any additional relying parties not previously identified, a completed Application of Authorization to Use (see Appendix A of this report) must be submitted to Converse Consultants.

2.0 Property Description

Item	Comment
Current Use(s) of the Property	The Property is owned by George R. Phillips of The John Te Velde Irrevocable Trust; Zwaantina Te Velde and George R. Phillips, Co Trustees, under Survivor's Trust, under The Harm and Zwaantina Te Velde Trust; and Artevel of California, LLC. It is operated as two (2) dairy farms and a nursery (tenants). A Property location map, and field generated Property and Property detail plans are provided in Appendix B. Pertinent Property photographs are provided in Appendix C.
Location and Legal Description	The Property is located at the southeast corner of Euclid Avenue and Schaefer Avenue, in the City of Ontario, California. The Property is located approximately 1.8-miles south of the California State Routes 60/83 interchange. The Property consists of 11 parcels and is approximately 60-acres. The San Bernardino County Assessor's Parcel Numbers are: Business Park APNs: APN 1053-071-01: No address APN 1053-071-02: 13813 and 13835 Euclid Avenue APN 1053-071-03: No address APN 1053-071-04: No address APN 1053-081-01: 7235, 7255, 7275, & 7277 Schaefer Ave. APN 1053-081-03: 7271 Schaefer Avenue APN: 1053-081-04: No address APN: 1053-211-01: No address APN:1053-211-02: No address Mixed- Use APN: APN: 1053-281-08: No address All of the above parcels and addresses were

Item	Comment
	assessed/researched herein. The legal description for the Property is as follows: LOTS 1, 2, 3, 16, 17, 18, 20, 21 AND 35 OF SECTION 18, TOWNSHIP 2 SOUTH, RANGE 7 WEST, SAN BERNARDINO BASE AND MERIDIAN, ACCORDING TO MAP OF SUBDIVISION OF PART OF RANCHO SANTA ANA DEL CHINO, AS PER PLAT RECORDED IN BOOK 6, PAGE 15, OF MAPS, RECORDS OF SAID COUNTY. EXCEPTING THEREFROM ANY PORTION LYING WITHIN EUCLID AVENUE 200 FEET WIDE, AS DESCRIBED IN SUPERIOR COURT CASE NO. 139648 AND CASE NO. 150425, A CERTIFIED COPY OF WHICH WAS RECORDED SEPTEMBER 13, 1972 AS INSTRUMENT NO. 614 IN BOOK 8019, PAGE 930 OF OFFICIAL RECORDS OF THE COUNTY OF SAN BERNARDINO, STATE OF CALIFORNIA.
Zoning Information	According to the City of Ontario, Planning Department, the zoning for the Property is AG, which is defined as Agricultural.
Property Characteristics	The Property is an irregular-shaped lot of agricultural land consisting of approximately 60 acres. The Property is generally level. Please refer to Figure 2, Property Map, and Figure 3, Property Detail, for the general locations of the following occupant spaces and their uses. A goat cheese dairy operation occupies the northeastern portion of the Property along Schaefer Avenue (Drake Farm at 7235, 7255, and 7277 Schaefer Avenue). Pertinent structures include a milking barn, fenced areas with shade canopies for goat keeping (animals present), an administrative/maintenance building, and storage barns. The eastern portion of the Drakes' tenant space, near the northeastern Property corner, also includes residential structures such as trailers and a single-family home. A vacant former dairy building adjoins the

Copyright 2021 Converse Consultants

Item	Comment
	residential structures. Photographs No. 32 through 46 depict Drake Family Farm. Approximately three (3) acres of the western portion of the Property along Euclid Avenue are occupied by Coco's Nursery (no address; western portion of APNs 1053-071-01 and 1053-071-02), which consists of irrigated potted plants, stockpiles of potting soil, and storage sheds. The remaining northern, northwestern, southern, eastern, and western portions of the Property are occupied by Art Venegas Dairy (13835 Euclid Avenue; tenant). This tenant space encompasses plowed farmland near the intersection of Euclid and Schaefer Avenues on the northwest, and on the south towards Edison Avenue. A catch basin for runoff collection is located on the southwestern Property corner. A system of catch basins is also located on the eastern Property portion, south of Drakes' farm. The central portion of the Art Venegas Dairy includes fenced areas with shade canopies for cows (animals present), a maintenance shop area, and storage areas for farm/dairy equipment/vehicles. The Venegas' milking barn and associated residential and storage structures are located on the central-west portion of the Property along Euclid Avenue. All structures within the Venegas' complex are associated with 13835 Euclid Avenue, except for a maintenance shed for Southern California Edison (SCE) pole-mounted transformer equipment (13813 Euclid Avenue) adjacent to the milking barn. Photographs No. 1 through 26, No. 29, and No. 48 depict the Art Venegas Dairy tenant space.
Description of Property Structure(s)	Observed building materials included exterior stucco, corrugated sheet metal, plaster, painted drywall, steel, concrete masonry unit, brick, and wood. Several residential/storage structures on the western Property portion (Art Venegas Dairy) were inaccessible due to earthquake/structural and fire damage.

Copyright 2021 Converse Consultants

Item	Comment
	Utility-owned (SCE) pole-mounted transformer equipment and a pertinent maintenance shed (13813 Euclid Avenue) were located adjacent to the Venegas' milk barn on the central-west portion of the Property. Utility-owned (AT&T) antenna equipment, southeast of the transformers, was located within the Coco's Nursery tenant space on the western portion of the Property.

The following services were present at the Property at the time of the assessment.

Item	Comments
Electricity:	SCE
Gas:	Not provided.
Potable Water:	Two on-site water wells (one per dairy operation). A third well, located near the northeastern Property corner, was decommissioned (date/reason unknown).
Sanitary Sewer:	Property has five (5) to six (6) septic tanks.
Heating, Ventilation, Air Conditioning (HVAC):	Wall-mounted units in residential/administrative spaces, and chiller equipment inside milk production areas.
Solid Waste:	City of Ontario, Integrated Waste Department

3.0 User Provided Information & Responsibilities

3.1 Requested Documents and Information

The ASTM E1527-13 specifies that the User, RCCD, Inc., provide any helpful documents that may be available as listed below.

- Environmental site assessment or environmental compliance audit reports
- Environmental permits or hazardous waste generator notices/reports
- Registrations for aboveground and underground storage tanks
- Septic systems, oil wells, or water wells
- Registrations for underground injection systems
- Safety Data Sheets; Community Right to Know Plans; Safety, Preparedness and Prevention Plans; or Spill Protection Countermeasures and Control Plans
- Reports regarding hydrologic conditions on the Property or surrounding area
- Notices or other correspondence from any government agency relating to past or current violations of environmental laws with respect to the Property or relating to environmental liens encumbering the Property.
- Hazardous waste generator notices or reports
- Geotechnical studies
- Risk assessments
- Recorded Activity Use Limitations (AULs)
- Proceedings regarding hazardous substances and petroleum products including any pending, threatened or past: litigation; administrative proceedings; or notices from any governmental entity regarding possible violations of environmental laws or other possible liability related to hazardous substances or petroleum products.

Mr. Jason Lee of RCCD Inc. provided a plot plan outlining the Property parcels and associated easements for public utilities (central and southern portions of the Property), as well as for roads (northeastern Property portion).

The provided amended preliminary title report, dated May 21, 2021, identified the Property owners and legal description/assessor's parcel maps. Several easements were provided for SCE, and a separate easement for pipelines and aqueducts (1970), the location of which was not disclosed. Liens were recorded in favor of the City of Ontario. According to Mr. Lee, these were recorded regarding weed abatement on portions of the Property.

3.2 User Provided Information

Section 6 of ASTM E1527-13 outlines specific User's responsibilities. This information will help identify the possibility of RECs in connection with the Property. The ASTM Standard provides a questionnaire to help the User to comply with the statutory requirements to perform tasks which would help identify RECs. Converse included the questionnaire as Attachment A to our proposal. In general, any Users should make Converse aware of information they have regarding the following:

- Environmental Cleanup Liens filed or recorded against the Property
- Activity and land use limitations that are in place on the Property or have been filed or recorded in a registry.
- Specialized knowledge or experience of the person seeking to qualify for the Legal Liability Protections (LLP)
- Relationship of the purchase price to fair market value of the Property if it were not contaminated
- Commonly known or reasonably ascertainable information about the Property

Copyright 2021 Converse Consultants

- The degree or obviousness of the presence or likely presence of contamination at the Property, and the ability to detect this contamination by appropriate investigation.

The following information was requested from the User.

3.2.1 Environmental Cleanup Liens

The User had no information regarding environmental cleanup liens or title records.

From review of the amended preliminary title report provided by the User, liens were recorded in favor of the City of Ontario. Per the User, these were related to weed abatement on portions of the Property.

3.2.2 Activity and Use Limitations

The User did not have any information indicating they were aware of any AULs.

3.2.3 Specialized Knowledge or Experience

The User did not have any information indicating they had specialized knowledge or experience related to the Property or nearby property.

3.2.4 Reason for Significantly Lower Purchase Price

Converse has no information regarding the purchase price of the Property or comparable properties. The User has not indicated to Converse that there is any conclusion that there was a lower purchase price because of known or suspected contamination at the Property.

3.2.5 Commonly Known or Reasonably Ascertainable Information

The User did not have any information about: past uses; specific chemicals at the Property; past spills; environmental cleanup or other reasonably ascertainable information regarding the Property.

3.2.6 Obviousness of Contamination

The User did not have any information based on their knowledge or experience that would be obvious indicators of contamination on the Property.

Unless specifically stated otherwise in the Scope of Services, the purpose of this Phase I ESA was to qualify for the landowner liability protections to CERCLA Liability as described in ASTM E1527-13.

Business risk unrelated to the CERCLA innocent landowners defense are only assessed as specifically agreed in the Scope of Services and discussed in Section 12.0, Additional Non-Scope Services, of this report.

Copyright 2021 Converse Consultants

3.3 Continuing Obligations

In order to assert a LLP, the User must satisfy a number of statutory requirements that are generally referred to as Continuing Obligations, which are outside the Scope of Services of the Phase I ESA. Examples of Continuing Obligations include providing legally required notices, stopping continuing releases and complying with land use restrictions. Failure to comply with these and other statutory post-acquisition requirements will jeopardize liability protection.

It is the responsibility of the User to comply with the Continuing Obligations requirements of ASTM E1527-13 and AAI. Anyone seeking LLP protections should take independent action beyond this Phase I ESA to perfect their position.

Copyright 2021 Converse Consultants

4.0 Owner Provided Information

The ASTM E1527-13 specifies that the Property owner and the Key Site Manager provide any helpful documents that may be available as listed below.

- Environmental site assessment or environmental compliance audit reports
- Environmental permits or hazardous waste generator notices/reports
- Registrations for aboveground and underground storage tanks
- Septic systems, oil wells, or water wells
- Registrations for underground injection systems
- Safety Data Sheets; Community Right to Know Plans; Safety, Preparedness and Prevention Plans; or Spill Protection Countermeasures and Control Plans
- Reports regarding hydrologic conditions on the Property or surrounding area
- Notices or other correspondence from any government agency relating to past or current violations of environmental laws with respect to the Property or relating to environmental liens encumbering the Property.
- Hazardous waste generator notices or reports
- Geotechnical studies
- Risk assessments
- Recorded AULs
- Proceedings regarding hazardous substances and petroleum products including any pending, threatened or past: litigation; administrative proceedings; or notices from any governmental entity regarding possible violations of environmental laws or other possible liability related to hazardous substances or petroleum products.

The owner representative, Mr. Gary R. Phillips of Phillips Law Partnership LLP, provided the following information:

- Underground Tank Closure Report dated September 7, 2011, and related documents, including inspection card, application for removal of underground storage tank (UST), fire department permit, Rule 1166 soil monitoring records, manifests, hazardous waste tank closure certification, certificate of destruction, plot plan, lab results, and chain of custody record. A 550-gallon diesel UST was removed in August 2011 from the former Summerhill Dairy operation on the northeastern portion the Property (7255 Schaefer Avenue; currently Drake Family Farm). The tank had been discovered during a San Bernardino County Fire Department inspection. It was removed by Moine Bros. Removal activities included Volatile Organic Compound (VOC) monitoring, and proper offsite disposal of the tank components and derived rinsate under County of San Bernardino and City of Ontario Fire Department oversight. One (1) soil sample was taken approximately three-feet beneath the tank invert, approximately 12 feet below ground surface (bgs). The sample was non-detect for VOCs. Total Petroleum Hydrocarbons (TPH) were detected at 57 milligram per kilogram (mg/kg) in the C25-C40 range, and lead was detected at 12 mg/kg. These concentrations are below the Department of Toxic Substances Control (DTSC) Human Health Risk Assessment (HHRA) Note 3 (June 2020) recommended Screening Levels for residential soil, and below the Environmental Protection Agency (EPA) Regional Screening Levels (November 2020) for residential soil. Some of the documents estimated the tank capacity at 1,000-gallon; however, upon removal the tank was found to have a volume of 550-gallons. See Appendix H, Owner Provided Documents.

- 2019 AT&T Wireless facilities plans, regarding antenna equipment located on a Southern California Edison electric transmission line tower, which lies within the Coco's Nursery tenant space on the southwestern portion of the Property toward Euclid Avenue.

- 2019 Frontier Communications plans, regarding relocation of telecommunication conduits along the northwestern Property line on Euclid Avenue.

Copyright 2021 Converse Consultants

- 2017 Southern California Edison plans, regarding installation of electric transmission conduits along the northwestern Property line on Euclid Avenue.

5.0 Records Review

5.1 Physical Setting

Item	Comments
Physical Setting:	The Property is located approximately 700 to 720 feet above mean sea level with surface topography sloping towards the south (United States Geological Survey [USGS] Topographic Map, Ontario, California, 2012).
Geology:	The Property is underlain by alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated (Division of Mines and Geology, Geologic Map of California, 2010).
Groundwater:	According to the Chino Basin Watermaster Depth to Groundwater Contour Map, first groundwater at the Property was located between 125 to 150 feet bgs in July of 2016. According to the pertinent Groundwater Elevation Contour Map, the groundwater elevation was approximately 570 feet, and the direction of regional groundwater flow was to the south.
Potable Water Supply:	Potable water is supplied from on-site production wells. One (1) well is located on the central-west Property line near Euclid Avenue (Art Venegas Dairy), and one (1) well is located on the northeastern portion of the Property near Schaefer Avenue (Drake Family Farm). A third well, which has been decommissioned (date unknown), is located near the northeastern Property corner on Schaefer Avenue.

5.2 Historical Review

5.2.1 Aerial Photograph and Map Review

Available historical aerial photographs and maps, which were provided by Environmental Data Resources (EDR), were reviewed. A summary of the review is provided in the following table. Copies of the aerial photographs and maps are provided in Appendix D.

Sanborn Fire Insurance Maps were requested from EDR. According to EDR, there is no Sanborn map coverage of the Property.

Historical Summary			
Resource and Year	**Property**	**Adjoining Properties**	**General Vicinity**

Copyright 2021 Converse Consultants

Resource and Year	Property	Adjoining Properties	General Vicinity
Topographic Maps: 1897 and 1900	Undeveloped. No structures indicated as being located on-site. The very southern end of the Property is not covered on the maps.	North adjacent land across the road undeveloped. South adjacent, and part of the east and west adjacent properties not covered. A road adjoins the Property on the north, and another road adjoins the Property on the west.	Scattered small structures, roads and railroads. Only northern vicinity covered.
Topographic Map: 1902	Southern portion of the Property undeveloped. Northern portion not shown.	Small structures are depicted west adjacent across the road and southwest adjacent. North adjoining land, and part of the east and west adjoining properties not covered.	Scattered small structures to the south and southwest. Northern vicinity not covered.
Topographic Map: 1903	No significant change from 1902 topo map. Southern portion of the Property not depicted.	No significant change from 1902 topo map. South adjacent, and part of the east and west adjacent properties not covered.	No significant change from 1902 topo map. Only northern vicinity covered.
Topographic Map: 1933	A total of four small structures are shown along the northeastern, southwestern, and western Property lines.	Small structures occupy property on the south, on the east, and on the west.	Scattered small developments throughout. Far eastern vicinity not covered.
Aerial Photograph: 1938	Agricultural. Related structures are depicted on the western and northeastern Property lines. An apparent power transmission line traverses the Property from	Agricultural land, including row crops and associated buildings.	Agricultural

5.2.2 Building Permit Review

Available building permits were reviewed at the City of Ontario, Department of Building & Safety. The following addresses/APNs comprising the Property were researched:

APN 1053-071-01: No address
APN 1053-071-02: 13813 and 13835 Euclid Avenue
APN 1053-071-03: No address
APN 1053-071-04: No address
APN 1053-081-01: 7235, 7255, 7275, and 7277 Schaefer Avenue
APN 1053-081-03: 7271 Schaefer Avenue
APN 1053-081-04: No address
APN 1053-211-01: No address
APN 1053-211-02: No address
APN 1053-281-08: No address

The department only had records on file for 13813 Euclid Avenue (Assessor's Parcel Number 1053-071-02):

Permits were issued in March of 2003 regarding electrical panels and a meter reset for electrical power to a water well pump (10 to 50 horsepower). The owner was noted as Martin Dairy. The electrical utility was noted as SCE.

5.2.3 City Directories

A city directory search was completed on the Property by EDR. The complete city directory is provided in Appendix D, Historical Research.

13813 South Euclid Avenue
The Property was identified with a residential listing in city directories published as early as 1965. Between 2003 and 2008, the Property was identified as residential listings.

13835 Euclid Avenue
Between 2003 and 2008, the Property was identified as residential listings, and as Coco's Nursery.

7255 Schaefer Avenue
In 1975, the Property was identified as Artevel Farms. Between 2003 and 2008, the Property was identified as residential listings.

The adjacent properties were not identified in the researched city directories.

5.2.4 Data Failure

Historical information regarding the Property indicated the Property was undeveloped land as early as 1897. Therefore, no historical data failure occurred during this assessment.

Copyright 2021 Converse Consultants

5.2.5 Summary of Historical Property Use

Historically, as early as 1897 the Property was undeveloped land. From as early as 1933, structures were evident along the northeastern and western Property lines, which were associated with agricultural operations by 1938. Between 1946 and the present, the Property was used agriculturally, including one (1) dairy operation on the western portion of the Property, and another dairy operation on the northeastern portion of the Property. From as early as 2006, the current day nursery operation on the southwestern portion of the Property was noted as well.

5.2.6 Summary of Past Uses of Adjoining Properties

As early as 1897, the adjoining properties were undeveloped land. By 1902, apparent residential structures were noted on adjoining properties. From as early as 1938, agricultural uses were noted as well, including row crops. Commercial developments were noted as early as 1959. By 1975, most of the north and east adjoining land was occupied by dairy farms, and commercial uses were concentrated to the southwest and west. Commercial, as well as residential uses, remain to the west along Euclid Avenue until the present day, whereas north and east adjoining land remains for agricultural use. Part of this land is currently fallow/vacant.

5.2.7 Summary of Past Uses of the Surrounding Area

Residential uses were evident in the surrounding area from as early as 1897. Agricultural uses were noted as early as 1938. By 1959, commercial developments were also evident.

Large portions of the surrounding land remain for agricultural use through the present day.

5.3 Results of Environmental Records Sources Review

An EDR report of Standard Environmental Record Sources (Records) was prepared specifically for the Property. The search included queries to the following databases for cases within specified ASTM search distances. A copy of the database report is provided in Appendix E.

5.3.1 Property Listings

The Property was identified on the following databases in the EDR report.

Property Listings	
Site Name:	DRAKE FAMILY FARMS
Databases:	San Bern. Co. Permit, CERS
Address:	7255 SCHAEFER AVE

Copyright 2021 Converse Consultants

Comments:	Underground Storage Tank (UST) inspection record noted a UST removed in 2011. Hazardous material handler permits included. Cited during San Bernardino County Fire Department inspections in 2014 to 2020, regarding business plan updates and hazardous material reporting.

Site Name:	ART VENEGAS DAIRY
Databases:	San Bern. Co. Permit, HWTS
Address:	13835 EUCLID AVE
Comments:	Conditionally Exempt Small Quantity Generator of hazardous waste (active) and hazardous materials handler (inactive).

Site Name:	ART VENEGAS DAIRY - EUCLID
Databases:	CERS HAZ WASTE, CERS, ENF, CIWQS, San Bern. Co. Permit
Address:	13835 EUCLID AVENUE
Comments:	Listed regarding stormwater runoff from a confined animal feeding facility. 13835 Euclid Avenue (western portion of the Property) listed regarding AT&T antenna equipment. 2014 to 2020 violations included a citation regarding a 275-gallon waste oil tote that was broken with contents exposed noted during a San Bernardino Fire Department inspection. Also issues regarding storage times of waste oil and hazardous material record keeping/labeling.

5.3.2 Adjoining Properties

The following adjoining properties were identified in the EDR report:

Adjoining properties' listings regarding Leaking Underground Storage Tank cases are not RECs based on regulatory closure, distance from the Property, and media (soil) affected.

Listings regarding hazardous material use/hazardous waste generation are not RECs based on no significant release records, offsite disposal and regulatory compliance inspections.

5.3.3 Other Off-site Locations of Concern

Other off-site locations of concern identified by EDR within a maximum one-mile radius from the Property included registered UST sites, LUST sites, hazardous waste generators, permitted hazardous materials handlers, and FINDS, ECHO, HAZNET, HWTS, HIST CORTESE, CERS, CERS HAZ WASTE, CERS TANKS, HIST UST, SWEEPS UST, CA FID UST, SWF/LF, ENF, CIWQS, DRYCLEANERS and ENVIROSTOR database listings.

The potential for environmental concern to the Property from these off-site locations appears to be low due to one or more of the following: type of regulatory listing; type of resource (soil) affected, location with respect to the direction of regional groundwater, distance from the Property; status of the case; and/or regulatory closure.

5.3.4 Orphan Listings

The EDR database report identified seven (7) orphan listings. The locations of sites that were identified by address were found to be in the general vicinity of the Property; however, due to distance, location with respect to the direction of regional groundwater, and/or type of listing were determined to have a low potential for environmental concern to the Property.

Other orphan sites were identified only by street name. These street names were found in the general vicinity of the Property; however, the specific site locations could not be determined. These orphan sites appeared to have a low potential for

Copyright 2021 Converse Consultants

environmental impact to the Property due to one or more of the following: type of regulatory listing; estimated distance from the Property; remedial efforts being directed by a regulatory agency; and/or potential responsible parties have been identified.

5.4 Additional Environmental Record Sources

The following addresses were researched for the Property.

- 13813 and 13835 Euclid Avenue
- 7235, 7255, 7271, 7275 and 7277 Schaefer Avenue

Federal Agencies

Source	Comments
U.S. Department of Transportation, Pipeline and Hazardous Material Safety Administration (PHMSA)	The PHMSA online mapping system for gas transmission pipelines and hazardous liquid pipelines on the Property or adjacent properties was reviewed (https://www.npms.phmsa.dot.gov/PublicViewer/). No pipelines were identified on or adjoining the Property.

State Agencies

Source	Comments
California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control (DTSC)	No information regarding the Property was on file with DTSC. The Envirostor website (http://www.envirostor.dtsc.ca.gov/public/) was reviewed for information, and the Property was not listed in the database.
Cal/EPA, Regional Water Quality Control Board (RWQCB)	The following information was on file with the RWQCB regarding 13835 Euclid Avenue (Art Venegas Dairy). All other addresses/APNs associated with the Property yielded no search results. May 2010 Waste Discharge Requirements for Art Venegas Dairy - The document confirmed the acceptance of the facility's Notice of Intent and Engineered Waste Management Plan (EWMP). Annual Reports of Animal Waste Discharge (2012 to 2019) - Approximately 200 to 300 animals, approximately 40 to 300 tons of manure stockpiled on-site annually, and approximately 350 to 750 tons of manure hauled offsite annually were noted, as well as two (2) milkings per day. Approximately 10 to 40 acres of cropland (alfalfa, bermuda grass, pumpkins and oats) on-site were indicated as the location of

Copyright 2021 Converse Consultants

Source	Comments
	manure application. The cropland was planted once per year. No discharge incidents were reported regarding Concentrated Animal Feeding Operation (CAFO) stormwater management. The pertinent manure manifests were provided for each year. April 2012 correspondence regarding a violation of the California Water Code (CWC) by Art Venegas Dairy - Payment options were outlined for penalties due to lateness of the Annual Waste Discharge report. 2014 to 2016 inspection reports by the Santa Ana Regional Water Quality Control Board (RWQCB) - The routine, non-sampling inspections noted no violations. The overall rating of the Venegas facility was noted as satisfactory. Three (3) to five (5) inches of corral manure and several large manure piles were observed. The catch basin/pasture area maintenance was evaluated as adequate, and the housekeeping as marginal. May 2019 Notice of Intent regarding compliance with the General Permit to Discharge Wastes from Concentrated Animal Feeding Operations (CAFO) by Art Venegas. The document indicated that the 60-acres of the Property include 15 acres of corrals, 25 acres of cropland, and 20 acres of disposal/pasture. The pertinent discharge authorization was issued on July 15, 2019. July 2019 inspection report by the Santa Ana Regional Water Quality Control Board (RWQCB) - Noted issues included manure excess inside the corrals and additional manure stockpiled outside the corrals. Remains of deceased cows were noted at one stockpile location. The Geotracker website (http://geotracker.waterboards.ca.gov/) was reviewed for information, and the Property was not listed in the database.
California Department of Conservation, California Department of Conservation (DOC), Geologic Energy	Converse reviewed the DOC CalGEM Online Well Finder (https://www.conservation.ca.gov/calgem/Pages/Wellfinder.aspx). According to the website, no oil or gas wells are located on or adjoining the Property. The Property is not located within an oil field.

Management Division (CalGEM)	

Local Agencies

Source	Comments
South Coast Air Quality Management District (SCAQMD)	The following document was on file with SCAQMD. June 2020 Facility Equipment List Report for Tony Martin Dairy at 13813 Euclid Avenue - Applications for Agop's Emergency Internal Combustion Engine (50 to 500 horsepower) and for Agop's Dairy were cancelled due to non-payment. The facility was noted as out of business.
San Bernardino County Fire Protection District (CUPA)	In addition to the documentation for the August 2011, 550-gallon diesel UST removal outlined in Section 4.0 (Owner Provided Information), the following documents were on file with the County. 2020 hazardous materials inventory for Drake Family Farms at 7255 Schaefer Avenue - Noted chemicals included alkaline cleaner (30 gallons), bleach (110 gallons), and phosphorous/nitric acid (30 gallons). Associated 2011 to 2020 inspections noted no hazardous wastes. Citations included overdue business plan reviews. Certified Unified Protection Agency (CUPA) hazardous materials permits (1-3 chemicals) were issued between 2012 and 2015. A former occupant at 7255 Schaefer Avenue, Summerhill Dairy, was noted with hazardous material permits between 2009 and 2011. In addition to the 550-gallon UST removed from this facility in 2011, fire department inspections in May 2007 also noted a 1,000-gallon diesel aboveground storage tank (AST) at the southwest end of the facility's yard (northeastern portion of the Property). Another AST (500-gallon diesel) was observed during the same May 2007 inspection at the northwest end of the facility's yard. No further documentation regarding these two (2) ASTs was available. Converse did not observe any fuel ASTs during the July 2, 2021 reconnaissance. 2020 hazardous material inventory for Art Venegas Dairy (13835 Euclid Avenue) - Noted chemicals included two (2), 275-gallon totes of waste oil; two (2), 55-gallon drums of hydraulic oil; one (1), 55-gallon drum of teat dip; and one (1), 55-gallon drum of enzyme cleaner. Citations included record keeping/hazardous waste labeling violations and

Copyright 2021 Converse Consultants

Source	Comments
	business plan review requirements. Records for the same address were on file regarding on-site AT&T antenna equipment. The pertinent inventory identified 12 lead acid batteries stored at the facility inside the Coco's Nursery tenant space on the southwestern portion of the Property.
Methane	The Property will need a methane assessment prior to redevelopment according to the City of Ontario, Building Department requirements. A copy of the City's requirements are appended to this report.

6.0 Property Reconnaissance

6.1 Methodology

On July 2, 2021 Converse visited the Property to evaluate present use and to identify observable environmental conditions at the Property. Our methodology involved walking the perimeters, center lines, and accessible interior areas of the buildings while noting observed evidence of present and potential environmental concerns.

Field-generated maps are provided in Appendix B. Pertinent Property photographs are provided in Appendix C.

6.2 Limiting Conditions

Converse's findings are based on the Property conditions observed on July 2, 2021.

The following limitation was encountered during the reconnaissance:

- There was no access to various storage containers for dairy equipment throughout the central and northeastern portions of the Property, within the Art Venegas Dairy tenant space (13835 Euclid Avenue).
- Converse did not access the residential structures at 13835 Euclid Avenue (Art Venegas Dairy) or the Drake Family Farm (7235, 7255 & 7277 Schaefer Avenue).
- Former storage/maintenance structures with fire damage adjacent to the Venegas milking barn were not accessed, but limited views of the interior were obtainable.
- A vacant former dairy facility on the northeastern portion of the Property was not accessible.
- Due to vegetative cover, observation of the ground surface was limited underneath dairy equipment/vehicles, including discarded vehicles, observed throughout storage areas on the central and northeastern Property portions within the Venegas Dairy tenant space.

6.3 Interior Observations of Property

During our Property visit, Converse made the following observations of the interior of the Property's building(s):

Interior Observations of Property		
Item or Condition	**Observed Evidence?**	**Comments**
Hazardous Substances & Petroleum Products:	Yes	Three (3), 55-gallon drums of alkaline and acid cleaners were observed inside the hazardous materials storage room of the Drakes' Farm milking barn at 7255 Schaefer Avenue on the northeastern portion of the Property. Corrosion and de minimis

Copyright 2021 Converse Consultants

Item or Condition	Observed Evidence?	Comments
		staining was evident throughout the room (Photograph No. 43). A nearby storage shed for livestock feed supplements also contained a compressed gas cylinder of argon for welding. Inside the farm's maintenance shop, five (5) bags of water softener salt and several one-gallon cans of pains and sealants were stored. A wooden cage inside the shop contained four (4), three-gallon, and two (2), one-gallon containers of gasoline and diesel fuel, as well as several small containers of two-stroke engine additives. Inside the Venegas Farm's milking barn at 13835 Euclid Avenue on the western portion of the Property on Euclid Avenue, Converse observed two (2), 50-pound bags of copper sulfate and a 10-gallon container of sanitizing teat dip. The barn's electrical/compressor room contained a small container of Freon 134a refrigerant. One (1), 55-gallon drum of acid cleaner, a 10-gallon container of enzyme cleaner, and a five-gallon bucket of medicated skin treatment product for cows were inside an adjacent work room. De minimis floor/wall staining noted (Photograph No. 3).
Storage Tanks & Related Equipment:	No	
Odors:	No	
Standing Surface Water or Other Pools of Liquid:	No	
Drums & Other Containers of Hazardous Substances, Petroleum Products, or Other Unidentified Contents:	Yes	See Hazardous Materials & Petroleum Products above.
Transformers or Equipment containing Polychlorinated Biphenyls (PCBs):	Yes	The Venegas' milk barn electrical room contained one dry-type transformer.

Copyright 2021 Converse Consultants

Item or Condition	Observed Evidence?	Comments
Heating/Cooling System:	Yes	Wall-mounted air conditioning units noted in residential spaces throughout. Chiller equipment associated with milk production areas.
Stains or Corrosion on Floors, Walls, or Ceilings:	Yes	De minimis corrosion/staining inside respective hazardous material storage rooms. Please see Hazardous Materials & Petroleum Products above.
Drains and Sumps:	Yes	Several floor/trench drains were observed throughout the two (2) on-site dairies' milking barns.

In addition to above items, Converse also observed the following:

An operations shed associated with SCE transformer equipment on the western portion of the Property (13813 Euclid Avenue) contained electrical and compressor equipment. No leaks/stains were observed.

Observed milking barn equipment included electrical water heaters, milk collection/pasteurizing tanks, compressors and other refrigeration components, air compressors for suction and other milking apparatuses, and valve equipment associated with washing stations.

Inside vacant storage/maintenance structures adjacent to the Venegas' milk barn, which were inaccessible due to earthquake/fire damage, maintenance spare parts, dairy hardware, filters and compressor equipment were observed through window openings.

A former AT&T communications room for electrical components was located north adjoining the Venegas' farm structures (northwestern portion of the Property).

Hydroponic nursery components were stored inside a room adjoining the Drakes' maintenance shop on the northeastern portion of the Property. A nearby vacant former dairy facility within the Drake tenant space (former owner/occupant unknown) contained two (2) milk collection/pasteurizing tanks inside a room on the north which were observed through a window. The facility was inaccessible.

6.4 Exterior Observations of Property

During our Property visit, Converse made the following observations of the exterior of the Property:

Exterior Observations		
Item or Condition	**Observed Evidence?**	**Comments**
Hazardous Substances & Petroleum Products:	Yes	Farm equipment/vehicles throughout the maintenance shop area on the central portion of the Property (Art Venegas Dairy) included gardening equipment, compressors, and tractors.

Copyright 2021 Converse Consultants

Item or Condition	Observed Evidence?	Comments
		Approximately 80 used tires were stored on a nearby rack. Converse observed multiple one to five-gallon containers of vehicle maintenance fluid containers. A total of approximately 35 empty, 55-gallon poly drums, labeled as disinfectants/sanitizing liquids were noted throughout the area. Per Mr. Venegas, the drums are cut open to store/handle brewery (malt) waste which is used as supplementary cow food. A wood pallet held 14 car batteries. Adjacent to the pallet an open five-gallon bucket with waste oil was noted. The maintenance shop area featured an intact concrete floor. South of the area, discarded automobiles were stored on the unimproved ground. A nearby approximately 500-gallon storage tank for liquid fertilizer, and an unlabeled 55-gallon metal drum were empty. On the exterior of the Drakes' milking barn, Converse noted a 55-gallon drum and a 10-gallon container with sanitizing agents under a canopy. A diesel generator with a 26-gallon tank was stored in the same area, as well as six (6), 55-gallon drums for acid sanitizer. An adjacent large tank was identified as dairy equipment for pasteurizing/milk processing purpose, per the on-site manager, Mr. Mike Carrasco of Drake Family Farms. On the exterior of an east adjacent vacant former dairy facility (name/address unknown), an apparently non-operational emergency generator was located. One-gallon containers with vehicle fluids remained on the exterior the building. De minimis staining of the unimproved ground observed. Throughout the storage spaces on the central-north portion of the Property (Venegas Dairy), which were partially covered by shade structures, multiple farm vehicles, as well as refrigeration equipment components, were stored. Per Mr. Venegas,

Copyright 2021 Converse Consultants

Item or Condition	Observed Evidence?	Comments
		materials from demolition of offsite dairy facilities are stored for resale. According to Mr. Venegas, storage containers observed adjacent to the equipment contain similar items. Used tires of larger farm vehicles were among the items. In the same general area, Converse noted a total of eight (8), 275-gallon totes and 25, 55-gallon poly drums (previously labeled as alkaline cleaner). All were used, or cleaned for use with the above mentioned brewery waste for cow feeding.
Storage Tanks & Related Equipment:	Yes	A maintenance shop area associated with the Venegas dairy (13835 Euclid Avenue), which was located on the central portion of the Property, included a 300-gallon AST for diesel. The tank was mounted on a steel frame above a drain. De minimis ground staining was observed on the concrete floor in the general area.
Odors:	No	
Standing Surface Water or Other Pools of Liquid:	No	
Drums & Other Containers of Hazardous Substances, Petroleum Products, or Other Unidentified Contents:	Yes	Please see Hazardous Materials & Petroleum Products above.
Transformers or Equipment containing Polychlorinated Biphenyls (PCBs):	Yes	Pole-mounted transformer equipment is located adjacent to the Venegas' milking barn. A nearby transmission line tower features AT&T antenna, and associated components inside a brick enclosure.
Pits, Ponds, or Lagoons:	Yes	A runoff catch basin is located on the southwestern Property corner. It was dry on the day of Converse's reconnaissance (July 2, 2021). An intermediate catch basin on the southwestern portion of the Property contained water. An east adjacent runoff channel was filled with water as well. A system of catch basins on the eastern part of the Property was only partially filled with water.
Stained Soil or Pavement:	No	

Copyright 2021 Converse Consultants

Item or Condition	Observed Evidence?	Comments
Stressed Vegetation (other than from insufficient water):	No	
Evidence of Mounds, Depressions or Filled or Graded Areas Suggesting Trash or Other Solid Waste Disposal:	No	
Waste Water or any discharge (including storm water) into a Drain, Ditch, or Stream on or Adjacent to the Property:	Yes	Dairy farm runoff is collected in onsite catch basins.
Wells (active, inactive, or abandoned):	Yes	The two (2) dairy operations feature one (1) active water well each. A third well near the northeastern Property corner was decommissioned.
Septic Systems or Cesspools:	Yes	Three (3) septic tanks were identified at the Venegas' farm, and two (2) septic tanks were identified at the Drakes' farm.
Prior Structures:	No	
Roads, Tracks, Railroad Tracks or Spurs:	Yes	Schaefer Avenue bounds the Property on the north; and Euclid Avenue bounds the Property on the west.

In addition to above items, Converse also noted the following:

Irrigation valve equipment was located adjacent to the Edison maintenance shed next to the Venegas Dairy milk barn.

Used dairy components for resale are stored on the central portion of the Property. It included multiple milk and water tanks, and electrical switch and compressor equipment.

Water utility test location covers were located on the northeastern Property line along Schaefer Avenue.

A storm drain was noted on the central portion of the Drakes' Dairy. A nearby work station comprised of tools/ingredients for goat cheese preparation. Chiller/boiler equipment on the milking barn exterior included a water storage tank and pressure vessels.

East adjoining farmland/cattle facilities featured farm machinery/materials storage yards adjacent to the respective Property line.

Adjacent to the southwestern Property line (offsite), Converse noted a large pile of concrete/construction debris.

Copyright 2021 Converse Consultants

Feedstock for cows and produce waste were staged south of the maintenance shop area on the central section of the Property. Five manure piles were noted throughout corrals on the western and central portions of the Property (Art Venegas Dairy).

6.5 Current Uses of Adjoining Properties

Based on our research and observations during our Property visit, the Property is bordered by the following:

Adjoining Property Use	
Direction	**Current Development**
North	Schaefer Avenue, followed by corn crops.
Northeast	Schaefer Avenue, followed by plowed agricultural land.
Northwest	Schaefer Avenue and Euclid Avenue, followed by agricultural land.
South	A truck yard, a vacant parcel, and a storage yard.
Southeast	A residential structure (7226 Edison Avenue)
Southwest	Euclid Avenue, followed by warehouses (14058 Euclid Avenue).
East	A residential structure (7365 Schaefer Avenue), vacant land, and farmland, including equipment/vehicle storage yards.
West	Euclid Avenue, followed by a commercial center, including Subway, Starbucks and Carl's Junior (7041, 7055, and 7069 Schaefer Avenue); a residential development (13817 Farmhouse Avenue); a trailer storage yard; and Robert R. Ford truck dealership (14042 Euclid Avenue).

6.6 Current Uses of Surrounding Area

Based on our research and observations during our Property visit, the surrounding area of the Property consists of residential, agricultural, and commercial uses. Commercial uses include a truck driving school, a church, retail stores, and restaurants.

Copyright 2021 Converse Consultants

7.0 Interviews

During the interviews, the owners and occupants were asked if they had any available documents that would be helpful. The documents that were requested are detailed in Section 4.0 of this report:

Interview:	Comments:
Property Owner:	According to Mr. Gary R. Phillips, representative for Artevel of California LLC (Property owner since 2008), from the mid to the late 1960's, the Property was owned by Harm and Zwaantina te Velde, and was gifted to various irrevocable trusts for the benefit of their children, some of whom are members of the current ownership. Mr. Phillips stated that up to six (6) septic tanks are located on the Property. On the day of Converse's Property reconnaissance (July 2, 2021), five (5) septic tank locations were indicated to Converse by Mr. Carrasco of Drake Family Farms and Mr. Venegas of Art Venegas Dairy. Mr. Phillips was not aware of any environmental concerns in connection with the Property.
Tenant/ Occupant:	Mr. Adrian Venegas of Art Venegas Dairy identified three (3) septic tanks associated with his dairy operation. He indicated that the only reportable hazardous waste on-site was manure, which needs to be tracked by the RWQCB prior to on-site disposal. Five (5) manure piles were observed by Converse throughout the corrals on the central and western portions of the Property. According to Mr. Venegas, manure stockpiles stored inside the corrals on the central-west portion of the Property are applied to cropland on the northwestern, central, and southern portions of the Property. Pumpkins are the main crops which is sold on-site in the fall. Mr. Venegas stated that sanitizers and other dairy related chemicals are replenished by Specialized Dairy Services, who also hauls the spent drums of sanitizer/cleaning agents. He indicated the 300-gallon diesel AST in the central maintenance shop area as the only petroleum product storage for his dairy operation. Mr. Venegas stated the storage containers observed throughout the Venegas Dairy on the central and northeastern portions of the Property contained equipment from demolition of offsite dairy operations. The equipment is resold, including

Copyright 2021 Converse Consultants

Interview:	Comments:
	milk processing apparatuses, electric switch panels, and refrigeration components. Upon Converse's request, Mr. Venegas inquired with Coco's Nursery staff whether any fertilizers/chemicals are stored at the nursery. He indicated that stock piles of potting soil on the unimproved ground is the only material stored on-site for plant production. Mr. Mike Carrasco of Drake Family Farms identified two (2) septic tanks throughout his facility, which are pumped by Ary Septic. He too stated that Specialized Dairy Services delivers/hauls all hazardous materials/empty drums. Mr. Carrasco indicated that the only petroleum product storage for his facility was inside the maintenance shop were small containers of diesel and gasoline are located.
State or Local Government Officials:	Other than the information provided in Section 5.4, no other information was provided by a government official.
Owners and Occupants of Neighboring Sites:	No interviews of owners or occupants of neighboring sites were conducted.

Copyright 2021 Converse Consultants

8.0 Findings

A cursory summary of findings is provided below. However, details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein.

- The Property is owned by George R. Phillips of The John Te Velde Irrevocable Trust; Zwaantina Te Velde and George R. Phillips, Co Trustees, under Survivor's Trust, under The Harm and Zwaantina Te Velde Trust; and Artevel of California, LLC. It is occupied by two (2) dairy farms and a nursery (tenants).
- The Property was identified as 13813 and 13835 Euclid Avenue, and 7235, 7255, 7271, 7275, and 7277 Schaefer Avenue.
- Historically, as early as 1897, the Property was undeveloped land. From as early as 1933, structures were evident along the northeastern and western Property lines, which were associated with agricultural operations by 1938. Between 1946 and the present, the Property was used agriculturally, including one (1) dairy operation on the western portion of the Property, and another dairy operation on the northeastern portion of the Property. From as early as 2006, the present day nursery operation on the southwestern portion of the Property was noted as well.
- The Property was identified on the following regulatory databases: CERS, HWTS, CERS HAZ WASTE, ENF, CIWQS, and San Bern. Co. Violations were noted regarding hazardous material reporting and housekeeping practices at the Property. A UST on the northern Property portion, operated by a historical occupant, was removed and received regulatory closure in 2011. From observations and interviews during Converse's reconnaissance, current on-site petroleum product storage is limited to one (1), 300-gallon AST for diesel at Art Venegas Dairy. The Drake Family Farm operation only stores petroleum product in one to three-gallon containers.
- Art Venegas Dairy (13835 Euclid Avenue) disposes of manure on-site. Five (5) manure piles were observed throughout the corrals on the central and western portions of the Property.
- Five (5) or six (6) septic tanks of unknown capacity are located on the Property. There (3) tanks are associated with the Venegas Dairy buildings (milk barn and two (2) residential structures), and two (2) tanks are located at the Drake Dairy facility. The location of the sixth tank location is unknown.
- Each of the two (2) dairies features one (1) active water well. A decommissioned water well is found near the northeastern Property corner.
- Catch basins for dairy runoff are located on the Property.
- Observed chemicals inside production areas for both on-site dairies included 55-gallon poly drums of acid/base cleaners and disinfectants, and five-gallon containers of medicated ointments/dips for animals. Compressed gas cylinders for welding gases, car/equipment batteries, and tires were stored in maintenance areas, mainly on the central-west portion of the Property (Venegas Dairy). Abandoned vehicles/equipment were noted in the same general area, and also in storage areas on the northeastern portion of the Property.
- As early as 1897, the adjoining properties were undeveloped land. By 1902, apparent residential structures were noted on adjoining properties. From as early as 1938, agricultural uses were noted as well, including row crops. Commercial developments were noted as early as 1959. By 1975, most of the north and east adjoining land was occupied by dairy farms, and commercial uses were concentrated to the southwest and west. Commercial, as well as residential uses, remain to the west along Euclid Avenue until the present day, whereas north and east adjoining land remains for agricultural use. Part of this land is currently fallow/vacant.
- Adjoining property regulatory database listings included, but were not limited to LUST, CERS HAZ WASTE, CORTESE, CERS TANKS, San Bern. Co. Permit, and CERS database listings. Pertinent historical Leaking Underground Storage Tank (LUST) cases on adjoining properties all received regulatory closure. All cases were limited to soil contamination only. Regulatory compliance inspections by the San Bernardino County

Copyright 2021 Converse Consultants

Fire Department were noted for all hazardous material handlers/hazardous waste generators.

- The surrounding area of the Property consists of residential, agricultural, and commercial uses. Commercial uses include a truck driving school, a church, retail stores, and restaurants.

Copyright 2021 Converse Consultants

9.0 Opinion

Agricultural use from as early as 1938 is a REC due to potential residual contamination from agricultural chemical use.

On-site dairy operations and associated chemicals and equipment from as early as 1946 is a REC. The potential for buried manure is a concern.

The five (5) or six (6) on-site septic tanks are located on the Property. These septic systems are not considered RECs.

The former UST on the northeastern portion of the Property is not a REC based on no significant release records, offsite disposal, and regulatory closure.

Property listings regarding hazardous materials/wastes are not RECs due to offsite disposal and regulatory compliance inspections.

Adjoining properties' listings regarding LUST cases are not RECs based on regulatory closure, distance from the Property, and media (soil) affected. Listings regarding hazardous material use/hazardous waste generation are not RECs based on no significant release records, offsite disposal and regulatory compliance inspections.

No significant data gaps were identified that affect the ability of the Environmental Professional (EP) to identify RECs.

There are no unusual circumstances where greater certainty is required regarding RECs.

Copyright 2021 Converse Consultants

10.0 Conclusions and Recommendations

Converse has performed a Phase I Environmental Site Assessment in general conformance with the scope and limitations of ASTM Practice E1527-13 for Euclid Avenue and Schaefer Avenue, Ontario, San Bernardino County, California. Any exceptions to or deletions from this practice are described in the Limitations and Exceptions of Assessment section of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the Property except for the following:

- Agricultural use from as early as 1938 is a REC due to potential residual contamination from agricultural chemical use.
- On-site dairy operations and associated chemicals, manure, and equipment, from as early as 1946 are RECs.

Based on this assessment, Converse has the following recommendation:

- Soil sampling over the Property. Areas to be assessed should include the farmland, catch basins, maintenance areas, AST (and drain located underneath the AST) & UST areas, and livestock/manure areas.
- Containers of hazardous materials, equipment, and tires should be removed from the Property prior to acquisition. If these items are left on-site, they will need to be disposed of in accordance to applicable regulations.
- A methane assessment in accordance with the City of Ontario requirements should be conducted.

Copyright 2021 Converse Consultants

11.0 Deviations and Limitations

The following deviations and/or limitations from the ASTM Standard were encountered during this assessment:

- There was no access to various storage containers for dairy equipment throughout the central and northeastern portions of the Property, within the Art Venegas Dairy tenant space (13835 Euclid Avenue).
- Converse did not access the residential structures at 13835 Euclid Avenue (Art Venegas Dairy) or the Drake Family Farm (7235, 7255 & 7277 Schaefer Avenue).
- Former storage/maintenance structures with fire damage adjacent to the Venegas milking barn were not accessed, but limited views of the interior were obtainable.
- A vacant former dairy facility on the northeastern portion of the Property was not accessible.
- Due to vegetative cover, observation of the ground surface was limited underneath dairy equipment/vehicles, including discarded vehicles, observed throughout storage areas on the central and northeastern Property portions within the Venegas Dairy tenant space.

Copyright 2021 Converse Consultants

12.0 Additional Non-Scope Services

There are environmental issues outside the scope of the ASTM E1527-13 that can be assessed in connection with a commercial real estate transaction. These are dealt with as non-scope considerations since they do not typically present a Superfund Liability. The specific level of inquiry (if any) is defined in the Proposal which contains a Scope of Work. These non-scope services are very client specific and not covered by the ASTM standard. They are frequently related to the business environmental risk which is defined in the standard as "risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate".

No non-scope issues were addressed during this assessment.

13.0 Signature of Environmental Professional

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

I have the specific qualifications based on education, training and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standard and practices set forth in 40 CFR Part 312.

Norman S. Eke
Senior Vice President

B.A., Liberal Studies, Environmental Studies Emphasis, University of California, Santa Barbara, 1988.
Cal/OSHA Certified Asbestos Consultant, #96-2093
NIOSH 582 Equivalent Training

Senior Vice President and Managing Officer of Converse's California Environmental offices. Mr. Eke has served as the Principal-in-Charge and Contract Administrator to deliver services to our public agency and private clients. Mr. Eke has 31 years of experience in the fields of Environmental Due Diligence including Phase I and Phase II Environmental Site Assessments, Asbestos surveys/specifications/abatement monitoring, Preliminary Endangerment Assessments and associated Supplemental Site Investigations and Removal Action Work Plans/Implementation, various forms of Remediation, Human Health Risk Assessment and Indoor Air Quality. Mr. Eke is a former Subcommittee Chairman for E.50-02 Real Assessment and Management of the ASTM E.50 Committee on Environmental Assessment, Risk Management, Corrective Action, which includes Phase I ESA standards.

Principal area of responsibility for this ESA report: Client Point of Contact., Report Review

Laura Tanaka
Principal Environmental Scientist

B.S., Biology, California State Polytechnic University, Pomona, 1987
Cal/OSHA Asbestos Consultant, 11-4708
CDPH Certified Lead Inspector/Assessor, #I-3086
CDPH Certified Project Designer, #D-3086
CDPH Certified Project Monitor, #M-3086

Ms. Tanaka is currently responsible for the day-to-day operations of the Costa Mesa office. Ms. Tanaka has 30 years experience with Phase I and II ESAs, Preliminary Endangerment Assessments, asbestos surveys, lead-based paint surveys, abatement monitoring, as well as hazardous material audits, completing business plans, and SCAQMD permitting. Current duties at Converse include project management, business development and client maintenance, conducting/managing ESAs, and completing third party documents reviews.

Principal area of responsibility for this ESA report: Project Management, Client Contact, Historical Research, Regulatory Agency Interaction, Property Reconnaissance, Interviews, and Report Generation and Review.

Kaspar Wittlinger
Senior Staff Environmental Scientist

B.S., Environmental Engineering, The City College of New York, New York, 2016
EIT Certificate #162789, Sacramento, CA

Mr. Wittlinger has 14 years of professional experience collaborating on international construction and site remediation projects. As an Engineer in Training he has resolved permitting issues in public spaces with strategic water and soil sample collection, pertaining data analysis, and presentation of recommendable courses of action. He has designed customized systems for water and soil best management practices. Mr. Wittlinger has experience conducting Environmental Site Assessments as part of the due diligence process.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Converse Consultants were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

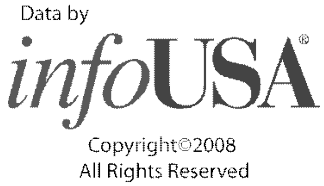
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/22/2021 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
STATER BROS MARKETS EPA ID:: CAL000340385	6989 SCHAEFER AVE	W 0 - 1/8 (0.115 mi.)	L39	143

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/25/2021 has revealed that there are

2 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 6 SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 6 UST sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 7 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/22/2021 has revealed that there are 10 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Description:	Caller is reporting numerous containers abandoned in the back of a business which were released during a fire. The released materials appear to be various paints and potentially some solvents. After knocking down the fire with approximately 1000 gallons of water, the fire run-off was contained in a dirt ditch area, where City Yards personnel are cleaning up the release. Caller confirms no nearby storm drains or public waterways were impacted.

Violation Date: 11-21-2019
Citation: 23 CCR 16 2641(j) - California Code of Regulations, Title 23, Chapter 16, Section(s) 2641(j)
Violation Description: Failure of the leak detection equipment to be installed, calibrated, operated, and/or maintained properly.
Violation Notes: Returned to compliance on 11/21/2019. OBSERVATION: 1) At the time of inspection, the 91-high liquid sensor for the secondary vapor line was not going into alarm when tested. 2) Before the technician started testing the system, the Veeder Root displayed an L8 alarm. In order to clear the alarm, the technician added approximately 1 gallon of brine to the 91 Fill Sump (T2), re-tested the sensor and monitored the level of brine. CORRECTIVE ACTION: 1) The technician replaced the 91-high liquid sensor for the secondary vapor line, re-tested and passed. Violation abated/corrected on site. 2) The technician notified the on-site manager that he added brine to the 91 Fill Sump at the beginning of the inspection and cautioned her that there may or may not be an L8 alarm within the next two days. NOTE: The exterior and internal penetrations for the 91 turbine sump were replaced under permit due to a brine leak.

RODRIGUEZ CALF RANCH (Continued) **U001568850**

Name:	RODRIGUEZ CALF RANCH
Address:	7416 SCHAEFER AVE
City:	CHINO
Facility ID:	Santa Ana River 365910001
Facility Type:	Agricultural - Facility that treats and/or disposes of the wastes associated with confined and concentrated animal feeding, confined animal feeding, confined animal holding, confined and concentrated aquatic animal production facilities, and aquaculture. the treatment and/or disposal of agricultural return water is included in this category.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	CAG018001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board
Subregion:	8
Facility Telephone:	9096285705
Facility Contact:	ANTONIO RODRIGUEZ
Agency Name:	RODRIGUEZ ANTONIO
Agency Address:	7416 SCHAEFER AVENUE
Agency City,St,Zip:	CHINO 91710
Agency Contact:	ANTONIO RODRIGUEZ
Agency Telephone:	9096285705
Agency Type:	Private
SIC Code:	241
SIC Code 2:	Not reported
Primary Waste Type:	Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.
Primary Waste:	STORMS
Waste Type2:	D
Waste2:	Stormwater Runoff
Primary Waste Type:	Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.
Secondary Waste:	Solid Wastes
Secondary Waste Type:	Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
