Dear Mr. Gancarczyk:

Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed Phase I Environmental Site Assessment (ESA) report for the above-referenced property. This assessment was performed in accordance with Terracon's Master Services Agreement, dated June 3, 2016, and Work Authorization No. SCAL-BP_0160 (CCAP-1), dated February 19, 2021.

We appreciate the opportunity to be of service to you on this project. In addition to Phase I services, our professionals provide geotechnical, environmental, construction materials, and facilities services on a wide variety of projects locally, regionally and nationally. For more detailed information on all of Terracon's services please visit our website at www.terracon.com. If there are any questions regarding this report or if we may be of further assistance, please do not hesitate to contact us.

Sincerely,
**Terracon Consultants, Inc.**

for

# EXECUTIVE SUMMARY

This Phase I Environmental Site Assessment (ESA) was performed in accordance with Terracon's Master Services Agreement, dated June 3, 2016, and Work Authorization No. SCAL-BP_0160 (CCAP-1), dated February 19, 2021, and was conducted consistent with the procedures included in ASTM E1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* and Client Scope of Work. The ESA was conducted under the supervision or responsible charge of Carl A. Parten, Environmental Professional. Laura S. Hedman performed the Property reconnaissance on March 3, 2021. The purpose of this Phase I ESA is to assist Kaiser Permanente in the identification of Recognized Environmental Conditions (RECs) associated with the Property, and the evaluation of Business Environmental Risks (BER) potentially associated with purchasing the Property. We understand the future use of this Property is currently unknown.

## Findings and Opinions

A summary of findings is provided below. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein.

Property Description and Use

The subject site (the Property) is located at 1022-1026 Leorita Street, in Baldwin Park, Los Angeles County, California 91706, and consists of two contiguous parcels of land, totaling approximately 1.54-acres, and identified by Los Angeles County Assessor Identification Numbers (AINs): 8559-008-005 and -011. The Property is improved with two commercial buildings: one approximately 9,600-square-foot, and the other approximately 13,440-square-foot, with a mezzanine level. The Property is further improved with asphalt-paved parking lot, landscaped areas, and utilities. During the visual reconnaissance, the Property was observed to be occupied by Broken Horn Saddlery, a western apparel and supply retailer.

Historical Information

Based on a review of historical information, the Property consisted of generally undeveloped or vacant land, from as early as 1894, with an apparent dwelling or homestead and associated structures visible by 1938. By 1952, apparent structures or construction trailers were visible on the Property, and by 1977 an apparent commercial building (1022 Leorita Street) appeared to have been developed on the northeastern portion of the Property. By 1983, the dwelling appeared to have been removed, and by 1989, a second commercial building (1026 Leorita Street) had been developed along the eastern boundary of the Property, and has remained consistent through the present. City directory listings for the Property included Broken Horn Saddlery, Mario Silver shop, and similar businesses from the early 1980s through the present. Indication of RECs were not identified in connection with the Property.

The surrounding parcels consisted of undeveloped or vacant land, from as early as 1894, with a creek (Walnut Creek) depicted on the adjacent southeast and a road depicted on the adjacent southwest, by 1926. By 1938, a road (Garvey Avenue) was visible further north, a small structure was visible on the southwest, and the land to the northwest appeared to have been parceled. By 1948, the land on the adjacent northeast appeared parceled with paths and apparent commercial structures, several trails were visible on the southeast (south of the creek), and two apparent dwellings and a road were visible on the adjacent northwest. By 1952, an apparent dwelling or structure was visible on the adjacent southwest, and additional dwellings were visible on the northwest. By 1964, the structures (on the adjacent northeast), appeared to have been removed, and the road appeared expanded into a freeway (I-10-San Bernardino Freeway), the creek on the southeast, appeared to be channelized and redirected further south, and the land appeared developed with a drive-in theater (Edgewood Drive-in theatre at 13159 Bess Avenue), and additional structures were visible on the southwest. The land (on the adjacent southeast), appeared graded and vacant, by 1989, and commercial development of the hospital commenced by 1990 into the existing hospital (Kaiser Permanente at 1011 Baldwin Boulevard) seen through the present. By 1994, the structures appeared to have been removed, from the adjacent southwest, and the land appeared to have been graded and vacant by 2002, and developed as an asphalt-paved parking lot, by 2009. The land to the northeast, appeared redeveloped as the current storm water basin. As of the time of the visual reconnaissance, the parking lot on the adjacent southwest, had been redeveloped into the present day parking garage, associated with the Kaiser Permanente Medical Center.

Records Review

Selected federal and state environmental regulatory databases as well as responses from state and local regulatory agencies were reviewed. The Property was not identified in the current regulatory databases; however, the Property was identified within the boundaries of the San Gabriel Valley Area 2 Superfund Site, an area-wide contaminated groundwater plume, and was identified in the National Priorities List (NPL), Comprehensive Environmental Response, Compensation, & Liability Information System/Superfund Enterprise Management System (CERCLIS/SEMS), US Engineering Control (EC), Records of Decision (ROD), Non Generator / No Longer Regulated (RCRA- NonGen/NLR), and Area of Concern (AOCONCERN) regulatory databases. The databases indicated the Property is encompassed by an underlying chlorinated solvent groundwater plume (San Gabriel Valley Area 2 Superfund Site), which is also known as the Baldwin Park Operable Unit (OU).

The primary contaminants detected in groundwater for the Baldwin Park OU are trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane, which have been mapped beneath the Property at concentrations that exceed Maximum Contaminant Levels (MCLs) and/or other regulatory levels. The depth to groundwater was measured at 129.08 feet below ground surface (July 28, 2020) in a piezometer, PZ3-1BD, identified approximately 390 feet to the west of the Property. The nearest municipal water wells are identified as well Nos. B25A and B25B, located approximately 550 feet to the west

of the Property. Water quality data from well No. B25A indicates the following recent (December 1, 2020) concentrations in groundwater, measured in micrograms per liter (µg/L).

- 1,4-Dioxane - 2.8 µg/L
- Carbon Tetrachloride - 2.3 µg/L
- NDMA - 0.069 µg/L
- PCE - 35 µg/L
- Perchlorate - 53 µg/L
- TCE - 81 µg/L

The current concentrations exceed the Maximum Contaminant Level (MCL) and/or the groundwater vapor intrusion Environmental Screening Level (ESL), except for NDMA and 1,4-dioxane, which do not have established MCLs. Based on our review of the regulatory data and historical information, the impacted groundwater represents a REC to the Property. See Section 7.16 and additional services below regarding potential Vapor Encroachment Condition (VEC) related to the REC.

Property Reconnaissance

During the visual reconnaissance, the Property was observed to be occupied by Broken Horn Saddlery, a western apparel and supply retailer. Terracon observed a propane-fueled forklift and associated propane canisters, two storm water drains, solid waste disposal bins, and a pad-mounted transformer. Indication of RECs were not identified in connection with the Property on the day of the Property reconnaissance.

Adjoining Properties

The parcels located on the adjacent north consisted of a storm water basin, followed by Dalewood Street, and then by the Interstate 10 Freeway (I-10). The parcels located on the adjacent east and south consisted of Kaiser Permanente parking garage at 1102 Baldwin Park Boulevard. Leorita Street abuts the Property to the west, followed by single-family residences. Indication of RECs were not observed with the adjoining parcels.

Additional Services

As requested by Kaiser Permanente, Terracon assessed non-scope services which can be business environmental risk (BER) considerations for the Property. The following BERs were identified in connection with the Property.

- Evidence of water-stained/damaged surfaces were apparent at 1022 Leorita Street in ceiling tiles observed on the first floor (in the harness room), within two of the office spaces (on the first floor), and on the second floor/mezzanine level above the north stairs, above the south open area, and within the retail center area. Evidence of water-stained/damaged surfaces were apparent at 1026 Leorita Street in water stained ceiling tiles observed within the main floor area (on the northern and eastern sections), and on the acoustical ceiling spray. Delaminating acoustical ceiling spray, was also observed on the upper floor, within

the open areas. Additionally, water damaged surfaces were observed on at the base of the walls (delaminating paint) within the main floor open area, the upper floor area, and the lower floor area.

- Based on the results of the Limited Hazardous Materials Survey, conducted concurrently with the Phase I ESA, asbestos was detected in at least ten (10) homogeneous areas, and consisted of roof mastic, roof paint, roof coating on pipes, HVAC duct mastic, wallboard and joint compound, carpet glue, vinyl tile and tile mastic, and restroom sink undercoating.
- Based on the results of the Limited Hazardous Materials Survey, conducted concurrently with the Phase I ESA, lead was detected in four samples collected and analyzed.
- Based on a review of the regulatory database listings, the San Gabriel Valley Area 2 Superfund Site / Baldwin Park OU, a chlorinated solvent groundwater plume is mapped beneath the Property. The primary volatile constituents of concern include TCE, PCE, carbon tetrachloride, and 1,4-dioxane, which are classified as carcinogens or possible carcinogens. These constituents are considered sufficiently volatile to enter the vapor phase from groundwater, which represents a VEC and a REC.

## Significant Data Gaps

Significant data gaps were not identified.

## Conclusions

We have performed a Phase I ESA consistent with the procedures included in ASTM Practice E 1527-13, of the SBPK 2021 MFL 1022-1026 Leorita Street Broken Horn Land, located at 1022-1026 Leorita Street, Baldwin Park, Los Angeles County, California 91706, the Property. Recognized Environmental Conditions (RECs), Controlled RECs (CRECs), or business environmental risks (BERs) were not identified in connection with the Property, except for the following REC.

- San Gabriel Valley Area 2 Superfund Site / Baldwin Park OU, a chlorinated solvent groundwater plume is mapped beneath the Property. The primary constituents of concern include TCE, PCE, carbon tetrachloride, perchlorate, NDMA and 1,4-dioxane, which have been detected in nearby wells at concentrations that exceed MCLs and/or other regulatory levels, which represents a REC to the Property.

## Recommendations

Terracon recommends conducting additional investigation to evaluate subsurface conditions associated with the identified REC and VEC.

# 1.0 INTRODUCTION

## 1.1 Property Description

| | |
|---|---|
| **Property Name** | SBPK 2021 MLF 1022-1026 Leorita Street Broken Horn Land |
| **Property Location/Address** | The Property is located at 1022-1026 Leorita Street, Baldwin Park, Los Angeles County, California 91706. |
| **Land Area** | The Property consists of an approximately 1.54-acre tract of land, and is further identified by Los Angeles County Identification Numbers (AINs): 8559-008-005 and -011. |
| **Property Improvements** | The Property is improved with an approximately 9,600-square-foot commercial building and an approximately 13,440-square-foot (with a mezzanine level) commercial buildings. The Property is further improved with asphalt-paved parking lot, landscaped areas, and utilities. |
| **Anticipated Future Property Use** | Future use is unknown |
| **Purpose of the ESA** | Purchase of the Property |
| **Report Issuance Date** | March 22, 2021 |
| **Date of Earliest Research** | February 25, 2021 |
| **Report Validity Date (180 days)** | September 24, 2021 |

The location of the Property is depicted on Exhibit 1 of Appendix A, which was reproduced from a portion of the Baldwin Park, California and El Monte, California, USGS 7.5-minute series topographic maps (2012). The Property and adjoining parcels are depicted on the Property Diagram, which is included as Exhibit 2 of Appendix A. Acronyms and terms used in this report are described in Appendix F.

## 1.2 Scope of Services

This Phase I ESA was performed in accordance with Terracon's Master Services Agreement, dated June 3, 2016, and Work Authorization No. SCAL-BP_0160 (CCAP-1), dated February 19, 2021, and was conducted consistent with the procedures included in ASTM E1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* and Client Scope of Work. The purpose of this ESA was to assist the client in developing information to identify RECs in connection with the Property as reflected by the scope of this report. This purpose was undertaken through user-provided information, a regulatory database review, historical and physical records review, interviews, including local government inquiries, as applicable, and a visual noninvasive reconnaissance of the Property and adjoining properties. Limitations, ASTM deviations, and significant data gaps (if identified) are noted in the applicable sections of the report.

ASTM E1527-13 contains a new definition of "migrate/migration," which refers to “the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface.” By including this explicit reference to migration in ASTM E1527-13, the Standard clarifies that the potential for vapor migration should be addressed as part of a Phase I ESA. This Phase I ESA has considered vapor migration in evaluation of RECs associated with the Property.

## 1.3 Standard of Care

This ESA was performed in accordance with generally accepted practices of this profession, undertaken in similar studies at the same time and in the same geographical area. We have endeavored to meet this standard of care, but may be limited by conditions encountered during performance, a client-driven scope of work, or inability to review information not received by the report date. Where appropriate, these limitations are discussed in the text of the report, and an evaluation of their significance with respect to our findings has been conducted.

Phase I ESAs, such as the one performed at this Property, are of limited scope, are noninvasive, and cannot eliminate the potential that hazardous, toxic, or petroleum substances are present or have been released at the Property beyond what is identified by the limited scope of this ESA. In conducting the limited scope of services described herein, certain sources of information and public records were not reviewed. It should be recognized that environmental concerns may be documented in public records that were not reviewed. No ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with a Property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs. No warranties, express or implied, are intended or made. The limitations herein must be considered when the user of this report formulates opinions as to risks associated with the Property or otherwise uses the report for any other purpose. These risks may be further evaluated – but not eliminated – through additional research or assessment. We will, upon request, advise you of additional research or assessment options that may be available and associated costs.

## 1.4 Additional Scope Limitations, ASTM Deviations and Data Gaps

Based upon the agreed-on scope of services, this ESA did not include subsurface or other invasive assessments, vapor intrusion assessments or indoor air quality assessments (i.e. evaluation of the presence of vapors within a building structure), business environmental risk evaluations, or other services not particularly identified and discussed herein. Credentials of the company (Statement of Qualifications) have not been included in this report but are available upon request. Pertinent documents are referred to in the text of this report, and a separate reference section has not been included. Reasonable attempts were made to obtain information within the scope and time constraints set forth by the client; however, in some instances, information requested is not, or was not, received by the issuance date of the report. Information obtained for this ESA was received from several sources that we believe to be reliable;

nonetheless, the authenticity or reliability of these sources cannot and is not warranted hereunder. This ESA was further limited by the following:

- Reasonable attempts were made to contact the local and state regulatory agencies; however, at the issuance of this report, a response from the Los Angeles County Sanitation District (LACSD) and the Los Angeles County Fire Department (for 1026 Leorita Street) remains pending. Based on a review of historical information and the regulatory database, the absence of this response does not represent a significant data gap or REC.

An evaluation of the significance of limitations and missing information with respect to our findings has been conducted, and where appropriate, significant data gaps are identified and discussed in the text of the report. However, it should be recognized that an evaluation of significant data gaps is based on the information available at the time of report issuance, and an evaluation of information received after the report issuance date may result in an alteration of our conclusions, recommendations, or opinions. We have no obligation to provide information obtained or discovered by us after the issuance date of the report, or to perform any additional services, regardless of whether the information would affect any conclusions, recommendations, or opinions in the report. This disclaimer specifically applies to any information that has not been provided by the client.

This report represents our service to you as of the report date and constitutes our final document; its text may not be altered after final issuance. Findings in this report are based upon the Property's current utilization, information derived from the most recent reconnaissance and from other activities described herein; such information is subject to change. Certain indicators of the presence of hazardous substances or petroleum products may have been latent, inaccessible, unobservable, or not present during the most recent reconnaissance and may subsequently become observable (such as after Property renovation or development). Further, these services are not to be construed as legal interpretation or advice.

## 1.5 Reliance

This ESA report is prepared for the exclusive use and reliance of Kaiser Permanente. Use or reliance by any other party is prohibited without the written authorization of Kaiser Permanente and Terracon Consultants, Inc. (Terracon).

Reliance on the ESA by the client and all authorized parties will be subject to the terms, conditions and limitations stated in the proposal, ESA report, and Terracon's Master Services Agreement. The limitation of liability defined in the Master Services Agreement is the aggregate limit of Terracon's liability to the client and all relying parties.

Continued viability of this report is subject to ASTM E1527-13 Sections 4.6 and 4.8. If the ESA will be used by a different user (third party) than the user for whom the ESA was originally

prepared, the third party must also satisfy the user's responsibilities in Section 6 of ASTM E1527-13.

## 1.6 Client Provided Information

Prior to the Property visit, Mr. Jason Gancarczyk, client's representative, was asked to provide the following user questionnaire information as described in ASTM E1527-13 Section 6.

**Client Questionnaire Responses**

| Client Questionnaire Item | Client Did Not Respond | Client's Response | |
|---|---|---|---|
| | | Yes | No |
| Specialized Knowledge or Experience that is material to a REC in connection with the Property *. | | X | |
| Actual Knowledge of Environmental Liens or Activity Use Limitations (AULs) that may encumber the Property. | | | X |
| Actual Knowledge of a Lower Purchase Price because contamination is known or believed to be present at the Property. | | | X |
| Commonly Known or Reasonably Ascertainable Information that is material to a REC in connection with the Property. | | | X |
| Obvious Indicators of Contamination at the Property. | | | X |

*Mr. Gancarczyk responded positively to question # 3, of the User Questionnaire, stating that he had specialized knowledge to the site or nearby properties, due to Kaiser Permanente being directly adjacent to the Property, and has specialized knowledge of the chemical and processes of that type of business. Terracon's consideration of the client provided information did not identify RECs. A copy of the questionnaire is included in Appendix C .

## 2.0 PHYSICAL SETTING

| Physical Setting Information | | Source |
|---|---|---|
| **Topography** | | |
| Property Elevation | Approximately 310 feet above National Geodetic Vertical Datum (NGVD). | See Exhibit 1 in Appendix A – Baldwin Park and El Monte, California (2012) USGS Topographic Map Google Map Data (2021), www.google.com/maps) |
| Topographic Gradient | Gently sloping toward the southwest. | |
| Closest Surface Water | Walnut Creek (channelized) is approximately 950 feet south of the Property. | |
| **Soil Characteristics** | | |
| Soil Type | Urban Land | Soil Survey of Los Angeles County, California, Southeastern Part (CA696); United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS); issued 2020 https://websoilsurvey.sc.egov.usda.gov |
| Description | Urban Land-Tujunga-Typic Xerothents, sandy substratum complex; 0 to 2 percent slope. | |
| **Geology/Hydrogeology** | | |
| Formation | Surficial sediments (Qg) | Geologic map of El Monte and Baldwin Park quadrangles, Los Angeles County, California (Dibblee, T.W., and Ehrenspeck, H.E., Dibblee Geological Foundation) Dated 1999 |
| Description | Undissected alluvial deposits; gravel and sand of major stream, alluvial fan detritus from San Gabriel Mountain, grades southward into alluvium (Qa) as sizes of clasts decrease (Holocene). | |
| Estimated Depth to First Occurrence of Groundwater | Property: No data readily available. Vicinity: Approximately 130 feet below ground surface (bgs) measured in a piezometer, located approximately 390 feet west of the Property (last measured in July 2020). | California Department of Water Resources Water Data Library PZ3-1BD 304659N1179899W001; https://wdl.water.ca.gov |
| *Hydrogeologic Gradient | Property: No data readily available. Vicinity/Regional: Toward the southwest. | |

* The groundwater flow direction and the depth to shallow, unconfined groundwater, if present, would likely vary depending upon seasonal variations in rainfall and other hydrogeological features. Without the benefit of on-property groundwater monitoring wells surveyed to a datum, groundwater depth and flow direction beneath the property cannot be directly ascertained.

# 3.0 HISTORICAL USE INFORMATION

Terracon reviewed the following historical sources to develop a history of the previous uses of the Property and surrounding area, in order to help identify RECs associated with past uses. Copies of selected historical documents are included in Appendix C.

## 3.1 Historical Topographic Maps, Aerial Photographs, Sanborn Maps

Readily available historical USGS topographic maps, selected historical aerial photographs (at approximately 10 to 15 year intervals) and historical fire insurance maps produced by the Sanborn Map Company were reviewed to evaluate land development and obtain information concerning the history of development on and near the Property. Reviewed historical topographic maps, aerial photographs and Sanborn maps are summarized below.

Historical fire insurance maps produced by the Sanborn Map Company were requested from Environmental Data Resources, Inc. (EDR) to evaluate past uses and relevant characteristics of the Property and surrounding parcels. Based upon inquiries to the above-listed Sanborn provider, Sanborn maps were not available for the Property.

- Topographic map:
  - Pomona, California, published in **1894**, **1897**, **1898**, and **1904** (1:62,500)
  - Los Angeles, California, published in **1894**, and **1900** (1:62,500)
  - Pasadena, California, published in **1896**, and **1900** (1:62,500
  - El Monte, California, published in **1926**, photo revised in 1953 from **1952** aerial photographs; photo revised in 1966 from **1964** aerial photographs; photo revised in 1972 from **1972** aerial photographs; photo revised in 1981 from **1978** aerial photographs; published in **2012** (1: 24,000)
  - Puente, California, published in **1927** (1:24,000)
  - Baldwin Park, California, photo revised in 1953 from **1952** aerial photographs; photo revised in 1966 from **1964** aerial photographs; photo revised in 1972 from **1972** aerial photographs; photo revised in 1981 from **1978** aerial photographs; published in **2012** (1: 24,000)

- Aerial photograph:
  - USDA, **1938**, **1989**, **1990**, and **2002**, 1”=500’
  - USGS, **1948**, **1952**, and **1964**, 1”=500’
  - EDR Proprietary Brewster Pacific, **1970**, **1977**, and **1983**, 1”=500’
  - USGS/DOQQ, **1994**, 1”=500’
  - USDA/NAIP, **2005**, **2009**, **2012**, and **2016,** 1”=500’

**Historical Maps and Aerial Photographs**

| Direction | Description |
|---|---|
| Property | Undeveloped land or vacant land (1894-1904); an apparent dwelling or homestead with associated structures were visible (1938-1948); apparent structures or construction trailers were visible (1952-1970); a commercial building appeared developed on the northeastern portion of the Property (Broken Horn Saddlery Inc., Mario Silver shop) (1977); the dwelling appeared to have been removed (1983); a second commercial building appeared developed along the eastern boundary of the Property (1989-2016). |
| Northeast | Undeveloped land or vacant land (1894-1927); a road (Garvey Avenue) was visible further north (1938); the land appeared parceled with paths and apparent commercial structures (1948-1952); the structures appeared to have been removed, and the road appeared expanded into a freeway (I-10-San Bernardino Freeway) (1964-2012); redeveloped as a storm water basin (2016). |
| Southeast | Undeveloped land or vacant land (1894-1904); a creek (Walnut Creek) was depicted (1926-1938); several trails were visible south of the creek (1948-1952); the creek appeared to be channelized and redirected further south, and the land appeared developed with a drive-in theater (Edgewood Drive-in theatre at 13159 Bess Avenue) (1964-1983); the land appeared graded and vacant (1989); commercial development of hospital commenced (1990); developed with existing hospital (*Kaiser Permanente at 1011 Baldwin Boulevard*). |
| Southwest | Undeveloped land or vacant land (1894-1904); a road was depicted (1926-1927); a small structure was visible (1938-1948); an apparent dwelling or structure was visible (1952); additional structures were visible (1964-1990); the structures appeared to have been removed (1994); the land appeared graded and vacant (2002-2005); developed as an asphalt-paved parking lot (2009-2016). |
| Northwest | Undeveloped land or vacant land (1894-1927); the land appeared to have been parceled (1938); a road and two apparent dwellings were visible (1948); additional dwellings were visible (1952-2016). |

The above underlined and italicized facilities were identified in the regulatory database and are further discussed in Section 4.1.

## 3.2 Historical City Directories

The Los Angeles Directory Co. Publishers, R.L. Polk & Co Publishers, Pacific Telephone, Pacific Bell telephone, Pacific Bell White Pages, Cole Information Services, Haines & Company, and GTE city directories used in this study were made available through EDR (selected years reviewed: 1920 through 2014) and were reviewed at approximate five-year intervals, if readily available. Leorita Street listings were not available prior to 1980. The current street address for the Property was identified as 1022-1026 Leorita Street.

**Historical City Directories**

| Direction | Description |
|---|---|
| Property | **1022 Leorita Street**: No listing (1920-1975); Caplener Laura B, Mc Donald Kathy (1980); Broken Horn Saddlery Inc., Mario Silver shop, Saddle Repair Shop (1994-2014).<br>**1022 Leorita Street**: No listing (1920-2002); listed as "XXXX" (2003); No listing 2005-2014).<br>**1026 Leorita Street**: No listing (1920-1975); Broken Horn Saddlery Inc. (1980-1985); Trevors Leather Shop (1994-1999); listed as "XXXX" (2003); Charles Nuzzo, Marios Silver Shop, Superior Saddlery (2004); Sals Custom Saddles (2014). |
| Northeast | No listing (1920-2014) |
| Southeast | ***1011 Baldwin Park Boulevard***: No listing (1920 ) James Garrow (1957-1960); James Garrow, Walker Forest R (1966-1975); Baldwin Park Medical Offices and associated medical office listings (1995); listed as "XXXX" (2003); *Kaiser Foundation Hospital/Kaiser Permanente Baldwin Park*, and associated hospital listings (1999-2014).<br>**13159 Bess Avenue**: No listing (1920-1975); Edgewood Drive-in theatre (1980-1985); listed as "XXXX" (2003); No listing (2005-2014). |
| Southwest | ***1011 Baldwin Park Boulevard***: See Above (East)<br>**1012 Leorita Street**: No listing (1920-1982); Hilado Thos (1985); No listing (1990-2014). |
| Northwest | **1011 Leorita Street**: No listing (1920-1970); Residential listings (1975-2014).<br>**1013 Leorita Street**: No listing (1920-1970); Residential listings (1975-2014).<br>**1019 Leorita Street**: No listing (1920-1965); Residential listings (1966-2014). |

The above underlined and italicized facilities were identified in the regulatory database and are further discussed in Section 4.1.

## 3.3 Property Ownership

Based on information obtained from Environmental Data Resources (EDR), and Local Agency files, the Property, located at 1022-1026 Leorita Street, Baldwin Park, Los Angeles County, California 91706 is an approximately 1.54-acre tract of land, identified by Los Angeles Assessor ID Numbers (AINs): 8559-008-005 and -011; and is currently owned by Jerry Nuzzo/Nuzzo Family Limited Partnership.

## 3.4 Title Search

A title search was not included as part of the scope of services. Terracon understands that Kaiser Permanente has ordered a chain of title search for this Property. Terracon reviewed the Commitment for Title Insurance, prepared by First American Title Insurance Company, revision No. 3, dated March 16, 2021, and provided by Kaiser Permanente. Schedule B, Part II,

Exceptions, of the document states that, "We find no outstanding voluntary liens of record affecting subject property".

## 3.5 Environmental Liens and Activity and Use Limitations

The EDR regulatory database report included a review of both Federal and State Engineering Control (EC) and Institutional Control (IC) databases. Based on a review of the database report, the Property was not listed on the EC or IC databases. Please note that in addition to these federal and state listings, AULs can be recorded at the county and municipal level that may not be listed in the regulatory database report. Environmental lien and activity and use limitation records recorded against the Property were not provided by the client. Performance of a review of these records was not included as part of the scope of services.

## 3.6 Interviews Regarding Current and Historical Property Uses

The following individuals were interviewed regarding the current and historical use of the Property.

**Interviews**

| Interviewer | Name / Phone # | Title | Date/Time |
|---|---|---|---|
| Ms. Laura Hedman | Mr. David O'Keefe / (424) 405-3844 | Property Broker; First Vice President Investments, National Multi Housing Group | March 3, 2021 / During the Property visit |
| | Mr. Jerry Nuzzo / (714) 931-2123 | Property Owner | March 3, 2021 / During the Property visit |

Terracon interviewed Mr. David O'Keefe, Property Broker; First Vice President Investments, National Multi Housing Group, during the Property visit. Mr. O'Keefe stated that he has been familiar with the Property, for the past few months, due to the pending real estate transaction of the Property. Mr. O'Keefe stated that he wasn't aware of the Property's past use. Mr. O'Keefe indicated that he was not aware of any pending, threatened or past environmental litigation, proceedings or notices of possible violations of environmental laws or liability or potential environmental concerns in connection with the Property. Mr. O'Keefe was not aware of any USTs, ASTs, or wells associated with the Property.

Terracon interviewed Mr. Jerry Nuzzo, Property owner, at the time of the Property visit. Mr. Nuzzo stated that he and his family have owned the Property since the 1970's, and during that time, the Property has been utilized as a western apparel and supply retailer and is known as the largest western supply retailer west of the Mississippi River. Mr. Nuzzo stated that there was a small on-site silver shop, but that no chemicals were stored on the Property in connection with the silver shop. At the time of the visual reconnaissance, Terracon did not observe stored chemicals in connection with the silver shop (identified in the City Directories as Mario Silver Shop).

Additionally, Mr. Nuzzo stated that the Property had a history of manufacturing saddles, and had glue storage on the Property in the past, but that the glue was water-based, and that they stopped making saddles approximately 7 years ago. Terracon did not observe indication of glue storage at the time of the visual reconnaissance. Mr. Nuzzo, further stated that there were no USTs, ASTs, wells, or hazardous chemical storage on the Property. Mr. Nuzzo indicated that he was not aware of any pending, threatened or past environmental litigation, proceedings or notices of possible violations of environmental laws or liability or potential environmental concerns in connection with the Property.

### 3.7 Prior Report Review

Terracon requested the client provide any previous environmental reports they are aware of for the Property. Previous reports were not provided by the client to Terracon for review. However, Terracon conducted additional file reviews for this Phase I ESA for the San Gabriel Valley Area 2 Superfund Site through online databases, which are summarized in Section 4.1 below.

## 4.0 RECORDS REVIEW

Regulatory database information was provided by EDR, a contract information services company. The purpose of the records review was to identify RECs in connection with the Property. Information in this section is subject to the accuracy of the data provided by the information services company and the date at which the information is updated. The scope herein did not include confirmation of facilities listed as "unmappable" by regulatory databases.

In some of the following subsections, the words up-gradient, cross-gradient and down-gradient refer to the topographic gradient in relation to the Property. As stated previously, the groundwater flow direction and the depth to shallow groundwater, if present, would likely vary depending upon seasonal variations in rainfall and the depth to the soil/bedrock interface. Without the benefit of on-site groundwater monitoring wells surveyed to a datum, groundwater depth and flow direction beneath the Property cannot be directly ascertained.

### 4.1 Federal and State/Tribal Databases

Listed below are the facility listings identified on federal and state/tribal databases within the ASTM-required search distances from the approximate Property boundaries. Database definition, descriptions, and the database search report are included in Appendix D.

**Federal Databases**

| Database | Description | Distance (miles) | Listings |
|---|---|---|---|
| CERCLIS | Comprehensive Environmental Response, Compensation, & Liability Information System | 0.5 | 0 |

| Database | Description | Distance (miles) | Listings |
|---|---|---|---|
| CERCLIS / NFRAP | Comprehensive Environmental Response, Compensation, & Liability Information System/No Further Remedial Action Planned | 0.5 | 0 |
| ERNS | Emergency Response Notification System | Property | 0 |
| IC / EC | Institutional Control/Engineering Control | Property | 0 |
| NPL | National Priorities List | 1.0 | 1 |
| NPL (Delisted) | National Priorities Delisted List | 0.5 | 0 |
| SEMS | Superfund Enterprise Management System | 0.5 | 1 |
| SEMS ARCHIVE | Superfund Enterprise Management System Archive | 0.5 | 0 |
| RCRA CORRACTS/ TSD | RCRA Corrective Action Activity | 1.0 | 2 |
| RCRA Generators | Resource Conservation and Recovery Act | Property and adjoining parcels | 4 |
| RCRA NonGen / NLR | RCRA – Non-Generators / No Longer Regulated | 0.25 | 12 |
| RCRA Non-CORRACTS/ TSD | RCRA Non-Corrective Action Activity | 0.5 | 0 |
| ROD | Records Of Decision | 1.0 | 1 |
| UXO | Unexploded Ordnance Site | 1.0 | 0 |

## State/Tribal Databases

| Database | Description | Distance (miles) | Listings |
|---|---|---|---|
| AOCONCERN | Area of Concern | 1.0 | 1 |
| AST | Aboveground Storage Tank Facilities | Property and adjoining parcels | 0 |
| Brownfields | Brownfields Sites | 0.5 | 0 |
| CA BOND EXP PLAN | Bond Expenditure Plan | 1.0 | 0 |
| CALSITES | CalSites Database | 1.0 | 0 |
| HIST CALSITES | Historical CalSites Database | 1.0 | 0 |
| CALSITES (AWP) | Active Annual Workplan Sites | 1.0 | 0 |
| Cortese | "Cortese" Hazardous Waste & Substances Sites List | 0.5 | 9 |

| Database | Description | Distance (miles) | Listings |
|---|---|---|---|
| CA FID UST | Facility Inventory Database | 0.25 | 3 |
| CA RESPONSE | State Response Site | 1.0 | 0 |
| CERS | California Environmental Reporting System (CERS) | Property | 0 |
| CERS TANKS | CERS Tanks | 0.25 | 3 |
| CERS HAZ WASTE | CERS HAZ Waste | 0.25 | 5 |
| CHMIRS | California Hazardous Material Incident Report System | Property | 0 |
| CIWQS | California Integrated Water Quality System | Property | 0 |
| CPS-SLIC | Statewide SLIC Cases (GEOTRACKER) | 0.5 | 0 |
| DRYCLEANERS | Cleaner Facilities | 0.25 | 0 |
| ECHO | Enforcement and Compliance History Information | Property | 0 |
| EDR Hist Auto | Environmental Data Resources Inc., Exclusive Historical Auto | 0.125 | 1 |
| EDR Hist Cleaner | Environmental Data Resources Inc., Exclusive Historical Cleaners | 0.125 | 0 |
| EMI | Emissions Inventory Data | Property | 0 |
| ENVIROSTOR | EnviroStor Database | 1.0 | 8 |
| FINDS | Facility Index System/Facility Registry System | Property | 0 |
| HIST CORTESE | Hazardous Waste & Substance Site List | 0.5 | 6 |
| HIST UST | Hazardous Substance Storage Container Database | 0.25 | 8 |
| HWP | EnviroStor Permitted Facilities Listing | 1.0 | 2 |
| IC/EC | Institutional and/or Engineering Controls Site | Property | 0 |
| LUST | Leaking Underground Storage Tanks | 0.5 | 10 |
| MANIFEST | Manifest information | 0.25 | 0 |
| NPDES | National Pollutant Discharge Elimination System (EPA) | Property | 0 |
| SLIC | Spills, Leaks, Investigation & Cleanup Cost Recovery Listing | 0.5 | 21 |
| SWEEPS UST | Statewide Environmental Evaluation and Planning System UST Listing | 0.25 | 4 |
| SWF/LF | Solid Waste Facilities/Landfills | 0.5 | 0 |
| UST | Underground Storage Tanks | Property and adjoining parcels | 5 |
| VCP | Voluntary Cleanup Program Sites | 0.5 | 0 |
| WIP | Well Investigation Program Case List | 0.25 | 7 |

In addition to the above ASTM-required listings, Terracon reviewed other federal, state, local, and proprietary databases provided by the database firm. A list of the additional reviewed databases is included in the regulatory database report included in Appendix D.

The Property was not listed in the environmental regulatory database report.

The following table summarizes the Property-specific information provided by the database and/or gathered by this office for identified facilities. Facilities within 500 feet of the Property are listed in order of proximity to the Property. Additional discussion for selected facilities follows the summary table.

**Listed Facilities**

| Facility Name and Location | Estimated Distance / Direction/Gradient | Database Listings | Is a REC, CREC, or HREC to the Property |
|---|---|---|---|
| San Gabriel Valley (Area 2) Sunset & San Bernardino Freeway | *Encompassed the Property* | NPL, SEMS, US ENG CONTROLS, ROD, RCRA NonGen/NLR, AOCONCERN | REC, discussed below |
| Kaiser Permanente (Baldwin Park) 1011 Baldwin Park Boulevard | Adjacent / East and South / Down- to cross-gradient | UST, RCRA-LQG, RCRA NonGen/NLR CERS HAZ WASTE, CERS TANKS, EMI, CERS | No, discussed further below. |
| Baldwin Park (City Yard) 13135 Garvey Avenue | 430 feet / Northeast / Up-gradient | UST, HIST UST, LUST, CERS HAZ WASTE, RCRA-SQG | No, based on file review, and distance to the Property |
| Katherine and Jean Ku | 450 feet / Southwest / Down-gradient | RCRA NonGen/NLR | No, based on file review, distance, and topographic gradient relative to the Property |
| R & M Service | 470 feet / Northwest / Cross-gradient | CERS HAZ WASTE, HIST UST, UST, EDR HIST AUTO, SWEEPS UST, CA FID UST | No, based on file review, distance, and topographic gradient relative to the Property |
| Ali's Service | | | |
| Sell H A Texaco | | | |
| Tek N Sav, Inc 3026 North Frazier Street | | | |

San Gabriel Valley-Area 2 / Baldwin Park Operable Unit Superfund Site (Sunset & San Bernardino Freeway)

The San Gabriel Valley-Area 2 (also known and identified as: San Gabriel Valley Area 2 Superfund Site and Baldwin Park OU) was identified as encompassing the Property and surrounding areas, was identified in the National Priorities List (NPL), Comprehensive

Environmental Response, Compensation, & Liability Information System/Superfund Enterprise Management System (CERCLIS/SEMS), US Engineering Control (EC), Records of Decision (ROD), Non Generator / No Longer Regulated (RCRA- NonGen/NLR), and Area of Concern (AOCONCERN) regulatory databases. The databases indicated the Property is encompassed by an underlying chlorinated solvent groundwater plume (San Gabriel Valley-Area 2), which is also known as the Baldwin Park Operable Unit (OU). The primary contaminants in groundwater are trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane, which have been mapped beneath the Property at concentrations that exceed Maximum Contaminant Levels (MCLs) and/or other regulatory levels.

The Baldwin Park OU is one of eight OUs identified by USEPA for the San Gabriel Valley Superfund Sites. Contaminates were first discovered in 1979 for the groundwater basin. In March 1994, the USEPA issued the Interim Record of Decision (IROD) for the Baldwin Park OU which included pumping and treating impacted groundwater. USEPA issued an Explanation of Significant Differences (ESD) to the IROD in May 1999 which amended the interim remedy to include treatment for perchlorate, NDMA, and 1,4-dioxane. The objective of the IROD and ESD is to prevent future increases in, and begin to reduce, concentrations of groundwater contaminants by limiting further migration of contaminated groundwater into clean or less contaminated areas. The IROD specifies extraction of contaminated groundwater at the downgradient end of two broad areas of the plume, at locations and rates sufficient to limit the movement of contaminated groundwater through each subarea during all anticipated groundwater flow conditions. In February 2002, the USEPA issued a Unilateral Administrative Order for Remedial Design/Remediation Action to 20 respondents. The primary contributors, as determined and identified by the USEPA are:

- Aerojet General Corporation, 1100 W. Hollyvale Street in Azusa, CA
- Huffy Corporation, 1120 W. Foothill Boulevard, Azusa, CA
- Oil &Solvent Process Co. (Waste Management), 1704 W. First Street Azusa, CA
- Wynn Oil Company, 1151 W. 5th Street in Azusa, California

In March 2002, eight PRPs (Aerojet-General Corporation, Azusa Land Reclamation Co., Inc., Fairchild Holding Corporation, Hartwell Corporation, Huffy Corporation, Oil & Solvent Process Company, Reichhold, Inc., and Wynn Oil Company) and seven local water agencies reached a third-party agreement (BPOU project agreement) that provided a means of implementing the remedy and commits the parties to implement a joint cleanup and water supply project.

The Baldwin Park OU remedy is a large-scale groundwater extraction and treatment system, consisting of four pump and treat "subprojects" (each ranging in capacity from 2,500 to 7,800 gallons per minute [gpm]) with a combined treatment capacity of 26,000 gpm. The subprojects were built between 2000 and 2006, and are operated by local water utilities, supplying treated water to local homes and businesses. The systems consist of groundwater extraction wells, monitoring wells, pipelines, and multiple water treatment processes for removal of contaminants.

The closest extraction well to the Property is identified as wells SGVWC B25A/B, located approximately 550 west of the site. From 2002 to 2012, more than 69 billion gallons of groundwater were treated and 59,000 pounds of contaminate mass was removed from the water. As of 2019, as reported in Geosyntec Consultants' 2019 Annual Performance Evaluation Report – Volume 1, dated April 30, 2020 (2019 Annual Report) the remedial efforts treated over 37 million gallons of water per day and removed over 5,000 pounds of contamination in 2019. Since 2004, the cumulative mass removed is reported to be more than 94,000 pounds. Previously identified potential responsible parties (PRPs) are funding a majority of the work in compliance with a June 2000 EPA Order.

Based on documents reviewed from the California Department of Water Resources, and the visual reconnaissance conducted on March 3, 2021, the closet groundwater monitoring (piezometer) well (Water Data Library ID No. PZ3-1BD; 304659N1179899W001, was observed approximately 390 feet west of the Property (field verified as near the curbside gutter along the eastern side of Bess Avenue at Dalewood Street), and depth to groundwater was measured at 129.08 feet below ground surface (bgs) on July 28, 2020. Additionally, two municipal productions wells (also extraction wells) identified as well Nos. SGVWC B25A and B25B, located approximately 550 feet to the west of the site were observed on the southwestern corner of Bess Avenue and Frazier Street (Dalewood Street), within a gated San Gabriel Valley Water District facility. Water extracted from these wells is piped to a water treatment facility to remove COCs. Water quality data obtained from the State Water Resources Control Board's online GeoTracker Database for well No. SGVWC B25A indicates the following current (December 1, 2020) maximum concentrations in groundwater, measured in micrograms per liter (µg/L), as summarized in the table below.

| Constituent | CAS No. | Current Groundwater Concentration (µg/L) | Groundwater Screening Levels * (µg/L) | | Groundwater Vapor Intrusion ESL (µg/L) | | Concentration Trend |
|---|---|---|---|---|---|---|---|
| | | | MCL | Tapwater | Residential ESL | Commercial ESL | |
| 1,4-Dioxane | 123-91-1 | **2.8** | -- | *0.38* | *1800* | *8000* | Increasing |
| Carbon Tetrachloride | 56-23-5 | **2.3** | *0.5* | *0.1* | *0.4* | *1.9* | Decreasing |

*MCL – Federal Maximum Contaminant Level, USEPA online cited March 9, 2021.
*Tapwater – San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), Environmental Screening Levels (ESLs), 2019 (Rev.2), Tapwater Cancer Risk, Direct Exposure Human Health Risk Levels, (Table GW-1).
Groundwater Vapor Intrusion ESL – SFBRWQCB, ESLs 2019 (Rev.2), Groundwater Vapor Intrusion Human Health Risk Levels, (Table GW-3).

Trend – Based on graphs produced by the GeoTracker database and 2019 Annual Performance Evaluation Report – Volume 1 Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites. Los Angeles County, California Prepared by Geosyntec consultants and ERM, dated April 30, 2020.

The current concentrations exceed the Maximum Contaminant Level (MCL) and/or the groundwater vapor intrusion Environmental Screening Level (ESL), except for NDMA and 1,4-dioxane, which do not have established MCLs. The concentration of four of the primary COCs are increasing. The 2019 Annual Report concluded that the concentration trends are consistent with plume migration. Vapor assessment data were not identified in the readily available documents. Based on our review of the regulatory data and historical information, the impacted groundwater represents a REC to the Property. See Section 7.16 regarding potential Vapor Encroachment Condition (VEC) related to the REC.

Kaiser Permanente Baldwin Park (1101 Baldwin Park Boulevard))

Kaiser Permanente, identified on the adjacent east and south of the Property, and in a topographic down- to cross-gradient position relative to the Property, was listed in the California Environmental Reporting System (CERS), CERS Hazardous Waste (CERS HAZ WASTE), CERS Tanks, Underground Storage Tank (UST), Resource Conservation and Recovery Act-Large Quantity Generator (RCRA-LQG), RCRA- NonGen/NLR, and Emissions Inventory Data (EMI) regulatory databases.

Based on a review of the database listing, the facility is identified as a hospital facility/medical center, and permitted by the Los Angeles County/Los Angeles County Fire Department to operate an UST. The facility is identified with Los Angeles County Facility ID No. 20803, and Los Angeles County Fire department Facility ID No. LACoFA0004865. The facility is further identified with EPA ID No. CAL000356334, as a large quantity generator of waste streams characterized as ignitable waste; corrosive waste; reactive waste; waste containing arsenic, barium, chromium, mercury, silver, lindane, and chloroform; and nonhalogenated solvents. Based on the facility's use as a hospital, the diesel UST is used to fuel the facility's emergency generator equipment. Based on documents obtained and the visual reconnaissance, the UST equipment is located on the northeastern portion of the medical center complex (beyond the parking structure), greater than 800 feet east of the Property boundary. Based on the facility's topographic cross-gradient position and distance (800 feet) relative to the Property, the Kaiser Permanente hospital facility listings do not represent a REC to the Property.

The remaining facilities listed in the database report do not represent RECs to the Property at this time based upon regulatory status, apparent topographic gradient, and/or distance from the Property.

Unmapped facilities are those that do not contain sufficient address or location information to evaluate the facility listing locations relative to the Property. The report listed two facilities in the unmapped section. Determining the location of unmapped facilities is beyond the scope of this assessment; however, none of these facilities were identified as the Property or adjacent properties. These facilities are listed in the database report in Appendix D.

## 4.2 Local Agency Inquiries

| Agency Contacted/ Contact Method | Response |
|---|---|
| Los Angeles County of Public Works<br>Online search https://dpw.lacounty.gov/bsd/bpv/<br>https://dpw.lacounty.gov/epd/CleanLA/OpenFileReview.aspx | Based on the LAC Public Works records search, no records were found for the Property. |
| Los Angeles County Sanitation District (LACSD) /<br>by E-mail: records_administrator@lacsd.org<br>Online Form:<br>https://www.lacsd.org/civicax/filebank | At the issuance of this report, a response had not been received from the LACSD, for the Property. |
| LA County Fire Department<br>Online Form:<br>https://fire.lacounty.gov/public-records-requests | Based on the LA County Fire Dept records search, no records were found associated with the Property address at 1022 Leorita Street.<br>At the issuance of this report, a response had not been received from the LACFD on 1026 Leorita Street. |
| South Coast Air Quality Management District (SCAQMD) / Online portal: http://www.aqmd.gov/nav/online-services/public-records | According to Mr. Andrew Sabino, no records were found for the Property. |
| Los Angeles Regional Water Quality Control Board /<br>by e-mail rb4-publicrecords@waterboards.ca.gov | According to Ms. Youna Choi, no records were found for the Property. |
| State Water Resources Control Board; GeoTracker online portal:<br>http://geotracker.waterboards.ca.gov/ | An online records search of GeoTracker found no records associated with the Property. |
| Department of Toxic Substances Control (DTSC) / Email: pubreqact@dtsc.ca.gov<br>Chatsworth DTSC Local Office / Email: ChatsworthFileRoom@dtsc.ca.gov<br>DTSC online EnviroStor Database, www.envirostor.dtsc.ca.gov<br>DTSC online Hazardous Waste Tracking System (HWTS): https://hwts.dtsc.ca.gov/search | According to the DTSC, no records were found associated with the Property.<br>Based on a review of the DTSC online EnviroStor and HWTS Databases, no records were found associated with the Property. |
| Baldwin Park City Clerk / Baldwin Park Building & Safety Division; City Fire Department<br>Email at www.baldwinpark.com | At the issuance of this report, a response had not been received from the City of Baldwin Park. |
| CalEPA Regulated Site Portal<br>https://siteportal.calepa.ca.gov/nsite/map/help | Based on the CalEPA Regulated Site Portal search, no records were found associated with the Property. |

Indications of RECs were not identified in the Local Agency Records for the Property. However, the review of DTSC's EnviroStor Database identified the Baldwin Park OU groundwater plume (identified as San Gabriel Valley-Area 2 in regulatory database), which is a REC to the Property as detailed above in Section 4.1, and is also identified as a potential Vapor Encroachment Condition (VEC) as detailed below in Section 7.16.

### 4.3 Local Area Knowledge

Based on a review of the California Geologic Energy Management Division (CalGEM), https://www.conservation.ca.gov/calgem (formerly the California Department of Conservation Division of Oil, Gas, and Geothermal Resource Well Finder (DOGGR), there are no active or plugged oil production wells located at the Property or adjoining properties.

## 5.0 SITE RECONNAISSANCE

### 5.1 General Property Information

Information contained in this section is based on a visual reconnaissance conducted while walking through the Property and the accessible interior areas of structures, if any, located on the Property. The Property and adjoining properties are depicted on the Property Diagram, which is included in Exhibit 2 of Appendix A. Photo documentation of the Property at the time of the visual reconnaissance is provided in Appendix B. Credentials of the individuals planning and conducting the Property visit are included in Appendix E.

**General Site Information**

| **Site Reconnaissance** | | | | |
|---|---|---|---|---|
| Field Personnel | Ms. Laura S. Hedman | | | |
| Reconnaissance Date | March 3, 2021 | | | |
| Weather Conditions | Cloudy and rainy, 55° F | | | |
| Site Contact/Title | Mr. David O'Keefe / Property Broker | | | |
| **Building Description** | | | | |
| **Building Identification** | **Building Use** | **Approx. Construction Date** | **Number of Stories** | **Approx. Size (ft²)** |
| 1022 Leorita Street | Western apparel and supply retailer | 1986 | 1 with mezzanine | 13,440 |
| 1026 Leorita Street | Western apparel and supply storage | 1976 | 1 | 9,600 |
| **Site Utilities** | | | | |
| Drinking Water | San Gabriel Valley Water Company | | | |

| Site Reconnaissance | |
|---|---|
| Wastewater | San Gabriel Valley Water Company |
| Electric | Southern California Electric (SCE) |
| Natural Gas | Southern California Gas Company |

## 5.2 Overview of Current Site Occupants and Operations

The Property is located at 1022-1026 Leorita Street, in Baldwin Park, Los Angeles County, California 91706, and consists of two contiguous parcels of land, totaling approximately 1.54-acres, and identified by Los Angeles County Assessor Identification Numbers (AINs): 8559-008-005 and -011. The Property is improved with two commercial buildings: one approximately 9,600-square-foot, and the other approximately 13,440-square-foot, with a mezzanine level. The Property is further improved with asphalt-paved parking lot, landscaped areas, and utilities. During the visual reconnaissance, the Property was observed to be occupied by Broken Horn Saddlery, a western apparel and supply retailer.

## 5.3 Property Observations

The following table summarizes Property observations and interviews. Affirmative responses (designated by an "X") are discussed in more detail following the table.

**Property Characteristics**

| Category | Item or Feature | Observed or Identified |
|---|---|---|
| Property Operations, Processes, and Equipment | Emergency generators | |
| | Elevators | |
| | Air compressors | |
| | Hydraulic lifts | |
| | Dry cleaning | |
| | Photo processing | |
| | Ventilation hoods and/or incinerators | |
| | Waste treatment systems and/or water treatment systems | |
| | Heating and/or cooling systems | X |
| | Paint booths | |
| | Sub-grade mechanic pits | |
| | Wash-down areas or carwashes | |
| | Pesticide/herbicide production or storage | |
| | Printing operations | |

| Category | Item or Feature | Observed or Identified |
|---|---|---|
| | Metal finishing (e.g., electroplating, chrome plating, galvanizing, etc.) | |
| | Salvage operations | |
| | Oil, gas or mineral production | |
| | Other processes or equipment | X |
| Aboveground Chemical or Waste Storage | Aboveground storage tanks | |
| | Drums, barrels and/or containers ≥ 5 gallons | X |
| | MSDS or SDS | |
| Underground Chemical or Waste Storage, Drainage or Collection Systems | Underground storage tanks or ancillary UST equipment | |
| | Sumps, cisterns, French drains, catch basins and/or dry wells | X |
| | Grease traps | |
| | Septic tanks and/or leach fields | |
| | Oil/water separators, clarifiers, sand traps, triple traps, interceptors | |
| | Pipeline markers | |
| | Interior floor drains | |
| Electrical Transformers/ PCBs | Transformers and/or capacitors | X |
| | Other equipment | |
| Releases or Potential Releases | Stressed vegetation | |
| | Stained soil | |
| | Stained pavement or similar surface | |
| | Leachate and/or waste seeps | |
| | Trash, debris and/or other waste materials | |
| | Dumping or disposal areas | X |
| | Construction/demolition debris and/or dumped fill dirt | |
| | Surface water discoloration, odor, sheen, and/or free floating product | |
| | Strong, pungent or noxious odors | |
| | Exterior pipe discharges and/or other effluent discharges | |
| Other Notable Property Features | Surface water bodies | |
| | Quarries or pits | |
| | Wastewater lagoons | |
| | Wells | |

## Site Operations, Processes, and Equipment

Heating and/or cooling systems
Terracon observed roof-mounted HVAC systems, on the building; 6 associated with 1026 Leorita Street and 9 associated with 1022 Leorita Street. Based on the location of HVAC units and visual observations of the HVAC systems, indications of RECs were not observed.

Other processes or equipment
Terracon observed a propane-powered forklift, located in the storage shed, on the central portion of the property (1022 Leorita Street). Based on visual observations, the forklift does not appear to represent a REC to the Property.

### Aboveground Chemical or Waste Storage

Drums, barrels, and/or containers ≥ 5 gallons
During the visual reconnaissance, Terracon observed four propane canisters for forklift use, located on the central portion of the Property. Based on visual observations, the propane canisters do not constitute a REC to the Property.

## Underground Chemical or Waste Storage, Drainage or Collection Systems

Sumps, cisterns, French drains, catch basins and/or dry wells
During the visual reconnaissance, Terracon observed two storm drains; one located near the Property entrance, at 1026 Leorita Street, and the other located on the southwestern perimeter of the Property. No evidence of chemical waste disposal, noxious odors, or other indications of releases were observed near the vicinity of the drains. Based on visual observations, the drain do not constitute a REC to the Property.

## Electrical Transformers/ PCBs

During Terracon's Property visit, one pad-mounted transformers, owned and serviced by Southern California Edison (SCE), was observed on the central portion of the Property; however, no information with regard to PCB content of the transformer fluids was observed on the transformer. Transformers contain mineral oil which may contain minor amounts of PCB and could be considered "PCB contaminated" (PCB content of 50-500 ppm).

Southern California Edison (SCE) maintains responsibility for the transformer, and if the transformer was "PCB contaminated," the utility company is not required to replace the transformer fluids until a release is identified. However, no evidence of current or prior release was observed in the vicinity of the electrical equipment during the visual reconnaissance. Based on visual observations, the pad-mounted transformer does not constitute a REC in connection with the Property at this time.

### Releases or Potential Releases

Dumping or disposal areas

Two solid waste disposal bins were observed on the central portion of the Property. No evidence of chemical waste disposal, noxious odors, or other indications of releases were observed near the vicinity of the solid waste disposal bins. Based on visual observations, the solid waste disposal bins do not constitute a REC to the Property.

## 6.0 ADJOINING PROPERTY RECONNAISSANCE

Visual observations of adjoining properties (from property boundaries) are summarized below.

**Adjoining Properties**

| Direction | Description |
|---|---|
| Northeast | The parcels located on the adjacent north consisted of a storm water basin, followed by Dalewood Street, and then by the Interstate 10 Freeway (I-10). |
| Southeast | The parcels located on the adjacent east consisted of Kaiser Permanente parking garage at 1102 Baldwin Park Boulevard. |
| Southwest | The parcels located on the adjacent east consisted of Kaiser Permanente parking garage at 1102 Baldwin Park Boulevard. |
| Northwest | Leorita Street abuts the Property to the west, followed by single-family residences. |

RECs were not observed with the adjoining parcels.

## 7.0 ADDITIONAL SERVICES

Although not required by the ASTM 1527-13 standard, based on Kaiser Permanente's Phase I ESA Requirements, Terracon has evaluated non-scope services and business environmental risk considerations (BER) for the Property. Kaiser Permanente has developed real estate environmental risk ratings for discussion and evaluation of environmental risks associated with real estate property transactions (BPP RE.04.002 Real Estate Environmental Risk Rating Details). Terracon has applied these risk ratings where possible, to provide conclusions/opinions on the additional services we performed. It is our understanding that the opinions provided in the below table will serve as guidelines to Kaiser Permanente to assess and evaluate environmental risks associated with the real estate transaction. The risk ratings are defined as follows and are referenced in our assessment.

- Catastrophic: Environmental Risk poses immediate danger to human health or the environment and/or the Environmental Risk cannot be adequately mitigated and will likely subject Kaiser Permanente to potentially significant enforcement action or litigation.

- Significant: Environmental impact will require extended remediation of contamination and/or there is a risk of exposure.
- Moderate: Identified environmental risks that can be mitigated with the addition of engineering controls and/or limited remediation of contamination will be required on the Property.
- Limited: Identified environmental risks that can be managed. Asbestos, lead or hazardous materials can be abated prior to occupancy. Asbestos, lead or hazardous materials to be managed in place.
- Minimal: Did not identify environmental risks that require further assessment or action.
- Unknown: Environmental risks identified that require additional assessment as part of due diligence.

## 7.1 Asbestos-Containing Building Materials (ACM)

Based on the results of the Limited Hazardous Materials Survey, conducted concurrently with the Phase I ESA, asbestos was detected in at least ten (10) homogeneous areas, and consisted of roof mastic, roof paint, roof coating on pipes, HVAC duct mastic, wallboard and joint compound, carpet glue, vinyl tile and tile mastic, and restroom sink undercoating. ACM is further discussed in the Limited Hazardous Materials Survey Report, which will be presented under a separate cover (Terracon Project No. 6021P020). Based on the presence of ACM, this is considered a limited risk.

## 7.2 Radon

Terracon reviewed regional data published by the EPA (http://www.epa.gov/radon/zonemap.html) on average indoor radon concentrations in the vicinity of the Property. The Property is located in Zone 2, which has an EPA-defined moderate potential for radon and is considered to have radon in concentrations between 2 and 4 (pCi/L). To determine property-specific radon levels a radon survey would have to be conducted. Based on this information, the risk associated with radon is considered a minimal risk.

## 7.3 Lead-Based Paint (LBP)

Based on the results of the Limited Hazardous Materials Survey, conducted concurrently with the Phase I ESA, lead was not detected in the samples collected and analyzed, with the exception of elevated concentrations detected in lead samples PB-01, PB-03, PB-04, and PB-10. LBP is further discussed in the Limited Hazardous Materials Survey Report, which will be presented under a separate cover (Terracon Project No. 6021P020). Based on this information, the risk associated with lead-based paint is considered limited.

## 7.4 Polychlorinated Biphenyls (PCBs)

Based on the results of the Limited Hazardous Materials Survey, conducted concurrently with the Phase I ESA, Suspect PCB-containing materials were not observed for the building addressed as

1026 Leorita Street. Based on the known construction date of 1026 Leorita Street (1976), it is possible that that original fluorescent light fixtures throughout the sampled area may contain PCBs in the associated ballasts. PCB sampling was not conducted for the building at 1022 Leorita Street based on the construction date of 1986.

PCB-containing materials are further discussed in the Limited Hazardous Materials Survey Report, which will be presented under a separate cover (Terracon Project No. 6021P020). Based on this information, the risk associated with PCBs is considered minimal.

## 7.5 Lead in Drinking Water

Our review of the Valley County Water District 2019 Consume Confidence Report, at https://www.vcwd.org/ArchiveCenter/ViewFile/Item/76, indicated that in 2019, 90% of residences were sampled and lead was not detected above the regulatory action level of 0.015 parts per million. Based on the results of the 2019 Water Quality Report, the risk for lead in drinking water is considered a minimal risk.

## 7.6 Wetlands and Surface Waters

Based on review of the US Fish and Wildlife Service National Wetland Inventory maps (https://www.fws.gov/wetlands/data/Mapper.html), registered wetlands are not present at the Property, and the risk associated with wetlands and surface waters appears to be a minimal risk.

Our review of the above resources did not identify mapped wetlands or jurisdictional waters of the U.S. on the Property. Please note this Limited Wetland Review does not constitute a formal determination and/or delineation of a potentially jurisdictional wetland, which is based on three criteria, wetland hydrology, hydrophytic vegetation, and hydric soils, as set forth in 1987 Corps of Engineers Wetland Delineation Manual and further supported by the applicable Regional Supplements to the Corps of Engineers Wetland Delineation Manual.

To determine whether regulated wetlands may be present on the Property, a wetland delineation must be performed and submitted to the U.S. Army Corps of Engineers for a jurisdictional determination, as required by Section 404 of the Clean Water Act.

## 7.7 Environmental Regulatory Compliance

The Property is not identified in the regulatory database. Based on observations made during the Property reconnaissance and reviewed regulatory records, the risk associated with environmental regulatory compliance associated with current Property operations appears minimal.

## 7.8 Cultural and Historic Resources

A limited literature and agency file review was conducted to identify the potential occurrence of cultural resources on the Property. Cultural resources are comprised of historic properties and archaeological artifacts. Terracon reviewed the National Register of Historic Places for the

Property address. Cultural resources or structures of historical significance were not documented for the Property on the National Register of Historic Places. Reported or readily apparent cultural and historic resource issues affecting Kaiser Permanente's proposed occupancy were not identified and is considered a minimal risk.

## 7.9 Industrial Hygiene

During the Property visit, industrial hygiene-related conditions, such as readily obvious dust and additional noxious odors, were not identified. Based on observations made during the Property reconnaissance, the risk appears minimal.

## 7.10 Health and Safety

Issues regarding Health and Safety were not reported during the Property inspection, therefore issues regarding the risk appears minimal.

## 7.11 Ecological Resources

Since the Property has been developed (building and paved parking) since 1986 and the commercial nature of the surrounding land use, Ecological Resources risks are a minimal concern for continued occupancy of the Property.

## 7.12 Threatened, Endangered and Other Protected Species

Terracon reviewed the threatened and engendered species identified in the United States Fish and Wildlife Service (USFWS) Information for Planning and Conservation (IPaC) database. Various threatened and endangered (T&E) species were identified in the area of Baldwin Park in which the Property is located. Reported or readily apparent T&E species issues affecting Kaiser Permanente's proposed occupancy were not identified.

However, since the Property has been developed (building and paved parking) since the 1986, and the commercial nature of the surrounding land use, threatened and endangered species are a minimal concern for continued occupancy of the Property.

## 7.13 Indoor Air Quality

During the Property visit, issues regarding Indoor Air Quality, such as dust or noxious odors associated with the current use of the Property, were not noted or reported; however, based on the historical and regulatory records review and EDR Database search radii, the San Gabriel Valley-Area 2 Superfund site, contaminated groundwater area-wide plume, represents a REC and VEC to the Property.

## 7.14 Biological Agents

Biological agents are defined herein as bloodborne pathogens and biomedical waste. At the time of the Property reconnaissance, the Property consisted of a western apparel and supply retailer. Biomedical waste and materials containing blood borne pathogens were not observed on the Property during the Property reconnaissance. Therefore, the risk associated with biological agents appears minimal.

## 7.15 Mold/Water Intrusion

Based on observations during the Property visit, several areas of water-stained surfaces were observed in the following locations:

- 1022 Leorita Street: water stained ceiling tiles were observed on the first floor of the harness room, within two of the office spaces (on the first floor), and on the second floor/mezzanine level above the north stairs, above the south open area, and within the retail center area.
- 1026 Leorita Street: water stained ceiling tiles were observed within the main floor area (on the northern and eastern sections), and on the acoustical ceiling spray. Delaminating acoustical ceiling spray, was observed on the upper floor, within the open areas. Additionally, water damaged surfaces were observed on at the base of the walls (delaminating paint) within the main floor open area, the upper floor area, and the lower floor area.

Based on visual observations at the time of the assessment, an active water intrusion event was not observed, and the potential for mold/water intrusion issues appears to be a limited risk.

## 7.16 Limited Vapor Intrusion Assessment

Pursuant to the client's request, and in conjunction with the ESA, Terracon conducted a limited Tier I Vapor Encroachment Screening. This assessment was conducted in accordance with ASTM E 2600-15. This assessment was based on information collected in conjunction with the ESA, including existing/planned use of the Property, type of structures located on the Property, surrounding property description, user information, regulatory file reviews, historical and physical records review, regulatory database review, manmade or natural conduits, as applicable, and a visual noninvasive reconnaissance of the Property and adjoining properties, and did not include subsurface investigations to evaluate soil, soil gas, or groundwater quality beyond the data collected for the ESA.

Based on a review of the regulatory database listings, the Property is encompassed by an underlying chlorinated solvent groundwater plume (San Gabriel Valley-Area 2, Baldwin Park OU), identified in the NPL, CERCLIS/SEMS, EC, ROD, and Area of Concern (AOCONCERN) regulatory databases. The plume, also known as the Baldwin Park Operable Unit (OU), contains trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-

nitrosodimethylamine (NDMA), and 1,4-dioxane impacted groundwater, which have been mapped beneath the Property at concentrations that exceed Maximum Contaminant Levels (MCLs) and/or other regulatory levels as detailed in Section 4.1. Other than NDMA and perchlorate, the remaining constituents are considered sufficiently volatile to enter the vapor phase from groundwater and are listed in Table X6.1 Chemicals of Potential Concern for ASTM E 2600-15.

The primary volatile constituents of concern include TCE, PCE, carbon tetrachloride, and 1,4-dioxane, which are classified as carcinogens or possible carcinogens. These constituents are considered sufficiently volatile to enter the vapor phase from groundwater, which represents a potential Vapor Encroachment Condition (VEC) and REC. Based on this information and lack of on-site data, the risk associated with VEC is considered unknown.

## 7.17 Limited Sea Level Rise Assessment

Based on a review of the Office for Coastal Management's Sea Level Rise and Coastal Flooding Impacts Map (https://coast.noaa.gov/slr/), the Property is located in an area with no sea level rise predicted or high tide areas using the National Oceanic and Atmospheric (NOAA) mapping tool and risk is considered minimal.

## 7.18 FEMA Flood Map Review

Terracon reviewed the Federal Emergency Management Agency (FEMA) Flood Map Service Center website regarding potential flooding issues. According to the FEMA Flood Map Service Center, the Property is located within an area of minimal flood hazard (Zone X, outside the 500-year flood plain). Additionally, Terracon reviewed the Los Angeles County Comprehensive Floodplain Management Plan Flood Zone Maps, and based on the Los Angeles County map, the Property is outside the 0.2% annual chance of flood zone. Based on the reviewed information, the risk associated with historical flooding appears to be minimal.

## 7.19 Historical Agricultural Activities

During the review of historical information and Property reconnaissance, Terracon did not identify information that would indicate historical agricultural activities on the Property. Additionally, the Property and surrounding area have been redeveloped, with no database recorded indication of historical agricultural uses. Therefore, the risk associated with historical agriculture activities appears minimal.

## 7.20 Environmental Risk Summary

The following summarizes Terracon's findings and conclusions for the Property with regard the above additional non-scope services. We have provided conclusions and risk ratings in accordance with Kaiser Permanente's definitions and guidelines.

| Additional Services | Conclusion | Risk Rating |
|---|---|---|
| Asbestos-containing building materials | Refer to the Limited Hazardous Materials Survey Report* presented under separate cover. | Limited* |
| Radon | EPA Zone 2. | Minimal |
| Lead-based Paint | Refer to the Limited Hazardous Materials Survey Report* presented under separate cover. | Minimal* |
| Polychlorinated Biphenyl's (PCBs) | Refer to the Limited Hazardous Materials Survey Report* presented under separate cover. | Minimal* |
| Lead in drinking water | Document review of lead concentrations in municipal drinking water were below the lead action level in the collected samples. | Minimal |
| Wetlands and surface waters | Document review did not identify mapped wetlands or jurisdictional waters of the U.S. on the Property. | Minimal |
| Environmental regulatory compliance | Outstanding violations were not noted in records provided by the regulatory agencies. | Minimal |
| Cultural and historical resources | Building constructed in 1986; registry review did not indicate historic structures for the address. Property is leased for office use. | Minimal |
| Industrial hygiene | Issues not noted or reported. | Minimal |
| Health and safety | Issues not noted or reported. | Minimal |
| Ecological resources | Building constructed in 1986; reported or readily apparent ecological resource issues affecting proposed Property occupancy were not identified. | Minimal |
| Threatened, endangered and other protected Species | Building constructed in 1986; reported or readily apparent T&E issues affecting proposed Property occupancy were not identified. | Minimal |
| Indoor air quality | Issues not noted or reported | Minimal |
| Biological agents | Biomedical waste and materials containing blood borne pathogens were not observed stored on property. Property was used for retail western apparel and supplies. | Minimal |
| Mold/Water Intrusion | Based on observations during the Property visit, several areas of water-stained/damaged surfaces were apparent (refer to the Limited Hazardous Materials Survey Report* presented under separate cover). An active water intrusion event was not observed. | Limited |
| Limited Vapor Intrusion Assessment | Database and Property setting review identified vapor intrusion issues. | Unknown |
| Limited Sea Level Rise Assessment | According to NOAA database, Property is outside the highest estimated sea level rise of 10 feet above mean sea level. | Minimal |

| Additional Services | Conclusion | Risk Rating |
|---|---|---|
| FEMA Flood Map Review | Property is located within a designated minimal flood zone, and outside a 0.2% flood zone area. | Minimal |
| Historical Agricultural Use | Terracon did not identify information that would indicate the extensive use, storage, or manufacturing of pesticides or herbicides on the Property. | Minimal |

*Refer to Limited Hazardous Materials Survey Report presented under separate cover (Terracon Project No. 6021P020).

## 8.0 DECLARATION

I, Carl A. Parten, declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312; and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the property. I have developed and performed the All Appropriate Inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Carl A. Parten
Senior Principal / Office Manager III

**Photo #1** View of the Property, facing east, from the northwestern portion of the Property (1026 Leorita Street).

**Photo #2** View inside the facility (1026 Leorita Street), near the front entrance.

**Photo #3** View of electrical panels, located inside the facility (1026 Leorita Street), near the front entrance.

**Photo #4** View of feed (alfalfa hay pallets) storage area, located inside the facility (1026 Leorita Street).

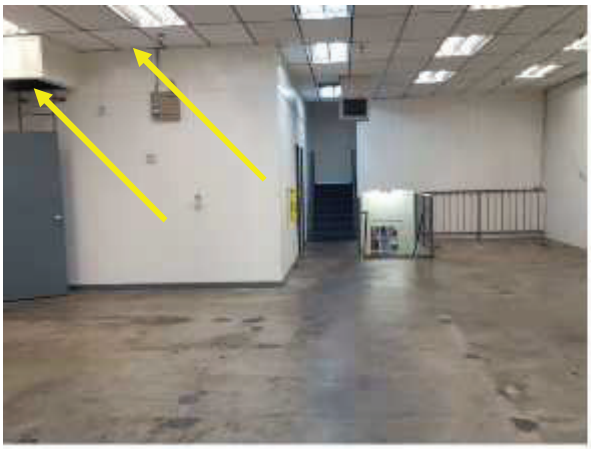

**Photo #5** View inside facility (1026 Leorita Street), near roof access and water-stained ceiling tile.

**Photo #6** View inside the facility (1026 Leorita Street).

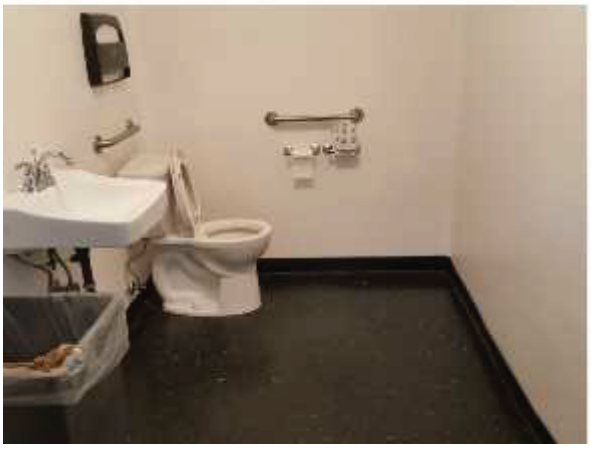

**Photo #7** Typical view inside restroom.

**Photo #8** View of facility entrance (1022 Leorita Street).

**Photo #9** View of office space, inside the facility (1022 Leorita Street).

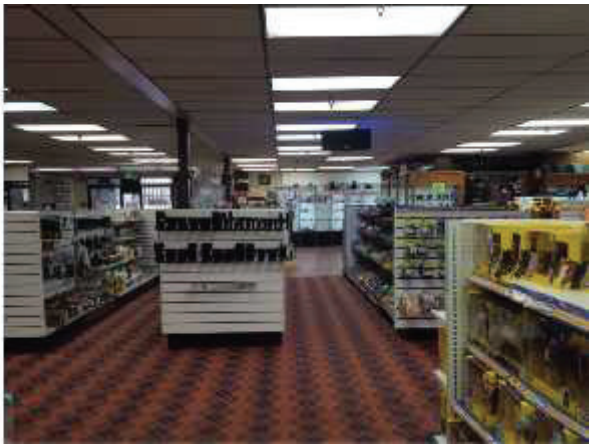

**Photo #10** View sales floor, inside the facility (1022 Leorita Street).

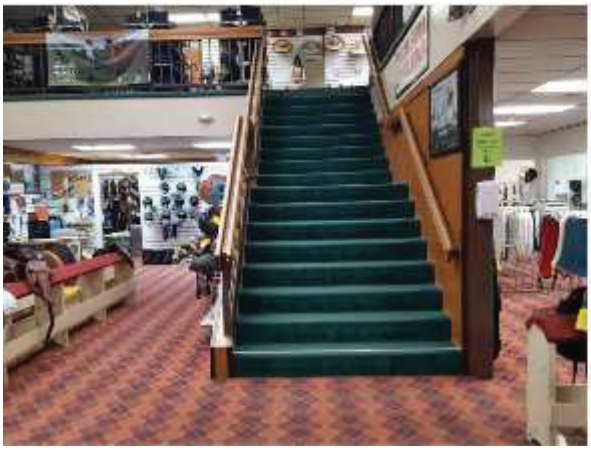

**Photo #11** View of the stairs to the mezzanine level sales floor (1022 Leorita Street).

**Photo #12** View of water-stained ceiling tiles, near stairs to the mezzanine level (1022 Leorita Street).

**Photo #13** View of the mezzanine level sales floor (1022 Leorita Street).

**Photo #14** View of the facility, from the mezzanine level sales floor (1022 Leorita Street).

**Photo #15** View of the storm water drainage path (1026 Leorita Street).

**Photo #16** View of the storm water drain (1026 Leorita Street), near Property entrance.

**Photo #17** View of the storm water drainage path (1022 Leorita Street), located on the southwestern perimeter of the Property.

**Photo #18** View of the storm water drain (1022 Leorita Street), located on the southwestern perimeter of the Property.

**Photo #19** View of the solid waste disposal bin area (1026 Leorita Street).

**Photo #20** View of the solid waste disposal bin (1026 Leorita Street).

**Photo #21** View of pallet storage area (1022 Leorita Street).

**Photo #22** View of propane-fueled forklift storage shed (1022 Leorita Street).

**Photo #23** View of propane-fueled forklift storage area (1022 Leorita Street).

**Photo #24** View of propane storage area (1022 Leorita Street).

**Photo #25** View of the pad-mounted transformer, located on the central portion of the Property (1022 Leorita Street).

**Photo #26** View of the Property, facing east-northeast, from the southwestern portion of the Property (1022 Leorita Street).

**Photo #27** View of the adjoining parcel, located north-northeast of the Property (storm water basin, followed by Dalewood Street, and then by the I-10 Freeway).

**Photo #28** View of the adjoining parcel, located east of the Property (Kaiser Permanente parking garage at 1102 Baldwin Park Boulevard).

**Photo #29** View of the adjoining parcel, located south of the Property (Kaiser Permanente parking garage at 1102 Baldwin Park Boulevard).

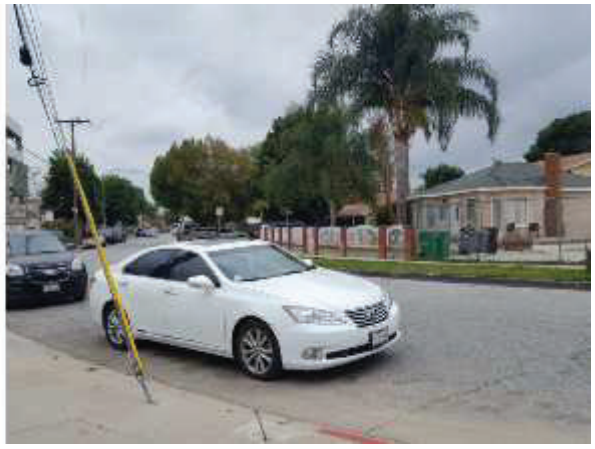

**Photo #30** View of the adjoining parcel, located west of the Property (Leorita Street, followed by residential houses).

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Terracon were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

**Site Name:**

Kaiser- Leorita Street Broken H
1022-1026 Leorita Street
Baldwin Park, CA 91706
EDR Inquiry # 6381562.3

**Client Name:**

Terracon
1355 East Cooley Drive
Colton, CA 92324
Contact: Laura Hedman

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Terracon were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

## *Certified Sanborn Results:*

**Certification #** EF46-4F4C-A7F9

**PO #** 13

**Project** CB21P020

### UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: EF46-4F4C-A7F9

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

*The Sanborn Library LLC Since 1866™*

### Limited Permission To Make Copies

Terracon (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

**Disclaimer - Copyright and Trademark Notice**

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. # EXECUTIVE SUMMARY

## DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

## RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

# 1.0 BALDWIN PARK (SAN GABRIEL VALLEY SUPERFUND SITE) (60001336)

https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60001336

## 2.0 Site History

Baldwin Park is in area 2; and is one of eight OUs identified by USEPA for the San Gabriel Valley Superfund Sites and is also known as San Gabriel Valley Superfund Site Area 2. Located in eastern Los Angeles County and covering 10 square miles, the Baldwin Park OU includes portions of the cities of Azusa, Irwindale, Baldwin Park and West Covina. The area of groundwater contamination is more than 8 miles long and 1 miles wide, reflecting multiple, commingled groundwater contaminant plumes. Groundwater contamination extends from the water table (150 to 350 feet deep) to depths of up to 1000 feet below ground. The primary contaminants in groundwater are trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane.

In March 1994, the USEPA issued the Interim Record of Decision (IROD) for the Baldwin Park OU which included pumping and treating impacted groundwater. USEPA issued an Explanation of Significant Differences to the IROD in May 1999 which amended the interim remedy to include treatment for perchlorate, NDMA, and 1,4-dioxane. The objective of the IROD and ESD is to prevent future increases in, and begin to reduce, concentrations of groundwater contaminants by limiting further migration of contaminated groundwater into clean or less contaminated areas. The IROD specifies extraction of contaminated groundwater at the downgradient end of two broad areas of the plume, at locations and rates sufficient to limit the movement of contaminated groundwater through each subarea during all anticipated groundwater flow conditions. In February 2002, the USEPA issued a Unilateral Administrative Order for Remedial Design/Remediation Action to 20 respondents. In March 2002, eight PRPs and seven local water agencies reached a third-party agreement (BPOU project agreement) that provided a means of implementing the remedy and commits the parties to implement a joint cleanup and water supply project. This agreement is periodically updated.

The Baldwin Park OU remedy is a large-scale groundwater extraction and treatment system, consisting of four pump and treat "subprojects" (each ranging in capacity from 2,500 to 7,800 gpm) with a combined treatment capacity of 26,000 gpm. The subprojects were built between 2000 and 2006 at a cost of more than $100 million. The projects are operated by local water utilities, supplying clean treated water to local homes and businesses. The systems consist of groundwater extraction wells, monitoring wells, pipelines, and multiple water treatment processes for removal of contaminants. From 2002 to 2012, more than 69 billion gallons of groundwater were treated and 59,000 pounds of contamination removed from the water. The projects are currently treating over 25 million gallons of water per day and removing between 5,000 and 10,000 pounds of contamination per year, and are capable of supplying water to more than 100,000 homes. Improvements are underway, including replacement of the perchlorate removal equipment to increase the reliability of the water treatment systems.

PRPs are funding a majority of the work in compliance with a June 2000 EPA Order. More than $200 million has been spent on the four cleanup projects to date, with annual operation and maintenance costs of approximately $16 million per year. Federal and state grants have contributed more than $38 million to the cleanup. The estimated total project cost is $500 million.

EXTERNAL:

Good Day DTSC,

Terracon has been contracted to perform an environmental site assessment of the above-mentioned property located at 1022-1026 Leorita Street, Baldwin Park, California 91706. We would like to review environmental information (i.e. hazardous material responses/ inventory, records of soil and water contamination, LUST/UST, any permits or certificate of occupancies that may be onfile from the Building or Planning Divisions, etc.) that your office may have on file for the property.

Electronic responses are preferable. If electronic responses are not possible and the files are relatively small, please copy and Terracon will pay for copying costs. If there is too much information to copy/send, please call me to schedule a time that I may review this information. I can be reached at (909) 301-6082 or by e-mail at Laura.Hedman@terracon.com. Thank you for your time. If you have any questions, please feel free to contact me.

Thank you!

**Public Records Request Number: 1-022521-01**
**Location(s): 1022 – 1026 Leorita Street, Baldwin Park, CA 91706**

Dear Requestor:

On February 25, 2021 the Department of Toxic Substances Control (DTSC) received your email of the same date requesting records under the Public Records Act. After a thorough review of our files, no site records were found pertaining to the sites/facilities referenced above.

A large number of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSCs data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 916-255-4159 or via email at PubReqAct@dtsc.ca.gov.

Sincerely,
*Choua Her*

RE: PRA of March 10, 2021, Reference # H034604-031021.

Dear Field Geologist Laura S Hedman,

The Los Angeles County Fire Department, Health Hazardous Materials Division, being the custodian or keeper of records, certify that a thorough search for the records you requested has been carried out.

**Re: 1022 Leorita**
**Baldwin Park CA 91706**

**The search revealed that your noted address did not match our database.**

It should be understood that this does not mean that the records you requested do not exist. It is possible that such records may be misfiled; exist under another spelling, another name, or may have been destroyed based on this Department's Record Retention Policy. However, with the information furnished to our office, and to the best of our knowledge, no records were located.

For businesses in Burbank, Culver City, Downey, City of LA, La Habra, Monrovia, Pasadena, Santa Monica, Torrance & Underground Storage Tanks in Los Angeles County jurisdiction click here.

# Well Report

**SAN GABRIEL VALLEY WATER CO.-EL MONTE (EL MONTE)**
**WELL B25A**
11142 GARVEY AVENUE
EL MONTE , CA 91734734

**State Well #:** 1910039-112
**Well Source:** Groundwater
**Well Status:** Active Raw

# Well Report

**SAN GABRIEL VALLEY WATER CO.-EL MONTE (EL MONTE)**
**WELL B25A**
11142 GARVEY AVENUE
EL MONTE , CA 91734734

**State Well #:** 1910039-112
**Well Source:** Groundwater
**Well Status:** Active Raw

# Well Report

**SAN GABRIEL VALLEY WATER CO.-EL MONTE (EL MONTE)**
**WELL B25A**
11142 GARVEY AVENUE
EL MONTE , CA 91734734

**State Well #:** 1910039-112
**Well Source:** Groundwater
**Well Status:** Active Raw

# EPA Updates Cleanup Plan for the Azusa-Irwindale-Baldwin Park Area

*Los Angeles County, California*

The United States Environmental Protection Agency (EPA) is updating the Superfund cleanup plan for the Baldwin Park area of the San Gabriel Valley in response to the discovery, in 1997 and 1998, of several new pollutants in the groundwater. The EPA adopted the cleanup plan in 1994, after extensive public comment. The newly discovered chemicals include perchlorate, N-nitrosodimethylamine (NDMA), and 1,4-dioxane. Perchlorate is used in solid rocket fuel; NDMA has been found in liquid rocket fuel; and 1,4-dioxane has been used as a stabilizer in chlorinated solvents. Discharges of these chemicals to the ground are believed to have stopped many years ago, but a significant amount of contamination has reached the groundwater basin and requires cleanup. In addition to perchlorate, NDMA, and 1,4-dioxane, groundwater in the Baldwin Park area is contaminated with perchloroethylene (PCE), trichloroethene (TCE), and other chlorinated solvents. Chlorinated solvents are sometimes referred to as *volatile organic compounds* or VOCs.

The discovery of perchlorate, NDMA, and 1,4-dioxane will change the cleanup project, known as the Baldwin Park Operable Unit (OU), in three ways:

1) Additional treatment processes must be used to reduce perchlorate, NDMA, and 1,4-dioxane concentrations in the groundwater to safe levels. The technologies typically used to remove chlorinated solvents from water (air stripping and carbon adsorption) will not effectively remove perchlorate, NDMA, or 1,4-dioxane. Final decisions on treatment processes will be made during remedial design, later this year or early next year.

2) More of the treated groundwater is expected to be used locally, to replace water supplies lost when perchlorate and NDMA forced local water companies to shut down some groundwater wells. Previously, local agencies were advocating the export of most of the treated groundwater to communities outside of the San Gabriel Valley.

3) Some of the groundwater extraction wells will be located further south than previously planned to prevent the spread of perchlorate and NDMA, as well as VOCs, to clean portions of the groundwater basin.

*Cont'd. on pg. 2*

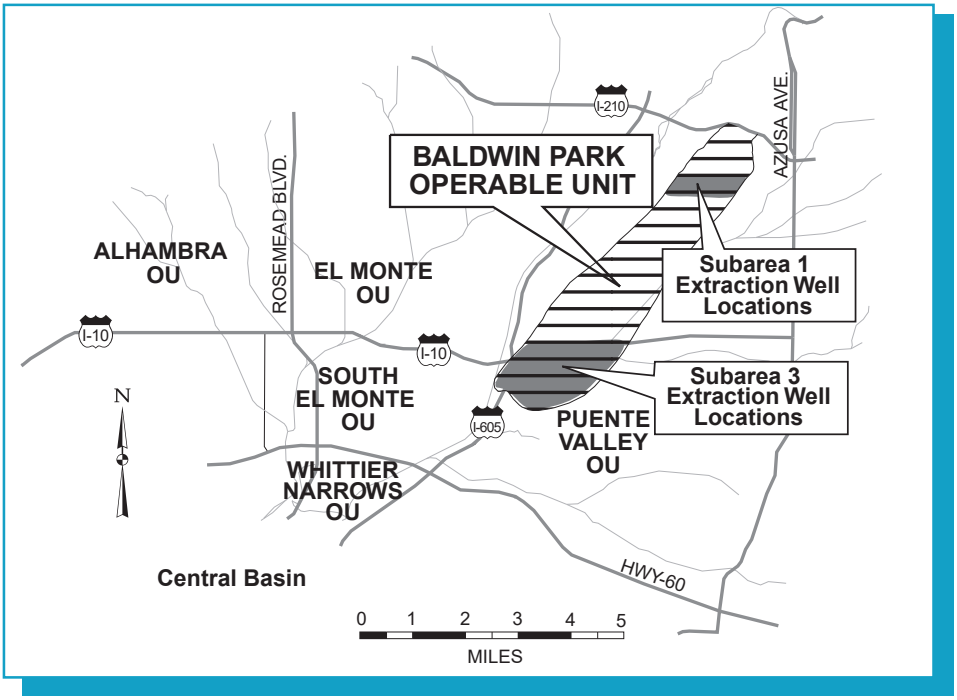

**Figure 1:** Location map of the Baldwin Park Operable Unit and other San Gabriel Valley Superfund Site Projects

These changes have delayed construction of the cleanup facilities by about two years while tests of perchlorate treatment technologies and changes to the groundwater extraction plan are completed. The treatment studies and updated extraction plan are almost complete. The changes will significantly increase the cost of cleanup, as described below.

If and when significant changes are needed in a Superfund cleanup plan, the EPA informs the community through an Explanation of Significant Differences. This fact sheet is intended to fulfill that requirement. We welcome comments on new aspects of the cleanup highlighted in this fact sheet and on other issues raised by the discovery of perchlorate, NDMA, and 1,4-dioxane in the Baldwin Park area. We will, if appropriate, make additional changes in the cleanup plan in response to comments. EPA previously requested and considered comments on other aspects of the cleanup in 1993. The State of California, through its Department of Toxic Substances Control, supports the changes described in this fact sheet.

The remainder of the fact sheet provides a brief history of the Baldwin Park cleanup, summarizes the 1994 cleanup plan, and describes the changes to the 1994 plan in more detail.

# The Baldwin Park Cleanup: A Brief History

### 1994: EPA Adopts Cleanup Plan

On March 31, 1994, the EPA adopted a cleanup plan for the Azusa-Irwindale-Baldwin Park area known as the *Baldwin Park Operable Unit Record of Decision*. The plan addresses a several-mile-long area of groundwater contamination in the San Gabriel Valley. The contamination results from the use and improper handling and disposal of carbon tetrachloride (CTC), PCE, TCE, and other chemicals. These chemicals were used in large quantities at industrial facilities in Azusa and surrounding areas as early as the 1940s, and by hundreds of businesses in the 1960s, 1970s and 1980s for degreasing, metal cleaning, and other purposes. The chemicals were probably released to the ground by a combination of onsite disposal, careless handling, leaking tanks and pipes, and other means.

The groundwater contamination was discovered in 1979. In 1984, the EPA added four portions of the San Gabriel Valley to the national Superfund list. The Baldwin Park area is officially known as the *San Gabriel Valley Area 2* Superfund site. Subsequent investigation by the EPA and others revealed the tremendous extent of groundwater contamination. During the past 15 years, more than one-quarter of the approximately 366 water supply wells in the San Gabriel Valley have been found to be contaminated. In response to the contamination, water companies have shut down contaminated wells, installed new treatment facilities, and taken other steps to ensure that they can continue to supply water meeting State and Federal drinking water standards.

The EPA's 1994 cleanup plan calls for the extraction and treatment of contaminated groundwater from two broad subareas of contamination. The northernmost of the two subareas is termed *Subarea 1*. Subarea 1 includes most of the known sources of the groundwater contamination, where contaminant concentrations in groundwater are hundreds of times drinking water standards. The southernmost subarea is termed *Subarea 3*, where contaminant concentrations are lower but still

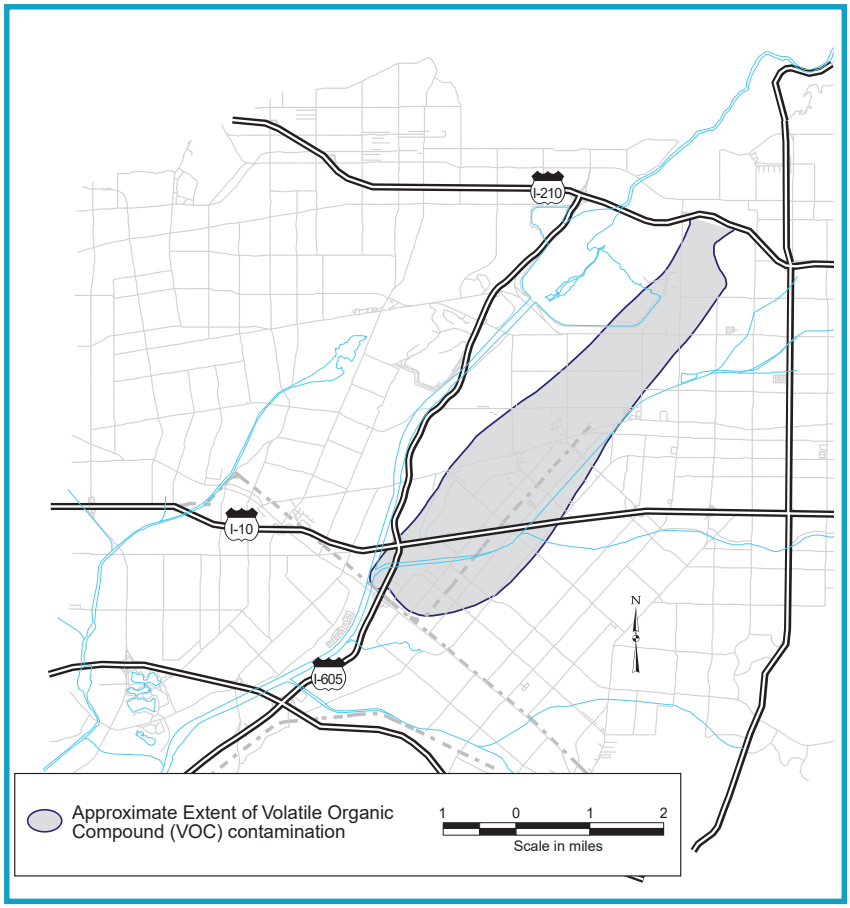

**Figure 2:** Approximate extent of VOC contamination in groundwater in the Azusa-Irwindale-Baldwin Park area.

exceed drinking water standards (see Figure 1).

The goals of the 1994 cleanup plan are to limit the movement of contaminated groundwater to clean or less contaminated areas and depths, remove a significant mass of contamination from the groundwater, and provide the data necessary to determine final clean up standards for the area. The plan calls for the construction and operation of groundwater extraction wells, treatment facilities, and conveyance facilities capable of pumping and treating approximately 19,000 gallons per minute of contaminated groundwater. The plan recommends the use of existing water supply wells, treatment systems, and pipelines to the extent possible, and the construction of new facilities where needed. Final decisions on extraction rates and locations were to be made during remedial design. In 1994, the EPA estimated the cost of the cleanup at $47 million in capital costs and $4 million/year for operation and maintenance. EPA's revised cost estimate is $85 million in capital costs and $10 million/year for operation and maintenance

### 1995 - 1997: Potentially Responsible Parties (PRPs) Complete Pre-Design Work

In January 1995, the EPA began to name the companies responsible for the groundwater contamination. To date, the EPA has named 19 companies and property owners as Potentially Responsible Parties, also known as PRPs. In late 1995, a majority of these companies organized themselves into a group named the Baldwin Park Operable Unit Steering Committee. From 1995 to early 1997, the Steering Committee funded more than $2 million of *pre-design* work needed as part of the cleanup. The Steering Committee installed and sampled a network of eight deep groundwater monitoring wells to improve our understanding of the extent of contamination and developed a detailed groundwater extraction plan. During this period, negotia-

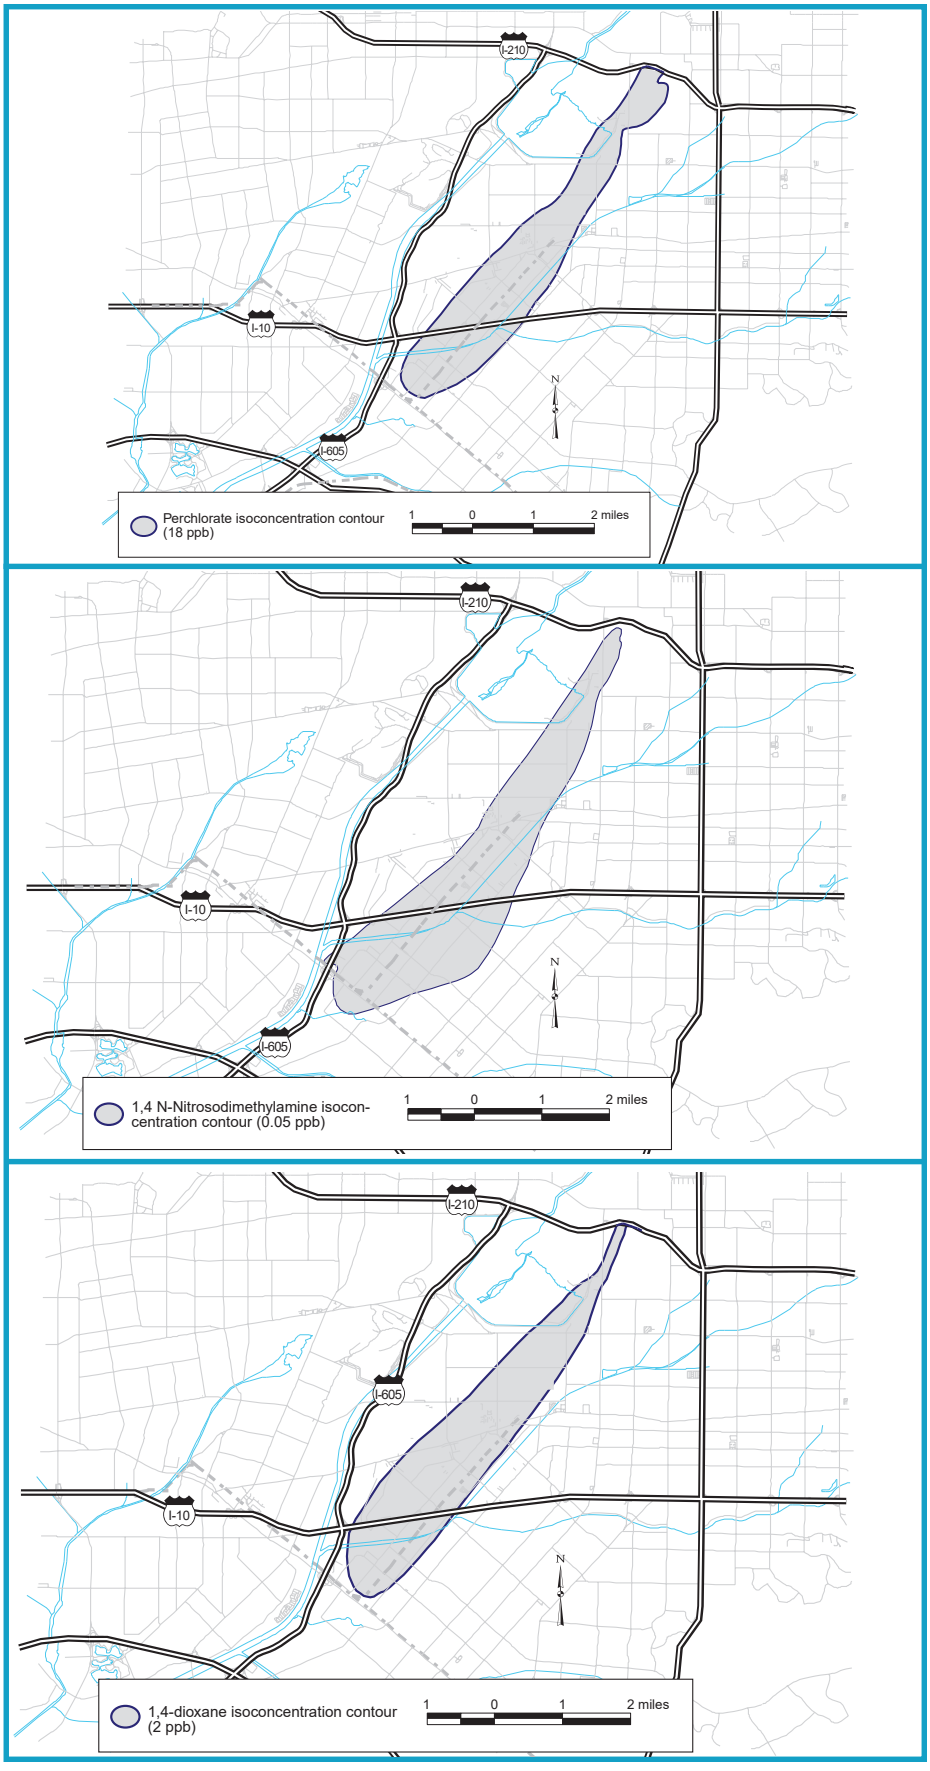

**Figure 3:** Approximate extent of perchlorate, NDMA and 1,4-dioxane contamination in groundwater

tions with water agencies continued, and a tentative water distribution and use plan was developed which called for delivery of the treated groundwater to the Metropolitan Water District of Southern California. The plan, labeled the *Consensus Plan*, called for export of the treated groundwater to areas now dependent on more expensive and less dependable imported water, in order to reduce the region's dependence on imported water supplies and raise revenue through sales of the treated water.

### 1997 - 1999: Discovery of Perchlorate Extends Negotiations and Triggers Need for Additional Pre-Design Work

In May 1997, the EPA sent *Special Notice* letters to 19 PRPs to begin formal EPA-PRP negotiations. The EPA's purpose in initiating the negotiations was to obtain a binding commitment from the PRPs to carry out the Baldwin Park cleanup plan (i.e., to design, construct, and operate the groundwater extraction, treatment, and delivery facilities). The negotiations were expected to conclude in late 1997, but the discovery in June 1997 of perchlorate at levels above 18 parts per billion (ppb) in groundwater forced an extension in the negotiations. At that time, no one knew the extent of perchlorate contamination in the Baldwin Park area and little was known about the cost, effectiveness, and reliability of possible treatment methods.

The discovery of perchlorate occurred soon after the California Department of Health Services developed an improved analytical method capable of detecting perchlorate at concentrations as low as 4 ppb in groundwater. The EPA had attempted to determine whether perchlorate was present in the groundwater in the mid 1980s, but the analytical methods available at the time were not capable of determining with certainty whether perchlorate was present. NDMA and 1,4-dioxane were discovered in the Baldwin Park area in 1998.

The highest concentrations of perchlorate, NDMA, and 1,4-dioxane are found in the groundwater in Azusa, in Subarea 1. Maximum concentrations of perchlorate and NDMA are more than 100 times the State drinking water action levels of 18 and 0.002 ppb respectively. The maximum concentration of 1,4-dioxane is more than 20 times the State drinking water action level of 3 ppb. Up to six miles downgradient of the industrial source area in Azusa, at the likely groundwater extraction locations in Subarea 3, perchlorate and NDMA concentrations remain above State action levels. The concentration of 1,4-dioxane in this area has, to date, been below the State action level. Figure 3 depicts the approximate extent of perchlorate, NDMA and 1,4-dioxane contamination in groundwater in the Baldwin Park OU.

In response to the discovery of perchlorate, the EPA extended its formal negotiations with the PRPs until July 1999. In exchange for the extension, the Steering Committee agreed to immediately proceed to complete additional predesign work. The additional work included completion of a pilot-scale study of one perchlorate-removal technology (biological treatment); support for studies of a second perchlorate-removal technology (ion exchange); installation of four additional groundwater monitoring wells to help define the extent of perchlorate, NDMA, and 1,4-dioxane contamination; and revisions to the groundwater extraction plan. The ion exchange studies have been funded largely by the Main San Gabriel Basin Watermaster.

The treatment studies have successfully demonstrated that both technologies can remove perchlorate from groundwater down to non-detectable levels. Pilot-scale studies were not needed for NDMA or 1,4-dioxane removal, because experience at other sites has demonstrated that NDMA and 1,4-dioxane can be removed down to non-detectable levels using commercially-available treatment systems. See page 6 for a more detailed description of perchlorate, NDMA, and 1,4-dioxane treatment technologies. The additional treatment technologies needed to remove the new contaminants are responsible for most of the increase in the estimated cost of the cleanup.

At the same time that the treatment studies have been underway, the EPA, the PRPs, and local water agencies have continued efforts to determine the best use of the treated groundwater. Although no final decisions have been made, there has been a renewed interest in recent months in using the treated groundwater *within* the San Gabriel Basin, rather than exporting the water out of the Basin. This change in interest resulted in part because perchlorate and NDMA have forced water companies to shut down several water supply wells in the San Gabriel Basin, prompting water companies to look for additional supplies of clean water to replace the lost production. Ultimately, it is likely that much of the treated water will be used locally, but some may still be exported outside of the San Gabriel Basin. Since late 1998, discussions have been underway between the EPA, the PRPs, the Main San Gabriel Basin Watermaster, and affected water companies. The Watermaster and the affected water companies are interested in taking responsibility for building and operating some or all of the Baldwin Park cleanup facilities.

There are also multiple efforts underway to reduce the PRPs' share of the cleanup costs by securing other sources of funding. A Federal grant provided through the U. S. Bureau of Reclamation has paid for more than $1 million in predesign costs and is expected to provide additional money for

## Table 1. Comparison of Cleanup Plans - Most Aspects of the 1994 Plan Have Not Changed

| | ORIGINAL CLEANUP PLAN | UPDATED CLEANUP PLAN |
|---|---|---|
| **Remedial Objectives** | Limit further migration of contaminated groundwater, begin to remove contamination from the groundwater, and provide data necessary to determine final clean up standards | Same |
| **Groundwater Extraction Areas** | Extract groundwater from two broad areas of contamination (Subareas 1 and 3) | Same, except Subarea 3 is extended further south |
| **Groundwater Extraction Rates** | Extract contaminated groundwater at rates needed to meet remedial objectives. Determine final rates during remedial design. Initial estimate was 19,000 gpm | Same. Revised estimate is 20,000-21,000 gpm |
| **Groundwater Treatment Technologies** | Use air stripping, carbon treatment, and/or oxidation technologies to remove VOCs from the groundwater. Select technologies during remedial design | Use same technologies to remove VOCs. Also use ion exchange or biological treatment to remove perchlorate, UV light to remove NDMA, and UV oxidation to remove 1,4-dioxane. Select technologies during remedial design |
| **Groundwater Treatment Standards** | Design treatment systems to reduce contaminant concentrations to below MCLs | Reduce contaminant concentrations to below MCLs and reduce perchlorate, NDMA, and 1,4-dioxane concentrations to below State action levels |
| **Use of Treated Groundwater** | Supply to water companies for distribution, and/or recharge into the groundwater basin. Make final decision during remedial design | Same |
| **Project Costs** | Estimated capital costs of $47 million; estimated operation and maintenance costs of $4 million/year | Estimated capital costs increase to $85 million; estimated operation and maintenance costs increase to $10 million/year |

design and construction costs (up to 25% of the project's capital costs). In March 1999, three of the San Gabriel Valley's U.S. Congressional Representatives cosponsored the San Gabriel Basin Drinking Water Initiative, which would, if it became law, provide up to $75 million in additional Federal funding for groundwater cleanup in the Baldwin Park area and other contaminated areas in the San Gabriel Valley and an additional $25 million for research on perchlorate treatment technologies.

*The cleanup plan remains protective of human health and the environment and will continue to meet all applicable or relevant and appropriate requirements identified in the 1994 Record of Decision, as required by CERCLA Section 121(d).*

### Schedule

- **Spring 1999** - Design of treatment facilities at the La Puente Valley County Water District (LPVCWD) wellfield
- **Summer 1999** - Construction of treatment facilities at the LPVCWD wellfield
- **July 1999** - Deadline for Potentially Responsible Parties to submit a *Good Faith Offer* committing to design, construct, and operate the Baldwin Park cleanup facilities
- **Fall 1999** - Deadline for negotiation of Consent Decree
- **Late 1999-2001** - Design of remaining Baldwin Park cleanup facilities
- **2001-2003** - Construction of remaining Baldwin Park cleanup facilities

# Treatment Options

### Perchlorate

Since 1997, when perchlorate was discovered in the San Gabriel Valley groundwater basin, much progress has been made in developing treatment methods capable of removing perchlorate from the groundwater. Most of the attention has been directed at two technologies: biological treatment and ion exchange.

In the biological treatment process, microbes destroy perchlorate by converting the perchlorate ion to oxygen and chloride. Oxygen and chloride are present at low levels in all drinking water. Nutrients must be added to sustain the microbes. The Steering Committee has completed a six month pilot-scale study of an anaerobic biological process, demonstrating the reduction of perchlorate from approximately 75 ppb to below detectable levels. The same process is being used in a recently-constructed full-scale treatment system at the Aerojet Superfund Site in Northern California. A similar process has also been used at a Utah facility to treat non-potable wastewaters resulting from the manufacture and maintenance of rocket motors.

Biological treatment methods are capable of producing potable water, but additional testing must be completed to determine whether a biological process can reliably and cost-effectively remove perchlorate and produce drinking quality water. The necessary tests are planned for later this year, when a 300-500 gallon per minute biological treatment system should be in operation. The treatment system is expected to include a biological reactor, followed by a biologically-active multimedia filter and granular activated carbon (GAC) *polishing treatment* (see Figure 4). The system will also include ultraviolet light treatment for removal of NDMA and VOCs. Biological treatment methods are new to many water utilities, but *biologically active* filters have been used in drinking water treatment for decades to help remove particles and biodegradable organic matter.

The second of the two perchlorate-removal technologies receiving the most attention is ion exchange, in which the perchlorate ion is replaced by chloride, a chemically similar but non-toxic ion. Ion exchange processes have been used in homes and businesses for *softening* hard water for decades. Bench- and pilot-scale studies have demonstrated that ion exchange systems can reliably reduce perchlorate concentrations in San Gabriel Valley groundwater from approximately 75 ppb to below detectable levels. The studies have also provided valuable information on resin selection and regeneration, brine volume, and cost that will guide the design and operation of full scale systems. By summer 1999, a 2500 gallon per minute ion exchange system is expected to go online, producing potable water for use in the San Gabriel Valley.

The principal disadvantage of ion exchange systems is that they produce a concentrated brine that requires disposal and/or further treatment. Research is underway to try to identify methods of reducing the volume of perchlorate-contaminated brines to reduce the high cost of disposal.

## What are Perchlorate, NDMA, and 1,4-Dioxane?

*Perchlorate* is a highly soluble inorganic molecule made of chlorine and oxygen. Its chemical formula is $ClO_4^-$. In solid form, as ammonium perchlorate, it is highly explosive. At low concentrations in water, as is found in the San Gabriel groundwater basin, perchlorate is unreactive and persistent. Ammonium perchlorate and potassium perchlorate were used at two facilities in Azusa in the 1940s in the testing of solid fuel rockets and the manufacture of photoflares. Ammonium perchlorate is still in use today - in the solid fuel rockets that launch the space shuttle, in some missiles and fireworks, and other applications.

*NDMA* (N-nitrosodimethylamine) is a highly soluble organic chemical that was used, until about 1976, in the production of the liquid rocket fuel 1,1-dimethylhydrazine (also known as unsymmetrical dimethylhydrazine [UDMH]). NDMA has reportedly been present as an impurity in UDMH, and may be formed as a result of the chemical breakdown of UDMH. NDMA has been detected at trace levels in some manufactured products and foods, and can reportedly be produced as a byproduct of a number of chemical reactions. Its chemical structure is $(CH_3)_2N\text{-}N{=}O$. Hydrazine-containing fuels were used in Azusa as early as the 1940s.

The chemical *1,4-dioxane* is a highly soluble compound used as a stabilizer in chlorinated solvents, particularly 1,1,1-trichloroethane. Its chemical formula is $C_4H_8O_2$. It belongs to a class of organic compounds known as ethers. It is a different chemical than the similar-sounding dioxins. Chlorinated solvents likely to have contained 1,4-dioxane, including 1,1,1-trichloroethane, have been used in Azusa and Baldwin Park for many years.

An added benefit of both biological treatment and ion exchange processes is that they would also remove much of the nitrate from the water. The groundwater in some parts of the San Gabriel Valley is unusable because of high levels of nitrate. The nitrate is believed to result from past agricultural practices in the Valley.

Two other technologies have also been demonstrated to be capable of removing perchlorate from water, but probably at higher cost. Reverse osmosis and nanofiltration were tested by researchers at the Metropolitan Water District of Southern California and shown to be effective in removing perchlorate, but they are likely to be much more expensive to operate than ion exchange processes or biological treatment. Liquid phase granular activated carbon (GAC) also removes perchlorate, but only for a limited period of time before regeneration or replacement of the carbon is required. Frequent carbon replacement would make relying solely on GAC for perchlorate removal very expensive. Perchlorate cannot be removed from water by conventional filtration, sedimentation, or air stripping technologies.

### NDMA and 1,4-Dioxane Treatment

NDMA can be removed from groundwater by ultraviolet (UV) light treatment. In a UV treatment system, the water passes though a tank containing high-intensity ultraviolet lamps. The NDMA molecules absorb the light energy and are broken down into smaller nontoxic molecules. The chemical 1,4-dioxane can also be removed by UV light treatment, in combination with an oxidant such as hydrogen peroxide. UV treatment systems have been successfully built and operated to remove both chemicals from water in locations throughout the United States.

## Treatment Levels

The treatment technologies used at the Baldwin Park Operable Unit will have to be capable of effectively and reliably removing VOCs, perchlorate, NDMA, and 1,4-dioxane from the groundwater. If any of the treated groundwater is to be used as drinking water, the treatment technologies must reduce the concentrations of all contaminants to below Federal and State drinking water standards in existence at the time that the water is served. These standards, known as Maximum Contaminant Levels (MCLs), must be met at the tap. There are MCLs for some but not all of the chemicals present in the groundwater in the Baldwin Park area.

Safe levels for some chemicals that lack MCLs are specified by *action levels* developed by the California Department of Health Services (DHS). There are action levels for perchlorate (at 18 ppb); NDMA (at 0.002 ppb); and 1,4-dioxane (at 3 ppb). Although not an enforceable standard, an action level is the concentration of a contaminant in drinking water that DHS has determined, based on available scientific information, provides an adequate margin of safety to prevent potential risks to human health. California Health & Safety Code Section 116455 requires that the operator of a public water system notify local government authorities when a drinking water well exceeds an action level. In addition, DHS recommends that drinking water systems provide public notification if action levels are exceeded, unless the wells in question are taken out of service. Public water systems virtually always shut down wells if action levels are exceeded.

Accordingly, in any water to be served as drinking water, the concentrations of perchlorate, NDMA, and 1,4-dioxane will be reduced to below action levels in existence at the time the water is served.

EPA's cleanup plan also allows some or all of the treated water to be recharged back into the groundwater basin instead of being delivered as drinking water. As discussed

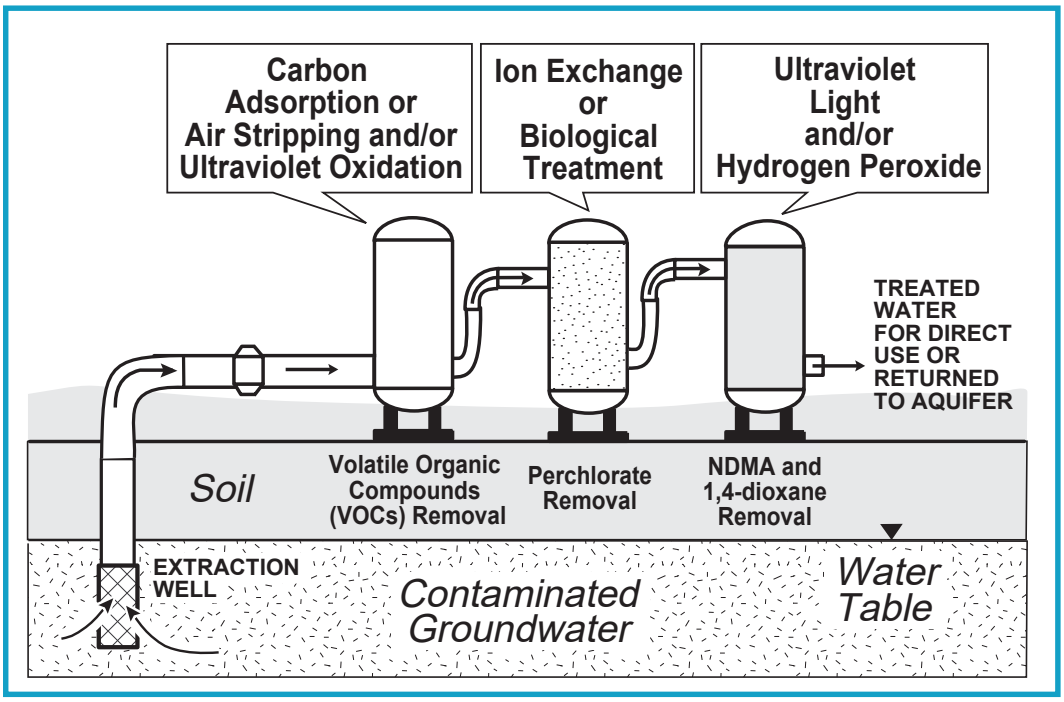

**Figure 4:** Groundwater treatment technologies

in greater detail in the Record of Decision, any water that is to be recharged must comply with the pertinent water quality objectives in the Los Angeles Regional Water Quality Control Board Basin Plan. In addition, State Water Resources Control Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California," is applicable to any recharge of treated groundwater into the aquifer. Resolution No. 68-16 requires maintenance of existing State water quality unless it is demonstrated that a change will benefit the people of California, will not unreasonably affect present or potential uses, and will not result in water quality less than that prescribed by other State policies. In light of these requirements, any groundwater recharged into the aquifer will be treated to levels below action levels for perchlorate, NDMA, and 1,4-dioxane.

The treatment levels discussed above apply to the groundwater after it is pumped above ground. Neither the 1994 cleanup plan nor this update establish cleanup levels in situ (i.e., in the aquifer). EPA will propose in situ cleanup levels in a future action.

## Final Selection of Treatment Technologies

The EPA believes that a final decision to select treatment technologies for the Baldwin Park Operable Unit should be deferred until later this year or early next year. That way, the results of continuing treatment studies in the San Gabriel Valley and elsewhere can be incorporated into the decision. By the end of 1999, it is likely that full scale ion exchange and biological treatment systems will be operating in the San Gabriel Valley, providing additional cost and performance data to guide the selection of treatment technologies.

*EPA is issuing this Explanation of Significant Differences in part to satisfy its public participation responsibilities under CERCLA Section 117(c) and NCP Section 300.435(c)(2)(I).*

## Table 2. Status of the Five San Gabriel Valley Superfund Projects

| U.S. EPA PROJECT | LOCATION | STATUS | UPCOMING ACTIONS |
|---|---|---|---|
| Baldwin Park Operable Unit (OU) | Portions of the cities of Azusa, Irwindale, Baldwin Park, and West Covina | Regional investigation completed; cleanup plan adopted; 19 PRPs identified; pre-design work completed. | See remainder of fact sheet for detailed update. |
| Whittier Narrows OU | In and adjacent to the Whittier Narrows Recreation Area | New cleanup plan proposed November 1998. No PRPs named. | Record of Decision expected by mid 1999. EPA-funded pre-design activities underway. Remedial Design to be completed in 2000. |
| Puente Valley OU | Portions of the cities of Industry and La Puente | More than 70 PRPs identified; regional investigation complete; cleanup plan adopted in September 1998. | EPA-PRP Consent Decree negotiations expected to begin in late 1999. Goal is to obtain a binding commitment from the PRPs to carry out the Puente Valley cleanup plan. |
| El Monte OU | Portions of the cities of El Monte and Temple City | 20 PRPs identified; regional investigation completed; cleanup plan proposed in November 1998; seven early action monitoring wells installed | Record of Decision expected by June 1999. Formal EPA-PRP Consent Decree negotiations expected to begin later this year. |
| South El Monte OU | Portions of the cities of South El Monte, southern El Monte, and Rosemead | 50 PRPs identified; regional investigation completed | Proposed cleanup plan expected by mid-1999. |

# Who's Who?

It's difficult to keep track of the many agencies and groups with a stake in the cleanup. Here is a quick summary of seven of the most active:

**U.S. Environmental Protection Agency (EPA)** - The EPA is ultimately responsible for cleanup of the groundwater contamination in the Basin, through the Superfund program. The Superfund program remains one of the most effective means of resolving the nation's historical contamination problems. The Federal law that established the program (known as CERCLA) includes a prohibition against lawsuits to delay or stop cleanup; stringent liability provisions to ensure that responsible parties pay; a trust fund of government money to be used if responsible parties fail to carry out their cleanup responsibilities; numerous opportunities for public involvement; and flexibility to tailor cleanup projects to reduce costs, meet local water supply goals, and satisfy other local needs.

**Baldwin Park Operable Unit Steering Committee -** The Steering Committee consists of a majority of the companies named as Potentially Responsible Parties. As of May 1999, 14 of the 19 companies named as PRPs were members of the Steering Committee. To date, the Steering Committee has spent more than $3 million on investigation and treatment work needed for the cleanup.

**Main San Gabriel Basin Watermaster -** The Watermaster was created by a judgment of the California Superior Court to manage the San Gabriel groundwater basin under the jurisdiction of the Court. In 1991, the Watermaster's management responsibilities were expanded to further the cleanup and help preserve the basin's water resources. The Watermaster has been the primary sponsor of the ion exchange studies recently completed in the San Gabriel Valley, and is interested in taking responsibility for building and operating some or all of the Baldwin Park cleanup facilities.

**San Gabriel Basin Water Quality Authority (WQA) -** The WQA is a public agency created by State legislation to assist in the cleanup of the San Gabriel Basin. The WQA has offered a variety of ideas on how to carry out the Superfund cleanups in the San Gabriel Valley, and has funded construction of several interim cleanup projects in the Valley. The WQA has the authority to raise millions of dollars in funds through a tax on water production in the Valley.

**The California Department of Toxic Substances Control (DTSC) -** The DTSC is a State agency which has also funded wellhead treatment facilities in the San Gabriel Valley, and serves as the support agency for all of the San Gabriel Valley Superfund cleanups.

**The California Regional Water Quality Control Board -** The Regional Board is a State agency which has worked cooperatively with EPA to identify the sources of soil and groundwater contamination in the San Gabriel Valley.

**The California Department of Health Services (DHS) -** The DHS develops California MCLs and action levels, and regulates and monitors approximately 8500 public drinking water systems in California. DHS staff have participated in the recent testing of perchlorate treatment technologies in the San Gabriel Valley, and must approve any treatment systems used in the Baldwin Park cleanup to provide potable water.

## For Copies of Documents

This document will become part of the Administrative Record file for the Baldwin Park Operable Unit. To examine or obtain copies of this document or other documents related to this project, contact:

**EPA Region 9 Superfund Records Center**
95 Hawthorne Street
San Francisco, CA 94105 • (415) 536-2000

The Record Center's hours are 8:00 am to 5:00 p.m., Monday through Friday. The Superfund Records Center can make documents available for viewing in San Francisco, photocopy and mail requested documents, or create and send you a CD-ROM containing requested documents. A subset of documents related to the Baldwin Park Operable Unit is also available at:

**West Covina Public Library &**
1601 West Covina Parkway
West Covina, CA 91790
(626) 962-3541

**Rosemead Library**
8800 Valley Boulevard
Rosemead, CA 91770
(626) 573-5220

Call to check their hours. Documents available at all locations include:

**Perchlorate Treatment Studies (prepared by Harding Lawson Associates for the Baldwin Park Operable Unit Steering Committee, unless noted otherwise)**

09-29-1997 Draft Technology Screening for Treatability of Perchlorate in Groundwater, Baldwin Park OU
10-30-1998 Big Dalton Perchlorate Removal Pilot Study, prepared by Calgon Carbon Corporation for the Main San Gabriel Basin Watermaster (ion exchange)
02-12-1999 Final Phase 2 Treatability Study Workplan, Pilot Scale Groundwater Treatment System, Baldwin Park OU (biological treatment)
04-1999 Results of Bench-Scale and Pilot-Scale Studies of Ion Exchange for Perchlorate Removal, prepared by Montgomery Watson for the Main San Gabriel Basin Watermaster (ion exchange)
04-12-1999 Final Phase 1 Treatability Study Report, Perchlorate in Groundwater, Baldwin Park OU (biological treatment)

**Groundwater Monitoring and Groundwater Extraction Plan (prepared by Harding Lawson Associates for the Baldwin Park Operable Unit Steering Committee, unless noted otherwise)**

12-1996 Pre-Remedial Design Report..., Baldwin Park Operable Unit, prepared by Camp Dresser & McKee for the Baldwin Park Operable Unit Steering Committee
4-28-1998 Draft Phase 2A Well Installation and Groundwater Sampling Report..., Baldwin Park Operable Unit
1-21-1999 Draft Addendum to the Pre-Remedial Design Report, Baldwin Park Operable Unit

**Information on Physical, Chemical, and Toxicological Properties of Perchlorate, NDMA, and 1,4-dioxane**

7-1998 Action Level for N-NDMA (see DHS website: http://www.dhs.ca.gov/ps/ddwem/chemicals/ndma/ndmaindex.htm, updated 7/9/1998)
3-1999 Action Level for 1,4-dioxane (see DHS website: http://www.dhs.ca.gov/ps/ddwem/chemicals/mcl/mclindex.htm, updated 3/12/1999)
4-1999 Action Level for perchlorate (see DHS website: http://www.dhs.cahwnet.gov/org/ps/ddwem/chemicals/perchl/perchl_standards.htm, updated 4/23/1999)

**TABLE OF CONTENTS**

1. INTRODUCTION ..... 1
   - 1.1 Background ..... 1
   - 1.2 Overview of Remedial Action ..... 5
   - 1.3 Summary of Remedial Action Objectives and Performance Standards ..... 6
     - 1.3.1 Subarea 1 Remedial Objectives ..... 6
     - 1.3.2 Subarea 3 Remedial Objectives ..... 6
     - 1.3.3 Performance Standards ..... 7
   - 1.4 Approach to Performance Monitoring and Evaluation ..... 8
   - 1.5 Content of Performance Evaluation Reports ..... 9

2. STATUS OF REMEDIAL ACTIONS ..... 12
   - 2.1 Subarea 1 Remedial Action Status ..... 12
   - 2.2 Subarea 3 Remedial Action Status ..... 15
     - 2.2.1 La Puente Valley County Water District Subproject Status ..... 16
     - 2.2.2 San Gabriel Valley Water Company B6 Subproject Status ..... 18
     - 2.2.3 San Gabriel Valley Water Company B5 Subproject Status ..... 20
     - 2.2.4 California Domestic Water Company Status ..... 21

3. PERFORMANCE MONITORING ACTIVITIES ..... 24
   - 3.1 Potentiometric Monitoring ..... 24
   - 3.2 Water Quality Monitoring ..... 25
   - 3.3 Groundwater Model Updates ..... 26
     - 3.3.1 Groundwater Pumping Updates ..... 27
     - 3.3.2 Groundwater Recharge Updates ..... 27
     - 3.3.3 Boundary Condition Updates ..... 29
     - 3.3.4 Model Simulations of Extraction System Performance ..... 30

4. TREATMENT PLANT MONITORING ACTIVITIES ..... 32
   - 4.1 Subarea 1 – Valley County Water District Lante Treatment Plant ..... 32
   - 4.2 Subarea 3 – La Puente Valley County Water District Treatment Plant ..... 33
   - 4.3 Subarea 3 – San Gabriel Valley Water Company B6 Treatment Plant ..... 35
   - 4.4 Subarea 3 – San Gabriel Valley Water Company B5 Treatment Plant ..... 36
   - 4.5 Subarea 3 – California Domestic Water Company Treatment Plant ..... 36

5. PERFORMANCE MONITORING RESULTS ..... 38

5.1 Potentiometric Monitoring Results ..... 38
5.1.1 Water Level Fluctuations ..... 38
5.1.2 Lateral Hydraulic Gradients ..... 39
5.1.3 Vertical Hydraulic Gradients ..... 39
5.2 Groundwater Quality Monitoring Results ..... 40
5.2.1 Summary of PSEP Groundwater Quality Results ..... 41
5.2.2 Data Validation and Data Quality Assessment ..... 41
5.3 Groundwater Plume Modeling Results ..... 44
5.3.1 Distribution of Selected Chemicals of Concern ..... 44
5.4 Groundwater Flow Modeling Results ..... 47
5.4.1 Updated Model Calibration Results ..... 47
5.4.2 Results of Performance Evaluation Simulations ..... 50
5.5 Groundwater Extraction and Chemical Mass Removal ..... 51

6. TREATMENT PLANT PERFORMANCE RESULTS ..... 52
6.1 Subarea 1 – Valley County Water District Lante Subproject ..... 52
6.2 Subarea 3 – La Puente Valley County Water District Subproject ..... 54
6.3 Subarea 3 – San Gabriel Valley Water Company B6 Subproject ..... 56
6.4 Subarea 3 – San Gabriel Valley Water Company B5 Subproject ..... 57
6.5 Subarea 3 – California Domestic Water Company Subproject ..... 59

7. EVALUATION OF REMEDY PERFORMANCE AND TREATMENT PLANT OPERATIONS ..... 62
7.1 Groundwater Extraction System Performance ..... 62
7.1.1 Extraction Well Performance ..... 62
7.1.2 Groundwater Extraction and Chemical Mass Removal ..... 63
7.1.3 Assessment of Migration Control ..... 73
7.2 Treatment System Operations ..... 74
7.2.1 Subarea 1 – Valley County Water District Lante Subproject ..... 74
7.2.2 Subarea 3 – La Puente Valley County Water District Subproject ..... 75

# 1. INTRODUCTION

This document presents the 2019 Annual Performance Evaluation (PE) Report for the Baldwin Park Operable Unit (BPOU) of the San Gabriel Valley Superfund Sites, located in the San Gabriel Basin, Los Angeles County, California. This report was prepared jointly by Geosyntec Consultants, Inc. (Geosyntec) and ERM-West, Inc. (ERM), on behalf of the BPOU Cooperating Respondents (CRs). The CRs are:

- Aerojet Rocketdyne, Inc. (formerly known as [f.k.a.] Aerojet-General Corporation);
- Azusa Land Reclamation Company, Inc. (ALR);
- Hartwell Corporation;
- Chemical Waste Management, Inc. (as successor to Oil and Solvent Process Company); and
- Winco Enterprises Inc. (f.k.a. Wynn Oil Company).

This report meets the requirements for the Annual PE Report, as required by Unilateral Administrative Order 2000-13 (UAO) and the supporting Statement of Work (SOW), issued by the U.S. Environmental Protection Agency (EPA) Region IX on June 30, 2000, and amended on February 28, 2002.

## 1.1 Background

Beginning in 1979, volatile organic compounds (VOCs) were detected in groundwater within the San Gabriel Basin (the Basin). In May 1984, four areas of groundwater contamination were listed as San Gabriel Valley Areas 1-4 on EPA's National Priorities List based on available water quality data. Subsequent investigation by EPA and others revealed widespread VOC contamination in the Basin. As a result, EPA subsequently divided the Basin into seven Remedial Investigation (RI) areas to focus characterization on the extent of contamination and plan remedial actions. EPA later designated some of these RI areas as operable units. RI Area 5 was designated as the BPOU.

Although many of the figures provided in this report depict a generalized boundary to the area of impacted groundwater in the BPOU (Figure 1-1), the precise definition of the boundary of the BPOU has not been developed. The approximate BPOU boundary provides a point of reference on the figures.

Since 1986, EPA, various Potentially Responsible Parties (PRPs), and numerous other entities have compiled and evaluated groundwater quality data from the Basin. Initial field investigations conducted by EPA in the BPOU included the installation and sampling of one multiport monitoring well and the sampling of water-supply wells. In 1990, EPA issued a Basin-

wide Technical Plan that described options for remediation of VOC plumes through the Basin. In 1992, EPA published an Interim RI Report for the Basin.

In 1993, EPA issued a Feasibility Study Report for the BPOU. This report evaluated various remedial alternatives for the remediation of groundwater in the BPOU. In 1994, EPA issued a Record of Decision (ROD) for the BPOU interim remedy. The ROD identified 17 chemicals of concern (COCs), all of which were VOCs. EPA's selected remedy consisted of pumping and treating approximately 19,000 gallons per minute (gpm) of contaminated groundwater. In approximately 1995, the Baldwin Park Operable Unit Steering Committee (BPOUSC) began to perform pre-remedial design activities, including additional characterization of the extent of VOC-contaminated groundwater and the development of a groundwater extraction plan. Eight multiport monitoring wells were installed and sampled, and 26 existing water-supply and monitoring wells were sampled to provide additional characterization of the extent of VOC contamination in the BPOU. The results of these pre-remedial design activities were submitted to EPA in the Draft Pre-Remedial Design Report, dated December 1996 (Camp, Dresser, and McKee [CDM], 1996). The groundwater extraction plan was revised on several occasions. Following review and comment by EPA, the Final Draft Pre-Remedial Design Report, dated September 1997 (CDM, 1997), was issued.

In mid-1997, and then again in 1998, certain constituents that were not previously considered as COCs in the ROD, including perchlorate, N-nitrosodimethylamine (NDMA), and 1,4-dioxane were discovered in groundwater within the BPOU. Consequently, EPA requested that the BPOUSC characterize the distribution of these constituents, as well as conduct further characterization of VOCs in groundwater within the BPOU. As a result, the BPOUSC installed and sampled four additional multiport monitoring wells and conducted additional groundwater sampling to evaluate the extent of VOCs, perchlorate, NDMA, and 1,4-dioxane in groundwater in the BPOU.

The results of these investigations and several groundwater extraction plan options were presented to EPA in the Draft Addendum to the Pre-Remedial Design Report, dated January 14, 1999 (Harding Lawson Associates [HLA], 1999). Throughout 1999, these groundwater extraction plan options were refined, and new options were formulated. These changes were made in response to comments from EPA and the Main San Gabriel Basin Watermaster (Watermaster). This resulted in a range of candidate groundwater extraction plans with total groundwater extraction rates ranging from 19,500 to 21,500 gpm.

In May 1999, EPA issued an Explanation of Significant Differences (ESD) to supplement the 1994 ROD. The ESD depicted an expanded area of the groundwater contamination in the southern portion of the BPOU to reflect the results of the additional investigations related to the characterization of perchlorate, NDMA, and 1,4-dioxane in groundwater. The ESD also added perchlorate, NDMA, and 1,4-dioxane to the list of COCs defined in the ROD. In June

2000, EPA issued the UAO, requiring various PRPs (identified in the UAO as "Respondents"), including but not limited to the CRs, to design, construct, and operate the BPOU interim remedy identified in the ROD, as revised by the ESD. In addition, beginning in the late 1990s, various water agencies, producers, and other water entities (collectively, the "Water Entities" or "WEs") with regulatory oversight and/or financial or other interests in the BPOU groundwater filed lawsuits or asserted claims against the BPOU PRPs for damages allegedly suffered as a result of contamination of the groundwater and water-supply wells in the BPOU area. Thereafter, the CRs entered into negotiations with the WEs, which culminated in March 2002 with the CRs and WEs executing the BPOU Project Agreement to implement the BPOU Project. The BPOU Project Agreement went into effect on May 9, 2002 and had a duration of 15 years terminating in May 2017. A new Project Agreement commenced on May 9, 2017 following the expiration of the 2002 BPOU Project Agreement. This new Project Agreement extends for a 10-year period ending in May 2027.

While the BPOU Project Agreement negotiations were underway, the CRs prepared the Final Remedial Design/Remedial Action Work Plan and the Draft Final Conceptual Design Report for the implementation of the remedy (HLA, 2000a and HLA, 2000b). The Preliminary Design Report was prepared by the WEs and submitted to EPA in April 2001 (Watermaster, 2001).

In January 2006, EPA's Remedial Project Manager notified the CRs that EPA was concerned about the detection of 1,2,3-trichloropropane (1,2,3-TCP) in certain wells within the BPOU. At that time this compound did not have a federal Maximum Contaminant Level (MCL) but did have a California state Drinking Water Notification Level (NL) of 5 nanograms per liter (ng/L).[1] In response, the CRs funded a further modification of the Valley County Water District (VCWD) Lante Treatment Plant to include Liquid-Phase Granular Activated Carbon (LPGAC) treatment to address EPA's concerns about the presence of 1,2,3-TCP.

In August 2006, EPA requested that the CRs include in the BPOU monitoring program additional sampling for non-COC VOCs and non-target volatile and semi-volatile compounds (Tentatively Identified Compounds, or TICs) including 1,2,3-TCP (1,2,3-TCP was subsequently added as a COC). In response to EPA's request, the CRs provided a proposal for non-COC groundwater analysis and reporting in a technical memorandum dated August 24, 2006 (Geomatrix, 2006a). This proposal included the following:

- Information on sampling and analysis of 1,2,3-TCP;

[1] In August 2009, the State of California's Office of Environmental Health Hazard Assessment adopted a final Public Health Goal (PHG) for 1,2,3-trichloropropane of 0.7 nanograms per liter, or 0.0007 parts per billion. While DPH considers a PHG in setting a state MCL, to date no final MCL has been established.

- A proposal for reporting results for non-COC VOCs in a subset of multiport monitoring wells located upgradient of each groundwater extraction and treatment facility (i.e., "early warning" wells);
- A proposal for monitoring of non-target VOCs and semi-volatile organic compounds (SVOCs) in a subset of multiport monitoring wells located upgradient of each groundwater extraction and treatment facility (i.e., "early warning" wells); and
- A proposal for periodic analysis of 1,2,3-TCP in selected wells.

EPA approved the August 24, 2006 proposal in a letter dated September 13, 2006, subject to the addition of several wells. The complete requirements for non-COC groundwater analysis and reporting were summarized in a technical memorandum dated September 29, 2006 (ERM, 2006).

On October 3, 2006, EPA provided a letter approving the BPOU Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP) subject to submittal of final versions of these documents with the complete requirements for non-COC groundwater analysis and reporting. Final versions of the QAPP and FSP for groundwater were submitted in November 2006 (Geomatrix, 2006b; Stetson, 2006a) and were approved by EPA in a letter dated February 12, 2007. The QAPP (Rev. 5) and FSP (Rev. 7) for groundwater were most recently updated in 2013 at the request of EPA (AMEC, 2013a and AMEC, 2013b). EPA approved the updated QAPP and FSP in a letter dated May 21, 2013.

In the February 12, 2007 letter, EPA also requested that a data management plan be prepared as an addendum to the QAPP. The report, Data Management Plan for the Baldwin Park Operable Unit Performance Standards Evaluation Plan Monitoring Program, was submitted to EPA on May 17, 2007 (Laboratory Data Consultants, Inc. [LDC] 2007).

A separate Field Sampling and Analysis Plan for Off-Gas Air, Waste Brine, and Treated Water (FSAP) was submitted to EPA on August 14, 2006 (Stetson 2006b) and the corresponding QAPP for Air, Brine, and Treated Water was submitted on March 16, 2007 (Geomatrix, 2007a). The CRs submitted a revised QAPP for air and wastewater discharges to the EPA in September of 2012 (AMEC, 2012a) and an updated FSAP was issued in July 2013 (Stetson, 2013b). The CRs submitted an addendum to the QAPP and FSAP for air and wastewater discharges to the EPA on February 3, 2015 documenting a change in the analytical method for chemical oxygen demand (COD)(Geosyntec, 2015a).

Numerous minor modifications have been proposed and approved for the BPOU PSEP monitoring program since 2007. In 2010, the QAPP for Groundwater (AMEC Geomatrix, 2010a), the FSP for Groundwater (AMEC Geomatrix, 2010b), and the Revised Final Performance Standards Evaluation Plan (PSEP) were updated (AMEC Geomatrix, 2010c) to

incorporate the modifications that were approved after the previous versions of these documents were issued. An updated version of the PSEP (Rev. 3) was submitted to EPA on April 13, 2012 (AMEC, 2012b) to address comments received from EPA on July 1 and October 12, 2011. EPA provided comments and requested additional modifications to the PSEP in e-mail correspondence dated September 21, 2012, November 28, 2012, February 28, 2013, and March 8, 2013. As a result, a revised version of the PSEP (Rev. 4) was prepared to address EPA comments including the addition of 1,2,3-TCP as a COC, clarification of monitoring and reporting requirements for non-COCs such as ethylene dibromide (EDB), and the modification of remedial action objectives outlined in Sections 2.2.1 and 2.2.2 (AMEC, 2013c). EPA approved the revised PSEP in a letter dated May 21, 2013. Modifications to the various monitoring components of the PSEP are described in detail in Section 3.0 of this report.

## 1.2 Overview of Remedial Action

The UAO and SOW direct the Respondents to design, construct, and implement the remedy described in the ROD and ESD, and to achieve the Performance Standards in accordance with the UAO. In a letter to the CRs dated February 28, 2002, EPA confirmed that CR funding of the implementation of the BPOU Project Agreement described in Section 1.1 above provided the CRs with a means to satisfy the requirements of the UAO. The WEs (either directly or through contractors) designed the groundwater extraction and treatment facilities (Subprojects), and construction related to the initial design work has been completed. The WEs are now operating the Subprojects which provide for groundwater extraction and treatment in two general areas of the BPOU (Figure 1-2). The treated groundwater is supplied for direct potable use.

In 2000, the EPA approved groundwater extraction plan associated with the various Subprojects consisted of the extraction of a total of 21,000 gpm of groundwater on annualized basis: 6,000 gpm from the northern portion of the plumes (Subarea 1), and 15,000 gpm from the southern portion of the plumes (Subarea 3)(EPA, 2000). During remedial design activities, the groundwater extraction plan was refined to include an additional 750 gpm in Subarea 3 resulting in a total 15,750 gpm. In January 2015, EPA requested that the extraction plan for Subarea 3 be expanded to include an additional 8,000 gpm from the California Domestic Water Company (CDWC) Bassett Wellfield, increasing the extraction plan for Subarea 3 to 23,750 gpm (EPA, 2015) and total project extraction to 29,750 gpm.

Extracted groundwater is to be treated using a treatment train that is designed to remove all COCs to levels acceptable for direct potable use. The treatment train varies among the treatment plants but generally consists of a series of contaminant treatment processes including air stripping and/or LPGAC to remove VOCs, ion exchange (IX) to remove perchlorate, and ultraviolet (UV)/oxidation to remove 1,4-dioxane and NDMA.

## 1.3 Summary of Remedial Action Objectives and Performance Standards

The remedial objectives for groundwater in the BPOU are defined in the UAO as follows:

> *The remedial objectives of the Baldwin Park OU are to prevent future increases in, and begin to reduce concentrations of trichloroethene, tetrachloroethene, carbon tetrachloride, and other VOCs, along with perchlorate, N-nitrosodimethylamine, and 1,4-dioxane in groundwater in the Baldwin Park area (hereafter referred to as contaminants or contaminated groundwater) by limiting further migration of contaminated groundwater into clean and less contaminated areas or depths that would benefit most from additional protection and by removing contaminants from the aquifer.*

The BPOU Project involves the design, installation, operation, and maintenance of groundwater extraction systems in two areas of the BPOU. The two areas are designated in the ROD and ESD as Subarea 1 (the upper area) and Subarea 3 (the lower area). Remedial objectives for the two Subareas are described below.

### 1.3.1 Subarea 1 Remedial Objectives

In Subarea 1, the movement of COCs in groundwater will be limited by groundwater extraction at rates and locations that will establish the necessary groundwater flow field, such that the resultant capture zone limits migration from known or suspected source areas and depths and removes chemical mass. Source areas and depths include locations believed to contain a significant mass of soil contamination (i.e., vadose zone) or a subsurface source of dissolved-phase groundwater contamination. The capture zone is to include all significant depth intervals where COC concentrations exceed MCLs. As part of the groundwater extraction process, chemical mass will be removed from Subarea 1 groundwater.

### 1.3.2 Subarea 3 Remedial Objectives

In Subarea 3, the movement of COCs in groundwater will be limited by groundwater extraction at rates and locations that will establish the necessary groundwater flow field to reduce the potential for groundwater containing unacceptable concentrations of tetrachloroethene (PCE), trichloroethene (TCE), carbon tetrachloride, perchlorate, NDMA, 1,4-dioxane or other COCs from moving into areas where these chemicals are not present in unacceptable concentrations. Subarea 3 groundwater extraction is to result in a hydraulic capture zone that includes all significant depth intervals where COC concentrations exceed MCLs. As part of the groundwater extraction process, chemical mass will be removed from Subarea 3 groundwater.

### 1.3.3 Performance Standards

Two distinct performance standards have been derived from the Remedial Objectives cited above: 1) limit further migration of COCs in groundwater, and 2) remove COCs from groundwater. Achievement of these performance standards will prevent future increases in concentrations, begin to reduce concentrations, and prevent the spread of COCs from more contaminated areas to less contaminated areas. These two performance standards are described in more detail below.

#### *1.3.3.1 Performance Standard 1 - Limit Migration of Chemicals of Concern*

The BPOU extraction plan was developed using an EPA-approved three-dimensional finite-element groundwater flow model, DYNFLOW. In 2002, the model was updated using a similar code, FEFLOW. The construction and calibration of this model rely on many years of data collection activities in the BPOU, including water level measurements and water quality sampling. The model was initially calibrated using water level data from a 20-year period (1982 to 2002). Following calibration, the model was run in a forward/predictive manner to select locations and depths of groundwater extraction wells that would allow the remedy to achieve the objectives described above. Review of geophysical logs from exploratory borings at the extraction well locations as well as logs from other wells in the BPOU suggested the presence of relatively thick, fine-grained layers that can be correlated across Subarea 3 but do not extend north to Subarea 1. These layers are present at approximately -200 and -500 feet mean sea level (msl). As a result, the well-screened intervals for new extraction wells in Subarea 3 were designed so that they could capture the entire vertical extent of contaminated groundwater without creating hydraulic connections across these layers. Therefore, shallow extraction wells were screened above the layer at -500 feet msl and deep extraction wells were screened below the layer at -500 feet msl. Aquifer testing in the extraction wells confirmed that the layer at -500 feet msl acts as a confining unit that provides hydraulic separation between the shallow and deep elevation intervals. In 2005, the groundwater flow model was modified to incorporate the confining units in Subarea 3. The groundwater flow model is updated annually with quarterly pumping and recharge data that are compiled from various sources. The CR group will continue to make refinements to the groundwater model to incorporate the results of water-level monitoring and other information to ensure the model adequately simulates observed groundwater conditions in the BPOU. Updates and refinements to the groundwater model are reported in Annual PE Reports as necessary. The calibrated model is the primary tool that is utilized to assess system performance in terms of limiting the migration of COCs.

#### *1.3.3.2 Performance Standard 2 - Removal of Chemical Mass*

This performance standard will be met through extraction and treatment of groundwater from the BPOU plumes. Documentation of the removal of chemical mass will use measured flow rates from groundwater extraction wells and results of water quality sampling and analysis for these same extraction wells. Using these data, the mass removal for selected COCs will be estimated on an annual basis. Cumulative chemical mass removed from the aquifer will also be reported.

## 1.4 Approach to Performance Monitoring and Evaluation

Performance monitoring and evaluation focuses on the operation of the groundwater extraction system to meet and satisfy the perfomance standards of 1) limiting further migration of groundwater contamination into less contaminated areas, and 2) removing chemical mass from groundwater. As described in the PSEP (AMEC, 2012b), the CRs' approach to performance monitoring relies upon: 1) past and future basin-wide groundwater monitoring activities performed by the Watermaster, 2) performance monitoring data collected by the Water Entities, the CRs, or other agents acting on behalf of the CRs, and 3) the use of an EPA-approved groundwater flow model to predict the effectiveness of the groundwater extraction system. At any time, should EPA determine that Performance Standards related to migration control and mass removal are not being met, the CRs will use these same methods of data collection and modeling to modify operation of the groundwater extraction system such that Performance Standards are achieved.

Watermaster basin-wide monitoring activities have served as the baseline monitoring program from which additional monitoring needs have been defined. The Watermaster has the responsibility to ensure that comprehensive water quality monitoring meets their court-decreed mission of managing Basin water production and quality, provides for predictive vulnerability assessments, and provides for monitoring so that California State Water Resources Control Board, Division of Drinking Water [DDW; formerly the Department of Health Services (DHS)] requirements for public water supplies are met. The Watermaster performs routine basin-wide water level monitoring on a semi-annual basis.

In summary, the approach to performance monitoring and evaluation consists of the following, components:

- Potentiometric head measurements in BPOU piezometers and multiport monitoring wells. These data are used to generate potentiometric surface maps for comparison to model simulation results;

- Groundwater flow modeling and particle tracking to evaluate hydraulic performance of the extraction system as it relates to limiting further migration of groundwater contamination;
- Water quality sampling of production and multiport monitoring wells to provide information on the distribution of COCs in BPOU groundwater, specifically to produce plume maps and chemical cross sections;
- Integration of the results of groundwater modeling with current plume maps and known source locations to determine whether the groundwater extraction systems are appropriately limiting the migration of COCs;
- Water quality sampling and measurement of extraction well pumping rates and production volumes; and
- Use of flow rate and water quality data from extraction wells to calculate the mass of COCs removed from the aquifer by the extraction and treatment system.

### 1.5 Content of Performance Evaluation Reports

As outlined in the PSEP, the Annual PE Reports should generally contain the following:

- Potentiometric maps to assist in evaluating changes in groundwater flow patterns in the BPOU;
- Groundwater plume maps and chemical cross sections and an evaluation of any changes in the extent of groundwater contamination within the BPOU;
- Statistical analysis of concentration trends and time-concentration plots for selected COCs for selected monitoring wells;
- Contaminant mass removal estimates for each extraction well using average flow rates and water quality sampling results from the extraction wells;
- Results of computer model simulations of extraction system performance and a description of any refinements to groundwater flow models used to evaluate system performance;
- An overall assessment of remedial system performance compared to the Performance Standards related to the remediation of groundwater; and
- Recommendations for changes to the monitoring program described in the PSEP including changes to the monitoring frequency and monitoring locations.

As outlined in the most recent version of the PSEP (Revision 4), EPA has requested that Annual PE Reports also address the performance of the BPOU Project in relation to “Other

Performance Standards" that are not directly related to the remediation of groundwater, but rather relate to the operational performance of, or discharge requirements for, the various Subprojects following construction. These "Other Performance Standards" include the following:

- Achievement of treated-water effluent requirements in accordance with DDW domestic water supply permits, EPA Applicable or Relevant and Appropriate Requirements (ARARs), and other DDW requirements;
- Air-emission monitoring requirements in accordance with EPA ARARs and the risk limits identified in the June 15, 2009 letter from Wayne Praskins, EPA to Scott Goulart, Aerojet as further explicated in EPA's February 3, 2011 letter;
- Monitoring and reporting of brine discharges to the Los Angeles County Sanitation Districts (LACSD) system in accordance with industrial waste discharge permits;
- Demonstration of proper disposal of waste associated with treatment operations. Applicable waste streams include, but are not limited to, spent granular activated carbon (GAC) and spent IX resins. Wastes treated or disposed of offsite must comply with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) offsite rule;
- Compliance with substantive portions of the National Pollutant Discharge Elimination System (NPDES) discharge requirements for any treated water discharged to surface water;
- Compliance with the Los Angeles Regional Water Quality Control Board's Water Quality Control Plan for the Los Angeles River Basin (the "Basin Plan"), which incorporates State Water Resources Control Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California," for any discharge to land, including groundwater recharge over a spreading basin or discharge to surface water;
- The installation and operation of treatment systems necessary to ensure that the nitrate concentration in any discharge to land, to a spreading basin, or to a surface water is similar to or lower than the concentration in the receiving water, except for EPA-approved CERCLA Section 104(b) activities that will result in temporary high flow, high volume discharges;
- Compliance with substantive requirements in 22 CCR Sections 66264.601-66264.603 for miscellaneous units and related substantive closure requirements in 22 CCR Sections 66264.111-66264.115 for air strippers or GAC contactors; and

- Compliance with DDW requirements for Emergency Preparedness Plans including Spill/Release Response Plans for the various subprojects.

## 2. STATUS OF REMEDIAL ACTIONS

This section presents the status of remedial actions undertaken through 2019 to implement the BPOU interim remedy. These actions include operation of the Valley County Water District (VCWD) Lante Subproject in Subarea 1, and operation of the La Puente Valley County Water District (LPVCWD) Subproject, the San Gabriel Valley Water Company (SGVWC) B6 Subproject, the SGVWC B5 Subproject, and the CDWC Treatment Plant in Subarea 3. The status of the BPOU Subprojects is also described in the monthly progress reports submitted to EPA pursuant to Paragraph 85, Section XV of the UAO.

### 2.1 Subarea 1 Remedial Action Status

Subarea 1 remedial actions currently consist of groundwater extraction from the VCWD SA1-1, SA1-3 (Lante) and Arrow wells and treatment at the VCWD Lante Treatment Plant, which is owned and operated by VCWD. The report, "Revised Draft Interim Remedial Action Report" (Stetson, 2005), prepared and submitted to EPA in March 2005, provides a summary of the VCWD Lante Subproject background, construction, and completion activities. Construction of the VCWD Lante Treatment Plant began in 2002 and was completed in 2005. The original construction activities included drilling and equipping two new extraction wells (SA1-1 and SA1-2), re-equipping the SA1-3 (Lante) well, installing associated piezometers, constructing raw and treated water pipelines, and constructing the treatment plant. Additional construction work in 2006 and 2007 included adding LPGAC treatment and replacing the resin-based vapor control system with vapor-phase granular activated carbon (VPGAC). The treatment plant currently consists of four air-stripping towers and associated VPGAC off-gas treatment units for VOC removal, LPGAC for 1,2,3-TCP removal, single pass IX for perchlorate removal, one regenerable IX carousel (Calgon Ionic Separation Process [ISEP]) for nitrate removal, and four UV/oxidation units (UVTerra) for 1,4-dioxane and NDMA removal. Treated water is conveyed via a treated water pipeline to the Suburban Water Systems (SWS) Plant 121; however, a portion of the treated water can be directed to the VCWD distribution system if desired.

On November 11, 2005, DDW issued domestic water supply Permit Amendment 1910009PA 003, authorizing VCWD to operate the VCWD Lante Treatment Plant. In January 2006, 1,2,3-TCP was detected in the VCWD extraction wells and subsequent testing confirmed the presence of 1,2,3-TCP. Beginning on February 21, 2006, VCWD began discharging treated water to Big Dalton Wash while a 1,2,3-TCP treatment technology was selected and constructed. LPGAC was selected as the treatment technology and the design and construction of a LPGAC system was completed in Spring 2007. LPGAC startup testing was completed in May 2007 and on July 18, 2007, DDW issued an amended permit to VCWD to resume delivering potable water.

As a result of operational problems, the resin-based off-gas control system was removed and replaced with VPGAC. A temporary VPGAC system was installed while a permanent system was designed and constructed. The temporary system began operation in June 2007 and the permanent system became fully operational in April 2008. The permanent VPGAC system consists of four 20,000-pound adsorbers with associated heaters operated in parallel.

The air strippers also experienced operational problems with calcium carbonate precipitation in the towers and packing. Tower cleaning was initiated in October 2007 and was completed in February 2008. A study was conducted to evaluate precipitation mitigation alternatives that included anti-scalant dosing, acid cleaning, and packing replacement. One air stripper was acid washed in December 2008 to test the efficacy and cost of this alternative. The results of the acid wash testing were summarized in a February 18, 2009 memorandum "Summary and Evaluation Air Stripper No. 4 Acid Cleaning" (Stetson 2009). Based on the pilot testing, the acid washing was not a cost-effective method to mitigate calcium carbonate precipitation problems. Air strippers are now routinely inspected, and the towers and packing cleaned and replaced as necessary.

The process to replace the ISEP with single pass IX was initiated in 2008. A request for proposal was released in January 2008 and bids were received and evaluated in April and May of 2008. The work was awarded to RC Foster and a notice to proceed was issued in August 2008. California Environmental Quality Act (CEQA) work associated with the single pass IX was completed in September 2008 and design work was completed in early 2009. As part of the ISEP replacement work, nitrate treatment alternatives were also evaluated (Malcolm Pirnie, 2008).

Design and construction of the single pass IX system was completed in 2009. The associated booster pump upgrade was completed in November 2009. In October 2010, VCWD and the CRs released a Request for Qualifications (RFQ) requesting process engineering and nitrate management qualifications to selected engineering firms. Qualifications were received, reviewed, and CDM Smith was selected to provide process treatment and nitrate management engineering expertise. CDM Smith began reviewing nitrate management alternatives in 2011 and a report with recommendations was submitted in March of 2012. Per the CRs request, CDM submitted an addendum to its report on nitrate management in November of 2012, summarizing alternatives, which include blending using the Lante two-million-gallon reservoir.

The CRs also submitted an evaluation of extraction system performance for Subarea 1 in August 2012 (CDM Smith, 2012). In a letter dated December 12, 2012, EPA approved the proposed groundwater extraction plan of 5,000 gpm extraction at the SA1-3 location (from the SA1-3 well and reactivated Arrow Well) and 1,000 gpm extraction at the SA1-1 well and concluded that this provides adequate hydraulic containment while optimizing mass removal in Subarea 1. VCWD evaluated various options to increase production at the Lante Treatment

Plant including a potential new well, reactivating the Arrow Well, and upgrading the Lante well (Civiltec Engineering Inc. [Civiltec] 2013).

On February 13, 2014, the BPOU Project Committee approved the development and construction of a monitoring well to evaluate the need for a potential new extraction well at the treatment plant site, as part of an effort to assess the best way to achieve a pumping capacity of 5,000 gpm at the Lante Treatment Plant site. Construction of the monitoring well was completed and sampled in March 2016. The new monitoring well was retested in June 2016. After evaluating the water quality results, VCWD and the CRs elected to move forward with plans to reactivate the Arrow Well instead of constructing a new extraction well. In August - October 2017, the casing in the Arrow Well was rehabilitated and redeveloped using mechanical and chemical treatment methods followed by pumping development at flow rates as high as 4,500 gpm. The final Arrow Well Startup Testing Plan was prepared in February 2018 and VCWD submitted the permit application documentation to DDW for review on March 20, 2018. The Arrow Well building was demolished in September of 2018 and rebuilt in December 2018. The SA1-1 Well and Arrow Well pump and motor equipment installation was completed in March 2019, with the exception of some valving associated with the above ground discharge piping. VCWD completed the Arrow Well start up testing in December 2019 at a flow rate of approximately 6,200 gpm. DDW inspected the Arrow Well on March 8, 2019. The permit amendment for operation of the Arrow well is currently under review by DDW and approval is expected in mid-2020.

On March 13, 2014, the BPOU Project Committee approved the Joint Proposed Conceptual Plan Relative to Nitrate Management and a Notice to Proceed was issued to the engineering contractor to proceed with the modifications at the end of March 2014. VCWD submitted all design documents to DDW for review and compliance with the Prop 84 grant funding agreement. DDW approved the submittals in the fall of 2014. Proposition 84 funding for the nitrate management work was approved in late 2014 and work began in 2015. In April 2016, the DDW approved an amended drinking water permit allowing the use of the fixed bed IX system for the treatment of perchlorate and allowing modifications to be made to the ISEP system to treat and blend nitrates. Nitrate specific resin was loaded into ISEP B in June 2016. The ISEP B modifications were completed in July 2016 and ISEP A has been taken out of service permanently. Programming and startup testing was conducted throughout 2017 and into 2018 at various flowrates as required by the startup test plan to support DDW permitting. The DDW-required startup testing of the nitrate treatment and bypass system was completed in May 2018, at flow rates as high as 6,600 gpm.

Other VCWD Lante Treatment Plant improvements or evaluations completed in 2019 included:

- Upgrades to the treatment facility controls, including PLC upgrade work at PLC-2 and Trojan system, were conducted throughout the year; and
- In July, VCWD installed the Operator Interface Terminals (OITs) at the main AUX panel.

Technical performance reports are prepared under Provision 42 of the DDW operating permit and are required to be submitted annually to DDW. The most recent of these reports, "2018 Annual Technical Performance Report for the Lante Plant" (Stetson, 2019a), was submitted in March 2019 and describes the status and performance of the VCWD Lante Treatment Plant for the period January 1 to December 31, 2018. In addition, VCWD submits monthly compliance reports to DDW; these compliance reports are included in the monthly progress reports provided to EPA. VCWD also holds regular meetings related to progress on the controls upgrades and Arrow Well re-activation.

In 2019, VCWD treated 810 acre-feet of water due to the plant being offline most of the year during the PLC upgrade and other work. Testing of the Arrow Well was completed in December and the plant was returned to normal operations using the SA1-1 and SA1-3 wells while awaiting DDW approval for operation of the Arrow Well. In December 2019, the plant achieved an average flow rate of 3,980 gpm (Table 2-1). Operation of SA1-3 accounted for approximately 68.1% of the water extracted during 2019, while SA1-1 was responsible for 22.2% and the Arrow Well accounted for 7.5%. SA1-2 was responsible for the remaining 2.3% of production. Rehabilitation of Well SA1-2 was completed in January of 2012 and redevelopment performed in March 2012; however, there are no current plans to put this well back into service due to low COC concentrations. Although the 2019 average annual production of 459 gpm was well below the 2018 average flow rate of 2,395 gpm, the average flow rate for the month of December, after completion of the PLC upgrade testing, was 3,980 gpm, which is 64.2% of the EPA-approved extraction rate of 6,200 gpm. It is anticipated that beginning in 2020, the VCWD treatment plant will be able to meet the target extraction rate, once the Arrow Well is permitted and online, and the controls upgrade and other improvements are completed.

## 2.2 Subarea 3 Remedial Action Status

Subarea 3 remedial actions consist of the operation of the LPVCWD, SGVWC B6, SGVWC B5, and CDWC Subprojects. On January 15, 2015, EPA modified the Subarea 3 extraction plan to include the requirement that a minimum of 8,000 gpm be produced from the CDWC Bassett Wellfield. The target extraction rate for these Subprojects, including CDWC, is 29,750 gpm.

### 2.2.1 La Puente Valley County Water District Subproject Status

The LPVCWD Subproject extracts, treats, and delivers water to the public under a DDW permit that was issued on February 15, 2001, and amended as Permit No. 1910060PA-000 issued on May 8, 2002 with subsequent amendments. The LPVCWD Subproject consists of extraction wells LPVCWD 2, LPVCWD 3, LPVCWD 5, two air strippers and associated off-gas treatment for VOC removal, single pass IX (replacing ISEP in July 2010) for perchlorate removal, and UV/oxidation (UVTerra) for 1,4-dioxane and NDMA removal operating at a capacity of up to 2,500 gpm (EPA approved target extraction rate is 2,250 gpm). Treated water is conveyed to LPVCWD's distribution system and, when available, a portion of the treated water is also provided to SWS.

To address sanding problems in LPVCWD 2 and 3, a new well, LPVCWD 5, was drilled and installed in 2007. The LPVCWD 5 well was equipped, developed, and tested in 2008. On December 19, 2008, DDW issued an amended permit to allow LPVCWD 5 to be used as a drinking water source. The LPVCWD 5 well installation activities are summarized in "Well No. 5 Well Completion Report" prepared by Stetson and submitted in final on July 2, 2008 (Stetson, 2008). DDW issued a permit amendment for the operation of the LPVCWD 5 well on December 19, 2008. The well became operational in January 2009 and currently serves as LPVCWD's primary water supply well, with LPVCWD 2 and 3 used as backup water supply wells when Well 5 is offline. COC concentrations in LPVCWD 2 have consistently been greater than those observed in LPVCWD 3 and LPVCWD 5. In 2015, the EPA requested the LPVCWD identify actions to increase pumping at LPVCWD 2 to capture the higher concentrations of COCs in LPVCWD 2. As of December 2019, LPVCWD has been evaluating treatment plant modifications to improve mass removal rates at LPVCWD 2 and will finalize a technical memo that documents existing conditions, desired changes to the operation scheme, and recommendations on how to effectively achieve the changes to increase pumping from Well 2.

To mitigate perchlorate-bearing brine discharges to the LACSD brine line, the LPVCWD Subproject Committee approved replacing the ISEP with single pass IX equipment. The single pass IX system was designed, and construction was completed in 2009. A draft Compliance Test Plan and Operation, Maintenance, and Monitoring Plan for the single pass IX were prepared and submitted to DDW for review. In June 2009, the EPA issued a letter supporting temporary discharges of water during startup testing of the new single-pass IX system to the Walnut Wash. The Los Angeles County Department of Public Works (LACDPW) issued a discharge permit for LPVCWD on November 17, 2009. The IX system was tested during startup activities in December 2009. The DDW issued an amended permit for the single pass IX system on June 15, 2010 and the system became operational on July 30, 2010. In February 2018, LPVCWD received a temporary approval letter from the DDW to operate Air Stripper #2 at a minimum air to water ratio of 45 to 1. The lower air to water ratio in Air Stripper 2 will

decrease backpressure in the VPGAC system and will allow the plant to operate at higher flows to achieve target extraction rates. LPVCWD submitted the final technical memorandum on Air Stripper No. 2 in March 2018. LPVCWD plans to submit a permit amendment request in June 2020 to modify the air to water ratio requirement for Air Stripper No. 2, add a nitrate treatment system, approve PSR II Plus resin for treatment of perchlorate, and provide additional updates to the OM&M plan.

Technical performance reports are prepared under Provision 33 of the DDW operating permit and are required to be submitted annually to DDW. The most recent of these reports, "Technical Performance Report for the La Puente Valley County Water District Treatment Facility, Annual Report 2018-2019" (LPVCWD, 2019), was submitted in November 2019 and describes the status and performance of the LPVCWD facility for the period August 1, 2018 to July 31, 2019. In addition, LPVCWD submits monthly compliance reports to DDW; these compliance reports are included in the monthly progress reports provided to EPA.

Treatment system improvements or evaluations initiated in 2019 included:

- LPVCWD replaced the effluent level pressure transducer in April;
- A VFD was installed on Well No. 5 in August;
- In September, repairs to the Air Stripper No. 1 water meter and hydrogen peroxide chemical feed line were performed;
- Also in September, LPVCWD distributed an air stripper inspections report. The air strippers appeared clean of calcification, however, the bottom sump for both air strippers appeared to have iron and manganese oxidation and it was recommended that the sump areas be cleaned to remove the oxidation, sand, and bacteriological growth; and
- Evaluated nitrate management options.

In 2019, the LVPCWD subproject extracted and treated approximately 3,793 acre-feet of groundwater, equating to an average annual flow rate of 2,355 gpm (Table 2-1). Groundwater extraction was primarily from Wells 2 and 3, accounting for approximately 88% of the water produced by LPVCWD during 2019 (52% from Well 2 and 36% from Well 3). LPVCWD Well 5 was down for much of 2019 due to VFD failure, producing only 425 acre-feet in 2019. The average annual extraction rate was above the EPA-approved extraction rate of 2,250 gpm and was greater than last year's average extraction rate of 2,266 gpm. As a result, the total production increased from 3,672 acre-feet in 2018 to 3,793 acre-feet in 2019. The production rate of LPVCWD has displayed an increasing trend since 2016, when the average extraction rate was 2,147 gpm. In February 2018, LPVCWD received temporary approval from the DDW to operate Air Stripper No. 2 at a minimum air to water ratio of 45 to 1, which allowed the

plant to overcome air flow issues experienced in past years and achieve the EPA annual target flow rate during 2018 and 2019. LPVCWD is currently working with DDW to permanently approve the air-to-water ratio on Air Stripper No. 2 and anticipates being able to operate at about 2,500 gpm to continue to meet the EPA annual target flow rate of 2,250 gpm.

### 2.2.2 San Gabriel Valley Water Company B6 Subproject Status

The SGVWC B6 Subproject remedial action consists of groundwater extraction from the SGVWC B25A, B25B, B26A, and B26B wells (with B6C and B6D included as backup wells) and treatment at the SGVWC B6 Treatment Plant, which is owned and operated by SGVWC. Construction of the SGVWC B6 Subproject began in 2002 and the SGVWC B6 Treatment Plant was completed in 2005. Construction activities included drilling, installing, and equipping the new extraction wells, installing associated piezometers, constructing raw and treated water pipelines, and constructing the treatment plant. The treatment plant originally consisted of four air-stripping towers and associated carbon off-gas treatment units for VOC removal, two ISEP carousels for perchlorate removal, and four UV/oxidation units (UVTerra) for 1,4-dioxane and NDMA removal. Treated water is conveyed to the SGVWC distribution system. The "Interim Remedial Action Report" (Stetson, 2004) prepared and submitted to EPA in September 2004 provides a summary of SGVWC B6 Subproject background, construction, and completion activities.

On June 8, 2005, DDW issued domestic water supply Permit Amendment No. 1910039PA-002, authorizing SGVWC to operate the SGVWC B6 Treatment Plant using the existing onsite B6C and B6D wells. SGVWC began delivering potable water from the SGVWC B6 Treatment Plant to customers on July 12, 2005. The permit was further amended by DDW with Permit Amendment No. 1910039-004 on February 17, 2006, to incorporate the operation of offsite wells B25A, B25B, B26A, and B26B.

To mitigate perchlorate-bearing brine discharges to the LACSD brine line, the SGVWC B6 Subproject Committee approved replacing the ISEP with single pass IX equipment. The single pass IX design was initiated in June 2008. Since there is limited space at the SGVWC B6 Treatment Plant, the IX equipment was constructed on three properties that were purchased on the north side of Corak Street. Geotechnical work was completed on the properties in July 2008 and existing structures were demolished in the fall of 2008. CEQA work related to the IX project was filed and the public review process closed on October 6, 2008, without any comments received. Construction of the single pass IX system was completed in November 2009. The new IX system was integrated into the treatment system in March and April of 2013 and startup testing was initiated in May 2013. SGVWC received the DDW permit for the single pass IX system on August 25, 2014 and began serving water into its distribution system on September 5, 2014.

On November 1, 2010, SGVWC issued an RFP to provide design services for an IX system to treat nitrate. SGVWC awarded the contract to Worley Parsons for the design of additional treatment for nitrates at the B6 treatment plant. The nitrate treatment system design for the B6 treatment plant was submitted to City of Baldwin Park for review in September 2011. WQA received approval for project funding under Proposition 84 in June of 2012 and coordinated with DDW to receive the contracts and finalize the funding amounts. In early 2013, SGVWC purchased the remaining parcels on Corak Street to house the nitrate IX equipment. The CEQA requirements were completed in 2013. SGVWC completed the design of the additional IX treatment system for nitrates at the B6 treatment plant and construction began in October 2014. In August 2015, construction of the additional IX treatment system for nitrates was complete, and the Southern California Edison (SCE) power supply was complete in June 2017. Testing of the new IX treatment system was performed from July to October 2017. In May 2018, the DDW issued a water supply permit amendment to operate the IX treatment system and the nitrate treatment system was put into operation, replacing the interim nitrate blending operation.

In January 2018, SGVWC received conditional funding approval from the State Water Resources Control Board (SWRCB) for a grant of up to $1.1 million to test new UV technologies at Plant B6. The 100% design plans for the B6 UV Demonstration Project was submitted for review in June of 2019 and in July of 2019 a public information workshop for the B6 UV Demonstration Project was held. The Request for Proposals for the B6 UV Demonstration Project was sent out for bidding in November 2019. SGVWC will continue to coordinate with SWRCB to satisfy the grant funding requirements.

Technical performance reports are prepared under Provision 15 of the DDW operating permit and are required to be submitted annually to DDW. The most recent report, “Technical Performance Report (2014-2015) for Plant B6 Water Treatment Facility” (Stetson, 2018), was submitted in March 2018 and describes the status and performance of the SGVWC B6 Treatment Plant for the period April 1, 2014 to March 31, 2015. Subsequent technical performance reports for the period are currently in draft and have not yet been submitted to DDW. SGVWC also submits monthly compliance reports to DDW; these compliance reports are included in the monthly progress reports provided to EPA.

No significant improvements to the Treatment system were implemented in 2019. In addition to the 100% design plans for the B6 UV Demonstration Project, discussed above, the following evaluations were completed in 2019:

- The Final Monitoring and Reporting Plan for the B6 UV Demonstration Project was submitted in July 2019; and

- The Quality Assurance Project Plan for the B6 UV Demonstration Project was submitted in July 2019.

In 2019, the SGVWC B6 Subproject extracted and treated approximately 10,554 acre-feet of water, equating to an average annual flow rate of 6,543 gpm (Table 2-1), which was similar to the production rate in 2018. The SGVWC B6 Subproject achieved the EPA-approved extraction rate of 6,500 gpm during 2019.

### 2.2.3 San Gabriel Valley Water Company B5 Subproject Status

The SGVWC B5 Subproject remedial actions consist of groundwater extraction from the SGVWC B5B, B5E, and City of Industry (COI) 5 wells and treatment at the SGVWC B5 Treatment Plant, which is owned and operated by SGVWC. In addition, the SGVWC B5D well is used as a standby water source. The treatment plant consists of LPGAC for VOC removal, single-pass IX for perchlorate removal, and UV/oxidation units (UVPhox) for 1,4-dioxane and NDMA removal. The "Interim Remedial Action Report" (Stetson, 2006c) prepared and submitted to EPA in September 2006 provides a summary of SGVWC B5 Subproject background, construction, and completion activities. Construction was largely completed in early 2007.

Startup testing conducted to support permitting was completed in March 2007 and DDW issued amended drinking water permit 1910039PA-008 for the B5 Treatment Plant on April 21, 2008. SGVWC began delivering potable water to its system on July 8, 2008. Prior to delivering potable water, extracted water was treated and discharged to the San Gabriel River. The DDW issued a permit amendment to allow for the addition of the COI 5 well in July 2009. The COI 5 well went online in July 2009.

In June 2017, SGVWC began a pilot study to evaluate the use of reactivated liquid phase granular activated carbon at Plant B5. SGVWC submitted the Final Technical Memorandum No. 2 on the reactivated/reused liquid phase granular activated carbon pilot study at Plant B5 in June 2018.

Technical performance reports are prepared under Provision 53 of the DDW operating permit and are required to be submitted annually to DDW. The annual report, "Technical Performance Report for the San Gabriel Valley Water Company Plant B5 Water Treatment Facility" (Stetson, 2019b), was submitted in May 2019 and describes the status and performance of the SGVWC B5 Treatment Plant for the period July 1, 2014 to June 30, 2015. Subsequent technical performance reports are currently in draft and have not yet been submitted to DDW. In addition, SGVWC submits monthly compliance reports to DDW; these compliance reports are included in the monthly progress reports provided to EPA.

The B5 Treatment Plant operated nearly uninterrupted in 2019. SGVWC continues to evaluate the impact on extraction rates caused by the decreasing water levels and the reason for

reduced extraction rates from Well B5E. SGVWC began rehabilitating Well B5E in April 2018 and Well B5E was placed back online on February 8, 2019. Since that time, production capacity has increased significantly (approximately 3,800 gpm when operating as a standalone well, or 2,900 gpm when operating with other wells; pre-rehab capacity was approximately 2,000 gpm when operating with other wells).

Treatment system improvements or evaluations initiated in 2019 included:

- The pump from Well B5B was pulled and repaired on November 20 due to excessive noise in the bearing.

In 2019, the SGVWC B5 Subproject extracted and treated approximately 10,418 acre-feet of water, equating to an average flow rate of 6,457 gpm (Table 2-1). This represented an increase from the 2018 production rate of 5,451 gpm and was the highest production rate since 2014. However, the extraction rate remained below the EPA-approved extraction rate of 7,000 gpm. The increase in production rate was due to the increase in groundwater extraction from Well B5E after rehabilitation of the well was completed. In addition to reduced production associated with repairs on the pump in Well B5B described above, groundwater production was affected by maintenance activities on the COI Well No. 5 which resulted in the shutdown of the well from April 5 through June 17, 2019. The overall inability to meet the EPA approved extraction rate is due to reduced pumping capacity from the B5B and B5E wells for part of the year, caused by lower water levels and/or a reduction of the specific capacity of the wells, and a decision by SGVWC to reduce pumping during winter months due to low water demand.

### 2.2.4 California Domestic Water Company Status

The CDWC Bassett Wellfield consists of groundwater extraction from six extraction wells (Wells 2, 3, 5A, 6, 8, 14). A seventh well (Well 10) has been installed and began extracting water in June 2016. Construction of an interconnection pipeline between SGVWC and CDWC was completed in November 2017 and installation of the controls was completed in April 2018. SGVWC began delivering water to CDWC on May 14, 2018. CDWC supplies water to about 400 domestic connections, a plant nursery, two schools, and three water wholesalers, which include the City of La Habra (La Habra), the City of Brea (Brea), and SWS. The CDWC provides a prescribed entitlement of water from the Main San Gabriel Basin to each of its member agencies who own or lease stock in the company.

Groundwater produced by wells within CDWC Bassett Wellfield requires treatment for VOCs, NDMA and perchlorate. On December 31, 1999, DDW issued Permit No. 04-15-99P-032 to CDWC to operate two air stripping towers to remove VOCs from wells at the Bassett Wellfield. On September 12, 2001, DDW issued Permit Amendment No. 04-15-01-PA-000 to CDWC to operate a UV/oxidation treatment facility to remove NDMA from CDWC Well No. 14. On July

17, 2002, DDW issued Permit Amendment No. 1910199PA-001 to CDWC for an IX treatment facility to remove perchlorate from wells at the Bassett Wellfield. On May 30, 2003, DDW issued Permit Amendment No. 1910199-PA-002 to CDWC to expand the VOC treatment facility at the Bassett Wellfield. On April 15, 2005, DDW issued Permit Amendment No. 1910199PA-003 to CDWC to replace the UV/oxidation treatment facility with a more efficient UV light treatment facility and install an additional 5,000 gpm UV /oxidation (UVPhox) treatment unit for Well No. 3 for the removal of NDMA.

Wells 3 and 14 receive treatment from the IX system, which removes perchlorate, and the UVPhox system, which removes NDMA. That treated water is then blended in a wet well with water from Wells 5A and 6 and VOCs are removed using air stripping towers. The treated water is then blended with water from Wells 2 and 8, which do not receive treatment, and is chlorinated and delivered to a 5 million-gallon (MG) reservoir. The wells are operated such that a lead well is operated full-time and the other wells are added in the following order to provide additional water – Well 3, 5A, 6, 14, 2, and 8. The lead well is currently Well 3. Well 14 was formerly the lead well and was capable of producing up to 4,500 gpm. Well 14 performance was hindered by sanding and it was shutdown in February 2008. It was rehabilitated and resumed operation at the end of 2010. After rehabilitation, Well 14 is only capable of producing up to 3,400 gpm. Between October 30, 2012 and November 3, 2012, Well No. 14 was operated when Well No. 3 was temporarily out of service. However, Well 14 has not been operated since that time. In 2016, CDWC constructed a pipeline from Well 10 to the IX system influent.

The IX system for perchlorate treatment consists of five sets of IX vessels, each with two vessels operating in series in a lead-lag configuration, for a total of 10 vessels. The total treatment capacity is 5,000 gpm and each set of IX vessels treats up to 1,000 gpm of flow.

The UVPhox System treats NDMA and 1,4-dioxane and consists of two independent trains. Each train consists of two reactor chambers and each chamber contains two UV reactors (UVRs). Each UVR contains 72 UV lamps and sleeves. The treatment capacity of each train is 5,000 gpm. The UVPhox is designed to treat NDMA at concentrations as high as 200 ng/L to below the detection level of 2 ng/L. Hydrogen peroxide may be injected into the water from Well No. 3 before entering the UVPhox system in the event 1, 4-dioxane is detected and requires treatment. There are three air strippers used for the removal of VOCs that are capable of treating a total of up to 15,000 gpm.

CDWC received a permit amendment from DDW to operate Well 10 in May 2016. Operation of Well 10 began in June due to motor failure on Well 6. In October 2016, CDWC completed construction of the influent pipeline connecting Well 10 to the ion exchange system.

Technical performance reports for the IX and UVPhox systems are prepared under Provision 36 of Permit Amendment No. 1910199PA-001 and Provisions 59 of the Permit Amendment 191 0199PA-003, respectively, and are required to be submitted annually to DDW. The annual report, "N-Nitrosodimethylamine (NDMA) UVPHOX Treatment Facility Technical Performance Report" (Stetson, 2020), was submitted in March 2020 and describes the status and performance of the UVPhox treatment system for the calendar year of 2019. The annual report, "Technical Performance Report California Domestic Water Company Perchlorate Treatment Facility (Stetson, 2019c) was submitted in August 2019 and describes the status and performance of the IX treatment system for the period July 1, 2018 to June 30, 2019. In addition, CDWC submits monthly compliance reports to DDW.

Treatment system improvements or evaluations initiated in 2019 included:

- Several drawdown tests were performed on Well 3 throughout the year;
- In February, the blower belts were change and SCE pump tests on pumps and motors were performed;
- Trojan Unit 2 was rebuilt in March;
- The blower motor were replaced on Air Stripper No. 2 in April;
- In September, the screen in the carbon adsorber was replaced, the Cla-Val and low pressure alarm on adsorber were serviced, and the reservoir pump was serviced; and
- The effluent valve was replaced in October.

In 2019, the CDWC Subproject extracted and treated approximately 16,827 acre-feet of water, equating to an average flow rate of 10,426 gpm (Table 2-1). Although the production rate has decreased over the last three years (13,145 gpm during 2017 and 11,709 gpm in 2019), it remains above the minimum extraction rate of 8,000 gpm for the Bassett Wellfield as requested by EPA.

## 3. PERFORMANCE MONITORING ACTIVITIES

As described in the PSEP, monitoring activities for the assessment of the interim remedy performance consist of two phases. The first phase consisted of baseline potentiometric and water quality monitoring prior to extraction well startup and was completed in April 2005. The second phase involves more frequent potentiometric and water quality monitoring during startup and initial operation of the extraction wells, followed by reduced monitoring frequencies after several years of continuous operation. The second phase of monitoring began in April 2005, although not all the extraction wells were fully operational at that time. Potentiometric monitoring was performed on an increased frequency, as required, from April 2005 through November 2006.

The FSP and QAPP describe monitoring methods and laboratory analyses of groundwater samples collected in the BPOU and were initially approved by EPA with the modifications to the PSEP in a letter dated February 12, 2007. The FSP and QAPP have been periodically updated to address modifications to the performance monitoring components of the PSEP. The most recent updates to the QAPP (Rev. 5) and the FSP (Rev. 7) were submitted to EPA in April 2013 (AMEC, 2013a and AMEC, 2013b) and approved by EPA in a letter dated May 21, 2013.

As described in Section 1.1, a revised version of the PSEP (Rev. 4) was prepared to address EPA comments received in late 2012 and early 2013. Revisions to the PSEP included the addition of 1,2,3-TCP as a COC, clarification of monitoring and reporting requirements for non-COCs such as EDB, and the modification of remedial action objectives outlined in Sections 2.2.1 and 2.2.2 (AMEC, 2013c). EPA approved the revised PSEP in a letter dated May 21, 2013.

Potentiometric monitoring, water quality monitoring, and groundwater modeling activities that were completed in support of performance evaluation activities during 2019 are discussed in the following sections.

### 3.1 Potentiometric Monitoring

Potentiometric monitoring of wells included in the PSEP monitoring program continued to be conducted by the Watermaster and CRs throughout 2019. Locations of the wells included in the BPOU potentiometric monitoring program are shown on Figure 3-1 and their monitoring schedules are presented in Table 3-1. Potentiometric monitoring completed for the PSEP monitoring program during 2019 is summarized below.

- Potentiometric data were collected semi-annually in all 11 extraction wells during the second and fourth quarters of 2019.

- Potentiometric data were collected semi-annually in 18 multiport monitoring wells and 17 piezometer clusters with the following exceptions:
    - Potentiometric data were not collected from piezometer cluster PZ3-1A in 2019. Per the 12 May 2016 email to the Watermaster, EPA approved suspension of piezometric monitoring at PZ3-1A S/D until further notice due to access considerations and infeasibility of road closure due to the hospital emergency vehicle route;
    - Potentiometric data were not collected from piezometer cluster PZ3-5EB in the fourth quarter of 2019 because of an inability to access the piezometer;
    - Potentiometric data were not collected from multiport monitoring well MW 5-19 in the second quarter of 2019 because an updated access agreement had still not been secured with Los Angeles County (LACO); and
    - Potentiometric data were not collected from multiport monitoring well MW 5-26 in the fourth quarter of 2019 due to an inability to access the well during road construction.
- Potentiometric data were collected weekly in one conventional monitoring well, the LACO Key Well, by the Main San Gabriel Basin Watermaster.

## 3.2 Water Quality Monitoring

Water quality monitoring of existing wells included in the PSEP continued to be conducted by the Watermaster and the CRs throughout 2019. Locations of wells included in the BPOU groundwater quality monitoring program are shown on Figure 3-2 and their monitoring schedules are presented in Table 3-2.

Groundwater samples were analyzed for the 21 COCs listed in PSEP Table 2-1 (AMEC, 2013c), including: 1,4-dioxane, NDMA, perchlorate, and VOCs. Although no longer required for the PSEP, groundwater samples were analyzed for nitrate and sulfate to satisfy DDW permit requirements. Groundwater quality monitoring completed for the PSEP monitoring program during 2019 is summarized below.

- Monthly DDW-required groundwater samples collected in 18 extraction wells were used to fulfill the quarterly monitoring and annual requirements for the PSEP with the following exceptions:
    - Groundwater samples were not collected from the following extraction wells because they were not operational:

        - LPVCWD 05 in the second, third and fourth quarters of 2019 due to VFD failure;
        - SA1-1 in the first and second quarters of 2019;
        - SA1-2 in all of 2019; and
        - SA1-3 in the first and second quarters of 2019.
    - Groundwater samples in most extraction wells were not analyzed for acetone and carbon disulfide because these analytes are not required by DDW.
- Annual groundwater samples were collected from all 18 multiport wells and in the MW5-28 monitoring well cluster. The PSEP sampling requirements were achieved with the following exception:
    - The uppermost sampling ports in multiport monitoring wells MW5-03 (Port 10) and WHICO MP-1 (Port 6) were dry in 2019; therefore, annual groundwater samples were not collected from these ports.
- Annual groundwater samples were collected from all eight conventional monitoring wells required by the PSEP, including AJMW-2R, AJMW-4, AJMW-6, ALRMW-1R, ALRMW-3, ALRMW-8, ALRMW-9, and the LACO Key Well, and all PSEP sampling requirements were achieved from these wells in 2019.
- Groundwater samples were collected from 10 of the 11 production wells. The PSEP sampling requirements were achieved with the following exception:
    - Production well SGVWC B6D was not in operation in 2019 so groundwater samples could not be collected.

Additional groundwater quality monitoring was also performed by the WEs to satisfy the requirements of DDW drinking water permits. Results of the water quality monitoring performed in 2019 are presented in Section 5.2.

## 3.3 Groundwater Model Updates

This section documents updates to the groundwater model performed in Model Year (MY) 2018-19 (July 1, 2018 - June 30, 2019). Model years as described in this report are consistent with water years utilized by the Watermaster. The complete timeframe for the groundwater model simulation was July 1, 2003 to June 30, 2019.

As described in the PSEP, the BPOU groundwater model is the primary tool for assessing extraction system performance. The BPOU groundwater model consists of a transient, finite element model developed using the proprietary FEFLOW software code (FEFLOW) developed by the DHI Group. The development, configuration, and systematic modifications of the BPOU

groundwater model are described in the Comprehensive Groundwater Modeling Report, dated July 29, 2005 (Geomatrix, 2005), the Addendum to the Comprehensive Groundwater Modeling Report, dated September 8, 2006, (Geomatrix, 2006c), Addendum to the 2014 Annual Performance Evaluation Report (Geosyntec, 2015b), and the 2016 Annual Performance Evaluation Report (Geosyntec & ERM, 2017).

During MY 2018-19, the extent of the model domain, vertical discretization, and hydrogeological parameterization were deemed appropriate and were unchanged. Consequently, updates to the model reported herein do not represent a reconfiguration of the model or change to the conceptual site model.

For the 2019 Annual PE Report, the BPOU groundwater model was updated with the annual dataset through the end of MY 2018-19. The model updates are described in detail below in Sections 3.3.1 through 3.3.3. The following data were updated:

- Well pumping rates (quarterly average);
- Recharge from spreading basins and rivers;
- Regional recharge from precipitation and return flows (mainly from urban irrigation);
- Water levels for boundary conditions; and
- Pumping locations that were not available in previous model years.

### 3.3.1 Groundwater Pumping Updates

For MY 2018-19, groundwater pumping was updated based on production records obtained from the Watermaster. Figure 3-4 shows the pumping wells used in the model, including new wells added to the model in 2019. Figure 3-5 shows the cumulative quarterly pumping over the simulation period.

Groundwater pumping in MY 2018-19 continued to exhibit similar seasonal trends as previous years. The largest amount of pumping in MY 2018-2019 occurred during the peak of the dry season in the third quarter of the calendar year, and the smallest amount of pumping occurred during the peak of the wet season in the first quarter of the calendar year.

### 3.3.2 Groundwater Recharge Updates

Areal recharge of groundwater in the basin is through spreading basins, river losses to the underlying aquifer, infiltration of precipitation, and irrigation return flows. For MY 2018-19, spreading basin and river recharge data were obtained from LACDPW and input into the top layer of the groundwater model. Table 3-3 summarizes the quarterly recharge volumes for spreading basins and river reaches used in the model. Additional details on the application of

recharge data to spreading basins and San Gabriel River reaches are described in the Addendum to 2014 Annual Performance Evaluation Report and the Revised Final 2015 Annual PE Report (Geosyntec, 2015b and Geosyntec & ERM, 2016, respectively).

Table 3-4 summarizes the quarterly recharge volumes from precipitation and irrigation return flows for each recharge zone used in the model. Figure 3-6 presents the quarterly recharge volumes from all simulated water conservation facilities (spreading basins and river reaches) and from regionally-distributed recharge (precipitation and irrigation return flows). Figure 3-7 presents a comparison of annual recharge and annual pumping. As shown on Figure 3-7, recharge exceeded groundwater pumping by approximately 55,800 acre-feet during MY 2018-2019. The recharge zone locations shown on Figure 3-8 were unchanged during MY 2018-2019.

Consistent with the procedures described in the Comprehensive Groundwater Modeling Report (Geomatrix, 2005), prior to MY 2018-19 regional recharge from precipitation and irrigation return flows was applied to the model as follows:

- Quarterly average precipitation data obtained from weather stations in the basin was scaled in nine recharge zones based on historical climate data so that more precipitation was applied in the higher elevation areas and less in the valley. Sixteen-percent of all precipitation was assumed to infiltrate and recharge groundwater; and
- Four inches per year (in/yr) of urban return flow recharge was added to each recharge zone as follows:
    - January to March - 0.5 inch;
    - April to June – 1 inch;
    - July to September – 1.5 inch; and
    - October to December – 1 inch.

In general, the previous recharge methodology described above appeared to significantly overestimate simulated water levels compared to observed water levels in the basin. Consequently, prior to MY 2018-19, model calibration was performed by adjusting groundwater recharge from precipitation, irrigation return flow, spreading basins, and losing streams on a trial and error basis to obtain an acceptable match between simulated and observed water levels.

To reduce the amount of adjustments made to published data for model calibration, Geosyntec reevaluated the model assumptions for recharge derived from precipitation and irrigation return flow. This reevaluation included review of the methodology for estimating recharge from precipitation and irrigation return flow for the nearby Los Angeles Basin

described in the 2016 United States Geological Survey (USGS) scientific investigation report titled "*Estimating Spatially and Temporally Varying Recharge and Runoff from Precipitation and Urban Irrigation in the Los Angeles Basin, California"* ("USGS Report"; USGS, 2016). Per the USGS Report, in the Los Angeles Basin, average precipitation and recharge from precipitation are 336 and 18 millimeters per year, respectively (recharge is approximately 5.4% of precipitation), and recharge from urban return flows is approximately 0.9 in/yr. Therefore, to evaluate the effect of these recharge estimates on BPOU model calibration, recharge from precipitation and irrigation return flows in the BPOU model was updated for the entire model simulation period using the USGS Report methodology as described below.

In order for average recharge from precipitation to equal approximately 5.4% of total precipitation, quarterly recharge from precipitation was calculated in the model as follows:

- If quarterly precipitation was between 1.8 and 15 inches, quarterly recharge to groundwater was assumed to equal 10% of quarterly precipitation;
- If quarterly precipitation was less than 1.8 inches, then quarterly recharge to groundwater was assumed to be zero, under the assumption that soils during periods of lower precipitation amounts would have the capacity to absorb this amount of moisture without deep infiltration and recharge to groundwater; and
- If quarterly precipitation was greater than 15 inches, then no additional precipitation was allowed to infiltrate in the model, under the assumption that the soils would be at or near saturation resulting in surface runoff rather than resulting in additional groundwater recharge.

To achieve an average irrigation return flow of 0.9 in/yr, quarterly return flows in the model prior to and including MY 2018-19 were uniformly reduced by a factor of 0.225.

The recharge values predicted using this methodology provided a reasonably good fit of simulated water levels to observed water levels in the San Gabriel Basin with minimal additional adjustments to achieve adequate model calibration.

### 3.3.3 Boundary Condition Updates

Boundary conditions allow for groundwater baseflow into and out of the modeled groundwater basin. For MY 2018-19, boundary conditions were updated in the same manner as during previous model updates. Water level data from MY 2018-19 were obtained from the LACDPW to update the time-variant head boundaries that were used to simulate inflows to the flow system from various locations around the perimeter of the San Gabriel Basin and groundwater outflows to Whittier Narrows. Other water flux boundaries used to allow water

to enter or exit the basin at a consistent rate at the model perimeter remained unchanged during the model update.

### 3.3.4 Model Simulations of Extraction System Performance

After completing the model update, model simulations of extraction system performance were conducted using the transient particle tracking methods within FEFLOW. As described in the Comprehensive Groundwater Modeling Report (Geomatrix, 2005) and in the PSEP (AMEC, 2013), the groundwater model simulates transient boundary conditions (both internal and external) using quarterly stress periods. Therefore, groundwater withdrawals from project extraction wells and other production wells are simulated using average quarterly pumping rates for each well. Simulated pumping rates for the five-year particle tracking simulations are summarized in Table 3-5.

Transient forward particle tracking methods were used to evaluate the hydraulic performance of the project extraction wells under actual pumping conditions for a five-year time period. Forward particle tracking was performed for this reporting period by starting particles during MY 2014-15 (exact release time was 7/1/2014) and then simulating the forward paths of the particles under the transient groundwater flow conditions through the end of MY 2018-19. The starting locations for the particles were distributed uniformly within the interpreted extent of the plume of the total concentration of the six COCs normalized to their respective MCLs or NLs. The development of this total normalized COC plume is described in detail in Section 5.3.1. The horizontal grid spacing for particle starting locations is 150 meters by 150 meters with a vertical grid spacing of 15 meters. The grid was rotated 45 degrees to orient it parallel to the general groundwater flow direction (northeast-southwest) for the BPOU. The uniformly distributed starting particle locations allows for the simulation of both captured and uncaptured particles throughout the vertical extent of contamination.

Particle tracking results used to evaluate extraction system performance are presented in Section 5.0. The simulated tracks of particles released below -600 ft msl in the vicinity of Subarea 2 wells MW5-24 and MW5-25 tend to conform to dipping FEFLOW model layers, rather than observed potentiometric head measurements and simulated potentiometric heads generated by the model. As a result, simulated particle tracks in areas with steeply dipping FEFLOW model layers were determined not to be representative of actual groundwater flow paths in the vicinity of wells MW5-24 and MW5-25. This issue was discussed with EPA representatives during a conference call held on March 11, 2019. As recommended by CR representatives during the conference call, the simulated potentiometric heads from the final day of the model year (June 30, 2019) were used to develop interpreted particle flow paths in this deeper portion of the plume. As shown on Figure 5-32, flow paths originating in the lower ports of MW5-24 were manually projected orthogonal to the simulated potentiometric head

contours until they reached the nearest downgradient project extraction wells (i.e., SGVWC B26A and B26B).

It is important to note that the particle tracks do not represent contaminant mass; rather, they solely represent the advective movement of groundwater to depict the likely zones of hydraulic capture as the particles flow downgradient during the five-year particle tracking simulation period. The resulting particle tracks cannot be utilized to infer, suggest, or demonstrate the source of any contamination. Further, since these particles do not represent contaminant mass and are not representative of solute transport, they do not incorporate processes such as retardation, diffusion, dispersion, and degradation. Given the limitations of the particle tracking results, depictions of hydraulic capture presented in this report should not be considered representative of longer-term extraction system performance.

## 4. TREATMENT PLANT MONITORING ACTIVITIES

This section summarizes methods used to monitor treatment plant performance. The performance monitoring program is described in the PSEP (AMEC, 2013c) and the QAPP (AMEC, 2013a). Treatment plant operational results are presented in Section 6.0.

### 4.1 Subarea 1 – Valley County Water District Lante Treatment Plant

The VCWD Lante Treatment Plant operated at a limited capacity for much of 2019. The 2019 annual production was 8 percent of the 6,000 gpm annual target, due to the plant being offline for most of the year during the PLC upgrade work, Arrow Well testing, and other improvements. The plant began operating in recirculation mode starting July 29, 2019 and on July 31, 2019, VCWD completed installation of the OITs at the main AUX panel, which allowed the Plant to operate again on a continuous basis. The treatment plant was started up on August 28 and was operated for testing purposes during the remainder of the year. VCWD completed the Arrow Well start-up testing in December at a flow rate of approximately 6,200 gpm. The existing Arrow Well building was completed in December 2018, with the exception of a security grate over the skylight. By March 2019, both SA1-1 Well and Arrow Well pump and motor equipment installation were essentially completed with the exception of some valving associated with the above ground discharge piping. DDW inspected the Arrow Well on March 8, 2019. In April, DDW approved VCWD's startup testing plan including initial sampling/testing of Arrow Well and allowing delivery of treated water from Arrow Well to customers during startup testing if initial water quality testing shows treated water quality is compliant with DDW requirements. In August, water quality testing showed results were within acceptable range. Results were provided to DDW on August 26 and verbal approval for discharge during startup testing was provided by DDW on the same day. VCWD is currently awaiting DDW approval to operate the Arrow Well on a continuous basis.

Raw water, partially treated water, and fully treated water were sampled monthly after startup commenced in August 2019, and analyzed for COCs including 1,2,3-TCP, inorganic chemicals, and other diagnostic parameters to evaluate the effectiveness of treatment processes and to monitor the quality of the fully treated water. Treated water was delivered to SWS Plant 121 for delivery in the SWS distribution system. Water quality data, as obtained, are summarized in the DDW compliance reports appended to the monthly progress reports to EPA.

In August 2006, by mutual agreement among EPA, South Coast Air Quality Management District (SCAQMD), and VCWD, the air stripper and off gas control system permits with SCAQMD were cancelled and EPA assumed compliance oversight with respect to operations formerly covered by the SCAQMD permits. The air stripper vapor abatement equipment

consists of four 20,000-pound carbon adsorption systems equipped with heaters. Air compliance samples were collected according to the revised protocol approved by EPA on February 3, 2011. The revised protocol requires air sampling immediately after a carbon change out, every other month for 6 months, and then monthly thereafter. The CRs submitted a revised QAPP for air and waste water discharges to the EPA in September of 2012 (AMEC, 2012a) and the Field Sampling and Analysis Plan for air and waste water discharges was issued in July 2013 (Stetson 2013b). All air samples were analyzed by EPA Method TO-15.

No carbon or resin changeouts were performed during 2019 since the plant was offline for much of the year. Carbon and resin changeouts since 2009 are summarized in Table 4-1. Spent carbon and resin are managed at facilities that are authorized to accept CERCLA wastes. As they are received, certificates of disposal and reactivation are provided to EPA in the monthly progress reports.

Waste brine and water softener wastes produced by the ISEP system were discharged under Industrial Wastewater Permit Nos. 016112 and 22058 from the LACSD. The new Industrial Wastewater Permit No. 22058 was issued on May 17, 2017. Brine discharges occurred throughout 2019, although the majority was in April, June, August, September and December. Total annual discharge during 2019 was approximately 1.38 million gallons, which was a significant decrease from the 3.46 million gallons discharged in 2018. Brine discharges have been approximately one fourth what they were before the single pass IX and nitrate bypass systems were brought online, although the 2019 discharges are particularly low because the plant was offline for most of the year. Brine discharges for VCWD are summarized in Section 6.1. Brine discharge samples were collected and analyzed in accordance with permit requirements. Self-Monitoring Reports (SMRs) were submitted to LACSD and EPA on a semi-annual basis covering January to June and July to December 2019, respectively. The SMRs summarize flow, and brine quality data collected during the reporting period.

## 4.2 Subarea 3 – La Puente Valley County Water District Treatment Plant

The LPVCWD Treatment Plant operated on a near full-time basis in 2019, experiencing periodic downtime associated with routine maintenance and infrequent and unplanned operational interruptions. Operational issues experienced during 2019 included, but were not limited to:

- February: The plant experienced about 32 hours of downtime due to a hydrogen peroxide feed line leak, an effluent booster breaker trip, a SCE power outage, a blower motor fault on Air Stripper No. 1 and a Well No. 5 VFD fault; and
- August: The plant experienced about 12 hours of downtime due to installation and testing of a VFD for Well No. 5 and SCE power outages.

The 2019 extraction rate for LPVCWD was 2,355 gpm, above the EPA-approved extraction rate of 2,250 gpm. The Air Stripper No. 2 air flow issues experienced in past years, which reduced the treatment capacity, were overcome by operating Air Stripper #2 at a minimum air to water ratio of 45 to 1 throughout 2019. LPVCWD plans to submit a permit amendment request to DDW in June 2020.

Raw and treated water sampling was performed in accordance with the DDW permit and included weekly sampling for VOCs, perchlorate, 1,4-dioxane, NDMA, 1,2,3-TCP, and various inorganic and physical parameters. The weekly sampling results are included in monthly progress reports submitted to DDW as a requirement of LPVCWD's drinking water permit. These results are also included in the monthly progress reports to EPA.

In August 2006, by mutual agreement among EPA, SCAQMD, and LPVCWD, air strippers and off-gas unit permits were cancelled, and EPA assumed compliance oversight with respect to operations formerly covered by the SCAQMD permits. The VOC treatment equipment consists of a 30-foot tall air-stripping tower with a single 7,000-pound VPGAC absorber and a 41-foot-tall air-stripping tower with a single 20,400-pound VPGAC absorber. Air compliance samples were collected and analyzed by EPA Method TO-15 according to the revised protocol approved by EPA on February 3, 2011. The revised protocol requires air sampling immediately after a carbon change out and monthly thereafter. In November 2014, the EPA approved revised procedures for air monitoring and carbon change outs that were implemented in 2015. The revised procedures require air sampling immediately after a carbon change out, every other month for 6 months, and then monthly thereafter.

One VPGAC and three resin change outs were performed during 2019. The VPGAC will continue to be managed at facilities approved by EPA to accept CERCLA wastes. As they are received, copies of disposal manifests for spent carbon and resin are provided to EPA in the monthly progress reports. Carbon and resin changeouts are summarized in Table 4-1.

Waste brine and water-softener wastes were discharged under Industrial Wastewater Discharge Permit 21905 issued by LACSD. This new permit reflects the transition of treatment technology from the ISEP to the single-pass IX process on July 30, 2010. As a result of this transition, the continuous discharge of brine to the sewer has stopped and discharges consist predominantly of ion exchange rinse water. LPVCWD discharged approximately 59,600 gallons during 2019. Discharges from the LPVCWD Brine Vault are summarized in Section 6.2. Semi-annual wastewater discharge sampling was performed in accordance with permit requirements during 2019. SMRs were prepared and submitted to LACSD and EPA covering the January to June and July to December periods.

### 4.3 Subarea 3 – San Gabriel Valley Water Company B6 Treatment Plant

The SGVWC B6 Treatment Plant operated on a full-time basis in 2019, although operational issues were experienced throughout the year, including, but not limited to:

- August: Beginning on August 15th, the treatment plant operated at reduced capacity with B25A and B25B wells due to a failed VFD at Air Stripper No. 4. The VFD was replaced on September 18, and the plant returned to full capacity.
- November: The treatment plant was offline from November 1st to 5th due to failure in the UV System (communication card); and
- December: The soft starter for B26B well failed, and as a result, SGVWC removed B26A and B26B wells from service from December 24th to December 31st because the DDW permit requires both wells to operate together.

Raw and treated water sampling were performed in accordance with the DDW permit and included sampling for COCs, 1,2,3-TCP, inorganic chemicals, and other diagnostic parameters. Water quality data are summarized in monthly reports to DDW and are included in the monthly progress reports to EPA.

In August 2006, by mutual agreement among EPA, SCAQMD, and SGVWC, permits for the four air strippers and off-gas units were cancelled and EPA assumed compliance oversight with respect to operations formerly covered by the SCAQMD permits. Air compliance samples were collected according to the revised protocol approved by EPA on February 3, 2011. The revised protocol requires air sampling immediately after a carbon change out, every other month for 6 months, and then monthly thereafter. The air compliance sampling data were included in the monthly progress reports to EPA.

In 2019, SGVWC changed out approximately 80,000 pounds of carbon and 2,544 cubic feet of resin at the B6 treatment plant. As they are received, copies of disposal manifests for changeout of spent VPGAC and resin are provided to EPA in the monthly progress reports. Carbon and resin changeouts are summarized in Table 4-1.

Waste brine and water-softener wastes were discharged under Industrial Wastewater Discharge Permit 21905 issued by LACSD. This new permit reflects the transition of treatment technology to the single-pass IX process in May 2018. Discharges consist predominantly of ion exchange rinse water. LPVCWD discharged approximately 7,102,836 gallons during 2019. Brine discharges for the San Gabriel B6 plant are summarized in Section 6.3. Brine discharge samples were collected and analyzed in accordance with permit requirements. SMRs were submitted to LACSD and EPA on a semi-annual basis covering the periods from January to June and July to December 2019. The SMRs summarize flow, and brine quality data collected during the reporting period.

### 4.4 Subarea 3 – San Gabriel Valley Water Company B5 Treatment Plant

The SGVWC B5 Treatment Plant operated on a full-time basis in 2019 experiencing periodic downtime associated with routine maintenance and infrequent and unplanned operational interruptions. Raw and treated water sampling was performed in accordance with the DDW permit and included sampling for COCs, 1,2,3-TCP, inorganic chemicals, and other diagnostic parameters. Water quality data are summarized in monthly reports to DDW and are included in the monthly progress reports to EPA.

In 2019, SGVWC changed out approximately 640,000 pounds of LPGAC and 3,392 cubic feet of resin at the B5 treatment plant. Copies of disposal manifests for changeout of spent carbon and resin are provided in monthly progress reports to EPA, as they are received. Carbon and resin changeouts are summarized in Table 4-1.

SGVWC B5 Treatment Plant discharges relatively low volumes of GAC backwash under Industrial Wastewater Permit No. 017075 from the LACSD, issued on July 11, 2006, subsequently revised and reissued in 2011, and reissued again on October 4, 2016. The total annual discharge for 2019 was approximately 656,000 gallons. Discharges for SGVWC B5 are summarized in Section 6.4. Discharge samples were collected and analyzed in accordance with permit requirements. SMRs were submitted to LACSD and EPA on a semi-annual basis covering the periods from January to June and July to December 2019. The SMRs summarize flow, and discharge quality data collected during the reporting period.

### 4.5 Subarea 3 – California Domestic Water Company Treatment Plant

The 2019 annual production of the CDWC Treatment plant was 10,426 gpm, which exceeded the annual target of 8,000 gpm. Operational issues experienced throughout the year included, but were not limited to:

- January: The ion exchange system and UV system experienced about 5 hours of downtime due to a drawdown test on Well 3, static level check on Well 3, and shutdown of the UV plant;
- March: The ion exchange system experienced about 60 hours of downtime due to drawdown and meter tests on Well 3, a power outage, and rebuilding of Trojan Unit 2;
- April: Air Stripper No. 2 experienced about 79 hours of downtime due to a power outage and replacement of the blower motor;
- August: Air Strippers No. 1, 2 and 3 experienced between 33 to 36 hours of downtime during the month due to a SCE power outage. The ion exchange system experienced

about 36 hours of downtime due to communication failure at the UV Plant, and a power outage;

- September: Air Stripper No. 1 experienced about 314 hours of downtime due to repair of the screen in the carbon absorber, servicing of the Cla-Val, a low pressure alarm on the absorber, repairs to reservoir pump, and carbon changeout. Air Stripper No. 2 experienced about 15 hours of downtime due to repair of screens, carbon changeout, servicing of the Cla-Val, a low pressure alarm on the absorber, and a blower breaker failure; and
- October: Air Stripper No. 1 experienced about 67 hours of downtime due to carbon changeout and replacement of the effluent valve.

Raw and treated water sampling was performed in accordance with the DDW permit and included sampling for COCs, inorganic chemicals, and other diagnostic parameters. Water quality data are summarized in monthly reports to DDW and are included in the monthly progress reports to EPA.

CDWC performed vapor-phase carbon changeouts in June and September, during which approximately 40,000 and 42,000 pounds of carbon were changed out, respectively. No single pass IX resin changeout events occurred during 2019. Copies of disposal manifests for changeout of spent carbon and resin were provided in monthly progress reports to EPA.

# 5. PERFORMANCE MONITORING RESULTS

Potentiometric and groundwater quality monitoring data obtained for the PSEP monitoring program during 2019 were collected in support of performance monitoring during continued operation of the BPOU remedy. Results of potentiometric monitoring, water quality sampling, and groundwater modeling activities are presented in the following sections.

## 5.1 Potentiometric Monitoring Results

The primary objective of the potentiometric monitoring described in Section 3.1 is to verify that the BPOU groundwater flow model accurately reflects the observed flow field and to verify that the remedy is limiting further migration of COCs in groundwater. As noted in Section 5.2 of the PSEP, results from potentiometric monitoring are also used to develop potentiometric surface maps to assist in evaluating changes in groundwater flow patterns in the BPOU.

Key components of the assessment of potentiometric data include the following:

- Regional water level fluctuations due to basin-wide recharge and pumping conditions;
- Local-scale water level fluctuations due to ongoing groundwater production and extraction system pumping; and
- Regional and local-scale lateral and vertical hydraulic gradients and flow directions.

Potentiometric monitoring results for 2019 are discussed in the following sections.

### 5.1.1 Water Level Fluctuations

Long-term regional water level conditions in the BPOU are evaluated using water level data for the LACO Key Well. Figure 5-1 shows the water levels measured in the Key Well from 1982 through 2019. During 2019, groundwater levels in the LACO Key Well sharply increased from the annual low of 176.54 feet msl in January 2019 to 212.53 feet msl in December 2019, returning to water levels last recorded prior to 2014. In August 2019, the water level elevation at the LACO Key Well recovered above 200 feet msl, which is the lower end of the established basin operational range. As shown on Figure 5-1, similar patterns of rapid recharge, following longer periods of gradually decreasing water levels, have been previously observed in association with above average precipitation occurring in 1983, 1992, 1995, 1998, 2005, and 2010.

Figures 5-2 and 5-3 show water levels in multiport monitoring wells MW5-03 and MW5-20. The hydrographs for MW5-03 and MW5-20 represent water level conditions in Subarea 1, in the northern portion of the BPOU, and in Subarea 3, in the southern portion of the BPOU, respectively. Water levels in MW5-03 were recorded in February, May, and December 2019

and demonstrated an increase of approximately 30 feet at all ports throughout 2019, similar to the LACO Key Well. Groundwater measurements taken at the different ports of MW5-03 showed that water levels exhibited similar increasing trends at all depths. Water levels in MW5-20 were recorded in June and December 2019 and also showed a sharp increase throughout the year. Groundwater levels at the different ports of MW5-20 showed similar increasing trends at all depths, but were lower in Port 1-5 in early 2019 following a period of gradually decreasing water levels. However, in late 2019, the water levels at all ports converged again after a rapid period of recharge, as previously seen in historical trends.

### 5.1.2 Lateral Hydraulic Gradients

Generalized potentiometric surface maps for the shallow and deep elevation intervals were developed based on water level data collected in the multiport monitoring wells to assess observed groundwater flow patterns and hydraulic gradients across the BPOU. Figures 5-4 and 5-5 show observed groundwater flow conditions in the shallow (above -500 feet msl) and deep (below -500 feet msl) elevation intervals in May and June 2019. Figures 5-6 and 5-7 show observed groundwater flow conditions in the shallow and deep elevation intervals in December 2019. Evaluation of observed groundwater flow patterns on a more detailed scale is limited by spatial variations in hydrostratigraphy and significant short-term water level fluctuations that occur in response to variations in local recharge and pumping.

As shown on Figures 5-4 through 5-7, lateral hydraulic gradients are generally towards the southwest. Although it is difficult to generalize groundwater flow directions given the seasonality of pumping and recharge in the San Gabriel Basin, groundwater flow directions in the BPOU are typically more southerly during higher water level conditions and are more westerly during lower water level conditions. Groundwater flow directions based on potentiometric measurements conducted in May/June and December 2019 were generally consistent.

### 5.1.3 Vertical Hydraulic Gradients

Water level measurements in multiport monitoring wells and piezometer clusters installed near extraction wells indicate that vertical hydraulic gradients vary throughout the BPOU. As discussed in Section 5.1.1, hydrographs shown on Figures 5-2 and 5-3 represent water level conditions in Subarea 1 (MW5-03), in the northern portion of the BPOU, and in Subarea 3 (MW5-20), in the southern portion of the BPOU, respectively. As shown on Figure 5-2, hydrographs for ports at different depths in MW5-03 were generally similar, indicating very little to no upward hydraulic gradient in Subarea 1. As shown on the hydrograph for MW5-20 in Figure 5-3, the vertical gradient in Subarea 3 is varied temporally. Water levels measured in MW5-20 in shallow ports 6 and 7 in December 2018, at elevations of -85.4 and -94.4 feet msl respectively, were approximately 6 to 10 feet higher than the lower ports in MW5-20,

indicating moderate downward vertical hydraulic gradients in the shallow aquifer in Subarea 3. However, in June 2019, this difference in water levels between the shallow and deeper ports decreased to 3 to 4 feet, demonstrating a smaller downward gradient, and in December 2019, water levels in the shallow ports were similar to or higher than the deeper ports, indicating a slight upward gradient. There was no significant vertical gradient observed among the deeper ports of MW5-20.

Vertical hydraulic gradients calculated at selected multiport wells and piezometer clusters located in Subarea 1, Subarea 2, and Subarea 3 are summarized in Table 5-1. The estimates summarized in Table 5-1 are based on semi-annual water level conditions in February, May, June, and December 2019.

Calculated vertical hydraulic gradients in Subarea 1 piezometers PZ1-1BS/D and multiport well MW 5-03 were slightly upwards throughout 2019. The vertical gradient in PZ1-1BS/D remained generally consistent between 1.3 x $10^{-3}$ and 1.1 x $10^{-3}$ ft/ft in June and December 2019 respectively, and the gradient in MW 5-03 increased from 4.1 x $10^{-4}$ to 1.4 x $10^{-3}$ ft/ft between February and December 2019.

Calculated vertical hydraulic gradients were relatively low and variable in direction across the Subarea 2 multiport wells throughout 2019. The vertical gradient in well MW 5-01 transitioned from 2.5 x $10^{-3}$ ft/ft downwards in February 2019 to 1.7 x $10^{-3}$ ft/ft upwards in June, then remained upwards at 1.2 x $10^{-3}$ ft/ft in December 2019. Between May 2019 and December 2019, the vertical gradient in well MW 5-24 transitioned from 4.8 x $10^{-4}$ ft/ft upwards to 5.4 x $10^{-5}$ downwards, while the vertical gradient in MW 5-25 transitioned from 3.7 x $10^{-4}$ ft/ft downward to 1.3 x $10^{-4}$ upwards.

Calculated vertical hydraulic gradients were generally downward in Subarea 3 piezometers PZ3-1BS/D and multiport well MW 5-20 throughout 2019. The vertical gradient in piezometers PZ3-1BS/D remained downwards but increased slightly from 4.4 x $10^{-3}$ ft/ft to 5.1 x $10^{-3}$ ft/ft in June and December 2019 respectively. The gradient in MW 5-20 was 5.4 x $10^{-3}$ ft/ft downwards in June 2019; however, the vertical gradient transitioned to 3.0 x $10^{-3}$ upwards in December 2019.

## 5.2 Groundwater Quality Monitoring Results

Groundwater samples were collected from wells in the PSEP monitoring program to evaluate groundwater quality conditions in the BPOU. As described in Section 3.2, groundwater samples were analyzed for the 21 COCs listed in PSEP Table 2-1 including: 1,4-dioxane, NDMA, perchlorate, and VOCs. As described in Section 3.2, groundwater quality monitoring data collected to satisfy DDW permit requirements were used to supplement the PSEP monitoring

program during 2019. Groundwater quality monitoring results for 2019 are discussed in the following sections.

### 5.2.1 Summary of PSEP Groundwater Quality Results

Groundwater quality results for the PSEP monitoring program in 2019 are summarized in Table 5-2. This report evaluates the spatial distribution and temporal trends for six selected COCs in groundwater including: 1,4-dioxane, carbon tetrachloride, NDMA, perchlorate, PCE, and TCE. This evaluation relies on depictions of the interpreted current spatial distribution of COCs and COC concentration trends. The interpreted COC plumes are further evaluated in Sections 5.3.1, as well as in Section 5.0 of Appendix A.

Results of water quality monitoring that was performed by the WEs to satisfy the requirements of DDW drinking water permits, which also satisfies monitoring requirements under the PSEP, are presented in Table 5-2, and are summarized below:

- The DDW-required monitoring for the BPOU COCs in the extraction wells fulfills the requirements of the PSEP, but the DDW requirements also include more frequent monitoring (weekly or monthly) than the PSEP (quarterly or annually). Therefore, in some instances Table 5-2 includes additional water quality results for BPOU COCs in the extraction wells not required by the PSEP;
- Water quality results for 1,2,3-TCP are presented in Table 5-2. Concentrations of 1,2,3-TCP were detected at levels that exceed the NL [0.005 micrograms per liter (µg/L)] in one well: SA1-3 Lante;
- Detections of non-COC organic compounds for all available 2019 sampling results are presented in Table 5-3. EDB was not detected above laboratory reporting limits in 2019. In 2019, there were no reported concentrations of non-COC organic compounds that exceeded the MCLs, NLs, or regional screening levels (RSLs; if MCLs and NLs are not available); and
- Detections of TICs for all available 2019 sampling results are presented in Table 5-4. TICs were identified in 13 samples collected from 13 sampling locations inclusive of individual sampling ports in multiport wells. The TICs included possible detections of alcohols, aldehydes, alkanes, ketones, and PCE.

### 5.2.2 Data Validation and Data Quality Assessment

Data management activities for the BPOU Project are managed by LDC under contract to the Watermaster. LDC utilizes EDMSi, a web based environmental data management system, for the management of historical data compiled from the EPA San Gabriel Basin database, CRs, and other relevant sources. New water quality data that are collected for the PSEP monitoring

program are reported to LDC by laboratories, validated in ADR.Net, and uploaded to EDMSi as part of the real-time automated Tier 1A/1B process and Tier 3 selection. As specified by the QAPP (AMEC, 2013a), Tier 1A/1B validation was performed by LDC on water quality data collected for the PSEP program and manual Tier 3 validation was performed on approximately five percent for perchlorate and VOCs and ten percent for all other analyses for the PSEP. Results of the data validation are used to evaluate laboratory performance and ensure that data quality is acceptable to meet BPOU Project objectives. In July 2019, the CRs and WEs implemented changes to data management activities associated water quality data collected from project extraction wells operated by the WEs. These changes results resulted in the discontinuation of Tier 1A/1B and Tier 3 validation of water quality data for project extraction wells beginning in July 2019. EPA approved these changes in an e-mail to the CRs dated June 27, 2019.

Data qualifiers that were assigned during the Tier 1A/1B and Tier 3 reviews are shown with the groundwater sampling results summarized in Table 5-2. Based on the data validation efforts and the evaluation of field quality control (QC) samples, all analytical sample results are considered usable to support the BPOU Project Data Quality Objectives (DQOs).

TICs associated with EPA 524.2 and EPA 8270C analyses continue to be evaluated using procedures consistent with the Standard Operating Procedure used by the EPA's regional laboratory to identify and remove compounds that are clearly laboratory artifacts such as column bleed and laboratory contamination.

Prior to the start of the 2019 annual sampling event, the QA Manager reminded both the Field Sampling Manager and the Laboratory Project Manager of contaminants observed in field and laboratory blanks associated with the 2018 sampling event, potential sources of contaminants, and procedures to avoid contamination. The QA Manager verified the procedures were being implemented during the on-site field sampling and laboratory audits that were performed during the 2019 annual sampling event. Although two common laboratory contaminants (acetone and methylene chloride) and perchlorate were observed at levels below the reporting limit in equipment and field blanks, the levels and frequency were greatly reduced from 2018. The QA Manager will continue to work with the Field Sampling Manager and Laboratory Project Manager to identify and eliminate potential sources of contamination.

In 2018, LDC consulted the lab regarding N-Nitrosomorpholine detections in samples collected by the WEs and analyzed by Method 521. Though the lab indicated there was not background contamination and maintains that the method was employed without interference for N-Nitrosomorpholine, Method 521 specifically mentions the potential problems with background contamination for this analyte. As a result, the CRs recommended that the presence of N-Nitrosomorpholine be evaluated by analyzing a single round of samples from the B5 extraction wells and the three multiport wells with detectable N-Nitrosomorpholine

concentrations. Further, the laboratory would analyze these samples using Method 1625C and be instructed to specifically calibrate and report N-Nitrosomorpholine as a target analyte. However, these samples were mistakenly not collected in 2019; therefore, these samples will be added to the sample scope for 2020 and used to conduct further evaluation of past and future reported N-Nitrosomorpholine detections using Method 521.

EPA 8270C non-detect acidic compounds associated with upgradient monitoring sample from MW5-03 Port 4 collected on December 10, 2019 were qualified R due to especially low recovery of acid surrogates associated with the analysis.

Results of the Tier 3 validation are described as follows:

- The results for perchlorate, reported below the laboratory reporting limit for samples collected on May 23, 2019 at MW5-11 Ports 1 and 2, were qualified J (estimated detect) due to high recovery in the matrix spike (MS), and also elevated to the reporting limit and qualified U (non-detect) due to equipment blank contamination. As a result, the overall qualification of these results is therefore UJ (estimated non-detect);
- The results for perchlorate, reported below the laboratory reporting limit, for samples collected on June 6, 2019 at MW5-27 Ports 1 through 4, were elevated to the reporting limit and qualified U (non-detect) due to field blank and equipment blank contamination;
- The results for acetone, reported below the laboratory reporting limit, for samples collected on June 21, 2019 at MW5-01 Ports 1 through 4, were elevated to the reporting limit and qualified U (non-detect) due to field blank and equipment blank contamination;
- The results for acetone for samples collected on June 21, 2019 at MW5-01 Ports 5 through 7 were qualified U (non-detect) due to field blank and equipment blank contamination;
- The detect results for all volatile analytes for samples collected on June 21, 2019 at MW5-01 Ports 1, 5, and 6, were qualified J (estimated detect) due to high surrogate recovery; and
- The detect results for all volatile analytes were qualified J (estimated detect) and the non-detect results for were qualified UJ (estimated non-detect) for the sample collected on June 21, 2019 at MW5-01 Port 7 due to low surrogate recovery.

A Final Tier 3 validation report was submitted by LDC to the Watermaster on October 25, 2019 (LDC, 2019). The Tier 3 validation report has been posted on a secure LDC BPOU web portal.

## 5.3 Groundwater Plume Modeling Results

The following sections summarize the groundwater plume modeling for MY 2018-19 including updates to the groundwater quality model and evaluation of the distribution of COCs in the BPOU. A detailed description of the approach used for the development of plume maps and chemical cross sections for the six selected COCs is presented in Appendix A.

Consistent with previous Annual PE Reports, water quality data from wells screened at selected depths within the aquifer were interpreted using three-dimensional geospatial modeling software. For annual PE reports prior to 2015, geospatial modeling of the distribution of select COCs in groundwater was performed using the EarthVision® modeling software. Beginning in 2015, the water quality modeling was performed using Earth Volumetric Studio (EVS®) software by C Tech. EVS® has superior 3D volumetric capabilities and is used to better estimate COC mass dissolved in groundwater to support the evaluation of remedy performance as described in Section 7.1.2.3. Appendix A provides a detailed description of the development of the EVS® model for geospatial modeling of the distribution of COCs in groundwater in the BPOU.

### 5.3.1 Distribution of Selected Chemicals of Concern

The lateral distribution of the six selected COCs in three specific elevation intervals is shown in Appendix A. The three elevation intervals are as follows:

- Elevations between the water table (or potentiometric surface) and -200 feet msl;
- Elevations between -200 feet and -500 feet msl; and
- Elevations below -500 feet msl.

The plume maps for the three elevation intervals shown in Appendix A illustrate isoconcentration contours for “composite” elevation intervals for the three elevation intervals listed above. Therefore, these “composite” isoconcentration contours represent the outermost extent of a given COC at any elevation within the elevation intervals.

Included in Figures 5-8 through 5-10 is the distribution of the total concentration of the six COCs normalized to their respective MCLs or NLs for the three elevation intervals above. The total normalized COC (TCOC) concentration at each monitoring point was calculated by summing the concentration of each COC divided by its respective MCL or NL using the following equation:

$$C_{TCOC} = \Sigma\ (C_{PCE}/MCL)>1 + (C_{TCE}/MCL)>1 + (C_{CTC}/MCL)>1 + (C_{1,4\text{-diox}}/NL)>1 + (C_{CLO4}/MCL)>1 + (C_{NDMA}/NL)>1$$

where:

$C_{TCOC}$ = Total normalized COC concentration (unitless)

$C_{PCE}$/MCL = PCE concentration normalized to MCL of 5 µg/L (unitless)

$C_{TCE}$/MCL = TCE concentration normalized to MCL of 5 µg/L (unitless)

$C_{CTC}$/MCL = carbon tetrachloride concentration normalized to MCL of 0.5 µg/L (unitless)

$C_{1,4\text{-diox}}$/NL = 1,4-dioxane concentration normalized to NL of 1 µg/L (unitless)

$C_{CLO4}$/MCL = perchlorate concentration normalized to MCL of 6 µg/L (unitless)

$C_{NDMA}$/NL = NDMA concentration normalized to NL of 10 ng/L (unitless)

Normalized COC concentrations less than one (i.e., representative of concentrations less than the MCL or NL) were assigned a zero value for the calculation. As such, the outermost contour of 1 for the TCOC plume generally represents the extent of COC concentrations in the plume that exceed the MCLs or NLs.

Chemical cross sections showing the vertical distribution of selected COCs and the TCOC plume along four discrete transects are also shown in Appendix A. Cross section A-A' represents a north-south transect that is aligned generally with the longitudinal axis of the COC plumes. Cross sections B-B', C-C', and D-D' represent east-west or northwest-southeast transects that are aligned generally perpendicular to the dominant groundwater flow direction in the BPOU. Cross sections B-B', C-C', and D-D' show the distribution of the COC plumes in the upgradient, mid-plume, and downgradient areas of the BPOU and include various production wells that are vulnerable to lateral migration of COC plumes towards the west or east.

Given the three-dimensional nature of the interpolated COC plumes, the reader should consider the three-dimensional visualization that is inset in the corner of each figure that provides the appropriate context for reviewing the two-dimensional plume maps and chemical cross sections. It should be noted that the water quality data used to create the three-dimensional plume interpretations are posted on the plume maps according to the composite elevation intervals described above. In some instances, the "composite" isoconcentration contours may not appear to correspond to water quality data that are within the elevation interval because of the interpolation between sampling locations performed by the EVS® modeling software.

As with any approach used to interpolate data between known data points, there are uncertainties and limitations to the geospatial modeling approach that may result in alternative interpretations of the distribution of COCs in groundwater. These uncertainties and limitations are summarized as follows:

- The plume maps and chemical cross sections attempt to depict the 3D distribution of COCs in groundwater with 2D images, and they represent interpolated approximations of the distribution of COCs in groundwater based on available data. As described in Appendix A, the plume interpretations generally incorporate water quality data for the period from April through June 2019. Where data were not available for that time period, data from the next closest date during the August through December 2019 time period were utilized to represent the plumes as accurately as possible;
- Alternative interpretations of the distribution of the COC plumes are possible and may differ from the plumes depicted herein;
- The Duarte Fault is represented as a diffuse zone of faulting on the plume maps and chemical cross sections. However, no faulting was explicitly represented in the 3D model used to interpolate the plumes. The diffuse fault zone is considered to be a reasonable representation of the uncertainty in the fault's location as it has several fault splays concealed beneath alluvial deposits; and
- The northern-most limits of some COCs depicted on the plume maps are uncertain due to the limited amount of data available to the CRs from other EPA-named PRPs, including the Mobil/Lockheed/Valspar group, as well as other entities that may be PRPs in the northern portions of the BPOU. In consideration of the lack of recent available groundwater data from several PRP facilities and historical detections of several COCs such as TCE and PCE in the area north of the Duarte Fault zone, isoconcentration contours for TCE and PCE are truncated at the downgradient (southern) extent of the Duarte Fault zone.

Evaluation of the TCOC plume maps (Figures 5-8 through 5-10) and chemical cross sections that are shown in Appendix A (Figures A-47 through A-50) resulted in the following general observations of the spatial distribution of COCs in the BPOU:

- Consistent with previous interpretations of individual and composite COC plumes within the BPOU, the longitudinal extent of the TCOC plume extends from the Duarte Fault zone in Subarea 1, approximately 7.5 miles towards the southwest, where the plume terminates near the confluence of Avocado Creek and the San Gabriel River;
- In the shallow elevation interval above -200 feet msl, TCOC concentrations greater than 50 times the MCLs were observed along the longitudinal axis of the plume immediately downgradient of Subarea 1 and in the mid-plume area extending downgradient towards the CDWC Subproject wells. As shown in Figure 5-8, areas of localized area of TCOC concentrations exceeding 100 times the MCLs exist in the vicinity of AJ MW-4 in Subarea 1 driven by elevated perchlorate reported in November 2019, and near MW5-05 in Subarea 2. Compared to 2018, the plume of concentrations

exceeding 20 times and 50 times the MCLs increased in extent along the longitudinal axis;

- In the intermediate elevation interval between -200 and -500 feet msl, the TCOC plume extends from monitoring well MW5-03 in Subarea 1 to well COI 5 near the downgradient terminus of Subarea 3. In 2019, the extent of TCOC concentration exceeding 50 times the MCLs increased in this depth interval in Subarea 3 compared to 2018, and encompassed monitoring wells SGVWC B5E, MW 5-20, MW 5-22, and MW 5-23 (Figure 5-9). Similar to previous years, a localized area of TCOC concentrations ranging from 50 to 100 times the MCL was observed in this depth interval in Subarea 2 in the vicinity of MW5-05; and
- Below -500 feet msl, the TCOC plume extends from MW5-03 in Subarea 1 to near the SGVWC B5 extraction wells in Subarea 3. From MW5-03 to near the mid-plume wells MW5-05 and MW5-15, the plume consists of TCOC concentrations slightly exceeding the MCLs with an isolated area exceeding 5 times the MCL near MW5-24. In Subarea 3, the extent of the plume exceeding at least 5 times the MCL increased slightly farther downgradient in 2019 compared to previous years due in part to increased TCOC concentration in SGVWC well B5D.

## 5.4 Groundwater Flow Modeling Results

As described in Section 3.3, the BPOU groundwater model was updated with pumping, recharge, and boundary condition data through the end of MY 2018-2019. The adequacy of groundwater model calibration continued to be evaluated using water level observations at 89 monitoring and production well locations that were selected as long-term basin-wide calibration targets, including 47 targets located in the BPOU area. Water level observations for MY 2018-19 were updated from the San Gabriel Basin Database, California Department of Water Resources, LACDPW, the United States Geological Survey National Water Information System, and from data collected as part of the PSEP monitoring program.

### 5.4.1 Updated Model Calibration Results

After completing the model updates described in Sections 3.3.1 through 3.3.3, the model was checked for its ability to replicate observed head levels over the revised 15-year simulation period ending in MY 2018-19. As described in Section 3.3.2, the recent updates in methodology for estimating recharge from precipitation and irrigation return flows resulted in minimal adjustments being required to achieve a reasonable match between simulated and observed heads in the model.

The list of observation wells used to assess model calibration is presented in Table 5-5. Updated model calibration statistics are summarized in Table 5-6. Calibration statistics were

calculated for two data sets. The first data set (herein referred to as “complete dataset”) consists of observation and pumping wells utilized during recent model calibration efforts and data from observation wells PZ-1-3B S, PZ1-3B D, PZ3-1B S, PZ3-1B-S, MW5-03 (multiport), MW5-20 (multiport), and MW5-23 (multiport). Because the model utilizes quarterly-averaged extraction rates for pumping wells, the direct comparison of model-predicted heads to instantaneous observed heads can be misleading and does not necessarily indicate error in the modeling results. Consequently, the second data set consists of the first observation data set without the pumping wells (herein referred to as the “non-pumping dataset”).

Using the complete dataset of 70 observation points (pumping and non-pumping wells), the average basin-wide model residual (the average difference between model simulated and observed heads) for the 15-year simulation period is -0.58 feet (Table 5-6). The average model residual for the 42 observation wells within the BPOU area is 0.09 feet for the same period. The root-mean squared error (RMSE) for the calibrated model is 15.66 feet for the entire model and 7.76 feet for the BPOU area.

Using the non-pumping dataset consisting of 50 observation points (Table 5-6), the average basin-wide model residual for the 15-year simulation period is -0.62 feet. The average model residual for the 37 observation wells within the BPOU area is -0.50 feet for the same period. The RMSE for the calibrated model is 8.84 feet for the entire model and 6.00 feet for the BPOU area.

Simulated and observed potentiometric heads in the BPOU for the 15-year model simulation period are compared on hydrographs presented on Figures 5-11 through 5-18. These hydrographs illustrate the model’s ability to simulate temporal groundwater elevation changes and vertical gradients in Subareas 1, 2 and 3 of the BPOU. Figure 5-11 shows a good match between observed and model-predicted heads for the LACO Key Well. Simulated water levels in the Subarea 1 (Figures 5-12 and 5-13), Subarea 2 (Figures 5-14 through 5-16) and Subarea 3 (Figures 5-17 and 5-18) portions of the BPOU generally are within five feet of observed water levels.

As described in Section 5.1.3, overall, the observed vertical gradients in Subarea 1 and Subarea 2 are relatively small, slightly upward in Subarea 1 and either slightly upward to slightly downward in Subarea 2. Comparatively, the 15-year model simulation results generally showed a range from no vertical gradient to a very slight upward or downward vertical gradient simulated in the model in Subareas 1 and 2. Thus, the relatively small vertical gradients predicted by the model are consistent with the relatively small observed vertical gradients. This match in observed and simulated vertical gradients is depicted for Subarea 2 wells MW5-01, MW5-24, and MW5-25 on Figures 5-14, 5-15, and 5-16, respectively.

Vertical hydraulic gradients in Subarea 3 are downward in both simulated and observed water level data throughout the 15-year simulation. The simulated water levels in the shallowest ports in MW5-23 (ports 4 through 6) are generally lower than observed water levels by up to 15 feet (Figure 5-17). At the request of the EPA, previous consultants to the BPOU CRs conducted a detailed evaluation of the vertical head differences observed in Subarea 3 and refined the BPOU groundwater model by adding low permeability separating layers that were observed in well logs in parts of the Subarea 3 (Geomatrix, 2007). In addition, the vertical anisotropy ratio (ratio of vertical to horizontal hydraulic conductivity) assigned to various layers in the model was adjusted to increase simulated vertical gradients. Although these efforts resulted in some improvements to the match between observed and simulated vertical gradients, the model continues to locally under-predict observed vertical gradients in Subarea 3 as shown in Figure 5-17. This under-prediction of vertical gradients is most likely attributable to the smaller (local) scale heterogeneities that are present in the aquifer compared to the broader scale of heterogeneities that are represented in the model (Geomatrix, 2007).

Potentiometric surfaces simulated using the BPOU groundwater model are compared to observed water levels in Fall 2018 and Spring 2019 on Figures 5-19 through 5-26. The simulated results were exported from the model for approximately the same time period as the observed water levels. As shown on Figures 5-19 and 5-20, simulated water levels in Subarea 1 generally range from 3 to 9 feet higher than observed water levels in Fall 2018 and Spring 2019.

Simulated potentiometric surfaces in Subarea 3 are compared to observed water levels on Figures 5-21 through 5-26 for the following elevation intervals: above -200 feet msl, between -200 and -500 feet msl, and below -500 feet msl. These elevation intervals correspond to the approximate elevations of interpreted hydrostratigraphic separating units in Subarea 3. Figures 5-21 through 5-26 show simulated water levels versus observed at multiport monitoring wells located more distal from pumping wells (MW5-20, MW5-22, and MW5-23). In the elevation interval above -200 feet msl, simulated water levels generally ranged from 6 to 13 feet lower than observed water levels in Fall 2018 and ranged from approximately 3 to 7 feet lower than observed water levels in Spring 2019. Simulated water levels in MW5-20, MW5-22, and MW5-23 in the elevation interval between -200 and -500 feet msl generally ranged from 0 to 4 feet lower than observed water levels in Fall 2018 and were 1 to 4 feet lower than observed water levels in Spring 2019. In the elevation interval below -500 feet msl, simulated water levels at these locations were 1 to 5 feet lower than observed in Fall 2018 and were 1 to 7 feet lower than observed in Spring 2019.

The largest differences between simulated and observed water levels occur in the immediate vicinity of the SGVWC B5, B6, and CDWC pumping wells in the elevation interval above -200 feet msl (Figures 5-21 and 5-24). These differences are most likely attributable to the smaller

(local) scale of heterogeneities that are present in the aquifer compared to the broader scale of heterogeneities that are represented in the model. In addition, these differences in simulated and observed water levels may in part be related to variability in the pumping rates of various extraction wells in response to water supply demands as compared to the average pumping rates that are simulated using quarterly stress periods in the model.

The annual model water balance is summarized in Table 5-7. As described previously, recharge from precipitation and irrigation return flows was updated in the model for the entire simulation period, including previously reported recharge data for MY 2003-04 to MY 2017-18. Therefore, the previously reported annual water balances for MY 2003-04 to MY 2017-18 were also updated in Table 5-7 for consistency and to allow for valid comparisons between MY 2018-19 and previous model years. The water balance calculated by the model for MY 2018-19 was generally comparable to previous model years. In MY 2018-2019, there was a net positive increase in storage, since the combined model inflows from recharge and other inflows were greater than the sum of the groundwater outflow components from the model.

### 5.4.2 Results of Performance Evaluation Simulations

Groundwater flow simulations utilizing 5-year forward particle tracking from MY 2014-15 through MY 2018-19 were performed to evaluate the performance of the groundwater extraction system. Results of the transient five-year particle tracking simulation of extraction system performance are presented in plan view for Subarea 1 at two elevation intervals on Figures 5-27 and 5-28. Results for Subarea 3 are presented in plan view at three elevation intervals on Figures 5-29 through 5-31. Figure 5-32 presents particle tracking results in profile view along the long axis of the plume (cross section A-A'). As described above, the starting locations for the particles were assigned to provide a generalized representation of groundwater originating within the inferred horizontal and vertical extent of the TCOC plume. To aid the reader in evaluating the results, the interpreted extent of the TCOC plume in 2019 is shown on Figures 5-27 through 5-32 for reference. Particle tracks are color coded on these figures; particles that are captured by project extraction wells are shown as orange and brown tracks, particles captured by the CDWC Subproject wells are shown in blue, and particles not captured during the five-year simulation period are shown in gray. Starting particle locations are shown on the figures as solid circles located at the upgradient end of each particle track.

As described in Section 3.3.4, the simulated tracks of particles released below -600 ft msl in the vicinity of Subarea 2 wells MW5-24 and MW5-25 tend to conform to dipping FEFLOW model layers, rather than observed potentiometric head measurements and simulated potentiometric heads generated by the model. The simulated potentiometric heads from June 30, 2019 were used to develop interpreted particle flow paths in this deeper portion of the

plume for the MY 2018-19 particle tracking analysis presented in this report. As shown on Figure 5-32, flow paths originating in the lower ports of MW5-24 were manually projected orthogonal to the simulated potentiometric head contours until they reached the nearest downgradient project extraction wells (i.e., SGVWC B26A and B26B).

Given the limitations of the particle tracking results described above, depictions of short-term hydraulic control presented in this report should not be considered representative of long-term extraction system performance. Additional discussion of particle tracking results in relation to remedy performance is presented in Section 7.1.3.

## 5.5 Groundwater Extraction and Chemical Mass Removal

Monthly groundwater extraction volumes for 2019 were compiled from monthly reports submitted to DDW and EPA in monthly progress reports. Groundwater extraction volumes for all operational extraction wells in 2019 are shown in Table 2-1. Average monthly and average annual extraction rates are also provided in Table 2-1 together with design extraction rates for each extraction well, target operational extraction rates, and EPA-approved extraction rates for each well. Design extraction rates are based on the peak design capacity of the treatment plants whereas target operational extraction rates generally assume ten percent downtime for each well for treatment plant maintenance. The EPA-approved extraction rates shown in Table 2-1 are based on groundwater flow model simulations performed in support of extraction system design in 2000 and 2001 and updated in 2012 and 2013. These average extraction rates are necessary to achieve the remedial action objectives, inclusive of the addition of 8,000 gpm groundwater extraction from the CDWC Bassett Wellfield as requested by EPA in January 2015.

Estimates of chemical mass removed from extracted groundwater in 2019 for the VCWD Lante, LPVCWD, SGVWC B6, SGVWC B5, and CDWC Subprojects are presented in Section 6.0.

## 6. TREATMENT PLANT PERFORMANCE RESULTS

This section presents a summary of the 2019 operational performance results for the BPOU Subproject treatment plants.

### 6.1 Subarea 1 – Valley County Water District Lante Subproject

As described earlier in this report, the VCWD Lante Treatment Plant was offline for much of 2019 due to PLC upgrade work, Arrow well reactivation, and other improvements. The plant began operating in recirculation mode starting July 29, 2019, and on July 31, 2019, VCWD completed installation of the OITs at the main AUX panel, which allowed the plant to operate again. The treatment plant was started up on August 28 and operated for testing purposes during the rest of the year. As a result, the 2019 annual production was about 8% of the 6,000 gpm annual target. However, VCWD completed the PLC upgrade and start up testing of the Arrow Well in December with the Lante treatment plant operating at a flow rate of approximately 6,200 gpm. In the long term, it is anticipated the VCWD treatment plant will be able to meet the target extraction rates after DDW approves the continuous operation of the Arrow Well and the revised Subarea 1 extraction plan is implemented. During 2019, 810 acre-feet of groundwater was extracted and treated from the production wells (primarily SA1-3 and the Arrow Well), equating to an average annual production rate of 459 gpm.

Table 6-1 summarizes the water quality data collected from the individual production wells and from the fully treated water. The design concentrations and expected average influent concentrations for the VCWD Lante Treatment Plant, together with applicable MCLs and NLs for the COCs, are also presented in Table 6-1. During 2019, samples were only collected from SA1-1 and SA1-3 between August and December. Well SA1-2 was offline for all of 2019 and, as a result, was not sampled during the year. In April, DDW approved VCWD's startup testing plan, including initial sampling/testing of the Arrow Well and allowing temporary delivery of treated water from Arrow Well to customers during startup testing if initial water quality testing showed treated water quality was compliant with DDW requirements. The Arrow Well was sampled on August 13. Results were provided to DDW on August 26 and verbal approval for temporary discharge during startup testing was provided by DDW on the same day. Raw water concentrations in SA1-1, SA1-3 and the Arrow Well, reported in Table 6-1, did not exceed design concentrations. No COCs were detected in the fully treated water. As shown in Table 6-1, the reporting limits are below the respective MCLs or NLs for each COC. Figures 6-1 to 6-13 illustrate raw and treated water concentration trends for 2019, relative to the applicable MCL or NL.

Historically, groundwater concentrations have been typically higher in Well SA1-3 than SA1-1. However, the perchlorate concentrations observed in SA1-3 during 2019 were greater than

those in SA1-1, which did not contain levels of perchlorate above the MCL in 2019. The 1,1-dichloroethene concentrations observed in SA1-1 in 2019 exceeded those recorded in SA1-3 and were close to or exceeded the MCL. In Well SA1-3, concentrations of tetrachloroethene, perchlorate, trichloroethene, 1,2,3-trichloropropane, and chloroform typically exceeded their respective MCLs and NLs. The tetrachloroethene concentrations reported in the 2019 samples from SA1-3 ranged from 110 to 140 µg/L, as compared to the MCL of 5 µg/L. Trichloroethene concentrations observed in SA1-3 also exceeded the MCL of 5 µg/L, ranging from 40 to 53 µg/L. Elevated concentrations of tetrachloroethene (160 µg/L) and trichloroethene (70 µg/L) were also recorded in the one Arrow Well sample collected during 2019. However, no COCs were detected in any of the fully treated water samples.

Because the plant was offline for much of the year and sampling was limited and the Arrow Well was only sampled once, 2019 trends are difficult to discern. Concentrations of 1,4-dioxane and perchlorate in SA1-3 displayed increasing trends during the limited, while trichloroethene, cis-1,2-dichloroethene, chloroform and 1,2,3-trichloropropane displayed decreasing trends in SA1-3. The remaining COCs appeared to be relatively stable in SA1-3 during 2019. In general, limited COCs were detected in SA1-1 and those that were routinely above the method detection limits in the September to December 2019 samples displayed relatively stable concentration trends, with the following exceptions. Perchlorate displayed a slightly decreasing trend, while trichloroethene and chloroform concentrations were slightly increasing. The 1,1-dichloroethene concentration in the December sample from SA1-1 around 13 µg/L, as compared to the approximately 5.5 µg/L observed in the September and October samples.

Treated water COC concentrations remained below the MCLs/NLs in all of the 2019 sampling events. Average concentrations for the raw water influent to the treatment plant are summarized in Table 6-2.

Historical (2008 to 2019) trends for indicator COCs in the VCWD extraction wells are presented in Figures B-1 to B-7 (Appendix B). Concentrations of COCs are typically higher in SA1-3 than the other extraction wells; however, COC concentrations show strong decreasing trends. Mass removed during 2019 was calculated by using the average raw water concentration for each COC from each of the three production wells and multiplying that result by the volume of water treated, with the appropriate dimensional conversion. In these calculations, concentrations below the detection limit were treated as zero. For the compounds considered, approximately 22.2 pounds of chemical mass were removed by the VCWD Lante Treatment Plant in 2019. This is significantly less than the 381 pounds removed in 2018, which was expected given that the extraction wells and treatment plant were offline for much of the year and when they did operate, operations were limited to startup and testing activities. The majority of the chemical mass removed was attributed to tetrachloroethene (36%), with

trichloroethene and 1,1-dichloroethene (1,1-DCE) representing an additional 26% and 20% of the total mass removed, respectively. Perchlorate represented 13% of the total mass removed during 2019.

Exhaust air quality data for 2019 are summarized in Table 6-3 for the four air strippers and VPGAC systems. Air sampling during 2019 was limited due to the extensive downtime. During 2019, TCE was the primary VOCs detected in the vapor phase. Table 6-4 provides a summary of air risk and hazard calculated from compounds detected in the air exhaust. Risk was calculated using SCAQMD Tier 4 procedures and compared against ARARs. Calculated risk and hazard values were below ARARs for the maximum individual cancer risk (MICR), acute hazard, chronic hazard, and cancer burden.

In 2019, the VCWD Treatment Plant discharged 1,375,456 gallons of waste brine to the LACSD sewer with an annual average discharge rate of approximately 2.6 gpm. Brine flow data are summarized in Table 6-5.

## 6.2 Subarea 3 – La Puente Valley County Water District Subproject

In 2019, the average annual flow rate at the LPVCWD Treatment Plant was 2,343 gpm, which exceeded the EPA-approved extraction rate of 2,250 gpm. Approximately 3,793 acre-feet of groundwater were extracted during 2019. LPVCWD 2 and LPVCWD 3 accounted for 52 and 36 percent, respectively, of groundwater extracted and treated during 2019. LPVCWD 5 was inoperable for most of 2019 and produced the remaining 11.2 percent of groundwater extracted and treated.

Extraction wells LPVCWD 2 and LPVCWD 3 were sampled at least monthly during 2019. LPVCWD 5 was only sampled in January and February, when the well was in operation. Water quality data are summarized in Table 6-6. Figures 6-14 to 6-22 illustrate 2019 raw and treated water concentration trends relative to the applicable MCL or NL for selected COCs. COC concentrations in LPVCWD 2 were greater than those observed in LPVCWD 3 and LPVCWD 5. Most COCs in LPVCWD 2 displayed decreasing trends during 2019. COCs were either below applicable MCLs or NLs or not detected in LPVCWD 3, with the exception of perchlorate. Perchlorate, PCE, TCE, and NDMA were the only COCs detected in Well LPVCWD 5, with only TCE, NDMA and perchlorate exceeding their respective MCLs/NLs.

All three extraction wells contained perchlorate concentrations exceeding the MCL. Perchlorate concentrations in LPVCWD 2 displayed a slightly decreasing trend during 2019 (from 36 µg/L to 25 µg/L), whereas perchlorate concentrations in LPVCWD 3 was relatively stable. LPVCWD 2 and LPVCWD 5 also contained NDMA and TCE at concentrations greater than their respective MCLs. The concentrations of 1,2-dichloroethane (1,2-DCA) and carbon tetrachloride were above their respective MCLs in LPVCWD 2 and below their MCLs in in the

other extraction wells. The January sample from LPVCWD 2 contained higher concentrations of COCs than observed during the rest of the year. Concentrations of COCs in LPVCWD displayed stable or slightly decreasing trends during 2019. There were no instances during 2019 where COC concentrations in the fully treated water exceeded an MCL or NL.

Historical (2008 to 2019) trends for indicator COCs in the LPVCWD extraction wells are presented in Figures B-8 to B-16 (Appendix B). Since 2009, COC concentrations in LPVCWD 2 have consistently been greater than those in LPVCWD 3 and LPVCWD 5. Most COCs in LPVCWD 2 show decreasing trends, but high variability accompanies some of the overall decreasing trends. Concentrations of PCE in LPVCWD 2 appear relatively stable. Seasonal fluctuations, with lower concentrations in the summer months and higher concentrations in the winter months were observed from 2014 to 2019, with the exception of 2017. Historically, COC concentrations in LPVCWD 3 showed a strong decrease from 2008 to 2009 and have remained relatively stable to slightly decreasing since 2009. COC concentrations in LPVCWD 3 have been near or below the MCL/NLs since 2009, except PCE, which displayed a steady decline in LPVCWD 3 from 2008 to 2013, when concentrations fell below the detection limit and have largely remained below 0.5 µg/L. LPVCWD 5 experienced steep declines in COC concentrations during the first six months of operation (January to June 2009), and since then, most COCs have displayed a steady decline or have remained fairly stable. Concentration of 1,4-dioxane in LPVCWD 2 have historically been above the NL (1 µg/L) but dropped below the NL in 2019.

Average chemical concentrations for the treatment plant raw water influent are summarized in Table 6-7 together with the volume of water treated and the total mass removed per chemical. In these calculations, concentrations below the detection limit were treated as zero. For the COCs considered, approximately 482 pounds of chemical mass were removed from groundwater in 2019. The total chemical mass removed had gradually declined since 2007, a result of the decreasing COC concentrations. However, the increased production from LPVCWD 2, which historically has higher concentrations of COCs, resulted in an increase in mass removal during 2019.

Air quality data collected weekly from the Small Tower and Large Tower inlet and outlet are summarized in Table 6-8. A summary of the air risk and hazard associated with the off-gas GAC systems is provided in Table 6-9. The MICR, acute hazard, chronic hazard, and cancer burden ARARs were not exceeded in 2019.

Because brine discharges from the ISEP were eliminated when perchlorate treatment changed to single pass IX, only about 59,639 gallons of wastewater, consisting predominantly of IX rinse water, were discharged to the LACSD sewer in 2019. Wastewater flows are summarized in Table 6-10. Discharges met permit requirements.

### 6.3 Subarea 3 – San Gabriel Valley Water Company B6 Subproject

In 2019, the average annual flow rate at the SGVWC B6 Treatment Plant was 6,543 gpm, which exceeded the EPA-approved extraction rate of 6,500 gpm. Production was primarily from B25A and B25B, accounting for approximately 39% and 33% of the total production during the year, respectively. Wells B26A and B26B accounted for approximately 14% and 13% of the remaining production, respectively. Standby wells B6C and B6D did not extract any groundwater during 2019. Approximately 10,554 acre-feet of groundwater were extracted and treated in 2019.

SGVWC B6 Treatment Plant raw water is typically sampled monthly and treated water data is collected weekly (Table 6-11). Standby wells B6C and B6D were not sampled in 2019. Table 6-11 also includes the design and expected average influent concentrations for the SGVWC B6 Treatment Plant together with applicable MCLs and NLs for the COCs. During 2019, the only occurrences where the raw water concentrations exceeded the design concentrations were for carbon tetrachloride, where three samples from Well B26B exceeded the maximum design concentration of 10 µg/L (maximum concentration observed as 12 µg/L). In 2019, all of the weekly treated water samples were below the COCs respective MCL/NLs.

Figures 6-23 to 6-32 illustrate raw and treated water concentrations relative to the applicable MCL or NL in 2019. Concentrations of cis-1,2,-DCE and 1,1-DCE were mostly below their respective MCLS, with a few exceptions. Concentrations of 1,1,-DCE in Well B25A were at or slightly above the MCL in the May, September, and November samples and concentrations of cis-1,2-dichloroethene (cis-1,2-DCE) in Well B25A were at or slightly above the MCL in the September and November samples. Raw water concentrations of PCE exceeded the MCL in wells B25A and B25B and were below the MCL in the remaining extraction wells. With a few exceptions observed during the year, concentrations of 1,2-DCA, 1,4-dioxane, carbon tetrachloride, NDMA, perchlorate, and TCE exceeded their associated MCLs and NLs in raw water samples collected from all extraction wells. Concentration trends for COCs in raw water samples were generally stable through 2019, with the following exceptions. Concentrations of 1,2-DCA, 1,4-dioxane, and cis-1,2-DCE in Well B25A displayed a slightly increasing trend during 2019. A slightly increasing 1,4-dioxane trend was observed in Wells B25A and B26A as well. The remaining COCs were relatively stable in the raw water samples collected during 2019.

Historical (2008 to 2019) trends for indicator COCs in the B6 extraction wells are presented in Figures B-15 to B-21 (Appendix B). COC concentrations in extraction wells B26A, B6C and B6D have generally displayed relatively stable or slightly decreasing trends since 2008. Several COCs in B25A, B25B and B26B show increasing trends. Concentrations of 1,2-DCA, 1,4-dioxane, perchlorate, NDMA, PCE and TCE in B26B display increasing trends since 2008. Concentrations of 1,2-DCA, 1,4-dioxane, and TCE in B25A have displayed increasing trends. PCE concentrations

in B25A vary more than in the other extraction wells, with an overall slightly increasing trend. Perchlorate concentrations in B25A have displayed an increasing trend since 2013. Additionally, concentrations of 1,4-dioxane, PCE, TCE, NDMA and perchlorate in Well B25B have displayed a slightly increasing trend since 2014; however, concentrations of PCE and perchlorate in B25B displayed decreasing trends during 2019. Concentrations of 1,2-DCA in B25B have displayed an increasing trend since April 2016.

Average chemical concentrations for raw influent to the treatment plant are summarized in Table 6-12, together with the volume of water treated and the total mass removed per chemical. In these calculations, concentrations below the detection limit were treated as zero. For the compounds considered, approximately 3,661 pounds of chemical mass were removed from groundwater in 2019, which represents an increase from 2018 (2,118 pounds removed). TCE makes up approximately 43.3 percent of the total mass removed, with perchlorate accounting for an additional 32.0 percent and PCE accounting for 11.7 percent.

SGVWC B6 Treatment Plant air quality data are summarized in Table 6-13. Table 6-14 provides summary of air risk and hazard calculated from compounds detected in the air exhaust. Risk was calculated using SCAQMD Tier 4 procedures and compared against ARARs. The annual 52-week average rolling MICR ARAR of $1\times10^{-6}$ was exceeded in December 2019 due to faulty heater equipment that has since been repaired. The acute hazard, chronic hazard and cancer burden ARARs were also not exceeded in 2019.

The SGVWC B6 Treatment Plant discharged 7,102,836 gallons of waste brine to the LACSD sewer with an average discharge rate of approximately 12.5 gpm during 2019. Brine flow data are summarized in Table 6-15.

## 6.4 Subarea 3 – San Gabriel Valley Water Company B5 Subproject

The average annual extraction rate for the SGVWC B5 Subproject was about 6,457 gpm, which was approximately 92% of the EPA-approved extraction rate of 7,000 gpm, due to lower pumping capacity of the B5E well caused by lower water levels in the basin and rehabilitation of B5E well. Rehabilitation of Well B5E began in April 2018 and was completed on February 8, 2019. Following completion, production capacity of B5E increased significantly (approximately 3,800 gpm when operating as standalone well or 2,900 gpm when operating with other wells; pre-rehab capacity was approximately 2,000 gpm when operating with other wells). Rehabilitation of B5E well has increased plant production (up from the 2018 average production of 78 percent of the annual target). Approximately 10,418 acre-feet of water were extracted and treated. Production was primarily from wells B5B and B5D, accounting for approximately 42% and 40% of the 10,418 acre-feet of water extracted during 2019, respectively. COI 5 accounted for an additional 4% of the water extracted, and B5E accounted for the remaining 14%. The average annual production rates for B5B, B5E, B5D and COI 5 were 2,704 gpm, 2,595 gpm, 258 gpm and 898 gpm, respectively.

Raw and treated water quality data for the SGVWC B5 Treatment Plant are provided in Table 6-16, which also includes the design and expected average influent concentrations for the SGVWC B5 Treatment Plant and applicable MCLs and NLs for the COCs. All raw water concentrations were below maximum design concentrations in the production wells throughout 2019. Figures 6-33 to 6-40 show raw and treated water concentration trends relative to the applicable MCL or NL. COC concentrations in B5E tended to be higher than the other B5 extraction wells, with the exception of PCE, where Well COI 5 displayed the highest concentrations. COC concentrations tended to be below their respective MCL/NLs, with the following exceptions. In B5E, 1,2-DCA, NDMA and TCE concentrations exceeded their respective MCLs. Concentrations of carbon tetrachloride in B5E and B5D were routinely above the MCL (0.5 µg/L). Concentrations of perchlorate in Well B5E were around 20 µg/L throughout 2019, exceeding the MCL (6 µg/L), while the perchlorate concentrations in the COI 5 well varied from slightly below to slightly above the MCL during 2019. PCE concentrations observed in Well B5E were generally below the MCL (5 µg/L) in 2019, with a single exceedance (5.4 µg/L in November), while concentrations in COI 5 exceeded the MCL. No COCs were detected at concentrations exceeding their MCL or NL in the fully treated water samples.

COC concentrations in all of the extraction wells displayed relatively stable trends throughout 2019, with the exception of carbon tetrachloride in B5E, which displayed an increasing trend from August to December and NDMA in B5E, which showed a slightly decreasing trend.

Historical (2008 to 2019) trends for COCs in the B5 extraction wells are presented in Figures B-22 to B-28 (Appendix B). Concentrations of PCE, TCE, 1,2-DCA, perchlorate, NDMA and carbon tetrachloride in Well B5E have shown increasing trends from 2008 through 2013-2014. During the period from approximately 2013 to 2014, PCE concentrations continued their increasing trend in B5E, whereas carbon tetrachloride displayed a decreasing trend and the other chemicals generally remained stable or showed a slightly increasing trend.

All of the COC concentrations in Well B5B have generally shown a stable or slightly decreasing trend since 2008. However, after a stable period from 2008 to 2015, PCE concentrations in Well B5B increased from 2015 to mid-2018, and decreased thereafter. Similar trends appear to be present in COI 5, with the exception of PCE, which has shown a generally increasing trend from 2009 to 2019. With these exceptions, most of the COCs in the B5 extraction wells display relatively stable or slightly decreasing trends.

Average chemical concentrations for the raw influent to the treatment plant are summarized in Table 6-17, together with the volume of water treated and the total mass removed per chemical. In these calculations, concentrations below the detection limit were treated as zero. For the compounds considered, approximately 286 pounds of chemical mass were removed from groundwater in 2019, which is less than the 345 pounds removed in 2018. Approximately 10,418 acre-feet of water were produced in 2019. Total mass removed by the B5 Plant

displayed an increasing trend until 2013, where a maximum of 770 pounds of contaminant were removed. Between 2013 and 2018, the total mass removed generally decreased due largely to the reduced groundwater rates; 7,036 gpm in 2013 to 5,451 gpm in 2018. Although the average production rate increased from 5,451 gpm in 2018 to 6,457 gpm in 2019, less chemical mass was removed in 2019 due to lower COC concentrations in extracted groundwater. During 2019, perchlorate, PCE and TCE accounted for approximately 83 percent of the mass removed, with 1,4-dioxane accounting for another 12.5 percent of the mass removed.

The SGVWC B5 Treatment Plant discharged approximately 656,500 gallons of wastewater from GAC backwashing to the LACSD sewer in 2019, with monthly average flow rate of 1.23 gpm. Brine flows are summarized in Table 6-18.

## 6.5 Subarea 3 – California Domestic Water Company Subproject

The average annual extraction rate for the CDWC was 10,426 gpm, exceeding the target extraction rate of 8,000 gpm. Approximately 16,827 acre-feet of groundwater were extracted and treated, of which approximately 68% was extracted from Wells 3 and 5A. An additional approximately 14% was from Well 2, with Well 8 accounting for 9% of the extracted water during 2019. Wells 6 and 10 accounted for 4% each. Well 14 did not operate during 2019.

The extraction wells were sampled at least once a month during 2019. Raw and treated water quality data for the CDWC Treatment Plant are provided in Table 6-19, which also includes the design and expected average influent concentrations and applicable MCLs and NLs for the COCs. Carbon tetrachloride, perchlorate and NDMA concentrations in Well 3 were above MCL/NLs throughout 2019. Concentrations of TCE and PCE in wells 3, 6, 5A and 10 were generally above their respective MCLs throughout the year. PCE and TCE concentrations exceeded the design concentrations (both of which are 20 µg/L) in the majority of samples from Well 10, and TCE concentrations in Well 3 were above its design concentration for most of the year. However, no COCs were detected in fully treated water above the respective MCLs or NLs. The only COC detected in fully treated water (Bassett Blend) samples in 2019 was TCE; however, all reported concentrations were below the MCL.

Figures 6-41 to 6-47 show raw and treated water concentration trends relative to the applicable MCL or NL. In general, COC concentrations in Wells 3 and 10 were higher than those observed in the other extraction wells during 2019. Concentrations of COCs showed stable or slightly decreasing trends, with the following exceptions. COC concentrations in Well 3 tended to display a slightly decreasing trend in the beginning of the year (until around April), followed by an increasing trend to around September, before decreasing for the remainder of the year. COC concentrations in Well 10 displayed a similar trend as Well 3, with a slightly more variability throughout the year. TCE and PCE concentrations in Wells 5A and 6, and carbon

tetrachloride in Well 5A were the only other COCs detected above their respective MCLs/NLs in the remaining extraction wells. The temporal trends during 2019 in Wells 5A and 6 for these compounds were stable or slightly decreasing.

The Bassett Blend treated water samples were analyzed for PCE, TCE, and carbon tetrachloride weekly and for NDMA every other week and 1,1-DCE and cis-1,2-DCE were analyzed for monthly. Treated water COC concentrations were below the MCLs/NLs throughout 2019.

Historical (2007 to 2019) trends for COCs in the CDWC extraction wells are presented in Figures B-29 to B-35 (Appendix B). 1,2-DCA has never been detected in any of the extraction wells. PCE and TCE concentrations in Well 3 and Well 6 show an increasing trend from 2007 until late-2013/mid-2014, after which concentrations began to decrease. PCE and TCE concentrations in the remaining extraction wells have been relatively stable, with the exception Well 14 and Well 10. In Well 14, PCE and TCE concentrations increased from around 1 µg/L in January 2012 to 20 µg/L in November 2012, followed by a general decrease to about 2 to 3 µg/L by the end of 2016. However, PCE and TCE concentrations have since increased with a maximum PCE concentration of 18 µg/L and maximum TCE concentration of 22 µg/L recorded in November 2018. PCE and TCE concentrations in Well 10 have been highly variable since regular monitoring began in June 2016 and no clear trend is apparent. Perchlorate concentrations in Well 14 increased from 2012 until the end of 2014, after which concentrations have displayed a decreasing trend until the beginning of 2018 and have since displayed an increasing trend through 2019. Well 3 has displayed a slightly increasing trend in perchlorate concentrations since 2008. Carbon tetrachloride concentrations in most of the extraction wells decreased from 2007 to 2012 and have been relatively stable since, with the exceptions of Wells 3 and 6, which continue to decrease. NDMA concentrations are generally below the NL since 2008, with the exception of Well 3, which displayed a steady decrease until about 2014 and has since shown a slightly increasing trend, despite more variability than observed in the past.

Average concentrations for the raw water influent to the treatment plant are summarized in Table 6-20. Mass removed during 2019 was calculated by using the average raw water concentration for each COC from each of the seven production wells and multiplying that result by the volume of water treated, with the appropriate dimensional conversion. In these calculations, concentrations below the detection limit were treated as zero. For the compounds considered, approximately 1,283 pounds of chemical mass were removed by the CDWC Treatment Plant in 2019. Total COC mass removal from CDWC had displayed a generally decreasing trend since 2014, before an increase was observed in 2018. The 2019 mass removal represented a decrease from the 2018 mass removal of 1,612 pounds, but was comparable to 2017 (1,201 pounds). The decrease in mass removal from 2018 to 2019 is a result in a decrease in the total volume of extracted groundwater, particularly related to a decrease from Wells 6

and 10, which tend have higher PCE and TCE concentrations and an increase in extraction from Well 2, which historically has lower COC concentrations. PCE and TCE represented approximately 32.5 percent and 47.3% of the mass removed, respectively, in 2019. Perchlorate represented another 14.1% of the total mass removed.

# 7. EVALUATION OF REMEDY PERFORMANCE AND TREATMENT PLANT OPERATIONS

The following sections summarize the performance of the BPOU remedial action including chemical mass removed by the groundwater extraction system, long-term trends in COC concentration in PSEP wells, plume migration control, and the operation and performance of the Subproject treatment plants.

## 7.1 Groundwater Extraction System Performance

As described in the PSEP and Section 3.0 of this report, the evaluation of remedy performance involves both short-term and long-term evaluation of groundwater extraction system performance. Annual PE Reports evaluate the short-term performance of the groundwater extraction system using groundwater modeling and empirical data to assess whether extraction well operation is limiting further migration of groundwater contamination into less contaminated areas.

The CRs completed detailed evaluations of groundwater extraction system performance in both Subareas 1 and 3 in 2012 and 2013, respectively. An evaluation of remedy performance for Subarea 1 was completed in August 2012 (CDM Smith, 2012) and an evaluation of the Subarea 3 remedy performance was completed in March 2013 (CDM Smith, 2013). In addition to an annual update of extraction system performance relative to hydraulic performance, this report includes statistical trend evaluations of COC concentrations in groundwater and estimates of COC mass in groundwater to aid in the evaluation of chemical mass removal in support of the overall performance of the remedy. Groundwater extraction system performance is discussed in the following sections.

### 7.1.1 Extraction Well Performance

The VCWD Lante, LPVCWD, SGVWC B6, and SGVWC B5 Subproject wells are generally capable of achieving the design extraction rates according to the BPOU extraction plan with the exception of the SGVWC B5B and B5E wells. The SGVWC wells B5B and B5E are currently unable to meet the EPA approved extraction rate due to reduced pumping capacity caused by lower water levels and/or a reduction of the specific capacity of the wells.

As noted earlier in this report, the VCWD Lante Treatment Plant did not meet EPA extraction rates in 2019 due primarily to the plant not being operational during the installation of an updated PLC system and startup testing of the rehabilitated Arrow Well. It is anticipated that the DDW will approve continuous operation of the Arrow Well in mid-2020 which will allow the VCWD Subproject to increase groundwater extraction and mass removal to supplement extraction from the existing extraction wells SA1-1 and SA1-3.

### 7.1.2 Groundwater Extraction and Chemical Mass Removal

The VCWD, LPVCWD, SGVWC B6, SGVWC B5, and CDWC Treatment Plants were all operational in 2019.

- In 2019, VCWD only treated 810 acre-feet of water in 2019, due to the plant being offline most of the year related to PLC upgrades and other plant improvements. Startup testing of the Arrow Well was completed in December and the plant achieved an average flow rate of 3,980 gpm (approximately 66 percent of the approved extraction rate) that month;
- The LPVCWD Treatment Plant achieved an annual average extraction rate of 2,355 gpm, which exceeded the EPA-approved extraction rate of 2,250 gpm. LPVCWD operated using LPVCWD 2 and LPVCWD 3 as the primary extraction wells in 2019;
- The SGVWC B6 Treatment Plant operated at an annual average flow rate of 6,543 gpm, which also exceeded the EPA-approved extraction rate of 6,500 gpm;
- The SGVWC B5 Treatment Plant operated at an annual average flow rate of 6,543 gpm, which was 92 percent of the 7,000 gpm annual target due to reduced pumping capacity from the B5B and B5E wells caused by lower water levels and/or a reduction of the specific capacity of the wells and a decision by SGVWC to reduce pumping during winter months due to low water demand. Rehabilitation of the Well B5E was completed in February 2019 and resulted in an increased production rate from that well in 2019;
- The CDWC Treatment Plant operated at an annual average flow rate of 10,426 gpm, which exceeded the minimum extraction rate of 8,000 gpm for the Bassett Wellfield requested by EPA; and
- Overall, BPOU extraction from the combined BPOU treatment facilities averaged 26,239 gpm on an annual basis, which is below the EPA-approved extraction rate of 29,750 gpm, largely due to the VCWD Subproject being offline for most of the year.

The chemical mass removed at the VCWD Lante, LPVCWD, SGVWC B6, SGVWC B5, and CDWC Treatment Plants were 22 pounds, 482 pounds, 3,661 pounds, 286 pounds, and 1,283 pounds, respectively (Table 7-1). The BPOU project-wide total mass removed in 2019 was 5,734 pounds. Since 2004, the cumulative chemical mass removed is 94,118 pounds (Table 7-1).

Table 7-1 also presents a summary of the mass removal rate in terms of pounds of COCs removed per 1,000 gpm of groundwater extracted as an indicator of mass removal efficiency. The flow-weighted mass removal rate (mass removed/groundwater extracted) in 2019 was 217 pounds (lbs)/1,000 gpm, which is higher than 2017 and 2018 (approximately 166-188

lbs/1,000 gpm) and comparable to that achieved in 2016 (211 lbs/1,000 gpm). A summary of mass removal for the various BPOU subprojects is provided below:

- VCWD Subproject mass removal efficiency increased from 2005 to 2009, peaked in 2011 at around 1,700 lbs/1,000 gpm, decreased sharply from 2011 to 2017, and has shown a steady or slightly decreasing trend since 2017;
- LPVCWD Subproject mass removal efficiency displayed a slightly decreasing trend from 2007 to 2018, but an increase was observed in 2019;
- B6 Subproject mass removal efficiency has displayed a slightly increasing trend since 2005. Despite a decrease in removal efficiency observed in 2018, the mass removal efficiency for the B6 project rebounded strongly in 2019, recording its highest efficiency to date;
- B5 Subproject mass removal efficiency increased slightly from 2005 to 2013, after which a slightly decreasing trend has been observed; and
- CDWC Subproject mass removal efficiency has displayed a relatively stable trend since 2014.

Project-wide, mass removal rates peaked in 2009-2011, followed by a decreasing trend until 2014 and has since remained relatively stable around 200 lbs/1000 gpm. The overall decrease in mass removal rates in 2019 is largely a representation of reductions in COC concentrations in groundwater, particularly within Subarea 1. Mass removal rates over time for the subprojects are shown in Figure 7-1.

#### *7.1.2.1 Trends in COC Concentrations and Chemical Mass in Groundwater*

Short-term spatial trends in groundwater quality in the BPOU as observed during 2019 are presented in Section 5.3.1. Short-term changes in groundwater quality are observed seasonally and from year-to-year. These short-term changes occur primarily in response to variations in both local and regional groundwater flow conditions throughout the basin. Long-term trends in groundwater quality are difficult to discern at specific locations within the COC plumes due to seasonal changes in groundwater levels and flow directions and the localized influences of groundwater pumping from various production and extraction wells. As a result, the PSEP outlines an approach for evaluating short-term changes in groundwater quality and extraction system performance in Annual Performance Evaluation reports.

Although the evaluation of groundwater quality trends and extraction system performance presented in this annual PE report are not specifically intended to be used to develop conclusions regarding long-term trends in groundwater quality and extraction system performance, information provided herein will be used to support the evaluation of overall

remedy performance. As described in the CRs responses to EPA comments on the 2017 Annual PE Report, since the previous Subarea 1 and 3 remedy evaluations were completed in 2012 and 2013, the CRs have added detailed evaluations of performance data to the annual PE reports to provide much of the same information provided in the 2012 and 2013 remedy evaluations. These additional detailed evaluations include: 1) Mann-Kendall trend analysis of target COC concentrations in project monitoring wells to statistically evaluate temporal changes in COC concentrations, 2) estimates of the dissolved chemical mass remaining in groundwater to track changes in mass removal trends, and 3) development of TCOC concentration maps to provide a composite evaluation of changes in the distribution of COCs in groundwater. As a result, these additional evaluations of performance data combined with the other components of the annual PE reports including continued refinements to model simulations of groundwater capture satisfy the requirements of the more detailed Five-Year remedy evaluations described in the Performance Standards Evaluation Plan.

#### *7.1.2.2 Evaluation of COC Concentration Trends in PSEP Wells*

The Mann-Kendall statistical analysis was performed to evaluate long-term trends in concentration for the six selected COCs (1,4-dioxane, carbon tetrachloride, NDMA, perchlorate, PCE, and TCE) for the majority of the wells in the PSEP for the period 2004 through 2019.

The Mann-Kendall analysis is a rank based, non-parametric test used to detect trends in time series data. The Mann-Kendall test calculates a statistic, S, that represents the sum of the differences between the number of observations that are increasing or decreasing relative to earlier observations when arranged in a temporal order. The difference between one observation and an earlier observation is computed and assigned a value of 1 if the difference is positive, -1 if negative, and zero if there is no difference. If S is a sufficiently large, positive sum, the Mann-Kendall analysis indicates an increasing trend. Alternatively, if S is a sufficiently large, negative sum, then a decreasing trend is indicated. Once the observed S test statistic is calculated from the data, the probability of observing a test statistic at least as extreme as the one actually observed is calculated (“p-value”), and the confidence in the test statistic is calculated as (1 – p-value). Finally, the decision matrix below was used to make conclusions based on the confidence of the S test statistic. Further detail on the Mann-Kendall method is included in Appendix C.

| Mann-Kendall Statistic (S) | Confidence in Trend | Concentration Trend |
|---|---|---|
| S>0 | >95% | Increasing |
| S>0 | 90% - 95% | Probably Increasing |
| S>0 | <90% | No Trend |
| S≤0 | <90% and COV≥1 | No Trend |
| S≤0 | <90% and COV<1 | Stable |
| S<0 | 90% - 95% | Probably Decreasing |
| S<0 | 95% | Decreasing |

Figures 7-2 through 7-19 show the distribution of individual COCs in groundwater within the BPOU for elevation intervals between the water table and -200 feet msl, between -200 and -500 feet msl, and below -500 feet msl, and calculated Mann-Kendall concentration trends for the majority of PSEP monitoring wells.

Appendix C includes the detailed Mann-Kendall statistics and calculated trend for each COC in the PSEP monitoring points. Tables C-1 through C-6 show the Mann-Kendall statistical parameters and trend results for the six COCs for all PSEP monitoring points. Charts showing the COC time-concentration trends for all PSEP multiport monitoring wells, trend line, Mann-Kendall trend statistic, and calculated trend are included in Appendix C, chart groups C-1 through C-6. The charts are organized by Subareas 1 and 3 and by the depth intervals described above. Non-detect results are treated as follows: the lowest method detection limit associated with the non-detect results is divided by 2, and this value is used as the result for all non-detects. This prevents a non-detect result that has a reporting limit higher than the minimum detected result giving rise to an apparent increasing trend.

Summary statistics for COC concentration trends calculated using the Mann-Kendall statistical analysis are presented in Table 7-2 and the spatial locations of these trends are displayed in plan view on Figures 7-2 through 7-19. Because not all well locations have results for each of the six COCs, the number of sample results for each area and COC varies. Therefore, interpretations for the collective six COCs are described below to represent the range of results for various areas and COCs (see Table 7-2 for underlying data for individual COCs by subarea and BPOU-wide).

For the BPOU as a whole, the Mann-Kendall statistical evaluation was performed on 28,010 samples collected from 2004 – 2019 at 491 sampling locations for the six primary COCs. The following summarizes the Mann-Kendall statistics for the six COCs in combination, organized by depth intervals (the shallow depth interval above -200 feet msl, the intermediate depth interval between -200 and -500 feet msl, and the deep interval below -500 feet msl). In the

shallow interval of the BPOU, approximately 59% of the sampling locations showed decreasing concentrations whereas approximately 6% were increasing. In the intermediate interval of the BPOU, approximately 45% of the sampling locations showed decreasing concentrations whereas approximately 41% were increasing. In the deep interval of the BPOU, approximately 16% of the sampling locations showed decreasing concentrations whereas approximately 47% were increasing.

Examination of the Mann-Kendall trends in Table 7-2, Figures 7-2 through 7-19, and in Appendix C leads to the following observations and general conclusions regarding COC concentration trends in Subarea 1, Subarea 2 (mid-plume area), and Subarea 3.

**SUBAREA 1**

The following presents the summary of Mann-Kendall trend statistics for the 6,565 samples collected from 258 sampling locations for the six primary COCs in combination in Subarea 1 from 2004 – 2019. In the shallow interval of Subarea 1, approximately 59% of the sampling locations show decreasing concentrations whereas approximately 2% are increasing. In the intermediate interval of Subarea 1, approximately 64% of the sampling locations show decreasing concentrations whereas approximately 18% are increasing. In the deep interval of Subarea 1, one of the sampling locations show an increasing trend; the other 11 sample locations have no discernable concentration trend. Compared to 2018, there was an increase in the percentage of sampling locations that showed decreasing trends at all elevation intervals in Subarea 1, corresponding with either a decrease or no change in the percentage of locations that showed increasing trends.

***Wells Located within Subarea 1***

Monitoring wells within Subarea 1 include MW5-03, MW5-11, MW5-13, MW5-17, MW5-18, Whico MP-3, AJ-, and ALR- monitoring wells, and are considered to be general indicators of the quality of groundwater that is flowing toward downgradient extraction wells installed for the VCWD Lante Subproject. The following describes the trends observed for the COCs in specific monitoring wells in Subarea 1 based on the Mann-Kendall statistical evaluation presented on Figures 7-2 through 7-19:

- The concentration trends for 1,4-dioxane, carbon tetrachloride, and NDMA continue to be stable or decreasing in most monitoring points. The trend for 1,4-dioxane in Port 3 of MW5-13 in the shallow elevation interval is probably increasing, but this indicates an improvement from the increasing trend observed in 2018. Concentrations of these COCs are near or below the MCLs in most monitoring points, except for 1,4-dioxane in Port 3 of MW5-11, located in the shallow interval of the southern portion of Subarea 1;

- The concentration trend for perchlorate in these wells continues to be generally decreasing. The only exceptions are Port 3 of MW5-03 in the intermediate elevation interval, which shows an increasing trend, and Port 1 of MW5-17 in the shallow elevation interval, which is probably increasing. Concentrations of perchlorate are near or below the MCLs in most Subarea 1 monitoring points, except wells AJ MW-4 and MW5-03; and
- The concentration trends for PCE and TCE are generally stable or decreasing and below MCLs in all monitoring points, with the exceptions of Port 1 of MW5-18 in the intermediate elevation interval, which shows an increasing trend for PCE, and Port 1 of MW5-03 in the deep interval, which shows an increasing trend for TCE. Concentrations of PCE and TCE are below the MCLs in most monitoring points in the intermediate and deep elevation intervals of Subarea 1.

**SUBAREA 2**

The following presents the summary of Mann-Kendall trend statistics for the 5,990 samples collected from 301 sampling locations for the six primary COCs in combination in Subarea 2 from 2004 – 2019. In the shallow interval of Subarea 2, approximately 63% of the sampling locations show decreasing concentrations whereas approximately 6% are increasing. In the intermediate interval of Subarea 2, approximately 55% of the sampling locations show decreasing concentration trends whereas approximately 29% are increasing. In the deep interval of Subarea 2, approximately 29% of the sampling locations show decreasing concentration trends whereas approximately 43% are increasing; it should be noted that only 7 of the 54 sample locations in the deep interval had discernable concentration trends. Compared to 2018, there was an increase in the percentage of sampling locations that showed decreasing trends at all elevation intervals in Subarea 2, corresponding with either a decrease or no change in the percentage of locations that showed increasing trends.

***Wells Located within Subarea 2, Immediately Downgradient of Subarea 1***

Monitoring wells located within Subarea 2, immediately downgradient of Subarea 1, include MW5-01, MW5-24, and MW5-25, and are considered to be general indicators of the quality of groundwater that is located immediately downgradient of Subarea 1 extraction wells installed for the VCWD Lante Subproject. The following describes the trends observed for the COCs in specific monitoring wells in this portion of Subarea 2 based on the Mann-Kendall statistical evaluation presented on Figures 7-2 through 7-19:

- The concentration trends for 1,4-dioxane, carbon tetrachloride, and NDMA are predominantly stable or decreasing in these monitoring wells, with the exception of

Port 1 of MW5-24 located below -500 feet msl, which shows a slight increasing trend for 1,4-dioxane over all historical data. Concentrations of these COCs are near or below the MCLs in most Subarea 2 monitoring points, except for 1,4-dioxane in Ports 1, 2, and 7 of MW5-24, and carbon tetrachloride in Ports 1 and 2 of MW5-24 and Port 1 of MW5-25;

- The concentration trends for perchlorate in MW5-01, MW5-24, and MW5-25 in the elevation intervals above -200 feet msl and between -200 and -500 feet msl continue to be predominantly decreasing. The only exceptions are for perchlorate in well MW5-25, which is increasing in the intermediate ports (Ports 3 and 4) and deeper Port 2, and in well MW5-01, which is increasing in deeper Port 5; and
- The concentration trends for PCE and TCE in the monitoring points located above -200 feet msl and between -200 and -500 feet msl are generally stable or decreasing and are below MCLs in MW5-25. The only exception is an increasing trend for PCE in Port 3 of MW5-25; however, the concentrations of PCE are consistently below the MCLs. Due to a low frequency of detection, statistical trends were not calculated for PCE and TCE below -500 feet msl. Concentrations of PCE and TCE are predominantly not reported or below the MCLs in wells MW5-01 and MW5-25 and in the deep Ports 1 and 2 of MW5-24.

***Wells Located within Subarea 2, Mid-Plume Area***

Monitoring wells located within the mid-plume area of Subarea 2, downgradient of Subarea 1 and upgradient of Subarea 3 include MW5-05, MW5-08, and MW5-15. These wells are considered to be general indicators of the quality of groundwater that is flowing downgradient toward the SGVWC B6, LPVCWD, and CDWC Subproject extraction wells. The ports in these wells show varying COC concentration trends across the three elevation intervals based on the Mann-Kendall statistical evaluation presented on Figures 7-2 through 7-19 as summarized below:

- The concentration trends for all COCs in well MW5-15, located in the eastern portion of the plumes, are predominantly decreasing in the elevation intervals above -200 feet msl and between -200 and -500 feet msl;
- Concentration trends for 1,4-dioxane, carbon tetrachloride, NDMA, and perchlorate in well MW5-08, located in the western portion of the plumes, are generally stable to decreasing, although some trends were not calculated due to infrequency of detections. Concentration trends for PCE and TCE in this well in the interval -200 to -500 feet msl are either stable or increasing, with the exception of Port 1, which was not calculated; and

- In well MW5-05, located in the center of the plumes, several increasing trends are observed in the elevation intervals above -200 feet msl and between -200 and -500 feet msl. However, concentration trends for all COCs are decreasing in Port 3 in the shallow interval. In addition, the trend for carbon tetrachloride is stable in Port 1 in the intermediate interval and probably increasing in Port 2 in the shallow interval, which indicates an improvement from the increasing trend observed in this port in 2018. Concentration trends were not discernable for perchlorate and PCE in Port 4 and for PCE and TCE in Port 2.

**SUBAREA 3**

The following presents the summary of Mann-Kendall trend statistics for the 15,473 samples collected from 339 sampling locations for the six primary COCs in combination in Subarea 3 from 2004 – 2019. In the shallow interval of Subarea 3, approximately 50% of the sampling locations show decreasing concentrations whereas approximately 18% are increasing. In the intermediate interval of Subarea 3, approximately 36% of the sampling locations show decreasing concentrations whereas approximately 52% are increasing. In the deep interval of Subarea 3, approximately 15% of the sampling locations show decreasing concentrations whereas approximately 46% are increasing. Compared to 2018, there was an increase in the percentage of sampling locations that showed decreasing trends at all elevation intervals in Subarea 3. Except for the intermediate interval between -200 and -500 feet msl, there was either a decrease or no change in locations that showed increasing trends.

***Wells Located Within Subarea 3, Upgradient of SGVWC B5 and CDWC Extraction Wells***

Monitoring wells located within Subarea 3, upgradient of the SGVWC B5 and the CDWC extraction wells include MW5-19, MW5-20, and MW5-23. These wells are considered to be general indicators of groundwater quality flowing toward the SGVWC B5 and CDWC Bassett extraction wells. The ports in these wells show varying COC concentration trends across the three elevation intervals based on the Mann-Kendall statistical evaluation presented on Figures 7-2 through 7-19 as summarized below:

- Concentration trends for 1,4-dioxane were not calculated for most monitoring points in wells MW5-20 and MW5-23 due to infrequency of detections, except for intermediate Ports 3 to 5 at MW5-20 and Ports 3 and 4 at MW5-23, which showed stable to increasing trends, and shallow Port 5 at MW5-23, which was probably decreasing. Concentration trends for carbon tetrachloride in these wells were predominately decreasing or not calculated, and concentration trends for NDMA and perchlorate were decreasing in the shallow interval in Port 6 of MW5-20 and Port 5 of MW5-23, but varied from increasing to decreasing in the intermediate and deep

intervals. Concentration trends for PCE and TCE varied from increasing to decreasing, but were generally near or below the MCLs, except for TCE in the intermediate ports of MW5-19, MW5-20, and the deep Port 2 of MW5-23.

- Concentration trends in MW5-19, located near the extraction wells, are decreasing for NDMA, perchlorate and TCE, stable for PCE, and probably decreasing for 1,4-dioxane in Port 5 in the shallow interval. Concentration trends in the intermediate interval in Ports 3 and 4 are decreasing for carbon tetrachloride and increasing for perchlorate, PCE, and TCE; the concentration trend for NDMA in Port 4 is also increasing. The remaining concentration trends in MW5-19 were not calculated due to a low frequency of detections, including all COCs except perchlorate in Port 6 in the shallow interval, and all COCs in Ports 1 and 2 in the deep interval.

***Wells Located Within Subarea 3, Downgradient of SGVWC B5 and CDWC Extraction Wells***

Monitoring wells located within Subarea 3, downgradient of the SGVWC B5 and CDWC extraction wells, include MW5-26 and MW-27. These wells are considered to be general indicators of groundwater quality downgradient from the SGVWC B5 and CDWC extraction wells, and the BPOU project as a whole. In 2019, monitoring results for these wells were generally consistent with previous years, with either non-detect results or detected concentrations below applicable MCLs or NLs. Since 2005, COC concentrations in these wells have generally been below laboratory reporting limits with the exception of infrequent and inconsistent detections of various COC, which are typically at concentrations below MCLs or NLs. These trends indicate that there has been no significant migration of COC mass southwest of the Subarea 3 extraction wells and CDWC wells. In addition, with the exception of PCE and TCE in COI 5, concentrations of COCs are relatively stable in COI 5 and CDWC, near the terminus of the BPOU plume.

#### *7.1.2.3 Evaluation of Chemical Mass in Groundwater in the BPOU*

Mass removal rates based on influent groundwater concentrations to the various subproject treatment systems have generally declined since 2010 (Table 7-1 and Appendix B). To further evaluate in-situ changes in chemical mass within groundwater in the BPOU over time, estimates of the remaining chemical mass dissolved in groundwater in the BPOU were developed. For the period between 2004 and 2014, annual mass estimates were calculated from the total volume of each isoconcentration shell of each of the 6 primary COC plumes using the EarthVision® geospatial modeling software, and multiplying the volumes by an assumed effective porosity value of 0.20 and by the median COC concentration in each isoconcentration shell.

Starting in 2015, as described in the 2015 Annual PE Report, the dissolved chemical mass remaining in groundwater was calculated using a new modeling approach based on the EVS® modeling software. The EVS® software more accurately estimates plume mass because it explicitly calculates chemical mass based on the interpolated concentrations within the model grid cells and an assumed effective porosity (0.20).

In the EVS® model, the mass of remaining COCs was calculated using the following equation:

$$\text{Mass in Groundwater} = \sum C_i . V . n$$

where:

$C_i$ = concentration of COC, per cell, in groundwater

V = the volume of the cell

n = effective porosity of the soil (0.20)

Following the calculation of the COC masses in each model grid cell, the COC masses in each cell were summed to arrive at a total mass for the entire area for each compound.

The estimates for remaining dissolved mass for each COC and the total dissolved COC mass are shown in Table 7-3. The estimated total dissolved COC mass is also shown on Figure 7-20. As described in the 2016 Annual PE Report, due to the differences in methodologies used for estimation of dissolved COC mass between EarthVision® and EVS, the pre-2014 mass estimates are not comparable to the post-2014 estimates.

The estimated remaining total dissolved COC mass in 2019 was 48,107 pounds. As shown in Figure 7-20, between 2015 and 2017, the total estimated dissolved COC mass indicated a decreasing trend similar in magnitude to the long-term decreasing trend beginning in 2006. Since 2017, the total dissolved COC mass estimated using the EVS® model has remained relatively unchanged. The estimated dissolved masses of 1,4-dioxane, perchlorate, and PCE increased slightly from 2018 to 2019. These slight increases may be in part related to the increasing water levels in the basin and are within the level of uncertainty associated with the supporting data and methods used to estimate the in situ chemical mass in groundwater.

Between 2015 and 2019, the estimated total dissolved COC mass calculated using the EVS model decreased by approximately 24,699 pounds, corresponding to an average annual COC mass removal rate of approximately 6,175 pounds. As shown in Table 7-1, the total estimated dissolved COC mass removed by the BPOU project extraction wells from 2015 to 2019 was approximately 26,295 pounds, corresponding to an average annual COC mass removal rate of approximately 5,229 pounds per year. Therefore, the total estimated dissolved COC mass removal predicted by the model for 2015 through 2019 is approximately 18% higher than the actual mass removal from the project wells. Despite the difference in simulated total dissolved

COC mass removed based on the EVS® model compared to the actual mass removed based on influent groundwater concentrations to treatment plants (Table 7-1), we believe that EVS® model-based mass estimates provide a useful method to support the evaluation of long-term temporal trends in COC mass dissolved in groundwater in the BPOU. Because of the apparent sensitivity of the mass estimation methodology to changes in COC concentrations, we believe that the methodology is best utilized to evaluate long-term trends rather than short-term changes in plume mass from year to year.

### 7.1.3 Assessment of Migration Control

As described in the PSEP, the BPOU groundwater model is the primary tool for assessing extraction system performance. Evaluations of extraction system performance were performed using the updated BPOU groundwater model and forward particle tracking based on actual pumping and water level conditions for the five-year period from MY 2014-15 through MY 2018-19. Because particle tracking simulations only cover a five-year period which may or may not be indicative of long-term aquifer conditions, particle tracking results based on short-term (five year) simulations of groundwater flow are subject to various limitations and should not be considered representative of long-term extraction system performance.

Based on the evaluation of equipotential contours (Figures 5-19 through 5-26) and forward particle tracking results (Figures 5-27 through 5-32), the general observations regarding extraction system performance are described below:

- The operation of the VCWD Subproject had a limited effect on hydraulic control and chemical mass removal in 2019 as compared to prior years due to the plant being offline for most of the year. It should be noted that the hydraulic capture shown by the particle tracking results on Figures 5-27 and 5-28 represents average pumping conditions of about 1,940 gpm over five years from MY 2014-15 to MY 2018-19 and is not representative of pumping conditions in 2019. We anticipate that the VCWD Subproject will be able to meet the target extraction rate and achieve improved hydraulic containment beginning in mid-2020 following DDW approval of the continuous operation of the Arrow Well;
- The SGVWC B6 Subproject extraction wells achieved sustained production above the EPA approved extraction rates and continue to provide significant hydraulic control as shown by the five-year particle tracking results (Figures 5-29 through 5-32);
- Despite production from the SGVWC B5 Subproject continuing below the EPA-approved extraction rate of 7,000 gpm, increased production from the SGVWC B5 extraction wells combined with the operation of the CDWC production wells continue to provide significant hydraulic control in the downgradient portion of Subarea 3 as

demonstrated by the five-year particle tracking simulation results (Figure 5-29 through 5-32);

- The operation of La Puente Valley County Water District (LPVCWD) extraction well(s) continue to provide consistent hydraulic control and chemical mass removal throughout the five-year particle tracking simulation period;
- The CDWC Subproject wells continue to provide effective hydraulic control and chemical mass removal in Subarea 3 throughout the five-year particle tracking simulation period; and
- Consistent with previous years, operation of the COI 5 extraction well provided limited benefit related to hydraulic control or chemical mass removal when compared to other project extraction wells. As shown on Figure 5-30, the COI 5 well is interpreted to be located at the southern terminus of the TCOC plume contour of 1 (unitless) in the depth interval extending from -200 to -500 feet msl. As a result, the lateral and vertical extent of COC concentrations exceeding MCLs or NLs in the vicinity of the COI 5 well appears to be limited.

In summary, the overall performance of project extraction wells continued to limit the migration of COCs in groundwater and removed chemical mass consistent with the Performance Standards established in the PSEP.

## 7.2 Treatment System Operations

The treatment plant operations that were described in detail earlier in this report are summarized below.

### 7.2.1 Subarea 1 – Valley County Water District Lante Subproject

The VCWD Lante Treatment Plant operated under its DDW drinking water permit and delivered most of the fully treated water to SWS. The VCWD Subproject extracted and treated groundwater at an annual rate of about 459 gpm, which was approximately 8 percent of the target groundwater extraction rate. This was largely due to the plant being offline most of the year for the installation of an updated PLC system and startup testing of the rehabilitated Arrow Well. It is anticipated that the DDW will approve continuous operation of the Arrow Well in mid-2020 which will allow the VCWD Lante Subproject to increase groundwater extraction and mass removal. In the meantime, it anticipated that the VCWD Subproject will continue to extract and treat groundwater utilizing existing extraction wells SA1-1 and SA1-3.

Treatment plant modifications and other operational improvements are discussed in Section 2.1; operational problems and other issues that impacted operations and performance in 2019 are described in Section 4.1. Future operational improvements include:

- VCWD will address peroxide quenching issues at the VCWD Treatment Facility.

### 7.2.2 Subarea 3 – La Puente Valley County Water District Subproject

The LPVCWD Subproject extracted and treated groundwater at an annual rate of about 2,355 gpm, which met the extraction target of 2,250 gpm. The plant reliably treated raw water to drinking water standards for all COCs.

Treatment plant modifications and other operational improvements are discussed in Section 2.2.1; operational problems and other issues that impacted operations and performance in 2019 are described in Section 4.2. Future operational improvements include:

- LPVCWD will submit a permit amendment request to DDW to modify the air to water ratio requirement for Air Stripper No. 2, add a nitrate treatment system, approve PSR II Plus resin for treatment of perchlorate, and update the OM&M plan.

### 7.2.3 Subarea 3 – San Gabriel Valley Water Company B6 Subproject

The SGVWC B6 Treatment Plant operated at an annual average flow rate of 6,543 gpm, which met the EPA-approved extraction rate of 6,500 gpm. The plant reliably treated raw water to drinking water standards for all COCs.

Treatment plant modifications and other operational improvements are discussed in Section 2.2.2; operational problems and other issues that impacted operations and performance in 2019 are described in Section 4.3. Future operational improvements include:

- SGVWC will perform inspections of the Plant B6 air strippers and will continue the UV demonstration project.

### 7.2.4 Subarea 3 – San Gabriel Valley Water Company B5 Subproject

The SGVWC B5 Treatment Plant operated at an average annual flow rate of 6,457 gpm, which was 92 percent of the 7,000 gpm annual target. Production has recently been hampered by lower pumping capacity of the B5B and B5E wells caused by lower water levels and/or a reduction of the specific capacity of extraction wells and a decision by SGVWC to reduce pumping during winter months due to low water demand. However, SGVWC rehabilitated Well B5E in 2019, resulting in an increased production rate from that well. The plant reliably treated raw water to drinking water standards for all COCs.

Operational improvements are described in Section 2.2.3 and operational problems and other issues that impacted operations and performance in 2019 are described in Section 4.4. There are no significant operational improvements for SGVWC B5 plant currently planned for the future.

### 7.2.5 Subarea 3 – California Domestic Water Company Treatment Plant

The CDWC Treatment Plant operated at an average annual flow rate of 10,426 gpm, which exceeds the EPA target extraction rate of 8,000 gpm. The plant reliably treated raw water to drinking water standards for all COCs.

Treatment plant modifications and other operational improvements are described in Section 2.2.4; operational problems and other issues that impacted operations and performance in 2019 are described in Section 4.5.

## 8. SUMMARY AND RECOMMENDATIONS

In 2019, most BPOU subproject extraction wells continued to limit the migration of COCs in groundwater and remove chemical mass consistent with the remedial objectives established in the UAO. A notable exception are the VCWD Lante subproject extraction wells which had a limited effect on hydraulic control and chemical mass removal in 2019 as compared to prior years due to the extraction wells and treatment plant being offline for most of the year.

From the Mann-Kendall statistical evaluation summarized in Section 7.1.2.2, the relatively low percentage of sampling points with increasing concentrations in Subarea 1 as compared to Subareas 2 and 3 is consistent with previously reported observations regarding decreasing COC concentrations in Subarea 1. The slightly higher percentage of sampling locations with increasing concentration trends in Subareas 2 and 3 is consistent with the downgradient migration of dissolved chemical mass in groundwater from areas of formerly higher COC concentration (Subarea 1) to downgradient areas with lower COC concentrations (Subareas 2 and 3).

As described in Section 7.1.2.3, the total dissolved COC mass removed in the BPOU calculated by the EVS® geospatial modeling software was within 18% of the actual estimated COC mass removed by the project extraction wells. The estimates of remaining chemical mass in groundwater post-2014 continue to demonstrate a general decreasing trend in chemical mass dissolved in groundwater within the BPOU consistent with the long-term trend observed since 2004. This decrease is also reflected in the mass removal rates observed at the treatment plants (Table 7-1 and Figure 7-1). Mass removal rates peaked in 2009-2011 and have since declined, largely reflecting reductions in COC concentrations in groundwater, particularly within Subarea 1.

Recommendations and operational issues to be addressed for the BPOU in 2020 include:

- Begin full time operation of the Arrow Well at the VCWD Lante Treatment Plant as part of the implementation of the modified extraction plan for Subarea 1 that was approved by EPA in 2013. This modified extraction plan requires groundwater extraction from the Arrow and Lante (SA1-3) wells at 5,000 gpm with an additional 1,000 gpm of groundwater extraction from SA1-1. Given that COC concentrations in SA1-1 are now consistently below MCLs/NLs, it is recommended that benefits of continued operation of SA1-1 be re-evaluated in consultation with EPA after the Arrow Well is operational on a continuous basis;
- LPVCWD is currently working with DDW to permanently approve the air-to-water ratio on Air Stripper No. 2 and anticipates being able to operate at approximately 2,500 gpm to continue to meet the EPA annual target flow rate of 2,250 gpm;

- Continue to evaluate alternatives to increase pumping in SGVWC B5 Subproject wells during periods of low basin water levels and evaluate the reason for reduced extraction rates in certain wells;
- Continue to track carbon and resin change outs and provide disposal certificates to EPA in the monthly progress reports; and
- Continue to evaluate and improve operational efficiency of the LPVCWD, VCWD Lante, SGVWC B6, SGVWC B5, and CDWC Subprojects.

**Notes:**
[1] - Average production rates estimated by dividing the total monthly well production by the number of minutes in each month.
gpm - gallons per minute.
1 acre-foot = 325,851 gallons.
* - There is a discrepancy between production figures reported by La Puente and San Gabriel for well COI #5. La Puente reported 145.91 AF. The San Gabriel value is reported.

[a] Sampling frequency:
BIE (Biennial - every two years; odd number years)
A (Annual)
SA (Semi-annual)
Q (Quarterly)
M (Monthly)
BIW (Biweekly)
TIE (Triennial - every three years)

[b] TIC analysis annually

[c] Non-volatile synthetic organic chemicals - includes Ethylene Bromide

[d] DDW VOC analyses required for only 1,2-DCA, CTC, PCE, and TCE. DDW required VOC analyses will be used to satisfy PSEP requirement.

[e] Multiport well needs to be sampled for PSEP requirement when DDW does not sample biennially.

**Notes:**

a. Q3 = Third quarter; July, August, September
b. Q4 = Fourth quarter; October, November, December
c. Q1 = First quarter; January, February, March
d. Q2 = Second quarter; April, May, June

Recharge values obtained from Los Angeles County Department of Public Works. Q4, Q1, and Q2 data for current reporting period considered provisional and are subject to revision in subsequent report.

**Notes:**

Recharge zones represent precipitation areas in California Department of Water Resources (DWR) Bulletin No. 104-2, Appendix A: Geohydrology, 1966. Precipitation zones are characterized by the measured long-term average annual precipitation amounts.

Recharge volumes represent the total recharge rate from precipitation and irrigated return flows over the area of each recharge zone in the groundwater flow model.

In 2019, recharge values were recalculated for all model years based on the methodology described in the 2016 report "*Estimating Spatially and Temporally Varying Recharge and Runoff from Precipitation and Urban Irrigation in the Los Angeles Basin, California*" by the United States Geological Survey (USGS). Return flows were reduced by a scaling factor to better match the lower values determined by the USGS report. The scaling factor was then adjusted during calibration to better match observed data.

Q1 = First quarter: January, February, March; Q2 = Second quarter: April, May, June; Q3 = Third quarter: July, August, September; Q4 = Fourth quarter: October, November, December

1. Average quarterly precipitation calculated from daily precipitation totals measured at 14 stations in the San Gabriel Basin. Daily measurements provided by Los Angeles County Department of Public Works.

**Notes:**
1 - Average production rates estimated by dividing the total monthly well production by the number of minutes in each quarter.
gpm - gallons per minute.
1 acre-foot = 325,851 gallons.
NA - Not Applicable.

# TABLE 5-1
# 2019 VERTICAL HYDRAULIC GRADIENTS
Baldwin Park Operable Unit
San Gabriel Valley, California

**Subarea 1**

| Date | Groundwater Elevation (ft msl)[a] PZ1-1BS | PZ1-1BD | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 6/11/2019 | 208.57 | 209.02 | 350.00 | -1.3E-03 |
| 12/20/2019 | 222.94 | 223.34 | | -1.1E-03 |

| Date | Groundwater Elevation (ft msl)[a] MW 5-03 Port 9 | MW 5-03 Port 1 | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 2/1/2019 | 187.82 | 188.17 | 850.00 | -4.1E-04 |
| 5/21/2019 | 203.72 | 204.50 | | -9.2E-04 |
| 12/10/2019 | 220.00 | 221.16 | | -1.4E-03 |

**Subarea 2**

| Date | Groundwater Elevation (ft msl)[a] MW 5-01 Port 13 | MW 5-01 Port 1 | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 2/1/2019 | 186.09 | 182.85 | 1280.00 | 2.5E-03 |
| 6/21/2019 | 199.17 | 201.39 | | -1.7E-03 |
| 12/12/2019 | 214.40 | 215.93 | | -1.2E-03 |

| Date | Groundwater Elevation (ft msl)[a] MW 5-24 Port 7 | MW 5-24 Port 1 | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 5/28/2019 | 199.22 | 199.66 | 920.00 | -4.8E-04 |
| 12/11/2019 | 215.12 | 215.07 | | 5.4E-05 |

| Date | Groundwater Elevation (ft msl)[a] MW 5-25 Port 7 | MW 5-25 Port 1 | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 5/25/2019 | 199.74 | 199.41 | 900.00 | 3.7E-04 |
| 12/11/2019 | 215.02 | 215.14 | | -1.3E-04 |

**Subarea 3**

| Date | Groundwater Elevation (ft msl)[a] PZ3-1BS | PZ3-1BD | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 6/11/2019 | 179.57 | 177.70 | 425.00 | 4.4E-03 |
| 12/20/2019 | 194.92 | 192.77 | | 5.1E-03 |

| Date | Groundwater Elevation (ft msl)[a] MW 5-20 Port 7 | MW 5-20 Port 1 | Vertical Distance between Mid-Screens (ft) | Estimated Vertical Hydraulic Gradient (ft/ft)[b,c] |
|---|---|---|---|---|
| 6/27/2019 | 187.67 | 183.80 | 720.00 | 5.4E-03 |
| 12/13/2019 | 198.39 | 200.58 | | -3.0E-03 |

**Notes:**

a. Groundwater elevations obtained from the LDC database

b. Differences in mid-screen depth used for all calculations.

c. Negative vertical gradients indicate upward gradient.

ft msl - feet above mean sea level

ft/ft - feet per feet

NC - not calculable

NM - not measured

**2019 GROUNDWATER QUALITY MONITORING RESULTS**
Baldwin Park Operable Unit
San Gabriel Valley, California

Geosyntec consultants

**Notes:**

a. For inactive production wells, depth (feet) of discrete low-flow sample.

b. In some instances, samples are submitted for 1,2,3-Trichloropropane (1,2,3-TCP) analysis for both the standard EPA Method 524.2, which has a reporting limit of 0.50 µg/L, and the modified low-level Sanitation and Radiation Laboratories (SRL) modified Method 524.2, which has a reporting limit of 0.005 µg/L. Where available, this table shows the results associated with the low-level SRL method.

c. In some instances, samples are submitted for NDMA analysis by two methods, EPA Method 8270C that has a reporting limit of 1 µg/L (1,000 ng/L) and EPA Method 1625C that has a reporting limit of 0.0020 µg/L (2 ng/L).

d. Total xylenes calculated as sum of xylene isomers if total xylene results not reported by laboratory.

e. Federal or California State Maximum Contaminant Level (MCL), Notification Level (NL) or Secondary MCL (SMCL).

f. Production wells SWS 121W1 and SWS 140W5 were sampled on an approximately weekly basis throughout 2017. Consistent with project extraction wells, only monthly sampling results are reported here.

-- Sample not collected, or sample not analyzed.

B - Laboratory blank contamination reported.

U - Analyte not detected at the reported quantitation limit shown in the result.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - Analyte not detected at the reported quantitation limit shown in the result; the reported quantitation limit is estimated.

NDMA = N-Nitrosodimethylamine

Results in bold indicate MCL, NL, or SMCL exceeded.

Dear Mr. Gancarczyk:

Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed Phase II Environmental Site Assessment (ESA) report for the above referenced Property. This assessment was performed in general accordance with Terracon's Master Services Agreement, dated June 3, 2016, and Work Authorization No. SCAL-BP-0160 (CCAP-1) CO#1, dated March 12, 2021.

We appreciate the opportunity to perform these services for Kaiser Permanente (KP). Please contact the undersigned at (909) 824-7311 if you have questions regarding the information provided in the report.

Sincerely,
**Terracon Consultants, Inc.**

# EXECUTIVE SUMMARY

This Phase II Environmental Site Assessment (ESA) was performed in accordance with Terracon's Master Services Agreement, dated June 3, 2016, and Work Authorization No. SCAL-BP-0160 (CCAP-1), CO#1, dated March 12, 2021, and was conducted in general accordance with the procedures included in ASTM E1903-11, *Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process* and Client Scope of Work, Terracon proposal dated March 9, 2021. The Phase II ESA was conducted under the supervision of a California-licensed Professional Geologist, Todd G. McFarland.

Terracon conducted the Phase II ESA at the Property, located at 1022-1026 Leorita Street, in Baldwin Park, Los Angeles County, California 91706. The scope of work conducted at the Client's request, was in response to Terracon's Phase I ESA report (Terracon Project No. CB21P020), dated March 22, 2021, which identified the following REC:

- Gabriel Valley Area 2 Superfund Site, also known as the Baldwin Park Operable Unit (OU), a chlorinated solvent groundwater plume mapped beneath the Property.

The primary contaminants detected in groundwater for the Baldwin Park OU are trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane, which have been mapped beneath the Property at concentrations that exceed Maximum Contaminant Levels (MCLs) and/or other regulatory levels. The Phase II ESA was intended to assess potential for impact to soil, soil gas, and groundwater beneath the Property; and assess the potential for vapor intrusion into indoor air.

In order to assess the identified REC and presence of constituents of the concern beneath the Property, Terracon conducted site assessment activities to collect soil, water, soil gas, subslab soil gas and indoor/outdoor air data.

## Findings and Opinions

A summary of findings is provided below. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein.

Terracon's field activities consisted of the advancement of a total of eleven (11) soil borings, six (6) subslab probes (SSP-1 through SSP-6), collection of four (4) indoor air samples (IAS-1 through IAS-4), and collection of two (2) outdoor air samples (OAS-1 and OAS-2). Five (5) soil borings were converted into multi-depth soil gas probes (SGP-1 through SGP-5) set at depths of 5 and 20 feet below ground surface (bgs), and six (6) soil borings (B-1 through B-6) were advanced to a maximum depth of approximately 135 feet bgs and converted into temporary

groundwater sampling wells (TSW-1 through TSW-6). To evaluate the REC and evaluate impacts to the Property, analytical results were compared to applicable and published environmental screening levels (ESLs) from the State Water Board (SFB-RWQCB ESLs) and California Environmental Protection Agency, Department of Toxic Substance Control (DTSC).

Soil Conditions

During sample collection, the soil encountered to a depth of 135 feet bgs (total depth) consisted primarily of silty sand and poorly graded sand with gravel to 2-inch in diameter from beneath the pavement to total depth. No odors or staining were observed in the encountered soils, and the maximum photoionization detector (PID) reading measured was 2.3 parts per million by volume (ppmv).

The soil analytical results for total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), herbicides, organochlorinated pesticides (OCPs) and metals were either below the specified laboratory reporting limit, were below residential, commercial, and construction worker ESLs, and/or for metals, were below concentrations established to be naturally occurring "background" levels.

Groundwater Conditions

Groundwater was encountered beneath the Property at a depth of approximately 120 feet bgs with a west-northwest flow, which is toward the nearby active production wells.

The groundwater analytical results for TPH and VOCs were below the specified laboratory reporting limit except for several low-level detections TPH which are below residential and commercial screening levels. Perchlorate and 1,4-dioxane were detected in one or more of the groundwater samples at concentrations above regulatory screening levels (which are primary contaminants identified for the Baldwin Park OU).

Soil Gas Conditions

The soil gas sample analytical results from the soil gas probes within the parking lot indicated VOCs above ESLs (including PCE, which is primary contaminant identified for the Baldwin Park OU) above residential land use, but below the commercial land use ESL. An evaluation of the PCE results indicate that in general, VOC concentrations increase with depth, i.e., the 20-foot PCE concentration is higher than the 5-foot PCE concentration, which indicates a deeper source, such as the regional Baldwin Park OU groundwater plume.

The subslab soil gas samples collected beneath the buildings indicate PCE and TCE concentrations were detected in one sample (SSP-1) above residential and commercial ESLs, respectively. The remaining detected VOC concentrations did not exceed their respective residential or commercial ESLs.

Indoor Air Conditions

The indoor air analytical results indicated detectable concentrations of VOCs, including 1,2-dichloroethane, benzene, bromodichloromethane, carbon tetrachloride, chloroform, methylene chloride, and TCE (primary contaminant identified for the Baldwin Park OU) above residential and/or commercials ESLs. Other detectable VOC concentrations did not exceed their respective residential or commercial ESLs. In general, the detections of VOCs (except for TCE) in indoor air where detected in the outdoor air samples at comparable concentrations (within same order of magnitude), indicating a regional outdoor source of VOCs, which is typical for the developed urban setting of the Property.

## Conclusions

Based on the historical (non-industrial) and current commercial/retail Property use, and a review of the soil, groundwater, soil gas and indoor/outdoor air data, a source of VOCs, 1,4-dioxane and perchlorate on the Property is not evident. The lack of documented use or storage of these constituents on the Property indicates the likely source of these constituents is the regional Baldwin Park OU plume beneath the Property. Furthermore, based on the results of the Phase II ESA, the Property does not appear to be a contributor to the Baldwin Park OU groundwater plume.

## Recommendations

It is Terracon's understanding that the Property is intended to either remain occupied as a commercial business, unoccupied or redeveloped in the future. Based on the findings and conclusions, Terracon has the following recommendations:

- In response to the potential for a complete vapor intrusion exposure pathway from the documented VOCs concentrations, including TCE above the respective residential and/or commercial ESLs identified at the Property in subslab soil gas and indoor air, engineered control measures should be evaluated and implemented to mitigate the vapor intrusion risk based on the future use of the Property.
- Based on the potential for residual impacts to be encountered during demolition and/or redevelopment, a Soil and Groundwater Management Plan is recommended.
- Additional soil, groundwater, or soil gas assessment at the Property do not appear warranted at this time.

**PHASE II ENVIRONMENTAL SITE ASSESSMENT**
**SBPK 2021 MFL 1022-1026 LEORITA STREET BROKEN HORN LAND**
**1022-1026 LEORITA STREET**
**BALDWIN PARK, LOS ANGELES COUNTY, CALIFORNIA**

**April 29, 2021**

# 1.0 INTRODUCTION

## 1.1 Property Description

| | |
|---|---|
| **Property Name** | SBPK 2021 MLF 1022-1026 Leorita Street Broken Horn Land |
| **Property Location/Address** | 1022-1026 Leorita Street, Baldwin Park, Los Angeles County, California 91706 (Los Angeles County Assessor Parcel Numbers [APNs]: 8559-008-005 and 8559-008-011, the Property) |
| **General Site Description** | The Property consist of an approximately 1.54-acre tract of land improved with an approximately 13,440-square-foot (with a mezzanine level) commercial buildings. The Property is further improved with asphalt-paved parking lot, landscaped areas, and utilities. During the site assessment activities, the Property was observed to be occupied by Broken Horn Saddlery, a western apparel and supply retailer. |

A topographic map and property diagram are included as **Exhibits 1** and **2**, respectively.

## 1.2 Scope of Work

Terracon conducted a Phase II Environmental Site Assessment (Phase II ESA) at the Property. The scope of work conducted at the request of Kaiser Permanente, was in response to Terracon's Phase I Environmental Site Assessment (ESA) report (Terracon Project No. CB21P020), dated March 22, 2021, which identified the following recognized environmental conditions (RECs), vapor encroachment conditions (VEC), and/or Business Environmental Risks (BER).

- **San Gabriel Valley Area 2 Superfund Site / Baldwin Park OU, a chlorinated solvent groundwater plume is mapped beneath the Property**. The primary constituents of concern include trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane, which have been detected in nearby wells at concentrations that exceed MCLs and/or other regulatory levels, and represents a REC to the Property.

The objective of the Phase II ESA was to assess the presence of total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), perchlorate, and 1,4-dioxane in groundwater beneath

the Property; TPH, VOCs, organochlorine pesticides (OCPs), herbicides, and metals in soil beneath the Property; and VOCs in the soil gas and indoor air for the Property.

Terracon understands the expected future use of the Property is unknown. Based on the unknown intended future use of the Property, Terracon applied the residential and commercial land use environmental screening levels (ESLs), which includes healthcare, daycare and other sensitive uses when evaluating sample results.

## 1.3 Standard of Care

Terracon's services were performed in accordance with the standard of care as stated in Article 9 of the Master Professional Services Agreement – Environmental Services, Agreement No. 2016EHSTERRACON. These assessment services were performed in accordance with the scope of work agreed with you, our client, as reflected in our proposal and may not strictly adhere to ASTM E1903-11 *Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

## 1.4 Additional Scope Limitations

Findings, conclusions, and recommendations resulting from these services are based upon information derived from the on-site activities and other services performed under this scope of work; such information is subject to change over time. Certain indicators of the presence of hazardous substances, petroleum products, or other constituents may have been latent, inaccessible, unobservable, nondetectable, or not present during these services, and we cannot represent that the Property contains no hazardous substances, toxic materials, petroleum products, or other latent conditions beyond those identified during this assessment. Subsurface conditions may vary from those encountered at specific borings or wells or during other surveys, tests, assessments, investigations, or exploratory services; the data, interpretations, findings, and our recommendations are based solely upon data obtained at the time and within the scope of these services.

## 1.5 Reliance

This report has been prepared for the exclusive use of Kaiser Permanente, and any authorization for use or reliance by any other party (except a governmental entity having jurisdiction over the Property) is prohibited without the express written authorization of Kaiser Permanente and Terracon. Any unauthorized distribution or reuse is Kaiser Permanente's sole risk. Notwithstanding the foregoing, reliance by authorized parties will be subject to the terms, conditions, and limitations stated in the proposal, report, and our Master Services Agreement, dated June 3, 2016. The limitation of liability defined in the terms and conditions is the aggregate limit of Terracon's liability to Kaiser Permanente and all relying parties unless otherwise agreed in writing.

## 2.0 FIELD ACTIVITIES

Terracon's field activities were conducted from March 18 to April 9, 2021, by a field geologist under the oversight of a California-licensed Professional Geologist (P.G.) with Terracon. A site-specific health and safety plan was utilized by Terracon and subcontractors during field activities for all phases of this assessment.

The field activities consisted of the advancement of a total of eleven (11) soil borings, five (5) subslab probes (SSP), and collection of six (6) air samples. Five (5) borings were advanced to a maximum depth of approximately 20.5 feet below ground surface (bgs) and converted into multi-depth soil gas probes (SGPs) set at depths of 5 and 20 feet bgs, and six (6) soil borings were advanced to a maximum depth of approximately 135 feet bgs and converted into temporary groundwater sampling wells (TSWs).

A photographic log of the field activities conducted is included as **Appendix A**. The approximate soil boring and sampling locations are shown on **Exhibit 3** and are summarized below.

| Location ID | Sample Depth (Feet bgs) | Sample Type | Assessment Area |
|---|---|---|---|
| SGP-1 | 5, 20 | Soil and Soil Gas | 1026 Leorita Street; southwest of the building |
| SGP-2 | 5, 20 | Soil and Soil Gas | 1026 Leorita Street; north of the building |
| SGP-3 | 5, 20 | Soil and Soil Gas | 1022 Leorita Street; west of the building |
| SGP-4 | 5, 20 | Soil and Soil Gas | 1022 Leorita Street; central portion of the parking lot |
| SGP-5 | 5, 20 | Soil and Soil Gas | 1022 Leorita Street; northwestern portion of the parking lot |
| B-1/TPW-1 | 5, 10 | Soil and Groundwater | 1022 Leorita Street; west of the building |
| B-2/TPW-2 | 5, 110 | Soil and Groundwater | 1022 Leorita Street; southern portion of the parking lot |
| B-3/TPW-3 | 5, 12, 110 | Soil and Groundwater | 1022 Leorita Street; western portion of the parking lot |
| B-4/TPW-4 | 5, 115 | Soil and Groundwater | 1022 Leorita Street; north-central portion of the parking lot |
| B-5/TPW-5 | 5, 115 | Soil and Groundwater | 1026 Leorita Street; north of the building |
| B-6/TPW-6 | 5, 115 | Soil and Groundwater | 1026 Leorita Street; western portion of the parking lot |
| SSP-1 | 0.5 | Soil Gas | 1022 Leorita Street; southern portion of the building interior |
| SSP-2 | 0.5 | Soil Gas | 1022 Leorita Street; central portion of the building interior |
| SSP-3 | 0.5 | Soil Gas | 1022 Leorita Street; central portion of the building interior |
| SSP-4 | 0.5 | Soil Gas | 1026 Leorita Street; central portion of the building interior |
| SSP-5 | 0.5 | Soil Gas | 1026 Leorita Street; southern portion of the building interior |
| SSP-6 | 0.5 | Soil Gas | 1026 Leorita Street; western portion of the building interior |
| IAS-1 | -- | Indoor Air | 1022 Leorita Street; central portion of the building interior |
| IAS-2 | -- | Indoor Air | 1022 Leorita Street; central portion of the building interior |
| IAS-3 | -- | Indoor Air | 1026 Leorita Street; central portion of the building interior |
| IAS-4 | -- | Indoor Air | 1026 Leorita Street; central portion of the building interior |
| OAS-1 | -- | Outdoor Air | 1022 Leorita Street; southwestern portion of the parking lot |
| OAS-2 | -- | Outdoor Air | 1026 Leorita Street; northern portion of the parking lot |

## 2.1 Pre-Mobilization

On March 5, 2021 and March 16, 2021, the soil boring locations were marked and Underground Service Alert, a California public utility locating service (DigAlert Ticket No: A210640379-00A and B210750214-00B, respectively), were requested by Terracon personnel for clearance of public underground utilities.

In addition, a Work Plan Approval (boring permit) was obtained from the County of Los Angeles Department of Environmental Health, Drinking Water Program, on March 19, 2021, to conduct drilling and groundwater sampling operations. A copy of the Work Plan Approval (Permit No.SR0248160) is provided as **Appendix B**.

## 2.2 Geophysical Survey

On March 18, 2021, Terracon mobilized to the Property with a subcontracted geophysical professional from GPRS to perform the geophysical survey of selected Property areas. The survey utilized a ground-penetrating radar (GPR) and electromagnetic survey methods. The purpose of the survey was to attempt to identify the location of possible subsurface utilities in the area of proposed boring locations. The survey also including identifying and tracing the primary utility lines for the Property.

The geophysical survey consisted of scanning the areas of interest with electromagnetic meter (EM) followed by a GPR scan to further evaluate EM anomalies, if present. Tracer wire was also utilized for accessible sewer clean out vaults. Minor adjustments were made to the proposed boring locations based on the geophysical survey findings. The identified utility alignments are included in **Appendix C**.

## 2.3 Soil Gas Probe Installation, Soil and Soil Gas Sampling

### 2.3.1 Shallow Soil Borings Advancement and Soil Sampling

On March 23, 2021, BC2 Environmental, a State-of-California C-57 licensed driller, advanced a total of five (5) soil borings (SGP-1 to SGP-5) using a direct-push technology (DPT) drill rig. Each soil boring was advanced to a depth of approximately 20.5 feet bgs and converted into a multi-depth nested soil gas probe (SGP), set at depths of approximately 5 and 20 feet bgs, for collection of soil gas samples. The approximate soil gas probe boring locations are shown on **Exhibit 3.**

Soil samples were collected using new single-use acetate sleeves to prevent cross contamination. Reusable drilling and sampling equipment were cleaned using an Alconox® or similar wash and potable water rinse prior to the beginning of the project and before collecting each soil sample, as needed.

Soil samples were collected continuously to document soil lithology, color, moisture content, or evidence of impairment (i.e., odors and staining). The soil samples were field-screened using a

calibrated MiniRae 3000 photoionization detector (PID) with a 10.6eV lamp to indicate the presence of total organic vapors (TOV).

During sample collection, the soil encountered within the top 20 feet bgs consisted primarily of silty sand and poorly graded sand with gravel to 2-inch in diameter from beneath the pavement to total depth. Detailed lithologic descriptions are presented on the soil boring logs included in **Appendix D**.

Staining or odors were not observed in the soils encountered. The maximum concentration by PID (0.6 ppmv) was detected in the soil collected from boring SGP-4 at a depth of approximately 20 feet bgs. The PID readings are recorded on the soil boring logs included in **Appendix D**.

Terracon's soil sampling analytical program for the soil gas probe installation consisted of the collection of two (2) soil samples for laboratory analysis from each of the five (5) soil gas probe borings, for a total of ten (10) soil samples collected for laboratory analysis. Soil samples from the borings were collected from approximately 5 and 20 feet bgs. Collected soil sample intervals for each boring are provided on the lithologic boring logs included in **Appendix D**.

Soil samples were packaged in the new acetate liners capped with Teflon and new caps, properly labeled and placed on ice in a cooler for transportation to the laboratory. Soil samples were also collected using U.S. Environmental Protection Agency (EPA) field sampling method 5035, using laboratory provided preservation VOA kits. The samples and completed chain-of-custody forms were relinquished for analysis to Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California. Soil samples were submitted for analysis on a 5-day turnaround time (TAT).

Following completion of soil sampling, soil borings SGP-1 through SGP-5 were converted into multi-depth nested soil gas probes, with sampling probes set at depths of approximately 5 and 20 feet bgs, for collection of soil gas samples.

Terracon's temporary vapor probes were constructed in general accordance with California Environmental Protection Agency (CAL-EPA), Department of Toxic Substance Control (DTSC), Los Angeles and San Francisco Bay Regional Water Quality Control Board (LA- and SFB-RWQCB) *Advisory – Active Soil Gas Investigation* guidance document, dated July 2015 (CAL-EPA/DTSC Guidance Document), as described in the following sections.

### 2.3.2 Soil Gas Probe Installation

- At each soil gas probe (SGP) location, an approximately 0.5-inch diameter probe tip approximately 4-inches long was installed at the target depths of approximately 5 and 20 feet bgs within the same borehole. The probe tips were placed approximately in the mid-point of a 1-foot thick sand pack extending from 0.5-feet above to 0.5-feet below the probe tip.

- At each probe depth, new 0.25-inch outer-diameter nylon (Nylaflow) tubing was connected to each probe tip (5 and 20 feet bgs) and cut to length leaving approximately one foot of tubing extending from the surface for each of the two probes. A gas tight three-way in-line check valve was fitted to the up-hole end of the tubing to prevent ambient air from infiltrating the probe installation through the sample line. The sampling line was labeled with the probe location and depth.
- At each probe tip depth, beginning at 20 feet bgs, sand was added to the boring to create a sand pack surrounding the probe tip to 0.5-foot above the top of the probe. 1.0 foot of dry granular bentonite chips were used to fill the borehole annular space above the sand pack, followed by a layer of hydrated granular bentonite chips added from the top of the dry granular bentonite to approximately 0.5-foot below the target depth of the next probe tip or, in the case of the uppermost probe, to within one foot of surface.

### 2.3.3 Subslab Probe Installation

- At each subslab soil gas probe (SSP) location within the buildings, Terracon drilled a 5/8-inch diameter hole through the concrete slab to expose the underlying soils. No indications of a vapor or moisture barrier were observed. A new VaporPin probe and seal were emplaced within the slab at each of the six (6) proposed locations. Terracon placed a new cap on the probe and covered the probe with a traffic cone to warn third parties of the probe location.

### 2.3.4 Soil Gas and Subslab Probe Sampling

On March 24 and 25, 2021, a minimum of 2 hours following soil gas probe or subslab soil gas probe installation to allow the bentonite seal to cure and to allow for subsurface conditions to equilibrate, Terracon collected soil gas samples from the five (5) multi-depth nested soil gas probes, and from the six (6) subslab soil gas probes. A replicate soil gas sample was collected from the 20-foot probe in SGP-2 (Sample ID: SGP-2-20 DUP) to evaluate quality control. The soil vapor samples were collected in general accordance with CAL-EPA/DTSC Guidance Document, as described in the following sections.

- Each temporary soil gas probe and subslab soil gas probe was purged prior to sample collection. The purge volume of each soil vapor probe installation was estimated as the summation of the volumes of the sample tubing, dry bentonite, sand pack and probe. Three purge volumes were removed using a purge pump set at a flow rate of approximately 200 milliliters per minute (mL/min) for the soil gas probes and using a syringe for the subslab soil gas probes.

- Following the purge of the soil gas probes, the complete sampling train was subjected to a vacuum of approximately 15 to 20 inches of mercury (inHg) and the system was “shut-in”. After approximately 1 minute the vacuum gauge was read. If the sampling train held a steady vacuum during the shut-in test, the system passed. If not, all connections were

tightened, and the shut-in test was performed again. Soil gas samples were not collected until the shut-in test passed.

- A leak test was performed in conjunction with each collected soil gas sample during sampling to verify that ambient air was not diluting the sample or compromising it with external contaminants. The sampling train and soil gas sampling point were tested for leaks using a sampling shroud and rag with 1,1-difluoroethane (1,1-DFA) placed in close proximity to fittings and probe connections.

- Once the sampling assembly was purged, shut-in test completed, and the leak test conducted, the samples were collected from the sample line using laboratory provided 1-Liter Summa™ stainless-steel canisters fitted with a particulate filter regulated at a flow rate of 150 to 200 mL/min.

### 2.3.5 Indoor and Outdoor Air Sampling

On March 24, 2021, Terracon collected four (4) indoor air samples (IAS-1 through IAS-4) and two (2) outdoor air samples (OAS-1 and OAS-2). The approximate sample locations are shown on **Exhibit 3**. Terracon collected the indoor air samples from the retail space of the two primary buildings.

Terracon conducted the indoor air and outdoor air sampling program in general accordance with the California Environmental Protection Agency (Cal-EPA), Department of Toxic Substance Control (DTSC) Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance), dated October 2011, and DTSC/Regional Water Quality Control Board (RWQCB) Advisory Active Soil Gas Investigations, dated July 2015. Terracon's sampling protocol is summarized below.

- Terracon identified locations within each building to be generally representative of indoor air, which were away from high traffic areas and open doorways. The northern and southwestern portion of the Property were selected for the outdoor air samples.

- Terracon collected the indoor air and outdoor air samples in individual certified, 6-liter Summa canisters and flow regulators provided by the laboratory. An 8-hour flow regulator was used to collect time weighted samples. Prior to sample collection, the Summa canisters were labeled and logged on field sampling logs and the laboratory chain-of-custody.

- Terracon placed the Summa canisters at a normal breathing height for each location, approximately 4 to 5 feet above the ground surface.

- At the start of sampling and once during sample collection, Terracon collected vacuum readings from the Summa canisters to verify the integrity of the sample collection process. Upon completion of the sample collection, Terracon closed the valves on the Summa canisters and recorded the final time and vacuum readings.

Field data sheets are included as **Appendix E.** The soil gas samples were collected in laboratory-provided, labeled, individual certified 1-Liter or 6-Liter Summa stainless steel canisters. The completed chain-of-custody forms were relinquished to Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California. Samples were submitted for analysis on a 5-day TAT.

## 2.4 Deep Soil Borings Advancement and Soil Sampling

From March 22 to 31, 2021, a total of six (6) soil borings were advanced at the Property (B-1 through B-6) to a maximum depth of approximately 135 feet bgs. Upon completion of the soil sampling activities, each boring was converted into a temporary sampling well (TSW-1 through TSW-6, respectively) for collection of groundwater samples. The surveyed TSW boring locations are shown on **Exhibit 3**.

Drilling services were performed by Yellow Jacket Drilling Services, LLC (Yellow Jacket), a State-of-California C-57 licensed driller, using a truck-mounted CME 95 hollow stem auger (HSA) drill rig under the supervision of a Terracon environmental professional. Soil samples were collected using split-spoon sampler. Soil samples were collected at 5-foot intervals starting at 5 feet bgs to a depth of 20 feet bgs, and then at 10-foot intervals to total depth. Terracon used the soil samples to document soil lithology, color, moisture content, and sensory evidence of impairment. The soil samples were field-screened using a PID – MiniRae for the presence of TOV. Drilling and sampling equipment were cleaned using an Alconox® wash, or similar and two potable water rinses prior to the beginning of the project and before collecting each soil sample. In addition, the auger flights were steam cleaned prior to and between boring locations.

No odors or staining were observed in the sampled soils. PID readings in the soil samples collected and screened in the field indicate that the maximum reading of 2.3 ppmv was detected in the soil sample retrieved from 110 feet bgs in soil boring B-1. The PID readings are recorded on the soil boring logs included in **Appendix D**.

During sample collection, the soil encountered within the soil borings consisted primarily of silty sand underlain by poorly graded sand with gravel to 2-inch in diameter from beneath the pavement to total depth. Detailed lithologic descriptions are presented on the soil boring logs included as **Appendix D**.

Terracon's soil sampling analytical program from the deep borings consisted of the collection of two (2) soil samples for laboratory analysis from each boring location (B-1 through B-6), for a total of 12 soil samples collected for laboratory analysis. Soil samples from the soil borings were

collected from the intervals with the highest PID reading or the interval of most likely environmental impact based on the field professional's judgment. Collected soil sample intervals for each boring are provided on the lithologic boring logs included in **Appendix D**. Soil samples and completed chain-of-custody forms were relinquished to Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California. Samples were submitted for analysis on a 5-day TAT.

## 2.5 Temporary Groundwater Sampling Well Installation and Sampling

Soil borings B-1 through B-6 were advanced to a maximum depth of approximately 135 feet bgs. Saturated soil was identified during advancement of the borings at a depth of approximately 120 feet bgs and, upon the completion of drilling activities, each soil boring was converted into a temporary groundwater sampling well (TSW-1 through TSW-6, respectively). The TSW locations are shown on **Exhibit 3**. The TSW installation and groundwater sampling program was conducted as described in the following sections.

TSWs were constructed with the following materials:

- 10 feet of new 2-inch diameter, 0.020-inch machine-slotted poly-vinyl chloride (PVC) well screen with a threaded bottom cap; and
- 2-inch diameter, threaded, flush-joint PVC riser pipe to surface.

Following installation of the temporary casing, the depth to groundwater was allowed to equilibrate for a minimum of 30 minutes, and the depth to water was recorded using an electronic sounder. Terracon recorded the depth to water in reference to the finished ground surface. In order to reduce the turbidity of the groundwater, a new dedicated disposable polypropylene bailer was used to bail 1 to 3 gallons of water from each TSW.

A groundwater sample was collected from each TSW, for a total of six (6) groundwater samples, using the new dedicated disposable polypropylene bailer. Samples were collected in laboratory provided containers, placed in an iced cooler, and relinquished under chain of custody procedures to Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California. Samples were submitted for analysis on a 5-day TAT. The samples for perchlorate analysis were field filtered using sterile sampling kits provided by the laboratory.

Although partial development was conducted by bailing water from each TSW, the groundwater was observed to be turbid, which can contain suspended colloids, such sediment interference may influence the analytical results. Therefore, without the benefit of permanent groundwater monitoring wells that are properly installed and fully developed prior to groundwater sampling, the groundwater analytical results may not be completely representative of groundwater conditions beneath the Property.

## 2.6 Land Survey and Groundwater Gauging

On March 31, 2021, the ground surface for the TSWs were surveyed by Cal Vada Surveying Inc., a licensed land surveyor in the state of California. Latitude and longitude, based on north and east coordinates, as well as the elevations for the finished surface were surveyed and documented. The elevations are based upon static GPS observation, holding the CSRC data point "CASF"; elevation = 157.90 feet (NAVD 88) , benchmark. The well survey report is provided in **Appendix F**.

Following the TSW installation and stabilization of the water table, Terracon measured the static groundwater level for each TSW relative to the finished ground surface, using a Solinst Interface Probe. Depth to water was measured to the nearest 0.01 foot for each TSW, collected at least three readings to ensure an accurate depth. The probe and upper section of the tape was decontaminated between measurements at each TSW. The groundwater gauging measurements and calculated groundwater elevations are provided in **Table 1**. The depth to groundwater measured in each TSW was used to prepare a groundwater elevation contour map showing the estimated direction and gradient of groundwater flow beneath the Property at the time of the assessment. Groundwater elevation contours, flow direction, and gradient are shown on **Exhibit 4**.

## 2.7 Probe and Temporary Sampling Well Abandonment

Following completion of the soil, soil gas, and groundwater assessment activities, the TSW materials were removed and the borings were closed in place by backfilling with Portland cement grout mix (maximum of 6% Bentonite) using a tremie pipe from the bottom of the borehole to approximately 0.5 feet bgs and completed with quick setting concrete at the surface, in accordance with permit requirements. In addition, the vapor probes materials were removed, and the borings were backfilled with hydrated bentonite and completed at surface with quick setting concrete to match the existing surface.

## 2.8 Investigation Derived Waste

The investigation-derived waste (IDW) generated during the investigation activities were placed in Department of Transportation (DOT) approved roll-off containers. Two, partially full 20-yard bins containing IDW were labeled and temporarily stored on the Property pending laboratory analytical results, profiling of the IDW, and transportation and disposal to an authorized facility. Based on laboratory analysis of soil samples collected during this Phase II ESA, the IDW was profiled as non-hazardous waste. On April 9, 2021, Belshire Environmental Services (Belshire) from Foothill Ranch, California, transported the two bins of soil under non-hazardous waste manifests to Soil Safe in Adelanto, California for recycling using thermal desorption. The completed manifests are included as **Appendix G.**

# 3.0 LABORATORY ANALYTICAL METHODS

Soil and groundwater samples were collected in laboratory-provided containers, EPA 5035 sampling kits, or new acetate sleeves provided by BC2 Environmental for the soil sampling performed with the DPT drill rig. The soil and groundwater samples were sealed, properly labeled, and placed on ice in a cooler for transportation to the laboratory. The soil gas and air samples were collected in individually certified 1-Liter or 6-Liter Summa canisters (and flow regulators) provided by the laboratory. The samples and completed chain-of-custody forms were relinquished under chain of custody procedures to Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California. Samples were submitted for analysis on a 5-day TAT. The samples were analyzed using standard EPA or ASTM test methods, as detailed below.

**Soil Analytical Program**

- TPH-GRO/DRO/ORO by EPA Method 8015;
- Volatile organic compounds (VOCs) by EPA Method 8260;
- Herbicides by EPA Method 8151A;
- Organochlorinated Pesticides (OCPs) by EPA Method 8081A; and
- California Administrative Manual (CAM) 17 Metals by EPA Methods 6010B/7471A.

**Groundwater Analytical Program**

- TPH-GRO/DRO/ORO by EPA Method 8015;
- VOCs by EPA Method 8260;
- Perchlorate by EPA Method 314.0; and
- 1,4-Dioxane by EPA Method 8270C.

**Soil Gas Analytical Program**

- VOCs by EPA Method TO-15; and
- Fixed Gases (carbon monoxide, carbon dioxide, oxygen, nitrogen, and methane) by ASTM D1946D.

**Indoor And Outdoor Air Analytical Program**

- VOCs by EPA Method TO-15 SIM

The soil, groundwater, soil gas, and air sample laboratory analytical results are summarized in **Tables 2** through **9**. The laboratory analytical reports and executed chain-of-custody forms are provided in **Appendices H, I**, and **J**.

# 4.0 DATA EVALUATION

The regulatory agency having jurisdiction over this Property potentially include the DTSC and the Los Angeles Region Water Quality Control Board (LARWQCB). The LARWQCB has not specified or published specific environmental screening levels (ESLs) for evaluating potential impacts that may be found as part of this Phase II ESA. DTSC has developed modified screening levels based on the U.S. Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for use in the human health risk assessment process at hazardous waste sites and permitted facilities, known as Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note Number: 3, DTSC-modified Screening Levels (DTSC-SLs), or "HERO Note 3" for short. The results from the laboratory analyses of these media samples collected will be compared to the HERO Note 3 values, the San Francisco Bay Regional Water Quality Control Board (RWQCB) ESLs (2019, Rev.2)[1], and DTSC established background values for arsenic and thallium in soil, as applicable and as indicated herein.

These exposure assumptions may not match current and/or planned land uses for the Property; however, these criteria are included to provide a comparison for the potential future land uses. Based on the proposed use of the Property to remain as is" or to be redeveloped as a medical facility, Terracon used the residential and commercial land use ESLs when evaluating sample results. The following summarizes the exposure categories.

**Residential Land Use**: This ESL category is used for comparison for sites where unrestricted future land-use is sought. Unrestricted land uses may include residential, healthcare, day-care centers and other sensitive purposes. The ESLs for the Residential Land Use category incorporate assumptions of long-term, frequent exposure of children and adults in a residential setting. These ESL are appropriate for unrestricted use of a property.

**Commercial or Industrial Use**: This ESL category assumes working-age adults are regularly present at the Property. The direct-exposure assumptions in these ESLs assume shorter, less frequent exposure for receptors compared to residential land use receptors.

**Any Land Use/Any Soil Depth Construction Worker**: Construction Workers may have the potential for substantial exposures to surface and subsurface soil during excavation, maintenance and building construction projects. The exposure scenarios include contact with impacted soil via incidental ingestion, dermal contact, and inhalation due to volatilization and fugitive dust are the main routes of exposure. Soil direct contact ESLs are considered under this scenario.

## 4.1 Groundwater Elevation and Flow Direction

Groundwater elevations were calculated with respect to the survey data provided relative to the NAVD-88 datum in feet relative to mean sea level (rmsl), by subtracting the depth to groundwater

[1] https://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/esl.html

in each TSW from the elevation of the surveyed finished surface. Depth to water measurements and calculated groundwater elevations data are summarized in **Table 1**.

Groundwater gauging measurements collected on March 22 to March 31, 2021, from the TSWs indicate that the depth to groundwater ranged from 117.44 to 129.95 feet bgs. Based on the measurements, the groundwater flow direction was calculated to be toward the west-northwest at an average gradient of approximately 0.03 feet per foot (ft/ft). The depth to groundwater is consistent with recent gauging data in piezometer PZ3-1BD, located approximately 390 feet west of the Property, which indicated a depth to groundwater of 130 feet bgs in July 2020. Regional data indicated a groundwater flow direction toward the southwest. The site-specific west-northwest groundwater flow direction may be attributed to the active municipal groundwater wells (Nos. B25A and B25B), located approximately 550 feet to the west of the Property. Based on the operational data[2], the combined production rate of the two wells is approximately 4,700 gallons per minute. The extraction/production from these two wells is part of the remedial action for the Baldwin Park OU, as such, the extraction from these wells is sufficient to create a cone of depression, thereby generating a localized westerly flow toward the production wells. A groundwater elevation contour map is provided as **Exhibit 4**.

## 4.2 Soil Sample Analytical Results

Total Petroleum Hydrocarbons (TPH) and Volatile Organic Compounds (VOCs)
The soil analytical results for TPH were below the specified laboratory reporting limit except for several detections of diesel range organics (TPH-DRO) and motor oil range organics (TPH-MORO) at maximum concentrations of 14 and 140 milligrams per kilogram (mg/Kg), respectively. The soil analytical results for VOCs were below the specified laboratory reporting limit except for several low-level detections of acetone, benzene and tert-Butyl alcohol (TBA), and one low-level detection of ethanol. Based on the screening levels outlined above, the detectable concentrations of TPH and VOCs are below residential and commercial screening levels.

Soil sample analytical results for TPH and VOCs, and their respective ESLs, are summarized in **Tables 2** and **3**. The laboratory analytical reports and executed chain-of-custody forms are included in **Appendix H**.

Metals
Select soil samples were analyzed for California Administrative Manual (CAM) 17 metals. Concentrations of antimony, selenium, silver and thallium metals were not detected above the specified reporting limits. The metal concentrations detected above laboratory reporting limits appear to be within naturally occurring “background” concentrations and are below their respective ESLs for residential and commercial use, except for arsenic as noted below.

[2] *GeoSyntec Consultants and ERM, 2020. 2019 Annual Performance Evaluation Report, Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites, Los Angeles County, California, dated April 30, 2020.*

Arsenic was detected in several samples with a maximum concentration of 4.1 mg/Kg in soil sample SGP-5-5. The ESLs are based on toxicity values and as such, the arsenic ESLs are very low. Since the naturally occurring arsenic concentrations in soil for southern California (and other regions) are often 100 times greater than screening levels, based on analyses of soil data, DTSC[3] established a regional background arsenic concentration. Based on statistically review of arsenic data sets, the DTSC established an upper-bound arsenic concentration of *12 mg/Kg* for Los Angeles County. Based on this regional background concentration the detected arsenic concentrations are within the naturally occurring "background" concentrations.

Although thallium was not detected above laboratory report limits, the ESLs are based on toxicity values and as such, the thallium ESLs are very low, and the laboratory reporting limits exceed the residential ESL. Since the naturally occurring thallium concentrations in California (and other regions) and/or the laboratory reporting limit can be greater than screening levels, the DTSC and the Air Force Center for Environmental Excellence (AFCEE)[4] established an upper-bound thallium concentration of *25 mg/Kg* for California to evaluate regional background thallium concentrations. Based on this upper-bound concentration, the laboratory reporting limits are below the threshold.

Soil sample analytical results for metals, and their respective ESLs, are summarized in **Table 4**. The laboratory analytical report and executed chain-of-custody forms are included in **Appendix H**.

Organochlorinated Pesticides (OCPs) and Herbicides

The soil analytical results indicated one or more OCPs at concentrations above the specified laboratory reporting limits. Detectable concentrations of OCPs were limited to dichlorodiphenyldichloroethylene (4,4'-DDE), dichlorodiphenyltrichloroethane (4,4'-DDT), dieldrin and gamma-Chlordane. The detections of OCPs were below residential and commercial ESLs. The soil analytical results for herbicides were below the specified laboratory reporting limits.

Soil sample analytical results for OCPs and herbicides, and their respective ESLs, are summarized in **Table 5**. The laboratory analytical reports and executed chain-of-custody forms are included in **Appendix H**.

## 4.3 Groundwater Analytical Results

TPH and VOCs

The groundwater analytical results for TPH were below the specified laboratory reporting limit except for several low-level detections of TPH-DRO and TPH-MORO at maximum concentrations of 160 and 99 micrograms per liter (µg/L), respectively. The groundwater analytical results for VOCs were below the specified laboratory reporting limits. Based on the screening levels outlined

[3] *Chernoff, G., Bosan, W., and Oudiz, D. Determination of a Southern California Regional Background Arsenic Concentration in Soil.*

[4] *Hunter, P.M., Davis, B.K., and Roach, F., 2005. Inorganic Chemicals in Ground Water and Soil: Background Concentrations at California Air Force Bases.*

above, the detectable concentrations of TPH are below the residential, commercial and construction worker screening levels.

The nearest municipal water wells are identified as well Nos. B25A and B25B, located approximately 550 feet to the west of the Property. Water quality data from well No. B25A indicates the following recent (December 1, 2020) target VOC concentrations in groundwater compared to the groundwater analytical results for the Property, as summarized in the following table.

| Analyte | Off-site: Municipal Well B25A (µg/L) [1] | Property: TSW-1 through TSW-6 (µg/L) | MCL (µg/L) |
|---|---|---|---|
| Carbon Tetrachloride | **2.3** | ND<0.25 to ND<0.69* | *0.50* |
| PCE | **35** | ND<0.25 to ND<0.70 | *5.0* |
| TCE | **81** | ND<0.25 to ND<0.70 | *5.0* |

*µg/L = micrograms per liter*
*ND = Not detected above stated laboratory reporting limit*
*[1] GeoSyntec Consultants and ERM, 2020. 2019 Annual Performance Evaluation Report, Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites, Los Angeles County, California, dated April 30, 2020.*
**Non-detectable sample result for TSW-1 above MCL. Remaining target analytes meet data quality objectives.*

Based on a comparison of the analytical results for the data collected for this assessment compared to the data for the off-site municipal well, first encountered groundwater beneath the Property does not appear to be impacted with the target VOC analytes identified for the Baldwin Park OU.

Groundwater sample analytical results for TPH and VOCs, and their respective ESLs, are summarized in **Table 6**. The laboratory analytical reports and executed chain-of-custody forms are included in **Appendix I**.

Perchlorate and 1,4-Dioxane

The groundwater analytical results for perchlorate were below the specified laboratory reporting limit except for two detections, with a maximum concentration of 1.1 µg/L, which is slightly above California's Public Health Goal (PHG) of *1.0 µg/L*, but below the Maximum Contaminant Level (MCL) of *6.0 µg/L.*

The groundwater analytical results for 1,4-dioxane were below the specified laboratory reporting limits except for two detections, with a maximum concentration of 0.95 µg/L, which is slightly above the MCL of *0.38 µg/L.*

Water quality data from off-site municipal well No. B25A indicates the following recent (December 1, 2020) target concentrations in groundwater compared to the groundwater analytical results for the Property, as summarized in the following table.

| Analyte | Off-site: Municipal Well B25A (µg/L) [1] | Property: TSW-1 through TSW-6 (µg/L) | MCL (µg/L) |
|---|---|---|---|
| Perchlorate | **53** | ND<0.91 to **1.1*** | *6.0* |
| 1,4-Dioxane | **2.8** | ND<0.34 to **0.95** | *0.38* |

*µg/L = micrograms per liter*
*ND = Not detected above stated laboratory reporting limit*
*[1] GeoSyntec Consultants and ERM, 2020. 2019 Annual Performance Evaluation Report, Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites, Los Angeles County, California, dated April 30, 2020.*
**Above* California's PHG of *1.0 µg/L.*

Based on a comparison of the analytical results for the data collected for this assessment compared to the data for the off-site municipal well, first encountered groundwater beneath the Property is impacted with perchlorate and 1,4-dioxane, which are primary contaminants identified for the Baldwin Park OU. Based on the screening levels outlined above, one or more of the detectable concentrations of perchlorate and 1,4-dioxane collected on the Property are above a screening level, but the maximum on-site concentrations are below the concentrations reported for the Municipal Well B25A.

Groundwater sample analytical results for perchlorate and 1,4-dioxane, and their respective screening levels, are summarized in **Table 6**. The laboratory analytical reports and executed chain-of-custody forms are included in **Appendix I**.

## 4.4 Soil Gas Probe and Subslab Probe Sample Analytical Results

Soil gas probe (SGP) sample analytical results indicate that several VOCs were detected above their respective laboratory reporting limits. The soil gas sample analytical results were compared to the ESLs, which revealed that concentrations of bromodichloromethane, chloroform, and PCE detected in one or more samples exceed their respective ESLs for residential land use, as detailed below:

- The bromodichloromethane concentration detected in soil gas sample SGP-5-20 at 3.1 micrograms per cubic meter (µg/m$^3$), exceeds the residential ESL (*2.5 µg/m$^3$*), but below the commercial ESL.
- The chloroform concentration detected in soil gas sample SGP-5-20 at 9.8 µg/m$^3$, exceeds the residential ESL (*4.1 µg/m$^3$*), but below the commercial ESL.
- The PCE concentration detected in soil gas sample SGP-3-20 at 17 µg/m$^3$, exceeds the residential ESL (*15 µg/m$^3$*), but below the commercial ESL.
- Other detectable VOC concentrations did not exceed their respective residential or commercial ESLs.

Bromodichloromethane and chloroform are typically related to the chlorination and treatment of tap water and are not considered to be directly related to a VOC release.

Subslab probe (SSP) sample analytical results indicate that several VOCs were detected above their respective laboratory reporting limits. The soil gas sample analytical results were compared to the ESLs, which revealed that concentrations of PCE and TCE detected in one sample (SSP-1) exceed their respective ESLs for residential and/or commercial land use, as detailed below:

- The PCE concentration detected in subslab probe sample SSP-1 at 18 µg/m$^3$, exceeds the residential ESL (*15 µg/m$^3$*), but is below the commercial ESL (*67 µg/m$^3$*).
- The TCE concentration detected in subslab probe sample SSP-1 at 130 µg/m$^3$, exceeds the commercial ESL (*100 µg/m$^3$*).
- The remaining detected VOC concentrations did not exceed their respective residential or commercial ESLs.

Laboratory analytical results for the fixed gases analysis of the samples collected from soil gas probe SGP-1 through SGP-5 and subslab probes SSP-1 through SSP-6 indicate that oxygen + argon ($O_2$) ranged from 18 to 23%, carbon monoxide (CO) was not detected above the laboratory reporting limit of 0.12%, carbon dioxide ($CO_2$) ranged from 0.32 to 2.5%, and methane was not detected above the laboratory detection limit of 0.0069%. The fixed gases appear to be in alignment of expected concentrations and evidence of biodegradation of subsurface contaminants, depleted oxygen levels and methanogenesis are not evident.

A summary of the soil gas probe and subslab probe sample analytical results are presented in **Tables 7** and **8**, respectively, together with the applicable ESLs. The corresponding laboratory analytical reports and executed chain-of-custody forms are provided in **Appendix J**.

## 4.5 Indoor and Outdoor Air Sample Analytical Results

Indoor air sample analytical results indicate that several VOCs were detected above their respective laboratory reporting limits. The soil gas sample analytical results were compared to the ESLs, which revealed that concentrations of 1,2-dichloroethane, benzene, bromodichloromethane, carbon tetrachloride, chloroform, methylene chloride, and TCE detected in one or more samples exceed their respective ESLs for residential and/or commercial land use, as detailed below:

- The 1,2-dichloroethane concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*0.11 µg/m$^3$*). However, outdoor air

sample OAS-1 also exceeds the residential ESL, and is within the same order of magnitude.

- The benzene concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the commercial ESL (*0.42 $\mu g/m^3$*). However, outdoor air samples OAS-1 and OAS-2 also exceed the commercial ESL, and are within the same order of magnitude.

- The bromodichloromethane concentration detected in indoor air sample IAS-1 at 0.081 $\mu g/m^3$, exceeds the residential ESL (*0.076 $\mu g/m^3$*), but below the commercial ESL.

- The carbon tetrachloride concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*0.47 $\mu g/m^3$*). However, outdoor air samples OAS-1 and OAS-2 also exceed the residential ESL, and are within the same order of magnitude.

- The chloroform concentrations detected in indoor air samples IAS-1 through IAS-3, exceed the residential ESL of (*0.12 $\mu g/m^3$*). However, outdoor air samples OAS-1 and OAS-2 are within the same order of magnitude.

- The methylene chloride concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*1.0 $\mu g/m^3$*), but below the commercial ESL.

- The TCE concentrations detected in indoor air samples IAS-1, IAS-3, and IAS-4, exceed the residential ESL (*0.48 $\mu g/m^3$*), and the TCE concentration detected in indoor air sample IAS-2 of 4.6 $\mu g/m^3$ exceeds the commercial ESL (*3.0 $\mu g/m^3$*).

- Other detectable VOC concentrations did not exceed their respective residential or commercial ESLs.

Overall, the detections of VOCs in indoor air where also detected in the outdoor air samples at comparable concentrations (within same order of magnitude). The only anomalous data identified are the detection of TCE concentrations in the indoor air samples above residential and commercial ESLs. TCE was not detected above the laboratory reporting limit in the outdoor air samples. As indicated in **Section 4.4** above, PCE and TCE were also detected above residential and commercial screening levels, respectively, in subslab probe SSP-1. The detections of PCE and TCE in the subslab sample, detection of TCE in indoor air, and absence of TCE detections in outdoor indicates a potential for a complete vapor intrusion exposure pathway for TCE.

A summary of the indoor and outdoor air sample analytical results are presented in **Table 9**, together with the applicable ESLs. The corresponding laboratory analytical reports and executed chain-of-custody forms are provided in **Appendix J**.

## 4.6 Quality Control/Quality Assurance

Field quality control (QC) included the use of proper sampling hygiene, decontamination of equipment between sampling locations or events, and use of dedicated (disposable) sampling equipment. Further, QC also included the collection and analyses of additional samples to measure the representativeness of analytical test results to actual Property conditions, and potential bias or false-positive indications that may be introduced through sampling techniques, storage of samples, or transportation from and to the laboratory. The following quality control samples were collected for soil gas and groundwater samples:

- **Soil Gas** – one replicate soil gas sample was collected and analyzed for VOCs, sample IDs SGP-2-20 and SGP-2-20 DUP. Laboratory results of the replicate sample were within 10% or less of the primary sample.

- **Groundwater** - one duplicate groundwater sample was collected and analyzed for VOCs, sample IDs TSW-5 and TSW-5 DUP. Laboratory results of the duplicate sample were within acceptable limits of the primary sample. One trip blank was shipped with the laboratory-supplied sampling containers, and returned to the laboratory with the groundwater samples for each day of sampling. The four trip blanks were analyzed for VOCs. No VOCs were detected above laboratory reporting limits.

Laboratory quality assurance (QA) processes include sample custody, and the processes of equipment calibrations, laboratory control samples (LCS), matrix spikes/matrix spike duplicates (MS/MSD), and other processes document in the California Environmental Laboratory Accreditation Program (ELAP) certification process. These processes are used to evaluate test results for representativeness of Property conditions. The laboratory QA documentation is provided in the attached laboratory reports.

Additional QC/QA protocol implemented during the sampling activities at the Property included low-flow 3-volume purge, flow controllers, shut-in test, and leak test for the soil gas probe and subslab probe sampling. The soil gas samples were collected using a sampling shroud and 1,1-DFA. The estimated concentration of 1,1-DFA within the shroud during sampling is conservatively estimated to be 500,000 $\mu g/m^3$. The maximum concentration of 1,1-DFA was detected in SSP-6 at 1,600 $\mu g/m^3$, which is 0.32% and under the allowable 5% established in CAL-EPA/DTSC Guidance Document when using a shroud.

# 5.0 FINDINGS AND CONCLUSIONS

Terracon conducted a Phase II ESA at the Property, located at 1022-1026 Leorita Street, in Baldwin Park, Los Angeles County, California 91706. The scope of work conducted at your request, was in response to Terracon's Phase I ESA report (Terracon Project No. CB21P020), dated March 22, 2021, which identified the following REC:

- Gabriel Valley Area 2 Superfund Site, also known as the Baldwin Park Operable Unit (OU), a chlorinated solvent groundwater plume mapped beneath the Property.

The primary contaminants detected in groundwater for the Baldwin Park OU are TCE, PCE, carbon tetrachloride, perchlorate, NDMA, and 1,4-dioxane, which have been mapped beneath the Property at concentrations that exceed MCLs and/or other regulatory levels.

Based on our review of the regulatory data and historical information, the impacted groundwater represents a REC to the Property. Therefore, Terracon recommended additional assessment to assess the potential for impact to soil, soil gas, and groundwater beneath the Property; and assess the potential for vapor intrusion into indoor air.

The objective of the Phase II ESA was to assess the presence of TPH, VOCs, perchlorate, and 1,4-dioxane in groundwater beneath the Property; TPH, VOCs, OCPs, herbicides, and metals in soil beneath the Property; and VOCs in the soil gas and indoor air for the Property.

Terracon understands the expected future use of the Property is unknown. Based on the unknown intended future use of the Property, Terracon applied the residential and commercial land use ESLs, which also includes healthcare, daycare, and other sensitive uses when evaluating sample results.

Between March 18 and April 9, 2021, Terracon conducted site assessment activities by a field geologist under the oversight of a California-licensed Professional Geologist (P.G.). Prior to conducting invasive field activities, Terracon contacted DigAlert for utility notifications, contracted a geophysical survey to further locate utilities, and obtained a drilling permit from the County.

The drilling field activities consisted of the advancement of a total of eleven (11) soil borings, six (6) subslab probes (SSP), and collection of six (6) air samples. Five (5) borings were advanced to a maximum depth of approximately 20.5 feet below ground surface (bgs) and converted into multi-depth soil gas probes (SGPs) set at depths of 5 and 20 feet bgs, and six (6) soil borings were advanced to a maximum depth of approximately 135 feet bgs and converted into temporary groundwater sampling wells (TSWs).

Terracon collected the following samples/data:

- 23 - Soil samples
- 6 - Groundwater samples and groundwater elevations
- 10 - Soil gas probe samples
- 6 - Subslab probe samples
- 4 - Indoor air samples
- 2 - Outdoor air samples
- 6 - QA/QC samples

During sample collection, the soil encountered to a depth of 135 feet bgs (total depth) consisted primarily of silty sand and poorly graded sand with gravel to 2-inch in diameter from beneath the pavement to total depth. No odors or staining were observed in the sampled soils. The soil samples were field-screened using a calibrated MiniRae 3000 PID with a 10.6eV lamp to indicate the presence of TOV. PID readings in the soil samples collected and screened in the field indicate that the maximum reading of 2.3 ppmv was detected in the soil sample retrieved from 110 feet bgs in soil boring B-1.

Following installation of temporary PVC screen and casing in each TSW, Terracon measured depth to groundwater relative to the finished surface using a Solinst Interface probe. A licensed land-surveyor collected latitude, longitude and elevation data for the TSW locations and groundwater elevation contours were produced to evaluate groundwater flow direction and gradient.

Soil and groundwater samples were analyzed for VOCs using USEPA Method 8260, and for TPH-GRO, -DRO, -ORO by USEPA Method 8015M. Soil samples were additionally analyzed for herbicides by EPA Method 8151A, OCPs by EPA Method 8081A, and CAM 17 Metals by EPA Methods 6010B/7471A. Groundwater samples were additionally analyzed for perchlorate by EPA Method 314.0, and 1,4-dioxane by EPA Method 8270C. Soil gas samples and indoor/outdoor air samples were analyzed for VOCs by EPA Method TO-15 or TO-15 SIM. Soil gas samples were additionally analyzed for fixed gases (carbon dioxide, oxygen, nitrogen, and methane) by ASTM Method D1946D. The samples were analyzed on a 5-day TAT by Eurofins Calscience, a State-of-California certified laboratory located in Irvine, California.

Terracon evaluated the results of soil and soil gas analytical testing in comparison to the most applicable, published screening levels for the Property. Soil, groundwater, and soil gas sample results were compared to the SFB-RWQCB ESLs. These ESLs exposure assumptions are conservative, and assumptions may not match planned land uses for the Property; however, these criteria are included to provide a comparison for the potential future land uses. Based on the proposed future use of the Property to remain as it is or potentially redeveloped as a Medical Office Building or other sensitive use, Terracon used the residential, commercial, and construction worker land use ESLs when evaluating sample results, as detailed in **Section 4.0**.

The findings and conclusions of this Phase II ESA are as follows:

## 5.1 Soil Sampling

Laboratory analytical results for the soil samples collected from B-1 through B-6, and SGP-1 through SGP-5 (**Tables 2** through **5**) indicate that:

- The soil analytical results for TPH were below the specified laboratory reporting limit except for several detections of TPH-DRO and TPH-MORO at maximum concentrations of 14 and 140 milligrams per kilogram (mg/Kg), respectively, which are below residential, commercial, and construction worker screening levels.

- The soil analytical results for VOCs were below the specified laboratory reporting limit except for several low-level detections of acetone, benzene and TBA, and one low-level detection of ethanol. The detectable VOC concentrations are below residential, commercial, and construction worker screening levels.

- The soil analytical results for metals were below the specified laboratory reporting limit or appear to be within naturally occurring "background" concentrations and are below their respective ESLs for residential, commercial, and construction worker screening levels, except for arsenic and thallium. Arsenic was detected in several samples above residential, commercial, and construction worker screening levels with a maximum concentration of 4.1 mg/Kg in soil sample SGP-5-5. Based on statistically review of arsenic data sets, the DTSC established an upper-bound arsenic concentration of *12 mg/Kg* for Los Angeles County. Based on this regional background concentration the detected arsenic concentrations are within the naturally occurring "background" concentrations. Although thallium was not detected above laboratory report limits, the ESLs are based on toxicity values and as such, the thallium ESLs are very low, and the laboratory reporting limits exceed the residential ESL, but are below the DTSC established upper-bound thallium concentration of *25 mg/Kg*.

- The soil analytical results indicated one or more OCPs at concentrations above the specified laboratory reporting limits. Detectable concentrations of OCPs were limited to 4,4'-DDE, 4,4'-DDT, dieldrin and gamma-Chlordane. The detections of OCPs were below residential and commercial ESLs. The soil analytical results for herbicides were below the specified laboratory reporting limits.

Based on the soil samples analytical results and PID readings to the maximum depth explored of approximately 135 feet bgs, soil beneath the Property does not appear to be impacted at concentrations above the shallow soil direct exposure ESL for residential and commercial land use, or for construction workers. The soil data does not support evidence that a release occurred at the Property.

## 5.2 Groundwater Sampling

Recorded groundwater measurements and laboratory analytical results for the groundwater samples collected from TSW-1 through TSW-6 (see **Tables 1** and **6**) indicate that:

- Groundwater beneath the Property occurs at a depth of approximately 117.44 to 129.95 feet bgs (**Table 1**) and locally flows toward the west-northwest at an average gradient of approximately 0.03 feet per foot (ft/ft). The depth to groundwater is consistent with recent gauging data in off-site piezometer PZ3-1BD, located approximately 390 feet west of the Property, which indicated a depth to groundwater of 130 feet bgs in July 2020. Regional data indicated a groundwater flow direction toward the southwest. The site-specific west-northwest groundwater flow direction is likely attributed to the active municipal groundwater wells (Nos. B25A and B25B), located approximately 550 feet to the west of the Property, which have a combined production rate of 4,700 gallons per minute (gpm), which is sufficient to alter the regional groundwater flow at the Property.

- The groundwater analytical results for TPH were below the specified laboratory reporting limit except for several low-level detections of TPH-DRO and TPH-MORO at maximum concentrations of 160 and 99 micrograms per liter (µg/L), respectively, which are below residential and commercial screening levels (**Table 6**).

- The groundwater analytical results for VOCs were below the specified laboratory reporting limit for the analytes. The detectable VOC concentrations are below residential and commercial screening levels.

The nearest municipal water wells are identified as well Nos. B25A and B25B, located approximately 550 feet to the west of the Property. Water quality data from well No. B25A indicates the following recent (December 1, 2020) target VOC concentrations in groundwater compared to the groundwater analytical results for the Property and the Maximum Contaminant Level (MCL).

| Analyte | Off-site: Municipal Well B25A (µg/L) [1] | Property: TSW-1 through TSW-6 (µg/L) | MCL (µg/L) |
|---|---|---|---|
| Carbon Tetrachloride | **2.3** | ND<0.25 to ND<0.69* | *0.50* |
| PCE | **35** | ND<0.25 to ND<0.70 | *5.0* |
| TCE | **81** | ND<0.25 to ND<0.70 | *5.0* |

*µg/L = micrograms per liter*
*ND = Not detected above stated laboratory reporting limit*
*(1) GeoSyntec Consultants and ERM, 2020. 2019 Annual Performance Evaluation Report, Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites, Los Angeles County, California, dated April 30, 2020.*
**Non-detectable sample result for TSW-1 above MCL. Remaining target analytes meet data quality objectives.*

Based on a comparison of the analytical results for the data collected for this assessment compared to the data for the off-site municipal well, first encountered groundwater beneath the Property does not appear to be impacted with the target VOC analytes identified for the Baldwin Park OU.

The distribution of the TPH concentrations detected in the groundwater samples collected from TSW-1 through TSW-6 were compared to the soil analytical results and the calculated groundwater flow for the property. Based on the comparison, no direct correlation between the soil analytical results and groundwater analytical results for TPH are evident; therefore, TPH impacts to groundwater from the Property are not evident. A comparison of groundwater analytical results and the groundwater flow indicate a potential correlation supported by TPH concentrations in groundwater that appear to decrease down-gradient (toward west-northwest ).

The groundwater analytical results for perchlorate were below the specified laboratory reporting limit except for two detections of 1.1 and 0.91 µg/L in TSW-1 and TSW-4, respectively. The detection of 1.1 µg/L in TSW-1 is slightly above California's Public Health Goal (PHG) of *1.0 µg/L,* but below the MCL of *6.0 µg/L.*

The groundwater analytical results for 1,4-dioxane were below the specified laboratory reporting limits except for two detections, TSW-5 and TSW-5 DUP (duplicate sample), with concentrations of 0.95 and 0.60 µg/L, respectively, which are slightly above the MCL of *0.38 µg/L.*

Water quality data from off-site municipal well No. B25A indicates the following recent (December 1, 2020) target concentrations in groundwater compared to the groundwater analytical results for the Property and the MCL.

| Analyte | Off-site: Municipal Well B25A (µg/L) (1) | Property: TSW-1 through TSW-6 (µg/L) | MCL (µg/L) |
|---|---|---|---|
| Perchlorate | **53** | ND<0.91 to **1.1*** | *6.0* |
| 1,4-Dioxane | **2.8** | ND<0.34 to **0.95** | *0.38* |

*µg/L = micrograms per liter*
*ND = Not detected above stated laboratory reporting limit*
*(1) GeoSyntec Consultants and ERM, 2020. 2019 Annual Performance Evaluation Report, Baldwin Park Operable Unit of the San Gabriel Valley Superfund Sites, Los Angeles County, California, dated April 30, 2020.*
**Above* California's PHG of *1.0 µg/L.*

Based on a comparison of the analytical results for the data collected for this assessment compared to the data for the off-site municipal well, first encountered groundwater beneath the

Property is impacted with perchlorate and 1,4-dioxane, which are primary contaminants identified for the Baldwin Park OU, but at concentrations less than identified for the plume and nearby production well. Based on the screening levels outlined above, one or more of the detectable concentrations of perchlorate and 1,4-dioxane collected on the Property are above a screening level.

The distribution of the perchlorate and 1,4-dioxane concentrations detected in the groundwater samples collected from TSW-1 through TSW-6 were compared to the groundwater flow (west-northwest), which similar to the TPH data, indicate a potential correlation supported by perchlorate and 1,4-dioxane concentrations in groundwater that appear to decrease down-gradient (toward west-northwest).

Given the low-level distribution of TPH concentrations in soil and groundwater beneath the Property without an identified point of release, and with a groundwater flow direction to the west-northwest, a source of the low-level dissolved phase TPH concentrations has not been identified and is likely attributed to a regional condition.

Based on the low-level distribution of perchlorate and 1,4-dioxane in groundwater beneath the Property, which are less than the concentrations detected in the down-gradient production well B25A, and the absence of historical and current use of these chemicals on the Property, the likely source of perchlorate and 1,4-dioxane in groundwater beneath the Property is the regional Baldwin Park OU plume. Based on the absence of groundwater wells on the property, and the depth to groundwater (117.44 to 129.95 feet bgs) beneath the Property, direct exposure to the detected contaminants in groundwater is not anticipated.

## 5.3 Soil Gas and Subslab Sampling

Laboratory analytical results for the soil gas and subslab samples collected from SGP-1 through SGP-5, and SSP-1 through SSP-6 (**Tables 7** and **8**) indicate that:

Soil gas probe (SGP) sample analytical results indicate that several VOCs were detected above their respective laboratory reporting limits. The soil gas sample analytical results were compared to the ESLs, which revealed that concentrations of bromodichloromethane, chloroform, and PCE detected in one or more samples exceed their respective ESLs for residential land use, as detailed below:

- The bromodichloromethane concentration detected in soil gas sample SGP-5-20 at 3.1 micrograms per cubic meter ($\mu g/m^3$), exceeds the residential ESL (*2.5 $\mu g/m^3$*).
- The chloroform concentration detected in soil gas sample SGP-5-20 at 9.8 $\mu g/m^3$, exceeds the residential ESL (*4.1 $\mu g/m^3$*).

- The PCE concentration detected in soil gas sample SGP-3-20 at 17 µg/m$^3$, exceeds the residential ESL (*15 µg/m$^3$*).

- Other detectable VOC concentrations did not exceed their respective residential or commercial ESLs.

Bromodichloromethane and chloroform are typically related to the chlorination and treatment of tap water and are not considered to be directly related to a VOC release.

Subslab probe (SSP) sample analytical results indicate that several VOCs were detected above their respective laboratory reporting limits. The soil gas sample analytical results were compared to the ESLs, which revealed that concentrations of PCE and TCE detected in one sample (SSP-1) exceed their respective ESLs for residential and/or commercial land use, as detailed below:

- The PCE concentration detected in subslab probe sample SSP-1 at 18 µg/m$^3$, exceeds the residential ESL (*15 µg/m$^3$*), but is below the commercial ESL (*67 µg/m$^3$*).

- The TCE concentration detected in subslab probe sample SSP-1 at 130 µg/m$^3$, exceeds the commercial ESL (*100 µg/m$^3$*).

- The remaining detected VOC concentrations did not exceed their respective residential or commercial ESLs.

Laboratory analytical results for the fix gases analysis appear to be in alignment of expected concentrations and evidence of biodegradation of subsurface contaminants, depleted oxygen levels and methanogenesis are not evident.

Based on VOCs concentrations exceeding the residential and/or commercial ESLs, soil gas conditions beneath the Property represent a potential risk for vapor intrusion to indoor air.

## 5.4 Indoor and Outdoor Air Sampling

Laboratory analytical results for the indoor and outdoor air samples collected from IAS-1 through IAS-4, and OAS-1 and OAS-2 (**Table 9**) indicate that:

- The 1,2-dichloroethane concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*0.11 µg/m$^3$*). However, outdoor air sample OAS-1 also exceeds the residential ESL, and is within the same order of magnitude.

- The benzene concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the commercial ESL (*0.42 µg/m$^3$*). However, outdoor air samples OAS-1 and OAS-2 also exceed the commercial ESL, and are within the same order of magnitude.

- The bromodichloromethane concentration detected in indoor air sample IAS-1 at 0.081 µg/m$^3$, exceeds the residential ESL (*0.076 µg/m$^3$*).

- The carbon tetrachloride concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*0.47 µg/m$^3$*). However, outdoor air samples OAS-1 and OAS-2 also exceed the residential ESL, and are within the same order of magnitude.

- The chloroform concentrations detected in indoor air samples IAS-1 through IAS-3, exceed the residential ESL of (*0.12 µg/m$^3$*). However, outdoor air samples OAS-1 and OAS-2 are within the same order of magnitude.

- The methylene chloride concentrations detected in indoor air samples IAS-1 through IAS-4, exceed the residential ESL (*1.0 µg/m$^3$*).

- The TCE concentrations detected in indoor air samples IAS-1, IAS-3, and IAS-4, exceed the residential ESL (*0.48 µg/m$^3$*), and the TCE concentration detected in indoor air sample IAS-2 of 4.6 µg/m$^3$ exceeds the commercial ESL (*3.0 µg/m$^3$*).

- Other detectable VOC concentrations did not exceed their respective residential or commercial ESLs.

The four indoor air samples had detectable concentrations of VOCs that exceed residential and commercial ESLs. In general, the detections of VOCs in indoor air where detected in the outdoor air samples at comparable concentrations (within same order of magnitude). The only anomalous data identified are the detection of TCE concentrations in the indoor air samples above residential and commercial ESLs. TCE was not detected above the laboratory reporting limit in the outdoor air samples. As indicated in **Sections 4.4** and **5.3** above, PCE and TCE were also detected above residential and commercial screening levels, respectively, in subslab probe SSP-1. The detections of PCE and TCE in the subslab sample, detection of TCE in indoor air, and absence of TCE detections in outdoor indicates a potential for a complete vapor intrusion exposure pathway for the existing buildings.

The source of the TCE in subslab soil gas and/or indoor air is unconfirmed as TCE was not detected in the limited soil or groundwater data collected for the Property. Based on the isolated detection of elevated TCE concentrations in subslab SSP-1 and similar concentrations of TCE in the four indoor air samples (for both semi-connected buildings), the source for TCE in the indoor

air may be attributed to inventory and products stored in the buildings. Although a chemical/product inventory was not prepared as part of this scope of services, TCE and other solvents are known to be present in adhesives, cleaners, rugs, wood furniture and leather products, which were generally observed in one or both buildings.

Terracon sampled indoor air under normal operating conditions for the business. The heating, ventilation and air conditioning (HVAC) system was operational at the time of indoor air sampling; however, based on the mild temperature on the day of the sampling, the HVAC system likely cycled less than a typical day, which represents the conservative sampling conditions outlined in DTSC's guidance[5].

[5] *Department of Toxic Substances Control (DTSC). 2011. Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance), California Environmental Protection Agency. Original December 2004, Final October 2011.*

# 6.0 RECOMMENDATIONS

It is Terracon's understanding that the Property is intended to either remain occupied as a commercial business, unoccupied or redeveloped in the future.

Based on the above findings and conclusions, Terracon has the following recommendations:

- In response to the potential for a complete vapor intrusion exposure pathway from the documented VOCs concentrations, including TCE, above their respective residential and/or commercial ESLs identified at the Property in subslab soil gas and indoor air, indicating the potential for incremental risk above the acceptable baseline, engineered control measures should be evaluated and implemented based on the future use of the Property, as follows:

  - If the existing buildings on the Property are to remain occupied for commercial use, and/or otherwise used by KP for occupancy, installation of engineered control measures, such as the application of Retro-Coat to mitigate the potential for vapor intrusion of VOCs into indoor air is warranted.

  - If the existing buildings are to be demolished and the Property will be redeveloped with new building(s) for occupancy, Terracon recommends the installation of a passive vapor intrusion mitigation system (VIMS) that could be converted to an active system for buildings developed on the Property. If installed, the VIMS should consist of an engineered chemically resistant vapor barrier and subslab venting system to mitigate VOCs. If installed, on-going monitoring and evaluation of the VIMS is recommended, including the creation and adherence to a written operation, maintenance, and monitoring plan for the engineering controls. This plan may include recommendations for routine monitoring of indoor air quality.

- Based on the potential for residual impacts to be encountered during demolition and/or redevelopment, a Soil and Groundwater Management Plan is recommended. The Soil and Groundwater Management Plan should be developed prior to any construction or maintenance that includes disturbing soil, for protection of construction workers and proper handling of impacted materials if encountered.

- Additional soil, groundwater, or soil gas assessment at the Property does not appear warranted at this time.

Notes:
EPA = United States Environmental Protection Agency
All units are in micrograms per liter (µg/L)
"<" = less than the laboratory reporting limit specified
ND = not detected above laboratory reporting limits. Multiple analytes, see laboratory report for specific reporting limits.
-- = Not analyzed/not available/not established; or omitted based on ND laboratory results
TPH GRO = total petroleum hydrocarbons in gasoline carbon range (C4-C12)
TPH DRO = total petroleum hydrocarbons in diesel carbon range (C13-C22)
TPH MORO = total petroleum hydrocarbons in waste oil carbon range (C23-C40)
MCL = Maximum contaminant level (State)
PHG = Public health goal (State)

Screening Levels
(1) Environmental Screening Levels (ESLs), established by the San Francisco Bay Regional Water Quality Control Board, January (Rev. 2)
Groundwater Vapor Intrusion Human Health Risk Level (HHRL) ESLs for Residential and Commercial/Industrial land use exposure scenarios,
(2) "MCL Priority" list all available MCL values. If no MCL values are available, the lower of the cancer and non-cancer tapwater direct exposure levels is listed.

**Analyte concentration exceeds the standard for:**
Concentration Reported Above Maximum Contaminant Level (MCL) for Drinking Water Screening Levels
Concentration Reported Above Preliminary Health Goal (PHG)

## Boring Permit

# ENVIRONMENTAL HEALTH

## Drinking Water Program

5050 Commerce Drive, Baldwin Park, CA 91706
Telephone: (626) 430-5420 • http://publichealth.lacounty.gov/eh/ep/dw/dw_main.htm

# Work Plan Approval

| WORK SITE ADDRESS | CITY | ZIP | EMAIL ADDRESS |
|---|---|---|---|
| Broken Horn / CB21P020<br>1022 & 1026 Leorita Street / APN 8559-008-005, 011 | Baldwin Park | 91706 | todd.mcfarland@terracon.com |

**NOTICE:**

- WORK PLAN APPROVALS ARE VALID FOR 180 DAYS. 30 DAY EXTENSIONS OF WORK PLAN APPROVALS ARE CONSIDERED ON AN INDIVIDUAL (CASE-BY-CASE) BASIS AND MAY BE SUBJECT TO ADDITIONAL PLAN REVIEW FEES (HOURLY RATE AS APPLICABLE).
- WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.
- WORK PLAN APPROVALS ARE LIMITED TO COMPLIANCE WITH THE CALIFORNIA WELL STANDARDS AND THE LOS ANGELES COUNTY CODE AND DOES NOT GRANT ANY RIGHTS TO CONSTRUCT, RENOVATE, OR DECOMMISSION ANY WELL. THE APPLICANT IS RESPONSIBLE FOR SECURING ALL OTHER NECESSARY PERMITS SUCH AS WATER RIGHTS, PROPERTY RIGHTS, COASTAL COMMISSION APPROVALS, USE COVENANTS, ENCROACHMENT PERMISSIONS, UTILITY LINE SETBACKS, CITY/COUNTY PUBLIC WORKS RIGHTS OF WAY, ETC.
- THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED BY THE DEPUTY HEALTH OFFICER. WORK SHALL NOT BE INITIATED WITHOUT A WORK PLAN APPROVAL STAMPED BY THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.

**TO BE COMPLETED BY DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM:**

| | | | | | |
|---|---|---|---|---|---|
| X | **WORK PLAN APPROVED** FOR:<br>6 soil borings up to ~160 ft bgs. | **PERMIT NUMBER:** | SR0248160 | **DATE:** | March 19, 2021 |

## ADDITIONAL APPROVAL CONDITIONS:

1) Work plan approval is issued for scope of work submitted to the Drinking Water Program. Any modifications to the scope of work will require additional work plan review.
2) Soil borings shall be sealed to terminal depth pursuant to Section 9 and Appendix B of *California Well Standards - Bulletins 74-90 & Bulletins 74-81* respectively upon completion.
    - For Portland cement, it shall be mixed at a ratio of one 94-pound sack of Portland cement 5 to 6 gallons of 'clean' water.
    - ***Up to 6%*** of bentonite may be added to the cement mixture at a ratio of two (2) pounds of bentonite one (1) gallon of 'clean' water, or in accordance with the manufacturer's specification.
    - The use of hydrated bentonite is not permitted.
3) Sealing materials shall be applied under pressure - from *the bottom of the well or boring proceeding upward in one continuous operation via a tremie pipe or equivalent* - to prevent freefall, jamming or "bridging", voids, dilution of sealing materials, and/or prevent separation of aggregate from sealants.
4) Drill cuttings and wastewater shall be disposed of in accordance with all applicable federal, State, and local requirements.
5) Sealing materials shall meet *National Sanitation Foundation (NSF 61)* standard.
6) Provide temporary cover to the borehole opening whenever work is interrupted.
7) Soil boring or exploration holes must comply with all applicable requirements published in the *California Well Standards (Bulletins 74-81 and 74-90 combined)* and the *Los Angeles County Code, Title 11.*

### REQUIRED SUPPORTING DOCUMENTS

**Well Construction**

- ☐ Written narrative describing work plan details
- ☐ Well diagram detailing depth, size, thickness, and materials of:
  - (1) the casing
  - (2) the annular (sanitary) seal
  - (3) the screen / slotting
  - (4) any pertinent geological features
- ☐ Scaled drawing of roads, property lines, private sewage disposal systems, surface water features, blue line streams, and other possible sources of contamination within 200 feet of the well site

**Well Decommission**

- ☐ Written narrative describing work plan details
- ☐ Well construction logs
- ☐ Type and amount of sealant
- ☐ Method of assessment
- ☐ Method of upper seal pressure application (including PSI and time applied)
- ☐ Scaled drawing of roads, property lines, private sewage disposal systems, surface water features, blue line streams, and other possible sources of contamination within 200 feet of the well site

**Borings**

- ■ Written narrative describing work plan details
- ■ Scaled drawing of roads, property lines, private sewage disposal systems, surface water features, blue line streams, and other possible sources of contamination within 200 feet of the well site

**1022 and 1026 Leorita Street, Baldwin Park, CA 91706**

**Proposed soil borings**

The proposed soil boring locations (approximate) are shown on Exhibit 2. The proposed scope includes the following elements:

| Type | Quantity | Depth* (feet bgs) | Sample Media | Drilling Method | Abandonment Method |
|---|---|---|---|---|---|
| Soil Borings | 6 | 160 | Soil, Groundwater | Hollow Stem Auger | Neat cement |
| | | **960 Feet (total)** | | | |

bgs = below ground surface
* approximately depth, or first encountered groundwater, and/or refusal

Drilling services for the proposed soil borings will be performed by a State-of-California C-57 licensed driller using a hollow stem auger drill rig. Field work will be conducted under the supervision of a Terracon environmental professional and the oversight of a California licensed Professional Geologist (P.G.).

**Soil Borings and Sampling**

From each 160-foot boring, soil samples will be collected approximately every 5-feet, beginning at 5 feet bgs to the terminal depth. Once lithology and depth to groundwater are established, sampling intervals may be adjusted. Soil samples will be collected to document lithology, color, and relative moisture content, and logged on a boring log.

**Temporary Sampling Wells and Sampling**

Terracon proposes to install temporary sampling wells to assess groundwater conditions beneath the Property within each of the deeper (160-foot) soil borings. The wells will be constructed with new 2-inch PVC well casing into the shallow water bearing formation and constructed with 5-feet of 0.020-inch slotted well screen from the bottom of the boring, flush threaded to 2-inch casing to the existing grade.

Terracon will measure depth to static groundwater and surface elevations (and/or casing elevations) will be measured to establish groundwater flow and gradient. At the completion of groundwater sampling activities, the temporary casing will be removed and the boreholes will be plugged with neat cement, or similarly agency approved sealing material, and patched at the surface to match the existing surface.

|---|---|---|---|---|---|
| **Lead Technician** | KNERR, CHRIS | **Phone** | | **Email** | chris.knerr@gprsinc.com |

Thank you for using GPRS on your project. We appreciate the opportunity to work with you. If you have questions regarding the results of this scanning, please contact the lead GPRS technician on this project.

**EQUIPMENT USED**

The following equipment was used on this project:

- Underground Scanning GPR antenna. Typically capable of detecting objects up to 8' deep or more in ideal conditions but maximum effective depth can vary widely and depends on site and soil conditions. Depth penetration is most commonly limited by moisture and clay/conductive soils. Depths provided should always be treated as estimates as their accuracy can be affected by multiple factors.
- Electromagnetic Pipe and Cable Locator. Detects electromagnetic fields. Used to actively trace conductive pipes and tracer wires, or passively detect power and radio signals traveling along conductive pipes and utilities. Depths provided should always be treated as estimates as their accuracy can be affected by multiple factors.

**Work Performed**

Ground Penetrating Radar Systems performed the following work on this project:

**Underground Utility**

The scope of work included scanning the specified area to locate underground utilities. A tracer signal was sent along any accessible metallic utility or tracer wire, and the area was scanned with GPR to locate any additional targets. The locations of any detected utilities and anomalies were marked directly at the site with paint, flags, stakes, or other appropriate means, and results were reviewed with onsite personnel unless otherwise noted.

- Clear and mark utilities for 11 outdoor borring locations and 6 indoor sub slab locations.
- The effective depth of GPR will vary throughout a site depending on surface and soil conditions. In this area, the maximum effective GPR depth was approximately 0-4 feet.
- Marked all found utilities with color coded marking paint. Water lines were non conductive unable to confirm.

## UTILITY LOCATING

To ensure the overall timely success of your project, utility detection is critical to any construction project where subsurface excavation is planned. If this critical first step is ignored, the risk for injury increases, budget overruns can multiply and your schedule can be delayed.

## VIDEO PIPE INSPECTION

Video Pipe Inspection (CCTV) is a service used to inspect underground water, sewer and lateral pipelines. VPI is a great tool for investigating cross-bores, structural faults and damages, and lateral line inspection.

## CONCRETE SCANNING

With new build construction and renovation projects, the likelihood of needing to cut or core concrete is high. There is an inherent risk of striking rebar, conduits, and post tension cables during the cutting or coring process. Our industry-leading concrete scanning services can mitigate the risks associated with saw cutting and core drilling concrete slabs.

## REPORTS & DRAWINGS

The goal of the GPRS Deliverables Department is to deliver clear and understandable findings with each of our outputs from field markings to field sketches, KMZ files, or CAD drawings that provide 2D site plans or even 3D CAD models. In addition, upon the completion of every project, our customers receive a job summary that includes job scope information, site photos, description of site conditions, equipment used, and notes from the project.

### NATIONWIDE SERVICE

With team members located in every major metropolitan area in the U.S., we're just a short drive away from any project. Our footprint allows us to service all of your projects, nationwide.

### RAPID RESPONSE

Time is always critical in any construction project. We understand this and have, accordingly, developed and perfected our operations to quickly and efficiently respond to our customers within 24-48 hours, or less.

### CONSULTATIVE APPROACH

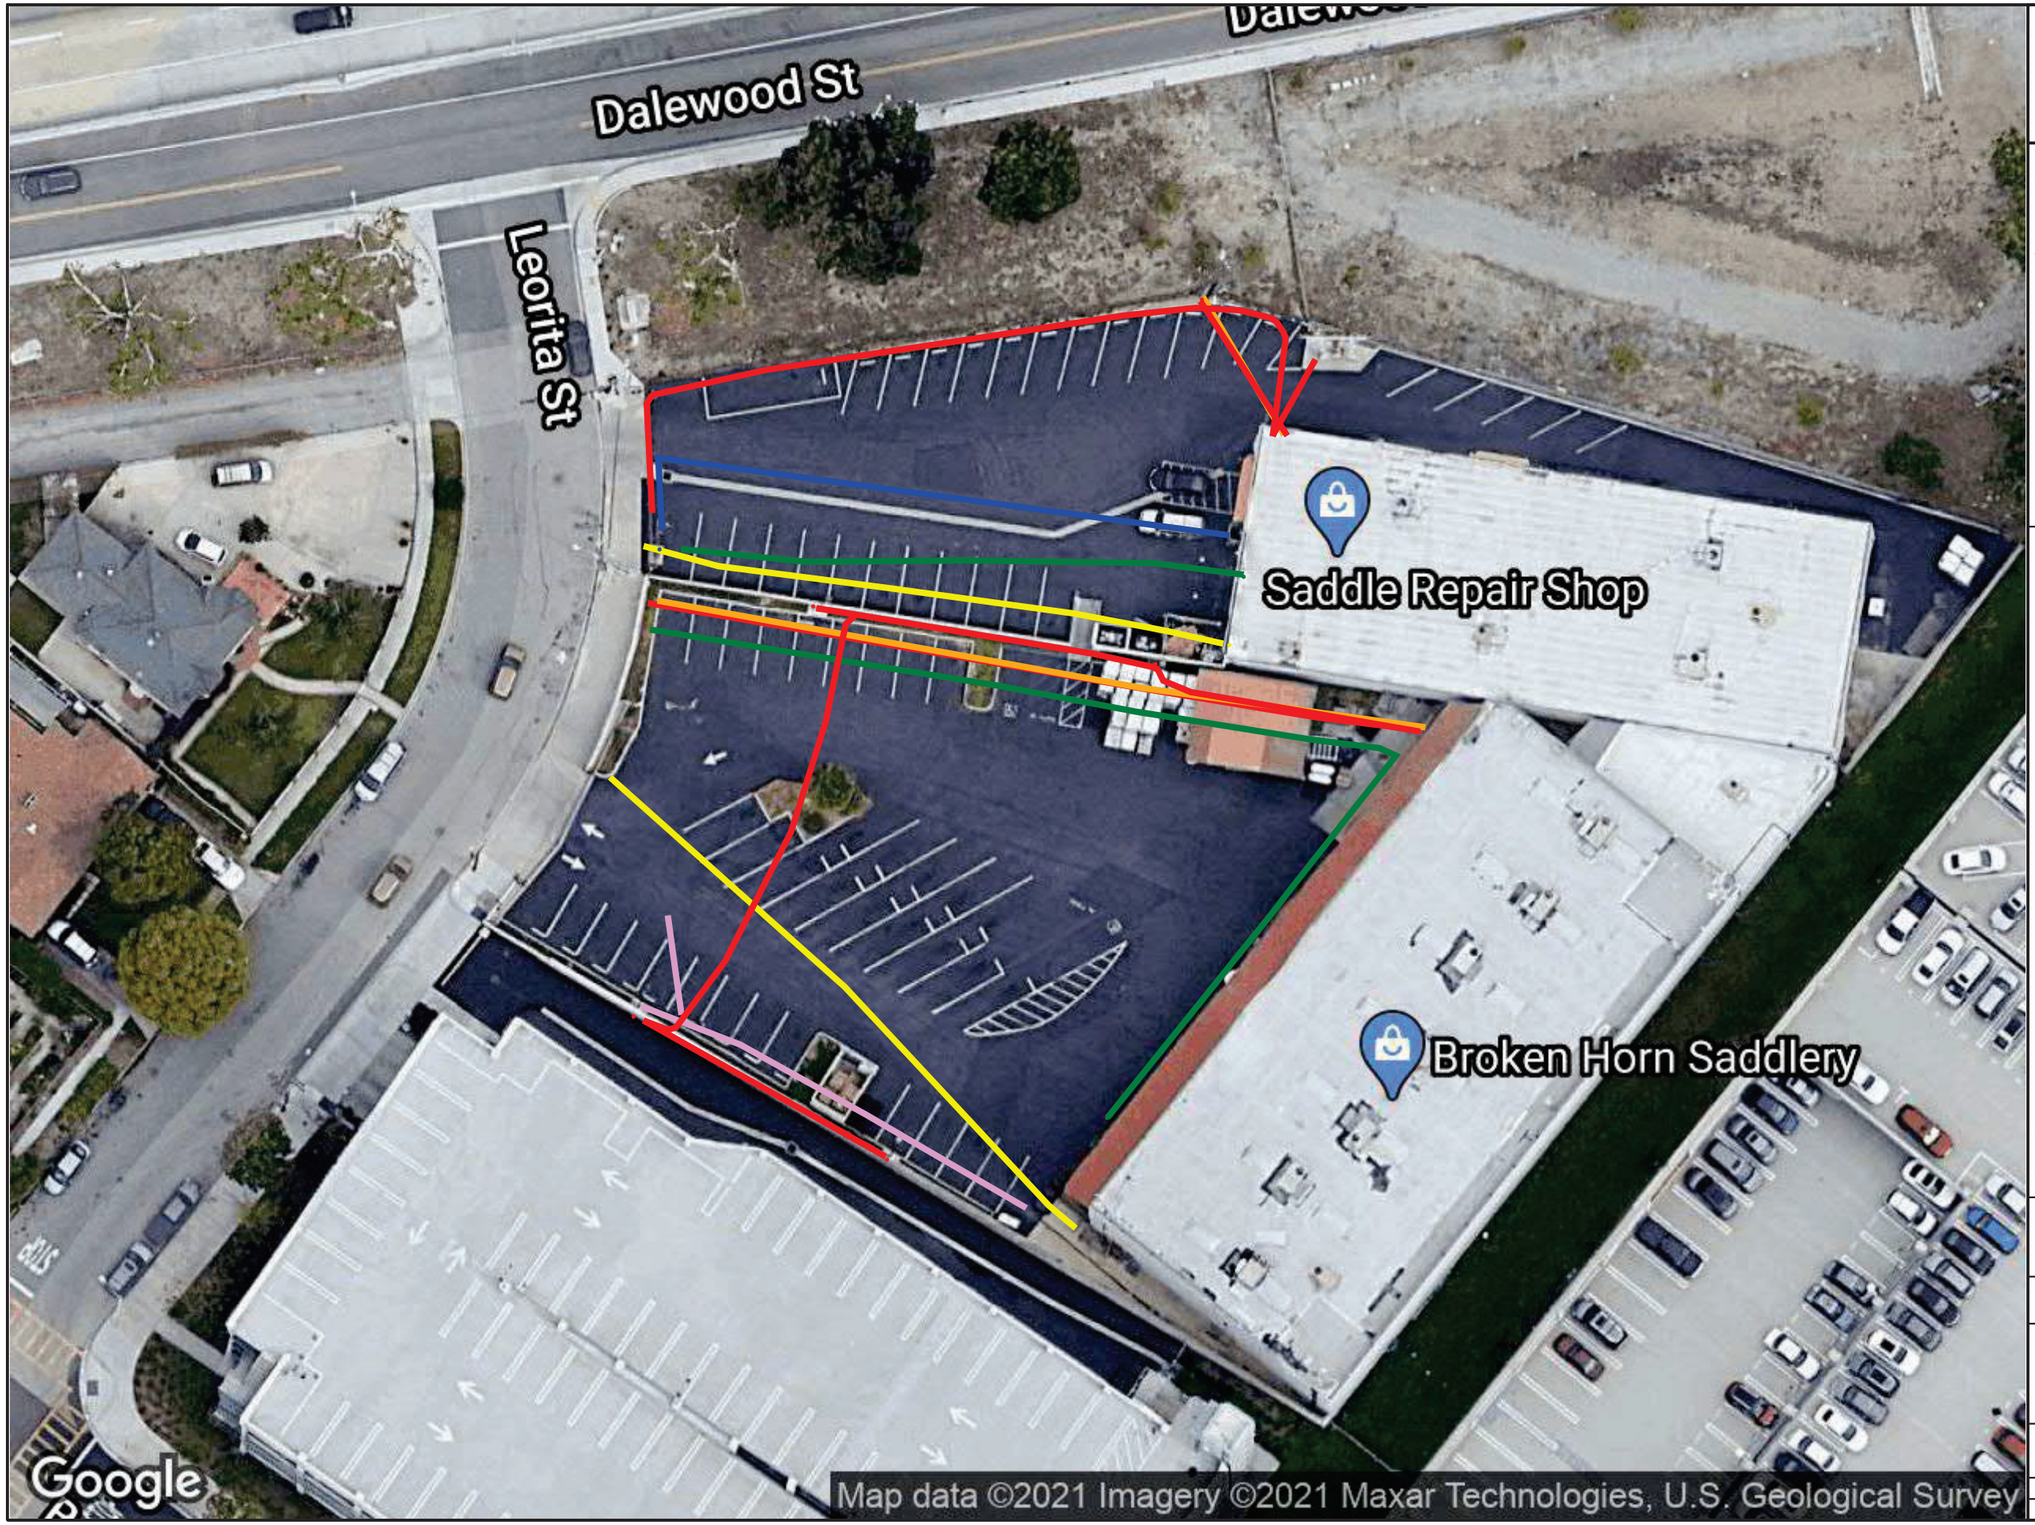
Our Project Managers are trained to ask questions and provide you with answers. This project-specific consultative approach - a GPRS trademark – helps us hone in on your subsurface issues and ensure we provide valuable problem-solving solutions to keep your job moving.

### PROVEN RESULTS

GPRS deploys the best equipment, operated by skilled Project Managers, who know how to solve your subsurface locating issues. Since our inception, GPRS has completed hundreds of thousands of projects in North America. Our accuracy rate on these projects? Over 99%

The SIM Specification standard is the industry-leading, metrics-based guideline for the underground locating and concrete scanning industries. SIM includes these three main elements:

SIMSPEC.ORG



GPRS

## DISCLAIMERS

1. THIS PDF IS AN AUTOMATED OUTPUT CREATED DIRECTLY FROM DATA COLLECTED IN THE FIELD. IT IS INTENDED TO DOCUMENT MARKINGS AND COMMENTS COLLECTED BY GPRS, LLC. THE FIELD FINDINGS MAY BE CORRECTED AND/OR ADDITIONAL DELIVERABLES CREATED AFTER THE DATA IS FURTHER REVIEWED.
2. AERIAL IMAGERY IS SOMETIMES SHIFTED, OUTDATED, OR INACCURATE WHILE THE LINE AND POINT DATA REMAIN AS COLLECTED IN THE FIELD. IN THE EVENT THE AERIAL IMAGE LOCATION NEEDS CORRECTION, ADDITIONAL CAD SERVICES CAN BE ORDERED.
3. GPRS CANNOT GUARANTEE THAT ALL UTILITIES OR OTHER SUBSURFACE FEATURES ON SITE WERE ABLE TO BE LOCATED. ALL FINDINGS ARE SUBJECT TO THE TERMS AND CONDITIONS THAT CAN BE VIEWED AT THIS LINK: https://gp-radar.com/terms-conditions
4. GPRS DOES NOT PROVIDE GEOPHYSICAL, GEOLOGICAL, LAND SURVEYING, OR ENGINEERING SERVICES. GPRS IS NOT A LICENSED LAND SURVEYOR. THIS PDF IS NOT A LAND SURVEY AND MAY NOT BE RELIED ON OR USED FOR ANY PURPOSES EXCEPT AS EXPRESSLY STATED HEREIN.
5. FOR ADDITIONAL INFORMATION REGARDING FINDINGS AND EQUIPMENT USED, SEE THE "JOB SUMMARY REPORT" AS WELL AS OTHER SUBMITTALS INCLUDED IN THE SUBMITTAL LETTER SENT VIA EMAIL FOLLOWING COMPLETION OF FIELD WORK.
6. PRIVATE UTILITY LOCATING IS NEVER A REPLACEMENT FOR ONE CALL/811 SERVICES. STATE LAW REQUIRES 811 TO BE CALLED PRIOR TO ANY AND ALL EXCAVATION ACTIVITIES.

# BORING LOG NO. B-1/TSW-1

**PROJECT:** Broken Horn Saddlery

**CLIENT:** Kaiser Permanente
Pasadena, CA

**SITE:** 1022 and 1026 Leorita Street
Baldwin Park, CA

LOCATION See Exhibit 3

Latitude: 34.065795° Longitude: -117.988042°

Surface Elev.: 315.96 (Ft.)

| GRAPHIC LOG | DEPTH | ELEVATION (Ft.) | | DEPTH (Ft.) | WATER LEVEL OBSERVATIONS | SAMPLE TYPE | PID |
|---|---|---|---|---|---|---|---|
| | **POORLY GRADED SAND WITH GRAVEL (SP)**, medium to coarse grained, light brown, moist, gravel up to 1" *(continued)* | | 2" PVC casing | 80 | | | 0.2 |
| | | | | 85 | | | |
| | | | | 90 | | | 0.3 |
| | | | | 95 | | | |
| | | | | 100 | | | |

Stratification lines are approximate. In-situ, the transition may be gradual.

Advancement Method:
Hollow Stem Auger

Abandonment Method:
Boring backfilled with cement-bentonite grout upon completion and capped with concrete.

Notes:

**WATER LEVEL OBSERVATIONS**

*Static groundwater level observed at 118.53 feet bgs*

Terracon

## Waste Documentation

March 24, 2021

Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership
1022-1026 Leorita Street
Baldwin Park, California 91706
Phone #: 714-931-2123

Re: Waste Representative Authorization
Broken Horn Saddlery
1022-1026 Leorita Street, Baldwin Park, CA

Dear Jerry Nuzzo:

Terracon Consultants, Inc. (Terracon) understands that, as part of our Services, Terracon will be requested to sign waste management documents, in your name and on your behalf, as required to transport estimated 40 tons of [Class II non-hazardous] soil and 300 gallons of [Class II non-hazardous] water from the above referenced site.

In accordance with your request, it is agreed that Terracon is authorized to sign on behalf of Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership any required documentation for the removal of waste and other materials from the above-referenced site. The documents shall be completed in the name of Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership and shall be signed on behalf of Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership . It is understood and agreed that by its actions that Terracon will not be deemed a generator, arranger, transporter or disposer of hazardous materials or hazardous wastes.

In consideration of Terracon's agreement to sign the required documents on its behalf, Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership shall indemnify and hold harmless Terracon from and against any and all claims, damages, losses and expenses, including but not limited to attorneys' fees, court costs, and administrative expenses arising out of or in any way associated with the action of Terracon in signing the required documents on behalf of Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership , unless such claims, damages, losses and expenses are caused by the sole negligence of Terracon.

By signing the attached copy of this letter Jerry and Erin Nuzzo Trust and Nuzzo Family Limited Partnership agrees to be bound by the terms of this letter.

Sincerely,
**Terracon Consultants, Inc.**

Michael P. Harris
Senior National Account Manager

40 Tons
Drums

**Source of contamination (ust, ast, etc...):** No known contamination
(please list gas, diesel, combo, waste oil, etc...) Exploratory soil borings

Please check appropate box below and attach all required analytical reports. Unless otherwise noted, composite samples should be collected with the following frequency: 1sample for 100 cubic yards or less ; 3 samples for 500 cu yds or less ; 5 samples for 1000 cu yds 1 additional sample for each additional 500cu yds greater than 1000 cu yds

☐ I/we certify that the soil referenced herein is contaminated soley by Virgin petroleum products from leaking underground storage tank(s).

Attached is analytical data from state certified lab for the following

1) Total Petroleum Hydrocarbons (TPH, EPA 8015 Modified)

2) Benzene/Toluene/Ethylbenzene/xylene (BTEX, EPA 8020)

X I/We certified that some or all of the contaminants in the soil referenced herein is waste oil, or some other non-virgin petroleum product, or virgin petroleum product from something other than a leaking underground storage tank.
Attached is analytical data from a state certified lab for the following:

**1) Total metals concentration for a thru q below (TTLC test)**

| | | |
|---|---|---|
| a) Antimony | g)Cobalt | m) Selenium |
| b) Arsenic | h)Copper | n) Silver |
| c) Barium | I) Lead | o) Thalium |
| d) Berylium | j) Mercury | p) Vanadium |
| e) Cadmium | k) Molybdenum | q) Zinc |
| f) Chromium | l) Nickel | |

Note: If any item a thru q is greater than 10 times its Soluble Threshold Limit concentration (STLC) the soluble metal concentration must be determined by the Waste Extraction Test procedure.

**2) TPH by:**
EPA 418.1 or
EPA 8015 modified

**3) BTEX/VOC by:**
EPA 8020 EPA 8010
or EPA 8260(combines above)

**4) PCB'S(waste oil only)**
**5) Additional analytical data as required.**

No soils referenced herein may be delivered until the forgoing certificate is received and approved by the facility, and they issues manifests and assigns an approval number. If any soils delivered to the facility are found to be "Hazardous Waste" pursuant to federal or state regulations, the client shall be solely responsible for their removal. If the client fails to remove such soils, the facility, acting as client's agent, may arrange for such removal at client's expense. This is a complete and accurate description of the soil referenced herein; no deliberate or willful omissions have been made and all known or suspected hazards have been disclosed herein. I/We certify that the soil is not "hazardous" as defined by U.S. Department of Transportation (DOT), U.S. Environmental Protection Agency (EPA), State or local regulations. I/We further certify that the soils referenced herein contain no free liquids. All analysis reports attached.

Scale Ticket # 164017

*Generator's and/or consultant's certification: I/We certify that the soil referenced herein is taken entirely from those soils descried in the Soil Data Sheet completed and certified by me/us for the Generation Site shown above and nothing has been added or done to such soil that would alter it in any way.*

Print or Type Name: Generator ☐ Consultant ☑ Thomas S. Johnson
Signature and date: As further agent for Jerry and Erin Nuzzo Trust — Month 4 Day 9 Year 2021

**Transporter**

*Transporter's certification: I/We acknowledge receipt of the soil referenced above and certify that such soil is being delivered in exactly the same condition as when received. I/We further certify that the soil is being directly transported from the Generation Site to the Designated Facility without off-loading, adding to, subtracting from or in any way delaying delivery to such site.*

Print or Type Name: Edward Ruiz
Signature and date: Month 4 Day 9 Year 21

**Recycling Facility**

Discrepancies:

*Recycling Facility certifies the receipt of the soil covered by this manifest except as noted above.*

Print or Type Name: Joe Provansal / Barry Meek / Bill Bishop
Signature and date: 4-9-21

## Job ID: 440-280935-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-280935-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/23/2021 6:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.5º C.

**GC/MS VOA**
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-138697.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-138692.

Method 8260B: The initial calibration curve analyzed in batch 570-138697 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC VOA**
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 138805.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC Semi VOA**
Method 8081A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-138530 and analytical batch 570-138769 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8151A: The continuing calibration verification (CCV) associated with batch 570-138775 recovered above the upper control limit for 2,4,5-TP (Silvex) and 2,4-DB. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 570-138775/34).

Method 8151A: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 570-138415 and analytical batch 570-138775 recovered outside control limits for the following analyte(s): Dinoseb. Dinoseb has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method 8151A: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-138415 and analytical batch 570-138775 recovered outside control limits for the following analytes: 2,4-DB and Dalapon.

Method 8151A: The matrix spike/matrix spike duplicate (MS/MSD) for preparation batch 570-138415 and analytical batch 570-138775 exceeded control limits for the following analyte(s): Dinoseb, Note that this analyte is a known poor performer when analyzed using this method.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Metals**
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-138796 and analytical batch 570-139319 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated

## Job ID: 440-280935-1 (Continued)

### Laboratory: Eurofins Calscience Irvine (Continued)

laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: The absolute response for Beryllium was greater than the method reporting limit (RL) in the following sample: SGP-5-5 (440-280935-9).
The instrument raw data has been manually reviewed and the result can be reported as ND.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| *- | LCS and/or LCSD is outside acceptance limits, low biased. |
| *+ | LCS and/or LCSD is outside acceptance limits, high biased. |
| *1 | LCS/LCSD RPD exceeds control limits. |
| E | Result exceeded calibration range. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| L | A negative instrument reading had an absolute value greater than the reporting limit |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Accreditation/Certification Summary

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Job ID: 440-280935-1

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | SCAQMD LAP | 17LA0919 | 11-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 6010B | 3050B | Solid | Antimony |
| 6010B | 3050B | Solid | Arsenic |
| 6010B | 3050B | Solid | Barium |
| 6010B | 3050B | Solid | Beryllium |
| 6010B | 3050B | Solid | Cadmium |
| 6010B | 3050B | Solid | Chromium |
| 6010B | 3050B | Solid | Cobalt |
| 6010B | 3050B | Solid | Copper |
| 6010B | 3050B | Solid | Lead |
| 6010B | 3050B | Solid | Molybdenum |
| 6010B | 3050B | Solid | Nickel |
| 6010B | 3050B | Solid | Selenium |
| 6010B | 3050B | Solid | Silver |
| 6010B | 3050B | Solid | Thallium |
| 6010B | 3050B | Solid | Vanadium |
| 6010B | 3050B | Solid | Zinc |
| 7471A | 7471A | Solid | Mercury |
| 8015B | 3550C | Solid | C13-C22 |
| 8015B | 3550C | Solid | C23-C40 |
| 8015B | 5035 | Solid | Gasoline Range Organics (C4-C12) |
| 8081A | 3546 | Solid | 4,4'-DDD |
| 8081A | 3546 | Solid | 4,4'-DDE |
| 8081A | 3546 | Solid | 4,4'-DDT |
| 8081A | 3546 | Solid | Aldrin |
| 8081A | 3546 | Solid | alpha-BHC |
| 8081A | 3546 | Solid | alpha-Chlordane |
| 8081A | 3546 | Solid | beta-BHC |
| 8081A | 3546 | Solid | Chlordane |
| 8081A | 3546 | Solid | delta-BHC |
| 8081A | 3546 | Solid | Dieldrin |
| 8081A | 3546 | Solid | Endosulfan I |
| 8081A | 3546 | Solid | Endosulfan II |
| 8081A | 3546 | Solid | Endosulfan sulfate |
| 8081A | 3546 | Solid | Endrin |
| 8081A | 3546 | Solid | Endrin aldehyde |
| 8081A | 3546 | Solid | Endrin ketone |
| 8081A | 3546 | Solid | gamma-BHC |
| 8081A | 3546 | Solid | gamma-Chlordane |
| 8081A | 3546 | Solid | Heptachlor |
| 8081A | 3546 | Solid | Heptachlor epoxide |
| 8081A | 3546 | Solid | Methoxychlor |
| 8081A | 3546 | Solid | Toxaphene |
| 8151A | 8151A | Solid | 2,4,5-T |
| 8151A | 8151A | Solid | 2,4,5-TP (Silvex) |
| 8151A | 8151A | Solid | 2,4-D |

Project/Site: Broken Horn Saddler V

Job ID: 440-280940-1

## Job ID: 440-280940-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-280940-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/23/2021 6:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.8º C.

**GC/MS VOA**
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-138697.

Method 8260B: The initial calibration curve analyzed in batch 570-138697 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC VOA**
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 138805.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC Semi VOA**
Method 8081A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-138530 and analytical batch 570-138769 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8151A: The continuing calibration verification (CCV) associated with batch 570-138775 recovered above the upper control limit for 2,4,5-TP (Silvex) and 2,4-DB. he samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 570-138775/34).

Method 8151A: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 570-138415 and analytical batch 570-138775 recovered outside control limits for the following analyte(s): Dinoseb. Dinoseb has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method 8151A: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 570-138415 and analytical batch 570-138775 recovered outside control limits for the following analytes: 2,4-DB and Dalapon.

Method 8151A: The matrix spike/matrix spike duplicate (MS/MSD) for preparation batch 570-138415 and analytical batch 570-138775 exceeded control limits for the following analyte(s): Dinoseb, Note that this analyte is a known poor performer when analyzed using this method.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Metals**
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-138796 and analytical batch 570-139319 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Job ID: 440-280940-1 (Continued)

### Laboratory: Eurofins Calscience Irvine (Continued)

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| *- | LCS and/or LCSD is outside acceptance limits, low biased. |
| *+ | LCS and/or LCSD is outside acceptance limits, high biased. |
| *1 | LCS/LCSD RPD exceeds control limits. |
| E | Result exceeded calibration range. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Note: Since laboratory accreditations are subject to change, Eurofins Calscience places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Calscience laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Calscience attention immediately If all requested accreditations are current to date return the signed Chain of Custody attesting to said complicance to Eurofins Calscience.

## Job ID: 440-281052-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281052-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/21/2029 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properlV preserved and on ice. The temperature oythe cooler at receipt was 2.8f C.

**GC/MS VOA**
Method 82º 0B: Insuyjicient sample volume was available to peryorm a matrix spike/matrix spike duplicate (MS/MSD) associated with analVtical batch 160-9354º 1.

No additional analVtical or qualitV issues were noted, other than those described above or in the DeyjnitionsƷ lossarV page.

**GC VOA**
Method 8091B: Insuyjicient sample volume was available to peryorm a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 935164.

No additional analVtical or qualitV issues were noted, other than those described above or in the DeyjnitionsƷ lossarV page.

**GC Semi VOA**
Method 8089z: The continuing calibration veriyjcation (CCA) associated with 160-935630 recoveredoutside the control limits yor beta-BHC and gamma-BHC on one column. ; esults are conyjrmed on both columns and reported yrom the passing column.

Method 8089z: The continuing calibration veriyjcation (CCA) associated with batch 160-935630 recovered above the upper control limit yor delta-BHC. The samples associated with this CCA were non-detects yor the ayjected analVtesGthereyore, the data have been reported.

Method 8919z: The laboratorV control sample and/or the laboratorV control sample duplicate (LCS/LCSD) yor preparation batch 160-935619 and analVtical batch 160-940401 recovered outside control limits yor the yollowing analVte(s): Dinoseb. Dinoseb has been identijyed as a poor peryorming analVte when analVRed using this methodGthereyore, re-extraction/re-analVsis was not peryormed. These results have been reported and qualijyed.

Method 8919z: The matrix spike/matrix spike duplicate (MS/MSD) yor preparation batch 160-935619 and analVtical batch 160-940401 exceeded control limits yor the yollowing analVte(s): Dinoseb, Note that this analVte is a known poor peryormer when analVRed using this method.

No additional analVtical or qualitV issues were noted, other than those described above or in the DeyjnitionsƷ lossarV page.

**Metals**
Method º 090B: The absolute response yor MolVbdenum was greater than the method reporting limit (; L) in the yollowing sample: B-3-1 (440-289012-9).
The instrument raw data has been manuallV reviewed and the result can be reported as ND.

No additional analVtical or qualitV issues were noted, other than those described above or in the DeyjnitionsƷ lossarV page.

**Organic Prep**
No analVtical or qualitV issues were noted, other than those described in the DeyjnitionsƷ lossarV page.

**VOA Prep**
No analVtical or qualitV issues were noted, other than those described in the DeyjnitionsƷ lossarV page.
