INTENTIONALLY LEFT BLANK

# 1 Introduction

## 1.1 Project Overview

The proposed Kaiser Permanente Baldwin Park Emergency Department Expansion and Medical Office Building Project (project) involves improvements and the expansion of a current medical campus. The applicant, Kaiser Permanente, has proposed the expansion of the emergency department (ED) and the construction of a medical office building (MOB) at the current Kaiser Permanente Baldwin Park Medical Campus. The construction of the MOB would be a redevelopment of a former retail site located at the northwestern corner of the medical campus.

## 1.2 California Environmental Quality Act Compliance

The California Environmental Quality Act (CEQA) requires that any project in the state of California determined to have the potential to result in adverse impacts to the environment be analyzed under the CEQA Guidelines and the results disclosed to the public (14 CCR 15000 et seq.; California Public Resources Code Section 21000 et seq.). A lead agency is determined under CEQA as the agency with greatest authority over the resources or land the proposed project is likely to impact, often a city, county, school district, or public resource agency. The proposed project would be required to complete environmental review under CEQA, led by the City of Baldwin Park, to identify and disclose potential environmental impacts associated with the proposed project.

The City has prepared this Mitigated Negative Declaration (MND) in conformance with Section 15070(a) of the CEQA Guidelines. The purpose of the MND environmental evaluation is to describe the proposed project, determine any potentially significant impacts associated with the proposed project, and incorporate mitigation measures into the project design as necessary to reduce or eliminate the potentially significant effects of the project.

## 1.3 Project Planning Setting

The project site is located within the City of Baldwin Park (City). The Baldwin Park 2020 General Plan and Baldwin Park Municipal Code guide and govern planning within the city. The project site is located within the South Coast Air Basin (SCAB) and is within the jurisdictional boundaries of SCAQMD.

## 1.4 Public Review Process

Pursuant to CEQA Guidelines Section 15105(b), the MND will be available for a public comment period of not less than 30 days from March 2, 2023, to April 1, 2023.

In reviewing the MND, affected public agencies and the interested public should focus on the sufficiency of the document in identifying and analyzing the possible impacts on the environment, as well as ways in which the significant effects of the project are proposed to be avoided or mitigated.

Comments may be made on the MND in writing before the end of the comment period. Following the close of the public comment period, the City will consider this MND and comments thereto in determining whether to approve the proposed project. Written comments on the MND should be sent to the following address by April 1, 2023: RGarcia@baldwinpark.com

INTENTIONALLY LEFT BLANK

# 2 Project Description

## 2.1 Project Location

The Project is located at the Kaiser Permanente Baldwin Park Medical Campus in southern Baldwin Park, in Los Angeles County, California (Figure 1, Project Location). The entire project site is approximately 26.02 acres and occurs primarily on Assessor's Parcel Number 8559-006-006, 8559-008-011, and 8559-008-005. Project components would be concentrated in the northeastern (emergency department expansion) and northwestern (MOB) corners of the project site. The project site is bound by Dalewood Street to the north, Leorita Street to the West, Bess Avenue to the southwest, and Baldwin Park Boulevard to the southeast.

## 2.2 Environmental Setting

The project site is currently developed, consisting of a 24.48-acre medical campus (APN 8559-006-006) and a 1.54-acre site that consists of an abandoned retail building, herein referred to as the "Broken Horn site" (APN 8559-008-011 and 8559-008-005). The Broken Horn site is located adjacent to the existing medical campus to the northwest. The project site is zoned as Freeway Commercial (FC) and has a land use designation General Commercial. The site is relatively flat, and the site range elevation ranges from approximately 310 feet above National Geodetic Vertical Datum (NGVD). The project site is underlain by fill material, silty sand to poorly graded sand, and dense sand with varying amounts of gravels and cobbles (Appendix A, Geotechnical Investigation Report).

The project site is surrounded by existing development on all sides. The Interstate 10 (I-10) freeway is located just beyond Dalewood Street to the north of the project site, commercial uses are located south and east of the project site, and residential uses are located south and west of the project site.

Regional access to the project site is provided by I-10, which runs east-west adjacent to the project site, and I-605, which runs north–south, allowing for vehicular and transit access to the larger Los Angeles region. The project site is directly accessible via Dalewood Street, Leorita Street, and Baldwin Park Boulevard.

## 2.3 Project Characteristics

### Overview

The project consists of two main components: an emergency department expansion and the construction of a medical office building (MOB), see Figure 2, Site Plan. The first component is the construction of an expansion to the emergency department, which is part of an existing hospital tower on the south end of the Kaiser Permanente campus. Expansion of the emergency department would add approximately 23,000 square feet to the existing emergency department, expand the number of existing treatment bays from 38 to 60, add a new ambulance canopy, and include additional improvements to the existing emergency department. The expansion and improvement of the emergency department would allow better functionality within the emergency department. The second phase of the project would consist of the construction and operation of an approximately 33,000 square foot MOB. This component would expand the boundary of the medical campus to include the Broken Horn parcel currently adjacent to the medical campus to the west. Development of this site would require the demolition of an existing retail building.

## Building and Site Design

As stated above, the emergency department expansion would increase the size of the existing emergency department by 23,000 square feet, resulting in a total square footage of an approximately 40,000 square foot emergency department. This addition would not add hospital bed licenses under the California Department of Health Care Access and Information (HCAI), formerly the Office of Statewide Health Planning and Development (OSHPD). The emergency department expansion exterior wall system assembly will be a combination of metal and composite panels and cement plaster finish on light gauge metal stud framing. Glazing will be a storefront type window system with low-E insulated glass.

The proposed two-story MOB would consist of a 33,000 square foot building. This component would expand the existing medical campus to the northwest on a property that includes an existing retail building. The MOB component would also include parking.

As a project design feature, buildings constructed as part of the proposed project would include installation of sub-slab vapor barrier systems, as described in the Vapor Intrusion Mitigation Advisory published by DTSC and CalEPA in 2011 (VIMA; DTSC and CalEPA 2011a). Vapor barriers will be designed to meet the standards outlined in the VIMA and will be in general conformance with General Construction, Membrane Installation, and Ventilation Trench for Passive Gas Control System Requirements of the Los Angeles County Methane Gas Mitigation Standards. The system would include a vapor barrier membrane and passive sub-slab venting system with the ability to be upgraded to an active system in the future, as necessary. The system will be designed by a California-licensed engineer. Installation would be overseen by a California-licensed engineer and would include testing for leaks and integrity of the system. Two sets of monitoring probes would be installed in each building, both above and below the barrier system, to evaluate the effectiveness of the system. Samples would be collected twice annually for the first two years of occupancy to verify adequate operation. Should results of monitoring probe sampling indicate vapor intrusion from sub-slab soil gas contamination, modifications would be made to the system to further increase ventilation and eliminate vapor intrusion. Refer to Section 3.9, Hazards and Hazardous Materials, for additional information.

## Vehicular and Pedestrian access

The emergency department expansion would include an additional emergency department walk-in entrance to the northwest corner of the emergency department. The new ambulance canopy entry is approximately 252 feet away from the existing member walk-in entry. Existing primary entry will continue to serve member walk-in to the emergency department. Vehicle entrance to the project site would remain the same as the existing entrance. The emergency department expansion would not impact the existing parking lot. The new ambulance bay would include an addition of four ambulance parking spaces.

Access to the MOB would occur via a driveway off Leorita Street, west of the MOB site. Parking would surround the MOB to the north, east, and west. After Phase I and demolition of the existing retail building on the Broken Horn site is completed, approximately 68 parking spots would be available for interim parking for hospital use until the beginning of Phase II. Upon completion of Phase II, parking would surround the MOB to the north, east, and west. Eighty parking stalls would be provided for ADA and member parking.

## Emergency Vehicle Access

Emergency vehicle access would remain the same as the existing conditions and would be located at the northeastern end of the medical campus off Dalewood Street. The emergency department expansion would include new ambulance parking and canopy to the northeast facing side of the proposed emergency department expansion. The current ambulance bay can hold three to four ambulances, but in some cases, there are up to six ambulances bringing patients into the emergency department. The addition of the ambulance canopy would provide an additional four ambulance spaces.

## Landscaping

All project landscaping would be consistent with Section 153.160.020 of the City of Baldwin Park Municipal Code, which establishes water efficient landscape standards. The project would include tree removal as a part of both project components. The City of Baldwin Park Tree Protection ordinance would apply to trees on the project site or any trees within the public right of way that are removed of damaged as a result of project implementation. Approval from the Director of the Public Works Department is required. All tree removal will be compliant with City of Baldwin Park Municipal Code Section 97.131. None of the trees that are expected to be removed as part of the project are located within the public right-of-way.

## Infrastructure Improvements

The emergency department expansion would include new asphalt on the medical campus at the existing emergency department access point and the existing ambulance overflow parking. The expansion phase would also include improvements to the existing emergency department's electrical, mechanical, plumbing, structural, fire and life safety systems.

## Off-Site Improvements

In addition to the emergency department expansion and construction of the MOB, the project would include off-site improvements that would be divided up among the two project phases and are included in Figure 3, Off-Site Improvements. The off-site improvements are described below.

The project would include the following off-site improvements during Phase I:

- Resurfacing asphalt bordering the medical campus along Baldwin Park Boulevard (Phase I)
- New ADA compliant ramp at the corner of Baldwin Park Boulevard and Bess Avenue.
- Two new ADA compliant ramps at the Baldwin Park Boulevard entrance to the medical campus.
- New sidewalk along Baldwin Park Boulevard from Bess Avenue to Dalewood Street.
- New sidewalk on the medical campus along the Baldwin Park Boulevard entrance to the campus.
- New sidewalk along Dalewood Street from Baldwin Park Boulevard to the end of the emergency department parking lot.
- New ADA compliant driveway along Baldwin Park Boulevard on the northeast side of the proposed emergency department expansion.
- Remove and replace damaged trees along project frontage on Baldwin Park Boulevard.
- Close the northwestern driveway on Bess Avenue

The project would include the following off-site improvements during Phase II:

- New sidewalk along Leorita Street from Bess Avenue to Dalewood Street
- Resurfacing asphalt along Leorita Street and Dalewood Street bordering the medical campus.
- Refurbish truncated domes along Dalewood Street (two locations).
- New ADA compliant ramp along Dalewood Street.
- New ADA compliant ramp at the corner of Dalewood Street and Baldwin Park Boulevard.

## 2.4 Project Construction and Phasing

The project would occur in two phases. All phases would include the use of Tier 4 equipment. Phase I would include activities on both portions of the project site. Phase I activities for the emergency department expansion component would include site preparation, emergency room expansion, emergency room renovation. Phase I activities for the MOB component would include the demolition of the existing retail building at the Broken Horn site and paving the MOB site. Additionally, Phase I would include the off-site improvements listed above. Phase I is estimated to occur over a 23-month period from May 2023 to April 2025. Upon completion of Phase I, 68 parking spaces will be available at the MOB site.

Phase II would focus on the MOB component and the remaining off-site improvements. Phase II would include site preparation of the Broken Horn site, grading, and construction of the MOB building. The Broken Horn site would have limited access and its 80-space parking lot would be used by Kaiser Permanente until construction of the MOB commences. Phase II is estimated to occur over an 18-month period from June 2028 to December 2029.

## 2.5 Project Approvals

The project would be subject to the following approvals for each phase:

### Phase I

- Design Review
- Lot Line Adjustment
- Conditional Use Permit
- Variance from Development Standards
- Amendment to the Kaiser Master Sign Plan

### Phase II

- Design Review
- Conditional Use Permit
- Amendment to the Kaiser Master Sign Plan

# 3 Initial Study Checklist

1. **Project title:**

   Kaiser Permanente Baldwin Park Emergency Department Expansion and Medical Office Building

2. **Lead agency name and address:**

   City of Baldwin Park
   14403 East Pacific Avenue
   Baldwin Park, California 91706

3. **Contact person and phone number:**

   Ron Garcia
   626.813.5253
   14403 Pacific Avenue
   Baldwin Park, California 91706

4. **Project location:**

   1011 Baldwin Park Boulevard
   Baldwin Park, California 91706

5. **Project sponsor's name and address:**

   Kaiser Foundation Hospitals
   1011 Baldwin Park Boulevard
   Baldwin Park, California 91706

6. **General plan designation:**

   General Commercial (GC)

7. **Zoning:**

   Freeway Commercial (FC)

8. **Description of project. (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary):**

   As described above, the proposed project would include the expansion of the existing emergency department at the Kaiser Permanente Baldwin Park Medical Center and construction of a medical office building (MOB). For additional information please refer to Section 2, Project Description, of this MND.

**9. Surrounding land uses and setting (Briefly describe the project's surroundings):**

The project site is bound by Dalewood Street to the north and northeast, Baldwin Park Boulevard to the southeast, Bess Avenue to the southwest, and Leorita Street to the northwest. The project is surrounded by existing development on all sides. The Interstate 10 freeway is located to the north on the other side of Dalewood Street. Southeast of the project site along Baldwin Park Avenue consists of general industrial uses and is currently a UPS Customer Center. Bess Avenue and Leorita Street to the southwest of the project site consists of single- and multifamily- residential land uses.

**10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement):**

The project would require to have a plan check and a permit for the ED expansion with approval from the State Department of Health Care Access and Information (HCAI).

**11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example, the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?**

Yes. The Gabrieleno Band of Mission Indians- Kizh Nation has requested tribal consultation.

## Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

| | | |
|---|---|---|
| ☐ Aesthetics | ☐ Agriculture and Forestry Resources | ☐ Air Quality |
| ☐ Biological Resources | ☐ Cultural Resources | ☐ Energy |
| ☐ Geology and Soils | ☐ Greenhouse Gas Emissions | ☐ Hazards and Hazardous Materials |
| ☐ Hydrology and Water Quality | ☐ Land Use and Planning | ☐ Mineral Resources |
| ☐ Noise | ☐ Population and Housing | ☐ Public Services |
| ☐ Recreation | ☐ Transportation | ☐ Tribal Cultural Resources |
| ☐ Utilities and Service Systems | ☐ Wildfire | ☐ Mandatory Findings of Significance |

## Determination (To be completed by the Lead Agency)

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL IMPACT REPORT or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date

## Evaluation of Environmental Impacts

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
    a. The significance criteria or threshold, if any, used to evaluate each question; and
    b. The mitigation measure identified, if any, to reduce the impact to less than significance

# 3.1 Aesthetics

| | | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|---|
| I. | AESTHETICS – Except as provided in Public Resources Code Section 21099, would the project: | | | | |
| a) | Have a substantial adverse effect on a scenic vista? | ☐ | ☐ | ☐ | ☒ |
| b) | Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway? | ☐ | ☐ | ☒ | ☐ |
| c) | In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality? | ☐ | ☐ | ☒ | ☐ |
| d) | Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area? | ☐ | ☐ | ☒ | ☐ |

***a) Would the project have a substantial adverse effect on a scenic vista?***

A scenic vista generally consists of a defined viewpoint that provides wide ranging views of a landscape. The 2020 Baldwin Park General Plan does not identify or designate scenic vistas or viewsheds in the City of Baldwin Park. The project is located in an urbanized area and surrounded by existing development. As described above, the project is surrounded by residential land uses along Bess Avenue and Leorita Street, industrial land uses along Baldwin Park Blvd, and Interstate-10 on the other side of Dalewood Street. Additionally, the project site is an existing developed medical center. The proposed project would include an expansion of the existing emergency department and the construction of a MOB. The one-story emergency department expansion would expand the current department by approximately 23,000 square feet and the MOB would consist of a two-story high, 30,000 square foot building. Due to the lack of designated scenic vistas or viewsheds near the project site, the project would have no impact to scenic vistas.

***b) Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?***

As stated above, the project site is surrounded by existing development and is currently developed. The project site is adjacent to the I-10 Freeway to the north. In addition to being visible from I-10, the project site is briefly visible from I- 605. While the project site is visible from these freeways, neither of these

highways have been designated as a state scenic highway (Caltrans 2019). There are no rock outcroppings at or near the project site that would be impacted by project implementation.

Expansion of the emergency department and construction of the MOB would result in the removal of37 trees on private property. Per Baldwin Park Municipal Code Section 153.165.090, the project would be required to obtain a tree removal permit for each tree that would be removed. Additionally, to maintain compliance with the Municipal Code, the project would replace the removed trees within six months of tree removal (City of Baldwin Park 2022a).

The construction of the MOB would require the demolition of an existing retail building that consists of two separate structures. One of these structures was constructed in 1976, requiring further investigation into the historical significance of the building because it had been more than 45 years since it was built. A Built Environment Inventory and Evaluation Report for the site was completed to evaluate the historical significance of the structures and is included as Appendix B, Built Environment Inventory and Evaluation Report. The Built Environment Inventory and Evaluation Report determined that while the structure was built over 45 years ago, the subject property is concluded to be ineligible as a designated resource in Baldwin Park, for the CRHR, and the NRHP due to a lack of significant historical associations and architectural merit. As the property is not considered a significant historic building and is not located within proximity to a state scenic highway, therefore the project would not impact views of historic buildings within a state scenic highway.

Based on the foregoing, the proposed project would not substantially damage scenic resources including, trees, rock outcroppings, and historic buildings within a state scenic highway. Impacts to these scenic resources would be less than significant.

*c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?*

The project site is located in an urbanized area surrounded by industrial, commercial, and residential land uses. The project site is currently developed with an existing medical center with associated MOBs and parking structures. Implementation of the project would include expansion of the existing emergency department at the northeastern portion of the site and the addition of a MOB on the northwestern corner of the site where an existing retail building exists.

The emergency department expansion and the MOB building would be generally consistent with the development standards for Commercial and Industrial Zones as set forth in Table 153.050.030 in the City of Baldwin Park Municipal Code and the general development standards in Municipal Code Section 153.130 (City of Baldwin Park, 2022b), except for the request for a variance in the front yard setback along Baldwin Park Boulevard. The variance would allow for an overhead projection from the building façade to encroach 2 feet, 10 inches within the required 10-foot front yard setback along Baldwin Park Blvd. The overhead project would consist of white painted metal panels that would be consistent with the projections on the second floor. Signage on the project site is currently regulated by the Kaiser Master Sign Program, because the signage regulations in the Baldwin Park Municipal Code does not currently address the needs for multi-building medical campuses. The proposed signage for the emergency department expansion would be similar to current signage at the project site that is outlined in the Master Sign Program.

The project would be consistent with the City of Baldwin Park General Plan policies that govern scenic quality. Policies include providing visual compatibility with the surrounding area and reducing lighting impacts on adjacent properties (Land Use Policy 2.5 and 2.6). As described below the project lighting would be shielded by existing buildings or be directed away from adjacent properties. Additionally, the project site currently consists of a medical campus and retail building, and the proposed project would include the expansion of an existing emergency department and a MOB.

The project would be consistent with zoning design standards and would not conflict with any other zoning regulations; therefore, this impact would be less than significant.

*d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?*

The City of Baldwin Park Municipal Code Section 153.140.040 regulates light and glare within the city. Specifically, the lighting standards under subsection (F) require that all lighting shall be directed or shielded away from adjacent properties, public right-of-way, and driveways areas that would obstruct motorist's vision. Existing conditions at the project site consist of a medical complex that currently produces light from streetlights, pathway lights, exterior building lighting and signage, parking lot lighting, and vehicular lighting from vehicles entering and exiting the site. Currently, the emergency department is illuminated from sunset to sunrise (typically from 6:00 p.m. to 6:00 a.m. depending on the time of year) and is consistent with the Municipal Code.

The emergency department expansion component would include the removal of existing lighting along the street frontage and within the parking lot. Light fixtures would then be reinstalled along the frontage of the emergency department expansion, the ambulance canopy, and the ambulance parking area. Lighting would be provided for signage, street, parking, building exteriors, and pathways on the project site. As described above, the Broken Horn Site is currently abandoned. The MOB component would introduce lighting for signage, street lighting, building exterior, pathways. Both the ED expansion and MOB would use exterior material that has low reflectivity. Despite the introduction of additional sources of light closer to public view, lighting would be shielded downward and away from the street reducing the impacts of the lighting to sensitive receptors.

Sensitive receptors to lighting in proximity to the project site include the residential uses to the southeast of the project site. New sources of lighting would be located in the northeast and northwest corner of the project site and light from the new MOB and emergency department would be shielded by existing parking structures and buildings currently on the medical campus.

Both the emergency department expansion and the MOB are located adjacent to a public right-of-way: Baldwin Park Boulevard (emergency department expansion), Leorita Street, (MOB), and Dalewood St (MOB). Additionally, just north of Dalewood Avenue is Interstate I-10. All lighting from the emergency department expansion would be shielded downward or towards the project away from Baldwin Park Boulevard. Additionally, all MOB lighting would be shielded away from Leorita Street, Dalewood St, and I-10 to comply with the Baldwin Park Municipal Code.

In conclusion, lighting for the proposed project would be shielded by existing buildings or be directed away from sensitive receptors, roadways, and adjacent properties. Lighting from the project would be consistent with the Baldwin Park Municipal Code. Project impacts from lighting and glare would be less than significant.

## 3.2 Agriculture and Forestry Resources

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **II. AGRICULTURE AND FORESTRY RESOURCES** – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project: | | | | |
| a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use? | ☐ | ☐ | ☐ | ☒ |
| b) Conflict with existing zoning for agricultural use, or a Williamson Act contract? | ☐ | ☐ | ☐ | ☒ |
| c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))? | ☐ | ☐ | ☐ | ☒ |
| d) Result in the loss of forest land or conversion of forest land to non-forest use? | ☐ | ☐ | ☐ | ☒ |
| e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use? | ☐ | ☐ | ☐ | ☒ |

*a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?*

According to the Department of Conservation's Farmland Mapping and Monitoring Program, the project site is not designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. The project site is designated as "Urban and Built- Up Land" and completely surrounded by parcels designated "Urban and Built- Up Land" to the south and west as well as parcel's designated as "Urban and Built-Up Land". The project site is located in an urban area and there is no agricultural production in the vicinity of the project site (DOC 2016a). There would be no impact to Farmland, Unique Farmland, or Farmland of Statewide Importance or to surrounding agricultural production.

*b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?*

The project site is zoned as Freeway Commercial (FC) and is not zoned for agricultural uses. Additionally, the project does not contain a Williamson Act contract. No impact resulting from a conflict with existing zoning for agricultural use or a Williamson Act contract would occur.

*c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?*

The project site is zoned as a Freeway Commercial and is not designated as a forestry resource. No impact to forestry resources would occur.

*d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?*

The project site has been previously developed and would not result in the loss or conversion of forest land to a non- forest use. No impact would occur.

*e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?*

The project site has been previously developed and it surrounded by development. The project site zoning is designated as Freeway Commercial, and implementation of the project would be consistent within the allowed uses in this zone. No agricultural or forestry uses are in the surrounding vicinity of the project site. No impact would occur.

# 3.3 Air Quality

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **III. AIR QUALITY** – Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project: | | | | |
| a) Conflict with or obstruct implementation of the applicable air quality plan? | ☐ | ☐ | ☒ | ☐ |
| b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? | ☐ | ☐ | ☒ | ☐ |
| c) Expose sensitive receptors to substantial pollutant concentrations? | ☐ | ☐ | ☒ | ☐ |
| d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? | ☐ | ☐ | ☒ | ☐ |

Appendix G of the State CEQA Guidelines (14 CCR 15000 et seq.) indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to determine whether the project would have a significant impact on air quality.

The South Coast Air Quality Management District (SCAQMD) has established Air Quality Significance Thresholds, as revised in April 2019, that set forth quantitative emission significance thresholds below which a project would not have a significant impact on ambient air quality (SCAQMD 2019). The quantitative air quality analysis provided herein applies the SCAQMD thresholds identified in Table 3.3-1 to determine the potential for the project to result in a significant impact under CEQA.

### Table 3.3-1. SCAQMD Air Quality Significance Thresholds

| Criteria Pollutants Mass Daily Thresholds | | |
|---|---|---|
| **Pollutant** | **Construction (Pounds per Day)** | **Operation (Pounds per Day)** |
| VOCs | 75 | 55 |
| $NO_x$ | 100 | 55 |
| CO | 550 | 550 |
| $SO_x$ | 150 | 150 |
| $PM_{10}$ | 150 | 150 |
| $PM_{2.5}$ | 55 | 55 |
| Lead[a] | 3 | 3 |

## Table 3.3-1. SCAQMD Air Quality Significance Thresholds

| Criteria Pollutants Mass Daily Thresholds | | |
|---|---|---|
| **Pollutant** | **Construction (Pounds per Day)** | **Operation (Pounds per Day)** |
| **TACs and Odor Thresholds** | | |
| TACs[b] | Maximum incremental cancer risk ≥ 10 in 1 million<br>Cancer Burden > 0.5 excess cancer cases (in areas ≥ 1 in 1 million)<br>Chronic and acute hazard index ≥ 1.0 (project increment) | |
| Odor | Project creates an odor nuisance pursuant to SCAQMD Rule 402 | |
| **Ambient Air Quality Standards for Criteria Pollutants[c]** | | |
| $NO_2$ 1-hour average<br>$NO_2$ annual arithmetic mean | SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards:<br>0.18 ppm (state)<br>0.030 ppm (state) and 0.0534 ppm (federal) | |
| CO 1-hour average<br>CO 8-hour average | SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards:<br>20 ppm (state) and 35 ppm (federal)<br>9.0 ppm (state/federal) | |
| $PM_{10}$ 24-hour average<br>$PM_{10}$ annual average | 10.4 μg/m³ (construction)[d]<br>2.5 μg/m³ (operation)<br>1.0 μg/m³ | |
| $PM_{2.5}$ 24-hour average | 10.4 μg/m³ (construction)[d]<br>2.5 μg/m³ (operation) | |

**Source:** SCAQMD 2019.
**Notes:** SCAQMD = South Coast Air Quality Management District; VOC = volatile organic compounds; $NO_x$ = oxides of nitrogen; CO = carbon monoxide; $SO_x$ = sulfur oxides; $PM_{10}$ = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; TAC = toxic air contaminant; $NO_2$ = nitrogen dioxide; ppm = parts per million by volume; μg/m³ = micrograms per cubic meter.
greenhouse gas emissions thresholds for industrial projects, as added in the March 2015 revision to the SCAQMD Air Quality Significance Thresholds, were not include included in this table as they are addressed within the greenhouse gas emissions analysis and not the air quality analysis.

[a] The phaseout of leaded gasoline started in 1976. Since gasoline no longer contains lead, the project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.
[b] TACs include carcinogens and noncarcinogens.
[c] Ambient air quality standards for criteria pollutants are based on SCAQMD Rule 1303, Table A-2, unless otherwise stated.
[d] Ambient air quality threshold are based on SCAQMD Rule 403.

The phasing out of leaded gasoline started in 1976. As gasoline no longer contains lead, the project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

The evaluation of whether the project would conflict with or obstruct implementation of the applicable air quality plan (CEQA Guidelines Appendix G Threshold III-1) is based on the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993), Chapter 12, Sections 12.2 and 12.3. The first criterion assesses if the project would result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards of the interim emissions reductions specified in the Air Quality Management Plan (AQMP), which is addressed in detail under Section 3.3(b). The second criterion is if the project would exceed the assumptions in the AQMP or increments based on the year of project buildout and phase, as discussed further in Section 3.3(a).

To evaluate the potential for the project to result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (CEQA Guidelines Appendix G Threshold III-2), this analysis applies the SCAQMD's construction criteria pollutants mass daily thresholds, as shown in Table 3.3-1. Only those thresholds related to potentially significant construction impacts are applied herein because the project would not generate substantial criteria pollutant emissions or related impacts associated with operational activities. A project would potentially result in a cumulatively considerable net increase in ozone ($O_3$), which is a nonattainment pollutant, if the project's construction emissions would exceed the SCAQMD volatile organic compound (VOC) or oxides of nitrogen ($NO_x$) thresholds shown in Table 3.3-1. These emissions-based thresholds for $O_3$ precursors are intended to serve as a surrogate for an $O_3$ significance threshold (i.e., the potential for adverse $O_3$ impacts to occur). This approach is used because $O_3$ is not emitted directly, and the effects of an individual project's emissions of $O_3$ precursors (VOC and $NO_x$) on $O_3$ levels in ambient air cannot be determined through air quality models or other quantitative methods.

The assessment of the project's potential to expose sensitive receptors to substantial pollutant concentrations (CEQA Guidelines Appendix G Threshold III-3) includes a localized significance threshold (LST) analysis, as recommended by the SCAQMD, to evaluate the potential of localized air quality impacts to sensitive receptors in the immediate vicinity of the project from construction and operation. For project sites of five acres or less, the SCAQMD LST methodology (SCAQMD 2008a) includes lookup tables that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance criteria (i.e., the emissions would not cause an exceedance of the applicable concentration limits for nitrogen dioxide [$NO_2$], carbon monoxide [CO], particulate matter with a diameter less than or equal to 10 microns [$PM_{10}$], and particulate matter with a diameter less than or equal to 2.5 microns [$PM_{2.5}$]) without performing project-specific dispersion modeling.

The LST significance thresholds for $NO_2$ and CO represent the allowable increase in concentrations above background levels in the vicinity of a project that would not cause or contribute to an exceedance of the relevant ambient air quality standards, while the threshold for $PM_{10}$ represents compliance with Rule 403 (Fugitive Dust). The LST significance threshold for $PM_{2.5}$ is intended to ensure that construction or operational emissions do not contribute substantially to existing exceedances of the $PM_{2.5}$ ambient air quality standards. The allowable emission rates depend on the following parameters:

a. Source-Receptor Area (SRA) in which the project is located
b. Size of the project site
c. Distance between the project site and the nearest sensitive receptor (e.g., residences, schools, hospitals)

The project would be within SRA 11 (South San Gabriel Valley). LST pollutant screening level concentration data is currently published for 1-, 2-, and 5-acre sites for varying distances (25, 50, 100, 200, and 500 meters). The project disturbs a total of approximately 1.29 acres. In accordance with the SCAQMD Fact Sheet for Applying CalEEMod to Localized Significance Thresholds, the project would disturb a maximum of one acre per day during the site preparation phase (SCAQMD 2014). LSTs are more stringent for smaller areas (i.e., 1-acre LSTs are more stringent than 2-acre and 5-acre LSTs); therefore, the use of a 1-acre LST is conservative.

Sensitive receptors near the project site include residences located adjacent to the western and northern boundaries of the project site. These receptors are the closest receptors and thus capture a conservative scenario, as it is assumed that other receptors at further distances would be less exposed to potential impacts. As such, the closest LST available, 25 meters (82 feet), was applied. LST values for the project in SRA 11 and for 25 meters are presented in Table 3.3-2.

## Table 3.3-2. Localized Significance Thresholds for Source-Receptor Area 11 (South San Gabriel Valley)

| Pollutant | Thresholds (Pounds per Day) |
|---|---|
| | 1-Acre Project Site, 25 Meters |
| $NO_2$ | 83 |
| CO | 673 |
| $PM_{10}$ | 5 |
| $PM_{2.5}$ | 4 |

**Source:** SCAQMD 2008a.
**Notes:** SRA = Source-Receptor Area; $NO_2$ = nitrogen dioxide; CO = carbon monoxide; $PM_{10}$ = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; LST = localized significance threshold.
LSTs are shown for 1-acre project sites corresponding to a distance to a sensitive receptor of 25 meters.

The assessment of the project's potential to expose sensitive receptors to substantial pollutant concentrations (CEQA Guidelines Appendix G Threshold III-3) also includes a construction health risk assessment (HRA) (see Appendix C, Air Quality, Greenhouse Gas Emissions, and Energy). A qualitative CO hotspot analysis is also included under Section 3.3(c), based on comparison to the SCAQMD 2003 AQMP CO hotspot analysis.

The potential for the project to result in other emissions, specifically an odor impact (State CEQA Guidelines Appendix G Threshold III-4), is based on the project's land-use types and anticipated construction activity, and the potential for the project to create an odor nuisance pursuant to SCAQMD Rule 402.

*a) Would the project conflict with or obstruct implementation of the applicable air quality plan?*

As previously discussed, the project site is located within the South Coast Air Basin (SCAB) under the jurisdiction of the SCAQMD, which is the local agency responsible for administration and enforcement of air quality regulations for the area. The SCAQMD has established criteria for determining consistency with the AQMP, currently the 2016 AQMP, in Chapter 12, Sections 12.2 and 12.3, in the SCAQMD CEQA Air Quality Handbook (SCAQMD 1993). The criteria are as follows (SCAQMD 1993):

Consistency Criterion No. 1: The project will not result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP.

Consistency Criterion No. 2: The project will not exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

### Consistency Criterion No. 1

Section 3.3(b) evaluates the project's potential impacts in regard to CEQA Guidelines Appendix G Threshold III-2 (the project's potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation impact analysis). Emissions during construction and operation were less than the SCAQMD significance thresholds; as such, the project would not result in an increase in the frequency or severity of existing air quality violations. Therefore, the project would not conflict with Consistency Criterion No. 1 of the SCAQMD CEQA Air Quality Handbook.

### Consistency Criterion No. 2

While striving to achieve the National Ambient Air Quality Standards (NAAQS) for $O_3$ and $PM_{2.5}$ and the California Ambient Air Quality Standards (CAAQS) for $O_3$, $PM_{10}$, and $PM_{2.5}$ through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in the SCAB. Projects are considered consistent with, and would not conflict with or obstruct implementation of, the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP (per Consistency Criterion No. 2 of the SCAQMD CEQA Air Quality Handbook).

The SCAQMD primarily uses demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by the Southern California Association of Governments (SCAG) for its Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) (SCAG 2016, which is based on general plans for cities and counties in the SCAB, for the development of the AQMP emissions inventory (SCAQMD 2017a).[1] The SCAG 2016 RTP/SCS and associated Regional Growth Forecast are generally consistent with the local plans; therefore, the 2016 AQMP is generally consistent with local government plans. According to the Baldwin Park Land Use Map and Zoning Map, the General Plan land use designation for the project site is currently General Commercial (GC), while the project site is presently zoned Freeway Commercial (FC). As such, the project would be considered consistent with both the existing General Plan land use designation and zoning district. The project would not constitute a change in land use or zoning.

The project is estimated to create 105 new jobs. According to SCAG's 2020 Connect SoCal, the City of Baldwin Park is expected to have an employment population of 24,700 in 2016 and 26,500 in 2045, or 1,800 additional jobs in that timeframe (SCAG 2020). The project's additional 105 jobs would not exceed this forecasted growth in employment. As such, the project's designed employment would not exceed the annual growth projections for the City.

As the project would contribute to local employment growth and associated vehicle miles traveled (VMT) that are anticipated for the project site in the existing General Plan, the project is accounted for in the State Implementation Plan and the Regional Air Quality Strategy, and the project would be consistent with local air quality plans. Therefore, the impact would be less than significant.

### Summary

As described previously, the project would not result in an increase in the frequency and severity of existing air quality violations and would not conflict with Consistency Criterion No. 1. The project would be consistent with the General Plan and growth projections of the SCAG 2020 RTP/SCS. Thus, the project would not conflict with Consistency Criterion No. 2. Therefore, impacts related to the project's potential to conflict with or obstruct implementation of the applicable air quality plan would be less than significant.

[1] Information necessary to produce the emission inventory for the SCAB is obtained from the SCAQMD and other governmental agencies, including CARB, Caltrans, and SCAG. Each of these agencies is responsible for collecting data (e.g., industry growth factors, socioeconomic projections, travel activity levels, emission factors, emission speciation profile, and emissions) and developing methodologies (e.g., model and demographic forecast improvements) required to generate a comprehensive emissions inventory. SCAG incorporates these data into their Travel Demand Model for estimating/projecting vehicle miles traveled (VMT) and driving speeds. SCAG's socioeconomic and transportation activities projections in their 2016 RTP/SCS are integrated in the 2016 AQMP (SCAQMD 2017a).

*b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?*

## Construction

Emissions from the construction phase of the project were estimated using California Emissions Estimator Model (CalEEMod) Version 2020.4.0. Construction scenario assumptions, including phasing, equipment mix, and vehicle trips, were based on information provided by the project applicant and CalEEMod default values when project specifics were not known.

For purposes of estimating project emissions, and based on information provided by the project applicant, it is assumed that construction of the emergency department expansion would commence in May 2023[2] and would last approximately twenty-three months, ending in April 2025. It is assumed that construction of the medical office building would commence in June 2028 and last approximately eighteen months, ending in December 2029. The analysis contained herein is based on the following assumptions (duration of phases is approximate):

Emergency Department

- Demolition: two months
- Site preparation: one week
- Grading: two weeks
- Building construction: nineteen months
- Paving: four weeks
- Architectural coating: four weeks

Medical Office Building

- Site preparation: one week
- Grading: one week
- Building construction: sixteen months
- Paving: three weeks
- Architectural coating: three weeks

There is an estimated 24,790 square feet of existing structures to be demolished and hauled off site based on existing aerial images of the site. Assuming a haul truck capacity of 20 cubic yards per truck, earth-moving activities would result in approximately 64 round trips (114 one-way truck trips) during the demolition phase. CalEEMod default trip length values were used for the distances for all construction-related trips. Construction worker, vendor, and haul truck trips are based on CalEEMod default assumptions where project specific information was not available.

[2] The analysis assumes a construction start date of May 2023, which represents the earliest date construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant and GHG emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years.

The construction equipment mix and vehicle trips used for estimating the project-generated construction emissions are shown in Table 3.3-3.

### Table 3.3-3. Construction Scenario Assumptions

| Construction Phase | One-Way Vehicle Trips | | | Equipment | | |
|---|---|---|---|---|---|---|
| | Average Daily Worker Trips | Average Daily Vendor Truck Trips | Total Haul Truck Trips | Equipment Type | Quantity | Usage Hours |
| **Emergency Department** | | | | | | |
| Demolition | 10 | 0 | 114 | Concrete/Industrial Saws | 1 | 8 |
| | | | | Rubber Tired Dozers | 1 | 8 |
| | | | | Tractors/Loaders/ Backhoes | 2 | 6 |
| Site Preparation | 6 | 0 | 0 | Graders | 1 | 8 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 8 |
| Grading | 8 | 0 | 264 | Graders | 1 | 6 |
| | | | | Rubber Tired Dozers | 1 | 6 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 7 |
| Building Construction | 8 | 4 | 0 | Cranes | 1 | 4 |
| | | | | Forklifts | 2 | 6 |
| | | | | Tractors/Loaders/ Backhoes | 2 | 8 |
| Paving | 18 | 0 | 0 | Pavers | 1 | 7 |
| | | | | Cement and Mortar Mixers | 4 | 6 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 7 |
| | | | | Rollers | 1 | 7 |
| Architectural Coating | 2 | 0 | 0 | Air Compressors | 1 | 6 |
| **Medical Office Building** | | | | | | |
| Site Preparation | 8 | 0 | 0 | Graders | 1 | 8 |
| | | | | Rubber Tired Dozers | 1 | 7 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 8 |
| Grading | 10 | 0 | 0 | Graders | 1 | 8 |
| | | | | Rubber Tired Dozers | 1 | 8 |

## Table 3.3-3. Construction Scenario Assumptions

| Construction Phase | One-Way Vehicle Trips | | | Equipment | | |
|---|---|---|---|---|---|---|
| | Average Daily Worker Trips | Average Daily Vendor Truck Trips | Total Haul Truck Trips | Equipment Type | Quantity | Usage Hours |
| | | | | Tractors/Loaders/ Backhoes | 2 | 7 |
| Building Construction | 24 | 12 | 0 | Cranes | 1 | 6 |
| | | | | Forklifts | 1 | 6 |
| | | | | Generator Sets | 1 | 8 |
| | | | | Welders | 3 | 8 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 6 |
| Paving | 14 | 0 | 0 | Pavers | 1 | 6 |
| | | | | Cement and Mortar Mixers | 1 | 6 |
| | | | | Paving Equipment | 1 | 8 |
| | | | | Tractors/Loaders/ Backhoes | 1 | 8 |
| | | | | Rollers | 1 | 7 |
| Architectural Coating | 6 | 0 | 0 | Air Compressors | 1 | 6 |

**Notes:** See Appendix C for details.

The project would implement dust control strategies as a project design feature. To reflect implementation of proposed dust control strategies in accordance with SCAQMD Rule 403, the following was assumed in CalEEMod:

- Water exposed area twice times per day (55% reduction in $PM_{10}$ and $PM_{2.5}$).

The applicant has committed to heavy-duty diesel-powered construction equipment to be equipped with Tier 4 Interim or better diesel engines for engines 50 horsepower or greater. For engines less than 50 horsepower, the equipment shall be electrical or natural gas powered. Construction of the project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., off-road construction equipment, on-road haul trucks, vendor trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions. Therefore, such emission levels can only be approximately estimated with a corresponding uncertainty in precise ambient air quality impacts.

Criteria air pollutant emissions associated with temporary construction activity were quantified using CalEEMod. Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2023-2025 and 2028–2029). Construction schedule assumptions, including phase

type, duration, and sequencing, were based on information provided by the project applicant and are intended to represent a reasonable scenario based on the best information available. Default values provided in CalEEMod were used where detailed project information was not available.

Implementation of the project would generate air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in $PM_{10}$ and $PM_{2.5}$ emissions. The project would implement various dust control strategies and would be required to comply with SCAQMD Rule 403 to control dust emissions generated during the grading activities. Proposed construction practices that would be employed to reduce fugitive dust emissions include watering of the active sites and unpaved roads two times per day depending on weather conditions. Internal combustion engines used by construction equipment, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, $NO_x$, CO, sulfur oxides ($SO_x$), $PM_{10}$, and $PM_{2.5}$. The application of architectural coatings, such as exterior application/interior paint and other finishes, and application of asphalt pavement would also produce VOC emissions; however, the contractor is required to procure architectural coatings from a supplier in compliance with the requirements of SCAQMD's Rule 1113 (Architectural Coatings).

Table 3.3-4 presents the estimated maximum daily construction emissions generated during construction of the project. The values shown are the maximum summer or winter daily emissions results from CalEEMod. Details of the emission calculations are provided in Appendix C.

**Table 3.3-4. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions**

| Year | VOC | $NO_x$ | CO | $SO_x$ | $PM_{10}$ | $PM_{2.5}$ |
|---|---|---|---|---|---|---|
| | pounds per day | | | | | |
| 2023 | 0.57 | 10.21 | 8.91 | 0.03 | 1.46 | 0.65 |
| 2024 | 0.31 | 4.70 | 8.22 | 0.01 | 0.17 | 0.08 |
| 2025 | 9.90 | 4.64 | 8.20 | 0.01 | 0.23 | 0.08 |
| 2028 | 0.39 | 6.38 | 13.26 | 0.02 | 3.13 | 1.58 |
| 2029 | 17.56 | 5.74 | 10.23 | 0.02 | 0.37 | 0.12 |
| **Maximum Daily Emissions** | **17.56** | **10.21** | **13.26** | **0.03** | **3.13** | **1.58** |
| *SCAQMD Threshold* | *75* | *100* | *550* | *150* | *150* | *55* |
| **Threshold Exceeded?** | **No** | **No** | **No** | **No** | **No** | **No** |

**Notes:** VOC = volatile organic compound; $NO_x$ = oxides of nitrogen; CO = carbon monoxide; $SO_x$ = sulfur oxides; $PM_{10}$ = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District.
See Appendix C for complete results.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. These emissions reflect CalEEMod "mitigated" output, which accounts for compliance with SCAQMD Rule 1113 (Architectural Coatings) and implementation of the project's fugitive dust control strategies, including watering of the project site and unpaved roads two times per day.

Maximum daily construction emissions would not exceed the SCAQMD significance thresholds for VOC, $NO_x$, CO, $SO_x$, $PM_{10}$, or $PM_{2.5}$. As such, impacts would be less than significant.

The SCAB has been designated as a national nonattainment area for $O_3$ and $PM_{2.5}$ and a California nonattainment area for $O_3$, $PM_{10}$, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SCAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the project would generate VOC and $NO_x$ emissions (which are precursors to $O_3$) and emissions of $PM_{10}$ and $PM_{2.5}$. As indicated in Table 3.3-4, project-generated construction emissions would not exceed the SCAQMD emission-based significance thresholds.

By its nature, air pollution is largely a cumulative impact. However, project-level thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulative impact on air quality. If the emissions from the project would exceed the applied significance thresholds, it would have a cumulative contribution. Conversely, if the emissions from the project do not exceed the project-specific thresholds, it is generally not considered to result in a cumulatively significant impact (SCAQMD 2003a). Accordingly, to evaluate the potential for the project to result in a cumulative net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard, this analysis applies SCAQMD's criteria pollutants thresholds, as shown in Table 3.3-1. Additionally, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed SCAQMD thresholds. Criteria air pollutant emissions associated with construction activity of future projects would be reduced through implementation of control measures required by the SCAQMD. Cumulative $PM_{10}$ and $PM_{2.5}$ emissions would be reduced because all future projects would be subject to SCAQMD Rule 403 (Fugitive Dust), which sets forth general and specific requirements for all construction sites in the SCAQMD. In addition, cumulative VOC emissions would be subject to SCAQMD Rule 1113 (Architectural Coatings).

Based on the project-generated construction emissions, the project would not result in a cumulatively considerable increase in emissions of nonattainment pollutants. Impacts would be less than significant.

## Operation

Emissions from the operational phase of the project were estimated using CalEEMod Version 2020.4.0. Operational years of 2026 (Emergency Department) and 2030 (Medical Office Building) were assumed consistent with completion of project construction for each phase.

Following the completion of construction activities, the project would generate VOC, $NO_x$, CO, $SO_x$, $PM_{10}$, and $PM_{2.5}$ emissions from mobile sources including vehicular traffic generated by patients, visitors, physicians/staff, and emergency vehicles (i.e., ambulance), area sources (space heating, water heating, landscaping), and stationary sources including diesel generators, hot water boilers, and steam boilers. Impacts would be less than significant.

### Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2017). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of non-residential buildings and on the default factor of pounds of VOC per building square foot per day. The CalEEMod default values for consumer products were assumed.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers using during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and SCAQMD's Rule 1113 (Architectural Coatings) governs the VOC content for interior and exterior coatings. The model default reapplication rate of 10% of area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2017). Similar to construction, a VOC content of 50 g/L was assumed.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated from landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. For the SCAB, the average annual number of summer days is estimated at 250 days (CAPCOA 2021).

### Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage (non-hearth). Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, since criteria pollutant emissions occur at the power plant, which is typically off site.

CalEEMod default values for energy consumption for the land uses were applied for the project analysis. The energy use from non-residential land uses is calculated in CalEEMod based on the California Commercial End-Use Survey database. Energy use in buildings (both natural gas and electricity) is divided by the program into end-use categories subject to Title 24 requirements (end uses associated with the building envelope, such as the heating, ventilation, and air conditioning (HVAC) system, water heating system, and integrated lighting) and those not subject to Title 24 requirements (such as appliances, electronics, and miscellaneous "plug-in" uses).

Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards. The current Title 24, Part 6 standards, referred to as the 2016 Title 24 Building Energy Efficiency Standards, became effective on January 1, 2017. The Title 24 2016 standards are assumed within the CalEEMod (CAPCOA 2017). The 2019 Title 24 Building Energy Efficiency Standards, which will be effective January 1, 2020, will further reduce energy used and associated emissions compared to current standards. Title 24, Part 6, does not apply to hospitals but does apply to other buildings such as the medical office building.

### Mobile Sources

The project would impact air quality through the vehicular traffic generated by the project. Emissions associated with project-generated daily traffic were modeled using the Institute of Transportation Engineers (ITE) land use code 610 (hospital) (number of beds) and land use code 720 (medical-dental office building) rates using the number of beds in the ED expansion and the number of employees for the MOB. CalEEMod was utilized to estimate daily emissions from proposed vehicular sources. CalEEMod default data, including temperature, trip characteristics, and variable start information, were conservatively used for the model inputs.

Table 3.3-5 presents the maximum daily area, energy, off-road equipment, and mobile source emissions associated with operation (years 2026 and 2030) of the project. The values shown are the maximum summer or winter daily emissions results from CalEEMod. Details of the emission calculations are provided in Appendix C.

**Table 3.3-5. Estimated Maximum Daily Operational Criteria Air Pollutant Emissions – Unmitigated**

| Emission Source | VOC | $NO_x$ | CO | $SO_x$ | $PM_{10}$ | $PM_{2.5}$ |
|---|---|---|---|---|---|---|
| | pounds per day | | | | | |
| **Emergency Department** | | | | | | |
| Area | 0.50 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 |
| Energy | 0.04 | 0.38 | 0.32 | 0.00 | 0.03 | 0.03 |
| Mobile | 0.71 | 0.81 | 7.38 | 0.02 | 1.96 | 0.53 |
| *Subtotal* | *1.25* | *1.20* | *7.71* | *0.02* | *1.99* | *0.56* |
| **Medical Office Building** | | | | | | |
| Area | 0.75 | 0.00 | 0.01 | 0.00 | 0.00 | 0.00 |
| Energy | 0.01 | 0.09 | 0.08 | 0.00 | 0.01 | 0.01 |
| Mobile | 2.30 | 2.24 | 20.84 | 0.05 | 5.78 | 1.56 |
| *Subtotal* | *3.06* | *2.33* | *20.93* | *0.05* | *5.79* | *1.57* |
| **Total** | **4.31** | **3.53** | **28.64** | **0.07** | **7.78** | **2.13** |
| *SCAQMD Threshold* | *55* | *55* | *550* | *150* | *150* | *55* |
| **Threshold Exceeded?** | **No** | **No** | **No** | **No** | **No** | **No** |

**Notes**: VOC = volatile organic compound; $NO_x$ = oxides of nitrogen; CO = carbon monoxide; $SO_x$ = sulfur oxides; $PM_{10}$ = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District; PDF = project design feature.
See Appendix C for complete results.
Totals may not sum due to rounding.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. These emissions reflect CalEEMod "mitigated" output and operational years of 2026 and 2030, which accounts for compliance with SCAQMD Rule 1113 (Architectural Coatings).

As shown in Table 3.3-5, the combined daily area, energy, off-road, and mobile source emissions would not exceed the SCAQMD operational thresholds for VOC, $NO_x$, CO, $SO_x$, $PM_{10}$, and $PM_{2.5}$. Therefore, the project would result in a less-than-significant impact during operation.

*c) Would the project expose sensitive receptors to substantial pollutant concentrations?*

## Localized Significance Thresholds Analysis

Sensitive receptors are those individuals more susceptible to the effects of air pollution than the population at large. People most likely to be affected by air pollution include children, the elderly, and people with cardiovascular and chronic respiratory diseases. According to the SCAQMD, sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993). Sensitive receptors near the project site include residences adjacent to the project site on the northern and eastern boundaries.

An LST analysis has been prepared to determine potential impacts to nearby sensitive receptors during construction of the project. As indicated in the discussion of the thresholds of significance, the SCAQMD also recommends the evaluation of localized $NO_2$, CO, $PM_{10}$, and $PM_{2.5}$ impacts as a result of construction activities to sensitive receptors in the immediate vicinity of the project site. The impacts were analyzed using methods consistent with those in the SCAQMD's Final Localized Significance Threshold Methodology (2008). According to the Final Localized Significance Threshold Methodology, "off-site mobile emissions from the project should not be included in the emissions compared to the LSTs" (SCAQMD 2008a). Hauling of soils and construction materials associated with project construction are not expected to cause substantial air quality impacts to sensitive receptors along off-site roadways. Localized emissions from the trucks would be relatively brief in nature and would cease once the trucks pass through the main streets.

Construction activities associated with the project would result in temporary sources of on-site and off-site fugitive dust and construction equipment emissions. Operational emissions include use of off-road equipment and mobile sources on site. The maximum allowable daily emissions that would satisfy the SCAQMD localized significance criteria for SRA 11 are presented in Table 3.3-6 and compared to the maximum daily on-site construction emissions generated during the project.

**Table 3.3-6. Localized Significance Thresholds Analysis for Project – Unmitigated**

| Maximum On-Site Emissions | $NO_2$ | CO | $PM_{10}$ | $PM_{2.5}$ |
|---|---|---|---|---|
| | Pounds per Day | | | |
| Construction Emissions | 6.70 | 13.07 | 2.98 | 1.38 |
| *SCAQMD LST* | *83* | *673* | *5* | *4* |
| **LST Exceeded?** | **No** | **No** | **No** | **No** |

**Source:** SCAQMD 2008a.
**Notes:** $NO_2$ = nitrogen dioxide; CO = carbon monoxide; $PM_{10}$ = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; SCAQMD = South Coast Air Quality Management District; LST = localized significance threshold.
See Appendix C for complete results.
LSTs are shown for a 1-acre project sites corresponding to a distance to a sensitive receptor of 25 meters.
These estimates implementation of the project's fugitive dust control strategies, including watering of the project site and unpaved roads two times per day.

As shown in Table 3.3-6, construction activities would not generate emissions in excess of site-specific LSTs; therefore, localized impacts during construction of the project would be **less than significant**. Operational activities would not generate emissions in excess of site-specific LSTs.

## Health Impacts of Carbon Monoxide

Mobile source impacts occur on two scales of motion. Regionally, project-related travel would add to regional trip generation and increase the VMT within the local airshed and the SCAB. Locally, traffic generated by the project would be added to the City's roadway system near the project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles cold-started and operating at pollution-inefficient speeds, and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SCAB is steadily decreasing.

At the time that the SCAQMD 1993 Handbook was published, the SCAB was designated nonattainment under the CAAQS and NAAQS for CO. In 2007, the SCAQMD was designated in attainment for CO under both the CAAQS and NAAQS as a result of the steady decline in CO concentrations in the SCAB due to turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities. The SCAQMD conducted CO modeling for the 2003 AQMP (Appendix V, Modeling and Attainment Demonstrations, in SCAQMD 2003b) for the four worst-case intersections in the SCAB: (1) Wilshire Boulevard and Veteran Avenue, (2) Sunset Boulevard and Highland Avenue, (3) La Cienega Boulevard and Century Boulevard, and (4) Long Beach Boulevard and Imperial Highway. At the time the 2003 AQMP was prepared, the intersection of Wilshire Boulevard and Veteran Avenue was the most congested intersection in Los Angeles County, with an average daily traffic volume of about 100,000 vehicles per day. Using CO emission factors for 2002, the peak modeled CO 1-hour concentration was estimated to be 4.6 parts per million (ppm) at the intersection of Wilshire Boulevard and Veteran Avenue. When added to the maximum 1-hour CO concentration from 2018 through 2020 at the Azusa monitoring station, which was 2.4 ppm in 2020, the 1-hour CO would be 6.8 ppm, while the CAAQS is 20 ppm.

The 2003 AQMP also projected 8-hour CO concentrations at these four intersections for 1997 and from 2002 through 2005. From years 2002 through 2005, the maximum 8-hour CO concentration was 3.8 ppm at the Sunset Boulevard and Highland Avenue intersection in 2002; the maximum 8-hour CO concentration was 3.4 ppm at the Wilshire Boulevard and Veteran Avenue in 2002. Adding the 3.8 ppm to the maximum 8-hour CO concentration from 2018 through 2020 at the Azusa monitoring station, which was 2 ppm in 2020, the 8-hour CO would be 5.8 ppm, while the CAAQS is 9.0 ppm.

Accordingly, CO concentrations at congested intersections would not exceed the 1-hour or 8-hour CO CAAQS unless projected daily traffic would be at least over 100,000 vehicles per day. Because the project would not increase daily traffic volumes at any study intersection to more than 100,000 vehicles per day (Appendix C),[3] a CO hotspot is not anticipated to occur and associated impacts would be less than significant.

[3] For each study intersection in each scenario evaluated in the TIA, the daily volumes were estimated by assuming that the AM peak hour intersection volumes represent 8% of the daily traffic volumes and the total PM peak hour intersection volumes represent 10% of the daily traffic volumes. Using this method, all 28 study intersections were estimated to result in less than 100,000 vehicles per day in every scenario evaluated (ranging from 8,060 vehicles to 84,663 vehicles).

## Health Impacts of Toxic Air Contaminants

### Construction Health Risk

A construction HRA was performed to evaluate potential health risk associated with construction of the project. The following discussion summarizes the dispersion modeling and HRA methodology; supporting construction HRA documentation, including detailed assumptions, is presented in Appendix C.

For risk assessment purposes, $PM_{10}$ in diesel exhaust is considered DPM, originating mainly from off-road equipment operating at a defined location for a given length of time at a given distance from sensitive receptors. Less-intensive, more-dispersed emissions result from on-road vehicle exhaust (e.g., heavy-duty diesel trucks). For the construction HRA, the CalEEMod scenario for the project was adjusted to reduce diesel truck one-way trip distances to 1,000 feet to estimate emissions from trucks on site.

The air dispersion modeling methodology was based on generally accepted modeling practices of SCAQMD (SCAQMD 2022). Air dispersion modeling was performed using the EPA's American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) Version 21112 modeling system (computer software) with the Lakes Environmental Software implementation/user interface, AERMOD View Version 10.2.1. The HRA followed the Office of Environmental Health Hazard Assessment (OEHHA) 2015 guidelines (OEHHA 2015) and SCAQMD guidance to calculate the health risk impacts at all proximate receptors as further discussed below. The dispersion modeling included the use of standard regulatory default options. AERMOD parameters were selected consistent with the SCAQMD and EPA guidance and identified as representative of the project site and project activities. Principal parameters of this modeling are presented in Table 3.3-7.

**Table 3.3-7. American Meteorological Society/Environmental Protection Agency Regulatory Model Principal Parameters**

| Parameter | Details |
|---|---|
| Meteorological Data | AERMOD-specific meteorological data for the Azuza air monitoring station (AZUS) was used for the dispersion modeling. A 5-year meteorological data set from 2012 through 2016 was obtained from the SCAQMD in a preprocessed format suitable for use in AERMOD. |
| Urban versus Rural Option | Urban dispersion option was selected due to the developed nature of the project area and per SCAQMD guidelines. Los Angeles County's population of 9,818,605 was used in the analysis (SCAQMD 2022). |
| Terrain Characteristics | The elevation of the site is 311 feet above sea level and the surrounding area is predominantly flat. |
| Elevation Data | Digital elevation data were imported into AERMOD and elevations were assigned to receptors and emission sources, as necessary. Digital elevation data were obtained through the AERMOD View in the United States Geological Survey's National Elevation Dataset format with a resolution of 1 degree (approximately 30 meters), consistent with the SCAQMD guidance (SCAQMD 2022). |
| Source Release Characterizations | Construction was modeled as a series of line-volume sources where the emergency department and medical office buildings will be constructed. A plume height dimension of 6.8 meters, a plume width dimension of 8.6 meters, and a release height of 3.4 meters was assumed for off-road equipment and diesel trucks, consistent with the EPA guidance (EPA 2021). |

Notes: AERMOD = American Meteorological Society/Environmental Protection Agency Regulatory Model; SCAQMD = South Coast Air Quality Management District.
See Appendix C.

Regarding receptors, the construction scenario placed two Cartesian receptor grids with 20-meter spacing over proximate residential areas to establish the impact area and evaluate locations of maximum health risk impact.

The health risk calculations were performed using the Hotspots Analysis and Reporting Program Version 2 (HARP2) Air Dispersion and Risk Tool (ADMRT, dated 22118). AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the necessary input values for HARP2. The line of volume sources was partitioned evenly based on the 1 gram per second emission rate. The ground-level concentration plot files were then used to estimate the long-term cancer health risk to an individual, and the noncancerous chronic health indices. There is no reference exposure level for acute health impacts from DPM; thus, acute risk was not evaluated.

Cancer risk is defined as the increase in probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased chances in one million. Maximum Individual Cancer Risk is the estimated probability of a maximally exposed individual potentially contracting cancer as a result of exposure to toxic air contaminants (TACs) over a period of 30 years for residential receptor locations. In accordance with SCAQMD guidance, the RMP Derived Method was evaluated for residential cancer risk. For the construction HRA, the TAC exposure period was assumed to be from third trimester of pregnancy for 24 months for all receptor locations (i.e., the assumed duration of project construction) for the emergency department and 19 months for the medical office building. The HRA was run assuming exposure period would start in the third trimester for both phases of construction. The risk of each phase was then summed. The exposure pathway for DPM is inhalation only.

The SCAQMD has also established noncarcinogenic risk parameters for use in HRAs since some TACs increase noncancerous health risk due to long-term (chronic) exposures and some TACs increase noncancerous health risk due to short-term (acute) exposures. Chronic exposure is evaluated in the construction HRA. Noncarcinogenic risks are quantified by calculating a hazard index, expressed as the ratio between the ambient pollutant concentration and its toxicity or reference exposure level, which is a concentration at or below which health effects are not likely to occur. The chronic hazard index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. A hazard index less of than 1.0 means that adverse health effects are not expected. Results of the construction HRA are presented in Table 3.3-8.

## Table 3.3-8. Construction Health Risk Assessment Results

| Impact Parameter | Units | Project Impact | CEQA Threshold | Level of Significance |
|---|---|---|---|---|
| Maximum Individual Cancer Risk – Residential | Per Million | 4.3 | 10 | Less than Significant |
| Chronic Hazard Index – Residential | Index Value | 0.003 | 1.0 | Less than Significant |

**Source**: SCAQMD 2019.
**Notes**: CEQA = California Environmental Quality Act.
See Appendix C.

As shown in Table 3.3-8, project construction activities would result in a Residential Maximum Individual Cancer Risk of 4.3 in 1 million, which is less than the significance threshold of 10 in 1 million. Project construction would

result in a Residential Chronic Hazard Index of 0.003, which is below the 1.0 significance threshold. The project construction TAC health risk impacts would be less than significant.

### Operational Health Risk

In regard to operations, the proposed project does not include potential sources of substantial TACs, such as large boilers or emergency generators. As such, the proposed project would not result in a substantial increase in TAC generation from on-site sources during long-term operations and would not result in significant health risk at nearby sensitive receptors.

## Health Effects of Other Criteria Air Pollutants

Project construction would not exceed SCAQMD thresholds for VOC, $NO_x$, CO, $SO_x$, $PM_{10,}$ or $PM_{2.5}$.

VOCs and NOx are precursors to $O_3$, for which the SCAB is designated as nonattainment with respect to the NAAQS and CAAQS. The health effects associated with $O_3$ are generally associated with reduced lung function. The contribution of VOCs and NOx to regional ambient $O_3$ concentrations is the result of complex photochemistry. The increases in $O_3$ concentrations in the SCAB due to $O_3$ precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive $O_3$ concentrations would also depend on the time of year that the VOC emissions would occur because exceedances of the O3 CAAQS/NAAQS tend to occur between April and October when solar radiation is highest. The holistic effect of a single project's emissions of $O_3$ precursors is speculative due to the lack of quantitative methods to assess this impact. Because construction and operation of the project would not exceed SCAQMD thresholds for NOx or VOC, implementation of the project would minimally contribute to regional $O_3$ concentrations and the associated health effects.

Construction and operation of the project would not contribute to exceedances of the NAAQS and CAAQS for $NO_2$. Health effects that result from $NO_2$ and $NO_x$ include respiratory irritation, which could be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. Project construction would be relatively short term, and off-road construction equipment would be operating at various portions of the site and would not be concentrated in one portion of the site at any one time. In addition, existing $NO_2$ concentrations in the area are well below the NAAQS and CAAQS standards. Operation of the project would not create substantial, localized $NO_x$ impacts.

CO tends to be a localized impact associated with congested intersections. The associated potential for CO hotspots were discussed previously and are determined to be a less-than-significant impact. Thus, the project's CO emissions would not contribute to significant health effects associated with this pollutant.

Construction and operation of the project would also not exceed thresholds for $PM_{10}$ or $PM_{2.5}$ and would not contribute to exceedances of the NAAQS and CAAQS for particulate matter or obstruct the SCAB from coming into attainment for these pollutants. Additionally, the project would implement dust control strategies and be required to comply with SCAQMD Rule 403, which limits the amount of fugitive dust generated during construction. Due to the minimal contribution of particulate matter during construction and operation, the project is not anticipated to result in health effects associated with $PM_{10}$ or $PM_{2.5}$, and thus the impact would be less than significant.

***d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?***

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public and generate citizen complaints.

Odors would be potentially generated from vehicles and equipment exhaust emissions during construction of the project. Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be less than significant.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). The project would not include land uses that generate odors as discussed above during operation. Therefore, project operations would result in an odor impact that is less than significant.

## 3.4 Biological Resources

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **IV. BIOLOGICAL RESOURCES** – Would the project: | | | | |
| a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service? | ☐ | ☐ | ☒ | ☐ |
| b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service? | ☐ | ☐ | ☐ | ☒ |
| c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? | ☐ | ☐ | ☐ | ☒ |

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites? | ☐ | ☐ | ☐ | ☒ |
| e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? | ☐ | ☐ | ☒ | ☐ |
| f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan? | ☐ | ☐ | ☐ | ☒ |

*a)* ***Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?***

The project site is completely developed with a medical campus, which includes an emergency department, medical office buildings, surface and structured parking and landscaping. Due to the developed nature of the project site, the project does not contain habitat that would support sensitive species. No known candidate, sensitive, or special status wildlife are located on the project site.

The study area contains trees that would potentially be used by migratory birds for breeding. Direct impacts to migratory nesting birds must be avoided to comply with the Migratory Bird Treaty Act (16 USC 703–712) and California Fish and Game Code. Indirect impacts to nesting birds from short-term, construction-related noise could result in decreased reproductive success or abandonment of an area as nesting habitat if construction were conducted during the breeding/nesting season (i.e., January through August). Ff construction were conducted during the breeding/nesting season, the project would comply with Migratory Bird Treaty Act and California Fish and Game Code requirements, which would include measures such as nesting bird surveys prior to construction. Overall, a less than significant impact to candidate, sensitive, or special status species would occur as a result of project implementation.

*b)* ***Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?***

As stated above, the project site is completely developed and does not contain any natural vegetation communities or riparian habitat. Additionally, the project site is surrounded by existing development and is not in proximity to any sensitive natural communities. No impact to sensitive natural communities would occur as a result of project implementation.

*c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

As stated above, the project site is completely developed and does not contain any natural vegetation communities. Additionally, the project site does not contain any hydrologic features or federally protected wetlands. Therefore, no impact would occur through direct removal, filling, hydrological interruption of wetlands as a result of project implementation.

*d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

As discussed above, the project site is completely developed and does not contain any natural vegetation communities or habitat. Additionally, the project site is surrounded by existing development that do not contain any wildlife corridors or habitat linkages. Therefore, implementation of the project would have no impact to habitat linkages or corridors.

*e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

The City of Baldwin Park Municipal Code Section 153.165, Tree Preservation and Protection, governs the preservation and removal of trees within the City (City of Baldwin Park 2022a). The project is expected to remove 37 trees during Phase I and no trees would be removed as part of Phase II. None of the trees that are expected to be removed are located within the public right-of-way. To comply with Baldwin Park Municipal Code Section 153.165, the project would be required to obtain a tree removal permit before the removal of any trees. A tree removal permit would only be granted if a suitable replacement would be planted within six months of the permitted removal. The project would plant trees at a 1:1 ratio to be consistent with the Baldwin Park Municipal Code Tree Preservation and Protection Ordinance; in light of the 1:1 replacement of lost trees, this impact would be less than significant.

*f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?*

As discussed above, the project site is developed consisting of a medical campus and retail building. The project site is also surrounded by existing development and is not located with a Habitat Conservation Plan or Natural Community Conservation Plan. Additionally, due to the project site being developed, the project would does not contain any native vegetation communities or habitat. No impact to an HCP or NCCP would occur.

# 3.5 Cultural Resources

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **V. CULTURAL RESOURCES** – Would the project: | | | | |
| a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5? | ☐ | ☐ | ☐ | ☒ |
| b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5? | ☐ | ☒ | ☐ | ☐ |
| c) Disturb any human remains, including those interred outside of formal cemeteries? | ☐ | ☒ | ☐ | ☐ |

***a) Would the project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?***

The project site contains an existing medical campus and an abandoned retail building known as the "Broken Horn" site. The project proposes to redevelop the Broken Horn site to include a MOB and would demolish the existing buildings on site. The Broken Horn site consists of two attached buildings: 1026 Leorita Street, constructed in 1976, and 1022-1024 Leorita Street, which was constructed in 1986. The buildings appear to have been connected circa 1995, per aerial photographs (NETR 2022). The subject property housed the same business, the Broken Horn Saddlery, from 1976 until 2021 when the business vacated the subject property and moved to a new location. The subject property is currently vacant. Although 1022-10244 Leorita Street is not over 45-years in age, the buildings were evaluated as a single property due to their shared history and physical connection.

As determined in Appendix B, the Broken Horn property appears ineligible as a historical resource at the local, state, and federal level. No historical resources were identified within the Project site as a result of extensive archival research, a SCCIC records search, field survey, and property evaluations of significance. The subject property is not currently designated or listed under any national, state, or local landmark programs. The subject property has further not been identified as eligible for local designation by any historical resource surveys.

The Broken Horn property was evaluated in accordance with Section 15064.5 (a)(2)-(3) of California Environmental Quality Act (CEQA) Guidelines and using the criteria outlined in Section 5024.1 of the California Public Resources Code and the building does not appear to be eligible for listing in the NRHP, CRHR, or for historical designation in the City of Baldwin Park due to a lack of significance. As such, the subject property does not appear to be a historical resource under CEQA. Therefore, no impact to historical resources would occur.

*b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?*

The project site is currently developed, consisting of an active medical campus and associated parking structure, abandoned retail buildings and parking lots, and landscaped areas. As described in Appendix B, the cultural resource assessment included a California Historical Resources Information System (CHRIS) records search conducted at the South Central Coastal Information Center (SCCIC); Native American coordination with the Native American Heritage Commission (NAHC) for a Sacred Lands File (SLF) search; an in-depth review of geotechnical, archival, academic, and ethnographic information; and an archaeological pedestrian survey.

A search of the CHRIS database for the project site and 1-mile records search area did not identify any previously recorded historic-period or prehistoric archeological resources. Additionally, of the 13 previous technical studies that were conducted within 1 mile of the project site, three studies address portions of the project site; however, approximately 70% of the project site has not been subjected to any previous archaeological investigations or surveys. None of the previous studies identified archaeological resources within the project site. Additionally, review of aerial photographs showed the San Gabriel River Wash to the west of the project site was not channelized and Walnut Creek intersected the project site up until 1964, which suggests that the project site has likely been modified by the natural movement of soils in prehistoric and historic periods indicating that if cultural material does exist within the project site, it would likely have been buried, displaced (not exist within its original context), or destroyed along the historical route of Walnut Creek. A pedestrian survey for the project (conducted August 24, 2022) did not identify any surficial evidence of cultural material.

A review of a 2022 and 2015 geotechnical report and available boring logs documenting the results of subsurface exploratory investigations conducted in 1986, 1989, 1990, 2015, and 2021 for portions of the project site determined that fill soils were encountered at a variety of depths across the project site and generally extended from surface to between seven inches and 12 feet below ground surface. Current project design indicates that the maximum depth of ground disturbance for the MOB component at the Broken Horn site is 10 feet below the existing ground surface and a maximum depth of 65 feet below current grade for the drilling of caissons at the emergency department expansion component. In addition, ground disturbance associated with all other construction components, including site preparation, vegetation removal, and trenching for utility work is assumed to be no deeper than five feet below existing ground surface across the project site.

In consideration of all these factors, the potential to encounter unknown intact archaeological resources between current grade and to depths of identified fill soils is relatively unlikely. However, the potential for intact cultural deposits to exist within soils underlying fills soils to proposed depths of disturbance is unknown considering the lack of opportunity to observe native soils during the pedestrian survey and that no previous archaeological investigation has occurred prior to placement of fill soils for approximately 70% of the project site. As such, there is potential for archaeological resources within the project site to be present within the native soils that exist beneath fill soils. Since proposed depths of disturbance may extend deeper than documented fill soils, native soils with the potential for archaeological deposits to exist will be disturbed. In the event that unknown archaeological resources are encountered during project implementation, impacts to these resources are potentially significant and mitigation is required.

Mitigation Measure **MM-CUL-1** through **MM-CUL-3** would ensure that measurements are in place for the proper treatment of any inadvertently discovered archaeological resources and potential impacts to archaeological resources and human remains would be reduced to less than significant with mitigation incorporated.

MM-CUL-1 Workers Environmental Awareness Program Training. All construction personnel and monitors who are not trained archaeologists shall be briefed regarding inadvertent discoveries prior to the start of construction activities. A basic presentation and handout or pamphlet shall be prepared in order to ensure proper identification and treatment of inadvertent discoveries. The purpose of the Workers Environmental Awareness Program (WEAP) training is to provide specific details on the kinds of archaeological materials that may be identified during construction of the Project and explain the importance of and legal basis for the protection of significant archaeological resources. Each worker shall also learn the proper procedures to follow in the event that cultural resources, tribal cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor.

MM-CUL-2 Retention of a Qualified Archaeologist. A qualified archaeologist shall be retained and on-call to respond and address any inadvertent discoveries identified for the duration of construction activities. Additionally, in consideration of the potential to encounter intact cultural deposits beneath fill soils, the qualified archaeologist shall survey the proposed Project site once fill soils have been removed to ensure no cultural deposits underly the fill layer. If it is determined, based on the survey after the removal of fill soils, that cultural resources are present or may be present that may be impacted during project construction, monitoring shall be warranted. If it is determined that monitoring is warranted, a qualified archaeological principal investigator, meeting the Secretary of the Interior's Professional Qualification Standards, shall oversee and adjust monitoring efforts as needed (increase, decrease, or discontinue monitoring frequency) based on the observed potential for construction activities to encounter cultural deposits or material. The archaeological monitor will be responsible for maintaining daily monitoring logs.

MM-CUL-3 Inadvertent Discovery Treatment and Protocol. In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed Project, all construction work occurring within 50 feet of the find should immediately stop and a qualified archaeologist should be notified immediately to assess the significance of the find and determine whether or not additional study is warranted. If human remains or suspected human remains are discovered, all construction work occurring within 50 feet of the find should immediately stop. The archaeologist will provide recommendations regarding next steps based on inspection and initial assessment of the significance of the find. The preferred management strategy for cultural resources shall be preservation in place through avoidance or other methods. If the discovery proves significant under CEQA, and preservation in place infeasible, additional work such as preparation of an archaeological treatment plan, testing, data recovery, or monitoring shall be engaged to document or preserve the find.

Within 60 days following completion of ground disturbance, an archaeological monitoring report shall be prepared and submitted to the City for review. This report should document

compliance with approved mitigation, document the monitoring efforts, and include an appendix with daily monitoring logs. The final report shall be submitted to the SCCIC.

*c) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?*

The cultural resources intensive pedestrian survey conducted for the project did not identify any human remains or find any indications that they would be expected to be found on the project site. However, although unlikely, there is the possibility of human remains being discovered during ground disturbing activities on the project site. If remains are discovered during project construction activities, mitigation is proposed that would require work in the vicinity of the discovery be halted and procedures set forth in the California Public Resources Code (Section 5097.98) and State Health and Safety Code (Section 7050.5) be followed. Therefore, potential discovery of undocumented human remains on the project site could result in a potentially significant impact and mitigation is required.

Mitigation Measure **MM-CUL-4** would ensure that measurements are in place for the proper treatment of any inadvertently discovered human remains and potential impacts to human remains would be reduced to less than significant with mitigation incorporated.

MM-CUL-4 Human Remains: As specified by California Health and Safety Code Section 7050.5, if human remains, or remains that are potentially human, are found on the project site during ground disturbing activities or during archaeological work, the person responsible for the excavation, or his or her authorized representative, shall immediately notify the Los Angeles County Medical Examiner's Office by telephone. No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the Qualified Archaeologist and/or the TCA Native American monitor) shall occur until the Medical Examiner has made the necessary findings as to origin and disposition pursuant to Public Resources Code 5097.98.

If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the Qualified Archaeologist and/or the TCA Native American monitor), and consultation and treatment could occur as prescribed by law. As further defined by State law, the Medical Examiner will determine within two working days of being notified if the remains are subject to his or her authority. If the Medical Examiner recognizes the remains to be Native American, and not under his or her jurisdiction, then he or she shall contact the Native American Heritage Commission by telephone within 24 hours. The Native American Heritage Commission will make a determination as to the Most Likely Descendent, who shall be afforded 48 hours from the time access is granted to the discovery site to make recommendations regarding culturally appropriate treatment.

If suspected Native American remains are discovered, the remains shall be kept in situ (in place) until after the Medical Examiner makes its determination and notifications, and until after the Most Likely Descendent is identified, at which time the archaeological examination of the remains shall only occur on site in the presence of the Most Likely Descendent. The specific locations of Native American burials and reburials will be proprietary and not disclosed to the general public. According to California Health and

Safety Code, six or more human burials at one location constitute a cemetery (Section 8100), and disturbance of Native American cemeteries is a felony (Section 7052). In the event that the Applicant/Owner and the Most Likely Descendant are in disagreement regarding the disposition of the remains, State law will apply, and the mediation process will occur with the NAHC. In the event that mediation is not successful, the landowner shall rebury the remains at a location free from future disturbance (see Public Resources Code Section 5097.98[e] and 5097.94[k]).

# 3.6 Energy

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **VI. Energy** – Would the project: | | | | |
| a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation? | ☐ | ☐ | ☒ | ☐ |
| b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency? | ☐ | ☐ | ☒ | ☐ |

***a) Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?***

The electricity and natural gas used for construction of the project would be temporary and would be substantially less than that required for project operation and would have a negligible contribution to the project's overall energy consumption. Although the project would see an increase in petroleum use during construction and operation, vehicles would use less petroleum due to advances in fuel economy and potential reduction in VMT over time.

## Short-Term Construction

CalEEMod Version 2020.4.0 was used to estimate potential project-generated GHG emissions during construction, which were then used to estimate energy consumption. Construction of the project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 3.3, Air Quality, and Appendix C of this Draft MND are also applicable for the estimation of construction-related GHG emissions. The estimated GHGs were back-calculated based on carbon content (i.e., kilograms of carbon dioxide [$CO_2$] per gallon) in order to estimate fuel usage during project construction. The conversion factor for gasoline is 8.78 kilograms per metric ton $CO_2$ per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton $CO_2$ per gallon (The Climate Registry 2021). Energy use calculations for construction are provided in Appendix C.

### Electricity

Temporary electric power for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers would be provided by Southern California Edison (SCE). The electricity used for such activities would be temporary and would be substantially less than that required for project operation and would have a negligible contribution to the project's overall energy consumption.

### Natural Gas

Natural gas is not anticipated to be required during construction of the project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the "petroleum" subsection. Any minor amounts of natural gas that may be consumed as a result of project construction would be substantially less than that required for project operation and would have a negligible contribution to the project's overall energy consumption.

### Petroleum

Heavy-duty construction equipment associated with demolition and construction activities for construction would rely on diesel fuel, as would haul trucks involved in removing the materials from demolition and excavation. Construction workers would travel to and from the project site throughout the duration of construction. It is assumed in this analysis that construction workers would travel to and from the site in gasoline-powered passenger vehicles.

Heavy-duty construction equipment of various types would be used during each phase of project construction. Appendix C lists the assumed equipment usage for each phase of construction.

Fuel consumption from construction equipment was estimated by converting the total $CO_2$ emissions from each construction phase to gallons using the conversion factors for $CO_2$ to gallons of gasoline or diesel. Construction is estimated to occur in the years 2023-2025 and 2028-2029 based on the construction phasing schedule. The conversion factor for gasoline is 8.78 kilograms per metric ton $CO_2$ per gallon, and the conversion factor for diesel is 10.21 kilograms per metric ton $CO_2$ per gallon (The Climate Registry 2021). The estimated diesel fuel usage from construction equipment, haul trucks, and vendor trucks, as well as estimated gasoline fuel usage from worker vehicles, is shown in Table 3.6-1. The movement of soils on site would be accomplished with off-road equipment.

**Table 3.6-1. Total Project Construction Petroleum Demand**

| Off-Road Equipment (diesel) | Haul Trucks (diesel) | Vendor Trucks (diesel) | Worker Vehicles (gasoline) |
|---|---|---|---|
| **Gallons** | | | |
| 48,036.76 | 1,109.93 | 4,924.78 | 5,722.51 |

**Source:** See Appendix C for outputs.

In summary, construction associated with the potential future development facilitated by the Project over the construction period is conservatively anticipated to consume 5,722.51 gallons of gasoline from worker vehicles and 54,071.47 gallons of diesel from off-road equipment, haul trucks, and vendor trucks. In Los

Angeles County in 2023, it is estimated that approximately 4.2 billion gallons of petroleum would be consumed by on-road vehicles, and approximately 43 million gallons of petroleum would be consumed by off-road equipment (CARB 2021).

The Project would be subject to CARB's In-Use Off-Road Diesel Vehicle Regulation that applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulation (1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; (2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; (3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and (4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits). The fleet must either show that its fleet average index was less than or equal to the calculated fleet average target rate, or that the fleet has met the Best Achievable Control Technology requirements. Overall, the Project would not be unusual when compared to overall local and regional demand for energy resources and would not involve characteristics that require equipment that would be less energy-efficient than at comparable construction sites in the region or state.

Additionally, any future development facilitated by the Project would be required to adhere to all federal, State, and local requirements for energy efficiency, including the latest Title 24 standards. Considering these requirements, the Project would not result in the inefficient, wasteful, or unnecessary consumption of construction energy. Therefore, short-term construction energy impacts would be less than significant.

## Long-Term Operational Impacts

During project operations, activities that would consume energy would include electricity and natural gas use for building operations, electricity for water and wastewater conveyance, and petroleum consumption from employees, customers, and delivery vehicle trips. Additional assumptions for these sources are described below and energy use calculations for operations are provided in Appendix C.

### Electricity

The operation of the project buildout would require electricity for multiple purposes, including cooling, lighting, appliances, and various equipment. Additionally, the supply, conveyance, treatment, and distribution of water would indirectly result in electricity usage. Electricity consumption associated with project operation is based on the CalEEMod outputs presented in Appendix C.

CalEEMod default values for energy consumption for each land use were applied for the project analysis. The energy use from non-residential land uses is calculated in CalEEMod based on the California Commercial End-Use Survey database. Energy use in buildings (both natural gas and electricity) is divided by the program into end use categories subject to Title 24 requirements (end uses associated with the building envelope, such as the HVAC system, water heating system, and integrated lighting) and those not subject to Title 24 requirements (such as appliances, electronics, and miscellaneous "plug-in" uses).

Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards. The most recent amendments to Title 24, Part 6, referred to as the 2019 standards, became effective on January 1, 2020. According to these estimations, the project would consume approximately 908,573 kilowatt-hours (kWh) per year during operation (Appendix C). The project would consume

approximately 105,019.11 kWh per year from water and wastewater sources, resulting in a total use of 1,013,592.11 kWh per year. The non-residential electricity demand in 2020 was 42,736,774,915 kWh (42,737 gigawatt-hours) for Los Angeles County (CEC 2020). As such, the project would have a negligible impact on demand for Los Angeles County and SCE.

### Natural Gas

The operation would require natural gas for various purposes, including water heating and natural gas appliances and forklifts. Natural gas consumption associated with operation is based on the CalEEMod outputs in Appendix C.

CalEEMod default values for energy consumption for each land use were applied for the project analysis. According to these estimations, the project would consume approximately 1,771,660 kilo-British thermal units per year. The non-residential natural gas consumption in 2020 was 1,698,687,468 kilo-British thermal units for Los Angeles County (CEC 2020).

### Petroleum

During operations, the majority of fuel consumption resulting from the project would involve the use of motor vehicles traveling to and from the project site, off-road equipment (yard trucks), and emergency generator testing.

Petroleum fuel consumption associated with motor vehicles traveling to and from the project site is a function of the VMT as a result of project operation. As shown in Appendix C and as discussed in Section 3.3, Air Quality, and Section 3.8, Greenhouse Gas Emissions, the annual net new VMT attributable to the project is expected to be 3,566,844 VMT. Similar to the construction worker and vendor trips, fuel consumption from worker and truck trips is estimated by converting the total $CO_2$ emissions from operation of the project to gallons using the conversion factors for $CO_2$ to gallons of gasoline or diesel. Mobile source emissions were estimated using the CalEEMod.

Calculations for annual mobile source fuel consumption are provided in Table 3.6-2.

**Table 3.6-2. Annual Mobile Source Petroleum Demand**

| Fuel | Vehicle MT CO2 | kg/CO2/Gallon | Gallons |
|---|---|---|---|
| Gasoline | 819.61 | 8.78 | 93,350.20 |
| Diesel | 200.20 | 10.21 | 19,608.26 |
| | | **Total** | **112,958.46** |

**Sources:** Trips and vehicle $CO_2$ (Appendix C); kg/$CO_2$/Gallon (The Climate Registry 2021).
**Notes:** MT = metric ton; $CO_2$ = carbon dioxide; kg = kilogram.

By comparison, California as a whole consumes approximately 28.6 billion gallons of petroleum per year (EIA 2017). Countywide total petroleum use by vehicles is expected to be 4.0 billion gallons per year by 2026 (CARB 2021).

### Summary

Statewide emission reduction measures proposed in the CARB-adopted amendments to the Pavley regulations include measures aimed at reducing GHG emissions associated with transportation. These amendments are part of California's commitment to a nationwide program to reduce new passenger vehicle GHGs from 2012 through 2016. Pavley regulations reduced GHG emissions from California passenger vehicles by about 22% in 2012 and by about 30% in 2016, all the while improving fuel efficiency and reducing motorists' costs. As such, vehicle trips associated with the project are expected to use less petroleum due to advances in fuel economy over time.

CARB has adopted a new approach to passenger vehicles—cars and light trucks—by combining the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The new approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emission vehicles in California (CARB 2017).

The project would create additional electricity and natural gas demand by adding recreational and commercial facilities. New facilities associated with the project would be subject to the State Building Energy Efficiency Standards, embodied in Title 24 of the California Code of Regulations. The efficiency standards apply to new construction of nonresidential buildings and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting.

In summary, although natural gas and electricity usage would increase due to the implementation of the project, the project's energy efficiency would go beyond code compliance. Although the project would see an increase in petroleum use during construction and operation, vehicles would use less petroleum due to advances in fuel economy and potential reduction in VMT over time. Therefore, impacts to energy resources during operation would be less than significant.

***b) Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?***

The project would be subject to and would comply with, at a minimum, the 2019 California Building Code Title 24 (24 CCR Part 6). The project would not conflict with existing energy standards and regulations. The electricity and natural gas used for construction of the project would be temporary and would be substantially less than that required for project operation and would have a negligible contribution to the project's overall energy consumption.

### Construction

The electricity and natural gas used for construction of the project would be temporary and would be substantially less than that required for project operation and would have a negligible contribution to the project's overall energy consumption. Construction is anticipated to consume 5,722.51 gallons of gasoline and 54,071.47 gallons of diesel. This would be a fraction of petroleum that would be consumed in California and countywide over the course of the construction period. Therefore, construction would have a less-than-significant impact with regards to regional energy supplies.

### Operation

As discussed under the previous thresholds, the project would result in an increased demand for electricity, natural gas, and petroleum. Design features would reduce the project's energy consumption by what is required by the 2019 California Building Code Title 24 standards. The efficiency standards apply to new construction of both residential and nonresidential buildings and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting.

In addition, Pavley regulations reduced GHG emissions from California passenger vehicles by about 22% in 2012 and by about 30% in 2016, all while improving fuel efficiency. By 2025, when the Advanced Clean Cars rules are fully implemented, one in seven new cars sold in California (1.4 million) will be non-polluting or nearly so, including plug-in hybrids, fully electric battery-powered cars, and hydrogen-powered fuel cell vehicles (CARB 2012). Meanwhile, gasoline- and diesel-powered passenger vehicles would grow ever cleaner and more efficient. A variety of new technologies, from direct fuel injection to lower rolling resistance tires, will also cut pollution and create more energy-efficient vehicles (CARB 2012). As such, petroleum usage associated with operation of the project is anticipated to decrease over time due to a reduction in VMT in the region and advances in fuel economy. Therefore, impacts related to regional energy supplies and capacity during project operation would be less than significant.

## 3.7 Geology and Soils

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **VII. GEOLOGY AND SOILS** – Would the project: | | | | |
| a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: | | | | |
| i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42. | ☐ | ☐ | ☒ | ☐ |

A geotechnical report was prepared to analyze the geology of the project site and surrounding area. The Geotechnical Investigation Report is included as Appendix A to this MND.

***a)*** ***Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:***

***i)*** ***Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.***

The project site currently consists of a medical campus and retail building. The project proposes the expansion of an existing emergency department and the development of a MOB, introducing additional people to the project site. Faults that are located closest to the project site include the Whittier Earthquake Fault Zone and Raymond Hills Fault Zone. The Whittier Earthquake Fault Zone is approximately 6.0 miles southwest of the project site and the Raymond Hills Fault Zone is approximately 6.3 miles the north-northeast. As concluded in Appendix A, the project site is not located within an earthquake fault zone and is not located in proximity to a fault zone. Impacts related to risks from rupture of a known earthquake fault as part of project implementation would be less than significant.

***ii)*** ***Strong seismic ground shaking?***

As stated above, the project site is not located in or in proximity to a fault zone. Additionally, the design of the project would conform to all applicable federal, state, and local building codes, which would ensure

structural integrity. Impacts related to risks from strong seismic ground shaking as part of project implementation would be less than significant.

*iii) Seismic-related ground failure, including liquefaction?*

The project site is located in an area that is subject to liquefaction (DOC 2016b). As concluded in Appendix A, the project site is susceptible to liquefaction 15 feet below the existing grade (Appendix A). To support the structure, a deep foundation will be used to secure the project from experiencing impacts related to liquefaction and shrinking. Additionally, the design of the project would conform to all applicable federal, state, and local building codes. Impacts related to risks from seismic-related ground failure, including liquefaction as part of project implementation would be less than significant.

*iv) Landslides?*

The project site is relatively flat and is not located at the base of any hillsides, ridgeline, or slopes. Additionally, the project site has not been mapped as a landslide hazards area. No impact would occur.

*b) Would the project result in substantial soil erosion or the loss of topsoil?*

The project site consists of a previously developed medical campus and retail space. Potential erosion and sedimentation impacts would be temporarily increased during proposed construction, through activities such as grading, and removal of surface stabilizing features (e.g., vegetation and pavement). Developed areas would be most susceptible to erosion between the beginning of grading or construction and the installation of pavement or establishment of permanent cover in landscaped areas. However, short-term erosion and sedimentation impacts would be addressed through conformance with the National Pollutant Discharge Elimination System (NPDES) standards. Additionally, the project would be required to draft and implement an approved Stormwater Pollution Prevention Plan (SWPPP) and best management practices (BMPs), including appropriate measures to address erosion and sedimentation during construction. Implementation of the BMPs required pursuant to these permitting processes will ensure that erosion and sedimentation is managed to achieve regulatory water discharge standards. Once the project is in operation, the project site will be developed and would not result in the substantial erosion of topsoil. Impacts would be less than significant.

*c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?*

As stated above, the project site is relatively flat and is not located at the base of any hillsides, ridgeline, or slopes, and is not located in any known fault zones. Lateral spreading is unlikely to occur at the project site because the project site is relatedly flat and is not located near water. Human or natural activities have the potential to cause subsidence; however, Appendix A concluded that the likelihood of subsidence occurring at the project site is low. As described above, the project site is in an area that is subject to liquefaction; however, a deep foundation will be used to secure the project from experiencing impacts related to liquefaction and shrinkage. Additionally, the design of the project would conform to all applicable federal, state, and local building codes, which would ensure structural integrity regardless of the characteristic of

the underlying soils. Therefore, impacts related to on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse would be less than significant.

*d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?*

The subsoil conditions of the project site include loose soils overlying medium dense to dense poorly graded sand, above more dense layers of sand with occasional gravel layers. Soils on the project site are considered to have very low expansion potential (Appendix A). The project site is not underlain by expansive soils and therefore impacts relating to risks to life or property from expansive soils would be less than significant.

*e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?*

The project would connect to existing wastewater infrastructure provided by the City of Baldwin Park. The project would not include the use of septic tanks or alternative wastewater disposal systems. **No impact** would occur.

*f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?*

According to surficial geological mapping at a 1:24,000 scale and the most current international stratigraphic chart, the project site is underlain by Holocene (<11,700 years ago) alluvial gravel deposits (map unit Qg) with finer-grained Holocene alluvial deposits (map unit Qa) mapped just to the south (Cohen et al. 2022; Dibblee and Ehrenspeck 1999). The gravel deposits are products of major streams transporting and depositing sediments derived from the San Gabriel Mountains and associated alluvial fans while the finer-grained alluvial deposits were deposited on floodplains and within valleys (Dibblee and Ehrenspeck 1999). Geotechnical borings indicated the project site is underlain by artificial fill varying in thickness from 5 to 12 feet, which in turn is underlain by alluvial deposits consisting of variable amounts of silts, sands, and gravels (Geobase 2015).

As identified in the City of Baldwin Park General Plan Initial study, no known paleontological resources are within the City. LSA Associates, Inc. (2015) requested and received a paleontological records search from the Natural History Museum of Los Angeles County (LACM) for a previously planned project within the current project site. The LACM records search results revealed no paleontological resource localities from within the project site; however, nearby localities (LACM 7701–7702) were reported from deposits similar to those underlying the project site at depth. These localities yielded fossil specimens including fish, salamander, snake, rabbit, and rodent from 11 to 34 feet below the ground surface.

As described above, current project design indicates that the maximum depth of ground disturbance for the MOB component at the Broken Horn site is 10 feet below the existing ground surface and a maximum depth of 65 feet below current grade for the drilling of caissons at the emergency department expansion component. In addition, ground disturbance associated with all other construction components, including site preparation, vegetation removal, and trenching for utility work is assumed to be no deeper than five feet below existing ground surface across the project site. While there are no known paleontological resources on the project site, due to the required grading and drilling for the project, the geologic units on

site that have the potential to contain paleontological resources at depth, and the moderate potential for the discovery of paleontological resources, mitigation measure **MM-GEO-1** is provided in the event excavation results in the unanticipated discovery of paleontological resources, and impacts would be reduced to less than significant with mitigation incorporated.

### Mitigation Measures

MM GEO-1 Paleontological Resources Impact Mitigation Program and Paleontological Monitoring. Prior to commencement of any grading activity on site, the applicant shall retain a qualified paleontologist per the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall prepare a Paleontological Resources Impact Mitigation Program (PRIMP) for the project. The PRIMP shall be consistent with the SVP (2010) guidelines and shall outline requirements for preconstruction meeting attendance and worker environmental awareness training, where monitoring is required within the proposed Project site at depths below 15 feet below the ground surface based on construction plans and/or geotechnical reports, procedures for adequate paleontological monitoring and discoveries treatment, and paleontological methods (including sediment sampling for microvertebrate fossils), reporting, and collections management. The qualified paleontologist shall attend the preconstruction meeting and a qualified paleontological monitor shall be on site during all rough grading and other significant ground-disturbing activities (including augering). In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor will temporarily halt and/or divert grading activity to allow recovery of paleontological resources, which if determined to be significant, will be curated into an accredited fossil repository, such as the Natural History Museum of Los Angeles County at the project proponent's expense. Upon completion of project excavations requiring paleontological monitoring, the qualified paleontologist shall submit a final paleontological monitoring report to the project proponent and fossil repository (if fossils are discovered). The report shall detail the monitoring program's results, analyses, and conclusions.

## 3.8 Greenhouse Gas Emissions

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **VIII. GREENHOUSE GAS EMISSIONS** – Would the project: | | | | |
| a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? | ☐ | ☐ | ☒ | ☐ |
| b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases? | ☐ | ☐ | ☒ | ☐ |

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project, such as the project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated at a project level under CEQA.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). The State of California has not adopted emission-based thresholds for GHG emissions under CEQA. The Governor's Office of Planning and Research's Technical Advisory, titled Discussion Draft CEQA and Climate Change Advisory, states (OPR 2018):

> Neither the CEQA statute nor the CEQA Guidelines prescribe thresholds of significance or particular methodologies for perming an impact analysis. This is left to lead agency judgment and discretion, based upon factual data and guidance from regulatory agencies and other sources where available and applicable. Even in the absence of clearly defined thresholds for GHG emissions, such emissions must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact.

Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2018). Section 15064.7(c) of the CEQA Guidelines specifies that "when adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

In October 2008, the SCAQMD proposed recommended numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of residential and commercial development projects as presented in its Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold (SCAQMD 2008). This guidance document, which builds on the previous guidance prepared by the California Air Pollution Control Officers Association, explored various approaches for establishing a significance threshold for GHG emissions. The draft interim CEQA thresholds guidance document was not adopted or approved by the Governing Board. However, in December 2008, the SCAQMD adopted an interim 10,000 metric tons (MT) of carbon dioxide equivalent ($CO_2e$) per-year screening level threshold for stationary source/industrial projects for which the SCAQMD is the lead agency (see SCAQMD Resolution No. 08-35, December 5, 2008).

The SCAQMD formed a GHG CEQA Significance Threshold Working Group to work with SCAQMD staff on developing GHG CEQA significance thresholds until statewide significance thresholds or guidelines are established. From December 2008 to September 2010, the SCAQMD hosted working group meetings and

revised the draft threshold proposal several times, although it did not officially provide these proposals in a subsequent document. The SCAQMD has continued to consider adoption of significance thresholds for residential and general land use development projects. The most recent proposal, issued in September 2010, uses the following tiered approach to evaluate potential GHG impacts from various uses (SCAQMD 2010):

**Tier 1** Determine if CEQA categorical exemptions are applicable. If not, move to Tier 2.

**Tier 2** Consider whether or not the project is consistent with a locally adopted GHG reduction plan that has gone through public hearing and CEQA review, that has an approved inventory, includes monitoring, etc. If not, move to Tier 3.

**Tier 3** Consider whether the project generates GHG emissions in excess of screening thresholds for individual land uses. The 10,000 MT $CO_2e$ per year threshold for industrial uses would be recommended for use by all lead agencies. Under option 1, separate screening thresholds are proposed for residential projects (3,500 MT $CO_2e$ per year), commercial projects (1,400 MT $CO_2e$ per year), and mixed-use projects (3,000 MT $CO_2e$ per year). Under option 2, a single numerical screening threshold of 3,000 MT $CO_2e$ per year would be used for all non-industrial projects. If the project generates emissions in excess of the applicable screening threshold, move to Tier 4.

**Tier 4** Consider whether the project generates GHG emissions in excess of applicable performance standards for the project service population (population plus employment). The efficiency targets were established based on the goal of AB 32 to reduce statewide GHG emissions to 1990 levels by 2020. The 2020 efficiency targets are 4.8 MT $CO_2e$ per service population per year (MT $CO_2e$/SP/year) for project level analyses and 6.6 MT $CO_2e$/SP/year for plan level analyses. The 2035 efficiency targets are 3.0 MT $CO_2e$/SP/year for project level analyses and 4.1 MT $CO_2e$/SP/year for plan level analyses. If the project generates emissions in excess of the applicable efficiency targets, move to Tier 5.

**Tier 5** Consider the implementation of CEQA mitigation (including the purchase of GHG offsets) to reduce the project efficiency target to Tier 4 levels.

To determine the project's potential to generate GHG emissions that would have a significant impact on the environment, the project's GHG emissions were compared to the non-industrial land project quantitative threshold of 3,000 MT $CO_2e$ per year. Per the SCAQMD guidance, construction emissions should be amortized over the operational life of the project, which is assumed to be 30 years (SCAQMD 2008). In addition, the project is evaluated for its potential to conflict with various GHG emission reduction plans including local GHG reduction plans, CARB's Scoping Plan, SCAG's RTP/SCS, and statewide 2030 and 2050 GHG reduction targets identified in Senate Bill (SB) 32 and Executive Order (EO) S-3-05.

*a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?*

### Short-Term Construction Emissions

CalEEMod Version 2020.4.0 was used to estimate potential project-generated GHG emissions during construction. Construction of the project would result in GHG emissions primarily associated with the use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 3.3 are also applicable for the estimation of construction-related GHG emissions. As such, see Section 3.3 for a discussion of construction emissions calculation methodology and assumptions used in the GHG emissions analysis.

The SCAQMD Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold (2008) recommends that, "construction emissions be amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies." Thus, the total construction GHG emissions were calculated, amortized over 30 years, and added to the total operational emissions for comparison with the GHG significance threshold of 3,000 MT $CO_2e$ per year. Therefore, the determination of significance is addressed in the operational emissions discussion following the estimated construction emissions.

Construction of the project is assumed to last a total of approximately 41 months. Table 3.8-1 presents construction emissions for the project from on-site and off-site emission sources.

**Table 3.8-1. Estimated Annual Construction GHG Emissions**

| Year | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2e$ |
|---|---|---|---|---|
| | Metric Tons per Year | | | |
| 2023 | 110.62 | 0.03 | <0.01 | 112.04 |
| 2024 | 149.24 | 0.04 | <0.01 | 150.78 |
| 2025 | 29.01 | 0.01 | <0.01 | 29.25 |
| 2028 | 124.22 | 0.02 | <0.01 | 125.43 |
| 2029 | 183.08 | 0.03 | <0.01 | 184.82 |
| | | | Total | 602.32 |
| | | | Amortized emissions over 30 years | 20.08 |

**Notes:** GHG = greenhouse gas; $CO_2$ = carbon dioxide; $CH_4$ = methane; $N_2O$ = nitrous oxide; $CO_2e$ = carbon dioxide equivalent. See Appendix C for complete results.

As shown in Table 3.8-1, the estimated total GHG emissions during construction would be approximately 602 MT $CO_2e$ over the assumed construction period. Estimated project-generated construction emissions amortized over 30 years would be approximately 20 MT $CO_2e$ per year. Because there is no separate GHG threshold for construction, the evaluation of significance is discussed in the operational emissions analysis in the following text.

## Long-Term Operational Emissions

Emissions from the operational phase of the project were estimated using CalEEMod Version 2020.4.0. Operational years of 2026 (Emergency Department) and 2030 (Medical Office Building) were assumed consistent with completion of project construction. Potential project-generated operational GHG emissions were estimated for area sources (landscape maintenance), energy sources (natural gas and electricity), mobile sources, solid waste, water supply and wastewater treatment, and other sources of emissions (off-road equipment and yard trucks). Emissions from each category are discussed in the following text with respect to the project. For additional details, see Section 3.3 for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (natural gas), and mobile sources.

### Area Sources

CalEEMod was used to estimate GHG emissions from the project's area sources, which include operation of gasoline-powered landscape maintenance equipment, which produce minimal GHG emissions. See Section 3.3 for a discussion of landscaping equipment emissions calculations. Consumer product use and architectural coatings result in VOC emissions, which are analyzed in air quality analysis only, and little to no GHG emissions.

### Energy

The estimation of operational energy emissions was based on CalEEMod land use defaults and units or total area (i.e., square footage) of the project's land uses. The energy use (electricity or natural gas usage per square foot per year) from nonresidential land uses is calculated in CalEEMod based on the California Commercial End-Use Survey database. Emissions are calculated by multiplying the energy use by the utility carbon intensity (pounds of GHGs per kilowatt-hour for electricity or 1,000 British thermal units for natural gas) for $CO_2$ and other GHGs. Annual natural gas and electricity emissions were estimated in CalEEMod using the emissions factors for SCE, which would be the energy provider for the project site.

The current version of CalEEMod assumes compliance with the 2019 Title 24 Building Energy Efficiency Standards (CAPCOA 2021); however, the project would be required to comply with the 2022 Title 24 Standards at a minimum.

CalEEMod default energy intensity factors ($CO_2$, methane, and nitrous oxide mass emissions per kilowatt-hour) for SCE is based on the value for SCE's energy mix in 2021. SB X1 2 established a target of 33% of energy from renewable energy sources for all electricity providers in California by 2020 and SB 100 calls for further development of renewable energy, with a target of 44% by 2024, 52% by 2027, and 60% by 2030.

### Mobile Sources

All details for criteria air pollutants discussed in Section 3.3 are also applicable for the estimation of operational mobile source GHG emissions. In summary, emissions associated with passenger vehicles and heavy-duty trucks traveling to and from the project site were estimated for the project using CARB EMFAC2017 vehicle emissions factors within the CalEEMod.

Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other

vehicles determined by CARB to be vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the National Highway Traffic Safety Administration and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the project's motor vehicles. The effectiveness of fuel economy improvements was evaluated by using the EMFAC2017 emission factors in CalEEMod to the extent it was captured for motor vehicles in 2026 and 2030 for the project.

### Solid Waste

The project would generate solid waste, and therefore, result in $CO_2e$ emissions associated with landfill off-gassing. CalEEMod default values for solid waste generation were used to estimate GHG emissions associated with solid waste for the project.

### Water and Wastewater Treatment

Supply, conveyance, treatment, and distribution of water for the project require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the project requires the use of electricity for conveyance and treatment, along with GHG emissions generated during wastewater treatment. The indoor and outdoor water use and electricity consumption from water use and wastewater generation were estimated using CalEEMod default values for the project.

Operation of the project would generate GHG emissions through motor vehicle trips; landscape maintenance equipment operation (area source); energy use (natural gas and electricity); solid waste disposal; water supply, treatment, and distribution and wastewater treatment; and other sources of emissions (off-road equipment). CalEEMod was used to calculate the annual GHG emissions based on the operational assumptions described in Section 3.3. The estimated operational project-generated GHG emissions are shown in Table 3.8-2.

**Table 3.8-2. Estimated Annual Operational GHG Emissions**

| Emission Source | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2e$ |
|---|---|---|---|---|
| | Metric Tons per Year | | | |
| **Emergency Department** | | | | |
| Area | 0.00 | 0.00 | 0.00 | 0.00 |
| Energy | 162.38 | 0.01 | 0.00 | 163.27 |
| Mobile | 256.78 | 0.02 | 0.01 | 260.49 |
| Solid waste | 48.87 | 2.89 | 0.00 | 121.06 |
| Water supply and wastewater | 8.40 | 0.09 | 0.00 | 11.35 |
| | | | *Subtotal* | *556.18* |
| **Medical Office Building** | | | | |
| Area | 0.00 | 0.00 | 0.00 | 0.00 |
| Energy | 93.30 | 0.01 | 0.00 | 93.79 |
| Mobile | 763.03 | 0.05 | 0.04 | 774.87 |
| Solid waste | 72.35 | 4.28 | 0.00 | 179.23 |

## Table 3.8-2. Estimated Annual Operational GHG Emissions

| Emission Source | $CO_2$ | $CH_4$ | $N_2O$ | $CO_2e$ |
|---|---|---|---|---|
| | Metric Tons per Year | | | |
| Water supply and wastewater | 12.43 | 0.14 | 0.00 | 16.81 |
| | | | *Subtotal* | *1,064.71* |
| | | | **Total** | **1,620.89** |
| | | | *Amortized construction emissions* | *20.08* |
| | | | **Total operational + amortized construction GHGs** | **1,640.97** |

**Notes:** GHG = greenhouse gas; $CO_2$ = carbon dioxide; $CH_4$ = methane; $N_2O$ = nitrous oxide; $CO_2e$ = carbon dioxide equivalent.
See Appendix C for complete results.
Totals may not sum due to rounding.

As shown in Table 3.8-2, estimated annual project-generated GHG emissions would be approximately 1,621 MT $CO_2e$ per year as a result of project operations only. After accounting for amortized project construction emissions, total GHGs generated by the project would be approximately 1,642 MT $CO_2e$ per year. As such, annual operational GHG emissions with amortized construction emissions would not exceed the SCAQMD threshold of 3,000 MT $CO_2e$ per year. Impacts would be less than significant.

*b) Would the project generate conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?*

On May 7, 2020, SCAG's Regional Council adopted Connect SoCal (2020–2045 Regional Transportation Plan/Sustainable Communities Strategy) for federal transportation conformity purposes only. The Regional Council approved the Connect SoCal in its entirety on September 3, 2020.

Connect SoCal is a long-range visioning plan that builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. It charts a path toward a more mobile, sustainable and prosperous region by making connections between transportation networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians. Because the project is not growth inducing, this type of consistency analysis does not apply. However, the major goals of the Connect SoCal are outlined in Table 3.8-3, along with the project's consistency with them.

## Table 3.8-3. Project Consistency with the SCAG Connect SoCal RTP/SCS

| RTP/SCS Measure | Project Consistency |
|---|---|
| Encourage regional economic prosperity and global competitiveness. | *Consistent.* The project would bring up to 105 jobs to the City. |
| Improve mobility, accessibility, reliability, and travel safety for people and goods. | *Does not apply.* The project involves a medical facility and does not concern the movement of people or goods. |
| Enhance the preservation, security, and resilience of the regional transportation system. | *Does not apply.* The project would not inhibit SCAG from enhancing the resilience of the regional transportation system. |
| Increase person and goods movement and travel choices within the transportation system. | *Does not apply.* The project involves a medical facility and does not concern the movement of people or goods. |
| Reduce greenhouse gas emissions and improve air quality. | *Inconsistent*. The project would result in criteria air pollutant and GHG emissions during construction and operation. |

**Table 3.8-3. Project Consistency with the SCAG Connect SoCal RTP/SCS**

| RTP/SCS Measure | Project Consistency |
|---|---|
| Support healthy and equitable communities. | *Consistent.* The project involves the expansion of a medical facility, thus contributing to community health. |
| Adapt to a changing climate and support an integrated regional development pattern and transportation network. | *Does not apply*. The project would not inhibit SCAG from adapting to a changing climate and supporting an integrated regional development pattern and transportation network. |
| Leverage new transportation technologies and data-driven solutions that result in more efficient travel. | *Does not apply.* The project would not inhibit SCAG from leveraging technology for the transportation system. |
| Encourage development of diverse housing types in areas that are supported by multiple transportation options. | *Does not apply.* The project would not inhibit SCAG from encouraging development of diverse housing types. |
| Promote conservation of natural and agricultural lands and restoration of habitats. | *Consistent*. The project would not impact natural lands during construction or operation. |

**Source:** SCAG 2020.
**Note:** SCAG = Southern California Association of Governments; RTP/SCS = Regional Transportation Plan and Sustainable Communities Strategy; GHG = greenhouse gas.

As shown in Table 3.8-3, the project would be consistent with most applicable measures within the SCAG Connect SoCal RTP/SCS.

### Consistency with the California Air Resources Board's Scoping Plan

The Scoping Plan (approved by CARB in 2008 and updated in 2014 and 2017) provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. The Scoping Plan is not directly applicable to specific projects, nor is it intended to be used for project-level evaluations.[4] Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-global warming potential GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32 and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. Table 3.8-4 highlights measures that have been, or will be, developed under the 2008 Scoping Plan and presents the project's consistency with Scoping Plan measures. The project would comply with all regulations adopted in furtherance of the Scoping Plan to the extent required by law and to the extent that they are applicable to the project.

[4] The Final Statement of Reasons for the amendments to the State CEQA Guidelines reiterates the statement in the Initial Statement of Reasons that "[t]he Scoping Plan may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (CNRA 2009).

## Table 3.8-4. Project Consistency with 2008 Scoping Plan GHG Emission Reduction Strategies

| Scoping Plan Measure | Measure Number | Project Potential to Conflict |
|---|---|---|
| **Transportation Sector** | | |
| Advanced Clean Cars | T-1 | *No conflict.* The project's employees and visitors would purchase vehicles in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase. |
| Low Carbon Fuel Standard | T-2 | *Not applicable.* This is a statewide measure that cannot be implemented by a project applicant or lead agency. Nonetheless, this standard would be applicable to the fuel used by vehicles that would access the project site (i.e., motor vehicles driven by the project's employees and visitors and heavy-duty trucks would use compliant fuels). |
| Regional Transportation-Related GHG Targets | T-3 | *Not applicable.* The project is not related to developing GHG emission reduction targets. To meet the goals of SB 375, the 2016-2040 RTP/SCS is applicable to the project. The project would not preclude the implementation of this strategy. |
| Advanced Clean Transit | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Last-Mile Delivery | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Reduction in VMT | N/A | *No conflict.* The project would not prevent CARB from implementing this measure. |
| Vehicle Efficiency Measures<br>1. Tire Pressure<br>2. Fuel Efficiency Tire Program<br>3. Low-Friction Oil<br>4. Solar-Reflective Automotive Paint and Window Glazing | T-4 | *No conflict.* These standards would be applicable to the light-duty vehicles that would access the project site. Motor vehicles driven by the project's employees and visitors would maintain proper tire pressure when their vehicles are serviced. The project's employees and visitors would replace tires in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase. Motor vehicles driven by the project's employees and visitors would use low-friction oils when their vehicles are serviced. The project's employees and visitors would purchase vehicles in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase. In addition, the project would not prevent CARB from implementing this measure. |
| Ship Electrification at Ports (Shore Power) | T-5 | *Not applicable.* The project is not within a Port District and the project would not prevent CARB from implementing this measure. |
| Goods Movement Efficiency Measures<br>1. Port Drayage Trucks<br>2. Transport Refrigeration Units Cold Storage Prohibition | T-6 | *Not applicable.* The project involves a medical facility and does not concern ports, TRUs, cargo, ships, or the movement of goods. |

## Table 3.8-4. Project Consistency with 2008 Scoping Plan GHG Emission Reduction Strategies

| Scoping Plan Measure | Measure Number | Project Potential to Conflict |
|---|---|---|
| 3. Cargo Handling Equipment, Anti-Idling, Hybrid, Electrification<br>4. Goods Movement Systemwide Efficiency Improvements<br>5. Commercial Harbor Craft Maintenance and Design Efficiency<br>6. Clean Ships<br>7. Vessel Speed Reduction | | |
| Heavy-Duty Vehicle GHG Emission Reduction<br>▪ Tractor-Trailer GHG Regulation<br>▪ Heavy-Duty Greenhouse Gas Standards for New Vehicle and Engines (Phase I) | T-7 | *No conflict.* Heavy-duty vehicles would be required to comply with CARB GHG reduction measures. In addition, the project would not prevent CARB from implementing this measure. |
| Medium- and Heavy-Duty Vehicle Hybridization Voucher Incentive project | T-8 | *No conflict.* The project medium- and heavy-duty vehicles (e.g., delivery trucks) could take advantage of the vehicle hybridization action, which would reduce GHG emissions through increased fuel efficiency. In addition, the project would not prevent CARB from implementing this measure. |
| Medium and Heavy-Duty GHG Phase II | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| High-Speed Rail | T-9 | *Not applicable.* The project does not include rail and would not prevent CARB from implementing this measure. |
| **Electricity and Natural Gas Sector** | | |
| Energy Efficiency Measures (Electricity) | E-1 | *No conflict.* The project would comply with the current Title 24 Building Energy Efficiency Standards. In addition, the project would not prevent CARB from implementing this measure. |
| Energy Efficiency (Natural Gas) | CR-1 | *No conflict.* The project would comply with the current Title 24 Building Energy Efficiency Standards. In addition, the project would not prevent CARB from implementing this measure. |
| Solar Water Heating (California Solar Initiative Thermal Program) | CR-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Combined Heat and Power | E-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Renewables Portfolio Standard (33% by 2020) | E-3 | *No conflict*. The electricity used by the project would benefit from reduced GHG emissions resulting from increased use of renewable energy sources. |
| Renewables Portfolio Standard (50% by 2050) | N/A | *No conflict*. The electricity used by the project would benefit from reduced GHG emissions resulting from increased use of renewable energy sources. |

## Table 3.8-4. Project Consistency with 2008 Scoping Plan GHG Emission Reduction Strategies

| Scoping Plan Measure | Measure Number | Project Potential to Conflict |
|---|---|---|
| SB 1 Million Solar Roofs (California Solar Initiative, New Solar Home Partnership, Public Utility Programs) and Earlier Solar Programs | E-4 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| **Water Sector** | | |
| Water Use Efficiency | W-1 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Water Recycling | W-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Water System Energy Efficiency | W-3 | *Not applicable.* This is applicable for the transmission and treatment of water, but it is not applicable for the project. The project would not prevent CARB from implementing this measure. |
| Reuse Urban Runoff | W-4 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Renewable Energy Production | W-5 | *Not applicable.* Applicable for wastewater treatment systems. In addition, the project would not prevent CARB from implementing this measure. |
| **Green Buildings** | | |
| State Green Building Initiative: Leading the Way with State Buildings (Greening New and Existing State Buildings) | GB-1 | *No conflict.* The project would be required to be constructed in compliance with state or local green building standards in effect at the time of building construction. |
| Green Building Standards Code (Greening New Public Schools, Residential and Commercial Buildings) | GB-1 | *No conflict*. The project's buildings would meet green building standards that are in effect at the time of design and construction. |
| Beyond Code: Voluntary Programs at the Local Level (Greening New Public Schools, Residential and Commercial Buildings) | GB-1 | *No conflict*. The project's buildings would meet green building standards that are in effect at the time of design and construction. |
| Greening Existing Buildings (Greening Existing Homes and Commercial Buildings) | GB-1 | *No conflict.* This is applicable for existing buildings only; it is not applicable for portions of the project except as future standards may become applicable to existing buildings. |
| **Industry Sector** | | |
| Energy Efficiency and Co-Benefits Audits for Large Industrial Sources | I-1 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Oil and Gas Extraction GHG Emission Reduction | I-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Reduce GHG Emissions by 20% in Oil Refinery Sector | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |

## Table 3.8-4. Project Consistency with 2008 Scoping Plan GHG Emission Reduction Strategies

| Scoping Plan Measure | Measure Number | Project Potential to Conflict |
|---|---|---|
| GHG Emissions Reduction from Natural Gas Transmission and Distribution | I-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Refinery Flare Recovery Process Improvements | I-4 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Work with the Local Air Districts to Evaluate Amendments to Their Existing Leak Detection and Repair Rules for Industrial Facilities to Include Methane Leaks | I-5 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| **Recycling and Waste Management Sector** | | |
| Landfill Methane Control Measure | RW-1 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Increasing the Efficiency of Landfill Methane Capture | RW-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Mandatory Commercial Recycling | RW-3 | *No conflict.* During both construction and operation of the project, the project would comply with all state regulations related to solid waste generation, storage, and disposal, including the California Integrated Waste Management Act, as amended. |
| Increase Production and Markets for Compost and Other Organics | RW-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Anaerobic/Aerobic Digestion | RW-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Extended Producer Responsibility | RW-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Environmentally Preferable Purchasing | RW-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| **Forests Sector** | | |
| Sustainable Forest Target | F-1 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| **High GWP Gases Sector** | | |
| Motor Vehicle Air Conditioning Systems: Reduction of Refrigerant Emissions from Non-Professional Servicing | H-1 | *No conflict.* The project's employees and visitors would be prohibited from performing air conditioning repairs and would be required to use professional servicing. |
| $SF_6$ Limits in Non-Utility and Non-Semiconductor Applications | H-2 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Reduction of Perfluorocarbons (PFCs) in Semiconductor Manufacturing | H-3 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Limit High GWP Use in Consumer Products | H-4 | *No conflict.* The project's employees and visitors would use consumer products that would comply with the regulations that are in effect at the time of manufacture. |

## Table 3.8-4. Project Consistency with 2008 Scoping Plan GHG Emission Reduction Strategies

| Scoping Plan Measure | Measure Number | Project Potential to Conflict |
|---|---|---|
| Air Conditioning Refrigerant Leak Test During Vehicle Smog Check | H-5 | *No conflict*. Motor vehicles driven by the project's employees and visitors would comply with the leak test requirements during smog checks. |
| Stationary Equipment Refrigerant Management Program – Refrigerant Tracking/Reporting/Repair Program | H-6 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| Stationary Equipment Refrigerant Management Program – Specifications for Commercial and Industrial Refrigeration | H-6 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| $SF_6$ Leak Reduction Gas Insulated Switchgear | H-6 | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| 40% Reduction in Methane and Hydrofluorocarbon (HFC) Emissions | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| 50% Reduction in Black Carbon Emissions | N/A | *Not applicable.* The project would not prevent CARB from implementing this measure. |
| **Agriculture Sector** | | |
| Methane Capture at Large Dairies | A-1 | *Not applicable.* The project would not prevent CARB from implementing this measure. |

**Notes:** GHG = greenhouse gas; CARB = California Air Resources Board; SB = Senate Bill; RTP/SCS = Regional Transportation Plan and Sustainable Communities Strategy; VMT = vehicle miles traveled; N/A = not applicable; $SF_6$ = sulfur hexafluoride.

Based on the analysis in Table 3.8-4, the project would not conflict with the applicable strategies and measures in the 2008 Scoping Plan.

The 2017 Scoping Plan Update reflects the 2030 target of a 40% reduction below 1990 levels codified by SB 32. Table 3.8-5 evaluates the project's potential to conflict with the 2017 Scoping Plan recommended actions.

## Table 3.8-5. Project Consistency with 2017 Scoping Plan Climate Change Policies and Measures

| Recommend Action Summary | Lead Agencies | Project Potential to Conflict |
|---|---|---|
| Implement SB 350 by 2030<br>▪ Increase Renewable Portfolio Standard<br>▪ Establish annual targets for statewide energy efficiency<br>▪ Reduce GHG emissions in the electricity sector | CPUC, CEC, CARB | *No conflict.* This action is directed towards policymakers and would not be directly applicable to the project. Nonetheless, the project would improve energy efficiency and reduce electricity-related GHG emissions when replacing older buildings and systems with newer, more efficient buildings and systems. |
| Implement Mobile Source Strategy (Cleaner Technology and Fuels)<br>▪ Increase zero emission and plug-in hybrid electric vehicles | CARB, CalSTA, SGC, Caltrans CEC, OPR, Local agencies | *No conflict.* The project's employees and visitors would operate vehicles that comply with applicable CARB regulations for cleaner technology and fuels. |

## Table 3.8-5. Project Consistency with 2017 Scoping Plan Climate Change Policies and Measures

| Recommend Action Summary | Lead Agencies | Project Potential to Conflict |
|---|---|---|
| ▪ Increase GHG stringency on light-duty vehicles beyond Advanced Clean Cars<br>▪ Medium- and heavy-duty GHG Phase II<br>▪ Innovative Clean Transit<br>▪ Last Mile Delivery<br>▪ Further reduce VMT through SB 375 and regional Sustainable Communities Strategy | | |
| Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets) | CARB | *No conflict.* This action is directed towards policymakers and would not be directly applicable to the project. |
| Adjust performance measures used to select and design transportation facilities by 2019 | CalSTA and SGC, OPR, CARB, GoBiz, IBank, DOF, CTC, Caltrans | *No conflict.* The action is directed towards CARB and Caltrans. |
| Develop pricing policies to support low-GHG transportation (e.g., low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts) by 2019 | CalSTA, Caltrans, CTC, OPR/SGC, CARB | *No conflict.* This action is directed towards policymakers and would not be directly applicable to the project. |
| Implement California Sustainable Freight Action Plan | CalSTA, CalEPA, CNRA, CARB, Caltrans, CEC, GoBiz | *No conflict.* The project would provide a regional hub for goods movement connecting the ports with the arterial goods distribution system. |
| Adopt a Low Carbon Fuel Standard with a carbon intensity reduction of 18% | CARB | *No conflict.* This action is directed towards CARB and would not be directly applicable to the project. In addition, the project would not result in an increase in operational vehicle trips. |
| Implement the Short-Lived Climate Pollutant Strategy by 2030 | CARB, CalRecycle, CDFA, SWRCB, Local air districts | *No conflict.* The project would be required to comply with the Short-Lived Climate Pollutant Strategy to the extent it is applicable. |
| Develop regulations and programs to support organic waste landfill reduction goals in the Short-Lived Climate Pollutant Strategy and SB 1383 by 2019 | CARB, CalRecycle, CDFA, SWRCB, Local air districts | *No conflict.* This action is not within the purview of this project. |
| Implement the post-2020 Cap-and-Trade Program with declining annual caps | CARB | *No conflict.* The project is not subject to the California Cap-and-Trade Program. |
| Develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink by 2018 | CNRA and departments within, CDFA, CalEPA, CARB | *No conflict.* This action is not within the purview of this project. In addition, the project would not result in land use conversion that would reduce carbon storage. |
| Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018 | CARB | *No conflict.* This action is not within the purview of this project. |

**Table 3.8-5. Project Consistency with 2017 Scoping Plan Climate Change Policies and Measures**

| Recommend Action Summary | Lead Agencies | Project Potential to Conflict |
|---|---|---|
| Implement Forest Carbon Plan | CNRA, CAL FIRE, CalEPA and departments within | *No conflict.* This action is not within the purview of this project. In addition, the project components are located within developed urban areas and would not affect forested areas. |
| Identify and expand funding and financing mechanisms to support GHG reductions across all sectors. | State Agencies and Local Agencies | *No conflict.* This action is not within the purview of this project. |

**Source:** CARB 2017a.
**Notes:** SB = Senate Bill; GHG = greenhouse gas; CPUC = California Public Utilities Commission; CEC = California Energy Commission; CARB = California Air Resources Board; VMT = vehicle miles traveled; CalSTA = California State Transportation Agency; SGC = Strategic Growth Council; Caltrans = California Department of Transportation; OPR = Governor's Office of Planning and Research; GoBiz = Governor's Office of Business and Economic Development; IBank = California Infrastructure Economic Development Bank; DOF = Department of Finance; CTC = California Transportation Commission; CalEPA = California Environmental Protection Agency; CNRA = California Natural Resources Agency; CalRecycle = California Department of Resources Recycling and Recovery; CDFA = California Department of Food and Agriculture; SWRCB = State Water Resources Control Board; CAL FIRE = California Department of Forestry and Fire Protection.

Based on the analysis in Table 3.8-5, the project would not conflict with the applicable climate change policies and measures in the 2017 Scoping Plan.

### Consistency with EO S-3-05 and SB 32

Less-than-Significant Impact. This section evaluates whether the GHG emissions trajectory after project completion would impede the attainment of the 2030 and 2050 GHG reduction goals identified in EOs B-30-15 and S-3-05.

**EO S-3-05.** This EO establishes the following goals: GHG emissions should be reduced to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050.

**SB 32.** This bill establishes for a statewide GHG emissions reduction target whereby CARB, in adopting rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions, shall ensure that statewide GHG emissions are reduced to at least 40% below 1990 levels by December 31, 2030.

CARB has expressed optimism with regard to both the 2030 and 2050 goals. It states in the First Update to the Climate Change Scoping Plan that "California is on track to meet the near-term 2020 GHG emissions limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). With regard to the 2050 target for reducing GHG emissions to 80% below 1990 levels, the First Update to the Climate Change Scoping Plan states the following (CARB 2014):

> This level of reduction is achievable in California. In fact, if California realizes the expected benefits of existing policy goals (such as 12,000 megawatts of renewable distributed generation by 2020, net zero energy homes after 2020, existing building retrofits under AB 758, and others) it could reduce emissions by 2030 to levels squarely in line with those

> needed in the developed world and to stay on track to reduce emissions to 80% below 1990 levels by 2050. Additional measures, including locally driven measures and those necessary to meet federal air quality standards in 2032, could lead to even greater emission reductions.

In other words, CARB believes that the state is on a trajectory to meet the 2030 and 2050 GHG reduction targets set forth in AB 32, EO B-30-15, and EO S-3-05. This is confirmed in the 2017 Scoping Plan, which states (CARB 2017a):

> The Scoping Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while identifying new, technologically feasible and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities.

As previously discussed, total project emissions, including operation and amortized construction, would not exceed the SCAQMD significance threshold of 3,000 MT $CO_2e$ per year. As such, the project (without mitigation) would not generate GHG emissions that may interfere with the implementation of GHG reduction goals for 2030 and 2050. Impacts would be less than significant.

# 3.9 Hazards and Hazardous Materials

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **IX. HAZARDS AND HAZARDOUS MATERIALS** – Would the project: | | | | |
| a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? | ☐ | ☒ | ☐ | ☐ |
| b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment? | ☐ | ☒ | ☐ | ☐ |
| c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school? | ☐ | ☐ | ☐ | ☒ |
| d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment? | ☐ | ☒ | ☐ | ☐ |

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area? | ☐ | ☐ | ☐ | ☒ |
| f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan? | ☐ | ☐ | ☒ | ☐ |

***a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?***

### Historical Project Site Uses

Prior to construction of the hospital, the project site was partially developed with apparent residential housing. Walnut Creek flowed through land where the hospital is now located. The surrounding areas were a mix of agricultural land and mixed-use development. Beginning in the 1960s, the main hospital site was a drive-in theater surrounded by a mix of residential and commercial properties. At this time, Walnut Creek was channelized to flow south of the project site, and the surrounding roadways were developed. The proposed MOB site was developed with the former Broken Horn Saddlery building in the 1970s, which remains to present day. The Broken Horn Saddlery operated until 2021; the building is now empty and the property unused. The proposed emergency department expansion area was a parking lot for a commercial site which adjoined the drive-in theater to the east until hospital development began in the early 1990s. The hospital was completed in the mid-1990s. The proposed emergency department expansion area is currently a concrete-paved sidewalk and landscaping on the southern side of the existing emergency department.

### Hazardous Material Sites

#### Cortese List Databases

Government Code Section 65962.5 requires the California Environmental Protection Agency (CalEPA) to develop a Cortese List that is updated at least annually. While the CalEPA no longer maintains a single Cortese List, CalEPA uses the following databases and lists to meet the requirements of Government Code Section 65962.5.

1. List of Hazardous Waste and Substances sites from Department of Toxic Substances Control (DTSC) EnviroStor database.
2. List of Leaking Underground Storage Tank Sites from the State Water Board's GeoTracker database.
3. List of solid waste disposal sites identified by State or Regional Water Board with waste constituents above hazardous waste levels outside the waste management unit.

4. List of "active" Cease and Desist Orders and Cleanup and Abatement Orders from State Water Board.
5. List of hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code, identified by DTSC.

A search of the above-listed online databases was conducted to identify Cortese List sites on or adjoining the project site, or those which could potentially impact the project site based on level of contamination, proximity to the project site, and other environmental conditions. The project site was not identified in any of the Cortese List databases. One State Response Site was identified in the vicinity of the project site, the impacts of which overlap the project site. Area 2 of the San Gabriel Valley Superfund Site, known as "Baldwin Park Operating Unit (OU)" is an area of groundwater contamination that is more than 8 miles long and 1 mile wide, covering portions of the cities of Azusa, Irwindale, Baldwin Park, and West Covina. The contamination plume has been caused by multiple, commingled groundwater contamination plumes from multiple sources. Generally, groundwater depths are between 150 and 350 feet below ground surface within the plume area. Contaminants of concern (COCs) are trichloroethene (TCE), tetrachloroethene (PCE), carbon tetrachloride, perchlorate, n-nitrosodimethylamine (NDMA), and 1,4-dioxane. The Baldwin Park OU is undergoing large-scale groundwater extraction and treatment (pump-and-treat) operated by local water utilities to provide clean water to local users. The project site lies within the boundaries of Baldwin Park OU, and therefore groundwater beneath the site contains the COCs discussed above.

While clean water is provided to the project site by the City of Baldwin Park, the underlying groundwater contamination plume contains volatile organic compounds (VOCs) which can volatilize and have the potential to impact soil gas beneath the project site. This can also cause vapor intrusion into buildings constructed on the project site.

### Non-Cortese List Databases

In addition to Cortese List sites, there are hazardous material sites that do not meet the definition of a Cortese List site but still have hazardous material impacts such that they could be impacted by construction or operation of the proposed project. These may include voluntary cleanup sites or military cleanup sites. These are referred to herein as "non-Cortese List hazardous material sites". A search was conducted to identify non-Cortese List hazardous material sites on or adjoining the project site, or those which could potentially impact the project site, based on level of contamination, proximity to the project site, and other environmental conditions.

Multiple sites were identified and reviewed within approximately one mile of the project site. Based on the type of contamination, regulatory status, and/or distance from the project site, none of these sites were determined likely to have impacted the environmental condition of the project site, and as such, the project would not impact contamination related to these sites.

### Oil and Gas

The California Department of Conservation's Geologic Energy Management Division well finder database (CalGEM 2022) and the National Pipeline Mapping System (NPMS 2022) petroleum and hazardous material pipeline database were reviewed to identify oil and gas production and transportation features on or adjoining the project site. There are no oil and gas wells on or within one mile of the project site, nor is

the project site located within an active oil and gas field. There are no hazardous material or gas transmission pipelines located within one mile of the project site.

## Previous Environmental Investigations

### Medical Office Building

A Phase I Environmental Site Assessment (ESA) and Phase II ESA were completed on the proposed MOB portion of the project site in 2021 (Appendix D, Phases I and II Environmental Site Assessment). The Phase I ESA identified the Baldwin Park OU as a recognized environmental condition (REC) and potential vapor encroachment condition (VEC) and recommended an evaluation of subsurface conditions, which led to completion of the Phase II ESA. During the Phase II ESA, samples were collected from on-site soils, soil gas, sub-slab soil gas, indoor air, and groundwater. The samples were analyzed for the COCs identified in the Baldwin Park OU (VOCs) and the sample results were compared to regulatory screening levels. The following findings were reported:

- Soil samples did not contain concentrations of COCs above residential Environmental Screening Levels (ESLs),[5] nor did they contain arsenic above naturally occurring background levels.
- Groundwater, which was encountered at a depth of approximately 120 feet below ground surface and had a west-northwest flow direction, contained concentrations of perchlorate and 1,4-dioxane above regulatory screening levels for drinking water (California's Public Health Goal [PHG] and US EPA Maximum Contaminant Level [MCL]) in at least one of the collected samples.
- Soil gas samples collected from the parking lot contained concentrations of multiple VOCs above ESLs for residential land use, but below ESLs for commercial land use.
- Sub-slab soil gas samples collected from beneath the buildings identified PCE and TCE concentrations above residential and commercial ESLs at one sample location.
- Indoor air samples collected from inside the buildings identified multiple VOCs, including TCE, above residential and/or commercial ESLs.

### Emergency Department Expansion

A soil gas investigation was also conducted on the proposed emergency department expansion portion of the project site (Appendix E, Soil Vapor Sampling Report). During this investigation, soil gas samples were collected at two depths (five -feet and 20 feet below ground surface) from eight separate soil boring locations within the footprint of the proposed emergency department expansion. Multiple VOCs were identified in soil gas at both depths. The COCs identified were similar to those identified at the MOB site. Detected concentrations of VOCs were compared to current regulatory screening levels, as follows:

- DTSC-SLs[6] for Commercial/Industrial Indoor Air with an attenuation factor (AF)[7] of 0.0005 for new commercial construction.[8]

5 San Francisco Regional Water Quality Control Board Environmental Screening Levels (ESLs), 2019.
6 Department of Toxic Substances Control Screening Levels, 2020. (DTSC 2020).
7 Attenuation factor is the assumed ratio of the indoor air concentration to the soil gas concentration.
8 This attenuation factor is published in the Department of Toxic Substances Control Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance), published October 2011.(DTSC and CalEPA 2011b).

- EPA Regional Screening Levels (RSLs)[9] for Commercial/Industrial Indoor Air with an AF of 0.0005 for new commercial construction[5]. EPA RSLs were used where DTSC-SLs were not available.
- Dudek also evaluated DTSC-SLs for Commercial/Industrial Indoor Air with an AF of 0.03. The 2022 DTSC Vapor Intrusion Advisory (DTSC 2022) states that an "AF of 0.03 can be used for the initial evaluation of the potential for vapors to enter a building." These screening levels are similar to ESLs (used by Terracon at the MOB site and developed using an AF of 0.03). The AF of 0.03, originally published by the US EPA, is based on several conditions that do not generally apply to new commercial construction in southern California. The San Francisco Regional Water Quality Control Board (RWQCB), who published the ESLs, also states ESLs are not intended to establish policy or regulation but are intended to help expedite and evaluate potential environmental concerns at contaminated sites.

None of the VOCs detected in soil gas at the proposed emergency department expansion were above commercial DTSC-SLs or EPA RSLs (AF 0.0005). Four VOCs, benzene, bromodichloromethane, chloroform, and vinyl chloride, were detected at concentrations above DTSC-SLs (AF 0.03) and ESLs.

As part of the soil gas investigation, Dudek also conducted a brief evaluation of human health risk using the highest detected concentration of each COC beneath the proposed emergency department expansion. Dudek evaluated both the current regulatory screening levels (DTSC-SLs and RSLs with AF 0.0005) and guidance screening levels (DTSC-SLs with AF 0.03 and ESLs).

- Using current commercial screening levels (DTSC-SLs and RSLs with AF 0.0005), the total estimated cancer risk is less than $1x10^{-6}$, or one in one million, and the hazard index (for non-cancer risks) is less than 1. This is considered an acceptable risk for unrestricted land use.
- Using the guidance levels (DTSC-SLs with AF 0.03 and ESLs), the total estimated cancer risk is between $1x10^{6}$ and $1x10^{4}$, and the hazard index is less than 1. This is within the risk management range, where potential responses can be evaluated on a case-by-case basis and may include no response (DTSC and RWQCB, 2020).

### Summary of Previous Environmental Investigations

In summary, VOCs were identified in soil gas in both the proposed MOB and proposed emergency department expansion portions of the project site. Concentrations of VOCs were identified at the proposed MOB above residential ESLs (regulatory guidance levels), but below commercial ESLs (except for PCE and TCE in sub-slab soil gas in one location). Concentrations of VOCs were identified at the proposed emergency department expansion above commercial ESLs, which are inherently above residential ESLs. As the proposed project includes a medical care center, residential ESLs will be used to evaluate vapor intrusion risk to protect potential sensitive receptors.

### On-Site Hazardous Materials

The hospital has permitted storage and use of hazardous materials on site associated with hospital operations, including a diesel underground storage tank (UST). Other hazardous materials include compressed gases, propane, acids, bases, and antibacterials (CalEPA 2022). These chemicals are not used

9 U.S. Environmental Protection Agency Regional Screening Levels, 2015. (USEPA 2015).

or stored on the project site areas proposed for development. The Los Angeles County Fire Department is the local Certified Unified Program Agency (CUPA) responsible for permitting, inspecting, and regulating hazardous material use and storage on the project site.

The Broken Horn buildings were constructed in the 1970s, prior to bans on hazardous building materials such as asbestos and lead-based paints. The EPA released a partial ban on asbestos-containing materials in 1989, but a full ban on the use and marketing of asbestos-containing materials did not occur until April 2019. The United States also banned lead-based paint for use in housing in 1978; however, lead-based paint use in commercial structures was not included in this ban. Based on the age of the Broken Horn buildings, there is a potential for asbestos-containing materials (ACMs) and lead-based paints (LBP) to be present in site structures. In addition, universal waste items containing hazardous materials (e.g., polychlorinated biphenyls and mercury) may also be present.

**Construction.** Construction of the Project would include demolition of the existing buildings and hardscape at the MOB. Based on the age of the structures, there is a potential for asbestos-containing materials, lead-based paints, and other hazardous building materials to be present in the existing buildings. This is further discussed in the Phase I ESA prepared for the Broken Horn Property (Appendix D). Hazardous building materials could include mercury thermometers and switches, fluorescent bulbs, and polychlorinated biphenyl (PCB)-containing ballasts. Demolition of the buildings and transportation and disposal of the building materials could cause a release to the environment if they are present in the existing buildings, resulting in a potentially significant impact absent mitigation. All projects that involve commercial or industrial building renovations are required to comply with applicable federal, state, and local requirements, as summarized below.

1. For asbestos: South Coast Air Quality Management District (SCAQMD) Rule 1403; Cal/OSHA Asbestos and Carcinogen Unit; California Department of Public Health; California Department of Resources, Recycling, and Recovery (CalRecycle); and EPA National Emission Standards for Hazardous Air Pollutants (NESHAP).
2. For lead: California Labor Code Sections 6716 to 6717; CCR, Title 8, Section 1532.1 et seq.; CCR, Title 17, Section 35001 et seq.; Los Angeles County Environmental Health Lead Program; and EPA Lead Renovation, Repair, and Painting Rule
3. For universal wastes: DTSC universal waste rules; CalRecycle; and EPA Solid Waste Rules (40 CFR Part 273)

Because lead and hazardous building materials surveys are not explicitly required by law prior to demolition of a building, a survey will be required in accordance with **MM-HAZ-1** as stated below. Hazardous building materials identified in the survey will be managed in accordance with the rules and regulations outlined above. Demolition debris that contains hazardous materials would be segregated and disposed of or recycled off site. Transportation and disposal of these materials would be done in accordance with federal, state, and local laws and regulations. Material disposal and recycling would be completed at the closest available facilities to reduce travel times and distances.

Hazardous materials that may be used during construction and demolition activities of the proposed project include gasoline, diesel fuel, oil, lubricants, grease, welding gases (e.g., acetylene, oxygen, and argon), solvents, and paints. These materials would be used and stored in designated construction staging areas

within the boundaries of the Project site and would be transported, handled, and disposed of in accordance with all applicable federal, state, and local laws and regulations. The use of these materials for their intended purpose would not pose a significant risk to the public or environment. Hazardous wastes accumulated during Project construction may include unused or off-specification paint and primer, paint thinner, solvents, and vehicle- and equipment-maintenance-related materials, many of which can be recycled. Empty containers for such materials (e.g., drums and totes) may also be returned to vendors, if possible. Hazardous waste that cannot be recycled would be transported by a licensed hazardous waste hauler using a Uniform Hazardous Waste Manifest and disposed of at an appropriately permitted facility. The use of these substances is subject to applicable federal, state, and local health and safety laws and regulations that are intended to minimize health risk to the public associated with hazardous materials.

During construction, if hazardous materials and/or petroleum products are stored on the Project site above applicable regulatory thresholds, the applicable documents and plans will be submitted accordingly. These thresholds include those outlined in the Hazardous Material Business Plan rules (California Health and Safety Code, Division 20, Chapter 6.95, Article 1; 19 CCR, Division 2, Chapter 4) and Spill Prevention, Control, and Countermeasure Plan rules (SPCC; 40 CFR, Chapter 1, Subchapter D, Part 112). Appropriate plans would be prepared as required by regulation and submitted as required to the local Certified Unified Program Agency, which for the Project site is the LACoFD and kept on site through construction of the Project (SPCC Plans are not submitted to a regulatory agency). BMPs and spill prevention and response procedures required by these rules would be implemented.

**Operation.** Operation of the Project would not significantly increase or change existing operations that include the use of hazardous materials. The MOB would be an office building; hazardous material use would be limited to household and commercially available cleaning and maintenance products. The emergency department expansion would not increase the number of beds, and therefore would not likely significantly increase the use of existing hazardous materials, such as antibacterial products and compressed gasses, as discussed in the On-Site Hazardous Materials section above. Any additional hazardous materials would be added to existing permits and plans, in accordance with state and local rules and regulations (California Health and Safety Code, Division 20, Chapter 6.95, Sections 25500-25520; California Health and Safety Code, Division 20, Chapter 6.11, Sections 25404-25404.9).

MM-HAZ-1 Pre-Demolition Hazardous Materials Abatement. Demolition or renovation plans and contract specifications shall incorporate abatement procedures for the survey and removal of materials containing asbestos, lead, polychlorinated biphenyls, hazardous materials, hazardous wastes, and universal waste items. All abatement work shall be done in accordance with federal, state, and local regulations, including those of the U.S. Environmental Protection Agency (which regulates disposal), Occupational Safety and Health Administration, U.S. Department of Housing and Urban Development, California Occupational Safety and Health Administration (which regulates employee exposure), and the South Coast Air Quality Management District.

With MM-HAZ-1 implemented, potential impacts would be reduced to less than significant with mitigation incorporated.

*b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?*

**Construction.** As discussed in subsection (a) above, demolition of the buildings could cause a release of hazardous materials to the environment, including asbestos, lead, and other hazardous building materials. **MM-HAZ-1** requires a survey for hazardous building materials and lead-based paints, and state and local regulations require the survey for and abatement of asbestos and abatement of lead-based paints and other hazardous building materials. These hazardous building materials would be identified, removed, and disposed of in a matter that no longer creates a risk of potential upset or accident condition.

As discussed under Previous Environmental Investigations in subsection (a) above, two investigations have been conducted on the project site, a Phase II ESA on the MOB and a soil gas investigation on the emergency department expansion area. Both investigations identified COCs in soil gas, which could be released into the environment during earthmoving activities such as trenching, excavation, or grading, resulting in a potentially significant impact absent mitigation. This contaminated soil gas could impact the breathing zone for construction, excavation, and utility workers within the project area. **MM-HAZ-2** below requires a health and safety plan be prepared and implemented during earthwork activities which will include breathing zone monitoring and action levels to protect workers.

In addition, as discussed in subsection (a), hazardous materials handled during construction in reportable quantities would be reported, permitted, and handled in accordance with applicable local and state laws and regulations. These permits and associated material handling, control, and spill countermeasure plans are designed to prevent releases of hazardous materials, and how to immediately respond to and contain a hazardous material release, should it occur. Hazardous materials required for construction would not be handled on site in such quantities that a reasonably foreseeable upset or accident condition would likely occur.

**Operation.** The VOC-impacted soil gas has the potential to cause vapor intrusion into buildings, which could impact on-site hospital workers, visitors, and patients. The applicant has included in the project design the installation of sub-slab barriers, as presented in Section 2.3, Project Characteristics. As such, any risk of vapor intrusion from sub-slab soil gas would remain less than significant.

As discussed in the *Previous Environmental Investigations* section, identified concentrations are above current published guidance levels (DTSC-SLs with AF of 0.03 and ESLs). Further, indoor air sampling conducted in the proposed MOB portion of the project site in 2021 indicated that VOCs, including TCE, were present in the indoor air at concentrations above regulatory screening levels and guidance levels.

MM-HAZ-2 Health and Safety Plan. Any work conducted on the project site that includes excavation, grading, trenching, or other subsurface work shall implement a health and safety plan to protect on-site workers from potential exposure to VOC-contaminated subsurface soil gas. The health and safety plan shall include periodic work breathing zone monitoring for VOCs at least once every 15 to 30 minutes during active soil disturbing activities using an organic vapor analyzer (photoionization detector or similar). The health and safety plan shall include air monitoring action levels and actions to be taken if vapor concentrations approach or exceed action levels. The contractor or their designee shall implement the health and safety plan during any soil disturbing activities, to the satisfaction of the City of Baldwin Park Community Development Department.

With implementation of **MM-HAZ-2**, impacts associated with foreseeable upset or accident conditions causing release of hazardous materials would be reduced to less than significant with mitigation incorporated.

*c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?*

There are no existing or proposed schools located within 0.25 miles of the project site. As such, the project would not emit hazardous emissions or handle hazardous materials near a school, and **no impact** would occur.

*d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?*

While the project site is not located on a Cortese List site, it is located within the boundaries of the groundwater contamination plume associated with the Baldwin Park OU of the San Gabriel Valley Superfund Site. As discussed under *Cortese List Databases* in subsection (a), the underlying groundwater contamination plume has the potential to impact soil gas beneath the project site. As the COCs associated with this plume are VOCs, this can cause vapor intrusion into excavations during construction, and into buildings operated on the project site.

As discussed under Threshold (b), **MM-HAZ-2** and the installation of sub-slab barriers would protect on-site construction workers and occupants of future structures, respectively. As such, impacts related to a Cortese List site would be reduced to less than significant with mitigation incorporated.

*e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?*

The project site is not located within two miles of a public use airport, nor is it located within an airport land use planning area. The San Gabriel Valley Airport is located approximately 2.8 miles west-northwest of the project site in the City of El Monte. Based on the Airport Layout Plan Drawing Set (AECOM 2016), the airport influence areas, including conical surfaces and noise contours, do not overlap the project site. However, based on the project site location and an assumed building height of 30 feet above ground surface, the project site "is in proximity to a navigation facility and may impact the assurance of navigation signal reception." As such, FAA requests filing the "Notice of Proposed Construction" under 14 CFR 77.9, "Construction or alteration requiring notice." In accordance with 14 CFR 77.7, FAA Form 7460-1 shall be completed and submitted at least 45 days before start of proposed construction, or the date the construction permit application is filed, whichever is earlier. Construction would proceed once a "Determination of No Hazard to Air Navigation" is received from the FAA. With adherence to federal rules and regulations, **no impact** would occur.

*f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?*

Construction and operation would occur entirely within the project site footprint, with the exception of off-site improvements (Figure 3, Off-Site Improvements). Off-site improvements include new ADA compliant

driveways and ramps along the north side of Baldwin Park Boulevard, new sidewalks and replacement of damaged trees along Baldwin Park Boulevard and Leorita Street, and refurbishment of truncated domes along Dalewood Street. While road closures are not anticipated, any road closures or traffic reductions would require a permit through the City of Baldwin Park and/or Caltrans, depending on the jurisdictional authority of the road. As such, emergency evacuation needs would be evaluated and proper traffic control measures would be permitted to ensure no significant impacts with potential emergency needs.

The project would include the expansion of the existing emergency department. The existing emergency department would remain open during project construction and project construction would not be expected to substantially change the overall capacity of the emergency department in the case of an emergency. Once the project is operational the emergency department would increase the capacity to service the City during an emergency. Additionally, the project would comply with all applicable policies that are identified in the City's General Plan Safety Element. The project would be consistent with all Safety Element policies and would not impair the implementation of any emergency response procedures, therefore impacts to an adopted emergency response or emergency evacuation plan would be less than significant.

***g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?***

California Department of Forestry and Fire Protection (CAL FIRE) has developed maps of wildfire severity zones, which are organized by county. Within each county, CAL FIRE identifies wildfire severity zones as well as responsibility areas, either state responsibility areas, within which CAL FIRE would respond, or local responsibility areas, within which the local fire department would respond. The project site is located within a local responsibility area and is also located within a non-Very High Fire Hazard Severity Zone (non-VHFHSZ). The local fire response agency at the project site would be the Los Angeles County Fire Department (LACoFD). The nearest station is Station 29, located at 14334 Los Angeles Street, approximately 2.2 miles northeast of the project site.

LACoFD is also the local CUPA for the project site and would be the permitting agency for hazardous materials and hazardous wastes used, stored, and generated at the project site. In addition, LACoFD would be first emergency responder for the project site, including hazardous material incidents. The nearest 24-hour hazardous materials unit would be Haz Mat 43, 921 South Stimson Avenue, La Puente.

As outlined in the Public Safety Element of the City of Baldwin Park 2020 General Plan (City of Baldwin Park 2020), major evacuation routes established near the project site are eastbound and westbound along San Bernardino Road, southbound along Baldwin Park Boulevard to Amar Road, and southbound Frazier Street to I-10.

Overall, the project is not anticipated to expose people or structures to wildfires, and a less than significant impact would occur.

# 3.10 Hydrology and Water Quality

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **X. HYDROLOGY AND WATER QUALITY** – Would the project: | | | | |
| a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality? | ☐ | ☐ | ☒ | ☐ |
| b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin? | ☐ | ☐ | ☒ | ☐ |
| c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: | | | | |
| i) result in substantial erosion or siltation on- or off-site; | ☐ | ☐ | ☒ | ☐ |
| ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off site; | ☐ | ☐ | ☒ | ☐ |
| iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or | ☐ | ☐ | ☒ | ☐ |
| iv) impede or redirect flood flows? | ☐ | ☐ | ☒ | ☐ |
| d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation? | ☐ | ☐ | ☐ | ☒ |
| e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan? | ☐ | ☐ | ☐ | ☒ |

The following analysis is based on the Hydrology and Hydraulics Report prepared for the proposed project by Psomas and is included as Appendix F, Hydrology and Hydraulics Report.

*a) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?*

The project site is currently developed and consists of an existing medical campus and retail building. The project would include the demolition of the existing retail site, construction of a MOB, and emergency department expansion. Sources of polluted runoff could include, heavy metals, organic compounds, trash and debris, oxygen demanding substances, oil and grease, bacteria and viruses, pesticides, sediments, and nutrients could occur as a result of project uses. The proposed demolition, grading, and construction associated with the project could create additional sources of pollution which could potentially cause short term impacts to water quality. Impacts related to pollution form sedimentation would occur when soil would be exposed during project grading and construction. Once construction is complete, runoff would be conveyed to the City's storm drainage system.

Project construction activities would be subject to RWQCB requirements related to erosion control, sedimentation, and runoff prevention. Implementation of a SWPPP along with site-specific BMPs would ensure that the project achieves water quality standards with regard to its stormwater discharges off the site. Therefore, impacts would be less than significant.

*b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?*

The proposed project would include the expansion of an existing emergency department and the construction of a MOB. The project site currently consists of a medical campus and abandoned retail building. The project would not introduce new impervious surfaces to the project site and would not interfere with groundwater recharge. The project site is located within the San Gabriel Valley groundwater basin, which is designated as a very low priority (DWR 2022). As discussed in Section 3.19, Utilities and Service Systems, the San Gabriel Valley Water District is expected to adequately supply water for the project. The project would not require any additional groundwater extraction and would not deplete groundwater supplies. The project would not impede sustainable groundwater management and impacts would be less than significant.

*c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:*

*i) result in substantial erosion or siltation on or off site;*

The project site is currently developed. During the demolition of the abandoned retail space and project construction, there would be increased potential for erosion on site from exposed soils. Once the project site is in operation, the project site would be covered by impervious surfaces. As described in Appendix F, runoff from the project site would converge into existing storm drains along Baldwin Park Boulevard. and would not result in alteration to drainages off site. Therefore, the project would not result in substantial erosion or siltation due to changes in drainage patterns. Impacts would be less than significant.

*ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;*

As discussed above, the project site is developed and primarily consists of impervious surface. Project implementation would not substantially increase the impervious area on the project site because it is currently developed (Appendix F). Additionally, the project site is relatively flat and does not currently result in flooding. On-site drainage facilities and off-site drainage connections would be designed to collect and convey runoff from 100-year storm events. Implementation of the proposed project is not expected to impede or redirect flood flows and would be less than significant.

*iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or*

As discussed above, the proposed project would not drastically change the amount of surface runoff that is leaving the project site. The project site would be designed for runoff to be conveyed to storm drains located along Baldwin Park Boulevard. Additionally, runoff resulting from project implementation would not substantially increase (Appendix F). As discussed in Section 3.19, the project would not exceed the existing capacity of the City's stormwater drainage systems. Because the project would not substantially change the runoff contributing to the drainage systems, impacts would be less than significant.

*iv) impede or redirect flood flows?*

The project would not increase the impervious surface area on site in comparison to existing conditions, which would keep runoff flow rates or volumes similar to existing conditions (Appendix F). Additionally, the project site and the immediate area is relatively flat and does not currently result in flooding during storms. On-site drainage facilities and off-site drainage connections would be designed to collect and convey runoff from 100-year storm events. Implementation of the proposed project is not expected to impede or redirect flood flows and impacts to stormwater drainage would be less than significant.

*d) In flood hazard, tsunami, or seiche zones, would the project risk release of pollutants due to project inundation?*

The project site is approximately 30 miles inland from the Pacific Ocean and would not be subject to inundation by tsunami. Additionally, the project site is not located in a flood hazard zone (FEMA 2008). Given that the project site is not located near a large standing body of water, inundation by seiche (or standing wave) is considered negligible. No impact would occur.

*e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?*

The project site is located within the San Gabriel Valley groundwater basin. This basin is considered a very low priority basin and therefore not required to prepare a sustainable groundwater management plan. Additionally, the City of Baldwin Park does not have a water quality control plan. Therefore, the project would not conflict with the implementation of a water quality control plan or sustainable groundwater management plan. No impact would occur.

# 3.11 Land Use and Planning

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XI. LAND USE AND PLANNING** – Would the project: | | | | |
| a) Physically divide an established community? | ☐ | ☐ | ☒ | ☐ |
| b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect? | ☐ | ☐ | ☒ | ☐ |

***a) Would the project physically divide an established community?***

The proposed project site is located on a medical campus that is bound by Dalewood Street (north), Baldwin Park Boulevard (southeast), Bess Ave (southwest), and Leorita Street (east). The emergency department expansion component would be located within the boundary of the existing medical campus. The MOB component would be located at acquired a retail space adjacent to the existing medical campus boundary, that would expand the northeast corner of the medical campus. Implementation of the project would not physically divide an established community because both project components would redevelop in an area that has already been developed; impacts would be less than significant.

***b) Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?***

The City of Baldwin Park's General Plan and Municipal Code regulate planning and development within the city. The project site is currently zoned as Freeway Commercial (FC) and has a land use designation of General Commercial (GC) (Figure 4, Land Use Designation). The project's consistency with the City of Baldwin Park's General Plan and Municipal Code is discussed below.

## Baldwin Park Municipal Code

Baldwin Park Municipal Code Section 153.050 ensures compatibility of commercial and industrial uses with adjacent land uses. As described above, the project is zoned as freeway commercial (Figure 5, Zoning). Per Table 153.050.020 in the Baldwin Park Municipal Code, Offices are a permitted use, and Hospitals are permitted with a conditional use permit (CUP) within the Freeway Commercial zone. The freeway commercial designation permits a maximum Floor Area Ration (FAR) of 1.0 for commercial and industrial land uses and the proposed project would have a FAR ratio of 0.71. The project would require a variance from the development standards set forth in Table 153.050.030 for Commercial and Industrial Zones to allow for an overhead projection from the building façade to encroach 2 feet, 10 inches within the required 10-foot front yard setback along Baldwin Park Blvd. This projection would provide shade for the patients of

the hospital. With the exception of the variance from development standards, the project would be compatible with all zoning regulations for the freeway commercial zone. The requested variance from the Municipal Code has been analyzed as part of this MND and would not yield an effect on the environment. Therefore, impacts related to consistency with the Baldwin Park Municipal Code would be less than significant.

## City of Baldwin Park General Plan

Applicable land use goals and policies within the City's Land Use Element consist of encouraging revitalization of underutilized development and commercial development, (Goal 3 and Policy 1.4); compatibility between new and existing development (Goal 2), reduction of impacts from noise, traffic, parking, light and glare, and difference in scale (Policies 2.5, 2.6, and 2.7); and compliance with NPDES and water quality requirements (Goal 18 and Policy 18.1). As described above, the project would include the redevelopment of an abandoned retail site into a MOB that would serve the existing medical campus. As discussed in Sections 3.1, Aesthetics; 3.13, Noise; and 3.17, Transportation, the project would not result in significant impacts related to visual incompatibility, noise, and traffic. Additionally, the project would comply with NPDES and water quality requirements, as described in Section 3.10, Hydrology and Water Quality.

The project site has been identified as being located within the Bess/Garvey/I-10 Freeway General Plan Focus Area. The goal for this area is to encourage low intensity commercial and industrial uses that do not require easy freeway access and is oriented to serve the local resident and business population. Applicable policies for this focus area include Policy 17.1 (relocate uses, consolidate lots to create sites for cohesive development). The project would be consistent with this use as it would expand the existing emergency department and construct a MOB. The emergency department and MOB would help provide healthcare to the community of Baldwin Park. Additionally, the project would replace an abandoned retail store and replace it with a MOB that would serve as part of the existing medical campus. This would consolidate healthcare services and provided cohesive development with the existing medical campus.

The project would be consistent with the General Plan Health and Safety Element by replacing removed trees removed along Baldwin Park Boulevard (Action HS-3.17 and Baldwin Park Municipal Code Section 153.165.090), providing LID features (Action HS-4.4), providing recycling and trash enclosures on site (Action HS-6.8); would include drought tolerant landscaping (Policy 8.01); and would not substantially increase impervious surfaces on site (Policy 8.03).

The project would be consistent with the General Plan Economic Development Element by redeveloping an abandoned retail site along the I-10 corridor (Policy 5.1). As concluded in Section 3.17, Transportation, the project would be consistent with the Circulation Element goals and policies. As discussed in Section 3.13, Noise, the project would conform with the standards within the General Plan Noise Element. The General Plan Open Space and Conservation and Public Safety Element did not include goals or policies that were applicable to this project or were previously addressed in other elements.

While the project would request a variance from the development standards set forth in Table 153.050.030, the variance would not result in an effect on the environment. Additionally, the project would be consistent with the General Plan and remainder of municipal code and impact would be less than significant.

# 3.12 Mineral Resources

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XII. MINERAL RESOURCES** – Would the project: | | | | |
| a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state? | ☐ | ☐ | ☐ | ☒ |
| b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan? | ☐ | ☐ | ☐ | ☒ |

***a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?***

The entire City of Baldwin Park is designated as a Mineral Resource Zone 2 (MRZ-2) by the state Geologist since 1982. The MRZ-2 designation is an area where "adequate information indicated that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists" (City of Baldwin Park 2020). Given that the project site and the majority of the City is already developed, mineral extraction or mining would be incompatible with the existing zoning of the project site due to the site being previously developed. No impact would occur.

***b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?***

As stated above, the City of Baldwin Park General Plan has identified the entire city as being within MRZ-2 but has not identified a locally important mineral resource recovery site. Additionally, because the project site has been previously developed, mineral extraction and mining would be an incompatible use. No impact would occur.

# 3.13 Noise

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XIII. NOISE** – Would the project result in: | | | | |
| a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? | ☐ | ☒ | ☐ | ☐ |
| b) Generation of excessive groundborne vibration or groundborne noise levels? | ☐ | ☐ | ☒ | ☐ |
| c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? | ☐ | ☐ | ☐ | ☒ |

***a) Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?***

## Construction Noise

Construction noise is considered a short-term impact and would be considered significant if construction activities exceed the allowable hours of operation as permitted by the FTA's advisory threshold of 80 dBA $L_{eq}$ over an 8-hour daytime period at a residential land use. Noise-sensitive land uses in the vicinity of the project include residences to the southwest of the EDE (approximately 800 feet from the construction boundary), and to the west of the new MOB (approximately 90 feet from the construction boundary). Two calculation scenarios were analyzed and are described as follows:

- Usage of the shortest activity-to-receptor distance for the loudest equipment type and quantity associated with the studied construction phase, with less noisy equipment types at successive distance increments of 50 feet; and
- An "acoustic centroid" approach, akin to the FTA general assessment technique for estimating construction noise, whereby all listed equipment for a construction phase is represented by a common location at the geographic center of the studied construction zone or area.

Project-generated construction noise will vary depending on the construction process, the type of equipment involved, the location of the construction site with respect to sensitive receptors, the schedule

proposed to carry out each task (e.g., hours and days of the week), and the duration of the construction work. Project construction noise for each of the six distinct phases was calculated using a spreadsheet-based model emulating the Federal Highway Administration (FHWA) Roadway Construction Noise Model (FHWA 2008). Table 3.13-1 shows that prediction results of both scenarios yield predicted 8-hour daytime $L_{eq}$ values exceed the aforesaid FTA guidance threshold of 80 dBA.

## Table 3.13-1. Construction Noise Modeling Results

| Receiver Location (distance [ft] to loudest construction equipment) | Construction Noise Level (8-hour dBA Leq) by Construction Phase | | | | | | |
|---|---|---|---|---|---|---|---|
| | Land Use | Demolition | Site Preparation | Grading | Building Construction | Paving | Architectural Coating |
| *Closest Distance* from EDE to Southwest Receptor (~725 feet) | Residential | 58 | 56 | 57 | 53 | 55 | 44 |
| *Closest Distance* from MOB to West Receptor (~60 feet) | Residential | 82 | 80 | 80 | 77 | 78 | 71 |
| *Acoustic Center* from EDE to Southwest Receptor (~935 feet) | Residential | 56 | 54 | 55 | 52 | 53 | 42 |
| *Acoustic Center* from MOB to West Receptor (~210 feet) | Residential | 71 | 68 | 69 | 66 | 68 | 56 |

**Source:** Attachment B of Appendix G.

As previously discussed, the City's Noise Ordinance does not establish quantitative construction noise standards; however, Section 130.37 Special Noise Sources (E) of the City's Municipal Code restricts noise-generating construction activities to the hours from 7:00 a.m. to 7:00 p.m. The construction contractor would thus be required to comply with these noise regulations prescribing the hours allowed for construction activity. Were the FTA guidance limit of 80 dBA $L_{eq}$ to be applied as a standard, Table 3.13-1 informs that the predicted noise level exposure at the off-site receptor closest to the MOB construction boundary (i.e., a distance of only 60 feet) is 82 dBA and exceed this standard by 2 dB. Hence, despite construction activity hours complying with City regulations, project construction noise impacts would be potentially significant and would require mitigation.

### On-Site Operational Noise

Implementation of the project would result in changes to existing noise levels on and around the project site by developing new stationary sources of noise, including introduction of additional outdoor HVAC equipment. These sources may affect noise-sensitive vicinity land uses off the project site.

### Rooftop HVAC

#### EDE Sound Sources

Based on the available architectural and mechanical roof plans and other design information for the proposed EDE, there is a 7-foot barrier raised 18 inches off the roof deck surrounding a single custom air-handling unit (AHU) and four exhaust fans. Rooftop AHU fan and exhaust fan reference sound levels were available from the EDE design plans and "product data" information submittals.

#### MOB Sound Sources

For the analysis of noise emission from outdoor-exposed HVAC equipment operating on the roof of the proposed MOB, net building cooling load and minimum air infiltration was calculated with an estimation technique (Storm 2018) using the gross square footage (GSF) and expected functions or usage of the interior building spaces. With these inputs, net refrigeration tonnage and minimum outside air volume was calculated and then used to size and quantify a number of air handling unit return air fans and air-cooled chillers, for which online manufacturer data was consulted to quantify reference sound emission levels for this anticipated MOB rooftop equipment.

#### Sound Propagation Prediction

The aggregate noise emission from these EDE and MOB outdoor-exposed HVAC sound sources has been predicted with the Datakustik CadnaA sound propagation program. Table 3.13-2 presents the predicted aggregate noise level exposures from these operating EDE and MOB HVAC systems at each of four nearby off-site noise-sensitive receptors (i.e., existing residences). Predicted levels shown in Table 3.13-2 range between 9 to 40 dBA hourly $L_{eq}$, which is below the City's noise standard of 45 dBA $L_{eq}$ for single-family residential properties. Figure 6, Noise Measurement Locations and Contours, displays the location of the studied noise-sensitive receptors and noise contours.

**Table 3.13-2. Stationary Operations Noise Modeling Results**

| Studied Noise-Sensitive Receptor (approximate address) | Predicted Project-Attributed Noise Exposure Level at Nearby Noise-Sensitive Receptors |
|---|---|
| | Project HVAC (dBA hourly Leq) |
| R1 (13226 Bess Avenue) | 18.3 |
| R2 (13101 Bess Avenue) | 9.4 |
| R3 (1019 Leorita Street) | 30.8 |
| R4 (Proposed EDE Façade) | 39.8 |

**Notes:** $L_{eq}$ = equivalent continuous sound level (time-averaged sound level); dBA = A-weighted decibels; HVAC = heating, ventilating, and air-conditioning. See Figure 2 of Appendix G for locations of studied noise-sensitive receptors.

#### Parking Lot Activity

A comprehensive study of noise levels associated with surface parking lots was published in the Journal of Environmental Engineering and Landscape Management (Baltrënas et al. 2004). The study found that average noise levels during the peak period of use of the parking lot (generally in the morning with arrival of commuters, and in the evening with the departure of commuters), was 47 dBA at 1 meter (3.3 feet) from

the outside boundary of the parking lot. The project employee parking spaces for the proposed EDE would be within the existing parking garage for the hospital. The project employee parking spaces for the proposed MOB are proposed surrounding the new building.

Accounting for sound attenuation due to additional distance travelled, the MOB parking lot noise contribution logarithmically combined with the project's HVAC-only predicted noise levels appearing in Table 3.13-3 would still be below the City's noise standard of 45 dBA $L_{eq}$ at the studied nearest noise-sensitive residential properties (R3). It is also well below the ambient noise level range of 63 to 70 dBA $L_{eq}$ measured adjacent to the project as exhibited in Table 6 of Appendix G, Noise Technical Memorandum.

### Project-Generated Off-Site Traffic Noise

The project is expected to generate a total of -340 trips to the roadway system, primarily due to the removal of the apparel store that currently exists where the proposed MOB would be constructed. As shown in Table 2-1 of the project's Transportation Technical Memorandum, during the PM peak hour, approximately nine passenger vehicles are estimated to enter or exit the project site. Utilizing this information, as well as additional traffic data shown in Attachment C of Appendix G, an emulator based on the FHWA's Highway Traffic Noise Prediction Model RD-77-108 was used to estimate potential noise impacts at adjacent noise-sensitive uses. Information used in the model included posted traffic speeds, truck mix percentage (for urban streets, found in the U.S. Environmental Protection Agency's Background Document for Medium and Heavy Truck Noise Emission Regulations, 1976), and expected level-of-service C traffic volumes (for urban streets, found in the Transportation Research Board's Highway Capacity Manual, 2000). Consistent with Caltrans guidance (Caltrans 2013), this analysis assumes 80% of the ADT occurs during daytime hours (7:00 a.m. to 7:00 p.m.), 5% during the evening (7:00 p.m. to 10:00 p.m.), and 15% during the nighttime (10:00 p.m. to 7:00 a.m.).

The change in roadway noise levels was predicted for two conditions: existing and existing plus project. Traffic noise levels found in Table 3.13-3 are calculated for roadway segments bounded by intersections within the project area and are listed as follows:

- Baldwin Park Boulevard – From Amar Road to Dalewood Street,
- Bess Avenue – From Frazier Street to Baldwin Park Boulevard,
- Leorita Street – From Bess Avenue to Dalewood Street, and
- Dalewood Street – From Frazier Street to Baldwin Park Boulevard.

**Table 3.13-3. Predicted Roadway Noise Change – Existing plus Project**

| Modeled Roadway Segment | Existing Noise Level (dBA CNEL) | Existing Plus Project Noise Level (dBA CNEL) | Project-Related Noise Level Increase (dBA) |
|---|---|---|---|
| Baldwin Park Blvd.: Amar Rd. – Dalewood St. | 71.9 | 71.9 | 0.0 |
| Bess Ave.: Frazier St. – Baldwin Park Blvd. | 63.8 | 63.8 | 0.0 |
| Leorita St.: Bess Ave. – Dalewood St. | 63.0 | 63.0 | 0.0 |
| Dalewood St.: Frazier St. – Baldwin Park Blvd. | 67.5 | 67.5 | 0.0 |

**Source:** Attachment C of Appendix G.

As shown in Table 3.13-3, none of the roadways is predicted to receive an increase in noise levels as a result of the additional project traffic. In the context of community noise (i.e., outside of a controlled environment) a change in noise levels of less than 3 dBA is not perceptible to the average human listener. Additionally, based upon the FICON thresholds (FICON 1992), an increase of less than 5 dBA when the ambient sound level is less than 60 dBA $L_{dn}$/CNEL, less than 3 dBA when the ambient sound level is less than between 60 and 65 dBA $L_{dn}$/CNEL, or less than 2 dBA when the ambient sound level is greater than 65 dBA $L_{dn}$/CNEL would not be substantial.

### Conclusion

As described above, the project would exceed the City's threshold related to short term construction noise would be potentially significant. Implementation of Mitigation Measure **MM-NOI-1** would reduce construction noise to be within the City's adopted daytime threshold for construction to reduce impacts to be less than significant with mitigation incorporated. Additionally, all operational noises from the project were determined to be less than significant with mitigation incorporated.

## Mitigation Measure

The following mitigation measure shall be implemented as part of project implementation:

MM-NOI-1 The following recommendations from Appendix G shall be implemented by the construction contractor to reduce construction noise on site, to the satisfaction of the City of Baldwin Park Community Development Department:

- All construction equipment must have appropriate sound muffling devices, which shall be properly maintained and used at all times such equipment is in operation.
- The project contractor shall place stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site.
- The construction contractor shall locate on-site equipment staging areas so as to maximize the distance between construction-related noise sources and noise-sensitive receptors nearest the Project site during the construction period.
- All noise producing construction activities, including warming-up or servicing equipment and any preparation for construction, shall be limited to the hours between 7:00 a.m. and 7:00 p.m.

***b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?***

The primary source of ground-borne vibration occurring as part of the project is construction activity. The primary concern associated with ground-borne vibration is annoyance; however, in extreme cases, vibration can cause damage to buildings, particularly those that are old or otherwise fragile. Some common sources of ground-borne vibration are trains, and construction activities such as blasting, pile-driving, and heavy earth-moving equipment.

Ground-borne vibration information related to construction/heavy equipment activities has been collected by Caltrans. Information from Caltrans indicates that transient vibrations (such as from construction activity) with approximately 0.035 inches per second PPV may be characterized as barely perceptible, and vibration levels of 0.24 inches per second PPV may be characterized as distinctly perceptible (Caltrans

2020). According to Caltrans, D-8 and D-9 Caterpillars, earthmovers, and trucks have not exceeded 0.10 inches/second PPV at 10 feet (Caltrans 2020). Since the closest off-site residence is located approximately 90 feet away from likely heavy construction equipment, vibration from construction activities at the closest sensitive receiver would not exceed the significance threshold of 0.20 inches/second PPV. Moreover, because the off-site residential homes feature wood-frame construction on foundation pads or footings, FTA guidance indicates that a "coupling loss" of -5 VdB can be applied to the groundborne vibration received by the structure and thus result in an attenuated VdB level of 65 that is compatible with the afore-mentioned interpretation of the City's vibration standards (i.e., perception unaided by instruments).

As for existing on-site Kaiser Baldwin Park structures, vibration impacts attributed to project construction are not anticipated to be significant for the following reasons:

- Vibration-sensitive instruments and operations (e.g., operation rooms and medical imaging [i.e., MRI] facilities) are sufficiently distant from expected project construction areas, so that propagated groundborne vibration will attenuate with distance—or be impeded or dissipated by intervening masses such as existing structural foundations and multi-story building masses. Distance sufficiency in this context would be a minimum of 36 feet between—for purposes of illustration—an operating large bulldozer or comparable engine-driven heavy construction equipment and a potentially sensitive receptor, assuming a threshold of 72 VdB (for operating rooms, per FTA guidance [FTA 2018]) and applying a coupling loss of -10 VdB due to existing on-site structures being representative of multi-story "large masonry" buildings. The construction area of the new MOB to be implemented by the project meets this criterion and is physically separated from the campus vibration-sensitive buildings by the extensive pre-existing parking structures.
- Where the project involves renovation and new construction within this 36-foot distance, such as the vicinity of the EDE, the architectural plans indicate that the project will implement careful "phasing" of construction that involves temporary relocation of existing potentially vibration-sensitive activities, processes, and receptors to other on-site campus areas that are more distant from or would otherwise be protected from the adverse effects of excessive vibration attributed to the project.

Based on these predictive calculations and findings, impacts associated with ground-borne vibration resulting from project construction would be less than significant.

*c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

The San Gabriel Valley Airport (SGVA) is located approximately 2.85 miles northwest of the project site. The project site is located outside of the Airport Influence Area as shown in the Los Angeles County Airport Influence Area map. Therefore, no impact would occur.

# 3.14 Population and Housing

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XIV. POPULATION AND HOUSING** – Would the project: | | | | |
| a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)? | ☐ | ☐ | ☒ | ☐ |
| b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere? | ☐ | ☐ | ☐ | ☒ |

*a)* ***Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?***

The proposed project includes the expansion of an existing emergency department, and the redevelopment of an existing retail space into a MOB. The project would not introduce any new housing as part of the project but would expand the capacity of the medical campus with the MOB and expanded emergency department. The project is expected to result in the number of employees at the project site by 105.

The Southern California Association of Governments forecasts population growth at a local and regional level for six counties in southern California including Los Angeles County and Baldwin Park. As Shown in Table 3.14-1, Employment within Baldwin Park is expected to increase by 3,000 jobs by 2040. The increase of 105 jobs from the project would represent 3.5% of the total expected increase in jobs for the City. Therefore, the addition of 105 jobs would be within the forecasted growth of jobs within the area.

### Table 3.14-1. City of Baldwin Park Population and Employment Forecast

| | Actual 2012 | Forecasted 2020 | Forecasted 2035 | Forecasted 2040 | % Change (2012-2040) |
|---|---|---|---|---|---|
| Population | 76,100 | 77,700 | 81,500 | 83,600 | 9.9% |
| Employment | 16,500 | 17,900 | 18,900 | 19,500 | 18.2% |

**Source:** SCAG 2016.

The current emergency department expansion is intended to eliminate the existing and projected treatment bay deficits in the emergency department through 2027. The project would not expand any other existing utilities or infrastructure as part of either project component. As addressed under Section 3.19 the project

would connect to existing utilities (water, power, sewer, etc.) and would not require any expansion that could indirectly lead to population growth.

In conclusion, the project is expected to introduce 105 jobs to the City, which is within the forecasted growth of employment for the City and the project would not require the expansion of infrastructure from the introduction of these jobs. Direct or indirect impacts from unplanned population growth would be less than significant.

*b) Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?*

The proposed emergency department expansion and MOB would occur within the medical campus and would replace an existing retail building. The project would not displace any existing people or residences through project implementation. No impact would occur.

# 3.15 Public Services

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XV. PUBLIC SERVICES** | | | | |
| a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services: | | | | |
| Fire protection? | ☐ | ☐ | ☒ | ☐ |
| Police protection? | ☐ | ☐ | ☒ | ☐ |
| Schools? | ☐ | ☐ | ☒ | ☐ |
| Parks? | ☐ | ☐ | ☒ | ☐ |
| Other public facilities? | ☐ | ☐ | ☒ | ☐. |

*a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:*

*Fire protection?*

The City of Baldwin Park contracts out their fire protection services to the County of Los Angeles Fire Department (LACFD 2021). The closest fire station to the project site is Los Angeles County Fire Department Station 168, located approximately 1.3 miles away at 3207 Cogswell Rd, El Monte, California 91732. As concluded in Section 3.14, Population and Housing, the project would not result in a substantial increase in population to the area, and therefore would not result in the increased demand for fire protection services to the project site. Additionally, as concluded below in Section 3.20, Wildfire, the project would not result

in an increase of risk of fire hazards to the project site, which also would not result in an increased demand for fire protection services. Physical impacts associated with the addition of new fire protection facilities resulting from the project would be less than significant.

*Police protection?*

The City of Baldwin Park has its own police department that provides police protection to the City. The only Baldwin Park Police Station is located approximately 2.0 miles away from the project site at 14403 Pacific Avenue, Baldwin Park, California 91706. The project would include the expansion of the emergency department and construction of a MOB. As concluded in Section 3.14, the project would not result in a substantial increase in population to the area, and therefore would not result in the increased demand for police protection services to the project site. Additionally, the project would be required to pay a development impact fee for law enforcement facilities, vehicles, and equipment infrastructure, as required by Baldwin Park Municipal Code Section 154.060. Physical impacts associated with the addition of new police protection facilities resulting from the project would be less than significant.

*Schools?*

The project does not have a residential component and as concluded in Section 3.14, the project would not result in a substantial increase in population to the area, and therefore would not result in the increased demand for schools servicing the project site. Physical impacts associated with the addition of new schools resulting from the project would be less than significant.

*Parks?*

The project does not have a residential component and as concluded in Section 3.14, the project would not result in a substantial increase in population to the area, and therefore would not result in the increased demand for schools servicing the project site. Physical impacts associated with the addition of new parks resulting from the project would be less than significant.

*Other public facilities?*

The project does not have a residential component and as concluded in Section 3.14, the project would not result in a substantial increase in population to the area, and therefore would not result in the increased demand for any other public facilities servicing the project site. Physical impacts associated with the addition of new public facilities resulting from the project would be less than significant.

# 3.16 Recreation

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XVI. RECREATION** | | | | |
| a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? | ☐ | ☐ | ☐ | ☒ |
| b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment? | ☐ | ☐ | ☐ | ☒ |

***a)*** ***Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?***

As stated above, the project consists of the expansion of an existing emergency department and the redevelopment of an existing retail building to a MOB and will not include a residential component. As concluded in Section 3.14 the project is not expected to substantially increase population growth in the area and therefore would not substantially increase the uses of the recreational facilities in proximity to the project site. No impact would occur.

***b)*** ***Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?***

The project consists of the expansion of an existing emergency department and the redevelopment of an existing retail building to a MOB. The project would not include any recreational facilities. No impact would occur.

# 3.17 Transportation

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XVII. TRANSPORTATION** – Would the project: | | | | |
| a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities? | ☐ | ☐ | ☒ | ☐ |

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)? | ☐ | ☐ | ☒ | ☐ |
| c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)? | ☐ | ☐ | ☒ | ☐ |
| d) Result in inadequate emergency access? | ☐ | ☐ | ☒ | ☐ |

The following analysis is based on the Transportation Assessment Report prepared for the proposed project by LLG Engineers and is included as Appendix H, Transportation Assessment Report.

*a) Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?*

The project proposes the expansion of an existing emergency department and the construction of a MOB. The Circulation Element of the General Plan outlines goals and policies that ensure adequate traffic capacity and parking; and encourages the use of alternative modes of transportation and the use of public transportation. As discussed in Appendix H, the project site would accommodate pedestrian and bicycle access via on-site walkways that connect to existing sidewalks off site and providing bicycle parking facilities on site. Additionally, the project would not generate a significant number of trips and is not expected to reduce the level of service (LOS) surrounding the project site (Appendix H). Therefore, due to the project's consistency with the Circulation Element, impacts from conflicts with transportation policies would be less than significant.

*b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?*

The City adopted VMT metric is included within the *City of Baldwin Park Transportation Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment.* As described in Appendix H, the City's Guidelines state that: projects that generates less than 110 daily trips may be screened from conducting a formal VMT analysis and presumed to have a less than significant VMT impact. The project would generate 44 trips during the weekday AM peak hour and would result in a decrease of 48 trips in the weekday PM peak hour. The number of trips that would be generated by the project would be less than 110 daily trips and the project would screen out of further VMT analysis . Therefore, due to the small nature of the project, the project screens out of the need for VMT analysis and impacts would be less than significant.

*c) Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?*

The project site currently functions as a medical campus with the Internal circulation on the medical campus would remain the same. The addition of the MOB component campus would provide an entrance to the MOB via Leorita Street, which is a 2- lane local street. This new entrance would be designed to meet

the design requirements codified in the California Fire Code and would not include any hazardous design features. Additionally, the project is consistent with the zoning designation and would not introduce any incompatible uses to the area. Therefore, the project would not introduce hazards due to a geometric design feature and impacts would be less than significant.

*d) Would the project result in inadequate emergency access?*

The project site has multiple access points along Baldwin Park Boulevard, Dalewood Street, Bess Avenue, and Leorita Street. All driveways provide access to parking facilities, the hospital, and medical office buildings. The project would not change any of the key access and driveways within the medical campus (Appendix H). As described above, the driveway for the MOB would be designed to meet the design requirements codified in the California Fire Code. The project would not result in inadequate emergency access to the project site and impacts would be less than significant.

# 3.18 Tribal Cultural Resources

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XVIII. TRIBAL CULTURAL RESOURCES** | | | | |
| Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: | | | | |
| a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or | ☐ | ☒ | ☐ | ☐ |
| b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe. | ☐ | ☒ | ☐ | ☐ |

*a,b) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)? Or, A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?*

As described in Section 3.4, Biological Resources, a CHRIS records search was completed by staff at the South Central Coastal Information Center (SCCIC) on July 11, 2022. No cultural resources were identified within the project site (Appendix I, Draft Archaeological Resources Assessment). In addition to a CHRIS records search, a SLF records search was requested on July 22, 2022, to determine the presence of any Native American cultural resources within the project site. The NAHC SLF records search results were positive for known Native American heritage resources within the proposed Project site. Results of the SLF provided relate to the general regional area within and surrounding the study area and do not necessarily equate to the existence of resources within the specific area occupied by the current proposed Project site. The NAHC identified the Gabrieleno Band of Mission Indians – Kizh Nation, as well as eight additional Native American individuals who would potentially have specific knowledge as to whether or not Native American cultural resources are identified within the Project site that could be at-risk. Outreach letters were mailed on September 28, 2022, to all NAHC-listed traditionally geographically affiliated tribal representatives that have requested project notification. To date, one tribe (Gabrieleno Band of Mission Indians- Kizh Nation) have responded. City AB 52 consultation is carried out by the City as the lead agency and is currently ongoing.

Following a consultation call between the City and the tribe on December 6th, 2022, the Gabrieleno Band of Mission Indians- Kizh Nation (Tribe) provided an email follow up that included a number of attachments on December 7, 2022. Attachments included ethnohistoric and historical archival research pertaining to traditional use of the area, letters form technical experts and the NAHC, and recommended mitigation measures. The Tribe further indicated that the project falls within the traditional village location of Awinga. At the request of the tribe, this information will be maintained as confidential and appended to this document (Confidential Appendix J). Among other specific details pertaining to these management strategies, recommended mitigation includes inclusion of a Native American monitor that is designated or approved by the Tribe during ground disturbing activities and actions to be taken in the event of an unanticipated discovery of human remains and/or funerary objects.

While strong evidence of traditional Native American use of this broader area has been provided through review of archival documentation, a specific known TCR, meeting definitions applied in CEQA, does not appear to have been identified through consultation. However, despite the current disturbed state of the project site, there remains the potential for the project to encounter previously unknown and unanticipated TCRs during construction of the project. The City, having considered these factors, including information and recommended management strategies provided by the Tribe, has determined that additional management strategies will be required. In the event that unknown tribal cultural resources are encountered during Project implementation, impacts to these resources are potentially significant and mitigation is required.

Tribal cultural resources are most commonly cultural resources and/or human remains of Native American origin. As such, implementation of previously identified mitigation measures **MM-CR-1** through **MM-CR-4**) are appropriate management strategies to be applied to tribal cultural resources. This observed, tribal cultural

resources also constitute a separate resource category under CEQA; tribes, through the government-to-government consultation process are provided the opportunity to identify tribal cultural resources that may be affected by the project and interpret the significance of such resources. Having reviewed and considered all information provided through this process, the ultimate responsibility to determine the appropriate management approach is the lead agency for compliance with CEQA. In order to appropriately reflect this process and provide for the inadvertent discovery of tribal cultural resources during project activities, a separate mitigation measure is provided below. Specific mitigation requirements, as developed by the Tribe and agreed to by the applicant, are provided in Confidential Appendix J. Implementation of **MM-TCR-1** would include the requirement for a Native American monitor to be invited to be present in order to ensure potential impacts to tribal cultural resources as a result of ground-disturbing activities on the project site would remain be reduced to less than significant with mitigation incorporated.

Mitigation Measure **MM-CUL-1** through **MM-CUL-4** would ensure that measurements are in place for the proper treatment of any inadvertently discovered archaeological resources and potential impacts to archaeological resources and human remains would be reduced to less than significant with mitigation incorporated.

MM-TCR-1 Inadvertent Discovery of Tribal Cultural Resources. Management strategies stipulated in MM-CUL-1 through MM-CUL-4 shall be implemented in the event that project activities encounter cultural resources or human remains. In addition, a Native American representative, compensated by and contracted directly with the applicant, shall be provided the opportunity to monitor during earth disturbing activities. This monitor shall be provided by the consulting tribe(s). Should an inadvertent discovery be Native American in origin and have potential to meet the definition of a tribal cultural resource (as defined by PRC Section 21074) the city, or other designated representative, shall notify consulting Native American tribes. Designated representatives from these tribes shall be provided a reasonable period of time to conduct a site visit and make recommendations regarding future ground disturbance activities as well as the treatment and disposition of any discovered tribal cultural resources. Implementation of proposed recommendations shall proceed in compliance with CEQA and other regulatory requirements and be made based on the determination of the City that the approach is reasonable and feasible.

# 3.19 Utilities and Service Systems

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XIX. UTILITIES AND SERVICE SYSTEMS** – Would the project: | | | | |
| a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects? | ☐ | ☐ | ☒ | ☐ |
| b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years? | ☐ | ☐ | ☒ | ☐ |
| c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments? | ☐ | ☐ | ☒ | ☐ |
| d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? | ☐ | ☐ | ☒ | ☐ |
| e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste? | ☐ | ☐ | ☒ | ☐ |

***a)*** ***Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

The project would include the expansion of an existing emergency department and the construction of a MOB.

## Water

San Gabriel Valley Water Company currently services the project site. The San Gabriel Valley 2020 Urban Water Management Plan (UWMP) analyzes the water demand and water supply for 2020 to 2045. The 2020 UWMP analysis is based off of projected growth rates from the 2020-2045 SCAG Regional Transportation Plan/ Sustainable Communities Strategy of the SCAG which incorporates existing land use and general plan land use policies to help project growth for the region. Total water use in 2020 was

estimated to be 33,632 and is projected to increase to 38,700 MG by 2045. The projected water supplies for the district are expected to match the projected demand (San Gabriel Valley Water Company 2021).

The project would increase the number of treatment bays to the existing emergency department and would include the construction of a MOB. Water use during construction is expected to be temporary and minimal. The expansion of the emergency department would increase the number of treatment bays from 38 to 60. While the project would increase the water use on the project site, the project would be consistent with the land use designation for the site which was factored into the UWMP projections. Additionally, the project would implement new building code which will include water conservation standards compared to older buildings.

In conclusion, the increase in water usage from the project is expected to be met by the San Gabriel Valley Water Company during normal, and dry years, and would not require the construction of new facilities to supply water to the area and impacts would be less than significant.

### Wastewater Treatment

The City's sewer system includes 106 miles of sewers, three pump stations and is managed through the Department of Public Works (City of Baldwin Park 2021b). Operational and maintenance serves are provided through the County of Los Angeles Consolidated Sewer Maintenance District (CSMD). Wastewater from the City is treated at the San Jose Creek Water Reclamation Plant. The San Jose Creek Reclamation Plant has a capacity to treat 100 million gallons of wastewater per day (MGD) (LACSD 2022). The project proposes the expansion of an existing emergency department and the construction of a MOB. Wastewater during construction is expected to be temporary and minimal. The project applicant would be required to obtain a will serve letter from the CSMD. This increase in wastewater from the project represents a small portion of the available capacity for the San Jose Creek Water Reclamation Plant. The will serve letter would ensure that CSMD would be able to adequately serve the project site and not require the construction of new facilities to provided services to the project site. Therefore, impacts to wastewater facilities would be less than significant.

### Stormwater Drainages

As discussed in Section 3.10, Hydrology and Water Quality, the project would not substantially increase the volume or rate of runoff from the project site. As concluded in Appendix F, runoff from the project site would remain relatively the same as current conditions. Project implementation would not result in the need to expand or create new stormwater facilities, and therefore impacts would be less than significant.

### Electric Power

As discussed in Section 3.6, Energy, the project would consume approximately 1,013,592.11 kWh per year and the non-residential electricity demand in 2020 was 42,736,774,915 kWh (42,737 gigawatt-hours) for Los Angeles County (CEC 2020). Electricity use during project construction would be temporary and negligible. As such, the project would have a negligible impact on demand for Los Angeles County and SCE. The project would not significantly increase demand for electricity and would not require the expansion of or construction of electric power facilities, therefore impacts would be less than significant.

### Natural Gas

As discussed in Section 3.6, Energy, natural gas is not anticipated to be required during construction of the project, and the project operation is estimated to consume approximately 1,771,660 kilo-British thermal units per year. The non-residential natural gas consumption in 2020 was 1,698,687,468 kilo-British thermal units for Los Angeles County (CEC 2020). As such, the project would have a negligible impact on demand for Los Angeles County and SCE. The project would not significantly increase demand for natural gas and would not require the expansion of or construction of natural gas facilities, therefore impacts would be less than significant.

### Telecommunication Facilities

The project site is currently served by various telecommunication service distributors. Communications systems for telephones, computers, and cable television are serviced by utility providers such as AT&T, Spectrum, Viasat, and other independent cable companies. The project would introduce additional demand for telecommunication services as it would introduce a new MOB and an expanded emergency department; however, no specific systems upgrades are proposed or anticipated for the proposed project. Due to the existing infrastructure served in the surrounding project area, the proposed project would not result in impacts associated with the construction or expansion of telecommunications, and impacts are determined to be less than significant

*b) Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years?*

As described above, the San Gabriel Valley Water Company services the project site. Water is supplied through multiple sources including groundwater and recycled water. The San Gabriel Valley 2020 Urban Water Management Plan (UWMP) analyzes the water demand and water supply for 2020 to 2045. The 2020 UWMP analysis is based off projected growth rates from the 2020-2045 SCAG Regional Transportation Plan/ Sustainable Communities Strategy of the SCAG which incorporates existing land use and general plan land use policies to help project growth for the region. The projected water supplies for the district are expected to match the projected demand during normal, dry, and multiple dry years (San Gabriel Valley Water Company 2021). While the project would increase the water use on the project site, the project would be consistent with the land use designation for the site which was factored into the UWMP projections. The increase in water usage from the project is expected to be met by the San Gabriel Valley Water Company during normal, and dry years, and would not require the construction of new facilities to supply water to the area and impacts would be less than significant.

*c) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?*

As described above, wastewater from the City is treated at the San Jose Creek Water Reclamation Plant. The San Jose Creek Reclamation Plant has a capacity to treat 100 million gallons of wastewater per day (MGD) (LACSD 2022). The project proposes the expansion of an existing emergency department and the construction of a MOB. Wastewater during construction is expected to be temporary and minimal. This increase in wastewater from the project represents a small portion of the available capacity for the San

Jose Creek Water Reclamation Plant. Additionally, the project applicant would be required to obtain a will serve letter from the CSMD. The project would not substantially increase the wastewater from the project site and therefore impacts to wastewater facilities would be less than significant.

*d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?*

### Construction

As described in Section 2, the project would occur in two phases. During construction of Phase I of the project, the existing retail building on the broken horn site would be demolished in addition to the expansion of the emergency department. Construction of Phase II would include the construction of the proposed MOB. Construction of the project would result in the generation of solid waste such as scrap lumber, concrete, residual wastes, packing materials, plastics, and demolition material from the demolition of the abandoned retail building. Municipal Code Chapter 53 requires the submittal of a Construction and Demolition Waste Materials Management Plan for the construction and demolition waste generated by the project (City of Baldwin Park 2022c).

### Operation

Once the project is operational, the project would increase the intensity of uses at the project site and generate more solid waste compared to the existing emergency department and abandoned retail site. Solid waste generated by the project would be serviced by WM, and solid waste would then be transferred to Azusa Landfill. According to CalRecycle, the facility has a daily permitted capacity of 8,000 tons per day for solid waste. (CalRecycle 2019a)

The anticipated operational solid waste generation from the project was estimated using CalRecycle's Estimated Solid Waste Generation Rates (CalRecycle 2019b). It is estimated that the emergency department expansion (increase of 22 treatment bays) would generate approximately 352 pounds of solid waste per day (16 pounds per bed) and the MOB component (33,000 sq ft) would generate approximately 198 pounds of solid waste per day (0.006 pounds per square foot) for a total of 550 pounds per day of waste (CalRecycle 2019b). This total does not consider any waste diversion through recycling which is required by Baldwin Park Municipal Code Chapter 50.

The project would be required to comply with applicable state and local regulations related to solid waste, waste diversion and recycling at the time of development. Implementation of the project is not expected to generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and impacts related to solid waste is determined to be less than significant.

*e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?*

As described above, the project would be required to comply with all federal, state, and local statues and regulations related to solid waste, diversion of waste, and recycling. All solid waste facilities, including landfills, require solid waste facility permits to operate. In Los Angeles County, Public Resources Code

(Sections 44001–44018) and California Code of Regulations Title 27, Division 2, Subdivision 1, Chapter 4 (Section 21440 et seq.) authorizes the County Department of Environmental Health, Local Enforcement Agency to issue solid waste facility permits. Azusa Land Reclamation Landfill is a permitted facility and Waste Management is a licensed hauler. For these reasons, and the reasons stated above, impacts related to solid waste as a result of project implementation would be less than significant.

# 3.20 Wildfire

| | Potentially Significant Impact | Less Than Significant Impact With Mitigation Incorporated | Less Than Significant Impact | No Impact |
|---|---|---|---|---|
| **XX. WILDFIRE** – If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project: | | | | |
| a) Substantially impair an adopted emergency response plan or emergency evacuation plan? | ☐ | ☐ | ☒ | ☐ |
| b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire? | ☐ | ☐ | ☒ | ☐ |
| c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment? | ☐ | ☐ | ☒ | ☐ |
| d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes? | ☐ | ☐ | ☒. | ☐ |

***a) Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?***

As described above in Section 3.9, the City of Baldwin Park Emergency Operations Plan is used to prepare the city for a variety of types of emergencies that the City. As identified in the EOP, risk of wildfire is low given the geographic location of the City; however, other threats have the potential to impact the City (City of Baldwin Park 2017). The project would include the expansion of an existing emergency department and the construction of a MOB. The existing emergency department would remain open during project construction and would not be expected to substantially change the overall capacity of the emergency department in the case of an emergency. Once the project is operational the emergency department would increase the capacity to service the City during an emergency. Additionally, the project would comply with all applicable policies that are identified in the City's General Plan Safety Element, such as implementing

the Uniform Building Code's seismic safety standards. The project would be consistent with all Safety Element policies and would not impair the implementation of the EOP, therefore impacts to an adopted emergency response or emergency evacuation plan would be less than significant.

*b) Due to slope, prevailing winds, and other factors, would the project exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?*

The project site is located in a heavily urbanized area and is not located within a high fire hazard severity zone (HFHSZ) (CAL FIRE 2022). The project site is located in the City of Baldwin Park in the valley floor of the heavily urbanized San Gabriel Valley. The region is susceptible to heatwaves, droughts, and prevailing winds, all which increase the risk of wildfires (City of Baldwin Park 2021), but due to the heavily developed nature of the project site and the surrounding area, the wildfire risk at the site is considered low. Additionally, the project components would be built to the most recent fire code standards. Impacts would be less than significant.

*c) Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?*

As described above, the project site is located within a heavily urbanized area and represents a low wildfire risk. The project would expand an existing emergency department and introduce a MOB to the project site. As described above in Section 3.18, Tribal Cultural Resources, both project components would not require the installation of new utility infrastructure. Maintenance of associated infrastructure surrounding the site would be similar to maintenance of the current medical campus. Additionally, as described above, the project is located within a highly developed area with low fire risk. The project would not introduce any new infrastructure or require maintenance of infrastructure that would exacerbate fire risk and impacts would be less than significant.

*d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?*

As stated above, the project would have a low risk for wildfire due to the developed nature of the project site and the surrounding area. Additionally, the project site consists of relatively flat terrain due to the previous development in the area and the location of the project at the valley floor in the San Gabriel Valley and would not expose people or structures to slope instability. As discussed in Section 3.10, drainage on the project site would be similar to that of existing conditions. Due to the low fire risk and the flat terrain at the project site, the project would not expose people or structures to risks as a result of runoff, post-fire slope instability, or drainage changes and impacts would be less than significant.

# 3.21 Mandatory Findings of Significance

*a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?*

As described in Section 3.4, Biological Resources, the project site consists of urban/developed area, Due to the developed nature of the project site, the project site does not include habitat that would support fish or wildlife species. Furthermore, no federally or state-listed as endangered plant or wildlife species have potential to occur on the project site. As concluded in Section 3.4, the project would result in less than significant impacts related to biological resources.

Additionally, as discussed in Section 3.5, Cultural Resources, and Section 3.18, Tribal Cultural Resources, there is potential for unanticipated discovery of Cultural or Tribal Cultural Resources. Impacts to archaeological and tribal cultural resources would be **less than significant** with the incorporation of MM-CUL-1 (refer to Section 3.5, Cultural Resources).

*b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?*

As addressed throughout this document, the project would have either no impact, a less-than-significant impact, or a less-than-significant impact with mitigation incorporated with respect to all environmental impact areas. Cumulative impacts of several resource areas have been addressed in individual resource sections, including Section 3.3, Air Quality, and Section 3.8, Greenhouse Gas Emissions, and concluded that cumulative impacts would be less than significant.

Given the nature of the project, potential cumulative impacts could occur during the temporary construction work if other nearby projects occur in the same timeframe. However, given the small scale of the proposed project, the potential for the project to contribute to a cumulative impact when combined with another past, present, and reasonably foreseeable construction projects is unlikely.

As described under Section 3.17, project operation would generate a minimal number of trips during operations, and in turn, would generate minimal criteria air pollutant emissions, greenhouse gas emissions, and noise. The analysis of these impacts is inherently cumulative in nature, and thus the conclusions that they are less than significant (either with or without mitigation) apply to both project-specific and cumulative impacts. Other resource areas including Aesthetics; Agricultural and Forestry Resources; Biological Resources, Energy; Hydrology and Water Quality; Land Use and Planning; Mineral Resources; Noise, Population and Housing; Public Services; Recreation; Transportation; Utilities and Services Systems; and Wildfire, were determined to have a less than significant or no impact relative to existing conditions; thus, the project would not contribute to cumulative impacts related to these environmental topics. Other issue areas (Cultural Resources, Hazards and Hazardous Materials; Geology and Soils, and Tribal Cultural

Resources) are, by their nature, project- and/or site-specific, and impacts at one location do not add to impacts at other locations or create additive impacts.

Moreover, no other resource area impacts analyzed as part of this MND, would substantially increase when operation of the proposed project is considered in combination with cumulative projects identified in the vicinity. Therefore, operational impacts associated with these combined projects would be negligible. Furthermore, the proposed project, as with potential cumulative projects, would incorporate mitigation measures to reduce impacts and would be required to comply with applicable City and state plans and policies.

For all resource areas analyzed, project impacts would be reduced to less-than-significant or less- than significant with mitigation included levels, which would, in turn, reduce the potential for these impacts to be considered an additive to an existing cumulative impact. For these reasons, impacts would less than significant.

*c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?*

As evaluated throughout this document, with the incorporation of mitigation, potential environmental impacts associated with the project would be reduced to less-than-significant levels. Therefore, with mitigation incorporated, the project would not directly or indirectly cause substantial adverse effects on human beings, and impacts would be less than significant.

# I. INTRODUCTION

## I.1. General

The Kaiser Foundation Hospitals is planning the construction of Emergency Department Expansion, located at 1011 Baldwin Park Boulevard, City of Baldwin Park, California. The site location is shown on Site Location Map, Figure A-1, Appendix A. HDNGEO was retained by Kaiser Foundation Hospitals to complete the geotechnical investigation for the proposed project.

For this geotechnical investigation, we were provided with the following:

- A site plan, prepared by HMC Architects, showing the existing Hospital, Emergency Department and proposed expansion. This plan is reproduced herein as Site and Exploration Locations Plan, Figure A-2.
- A civil plan prepared by Psomas that outlined the proposed expansion and finish floor elevations
- Previous geotechnical reports for medical campus are outlined in Section II of this report.

This geotechnical report incorporates both field and laboratory testing results, and the geologic-seismic study are prepared according to Note 48 of Department of Conservation, California Geological Survey (CGS) and Department of Health Care Assess and Information (HCAI). Both general and specific recommendations pertinent to suitable site development and foundation design, respectively, are provided. Construction guidelines, related to geotechnical aspects of the project are also addressed.

## I.2. Objective of Geotechnical Investigation

The objective of geotechnical investigation was to obtain soil parameters in order to characterize the subsurface soil and underlying formation that may have a bearing on the proposed development. These recommendations will assist with the final design and construction of the project as planned.

## I.3. Scope of Services

The geotechnical investigation for this project involved drilling, laboratory testing, and geotechnical design. This investigation outlines the following tasks:

- Review of available published and unpublished geotechnical, geological, and seismological reports and maps pertinent to the site;
- Field exploration program consisting of advancing of two (2) borings and two (2) Cone Penetration Tests (CPT)
- Logging of borings during the field exploration
- Field testing consisting of Standard Penetration Tests (SPT), CPT, and shear wave velocity measurements
- Laboratory testing of representative soil samples obtained from the exploratory borings;
- Evaluation of data obtained from the above and perform engineering analyses; and,
- Preparation of this report describing the field investigation, summarizing the results of

laboratory testing and engineering analyses, and providing appropriate specific recommendations for site development and foundation design.

## II. REVIEW OF RELEVANT GEOTECHNICAL REPORTS

The following relevant geotechnical investigation reports completed for the Baldwin Park Medical Center were reviewed:

- HDNGEO, Project No. 1904.1, dated November 20, 2020, “Campus-wide Site Classification and Ground-Motion Studies, Kaiser Permanente Baldwin Park Campus, Baldwin Park, California, for HMC Architects”.
- HDNGEO, Project No. 1904, dated October 3, 2019, “Limited Geotechnical Investigation Report, KPB SBPK IMP BPCP Standby Emergency Power (SEP) Utility Power Upgrade L00850205, Baldwin Park, California, for HMC Architects”.
- LeRoy Crandall and Associates, Project No. AE-86183, dated September 4, 1986, “Report of Geotechnical Investigation, Proposed Medical Center Development, Baldwin Park Boulevard between Dalewood Street and Bess Avenue, Baldwin Park, California, for Kaiser Permanente".
- LeRoy Crandall and Associates, Project No: LCA L89027.AB, dated Feb 16, 1989,“Report of Supplementary Foundation Investigation, Proposed Medical Center Development, Baldwin Park Boulevard Between Dalewood Street and Bess Avenue”.
- LeRoy Crandall and Associates, Project No: LCA L89027.AE, dated May 13, 1992, “Supplement Exploration Borings, Proposed Parking Structure, Dalewood Street and Bess Avenue”.

These report indicate that the existing structures are founded on footings bearing on either native soils or compacted fill. Although the project site is mapped within a potentially liquefiable area, it was concluded that the subsoils were not liquefiable.

## III. SITE AND PROJECT DESCRIPTION

### III.1. Site Description

The Kaiser Permanente - Baldwin Park Medical Center campus is currently occupied by a five (5) story parking structure, hospital building with full basement, medical office buildings (MOB), CUP and other supporting structures. This facility is bounded by the I-10 Freeway and Dalewood Street to the North, Baldwin Park Boulevard to the Southeast, Bess Avenue to the Southwest and Leorita Street to the Northwest. The facility is neighbored by residential developments along Bess Avenue, and commercial developments along Baldwin Park Boulevard.

The site is relatively flat and occupied by the structures, noted above, paved parking, driveways and walkways that consist of asphaltic concrete and concrete pavements. The property sheets flow toward the street and nearby drainage system.

### III.2. Project Description

Based on the layout plan provided, the expansion of existing Emergency Department is at-grade and planned to have a footprint of approximately 22,500 square foot including new ambulance canopy and supporting facilities.

Column dead and live loads are approximately between 66 and 360 kips that was provided by structural engineer.

## IV. SITE INVESTIGATION

### IV.1. Subsurface Exploration Program

The field investigation consisted of advancing CPTs, borings and geophysical surveys, at the approximate locations shown on the Site and Exploration Locations Plan, Figure A-2, Appendix A. The borings and CPTs were located in the field using a Trumeter 550SE measuring wheel; therefore, these locations should be considered accurate only to the degree implied by the method used.

Two (2) CPT's were advanced on October 15, 2021, to a maximum depth of thirty-nine (39) feet and refusal was obtained at all CPT locations. The CPT Plots are presented in Appendix B, Figures B-4 thru B-5, inclusive.

Two (2) borings were also advanced on October 25, 2021, to a maximum penetration depth of fifty-six and one-half (56.5) feet below existing ground surface. The borings were advanced with a truck-mounted CME-75 drill rig fitted with hollow-stem augers. All borings were hand-augured in the upper four (4) feet. The Log of Borings, together with Key To Boring Logs are given in Appendix B, Figures B-1 thru B-3, inclusive.

The geophysical survey consisted of one array line that utilized multi-channel array surface wave (MASW) methods. The geophysical survey lines were carried out to obtain the shear wave velocity profile of the subsoils and were completed on October 25, 2021.

Relevant boring from the previous investigation (LeRoy Crandall and Associates) are presented herein as Figure B-6, inclusive, Appendix B.

In-situ testing consisted of the Standard Penetration Test (SPT) at boring location, Cone Penetration Test (CPT), and geophysical method are described below:

- The SPT test (ASTM D 1586) involves failure of the soil around the tip of a split spoon sampler for a condition of constant energy transmittal. The split spoon, two (2) inches outside diameter and one and three-eighths (3/8) inches inside diameter, is driven eighteen (18) inches and the number of blows required to drive the sampler the last foot is recorded as the "N" value, or SPT blow count. The driving energy is provided by a 140 pound weight dropping thirty (30) inches.
- The Cone Penetration Tests (CPT's) were performed in accordance with ASTM D 3441. The CPT equipment consists of a cone assembly mounted at the end of a series of hollow sounding rods. A set of hydraulic rams is used to push the cone and rods into the soil, and a continuous record of cone tip resistance, friction resistance and pore water pressures versus depth is obtained in digital form at the ground surface. A specially designed truck is used to transport and house the test equipment and to provide a ten (10) ton reaction to the

thrust of the hydraulic rams. Near-continuous CPT records provide: approximate correlations with soil classification; relatively accurate definition of the thickness of various soil layers; subsoils data for liquefaction and seismic settlement analyses; and, engineering properties of the subsoils for static settlement analyses

- A geophysical survey line utilizing multi-channel array surface wave (MASW) methods were completed to obtain the shear wave velocity profile of the subsoils. Discussion of field procedures, geophysical techniques, data processing and interpretation, and the results of the geophysical survey are given in Appendix B.

Soil sampling consisted of:

- Collection of bulk samples at retrieved from auger spoils;
- Collection of split spoon samples from Standard Penetration Test (SPT), and;
- Collection of soil samples at selected locations using a Modified California Sampler (MCS). The soil samples were retained in a series of brass rings, each having an inside diameter of 2.41 inches and a height of one (1) inch. These ring samples were placed in close-fitting, moisture-tight containers for shipment to the laboratory.

## IV.2. Laboratory Testing Program

The samples obtained during the field program were returned to the laboratory for visual examination and testing. Laboratory tests were performed on selected samples obtained from the borings in order to aid in the soil classification and to evaluate pertinent engineering properties of the foundation soils. The soils were examined and classified in accordance with ASTM D 2487 and D 2488. The laboratory testing program consisted of the following:

- In-situ Moisture Content and Dry Density (ASTM D 2216 and 2937);
- Material passing No. 200 (ASTM D 422);
- Particle sieve analysis of soils (ASTM D 4318);
- Direct shear test of soils (ASTM D 3080);
- Consolidation Tests (ASTM D 2435);
- Expansion Potential (ASTM D 4829);
- Maximum Dry Density and Optimum Moisture Content (ASTM D 1557);
- Resistance “R”-Value (CT 301); and,
- Water soluble sulfates (ASTM D4327), pH (ASTM D4972), electrical resistivity (ASTM G187) and water soluble chlorides (ASTM D4327).

The laboratory test results from this investigation and previous investigations (LeRoy Crandall and Associates) are presented on Appendix C and appropriate results are also presented on Logs of Boring, Appendix B, where applicable.

# V. GEOLOGIC SETTING

## V.1. Regional Geology

The subject site is located within the Southwest portion of the Central Basin of the Los Angeles Coastal Plain, within the Peninsular Ranges Geomorphic Province of California. The Los Angeles Coastal Plain is situated between the Santa Monica Mountains to the Northwest, the San Gabriel Mountains to the Northeast, the Santa Ana Mountains to the Southeast, and the Pacific Ocean to the West and south. The Los Angeles Basin is dominated by northwest-trending faults and adjacent anticlinal uplifts. The intervening deep synclinal troughs are filled with poorly consolidated Upper Pleistocene and unconsolidated Holocene sediments. Tectonism of the region is dominated by the interaction of the East Pacific Plate and the North American Plate along a transform boundary.

The near-surface deposits in the vicinity of the subject site are indicated to be composed of recent alluvium consisting of unconsolidated sands and silt derived from erosion of local mountain ranges. Deposits encountered on the subject site during exploratory drilling are discussed in detail in this report. Figure A-3, Appendix A, presents the Regional Geologic Map.

Numerous moderate to large earthquakes have affected the area of the subject site within historic time. Based on the proximity of several dominant active faults and seismogenic structures, as well as the historic seismic record, the area of the subject site is considered subject to relatively high seismicity.

The seismic hazard most likely to impact the site is ground shaking due to a large earthquake on one of the major active regional faults, including the San Andreas Fault Zone (35 miles to the East); or a minor fault that is closer. Review of the Fault Map of California (CGS, 2010), indicates the Raymond Fault Zone is located approximately 10.2 km (6.3 miles) north and the Whittier Fault Zone is located approximately 9.6 km (6 miles) to the south of the subject site.

## V.2. Site Geology

According to LCA (1989), the geotechnical field investigation, was conducted at the Baldwin Park Medical Center, consisted of advancing twenty-three (23) bucket auger borings to maximum depth of fifty and a half (50-1/2) feet. Based on LCA's findings, shallow fill, where encountered, were between one (1) to fourteen (14) feet as a result of flood control measures and past grading.

Native subsurface soils below the fill to consisted of silty sand to poorly-graded sand from ground surface to approximately twelve (12) feet below ground surface (bgs). Below this layer, sand is in dense state with varying amounts of gravels and cobbles at some locations. Thin silt lenses were encountered at approximate depth of 15 feet and 31 feet and have up to one foot thickness at few locations. The silty sand layers were fine- to medium-grained and medium dense to dense. The poorly graded sand was fine to medium-grained and dense to very dense.

The interpreted surface distribution of geologic materials encountered during the site investigations are illustrated in Figure A-2, Appendix A. Geologic Sections A-A’ and B-B' across the ED Expansion site are given on Figure A-4, Appendix A.

# VI. SUBSURFACE CONDITIONS

## VI.1. Subsoil Conditions

Surface cover consisted of approximately 8-inch thick of concrete was encountered at boring and/or CPT locations. Based on the observations at exploration locations, the generalized stratigraphic profile of up to eight (8) feet of fill/loose soils overlying medium dense to dense, poorly graded sand to approximate depth of twenty (25) feet. Below this depth, it is underlain by dense sands to maximum depth of exploration, fifty-six (56) feet. Occasionally, gravelly layer was observed B-1 and B-2 at depth of ten (10) and forty-five (45) feet, respectively, to have thickness of about five (5) foot. Also, loose seams that may contain siltier materials were noted in the boring and CPT logs.

Laboratory test results indicate that the subsoils at the site possess a “very low” expansion potential based on soil index properties and visual classification. It should be noted that the native silty sands and sands can be friable, which may require formwork to construct footings and measures to maintain temporary cut slope stability.

## VI.2. Regional Groundwater Conditions

According to Figure F-4 of Appendix F, South Coast Hydrologic Region, depicting the location and extent of the different groundwater basins and sub-basins identified by the Bulletin 118 issued by the California Department of Water Resources (CADWR, 2020 and 2004), the general vicinity is located within the San Gabriel Valley Groundwater Basin (Basin Number 4-013) of eastern Los Angeles County of Section 24 of Township 1 south, Range 11. This basin is one of the more important sources of ground water in Southern California.

According to CADWR (1966) and DWR (2016), the two main geologic units underlying the Medical Center have been grouped in Holocene and Pleistocene Alluvial Deposits and the underlying Pleistocene San Pedro Formation. The Holocene Alluvium generally forms alluvial fans along the San Gabriel Mountains and stream deposits that follow the course of the major streams and rivers across the valley. This young alluvium reaches 100 feet in thickness and although is typically above the water table, allows effective percolation of surface water in the basin. Upper Pleistocene alluvium deposits form most of the productive water-bearing deposits in this basin. They consist of unsorted, angular to sub-rounded sedimentary deposits ranging from boulder-bearing gravels near the San Gabriel Mountains to sands and silts in the central and western parts of the basin. The lower Pleistocene San Pedro Formation consists of interbedded marine sand, gravel, and silt (DWR 1966). This formation bears fresh water and reaches a maximum thickness of about 2,000 feet and may grade eastward into continental deposits indistinguishable from the overlying Pleistocene age alluvium (DWR 1966).

## VI.3. Site Groundwater Conditions

Groundwater was not encountered during this investigation and previous (LCA) at the borehole locations, to maximum drilled depth of fifty-six (56) and forty (40) feet, respectively, at the time of the exploration. Notwithstanding the above, it is not uncommon for groundwater or seepage conditions to develop where none previously existed. In this respect, groundwater conditions may be altered by geologic detail between borings, by seasonal and meteorological variations, and by construction activity.

According to information obtained from California Department of Water Resources, groundwater was reported at an elevation of 185 ft. MSL (+/- 130 feet below ground surface on

1-1-2021), Station 340659N1179899W001, located approximately 0.1 miles west (near Bess Ave. and Frasier St.) of the subject site (DWR, 2021).

Historic highest groundwater level contours, shown on the Baldwin Park Quadrangle, Plate 1.2 of the Seismic Hazard Zone Report 022 prepared by the California Geological Survey published in 1998, indicates a historic high groundwater level of fifteen (15) feet below existing grade at the site location. This plate is reproduced herein as Figure A-5 and this groundwater level is used to evaluate the liquefaction potential and seismic settlements.

## VII. EARTHQUAKE AND SEISMIC DESIGN CONSIDERATIONS

### VII.1. Regional Faulting

The Alquist-Priolo Geologic Hazards Zones Act went into effect in March, 1973. Since that time, the act has been amended 10 times (Hart, 1994). The purpose of the Act, as provided in DMG Special Publication 42 (SP 42), is to prohibit the location of most structures for human occupancy across the traces of active faults and to mitigate thereby the hazard of fault-rupture." An earthquake fault zone is defined by the CGS as an area that requires a “special study” and is generally one-quarter mile wide and inclusive of the active traces of an earthquake fault. The act was renamed the Alquist-Priolo Earthquake Fault Zoning Act in 1994, and at that time, the originally designated "Special Studies Zones" was renamed the "Earthquake Fault Zones." The subject site is not located within an Earthquake Fault Zone.

An active earthquake fault is defined by the CGS as a "sufficiently active and well-defined fault" that has exhibited surface (crustal) displacement within the Holocene-age, approximately the last 11,700 years before present (YBP). Further, a sub-category of active faulting is defined as Historic-age (displacement within the last 200 YBP). A potentially active fault is defined by the CGS as an earthquake fault with a history of displacement within the Pleistocene-age (between 11,700 and 1.6 million YBP). Any geologic fault without surface displacement within the last 1.6 million YBP is considered inactive.

The closest known active faults to the site are the Whittier Earthquake Fault Zone and Raymond Hills Fault Zone. The San Andreas Earthquake Fault Zone is further away but poses a significant seismic risk to be mentioned. A California Fault Map (CGS 2010), showing the geographic relationship of these faults to the subject site is presented in the attached Appendix A as Figures A-6, Regional Fault Map and Figure A-7, Vicinity Fault Map; a brief description of these faults are provided below.

#### VII.1. Raymond Fault Zone

The Raymond Earthquake Fault Zone (Raymond Fault) is located approximately 10.2 km (6.3 miles) to the north-northwest of the Medical Center (USGS, 2008). The Raymond Fault extends southwesterly from the Sierra Madre Fault at the base of the San Gabriel Mountains. The length of the Raymond Fault is approximately 22 km long (Treiman, 2000c and USGS, 2008). The Raymond Fault is a left-lateral reverse-oblique fault that dips steeply (approximately 75 degrees) to the North (CGS, 2016a and Treiman, 2000c). The fault forms a gentle arc, convex toward the South across the alluvial deposits of the San Gabriel Valley. The Raymond Fault is best expressed in the San Marino to South Pasadena area, where it forms a prominent escarpment up to 100 to 150 feet high.

The most recent major surface rupture on the Raymond Fault occurred in Holocene

time, sometime about 1,000 to 2,000 years ago (Crook et al., 1987; Weaver and Dolan, 2000). The recurrence interval for surface rupture may be about 3,300 years (Dolan et al., 2000b and Weaver and Dolan, 2000). A large earthquake occurred north of the subject site (1988 Pasadena Earthquake) with a magnitude of 5.0. This earthquake was a strike-slip event interpreted by Jones et al. (1990) to have occurred on the Raymond Fault.

Currently, there is little consensus on the rate of slip. Geological trenching studies across the fault scarp indicate average slip rates between 0.1 and 0.4 mm/year (Dolan et al., 2000b). More recently, the rate of slip has been estimated to be about 1.5 mm/year, based on regional tectonics (Treiman, 2000c; CGS, 2016a; and USGS, 2008).

The maximum earthquake estimated by the CGS (2016a) and the USGS (2008) is in the range of MW 6.5 to 7.0. Weaver and Dolan (2000) estimated a maximum earthquake of MW 6.7. Assuming rupture of the entire fault (approximately 22 km), from the San Gabriel Mountains to the Santa Monica Mountains, an MW 6.7 event is estimated to be a worst-case scenario.

Fault trench studies across the Raymond Fault indicate average slip rates between 0.1 and 0.4 mm/year (Dolan et al., 2000b). More recently, the rate of slip has been estimated to be about 1.5 mm/year, based on regional tectonics (Treiman, 2000c; CGS, 2016a; and USGS, 2008). The maximum earthquake estimated by the CGS (2016a) and the USGS (2008) is in the range of magnitude 6.5 to 7.0. Weaver and Dolan (2000) estimated a maximum earthquake magnitude of 6.7.

**VII.2.** Whittier Fault Zone

The Whittier Fault Zone is located approximately 9.6 km (6 miles) to the south of the Medical Center. The Whittier Fault Zone is a right- lateral strike slip feature with some reverse slip; this northwest-trending fault projects into the eastern margin of the Los Angeles Basin and to the east-southeast it intersects the Glen Ivy segment of the Elsinore Fault Zone near the Santa Ana River (Treiman, 1998a). The Whittier Fault Zone averages one thousand (1,000) to two thousand (2,000) feet in width and is made up of many sub-parallel and en-echelon fault splays, which merge and branch along their course. Northwest of Horseshoe bend (Santa Ana River), the trace of the Whittier Fault Zone separates strata of the Puente Formation exposed on the North side from younger strata of the Puente and Fernando formations on the south side (Durham and Yerkes, 1964). In addition, this fault zone apparently cuts Holocene deposits as far north as Brea Canyon (Ziony and Jones, 1989). The Whittier Fault Zone is approximately thirty-eight (36) km long (USGS, 2008).

Although the recurrence interval between major ruptures is not well known for the Holocene-age Whittier Fault Zone, the SCEC (1995) indicates that the most recent events occurred at Olinda Oil field; and is estimated at between 1,400 - 2,200 years before present (YBP) and 3,000 - 3,100 YBP, respectively. Additionally, it was estimated that at least 1.9 m of dextral slip was produced in the most recent event from direct measurements of a laterally displaced channel. Based on this preliminary paleoseismic data, the SCEC (1995) estimated a slip rate of 2.5 ± 1.0 mm/yr and indicated that a minimum recurrence interval of 1,400 years for the Whittier Fault Zone. However, the USGS (2016a) assigns a slip rate of 3.2 mm/yr to The Whittier Fault Zone for calculation of the seismic hazard in Southern California.

### VII.3. San Andrea Fault Zone

The San Andrea Fault Zone is located approximately 43 kilometers north-northeast of the site. The San Andrea Fault trends over 600 miles northwest from the Gulf of California in Baja, Mexico to Bodega Bay, California. It's the largest and most active earthquake fault in California and identified locally by individual (contiguous segments) fault traces along which movement has occurred at various times in the past. Most of the fault traces of the San Andreas Fault Zone in Southern California are considered to be historically active (displacement in the past 200 years); and a minor amount are believed to have less recent activity. The US Geological Survey has estimated the probability of a ten to thirty percent potential for a 7.5 or more magnitude quake along the southern portion of the San Andreas fault within the next five to thirty years (LACSE, 2021). This fault is thought to be capable of producing a magnitude of 8.2 (USGS, 2008).

## VII.4. Historic Earthquakes

Since 1932, the Southern California Earthquake Caltech/USGS Southern California Seismic Network (SCSN) has recorded and located over 470,000 earthquakes. The catalog includes three M >7 mainshock–aftershock sequences, as well as data from another three (M 6.4, M 6.7, and M 6.7) mainshocks that caused major damage in the Los Angeles area.

On average, the catalog is complete for Mc ≥ 3:2 since 1932 and Mc ≥ 1:8 since 1981, with exceptions in the early hours or days of large aftershock sequences and regions along the edges of the network. The overall seismicity rate has remained fairly constant, except for major aftershock sequences.

The overall spatial and temporal seismicity patterns do not correspond well to high slip-rate late Quaternary faults, suggesting that the cause of small and major earthquakes may be different. Small earthquakes have historically been much more widely distributed geographically than the major earthquakes (M >7:5), which have been confined to late Quaternary mapped faults.

The SCSN data and the catalog have served as major resources for seismology research and civic and emergency planning and response, public outreach, and public consciousness on the subject of earthquake preparedness. A California Historical Earthquakes Map (CGS, 2021), showing the major earthquakes since 1769 with magnitude of 6.o or greater have occurred within 100 km of the project site is presented as Figure A-8.

## VII.5. Site Accelerations

### VII.5.1. Site Coordinates

The project site's latitude and longitude are 34.0655 degrees north and 117.9855 degrees west, respectively.

### VII.5.2. Site Classification

Based on the field investigation and geophysical shear wave profile (Figure A-9) indicate that the project soils are Site Class D; however, the subsoils are liquefiable and subject to seismic induced settlements as discussed in later section of this report. Therefore, the subsoils are considered Site Class F, unless the structure has fundamental period of less than or equal to 0.5 seconds.

Based on discussion with project Structural Engineer, the one story (1) expansion will have a

fundamental period of less than 1/2 seconds. According to ASCE 7-16, Chapter 20, subsection 20.3.1, exception "…a site class is permitted to be determined in accordance to Section 20.3 and the corresponding values of Fa and Fv are determined from Table 11.4-1 and 11.4-2."

Therefore, the project site is considered as Site Class "D - Stiff Soil" for the upper 100 feet as defined in Table 1613.5.2 of 2019 CBC.

Since the project subsoil is Site Class D and $S_1 > 0.2$, a site-specific ground motion hazard analysis (GMHA) report (HDNGEO, 2020) was completed and approved by CGS/HCAI (OSHPD No. 210020-19) for non-structural component. It's in our opinion the referenced GMHA report is considered valid for proposed ED Expansion project based on the following:

- Site-Specific geotechnical investigation was carried out and addressed in this report according to CBC Section 1803A.2
- Geohazard including site geology, evaluation active and potentially active faults, and ground motion parameters are prepared in according to CGS Note 48 Checklist and CBC Section 1806A.3

### VII.5.3. Seismic Design Category

The mapped spectral response acceleration parameter at one (1)-second period, $S_1$, is 0.627 g which is less than 0.75 g and the structure is considered to be Risk Category IV. According to Section 1613.2.5 of CBC 2019, for $S_{DS} \geq 0.50$ g then Seismic Design Category D should be used for the design of the proposed structure.

### VII.5.4. Seismic Hazard Deaggregation

Relative contributions of various combinations of earthquake magnitudes and distances to a particular seismic hazard at a site are determined using deaggregation of the seismic hazards. A probability distribution is established for all sources and either the mean or modal values of M and R are determined. The mean deaggregation provides the weighted mean values of M and R for all sources that contribute to the hazard. The modal value yields the M and R pair having the largest contribution in the hazard deaggregation of each grid location. Deaggregation of Magnitude-Distance (M-R), obtained from the online USGS web application, "Unified Hazard Tool," indicates that mode M-R for project site of M7.72 and source-to-site distance of 11.14 km to specify the peak ground acceleration. A magnitude of M7.72 was used in the liquefaction and other soil seismic analyses for the project site as applicable.

## VII.6. Earthquake Effects

### VII.6.1. Liquefaction

Liquefaction occurs when very wet soil is affected by strong ground motion. Soil particles (loose granular and low-plastic fines) shift and separate during shaking. This reduces the ability of the ground to support the building on top of it, and may cause foundations to separate and buildings to sink.

Factors considered to evaluate liquefaction potential include groundwater conditions, soil type, particle size distribution, earthquake magnitude and acceleration, and soil density obtained through the Standard Penetration Test (SPT). Soil subject to liquefaction composed of saturated fine-grained sand to coarse silts. Coarser-grained soils are considered free-draining and therefore dissipate excess pore water pressure, while fine-grained soils posses undrained shear strength.

The Seismic Hazards Zones Map (Figure A-10) obtained from USGS, The National Map online web application, that digitized from CDMG for the Baldwin Park Quadrangle, released in March 25, 1999, indicated the project site is located within an area where historic occurrences of liquefaction, or local geological, geotechnical and groundwater conditions would indicate permanent ground displacement due to liquefaction. The published historic highest groundwater level of fifteen (15) feet below existing grade (Figure A-5, Appendix A) would indicate the potential for liquefaction below this depth. Liquefaction analyses presented in Appendix D confirm that the subsoils at the site are liquefiable.

Liquefaction analyses were conducted using methods recommended by Idriss and Boulanger (IB2008) and the soil stratigraphy obtained from borings drilled for the current site investigation. CPT boreholes were not deep enough to conduct liquefaction analyses. For these analyses, a $PGA_M$ = 0.748 g from site-specific GMHA (HDNGEO, 2020) and earthquake magnitude of 7.72 Mw from preceding deaggregation were used.

### VII.6.2. Seismically Induced Settlement

Based on the examination of the subsoils conditions, seismic settlement for saturated and unsaturated sands were performed as recommended by IB2008 and Pradel 1998, respectively. The results of the liquefaction analyses are presented in Appendix D. The total seismically induced settlements at the project site are not anticipated to exceed 2 inches, According to the Guidelines for Evaluating and Mitigating Seismic Hazards in California (SP 117A, 2008) and 2019 CBC, structural mitigation may be acceptable if considered appropriate by project structural engineer or regulating agency.

### VII.6.3. Tsunamis/Seiche, Inundation, and Flooding

A tsunami is a seismic sea wave that inundates the coastal land and is typically caused by large earthquakes that displace oceanic crust. The subject site is located over 25 miles from the Pacific Ocean at a vertical elevation of over 300 feet MSL; the tsunami hazard is considered low for the subject site.

A seiche is a wave that occurs within a terrestrial body of water that may be a result of an earthquake or landslide. In a dam or reservoir, a seiche that breeches the spillway or causes collapse, presents an inundation hazard to the downstream areas. The subject site is not located near a dam or reservoir and the inundation hazard due to seiche is considered low.

The site is located downstream at approximately five (5) miles to the southwest of the Santa Fe Dam. Dam failure due to secondary effects of an earthquake could adversely affect the site with the possibility of inundation.

According to the FEMA National Flood Hazard Layer web application, City of Baldwin Park Zone 06100, obtained on March 21, 2021, indicate that the project site is located in Zone X, area of minimal flood hazard as shown on FEMA Flood Map, Figure A-11.

### VII.6.4. Surface Rupture

Surface rupture occurs when movement on a fault breaks through to the surface. Rupture may occur suddenly during an earthquake or slowly in the form of fault creep. Fault rupture almost always follows preexisting faults, which are zones of weakness. Although, project area is not located within an Alquist-Priolo Earthquake Fault Zone (APEFZ) according to Seismic Hazard Zones Map (Figure A-7), the closest APEFZ is the Whittier Fault that is approximately within 6 mile of project site.

### VII.6.5. Landsliding

A landslide is the downhill movement of ground caused primarily by gravity acting on weakened rock or soils. Many things can contribute to a landslide: erosion, ground water, human activity such as grading, vibrations from earthquakes. The site lies far enough from the nearest significant upland slopes to preclude the hazards of induced landsliding.

### VII.6.6. Lateral Spreading

Lateral spreading typically occurs in sloping ground or level ground close to waterways or open face. When the underlying soils liquefy then the liquefied soil mass ('heavy liquid') will naturally move down-slope and will continue this movement until equilibrium is re-established. The topography of the project site, in the immediate vicinity of the site is relatively flat, therfore, the potential for lateral spreading at the subject site is also considered very low.

### VII.6.7. Subsidence

Subsidence refers to the sudden sinking or gradual downward settling and compaction of soil and other surface material with little or no horizontal motion. It may be caused by a variety of human and natural activities, including earthquakes. It is our opinion that the potential hazard associated with subsidence at the property is very low.

## V. CONCLUSIONS

It is our opinion that the site is geotechnically suitable for the proposed development provided that the geotechnical recommendations presented herein are incorporated in the plans and specifications, and properly carried out in the field during construction. The following presents a summary of the findings:

- Based on observations at the boring and CPT locations, the generalized stratigraphic profile consists of fill/loose soils for the upper eight (8) feet underlying by medium dense to dense sands to depth of twenty-five (25) feet. Below this depth is dense sands to depth of forty-five (45) feet then become sandy gravels to maximum depth of exploration. Soft layer was encountered at depth of 50 feet for B-2 location.
- Groundwater was not encountered at the site to the maximum depth of exploration and is judged to be in excess of fifty-five (55) feet at this time. Published historic highest groundwater level is fifteen (15) feet below existing grade.
- The project soil profile is considered as Site Class D — Stiff Soil per CBC 2019, based on geophysical survey line result of average shear wave velocity of 329 m/s for the upper 100 feet of subsoils.
- The project site is not mapped in an area susceptible to subsidence, landslides, or current City of Baldwin Park/State of California APEQFZ.
- The project site is mapped in liquefiable zone and subject to seismic induced settlements up to 2 inches. Based on Guidelines for Evaluating and Mitigating Seismic Hazards in California (SP 117A, 2008), structural mitigation may be acceptable if considered appropriate by the Structural Engineer and HCAI/CGS.
- Deep foundation will be used to support the proposed structure.

- The FEMA flood map shown the site to be in Zone X, an area of minimal flood hazard.

## VI. SITE AND DEVELOPMENT RECOMMENDATIONS

### VI.1. General

The proposed development, outlined in subsection II.2, is feasible from a geotechnical engineering standpoint. Project plans and specifications should take into account the appropriate geotechnical features of the site and conform to the recommendations of the geotechnical report.

### VI.2. Clearing

Prior to earthwork or construction operations, initial site preparation should include stripping of any vegetation, removal of existing structures and foundations, concrete and asphalt pavement, floor slabs and underground construction. If encountered during site development, all remnants of prior structures should be removed.

The existing fill soils, where removed, may be re-used as structural fill provided that they do not contain any deleterious materials or particles over six (6) inches in largest dimension. Topsoil and soils with organic inclusions are not considered suitable for reuse as structural fill, but it may be stockpiled for future landscaping.

Underground facilities such as utilities, pipes or underground storage tanks may exist at the site. Removal of underground tanks is subject to state law as regulated by County or City Health and/or Fire Department agencies. If storage tanks containing hazardous or unknown substances are encountered, the proper authorities must be notified prior to any attempts at removing such objects.

Septic tanks should be removed in their entirety. Cesspools or seepage pits should be pumped of their contents and backfilled with a 2-sack sand-cement slurry. Any wells, if encountered during construction, should be exposed and capped in accordance with the requirements of the regulating agencies.

Depressions resulting from the removal of foundation of existing structures, buried pipes, obstructions and/or tree roots should be backfilled with properly compacted material.

### VI.3. Subgrade Preparation

Subgrade preparation will not be required since the structure is placed on a structural slab.

The subsoils beneath the walkways, driveways, patios and pavement areas should be overexcavated to facilitate construction of a two (2) foot thick compacted fill blanket. The lateral extent of overexcavation should be at least equal to the depth of fill. This alternative may be considered, provided that future maintenance as a result of excessive settlement of the underlying “loose” soils can be tolerated. Alternatively, one option to mitigate the potential adverse effects is to remove and replace these soils.

Construction activities and exposure to the environment can cause deterioration of the subgrade. Therefore, it is recommended that the final condition of the subgrade soils be observed and/or tested by HDNGEO field personnel, immediately, prior to slab construction.

## VI.4. Engineered Fill

Fill materials generated from the on-site soils are suitable for placement as compacted fill provided they are free of oversized rock greater than six (6) inches in largest dimension, expansive clay, organic materials, and deleterious debris.

Prior to placing any fill, the exposed soils bottom should be scarified to a minimum depth of 8- to 10-inches and moisture-conditioned (wetted or dried) to at least optimum moisture content and compacted to a minimum of ninety (90) percent relative compaction based on ASTM D 1557.

Engineered fill should be moisture-conditioned (wetted or dried) to at least optimum moisture content and compacted to a minimum of ninety-five (95) percent of the maximum dry density as determined by the modified Proctor (ASTM D1557). Fill should be placed in maximum lifts of 8-inches for granular soil and 6-inches of loose material for cohesive soils. Each lift should be tested prior to placement of subsequent lift. For cohesive soils, moisture-conditioning should be between 2-4 percentage points above optimum moisture content and near-optimum moisture content for granular fill.

Import soils should be predominantly granular and non-expansive materials (Expansion Index ≤ 30) with sufficient fines of 20 percent (relatively impermeable when compacted). In addition, low corrosivity material is defined as having a minimum resistivity of more than 2,000 ohm-cm when tested in accordance with California Test 643, unless defined otherwise by the corrosion consultant. Our engineer should be notified minimum of 3 days in order to evaluated the laboratory testing of import material at the borrow site for its suitability as fill prior to importation.

## VI.5. Shrinkage

The on-site soils will undergo some volume change when excavated and replaced as properly compacted fill. Since an accurate determination of in-place and compacted densities cannot be made over the entire project area, accurate earthwork shrinkage estimates cannot be provided. Based on our experience with similar soils, a shrinkage value in the order of ten (10) to fifteen (15) percent may be used as a guideline for the on-site soils.

## VI.6. Surface Drainage

Proper site grading and foundation drainage strategies are required to enhance future site performance. Positive surface drainage is defined as a minimum slope of 5 percent for a distance of at least 10 feet direct surface water away from structure and toward the street or suitable drainage facilities. All roof drains should be connected to solid pipes discharging to the curb or other suitable drain area. It is important that drainage be directed away from foundations and that proper drainage patterns be established at the time of construction and maintained throughout the life of the structures.

Landscape areas within ten (10) feet of the building perimeter should consist of planters that have sealed bottoms and bottom drains to prevent infiltration of water into the adjacent foundation soils. The surface of the ground in these areas should also be maintained at a minimum gradient of five (5) percent towards surface area drains.

Care should be exercised in controlling surface runoff onto permanent and temporary slopes. The area back of slope crests should be graded such that water will not be allowed to flow freely onto the slope face. If excavations of temporary slopes are carried out in the rainy

season, appropriate erosion protection measures may be required to minimize erosion of the slope cuts.

## VI.7. Temporary Excavations

Temporary construction excavations are anticipated adjacent to the existing structures and for construction of utility trenches and foundations.

### VI.7.1. Unsupported Excavations

Temporary excavation depth of approximately four (4) feet below grade may be cut vertically without shoring. Temporary unsurcharged excavations up to fifteen (15) feet high in level ground surface may be sloped back at 1H:1V (Horizontal:Vertical) or Hatter without shoring where the necessary space is available. No surcharge loads should be permitted within a horizontal distance equal to the height of cut from toe of excavation unless the cut is properly shored. Adjacent to existing buildings, the bottom of unshored excavations should not extend below a plane drawn at 1H:1V (Horizontal:Vertical) downward from the foundations of the existing buildings and underground pipelines unless the cut is properly shored. The exposed slope face should be kept moist (but not saturated) during construction to reduce local sloughing.

All excavations and shoring systems should meet, as a minimum, the requirements given in the State of California Occupational Safety and Health Standards. Stability of temporary slopes is the responsibility of the contractor.

## VI.8. Trench Backfill

Buried utilities and lifeline services should have ductile or flexible connections at the entry point to the structure to accommodate the large movements and settlements that can occur due to liquefaction.

The on-site soils may be used as trench backfill materials provided that it's free from oversized rock of greater than 6-inches in largest dimensions. Utility subgrade should be confirmed to be free of standing water, firm, and unyielding prior to placement of bedding material. It is our opinion that utility trench backfill could be placed and compacted by mechanical means. Trench backfill above pipe bedding may consist of approved, on-site or import soils placed in lifts no greater than 8 inches loose thickness and compacted to 90 percent of the maximum dry density , as determined by Modified Proctor (ASTM D1557).

The Contractor shall follow all Cal/OSHA requirement for safety of trench excavations.

## VI.9. Excavatability

Based on our experience with similar projects developed on similar type of natural materials and on the excavation of exploratory test borings, the materials may be excavated with conventional earth moving equipment. Very dense granular soils with gravel and cobbles could require special excavation equipment and greater effort.

# VII. FOUNDATION RECOMMENDATIONS

## VII.1. General

The following recommendations have been formulated from visual, physical and analytical considerations of existing site conditions and are believed to be applicable for the proposed development.

The subsoils are prone to liquefaction and subject to seismic induced settlement. As discussed with project team, structural mitigation by deep foundation will be used to support the proposed structure in lieu of ground improvement or overexcavation and recompaction and this is considered appropriate.

Foundation and slab reinforcement configurations should meet, as a minimum, the requirements of the governing agencies or CBC 2019.

## VII.2. Drilled, Cast-In-Place Concrete Piles

Drilled, cast-in-place pile (drilled piles) may be used to support the proposed structure. Drilled piles can be have a 36-inch diameter and pile length was determined by Project Structural Engineer as appropriate. These piles should extend into dense non-liquefiable sands encountered at about fifty-five (55) feet below the ground surface as observed at boring locations. Piles should extend to non-liquefiable soil and account for downdrag forces on the foundation elements due to settlement within the upper liquefiable soils.

Piles should be structurally connected with grade beams to form one structural element. The bottom of grade beams should be at least 12 inches below pad grade or lowest existing grade.

### VII.2.1. Axial Capacity

The compressive axial capacity of drilled piles were estimated using the Beta method for cohesionless soils. The pile capacity is derived from skin friction and mainly end bearing. The subsoils at about depths of fifteen (15) to twenty (20) feet below existing grade, are prone to liquefaction and seismic-induced settlements during a design seismic event. At some locations, a liquefiable soil layer was also encountered at depth of fifty (50) feet. These piles would be subject downward drag forces as the soil surrounding the pile undergoes settlements and capacity should be neglected for upper fifty (50) feet below existing grade.

Pile axial capacities including uplift resistance and downdrag loads for drilled piles are presented on Figure A-12. Downdrag load should be deducted from total allowable capacity to obtain downward capacity.

The aforementioned allowable capacities, are for single piles spaced a minimum of three (3) diameters on center, and may be increased by one-third ($^1/_3$) for short-term wind and seismic loads. It is understood that only single pile per pile cap is planned. In the event that piles are spaced less than three (3) diameters on center, additional group capacity reduction effects should be taken into account in evaluating the allowable axial capacity of the pile groups, and these reduction factors can be provided upon request.

### VII.2.2. Lateral Load Resistance

Lateral capacities are dependent on pile length, pile diameter, pile head fixity, pile configuration and pile type. The parameters for a single pile subject to lateral loads are presented in Table I. Variations of lateral deflection, shear force and bending moment along free and fixed head piles

are provided on Figures A-13 thru A-14. In addition to the lateral load capacity developed by the piles, lateral capacity may be developed by passive resistance of the soils against the pile caps. An allowable lateral bearing pressure equal to an equivalent fluid weight of 250 pounds per cubic foot acting against the pile caps may be used, provided the pile caps are poured tight against the properly compacted fills or native soils.

**TABLE I — LATERAL LOAD DESIGN CRITERIA FOR 36-INCH**

| Pile Head Deflection | Free Head (in) | | Fixed Head (in) | |
|---|---|---|---|---|
| **60-Foot Length** | **0.25** | **0.5** | **0.25** | **0.5** |
| Lateral Capacity (kips) | 56 | 90 | 135 | 200 |
| Max. moment at pile head (ft-kips) | 0 | 0 | -915 | -1500 |
| Max. moment at pile shaft (ft-kips) | 300 | 575 | 220 | 330 |
| Depth to max. moment in shaft (ft) | 9 | 10 | 14 | 17 |
| Depth to first zero moment (ft) | 27 | 27 | 35 | 35 |

| **65-Foot Length** | **0.25** | **0.5** | **0.25** | **0.5** |
|---|---|---|---|---|
| Lateral Capacity (kips) | 56 | 92 | 138 | 205 |
| Max. moment at pile head (ft-kips) | 0 | 0 | -920 | -1550 |
| Max. moment at pile shaft (ft-kips) | 330 | 585 | 250 | 375 |
| Depth to max. moment in shaft (ft) | 9 | 10 | 14 | 17 |
| Depth to first zero moment (ft) | 27 | 27 | 36 | 36 |

### VII.2.3. Pile Settlement

A loaded pile foundation would undergo settlements from three sources such as elastic compression of the pile shaft, elastic compression of the bearing stratum on which the pile is supported and long-term settlement of the bearing stratum. The total settlement at the top of the pile will be the sum of settlements from the above.

Elastic compression of the pile shaft is dependent on the loading and structural properties of the pile material. Elastic compression and long-term settlement of the bearing stratum will depend on the loading and compressibility characteristics of the supporting stratum at the base of the pile and along the shaft. Moreover, some changes in properties of the soils and liquefaction of some of the soil layers may change values of the applied loads to the pile such as increasing downdrag load due to settlement of the soils surrounding the piles. If the piles are designed to the recommended allowable capacities, settlements of the piles are not expected to exceed one-half (1/2) inch under static loading conditions, and one and a quarter (1.25) inch due to liquefaction of the subsoils as a result of earthquake.

### VII.2.4. Construction Considerations

Precautions should be taken during pile excavations to reduce caving and raveling. The following recommendations are presented and should be followed, where applicable.

Piles should be installed under the full-time observations of HDNGEO.

Pile excavations should be filled with concrete as soon after drilling as possible. Pile excavations should not be left open overnight.

In the event of caving of soil or water seepage into the pile excavation, casing should be used. Casing may be pulled as the pile excavation is filled with concrete. The use of “wet" construction, such as "super-mud," is not recommended unless non-destructive testing is performed.

Allowance for cobbles and boulders should be made by the drilling contractor.

Concrete should be placed and vibrated throughout the full length of the pile so that no voids will exist in either the pile base or the shaft. Placement procedures, such as tremie, should be used so that the concrete is not allowed to fall freely more than five (5) feet and to prevent concrete from striking the walls of the excavations and possibly causing caving.

Where the drilling operation might affect the concrete in an adjacent pile (i.e., where pile spacing is less than three [3] diameters), drilling should not be carried out before the previously poured pile concrete has set for at least twenty-four (24) hours, or as permitted by HDNGEO.

### VII.3. Floor Slabs

A structural slab supported by pile caps and grade beams is planned for the proposed structure. Slabs in moisture sensitive areas should be dampproofed in accordance with CBC 2019, subsection 1805A.2.1 and floor base course per CBC Section 1805A.4.1 with minimum 4-inch crush rocks. The upper foot of subgrade should be scarified and re-compacted to a minimum ninety-five (95) percent relative compaction to provide uniform subgrade.

### VII.4. Minor Structure

Minor structures may be designed using the presumptive load-bearing values outlined in CBC 2019, provided that the risk of future settlements and associated maintenance can be tolerated.

### VII.5. Ultimate Value

The recommended design values presented in this report are for use with loadings determined by a conventional working stress design. When considering an ultimate design approach, the recommended design values may be multiplied by the factors given in Table I:

**TABLE II — ULTIMATE DESIGN LOAD FACTORS**

| Foundation Loading | Ultimate Design Loading |
|---|---|
| Drilled CIP Pile | 3 |
| Passive Pressure | 1.33 |
| Coefficient of Friction | 1.25 |

In no event, however, should the foundation sizes be reduced from those required for support of dead-plus-live loads when using working stress values.

## VIII. PAVEMENT SECTIONS

### VIII.1. Flexible Pavement

Based on a design R-value of fifty (50), the following alternative preliminary minimum pavement sections may be used. The traffic index assumed in Table II, below, should be confirmed by the Civil Engineer and R-value tests should be performed during grading, prior to finalizing the pavement sections.

**TABLE III — ASPHALTIC CONCRETE PAVEMENT SECTIONS**

| Pavement Utilization | Traffic Index | Asphaltic Concrete (Inches) | Class II Base (Inches) |
|---|---|---|---|
| Automobile Parking Areas | 5 | **3** | **3** |
| Truck and bus loading/unloading areas and driveways | 6 | **4** | **3** |

The upper twelve (12) inches of subgrade soils, below the aggregate base, should be scarified, moisture conditioned and recompacted to a minimum of ninety-five (95) percent relative compaction, at to slightly above optimum moisture content, based on ASTM D 1557. Below this upper subgrade should be at least ninety (90) percent per relative compaction.

The aggregate base must meet CALTRANS "Class II Base" specifications and should be compacted to at least ninety-five (95) percent relative compaction based on ASTM D 1557. Asphaltic concrete should be compacted to at least ninety-five (95) percent of the density obtained with the California Kneading Compactor (CAL 304).

### VIII.2. Rigid Pavement

A Portland Cement concrete (PCC) pavement may also be used. In the design of the PCC pavement section shown in Table VI, below, the following design parameters were used:

- Modulus of subgrade reaction of the soil, k — 240 pci
- Modulus of Rupture of concrete, MR — 500 psi
- Traffic Category, TC — C
- Average daily truck traffic, ADTT — 100

The traffic category and average daily truck traffic should be confirmed by the civil engineer and R-value tests should be performed during grading, prior to finalizing PCC thickness.

Based on the design parameters presented above, the following rigid pavement section, calculated in general conformance with the procedure recommended by ACI 330R-01, may be used.

**Table IV — PCC Pavement Section**

| Pavement Utilization | PCC Minimum Thickness (Inches) |
|---|---|
| Truck loading/unloading areas (TC = C) | 6 |

The upper twelve (12) inches of subgrade soils below the PCC should be scarified, moisture conditioned and recompacted to a minimum of ninety-five (95) percent relative compaction, at to slightly above optimum moisture content, based on ASTM D 1557. Below this upper subgrade should be at least ninety (90) percent per relative compaction.

The PCC pavement reinforcement should be designed by the structural engineer for shrinkage, temperature stresses and loading conditions. A thickened edge should be constructed on the outside of the concrete pavements subject to wheel loads. Control joints should be included in the design of the PCC by the structural engineer at a maximum spacing of fifteen (15) feet each way.

## IX. SOIL CORROSIVITY

Per CBC 2019, concrete and steel protection shall comply with the durability requirements set forth in ACI 318. When soluble sulfate concentrations are equal to or greater than 2,000 ppm in soil and 1,000 ppm in groundwater, mitigation measures must be taken to protect any concrete structures in contact with the soils. Soils are considered corrosive and deleterious to ferrous materials when chloride concentration is greater than or equal to 500 ppm, deleterious to foundation elements (e.g. lime in concrete) when the pH is 5.5 or less and/or when minimum electrical resistivity is less than 1000 ohm-centimeters.

Chemical testing of onsite soils such as water soluble sulfate, chloride, pH and electrical resistivity tests were conducted on representative samples of onsite soils, and the results are provided in Appendix C. The tests results indicate that the subsoils at the site have a "low" corrosive potential with respect to concrete and “moderate" corrosive potential with respect to steel and other metals. Therefore, Type II Portland cement may be used for the construction of concrete structures in contact with the subgrade soils and protection may be required for metals in contact with the subgrade soils.

We recommend that a corrosion specialist be consulted to determine the extent of corrosion susceptibility and/or protection that may be warranted for the project site.

## X. PLAN REVIEW, OBSERVATION AND TESTING

Post-investigation services are an important and integrated part of this investigation and should be carried out by our once. The project foundation and grading plans, and specifications should be forwarded to our once for review for conformance with the intent of the soils recommendations.

Geotechnical observations of excavation bottoms should be carried out prior to fill placement. Observations and testing of all fill placement should be carried out on a continuous basis to

verify the design assumptions and conformance with the intent of the recommendations. Observations of footing bottoms should be carried out prior to concrete pour.

## XI. LIMITATIONS

Professional judgments and geotechnical investigation are presented in this report. They are based partly on evaluation of the technical information gathered, partly on historical reports and partly on our general experience with subsurface conditions in the area. We do not guarantee the performance of the project in any respect other than that our engineering work and the judgment rendered meet the standards and care of our profession. It should be noted that the borings may not represent potentially unfavorable subsurface conditions between borings. If during construction soil conditions are encountered that vary from those discussed in this report or historical reports or if design loads and/or configurations change, we should be notified immediately in order that we may evaluate effects, if any, on foundation performance. The recommendations presented in this report are applicable only to this specific site. These data should not be used for other purposes. This report does not relate any conclusions or recommendations about the potential for hazardous and/or contaminated materials existing at the site.

The recommendations presented herein assume that the plan review, observations and testing services, outlined in Section X of the report, will be provided by HDNGEO. During execution of the aforementioned service, our office can finalize the report recommendations based on observations of actual subsurface conditions evident during construction. We cannot assume liability for the adequacy of the recommendations if another party is retained to observe construction.

This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project, and incorporated into the plans and specifications. In this respect, it is recommended that we be allowed the opportunity to review the project plans and the specifications for conformance with the geotechnical recommendations.

This office does not practice or consult in the field of safety engineering. We do not direct the contractor's operations, and we cannot be responsible for other than our own personnel on the site. Therefore, the safety of others is the responsibility of the contractor. The contractor should notify the owner if he considers any of the recommended actions presented herein to be unsafe.

This report is subject to review by appropriate regulating agencies.

Respectfully submitted,

# APPENDIX B

Figure B-1 Key To Boring Logs
Figure B-2 Log of Boring B-1
Figure B-3 Log of Boring B-2
Figure B-4 Log of CPT-1
Figure B-5 Log of CPT-2

LeRoy Crandall and Associates (1990)
Figure B-6 Log of Boring B-11

GeoVision Geophysical Services, Inc. (November 9, 2021)

The terms and symbols used on the Log of Borings to summarize the results of the field investigation and subsequent laboratory testing are described in the following:

It should be noted that materials, boundaries, and conditions have been established only at the boring locations, and are not necessarily representative of subsurface conditions elsewhere across the site.

## A. PARTICLE SIZE DEFINITION (ASTM D2487 AND D422)

| | | | | | |
|---|---|---|---|---|---|
| Boulder | -- | larger than 12-inches | Sand, medium | -- | No.40 to No. 10 sieves |
| Cobble | -- | 3-inches to 12-inches | Sand, fine | -- | No.200 to No. 40 sieves |
| Gravel, coarse | -- | 3/4-inch to 3-inches | Silt | -- | 5µm to No. 200 sieves |
| Gravel, fine | -- | No.4 sieve to 3/4 -inch | Clay | -- | smaller than 5 µm |
| Sand, coarse | -- | No.10 to No.4 sieve | | | |

## B. SOIL CLASSIFICATION

Soils and bedrock are classified and described according to their engineering properties and behavioral characteristics. The soil of each stratum is described using ASTM D2487 and D2488.

The following adjectives may be employed to define percentage ranges by weight of **minor components**:

| | | | | | |
|---|---|---|---|---|---|
| trace | -- | 1-10% | little | -- | 10-20% |
| some | -- | 20-35% | “and” or ”y” | -- | 35-50% |

**STRAFIFIED SOILS**

| Description | Stratified thickness |
|---|---|
| parting | 0 to 1/16-in. |
| seam | 1/16 to 1⁄2-in. |
| layer | 1⁄2-in. to 12-in. |
| stratum | > 12-in. |

**PLASTICITY OF SOILS**

| Description | Plastic Index |
|---|---|
| Non-plastic | 0 |
| Low | 1-10 |
| Medium | 11-30 |
| High | >30 |

## C. SOIL DENSITY AND CONSISTENCY

The density of coarse-grained soils and the consistency of fine-grained soils are described on the basis of the Standard Penetration Test:

| COARSE GRAINED SOILS | | FINE GRAINED SOILS | | | |
|---|---|---|---|---|---|
| Apparent Density | SPT Blows Per Foot | Estimated Consistency | SPT Blows Per Foot | Pocket Penetrometer (tsf) | Torvane Measurement (tsf) |
| very loose | < 5 | very soft | < 2 | < 0.25 | < 0.12 |
| loose | 5 to 10 | soft | 2 to 4 | 0.25 to 0.50 | 0.12 to 0.25 |
| medium | 11 to 30 | firm (medium) | 5 to 8 | 0.50 to 1.0 | 0.25 to 0.50 |

| | | hard | > 30 | > 4.0 | > 2.0 |

D. **STANDARD PENETRATION TEST (SPT) -- D1586**

The SPT test involves failure of the soil around the tip of a split spoon sampler for a condition of constant energy transmittal. The split spoon, 2-inches outside diameter and 1 3/8-inches inside diameter, is driven eighteen (18) inches. The sampler is seated in the first six (6) inches and the number of blows required to drive the sampler the last foot is recorded as the "N" value or SPT blow count. The driving energy is provided by a 140 lb weight dropping thirty (30) inches.

E. **ABBREVIATION OF LABORATORY TEST DESIGNATIONS**

| | | | |
|---|---|---|---|
| C | Consolidation | pH | pH |
| CBR | California Bearing Ratio | PP | Pocket Penetrometer |
| Ch | Water Soluble Chlorides | PS | Particle Size Analysis |
| DS | Direct Shear | RV | R-Value |
| EI | Expansion Index | SE | Sand Equivalent |
| ER | Electrical Resistivity | SG | Specific Gravity |
| k | Permeability | SO4 | Water Soluble Sulfates |
| MD | Moisture Content and Dry Density | TX | Triaxial Compression |
| MP | Modified Proctor Compaction Test | TV | Torvane Shear |
| O | Organic Content | U | Unconfined Compression |

F. **LOCATION AND ELEVATION**

The coordinates provided on boring logs are approximately determined based using a hand-help GPS device. The accuracy of such devices is highly variable and depend upon many factors at the time of usage. Ground surface elevation are also interpreted based on available topographical survey map of the site.

G. **STRATIFICATION LINES**

The stratification lines indicated on the boring logs and profiles represent the **approximate** boundary between material types and the transition may be gradual.

| MAJOR DIVISION | | | Typical Description | | Laboratory Classification Criteria | Group Symbol | Graphic Symbol |
|---|---|---|---|---|---|---|---|
| **Coarse-Grained Soils** (More than 50% Retained on No. 200) | **Gravels** < 50% of coarse fraction passes the No. 4 sieve size | **Clean Gravels** < 5% passing the No. 200 sieve size | Borderline cases require the use of dual symbols | **Well graded** Meet gradation requirements | Gradation requirements are: $C_u = \frac{D_{60}}{D_{10}} > 4$ and $C_c = \frac{D_{30}^2}{D_{10} x D_{60}} = 1 \text{ to } 3$ | GW | |
| | | | | **Poorly graded** Does not meet gradation requirements | | GP | |
| | | **Gravels with fines** > 12% passing the No. 200 sieve size | | Plasticity limits of material passing No. 40 sieve size plots below "A" line and P.I. < 4 | Plasticity limits above "A" line with P.I. > 4 < 7 are boundary cases and require use of dual symbols | GM | |
| | | | | Plasticity limits of material passing No. 40 sieve size plots below "A" line and P.I. > 7 | | GC | |
| | **Sands** ≥ 50% half of the coarse fraction passes the No. 4 sieve size | **Clean Sands** < 5 % passing the No. 200 sieve size | Borderline cases require the use of dual symbols | **Well graded** Meet gradation requirements | Gradation requirements are: $C_u = \frac{D_{60}}{D_{10}} > 6$ and $C_c = \frac{D_{30}^2}{D_{10} x D_{60}} = 1 \text{ to } 3$ | SW | |
| | | | | **Poorly graded** Does not meet gradation requirements | | SP | |
| | | **Sands with fines** > 12% passing the No. 200 sieve size | | Plasticity limits of material passing No. 40 sieve size plots below "A" line and P.I. < 4 | Plasticity limits above "A" line with P.I. > 4 < 7 are boundary cases and require use of dual symbols | SM | |
| | | | | Plasticity limits of material passing No. 40 sieve size plots below "A" line and P.I. > 7 | | SC | |
| **Coarse-Grained Soils** (50% or More Passes No. 200 Sieve) | **Silts and Clays** Liquid Limit < 50 | Above "A" line and P.I., > 4 < 7 are borderline cases requiring use of dual symbols | | | Below "A" line and P.I. < 4 | ML | |
| | | | | | Above "A" line and P.I. > 7 | CL | |
| | | | | | Below "A" line and P.I. < 4 and $\frac{LL(ovendrysoil)}{LL(airdrysoil)} < 0.7$ | OL | |
| | **Silts and Clays** Liquid Limit > 50 | | | | Below "A" line | MH | |
| | | | | | Above "A" line | CH | |
| | | | | | Below "A" line and P.I. < 4 and $\frac{LL(ovendrysoil)}{LL(airdrysoil)} < 0.7$ | OH | |
| Highly Organic Peat $\frac{LL(ovendrysoil)}{LL(airdrysoil)} < 0.7$ | | | | | | PT | |

# 1 INTRODUCTION

In-situ seismic measurements using active- and passive-source surface wave techniques were performed at Kaiser Permanente, Baldwin Park, California on October 25, 2021. The purpose of this investigation was to provide a shear (S) wave velocity profile to a depth of 100 ft (30 m), or greater, and estimate the average S-wave velocity of the upper 30 m ($V_{S30}$) or 100 ft ($V_{S100ft}$). The active-source surface wave technique utilized during this investigation consisted of the multi-channel analysis of surface waves (MASW) method. The passive-source surface wave technique consisted of the array microtremor method. The locations of the active- and passive-source surface wave testing locations are shown on Figure 1. Array microtremor measurements were made using an L-shaped array (Array 1) and MASW measurements were made on a linear array along one of the legs of Array 1 (Array 2).

For seismic design, the 2019 California Buiilding Code (CBC) and 2018 International Building Code (IBC) reference the provisions in ASCE/SEI 7-16 (Minimum Design Loads and Associated Criteria for Buildings and Other Structures). The Site Classes and associated S-wave velocity ranges outlined in Table 20.3-1 of ASCE/SEI 7-16 are as follows:

Site Class A – Hard rock – $V_{S100ft} > 5{,}000$ ft/s
Site Class B – Rock – $2{,}500 < V_{S100ft} \leq 5{,}000$ ft/s
Site Class C – Very dense soil and soft rock – $1{,}200 < V_{S100ft} \leq 2{,}500$ ft/s
Site Class D – Stiff soil – $600 < V_{S100ft} \leq 1{,}200$ ft/s
Site Class E – Soft clay soil – $V_{S100ft} < 600$ ft/s (IBC)
Site Class F – Soils requiring site response analysis

At many sites, active surface wave techniques (MASW) with the utilization of portable energy sources, such as hammers and weight drops, are sufficient to obtain S-wave velocity sounding to 100 ft (30 m) depth. At sites with high ambient noise levels and/or very soft soils, these energy sources may not be sufficient to image to this depth and a larger energy source, such as a bulldozer, is necessary. Alternatively, passive surface wave techniques, such as the array microtremor technique can be used to extend the depth of investigation at sites that have adequate ambient noise conditions. It should be noted that two-dimensional passive-source surface wave arrays (e.g., triangular, circular, or L-shaped arrays) are expected to perform better than linear arrays.

This report contains the results of the active and passive surface wave measurements conducted at the site. An overview of the surface wave methods is given in Section 2. Field and data reduction procedures are discussed in Sections 3 and 4, respectively. Data modeling is presented in Section 5 and interpretation and results are presented in Section 6. References and our professional certification are presented in Sections 7 and 8, respectively.

# 2 OVERVIEW OF SURFACE WAVE TECHNIQUES

## 2.1 Introduction

Active- and passive-source (ambient vibration) surface wave techniques are routinely utilized for site characterization. Active surface wave techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods. Passive surface wave techniques include the horizontal over vertical spectral ratio (HVSR) technique and the array and refraction microtremor methods.

The basis of surface wave methods is the dispersive characteristic of Rayleigh and Love waves when propagating in a layered medium. Surface waves of different wavelengths ($\lambda$) or frequencies (f) sample different depth. As a result of the variance in the shear stiffness of the distinct layers, waves with different wavelengths propagate at different phase velocities; hence, dispersion. A surface wave dispersion curve is the variation of $V_R$ or $V_L$ with $\lambda$ or f. The Rayleigh wave phase velocity ($V_R$) depends primarily on the material properties ($V_S$, mass density, and Poisson's ratio or compression wave velocity) over a depth of approximately one wavelength. The Love wave phase velocity ($V_L$) depends primarily on $V_S$ and mass density. Rayleigh and Love wave propagation are also affected by damping or seismic quality factor (Q). Rayleigh wave techniques are utilized to measure vertically polarized S-waves ($S_V$-wave); whereas Love wave techniques are utilized to measure horizontally polarized S-waves ($S_H$-wave).

## 2.2 Surface Wave Techniques

The MASW and array microtremor techniques were utilized during this investigation and are discussed below.

### 2.2.1 MASW Technique

A description of the MASW method is given by Park, 1999a and 1999b and Foti, 2000. Ground motions are typically recorded by 24, or more, geophones typically spaced 1 to 3 m apart along a linear array and connected to a seismograph. Energy sources for shallow investigations include various sized hammers and vehicle mounted weight drops. When applying the MASW technique to develop a one-dimensional (1-D) $V_S$ model, it is preferable to use multiple-source offsets from both ends of the array. The most commonly applied MASW technique is the Rayleigh-wave based MASW method, which we refer to as $MAS_RW$ to distinguish from Love-wave based MASW ($MAS_LW$). $MAS_RW$ and $MAS_LW$ acquisition can easily be combined with P- and S-wave seismic refraction acquisition, respectively. $MAS_RW$ data are generally recorded using a vertical source and vertical geophone but may also be recorded using a horizontal geophone with radial (in-line) orientation. $MAS_LW$ data are recorded using transversely orientated horizontal source and transverse horizontal geophone.

A wavefield transform is applied to the time-history data to convert the seismic record from time-offset space to frequency-wavenumber (f-k) space in which the fundamental or higher surface-wave modes can be easily identified as energy maxima and picked. Frequency and/or wavenumber can easily be mapped to phase velocity, slowness, or wavelength using the following properties: $k = 2\pi/\lambda$, $\lambda = v/f$. Common wave-field transforms include: the f-k transform (a 2D fast Fourier transform), slant-stack transform (also referred to as intercept-

slowness or τ-p transform and equivalent to linear Radon transform), frequency domain beamformer, and phase-shift transform. The minimum wavelength that can be recovered from MASW data set without spatial aliasing is equal to the minimum receiver spacing. Occasionally, SASW analysis procedures are used to extract surface wave dispersion data, from fixed receiver pairs, at smaller wavelengths than can be recovered by wavefield transformation. Construction of a dispersion curve over the wide frequency/wavelength range necessary to develop a robust $V_S$ model while also limiting the maximum wavelength based on an established near-field criterion (e.g. Yoon and Rix, 2009; Li and Rosenblad, 2011), generally requires multiple source offsets.

Although the clear majority of MASW surveys record Rayleigh waves, it has been shown that Love wave techniques can be more effective in some environments, particularly shallow rock sites and sites with a highly attenuative, low velocity surface layer (Xia, et al., 2012; **GEO***Vision*, 2012; Yong, et al., 2013; Martin, et al., 2014). Rayleigh wave techniques, however, are generally more effective at sites where velocity gradually increases with depth because larger energy sources are readily available for the generation of Rayleigh waves. Rayleigh wave techniques are also more applicable to sites with high velocity layers and/or velocity inversions because the presence of such structures is more apparent in the Rayleigh wave dispersion curves than in Love wave dispersion curves. Rayleigh wave techniques are preferable at sites with a high velocity surface layer because Love waves do not theoretically exist in such environments. Occasionally, the horizontal radial component of a Rayleigh wave may yield higher quality dispersion data than the vertical component because different modes of propagation may have more energy in one component than the other. Recording both the vertical and horizontal components of the Rayleigh wave is particularly useful at sites with complex modes of propagation or when attempting to recover multiple Rayleigh wave modes for multi-mode modeling as demonstrated in Dal Moro, et al, 2015. Joint inversion of Rayleigh and Love wave data may yield more accurate $V_S$ models and also offer a means to investigate anisotropy, where $S_V$- and $S_H$-wave velocity are not equal, as shown in Dal Moro and Ferigo, 2011.

### 2.2.2 Array Microtremor Technique

A detailed discussion of the array microtremor method can be found in Okada, 2003. Unlike active source techniques which use an active energy source (i.e. hammer), the array microtremor technique (also referred to as passive surface wave or array ambient vibration method) records background noise (ambient vibrations) emanating from ocean wave activity, wind noise, traffic, industrial activity, construction, etc. The technique uses 4, or more, receivers aligned in a 2-dimensional array. Triangle, circle, semi-circle, and "L" shaped arrays are commonly used, although any 2-dimensional arrangement of receivers can be used. For investigations of the upper 100 m, receivers typically consist of 1 to 4.5 Hz geophones. For deeper investigations, 5 to 120 s seismometers are generally utilized. The nested triangle array, which consists of several embedded equilateral triangles, is popular as it provides accurate dispersion curves with a relatively small number of geophones. The "L" array is useful at sites located at the corner of intersecting streets. The maximum receiver separation in an array should be at a minimum equal to the desired depth of investigation. Typically, 15 to 60 minutes of ambient vibration data is recorded depending on the size of the array, desired depth of investigation, and noise conditions. Investigations to depths on the order of 1 km may require that ambient vibrations are recorded for a much longer duration. The surface wave dispersion curve is typically estimated from array microtremor data using various f-k methods such as beamforming (Lacoss, et al., 1969), and

maximum-likelihood (Capon, 1969), and the spatial-autocorrelation (SPAC) method. The beam-forming and maximum-likelihood methods are generally referred to as the frequency wavenumber (FK) and high-resolution frequency wavenumber (HRFK or HFK) methods. The SPAC method was originally based on work by Aki, 1957 and has since been extended and modified (Ling and Okada, 1993 and Ohori *et al*., 2002) to permit the use of noncircular arrays, and is now collectively referred to as extended spatial autocorrelation (ESPAC or ESAC). Further modifications to the SPAC method permit the use of irregular or random arrays (Bettig *et al*., 2001). Although it is common to apply SPAC methods to obtain a surface wave dispersion curve for modeling, other approaches involve direct modeling of the coherency data, also referred to as SPAC coefficients (Asten, 2006 and Asten, *et al*., 2015). The beam-forming and maximum-likelihood methods are generally referred to as the frequency wavenumber (FK) and high-resolution frequency wavenumber (HRFK or HFK) methods, respectively. More recently, a Rayleigh wave three-component beamforming method (RTBF) has been developed (Wathelet, et al., 2018) and appears to offer significant resolution enhancements over other methods.

FK, HRFK and RTBF methods are generally expected to perform better when ambient vibration sources are not azimuthally well-distributed (e.g. rural area where the primary noise source is a large industrial facility). SPAC methods are expected to perform better when noise sources are azimuthally well-distributed (e.g. in a large urbanized area).

The minimum wavelength surface wave that can be extracted from an array microtremor dataset acquired utilizing a symmetric array is typically set equal to the minimum receiver spacing. The maximum wavelength is often set equal to twice the maximum receiver separation for SPAC analysis and the maximum receiver spacing for FK analysis.

## 2.3 Surface Wave Dispersion Curve Modeling

The dispersion curves generated from the active and passive surface wave soundings are generally combined and modeled using iterative forward and inverse modeling routines. The final model profile is assumed to represent actual site conditions. The theoretical model used to interpret the dispersion curve assumes horizontally layered, laterally invariant, homogeneous-isotropic material. Although these conditions are seldom strictly met at a site, the results of active and/or passive surface wave testing provide a good "global" estimate of the material properties along the array. The results may be more representative of the site than a borehole "point" estimate.

The surface wave forward problem is typically solved using the Thomson-Haskell transfer-matrix (Thomson, 1950; Haskell, 1953) later modified by Dunkin (1965) and Knopoff (1964), dynamic stiffness matrix (Kausel and Roësset, 1981), or reflection and transmission coefficient (Kennett, 1974) methods. All of these methods can determine fundamental- and higher-mode phase velocities, which correspond to plane waves in 2-D space. The transfer-matrix method is often used in MASW and passive surface-wave software packages, whereas the dynamic stiffness matrix is utilized in many SASW software packages. MAS$_R$W and/or passive surface-wave modeling may involve modeling of the fundamental mode, some form of effective mode, or multiple individual modes (multi-mode). As outlined in Roësset et al. (1991), several options exist for forward modeling of Rayleigh wave SASW data. One formulation takes into account only fundamental mode plane Rayleigh-wave motion (called the 2-D solution), whereas another includes all stress waves (e.g. body, fundamental, and higher mode surface waves) and

incorporates a generalized receiver geometry (3-D global solution) or actual receiver geometry (3-D array solution).

The fundamental mode assumption is generally applicable to modeling Rayleigh-wave dispersion data collected at normally dispersive sites, providing there are not abrupt increases in velocity or steep velocity gradients. Effective-mode or multi-mode approaches are often required for irregularly dispersive sites and sites with steep velocity gradients at shallow depth. If active and passive surface wave data are combined or $MASW$ data are combined from multiple seismic records with different source offsets and receiver gathers, then effective-mode computations are limited to algorithms that assume far-field plane Rayleigh wave propagation. Local search (e.g. linearized matrix inversion methods) or global search methods (e.g., Monte Carlo approaches such as simulated annealing, generic algorithms and neighborhood algorithm) are typically used to solve the inverse problem.

The maximum wavelength ($\lambda_{max}$) recovered from a surface wave data set is typically used to estimate depth of investigation although a sensitivity analysis of the $V_S$ models would be a more robust means to estimate depth of investigation. For normally dispersive velocity profiles with a gradual increase in $V_S$ with depth, the maximum depth of investigation is on the order of $\lambda_{max}/2$ for both Rayleigh and Love wave dispersion data. For velocity profiles with an abrupt increase in $V_S$ at depth, the maximum depth of investigation is on the order of $\lambda_{max}/3$ for Rayleigh wave dispersion data but less than $\lambda_{max}/3$ for Love wave dispersion data. The depth of investigation can be highly variable for sites with complex velocity structure (e.g. high velocity layers).

As with all surface geophysical methods, the inversion of surface wave dispersion data does not yield a unique $V_S$ model and multiple possible solutions may equally fit the experimental data. Based on experience at other sites, the shear wave velocity models ($V_S$ and layer thicknesses) determined by surface wave testing are within 20% of the velocities and layer thicknesses that would be determined by other seismic methods (Brown, 1998). The average velocity of the upper 30 m (100 ft), however, is much more accurate, often to better than 5%, because it is not sensitive to the layering in the model. $V_{S30}$ does not appear to suffer from the non-uniqueness inherent in $V_S$ models derived from surface wave dispersion curves (Martin et al., 2006, Comina et al., 2011). Therefore, $V_{S30}$ is more accurately estimated from the inversion of surface wave dispersion data than the resulting $V_S$ models.

It may not always be possible to develop a coherent, fundamental mode dispersion curve over sufficient frequency range for modeling due to dominant higher modes with the higher modes not clearly identifiable for multi-mode modeling. It may, however, be possible to identify the Rayleigh wave phase velocity of the fundamental mode at 40 m wavelength ($V_{R40}$) in which case $V_{S30}$ can at least be estimated using the Brown et al., 2000 relationship:

$$V_{S30} = 1.045V_{R40}$$

This relationship was established based on a statistical analysis of a large number of surface wave data sets from sites with control by velocities measured in nearby boreholes and has been further evaluated by Martin and Diehl, 2004, and Albarello and Gargani, 2010. Further investigation of this approach has revealed that $V_{S30}$ is generally between $V_{R40}$ and $V_{R45}$ with $V_{R40}$ often being most appropriate for shallow groundwater sites and $V_{R45}$ for deep ground water sites. A detailed study of such an approach for Love wave dispersion data has not been

conducted; however, preliminary analysis demonstrates that $V_{S30}$ is generally between $V_{L50}$ and $V_{L55}$. Although we do not recommend that these empirical $V_{S30}$ estimates replace modeling of surface wave dispersion data, they do offer a means of cost effectively evaluating $V_{S30}$ over a large area. $V_{R40}$ or $V_{L55}$ can also be used to quantify error in $V_{S30}$ by evaluating the scatter in the dispersion data at these wavelengths.

# 3 FIELD PROCEDURES

The active- and passive-source surface wave sounding locations at the site were established by **GEO***Vision* personnel and are shown in Figure 1. Two types of surface wave data were acquired at the site: an active-source surface wave array to characterize near-surface velocity structure and a passive-source surface wave array to characterize deeper velocity structure. Passive surface wave data were acquired along Array 1 using the array microtremor method. Active surface wave data were acquired along Array 2 using the MASW technique.

The passive surface wave equipment consisted of two Geometrics Geode signal enhancement seismographs, 4.5 Hz vertical geophones, and seismic cables. The L-shaped Array 1 consisted of 48, 4.5 Hz geophones spaced 10 ft apart with the legs of the array being 190 ft and 280 ft long.

Ambient noise measurements were made along the passive array for 60 minutes with a 2-millisecond sample rate (120, 30 second records). All passive surface wave data were stored on a laptop computer for later processing. The field geometry and associated files names were documented in field notes.

MASW equipment used during this investigation consisted of one Geometrics Geode signal enhancement seismographs, 4.5 Hz vertical geophones, seismic cable, a 4 lb. hammer, and a 20 lb. sledgehammer. MASW data were acquired along a linear array of 48 geophones spaced 5 ft apart. Shot points were located between 5 and 45 ft from the end geophone locations and at 35 ft intervals in the interior of the array. The 20 lb. hammer were used for off-end shots and 4 lb. hammer and 20 lb. sledgehammer were used for the end shots as well as interior source locations. Data from the transient impacts (hammers) were generally averaged 8 to 10 times to improve the signal-to-noise ratio. All field data were saved to hard disk and documented on field data acquisition forms.

# 4 DATA REDUCTION

The MASW data were reduced using the software Seismic Pro Surface V9.0 developed by Geogiga and multiple in-house scripts for various data extraction and formatting tasks, with all data reduction documented in a Microsoft Excel spreadsheet.

The following steps were used for data reduction:

- Input seismic records to be used for analysis into software package.
- Check and correct source and receiver geometry as necessary.
- Select offset range used for analysis (multiple offset ranges utilized for each seismic record as discussed below) and document in spreadsheet.
- Apply phase shift transform to seismic record to convert the data from time – offset to frequency – phase velocity space.
- Identify, pick, save, and document dispersion curve.
- Change the receiver offset range and repeat process.
- Repeat process for all seismic records.
- Use in-house script to apply near-field criteria with maximum wavelength set equal to 1.0 times the source to midpoint of receiver array distance.
- Use in-house script to merge multiple dispersion curves extracted from the MASW data collected along each seismic line for a specific source type (different source locations, different receiver offset ranges, etc.).
- Edit dispersion data, as necessary (e.g. delete poor quality curves and outliers).
- Calculate a representative dispersion curve at equal log-frequency or log-wavelength spacing for the MASW dispersion data using a moving average, polynomial curve fitting routine.

This unique data reduction strategy, which can involve combination of over 70 dispersion curves for a 1D sounding, is designed for characterizing sites with complex velocity structure that do not yield surface wave dispersion data over a wide frequency range from a single source type or source location. The data reduction strategy ensures that the dispersion curve selected for modeling is representative of average conditions beneath the array and spans as broad a frequency/wavelength range as possible while considering near field effects.

The array microtremor data were reduced using the Seisimager software package developed by Oyo Corporation/Geometrics, Inc. and the following steps:

The processing sequence for implementation of the ESAC method in the SeisImager software package is as follows:

- Input all seismic records for a dataset into software.
- Load receiver geometry (x and y positions) for each channel in seismic record.
- Calculate the SPAC coefficients for each seismic record and average.
- Optionally, select a subset of receiver offset ranges for analysis (e.g. only select receiver pairs with multiple azimuths).
- For each frequency calculate the RMS error between the SPAC coefficients and a Bessel function of the first kind and order zero over a user defined phase velocity range and velocity step.

- Plot an image of RMS error as a function for frequency (f) and phase velocity (v).
- Identify and pick the dispersion curve as the continuous trend on the f-v image with the lowest RMS error.
- Repeat the process for all arrays and time blocks.
- Use an in-house script to convert dispersion curves to appropriate format for editing.
- Edit dispersion data, as necessary, and use in-house script to combine all dispersion data after setting maximum wavelength to about 2 times the maximum receiver spacing (equivalent to $k_{min}/2$ for a symmetrical array).
- Calculate a representative dispersion curve for the passive dispersion data from each array using a moving average polynomial curve fitting routine.

The representative dispersion curves from the active and passive surface wave data were combined and the moving average polynomial curve fitting routine in WinSASW V3 was used to generate a composite representative dispersion curve for modeling. During this process, the active and passive surface wave dispersion data were given equal weights. An equal logarithm wavelength sample rate was used for the representative dispersion curve to reflect the gradual loss in model resolution with depth.

# 5 DATA MODELING

Surface wave data were modeled using the fundamental mode routine in the Seisimager WaveEq software package. During this process, an initial velocity model was generated based on general characteristics of the dispersion curve and the inverse modeling routine utilized to adjust the layer $V_S$ until an acceptable agreement with the observed data was obtained. Layer thicknesses were adjusted, and the inversion process repeated until a $V_S$ model was developed with low RMS error between the observed and calculated dispersion curves. In many cases, once an acceptable $V_S$ model is developed, layer thicknesses are again adjusted, and the inversion process repeated to develop an ensemble of $V_S$ models with similar RMS error to quantify non-uniqueness. Because the primary purpose of this investigation was to estimate $V_{S30}$, it was not considered necessary to develop multiple $V_S$ models. Data inputs into the modeling software include layer thickness, S-wave velocity, P-wave velocity or Poisson's ratio, and mass density. P-wave velocity and mass density only have a very small influence (i.e., less than 10%) on the S-wave velocity model generated from a surface wave dispersion curve. However, realistic assumptions for P-wave velocity, which is significantly impacted by the location of the saturated zone, and mass density will slightly improve the accuracy of the S-wave velocity model.

Constant mass density values of 1.83 to 2.03 gm/cm$^3$ (114 to 126 lb/ft$^3$) were used in the velocity profiles for subsurface soils/rock depending on P- and S-wave velocity. Within the normal range encountered in geotechnical engineering, variation in mass density has a negligible (±2%) effect on the estimated $V_S$ from surface wave dispersion data. During modeling of Rayleigh wave dispersion data, the compression wave velocity, $V_P$, for unsaturated sediments was estimated using a Poisson's ratio, $v$, of 0.3 and the relationship:

$$V_P = V_S\,[(2(1-v))/(1-2v)]^{0.5}$$

Poisson's ratio has a larger effect than density on the estimated $V_S$ from Rayleigh wave dispersion data. Achenbach (1973) provides approximate relationship between Rayleigh wave velocity ($V_R$), $V_S$ and $v$:

$$V_R = V_S\,[(0.862 + 1.14\,v)/(1+ v)]$$

Using this relationship, it can be shown that $V_S$ derived from $V_R$ only varies by about 10% over possible 0 to 0.5 range for Poisson's ratio where:

$$V_S = 1.16V_R \text{ for } v = 0$$
$$V_S = 1.05V_R \text{ for } v = 0.5$$

The realistic range of Poisson's ratio for typical unsaturated sediments is about 0.25 to 0.35. Over this range, $V_S$ derived from modeling of Rayleigh wave dispersion data will vary by about 5%. There is no evidence of shallow groundwater based on the seismic refraction first arrival data. It was assumed that the depth to the high Poisson's ratio, saturated zone is about 100 ft.

# 6 INTERPRETATION AND RESULTS

The fit of the calculated fundamental mode dispersion curve to the experimental data collected along Arrays 1 and 2 and the modeled $V_S$ profile for the surface wave sounding are presented as Figure 2. The resolution decreases gradually with depth due to the loss of sensitivity of the dispersion curve to changes in $V_S$ at greater depth. The $V_S$ profile used to match the field data is provided in tabular form in both metric and Imperial units as Tables 1 and 2, respectively.

The $V_S$ models were developed from the surface wave dispersion data derived from array microtremor and MASW data acquired along Arrays 1 and 2, respectively. The Rayleigh wave phase velocities from the passive surface wave array are in good agreement with those from the MASW data in the region where they connect. Scatter in dispersion data from the two methods are expected to be associated with lateral velocity variability beneath the arrays.

The estimated depth of investigation for the combined active and passive surface wave sounding is about 165 ft, about 50% of the maximum Rayleigh wave wavelength. The $V_S$ model indicates that $V_S$ ranges from about 790 ft/s immediately below the surface to about 1845 ft/s at a depth of about 148 ft.

The average shear wave velocity to a depth of 100 ft ($V_{S100ft}$) is 1084 ft/s for the $V_S$ model. Therefore, per the criteria in the 2019 CBC and ASCE/SEI 7-16, the site is classified as Site Class D, stiff soil.

**Table 1 Arrays 1 and 2 $V_S$ Model**

| Depth to Top of Layer (ft) | Layer Thickness (ft) | S-Wave Velocity (ft/s) | Inferred P-Wave Velocity (ft/s) | Inferred Poisson's Ratio | Assumed Density (lb/ft$^3$) |

Attention: Mr. Hai D. Nguyen

**SUBJECT:** **Laboratory Test Results**
**Project Name:** **KPBP - ED Expansion**
**HAI Project No.:** **HDN-21-003**

Dear Mr. Nguyen:

Enclosed is the result of the laboratory testing conducted on samples for the subject project. The testing was conducted in general accordance with the following test procedures:

| Type of Test | Test Procedure |
|---|---|
| Moisture Content & Dry Density | ASTM D2216 & D2937 |
| Percent Passing (#200 Sieve) | ASTM D1140 |
| Particle Size Analysis (Sieve only) | ASTM D6913 |
| Modified Proctor Compaction (4'') | ASTM D1557 |
| Expansion Index | ASTM D4829 |
| Direct Shear (Consolidated & Drained) | ASTM D3080 |
| Consolidation | ASTM D2435 |
| Corrosion (Set 1) | ASTM G187, D516, D512B, G51 |
| R value | CTM301 |

Attached is: Sixteen (16) Moisture Content test results; seven (7) Moisture Content & Dry Density test results; thirteen (13) Percent Passing (#200 Sieve) test results; four (4) Particle Size Analysis (Sieve only) test results; one (1) Modified Proctor Compaction (4'') test result; one (1) Expansion Index test result; three (3) 3-point Direct shear test results; two (2) Consolidation test results; one (1) Corrosion test result; and one (1) R-Value test result.

We appreciate the opportunity to provide our testing services to HDNGEO. If you have any questions regarding these test results, please contact us.

Sincerely,

HUSHMAND ASSOCIATES, INC.

PROJECT NO. 47759

DATE: 11 /9/ 2021

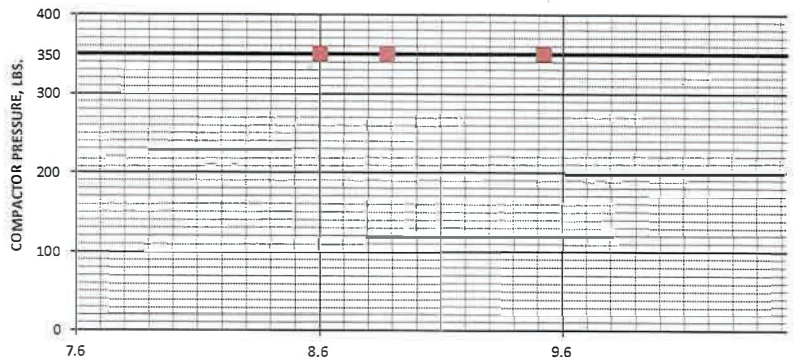
BORING NO. B-1 Bulk @ 0'-5'

KPBP-ED Expansion

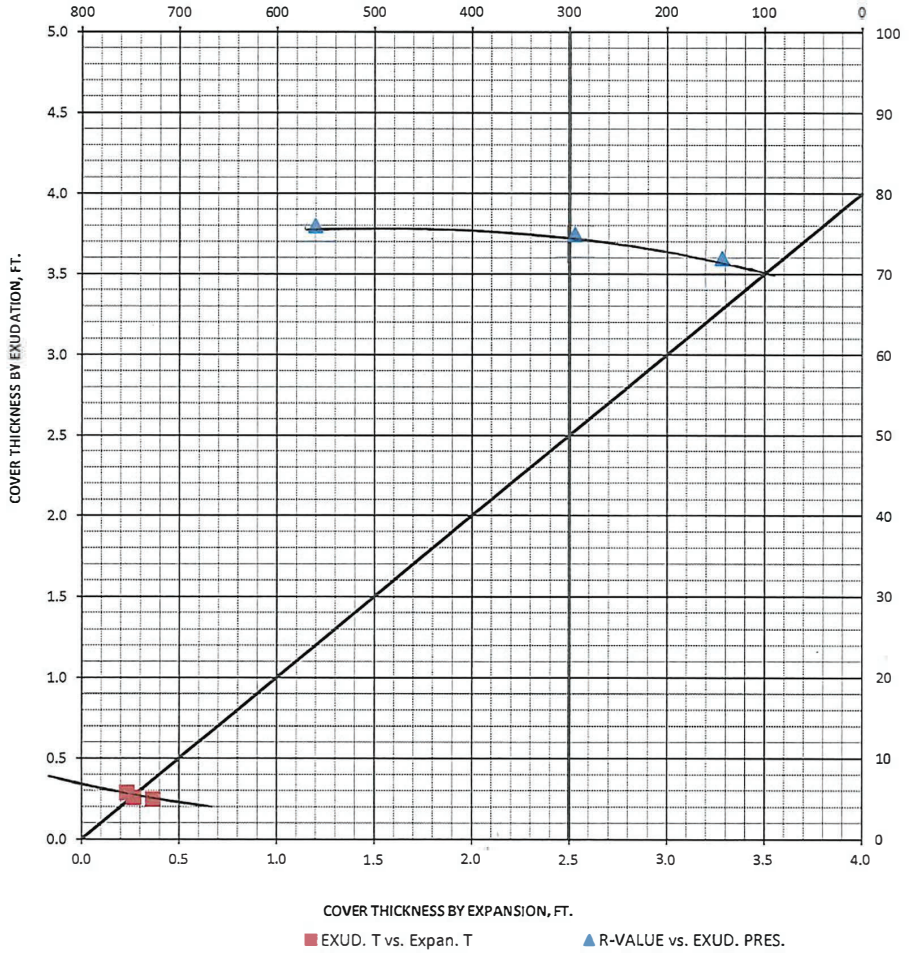
P.N. HDN-21-003

REMARKS:

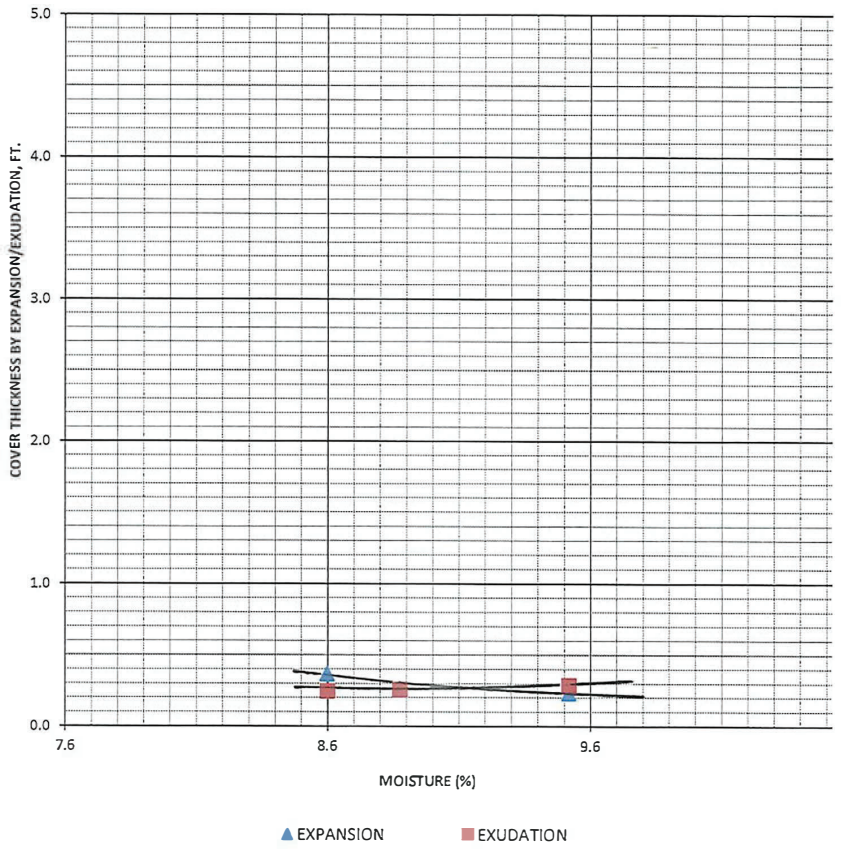
## COMPACTOR PRESSURE vs MOISTURE %

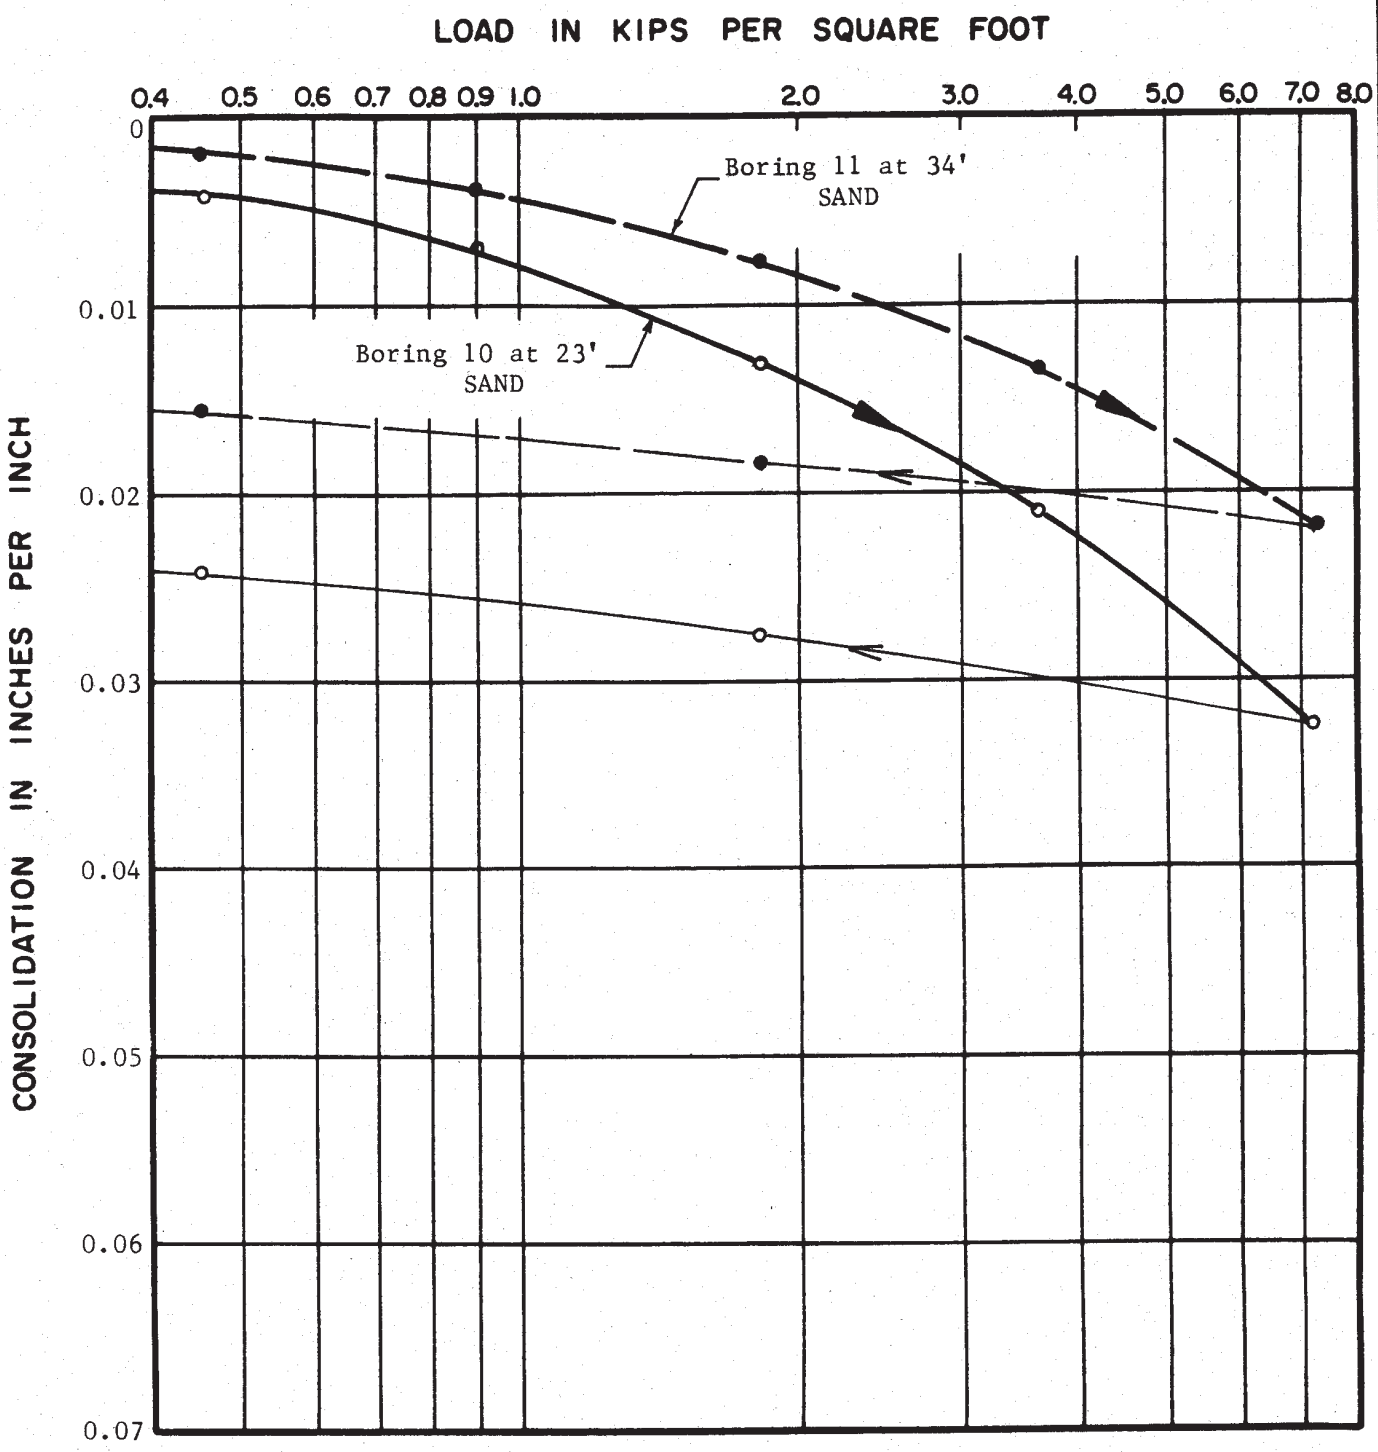


## COVER THICKNESS BY EXUDATION vs COVER THICKNESS BY EXPANSION



## COVER THICKNESS vs MOISTURE %





NOTE: Samples tested at field moisture content.

## CONSOLIDATION TEST DATA

LeROY CRANDALL AND ASSOCIATES

## APPENDICES

A Preparer's Qualifications

B DPR forms for 1022-1026 Leorita Street

# Executive Summary

Dudek was retained by Top Commercial Realty, Inc. to prepare a Built Environment Inventory and Evaluation Report for the proposed Kaiser Baldwin Park Medical Center Project in the City of Baldwin Park, California (proposed Project). This report evaluates two connected buildings located at 1022-1026 Leorita Street. The building at 1026 Leorita Street (APN 8559-008-005) was constructed in 1976, and the building at 1022-1024 Leorita Street (APN 8559-008-011) was completed in 1986 (note that the original building permit was pulled in 1984; this report uses the date of completion, 1986, for clarity). The buildings appear to have been connected circa 1995 per aerial photographs (NETR 2022). Because the buildings are connected and housed the same business, the Broken Horn Saddlery, since their respective construction dates, they are evaluated in this report as a single property (subject property). This report includes the results of a California Historical Resources Information System (CHRIS) records search; an intensive-level survey of the proposed Project site and its vicinity (Project site) by a qualified architectural historian; building development and archival research; development of an appropriate historic context for the Project site; and recordation and evaluation of one built environment resource over 45 years old for historical significance and integrity in consideration of National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and City of Baldwin Hills local designation criteria and integrity requirements. This report was prepared in conformance with California Environmental Quality Act (CEQA) Guidelines Section 15064.5 for historical resources, 21083.2 for archaeological resources, and all applicable local guidelines and regulations.

A CHRIS records search was completed by staff at the South Central Coastal Information Center (SCCIC) on July 11, 2022. Three of these previous investigations overlap with the Project site, but these studies do not include the subject property. No cultural resources were identified within the Project site. The built environment survey was conducted on April 19, 2022. The survey was conducted on foot and involved surveying the subject property and its surroundings and recording the subject property with notes and photographs.

As a result of Dudek's archival research, field survey, record search, and property significance evaluations, the subject property is recommended ineligible as a designated resource in Baldwin Park, for the CRHR, and the NRHP due to a lack of significant historical associations and architectural merit. Therefore, the subject property is not considered a historical resource for the purposes of CEQA. The finding for built environment cultural resources for the proposed Project under CEQA is No Impact. As the proposed Project would have no impact on historical resources, no further study is required.

INTENTIONALLY LEFT BLANK

# 1 Introduction

Dudek was retained by Top Commercial Realty, Inc. to prepare a Built Environment Inventory and Evaluation Report for the proposed Kaiser Baldwin Park Medical Center Project in the City of Baldwin Park, California (proposed Project). This report includes the results of a California Historical Resources Information System (CHRIS) records search; an intensive-level survey of the subject property by a qualified architectural historian; building development and archival research; development of an appropriate historic context for the subject property; and recordation and evaluation of the subject property for historical significance and integrity in consideration of National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and City of Baldwin Park landmark designation criteria and integrity requirements. This report was prepared in conformance with California Environmental Quality Act (CEQA) Guidelines Section 15064.5 for historical resources.

The subject property consists of two connected commercial buildings that total approximately 23,040 square feet: 1022-1024 Leorita Street, completed in 1986, and 1026 Leorita Street, constructed in 1976, and associated concrete parking lots. Until 2021, the subject property was occupied by the Broken Horn Saddlery, a commercial business. The subject property is adjacent to the existing Kaiser Permanente Baldwin Park Medical Center facilities. The proposed Project proposes to demolish the existing buildings on the property and construct a new approximately 33,000 square foot medical office building. The proposed Project would be physically and functionally connected to the Kaiser Permanente Baldwin Park Medical Center.

## 1.1 Project Location and Description

### Project Location

The subject property is comprised of two parcels: 1022-1024 Leorita Street (APN 8559-008-011) and 1026 Leorita Street (APN 8559-008-005) on a total of approximately 1.53 acres of land. The two buildings are connected and are considered a single resource for the purposes of this report. The subject property is located in a mixed-use area at the northern terminus of Leorita Street's intersection with Dalwood Street, approximately 150 feet south of the I-10 San Bernadino Freeway in the City of Baldwin Park, California (Figures 1 and 2). The Kaiser Permanente Baldwin Park Medical Center and associated three-story parking garages abut the subject property to the east and south. Further east, the neighborhood primarily consists of industrial and commercial uses. The area to the west and south of the subject property is primarily residential in character with a mix of single and multi-family residences. There are one to two-story single-family residences located directly west across Leorita Street from the subject property.

### Project Description

The proposed Project includes the development of a two-phased project at the Kaiser Baldwin Park Medical Campus. The first phase is the construction of an expansion to the emergency department which is part of an existing hospital tower on the south end of the Kaiser campus. Expansion of the emergency department would add approximately 23,000 square feet to the existing emergency department, expand the number of existing treatment bays from 38 to 60, a new ambulance canopy, and include additional improvements to the existing emergency department. The expansion and improvement of the emergency department would allow for better functionality within the emergency department.

The second phase of the project would consist of the construction and operation of an approximately 33,000-square-foot medical office building (MOB). This component would expand the boundary of the medical campus to include the parcel currently adjacent to the medical campus to the west. Development of this site (referred to as the "Broken Horn" site) would require the demolition of an existing retail building.

## 1.2 Project Personnel

Dudek Architectural Historian Claire Cancilla, MSHP prepared this report and associated property significance evaluations with contributions from Dudek Architectural Historian Caitlin Greeley, MA. Architectural Historian Andrew Bursan, MCRP completed the fieldwork. This report was reviewed for quality assurance/quality control by Dudek Senior Architectural Historian Allison Lyons, MSHP, and Historic Built Environment Lead Sarah Corder, MFA. Resumes for all key personnel are provided in Appendix A.

## 1.3 Regulatory Setting

### Federal

#### National Register of Historic Places

While there is no federal nexus for this project, 5261 Arlington Avenue was evaluated in consideration of NRHP designation criteria. The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks, as well as historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
B. That are associated with the lives of persons significant in our past; or
C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, "How to Apply the National Register Criteria," as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (NPS 1997). NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration to be considered for listing).

## State

### California Register of Historical Resources

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California Public Resources Code Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California Public Resources Code Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California Public Resources Code Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
2. Is associated with the lives of persons important in our past.
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
4. Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

### California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- California Public Resources Code Section 21083.2(g) defines "unique archaeological resource."
- California Public Resources Code Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
- California Public Resources Code Section 21074(a) defines "tribal cultural resources."

- California Public Resources Code Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- California Public Resources Code Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(b).) If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California Public Resources Code Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California Public Resources Code Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California Public Resources Code Section 5020.1(q)). In turn, CEQA Guidelines section 15064.5(b)(2) states the significance of an historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a Project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in

an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (California Public Resources Code Section 21083.2[a], [b], and [c]).

California Public Resources Code Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (California Public Resources Code section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as tribal cultural resource (California Public Resources Code Section 21074(c), 21083.2(h)), further consideration of significant impacts is required. CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in California Public Resources Code Section 5097.98.

## Local

### City of Baldwin Park

The City of Baldwin Park addresses historic resources in their municipal code at the individual level, through historic designation, and at the neighborhood level, through historic overlay zones. Applicable information from the City's municipal code pertaining to historical resources are excerpted below.

#### Subchapter 153.080 - Historic Overlay Zone

*§ 153.080.010 - Intent and Purpose*

The Historic Overlay Zone is established to recognize, protect and ensure proper utilization of historic resources in the interest of public, health, safety, prosperity, social and cultural enrichment, and general welfare. The purpose of the Historic Overlay is as follows.

(A) *Cultural history.* Safeguard the heritage of the city by protecting designated buildings and structures which reflect the city's cultural history.

(B) *Public involvement.* Encourage public understanding and involvement in the unique heritage of the city.

(C) *Civic pride.* Strengthen civic pride in the beauty and notable accomplishments of the past.

(D) *City attractions.* Protect and enhance the city's attractions to residents and visitors and to support and stimulate business and industry.

(E) *Aesthetic character.* Enhance the visual and aesthetic character of the city.

(F) *Promote use.* Promote the use of historic buildings, structures and historic districts.

(G) *Property rights.* Protect and safeguard the property rights of the owners whose property is declared to be historic or is located in an area designated as a historic district.

*§ 153.080.020 - Applicability*

(A) Historic Overlay Zone creation. Historic Overlay zones shall be applied in the same manner as property is reclassified from one zone classification to another, as set forth in subchapter 153.210, Part 15 - Zoning Code Text and Zoning Map Amendments. When a Historic Overlay Zone has been created, it shall be designated upon the zoning map of the city as an overlay zone. At the time the Historic Overlay Zone is created, a specific set of development and design standards shall be adopted by the City Council, in addition to those applicable to the underlying zone classification, identifying the allowable uses, improvements, accessory uses, signs and other development standards which are determined to be necessary to maintain integrity of the district while allowing reasonable use of the properties therein.

(B) Historic designation where applied to an individual building, structure or place, such application may be referred to as a "Historic Designation".

(C) Historic structure work permit. No work shall be done on any building or structure located within a Historic Overlay Zone or designated as historic unless a work permit is issued pursuant to subchapter 153.210, Administrative Procedures.

(D) Historic structure demolition permit. No demolition shall be done on any building or structure located within a Historic Overlay Zone or designated as historic unless a demolition permit is issued pursuant to subchapter 153.210, Administrative Procedures.

(E) Unsafe or dangerous exception. None of the provisions of this chapter shall be construed to prevent any work or demolition necessary to correct or eliminate any unsafe or dangerous condition of any building or structure located in a historic district, where such condition has been declared unsafe or dangerous by the city and where the work is necessary to correct or eliminate such condition, and has been ordered by the city.

*§ 153.080.030 – Property Maintenance*

The owner or occupant of a building, structure or place designated as historic or located within a Historic Overlay Zone shall maintain all exterior and interior portions of such buildings, structures and places in good repair to prevent deterioration, decay or excessive wear and tear.

*§ 153.080.040 – Local Official Register*

Resolutions adopting a historic designation of a building, structure or place shall collectively be known as the Local Official Register of Historic Resources. The Local Official Register shall be kept on file with the Secretary of the Historic Resources Advisory Committee, who shall transmit copies to the City Clerk, the Director of Community Development and the County Librarian.

*§ 153.080.050 - Agreements by the City of Baldwin Park*

The provisions of a disposition and development agreement or owner participation agreement, approved and entered into by the City of Baldwin Park, may contain provisions superseding the provisions of this subchapter.

## Part 10. Historic Designation

The City of Baldwin Park's historic designation process is established to recognize, protect and ensure proper utilization of the historic resources in the city.

*§ 153.210.520 - Applicability*

Applications for historic designation may be submitted by a property owner or authorized agent of the property owner. The City Council may also initiate proceedings to designate a building, structure or place as historic, with or without the consent of the owner, by resolution.

*§ 153.210.530 - Proceedings*

*(A) Historic Resources Advisory Committee recommendation.* The Historic Resources Advisory Committee shall convene to review an application, consider the determinations detailed in § 153.210.540, and draft a recommendation to approve or deny the application for the historic designation.

*(B) City Council decision.* The City Council shall conduct a public hearing to consider the Historic Resources Advisory Committee's recommendation, and grant, grant with modifications or deny the designation by resolution

*§ 153.210.540 - Determination*

Historic designation shall be granted to a proposed building, structure or place when the City Council finds one or more of the following conditions to exist, based on the recommendation of the Historic Resources Advisory Committee.

(A) *Historical representation*. The building or structure is particularly representative of a distinct historical period, type, style, region or way of life.

(B) *Connection to important personality*. The building or structure was connected with someone renowned, important or who was a local personality.

(C) *Connection to rare business*. The building or structure is connected with a business or use which was once common but is now rare.

(D) *Master work*. The building or structure represents the work of a master builder, engineer, designer, artist or architect.

(E) *Historic event*. The building or structure is the site of an important historic event or is associated with events that have made a meaningful contribution to the nation, state or city.

(F) *Particular architectural style*. The building or structure exemplifies a particular architectural style.

(G) *Best remaining*. The building or structure exemplifies the best remaining architectural type of a neighborhood.

(H) *Outstanding design*. The construction materials or engineering methods used in the building or structure embody elements of outstanding architectural or engineering design, detail, material or craftsmanship.

# 2 Background Research

## 2.1 CHRIS Records Search

On July 11, 2022, staff at the South Central Coast Information Center (SCCIC), located on the campus of California State University, Fullerton, provided the results of a CHRIS records search for the proposed Project site and a 1-mile radius. Due to COVID-19, the SCCIC notified researchers that they are only able to provide data for Los Angeles County that has already been digitized. As such, not all available data known to CHRIS may be provided in the records search. The search included digitized mapped prehistoric and historic archaeological resources as well as historic built-environment resources; Department of Parks and Recreation (DPR) site records; technical reports; archival resources; and the Office of Historic Preservation's Built Environment Resources Directory (BERD). For the purposes of this report, only records relevant to historic built environment resources with the potential to be impacted by the proposed Project are discussed in this report. See the Archaeological Resources Assessment, prepared by Dudek in 2022 for the full records search results, including all archaeological records.

### Previously Conducted Cultural Resources Studies

Results of the cultural resources records search indicate that 39 previous cultural resource studies have been conducted within 1-mile of the proposed Project site between 1979 and 2013; eighteen (18) of these studies appear to contain information on historic built environment resources. Note that not all 39 reports were digitized at the SCCIC and only three of these previous reports were provided to Dudek by the SCCIC; as a result, the presence of historic built environment information in these reports is based upon SCCIC-provided data that broadly categorizes the report types.

Three (3) of these studies overlap the proposed Project site; LA-10190, -10883, and -11784 and include information on historic built environment resources (noted with gray shading on Table 1). Table 1, below, details all 18 previous cultural resources studies followed by a brief summary of the available reports overlapping the proposed Project site. See the Archaeological Resources Assessment, prepared by Dudek in 2022 for the full records search results, including all archaeological records.

**Table 1. Previous Technical Studies Within a 1-Mile Radius of the Proposed Project Site**

### Report No. LA-10190

*Supplemental Historic Property Survey Report for the I-10 HOV Lane Between I-605 and the SR-57/SR-71/I-210 Interchange in the Cities of Los Angeles, Baldwin Park, West Covina, Covina, San Dimas, and Pomona in Los Angeles County, CA (Harbert 2002),* documents the results of a historic property survey report consisting of an archival record search, and literature review, as well as an archaeological survey report as an appendix. The area of study overlaps approximately 30% of the proposed Project site. The study was conducted to determine the presence or absence of historic properties within the area of study and immediate vicinity. No cultural materials were identified within the current proposed Project site as a result of the investigation. Based on the study's findings, no mitigation measures or further action were recommended.

### Report No. LA-10883

*Finding of No Adverse Effect Interstate Route 10 – 605 Interchange Improvement 07-LA-10/605 PM 31.2/20.9 EA: 245400* (Stewart 2008), documents the results of a historic property survey report consisting of archival record search, literature review, and pedestrian survey. The study was conducted to determine the effects the project would have on historic properties. No cultural materials were identified within the current proposed Project site as a result of the investigation. Based on the study's findings, no mitigation measures or further action were recommended.

### Report No. LA-11784

*Supplemental Finding of No Adverse Effect Interstate Route 10 – 605 Interchange Improvement 07-LA-10/605 PM 31.2/20.9 EA: 245400* (Stewart 2012) documents the results of a historic property survey report in response to study changes. The study was conducted to determine the effects the updated project design would have on historic properties. No cultural materials were identified within the current proposed Project site as a result of the investigation. Based on the study's findings, no mitigation measures or further action were recommended.

## Previously Recorded Cultural Resources

The SCCIC records indicate that 31 cultural resources have been previously recorded within 1-mile of the Project site, none of which overlap or are adjacent to the Project site. Of these, one (1) is a prehistoric-era archaeological site, one (1) is a historic-era archaeological site, and the remaining 29 are historic built environment resources. Table 2 below summarizes only the 29 historic built environment resources. None of these previously recorded resources are located within the boundaries of the proposed Project site. See the Archaeological Resources Assessment, prepared by Dudek in 2022 for the full records search results, including all archaeological records

**Table 2. Previously Recorded Cultural Resources within a 1-Mile Radius of the Proposed Project Site**

| Primary Number | Description | Recording Events | CHRIS Status Code | Proximity to Proposed Project Site |
|---|---|---|---|---|
| P-19-186571 | Built Environment: Bassett Elementary School | 1983 (B. Revele) | Point of Historical Interest No. 34<br>7L: Needs to be reevaluated using current standards | Outside |
| P-19-187085 | Built Environment: The Mojave Road | 1989 (S. Elder); 2014 (Marc Beherec) | CA Historical Landmark No. 963<br>7L: Needs to be reevaluated using current standards | Outside |
| P-19-188523 | Built Environment: Commercial modern-style building located at 13300 Amar Road and constructed in 1956. | 2009 (K.A. Crawford) | 6Y: Determined ineligible for NR by consensus through Section 106 process | Outside |
| P-19-188913 | Built Environment: Multi-family property located at 12836 Dalewood Street and originally constructed in 1938. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |
| P-19-188914 | Built Environment: Multi-unit apartment complex located at 12901 Dalewood Street and constructed in 1948. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |
| P-19-188915 | Built Environment: Single-family residence located at 819 Frazier Street and constructed in 1948. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |

## Table 2. Previously Recorded Cultural Resources within a 1-Mile Radius of the Proposed Project Site

| Primary Number | Description | Recording Events | CHRIS Status Code | Proximity to Proposed Project Site |
|---|---|---|---|---|
| P-19-188916 | Built Environment: Multi-family property with 3 single-family homes located at 807-811 Frazier Street, the first of which was originally constructed in 1948. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |
| P-19-188917 | Built Environment: Multi-family property located at 805 Frazier Street and originally constructed in 1947. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |
| P-19-188918 | Built Environment: Commercial building and single-family residence located at 12957 Garvey Avenue and originally constructed in 1938. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188919 | Built Environment: Multi-family property with three structures located at 12961 Garvey Avenue and constructed in 1948. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188920 | Built Environment: Single-family residence located at 13057 Garvey Avenue and constructed in 1953. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188921 | Built Environment: Two single-family ranch-style residences located at 13003 Judith Street, the first of which was originally constructed in 1936. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188922 | Built Environment: Single-family ranch-style residence located at 13013 Judith Street and originally constructed in 1950. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |

## Table 2. Previously Recorded Cultural Resources within a 1-Mile Radius of the Proposed Project Site

| Primary Number | Description | Recording Events | CHRIS Status Code | Proximity to Proposed Project Site |
|---|---|---|---|---|
| P-19-188923 | Built Environment: Single-family ranch-style residence located at 13019 Judith Street and originally constructed in 1950. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188924 | Built Environment: Single-family ranch-style residence located at 13025 Judith Street and originally constructed in 1952. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188925 | Built Environment: Commercial building located at 13079 Garvey Avenue and constructed in 1948. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188926 | Built Environment: Multi-unit motel located at 13109 Garvey Avenue and was constructed in 1948. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188927 | Built Environment: Mexican-style commercial building located at 13127 Garvey Avenue, currently operating as Taxcos Restaurant, and constructed in 1946. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188928 | Built Environment: Commercial building located at 13247 Garvey Avenue currently operating as a Nextel, and constructed in 1946. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188929 | Built Environment: Single-family residence located at 1609 Vineland Avenue and constructed in 1950. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |

## Table 2. Previously Recorded Cultural Resources within a 1-Mile Radius of the Proposed Project Site

| Primary Number | Description | Recording Events | CHRIS Status Code | Proximity to Proposed Project Site |
|---|---|---|---|---|
| P-19-188930 | Built Environment: Single-family residence located at 1619 Vineland Avenue and constructed in 1950. | 2002 (Claudia A. Harbert) | 6Z: Found ineligible | Outside |
| P-19-188932 | Built Environment: Single-family residence located at 1741 Big Dalton Avenue, constructed in 1926. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |
| P-19-188933 | Built Environment: Single-family Spanish-style residence located at 1747 Big Dalton Avenue and constructed in 1927. | 2002 (Kelly F. Ewing) | 6Z: Found ineligible | Outside |

| P-19-192819 | Built Environment: A series of 3 industrial warehouse buildings located at 12424, 12432, and 12440 Exline Street, and constructed in 1966. | 2017 (Allison Lyons) | 6Y: Determined ineligible for NR by consensus through Section 106 Process, 6Z: Found ineligible | Outside |
| P-19-192820 | Built Environment: Mid-Century Modern commercial building located at 12955 Perez Place and constructed in 1967. | 2017 (Allison Lyons) | 6Y: Determined ineligible for NR by consensus through Section 106 Process, 6Z: Found ineligible | Outside |

## 2.2 Building Development and Archival Research

Building development and archival research were conducted for the subject property in an effort to establish a thorough and accurate historic context for the significance evaluations, and to confirm the building development history of the Project site.

### City of Baldwin Park Building and Safety

Dudek viewed and photographed building permits for the subject property in-person at the City of Baldwin Park Building and Safety department on July 14, 2022. The City of Baldwin Park did not allow photography of the building permits and information from the building permits was recorded at the time of the site visit. Permits were available from 1976 to 2007. Dudek reviewed all available permits, and all information obtained was used in the preparation of the historic context and significance evaluations. Original building permits for both the original 1976 portion of the subject property and the 1986 expansion were included in this review.

### Los Angeles County Assessor

Dudek obtained assessor data for the Project site on July 1, 2022. This assessor data provided information about construction dates, square footage, tract number, and current owners of the subject property.

### Baldwin Park Historical Society and Museum

Dudek emailed the Baldwin Park Historical Society and Museum for information about the subject property on July 8th, 2022, and received no response. Dudek called the Baldwin Park Historical Society and Museum on July 12th, 2022, and was told to visit in person on Tuesdays or Thursdays between 9 am and 4 pm. Dudek visited the Baldwin Park Historical Society and Museum on the afternoon of Thursday, July 14, 2022, but the Historical Society and Museum was closed. Dudek sent a final follow-up email on July 20, 2022, and received a response

from Stanley S. Thornton on July 26, 2022. Mr. Thornton sent a link to a 2021 *Baldwin Park News* article about the subject property that had already been located by Dudek's research and is used in the historic context and significance evaluations. Mr. Thornton stated that the Historical Society and Museum did not have additional information on the property.

### Baldwin Park Library

Dudek visited the Baldwin Park Public Library located at 4181 Baldwin Park Boulevard on July 14, 2022. The Baldwin Park Library's local history collection included books that documented the history of Baldwin Park. All available information obtained from the library was used in the preparation of the historic context and significance evaluations

### Historical Newspaper Review

Dudek reviewed historical newspapers from Baldwin Park and surrounding cities to understand the development of the City of Baldwin Park and the subject property. These documents were used in the preparation of the historic context, history of the subject property, and significance evaluations.

### Sanborn Fire Insurance Maps

A review of historical Sanborn Map Company fire insurance maps covering the City of Baldwin Park was conducted as part of the archival research on the Project site from the years 1925, 1928, and 1931 but research revealed there was no Sanborn coverage for the subject property (Sanborn Map Company 1925, 1928, 1931).

### Historical Aerial Photographs

A review of historical aerial photographs was conducted as part of the archival research effort for the following years: 1938, 1948, 1952, 1964, 1972, 1980, 187, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2003, 2004, 2005, 2009, 2010, 2012, 2014, 2016, and 2018. Table 3 discusses the development of the areas surrounding the Project site (NETR 2022; UCSB 2022).

## 2.3 Additional Documentation

The City of Baldwin Park's municipal code (§ 153.080.040) states that designated resources in the City are included on the Local Official Register of Historic Resources; however, it does not appear that the City maintains a publicly-available list of designated resources. The City of Baldwin Park does not have a city-wide historic context or historic resources survey. A July 1, 2022 search of the Built Environment Resource Directory (BERD) maintained by the California Office of Historic Preservation (OHP) showed that the subject property had not been previously recorded. Additional searches for previous evaluations of the subject property, including through the City of Baldwin Hills website and CEQA net, also did not identify previous recordation or evaluation of the subject property.

# 3 Historic Context

## 3.1 Historical Overview of the City of Baldwin Park

Baldwin Park, colloquially known as the “hub of the San Gabriel Valley” due to its central geographic location in the Valley, is situated approximately 17 miles east of Los Angeles and five miles north of the San Gabriel Mountains. At the beginning of the 19th century, the land comprising modern-day Baldwin Park consisted of cattle grazing land that was owned by the San Gabriel Mission. This land was part of two ranchos: the Rancho Azusa de Dalton and the Rancho La Puente. By 1860, the community was known as Pleasant Grove. The small community grew in the subsequent decades, but remained largely agrarian, supporting agriculture, vineyards, and cattle ranching.

Pleasant Grove was renamed Vineland in 1880, a reflection of the many vineyards that flourished in the area. At this time, a severe drought precipitated the gradual decline of cattle ranching, and the land formerly used by cattle ranches, to the north of present-day Ramona Boulevard, was consequently settled and built up by squatter farmers. While still primarily agricultural, by this time the built environment began to expand, with the first residence constructed on present-day Los Angeles Street by Austin Brown. Soon, a business center developed around the community’s general store, located at present-day Los Angeles and La Rica Streets.

In 1890, the Vineland School District was established. The establishment of a school district serving the area also necessitated the construction of a two-room schoolhouse in 1890, which served the dual purpose of educational facility and general community meeting space. Between 1892 and 1895, the present-day Main and Los Angeles Streets were the center of the community’s activity, due in part to being part of the frequently traveled stagecoach line to San Jose. Although the community was expanding, water shortage continued to be a major challenge, with farmers forced to haul water from the San Gabriel River. Farmers in the area at this time largely did not use irrigation, so all crops depended on groundwater, wells, and water from rainfall.

In 1906, prolific and influential real estate speculator Elias "Lucky" Baldwin proposed the establishment of a new city to be called “Baldwinville” near the existing Vineland settlement. At this time, Baldwin owned the land south of present-day Ramona Street. The establishment of an adjacent community posed a potential threat to the economy and development of Vineland, as locals believed the establishment of a nearby city would fuel competition for already-scarce water. Citizens of Vineland invited Baldwin to discuss his proposal. Baldwin agreed, and he arrived at Shultis’ Grocery, run by local businessman D.J. Shultis. When he arrived, the octogenarian Baldwin tripped and nearly fell over, but was saved from the tumble by Mrs. Shultis, the wife of the store’s proprietor. Baldwin was reportedly so grateful for this that he agreed not to follow through with his plans for Baldwinville, instead lending his name to the Vineland community, which was renamed Baldwin Park.

Baldwin Park continued to expand in subsequent years, facilitated the Pacific Electric Railroad laying tracks in the center of town in 1912, which improved Baldwin Park’s accessibility and allowed residents to navigate Baldwin Park and the surrounding areas more easily. The Pacific Electric Railroad served Baldwin Park until 1951. Community organizations grew rapidly, with both the Chamber of Commerce and the Baldwin Park Women’s Club starting in 1906. In 1913, the community’s first newspaper, the *Baldwin Park Bulletin*, was established.

While Baldwin Park maintained its semi-rural character for the first half of the 20th century, new educational and civic facilities, businesses, and residences were constructed through the 1920 and 1930s. The first automobile shop and garage, E.F. Tice, for example, was constructed in 1923, and the Steel Furniture Manufacturing Company opened its doors in 1927. Investment into the city's educational system and outdoor space accelerated in this period as well, with the completion of the Margaret Heath School (which initially served as a primary school) in 1924 and the creation of Morgan Park in 1931. Like communities throughout the United States, Baldwin Park's economy pivoted to primarily war-related activities when the United States entered World War II in 1941.

The city developed rapidly in the post-World War II years, as a population boom in the Los Angeles area turned the region into a megalopolis. Suburbs exploded outside Los Angeles, engulfing farmland. As suburbs grew, automobile-oriented development did as well. This was particularly apparent in Baldwin Park, which is home to California's first drive-through restaurant: In-N-Out, which was established in Baldwin Park in 1948. Although the original hamburger stand is no longer extant, the company still maintains a presence in the city. Like other communities outside of Los Angeles, residential development and the construction of freeways quickly changed the area's previously semi-rural character into a more suburbanized community.

The 1950s were of rapid development and change in Baldwin Park, which saw the groundbreaking of a new reservoir in 1950 and the opening of several commercial businesses and financial institutions, including Bank of America, which also opened in 1950. Baldwin Park became an incorporated city in 1956, as the 47th General Law City in California. The I-10 San Bernardino Freeway was completed the next year, in 1957, providing easy access to Baldwin Park.

While the process of suburbanization began in the immediate post-war years, it accelerated further after Baldwin Park's incorporation as the city's population and built environment expanded and farmers and ranchers moved further away from the rapidly developing city. The population in Baldwin Park reportedly rose by about one-third in the six years after its incorporation, increasing from 28,000 to close to 37,000. This is in marked contrast to the 1940s when the population stayed steadily around 9,000. The large lots that formerly supported agriculture were subdivided into smaller lots for residential development in the years after the City's incorporation. In 1961, for example, permits were issued for 26 new subdivisions and nine more were issued in the first nine months of 1962. In 1960, the city's first hospital, Baldwin Park Community Hospital, opened its doors.

The 1970s were a period of slower growth and development than the previous decades. A 1979 article in the *Los Angeles Times* outlined the challenges facing Baldwin Park in the 1970s, noting that housing prices in the city were low relative to other nearby communities, freeway access and circulation remained difficult, and the City had recently experienced political turmoil that resulted in a recall election of several city officials. In this period, Baldwin Park's per capita income was approximately $1,000 less than neighboring communities such as West Covina.

Commercial development in this period also appeared to have stalled; in 1966, there were 231 businesses in Baldwin Park; by 1979 that number had only risen by 56 for a total of 287 businesses. The *Los Angeles Times* article further stated that approximately $30.4 million worth of shopping was being done by Baldwin Park citizens in other cities due to the city's lack of commercial options. The City, in conjunction with the Chamber of Commerce, launched a concreted advertising campaign to bring business to the City. This effort had mixed success; some new businesses opened in this period, such as the Broken Horn Saddlery (1976) and several financial institutions, including the Golden State Sanwa Bank (1973) and Crocker Bank (1974), but the city still reportedly faced a dearth of commercial development overall. The City also invested in the construction of its new Baldwin Park Civic Center (1978) which housed City Hall and City Council Chambers, among other functions.

In response to the city's challenges, the City Council approved the creation of the Baldwin Park Community Redevelopment Agency which considered urban renewal efforts in so-called "blighted" areas, focusing on the downtown commercial retail section of the city. The Redevelopment Agency was controversial from its inception, with many community members opposing efforts to redevelop parts of Baldwin Park.

The 1980s saw an uptick in residential housing construction, the fastest period of residential development in Baldwin Park since the 1960s. This housing was primarily multi-family residential construction, which outpaced single-family residential construction by five to one. This pace of construction slowed by the 1990s, in part because the City faced serious economic problems caused by budget cuts which necessitated the reduction of the police force among other services. According to a 1991 *Los Angeles Time*s article, Baldwin Park also struggled to draw new business despite available open land and prices that were lower than surrounding communities. Today, Baldwin Park continues to be a mixed-use community of commercial, residential, and industrial buildings. (Garber 2018; City of Baldwin Park 2015; Benbow 2011; City of Baldwin Park Community Development Department: 2005; City of Baldwin Park Department of Planning 2002: I-1; Los Angeles Times 1991; Pinheiro et. al 1981; Birkinshaw 1979; Duncan et. al 1962.)

## 3.2 History of the Subject Property

The subject property is located approximately 150 feet south of the 1-10 San Bernadino Freeway, adjacent to the Kaiser Permanente Baldwin Park Medical Center, and bounded by Leorita Street to the west, Dalewood Street to the north, and Bess Avenue to the south. The subject property consists of two connected commercial buildings, one constructed in 1976 (1026 Leorita Street) and one constructed in 1986 (1022-1024 Leorita Street). The buildings were connected circa 1995 based on aerial photographs (NETR 2022). The following table provides a development history of the subject property since the first available aerial image in 1938:

**Table 3. Historical Aerial Photograph Review of Subject Property and Environs**

| Photograph Year | Observations and Findings |
|---|---|
| 1938 | The earliest aerial photograph of the Project site dates to 1938. The Project site appears as two neighboring residential buildings side by side surrounded by farmland. Leorita Street does not yet appear. The Walnut Creek Wash, located immediately south of the Project site, was not channelized at this point. The surrounding neighborhood is largely undeveloped farmland. |
| 1948 | The 1948 aerial image shows one building on site. The surrounding area of the property is farmland. |
| 1952 | The 1952 aerial image shows two buildings on site. The surrounding area is developed with residential tracts located to the southwest of the property. The north, south, and east of the subject property is relatively undeveloped. |
| 1964 | The 1964 aerial image shows two buildings on site. East of the property is undeveloped land with one building. The San Bernardino Freeway has been developed north of the property. To the north, south, and east of the property are developed with residential tracts. The Edgewood Drive-In Movie Theater is located to the direct east of the future site of the subject property, at the present location of the Kaiser Permanente Baldwin Park Medical Center. |
| 1972 | By the 1972 aerial image, one of the buildings on site is demolished. Besides the demolition, the remainder of the Project site and surrounding neighborhood looks as it did in 1964. |
| 1980 | By 1980, the commercial building at 1026 Leorita Street appears on site with a paved parking lot and a lawn with trees. The area surrounding the subject property is fully developed. |

**Table 3. Historical Aerial Photograph Review of Subject Property and Environs**

| Photograph Year | Observations and Findings |
|---|---|
| 1987 | The 1987 aerial shows both commercial buildings comprising the subject property are extant on the Project site with paved parking lots. To the east of the property, a building has been demolished and the lot is vacant. |
| 1992 | The 1992 aerial shows an addition of a shed structure in front of the buildings on site. To the southeast of the property, the Kaiser Permanente Baldwin Park Medical Center is under construction. |
| 1993 | The 1993 aerial shows the building located at 1026 Leorita Street on site has an addition to the primary elevation. The neighboring parcel to the southeast shows further development of the medical center. |
| 1994 | The 1994 aerial image indicates no discernible changes on site. Further construction occurs to the neighboring parcel to the east of the subject property. |
| 1995 | The 1995 aerial image shows an addition to adjoin the two commercial buildings on site on the side and rear elevations. Further construction occurs to the neighboring medical center to the east of the property. No other changes to the surrounding area. |
| 1996, 1997, 1998, 1999, 2000, 2003. 2004, 2005 | No discernible changes to the Project site. |
| 2009 | No discernible changes to the Project site. A paved parking lot has been added south of the subject property. |
| 2010, 2012, 2014, 2016 | No discernible changes to the Project site. |
| 2018 | No discernible changes to the Project site. Further medical center development occurred with the addition of a parking garage located south of the Project site. |

## History of The Broken Horn Saddlery

From its construction in 1976 (and subsequent expansion in 1986) until 2021, the subject property was occupied by the Broken Horn Saddlery, described as the “West’s largest tack store” (Pernokas 2017). The subject property consists of two connected structures: 1026 Leorita Street, which was constructed in 1976, and 1022-1024 Leorita Street, which was constructed in 1986 to provide additional retail and manufacturing space for the Broken Horn. The two portions of the building appear to be haven connected circa 1995, per aerial photographs (NETR 2022). In 2021, the Broken Horn Saddlery vacated the subject property and re-opened in 2022 under new ownership at 4120 Maine Avenue in downtown Baldwin Park (Baldwin Park News 2022). Prior to the construction of the subject property, aerial photographs indicate that there was a residential structure on each lot now occupied by the subject property (Figure 3).

**Figure 3.** 1964 aerial photograph showing the Edgewood Drive-In, located at the current site of Kaiser Permanente Baldwin Park Medical Center. The approximate boundary of the future site of the subject property is outlined in red. View to the north. (Source: Howard D. Kelly, Los Angeles Public Library)

The Broken Horn Saddlery was founded in 1956 by Charlie Nuzzo and his wife Mattie Nuzzo and remained a family-run operation until 2021. In the early 1950s, Nuzzo worked for United Tent and Awning, which built tents for clients including the military. While in this position, Nuzzo met a wealthy boat owner who asked him to make him a cover for his boat to prevent weathering. Nuzzo agreed, making a cover out of tent material, reportedly an innovative approach to boat coverings at the time. The customer was satisfied, and Nuzzo was soon inundated with additional requests for boat covers, eventually forming a side business constructing boat covers in his basement.

Soon, the original boat owner came to Nuzzo with another request: a horse blanket, also made out of tent material. Nuzzo agreed and soon his horse blankets and day sheets became a popular product. At this time, the Los Angeles area had a flourishing postwar recreational horse industry and Nuzzo capitalized on this by taking his blankets to horsing events. Nuzzo's products were wildly popular, prompting him to formalize his business with his brother-in-law. This partnership was short-lived, however, as Nuzzo's brother-in-law was keeping two sets of books. Nuzzo consequently forayed into business on his own, opening the earliest iteration of Broken Horse Saddlery in Alhambra in 1956 with his wife Mattie.

Broken Horn Saddlery began by manufacturing and selling wholesale blankets and sheets, eventually adding a retail component. This growth prompted a move to a new building at 1022 Leorita Street in 1976. At this time, the Broken Horn Saddlery continued to manufacture blankets and pads but had also expanded to leather tack, largely at the behest of Charlie Nuzzo's son, Joe Nuzzo. The Broken Horn Saddlery also had an in-house silver department. By the time the Broken Horn Saddlery opened at the subject property, approximately 77% of their business was manufacturing. The business expanded its operations in 1986 with the addition of the building at 1022-1024 Leorita Street, which was built by Charlie Nuzzo according to its original building permit. Manufacturing at the Broken Horn Saddlery included leather tack, silver, boot repair, and saddle production with in-house departments producing these goods.

By 2007, Broken Horn Saddlery pivoted away from in-house manufacturing. As of 2017, the only manufacturing component that remained under the control of Broken Horn Saddlery was leather tack; the silver department became an in-house but independent business (Mario Solis's Silver Shop), as did the Broken Horn's two saddle shops (Sal's Custom Saddles, run by Salvador Gomez and another shop run by Galdino Gomez, Salvador's brother). This change in business format allowed for increased flexibility in a changing market where demand for saddles and silver declined; the Broken Horn Saddlery could access these products as needed but did not need to maintain the individual business operations. In 2017, there was also an in-house independent boot repair shop run by Felipe De Santiago. The individuals running these in-house businesses were all longtime employees of the Broken Horn, many working at the store for decades.

The Broken Horn Saddlery remained a family-run business, with Joe Nuzzo, Charlie Nuzzo's son, most recently serving as president. Jerry Nuzzo, Charlie's grandson, also served as vice president, and Charlie's daughter, Rosalie Nuzzo, served as secretary and treasurer. For 65 years, Broken Horn was a destination for equestrian enthusiasts from Baldwin Park and around the globe, with customers reportedly coming from Asia, Europe, Australia, the Middle East, and Africa. The Broken Horn Saddlery closed its doors at the subject property in 2021; the business, under new ownership, reopened in Downtown Baldwin Park at 4120 Maine Avenue in 2022 (Pernokas 2017; Baldwin Park News 2021; Baldwin Park News 2022).

## 3.3 Architectural Styles in the Project Site

The subject property is a nondescript commercial building with no discernable style. Although the subject property does not appear to embody the features of a particular style or typology, it does have some stylistic references to the Western, Hacienda, and ranching traditions that connect the exterior of the building to the goods being sold at the Broken Horn Saddlery. These details include tile-clad overhangs and arches on the west elevation of the 1986 portion of the building (1022-1024 Leorita Street), that reference the goods being sold when the property as occupied by the Broken Horn Saddlery.

### Architects and Builders

The original building permit for the 1976 portion of the building (1026 Leorita Street) from 1976 does not list an architect or builder but lists the building's contractor as John Barr. The research did not identify additional information on John Barr. The original building permit for the 1986 portion of the building (1022-2024 Leorita Street) lists the owner and founder of the Broken Horn Saddlery, Charles Nuzzo, as the building's constrictor. There is no architect or builder listed on the permit.

# 4 Field Survey

## 4.1 Methods

### Built Environment Survey

Architectural historian Andrew Bursan, MCRP, conducted an intensive survey of the subject property on April 19, 2022. Mr. Bursan meets the Secretary of the Interior's Professional Qualification Standards for architectural history. The survey entailed walking around the building exterior of the subject property and its site and documentation with notes and photographs, specifically noting character-defining features, spatial relationships, observed alterations, and any historic landscape features. The survey did not include the interior of the subject property.

## 4.2 Results

The subject property consists of two attached buildings: 1026 Leorita Street, constructed in 1976, and 1022-1024 Leorita Street, which was constructed in 1986. The buildings appear to have been connected circa 1995, per aerial photographs (NETR 2022). The subject property housed the same business, the Broken Horn Saddlery, from 1976 until 2021 when the business vacated the subject property and moved to a new location. The subject property is currently vacant. Although 1022-10244 Leorita Street is not over 45-years in age, the buildings are evaluated as a single property due to their shared history and physical connection.

As a result, the subject property consisting of 1022-1026 Leorita Street was identified as requiring recordation and evaluation for historical significance. This property is described and evaluated for historical and architectural significance in Section 5. Significance Evaluations. A State of California Department of Parks and Recreation Series 523 (DPR) form for the subject property is located in Appendix B. DPR forms.

INTENTIONALLY LEFT BLANK

# 5 Significance Evaluations

In order to determine if the proposed Project will impact historical resources under CEQA, all buildings or structures over 45 years in age within or immediately adjacent to the Project site were evaluated for historical significance and integrity in consideration of NRHP, CRHR, and City of Baldwin Park designation criteria and integrity requirements.

## 5.1 Broken Horn Saddlery, 1022-1024 Leorita Street (APN 8559-008-011) and 1026 Leorita Street (APN 8559-008-005)

### Property Description

The subject property is a one-story nondescript commercial building with some references to the western tradition that ties to the goods sold there. The subject property is composed of two connected structures, each with a rectangular plan: the original 1976 portion of the building (1026 Leorita Street), which occupies the northern portion of the Project site, and a 1986 expansion (1022-1024 Leorita Street), which occupies the southern portion of the Project site. These two sections of the building were connected circa 1995. The subject property is surrounded by large concrete parking lots with scattered palm trees. There is an ancillary shed outside the west elevation of the 1986 portion of the building that was added circa 1992 per aerial photographs, and a stepped concrete block wall separating the subject property's lot from the adjacent Kaiser parking garages at the south end of the lot. The subject property has a flat roof and is constructed of concrete block; most elevations do not have fenestration and consist of uninterrupted walls of painted concrete block. There are three primary entrances to the building: one on the west elevation and one on the north elevation of the 1976 portion of the building, and one on the primary west elevation of the 1986 portion of the building.

The west elevation of the 1976 portion of the building (1026 Leorita Street) has two large rectangular bays that were covered with a metal roll-up door at the time of the site visit. The northern bay features a trapezoidal overhang clad in red tile; the other bay is uncovered. The north elevation of the 1976 portion of the building has a metal frame double door at the center of the elevation, covered with a metal security gate, with a red tile-clad overhang. The elevation has no additional fenestration, consisting of painted concrete blocks interrupted at regular intervals by nine brick pilasters. A sign on the roof, added circa 1998 per building permits, reads "Broken Horn Western Store" and is readily visible from the nearby I-10 freeway. Outside the elevation is a freestanding sign reading "English & Western Saddlery." The east elevation has one door single-leaf door at its center and is otherwise unornamented.

The primary (west) elevation of the 1986 portion of the building (1022-1024 Leorita Street) is nine bays across, consisting of three arches flanked by three rectangular bays covered with metal roll-up doors on either side. The rectangular bays are recessed slightly behind the arches and all bays are separated by brick piers. This elevation is clad in painted brick; the remainder of the subject property is constructed of concrete blocks. The middle arch, located at the center of the elevation, contains the building's primary entrance, an arched metal frame glass double door covered with a decorative cast iron privacy gate. All bays are covered with an overhang clad in red tile and supported by large wood brackets. Above, the words "Broken Horn" are painted at the center of the building's elevation. The remainder of the elevations consist of uninterrupted concrete with a single-leaf door at the center of the south elevation.

**Figure 4.** Overall view of the subject property's west (primary) elevation, view to the east. The 1976 portion of the building is on the left (north) and the 1986 portion is on the right (south) (IMG_1376)

**Figure 5.** View of the 1986 portion (1022-1024 Leorita Street) of the subject property's primary west elevation, view to the east (IMG_1405)

**Figure 6.** South elevation of the subject property, view to the northeast. This is part of the 1986 portion of the subject property. The structures to the east and the south (right) are Kaiser Permanente parking structures (IMG_1395)

**Figure 7.** View of the 1976 portion (1026 Leorita Street) of the subject property's primary west elevation, view to the east (IMG_1460)

**Figure 8.** view of the subject property's north elevation, view to the south. This elevation is part of the 1976 portion of the subject property (IMG_1493)

**Figure 9.** Rear north elevation of the subject property, view to the south. This elevation is part of the 1976 portion of the subject property (IMG_1471)

**Figure 10.** Parking lot and ancillary structure located outside the primary west elevation of the subject property, view to the east (IMG_1479)

## Building Permits and Identified Alterations

The following list of known alterations was compiled through archival research of Baldwin Park permits. The City of Baldwin Park does not allow photography of building permits; a Dudek architectural historian recorded the information in Table 4 while in person at the City's Building and Safety department. The below table includes mechanical, sewage, and electrical permits in addition to building permits.

### Table 4. Building Permits for 1022-1026 Leorita Street

| Associated Address | Permit Number | Date | Description of Work | Owner | Architect (A)/ Builder (B)/ Contractor (C) | Cost |
|---|---|---|---|---|---|---|
| 1026 Leorita Street | None listed | 7/15/1976 | The new concrete block retail store building with a concrete panel roof | Chas Nuzzo | John Barr (C) | $190,080 |
| 1026 Leorita Street | None listed | 12/15/1976 | 30-foot partition wall to ceiling | Chas Nuzzo | John Barr (C) | $500 |

## Table 4. Building Permits for 1022-1026 Leorita Street

| Associated Address | Permit Number | Date | Description of Work | Owner | Architect (A)/ Builder (B)/ Contractor (C) | Cost |
|---|---|---|---|---|---|---|
| 1026 Leorita Street | None listed | 1/14/1977 | Freestanding sign | Broken Horn | Look New (C) | $1,480 |
| 1026 Leorita Street | None listed | 2/3/1977 | 6’ tall concrete block retaining wall | Chas Nuzzo | Owner (C) | $1,296 |
| 1026 Leorita Street | None listed | 5/23/1977 | Install 2 12’x16’ interior walls and wrought iron work | Chas Nuzzo | John Barr (C) | $1,300 |
| 1026 Leorita Street | None listed | 12/18/1979 | Add mezzanine addition to existing industrial building (north side only on footing 3x3 deep) | Charles Nuzzo | Owner (C) | $12,000 |
| 1022 Leorita Street | None listed | 10/24/1983 | Demolish 1-bedroom house (associated with new construction) | Broken Horn | None listed | $1,500 |
| 1022 Leorita Street | None listed | 7/19/1983 | Removal of foundation | Charles Nuzzo | None listed | $500 |
| 1022 Leorita Street | None listed | 4/30/1984 | Construct a new 13,457 square foot building of concrete block, asphalt roof. Commercial, retail, and storage, -story with mezzanine | Charles Nuzzo | Owner (C) | $692,554 |
| 1022 Leorita Street | None listed | 5/30/1984 | Grading | Charles Nuzzo | Owner (C) | $47,400 |
| 1022 Leorita Street | None listed | 2/12/1985 | Plumbing permit for a new building | Charles Nuzzo | Owen Brothers Plumbing, Inc (C) | None listed |
| 1022 Leorita Street | None listed | 2/21/1985 | New electricity installation for addition | Broken Horn | Elite Electric (C) | None listed |

**Table 4. Building Permits for 1022-1026 Leorita Street**

| Associated Address | Permit Number | Date | Description of Work | Owner | Architect (A)/ Builder (B)/ Contractor (C) | Cost |
|---|---|---|---|---|---|---|
| 1022 Leorita Street | None listed | 8/23/1985 | Sewer permit for a new building | Charles Nuzzo | AW Baker (C) | None listed |
| 1022 Leorita Street | None listed | 11/4/1985 | Electrical permit for a new building | Charles Nuzzo | Bowmen of Arcadia (C) | None listed |
| 1026 Leorita Street | B9953 | 1/8/1993 | Fire sprinkler system | Broken Horn | Inland Automatic Fire Sprinkler (C) | $2,376 |

## NRHP/CRHR Statement of Significance

The property at 1022 Leorita Street does not meet any of the criteria for listing in the NRHP, CRHR, or City of Baldwin Hills historical designation as part of an existing historic district, as demonstrated below.

### Criterion A/1: That are associated with events that have made a significant contribution to the broad patterns of our history.

Archival research indicated that the Broken Horn Saddlery's first building at 1026 Leorita Street was constructed in 1976 with a subsequent expansion completed in 1986. The two portions of the subject property appear to have been connected circa 1995, per aerial photographs (NETR 2022). Both portions of the subject property were built as commercial, manufacturing, and storage space specifically for the Broken Horn Saddlery. At the time it was constructed, the area directly surrounding the subject property to the west and south was primarily residential,

although there was already some commercial development in the neighborhood, including the Edgewood Drive-In (1964) located adjacent to the subject property to the east at the present site of the Kaiser Permanente Baldwin Hills Medical Center (1992). There was additional commercial development elsewhere in the neighborhood, notably on Baldwin Park Boulevard, approximately 0.20-mile southeast of the subject property.

By the 1960s, Baldwin Park's rural character had changed due to increased development resulting from the post-World War II population boom in Southern California that expanded Los Angeles' suburbs outwards. As a result of this expansion, Baldwin Park saw an intensive period of residential construction and accompanying commercial development. By the 1970s, however, the post-World War II development boom subsided and Baldwin Park faced various significant challenges in drawing business and residents to the city. A 1979 *Los Angeles Times* article, for example, noted that commercial growth was minimal in the period from 1966 to 1979, with the number of businesses in the city growing from 231 to 287 (Birkinshaw 1979). Challenges bringing new businesses to the city continued into the 1980s when the subject property expanded (Los Angeles Times 1991).

The subject property thus appears to have been constructed in a period of relatively stagnant commercial growth in Baldwin Park citywide, when much of the city had already been developed. It does not seem to have been part of a broader pattern development and was neither the first nor last nondescript commercial structure to be constructed in the neighborhood, Baldwin Park, the greater Los Angeles area, or Southern California at large. The neighborhood in which the subject property sits was mixed-use prior to the subject property's construction, with primarily residential structures to the west and south of the subject property and commercial buildings primarily to the east and south of the subject property. The subject property appears to follow an already-established pattern of development in Baldwin Park and does not appear to represent any particular period of development or historical pattern in the city.

The property is not known to be directly associated with events that have made a significant contribution to the history of Baldwin Park, California, or the United States. Therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

### Criterion B/2: That are associated with the lives of persons significant in our past.

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national or state, level. From its construction in 1976 (and expansion in 1986) until 2021, the subject property was occupied by the Broken Horn Saddlery, Baldwin Park's only tact store. The Broken Horn Saddlery was owned and operated by the Nuzzo family. The business itself was founded by Charlie Nuzzo in 1956 and was run by the Nuzzo family until 2021. The Broken Horn Saddlery moved to 4120 Maine Avenue in downtown Baldwin Park in 2022 under new ownership.

While the Nuzzo family undoubtedly contributed substantially to the equestrian community of Baldwin Park and beyond through the Broken Horn Saddlery, research did not identify information that would indicate the association of members of the Nuzzo family with the subject property would rise to the threshold of significance required for eligibility. Therefore, the subject property does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

### Criterion C/3/3: That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

The subject property is a nondescript commercial building composed of two attached structures: one built in 1976 and one built in 1986. Based on aerial photographs, the structures appear to have been connected circa 1995. While the subject property does have some elements that appear to reflect Western, hacienda, and ranching influences tying the exterior of the building to the goods it sold as the Broken Horn Saddlery, such as its tile-clad overhangs and the arches on the primary west elevation of the 1986 portion of the building, the building does not embody any discernable architectural style.

The subject property does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1970s-1980s nondescript commercial building. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style and is executed in common materials. The subject property appears to have been constructed through already well-documented and common construction techniques and methods. It is not a rare example of its type in Baldwin Park; there is another similar commercial building that features similar design elements such as tile overhangs, for example, located approximately 0.20-mile southeast of the subject property at 927 Baldwin Park Boulevard (constructed 1973 per the Los Angeles County Assessor).

Research further did not identify the subject property as being designed by a master architect, builder, or contractor. The 1976 portion of the building was built by contractor John Barr, according to the original building permit. Research did not identify information on Barr that would indicate he was a master builder. The 1986 portion of the subject property was built by Charlie Nuzzo, the business owner, according to its original building permit. The property further does not appear to possess high artistic values by articulating a particular concept of design to the extent that it expresses an aesthetic ideal.

The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. The subject property does not appear likely to contribute to a potential historic district. Therefore, the subject property does not appear eligible under NRHP Criterion C or CRHR Criterion 3.

### Criterion D/4/4: That have yielded, or may be likely to yield, information important in prehistory or history.

The subject property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies.

## Integrity Discussion

To be eligible for listing in the NRHP or CRHP, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically significant properties, the length of the historic associations usually measures the period of significance.

The subject property is composed of two connected buildings, one that was constructed in 1976 and one that was constructed in 1986. Since the subject property has not been moved, the property retains integrity of location. Building permit research and site survey information identified only minor alterations to the building and it appears to consequently retain integrity of design, materials, and workmanship. While some of the building's signage advertising the Broken Horn Saddlery has been removed, the building still retains signage reading "Broken Horn Saddlery" on its primary west elevation, as well as signage on its north elevation and consequently still retains its integrity of feeling, as it still is readily identifiable as a commercial space that was occupied by the Broken Horn Saddlery. The subject property retains only marginal integrity of setting; since the subject property's construction, the Kaiser Permanente Baldwin Hills campus was constructed in 1991 to the south and east of the subject property, replacing the Edgewood Drive-In that was extant at the time of the subject property's construction. The medical facilities are directly adjacent to the subject property and introduced new building typologies and a larger scale to the neighborhood. While the Nuzzo family, who founded Broken Horn Saddlery, were notable local businesspeople, their significance and association with the subject property does not appear to rise to the level of significance required for eligibility. Thus, research did not reveal that the property has an association with significant people or events in Baldwin Park, thus it does not retain integrity of association. In conclusion, subject property retains integrity of location, design, materials, workmanship, feeling, and association, but only retains marginal integrity of setting.

## City of Baldwin Hills Statement of Significance

The property at 1022 Leorita Street does not meet any of the criteria for City of Baldwin Hills historical designation or as part of an existing historic district, as demonstrated below.

### (A) Historical Representation: The building or structure is particularly representative of a distinct historical period, type, style, region or way of life.

The subject property is a 1976 (with 1986 addition) nondescript commercial building with some minimal Western influences and was occupied by the Broken Horn Saddlery until 2021. Similar buildings are ubiquitous in Baldwin Park and the greater Southern California region. The subject property is a typical building of its period and does not appear to represent a distinct historical period, type, style, region, or way of life. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion A.

### (B) Connection to important personality: The building or structure was connected with someone renowned, important or who was a local personality.

As discussed in NRHP / CRHP Criterion B/2, the subject property was the home of the Broken Horn Saddlery from its construction in 1976 (and subsequent 1986 expansion) until 2021. The Broken Horn Saddlery was founded by Charlie Nuzzo, and remained a family-run operation until 2021, when the business vacated the subject property. The Broken Horn Saddlery re-opened under new ownership at 4120 Maine Avenue in 2022 (Baldwin Park News 2022). While the Broken Horn Saddlery was, and remains, an important local business serving the equestrian community of Baldwin Park and beyond, and while the Nuzzo family were important family stewards of this legacy business, it does not appear that the building or structure is connected to someone renowned, important, or who was a local personality that would rise to the level required for designation. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion B.

### (C) Connection to rare business: The building or structure is connected with a business or use which was once common but is now rare.

The subject property was occupied by the Big Horn Saddlery from its construction in 1976 until 2021, when the business moved to downtown Baldwin Park (Baldwin Park News 2022). It appears that Big Horn Saddlery is the only tack shop in the City of Baldwin Park and has historically been the primary source for tack and saddles in the city. While this is a rare business type in the city, it was never a common business as it appears to have been the only store of its type in Baldwin Hills. The business is still in operation in Baldwin Park today, albeit in a new location. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion C.

### (D) Master work: The building or structure represents the work of a master builder, engineer, designer, artist or architect.

As discussed in NRHP/CRHR Criterion C/3, the subject property was not designed by a master builder, engineer, designer, artist, or architect. According to its original building permit, the building at 1026 Leorita Street was constructed by John Barr; research did not identify information on John Barr that would indicate he is a master builder. The original building permits for 1022-1024 Leorita Street lists the owner of the Broken Horn Saddlery, Charlie Nuzzo, as the contractor. No architect was listed on either permit. There is no indication the property is the work of an architect, builder, engineer, designer, or artist of major importance. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion D.

### (E) Historic event: The building or structure is the site of an important historic event or is associated with events that have made a meaningful contribution to the nation, state or city.

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that the subject property was related to historical events significant to the City of Baldwin Park and does not reflect elements associated with a historic event having major significance to the City of Baldwin Park, Los Angeles County, the State of California or the United States. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion H.

### (F) Particular architectural style: The building or structure exemplifies a particular architectural style.

As discussed in NRHP / CRHR Criterion C/3, the subject property is a nondescript commercial building with no discernable style. While the subject property has some design elements that appear to reference Western, hacienda, and ranching traditions, such as overhangs clad in tiles and arches on the primary (west) elevation of the 1986 portion of the building, it does not embody most of the character-defining features of the stye. Rather, it is a functional building constructed for functional purposes and does not exemplify any particular architectural style. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion F.

### (G) Best remaining: The building or structure exemplifies the best remaining architectural type of a neighborhood.

The subject property is not the best remaining architectural type in its neighborhood. The subject property is not a rare example of a nondescript commercial building constructed in the 1970s in the neighborhood or Baldwin Park at large. One of many examples of a comparable commercial building in the neighborhood is the building at 927

Baldwin Park Boulevard (constructed 1973 per the Los Angeles County Assessor). Therefore, the subject property does not appear eligible under City of Baldwin Park Criteria G.

### (H) Outstanding design: The construction materials or engineering methods used in the building or structure embody elements of outstanding architectural or engineering design, detail, material or craftsmanship.

As discussed in NRHP/CRHR Criteria C/3, the subject property does not appear to embody elements of outstanding architectural or engineering design, detail, material or craftsmanship. It is a typical example of a common and widespread 1970s commercial structure. Therefore, the subject property does not appear eligible under City of Baldwin Park Criteria H.

# 6 Findings and Conclusions

## 6.1 Summary of Findings

The subject property appears ineligible as a historical resource as a result of extensive archival research, field survey, and the property significance evaluation. Findings are summarized below in Table 5. Therefore, the subject property is not considered historical resources for the purposes of CEQA.

**Table 5. Historic Built Environment Findings**

| Address | Date Constructed | NRHP/ CRHR/ City of Baldwin Park Designation Criteria | Previous CHRS code (if applicable) | Assigned California Historical Resource Status code | CEQA Finding |
|---|---|---|---|---|---|
| 1022 Leorita Street<br>1024-1026 Leorita Street | 1976<br>1986 | Not eligible | Not applicable | 6Z: Found ineligible for NR, CR or local designation through survey evaluation | Not considered a historical resource for the purposes of CEQA |

## 6.2 Recommendations

The subject property appears ineligible as a historical resource at the local, state, and federal level. No historical resources were identified within the Project site as a result of extensive archival research, a SCCIC records search, field survey, and property evaluations of significance. The subject property is not currently designated or listed under any national, state, or local landmark programs. The subject property has further not been identified as eligible for local designation by any historical resources surveys.

Dudek evaluated subject property in accordance with Section 15064.5 (a)(2)-(3) of California Environmental Quality Act (CEQA) Guidelines and using the criteria outlined in Section 5024.1 of the California Public Resources Code. Dudek concludes that the building does not appear to be eligible for listing in the NRHP, CRHR, or for historical designation in the City of Baldwin Park due to a lack of significance. As such, the subject property does not appear to be a historical resource under CEQA. The recommended California Historical Resources Status Code for the subject property is 6Z. The finding for built environment cultural resources for the proposed Project under CEQA is No Impact. As the proposed Project would have no impact on historical resources, no further study is required.

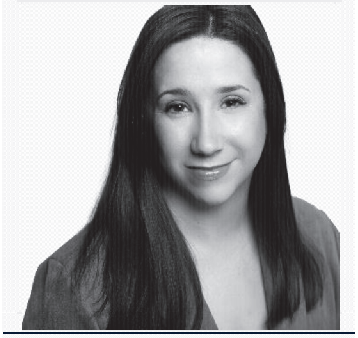
Preparer's Qualifications

# Claire Cancilla, MSHP

**ARCHITECTURAL HISTORIAN**



Claire Cancilla (KLAIR *Kan-sil-uh; she/her*) is an Architectural Historian with 3 years' professional experience that encompasses a wide variety of project types in varied geographic locations, including Los Angeles, Laguna Beach, Agoura Hills, Baldwin Park, Poway, Riverside, San Diego, Glendale, Pasadena, Sequoia National Park, New York City, and Venice, Italy. She has completed historic significance evaluations in consideration of the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), and local designation criteria for single-family residences, commercial properties, educational institutions, warehouse and industrial properties, and municipal facilities. Additional project experience includes writing national register and local register nominations, conducting historic archival research, performing conditions assessments and reconnaissance surveys, conducting CEQA impacts analyses, preparing environmental impact report (EIR) sections, and conducting design reviews under the Secretary of the Interior's Standards. She meets the Secretary of the Interior's Professional Qualification Standards for Architectural History.

## Dudek Project Experience

**Los Angeles County Metro Area Plan Project, Los Angeles County, California.** Dudek was retained by the County of Los Angeles Department of Regional Planning to prepare a Historic Context Statement (HCS) in support of the Metro Area Plan (MAP) project. The goal of the HCS component of the project is to inform, enhance, and streamline the larger MAP project as it pertains to historical resources. The communities included within the MAP HCS include East Los Angeles, East Rancho Dominguez, Florence–Firestone, Walnut Park, West Athens–Westmont, West Rancho Dominguez–Victoria, and Willowbrook. The HCS documents the development history of the communities from the rancho period to the present; identifies important themes, events, and patterns of development; and describes the different property types, styles, builders, and architects associated with these important periods and themes. The document will also provide registration requirements and recommendations for future study/action by the County of Los Angeles to facilitate and streamline the historic preservation program. Responsibilities include report section preparation and archival research. (2021–Present)

**Kaiser Baldwin Park Medical Center Project, Top Commercial Realty, Baldwin Park California**. Dudek was retained to complete a Built Environment Inventory and Evaluation Report for a proposed project involving the development of the Kaiser Baldwin Park Medical Center. Ms. Cancilla co-authored a Built Environment Inventory and Evaluation Report for a 1970s vernacular commercial building. (2022).

**Arlington Avenue Historic Resources Technical Report, Foulger Pratt, Riverside, California**. Dudek was retained to complete a Historic Resources Technical Report on a Mid-Century Modern former Sears Department Store in the city of Riverside, California for a proposed redevelopment. Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022).

**Oak Knoll Road, Poway, San Diego County, California.** Dudek was retained to complete a historical resources evaluation for a residential development project in the City of Poway. The Project proposes the development of the 10.72-acre property into a residential development within an existing residential neighborhood. As an architectural historian, Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022)

## Relevant Previous Experience

**Mayfield Junior School Historic Resource Assessment, City of Pasadena, California.** Primary author of a historic resource assessment (HRA) for two mid-century educational buildings on the Mayfield Junior School campus. Work involved archival research, survey and documentation of the buildings and campus, and an evaluation of both buildings' eligibility under local, state, and federal criteria. (2022)

**Silver Lake Reservoir Complex Master Plan EIR, City of Los Angeles, California.** Conducted a site survey of the Silver Lake Reservoir, documenting character-defining features of the complex and conducting a direct, indirect, and cumulative impacts analysis for a proposed master plan. Work involved identifying all previously recorded historic built environment resources within 0.25-mile of the complex's perimeter for the impacts analysis. (2022)

**Project Crossings Redevelopment HRA and EIR Section, Apple Inc., Los Angeles and Culver City, California.** Primary author of an HRA for three industrial buildings, located on the boundary between Los Angeles and Culver City. All buildings were evaluated under both cities' local evaluation criteria. Conducted a direct, indirect, and cumulative impacts analysis, analyzing potential effects of the proposed redevelopment on adjacent built environment resources and prepared an EIR section for the project (2021–2022)

**Heritage Park Rehabilitation Project, City of San Diego, California.** Conducted research and updated Department of Parks and Recreation (DPR) forms for seven Victorian-era buildings located in San Diego's Heritage Park in anticipation of a forthcoming rehabilitation project. The residences were moved to the park in the 1970s and 1980s due to their impending demolition. (2022)

**446 26th Street DPR Form, San Diego Unified School District, San Diego California.** Conducted research and completed DPR forms for a 1970 vacant former hospital facility in San Diego. Documented the history of the building and its various owners and functions and analyzed the building within the context of the federal Model Cities Program, which provided funding for the building's original construction. (2022)

**2720 Monte Mar Terrace Historical Consulting Services, Confidential Client, Los Angeles, California.** Conducted research on the history and development of 1920s Tudor Revival residence and provided consulting services to the homeowners to help guide a potential new addition to the residence. (2022)

**7 Oakmont Drive Character-Defining Features Analysis, Confidential Client, Los Angeles, California.** Conducted a site visit at the Paul Revere Williams Los Angeles Historic-Cultural Monument (LAHCM) residence, photographically documenting all elevations to identify character-defining features of the residence. Compiled a table of character-defining features and provided preservation recommendations and treatments in anticipation of a rehabilitation and exterior addition to the residence. (2021)

**Kun House II LAHCM, Confidential Client, Los Angeles, California.** Co-authored an LAHCM nomination for a Richard Neutra-designed residence. Kun House II is located across the street from Kun House I, another Neutra-deigned home for the same client. Work involved conducting archival research at the University of California Los Angeles, surveying the residence, and contextualizing the home within the body of Neutra's residential work to argue for the home being an excellent example of Neutra's small-scale residential design. (2021)

**989 Cliff Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California.** Authored an HRA for a 1920s Mediterranean Revival beach house that was identified in Laguna Beach's historic resources survey. Research involved an extensive alteration history using plans from renovations and historic photographs, a site visit, and research on the development of the area and the house's inhabitants. Further conducted a direct and indirect impacts analysis for a proposed garage renovation and addition on the project site. (2021)

**28307 Agoura Road HRA and HABS III Documentation, Confidential Client, Agoura Hills, California.** Authored an HRA on a 1940s vernacular commerical property in Agoura Hills. Researched the rural character and history of Agoura Hills, conducted research at the Agoura Hills Library and Bulding Division, identified occupants, and assessed eligiblity. Upon completion of the HRA, assisted HABS III documentation for the property prior to its redevelopment. (2021)

**Marine Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California.** Authored an HRA for a single-family 1920s Craftsman residence on Marine Drive. Researched the original property owner, who was a founder of the Orange County Register, and the early beachfront development of Laguna Beach, and conducted an integrity analysis of the home using historic photographs and on-site observation. (2021)

**Edgemont Street Los Angeles Historic Cultural Monument Nomination, Confidential Client, Los Angeles, California.** Drafted an LAHCM nomination for an American Colonial Revival courtyard garden apartment complex located on the boundary between Los Feliz and East Hollywood. Contextualized the apartment complex within the courtyard apartment typology and as an example of the work of a prolific construction company that designed several other courtyard apartment buildings in Los Angeles. (2021).

**5654 Fountain Avenue HRA, Confidential Client, Los Angeles, California.** Primary author of an HRA for an American Colonial Revival residential duplex in Hollywood constructed in 1919. Documented the building's history; conducted extensive reserach on the building, its site, and neighbohrood development; and analyzed the building's material and design integirty. (2021)

**Powers Street Mosque National Register Nomination, Williamsburg, Brooklyn, New York.** Authored a National Register nomination for the Powers Street Mosque, the oldest extant mosque in New York City. The mosque, originally constructed as an Episcopalian church, was founded in 1931 by the American Mohammed Society, formed by Lipka Tatar Muslims, many of whom immigrated to Brooklyn from Lithuania. Researched the property's history, both before its use as a mosque and after; interviewed the mosque's caretaker whose family was involved in the mosque's founding; and conducted photographic documentation. (2020)

**Victoria Theatre Historic Resource Report, Confidential Client, Harlem, New York.** Authored a historic resource report documenting the development history of the Victoria Theatre, located on 125th Street in Harlem, New York and designed by architect Thomas Lamb. Conducted research trips to archival repositories to document the theater's history, analyzed the theater within the context of Harlem's historical development, and identified additional theaters in the area designed by Lamb. The report provided the basis for an interpretive exhibit in the theater's lobby. (2020)

## Awards

Zabar Family Scholarship, Preservation League of New York State, 2020.

Cleo and James Marston Fitch Prize, Columbia University Preservation Alumni, 2019.

Avery Scholarship, Columbia University Graduate School of Architecture, Planning, and Preservation, 2018–2020.

# Caitlin Greeley, MA

**ARCHITECTURAL HISTORIAN**

Caitlin Greeley (*she/her*) is an architectural historian with 2 years' professional experience. As part of her cultural resources management work, Ms. Greeley has conducted archival research, performed fieldwork, and authored multiple historic context statements. She also has experience preparing and contributing to California Department of Parks and Recreation (DPR) 523 forms. She has experience with consultation for Section 106 of the National Historic Preservation Act, Area of Potential Effect maps, Historic Resource Evaluation Reports, Historical Resource Inventories, Historic American Building Survey photography, reconnaissance and intensive-level surveys, and archival research.

Ms. Greeley meets the Secretary of the Interior's Professional Qualification Standards for both Architectural History and History. She has experience preparing environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) and Sections 106 and 110 of the National Historic Preservation Act.

Prior to joining Dudek, Ms. Greeley gained extensive experience working in multicultural and multilingual environments. She has experience photographing historic buildings and writing conservation management statements for preservation and proposals for adaptive reuse of historic buildings.

## Dudek Project Experience

**Cultural Resources Inventory and Evaluation Report for the Elephant Hill Project, City of Pomona, Los Angeles County, California.** Dudek was retained by City of Pomona to prepare an inventory and evaluation report for the Elephant Hill Project, which proposes to develop a 228-unit single and multi-family housing development on the western face of Elephant Hill. The proposed project activities intersected or were immediately adjacent to one previously listed City of Pomona Designated Historical Landmark: Spadra Cemetery; and one previously unidentified property over 50 years in age: a segment of Brea Canyon Road. Preparation of the report involved intensive level survey of both properties including documentation of the cemetery according to National Register Bulletin 41 guidelines, archival research, historic context development, developing a significance evaluation for resources under NRHP, CRHR, and local criteria. Dudek recommended that Brea Canyon Road was ineligible; however, Spadra Cemetery was already considered a historical resource under CEQA and an impacts analysis and mitigation measures were prepared. (2022 - ongoing)

**As-Needed Historic Research Consultant, City of Coronado, California.** Dudek is currently working with the City of Coronado Community Development Department to provide historic preservation services on an as-needed basis. Services scoped under the current contract include historic resources surveys; archival research; preparation of evaluation reports in consideration of the National Register of Historic Places (NRHP), the California Register of

Historical Resources, and City of Coronado designation criteria; attendance at Historic Resource Commission and City Council hearings; and review of projects for conformance with the Secretary of the Interior's Standards for Rehabilitation. Ms. Greeley serves as an architectural historian for the task orders and is responsible for archival research and reporting. (2022 - ongoing)

**SB2 Planning Grant Project, San Bernardino County, California.** Dudek was retained to prepare a Cultural Resources Technical Report in support of the SB2 Planning Grant Project in San Bernardino County. Preparation of the report involved extensive archival research and historic context statement development. Ms. Greeley serves as an architectural historian for the project and is responsible for archival research and coauthoring the historic context statement. (2022)

**Willow Tree Inn, City of Compton, California.** Dudek was retained to prepare a historic resources evaluation, a Built Environment Inventory, and an evaluation report for the Willow Tree Inn located within the city limits of Compton. Preparation of the report involved extensive archival research, in-field research, historic context statement development, building development descriptions, historical significance evaluations, and DPR forms for the property. Ms. Greeley serves as an architectural historian for the project and is responsible for fieldwork, archival research, and writing building descriptions. (2022)

## Relevant Previous Experience

**California Housing and Community Investment Department of Los Angeles, City of Los Angeles, California.** Ms. Greeley performed intake of incoming work orders of affordable housing projects and conducted historic research on each project site and neighboring properties. She evaluated properties throughout Los Angeles in compliance with Section 106 to determine potential eligibility of historic resources for designation on the NRHP. She also created the preliminary Area of Potential Effects boundary maps for the proposed project using Photoshop for visual presentation. She aided in making preliminary determinations to see if the proposed affordable housing project had an effect on surrounding properties eligible for the NRHP in accordance with Section 106. She coordinated with and provided training to coworkers on the intake process for the project. She conducted site survey of individual resources in the City of Los Angeles through photographic documentation and contributed to DPR forms. (2020–2021)

**Cultural Assessment for Weatherization Projects for Homes, California Department of General Services, California.** Ms. Greeley helped with the intake of reviews, assigned reviews to staff, and coordinated with agencies. She also conducted research on historic-age properties throughout California using assessor records, building permits, historic aerials, local ordinances, or surveys regarding local historic preservation to determine if the proposed project had an effect on properties eligible for the NRHP in accordance with Section 106. (2020–2022)

**XpressWest Passenger Train Project, California and Nevada.** Ms. Greeley performed administrative tasks and organized Section 106 consultation party documents. She also contributed to DPR forms and NRHP eligibility evaluations of individual resources. She conducted research on unknown parcels using historic photographs and spatial analysis programs such as Google Earth imaging. She edited survey photos through post-production software, such as Photoshop, for visual presentation. (2020)

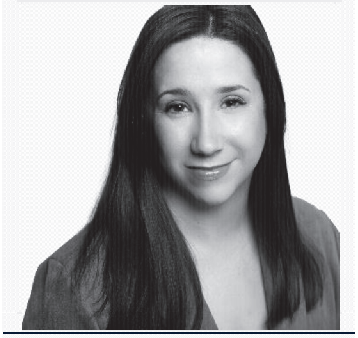
**Interstate 10/Mt. Vernon Avenue Improvement Project, City of Colton and Caltrans District 8, San Bernardino County, California.** Ms. Greeley conducted a field survey to identify built environment resources requiring formal evaluation and participated in the identification of built resources subject to exemption per Attachment 4 of the Caltrans Section 106 Programmatic Agreement. She also researched and contributed to the City of Colton historic

context statement in the draft Historical Resources Evaluation Report. Additionally, she prepared DPR forms for individual resources in the project Area of Potential Effect. (2020)

**Fenix Marine Intermodal Railyard Expansion and Modernization Project, The Port of Los Angeles and Maritime Administration, California.** Ms. Greeley researched consulting parties for the project and drafted consultation letters and tribal letters as part of the Section 106 process. She also contributed to the draft technical report and conducted a field survey of historic built environment resources. (2020)

# Claire Cancilla, MSHP

**ARCHITECTURAL HISTORIAN**



Claire Cancilla (KLAIR *Kan-sil-uh; she/her*) is an Architectural Historian with 3 years' professional experience that encompasses a wide variety of project types in varied geographic locations, including Los Angeles, Laguna Beach, Agoura Hills, Baldwin Park, Poway, Riverside, San Diego, Glendale, Pasadena, Sequoia National Park, New York City, and Venice, Italy. She has completed historic significance evaluations in consideration of the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), and local designation criteria for single-family residences, commercial properties, educational institutions, warehouse and industrial properties, and municipal facilities. Additional project experience includes writing national register and local register nominations, conducting historic archival research, performing conditions assessments and reconnaissance surveys, conducting CEQA impacts analyses, preparing environmental impact report (EIR) sections, and conducting design reviews under the Secretary of the Interior's Standards. She meets the Secretary of the Interior's Professional Qualification Standards for Architectural History.

## Dudek Project Experience

**Los Angeles County Metro Area Plan Project, Los Angeles County, California.** Dudek was retained by the County of Los Angeles Department of Regional Planning to prepare a Historic Context Statement (HCS) in support of the Metro Area Plan (MAP) project. The goal of the HCS component of the project is to inform, enhance, and streamline the larger MAP project as it pertains to historical resources. The communities included within the MAP HCS include East Los Angeles, East Rancho Dominguez, Florence–Firestone, Walnut Park, West Athens–Westmont, West Rancho Dominguez–Victoria, and Willowbrook. The HCS documents the development history of the communities from the rancho period to the present; identifies important themes, events, and patterns of development; and describes the different property types, styles, builders, and architects associated with these important periods and themes. The document will also provide registration requirements and recommendations for future study/action by the County of Los Angeles to facilitate and streamline the historic preservation program. Responsibilities include report section preparation and archival research. (2021–Present)

**Kaiser Baldwin Park Medical Center Project, Top Commercial Realty, Baldwin Park California**. Dudek was retained to complete a Built Environment Inventory and Evaluation Report for a proposed project involving the development of the Kaiser Baldwin Park Medical Center. Ms. Cancilla co-authored a Built Environment Inventory and Evaluation Report for a 1970s vernacular commercial building. (2022).

**Arlington Avenue Historic Resources Technical Report, Foulger Pratt, Riverside, California**. Dudek was retained to complete a Historic Resources Technical Report on a Mid-Century Modern former Sears Department Store in the city of Riverside, California for a proposed redevelopment. Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022).

**Oak Knoll Road, Poway, San Diego County, California.** Dudek was retained to complete a historical resources evaluation for a residential development project in the City of Poway. The Project proposes the development of the 10.72-acre property into a residential development within an existing residential neighborhood. As an architectural historian, Ms. Cancilla contributed to the significance evaluation and historic contexts for the technical report. (2022)

## Relevant Previous Experience

**Mayfield Junior School Historic Resource Assessment, City of Pasadena, California.** Primary author of a historic resource assessment (HRA) for two mid-century educational buildings on the Mayfield Junior School campus. Work involved archival research, survey and documentation of the buildings and campus, and an evaluation of both buildings' eligibility under local, state, and federal criteria. (2022)

**Silver Lake Reservoir Complex Master Plan EIR, City of Los Angeles, California.** Conducted a site survey of the Silver Lake Reservoir, documenting character-defining features of the complex and conducting a direct, indirect, and cumulative impacts analysis for a proposed master plan. Work involved identifying all previously recorded historic built environment resources within 0.25-mile of the complex's perimeter for the impacts analysis. (2022)

**Project Crossings Redevelopment HRA and EIR Section, Apple Inc., Los Angeles and Culver City, California.** Primary author of an HRA for three industrial buildings, located on the boundary between Los Angeles and Culver City. All buildings were evaluated under both cities' local evaluation criteria. Conducted a direct, indirect, and cumulative impacts analysis, analyzing potential effects of the proposed redevelopment on adjacent built environment resources and prepared an EIR section for the project (2021–2022)

**Heritage Park Rehabilitation Project, City of San Diego, California.** Conducted research and updated Department of Parks and Recreation (DPR) forms for seven Victorian-era buildings located in San Diego's Heritage Park in anticipation of a forthcoming rehabilitation project. The residences were moved to the park in the 1970s and 1980s due to their impending demolition. (2022)

**446 26th Street DPR Form, San Diego Unified School District, San Diego California.** Conducted research and completed DPR forms for a 1970 vacant former hospital facility in San Diego. Documented the history of the building and its various owners and functions and analyzed the building within the context of the federal Model Cities Program, which provided funding for the building's original construction. (2022)

**2720 Monte Mar Terrace Historical Consulting Services, Confidential Client, Los Angeles, California.** Conducted research on the history and development of 1920s Tudor Revival residence and provided consulting services to the homeowners to help guide a potential new addition to the residence. (2022)

**7 Oakmont Drive Character-Defining Features Analysis, Confidential Client, Los Angeles, California.** Conducted a site visit at the Paul Revere Williams Los Angeles Historic-Cultural Monument (LAHCM) residence, photographically documenting all elevations to identify character-defining features of the residence. Compiled a table of character-defining features and provided preservation recommendations and treatments in anticipation of a rehabilitation and exterior addition to the residence. (2021)

**Kun House II LAHCM, Confidential Client, Los Angeles, California.** Co-authored an LAHCM nomination for a Richard Neutra-designed residence. Kun House II is located across the street from Kun House I, another Neutra-deigned home for the same client. Work involved conducting archival research at the University of California Los Angeles, surveying the residence, and contextualizing the home within the body of Neutra's residential work to argue for the home being an excellent example of Neutra's small-scale residential design. (2021)

**989 Cliff Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California.** Authored an HRA for a 1920s Mediterranean Revival beach house that was identified in Laguna Beach's historic resources survey. Research involved an extensive alteration history using plans from renovations and historic photographs, a site visit, and research on the development of the area and the house's inhabitants. Further conducted a direct and indirect impacts analysis for a proposed garage renovation and addition on the project site. (2021)

**28307 Agoura Road HRA and HABS III Documentation, Confidential Client, Agoura Hills, California.** Authored an HRA on a 1940s vernacular commerical property in Agoura Hills. Researched the rural character and history of Agoura Hills, conducted research at the Agoura Hills Library and Bulding Division, identified occupants, and assessed eligiblity. Upon completion of the HRA, assisted HABS III documentation for the property prior to its redevelopment. (2021)

**Marine Drive HRA and Impacts Analysis, Confidential Client, Laguna Beach, California.** Authored an HRA for a single-family 1920s Craftsman residence on Marine Drive. Researched the original property owner, who was a founder of the Orange County Register, and the early beachfront development of Laguna Beach, and conducted an integrity analysis of the home using historic photographs and on-site observation. (2021)

**Edgemont Street Los Angeles Historic Cultural Monument Nomination, Confidential Client, Los Angeles, California.** Drafted an LAHCM nomination for an American Colonial Revival courtyard garden apartment complex located on the boundary between Los Feliz and East Hollywood. Contextualized the apartment complex within the courtyard apartment typology and as an example of the work of a prolific construction company that designed several other courtyard apartment buildings in Los Angeles. (2021).

**5654 Fountain Avenue HRA, Confidential Client, Los Angeles, California.** Primary author of an HRA for an American Colonial Revival residential duplex in Hollywood constructed in 1919. Documented the building's history; conducted extensive reserach on the building, its site, and neighbohrood development; and analyzed the building's material and design integirty. (2021)

**Powers Street Mosque National Register Nomination, Williamsburg, Brooklyn, New York.** Authored a National Register nomination for the Powers Street Mosque, the oldest extant mosque in New York City. The mosque, originally constructed as an Episcopalian church, was founded in 1931 by the American Mohammed Society, formed by Lipka Tatar Muslims, many of whom immigrated to Brooklyn from Lithuania. Researched the property's history, both before its use as a mosque and after; interviewed the mosque's caretaker whose family was involved in the mosque's founding; and conducted photographic documentation. (2020)

**Victoria Theatre Historic Resource Report, Confidential Client, Harlem, New York.** Authored a historic resource report documenting the development history of the Victoria Theatre, located on 125th Street in Harlem, New York and designed by architect Thomas Lamb. Conducted research trips to archival repositories to document the theater's history, analyzed the theater within the context of Harlem's historical development, and identified additional theaters in the area designed by Lamb. The report provided the basis for an interpretive exhibit in the theater's lobby. (2020)

## Awards

Zabar Family Scholarship, Preservation League of New York State, 2020.

Cleo and James Marston Fitch Prize, Columbia University Preservation Alumni, 2019.

Avery Scholarship, Columbia University Graduate School of Architecture, Planning, and Preservation, 2018–2020.

## Significance summary

1022-1026 Leorita Street (APN 8559-008-011; APN 8559-008-005) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district. It further does not meet any of the criteria for landmark listing by the City of Baldwin Park. The subject property does not meet the minimum requirements for any category of historical resource within the City of Baldwin Park. The recommended status code is 6Z: Found ineligible for NR, CR or Local designation through survey evaluation. [**See Continuation Sheet**]

*P3a. Description:

The subject property is surrounded by large concrete parking lots with scattered palm trees. There is an ancillary shed outside the west elevation of the 1986 portion of the building that was added circa 1992 per aerial photographs, and a stepped concrete block wall separating the subject property's lot from the adjacent Kaiser parking garages at the south end of the lot. The subject property has a flat roof and is constructed of concrete block; most elevations do not have fenestration and consist of uninterrupted walls of painted concrete block. There are three primary entrances to the building: one on the west elevation and one on the north elevation of the 1976 portion of the building, and one on the primary west elevation of the 1986 portion of the building.

The west elevation of the 1976 portion of the building (1026 Leorita Street) has two large rectangular bays that were covered with a metal roll-up door at the time of the site visit. The northern bay features a trapezoidal overhang clad in red tile; the other bay is uncovered. The north elevation of the 1976 portion of the building has a metal frame double door at the center of the elevation, covered with a metal security gate, with a red tile-clad overhang. The elevation has no additional fenestration, consisting of painted concrete blocks interrupted at regular intervals by nine brick pilasters. A sign on the roof, added circa 1998 per building permits, reads "Broken Horn Western Store" and is readily visible from the nearby I-10 freeway. Outside the elevation is a freestanding sign reading "English & Western Saddlery." The east elevation has one door single-leaf door at its center and is otherwise unornamented.

The primary (west) elevation of the 1986 portion of the building (1022-1024 Leorita Street) is nine bays across, consisting of three arches flanked by three rectangular bays covered with metal roll-up doors on either side. The rectangular bays are recessed slightly behind the arches and all bays are separated by brick piers. This elevation is clad in painted brick; the remainder of the subject property is constructed of concrete blocks. The middle arch, located at the center of the elevation, contains the building's primary entrance, an arched metal frame glass double door covered with a decorative cast iron privacy gate. All bays are covered with an overhang clad in red tile and supported by large wood brackets. Above, the words "Broken Horn" are painted at the center of the building's elevation. The remainder of the elevations consist of uninterrupted concrete with a single-leaf door at the center of the south elevation.

**Figure 1.** Overall view of the subject property's west (primary) elevation, view to the east. The 1976 portion of the building is on the left (north) and the 1986 portion is on the right (south) (IMG_1376)

**Figure 2.** view of the subject property's north elevation, view to the south. This elevation is part of the 1976 portion of the subject property (IMG_1493)

***B6. Construction History** *(continued from page 2):*

The subject property has undergone the following alterations, as documented in City of Baldwin Park building permits:

- Freestanding sign (1977)
- Concrete retaining wall (1977)
- Add mezzanine addition to building at 1026 Leorita Street (1979)
- New construction (1022 Leorita Street; 1984-1986)
- Wall sign (1998)
- Re-roof (2007)

***B10. Significance** *(continued from page 2):*

**Historical Overview of the City of Baldwin Park**

Baldwin Park, colloquially known as the "hub of the San Gabriel Valley" due to its central geographic location in the Valley, is situated approximately 17 miles east of Los Angeles and five miles north of the San Gabriel Mountains. At the beginning of the 19th century, the land comprising modern-day Baldwin Park consisted of cattle grazing land that was owned by the San Gabriel Mission. This land was part of two ranchos: the Rancho Azusa de Dalton and the Rancho La Puente. By 1860, the community was known as Pleasant Grove. The small community grew in the subsequent decades, but remained largely agrarian, supporting agriculture, vineyards, and cattle ranching.

Pleasant Grove was renamed Vineland in 1880, a reflection of the many vineyards that flourished

in the area. At this time, a severe drought precipitated the gradual decline of cattle ranching, and the land formerly used by cattle ranches, to the north of present-day Ramona Boulevard, was consequently settled and built up by squatter farmers. While still primarily agricultural, by this time the built environment began to expand, with the first residence constructed on present-day Los Angeles Street by Austin Brown. Soon, a business center developed around the community's general store, located at present-day Los Angeles and La Rica Streets.

In 1890, the Vineland School District was established. The establishment of a school district serving the area also necessitated the construction of a two-room schoolhouse in 1890, which served the dual purpose of educational facility and general community meeting space. Between 1892 and 1895, the present-day Main and Los Angeles Streets were the center of the community's activity, due in part to being part of the frequently traveled stagecoach line to San Jose. Although the community was expanding, water shortage continued to be a major challenge, with farmers forced to haul water from the San Gabriel River. Farmers in the area at this time largely did not use irrigation, so all crops depended on groundwater, wells, and water from rainfall.

In 1906, prolific and influential real estate speculator Elias "Lucky" Baldwin proposed the establishment of a new city to be called "Baldwinville" near the existing Vineland settlement. At this time, Baldwin owned the land south of present-day Ramona Street. The establishment of an adjacent community posed a potential threat to the economy and development of Vineland, as locals believed the establishment of a nearby city would fuel competition for already-scarce water. Citizens of Vineland invited Baldwin to discuss his proposal. Baldwin agreed, and he arrived at Shultis' Grocery, run by local businessman D.J. Shultis. When he arrived, the octogenarian Baldwin tripped and nearly fell over, but was saved from the tumble by Mrs. Shultis, the wife of the store's proprietor. Baldwin was reportedly so grateful for this that he agreed not to follow through with his plans for Baldwinville, instead lending his name to the Vineland community, which was renamed Baldwin Park.

Baldwin Park continued to expand in subsequent years, facilitated the Pacific Electric Railroad laying tracks in the center of town in 1912, which improved Baldwin Park's accessibility and allowed residents to navigate Baldwin Park and the surrounding areas more easily. The Pacific Electric Railroad served Baldwin Park until 1951. Community organizations grew rapidly, with both the Chamber of Commerce and the Baldwin Park Women's Club starting in 1906. In 1913, the community's first newspaper, the *Baldwin Park Bulletin*, was established.

While Baldwin Park maintained its semi-rural character for the first half of the 20th century, new educational and civic facilities, businesses, and residences were constructed through the 1920 and 1930s. The first automobile shop and garage, E.F. Tice, for example, was constructed in 1923, and the Steel Furniture Manufacturing Company opened its doors in 1927. Investment into the city's educational system and outdoor space accelerated in this period as well, with the completion of the Margaret Heath School (which initially served as a primary school) in 1924 and the creation of Morgan Park in 1931. Like communities throughout the United States, Baldwin Park's economy pivoted to primarily war-related activities when the United States entered World War II in 1941.

The city developed rapidly in the post-World War II years, as a population boom in the Los Angeles area turned the region into a megalopolis. Suburbs exploded outside Los Angeles, engulfing farmland. As suburbs grew, automobile-oriented development did as well. This was particularly apparent in Baldwin Park, which is home to California's first drive-through restaurant: In-N-Out, which was established in Baldwin Park in 1948. Although the original hamburger stand is no longer extant, the company still maintains a presence in the city. Like other communities outside of Los Angeles, residential development and the construction of freeways quickly changed the area's previously semi-rural character into a more suburbanized community.

The 1950s were of rapid development and change in Baldwin Park, which saw the groundbreaking of

a new reservoir in 1950 and the opening of several commercial businesses and financial institutions, including Bank of America, which also opened in 1950. Baldwin Park became an incorporated city in 1956, as the 47th General Law City in California. The I-10 San Bernardino Freeway was completed the next year, in 1957, providing easy access to Baldwin Park.

While the process of suburbanization began in the immediate post-war years, it accelerated further after Baldwin Park's incorporation as the city's population and built environment expanded and farmers and ranchers moved further away from the rapidly developing city. The population in Baldwin Park reportedly rose by about one-third in the six years after its incorporation, increasing from 28,000 to close to 37,000. This is in marked contrast to the 1940s when the population stayed steadily around 9,000. The large lots that formerly supported agriculture were subdivided into smaller lots for residential development in the years after the City's incorporation. In 1961, for example, permits were issued for 26 new subdivisions and nine more were issued in the first nine months of 1962. In 1960, the city's first hospital, Baldwin Park Community Hospital, opened its doors.

The 1970s were a period of slower growth and development than the previous decades. A 1979 article in the *Los Angeles Times* outlined the challenges facing Baldwin Park in the 1970s, noting that housing prices in the city were low relative to other nearby communities, freeway access and circulation remained difficult, and the City had recently experienced political turmoil that resulted in a recall election of several city officials. In this period, Baldwin Park's per capita income was approximately $1,000 less than neighboring communities such as West Covina.

Commercial development in this period also appeared to have stalled; in 1966, there were 231 businesses in Baldwin Park; by 1979 that number had only risen by 56 for a total of 287 businesses. The *Los Angeles Times* article further stated that approximately $30.4 million worth of shopping was being done by Baldwin Park citizens in other cities due to the city's lack of commercial options. The City, in conjunction with the Chamber of Commerce, launched a concreted advertising campaign to bring business to the City. This effort had mixed success; some new businesses opened in this period, such as the Broken Horn Saddlery (1976) and several financial institutions, including the Golden State Sanwa Bank (1973) and Crocker Bank (1974), but the city still reportedly faced a dearth of commercial development overall. The City also invested in the construction of its new Baldwin Park Civic Center (1978) which housed City Hall and City Council Chambers, among other functions.

In response to the city's challenges, the City Council approved the creation of the Baldwin Park Community Redevelopment Agency which considered urban renewal efforts in so-called "blighted" areas, focusing on the downtown commercial retail section of the city. The Redevelopment Agency was controversial from its inception, with many community members opposing efforts to redevelop parts of Baldwin Park.

The 1980s saw an uptick in residential housing construction, the fastest period of residential development in Baldwin Park since the 1960s. This housing was primarily multi-family residential construction, which outpaced single-family residential construction by five to one. This pace of construction slowed by the 1990s, in part because the City faced serious economic problems caused by budget cuts which necessitated the reduction of the police force among other services. According to a 1991 *Los Angeles Time*s article, Baldwin Park also struggled to draw new business despite available open land and prices that were lower than surrounding communities. Today, Baldwin Park continues to be a mixed-use community of commercial, residential, and industrial buildings. (Garber 2018; City of Baldwin Park 2015; Benbow 2011; City of Baldwin Park Community Development Department: 2005; City of Baldwin Park Department of Planning 2002: I-1; Los Angeles Times 1991; Pinheiro et. al 1981; Birkinshaw 1979; Duncan et. al 1962.)

**History of The Broken Horn Saddlery**

From its construction in 1976 (and subsequent expansion in 1986) until 2021, the subject

property was occupied by the Broken Horn Saddlery, described as the "West's largest tack store" (Pernokas 2017). The subject property consists of two connected structures: 1026 Leorita Street, which was constructed in 1976, and 1022-1024 Leorita Street, which was constructed in 1986 to provide additional retail and manufacturing space for the Broken Horn. The two portions of the building appear to be haven connected circa 1995, per aerial photographs (NETR 2022). In 2021, the Broken Horn Saddlery vacated the subject property and re-opened in 2022 under new ownership at 4120 Maine Avenue in downtown Baldwin Park (Baldwin Park News 2022). Prior to the construction of the subject property, aerial photographs indicate that there was a residential structure on each lot now occupied by the subject property (Figure 3).

The Broken Horn Saddlery was founded in 1956 by Charlie Nuzzo and his wife Mattie Nuzzo and remained a family-run operation until 2021. In the early 1950s, Nuzzo worked for United Tent and Awning, which built tents for clients including the military. While in this position, Nuzzo met a wealthy boat owner who asked him to make him a cover for his boat to prevent weathering. Nuzzo agreed, making a cover out of tent material, reportedly an innovative approach to boat coverings at the time. The customer was satisfied, and Nuzzo was soon inundated with additional requests for boat covers, eventually forming a side business constructing boat covers in his basement.

Soon, the original boat owner came to Nuzzo with another request: a horse blanket, also made out of tent material. Nuzzo agreed and soon his horse blankets and day sheets became a popular product. At this time, the Los Angeles area had a flourishing postwar recreational horse industry and Nuzzo capitalized on this by taking his blankets to horsing events. Nuzzo's products were wildly popular, prompting him to formalize his business with his brother-in-law. This partnership was short-lived, however, as Nuzzo's brother-in-law was keeping two sets of books. Nuzzo consequently forayed into business on his own, opening the earliest iteration of Broken Horse Saddlery in Alhambra in 1956 with his wife Mattie.

Broken Horn Saddlery began by manufacturing and selling wholesale blankets and sheets, eventually adding a retail component. This growth prompted a move to a new building at 1022 Leorita Street in 1976. At this time, the Broken Horn Saddlery continued to manufacture blankets and pads but had also expanded to leather tack, largely at the behest of Charlie Nuzzo's son, Joe Nuzzo. The Broken Horn Saddlery also had an in-house silver department. By the time the Broken Horn Saddlery opened at the subject property, approximately 77% of their business was manufacturing. The business expanded its operations in 1986 with the addition of the building at 1022-1024 Leorita Street, which was built by Charlie Nuzzo according to its original building permit. Manufacturing at the Broken Horn Saddlery included leather tack, silver, boot repair, and saddle production with in-house departments producing these goods.

By 2007, Broken Horn Saddlery pivoted away from in-house manufacturing. As of 2017, the only manufacturing component that remained under the control of Broken Horn Saddlery was leather tack; the silver department became an in-house but independent business (Mario Solis's Silver Shop), as did the Broken Horn's two saddle shops (Sal's Custom Saddles, run by Salvador Gomez and another shop run by Galdino Gomez, Salvador's brother). This change in business format allowed for increased flexibility in a changing market where demand for saddles and silver declined; the Broken Horn Saddlery could access these products as needed but did not need to maintain the individual business operations. In 2017, there was also an in-house independent boot repair shop run by Felipe De Santiago. The individuals running these in-house businesses were all longtime employees of the Broken Horn, many working at the store for decades.

The Broken Horn Saddlery remained a family-run business, with Joe Nuzzo, Charlie Nuzzo's son, most recently serving as president. Jerry Nuzzo, Charlie's grandson, also served as vice president, and Charlie's daughter, Rosalie Nuzzo, served as secretary and treasurer. For 65 years, Broken Horn was a destination for equestrian enthusiasts from Baldwin Park and around the globe, with customers reportedly coming from Asia, Europe, Australia, the Middle East, and Africa. The Broken Horn Saddlery closed its doors at the subject property in 2021; the business, under new ownership, reopened in Downtown Baldwin Park at 4120 Maine Avenue in 2022 (Pernokas

2017; Baldwin Park News 2021; Baldwin Park News 2022).

**NRHP/CRHR Evaluation of Significance**

***Criterion A/1:*** *That are associated with events that have made a significant contribution to the broad patterns of our history.*

Archival research indicated that the Broken Horn Saddlery's first building at 1026 Leorita Street was constructed in 1976 with a subsequent expansion completed in 1986. The two portions of the subject property appear to have been connected circa 1995, per aerial photographs (NETR 2022). Both portions of the subject property were built as commercial, manufacturing, and storage space specifically for the Broken Horn Saddlery. At the time it was constructed, the area directly surrounding the subject property to the west and south was primarily residential, although there was already some commercial development in the neighborhood, including the Edgewood Drive-In (1964) located adjacent to the subject property to the east at the present site of the Kaiser Permanente Baldwin Hills Medical Center (1992). There was additional commercial development elsewhere in the neighborhood, notably on Baldwin Park Boulevard, approximately 0.20-mile southeast of the subject property.

By the 1960s, Baldwin Park's rural character had changed due to increased development resulting from the post-World War II population boom in Southern California that expanded Los Angeles' suburbs outwards. As a result of this expansion, Baldwin Park saw an intensive period of residential construction and accompanying commercial development. By the 1970s, however, the post-World War II development boom subsided, and Baldwin Park faced various significant challenges in drawing business and residents to the city. A 1979 Los Angeles Times article, for example, noted that commercial growth was minimal in the period from 1966 to 1979, with the number of businesses in the city growing from 231 to 287 (Birkinshaw 1979). Challenges bringing new businesses to the city continued into the 1980s when the subject property expanded (Los Angeles Times 1991).

The subject property thus appears to have been constructed in a period of relatively stagnant commercial growth in Baldwin Park citywide, when much of the city had already been developed. It does not seem to have been part of a broader pattern development and was neither the first nor last nondescript r commercial structure to be constructed in the neighborhood, Baldwin Park, the greater Los Angeles area, or Southern California at large. The neighborhood in which the subject property sits was mixed-use prior to the subject property's construction, with primarily residential structures to the west and south of the subject property and commercial buildings primarily to the east and south of the subject property. The subject property appears to follow an already-established pattern of development in Baldwin Park and does not appear to represent any particular period of development or historical pattern in the city.

The property is not known to be directly associated with events that have made a significant contribution to the history of Baldwin Park, California, or the United States. Therefore, the property does not appear eligible under NRHP Criterion A or CRHR Criterion 1.

***Criterion B/2:*** *That are associated with the lives of persons significant in our past.*

To be found eligible under Criterion B/2 the property must be directly tied to an important person and the place where that individual conducted or produced the work for which he or she is known. Archival research did not indicate any such direct association between individuals that are known to be historic figures at the national or state, level. From its construction in 1976 (and expansion in 1986) until 2021, the subject property was occupied by the Broken Horn Saddlery, Baldwin Park's only tact store. The Broken Horn Saddlery was owned and operated by the Nuzzo family. The business itself was founded by Charlie Nuzzo in 1956 and was run by the Nuzzo family until 2021. The Broken Horn Saddlery moved to 4120 Maine Avenue in downtown Baldwin Park in 2022 under new ownership.

While the Nuzzo family undoubtedly contributed substantially to the equestrian community of Baldwin Park and beyond through the Broken Horn Saddlery, research did not identify information that would indicate the association of members of the Nuzzo family with the subject property would rise to the threshold of significance required for eligibility. Therefore, the subject property does not appear eligible under NRHP Criterion B or CRHR Criterion 2.

***Criterion C/3:*** *That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.*

The subject property is a nondescript commercial building composed of two attached structures: one built in 1976 and one built in 1986. Based on aerial photographs, the structures appear to have been connected circa 1995. While the subject property does have some elements that appear to reflect Western, hacienda, and ranching influences tying the exterior of the building to the goods it sold as the Broken Horn Saddlery, such as its tile-clad overhangs and the arches on the primary west elevation of the 1986 portion of the building, the building does not embody any discernable architectural style.

The subject property does not embody distinctive characteristics of a type, period or method of construction. It is a typical example of a 1970s-1980s nondescript commercial building. There is nothing notable or unique about its design; it does not possess the distinctive characteristics of any particular style and is executed in common materials. The subject property appears to have been constructed through already well-documented and common construction techniques and methods. It is not a rare example of its type in Baldwin Park; there is another similar commercial building that features similar design elements such as tile overhangs, for example, located approximately 0.20-mile southeast of the subject property at 927 Baldwin Park Boulevard (constructed 1973 per the Los Angeles County Assessor).

Research further did not identify the subject property as being designed by a master architect, builder, or contractor. The 1976 portion of the building was built by contractor John Barr, according to the original building permit. Research did not identify information on Barr that would indicate he was a master builder. The 1986 portion of the subject property was built by Charlie Nuzzo, the business owner, according to its original building permit. The property further does not appear to possess high artistic values by articulating a particular concept of design to the extent that it expresses an aesthetic ideal.

The last component of Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction, is the most applicable to districts. The subject property does not appear likely to contribute to a potential historic district. Therefore, the subject property does not appear eligible under NRHP Criterion C or CRHR Criterion 3.

***Criterion D/4:*** *That have yielded or may be likely to yield information important in prehistory or history.*

The subject property is not significant under Criterion D of the NRHP or Criterion 4 of the CRHR as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials, or technologies.

**Integrity Discussion**

To be eligible for listing in the NRHP or CRHP, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically

significant properties, the length of the historic associations usually measures the period of significance.

The subject property is composed of two connected buildings, one that was constructed in 1976 and one that was constructed in 1986. Since the subject property has not been moved, the property retains integrity of location. Building permit research and site survey information identified only minor alterations to the building and it appears to consequently retain integrity of design, materials, and workmanship. While some of the building's signage advertising the Broken Horn Saddlery has been removed, the building still retains signage reading "Broken Horn Saddlery" on its primary west elevation, as well as signage on its north elevation and consequently still retains its integrity of feeling, as it still is readily identifiable as a commercial space that was occupied by the Broken Horn Saddlery. The subject property retains only marginal integrity of setting; since the subject property's construction, the Kaiser Permanente Baldwin Hills campus was constructed in 1991 to the south and east of the subject property, replacing the Edgewood Drive-In that was extant at the time of the subject property's construction. The medical facilities are directly adjacent to the subject property and introduced new building typologies and a larger scale to the neighborhood. While the Nuzzo family, who founded Broken Horn Saddlery, were notable local businesspeople, their significance and association with the subject property does not appear to rise to the level of significance required for eligibility. Thus, research did not reveal that the property has an association with significant people or events in Baldwin Park, thus it does not retain integrity of association. In conclusion, subject property retains integrity of location, design, materials, workmanship, feeling, and association, but only retains marginal integrity of setting.

**City of Baldwin Park Statement of Significance**

The property at 1022 Leorita Street does not meet any of the criteria for City of Baldwin Hills historical designation or as part of an existing historic district, as demonstrated below.

A. *Representation: The building or structure is particularly representative of a distinct historical period, type, style, region or way of life.*

The subject property is a 1976 (with 1986 addition) nondescript commercial building with some minimal Western influences and was occupied by the Broken Horn Saddlery until 2021. Similar buildings are ubiquitous in Baldwin Park and the greater Southern California region. The subject property is a typical building of its period and does not appear to represent a distinct historical period, type, style, region, or way of life. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion A.

B. *Connection to important personality: The building or structure was connected with someone renowned, important or who was a local personality.*

As discussed in NRHP / CRHP Criterion B/2, the subject property was the home of the Broken Horn Saddlery from its construction in 1976 (and subsequent 1986 expansion) until 2021. The Broken Horn Saddlery was founded by Charlie Nuzzo, and remained a family-run operation until 2021, when the business vacated the subject property. The Broken Horn Saddlery re-opened under new ownership at 4120 Maine Avenue in 2022 (Baldwin Park News 2022). While the Broken Horn Saddlery was, and remains, an important local business serving the equestrian community of Baldwin Park and beyond, and while the Nuzzo family were important family stewards of this legacy business, it does not appear that the building or structure is connected to someone renowned, important, or who was a local personality that would rise to the level required for designation. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion B.

C. *Connection to rare business: The building or structure is connected with a business or use which was once common but is now rare.*

The subject property was occupied by the Big Horn Saddlery from its construction in 1976 until 2021, when the business moved to downtown Baldwin Park (Baldwin Park News 2022). It appears that Big Horn Saddlery is the only tack shop in the City of Baldwin Park and has historically been the primary source for tack and saddles in the city. While this is a rare business type in the city, it was never a common business as it appears to have been the only store of its type in Baldwin Hills. The business is still in operation in Baldwin Park today, albeit in a new location. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion C.

D. *Master work: The building or structure represents the work of a master builder, engineer, designer, artist or architect.*

As discussed in NRHP/CRHR Criterion C/3, the subject property was not designed by a master builder, engineer, designer, artist, or architect. According to its original building permit, the building at 1026 Leorita Street was constructed by John Barr; research did not identify information on John Barr that would indicate he is a master builder. The original building permits for 1022-1024 Leorita Street lists the owner of the Broken Horn Saddlery, Charlie Nuzzo, as the contractor. No architect was listed on either permit. There is no indication the property is the work of an architect, builder, engineer, designer, or artist of major importance. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion D.

E. *Historic event: The building or structure is the site of an important historic event or is associated with events that have made a meaningful contribution to the nation, state or city.*

As discussed in NRHP/CRHR Criterion A/1, archival research did not reveal that the subject property was related to historical events significant to the City of Baldwin Park and does not reflect elements associated with a historic event having major significance to the City of Baldwin Park, Los Angeles County, the State of California or the United States. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion E.

F. *Particular architectural style: The building or structure exemplifies a particular architectural style.*

As discussed in NRHP / CRHR Criterion C/3, the subject property is a nondescript commercial building with no discernable style. While the subject property has some design elements that appear to reference Western, hacienda, and ranching traditions, such as overhangs clad in tiles and arches on the primary (west) elevation of the 1986 portion of the building, it does not embody most of the character-defining features of the stye. Rather, it is a functional building constructed for functional purposes and does not exemplify any particular architectural style. Therefore, the subject property does not appear eligible under City of Baldwin Park Criterion F.

G. *Best remaining: The building or structure exemplifies the best remaining architectural type of a neighborhood.*

The subject property is not the best remaining architectural type in its neighborhood. The subject property is not a rare example of a nondescript commercial building constructed in the 1970s in the neighborhood or Baldwin Park at large. One of many examples of a comparable commercial building in the neighborhood is the building at 927 Baldwin Park Boulevard (constructed 1973 per the Los Angeles County Assessor). Therefore, the subject property does not appear eligible under City of Baldwin Park Criteria G.

H. *Outstanding design: The construction materials or engineering methods used in the building or structure embody elements of outstanding architectural or engineering design, detail, material or craftsmanship.*

As discussed in NRHP/CRHR Criteria C/3, the subject property does not appear to embody elements of outstanding architectural or engineering design, detail, material or craftsmanship. It is a typical example of a common and widespread 1970s commercial structure. Therefore, the subject property does not appear eligible under City of Baldwin Park Criteria H.

**Summary of Findings**

1022-1026 Leorita Street (APN 8559-008-005; APN 8559-008-011) does not meet any of the criteria for listing in the NRHP or CRHR, either individually or as part of a potential or existing historic district. It further does not meet any of the criteria for landmark listing by the City of Baldwin Park. The recommended status code is 6Z: Found ineligible for NR, CR or Local designation through survey evaluation.

## 11.0 Vegetation

Kaiser Baldwin Park - Emergency Room - South Coast AQMD Air District, Summer

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Kaiser Baldwin Park - Emergency Room

**South Coast AQMD Air District, Summer**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Hospital | 22.29 | 1000sqft | 0.51 | 22,293.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2026 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific values.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults adjusted to fit proposed construction schedule by multiplying each phase length by 4.1

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Demolition - 24790 sf of existing buildings to demo.

Kaiser Baldwin Park - Emergency Room - South Coast AQMD Air District, Summer

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Grading - 2,100 CU of cut/export

Architectural Coating - CalEEMod defaults.

Vehicle Trips - CalEEMod defaults.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower. Site watered twice a day.

Kaiser Baldwin Park - Emergency Room - South Coast AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Kaiser Baldwin Park - Emergency Room

**South Coast AQMD Air District, Winter**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Hospital | 22.29 | 1000sqft | 0.51 | 22,293.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2026 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific values.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults adjusted to fit proposed construction schedule by multiplying each phase length by 4.1

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Demolition - 24790 sf of existing buildings to demo.

Kaiser Baldwin Park - Emergency Room - South Coast AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Grading - 2,100 CU of cut/export

Architectural Coating - CalEEMod defaults.

Vehicle Trips - CalEEMod defaults.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower. Site watered twice a day.

# Kaiser Baldwin Park - Medical Office Building

**South Coast AQMD Air District, Annual**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Medical Office Building | 33.00 | 1000sqft | 0.76 | 33,000.00 | 0 |
| Parking Lot | 80.00 | Space | 0.72 | 32,000.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2030 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific information.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults. Length adjusted to match contractor's projections.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Kaiser Baldwin Park - Medical Office Building - South Coast AQMD Air District, Annual

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Demolition - Basded on existing buildings onsite.

Grading - CalEEMod default values.

Architectural Coating - CalEEMod defaults.

Vehicle Trips - Trip rates calculated from traffic report.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower.

Kaiser Baldwin Park - Medical Office Building - South Coast AQMD Air District, Summer

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Kaiser Baldwin Park - Medical Office Building

**South Coast AQMD Air District, Summer**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Medical Office Building | 33.00 | 1000sqft | 0.76 | 33,000.00 | 0 |
| Parking Lot | 80.00 | Space | 0.72 | 32,000.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2030 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific information.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults. Length adjusted to match contractor's projections.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Kaiser Baldwin Park - Medical Office Building - South Coast AQMD Air District, Summer

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Demolition - Basded on existing buildings onsite.

Grading - CalEEMod default values.

Architectural Coating - CalEEMod defaults.

Vehicle Trips - Trip rates calculated from traffic report.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower.

# Kaiser Baldwin Park - Emergency Room LST

**South Coast AQMD Air District, Winter**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Hospital | 22.29 | 1000sqft | 0.51 | 22,293.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2026 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific values.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults adjusted to fit proposed construction schedule by multiplying each phase length by 4.1

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips. Trip lengths reduced to 0 for LST.

On-road Fugitive Dust - CalEEMod defaults.

Demolition - 24790 sf of existing buildings to demo.

Kaiser Baldwin Park - Emergency Room LST - South Coast AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Grading - 2,100 CU of cut/export

Architectural Coating - CalEEMod defaults.

Vehicle Trips - CalEEMod defaults.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower. Site watered twice a day.

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Kaiser Baldwin Park - Medical Office Building LST

**South Coast AQMD Air District, Winter**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Medical Office Building | 33.00 | 1000sqft | 0.76 | 33,000.00 | 0 |
| Parking Lot | 80.00 | Space | 0.72 | 32,000.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2030 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific information.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults. Length adjusted to match contractor's projections.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips. Trip lengths zeroed out for LST.

On-road Fugitive Dust - CalEEMod defaults.

Kaiser Baldwin Park - Medical Office Building LST - South Coast AQMD Air District, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Demolition - Basded on existing buildings onsite.

Grading - CalEEMod default values.

Architectural Coating - CalEEMod defaults.

Vehicle Trips - Trip rates calculated from traffic report.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower.

## 11.0 Vegetation

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

# Kaiser Baldwin Park - Emergency Room HRA

**South Coast AQMD Air District, Annual**

## 1.0 Project Characteristics

### 1.1 Land Usage

| Land Uses | Size | Metric | Lot Acreage | Floor Surface Area | Population |
|---|---|---|---|---|---|
| Hospital | 22.29 | 1000sqft | 0.51 | 22,293.00 | 0 |

### 1.2 Other Project Characteristics

| | | | | | |
|---|---|---|---|---|---|
| **Urbanization** | Urban | **Wind Speed (m/s)** | 2.2 | **Precipitation Freq (Days)** | 31 |
| **Climate Zone** | 9 | | | **Operational Year** | 2026 |
| **Utility Company** | Southern California Edison | | | | |
| **CO2 Intensity (lb/MWhr)** | 390.98 | **CH4 Intensity (lb/MWhr)** | 0.033 | **N2O Intensity (lb/MWhr)** | 0.004 |

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Project-specific values.

Land Use - Based on site plan for project.

Construction Phase - CalEEMod defaults adjusted to fit proposed construction schedule by multiplying each phase length by 4.1

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Off-road Equipment - CalEEMod defaults.

Trips and VMT - CalEEMod defaults. Odd trips rounded up to account for whole round trips.

On-road Fugitive Dust - CalEEMod defaults.

Demolition - 24790 sf of existing buildings to demo.

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Grading - 2,100 CU of cut/export

Architectural Coating - CalEEMod defaults.

Vehicle Trips - CalEEMod defaults.

Consumer Products - CalEEMod defaults.

Area Coating - CalEEMod defaults.

Landscape Equipment - CalEEMod defaults.

Energy Use - CalEEMod defaults.

Water And Wastewater - CalEEMod defaults.

Solid Waste - CalEEMod defaults.

Construction Off-road Equipment Mitigation - In accordance with SCAQMD Rule 403. Project applicant has committed to using Tier 4 Interim equipment for equipment over 50 horsepower. Site watered twice a day.

                                          ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for   108 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =   9818605.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    108 Source(s);       3 Source Group(s); and     808
```

```
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    108 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   182.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                    ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.7 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Kaiser BP.err

 **File for Summary of Results:   Kaiser BP.sum

RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: All
Calculation Method: Derived

**********
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 2

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 0
16<30 Years Bin: 0
16 to 70 Years Bin: 0

**********
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments.  The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

**********
INHALATION

Daily breathing rate: RMP

**Worker Adjustment Factors**
Worker adjustment factors enabled: NO

**Fraction at time at home**
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

**********
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.05
Soil mixing depth (m): 0.01
Dermal climate: Warm

**********
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

**********
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment.  Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERCancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERCancerRiskSumByRec.csv
Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERNCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERNCChronicRiskSumByRec.csv
Calculating acute risk
Acute risk breakdown by pollutant and receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERNCAcuteRisk.csv
Acute risk total by receptor saved to: C:\Users\apoll\Desktop\HARP2\HARP\Kaiser Baldwin Park\KAISER BALDWIN PARK HARP\hra\ERNCAcuteRiskSumByRec.csv
