## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| *- | LCS and/or LCSD is outside acceptance limits, low biased. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| B | Compound was found in the blank and sample. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| L | A negative instrument reading had an absolute value greater than the reporting limit |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

## Job ID: 440-281213-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281213-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/30/2021 3:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.0º C.

**GC/MS VOA**
Method 8260B: The following analyte recovered outside control limits for the LCS associated with analytical batch 570-140088: Hexachlorobutadiene. This is not indicative of a systematic control problem because this was random marginal exceedances. Qualified results have been reported.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-140088.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC VOA**
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 140483.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC Semi VOA**
Method 8081A: The continuing calibration verification (CCV) associated with 570-140376 recovered outside the control limits for Heptachlor on one column. Results are confirmed on both columns and reported from the passing column.

Method 8151A: The matrix spike/matrix spike duplicate (MS/MSD) for preparation batch 570-140431 and analytical batch 570-140830 exceeded control limits for the following analyte(s): Dinoseb, Note that this analyte is a known poor performer when analyzed using this method.

Method 8151A: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 570-140431 and analytical batch 570-140830 recovered outside control limits for the following analyte(s): Dinoseb. Dinoseb has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Method 8151A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-140431 and analytical batch 570-140830 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Metals**
Method 6010B: The absolute response for Molybdenum was greater than the method reporting limit (RL) in the following sample: B-6-5 (440-281213-3).
The instrument raw data has been manually reviewed and the result can be reported as ND.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Job ID: 440-281213-1 (Continued)

### Laboratory: Eurofins Calscience Irvine (Continued)

**VOA Prep**

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Detection Summary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281213-1

## Client Sample ID: B-5-5 — Lab Sample ID: 440-281213-1

# Definitions/Glossary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281213-1

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| *+ | LCS and/or LCSD is outside acceptance limits, high biased. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| *- | LCS and/or LCSD is outside acceptance limits, low biased. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### Metals

| Qualifier | Qualifier Description |
|---|---|
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| L | A negative instrument reading had an absolute value greater than the reporting limit |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Definitions/Glossary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281259-1

## Qualifiers

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| *- | LCS and/or LCSD is outside acceptance limits, low biased. |
| *1 | LCS/LCSD RPD exceeds control limits. |
| E | Result exceeded calibration range. |
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| p | The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Job ID: 440-281259-1

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | SCAQMD LAP | 17LA0919 | 11-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8015B | 3550C | Solid | C13-C22 |
| 8015B | 3550C | Solid | C23-C40 |
| 8015B | 5035 | Solid | Gasoline Range Organics (C4-C12) |
| 8081A | 3546 | Solid | 4,4'-DDD |
| 8081A | 3546 | Solid | 4,4'-DDE |
| 8081A | 3546 | Solid | 4,4'-DDT |
| 8081A | 3546 | Solid | Aldrin |
| 8081A | 3546 | Solid | alpha-BHC |
| 8081A | 3546 | Solid | alpha-Chlordane |
| 8081A | 3546 | Solid | beta-BHC |
| 8081A | 3546 | Solid | Chlordane |
| 8081A | 3546 | Solid | delta-BHC |
| 8081A | 3546 | Solid | Dieldrin |
| 8081A | 3546 | Solid | Endosulfan I |
| 8081A | 3546 | Solid | Endosulfan II |
| 8081A | 3546 | Solid | Endosulfan sulfate |
| 8081A | 3546 | Solid | Endrin |
| 8081A | 3546 | Solid | Endrin aldehyde |
| 8081A | 3546 | Solid | Endrin ketone |
| 8081A | 3546 | Solid | gamma-BHC |
| 8081A | 3546 | Solid | gamma-Chlordane |
| 8081A | 3546 | Solid | Heptachlor |
| 8081A | 3546 | Solid | Heptachlor epoxide |
| 8081A | 3546 | Solid | Methoxychlor |
| 8081A | 3546 | Solid | Toxaphene |

## Job ID: 440-280936-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-280936-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/23/2021 6:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.8º C.

**GC/MS VOA**
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-139250.

Method 8260B: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 570-139250 recovered outside control limits for the following analyte: Vinyl acetate. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The continuing calibration verification (CCV) associated with batch 570-139250 recovered above the upper control limit for Vinyl acetate. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCVIS 570-139250/2).

Method 8260B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 570-139544 recovered outside control limits for the following analytes: 1,1,1-Trichloroethane and 1,1-Dichloropropene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-139544.

Method 8260B: The following sample was diluted due to the nature of the sample matrix: TSW-1 (440-280936-1). Elevated reporting limits (RLs) are provided. High sediment.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC/MS Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**HPLC/IC**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Organic Prep**
Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-139268. LCS/LCSD was performed to meet QC requirement.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| *+ | LCS and/or LCSD is outside acceptance limits, high biased. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### HPLC/IC

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Sample Summary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281062-1

| Lab Sample ID | Client Sample ID | Matrix | Collected | Received | Asset ID |
|---|---|---|---|---|---|
| 440-281062-1 | TSW-2 | Water | 03/24/21 08:35 | 03/25/21 19:00 | |
| 440-281062-2 | TSW-3 | Water | 03/25/21 09:20 | 03/25/21 19:00 | |
| 440-281062-3 | Trip Blank | Water | 03/25/21 11:10 | 03/25/21 19:00 | |

## Job ID: 440-281062-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281062-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/25/2021 7:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.9º C.

**GC/MS VOA**
Method 8260B: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: TSW-2 (440-281062-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC/MS Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**HPLC/IC**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Definitions/Glossary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281062-1

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Accreditation/Certification Summary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281062-1

## Laboratory: Eurofins Calscience Irvine

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 2706 | 06-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8260B | | Water | 1,1-Dichloropropene |
| 8260B | | Water | 1,2,3-Trichlorobenzene |
| 8260B | | Water | 1,2,4-Trimethylbenzene |
| 8260B | | Water | 1,3,5-Trimethylbenzene |
| 8260B | | Water | 1,3-Dichloropropane |
| 8260B | | Water | 2,2-Dichloropropane |
| 8260B | | Water | 2-Butanone (MEK) |
| 8260B | | Water | 2-Chlorotoluene |
| 8260B | | Water | Isopropylbenzene |
| 8260B | | Water | m,p-Xylene |
| 8260B | | Water | p-Isopropyltoluene |

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |

Note: Since laboratory accreditations are subject to change, Eurofins Calscience places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Calscience laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Calscience attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Calscience.

## Job ID: 440-281211-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281211-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/30/2021 3:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.3º C.

**GC/MS VOA**
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 570-140799 were outside control limits: (570-55034-A-4 MS) and (570-55034-A-4 MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**GC/MS Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**HPLC/IC**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Definitions/Glossary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281211-1

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |

### mHPC/LC

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | I Tese coh h only used abbreviations h ay or h ay not be present in tTis report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Note: Since laboratory accreditations are subject to change, Eurofins Calscience places the ownership of method analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Calscience laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Calscience attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Calscience.

## Job ID: 440-281260-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281260-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/31/2021 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.2º C.

**GC/MS VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC/MS Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**HPLC/IC**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**GC Semi VOA**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Organic Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**VOA Prep**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### GC Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Accreditation/Certification Summary

Client: Terracon Consultants Inc
Project/Site: Broken Horn Saddlery

Job ID: 440-281260-1

## Laboratory: Eurofins Calscience Irvine

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | State | 2706 | 06-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| 8260B | | Water | 1,1-Dichloropropene |
| 8260B | | Water | 1,2,3-Trichlorobenzene |
| 8260B | | Water | 1,2,4-Trimethylbenzene |
| 8260B | | Water | 1,3,5-Trimethylbenzene |
| 8260B | | Water | 1,3-Dichloropropane |
| 8260B | | Water | 2,2-Dichloropropane |
| 8260B | | Water | 2-Butanone (MEK) |
| 8260B | | Water | 2-Chlorotoluene |
| 8260B | | Water | Isopropylbenzene |
| 8260B | | Water | m,p-Xylene |
| 8260B | | Water | p-Isopropyltoluene |

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | SCAQMD LAP | 17LA0919 | 11-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

## Job ID: 440-281102-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281102-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/25/2021 7:00 PM. Unless otherwise noted below, the samples arrived in good condition. The temperature of the cooler at receipt was 18.8º C.

**Air Toxics**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

**Surrogate Legend**

DCA = 1,2-Dichloroethane-d4 (Surr)
BFB = 4-Bromofluorobenzene (Surr)
TOL = Toluene-d8 (Surr)

# Method Summary

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Job ID: 440-281102-1

| Method | Method Description | Protocol | Laboratory |
|---|---|---|---|
| TO-15 | Volatile Organic Compounds in Ambient Air | EPA | ECL 2 |
| D1946 | Fixed Gases in Air (GC) | ASTM | ECL 2 |
| Fixed Gas Norm | Fixed Gases from Stationary Sources | EPA | ECL 2 |

**Protocol References:**

ASTM = ASTM International

EPA = US Environmental Protection Agency

**Laboratory References:**

ECL 2 = Eurofins Calscience LLC  Lampson, 7445 Lampson Ave, Garden Grove, CA 92841, TEL (714)895-5494

## Qualifiers

### Air - GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### Air - GC VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Note. Since laboratory accreditations are subject to change, Eurofins Calscience places the ownership of method analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Calscience laboratory or other instructions will be provided Any changes to accreditation status should be brought to Eurofins Calscience attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Calscience.

# Summa Canister Dilution Worksheet

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Job No.: 440-281102-1

| Lab Sample ID | Canister Volume (L) | Presampling Pressure ("Hg) | Preadjusted Pressure ("Hg) | Preadjusted Pressure (atm) | Preadjusted Volume (L) | Adjusted Pressure (psig) | Adjusted Pressure (atm) | Adjusted Volume (L) | Initial Volume (mL) | Dilution Factor | Final Dilution Factor | Pressure Gauge ID | Date | Analyst Initials |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 440-281102-4 | 1 | -29.5 | -0.6 | 0.98 | 0.98 | -0.294692 | 0.98 | 0.98 | | 1.00 | 1.00 | AIR MG 4 | 04/04/21 19:15 | UX77 |
| 440-281102-4 | 1 | -29.5 | -12.6 | 0.58 | 0.58 | 0 | 1.00 | 1.00 | | 1.73 | 1.73 | AIR MG 4 | 04/04/21 19:15 | UX77 |
| 440-281102-6 | 1 | -29.5 | -3.4 | 0.89 | 0.89 | -1.66992 | 0.89 | 0.89 | | 1.00 | 1.00 | AIR MG 4 | 04/04/21 19:15 | UX77 |
| 440-281102-6 | 1 | -29.5 | -15 | 0.50 | 0.50 | 0 | 1.00 | 1.00 | | 2.01 | 2.01 | AIR MG 4 | 04/04/21 19:16 | UX77 |

**Formulae:**

Preadjusted Volume (L) = ( Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L ) / 29.92 "Hg
Adjusted Volume (L) = ( Adjusted Pressure (psig) + 14.7 psig * Vol L ) / 14.7 psig
Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

**Where:**

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)
14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

## Job ID: 440-281106-1

### Laboratory: Eurofins Calscience Irvine

**Narrative**

**Job Narrative**
**440-281106-1**

**Comments**
No additional comments.

**Receipt**
The samples were received on 3/25/2021 7:00 PM. Unless otherwise noted below, the samples arrived in good condition. The temperature of the cooler at receipt was 18.8º C.

**Air Toxics**
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Qualifiers

### Air - GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### Air - GC VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Accreditation/Certification Summary

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Job ID: 440-281106-1

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | SCAQMD LAP | 17LA0919 | 11-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| D1946 | | Air | Carbon dioxide |
| D1946 | | Air | Carbon monoxide |
| D1946 | | Air | Methane |
| D1946 | | Air | Nitrogen |
| D1946 | | Air | Oxygen + Argon |

Project/Site: Baldwin Park

Job ID: 440-281107-1

## Qualifiers

### Air - GC/MS VOA

| Qualifier | Qualifier Description |
|---|---|
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Accreditation/Certification Summary

Client: Terracon Consultants Inc
Project/Site: Baldwin Park

Job ID: 440-281107-1

## Laboratory: Eurofins Calscience LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

| Authority | Program | Identification Number | Expiration Date |
|---|---|---|---|
| California | SCAQMD LAP | 17LA0919 | 11-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| TO-15 SIM | | Air | 1,1,1-Trichloroethane |
| TO-15 SIM | | Air | 1,1,2,2-Tetrachloroethane |
| TO-15 SIM | | Air | 1,1,2-Trichloro-1,2,2-trifluoroethane |
| TO-15 SIM | | Air | 1,1,2-Trichloroethane |
| TO-15 SIM | | Air | 1,1-Dichloroethane |
| TO-15 SIM | | Air | 1,1-Dichloroethene |
| TO-15 SIM | | Air | 1,1-Difluoroethane |
| TO-15 SIM | | Air | 1,2,4-Trimethylbenzene |
| TO-15 SIM | | Air | 1,2-Dichloroethane |
| TO-15 SIM | | Air | 1,3,5-Trimethylbenzene |
| TO-15 SIM | | Air | 4-Ethyltoluene |
| TO-15 SIM | | Air | Benzene |
| TO-15 SIM | | Air | Bromodichloromethane |
| TO-15 SIM | | Air | Carbon tetrachloride |
| TO-15 SIM | | Air | Chlorobenzene |
| TO-15 SIM | | Air | Chloroethane |
| TO-15 SIM | | Air | Chloroform |
| TO-15 SIM | | Air | Chloromethane |
| TO-15 SIM | | Air | cis-1,2-Dichloroethene |
| TO-15 SIM | | Air | Dibromochloromethane |
| TO-15 SIM | | Air | Dichlorodifluoromethane |
| TO-15 SIM | | Air | Ethylbenzene |
| TO-15 SIM | | Air | Hexachloro-1,3-butadiene |
| TO-15 SIM | | Air | m,p-Xylene |
| TO-15 SIM | | Air | Methylene Chloride |
| TO-15 SIM | | Air | Methyl-t-Butyl Ether (MTBE) |
| TO-15 SIM | | Air | o-Xylene |
| TO-15 SIM | | Air | Tetrachloroethene |
| TO-15 SIM | | Air | Toluene |
| TO-15 SIM | | Air | trans-1,2-Dichloroethene |
| TO-15 SIM | | Air | Trichloroethene |
| TO-15 SIM | | Air | Trichlorofluoromethane |
| TO-15 SIM | | Air | Vinyl chloride |

| | | | |
|---|---|---|---|
| California | State | 2944 | 09-30-21 |

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

| Analysis Method | Prep Method | Matrix | Analyte |
|---|---|---|---|
| TO-15 SIM | | Air | 1,1,1-Trichloroethane |
| TO-15 SIM | | Air | 1,1,2,2-Tetrachloroethane |
| TO-15 SIM | | Air | 1,1,2-Trichloro-1,2,2-trifluoroethane |

# 1 Introduction and Background

This soil vapor sampling report has been prepared by Dudek on behalf of Kaiser Foundation Health Plan, Inc. (Kaiser) for the proposed emergency department expansion at the Kaiser Permanente Baldwin Park Medical Center (Project). The Project is located on the north side of Baldwin Park Boulevard, south of the existing emergency department and clinic wing of the medical center, and is associated with the address 1011 Baldwin Park Boulevard, Baldwin Park, California 91706 (Project Site). The purpose of this soil vapor sampling is to evaluate potential soil vapor contamination within the Project Site.

The Project Site is located within the Baldwin Park Operational Unit of the San Gabriel Valley Superfund Site (Superfund site), which is a regional groundwater contamination plume impacting portions of Azusa, Irwindale, Baldwin Park, and West Covina. Based on the 2019 Annual Performance Evaluation Report completed for the Superfund site (Geosyntec 2019), the Project Site is located within the footprint of the groundwater contamination plume, in an area where contaminants of concern (COCs) exceed United States Environmental Protection Agency (EPA) maximum contaminant levels for drinking water by 10 times or more. COCs are volatile organic compounds (VOCs) including 1,4-dioxane, carbon tetrachloride, N-Nitrosodimethylamine, perchlorate, tetrachloroethylene (PCE), and trichloroethylene.

A Phase II Environmental Site Assessment (ESA) was conducted by Terracon on the Broken Horn property (Terracon 2020), west of the Project Site (on the western corner of the hospital property) and also located within the Superfund site footprint. The Phase II ESA identified COCs (multiple VOCs) in soil vapor and indoor air above applicable Department of Toxic Substances Control Screening Levels (DTSC-SLs). Based on the identified COCs and lack of documented use or storage of these constituents on the property, the Phase II ESA concluded the likely source of these COCs was the regional groundwater contamination plume located approximately 120 below ground surface (bgs) at the project site (Terracon 2020). COCs identified in soil gas, sub slab, and indoor air during the 2020 Phase II ESA include PCE, chloroform, bromodichloromethane, trichloroethylene, benzene, carbon tetrachloride, and methylene chloride.

Based on the available information and the Project Site's location within the Superfund site, it is suspected that soil vapor contamination may be present beneath the Project Site that could impact the Project. This soil vapor sampling was conducted to evaluate potential impacts to soil vapor beneath the proposed emergency department expansion. Soil vapor samples were collected from within the boundaries of the Project Site (Figure 1, Soil Vapor Boring Locations). Soil vapor samples were analyzed for VOCs.

# 2 Subsurface Investigation

## 2.1 Pre-Sampling Activities

ULS Service Corp. (ULS) of San Diego, California, performed underground location services at the Project Site on August 2, 2022. Underground utilities were identified by ULS near the proposed boring locations. The underground utilities were avoided during drilling. The ULS report is included in Appendix A.

## 2.2 Borehole Drilling

On August 29, 2022, eight soil vapor borings were advanced by Millennium Environmental (Millennium) using a Geoprobe 7822DT track-mounted direct-push technology rig to 20 feet bgs. Soil vapor borings were advanced with a 2.25-inch outside-diameter tool equipped with a sampling sleeve. Soil from two soil vapor boring locations was collected and evaluated at 5-foot intervals to characterize lithology. Soil vapor was sampled at 5 feet bgs and 20 feet bgs in each boring. The soil vapor boring locations are shown in Figure 1.

Soil vapor borings SV1 through SV8 were completed within the footprint of the Project Site. SV1 through SV4 are located within the sidewalk along the southwestern wall of the emergency department, while SV5 through SV8 are located in the adjacent grassy area (Figure 1). All eight borings were abandoned after soil vapor sampling; SV1 through SV4 located in the sidewalk were capped with concrete after abandonment.

## 2.3 Lithology

Lithology was characterized at SV4 and SV5 to ensure proper flow during soil vapor sampling at the proposed depths of 5 feet bgs and 20 feet bgs. Lithology was characterized at 5-foot intervals by a Dudek geologist according to ASTM D-2488 (visual-manual procedure), and color was characterized using a Munsell Coil Color Chart. A portable photoionization detector (PID) was used to screen soil samples in the field at 5-foot intervals.

Lithology encountered during drilling at each boring location consisted of loose, medium, poorly graded silty sand with trace gravel. No staining or odor was observed. No groundwater was encountered. Soil appeared moist to dry. Measurements made with the portable PID recorded <1.0 parts per million at the two boring locations where lithology was described.

## 2.4 Soil Vapor Probe Construction and Sampling

Nested soil vapor probes were constructed in each of the eight boreholes following guidance outlined in the Advisory Active Soil Gas Investigation (CalEPA et al. 2015). Temporary soil vapor probes were placed at 5 and 20 feet bgs in each boring. Filter pack (#3) sand was placed 6 inches above and below each soil vapor probe sample inlet (1 foot of sand). One foot of dry granular bentonite was placed on top of the sand, followed by hydrated bentonite to the next probe interval where another 1 foot of filter pack will be placed interval (e.g., 4.5 to 5.5 feet bgs) followed by another 1 foot of dry granular bentonite (e.g., 3.5 feet bgs to 4.5 feet bgs) then hydrated bentonite to the surface. Each probe was sealed with a valve attached to the end of the tubing and left to equilibrate for a minimum of 2 hours.

Each soil vapor probe was subjected to a shut-in test to check the above ground system for leaks by pulling 100-inches of mercury vacuum on the system and letting it sit for approximately 60 seconds. If the vacuum decreased, adjustments were made to the connections and the process was repeated until no discernible loss in the vacuum was observed. Soil vapor probes were then purged at a rate of 200 milliliters per minute for approximately 10 minutes using a portable vacuum pump connected to a pressure gauge. A tracer of n-pentane, n-hexane, n-propanol, and propanol was placed near the sampling container during sample collection to detect leaks. Soil vapor samples were collected by Jones Environmental Laboratories in a gas-tight glass syringe with Teflon seals and analyzed for VOCs by EPA Method 8260B in an on-site mobile lab.

After sample collection, the tubing was removed from each soil vapor boring and topped with granular bentonite when possible (SV5 through SV8). The granular bentonite expands in the space left by the tubing, plugging the annular space. Approximately 1 foot of bentonite material was removed from the upper portion of the soil vapor borings located in the sidewalk (SV1 through SV4) and the annular space was capped with cement to ground surface. No soil waste was generated during drilling or sampling.

# 3 Subsurface Investigation Sample Results

The laboratory analytical results for the soil vapor samples were compared to regulatory screening levels. The screening levels for soil vapor were calculated by dividing the DTSC-SLs and the EPA regional screening levels (RSLs) for commercial/industrial indoor air by a soil vapor to ambient air attenuation factor. The DTSC, in their final vapor intrusion guidance document, uses an attenuation factor for soil vapor to ambient air of 0.0005 in new commercial construction over a soil vapor contaminant source (DTSC 2011). A more conservative attenuation factor of 0.03 was proposed by the U.S. Environmental Protection Agency (EPA 2015). This more conservative attenuation factor was proposed for California in a draft guidance document presented by the DTSC and RWQCB in 2020 (DTSC and SWRCB 2020) and was used to calculate Environmental Screening Levels (ESLs) published by the State Water Quality Control Board (SFBRWQCB 2019). However, the EPA attenuation factor of 0.03 is based on several building and climate factors that generally do not apply to southern California buildings, and is therefore considered overly conservative. The DTSC is in the process of finalizing a study on attenuation factors based on buildings in California. As such, the following screening levels were used for comparison to the analytical sample results:

- DTSC-SLs (2020) Screening Level for Commercial/Industrial Indoor Air, Cancer End Point adjusted with a 0.0005 attenuation factor (AF) for new commercial construction (DTSC 2011)
- EPA RSLs for Industrial Indoor Air, Cancer End Point adjusted with a 0.0005 attenuation factor
- DTSC-SLs (2020) Screening Level for Commercial/Industrial Indoor Air, Cancer End Point adjusted with a 0.03 attenuation factor for soil vapor (DTSC and RWQCB 2020; DTSC 2022). This more conservative screening level based on draft guidance, is used for evaluation purposes only.
    - ESLs were calculated using the 0.03 attenuation factor, and as such they are almost identical to the adjusted DTSC-SL (with attenuation factor of 0.03). As the ESLs have been published by the San Francisco Regional Water Quality Control Board, they are also included in Appendix B, Table 1 for reference purposes. As noted by the San Francisco Regional Water Quality Control Board, ESLs are not intended to establish policy or regulation, but are intended to help expedite the identification and evaluation of potential environmental concerns at contaminated sites.

The non-cancer hazard value DTSC-SL and RSL was used to compare analytical sample results for detected analytes that do not have cancer risk values. RSL values were only used for analytes that do not have a DTSC-SL. Commercial/Industrial screening levels were used for comparison to analytical sample results based on the exposure factors used to calculate each screening level. Commercial/industrial values are based on an exposure duration of 25 years at a frequency of 250 days per year at 8 hours per day and residential values are based on an exposure duration of 26 years at a frequency of 350 days per year at 24 hours per day (DTSC 2019). Exposure in an emergency department is assumed to be similar (or less) than that of the commercial/industrial screening level.

Laboratory reports for soil vapor samples are included in Appendix C. A summary of detected analytes for samples are presented in Table 1 (Appendix B).

## 3.1 Volatile Organic Compounds

VOCs were not detected at concentrations exceeding DTSC commercial/industrial screening levels with an attenuation factor of 0.0005. Benzene, bromodichloromethane, chloroform, and vinyl chloride were detected above DTSC-SL and/or RSL values calculated with the more conservative attenuation factor of 0.03.

Benzene concentrations ranged from 2.1 micrograms per cubic meter (µg/m$^3$) to 54.9 µg/m$^3$, with the highest concentration in SV1-5 (boring SV1 at 5 feet bgs). In general, higher concentrations of benzene were detected at 5-foot bgs at each location with the exception of SV8, where the higher concentration was observed at 20 feet bgs. The commercial/industrial DTSC-SL (AF = 0.0005) is 840 µg/m$^3$, and commercial/industrial DTSC-SL (AF = 0.03) is 14 µg/m$^3$.

Bromodichloromethane concentrations ranged from <2.0 µg/m$^3$ to 46.1 µg/m$^3$, with the highest concentration in SV4-5 (boring SV4 at 5 feet bgs). Higher concentrations of bromodichloromethane were detected in the 5-foot bgs samples at each location, with the exception of SV6 where concentrations were below the laboratory reporting limit (RL) at both depths. The commercial/industrial DTSC-SL (AF = 0.0005) is 660 µg/m$^3$, and commercial/industrial DTSC-SL (AF = 0.03) is 11 µg/m$^3$.

Chloroform concentrations ranged from <2.0 µg/m$^3$ to 265 µg/m$^3$, with the highest concentration in SV4-5 (boring SV4 at 5 feet bgs). Higher concentrations of chloroform were detected in the 5-foot bgs samples at each location. The commercial/industrial RSL (AF = 0.0005) is 1060 µg/m$^3$, and industrial RSL (AF = 0.03) is 18 µg/m$^3$.

Vinyl chloride was only detected above the laboratory RL in one sample, SV7-5 (boring SV-7 at 5 feet bgs) at a concentration of 10.3 µg/m$^3$. The commercial/industrial DTSC-SL (AF = 0.0005) is 320 µg/m$^3$, and commercial/industrial DTSC-SL (AF = 0.03) is 5.3 µg/m$^3$.

Bromoform, carbon tetrachloride, dichlorofluoromethane, ethylbenzene, methylene chloride, styrene, PCE, toluene, trichloroethylene, trichlorofluoromethane, and 1,2,4-trimethylbenzene were detected at some locations above laboratory RLs but below DTSC-SLs (AF of 0.0005 and AF of 0.03). Additionally, 4-Isopropyltoluene was detected above the laboratory RL in SV3 through SV7 but does not have an associated DTSC-SL or RSL. All other VOCs were below their respective laboratory RLs. N-pentane, n-hexane, and n-heptane were used as a tracer during soil gas sampling for leak detection. All three tracer types were not detected in any samples.

# 4 Quality Assurance and Quality Control Measures

Quality assurance and quality control measures were performed in the field by the Dudek geologist and in the laboratory by Jones Environmental. Field measures included PID calibration, leak detection, and duplicate sampling. Laboratory measures included sample surrogates, analytical laboratory control samples, and matrix spike/matrix spike duplicates.

## 4.1 Soil Vapor Sampling Quality Assurance/Quality Control

One duplicate soil vapor sample was collected from SV3 at 5 feet bgs. The results for the original and duplicate samples were below the laboratory-accepted relative percent difference of less than or equal to 20%.

As part of the laboratory quality assurance, the surrogates toluene-$d_8$, dibromofluoromethane, and 4-bromofluorobenzene were added to each sample at known concentrations. The analytical results were compared to the known concentration and reported as percent recovered. The percent recoveries were within the laboratory's acceptable range of 60% to 140%.

The laboratory quality control evaluation also included a method blank, sampling blank, laboratory control sample, and laboratory control sample duplicate. No VOCs were detected in the method and sampling blanks. The percent recoveries and relative percent difference for the for laboratory control sample and laboratory control sample duplicate were within the acceptable range therefore the data are considered acceptable.

Leak checks were conducted at each sampling location as described in Section 2.4, Soil Vapor Probe Construction and Sampling. The leak check compound (n-pentane, n-hexane, n-propanol, and propanol) was not detected in any of the soil vapor samples.

This quality assurance and quality control evaluation indicates that the data are of acceptable quality.

# 5 Human Health Risk

All soil vapor samples collected from each of the eight locations are within the proposed emergency department expansion footprint (Project Site). This section presents a screening level risk evaluation using the maximum concentration of VOCs detected within the Project Site. The potential exposure scenario within the Project Area is vapor intrusion into the future building impacting indoor air; therefore, it is appropriate to use the soil vapor samples collected during this investigation. Additionally, use of the 0.0005 attenuation factor is appropriate due to the new construction associated with the future building (DTSC 2011).

Table 2 (Appendix B) presents the screening level risk evaluation under this scenario using the maximum detected concentration of each VOC in the Project Site and an attenuation factor of 0.0005 for new commercial construction. The cumulative commercial cancer risk is estimated to be $4.9 \times 10^{-7}$. The cumulative commercial non-cancer risk, or hazard index, is estimated to be 0.004. As discussed in the DTSC Vapor Intrusion Guidance, a cancer risk $<1 \times 10^{-6}$ and a Hazard Index $\leq 1$ do not pose an unacceptable human health risk and do not require further action assuming future risk does not increase due to increasing concentrations of COCs (DTSC 2011).

Under a more conservative approach, in accordance with the 2020 draft DTSC and RWQCB vapor intrusion guidance, the attenuation factor of 0.03 was also considered. Table 2 also presents the risk estimates using the more conservative attenuation factor of 0.03. The resulting cumulative commercial cancer risk is estimated to be $3 \times 10^{-5}$. This estimated cancer risk is above the de minimis cancer risk of one in a million ($1 \times 10^{-6}$), but falls within the risk management range, for which potential response actions could include no action, additional sampling, monitoring, mitigation, or remediation, among other actions (DTSC and RWQCB 2020). As such, while the cumulative cancer risk is above the de minimis threshold, it is still within an acceptable range for a commercial exposure scenario. The cumulative commercial non-cancer risk, or hazard index, is estimated to be 0.24. The non-cancer risk estimate for commercial use scenarios is de minimis, indicating no need for vapor mitigation.

# 6 Summary and Conclusion

Eight soil vapor borings were advance using direct-push methods to a depth of 20 feet bgs. Soil vapor borings were located southeast of the current emergency department within the Project Site. Soil vapor probes were installed at 5 feet bgs and 20 feet bgs in each borehole, and samples were collected in gas-tight glass syringes with Teflon seals. The soil vapor samples were analyzed for VOCs by Jones Environmental Laboratory by method 8260B. Following sampling, the tubing was removed from each borehole and the boreholes abandoned.

Lithology encountered consisted mainly of loose, poorly graded silty sands. No odor or staining was observed. No groundwater was encountered. PID measurements were <1.0 parts per million at the 5-foot intervals in the two borings where lithology was characterized (SV4 and SV5).

Soil vapor sampling results were compared to commercial/industrial DTSC-SLs with an applied attenuation factor of 0.0005 for a new commercial building as outlined in the DTSC Vapor Intrusion Guidance (DTSC 2011). No VOC concentrations were detected above this DTSC-SL. Soil vapor samples were also conservatively compared to commercial/industrial DTSC-SLs with an applied attenuation factor of 0.03 as outlined in the Draft Vapor Intrusion Guidance (DTSC 2020), and to the SWQCB ESLs (SFBRWQCB 2019). Benzene, bromodichloromethane, chloroform, and vinyl chloride were detected above this DTSC-SL/ESL. All other VOCs detected above laboratory reporting limits were below both screening levels. Detected COCs in soil vapor at the Project Site are similar to those identified at the Broken Horn property to the west.

A screening level risk evaluation was conducted to estimate potential cancer and non-cancer risk associated with potential vapor intrusion into the future proposed emergency department expansion in the Project Site. As the evaluation considers vapor intrusion into the future proposed building expansion, all samples were collected from within the proposed building footprint.

The cancer and non-cancer risk estimates for commercial use scenarios using the 0.0005 attenuation factor are all de minimis, indicating no need for vapor mitigation or other response actions as discussed in the DTSC Vapor Intrusion Guidance (DTSC 2011). However, in accordance with the 2020 draft DTSC and RWQCB vapor intrusion guidance (DTSC and RWQCB 2020), the more conservative attenuation factor of 0.03 was also considered. The estimated cancer risk using the attenuation factor of 0.03 is above the de minimis cancer risk of one in a million ($1 \times 10^{-6}$), but falls within the risk management range, for which potential response actions could include no action, additional sampling, monitoring, mitigation, or remediation, among other actions. The non-cancer risk estimate for commercial use scenarios using the 0.03 attenuation factor fall below the de minimis value of 1, indicating no unacceptable risk to human health and need for vapor mitigation based on the 2020 draft DTSC and RWQCB vapor intrusion guidance.

**GENERAL LIMITATIONS**

NOTE: The work described herein is performed to industry standards (or higher) using multiple methodology and QA/QC protocol. ULS cannot guarantee the accuracy or the ability to detect all underground facilities and potential interferences. Non-conductive or conductive utilities/facilities may not be detected due to variables and constraints beyond ULS control. Where known, constraints and limitations will be brought to the client's attention. Excavation work may result in injury to persons and/or damage to facilities. Client and/or excavator are advised to take all steps necessary to avoid contact with underground facilities. This includes, but is not limited to, safe digging practices, hand tooling in congested areas and within two feet on side of marked utilities (distance may vary by law), utility drawing review, site facilities representative review, and "one-call" utilities notification. ULS and its representatives are not responsible for injury to persons or damage to facilities. This document and accompanying pages will be delivered to the client before commencement of intrusive work for the client's review. If any questions arise, please notify our office immediately.

NOTE: Specific comments/limitations/constraints, known and recognized will be recorded on attached pages (field notes). Caution – some facilities (conductive or non- conductive) may not be detected. Not all limitations and constraints may be recognized.

# Table 1 Notes

**Notes:**
Samples analyzed by EPA Test Method 8260B by Jones Environmental.
**Bold text** indicates exceedance of DTSC-SL (AF = 0.03) or RSL (AF 0.03).
bgs = below ground surface
VOC = volatile organic compound
DTSC-SL = Department of Toxic Substance Control - Modified Screening Level
SWQCB ESL = State Water Quality Control Board Environmental Screening Level
RSL = USEPA Regional Screening Level
<1.0 = constituent not detected above method reporting limit shown.
ND = not detected above the laboratory method reporting limit. See laboratory reports for other VOCs and the associated reporting limits.
- = no documented value
[1] Department of Toxic Substances Control, Human Health Risk Assessment Note Number 3. Screening Level, Cancer End Point (DTSC 2020). Ambient air cancer endpoint was divided by the attenuation factor (AF) shown to estimate soil vapor cancer endpoint shown in the table.
[2] Environmental Protection Agency, Regional Screening Level, Industrial Air (May 2022). Industrial air screening level was divided by the AF shown to estimate soil vapor screening level.
* Tracer used during sampling
** Non-cancer hazard screening level used in the absence of a cancer risk screening level.

## Table 2. Soil Vapor Risk Evaluation

## ANALYSES REQUESTED

1. EPA 8260B – Volatile Organics by GC/MS + Oxygenates

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas mixture of n-pentane, n-hexane, isopropanol, and n-propyl alcohol was placed at the tubing-surface interface before sampling. These compounds were analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No tracer was detected in any of the samples reported herein.

The sampling rate was approximately 200 cc/min, except when noted differently on the chain of custody record, using a glass gas-tight syringe. Purging was completed using a pump set at approximately 200 cc/min, except when noted differently on the chain of custody record. A default of 3 purge volumes was used as recommended by July 2015 DTSC/RWQCB guidance documents.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for at least one minute. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

No flow conditions occur when a sampling rate greater than 10 mL/min cannot be maintained without applying a vacuum greater than 100 inches of water to the sampling train. The sampling train is left at a vacuum for no less than three minutes. If the vacuum does not subside appreciably after three minutes, the sample location is determined to be a no flow sample.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Sampling Blanks were analyzed every 12 hours as prescribed by the method. In addition, a Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were analyzed with each batch of Soil Gas samples. A duplicate/replicate sample was analyzed each day of the sampling activity. All samples were injected into the GC/MS system within 30 minutes of collection.

**Approval:** _____

# 1.0 Introduction

## 1.1 Project Background

The 1.76-acre project site is located along the southerly side of the Kaiser Permanente Baldwin Park Medical Center campus at 1011 Baldwin Park Boulevard in Baldwin Park, California. The existing site was previously being used as plaza area, a landscape berm with trees, a parking lot and an ambulance parking area and driveway. The proposed project will repurpose the existing plaza area and landscaped berm to construct a 22,000-square foot emergency department building expansion to the south and construct a new ambulance parking area along the east side, landscaping including bioretention BMPs along the south and west sides, and a new plaza area to the west side of the building expansion. The project also includes constructing a new ambulance drop-off along the east side of the existing emergency department and restriping and remodeling the adjacent east parking lot to incorporate ADA paths of travel from the public sidewalk along Baldwin Park Boulevard and the ADA parking spaces. The parking lot will also include a portion of AC pavement removal and replacement, AC overlay or slurry seal improvements, and will be restriped per City and ADA/CBC standards. The drainage from the new hardscape areas including the building expansion, plaza, ambulance drop-off and driveway, and the parking stalls will drain southerly into proposed bioretention BMPs in the new landscaped areas to the south adjacent to Baldwin Park Boulevard.

The proposed Emergency Department Expansion is not part of a larger planned development for the Kaiser Permanente Baldwin Park Medical Center campus. The total impervious area of new or altered improvements is approximately 37,730 SF (0.87 acres), which is approximately 3.5% of the entire 25-acre campus.

## 1.2 Purpose and Scope

The project falls under the jurisdiction of the City of Baldwin Park. The purpose of this Low Impact Development report is:

- To meet City of Baldwin Park and County of Los Angeles Hydrology Manual requirements in allowing final design and construction to proceed in a timely manner;
- To determine the proposed development's impact on existing hydrologic conditions;
- To provide sufficient detailed information to support detailed hydraulic design of storm drainage facilities.

# 2.0 Hydrology

## 2.1 General Approach

The analysis for the project site consists of the existing and proposed condition. The existing condition analyzes the surface drainage from the northeasterly corner to the southwesterly corner of the project site, where any drainage that does not infiltrate surfaces flows into the existing storm drain system and is ultimately discharged to Walnut Creek Channel. The proposed condition analyzes the surface drainage in the similar path as the existing condition, where it will connect the existing 24" RCP through 42" RCP private storm drain, which is routed to the west and northwest sides of the site, and discharge into the LACFCD 11'-wide x 12'-high RCB (box) and ultimately into Walnut Creek Channel. The LA County computer program, HydroCalc, was used to estimate the runoff flowrate for the 25-year storm event to calculate the peak flows and times of concentration for the overland portions of the analyses for both the existing and proposed conditions. These calculations are in accordance with LACDPW requirements.

## 2.2 Data Sources

The primary source of data is from the *LACDPW: Hydrology Manual* (January 2006). For this project, the 25-year storm, which in Los Angeles County is defined as the Urban Flood, was used to analyze the storm drain system.

## 2.3 Watershed Characteristics

Rainfall and soil characteristics for the Kaiser Permanente Baldwin Park Medical Center Emergency Department Expansion project are illustrated in the Baldwin Park quadrant of Hydrologic Map Figure LACDPW 1-H1.21 (*Appendix 1*). The 50-year and 25-year 24-hour rainfall isohyets nearest the project area are approximately 6.3 inches, and 5.53" (0.878x6.3"), respectively.

In addition to the isohyet data, the hydrologic map shows the classification of the soil type. The project site falls within soil classification area 006. The project area is 1.76 acres in size, although about 0.87 acres of this area will include building, AC pavement and concrete improvements. The remainder of the impervious surfaces within the project limits will not require removal and replacement (i.e. east parking lot). The total tributary watershed area to be studied is 2.6 acres in size and includes drainage from outside the project limits from the existing central plant building and driveway to the northeast.

The *LACDPW HydroCalc* program was used to calculate the times of concentration and peak flows for existing and proposed conditions. A Microsoft Excel (Manning's equation) spreadsheet was used to determine the full flow capacity in the proposed

storm drain system for the onsite condition. The hydrology peak flows and hydraulic calculations are provided in *Appendix 3*.

Due to the building expansion, the proposed redevelopment will increase the site imperviousness within the project limits from 64% in the existing condition to 80% in the proposed condition. However, because the existing site does not have any well-defined BMPs where runoff from impervious surfaces could flow into and infiltrate into the adjacent planter areas the effective imperviousness is approximately the same as the total imperviousness, whereas, in the proposed condition, almost all the impervious surfaces will drain into adjacent bioretention BMPs. In effect, the proposed design will decrease the effective imperviousness from 64% in the existing condition to approximately 2% in the proposed condition.

The existing site generally flows southerly directly into grate inlets along the south edge of the concrete plaza, and through curbs and gutters into a curb opening catch basin along the south edge of the east parking lot. The runoff from the landscaped berms along the Baldwin Park Boulevard frontage are split to drain northerly into these grates inlets or catch basin, or sheet flow southerly into Baldwin Park Boulevard. The drainage then flows into the existing 24” RCP public storm drain (aka Line “B”), which flows southerly and westerly along the south end of the site, and then northerly to the northwest area of the campus.

Line “B” receives drainage from the south half of the Baldwin Park Medical Center campus - beginning at the CUP and east parking lot, where it begins as a 15” RCP, flows westerly along the south side of the campus as a 24” RCP, and ending at the northwest side of the campus where it confluences with a 36” RCP storm drain Line “A”. From this junction structure, the 36” RCP main then flows westerly and northerly, increases to a 42” RCP, and confluences with the Los Angeles County Flood Control District Facility Project No. 1701, Unit 1, which is an 11’-wide x 12’-high RCB (box) storm drain. This RCB storm drain main is contained within a 20’-wide easement on the campus and flows southwesterly and southerly into Walnut Creek. Walnut Creek Channel, which is a trapezoidal channel with grouted rip-rap and concrete side walls and an ungrouted toe stone and earth bottom, flows westerly and confluences with the San Gabriel River just west of the 605 freeway. The San Gabriel River thence flows southwesterly and ultimately outlets into the Pacific Ocean adjacent to the Alamitos Bay entrance channel.

Drainage in the proposed condition surfaces flows to various bioretention areas to be treated. Overflow and treated flow from the bioretention BMPs is then conveyed from atrium drains and subdrains, respectively, through the 24” RCP on-site Line “B” storm drain system. A portion of this 24” RCP storm drain is being realigned around the south edge of the proposed building expansion and will have a slope of 0.48%.

The results from the 25-year storm hydrology calculations are summarized in the following table:

## Table 2.1: Hydrology Report Summary

| Description | Proposed Condition |
|---|---|
| Study drainage area | 2.60 Ac |
| 25-Year Peak Flow Rate through 24" RCP Storm Drain at downstream end of project | 6.4 CFS |
| 24" RCP Storm Drain Capacity | 16.0 CFS |
| Time of Concentration | 8.6 min. |

In conclusion, the proposed development impact on the existing hydrologic condition will be minimal. The peak flow from the project site and upstream areas will not significantly change. The existing and proposed re-routed 24" RCP private storm drain, which conveys the project drainage and the south portion of the campus is shown to provide adequate capacity though the project limits.

## 3.0 Limitations

This report was prepared to comply with the guidelines established by the City of Baldwin Park and the County of Los Angeles and their representatives. Evaluation of the appropriateness of these guidelines and the accuracy of the County data were beyond the scope of this work.

Usage of this report is limited to address the purpose and scope previously defined by the project owner. Psomas shall not be held responsible for any unauthorized application of this report and the contents therein.

The opinions represented in this report have been derived in accordance with current standards of civil engineering practice. No other warranty is expressed or implied.

| **To:** | Kaiser Permanente |
| **From:** | Mark Storm, INCE Bd. Cert.; Cole Martin, INCE |
| **Subject:** | Noise Technical Memorandum for the Kaiser Baldwin Park Project Mitigated Negative Declaration |
| **Date:** | October 7, 2022 |
| **Attachments:** | Attachment A, Photographs of Measurement Locations and Field Notes<br>Attachment B, Construction Noise Prediction Model Worksheets<br>Attachment C, Traffic Noise Model Input/Output |

## Introduction

Dudek is pleased to submit this noise technical memorandum to assist Kaiser Permanente with the Mitigated Negative Declaration (MND) requirements for the proposed Kaiser Baldwin Park Project (Project). The Project is located at the Kaiser Baldwin Park Medical Campus in southern Baldwin Park, in Los Angeles County, CA. The entire Project site is approximately 26.02 acres and occurs primarily on Assessor's Parcel Number 8559-006-006, 8559-008-011, and 8559-008-005. In summary, Project components include the Emergency Department Expansion (EDE) and a new Medical Office Building (MOB) that would be concentrated at the northeastern (emergency department expansion) and northwestern (MOB) corners of the Project site, respectively. The Project site is bound by Dalewood Street to the north, Leorita Street to the west, Bess Avenue to the southwest, and Baldwin Park Boulevard to the southeast.

The Project site is currently developed, consisting of a 24.48 acre medical campus (APN 8559-006-006) and a 1.54 acre site that consists of an abandoned retail building, herein referred to as the "Broken Horn site" (APN 8559-008-011 and 8559-008-005). The Broken Horn site is located adjacent to the existing medical campus to the northwest. The Project site is zoned as Freeway Commercial (FC) and has a land use designation Commercial. Due to the developed nature of the site, the site features relatively flat topography.

The Project site is surrounded by existing development on all sides. The Interstate-10 (I-10) freeway is located just beyond Dalewood Street to the north of the Project site. Commercial uses are located south and east of the Project site, and residential uses are located south and west of the Project site.

Regional access to the Project site is provided by I-10, which runs east-west adjacent to the Project, and Interstate 605 (I-605) which runs north–south, allowing for vehicular and transit access to the larger Los Angeles region. The Project site is directly accessible via Dalewood Street, Leorita Street, and Baldwin Park Boulevard.

The first of two Project development phases is the construction of the EDE facility, which is a planned expansion to the emergency department that is part of an existing hospital tower on the south end of the Kaiser medical campus. The EDE would add approximately 23,000 square feet to the existing emergency department, expand the number of existing treatment bays from 38 to 60, add a new ambulance canopy, and include additional improvements to the existing emergency department.

The second phase of the Project would consist of demolishing the existing Broken Horn building, followed by construction and operation of an approximately 33,000 square foot (sf) MOB on the former site of the existing retail building. The proposed 3-story MOB would include parking and expand the existing medical campus to the northwest.

## Environmental Setting

Due to the technical nature of noise and vibration impacts, a brief overview of basic noise principles and descriptors is provided below, as well as a summary of the existing noise environment.

### Noise and Vibration Basics

Noise is defined as unwanted sound. Sound may be described in terms of level or amplitude (measured in decibels [dB]), frequency or pitch (measured in hertz or cycles per second), and duration (measured in seconds or minutes). The standard unit of measurement of the amplitude of sound is the decibel. Because the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale is used to relate noise to human sensitivity. The dBA scale performs this compensation by discriminating against low and very high frequencies in a manner approximating the sensitivity of the human ear. Several descriptors of noise (noise metrics) exist to help predict average community reactions to the adverse effects of environmental noise, including traffic-generated noise, on a community. These descriptors include the equivalent noise level over a given period ($L_{eq}$), the statistical sound level, the day–night average noise level ($L_{dn}$), and the Community Noise Equivalent Level (CNEL). Each of these descriptors uses units of dBA. Table 1 provides examples of A-weighted noise levels from common sounds. In general, human sound perception is such that a change in sound level of 3 dBA is barely noticeable, a change of 5 dBA is clearly noticeable, and a change of 10 dBA is perceived as doubling or halving the sound level.

Table 1. Typical Sound Levels in the Environment and Industry

| Common Outdoor Activities | Noise Level (dBA) | Common Indoor Activities |
|---|---|---|
| — | 110 | Rock band |
| Jet flyover at 300 meters (1,000 feet) | 100 | — |
| Gas lawn mower at 1 meter (3 feet) | 90 | — |
| Diesel truck at 15 meters (50 feet), at 80 kilometers per hour (50 mph) | 80 | Food blender at 1 meter (3 feet)<br>Garbage disposal at 1 meter (3 feet) |
| Noisy urban area, daytime<br>gas lawn mower at 30 meters (100 feet) | 70 | Vacuum cleaner at 3 meters (10 feet) |
| Commercial area<br>Heavy traffic at 90 meters (300 feet) | 60 | Normal speech at 1 meter (3 feet) |
| Quiet urban daytime | 50 | Large business office<br>Dishwasher, next room |
| Quiet urban nighttime | 40 | Theater, large conference room (background) |
| Quiet suburban nighttime | 30 | Library |
| Quiet rural nighttime | 20 | Bedroom at night, concert hall (background) |
| — | 10 | Broadcast/recording studio |
| Lowest threshold of human hearing | 0 | Lowest threshold of human hearing |

**Source:** Caltrans 2020.
**Note:** dBA = A-weighted decibel.

$L_{eq}$ is a sound energy level averaged over a specified period (typically no less than 15 minutes for environmental studies). $L_{eq}$ is a single numerical value that represents the amount of variable sound energy received by a receptor during a time interval. For example, a 1-hour $L_{eq}$ measurement would represent the average amount of energy contained in all the noise that occurred in that hour. $L_{eq}$ is an effective noise descriptor because of its ability to assess the total time-varying effects of noise on sensitive receptors.

Unlike the $L_{eq}$ metrics, $L_{dn}$ and CNEL metrics always represent 24-hour periods, usually on an annualized basis. $L_{dn}$ and CNEL also differ from $L_{eq}$ because they apply a time-weighted factor designed to emphasize noise events that occur during the evening and nighttime hours (when speech and sleep disturbance is of more concern). "Time weighted" refers to the fact that $L_{dn}$ and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m.–7:00 p.m.) receives no penalty. Noise during the evening (7:00 p.m.–10:00 p.m.) is penalized by adding 5 dB, while nighttime (10:00 p.m.–7:00 a.m.) noise is penalized by adding 10 dB. $L_{dn}$ differs from CNEL in that the daytime period is defined as 7:00 a.m.–10:00 p.m., thus eliminating the evening period. $L_{dn}$ and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5 dB to 1 dB and, as such, are often treated as equivalent to one another.

## Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Vibration can be a serious concern, causing buildings to shake and rumbling sounds to be heard. In contrast to noise, vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major

roads. Some common sources of vibration are trains, buses on rough roads, and construction activities, such as blasting, pile driving, and heavy earthmoving equipment.

Several different methods are used to quantify vibration. Peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration velocity signal. PPV is most frequently used to describe vibration impacts to buildings and is usually measured in inches per second (ips). The root mean square (rms) amplitude is most frequently used to describe the effect of vibration on the human body and is defined as the average of the squared amplitude of the signal with respect to a reference value, which is then commonly denoted as vibration decibels (VdB).

High levels of vibration may cause physical personal injury or damage to buildings. However, vibration levels rarely affect human health. Instead, most people consider vibration to be an annoyance that can affect concentration or disturb sleep. In addition, high levels of vibration can damage fragile buildings or interfere with equipment that is highly sensitive to vibration (e.g., electron microscopes). Most perceptible indoor vibration is caused by sources within buildings, such as operation of mechanical equipment, movement of people, or slamming of doors. Typical outdoor sources of perceptible vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If the roadway is smooth, the vibration from traffic is rarely perceptible.

### Sensitive Receptors

Noise- and vibration-sensitive land uses are locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Residences, schools, hospitals, guest lodging, libraries, and some passive recreation areas would be considered noise and vibration sensitive and may warrant unique measures for protection from intruding noise. Sensitive receptors in the vicinity of the project site consist of residential uses located to the west and southwest of the project site. These sensitive receptors represent the nearest sensitive land uses with the potential to be impacted by construction and/or operation of the project.

## Regulatory Setting

The following subsections summarize relevant laws, ordinances, regulations, policies, standards, and guidance that establish noise and vibration impact significance assessment criteria for the proposed project.

### Federal

There are no federal noise standards that would directly regulate environmental noise during construction and operation of the project. The following is provided because guidance summarized herein is used or pertains to the analysis.

#### Federal Transit Administration

In its Transit Noise and Vibration Impact Assessment guidance manual, the Federal Transit Administration (FTA) recommends a daytime construction noise level threshold of 80 dBA $L_{eq}$ over an 8-hour period (FTA 2018) when "detailed" construction noise assessments are performed to evaluate potential impacts to community residences surrounding a project. Although this FTA guidance is not a regulation, it can serve as a quantified standard in the absence of such quantified limits at the state and local jurisdictional levels.

### Federal Interagency Committee on Noise

Some guidance regarding the determination of a substantial permanent increase in ambient noise levels in the project vicinity above existing levels is provided by the 1992 findings of the Federal Interagency Committee on Noise (FICON 1992), which assessed the annoyance effects of changes in ambient noise levels resulting from aircraft operations. The FICON recommendations are based upon studies that relate aircraft and traffic noise levels to the percentage of persons highly annoyed by the noise. Annoyance is a qualitative measure of the adverse reaction of people to noise that generates speech interference, sleep disturbance, or interference with the desire for a tranquil environment.

The rationale for the FICON recommendations is that it is possible to consistently describe the annoyance of people exposed to transportation noise in terms of $L_{dn}$. The changes in noise exposure that are shown below are expected to result in equal changes in annoyance at sensitive land uses. Although the FICON recommendations were specifically developed to address aircraft noise impacts, they are used in this analysis to define a substantial increase in community noise levels related to all transportation noise sources and permanent non-transportation noise sources.

- Outdoor ambient sound level without the project is less than 60 dBA $L_{dn}$, then a project-attributed increase of 5 dBA or more would be considered significant;
- Outdoor ambient sound level without the project is between 60 and 65 dBA $L_{dn}$, project-attributed increase of 3 dBA or more would be considered significant; and
- Outdoor ambient sound level without the project is greater than 65 dBA $L_{dn}$, then project-attributed increase of 2 dBA or more would be considered significant.

## State

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of “normally acceptable”, “conditionally acceptable”, “normally unacceptable”, and “clearly unacceptable” noise levels for various land use types. Single-family homes are “normally acceptable” in exterior noise environments up to 60 dBA CNEL and “conditionally acceptable” up to 70 dBA CNEL. Multiple-family residential uses are “normally acceptable” up to dBA 65 CNEL and “conditionally acceptable” up to dBA 70 CNEL. Schools, libraries, and churches are “normally acceptable” up to 70 dBA CNEL, as are office buildings and business, commercial, and professional uses.

With regards to groundborne vibration, in its Transportation and Construction Vibration Guidance Manual (Caltrans 2013b), the California Department of Transportation (Caltrans) recommends 0.5 ips PPV as a threshold for the avoidance of structural damage to typical newer residential buildings exposed to continuous or frequent intermittent sources of groundborne vibration. For transient vibration events, such as blasting, the damage risk threshold would be 1.0 ips PPV (Caltrans 2013) at the same type of newer residential structures. For older structures, these guidance thresholds would be more stringent: 0.3 ips PPV for continuous/intermittent vibration sources, and 0.5 ips PPV for transient vibration events. With respect to human annoyance, Caltrans guidance indicates that building occupants exposed to continuous groundborne vibration in the range of 0.2-0.6 ips PPV would find it “unpleasant or “annoying” and thus a likely significant impact. Although these Caltrans guidance thresholds are not regulations, they can serve as quantified standards in the absence of such limits at the local jurisdictional level.

## Local

With the proposed project sited within the City of Baldwin Park, its relevant municipal code requirements and general plan policies and goals represent the primary source of impact assessment standards.

### City of Baldwin Park Municipal Code

#### Noise

Operational noise impacts for projects are governed by the City of Baldwin Park Municipal Code (BPMC), Title XIII, Sections 130.30 to Section 130.44. Section 130.34 Ambient Base Noise Levels (A) states noise which is received on property occupied by another person within the designated zone, in excess of the following levels found in Table 2, is unlawful:

**Table 2. Baldwin Park Ambient Noise Level Standards**

| Zone | Day<br>7:00 a.m - 10:00 p.m. | Night<br>10:00 p.m. - 7:00 a.m. |
|---|---|---|
| R-I | 55 dBA | 45 dBA |
| RG and R-3 | 60 dBA | 55 dBA |
| Commercial | 65 dBA | 60 dBA |
| Industrial | 70 dBA | 70 dBA |

Temporal allowances and source-related dB adjustments with respect to these 15-minute noise level limits (based on definition of "ambient noise" per BPMC 130.31) in Table 2 are as follows and reproduced from BPMC 130.34 (B):

- -5 dB (i.e., more stringent) for "Repetitive impulsive noise, pure tones and sound with cyclically varying amplitude" or a "steady whine, screech, or hum";
- +2 dB (more lenient) for "Noise occurring more than 5 but less than 15 minutes per hour";
- +5 dB for "Noise occurring more than 1 but less than 5 minutes per hour'; and
- +7 dB for "Noise occurring less than 1 minute per hour".

Noise sensitive land uses adjacent to the Project site include single-family residential (R-I) and residential garden (RG) land uses.

Additionally, the City has codified "Performance Standards" with respect to "all new construction, renovation and alteration of existing uses or structures in all zone districts" per BPMC 153.140.020. BPMC 153.140.070 Noise (2) states that increases in allowable exterior noise are permitted in accordance with Table 3, below.

Table 3. Baldwin Park Allowable Increases in Exterior Noise Levels

| Zone | Time | Allowable Noise Level (dBA) |
|---|---|---|
| Residential | 7 a.m. to 7 p.m. (day) | 55 |
| Residential | 7 p.m. to 10 p.m. (evening) | 50 |
| Residential | 10 p.m. to 7 a.m. (night) | 45 |
| Commercial | 7 a.m. to 10 p.m. (day and evening) | 65 |
| Commercial | 10 p.m. to 7 a.m. (night) | 55 |
| Industrial | anytime | 65 |

Permitted increases in noise level with respect to these noise level limits over a 24-hour period are as follows and reproduced from BPMC Table 153.140.070 (D):

- +5 dB for up to 15 cumulative minutes during a 24-hour period;
- +10 dB for up to 5 cumulative minutes during a 24-hour period;
- +15 dB for 1 cumulative minute during a 24-hour period; and
- +20 dB for less than 1 cumulative minute during a 24-hour period;

BPMC 153.140.070 (D), Interior Standards (1) states: "No person shall create or allow the creation of noise that causes the interior noise level when measured within any dwelling unit to exceed 45 dBA at any time." Part (2) states that allowable interior noise level increases may be permitted in accordance with Table 4, below, reproduced from BPMC Table 153.140.070 (F).

Table 4. Baldwin Park Allowable Increases in Interior Noise Levels

| Permitted Increase (dBA) | Duration (cumulative minutes per 24 hour period) |
|---|---|
| 5 | 1 |
| 10 | Less than 1 minute |

With respect to construction noise, BPMC 130.37 Special Noise Sources (E) prohibits construction in or within 500 feet of a residential zone between the hours of 7:00 p.m. of one day and 7:00 a.m. of the next day.

Finally, BPMC 130.44 (A) states: "No person shall operate, or permit operation of, any sound amplification system mounted or installed in any motor vehicle which can be heard from 50 or more feet…". However, part (B) of the same section exempts authorized emergency vehicles such as ambulances.

### Vibration

BPMC Section 153.140.090 Vibration states: "Vibration may disturb the conduct of certain activities and create discomfort for some individuals. To minimize the disturbance and inconvenience from vibrations, no person or use shall create, maintain or cause ground vibration that is discernable without the aid of instruments to a person of normal sensitivity at any point on a property that is adjacent to the property of the vibration source. The ground vibration caused by moving vehicles, trains, aircraft or temporary construction or demolition is exempted."

While not specifically quantified, for purposes of this assessment the phrase "discernable without the aid of instruments to a person of normal sensitivity" above shall be interpreted to mean a threshold of perception, which Caltrans and FTA guidance agree is 65 VdB or approximately 0.006 ips PPV.

### City of Baldwin Park General Plan Noise Element

The Noise Element of the City of Baldwin Park General Plan (City of Baldwin Park, 2002) establishes interior and exterior noise standards by land use. Table 5 contains a summary of the interior and exterior noise standards from the General Plan.

**Table 5. Baldwin Park General Plan Interior and Exterior Noise Standards**

| Land Use | Noise Standards[1] | |
|---|---|---|
| | Interior[2,3] | Exterior |
| Residential - Single family, multifamily, duplex, mobile home | CNEL 45 dB | CNEL 65 dB[4] |
| Residential - Transient lodging, hotels, motels, nursing homes, hospitals | CNEL 45 dB | CNEL 65 dB[4] |
| Private offices, church sanctuaries, libraries, board rooms, conference rooms, theaters, auditoriums, concert halls, meeting halls, etc. | Leq(12) 45 dBA | - |
| Schools | Leq(12) 45 dBA | Leq(12) 47 dBA |
| General offices, reception, clerical, etc. | Leq(12) 50 dBA | - |
| Bank, lobby, retail store, restaurant, typing pool, etc. | Leq(12) 55 dBA | - |
| Manufacturing, kitchen, warehousing, etc. | Leq(12) 65 dBA | - |
| Parks, playgrounds | - | CNEL 65 dB[4] |
| Golf course, outdoor spectator sports, amusement parks | - | CNEL 70 dB[4] |

The City of Baldwin Park General Plan includes the State Noise Insulation Standards (Title 24) which specifies that that combined indoor noise for multi-family living spaces shall not exceed 45 dB CNEL; a standard which must be implanted when the outdoor noise level exceeds 60 dB CNEL. The General Plan also includes goals and policies pertaining to noise and land use compatibility, including (but not limited to) the following:

- Goal 1.0 Incorporate noise considerations into land use planning decisions.
- Policy 1.1 Use the noise/land use compatibility standards… as a guide for future planning and development decisions.
- Policy 1.2 Require noise-reduction techniques in site planning, architectural design, and construction where noise reduction is necessary. Provide noise control measures such as berms, walls, and sound attenuating construction in areas of new construction.
- Policy 1.3 Promote acceptable noise levels near schools, hospitals, convalescent homes, and other noise-sensitive areas.
- Policy 1.4 Establish targeted limits of noise for various land uses throughout the community.

- Goal 2.0 Minimize noise spillover from commercial and industrial uses into nearby residential neighborhoods.
- Policy 2.1 Enforce the 65 dBA State standard for exterior noise levels for all commercial uses.
- Policy 2.2 Require that automobile and truck access to commercial properties located adjacent to residential parcels be located at the maximum practical distance from the residential parcel.
- Policy 2.3 Require that landscaped buffers be created between a commercial or mixed-use structure and an adjoining residential parcel.

## Existing Noise Conditions

Noise measurements were conducted at five (5) representative positions in the vicinity of the project site on August 19, 2022 to characterize the existing outdoor ambient noise levels. The noise measurement locations are shown in Figure 1. Table 6 provides a summary of the noise measurement results as well as the locations, dates, and times the noise level measurements were performed. As shown in Table 6, short-term (15 to 20 minutes duration) noise levels ranged from approximately 50 dBA $L_{eq}$ (at location ST3) to 83 dBA $L_{eq}$ (at location ST5). The measurements were conducted by an attending Dudek investigator with a SoftdB "Piccolo" model sound level meter equipped with a windscreen-protected, 0.5-inch diameter pre-polarized condenser microphone with pre-amplifier. The sound level meter meets the current American National Standards Institute (ANSI) standard for a Type 2 (General Use) sound level meter. The accuracy of the sound level meter was verified using a field calibrator before and after the measurements, and the measurements were conducted with the microphone positioned approximately 5 feet above the ground.

Table 6. Measured Outdoor Ambient Noise Levels

| Survey Location | Location (and noted sounds) | Date | Time | $L_{eq}$ (dBA) | $L_{max}$ (dBA) | $L_{min}$ (dBA) |
|---|---|---|---|---|---|---|
| ST1 | Across From 1019 Leorita St (nearby and distant traffic) | 8/19/2022 | 10:38 a.m. – 10:53 a.m. | 66.6 | 76.0 | 62.9 |
| ST2 | Across From 13101 Bess Ave (nearby and distant traffic, birds, distant conversations, yelling, rustling leaves, people entering cars, music from cars, skateboarder) | 8/19/2022 | 10:57 a.m.- 11:12 a.m. | 62.6 | 77.1 | 54.3 |
| ST3 | Across From 13157 Shaver St (nearby and distant traffic, distant conversations, yelling, rustling leaves, footsteps) | 8/19/2022 | 11:16 a.m – 11:31 a.m. | 64.3 | 76.2 | 49.5 |
| ST4 | Across From 13226 Bess Ave (nearby and distant traffic, birds,distant Industrial,rustling leaves, police sirens, footsteps, car radio) | 8/19/2022 | 11:36 a.m. – 11:51 a.m. | 65.2 | 82.2 | 52.0 |
| ST5 | Parking Garage Staff Entrance (nearby and distant traffic, footsteps) | 8/19/2022 | 12:04 p.m. – 12:19 p.m. | 69.8 | 83.3 | 63.5 |

**Notes:** $L_{eq}$ = equivalent continuous sound level (time-averaged sound level); dBA = A-weighted decibels; $L_{max}$ = maximum sound level during the measurement interval; $L_{min}$ = minimum sound level during the measurement interval. See Figure 1 for measurement locations.

Attachment A provides sample digital photographs of the field noise level survey locations, followed by Dudek investigator field notes.

## Noise and Vibration Assessment

### Short-Term Construction Noise

Construction noise is considered a short-term impact and would be considered significant if construction activities exceed the allowable hours of operation as permitted by the FTA's advisory threshold of 80 dBA $L_{eq}$ over an 8-hour daytime period at a residential land use. Noise-sensitive land uses in the vicinity of the project include residences to the southwest of the EDE (approximately 800 feet from the construction boundary), and to the west of the new MOB (approximately 90 feet from the construction boundary). Although additional residences and other noise-sensitive receivers are further afield, the construction noise assessment focused on project-attributed noise exposure levels predicted to occur at these nearest existing residences. Construction noise levels at more distant receivers would be substantially lower, consistent with established acoustical principles of attenuation with geometric divergence and other factors.

Project-generated construction noise will vary depending on the construction process, the type of equipment involved, the location of the construction site with respect to sensitive receptors, the schedule proposed to carry

out each task (e.g., hours and days of the week), and the duration of the construction work. Using information provided by the project applicant as well as typical equipment identified by CalEEMod for this type and size of development, project construction noise per each of six distinct phases was calculated using a spreadsheet-based model emulating the Federal Highway Administration (FHWA) Roadway Construction Noise Model (FHWA 2008). Table 7 presents the equipment list used for the construction noise analysis.

Table 7. Construction Equipment Assumptions by Phase

| Potential Construction Phase Duration | One-Way Vehicle Trips | | | Equipment | | |
|---|---|---|---|---|---|---|
| | Average Daily Workers | Average Daily Vendor Trucks | Total Haul Trucks | Type | Quantity | Usage Hours |
| Demolition | 14 | 4 | 128 | Concrete/Industrial Saws | 1 | 8 |
| | | | | Rubber Tired Dozers | 1 | 8 |
| | | | | Tractors/Loaders/Backhoes | 3 | 8 |
| Site Preparation | 8 | 4 | 0 | Graders | 1 | 8 |
| | | | | Scrapers | 1 | 8 |
| | | | | Tractors/Loaders/Backhoes | 1 | 7 |
| Grading | 10 | 4 | 0 | Graders | 1 | 8 |
| | | | | Rubber Tired Dozers | 1 | 8 |
| | | | | Tractors/Loaders/Backhoes | 2 | 7 |
| Building Construction | 40 | 20 | 0 | Cranes | 1 | 8 |
| | | | | Forklifts | 2 | 7 |
| | | | | Generator Sets | 1 | 8 |
| | | | | Tractors/Loaders/Backhoes | 1 | 6 |
| | | | | Welders | 3 | 8 |
| Paving | 16 | 4 | 0 | Cement and Mortar Mixers | 1 | 8 |
| | | | | Pavers | 1 | 8 |
| | | | | Paving Equipment | 1 | 8 |
| | | | | Rollers | 2 | 8 |
| | | | | Tractors/Loaders/Backhoes | 1 | 8 |
| Architectural Coating | 8 | 4 | 0 | Air Compressors | 1 | 6 |

Using the provided construction information, prediction results are summarized in Table 7 at each of the two noise-sensitive receiver categories (i.e., southwest of the proposed EDE and west of the proposed MOB) for two calculation scenarios as follows:

- Usage of the shortest activity-to-receptor distance for the loudest equipment type and quantity associated with the studied construction phase, with less noisy equipment types at successive distance increments of 50 feet; and
- An “acoustic centroid” approach, akin to the FTA general assessment technique for estimating construction noise, whereby all listed equipment for a construction phases is represented by a common location at the geographic center of the studied construction zone or area.

The first of these methods is considered a conservative approach to assess what might be characterized as a peak exposure level, applicable to not more than approximately 10%–15% of the total construction period and when the studied construction activity is taking place with loudest equipment along the property boundary closest to these nearest off-site receivers. The second approach utilizes the acoustic centroid technique to represent a time-averaged location for the phase equipment and activity, thereby yielding average noise levels to represent overall noise exposure as experienced for adjacent receivers over the duration of each construction phase.

Attachment B displays the construction noise model worksheets for each of these analysis approaches. Although the quantities and types of equipment per construction phase are the same in each of the two approaches, due primarily to the differences in source-to-receptor distance variables, Table 8 shows that prediction results of both scenarios yield predicted 8-hour daytime $L_{eq}$ values exceed the aforesaid FTA guidance threshold of 80 dBA.

**Table 8. Construction Noise Modeling Results**

| Receiver Location (distance [ft] to loudest construction equipment) | Construction Noise Level (8-hour dBA Leq) by Construction Phase | | | | | | |
|---|---|---|---|---|---|---|---|
| | Land Use | Demolition | Site Preparation | Grading | Building Construction | Paving | Architectural Coating |
| *Closest Distance* from EDE to Southwest Receptor (~725 feet) | Residential | 58 | 56 | 57 | 53 | 55 | 44 |
| *Closest Distance* from MOB to West Receptor (~60 feet) | Residential | 82 | 80 | 80 | 77 | 78 | 71 |
| *Acoustic Center* from EDE to Southwest Receptor (~935 feet) | Residential | 56 | 54 | 55 | 52 | 53 | 42 |
| *Acoustic Center* from MOB to West Receptor (~210 feet) | Residential | 71 | 68 | 69 | 66 | 68 | 56 |

**Source:** Attachment B.

As previously discussed, the City's Noise Ordinance does not establish quantitative construction noise standards; however, Section 130.37 Special Noise Sources (E) of the City's Municipal Code restricts noise-generating construction activities to the hours from 7:00 a.m. to 7:00 p.m. The construction contractor would thus be required to comply with these noise regulations prescribing the hours allowed for construction activity. Were the FTA guidance limit of 80 dBA $L_{eq}$ to be applied as a standard, Table 8 informs that the predicted noise level exposure at the offsite receptor closest to the MOB construction boundary (i.e., a distance of only 60 feet) is 82 dBA and exceed this standard by 2 dB. Hence, despite construction activity hours complying with City regulations, project construction noise impacts could be less than significant with mitigation such as the following measure:

**MM-NOI-1** The applicant and/or project contractor shall implement the following measures:

- All construction equipment must have appropriate sound muffling devices, which shall be properly maintained and used at all times such equipment is in operation.
- The project contractor shall place stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site.
- The construction contractor shall locate on-site equipment staging areas so as to maximize the distance between construction-related noise sources and noise-sensitive receptors nearest the Project site during the construction period.

- All noise producing construction activities, including warming-up or servicing equipment and any preparation for construction, shall be limited to the hours between 7:00 a.m. and 7:00 p.m.

One or more of the following noise-reducing practices shall be incorporated into the project's construction program:

- Administrative controls (e.g., reduce operating time of equipment and/or prohibit usage of equipment type[s] within certain distances).
- Engineering controls (upgrade noise controls, such as install better engine exhaust mufflers).
- Install noise abatement on the site boundary fencing (or within, as practical and appropriate) in the form of sound blankets or comparable temporary barriers (e.g., stacked sheets of plywood supported with framing) to occlude construction noise emission between the site (or specific equipment operation as the situation may define) and offsite noise-sensitive receptor(s) of concern.
- At the outset of a project construction activity, an unattended noise level monitor might be deployed onsite to measure and document that noise exposure levels attributed to project construction activity at adjacent offsite sensitive receptors are in conformance with the 80 dBA 8 hour $L_{eq}$ threshold.

With the needed noise reduction quantity being only 2 dB (i.e., the arithmetic difference of 82 dBA and 80 dBA), **MM-NOI-1** offers the project Applicant (or its construction contractors) flexible and practical options to implement it successfully and yield compliant noise exposure levels. For example, installation of a temporary barrier that blocks line-of-sight between a noise source and a receptor should yield a minimum 3 dB noise reduction. Separately, and independent of any barrier-based sound path occlusion, reducing operation time of a piece of steady noise-producing equipment by 50% would also yield a 3 dB reduction.

### Long-Term Operational Noise

Operation of the project would result in the generation of noise both on and off site. Consistent with similar land uses, operations supported by the project would primarily be conducted within the enclosed buildings, except for traffic movement, parking, and ambulance activities such as emergency sirens to, from, and around the hospital, as well as loading and unloading of patients and equipment at the ambulance bay. As such, on-site operational noise sources are expected to include roof-top air conditioning units, parking lot activity, and ambulance bay activity. Off-site noise could be generated by vehicles accessing the project site and contributing to vehicular roadway noise, as well as the ambulance emergency sirens. As detailed below, these operational project activities would not result in the generation of a substantial temporary or permanent increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

#### *On-Site Operational Noise*

Implementation of the project would result in changes to existing noise levels on and around the project site by developing new stationary sources of noise, including introduction of additional outdoor HVAC equipment. These sources may affect noise-sensitive vicinity land uses off the project site.

### *Rooftop HVAC*

*EDE Sound Sources*

Based on the available architectural and mechanical roof plans and other design information for the proposed EDE, there is a seven-foot barrier raised 18" off the roof deck surrounding a single custom air-handling unit (AHU) and four (4) exhaust fans. Rooftop AHU fan and exhaust fan reference sound levels were available from the EDE design plans and "product data" information submittals.

*MOB Sound Sources*

For the analysis of noise emission from outdoor-exposed HVAC equipment operating on the roof of the proposed MOB, net building cooling load and minimum air infiltration was calculated with an estimation technique (Storm 2018) using the gross square footage (GSF) and expected functions or usage of the interior building spaces. With these inputs, net refrigeration tonnage and minimum outside air volume was calculated and then used to size and quantify a number of air handling unit return air fans and air-cooled chillers, for which online manufacturer data was consulted to quantify reference sound emission levels for this anticipated MOB rooftop equipment.

*Sound Propagation Prediction*

The aggregate noise emission from these EDE and MOB outdoor-exposed HVAC sound sources has been predicted with the Datakustik CadnaA sound propagation program. CadnaA is a commercially available software program for the calculation, presentation, assessment, and prediction of environmental noise based on algorithms and reference data per International Organization of Standardization (ISO) Standard 9613-2, "Attenuation of Sound During Propagation Outdoors, Part 2: General Method of Calculation" (ISO 1996). The CadnaA computer software allows one to position sources of sound emission in a simulated three-dimensional (3-D) space atop rendered "blocks" of project building masses having heights and footprints consistent with project architectural plans and elevations. In addition to the above-mentioned sound source inputs and building-block structures that define the three-dimensional sound propagation model space, the following assumptions and parameters are included in this CadnaA-supported stationary noise source assessment:

- Ground effect acoustical absorption coefficient equal to 0.1, which intends to represent an average or blending of ground covers that are characterized largely by hard reflective pavements and existing building surfaces across the Project site and the surroundings;
- Reflection order of 1, which allows for a single reflection of sound paths on encountered structural surfaces such as the modeled building masses;
- Off-site residential structures and the commercial buildings have not been rendered in the model;
- Calm meteorological conditions (i.e., no wind) with 68 degrees Fahrenheit and 50% relative humidity; and
- All of the modeled HVAC equipment is operating concurrently and continuously for a minimum period of 1 hour.

Details of these CadnaA modeling input parameters (e.g., sources and buildings) and calculations for estimating equipment sound levels can be found in Appendix D. Table 9 presents the predicted aggregate noise level exposures from these operating EDE and MOB HVAC systems at each of four (4) nearby offsite noise-sensitive receptors (i.e., existing residences). Predicted levels shown in Table 9 range between 9 to 40 dBA hourly $L_{eq}$, which is below the City's noise standard of 45 dBA $L_{eq}$ for single-family residential properties. Figure 2 displays the location of the studied noise-sensitive receptors and noise contours.

Table 9. Stationary Operations Noise Modeling Results

| Studied Noise-Sensitive Receptor (approximate address) | Predicted Project-Attributed Noise Exposure Level at Nearby Noise-Sensitive Receptors |
|---|---|
| | Project HVAC (dBA hourly $L_{eq}$) |
| R1 (13226 Bess Avenue) | 18.3 |
| R2 (13101 Bess Avenue) | 9.4 |
| R3 (1019 Leorita Street) | 30.8 |
| R4 (Proposed EDE Façade) | 39.8 |

Note: $L_{eq}$ = equivalent continuous sound level (time-averaged sound level); dBA = A-weighted decibels; HVAC = heating, ventilating, and air-conditioning. See Figure 2 for locations of studied noise-sensitive receptors.

*Parking Lot Activity*

A comprehensive study of noise levels associated with surface parking lots was published in the Journal of Environmental Engineering and Landscape Management (Baltrënas et al. 2004). The study found that average noise levels during the peak period of use of the parking lot (generally in the morning with arrival of commuters, and in the evening with the departure of commuters), was 47 dBA at 1 meter (3.3 feet) from the outside boundary of the parking lot. The project employee parking spaces for the proposed EDE would be within the existing parking garage for the hospital. The project employee parking spaces for the proposed MOB are proposed surrounding the new building.

Accounting for sound attenuation due to additional distance travelled, the MOB parking lot noise contribution logarithmically combined with the project's HVAC-only predicted noise levels appearing in Table 9 would still be well below the City's noise standard of 45 dBA $L_{eq}$ at the studied nearest noise-sensitive residential properties (R3). It is also well below the ambient noise level range of 63 to 70 dBA $L_{eq}$ measured adjacent to the project as exhibited in Table 6.

*Project-Generated Off-Site Traffic Noise*

The project is expected to generate a total of -340 trips to the roadway system, primarily due to the removal of the apparel store that currently exists where the proposed MOB would be constructed. As shown in Table 2-1 of the project's Transportation Technical Memorandum, during the PM peak-hour, approximately nine passenger vehicles are estimated to enter or exit the project site. Utilizing this information, as well as additional traffic data shown in Attachment C, an emulator based on the FHWA's Highway Traffic Noise Prediction Model RD-77-108 was used to estimate potential noise impacts at adjacent noise-sensitive uses. Information used in the model included posted traffic speeds, truck mix percentage (for urban streets, found in the U.S. Environmental Protection Agency's Background Document for Medium and Heavy Truck Noise Emission Regulations, 1976), and expected level-of-service C traffic volumes (for urban streets, found in the Transportation Research Board's Highway Capacity Manual, 2000). Consistent with Caltrans guidance (Caltrans, 2013), this analysis assumes 80% of the ADT occurs during daytime hours (7:00 a.m. to 7:00 p.m.), 5% during the evening (7:00 p.m. to 10:00 p.m.), and 15% during the nighttime (10:00 p.m. to 7:00 a.m.).

The change in roadway noise levels was predicted for two conditions: existing and existing plus project. Traffic noise levels found in Table 10 are calculated for roadway segments bounded by intersections within the project area and are listed as follows:

Baldwin Park Boulevard – From Amar Road to Dalewood Street,

Bess Avenue – From Frazier Street to Baldwin Park Boulevard,

Leorita Street – From Bess Avenue to Dalewood Street, and

Dalewood Street – From Frazier Street to Baldwin Park Boulevard.

**Table 10. Predicted Roadway Noise Change – Existing plus Project**

| Modeled Roadway Segment | Existing Noise Level (dBA CNEL) | Existing Plus Project Noise Level (dBA CNEL) | Project-Related Noise Level Increase (dBA) |
|---|---|---|---|
| Baldwin Park Blvd.: Amar Rd. – Dalewood St. | 71.9 | 71.9 | 0.0 |
| Bess Ave.: Frazier St. – Baldwin Park Blvd. | 63.8 | 63.8 | 0.0 |
| Leorita St.: Bess Ave. – Dalewood St. | 63.0 | 63.0 | 0.0 |
| Dalewood St.: Frazier St. – Baldwin Park Blvd. | 67.5 | 67.5 | 0.0 |

**Source:** Attachment C.

As shown in Table 10, none of the roadways is predicted to receive an increase in noise levels as a result of the additional project traffic. In the context of community noise (i.e., outside of a controlled environment) a change in noise levels of less than 3 dBA is not perceptible to the average human listener. Additionally, based upon the FICON thresholds presented in Section 3.1.2, an increase of less than 5 dBA when the ambient sound level is less than 60 dBA $L_{dn}$/CNEL, less than 3 dBA when the ambient sound level is less than between 60 and 65 dBA $L_{dn}$/CNEL, or less than 2 dBA when the ambient sound level is greater than 65 dBA $L_{dn}$/CNEL would not be substantial. Therefore, impacts associated with off-site project-generated traffic noise would be less than significant.

*Ground-borne Vibration*

The main concern associated with ground-borne vibration is annoyance; however, in extreme cases, vibration can cause damage to buildings, particularly those that are old or otherwise fragile. Some common sources of ground-borne vibration are trains, and construction activities such as blasting, pile-driving, and heavy earth-moving equipment. The primary source of ground-borne vibration occurring as part of the project is construction activity.

Ground-borne vibration information related to construction/heavy equipment activities has been collected by Caltrans. Information from Caltrans indicates that transient vibrations (such as from construction activity) with approximately 0.035 inches per second PPV may be characterized as barely perceptible, and vibration levels of 0.24 inches per second PPV may be characterized as distinctly perceptible (Caltrans 2020). The heavier pieces of construction equipment, such as large bulldozers or hoe rams, would register up to approximately 0.089 inches

per second PPV at a distance of 25 feet, and a clam shovel drop would measure up to approximately 0.202 inches per second PPV at a distance of 25 feet (FTA 2018).

According to Caltrans, D-8 and D-9 Caterpillars, earthmovers, and trucks have not exceeded 0.10 inches/second PPV at 10 feet (Caltrans 2020). Since the closest off-site residence is located approximately 90 feet away from likely heavy construction equipment, vibration from construction activities at the closest sensitive receiver would not exceed the significance threshold of 0.20 inches/second PPV. Moreover, because the offsite residential homes feature wood-frame construction on foundation pads or footings, FTA guidance indicates that a "coupling loss" of -5 VdB can be applied to the groundborne vibration received by the structure and thus result in an attenuated VdB level of 65 that is compatible with the afore-mentioned interpretation of the City's vibration standards (i.e., perception unaided by instruments).

As for existing onsite Kaiser Baldwin Park structures, vibration impacts attributed to project construction are not anticipated to be significant for the following reasons:

- Vibration-sensitive instruments and operations (e.g., operation rooms and medical imaging [i.e., MRI] facilities) are sufficiently distant from expected project construction areas, so that propagated groundborne vibration will attenuate with distance—or be impeded or dissipated by intervening masses such as existing structural foundations and multi-story building masses. Distance sufficiency in this context would be a minimum of 36 feet between—for purposes of illustration—an operating large bulldozer or comparable engine-driven heavy construction equipment and a potentially sensitive receptor, assuming a threshold of 72 VdB (for operating rooms, per FTA guidance [FTA 2018]) and applying a coupling loss of -10 VdB due to existing onsite structures being representative of multi-story "large masonry" buildings. The construction area of the new MOB to be implemented by the project meets this criterion, and is physically separated from the campus vibration-sensitive buildings by the extensive pre-existing parking structures.
- Where the project involves renovation and new construction within this 36-foot distance, such as the vicinity of the EDE, the architectural plans indicate that the project will implement careful "phasing" of construction that involves temporary relocation of existing potentially vibration-sensitive activities, processes, and receptors to other onsite campus areas that are more distant from or would otherwise be protected from the adverse effects of excessive vibration attributed to the project.

Based on these predictive calculations and findings, project construction would not result in a significant impact associated with ground-borne vibration.

### *Airport Noise*

The San Gabriel Valley Airport (SGVA) is located approximately 2.85 miles northwest of the project site. The project site is located outside of the Airport Influence Area as shown in the Los Angeles County Airport Influence Area map. Therefore, no impact would occur.

## Construction Noise Prediction Model Worksheets

*To User: bordered cells are inputs, unbordered cells have formulae*

noise level limit for construction phase at residential land use, per FTA guidance = 80
allowable hours over which Leq is to be averaged = 8

= temporary barrier (TB) of input height inserted between source and receptor

| Construction Activity | Equipment | Total Equipment Qty | AUF % (from FHWA RCNM) | Reference Lmax @ 50 ft. from FHWA RCNM | Client Equipment Description, Data Source and/or Notes | Source to NSR Distance (ft.) | *Temporary Barrier Insertion Loss (dB)* | *Additional Noise Reduction* | Distance-Adjusted Lmax | Allowable Operation Time (hours) | Allowable Operation Time (minutes) | Predicted 8-hour Leq | Source Elevation (ft) | Receiver Elevation (ft) | Barrier Height (ft) | Source to Barr. ## Traffic Noise Model Input/Output

## Appendix 2C

### Traffic Noise Modeling Calculations - Summary

**Project:** **14416 Kaiser Baldwin Park**

| Number | Name | Segment Description and Location From | To | Existing | Existing + Project | Δ Existing – Existing + Project |
|---|---|---|---|---|---|---|
| **Summary of Net Changes** | | | | | | |
| 1 | Baldwin Park Boulevard | Amar Road | Dalewood Street | 71.9 | 71.9 | 0.0 |
| 2 | Bess Avenue | Frazier Street | Baldwin Park Avenue | 63.8 | 63.8 | 0.0 |
| 3 | Leorita Street | Bess Avenue | Dalewood Street | 63.0 | 63.0 | 0.0 |
| 4 | Dalewood Street | Frazier Street | Baldwin Park Avenue | 67.5 | 67.5 | 0.0 |

*All modeling assumes average pavement, level roadways (less than 1.5% grade), constant traffic flow and does not account for shielding of any type or finite roadway adjustments. All levels are reported as A-weighted noise lev

# Appendix 2C - 1

## Traffic Noise Model Calculations

**Project:** 14416 Kaiser Baldwin Park

**Noise Level Descriptor:** CNEL
**Site Conditions:** Hard
**Traffic Input:** Peak
**Traffic K-Factor:** 10

| | Segment Description and Location | | | Input | | | | | | | | | | Output | | | | |

**TRANSPORTATION ASSESSMENT REPORT**

# KAISER PERMANENTE BALDWIN PARK MEDICAL CENTER PROJECT

**City of Baldwin Park, California**
**October 7, 2022**

## 1.0 INTRODUCTION

### 1.1 Transportation Assessment Overview

This transportation assessment report has been prepared to identify and evaluate the potential transportation impacts of the proposed Kaiser Permanente Baldwin Park Medical Center (BPMC) project ("proposed project"). The Kaiser Permanente BPMC campus is located at 1011 Baldwin Park Boulevard in the City of Baldwin Park, California. The Kaiser Permanente BPMC campus is generally bounded by Dalewood Street and I-10 Freeway to the north, Bess Avenue to the south, Baldwin Park Boulevard to the east, and Leorita Street to the west. The proposed Kaiser Permanente BPMC MOB project and general vicinity are shown in ***Figure 1-1***.

The transportation impact analysis follows the *City of Baldwin Park Transportation Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment*[1] ("Guidelines"). The City Guidelines are focused on transportation metrics that promote: the reduction of greenhouse gas emissions, the development of multimodal networks and access to diverse land uses, as well as safety, sustainability and smart growth. In compliance with the California Environmental Quality Act (CEQA), the City Guidelines identify vehicle miles traveled (VMT) as the primary metric for evaluating a project's transportation impacts. In addition, the City requires non-CEQA intersection Level of Service (LOS) analysis evaluating potential project-related effects at key intersections in the vicinity of the project site.

This assessment report (i) presents the proposed project's existing transportation network context, (ii) forecasts project-generated traffic, (iii) presents a CEQA assessment of project-related VMT, (iv) provides a non-CEQA evaluation of project access and circulation, and (v) recommends VMT-reducing measures or other transportation network improvement measures, where necessary.

### 1.2 Study Methodology

The CEQA and non-CEQA analysis criteria for this transportation assessment were identified in consultation with the City of Baldwin Park staff. The analysis criteria were determined based on the City's Guidelines, the proposed project description and location, and the characteristics of the surrounding transportation system. A total of two study intersections have been identified for evaluation during the weekday morning and afternoon peak hours. The study intersections provide

[1] *City of Baldwin Park Transportation Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment,"* September 2020.

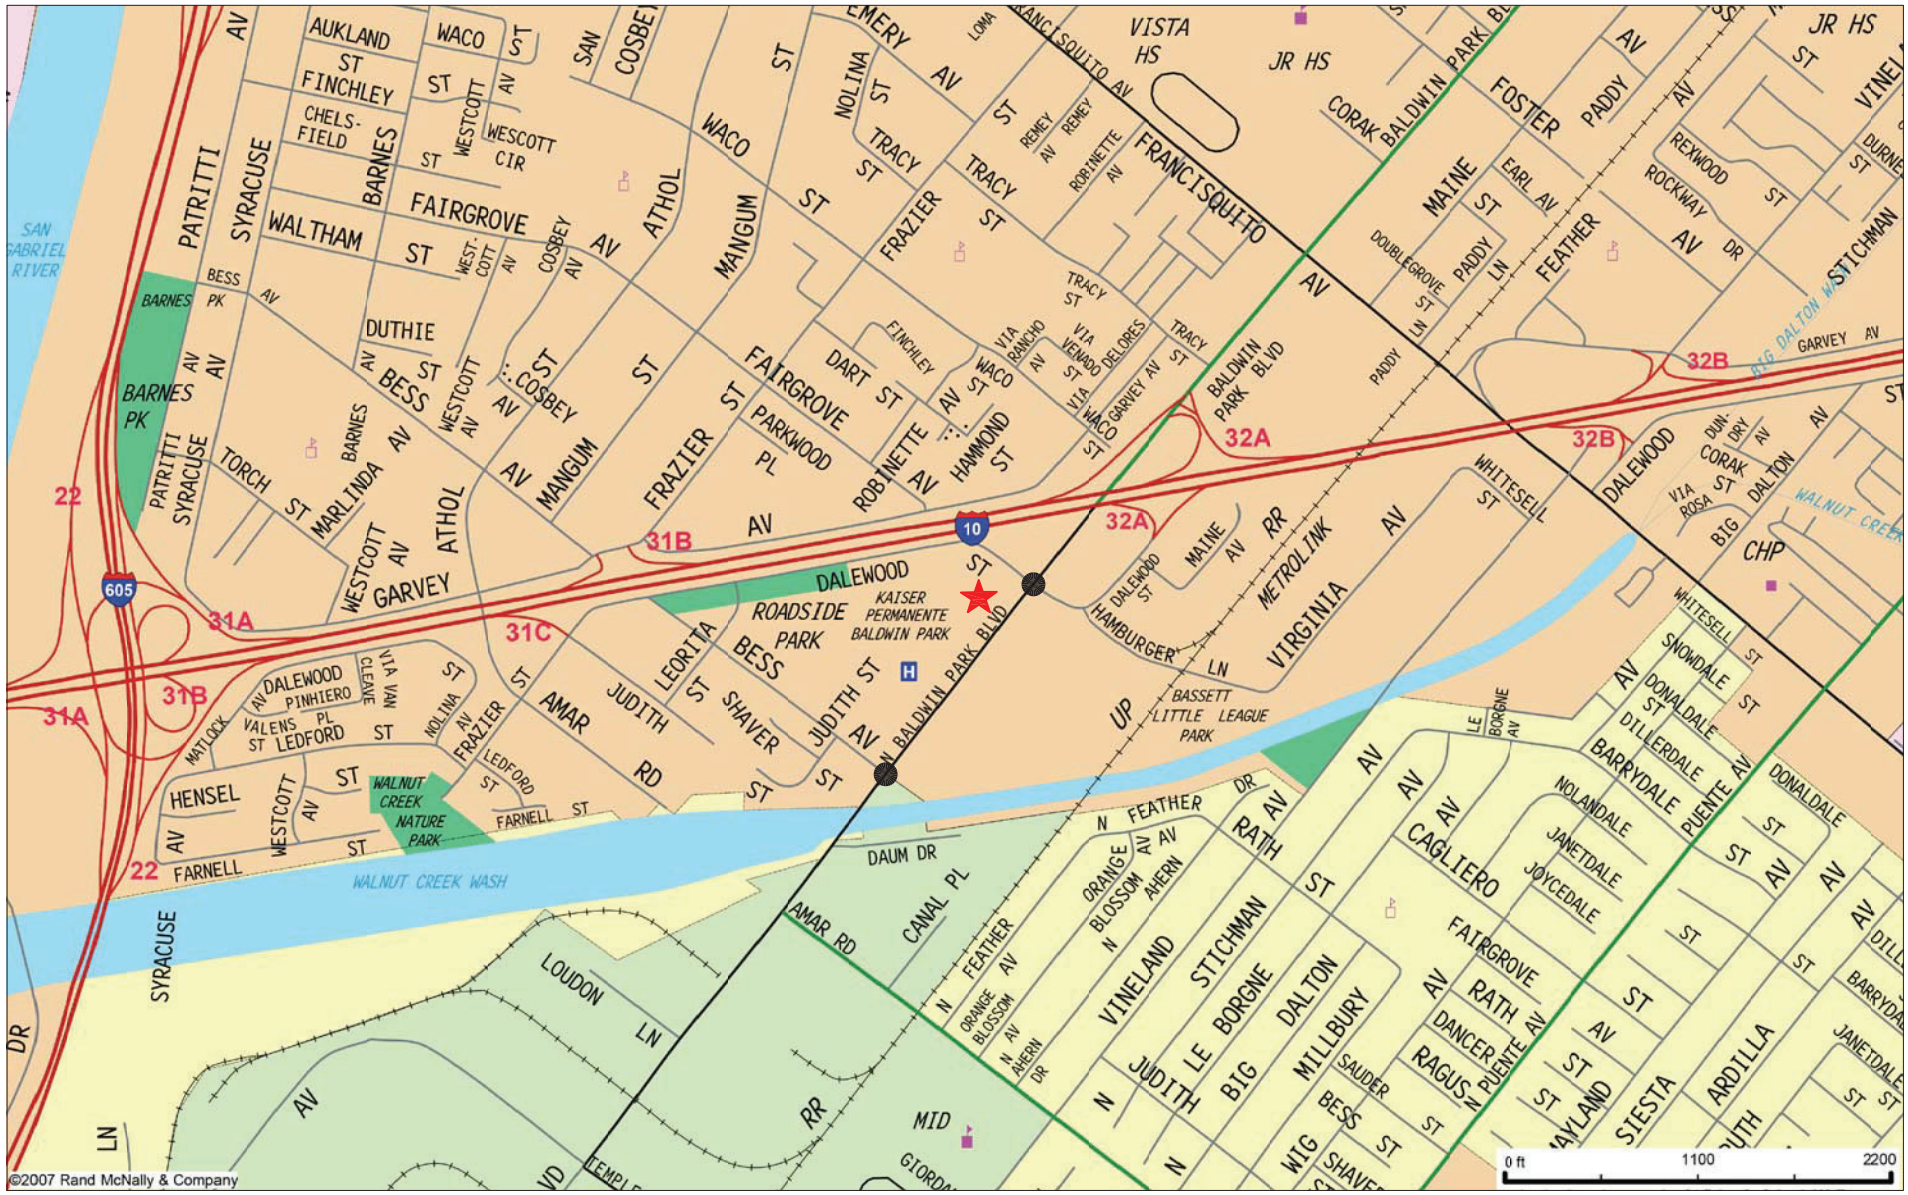

Figure 1-1
Vicinity Map

Kaiser Permanente Baldwin Park Medical Center Project

o:\job_file\4109-3\dwg\f1-1.dwg 05/12/2022 11:29:45 rodriquez

local access to the study area and define the extent of the boundaries for this transportation impact analysis.

## 1.3 Los Angeles County Congestion Management Program Status

The Los Angeles County Congestion Management Program (CMP) was previously a state-mandated program that was enacted by the California State Legislature with the passage of Proposition 111 in 1990 that primarily utilized a level of service (LOS) performance metric. Pursuant to California Government Code §65088.3, local jurisdictions may opt out of the CMP requirement without penalty if a majority of the local jurisdictions representing a majority of the County's population formally adopt resolutions requesting to opt out of the program. As stated in a letter from the Los Angeles County Metropolitan Transportation Authority (Metro)[2], by August 28, 2019 fifty-seven local jurisdictions, which in total represent 8.5 million in population, had adopted resolutions electing to be exempt from the CMP. With the Los Angeles County region having reached the statutorily required threshold, the provisions of the CMP are no longer applicable to any of the 89 local jurisdictions within Los Angeles County, regardless of whether or not a jurisdiction adopted an opt-out resolution. Therefore, CMP Traffic Impact Analysis is no longer required.

[2] Kalieh Honish, Los Angeles County Metropolitan Transportation Authority, to Seleta Reynolds, City of Los Angeles Department of Transportation, "Re: Dissolution of the Congestion Management Program in Los Angeles County", August 28, 2019.

# 2.0 PROJECT DESCRIPTION

## 2.1 Existing Kaiser Permanente BPMC Campus

The Kaiser Permanente BPMC campus is located at 1011 Baldwin Park Boulevard. The Kaiser Permanente BPMC campus is generally bounded by Dalewood Street and I-10 Freeway to the north, Bess Avenue to the south, Baldwin Park Boulevard to the east, and Leorita Street to the west. The proposed Kaiser Permanente BPMC MOB project and general vicinity are shown in *Figure 1-1*.

The Kaiser Permanente BPMC is a major medical center that provides medical and health care service on a local and regional basis. It includes an emergency department, inpatient care, outpatient treatment, and other medical center facilities. The BPMC campus is owned and operated by Kaiser Permanente, one of the nation's largest not-for-profit health plans, currently serving approximately 10 million members, with headquarters in Oakland, California. The Kaiser Permanente BPMC campus currently consists of a 272-bed hospital, approximately 419,000 square feet of medical office, and associated surface and structured parking. The Kaiser Permanente BPMC campus including hospital/medical-related buildings and parking facilities are highlighted in the aerial photograph presented in ***Figure 2-1***.

## 2.2 Proposed Project Description

The proposed project consists of the development of a two-phased project at the existing Kaiser Permanente BPMC campus. The first phase (Phase 1) is the construction of an expansion to the existing hospital emergency department (ED) located on the northeast portion of the Kaiser campus. Expansion of the emergency department would add approximately 23,000 square feet resulting in a total square footage of approximately 40,000 square feet, expand the number of existing treatment bays from 38 to 60, a new ambulance canopy with four ambulance parking spaces, and tenant improvements within the existing emergency department. This addition will not add hospital bed licenses under the California Department of Health Care Access and Information (HCAI), formerly the Office of Statewide Health Planning and Development (OSHPD). The expansion and improvement of the emergency department would allow better functionality within the emergency department and eliminate existing and projected treatment bay deficits in compliance with current OSHPD space requirements and standards. A total of 37 additional full-time employees are estimated as part of the expansion. The Phase 1 project would also include the demolition of existing structures at 1022 Leorita Street (referred to as the "Broken Horn" site) with existing 68 parking spaces to remain. The "Broken Horn" site will remain gated until such time that the Phase 2 project construction will commence. Construction of the Phase 1 project is expected to commence in year 2023 with occupancy in the year 2026.

The second phase of the project (Phase 2) would consist of the construction of an approximately 33,000 square foot medical office building (MOB). This component would expand the boundary of the medical campus to include the adjacent parcel to the northwest of the campus located at 1022 Leorita Street. The development of this site (the "Broken Horn" site) would require the demolition of the existing 23,040 square foot retail building under the Phase 1 project. A total of 80 parking

spaces is planned to be provided at this site upon completion. Construction of the Phase 2 project is expected to commence in year 2028 with occupancy in the year 2029. The proposed campus site plan is illustrated in ***Figure 2-2***.

## 2.3 Project Site Access

### 2.3.1 *Vehicular Site Access*

Vehicular access to the Kaiser Permanente BPMC campus is primarily provided via four roadways: Baldwin Park Boulevard, Dalewood Street, Bess Avenue, and Leorita Street. As noted in *Figure 2-1*, campus driveways (i.e., BPMC driveways on bordering roadways) are provided on all four adjoining roadways. All of the campus driveways provide access to parking facilities and hospital/medical office buildings that are situated within the BPMC campus. There are no changes to the BPMC campus key access intersections and driveways planned as part of the proposed Kaiser Permanente BPMC project. Brief descriptions of the site access for the ED and the Leorita site are provided in the following paragraphs.

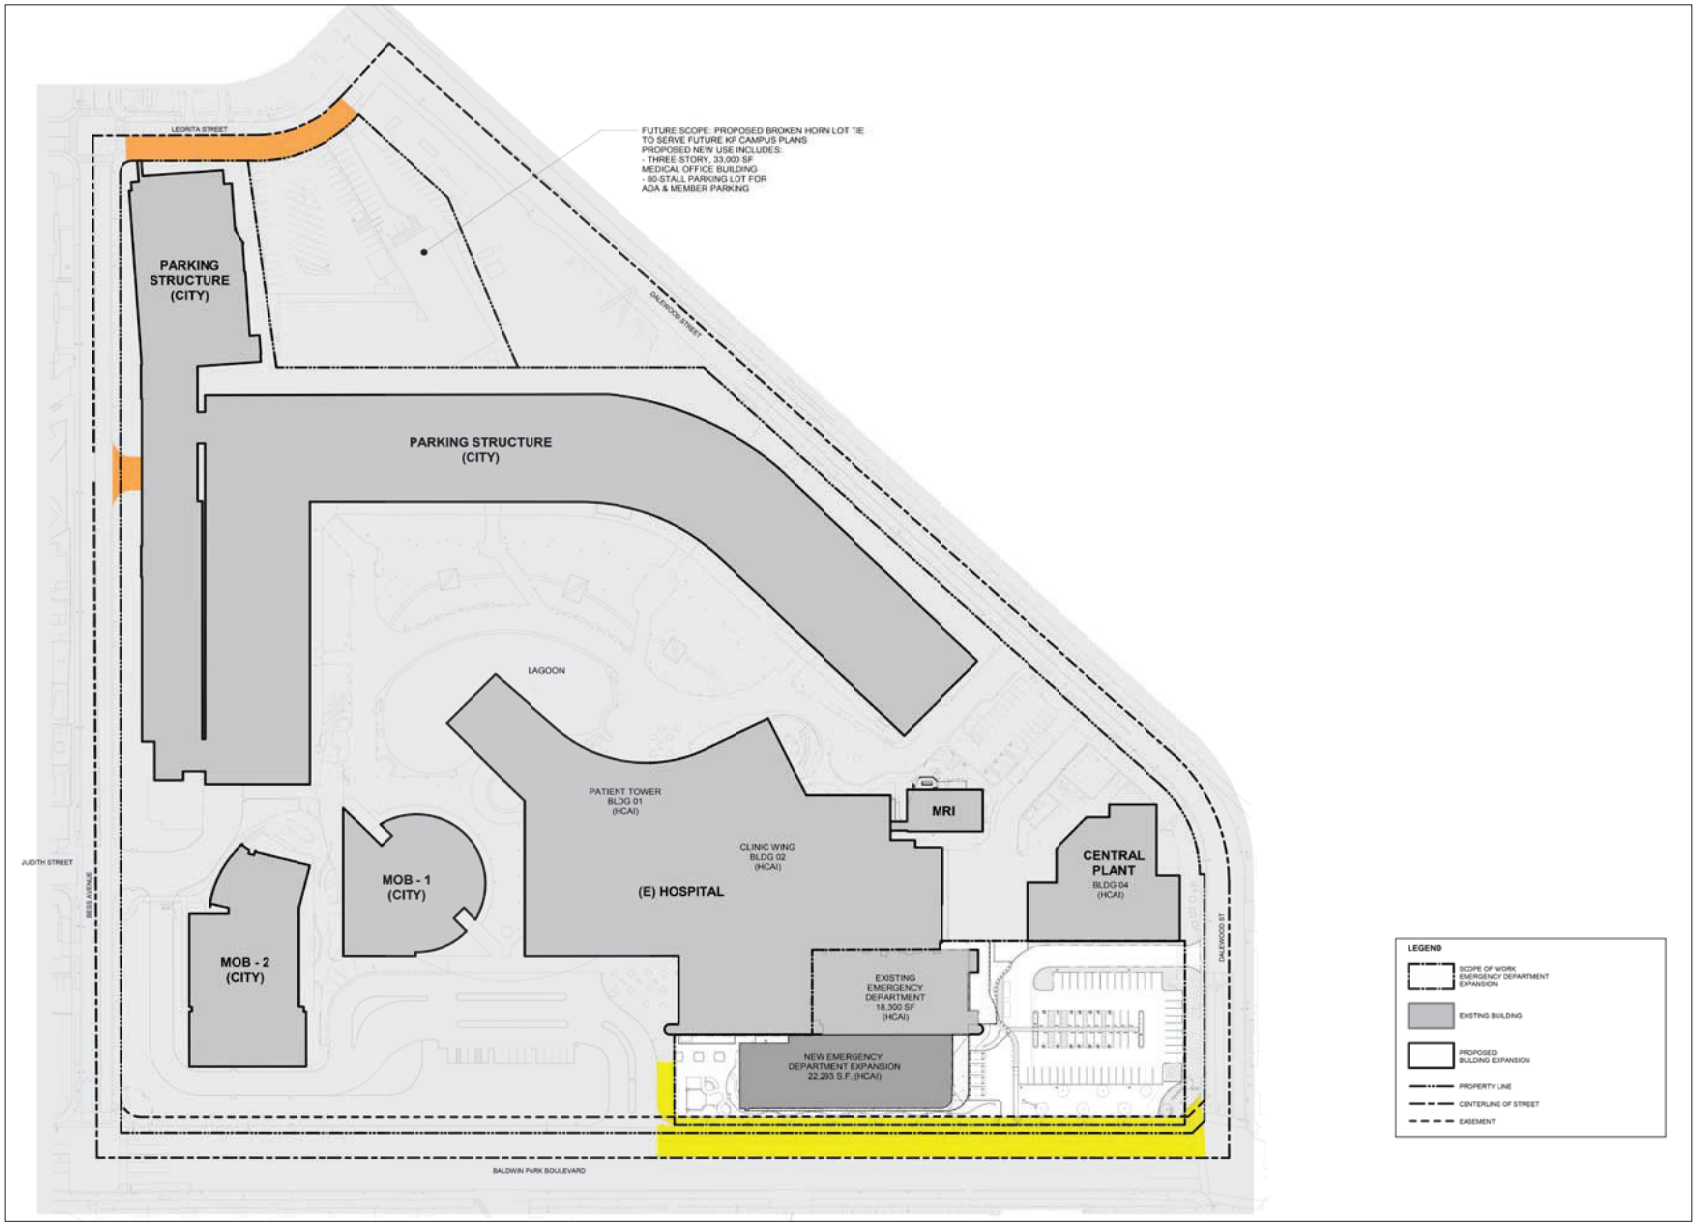
- Emergency Department Vehicular Access. Main vehicular access to the Emergency Department for patients and visitors will continue to be provided via two driveways: one entrance only driveway on Baldwin Park Boulevard and one driveway on Dalewood Street. The existing Baldwin Park ED driveway is located along the north side of Baldwin Park Boulevard and will continue to accommodate left-turn and right-turn ingress movements. The existing Dalewood Street driveway is located along the west side of Dalewood Street and will continue to accommodate full access (i.e., left-turn and right-turn ingress and egress movements). ED staff will continue to park at the designated parking spaces within the existing parking structure.

  Ambulance access will also be provided via the existing Baldwin Park Boulevard ED driveway. As noted previously, a new ambulance canopy with four ambulance parking spaces will be constructed as part of the Phase 1 project.

- Leorita Street Site Vehicular Access. Main vehicular access to the Leorita Street site will continue to be provided via two driveways on Leorita Street. The existing Leorita Street Driveways are located along the south side of Leorita Street and will continue to accommodate full access (i.e., right-turn and left-turn ingress and egress turning movements). It is anticipated that patients and staff will have access to the existing campus parking structure.

### 2.3.2 *Non-Vehicular Site Access*

Pedestrian access to the project site will be accommodated via the existing public sidewalks and pedestrian facilities provided along Baldwin Park Boulevard, Dalewood Street, and Leorita Street. Pedestrian pathways will be constructed on-site and will connect to the existing pedestrian facilities along Baldwin Park Boulevard, Dalewood Street, and Leorita Street. Pedestrian access within the project site will be accommodated by walkways that will connect the building entrances to the public



MAP SOURCE: HMC ARCHITECTS

o:\job_file\4109-3\dwg\f2-2.dwg 10/06/2022 16:13:02 rodriquez ----

LINSCOTT LAW & GREENSPAN engineers

Figure 2-2
Site Plan

right-of-way. This walkway will provide exclusive pedestrian and bicycle access from the public sidewalks to the proposed project, thus minimizing the extent of pedestrian and bicycle interaction with vehicles at the site and providing a comfortable, convenient, and safe environment for pedestrians and bicyclists to access the proposed project from the public right-of-way. Pedestrian access to and from the project site as well as within the project is illustrated in *Figure 2-2*.

## 2.4 Project Trip Generation and Distribution

### 2.4.1 *Project Trip Generation Forecast*

Traffic trip generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Traffic volumes to be generated by the proposed project were forecast for the weekday AM and PM peak hours, and over a 24-hour period. Trip generation rates provided in the ITE's *Trip Generation Manual*[3] were utilized to forecast project traffic generation for the proposed project. Traffic volumes expected to be generated by the project's hospital and medical office components were based upon the following ITE trip generation average rates:

- ITE Land Use Code 610: Hospital
- ITE Land Use Code 720: Medical-Dental Office Building

In addition to the proposed project trip generation forecasts, forecasts also were made for the existing retail land use located on the 1022 Leorita Street development site (Phase 2) which will be demolished as part of the project. ITE Land Use Code 822 (Strip Retail Plaza) trip generation average rates were used to forecast the traffic volumes expected to be generated by the existing retail use during the weekday AM and PM peak hours.

### 2.4.2 *Phase 1 Project Trip Generation*

The trip generation rates and forecast of the vehicular trips anticipated to be generated by the Phase 1 project are presented in ***Table 2-1***. As summarized in *Table 2-1*, the Phase 1 project is expected to generate 10 vehicle trips (7 inbound trips and 3 outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the Phase 1 project is expected to generate 10 vehicle trips (3 inbound trips and 7 outbound trips). Over a 24-hour period, the Phase 1 project is forecast to generate 139 vehicle trips (70 inbound trips and 70 outbound trips) during a typical weekday.

### 2.4.3 *Phase 2 Project Trip Generation*

The trip generation rates and forecast of the vehicular trips anticipated to be generated by the Phase 2 project are also presented in *Table 2-1*. As summarized in *Table 2-1*, the Phase 2 project is expected to generate a net increase of 34 trips (39 inbound trips and 5 fewer outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the Phase 2 project is expected to generate a net decrease of 58 trips (52 fewer inbound trips and 6 fewer outbound trips). Over a 24-

[1] Source: ITE "Trip Generation Manual", 11th Edition, 2021.

[2] Trips are one-way traffic movements, entering or leaving.

[3] ITE Land Use Code 610 (Hospital) trip generation average rates.
- Daily Trip Rate: 3.77 trips/employee; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.28 trips/employee; 72% inbound/28% outbound
- PM Peak Hour Trip Rate: 0.28 trips/employee; 30% inbound/70% outbound

[4] ITE Land Use Code 720 (Medical-Dental Office Building) trip generation average rates.
- Daily Trip Rate: 31.86 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 2.68 trips/1,000 SF of floor area; 81% inbound/19% outbound
- PM Peak Hour Trip Rate: 2.84 trips/1,000 SF of floor area; 25% inbound/75% outbound

[5] ITE Land Use Code 822 (Strip Retail Plaza) trip generation average rates.
- Daily Trip Rate: 54.45 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 2.36 trips/1,000 SF of floor area; 60% inbound/40% outbound
- PM Peak Hour Trip Rate: 6.59 trips/1,000 SF of floor area; 50% inbound/50% outbound

hour period, the Phase 2 project is forecast to generate a net decrease of 204 trips (102 fewer inbound trips and 102 fewer outbound trips) during a typical weekday.

### 2.4.4 *Project Build-out Trip Generation*

As also shown in *Table 2-1*, the proposed project at build-out is forecast to generate a net increase of 44 trips (46 inbound trips and 2 fewer outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project at build-out is expected to generate a net decrease of 48 trips (49 fewer inbound trips and 1 outbound trip). Over a 24-hour period, the proposed project is forecast to generate a net decrease of 65 trips (33 fewer inbound trips and 33 fewer outbound trips) during a typical weekday.

### 2.4.5 *Project Trip Distribution and Assignment*

Project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- The site's proximity to major traffic corridors (i.e., I-10 Freeway and Baldwin Park Boulevard, etc.);
- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;
- Existing intersection traffic volumes;
- Existing BPMC campus site access ingress/egress schemes; and
- Nearby population and employment centers.

The general, directional traffic distribution pattern for the Phase 1 project is presented in ***Figure 2-3***. The general, directional traffic distribution pattern for the Phase 2 project is presented in ***Figure 2-4***. The forecast net weekday AM and PM peak hour project traffic volumes at the study intersections associated with the proposed project at build-out are presented in ***Figures 2-5*** and ***2-6***, respectively. The traffic volume assignments presented in *Figures 2-5* and *2-6* reflect the traffic distribution characteristics shown in *Figures 2-3* and *2-4* and the project trip generation forecasts presented in *Table 2-1*.

# 3.0 PROJECT SITE CONTEXT

The following sections provide an overview of the transportation infrastructure in the vicinity of the proposed project, including infrastructure which supports both motorized and non-motorized transportation modes.

## 3.1 Non-Vehicle Network

Non-vehicular transportation generally encompasses walking, biking, and other active transportation modes. Distinct facilities are often provided for these non-vehicular modes. Most prominently, paved sidewalks are typically provided to facilitate pedestrian travel outside of the roadway. In some cases, bicycle facilities such as painted bike lanes or separated bike paths are provided within the roadway in order to separate bike traffic from vehicular traffic. Roadways which are designed to prioritize non-vehicular transportation modes utilize complimentary non-vehicular infrastructure in order to promote comfortable, safe travel for both pedestrians and bicyclists. A review of the pedestrian and bicycle infrastructure provided in the vicinity of the project site is provided below.

### 3.1.1 *Pedestrian System*

Public sidewalks and pedestrian facilities are provided on all streets within the project vicinity. ***Figure 3-1*** shows the existing pedestrian and transit facilities near the project site. The proposed project is designed to encourage pedestrian activity and walking as a transportation mode with a Walkability score for the project site of approximately 54 (Somewhat Walkable) out of 100.[4] As indicated in *Figure 2–2*, walkways are planned within the proposed project which will connect to adjacent sidewalks in a manner that promotes walkability. Walkability is a term for the extent to which walking is readily available as a safe, connected, accessible and pleasant mode of transport. There are several criteria that are widely accepted as key aspects of the walkability of urban areas that should be satisfied. The underlying principle is that pedestrians should not be delayed, diverted, or placed in danger. The widely accepted characteristics of walkability are as follows:

- Connectivity: People can walk from one place to another without encountering major obstacles, obstructions, or loss of connectivity.

- Convivial: Pedestrian routes are friendly and attractive, and are perceived as such by pedestrians.

- Conspicuous: Suitable levels of lighting, visibility and surveillance over its entire length, with high quality delineation and signage.

- Comfortable: High quality and well-maintained footpaths of suitable widths, attractive landscaping and architecture, shelter and rest spaces, and a suitable allocation of roadspace to pedestrians.

[4] Refer to http://www.walkscore.com/, which generates the walkability score for the project site. Walk Score calculates the walkability of an address by locating nearby stores, restaurants, schools, parks, etc. Walk Score measures how easy it is to live a car-lite lifestyle.

Figure 3-1
Existing Nearby Pedestrian & Transit Facilities

Kaiser Permanente Baldwin Park Medical Center Project

o:\job_file\4109-3\dwg\3-1.dwg 10/06/2022 14:51:46 rodriquez

- Convenient: Walking is a realistic travel choice, partly because of the impact of the other criteria set forth above, but also because walking routes are of a suitable length as a result of land use planning with minimal delays.

A review of the proposed project pedestrian walkways indicates that these primary characteristics are accommodated within the project. Proposed project features would include landscaped pedestrian walkways connecting facilities within the site, as well as connections with the adjacent public sidewalks on the Baldwin Park Boulevard, Dalewood Street and Leorita Street project frontages for access to nearby pedestrian and transit facilities. In addition, project signage could include general ground level and wayfinding pedestrian signage around the perimeter of the project site, building identification signs, and other sign types. Wayfinding signs would be located at access points to the on-site amenities and facilities, and parking areas.

### 3.1.2 *Bicycle System*

Bicycle infrastructure consists of both facilities within the roadway as well as public bicycle parking spaces. The Federal and State transportation systems recognize three primary bikeway facilities: Bicycle Paths (Class I), Bicycle Lanes (Class II), and Bicycle Routes (Class III). Bicycle Paths (Class I) are exclusive car-free facilities that are typically not located within a roadway area. Bicycle Lanes (Class II) are part of the street design that is dedicated only for bicycles and identified by a striped lane separating vehicle lanes from bicycle lanes. Bicycle Routes (Class III) are preferably located on collector and lower volume arterial streets.

Bicycle access to the project site will be facilitated by the City's bicycle roadway network. Walk Score calculates a bike score based on the topography, number and proximity of bike lanes, etc., and generates a bike score for the project site of approximately 49 (Somewhat Bikeable) out of 100[5] Proposed bicycle facilities (e.g., Class I Bicycle Path, Class II Bicycle Lanes, Class III Bicycle Routes, etc.) identified in the City's General Plan Circulation Element[6] will be located within the project study area. The location of the proposed bicycle lane network for the City in close proximity to the project site and in the surrounding area is illustrated in ***Figure 3-2***. As shown in *Figure 3-2*, a Class III Bicycle Route is proposed for Baldwin Park Boulevard between Ramona Boulevard and City Limits.

## 3.2 Transit Network

Public bus and rail transit service within the project study area is currently provided by Foothill Transit, Baldwin Park Transit and Metrolink. The existing public transit routes in the project site vicinity are illustrated in ***Figure 3–3***. A summary of the existing transit service, including the transit route, destinations and peak hour headways is presented in ***Table 3–1***. As summarized in *Table 3-1*, a total of four public transit routes provide service near the project site.

[5] Refer to http://www.walkscore.com/, which generates a bike score for the project site. Walk Score calculates the bike score of an address by locating nearby bicycling facilities as well as connections to bus/rail transit routes and stops. Walk Score measures how easy it is to live a car-lite lifestyle.

The Metrolink is a regional rail system that serves Southern California. The Metrolink San Bernardino Line, located west of the project site, runs from downtown Los Angeles to San Bernardino. The Metrolink Baldwin Park station is located approximately two miles from the Kaiser Permanente BPMC campus. During the AM and PM peak hours, the Metrolink San Bernardino Line provides one train per hour in the eastbound and westbound directions.

## 3.3 Vehicle Network

### 3.3.1 *Roadway Classifications*

The City of Baldwin Park utilizes the roadway categories recognized by regional, state and federal transportation agencies. There are four (4) categories in the roadway hierarchy, ranging from freeways with the highest capacity to two-lane undivided roadways with the lowest capacity. The roadway categories are summarized as follows:

- *Freeways* are limited-access and high speed travel ways included in the state and federal highway systems. Their purpose is to carry regional through-traffic. Access is provided by interchanges with typical spacing of one mile or greater. No local access is provided to adjacent land uses.

- *Arterial* roadways are major streets that primarily serve through-traffic and provide access to abutting properties as a secondary function. Arterials are generally designed with two to six travel lanes and their major intersections are signalized. This roadway type is divided into two categories: principal and minor arterials. Principal arterials are typically four-or-more lane roadways and serve both local and regional through-traffic. Minor arterials are typically two-to-four lane streets that service local and commuter traffic.

- *Collector* roadways are streets that provide access and traffic circulation within residential and non-residential (e.g., commercial and industrial) areas. Collector roadways connect local streets to arterials and are typically designed with two through travel lanes (i.e., one through travel lane in each direction) that may accommodate on-street parking. They may also provide access to abutting properties.

- *Local* roadways distribute traffic within a neighborhood, or similar adjacent neighborhoods, and are not intended for use as a through-street or a link between higher capacity facilities such as collector or arterial roadways. Local streets are fronted by residential uses and do not typically serve commercial uses.

### 3.3.2 *Roadway Descriptions*

Immediate access to the project site is provided via Baldwin Park Boulevard and Dalewood Street. The existing roadway configurations and intersection controls at the study intersections are displayed in ***Figure 3-4*** and descriptions of the existing roadways (e.g., roadway classifications, number of travel lanes, median type, speed limit, etc.) are provided in ***Table 3-2***.

## 3.4 Traffic Count Data

Manual counts of vehicular turning movements were conducted at each of the study intersections during the weekday morning (AM) and afternoon (PM) commute periods to determine the peak hour traffic volumes. The manual counts were conducted by an independent traffic count subconsultant (The Traffic Solution) at the study intersections from 7:00 to 9:00 AM to determine the weekday AM peak commute hour, and from 4:00 to 6:00 PM to determine the weekday PM peak commute hour. In conjunction with the manual turning movement vehicle counts, a count of bicycle and pedestrian volumes were also collected during the peak periods. Traffic volumes at the study intersections show the typical peak periods between 7:00 to 9:00 AM and 4:00 to 6:00 PM generally associated with metropolitan Los Angeles area weekday peak commute hours.

The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are shown in ***Figures 3-5*** and ***3-6***, respectively. Summary data worksheets of the manual traffic counts at the study intersections are contained in ***Appendix A***.

## 3.5 Cumulative Development Projects

The forecast of future pre-project conditions was prepared in accordance to procedures outlined in Section 15130 of the CEQA Guidelines. Specifically, the CEQA Guidelines provide two (2) options for developing the future traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency."

Although the CEQA Guidelines do not strictly apply to the local transportation assessment required by the City of Baldwin Park, this transportation analysis provides a highly conservative estimate of future pre-project traffic volumes as it incorporates both the "A" and "B" options outlined in the CEQA Guidelines for purposes of developing the forecast.

### 3.5.1 *Related Projects*

A forecast of on-street traffic conditions prior to occupancy of the proposed project was prepared by incorporating the potential trips associated with other known development projects (related projects)

in the area (i.e., within an approximate 0.50-mile radius from the project site). With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impacts of all ongoing development. The related projects research was based on information on file with the City of Baldwin Park. The list of related projects in the project site area is presented in ***Table 3-3***. The location of the related projects is shown in ***Figure 3-7***.

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*. The related projects' respective traffic generation for the weekday AM and PM peak hours, as well as on a daily basis for a typical weekday, is summarized in *Table 3-3*. The related projects traffic volumes were distributed and assigned to the street system based on the projects' locations in relation to the study intersections, their proximity to major traffic corridors, proposed land uses, nearby population and employment centers, etc.

### 3.5.2 *Ambient Traffic Growth Factor*

Horizon year, background traffic growth estimates also have been calculated by using an ambient traffic growth factor. The ambient traffic growth factor is intended to include unknown related projects in the study area, as well as account for typical growth in traffic volumes due to the development of projects outside the study area. The future growth in traffic volumes has been calculated at one percent (1.0%) per year. The ambient growth factor was based on review of the background traffic growth estimates for the Baldwin Park area (RSA 26, San Gabriel Valley) published in the *2010 Congestion Management Program for Los Angeles County*, which indicate that existing traffic volumes would be expected to increase at an annual rate of less than one percent (approximately 0.40% per year) between years 2020 and 2030. However, a one percent (1.0%) ambient traffic growth factor has been employed in this analysis in order to provide a conservative, worst case forecast of future traffic volumes in the area. Further, it is noted that the CMP manual's traffic growth rate is intended to anticipate future traffic generated by development projects in the project vicinity. Thus, the inclusion in this traffic analysis of both a forecast of traffic generated by known related projects plus the use of an ambient traffic growth factor based on CMP travel demand model data results in a conservative estimate of future traffic volumes at the study intersections.

# 4.0 CEQA TRANSPORTATION ANALYSIS

## 4.1 Vehicle Miles Traveled Analysis

The State of California Governor's Office of Planning and Research (OPR) issued proposed updates to the CEQA guidelines in November 2017 and an accompanying technical advisory guidance finalized in December 2018 (*OPR Technical Advisory*) that amends the Appendix G question for transportation impacts to delete reference to vehicle delay and level of service and instead refer to Section 15064.3, subdivision (b)(1) of the CEQA Guidelines asking if the project will result in a substantial increase in vehicle miles traveled (VMT). The California Natural Resources Agency certified and adopted the CEQA Guidelines in December of 2018, and as of July 1, 2020 the provisions of the new section are in effect statewide. Concurrently, OPR developed the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018), which provides non-binding recommendations on the implementation of VMT methodology which has significantly informed the way VMT analyses are conducted in the State. Accordingly, for the purpose of environmental review under CEQA, the City of Baldwin Park has established criteria for transportation impacts based on VMT for land use projects and plans which is generally consistent with the recommendations provided by OPR in the *Technical Advisory*.

The City of Baldwin Park is a member agency of the San Gabriel Valley Council of Governments (SGVCOG). The SGVCOG undertook the SGVCOG SB 743 Implementation Study to assist with answering important implementation questions about the methodology, thresholds, and mitigation approaches for VMT impact analysis for its member agencies. As part of the SGVCOG SB 743 Implementation Study, a VMT Evaluation Tool was developed, which is a web-based tool that can be used for VMT screening and mitigation recommendation. The SGVCOG VMT Evaluation Tool is designed to assist in screening and estimating project-generated VMT for certain types of land use projects in the San Gabriel Valley and calculating VMT reductions associated with certain VMT-reducing measures. The SGVCOG VMT Evaluation Tool utilizes the Southern California Association of Governments Regional Travel Demand Model (SCAG RTDM).

As a member agency of the SGVCOG, the City of Baldwin Park utilized the information produced through the Implementation Study to adopt a methodology and significance thresholds for use in CEQA compliance. The City of Baldwin Park has adopted VMT as the metric for determining environmental impacts and released its *City of Baldwin Park Transportation Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* dated September 2020. The guidelines outline the steps for complying with the new CEQA VMT analysis.

### 4.1.1 *Screening Criteria*

Consistent with the recommendations provided by OPR in the *Technical Advisory*, the City's Guidelines recognize three (3) screening criteria which may be applied to screen proposed projects out of detailed VMT analysis. The guidelines have established screening criteria pertaining to project trip generation forecasts, project land use types (i.e., local serving retail, affordable housing, etc.), proximity to transit, and locality within a low VMT-generating area. The guidelines provide the

following three (3) types of potential screening criteria that may be applied to screen projects from project-level assessment:

- Transit Priority Area (TPA) Screening
- Low VMT Area Screening
- Project Size Screening

Proposed projects are not required to satisfy all of the screening criteria in order to screen out of further VMT analysis; satisfaction of one criterion is sufficient for screening purposes. Projects which are screened out of detailed VMT assessment based on these criteria are presumed to have less than significant transportation impacts. Projects which are not screened out would be required to conduct a formal VMT Analysis in order to determine the significance of project impacts. Based on a review of the project's development program, size, and other pertinent factors, it was determined that the City's screening criteria may be applied to the proposed project.

### 4.1.2 *Transit Priority Area Screening*

Projects located within a Transit Priority Area (TPA) may be presumed to have a less than significant impact. A TPA is defined as one-half mile of either an existing major transit stop[7] or an existing stop along a high-quality transit corridor[8]. Thus, development projects that are located within one-half mile of either an existing major transit stop or a stop along an existing high-quality transit corridor may also be presumed to cause a less than significant transportation impact. Similarly, development projects that decrease VMTs in the project area compared to existing conditions may be considered to have a less than significant transportation impact. However, according to the City's guidelines, the presumption might not be appropriate if the project:

- Has a floor area ratio of less than 0.75;
- Includes more parking for use by residents, customers, or employees of the project than required by City Code;
- Is inconsistent with the SCAG Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS),
- Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

[7] Pub. Resources Code 21064.3: Major transit stop means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.
[8] Pub. Resources Code 21155: A high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

Based on the SGVCOG VMT Evaluation Tool, the project site is located within a TPA. In addition, as noted in Section 3.2, extensive transit service is currently provided within the project study area. Therefore, the proposed project meets the statutory requirements to presume less than significant transportation impacts.

The proposed project was further reviewed in order to determine if any project-specific or site-specific information indicates that the presumption would not be valid. A detailed review of each question is provided below.

- Does the project have a Floor Area Ratio (FAR) less than 0.75?

  Yes. Based on information provided by the project team, the project will have an overall FAR of 0.71, which is less than 0.75.

- Does the project provide more parking than required by the City Code?

  Yes. The parking supply of 3,059 spaces provided on-site exceeds the City of Baldwin Park Municipal Code parking requirement of 2,632 spaces.

- Is the project inconsistent with the SCAG RTP/SCS?

  No. The project site is currently zoned as General Commercial (GC). Since the project is consistent with the City's adopted zoning, and is not expected to result in substantial changes to the existing transportation network/infrastructure, it is assumed to be consistent with the land use and transportation network assumptions incorporated in the Southern California Council of Government's (SCAG) Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS).

- Does the project replace residential units set aside for lower income households with a smaller number of market-rate residential units?

  No. The project will not result in the replacement or loss of affordable housing units.

Based on this review, it is concluded that the answer to two of the four questions is no. Since it is concluded that the answer to two of the questions is yes, according to the *Technical Advisory*, the presumption of less than significant impacts may not be appropriate. Therefore, while the project does meet the conditions to presume less than significant transportation impacts stated in CEQA Guidelines Section 15064.3 and therefore screen out of VMT analysis, it has been conservatively concluded that such a presumption may not be appropriate for the proposed project. Therefore, the project does not satisfy the proximity to transit screening criteria.

### 4.1.3 *Low VMT Area Screening*

As outlined in the City's guidelines, residential and office development projects located within a low VMT-generating area may be presumed to have a less than significant impact absent any substantial

evidence to the contrary. Other employment-related and mixed-use land use projects may also qualify for the screening if the project can reasonably be expected to generate VMT per resident, per worker or per service population that is similar to the existing land uses in the low VMT-generating area.

If the proposed project is residential, the project is considered screened out if it is located within the Low VMT areas of the "Home-Based VMT per Capita". Alternatively, if the predominant land uses in the vicinity are nominally of the same type as the proposed project and the proposed project is reasonably expected to generate similar VMT as the existing land uses, the project is considered screened out if it is in the low VMT area for the "Home-Based Work VMT per Employee".

As the project site is not located within a low VMT area, this screening criterion does not apply.

### 4.1.4 *Project Size Screening*

The City's Guidelines state that: projects that generates less than 110 daily trips may be screened from conducting a formal VMT analysis and presumed to have a less than significant VMT impact. The *Technical Advisory* provides the following evidence for this presumption: "CEQA provides a categorical exemption for existing facilities, including additions to existing structures of up to 10,000 square feet, so long as the project is in an area where public infrastructure is available to allow for maximum planned development and the project is not in an environmentally sensitive area. (CEQA Guidelines, § 15301, subd. (e)(2).) Typical project types for which trip generation increases relatively linearly with building footprint (i.e., general office building, single tenant office building, office park, and business park) generate or attract an additional 110-124 trips per 10,000 square feet. Therefore, absent substantial evidence otherwise, it is reasonable to conclude that the addition of 110 or fewer trips could be considered not to lead to a significant impact."

Local serving retail projects with a total square footage of less than 50,000 square feet may be presumed to have a less than significant impact absent substantial evidence to the contrary. Local serving retail generally improves the convenience of shopping close to home and has the effect of reducing vehicle travel. Any project that uses the designation of "local-serving" should be able to demonstrate that its users (employees, customers, visitors) would be existing within the community. The project would not generate new "demand" for the project land uses but would meet the existing demand that would shorten the distance existing residents, employees, customers, or visitors would need to travel.

As shown in *Table 2-1*, the proposed project is expected to generate a net decrease of 65 daily trips at project build-out. Since the proposed project is expected to generate less than 110 daily trips, the project satisfies the project size screening criteria. Further, it is noted that emergency department services are generally local serving, in that most patrons select service at locations which are near either their place of residence or their employment/business location. Emergency department services function in similar ways to other service land uses in that the predominant source of trips and therefore project-related VMT will be generated by the patrons of the site rather than employees.

As such, the proposed project would improve the density of available destinations, thereby shortening travel distances in the vicinity and reducing VMT.

Further, it is recognized that the emergency department/medical office land use generates trips at much lower rates than similarly sized retail projects, as much of the space is passively utilized for medical equipment and circulation around this equipment. It is expected that the proposed project will generate significantly fewer trips than a theoretical 50,000 square-foot retail project which would otherwise be screened out under the same criterion.

### 4.1.5 *VMT Screening Summary*

Proposed projects are not required to satisfy all of the screening criteria in order to screen out of further VMT analysis; satisfaction of one criterion is sufficient for screening purposes. The proposed project screens out from further analysis of VMT as the proposed development satisfies the project size screening criteria. Therefore, the proposed project is determined to have a less that significant transportation impact and is not required to conduct any additional VMT analysis.

### 4.1.6 *Summary of Cumulative VMT Analysis*

As stated in the City's TIA Guidelines (refer to page 29), analyses should consider both short-term and long-term project effects on VMT. Short-term effects are evaluated in the detailed project-level VMT analysis summarized above. Long-term, or cumulative, effects are determined through a consistency check with the Southern California Association of Government's (SCAG's) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The RTP/SCS is the regional plan that demonstrates compliance with air quality conformity requirements and greenhouse gas (GHG) reduction targets. As such, projects that are consistent with this plan in terms of development, location, density, and intensity, are part of the regional solution for meeting air pollution and GHG reduction goals. Projects that are deemed to be consistent would have a less than significant cumulative impact on VMT. Development in a location where the RTP/SCS does not specify any development may indicate a significant impact on transportation. However, as noted in the City's TIA Guidelines, for projects that do not demonstrate a project impact by applying an efficiency-based impact threshold (i.e., VMT per capita, VMT per employee, or VMT per service population) in the impact analysis, a less than significant project impact conclusion is sufficient in demonstrating there is no cumulative VMT impact. Projects that fall under the City's efficiency-based impact thresholds are already shown to align with the long-term VMT and GHG reduction goals of SCAG's RTP/SCS. The City's TIA Guidelines also note that projects which demonstrate VMT impacts through application of efficiency-based thresholds, and which are deemed inconsistent with the RTP/SCS, could contribute toward a significant cumulative impact on VMT. The proposed project is not expected to have a significant project-level VMT impact. Therefore, it is concluded that the proposed project will not result in a significant cumulative VMT impact.

## 4.2 Active Transportation and Public Transit Analysis

Pursuant to current CEQA Guidelines, a significant impact may also occur "if the project conflicts with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or

otherwise decreases the performance or safety of such facilities". The following section provides a brief review of the City's adopted policies, plans, and programs pertaining to active transportation and public transit analysis.

### 4.2.1 *Adopted Policies, Plans, or Programs*

The City's current Circulation Element of the General Plan sets forth goals and objectives pertaining to complete streets, transit and public transportation, and bicycle routes and pedestrian facilities, safety, among other things. Relevant adopted goals and policies include:

- Goal 1.0, Internal Traffic Circulation: Provide a street and highway system in Baldwin Park that provided adequate capacity to ensure acceptable traffic flow.
    - Policy 1.1: Develop and maintain the local circulation system.
    - Policy 1.2: Require significant new land use developments to prepare traffic studies using intersection analyses to detail potential traffic impacts.
    - Policy 1.3: Where project level traffic studies support the need for added street segment capacity, pursue alternatives to street widenings including lane restriping, peak hour restrictions, and/or similar less intensive and costly measures.
    - Policy 1.4: Maintain as a goal the provision of service levels at intersections along arterial highways at Level of Service "D" or better during the morning and evening peak travel periods.
    - Policy 1.5: Adopt five-year Capital Improvement Programs that identify street and related improvements required to ensure smooth traffic flow.
    - Policy 1.6: Continue to automate traffic signals and to develop an integrated traffic signal control system.
- Goal 3.0, Public Transportation: Encourage increased use of public transportation.
    - Policy 3.1: Work with MTA to establish bus stops at appropriate locations throughout the City to adequately serve retail, employment, rail and other public gathering areas.
    - Policy 3.2: Provide lighted, sheltered bus stops to encourage transit use.
    - Policy 3.3: Continue to support the City Transit system which serves to provide a viable alternative to the automobile and to reduce traffic trips.
- Goal 4.0, Alternative Modes of Transportation: Accommodate alternative modes of transportation in land use and circulation planning.

- Policy 4.1: Provide for a Citywide bicycle path system consistent with Figure C-4 that can be implemented in a safe and efficient manner.

- Policy 4.2: Continue funding City programs which provide for sidewalk construction in residential neighborhoods where sidewalks do not exist and are desired by local residents.

- Policy 4.3: Continue funding City programs which provide for sidewalk improvements and enhancements, particularly in areas where sidewalks link residential neighborhoods to local schools, parks and shopping areas.

- Goal 5.0, Parking: Ensure that adequate parking is provided to meet existing and future demand.

    - Policy 5.1: Provide incentives for carpooling and other rideshare programs through zoning ordinance parking regulations and other mechanisms.

    - Policy 5.2: Require new developments to incorporate a limited number of parking spaces capable of accommodating electric vehicle recharge stations.

### 4.2.2 *Qualitative Impact Conclusions*

The proposed project is not expected to have a significant impact on active transportation or public transit in the vicinity of the project site. As described in *Section 3.1.1* herein, the project site is planned to accommodate pedestrian and bicycle access via exclusive walkways which connect the proposed project to the public sidewalks. The walkways minimize the extent of pedestrian and bicycle interaction with vehicles at the site and provide a comfortable, convenient, and safe environment which in turn can encourage use of active transportation modes. The project site is further planned to provide bicycle parking facilities for use by staff, patients, and the public. The proposed project is therefore found to be in alignment with the City's General Plan Circulation Element goals to promote pedestrian and bicycle safety and provide appropriate and supportive active transportation infrastructure. The proposed project is not expected to affect access or safety at the existing bus stops, nor is it expected to hinder public transit service along Baldwin Park Boulevard. Further, the proposed project is not expected to preclude the City from constructing bicycle facilities or pursuing bicycle network improvements along local roadways within the study area. Development of the proposed project will not prevent the City from completing any proposed transit, bicycle, or pedestrian facilities.

Since the proposed project is not found to result in conflicts with adopted policies, plans, or programs, nor is it expected to negatively affect the performance or safety of existing or planned pedestrian, bicycle, or transit facilities, it is determined that the proposed project will have a less than significant impact on active transportation and public transit in the vicinity of the project site.

# 5.0 INTERSECTION OPERATIONAL ANALYSIS

As part of the approval process, the City has the authority to require a LOS analysis in order to assess the overall effects of the proposed project. Specifically, the City's *Transportation Analysis Updates* document requires an operational analysis of intersections and roadways in the vicinity of a proposed project in order to evaluate site access and circulation constraints that may be caused or worsened by project-generated traffic. The following section presents the intersection operational (i.e., Level of Service) analyses prepared for the proposed project pursuant to the General Plan LOS standards and transportation infrastructure goals.

## 5.1 Analysis Methodology

In order to estimate the proposed project's effect on intersection operations, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis. The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area. The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area. The proposed project's forecast trip generation, distribution, and assignment is presented in *Section 2.4* herein. With the forecasting process complete and project traffic assignments developed, the effect of the proposed project is isolated by comparing operational conditions at the selected study intersections using existing and expected future traffic volumes without and with forecast project traffic.

The study intersection LOS was analyzed using the Highway Capacity Manual[9] (HCM) method of analysis. The HCM methodology determines the average control delay (expressed in seconds per vehicle [s/veh]) at the intersection. Average control delay for any particular movement is a function of the capacity of the approach and the degree of saturation. The intersection delay is subsequently assigned a LOS value to describe intersection operations. Level of Service varies from LOS A (free flow conditions) to LOS F (jammed condition). The average control delay for signalized intersections represents the delay attributed to the traffic control facility as compared to a reference travel time in the absence of traffic control, geometric delay, incidents, and the influence of other vehicles. A detailed description of the HCM method and corresponding Level of Service for the signalized study intersections is provided in ***Appendix B***.

The HCM method calculations were prepared using the *Synchro 11* software package which implements the HCM operational methodology. A *Synchro* network was created based on existing conditions field reviews at the study intersections. In addition, specifics such as traffic volume data,

[9] *Highway Capacity Manual 6th Edition*, Transportation Research Board of the National Academies of Sciences-Engineering-Medicine, 2016.

lane configurations, available vehicle storage lengths, crosswalk locations, posted speed limits, traffic signal timing and phasing, etc., were coded to complete the existing network. The parameters and assumptions utilized in the analysis were based on the direction provided by City staff.

## 5.2 Criteria for Intersection Operational Analysis

The relative effect of the added project traffic volumes to be generated by the proposed project during the weekday AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the study intersections, without and with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the delay and service level characteristics at each study intersection. As stated in the City's Guidelines, an intersection is considered to be affected if the addition of the traffic generated from the proposed project results in any one of the following:

- The addition of project traffic to an intersection results in the degradation of intersection operations from acceptable LOS (LOS D) to unacceptable LOS (LOS E or F)

- The project contributes 2% or more of the total traffic at an intersection that is expected to be deficient

Where intersections are found to operate at unacceptable LOS, and the addition of project-generated traffic causes an exceedance of the City's criteria, improvements should be identified to increase performance to pre-project conditions.

## 5.3 Analysis Scenarios

### 5.3.1 *Phase 1 Project Analysis Scenarios*

Traffic impacts at the study intersections for the Phase 1 project were analyzed for the following conditions:

[a] Existing conditions.

[b] Existing with Phase 1 project conditions.

[c] Condition [a] plus one percent (1.0%) annual ambient traffic growth through year 2026 and with completion and occupancy of the related projects (i.e., future without Phase 1 project conditions).

[d] Condition [c] with completion and occupancy of the Phase 1 project.

[e] Condition [d] with implementation of Phase 1 project mitigation measures, where necessary.

It should be noted that Condition [b] above is a hypothetical scenario in that it calculates the traffic due to the occupancy of the proposed project in addition to the existing traffic volumes, but changes

to existing volumes are expected to occur throughout the project's construction period due to other area projects and regional growth. However, this condition has been prepared to be consistent with the general rule under CEQA that the potential impacts of a development project are to be measured against existing conditions. Condition [d] above analyzes future conditions upon completion and full occupancy of the Phase 1 project, which is expected to occur in 2026.

### 5.3.2 *Project Build-out (Phases 1 and 2) Analysis Scenarios*

Traffic impacts at the study intersections for the Phase 2 project were analyzed for the following conditions:

[a] Existing conditions.

[b] Existing with Phase 2 project conditions.

[c] Condition [a] plus one percent (1.0%) annual ambient traffic growth through year 2029 and with completion and occupancy of the related projects (i.e., future without project build-out conditions).

[d] Condition [c] with completion and occupancy of the project at build-out (i.e., the combined effects of the removal of existing uses and addition of the proposed project components included on the Phases 1 and 2 development sites).

[e] Condition [d] with implementation of project build-out mitigation measures, where necessary.

It should be noted that Condition [b] above is a hypothetical scenario in that it calculates the traffic due to the occupancy of the proposed project in addition to the existing traffic volumes, but changes to existing volumes are expected to occur throughout the project's construction period due to other area projects and regional growth. However, this condition has been prepared to be consistent with the general rule under CEQA that the potential impacts of a development project are to be measured against existing conditions. Condition [d] above analyzes future conditions upon completion and full occupancy of the Phase 2 project, which is expected to occur in 2029.

The weekday AM and PM peak hour intersection analysis prepared for the study intersections for the Phase 1 and Project Build-out conditions are summarized in ***Tables 5-1 and 5-2, respectively***. The calculation data worksheets for the analyzed intersections are provided in *Appendix B*.

## 5.4 Existing Conditions

### 5.4.1 *Existing Conditions*

As indicated in column [1] of *Table 5–1*, all of the study intersections are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 3–5* and *3–6*, respectively.

**Table 5-1**
**SUMMARY OF INTERSECTION OPERATIONAL ANALYSIS [a]**
**DELAYS AND LEVELS OF SERVICE**
**WEEKDAY AM AND PM PEAK HOURS**

### 5.4.2 *Existing With Phase 1 Project Conditions*

As shown in column [2] of *Table 5–1,* application of the City's threshold criteria to the "Existing With Phase 1 Project" scenario indicates that the project-related effects of the Phase 1 project is not expected to exceed the City's threshold criteria at any of the study intersections. Incremental delays, but not exceeding the City's criteria, are noted at the study intersections. As such, no improvements are required or recommended for the study intersections under the "Existing With Phase 1 Project" conditions. The existing with Phase 1 project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in ***Figures 5–1*** and ***5–2***, respectively.

### 5.4.3 *Existing With Project Build-out Conditions*

As indicated in column [2] of ***Table 5–2,*** application of the City's threshold criteria to the "Existing With Project Build-out" scenario indicates that the project-related effects of the Phase 2 project is not expected to exceed the City's threshold criteria at any of the study intersections. Incremental delays, but not exceeding the City's criteria, are noted at the study intersections. As such, no improvements are required or recommended for the study intersections. The existing with project build-out traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in ***Figures 5–3*** and ***5–4***, respectively.

## 5.5 Future 2026 Conditions

### 5.5.1 *Future Without Phase 1 Project Conditions*

The future cumulative baseline without Phase 1 project conditions (i.e., year 2026 without Phase 1 project) were forecast based on the addition of traffic generated by the completion and occupancy of the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth to year 2026). The delay ratios at all of the study intersections are incrementally increased with the addition of ambient traffic and traffic generated by the related projects listed in *Table 3–1*. As presented in column [3] of *Table 5–1*, all of the study intersections are expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related projects traffic under the future without Phase 1 project conditions.

The future without Phase 1 project (existing, ambient growth and related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are presented in ***Figures 5–5*** and ***5–6***, respectively.

### 5.5.2 *Future With Phase 1 Project Conditions*

As shown in column [4] of *Table 5–1,* application of the City's threshold criteria to the "Future With Proposed Phase 1 Project" scenario indicates that the project-related effects of the Phase 1 project is not expected to exceed the City's threshold criteria at any of the study intersections. Incremental delays, but not exceeding the City's criteria, are noted at the study intersections. As such, no improvements are required or recommended for the study intersections under the "Future With Proposed Phase 1 Project" scenario. The future with Phase 1 project (existing, ambient growth,

related projects and Phase 1 project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in ***Figures 5-7*** and ***5-8***, respectively.

## 5.6 Future 2029 Conditions

### 5.6.1 *Future 2029 Without Project Build-out Conditions*

The future cumulative baseline without project build-out conditions (i.e., year 2029 without Phases 1 and 2 project) were forecast based on the addition of traffic generated by the completion and occupancy of the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth to year 2029). The delay at all of the study intersections are incrementally increased with the addition of ambient traffic and traffic generated by the related projects listed in *Table 3–1*. As presented in column [3] of *Table 5–2*, all of the study intersections are expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related projects traffic under the future without project build-out conditions. The future without project build-out (existing, ambient growth and related projects) traffic volumes at the study intersections during the weekday AM and PM peak hours are presented in ***Figures 5–9*** and ***5–10***, respectively.

### 5.6.2 *Future 2029 With Project Build-out Conditions*

As shown in column [4] of *Table 5-2,* application of the City's threshold criteria to the "Future With Project Build-out" scenario indicates that the project-related effects of the Phase 2 project is not expected to exceed the City's threshold criteria at any of the study intersections. Incremental delays, but not exceeding the City's criteria, are noted at the study intersections. As such, no improvements are required or recommended for the study intersections. The future with project build-out (existing, ambient growth, related projects and Phases 1 and 2 project) traffic volumes at the study intersections during the weekday AM and PM peak hours are provided in ***Figures 5-11*** and ***5-12***, respectively.

## 6.0 SUMMARY AND CONCLUSIONS

- ***Project Description*** – The proposed Kaiser Permanente Baldwin Park project consists of the development of a two-phased project at the existing Kaiser Permanente BPMC campus. The first phase (Phase 1) is the construction of an expansion to the existing hospital emergency department (ED) located on the south end of the Kaiser campus. Expansion of the emergency department would add approximately 23,000 square feet resulting in a total square footage of approximately 40,000 square feet, expand the number of existing treatment bays from 38 to 60, a new ambulance canopy with four ambulance parking spaces, and tenant improvements within the existing emergency department. The Phase 1 project would also include the demolition of existing structures at 1022 Leorita Street (referred to as the "Broken Horn" site) with existing 68 parking spaces to remain. The "Broken Horn" site will remain gated until such time that the Phase 2 project construction will commence. The second phase of the project (Phase 2) would consist of the construction of an approximately 33,000 square foot medical office building (MOB). This component would expand the boundary of the medical campus to include the adjacent parcel to the northwest of the campus located at 1022 Leorita Street. The development of this site (the "Broken Horn" site) would require the demolition of the existing 23,040 square foot retail building under the Phase 1 project. A total of 80 parking spaces is planned to be provided at this site upon completion.

- ***Project Site Access*** – Vehicular access to the Kaiser Permanente BPMC campus is primarily provided via four roadways: Baldwin Park Boulevard, Dalewood Street, Bess Avenue, and Leorita Street. All of the campus driveways provide access to parking facilities and hospital/medical office buildings that are situated within the BPMC campus. There are no changes to the BPMC campus key access intersections and driveways planned as part of the proposed Kaiser Permanente BPMC project.

- ***Project Trip Generation*** – The proposed project at build-out is forecast to generate a net increase of 44 trips (46 inbound trips and 2 fewer outbound trips) during the weekday AM peak hour. During the weekday PM peak hour, the proposed project at build-out is expected to generate a net decrease of 48 trips (49 fewer inbound trips and 1 outbound trip). Over a 24-hour period, the proposed project is forecast to generate a net decrease of 65 trips (33 fewer inbound trips and 33 fewer outbound trips) during a typical weekday.

- ***VMT Analysis****:* The proposed project screens out from further analysis of VMT as the proposed development satisfies the project size screening criteria. Thus, the project is not expected to result in a significant VMT impact. Therefore, no mitigation is necessary as it relates to VMT. Further, based on the project-related VMT analysis and the conclusions reported in Section 4.1.7 (i.e., which conclude that the proposed project aligns with the long-term VMT and GHG reduction goals of SCAG's RTP/SCS), no cumulative VMT impacts are anticipated.

- ***CEQA Active Transportation and Public Transit Assessment*** –The proposed project is found to be in alignment with the City's General Plan Circulation Element goals to promote pedestrian

and bicycle safety and provide appropriate and supportive active transportation infrastructure. Further, development of the proposed project will not prevent the City from completing any proposed transit, bicycle, or pedestrian facilities. It is therefore determined that the proposed project will have a less than significant impact on active transportation and public transit in the vicinity of the project site.

- ***Intersection Level of Service Analysis*** – – Two (2) study intersections were reviewed for consistency with the City of Baldwin Park's adopted Level of Service (LOS) standards. The study intersections were evaluated using the City-approved Highway Capacity Manual (HCM) methodology to determine the LOS under existing, future year 2026 cumulative without and with project conditions, and future year 2029 cumulative without and with project conditions.. Based on application of the City's threshold criteria, project-related effects in delay at the study intersections are not expected to exceed the City's threshold criteria.

# APPENDIX B

## SYNCHRO ANALYSIS DATA
## SYNCHRO ANALYSIS DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS

## LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of incidents, and when there are no other vehicles on the road. Only the portion of total delay attributed to the control facility is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for traffic signals are stated in terms of the average control delay per vehicle. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the *v/c* ratio for the lane group in question.

Level of Service Criteria for Signalized Intersections

| Level of Service | Control Delay (Sec/Veh) |
|---|---|
| A | $\leq 10$ |
| B | $> 10$ and $\leq 20$ |
| C | $> 20$ and $\leq 35$ |
| D | $> 35$ and $\leq 55$ |
| E | $> 55$ and $\leq 80$ |
| F | $> 80$ |

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

**LOS A** describes operations with very low control delay, up to 10 seconds per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay values.

**LOS B** describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.

**LOS C** describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

**LOS D** describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high *v/c* ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

**LOS E** describes operations with control delay greater than 55 and up to 80 seconds per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high *v/c* ratios. Individual cycle failures are frequent occurrences.

**LOS F** describes operations with control delay in excess of 80 seconds per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the lane groups. It may also occur at high *v/c* ratios with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

September 23, 2022 14416

Kaiser Foundation Hospitals
Attn: Mr. Eddie Arango, Project Manager
Capital Projects/Baldwin Park Service Area
4900 Rivergrade Rd., Suite C110
Irwindale, California 91706

**Subject: Draft Archaeological Resources Assessment for the Kaiser Baldwin Park Emergency Room Expansion and Medical Office Building Project, City of Baldwin Park, Los Angeles County, California**

Dear Mr. Eddie Arango:

This letter report documents the archaeological resources assessment conducted by Dudek for the proposed Kaiser Baldwin Park Emergency Room Expansion and Medical Office Building Project (Project or proposed Project) located at Kaiser's existing Kaiser Baldwin Park Medical Campus located within the City of Baldwin Park, Los Angeles County, California. The present study documents the results of a California Historical Resources Information System (CHRIS) records search conducted at the South Central Coastal Information Center (SCCIC); Native American coordination with the Native American Heritage Commission (NAHC) for a Sacred Lands File (SLF) search; in-depth review of geotechnical, archival, academic, and ethnographic information; an archaeological pedestrian survey; an analysis of the potential for the proposed Project site to contain archaeological resources; as well as management recommendations. The City of Baldwin Park (City) is the lead agency responsible for compliance with California Environmental Quality Act (CEQA).

# Project Location

The proposed Project site is located within the southern portion of the City of Baldwin Park, Los Angeles County, California. Specifically, the proposed Project site is located within public land survey system (PLSS) Section 24, Township 1 South, Range 11 West on the *Baldwin Park*, California 7.5-minute USGS Quadrangle (Appendix A: Figure 1). The proposed Project site is composed of three (3) parcels and includes Assessor Identification Number (AIN) 8559-006-006 (Kaiser Baldwin Park Medical Campus) and AINs 8559-008-011 and 8559-008-005 (herein collectively referred to as the "Broken Horn site"). The proposed Project site includes addresses 1026 Leorita Street and 1101 Baldwin Park Boulevard, and is bound by Dalewood Street to the north, Leorita Street to the West, Bess Avenue to the southwest, and Baldwin Park Boulevard to the southeast (Appendix A: Figure 2).

# Project Description

The proposed Project consists of two components, the expansion to the emergency department and the construction of a medical office building (MOB) at the current Kaiser Baldwin Park Medical Campus (medical

DRAFT

campus). The emergency department building is part of an existing hospital tower located on the south end of the medical campus within AIN 8559-006-006. The MOB site or "Broken Horn" site includes AINs 8559-008-011 and 8559-008-005. While the existing medical campus is approximately 24.48 acres, only portions of the medical campus would be subject to development. Each proposed Project component is discussed below.

### Emergency Department Expansion

The emergency department expansion would increase the size of the existing emergency department by 23,000 square feet, resulting in a total square footage of an approximately 40,000 square foot emergency department once the project is complete and would be one-story. Phase 1 would also involve expanding the number of existing treatment bays from 38 to 60 and include a new ambulance canopy as well as additional improvements to the existing emergency department. The emergency department expansion would include an additional emergency department walk- in entrance to the northwest corner of the emergency department. The new ambulance canopy entry is approximately 252 feet away from the existing member walk-in entry. Existing primary entry will continue to serve member walk-in to the emergency department. Vehicle entrance to the proposed Project site would remain the same as the existing entrance. The new ambulance bay would include an addition of four ambulance parking spaces. The expansion and improvement of the emergency department would allow for better functionality within the emergency department. The emergency room department expansion includes proposed new underground utilities within the extant parking lot located immediately east. The proposed underground utility work involves routing from the existing Central Plant, located immediately north of the extant parking lot, to the proposed emergency room department expansion to the southwest. The remaining portions of the extant parking lot of the emergency room department expansion will only be subject to repaving and paring restriping. In total, the proposed emergency department expansion and adjacent parking lot encompasses approximately 0.79 acres.

### Construction and Operation of MOB

The construction and operation of the proposed MOB would consist of a two-story 33,000 square foot building at the Broken Horn site. This component would expand the existing medical campus to the northwest on a property which includes an existing retail building (AINs 8559-008-011 and 8559-008-005) and encompasses approximately 1.54 acres. The MOB component would also include 80 stall parking lot for Americans with Disabilities Act (ADA) and Member parking.

### Off-Site Improvements

The proposed Project also includes several off-site improvements for both phases, which include the following activities: new sidewalks adjacent to several of the streets that bound the proposed Project site, new ADA compliant ramps at a number of different entry points and junctions, closure of the northwestern driveway on Bess Avenue, asphalt grinding and overlaying close to the medical campus, and the removal and replacement of damages trees along the frontage of Baldwin Park Boulevard. The off-site improvements encompass approximately 3.03 acres.

### Project Construction and Phasing

The proposed Project will occur in two phases. Phase one would include activities on within AINs 8559-006-006, 8559-008-011, and 8559-008-005 of the proposed Project. Phase one activities for the emergency department expansion component would include site preparation, emergency room expansion, emergency room renovation.

DRAFT

Phase one activities for the MOB component would include the demolition of the existing retail building and paving at the Broken Horn site. Additionally, phase one would include the off-site improvements listed above. Phase two will focus on the MOB component at the Broken Horn site and the remaining off-site improvements, including site preparation, grading, and construction of the MOB building. Current Project design indicates that the maximum depth of ground disturbance for the MOB component at the Broken Horn site is 10 feet below the existing ground surface and a maximum depth of 65 feet below current grade for the drilling of caissons at the emergency department expansion component. In addition, ground disturbance associated with all other construction components, including site preparation, vegetation removal, and trenching for utility work is assumed to be no deeper than 5 feet below existing ground surface.

# Environmental Setting

The proposed Project site is located approximately 7 miles south of the San Gabriel Mountains, approximately 0.05 miles north of the channelized Walnut Creek, approximately 1 mile east of the channelized San Gabriel River and over 30 miles east of the Pacific Ocean.

The proposed Project site is currently developed, consisting of the existing medical campus (AIN 8559-006-006) and an abandoned retail building within the Broken Horn site (AINs 8559-008-011 and 8559-008-005). The Broken Horn site is located adjacent to the existing medical campus to the northwest. Due to the develop nature of the site, the site is relatively flat and the site range elevation averages 308 feet above mean sea level (amsl) (Google Earth 2022). The proposed Project site is surrounded by existing development on all sides, including Interstate 10 (I-10) freeway to the north, commercial uses to the south and east, and residential uses to the south and west.

According to the to the Natural Resources Conservation Service (NRCS) Web Soil Survey (USDA 2022), soils within the proposed Project site predominantly consist of the Urban Land-Tujunga-Typic Xerorthents, sandy substratum complex at 0 to 2 percent slopes, and are composed of the following: Urban land (45 percent), Tujunga (35 percent), Typic Xerorthents (15 percent), and Palmview (5 percent). The above soil complex accounts for entirety of the proposed Project site, and all are found within flood plains.

The dominant soil series within the proposed Project site, Urban Land, refers to soils in areas of high population density in a largely built environment and can include human-transported or human-altered materials, minimally altered materials, or intact native soils (USDA 2022). The horizontal or slope data for this series is associated with soils that have been significantly altered by human activities and therefore associated with nearly level or low slopes (USDA 2022).

# Regulatory Context

Work for this Project was conducted in compliance with the California Environmental Quality Act (CEQA). The regulatory framework as it pertains to cultural resources under CEQA is detailed below.

Under the provisions of CEQA, including the CEQA Statutes (PRC Sections 21083.2 and 21084.1), the CEQA Guidelines (14 CCR 15064.5), and California Public Resources Code (PRC) Section 5024.1 (14 CCR 4850 et seq.), properties

DRAFT

expected to be directly or indirectly affected by a proposed project must be evaluated for California Register of Historical Resources (CRHR) eligibility (PRC Section 5024.1).

The purpose of the CRHR is to maintain listings of the state's historical resources and to indicate which properties are to be protected, to the extent prudent and feasible, from material impairment and substantial adverse change. The term historical resources includes a resource listed in or determined to be eligible for listing in the CRHR; a resource included in a local register of historical resources; and any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant (14 CCR 15064.5[a]). The criteria for listing properties in the CRHR were developed in accordance with previously established criteria developed for listing in the National Register of Historic Places. The California Office of Historic Preservation regards "any physical evidence of human activities over 45 years old" as meriting recordation and evaluation (OHP 1995:2).

# State

## The California Register of Historical Resources

A cultural resource is considered "historically significant" under CEQA if the resource meets one or more of the criteria for listing on the CRHR. The CRHR was designed to be used by state and local agencies, private groups, and citizens to identify existing cultural resources within the state and to indicate which of those resources should be protected, to the extent prudent and feasible, from substantial adverse change. The following criteria have been established for the CRHR. A resource is considered significant if it:

1. is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. is associated with the lives of persons important in our past;
3. embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the above criteria, historical resources eligible for listing in the CRHR must retain enough of their historic character or appearance to be able to convey the reasons for their significance. Such integrity is evaluated in regard to the retention of location, design, setting, materials, workmanship, feeling, and association.

Under CEQA, if an archeological site is not a historical resource but meets the definition of a "unique archeological resource" as defined in PRC Section 21083.2, then it should be treated in accordance with the provisions of that section. A unique archaeological resource is defined as follows:

- An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:
  - Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information
  - Has a special and particular quality, such as being the oldest of its type or the best available example of its type
  - Is directly associated with a scientifically recognized important prehistoric or historic event or person

DRAFT

Resources that neither meet any of these criteria for listing in the CRHR nor qualify as a "unique archaeological resource" under CEQA (PRC Section 21083.2) are viewed as not significant. Under CEQA, "A non-unique archaeological resource need be given no further consideration, other than the simple recording of its existence by the lead agency if it so elects" (PRC Section 21083.2[h]).

Impacts that adversely alter the significance of a resource listed in or eligible for listing in the CRHR are considered a significant effect on the environment. Impacts to historical resources from a proposed project are thus considered significant if the project (1) physically destroys or damages all or part of a resource; (2) changes the character of the use of the resource or physical feature within the setting of the resource, which contributes to its significance; or (3) introduces visual, atmospheric, or audible elements that diminish the integrity of significant features of the resource.

## California Environmental Quality Act

As described further, the following CEQA statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; CEQA Guidelines Section 15064.5(b)). If a site is listed or eligible for listing in the CRHR, or included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines

Section 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA (CEQA Guidelines Section 15064.5(b)(2)).

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. (Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC Section 21083.2(g)).

Impacts on nonunique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a nonunique archaeological resource qualifies as a TCR (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. As described below, these procedures are detailed in PRC Section 5097.98.

### California State Assembly Bill 52

Assembly Bill (AB) 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that tribal cultural resources (TCRs) must be considered under CEQA and also provided for additional Native American consultation requirements for

the lead agency. Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American Tribe and that is either:

- On or determined to be eligible for the California Register of Historical Resources or a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project site, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on TCRs should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

### California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the county coroner has examined the remains (Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact NAHC within 24 hours (Section 7050.5(c)). NAHC will notify the "most likely descendant." With the permission of the landowner, the most likely descendant may inspect the site of discovery. Recommendations from the MLD(s) should be provided within 48 hours of being provided access to the site. The most likely descendant may recommend means of treating or disposing of, with appropriate dignity, the human remains, and items associated with Native Americans.

## Local

There are no applicable local regulations for archaeological resources for the City of Baldwin Park.

DRAFT

# Background Research

## SCCIC Records Search

On July 11, 2022, staff at the South Central Coast Information Center (SCCIC), located on the campus of California State University, Fullerton, provided the results of a CHRIS records search for the proposed Project site and a 1-mile radius. Due to COVID-19, the SCCIC notified researchers that they are only able to provide data for Los Angeles County that has already been digitized. As such, not all available data known to CHRIS may be provided in the records search. The CHRIS records search results provided by the SCCIC included their digitized collections of mapped prehistoric and historic archaeological resources and historic built-environment resources; Department of Parks and Recreation site records; technical reports; archival resources; and ethnographic references. The confidential records search results are also provided in Confidential Appendix B.

### Previously Conducted Cultural Resource Studies

Results of the cultural resources records search indicate that 39 previous cultural resource studies have been conducted within 1-mile of the proposed Project site between 1979 and 2013. Of these studies, three (3) overlap the proposed Project site (LA-10190, -10883, and -11784). Table 1, below, details all 39 previous cultural resources studies followed by a brief summary of the available reports overlapping the proposed Project site.

**Report No. LA-10190**

*Supplemental Historic Property Survey Report for the I-10 HOV Lane Between I-605 and the SR-57/SR-71/I-210 Interchange in the Cities of Los Angeles, Baldwin Park, West Covina, Covina, San Dimas, and Pomona in Los Angeles County, CA* (Harbert 2002), documents the results of a historic property survey report consisting of an archival record search, and literature review, as well as an archaeological survey report (ASR) as an appendix. The

area of study overlaps approximately 30 percent of the current proposed Project site, which includes the entirety of AIN 8559-008-005 and a portion of AIN 8559-008-011. The study was conducted to determine the presence or absence of historic properties within the area of study and immediate vicinity. A review of the ASR included as Appendix A to the 2002 study revealed that the archaeological survey conducted in support of the project included a "windshield" survey for the entire project area and a pedestrian survey was employed within all "open" areas; no archaeological resources were identified within the current proposed Project site through the ASR. Based on the study's findings, no mitigation measures or further action were recommended.

### Report No. LA-10883

*Finding of No Adverse Effect Interstate Route 10 – 605 Interchange Improvement 07-LA-10/605 PM 31.2/20.9 EA: 245400* (Stewart 2008), documents the results of a historic property survey report consisting of archival record search, literature review, and pedestrian survey. The area of study overlaps the entirety (100 percent) of the medical campus and Broken Horn site of the current proposed Project site, which includes AINs 8559-006-006, 8559-008-011 and 8559-008-005. The study was conducted to determine the effects the project would have on historic properties. No cultural materials were identified within the current proposed Project site as a result of the 2008 investigation. Based on the study's findings, no mitigation measures or further action were recommended.

### Report No. LA-11784

*Supplemental Finding of No Adverse Effect Interstate Route 10 – 605 Interchange Improvement 07-LA-10/605 PM 31.2/20.9 EA: 245400* (Stewart 2012) documents the results of a historic property survey report in response to study changes. The area of study overlaps the entirety (100 percent) of the medical campus and Broken Horn site of the current proposed Project site, which includes AINs 8559-006-006, 8559-008-011 and 8559-008-005. The study was conducted to determine the effects the updated project design would have on historic properties. No cultural materials were identified within the current proposed Project site as a result of the 2012 investigation. Based on the study's findings, no mitigation measures or further action were recommended.

## Previously Recorded Cultural Resources

The SCCIC records indicate that 31 cultural resources have been previously recorded within 1-mile of the proposed Project site; none of these resources overlap or are adjacent to the proposed Project site. Of these, one (1) is a prehistoric archaeological site (P-19-000136/CA-LAN-136) located nearly 1-mile to the southwest, one (1) is a historic-period archaeological site (P-19-003118/CA-LAN-3118H) located 1-mile to the northwest, and the remaining 29 are historic built environment resources. None of the 31 resources overlap or are adjacent to the proposed Project site. Historic built environment resources, or non-archeological resources, are not within the purview of the present study and therefore, will not be addressed in this report. No historic-period or prehistoric archaeological resources were identified within the proposed Project site. Table 2, below, summarizes all 31 previously recorded cultural resources identified within the records search area.

# Review of Historical Topographical Maps and Aerial Photographs

Dudek consulted historical topographic maps and aerial photographs through the Nationwide Environmental Title Research, LLC (NETR) to better understand any natural or human-made changes to the proposed Project site and surrounding properties over time.

## Historical Topographic Maps

Topographic maps depict elevation of the study area as well as the areas surrounding it and illustrate the location of roads and some buildings. Although topographic maps are not comprehensive, they are another tool in determining whether a study area has been disturbed and at times to what approximate depth. Historical Topographic maps reviewed are available for the following years: 1897, 1898, 1902, 1904, 1908, 1912, 1923, 1927, 1932, 1937, 1941, 1946, 1955, 1960, 1967, 1975, 1982, 2012, 2015, and 2018 (NETR 2022a).

- **1897-1923**: The proposed Project site is illustrated as undeveloped, with an unnamed road bordering the east side of the proposed Project site. It is possible this unnamed road represents present-day Baldwin Park Boulevard.

- **1927**: The map shows another unnamed road developed in the southwest section of the proposed Project site, and it appears to correspond with present-day Bess Avenue. The 1927 topographic map also displays four relatively small square objects, possibly structures, near the intersections of the two roads previously mentioned.

DRAFT

- **1932**: Illustrates the proposed Project site as undeveloped land with the one unnamed road as seen from the 1897 to 1923 topographic maps.
- **1937**: This map depicts what is represented in the 1927 topographic map.
- **1941 and 1946**: These topographic maps depict the proposed Project site as undeveloped land, with a road to the east of the proposed Project site.
- **1955**: This map shows what appears to be the development of the I-10 to the north of the medical campus as well as several relatively small square figures, which are probably structures, within AIN 8559-006-006.
- **1960**: This map depicts what is represented in the 1941 and 1946 topographic maps.
- **1967-1982**: These topographic maps portray more noteworthy changes to the proposed Project site, with "Drive-in Theater" labeled and two rectangular structures depicted within AIN 8559-006-006 of the proposed Project site. These maps also depict a road adjacent to the I-10.
- **2012-2018**: These topographic maps display the development of the Kaiser Baldwin Park Medical Campus (AIN 8559-006-006), consistent with present site conditions.

While topographic maps are informative, they do not illustrate the minute changes that can occur to a landscape overtime and at times, are inconsistent with what is depicted year to year. Most often, structures depicted in topographical maps are limited to those with community or social significance (e.g. Firehouses or Hospitals), including additions or changes to roads and/or waterways. Nonetheless, the information gathered contributes to the understanding of the chronological development of a study area.

## Historical Aerial Photographs

A review of historical aerial photographs was conducted as part of the archival research effort from the following years: 1948, 1952, 1964, 1972, 1980, 1987, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2003, 2004, 2005, 2009, 2010, 2012, 2014, 2016, and 2018 (NETR 2022b). Through careful comparative review of historical aerials, changes to the landscape of a study area may be revealed. Disturbance to the study area is specifically important as it helps determine if soils within the study area are capable of sustaining intact archaeological deposits. Additionally, historical aerials have the potential to reveal whether a study area was subjected to alluvial deposits by way of flooding, debris flows or mudslides, as well as placement of artificial or foreign fill soils that may have buried intact archaeological deposits. Table 3, below, summarizes the results of the aerial photographs review of the proposed Project site and surrounding properties for all available years.

DRAFT

## Table 3. Historical Aerial Photographs Review

| Year | Description |
|---|---|
| 1948 | The proposed Project site has a U-shaped stream or creek essentially in the center of the site; it has several small buildings in the eastern section and a cluster of roads in the western section of the proposed Project site. The buildings and roads appear to be within present-day AIN 8559-006-006.<br><br>The San Gabriel River Wash and Walnut Creek are present, west and south of the proposed Project site, respectively, prior to channelization. Of note, the un-channelized route of Walnut Creek visibly intersects the proposed Project site from the west, traversing curvilinearly north then east before exiting the northeast portion of the proposed Project site. |
| 1952 | No significant changes to the proposed Project site, although some of the small buildings on the eastern side of the proposed Project site may have been removed.<br><br>Of note, the trajectory of the un-channelized route of Walnut Creek has shifted from its entrance into the proposed Project site from the west and now intersects from the southwest before changing course to the north then traveling east as it exists the proposed Project site from the northeast portion. Additionally, the span of the San Gabriel River Wash appears to have decrease in width with the previous footprint now consisting of residential development. |
| 1964 | The proposed Project site is shown to be undergoing significant grading within the central portion of the proposed Project site for the development of the drive-in theater with an amphitheater-shape (AIN 8559-006-006).<br><br>Additionally, the San Gabriel River Wash appears to have been channelized and Walnut Creek no longer intersects the proposed Project site and has been rerouted south and channelized. |
| 1972 | The continued development of the drive-in theater and staging of vehicles in possible designated parking areas are visible. Larger structures are visible to the east of the drive-in theater. There is also a small building in the western section of the proposed Project site. The drive-in theater, large structure, parking spots, and small building appear to be within present-day AINs 8559-008-011 and 8559-006-006. Ornamental landscaping along the perimeter of the amphitheater is visible.<br><br>AIN 8559-008-005 appears vacant and undeveloped. |
| 1980 | Visible within AIN 8559-008-005 is a large rectangular building/structure within its eastern half portion and a paved parking lot within the western half portion.<br><br>No other observable significant changes to the proposed Project site. |
| 1987 | There appears to be a new rectangular building present within the eastern half portion of AIN 8559-008-011 and a paved parking lot within the western half portion. The buildings and parking lots shown in this aerial for both AINs 8559-008-005 and 8559-008-011 appear consistent with present-day site conditions for both parcels. |
| 1992 | The drive-in theater appears to have been demolished to make way for the hospital as significant earthwork is shown to be underway.<br><br>To the south of the former drive-in theater is now a circular building. There are also several buildings to the west of the circular building, plus a paved parking lot south of the circular building along Bess Avenue. All the previously mentioned developments are within AIN 8559-006-006. |
| 1993 | Several more buildings along the eastern portion of the proposed Project site (AIN 8559-006-006) are visible, which appear to be consistent with present-day site conditions for the medical campus. |

DRAFT

**Table 3. Historical Aerial Photographs Review**

| Year | Description |
|---|---|
| 1994 | Development observed in 1993 is on-going. Two more buildings are observed to be added to the proposed Project site, including one building immediately southeast of AINs 8559-008-005 and 8559-008-011 and expansions of the buildings observed in 1993 for the medical campus buildout. Also observed is the construction for the footprint of the man-made pond within the central portion of the proposed Project site, within AIN 8559-006-006. |
| 1995 | Continuation of the development for the medical campus buildout is observed, including an extension of the present-day parking structure that wraps around the medical campus from the north. Also observed are additional paved areas for walkways and parking along the southeastern and eastern portions of the proposed Project site. The previously mentioned developments are within present-day AIN 8559-006-006. |
| 1996 | No significant changes to the proposed Project site. |
| 1997 | No significant changes to the proposed Project site. |
| 1998 | No significant changes to the proposed Project site. |
| 1999 | No significant changes to the proposed Project site. |
| 2000 | No significant changes to the proposed Project site. |
| 2003 | No significant changes to the proposed Project site. |
| 2004 | No significant changes to the proposed Project site. |
| 2005 | No significant changes to the proposed Project site. |
| 2009 | No significant changes to the proposed Project site. |
| 2010 | No significant changes to the proposed Project site. |
| 2012 | No significant changes to the proposed Project site. |
| 2014 | No significant changes to the proposed Project site. |
| 2016 | No significant changes to the proposed Project site. |
| 2018 | An extension of the extant parking lot structure first observed in 1995, to include an addition along the western portion of the parking structure in a roughly northwest to southeast layout within AIN 8559-006-006.<br><br>The proposed Project site, including all three parcels (AINs 8559-008-005, 8559-006-006 and 8559-008-011, appears to be consistent with present-day site conditions. |

## Geotechnical Report Review

The geotechnical investigation report, *KAISER PERMANENTE — Baldwin Park Medical Center Emergency Department Expansion 1011 Baldwin Park Boulevard Baldwin Park, California, KP # CAP-015077 / HMC #: 1120180* (HDNGEO 2022), was prepared for HMC Architects on February 23, 2022 to determine subsurface geological conditions of the emergency department expansion component of the proposed Project site. The report details the results of two (2) subsurface investigations that were hand-augered in the upper 4 feet followed by the use of a truck-mounted CME-75 drill rig fitted with hollow-stem-augers. The borings were placed within accessible locations within the proposed emergency department expansion area of AIN 8559-006-006, with one boring (B-1) placed within the northwestern quadrant and the second (B-2) placed within the southeastern quadrant. According to the report boring logs, both exploratory borings were completed October 25, 2021. The soils encountered include: 1) pavement/concrete from surface to 8 inches below current grade; 2) Fills soils: characterized as a brown, medium- to coarse-grained sand with gravels that increased in density as the borings advanced in depth between 8 inches and 7.5 feet below ground surface (bgs); 3) Native soils: Quaternary Alluvium characterized as light brown,

medium- to coarse-grained silty sand and gravels, were identified underlying fill soils to the maximum depths explored, between 7.5 and 56.5 feet bgs. Additionally, the report includes a review of a geotechnical investigation conducted within the subject property by LeRoy Crandall and Associates, specifically one boring location (LCA 11) completed on June 23, 1986, along the mid-point of the western boundary of the proposed emergency department expansion location. A review of the boring log for LCA 11 (Boring 11) indicates that asphaltic pavement was encountered from surface to 2 inches bgs, overlying fine silty-sand with gravel and some cobbles between 2 inches and approximately 4 feet bgs, followed by fine to medium sand with some gravel and cobbles to maximum depth explored (40 feet bgs). It is unclear whether the silty-sand identified underlying the pavement (between 2 inches and approximately 4 feet bgs) represents fill soils as the boring log reviewed does not provide clarification.

The geotechnical report, *Kaiser Permanente Scoping for Additional Parking 1011 Baldwin Park Boulevard, Baldwin Park, California* (GEOBASE 2015), was submitted by GEOBASE, Inc in August 2015 to assess the subsurface conditions of a proposed parking structure located along the western portion of the present proposed Project site and the proposed MOB in the southwest portion of the present proposed Project site, both of which are within AIN 8559-006-006. The report details the results of four (4) subsurface exploratory borings, placed at accessible locations of the areas subjected to subsurface investigations, including three borings (B-2, B-3, and B-4) within the proposed parking structure location and one boring (B-1) immediately south of the proposed MOB development. Additionally, the report includes a review of geotechnical investigations conducted within the subject property by LeRoy Crandall and Associates between 1983 and 1991. Relevant subsurface geological investigations that were conducted by GEOBASE, Inc. and LeRoy Crandall and Associates are summarized below.

**GEOBASE, Inc (2015):** Four (4) subsurface exploratory borings were conducted August 28, 2015, along the western portion and southwestern quadrant of the present Project proposed site. The results of the GEOBASE, Inc. subsurface exploratory investigations are as follows:

- **B-1**: Pavement from 0-7 inches bgs. Fill soils were encountered between 7 inches and 5 feet bgs and is characterized as sand that is brown in color with little silt and gravels. Native soils, characterized as silty sands and gravels, underlies the fill soils, and was observed to a maximum boring depth of 56.5 feet bgs.

- **B-2**: Pavement from 0-10 inches bgs. Fill soils were encountered between 10 inches and 10 feet bgs and is characterized as sand that is light brown in color with little silt and gravels. Native soils, characterized as light brown, micaceous, sand with traces of silt and gravels, underlies the fill soils, and was observed to a maximum exploratory depth of 51.5 feet bgs.

- **B-3**: Pavement from 0-10 inches bgs. Fill soils were encountered between 10 inches and 12 feet bgs and is characterized as sand that is light brown in color with little silt and gravels. Native soils, characterized as light brown sand with traces of silt and gravels, underlies the fill soils, and was observed to a maximum exploratory depth of 51.5 feet bgs.

- **B-4**: Pavement from 0-10 inches bgs. Fill soils were encountered between 10 inches bgs and 8 feet bgs and is characterized as sand that is light brown in color with little silt and trace of gravels. Native soils, characterized as light brown, micaceous, sand with traces of silt and gravels, underlies the fill soils, and was observed to a maximum exploratory depth of 51.5 feet bgs.

**LeRoy Crandall and Associates (1990):** Figure A-2 of the GEOBASE, Inc. 2015 report shows five (5) subsurface exploratory borings that were conducted November 20, 1990 by LeRoy Crandall and Associates. These

DRAFT

investigations were limited to the northwest quadrant of the present Project proposed site, within AIN 8559-006-006, directly southwest of AINs 8559-008-011 and 8559-008-005, which collectively represent the Broken Horn site. The results of the LeRoy Crandall and Associates 1990 subsurface exploratory investigations, as gleaned from the boring logs, are as follows:

- **LCA-1 (Boring 1)**: Silty sand encountered from 0-5 feet bgs, and native soils were encountered from 5-20 feet bgs. It is unclear whether the silty sand identified represents fill soils as the boring log reviewed does not provide the clarification.

- **LCA-2 (Boring 2)**: Silty sand encountered from 0-9 feet bgs and native soils from 9 feet bgs to a maximum exploratory depth of 20 feet bgs. It is unclear whether the silty sand identified represents fill soils as the boring log reviewed does not provide the clarification.

- **LCA-3 (Boring 3)**: Silty sand encountered from 0 to approximately 2.5 feet bgs and native soils from 2.5 feet to a maximum exploratory depth of 20 feet bgs. It is unclear whether the silty sand identified represents fill soils as the boring log reviewed does not provide the clarification.

- **LCA-4 (Boring 4)**: Silty sand encountered from 0 to approximately 4.5 feet bgs and native soils from 4.5 feet to a maximum exploratory depth of 20 feet bgs. It is unclear whether the silty sand identified represents fill soils as the boring log reviewed does not provide the clarification.

- **LCA-5 (Boring 5)**: Silty sand encountered from 0-4 feet bgs and native soils from 4-20 feet bgs. It is unclear whether the silty sand identified represents fill soils as the boring log reviewed does not provide the clarification.

**LeRoy Crandall and Associates (1986):** Of note, Figure A-2 of the GEOBASE, Inc. 2015 report does not show any of the subsurface exploratory boring locations for the investigations that were conducted between June 23-26, 1986 by LeRoy Crandall and Associates; however, based on the title of the 1986 report, the investigations were conducted between Dalewood Street and Bess Avenue, which border the present proposed Project site to the east and west, though the specific locations are unknown. A review of available records in the GEOBASE, Inc. 2015 for the 1986 investigation include four (4) boring logs and the results are as follows:

- **Boring 1**: Pavement from 0-2 inches bgs. Fill soils, characterized as sand with some gravel, cobbles, and pieces of metal and wood, were encountered between 2 inches and 12 feet bgs. Native soils, characterized as fine sand with some gravel and cobbles, underlie the fill soils and were encountered from 12-40 feet bgs.

- **Boring 4**: Pavement from 0-2 inches bgs. Fill soils, characterized as silty sand, were encountered from 2 inches to approximately 2 feet bgs with a 1-inch pipe that was observed between those depths. Native soils, characterized as fine sand with some gravel and cobbles, underlie the fill soils and were encountered from 2-50 feet bgs.

- **Boring 7**: Fill soils, characterized as silty sand, were encountered from 0 to approximately 2 feet bgs. Native soils, characterized as fine to medium sand with some gravel and cobbles, underlie the fill soils and were encountered from 2-50 feet bgs.

DRAFT

- **Boring 9**: Sandy silt was encountered from 0-10 feet bgs and sand was encountered from 10-40 feet bgs. It is unclear whether the sandy silt identified represents fill soils as the boring log reviewed does not provide the clarification.

**LeRoy Crandall and Associates (1989):** Of note, Figure A-2 of the GEOBASE, Inc. 2015 report does not show any of the subsurface exploratory boring locations for the investigations that were conducted January 17, 1989 by LeRoy Crandall and Associates. Furthermore, a review of the references in the GEOBASE, Inc. 2015 report does not include any mention of an investigation conducted in 1989 and as such, it is unclear where this testing was conducted in relation to the present proposed Project site. A review of available records in the GEOBASE, Inc. 2015 for the 1989 investigation include one (1) boring log and the results are as follows:

- **Boring 18**: Sand with some gravel, few cobbles, lenses of silt, and a layer of silty sand was encountered from 0-21 feet bgs. It is unclear whether the soils identified represents fill soils as the boring log reviewed does not provide the clarification.

# Native American Coordination

## NAHC Sacred Lands File Search

Dudek requested a search of the SLF on July 22, 2022, to determine the presence of any Native American cultural resources within the proposed Project site. The NAHC maintains and reviews the SLF. Andrew Green, Cultural Resources Analyst, provided the SLF search results on September 6, 2022. The NAHC SLF records search results were positive for known Native American heritage resources within the proposed Project site. The NAHC identified the Gabrieleno Band of Mission Indians – Kizh Nation, as well as eight (8) additional Native American individuals who would potentially have specific knowledge as to whether or not Native American cultural resources are identified within the Project site that could be at-risk. To date, Dudek has not initiated contact with the individuals on the NAHC's contact list, in regard to the proposed Project site. However, in compliance with AB 52, the City has contacted all NAHC-listed traditionally geographically affiliated tribal representatives that have requested project notification. Assembly Bill 52 consultation efforts conducted by the City are discussed in the following paragraph. Documentation of the NAHC SLF search results is provided in Appendix C.

Note: SLF database maintained by the NAHC, represent a curation of "ancient places of special religious or social significance to Native Americans and known ancient graves and cemeteries of Native Americans on private and public lands in California" (nahc.gov 2021) provided by Tribal entities and Native American representatives. For various reasons, Tribal entities and Native American representatives do no not always report sacred lands or TCRs to the NAHC; as such, the NAHC's SLF is not necessarily a comprehensive list of known TCRs and searches of the SLF must be considered in concert with other research and not used as a sole source of information regarding the presence of TCRs or other resources of Native American cultural value. Additionally, results of the SLF provided relate to the general regional area within and surrounding the study area and do not necessarily equate to the existence of resources within the specific area occupied by the current proposed Project site.

## Assembly Bill 52

The proposed Project is subject to compliance with Assembly Bill (AB) 52 (PRC 21074), which requires consideration of impacts to TCRs as part of the CEQA process, and that the lead agency notify California Native American Tribal

representatives that have requested notification who are traditionally or culturally affiliated with the geographic area of the proposed Project site. All records of correspondence related to AB 52 notification and any subsequent consultation are on file with the City. A summary of the consultation record is provided and addressed in the Initial Study/Mitigated Negative Declaration document for the proposed Project.

## 1938 Kirkman-Harriman Historical Map Review

Dudek cultural resources specialists reviewed sources commonly identified though Tribal consultation, notably the 1938 Kirkman-Harriman Historical Map (Image 1). Based on this map, the proposed Project site is approximately 375 feet directly south of the three Portolá expedition trails, approximately 573 feet northeast of a Mission Road (old highway as of May 19, 1851) and is within the historical route of the San Gabriel Wash. The proposed Project site is over 4 miles east/northeast of "Mission Vieja," which was founded in 1771 and identified as the first Mission of San Gabriel. The nearest mapped Native American village is nearly 4 miles southwest of the proposed Project site and referenced in the map as "The Abrarsanth-cogna." Additionally, the proposed Project site is approximately 578 feet directly south of one of the Portolá expedition camps. Father Juan Crespi of the Portola Expedition passed through the area on July 30, 1769, and January 17, 1770, as notated on the map. A review of the Crespi's diary entries for those dates did not include any reference to any encounters or interactions with Native American peoples or any mention of Native American villages (Brown 2002).

It should be noted that this map is highly generalized due to scale and age and may be somewhat inaccurate with regard to distance and location of mapped features. Additionally, this map was prepared based on review of historic documents and notes more than 100 years following secularization of the missions (in 1833). Although the map contains no specific primary references, it matches with the details documented by the Portolá expedition (circa 1769–1770). The map is a valuable representation of post-colonization mission history; however, it is limited to a specific period of Native American history and substantiation of the specific location and uses of the represented individual features should be verified by archaeological records and/or other primary documentation

No archaeological evidence of the nearest village on the 1938 Kirkman-Harriman map was provided in the available SCCIC records or as the result of a review of other archaeological information for the proposed Project site and surrounding area. This may suggest that the village is either likely no nearer than 1-mile from the proposed Project site or if existent within the records search radius, subsurface deposits associated with the village have not yet been discovered.

DRAFT

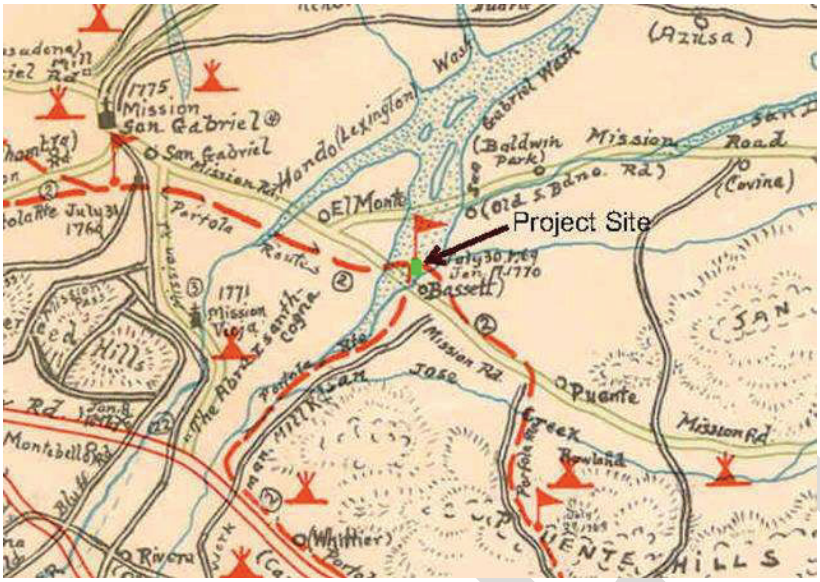

**Image 1**. 1938 Kirkman-Harriman Historical Map (Proposed Project Site in Green).

# Field Survey

## Methods

Dudek Archaeologist, Brenda Rogers, BA, conducted a pedestrian survey of the proposed Project site on August 24, 2022. The survey area of the proposed Project site included portions of AIN 8559-006-006 (emergency department expansion component, and off-site improvements, and the entirety of AINs 8559-008-011 and 8559-008-005 (Broken Horn site: abandoned retail buildings and parking lots) (see Figure 2). Because the proposed Project site is within a developed setting with limited exposed sediment, a compressive archaeological survey was not conducted. Instead, a mixed approach of transects spaced no more than 5-meters apart (approximately 15 feet), where feasible, and an opportunistic survey, selectively examining areas of exposed ground surfaces, were utilized. Developed portions of the proposed Project site with extant buildings/structures and paved parking lots, were subjected to a reconnaissance survey (visual inspection). The ground surface was inspected for prehistoric artifacts (e.g., flaked stone tools, tool-making debris, groundstone tools, ceramics, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, features indicative of structures and/or buildings (e.g., standing exterior walls, post holes, foundations), and historical artifacts (e.g., metal, glass, ceramics, building materials). Careful attention was given to barren ground including at the base of trees and bushes, within paths/trails and any soils exposed within landscaped flower beds for exposed subsurface materials. No artifacts were collected during the survey.

All fieldwork was documented using field notes and an Apple Generation 12 iPhone (iPhone) equipped with ESRI Collector and Avenza PDF Maps software with close-scale georeferenced field maps of the proposed Project site, and aerial photographs. Location-specific photographs were taken using the iPhone's 12-mega-pixel resolution camera. All field notes, photographs, and records related to the current study are on file at Dudek's Pasadena,

DRAFT

California office. All field practices met the Secretary of Interior's standards and guidelines for a cultural resources inventory.

## Results

The proposed Project site is currently developed, consisting of an active medical campus and associated parking structure (AIN 8559-006-006), abandoned retail buildings and parking lots (AINs 8559-008-011 and 8559-008-005; Broken Horn site), and landscaped areas. The medical campus includes a large man-made water feature, and landscaped open areas that have terraced flower beds. Where possible, transects were employed, specifically in larger open grassy areas on either side of the extant parking structure and along Dalewood Street, Baldwin Park Boulevard, and Best Avenue. Exposed ground surfaces within landscaped flower beds were opportunistically surveyed across the entire proposed Project site. Approximately 95 percent of the proposed Project site is developed with extant buildings and structures and/or paved parking lots, which did not allow for the observation of any exposed ground soils. The remaining 5 percent consisted of landscape areas with grasses and ornamental trees, bushes, and flower beds. Given the current proposed Project site conditions, ground surface visibility was non-existent to poor (0-20 percent), depending on locations surveyed.

It is important to note that the geotechnical studies revealed that the proposed Project site is predominately covered in fill soils, though the origin of the soils and some of the locations investigated were not provided in available records. However, a review of aerial photographs indicate that the proposed Project site has been subjected to consistent ground disturbance since as early as the mid-twentieth century. As such, any exposed soils observed during the survey were likely fill soils and not a good representation of the native soils present prior to development/ground disturbing activities. Moreover, the presence of the fill soil is an indication that any potential cultural material from surface to native soils, has been previously displaced from the primary depositional location, buried, or destroyed. No cultural materials were observed within any of the three (3) parcels representing the proposed Project site; however, due to the presence of fill soils, observation of intact native soils was not possible.

Overall, the soils observed included brown silty sand in the terraced flower beds, as well as in faint trails across the grass lawns and yellow brown sand with rounded gravels as observed within some of the landscaped areas. These soils are consistent with the fill soils encountered during subsurface geological investigations.

# Sensitivity Analysis

## Archaeological Sensitivity

While the NAHC SLF records search results were positive, the results relate to the general regional area and do not necessarily equate to the existence of resources within the specific area occupied by the proposed Project site. A search of the CHRIS database for the Project site and 1-mile records search area did not identify any previously recorded historic-period or prehistoric archeological resources. Additionally, of the 13 previous technical studies that were conducted within 1-mile of the proposed Project site, three studies address portions of the proposed Project site; however, none of these previous studies identified archaeological resources within the proposed Project site. Approximately 70 percent of the proposed Project site has not been subjected to any previous archaeological investigations or surveys. According to the historical topographic maps and aerial photographs review, the proposed Project site has been subjected to consistent ground disturbance, shifting from undeveloped

DRAFT

land as early as the late 1890s and transforming in the 1960s with the development of a drive-in theater. By the early 1990s, the proposed Project site underwent significant changes and extensive ground disturbance with the demolishment of the drive-in theater and the grading and construction of the extant medical campus, continuing into 2018. Also of note, aerial photographs showed the San Gabriel River Wash to the west of the proposed Project site was not channelized and Walnut Creek intersected the proposed Project site up until 1964, which suggests that the proposed Project site has likely been modified by the natural movement of soils in prehistoric and historic periods indicating that if cultural material does exist within the proposed Project site, it would likely have been buried, displaced (not exist within its original context), or destroyed along the historical route of Walnut Creek.

A pedestrian survey for the proposed Project (conducted August 24, 2022) did not identify any surficial evidence of cultural material.

A review of a 2022 and 2015 geotechnical report and available boring logs documenting the results of subsurface exploratory investigations conducted in 1986, 1989, 1990, 2015, and 2021 for portions of the proposed Project site determined that fill soils were encountered at a variety of depths across the proposed Project site and generally extended from surface to between 7 inches and 12 feet bgs, depending on the locations investigated. Current Project design indicates that the maximum depth of ground disturbance for the MOB component at the Broken Horn site (AINs 8559-008-005 and 8559-008-011) is 10 feet below the existing ground surface and a maximum depth of 65 feet below current grade for the drilling of caissons at the emergency department expansion component (8559-008-006). In addition, ground disturbance associated with all other construction components, including site preparation, vegetation removal, and trenching for utility work is assumed to be no deeper than 5 feet below existing ground surface across the proposed Project site.

In consideration of all these factors, the potential to encounter unknown intact archaeological resources between current grade and to depths of identified fill soils is relatively unlikely. However, the potential for intact cultural deposits to exist within soils underlying fills soils to proposed depths of disturbance is unknown considering the lack of opportunity to observe native soils during the pedestrian survey and that no previous archaeological investigation has occurred prior to placement of fill soils for approximately 70 percent of the proposed Project site. As such, there is potential for archaeological resources within the proposed Project site to be present within the native soils that exist beneath fill soils. Since proposed depths of disturbance may extend deeper than documented fill soils, native soils with the potential for archaeological deposits to exist will be disturbed. In the event that unknown archaeological resources are encountered during Project implementation, impacts to these resources could be significant. The following management recommendations are provided to ensure that measurements are in place for the proper treatment of any inadvertently discovered archaeological resources and potential impacts to archaeological resources and human remains would be reduced to less than significant.

# Management Recommendations

The following measures have been developed to ensure that any inadvertent discovery of archaeological resources will be treated appropriately and in accordance with CEQA regulations: preconstruction training, retention of an on-call archaeologist to address inadvertent discoveries, and inadvertent discovery clause implemented and included on all construction plans. Dudek further recommends an additional survey be conducted once fill soils have been removed. If cultural materials are observed during the course of ground disturbing activities below fill soils, then

subsurface testing may be required. These measures will ensure the potential Project impacts to archaeological resources and human remains would be less than significant.

## Inadvertent Discovery of Archaeological Resources

**Workers Environmental Awareness Program Training.** All construction personnel and monitors who are not trained archaeologists shall be briefed regarding inadvertent discoveries prior to the start of construction activities. A basic presentation and handout or pamphlet shall be prepared in order to ensure proper identification and treatment of inadvertent discoveries. The purpose of the Workers Environmental Awareness Program (WEAP) training is to provide specific details on the kinds of archaeological materials that may be identified during construction of the Project and explain the importance of and legal basis for the protection of significant archaeological resources. Each worker shall also learn the proper procedures to follow in the event that cultural resources or human remains are uncovered during ground-disturbing activities. These procedures include work curtailment or redirection, and the immediate contact of the site supervisor and archaeological monitor.

**Retention of a Qualified Archaeologist.** A qualified archaeologist shall be retained and on-call to respond and address any inadvertent discoveries identified for the duration of construction activities. Additionally, in consideration of the potential to encounter intact cultural deposits beneath fill soils, the qualified archaeologist shall survey the proposed Project site once fill soils have been removed to ensure no cultural deposits underly the fill layer. If is determined, based on the survey after the removal of fill soils, that cultural resources are present or may be present that may be impacted during Project construction, monitoring may be warranted. If it is determined that monitoring is warranted, a qualified archaeological principal investigator, meeting the Secretary of the Interior's Professional Qualification Standards, should oversee and adjust monitoring efforts as needed (increase, decrease, or discontinue monitoring frequency) based on the observed potential for construction activities to encounter cultural deposits or material. The archaeological monitor will be responsible for maintaining daily monitoring logs.

**Inadvertent Discovery Treatment and Protocol.** In the event that archaeological resources (sites, features, or artifacts) are exposed during construction activities for the proposed Project, all construction work occurring within 50 feet of the find should immediately stop and a qualified archaeologist should be notified immediately to assess the significance of the find and determine whether or not additional study is warranted. If human remains or suspected human remains are discovered, all construction work occurring within 50 feet of the find should immediately stop. The archaeologist will provide recommendations regarding next steps based on inspection and initial assessment of the significance of the find. The preferred management strategy for cultural resources should be preservation in place through avoidance or other methods. If the discovery proves significant under CEQA, and preservation in place infeasible, additional work such as preparation of an archaeological treatment plan, testing, data recovery, or monitoring may be warranted.

Within 60 days following completion of ground disturbance, an archaeological monitoring report shall be prepared and submitted to the City for review. This report should document compliance with approved mitigation, document the monitoring efforts, and include an appendix with daily monitoring logs. The final report shall be submitted to the SCCIC.

## Inadvertent Discovery of Human Remains

In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the county coroner shall be immediately notified of the discovery. No further excavation or disturbance of the site or

any nearby area reasonably suspected to overlie adjacent remains shall occur until the county coroner has determined the appropriate treatment and disposition of the human remains. If the county coroner determines that the remains are, or are believed to be, Native American, he or she shall follow all required protocols according to California Public Resources Code, Section 5097.98.

Should you have any questions relating to this report and the findings and recommendations, please do not hesitate to contact dfaith@dudek.com and Linda Kry at lkry@dudek.com.

**Re: Kaiser Baldwin Park Emergency Department Project, Los Angeles County**

Dear Mr. Faith:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the Gabrieleno Band of Mission Indians – Kizh Nation on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Re: California Environmental Quality Act Public Resources Code section 21080.3, subd.(b) California Assembly Bill 52, Formal Notification of Proposed Kaiser Permanente Baldwin Park Emergency Department Project

Dear Mr. Salas,

Pursuant to California Assembly Bill (AB) 52, the City of Baldwin Park is providing you with formal notification of the Kaiser Baldwin Park Emergency Department Project (proposed project),located in the City of Baldwin Park, California. The City of Baldwin Park, as lead agency, is reaching out to all groups listed on the California Native American Heritage Commission (NAHC)Sacred Lands File Contact List in a good faith effort to provide notification of the proposed project to groups that are traditionally or culturally affiliated with the geographic area of the proposed project. The present notice includes:

- A description of the proposed project and location;
- A summary of cultural resources work to date, and summary of associated information thatcan be made available upon request;
- A clear and definitive statement that the tribe has 30 days to request consultation; and
- The lead agency contact information.

**Project Description and Location**

The proposed Project, located at 1011 Baldwin Park Boulevard, in the city of Baldwin Park, includes the development of a two-phased project at the Kaiser Permanente Baldwin ParkEmergency Department. The first phase is the construction of an expansion to the emergency department which is part of an existing hospital tower on the south end of the Kaiser campus. Expansion of the emergency department would add approximately 23,000 square feet to the existing emergency department, expand the number of existing treatment bays from 38 to 60, a new ambulance canopy, and include additional improvements to the existing emergency department. The expansion and improvement of the emergency department would allow better functionality within the emergency department.

The second phase of the project would consist of the construction and operation of an approximately 33,000 square foot medical office building. This component would expand the boundary of the medical campus to include the parcel currently adjacent to the medical campus to the west. Development of this site (referred to as the "Broken Horn" site) would require the demolition of an existing retail building. The medical office building component would also include parking.

**Project Involves Ground Disturbance:** Yes

**Summary of Cultural Resources Work and Documentation**

A California Historical Resources Information System (CHRIS) records search, Native American Heritage Commission (NAHC) Sacred Lands File, and cultural resources investigation is currently underway. Once completed, cultural resources documentation can be provided upon request. Please note, this information should be considered confidential and is not to be redistributed to individuals without traditional or cultural affiliation.

**Consultation Request**

If you have any comments or concerns regarding potential impacts to tribal cultural resources (as defined in Public Resources Code § 21074) in relation to the proposed project, or would like to request any additional information, please contact the City of Baldwin Park at the address below or via email to Ron Garcia (RGarcia@baldwinpark.com) within 30 days of receipt of this notice with a formal request for consultation. Please include in this response the name of a designated lead contact person. If we do not receive notification within the 30-day period, we will assume that the Soboba Band of Luiseno Indians has no tribal cultural resource concerns regarding this project.

Sincerely,

For: Ron Garcia
