THE VILLAGE AT JUNIPERO

MENIFEE, CALIFORNIA

DEV2022-006 (Major Plot Plan No. PLN22-0030)

ENTITLEMENT RESUBMITTAL
2/20/2023

HUMPHREYS & **PARTNERS** ARCHITECTS, L.P.
5339 Alpha Rd., Suite 300, Dallas, TX 75240 | 972.701.9636 | www.humphreys.com

PROJECT DESCRIPTION:

The Vilage at Junipero has 240 garden style apartment homes each with direct, completely private access garage. The main open space, which is on axis with the main entry driveway from Heritage Rd, provides a 2 story club house, a bocce ball court and a pool area with gazebos. In addition to the main courtyard, there are 4 other distinctly designed courts, with building unit entries exiting straight into the lawn or various outdoor amenities to include fire pits, barbq areas, tot lot and a dog park. Each unit is provided with a minimum of 100SF of Private Open Space.

OVERALL PROJECT DATA:

GENERAL LAND DESIGNATION:	8.1 - 14R	PROJECT ADDRESS:	JUNIPERO ROAD AND HERITAGE DRIVE MENIFEE, CA 92224
EXISTING ZONING:	MDR	APPLICANT:	CHRISTIANSEN AND COMPANY, keith@christiansenco.com

TOTALS					240	100.00%	318,240	100.00%		473

UNIT AVERAGE NET SF : 1,326 SF (NET AREA INCLUDES SQUARE FOOTAGE FROM EXTERIOR FACE OF ALL EXTERIOR FRAME WALLS THAT ENCLOSE A/C SPACE)

STORAGE REQUIREMENT: EACH UNIT HAS +/-16 SF OF STORAGE SPACE ACCESSIBLE FROM THE GARAGE AND LOCATED TYPICALLY UNDER STAIRS

PARKING SUMMARY:

	GARAGE PARKING	384	SPACES, IN 240 GARAGES
	SURFACE PARKING TYPE 1	121	STANDARD SPACES, NON ASIGNED, GUEST AND STAFF INCLUDED IN THIS NUMBER
	SURFACE PARKING TYPE 2	18	STALLS LOCATED IN FRONT OF GARAGES WITH AN 18' LONG DRIVEWAY
	TOTAL	523	
	(2% ACCESSIBLE PARKING PROVIDED FOR BOTH SURFACE STALLS AND GARAGES) STANDARD STALL SIZE 9'X18'		

TRASH: Design and capacity to be further refined, still awaiting Waste Management feedback and direction.
Currently providing: 4-cy bins per enclosure, 5 enclosures equally dispersed through the site.

EV stalls: Per 2022 CalGreen Section 4.106.4.2.2: This project will provide 5% EV w/ chargers,10% EV capable and 25% EV Charging receptacles. The total EV combined, as required per CalGreen will be 210 stalls. Distribution of EV stalls to be determined at a later time.

PARKING CALCULATION OF GARAGE AND SURFACE STALLS NEEDED TO MEET THE MINIMUM REQUIRED

UNIT TYPES	TOTAL OF EACH TYPE	GARAGE STALLS EA.	ADDTL. SURFACE STALL REQD. EA.	TOTAL PROV./REQ.
A1-U	24	1	0	24
B1-L	24	1	0.5	36
B1-U	24	2	0.5	48 *
B2-U	24	2	0	48 *
B3-U	48	1	0.5	72
C1-L	48	2	0.5	120
C1-U	48	2	0.5	120
GUEST PKG (1 PER 10 UNITS)				24
STAFF PARKING (1 PER EMPLOYEE)				5
	240			497

* 2 Bedroom units with 2 car garages exceed the minimum parking requirement by 0.5 stall but since it is in an enclosed private garage, that number is not counted towards the overall 1.5 per 2 Bedroom unit

OPEN SPACE SUMMARY:

PRIVATE OPEN SPACE	REQUIRED	100 SF	PER UNIT
	PROVIDED	+/- 115 SF	PER UNIT
COMMON OPEN SPACE	OPEN AREA 1	+/- 52,000	SF
	OPEN AREA 2	+/- 35,000	SF
	OPEN AREA 3	+/- 35,000	SF
	OPEN AREA 4	+/- 27,000	SF
	OPEN AREA 5	+/- 17,000	SF
	MISC.	+/- 48,000	SF
	TOTAL OPEN SPACE PROVIDED	+/- 250,000	SF

MENIFEE
New. Better. Best.

TRASH ENCLOSURES STANDARDS AND SPECIFICATIONS :

STORM RUNOFF RESULTING IN DIRECT CONTACT WITH TRASH ENCLOSURE, OR WASTEWATER RUNOFF FROM TRASH ENCLOSURE ARE PROHIBITED FROM RUNNING OFF A SITE ONTO THE CITY MS4 WITHOUT PROPER TREATMENT. TRASH ENCLOSURES IN NEW DEVELOPMENTS AND REDEVELOPMENT PROJECTS SHALL MEET NEW STORM WATER QUALITY STANDARDS INCLUDING:

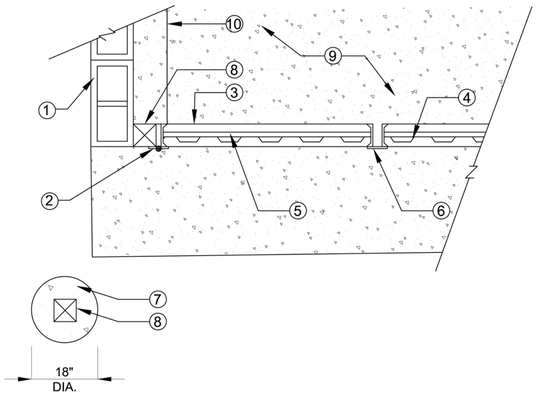
a) PROVISION OF A SOLID IMPERMEABLE ROOF WITH A MINIMUM CLEARANCE HEIGHT TO ALLOW THE BIN LID TO COMPLETELY OPEN.

b) CONSTRUCTED OF REINFORCED MASONRY WITHOUT WOODEN GATES. WALLS SHALL BE AT LEAST 6 FEET HIGH.

c) PROVISION OF CONCRETE SLAB FLOOR, GRADED TO COLLECT ANY SPILL WITHIN THE ENCLOSURE.

d) ALL TRASH BINS IN THE TRASH ENCLOSURE SHALL BE LEAK PROOF WITH LIDS THAT ARE CONTINUOUSLY KEPT CLOSED.

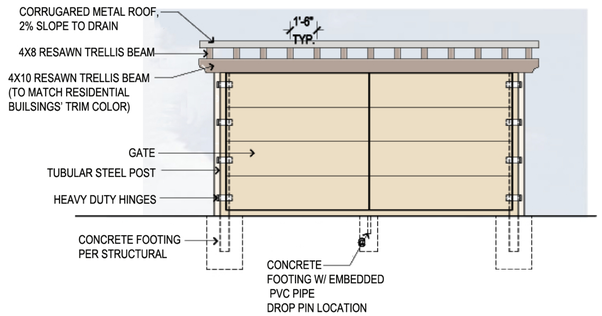
e) THE ENCLOSURE AREA SHALL BE PROTECTED FROM RECEIVING DIRECT RAINFALL OR RUN-ON FROM COLLATERAL SURFACES.



ANY STANDING LIQUIDS WITHIN THE TRASH ENCLOSURES WITHOUT FLOOR DRAIN MUST BE CLEANED UP AND DISPOSED OF PROPERLY USING A MOP AND A BUCKET OR A WET/DRY VACUUM MACHINE. ALL NON-HAZARDOUS LIQUIDS WITHOUT SOLID TRASH MAY BE PUT IN THE SANITARY SEWER AS AN OPTION, IN ACCORDANCE WITH EASTERN MUNICIPAL WATER DISTRICT (EMWD) CRITERIA.

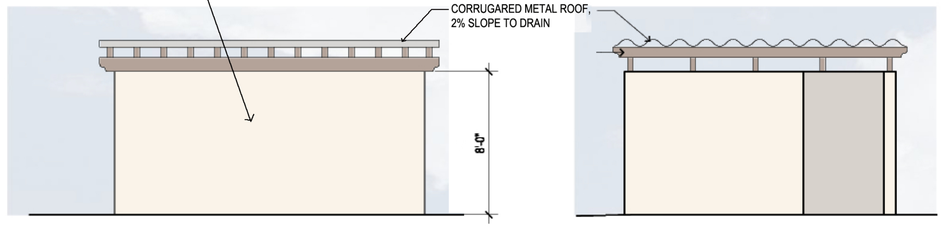
AN ALTERNATE FLOOR DRAIN FROM THE INTERIOR OF THE ENCLOSURE THAT DISCHARGES TO THE SANITARY SEWER MAY BE CONSTRUCTED ONLY AFTER OBTAINING APPROVAL FROM EMWD. THIS OPTION REQUIRES THE FOLLOWING:

a) THE TRASH ENCLOSURE SHALL BE LOCKABLE AND LOCKED WHEN NOT IN USE WITH A 2-INCH OR LARGER BRASS RESETTABLE COMBINATION LOCK. ONLY EMPLOYEES AND STAFF AUTHORIZED BY THE ENCLOSURE PROPERTY OWNER SHALL BE GIVEN ACCESS. THIS REQUIREMENT MAY NOT BE APPLICABLE TO COMMERCIAL COMPLEXES WITH MULTIPLE TENANTS.



b) A WATERLESS TRAP PRIMER SHALL BE PROVIDED TO PREVENT ESCAPE OF GASSES FROM THE SEWER LINE AND SAVE WATER.

c) HOT AND COLD RUNNING WATER SHALL BE PROVIDED WITH A CONNECTION NEARBY WITH AN APPROVED BACKFLOW PREVENTER. THE SPIGOT SHALL BE PROTECTED AND LOCATED AT THE REAR OF THE ENCLOSURE TO PREVENT DAMAGE FROM BINS.



1. CMU WALL - SEE NOTE A
2. HEAVY DUTY GATE HINGE (3)
3. 3-INCH GALVANIZED STEEL ANGLE FRAME
4. MINI-V-BEAM 26 GAUGE WITH ENDURA CLAD FINISH AS MANUFACTURED BY ASC PACIFIC INC. OR APPROVED EQUAL. SPOT WELD TO ANGLE FRAME (CONTRACTOR TO SUBMIT SHOP DRAWINGS)
5. GALV. STEEL DIAGONAL CROSS BRACE
6. GALVANIZED STEEL STOP PLATE
7. CONCRETE FOOTING (18-INCH DIA. X 48-INCH DEPTH) / REFER TO STRUCTURAL ENGINEER'S SPECIFICATIONS FOR REINFORCEMENT
8. 4-INCH X 4-INCH TUBULAR STEEL GATE POST. SET POST FLUSH TO WALL, GROUT FILL POST SOLID. PAINT WITH (2) COATS ZINC PRIMER & (2) COATS SATIN FINISH PAINT - COLOR TO BE SELECTED
9. CONCRETE FLOOR
10. CONCRETE CURB

NOTES:
A. 8-INCH X 8-INCH X 16-INCH CMU / REFER TO STRUCTURAL ENGINEER'S SPECIFICATIONS FOR REINFORCEMENT.
B. CONCRETE FOOTING TO ACHIEVE 4300 PSI @ 28 DAYS.

SURFACE MATERIALS

DESCRIPTION	QUANTITY
NATIVE SEED MIX: 50% BUFFALO GRASS (UC VERDE) 50% BLUE GRAMA	XXXX SQ.FT. AT 3LBS. PER 1,000 SQ.FT. FOR BUFFALO GRASS & 1LB. PER 1,000 SQ.FT. FOR BLUE GRAMA
SHREDDED HARDWOOD MULCH 4" DEPTH MIN. IN ALL BEDS	

NOTE: TEMPORARY IRRIGATION IS NEEDED FOR A MINIMUM OF 60 DAYS FOR SEED TO TAKE ROOT AND ESTABLISH. 60 DEGREE SOIL TEMPERATURE REQUIRED FOR INSTALLATION. PLANT IN SPRING FOR BEST RESULTS.

NOTE:

GROUND IMMEDIATELY ADJACENT TO THE PROPOSED BUILDING FOUNDATION AREAS TO BE GRADED AWAY AT A SLOPE NOT LESS THAN 1:20 (5%) FOR A MINIMUM DISTANCE OF 10-FEET AS PER THE REQUIREMENTS OF SECTION 1804.3 INTERNATIONAL BUILDING CODE (IBC) 2012.

GENERAL LANDSCAPE NOTES

1. PROVIDE 3" LAYER (MIN.) OF MULCH IN SHRUB BEDS AND UNPLANTED AREAS; 2" LAYER (MIN.) OF MULCH IN GROUNDCOVER AREAS; & 3" LAYER (MIN.) OF MULCH FOR SLOPES.
2. TREES SHALL BE STAKED WITH 2-3 STAKES AND 6 TREE TIES PER COUNTY STANDARD DETAILS. USE TRIPLE STAKING WITH 3" DIAMETER STAKES IN HIGH WIND AREAS.
3. ROOT BARRIERS SHALL BE INSTALLED FOR TREES WITH 6' (MIN.) OF HARDSCAPE PER COUNTY STANDARD DETAILS. ROOT BARRIER SHALL NOT ENCIRCLE THE TREE ROOTBALL BUT SHALL BE LOCATED AT EDGE OF HARDSCAPE AND EXTEND BEYOND CENTER OF TREE A MINIMUM OF 5' IN EACH DIRECTION.
4. TREES SHALL HAVE BREATHER TUBES PER COUNTY STANDARD DETAILS.
5. PLANTER ISLANDS ADJACENT TO PARKING SPACES SHALL HAVE 12" WIDE CONCRETE WALKWAY STRIP INSTALLED ADJACENT TO AND INTEGRAL WITH OR DOWELED INTO THE 6" WIDE CURB.
6. TURF SHALL BE FOR EITHER FUNCTIONAL OR RECREATIONAL USES ONLY AND ALL TREES LOCATED WITHIN TURF AREAS TO HAVE ARBOR GUARD.
7. NO PLANTS TO BE LISTED OR INSTALLED THAT ARE 'PROHIBITED' IN RIVERSIDE COUNTY CALIFORNIA FRIENDLY PLANT LIST.
8. PER ORDINANCE 460 - TREES MUST BE PLANTED AT A MINIMUM OF 60' INTERVALS ALONG FRONTAGES.
9. PARKING AREA LANDSCAPING SHALL INCLUDE SHADE TREES FROM THE 'RIVERSIDE COUNTY GUIDE TO TREES, SHRUBS, & GROUNDCOVERS', UNLESS OTHERWISE APPROVED BY THE PLANNING DIRECTOR, SO AS TO PROVIDE FOR ADEQUATE SHADE CANOPIES WITHIN 15 YEARS FOR 50% COVERAGE OF PARKING SPACES.
10. AREA BETWEEN ROW LINE AND BACK OF PUBLIC SIDEWALK SHALL BE LANDSCAPED.
11. IRRIGATION NARRATIVE- THE PROJECT WILL BE IRRIGATED BY AN EFFICIENT WATER SAVING IRRIGATION SYSTEM. PLANTS WILL BE WATER WITH MULTI-PORT EMITTERS ALLOWING EACH PLANT TO RECEIVE A SMALL AMOUNT OF WATER APPLIED DIRECTLY TO THE PLANT. TURF AREAS WILL BE WATERED WITH EFICIENT SPRAY HEADS WITH WIND AND RAIN SENSORS. THE ENTIRE IRRIGATION SYSTEM WILL BE RUN BY WATER SAVING CONTROLLERS WITH TIMERS AND ITS OWN DEDICATED METER.
12. THE FOLLOWING ITEMS WILL BE INCORPORATED INTO THE FINAL IRRIGATION DESIGN PLANS AND SPECIFICATIONS:
    -SMART CONTROLLER WITH AN ET GAGE WITH ACCESS TO REAL-TIME ET (MIN. CONTROLLER RATING SHALL BE LIGHT COMMERCIAL)
    -MASTER VALVE AND FLOW SENSOR (EXCEPT FOR PRIVATE RESIDENTIAL LOTS)
    -RAIN SENSING DEVICE
    -ANTI-DRAIN CHECK VALVES
    -PRESSURE REGULATOR (IF NEEDED)
    -HYDROZONES WILL BE PROPERLY DESIGNATED
    -NO OVERHEAD IRRIGATION WITHIN 24" OF NON-PERMEABLE SURFACES. (NO RESTRICTIONS TO METHOD IF ADJACENT TO PERMEABLE SURFACE WITH NO RUNOFF/OVERSPRAY)
    -SUBSURFACE OR LOW-VOLUME IRRIGATION WILL BE USED FOR IRREGULARLY SHAPED AREAS, OR AREAS LESS THAN 8' IN WIDTH

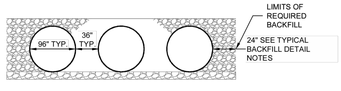
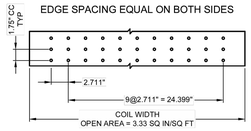
NOTES

- THE PIPE SHOULD BE FULLY PERFORATED IN ACCORDANCE WITH AASHTO M 36, SECTION 8.3.2.2, AND USING CLASS 2 PERFORATIONS. THE TOTAL OPEN AREA OF THE PERFORATIONS WILL BE A MINIMUM OF 2.3% OF THE PIPE SURFACE AREA.
- BULKHEADS SHALL BE 12-GAGE OR HEAVIER STEEL AND THE COATING WILL MATCH THE SPECIFIED CMP COATING. BULKHEAD PLATES SHALL BE FULLY WELDED ONTO THE CMP WITH STEEL REINFORCEMENT AS REQUIRED. THE STEEL REINFORCEMENT SHALL BE POST COATED WITH ZINC RICH PAINT PER AASHTO M 36. BULKHEAD DESIGNS SHALL SATISFY THE REQUIREMENTS SHOWN IN CHAPTER 8 OF THE NCSPA CSP DESIGN MANUAL, AND CALCULATIONS SHALL BE PROVIDED TO THE ENGINEER OF RECORD (EOR) FOR APPROVAL UPON REQUEST.
- ALL FITTINGS SHALL BE STRUCTURALLY CHECKED FOR REINFORCEMENTS PER ASTM A998 AND PROVIDED TO THE EOR FOR APPROVAL UPON REQUEST.
- CONNECTING BANDS FOR INFILTRATION SYSTEMS SHALL BE ANY TYPE, BUT MUST BE AT LEAST 12" WIDE. BANDS SHALL MATCH THE SPECIFIED CMP COATING AND MEET THE REQUIREMENTS OF AASHTO M 36.
- ALL METALLIC COATINGS AFFECTED BY MANUFACTURING FABRICATION SHALL BE REPAIRED PE AASHTO M 36 SECTION 11 REQUIREMENTS (E.G. ZINC-RICH PAINT ON ALL WELDS). IF POLYMER COATINGS ARE USED THE REPAIR OF DAMAGED COATINGS WILL BE IN CONFORMANCE WITH AASHTO M 245 SECTION 11 REQUIREMENTS.
- ACCESS LADDERS SHALL BE ATTACHED BY THE MANUFACTURER PRIOR TO DELIVERY, NOT INSTALLED ON THE JOBSITE.



ASSEMBLY
TOTAL STORAGE PROVIDED = 15000 CF

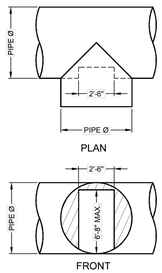


CONTECH 96" CHAMBER 2 (EAST)
N.T.S.

NOTES

- THE PIPE SHOULD BE FULLY PERFORATED IN ACCORDANCE WITH AASHTO M 36, SECTION 8.3.2.2, AND USING CLASS 2 PERFORATIONS. THE TOTAL OPEN AREA OF THE PERFORATIONS WILL BE A MINIMUM OF 2.3% OF THE PIPE SURFACE AREA.
- BULKHEADS SHALL BE 12-GAGE OR HEAVIER STEEL AND THE COATING WILL MATCH THE SPECIFIED CMP COATING. BULKHEAD PLATES SHALL BE FULLY WELDED ONTO THE CMP WITH STEEL REINFORCEMENT AS REQUIRED. THE STEEL REINFORCEMENT SHALL BE POST COATED WITH ZINC RICH PAINT PER AASHTO M 36. BULKHEAD DESIGNS SHALL SATISFY THE REQUIREMENTS SHOWN IN CHAPTER 8 OF THE NCSPA CSP DESIGN MANUAL AND CALCULATIONS SHALL BE PROVIDED TO THE ENGINEER OF RECORD (EOR) FOR APPROVAL UPON REQUEST.
- ALL FITTINGS SHALL BE STRUCTURALLY CHECKED FOR REINFORCEMENTS PER ASTM A998 AND PROVIDED TO THE EOR FOR APPROVAL UPON REQUEST.
- CONNECTING BANDS FOR INFILTRATION SYSTEMS SHALL BE ANY TYPE, BUT MUST BE AT LEAST 12" WIDE. BANDS SHALL MATCH THE SPECIFIED CMP COATING AND MEET THE REQUIREMENTS OF AASHTO M 36.
- ALL METALLIC COATINGS AFFECTED BY MANUFACTURING FABRICATION SHALL BE REPAIRED PE AASHTO M 36 SECTION 11 REQUIREMENTS (E.G. ZINC-RICH PAINT ON ALL WELDS). IF POLYMER COATINGS ARE USED THE REPAIR OF DAMAGED COATINGS WILL BE IN CONFORMANCE WITH AASHTO M 245 SECTION 11 REQUIREMENTS.
- ACCESS LADDERS SHALL BE ATTACHED BY THE MANUFACTURER PRIOR TO DELIVERY, NOT INSTALLED ON THE JOBSITE.

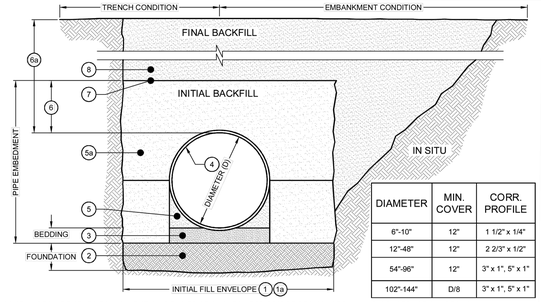
TYPICAL SECTION VIEW
NOT TO SCALE



NOTES:
1. PERFORATIONS MEET AASHTO AND ASTM SPECIFICATIONS.
2. PERFORATION OPEN AREA PER SQUARE FOOT OF PIPE IS BASED ON THE NOMINAL DIAMETER AND LENGTH OF PIPE.
3. DIMENSIONS SUBJECT TO MANUFACTURER'S TOLERANCES.
4. ALL HOLES 3/8"Ø.

EXFILTRATION AREA
STANDARD PERFORATION PATTERNS

APPROXIMATE AREA PER LINEAR FOOT OF PIPE				
PIPE	CORRUGATION PATTERN			
	2 2/3" x 1/2"	3" x 1"	5" x 1"	ULTRA FLO
96"Ø	97.7 SQ. IN.	103.2 SQ. IN.	100.4 SQ. IN.	



NOTES:
- GAGE AND COATING LIMITATIONS APPLY. 5" x 1" IS NOT AVAILABLE IN ALUMINUM.
- DIMENSIONS SUBJECT TO MANUFACTURER'S TOLERANCES.

TYPICAL PERFORATION DETAIL
NOT TO SCALE

96"Ø to 144"Ø FITTING REINFORCEMENT MAY BE REQUIRED BASED ON HEIGHT OF COVER AND LIVE LOAD CONDITION

TYPICAL MANWAY DETAIL
NOT TO SCALE

DIAMETER	MIN. COVER	CORR. PROFILE
6"-10"	12"	1 1/2" x 1/4"
12"-48"	12"	2 2/3" x 1/2"
54"-96"	12"	3" x 1", 5" x 1"
102"-144"	D/8	3" x 1", 5" x 1"

BACKFILL REQUIREMENTS FOLLOW THE GUIDELINES OF AASHTO LRFD BRIDGE DESIGN (SEC 12) AND CONSTRUCTION (SEC 26)

1 MINIMUM TRENCH WIDTH MUST ALLOW ROOM FOR PROPER COMPACTION OF HAUNCH MATERIALS UNDER THE PIPE. THE MINIMUM TRENCH WIDTH (12.6.6.1):
PIPE ≤ 12": D + 16"
PIPE > 12": 1.5D + 12"

1a MINIMUM EMBANKMENT WIDTH (IN FEET) FOR INITIAL FILL ENVELOPE (12.6.6.2):
PIPE < 24": 3.0D
PIPE 24" - 144": D + 4'0"
PIPE > 144": D + 10'0"

2 THE FOUNDATION UNDER THE PIPE AND SIDE BACKFILL SHALL BE ADEQUATE TO SUPPORT THE LOADS ACTING UPON IT (26.5.2).

3 BEDDING MATERIAL SHALL BE A RELATIVELY LOOSE GRANULAR MATERIAL THAT IS ROUGHLY SHAPED TO FIT THE BOTTOM OF THE PIPE, AND A MINIMUM OF TWICE THE CORRUGATION DEPTH IN THICKNESS, WITH THE MAXIMUM PARTICLE SIZE OF ONE-HALF OF THE CORRUGATION DEPTH (26.3.8.1, 26.5.3).

4 PERFORATED CORRUGATED STEEL PIPE (CSP / HEL-COR).

5 HAUNCH ZONE MATERIAL SHALL BE HAND SHOVELED OR SHOVEL SLICED INTO PLACE TO ALLOW FOR PROPER COMPACTION (26.5.4).

5a BACKFILL MATERIAL SHALL BE A CLEAN, CRUSHED STONE MEETING SIZE NO. 3 OR 4, PER AASHTO M 43. IT IS RECOMMENDED THAT LIFTS NOT EXCEED AN 8" UNCOMPACTED LIFT HEIGHT TO PREVENT UNEVEN LOADING, AND THE LESSER OF 1/3 THE DIAMETER OR 24" AS THE MAXIMUM DIFFERENTIAL SIDE-TO-SIDE. COMPACTION OF ALL PLACED FILL MATERIAL IS NECESSARY AND SHALL BE CONSIDERED ADEQUATE WHEN NO FURTHER YIELDING OF THE MATERIAL IS OBSERVED UNDER THE COMPACTOR, OR UNDER FOOT, AND THE PROJECT ENGINEER, OR THEIR REPRESENTATIVE, IS SATISFIED WITH THE LEVEL OF COMPACTION (26.5.4).

6 INITIAL BACKFILL ABOVE PIPE MAY INCLUDE ROAD BASE MATERIAL (AND RIGID PAVEMENT IF APPLICABLE). SEE TABLE ABOVE.

6a TOTAL HEIGHT OF COMPACTED COVER FOR CONVENTIONAL HIGHWAY LOADS IS MEASURED FROM TOP OF PIPE TO BOTTOM OF FLEXIBLE PAVEMENT OR TOP OF RIGID PAVEMENT (12.6.6.3).

7 GEOTEXTILE SHALL BE USED TO WRAP TRENCH SIDES AND TOP ONLY TO PREVENT SOIL MIGRATION INTO VARYING SOIL TYPES (PROJECT ENGINEER).

8 FINAL BACKFILL MATERIAL SELECTION AND COMPACTION REQUIREMENTS SHALL FOLLOW THE PROJECT PLANS AND SPECIFICATIONS PER THE ENGINEER OF RECORD (26.5.4.1).

NOTES:
- FOR MULTIPLE BARREL INSTALLATIONS THE RECOMMENDED STANDARD SPACING BETWEEN PARALLEL PIPE RUNS SHALL BE PIPE DIA./2 BUT NO LESS THAN 12", OR 36" FOR PIPE DIAMETERS 72" AND LARGER. CONTACT YOUR CONTECH REPRESENTATIVE FOR NONSTANDARD SPACING (TABLE C12.6.7-1).

VIPER L OPTICS STRIKE

LARGE VIPER LUMINAIRE

Cat.#

Job

Type

SL2,SL3,SL5

BEACON design . performance . technology

Approvals

SPECIFICATIONS

Intended Use:

The Beacon Viper luminaire is available in two sizes with a wide choice of different LED wattage configurations and optical distributions designed to replace HID lighting up to 1000W MH or HPS. Luminaires are suitable for wet locations.

Construction:

- Manufactured with die cast aluminum.
- Coated with a polyester finish that meets ASTM B117 corrosion test requirements and ASTM D522 cracking and loss of adhesion test requirements.
- External hardware is corrosion resistant.
- One piece optical cartridge system consisting of an LED engine, LED lamps, optics, gasket and stainless steel bezel.
- Cartridge is held together with internal brass standoffs soldered to the board so that it can be field replaced as a one piece optical system.
- Two-piece silicone and microcellular polyurethane foam gasket ensures a weather-proof seal around each individual optic.

Electrical:

- Luminaire accepts 100V through 277V, 50 Hz to 60 Hz (UNV), 347V, or 480V input.
- Power factor is ≥ .90 at full load.
- Dimming Drivers are standard and dimming leads are extended out of the luminaire unless control options require connection to the dimming leads. Must specify if wiring leads are to be greater than the 6" standard.
- Component-to-component wiring within the luminaire may carry no more than 80% of rated load and is certified by UL for use at 600VAC at 90°C or higher.
- Plug disconnects are certified by UL for use at 600 VAC, 13A or higher. 13A rating applies to primary (AC) side only.
- Fixture electrical compartment shall contain all LED driver components
- Optional 7-pin ANSI C136.41-2013 twist-lock photo control receptacle available. Compatible with ANSI C136.41 external wireless control devices.
- Ambient operating temperature -40°C to 40°C
- Surge protection - 20kA.
- Lifeshield™ Circuit - protects luminaire from excessive temperature. The device shall activate at a specific, factory-preset temperature, and progressively reduce power over a finite temperature range. Operation shall be smooth and undetectable to the eye. Thermal circuit is designed to "fail on", allowing the luminaire to revert to full power in the event of an interruption of its power supply, or faulty wiring connection to the drivers. The device shall be able to co-exist with other 0-10V control devices (occupancy sensors, external dimmers, etc.).
- Please consult brand or sales representative when combining control and electrical options as some combinations may not operate as anticipated depending on your application.

Installation:

- Mounting options for horizontal arm, vertical tenon or traditional arm mounting available. Mounting hardware included.

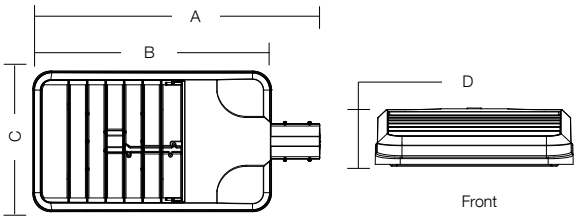
Finish:

- IFS polyester powder-coat electrostatically applied and thermocured. IFS finish consists of a five stage pretreatment regimen with a polymer primer sealer and top coated with a thermoset super TGIC polyester powder coat finish.
- The finish meets the AAMA 2604 performance specification which includes passing a 3000 hour salt spray test for corrosion resistance and resists cracking or loss of adhesion per ASTM D522 and resists surface impacts of up to 160 inch-pounds.

Certifications/Ratings:

- Certified to UL 1598, UL 8750, and CSA C22.2
- 3G rated for ANSI C136.31 high vibration applications with MAF mounting
- IDA approved
- This product is approved by the Florida Fish and Wildlife Conservation Commission.

Warranty:



Five year limited warranty for more information visit:

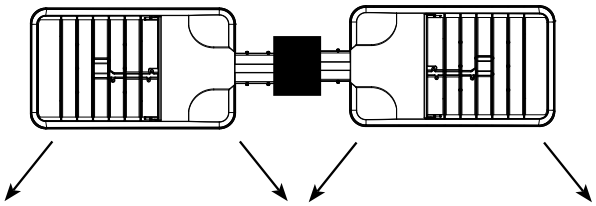
- **CC** Custom Color

OPTIONS
- **CD** Continuous Dimming
- **F** Fusing
- **BSP** Bird Spikes
- **BC** Backshield (available for FR, 2, 3, 4, 4W Optics)
- **TB** Terminal Block

DISTRIBUTION
- **FR** Type 1/Front Row
- **2** Type 2
- **3** Type 3
- **4F (formerly 4)** Type 4
- **4W** Type 4 Wide
- **5QM** Type 5QM
- **5QN** Type 5QN
- **5R** Type 5R (rectangular)
- **5W** Type 5W (round wide)
- **TC** Tennis Court

MOUNTING
- **A** Rectangular Arm (formerly RA) for square or round pole
- **MAF** Mast Arm Fitter (formerly SF2) for 2-3/8" OD horizontal arm
- **K** Knuckle (formerly PK2) limit to 30° tilt or 2-3/8" OD horizontal arm or vertical tenon
- **WB** Wall Bracket
- **AD** Universal Arm for square pole
- **AD3** Universal Arm for 2.4"-4.1" round pole
- **AD4** Universal Arm for 4.2" -5.3" round pole
- **AD5** Universal Arm for 5.5" -5.9" round pole
- **AD6** Universal Arm for 6.0"-6.5" round pole

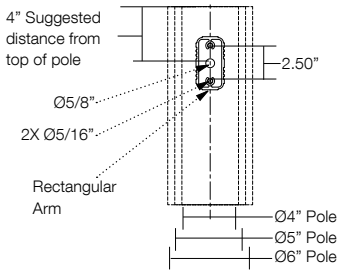
CONTROL OPTIONS
- **7PR** 7-Pin Receptacle only (shorting cap, photo control, or wireless control provided by others)
- **PCR-SC** 7-Pin Receptacle w/Shorting Cap
- **PCR-TL** 7-Pin Receptacle w/Twist Lock photo control



HOUSE SIDE SHIELD ACCESSORIES
- **HSS/EVP-L/90-FB/XXX** 90° shield front or back
- **HSS/EVP-L/90-LR/XXX** 90° shield left or right
- **HSS/EVP-L/270-FB/XXX** 270° shield front or back
- **HSS/EVP-L/270-LR/XXX** 270° shield left or right
- **HSS/EVP-L/360/XXX** Full shield

(Replace XXX with notation for desired finish color)
(Refer to page 5 for shield images)

MOUNTING ACCESSORIES
- **VPL-AD-RPA3** 2.4"-4.1" Round Pole Adapter for AD arm
- **VPL-AD-RPA4** 4.2"-5.3" Round Pole Adapter for AD arm
- **VPL-AD-RPA5** 5.5"-5.9" Round Pole Adapter for AD arm
- **VPL-AD-RPA6** 6.0"-6.5" Round Pole Adapter for AD arm



[1] Only available with FR, 2, 3, 4, 4W and 5R distributions

LEFT ROTATED OPTIC **RIGHT ROTATED OPTIC**

DRILL PATTERN

COLONIAL

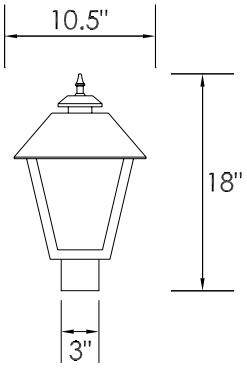
PROJECT:	
MODEL #:	
FIXTURE TYPE:	SL4

STANDARD SPECIFICATIONS

HOUSING
The traditional styling is constructed from an injection molded UV stabilized polycarbonate housing.

DIFFUSER
UV stabilized acrylic panels slip easily into position on all four sides of the housing. The panels are frosted to create a soft glow of light and disguise the lamp source.

LED PERFORMANCE - 3500K STANDARD
120-277V - 3500K, 82 CRI - L80 rating - 60,000 hrs - L70 rating (projected) - 100,000 hrs
Amperage rated @ 110V input
Operating ambient temperature: -20°C / -4°F - 40°C / 104°F



Delivered 3500K lumens noted. Consult Brownlee.com for performance of all CCTs.
B12 - 12W nominal, .10 A input - 1254 lm. Dimmable (0-10V).
C17 - 16W nominal, .15 A input - 1812 lm. Dimmable (0-10V).
C24 - 23W nominal, .20 A input - 2486 lm. Dimmable (0-10V).

MOUNTING
The 7080 series has a fitter designed for 3" diameter poles.

FINISH
This series is available in a standard black polyester powder coat.

WARRANTY
3 year limited warranty on this LED product. Consult factory for details.

WET

SUPPORTS T24 COMPLIANCE

EVERGREEN LIGHTING

Catalog #		Type
Project		WP1
Description		Date

FLORENCE

WALL MOUNT

Standard Features

Material
Paintlok sheet; Standard Powdercoat Finish, White Acrylic Lens; .125 thickness, ETL Wet Location.

Installation
Mounting/wireway hole in center of backplate. Supplied with standard mounting hardware to mount to a 4" J-box or plaster ring.

Optics*
Contact Evergreen Lighting for complete photometrics.

LED Features

LED
Alta LED #AL-R-1W-30LED array to be mounted onto an Aluminum MPCB Board configured to the proper wattage. The LED arrays will be centered within the Lens area and mounted on a white aluminum reflective plate.

Driver
Specific Drivers will be matched with each different LED array configuration/wattage.
Standard Driver Features:
- Constant Current
- 3 / 5 year warranty
- 120/277 multi-voltage power supplies
- Kelvin - 2700K, 3000K, 3500K, 4100K, 5000K

Fluorescent Features

Ballast
SC programmed electronic high power factor ballast, multivoltage 120V/277V.
Lamps not included

Finishes

Ballast

SUBJECT: **Habitat Assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis for the Proposed "Village at Junipero" Project Located within Assessor Parcel Numbers (APNs) 333-070-018, -019, and -053 in the City of Menifee, Riverside County, California**

Introduction

This report contains the findings of ELMT Consulting's (ELMT) habitat assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis for the proposed "Village at Junipero" project (project site or site) located in the City of Menifee, Riverside County, California. The habitat assessment was conducted by ELMT biologist Travis J. McGill on July 29, 2022, to update baseline conditions, previously assessed in March 2020, and to re-evaluate the potential for special-status[1] plant and wildlife species to occur within the proposed project site that could pose a constraint to implementation of the proposed project. Special attention was given to the suitability of the on-site habitat to support burrowing owl (*Athene cunicularia*) and several other special-status species identified by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and other electronic databases as potentially occurring on or within the general vicinity of the project.

The Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map was queried to determine if the MSHCP identifies any potential survey requirements for the project. Further, the project site was reviewed against the MSHCP to determine if the site is located within any MSHCP areas including Criteria Cells (core habitat and wildlife movement corridors) or areas proposed for conservation. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is located within the Sun City/Menifee Valley Area Plan of the MSHCP but is not located within any Criteria Cells or MSHCP Conservation Areas. Further, it was determined that the project site is only located within the designated survey area for burrowing owl (*Athene cuincularia*).

1 As used in this report, "special-status" refers to plant and wildlife species that are federally, State, and MSHCP listed, proposed, or candidates; plant species that have been designated with a California Native Plant Society Rare Plant Rank; wildlife species that are designated by the CDFW as fully protected, species of special concern, or watch list species; and specially protected natural vegetation communities as designated by the CDFW.

Project Location

The project site is generally located east of Interstate 215, south of State Route 74, west of State Route 79, and north of Domenigoni Parkway in the City of Menifee, Riverside County, California. The project site is depicted on the Romoland quadrangle of the United States Geological Survey's (USGS) 7.5-minute topographic map within Section 23 of Township 5 South, Range 3 West. Specifically, the project site is bordered by Menifee Road on its eastern boundary, Junipero Road on its western boundary, a new residential development to the north, approximately 600 feet north of McCall Boulevard within Assessor Parcel Numbers (APN) 333-070-018, -019, and -053. Refer to Exhibits 1- 3 in Attachment A.

Project Description

The "Village at Junipero" Project (Major Plot Plan No. PLN22-0030) is being proposed in the City of Menifee (City). The 19.25-acre project site is currently vacant and located north of McCall Blvd, east of Junipero Road, south of Heritage Lakes Drive, and west of Menifee Road (APN: 333-070-018, 333-070-019 & 333-070-053). The site is adjacent to existing residential uses to the east, approved residential uses to the north, approved commercial uses to the south, and Boulder Ridge Elementary School to the west.

This project is a proposed multi-family residential development of 240 market-rate apartments with a gross density of 12.5 units per acre. The proposed apartment complex consists of 24 buildings containing ten (10) units per building with individual unit sizes ranging from one to three bedrooms. Each unit containing a one- or two-car garage and a total of 480 surface parking spaces are proposed. The project proposes a community pool area and clubhouse, along with additional community gathering areas such as a tot lot, a dog park, and internal paseos containing BBQ areas and tables/chairs.

Methodology

Literature Review

The first step in determining if a project is consistent with the above listed sections of the MSHCP is to conduct a literature review and records search for special-status biological resources potentially occurring on or within the vicinity of the project site. Previously recorded occurrences of special-status plant and wildlife species and their proximity to the project were determined through a query of the CDFWs CNDDB Rarefind 5, the California Native Plant Society (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California, Calflora Database, compendia of special-status species published by CDFW, United States Fish and Wildlife Service (USFWS) species listings, and species covered within the MSHCP and associated technical documents.

All available reports, survey results, and literature detailing the biological resources previously observed on or within the vicinity of the project site were reviewed to understand existing site conditions and note the extent of any disturbances that have occurred on the project site that would otherwise limit the distribution of special-status biological resources. Standard field guides and texts were reviewed for specific habitat requirements of special-status and non-special-status biological resources, as well as the following resources:

- Environmental Protection Agency (EPA) Water Program "My Waters" data layers
- Google Earth Pro historic aerial imagery (1985-2022);

- United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), Soil Survey[2];
- USFWS Critical Habitat designations for Threatened and Endangered Species;
- USFWS National Wetlands Inventory (NWI);
- Stephen's Kangaroo Rat Habitat Conservation Plan;
- Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map; and
- 2006 Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area.

The literature review provided a baseline from which to inventory the biological resources potentially occurring on the project site. The CNDDB database was used, in conjunction with ArcGIS software, to locate the nearest recorded occurrences of special-status species and determine the distance from the project.

Habitat Assessment/Field Investigation

Following the literature review, biologist Travis J. McGill on inventoried and evaluated the condition of the habitat within the project site on July 29, 2022. An initial field investigation was conducted in March 2020. Plant communities identified on aerial photographs during the literature review were verified by walking meandering transects through the plant communities and along boundaries between plant communities. In addition, aerial photography was reviewed prior to the site investigation to locate potential natural corridors and linkages that may support the movement of wildlife through the area. These areas identified on aerial photography were then walked during the field survey.

All plant and wildlife species observed, as well as dominant plant species within each plant community, were recorded. Plant species observed during the field survey were identified by visual characteristics and morphology in the field. Unusual and less familiar plant species were photographed during the field survey and identified in the laboratory using taxonomical guides. Wildlife detections were made through observation of scat, trails, tracks, burrows, nests, and/or visual and aural observation. In addition, site characteristics such as soil condition, topography, hydrology, anthropogenic disturbances, indicator species, condition of on-site plant communities, and presence of potential jurisdictional drainage and/or wetland features were noted.

Soil Series Assessment

On-site and adjoining soils were researched prior to the field survey using the USDA NRCS Soil Survey for Western Riverside Area, California. In addition, a review of the local geological conditions and historical aerial photographs was conducted to assess the ecological changes that the project site has undergone.

[2] A soil series is defined as a group of soils with similar profiles developed from similar parent materials under comparable climatic and vegetation conditions. These profiles include major horizons with similar thickness, arrangement, and other important characteristics, which may promote favorable conditions for certain biological resources.

Plant Communities

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photography. The plant communities were delineated on an aerial photograph, classified in accordance with those described in the MSHCP, and then digitized into GIS Arcview. The Arcview application was used to compute the area of each plant community in acres.

Plants

Common plant species observed during the field survey were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less-familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

Wildlife

Wildlife species detected during field surveys by sight, calls, tracks, scat, or other sign were recorded during surveys in a field notebook. Field guides were used to assist with identification of wildlife species during the survey included The Sibley Field Guide to the Birds of Western North America (Sibley 2003), A Field Guide to Western Reptiles and Amphibians (Stebbins 2003), and A Field Guide to Mammals of North America (Reid 2006). Although common names of wildlife species are fairly well standardized, scientific names are provided immediately following common names in this report (first reference only).

Jurisdictional Drainages and Wetlands

Aerial photography was reviewed prior to conducting a field investigation in order to locate and inspect any potential natural drainage features, ponded areas, or water bodies that may fall under the jurisdiction of the United States Army Corps of Engineers (Corps), Regional Water Quality Control Board (Regional Board), or CDFW. In general, surface drainage features indicated as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory jurisdiction. In addition, ELMT reviewed jurisdictional waters information through examining historical aerial photographs to gain an understanding of the impact of land-use on natural drainage patterns in the area. The USFWS National Wetland Inventory (NWI) and Environmental Protection Agency (EPA) Water Program "My Waters" data layers were also reviewed to determine whether any hydrologic features and wetland areas have been documented on or within the vicinity of the project site.

Existing Site Condition

The project site is relatively flat with no areas of significant topographic relief at an approximate elevation of 1,457 to 1,469 feet above mean sea level. Based on the NRCS USDA Web Soil Survey, the project site is underlain by the following soil units: Cieneba rocky sandy loam (15 to 50 percent slopes), Exeter sandy loam (2 to 8 percent slopes, eroded), Exeter sandy loam (2 to 8 percent slopes, deep, eroded), Exeter very fine sandy loam (0 to 5 percent slopes, deep), Greenfield sandy loam (0 to 2 percent slopes), and Hanford coarse sandy loam (2 to 8 percent slopes). Refer to Exhibit 4, *Soils*, in Attachment A. Soils on-site have

been mechanically disturbed and heavily compacted from historic land uses (i.e., agricultural activities, grading activities and surrounding development).

The project site is bordered by developments currently under construction to the north and northwest, residential development to the east, and a water detention basin, and a school to the west. Portions of the site have been used as staging areas to support adjacent construction. In association with the adjacent development, an underground storm drain was installed, extending north to the south, through the middle of the project site. The underground storm drain daylights into a constructed earthen trapezoidal channel north of the project site in association with the residential development to the north of the project site.

Vegetation

Due to historic land uses, no native plant communities or natural communities of special concern were observed on or adjacent to the project site. The project site primarily consists of vacant, undeveloped land that has been subject to a variety of anthropogenic disturbances that was historically used for agricultural land uses. The project site no longer is used for agricultural activities but has been subject to on-going weed abatement activities and disturbance associated with surrounding development. These disturbances have eliminated and/or greatly disturbed the natural plant communities that once occurred on and surrounded the project site. Refer to Attachment B, *Site Photographs*, for representative site photographs. No native plant communities will be impacted from implementation of the proposed project.

The project site supports one (1) plant community: non-native grassland, and one land type that would be classified as disturbed (refer to Exhibit 5, *Vegetation* in Attachment A). The non-native grassland plant community is found on both the eastern and western halves of the site where current construction and staging activities are absent. The non-native grassland plant community is dominated by non-native grasses that include mouse barley (*Hordeum murinum*), red brome (*Bromus madritensis*), filaree (*Erodium* sp.), fiddleneck (*Amsinckia menziesii*), and ripgut brome (*Bromus diandrus*). Other common plant species observed in this plant community include bicolor lupine (*Lupinus bicolor*), cheeseweed (*Malva parviflora*), alfalfa (*Medicago sativa*), slender goldfields (*Lasthenia gracilis*), London rocket (*Sisybrium irio*), sweet clover (*Melilotus officinalis*), stinknet (*Oncosiphon piluliferum*), telegraph weed (*Heterotheca grandiflora*), and tidytips (*Layia platyglossa*).

Areas within the project site that are classified as disturbed include those that currently support ongoing construction and staging activities associated with adjacent development. These areas are entirely devoid of vegetation or support minimal weedy/early successional species like short-podded mustard and filaree.

Wildlife

Plant communities provide foraging habitat, nesting/denning sites, and shelter from adverse weather or predation. This section provides a discussion of those wildlife species that were observed or are expected to occur within the project site. The discussion is to be used a general reference and is limited by the season, time of day, and weather conditions in which the field survey was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation.

Fish

The MSHCP does not identify any covered or special-status fish species as potentially occurring within the project site. No fish or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for fish were observed on or within the vicinity of the project site. Therefore, no fish are expected to occur and are presumed absent.

Amphibians

The MSHCP does not identify any covered or special-status amphibian species as potentially occurring within the project site. No amphibians or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for amphibian species were observed on or within the vicinity of the project site. Therefore, no amphibians are expected to occur.

Reptiles

The MSHCP does not identify any covered or special-status reptilian species as potentially occurring within the project site. The project site provides a limited amount of habitat for a few reptile species adapted to a high degree of human disturbance associated with the on-site weed abatement activities and development. Common side-blotched lizard (*Uta stansburiana elegans*) was the only reptilian species observed during the field investigation. Other common reptilian species expected to occur include gopher snake (*Pituophis catenifer*), and southern alligator lizard (*Elgaria multicarinata*). Due to the high level of anthropogenic disturbances on-site, and surrounding development, no special-status reptilian species are expected to occur within project site.

Birds

The project site provides minimal foraging habitat for bird species adapted to a high degree of human disturbance. Bird species detected during the field survey included northern mockingbird (*Mimus polyglottos*), mourning dove (*Zenaida macroura*), house finch (*Haemorhouse mexicanus*), American crow (*Corcus brachyrhynchos*), red-tailed hawk (*Buteo jamaicensis*), Anna's hummingbird (*Calypte anna*), bushtit (*Psaltriparus minimus*), and lesser goldfinch (*Spinus psaltria*).

Mammals

The MSHCP does not identify any covered or special-status mammalian species as potentially occurring within the project site. No mammalian species were observed during the field investigation. Common mammalian species expected to occur include Audubon's cottontail (*Sylvilagus audubonii*), coyote (*Canis latrans*), opossum (*Didelphis virginiana*), California ground squirrel (*Otospermophilus beecheyi*) and raccoon (*Procyon lotor*). No bat species are expected to occur due to a lack of suitable roosting habitat (i.e., trees, crevices).

Nesting Birds and Raptors

No active nests or birds displaying nesting behavior were observed during the field survey, which was conducted during breeding season. Although subjected to routine disturbance, the ornamental vegetation found off-site along site boundaries has the potential to provide suitable nesting habitat for year-round and seasonal avian residents, as well as migrating songbirds that could occur in the area that area adapted to urban environments. Additionally, the disturbed portions of the site have to potential to support ground-

nesting birds such as killdeer. No raptors are expected to nest on-site due to lack of suitable nesting opportunities.

Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted within three (3) days of the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction.

Migratory Corridors and Linkages

Habitat linkages provide connections between larger habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species yet still inadequate for others. Wildlife corridors are features that allow for the dispersal, seasonal migration, breeding, and foraging of a variety of wildlife species. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

The project site has not been identified as occurring in a wildlife corridor or linkage. The proposed project will be confined to existing areas that have been heavily disturbed or developed, are isolated from regional wildlife corridors and linkages, and there are no riparian corridors, creeks, or useful patches of stepping stone habitat (natural areas) within or connecting the improvement areas to a recognized wildlife corridor or linkage. As such, implementation of the proposed project is not expected to impact wildlife movement opportunities. Therefore, impacts to wildlife corridors or linkages are not expected to occur.

Jurisdictional Areas

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates discharge of dredge or fill materials into "waters of the United States" pursuant to Section 404 of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFW regulates alterations to streambed and bank under Fish and Wildlife Code Sections 1600 et seq., and the Regional Board regulates discharges into surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

No jurisdictional drainage and/or wetland features were observed on the project site during the field investigation. Further no blueline streams have been recorded on the project site. Therefore, development of the project will not result in impacts to Corps, Regional Board, or CDFW jurisdiction and regulatory approvals will not be required.

It should be noted that in association with the adjacent development, an underground storm drain was installed, extending north to the south, through the middle of the project site. The underground storm drain daylights into a constructed earthen trapezoidal channel north of the project site in association with the residential development to the north of the project site. Since this underground storm drain and trapezoidal channel were constructed wholly in the uplands as part of the residential developments to convey storm

flows, and do not have a connection to downstream waters, they will fall under the regulatory authority of the Corps, Regional Board or CDFW.

Special-Status Biological Resources

The CNDDB was queried for reported locations of special-status plant and wildlife species as well as natural communities of special concern in the Romoland USGS 7.5-minute quadrangle. A search of published records within these quadrangles were conducted using the CNDDB Rarefind 5 online software and the CDFW BIOS database and the CNPS Inventory of Rare and Endangered Plants of California that supplied information regarding the distribution and habitats of vascular plants in the vicinity of the project site. The habitat assessment evaluated the conditions of the habitat(s) within the boundaries of the project site to determine if the existing plant communities, at the time of the survey, have the potential to provide suitable habitat(s) for special-status plant and wildlife species.

The literature search identified seventeen (17) special-status plant species, fifty (50) special-status wildlife species, and two (2) special-status habitats as having potential to occur within the Romoland quadrangle. Special-status plant and wildlife species were evaluated for their potential to occur within the project site based on habitat requirements, availability and quality of suitable habitat, and known distributions. Species determined to have the potential to occur within the general vicinity are presented in *Table C-1: Potentially Occurring Special-Status Biological Resources*, provided in Attachment C. Refer to Table C-1 for a determination regarding the potential occurrence of special-status plant and wildlife species within the project site.

Special-Status Plants

According to the CNDDB and CNPS, seventeen (17) special-status plant species have been recorded in the Romoland quadrangle (refer to Attachment C). The project site consists of vacant, undeveloped land that have been subject to a variety of anthropogenic disturbances from grading/disking activities, historic agricultural uses, and activities associated with surrounding development. These disturbances have resulted in a majority of the project site being dominated by early successional and non-native vegetation, which has reduced, if not eliminated, the ability of the project site to provide suitable habitat for special-status plant species. Although the field investigation was not conducted during the blooming season for the majority of the special-status plant species known to occur in the general vicinity of the project site, based on habitat requirements for specific special-status plant species and the availability and quality of habitats needed by each species, it was determined that the project site does not provide suitable habitat for special-status species know to occur in the area and are presumed absent due to the high level of disturbances the project site has been subject to.

Special-Status Wildlife

According to the CNDDB, fifty (50) special-status wildlife species have been reported in the Romoland quadrangle (refer to Attachment C). No special-status wildlife species were observed on-site during the habitat assessment. Based on habitat requirements for specific species and the availability and quality of on-site habitats, it was determined that the proposed project site has a moderate potential to support Cooper's hawk (*Accipiter cooperii*), and sharp-shinned hawk (*Accipiter striatus*); and a low potential to support great egret (*Ardea alba*), burrowing owl, white-tailed kite (*Elanus leucurus*), and California horned

lark (*Eremophila alpestris actia*). Further it was determined that the project site does not provide suitable habitat for any of the other special-status wildlife species known to occur in the area since the project site has been heavily disturbed from on-site disturbances and surrounding development.

To ensure no impacts to the aforementioned species do not occur from implementation of the proposed project, a pre-construction nesting bird clearance survey shall be conducted prior to ground disturbance. With implementation of the pre-construction nesting bird clearance survey, impacts to the aforementioned species will be less than significant and no mitigation will be required.

Special-Status Plant Communities

The CNDDB lists two (2) special-status habitats as being identified within the Romoland quadrangle: Southern Coast Live Oak Riparian Forest and Southern Cottonwood Willow Riparian Forest. No CDFW special-status plant communities occur within the boundaries of the project site.

Critical Habitat

Under the federal Endangered Species Act, "Critical Habitat" is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the United States Fish and Wildlife Service (USFWS) regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a CWA Permit from the Corps). If a there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The project site is not located with federally designated Critical Habitat (refer to Exhibit 6, *Critical Habitat*, in Attachment A). The closest designated Critical Habitat is located approximately 3.6 miles northwest of the project site for spreading navarretia (*Navarretia fossalis*) and thread-leaved brodiaea (*Brodiaea filifolia*) along the San Jacinto River, and approximalty 4.10 miles southeast of the project site for coastal California gnatcatcher (*Polioptila californica californica*). Therefore, the loss or adverse modification of Critical Habitat will not occur as a result of the proposed project and consultation with the USFWS will not be required for implementation of the proposed project.

Western Riverside County MSHCP

The project site is located within the Sun City/Menifee Valley Area Plan of the MSHCP but are not located within any Criteria Cells or MSHCP Conservation Areas (refer to Exhibit 7, *MSHCP Criteria Area*, in Attachment A). Additionally, the project is only located within the designated survey area for burrowing owl as depicted in Figures 6-4 within Section 6.3.2 of the MSHCP.

- Amphibian — Not in an amphibian survey area
- Burrowing Owls — Burrowing Owl Survey Area
- Criteria Area Species — Not in a criteria area species survey area
- Mammals — Not in a mammal survey area
- Narrow Endemic Plants — Not in a narrow endemic plant survey area

The City of Menifee is a permittee under the MSHCP and, while the project is not specifically identified as a Covered Activity in the MSHCP, under Section 7.3.1, *Public and Private Development Consistent with MSHCP Criteria*, public and private development within the Criteria Area that is determined to be consistent with the Criteria is considered a Covered Activity. As such, to achieve coverage, the project must be consistent with the following policies of the MSHCP:

Since the City is a permittee under the MSHCP and, while the project is not specifically identified as a Covered Activity under Section 7.1 of the MSHCP, public and private development that are outside of Criteria Areas and Public/Quasi-Public (PQP) Lands are permitted under the MSHCP, subject to consistency with MSHCP policies that apply to area outside of Criteria Areas. As such, to achieve coverage, the project must be consistent with the following policies of the MSHCP:

- The policies for the protection of species associated with Riparian/Riverine areas and vernal pools as set forth in Section 6.1.2 of the MSHCP;
- The policies for the protection of Narrow Endemic Plant Species as set forth in Section 6.1.3 of the MSHCP;
- Guidelines pertaining to the Urban/Wildlands Interface intended to address indirect effects associated with locating Development in proximity to the MSHCP Conservation Area as detailed in Section 6.1.4 of the MSHCP;
- The requirements for conducting additional surveys as set forth in Section 6.3.2 of the MSHCP; and
- A Habitat Evaluation Acquisition Negotiation Strategy (HANS) as set forth in Section 6.1.1 of the MSHCP.

Riparian/Riverine Areas and Vernal Pools

Riparian/Riverine Areas

As identified in Section 6.1.2 of the MSHCP, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools,* riparian/riverine areas are defined as areas dominated by trees, shrubs, persistent emergent plants, or emergent mosses and lichens which occur close to or are dependent upon nearby freshwater, or areas with freshwater flowing during all or a portion of the year. Conservation of these areas is intended to protect habitat that is essential to a number of listed or special-status water-dependent fish, amphibian, avian, and plant species. If impacts to riparian/riverine habitat cannot be avoided, a Determination of Biologically Equivalent or Superior Preservation (DBESP) must be developed to address the replacement of lost functions of habitats in regards to the listed species. This assessment is independent from considerations given to "waters of the U.S." and "waters of the State" under the CWA and the California Fish and Game Code.

No jurisdictional drainages, riparian/riverine and/or wetland features were observed within the project site during the field investigation. Therefore, development of the proposed project will not result in impacts to riparian/riverine habitats and a DBESP will not be required for the loss of riparian/riverine habitat from development of the proposed project.

Vernal Pools and Fairy Shrimp Habitat

One of the factors for determining the suitability of the habitat for fairy shrimp would be demonstrable evidence of seasonal ponding in an area of topographic depression that is not subject to flowing waters. These astatic pools are typically characterized as vernal pools. More specifically, vernal pools are seasonal wetlands that occur in depression areas without a continual source of water. They have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology is made on a case-by-case basis. Such determinations should be considered the length of time the areas exhibit upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. The seasonal hydrology of vernal pools provides for a unique environment, which supports plants and invertebrates specifically adapted to a regime of winter inundation, followed by an extended period when the pool soils are dry.

Vernal pools are seasonally inundated, ponded areas that only form in regions where specialized soil and climatic conditions exist. During fall and winter rains typical of Mediterranean climates, water collects in shallow depressions where downward percolation of water is prevented by the presence of a hard pan or clay pan layer (duripan) below the soil surface. Later in the spring when rains decrease and the weather warms, the water evaporates and the pools generally disappear by May. The shallow depressions remain relatively dry until late fall and early winter with the advent of greater precipitation and cooler temperatures. Vernal pools provide unusual "flood and drought" habitat conditions to which certain plant and wildlife species have specifically adapted as well as invertebrate species such as fairy shrimp.

The MSHCP lists two general classes of soils known to be associated with listed and special-status plant species; clay soils and Traver-Domino Willow association soils. The specific clay soils known to be associated with listed and special-status species within the MSHCP plan area include Bosanko, Auld, Altamont, and Porterville series soils, whereas Traver-Domino Willows association includes saline-alkali soils largely located along floodplain areas of the San Jacinto River and Salt Creek. Without the appropriate soils to create the impermeable restrictive layer, none of the special-status plant or wildlife species associated with vernal pools can occur on the project site. None of these soils have been documented within the project site.

A review of recent and historic aerial photographs (1985-2022) of the project site did not provide visual evidence of an astatic or vernal pool conditions within the project site. No ponding was observed, further supporting the fact that the drainage patterns currently occurring on the project site do not follow hydrologic regime needed for vernal pools. From this review of historic aerial photographs and observations during

the field investigations, it can be concluded that there is no indication of vernal pools or suitable fairy shrimp habitat occurring within the proposed project site.

Fairy Shrimp Habitat

Riverside fairy shrimp (*Streptocephalus woottoni*)

Riverside fairy shrimp are restricted to deep seasonal vernal pools, vernal pool like ephemeral ponds, and stock ponds and other human modified depressions The prefer warm-water pools that have low to moderate dissolved solids, are less predictable, and remained filled for extended periods of time. Basins that support Riverside fairy shrimp are typically dry a portion of the year, but usually are filled by late fall, winter or spring rains, and may persist through May. Know habitat occur within annual grasslands, which may be interspersed through chaparral or coastal sage scrub vegetation. In Riverside County, Riverside fairy shrimp have been found in pools formed over the following soils: Murrieta stony clay loams, Las Posas series, Wyman clay loam, and Willows soils.

The project site is underlain by Cieneba rocky sandy loam, Exeter sandy loam, Exeter very fine sandy loam, Greenfield sandy loam, and Hanford coarse sandy loam. The aforementioned soils that Riverside fairy shrimp are typically associated with in Riverside County do not occur onsite. Soils on-site have been mechanically disturbed and heavily compacted from historic land uses (i.e., historic agricultural activities and surrounding development). Due to the lack of soils associated with Riverside fairy shrimp, onsite anthropogenic disturbances, and no indicators of water ponding or astatic water conditions, the site was determined not to provide suitable habitat for Riverside fairy shrimp.

Santa Rosa Plateau fairy shrimp (*Linderiella santarosae*)

Santa Rosa Plateau fairy shrimp are restricted to seasonal southern basalt flow vernal pools with cool clear to milky waters that are moderately predictable and remain filled for extended periods of time and are known only from vernal pool on the Santa Rosa Plateau. Since the project site is not located within the known area where Santa Rosa Plateau fairy shrimp have been documented, and no indicators of water ponding or astatic water conditions, the site was determined not to provide suitable habitat for Santa Rosa Plateau fairy shrimp.

Vernal pool fairy shrimp (*Branchinecta lynchi*)

Vernal pool fairy shrimp are restricted to seasonal vernal pools (vernal pools and alkali vernal pools) and prefer cool-water pools that have low to moderate dissolved solids, are unpredictable, and often short lived. The vernal pool fairy shrimp is known from four locations in Western Riverside County MSHCP Plan Area: Skunk Hollow, the Santa Rosa Plateau, Salt Creek, and the vicinity of the Pechanga Indian Reservation. Since the project site is not located within or adjacent to the four know populations, and no indicators of water ponding or astatic water conditions, the site was determined not to provide suitable habitat for vernal pool fairy shrimp.

Narrow Endemic Plant Species

Section 6.1.3 of the MSHCP, *Protection of Narrow Endemic Plant Species*, states that the MSHCP database does not provide sufficient detail to determine the extent of the presence/distribution of Narrow Endemic

Plant Species within the MSHCP Plan Area. Additional surveys may be needed to gather information to determine the presence/absence of these species to ensure that appropriate conservation of these species occurs. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is not located within the designated survey area for Narrow Endemic Plant Species. Through the field investigation, it was determined that the project site does not provide suitable habitat for any of the Narrow Endemic Plant Species listed under Section 6.1.3 of the MSHCP, and, therefore, the project is consistent with Section 6.1.3 of the MSHCP. No additional surveys or analysis is required.

Additional Survey Needs and Procedures

In accordance with Section 6.3.2 of the MSHCP, *Additional Survey Needs and Procedures*, additional surveys may be needed for certain species in order to achieve coverage for these species. The query of the RCA MSHCP Information Map and review of the MSHCP determined that the project site is located within the designated survey area for burrowing owl as depicted in Figure 6-4 within Section 6.3.2 of the MSHCP. No other special-status wildlife species surveys were identified.

Burrowing Owl

Burrowing owl is currently designated as a California Species of Special Concern. The burrowing owl is a grassland specialist distributed throughout western North America where it occupies open areas with short vegetation and bare ground within shrub, desert, and grassland environments. Burrowing owls use a wide variety of arid and semi-arid environments with level to gently-sloping areas characterized by open vegetation and bare ground. The western burrowing owl (*A.c. hypugaea*), which occurs throughout the western United States including California, rarely digs its own burrows and is instead dependent upon the presence of burrowing mammals (i.e., California ground squirrels, coyotes, and badgers) whose burrows are often used for roosting and nesting. The presence or absence of colonial mammal burrows is often a major factor that limits the presence or absence of burrowing owls. Where mammal burrows are scarce, burrowing owls have been found occupying man-made cavities, such as buried and non-functioning drain pipes, stand-pipes, and dry culverts. They also require low growth or open vegetation allowing line-of-sight observation of the surrounding habitat to forage and watch for predators. In California, the burrowing owl breeding season extends from the beginning of February through the end of August.

Under the MSHCP burrowing owl is considered an adequately conserved covered species that may still require focused surveys in certain areas as designated in Figure 6-4 of the MSHCP. The project site occurs within the MSHCP burrowing owl survey area and a habitat assessment was conducted for the species to ensure compliance with MSHCP guidelines for the species. In accordance with the MSHCP Burrowing Owl Survey Instructions (2006), survey protocol consists of two steps, Step I – Habitat Assessment and Step II – Locating Burrows and Burrowing Owls. The following section describes the methodology followed during the burrowing owl habitat assessment conducted for this project.

- Step I – Habitat Assessment: Step 1 of the MSHCP habitat assessment for burrowing owl consists of a walking survey to determine if suitable habitat is present onsite. The habitat assessment was conducted on July 29, 2022. Upon arrival at the project site, and prior to initiating the assessment survey, binoculars were used to scan all suitable habitats on and adjacent to the property, including perch locations, to establish owl presence.

All suitable areas of the project site were surveyed on foot by walking slowly and methodically while recording/mapping areas that may represent suitable owl habitat onsite. Primary indicators of suitable burrowing owl habitat in western Riverside County include, but are not limited to, native and non-native grassland, interstitial grassland within shrub lands, shrub lands with low density shrub cover, golf courses, drainage ditches, earthen berms, unpaved airfields, pastureland, dairies, fallow fields, and agricultural use areas. Burrowing owls typically use burrows made by fossorial mammals, but they often utilize man-made structures, such as earthen berms, cement culverts, cement, asphalt, rock, wood debris piles, openings beneath cement or asphalt pavement. Burrowing owls are often found within, under, or in close proximity to man-made structures.

According to the MSHCP guidelines, if suitable habitat is present, the biologist should also walk the perimeter of the property, which consists of a 150-meter (approximately 500 feet) buffer zone around the project site boundary. If permission to access the buffer area cannot be obtained, the biologist shall not trespass, but visually inspect adjacent habitats with binoculars. In addition to surveying the entire Project Site all bordering natural habitats located immediately adjacent to the Project Site were assessed. Results from the habitat assessment indicate that suitable resources for burrowing owl are present throughout the Project Site. Accordingly, if suitable habitat is documented onsite or within adjacent habitats, both Step II, focused surveys and the 30-day preconstruction surveys are required in order to comply with the MSHCP guidelines.

- Step II – Locating Burrows and Burrowing Owls: Concurrent with the initial habitat assessment, a detailed focused burrow survey was conducted and included documentation of appropriately sized natural burrows or suitable man-made structures that may be utilized by burrowing owl - as part of the MSHCP protocol, which is described below under Part A, Focused Burrow Survey. The MSHCP protocol indicates that no more than 100 acres should be surveyed per day/per biologist.

    - Part A – Focused Burrow Survey: A systematic survey for burrows, including burrowing owl sign, was conducted by walking across all suitable habitats mapped within the project site on July 29, 2022. Pedestrian survey transects were spaced to allow 100% visual coverage of the ground surface. The distances between transect centerlines were no more than 30 meters (approximately 100 feet) apart, and owing to the terrain, often much smaller. Transect routes were also adjusted to account for topography and in general ground surface visibility (refer to Exhibit 8, *Survey Transects*, in Attachment A). Areas providing potential habitat for burrowing owls were surveyed for suitable burrows, consisting of natural and non-natural substrates in areas with low, open vegetation. All burrows encountered were examined for shape, scat, pellets, white-wash, feathers, tracks, and prey remains. Suitable burrows/sites, including rock piles and non-natural substrates, were thoroughly examined for signs of presence.

Despite a systematic search of the project site, no burrowing owls or sign (i.e., pellets, feathers, castings, or whitewash) were observed during the field investigation. The majority of the project site is unvegetated, which allows for minimal line-of-sight observation favored by burrowing owls, and several small mammal burrows that have the potential to provide suitable burrowing owl nesting habitat (>4 inches in diameter) were observed within the boundaries of the site. However, the site is surrounded by tall trees and poles that

provide perching opportunities for large raptors (i.e., red-tailed hawk) that can prey on burrowing owls. Based on this information, and as a result of current and historic on-site disturbances, and surrounding development, it was determined that burrowing owls do not have potential to occur on-site and no focused surveys are recommended. Being that no appropriate burrows or burrowing owl habitat was found, Part B-Focused Burrowing Owl surveys were not required. Therefore, the project is consistent with Section 6.3.2. However, out of an abundance of caution a pre-construction burrowing owl clearance survey shall be conducted prior to ground disturbing activities.

Urban/Wildlands Interface Guidelines

Section 6.1.4 of the MSHCP, *Guidelines Pertaining to Urban/Wildlands Interface,* is intended to address indirect effects associated with development in proximity to MSHCP Conservation Areas. The Urban/Wildlife Interface Guidelines are intended to ensure that indirect project-related impacts to the MSHCP Conservation Area, including drainage, toxics, lighting, noise, invasive plant species, barriers, and grading/land development, are avoided or minimized. The project site is not located within or immediately adjacent to any Criteria Cells, corridors, or linkages. The urban/Wildlands Interface Guidelines do not apply to this project, and, therefore, the project is consistent with Section 6.1.4 of the MSHCP.

Stephen's Kangaroo Rat Habitat Conservation Plan

Separate from the consistency review against the policies of the MSHCP, Riverside County established a boundary in 1996 for protecting the Stephens' kangaroo rat (*Dipodomys stephensi*), a federally endangered and state threatened species. The Stephens' kangaroo rat is protected under the Stephens' Kangaroo Rat Habitat Conservation Plan (County Ordinance No. 663.10; SKR HCP). As described in the MSHCP Implementation Agreement, a Section 10(a) Permit, and California Fish and Game Code Section 2081 Management Authorization were issued to the Riverside County Habitat Conservation Agency (RCHCA) for the Long-Term SKR HCP and was approved by the USFWS and CDFW in August 1990 (RCHCA 1996). Relevant terms of the SKR HCP have been incorporated into the MSHCP and its Implementation Agreement. The SKR HCP will continue to be implemented as a separate HCP; however, to provide the greatest conservation for the largest number of Covered Species, the Core Reserves established by the SKR HCP are managed as part of the MSHCP Conservation Area consistent with the SKR HCP. Actions shall not be taken as part of the implementation of the SKR HCP that will significantly affect other Covered Species. Take of Stephens' kangaroo rat outside of the boundaries but within the MSHCP area is authorized under the MSHCP and the associated permits.

The project site is located within the Mitigation Fee Area of the SKR HCP. Therefore, the applicant will be required to pay the SKR HCP Mitigation Fee prior to development of the project site.

Conclusion

Based on the literature review and field survey, implementation of the project will have no significant impacts on federally, State, or MSHCP listed species known to occur in the general vicinity of the project site. Additionally, the project will have no effect on designated Critical Habitat because none exists within the area. No jurisdictional drainage and/or wetland features were observed on the project site during the field investigation. Additionally, the project site is not located within or adjacent to any criteria cell, and no riparian/riverine resources or vernal pools were found onsite. No further surveys are recommended.

With completion of the recommendations provided below and payment of the SKR HCP mitigation fee and MSHCP mitigation fee, development of the project site is fully consistent with the Western Riverside County MSHCP.

Recommendations

Migratory Bird Treaty Act and Fish and Game Code Compliance

Vegetation within and surrounding the project site has the potential to provide refuge cover from predators, perching sites and favorable conditions for avian nesting that could be impacted by construction activities associated with the project. Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.3, 3511, and 3513 of the California Fish and Game Code prohibit the take, possession, or destruction of birds, their nests or eggs). In order to protect migratory bird species, a nesting bird clearance survey should be conducted prior to any ground disturbance or vegetation removal activities that may disrupt the birds during the nesting season. Consequently, if avian nesting behaviors are disrupted, such as nest abandonment and/or loss of reproductive effort, it is considered "take" and is potentially punishable by fines and/or imprisonment.

If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted within three (3) days of the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction. The biologist conducting the clearance survey should document a negative survey with a brief letter report indicating that no impacts to active avian nests will occur. If an active avian nest is discovered during the pre-construction clearance survey, construction activities should stay outside of a no-disturbance buffer. The size of the no-disturbance buffer will be determined by the wildlife biologist and will depend on the level of noise and/or surrounding anthropogenic disturbances, line of sight between the nest and the construction activity, type and duration of construction activity, ambient noise, species habituation, and topographical barriers. These factors will be evaluated on a case-by-case basis when developing buffer distances. Limits of construction to avoid an active nest will be established in the field with flagging, fencing, or other appropriate barriers; and construction personnel will be instructed on the sensitivity of nest areas. A biological monitor should be present to delineate the boundaries of the buffer area and to monitor the active nest to ensure that nesting behavior is not adversely affected by the construction activity. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, construction activities within the buffer area can occur.

Burrowing Owl Pre-Construction Clearance Survey

A 30-day pre-construction burrowing owl survey shall be conducted prior to any ground disturbing activities to avoid direct take of burrowing owls, in accordance Objectives 6 of the Species Account for the Burrowing Owl included in the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

Please do not hesitate to contact Tom McGill at (951) 285-6014 or tmcgill@elmtconsulting.com or Travis McGill at (909) 816-1646 or travismcgill@elmtconsulting.com should you have any questions.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
SPECIAL-STATUS WILDLIFE SPECIES				
Accipiter cooperii Cooper's hawk	Fed: None CA: WL	Generally found in forested areas up to 3,000 feet in elevation, especially near edges and rivers. Prefers hardwood stands and mature forests, but can be found in urban and suburban areas where there are tall trees for nesting. Common in open areas during nesting season.	No	**Moderate**. The project site provides suitable foraging opportunities, but the project site does not provide suitable nesting opportunities. This species is adapted to urban environments and occurs commonly.
Accipiter striatus sharp-shinned hawk	Fed: None CA: WL	Found in pine, fir and aspen forests. They can be found hunting in forest interior and edges from sea level to near alpine areas. Can also be found in rural, suburban and agricultural areas, where they often hunt at bird feeders. Typically found in southern California in the winter months.	No	**Moderate**. The project site provides suitable foraging opportunities. This species does not nest in this region.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	Fed: None CA: WL	Typically found between 3,000 and 6,000 feet in elevation. Breed in sparsely vegetated scrubland on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush (*Artemisia californica*), but they can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Ammodramus savannarum grasshopper sparrow	Fed: None CA: SSC	Occurs in grassland, upland meadow, pasture, hayfield, and old field habitats. Optimal habitat contains short- to medium-height bunch grasses interspersed with patches of bare ground, a shallow litter layer, scattered forbs, and few shrubs. May inhabit thickets, weedy lawns, vegetated landfills, fence rows, open fields, or grasslands.	No	**Presumed absent.** No suitable habitat is present on-site.
Aquila chrysaetos golden eagle	Fed: None CA: FP; WL	Occupies nearly all terrestrial habitats of the western states except densely forested areas. Favors secluded cliffs with overhanging ledges and large trees for nesting and cover. Hilly or mountainous country where takeoff and soaring are supported by updrafts is generally preferred to flat habitats. Deeply cut canyons rising to open mountain slopes and crags are ideal habitat.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Ardea alba great egret	Fed: None CA: None	Yearlong resident throughout California, except for the high mountains and deserts. Feeds and rests in fresh, and saline emergent wetlands, along the margins of estuaries, lakes, and slow-moving streams, on mudflats and salt ponds, and in irrigated croplands and pastures.	No	**Low.** The project site provides suitable foraging opportunities, but does not provide suitable nesting opportunities.
Ardea herodias great blue heron	Fed: None CA: None	Forages along streams, marshes, lakes, and meadows. Nests colonially in tall trees (typically Eucalyptus sp.), on cliffsides, or in isolated spots in marshes.	No	**Presumed absent.** No suitable habitat is present on-site.
Arizona elegans occidentalis California glossy snake	Fed: None CA: SSC	Inhabits arid scrub, rocky washes, grasslands, and chaparral habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Artemisiospiza belli belli Bell's sparrow	Fed: None CA: WL	Generally prefers semi-open habitats with evenly spaced shrubs 1 – 2 meters in height. Dry chaparral and coastal sage scrub. Less common in tall dense, old chaparral.	No	**Presumed absent.** No suitable habitat is present on-site.
Aspidoscelis hyperythra orangethroat whiptail	Fed: None CA: SSC; WL	Semi-arid brushy areas typically with loose soil and rocks, including washes, streamsides, rocky hillsides, and coastal chaparral.	No	**Presumed absent**. No suitable habitat is present.
Aspidoscelis tigris stejnegeri coastal whiptail	Fed: None CA: SSC	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage - chaparral, woodland, and riparian areas.	No	**Presumed absent**. No suitable habitat is present.
Athene cunicularia burrowing owl	Fed: None CA: SSC	Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Dependent upon fossorial mammals for burrows, most notable ground squirrels.	No	**Low**. The project site provides marginal foraging and nesting habitat. Although heavily disturbed, the western portion of the site provides line-of-sight opportunities favored by burrowing owls; however, no suitable burrows (>4 inches in diameter) were observed on-site.
Baeolophus inornatus oak titmouse	Fed: None CA: None	Lives mostly in warm, open, dry oak or oak-pine woodlands. Restricted to southwest Oregon to northwest Baja California with another population in the Cape District of south Baja California.	No	**Presumed absent.** No suitable habitat is present on-site.
Bombus crotchii Crotch bumble bee	Fed: None CA: CE	Exclusive to coastal California east towards the Sierra-Cascade Crest; less common in western Nevada.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Buteo regalis ferruginous hawk	Fed: None CA: WL	Occurs primarily in open grasslands and fields, but may be found in sagebrush flats, desert scrub, low foothills, or along the edges of pinyon-juniper woodland. Feeds primarily on small mammals and typically found in agricultural or open fields.	No	**Presumed absent.** No suitable habitat is present on-site.
Buteo swainsoni Swainson's hawk	Fed: None CA: **THR**	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	No	**Presumed absent.** No suitable habitat is present on-site.
Calypte costae Costa's hummingbird	Fed: None CA: None	Desert and semi-desert, arid brushy foothills and chaparral. A desert hummingbird that breeds in the Sonoran and Mojave Deserts. Departs desert heat moving into chaparral, scrub, and woodland habitats.	No	**Presumed absent**. No suitable habitat is present on-site.
Chaetodipus californicus femoralis Dulzura pocket mouse	Fed: None CA: SSC	Found most often in grass-chaparral edges but may also be found in coastal scrub or other habitats, primarily in San Diego County.	No	**Presumed absent.** No suitable habitat is present on-site.
Chaetodipus fallax fallax northwestern San Diego pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	**Presumed absent.** No suitable habitat is present on-site.
Chaetura vauxi Vaux's swift	Fed:CA: None SSC	Prefers redwood and Douglas-fir habitats with nest-sites in large hallow trees and snags, especially tall, burned-out snags. Fairly common migrant throughout most of the state in April and May, and August and September.	No	**Presumed absent.** No suitable habitat is present on-site.
Circus hudsonius northern harrier	Fed: None CA: SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Mostly found in flat, or hummocky, open areas of tall, dense grasses moist or dry shrubs, and edges for nesting, cover, and feeding.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Coleonyx variegatus abbotti San Diego banded gecko	Fed: None CA: SSC	Occurs in coastal and cismontane southern California from interior Ventura County south, although it is absent from the extreme outer coast. It is uncommon in coastal scrub and chaparral, most often occurring in granite or rocky outcrops in these habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Crotalus ruber red-diamond rattlesnake	Fed: None CA: SSC	It can be found from the desert, through dense chaparral in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. It is most commonly associated with heavy brush with large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake; however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys merriami parvus San Bernardino kangaroo rat	Fed: **END** CA: CE	Primarily found in Riversidian alluvial fan sage scrub and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May occur at lower densities in Riversidian upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to Riversidian alluvial fan sage scrub habitats. Tend to avoid rocky substrates and prefer sandy loam substrates for digging of shallow burrows.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys simulans Dulzura kangaroo rat	Fed: None CA: None	Relatively common in chaparral, coastal sage scrub, Riversidean alluvial fan sage scrub, and peninsular juniper woodland habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys stephensi Stephens' kangaroo rat	Fed: **END** CA: **THR**	Occur in arid and semi-arid habitats with some grass or brush. Prefer open habitats with less than 50% protective cover. Require soft, well-drained substrate for building burrows and are typically found in areas with sandy soil.	No	**Presumed absent.** No suitable habitat is present on-site.
Elanus leucurus white-tailed kite	Fed: None CA: FP	Occurs in low elevation, open grasslands, savannah-like habitats, agricultural areas, wetlands, and oak woodlands. Uses trees with dense canopies for cover.	No	**Low**. The project site provides marginal foraging habitat. No suitable nesting opportunities on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Empidonax traillii willow flycatcher	Fed: None CA: **END**	A rare to locally uncommon, summer resident in wet meadow and montane riparian habitats (2,000 to 8,000 ft) in the Sierra Nevada and Cascade Range. Most often occurs in broad, open river valleys or large mountain meadows with lush growth of shrubby willows.	No	**Presumed absent.** No suitable habitat is present on-site.
Eremophila alpestris actia California horned lark	Fed: None CA: WL	Generally found in shortgrass prairies, grasslands, disturbed fields, or similar habitat types along the coast or in deserts. Trees are shrubs are usually scarce or absent. Generally rare in montane, coniferous, or chaparral habitats. Forms large flocks outside of the breeding season.	No	**Low** The project site provides suitable foraging and minimal nesting habitat.
Eumops perotis californicus western mastiff bat	Fed: None CA: SSC	Primarily a cliff-dwelling species, roost generally under exfoliating rock slabs. Roosts are generally high above the ground, usually allowing a clear vertical drop of at least 3 meters below the entrance for flight. In California, it is most frequently encountered in broad open areas. Its foraging habitat includes dry desert washes, flood plains, chaparral, oak woodland, open ponderosa pine forest, grassland, and agricultural areas.	No	**Presumed absent.** No suitable habitat is present on-site.
Euphydryas editha quino Quino checkerspot butterfly	Fed: **END** CA: None	Range is now limited to a few populations in Riverside and San Diego counties. Common in meadows and upland sage scrub/chapparal habitat.	No	**Presumed absent.** No suitable habitat is present on-site.
Falco peregrinus anatum American peregrine falcon	Fed: DL CA: DL; FP	Uncommon winter resident of the inland region of southern California. Active nesting sites are known along the coast north of Santa Barbara, in the Sierra Nevada, and in other mountains of northern California. Breeds mostly in woodland, forest, and coastal habitats. Riparian areas and coastal and inland wetlands are important habitats yearlong, especially in nonbreeding seasons.	No	**Presumed absent.** No suitable habitat is present on-site.
Lanius ludovicianus loggerhead shrike	Fed: None CA: SSC	Often found in broken woodlands, shrublands, and other habitats. Prefers open country with scattered perches for hunting and fairly dense brush for nesting.	No	**Presumed absent.** No suitable habitat is present on-site.
Lasiurus xanthinus western yellow bat	Fed: None CA: SSC	Roosts in palm trees in foothill riparian, desert wash, and palm oasis habitats with access to water for foraging.	No	**Presumed absent.** No suitable habitat is present on-site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	Fed: None CA: SSC	Occurs in diverse habitats, but primarily is found in arid regions supporting shortgrass habitats. Openness of open scrub habitat is preferred over dense chaparral.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Neotoma lepida intermedia San Diego desert woodrat	Fed: None CA: SSC	Occurs in coastal scrub communities between San Luis Obispo and San Diego Counties. Prefers moderate to dense canopies, and especially rocky outcrops.	No	**Presumed absent.** No suitable habitat is present on-site.
Numenius americanus long-billed curlew	Fed: None CA: WL	Preferred winter habitats include large coastal estuaries, upland herbaceous areas, and croplands. On estuaries, feeding occurs mostly on intertidal mudflats.	No	**Presumed absent.** No suitable habitat is present on-site.
Nycticorax nycticorax black-crowned night heron	Fed: None CA: None	Fairly common, yearlong resident in lowlands and foothills throughout most of California, including the Salton Sea and Colorado River areas, and very common locally in large nesting colonies. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and rarely, on kelp beds in marine sub tidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	No	**Presumed absent.** No suitable habitat is present on-site.
Onychomys torridus ramona southern grasshopper mouse	Fed: None CA: SSC	Inhabits alkali desert scrub and other desert scrub habitats, and to a lesser extent succulent shrubs, desert washes, desert riparian, coastal scrub, mixed chaparral, and sagebrush habitats. Generally rare in valley foothill and montane riparian habitats. Prefers low to moderate shrub cover and requires friable soils.	No	**Presumed absent.** No suitable habitat is present on-site.
Perognathus longimembris brevinasus Los Angeles pocket mouse	Fed: None CA: SSC	Occurs in lower elevation grasslands and coastal sage scrub communities in and around the Los Angeles Basin. Prefers open ground with fine sandy soils. May not dig extensive burrows, but instead will seek refuge under weeds and dead leaves instead.	No	**Presumed absent.** No suitable habitat is present on-site.
Phrynosoma blainvillii coast horned lizard	Fed: None CA: SSC	Occurs in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. In inland areas, this species is restricted to areas with pockets of open microhabitat, created by disturbance (i.e. fire, floods, roads, grazing, fire breaks). The key elements of such habitats are loose, fine soils with a high sand fraction; an abundance of native ants or other insects; and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Plegadis chihi white-faced ibis	Fed: None CA: WL	Prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated or flooded partures and croplands. Nests in dense, fresh emergent wetland.	No	**Presumed absent.** No suitable habitat is present on-site.
Polioptila californica californica coastal California gnatcatcher	Fed: **THR** CA: SSC	Obligate resident of sage scrub habitats that are dominated by California sagebrush (*Artemisia californica*). This species generally occurs below 750 feet elevation in coastal regions and below 1,500 feet inland. Ranges from the Ventura County, south to San Diego County and northern Baja California and it is less common in sage scrub with a high percentage of tall shrubs. Prefers habitat with more low-growing vegetation.	No	**Presumed absent.** No suitable habitat is present on-site.
Setophaga petechia yellow warbler	Fed: None CA: SSC	Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near stream courses.	No	**Presumed absent.** No suitable habitat is present on-site.
Spea hammondii western spadefoot	Fed: None CA: SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washed, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rainpools which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	No	**Presumed absent.** No suitable habitat is present on-site.
Spinus lawrencei Lawrence's goldfinch	Fed: None CA: None	Open woodlands, chaparral, and weedy fields. Closely associated with oaks. Nests in open oak or other arid woodland and chaparral near water.	No	**Presumed absent.** No suitable habitat is present on-site.
Streptocephalus woottoni Riverside fairy shrimp	Fed: **END** CA: None	Freshwater crustacean that is found in vernal pools in the coastal California area.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Vireo bellii pusillus least Bell's vireo	Fed: **END** CA: **END**	Primarily occupy Riverine riparian habitat that typically feature dense cover within 1 -2 meters of the ground and a dense, stratified canopy. Typically it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodlands, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses, 2,000 feet elevation in the interior.	No	**Presumed absent.** No suitable habitat is present on-site.
SPECIAL-STATUS PLANT SPECIES				
Allium munzii Munz's onion	Fed: **END** CA: **THR** CNPS: 1B.1	Found in chaparral, cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Found at elevations ranging from 974 to 3,510 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Brodiaea filifolia thread-leaved brodiaea	Fed: **END** CA: **THR** CNPS: 1B.1	Grows in chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, and vernal pools, often in clay soils. Found at elevations ranging from 82 to 3,675 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Caulanthus simulans Payson's jewelflower	Fed: None CA: None CNPS: 4.2	Occurs on granitic sandy soils in chaparral and coastal scrub habitats. Found at elevations ranging from 295 to 7,218 feet. Blooming period is from February to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Centromadia pungens ssp. laevis smooth tarplant	Fed: None CA: None CNPS: 1B.1	Found in alkaline soils within chenopod scrub, meadows and seeps, playas, riparian woodland, valley and foothill grassland habitats. Found at elevations ranging from 0 to 2,100 feet. Blooming period is from April to September.	No	**Presumed absent**. No suitable habitat is present on-site.
Chorizanthe leptotheca Peninsular spineflower	Fed: None CA: None CNPS: 4.2	Found in granitic soils within chaparral, coast scrub, and lower montane coniferous forest habitats. Found at elevations ranging from 984 to 6,234 feet. Blooming period is from May to August.	No	**Presumed absent**. No suitable habitat is present on-site.
Chorizanthe parryi* var. *parryi Parry's spineflower	Fed: None CA: None CNPS: 1B.1	Occurs on sandy and/or rocky soils in chaparral, coastal sage scrub, and sandy openings within alluvial washes and margins. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Chorizanthe polygonoides var. longispina long-spined spineflower	Fed: None CA: None CNPS: 1B.2	Typically found on clay lenses which are largely devoid of shrubs. Can be found on the periphery of vernal pool habitat and even on the periphery of montane meadows near vernal seeps. Found at elevations ranging from 98 to 5,020 feet. Blooming period is from April to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Convolvulus simulans small-flowered morning-glory	Fed: None CA: None CNPS: 4.2	Grows in clay soils within serpentinite seeps, chaparral, coastal scrub, valley and foothill grassland habitats. Found at elevations ranging from 98 to 2,297 feet. Blooming period is from March to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Deinandra paniculata paniculate tarplant	Fed: None CA: None CNPS: 4.2	Typically found in vernally mesic, sometimes sandy soils in coastal scrub, valley and foothill grasslands, and vernal pools. Found at elevations ranging from 82 to 3,084 feet. Blooming period is from April to November.	No	**Presumed absent**. No suitable habitat is present on-site.
Harpagonella palmeri Palmer's grapplinghook	Fed: None CA: None CNPS: 4.2	Occurs on clay soils in chaparral, coastal scrub, and valley and foothill grasslands. Found at elevations ranging from 66 to 3,133 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Juglans californica southern California black walnut	Fed: None CA: None CNPS: 4.2	Found in chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 164 to 2,953 feet. Blooming period is from March to August.	No	**Presumed absent**. No suitable habitat is present on-site.
Lasthenia glabrata* ssp. *coulteri Coulter's goldfields	Fed: None CA: None CNPS: 1B.1	Prefers playas, vernal pools, and coastal salt marshes and swamps. Found at elevations ranging from 3 to 4,003 feet. Blooming period is from February to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Lepidium virginicum var. robinsonii Robinson's pepper-grass	Fed: None CA: None CNPS: 4.3	Dry soils on chaparral and coastal sage scrub. Found at elevations ranging from 3 to 2,904 feet. Blooming period is from January to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Microseris douglasii* ssp. *platycarpha small-flowered microseris	Fed: None CA: None CNPS: 4.2	Occurs in clay soils in cismontane woodland, coastal scrub, valley and foothill grasslands, and around vernal pools. Found at elevations ranging from 49 to 3,510 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Myosurus minimus ssp. apus little mousetail	Fed: None CA: None CNPS: 3.1	Occurs in alkaline soils in valley and foothill grassland and vernal pools. Found at elevations ranging from 66 to 2,100 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Navarretia fossalis spreading navarretia	Fed: **THR** CA: None CNPS: 1B.1	Grows in chenopod scrub, assorted shallow freshwater marshes and swamps, playas, and vernal pools. Found at elevations ranging from 98 to 2,149 feet. Blooming period is from April to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Orcuttia californica California Orcutt grass	Fed: **END** CA: **END** CNPS: 1B.1	Primarily restricted to the southern basaltic claypan vernal pools at the Santa Rosa Plateau, and alkali vernal pools at Skunk Hollow, and at Salt Creek. Grows in elevations ranging from 45 to 2,165 feet above msl. Blooming period is from April to August.	No	**Presumed absent**. No suitable habitat is present on-site.
CDFW SENSITIVE HABITATS				
Southern Coast Live Oak Riparian Forest	CDFW Sensitive Habitat	Open to locally dense evergreen riparian woodlands dominated by *Quercus agrifolia*. This type appears to be richer in herbs and poorer in understory shrubs than other riparian communities. Bottomlands and outer floodplains along larger streams, on fine-grained, rich alluvium. Canyons and valleys of coastal southern California.	No	**Absent**
Southern Cottonwood Willow Riparian Forest	CDFW Sensitive Habitat	Dominated by cottonwood (*Populus* ssp.) and willow (*Salix* ssp.) trees and shrubs. Considered to be an early successional stage as both species are known to germinate almost exclusively on recently deposited or exposed alluvial soils.	No	**Absent**

Attachment D

Regulations

Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to continued existence and existing knowledge of population levels.

Federal Regulations

Endangered Species Act of 1973

Federally listed threatened and endangered species and their habitats are protected under provisions of the Federal Endangered Species Act (ESA). Section 9 of the ESA prohibits "take" of threatened or endangered species. "Take" under the ESA is defined as to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any of the specifically enumerated conduct." The presence of any federally threatened or endangered species that are in a project area generally imposes severe constraints on development, particularly if development would result in "take" of the species or its habitat. Under the regulations of the ESA, the United States Fish and Wildlife Service (USFWS) may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act.

Critical Habitat is designated for the survival and recovery of species listed as threatened or endangered under the ESA. Critical Habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an ESA listed species and which may require special management considerations or protection. Critical Habitat may also include unoccupied habitat if it is determined that the unoccupied habitat is essential for the conservation of the species.

Whenever federal agencies authorize, fund, or carry out actions that may adversely modify or destroy Critical Habitat, they must consult with USFWS under Section 7 of the ESA. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highway Administration or a permit from the U.S. Army Corps of Engineers (Corps)).

If USFWS determines that Critical Habitat will be adversely modified or destroyed from a proposed action, the USFWS will develop reasonable and prudent alternatives in cooperation with the federal institution to ensure the purpose of the proposed action can be achieved without loss of Critical Habitat. If the action is not likely to adversely modify or destroy Critical Habitat, USFWS will include a statement in its biological opinion concerning any incidental take that may be authorized and specify terms and conditions to ensure the agency is in compliance with the opinion.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 U.S. Government Code [USC] 703) makes it unlawful to pursue, capture, kill, possess, or attempt to do the same to any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union, and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs (16 USC 703; 50 CFR 10, 21).

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. Disturbances causing nest abandonment and/or loss of reproductive effort (i.e., killing or abandonment of eggs or young) may also be considered "take." This regulation seeks to protect migratory birds and active nests.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protects all species and subspecies of the families listed above. The MBTA protects over 800 species including geese, ducks, shorebirds, raptors, songbirds and many relatively common species.

State Regulations

California Environmental Quality Act (CEQA)

The California Environmental Quality Act (CEQA) provides for the protection of the environment within the State of California by establishing State policy to prevent significant, avoidable damage to the environment through the use of alternatives or mitigation measures for projects. It applies to actions directly undertaken, financed, or permitted by State lead agencies. If a project is determined to be subject to CEQA, the lead agency will be required to conduct an Initial Study (IS); if the IS determines that the project may have significant impacts on the environment, the lead agency will subsequently be required to write an Environmental Impact Report (EIR). A finding of non-significant effects will require either a Negative Declaration or a Mitigated Negative Declaration instead of an EIR. Section 15380 of the CEQA Guidelines independently defines "endangered" and "rare" species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, "endangered" species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while "rare" species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

California Endangered Species Act (CESA)

In addition to federal laws, the state of California implements the CESA which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in "take" of individuals (defined in CESA as; "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") are regulated by CDFW. Habitat degradation or modification is not included in the definition of "take" under CESA. Nonetheless, CDFW has interpreted "take" to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the

absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

The CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

Fish and Game Code

Fish and Game Code Sections 3503, 3503.5, 3511, and 3513 are applicable to natural resource management. For example, Section 3503 of the Code makes it unlawful to destroy any birds' nest or any birds' eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs. A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*). Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

Native Plant Protection Act

Sections 1900–1913 of the Fish and Game Code were developed to preserve, protect, and enhance Rare and Endangered plants in the state of California. The act requires all state agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

California Native Plant Society Rare and Endangered Plant Species

Vascular plants listed as rare or endangered by the CNPS, but which have no designated status under FESA or CESA are defined as follows:

California Rare Plant Rank

1A- Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere

1B- Plants Rare, Threatened, or Endangered in California and Elsewhere

2A- Plants Presumed Extirpated in California, But More Common Elsewhere

2B- Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3- Plants about Which More Information is Needed - A Review List

4- Plants of Limited Distribution - A Watch List

Threat Ranks

.1- Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2- Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

.3- Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

Local Policies

Western Riverside County MSHCP

The MSHCP is a comprehensive, multi-jurisdictional HCP focusing on conservation of species and their associated habitats in western Riverside County. The goal of the MSHCP is to maintain biological and ecological diversity within a rapidly urbanizing region.

The approval of the MSHCP and execution of the Implementing Agreement (IA) by the wildlife agencies allows signatories of the IA to issue "take" authorizations for all species covered by the MSHCP, including state- and federal-listed species as well as other identified sensitive species and/or their habitats. Each city or local jurisdiction will impose a Development Mitigation Fee for projects within their jurisdiction. With payment of the mitigation fee to the County and compliance with the survey requirements of the MSHCP where required, full mitigation in compliance with the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), CESA, and FESA will be granted. The Development Mitigation Fee varies according to project size and project description. The fee for industrial development is $7,382 per acre (County Ordinance 810.2). Payment of the mitigation fee and compliance with the requirements of Section 6.0 of the MSHCP are intended to provide full mitigation under CEQA, NEPA, CESA, and FESA for impacts to the species and habitats covered by the MSHCP pursuant to agreements with the USFWS, the CDFW, and/or any other appropriate participating regulatory agencies and as set forth in the IA for the MSHCP.

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates activities pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFG regulates activities under the Fish and Game Code Section 1600-1616, and the Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

Federal Regulations

Section 404 of the Clean Water Act

Since 1972, the Corps and U.S. Environmental Protection Agency (EPA) have jointly regulated the filling of "waters of the U.S.," including wetlands, pursuant to Section 404 of the Clean Water Act (CWA). The Corps has regulatory authority over the discharge of dredged or fill material into the waters of the United States under Section 404 of the CWA. The Corps and EPA define "fill material" to include any "material placed in waters of the United States where the material has the effect of: (i) replacing any portion of a water of the United States with dry land; or (ii) changing the bottom elevation of any portion of the waters of the United States." Examples include, but are not limited to, sand, rock, clay, construction debris, wood chips, and "materials used to create any structure or infrastructure in the waters of the United States." In order to further define the scope of waters protected under the CWA, the Corps and EPA published the Clean Water Rule on June 29, 2015. Pursuant to the Clean Water Rule, the term "*waters of the United States*" is defined as follows:

(i) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide.

(ii) All interstate waters, including interstate wetlands[1].

(iii) The territorial seas.

(iv) All impoundments of waters otherwise defined as waters of the United States under the definition.

(v) All tributaries[2] of waters identified in paragraphs (i) through (iii) mentioned above.

(vi) All waters adjacent[3] to a water identified in paragraphs (i) through (v) mentioned above, including wetlands, ponds, lakes, oxbows, impoundments, and similar waters.

---

1 The term *wetlands* means those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

2 The terms *tributary* and *tributaries* each mean a water that contributes flow, either directly or through another water (including an impoundment identified in paragraph (iv) mentioned above), to a water identified in paragraphs (i) through (iii) mentioned above, that is characterized by the presence of the physical indicators of a bed and banks and an ordinary high water mark.

3 The term *adjacent* means bordering, contiguous, or neighboring a water identified in paragraphs (i) through (v) mentioned above, including waters separated by constructed dikes or barriers, natural river berms, beach dunes, and the like.

(vii) All prairie potholes, Carolina bays and Delmarva bays, Pocosins, western vernals pools, Texas coastal prairie wetlands, where they are determined, on a case-specific basis, to have a significant nexus to a water identified in paragraphs (i) through (iii) meantioned above.

(viii) All waters located within the 100-year floodplain of a water identified in paragraphs (i) through (iii) mentioned above and all waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (i) through (v) mentioned above, where they are determined on a case-specific basis to have a significant nexus to a waters identified in paragraphs (i) through (iii) mentioned above.

The following features are not defined as "waters of the United States" even when they meet the terms of paragraphs (iv) through (viii) mentioned above:

(i) Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the Clean Water Act.

(ii) Prior converted cropland.

(iii) The following ditches:

(A) Ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary.
(B) Ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands.
(C) Ditches that do not flow, either directly or through another water, into a water of the United States as identified in paragraphs (i) through (iii) of the previous section.

(iv) The following features:

(A) Artificially irrigated areas that would revert to dry land should application of water to that area cease;
(B) Artificial, constructed lakes and ponds created in dry land such as farm and stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, or cooling ponds;
(C) Artificial reflecting pools or swimming pools created in dry land;
(D) Small ornamental waters created in dry land;
(E) Water-filled depressions created in dry land incidental to mining or construction activity, including pits excavated for obtaining fill, sand, or gravel that fill with water;
(F) Erosional features, including gullies, rills, and other ephemeral features that do not meet the definition of a tributary, non-wetland swales, and lawfully constructed grassed waterways; and
(G) Puddles.

(v) Groundwater, including groundwater drained through subsurface drainage systems.

(vi) Stormwater control features constructed to convey, treat, or store stormwater that are created in dry land.

Section 401 of the Clean Water Act

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits, and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Water Quality Control Boards (Regional Board) that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board assumed this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

State Regulations

Fish and Game Code

Fish and Game Code Sections 1600 et. seq. establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

Fish and Game Code Section 1602 requires any person, state, or local governmental agency or public utility to notify the CDFW before beginning any activity that will do one or more of the following:

(1) substantially obstruct or divert the natural flow of a river, stream, or lake;
(2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or
(3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, the CDFW takes jurisdiction to the top of bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

Porter Cologne Act

The California *Porter-Cologne Water Quality Control Act* gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Act has become an important tool in the post SWANCC and Rapanos regulatory environment, with respect to the state's authority over isolated and insignificant waters. Generally, any

person proposing to discharge waste into a water body that could affect its water quality must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although "waste" is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include fill discharged into water bodies.

SUBJECT: Habitat Assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis for the Proposed "The Village" Project Located within Assessor Parcel Numbers (APNs) 333-070-018, -019, and -053 in the City of Menifee, Riverside County, California

Introduction

This report contains the findings of ELMT Consulting's (ELMT) habitat assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis for the proposed "The Village" project (project site or site) located in the City of Menifee, Riverside County, California. The habitat assessment was conducted by ELMT biologist Travis J. McGill on March 20, 2020 to document baseline conditions and assess the potential for special-status[1] plant and wildlife species to occur within the proposed project site that could pose a constraint to implementation of the proposed project. Special attention was given to the suitability of the on-site habitat to support burrowing owl (*Athene cunicularia*) and several other special-status species identified by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and other electronic databases as potentially occurring on or within the general vicinity of the project.

The Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map was queried to determine if the MSHCP identifies any potential survey requirements for the project. Further, the project site was reviewed against the MSHCP to determine if the site is located within any MSHCP areas including Criteria Cells (core habitat and wildlife movement corridors) or areas proposed for conservation. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is located within the Sun City/Menifee Valley Area Plan of the MSHCP, but is not located within any Criteria Cells or MSHCP Conservation Areas. Further, it was determined that the project site is only located within the designated survey area for burrowing owl (*Athene cuincularia*).

Project Location

The project site is generally located east of Interstate 215, south of State Route 74, west of State Route 79, and north of Domenigoni Parkway in the City of Menifee, Riverside County, California. The project site is

1 As used in this report, "special-status" refers to plant and wildlife species that are federally, State, and MSHCP listed, proposed, or candidates; plant species that have been designated with a California Native Plant Society Rare Plant Rank; wildlife species that are designated by the CDFW as fully protected, species of special concern, or watch list species; and specially protected natural vegetation communities as designated by the CDFW.

depicted on the Romoland quadrangle of the United States Geological Survey's (USGS) 7.5-minute topographic map within Section 23 of Township 5 South, Range 3 West. Specifically, the project site is bordered by Menifee Road on its eastern boundary, Junipero Road on its western boundary, a new residential development to the north, approximately 600 feet north of McCall Boulevard within Assessor Parcel Numbers (APN) 333-070-018, -019, and -053. Refer to Exhibits 1- 3 in Attachment A.

Project Description

The project proposes the grading for, and development of, an apartment complex.

Methodology

Western Riverside County MSHCP Consistency Analysis

The project site is located in the City of Menifee within the Sun City/Menifee Valley Area Plan of the MSHCP. The City is a permittee under the MSHCP and, while the project is not specifically identified as a Covered Activity under Section 7.1 of the MSHCP, public and private development that are outside of Criteria Areas and Public/Quasi-Public (PQP) Lands are permitted under the MSHCP, subject to consistency with MSHCP policies that apply to area outside of Criteria Areas. As such, to achieve coverage, the project must be consistent with the following policies of the MSHCP:

- The policies for the protection of species associated with Riparian/Riverine areas and vernal pools as set forth in Section 6.1.2 of the MSHCP;
- The policies for the protection of Narrow Endemic Plant Species as set forth in Section 6.1.3 of the MSHCP;
- The requirements for conducting additional surveys as set forth in Section 6.3.2 of the MSHCP; and
- Guidelines pertaining to the Urban/Wildlands Interface intended to address indirect effects associated with locating Development in proximity to the MSHCP Conservation Area as detailed in Section 6.1.4 of the MSHCP.

The proposed project was reviewed to determine consistency with the MSHCP. Geographic Information System (GIS) software was utilized to map the project site in relation to MSHCP areas including Criteria Cells (core habitat and wildlife movement corridors) and the Conservation Area, including PQP lands.

Riparian/Riverine Areas and Vernal Pools

The MSHCP requires that an assessment be completed if impacts to riparian/riverine areas and vernal pools could occur from construction of the proposed project. According to the MSHCP, the documentation for the assessment shall include mapping and a description of the functions and values of the mapped areas with respect to the species listed in Section 6.1.2 of the MSHCP, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*.

Aerial photography was reviewed prior to conducting the habitat assessment. The aerials were used to locate and inspect any potential natural drainage features and water bodies that may be considered riparian/riverine habitat and/or fall under the jurisdiction of the United States Army Corps of Engineers (Corps), Regional Water Quality Control Board (Regional Board), or CDFW. In general, surface drainage features indicated

as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory authorities. No riparian/riverine were observed on the project site during the aerial review or during the field investigation.

Narrow Endemic Plant Species

Section 6.1.3 of the MSHCP, *Protection of Narrow Endemic Plant Species*, states that the MSHCP database does not provide sufficient detail to determine the extent of the presence/distribution of Narrow Endemic Plant Species within the MSHCP Plan Area. Additional surveys may be needed to gather information to determine the presence/absence of these species to ensure that appropriate conservation of these species occurs. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the project site is not located within the designated survey area for Narrow Endemic Plant Species. Through the field investigation, it was determined that the project site does not provide suitable habitat for any of the Narrow Endemic Plant Species listed under Section 6.1.3 of the MSHCP. Therefore, no additional surveys or analysis is required.

Additional Survey Needs and Procedures

In accordance with Section 6.3.2 of the MSHCP, *Additional Survey Needs and Procedures*, additional surveys may be needed for certain species in order to achieve coverage for these species. The query of the RCA MSHCP Information Map and review of the MSHCP determined that the project site is located within the designated survey area for burrowing owl as depicted in Figure 6-4 within Section 6.3.2 of the MSHCP. No other special-status wildlife species surveys were identified.

Urban/Wildlands Interface Guidelines

Section 6.1.4 of the MSHCP, *Guidelines Pertaining to Urban/Wildlands Interface,* is intended to address indirect effects associated with development in proximity to MSHCP Conservation Areas. The Urban/Wildlife Interface Guidelines are intended to ensure that indirect project-related impacts to the MSHCP Conservation Area, including drainage, toxics, lighting, noise, invasive plant species, barriers, and grading/land development, are avoided or minimized. The project site is not located within or immediately adjacent to any Criteria Cells, corridors, or linkages. Therefore, the urban/Wildlands Interface Guidelines do not apply to this project.

Literature Review

The first step in determining if a project is consistent with the above listed sections of the MSHCP is to conduct a literature review and records search for special-status biological resources potentially occurring on or within the vicinity of the project site. Previously recorded occurrences of special-status plant and wildlife species and their proximity to the project were determined through a query of the CDFWs CNDDB Rarefind 5, the California Native Plant Society (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California, Calflora Database, compendia of special-status species published by CDFW, United States Fish and Wildlife Service (USFWS) species listings, and species covered within the MSHCP and associated technical documents.

All available reports, survey results, and literature detailing the biological resources previously observed on or within the vicinity of the project site was reviewed to understand existing site conditions and note the extent of any disturbances that have occurred on the project site that would otherwise limit the distribution

of special-status biological resources. Standard field guides and texts were reviewed for specific habitat requirements of special-status and non-special-status biological resources, as well as the following resources:

- Google Earth Pro historic aerial imagery (1996-2018);
- United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), Soil Survey[2];
- USFWS Critical Habitat designations for Threatened and Endangered Species;
- Stephen's Kangaroo Rat Habitat Conservation Plan; and
- RCA MSHCP Information Map.

The literature review provided a baseline from which to inventory the biological resources potentially occurring on the project site. The CNDDB database was used, in conjunction with ArcGIS software, to locate the nearest recorded occurrences of special-status species and determine the distance from the project.

Habitat Assessment/Field Investigation

Following the literature review, biologist Travis J. McGill inventoried and evaluated the condition of the habitat within the project site on March 20, 2020. Plant communities identified on aerial photographs during the literature review were verified by walking meandering transects through the plant communities and along boundaries between plant communities. In addition, aerial photography was reviewed prior to the site investigation to locate potential natural corridors and linkages that may support the movement of wildlife through the area. These areas identified on aerial photography were then walked during the field survey.

All plant and wildlife species observed, as well as dominant plant species within each plant community, were recorded. Plant species observed during the field survey were identified by visual characteristics and morphology in the field. Unusual and less familiar plant species were photographed during the field survey and identified in the laboratory using taxonomical guides. Wildlife detections were made through observation of scat, trails, tracks, burrows, nests, and/or visual and aural observation. In addition, site characteristics such as soil condition, topography, hydrology, anthropogenic disturbances, indicator species, condition of on-site plant communities, and presence of potential jurisdictional drainage and/or wetland features were noted.

Soil Series Assessment

On-site and adjoining soils were researched prior to the field survey using the USDA NRCS Soil Survey for Western Riverside Area, California. In addition, a review of the local geological conditions and historical aerial photographs was conducted to assess the ecological changes that the project site has undergone.

Plant Communities

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photography.

2 A soil series is defined as a group of soils with similar profiles developed from similar parent materials under comparable climatic and vegetation conditions. These profiles include major horizons with similar thickness, arrangement, and other important characteristics, which may promote favorable conditions for certain biological resources.

The plant communities were delineated on an aerial photograph, classified in accordance with those described in the MSHCP, and then digitized into GIS Arcview. The Arcview application was used to compute the area of each plant community in acres.

Plants

Common plant species observed during the field survey were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

Wildlife

Wildlife species detected during field surveys by sight, calls, tracks, scat, or other sign were recorded during surveys in a field notebook. Field guides were used to assist with identification of wildlife species during the survey included The Sibley Field Guide to the Birds of Western North America (Sibley 2003), A Field Guide to Western Reptiles and Amphibians (Stebbins 2003), and A Field Guide to Mammals of North America (Reid 2006). Although common names of wildlife species are fairly well standardized, scientific names are provided immediately following common names in this report (first reference only).

Jurisdictional Drainages and Wetlands

Aerial photography was reviewed prior to conducting a field investigation in order to locate and inspect any potential natural drainage features, ponded areas, or water bodies that may be considered riparian/riverine habitat and/or fall under the jurisdiction of the Corps, Regional Board, or CDFW. In general, surface drainage features indicated as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory jurisdiction.

Stephen's Kangaroo Rat Habitat Conservation Plan

Separate from the consistency review against the policies of the MSHCP, Riverside County established a boundary in 1996 for protecting the Stephens' kangaroo rat (*Dipodomys stephensi*), a federally endangered and state threatened species. The Stephens' kangaroo rat is protected under the Stephens' Kangaroo Rat Habitat Conservation Plan (County Ordinance No. 663.10; SKR HCP). As described in the MSHCP Implementation Agreement, a Section 10(a) Permit, and California Fish and Game Code Section 2081 Management Authorization were issued to the Riverside County Habitat Conservation Agency (RCHCA) for the Long-Term SKR HCP and was approved by the USFWS and CDFW in August 1990 (RCHCA 1996). Relevant terms of the SKR HCP have been incorporated into the MSHCP and its Implementation Agreement. The SKR HCP will continue to be implemented as a separate HCP; however, to provide the greatest conservation for the largest number of Covered Species, the Core Reserves established by the SKR HCP are managed as part of the MSHCP Conservation Area consistent with the SKR HCP. Actions shall not be taken as part of the implementation of the SKR HCP that will significantly affect other Covered Species. Take of Stephens' kangaroo rat outside of the boundaries but within the MSHCP area is authorized under the MSHCP and the associated permits.

The project site is located within the Mitigation Fee Area of the SKR HCP. Therefore, the applicant will be

required to pay the SKR HCP Mitigation Fee prior to development of the project site.

Existing Site Condition

The project site is relatively flat with no areas of significant topographic relief at an approximate elevation of 1,457 to 1,469 feet above mean sea level. Based on the NRCS USDA Web Soil Survey, the project site is underlain by the following soil units: Cieneba rocky sandy loam (15 to 50 percent slopes), Exeter sandy loam (2 to 8 percent slopes, eroded), Exeter sandy loam (2 to 8 percent slopes, deep, eroded), Exeter very fine sandy loam (0 to 5 percent slopes, deep), Greenfield sandy loam (0 to 2 percent slopes), and Hanford coarse sandy loam (2 to 8 percent slopes). Refer to Exhibit 4, *Soils*, in Attachment A. Soils on-site have been mechanically disturbed and heavily compacted from historic land uses (i.e., agricultural activities, grading activities and surrounding development).

The project site is bordered by developments currently under construction to the north and south, residential development to the east, and undeveloped, vacant land, a water detention basin, and a school to the west. Portions of the site are currently being used as staging areas to support adjacent construction. In association with the adjacent development, an underground storm drain was installed, extending north to the south, through the middle of the project site. The underground storm drain daylights into a constructed earthen trapezoidal channel north of the project site in association with the residential development to the north of the project site. Due to surrounding development activities, the project site is bordered by silt fencing. Silt fencing was also found traversing the project site where the underground storm drain was installed.

Vegetation

Due to historic land uses, no native plant communities or natural communities of special concern were observed on or adjacent to the project site. The project site primarily consists of vacant, undeveloped land that has been subject to a variety of anthropogenic disturbances that was historically used for agricultural land uses. The project site no longer is used for agricultural activities but has been subject to on-going weed abatement activities and disturbance associated with surrounding development. These disturbances have eliminated and/or greatly disturbed the natural plant communities that once occurred on and surrounded the project site. Refer to Attachment B, *Site Photographs,* for representative site photographs. No native plant communities will be impacted from implementation of the proposed project.

The project site supports one (1) plant community: non-native grassland, and one land type that would be classified as disturbed (refer to Exhibit 5, *Vegetation* in Attachment A). The non-native grassland plant community is found on both the eastern and western halves of the site where current construction and staging activities are absent. The non-native grassland plant community is dominated by non-native grasses that include mouse barley (*Hordeum murinum*), red brome (*Bromus madritensis*), filaree (*Erodium* sp.), fiddleneck (*Amsinckia menziesii*), and ripgut brome (*Bromus diandrus*). Other common plant species observed in this plant community include bicolor lupine (*Lupinus bicolor*), cheeseweed (*Malva parviflora*), alfalfa (*Medicago sativa*), slender goldfields (*Lasthenia gracilis*), London rocket (*Sisybrium irio*), sweet clover (*Melilotus officinalis*), stinknet (*Oncosiphon piluliferum*), telegraph weed (*Heterotheca grandiflora*), and tidytips (*Layia platyglossa*).

Areas within the project site that are classified as disturbed include those that currently support ongoing construction and staging activities associated with adjacent development. These areas are entirely devoid

of vegetation or support minimal weedy/early successional species like short-podded mustard and filaree.

Wildlife

Plant communities provide foraging habitat, nesting/denning sites, and shelter from adverse weather or predation. This section provides a discussion of those wildlife species that were observed or are expected to occur within the project site. The discussion is to be used a general reference and is limited by the season, time of day, and weather conditions in which the field survey was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation.

Fish

The MSHCP does not identify any covered or special-status fish species as potentially occurring within the project site. No fish or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for fish were observed on or within the vicinity of the project site. Therefore, no fish are expected to occur and are presumed absent.

Amphibians

The MSHCP does not identify any covered or special-status amphibian species as potentially occurring within the project site. No amphibians or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for amphibian species were observed on or within the vicinity of the project site. Therefore, no amphibians are expected to occur.

Reptiles

The MSHCP does not identify any covered or special-status reptilian species as potentially occurring within the project site. The project site provides a limited amount of habitat for a few reptile species adapted to a high degree of human disturbance associated with the on-site weed abatement activities and development. Common side-blotched lizard (*Uta stansburiana elegans*) was the only reptilian species observed during the field investigation. Other common reptilian species expected to occur include gopher snake (*Pituophis catenifer*), and southern alligator lizard (*Elgaria multicarinata*). Due to the high level of anthropogenic disturbances on-site, and surrounding development, no special-status reptilian species are expected to occur within project site.

Birds

The project site provides minimal foraging habitat for bird species adapted to a high degree of human disturbance. Bird species detected during the field survey included northern mockingbird (*Mimus polyglottos*), mourning dove (*Zenaida macroura*), house finch (*Haemorhouse mexicanus*), American crow (*Corcus brachyrhynchos*), red-tailed hawk (*Buteo jamaicensis*), Anna's hummingbird (*Calypte anna*), bushtit (*Psaltriparus minimus*), and lesser goldfinch (*Spinus psaltria*).

Despite a systematic search of the project site, no burrowing owls or recent signs (i.e., pellets, feathers, castings, or whitewash) were observed during the field investigation. The project site is vegetated with a variety of low-growing plant species that allow for minimal line-of-sight observation favored by burrowing owls. However, the project site lacks suitable burrows (>4 inches in diameter) capable of providing roosting and nesting opportunities. Additionally, the power poles along the eastern boundary of the project site

provide perching opportunities for large raptors (i.e., red-tailed hawk) that can prey on burrowing owls. As a result, burrowing owl was determined to have a low potential to occur on the project site.

Mammals

The MSHCP does not identify any covered or special-status mammalian species as potentially occurring within the project site. No mammalian species were observed during the field investigation. Common mammalian species expected to occur include Audubon's cottontail (*Sylvilagus audubonii*), coyote (*Canis latrans*), opossum (*Didelphis virginiana*), California ground squirrel (*Otospermophilus beecheyi*) and raccoon (*Procyon lotor*). No bat species are expected to occur due to a lack of suitable roosting habitat (i.e., trees, crevices).

Nesting Birds and Raptors

No active nests or birds displaying nesting behavior were observed during the field survey, which was conducted during the breeding season. Although heavily disturbed, the project has the potential to provide minimal foraging and nesting habitat for year-round and seasonal avian residents, raptors, as well as migrating songbirds that could occur in the area that area adapted to disturbed environments. A pre-construction nesting bird clearance survey shall be conducted prior to ground disturbance to ensure no nesting birds will be impacted from site development.

Migratory Corridors and Linkages

Habitat linkages provide connections between larger habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species yet still inadequate for others. Wildlife corridors are features that allow for the dispersal, seasonal migration, breeding, and foraging of a variety of wildlife species. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

The project site has not been identified as occurring in a wildlife corridor or linkage. The proposed project will be confined to existing areas that have been heavily disturbed or developed, are isolated from regional wildlife corridors and linkages, and there are no riparian corridors, creeks, or useful patches of stepping stone habitat (natural areas) within or connecting the improvement areas to a recognized wildlife corridor or linkage. As such, implementation of the proposed project is not expected to impact wildlife movement opportunities. Therefore, impacts to wildlife corridors or linkages are not expected to occur.

Jurisdictional Areas

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates discharge of dredge or fill materials into "waters of the United States" pursuant to Section 404 of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFW regulates alterations to streambed and bank under Fish and Wildlife Code Sections 1600 et seq., and the Regional Board regulates discharges into surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

No jurisdictional drainage and/or wetland features were observed on the project site during the field investigation. Further no blueline streams have been recorded on the project site. Therefore, development of the project will not result in impacts to Corps, Regional Board, or CDFW jurisdiction and regulatory approvals will not be required.

It should be noted that surrounding development activities have heavily disturbed the boundaries of the project site by installing silt fencing around the project site, and through the middle of the site on either side of the underground storm drain alignment. Surrounding development has effectively cut off the project site from any potential water draining on the site.

Special-Status Biological Resources

The CNDDB was queried for reported locations of special-status plant and wildlife species as well as natural communities of special concern in the Romoland USGS 7.5-minute quadrangle. A search of published records within these quadrangles were conducted using the CNDDB Rarefind 5 online software and the CDFW BIOS database and the CNPS Inventory of Rare and Endangered Plants of California that supplied information regarding the distribution and habitats of vascular plants in the vicinity of the project site. The habitat assessment evaluated the conditions of the habitat(s) within the boundaries of the project site to determine if the existing plant communities, at the time of the survey, have the potential to provide suitable habitat(s) for special-status plant and wildlife species.

The literature search identified seventeen (17) special-status plant species, fifty (50) special-status wildlife species, and two (2) special-status habitats as having potential to occur within the Romoland quadrangle. Special-status plant and wildlife species were evaluated for their potential to occur within the project site based on habitat requirements, availability and quality of suitable habitat, and known distributions. Species determined to have the potential to occur within the general vicinity are presented in *Table C-1: Potentially Occurring Special-Status Biological Resources*, provided in Attachment C. Refer to Table C-1 for a determination regarding the potential occurrence of special-status plant and wildlife species within the project site.

Special-Status Plants

According to the CNDDB and CNPS, seventeen (17) special-status plant species have been recorded in the Romoland quadrangle (refer to Attachment C). The project site consists of vacant, undeveloped land that have been subject to a variety of anthropogenic disturbances from grading/disking activities, historic agricultural uses, and activities associated with surrounding development. These disturbances have resulted in a majority of the project site being dominated by early successional and non-native vegetation, which has reduced, if not eliminated, the ability of the project site to provide suitable habitat for special-status plant species. Although the field investigation was not conducted during the blooming season for the majority of the special-status plant species known to occur in the general vicinity of the project site, based on habitat requirements for specific special-status plant species and the availability and quality of habitats needed by each species, it was determined that the project site does not provide suitable habitat for special-status species know to occur in the area and are presumed absent.

Special-Status Wildlife

According to the CNDDB, fifty (50) special-status wildlife species have been reported in the Romoland quadrangle (refer to Attachment C). No special-status wildlife species were observed on-site during the habitat assessment. Based on habitat requirements for specific species and the availability and quality of on-site habitats, it was determined that the proposed project site has a moderate potential to support Cooper's hawk (*Accipiter cooperii*), and sharp-shinned hawk (*Accipiter striatus*); and a low potential to support great egret (*Ardea alba*), burrowing owl, white-tailed kite (*Elanus leucurus*), and California horned lark (*Eremophila alpestris actia*). Further it was determined that the project site does not provide suitable habitat for any of the other special-status wildlife species known to occur in the area since the project site has been heavily disturbed from on-site disturbances and surrounding development.

To ensure no impacts to the aforementioned species do not occur from implementation of the proposed project, a pre-construction nesting bird clearance survey shall be conducted prior to ground disturbance. With implementation of the pre-construction nesting bird clearance survey, impacts to the aforementioned species will be less than significant and no mitigation will be required.

Special-Status Plant Communities

The CNDDB lists two (2) special-status habitats as being identified within the Romoland quadrangle: Southern Coast Live Oak Riparian Forest and Southern Cottonwood Willow Riparian Forest. No CDFW special-status plant communities occur within the boundaries of the project site.

Critical Habitat

Under the federal Endangered Species Act, "Critical Habitat" is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the United States Fish and Wildlife Service (USFWS) regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a CWA Permit from the Corps). If a there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The project site is not located with federally designated Critical Habitat (refer to Exhibit 6, *Critical Habitat*, in Attachment A). The closest designated Critical Habitat is located approximately 3.6 miles northwest of the project site for spreading navarretia (*Navarretia fossalis*) and thread-leaved brodiaea (*Brodiaea filifolia*) along the San Jacinto River, and approximalty 4.10 miles southeast of the project site for coastal California gnatcatcher (*Polioptila californica californica*). Therefore, the loss or adverse modification of Critical Habitat will not occur as a result of the proposed project and consultation with the USFWS will not be required for implementation of the proposed project.

Western Riverside County MSHCP

The project site is located within the Sun City/Menifee Valley Area Plan of the MSHCP but are not located within any Criteria Cells or MSHCP Conservation Areas (refer to Exhibit 7, *MSHCP Criteria Area*, in Attachment A). Additionally, the project is only located within the designated survey area for burrowing owl as depicted in Figures 6-4 within Section 6.3.2 of the MSHCP.

Riparian/Riverine Areas and Vernal Pools

Riparian/Riverine Areas

As identified in Section 6.1.2 of the MSHCP, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, riparian/riverine areas are defined as areas dominated by trees, shrubs, persistent emergent plants, or emergent mosses and lichens which occur close to or are dependent upon nearby freshwater, or areas with freshwater flowing during all or a portion of the year. Conservation of these areas is intended to protect habitat that is essential to a number of listed or special-status water-dependent fish, amphibian, avian, and plant species. If impacts to riparian/riverine habitat cannot be avoided, a Determination of Biologically Equivalent or Superior Preservation (DBESP) must be developed to address the replacement of lost functions of habitats in regards to the listed species. This assessment is independent from considerations given to "waters of the U.S." and "waters of the State" under the CWA and the California Fish and Game Code.

No jurisdictional drainages, riparian/riverine and/or wetland features were observed within the project site during the field investigation. Therefore, development of the proposed project will not result in impacts to riparian/riverine habitats and a DBESP will not be required for the loss of riparian/riverine habitat from development of the proposed project.

Vernal Pools and Fairy Shrimp Habitat

One of the factors for determining the suitability of the habitat for fairy shrimp would be demonstrable evidence of seasonal ponding in an area of topographic depression that is not subject to flowing waters. These astatic pools are typically characterized as vernal pools. More specifically, vernal pools are seasonal wetlands that occur in depression areas without a continual source of water. They have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology is made on a case-by-case basis. Such determinations should be considered the length of time the areas exhibits upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. The seasonal hydrology of vernal pools provides for a unique environment, which supports plants and invertebrates specifically adapted to a regime of winter inundation, followed by an extended period when the pool soils are dry.

Vernal pools are seasonally inundated, ponded areas that only form in regions where specialized soil and climatic conditions exist. During fall and winter rains typical of Mediterranean climates, water collects in shallow depressions where downward percolation of water is prevented by the presence of a hard pan or

clay pan layer (duripan) below the soil surface. Later in the spring when rains decrease and the weather warms, the water evaporates and the pools generally disappear by May. The shallow depressions remain relatively dry until late fall and early winter with the advent of greater precipitation and cooler temperatures. Vernal pools provide unusual "flood and drought" habitat conditions to which certain plant and wildlife species have specifically adapted as well as invertebrate species such as fairy shrimp.

The MSHCP lists two general classes of soils known to be associated with listed and special-status plant species; clay soils and Traver-Domino Willow association soils. The specific clay soils known to be associated with listed and special-status species within the MSHCP plan area include Bosanko, Auld, Altamont, and Porterville series soils, whereas Traver-Domino Willows association includes saline-alkali soils largely located along floodplain areas of the San Jacinto River and Salt Creek. Without the appropriate soils to create the impermeable restrictive layer, none of the special-status plant or wildlife species associated with vernal pools can occur on the project site. None of these soils have been documented within the project site.

A review of recent and historic aerial photographs (1996-2018) of the project site did not provide visual evidence of an astatic or vernal pool conditions within the project site. No ponding was observed, further supporting the fact that the drainage patterns currently occurring on the project site do not follow hydrologic regime needed for vernal pools. From this review of historic aerial photographs and observations during the field investigations, it can be concluded that there is no indication of vernal pools or suitable fairy shrimp habitat occurring within the proposed project site.

Additional Survey Needs and Procedures

The RCA MSHCP Information Map query and review of the MSHCP identified that the project site is located within the designated survey area for burrowing owl as depicted in Figure 6-4 within Section 6.3.2 of the MSHCP.

Burrowing Owl

Burrowing owl is currently designated as a California Species of Special Concern. The burrowing owl is a grassland specialist distributed throughout western North America where it occupies open areas with short vegetation and bare ground within shrub, desert, and grassland environments. Burrowing owls use a wide variety of arid and semi-arid environments with level to gently-sloping areas characterized by open vegetation and bare ground. The western burrowing owl (*A.c. hypugaea*), which occurs throughout the western United States including California, rarely digs its own burrows and is instead dependent upon the presence of burrowing mammals (i.e., California ground squirrels, coyotes, and badgers) whose burrows are often used for roosting and nesting. The presence or absence of colonial mammal burrows is often a major factor that limits the presence or absence of burrowing owls. Where mammal burrows are scarce, burrowing owls have been found occupying man-made cavities, such as buried and non-functioning drain pipes, stand-pipes, and dry culverts. They also require low growth or open vegetation allowing line-of-sight observation of the surrounding habitat to forage and watch for predators. In California, the burrowing owl breeding season extends from the beginning of February through the end of August.

Despite a systematic search of the project site, no burrowing owls or recent signs (i.e., pellets, feathers, castings, or whitewash) were observed during the field investigation. The project site is vegetated with a

variety of low-growing plant species that allow for minimal line-of-sight observation favored by burrowing owls. However, the project site lacks suitable burrows (>4 inches in diameter) capable of providing roosting and nesting opportunities. Additionally, the power poles along the eastern boundary of the project site provide perching opportunities for large raptors (i.e., red-tailed hawk) that can prey on burrowing owls. As a result, burrowing owl was determined to have a low potential to occur on the project site.

Out of an abundance of caution, and to ensure burrowing owl remain absent from the project site, it is recommended that a 30-day burrowing owl pre-construction clearance survey be conducted prior to any ground disturbing activities.

Conclusion

Based on the proposed project footprint, and with the implementation of the recommendations provided in this report, project impacts to special-status plant and wildlife species will be considered less than significant. Therefore, it has been determined that implementation of the project will have no significant impacts on federally, State, or MSHCP listed species known to occur in the general vicinity of the project site. Additionally, the project will have "no effect" on designated Critical Habitats. With completion of the recommendations provided in this report and payment of the SKR HCP mitigation fee and MSHCP mitigation fee, development of the project site is fully consistent with the Western Riverside County MSHCP.

Please do not hesitate to contact Tom McGill at (951) 285-6014 or tmcgill@elmtconsulting.com or Travis McGill at (909) 816-1646 or travismcgill@elmtconsulting.com should you have any questions regarding this proposal.

Sincerely,

Thomas J. McGill, Ph.D.

Potentially Occurring Special-Status Plant Species

Table C-1: Potentially Occurring Special-Status Biological Resources

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
SPECIAL-STATUS WILDLIFE SPECIES				
Accipiter cooperii Cooper's hawk	Fed: None CA: WL	Generally found in forested areas up to 3,000 feet in elevation, especially near edges and rivers. Prefers hardwood stands and mature forests, but can be found in urban and suburban areas where there are tall trees for nesting. Common in open areas during nesting season.	No	**Moderate**. The project site provides suitable foraging opportunities, but the project site does not provide suitable nesting opportunities. This species is adapted to urban environments and occurs commonly.
Accipiter striatus sharp-shinned hawk	Fed: None CA: WL	Found in pine, fir and aspen forests. They can be found hunting in forest interior and edges from sea level to near alpine areas. Can also be found in rural, suburban and agricultural areas, where they often hunt at bird feeders. Typically found in southern California in the winter months.	No	**Moderate**. The project site provides suitable foraging opportunities. This species does not nest in this region.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	Fed: None CA: WL	Typically found between 3,000 and 6,000 feet in elevation. Breed in sparsely vegetated scrubland on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush (*Artemisia californica*), but they can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Ammodramus savannarum grasshopper sparrow	Fed: None CA: SSC	Occurs in grassland, upland meadow, pasture, hayfield, and old field habitats. Optimal habitat contains short- to medium-height bunch grasses interspersed with patches of bare ground, a shallow litter layer, scattered forbs, and few shrubs. May inhabit thickets, weedy lawns, vegetated landfills, fence rows, open fields, or grasslands.	No	**Presumed absent.** No suitable habitat is present on-site.
Aquila chrysaetos golden eagle	Fed: None CA: FP; WL	Occupies nearly all terrestrial habitats of the western states except densely forested areas. Favors secluded cliffs with overhanging ledges and large trees for nesting and cover. Hilly or mountainous country where takeoff and soaring are supported by updrafts is generally preferred to flat habitats. Deeply cut canyons rising to open mountain slopes and crags are ideal habitat.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Ardea alba great egret	Fed: None CA: None	Yearlong resident throughout California, except for the high mountains and deserts. Feeds and rests in fresh, and saline emergent wetlands, along the margins of estuaries, lakes, and slow-moving streams, on mudflats and salt ponds, and in irrigated croplands and pastures.	No	**Low.** The project site provides suitable foraging opportunities, but does not provide suitable nesting opportunities.
Ardea herodias great blue heron	Fed: None CA: None	Forages along streams, marshes, lakes, and meadows. Nests colonially in tall trees (typically Eucalyptus sp.), on cliffsides, or in isolated spots in marshes.	No	**Presumed absent.** No suitable habitat is present on-site.
Arizona elegans occidentalis California glossy snake	Fed: None CA: SSC	Inhabits arid scrub, rocky washes, grasslands, and chaparral habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Artemisiospiza belli belli Bell's sparrow	Fed: None CA: WL	Generally prefers semi-open habitats with evenly spaced shrubs 1 – 2 meters in height. Dry chaparral and coastal sage scrub. Less common in tall dense, old chaparral.	No	**Presumed absent.** No suitable habitat is present on-site.
Aspidoscelis hyperythra orangethroat whiptail	Fed: None CA: SSC; WL	Semi-arid brushy areas typically with loose soil and rocks, including washes, streamsides, rocky hillsides, and coastal chaparral.	No	**Presumed absent**. No suitable habitat is present.
Aspidoscelis tigris stejnegeri coastal whiptail	Fed: None CA: SSC	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage - chaparral, woodland, and riparian areas.	No	**Presumed absent**. No suitable habitat is present.
Athene cunicularia burrowing owl	Fed: None CA: SSC	Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Dependent upon fossorial mammals for burrows, most notable ground squirrels.	No	**Low**. The project site provides marginal foraging and nesting habitat. Although heavily disturbed, the western portion of the site provides line-of-sight opportunities favored by burrowing owls; however, no suitable burrows (>4 inches in diameter) were observed on-site.
Baeolophus inornatus oak titmouse	Fed: None CA: None	Lives mostly in warm, open, dry oak or oak-pine woodlands. Restricted to southwest Oregon to northwest Baja California with another population in the Cape District of south Baja California.	No	**Presumed absent.** No suitable habitat is present on-site.
Bombus crotchii Crotch bumble bee	Fed: None CA: CE	Exclusive to coastal California east towards the Sierra-Cascade Crest; less common in western Nevada.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Buteo regalis ferruginous hawk	Fed: None CA: WL	Occurs primarily in open grasslands and fields, but may be found in sagebrush flats, desert scrub, low foothills, or along the edges of pinyon-juniper woodland. Feeds primarily on small mammals and typically found in agricultural or open fields.	No	**Presumed absent.** No suitable habitat is present on-site.
Buteo swainsoni Swainson's hawk	Fed: None CA: **THR**	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	No	**Presumed absent.** No suitable habitat is present on-site.
Calypte costae Costa's hummingbird	Fed: None CA: None	Desert and semi-desert, arid brushy foothills and chaparral. A desert hummingbird that breeds in the Sonoran and Mojave Deserts. Departs desert heat moving into chaparral, scrub, and woodland habitats.	No	**Presumed absent**. No suitable habitat is present on-site.
Chaetodipus californicus femoralis Dulzura pocket mouse	Fed: None CA: SSC	Found most often in grass-chaparral edges but may also be found in coastal scrub or other habitats, primarily in San Diego County.	No	**Presumed absent.** No suitable habitat is present on-site.
Chaetodipus fallax fallax northwestern San Diego pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	**Presumed absent.** No suitable habitat is present on-site.
Chaetura vauxi Vaux's swift	Fed:CA: None SSC	Prefers redwood and Douglas-fir habitats with nest-sites in large hallow trees and snags, especially tall, burned-out snags. Fairly common migrant throughout most of the state in April and May, and August and September.	No	**Presumed absent.** No suitable habitat is present on-site.
Circus hudsonius northern harrier	Fed: None CA: SSC	Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Mostly found in flat, or hummocky, open areas of tall, dense grasses moist or dry shrubs, and edges for nesting, cover, and feeding.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Coleonyx variegatus abbotti San Diego banded gecko	Fed: None CA: SSC	Occurs in coastal and cismontane southern California from interior Ventura County south, although it is absent from the extreme outer coast. It is uncommon in coastal scrub and chaparral, most often occurring in granite or rocky outcrops in these habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Crotalus ruber red-diamond rattlesnake	Fed: None CA: SSC	It can be found from the desert, through dense chaparral in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. It is most commonly associated with heavy brush with large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake; however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys merriami parvus San Bernardino kangaroo rat	Fed: **END** CA: CE	Primarily found in Riversidian alluvial fan sage scrub and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May occur at lower densities in Riversidian upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to Riversidian alluvial fan sage scrub habitats. Tend to avoid rocky substrates and prefer sandy loam substrates for digging of shallow burrows.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys simulans Dulzura kangaroo rat	Fed: None CA: None	Relatively common in chaparral, coastal sage scrub, Riversidean alluvial fan sage scrub, and peninsular juniper woodland habitats.	No	**Presumed absent.** No suitable habitat is present on-site.
Dipodomys stephensi Stephens' kangaroo rat	Fed: **END** CA: **THR**	Occur in arid and semi-arid habitats with some grass or brush. Prefer open habitats with less than 50% protective cover. Require soft, well-drained substrate for building burrows and are typically found in areas with sandy soil.	No	**Presumed absent.** No suitable habitat is present on-site.
Elanus leucurus white-tailed kite	Fed: None CA: FP	Occurs in low elevation, open grasslands, savannah-like habitats, agricultural areas, wetlands, and oak woodlands. Uses trees with dense canopies for cover.	No	**Low**. The project site provides marginal foraging habitat. No suitable nesting opportunities on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Empidonax traillii willow flycatcher	Fed: None CA: **END**	A rare to locally uncommon, summer resident in wet meadow and montane riparian habitats (2,000 to 8,000 ft) in the Sierra Nevada and Cascade Range. Most often occurs in broad, open river valleys or large mountain meadows with lush growth of shrubby willows.	No	**Presumed absent.** No suitable habitat is present on-site.
Eremophila alpestris actia California horned lark	Fed: None CA: WL	Generally found in shortgrass prairies, grasslands, disturbed fields, or similar habitat types along the coast or in deserts. Trees are shrubs are usually scarce or absent. Generally rare in montane, coniferous, or chaparral habitats. Forms large flocks outside of the breeding season.	No	**Low** The project site provides suitable foraging and minimal nesting habitat.
Eumops perotis californicus western mastiff bat	Fed: None CA: SSC	Primarily a cliff-dwelling species, roost generally under exfoliating rock slabs. Roosts are generally high above the ground, usually allowing a clear vertical drop of at least 3 meters below the entrance for flight. In California, it is most frequently encountered in broad open areas. Its foraging habitat includes dry desert washes, flood plains, chaparral, oak woodland, open ponderosa pine forest, grassland, and agricultural areas.	No	**Presumed absent.** No suitable habitat is present on-site.
Euphydryas editha quino Quino checkerspot butterfly	Fed: **END** CA: None	Range is now limited to a few populations in Riverside and San Diego counties. Common in meadows and upland sage scrub/chapparal habitat.	No	**Presumed absent.** No suitable habitat is present on-site.
Falco peregrinus anatum American peregrine falcon	Fed: DL CA: DL; FP	Uncommon winter resident of the inland region of southern California. Active nesting sites are known along the coast north of Santa Barbara, in the Sierra Nevada, and in other mountains of northern California. Breeds mostly in woodland, forest, and coastal habitats. Riparian areas and coastal and inland wetlands are important habitats yearlong, especially in nonbreeding seasons.	No	**Presumed absent.** No suitable habitat is present on-site.
Lanius ludovicianus loggerhead shrike	Fed: None CA: SSC	Often found in broken woodlands, shrublands, and other habitats. Prefers open country with scattered perches for hunting and fairly dense brush for nesting.	No	**Presumed absent.** No suitable habitat is present on-site.
Lasiurus xanthinus western yellow bat	Fed: None CA: SSC	Roosts in palm trees in foothill riparian, desert wash, and palm oasis habitats with access to water for foraging.	No	**Presumed absent.** No suitable habitat is present on-site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	Fed: None CA: SSC	Occurs in diverse habitats, but primarily is found in arid regions supporting shortgrass habitats. Openness of open scrub habitat is preferred over dense chaparral.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Neotoma lepida intermedia San Diego desert woodrat	Fed: None CA: SSC	Occurs in coastal scrub communities between San Luis Obispo and San Diego Counties. Prefers moderate to dense canopies, and especially rocky outcrops.	No	**Presumed absent.** No suitable habitat is present on-site.
Numenius americanus long-billed curlew	Fed: None CA: WL	Preferred winter habitats include large coastal estuaries, upland herbaceous areas, and croplands. On estuaries, feeding occurs mostly on intertidal mudflats.	No	**Presumed absent.** No suitable habitat is present on-site.
Nycticorax nycticorax black-crowned night heron	Fed: None CA: None	Fairly common, yearlong resident in lowlands and foothills throughout most of California, including the Salton Sea and Colorado River areas, and very common locally in large nesting colonies. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and rarely, on kelp beds in marine sub tidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	No	**Presumed absent.** No suitable habitat is present on-site.
Onychomys torridus ramona southern grasshopper mouse	Fed: None CA: SSC	Inhabits alkali desert scrub and other desert scrub habitats, and to a lesser extent succulent shrubs, desert washes, desert riparian, coastal scrub, mixed chaparral, and sagebrush habitats. Generally rare in valley foothill and montane riparian habitats. Prefers low to moderate shrub cover and requires friable soils.	No	**Presumed absent.** No suitable habitat is present on-site.
Perognathus longimembris brevinasus Los Angeles pocket mouse	Fed: None CA: SSC	Occurs in lower elevation grasslands and coastal sage scrub communities in and around the Los Angeles Basin. Prefers open ground with fine sandy soils. May not dig extensive burrows, but instead will seek refuge under weeds and dead leaves instead.	No	**Presumed absent.** No suitable habitat is present on-site.
Phrynosoma blainvillii coast horned lizard	Fed: None CA: SSC	Occurs in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. In inland areas, this species is restricted to areas with pockets of open microhabitat, created by disturbance (i.e. fire, floods, roads, grazing, fire breaks). The key elements of such habitats are loose, fine soils with a high sand fraction; an abundance of native ants or other insects; and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Plegadis chihi white-faced ibis	Fed: None CA: WL	Prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated or flooded partures and croplands. Nests in dense, fresh emergent wetland.	No	**Presumed absent.** No suitable habitat is present on-site.
Polioptila californica californica coastal California gnatcatcher	Fed: **THR** CA: SSC	Obligate resident of sage scrub habitats that are dominated by California sagebrush (*Artemisia californica*). This species generally occurs below 750 feet elevation in coastal regions and below 1,500 feet inland. Ranges from the Ventura County, south to San Diego County and northern Baja California and it is less common in sage scrub with a high percentage of tall shrubs. Prefers habitat with more low-growing vegetation.	No	**Presumed absent.** No suitable habitat is present on-site.
Setophaga petechia yellow warbler	Fed: None CA: SSC	Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near stream courses.	No	**Presumed absent.** No suitable habitat is present on-site.
Spea hammondii western spadefoot	Fed: None CA: SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washed, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rainpools which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	No	**Presumed absent.** No suitable habitat is present on-site.
Spinus lawrencei Lawrence's goldfinch	Fed: None CA: None	Open woodlands, chaparral, and weedy fields. Closely associated with oaks. Nests in open oak or other arid woodland and chaparral near water.	No	**Presumed absent.** No suitable habitat is present on-site.
Streptocephalus woottoni Riverside fairy shrimp	Fed: **END** CA: None	Freshwater crustacean that is found in vernal pools in the coastal California area.	No	**Presumed absent.** No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Vireo bellii pusillus least Bell's vireo	Fed: **END** CA: **END**	Primarily occupy Riverine riparian habitat that typically feature dense cover within 1 -2 meters of the ground and a dense, stratified canopy. Typically it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodlands, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses, 2,000 feet elevation in the interior.	No	**Presumed absent.** No suitable habitat is present on-site.
SPECIAL-STATUS PLANT SPECIES				
Allium munzii Munz's onion	Fed: **END** CA: **THR** CNPS: 1B.1	Found in chaparral, cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Found at elevations ranging from 974 to 3,510 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Brodiaea filifolia thread-leaved brodiaea	Fed: **END** CA: **THR** CNPS: 1B.1	Grows in chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, and vernal pools, often in clay soils. Found at elevations ranging from 82 to 3,675 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Caulanthus simulans Payson's jewelflower	Fed: None CA: None CNPS: 4.2	Occurs on granitic sandy soils in chaparral and coastal scrub habitats. Found at elevations ranging from 295 to 7,218 feet. Blooming period is from February to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Centromadia pungens ssp. laevis smooth tarplant	Fed: None CA: None CNPS: 1B.1	Found in alkaline soils within chenopod scrub, meadows and seeps, playas, riparian woodland, valley and foothill grassland habitats. Found at elevations ranging from 0 to 2,100 feet. Blooming period is from April to September.	No	**Presumed absent**. No suitable habitat is present on-site.
Chorizanthe leptotheca Peninsular spineflower	Fed: None CA: None CNPS: 4.2	Found in granitic soils within chaparral, coast scrub, and lower montane coniferous forest habitats. Found at elevations ranging from 984 to 6,234 feet. Blooming period is from May to August.	No	**Presumed absent**. No suitable habitat is present on-site.
Chorizanthe parryi* var. *parryi Parry's spineflower	Fed: None CA: None CNPS: 1B.1	Occurs on sandy and/or rocky soils in chaparral, coastal sage scrub, and sandy openings within alluvial washes and margins. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Chorizanthe polygonoides var. longispina long-spined spineflower	Fed: None CA: None CNPS: 1B.2	Typically found on clay lenses which are largely devoid of shrubs. Can be found on the periphery of vernal pool habitat and even on the periphery of montane meadows near vernal seeps. Found at elevations ranging from 98 to 5,020 feet. Blooming period is from April to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Convolvulus simulans small-flowered morning-glory	Fed: None CA: None CNPS: 4.2	Grows in clay soils within serpentinite seeps, chaparral, coastal scrub, valley and foothill grassland habitats. Found at elevations ranging from 98 to 2,297 feet. Blooming period is from March to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Deinandra paniculata paniculate tarplant	Fed: None CA: None CNPS: 4.2	Typically found in vernally mesic, sometimes sandy soils in coastal scrub, valley and foothill grasslands, and vernal pools. Found at elevations ranging from 82 to 3,084 feet. Blooming period is from April to November.	No	**Presumed absent**. No suitable habitat is present on-site.
Harpagonella palmeri Palmer's grapplinghook	Fed: None CA: None CNPS: 4.2	Occurs on clay soils in chaparral, coastal scrub, and valley and foothill grasslands. Found at elevations ranging from 66 to 3,133 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Juglans californica southern California black walnut	Fed: None CA: None CNPS: 4.2	Found in chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 164 to 2,953 feet. Blooming period is from March to August.	No	**Presumed absent**. No suitable habitat is present on-site.
Lasthenia glabrata* ssp. *coulteri Coulter's goldfields	Fed: None CA: None CNPS: 1B.1	Prefers playas, vernal pools, and coastal salt marshes and swamps. Found at elevations ranging from 3 to 4,003 feet. Blooming period is from February to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Lepidium virginicum var. robinsonii Robinson's pepper-grass	Fed: None CA: None CNPS: 4.3	Dry soils on chaparral and coastal sage scrub. Found at elevations ranging from 3 to 2,904 feet. Blooming period is from January to July.	No	**Presumed absent**. No suitable habitat is present on-site.
Microseris douglasii* ssp. *platycarpha small-flowered microseris	Fed: None CA: None CNPS: 4.2	Occurs in clay soils in cismontane woodland, coastal scrub, valley and foothill grasslands, and around vernal pools. Found at elevations ranging from 49 to 3,510 feet. Blooming period is from March to May.	No	**Presumed absent**. No suitable habitat is present on-site.
Myosurus minimus ssp. apus little mousetail	Fed: None CA: None CNPS: 3.1	Occurs in alkaline soils in valley and foothill grassland and vernal pools. Found at elevations ranging from 66 to 2,100 feet. Blooming period is from March to June.	No	**Presumed absent**. No suitable habitat is present on-site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Navarretia fossalis spreading navarretia	Fed: **THR** CA: None CNPS: 1B.1	Grows in chenopod scrub, assorted shallow freshwater marshes and swamps, playas, and vernal pools. Found at elevations ranging from 98 to 2,149 feet. Blooming period is from April to June.	No	**Presumed absent**. No suitable habitat is present on-site.
Orcuttia californica California Orcutt grass	Fed: **END** CA: **END** CNPS: 1B.1	Primarily restricted to the southern basaltic claypan vernal pools at the Santa Rosa Plateau, and alkali vernal pools at Skunk Hollow, and at Salt Creek. Grows in elevations ranging from 45 to 2,165 feet above msl. Blooming period is from April to August.	No	**Presumed absent**. No suitable habitat is present on-site.
CDFW SENSITIVE HABITATS				
Southern Coast Live Oak Riparian Forest	CDFW Sensitive Habitat	Open to locally dense evergreen riparian woodlands dominated by *Quercus agrifolia*. This type appears to be richer in herbs and poorer in understory shrubs than other riparian communities. Bottomlands and outer floodplains along larger streams, on fine-grained, rich alluvium. Canyons and valleys of coastal southern California.	No	**Absent**
Southern Cottonwood Willow Riparian Forest	CDFW Sensitive Habitat	Dominated by cottonwood (*Populus* ssp.) and willow (*Salix* ssp.) trees and shrubs. Considered to be an early successional stage as both species are known to germinate almost exclusively on recently deposited or exposed alluvial soils.	No	**Absent**

0.3- Not very threatened in California

Attachment D

Regulations

Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to continued existence and existing knowledge of population levels.

Federal Regulations

Endangered Species Act of 1973

Federally listed threatened and endangered species and their habitats are protected under provisions of the Federal Endangered Species Act (ESA). Section 9 of the ESA prohibits "take" of threatened or endangered species. "Take" under the ESA is defined as to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any of the specifically enumerated conduct." The presence of any federally threatened or endangered species that are in a project area generally imposes severe constraints on development, particularly if development would result in "take" of the species or its habitat. Under the regulations of the ESA, the United States Fish and Wildlife Service (USFWS) may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act.

Critical Habitat is designated for the survival and recovery of species listed as threatened or endangered under the ESA. Critical Habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an ESA listed species and which may require special management considerations or protection. Critical Habitat may also include unoccupied habitat if it is determined that the unoccupied habitat is essential for the conservation of the species.

Whenever federal agencies authorize, fund, or carry out actions that may adversely modify or destroy Critical Habitat, they must consult with USFWS under Section 7 of the ESA. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highway Administration or a permit from the U.S. Army Corps of Engineers (Corps)).

If USFWS determines that Critical Habitat will be adversely modified or destroyed from a proposed action, the USFWS will develop reasonable and prudent alternatives in cooperation with the federal institution to ensure the purpose of the proposed action can be achieved without loss of Critical Habitat. If the action is not likely to adversely modify or destroy Critical Habitat, USFWS will include a statement in its biological opinion concerning any incidental take that may be authorized and specify terms and conditions to ensure the agency is in compliance with the opinion.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 U.S. Government Code [USC] 703) makes it unlawful to pursue, capture, kill, possess, or attempt to do the same to any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union, and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs (16 USC 703; 50 CFR 10, 21).

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. Disturbances causing nest abandonment and/or loss of reproductive effort (i.e., killing or abandonment of eggs or young) may also be considered "take." This regulation seeks to protect migratory birds and active nests.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protects all species and subspecies of the families listed above. The MBTA protects over 800 species including geese, ducks, shorebirds, raptors, songbirds and many relatively common species.

State Regulations

California Environmental Quality Act (CEQA)

The California Environmental Quality Act (CEQA) provides for the protection of the environment within the State of California by establishing State policy to prevent significant, avoidable damage to the environment through the use of alternatives or mitigation measures for projects. It applies to actions directly undertaken, financed, or permitted by State lead agencies. If a project is determined to be subject to CEQA, the lead agency will be required to conduct an Initial Study (IS); if the IS determines that the project may have significant impacts on the environment, the lead agency will subsequently be required to write an Environmental Impact Report (EIR). A finding of non-significant effects will require either a Negative Declaration or a Mitigated Negative Declaration instead of an EIR. Section 15380 of the CEQA Guidelines independently defines "endangered" and "rare" species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, "endangered" species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while "rare" species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

California Endangered Species Act (CESA)

In addition to federal laws, the state of California implements the CESA which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in "take" of individuals (defined in CESA as; "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") are regulated by CDFW. Habitat degradation or modification is not included in the definition of "take" under CESA. Nonetheless, CDFW has interpreted "take" to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the

absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

The CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

Fish and Game Code

Fish and Game Code Sections 3503, 3503.5, 3511, and 3513 are applicable to natural resource management. For example, Section 3503 of the Code makes it unlawful to destroy any birds' nest or any birds' eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs. A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*). Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

Native Plant Protection Act

Sections 1900–1913 of the Fish and Game Code were developed to preserve, protect, and enhance Rare and Endangered plants in the state of California. The act requires all state agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

California Native Plant Society Rare and Endangered Plant Species

Vascular plants listed as rare or endangered by the CNPS, but which have no designated status under FESA or CESA are defined as follows:

California Rare Plant Rank

1A- Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere

1B- Plants Rare, Threatened, or Endangered in California and Elsewhere

2A- Plants Presumed Extirpated in California, But More Common Elsewhere

2B- Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3- Plants about Which More Information is Needed - A Review List

4- Plants of Limited Distribution - A Watch List

Threat Ranks

.1- Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2- Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

.3- Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

Local Policies

Western Riverside County MSHCP

The MSHCP is a comprehensive, multi-jurisdictional HCP focusing on conservation of species and their associated habitats in western Riverside County. The goal of the MSHCP is to maintain biological and ecological diversity within a rapidly urbanizing region.

The approval of the MSHCP and execution of the Implementing Agreement (IA) by the wildlife agencies allows signatories of the IA to issue "take" authorizations for all species covered by the MSHCP, including state- and federal-listed species as well as other identified sensitive species and/or their habitats. Each city or local jurisdiction will impose a Development Mitigation Fee for projects within their jurisdiction. With payment of the mitigation fee to the County and compliance with the survey requirements of the MSHCP where required, full mitigation in compliance with the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), CESA, and FESA will be granted. The Development Mitigation Fee varies according to project size and project description. The fee for residential development ranges from approximately $800 per unit to $1,600 per unit depending on development density (County Ordinance 810.2). Payment of the mitigation fee and compliance with the requirements of Section 6.0 of the MSHCP are intended to provide full mitigation under CEQA, NEPA, CESA, and FESA for impacts to the species and habitats covered by the MSHCP pursuant to agreements with the USFWS, the CDFW, and/or any other appropriate participating regulatory agencies and as set forth in the IA for the MSHCP.

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates activities pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFG regulates activities under the Fish and Game Code Section 1600-1616, and the Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

Federal Regulations

Section 404 of the Clean Water Act

Since 1972, the Corps and U.S. Environmental Protection Agency (EPA) have jointly regulated the filling of "waters of the U.S.," including wetlands, pursuant to Section 404 of the Clean Water Act (CWA). The Corps has regulatory authority over the discharge of dredged or fill material into the waters of the United States under Section 404 of the CWA. The Corps and EPA define "fill material" to include any "material placed in waters of the United States where the material has the effect of: (i) replacing any portion of a water of the United States with dry land; or (ii) changing the bottom elevation of any portion of the waters of the United States." Examples include, but are not limited to, sand, rock, clay, construction debris, wood chips, and "materials used to create any structure or infrastructure in the waters of the United States." In order to further define the scope of waters protected under the CWA, the Corps and EPA published the Clean Water Rule on June 29, 2015. Pursuant to the Clean Water Rule, the term "*waters of the United States*" is defined as follows:

(i) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide.

(ii) All interstate waters, including interstate wetlands[1].

(iii) The territorial seas.

(iv) All impoundments of waters otherwise defined as waters of the United States under the definition.

(v) All tributaries[2] of waters identified in paragraphs (i) through (iii) mentioned above.

(vi) All waters adjacent[3] to a water identified in paragraphs (i) through (v) mentioned above, including wetlands, ponds, lakes, oxbows, impoundments, and similar waters.

---

1 The term *wetlands* means those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

2 The terms *tributary* and *tributaries* each mean a water that contributes flow, either directly or through another water (including an impoundment identified in paragraph (iv) mentioned above), to a water identified in paragraphs (i) through (iii) mentioned above, that is characterized by the presence of the physical indicators of a bed and banks and an ordinary high water mark.

3 The term *adjacent* means bordering, contiguous, or neighboring a water identified in paragraphs (i) through (v) mentioned above, including waters separated by constructed dikes or barriers, natural river berms, beach dunes, and the like.

(vii) All prairie potholes, Carolina bays and Delmarva bays, Pocosins, western vernals pools, Texas coastal prairie wetlands, where they are determined, on a case-specific basis, to have a significant nexus to a water identified in paragraphs (i) through (iii) meantioned above.

(viii) All waters located within the 100-year floodplain of a water identified in paragraphs (i) through (iii) mentioned above and all waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (i) through (v) mentioned above, where they are determined on a case-specific basis to have a significant nexus to a waters identified in paragraphs (i) through (iii) mentioned above.

The following features are not defined as "waters of the United States" even when they meet the terms of paragraphs (iv) through (viii) mentioned above:

(i) Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the Clean Water Act.

(ii) Prior converted cropland.

(iii) The following ditches:

(A) Ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary.
(B) Ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands.
(C) Ditches that do not flow, either directly or through another water, into a water of the United States as identified in paragraphs (i) through (iii) of the previous section.

(iv) The following features:

(A) Artificially irrigated areas that would revert to dry land should application of water to that area cease;
(B) Artificial, constructed lakes and ponds created in dry land such as farm and stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, or cooling ponds;
(C) Artificial reflecting pools or swimming pools created in dry land;
(D) Small ornamental waters created in dry land;
(E) Water-filled depressions created in dry land incidental to mining or construction activity, including pits excavated for obtaining fill, sand, or gravel that fill with water;
(F) Erosional features, including gullies, rills, and other ephemeral features that do not meet the definition of a tributary, non-wetland swales, and lawfully constructed grassed waterways; and
(G) Puddles.

(v) Groundwater, including groundwater drained through subsurface drainage systems.

(vi) Stormwater control features constructed to convey, treat, or store stormwater that are created in dry land.

(vii) Wastewater recycling structures constructed in dry land; detention and retention basins built for wastewater recycling; groundwater recharge basins; percolation ponds built for wastewater recycling; and water distributary structures built for wastewater recycling.

Section 401 of the Clean Water Act

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits, and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Water Quality Control Boards (Regional Board) that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board assumed this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

State Regulations

Fish and Game Code

Fish and Game Code Sections 1600 et. seq. establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

Fish and Game Code Section 1602 requires any person, state, or local governmental agency or public utility to notify the CDFW before beginning any activity that will do one or more of the following:

(1) substantially obstruct or divert the natural flow of a river, stream, or lake;
(2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or
(3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, the CDFW takes jurisdiction to the top of bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

Porter Cologne Act

The California *Porter-Cologne Water Quality Control Act* gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Act has become an important tool in the post SWANCC and Rapanos regulatory environment, with respect to the state's authority over isolated and insignificant waters. Generally, any person proposing to discharge waste into a water body that could affect its water quality must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although "waste" is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include fill discharged into water bodies.

Re: Update to Historical/Archaeological Resources Survey
The Village at Junipero Project; APN 333-070-018, -019, and -053
City of Menifee, Riverside County, California
Plot Plan No. 22-0030; CRM TECH Contract No. 3894

Dear Mr. Norton:

At your request, CRM TECH has completed a cultural resources study on approximately 20 acres of vacant land in the City of Menifee, Riverside County, California. The subject property of the study consists of Assessor's Parcel Numbers 333-070-018, -019, and -053, located on the south side of Heritage Lake Drive between Junipero Road and Menifee Road, in the northeast quarter of Section 23, Township 5 South Range 3 West, San Bernardino Baseline and Meridian, as depicted in the United States Geological Survey Romoland, California, 7.5' quadrangle (Figs. 1, 2).

The study is part of the environmental review process for the proposed Village at Junipero Project, which entails primarily the construction of approximately 240 residential units in 24 buildings, along with associated administrative and recreational facilities, parking lots, landscaping, and infrastructure improvements. The City of Menifee, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA). The purpose of the study is to provide the City with the necessary information and analysis to determine whether the project would cause a substantial adverse change to any "historical resources," as defined by CEQA, that may exist in the project area.

Background

As you know, the project area was previously the subject of a standard Phase I cultural resources survey that CRM TECH conducted in 2014-2015 (Tang et al. 2015; see attachment). The scope of that study included a historical/archaeological resources records search, historical background research, Native American consultation, and an intensive-level field survey. During the field survey, a prehistoric isolate consisting of a single obsidian flake was found in a fallow agricultural field near the western project boundary and subsequently designated 33-024087 in the California Historical Resources Inventory. By definition, the isolate did not qualify as an archaeological site due to the lack of contextual integrity and was not considered a potential "historical resource" (*ibid.*:13). Since no other cultural resources were encountered, the 2014-2015 study concluded that no "historical resources" were present within or adjacent to the project area (*ibid.*).

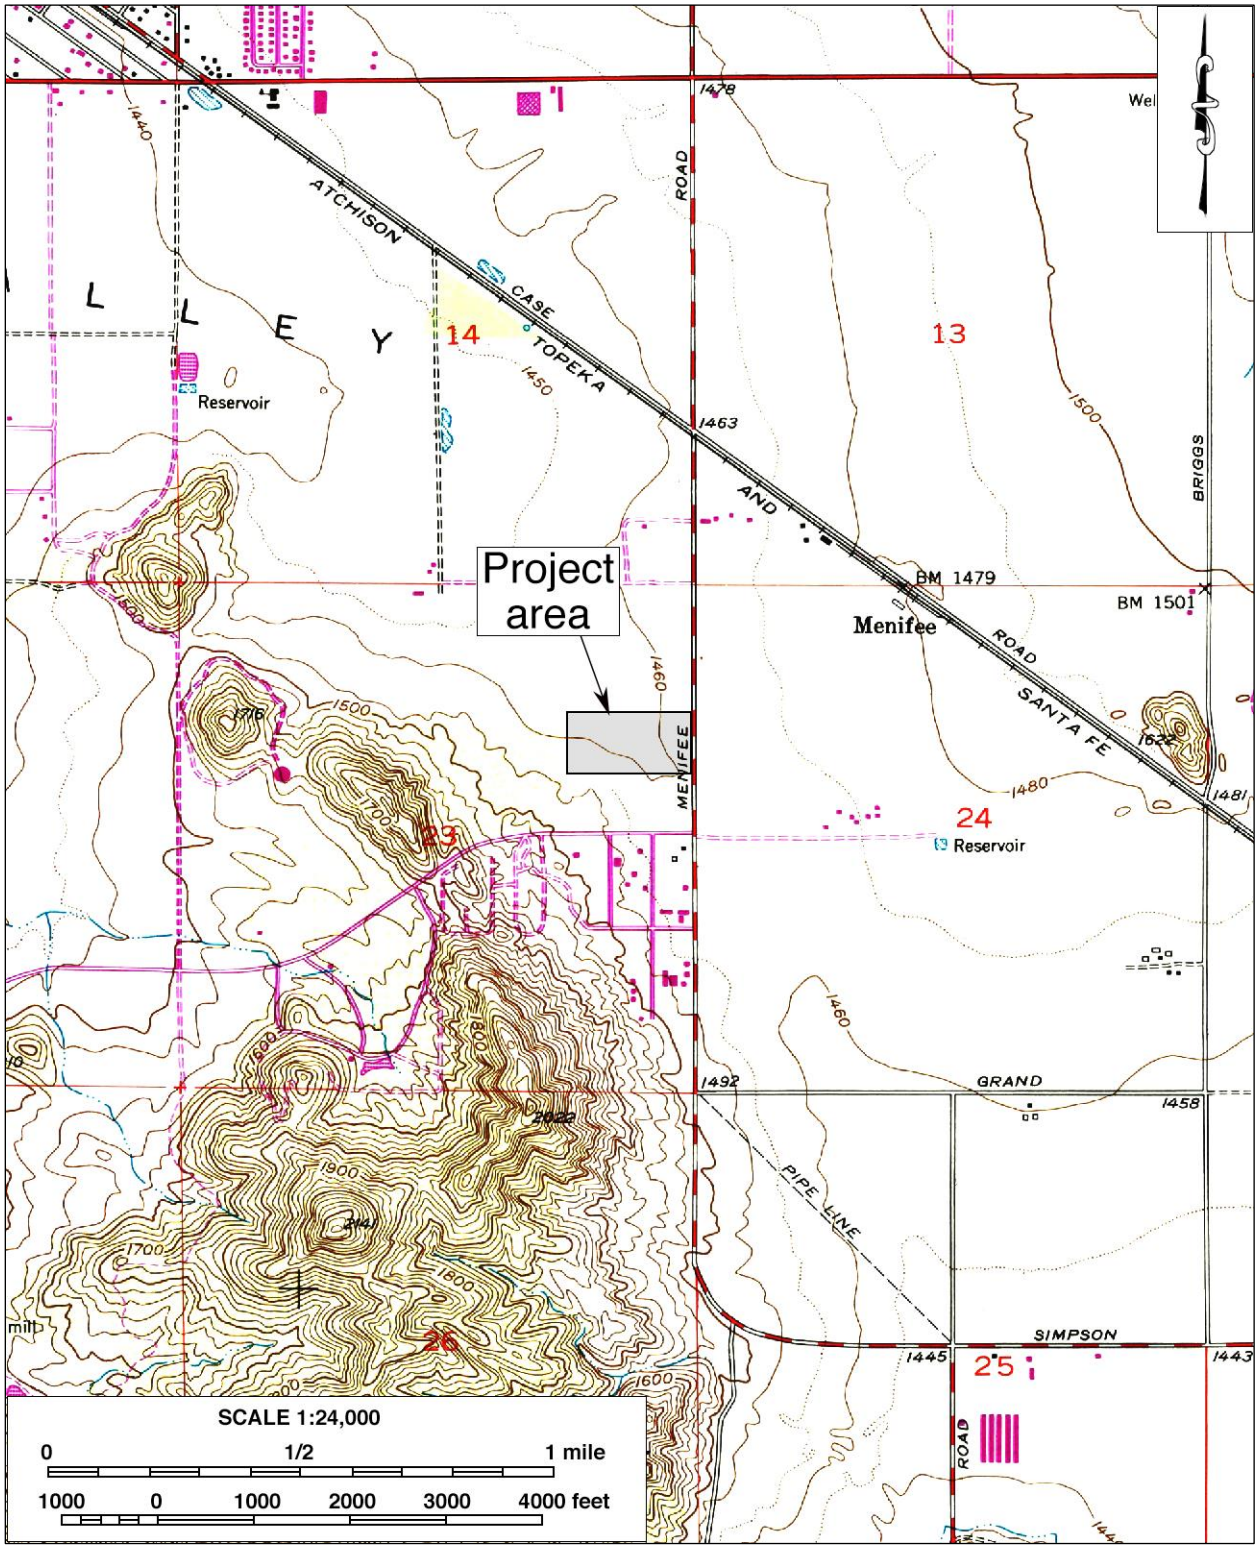

Figure 1. Location and configuration of the project area. (Based on USGS Romoland, Calif., 7.5' quadrangle, 1979 edition)

Figure 2. Recent satellite image of the project area.

Because the 2014-2015 study is now seven years old, the present study was designed and implemented to update and reexamine its findings and conclusions. Research procedures completed during this study include a review of data gathered during the 2014-2015 study and a reconnaissance-level field inspection of the project area. Finding from the field inspection and the final conclusion of the study are presented in the sections below.

Field Inspection of the Project Area

The field inspection was carried out on June 2, 2022, by CRM TECH archaeologist Daniel Ballester, M.S., who also conducted the intensive-level field survey of the project area in 2014 (Tang et al. 2015:9). The survey was completed at a reconnaissance level by walking a series of parallel north-south transects spaced 30 meters (approximately 90 feet) apart. Ground visibility ranged from poor (25%) to fair (70%) in most of the project area due to scattered vegetation growth but was good (80%) to excellent (>90%) in previously disturbed areas where the vegetation had been removed (Fig. 3), especially in the western portion of the property (Fig. 2).

The field inspection did not re-locate Isolate 33-024087, nor were any other historical/archaeological resources encountered. The ground surface in the project area has received extensive further

Figure 3. Overview of the current condition of the project area. (Photograph taken on June 2, 2022; view to the northeast)

disturbance since 2019 (Google Earth 2019-2022; Fig. 2). In particular, the western portion of the property, including the former location of the isolate, is currently used as a staging area for an adjacent residential development and is occupied by stockpiles of imported soil (Fig. 3).

Conclusion and Recommendations

In summary, the results of the recent field inspection confirmed the 2014-2015 finding that no "historical resources" are known to be present within or adjacent to the project area. Accordingly, CRM TECH presents the following recommendations to the City of Menifee:

- The proposed Village at Junipero Project will not cause a "substantial adverse change" to any known "historical resources," pursuant to PRC §21084.1.
- No further cultural resources investigation will be necessary for the project unless development plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are discovered during any earth-moving operations associated with the project, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

Thank you for this opportunity to be of service. Should you have any questions or need additional information, please feel free to contact our office.

Sincerely,

Bai "Tom" Tang, M.A.
Principal, CRM TECH

MANAGEMENT SUMMARY

Between November 2014 and January 2015, at the request of North Bayport Industrial Park II, Inc., CRM TECH performed a Phase I cultural resources study on approximately 20 acres of vacant land in the City of Menifee, Riverside County, California. The subject property of the study consists of Assessor's Parcel Nos. 333-070-018, -019 and -053, located between Junipero Road and Menifee Road and to the north of McCall Boulevard, within the northeast quarter of Section 23, T5S R3W, San Bernardino Baseline and Meridian. The study is a part of the environmental review process for a proposed residential development project known as The Village at Menifee. The City of Menifee, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA).

As currently proposed, the project entails primarily the construction of an apartment complex with 260 residential units and a pool, along with associated improvements to streets and utility infrastructure, including the construction of water retention basins, parking lots, sidewalks, and landscaping. The purpose of the study is to provide the City of Menifee with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area. In order to accomplish this objective, CRM TECH conducted a historical/archaeological resources records search, pursued historical background research, contacted Native American representatives, and carried out an intensive-level field survey.

As a result of the field survey, a prehistoric isolate, subsequently designated 33-024087 in the California Historical Resources Inventory, was found in a fallow agricultural field that had recently been cleared, near the western project boundary. The isolate consists of a single obsidian flake. By definition, the isolate does not qualify as an archaeological site due to the lack of contextual integrity. As such, 33-024087 is not considered a potential "historical resource," and requires no further consideration in the CEQA-compliance process. No other cultural resources, either historic or prehistoric in origin, were encountered throughout the course of the study.

Based on these findings, CRM TECH concludes that no "historical resources" are present within or adjacent to the project area. Accordingly, CRM TECH recommends to the City of Menifee a determination of *No Mitigation Needed* regarding cultural resources under the condition that, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work in that area be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION AND SETTING

Between November 2014 and January 2015, at the request of North Bayport Industrial Park II, Inc., CRM TECH performed a Phase I cultural resources study on approximately 20 acres of vacant land in the City of Menifee, Riverside County, California (Fig. 1). The subject property of the study consists of Assessor's Parcel Nos. 333-070-018, -019 and -053, located between Junipero Road and Menifee Road and to the north of McCall Boulevard, within the northeast quarter of Section 23, T5S R3W, San Bernardino Baseline and Meridian (Fig. 2). The study is a part of the environmental review process for a proposed residential development project known as The Village at Menifee. The City of Menifee, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA).

As currently proposed, the project entails primarily the construction of an apartment complex with 260 residential units and a pool, along with associated improvements to streets and utility infrastructure, including the construction of water retention basins, parking lots, sidewalks, and landscaping. The purpose of the study is to provide the City of Menifee with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area. In order to accomplish this objective, CRM TECH conducted a historical/ archaeological resources records search, pursued historical background research, contacted Native American representatives, and carried out an intensive-level field survey.

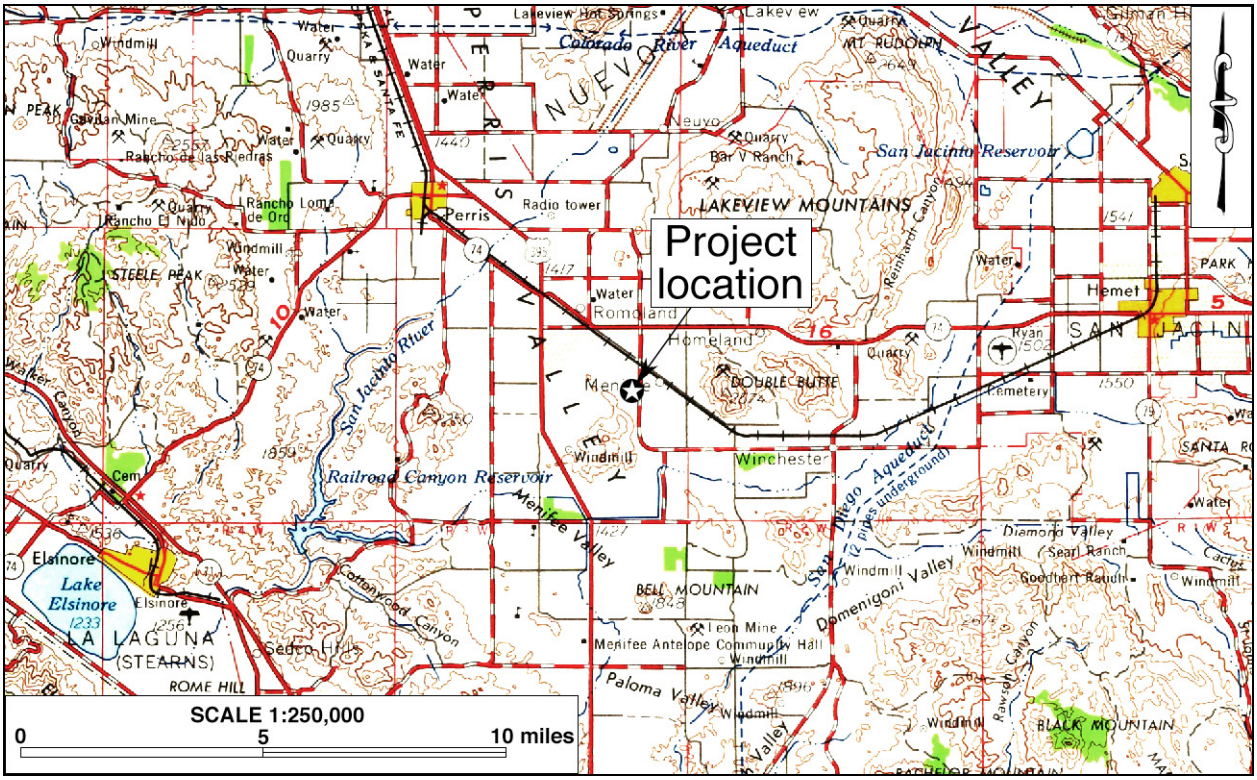

Figure 1. Project vicinity. (Based on USGS Santa Ana, Calif., 1:250,000 quadrangle [USGS 1979a])

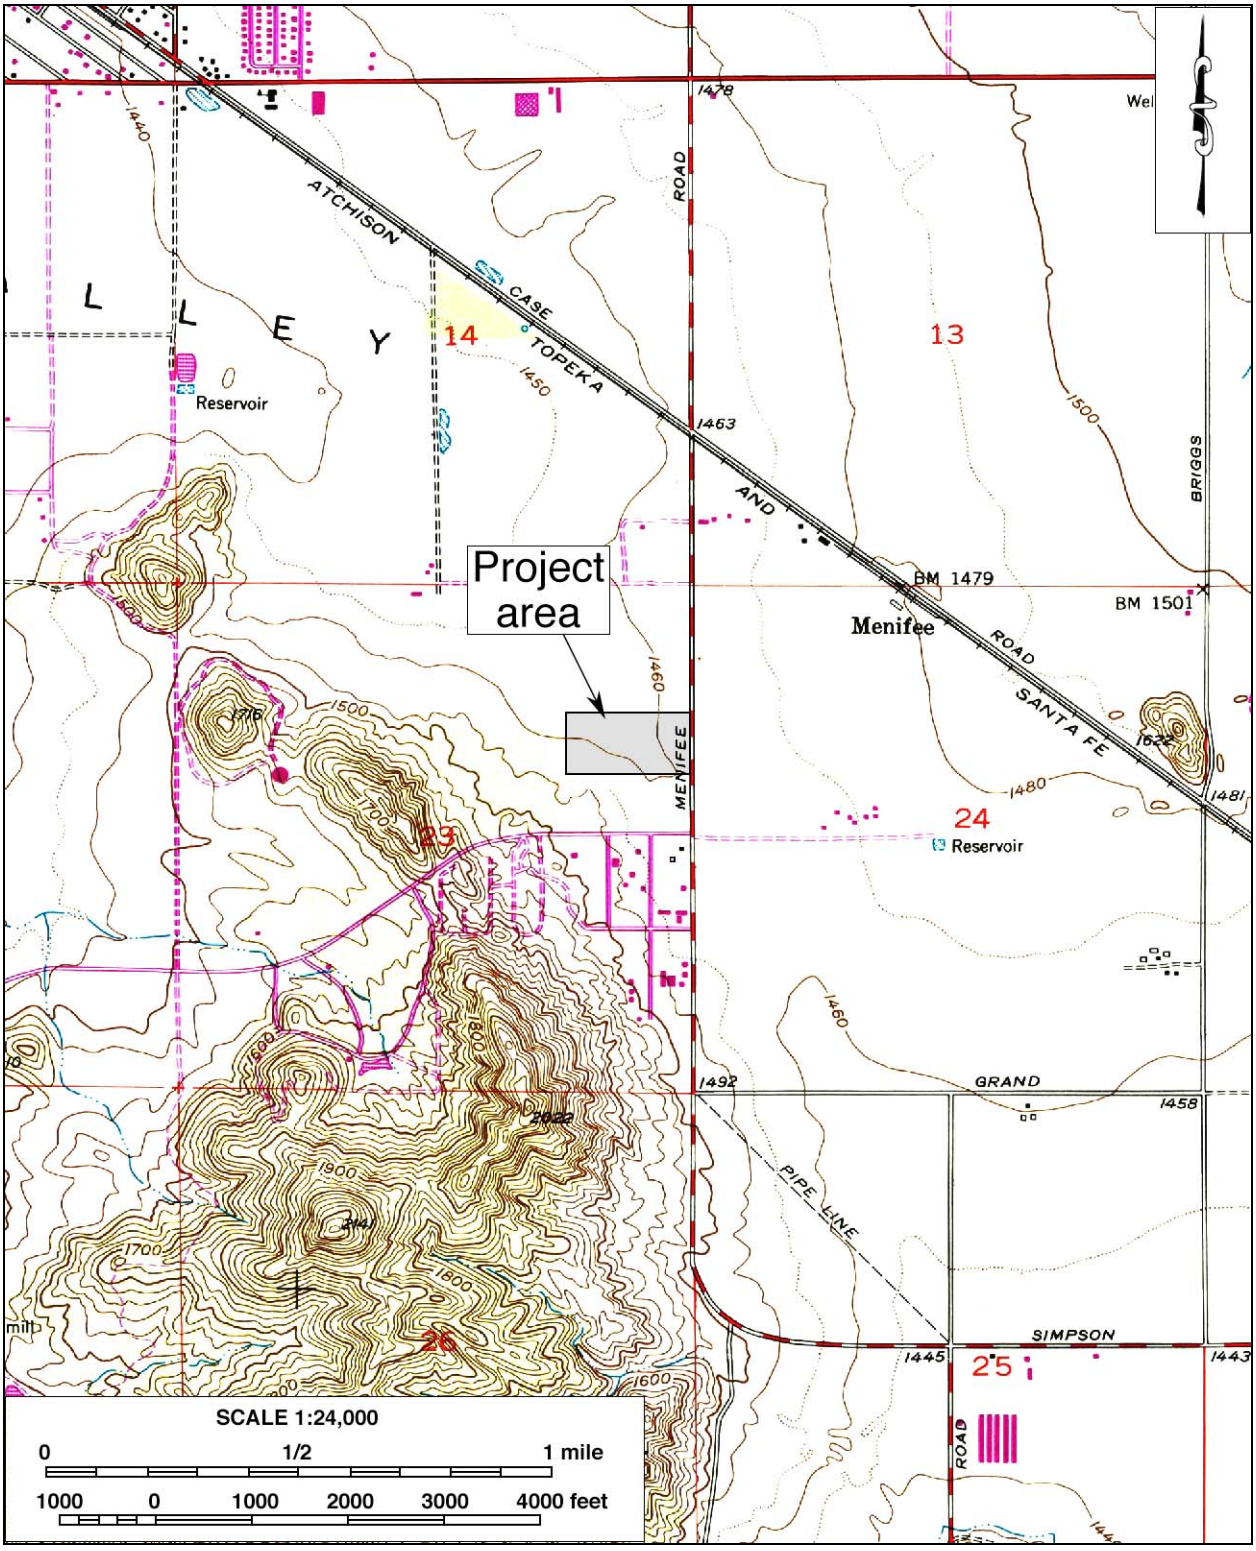

Figure 2. Project area. (Based on USGS Romoland, Calif., 1:24,000 quadrangle [USGS 1979b])

The study was completed under the direction of CRM TECH principal investigators Bai "Tom" Tang, M.A., and Michael Hogan, Ph.D. Other company personnel who participated in the study include archaeologist/report writer Deirdre Encarnación, M.A., and archaeologists Daniel Ballester, M.S., and Nina Gallardo, B.A. Further information on personnel qualifications is provided in Appendix 1.

The project area consists of rectangular-shaped tract of agricultural land that is currently under fallow. It is surrounded mostly by other parcels of open land, but adjoins a residential neighborhood to the east and an elementary school to the west, across Menifee Road and Junipero Road, respectively. Elevations on the property range approximately from 1,460 feet to 1,470 feet above mean sea level, with a slight westerly incline over a mostly level terrain. Vegetation is sparse, and includes mainly small grasses and shrubs. The ground surface has been extensively disturbed by possible past agricultural activities and recent disking (Fig. 3).

Geologically, the project area is located in the southeastern portion of the Perris Valley, a semi-arid inland alluvial valley that extends generally in a northwest-southeast direction. A number of isolated granitic mountains, such as the Lakeview Mountains and the Bernasconi Hills, separate the Perris Valley from the nearby Moreno, San Jacinto, and Menifee Valleys. These valleys are sub-basins of the San Jacinto watershed, one of the three major geographical subdivisions of the Santa Ana Basin. This valley complex is bounded on the northeast by the San Jacinto Mountains and on the southwest by the Santa Ana Mountains. The climate and environment of the surrounding area are typical of the southern California inland valleys, with temperatures in the region reaching over 100 degrees Fahrenheit in summer and dipping to near freezing in winter.

PREHISTORIC CONTEXT

ARCHAEOLOGY

It is widely acknowledged that human occupation in what is now the State of California began 8,000-12,000 years ago. In order to understand Native American cultures before European contact, archaeologists have devised chronological frameworks that endeavor to correlate the observable

Figure 3. Overview of the current condition of the project area, views to the west and the north. (Photographs taken on December 5, 2014)

technological and cultural changes in the archaeological record to distinct periods. Unfortunately, none of these chronological frameworks has been widely accepted, and none has been developed specifically for the so-called Inland Empire region of southern California, the nearest ones being for the Colorado Desert and Peninsular Ranges area (Warren 1984) and for the Mojave Desert (Warren and Crabtree 1986).

The development of an overall chronological framework for the region is hindered by the lack of distinct stratigraphic layers of cultural sequences that could be dated by absolute dating methods. Since results from archaeological investigations in this region have yet to be synthesized into an overall chronological framework, most archaeologists tend to follow a chronology adapted from a scheme developed by William J. Wallace in 1955 and modified by others (Wallace 1955; 1978; Warren 1968; Chartkoff and Chartkoff 1984; Moratto 1984). Although the beginning and ending dates of the different horizons or periods may vary, the general framework of prehistory in this region under this chronology consists of the following four periods:

- Early Hunting Stage (ca. 10000-6000 B.C.), which was characterized by human reliance on big game animals, as evidenced by large, archaic-style projectile points and the relative lack of plant-processing artifacts;
- Millingstone Horizon (ca. 6000 B.C.-1000 A.D.), when plant foods and small game animals came to the forefront of subsistence strategies, and from which a large number of millingstones, especially heavily used, deep-basin metates, were left;
- Late Prehistoric Period (ca. 1000-1500 A.D.), during which a more complex social organization, a more diversified subsistence base—as evidenced by smaller projectile points, expedient milling stones and, later, pottery—and regional cultures and tribal territories began to develop;
- Protohistoric Period (ca. 1500-1700s A.D.), which ushered in long-distance contact with Europeans and led to the historic period.

ETHNOHISTORY

The Perris Valley has long been a part of the homelands of the Luiseño Indians, a Takic-speaking people whose territory extended from present-day Riverside to Escondido and Oceanside. The name of the group derived from Mission San Luis Rey, which held jurisdiction over most of the traditional Luiseño territory during the mission period. Luiseño history, as recorded in traditional songs, tells the creation story from the birth of the first people, the *kaamalam*, to the sickness, death, and cremation of *Wiyoot*, the most powerful and wise one, at Lake Elsinore. In modern anthropological literature, the leading sources on Luiseño culture and history are Kroeber (1925), Strong (1929), and Bean and Shipek (1978).

Anthropologists have divided the Luiseño into several autonomous lineages or kin groups, which represented the basic political unit among most southern California Indians. According to Bean and Shipek (1978:551), each Luiseño lineage possessed a permanent base camp, or village, on the valley floor and another in the mountain regions for acorn collection. Luiseño villages were made up of family members and relatives, where chiefs of the village inherited their rank and each village owned its own land. Villages were usually located in sheltered canyons or near year-round sources of freshwater, always near subsistence resources.

The Luiseño exploited nearly all resources of the environment in a highly developed seasonal mobility system. The Luiseño people were primarily hunters and gatherers. They collected seeds, roots, wild berries, acorns, wild grapes, strawberries, wild onions, and prickly pear cacti, and hunted deer, elks, antelopes, rabbits, wood rats, and a variety of insects. Bows and arrows, atlatls or spear throwers, rabbit sticks, traps, nets, clubs, and slings were the main hunting tools. Each lineage had exclusive hunting and gathering rights in their procurement ranges. These boundaries were respected and only crossed with permission (Bean and Shipek 1978:551).

It is estimated that when Spanish colonization of Alta California began in 1769, the Luiseño had approximately 50 active villages with an average population of 200 each, although other estimates place the total Luiseño population at 4,000-5,000 (Bean and Shipek 1978:557). Some of the villages were forcefully moved to the Spanish missions, while others were largely left intact (*ibid.*:558). Ultimately, Luiseño population declined rapidly after European contact because of diseases such as small pox, harsh living conditions at the missions and, later, on the Mexican ranchos, where the Native people often worked as seasonal ranch hands.

After the American annexation of Alta California, the large number of non-Native settlers further eroded the foundation of the traditional Luiseño society. During the latter half of the 19th century, almost all of the remaining Luiseño villages were displaced, their occupants eventually removed to the various reservations. Today, the nearest Native American groups of Luiseño heritage live on the Soboba, Pechanga, and Pala Indian Reservations.

HISTORIC CONTEXT

REGIONAL OVERVIEW

In California, the so-called "historic period" began in 1769, when an expedition sent by the Spanish authorities in Mexico founded Mission San Diego, the first European outpost in Alta California. For several decades after that, Spanish colonization activities were largely confined to the coastal regions, and left little impact on the arid hinterland of the territory. Although the first explorers, including Pedro Fages and Juan Bautista de Anza, traveled through the Perris and San Jacinto Valleys as early as 1772-1774, no Europeans were known to have settled in the vicinity until the beginning of the 19th century (Gunther 1984).

Situated deep in the arid hinterland of Alta California, the Perris Valley received little influence from the Spanish/Mexican colonization activities in the coastal regions, although the area was nominally under the control of Mission San Luis Rey, established near present-day Oceanside in 1798 (Gunther 1984). After secularization of the mission system in the 1830s, the Mexican government issued several large land grants in what is now southwestern Riverside County to various prominent citizens in the province. The area around the project site, however, was not included in any of them, and remained public land when the U.S. annexed California in 1848 (BLM n.d.).

Around 1880, S. Menifee Wilson located a gold quartz mine about eight miles south of present-day Perris, and named it the Menifee Quartz Lode (Gunther 1984:320). The area around the mine thus came to be known as the Menifee Valley. Other miners began to arrive in the valley, and the

Menifee Mining District was soon organized. By the time Riverside County was created in 1893, Menifee had also become an important grain- and hay-growing area (*ibid*). Menifee continued as a farming and mining community well into the 20th century, however, in more recent decades residential and commercial development has increasingly becoming the driving force in regional growth. As the ongoing urbanization transformed the socioeconomic landscape of the valley, in October 2008, Menifee incorporated as the 26th city in Riverside County.

THE PROJECT AREA

Historic maps consulted for this study indicate that the project area apparently remained unsettled and undeveloped, except perhaps as agricultural fields, throughout the historic period, and the only man-made features noted prior to the 1970s were a few roads passing through (Figs. 2, 4-7). In the 1850s, when the U.S. government conducted the first systematic land surveys in the present-day Menifee area, no man-made features were observed in or near the project area (Fig. 4). In 1894, the project area became part of a large railroad land grant that the U.S. government awarded the Southern Pacific Company (BLM n.d.).

By the late 1890s, the forerunner of present-day Menifee Road had come into being along the eastern boundary of the project area, with other, secondary roads branching off across the project area and leading to the northwest (Fig. 5). Despite the gradual development of the Menifee area between the 1890s and the 1950s, no buildings or other indications of settlement or land development activities were noted on this property (Figs. 5-7). As late as 2005, Menifee Road remained the only notable man-made feature within or adjacent to the project boundaries (Fig. 2; NETR Online 1967-2005).

RESEARCH DESIGN

Scientific research should be directed by a theoretical orientation that is geared toward gathering data to answer questions of current research interest. While numerous theoretical orientations have been put forward and used to guide archaeological research and to improve data-collecting efforts, the cultural ecology approach still tends to be the most useful paradigm in archaeological endeavors, although it is often used in conjunction with newer models. Basically, the cultural ecology approach to understanding cultural development contends that people develop behavioral patterns in order to exploit the resources of the area by means of particular technologies. It also assumes that there is interrelationship of these technologies, the environment, survival, and other aspects of the culture.

Since archaeology deals mostly with the cultural remains that are left long after the people are gone, this theoretical orientation has obvious advantages for archaeological research, although it is left to the archaeologist to determine the extent to which the behavior patterns used to exploit the environment affect other aspects of culture. Because of its continuing usefulness, the cultural ecology theoretical orientation is the basis of the historical/archaeological investigation used in this study. In practice, a research design serves to identify research issues and to illuminate new information for the purpose of evaluating the significance of cultural resources present within a study area. While no overarching research design has been established for this part of Riverside County, a standard set of research questions, or research domains, can be applied to historical/archaeological investigations in the region, especially for Phase I studies such as this.

The primary goal of a Phase I survey is to identify any prehistoric or historic-period cultural resources that may be present within the study area. This identification process generally includes a historical/archaeological resources records search, historical background research, Native American contacts, and a field inspection. While little detailed data may be available from the research methods employed during Phase I studies, some types of data gathered during the investigation may be used to address research issues, at least on a basic level. For instance, just the presence of cultural resources on a property indicates that people used the area. Other research questions, such as those posited below, can be addressed during Phase I studies only if certain types of artifacts or features are found within or near the study area.

- Is there any evidence that important events took place on the property or that the property is associated with a historically important person?
- Can anything be learned regarding the time period the area was used? Can it be determined whether people used the area during early or late prehistoric times, or during the historic period?
- Can anything be learned about the duration of the use of the land? Was the land used continuously for a long period, was it used only briefly, or was it used repeatedly over time?
- Can anything be learned about the subsistence strategies of the people who used the land? Is there any evidence visible on the surface that indicates what food resources were being processed and/or consumed?
- Would any of the information gathered during a Phase I study shed light on settlement patterns? Could activities in the study area be related with broader patterns of human habitation of the region? Did the people live on the property or use it only for resource procurement? If they lived on the property, was it a dense or sparse population? Does occupation of the subject property disclose any information regarding settlement strategies or preferences?
- Are there historical/archaeological data to be obtained about trade, travel, or cultural interactions?

In addition, a research design should also outline major themes in the prehistory and history of a region or specific area, so that any cultural resources encountered during a Phase I study could be evaluated within the proper context. Based on the prehistoric, ethnohistoric, and historic contexts discussed above, the following themes can be established for past human activities in the vicinity of the current project area:

- Native American land use during the Paleoindian, Early Archaic, Late Archaic, and Late Prehistoric Periods;
- Early European and American exploration of inland southern California during the early and mid-19th century;
- Travel and transportation across inland southern California;
- Settlement and agricultural growth in the Perris/Menifee Valleys during late 19th and early 20th centuries;
- Growth of the Perris/Menifee Valley region during the 20th century and suburbanization in the post-WWII era.

METHODS

RECORDS SEARCH

On December 3, 2014, Nina Gallardo conducted the records search at the Eastern Information Center (EIC), University of California, Riverside. During the records search, Gallardo examined maps and records on file at the EIC for previously identified cultural resources and existing cultural resources reports within a one-mile radius of the project area. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

HISTORICAL BACKGROUND RESEARCH

Historical background research for this study was conducted by Bai "Tom" Tang on the basis of published literature in local and regional history, the archival records of the U.S. Bureau of Land Management (BLM), and historic maps and aerial photographs of the project vicinity. Among maps consulted for this study were U.S. General Land Office's (GLO) land survey plat maps dated 1895 and U.S. Geological Survey's (USGS) topographic maps dated 1901-1979. These maps are collected at the Science Library of the University of California, Riverside, and the California Desert District of the BLM, located in Moreno Valley. Aerial photographs of the project area are available at www.historicaerial.com. Findings from these sources are incorporated into the "Historic Context" section above.

NATIVE AMERICAN CONSULTATION

On November 21, 2014, CRM TECH submitted a written request to the State of California's Native American Heritage Commission for a records search in the commission's sacred lands file. Following the Native American Heritage Commission's recommendations, CRM TECH contacted 19 Native American representatives in the region in writing on December 16 to solicit local Native American input regarding any potential cultural resources concerns over the proposed project. Additionally, the Pechanga Band of Luiseño Indians and the Soboba Band of Luiseño Indians, the two Native American groups located closest to the project location, were invited to participate in the field survey. The correspondences between CRM TECH and the Native American representatives are attached to this report in Appendix 2.

FIELD SURVEY

On December 5, 2014, Daniel Ballester carried out the intensive-level, on-foot field survey of the project area. The survey was completed by walking a series of parallel east-west transects spaced 15 meters (approx. 50 feet) apart. In this way, the ground surface in the entire project area was systematically and carefully examined for any evidence of human activities dating to the prehistoric or historic period (i.e., 50 years ago or older). Ground visibility was good (80%) to excellent (90%) throughout the project area due to recent weed abatement activities.

RESULTS

PREVIOUS CULTURAL RESOURCES STUDIES IN THE VICINITY

The records search results indicate that the project area was surveyed for cultural resources in 2003 (Drover 2003, #5627 in Fig. 8), but no cultural resources had been recorded on the property prior to this study. The 2003 survey, covering a total of 160 acres, was conducted in anticipation of a residential development project that never materialized. Another past survey, completed in 2008, occurred on a proposed power transmission line along Menifee Road, adjacent to the current project area (Cooley 2008, #7528 in Fig. 8).

Outside the project area but within a one-mile radius, more than 30 additional studies have been reported to the EIC (Fig. 8). A bibliography of these past studies is attached to this report in Appendix 3. As a result of these studies, 21 historical/archaeological sites were previously recorded within the one-mile scope of the records search, as listed in Table 1. None of these sites was found in the immediate vicinity of the project area, and thus none of them requires further consideration during this study.

Table 1. Previously Recorded Cultural Resources within the Scope of the Records Search

Site No.	Recorded by/Date	Description
33-002221	Elliot 1931	Homestead, ca. 1848
33-003429	Drover 1986	Bedrock milling feature
33-009722	Brian F. Smith & Assoc. nd.	Historic-period homestead
33-009723	Brian F. Smith & Assoc. nd.	Historic-period refuse scatter
33-009724	Brian F. Smith & Assoc. nd.	Historic-period farm features
33-009725	Brian F. Smith & Assoc. nd.	Concrete foundations with refuse scatter
33-009726	Brian F. Smith & Assoc. nd.	Stockyard/cattle staging area
33-011464	Pierson 2002	Historic-period refuse dump
33-011465	Buysse 2002	Bedrock milling feature
33-011466	Pierson 2002	Bedrock milling feature with historic-period refuse scatter
33-011467	Buysse 2002	Bedrock milling features with sparse lithic scatter
33-011468	Pierson 2002	Bedrock milling features with historic-period refuse scatter
33-011469	Buysse 2002	Bedrock milling features
33-011470	Pierson 2002	Bedrock milling features with historic-period refuse scatter
33-011471	Pierson 2002	Bedrock milling features with artifacts and historic-period refuse scatter
33-011472	Buysse 2002	Bedrock milling feature
33-012535	Lambert 2003	Bedrock milling features with lithic scatter
33-012536	Lambert 2003	Scattered chipped-stone and groundstone artifacts
33-014092	Brian F. Smith & Assoc. 2005	Bedrock milling features
33-014093	Brian F. Smith & Assoc. 2005	Bedrock milling features with sparse lithic flake scatter
33-015743	Easter and Beedle 2005	San Jacinto Valley Railway

CULTURAL RESOURCES IN THE PROJECT AREA

During the field survey, a prehistoric isolate–i.e., a locality with fewer than three artifacts–was found in a fallow agricultural field that had recently been cleared, near the western project boundary. The isolate consists of a single obsidian flake that measures approximately 0.9x0.8x0.3 centimeters in

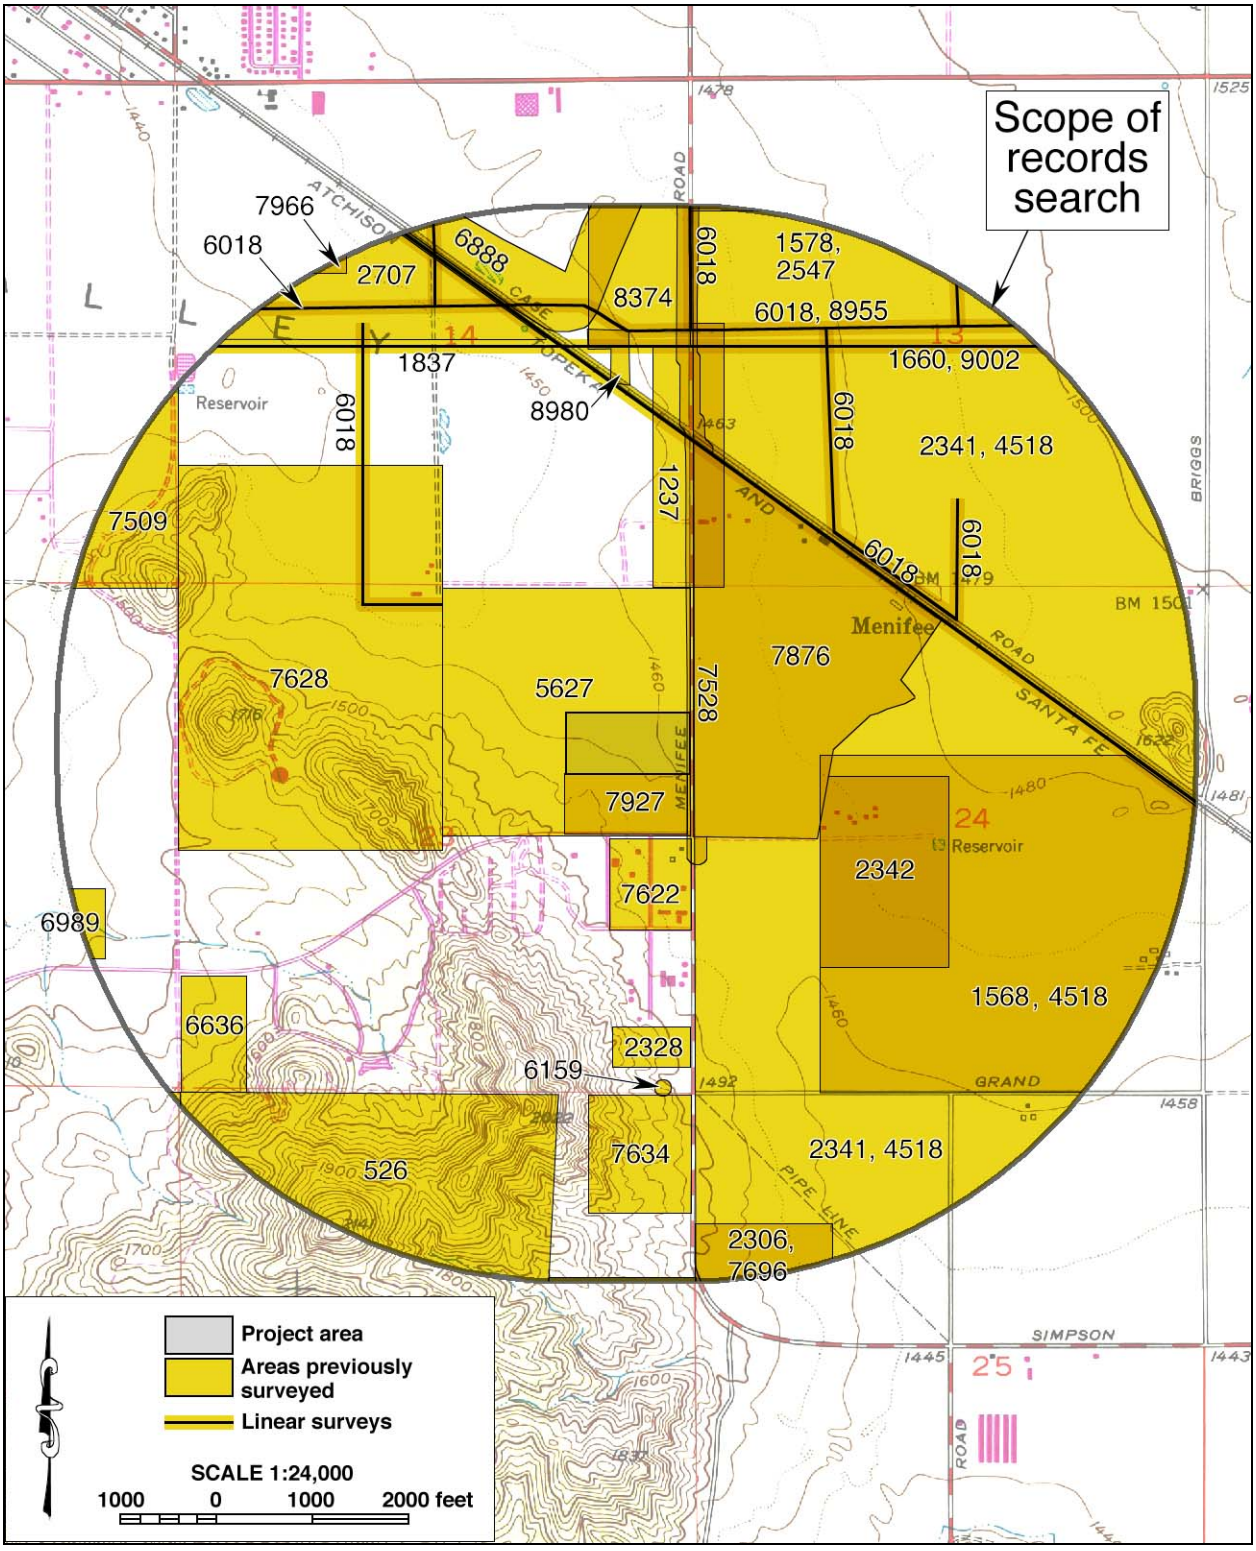

Figure 8. Previous cultural resources studies in the vicinity of the project area, listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

Figure 9. Obsidian flake found within project area (Isolate 33-024087).

dimension and exhibits pressure flaking scars on the surface (Fig. 9). It was subsequently designated by the EIC as 33-024087 in the California Historical Resources Inventory.

No other evidence of human activities dating to the prehistoric or historic period was found within or adjacent to the project boundaries. Modern trash was observed over much of the property, especially along the eastern and western boundaries, but none of the items is of any historical or archaeological interest. The ground surface within the project area has been extensively disturbed by recent vegetation removal operations, and presumably by past agricultural activities.

NATIVE AMERICAN INPUT

In response to CRM TECH's inquiry, the NAHC reported in a letter dated December 11, 2014, that a record search in the Sacred Lands File failed to indicate the presence of Native American sacred places/sites in the project area. Nevertheless, the commission recommended that local Native American groups be contacted for further information. For that purpose, the commission provided a list of potential contacts in the region.

Upon receiving the NAHC's response, on December 16, 2014, CRM TECH sent written requests for comments to all 18 individuals on the referral list and the organizations they represent. In addition, Rose Duro, Cultural Committee Chairman for the Rincon Band of Mission Indians, was also contacted. As of this time, two of the tribal representatives have responded in writing (see App. 2).

Chris Devers, Cultural Clerk for the Pauma Band of Luiseño Indians, replied by e-mail on December 23, 2014, stating that the tribe was not aware of any Native American cultural resources in the project area but would recommend monitoring during grading activities on the property due to the potential for buried cultural remains. The tribe also requested to continue receiving cultural resources information regarding this project.

On December 31, 2014, Shasta Gaughen, Tribal Historic Preservation Officer for the Pala Band of Mission Indians, responded in writing and stated that the project area lay beyond the tribe's Traditional Use Area. Therefore, the Pala Band wished to defer to other tribes located in closer in proximity to the project area.

DISCUSSION

The purpose of this study is to identify any cultural resources within or adjacent to the project area, and to assist the City of Menifee in determining whether such resources meet the official definition of "historical resources," as provided in the California Public Resources Code, in particular CEQA.

According to PRC §5020.1(j), "'historical resource' includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California." More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the Lead Agency (Title 14 CCR §15064.5(a)(1)-(3)).

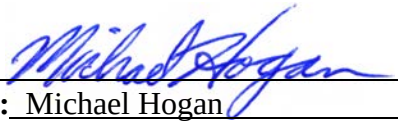
Regarding the proper criteria for the evaluation of historical significance, CEQA guidelines mandate that "a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

In summary of the research results presented above, 33-024087, a prehistoric isolate consisting of a single obsidian flake, is the only cultural resource known to be present within or adjacent to the project area. By definition, the isolate does not qualify as an archaeological site due to the lack of contextual integrity. As such, 33-024087 is not considered a potential "historical resource," and requires no further consideration in the CEQA-compliance process. No other cultural resources, either historic or prehistoric in origin, were encountered throughout the course of the study. Based on these findings, and in light of the criteria listed above, the present study concludes that *no historical resources exist within or adjacent to the project area*.

RECOMMENDED MITIGATION

CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition,



destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

As no "historical resources," as defined by CEQA, were encountered within or adjacent to the project area during this study, CRM TECH recommends to the City of Menifee a determination of *No Mitigation Needed* regarding cultural resources under the condition that, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work in that area be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this archaeological report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

Hello Ms. Mendoza,

I'm emailing to inform you that we will be conducting an archaeological survey this Friday (12/5/14) at 7 am for The Village at Junipero project (APNs 333-070-018, -019, and -053; CRM#2875) and we want to see if the Pechanga Tribe would like to participate in the survey with us. I'm attaching a map for this project. Please contact me or Daniel Ballester (909-376-7842) for more information about the location to meet up for the survey. Thank you for your time.

Re: The Village at Junipero: APNs 333-070-018, -019 and 333-070-053 (CRM TECH Contract No, 2875), Riverside County.

Dear Ms. Gallardo,

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe or group. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 373-3712.

Sincerely,

Katy Sanchez

RE: The Village at Junipero; APNs 333-070-018, -019, and -053
Approximately 19 Acres in the City of Menifee
Riverside County, California
CRM TECH Contract #2875

Dear Mr. Devers:

North Bayport Industrial Park II, Inc., is proposing a residential development in the City of Menifee, Riverside County, California, known as The Village at Junipero Project (APNs 333-070-018, -019, and -053). The project area encompasses approximately 19 acres of undeveloped land located north of the intersection of McCall Boulevard and Menifee Road. The accompanying map, based on the USGS Romoland, Calif., 7.5' quadrangle, depicts the location of the project area in Section 23, T5S R3W, SBBM. CRM TECH has been hired to conduct a cultural resource study, including the Native American scoping, for this project.

In a letter dated December 11, 2014, the Native American Heritage Commission reports that the sacred lands record search identified no Native American cultural resources within the project area, but recommends that local Native American groups be contacted for further information. Therefore, as part of the cultural resources study for this project, I am writing to request your input on potential Native American cultural resources in or near the project area.

According to records on file at the Eastern Information Center, there are no known historical/archaeological sites within the boundaries of the project area. Outside the project area but within a one-mile radius, 9 prehistoric sites and 12 historic-period sites were previously identified. The closest among these, Site 33-012535, consists of a bedrock milling feature and a lithic scatter, located about 0.10 mile west of the project area. The majority of the sites are concentrated in the foothills to the west of the project area and consist mainly of bedrock milling features and lithic scatters. The majority of the historic-period sites are farms, foundations, and refuse dumps. A systematic field survey of the project area on December 5, 2014, encountered one isolate near the western boundary of the project area, consisting of a single obsidian flake.

Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value within or near the project area that need to be taken into consideration as part of the cultural resources investigation. Any information or concerns may be forwarded to CRM TECH by telephone, e-mail, facsimile, or standard mail. Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agency, which is the City of Menifee for CEQA-compliance purposes. We would also like to clarify that CRM TECH, as the cultural resources consultant for the project, is not the appropriate entity to initiate government-to-government consultations. Thank you for the time and effort in addressing this important matter.

Respectfully,

Nina Gallardo, CRM TECH
Email: ngallardo@crmtech.us

Subject: The Village at Junipero

Ms. Gallardo,

The Pauma Band of Luiseno Indians has received your December 16 letter on the Village at Junipero. We would urge the developer to have cultural monitors on site during the grading phase of the project. While we are not aware of any specific sites on the project property and with sites close by, the potential of un-earthing cultural resources increases. Please continue to provide us with information of your studies on or near the project property.

Thank you,

Chris Devers
Cultural Clerk
Pauma Band of Luiseno Indians

Re: The Village at Junipero; CRM Tech Contract # 2875

Dear Mrs. Gallardo,

The Pala Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of Robert Smith, Tribal Chairman.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognized Pala Indian Reservation. The project is also beyond the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Therefore, we have no objection to the continuation of project activities as currently planned and we defer to the wishes of Tribes in closer proximity to the project area.

We appreciate involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone at 760-891-3515 or by e-mail at sgaughen@palatribe.com.

Sincerely,

Shasta C. Gaughen, PhD
Tribal Historic Preservation Officer
Pala Band of Mission Indians

ATTENTION: THE PALA TRIBAL HISTORIC PRESERVATION OFFICE IS RESPONSIBLE FOR ALL REQUESTS FOR CONSULTATION. PLEASE ADDRESS CORRESPONDENCE TO **SHASTA C. GAUGHEN** AT THE ABOVE ADDRESS. IT IS NOT NECESSARY TO ALSO SEND NOTICES TO PALA TRIBAL CHAIRMAN ROBERT SMITH.

MANAGEMENT SUMMARY

Between November 2014 and January 2015, at the request of North Bayport Industrial Park II, Inc., CRM TECH performed a Phase I cultural resources study on approximately 20 acres of vacant land in the City of Menifee, Riverside County, California. The subject property of the study consists of Assessor's Parcel Nos. 333-070-018, -019 and -053, located between Junipero Road and Menifee Road and to the north of McCall Boulevard, within the northeast quarter of Section 23, T5S R3W, San Bernardino Baseline and Meridian. The study is a part of the environmental review process for a proposed residential development project known as The Village at Menifee. The City of Menifee, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA).

As currently proposed, the project entails primarily the construction of an apartment complex with 260 residential units and a pool, along with associated improvements to streets and utility infrastructure, including the construction of water retention basins, parking lots, sidewalks, and landscaping. The purpose of the study is to provide the City of Menifee with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area. In order to accomplish this objective, CRM TECH conducted a historical/archaeological resources records search, pursued historical background research, contacted Native American representatives, and carried out an intensive-level field survey.

As a result of the field survey, a prehistoric isolate, subsequently designated 33-024087 in the California Historical Resources Inventory, was found in a fallow agricultural field that had recently been cleared, near the western project boundary. The isolate consists of a single obsidian flake. By definition, the isolate does not qualify as an archaeological site due to the lack of contextual integrity. As such, 33-024087 is not considered a potential "historical resource," and requires no further consideration in the CEQA-compliance process. No other cultural resources, either historic or prehistoric in origin, were encountered throughout the course of the study.

Based on these findings, CRM TECH concludes that no "historical resources" are present within or adjacent to the project area. Accordingly, CRM TECH recommends to the City of Menifee a determination of *No Mitigation Needed* regarding cultural resources under the condition that, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work in that area be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION AND SETTING

Between November 2014 and January 2015, at the request of North Bayport Industrial Park II, Inc., CRM TECH performed a Phase I cultural resources study on approximately 20 acres of vacant land in the City of Menifee, Riverside County, California (Fig. 1). The subject property of the study consists of Assessor's Parcel Nos. 333-070-018, -019 and -053, located between Junipero Road and Menifee Road and to the north of McCall Boulevard, within the northeast quarter of Section 23, T5S R3W, San Bernardino Baseline and Meridian (Fig. 2). The study is a part of the environmental review process for a proposed residential development project known as The Village at Menifee. The City of Menifee, as the lead agency for the project, required the study in compliance with the California Environmental Quality Act (CEQA).

As currently proposed, the project entails primarily the construction of an apartment complex with 260 residential units and a pool, along with associated improvements to streets and utility infrastructure, including the construction of water retention basins, parking lots, sidewalks, and landscaping. The purpose of the study is to provide the City of Menifee with the necessary information and analysis to determine whether the proposed project would cause substantial adverse changes to any "historical resources," as defined by CEQA, that may exist in or near the project area. In order to accomplish this objective, CRM TECH conducted a historical/ archaeological resources records search, pursued historical background research, contacted Native American representatives, and carried out an intensive-level field survey.

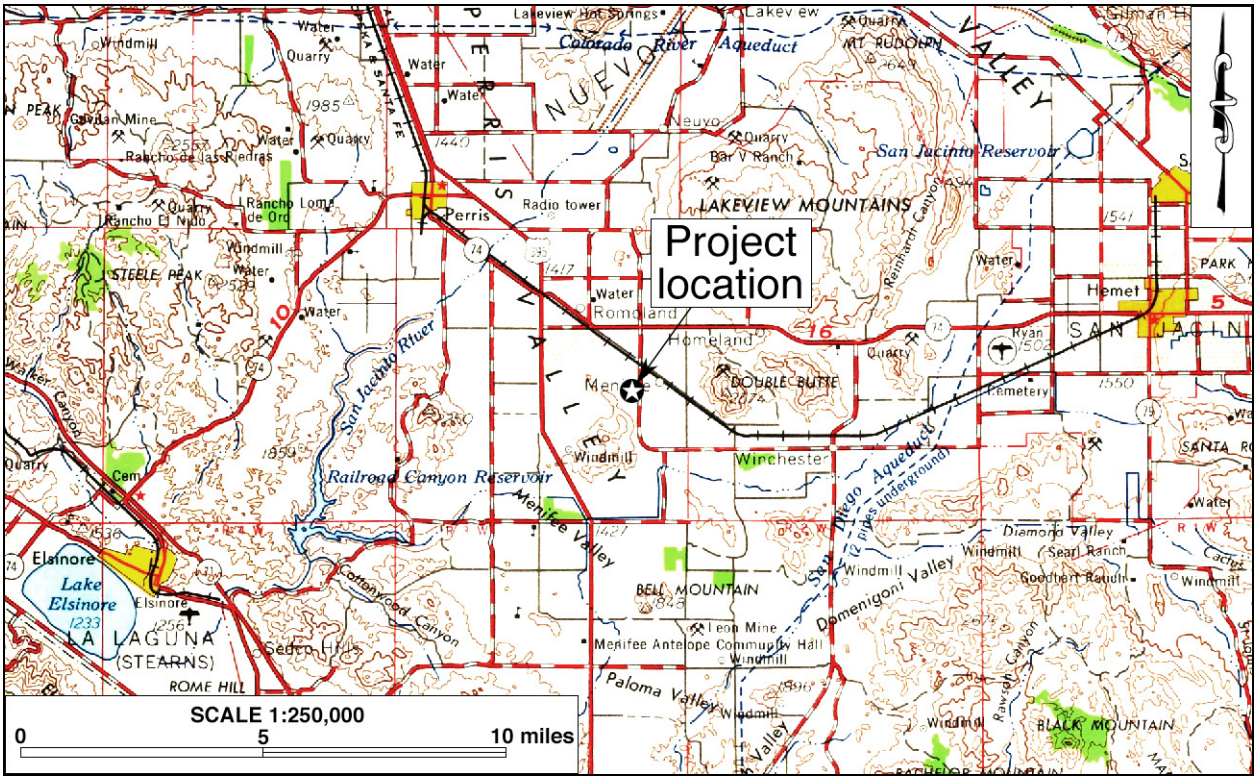

Figure 1. Project vicinity. (Based on USGS Santa Ana, Calif., 1:250,000 quadrangle [USGS 1979a])

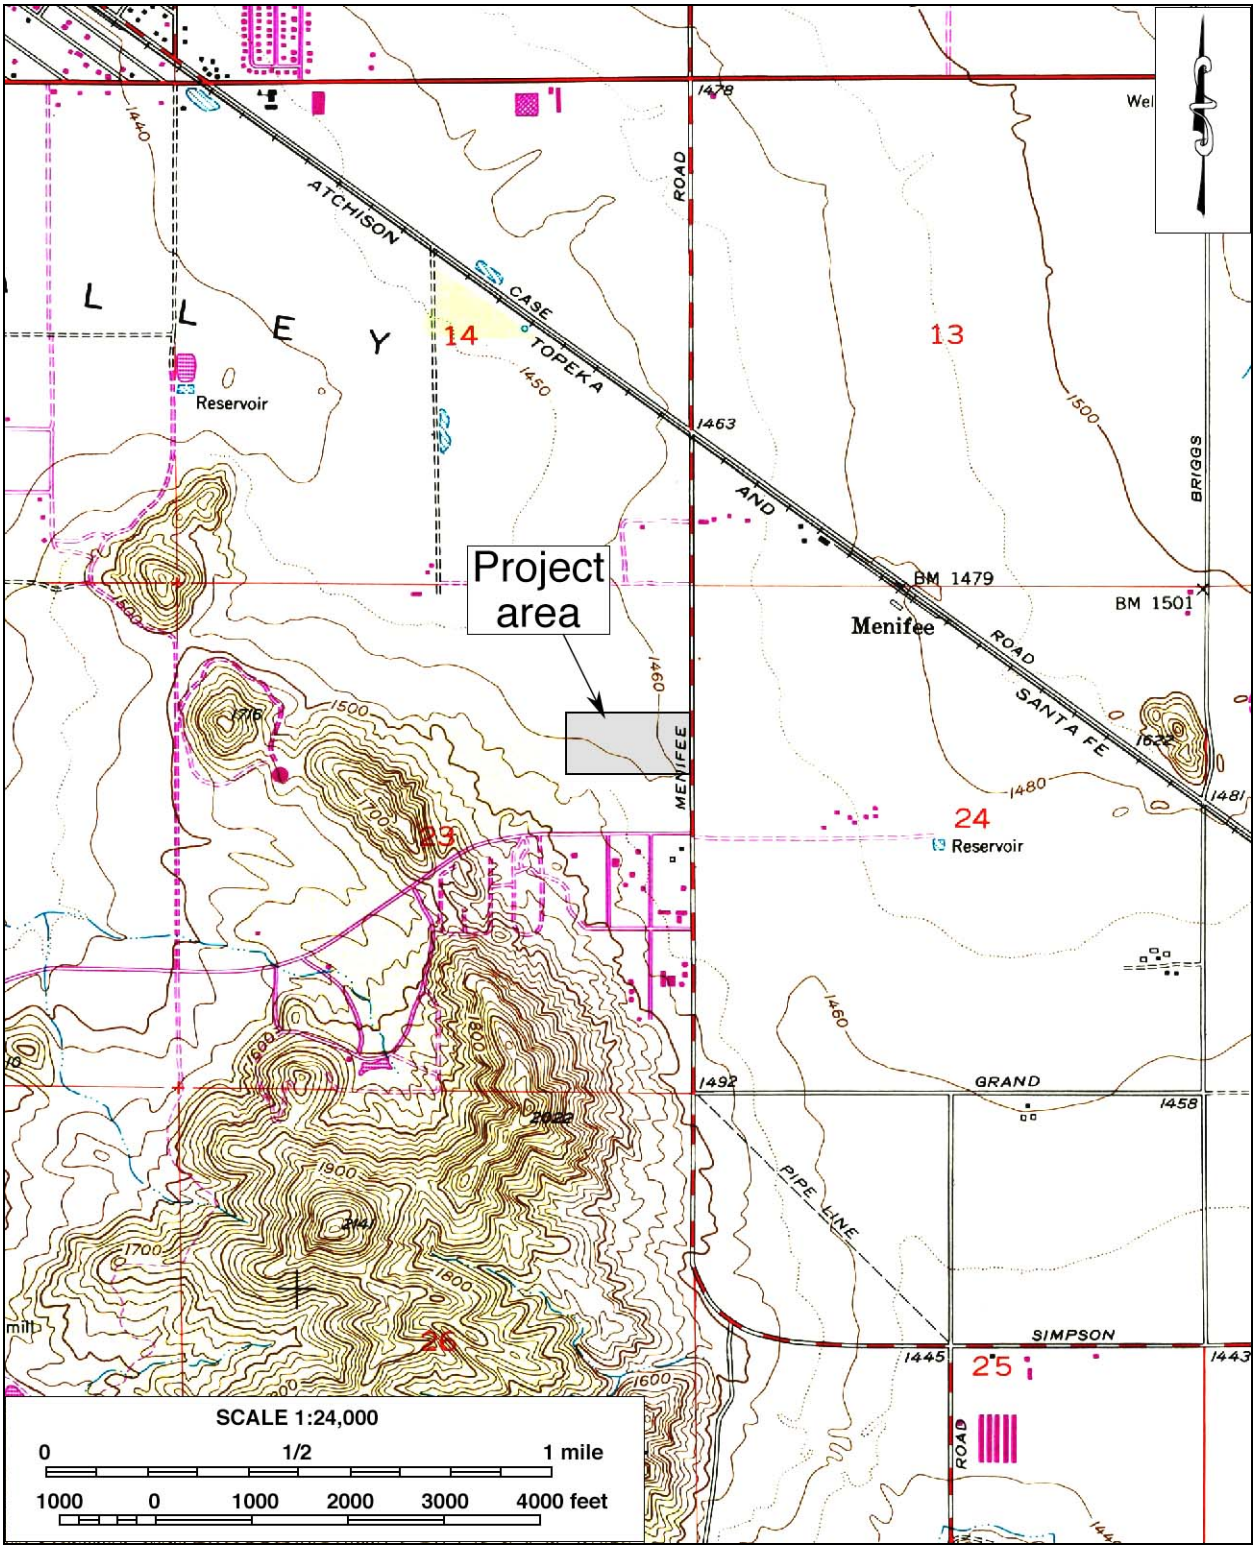

Figure 2. Project area. (Based on USGS Romoland, Calif., 1:24,000 quadrangle [USGS 1979b])

The study was completed under the direction of CRM TECH principal investigators Bai "Tom" Tang, M.A., and Michael Hogan, Ph.D. Other company personnel who participated in the study include archaeologist/report writer Deirdre Encarnación, M.A., and archaeologists Daniel Ballester, M.S., and Nina Gallardo, B.A. Further information on personnel qualifications is provided in Appendix 1.

The project area consists of rectangular-shaped tract of agricultural land that is currently under fallow. It is surrounded mostly by other parcels of open land, but adjoins a residential neighborhood to the east and an elementary school to the west, across Menifee Road and Junipero Road, respectively. Elevations on the property range approximately from 1,460 feet to 1,470 feet above mean sea level, with a slight westerly incline over a mostly level terrain. Vegetation is sparse, and includes mainly small grasses and shrubs. The ground surface has been extensively disturbed by possible past agricultural activities and recent disking (Fig. 3).

Geologically, the project area is located in the southeastern portion of the Perris Valley, a semi-arid inland alluvial valley that extends generally in a northwest-southeast direction. A number of isolated granitic mountains, such as the Lakeview Mountains and the Bernasconi Hills, separate the Perris Valley from the nearby Moreno, San Jacinto, and Menifee Valleys. These valleys are sub-basins of the San Jacinto watershed, one of the three major geographical subdivisions of the Santa Ana Basin. This valley complex is bounded on the northeast by the San Jacinto Mountains and on the southwest by the Santa Ana Mountains. The climate and environment of the surrounding area are typical of the southern California inland valleys, with temperatures in the region reaching over 100 degrees Fahrenheit in summer and dipping to near freezing in winter.

PREHISTORIC CONTEXT

ARCHAEOLOGY

It is widely acknowledged that human occupation in what is now the State of California began 8,000-12,000 years ago. In order to understand Native American cultures before European contact, archaeologists have devised chronological frameworks that endeavor to correlate the observable

Figure 3. Overview of the current condition of the project area, views to the west and the north. (Photographs taken on December 5, 2014)

technological and cultural changes in the archaeological record to distinct periods. Unfortunately, none of these chronological frameworks has been widely accepted, and none has been developed specifically for the so-called Inland Empire region of southern California, the nearest ones being for the Colorado Desert and Peninsular Ranges area (Warren 1984) and for the Mojave Desert (Warren and Crabtree 1986).

The development of an overall chronological framework for the region is hindered by the lack of distinct stratigraphic layers of cultural sequences that could be dated by absolute dating methods. Since results from archaeological investigations in this region have yet to be synthesized into an overall chronological framework, most archaeologists tend to follow a chronology adapted from a scheme developed by William J. Wallace in 1955 and modified by others (Wallace 1955; 1978; Warren 1968; Chartkoff and Chartkoff 1984; Moratto 1984). Although the beginning and ending dates of the different horizons or periods may vary, the general framework of prehistory in this region under this chronology consists of the following four periods:

- Early Hunting Stage (ca. 10000-6000 B.C.), which was characterized by human reliance on big game animals, as evidenced by large, archaic-style projectile points and the relative lack of plant-processing artifacts;
- Millingstone Horizon (ca. 6000 B.C.-1000 A.D.), when plant foods and small game animals came to the forefront of subsistence strategies, and from which a large number of millingstones, especially heavily used, deep-basin metates, were left;
- Late Prehistoric Period (ca. 1000-1500 A.D.), during which a more complex social organization, a more diversified subsistence base—as evidenced by smaller projectile points, expedient milling stones and, later, pottery—and regional cultures and tribal territories began to develop;
- Protohistoric Period (ca. 1500-1700s A.D.), which ushered in long-distance contact with Europeans and led to the historic period.

ETHNOHISTORY

The Perris Valley has long been a part of the homelands of the Luiseño Indians, a Takic-speaking people whose territory extended from present-day Riverside to Escondido and Oceanside. The name of the group derived from Mission San Luis Rey, which held jurisdiction over most of the traditional Luiseño territory during the mission period. Luiseño history, as recorded in traditional songs, tells the creation story from the birth of the first people, the *kaamalam*, to the sickness, death, and cremation of *Wiyoot*, the most powerful and wise one, at Lake Elsinore. In modern anthropological literature, the leading sources on Luiseño culture and history are Kroeber (1925), Strong (1929), and Bean and Shipek (1978).

Anthropologists have divided the Luiseño into several autonomous lineages or kin groups, which represented the basic political unit among most southern California Indians. According to Bean and Shipek (1978:551), each Luiseño lineage possessed a permanent base camp, or village, on the valley floor and another in the mountain regions for acorn collection. Luiseño villages were made up of family members and relatives, where chiefs of the village inherited their rank and each village owned its own land. Villages were usually located in sheltered canyons or near year-round sources of freshwater, always near subsistence resources.

The Luiseño exploited nearly all resources of the environment in a highly developed seasonal mobility system. The Luiseño people were primarily hunters and gatherers. They collected seeds, roots, wild berries, acorns, wild grapes, strawberries, wild onions, and prickly pear cacti, and hunted deer, elks, antelopes, rabbits, wood rats, and a variety of insects. Bows and arrows, atlatls or spear throwers, rabbit sticks, traps, nets, clubs, and slings were the main hunting tools. Each lineage had exclusive hunting and gathering rights in their procurement ranges. These boundaries were respected and only crossed with permission (Bean and Shipek 1978:551).

It is estimated that when Spanish colonization of Alta California began in 1769, the Luiseño had approximately 50 active villages with an average population of 200 each, although other estimates place the total Luiseño population at 4,000-5,000 (Bean and Shipek 1978:557). Some of the villages were forcefully moved to the Spanish missions, while others were largely left intact (*ibid.*:558). Ultimately, Luiseño population declined rapidly after European contact because of diseases such as small pox, harsh living conditions at the missions and, later, on the Mexican ranchos, where the Native people often worked as seasonal ranch hands.

After the American annexation of Alta California, the large number of non-Native settlers further eroded the foundation of the traditional Luiseño society. During the latter half of the 19th century, almost all of the remaining Luiseño villages were displaced, their occupants eventually removed to the various reservations. Today, the nearest Native American groups of Luiseño heritage live on the Soboba, Pechanga, and Pala Indian Reservations.

HISTORIC CONTEXT

REGIONAL OVERVIEW

In California, the so-called "historic period" began in 1769, when an expedition sent by the Spanish authorities in Mexico founded Mission San Diego, the first European outpost in Alta California. For several decades after that, Spanish colonization activities were largely confined to the coastal regions, and left little impact on the arid hinterland of the territory. Although the first explorers, including Pedro Fages and Juan Bautista de Anza, traveled through the Perris and San Jacinto Valleys as early as 1772-1774, no Europeans were known to have settled in the vicinity until the beginning of the 19th century (Gunther 1984).

Situated deep in the arid hinterland of Alta California, the Perris Valley received little influence from the Spanish/Mexican colonization activities in the coastal regions, although the area was nominally under the control of Mission San Luis Rey, established near present-day Oceanside in 1798 (Gunther 1984). After secularization of the mission system in the 1830s, the Mexican government issued several large land grants in what is now southwestern Riverside County to various prominent citizens in the province. The area around the project site, however, was not included in any of them, and remained public land when the U.S. annexed California in 1848 (BLM n.d.).

Around 1880, S. Menifee Wilson located a gold quartz mine about eight miles south of present-day Perris, and named it the Menifee Quartz Lode (Gunther 1984:320). The area around the mine thus came to be known as the Menifee Valley. Other miners began to arrive in the valley, and the

Menifee Mining District was soon organized. By the time Riverside County was created in 1893, Menifee had also become an important grain- and hay-growing area (*ibid*). Menifee continued as a farming and mining community well into the 20th century, however, in more recent decades residential and commercial development has increasingly becoming the driving force in regional growth. As the ongoing urbanization transformed the socioeconomic landscape of the valley, in October 2008, Menifee incorporated as the 26th city in Riverside County.

THE PROJECT AREA

Historic maps consulted for this study indicate that the project area apparently remained unsettled and undeveloped, except perhaps as agricultural fields, throughout the historic period, and the only man-made features noted prior to the 1970s were a few roads passing through (Figs. 2, 4-7). In the 1850s, when the U.S. government conducted the first systematic land surveys in the present-day Menifee area, no man-made features were observed in or near the project area (Fig. 4). In 1894, the project area became part of a large railroad land grant that the U.S. government awarded the Southern Pacific Company (BLM n.d.).

By the late 1890s, the forerunner of present-day Menifee Road had come into being along the eastern boundary of the project area, with other, secondary roads branching off across the project area and leading to the northwest (Fig. 5). Despite the gradual development of the Menifee area between the 1890s and the 1950s, no buildings or other indications of settlement or land development activities were noted on this property (Figs. 5-7). As late as 2005, Menifee Road remained the only notable man-made feature within or adjacent to the project boundaries (Fig. 2; NETR Online 1967-2005).

RESEARCH DESIGN

Scientific research should be directed by a theoretical orientation that is geared toward gathering data to answer questions of current research interest. While numerous theoretical orientations have been put forward and used to guide archaeological research and to improve data-collecting efforts, the cultural ecology approach still tends to be the most useful paradigm in archaeological endeavors, although it is often used in conjunction with newer models. Basically, the cultural ecology approach to understanding cultural development contends that people develop behavioral patterns in order to exploit the resources of the area by means of particular technologies. It also assumes that there is interrelationship of these technologies, the environment, survival, and other aspects of the culture.

Since archaeology deals mostly with the cultural remains that are left long after the people are gone, this theoretical orientation has obvious advantages for archaeological research, although it is left to the archaeologist to determine the extent to which the behavior patterns used to exploit the environment affect other aspects of culture. Because of its continuing usefulness, the cultural ecology theoretical orientation is the basis of the historical/archaeological investigation used in this study. In practice, a research design serves to identify research issues and to illuminate new information for the purpose of evaluating the significance of cultural resources present within a study area. While no overarching research design has been established for this part of Riverside County, a standard set of research questions, or research domains, can be applied to historical/archaeological investigations in the region, especially for Phase I studies such as this.

The primary goal of a Phase I survey is to identify any prehistoric or historic-period cultural resources that may be present within the study area. This identification process generally includes a historical/archaeological resources records search, historical background research, Native American contacts, and a field inspection. While little detailed data may be available from the research methods employed during Phase I studies, some types of data gathered during the investigation may be used to address research issues, at least on a basic level. For instance, just the presence of cultural resources on a property indicates that people used the area. Other research questions, such as those posited below, can be addressed during Phase I studies only if certain types of artifacts or features are found within or near the study area.

- Is there any evidence that important events took place on the property or that the property is associated with a historically important person?
- Can anything be learned regarding the time period the area was used? Can it be determined whether people used the area during early or late prehistoric times, or during the historic period?
- Can anything be learned about the duration of the use of the land? Was the land used continuously for a long period, was it used only briefly, or was it used repeatedly over time?
- Can anything be learned about the subsistence strategies of the people who used the land? Is there any evidence visible on the surface that indicates what food resources were being processed and/or consumed?
- Would any of the information gathered during a Phase I study shed light on settlement patterns? Could activities in the study area be related with broader patterns of human habitation of the region? Did the people live on the property or use it only for resource procurement? If they lived on the property, was it a dense or sparse population? Does occupation of the subject property disclose any information regarding settlement strategies or preferences?
- Are there historical/archaeological data to be obtained about trade, travel, or cultural interactions?

In addition, a research design should also outline major themes in the prehistory and history of a region or specific area, so that any cultural resources encountered during a Phase I study could be evaluated within the proper context. Based on the prehistoric, ethnohistoric, and historic contexts discussed above, the following themes can be established for past human activities in the vicinity of the current project area:

- Native American land use during the Paleoindian, Early Archaic, Late Archaic, and Late Prehistoric Periods;
- Early European and American exploration of inland southern California during the early and mid-19th century;
- Travel and transportation across inland southern California;
- Settlement and agricultural growth in the Perris/Menifee Valleys during late 19th and early 20th centuries;
- Growth of the Perris/Menifee Valley region during the 20th century and suburbanization in the post-WWII era.

METHODS

RECORDS SEARCH

On December 3, 2014, Nina Gallardo conducted the records search at the Eastern Information Center (EIC), University of California, Riverside. During the records search, Gallardo examined maps and records on file at the EIC for previously identified cultural resources and existing cultural resources reports within a one-mile radius of the project area. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

HISTORICAL BACKGROUND RESEARCH

Historical background research for this study was conducted by Bai "Tom" Tang on the basis of published literature in local and regional history, the archival records of the U.S. Bureau of Land Management (BLM), and historic maps and aerial photographs of the project vicinity. Among maps consulted for this study were U.S. General Land Office's (GLO) land survey plat maps dated 1895 and U.S. Geological Survey's (USGS) topographic maps dated 1901-1979. These maps are collected at the Science Library of the University of California, Riverside, and the California Desert District of the BLM, located in Moreno Valley. Aerial photographs of the project area are available at www.historicaerial.com. Findings from these sources are incorporated into the "Historic Context" section above.

NATIVE AMERICAN CONSULTATION

On November 21, 2014, CRM TECH submitted a written request to the State of California's Native American Heritage Commission for a records search in the commission's sacred lands file. Following the Native American Heritage Commission's recommendations, CRM TECH contacted 19 Native American representatives in the region in writing on December 16 to solicit local Native American input regarding any potential cultural resources concerns over the proposed project. Additionally, the Pechanga Band of Luiseño Indians and the Soboba Band of Luiseño Indians, the two Native American groups located closest to the project location, were invited to participate in the field survey. The correspondences between CRM TECH and the Native American representatives are attached to this report in Appendix 2.

FIELD SURVEY

On December 5, 2014, Daniel Ballester carried out the intensive-level, on-foot field survey of the project area. The survey was completed by walking a series of parallel east-west transects spaced 15 meters (approx. 50 feet) apart. In this way, the ground surface in the entire project area was systematically and carefully examined for any evidence of human activities dating to the prehistoric or historic period (i.e., 50 years ago or older). Ground visibility was good (80%) to excellent (90%) throughout the project area due to recent weed abatement activities.

RESULTS

PREVIOUS CULTURAL RESOURCES STUDIES IN THE VICINITY

The records search results indicate that the project area was surveyed for cultural resources in 2003 (Drover 2003, #5627 in Fig. 8), but no cultural resources had been recorded on the property prior to this study. The 2003 survey, covering a total of 160 acres, was conducted in anticipation of a residential development project that never materialized. Another past survey, completed in 2008, occurred on a proposed power transmission line along Menifee Road, adjacent to the current project area (Cooley 2008, #7528 in Fig. 8).

Outside the project area but within a one-mile radius, more than 30 additional studies have been reported to the EIC (Fig. 8). A bibliography of these past studies is attached to this report in Appendix 3. As a result of these studies, 21 historical/archaeological sites were previously recorded within the one-mile scope of the records search, as listed in Table 1. None of these sites was found in the immediate vicinity of the project area, and thus none of them requires further consideration during this study.

Table 1. Previously Recorded Cultural Resources within the Scope of the Records Search

Site No.	Recorded by/Date	Description
33-002221	Elliot 1931	Homestead, ca. 1848

33-015743	Easter and Beedle 2005	San Jacinto Valley Railway

CULTURAL RESOURCES IN THE PROJECT AREA

During the field survey, a prehistoric isolate–i.e., a locality with fewer than three artifacts–was found in a fallow agricultural field that had recently been cleared, near the western project boundary. The isolate consists of a single obsidian flake that measures approximately 0.9x0.8x0.3 centimeters in

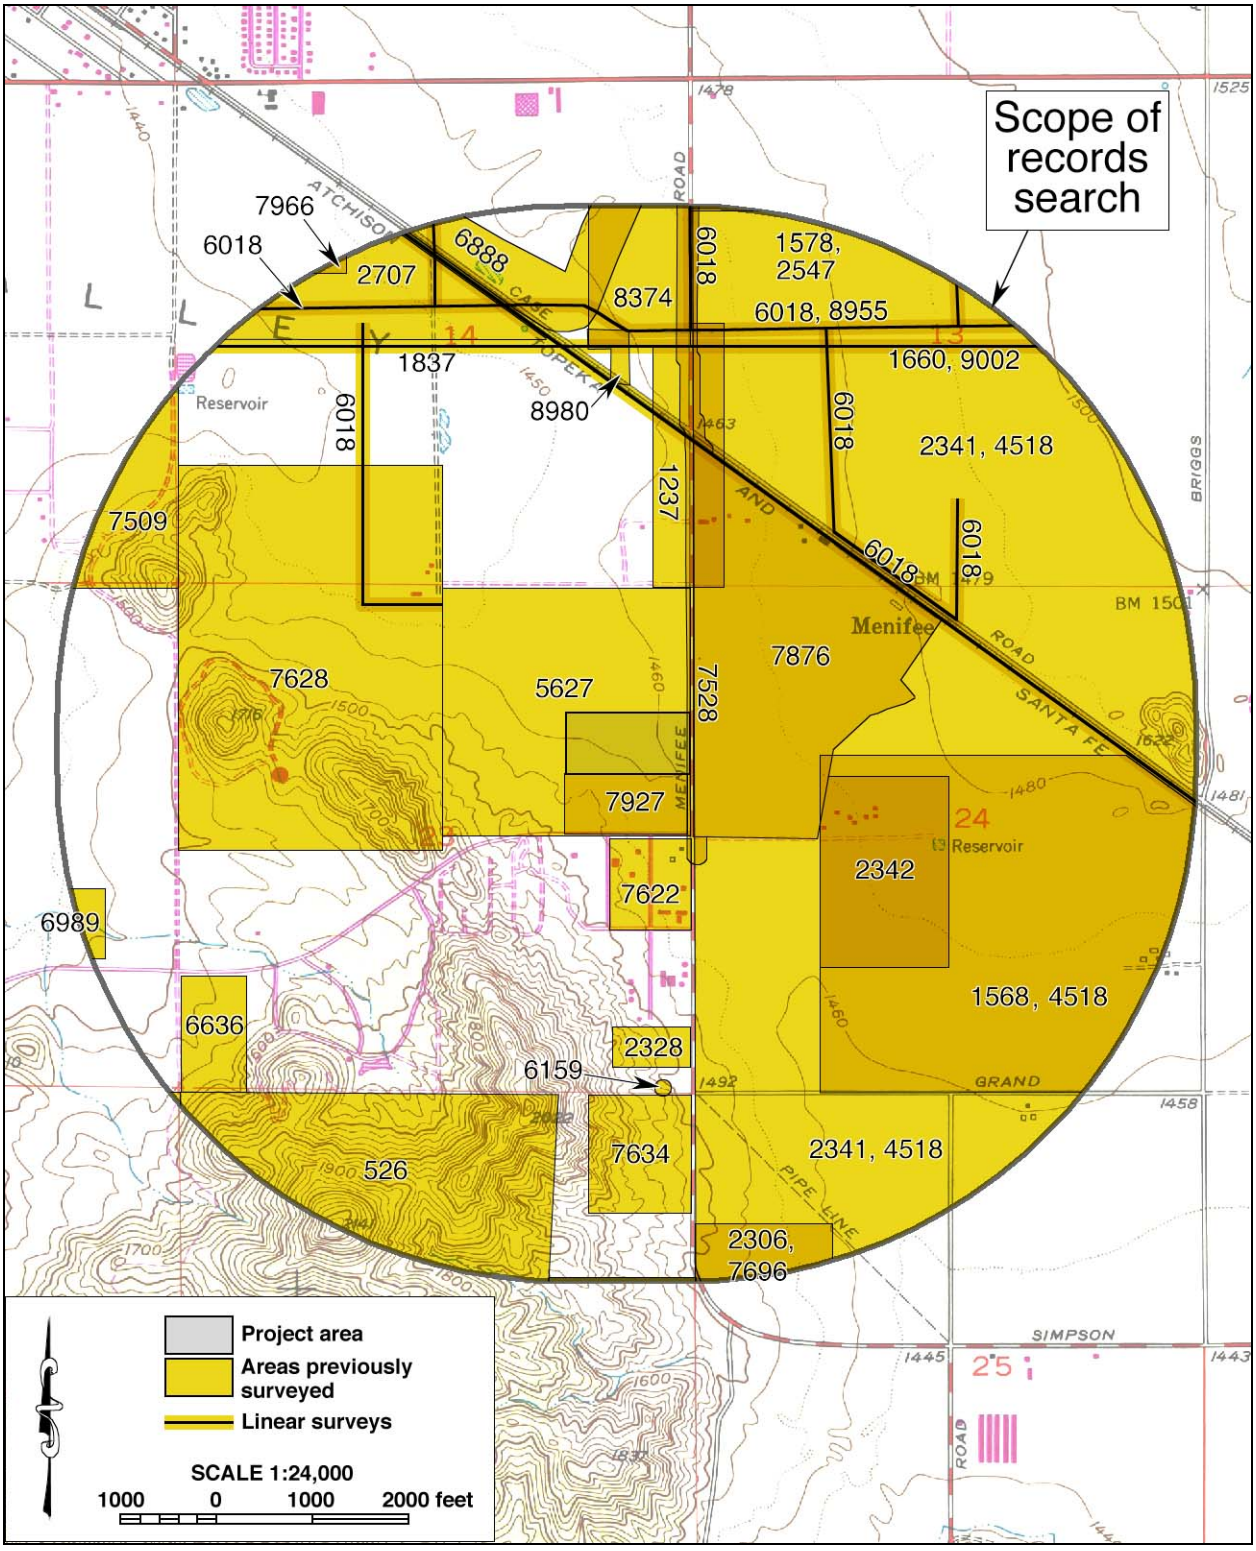

Figure 8. Previous cultural resources studies in the vicinity of the project area, listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

Figure 9. Obsidian flake found within project area (Isolate 33-024087).

dimension and exhibits pressure flaking scars on the surface (Fig. 9). It was subsequently designated by the EIC as 33-024087 in the California Historical Resources Inventory.

No other evidence of human activities dating to the prehistoric or historic period was found within or adjacent to the project boundaries. Modern trash was observed over much of the property, especially along the eastern and western boundaries, but none of the items is of any historical or archaeological interest. The ground surface within the project area has been extensively disturbed by recent vegetation removal operations, and presumably by past agricultural activities.

NATIVE AMERICAN INPUT

In response to CRM TECH's inquiry, the NAHC reported in a letter dated December 11, 2014, that a record search in the Sacred Lands File failed to indicate the presence of Native American sacred places/sites in the project area. Nevertheless, the commission recommended that local Native American groups be contacted for further information. For that purpose, the commission provided a list of potential contacts in the region.

Upon receiving the NAHC's response, on December 16, 2014, CRM TECH sent written requests for comments to all 18 individuals on the referral list and the organizations they represent. In addition, Rose Duro, Cultural Committee Chairman for the Rincon Band of Mission Indians, was also contacted. As of this time, two of the tribal representatives have responded in writing (see App. 2).

Chris Devers, Cultural Clerk for the Pauma Band of Luiseño Indians, replied by e-mail on December 23, 2014, stating that the tribe was not aware of any Native American cultural resources in the project area but would recommend monitoring during grading activities on the property due to the potential for buried cultural remains. The tribe also requested to continue receiving cultural resources information regarding this project.

On December 31, 2014, Shasta Gaughen, Tribal Historic Preservation Officer for the Pala Band of Mission Indians, responded in writing and stated that the project area lay beyond the tribe's Traditional Use Area. Therefore, the Pala Band wished to defer to other tribes located in closer in proximity to the project area.

DISCUSSION

The purpose of this study is to identify any cultural resources within or adjacent to the project area, and to assist the City of Menifee in determining whether such resources meet the official definition of "historical resources," as provided in the California Public Resources Code, in particular CEQA.

According to PRC §5020.1(j), "'historical resource' includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California." More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the Lead Agency (Title 14 CCR §15064.5(a)(1)-(3)).

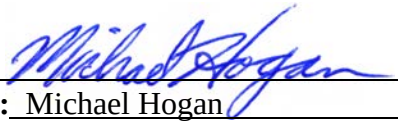
Regarding the proper criteria for the evaluation of historical significance, CEQA guidelines mandate that "a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

In summary of the research results presented above, 33-024087, a prehistoric isolate consisting of a single obsidian flake, is the only cultural resource known to be present within or adjacent to the project area. By definition, the isolate does not qualify as an archaeological site due to the lack of contextual integrity. As such, 33-024087 is not considered a potential "historical resource," and requires no further consideration in the CEQA-compliance process. No other cultural resources, either historic or prehistoric in origin, were encountered throughout the course of the study. Based on these findings, and in light of the criteria listed above, the present study concludes that *no historical resources exist within or adjacent to the project area*.

RECOMMENDED MITIGATION

CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition,



destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

As no "historical resources," as defined by CEQA, were encountered within or adjacent to the project area during this study, CRM TECH recommends to the City of Menifee a determination of *No Mitigation Needed* regarding cultural resources under the condition that, if buried cultural materials are encountered during any earth-moving operations associated with the project, all work in that area be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this archaeological report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

APPENDIX 1:
PERSONNEL QUALIFICATIONS

PRINCIPAL INVESTIGATOR/HISTORIAN
Bai "Tom" Tang, M.A.

Education

1988-1993	Graduate Program in Public History/Historic Preservation, UC Riverside.
1987	M.A., American History, Yale University, New Haven, Connecticut.
1982	B.A., History, Northwestern University, Xi'an, China.
2000	"Introduction to Section 106 Review," presented by the Advisory Council on Historic Preservation and the University of Nevada, Reno.
1994	"Assessing the Significance of Historic Archaeological Sites," presented by the Historic Preservation Program, University of Nevada, Reno.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1993-2002	Project Historian/Architectural Historian, CRM TECH, Riverside, California.
1993-1997	Project Historian, Greenwood and Associates, Pacific Palisades, California.
1991-1993	Project Historian, Archaeological Research Unit, UC Riverside.
1990	Intern Researcher, California State Office of Historic Preservation, Sacramento.
1990-1992	Teaching Assistant, History of Modern World, UC Riverside.
1988-1993	Research Assistant, American Social History, UC Riverside.
1985-1988	Research Assistant, Modern Chinese History, Yale University.
1985-1986	Teaching Assistant, Modern Chinese History, Yale University.
1982-1985	Lecturer, History, Xi'an Foreign Languages Institute, Xi'an, China.

Honors and Awards

1988-1990	University of California Graduate Fellowship, UC Riverside.
1985-1987	Yale University Fellowship, Yale University Graduate School.
1980, 1981	President's Honor List, Northwestern University, Xi'an, China.

Cultural Resources Management Reports

Preliminary Analyses and Recommendations Regarding California's Cultural Resources Inventory System (With Special Reference to Condition 14 of NPS 1990 Program Review Report). California State Office of Historic Preservation working paper, Sacramento, September 1990.

Numerous cultural resources management reports with the Archaeological Research Unit, Greenwood and Associates, and CRM TECH, since October 1991.

PRINCIPAL INVESTIGATOR/ARCHAEOLOGIST
Michael Hogan, Ph.D., RPA*

Education

1991	Ph.D., Anthropology, University of California, Riverside.
1981	B.S., Anthropology, University of California, Riverside; with honors.
1980-1981	Education Abroad Program, Lima, Peru.
2002	Section 106—National Historic Preservation Act: Federal Law at the Local Level. UCLA Extension Course #888.
2002	"Recognizing Historic Artifacts," workshop presented by Richard Norwood, Historical Archaeologist.
2002	"Wending Your Way through the Regulatory Maze," symposium presented by the Association of Environmental Professionals.
1992	"Southern California Ceramics Workshop," presented by Jerry Schaefer.
1992	"Historic Artifact Workshop," presented by Anne Duffield-Stoll.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1999-2002	Project Archaeologist/Field Director, CRM TECH, Riverside.
1996-1998	Project Director and Ethnographer, Statistical Research, Inc., Redlands.
1992-1998	Assistant Research Anthropologist, University of California, Riverside
1992-1995	Project Director, Archaeological Research Unit, U. C. Riverside.
1993-1994	Adjunct Professor, Riverside Community College, Mt. San Jacinto College, U.C. Riverside, Chapman University, and San Bernardino Valley College.
1991-1992	Crew Chief, Archaeological Research Unit, U. C. Riverside.
1984-1998	Archaeological Technician, Field Director, and Project Director for various southern California cultural resources management firms.

Research Interests

Cultural Resource Management, Southern Californian Archaeology, Settlement and Exchange Patterns, Specialization and Stratification, Culture Change, Native American Culture, Cultural Diversity.

Cultural Resources Management Reports

Author and co-author of, contributor to, and principal investigator for numerous cultural resources management study reports since 1986.

Re: The Village at Junipero: APNs 333-070-018, -019 and 333-070-053 (CRM TECH Contract No, 2875), Riverside County.

Dear Ms. Gallardo,

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe or group. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 373-3712.

Sincerely,

Katy Sanchez

RE: The Village at Junipero; APNs 333-070-018, -019, and -053
Approximately 19 Acres in the City of Menifee
Riverside County, California
CRM TECH Contract #2875

Dear Mr. Devers:

North Bayport Industrial Park II, Inc., is proposing a residential development in the City of Menifee, Riverside County, California, known as The Village at Junipero Project (APNs 333-070-018, -019, and -053). The project area encompasses approximately 19 acres of undeveloped land located north of the intersection of McCall Boulevard and Menifee Road. The accompanying map, based on the USGS Romoland, Calif., 7.5' quadrangle, depicts the location of the project area in Section 23, T5S R3W, SBBM. CRM TECH has been hired to conduct a cultural resource study, including the Native American scoping, for this project.

In a letter dated December 11, 2014, the Native American Heritage Commission reports that the sacred lands record search identified no Native American cultural resources within the project area, but recommends that local Native American groups be contacted for further information. Therefore, as part of the cultural resources study for this project, I am writing to request your input on potential Native American cultural resources in or near the project area.

According to records on file at the Eastern Information Center, there are no known historical/archaeological sites within the boundaries of the project area. Outside the project area but within a one-mile radius, 9 prehistoric sites and 12 historic-period sites were previously identified. The closest among these, Site 33-012535, consists of a bedrock milling feature and a lithic scatter, located about 0.10 mile west of the project area. The majority of the sites are concentrated in the foothills to the west of the project area and consist mainly of bedrock milling features and lithic scatters. The majority of the historic-period sites are farms, foundations, and refuse dumps. A systematic field survey of the project area on December 5, 2014, encountered one isolate near the western boundary of the project area, consisting of a single obsidian flake.

Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value within or near the project area that need to be taken into consideration as part of the cultural resources investigation. Any information or concerns may be forwarded to CRM TECH by telephone, e-mail, facsimile, or standard mail. Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agency, which is the City of Menifee for CEQA-compliance purposes. We would also like to clarify that CRM TECH, as the cultural resources consultant for the project, is not the appropriate entity to initiate government-to-government consultations. Thank you for the time and effort in addressing this important matter.

Respectfully,

Nina Gallardo, CRM TECH

Subject: The Village at Junipero

Ms. Gallardo,

The Pauma Band of Luiseno Indians has received your December 16 letter on the Village at Junipero. We would urge the developer to have cultural monitors on site during the grading phase of the project. While we are not aware of any specific sites on the project property and with sites close by, the potential of un-earthing cultural resources increases. Please continue to provide us with information of your studies on or near the project property.

Thank you,

Chris Devers
Cultural Clerk

Re: The Village at Junipero; CRM Tech Contract # 2875

Dear Mrs. Gallardo,

The Pala Band of Mission Indians Tribal Historic Preservation Office has received your notification of the project referenced above. This letter constitutes our response on behalf of Robert Smith, Tribal Chairman.

We have consulted our maps and determined that the project as described is not within the boundaries of the recognized Pala Indian Reservation. The project is also beyond the boundaries of the territory that the tribe considers its Traditional Use Area (TUA). Therefore, we have no objection to the continuation of project activities as currently planned and we defer to the wishes of Tribes in closer proximity to the project area.

We appreciate involvement with your initiative and look forward to working with you on future efforts. If you have questions or need additional information, please do not hesitate to contact me by telephone at 760-891-3515 or by e-mail at sgaughen@palatribe.com.

Sincerely,

Shasta C. Gaughen, PhD
Tribal Historic Preservation Officer
Pala Band of Mission Indians

ATTENTION: THE PALA TRIBAL HISTORIC PRESERVATION OFFICE IS RESPONSIBLE FOR ALL REQUESTS FOR CONSULTATION. PLEASE ADDRESS CORRESPONDENCE TO **SHASTA C. GAUGHEN** AT THE ABOVE ADDRESS. IT IS NOT NECESSARY TO ALSO SEND NOTICES TO PALA TRIBAL CHAIRMAN ROBERT SMITH.

MEMORANDUM

URBAN | CROSSROADS

DATE: October 31, 2022
TO: Kent Norton, MIG
FROM: Haseeb Qureshi
Ali Dadabhoy
JOB NO: 14854-02 AQ, GHG & EA Assessment

VILLAGE AT JUNIPERO (PLN22-0030) AIR QUALITY, GREENHOUSE GAS & ENERGY ASSESSMENT

Kent Norton,

Urban Crossroads, Inc. is pleased to provide the following Air Quality, Greenhouse Gas & Energy Assessment for the Village at Junipero (PLN22-0030) (**Project**), which is located north of McCall Boulevard, east of Junipero Road, south of Heritage Lakes Drive, and west of Menifee Road in the City of Menifee. The closest major airport is the Perris Valley Airport located roughly 4 miles northwest of the Project site.

PROJECT OVERVIEW

The Project is proposed to consist of the development of 240 market-rate apartments (multifamily (low-rise, 2-3 floors) residential) (see Exhibit 1). The proposed apartment complex consists of 24 buildings containing 10 units per building with individual unit sizes ranging from one to three bedrooms and each unit would contain one to two car garages. The proposed Project is anticipated to have an opening year of 2025.

SUMMARY OF FINDINGS

Results of the assessment indicate that the Project would result in a less than significant impact with respect to air quality, greenhouse gases and energy and no mitigation is required.

EXHIBIT 1: PROJECT'S TENTATIVE TRACT MAP

PROJECT AIR QUALITY IMPACTS

AIR QUALITY SETTING

SOUTH COAST AIR BASIN (SCAB)

The Project site is located in the SCAB within the jurisdiction of South Coast Air Quality Management District (SCAQMD) (3). The SCAQMD was created by the 1977 Lewis-Presley Air Quality Management Act, which merged four county air pollution control bodies into one regional district. Under the Act, the SCAQMD is responsible for bringing air quality in areas under its jurisdiction into conformity with federal and state air quality standards. As previously stated, the Project site is located within the SCAB, a 6,745-square mile subregion of the SCAQMD, which includes portions of Los Angeles, Riverside, and San Bernardino Counties, and all of Orange County.

The SCAB is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Los Angeles County portion of the Mojave Desert Air Basin is bounded by the San Gabriel Mountains to the south and west, the Los Angeles / Kern County border to the north, and the Los Angeles / San Bernardino County border to the east. The Riverside County portion of the Salton Sea Air Basin is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley.

Regional Climate

The regional climate has a substantial influence on air quality in the SCAB. In addition, the temperature, wind, humidity, precipitation, and amount of sunshine influence the air quality.

The annual average temperatures throughout the SCAB vary from the low to middle 60s degrees Fahrenheit (°F). Due to a decreased marine influence, the eastern portion of the SCAB shows greater variability in average annual minimum and maximum temperatures. January is the coldest month throughout the SCAB, with average minimum temperatures of 47°F in downtown Los Angeles and 36°F in San Bernardino. All portions of the SCAB have recorded maximum temperatures above 100°F.

Although the climate of the SCAB can be characterized as semi-arid, the air near the land surface is quite moist on most days because of the presence of a marine layer. This shallow layer of sea air is an important modifier of SCAB climate. Humidity restricts visibility in the SCAB, and the conversion of sulfur dioxide (SO_2) to sulfates (SO_4) is heightened in air with high relative humidity. The marine layer provides an environment for that conversion process, especially during the spring and summer months. The annual average relative humidity within the SCAB is 71 percent (%) along the coast and 59% inland. Since the ocean effect is dominant, periods of heavy early morning fog are frequent and low stratus clouds are a characteristic feature. These effects decrease with distance from the coast.

More than 90% of the SCAB's rainfall occurs from November through April. The annual average rainfall varies from approximately nine inches in Riverside to fourteen inches in downtown Los Angeles. Monthly and yearly rainfall totals are extremely variable. Summer rainfall usually consists of widely scattered thunderstorms near the coast and slightly heavier shower activity in the eastern portion of the SCAB with frequency being higher near the coast.

Due to its generally clear weather, about three-quarters of available sunshine is received in the SCAB. The remaining one-quarter is absorbed by clouds. The ultraviolet portion of this abundant radiation is a key factor in photochemical reactions. On the shortest day of the year there are approximately 10 hours of possible sunshine, and on the longest day of the year there are approximately 14½ hours of possible sunshine.

The importance of wind to air pollution is considerable. The direction and speed of the wind determines the horizontal dispersion and transport of the air pollutants. During the late autumn to early spring rainy season, the SCAB is subjected to wind flows associated with the traveling storms moving through the region from the northwest. This period also brings five to ten periods of strong, dry offshore winds, locally termed "Santa Anas" each year. During the dry season, which coincides with the months of maximum photochemical smog concentrations, the wind flow is bimodal, typified by a daytime onshore sea breeze and a nighttime offshore drainage wind. Summer wind flows are created by the pressure differences between the relatively cold ocean and the unevenly heated and cooled land surfaces that modify the general northwesterly wind circulation over southern California. Nighttime drainage begins with the radiational cooling of the mountain slopes. Heavy, cool air descends the slopes and flows through the mountain passes and canyons as it follows the lowering terrain toward the ocean. Another characteristic wind regime in the SCAB is the "Catalina Eddy," a low level cyclonic (counterclockwise) flow centered over Santa Catalina Island which results in an offshore flow to the southwest. On most spring and summer days, some indication of an eddy is apparent in coastal sections.

In the SCAB, there are two distinct temperature inversion structures that control vertical mixing of air pollution. During the summer, warm high-pressure descending (subsiding) air is undercut by a shallow layer of cool marine air. The boundary between these two layers of air is a persistent marine subsidence/inversion. This boundary prevents vertical mixing which effectively acts as an impervious lid to pollutants over the entire SCAB. The mixing height for the inversion structure is normally situated 1,000 to 1,500 feet above mean sea level.

A second inversion-type forms in conjunction with the drainage of cool air off the surrounding mountains at night followed by the seaward drift of this pool of cool air. The top of this layer forms a sharp boundary with the warmer air aloft and creates nocturnal radiation inversions. These inversions occur primarily in the winter when nights are longer and onshore flow is weakest. They are typically only a few hundred feet above mean sea level. These inversions effectively trap pollutants, such as nitrogen oxides (NO_X) and carbon monoxide (CO) from vehicles, as the pool of cool air drifts seaward. Winter is therefore a period of high levels of primary pollutants along the coastline.

Wind Patterns and Project Location

The distinctive climate of the Project area and the SCAB is determined by its terrain and geographical location. The SCAB is located in a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean in the southwest quadrant with high mountains forming the remainder of the perimeter.

Wind patterns across the south coastal region are characterized by westerly and southwesterly onshore winds during the day and easterly or northeasterly breezes at night. Winds are characteristically light although the speed is somewhat greater during the dry summer months than during the rainy winter season.

Criteria Pollutants

Both the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) have established ambient air quality standards for common pollutants. These ambient air quality standards are levels of contaminants representing safe levels that avoid specific adverse health effects associated with each pollutant. The ambient air quality standards cover what are called "criteria" pollutants because the health and other effects of each pollutant are described in criteria documents. The six criteria pollutants are ozone (O_3) (precursor emissions include NO_X and reactive organic gases (ROG), CO, particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead. Areas that meet ambient air quality standards are classified as attainment areas, while areas that do not meet these standards are classified as nonattainment areas. The Riverside County portion of the SCAB is designated as a nonattainment area for the federal O_3 and $PM_{2.5}$ standards and is also a nonattainment area for the state standards for O_3, PM_{10}, and $PM_{2.5}$.

Sensitive Receptor Locations

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, and individuals with pre-existing respiratory or cardiovascular illness. Structures that house these persons or places where they gather are defined as "sensitive receptors". These structures typically include uses such as residences, hotels, and hospitals where an individual can remain for 24 hours. Consistent with the LST Methodology, the nearest land use where an individual could remain for 24 hours to the Project site has been used to determine construction and operational air quality impacts for emissions of PM_{10} and $PM_{2.5}$, since PM_{10} and $PM_{2.5}$ thresholds are based on a 24-hour averaging time.

Receptors in the Project study area are described below. All distances are measured from the Project site boundary to the outdoor living areas (e.g., backyards) or at the building façade, whichever is closer to the Project site. Receptors in the Project study area are shown on Exhibit 2 under the Localized Construction Emissions section later in the report.

- Receptor R1 represents the existing residence at 27151 Settlement Street, approximately 89 feet north of the Project site.
- Receptor R2 represents the residence at 27299 Stonehurst Road, approximately 185 feet east of the Project site.
- Receptor R3 represents the school (Boulder Ridge Elementary) at 27327 Junipero Road, approximately 102 feet west of the Project site.
- Receptor R4 represents the existing residence at 27250 Buckaroo Circle, approximately 61 feet west of the Project site.

REGULATORY BACKGROUND

FEDERAL REGULATIONS

The EPA is responsible for setting and enforcing the national ambient air quality standards (NAAQS) for O_3, CO, NO_X, SO_2, PM_{10}, and lead (Pb) (5). The EPA has jurisdiction over emissions sources that are under the authority of the federal government including aircraft, locomotives, and emissions sources outside state waters (Outer Continental Shelf). The EPA also establishes emission standards for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission requirements of CARB.

The Federal Clean Air Act (CAA) was first enacted in 1955 and has been amended numerous times in subsequent years (1963, 1965, 1967, 1970, 1977, and 1990). The CAA establishes the federal air quality standards, the NAAQS, and specifies future dates for achieving compliance (6). The CAA also mandates that each state submit and implement state implementation plans (SIPs) for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The 1990 amendments to the CAA that identify specific emission reduction goals for areas not meeting the NAAQS require a demonstration of reasonable further progress toward attainment and incorporate additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA most directly applicable to the development of the Project site include Title I (Non-Attainment Provisions) and Title II (Mobile Source Provisions) (7) (8). Title I provisions were established with the goal of attaining the NAAQS for the following criteria pollutants O_3, NO_2, SO_2, PM_{10}, CO, $PM_{2.5}$, and Pb. The NAAQS were amended in July 1997 to include an additional standard for O_3 and to adopt a NAAQS for $PM_{2.5}$.

Mobile source emissions are regulated in accordance with Title II provisions. These provisions require the use of cleaner burning gasoline and other cleaner burning fuels such as methanol and natural gas. Automobile manufacturers are also required to reduce tailpipe emissions of hydrocarbons and NO_X. NO_X is a collective term that includes all forms of NO_X which are emitted as byproducts of the combustion process.

CALIFORNIA REGULATIONS

CARB

The CARB, which became part of the California EPA (CalEPA) in 1991, is responsible for ensuring implementation of the California Clean Air Act (AB 2595), responding to the federal CAA, and for regulating emissions from consumer products and motor vehicles. AB 2595 mandates achievement of the maximum degree of emissions reductions possible from vehicular and other mobile sources in order to attain the state ambient air quality standards by the earliest practical date. The CARB established the California ambient air quality standards (CAAQS) for all pollutants for which the federal government has NAAQS and, in addition, establishes standards for SO_4, visibility, hydrogen sulfide (H_2S), and vinyl chloride (C_2H_3Cl). However, at this time, H_2S and C_2H_3Cl are not measured at any monitoring stations in the SCAB because they are not considered to be a regional air quality problem. Generally, the CAAQS are more stringent than the NAAQS (1) (2).

Local air quality management districts, such as the SCAQMD, regulate air emissions from stationary sources such as commercial and industrial facilities. All air pollution control districts have been formally designated as attainment or non-attainment for each CAAQS.

Serious non-attainment areas are required to prepare Air Quality Management Plans (AQMP) that include specified emission reduction strategies in an effort to meet clean air goals. These plans are required to include:

- Application of Best Available Retrofit Control Technology to existing sources;
- Developing control programs for area sources (e.g., architectural coatings and solvents) and indirect sources (e.g. motor vehicle use generated by residential and commercial development);
- A District permitting system designed to allow no net increase in emissions from any new or modified permitted sources of emissions;
- Implementing reasonably available transportation control measures and assuring a substantial reduction in growth rate of vehicle trips and miles traveled;
- Significant use of low emissions vehicles by fleet operators;
- Sufficient control strategies to achieve a 5% or more annual reduction in emissions or 15% or more in a period of three years for ROGs, NO_X, CO and PM_{10}. However, air basins may use alternative emission reduction strategy that achieves a reduction of less than 5% per year under certain circumstances.

AQMP

Currently, the NAAQS and CAAQS are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMP to meet the state and federal ambient air quality standards (10). AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

APPLICABLE REGULATORY REQUIRMENTS

SCAQMD Rules that are currently applicable during construction activity for this Project include but are not limited to Rule 403 (Fugitive Dust), Rule 445 (Wood Burning Devices), and Rule 1113 (Architectural Coatings) (3) (4) (5).

SCAQMD Rule 403

This rule is intended to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (human-made) fugitive dust sources by requiring actions to prevent and reduce fugitive dust emissions. Rule 403 applies to any activity or human-made condition capable of generating fugitive dust and requires best available control measures to be applied to earth moving and grading activities. This rule is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. PM_{10} suppression techniques are summarized below.

- Portions of a construction site to remain inactive longer than a period of three months will be seeded and watered until grass cover is grown or otherwise stabilized.
- All onsite roads will be paved as soon as feasible or watered periodically or chemically stabilized.
- All material transported offsite will be either sufficiently watered or securely covered to prevent excessive amounts of dust.
- The area disturbed by clearing, grading, earthmoving, or excavation operations will be minimized at all times.
- Where vehicles leave a construction site and enter adjacent public streets, the streets will be swept daily or washed down at the end of the workday to remove soil tracked onto the paved surface.

SCAQMD Rule 445

This rule is intended to reduce the emission of particulate matter from wood-burning devices. The Project is required to comply with SCAQMD Rule 445, which prohibits the use of wood burning stoves and fireplaces in new development.

SCAQMD Rule 1113

This rule serves to limit the volatile organic compound (VOC) content of architectural coatings used on projects in the SCAQMD. Any person who supplies, sells, offers for sale, or manufactures any architectural coating for use on projects in the SCAQMD must comply with the current VOC standards set in this rule.

METHODOLOGY

In May 2022, the California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including SCAQMD, released the latest version of the CalEEMod Version 2022.1. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (6). Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality and greenhouse gas emissions.

Standards of Significance

The criteria used to determine the significance of potential Project-related air quality impacts are taken from the California Environmental Quality Act Guidelines (CEQA Guidelines) (14 CCR §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to air quality if it would (7):

- **Threshold 1**: Conflict with or obstruct implementation of the applicable air quality plan.
- **Threshold 2**: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard.
- **Threshold 3**: Expose sensitive receptors to substantial pollutant concentrations.

- **Threshold 4**: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

AIR QUALITY REGIONAL EMISSIONS THRESHOLDS

The SCAQMD has developed regional significance thresholds for criteria pollutants, as summarized at Table 1 (8). The SCAQMD's CEQA Air Quality Significance Thresholds (April 2019) indicate that any projects in the South Coast Air Basin (SCAB) with daily emissions that exceed any of the indicated thresholds should be considered as having an individually and cumulatively significant air quality impact.

TABLE 1: MAXIMUM DAILY REGIONAL EMISSIONS THRESHOLDS

Pollutant	Construction	Operations
NO_X	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM_{10}	150 lbs/day	150 lbs/day
$PM_{2.5}$	55 lbs/day	55 lbs/day
SO_X	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day

lbs/day – Pounds Per Day

AIR QUALITY LOCALIZED EMISSIONS THRESHOLDS

For this Project, the appropriate SRA for the LST analysis is the SCAQMD Perris Valley monitoring station (SRA 24). LSTs apply to CO, NO_2, PM_{10}, and $PM_{2.5}$. The SCAQMD produced look-up tables for projects less than or equal to 5 acres in size. The SCAQMD's screening look-up tables are utilized in determining localized impacts. It should be noted that since the look-up tables identify thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in Table 2 were calculated by interpolating the threshold values for the Project's disturbed acreage.

The acres disturbed is based on the equipment list and days in the site preparation and grading phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday. The equipment-specific grading rates are summarized in the CalEEMod user's guide, Appendix A: Calculation Details for CalEEMod (9). It should be noted that the disturbed area per day is representative of a piece of equipment making multiple passes over the same land area. In other words, one Rubber Tired Dozer can make multiple passes over the same land area totaling 0.5 acres in a given 8-hour day. Appendix A of the CalEEMod User Manual only identifies equipment-specific grading rates for Crawler Tractors, Graders, Rubber Tired Dozers, and Scrapers; therefore, Tractors/Loaders/Backhoes equipment that was included in the site preparation and grading phase was replaced with crawler tractors. For analytical purposes, emissions associated with peak site preparation and grading activities are considered for purposes of localized significance thresholds (LSTs) since this phase represents the maximum

localized emissions that would occur. The Project's construction activities could disturb a maximum of approximately 3.5 acres per day for site preparation and 4 acres per day for grading activities. Any other construction phases of development would result in lesser emissions and consequently lesser impacts than what is disclosed herein. As such, Table 2 presents thresholds for localized construction and operational emissions.

TABLE 2: MAXIMUM DAILY LOCALIZED EMISSIONS THRESHOLDS

Source	Activity	Emissions (lbs/day)			
		VOC	NOX	PM_{10}	$PM_{2.5}$
Construction	Site Preparation	220 lbs/day	1,230 lbs/day	10 lbs/day	6 lbs/day
	Grading	237 lbs/day	1,346 lbs/day	11 lbs/day	7 lbs/day

[1]Source of localized significance threshold (LSTs) is provided on page 8.

REGIONAL CONSTRUCTION EMISSIONS SUMMARY

The estimated maximum daily construction emissions without mitigation are summarized on Table 3. Detailed construction model outputs are presented in Attachment A. Under the assumed scenarios, emissions resulting from the Project construction will not exceed thresholds established by the SCAQMD for emissions of any criteria pollutant and no mitigation is required.

REGIONAL OPERATIONAL EMISSIONS

Operational activities associated with the Project would result in emissions of CO, VOCs, NO_X, SO_X, PM_{10}, and $PM_{2.5}$. Operational related emissions are expected from the following primary sources: area source emissions, energy source emissions, and mobile source emissions,

The Project related operational air quality impacts derive primarily from vehicle trips generated by the Project. Trip characteristics available from the *Village at Junipero (PLN22-0030) Traffic Scope* report were utilized in this analysis (10).

The estimated operation-source emissions from the Project are summarized on Table 4. Detailed operation model outputs are presented in Attachment A. As shown on Table 4, operational-source emissions would not exceed the applicable SCAQMD regional thresholds for emissions of any criteria pollutant and no mitigation is required.

TABLE 3 OVERALL REGIONAL CONSTRUCTION EMISSIONS SUMMARY

Source	Emissions (lbs/day)					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Summer						
2023	4.31	41.10	34.50	0.06	4.90	2.85
2024	2.20	13.80	28.90	0.03	2.99	1.09
Winter						
2023	4.99	47.10	39.20	0.06	8.43	5.07
2024	55.10	13.90	25.40	0.03	2.99	1.08
2025	55.10	1.40	3.55	< 0.005	0.50	0.14
Maximum Daily Emissions	**55.10**	**47.10**	**39.20**	**0.06**	**8.43**	**5.07**

SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

SENSITIVE RECEPTORS

The analysis uses the methodology included in the SCAQMD *Final Localized Significance Threshold Methodology* (LST Methodology) (11). The SCAQMD has established that impacts to air quality are significant if there is a potential to contribute or cause localized exceedances of the federal and/or state ambient air quality standards (NAAQS/CAAQS). Collectively, these are referred to as Localized Significance Thresholds (LSTs). The SCAQMD established LSTs in response to the SCAQMD Governing Board's Environmental Justice Initiative I-41. LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard at the sensitive receptor. The SCAQMD states that lead agencies can use the LSTs as another indicator of significance in its air quality impact analyses. It should be noted that SCAQMD also states that projects that are statutorily or categorically exempt under CEQA would not be subject to LST analyses. Projects exempt from CEQA also include infill projects that meet the H&S Code provisions. As such, although not required for this Project, LST analysis is presented to further underscore that there are in fact no significant impacts associated with the Project.

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Project's potential to cause an individual or cumulatively significant impact. The nearest land use where an individual could remain for 24 hours to the Project site has been used to determine localized construction and operational air quality impacts for emissions of PM_{10} and $PM_{2.5}$ (since PM_{10} and $PM_{2.5}$ thresholds are based on a 24-hour averaging time). The nearest receptor used for evaluation of localized impacts of PM_{10} and $PM_{2.5}$ is location R4 represented by the existing residence at 27250 Buckaroo Circle, approximately 61 feet (19 meters) west of the Project site. As such, for evaluation of localized PM10 and PM2.5, a 25-meter distance will be used. Receptors in the Project study area shown on Exhibit 2.

As previously stated, and consistent with LST Methodology, the nearest industrial/commercial use to the Project site is used to determine construction and operational LST air impacts for emissions of NO_X and CO as the averaging periods for these pollutants are shorter (8 hours or less) and it is reasonable to assume that an individual could be present at these sites for periods of one to 8 hours. It should be noted that the existing residence (R4) is located at a closer distance than the nearest industrial/commercial use. As such, the same receptor will be used for evaluation of localized NO_X and CO.

1 The purpose of SCAQMD's Environmental Justice program is to ensure that everyone has the right to equal protection from air pollution and fair access to the decision-making process that works to improve the quality of air within their communities. Further, the SCAQMD defines Environmental Justice as "…equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

EXHIBIT 2: SENSITIVE RECEPTOR LOCATIONS

LOCALIZED CONSTRUCTION EMISSIONS

Table 5 identifies the localized impacts at the nearest receptor location in the vicinity of the Project. Outputs from the model runs for construction LSTs are provided in Attachment A. For analytical purposes, emissions associated with peak site preparation and grading activities are considered for purposes of LSTs since these phases represents the maximum localized emissions that would occur. Any other construction phases of development that overlap would result in lesser emissions and consequently lesser impacts than what is disclosed herein. As shown in Table 5, emissions resulting from the construction will not exceed the numerical thresholds of significance established by the SCAQMD for any criteria pollutant. Thus, a less than significant impact would occur for localized Project-related construction-source emissions and no mitigation is required.

LOCALIZED OPERATIONAL EMISSIONS

The proposed project is located on approximately 19.25 acres, and the total development is proposed to consist of 240 market-rate apartments (multifamily (low-rise, 2-3 floors) residential units. According to SCAQMD LST methodology, LSTs would apply to the operational phase of a proposed project, if the project includes stationary sources, or attracts mobile sources that may spend long periods queuing and idling at the site (e.g., transfer facilities and warehouse buildings). The proposed project does not include such uses, and thus, due to the lack of significant stationary source emissions, no LST analysis is needed for operations.

TABLE 5: PROJECT LOCALIZED CONSTRUCTION IMPACTS

On-Site Emissions	Emissions (lbs/day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Site Preparation				
Maximum Daily Emissions	47.00	38.00	8.19	5.02
SCAQMD Localized Threshold	220	1,230	10	6
Threshold Exceeded?	NO	NO	NO	NO
Grading				
Maximum Daily Emissions	40.90	32.70	4.63	2.78
SCAQMD Localized Threshold	237	1,346	11	7
Threshold Exceeded?	NO	NO	NO	NO

AIR QUALITY IMPACTS – CONSISTENCY WITH THRESHOLD NO. 1

Would the Project conflict with or obstruct implementation of the applicable air quality plan?

The Project site is located within the SCAB, which is characterized by relatively poor air quality. The SCAQMD has jurisdiction over an approximately 10,743 square-mile area consisting of the four-county Basin and the Los Angeles County and Riverside County portions of what use to be referred to as the Southeast Desert Air Basin. In these areas, the SCAQMD is principally responsible for air pollution control, and works directly with the Southern California Association of Governments (SCAG), county transportation commissions, local governments, as well as state and federal agencies to reduce emissions from stationary, mobile, and indirect sources to meet state and federal ambient air quality standards.

Currently, these state and federal air quality standards are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMPs to meet the state and federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

In March 2017, the SCAQMD released the Final 2016 AQMP (2016 AQMP). The 2016 AQMP continues to evaluate current integrated strategies and control measures to meet the NAAQS, as well as explore new and innovative methods to reach its goals. Some of these approaches include utilizing incentive programs, recognizing existing co-benefit programs from other sectors, and developing a strategy with fair-share reductions at the federal, state, and local levels (17). Similar to the 2012 AQMP, the 2016 AQMP incorporates scientific and technological information and planning assumptions, including the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS), a planning document that supports the integration of land use and transportation to help the region meet the federal CAA requirements (10). The Project's consistency with the AQMP will be determined using the 2016 AQMP as discussed below.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2 and Section 12.3 of the 1993 CEQA Handbook (18). These indicators are discussed below.

The proposed Project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

The violations under this criterion refer to the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if regional or localized significance thresholds were exceeded.

CAAQS and NAAQS violations would occur if regional or localized significance thresholds were exceeded. As evaluated, the Project's regional and localized construction and operational-source emissions would not exceed applicable regional significance thresholds. As such, a less than significant impact is expected.

On the basis of the preceding discussion, the Project is determined to be consistent with the first criterion.

The Project will not exceed the assumptions in the AQMP based on the years of Project build-out phase.

The 2016 AQMP demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under federal law. Growth projections from local general plans adopted by cities in the district are provided to the SCAG, which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections in City of Menifee General Plan is considered to be consistent with the AQMP.

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. Irrespective of the site's land use designation, development of the site to its maximum potential would likely occur, with disturbance of the entire site occurring during construction activities. As such, when considering that no emissions thresholds will be exceeded, a less than significant impact would result.

The City of Menifee General Plan designates the Project site as 8.1-14 du/ac Residential (8.1-14R) uses. The 8.1-14R designation allows for up to 8.1-14 dwelling units per acre. This land uses allows for Single-family attached and detached residences, including townhouses, stacked flats, courtyard homes, patio homes, and zero lot line homes (12).

As the Project includes development of 240 market-rate apartments (multifamily (low-rise, 2-3 floors) residential) and consists of 24 buildings containing 10 units per building with individual unit sizes ranging from one to three bedrooms and each unit would contain one to two car garages, the Project's proposed uses are consistent with the site's land use designations, and a general plan amendment will not be required.

On the basis of the preceding discussion, the Project is determined to be consistent with the second criterion.

As the proposed Project is consistent with site's land use designation, would not exceed any applicable regional or local thresholds, and would not result in or cause NAAQS or CAAQS violations, the Project is therefore considered to be consistent with the AQMP and a less than significant impact is expected.

AIR QUALITY IMPACTS – CONSISTENCY WITH THRESHOLD NO. 2

Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard?

The CAAQS designate the Project site as nonattainment for O_3, PM_{10}, and $PM_{2.5}$ while the NAAQS designates the Project site as nonattainment for O_3 and $PM_{2.5}$.

The SCAQMD has published a report on how to address cumulative impacts from air pollution: White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution (13). In this report the SCAQMD clearly states (Page D-3):

> *"…the SCAQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.*
>
> *Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."*

Therefore, this analysis assumes that individual projects that do not generate operational or construction emissions that exceed the SCAQMD's recommended daily thresholds for project-specific impacts would also not cause a cumulatively considerable increase in emissions for those pollutants for which SCAB is in nonattainment, and, therefore, would not be considered to have a significant, adverse air quality impact. Alternatively, individual project-related construction and operational emissions that exceed SCAQMD thresholds for project-specific impacts would be considered cumulatively considerable.

Construction Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that proposed Project construction-source air pollutant emissions would not result in exceedances of regional thresholds. Therefore, the proposed Project construction-source emissions would be considered less than significant on a project-specific and cumulative basis.

Operational Impacts

The Project-specific evaluation of emissions presented in the preceding analysis demonstrates that proposed Project operational-source air pollutant emissions would not result in exceedances of regional thresholds. Therefore, the proposed Project operational-source emissions would be considered less than significant on a project-specific and cumulative basis.

AIR QUALITY IMPACTS – CONSISTENCY WITH THRESHOLD NO. 3

Would the expose sensitive receptors to substantial pollutant concentrations?

The potential impact of Project-generated air pollutant emissions at sensitive receptors has also been considered. Results of the LST analysis indicate that the Project will not exceed the SCAQMD localized significance thresholds during construction. Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations during Project construction.

Additionally, the Project will not exceed the SCAQMD localized significance thresholds during operational activity. Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations as the result of Project operations.

CO "HOT SPOT" ANALYSIS

As discussed below, the Project would not result in potentially adverse CO concentrations or "hot spots." Further, detailed modeling of Project-specific CO "hot spots" is not needed to reach this conclusion. An adverse CO concentration, known as a "hot spot", would occur if an exceedance of the state one-hour standard of 20 parts per million (ppm) or the eight-hour standard of 9 ppm were to occur.

It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last twenty years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment. To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO "hot spot" analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods. This "hot spot" analysis did not predict any violation of CO standards, as shown on Table 6.

TABLE 6: CO MODEL RESULTS

Intersection Location	CO Concentrations (ppm)		
	Morning 1-hour	Afternoon 1-hour	8-hour
Wilshire Boulevard/Veteran Avenue	4.6	3.5	3.7
Sunset Boulevard/Highland Avenue	4	4.5	3.5
La Cienega Boulevard/Century Boulevard	3.7	3.1	5.2
Long Beach Boulevard/Imperial Highway	3	3.1	8.4

Notes: Federal 1-hour standard is 35 ppm and the deferral 8-hour standard is 9.0 ppm.

Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan), peak carbon monoxide concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. As evidence of this, for example, 8.4 ppm 8-hr CO concentration

measured at the Long Beach Blvd. and Imperial Hwy. intersection (highest CO generating intersection within the "hot spot" analysis), only 0.7 ppm was attributable to the traffic volumes and congestion at this intersection; the remaining 7.7 ppm were due to the ambient air measurements at the time the 2003 AQMP was prepared (20). In contrast, an adverse CO concentration, known as a "hot spot", would occur if an exceedance of the state one-hour standard of 20 parts per million (ppm) or the eight-hour standard of 9 ppm were to occur.

Similar considerations are also employed by other Air Districts when evaluating potential CO concentration impacts. More specifically, the Bay Area Air Quality Management District (BAAQMD) concludes that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour (vph)—or 24,000 vph where vertical and/or horizontal air does not mix—in order to generate a significant CO impact (21). Traffic volumes generating the CO concentrations for the "hot spot" analysis is shown on Table 7. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vph and AM/PM traffic volumes of 8,062 vph and 7,719 vph respectively (20). The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm; this indicates that, should the daily traffic volume increase four times to 400,000 vehicles per day, CO concentrations (4.6 ppm x 4= 18.4 ppm) would still not likely exceed the most stringent 1-hour CO standard (20.0 ppm).

TABLE 7: CO MODEL RESULTS

Intersection Location	Peak Traffic Volumes (vph)				
	Eastbound (AM/PM)	Westbound (AM/PM)	Southbound (AM/PM)	Northbound (AM/PM)	Total (AM/PM)
Wilshire Boulevard/Veteran Avenue	4,954/2,069	1,830/3,317	721/1,400	560/933	8,062/7,719
Sunset Boulevard/Highland Avenue	1,417/1,764	1,342/1,540	2,304/1,832	1,551/2,238	6,614/5,374
La Cienega Boulevard/Century Boulevard	2,540/2,243	1,890/2,728	1,384/2,029	821/1,674	6,634/8,674
Long Beach Boulevard/Imperial Highway	1,217/2,020	1,760/1,400	479/944	756/1,150	4,212/5,514

As shown on Table 8, the highest trips on a segment of road for the proposed Project during AM and PM traffic is 6,102 vph and 6,379 vph, respectively, on Beach Bl. (SR-39) & Orangethorpe Av. (10). As such, Project-related traffic volumes are less than the traffic volumes identified in the 2003 AQMP. The Project considered herein would not produce the volume of traffic required to generate a CO "hot spot" either in the context of the 2003 Los Angeles hot spot study or based on representative BAAQMD CO threshold considerations. Therefore, CO "hot spots" are not an environmental impact of concern for the Project. Localized air quality impacts related to mobile-source emissions would therefore be less than significant.

TABLE 8: PROJECT TRAFFIC VOLUMES

Intersection Location	Peak Traffic Volumes (vph)				
	Eastbound (AM/PM)	Westbound (AM/PM)	Southbound (AM/PM)	Northbound (AM/PM)	Total (AM/PM)
Sherman Rd. & McCall Bl.	0/0	1/4	12/39	41/25	54/68
Junipero Rd. & Heritage Lakes Dr.	14/46	0/0	0/0	29/18	43/64
Settlement St./Driveway 1 & Heritage Lakes Dr.	47/29	0/0	14/46	6/19	67/94
Menifee Rd. & Heritage Lakes Dr.	3/12	5/15	19/11	1/4	28/42

AIR QUALITY IMPACTS – CONSISTENCY WITH THRESHOLD NO. 4

Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The potential for the Project to generate objectionable odors has also been considered. Land uses generally associated with odor complaints include:

- Agricultural uses (livestock and farming)
- Wastewater treatment plants
- Food processing plants
- Chemical plants
- Composting operations
- Refineries
- Landfills
- Dairies
- Fiberglass molding facilities

The Project does not contain land uses typically associated with emitting objectionable odors. Potential odor sources associated with the proposed Project may result from construction equipment exhaust and the application of asphalt and architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the proposed Project's (long-term operational) uses. Standard construction requirements would minimize odor impacts from construct ion. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. It is expected that Project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with the solid waste regulations. The proposed Project would also be required to comply with SCAQMD Rule 402 to prevent occurrences of public nuisances. Therefore, odors associated with the proposed Project construction and operations would be less than significant and no mitigation is required (14).

PROJECT GHG ANALYSIS

CLIMATE CHANGE SETTING

Global climate change (GCC) is the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The majority of scientists believe that the climate shift taking place since the Industrial Revolution is occurring at a quicker rate and magnitude than in the past. Scientific evidence suggests that GCC is the result of increased concentrations of GHGs in the earth's atmosphere, including carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and fluorinated gases. The majority of scientists believe that this increased rate of climate change is the result of GHGs resulting from human activity and industrialization over the past 200 years.

An individual project like the proposed Project evaluated in this memo cannot generate enough GHG emissions to affect a discernible change in global climate. However, the proposed Project may participate in the potential for GCC by its incremental contribution of GHGs combined with the cumulative increase of all other sources of GHGs, which when taken together constitute potential influences on GCC. Because these changes may have serious environmental consequences, this memo will evaluate the potential for the proposed Project to have a significant effect upon the environment as a result of its potential contribution to the greenhouse effect.

GCC refers to the change in average meteorological conditions on the earth with respect to temperature, wind patterns, precipitation and storms. Global temperatures are regulated by naturally occurring atmospheric gases such as water vapor, CO_2, N_2O, CH_4, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These particular gases are important due to their residence time (duration they stay) in the atmosphere, which ranges from 10 years to more than 100 years. These gases allow solar radiation into the earth's atmosphere, but prevent radioactive heat from escaping, thus warming the earth's atmosphere. GCC can occur naturally as it has in the past with the previous ice ages.

Gases that trap heat in the atmosphere are often referred to as GHGs. GHGs are released into the atmosphere by both natural and anthropogenic activity. Without the natural GHG effect, the earth's average temperature would be approximately 61 degrees Fahrenheit (°F) cooler than it is currently. The cumulative accumulation of these gases in the earth's atmosphere is considered to be the cause for the observed increase in the earth's temperature.

For the purposes of this analysis, emissions of CO_2, CH_4, and N_2O were evaluated because these gases are the primary contributors to GCC from development projects. Although there are other substances such as fluorinated gases that also contribute to GCC, these fluorinated gases were not evaluated as their sources are not well-defined and do not contain accepted emissions factors or methodology to accurately calculate these gases.

REGULATORY SETTING

Executive Order S-3-05

Former California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following reduction targets for GHG emissions:

- By 2010, reduce GHG emissions to 2000 levels.

- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80% below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Assembly Bill (AB) 32

The California State Legislature enacted AB 32, which requires that GHGs emitted in California be reduced to 1990 levels by the year 2020. "GHGs" as defined under AB 32 include CO_2, CH_4, N_2O, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). Since AB 32 was enacted, a seventh chemical, nitrogen trifluoride, has also been added to the list of GHGs. CARB is the state agency charged with monitoring and regulating sources of GHGs. Pursuant to AB 32, CARB adopted regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 states the following:

"Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems."

CARB approved the 1990 GHG emissions level of 427 million metric ton of CO_2 equivalent per year ($MMTCO_2e$) on December 6, 2007 (15). Therefore, emissions generated in California in 2020 are required to be equal to or less than 427 $MMTCO_2e$. Emissions in 2020 in a "business as usual" (BAU) scenario were estimated to be 596 $MMTCO_2e$, which do not account for reductions from AB 32 regulations (16). At that level, a 28.4% reduction was required to achieve the 427 MMTCO2e 1990 inventory. In October 2010, CARB prepared an updated BAU 2020 forecast to account for the recession and slower forecasted growth. The forecasted inventory without the benefits of adopted regulation is now estimated at 545 $MMTCO_2e$. Therefore, under the updated forecast, a 21.7% reduction from BAU is required to achieve 1990 levels (17).

Progress in Achieving AB 32 Targets and Remaining Reductions Required

The State has made steady progress in implementing AB 32 and achieving targets included in Executive Order S-3-05. The progress is shown in updated emission inventories prepared by CARB for 2000 through 2012 (18). The State has achieved the Executive Order S-3-05 target for 2010 of reducing GHG emissions to 2000 levels. As shown below, the 2010 emission inventory achieved this target.

- 1990: 427 $MMTCO_2e$ (AB 32 2020 target)
- 2000: 463 $MMTCO_2e$ (an average 8% reduction needed to achieve 1990 base)
- 2010: 450 $MMTCO_2e$ (an average 5% reduction needed to achieve 1990 base)

CARB has also made substantial progress in achieving its goal of achieving 1990 emissions levels by 2020. As described earlier in this section, CARB revised the 2020 BAU inventory forecast to account for new lower growth projections, which resulted in a new lower reduction from BAU to achieve the 1990 base. The previous reduction from 2020 BAU needed to achieve 1990 levels was 28.4% and the latest reduction from 2020 BAU is 21.7%.

- 2020: 545 $MMTCO_2e$ BAU (an average 21.7% reduction from BAU needed to achieve 1990 base)

Senate Bill (SB) 32

On September 8, 2016, Governor Jerry Brown signed the SB 32 and its companion bill, AB 197. SB 32 requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15. The new legislation builds upon the AB 32 goal of 1990 levels by 2020 and provides an intermediate goal to achieving S-3-05, which sets a statewide GHG reduction target of 80% below 1990 levels by 2050. AB 197 creates a legislative committee to oversee regulators to ensure that CARB not only responds to the Governor, but also the Legislature (19).

AB 197

A condition of approval for SB 32 was the passage of AB 197. AB 197 requires that CARB consider the social costs of GHG emissions and prioritize direct reductions in GHG emissions at mobile sources and large stationary sources. AB 197 also gives the California legislature more oversight over CARB through the addition of two legislatively appointed members to the CARB Board and the establishment a legislative committee to make recommendations about CARB programs to the legislature.

Executive Order B-55-18 and SB 100

Executive Order B-55-18 and SB 100. SB 100 and Executive Order B-55-18 were signed by Governor Brown on September 10, 2018. Under the existing RPS, 25% of retail sales are required to be from renewable sources by December 31, 2016, 33% by December 31, 2020, 40% by December 31, 2024, 45% by December 31, 2027, and 50% by December 31, 2030. SB 100 raises California's RPS requirement to 50% renewable resources target by December 31, 2026, and to achieve a 60% target by December 31, 2030. SB 100 also requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours of those products sold to their retail end-use customers achieve 44% of retail sales by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030. In addition to targets under AB 32 and SB 32, Executive Order B-55-18 establishes a carbon neutrality goal for the state of California by 2045; and sets a goal to maintain net negative emissions thereafter. The Executive Order directs the California Natural Resources Agency (CNRA), California Environmental Protection Agency (CalEPA), the Department of Food and Agriculture (CDFA), and CARB to include sequestration targets in the Natural and Working Lands Climate Change Implementation Plan consistent with the carbon neutrality goal.

Title 24 California Code of Regulations (CCR)

California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2022 California Green Building Code Standards that will be effective on January 1, 2023[2]. As construction of the Project is anticipated to be completed in 2025, it is presumed that the Project would be required to comply with the Title 24 standards in place at that time.

SCAQMD

SCAQMD is the agency responsible for air quality planning and regulation in the SCAB. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

In 2008, SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the SCAB. The Working Group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA GHG Significance Threshold, that could be applied by lead agencies. The working group has not provided additional guidance since release of the interim guidance in 2008. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the lead agency in adopting its own threshold. The current interim thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.
- Tier 2 consists of determining whether the project is consistent with a GHG reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project is less than significant:
    - Residential and commercial land use: 3,000 metric ton of CO_2 equivalent ($MTCO_2e/yr$)

[2] The 2022 California Green Building Standard Code will be published July 1, 2022.

  - Industrial land use: 10,000 $MTCO_2e/yr$
  - Based on land use type: residential: 3,500 $MTCO_2e/yr$; commercial: 1,400 $MTCO_2e/yr$; or mixed use: 3,000 $MTCO_2e/yr$
- Tier 4 has the following options:
  - Option 1: Reduce Business-as-Usual (BAU) emissions by a certain percentage; this percentage is currently undefined.
  - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
  - Option 3: 2020 target for service populations (SP), which includes residents and employees: 4.8 $MTCO_2e$ per SP per year for projects and 6.6 $MTCO_2e$ per SP per year for plans;
  - Option 3, 2035 target: 3.0 $MTCO_2e$ per SP per year for projects and 4.1 $MTCO_2e$ per SP per year for plans
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's interim thresholds used the Executive Order S-3-05-year 2050 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap CO_2 concentrations at 450 ppm, thus stabilizing global climate.

SCAQMD only has authority over GHG emissions from development projects that include air quality permits. At this time, it is unknown if the project would include stationary sources of emissions subject to SCAQMD permits. Notwithstanding, if the Project requires a stationary permit, it would be subject to the applicable SCAQMD regulations.

SCAQMD Regulation XXVII, adopted in 2009 includes the following rules:

- Rule 2700 defines terms and post global warming potentials.
- Rule 2701, Southern California (SoCal) Climate Solutions Exchange, establishes a voluntary program to encourage, quantify, and certify voluntary, high quality certified GHG emission reductions in the SCAQMD.
- Rule 2702, GHG Reduction Program created a program to produce GHG emission reductions within the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

SCAQMD is the agency responsible for air quality planning and regulation in the SCAB. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

GHG IMPACTS

Standards of Significance

According to the CEQA Guidelines Appendix G thresholds, to determine whether impacts from GHG emissions are significant. Would the project:

- **Threshold 1**: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- **Threshold 2**: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

The evaluation of an impact under CEQA requires measuring data from a project against both existing conditions and a "threshold of significance." For establishing significance thresholds, the Office of Planning and Research's amendments to the CEQA Guidelines Section 15064.7(c) state "[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

CEQA Guidelines Section 15064.4(a) further states, ". . . A lead agency shall have discretion to determine, in the context of a particular project, whether to: (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use . . .; or (2) Rely on a qualitative analysis or performance-based standards."

CEQA Guidelines Section 15064.4 provides that a lead agency should consider the following factors, among others, in assessing the significance of impacts from greenhouse gas emissions:

- **Consideration #1:** The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
- **Consideration #2:** Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- **Consideration #3:** The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable.

Discussion on Establishment of Significance Thresholds

Based on the foregoing guidance, the City of Menifee has elected to rely on compliance with a local air district threshold in the determination of significance of Project-related GHG emissions.

Specifically, the City has selected the interim 3,000 $MTCO_2e$ per year threshold recommended by SCAQMD staff for residential and commercial sector projects against which to compare Project-related GHG emissions.

The 3,000 $MTCO_2e$ per year threshold is based on a 90 percent emission "capture" rate methodology. Prior to its use by the SCAQMD, the 90 percent emissions capture approach was one of the options suggested by the California Air Pollution Control Officers Association (CAPCOA) in their CEQA & Climate Change white paper (2008). A 90 percent emission capture rate means that unmitigated GHG emissions from the top 90 percent of all GHG-producing projects within a geographic area – the SCAB in this instance – would be subject to a detailed analysis of potential environmental impacts from GHG emissions, while the bottom 10 percent of all GHG-producing projects would be excluded from detailed analysis. A GHG significance threshold based on a 90 percent emission capture rate is appropriate to address the long-term adverse impacts associated with global climate change because medium and large projects will be required to implement measures to reduce GHG emissions, while small projects, which are generally infill development projects that are not the focus of the State's GHG reduction targets, are allowed to proceed. Further, a 90 percent emission capture rate sets the emission threshold low enough to capture a substantial proportion of future development projects and demonstrate that cumulative emissions reductions are being achieved while setting the emission threshold high enough to exclude small projects that will, in aggregate, contribute approximate 1 percent of projected statewide GHG emissions in the Year 2050 (20).

In setting the threshold at 3,000 $MTCO_2e$ per year, SCAQMD researched a database of projects kept by the Governor's Office of Planning and Research (OPR). That database contained 798 projects, 87 of which were removed because they were very large projects and/or outliers that would skew emissions values too high, leaving 711 as the sample population to use in determining the 90th percentile capture rate. The SCAQMD analysis of the 711 projects within the sample population combined commercial, residential, and mixed-use projects. Emissions from each of these projects were calculated by SCAQMD to provide a consistent method of emissions calculations across the sample population and from projects within the sample population. In calculating the emissions, the SCAQMD analysis determined that the 90th percentile ranged between 2,983 to 3,143 $MTCO_2e$ per year. The SCAQMD set their significance threshold at the low-end value of the range when rounded to the nearest hundred tons of emissions (i.e., 3,000 $MTCO_2e$ per year) to define small projects that are considered less than significant and do not need to provide further analysis.

The City understands that the 3,000 $MTCO_2e$ per year threshold for residential/commercial uses was proposed by SCAQMD a decade ago and was adopted as an interim policy; however, no permanent, superseding policy or threshold has since been adopted. The 3,000 $MTCO_2e$ per year threshold was developed and recommended by SCAQMD, an expert agency, based on substantial evidence as provided in the Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (2008) document and subsequent Working Group meetings (latest of which occurred in 2010). SCAQMD has not withdrawn its support of the interim threshold and all documentation supporting the interim threshold remains on the SCAQMD website on a page that provides guidance to CEQA practitioners for air quality analysis (and where all SCAQMD significance thresholds for regional and local criteria pollutants and toxic air contaminants also are listed). Further, as stated by SCAQMD, this threshold "uses the Executive Order S-3-05 goal

[80 percent below 1990 levels by 2050] as the basis for deriving the screening level" and, thus, remains valid for use in 2022 (20). Lastly, this threshold has been used for hundreds, if not thousands of GHG analyses performed for projects located within the SCAQMD jurisdiction.

Thus, for purposes of analysis in this analysis, if Project-related GHG emissions do not exceed the 3,000 $MTCO_2e$ per year threshold, then Project-related GHG emissions would clearly have a less-than-significant impact pursuant to Threshold GHG-1. On the other hand, if Project-related GHG emissions exceed 3,000 $MTCO_2e$ per year, the Project would be considered a substantial source of GHG emissions.

GHG IMPACTS – CONSISTENCY WITH THRESHOLD NO. 1

Would the Project have the potential to generate direct or indirect GHG emissions that would result in a significant impact on the environment?

PROJECT GHG EMISSIONS

The estimated GHG emissions for the Project are summarized on Table 9. The estimated GHG emission include emissions from Carbon Dioxide (CO_2), Methane (CH_4), Nitrous Oxide (N_20), and Refrigerants (R). As shown on Table 9, the Project would generate a total of approximately 2,645.54 $MTCO_2e$/yr.

TABLE 9: TOTAL PROJECT GHG EMISSIONS

Source	Emission (lbs/day)				
	CO_2	CH_4	N_20	R	Total CO_2E
Annual construction-related emissions amortized over 30 years	40.71	1.33E-03	1.33E-03	3.43E-02	41.17
Mobile Source	1,931.00	0.09	0.10	3.32	1,965.00
Area Source	55.70	< 0.005	< 0.005	0.00	55.80
Energy Source	502.00	0.05	< 0.005	0.00	504.00
Water	13.60	0.32	0.01	0.00	23.90
Waste	15.80	1.58	0.00	0.00	55.40
Refrigerants	0.00	0.00	0.00	0.27	0.27
Total CO_2E (All Sources)	2,645.54				

A numerical threshold for determining the significance of GHG emissions in the SCAB has not been established by the SCAQMD for projects where it is not the lead agency. As an interim threshold based on guidance provided in the CAPCOA *CEQA and Climate Change* handbook, the City has opted to use a non-zero threshold approach based on Approach 2 of the handbook. Threshold 2.5 (Unit-Based Thresholds Based on Market Capture) establishes a numerical threshold based on capture of approximately 90% of emissions from future development. The latest threshold developed by SCAQMD using this method is 3,000 $MTCO_2e$/yr for all projects (21).

The Project would result in approximately 2,645.54 $MTCO_2e$/yr; the proposed Project would not exceed the SCAQMD's numeric threshold of 3,000 $MTCO_2e$/yr. Thus, the Project would result in a less than significant impact with respect to GHG emissions.

GHG IMPACTS – CONSISTENCY WITH THRESHOLD NO. 2

Would the Project have the potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs?

Pursuant to 15604.4 of the CEQA Guidelines, a lead agency may rely on qualitative analysis or performance-based standards to determine the significance of impacts from GHG emissions (22).

In November 2017, CARB released the Final 2017 Scoping Plan Update, which identifies the State's post-2020 reduction strategy. The Project would not conflict with any of the 2017 Scoping Plan elements as any regulations adopted would apply directly or indirectly to the Project. Further, recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40% below 1990 levels by 2030 (23). The Project would not conflict with any of the 2017 Scoping Plan elements. Further, recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40% below 1990 levels by 2030 (23).

Finally, the Project is consistent with the general plan land use designation, density, building intensity, and applicable policies specified for the Project area in SCAG's Sustainable Community Strategy/ Regional Transportation Plan, which pursuant to SB 375 calls for the integration of transportation, land-use and housing policies to plan for achievement of the GHG-emissions target for the region. Thus, a less than significant impact related to GHG emissions from Project construction and operation would occur and no mitigation is required.

PROJECT ENERGY ANALYSIS

Vehicle fuel efficiencies for light-duty-auto vehicles (LDA), light-duty-trucks (LDT1), and light-duty-trucks (LDT2) were estimated using information generated within the 2021 version of the EMFAC developed by the California Air Resources Board (CARB). EMFAC2021 is a mathematical model that was developed to calculate emission rates, fuel consumption, and VMT from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by CARB to project changes in future emissions from on-road mobile sources (9). EMFAC2021 was run for the LDA, LDT1, and LDT2 vehicle class within the California Riverside South-Coast sub-area for the 2023, 2024, and 2025 calendar year. Data from EMFAC2021 is shown in Attachment C.

CONSTRUCTION ENERGY DEMANDS

CONSTRUCTION EQUIPMENT ELECTRICITY USAGE ESTIMATES

The *2022 National Construction Estimator* identifies a typical power cost per 1,000 sf of construction per month of $2.41, which was used to calculate the Project's total construction power cost (24).

Based on Table 10, the total power cost of the on-site electricity usage during the construction of the Project is estimated to be approximately $46,479.78. As shown on Table 11, the total

electricity usage from on-site Project construction related activities is estimated to be approximately 352,868 kWh.

TABLE 10: PROJECT CONSTRUCTION POWER COST

Land Use	Power Cost (per 1,000 SF of building per month of construction)	Total Building Size (1,000 SF)	Construction Duration (months)	Project Construction Power Cost
Multi-Family Residential	$2.41	653.401	23	$36,218.03
Parking Lot	$2.41	185.130	23	$10,261.76
			TOTAL PROJECT CONSTRUCTION POWER COST	***$46,479.78***

TABLE 11: PROJECT CONSTRUCTION ELECTRICITY USAGE

Land Use	Cost per kWh[1]	Project Construction Electricity Usage (kWh)
Multi-Family Residential	$0.13	274,962
Parking Lot	$0.13	77,906
TOTAL PROJECT CONSTURCTION ELECTRICTY USAGE (kWh)		***352,868***

[1]Assumes the Project will be under the GS-1 General Service Rate under Southern California Edison

CONSTRUCTION EQUIPMENT FUEL ESTIMATES

As presented in Table 12, Project construction activities would consume an estimated 64,288 gallons of diesel fuel. Project construction would represent a "single-event" diesel fuel demand and would not require on-going or permanent commitment of diesel fuel resources for this purpose.

CONSTRUCTION WORKER FUEL ESTIMATES

With respect to estimated VMT, the construction worker trips would generate an estimated 1,400,265 VMT. Based on CalEEMod methodology, it is assumed that 50% of all vendor trips are from LDA, 25% are from LDT1, and 25% are from LDT2. Data regarding Project related construction worker trips were based on CalEEMod defaults for the land use type and project location which are also utilized within the air quality assessment and CalEEMod outputs contained herein.

As shown on Table 13, it is estimated that 51,307 gallons of fuel will be consumed related to construction worker trips during full construction of the proposed Project. Project construction worker trips would represent a "single-event" gasoline fuel demand and would not require on-going or permanent commitment of fuel resources for this purpose.

TABLE 12: PROJECT CONSTRUCTION EQUIPMENT FUEL CONSUMPTIONS ESTIMATES

Activity/Duration	Duration (Days)	Equipment	HP Rating	Quantity	Usage Hours	Load Factor	HP-hrs/day	Total Fuel Consumption (gal. diesel fuel)

						TOTAL CONSTRUCTION WORKER FUEL CONSUMPTION	***51,307***

CONSTRUCTION VENDOR/HAULING FUEL ESTIMATES

With respect to estimated VMT, the construction vendor trips would generate an estimated 96,084 VMT. It is assumed that 50% of all vendor trips are from medium-heavy duty trucks (MHDT) and 50% of vendor trips are from heavy-heavy duty trucks (HHDT). As shown on Table 14, it is estimated that 13,571 gallons of fuel will be consumed related to construction vendor trips (medium duty trucks) during full construction of the Project. Project construction vendor trips would represent a "single- event" diesel fuel demand and would not require on-going or permanent commitment of diesel fuel resources for this purpose.

TABLE 14: CONSTRUCTION VENDOR FUEL CONSUMPTION ESTIMATES (TRUCKS)

Year	Construction Activity	Duration (Days)	Worker Trips/Day	Trip Length (miles)	VMT	Average Vehicle Fuel Economy	Estimated Fuel Consumptio

CONSTRUCTION ENERGY DEMANDS SUMMARY

Construction equipment use of fuel would not be atypical for the type of construction proposed because there are no aspects of the Project's proposed construction process that are unusual or energy-intensive, and Project construction equipment would conform to the applicable CARB emissions standards, acting to promote equipment fuel efficiencies.

CCR Title 13, Title 13, Motor Vehicles, section 2449(d)(3) Idling, limits idling times of construction vehicles to no more than 5 minutes, thereby precluding unnecessary and wasteful consumption of fuel due to unproductive idling of construction equipment. Best Available Control Measures (BACMs) inform construction equipment operators of this requirement.

With regard to construction worker trips, the 2021 IEPR released by the CEC has shown that fuel efficiencies are getting better within on and off-road vehicle engines due to more stringent government requirements. As supported by the preceding discussions, Project construction energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

OPERATIONAL ENERGY DEMANDS

TRANSPORTATION ENERGY DEMANDS

Energy that would be consumed by Project-generated traffic is a function of total VMT and estimated vehicle fuel economies of vehicles accessing the Project site. The VMT per vehicle class can be determined by the vehicle fleet mix and the total VMT. As with worker and vendors trips, operational vehicle fuel efficiencies were estimated using information generated within EMFAC2021 developed by CARB (25). As summarized on Table 15 the Project will result in a 5,268,712 annual VMT and an estimated annual fuel consumption of 218,267 gallons of fuel.

OPERATIONAL ENERGY DEMANDS SUMMARY

The Project proposes conventional residential uses reflecting contemporary energy efficient/energy conserving designs and operational programs. The Project does not propose uses that are inherently energy intensive and the energy demands in total would be comparable to other residential land use projects of similar scale and configuration.

The Project will comply with the applicable Title 24 standards which will ensure that the Project energy demands would not be inefficient, wasteful, or otherwise unnecessary.

The Project would not cause or result in the need for additional energy producing or transmission facilities. The Project would not engage in wasteful or inefficient uses of energy and aims to achieve energy conservations goals within the State of California. As supported by the preceding analyses, Project operations would not result in the inefficient, wasteful, or unnecessary consumption of energy.

TABLE 15: PROJECT-GENERATED VEHICLE TRAFFIC ANNUAL FUEL CONSUMPTION

Vehicle Type	Average Vehicle Fuel Economy (mpg)	Annual VMT	Estimated Annual Fuel Consumption (gallons)
LDA	32.49	2,615,709	80,507
LDT1	25.14	205,851	8,188

MH	5.82	33,554	5,760
	TOTAL (ALL VEHICLES)	***5,268,712***	***218,267***

PROJECT ENERGY DEMANDS

As shown on Table 16, the Project operational energy demands are estimated to result in a 4,072,853 kBTU/year of natural gas; and 1,805,404 kWh/year of electricity. Natural gas would be supplied to the Project by Southern California Gas; electricity would be supplied by Southern California Edison.

TABLE 16: PROJECT ANNUAL OPERATIONAL ENERGY DEMAND SUMMARY

Land Use	Natural Gas Demand (kBTU/year)	Electricity Demand (kWh/year)
Multi-Family Residential	4,072,853	1,643,230
Parking Lot	0	162,174
TOTAL PROJECT ENERGY DEMAND	***4,072,853***	***1,805,404***

AIR QUALITY, GREENHOUSE GAS, ENERGY CONCLUSION

Results of the assessment indicate that the Project is not anticipated to result in a significant impact during construction or operational activities associated with air quality, greenhouse gas and energy and no mitigation is required.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	27.8	annual days of extreme heat
Extreme Precipitation	2.60	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.89	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack	N/A	N/A	N/A	N/A
Air Quality	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	91.1
AQ-PM	49.2
AQ-DPM	31.8
Drinking Water	10.2
Lead Risk Housing	16.1
Pesticides	27.2
Toxic Releases	23.1
Traffic	72.3
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	22.1
Haz Waste Facilities/Generators	23.7
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	42.3
Cardio-vascular	74.9

Low Birth Weights	9.85
Socioeconomic Factor Indicators	—
Education	58.9
Housing	12.8
Linguistic	7.38
Poverty	50.7
Unemployment	30.9

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	31.83626331
Employed	9.39304504
Median HI	19.47901963
Education	—
Bachelor's or higher	31.46413448
High school enrollment	100
Preschool enrollment	61.41408957
Transportation	—
Auto Access	91.71050943
Active commuting	43.93686642
Social	—
2-parent households	8.456306942
Voting	25.54856923
Neighborhood	—
Alcohol availability	85.78211215

Park access	2.194276915
Retail density	15.48825869

2016 Voting	40.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	27.0

Healthy Places Index Score for Project Location (b)	20.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Taken from site plan and project description
Construction: Construction Phases	Building construction schedule increased to account for 2025 Opening year
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases Standard 8-hour work days
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for all phases of construction
Operations: Vehicle Data	Taken from traffic analysis and ITE weekend rates
Operations: Hearths	Rule 445 no wood burning devices, Wood burning devices added to gas devices
Operations: Refrigerants	Beginning 1 January 2025, all new air conditioning equipment may not use refrigerants with a GWP of 750 or greater.

1.0 INTRODUCTION

This Phase I and Limited Phase II Environmental Site Assessment (ESA) is prepared for the review of three parcels (APN Nos. 333-070-018, 019, and 053) consisting of approximately 17.67 acres, located at East Heritage Lake Drive and Menifee Road in the City of Menifee, California. The ESA examines the existing environmental conditions upon, and in the vicinity of the subject site, and identifies any historical or current land use that may pose a Recognized Environmental Condition (REC)[1] affecting the use or continued use of the subject property. Refer to Figures 1 and 2 for a Regional Location Map and Vicinity Map/Aerial Photograph of the subject property.

The purpose of this Limited Phase I/II ESA is to assess historical uses that may have affected the subject site specifically relating to the presence or likely presence of a REC such as hazardous materials or petroleum products. This report includes any observed potential impacts to the site that may have altered the site's ecology, environment, or functional use. Visual observations and inquiry into public records are documented; no documents related to the placement of water pipelines, gas mains or other infrastructure were reviewed. This Limited Phase I/II ESA includes limited soil testing for the presence of pesticides and biosolids at the request of the client. No other testing of soil, air, water or any other matter was conducted as part of this Phase I ESA.

American Society for Testing and Materials (ASTM) Guidelines*:* This environmental assessment follows the guidelines established by the ASTM Standard Practice Manual for the *Phase I Environmental Site Assessment* process, *ASTM Designation E 1527-05*.

The objective of this ESA is to evaluate the subject site for current and historical sources of environmental concerns, evidence of hazardous substance disposal or releases from or onto the subject site, evidence of environmental threats from adjacent properties, and whether further environmental testing of the site is warranted. This report meets *ASTM Standards for ESA's*. To meet these objectives, Lilburn Corporation performed the following tasks:

- Reviewed available environmental reports.
- Reviewed historic land use records and files.
- Reviewed pertinent regulatory agency documents.
- Reviewed available current and historical aerial photographs of the site and adjacent properties.
- Performed a reconnaissance of adjacent and immediately surrounding properties.
- Performed an on-site reconnaissance of the property and collected limited soil samples.
- Obtained laboratory analysis of soil samples.
- Prepared this report.

Results of this Environmental Site Assessment for the site located in the City of Menifee, County of Riverside, California are presented in the following Sections 2.0 – 7.0.

[1] American Society for Testing and Materials defines a Recognized Environmental Condition as "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws.

2.0 SITE LOCATION

The subject site herein referred to as “site, subject site” or "property" is being evaluated at the request of 29th Street Capital. The property consists of three parcels totaling approximately 17.67 acres, located at the southwest corner of E. Heritage Lake Drive and Menifee Road in the City of Menifee, California. In 2014, a report was completed for the subject property and entitled *Phase I and Limited Phase II Environmental Site Assessment on Three Parcels Located Northeast of the Intersection of Junipero Road and McCall Boulevard, Menifee, CA.* That report concluded that based on the field reconnaissance of the site, a Phase I and limited Phase II site assessment was sufficient to evaluate the property in question and additional site investigations were not recommended. This 2022 report has been prepared to evaluate existing and historic site conditions.

The geographical location of the site is as follows:

COORDINATES

Latitude (North):	33.7240790 - 33° 43’ 26.68’’
Longitude (West):	117.1562410 - 117° 9’ 22.46’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	485524.7
UTM Y (Meters):	3731380.5
Elevation:	Approximately 1461 ft. above sea level
Assessor’s Parcel Numbers:	0333-070-018, 019, and 053

The subject site boundaries are within the U.S. Geological Survey (USGS) Topographic Map: Romoland 7.5-minute series, Section 23, T5S, R3W, San Bernardino Base and Meridian.

2.1 DESCRIPTION OF SURROUNDING AREA

The property is predominately surrounded by development. Land uses include Menifee Road, Junipero Road, E. Heritage Lake Drive, residential, institutional (elementary school), and vacant properties. East Heritage Lake Drive and single-family residential uses are located to the north, Menifee Road and single-family residential uses are on the east, Junipero Road and Boulder Ridge Elementary School are to the west, and the property to the south is currently being developed (end use could not be determined). The subject site contains no buildings or structures, but appears to be an active construction office for the development of the property to the south.

2.2 REVIEW OF HISTORIC PHOTOGRAPHS

Various governmental agencies including the USGS and local flood control agencies have systematically photographed land uses since the early 1920s. These historical photographs are utilized to assist in identifying historical uses of the subject and adjacent properties. Aerial photographs available that show the subject site and surrounding land uses were analyzed for the following years and corresponding scales:

1938: 1"=500'	*1953: 1"=500'*	*1967: 1"=500'*	*1978: 1"=500'*
1985: 1"=500'	*1997: 1"=500'*	*2006: 1"=500'*	*2012: 1"=500'*
2016: 1"=500'			

Appendix A contains the aerial photographs analyzed. The subject site was marked on each photograph to show an approximate location. The following is a summary of the photograph observations of land uses on-site and in the vicinity for the corresponding years when the photographs were taken.

- The 1938 aerial photograph shows the subject site being located in an undeveloped area with agricultural uses on and surrounding the subject property. A single-family structure and trees/landscaping is evident approximately ¼-mile north of the subject site.

- The 1953 aerial photograph shows that the subject property and surrounding area continues to be used for agriculture. Structures are evident approximately ¼-mile south of the subject site. There appears to be little development that has occurred within the immediate area of the site when compared to the 1938 aerial photograph.

- The 1967 aerial photograph shows a new east-west roadway located approximately ¼-mile south of the subject property (today known as McCall Boulevard), with additional structures appearing south of the new roadway. There is no discernable change to the subject site in the 1967 aerial photograph when compared to the 1953 aerial photograph. Property surrounding the subject site and the subject site itself remain vacant.

- The 1978 aerial photograph shows additional development occurring ¼- to ½-mile south of the subject property. No other significant changes from the 1967 aerial photograph are evident. Menifee Road appears to have been developed. No structures are located on the subject site or on the immediate surrounding properties.

- The 1985 aerial photograph shows little change from the 1978 aerial photograph. The subject property and surrounding area continue to be used for agriculture.

- The 1997 aerial photograph shows little change from the 1985 aerial photograph with some development occurring approximately ½-mile north of the subject property. The subject property and surrounding area continue to be used for agriculture.

- The 2006 aerial photograph shows construction occurring on the property directly to the west of the subject site (Boulder Ridge Middle School). Property directly south of the westernmost parcels appears to be being utilized as a stockpile for the middle school construction material/equipment. Property located east of the subject property across Menifee Road appears to have been graded, and single-family homes appear to have been developed approximately ¼-mile southeast of the subject site. The subject site appears to be unchanged from the 1997 aerial and remains vacant with only routing disking.

- The 2012 aerial photograph shows completion of a single-family home development to the east of the subject site. No other significant changes from the 2006 aerial photograph are evident. The subject site appears to be fallow.

- The 2016 aerial photograph shows no significant changes from the 2012 aerial photograph. The subject site appears unchanged.

None of the historical aerial photographs reviewed show any development on the subject property or development of railroad tracks or bridges on or adjacent to the subject property that would create a REC.

2.3 HISTORIC UNITED STATES GEOLOGICAL SURVEY (USGS) MAPS

Available historic and current USGS maps that include the subject site and surrounding area were reviewed for the following years:

1901: Elsinore Quadrangle; 30 Minute Series
1947: Murrieta Quadrangle; 15 Minute Series
1953: Romoland Quadrangle; 7.5 Minute Series
1973: Romoland Quadrangle 7.5 Minute Series
1979: Romoland Quadrangle; 7.5 Minute Series
2015: Romoland Quadrangle; 7.5 Minute Series
2018: Romoland Quadrangle; 7.5 Minute Series

The USGS has produced several national series of topographic maps which vary in scale and extent in the area going back to the early 1900's. The largest (both in terms of scale and quantity) and best-known topographic series is the 7.5-minute, 1:24,000 scale, and quadrangle. Each of these maps covers an area bounded by two lines of latitude and two lines of longitude spaced 7.5 minutes apart. These maps are utilized to assist in identifying historical uses of the subject and adjacent properties and identify power lines and other physical infrastructure that could affect the subject property or the surrounding area. Appendix B contains the topographic maps reviewed, and the approximate location of the subject site is identified on each map. The subject site is currently located on the Romoland USGS Quadrangle. A summary of the review of the maps are discussed herein.

- The 1901 Elsinore Quadrangle USGS map of the area show no specific streets or development in the immediate vicinity of the subject property however the map scale lacks detail relating to structures on or in the vicinity of the site. The map shows a rail line located approximately ½-mile north of the subject property.
- The 1947 USGS map of the area shows development of a street (Menifee Road) adjacent to the easternmost parcel of the subject property. No structures or development is evident within the immediate area of the project site.
- The 1953 USGS map of the area shows no structures or development within the immediate area of the project site.
- The 1973 USGS map of the area shows the development of roads and structures approximately ¼-mile south of the subject property. No structures or development is evident within the immediate area of the project site.
- The 1979 USGS map of the area shows relatively little change when compared to the 1973 USGS map. The subject property appears unchanged.
- The 2015 USGS map of the area shows the development of roads east of Menifee Road and south of McCall Boulevard. Development of Boulder Ridge Elementary School is shown. No structures or development is evident within the immediate area of the project site.

- The 2018 USGS map of the area shows relatively little change when compared to the 2015 USGS map. However, it shows a road bisecting the property. The subject site remains vacant and undeveloped.

None of the historic USGS maps reviewed show any development of railroad tracks, utility easements, or bridges on the subject property.

3.0 SITE VISIT

Summary: A site inspection was conducted on July 28, 2022. The subject property was active with construction equipment, portable construction offices, numerous shipping containers (aka, PODS), as well as stockpiles of various materials (earth, fines from grading, gravel, etc.). It appears these uses are supporting the development of the adjacent property to the south. No building foundations or remnants were observed on the subject property. No evidence of underground storage tanks, stained soils, electrical transformers, or seepage pits were present. High voltage power lines were observed along the eastern edge of the property adjacent to Menifee Road. Refer to Appendix C for photographs depicting the site and surrounding properties.

3.1 PROPERTY EVALUATION

On-Site Observations

Mr. Frank Amendola and Giang Ngo of Lilburn Corporation conducted a site survey/property evaluation on July 28, 2022. Table 1 presents a summary of the site survey/property evaluation.

Table 1
Summary of Site Reconnaissance

Observed on-site?	Yes	No
Existing structures		●
Power line towers	●	
Evidence of past uses (foundations, debris, roads)		●
Hazardous substances and/or petroleum products (including containers)		●
Aboveground storage tanks (ASTs) or evidence of ASTs		●
Underground storage tanks (USTs) or evidence of USTs		●
Strong, pungent, or noxious odors		●
Pools of liquid likely to be hazardous materials or petroleum products		●
55-gallon drums		●
Unidentified substance containers		●
PCB-containing equipment		●
Subsurface hydraulic equipment		●
Stains or corrosion on floors, walls, or ceilings		●
Floor drains and sumps		●
Pits, ponds, or lagoons		●
Stained soil and/or pavement		●
Stressed vegetation		●
Waste or wastewater discharges to surface or surface waters on subject site (including stormwater)		●
Wells (irrigation, domestic, dry, injection, abandoned, monitoring)		●
Septic systems		●

Access to property was from Menifee Road and was unrestricted. However, the property was fenced along Junipero Road and E. Heritage Lake Drive. Portions of the property to the west

were being used as a construction staging area for the development of the adjacent property to the south. Numerous shipping containers were evident as well as stockpiles of earth and fines from grading. The eastern portion of the property was vacant and clear of construction uses. Refer to Appendix C for photographs of various views of the subject site and surrounding properties.

No permanent structures or remnants of foundations were observed during the site visit. No discoloration of soils was evident and no remnants of underground storage tanks were observed during the visual site inspection. Although high voltage power lines are present on the eastern portion of the subject property along Menifee Road, there were no electrical transformers observed. Signage adjacent to Menifee Road near the site indicates the presence of underground high pressure gas lines.

Surrounding Land Uses

A summary description of surrounding land uses follows:

West Land Uses
Land uses to the west of the subject property consist of Junipero Road and Boulder Ridge Elementary School.

South Land Uses
Land uses to the south of the subject property include undeveloped property. However, it was being developed at the time of the site visit. A construction fence was evident.

North Land Uses
Land uses north of the subject property consist of E. Heritage Lake Drive and single-family homes.

East Land Uses
Land uses east of the subject property consist of Menifee Road and single-family homes.

3.2 PROPERTY OWNER/AGENT INTTERVIEWS

No interviews with the current landowner as no one was available that was familiar with prior uses.

4.0 LIMITED SOIL SAMPLING AND ANALYSIS

Summary: Laboratory results of four soil samples collected did not indicate any issues of concern related to any residual pesticides or biosolids. Appendix D includes the Limited Subsurface Investigative Report and Laboratory testing results, which are summarized below.

4.1 PESTICIDE AND BIOSOLID SOIL SAMPLE LOCATIONS AND PROCEDURES

Samples were collected from depths of 6 inches below grade (18 samples), with the aid of a hand auger. Prior to sampling and between samples, reusable drilling and sampling equipment was cleaned using an Alconox wash and two potable water rinses prior to the beginning of the project and before collecting each soil sample to ensure that cross-contamination of samples did not occur. The sample packaging consisted of placing the soil directly into laboratory provided containers. The field crew used new nitrile gloves for each sample collection to prevent cross contamination. The samples were labeled, sealed, recorded on chain-of-custody forms and stored in a chilled ice chest pending delivery to the laboratory.

4.2 LABORATORY ANALYSIS

The laboratory composited the discrete samples at a 3:1 ratio for laboratory analysis. The soil samples and completed chain-of-custody forms were relinquished to SunStar Laboratories Inc., in Lake Forest, California, a State-of-California certified laboratory for analysis.

4.3 ANALYTICAL RESULTS

All analytical results for organochlorine pesticides in the four samples were non-detect, indicating the soil is not impacted by organochlorine pesticides.

The findings were as follows:

- No indications of staining or significant impacts based on field observations.
- Soil analysis for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits.
- IDW was not generated for this investigation.
- Groundwater was not encountered to the total depth of 0.5 feet bgs.

Based on the field observations and laboratory data, evidence of significant impairment was not identified in the areas accessible and investigated, and at the time the investigation was conducted. Concentrations of detected analytes were below applicable residential and commercial screening levels.

Based on the soil testing conducted, there is no indication of a REC due to potential biosolid application to the subject property. Refer to Appendix D for the comprehensive soil analysis results, prepared by Terracon.

5.0 GEOLOGY AND HYDROGEOLOGY

Summary: No geologic or hydrogeologic concerns were encountered during the site visit, which would be considered "an impairment" to the use of the subject site or a REC. According to the Environmental Data Resources, Inc. (EDR) report the project site is not within the 100-year or 500-year flood plain. Refer to Appendix E for the EDR Report.

5.1 GEOLOGY

Topography

The topography of the subject site is relatively flat and varies little from north to south. The subject site is at an elevation of approximately 1461 feet above mean sea level (amsl). The subject property generally falls from south to north and should not create concerns regarding landslides, erosion, or ground failure. Therefore, development of the site is not anticipated to be impaired.

Seismic Fault Systems

According to the Southern California Earthquake Data Center (www.data.scec.org), several fault systems are located within relatively close proximity to the subject site. The subject site lies on the western edge of the San Jacinto Fault Zone that is capable of producing a maximum credible earthquake magnitude (M_w) of 6.5-7.5. The most recent surface rupture was on April 9, 1968.

Earthquakes, due to their ground acceleration and shifting, can cause major damage to buildings and create dangerous hazards to people through injury or death. Development projects in the seismically-active southern California region must mitigate these potential hazards through strict adherence to the California Building Code (CBC) and implementing recommendations from geotechnical engineers.

5.2 REGIONAL HYDROLOGY AND GROUNDWATER

FEMA Flood Zone Mapping

According to the Environmental Data Resources, Inc. (EDR) report included as Appendix E, the project site is located within Flood Plain Panel 06065C and is not within the 100-year or 500-year flood plain.

Groundwater/Well Data

The EDR report identifies 16 wells located with a 1-mile radius of the subject property, none of which are located within a 1/8-mile radius. All of the wells within the 1-mile radius are either cross-gradient or down-gradient from the subject property.

6.0 LOCAL AGENCY REVIEW

Summary: The County of Riverside Department of Environmental Health-Hazardous Materials Division was contacted as part of the EDR records search. As of August 8, 2022, the records request is pending. Other records reviewed include County of Riverside Building Department, Sanborn Fire Insurance maps, City of Menifee-Planning Division, and local RADON reporting data.

Various local (County) agencies maintain databases or records which are useful for evaluating the history of a property, and which may provide indications pertaining to the past uses of the property and any potential environmental concerns. For the purposes of this ESA, records reviewed are presented below.

- County of Riverside Environmental Health Division, Hazardous Material Department
- County of Riverside Building Department
- City of Menifee Planning Division
- Sanborn Fire Insurance Mapping

County of Riverside Building Department

A review of the County of Riverside Building Department records for building permits issued on the subject property were as follows: On November 2, 2004, a grading permit was issued on the Subject Site for a grading stockpile. The permit description included the following language: Import Stockpile For TR31457. The permit is no longer active.

County of Riverside Environmental Health Department, Hazardous Material Division

The County of Riverside Department of Environmental Health, Hazardous Materials Division was contacted for a hazard's records search. As of August 8, 2022, the records request finding continues to be pending.

City of Menifee Planning Division

The City of Menifee Planning Division was contacted. No planning records were found on the subject site.

Sanborn Fire Insurance Mapping

The Sanborn Maps were originally created for assessing fire insurance liability in urbanized areas in the United States. No Sanborn maps covering the subject property were available for review.

Area Radon Information

No testing for radon was performed as part of this ESA, however a review of available information for the subject area (zip code 92585), revealed that six (6) tests for radon gas within structures have been performed in the area and none of the tests performed indicated radon levels within the structures in excess of 4 pCi/L[2] (Picocuries Per Liter).

[2] 4 pCi/L is the EPA lower action limit for habitable structures. Levels in excess of 4 pCi/L typically require remediation.

7.0 REGULATORY REVIEW

Summary: A review of Federal and State environmental databases revealed no environmental concerns or issues directly related to the site, which would be considered "an impairment" or REC. However, the review of the EDR records search revealed several sites of potential concern within the vicinity. These sites appear to be in compliance with applicable hazardous waste regulations as they are either a permitted operation, actively in remedial work, or remedial work has been completed. These sites are not anticipated to impact the subject property as they are located either a greater distance than would warrant establishment of a REC or are cross-gradient or down-gradient of the subject site and applicable water flow. Refer to Appendix E for additional information.

The State of California and various federal government agencies investigate and/or track numerous environmental concerns on a regional basis. For the purposes of this ESA, the following agency records were reviewed for a one-mile radius of the subject property.

FEDERAL RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites
Source: EPA
Telephone: N/A
This database includes site proposed for listing in the NPL database.

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establish the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or

when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-412-9810
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by States, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS includes sites that are either proposed for or on the National Priorities List (NPL), and sites that are in the screening and assessment phase for possible inclusion on the NPL.

CERCLIS - NFRAP: No Further Remedial Action Planned
Source: EPA
Telephone: 703-412-9810
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, States, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

LIENS 2: CERCLA Lien Information
Source: EPA
Telephone: 202-564-6023
Database provides information as the identity of sites and properties that have used Superfund funds.

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

RCRA: Resource Conservation and Recovery Act Information
Source: EPA
Telephone: 415-495-8895
RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as

defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kg of hazardous waste, or over 1kg of actual hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US ENG CONTROLS: Engineering Controls Sites List
Source: Environmental Protection Agency
Telephone: 703-603-8905
A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

US INST CONTROL: Sites with Institutional Controls
Source: Environmental Protection Agency
Telephone: 703-603-8905
A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-267-2180
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

DOT OPS: Incident and Accident Data
Source: Department of Transportation, Office of Pipeline Safety
Telephone: 202-366-4595
Pipeline safety and incident report database.

CDL: Clandestine Drug Labs
Source: Department of Toxic Substances Control
Telephone: 916-255-6504
A listing of drug lab locations. Listing of a location in this database does not indicate that any illegal drug lab materials were or were not present there, and does not constitute a determination that the location either requires or does not require additional cleanup work.

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

DOD: Department of Defense Sites
Source: USGS
Telephone: 703-692-8801
This data sets consists of federally owned or administered lands, administered by the Department of Defense, that have any equal to or greater than 640 acre of the United States, Puerto Rico, and the U.S. Virgin islands.

FUDS: Formerly Used Defense Sites
Source: U.S. Army Corps of Engineers
Telephone: 202-528-4285
The listing includes locations of Formerly Used Defense Sites properties where the US Army Corps of Engineers is actively working or will take necessary cleanup actions.

LUCIS: Land Use Control Information System
Source: Department of the Navy
Telephone: 843-820-7326
Database contains records of land use control information pertaining to the former Navy Base Realignment and Closure properties.

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters. Date of Government Version.

ROD: Records of Decision
Source: NTIS
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at a NPL (Superfund) site containing technical and health information to aid in the cleanup.

UMTRA: Uranium Mill Tailings sites
Source: Department of Energy
Telephone: 505-845-0011
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

ODI: Open Dump Inventory
Source: Environmental Protection Agency
Telephone: 800-424-9346
An open dump is defined as a disposal facility that does not comply with one or more of the Part 257 or Part 258 Subtitle D Criteria.

DEBRIS REGION 9: Torres Martinez Reservation Illegal Dump Site Locations
Source: EPA
Telephone: 415-972-3336
A listing of illegal dump sites located on the Torres Martinez Indian Reservation located in eastern Riverside County and northern Imperial County, California.

MINES: Mines Master Index File
Source: Department of Labor, Mine Safety and Health Administration
Telephone: 303-231-5959

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-566-0250
Toxic Release Inventory System. TRIS identifies facilities that release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

FTTS: FIFRA/TSCA Tracking System – FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act)/TSCA(Toxic Substance Control Act)
Source: EPA
Telephone: 202-566-1667
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

FTTS INSP: FIFRA/TSCA Tracking System – FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act)/TSCA(Toxic Substance Control Act)
Source: EPA
Telephone: 202-564-1667

HIST FTTS: FIFRA/TSCA Tracking System Administration Case Listing
Source: EPA
Telephone: 202-564-2501
Database tracks establishments that generate pesticide use within the course of the calendar year.

SSTS: Section & Tracking System
Source: EPA
Telephone: 202-564-4203
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

ICIS: Integrated Compliance Information System
Source: EPA
Telephone: 202-564-5088
The Integrated Compliance Information System (ICIS) supports the information needs of the national enforcement and compliance program as well as the unique needs of the National Pollutant Discharge Elimination System (NPDES) program.

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-566-0500
PCB Activity Database. PADS Identifies generators, transporters, commercial stores and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements.

RADINFO: Radiation Information Database
Source: EPA
Telephone; 202-343-9775
Contains information about facilities that are regulated by U.S. EPA regulations for radiation and radioactivility.

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: 415-947-8000
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA retains a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

STATE AND LOCAL RECORDS:

HIST CAL-SITES: Calsites Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database. No longer updated by the state agency. It has been replaced by ENVIROSTOR.

SCH: School Property Evaluation Program
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the Cal Sites category depending on the level of threat to public health and safety or the environment they pose.

TOXIC PITS: Toxic Pits Cleanup Act Sites
Source: State Water Resources Control Board
Telephone: 916-227-4364
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

SWF/LF (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-341-6320
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 2004 criteria for solid waste landfills or disposal sites.

WMUDS/SWAT: Waste Management Unit Database
Source: State Water Resources Control Board
Telephone: 916-227-4448
Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

CA WDS: Waste Discharge system
Source: State Water Resources Control Board
Telephone: 916-341-5227
Sites that have been issued waste discharge requirements.

CORTESE: "Cortese" Hazardous Waste & Substance Sites List
Source: CAL EPA/Office of Emergency Information
Telephone: 916-323-3400
The sites for the list are designated by the State Water Resources Control Board (LUST), the Integrated Waste Management Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

SWRCY: Recycler Database
Source: Department of Conservation
Telephone: 916-323-3836
A listing of recycling facilities in California.

LUST: Geotracker's Leaking Underground Fuel Tank Report
Source: State Water Resources Control Board
Telephone: Per Region
Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

CA FID UST: Facility Inventory Database
Source: California Environmental Protection Agency
Telephone: 916-341-5851
The facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resources Control Board.

SLIC: Statewide SLIC Cases
Source: State Water Resources Control Board
Telephone: 886-480-1028
The Spills, Leaks, Investigations, and Cleanups (SLIC) listings includes unauthorized discharges from spills and leaks, other than from underground storage tanks or other regulated sites.

UST: Active UST Facilities
Source: State Water Resources Control Board
Telephone: 916-480-1028
Active UST facilities gathered from the local regulatory agencies.

UST MENDOCINO: Mendocino County UST Database
Source: Department of Public Health
Telephone: 707-463-4466
A list of underground storage tanks in Mendocino County.

HIST UST: Hazardous Materials Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-341-5851
The Hazardous Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

AST: Aboveground Petroleum Storage Tank Facilities
Source: State Water Resources Control Board
Telephone: 916-341-5712
Registered Aboveground Storage Tanks.

LIENS: Environmental Liens Listing
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
A listing of property locations with environmental liens for California where DTSC is a lien holder.

SWEEPS UST: SWEEPS UST Listing
Source: State Water Resources Control Board
Telephone: N/A
Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1980s? The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-845-8400
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

NOTIFY 65: Proposition 65 Records
Source: State Water Resources Control Board
Telephone: 916-445-3846
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

DEED: List of Deed Restrictions
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes.

VCP: Voluntary Cleanup Program Properties
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

DRY CLEANERS: Cleaner Facilities
Source: Department of Toxic Substances Control
Telephone: 916-327-4498
A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial, garment pressing and cleaner's agents, linen supply, coin-operated laundries and cleaning, drycleaning plants, except rugs, carpet and upholstery cleaning, industrial launders, laundry and garment services.

WIP: Well Investigation Program Case List
Source: Los Angeles Water Quality Control Board
Telephone: 213-576-6726
Well investigation program case in the San Gabriel and San Fernando Valley area.

CDL: Clandestine Drug Labs
Source: Drug Enforcement Administration
Telephone: 202-307-1000
Database provides a listing of clandestine drug lab locations.

RESPONSE: State Response Sites
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

HAZNET: Hazardous Waste Information System
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the Department of Toxic Substances Control (DTSC). The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EMI: Emissions Inventory Data
Source: California Air Resources Board
Telephone: 916-322-2990
Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies.

HAULERS: Registered Waste Tire Haulers Listing
Source: Integrated Waste Management Board
Telephone: 916-341-6422
A listing of registered waste tire haulers.

ENVIROSTOR: EnviroStor Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides

additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

HISTORICAL AND OTHER DATABASE(S)

Depending on the geographic area covered by the EDR Report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included.

Other Databases

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include

gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

EDR Historical Cleaners: EDR Proprietary Historic Dry Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc.

7.1 TARGET PROPERTY SEARCH RESULTS

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR) and reviewed a part of this ESA. The EDR database report meets the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) for the evaluation of environmental risk associated with a parcel of real estate. The subject property was not identified on any of the databases searched.

7.2 SURROUNDING SITES SEARCH RESULTS

EDR was utilized to conduct a search of environmental databases within a 1-mile radius of the subject site to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) for the evaluation of environmental risk associated with a parcel of real estate. Identified properties that are down-gradient of the subject site are not listed herein. Additionally, some identified properties are listed on multiple databases and have been excluded from the duplicative databases herein. Refer to Appendix E for the EDR Report.

STANDARD ENVIRONMENTAL RECORDS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database include: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. A review of the ENVIROSTOR list has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Menifee Valley Ranch School	McCall Blvd Menifee Street	SE 0 – 1/8	1	8
McCall Mesa K-8 School	McCall Blvd Junipero	SW 0-1/8	2	11

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Elementary School #1	Chambers Avenue	WSW ½-1	3	14
Proposed Elementary	Rouse Road	W ½-1	4	17

This category contains proposed and existing school sites that were being evaluated by DTSC for possible hazardous materials contamination. The investigations did not reveal any contamination at the sites that would be considered a REC and no further action was required. This listing does not represent a release of hazardous are therefore the sites are not considered a REC.

Orphan Sites: These are sites that cannot be mapped because of poor or inadequate information relating to the location of the site in relation to the subject site. Further information was not obtained for these sites.

Based on the information obtained from the EDR report, all of the sites could be eliminated as potential locations of environmental concern to the subject site as they are located greater than one mile from the project site or are a permitted (permit issued to operate) local/State/federal operation.

7.3 VAPOR ENCROACHMENT

The purpose of the preliminary vapor encroachment screen is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of vapor chemicals of concern (COC) in subsurface soils at the site caused by the release of volatile organic compounds from contaminated soils or groundwater either on or near the site. The potential for VECs beneath the site was evaluated using EDR's Vapor Encroachment Screen in accordance with ASTM E 2600-10 Standard Guide for Vapor Encroachment Screening. The evaluation included performing a Search Distance Test to identify if there are any known or potential contaminated properties surrounding or up gradient of the site within specific search radii, a COC test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COCs are likely to be present, and a Critical Distance Test to evaluate whether or not COCs in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum hydrocarbon contaminants and 30 feet for petroleum hydrocarbons contaminants).

A review of the Vapor Encroachment Screen, as provided by EDR, and dated June 10, 2022 has revealed two COC site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Menifee Valley Ranch School	McCall Blvd Menifee Street	SE 1/10 – 1/3	1	8
McCall Mesa K-8 School	McCall Blvd Junipero	SSW 1/10-1/3	2	11

These sites are not anticipated to present any environmental impact to the subject property as the listing herein is a required reporting of their operations and not a violation of local, state, or federal regulations. Refer to Appendix E-1 for Vapor Encroachment Screen Report.

8.0 CONCLUSION

Summary: The review of the EDR records search revealed no sites of concern within the vicinity of the subject property that could represent a REC.

Based on a visual inspection of the subject site and the surrounding area; an environmental records search and review of local, federal, and State databases; and in accordance with the limitations presented in this report, Lilburn Corporation presents the following conclusions concerning the subject site:

- No evidence was observed that the property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility. Additionally no evidence was observed that there have been any previously damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals individually stored on or used at the property or at the subject site. No industrial drums (typically 55 gal (208 L)) or sacks of chemicals were observed on the property.
- No evidence that fill dirt has been brought onto the property that originated from a contaminated site or from an unknown origin was observed. Refer to Section 4.0 for soil sampling findings.
- No pits, ponds, or lagoons were observed on the property in connection with waste treatment or waste disposal.
- No signs or evidence or of stained soil were observed on the property.
- No evidence was observed of any registered or unregistered storage tanks (above or underground) located on the property and no observations of any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property were made.
- No indication or evidence of leaks, spills, or staining by substances other than water, or foul odors, associated with any flooring drains, walls, ceilings or exposed grounds on the property was observed.
- No observations were made of evidence that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been buried and/or burned on the property.
- No transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs was observed.
- No evidence was observed indicating any adjoining property was used as a gasoline station, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility.

- Local records reviewed to date have not revealed environmental concerns or issues that would be considered an immediate impairment to property development (pending San Bernardino County Fire Department findings).
- No geologic or hydrogeologic impairments to the subject site were encountered.
- Federal and State environmental databases revealed no environmental issues, which would be considered "an impairment" or REC to the subject site. Refer to Appendix E for a copy of the EDR Reports.

Based on the field reconnaissance of the site a Phase I and limited Phase II site assessment is sufficient to evaluate the property in question and additional site investigations are not recommended.

CERTIFICATION

I, Frank Amendola, certify and agree that:

(1) The inspector has no present or contemplated future interest in the site inspected.

(2) The inspector has no personal interest in or bias with respect to the subject matter of the assessment report or the participants to the sale. This Site Assessment Report is not based in whole or in part upon the race, color, or national origin of the prospective owners or occupants of the site inspected, or upon the race, color or national origin of the present owners or occupants of the properties in the vicinity of the site inspected.

(3) The inspector has personally inspected the site and has made an exterior inspection of all adjacent properties identified in the report. To the best of the inspector's knowledge and belief, all statements and information in this Site Assessment Report are true and correct, and the inspector has not knowingly withheld any significant information.

(4) The legal description and address furnished is correct according to the information furnished to the inspector.

(5) This Site Assessment Report was prepared in conformity with and is subject to the requirements of the Code of Professional Ethics and Standards of Professional Conduct of the environmental organizations with which the inspector is affiliated.

(6) All conclusions and opinions concerning the subject site that are set forth in the Site Assessment Report were prepared by the inspector whose signature appears below.

(7) I declare that to the best of my professional knowledge and belief, I meet the definition of an Environmental Professional as defined in ASTM E 1527-05 and 40 CFR 312.10. I have the specific qualification based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquiries in conformance with the standard and practices set forth in 40 CFR Part 312.

Prepared By:

Frank Amendola

QUALIFICATIONS STATEMENT

Lilburn Corporation is a full service environmental consulting company with extensive experience in the completion of Phase I ESAs having completed more than 50 ESAs since 1999. Lilburn staff responsible for preparation of Phase I ESAs (including this document) have extensive experience in completing Phase I ESAs in accordance with the current American Society of Testing and Materials standard practice document (ASTM E 1527-05). The resumes of the individual environmental professionals responsible for the completion of this Phase I ESA are included in Appendix F.

This Phase I ESA was completed under the direction of an "Environmental Professional" as defined in ASTM E 1527-005 and 40 CFR 312.10. The Environmental Professional was involved in the planning of the site reconnaissance and the interviews as well as the review and preparation of the report.

LIMITATIONS

The services described in this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. Not laboratory testing was performed in conjunction with this report. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, nor the use of segregated portions of this report.

The purpose of an environmental assessment is to reasonably evaluate the potential for or actual impact of past practices on a given site area. In performing an environmental assessment, it is understood that a balance must be struck between a reasonable inquiry into the environmental issues and an exhaustive analysis of each conceivable issue of potential concern. The following paragraphs discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to exclude the presence of hazardous materials at a given site. If hazardous conditions have not been identified during the assessment, such a finding should not therefore be construed as a guarantee of the absence of such materials on the site, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

Environmental conditions may exist at the site that cannot be identified by visual observation. Where subsurface work was performed, our professional opinions are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions at unsampled locations.

Except where there is express concern of our client, or where specific environmental contaminants have been previously reported by others, naturally occurring toxic substances, potential environmental contaminants inside buildings, or contaminant concentrations that are not of current environmental concern may not be reflected in this document.

Terracon Project No. 60227232

Dear Ms. Tubbs:

Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed Limited Site Investigation report for the above referenced site. This assessment was performed in general accordance with Terracon's Proposal for Limited Site Investigation, dated June 8, 2022, and Terracon's Agreement for Services, executed June 9, 2022.

We appreciate the opportunity to perform these services for Lilburn Corporation . Please contact the undersigned at (949) 864-2078 if you have questions regarding the information provided in the report.

Sincerely,
Terracon Consultants, Inc.

MENIFEE DEVELOPMENT
NORTHEAST INTERSECTION OF JUNIPERO ROAD AND MCCALL BOULEVARD
MENIFEE, RIVERSIDE COUNTY, CALIFORNIA
Terracon Project No. 60227232
July 18, 2022

1.0 INTRODUCTION

1.1 Site Description

Site Name	Menifee Development
Site Location/Address	Northeast Intersection of Junipero Road and McCall Boulevard, Menifee, Riverside County, California
General Site Description	The property is identified as the Menifee development located northeast of the intersection of Junipero Road and McCall Boulevard in Menifee, Riverside County, California. Terracon understands that the site consists of approximately 17.67-acres of undeveloped land that was previously utilized for agricultural practices.

A topographic map and site diagram are included as **Exhibits 1** and **2** of **Appendix A**, respectively.

1.2 Scope of Work

Terracon conducted a Limited Site Investigation (LSI) at the site, northeast of the intersection of Junipero Road and McCall Boulevard in Menifee, Riverside County, California (the site). The scope of services was conducted to assess potential environmental impacts that may be present as a result of the below-listed recognized environmental conditions (RECs) and/or site concerns. Please note that Terracon did not conduct a Phase I Environmental Site Assessment (ESA) of the property, and that the scope of services was based solely on information provided in Lilburn Corporation's Phase I Environmental Site Assessment and Limited Phase II ESA dated December 2014, and additional information provided by the client.

REC/Site Concern	Description
Former agricultural use	Potential for improper use and/or application of pesticides and herbicides associated with the former agricultural uses.

The objective of the LSI was to assess the presence of chemicals commonly associated with the identified RECs and/or site concerns at concentrations above laboratory reporting limits in the on-site soil. Based on the surficial nature of the identified REC, groundwater and soil vapor sampling were not included in the proposed scope.

1.3 Standard of Care

Terracon's services were performed in a manner consistent with generally accepted practices of the profession undertaken in similar studies in the same geographical area during the same time period. Terracon makes no warranties, either express or implied, regarding the findings, conclusions, or recommendations. Please note that Terracon does not warrant the work of laboratories, regulatory agencies, or other third parties supplying information used in the preparation of the report. These LSI services were performed in accordance with the scope of work agreed with you, our client, as reflected in our proposal and were not restricted by ASTM E1903-19.

1.4 Additional Scope Limitations

Findings, conclusions, and recommendations resulting from these services are based upon information derived from the on-site activities and other services performed under this scope of work; such information is subject to change over time. Certain indicators of the presence of hazardous substances, petroleum products, or other constituents may have been latent, inaccessible, unobservable, nondetectable, or not present during these services, and we cannot represent that the site contains no hazardous substances, toxic materials, petroleum products, or other latent conditions beyond those identified during this LSI. Subsurface conditions may vary from those encountered at specific borings or wells or during other surveys, tests, assessments, investigations, or exploratory services; the data, interpretations, findings, and our recommendations are based solely upon data obtained at the time and within the scope of these services.

1.5 Reliance

This report has been prepared for the exclusive use of and reliance of Lilburn Corporation. Use or reliance by any other parties (except a governmental entity having jurisdiction over the site) is prohibited without the express written authorization of and reliance of Lilburn Corporation and Terracon. Any unauthorized distribution or reuse is at and reliance of Lilburn Corporation's sole risk. Notwithstanding the foregoing, reliance by authorized parties will be subject to the terms, conditions, and limitations stated in the proposal, LSI report, and Terracon's Terms and Conditions. The limitation of liability defined in the terms and conditions is the aggregate limit of Terracon's liability to and reliance of Lilburn Corporation unless otherwise agreed in writing.

2.0 FIELD ACTIVITIES

Terracon's field activities were conducted on June 17, 2022, by a staff geologist with oversight by a California-licensed Professional Geologist (P.G.) with Terracon. A site-specific health and safety plan was utilized by Terracon during field activities for all phases of this assessment.

2.1 Soil Borings and Soil Sampling

On June 17, 2022, Terracon advanced eighteen (18) shallow soil borings using a hand-auger to 0.5 feet below ground surface (bgs). The discrete samples were then composited by the laboratory at a ratio of 3:1, for a total of six (6) analytical samples. The approximate boring locations are shown on **Exhibit 2** of **Appendix A** and are summarized below.

advanced fourteen (14) shallow soil borings (B-1 through B-14) using a hand-auger to 0.5 feet below ground surface (bgs). The approximate boring locations are shown on **Exhibit 2** of **Appendix A** and are summarized below.

Table 2.1 – Soil Boring Summary

Sample ID	Composite Sample ID	Total Depth (feet bgs)	Soil Sample Depth* (feet bgs)	Sample Type	Assessment Area/REC
S-1A	COMP 3:1 (S-1A – S-1C)	0.5	0.5	Grab	Former agricultural use
S-1B					
S-1C					
S-2A	COMP 3:1 (S-2A – S-2C)	0.5	0.5	Grab	Former agricultural use
S-2B					
S-2C					
S-3A	COMP 3:1 (S-3A – S-3C)	0.5	0.5	Grab	Former agricultural use

S-6A	COMP 3:1 (S-6A – S-6C)	0.5	0.5	Grab	Former agricultural use
S-6B					
S-6C					

*Sample depths selected for analytical testing.

Terracon collected soil samples from the soil borings to observe soil lithology, color, moisture content, and staining, if present. The soils encountered generally consisted of dry to damp silty sand and sand to the maximum depth of exploration of 0.5 feet bgs. Indications of staining were not observed.

Terracon's soil sampling program included the collection of one soil sample from each boring. Terracon collected grab soil samples from the barrel of the hand-auger. Samples were retrieved from the sampler and placed in laboratory provided containers. The field crew used new nitrile gloves for each sample collection to prevent cross contamination. The samples were labeled, sealed, recorded on chain-of-custody forms and stored in a chilled ice chest pending delivery to the laboratory.

Reusable drilling and sampling equipment was cleaned using an Alconox® wash and two potable water rinses prior to the beginning of the project and before collecting each soil sample. Investigation derived waste (IDW) was not generated during this investigation.

3.0 LABORATORY ANALYTICAL METHODS

3.1 Soil

A total of eighteen (18) discrete soil samples were collected. The laboratory composited the discrete samples at a 3:1 ratio for laboratory analysis. The soil samples and completed chain-of-custody forms were relinquished to SunStar Laboratories Inc., in Lake Forest, California, a State-of-California certified laboratory for analysis. The selected soil samples were analyzed using standard Environmental Protection Agency (EPA) methods and included:

- organochlorine pesticides (OCPs) by EPA 8081A; and,
- arsenic by EPA 6010B.

4.0 DATA EVALUATION

Terracon screened the analytical data using the current residential and commercial Environmental Screening Levels (ESLs) published by San Francisco Bay Regional Water Quality Control Board (2019, Rev. 2). Arsenic data was additionally evaluated using California Department of Toxic Substances Control (DTSC), Determination of a Southern California Regional Background Arsenic Concentration in Soil. The detection of an analyte at a concentration above a screening level does not necessarily indicate an adverse impact to human health or the environment; however, an exceedance of a screening level may indicate that additional investigation is warranted.

4.1 Soil Analytical Results – OCPs and Arsenic

The soil analytical results for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits, as summarized below.

Table 4.1 – Analytical Summary

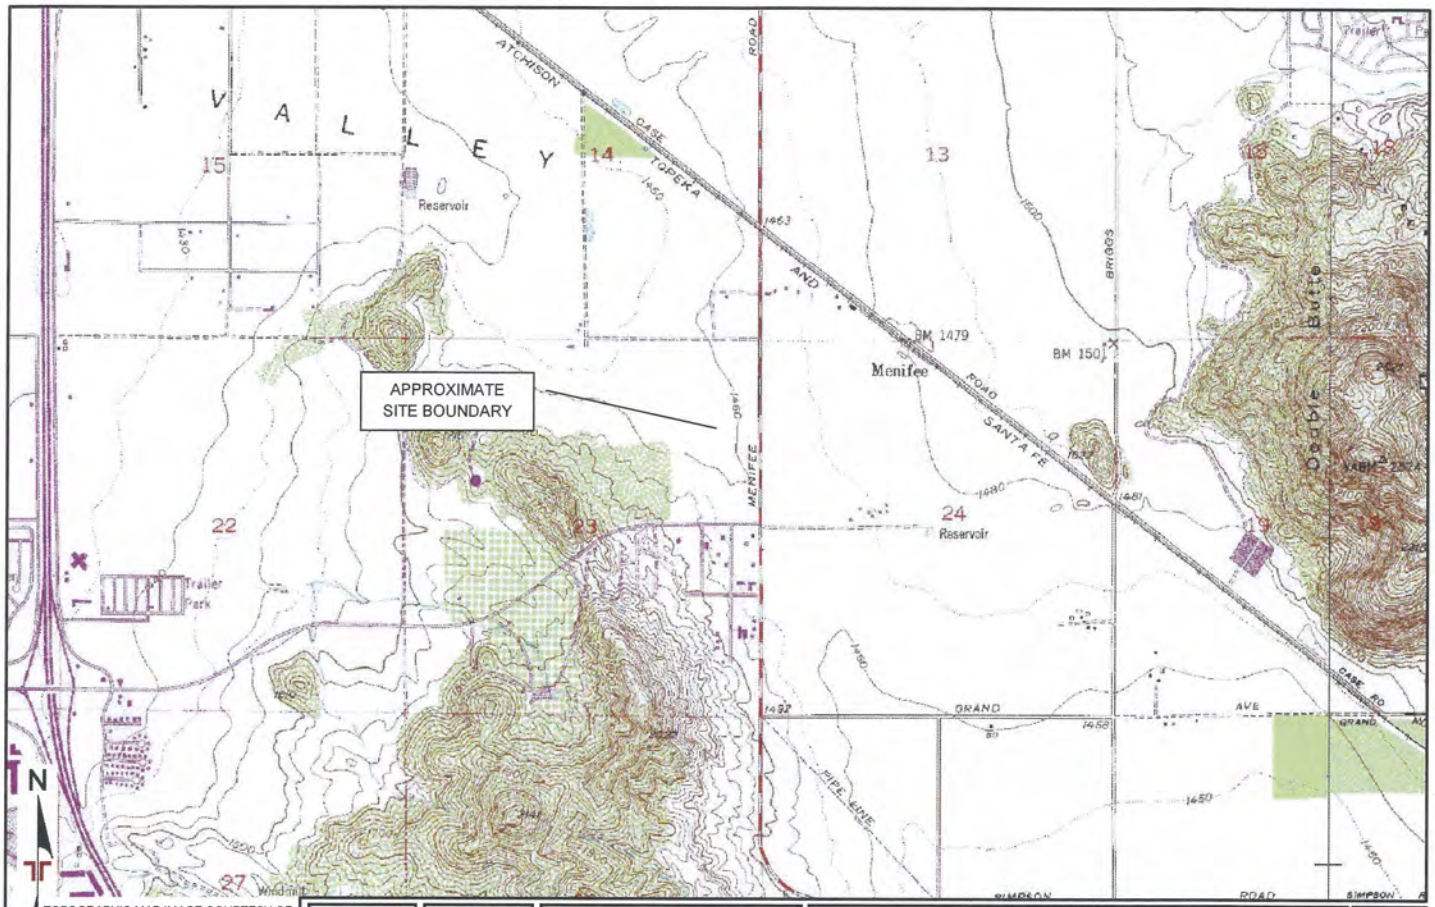
	Arsenic (mg/kg)	OCPs[1] (mg/kg)	Toxaphene (mg/kg)
Reporting Limit	<5.0	<0.0050	<0.020
Screening Levels			
DTSC	12	--	--
Residential ESL	--	0.035[2]	0.51
Commercial ESL	--	0.15[2]	2.2

[1] Excludes toxaphene
[2] Aldrin ESL value, lowest screening level for OCPs

The soil analytical results are detailed in the laboratory analytical report and chain-of-custody forms, which are included in **Appendix B**.

5.0 FINDINGS AND CONCLUSIONS

The findings of this LSI are as follows:



- No indications of staining or significant impacts based on field observations.
- Soil analysis for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits.
- IDW was not generated for this investigation.
- Groundwater was not encountered to the total depth of 0.5 feet bgs.

Based on the field observations and laboratory data, evidence of significant impairment were not identified in the areas accessible and investigated, and at the time the investigation was conducted. Concentrations of detected analytes were below applicable residential and commercial screening levels.

6.0 RECOMMENDATIONS

Based on the findings of the LSI, no additional investigation appears warranted at this time.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites
NPL LIENS ---------- Federal Superfund Liens

Lists of Federal Delisted NPL sites

Delisted NPL ---------- National Priority List Deletions

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY ---------- Federal Facility Site Information listing
SEMS ---------- Superfund Enterprise Management System

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE ---------- Superfund Enterprise Management System Archive

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS ---------- Corrective Action Report

Lists of Federal RCRA TSD facilities

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Lists of Federal RCRA generators

RCRA-LQG ---------- RCRA - Large Quantity Generators
RCRA-SQG ---------- RCRA - Small Quantity Generators
RCRA-VSQG ---------- RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

Federal institutional controls / engineering controls registries

LUCIS ---------- Land Use Control Information System

US ENG CONTROLS ..... Engineering Controls Sites List
US INST CONTROLS ..... Institutional Controls Sites List

Federal ERNS list

ERNS ..... Emergency Response Notification System

Lists of state- and tribal (Superfund) equivalent sites

RESPONSE ..... State Response Sites

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF ..... Solid Waste Information System

Lists of state and tribal leaking storage tanks

LUST ..... Geotracker's Leaking Underground Fuel Tank Report
INDIAN LUST ..... Leaking Underground Storage Tanks on Indian Land
CPS-SLIC ..... Statewide SLIC Cases

Lists of state and tribal registered storage tanks

FEMA UST ..... Underground Storage Tank Listing
UST ..... Active UST Facilities
AST ..... Aboveground Petroleum Storage Tank Facilities
INDIAN UST ..... Underground Storage Tanks on Indian Land

Lists of state and tribal voluntary cleanup sites

VCP ..... Voluntary Cleanup Program Properties
INDIAN VCP ..... Voluntary Cleanup Priority Listing

Lists of state and tribal brownfield sites

BROWNFIELDS ..... Considered Brownfieds Sites Listing

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS ..... A Listing of Brownfields Sites

Local Lists of Landfill / Solid Waste Disposal Sites

WMUDS/SWAT ..... Waste Management Unit Database
SWRCY ..... Recycler Database
HAULERS ..... Registered Waste Tire Haulers Listing
INDIAN ODI ..... Report on the Status of Open Dumps on Indian Lands
ODI ..... Open Dump Inventory
DEBRIS REGION 9 ..... Torres Martinez Reservation Illegal Dump Site Locations
IHS OPEN DUMPS ..... Open Dumps on Indian Land

Local Lists of Hazardous waste / Contaminated Sites

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/24/2022 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
MENIFEE VALLEY RANCH Facility Id: 33010076 Status: No Further Action	***MCCALL BOULEVARD/MEN***	***SE 0 - 1/8 (0.125 mi.)***	***1***	***9***

Status: No Action Required

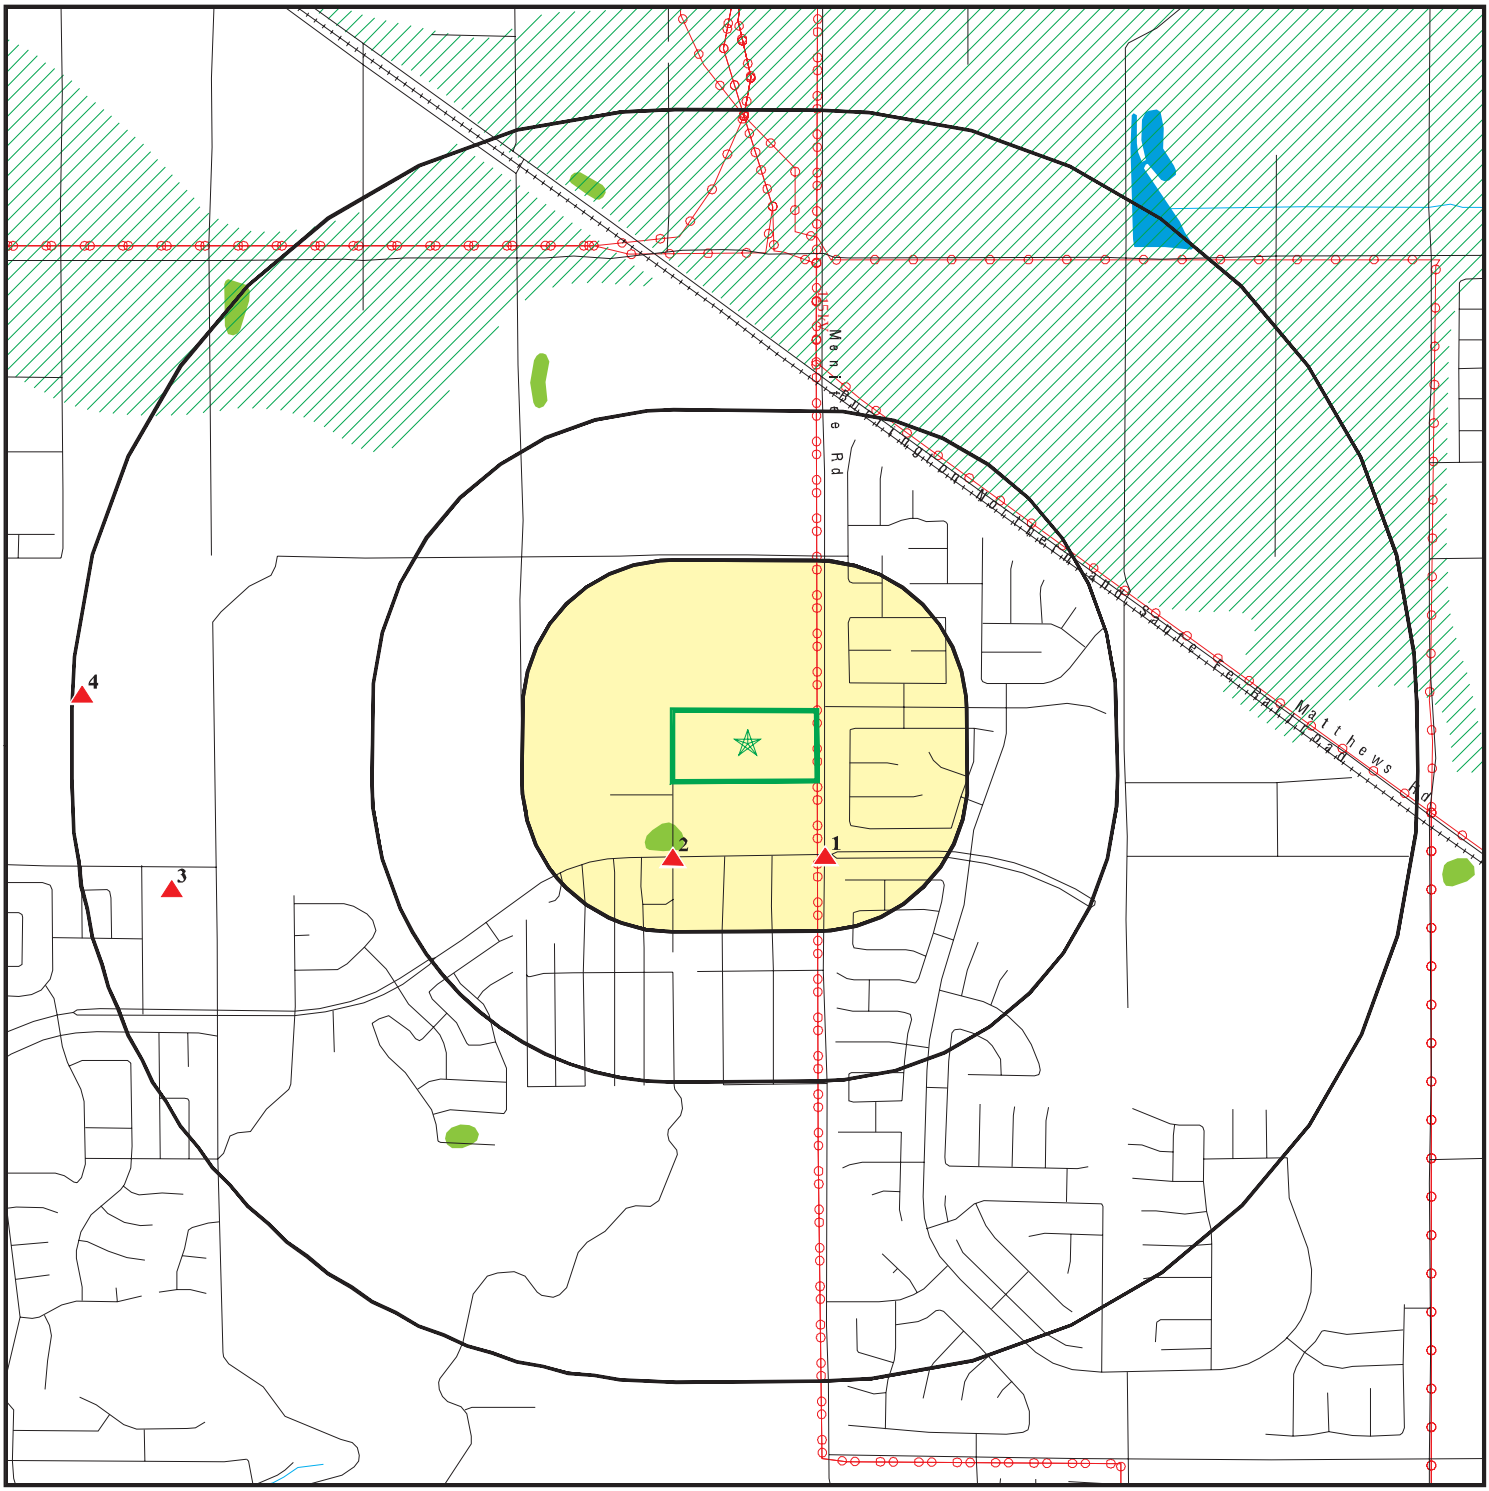
PROPOSED ELEMENTARY	***ROUSE ROAD/SHERMAN R***	***W 1/2 - 1 (0.984 mi.)***	***4***	***17***
Facility Id: 60001068 Status: No Action Required				

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 01/24/2022 has revealed that there are 2 SCH sites within approximately 0.25 miles of the target property.



Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022
Number of Days to Update: 26

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

AQUEOUS FOAM: Former Fire Training Facility Assessments Listing

Airports shown on this list are those believed to use Aqueous Film Forming Foam (AFFF), and certified by the Federal Aviation Administration (FAA) under Title 14, Code of Federal Regulations (CFR), Part 139 (14 CFR Part 139). This list was created by SWRCB using information available from the FAA. Location points shown are from the latitude and longitude listed on the FAA airport master record.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing
A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills
This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

JUNIPERO ROAD AND MCCALL BLVD
JUNIPERO RD
MENIFEE, CA 92585

TARGET PROPERTY COORDINATES

Latitude (North):	33.724079 - 33ˆ 43’ 26.68’’
Longitude (West):	117.156241 - 117ˆ 9’ 22.47’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	485524.7
UTM Y (Meters):	3731380.5
Elevation:	1461 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	12015913 ROMOLAND, CA
Version Date:	2018

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

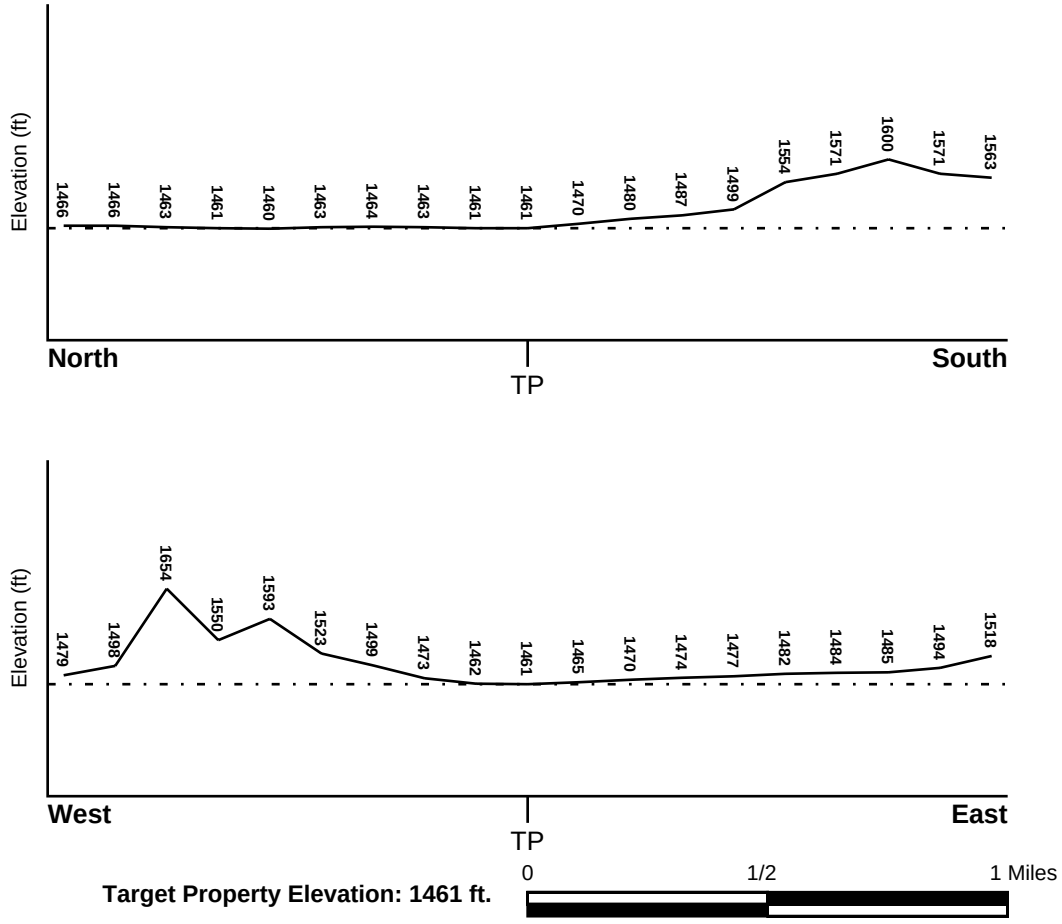
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 1461 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06065C2060H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: EXETER

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 7.4
2	16 inches	37 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 7.4
3	37 inches	50 inches	indurated	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 7.4

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
4	50 inches	59 inches	stratified sandy loam to silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 7.4

Soil Map ID: 2

Soil Component Name: GREENFIELD

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	25 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6
2	25 inches	42 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
3	42 inches	59 inches	loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6
4	59 inches	72 inches	stratified loamy sand to sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6

Soil Map ID: 3

Soil Component Name: EXETER

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 4 Min: 1.4	Max: 8.4 Min: 7.4

Soil Map ID: 4

Soil Component Name: EXETER

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon

APPENDIX F
RESUME OF ESA REPORT PREPARER

EDUCATION

- M.B.A., Business, California Baptist University, Riverside, 2007
- B.S. Health Science; Environmental Health Concentration, California State University, San Bernardino, 2002

EXPERIENCE SUMMARY

Mr. Amendola has experience in land use planning, CEQA compliance, surface mine planning and permitting, and regulatory compliance since 2002. He has managed the environmental compliance documentation for both public and private development projects throughout southern California. Mr. Amendola has completed Phase I Environmental Site Assessments in compliance with ASTM and Federal Standards since 2002. In addition to completing ESAs for local municipalities throughout the Inland Empire, he is also experienced in the preparation of documents in compliance with the Certified Unified Program Agency (CUPA), Business Emergency/Contingency Plan, California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), Surface Mining and Reclamation Act (SMRA), and California Clean Air Act.

SELECTED PHASE I ESA PROJECT EXPERIENCE

- Phase I ESA for Apple Valley Ranchos Water Company Well Site, Town of Apple Valley
- Phase I ESA San Bernardino County Public Works on a 0.9-acre vacant parcel within City of Victorville.
- Phase I ESA San Bernardino County Flood Control District on 1.48 acres located west of Hesperia Road and north of Seneca Road in the City of Victorville,
- Phase I ESA for Northern Portion of a 3.5-acre property at 5156 Route 66, City of Needles
- Phase I ESA for Southern Portion of a 3.5-acre property at 5156 Route 66, City of Needles
- Phase I ESA for Property West of Graham Street Between West Merz Road and Weston Road, City of Perris
- Phase I ESA for County of Riverside Future Animal Shelter on Six Parcels Totaling 20.5 acres, City of San Jacinto
- Phase I ESA for 10.5-acre Property South of Congress Street and North of Santa Ana River, City of Colton
- Phase I ESA for 0.5-acre Property at 1595 W. Valley Boulevard, City of Colton
- Phase I ESA Future San Bernardino County Fire Station on 2.91-acre Site near San Bernardino Avenue and Commerce Drive, City of San Bernardino

- Phase I ESA for 2.8-acre Property at 14205 Valley Boulevard, City of Fontana
- Phase I ESA for Nine Parcels Totaling Approximately 20 Acres south of San Bernardino Avenue in Vicinity of North Woodpine and North Indigo Avenues, City of Colton
- Phase I ESA for Five Parcels Totaling Approximately 4.2 Acres At Southwest Corner of Foothill Boulevard and Almeria Avenue, Unincorporated Area of Fontana
- Phase I ESA for 0.6-acre Property near Arrow Boulevard and Whittram Avenue, Fontana
- Phase I ESA for 9.74-acre Property Near Terminus of Love Lane, Unincorporated Area of Corona

CITY OF MENIFEE

MEMORANDUM

PUBLIC WORKS / ENGINEERING DEPARTMENT

DATE: **January 18, 2023**

TO: **Russell Brown, AICP, Senior Planner**

FROM: **Chet Robinson, PE, GE, Senior Engineer**

CC: **Steve Strapac, PE, PLS, Principal Engineer**

SUBJECT: **RPT22-023 – Phase I ESA Report Review Comments, PC2**
Villages at Junipero

The comments noted herein are for review of the following:

- Phase I and Limited Phase II Environmental Site Assessment on Three Parcels Located at E. Heritage Lake Drive and Menifee Road, prepared by Lilburn Corporation, dated August 2022.

Our review was provided of the Phase I Environmental Site Assessment for the Villages at Junipero for conformance with the minimum criteria outlined in ASTM International E1527, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

The submitted report adequately addresses our review comments and is recommended for entitlement approval. Any questions can be directed to Chet Robinson at (951) 723-3879, or by email at crobinson@cityofmenifee.us

January 11, 2023
Project Number: 01217205.00

Mr. Chet Robinson, PE, GE
City of Menifee
29714 Haun Road
Menifee, California 92586

Subject: **Third Party Report - Review of Phase II and II Environmental Site Assessment (Review)**
RPT22-023

Site: **Villages at Junipero**
Vacant Parcels Southeast of the Intersection of Junipero Road and E. Heritage Lake Drive, Menifee, California 92585

Dear Mr. Robinson:

Pursuant to your request and authorization, SCS Engineers (SCS) has reviewed[1] two City of Menifee (Client)-provided documents in connection with the above-referenced Site. SCS performed the Review to assess whether the Phase I ESA report and underlying work are generally consistent with the ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process E 1527-13 (Standard) and our experience, and to assess whether the completed soil sampling and analysis procedures are generally consistent with our experience and applicable regulatory guidance. The work described in this Review was performed by SCS in general accordance with the City of Menifee Professional Services Agreement, FY2022/2023 On-Call Engineering Services (Contract) between SCS and the Client, which is valid from July 1, 2022 through June 30, 2023.

Should you have any questions regarding this Review, please do not hesitate to call the undersigned at (858) 583-7749.

Sincerely,

Luke Montague, MESM, PG 8071
Vice President
SCS ENGINEERS

1 This Review was general in nature and not intended to address a detailed assessment of consistency with applicable regulatory standards.

1. BACKGROUND

Based on the Client's request and authorization, SCS has completed a Review of the following Client-provided reports:

- *Phase I and Limited Phase II Environmental Site Assessment On Three Parcels Located at E. Heritage Lake Drive and Menifee Road, Menifee CA (Parcel Nos. 333-070-018, 019, and 053),* prepared by Lilburn Corporation (Lilburn) for 29th Street Development and dated August 2022 (Phase I/II ESA)

- *Limited Site Investigation, Menifee Development, Northeast Intersection of Junipero Road and McCall Boulevard, Menifee, Riverside County, California,* prepared by Terracon and dated July 18, 2022 (Phase II ESA)

The above-referenced Phase I/II ESA report prepared by Lilburn appends and incorporates the results of the Phase II ESA report prepared by Terracon. The Phase I/II ESA report indicates that the site is comprised of three parcels of land comprising approximately 17.67 acres, is identified with Assessor's Parcel Number 333-070-018, -019, and -053, with no reported addresses available and located at the southwest corner of the intersection of East Heritage Lake Drive and Menifee Road in Menifee, California (Site). The Site is currently reported to store construction equipment such as portable construction offices, numerous shipping containers, as well as stockpiles of various materials including fine grained soil and gravel. No buildings or building remnants were reported to be present, and no evidence of underground storage tanks, stained soils, electrical transformers, or seepage pits were reported to be present.

Historically, Lilburn reported the Site was used for agricultural purposes from approximately 1938 to 1997, was reported to be vacant property that appeared to be disked in 1997, and was reported to be fallow in 2012 and 2016.

The Phase II ESA report that is summarized in the Phase I/II ESA report was conducted to assess for organochlorine pesticides and arsenic residues in shallow soil, in connection with the former agricultural land use of the Site. Terracon reported that soil analysis for organochlorine pesticides and arsenic were below the specified laboratory reporting limits and applicable screening limits. Overall, Terracon indicated that "Based on the findings of the LSI, no additional investigation appears warranted at this time." The means and methods and further details of the Phase II ESA are further discussed in the "Phase II ESA Report Review" section below.

Overall, Lilburn concluded that "Based on the field reconnaissance of the site a Phase I and limited Phase II site assessment is sufficient to evaluate the property in question and additional site investigations are not recommended."

REVIEW OF BIOSOLIDS/SLUDGE MAPS

In order to assess whether the Site is recorded as a biosolids/sludge application property, SCS reviewed the map titled "Permitted Biosolids/Sludge Application Map," prepared by the City of Menifee and un-dated. Based upon a review of the map, the Site is not shown as an area where Composite Fields were present.

2. PHASE I ENVIRONMENTAL SITE ASSESSMENT REVIEW

2.1 PHASE I ESA REQUIREMENTS

The following table summarizes various requirements of the Standard and if they were addressed as part of the above-referenced Phase I ESA. Please note that the table below does not include all requirements of the Standard.

Requirement	Addressed
User Requirements	
Review of title and judicial records for environmental liens or activity use limitations	No*
Specialized knowledge or experience of the user	No*
Purchase price compared to property value	No*
Commonly known or reasonably ascertainable information	No*
Obvious indications that point to the presence of contamination	No*
Site Reconnaissance	
Site building description	Yes
Site grounds description	Yes
Hazardous materials and petroleum product use and storage (type, quantity, storage conditions)	Yes
Hazardous waste generation (type, quantity, storage conditions)	Yes
Indications of releases	Yes
PCB-containing equipment	Yes
Fuel source for heating and cooling	Yes
Electricity and natural gas supplier	Yes
Potable water supplier	Yes
Sewer conveyance	Yes
Records Review	
Building department/ City clerk records review	Yes
Department of environmental health or other Standard Environmental Record Sources	Yes
Other additional records sources requests	Yes
Interviews	
Interviews with current owner	No*
Interview with current occupant	No*
Interview with previous owners	No*
Interview with previous occupants	No*
Physical Setting	
Topographic map review	Yes
Geology	Yes
Depth and flow direction of groundwater	Yes
Off-Site Source Survey	
Regulatory database review	Yes
Discussion and conclusions for facilities identified on the regulatory database	Yes
Regulatory file review for off-Site sources	Yes
Historical Site and Site Vicinity Land Use Review	
Aerial photograph review	Yes
Sanborn fire insurance map review	Yes
City directory review	No*
Historical resources reviewed back to when the Site was undeveloped or to 1940	Yes
Discussion of gaps of unconfirmed historical Site land use	Yes
Discussion of historical Site and Site vicinity land use	Yes
Data Gaps	
Discussion of Data Gaps	No*

Requirement	Addressed
Conclusions and Recommendations	
Conclusion consistent with Standard	Yes
Environmental professional signature	Yes
Report	
Within shelf-life	Yes
Reliance provided to The City of Menifee	No*

Notes:
* See Additional Discussion section below

2.2 PHASE I ESA REPORT ADDITIONAL DISCUSSION

SCS identified the following items in the Phase I ESA that are interpreted to either be either inconsistent with the Standard or our experience, or to warrant further discussion.

User Requirements

According to the Standard, completion of the User Questionnaire by the User (i.e., 29th Street Development) is optional to assist the User and the environmental professional in gathering information that may be material to identifying recognized environmental conditions. The User Questionnaire consists of questions regarding the following items that are to be completed by the User in order to qualify for one of the Landowner Liability Protections offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001:

- Environmental cleanup liens filed or recorded against the Site
- Activity and land use limitations that are in place on the Site or that have been filed or recorded in a registry
- Specialized knowledge or experience of the person seeking to qualify for CERCLA liability protections
- Relationship of the purchase price to the fair market value of the property as if it were not contaminated
- Commonly known or reasonably ascertainable information about the property
- The degree of obviousness of the presence of contamination at the property, and the ability to detect the contamination by appropriate investigation.

Considering that the Standard indicates that the User Questionnaire is optional, and considering that Lilburn appeared to address several of the above User Requirements using other relevant information sources such as through the various environmental databases that were searched in the EDR report and through requesting owner interviews, the lack of a completed User Questionnaire is not considered a significant data gap, and is not considered by SCS to be a potential recognized environmental condition.

Interviews

The above-referenced Standard requires that interviews be conducted with present and past owners and occupants of the Site. Although current Site owner representative was attempted to be interviewed as a part of the Phase I ESA, and there have reportedly not been tenants currently or historically at the Site, it does not appear that former Site owners were attempted to be interviewed as part of the Phase I ESA report.

Since there appear to be no current or historic tenants at the Site, tenant interviews are not possible. SCS considers the lack of interviews with current and former owners to be a data gap; however, SCS does not consider the lack of interviews with current and former owners to represent a significant data gap, considering that the Site has been vacant land with agricultural land uses, and based on the availability of other relevant information.

Historical Records Search – City Directories

No historical city directories were reported to have been requested for review for the Site or adjoining properties in the Phase I/II ESA report. Per the above-referenced Standard, city directories or local street directories are a standard historical record source that "shall be checked when, in the judgment of the environmental professional, such additional records (1) are reasonably ascertainable, (2) are sufficiently useful, accurate, and complete in light of the objective of the records review (see 8.1.1), and (3) are generally obtained, pursuant to local good commercial and customary practice, in initial environmental site assessments in the type of commercial real estate transaction involved." Although city directory records do not appear to have been requested for the Site or adjoining properties, the Site was not reported by Lilburn to have an address associated with the Site parcels, and was reported to have currently and historically been vacant and undeveloped land. Since Lilburn did review other various standard historical record sources, considering the presence of residential, school, and vacant land at the adjacent properties, and based on the availability of other relevant information, SCS does not consider the lack of a city directory records request to be a significant data gap. Therefore, the lack of a request for city directory records is not considered by SCS to represent a recognized environmental condition.

Discussion of Data Gaps

A data gap section or discussion about possible data gaps was not provided in the Phase I/II ESA report. The above-referenced Standard requires that "The report shall identify and comment on significant data gaps that affect the ability of the EP [environmental professional] to identify recognized environmental conditions and identify the sources of information that were consulted to address the data gaps."

SCS considers the lack of identification of data gaps in the Phase I/II ESA report to be a data gap. However, SCS does not consider the lack of identification of data gaps to represent a significant data gap, considering that the Site is currently and has historically been vacant land used for agricultural purposes, and based on the availability of other relevant information.

Reliance

The Phase I ESA report was prepared for 29th Street Development, the User of the Phase I ESA. No reliance of the Phase I/II ESA was provided to the City of Menifee.

SCS recommends that if the City of Menifee acts in a capacity as a relying party for the Site (i.e., as a lender extending credit to be secured by the Site, any purchaser, transferee or assignee, of a mortgage loan [or any portion thereof]), that the City of Menifee consider requesting a reliance letter from Lilburn as a relying party for the Phase I/II ESA for the Site.

3. PHASE II ESA REPORT REVIEW

The Phase II ESA report prepared by Terracon that is appended to the Phase I/II ESA report included the advancement of 18 shallow soil borings using a hand held auger, with samples collected from each boring location at a depth of approximately 0.5 feet below grade. Prior to sampling and in between samples, the auger was decontaminated in a detergent solution and two potable water rinses to ensure that cross-contamination of samples did not occur. The samples were transferred to laboratory supplied containers, which were sealed, labeled, and preserved in an iced cooler. The soil samples were transported under Chain-of-Custody protocol to Sun Star Laboratories in Lake Star, California for analysis.

The discrete samples were then composited by the laboratory at a 3:1 ratio, for a total of six analytical samples. The six samples were analyzed by the laboratory for organochlorine pesticides (OCPs) and arsenic by EPA Method 6010B. The laboratory reports and associated chain-of-custody forms were provided in the Appendix of the Phase II ESA. A map illustrating the soil sample locations was provided in the Phase II ESA.

Note that based on SCS' review of the historical aerial photographs included in the Phase I/II ESA, the former agricultural land use at the Site is interpreted to have been for dry farming purposes, and per the *Interim Guidance for Sampling Agricultural Properties (Third Revision)* prepared by the Department of Toxic Substances Control (DTSC) and dated August 7, 2008 (DTSC Guidance), land used for dry-land farming does not need further investigation for pesticides or metals such as arsenic. Additionally, as discussed in the "Review of Biosolids/Sludge Maps" section above, based on a review of the map titled "Permitted Biosolids/Sludge Application Map," prepared by the City of Menifee and un-dated, the Site is not shown as an area where Composite Fields were present. The Phase I/II ESA also did not appear to indicate that biosolids were applied to the Site historically. Therefore, the soil sampling for OCPs and arsenic does not appear to have been required in SCS' opinion based on current regulatory guidance and the available map reviewed. However; shallow sampling for OCPs is considered to be a suitable method to further verify whether OCPs and arsenic may be present in shallow soil to assess for pesticides residues in soil.

The six soil samples were reported by the laboratory to be non-detect for organochlorine pesticides and arsenic above laboratory reporting limits. Terracon concluded that the "Concentrations of detected analytes were below the applicable residential and commercial screening levels." Terracon recommended that "Based on the findings of the LSI, no additional investigation appears warranted at this time." The report was signed by a Registered Professional Geologist in the State of California.

The following table summarizes various portions of the Phase II ESA, as well as SCS' assessment with each of the portions of the work completed. SCS' assessment of the Phase II ESA is based on our experience and professional opinion, and on the use and practice of current industry standards known to SCS. Please note that the table below may not include all local, State, and Federal requirements.

Category	Satisfactory
Regulatory Standard Followed	
Generally follows the DTSC Guidance regarding sampling depth and laboratory analyses but not sample frequency. However, sampling for arsenic and OCPs are not required for former dry land agricultural land use per the DTSC Guidance	Not applicable
Sampling Methodology	
Shallow soil samples collected with a hand held auger and transferred to laboratory provided containers	Yes
Sampling equipment decontaminated between sample locations	Yes
Samples shipped in a chilled container under chain-of-custody	Yes
Laboratory Analysis	
Analysis of samples by State-certified laboratory	Yes
OCPs – EPA Method 8081A	Yes
Arsenic – EPA Method 6010B	Yes
Findings	
Summary of laboratory results	Yes
Comparison of laboratory results to applicable regulatory standard(s)	Yes
Conclusions and Recommendations	
Statement of whether objective(s) were achieved	Yes
Recommendations of further assessment or remedial measures, if needed	Yes
Report	
Sample Location Map	Yes
Copy of laboratory analytical report	Yes
Report signed by a properly licensed individual	Yes

4. RECOMMENDATIONS

Based on a review of the Phase I/II ESA and Phase II ESA reports, SCS recommends that the City of Menifee approve the Phase I/II ESA and Phase II ESA reports.

The below additional recommendation is provided at the discretion of the City of Menifee:

- SCS recommends that if the City of Menifee acts in a capacity as a relying party for the Site (i.e., as a lender extending credit to be secured by the Site, any purchaser, transferee or assignee, of a mortgage loan [or any portion thereof]), that the City of Menifee consider requesting a reliance letter from Lilburn as a relying party for the Phase I/II ESA report for the Site.

PHASE I AND LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT ON THREE PARCELS LOCATED AT E. HERITAGE LAKE DRIVE AND MENIFEE ROAD, MENIFEE, CA

1.0 INTRODUCTION

This Phase I and Limited Phase II Environmental Site Assessment (ESA) is prepared for the review of three parcels (APN Nos. 333-070-018, 019, and 053) consisting of approximately 17.67 acres, located at East Heritage Lake Drive and Menifee Road in the City of Menifee, California. The ESA examines the existing environmental conditions upon, and in the vicinity of the subject site, and identifies any historical or current land use that may pose a Recognized Environmental Condition (REC)[1] affecting the use or continued use of the subject property. Refer to Figures 1 and 2 for a Regional Location Map and Vicinity Map/Aerial Photograph of the subject property.

The purpose of this Limited Phase I/II ESA is to assess historical uses that may have affected the subject site specifically relating to the presence or likely presence of a REC such as hazardous materials or petroleum products. This report includes any observed potential impacts to the site that may have altered the site's ecology, environment, or functional use. Visual observations and inquiry into public records are documented; no documents related to the placement of water pipelines, gas mains or other infrastructure were reviewed. This Limited Phase I/II ESA includes limited soil testing for the presence of pesticides and biosolids at the request of the client. No other testing of soil, air, water or any other matter was conducted as part of this Phase I ESA.

American Society for Testing and Materials (ASTM) Guidelines*:* This environmental assessment follows the guidelines established by the ASTM Standard Practice Manual for the *Phase I Environmental Site Assessment* process, *ASTM Designation E 1527-05*.

The objective of this ESA is to evaluate the subject site for current and historical sources of environmental concerns, evidence of hazardous substance disposal or releases from or onto the subject site, evidence of environmental threats from adjacent properties, and whether further environmental testing of the site is warranted. This report meets *ASTM Standards for ESA's*. To meet these objectives, Lilburn Corporation performed the following tasks:

- Reviewed available environmental reports.
- Reviewed historic land use records and files.
- Reviewed pertinent regulatory agency documents.
- Reviewed available current and historical aerial photographs of the site and adjacent properties.
- Performed a reconnaissance of adjacent and immediately surrounding properties.
- Performed an on-site reconnaissance of the property and collected limited soil samples.
- Obtained laboratory analysis of soil samples.
- Prepared this report.

Results of this Environmental Site Assessment for the site located in the City of Menifee, County of Riverside, California are presented in the following Sections 2.0 – 7.0.

[1] American Society for Testing and Materials defines a Recognized Environmental Condition as "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws.

2.0 SITE LOCATION

The subject site herein referred to as “site, subject site” or "property" is being evaluated at the request of 29th Street Capital. The property consists of three parcels totaling approximately 17.67 acres, located at the southwest corner of E. Heritage Lake Drive and Menifee Road in the City of Menifee, California. In 2014, a report was completed for the subject property and entitled *Phase I and Limited Phase II Environmental Site Assessment on Three Parcels Located Northeast of the Intersection of Junipero Road and McCall Boulevard, Menifee, CA.* That report concluded that based on the field reconnaissance of the site, a Phase I and limited Phase II site assessment was sufficient to evaluate the property in question and additional site investigations were not recommended. This 2022 report has been prepared to evaluate existing and historic site conditions.

The geographical location of the site is as follows:

COORDINATES

Latitude (North):	33.7240790 - 33° 43’ 26.68’’
Longitude (West):	117.1562410 - 117° 9’ 22.46’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	485524.7
UTM Y (Meters):	3731380.5
Elevation:	Approximately 1461 ft. above sea level
Assessor’s Parcel Numbers:	0333-070-018, 019, and 053

The subject site boundaries are within the U.S. Geological Survey (USGS) Topographic Map: Romoland 7.5-minute series, Section 23, T5S, R3W, San Bernardino Base and Meridian.

2.1 DESCRIPTION OF SURROUNDING AREA

The property is predominately surrounded by development. Land uses include Menifee Road, Junipero Road, E. Heritage Lake Drive, residential, institutional (elementary school), and vacant properties. East Heritage Lake Drive and single-family residential uses are located to the north, Menifee Road and single-family residential uses are on the east, Junipero Road and Boulder Ridge Elementary School are to the west, and the property to the south is currently being developed (end use could not be determined). The subject site contains no buildings or structures, but appears to be an active construction office for the development of the property to the south.

2.2 REVIEW OF HISTORIC PHOTOGRAPHS

Various governmental agencies including the USGS and local flood control agencies have systematically photographed land uses since the early 1920s. These historical photographs are utilized to assist in identifying historical uses of the subject and adjacent properties. Aerial photographs available that show the subject site and surrounding land uses were analyzed for the following years and corresponding scales:

1938: 1"=500'	*1953: 1"=500'*	*1967: 1"=500'*	*1978: 1"=500'*
1985: 1"=500'	*1997: 1"=500'*	*2006: 1"=500'*	*2012: 1"=500'*
2016: 1"=500'			

Appendix A contains the aerial photographs analyzed. The subject site was marked on each photograph to show an approximate location. The following is a summary of the photograph observations of land uses on-site and in the vicinity for the corresponding years when the photographs were taken.

- The 1938 aerial photograph shows the subject site being located in an undeveloped area with agricultural uses on and surrounding the subject property. A single-family structure and trees/landscaping is evident approximately ¼-mile north of the subject site.

- The 1953 aerial photograph shows that the subject property and surrounding area continues to be used for agriculture. Structures are evident approximately ¼-mile south of the subject site. There appears to be little development that has occurred within the immediate area of the site when compared to the 1938 aerial photograph.

- The 1967 aerial photograph shows a new east-west roadway located approximately ¼-mile south of the subject property (today known as McCall Boulevard), with additional structures appearing south of the new roadway. There is no discernable change to the subject site in the 1967 aerial photograph when compared to the 1953 aerial photograph. Property surrounding the subject site and the subject site itself remain vacant.

- The 1978 aerial photograph shows additional development occurring ¼- to ½-mile south of the subject property. No other significant changes from the 1967 aerial photograph are evident. Menifee Road appears to have been developed. No structures are located on the subject site or on the immediate surrounding properties.

- The 1985 aerial photograph shows little change from the 1978 aerial photograph. The subject property and surrounding area continue to be used for agriculture.

- The 1997 aerial photograph shows little change from the 1985 aerial photograph with some development occurring approximately ½-mile north of the subject property. The subject property and surrounding area continue to be used for agriculture.

- The 2006 aerial photograph shows construction occurring on the property directly to the west of the subject site (Boulder Ridge Middle School). Property directly south of the westernmost parcels appears to be being utilized as a stockpile for the middle school construction material/equipment. Property located east of the subject property across Menifee Road appears to have been graded, and single-family homes appear to have been developed approximately ¼-mile southeast of the subject site. The subject site appears to be unchanged from the 1997 aerial and remains vacant with only routing disking.

- The 2012 aerial photograph shows completion of a single-family home development to the east of the subject site. No other significant changes from the 2006 aerial photograph are evident. The subject site appears to be fallow.

- The 2016 aerial photograph shows no significant changes from the 2012 aerial photograph. The subject site appears unchanged.

None of the historical aerial photographs reviewed show any development on the subject property or development of railroad tracks or bridges on or adjacent to the subject property that would create a REC.

2.3 HISTORIC UNITED STATES GEOLOGICAL SURVEY (USGS) MAPS

Available historic and current USGS maps that include the subject site and surrounding area were reviewed for the following years:

1901: Elsinore Quadrangle; 30 Minute Series
1947: Murrieta Quadrangle; 15 Minute Series
1953: Romoland Quadrangle; 7.5 Minute Series
1973: Romoland Quadrangle 7.5 Minute Series
1979: Romoland Quadrangle; 7.5 Minute Series
2015: Romoland Quadrangle; 7.5 Minute Series
2018: Romoland Quadrangle; 7.5 Minute Series

The USGS has produced several national series of topographic maps which vary in scale and extent in the area going back to the early 1900's. The largest (both in terms of scale and quantity) and best-known topographic series is the 7.5-minute, 1:24,000 scale, and quadrangle. Each of these maps covers an area bounded by two lines of latitude and two lines of longitude spaced 7.5 minutes apart. These maps are utilized to assist in identifying historical uses of the subject and adjacent properties and identify power lines and other physical infrastructure that could affect the subject property or the surrounding area. Appendix B contains the topographic maps reviewed, and the approximate location of the subject site is identified on each map. The subject site is currently located on the Romoland USGS Quadrangle. A summary of the review of the maps are discussed herein.

- The 1901 Elsinore Quadrangle USGS map of the area show no specific streets or development in the immediate vicinity of the subject property however the map scale lacks detail relating to structures on or in the vicinity of the site. The map shows a rail line located approximately ½-mile north of the subject property.
- The 1947 USGS map of the area shows development of a street (Menifee Road) adjacent to the easternmost parcel of the subject property. No structures or development is evident within the immediate area of the project site.
- The 1953 USGS map of the area shows no structures or development within the immediate area of the project site.
- The 1973 USGS map of the area shows the development of roads and structures approximately ¼-mile south of the subject property. No structures or development is evident within the immediate area of the project site.
- The 1979 USGS map of the area shows relatively little change when compared to the 1973 USGS map. The subject property appears unchanged.
- The 2015 USGS map of the area shows the development of roads east of Menifee Road and south of McCall Boulevard. Development of Boulder Ridge Elementary School is shown. No structures or development is evident within the immediate area of the project site.

- The 2018 USGS map of the area shows relatively little change when compared to the 2015 USGS map. However, it shows a road bisecting the property. The subject site remains vacant and undeveloped.

None of the historic USGS maps reviewed show any development of railroad tracks, utility easements, or bridges on the subject property.

3.0 SITE VISIT

Summary: A site inspection was conducted on July 28, 2022. The subject property was active with construction equipment, portable construction offices, numerous shipping containers (aka, PODS), as well as stockpiles of various materials (earth, fines from grading, gravel, etc.). It appears these uses are supporting the development of the adjacent property to the south. No building foundations or remnants were observed on the subject property. No evidence of underground storage tanks, stained soils, electrical transformers, or seepage pits were present. High voltage power lines were observed along the eastern edge of the property adjacent to Menifee Road. Refer to Appendix C for photographs depicting the site and surrounding properties.

3.1 PROPERTY EVALUATION

On-Site Observations

Mr. Frank Amendola and Giang Ngo of Lilburn Corporation conducted a site survey/property evaluation on July 28, 2022. Table 1 presents a summary of the site survey/property evaluation.

Table 1
Summary of Site Reconnaissance

Observed on-site?	Yes	No
Existing structures		●
Power line towers	●	
Evidence of past uses (foundations, debris, roads)		●
Hazardous substances and/or petroleum products (including containers)		●
Aboveground storage tanks (ASTs) or evidence of ASTs		●
Underground storage tanks (USTs) or evidence of USTs		●
Strong, pungent, or noxious odors		●
Pools of liquid likely to be hazardous materials or petroleum products		●
55-gallon drums		●
Unidentified substance containers		●
PCB-containing equipment		●
Subsurface hydraulic equipment		●
Stains or corrosion on floors, walls, or ceilings		●
Floor drains and sumps		●
Pits, ponds, or lagoons		●
Stained soil and/or pavement		●
Stressed vegetation		●
Waste or wastewater discharges to surface or surface waters on subject site (including stormwater)		●
Wells (irrigation, domestic, dry, injection, abandoned, monitoring)		●
Septic systems		●

Access to property was from Menifee Road and was unrestricted. However, the property was fenced along Junipero Road and E. Heritage Lake Drive. Portions of the property to the west

were being used as a construction staging area for the development of the adjacent property to the south. Numerous shipping containers were evident as well as stockpiles of earth and fines from grading. The eastern portion of the property was vacant and clear of construction uses. Refer to Appendix C for photographs of various views of the subject site and surrounding properties.

No permanent structures or remnants of foundations were observed during the site visit. No discoloration of soils was evident and no remnants of underground storage tanks were observed during the visual site inspection. Although high voltage power lines are present on the eastern portion of the subject property along Menifee Road, there were no electrical transformers observed. Signage adjacent to Menifee Road near the site indicates the presence of underground high pressure gas lines.

Surrounding Land Uses

A summary description of surrounding land uses follows:

West Land Uses
Land uses to the west of the subject property consist of Junipero Road and Boulder Ridge Elementary School.

South Land Uses
Land uses to the south of the subject property include undeveloped property. However, it was being developed at the time of the site visit. A construction fence was evident.

North Land Uses
Land uses north of the subject property consist of E. Heritage Lake Drive and single-family homes.

East Land Uses
Land uses east of the subject property consist of Menifee Road and single-family homes.

3.2 PROPERTY OWNER/AGENT INTTERVIEWS

No interviews with the current landowner as no one was available that was familiar with prior uses.

4.0 LIMITED SOIL SAMPLING AND ANALYSIS

Summary: Laboratory results of four soil samples collected did not indicate any issues of concern related to any residual pesticides or biosolids. Appendix D includes the Limited Subsurface Investigative Report and Laboratory testing results, which are summarized below.

4.1 PESTICIDE AND BIOSOLID SOIL SAMPLE LOCATIONS AND PROCEDURES

Samples were collected from depths of 6 inches below grade (18 samples), with the aid of a hand auger. Prior to sampling and between samples, reusable drilling and sampling equipment was cleaned using an Alconox wash and two potable water rinses prior to the beginning of the project and before collecting each soil sample to ensure that cross-contamination of samples did not occur. The sample packaging consisted of placing the soil directly into laboratory provided containers. The field crew used new nitrile gloves for each sample collection to prevent cross contamination. The samples were labeled, sealed, recorded on chain-of-custody forms and stored in a chilled ice chest pending delivery to the laboratory.

4.2 LABORATORY ANALYSIS

The laboratory composited the discrete samples at a 3:1 ratio for laboratory analysis. The soil samples and completed chain-of-custody forms were relinquished to SunStar Laboratories Inc., in Lake Forest, California, a State-of-California certified laboratory for analysis.

4.3 ANALYTICAL RESULTS

All analytical results for organochlorine pesticides in the four samples were non-detect, indicating the soil is not impacted by organochlorine pesticides.

The findings were as follows:

- No indications of staining or significant impacts based on field observations.
- Soil analysis for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits.
- IDW was not generated for this investigation.
- Groundwater was not encountered to the total depth of 0.5 feet bgs.

Based on the field observations and laboratory data, evidence of significant impairment was not identified in the areas accessible and investigated, and at the time the investigation was conducted. Concentrations of detected analytes were below applicable residential and commercial screening levels.

Based on the soil testing conducted, there is no indication of a REC due to potential biosolid application to the subject property. Refer to Appendix D for the comprehensive soil analysis results, prepared by Terracon.

5.0 GEOLOGY AND HYDROGEOLOGY

Summary: No geologic or hydrogeologic concerns were encountered during the site visit, which would be considered "an impairment" to the use of the subject site or a REC. According to the Environmental Data Resources, Inc. (EDR) report the project site is not within the 100-year or 500-year flood plain. Refer to Appendix E for the EDR Report.

5.1 GEOLOGY

Topography

The topography of the subject site is relatively flat and varies little from north to south. The subject site is at an elevation of approximately 1461 feet above mean sea level (amsl). The subject property generally falls from south to north and should not create concerns regarding landslides, erosion, or ground failure. Therefore, development of the site is not anticipated to be impaired.

Seismic Fault Systems

According to the Southern California Earthquake Data Center (www.data.scec.org), several fault systems are located within relatively close proximity to the subject site. The subject site lies on the western edge of the San Jacinto Fault Zone that is capable of producing a maximum credible earthquake magnitude (M_w) of 6.5-7.5. The most recent surface rupture was on April 9, 1968.

Earthquakes, due to their ground acceleration and shifting, can cause major damage to buildings and create dangerous hazards to people through injury or death. Development projects in the seismically-active southern California region must mitigate these potential hazards through strict adherence to the California Building Code (CBC) and implementing recommendations from geotechnical engineers.

5.2 REGIONAL HYDROLOGY AND GROUNDWATER

FEMA Flood Zone Mapping

According to the Environmental Data Resources, Inc. (EDR) report included as Appendix E, the project site is located within Flood Plain Panel 06065C and is not within the 100-year or 500-year flood plain.

Groundwater/Well Data

The EDR report identifies 16 wells located with a 1-mile radius of the subject property, none of which are located within a 1/8-mile radius. All of the wells within the 1-mile radius are either cross-gradient or down-gradient from the subject property.

6.0 LOCAL AGENCY REVIEW

Summary: The County of Riverside Department of Environmental Health-Hazardous Materials Division was contacted as part of the EDR records search. As of August 8, 2022, the records request is pending. Other records reviewed include County of Riverside Building Department, Sanborn Fire Insurance maps, City of Menifee-Planning Division, and local RADON reporting data.

Various local (County) agencies maintain databases or records which are useful for evaluating the history of a property, and which may provide indications pertaining to the past uses of the property and any potential environmental concerns. For the purposes of this ESA, records reviewed are presented below.

- County of Riverside Environmental Health Division, Hazardous Material Department
- County of Riverside Building Department
- City of Menifee Planning Division
- Sanborn Fire Insurance Mapping

County of Riverside Building Department

A review of the County of Riverside Building Department records for building permits issued on the subject property were as follows: On November 2, 2004, a grading permit was issued on the Subject Site for a grading stockpile. The permit description included the following language: Import Stockpile For TR31457. The permit is no longer active.

County of Riverside Environmental Health Department, Hazardous Material Division

The County of Riverside Department of Environmental Health, Hazardous Materials Division was contacted for a hazard's records search. As of August 8, 2022, the records request finding continues to be pending.

City of Menifee Planning Division

The City of Menifee Planning Division was contacted. No planning records were found on the subject site.

Sanborn Fire Insurance Mapping

The Sanborn Maps were originally created for assessing fire insurance liability in urbanized areas in the United States. No Sanborn maps covering the subject property were available for review.

Area Radon Information

No testing for radon was performed as part of this ESA, however a review of available information for the subject area (zip code 92585), revealed that six (6) tests for radon gas within structures have been performed in the area and none of the tests performed indicated radon levels within the structures in excess of 4 pCi/L[2] (Picocuries Per Liter).

[2] 4 pCi/L is the EPA lower action limit for habitable structures. Levels in excess of 4 pCi/L typically require remediation.

7.0 REGULATORY REVIEW

Summary: A review of Federal and State environmental databases revealed no environmental concerns or issues directly related to the site, which would be considered "an impairment" or REC. However, the review of the EDR records search revealed several sites of potential concern within the vicinity. These sites appear to be in compliance with applicable hazardous waste regulations as they are either a permitted operation, actively in remedial work, or remedial work has been completed. These sites are not anticipated to impact the subject property as they are located either a greater distance than would warrant establishment of a REC or are cross-gradient or down-gradient of the subject site and applicable water flow. Refer to Appendix E for additional information.

The State of California and various federal government agencies investigate and/or track numerous environmental concerns on a regional basis. For the purposes of this ESA, the following agency records were reviewed for a one-mile radius of the subject property.

FEDERAL RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites
Source: EPA
Telephone: N/A
This database includes site proposed for listing in the NPL database.

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: N/A
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establish the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or

when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-412-9810
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by States, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS includes sites that are either proposed for or on the National Priorities List (NPL), and sites that are in the screening and assessment phase for possible inclusion on the NPL.

CERCLIS - NFRAP: No Further Remedial Action Planned
Source: EPA
Telephone: 703-412-9810
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, States, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

LIENS 2: CERCLA Lien Information
Source: EPA
Telephone: 202-564-6023
Database provides information as the identity of sites and properties that have used Superfund funds.

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

RCRA: Resource Conservation and Recovery Act Information
Source: EPA
Telephone: 415-495-8895
RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as

defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kg of hazardous waste, or over 1kg of actual hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US ENG CONTROLS: Engineering Controls Sites List
Source: Environmental Protection Agency
Telephone: 703-603-8905
A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

US INST CONTROL: Sites with Institutional Controls
Source: Environmental Protection Agency
Telephone: 703-603-8905
A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-267-2180
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

DOT OPS: Incident and Accident Data
Source: Department of Transportation, Office of Pipeline Safety
Telephone: 202-366-4595
Pipeline safety and incident report database.

CDL: Clandestine Drug Labs
Source: Department of Toxic Substances Control
Telephone: 916-255-6504
A listing of drug lab locations. Listing of a location in this database does not indicate that any illegal drug lab materials were or were not present there, and does not constitute a determination that the location either requires or does not require additional cleanup work.

US BROWNFIELDS: A Listing of Brownfields Sites
Source: Environmental Protection Agency
Telephone: 202-566-2777
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

DOD: Department of Defense Sites
Source: USGS
Telephone: 703-692-8801
This data sets consists of federally owned or administered lands, administered by the Department of Defense, that have any equal to or greater than 640 acre of the United States, Puerto Rico, and the U.S. Virgin islands.

FUDS: Formerly Used Defense Sites
Source: U.S. Army Corps of Engineers
Telephone: 202-528-4285
The listing includes locations of Formerly Used Defense Sites properties where the US Army Corps of Engineers is actively working or will take necessary cleanup actions.

LUCIS: Land Use Control Information System
Source: Department of the Navy
Telephone: 843-820-7326
Database contains records of land use control information pertaining to the former Navy Base Realignment and Closure properties.

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters. Date of Government Version.

ROD: Records of Decision
Source: NTIS
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at a NPL (Superfund) site containing technical and health information to aid in the cleanup.

UMTRA: Uranium Mill Tailings sites
Source: Department of Energy
Telephone: 505-845-0011
Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

ODI: Open Dump Inventory
Source: Environmental Protection Agency
Telephone: 800-424-9346
An open dump is defined as a disposal facility that does not comply with one or more of the Part 257 or Part 258 Subtitle D Criteria.

DEBRIS REGION 9: Torres Martinez Reservation Illegal Dump Site Locations
Source: EPA
Telephone: 415-972-3336
A listing of illegal dump sites located on the Torres Martinez Indian Reservation located in eastern Riverside County and northern Imperial County, California.

MINES: Mines Master Index File
Source: Department of Labor, Mine Safety and Health Administration
Telephone: 303-231-5959

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-566-0250
Toxic Release Inventory System. TRIS identifies facilities that release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

FTTS: FIFRA/TSCA Tracking System – FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act)/TSCA(Toxic Substance Control Act)
Source: EPA
Telephone: 202-566-1667
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

FTTS INSP: FIFRA/TSCA Tracking System – FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act)/TSCA(Toxic Substance Control Act)
Source: EPA
Telephone: 202-564-1667

HIST FTTS: FIFRA/TSCA Tracking System Administration Case Listing
Source: EPA
Telephone: 202-564-2501
Database tracks establishments that generate pesticide use within the course of the calendar year.

SSTS: Section & Tracking System
Source: EPA
Telephone: 202-564-4203
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

ICIS: Integrated Compliance Information System
Source: EPA
Telephone: 202-564-5088
The Integrated Compliance Information System (ICIS) supports the information needs of the national enforcement and compliance program as well as the unique needs of the National Pollutant Discharge Elimination System (NPDES) program.

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-566-0500
PCB Activity Database. PADS Identifies generators, transporters, commercial stores and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements.

RADINFO: Radiation Information Database
Source: EPA
Telephone; 202-343-9775
Contains information about facilities that are regulated by U.S. EPA regulations for radiation and radioactivility.

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: 415-947-8000
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA retains a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

STATE AND LOCAL RECORDS:

HIST CAL-SITES: Calsites Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database. No longer updated by the state agency. It has been replaced by ENVIROSTOR.

SCH: School Property Evaluation Program
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the Cal Sites category depending on the level of threat to public health and safety or the environment they pose.

TOXIC PITS: Toxic Pits Cleanup Act Sites
Source: State Water Resources Control Board
Telephone: 916-227-4364
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

SWF/LF (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-341-6320
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 2004 criteria for solid waste landfills or disposal sites.

WMUDS/SWAT: Waste Management Unit Database
Source: State Water Resources Control Board
Telephone: 916-227-4448
Waste Management Unit Database System. WMUDS is used by the State Water Resources Control Board staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information.

CA WDS: Waste Discharge system
Source: State Water Resources Control Board
Telephone: 916-341-5227
Sites that have been issued waste discharge requirements.

CORTESE: "Cortese" Hazardous Waste & Substance Sites List
Source: CAL EPA/Office of Emergency Information
Telephone: 916-323-3400
The sites for the list are designated by the State Water Resources Control Board (LUST), the Integrated Waste Management Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

SWRCY: Recycler Database
Source: Department of Conservation
Telephone: 916-323-3836
A listing of recycling facilities in California.

LUST: Geotracker's Leaking Underground Fuel Tank Report
Source: State Water Resources Control Board

Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

CA FID UST: Facility Inventory Database
Source: California Environmental Protection Agency
Telephone: 916-341-5851
The facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resources Control Board.

SLIC: Statewide SLIC Cases
Source: State Water Resources Control Board
Telephone: 886-480-1028
The Spills, Leaks, Investigations, and Cleanups (SLIC) listings includes unauthorized discharges from spills and leaks, other than from underground storage tanks or other regulated sites.

UST: Active UST Facilities
Source: State Water Resources Control Board
Telephone: 916-480-1028
Active UST facilities gathered from the local regulatory agencies.

UST MENDOCINO: Mendocino County UST Database
Source: Department of Public Health
Telephone: 707-463-4466
A list of underground storage tanks in Mendocino County.

HIST UST: Hazardous Materials Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-341-5851
The Hazardous Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.

AST: Aboveground Petroleum Storage Tank Facilities
Source: State Water Resources Control Board
Telephone: 916-341-5712
Registered Aboveground Storage Tanks.

LIENS: Environmental Liens Listing
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
A listing of property locations with environmental liens for California where DTSC is a lien holder.

SWEEPS UST: SWEEPS UST Listing
Source: State Water Resources Control Board
Telephone: N/A
Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1980s? The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-845-8400
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

NOTIFY 65: Proposition 65 Records
Source: State Water Resources Control Board
Telephone: 916-445-3846
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

DEED: List of Deed Restrictions
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes.

VCP: Voluntary Cleanup Program Properties
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

DRY CLEANERS: Cleaner Facilities
Source: Department of Toxic Substances Control
Telephone: 916-327-4498
A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial, garment pressing and cleaner's agents, linen supply, coin-operated laundries and cleaning, drycleaning plants, except rugs, carpet and upholstery cleaning, industrial launders, laundry and garment services.

WIP: Well Investigation Program Case List
Source: Los Angeles Water Quality Control Board
Telephone: 213-576-6726
Well investigation program case in the San Gabriel and San Fernando Valley area.

CDL: Clandestine Drug Labs
Source: Drug Enforcement Administration
Telephone: 202-307-1000
Database provides a listing of clandestine drug lab locations.

RESPONSE: State Response Sites
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

HAZNET: Hazardous Waste Information System
Source: California Environmental Protection Agency
Telephone: 916-255-1136
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the Department of Toxic Substances Control (DTSC). The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EMI: Emissions Inventory Data
Source: California Air Resources Board
Telephone: 916-322-2990
Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies.

HAULERS: Registered Waste Tire Haulers Listing
Source: Integrated Waste Management Board
Telephone: 916-341-6422
A listing of registered waste tire haulers.

ENVIROSTOR: EnviroStor Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides

additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Underground Storage Tanks on Indian land in Arizona, California, New Mexico and Nevada

HISTORICAL AND OTHER DATABASE(S)

Depending on the geographic area covered by the EDR Report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included.

Other Databases

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include

gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

EDR Historical Cleaners: EDR Proprietary Historic Dry Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc.

7.1 TARGET PROPERTY SEARCH RESULTS

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR) and reviewed a part of this ESA. The EDR database report meets the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) for the evaluation of environmental risk associated with a parcel of real estate. The subject property was not identified on any of the databases searched.

7.2 SURROUNDING SITES SEARCH RESULTS

EDR was utilized to conduct a search of environmental databases within a 1-mile radius of the subject site to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) for the evaluation of environmental risk associated with a parcel of real estate. Identified properties that are down-gradient of the subject site are not listed herein. Additionally, some identified properties are listed on multiple databases and have been excluded from the duplicative databases herein. Refer to Appendix E for the EDR Report.

STANDARD ENVIRONMENTAL RECORDS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database include: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. A review of the ENVIROSTOR list has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Menifee Valley Ranch School	McCall Blvd Menifee Street	SE 0 – 1/8	1	8
McCall Mesa K-8 School	McCall Blvd Junipero	SW 0-1/8	2	11

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Elementary School #1	Chambers Avenue	WSW ½-1	3	14
Proposed Elementary	Rouse Road	W ½-1	4	17

This category contains proposed and existing school sites that were being evaluated by DTSC for possible hazardous materials contamination. The investigations did not reveal any contamination at the sites that would be considered a REC and no further action was required. This listing does not represent a release of hazardous are therefore the sites are not considered a REC.

Orphan Sites: These are sites that cannot be mapped because of poor or inadequate information relating to the location of the site in relation to the subject site. Further information was not obtained for these sites.

Based on the information obtained from the EDR report, all of the sites could be eliminated as potential locations of environmental concern to the subject site as they are located greater than one mile from the project site or are a permitted (permit issued to operate) local/State/federal operation.

7.3 VAPOR ENCROACHMENT

The purpose of the preliminary vapor encroachment screen is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of vapor chemicals of concern (COC) in subsurface soils at the site caused by the release of volatile organic compounds from contaminated soils or groundwater either on or near the site. The potential for VECs beneath the site was evaluated using EDR's Vapor Encroachment Screen in accordance with ASTM E 2600-10 Standard Guide for Vapor Encroachment Screening. The evaluation included performing a Search Distance Test to identify if there are any known or potential contaminated properties surrounding or up gradient of the site within specific search radii, a COC test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COCs are likely to be present, and a Critical Distance Test to evaluate whether or not COCs in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum hydrocarbon contaminants and 30 feet for petroleum hydrocarbons contaminants).

A review of the Vapor Encroachment Screen, as provided by EDR, and dated June 10, 2022 has revealed two COC site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Dir/Dist	Map ID	Page
Menifee Valley Ranch School	McCall Blvd Menifee Street	SE 1/10 – 1/3	1	8
McCall Mesa K-8 School	McCall Blvd Junipero	SSW 1/10-1/3	2	11

These sites are not anticipated to present any environmental impact to the subject property as the listing herein is a required reporting of their operations and not a violation of local, state, or federal regulations. Refer to Appendix E-1 for Vapor Encroachment Screen Report.

8.0 CONCLUSION

Summary: The review of the EDR records search revealed no sites of concern within the vicinity of the subject property that could represent a REC.

Based on a visual inspection of the subject site and the surrounding area; an environmental records search and review of local, federal, and State databases; and in accordance with the limitations presented in this report, Lilburn Corporation presents the following conclusions concerning the subject site:

- No evidence was observed that the property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility. Additionally no evidence was observed that there have been any previously damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals individually stored on or used at the property or at the subject site. No industrial drums (typically 55 gal (208 L)) or sacks of chemicals were observed on the property.
- No evidence that fill dirt has been brought onto the property that originated from a contaminated site or from an unknown origin was observed. Refer to Section 4.0 for soil sampling findings.
- No pits, ponds, or lagoons were observed on the property in connection with waste treatment or waste disposal.
- No signs or evidence or of stained soil were observed on the property.
- No evidence was observed of any registered or unregistered storage tanks (above or underground) located on the property and no observations of any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property were made.
- No indication or evidence of leaks, spills, or staining by substances other than water, or foul odors, associated with any flooring drains, walls, ceilings or exposed grounds on the property was observed.
- No observations were made of evidence that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been buried and/or burned on the property.
- No transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs was observed.
- No evidence was observed indicating any adjoining property was used as a gasoline station, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility.

- Local records reviewed to date have not revealed environmental concerns or issues that would be considered an immediate impairment to property development (pending San Bernardino County Fire Department findings).
- No geologic or hydrogeologic impairments to the subject site were encountered.
- Federal and State environmental databases revealed no environmental issues, which would be considered "an impairment" or REC to the subject site. Refer to Appendix E for a copy of the EDR Reports.

Based on the field reconnaissance of the site a Phase I and limited Phase II site assessment is sufficient to evaluate the property in question and additional site investigations are not recommended.

CERTIFICATION

I, Frank Amendola, certify and agree that:

(1) The inspector has no present or contemplated future interest in the site inspected.

(2) The inspector has no personal interest in or bias with respect to the subject matter of the assessment report or the participants to the sale. This Site Assessment Report is not based in whole or in part upon the race, color, or national origin of the prospective owners or occupants of the site inspected, or upon the race, color or national origin of the present owners or occupants of the properties in the vicinity of the site inspected.

(3) The inspector has personally inspected the site and has made an exterior inspection of all adjacent properties identified in the report. To the best of the inspector's knowledge and belief, all statements and information in this Site Assessment Report are true and correct, and the inspector has not knowingly withheld any significant information.

(4) The legal description and address furnished is correct according to the information furnished to the inspector.

(5) This Site Assessment Report was prepared in conformity with and is subject to the requirements of the Code of Professional Ethics and Standards of Professional Conduct of the environmental organizations with which the inspector is affiliated.

(6) All conclusions and opinions concerning the subject site that are set forth in the Site Assessment Report were prepared by the inspector whose signature appears below.

(7) I declare that to the best of my professional knowledge and belief, I meet the definition of an Environmental Professional as defined in ASTM E 1527-05 and 40 CFR 312.10. I have the specific qualification based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed all appropriate inquiries in conformance with the standard and practices set forth in 40 CFR Part 312.

Prepared By:

Frank Amendola

QUALIFICATIONS STATEMENT

Lilburn Corporation is a full service environmental consulting company with extensive experience in the completion of Phase I ESAs having completed more than 50 ESAs since 1999. Lilburn staff responsible for preparation of Phase I ESAs (including this document) have extensive experience in completing Phase I ESAs in accordance with the current American Society of Testing and Materials standard practice document (ASTM E 1527-05). The resumes of the individual environmental professionals responsible for the completion of this Phase I ESA are included in Appendix F.

This Phase I ESA was completed under the direction of an "Environmental Professional" as defined in ASTM E 1527-005 and 40 CFR 312.10. The Environmental Professional was involved in the planning of the site reconnaissance and the interviews as well as the review and preparation of the report.

LIMITATIONS

The services described in this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. Not laboratory testing was performed in conjunction with this report. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, nor the use of segregated portions of this report.

The purpose of an environmental assessment is to reasonably evaluate the potential for or actual impact of past practices on a given site area. In performing an environmental assessment, it is understood that a balance must be struck between a reasonable inquiry into the environmental issues and an exhaustive analysis of each conceivable issue of potential concern. The following paragraphs discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to exclude the presence of hazardous materials at a given site. If hazardous conditions have not been identified during the assessment, such a finding should not therefore be construed as a guarantee of the absence of such materials on the site, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

Environmental conditions may exist at the site that cannot be identified by visual observation. Where subsurface work was performed, our professional opinions are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions at unsampled locations.

Except where there is express concern of our client, or where specific environmental contaminants have been previously reported by others, naturally occurring toxic substances, potential environmental contaminants inside buildings, or contaminant concentrations that are not of current environmental concern may not be reflected in this document.

Re: Proposal for Limited Site Investigation
Menifee Development
Northeast Intersection of Junipero Road and McCall Boulevard
Menifee, Riverside County, California
Terracon Project No. 60227232

Dear Ms. Tubbs:

Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed Limited Site Investigation report for the above referenced site. This assessment was performed in general accordance with Terracon's Proposal for Limited Site Investigation, dated June 8, 2022, and Terracon's Agreement for Services, executed June 9, 2022.

We appreciate the opportunity to perform these services for Lilburn Corporation . Please contact the undersigned at (949) 864-2078 if you have questions regarding the information provided in the report.

Sincerely,
Terracon Consultants, Inc.

Eric J. St. Michel
Staff Scientist

Todd G. McFarland, P.G., C.H.G.

MENIFEE DEVELOPMENT
NORTHEAST INTERSECTION OF JUNIPERO ROAD AND MCCALL BOULEVARD
MENIFEE, RIVERSIDE COUNTY, CALIFORNIA
Terracon Project No. 60227232
July 18, 2022

1.0 INTRODUCTION

1.1 Site Description

Site Name	Menifee Development
Site Location/Address	Northeast Intersection of Junipero Road and McCall Boulevard, Menifee, Riverside County, California
General Site Description	The property is identified as the Menifee development located northeast of the intersection of Junipero Road and McCall Boulevard in Menifee, Riverside County, California. Terracon understands that the site consists of approximately 17.67-acres of undeveloped land that was previously utilized for agricultural practices.

A topographic map and site diagram are included as **Exhibits 1** and **2** of **Appendix A**, respectively.

1.2 Scope of Work

Terracon conducted a Limited Site Investigation (LSI) at the site, northeast of the intersection of Junipero Road and McCall Boulevard in Menifee, Riverside County, California (the site). The scope of services was conducted to assess potential environmental impacts that may be present as a result of the below-listed recognized environmental conditions (RECs) and/or site concerns. Please note that Terracon did not conduct a Phase I Environmental Site Assessment (ESA) of the property, and that the scope of services was based solely on information provided in Lilburn Corporation's Phase I Environmental Site Assessment and Limited Phase II ESA dated December 2014, and additional information provided by the client.

REC/Site Concern	Description
Former agricultural use	Potential for improper use and/or application of pesticides and herbicides associated with the former agricultural uses.

The objective of the LSI was to assess the presence of chemicals commonly associated with the identified RECs and/or site concerns at concentrations above laboratory reporting limits in the on-site soil. Based on the surficial nature of the identified REC, groundwater and soil vapor sampling were not included in the proposed scope.

1.3 Standard of Care

Terracon's services were performed in a manner consistent with generally accepted practices of the profession undertaken in similar studies in the same geographical area during the same time period. Terracon makes no warranties, either express or implied, regarding the findings, conclusions, or recommendations. Please note that Terracon does not warrant the work of laboratories, regulatory agencies, or other third parties supplying information used in the preparation of the report. These LSI services were performed in accordance with the scope of work agreed with you, our client, as reflected in our proposal and were not restricted by ASTM E1903-19.

1.4 Additional Scope Limitations

Findings, conclusions, and recommendations resulting from these services are based upon information derived from the on-site activities and other services performed under this scope of work; such information is subject to change over time. Certain indicators of the presence of hazardous substances, petroleum products, or other constituents may have been latent, inaccessible, unobservable, nondetectable, or not present during these services, and we cannot represent that the site contains no hazardous substances, toxic materials, petroleum products, or other latent conditions beyond those identified during this LSI. Subsurface conditions may vary from those encountered at specific borings or wells or during other surveys, tests, assessments, investigations, or exploratory services; the data, interpretations, findings, and our recommendations are based solely upon data obtained at the time and within the scope of these services.

1.5 Reliance

This report has been prepared for the exclusive use of and reliance of Lilburn Corporation. Use or reliance by any other parties (except a governmental entity having jurisdiction over the site) is prohibited without the express written authorization of and reliance of Lilburn Corporation and Terracon. Any unauthorized distribution or reuse is at and reliance of Lilburn Corporation's sole risk. Notwithstanding the foregoing, reliance by authorized parties will be subject to the terms, conditions, and limitations stated in the proposal, LSI report, and Terracon's Terms and Conditions. The limitation of liability defined in the terms and conditions is the aggregate limit of Terracon's liability to and reliance of Lilburn Corporation unless otherwise agreed in writing.

2.0 FIELD ACTIVITIES

Terracon's field activities were conducted on June 17, 2022, by a staff geologist with oversight by a California-licensed Professional Geologist (P.G.) with Terracon. A site-specific health and safety plan was utilized by Terracon during field activities for all phases of this assessment.

2.1 Soil Borings and Soil Sampling

On June 17, 2022, Terracon advanced eighteen (18) shallow soil borings using a hand-auger to 0.5 feet below ground surface (bgs). The discrete samples were then composited by the laboratory at a ratio of 3:1, for a total of six (6) analytical samples. The approximate boring locations are shown on **Exhibit 2** of **Appendix A** and are summarized below.

advanced fourteen (14) shallow soil borings (B-1 through B-14) using a hand-auger to 0.5 feet below ground surface (bgs). The approximate boring locations are shown on **Exhibit 2** of **Appendix A** and are summarized below.

Table 2.1 – Soil Boring Summary

Sample ID	Composite Sample ID	Total Depth (feet bgs)	Soil Sample Depth* (feet bgs)	Sample Type	Assessment Area/REC
S-1A	COMP 3:1 (S-1A – S-1C)	0.5	0.5	Grab	Former agricultural use
S-1B					
S-1C					
S-2A	COMP 3:1 (S-2A – S-2C)	0.5	0.5	Grab	Former agricultural use
S-2B

S-4B					
S-4C					
S-5A	COMP 3:1 (S-5A – S-5C)	0.5	0.5	Grab	Former agricultural use
S-5B					
S-5C					
S-6A	COMP 3:1 (S-6A – S-6C)	0.5	0.5	Grab	Former agricultural use
S-6B					
S-6C					

*Sample depths selected for analytical testing.

Terracon collected soil samples from the soil borings to observe soil lithology, color, moisture content, and staining, if present. The soils encountered generally consisted of dry to damp silty sand and sand to the maximum depth of exploration of 0.5 feet bgs. Indications of staining were not observed.

Terracon's soil sampling program included the collection of one soil sample from each boring. Terracon collected grab soil samples from the barrel of the hand-auger. Samples were retrieved from the sampler and placed in laboratory provided containers. The field crew used new nitrile gloves for each sample collection to prevent cross contamination. The samples were labeled, sealed, recorded on chain-of-custody forms and stored in a chilled ice chest pending delivery to the laboratory.

Reusable drilling and sampling equipment was cleaned using an Alconox® wash and two potable water rinses prior to the beginning of the project and before collecting each soil sample. Investigation derived waste (IDW) was not generated during this investigation.

3.0 LABORATORY ANALYTICAL METHODS

3.1 Soil

A total of eighteen (18) discrete soil samples were collected. The laboratory composited the discrete samples at a 3:1 ratio for laboratory analysis. The soil samples and completed chain-of-custody forms were relinquished to SunStar Laboratories Inc., in Lake Forest, California, a State-of-California certified laboratory for analysis. The selected soil samples were analyzed using standard Environmental Protection Agency (EPA) methods and included:

- organochlorine pesticides (OCPs) by EPA 8081A; and,
- arsenic by EPA 6010B.

4.0 DATA EVALUATION

Terracon screened the analytical data using the current residential and commercial Environmental Screening Levels (ESLs) published by San Francisco Bay Regional Water Quality Control Board (2019, Rev. 2). Arsenic data was additionally evaluated using California Department of Toxic Substances Control (DTSC), Determination of a Southern California Regional Background Arsenic Concentration in Soil. The detection of an analyte at a concentration above a screening level does not necessarily indicate an adverse impact to human health or the environment; however, an exceedance of a screening level may indicate that additional investigation is warranted.

4.1 Soil Analytical Results – OCPs and Arsenic

The soil analytical results for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits, as summarized below.

Table 4.1 – Analytical Summary

	Arsenic (mg/kg)	OCPs[1] (mg/kg)	Toxaphene (mg/kg)
Reporting Limit	<5.0	<0.0050	<0.020
Screening Levels			
DTSC	12	--	--
Residential ESL	--	0.035[2]	0.51
Commercial ESL	--	0.15[2]	2.2

[1] Excludes toxaphene
[2] Aldrin ESL value, lowest screening level for OCPs

The soil analytical results are detailed in the laboratory analytical report and chain-of-custody forms, which are included in **Appendix B**.

5.0 FINDINGS AND CONCLUSIONS

The findings of this LSI are as follows:

- No indications of staining or significant impacts based on field observations.
- Soil analysis for OCPs and arsenic were below the specified laboratory report limits and applicable screening limits.
- IDW was not generated for this investigation.
- Groundwater was not encountered to the total depth of 0.5 feet bgs.

Based on the field observations and laboratory data, evidence of significant impairment were not identified in the areas accessible and investigated, and at the time the investigation was conducted. Concentrations of detected analytes were below applicable residential and commercial screening levels.

6.0 RECOMMENDATIONS

Based on the findings of the LSI, no additional investigation appears warranted at this time.

Geotechnical Engineering Investigation

RE: **Geotechnical Engineering Investigation** - Proposed "The Village at Junipero Apartment Development" - Located at the Southwest Corner of Menifee Road and Heritage Lakes Drive, in the City of Menifee, California

Dear Mr. Christiansen:

Pursuant to your request, this firm has performed a Geotechnical Engineering Investigation in accordance with your authorization of signed proposal dated August 18, 2014 for the above referenced project. The purpose of this investigation is to evaluate the subsurface conditions of the subject site and to provide recommendations for the proposed residential development.

The scope of work included the following: 1) site reconnaissance; 2) subsurface geotechnical exploration and sampling; 3) laboratory testing; 4) engineering analysis of field and laboratory data; 5) and preparation of a geotechnical engineering report. It is the opinion of this firm that the proposed development is feasible from a geotechnical standpoint provided that the recommendations presented in this report are followed in the design and construction of the project.

1.0 Project Description

It is proposed to construct a multi-unit apartment development as shown on the attached conceptual site plan. The project will consist of twenty-four (24) apartment buildings including a new clubhouse and swimming pool on the 19.25-acre property. The two and/or three story buildings will be supported by conventional slab-on-grade foundation systems with perimeter-spread footings and isolated interior footings. Other improvements will consist of asphalt/concrete pavement, hardscape and landscaping. It is assumed that the proposed grading for the entire development will include cut and fill procedures. The latest grading plan shall be reviewed by this firm prior to submittal for city/county approval to determine the need for any additional study and revised recommendations pertinent to the proposed development, if necessary.

2.0 Site Description

The subject property is situated at the southwest corner of Menifee Road and Heritage Lakes Drive, in the City of Menifee. The generally rectangular shaped parcel is elongated in an east to west direction and topography of the relatively level parcel descending gradually from south to north on the order of a few feet. The site is an undeveloped lot currently covered with a low to moderate growth of vegetation consisting of natural grasses and weeds.

3.0 Site Exploration

The investigation consisted of the placement of two (2) subsurface exploratory borings by a truckmounted hollow stem auger to depths of 20 and 50 feet and eleven (11) subsurface exploratory trenches by a backhoe to depths ranging between 5 and 15 feet below current ground elevations. The explorations were visually classified and logged by a field engineer with locations of the subsurface explorations shown on the attached Site Plan. The exploratory borings and trenches revealed the existing earth materials to consist of a fill and natural soil. A detailed description of the subsurface conditions is listed on the excavation logs in Appendix A.

Fill: A fill and/or disturbed top soil classifying as brown, sandy SILT was encountered to a depth of 1 to 1½ feet. These soils were noted to be soft and dry to damp.

Natural: An undisturbed native soil classifying as a brown to grey and red brown, sandy SILT to a fine to coarse grained, silty to clayey SAND was encountered directly beneath the fill and observed to be stiff to very stiff and dense to very dense and damp to moist.

The overall engineering characteristics of the earth material were relatively uniform with each excavation. Groundwater was encountered at a depth of 36 feet and no caving occurred to the depth of our borings.

4.0 Laboratory Tests

Relatively undisturbed samples of the subsurface soils were obtained to perform laboratory testing and analysis for direct shear, consolidation tests, and to determine in-place moisture/densities. These relatively undisturbed ring samples were obtained by driving a thin-walled steel sampler lined with one inch long brass rings with an inside diameter of 2.42 inches into the undisturbed soils.

Standard penetration tests were obtained by driving an unlined steel sampler with an inside diameter of 1.5 inches into the soils. This standard penetrometer sampler was driven a total of eighteen inches with blow counts tallied every six inches. Blow count data is given on the Boring Logs in Appendix A. Bulk bag samples were obtained in the upper soils for expansion index tests and maximum density tests. All test results are included in Appendix B, unless otherwise noted.

4.1 **Field moisture content** (ASTM: D 2216) and the dry density of the ring samples were determined in the laboratory. This data is listed on the logs of explorations.

4.2 **Sieve analyses** (ASTM: D 422-63) and the percent by weight of soil finer than the No. 200 sieve (ASTM: 1140) were performed on selected soil samples. These results are shown later within the body of this report.

4.3 **Maximum density tests** (ASTM: D-1557-07) were performed on typical samples of the upper soils. Results of these tests are shown on Table I.

4.4 **Expansion index tests** (ASTM: D 4829-07) were performed on remolded samples of the upper soils. Results of these tests are provided on Table II.

4.5 **Atterberg Limits** (ASTM: D 4318-05) consisting of liquid limit, plastic limit and plasticity index were performed on representative soil samples. Results are shown on Table III.

4.6 **Corrosion tests** consisting of sulfate, pH, resistivity and chloride analysis to determine potential corrosive effects of soils on concrete and underground utilities. Test results are provided on Table IV.

4.7 **R-Value test** per California Test Method 301 was performed on a representative sample, which may be anticipated to be near subgrade to determine pavement design. Result provided within pavement section design section of report.

4.8 **Direct Shear tests** (ASTM: D-3080) were performed on undisturbed and disturbed samples of the subsurface soils. The test is performed under saturated conditions at loads of 1,000 lbs./sq.ft., 2,000 lbs./sq.ft., and 3,000 lbs./sq.ft. with results shown on Plates A to C.

4.9 **Consolidation tests** (ASTM: D-2435) were performed on undisturbed samples to determine the differential and total settlement which may be anticipated based upon the proposed loads. Water was added to the samples at a surcharge of one KSF and the settlement curves are plotted on Plates D to G.

5.0 Geologic Setting

The property is located in the Peninsular Ranges geomorphic province of California. The Peninsular Ranges province extends from the Los Angeles Basin southeast to Baja California and from the Pacific Ocean eastward to the Coachella Valley and Colorado Desert. The province consists of numerous northwest to southeast-trending mountain ranges and valleys that are geologically controlled by several major active faults. The site is located in the central portion of the Perris block, a generally stable area situated between two of these major faults; the Chino /Elsinore (roughly 8 miles southwest) and San Jacinto (roughly 10 miles northeast) fault zones.

5.1 Site Geology

The USGS Open File Report for the Romoland 7.5 minute quadrangle assigns the soil materials underlying the site as alluvial deposits bordering Cretaceous granitic rocks at the very western edge of the property. Exploration at the site encountered existing earth materials to consist of a fill and natural soil. A detailed description of the subsurface conditions is listed on the excavation logs in Appendix A.

5.2 Surface Fault Rupture

The property is not located in a Riverside County Recommended Earthquake Fault Study Zone, a Riverside County Land Information System (RCLIS) fault zone or an Alquist-Priolo (AP) earthquake fault zone. No indications of natural lineaments or other fault-related features indicative of Holocene or older faulting were noted in review of topographic and geologic maps pertaining to the area and no indications of faulting were noted during our reconnaissance at and in the vicinity of the site.

Based on our evaluation, we conclude that there are no active or potentially active faults trending towards or through the parcels, and additional fault investigations are not necessary. The potential for surface fault rupture to occur at the parcels is considered low. As is the case with most of southern California, the properties are expected to experience strong ground shaking during the lifetime of the project.

5.3 Slope Stability-Landslides, Debris Flows and Rock Falls

The property is not mapped in an area considered susceptible to seismically induced landslides or rockfalls as shown on the Riverside County Earthquake-Induced Slope Instability Map. The property is situated on gently sloped ground well away from topography with any significant relief. The potential for landslides, debris flows or rock falls to impact the site is considered low.

5.4 Subsidence and Fissuring

The site is located in an area designated on the Riverside County Land Information System as "susceptible" to subsidence. According to the Riverside County Hazards report (Earth Consultants International, 2001), subsidence in Riverside County has been linked to significant fluctuations in groundwater levels within deep alluvial basins, and generally, the subsidence occurs throughout the valley region. Three areas have been identified with documented subsidence; the Elsinore Trough, the San Jacinto Valley, and the southern Coachella Valley.

Fissuring associated with land subsidence is well-documented in Riverside County. Displacements consisting of fissuring and ground cracking occur at, or near, valley margins. Many areas associated with fissuring are along active faults.

Based on our evaluation, the potential for subsidence and ground fissures at the site is considered low. The property is not situated within any of the three areas of Riverside County associated with subsidence and resulting fissuring, and the property is not situated at a valley margin or along an active fault.

5.5 Seiches

The parcels are not in proximity to an enclosed or partially enclosed body of water or basin with the potential to hold water; the properties are not subject to seiche inundation.

5.6 Water Erosion

The parcels are not situated in a flood zone, but could be susceptible to erosion by water without appropriate erosion control measures.

6.0 Seismicity Evaluation

The proposed development lies outside of any Alquist Priolo Special Studies Zone and the potential for damage due to direct fault rupture is considered very remote. The site is located in an area of high regional seismicity and a maximum horizontal ground acceleration of 0.40g may occur from a Magnitude 6.8 earthquake along the Elsinore (Glen Ivy) fault zone, which is located approximately 13 kilometers away. Ground shaking originating from earthquakes along other active faults in the region is expected to induce lower horizontal accelerations due to smaller anticipated earthquakes and/or greater distances to other faults.

The seismic design of the project has been updated to the latest 2010 ASCE 7-10 (with July 2013 errata) standards and the mapped seismic ground motions were provided by using the Java based program available from the United States Geological Survey (USGS) website: http://geohazards.usgs.gov/designmaps/us/application.php. The earthquake design parameters are in accordance with the 2013 California Building Code (CBC) and are listed below.

Seismic Design Parameters

Site Location	Latitude	33.724°
	Longitude	-117.156°
Site Class		D
Risk Category		I/II/III
Maximum Spectral Response Acceleration	S_S	1.500g
	S_1	0.600g
Adjusted Maximum Acceleration	S_{MS}	1.500g
	S_{M1}	0.900g
Design Spectral Response Acceleration Parameters	S_{DS}	1.000g
	S_{D1}	0.600g

7.0 Liquefaction Evaluation

The site is expected to experience ground shaking and earthquake activity that is typical of Southern California area. It is during severe ground shaking that loose, granular soils below the groundwater table can liquefy. A review of the exploratory boring log and the laboratory test results on selected soil samples obtained indicate the following soil classifications, field blowcounts and amounts of fines passing through the No. 200 sieve.

Field Blowcount and Gradation Data

Location	Classification	Blowcounts (blows/ft)	Relative Density	% Passing No. 200 Sieve
B-1 @ 5'	SC	59	Very Dense	47
B-1 @ 10'	SM	73	Very Dense	22
B-1 @ 15'	SC	46	Very Dense	32
B-1 @ 20'	SM	67	Very Dense	10
B-1 @ 25'	SC	>50	Very Dense	32
B-1 @ 30'	SM	72	Very Dense	19
B-1 @ 35'	CL	46	Very Dense	73
B-1 @ 40'	SC	62	Very Dense	32
B-1 @ 45'	SM	39	Very Dense	17
B-1 @ 50'	SM	>50	Very Dense	20

Groundwater was encountered at a depth of 36 feet below existing ground surface from our field exploration. Based upon information in the City of Riverside Public Safety Element "Liquefaction Zones (2006)", the subject site is situated in an area of low generalized liquefaction susceptibility.

Our analysis indicates the potential for liquefaction at this site is considered to be low due to the density of the subsurface soils. The seismic-induced settlements shall be on the order of less than one-half inch and should occur rather uniformly across the lot. Differential settlements would be on the order of less than one-half inch over a 50 feet distance in the building area. Thus, the design of the proposed construction in conformance with the latest Building Code provisions for earthquake design is expected to provide mitigation of ground shaking hazards that are typical to Southern California.

8.0 Conclusions and Recommendations

Based upon our evaluations, the proposed development is acceptable from a geotechnical engineering standpoint. By following the recommendations and guidelines set forth in our report, the structures will be safe from excessive settlements under the anticipated design loadings and conditions. The proposed development shall meet all requirements of the City Building Ordinance and will not impose any adverse effect on existing adjacent structures.

The following recommendations are based upon geotechnical conditions encountered in our field investigation and laboratory data. Therefore, these surface and subsurface conditions could vary across the site. Variations in these conditions may not become evident until the commencement of grading operations and any unusual conditions which may be encountered in the course of the project development may require the need for additional study and revised recommendations.

It is recommended that site inspections be performed by a representative of this firm during all grading and construction of the development to verify the findings and recommendations documented in this report. The following sections present a discussion of geotechnical related requirements for specific design recommendations of different aspects of the project.

8.1 Site Grading Recommendations

Any vegetation and or demolition debris shall be removed and hauled from proposed grading areas prior to the start of grading operations. Existing vegetation shall not be mixed or disced into the soils. Any removed soils may be reutilized as compacted fill once any deleterious material or oversized materials (in excess of eight inches) is removed. Grading operations shall be performed in accordance with the attached "Specifications for Compacted Fill Operations".

8.1.1 **Removal and Recompaction Recommendations**

All disturbed top soils and fill (about 1 to 1½ feet below existing ground surface) shall be removed to competent native material, the exposed surface scarified to a depth of 12 inches, brought to within 2% of optimum moisture content and compacted to a minimum of 90% of the laboratory standard (ASTM: D-1557) prior to placement of any additional compacted fill soils, foundations, slabs-on-grade and pavement. Grading shall extend a minimum of five horizontal feet outside the edges of foundations or equidistant to the depth of fill placed, whichever is greater.

It is possible that isolated areas of undiscovered fill not described in this report are present on site. If found, these areas should be treated as discussed earlier. A diligent search shall also be conducted during grading operations in an effort to uncover any underground structures, irrigation or utility lines. If encountered, these structures and lines shall be either removed or properly abandoned prior to the proposed construction.

Any imported fill material should be preferably soil similar to the upper soils encountered at the subject site. All soils shall be approved by this firm prior to importing at the site and will be subjected to additional laboratory testing to assure concurrence with the recommendations stated in this report.

Care should be taken to provide or maintain adequate lateral support for all adjacent improvements and structures at all times during the grading operations and construction phase. Adequate drainage away from the structures, pavement and slopes should be provided at all times.

If placement of slabs-on-grade and pavement is not completed immediately upon completion of grading operations, additional testing and grading of the areas may be necessary prior to continuation of construction operations. Likewise, if adverse weather conditions occur which may damage the subgrade soils, additional assessment by the geotechnical engineer as to the suitability of the supporting soils may be needed.

8.1.2 **Fill Blanket Recommendations**

In areas of transition between the underlying native material and engineered fill, additional overexcavation of the native material consisting of a depth of two feet below proposed foundations is required to mitigate the potential of differential settlement. This fill shall extend a minimum of five horizontal feet or to the depth of vertical overexcavation, whichever is greater, beyond the outside edge of the perimeter foundation.

8.2 **Shrinkage and Subsidence**

Results of our in-place density tests reveal that the soil shrinkage will be on the order of 5 to 15% due to excavation and recompaction, based upon the assumption that the fill is compacted to 92% of the maximum dry density per ASTM standards. Subsidence should be 0.2 feet due to earthwork operations. The volume change does not include any allowance for vegetation or organic stripping, removal of subsurface improvements or topographic approximations. Although these values are only approximate, they represent our best estimate of lost yardage which will likely occur during grading. If more accurate shrinkage and subsidence factors are needed, it is recommended that field testing using the actual equipment and grading techniques should be conducted.

8.3 **Temporary Excavations**

Temporary unsurcharged excavations in the existing site materials less than 4 feet high may be made at a vertical gradient unless cohesionless soils are encountered. In areas where soils with little or no binder are encountered, where adverse geological conditions are exposed, or where excavations are adjacent to existing structures, shoring, slot-cutting, or flatter excavations may be required. The temporary cut slope gradients given do not preclude local raveling and sloughing. All excavations shall be made in accordance with the requirements of CAL-OSHA and other public agencies having jurisdiction. Care should be taken to provide or maintain adequate lateral support for all adjacent improvements and structures at all times during the grading operations and construction phase.

8.4 **Foundation Design**

All foundations may be designed utilizing the following safe bearing capacities for an embedded depth of 24 inches into approved fill materials with the corresponding widths:

Allowable Safe Bearing Capacity (psf)

Width (ft)	Continuous Foundation	Isolated Foundation
1.5	2000	2500
2.0	2075	2575
4.0	2375	2875
6.0	2500	3000

The bearing value may be increased by 500 psf for each additional foot of depth in excess of the 24-inch minimum depth, up to a maximum of 4,000 psf. Any foundations located along the property lines or where lateral overexcavation is not possible may utilize a safe bearing capacity of 1,500 psf. A one third increase may be used when considering short-term loading and seismic forces.

All continuous foundations shall be reinforced a minimum of one No. 4 bar, top and bottom. Isolated foundations shall be reinforced per the discretion of the project structural engineer. A representative of this firm shall inspect all foundation excavations prior to pouring concrete.

8.5 **Settlement Analysis**

Resultant pressure curves for the consolidation tests are shown on Plates D to G. Computations utilizing these curves and the recommended safe bearing capacities reveal that the foundations will experience settlements on the order of 3/4 inch and differential settlements of less than 1/4 inch.

8.6 Lateral Resistance

The following values may be utilized in resisting lateral loads imposed on the structure. Requirements of the California Building Code should be adhered to when the coefficient of friction and passive pressures are combined.

Coefficient of Friction – 0.40

Equivalent Passive Fluid Pressure = 250 lbs./cu.ft.

Maximum Passive Pressure = 2,500 lbs./cu.ft.

The passive pressure recommendations are valid only for approved compacted fill soils.

8.7 Retaining Wall Design Parameters

Active earth pressures against retaining wall will be equal to the pressures developed by the following fluid densities. These values are for **granular backfill material** placed behind the walls at various ground slopes above the walls.

Surface Slope of Retained Materials (Horizontal to Vertical)	Equivalent Fluid Density (lb./cu.ft.)
Level	30
5 to 1	35
4 to 1	38
3 to 1	40
2 to 1	45

Any applicable short-term construction surcharges and seismic forces should be added to the above lateral pressure values. All walls shall be waterproofed as needed and protected from hydrostatic pressure by a reliable permanent subdrain system. The subsurface drainage system shall consist of 4-inch diameter perforated PVC pipe encased with gravel. The granular backfill to be utilized immediately adjacent to the basement walls shall consist of an approved granular soils with a sand equivalency greater than 30. This backfill zone of free draining material shall consist of a wedge beginning a minimum of one horizontal foot from the base of the wall extending upward at an inclination of no less than 3/4 to 1 (horizontal to vertical).

The seismic-induced lateral soil pressure may be computed using a triangular pressure distribution with the maximum value at the top of the wall. The maximum lateral pressure of (20pcf) H, where H is the height of the retained soils above the wall footing should be utilized in final design of retaining walls. Sliding resistance values and passive fluid pressures given in our referenced report may be increased by 1/3 during short-term wind and seismic loading conditions.

8.8 Slab Design

All concrete slabs-on-grade shall be at least four inches reinforced with No. 3 bars at sixteen inch spacing in each direction and positioned in the center of the slab and placed on approved subgrade soils. These slabs shall be placed on approved subgrade soils moisture conditioned to above optimum moisture content to a depth of twelve inches.

A vapor retarder (10-mil minimum thickness) should be utilized in areas which would be sensitive to the infiltration of moisture. This retarder shall meet requirements of ASTM E 96, *Water Vapor Transmission of Materials* and ASTM E 1745, *Standard Specification for Water Vapor Retarders used in Contact with Soil or Granular Fill Under Concrete Slabs.* The vapor retarder shall be installed in accordance with procedures stated in ASTM E 1643, *Standard practice for Installation of Water Vapor Retarders used in Contact with Earth or Granular Fill Under Concrete Slabs.*

The moisture retarder may be placed directly upon approved subgrade soils, although one to two inches of sand beneath the membrane is desirable. The subgrade upon which the retarder is placed shall be smooth and free of rocks, gravel or other protrusions which may damage the retarder. Use of sand above the retarder is under the purview of the structural engineer; if sand is used over the retarder, it should be placed in a dry condition.

8.9 **Pavement Section Design**

The table below provides a preliminary pavement design based upon an R-Value of 28 for the proposed pavement areas. Final pavement design may need to be based on R-Value testing of the subgrade soils near the conclusion of rough grading to assure that these soils are consistent with those assumed in this preliminary design.

Type of Traffic	Traffic Index	Asphaltic Concrete (in)	Base Material (in)
Automobile Parking Stalls	4.0	3.0	4.0
Light Vehicle Circulation Areas	5.5	3.5	7.0

All concrete slabs to be utilized for pavement shall be a minimum of six inches in thickness and placed on approved subgrade soils. Client should submit anticipated traffic loadings, when available, so that pavement sections may be reviewed to determine adequacy to support these loads.

Any approved base material shall consist of a Class II aggregate or equivalent and should be compacted to a minimum of 95% relative compaction. All pavement materials shall conform to the requirements set forth by the City of Menifee. The base material and asphaltic concrete should be tested prior to delivery to the site and during placement to determine conformance with the project specifications. A pavement engineer shall designate the specific asphalt mix design to meet the required project specifications.

All pavement areas shall have positive drainage toward an approved outlet from the site. Drain lines behind curbs and/or adjacent to landscape areas should be considered by client and the appropriate design engineers to prevent water from infiltrating beneath pavement. If such infiltration occurs, damage to pavement, curbs and flow lines, especially on sites with expansive soils, may occur during the life of the project.

8.10 **Utility Trench and Excavation Backfill**

Trenches from installation of utility lines and other excavations may be backfilled with on-site soils or approved imported soils compacted to a minimum of 90% relative compaction. All utility lines shall be properly bedded with clean sand having a sand equivalency rating of 30 (SE > 30) or more. This bedding material shall be thoroughly water jetted around the pipe structure prior to placement of compacted backfill soils.

8.11 **Corrosion Design Criteria**

Representative samples of the surficial soils, typical of the subgrade soils expected to be encountered within foundation excavations and underground utilities were tested for corrosion potential. The minimum resistivity value obtained for the samples tested is representative of an environment that may be corrosive to metals. The soil pH value was considered mildly acidic and may have a significant effect on soil corrosivity. Consideration should be given to corrosion protection systems for buried metal such as protective coatings, wrappings or the use of PVC where permitted by local building codes.

According to Table 4.3.1, ACI 318 Building Code and Commentary, these contents revealed negligible levels of sulfate exposure. Therefore, a Type II cement according to latest CBC specifications may be utilized for building foundations at this time. Additional sulfate tests shall be performed at the completion of site grading to assure that these soils are consistent with the recommendations stated in this design. Sulfate test results may be found on the attached Table IV.

8.12 **Expansive Soil**

Since expansive soils were encountered, special attention should be given to the project design and maintenance. The attached *Expansive Soil Guidelines* should be reviewed by the engineers, architects, owner, maintenance personnel and other interested parties and considered during the design of the project and future property maintenance.

9.0 Closure

The recommendations and conclusions contained in this report are based upon the soil conditions uncovered in our test excavations. No warranty of the soil condition between our excavations is implied. NorCal Engineering should be notified for possible further recommendations if unexpected to unfavorable conditions are encountered during construction phase. It is the responsibility of the owner to ensure that all information within this report is submitted to the Architect and appropriate Engineers for the project. This firm should have the opportunity to review the final plans to verify that all our recommendations are incorporated. This report and all conclusions are subject to the review of the controlling authorities for the project.

A preconstruction conference should be held between the developer, general contractor, grading contractor, city inspector, architect, and soil engineer to clarify any questions relating to the grading operations and subsequent construction. Our representative should be present during the grading operations and construction phase to certify that such recommendations are complied within the field.

This geotechnical investigation has been conducted in a manner consistent with the level of care and skill exercised by members of our profession currently practicing under similar conditions in the Southern California area. No other warranty, expressed or implied is made.

We appreciate this opportunity to be of service to you. If you have any further questions, please do not hesitate to contact the undersigned.

Respectfully submitted,
NORCAL ENGINEERING

SPECIFICATIONS FOR PLACEMENT OF COMPACTED FILL

Excavation

Any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90% relative compaction (in accordance with ASTM: D-1557).

In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure.

Material For Fill

The on-site soils or approved import soils may be utilized for the compacted fill provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation of site.

Placement of Compacted Fill Soils

The approved fill soils shall be placed in layers not excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2% of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90% relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every 2 feet of compacted fill placed.

The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm.

Grading Observations

The controlling governmental agencies should be notified prior to commencement of any grading operations. This firm recommends that the grading operations be conducted under the observation of a Soils Engineering firm as deemed necessary. A 24 hour notice must be provided to this firm prior to the time of our initial inspection.

Observation shall include the clearing and grubbing operations to assure that all unsuitable materials have been properly removed; approve the exposed subgrade in areas to receive fill and in areas where excavation has resulted in the desired finished grade and designate areas of overexcavation; and perform field compaction tests to determine relative compaction achieved during fill placement. In addition, all foundation excavations shall be observed by the Soils Engineering firm to confirm that appropriate bearing materials are present at the design grades and recommend any modifications to construct footings.

Expansive Soil Guidelines

The following expansive soil guidelines are provided for your project. The intent of these guidelines is to inform you, the client, of the importance of proper design and maintenance of projects supported on expansive soils. ***You, as the owner or other interested party, should be warned that you have a duty to provide the information contained in the soil report including these guidelines to your design engineers, architects, landscapers and other design parties in order to enable them to provide a design that takes into consideration expansive soils.***

In addition, you should provide the soil report with these guidelines to any property manager, lessee, property purchaser or other interested party that will have or assume the responsibility of maintaining the development in the future.

Expansive soils are fine-grained silts and clays which are subject to swelling and contracting. The amount of this swelling and contracting is subject to the amount of fine-grained clay materials present in the soils and the amount of moisture either introduced or extracted from the soils. Expansive soils are divided into five categories ranging from "very low" to "very high". Expansion indices are assigned to each classification and are included in the laboratory testing section of this report. *If the expansion index of the soils on your site, as stated in this report, is 21 or higher, you have expansive soils.* The classifications of expansive soils are as follows:

Classification of Expansive Soil*

Expansion Index	Potential Expansion
0-20	Very Low
21-50	Low
51-90	Medium
91-130	High
Above 130	Very High

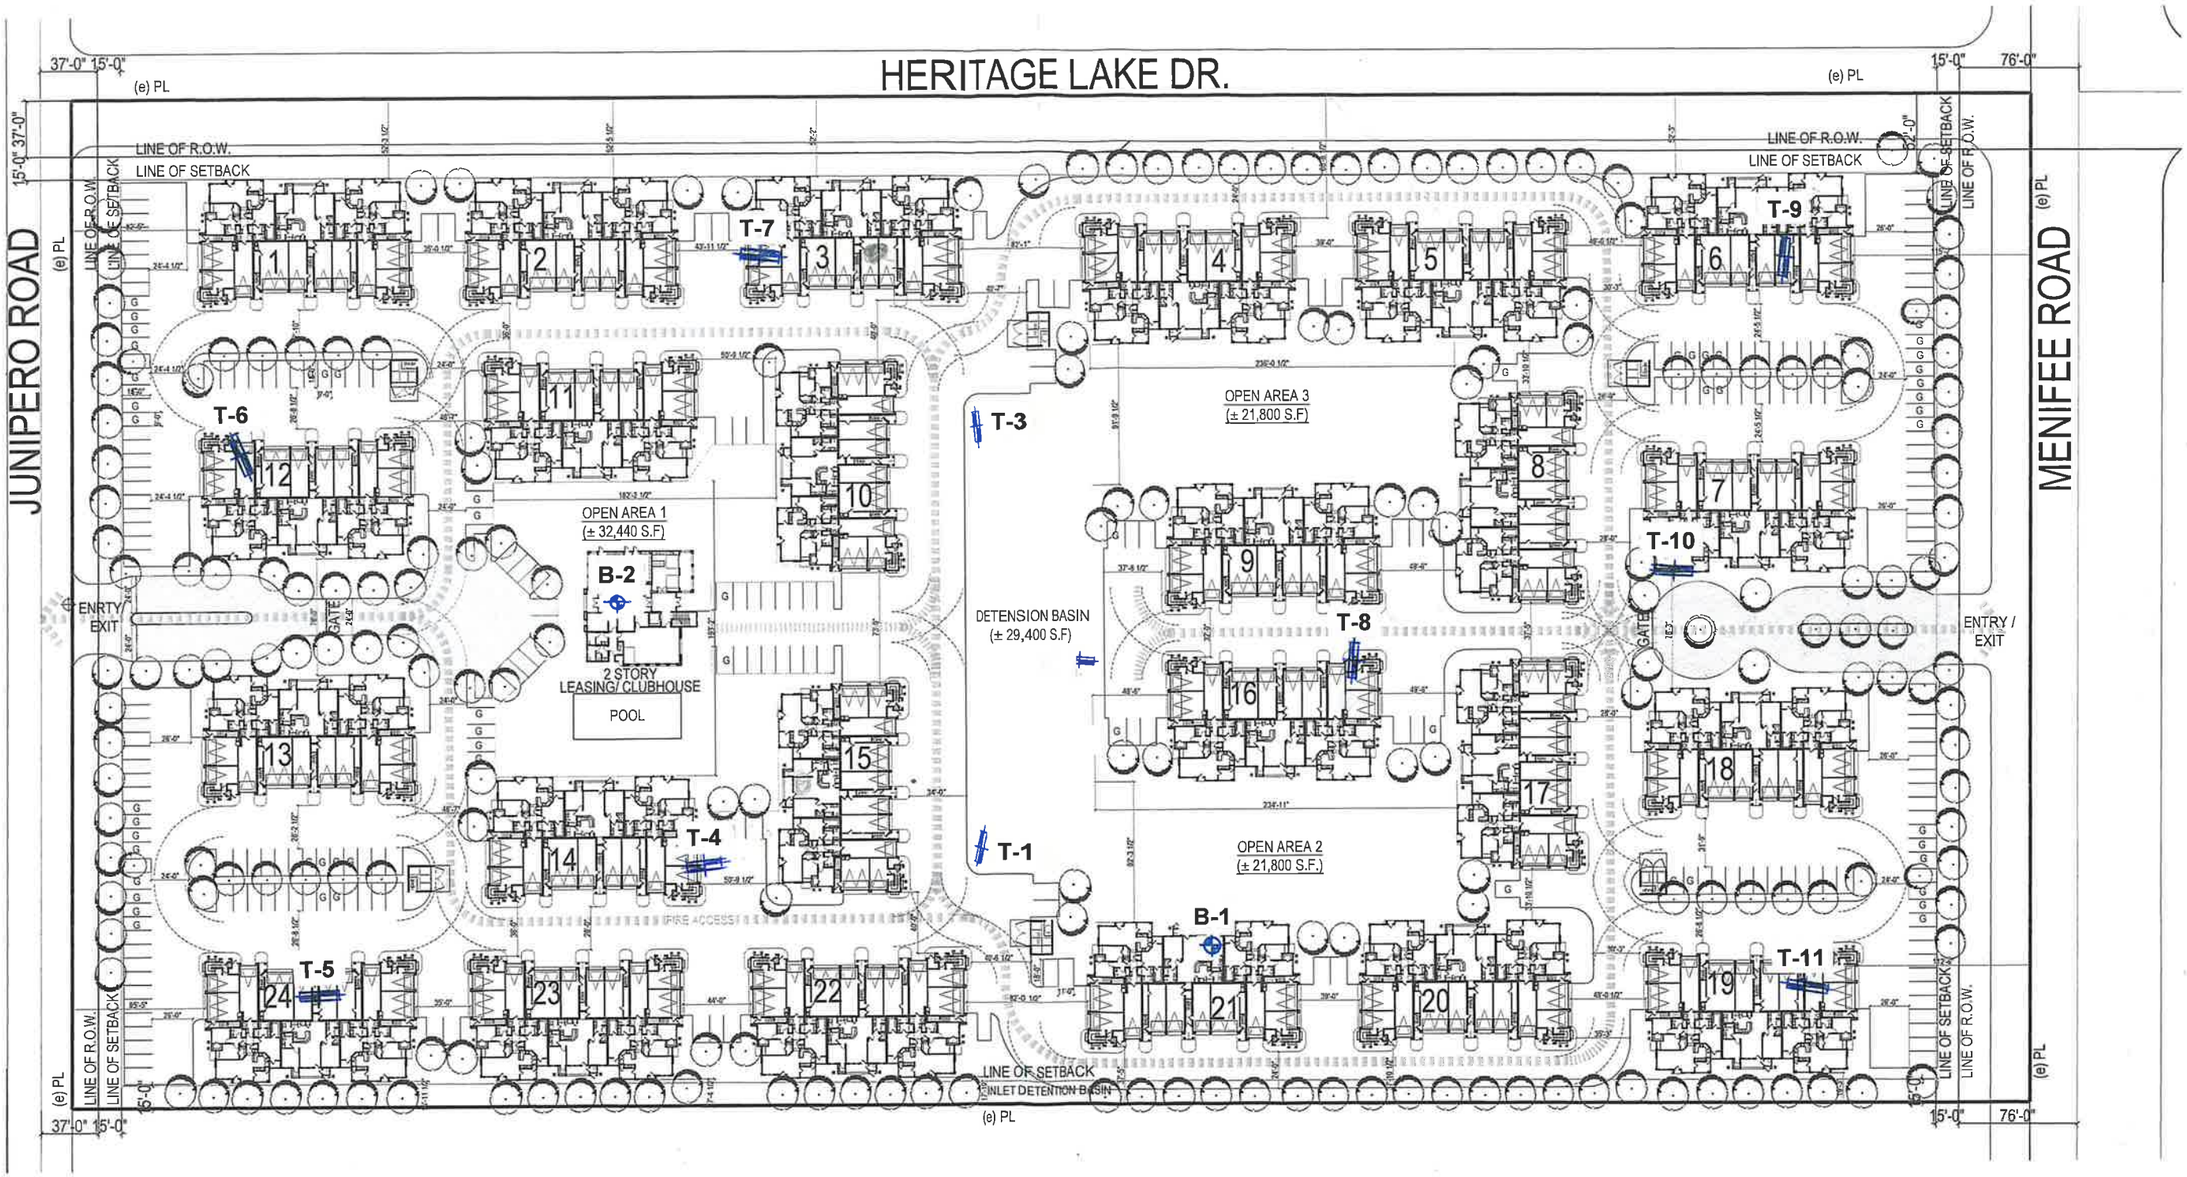
When expansive soils are compacted during site grading operations, care is taken to place the materials at or slightly above optimum moisture levels and perform proper compaction operations. Any subsequent excessive wetting and/or drying of expansive soils will cause the soil materials to expand and/or contract. These actions are likely to cause distress of foundations, structures, slabs-on-grade, sidewalks and pavement over the life of the structure. ***It is therefore imperative that even after construction of improvements, the moisture contents are maintained at relatively constant levels, allowing neither excessive wetting or drying of soils.***

Evidence of excessive wetting of expansive soils may be seen in concrete slabs, both interior and exterior. Slabs may lift at construction joints producing a trip hazard or may crack from the pressure of soil expansion. Wet clays in foundation areas may result in lifting of the structure causing difficulty in the opening and closing of doors and windows, as well as cracking in exterior and interior wall surfaces. In extreme wetting of soils to depth, settlement of the structure may eventually result. Excessive wetting of soils in landscape areas adjacent to concrete or asphaltic pavement areas may also result in expansion of soils beneath pavement and resultant distress to the pavement surface.

Excessive drying of expansive soils is initially evidenced by cracking in the surface of the soils due to contraction. Settlement of structures and on-grade slabs may also eventually result along with problems in the operation of doors and windows.

Projects located in areas of expansive clay soils will be subject to more movement and "hairline" cracking of walls and slabs than similar projects situated on non-expansive sandy soils. There are, however, measures that developers and property owners may take to reduce the amount of movement over the life the development. The following guidelines are provided to assist you in both design and maintenance of projects on expansive soils:

- Drainage away from structures and pavement is essential to prevent excessive wetting of expansive soils. Grades to the latest building code should be designed and maintained to allow flow of irrigation and rain water to approved drainage devices or to the street. Any "ponding" of water adjacent to buildings, slabs and pavement after rains is evidence of poor drainage; the installation of drainage devices or regrading of the area may be required to assure proper drainage. Installation of rain gutters is also recommended to control the introduction of moisture next to buildings. Gutters should discharge into a drainage device or onto pavement which drains to roadways.



- Irrigation should be strictly controlled around building foundations, slabs and pavement and may need to be adjusted depending upon season. This control is essential to maintain a relatively uniform moisture content in the expansive soils and to prevent swelling and contracting. Over-watering adjacent to improvements may result in damage to those improvements. NorCal Engineering makes no specific recommendations regarding landscape irrigation schedules.

- Planting schemes for landscaping around structures and pavement should be analyzed carefully. Plants (including sod) requiring high amounts of water may result in excessive wetting of soils. Trees and large shrubs may actually extract moisture from the expansive soils, thus causing contraction of the fine-grained soils.

- Thickened edges on exterior slabs will assist in keeping excessive moisture from entering directly beneath the concrete. A six-inch thick or greater deepened edge on slabs may be considered. Underlying interior and exterior slabs with 6 to 12 inches or more of non-expansive soils and providing presaturation of the underlying clayey soils as recommended in the soil report will improve the overall performance of on-grade slabs.

- Increase the amount of steel reinforcing in concrete slabs, foundations and other structures to resist the forces of expansive soils. The precise amount of reinforcing should be determined by the appropriate design engineers and/or architects.

- Recommendations of the soil report should always be followed in the development of the project. Any recommendations regarding presaturation of the upper subgrade soils in slab areas should be performed in the field and verified by the Soil Engineer.

COMPONENT PROPORTIONS

DESCRIPTIVE TERMS	RANGE OF PROPORTION
Trace	1 - 5%
Few	5 - 10%
Little	10 - 20%
Some	20 - 35%
And	35 - 50%

COMPONENT DEFINITIONS

COMPONENT	SIZE RANGE
Boulders	Larger than 12 in
Cobbles	3 in to 12 in
Gravel	3 in to No 4 (4.5mm)
Coarse gravel	3 in to 3/4 in
Fine gravel	3/4 in to No 4 (4.5mm)
Sand	No. 4 (4.5mm) to No. 200 (0.074mm)
Coarse sand	No. 4 (4.5 mm) to No. 10 (2.0 mm)
Medium sand	No. 10 (2.0 mm) to No. 40 (0.42 mm)
Fine sand	No. 40 (0.42 mm) to No. 200 (0.074 mm)
Silt and Clay	Smaller than No. 200 (0.074 mm)

MOISTURE CONTENT

DRY	Absence of moisture, dusty, dry to the touch.
DAMP	Some perceptible moisture; below optimum
MOIST	No visible water; near optimum moisture content
WET	Visible free water, usually soil is below water table.

RE: **Response to City Geotechnical Review Comments** - Proposed "The Village at Junipero" Residential Development - Located at the Southwest Corner of Menifee Road and Heritage Lake Drive, Menifee, County of Riverside, California

Dear Mr. Cunningham:
Submitted herewith is response to the attached City of Menifee Geotechnical Report Review Comments dated March 9, 2022 of our geotechnical report for the above referenced project. The following items are provided in the same order of the review sheet for clarity.

Response to Comment No. 1
Overall, the geotechnical conditions of the subject site are currently representative of the conditions described in the previous referenced report. It is our opinion that the planned construction will be geotechnically feasible provided that all of the recommendations presented in our referenced report are implemented and all conditions of latest 2019 California Building Code (CBC) are adhered. This firm shall have the opportunity to review building plans when they are made available to verify that all recommendations are incorporated and if additional information or revisions will be required.

Response to Comment No. 2
A Site Location Map (Figure 1) is attached.

Response to Comment No. 3
The potential for hydro-consolidation and the susceptibility for any ground settlements are considered low.

Response to Comment No. 4
The subject property is situated at the southwest corner of Menifee Road and Heritage Lake Drive, in the City of Menifee. The generally rectangular shaped parcel is elongated in an east to west direction and topography of the relatively level parcel descending gradually from south to north on the order of a few feet. The site is an undeveloped lot currently covered a low growth of vegetation consisting of natural grasses and weeds. Recently, the grading operations from the site next door consisted of exporting and forming a large stockpile of soil on the subject site. A portion of the project site was previously used as a staging area during construction for the new neighboring development.

Response to Comment No. 5
The site grading recommendations will remain the same as stated in our preliminary geotechnical report dated December 9, 2014.

Response to Comment No. 6
The seismic design parameters have been revised and are provided below and based upon the 2019 California Building Code (CBC) Standard ASCE/SEI 7-16. The data was obtained from the American Society of Civil Engineers (ASCE) website, https://asce7hazardtool.online/ and the ASCE 7 Hazards Report.

Seismic Design Acceleration Parameters

Latitude	33.725
Longitude	-117.155
Site Class	D
Risk Category	II
Mapped Spectral Response Acceleration	S_S = 1.411 S_1 = 0.525
Adjusted Maximum Acceleration	S_{MS} = 1.411
Design Spectral Response Acceleration Parameters	S_{DS} = 0.941
Peak Ground Acceleration	PGA_M = 0.55

Use of these values is dependent on requirements of Section 11-4.8 ASCE 7, exception 2 that requires the value of the seismic response coefficient C_s be determined by Equation 12.8.2 for values of $T \leq 1.5T_s$ and taken as equal to 1.5 times the value computed in accordance with either 12.8-3 for $T_L \geq T \geq 1.5T_s$ or Equation 12.8-4 for $T > T_L$. Computations and verification of these conditions is referred to the structural engineer.

We appreciate this opportunity to be of service to you. If you have any further questions, please do not hesitate to contact the undersigned.

Respectfully submitted,

MEMORANDUM

PUBLIC WORKS / ENGINEERING DEPARTMENT

DATE: March 9, 2022

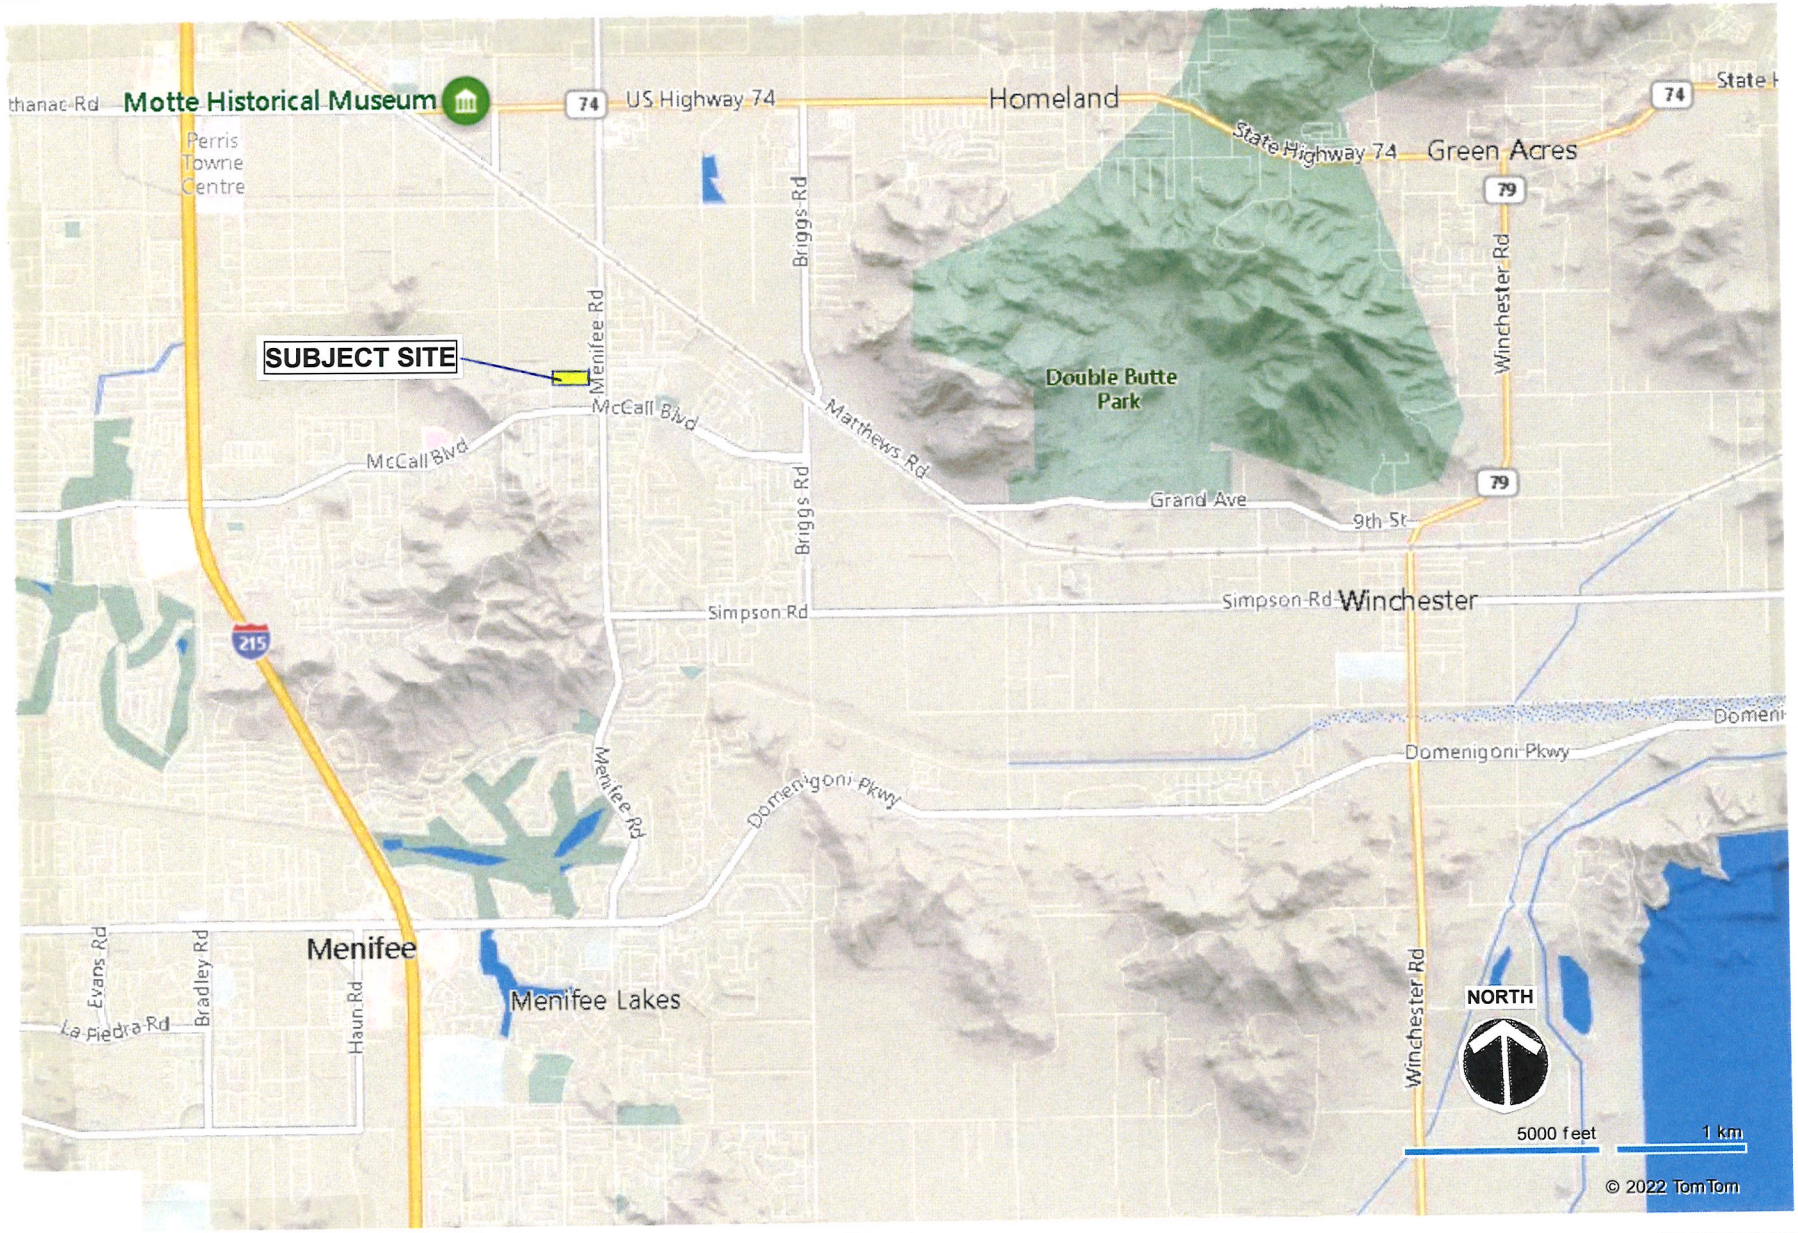
TO: Russell Brown, Senior Planner, Community Development Department

FROM: Chet Robinson, Senior Engineer, Engineering Department

SUBJECT: RPT22-022 – Geotechincal Report Review Comments, PC1
Villages at Junipero

The comments noted herein are for review of the following:

- Geotechnical Engineering Investigation, The Villages at Junipero Development, SWC Menifee Road and Heritage Lakes Drive, prepared by NorCal Engineering, Project Number 17802-14, dated December 9, 2014.
- Response to County Geological Report Review Sheet, prepared by NorCal Engineering, Project Number 17802-14, dated May 5, 2015.
- Preliminary Grading Plan, Sheet PGP-1, prepared by Christiansen & Company, dated December 12, 2021 (for reference only).



Our review was provided of the Geotechnical Engineering Investigation report for the proposed development. The following comments should be addressed by the consultant for conformance with the minimum criteria outlined in the County of Riverside Technical Guidelines for Review of Geotechnical and Geologic Reports.

Geotechnical Comments

1. The submitted report and response letter are from 2014 and 2015. Geotechnical reports greater than 3 years old must be updated to current standards and codes, or an addendum letter provided stating that the report is still applicable and providing updated recommendations as needed.
2. The report does not include a site location map showing the location of the site within the City of Menifee.
3. The report does not address hydrocollapse potential.
4. The site description is outdated as the site has been disturbed by recent construction activity and has been used to stockpile soil. Provide an updated description of site conditions and land use history.

5. Grading Recommendations: Provide updated grading recommendations if needed based on recent site activity.
6. CBC Seismic Design Parameters do not reflect requirements of the current California Building Code.

The applicant should update their report or submit an addendum letter addressing each comment. Any questions can be directed to Chet Robinson at (951) 723-3879, or by email at crobinson@cityofmenifee.us

RE: **Soil Infiltration Study** - Proposed "The Village at Junipero Apartment Development" - Located at the Southwest Corner of Menifee Road and Heritage Lakes Drive, in the City of Menifee, California

Dear Mr. Christiansen:

Pursuant to your request, this firm has performed a Soils Infiltration Study for the above referenced project in accordance with your approval of proposal dated August 18, 2014. The purpose of this study is to evaluate the feasibility of an on-site drainage disposal system for the proposed residential development. The scope of work included the following: 1) site reconnaissance; 2) subsurface geotechnical exploration; 3) double ring infiltration testing; 4) engineering analysis of field and laboratory data; and 5) preparation of a report.

It is proposed to construct a multi-unit apartment complex as shown on the attached conceptual site plan. The project will consist of twenty-four (24) buildings including a new clubhouse and swimming pool on the 19.25-acre property. The two and/or three story buildings will be supported by a conventional slab-on-grade foundation system with perimeter-spread footings and isolated interior footings. It is assumed that the proposed grading for the development will include minor cut and fill procedures. The proposed on-site drainage disposal system will consist of a large detention/infiltration basin on the order of 5 to 8 feet in depth.

Site Description

The subject property is situated at the southwest corner of Menifee Road and Heritage Lakes Drive, in the City of Menifee. The generally rectangular shaped parcel is elongated in an east to west direction and topography of the relatively level parcel descending gradually from south to north on the order of a few feet. The site is an undeveloped lot currently covered with a low to moderate growth of vegetation consisting of natural grasses and weeds.

Field Exploration

The testing was conducted on November 22, 2014 and consisted of using the double ring infiltrometer at three (3) locations to determine the infiltration rate of the proposed drainage disposal system. The location of these tests is shown on the attached Site Plan. These test locations were excavated by a backhoe at a depth of 5 to 7½ feet below ground surface (bgs). No caving occurred to the depth of these test excavations and no groundwater was encountered.

Detailed description of the subsurface soils is shown on the attached test excavations logs in Appendix B. In general, the site was found to be underlain by a fill and native soil classified as a sandy silt which was noted to be stiff to very stiff and damp and a a brown, silty to clayey sand which were noted to be very dense and damp.

Infiltration Test Procedure and Results

The infiltration test consisted of the double ring infiltration test per ASTM Method D 3385. "The double ring infiltrometer method consists of driving two open cylinders, one inside the other, into the ground, partially filling the ring with water or other liquid, and then maintaining the liquid at a constant level. The volume of liquid added to the inner ring, to maintain the liquid level constant is the measure of the volume of liquid that infiltrates the soil.

The volume infiltrated during timed intervals is converted to an incremental infiltration velocity, usually expressed in centimeters per hour or inches per hour and plotted verses elapsed time. The maximum-steady state or average incremental infiltration velocity, depending on the purpose/application of the test is equivalent to the infiltration rate".

Along the bottom of the infiltration test pits, dual infiltration rings were inserted 7 cm vertically into the soil by an impact-absorbing hammer. Guelph tubes, also referred to as bubblers were installed to maintain constant water level in each of the rings. Water levels were maintained at a constant level in both the inner ring and annular space between rings throughout the test, to prevent flow of water from one ring to the other.

The volume of liquid used during each measured time interval was converted into an incremental infiltration velocity of both the inner ring in the annular space using the following equations:

For the inner ring calculated as follows:

$$Vir=\Delta Vir/(Air\Delta t)$$

where:

Vir = inner ring incremental infiltration velocity, cm/hr

ΔVir = volume of water used during time interval to maintain constant head in the inner ring, cm^3

Air = internal area of the inner ting, cm^2

Δt = time interval, hr

The last reading was used for design purposes in each of the test pits. The testing data sheets are attached in Appendix B and summarized in the table below. These excavations were immediately backfilled with the excavated soils and compacted. The double ring infiltration results are shown in Appendix B.

Test No.	Depth (feet bgs)	Classification	Infiltration Rate (cm/hr)	(in/hr)
1	7.5'	Sandy SILT	0.26	0.10
2	5'	Sandy SILT	0.10	0.04
3	7.5'	Sandy SILT	0.40	0.16

Groundwater Information

Our firm had recently performed a "Geotechnical Engineering Investigation" dated December 8, 2014 for the subject property and excavated an additional eleven (11) exploratory trenches to depths ranging between 5 and 15 feet and one (1) boring to a depth of 50 feet. Groundwater was encountered at a depth of 36 feet below ground surface. The exposed sidewalls of our borings did not reveal any evidence (mottling, etc.) that groundwater had been near the surface.

Discussion of Results

Based upon the results of our testing, the subsurface soils encountered in the proposed on-site drainage disposal system shall utilize a conservative design rate of 0.1 in/hr. All systems must meet the latest city and/or county specifications and California Regional Water Quality Control Board (CRWQCB) requirements.

It is our opinion that the site is suitable for stormwater infiltration without increasing the potential of settlement of proposed and existing structures located either on or adjacent to the subject site. In addition, the potential for hydro-consolidation and the susceptibility for any ground settlements are considered very low. Foundations shall be set back a minimum distance of 10 feet from the drainage disposal system and the bottom of footing shall be a minimum of 10 feet from the expected zone of saturation. The boundary of the zone of saturation may be assumed to project downward from the top of the permeable portion of the disposal system at an inclination of 1 to 1 or flatter, as determined by the soils engineer.

Closure

The recommendations and conclusions contained in this report are based upon the soil conditions uncovered in our test excavations. No warranty of the soil condition between our excavations is implied. NorCal Engineering should be notified for possible further recommendations if unexpected to unfavorable conditions are encountered during construction phase.

This firm should have the opportunity to review the final plans to verify that all our recommendations are incorporated. This report and all conclusions are subject to the review of the controlling authorities for the project. Our representative should be present during the grading operations and construction phase to certify that such recommendations are complied within the field.

This geotechnical investigation has been conducted in a manner consistent with the level of care and skill exercised by members of our profession currently practicing under similar conditions in the Southern California area. All work was performed under the supervision of the Geotechnical Engineer. No other warranty, expressed or implied is made. No other warranty, expressed or implied is made.

We appreciate this opportunity to be of service to you. If you have any further questions, please do not hesitate to contact the undersigned.

Respectfully submitted,
NORCAL ENGINEERING

IN THE CITY OF MENIFEE, CALIFORNIA

HYDROLOGY AND HYDRAULICS REPORT FOR THE VILLAGE AT JUNIPERO

APN 333-070-018, 019 & 053

IN SECTION 23, T5S, R3W, SBM

Site Description:

The Village at Junipero is a 240 unit apartment complex development located at the northwest corner of Menifee Road and McCall Blvd between Menifee Road and Junipero Road. This project comprises 19.25 acres.

The existing condition of the property has one flowline through the property from the southeast corner to the northwest corner. This drainage course shall be calculated for 100yr flow, volume and time of concentration. The entire existing flow pattern shall be eliminated with the proposed development

The units of the project have been designed as 24 - 10 units structures. This project consists of 3 Storm Drain Systems. The westerly ½ of the property drains through a series of 2'x2' Prinsco Grate Inlets located in project 4' Wide valley Gutters, and a series of 12", 18" and 24" HDPE Pipe. The easterly ½ also drains through a series of 2'x2' Prinsco Grate Inlets located in project 4' Wide valley Gutters, and a series of 12", 18" and 24" HDPE Pipe. The westerly drainage system shall be connected to a 96" Contech Underground Storage System (12000 cf) (for WQMP "first flush" containment and allowed to overflow through a 24" HDPE Pipe to the existing 60" Storm Drain Pipe that Bisects the property. The easterly drainage system shall be connected to a 96" Contech Underground Storage System (15000 cf) (for WQMP "first flush" containment and allowed to overflow through a 24" HDPE Pipe to the existing 60" Storm Drain Pipe that Bisects the property. Please note that a 48"/60" HDPE existing storm drain system has been constructed through the center of the Village at Junipero. Said storm drain collects all offsite drainage from the south and passes through the 48"/60" HDPE Pipe and connects to an existing Culvert crossing Heritage Lakes and connects to the existing channel within Tract No. 31098. Consultants for Tract No. 31098 have meet with our staff to ensure that the HGL withing this pipe is low enough to service The Village at Junipero and all proposed flows from the Village at Junipero shall be contained in the existing storm drain pipe.

Lastly, all storm drain systems for the perimeter streets (to the Village at Junipero) of Junipero Road, Heritage Lake Dr. and Menifee Rd. are existing per Tract. No. 31098 Improvement Plans

Purpose of this study:

The purpose of this study is to determine the 100yr-1hr, 3-hr, 6hr and 24hr runoff accumulated by proposed improvements of this the project. All 2'x2' Prinsco Drains, HDPE Pipe and Storage Chambers shall be sized for zero ponding on site.

Sources:

The majority soil type for this project is HcC, GyA, EpC2, EyB, EnC2 and CkF2per Web Soils Survey. This coincides with soil type "A", "C" and "D" per RCFD&WCD. The percentages per respective soils type were used in the RCFC&WCD Rational Method – Bonadiman Program and the SUH Program (volumes).

Rainfall intensity data for the above storm events were derived from NOAA Atlas 14 for this location

RCFC&WCD provides much of the bulk of this report and is derived directly from their hydrology manual. The pages have been modified with lines showing the pertinent data for this report.

Analysis:

In keeping with the recently accepted parameters of the City of Menifee, we find that Per the RCFC&WCD manual and RCFC&WCD Rational and SUH Methods the AMCII numbers were calculated and within the program and noted on the calculations section of this report. The development type is Apartment which leads us to use Plate D-5.2 when using an AMCII to acquire our coefficient of runoff.

Below are the flows, volumes and time of concentrations for the project. All Tributary Areas (DMA) coincide to the respective Nodes within the DMA and specific grate inlet Node. Lengths of flow lines between each DMA and height difference are noted within the tables below. Please note the volumes listed are per the critical 100yr storm event (3hr, 6hr or 24hr).

Existing Drainage Area

Tributary	Max. Q100 (cfs)	Max. V100 (cf)	Tc (min.)	Nodes	Length between Nodes (ft)	Height Diff. Bet.Nodes(ft)
EDMA1	14.285	159078	21.085	1 2	748	4.2
EDMA2	10.596	149741	12.300	2 3	631	0.5
TOTAL	24.881	308819	33.39		1379	4.7

Drainage Area (DA1)

Tributary	Max. Q100 (cfs)	Max. V100 (cf)	Tc (min.)	Nodes	Length between Nodes (ft)	Height Diff. Bet.Nodes(ft)
DMA1	2.072	3299	5.00	23 32	60	0.27

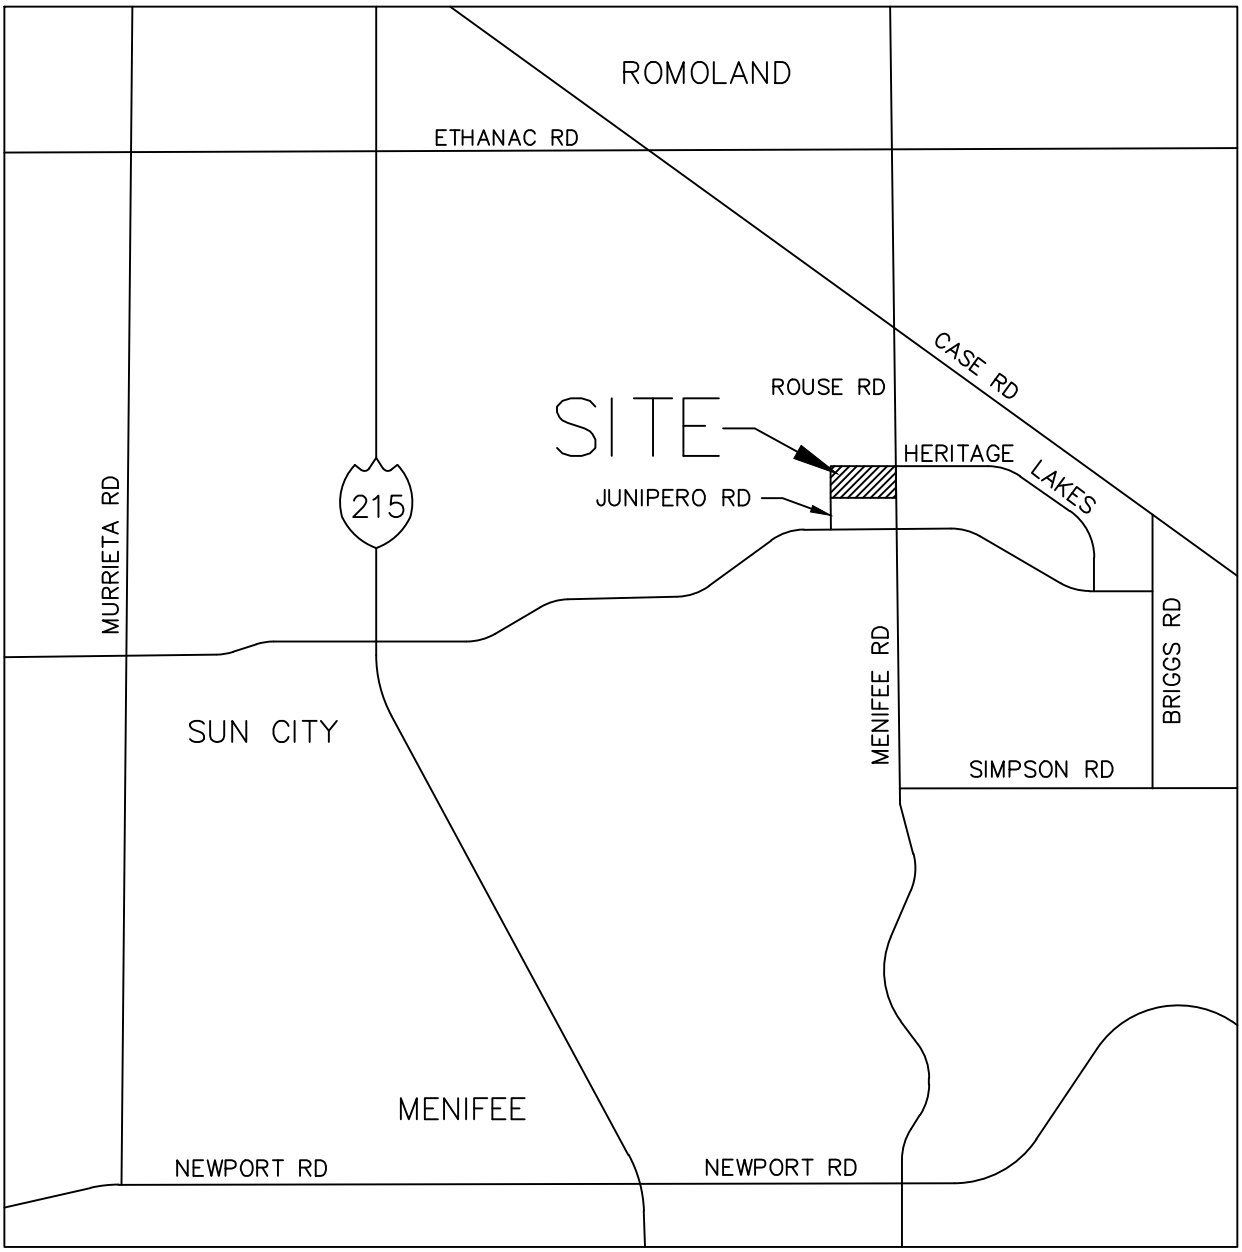
DMA17	1.792	3842	7.271	26 27	170	0.85
TOTAL	18.830	37760	21.028			

Drainage Area (DA2)

Tributary	Max. Q100 (cfs)Max.	Max. V100 (cf)	Tc (min.)	Nodes	Length between Nodes (ft)	Height Diff. Bet.Nodes(ft)
DMA4	6.118	11790	7.159	8 9	225	2.13
DMA5	4.837	9469	7.371	10 11	220	1.72
DMA6	1.476	2382	5.128	12 13	70	0.342
DMA7	5.461	11301	8.138	6 7	220	1.02
DMA8	1.952	3299	5.595	14 15	70	0.22
DMA9	1.789	2251	5.000	16 17	65	0.32
DMA10	5.265	1759	5.378	3 4	80	0.40
DMA11	4.027	7575	6.839	1 2	180	1.37
DMA12	3.976	16779	8.254	1 18	210	0.85
TOTAL	31.730	66329	20.678			



WQMP Worksheets

The project site is separated into a west half and an east half of the site. The west half shall drain into a 96" Contech Underground Stormwater Retention System (12000 cf) to ensure the WQMP Worksheet Calculation of Volume for DMA1 (10513 cf). The east half shall drain into a 96" Contech Underground Stormwater Retention System (15000 cf) to ensure the WQMP Worksheet Calculation of Volume for DMA2 (14569 cf). All WQMP required 1st flush requirements have been met.

Conclusions:

If the designs contained within this report and the plans that are based upon its findings are followed, the design shall provide the protection for the above storm water flows. Therefore, the entire site has been designed for complete storm drain and grate inlet containment of the respective critical storm event. All "first flush" WQMP measures have been processed through the two 96" Contech Underground Stormwater Retention Systems located withing the project and parallel to the existing 60" HDPE Storm Drain Pipe.

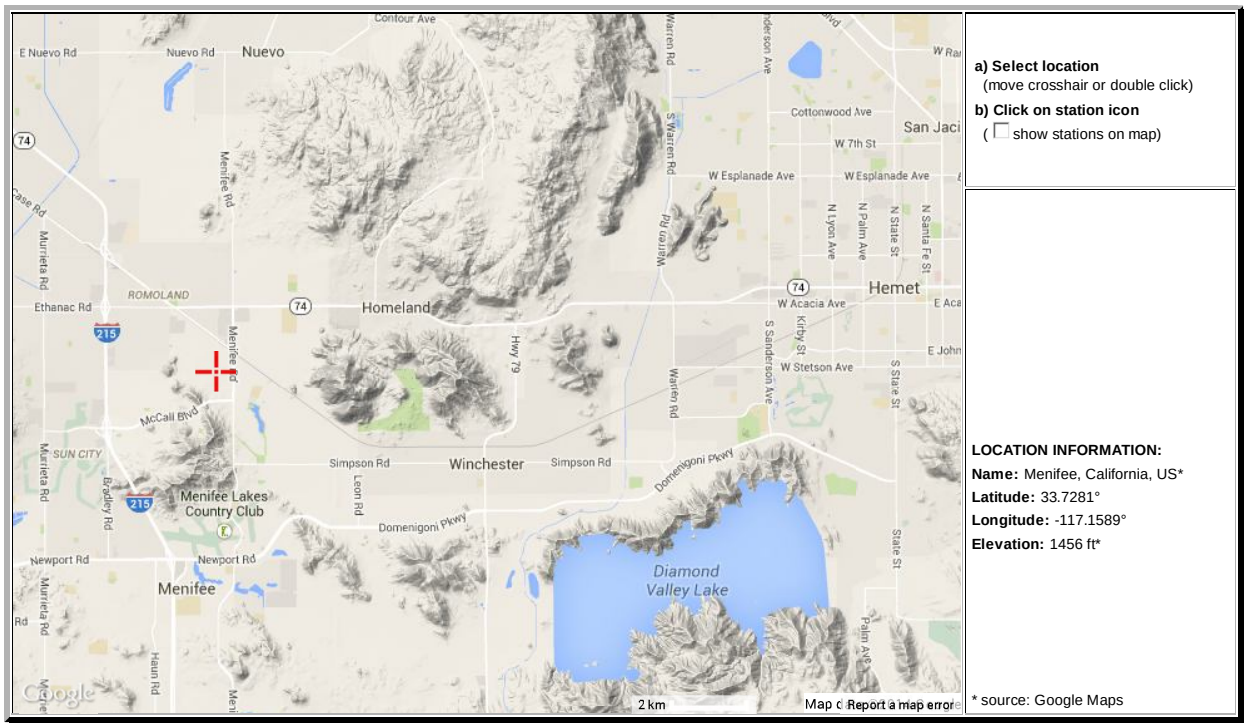
NOAA ATLAS 14 POINT PRECIPITATION FREQUENCY ESTIMATES: CA

DATA DESCRIPTION

Data type: precipitation depth **Units:** english **Time series type:** partial duration



SELECT LOCATION

1. Manually:

a) Enter location (decimal degrees, use "-" for S and W): latitude: longitude: submit

b) Select station (click here for a list of stations used in frequency analysis for CA): select station

2. Use map:

a) Select location
(move crosshair or double click)

b) Click on station icon
(show stations on map)

LOCATION INFORMATION:
Name: Menifee, California, US*
Latitude: 33.7281°
Longitude: -117.1589°
Elevation: 1456 ft*

* source: Google Maps

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Estimates from the table in csv format: precipitation frequency estimates Submit

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Western Riverside Area, California
Survey Area Data: Version 6, Dec 9, 2013

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 3, 2010—Jun 19, 2010

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Western Riverside Area, California (CA679)				
Map unit symbol	**Map unit name**	**Rating**	**Acres in AOI**	**Percent of AOI**
CkF2	Cieneba rocky sandy loam, 15 to 50 percent slopes, erod ed	D	0.3	1.5%
EnC2	Exeter sandy loam, 2 to 8 percent slopes, eroded	C	2.4	11.3%
EpC2	Exeter sandy loam, deep, 2 to 8 percent slopes, eroded	C	5.4	25.0%
EyB	Exeter very fine sandy loam, deep, 0 to 5 percent slope s	C	6.7	30.9%
GyA	Greenfield sandy loam, 0 to 2 percent slopes	A	4.2	19.3%
HcC	Hanford coarse sandy loam, 2 to 8 percent slopes	A	2.6	12.1%
Totals for Area of Interest			**21.5**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher

Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 100.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Homeland-Winchester] area used.
10 year storm 10 minute intensity = 2.030(In/Hr)
10 year storm 60 minute intensity = 0.800(In/Hr)
100 year storm 10 minute intensity = 3.050(In/Hr)
100 year storm 60 minute intensity = 1.200(In/Hr)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity = 1.200(In/Hr)
Slope of intensity duration curve = 0.5200

++
Process from Point/Station 24.000 to Point/Station 22.000
**** INITIAL AREA EVALUATION ****

```
Initial area flow distance =   100.000(Ft.)
Top (of initial area) elevation =  1463.950(Ft.)
Bottom (of initial area) elevation =  1463.410(Ft.)
Difference in elevation =     0.540(Ft.)
Slope =    0.00540  s(percent)=       0.54
TC = k(0.323)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration =     5.791 min.
Rainfall intensity =      4.048(In/Hr) for a   100.0 year storm
APARTMENT subarea type
Runoff Coefficient = 0.833
Decimal fraction soil group A = 0.900
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.100
Decimal fraction soil group D = 0.000
RI index for soil(AMC 2)  =  35.70
Pervious area fraction =  0.200; Impervious fraction =  0.800
Initial subarea runoff =     3.574(CFS)
Total initial stream area =        1.060(Ac.)
Pervious area fraction = 0.200
End of computations, total study area =            1.06 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 0.200
Area averaged RI index number =  35.7
```

EDMA 2 - 100YR VOLUME PRE-DEVELOPMENT

Drainage Area = 8.66(Ac.) = 0.014 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 8.66(Ac.) = 0.014 Sq. Mi.
Length along longest watercourse = 631.00(Ft.)
Length along longest watercourse measured to centroid = 315.00(Ft.)
Length along longest watercourse = 0.120 Mi.
Length along longest watercourse measured to centroid = 0.060 Mi.
Difference in elevation = 1.00(Ft.)
Slope along watercourse = 8.3677 Ft./Mi.

```
Average Manning's 'N' = 0.030
Lag time =    0.073 Hr.
Lag time =     4.41 Min.
25% of lag time =     1.10 Min.
40% of lag time =     1.76 Min.
Unit time =     5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =    14.29(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        8.66             2.06                 17.84

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        8.66             5.39                 46.68

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    2.060(In)
Area Averaged 100-Year Rainfall =    5.390(In)

Point rain (area averaged) =    5.390(In)
Areal adjustment factor =  100.00 %
Adjusted average point rain =    5.390(In)

Sub-Area Data:
Area(Ac.)         Runoff Index   Impervious %
     8.660           78.50         1.000
 Total Area Entered =      8.66(Ac.)

DMA 16- 100 YR, 24-hr

Drainage Area = 1.63(Ac.) = 0.003 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 1.63(Ac.) = 0.003 Sq. Mi.
Length along longest watercourse = 180.00(Ft.)
Length along longest watercourse measured to centroid = 90.00(Ft.)
Length along longest watercourse = 0.034 Mi.
Length along longest watercourse measured to centroid = 0.017 Mi.
Difference in elevation = 1.30(Ft.)
Slope along watercourse = 38.1333 Ft./Mi.

```
Average Manning's 'N' = 0.015
Lag time =    0.011 Hr.
Lag time =     0.64 Min.
25% of lag time =     0.16 Min.
40% of lag time =     0.25 Min.
Unit time =     5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        1.63             2.06                 3.36

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        1.63             5.39                 8.79

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    2.060(In)
Area Averaged 100-Year Rainfall =    5.390(In)

Point rain (area averaged) =    5.390(In)
Areal adjustment factor =  100.00 %
Adjusted average point rain =    5.390(In)

Sub-Area Data:
Area(Ac.)         Runoff Index   Impervious %
     1.630           69.00          0.200
 Total Area Entered =      1.63(Ac.)

RI    RI   Infil. Rate Impervious   Adj. Infil. Rate  Area%     F
AMC2 AMC-2     (In/Hr)    (Dec.%)     (In/Hr)       (Dec.)    (In/Hr)
69.0  69.0      0.373     0.200        0.306        1.000      0.306
```

Sum (F) = 0.306

Area averaged mean soil loss (F) (In/Hr) = 0.306
Minimum soil loss rate ((In/Hr)) = 0.153
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6351

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

DMA 7- 100 YR, 24-hr

Drainage Area = 1.85(Ac.) = 0.003 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 1.85(Ac.) = 0.003 Sq. Mi.
Length along longest watercourse = 220.00(Ft.)
Length along longest watercourse measured to centroid = 110.00(Ft.)
Length along longest watercourse = 0.042 Mi.
Length along longest watercourse measured to centroid = 0.021 Mi.
Difference in elevation = 1.02(Ft.)
Slope along watercourse = 24.4800 Ft./Mi.

```
Average Manning's 'N' = 0.015
Lag time =    0.013 Hr.
Lag time =     0.81 Min.
25% of lag time =     0.20 Min.
40% of lag time =     0.32 Min.
Unit time =     5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        1.85              2.06                 3.81

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        1.85              5.39                 9.97

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    2.060(In)
Area Averaged 100-Year Rainfall =    5.390(In)

Point rain (area averaged) =    5.390(In)
Areal adjustment factor =  100.00 %
Adjusted average point rain =    5.390(In)

Sub-Area Data:
Area(Ac.)         Runoff Index   Impervious %
     1.850           69.00          0.200
 Total Area Entered =      1.85(Ac.)

RI    RI   Infil. Rate Impervious   Adj. Infil. Rate  Area%     F
AMC2 AMC-2     (In/Hr)    (Dec.%)     (In/Hr)       (Dec.)    (In/Hr)
69.0  69.0      0.373     0.200        0.306       1.000      0.306
```

Sum (F) = 0.306

Area averaged mean soil loss (F) (In/Hr) = 0.306
Minimum soil loss rate ((In/Hr)) = 0.153
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900
