These criteria were applied in order to eliminate sites that were identified in Geotracker as being potentially contaminated with arsenic, or that contained insufficient data to reliably estimate a central tendency or derive other simple statistics. Sites that otherwise would have satisfied the criteria were excluded from the database due to one or more of the following reasons: 1) laboratory notes indicated excessive interference or other problems with the analysis, 2) arsenic contamination was suspected based on detected data, and 3) duplicate ESI entries (i.e. the same laboratory report was submitted to Geotracker more than once). The level of effort and approach taken to avoid sites with metals contamination used in this study is consistent with other works that have utilized existing data (LBNL, 2002; Scott, 1994; Yesilonis et al., 2008; Lado et al., 2008).

Following ESI data download and site selection, the JMP 7.0 database was expanded to include fields that were not a part of the original ESI, including sample depth and geologic unit. Using ArcMap 9.2, the site locations were overlain onto a regional geologic map of the Bay Area to assign geologic units to each site. The geologic map is a digital database containing a GIS shapefile for the general distribution of geologic materials in the San Francisco Bay Region released by the USGS (Wentworth 1997). Geologic materials are categorized in the database by general age and lithology. The cleanup sites used in this study were predominantly underlain by Pleistocene alluvium, Holocene alluvium, and Holocene bay mud deposits. Other geologic units included undifferentiated Quaternary units such as terrace deposits, colluvium, and dune sands. The fields included in the database, their definitions and source are provided in Table 3. All the samples in the database were analyzed by either inductively coupled plasma (ICP) atomic emission spectroscopy or ICP mass spectrometry.

Table 3 - Explanation of database fields by name, type and source

Field Name	Type	Source / Description
Global ID	text / nominal	Geotracker
Site name	text / nominal	Geotracker cleanup site database
City	text / nominal	Geotracker cleanup site database
County	text / nominal	Geotracker cleanup site database
Site N	numeric / ordinal	Number of samples per site; derived in JMP
Sample ID	text / nominal	Geotracker EDF download
Field point class	text / nominal	Identifies sample collection method. Geotracker EDF download
Depth	numeric / continuous	Site investigation reports
Depth class	text / nominal	Shallow or subsurface, based on Navy guidance. See section 3.3
Value (mg/kg)	numeric / continuous	Geotracker EDF download
RL	numeric / continuous	Reporting Limit, Geotracker website, site by site search
MDL	numeric / continuous	Method Detection Limit, Geotracker website, site by site search
D_Arsenic	numeric / ordinal	Censored data identifier
Arsenic	numeric / continuous	Arsenic value field with censored data estimates. See Section 3.4
Substitution method	text / nominal	See Section 3.4
Comments	text / nominal	Optional field for comments
Age-Lith	text / nominal	Age / lithology ID from USGS
Geologic Unit	text / nominal	Geologic unit name from USGS
Geology Class	text / nominal	Geologic units grouped into four categories for this analysis

In order to gather information on sample depths, pdf or scanned hard copies of the site investigation report(s) for each site were reviewed and pertinent information was then transferred to the database. Site investigation reports were not available for approximately 17 sites in the Geotracker database, in which case information on sample depth was either left blank, or assumed based on the sample ID (i.e., if the sample ID was "B-2@2'" the depth was recorded as 2 feet in the database). Sample depths and field collection method were reviewed to classify samples as being either surface or subsurface samples. Boring equipment used to collect soil samples may not be capable of collecting samples over discrete intervals less than 2 feet long. In addition, the boring action may mix soil from near the surface with deeper soils. Therefore, as recommended in a Navy guidance document for environmental background analysis (NAVFAC, 2002), each of the following were considered as surface soil samples:

- soil samples collected with hand tools ("grab samples") between the surface and 0.5 foot bgs
- soil samples collected from borings between the surface and 2 feet bgs
- soil samples explicitly identified as surface samples

All other samples were considered subsurface soil samples. Composites or samples without depth information were not assigned depths or depth classes.

As discussed in Chapter 2, the study area is within urban areas whose soils have likely been disturbed and reworked within several feet of the ground surface due to grading, soil moving, construction activity and utility work. It is possible that anthropogenic inputs of arsenic, if present, have been mixed down to the historical depth of disturbance. To account for this possibility, soil depths were also classified as shallow ($\leq$ 6 feet bgs) or deep (> 6 feet bgs). Six feet (1.8 meters), while somewhat arbitrary, was

considered a reasonable depth based on common depths of excavation needed for utilities, roads, building foundations and site leveling within flatland soils.

3.3 Assessment of Site Data, Treatment of Censored Data, and Identification of Outliers

Due to the broad geographical area, geological diversity, and land-use setting of the study area, before conducting an assessment of background arsenic concentrations within the Bay Area as a whole, outliers and censored data for each individual site were evaluated. For sites that contain censored data (i.e., nondetects, or values that are less than the laboratory reporting limit), normal quantile plots of site data were generated in JMP to characterize the distribution of arsenic concentrations. Where neither a normal nor lognormal model fit the data, non-parametric statistical methods were used to conduct further analyses. For several sites, especially those with a low number of samples, the graphical methods were insufficient to determine the type of population distribution. In such cases, goodness-of-fit tests available in ProUCL were used to best estimate the distribution type of the data. ProUCL is a statistical application released by the U.S. EPA that is designed specifically for environmental datasets with nondetects. Most of the statistical methods described and recommended in EPA's guidance on assessing background concentrations at contaminated sites (EPA, 2002) are incorporated into ProUCL. Either the Shapiro-Wilk test or the Lilliefors test, depending on sample size was used to determine the distribution type. Information on the distribution type was used to estimate the values of censored data, as described below.

The predominant method in the environmental field to incorporate nondetects data into statistical analysis is to replace censored data with artificial values, such as the reporting limit or half of the reporting limit (i.e., simple substitution). However, Helsel

and Hirsch (2002) found that summary statistics obtained using the simple substitution method do not perform well even when the percentage of nondetect observations is low, such as 5%-10%. Therefore, rather than handling non-detect values in the conventional way, the regression on order statistics (ROS) method recommended by Helsel and Hirsch (2002) was used to estimate the values of censored data. An ROS estimation function in ProUCL was used to generate estimated values for the censored data based on the most likely distribution type at each site. For censored data at sites where no discernable distribution was apparent, simple substitution using half the reporting limit was used to substitute for nondetects.

Outliers—defined as sample values that are unusually large (or small), and that are obvious deviations from the background distribution—may result from analytical errors, transcriptions errors, or the presence of contaminated samples in the background dataset. To identify outliers, box plots were generated for each site in JMP. Any values beyond the upper (or lower) quantile +/- 1.5x the inter-quartile range (IQR) were identified as outliers and eliminated from the database. The purpose of this evaluation was to minimize the effect of outliers on the background statistical analysis.

3.4 Summary Statistics and Statistical Tests

Using JMP, summary statistics were derived for each site in the database, including the number of observations (N), percent of observations that were nondetects, mean, median, standard deviation, and IQR. A frequency distribution and a normal probability plot were also generated to graphically display the site medians. The spatial autocorrelation tool in ArcMap 9.2 was used to assess the degree to which site medians were spatially clustered. The sites were then grouped based on the mapped geology, and summary statistics were derived for each soil type. Using analysis of variance (ANOVA) and the Tukey Kramer HSD test (Tukey test) available in JMP, each geological grouping

was used to test for significant differences among their means. The sites were also grouped by depth class, and Wilcoxon test was used to determine if the group medians are significantly different. A 95% confidence level was used for all statistical tests to determine statistically significant differences among group means. ProUCL provides a number of statistical options for calculating background threshold values (BTVs). Because of the large, well distributed nature of the dataset, and consistent with federal guidance (EPA, 2002; NAVFAC, 2002), the 99th percentile was selected as the appropriate measure of the upper range of background concentrations within the study area.

3.5 Limitations and Assumptions

Because this research is based on existing data and does not involve field sampling or field verification of geologic mapping, the statistical analyses and associated findings presented herein must be viewed in the context of several assumptions and associated limitations:

- It is assumed that the geology of a Geotracker site is representative of the lithology mapped by Wentworth (1997), and that Geotracker has recorded accurate locations for each of the sites. Locations close to the bay or in dense urban settings are likely to be underlain by a variable thickness of artificial fill soils used to prepare sites for development. Due to the relatively flat topography of Quaternary geologic units, it is standard practice to balance cuts and fills onsite during construction-related grading. Therefore, for sites mapped as being within Pleistocene or Holocene alluvium, it is assumed that fill soils are representative of the same geologic unit. For sites within bay mud, which are highly compressible and (from a geotechnical standpoint) not suitable for most urban development projects, fills from offsite sources have commonly been placed over the surface of

the bay mud (Helley at al., 1979). For sites in Geotracker mapped as being on bay mud, boring logs of the site were reviewed, if available, to verify the accuracy of the mapped geology. Samples identified as being within artificial fills were removed from the database because their origin and lithology is unknown.

- It is assumed that the Geotracker database fields identifying potential contaminants of concern are accurate and represent the full range of contaminants thought to be the result of site-related activities. If arsenic or metals were not identified as a contaminant of concern in the database, it is assumed that arsenic detections are generally representative of the anthropogenic background. This assumption was verified to the extent possible through review of the site investigation reports available in Geotracker.
- A generic method (see Section 3.2) was used to identify outliers for each site in the database that may not effectively identify outliers that are part of a second distribution. EPA guidance (NAVFAC, 2002) generally recommends identifying outliers through observation of log-transformed data on a probability plot. Data points that are not near the line or do not fit a continuous distribution are generally considered as outliers or belonging to a second, contaminated population. However, due to the high number of sites in the database, any values exceeding the upper quartile + 1.5*IQR were considered outliers for the purpose of efficiency.

This study does not attempt to characterize the geochemical behavior of arsenic in soil or explain the influence of small-scale geochemical processes on total arsenic concentrations. Rather, sufficient data is being collected to reasonably characterize arsenic concentrations representative of background at a regional scale, and to determine whether differences in flatland geology represents a statistically significant variable. The

results of this study are most relevant to areas underlain by quaternary geologic units within the Bay Area, and should not be used outside of the relevant geographical area.

4.0 RESULTS

4.1 Summary of the Database

Based on the site selection criteria (Section 3.2), 77 sites were selected from the Geotracker database for inclusion in this study. The 77 sites represent 2 percent of the total number of Geotracker sites within the 9-county Bay Area. The number of arsenic samples at each site ranges from 5 to a maximum of 139, totaling 1,454 samples across the 77 sites. All 1,454 records, including the fields described in Table 3 are included in a Microsoft Excel file on CD attached to this thesis. Approximately 65 percent of the data selected from Geotracker comes from soil borings, which were made for the purpose of collecting soil samples or as part of the installation of groundwater monitoring or remediation wells. The remaining 35 percent of the data consists of 1) soil samples collected from the walls or pits of excavated areas that formerly contained underground storage tanks or soils impacted by petroleum hydrocarbons or organic solvents, 2) surface samples collected by hand or hand-auger as part of an environmental investigation, or 3) soil stockpile samples for the purpose determining an appropriate off-site disposal method. Reporting limits in the database were generally below 1 mg/kg, although approximately 16 samples (less than 0.5 percent of the database) had high reporting limits over 5 mg/kg.

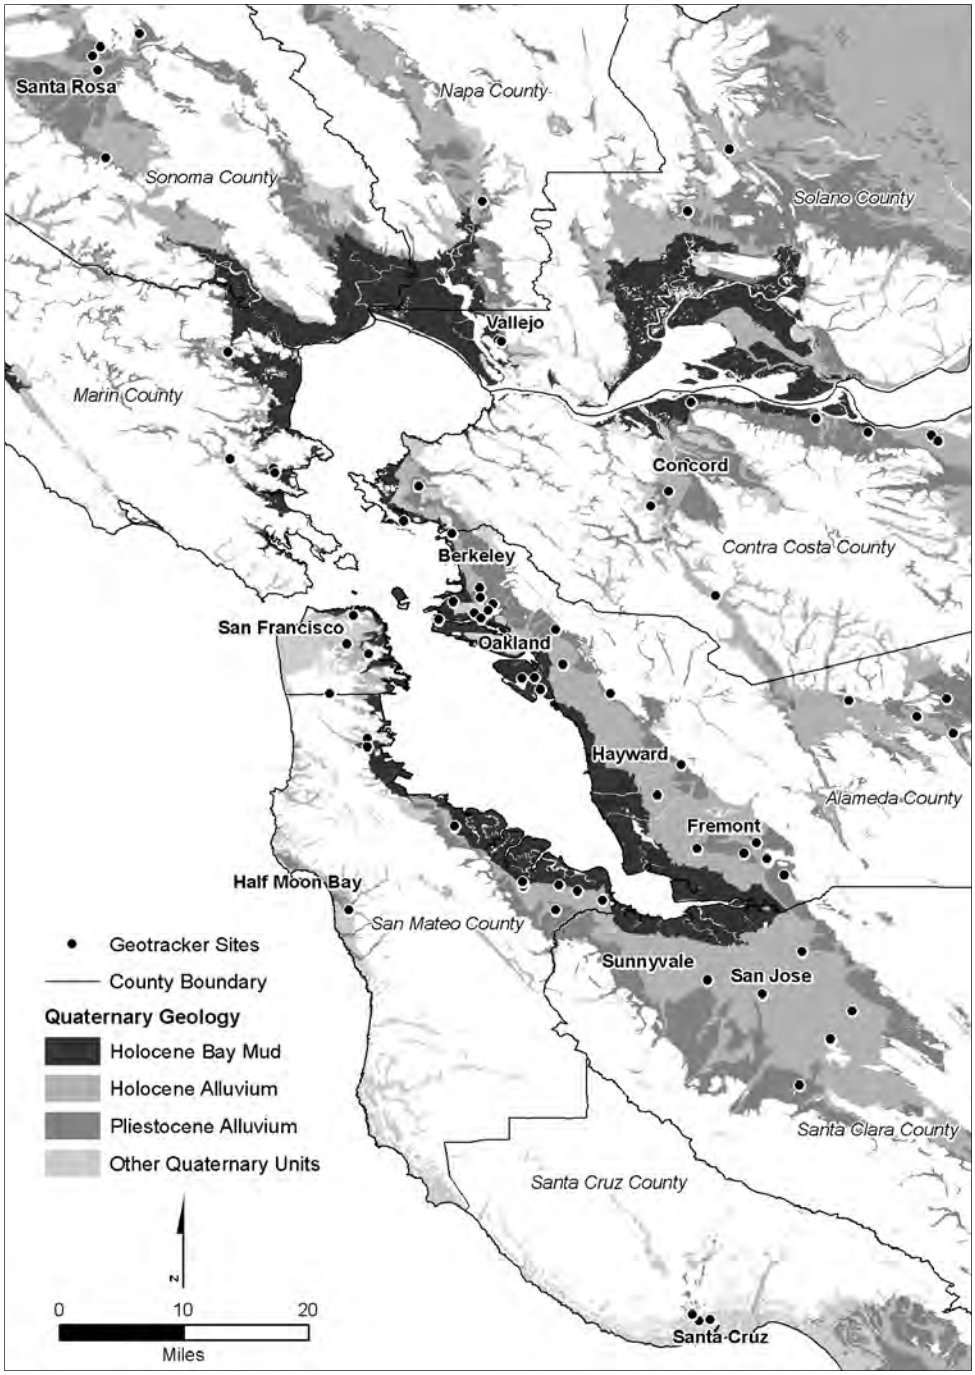
A summary of the 77 sites by county and soil type is provided in Table 4 and illustrated in Figure 4. All of the sites are located within urbanized portions of the Bay Area and consist primarily of industrial, military, transportation, and service commercial facilities, including numerous gas stations. A handful of sites consist of housing developments proposed on formerly industrial sites or residential properties. The sites are located across relatively flat Quaternary surficial deposits (Figure 4).

Table 4 – Summary of the 77 sites from the Geotracker database, sorted by county and soil type

	No. of Sites	No. of Samples
By County		
Alameda	30	745
Contra Costa	11	145
Marin	4	48
Napa	1	9
San Francisco	4	30
San Mateo	10	140
Santa Clara	5	154
Santa Cruz	3	81
Solano	4	48
Sonoma	5	54
By Soil Type		
Holocene Bay Mud	14	192
Holocene Alluvium	27	694
Pleistocene Alluvium	24	369
Other Quaternary Unit	11	190
Residual Soil, Franciscan Complex	1	9
TOTAL	**77**	**1,454**

Sites located within Pleistocene alluvium tend to be located on large alluvial fans extending out from the base of hills, whereas sites underlain by Holocene bay mud are located along the margins of the bay (Figure 4). Sites underlain by Holocene alluvium are generally found on large flat plains between the Pleistocene alluvial fans and bay muds (see Figures 3 & 4).

Figure 4 – Location of the 77 selected sites selected from the Geotracker database

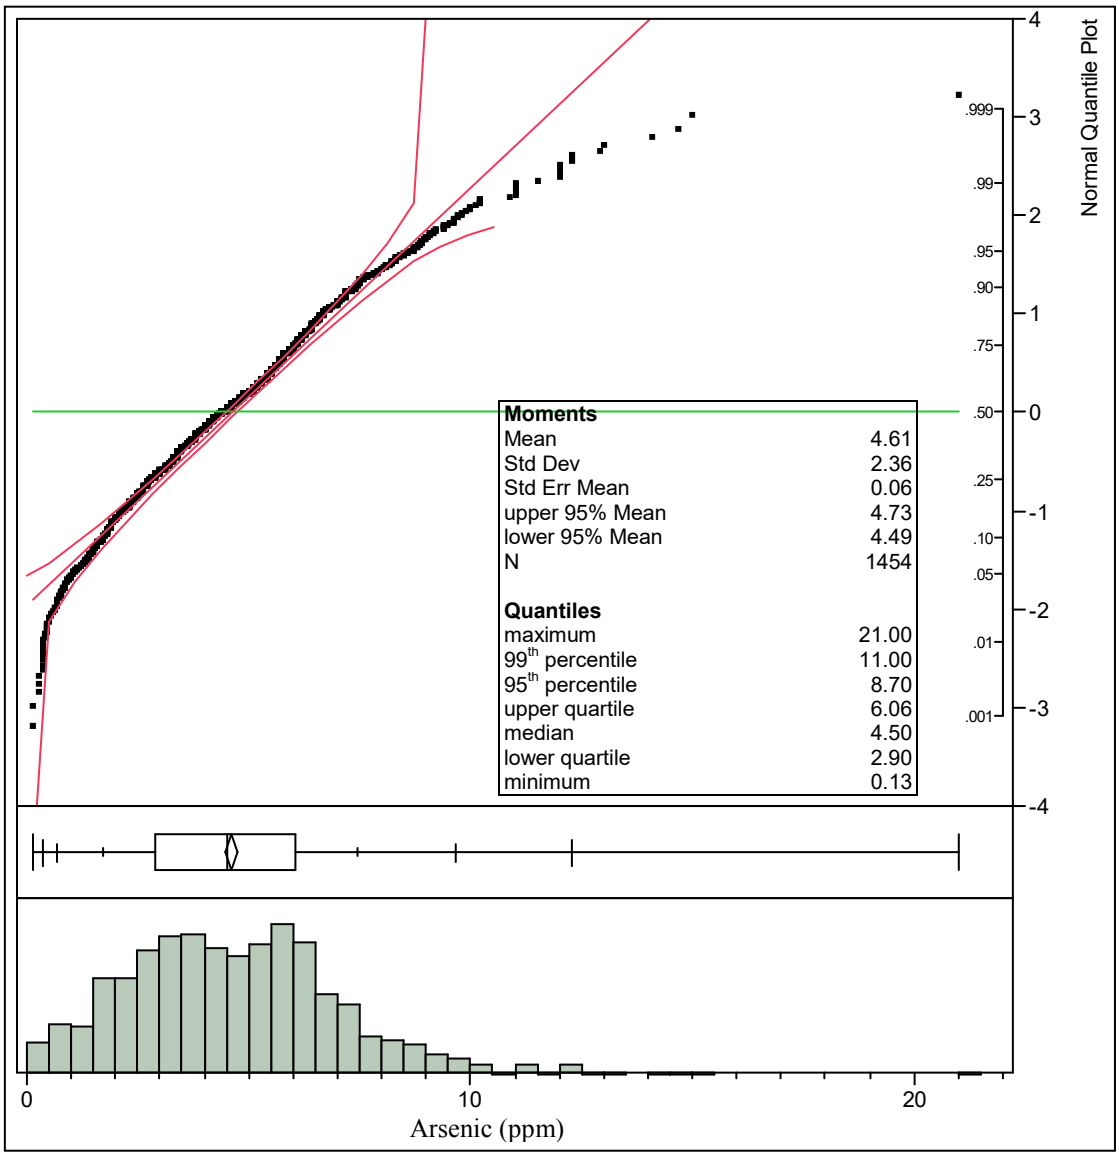


Adapted from Wentworth (1997)

The geographic distribution of the 77 sites is not uniform; rather, they are more concentrated within the more heavily urbanized portions of the Bay Area, particularly in Alameda County and other parts of the east bay (Figure 4). The relatively high density of sites in certain areas may indicate the general intensity of industrial and commercial development and the efficiency with which local enforcement agencies impose electronic reporting to Geotracker. Over 50 percent of the data in the database comes from Alameda County. Further, a relatively small number of sites make up a large fraction of the database—50 percent of the data comes from about 16 of the 77 sites. For the above reasons, the background dataset is biased both in terms of the number of samples per site and due to geographic clustering. Given the Bay Area has a developed land area of about 2,800 square kilometers (ABAG and MTC, 2011); the average density of sites is approximately one site per 36 square kilometers.

The database contains all arsenic data that is considered representative of background. Using the methods described in Section 3.3, the ROS method was used to replace 77 nondetects with estimated values, and 60 outliers were identified and eliminated. Figure 5 presents a histogram, quantile box plot, normal quantile plot, and summary statistics for the arsenic concentrations within the database. The data includes all samples from the 77 sites, thereby skewing the distribution pattern and overall summary statistics in favor of sites with a high number of samples, and combining multiple background populations into one distribution. As such, the visual analysis of the histogram and probability plot are unlikely to point to regional-scale influences on arsenic concentrations such as geography or geologic unit. In addition, the right tail of the probability plot shows several data points that might be interpreted as outliers; however, these did not meet the criteria for excluding outliers discussed in Section 3.3.

Figure 5 – Distribution of arsenic concentrations, including a histogram, a quantile box plot, and a normal quantile plot



Summary statistics of arsenic concentration in the database include a mean of 4.61 ppm, median of 4.50 ppm mg/kg, standard deviation of 2.36 mg/kg; and an IQR of 3.16 mg/kg (Figure 5). The concave shape of the normal quantile plot indicates that arsenic concentrations are not normally distributed. Based on the Lilliefors tests in ProUCL, the arsenic concentration data do not follow a discernable distribution and thus non-parametric methods are used when comparing groups (i.e., sample depth) within the database. Based on this data, the upper estimate of arsenic concentrations (99th percentile) considered as background is **11 mg/kg**.

4.2 Summary of Background Arsenic Concentrations by Site

Appendix A lists the 77 sites selected from Geotracker, their location, the soil type and basic summary statistics, including quantiles. Figure 6 and Figure 7 include a normal quantile plot, a quantile box plot, and a histogram of median values from the 77 sites first in original values (Figure 6), and as log-transformed data (Figure 7). The Lilliefors test was used on both distributions to test the null hypothesis that the data come from a normally (or log-normally) distributed population. The test, which used untransformed data to test both the normal and lognormal model, failed to reject the null hypothesis in either case, indicating the data can be characterized as being normally or log-normally distributed. The correlation coefficients (R) for both tests were nearly identical—R values were 0.981 and 0.983 for the normal and the log-normal data, respectively; however, the lognormal distribution has a better visual fit to the data. Site medians range from 0.61 mg/kg to 11 mg/kg, and the data display a positively skewed distribution. The mean of the dataset is 4.23 mg/kg, the median is 3.9 mg/kg, and additional summary statistics are shown in the box in Figure 6.

Figure 6 – Normal quantile plot, box plot, and histogram of site medians

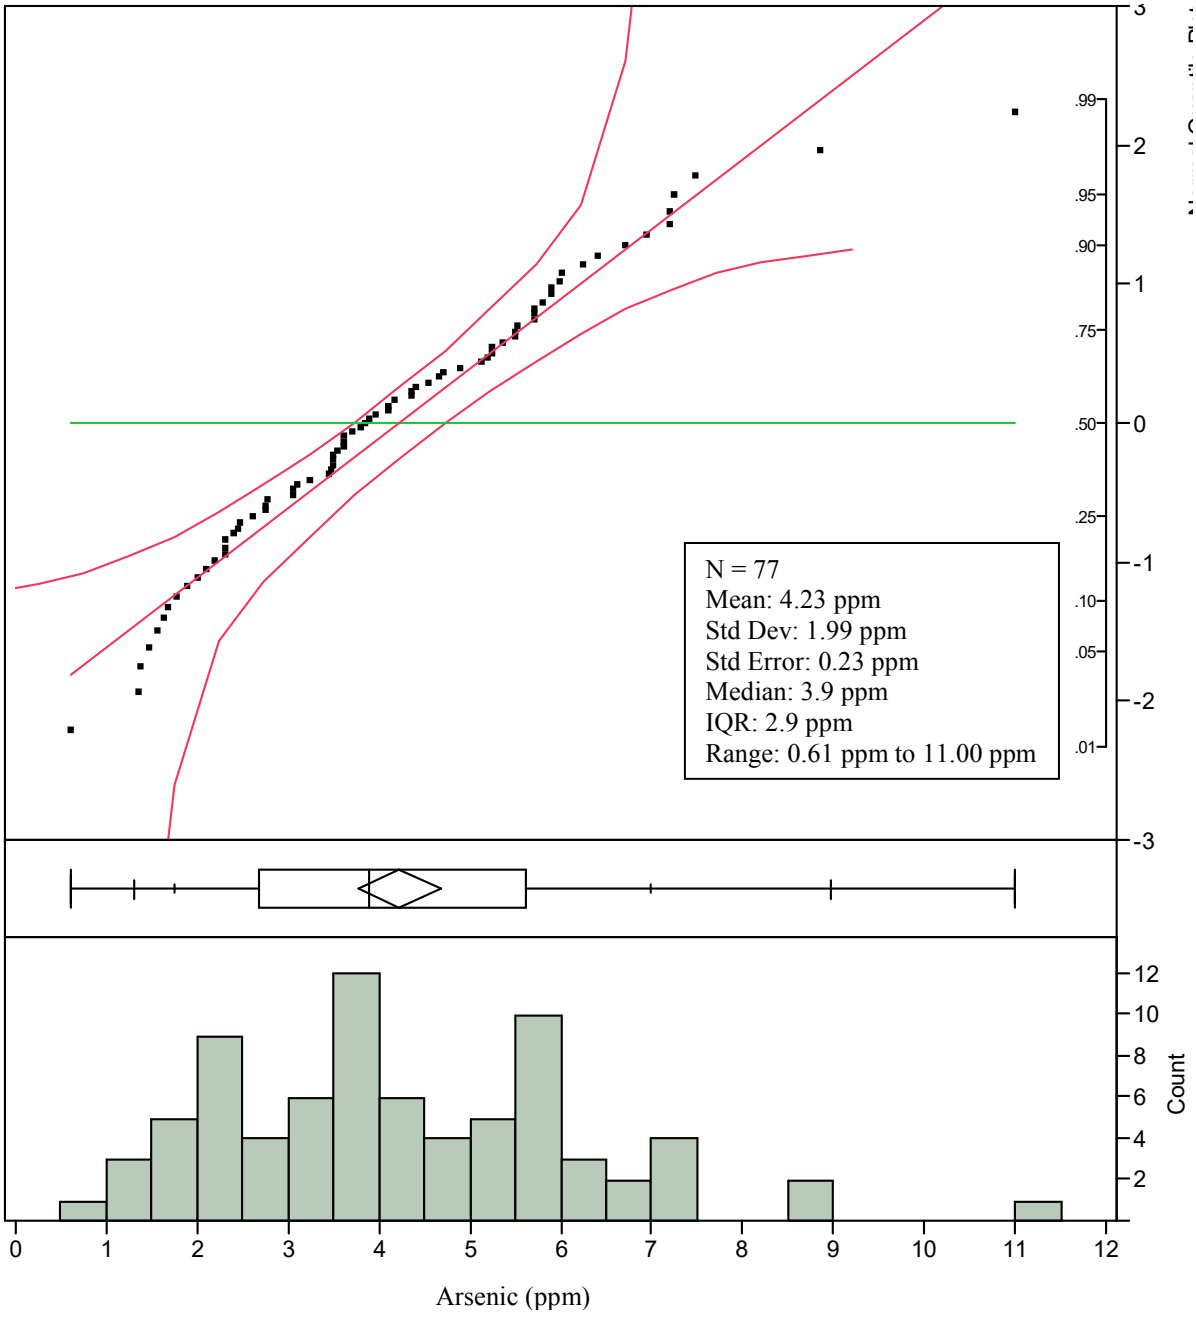


Figure 7 – Normal quantile plot, box plot, and histogram of the natural log of site medians

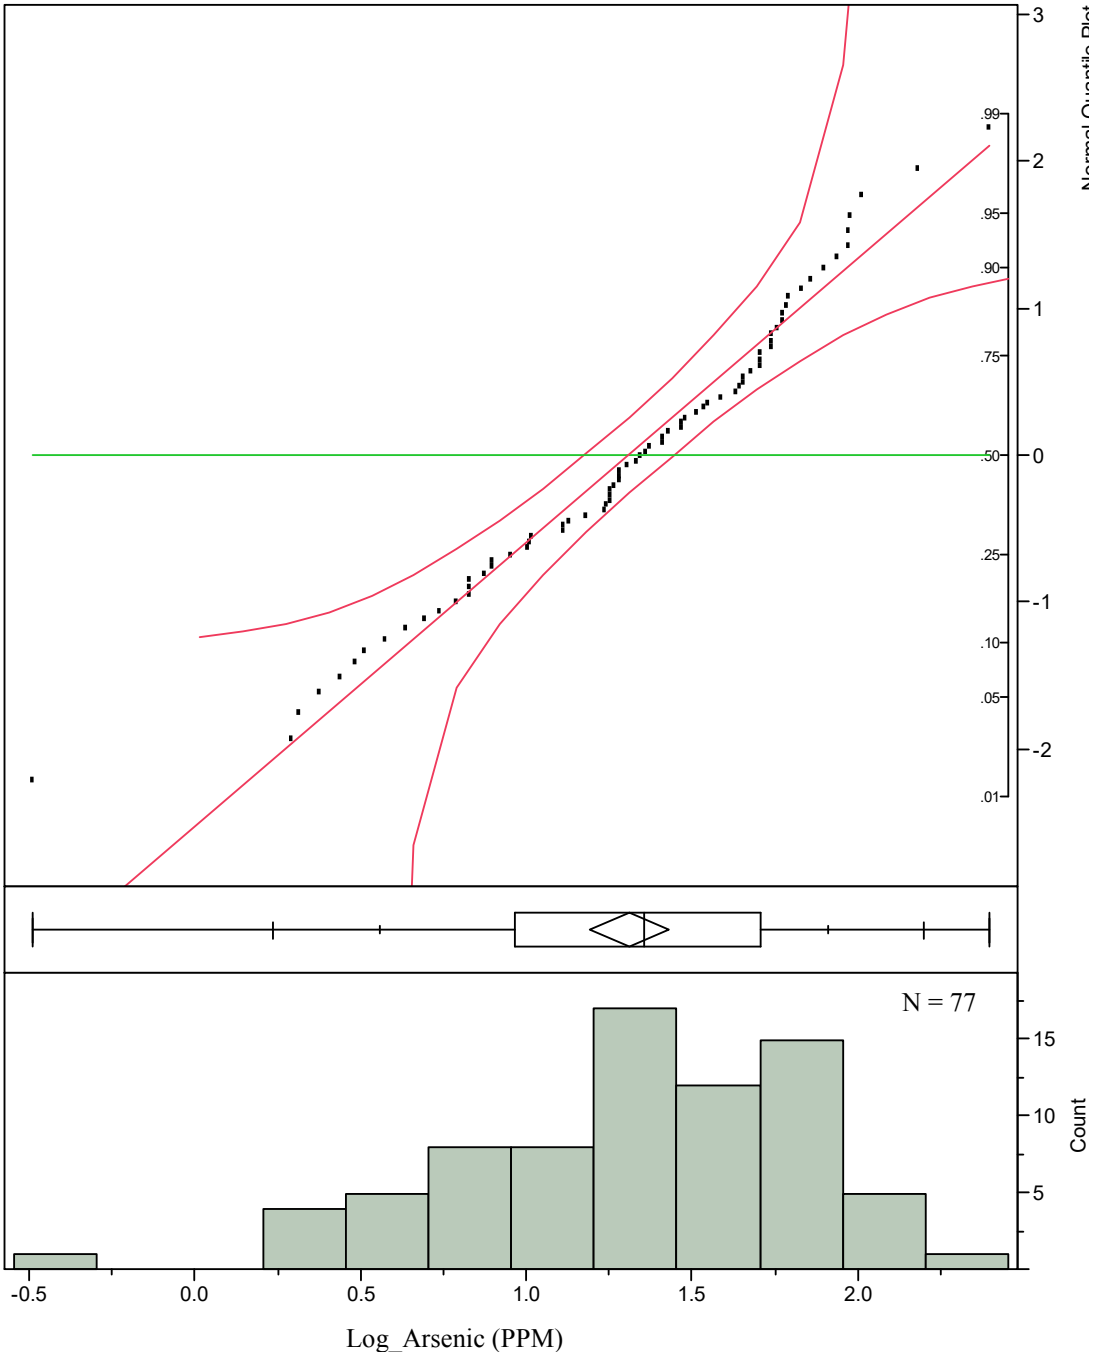
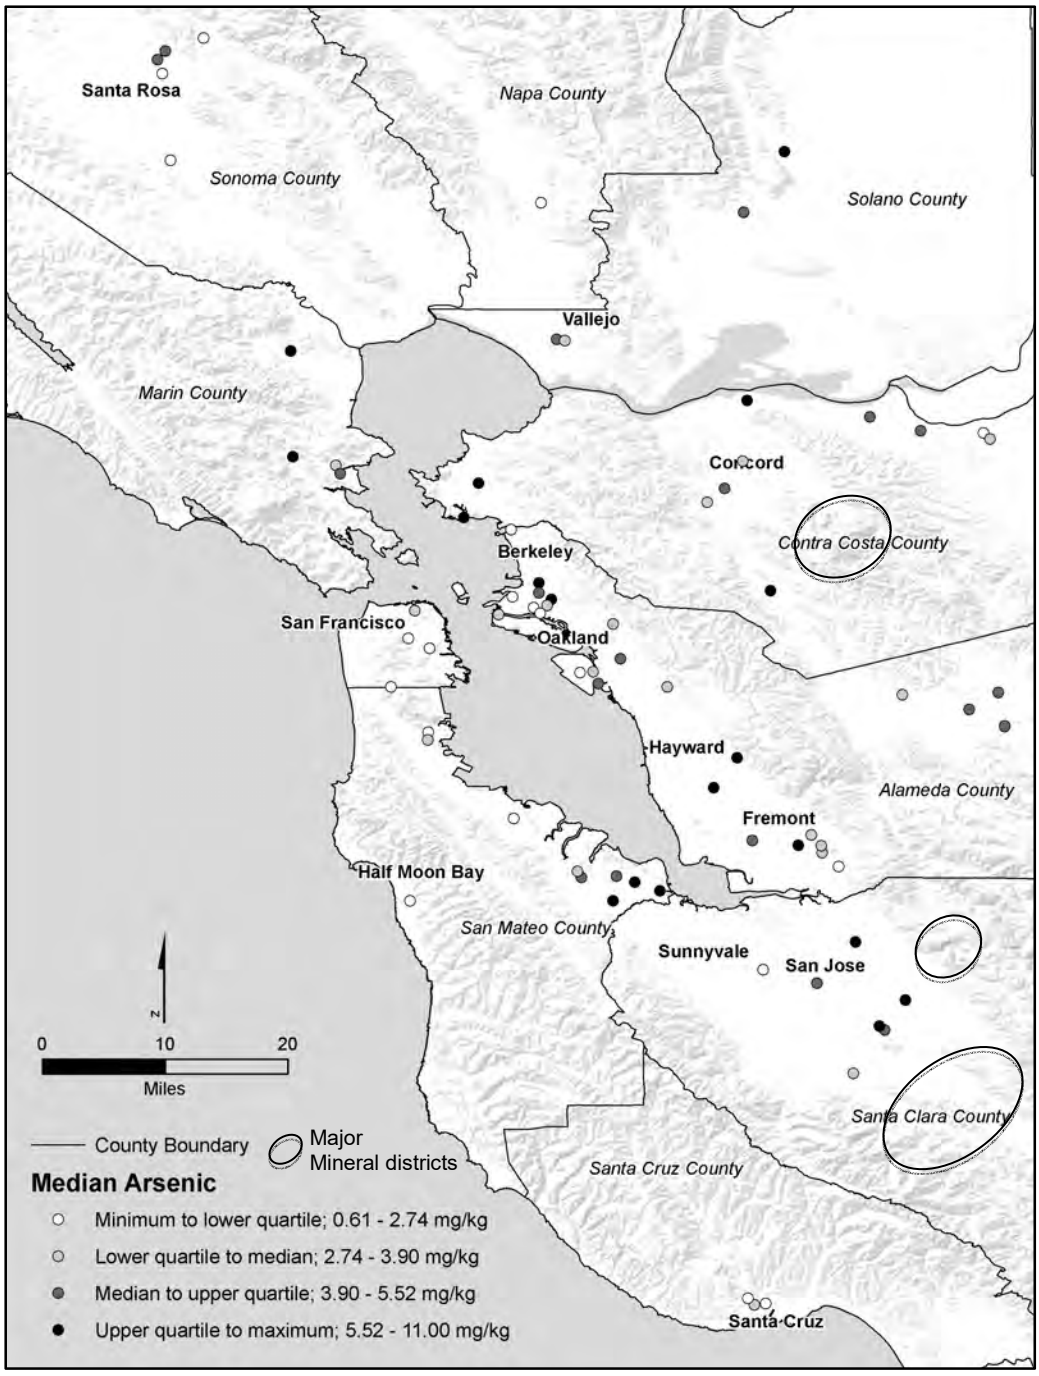


Three sites contributed to a large portion of the spread in the data. On the low end, site no. 22 has a mean of 0.8 mg/kg and 75 percent of the data, including the median is below the reporting limit (Appendix A). The detected data for site no. 22 ranged from 1.0 mg/kg to 2.0 mg/kg. Review of the site investigation report for the property did not indicate a reason (such as laboratory analysis problems or site-related sources of arsenic contamination) that the site should be excluded from the dataset. On the high end, site nos. 18 and 25 have median arsenic concentrations of 11.0 mg/kg and 8.9 mg/kg, respectively. The samples collected from both sites were deep (>1.8 meters bgs) and the site investigation reports contained no evidence to indicate site related arsenic contamination has occurred. As such, the sites were not eliminated from the dataset as outliers.

Figure 8 illustrates the spatial pattern of median arsenic concentrations by site across the study area. The 77 sites are colored by value, with white and black dots representing the lowest fourth and highest fourth of median values, respectively. Median values for sites in the northern San Francisco Peninsula and along the Pacific coastline appear to be consistently on the low end of the range, whereas sites on the high end of the range do not appear to dominate a single geographic region. Certain areas, such as central Marin County, the City of Hayward, the east side of San Jose, and the west end of Contra Costa County, have sites with high median arsenic concentrations. However, a clear geographic pattern cannot be discerned due to the low spatial density of the data in those places. Areas where the spatial density of sampling sites is high, such as the Berkeley, Oakland, Fremont, and north of Sunnyvale areas, have median arsenic concentrations that vary from the low to the high end of the range within relatively short distances. Figure 8 also shows general regions where rocks have been historically mined for Mercury.

Figure 8 – Map of median arsenic by site



To evaluate whether the spatial pattern expressed is clustered, dispersed, or random, the spatial autocorrelation tool in ArcMap 9.2 was used to calculate the Moran's I Index value and a Z score. A Moran's I value near +1.0 indicates clustering while a value near –1.0 indicates dispersion. The Z score value indicates whether or not the null hypothsis that there is no spatial clustering can be rejected. The Moran's I Index for the site medians is 0.18 and the Z score is 1.2 standard deviations. These scores confirm the visual observation that while somewhat clustered, the observed pattern of median arsenic concentrations may be due to random chance.

4.3 Arsenic Concentrations by Sample Depth

Because releases of arsenic are most likely to occur above ground (NAVFAC, 2002), sample depths (bgs) were classified as surface or subsurface as described in Section 3.2 to evaluate whether arsenic contamination within surface soils should be suspected. Soil samples were excluded from this analysis if the sample depth was not reported or if a composite depth was reported, which represents a range of depth rather than discrete depth. To compare depth classes, a univariate plot of arsenic concentrations for surface samples vs. subsurface samples was examined (Figure 9). Arsenic concentrations in the database plotted on a normal quantile plot indicate the distribution pattern is non-parametric in nature (Figure 5). As such, the non-parametric Wilcoxon test was used to determine if the group medians are significantly different. The test resulted in a significance probability (probability > |z|) of 0.40. Because the observed significance probability is not less than 0.05, there is no significant difference between surface and subsurface soil concentrations at the 95% confidence level. A univariate plot of arsenic concentrations for shallow (≤ 1.8 meters) vs. deep (> 1.8 meters) samples was created (Figure 10), and the non-parametric Wilcoxon test resulted in a significance probability

Figure 9 – Univariate plot of arsenic concentrations vs. sampling depth (surface and subsurface)

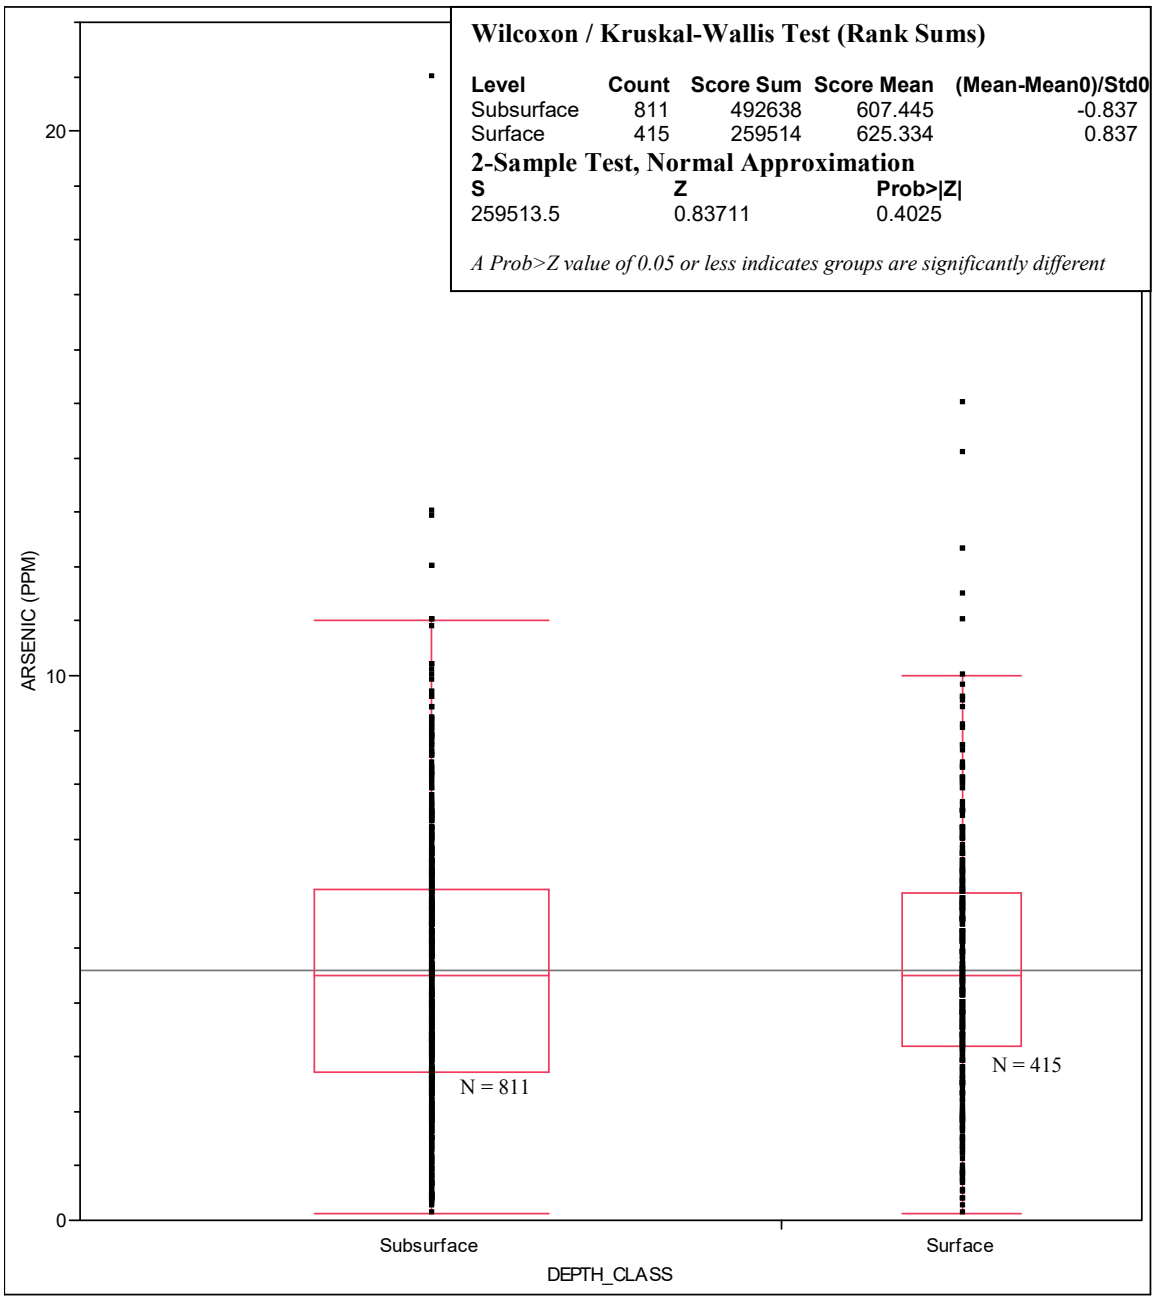


Figure 10 - Univariate plot of arsenic concentrations vs. sampling depth (shallow and deep)

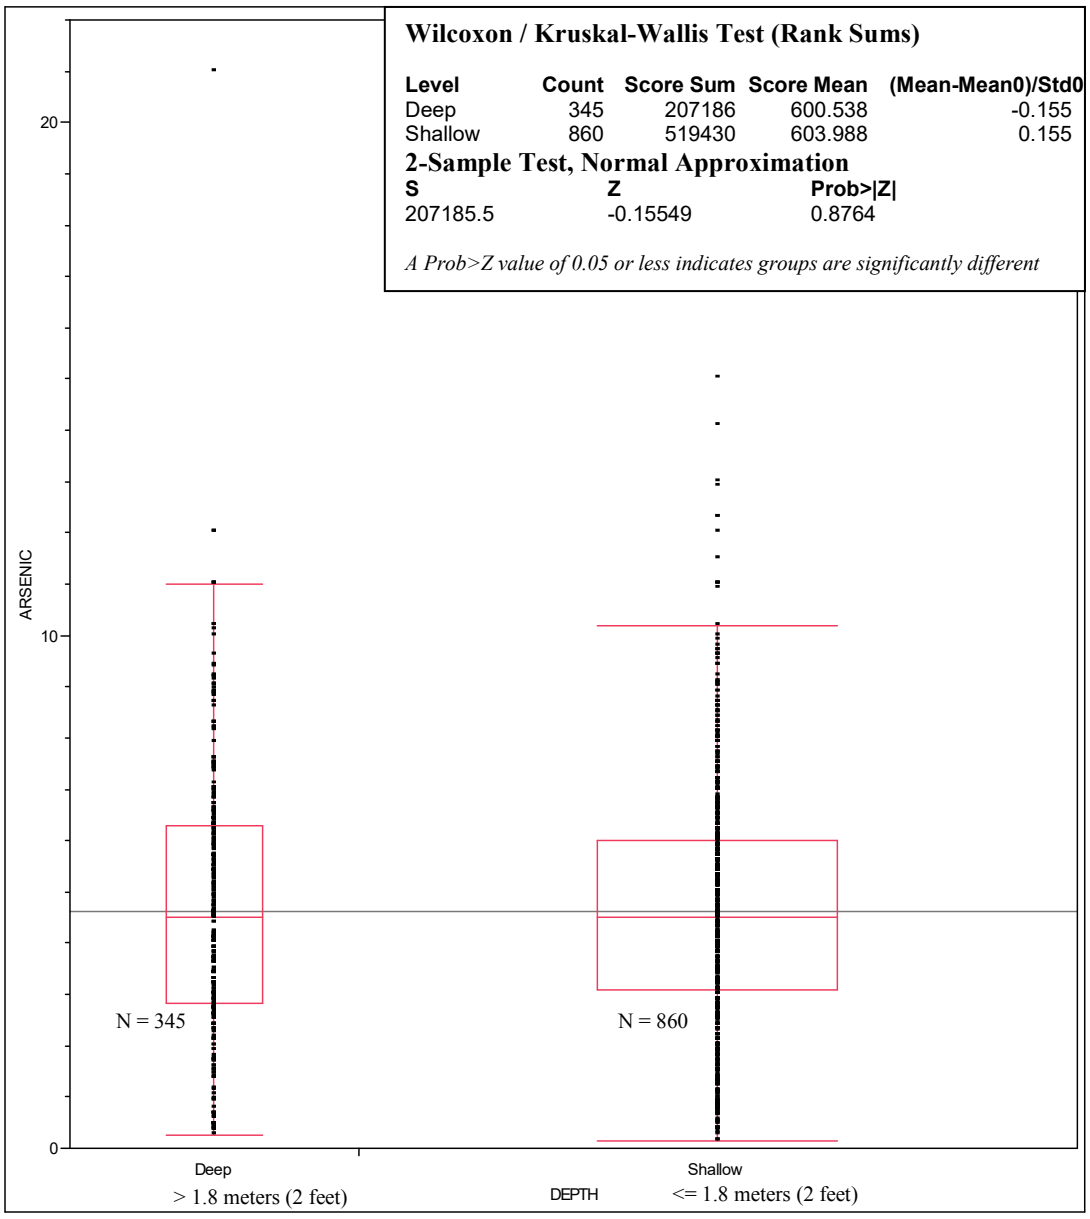


(probability > |z|) of 0.88, likewise indicating there is no significant difference in arsenic concentrations between shallow and deep soil samples (95% confidence level).

4.4 Statistics by Soil Type and Significance Tests

The 77 sites are underlain by several geologic units, including Holocene bay mud, Holocene alluvium, Pleistocene alluvium, other Quaternary units, and Franciscan Complex bedrock (Table 4). Because only one site is located within the Franciscan Complex, it was excluded from this analysis. Eleven sites are underlain by several different Quaternary units that are not alluvial in origin. These sites were either underlain by dune sands, coastal/marine terrace deposits, or colluvium, and were grouped together as one category. Table 5 lists summary statistics for arsenic concentrations by soil unit. An ANOVA was performed to test whether grouping by soil type can explain some of the variation in background arsenic concentrations. An ANOVA was considered appropriate because the site medians follow a normal distribution, and because variances are equal. The F Ratio obtained from the ANOVA (3.85) indicates that the model fits the data at a 95% confidence level (probability > F is 0.013), and that group means are statistically different from the overall response mean.

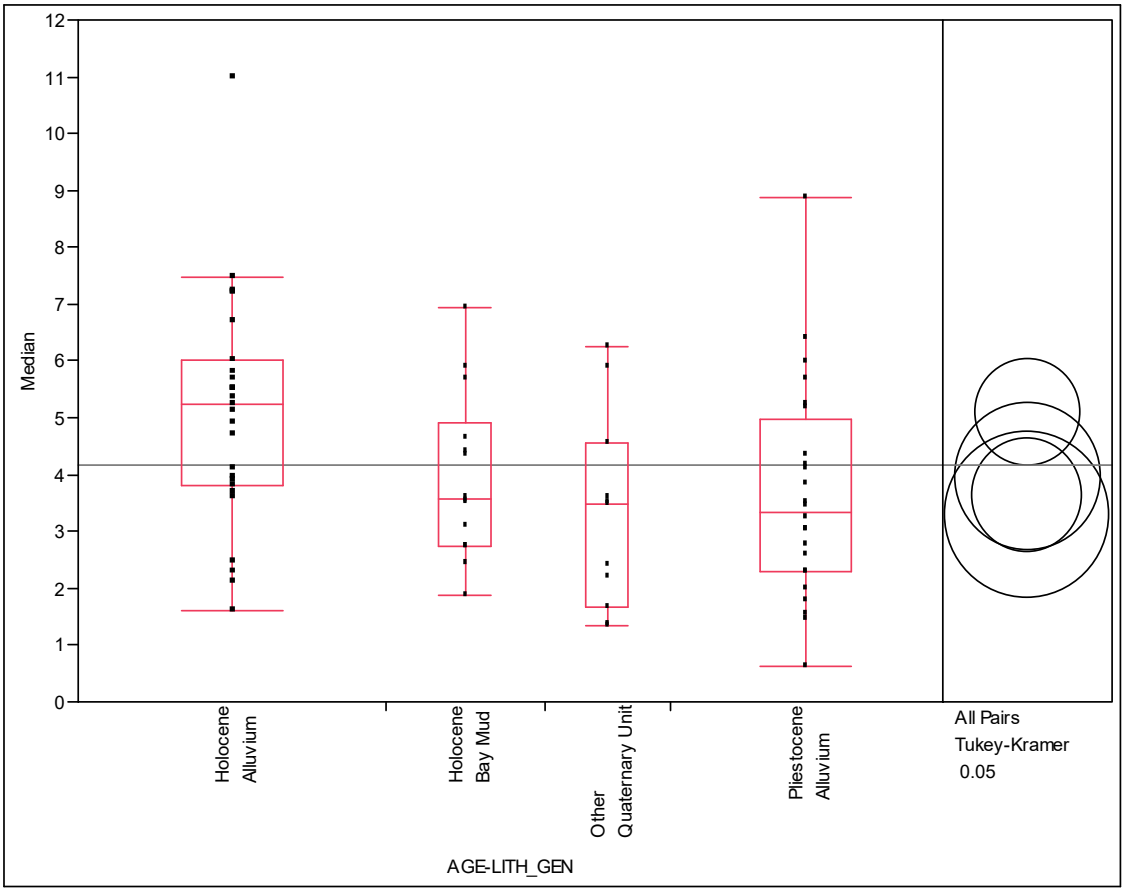
Table 5 – Statistics by soil unit and means comparison using Tukey test

Soil Type	Number	Mean	Min (mg/kg)	Median (mg/kg)	Max (mg/kg)	Tukey test*
Holocene alluvium	27	5.10	1.62	5.25	11	A
Holocene bay mud	14	3.97	1.89	3.58	6.94	A B
Pleistocene alluvium	24	3.65	0.61	3.35	8.86	B
other Quaternary unit	11	3.30	1.34	3.47	6.25	B

** Levels not connected by same letter are significantly different*

To make multiple comparisons between soil types, a Tukey test was performed, as shown in Figure 11 and Table 5. The comparison circles plot on the right side of Figure 10 is a visual representation of group mean comparisons. Circles for means that are significantly different either do not intersect or intersect slightly so that the outside angle of intersection is less than 90 degrees. If the circles intersect by an angle of more than 90 degrees or if they are nested, the means are not significantly different. Group means for Holocene alluvium, Holocene bay mud, Pleistocene alluvium, and other Quaternary units were 5.10 mg/kg, 3.97 mg/kg, 3.65 mg/kg, and 3.30 mg/kg respectively. According the Tukey test, Holocene alluvium has a group mean that is significantly higher than both Pleistocene alluvium and other Quaternary units, but there is no significant difference between Holocene bay mud and any other unit. In addition, there is also no statistically significant difference between group means of Pleistocene alluvium and other Quaternary units. The R^2 value of the ANOVA model is 0.14, indicating the groupings explains 14 percent of the overall variability of the sample group.

Figure 11 – Distribution of arsenic concentrations by soil type and Tukey-Kramer HSD comparison of means



5.0 DISCUSSION AND CONCLUSION

5.1 Summary of Results

The results of this study indicate that background arsenic concentrations within the urbanized San Francisco Bay Region are lower than many of the estimates found in the literature, and are only weakly correlated with the underlying Quaternary geologic unit. Based on the data screened from Geotracker, the mean and upper estimate (the 99th percentile) for the regional background level of arsenic is 4.61 mg/kg and 11.00 mg/kg, respectively. In increasing order, the mean concentration of site medians grouped by soil type are 3.30 mg/kg ("other" Quaternary units), 3.65 mg/kg (Pleistocene alluvium), 3.97 mg/kg (Holocene bay mud), and 5.10 mg/kg (Holocene alluvium). Arsenic concentrations within Holocene alluvium were found to be statistically greater than Pleistocene alluvium and "other" Quaternary units; but no statistically significant difference was found between Holocene Bay Mud, Pleistocene alluvium, and "other" Quaternary units. The ANOVA and Tukey test revealed that the differences between group means are not pronounced, accounting for only 14 percent of the variation in median values across the 77 sites included in this study.

While it was anticipated that non-point anthropogenic sources of arsenic might result in higher concentrations of arsenic within surface samples, there was no statistically significant difference found between surface and subsurface soil samples. Further accounting for the soil mixing and reworking that takes place in urban settings, there was likewise no statistically significant difference found between shallow ($\leq$ 1.8 meters) and deep ($>$ 1.8 meters) soil samples. These results provide further evidence that the anthropogenic influence on the sample sites as it relates to arsenic is minimal.

The relative differences in mean arsenic concentrations across the four soil types, despite being subtle, correlate well with the general expectation that finer grained soils would result in elevated arsenic concentrations relative to coarse grained soils (NAVFAC, 2002; Alloway, 1990). Helley et al. (1979) explains that Pleistocene alluvium, which extends out from the base of hills in the Bay Area, is generally a coarser-grained unit than Holocene alluvium on the bay plains. Further, the "other" Quaternary units—predominantly composed of dune sands, colluvium, and shallow marine terrace deposits—had the lowest mean arsenic concentration. These "other" units are generally clean sandy units, and/or coarse-grained as a result of their depositional environment. This is generally consistent with finding made by Gustavvson et al. (2001), who associated the Nebraska Sand Hills, the largest dune field in the Western Hemisphere with low concentrations of arsenic.

5.2 Other Potential Sources of Variability in the Regional Background

As explained in Chapter 2, there are a number of other factors besides Quaternary soil type that likely contribute to regional variability in background arsenic concentrations, including the geologic source material for the Quaternary soils, the anthropogenic background, and/or ongoing geochemical processes (e.g., weathering, leaching, or enrichment). Localized areas in the hills and mountains of the region may produce unusually high concentrations of arsenic due to favorable geologic environments such as ore deposits (i.e. former mercury mines) and presence of organic-rich shales or coal. It is reasonable to expect that depositional settings sourced from these regions may result in naturally elevated concentrations of arsenic within Quaternary-age sediments.

However, there are several limitations, both in this study's dataset and in the existing geologic environment, that limit the ability to test this idea. Firstly, there are inherent difficulties in associating alluvial soils to specific bedrock sources, especially

when the watershed is large and geologically complex. The influence of arsenic-rich geologic environments would become decreasingly detectable as a greater portion of the watershed is underlain by other bedrock units (i.e., distance from source). Secondly, while the general locations of former mercury and coal mines are known, shale and/or mudstones often occur in repeating sequences along with other sedimentary lithologies (e.g. sandstone). These sequences are frequently mapped together in the same formation, making it difficult to reliably estimate the portion of the watershed underlain by a specific lithology. Lastly, rather than being concentrated in one geographic location, shale-rich lithologies are fairly widespread throughout the Bay Area, making it unlikely a clear geographic pattern would be detected.

These limitations, along with the low geographic resolution of the data make correlations of high arsenic concentrations within Quaternary soils to specific source rocks speculative at best. If there were a strong source-rock influence on arsenic concentrations in Quaternary soils, it would be expected that sites with high arsenic values would be clustered and coincident with similar source regions. As discussed in Section 4.2 and shown in Figure 8, while the data in this study appears slightly clustered, it is also possible that it is the result of random chance. The lack of evidence for strong clustering or a striking geographic pattern may have more to do with the geographically sparse nature of the dataset than the absence of a source rock influence. The two general observations of 1) low median values along the northern end of the San Francisco Peninsula and the San Mateo and Santa Cruz County coastlines, and 2) high values in the eastern and southern Bay Area beg for a geologic explanation. Further study aimed at greater understanding of the relationship between arsenic concentrations found in Quaternary soils, and the geologic characteristics of their source regions would be valuable in further explaining natural variability in arsenic, and could possibly lead to the development of predictive tools.

An additional consideration which might influence the regional variability in background arsenic concentrations is broad land-use patterns and associated non-point sources of anthropogenic arsenic. It is important to recognize that regional land-use patterns often coincide with major changes in the underlying soil type. As illustrated in Figure 3, Holocene alluvium and bay muds underlie some of the most intensely developed urban and industrial areas, whereas Pleistocene alluvium more often underlies low-density residential areas. In addition, Holocene alluvium commonly supports prime agricultural soils and is likely to have supported agricultural uses prior to urban development, particularly in the eastern and southern Bay Area. Despite findings of no significant difference between surface and subsurface samples, it is difficult to fully dismiss the possibility that higher arsenic concentrations within Holocene alluvium are associated with concurrent variations in the anthropogenic background (e.g., the general type, intensity, and history of land development).

Due to its considerably greater age, it is also possible that Pleistocene alluvium in the study area was derived from different source rocks, or that geochemical processes that remove arsenic from alluvial soils have had a longer time to take place. It should also be recognized that the datasets for two of the geologic groups are small (n=11 for bay mud, n=14 for "other" Quaternary units), so the differences may also reflect a lack of a representative dataset. While a statistical correlation was identified between soil type and arsenic concentration, the actual processes governing those relations remain elusive.

5.3 Comparison of Findings with Other Background Studies

Despite the difficulties in clearly explaining sources of variation in the background dataset, statistics derived from the database provide defensible global estimates for background concentrations of arsenic within the flatland deposits of the Bay Area. The screening criteria avoided obvious sources of contamination and the

Geotracker database by nature contains primarily sites where fuels and organic solvents are the primary contaminant of potential concern. As discussed in Section 3.1, there is little to no correlation between metal and organic compound distributions, and the presence of organic co-contaminants has no effect on metal concentration background ranges.

The location and type of sample sites in this study is especially appropriate given they are representative of the geological and land-use settings where future environmental investigations are likely to be performed. A map of Geotracker site locations in the Bay Area instantly reveals that the vast majority of sites undergoing investigation and/or cleanup are located on urbanized flatland underlain by Quaternary-age geologic units. The commercial, industrial, institutional, and transportation-related land uses that are most often the subject of environmental investigations will continue to be predominantly located in such settings. Thus, the regional background estimates derived in this study may actually be more appropriate than background estimates derived from a pristine natural area, particularly if derived from bedrock units that naturally have anomalously high levels of arsenic.

The mean of 4.61 mg/kg and the proposed upper estimate of 11 mg/kg for the regional background concentration of arsenic found in this study are noticeably lower than upper limits from several other background studies of various geographic scope and scale (see Sections 1.3 and 1.5). The most obvious difference is with the background threshold value of 42 mg/kg for the Great Valley Sequence and 24 mg/kg for the “other” bedrock discussed in the LBNL (2002) study. The approach to screening sites/samples and the number of samples for this study was comparable to the LBNL study, though the approach to identifying outliers differed. The LBNL study used a uniform criterion of 50 mg/kg to eliminate outliers, whereas this study performed a site-by-site evaluation of

outliers based on individual site distributions (the lowest value identified as an outlier, for example, was 7.1 mg/kg). While this difference in approach may have resulted in some of the disparity between background estimates, it is not sufficient to account for the substantially higher background threshold value found in the Berkeley hills.

In the LBNL case, the difference can be reasonably explained by differences in the geological setting. The LBNL area is underlain by tertiary-age sedimentary rocks (the Moraga and Orinda Formations) which are highly variable in their lithology, but commonly contain repetitious layers of shale and sandstone. The Great Valley Sequence in the area is mapped as the Claremont Shale of the Monterey Group, which is a fine-grained organic-rich shale and mudstone formation. As discussed in Section 1.3 (see Table 1), there is general consensus in the literature that shales and fine-grained soils tend to have naturally higher levels of arsenic than other types of rocks. The fact that the LBNL found a significant difference between different bedrock types on-site, and their finding of relatively high background threshold values support this notion. The national study by Shacklette and Boerngen (1984) also reported noticeably higher background arsenic concentrations (7.2, <RL to 93 mg/kg), although this isn't unexpected based on the coarse scale of the study.

Several studies in flatland geologic environments found similar or lower background levels than reported in this study. Scott's (1994) study area was located in an urban portion of the Santa Clara Valley underlain by Quaternary alluvium and bay muds, and she found a lower mean background concentration of arsenic, although a similar range of values (2.28, <DL to 20 mg/kg). The study area for the UCR study focused on alluvial/agricultural soils—primarily in the central valley—and found a comparatively lower mean and range of arsenic concentrations (3.5, <RL – 11 mg/kg) (UCR, 1996).

The findings of this thesis suggest that the most commonly cited background estimates of arsenic—namely from LBNL (2002) and Shacklette and Boerngen (1984)—are too high and do not represent the flatland soils of the Bay Area. Based on the findings herein, ESA's performed in the urbanized Bay Area should not automatically conclude that arsenic detections are representative of background so long as they are within the ranges found in the prior literature. Future metals analyses in areas underlain by flatland soils of the Bay Area should carefully examine arsenic detections in exceedance of 11 mg/kg as possibly exceeding background levels. In such cases, additional tests (such as the Wilcoxon ranked-sum test) should be performed to answer with a set confidence level whether the data exceeding background truly represents a different population. If no other defensible geological or geochemical reason for the high concentrations is provided, then site related contamination should be suspected. The background threshold value of 11 mg/kg is nearly double the 99th percentile value of 6 mg/kg found in a recent arsenic background study of the urbanized flatlands of the Los Angeles area for LA Unified School District sites (CalEPA, 2005). The Los Angeles basin is surrounded by large granitic mountain ranges that are geologically distinct than those in the Bay Area, producing much sandier flatlands than the watersheds of the Bay Area. Thus, the lower value is reasonable from a geologic standpoint, given that arsenic is thought to be elevated in mudstones and shales.

The method used herein to obtain, compile, and analyze background data on arsenic can be repeated for a suite of other constituents of concern whose natural background level often exceeds risk-based screening thresholds. Examples include other naturally-occurring metals such as cadmium, selenium, or nickel, to name a few. The increasing accessibility of environmental data in multiple, easily queried formats presents opportunities to develop better background information. Publically available

environmental databases such as Geotracker provide an efficient and cost-effective means of establishing defensible regional background estimates.

Good Afternoon Rodrigo:

Alameda County Department of Environmental Health (ACDEH) is providing regulatory oversight for an environmental cleanup case located on APN 946-1250-6-4, the parcel of the proposed subdivision. Based on a review of the case file on the State Water Resources Control Board's Geotracker website and the subject Project Referral dated October 17, 2022 for PLN2022-00193, ACDEH is providing clearance of the proposed subdivision provided the conditions of approval listed below are met.

Conditions of Approval

1. Submittal of a Final Soil Import Report to ACDEH for review and approval documenting soil imported to the parcel to restore the former quarry in accordance with the Reclamation Plan being implemented under the oversight of Alameda County Community Development Agency on the Former Aggregates Facility under Surface Mining Permit (SMP) 31 to facilitate closure of the open environmental cleanup case.

2. Obtaining Permits from Zone 7 Water Agency, Regional Water Quality Control Board, and ACDEH for the proposed onsite wastewater treatment system.

Please note, ACDEH met with the applicant today and discussed the conditions of approval listed above.

Greetings, folks.

Attached for your review and comment is a subdivision development proposal for 194 detached single family homes, to be located at a reclaimed site that used to be a quarry outside of Pleasanton. Please provide me your comments on the project. I would like to discuss on this Thursday, October 20, 2021 at 2:00 pm, for those who are available.

Regards,

Rodrigo

PROJECT REFFERAL

Date: October 17, 2022

RE: Case No.: PLN2022-00193
Vesting Tentative Tract Map Subdivision

Due Date: 10/24/2022

* ACPWA BUILDING DEPARTMENT
* ACPWA TRANSPORTATION
* ACPWA GRADING DIVISION
* ACPWA LAND SURVEY
* ACPWA LAND DEVELOPMENT
* ALAMEDA COUNTY CODE ENFORCEMENT DIVISION
* ALAMEDA COUNTY FIRE DEPTARTMENT
* ALAMEDA COUNTY SHERIFF'S OFFICE, PERMITS
* ZONE 7 WATER AGENCY
* ALAMEDA COUNTY DEPARTMENT OF ENVIRONMENTAL HEALTH
* CITY OF PLEASANTON PLANNING DEPARTMENT
* PLEASANTON UNIFIED SCHOOL DISTRICT

The following application is referred to you for your information and recommendation:

PLN2022-00193 / USL PLEASANTON LAKES, L.P. // 330 LAND COMPANY, L.L.C., VESTING TENTATIVE TRACT MAP (TR-8423), application to allow subdivision of a 26.6-acre parcel into 194 residential lots with infrastructure needed to serve the development including roads, sewer, domestic water, and storm-drain; 3030 Mohr Avenue, fronting on and extending south to Busch Road, unincorporated Pleasanton area of Alameda County.

County Assessor's Parcel Numbers (APNs): 946-1250-006-04 (portion) for subdivision and roads, 946-1350-003-12 for sewer, and 946-1350-003-10 for water.

General Plan Land Use Designation: 946-1250-006-04 (portion): Medium Density Residential, allowing densities of 4.1 to 8.0 units per acre. This designation provides for single family detached and attached homes, multiple family residential units, group quarters, public and quasi-public uses, limited agricultural uses (e.g., nurseries, orchards, field crops), community and neighborhood commercial uses (e.g., retail stores on sites up to 15 acres, with a maximum of 0.4 FAR), neighborhood support uses (e.g., child-care facilities with a maximum of 0.4 FAR), and similar and compatible uses; 946-1350-003-12: Large Parcel Agriculture; and 946-1350-003-10: Water Management.

Zoning: Agriculture

CEQA: This project is being reviewed for impacts to the environment per the California Environmental Quality Act.

Receipt of your comments regarding this project by the indicated due date will enable the consideration of your comments in the analysis of the proposal, and inclusion of relevant information in the preparation of a written staff report. If you have no comments on this proposal, please initial and date below that your organization, department, or agency has no comment and return this notice by the indicated due date.

Please send a copy of your recommendation(s) to the applicant.

If you have any questions, please contact me at 510-670-5400, or at the email below.

Sincerely,

DocuSigned by:

Re: Development Plan & Vesting Tentative Map Application For Arroyo Lago

Introduction

Arroyo Lago (the "Project") is contemplated as a new community consisting of 194 single-family homes, a .7 acre centrally located park, and approximately 1/2 mile of designated walking trails. The Project is located in unincorporated Alameda County adjacent to the City of Pleasanton and is within the Urban Growth Boundary. Consistent with the Medium Density Residential ("MDR") land use designation in the County's East County Area Plan applicable to the project site, Arroyo Lago's 194 units would be constructed on approximately 26.6 acres, for an average density of approximately 7.3 units per gross acre. This is consistent with the objective allowed MDR density range of 4.1 to 8.0 units per gross acre.

The vision of the Project is to develop a family friendly community that is respectful to the existing patterns of development. To achieve this vision, the site plan has been developed with a centrally located park which is connected to multi-use trail on the perimeter of the Project. Homes are all designed on similar lot sizes to the surrounding community and heights are kept to two stories. Additionally, approximately 25% of the homes are designed with junior ADUs

Surrounding Land Uses

- East – Vacant land, designated as Large Parcel Agriculture in the East County Area Plan
- South – Busch Road
- West – Age-Restricted Single Family Detached Homes
- North – Lake I part of the Zone 7 Chain of Lakes

330 Land Company LLC
16381 Scientific Way
Irvine, California 92618

Proposed Entitlements

The contemplated Project entitlements to be obtained through the County include a Vesting Tentative Map and Conditions of Approval.

Architectural Style

The architectural styles that will constitute the design vocabulary are contemplated as Farmhouse, Craftsman and Modern Ranch which have been inspired by the Tri-Valley's agricultural heritage and the iconic wine country architecture. The homes will cohesively add visual interest and contribute to the overall neighborhood identity. To achieve an architectural variety throughout the site, duplicate styles will never be adjacent to one another. The homes are intended as a model for a superior design throughout the region as they will exhibit high quality materials, articulation, and detail.

East County Area Plan Consistency

The East County Area Plan ("ECAP") includes numerous goals, policies and programs in addition to the "objective" standards and criteria. The Housing Accountability Act stringently defines the term "objective" to mean "involving no personal or subjective judgment by a public official and being uniformly verifiable by reference to an external and uniform benchmark or criterion available and knowable by both the development applicant or proponent and the public official." (Gov. Code § 65589.5(h)(8)). Utilizing objective as defined in the Housing Accountability Act, the only development standard that is an objective standard applicable to the Project is the Allowable Gross Density detailed in Table 6 & 7 of the ECAP, which allows for a Gross Density in the Medium Density Residential category of 4.1 to 8.0 units per gross acre.

The other goals and policies of the ECAP are subjective and generally intended to provide for compact urban development in areas suitable for urban development while preserving agricultural lands, natural resources and open space. Development of Arroyo Lago will be limited to the 26+/- acre parcel designated as Medium Density Residential in the ECAP and the off-site infrastructure for Arroyo Lago is sized and designed to only meet the needs of the project and is not sized for any future development. The project is a compact infill development adjacent to existing development and will allow for preservation of open space in other areas of the ECAP, as such Arroyo Lago is entirely consistent with not only the "objective" standards of the ECAP but is also consistent with the goals and policies of the ECAP.

330 Land Company LLC

Irvine, California 92618

330 Land is excited to work in cooperation with the County of Alameda in providing much needed housing to the community consistent with the objective provisions of the East County Area Plan, pursuant to critical state laws that are designed to facilitate housing production. The development team would be happy to discuss the Project or this Application with you at any time. I can be reached by e-mail at sreilly@330land.com or by phone at (925) 368-3128.

Sincerely,

Steve Reilly

STORMWATER CHECKLIST FOR C.6/C.3 COMPLIANCE

The purposes of this Checklist are 1) to provide a summary of the requirements for obtaining County C.6 and C.3 Stormwater Permits, 2) to indicate whether the project described below will be subject to either or both of these Permits, 3) to provide a summary listing of standard design guidelines for permanent C.3 measures, and 4) to serve as a record of conditional approval by PWA of the proposed temporary and permanent Best Management Practices (BMPs) for the control of stormwater runoff, as described in the preliminary Stormwater Plans referenced below.

Instructions: Complete this Checklist for all projects, including demolition, that are or will be subject to a County Building Permit (and/or a County Planning review and approval). Provide all of the requested information, and answer all of the questions. *Make sure that this Checklist is consistent with all other plans and documents included in the submittal package.*

Failure to submit a complete and consistent Checklist will result in a delay in the review and approval of the project. If you have any questions about this Checklist, or about Provisions C.6 and C.3 of the Municipal Regional Stormwater Permit, call the PWA Land Development Division at (510) 670-5480.

SECTION A, GENERAL PROJECT INFORMATION:

A.1	Site Address(es) or APN(s):	APN: 946-1250-06-04 (PORTION)
A.2	Applicant Name & Contact Information:	330 LAND, LLC STEVE REILLY (925) 217-4296
A.3	General Description of Project: (Subdivision, CUP, SDR, Building, Addition, etc.)	SUBDIVISION
A.4	Project PLN or BID Number (if assigned):	PLN 2022-001347

SECTION B, DEVELOPMENT INFORMATION:

		YES	NO
B.1	Does the proposed project include a subdivision, realignment, combining, or other adjustment of the existing legal site boundaries (as defined by A.1 above)? If "**yes**," attach sketches of the existing boundaries vs. the proposed boundaries. **Go to B.2.**	✓	
B.2	Attach a sketch (or mark up the sketch provided in B.1) describing the location and nature of all existing development on the proposed site. Was any of this previous development designed and constructed in compliance with Provision C.3? If "**yes**," provide a reference to previous County approvals or permits: _____; **Go to B.3.**		✓
B.3	The determination of whether a proposed project is required to incorporate permanent Best Management Practice (BMP) stormwater measures in one or more of the four categories described in Provision C.3 (Site Design, Source Control, Treatment, and Hydromodification Management) is dependent upon the location of the site, the planned usage, and the amount of new (or replaced) impervious surface (IS) on the site; see the following table: **Go to B.4.**		

Planned Usage of Site	**Required Permanent BMPs**	**Threshold for Incorporation of Low Impact Development (LID) Measures**	**Threshold for Incorporation of Hydro-modification Management (HM) Controls**
Standalone Single Family Dwelling	• Site Design per Building Ordinance (See Section D of this Checklist)	N/A; LID Treatment not required	

	• Source Controls per Building Ordinance (See Section E)		HM req'd when total new and recreated IS > 1 acre, except: • Post-project IS < pre-project. • Project is located in a catchment that drains to a hardened facility. • Project drains to a tidal channel. • Project is in a catchment that is highly developed.
Restaurant, Retail Gas Station, or Auto Service Facility	• Ditto above, plus: • LID Treatment if IS exceeds threshold	5000 sq. ft. of new and recreated IS on site	
Uncovered Parking Lot	Ditto	Ditto	
Other (new development)	Ditto	10000 sq. ft. of new and recreated IS on site	
Other (redevelopment)	Ditto	Ditto, plus LID Treatment may be required for preexisting IS	

		YES	NO
B.4	Does the proposed project include the construction of a new access roadway/sidewalk(s) serving two or more sites (or two or more buildings on the same site) with a footprint of 10,000 sq. ft. or more (or the construction of 10,000 sq. ft. or more of additional travel lanes on an existing access roadway)? **Go to B.5.**	✓	
B.5	If you answered "yes" to B.4, or if the proposed project is classified as (or includes) one of the usage categories that could require LID and/or HM measures per the table in B.3, you may be required to construct permanent BMPs. Describe the nature and size of the project on the following lines: _____ _____ *Note that stormwater run-on from adjacent properties must either be safely blocked away from any on-site drainage area requiring LID/HM, or included in the design of the said LID/HM system. If run-on diversion or collection is part of the project, be sure to include a complete description of this sub-system.* **Go to B.6.** - - - -

	_____ **Go to B.7.** - - - -

	If "**no**," **go to B.11.**		
B.11	If you answered "no" to both B.7 and B.8, the Agency could still require that you take out a County C.6 Stormwater Permit if the construction-related stormwater runoff from the work site could constitute a water quality hazard; c*heck with the Land Development Division at (510) 670-5480.* **Go to B.12.**		
B.12	Summarizing Items B.9 thru B.11, is the proposed construction subject to Provision C.6 (and the issuance of a County C.6 Stormwater Permit? *Note that even if you are not required to take out a C.6 Stormwater Permit, you may still be required to implement certain construction BMPs under the regulations of the California Green Building Standards Code (CalGreen). Check with the Land Development Division at (510) 670-5480 if you have any questions about the CalGreen BMP requirements.* **Go to Section C.**	✓	

SECTION C, DESIGN GUIDELINES FOR PERMANENT BMPS:

		YES	NO
C.1	Has the project been determined to be a "Regulated Project" per B.8 above? If "yes," you will be required to install and maintain permanent stormwater treatment BMPs in accordance with the County standards and guidelines. **Go to C.2.** - - - -

			• BRAs must be flat-bottomed, and must provide a minimum of 3" of freeboard above the rim height of the overflow inlet. • See Section 6.1 for additional restrictions.
	Flow-through Planter	Section 6.2	• Same as the first five BRA bullets, except that Planters may be installed adjacent to a building foundation, subject to the approval of the Building Official. • See Section 6.2 for additional restrictions.
	Non-proprietary Tree Well Filter	Section 6.3	• Same as the first five BRA bullets, except that Tree Filters may be installed adjacent to a building foundation, subject to the approval of the Building Official. • Proprietary Tree Filters, such as Filterra units, may only be used in approved "Special Projects;" see Section F. • See Section 6.3 for additional restrictions.
All			• All permanent treatment BMPs must be located so that they will be easily accessible following construction by means of an unhindered hardscape path or accessway. • Full unhindered post-construction access must also be provided to all areas and features intended to provide pre-treatment or retention of stormwater. In particular, any underground facility that is designed to retain treated stormwater must be designed and located so as to allow regular inspections and controls for the purpose of mosquito abatement. • Permanent treatment BMPs should be designed in conjunction with the siting requirements of other agencies and departments, including but not limited to the following: o County Fire may require impervious emergency accessways. o County Environmental Health may require setbacks from on-site wastewater treatment systems.

*Notes: 1. All Section references are to the Alameda County *Clean Water Program C.3 Technical Guidance*.
2. Other permanent treatment BMP's, such as Green Roofs, Subsurface Infiltration Vaults, Proprietary Tree Filters, Proprietary Media Filters, Exfiltration Basins, Hydrodynamic Separators, or Drop-in Filters may be approved by PWA for use in special circumstances, or as pre-treatment measures in a treatment train with a "standard" BMP. *Check with the Land Development Division before proposing any of these "special" BMPs.*

		YES	NO
C.3	Are the proposed permanent treatment BMPs in compliance with C.2? If "**yes**," describe the planned BMPs, including any planned pre-treatment measures, or attach a sketch: _____ _____ *Note that all proposed permanent treatment BMPs will be formally subject to approval through the review and issuance of the C.3 Stormwater Permit. Check with the Land Development Division at (510) 670-5480 if you have any questions about the requirements for this permit.* **Go to C.4.**	✓	

	- - -

	If you are planning to construct site design measures, describe them on the following lines, or include a sketch: _____ PROJECT SHALL IMPLEMENT #3 IN ADDITION TO INSTALL PERMANENT TREATMENT BMPS _____ - If you are not planning to construct site design measures, provide an explanation on the following lines: _____ _____ **Go to Section E.**	

SECTION E, DESIGN REQUIREMENTS FOR SOURCE CONTROL:

			YES	NO
E.1	Does the proposed project include any of the following features or facilities (new or existing)?			
	E.1.a	Motor vehicle fueling station? If "**yes**," see Sections 1., 2., 3., and the other sections of Attachment A to this Checklist for the specific source control design requirements; if "**no**," go to E.1.b.		✓
	E.1.b	Food preparation area or area for cleaning of food processing equipment? If "**yes**," see Section 1. and the other sections of Attachment A; if "**no**," go to E.1.c.		✓
	E.1.c	Enclosure for the storage of dumpsters or trash/waste containers – or compactor enclosure? If "**yes**," see Section 1. and the other sections of Attachment A; if "**no**," go to E.1.d.		✓
	E.1.d	Commercial car wash – or exterior wash area for vehicles or equipment? If "**yes**," see Sections 1., 3., and the other sections of Attachment A; if "**no**," go to E.1.e.		✓
	E.1.e	Swimming pool, hot tub, fountain, or other water feature? If "**yes**," see Section 1. and the other sections of Attachment A; if "**no**," go to E.1.f.		✓
	E.1.f	Motor vehicle repair garage? If "**yes**," see Section 2. and the other sections of Attachment A; if "**no**," go to E.1.g.		✓
	E.1.g	Outdoor storage or processing area? If "**yes**," see Section 4. and the other sections of Attachment A; if "**no**," go to E.1.h.		✓
	E.1.h	Loading dock or other material transfer area? If "**yes**," see Section 4. and the other sections of Attachment A; if "**no**," go to E.1.i.		✓
	E.1.i	Air conditioning? If "**yes**," see Section 5. and the other sections of Attachment A; if "**no**," go to E.1.j.	✓	
	E.1.j	Storm drain inlet? If "**yes**," see Section 6. and the other sections of Attachment A if "**no**," go to E.2.	✓	
E.2	If you answered "yes" to any part of E.1, describe on the following lines the source control measure(s) that you are planning to construct: _____ ENTIRE SITE TO BE TREATED BY BIORETENTION _____ _____ **Go to Section F.**			

SECTION F, DESIGN REQUIREMENTS FOR ALTERNATIVE COMPLIANCE:

		YES	NO
F.1	If you answered "no" to C.3, you may be required to provide alternative or in-lieu permanent treatment BMPs per Provision C.3.e of the MRP; however, any such alternative or in-lieu measures will only be approved upon a finding, by the Agency, of infeasibility to provide fully compliant BMPs per Provision C.3.c of the MRP. Are you planning to include alternative or in-lieu BMPs? If "**yes**," schedule a meeting with the Land Development Division at (510) 670-5480 to review the project scope. *Note that a finding of infeasibility will require a complete analysis of the project, including but not limited to, the considerations of a possible reduction of the post-construction footprint and/or a minimization of impervious surfaces. Also note that any proposed off-site in-lieu treatment measures will only be allowed on property that is 1) located within the same watershed as the primary site, and 2) under the control of the owner of the primary site.* **Go to Section G.**		✓

SECTION G, SUBMITTAL AND TENTATIVE APPROVAL:

Name of person submitting this Checklist: CBG - CIVIL ENGINEERS

If this is not the applicant identified in A.2, provide explanation and contact information on the following lines:

CBG IS THE CIVIL ENGINEER ON THIS PROJECT AND HAS COMPLETED
THIS CHECKLIST ON BEHALF OF THE APPLICANT

Signature of person submitting this Checklist: _____

(Before you sign, verify that all Sections are complete.)

Name of County employee receiving this submittal: _____.

This Checklist is: ☐ accepted, with the following conditions:

- ☐ Construction/demolition approval is contingent upon the issuance of a C.6 Stormwater Permit.
- ☐ Final design approval is contingent upon the issuance of a C.3 Stormwater Permit.
- ☐ _____
- ☐ _____

Subject: Soil Import Management Plan – Addendum
Former Hanson Aggregates Radum Facility
Pleasanton, California
(ACDEH Case Nos. RO0002952 and RO0003228)

Dear Ms. Roe:

The enclosed *Soil Import Management Plan - Addendum, Former Hanson Aggregates Radum Facility, Pleasanton, California*, dated 10 May 2019, was prepared by Haley & Aldrich, Inc. on behalf of USL Pleasanton Lakes, L.P.

I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely yours,
USL PLEASANTON LAKES, L.P.

Dear Mr. Sanders:

On behalf of USL Pleasanton Lakes, L.P. (USL Pleasanton), Haley & Aldrich, Inc. (Haley & Aldrich) is pleased to submit this *Soil Import Management Plan – Addendum (SIMP Addendum)* for the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. Haley & Aldrich is submitting this SIMP Addendum in order to establish updated Site-Specific Soil Import Screening Levels.

If you have any questions, please contact either of the undersigned.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

Haley & Aldrich, Inc. (Haley & Aldrich) prepared for USL Pleasanton Lakes, L.P., (USL Pleasanton) the *Soil Import Management Plan, Former Hanson Aggregates Radum Facility, Pleasanton, California (SIMP)*, dated 8 August 2018, which was approved by Alameda County Department of Environmental Health (ACDEH). This SIMP was prepared for assessing soil proposed to be imported to the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California (the Site), currently owned by USL Pleasanton. Included in the SIMP were Site-Specific Soil Import Screening Levels, which were based on the Tier 1 Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB), dated February 2016 (Revision 3), except for the metals arsenic, chromium and nickel, which were based on ambient background levels. As the RWQCB recently updated their ESLs in January 2019, ACDEH requested USL Pleasanton to revise the Site-Specific Soil Impact Screening Levels to comply with this update. This SIMP Addendum is being submitted to ACDEH to present the updated screening levels.

2. Site-Specific Soil Import Screening Levels

The updated Site-Specific Soil Import Screening Levels are summarized in Table 1. As shown in this table, these levels are based on one of the following references:

- Tier 1 ESL: established by the RWQCB, dated January 2019 (Revision 1).
- Local Background (Zone 7): Zone 7 Water Agency provided background metals concentrations they calculated for the Cope Lake, which is contained within the boundaries of the Site. The Site-Specific Soil Import Screening Levels refence the Zone 7 background concentrations for the three metals chromium, nickel, and vanadium, as the Tier 1 ESLs for these three metals are lower than their respective background concentrations. It is noted that the initial SIMP's screening levels referenced the Zone 7 background concentrations for chromium and nickel, which was previously accepted by ACDEH. Vanadium is the only new metal for which the updated screening level would be based on the Zone 7 background concentration. A copy of the "Zone 7 Water Agency - Table 1 Background Metal Concentrations - Cope Lake Area and Acceptance Threshold Values" that was provided to Haley & Aldrich is included in Appendix A.
- Regional Background (Duvergé): In the San Francisco Bay Area, the background arsenic concentrations in soil exceed its Tier 1 ESL. Given this known condition, the RWQCB references a collegiate Master's thesis to establish the regional background concentration.[1] This is the same background concentration referenced and accepted as the screening level by ACDEH in the initial SIMP.

Former Hanson Aggregates Radum Facility
Pleasanton, California
(ACDEH VRAP Case No. RO0003228)

Dear Ms. Soo:

The enclosed *Soil Management Plan – APNs 946-1250-6-4 & 946-1350-3-12,* dated 29 March 2017, was prepared by Haley & Aldrich, Inc. on behalf of USL Pleasanton Lakes, L.P. for the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. This *Soil Management Plan* is being submitted pursuant to the Voluntary Remedial Action Agreement established for this site under Alameda County Department of Environmental Health Case Number RO0003228.

I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. (ACDEH VRAP Case No. RO0003228)

Dear Ms. Soo:

On behalf of USL Pleasanton Lakes, L.P. (USL Pleasanton), Haley & Aldrich, Inc. (Haley & Aldrich) is pleased to submit this *Soil Management Plan* for Alameda County Assessor Parcel Numbers (APNs) 946-1250-6-4 and 946-1350-3-12, which are contained within the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. Haley & Aldrich prepared this *Soil Management Plan* as requested by Alameda County Department of Environmental Health (ACDEH) to provide guidance for the management of soils to be handled as part of the anticipated development activities, if entitled and permitted, for these two APNS. This *Soil Management Plan* is being submitted to ACDEH to replace Haley & Aldrich's previous *Soil Management Plan*, dated 19 October 2016, and has been developed in conjunction with Haley & Aldrich's *Closure Plan*, dated 29 March 2017.

If you have any questions, please contact either of the undersigned.

1. Introduction

Haley & Aldrich, Inc. (Haley & Aldrich) prepared this *Soil Management Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California (Soil Management Plan)* on behalf of USL Pleasanton Lakes, L.P. (USL Pleasanton) for Alameda County Assessor Parcel Numbers (APNs) 946-1250-6-4 and 946-1350-3-12, which are contained within the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. This *Soil Management Plan* was requested by Alameda County Department of Environmental Health (ACDEH) as USL Pleasanton is seeking regulatory closure for these two APNs under the ACDEH Voluntary Remedial Action Program (VRAP) Case No. RO0003228. As documented in Haley & Aldrich's *Closure Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California (Closure Plan)*, dated 29 March 2017, impacted soil conditions are present within these two APNs that require removal to obtain regulatory closure and approval from ACDEH for USL Pleasanton's anticipated development plans, if entitled and permitted. Presented within this document are procedures to be followed to properly remove known impacted soil conditions and to also address unknown features or suspected conditions of concern that may be encountered during the development activities.[1]

1.1 FORMER AGGREGATES FACILITY HISTORY

The Former Hanson Radum Aggregates Facility (Former Aggregates Facility) is comprised of a total of approximately 1,200 acres, of which about 320 acres is dry land and 700 acres is lakes and ponds (Figure 1). Beginning in 1938, aggregate mining operations were initiated at this facility by Kaiser Sand and Gravel under Surface Mining Permit (SMP) 31. These mining operations included excavating areas to remove the aggregate, and then backfilling the mined areas with rubble, debris and/or mine waste, or for use as disposal ponds for water, silt and the aggregate washing operations. In 1991, Hanson Aggregates purchased the facility and continued the mining operations through 2001, at which time the aggregate resource was considered depleted.

Following the cessation of the mining operations, the Former Aggregates Facility was purchased in September 2007 by Legacy Pleasanton Land, LLC. This purchase included the entire Former Aggregates Facility, except for a 16.5-acre portion located adjacent and behind the current 7-acre Pleasanton Garbage Services transfer station. During the Fourth Quarter 2010, Legacy Pleasanton Option Land, LLC, purchased the 16.5-acre portion. In the Third Quarter 2012, USL Pleasanton foreclosed on the Former Aggregates Facility, except for the 16.5-acre portion. Subsequently, on 1 January 2013, Legacy Pleasanton Option Land, LLC contributed its 16.5-acre portion of land into a joint venture partnership with USL Pleasanton.

USL Pleasanton currently owns the approximately 320 acres of land contained with the Former Aggregates Facility. The 700 acres of lakes and ponds include Lake I and Cope Pond, which are currently owned by Alameda County Flood Control and Water Conservation District – Zone 7 (Zone 7), and Lake H, which is currently owned by Pleasanton Gravel Company, but contracted to imminently transfer to Zone 7. USL Pleasanton has and retains stormwater discharge rights to Cope Pond for this land's current use and ultimate development, upon entitlement and permitting.

[1] This *Soil Management Plan* is being submitted to ACDEH to replace Haley & Aldrich's previous *Soil Management Plan*, dated 19 October 2016, which was enclosed as Appendix C to Haley & Aldrich's *Draft Closure Plan*, dated 21 February 2017.

The table below provides a summary of the 23 APNs contained within the Former Aggregates Facility, along with their current owners, and identifies whether these APNs are within the boundaries of the City of Pleasanton or County of Alameda lands. Figure 2 shows the locations of the 23 APNs within the Former Aggregates Facility.

Former Aggregate Facility APNs and Current Ownership

APN	Current Owner	City or County Land
946-1128-4-4	USL Pleasanton	County of Alameda
946-1250-6-4		County of Alameda
946-1250-7-6		City of Pleasanton
946-1250-19-5		City of Pleasanton
946-1251-7-2		City of Pleasanton
946-1350-3-8		City of Pleasanton
946-1350-3-12		County of Alameda
946-1128-4-6	Zone 7	County of Alameda
946-1128-5		County of Alameda
946-1128-6-1		County of Alameda
946-1151-1-3		County of Alameda

1.2 FORMER AGGREGTES FACILITY REGULATORY OVERSIGHT

The Former Aggregates Facility receives regulatory oversight from ACDEH, the Alameda County Community Development Agency (ACCDA), and the Livermore-Pleasanton Fire Department (LPFD).

1.2.1 Alameda County Department of Environmental Health

ACDEH is providing oversight of the environmental concerns related to potential releases to soil and groundwater that may have resulted from the former mining operations. Environmental investigation activities began in 2006, which resulted in identifying the following nine Areas of Concern (AOCs):

- AOC1 – Former Asphalt Plant;
- AOC 2 – Idle Truck Maintenance Area;

- AOC 3 – Heavy Equipment Maintenance and Wash Rack Area;[2]
- AOC 4 – Former Concrete Batch Plant Area;
- AOC 5 – Former Mining Operation Area;
- AOC 6 – Storm Water Retention Pond ("Busch Pit");
- AOC 7 – PEC Identified by Temporary Soil Boring SS31;
- AOC 8 – PEC Identified by Temporary Soil Boring SS123; and
- AOC 9 – Vulcan Materials Company Storm Water Runoff Area.

The approximate locations and boundaries of these nine AOCs are shown on Figure 3, and the table below identifies the five APNs that contain these AOCs.

Former Aggregate Facility APNs and AOCs

APN	AOCs
946-1250-19-5	AOCs 1 & 2
946-1350-3-8	AOCs 2, 3, 4, 5*, 8* & 9*
946-1250-7-6	AOC 3
946-1250-6-4	AOC 6
946-1350-3-12	AOC 7

Note: * - A portion of AOC 5 and all of AOCs 8 and 9 are not within the City of Pleasanton's Urban Growth Boundary.

ACDEH's oversight is separated into the following three regulatory cases:

- GeoTracker Case No. RO0002941, Hanson Aggregates Radum Plant (SLT19719376) – established for AOC 1;
- GeoTracker Case No. RO0002952, Hanson Aggregates Legacy Radum Facility (SL0600101555) – originally established for AOCs 2 through 9, however, was revised to remove AOCs 6 and 7; and
- GeoTracker Case No. RO0003228, USL Pleasanton Lakes (T10000009398) – established for AOCs 6 and 7.

Further information regarding the status of the Former Aggregate Facility's AOCs and related regulatory cases are provided in Haley and Aldrich's *Summary of Environmental Status, Former Hanson Aggregates Radum Site, Pleasanton, California*, dated 20 February 2017.

1.2.2 Alameda County Community Development Agency

ACCDA is providing oversight of the Reclamation Plan being implemented on the Former Aggregates Facility under SMP 31. Activities conducted as part of this Reclamation Plan has included the reuse of soil stockpiles generated from the previous mining operations to level the ground surface in order to prevent depressions where surface water could pond and to also facilitate drainage in to Cope Pond. In

[2] AOC 3 was previously also associated with the potential environmental concern (PEC) identified by temporary soil boring EB-35. However, further investigation of this boring location revealed the PEC is related to a subsurface asphalt layer and not a former feature included within the heavy equipment maintenance and wash rack area.

addition, the previously existing storm water retention pond identified as Busch Pit was backfilled with approximately 367,000 cubic yards of on-site soil obtained from an adjacent stockpile generated from the previous mining operations. Per the SMP 31 Reclamation Plan, the land within the Former Aggregates Facility was hydroseeded to mitigate erosion and is currently being monitored to ensure compliance with this plan.

1.2.3 Livermore-Pleasanton Fire Department

LPFD, the Certified Unified Program Agency (CUPA), with assistance from ACDEH, provided oversight of the facility closure activities conducted on the mining operation's former features that were contained within the Former Aggregates Facility. The facility closure activities were performed in 2013 and 2014, and included the following activities:

- Abatement of hazardous building materials (i.e., asbestos-containing materials [ACM], lead-based paint [LBP], and other hazardous or potentially hazardous materials);
- Demolition and removal of the following structures: idle truck maintenance shop and associated fuel lines; heavy equipment maintenance shop; office buildings; plant lube storage shed/warehouse; electrical transformers; concrete batch plant; rock crusher; aboveground waste oil tank; concrete pads and footing; asphalt paving; underground storage tanks (USTs) and associated piping and fuel dispenser island; wash rack and associated piping; oil/water separator; septic tank and associated clay pipes and leach field; former rod mill; truck scale; and underground cistern and associated conveyor tunnel;
- Collection of soil samples to assess and characterize the existing conditions, and determine whether further excavation was warranted to mitigate impacted conditions;
- Off-site transportation and disposal of impacted soil; and,
- Backfilling of the areas excavated during the demolition and removal activities using a mixture of soil stockpiles generated from the previous mining operations, clean excavated material and select sand from the adjacent Vulcan Materials Company Quarry.

Reports documenting the facility closure activities are available for review in the GeoTracker Case Nos. RO0002941 and RO0002952. The facility closure was approved of by the LPFD on 1 April 2016.

1.3 APNS INCLUDED IN SOIL MANAGEMENT PLAN – THE "SITE"

If entitled and permitted, USL Pleasanton is planning the development of the entire Former Aggregates Facility. In order to initiate these development plans, USL Pleasanton is seeking regulatory closure for APNs 946-1250-6-4 and 946-1350-3-12 under ACDEH VRAP Case No. RO0003228. For the purposes of this *Soil Management Plan*, these two APNs are collectively referred to as the "Site" (see Figure 3). As part of their closure evaluation, ACDEH requested USL Pleasanton prepare this *Soil Management Plan* to specify procedures to be followed to remove the Site's known impacted soil conditions and to also address unknown features or suspected conditions of concern that may be encountered during the development activities.

2. Background

Presented below is a summary of the results of the environmental investigations performed within the boundaries of the Site. This summary focuses on the Site's remaining area of concern, EB-35, which will need to be mitigated to obtain regulatory closure from ACDEH. Further information regarding the complete results of the previous environmental investigation activities performed within the boundaries of the Site are summarized in Haley & Aldrich's *Closure Plan*.

2.1 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

The Site has undergone a series of environmental investigations to evaluate potential concerns associated with the former mining operations. The investigation activities were performed to both evaluate areas suspected to contain potential environmental concern based on the former mining operations, and also to provide a general evaluation of the soil and groundwater conditions present following the cessation of the mining operations. ACDEH was the lead regulatory agency overseeing these investigations.

Environmental investigation activities were performed on the Site between 2006 and 2008, and included the following four sampling events:[3]

- May 2006: a limited subsurface investigation was conducted that included the collection of sediment and surface water samples from the bottom of the storm water retention pond previously known as Busch Pit;
- November 2006: a Phase II Environmental Site Assessment (ESA) was conducted that included the collection of additional sediment and surface water samples from the bottom of Busch Pit, and also investigated two areas of potential environmental concern, with one soil sample collected at the location of a former electrical transformer and a second soil sample collected at a former storm water runoff discharge point to Cope Pond;
- February 2007: a due diligence environmental sampling program was conducted that included five borings advanced within the boundaries of the Site and one additional targeted boring location to investigate potential downgradient migration from an impacted area of concern, with soil and groundwater samples collected to provide an evaluation of the subsurface conditions; and,
- October 2007: a step-out soil boring sampling program was conducted based on previously identified potential areas of environmental concerns, which included for the Site two of the February 2007 boring locations, and additional sediment samples were collected from Busch Pit; this sampling program established the locations and concerns for AOCs 1 through 9.

The above environmental investigations included the collection of soil, sediment and groundwater samples, with the analytical results revealing environmental concerns based on a comparison against 2007 Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB). Figure 4 shows the locations of the environmental samples collected as part of

[3] Summary below is for sampling within the boundaries of the Site. The listed investigations included additional sampling at locations outside the Site and within the Former Aggregate Facility.

these previous investigation activities. The initial evaluation of the previous investigation results established AOC 6 for area of the former Busch Pit storm water retention pond and AOC 7 for the area surrounding boring SS31. Further evaluation of these two AOC's analytical results against the current 2016 ESLs[4] indicates no potential risk to human health or the environment, and therefore, these two AOCs have been addressed and require no further investigation or remedial measures. The previous environmental investigation results did identify one remaining area of concern associated with a shallow soil petroleum hydrocarbon impact in the vicinity of boring EB-35.

2.2 EB-35 AREA OF CONCERN[5]

The February 2007 investigation activities included one boring location, EB-35, drilled to investigate potential downgradient migration from an impacted subsurface zone discovered during the November 2006 Phase II ESA. The November 2006 investigation activities conducted on APN 946-1250-19-5 included drilling 13 borings to evaluate the extent a heavy, viscous, black, free phase petroleum product encountered at a depth of approximately 33 to 40 feet below ground surface (bgs).[6] In February 2007, boring location EB-35 was drilled on APN 946-1350-3-12 to evaluate potential downgradient migration from this impacted subsurface zone. Five discrete soil samples were collected from EB-35 at depths down to 40 feet bgs and one grab groundwater sample was collected. A summary of the environmental investigation and results for this boring is provided in Tables 1A, 1B and 1C. As indicated in these tables, although the deeper soil and groundwater samples collected did not reveal potential downgradient migration from the 33 to 40 feet bgs impacted zone, a shallow soil sample collected from EB-35 at 2 feet bgs contained total petroleum hydrocarbons as diesel (TPHd) and as motor oil (TPHmo) at concentrations of 400 milligrams per kilogram (mg/kg) and 3,400 mg/kg, respectively, which exceeded the former 2007 ESLs for residential shallow soil (100 mg/kg and 500 mg/kg, respectively). The detected TPHd concentration also exceeds the 2016 Tier 1 ESL (230 mg/kg). Therefore, further investigation of the shallow soil impact at this location was conducted in October 2007.

Given the EB-35 results, in October 2007 four step-out borings, EB-35A, EB-35B, EB-35C and EB-35D, were drilled surrounding this initial boring location to characterize the extent of this shallow soil impact. A total of 12 discrete soil samples, three per step-out boring, were collected at depths down to 10.5 feet bgs. A black petroleum product observed to be similar to asphalt concrete was encountered in three of the four boring locations at depths between 2.5 and 4 feet bgs.[7] Summaries of the environmental investigation and results for these step-out sampling locations are provided in Table 1A. Although some of the samples collected between 3.5 and 5 feet bgs contained TPHd and/or TPHmo concentrations exceeding the former 2007 ESLs for residential shallow soil, there were no ESL exceedances for the soil samples collected between 8.5 and 10 feet bgs. In addition, none of the soil samples collected contained TPHd or TPHmo concentrations exceeding the current 2016 Tier 1 ESLs.

In 2008, an additional investigation was conducted in the EB-35 area of concern. This investigation consisted of excavating the locations of previously drilled borings EB-35 and EB-35B, with the former excavated approximately 4 feet bgs and the latter excavated approximately 5.5 feet bgs. In the

[4] Dated 22 February 2016 (Revision 3)
[5] EB-35 was initially identified to contain a potential environmental concern (PEC) associated with AOC 3. However, as described in this section, further investigation activities revealed this PEC to be associated with an asphalt layer that is not affiliated with the former mining operation features comprising AOC 3.
[6] Following the October 2007 investigation, this deeper impacted zone was established to be within AOC 1.
[7] This shallow petroleum product is not related to the deeper zone of petroleum product that was encountered on APN 946-1250-19-5 for which boring EB-35 was initially investigating.

excavation of EB-35 an asphalt layer was encountered between approximately 2 and 3 feet bgs, while in the excavation of EB-35B this asphalt layer was encountered between approximately 3.5 and 5.5 feet bgs. Summaries of the environmental investigation and results for these excavation sampling locations are provided in Table 1A. Although the soil sample collected from within this layer at 2.5 feet bgs, sample T-35A, contained TPHd and TPHmo at concentrations of 3,500 mg/kg and 45,000 mg/kg, respectively, which exceed their Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively), the soil sample collected from immediately below this layer at 3.5 feet bgs, sample T-35B, contained TPHd and TPHmo at concentrations of 14 mg/kg and 150 mg/kg, respectively, which do not exceed their Tier 1 ESLs. Given these results, it was concluded that this area's petroleum hydrocarbon impacted conditions are limited to the depths of the asphalt layer and do not appear to present a leachability risk for deeper soil impacts. ACDEH agreed with this conclusion per their 13 June 2008 letter.

The investigation activities conducted in the EB-35 area of concern detected elevated petroleum hydrocarbons in the collected soil samples due to the presence of an asphalt layer encountered at depths ranging between approximately 2 and 5.5 feet bgs. Although soil samples collected from within this asphalt layer contain TPHd and TPHmo concentrations exceeding 2016 Tier 1 ESLs, soil samples collected immediately below do not. Therefore, the petroleum hydrocarbon impacted conditions are limited and contained to the subsurface soil horizon containing this asphalt layer and do not represent an immediate concern to human health or the environment that warrants remediation.

If entitled and permitted, USL Pleasanton's anticipated development plan for the vicinity of the EB-35 area of concern includes grading activities that are expected to cut this area approximately 11 to 12 feet deep.[8] Therefore, the asphalt layer encountered between 2 and 5.5 feet bgs would be removed as part of the Site's development. The procedures to be followed for the removal of the EB-35 area of concern are specified in Section 3.2 of this *Soil Management Plan*.

[8] The ground surface elevation at this location is approximately 365 to 366 feet above mean sea level (msl). USL Pleasanton's development plan for this area anticipates having the future ground surface at 354 feet above msl.

3. Soil Management Measures

If entitled and permitted, the development of the Site will require the handling and management of known and, if encountered, suspect impacted soils. These activities shall be performed according to the following measures.

3.1 PLANNING

3.1.1 Project Stakeholders and Responsibilities

Owner – The current Owner of the Site, USL Pleasanton, is represented by Mr. Steven M. Dunn. Mr. Dunn will receive all notices, comments, approvals, and other communications from Haley & Aldrich, oversight agencies, media and other parties. USL Pleasanton will contract with the future Owner responsible for the development of the Site.

Environmental Professional – The current Environmental Professional retained by the Owner is Haley & Aldrich, Inc., who acts as the primary liaison between the Owner and ACDEH. Haley & Aldrich, or another Environmental Professional to be selected by the future Owner, will be responsible for the following:

- Oversee excavation activities of impacted soils, both known and suspected, in the field;
- Observe work practices to ensure compliance with the site-specific health and safety plan (HASP); and
- Document work progress and findings, and prepare the project completion report.

Prime Contractor – A Prime Contractor will be retained by the future Owner of the Site. This contractor will identify a site supervisor who will be responsible for overseeing, coordinating and implementing the soil excavation activities in accordance with this *Soil Management Plan*. The Prime Contractor will be responsible for providing properly licensed personnel and/or subcontractors to perform the excavation, special handling and off-site transportation and disposal as required by this *Soil Management Plan*. The Prime Contractor and their subcontractors will produce and adhere to their own HASP.

Excavation Contractor – An Excavation Contractor will be retained by the Prime Contractor to provide the personnel and equipment required to conduct the excavation and grading activities. For removal of the impacted soil requiring special handling, the Excavation Contractor shall provide properly licensed personnel, including Hazardous Waste Operations and Emergency Response Standard (HAZWOPER)-certified personnel. The Excavation Contractor and their subcontractors will produce and adhere to their own HASP.

Environmental Regulator – ACDEH is providing environmental regulatory oversight of the project, review of work plans and reports, and approval of the Site's *Closure Plan* and this *Soil Management Plan*. The Site is being overseen by ACDEH under VRAP Case No. RO0003228.

The table below identifies the entity's currently project stakeholders fulfilling the above roles and provides their contact information.

Project Stakeholders

Role	Stakeholder	Contact Information
Owner	USL Pleasanton Steven M. Dunn	(650) 235-2833 sdunn@steelwavellc.com
Environmental Professional	Haley & Aldrich, Inc. Jason Grant, P.E.	(925) 949-4412 jgrant@haleyaldrich.com
Prime Contractor	(To be determined, TBD)	(TBD)
Excavation Contractor	(TBD)	(TBD)
Environmental Regulator	ACDEH Dilan Roe, P.E.	(510) 567-6767 dilan.roe@acgov.org

3.1.2 Permitting

The following permits are anticipated for the Site's development and will be obtained from the respective regulatory authorities prior to conducting the associated activities:

- County of Alameda or City of Pleasanton – Grading Permit; and
- Underground Service Alert (USA) – USA notification will be performed a minimum of 48 hours prior to commencing with the intrusive subsurface activities.

Additional permits may be required should conditions warrant.

3.1.3 Stormwater Pollution Prevention Plan

In accordance with the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction Activities (Construction General Permit; Order No. 2012-0006-DWQ; NPDES No. CAS000002), a Construction Stormwater Pollution Prevention Plan (SWPPP) will be prepared for the Site. The SWPPP will outline stormwater best management practices (BMPs) during the proposed excavation activities at the Site. A Notice of Intent (NOI) to comply with the Construction General Permit, the first annual fee, and related permit registration documents (PRDs) will be filed with the State Water Resources Control Board (SWRCB), and a Waste Discharge Identification (WDID) Number will be obtained from the SWRCB.

3.1.4 Health and Safety

A Site-specific HASP will be prepared prior to commencing with the development activities. The HASP will outline safe work practices and emergency procedures to be followed during earthwork activities involving impacted soils conducted at the Site, including job hazard analyses, personnel protection, and emergency procedures. All contractors and subcontractors working on the Site will be responsible for preparing a HASP for their own employees and associated activities.

3.2 REMOVAL OF EB-35 AREA OF CONCERN

The EB-35 area of concern contains petroleum hydrocarbon impacted soils due to the presence of a shallow subsurface layer of asphaltic material. All excavation and grading activities conducted within this area of concern shall be overseen by the Environmental Professional and performed following the procedures specified below. Additionally, should a subsurface asphalt layer be observed anywhere

within the boundaries of the Site, the procedures specified in this section shall be implemented under the direction of the Environmental Professional.

3.2.1 Soil Excavation and Stockpile

Soil removed during the excavation and grading activities identified to contain the previously encountered asphalt layer shall be segregated and stockpiled on-site. The stockpiled soil will be placed on and covered with plastic sheeting, and managed in accordance with this *Soil Management Plan* and the project SWPPP. The extent of the soil excavation will be based on the visual removal of the asphalt layer, and will extend 1 foot below this layer. During the excavation activities, two stockpiles will be generated, with one segregating the layer of asphaltic material, and the second containing the soil removed above and below this layer.

As the previous environmental investigation results indicated that this soil impact is limited to this layer and does not leach to the soil below, no excavation confirmation samples are required. Should perched groundwater be encountered within the excavated area,[9] this water will be pumped from the excavation and securely contained. A sample of this water shall be collected and analyzed for the following:

- total petroleum hydrocarbons as gasoline (TPHg)[10] and volatile organic compounds (VOCs) using United States Environmental Protection Agency (USEPA) Method 8260;
- TPHd and TPHmo using USEPA Method 8015; and,
- California Title 22 metals (dissolved) using USEPA Method 6010/7471.

The contained groundwater will require offsite transportation and disposal (see Section 3.2.3).

3.2.2 Stockpile Characterization Sampling

The stockpile generated of the soil excavated above and below the asphalt layer will be evaluated to determine whether this soil is acceptable for reuse as part of the Site's development, or will require off-site transportation and disposal. The stockpile of the segregated asphaltic material will be evaluated by the Prime Contractor to determine whether it would be suitable for reuse in areas to be developed with impervious surfaces (e.g., roadways, parking lots, concrete foundations). Should the Prime Contractor identify reuse potential, the Environmental Professional will submit a reuse plan to ACDEH for review and approval. If no reuse potential is identified, the stockpiled asphaltic material will be evaluated for off-site transportation and disposal (see Section 3.2.3).

The reuse evaluation for the stockpile of soil from above and below the asphalt layer will be performed to comply with the RWQCB's *Draft Characterization and Reuse of Petroleum Hydrocarbon Impacted Soil as Inert Waste*, dated 20 October 2006. A copy of this RWQCB technical reference document is provided in Appendix A. As noted in this document's Table 3, Footnote 4, the detected analytical results are to be compared against the current 2016 ESLs, which are the following:

- TPHg: Tier 1 ESL = 100 mg/kg; Leaching to Groundwater ESL = 770 mg/kg;

[9] The previous environmental investigations encountered the first shallow groundwater unit underlying the Site to be present at approximately 70 to 80 feet bgs. This perched groundwater sample is not associated with this shallow groundwater unit.

[10] TPHg may also be analyzed using USEPA Method 8015.

- TPHd: Tier 1 ESL = 230 mg/kg; Leaching to Groundwater ESL = 570 mg/kg;
- TPHmo = Tier 1 ESL = 5,100 mg/kg; Leaching to Groundwater ESL = not established

The stockpile sampling results shall be preliminary reviewed by the Environmental Professional. Should these results indicate acceptable conditions based on a comparison against the respective ESLs, the soil would be deemed acceptable for reuse to either backfill the excavated area or for general grading throughout the Site. The Environmental Professional shall submit the stockpile characterization sampling results to ACDEH for review and final approval. No stockpiled soil shall be reused without prior approval from ACDEH. If the stockpile sampling indicates unacceptable conditions, the soil will require off-site transportation and disposal (see Section 3.2.3).

3.2.3 Waste Characterization Sampling and Off-site Transportation and Disposal

If either stockpile cannot be reused onsite and requires off-site transportation and disposal, waste characterization sampling will be performed to determine the appropriate disposal profile. The waste characterization sampling shall be coordinated with the disposal facility, and at a minimum will include the following analyses:

- TPHg and VOCs using USEPA Method 8260;
- TPHd and TPHmo using USEPA Method 8015; and,
- California Title 22 metals using USEPA Method 6010/7471.

Additional analyses may be required depending on the results obtained from the above and/or as requested by the disposal facility. Although not anticipated, depending on the waste characterization sampling results, the Owner (i.e., Generator) may be required to obtain a temporary USEPA hazardous waste generator identification number.

Transportation and disposal will be performed in accordance with City, County, State and Federal regulations, and under the appropriate manifest, bill of lading and/or material shipping/tracking documentation. For each shipment, documentation in the daily field notes will include:

- Date and time of loading for each truck;
- Transport company and unique truck identifier (e.g., license plate number);
- Approximate volume of waste transported by each truck;
- Destination of the waste; and
- Shipping document number (e.g., bill of lading, shipping paper, non-hazardous waste manifest or hazardous waste manifest).

3.3 CONTINGENCY PLANNING FOR SUSPECTED IMPACTED SOIL OR UNANTICIPATED SUBSURFACE FEATURES

For areas of the Site outside the EB-35 area of concern, the excavation and grading activities conducted to develop the Site may encounter soil suspected to be impacted, or unexpected subsurface features such as underground storage tanks (USTs), wells, etc. Should these conditions be encountered, the following steps shall be taken:

- The Excavation Contractor shall stop work immediately in the area where the soil is suspected to be impacted, or in the area where the unexpected subsurface feature is encountered;
- The Excavation Contractor shall notify the Prime Contractor, who will then notify the Environmental Professional;
- If not already onsite, the Environmental Professional shall mobilize to the Site with appropriate personnel and assess the newly-discovered soil suspected to be impacted, or the unexpected subsurface feature, on a case-by-case basis.
- The Environmental Professional will report their preliminary assessment findings to the future Owner of the Site, and if required, develop a mitigation plan.
- The Environmental Professional will notify ACDEH, and if necessary LPFD. This notification will identify the encountered suspected condition or feature, include the preliminary assessment findings, and identify whether a mitigation measure is required.

While not comprehensive, the following general procedures apply if unknown features are encountered:

- If a previously unknown subsurface layer of asphaltic material is encountered outside the EB-35 area of concern, the procedures specified in Section 3.2 shall be followed. ACDEH will be notified of the discovered asphalt layer(s).
- If a previously unknown UST (or similar feature associated with the use or storage of petroleum hydrocarbons or other liquids) is encountered, LPFD and ACDEH will be notified, appropriate permits will be obtained, and the UST will be removed and disposed in accordance with applicable procedures and regulatory guidance.
- If a previously unknown monitoring well or water supply well is encountered, Zone 7 Water Agency and ACDEH will be notified. If required by the well's conditions, a well destruction permit will be obtained, and the well will be destroyed in accordance with applicable procedures and with regulatory guidance.
- Soil and waste material generated during soil excavation and/or removal of unanticipated structures may be segregated into temporary stockpiles pending characterization for on-site reuse and/or off-site transportation and disposal. The stockpiles will be placed on and covered with plastic sheeting, and managed in accordance with this *Soil Management Plan* and the project SWPPP.
- Confirmation soil sampling will be conducted by the Environmental Professional as appropriate.

3.4 IMPORTED FILL MATERIAL

Fill material imported for the development of the Site shall be characterized in accordance with the California Department of Toxic Substances Control (DTSC) *Information Advisory Clean Imported Fill Material*, dated October 2001. A copy of this DTSC document is provided in Appendix A. The source location of the fill material will be identified, and the analytical characterization results shall be initially reviewed by the Environmental Professional. If these results appear acceptable, the Environmental Professional will submit to ACDEH for review and final approval. No fill material shall be brought on to the Site without prior approval from ACDEH.

The analytical characterization results will be compared against the Tier 1 ESLs established by the RWQCB. If no Tier 1 ESL is exceeded, no further evaluation is warranted and the proposed import material would be deemed acceptable for placement anywhere within the Site. If a Tier 1 ESL is exceeded, further evaluation of the analytical results will be performed by the Environmental Professional to determine if the Site's development plans can incorporate this soil using either engineering or institutional controls. The results of this evaluation will be provided in the submittal to ACDEH for their review and approval.

3.5 REPORTING

A final report shall be prepared following the completion of the earthwork activities required to develop the Site. This report will: document the removal of the EB-35 area of concern and any additional previously unknown location(s) where a subsurface asphalt layer was encountered; include the stockpile sampling results and corresponding on-site reuse and/or off-site transportation and disposal evaluation; include copies of off-site transportation and disposal waste manifests and/or bills of lading; and discuss any contingency measures and/or mitigation plans that were implemented for suspect soil or other unanticipated subsurface features. The report will be prepared by the Environmental Professional and submitted to ACDEH for review and approval. Following the submittal of this report, USL Pleasanton will request regulatory closure for the Site under VRAP Case No. RO0003228.

TABLES

TABLE 1A
HISTORICAL ANALYTICAL DATA: EB-35 AREA OF CONCERN - SOIL (mg/kg)
PLEASANTON, CALIFORNIA

Sample Location	Date Sampled	Sample Depth (feet bgs)	Matrix	Source of Sample Data	Purpose of Sampling	Rationale for Analyses	Result or Conclusion	Total Petroleum Hydrocarbons (TPH) (mg/kg)		
								TPHd	TPHmo	TPHg
EB35-2	1/10/2007	2	soil	ENV 2/2007[1]	Boring location EB-35 was advanced as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Discrete soil samples were collected approximately every 10 vertical feet down to 40 feet deep, with the boring then further advanced deeper for the collection of a grab groundwater sample.	The soil and groundwater samples were analyzed for potential constituents of concern based the findings of the previous investigation activities conducted on the encountered zone of petroleum product. This evaluation resulted in the samples being analyzed for: Total Petroleum Hydrocarbons as Gasoline (TPHg), as diesel (TPHd) and as Motor Oil (TPHmo); and Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations.	TPHg and BTEX were not detected at concentrations greater than laboratory reporting limits. TPHd and TPHmo were either non detected at concentrations greater than laboratory reporting limits or were not detected at concentrations exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil, except for one sample. Sample locations EB35-2 contained TPHd and TPHmo at concentrations exceeding the 2007 ESLs for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). The TPHmo concentration does not exceed the 2016 Tier 1 ESL (5,100 mg/kg), while the TPHd concentration does exceed the 2016 Tier 1 ESL (230 mg/kg). Therefore, further investigation was conducted. The lateral and vertical extent of this TPHd impact was delineated based on subsequent sampling activities, which included four step-out borings locations and two excavation areas (see below). These additional sampling activities conducted in this area determined that the petroleum hydrocarbon impact is due to the presence of a subsurface asphalt layer, with limited leaching risk to deeper soils. Therefore, no further evaluation is warranted. The petroleum hydrocarbon impacted soil will be removed per the procedures specified in the Soil Management Plan (SMP).	**400**	3,400	<0.24
EB35-10	1/10/2007	10	soil					2.6	<50	<0.25
EB35-20	1/10/2007	20	soil					<0.99	<49	<0.24
EB35-30	1/10/2007	30	soil					<0.96	<48	<0.24
EB35-40	1/10/2007	40	soil					9	<49	<0.24
EB-35(A)-3	7/17/2007	2.5	soil	LFR 10/2007[2]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which included further investigation of one of the borings advanced as part of the 2006 Phase II Environmental Site Assessment as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Sample location EB-35 reported elevated petroleum hydrocarbon concentrations in the soil sample collected at 2 feet deep. Therefore, four step-out borings were advanced approximately 25 feet to the north, south, east and west of the initial sample location to delineate the horizontal and vertical extent of the encountered petroleum hydrocarbon soil impact. Three discrete soil samples were collected from each boring down to a depths of 8.5 to 10 feet, with the two deeper soil samples submitted for laboratory analysis.	The previous discrete soil samples collected from EB-35 at 2 feet deep contained Total Petroleum Hydrocarbons as diesel (TPHd) at a concentration exceeding a regulatory screening level. Therefore, the soil samples were analyzed for TPHd and Total Petroleum Hydrocarbons as Motor Oil (TPHmo).	TPHmo was detected in the three shallower samples at a concentration exceeding the 2007 ESLs for residential, shallow soil (500 mg/kg), while it was not detected at concentrations exceeding the 2007 ESL in the deeper soil samples. TPHd was detected in one of the shallow soil samples at a concentration exceeding the 2007 ESL for residential, shallow soil (100 mg/kg), but was not detected at concentrations greater than laboratory reporting limits in the three deeper samples. A black petroleum product was observed in three of the four step-out borings between approximately 2.5 and 4 feet deep, with this product assumed to be the same material that was sample in the initial boring that resulted in the elevated petroleum hydrocarbon concentrations. This product was observed to be dry, similar to asphalt concrete, with a trace of oil. Given these observations, it was concluded that the horizontal and vertical extent of the observed petroleum hydrocarbon impact is limited to the area of the initial boring location and has been delineated, and no further evaluation was recommended. The TPHd and TPHmo concentrations detected in the step-out boring samples do not exceed the 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). Therefore, no further evaluation is warranted.	-	-	-

T-35A	3/25/2008	2.5	soil	ENV 4/2008[3]	A 2008 Soil Excavation was conducted in the location of previous borings EB-35 and EB-35(B) to further investigate the extent of petroleum hydrocarbon impacted soil. The excavation activities encountered an asphalt layer between approximately 2 and 3 feet deep in the excavation of EB-35, and between approximately 3.5 and 5.5 feet deep in the excavation of EB-35B. In order to evaluate potential leaching concerns associated with this layer, for excavation EB-35, one soil sample was collected from within this layer at 2.5 feet deep and a second soil sample was collected immediately below at 3.5 feet deep.	Each soil sample was analyzed for this area's constituents of concern, TPHd and TPHmo.	TPHd and TPHmo were detected in the soil sampled collected from within the asphalt layer exceeding 2007 ESLs for residential, shallow soil, however, the ESL was not exceeded in the soil sample collected immediately below this layer. Therefore, it was concluded that leaching of petroleum hydrocarbons from the asphalt layer to deeper soils does not appear to pose a risk and the petroleum hydrocarbon impacted conditions are limited to this layer. No further excavation or investigation activities were recommended. Alameda County Environmental Health (ACEH) agreed with this conclusion in a June 18, 2008, letter.	**3,500**	**45,000**	-
T-35B	3/25/2008	3.5	soil				The TPHd and TPHmo concentrations detected in the soil sample collected from within the asphalt layer exceeds the 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively. TECHNICAL REFERENCE DOCUMENT

CHARACTERIZATION AND REUSE OF PETROLEUM HYDROCARBON IMPACTED SOIL AS INERT WASTE

October 20, 2006

1.0 INTRODUCTION

Staff of the San Francisco Bay Regional Water Quality Control Board (Water Board) has prepared a ***draft*** technical reference document entitled *Characterization and Reuse of Petroleum Hydrocarbon Impacted Soil as Inert Waste* (Interim Final – October 2006). This document presents a method for characterizing non-hazardous petroleum hydrocarbon impacted soil that is proposed for reuse (or disposal) on the same contiguous property where it was generated (i.e., "**on-site**"). Furthermore, the document presents petroleum hydrocarbon testing requirements and conditions/restrictions for the soil reuse. The testing requirements and restrictions are intended to address human and ecological health concerns and protect the beneficial uses of waters of the State.

The Water Board typically considers requests for on-site reuse of soil based on the overall threats to human and environmental health and water quality. Such threats are a function of petroleum constituent concentrations, toxicity, soil volume, contaminant mass, and the reuse location among others. The intent of this document is to assure that the reuse (or disposal) of PHIS is protective of human and environmental health and the beneficial uses of waters of the State by establishing testing requirements and conditions for reuse.

The petroleum hydrocarbon standards applied in this document meet risk-based screening levels for industrial and residential reuse. Furthermore, the standards are intended to demonstrate that the soil is inert as defined in Title 27, Section 20230 of the California Code of Regulations with respect to the water quality objectives set forth in the San Francisco Bay Regional Water Quality Control Board's Water Quality Control Plan. Due to these conditions, the Water Board does not intend to issue Waste Discharge Requirements (WDRs) or WDR waivers for soil reuse in accordance with this document.

For the purpose of this document petroleum hydrocarbon impacted soil (PHIS) is defined as soil impacted with gasolines and/or middle distillates, including diesel, kerosene, and jet fuel, collectively referred to as "diesel". Inert waste is defined in Title 27, Section 20230 of the California Code of Regulations, to be "a subset of solid waste that does not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives, and does not contain significant quantities of decomposable waste". On-site refers to the same contiguous property where the PHIS was generated.

This document does not apply to hazardous waste, nor does it apply to the off-site reuse or disposal of soil, or the import of soil for construction or other uses. The Department of Toxic Substances Control has prepared an Information Advisory that addresses the import of fill material on sensitive lands (DTSC, Oct. 2001).

This guidance is intended to address the reuse of soils impacted with gasolines and middle distillate fuels. It is not intended to address reuse of soils impacted with heavier petroleum products (e.g., fuel oil Nos. 4, 5, and 6, lubricating oils, motor oil, etc.) or any other contaminant. Used motor oil, hydraulic fluids and other common types of heavy petroleum products/wastes may contain significant amounts of polynuclear aromatic hydrocarbons (PAHs), heavy metals, polychlorinated biphenyls (PCBs), chlorinated solvents, pesticides, volatile organic compounds (VOCs) and other potentially harmful chemicals. Evaluation of soil impacted with heavy petroleum hydrocarbons or other contaminants for reuse should be based on a more complete assessment of potential constituents and exposure concerns.

In order to expedite reuse issues, this document is intended to establish a "self-certification" process whereby the property owner and waste discharger retain the necessary documentation, but no formal approval by Water Board staff is provided. For sites under Water Board oversight, documentation (see Section 6.0) must be submitted to the Water Board staff case handler. For sites not under Water Board oversight, documentation should be retained by the property owner and waste discharger and provided to the Water Board only upon request.

This document is <u>not</u> intended to establish policy or regulation. Use of this document is entirely optional on the part of the discharger. This document provides conservative guidance to streamline the request/approval process for on-site soil reuse. Site-specific decisions made by the Water Board or other lead agencies regarding the reuse of PHIS and/or the management of impacted or suspect soil may supersede the guidance provided in this document. Conversely, this document is not intended to supersede any site-specific Water Board or other lead agency decisions regarding cleanup, cleanup standards, or reuse of impacted soil.

This document will be periodically updated as needed. Please send comments in writing to the contact noted below. Water Board staff overseeing work at a specific site should be contacted prior to use of this document in order to ensure that the document is applicable to the site and that the user has the most up-to-date version available.

For further information, please contact:

Alec W. Naugle
California RWQCB - San Francisco Bay Region

Oakland, CA 94612
tel: 1-510-622-2510
e-mail: anaugle@waterboards.ca.gov

2.0 DEFINITIONS

Petroleum Hydrocarbon Impacted Soil (PHIS) is defined as soil impacted with gasolines (C_6 - C_{12}) and/or middle distillates (C_9 - C_{25}) including diesel, kerosene, and jet fuel, collectively referred to as "diesel".

Inert Waste is defined in the California Code of Regulations, Division 2, Title 27, Subdivision 1, Chapter 3, Subchapter 2, Article 2, Section 20230, to be "a subset of solid waste that does not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives, and does not contain significant quantities of decomposable waste".

Water Quality Objectives are those specified in the San Francisco Bay Regional Water Quality Control Board's Water Quality Control Plan (Basin Plan)

On-Site refers to the same contiguous property where the PHIS was generated.

3.0. CONDITIONS FOR REUSE

3.1 Restrictions

1. The PHIS proposed for reuse must be inert waste as defined in Title 27, Section 20230 (e.g., non-hazardous solid waste that does not contain soluble pollutants of any kind in excess of applicable water quality objectives).

2. The proposed reuse location must be on-site (e.g., the same contiguous property where the PHIS was generated). The Department of Toxic Substances Control and local regulatory agencies should be contacted for proposed off-site reuse or disposal at non-permitted (e.g., landfill) locations.

3.2 Site Conditions

The proposed reuse location shall meet the following conditions to the extent practicable. In all cases, the discharger shall demonstrate that the reuse location is protective of beneficial uses of waters of the State in a manner consistent with Title 27.

1. Separation from Ground Water: The PHIS shall be placed at least five feet above the highest anticipated level of ground water.

2. Separation from Surface Water: The PHIS shall be placed at least 100 feet from the nearest surface water body.

3. Flood Plain Protection: The PHIS shall be protected against 100-year peak stream flows as defined by the County flood control agency.

4. Cover and Erosion Protection: The PHIS shall be buried at least three feet beneath the surface grade. It shall also be capped with erosion-resistant materials such as compacted soil, rock, asphalt, concrete, etc. The PHIS shall be protected from erosion and exposure at the ground surface for as long as it remains in place and has detectable concentrations of petroleum hydrocarbons.

5. Property Owner Acknowledgement: By written correspondence to Water Board staff, the owner of the property where the PHIS is proposed for reuse shall acknowledge their acceptance of the placement of the PHIS and any maintenance required to comply with the above conditions.

4.0 SAMPLING AND CHARACTERIZATION

All stockpiled soil must be characterized in accordance with the methodology set forth in the most recently promulgated edition of "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846", U.S. Environmental Protection Agency (EPA SW-846).

4.1. Sampling Frequency

Procedures in EPA Publication SW-846 provide a method for determining the mean concentration of a given contaminant within a soil mass and the appropriate number of samples necessary to calculate this mean to within a specified confidence level. Initial sampling should generate a minimum number of samples/analyses as described below. Additional sample analyses may be required to meet the confidence levels specified in EPA SW-846, therefore, archiving of samples may be appropriate. Archived samples must be appropriately preserved and analyzed within maximum holding times.

The minimum number of discrete samples necessary to adequately characterize the PHIS shall be determined in accordance with the statistical procedure in EPA SW-846. The following schedule can be used to estimate the minimum number of samples necessary to meet the statistical requirements in EPA SW-846, in most cases. If the number of samples collected is fewer than indicated in the following schedule, then the statistical basis for the deviation must be provided.

- Stockpiles less than 500 cubic yards: One sample for every 25 cubic yards (*e.g., 20 samples for a 500 cubic yard stockpile*).

- Stockpiles from 500 to 1,000 cubic yards: Twenty (20) samples plus one sample for every 100 cubic yards in excess of the initial 500 cubic yards (*e.g., 25 samples for a 1000 cubic yard stockpile*).

- Stockpiles from 1,000 to 10,000 cubic yards: Twenty-five (25) samples plus one sample for every 500 cubic yards in excess of the initial 1,000 cubic yards (*e.g., 43 samples for a 10,000 cubic yard stockpile*).

- Stockpiles greater than 10,000 cubic yards: Forty-three (43) samples plus one sample for every 5,000 cubic yards in excess of the initial 10,000 cubic yards (*e.g., 61 samples for a 100,000 cubic yard stockpile*).

Table 1 and Figure 1 illustrate the relationship between soil volume and the minimum number of samples provided in the above schedule.

4.2 Discrete vs. Composite Sampling

The statistical method in EPA SW-846 assumes that contaminants are heterogeneously distributed within the soil mass and that hotspots exist and are of concern. Composite sampling is not well suited for identifying hotspots because of the "dilution" or

"averaging" effect of mixing samples to create a single composite. Furthermore, composite sampling is not appropriate when sampling for volatile organic compounds, due to the losses inherent in the composite mixing process. Therefore, discrete sampling is required for volatile compounds.

Additionally, the statistical method in EPA SW-846 requires a reasonably accurate measure of sample variability in order to estimate a reasonably accurate confidence interval (CI) about the mean for each constituent in the soil mass. Variability between composite sample results tends to be muted due to the averaging effect of the mixing process, which generally leads to a falsely narrow CI about the mean. It is the upper limit of the CI that is compared to the regulatory limit to determine if a sufficient number of samples have been collected to identify hotspots and capture the true range of contaminant concentrations. Therefore, if contaminants are heterogeneously distributed, and if hotspots are a concern, composite sampling is not appropriate and discrete sampling is required.

4.3 Sample Location

Sample locations should be random, uniform, or biased toward hotspot areas, based on professional judgment and field screening indications.

4.4 Analyses

A two-tiered evaluation approach is required to determine if soil is suitable for reuse under this guidance. Therefore, two types of sample analyses may be required. The Tier 1 analyses consist of measuring the total concentrations of contaminants in the soil. The Tier 2 analyses consist of measuring the leachable concentration of contaminants from the soil. Section 5.0 discusses how the results from the Tier 1 and 2 analyses are evaluated.

Tier 1 Analyses

The Tier 1 analyses necessary to adequately characterize the PHIS shall be in accordance with protocol described below and in Table 2 (attached).

a. Gasolines ($C_6 - C_{12}$)

Soils impacted with gasolines shall be analyzed using the DHS/EPA Method 8015 modified to quantify the total petroleum hydrocarbons (TPH) through the carbon range C_6 to C_{12}. The minimum laboratory reporting limit for this method of analysis shall be no greater than 10 mg/kg. Additionally, soil sample results for TPH shall be ranked from highest concentration to lowest. The highest 25% of samples for TPH (minimum of four samples) shall be further analyzed using EPA Method 8021, 8260B (or equivalent) to quantify the concentrations of benzene, toluene, ethylbenzene, total xylenes (BTEX), methyl-tertiary butyl ether (MtBE) and other fuel oxygenates as required on a case-by-case basis. The minimum

laboratory reporting limit for volatile organic compounds in soil using EPA method 8021, 8260B (or equivalent), shall be no greater than 5 ug/kg.

b. Middle Distillates ($C_9 – C_{25}$)

Soils impacted with middle distillate petroleum fuels such as diesel shall be analyzed using the DHS/EPA Method 8015 modified to quantify the total petroleum hydrocarbons through the carbon range C_9 to C_{25}. The minimum laboratory reporting limit for this method of analysis shall be no greater than 10 mg/kg. Additionally, soil sample results for TPH shall be ranked from highest concentration to lowest. The highest 25% of samples for TPH (minimum of four samples) shall be further analyzed using EPA Method 8021, 8260B (or equivalent) to quantify the concentrations of BTEX and naphthalene. Analysis for MtBE and other fuel oxygenates may be required on a case-by-case basis. The minimum laboratory reporting limit for volatile organic compounds in soil using EPA method 8021, 8260B (or equivalent), shall be no greater than 5 ug/kg.

Tier 2 Analyses

The Tier 2 analyses necessary to adequately characterize the PHIS shall be in accordance with protocol described below and in Table 3 (attached).

a. Gasolines ($C_6 – C_{12}$)

The same 25% of soil samples with the highest TPH concentrations as ranked in the Tier 1 analyses (minimum of four samples) shall be extracted using the Synthetic Precipitation Leaching Procedure (SPLP). Procedures for the SPLP are described in EPA SW-846 (EPA Method 1312). The SPLP extract shall be analyzed for gasolines using DHS/EPA Method 8015 modified to quantify the total petroleum hydrocarbons in the carbon range C_6 through C_{12}, BTEX, MtBE and other fuel oxygenates as required on a case-by-case basis using Method 8021, 8260B (or equivalent). The minimum laboratory reporting limit for this method of analysis for gasolines in water shall be no greater than 100 ug/L. The minimum laboratory reporting limit for volatile organic compounds in water using EPA method 8021, 8260B (or equivalent), shall be no greater than 1.0 ug/L.

b. Middle Distillates ($C_9 – C_{25}$)

The same 25% of soil samples with the highest TPH concentrations as ranked in the Tier 1 analyses (minimum of four samples) shall be analyzed using the SPLP described above. The SPLP extract shall be analyzed for diesel using DHS/EPA Method 8015 modified to quantify the total petroleum hydrocarbons in the carbon range C_9 through C_{25}, plus BTEX and naphthalene using Method 8021, 8260B (or equivalent). The minimum laboratory reporting limit for this method of analysis for middle distillates in water shall be no greater than 100 ug/L. The minimum laboratory reporting limit for volatile organic compounds in water using EPA method 8021, 8260B (or equivalent), shall be no greater than 1.0 ug/L.

5.0 EVALUATION CRITERIA AND REGULATORY LIMITS

There are three types of regulatory limits applicable to the reuse of PHIS. These include 1) the Not-to-Exceed soil concentration limits, 2) the Tier 1 soil concentration limits, and 3) the Tier 2 leachate concentration limits. The Tier 1 and Not-to-Exceed soil limits are listed in Table 2 and the Tier 2 leachate limits are listed in Table 3.

5.1 Evaluation Process

Figure 2 illustrates the process for determining if the PHIS is acceptable for reuse in accordance with this guidance.

Category 1

After ranking the soil results from highest to lowest, if the highest concentration for each constituent does not exceed the Tier 1 soil limits (Table 2), then no further evaluation is necessary and the soil is suitable for reuse in accordance with this document.

Category 2

Conversely, if any constituent concentration exceeds the Not-to-Exceed soil limits (Table 2), then the soil is **not** suitable for reuse, without further remedial action, such as hotspot removal or treatment, confirmation sampling, and re-evaluation.

Category 3

If the soil does not fall into categories 1 or 2, then the 95% upper confidence limit (UCL) of the mean, as computed from the soil characterization data for each constituent, can be used for comparison to the applicable regulatory limits for each constituent.

Tier 1 Soil Limits:

If the 95% UCL of the mean for any constituent exceeds its Tier 1 soil concentration limit listed in Table 2 (but is less than its Not-to-Exceed soil limit per Category 2 restrictions), then the Tier 2 leachability analyses described in section 4.4 must be performed.

Tier 2 Leachate Limits:

If the 95% UCL of the mean of the leachate concentrations, for any constituent, exceeds its Tier 2 leachate limit listed in Table 3, then the soil is **not** suitable for reuse in accordance with this document, without further remedial action and re-evaluation.

5.2 Computing the 95% UCL of the Mean

The 95% UCL of the mean must be determined for each constituent of concern after an appropriate number of samples has been collected from the stockpiled soil (see Section 4.1). If a data set is not normally distributed, it must be appropriately transformed. Guidance on determining the 95% UCL of the mean is found in EPA SW-846 (see Section 4.0) and in the EPA publication titled "Supplemental Guidance to RAGS: Calculating the Concentration Term" as presented in "Risk Assessment Guidance for Superfund (RAGS) Volume I, Human Health Evaluation Manual", publication 9285.7, May 1992.

6.0 REPORTING REQUIREMENTS

For sites under Water Board oversight, a technical report, containing the compliance information summarized below, must be submitted to the Water Board staff case handler for review and placement in the public record. For sites not under Water Board oversight, the compliance documentation must be retained by the property owner and waste discharger and provided to the Water Board only upon request:

1. Source of the PHIS (e.g., gas station, tank farm, refinery, industrial facility, etc.)
2. An estimate of the volume of impacted soil
3. A description of the contaminant(s) (e.g., gasoline, diesel, aviation fuel, etc.)
4. A description of the sampling methodology and the sample location/selection process
5. A plot plan detailing the stockpile and sample locations
6. A copy of all sample results, chain of custody documents, and QA/QC supporting data (electronic format preferred)
7. A one-page summary table of the laboratory results for the stockpile sampling
8. Statistical calculations for all stockpiles
9. A tabular comparison of the statistical results for each constituent for each stockpile to the Table 2 and Table 3 regulatory limits
10. A statement signed by the discharger/responsible party and a registered professional certifying compliance with the restrictions, site conditions, sampling and analysis, and evaluation criteria described in this guidance
11. Description and map of the reuse location and site
12. A statement signed by the property owner acknowledging the reuse of the impacted soil on his/her property and responsibility for maintaining compliance with the conditions of this guidance

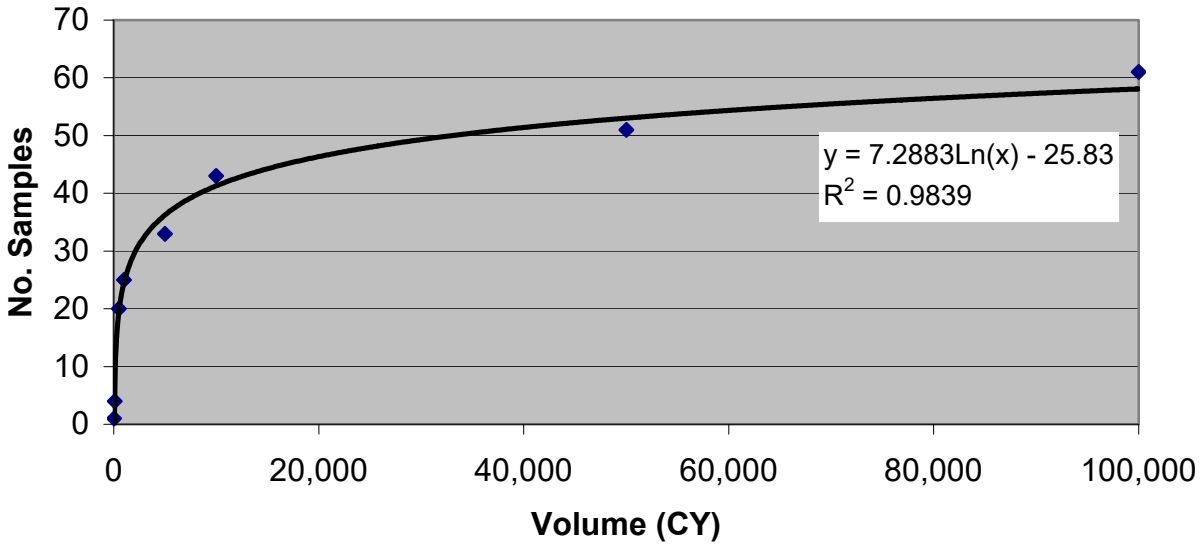
Figure 1: Relationship of No. Samples to Soil Volume



ATTACHMENT 2

Table 2: Tier 1 Analytical Methods and Concentration Limits for Gasoline and Diesel[1] in Soil

Contaminant	Constituent of Concern	Carbon Range	Preparation Method[3]	DHS/EPA Method of Analysis[3]	Soil Concentration Limits[4] (mg/kg)	Not To Exceed Limits[5] (mg/kg)
Gasoline	TPH-Gasoline	C_6-C_{12}	3550	8015M	100	400
Diesel	TPH Diesel	C_9-C_{25}	3550	8015M	100	400
Gasoline/Diesel	Benzene		5030	8021/8260B	0.044	0.18
Gasoline/Diesel	Toluene		5030	8021/8260B	2.9	100
Gasoline/Diesel	Ethylbenzene		5030	8021/8260B	3.3	390
Gasoline/Diesel	Xylenes		5030	8021/8260B	2.3	310
Gasoline	MtBE[2]		5030	8021/8260B	0.023	2
Diesel	Naphthalene		5030	8021/8270	0.46	1.5

1. Includes comparable middle distillates ($C_9 – C_{25}$) including diesel, kerosene, and jet fuel.
2. Testing for other fuel oxygenates may be required on a case-by-case basis.
3. Or equivalent laboratory method.
4. Soil concentration limits may be compared to the 95% upper confidence limit of the mean calculated from the stockpile sample data for each constituent. Soil concentration limits are based on the lowest Environmental Screening Level ("ESL") as presented in the Region 2 Technical Document, Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Interim Final, February 2005, Appendix 1, Volume 2, Table A-1 for protection of 1) human health via drinking water consumption, 2) human health via direct contact, 3) human health via indoor air exposure, or 4) nuisance concerns. Additional assumptions include residential landuse, groundwater is a source of drinking water, and soils are shallow (< 10 feet). Soil concentration limits for TPH as gasoline & diesel are based on gross contamination ceiling (i.e., nuisance) limits. Soil concentration limits for BTEX and MtBE are based on a generalized leaching model for the protection of groundwater as a potential source of drinking water. Soil concentration limits for naphthalene are based on protection of human health via indoor air exposure. Updates to the Region 2 ESLs will supersede the concentration limits listed in this table.
5. Soil not-to-exceed limits must be compared to individual stockpile sample results for each constituent. Soil not-to-exceed limits are based on the second lowest ESL as presented in the Region 2 Technical Document, Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Interim Final, February 2005, Appendix 1, Volume 2, Table A-1 for protection of 1) human health via drinking water consumption, 2) human health via direct contact, 3) human health via indoor air exposure, or 4) nuisance concerns. Additional assumptions include residential landuse, groundwater is a source of drinking water, and soils are shallow (< 10 feet). Soil not-to-exceed limits for TPH as gasoline & diesel, BTEX, MtBE, and naphthalene are based on protection of human health via direct exposure. Updates to the Region 2 ESLs will supersede the concentration limits listed in this table.

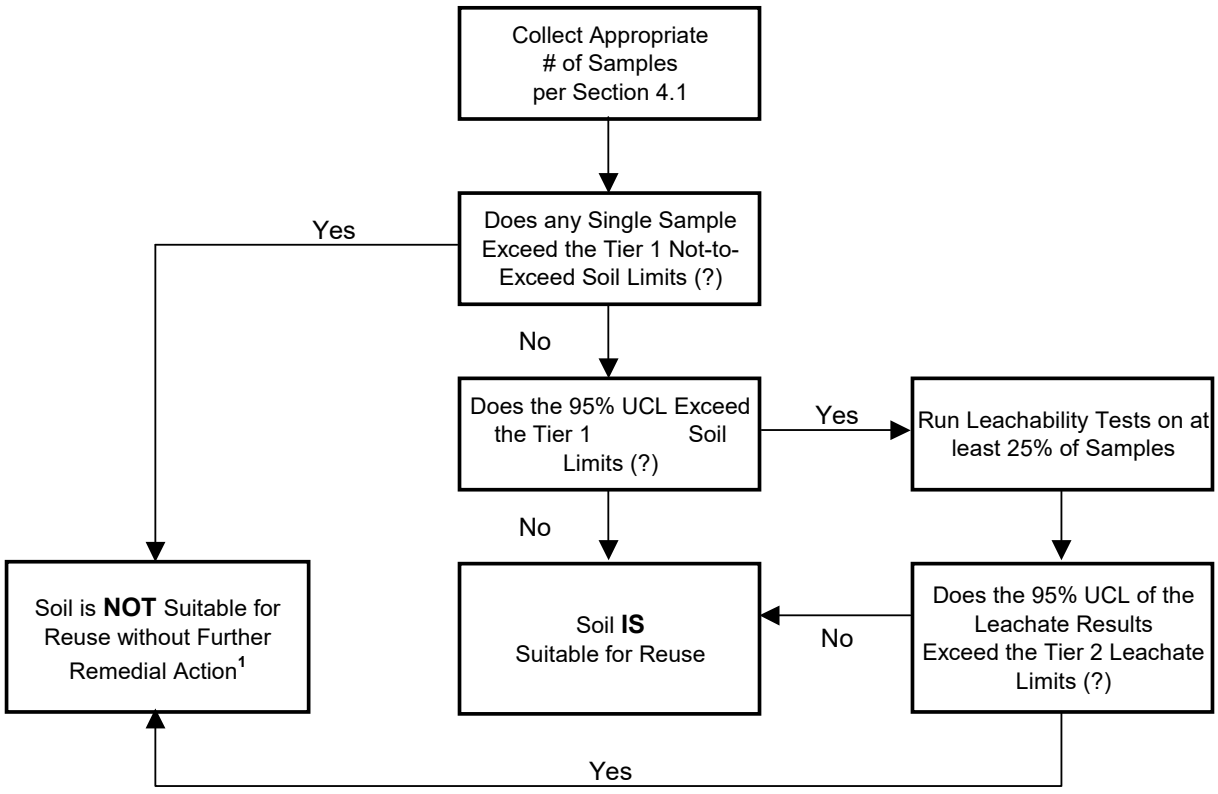
Table 3: Tier 2 Analytical Methods and Concentration Limits for Gasoline and Diesel[1] Leachable Extract

Contaminant	Constituent of Concern	Extraction Method	Carbon Range	Preparation Method[3]	DHS/EPA Method of Analysis[3]	Leachate Concentration Limits[4] (ug/l)
Gasoline	TPH-Gas	SPLP	C_6-C_{12}	3510	8015M	100
Diesel	TPH-Diesel	SPLP	C_9-C_{25}	3510	8015M	100
Gasoline/Diesel	Benzene	SPLP		5030	8021/8260B	1.0
Gasoline/Diesel	Toluene	SPLP		5030	8021/8260B	40
Gasoline/Diesel	Ethylbenzene	SPLP		5030	8021/8260B	30
Gasoline/Diesel	Xylenes	SPLP		5030	8021/8260B	20
Gasoline	MtBE[2]	SPLP		5030	8021/8260B	5
Diesel	Naphthalene	SPLP		5030	8021/8270	17

1. Includes comparable middle distillates ($C_9 – C_{25}$) including diesel, kerosene, and jet fuel.
2. Testing for other fuel oxygenates may be required on a case-by-case basis.
3. Or equivalent laboratory method.
4. The leachate concentration limits for all constituents are based on the lowest groundwater screening level that is protective of nuisance odors or human health (via drinking water or indoor air impacts), as presented in the Region 2 Environmental Screening Levels ("ESLs") Technical Document, Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Interim Final, February 2005, Appendix 1, Volume 2, Table F-1a (groundwater is a current or potential drinking water resource). Updates to the Region 2 ESLs will supersede the concentration limits listed in this table.

ATTACHMENT 3

Figure 2: Evaluation Process for Reuse of Non-Hazardous PHIS



[1] Additional remedial action may include removal and/or treatment of the hotspot with additional confirmation sampling and re-evaluation.

Information Advisory
Clean Imported Fill Material

October 2001

DEPARTMENT OF TOXIC SUBSTANCES CONTROL

It is DTSC's mission to restore, protect and enhance the environment, to ensure public health, environmental quality and economic vitality, by regulating hazardous waste, conducting and overseeing cleanups, and developing and promoting pollution prevention.

State of California

California Environmental Protection Agency

Executive Summary

This fact sheet has been prepared to ensure that inappropriate fill material is not introduced onto sensitive land use properties under the oversight of the DTSC or applicable regulatory authorities. Sensitive land use properties include those that contain facilities such as hospitals, homes, day care centers, and schools. This document only focuses on human health concerns and ecological issues are not addressed. It identifies those types of land use activities that may be appropriate when determining whether a site may be used as a fill material source area. It also provides guidelines for the appropriate types of analyses that should be performed relative to the former land use, and for the number of samples that should be collected and analyzed based on the estimated volume of fill material that will need to be used. The information provided in this fact sheet is not regulatory in nature, rather is to be used as a guide, and in most situations the final decision as to the acceptability of fill material for a sensitive land use property is made on a case-by-case basis by the appropriate regulatory agency.

Introduction

The use of imported fill material has recently come under scrutiny because of the instances where contaminated soil has been brought onto an otherwise clean site. However, there are currently no established standards in the statutes or regulations that address environmental requirements for imported fill material. Therefore, the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) has prepared this fact sheet to identify procedures that can be used to minimize the possibility of introducing contaminated soil onto a site that requires imported fill material. Such sites include those that are undergoing site remediation, corrective action, and closure activities overseen by DTSC or the appropriate regulatory agency. These procedures may also apply to construction projects that will result in sensitive land uses. The intent of this fact sheet is to protect people who live on or otherwise use a sensitive land use property. By using this fact sheet as a guide, the reader will minimize the chance of introducing fill material that may result in potential risk to human health or the environment at some future time.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our website at www.dtsc.ca.gov.

Overview

Both natural and manmade fill materials are used for a variety of purposes. Fill material properties are commonly controlled to meet the necessary site specific engineering specifications. Because most sites requiring fill material are located in or near urban areas, the fill materials are often obtained from construction projects that generate an excess of soil, and from demolition debris (asphalt, broken concrete, etc.). However, materials from those types of sites may or may not be appropriate, depending on the proposed use of the fill, and the quality of the assessment and/or mitigation measures, if necessary. Therefore, unless material from construction projects can be demonstrated to be free of contamination and/or appropriate for the proposed use, the use of that material as fill should be avoided.

Selecting Fill Material

In general, the fill source area should be located in nonindustrial areas, and not from sites undergoing an environmental cleanup. Nonindustrial sites include those that were previously undeveloped, or used solely for residential or agricultural purposes. If the source is from an agricultural area, care should be taken to insure that the fill does not include former agricultural waste process byproducts such as manure or other decomposed organic material. Undesirable sources of fill material include industrial and/or commercial sites where hazardous ma-

Potential Contaminants Based on the Fill Source Area

Fill Source:	Target Compounds
Land near to an existing freeway	Lead (EPA methods 6010B or 7471A), PAHs (EPA method 8310)
Land near a mining area or rock quarry	Heavy Metals (EPA methods 6010B and 7471A), asbestos (polarized light microscopy), pH
Agricultural land	Pesticides (Organochlorine Pesticides: EPA method 8081A or 8080A; Organophosphorus Pesticides: EPA method 8141A; Chlorinated Herbicides: EPA method 8151A), heavy metals (EPA methods 6010B and 7471A)
Residential/acceptable commercial land	VOCs (EPA method 8021 or 8260B, as appropriate and combined with collection by EPA Method 5035), semi-VOCs (EPA method 8270C), TPH (modified EPA method 8015), PCBs (EPA method 8082 or 8080A), heavy metals including lead (EPA methods 6010B and 7471A), asbestos (OSHA Method ID-191)

**The recommended analyses should be performed in accordance with USEPA SW-846 methods (1996). Other possible analyses include Hexavalent Chromium: EPA method 7199*

Recommended Fill Material Sampling Schedule

Area of Individual Borrow Area	Sampling Requirements
2 acres or less	Minimum of 4 samples
2 to 4 acres	Minimum of 1 sample every 1/2 acre
4 to 10 acres	Minimum of 8 samples
Greater than 10 acres	Minimum of 8 locations with 4 subsamples per location
Volume of Borrow Area Stockpile	**Samples per Volume**
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

terials were used, handled or stored as part of the business operations, or unpaved parking areas where petroleum hydrocarbons could have been spilled or leaked into the soil. Undesirable commercial sites include former gasoline service stations, retail strip malls that contained dry cleaners or photographic processing facilities, paint stores, auto repair and/or painting facilities. Undesirable industrial facilities include metal processing shops, manufacturing facilities, aerospace facilities, oil refineries, waste treatment plants, etc. Alternatives to using fill from construction sites include the use of fill material obtained from a commercial supplier of fill material or from soil pits in rural or suburban areas. However, care should be taken to ensure that those materials are also uncontaminated.

Documentation and Analysis

In order to minimize the potential of introducing contaminated fill material onto a site, it is necessary to verify through documentation that the fill source is appropriate and/or to have the fill material analyzed for potential contaminants based on the location and history of the source area. Fill documentation should include detailed information on the previous use of the land from where the fill is taken, whether an environmental site assessment was performed and its findings, and the results of any testing performed. It is recommended that any such documentation should be signed by an appropriately licensed (CA-registered) individual. If such documentation is not available or is inadequate, samples of the fill material should be chemically analyzed. Analysis of the fill material should be based on the source of the fill and knowledge of the prior land use.

Detectable amounts of compounds of concern within the fill material should be evaluated for risk in accordance with the DTSC Preliminary Endangerment Assessment (PEA) Guidance Manual. If

metal analyses are performed, only those metals (CAM 17 / Title 22) to which risk levels have been assigned need to be evaluated. At present, the DTSC is working to establish California Screening Levels (CSL) to determine whether some compounds of concern pose a risk. Until such time as these CSL values are established, DTSC recommends that the DTSC PEA Guidance Manual or an equivalent process be referenced. This guidance may include the Regional Water Quality Control Board's (RWQCB) guidelines for reuse of non-hazardous petroleum hydrocarbon contaminated soil as applied to Total Petroleum Hydrocarbons (TPH) only. The RWQCB guidelines should not be used for volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCS). In addition, a standard laboratory data package, including a summary of the QA/QC (Quality Assurance/Quality Control) sample results should also accompany all analytical reports.

When possible, representative samples should be collected at the borrow area while the potential fill material is still in place, and analyzed prior to removal from the borrow area. In addition to performing the appropriate analyses of the fill material, an appropriate number of samples should also be determined based on the approximate volume or area of soil to be used as fill material. The table above can be used as a guide to determine the number of samples needed to adequately characterize the fill material when sampled at the borrow site.

Alternative Sampling

A Phase I or PEA may be conducted prior to sampling to determine whether the borrow area may have been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with DTSC or appropriate regulatory agency. However, if it is not possible to analyze the fill material at the borrow area or determine that it is appropriate for use via a Phase I or PEA, it is recommended that one (1) sample per truckload be collected and analyzed for all compounds of concern to ensure that the imported soil is uncontaminated and acceptable. (See chart on Potential Contaminants Based on the Fill Source Area for appropriate analyses). This sampling frequency may be modified upon consultation with the DTSC or appropriate regulatory agency if all of the fill material is derived from a common borrow area. However, fill material that is not characterized at the borrow area will need to be stockpiled either on or off-site until the analyses have been completed. In addition, should contaminants exceeding acceptance criteria be identified in the stockpiled fill material, that material will be deemed unacceptable and new fill material will need to be obtained, sampled and analyzed. Therefore, the DTSC recommends that all sampling and analyses should be completed prior to delivery to the site to ensure the soil is free of contamination, and to eliminate unnecessary transportation charges for unacceptable fill material.

Composite sampling for fill material characterization may or may not be appropriate, depending on quality and homogeneity of source/borrow area, and compounds of concern. Compositing samples for volatile and semivolatile constituents is not acceptable. Composite sampling for heavy metals, pesticides, herbicides or PAH's from unanalyzed stockpiled soil is also unacceptable, unless it is stockpiled at the borrow area and originates from the same source area. In addition, if samples are composited, they should be from the same soil layer, and not from different soil layers.

When very large volumes of fill material are anticipated, or when larger areas are being considered as borrow areas, the DTSC recommends that a Phase I or PEA be conducted on the area to ensure that the borrow area has not been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with the DTSC.

For further information, call Richard Coffman, Ph.D., R.G., at (818) 551-2175.

Subject: Soil Import Summary
Former Hanson Aggregates Radum Facility
3000 Busch Road, Pleasanton, California
(ACDEH Case No. RO0003228)

Dear Mr. Sanders:

This letter is being submitted to Alameda County Department of Environmental Health (ACDEH) to comply with your 9 July 2019 email request for a summary of the soil import activities conducted by USL Pleasanton Lakes, L.P. (USL Pleasanton) at the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California (the "site"). This letter documents the soil import characterization activities and ACDEH's review and approval of the soil import characterization results, and provides a summary of the soil import activities, figures showing the soil import location, and contractor documentation for the soil transportation.

Soil Import Characterization

USL Pleasanton imported soil to the site from the following two fill material source areas:

- 373 Diablo Road, Danville, California ("Danville Riverwalk Source Area"); and,
- 265 Sobrante Way, Sunnyvale, California ("Sobrante Sunnyvale Source Area").

Prior to importing any soil to the site, environmental testing activities were conducted for each of these fill material source areas following the requirements of the *Soil Import Management Plan, Former Hanson Aggregates Radum Facility, Pleasanton, California (SIMP)*, dated 8 August 2018, prepared by Haley & Aldrich, Inc. (Haley & Aldrich). The SIMP was reviewed by ACDEH and approved per their 8 August 2018 Directive Letter. The soil characterization activities were also performed to comply with ACDEH's *Fill Material Characterization Guidance*, dated 1 August 2018.

Soil Import Approval

The soil import characterization results for each fill material source area were documented in:

- *Fill Material Characterization Report for Import to USL Pleasanton Site, Proposed*

Danville/Riverwalk Fill Material Source Area, 373 to 383 Diablo Road, Danville, California, dated 7 November 2018, prepared by Haley & Aldrich; and,

- *Fill Material Characterization Report for Import to USL Pleasanton Site, Proposed Fill Material Source Area: 265 Sobrante Way Sunnyvale, California*, dated 29 March 2019, prepared by Haley & Aldrich.

ACDEH reviewed both of these fill material characterization reports and respectively approved import per their 8 November 2018 email and their 5 April 2019 email. In addition, ACDEH consulted with Zone 7 Water Agency (Zone 7) on this review, with Zone 7 also approving import.

Following ACDEH's approval of the Sobrante Sunnyvale Source Area, they requested the SIMP to be updated for evaluating future potential fill material source areas. The *Soil Import Management Plan – Addendum, Former Hanson Aggregates Radum Facility, Pleasanton, California (SIMP Addendum)*, dated 10 May 2019, prepared by Haley & Aldrich, was approved by ACDEH per their 29 May 2019 email. The SIMP Addendum was also reviewed and approved by Zone 7. Future soil import characterizations and approvals will be performed to meet the requirements of the SIMP Addendum.

Soil Import Activities

Soil imported to the site from the Danville Riverwalk Source Area and from the Sobrante Sunnyvale Source Area were graded and compacted at the locations shown in the attached Figures 1 and 2, respectively. Copies of the transportation contractors' haul sheets and freight logs are attached to this letter (Pacific States Environmental Contractors and Double D Transportation for Danville Riverwalk Source Area; Fremont Paving Company and STI Trucking for the Sobrante Sunnyvale Source Area); except the July freight logs for the Sobrante Sunnyvale Source Area, which are pending and will be provided to ACDEH once available.

A summary of the overall soil import activities is presented in the table below.

Fill Material Source Area	Total Imported Volume (cubic yards)	Total Number of Truckloads	Import Start Date	Import End Date	Fill Depth
Danville Riverwalk Source Area	15,228	1,269	11/12/2018	11/20/2018	2 feet maximum; 9 inches average
Sobrante Sunnyvale Source Area	17,850	1,785	6/17/2019	7/8/2019	2.5 feet maximum; 8 inches average

As specified in ACDEH's approval of the Sobrante Sunnyvale Source Area, a portion of this fill material source area's soil was not permitted for import as shown in the attached Figure 3, which also provides the surveyed coordinates referenced for this segregated excavation area. This soil was transported to the STI Dump Facility located in Newark, California, for disposal as non-hazardous waste. A total of 150 cubic yards was transported to the STI Dump Facility in 15 truckloads. Copies of the transportation contractor's haul sheets and freight logs documenting this disposal are attached to this letter.

Perjury Statement

I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely yours,
USL PLEASANTON LAKES, L.P.

Steven M. Dunn

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Haley & Aldrich, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # E5CC-4064-B8EF

PO # 0207936-000

Project 330 Land Pleasanton Phase I

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: E5CC-4064-B8EF

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Haley & Aldrich, Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, LLC. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. This Report is provided on an "AS IS", "AS AVAILABLE" basis. **NO WARRANTY EXPRESS OR IMPLIED IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, LLC AND ITS SUBSIDIARIES, AFFILIATES AND THIRD PARTY SUPPLIERS DISCLAIM ALL WARRANTIES, OF ANY KIND OR NATURE, EXPRESS OR IMPLIED, ARISING OUT OF OR RELATED TO THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT, INCLUDING WITHOUT LIMITATION, ANY WARRANTIES REGARDING ACCURACY, QUALITY, CORRECTNESS, COMPLETENESS, COMPREHENSIVENESS, SUITABILITY, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, MISAPPROPRIATION, OR OTHERWISE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, LLC OR ITS SUBSIDIARIES, AFFILIATES OR THIRD PARTY SUPPLIERS BE LIABLE TO ANYONE FOR ANY DIRECT, INCIDENTAL, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES OF ANY TYPE OR KIND (INCLUDING BUT NOT LIMITED TO LOSS OF PROFITS, LOSS OF USE, OR LOSS OF DATA) INFORMATION PROVIDED IN THIS REPORT.** Any analyses, estimates, ratings, environmental risk levels, or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only an assessment performed by a qualified environmental professional can provide findings, opinions or conclusions regarding the environmental risk or conditions in, on or at any property.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA generators

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/06/2023 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/23/2023 has revealed that there are

2 ENVIROSTOR sites within approximately 1 mile of the target property.

Lists of state and tribal landfills and solid waste disposal facilities

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there are 2 SWF/LF sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Lists of state and tribal registered storage tanks

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 5 UST sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

Lists of state and tribal voluntary cleanup sites

VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the VCP list, as provided by EDR, and dated 01/23/2023 has revealed that there is 1 VCP site within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

CERS HAZ WASTE: List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA LQ HW Generator programs.

A review of the CERS HAZ WASTE list, as provided by EDR, and dated 01/05/2023 has revealed that there are 6 CERS HAZ WASTE sites within approximately 0.25 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 3 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/06/2023 has revealed that there are 5 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

ABANDONED MINES: An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

A review of the ABANDONED MINES list, as provided by EDR, and dated 12/20/2022 has revealed that there is 1 ABANDONED MINES site within approximately 0.25 miles of the target property.

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 3 CUPA Listings sites within approximately 0.25 miles of the target property.

Violation Source: CERS,

Site ID: 399691
Site Name: Pleasanton Garbage Service, Inc
Violation Date: 09-29-2017
Citation: 22 CCR 15 66265.192(a) - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.192(a)
Violation Description: Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer prior to placing the tank system in service. The written assessment shall state that, the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed to meet the regulation.

Violation Date: 07-15-2021
Citation: 2014-0057-DWQ - Industrial General Permit
Violation Description: SW - Late Report
Violation Notes: Failure to submit required report 2021 Level 2 ERA Action Plan
Violation Division: Water Boards
Violation Program: INDSTW
Violation Source: SMARTS,

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 08-07-2018
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Paved areas of the yard by the transfer station building and maintenance shop appeared swept. The areas by green waste processing and construction debris grinding were observed with higher levels of dust and debris than the paved yard and road areas. Improve housekeeping, for example by increasing trash removal and sweeping, in these areas. Leaks and drips, potentially of petroleum products, were observed by the repair shop and the fueling area. Improve BMPs to include absorbent, drip pans or similar BMPs to control leaks and drips from vehicles. A possible spill covered with absorbent was observed outside the repair shop. Please describe where the absorbent is stored and how used absorbent is stored and disposed. Housekeeping, preventive maintenance, and spill and leak prevention and response, are all minimum BMPs listed in Section X.H. of the Permit. The storm drain inlets by the green waste processing area and construction waste grinding unit had poor housekeeping. The areas contained significant dust and sediment. Although swaddles, also called wattles, were observed around the SDI, they were worn and in need of replacement. Keeping the area clean and wattles refreshed may help address current NAL exceedances. Although filters are in place in the SDI, the filters can be used up or clogged, if not maintained as frequently as required by conditions around the SDI. Any filter unit has a capacity limit. Improved housekeeping is often recommended for recycling facilities. We observed liquid drainage to the SDI in the yard by the maintenance building. This may be an unauthorized non stormwater discharge. Wash and rinse waters may not be discharged to a storm drain, per Permit section III. The 2015 SWPPP for this facility, section 4.8 (pdf page 23) states that unauthorized non stormwater discharges will not be allowed. Wash and rinse were must be discharged to the sanitary sewer or appropriately disposed per applicable laws, regulations and guidelines.

Facility Project Subtype:	Not reported
RWQCB Region:	SAN FRANCISCO BAY RWQCB (REGION 2)
Site History:	One 12,000-gallon diesel UST and one 10,000-gallon gasoline UST was removed from the site on May 23, 2003. A total of eight soil samples were collected from the floor and sidewalls of the excavation and two soil samples were collected from the soil stockpile. TPH as gasoline, BTEX, MTBE, and total lead were not detected in any of the soil samples. One of the soil samples collected below the dispenser at a depth of 1.0-1.5 feet bgs contained TPH as diesel at concentration of 210 ppm and one of the stockpile soil samples contained 10 ppm of TPH as diesel. The remaining soil samples did not have detectable concentrations of TPH as diesel. Minor fuel releases were reported during the UST removal activities and were suspected to contribute to the detections of TPH as diesel in two of the soil samples. Most of the approximately 100 to 120 cubic yards of excavated soil (stockpiles 2, 3, and 4) was placed back in the excavation. Approximately seven cubic yards of soil described as odiferous was stockpiled separately (stockpile 1) and sampled (EX-1). TPH as diesel was detected at a concentration of 10 ppm in sample EX-1. Following receipt of the analytical results from sample EX-1, stockpile 1 was moved to a vacant unpaved area of the site and spread onto the surface. Groundwater was not encountered during the tank removal. In order to investigate groundwater beneath the site, borings were advanced at four locations using a cone penetration testing (CPT) rig. A total of eight soil samples were collected in the CPT borings at depths of 17 to 28 feet bgs. TPH as gasoline, BTEX, and MTBE were not detected in the soil samples. TPH as diesel was detected in six of the eight soil samples at concentrations ranging from 1.3 to 9.5 ppm. Groundwater was generally encountered at a depth of approximately 70 feet bgs in the four borings. TPH as gasoline, TPH as diesel, BTEX, and MTBE were not detected in the four groundwater

KAISER SAND & GRAVEL (Continued) **S101293825**

samples. A currently non-operational water supply well located approximately 250 feet south of the former USTs was sampled on February 1, 2007. TPH as gasoline, TPH as diesel, TPH as motor oil, and BTEX were not detected in the water sample collected from the supply well. The Hansen Aggregates West Radum facility at 3000 Busch Road in Pleasanton is a large facility covering approximately 1,050 acres. This case closure applies only to the two USTs removed from the location shown on Attachment 1. An investigation of soil and groundwater contamination in other areas of the Hansen Aggregates West Radum Plant is currently ongoing as part of ACEH SLIC case RO0002941.

Address: 3000 BUSCH
City,State,Zip: PLEASANTON, CA 94566
Region: STATE
Facility Status: Completed - Case Closed
Status Date: 10/20/2021
Global Id: SL0600101555
Lead Agency: ALAMEDA COUNTY LOP
Lead Agency Case Number: RO0002952
Latitude: 37.6748651429292
Longitude: -121.851188764557
Case Type: Cleanup Program Site
Case Worker: DR
Local Agency: ALAMEDA COUNTY LOP
RB Case Number: NA
File Location: All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected: Aquifer used for drinking water supply
Potential Contaminants of Concern: Other Metal, Asphalt, Diesel, Gasoline, Other Petroleum, Polynuclear

KAISER SAND & GRAVEL (Continued) **S101293825**

Military DOD Site:	No
Facility Project Subtype:	Not reported
RWQCB Region:	SAN FRANCISCO BAY RWQCB (REGION 2)
Site History:	Alameda County Department of Environmental Health (ACDEH) was the lead regulatory oversight agency for the investigation and cleanup of unauthorized releases of hazardous materials to soil and groundwater from former aggregate mining operations at the Kaiser Sand and Hanson Aggregates facility (the "Site") under the following four environmental cases: Leaking Underground Storage Tank (LUST) Case No. RO0000716, GeoTracker ID T0600100778, , Kaiser Sand & Gavel (closed in 1998) LUST Case No. RO0002858, Geotracker ID T06019765846, Hanson Aggregates Mid Pacific Inc (closed in 2007) Cleanup Program Site (CSP) Case No. RO0002941, GeoTracker ID SLT19719376, Hanson Aggregates Radum Plant CSP Case No. RO0002952, GeoTracker ID SL0600101555, Hanson Aggregates Legacy Radum Plant Mining operations ceased in 2001 and investigation and cleanup of the Site has been ongoing. Nine areas of concern (AOC 1 through AOC 9) were established at the Site and total petroleum hydrocarbons (as gasoline, diesel, and motor oil), polynuclear aromatic hydrocarbons, and metals identified as the primary chemicals of concern. USL Pleasanton, the property owner of the Site as of 2013, adjusted the Site s lot lines and established new Alameda County Assessor Parcel Numbers (APNs) to facilitate future property ownership transactions and redevelopment of the parcels and redevelopment with residential, commercial, and/or parkland uses. In turn, ACDEH closed CSP cases (RO0002941 and RO0002952) and opened the following cases to align the remaining areas of concern of residual contamination with new parcel boundaries: CSP Case No. RO0003458, GeoTracker ID T10000016201, USL Pleasanton Lakes Parcel 946-1250-19-6, 0 Mohr Ave, Pleasanton, CA 94566 CSP Case No. RO0003459, GeoTracker ID T10000016203, USL Pleasanton Lakes Parcel 946-1350-3-18, 0 Mohr Ave, Pleasanton, CA 94566 CSP Case No. RO0003228, GeoTracker ID T10000016203, USL Pleasanton Lakes Parcel 946-1350-3-18, 0 Mohr Ave, Pleasanton, CA 94566

Facility Project Subtype:	Not reported
RWQCB Region:	SAN FRANCISCO BAY RWQCB (REGION 2)
Site History:	USL Pleasanton is planning the development of the entire former Hanson Radum Aggregates Facility comprised of approximately 1,000 acres. The Hanson Radum Aggregates Facility is regulated by the Alameda County Department of Environmental Health (ACDEH) under two existing voluntary remedial action program (VRAP) cases RO0002941 and RO002952. USL Pleasanton is seeking regulatory closure for three parcels contained within this former facility where potential environmental impacts from the former mining operations have been adequately investigated and delineated, and found to not present an adverse risk to human health or the environment. Regulatory closure and redevelopment approval of the former facility 's other four parcels will be addressed separately. ACDEH has opened this new VRAP case no. RO0003228 to evaluate the proposed site development and potentially close the three parcels (Parcels D, E and F) to facilitate subsequent development while continuing to provide regulatory oversight of the remaining parcels of the facility under VRAP cases RO0002941 and RO002952. The majority of these three

KAISER SAND & GRAVEL (Continued) **S101293825**

parcels are contained within Alameda County Assessor Parcel Numbers (APNs) 946 -1250 -6 -4 and 946 -1350 -3]-2, while the northern extent of Parcel E is also within Alameda County APNs 946 -1250 -6 -5 and 946 -1350 -3 -13 and the northern extent of Parcel F is also within Alameda County APN 946 -1250 -6 -5.

Environmental Interest/Information System:
AIR EMISSIONS CLASSIFICATION UNKNOWN
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Name: OLDCASTLE INFRASTRUCTURE
Address: 3786 VALLEY AVE
City,State,Zip: PLEASANTON, CA 94566
Site ID: 538357
CERS ID: 269868
CERS Description: Industrial Facility Storm Water

Violations:
Site ID: 538357
Site Name: Oldcastle Infrastructure
Violation Date: 12-29-2008
Citation: 2014-0057-DWQ - Industrial General Permit
Violation Description: SW - Deficient BMP Implementation
Violation Notes: Excess tracking onto street; insufficient BMPs
Violation Division: Water Boards
Violation Program: INDSTW
Violation Source: SMARTS,

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 08-07-2018
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: This site manufactures precast concrete utility vaults and Convault brand fuel storage tanks, which have a concrete outer wall. The site

UTILITY VAULT COMPANY (Continued) **S101580459**

has two sampling points, one at the stormwater treatment unit and one along Valley Avenue. The stormwater treatment unit collects and treats site stormwater from the employee parking lot and most of the yard. The discharge location by Valley Avenue collects stormwater primarily for the building roof drains. Per Alfred Trovao, this location has not discharged stormwater. Stormwater from the roof drains dissipates along the unlined channel from the building to the discharge point. We observed the yard, chemical product storage areas, the stormwater treatment unit, discharge locations and the Convault tank manufacturing area. Industrial materials stored include cement, fly ash and cement additives stored in silos with secondary containment. Aggregate rock and sand are stored in open sided vaults. The yard is largely unpaved. Unpaved areas and internal roadways are treated wth a salt based solution to create a crust and control dust. The application appeared effective. Alfred Trovao was knowledgeable of stormwater issues and site stormwater best management practices and equipment. A location of concern was the parking location of the old large forklift. Although a pan and absorbent was placed in the area, a large oily stain was observed on and around the pan. Improve housekeeping BMPs until the forklift can be replaced. A new forklift may arrive later this year.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 12/20/2022

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS WQP: Ambient Environmental Sampling for PFAS

The Water Quality Portal (WQP) is a part of a modernized repository storing ambient sampling data for all environmental media and tissue samples. A wide range of federal, state, tribal and local governments, academic and non-governmental organizations and individuals submit project details and sampling results to this public repository. The information is commonly used for research and assessments of environmental quality.

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits.

PFAS ECHO: Facilities in Industries that May Be Handling PFAS Listing

Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

AQUEOUS FOAM NRC: Aqueous Foam Related Incidents Listing

The National Response Center (NRC) serves as an emergency call center that fields initial reports for pollution and railroad incidents and forwards that information to appropriate federal/state agencies for response. The spreadsheets posted to the NRC website contain initial incident data that has not been validated or investigated by a federal/state response agency. Response center calls from 1990 to the most recent complete calendar year where there was indication of Aqueous Film Forming Foam (AFFF) usage are included in this dataset. NRC calls may reference AFFF usage in the ?Material Involved? or ?Incident Description? fields.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills
This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Version Date:	2018
West Map:	12008706 DUBLIN, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

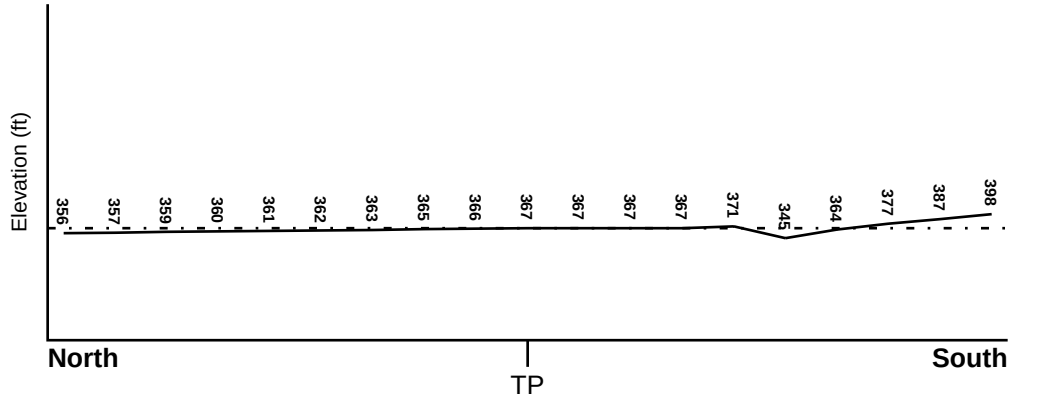
TOPOGRAPHIC INFORMATION

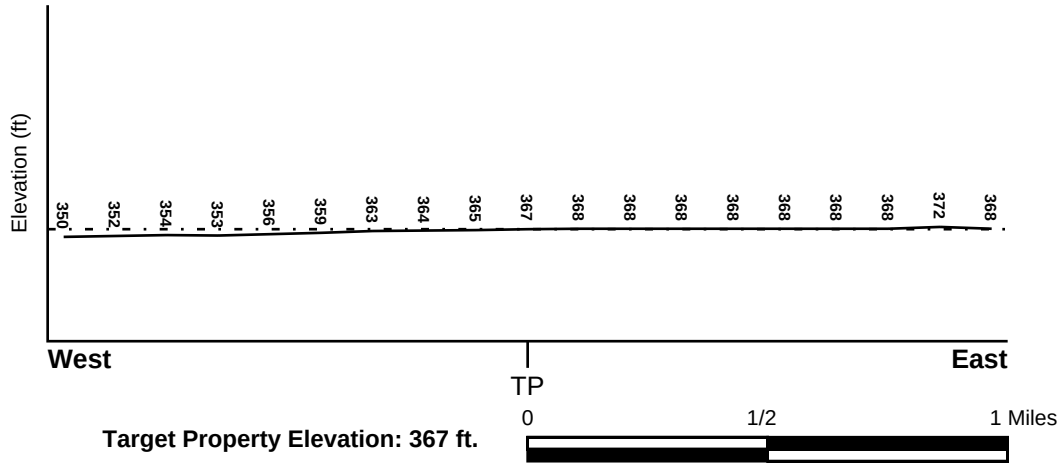
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 367 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06001C0336G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06001C0328G	FEMA FIRM Flood data
06001C0329G	FEMA FIRM Flood data
06001C0337G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LIVERMORE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
D16	1/2 - 1 Mile WSW	W
1G	1/2 - 1 Mile WSW	W

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Yolo

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9
2	16 inches	59 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: Yolo

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.9
2	16 inches	35 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.9
3	35 inches	59 inches	gravelly sand	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.9

Soil Map ID: 3

Soil Component Name: Gravel pit

Soil Surface Texture: extremely gravelly sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
2	16 inches	59 inches	stratified gravelly sandy loam to gravelly loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.9

Soil Map ID: 5

Soil Component Name: Water

Soil Surface Texture: gravelly loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

CAUTION: External Email

Hello Marie Rose,

The San Francisco Bay Regional Water Board received your April 24, 2023 file review request, which seeks records related to the addresses as described below. Based on a thorough search, the San Francisco Bay Water Board does not possess any records responsive to your request.
I searched the street addresses, but no records were found. We do not maintain records with the parcel numbers. I will search our records again if you provide me with property address.

I would recommend contacting the local agency, Alameda County Health Department for any further information they may have.

Thank you,

Melinda Wong

REMEDIAL ACTION COMPLETION CERTIFICATION

Pleasanton Ready Mix Concrete
3400 Boulder Court
Pleasanton, CA 94566
Attn: Al Riebli

RE: Pleasanton Ready Mix Concrete, 3400 Boulder Court, Pleasanton

Dear Mr. Riebli:

This letter confirms the completion of a site investigation and remedial action for the underground storage tanks located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the underground storage tanks are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Mee Ling Tung
Director, Environmental Health Services

Mr. Al Riebli
Pleasanton Ready Mix Concrete
3400 Boulder Court
Pleasanton, CA 94566

RE: Pleasanton Ready Mix Concrete, 3400 Boulder Court, Pleasanton

Dear Mr. Riebli:

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]) of the California Health and Safety Code. The State Water Resources Control Board (SWRCB) has required since March 1, 1997 that this agency use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at this site.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Up to 1800 parts per million (ppm) Total petroleum hydrocarbons as gasoline and 4.3 ppm benzene are present in soil at a depth of 18.5 feet below grade directly adjacent the gasoline underground storage tank location.

If you have any questions, please contact the undersigned at (510) 567-6783.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

Heavy metals	"	"		
Other **MtBE**	"	ND		

Note: 1) All "before" soil samples from the 18.5' sample collected from boring B-3, emplaced during September 1997.

2) All "after" soil data from borings completed in July 1998.

Comments (Depth of Remediation, etc.):

In preparation for in-place closure, slant borings were advanced adjacent to one (1) 10,000 gallon diesel and one (1) 2000 gallon gasoline underground storage tanks (UST). Undisturbed soil samples were collected from depths of up to a reported 21.5 feet below grade (BG), and analyzed for the suite of fuel compounds commensurate with the product stored in each tank.

Leaking Underground Fuel Storage Tank Program

Up to 1800 ppm TPH-G and 4.3 ppm benzene, among other aromatic compounds detected, were identified in those borings advanced adjacent to the gasoline UST. No detectable target compounds were identified in samples collected from the borings emplaced adjacent to the diesel UST.

IV. CLOSURE

Leaking Underground Fuel Storage Tank Program

VII. ADDITIONAL COMMENTS, DATA, ETC.

Four (4) additional soil boring were advanced about the gasoline UST pit during July 1998 to further assess the release. Three borings were advanced to 40', while the fourth was advanced to 45' BG in an attempt to intercept groundwater. Groundwater was not encountered to the depth explored.

Soil samples were collected at standard 5' intervals, beginning at 10' (the approximate depth of the UST invert) for potential laboratory analyses. Only the 10' and 40' samples were analyzed based on the reported absence of any field evidence of hydrocarbon impact. No detectable target compounds were identified in those samples analyzed.

Clearly, no significant release from the gasoline UST occurred. Concentrations of gasoline compounds (e.g., benzene) identified at the 18.5' depth during the 1997 assessment of the gasoline UST appear isolated, as demonstrated during the 1998 assessment. Consequently, no additional assessment or clean-up appear warranted.

RE: PLEASANTON READY MIX AND CONCRETE, INC., 3400 BOULDER STREET, PLEASANTON

Dear Mr. Riebli:

I have reviewed the April 8, 1998 Terra Nexus (TN) request to revise the approved, amended TN work plan for the preliminary assessment of the subject site. The noted revision requests the substitution of hollow stem auger drilling equipment for the previously-approved Geoprobe push tool equipment.

Based solely on the professional recommendations of TN's principle geologist, Mr. Scott Nelson, this work plan modification is accepted.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

RE: PLEASANTON READY MIX AND CONCRETE, INC., 3400 BOULDER STREET, PLEASANTON

Dear Mr. Riebli:

I have completed review of the March 10, 1998 Terra Nexus (TN) work plan for the preliminary assessment of the gasoline underground storage tank (UST) area at the subject site. This initial work plan called for the advancement of six (6) Geoprobe "borings" about the UST with the collection of both soil and ground water samples from each. The need for additional "step-out" Geoprobe points would be determined based on field observations. After discussion with Mr. Scott Nelson of TN on March 18, 1998, the initial number of "borings" was reduced from six to four (4). The new locations of the proposed "borings" were presented on a revised map of the same date.

The noted TN work plan has been accepted as revised, with the following conditions:

1) Initial soil sample depths from each Geoprobe point shall be at the approximate depth of the UST invert (~ 10')

2) Only those soil samples showing signs of impact (e.g., meter deflection, odors, etc.) need be analyzed, <u>except</u> that the soil samples collected from the initial sample interval (~ 10') and the capillary zone shall be analyzed

3) "Step-out" Geoprobe points are appropriate only when clear evidence of impact is noted in initial points

Please contact me at 510/567-6783 when field work will be scheduled to begin.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

RE: PLEASANTON READY MIX AND CONCRETE, INC., 3400 BOULDER STREET, PLEASANTON

Dear Mr. Riebli:

For your information, the Alameda County Department of Environmental Health (ACDEH), Environmental Protection Division, is contracted with the City of Livermore-Pleasanton Fire Department ("City") for oversight of environmental investigations associated with leaking underground storage tank (UST) sites in their jurisdiction. Projects are referred by the City to ACDEH on a case-by-case basis.

Your case was recently referred to ACDEH from the City for review and oversight. In response, you will soon be notified that your case has been placed into the ACDEH Local Oversight Program (LOP). By doing so, all administrative costs incurred by LOP staff during oversight of the case are reimbursed directly from the State Water Resources Control Board (SWRCB), thereby facilitating streamlined case oversight and cost recovery.

Review of the October 10, 1997 Terra Nexus report entitled *"Report of Subsurface Investigation"* indicates an unauthorized release of fuel was identified in soil samples collected from borings emplaced adjacent to the gasoline UST. Up to 1800 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G) and 4.3 ppm benzene were identified in the 18.5' sample collected during advancement of boring B-3.

Provisions of the *California Underground Storage Tank Regulations*, Title 23, Division 3, Chapter 16, Article 11, California Code of Regulations (CCR), stipulate that an environmental investigation shall follow in the wake of the discovery of an unauthorized release. Initial investigations are in the form of a **Preliminary Site Assessment**, or PSA. The information gathered by a PSA is used to determine the possible extent of any environmental impact resulting from the release, and what, if any, additional work is needed to further assess or clean-up the release.

A PSA must be performed at this site.

PSAs are to be conducted in accordance with the provisions of Article 11 of 23CCR, the San Francisco Bay Regional Water Quality Control Board (RWQCB) *"Staff Recommendations for the Initial Evaluation and Investigation of Underground Tanks,"* and the SWRCB *"Leaking Underground Fuel Tank (LUFT) Field Manual."*

In order to proceed with your PSA you should obtain the professional services of a reputable environmental consultant. Your responsibility is to have the consultant submit a PSA work plan for review which outlines planned activities pertinent to meeting the criteria described in the referenced guidance documents, and must be submitted under seal of a California-registered geologist or civil engineer with the appropriate environmental background. The technical criteria are broadly outlined in the attached **Appendix A** from the RWQCB.

The PSA work plan is due for submittal within 90 days of the date of this letter. You are encouraged to have your consultant contact me to discuss a suitable scope of work before committing it to final form. I anticipate that the final proposal will not be onerous in scope.

Please call me at (510) 567-6783 should you have any questions.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

④

April 3, 1991

Mr. Tim W. Berger
BSK & Associates
1181 Quarry Ln., Bldg. 300
Pleasanton, CA 94566

Dear Mr. Berger:

In a letter sent by facsimile to this office on March 25, 1991, as well as in a subsequent telephone conversation, you requested current environmental information on a large number of sites in Pleasanton, California. These sites are within an approximate 1/4-mile radius of property that BSK may purchase on Quarry Lane. As a result of this request for information, we have searched our hazardous waste generator, mitigation, and emergency response files for the sites you requested. Regarding your request for underground tank information, as well as for specific hazardous material storage information, this office does not administer either of these programs within the city limits of Pleasanton. You may wish to contact the Pleasanton Fire Dept. for information on underground tanks or Hazardous Material Management Plans they have on file.

This office has no information on file for the following sites:

Abtox, 1232 Quarry Ln.;
Air Systems, 1228 Quarry Ln.;
Alameda Instruments, 1075 Serpentine Ln.;
Arco/Armour Oil Co./Gas N Save, 4191 First St.;
Dale Soze, 1040 Serpentine Lane #210;
Dublin Construction, 1181 Quarry Lane;
Irby Milk Store, 3780 Stanley Blvd.;
Manning Groves, Ltd. (no address given);
Norick Brothers (no address given);
Pleasanton Steel & Supply Co., 3500 Valley Ave.;
Scholastic Magazines, Inc., 4460 Black Ave.; or
Tri-Valley Cab Co., 1043 Serpentine Ln.

Kenneth Best, 2700 Boulder St.

Unauthorized Releases: On February 3, 1989, this office was called for an emergency response to this lot behind an RV storage facility, as a result of rain causing runoff of hydrocarbons from an illegal auto dismantling operation. Gasoline and motor oil was found in open containers and tanks, throughout the lot and in the dumpster in the middle of the property. Dikes were erected as a temporary measure to prevent further runoff of hydrocarbons.

Assessments, Characterizations, Remediation: Several months later, the property owner hired a consulting firm to characterize the lateral and vertical extent of contamination, via surface samples and shallow borings in hydrocarbon-stained areas. The results indicate that contamination was limited to 1-3 foot depths in a few areas. Soil was excavated and aerated on-site, and no further work was done.

Hazardous Waste Generation, Storage, and Handling: Auto dismantling is no longer occurring at the site; the lot is being used for vehicle storage.

(RO796) **Pleasanton Ready Mix Concrete, 3400 Boulder St.**

Hazardous Waste Generation, Storage, and Handling: This facility generates waste oil, which is stored in containers in an outdoor area.

Western Concrete Products, 3500 Boulder St.

Unauthorized Releases: An inspection by this office in September 1989 revealed stained areas of sand and gravel from waste oil/diesel spillage and sloppy housekeeping. The company was ordered to excavate and properly dispose of the contaminated soil, and then to sample beneath to ensure cleanup.

Assessments, Characterizations, Remediation: In a letter dated November 3, 1989, the company submitted a plan for correction of the problems at the site; the letter stated that one stained area had already been cleaned, and another would be cleaned within two weeks. This letter also mentioned the hiring of a consulting firm to collect confirmation samples.

Hazardous Waste Generation, Storage, and Handling: This business stores a variety of hydrocarbons, such as diesel, hydraulic oil, motor oil, and form oil. It generates waste oil, which is stored in a double-contained bin.

Pleasanton Rentals, 20 California Ave.

Hazardous Waste Generation, Storage, and Handling: This business generates small quantities of used oil, storing it in a single 55-gallon drum.

DeCoite's Auto Body Emporium, 32 California Ave. #E

Hazardous Waste Generation, Storage, and Handling: This business maintains one 55-gallon drum of waste thinner, and also generates

small amounts of used oil and antifreeze from automobiles. It stores a wide variety of acrylic auto paints.

Larry's Automotive, 39 California Ave. #309

Unauthorized Releases: In March 1989, the business owner at this location complained about a neighboring business at 39 California called All-Valley Auto Body. The complaint, later verified by police and fire dept. officials, involved the illegal outdoor painting of vehicles after hours. This caused uncontrolled volatile organic vapor emissions, and drifting paint that damaged downwind property. The owner of All-Valley Auto Body may have disposed of paint waste into the storm drain.

Assessments, Characterizations, Remediation: No file information for 39 California Ave.

Hazardous Waste Generation, Storage, and Handling: Larry's Automotive generates used oil and solvent waste, as well as spent antifreeze. All-Valley Auto Body is not on record as storing any hazardous wastes on site.

Quality Auto Craft and Diablo Auto Body, 57 California Ave. #D, #H, respectively

Hazardous Waste Generation, Storage, and Handling: Each business maintains a 55-gallon drum of waste thinner, and stores a wide variety of acrylic auto paints.

German Auto Werke, 57 California Ave. #J

Hazardous Waste Generation, Storage, and Handling: This business was last inspected in May 1989, and may no longer be in operation. It generates waste oil, stored in two 55-gallon drums, as well as spent antifreeze and dirty solvent.

Techni-Tune & Brake, 57 California Ave. #Q

Hazardous Waste Generation, Storage, and Handling: This business does change oil, and stores used oil in two 55-gallon drums; it also generates waste solvent from parts cleaning.

Metalaser Technologies, 1244 Quarry Lane

Hazardous Waste Generation, Storage, and Handling: This business stores acetone, alcohols, petroleum-based solvents, and cooling

oils. Small amounts of the solvents are generated as waste, and stored in 5-gallon containers. Waste oils are stored in 55-gallon drums.

Clayton Environmental Consultants, 1252 Quarry Ln.

Hazardous Waste Generation, Storage, and Handling: The company operates a hazardous waste analytical lab in this location. It stores a large variety of chemicals and reagents for lab work. the largest category of wastes generated are acids, non-chlorinated solvents, and chlorinated solvents, which are all stored and disposed of separately.

Airrigation Engineering Co., 1279-C Quarry Ln.

Hazardous Waste Generation, Storage, and Handling: This site was formerly occupied by Berkeley Glass Labs, which ceased operations at this location in late 1987. BGL had two 4,000-gallon tanks of hydrofluoric acid (HF) it used in its manufacturing process, which generated waste HF. In June 1987, the company was found to be illegally neutralizing this waste HF, using sodium carbonate, in plastic pools on the roof of the building. Our office issued a notice of violation for this activity. There are copies in the file of two manifests dated June 26, 1987, for disposal of 9,300 gallons of HF waste through IT Corp. The firm had been issued an Extremely Hazardous Waste Disposal Permit by Calif. DHS in July 1986, good for one year. The company subsequently filed for Chapter 11 bankruptcy, and worked with the Pleasanton Fire Dept. on site closure in September 1987. Airrigation Engineering, now in Suite C of 1279 Quarry Ln., generates pesticide waste, waste solvent, and used oil, all of which are generally stored in 5-gallon containers.

Accurate Tool & Manufacturing Co., 1048 Serpentine Ln. #313

Hazardous Waste Generation, Storage, and Handling: This machine shop uses both oil- and water-based coolant/cutting fluid, but mainly the water-based fluid, which evaporates and is not stored or disposed of as a waste. There is a solvent tank on the premises, so the facility generates dirty solvent for off-site recycling.

Ed Turman & Co., 1051 Serpentine Ln., Suite 400

Hazardous Waste Generation, Storage, and Handling: This facility stores flammable paints and thinners, and operates a thinner recycling unit. As a result, there in no liquid hazardous stored for disposal. The facility uses an air-dry technique to dry paint

residuals; once hard, this material is disposed of in the regular trash.

AMP Printing, 1056 Serpentine Ln.

Hazardous Waste Generation, Storage, and Handling: Hazardous materials stored on the premises include inks, film developers, fixer, and hydraulic oils in the printing presses. Waste generated is spent fixer, which is stored in 5-gallon plastic "cubes."

Air Factors, 1071 Serpentine Ln.

Hazardous Waste Generation, Storage, and Handling: This business uses a phosphoric acid etching solution for aluminum; waste etchant is discharged to the sanitary sewer under permit. Other materials used are chlorinated solvents, oil- and water-based adhesives, paints, and thinners. The company generates small amounts of waste oil.

Advanced Printing, 1072-A Serpentine Ln.

Hazardous Waste Generation, Storage, and Handling: Hazardous materials stored at this company are inks, developer, fixer, and oils. Wastes generated are spent fixer (there is a silver recovery unit on-site) and waste oil, which is stored in a 55-gallon drum.

Ry-Nck Tire & Brake, 3420 Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: The facility stores bulk oils and generates waste oil, spent solvent, and used antifreeze.

Stop & Go Independent VW Repair, 3440-A Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: Hazardous wastes at this site include used oil, antifreeze, and sludge from the caustic hot tank. During a routine inspection in February 1990, this company could not produce adequate documentation for proper disposal of these wastes.

Pleasanton Import Car Service, 3440-D Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: The facility stores bulk oils and generates waste oil, spent solvent, and used antifreeze.

Wilson Automotive, 3440-F&G Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: The facility stores bulk oils and generates waste oil, spent solvent, and used antifreeze.

Awesome Automotive, 3440-I Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: The facility stores bulk oils and generates waste oil, spent solvent and carburetor cleaner, and used antifreeze.

Bernie's Body Shop, 3440-B Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: This business maintains several 55-gallon containers of spent paint thinner, and stores extra thinner and paints in bulk.

Pleasanton Body Shop, 4262 Stanley Blvd.

Hazardous Waste Generation, Storage, and Handling: This business maintains several 55-gallon containers of spent paint thinner, and stores extra thinner and paints in bulk.

(R0980) **B&J Trucking Lines/D&L Trucking Co., 3742 Valley Ave.**

Apparently, in 1982 or 1983 the Alameda County District Attorney's Office filed a complaint against this operation for the following hazardous waste violations (based on interrogatories propounded to the plaintiff from the defendants' law firm):

1. Improper storage/handling of hazardous wastes;
2. November 22, 1982 - an illegal discharge of PCB-contaminated waste to a storm drain leading to Arroyo del Valle;
3. Failure to take steps to stop this discharge;
4. Illegal disposal of hazardous waste (soil contaminated with PCBs) at a solid waste landfill; and
5. Illegal transportation of hazardous waste.

In an article in the February 25, 1983 Daily Review, a spokesman speculates that 200 gallons of PCB oil may have been released, and that B&J Trucking had been a waste hauling contractor for PG&E for 10 years. There is no other file information on this site.

(R0725) **Utility Vault Co., 3786 Valley Ave.**

Unauthorized Releases: The adjacent property at 3800 Valley Ave. had an ongoing series of waste oil releases to the ground from a former tenant.

Assessments, Characterizations, Remediation: Utility Vault, the property owner, had this oil/water mixture pumped on May 11, 1990, and removed contaminated soil. The area of contamination was apparently limited to shallow soil.

Hazardous Waste Generation, Storage, and Handling: Utility Vault and its tenants at 3800 Valley Ave. generate waste oil, which is generally kept in outdoor storage areas. The 3786 Valley Ave. property contains bulk petroleum products, including form oil.

Big "O" Tires, 3688-A Washington St.

Hazardous Waste Generation, Storage, and Handling: This facility stores bulk petroleum products and generates waste oil, which is stored in 55-gallon drums.

J&T Auto Center, 3688-D Washington St.

Unauthorized Releases: On August 18, 1989, an employee of this business apparently disposed of waste oil and antifreeze to the parking lot behind the 3688 building. This material clogged the storm drain in the parking lot, pooled, and overflowed into a dirt area beyond the parking lot. Samples this office collected from the pooled liquid and surrounding soil contained high levels of lead and other metals, as well as oil & grease. The owner was instructed to remove the liquid and contaminated soil, store these materials in containers, and dispose of them as hazardous wastes.

Assessments, Characterizations, Remediation: There is no record of any subsequent site characterization or confirmation of cleanup.

Hazardous Waste Generation, Storage, and Handling: This business generated waste oil, antifreeze, and solvent, and stored bulk oils. It may no longer be operating at this location.

Autotron, 3688-F Washington St.

Hazardous Waste Generation, Storage, and Handling: This business was last inspected in March 1988, at which time it generated waste oil, antifreeze, and solvent.

(R02425) **Can-Am Plumbing, 151 Wyoming St.**

Hazardous Waste Generation, Storage, and Handling: This business generates used oil, primarily from vehicle maintenance, as well as dirty solvent from a solvent sink.

Central Petroleum Maintenance Co., 176 Wyoming St.

Hazardous Waste Generation, Storage, and Handling: Waste oil is stored in a 55-gallon drum; dirty solvent is also generated. As of the last inspection in March 1988, the solvent was being mixed with the waste oil.

This letter contains information limited to files in this office, and does not reflect information that may be available from other agencies or parties. As I explained over the phone, your company will be billed for provision of this service at the rate of $67 per hour labor; enclosed is a copy of the invoice sent to our Billing Department.

If you have any questions concerning this letter, please contact the undersigned at 271-4320.

Sincerely,

Gilbert M. Wistar

REMEDIAL ACTION COMPLETION CERTIFICATION

Robert J. Molinaro et al
P.O. Box 399
Pleasanton, CA 94566

RE: PLEASANTON TRUCK AND EQUIPMENT, 3110 BUSCHE ROAD, PLEASANTON

Dear Mr. Molinaro:

This letter confirms the completion of a site investigation and remedial action for the underground storage tanks formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tanks are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Mee Ling Tung
Director, Environmental Health Services

CASE CLOSURE SUMMARY
Leaking Underground Fuel Storage Tank Program

I. AGENCY INFORMATION **Date: 01/07/97**

Agency name: **Alameda County-EPD** Address: **1131 Harbor Bay Pkwy #250**
City/State/Zip: **Alameda, CA 94502** Phone: **(510) 567-6700**
Responsible staff person: **Scott Seery** Title: **Sr. Haz. Materials Spec.**

II. CASE INFORMATION

Site facility name: **Pleasanton Truck and Equipment**
Site facility address: **3110 Busche Road, Pleasanton 94566**
RB LUSTIS Case No: **N/A** Local Case No./LOP Case No.: **1979**
URF filing date: 03/20/89 SWEEPS No: **N/A**

Responsible Parties:	Addresses:	Phone Numbers:
Robert J. & Carol E. Molinaro and Anthony & Shirley H. Macchiano	P.O. Box 399 Pleasanton, CA 94566	

Tank No:	Size in gal.:	Contents:	Closed in-place or removed?:	Date:
1	1000 gal	diesel	removed	02/23/89
2	500 "	gasoline	"	"

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and type of release: apparent dispenser leak

Site characterization complete? YES

Date approved by oversight agency:

Monitoring Wells installed? NO Number: NA

Proper screened interval? NA

Highest GW depth below ground surface: UNK (presumed >20') Lowest: UNK

Flow direction: UNK

Most sensitive current use: industrial

Are drinking water wells affected? NO Aquifer name: Amador subbasin

Is surface water affected? NO Nearest affected SW name: NA

Off-site beneficial use impacts (addresses/locations): NONE

Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

Report(s) on file? **YES** Where is report filed? **Alameda County**
1131 Harbor Bay Pkwy
Alameda CA 94502

Treatment and Disposal of Affected Material:

Material	Amount (include units)	Action (Treatment of Disposal w/destination)	Date
Tank	500 & 1000 gal	Disposal - disposal*	1990
Piping	UNK		
Free Product	NA		
Soil	UNK	Disposal on-site	1990
Groundwater	NA		
Barrels	"		

* Although manifests are not (now) available, the contracter performing closures indicates USTs were transported to H & H Ship Service, San Francisco, and eventually to Levine Metals for scrapping.

Maximum Documented Contaminant Concentrations - - Before and After Cleanup

Contaminant	Soil (ppm)[1]		Water (ppb)	
	Before	After	Before	After
TPH (Gas)	120	NA	NA	NA
TPH (Diesel)	11,000	"	"	"
Benzene	ND	"	"	"
Toluene	"	"	"	"
Xylene	10	"	"	"
Ethylbenzene	"	"	"	"

Note: 1) "Before" soil results from samples collected during 1989 UST closures. All but TPH-D results are from sample A5 associated with gasoline UST system. TPH-D result from initial sample collected adjacent diesel dispenser.

(A6)

Comments (Depth of Remediation, etc.):

Two USTs (500 gal. gasoline / 1000 gal. diesel) were removed from this site during February 1989 under Pleasanton Fire Department oversight. Soil samples were collected below each end of the USTs @ 12' BG, and from pit sidewalls @ 7' BG where product piping entered the excavation from the two dispensers.

All samples associated with the gasoline UST system, except sample A5, were below laboratory detection limits for TPH-G and BTEX. Up to 120 ppm TPH-G and 10 ppm total xylenes were noted in A5, collected from below product piping entering the gasoline UST excavation at the 7' depth. BTE were not detected in this sample.

Leaking Underground Fuel Storage Tank Program

Up to 11,000 TPH-D was detected in sample A6, collected from below product piping entering the diesel UST excavation at the 7' depth. All other samples associated with the diesel UST system were below laboratory detection limits for TPH-D. BTEX were not sought in diesel UST samples.

The record does not indicate that any additional excavation occurred. However, the city approved the on-site reuse of the previously-excavated backfill material in January 1990 based on the low residual (34 ppm TPH-D) concentrations.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Undetermined

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Undetermined

Does corrective action protect public health for current land use? YES
Site management requirements: NA

Should corrective action be reviewed if land use changes? YES

Monitoring wells Decommisioned: NA

Number Decommisioned: NA Number Retained: NA

List enforcement actions taken: NONE

List enforcement actions rescinded: NA

V. LOCAL AGENCY REPRESENTATIVE DATA

Name: Scott Seery Title: Sr. Haz Mat Specialist
Signature: Date: 1-30-97

Reviewed by
Name: Tom Peacock Title: Supervising Haz Mat Specialist
Signature: Date: 1-30-97

Name: Eva Chu Title: Haz Mat Specialist

VI. RWQCB NOTIFICATION

Date Submitted to RB: 1-30-97 RB Response: Approved
RWQCB Staff Name: Kevin Graves Title: San. Eng. Assoc. Date: 3-3-97

VII. ADDITIONAL COMMENTS, DATA, ETC.

Fuel compound concentrations varied markedly between those samples collected at the base of the UST excavations, and those collected from the sidewall of the excavations where product piping entered the pit. To wit, no detectable target compounds were identified in any of the four (4) pit bottom samples, yet concentrations of TPH were detected in the sidewall samples below the product piping.

These facts suggest a few explanations:

1) the apparent release appears limited to the dispenser side of the UST complex and at shallow depth;

2) the release was likely not one which occurred either long-term or at significant magnitude based on the limited spatial and vertical concentration distribution; and,

3) the apparent release identified in the sidewall samples may actually be reflective of incidental spills occurring when piping was disconnected from the dispensers/tanks in preparation for UST closures.

BTEX were not sought in sample A6 (11,000 ppm TPH-D). However, latent BTEX concentrations are nonetheless expected to be below "actionable" levels. This position is based on:

1) benzene, the most important "risk-driving" chemical of concern in motor vehicle fuels, represents a very small percentage of the total hydrocarbon mixture comprising *fresh* diesel fuel;

2) the release at this site occurred *at least* 8 years ago;

3) the severity and area affected by the release appear limited both vertically and spatially;

4) natural attenuation, including biodegradation, will (has) reduce(d) any residual benzene in the UST area to inconsequential or non-detectable concentrations; and,

5) even *if* benzene were present at elevated levels, no reasonably-plausible complete exposure pathways are presented by the site configuration (e.g., asphalt cap, open to outside air, no nearby receptors, etc.).

No additional assessment work or remediation appear warranted.

RE: PLEASANTON TRUCK AND EQUIPMENT, 3110 BUSCH ROAD, PLEASANTON

Dear Ms. and Messrs. Molinaro and Macchiano:

The Alameda County Department of Environmental Health (ACDEH), Environmental Protection Division, recently contracted with the City of Pleasanton ("City") for oversight of environmental investigations associated with leaking underground storage tank (UST) sites in the City. We are actively attempting to evaluate several outstanding UST cases to determine what, if any, additional environmental work may be necessary before "case closure" may be granted.

For your information, your case has been transferred into the ACDEH Local Oversight Program (LOP). LOP agencies are funded through monies provided by the Federal Trust Fund, established to reimburse local agencies for oversight of UST leak cases, among other uses. You will soon be receiving a notice advising you of this process.

ACDEH has become aware that a release from the diesel UST system was discovered during the removal of two USTs in February 1989. The City is not aware whether any additional assessment work (e.g., installation of ground water monitoring wells, etc.) occurred subsequent to tank removals. The City, consequently, has requested ACDEH to evaluate this case.

To facilitate our efforts, please submit any technical documents you may have which illustrate the status of investigations or other related activities which may have occurred at the subject site since February 1989. Please submit any such documents within **45 days** of the date of this letter.

Please call me at 510/567-6783 should you have any questions.

Sincerely,

Scott O. Seery, CHMM

The federal Petroleum Leaking Underground Storage Tank Trust Fund (Federal Trust Fund) provides funding to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks. The legislature has authorized funds to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks. The direct and indirect costs of overseeing site investigation or remedial action at the above site are funded, in whole or in part, from the Federal Trust Fund. The above individual(s) or entity(ies) have been identified as the party or parties responsible for investigation and cleanup of the above site. **YOU ARE HEREBY NOTIFIED** that pursuant to Title 42 of the United States Code, Section 6991b(h)(6) and Section 25297.1 of the California Health and Safety Code, the above Responsible Party or Parties must reimburse the State Water Resources Control Board (SWRCB) not more than 150 percent of the total amount of site specific oversight costs actually incurred while overseeing the cleanup of the above referenced underground storage tank site, and the above Responsible Party or Parties must make full payment of such costs within 30 days of receipt of a detailed invoice from the SWRCB.

A determination of a secondary RP status may be made if it is shown that one or more of the RP(s) is performing corrective action and it is clear that the party seeking secondary status did not in any way initiate or contribute to the actual discharge. If the primary RP fails to perform corrective action, then the secondary RP will be considered a primary RP. To request designation as a secondary RP, contact this office.

Any action or inaction by this local agency associated with corrective action, including responsible party identification, is subject to petition to the SWRCB. Petitions must be filed within 30 days from the date of the action/inaction. To obtain petition procedures, Please fax your request to Roni Riley at the SWRCB at (916) 227-4349 telephone the SWRCB at (916) 227-4408.
Please contact Scott SEERY, Hazardous Materials Specialist at this office if you have any further questions concerning this matter.

1. Sewage	=	1,530	Gal(s)	SEWAGE		No	No
2.	=					No	No
3.	=					No	No

g. DESCRIPTION:

A sewer main blockage occurred due to an excessive grease build-up in the line. The blockage resulted in a sewage overflow from a manhole cover and into a nearby creek (name unknown).

The City of **Pleasanton** responded to the scene and cleared the blockage. A vacuum truck was used in the cleanup operation. An estimated 1,326 gallons of sewage was recovered. The remainder of the release entered the creek and was unrecoverable.

Subject: ASTM Phase I Environmental Site Assessment
Arroyo Lago Residential Community
APNs 946-4634-2 and 946-1350-3-10
Pleasanton, California

Ladies and Gentlemen:

The enclosed report presents the results of a Phase I Environmental Site Assessment (Phase I) conducted at the above-referenced property, located at Assessor Parcel Numbers (APNs) 946-4634-2 and 946-1350-3-10 in Pleasanton, California (herein referred to as the "subject property"). This work was performed by Haley & Aldrich, Inc. (Haley & Aldrich), in accordance with our proposal to 330 Land Company, LLC dated 23 February 2023 ("Agreement") as authorized on 19 April 2023. This Phase I was conducted in conformance with the scope and limitations of the ASTM International (ASTM) ASTM E1527-21 Standard Practice for Environmental Site Assessments.[1]

The objective of a Phase I is to assess whether known and suspect "recognized environmental conditions" (REC), historical RECs (HREC), or controlled RECs (CREC) are associated with the subject property, as defined in the ASTM E1527-21 Standard.

This Phase I has revealed evidence of one CREC associated with the subject property.

[1] The ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527 21 Standard) as referenced in 40 CFR Part 312 (the All Appropriate Inquiries [AAI] Rule).

Thank you for the opportunity to perform these services for you. Please do not hesitate to contact us if you have any questions or comments.

Sincerely yours,
HALEY & ALDRICH, INC.

Executive Summary

Haley & Aldrich, Inc. (Haley & Aldrich) has performed a Phase I Environmental Site Assessment (Phase I) of the property located at Assessor Parcel Numbers (APNs) 946-4634-2 and 946-1350-3-10 in Pleasanton, California (herein referred to as the "subject property"). The scope of work is described and conditioned by our proposal dated 23 February 2023. This Phase I was performed for 330 Land Company, LLC who seeks to develop the subject property. This Phase I was performed in conformance with the scope and limitations of the ASTM International (ASTM) ASTM E1527-21 Standard and All Appropriate Inquiries (AAI) Rule.

SUBJECT PROPERTY DESCRIPTION

As shown in Figure 2, the subject property consists of two Alameda County parcels, APNs 946-4634-2 and 946-1350-3-10. The subject property is approximately 120 acres of currently undeveloped or graded grassland.

OBJECTIVE

The objective of a Phase I is to assess whether "recognized environmental conditions" (REC), historical RECs (HREC), and controlled RECs (CREC) are associated with the subject property. Our conclusions are intended to help the user evaluate the "business environmental risk" associated with the subject property. Our opinion regarding a REC's potential impact on the subject property is based on the scope of our work, the information obtained during the course of our work, the conditions prevailing at the time our work was performed, the applicable regulatory requirements in effect at the time our work was performed, our experience evaluating similar sites, and on our understanding of the client's intention to develop the subject property.

SIGNIFICANT DATA GAPS

Our ability to identify and evaluate RECs at the subject property is conditioned upon significant data gaps identified as part of this Phase I. The ASTM E1527-21 Standard defines a significant data gap as a data gap that affects the ability of the environmental professional to identify a REC.

No significant data gaps were identified during the performance of this Phase I. Thus, it is our opinion that sufficient information was obtained to identify subject property conditions indicative of releases or threatened releases of hazardous substances and petroleum hydrocarbons. Our opinion is limited by the conditions prevailing at the time our work is performed and the applicable regulatory requirements in effect.

RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines a REC as (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

RECs were not identified in connection with the subject property.

CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines a CREC as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

CREC #1: Former Hanson Aggregates Radum Facility

The Former Hanson Aggregates Radum Facility is a closed aggregates facility being overseen by Alameda County Department of Environmental Health (ACDEH) who has split the 1,000 acres formerly encompassing this facility in separate regulatory cases based on APN boundaries and Areas of Concern (AOCs). Environmental investigations previously completed within the boundaries of the Former Hanson Aggregates Radum Facility starting in approximately 2007 included the collection of soil and groundwater samples as part of due diligence activities following the cessation of the former aggregate facility's mining operations. The results of these investigations revealed environmental concerns for nine AOCs within the former aggregates facility, with AOC 7 and EB-35 contained within the subject property. AOC 7 is comprised of former boring investigation location SS31 and associated step-out locations. Boring location SS31 contained elevated TPHd and TPHmo concentrations, but was adequately delineated through step-outs. EB-35 was identified as an area of concern associated with a shallow soil petroleum hydrocarbon impact. The impacted soil was determined to be the result of an asphalt layer encountered at approximately 2 and 5.5 feet below ground surface (bgs). Given the presence of AOC 7 and EB-35, and the subject property's inclusion within the former aggregates facility, ACDEH required a Soil Management Plan and Soil Import Management Plan to be prepared which established procedures for managing environmental impacts encountered during the development of the subject property and screening levels and other requirements for importing soil to the subject property. Given this condition, the subject property is currently receiving regulatory oversight under ACDEH Case Number RO0003228 and is listed as being open with long-term management as of 18 July 2017.

HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines an HREC as a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls. A historical recognized environmental condition is not a recognized environmental condition.

HRECs were not identified in connection with the subject property.

DE MINIMIS CONDITIONS

The ASTM E1527-21 Standard defines *de minimis* conditions as a condition related to a release that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The ASTM E1527-21 Standard notes that conditions determined to be *de minimis* are not recognized environmental conditions.

SUMMARY AND RECOMMENDATIONS

In summary, we identified one CREC during this Phase I.

The remainder of this report contains additional information regarding the Phase I, the resulting findings summarized above, and limitations affecting this report.

Continued Viability of Environmental Site Assessment

In accordance with the ASTM E1527-21 Standard, the following components of the Phase I Report must be conducted or updated within 180 days prior to the date of acquisition or prior to the date of the transaction:

1. Interviews with owners, operators, and occupants. Completed on: 10 May 2023
2. Searches for recorded environmental cleanup liens (a user responsibility). Completed on: 25 April 2023
3. Reviews of federal, tribal, state, and local government records. Completed on: 25 April 2023
4. Visual inspections of the subject property and of adjoining properties. Completed on: 10 May 2023
5. The declaration by the environmental professional responsible for the assessment or update (refer to Section 9). Completed on 12 July 2023

1. Introduction

This report presents the results of an ASTM International (ASTM) Phase I Environmental Site Assessment (Phase I) located at Assessor Parcel Numbers (APNs) 946-4634-2 and 946-1350-3-10 in Pleasanton, California, (herein referred to as the "subject property") The approximately 120-acre subject property is currently undeveloped grassland property at the location shown on the Project Locus, Figure 1. This Phase I was conducted in consideration of 330 Land Company, LLC's intention to develop the property with wastewater and utility facilities for the associated 195-unit community property.

1.1 OBJECTIVE

The objective of a Phase I is to assess whether "recognized environmental conditions" (REC), historical RECs (HREC), and controlled RECs (CREC) are associated with the subject property by evaluating site history, interviews, existing observable conditions, current site use, and current and former uses of adjoining properties as well as potential releases at surrounding properties that may impact the subject property. Our conclusions are intended to help the user evaluate the "business environmental risk" associated with the subject property.

The ASTM E1527-21 Standard defines a REC as (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. The definitions of RECs, HRECs, and CRECs are included in the Glossary section of this report.

1.2 SCOPE OF SERVICES

This work was performed by Haley & Aldrich, Inc. (Haley & Aldrich) and this Phase I was performed in conformance with the scope and limitations of the ASTM E1527-21 Standard and All Appropriate Inquiries (AAI) Rule and in accordance with our proposal dated 23 February 2023 ("Agreement") as authorized on 19 April 2023. The Phase I limitations is attached hereto as Appendix A.

As part of this Phase I, Haley & Aldrich conducted visual observations of site conditions and of abutting property use and interviewed a key site manager and applicable tenant representatives (subject property reconnaissance); reviewed federal, state, tribal, and local environmental database information, federal and state environmental files, previous reports (if identified and provided), and site historical use records; and formulated conclusions regarding the potential presence and impact of RECs.

1.3 NON-SCOPE CONSIDERATIONS

The ASTM E1527-21 Standard includes the following list of "additional issues" that are non-scope considerations outside of the scope of the ASTM Phase I practice: asbestos-containing materials, biological agents, cultural and historic resources, ecological resources, endangered species, health and safety, indoor air quality related to release of hazardous substances or petroleum products into the environment, industrial hygiene, lead-based paint unrelated to releases into the environment, lead in drinking water, mold or microbial growth conditions, polychlorinated biphenyl (PCB)-containing materials, naturally occurring radon, regulatory compliance, substances not defined as hazardous

substances (emerging compounds[2]), and wetlands. These items were not included in this Phase I of the subject property.

The assessment of the presence of PCBs is limited to those potential sources specified in the ASTM E1527-21 Standard as "electrical or hydraulic equipment known or likely to contain PCBs…to the extent visually and or physically observed or identified from the interview or records review."

Note that PCBs may be present in miscellaneous building materials such as caulking, sealants, insulation and sound dampening materials, paint, gaskets, roofing and siding materials, waterproofing compounds, enamel coatings, and other chemical products manufactured prior to 1979. Evaluating the subject property building for potential PCB-containing building materials and possible PCB-containing materials other than "electrical or hydraulic equipment known or likely to contain PCBs" was outside the scope of this Phase I.

1.4 LIMITING CONDITIONS/DEVIATIONS

Haley & Aldrich completed this Phase I in substantial conformance with the ASTM E1527-21 Standard. In our opinion, no additions were made to or deviations and deletions made from the ASTM work scope in completing this Phase I.

1.5 USER RESPONSIBILITIES

The completion of this Phase I is only one component of the process required to satisfy the AAI Rule. In addition, the user must adhere to a set of user responsibilities as defined by the ASTM E1527-21 Standard and the AAI Rule. User responsibilities are discussed in Section 6.6 of this report. A user seeking protection from Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) liability as an innocent landowner, bona fide prospective purchaser, or contiguous property owner must complete all components of the AAI process in addition to meeting ongoing obligations. AAI components, CERCLA liability relief, and ongoing obligations are discussed in the AAI Rule and in Appendix XI of the ASTM E1527-21 Standard.

[2] PFAS are examples of emerging compounds.

2. Site Description

A description of the subject property is detailed in the sections below. Refer to Figure 1 for a project locus and Figure 2 for a site plan showing relevant subject property features and adjacent properties.

2.1 SITE OWNERSHIP, LOCATION, AND VICINITY DESCRIPTION

Site Description		
Owner	USL Pleasanton Lakes LP	
Operator	Vacant	
Current Subject Property Use	Undeveloped land	
Size	Approximately 120 acres	
USGS 7.5 Minute Topographic Map	12008728 LIVERMORE, CA, 2018	
Site County	Alameda County	
Zoning	Commercial Vacant land	
Parcel Information	APNs 946-4634-2 & 946-1350-3-10	
Utilities	Water: Sewerage: Electricity: Gas/Oil/LPG:	N/A
Heating/Cooling System	N/A	

Site Vicinity Description		
General Area Description	The subject property vicinity consists of water holding ponds, mining/industrial, mixed commercial buildings, and business complexes.	
Adjoining Property Description	North:	Water ponds
	East:	Water ponds, vacant land
	South:	Commercial/Industrial
	West:	Residential

2.2 PHYSICAL SETTING

Subsurface explorations and/or hydrogeologic investigations were not performed for this Phase I. Subject property geology and hydrology were evaluated on the basis of readily available public

information or references, and/or based upon our experience and understanding of subsurface conditions in the vicinity of the subject property. It is unknown to what extent localized variations in groundwater depth and flow occur on the subject property.

Physical Setting		Source
Topography Summary	The subject property is generally flat sloping to the west northwest.	1,2
Subject Property Elevation	Approximately El. 367 feet above sea level.	2
Overburden Soils	Overburden soil at the subject property consists of Yolo loam, a class A soil (high infiltration rates). Soils are deep, well drained excessively drained sands and gravels.	2
Bedrock Formation	The subject property is underlain by Cenozoic aged Continental Deposits.	2
Depth to Bedrock	Depth to bedrock was not determined for this Phase I.	
Depth to Groundwater	Approximately 43 to 74 feet below ground surface (bgs) based on the November 2017 Groundwater Sampling Results for groundwater monitoring wells formerly located on the adjacent Former Hanson Aggregates Radum Facility.	3
Surface Water Flow Direction	Surface water appears to flow towards the west - northwest based on observed surface topography.	2
Regional Groundwater Flow Direction	Regional groundwater flow appears to flow to the west - northwest based on site topography.	2
Nearest Surface Water Body	Zone 7 Water Agency water supply ponds are approximately adjacent of the subject property to north and east sides of the subject property.	2
Environmentally Sensitive Areas		**Source**
Floodplain	The subject site is located within the 0.2% annual chance flood hazard area.	2
Mapped Wetlands	Yes, the subject property is located within the National Wetlands inventory.	4

4. *National Wetlands Inventory, surface waters and wetlands map, accessed 2 June 2023.*

3. Previous Reports

Previously prepared reports for the subject property were not identified or provided as part of this assessment. Relevant excerpts from these reports are included in Appendix B.

Closure Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California, 29 March 2017, prepared by Haley & Aldrich

- Haley & Aldrich prepared a Closure Plan for the Former Hanson Aggregates Radum Facility in Pleasanton, California, on behalf of USL Pleasanton Lakes, L.P. The Closure Plan was requested by the Alameda County Department of Environmental Health (ACDEH) as part of the facility's Voluntary Remedial Action Program. The plan summarized the environmental investigation results for specific areas within the facility and outlined measures required to achieve residential standards. The Closure Plan was approved by ACDEH in July 2017.

  The Closure Plan summarized the series of environmental investigations performed to evaluate potential concerns associated with former mining operations. Environmental investigation activities were performed on the Site between 2006 and 2008 and included four sampling events completed in May and November 2006 and February and October 2007. The investigation activities included collecting soil, sediment and groundwater samples following the cessation of the former aggregate facility's mining operations and as part of a due diligence sampling program. Sampling locations were both targeted to assess specific operational features and randomly selected across the expanse of the large facility. The results of these investigations revealed environmental concerns based on a comparison of analytical results against the 2007 Environmental Screening Levels (ESLs), which resulted in establishing nine Areas of Concern (AOCs), with AOC 7, comprised of former boring investigation location SS31 and associated step-out locations and EB-35 located on the subject property (Figure 2). Boring location SS31 contained elevated total petroleum hydrocarbons as diesel (TPHd) and as motor oil (TPHmo) concentrations. None of the samples contained concentrations exceeding either the former 2007 ESLs for residential, shallow soil, or the 2016 Tier 1 ESLs for soil and groundwater. In addition, the TPHd and TPHmo concentrations detected in the initial SS31 samples (200 milligrams per kilogram [mg/kg] and 1,500 mg/kg, respectively, at 2 feet bgs; and 210 mg/kg and 1,500 mg/kg, respectively, at 40 feet bgs) did not exceed 2016 Tier 1 ESLs for soil (230 mg/kg and 5,100 mg/kg, respectively). Further evaluation of AOC 7's analytical results against the current 2019 ESLs indicates no potential risk to human health or the environment, and therefore, this AOC has been addressed and requires no further investigation or remedial measures. EB-35 was identified as an area of concern associated with a shallow soil petroleum hydrocarbon impact in the vicinity of boring EB-35. The impacted soil was determined to be the result of an asphalt layer encountered at approximately 2 and 5.5 feet bgs.

Soil Management Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California, 29 March 2017, prepared by Haley & Aldrich

- Haley & Aldrich prepared a Soil Management Plan for the Former Hanson Aggregates Radum Facility in Pleasanton, California, on behalf of USL Pleasanton Lakes, L.P. The Soil Management Plan was requested by the Alameda County Department of Environmental Health (ACDEH) as part of the facility's Voluntary Remedial Action Program. The plan required the removal of the EB-35 area's asphalt layer and surrounding soil, and specified procedures to follow should areas

with previously unknown environmental impacts be encountered during future development activities. The Soil Management Plan was approved by ACDEH in July 2017.

Soil Import Management Plan - Former Hanson Aggregates Radum Facility, APNS 946-1250-64 & 946-1350-3-12, Pleasanton, California, August 2018 (ACDEH Case Nos. RO0002952 and RO0003228) and Soil Import Management Plan Addendum, 2019

- In 2018 Haley & Aldrich prepared a Soil Import Management Plan (SIMP) for USL Pleasanton Lakes, L.P., (USL Pleasanton) Former Hanson Aggregates Radum Facility, Pleasanton, California dated 8 August 2018, which was approved by ACDEH. The SIMP was prepared for assessing soil proposed to be imported for the development of portions of the former aggregates facility, including the subject property, and established Site-Specific Soil Import Screening Levels, which were based on the Tier 1 ESLs established by the San Francisco Bay Regional Water Quality Control Board (RWQCB), dated February 2016 (Revision 3), except for the metals arsenic, chromium and nickel, which were based on ambient background levels. As the RWQCB updated their ESLs in January 2019, ACDEH requested USL Pleasanton to revise the Site-Specific Soil Impact Screening Levels to incorporate this update. The SIMP Addendum, dated 10 May 2019, was prepared to comply with this request.

Soil Import Summary Former Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California (ACDEH Case No. RO0003228), 12 July 2019, prepared by USL Pleasanton Lakes, L.P.

- Soil was imported to the subject property from two fill material source areas: the Danville Riverwalk Source Area in Danville, California, and the Sobrante Sunnyvale Source Area in Sunnyvale, California. Prior to importing the soil, environmental testing activities were performed in accordance with the SIMP and SIMP Addendum and ACDEH's Fill Material Characterization Guidance. The soil import characterization results for each fill material source area were documented in separate reports prepared by Haley & Aldrich. ACDEH reviewed each source area's fill material characterization results and approved the import of the soil which was completed in November 2018 and June and July 2019. The above report summarized both soil import events, detailing the total imported volume, number of truckloads, import start and end dates, and fill depth for each fill material source area. No further soil has been imported to the subject property.

ACDEH Conditional Clearance Letter, APN 946-1250-6-4; Cleanup Program Site Case No. RO0003228, GeoTracker Global ID T10000009398, USL Pleasanton Lakes - Long-Term Monitoring, 3000 Busch Road, Pleasanton, CA, 2022

- In 2022 ACDEH provided conditional clearance to Alameda County Planning Department Community Development Agency for the proposed development of a 194 detached single-family homes subdivision located on a portion of the former APN 946-1250-6-4, now designated as APN 946-4634-1, the subject property. Clearance was granted provided the following condition will be met: submission of a Final Soil Import Report to ACDEH documenting the soil imported to the parcel for restoration in accordance with the Reclamation Plan under Surface Mining Permit (SMP) 31 and which is required to facilitate closure of the open environmental cleanup case, ACDEH Case No. RO0003228.

4. Subject Property History

Haley & Aldrich assessed past usage of the subject property and adjoining properties through a review of:

- Sanborn Fire Insurance Maps were not available for the subject site.
- Topographic Maps dated 1906, 1941, 1947, 1953, 1961, 1968, 1980, 2012, and 2018.
- Aerial Photographs dated 1939, 1940, 1949, 1958, 1968, 1963, 1966, 1968, 1979, 1982, 1993, 1998, 2006, 2009, 2012, 2016 and 2020.
- City Directories from 1975 through 2020.
- Municipal records.
- Previous Reports.
- Interviews with subject site personnel.

Copies of information obtained from historical references reviewed are included in Appendix C. Unless otherwise noted below, per the ASTM standard, sources were reviewed dating back to 1940 or first developed use, whichever is earlier, and at 5-year intervals if the use of the property has changed within the time period.

4.1 SUBJECT PROPERTY

The table below provides a detailed summary of pertinent information from the historical sources reviewed.

Dates	Description of Subject Property	Sources
1938-1979	Aggregate mining operations were referenced as initiated in 1938 at the subject property by Kaiser Sand and Gravel under SMP 31. Aerial photos until 1979 depict assumed associated buildings. The 1953 topographic map shows a water body on the southeast portion of the subject property.	Haley & Aldrich 2019 Development Plan, Historical Topographic Maps, Aerial Photos
1980-1982	The 1982 aerial photo shows a large body of water on the subject property.	Historical Topographic Maps, Aerial Photos
1993-present	This date range of aerial photos depicts the subject property as undeveloped grasslands or paved area until present.	Historical Topographic Maps, Aerial Photos

4.2 ADJOINING PROPERTIES

The table below provides a summary of pertinent information from the historical sources reviewed regarding adjacent properties:

Dates	Description of Adjacent Properties	Sources
1916-1979	**North:** Farmlands or undeveloped grasslands. **East:** Farmlands or undeveloped grasslands. A cluster of commercial buildings is in the distance. **South**: Farmlands and undeveloped grasslands. **West:** Farmlands and undeveloped grasslands.	Historical Topographic Maps, Aerial Photos
1979-2012	**North:** Farmlands and undeveloped grasslands. **East:** Undeveloped grasslands and a large body of water. **South**: A few commercial buildings with asphalt parking lots and various landscaping are present to the southeast. Undeveloped grasslands and Stanley Road go beyond the buildings. **West:** An empty lot used for industrial staging and commercial use sits between the subject property and Stanley Road to the southwest.	Historical Topographic Maps, Aerial Photos
2012-Present	**North:** In 2012 aerial photos, a residential neighborhood begins to emerge west of the subject property. A large wall separates the property and the neighborhood. **East:** Undeveloped grasslands and a large body of water. **Sout:** A few commercial buildings with asphalt parking lots and various landscaping are present to the southeast. Undeveloped grasslands and Stanley Road go beyond the buildings. **West:** An empty lot used for industrial staging and commercial use sits between the subject property and Stanley Road to the southwest.	Historical Topographic Maps, Aerial Photos

5. Environmental Records Review

5.1 ENVIRONMENTAL DATABASE RECORDS SEARCH

Haley & Aldrich used an electronic database service,[3] to complete the environmental records review. The database search was used to identify properties that may be listed in the referenced agency records, located within the ASTM-specified approximate minimum search distances as shown in the table below. A description of each database searched is in Section 11.2 of this report. The complete environmental database report is provided in Appendix D. Pertinent information obtained from the database is summarized in Section 5.3 below.

Database Searched	Approximate Minimum Search Distance	Subject Property Listed?	Number of Sites within Search Distance[1]
1. NPL Sites	1 mile	No	0
2. Delisted NPL Sites	0.5 mile	No	0
3. CERCLIS/SEMs[2] Sites	0.5 mile	No	0
4. CERCLIS-NFRAP/SEMs[2] Sites	0.5 mile	No	0
5. Federal ERNS	Site only	No	Not Applicable
6. RCRA non-CORRACTS TSD Facilities	0.5 mile	No	0
7. RCRA CORRACTS TSD Facilities	1 mile	No	0
8. RCRA Generators	Site & Adjoining	Yes	2
9. Federal Institutional/Engineering Controls	Site Only	No	Not Applicable
10. State/Tribal Equivalent NPL Sites	1 mile	No	0
11. State/Tribal Equivalent CERCLIS[2] Sites	0.5 mile	No	0
12. State/Tribal Registered Storage Tanks	Site & Adjoining	No	6
13. State/Tribal Landfills and Solid Waste Disposal Sites	0.5 mile	No	0
14. State/Tribal Leaking Storage Tanks	0.5 mile	No	15
15. State/Tribal Institutional Controls/Engineering Controls	Site Only	No	Not Applicable
16. State/Tribal Voluntary Cleanup Sites	0.5 mile	No	1
17. State/Tribal Brownfield Sites	0.5 mile	No	0
18. Orphan Site List[3]	Site & Adjoining	Yes	2

Notes:

1. *Some sites may be included on multiple databases.*
2. *Formerly the CERCLIS database.*
3. *Haley & Aldrich also searched the Orphan Site List provided in the database report for the subject property and sites adjoining the subject property. Orphan sites are those that, due to incorrect or incomplete addresses, could not be mapped.*

[3] Examples of electronic database services are EDR/Lightbox and ERIS.

5.2 ADDITIONAL ENVIRONMENTAL RECORDS OR FILE REVIEW

To supplement the environmental record search, we contacted the following state and local government agencies and searched applicable online databases. If copies of the documents reviewed were obtained, pertinent material is included in Appendix D. Relevant information obtained is included in the appropriate sections of the report and/or discussed in Section 5.3 below. Adjacent properties were also included in requests for additional information if a significant incident or release was identified. Those adjacent properties reviewed for this assessment include:

Agency	Request Sent or Files Searched		Files Exist and Are Available for Review	Files Reviewed
	Subject Property	Adjoining Properties		
Department of Toxic Substances Control (DTSC)[1]	Yes	Yes	A file review request was submitted to the DTSC on 24 April 2023. As of the date of this report, no response has been received. Additionally, a search of the DTSC's website, EnviroStor, was conducted on 26 May 2023. EnviroStor generally contains all existing DTSC information on permits and corrective action at hazardous waste facilities, as well as site cleanup projects. There were no EnviroStor files pertaining to the subject property. EnviroStor files pertaining to adjoining properties are discussed in Section 5.3.2.	Yes
San Francisco Bay Regional Water Quality Control Board (RWQCB)[2]	Yes	Yes	On 28 April 2023, RWQCB responded they found no files pertaining to the subject property. Additionally, a search of the State Water Resource Control Board's website, GeoTracker, was conducted on 25 May 2023. GeoTracker generally contains information on sites that impact groundwater, especially those that require groundwater cleanup, and permitted facilities. Pertinent files for the subject property and adjoining properties are discussed in Section 5.3.1 and Section 5.3.2.	Yes

Agency	Request Sent or Files Searched		Files Exist and Are Available for Review	Files Reviewed
	Subject Property	Adjoining Properties		
Alameda County Department of Environmental Health (ACDEH)[3]	Yes	Yes	On 24 April 2023, ACDEH responded with files for the adjacent Pleasanton Ready Mix Concrete and Pleasanton Truck and Equipment Sites. The adjacent properties are discussed in Section 5.3.2.	Yes
California Governor's Office of Emergency Services (Cal OES)4	Yes	Yes	On 26 April 2023 the Cal OES database was accessed and Hazardous Material Spill Reports from the Pleasanton Fire Department for adjacent properties were reviewed. No follow up actions were documented to have been required from Cal OES.	Yes
California Water Boards Groundwater Information System[5] (GAMA)	Yes	Yes	A search of the GAMA web tool was conducted on 26 May 2023. GAMA identified a water supply well on subject property. There were several wells designated either monitoring wells or water supply wells on adjoining properties.	Yes

Notes:

1. *The California Department of Toxic Substances Control maintains records related to site cleanups, hazardous waste, and underground storage tanks (USTs).*
2. *The San Francisco Bay Regional Water Quality Control Board maintains information regarding water, monitoring wells, USTs, and cleanups.*
3. *The Alameda County Department of Environmental Health maintains information regarding environmental impact reports and other department record.*
4. *The Cal OES database maintains information regarding hazardous material spill reports/fire department records.*
5. *The California State Water Resources Control Board GAMA Program and the U.S. Geological Survey have created tools to help users understand groundwater quality in California.*

5.3 DETAILED DESCRIPTION OF RELEVANT INFORMATION

5.3.1 Subject Property

Listing	Description	Potential Impact
GeoTracker, EnviroStor, UST, RCRA Nongen/ NLR, RCRA-SQG, SWEEPS UST, HIST UST, CA FID UST, LUST CPS-SLIC	The larger Kaiser Sand and Hanson Aggregates, also listed in the EDR database as Kaiser Sand and Hanson Aggregates facility, Hanson Aggregates Mid Pacific Inc, Hanson Aggregates Legacy Radum Facility, and Kiewit Construction Company, and similar designations was comprised of a total of approximately 1,000 acres, of which about 320 acres are dry land and 700 acres are lakes and ponds. Mining operations ceased in 2001 and investigation and cleanup of the site has been ongoing. Nine areas of concern (AOC 1 through AOC 9) were established at the site and total petroleum hydrocarbons (as gasoline, diesel, and motor oil), polynuclear aromatic hydrocarbons, and metals were identified as the primary chemicals of concern. The larger former site is in GeoTracker listed under the following separate cases: Leaking Underground Storage Tank (LUST) Case No. RO0000716, GeoTracker ID T0600100778, Kaiser Sand & Gravel (closed in 1998). LUST Case No. RO0002858, GeoTracker ID T06019765846, Hanson Aggregates Mid Pacific Inc (closed in 2007). Cleanup Program Site (CSP) Case No. RO0002941, GeoTracker ID SLT19719376, Hanson Aggregates Radum Plant. CSP Case No. RO0002952, GeoTracker ID SL0600101555, Hanson Aggregates Legacy Radum Plant. Voluntary Remedial Action Program (VRAP) Case no. RO0003228, USL Pleasanton Lakes – Long-Term Monitoring. The subject property falls within a portion of this larger Hanson Radum Aggregates facility site regulated by the ACDEH under existing VRAP case RO0003228., USL Pleasanton Lakes – Long-term Monitoring. Potential contaminants of concern related to former operations to groundwater include arsenic, chromium, copper, diesel, lead, nickel, other metal, waste/motor/hydraulic/lubricating oils, and zinc. ACDEH requested USL Pleasanton prepare a Closure Plan in order to obtain regulatory closure for AOCs 7, EB-35, and the adjoining property AOC 6. AOC 7 and EB-35 are contained within the former APNs 946-1250-6-4 and 946-1350-3-12, corresponding with the current portion of the subject property 946-4634-2. Site investigative activities are ongoing and the case is still open in GeoTracker listed as a long term monitoring project with an active Soil Import Management Plan in place (See Section 3).	This constitutes a CREC. See Section 7.3.

5.3.2 Nearby Sites

Several sites were listed in the database report within the applicable search radii or identified in regulatory records reviews. Due to their location with respect to the subject property (on the opposite side of a hydrogeologic barrier, distance from the site, location of the site relative to inferred groundwater flow, subsurface utilities and building levels, etc.), or their status (closed out release, etc.), several of the sites are not likely to adversely affect the subject property and are not discussed herein. Only those sites adjacent to the subject property and sites with a potential to have impacted the subject property are discussed below. The complete database report and relevant records review information is included in Appendix D.

Property Name & Location	Database/ Record Identified	Description	Potential Impact to Subject Property
Pleasanton Garbage Service 3110 Busch Road SW 0.022 mi. Crossgradient	UST, AST,LUST	The site is listed in GeoTracker and in the EDR database under similar names including Pleasanton Truck and Equipment and Pleasanton Truck & Equipment Repair Inc., as a diesel leaking underground storage tank (LUST) case with soil as the potential media of concern. ACDEH provided several files for the site including a closure letter confirming the completion of a site investigation and remedial action for closure activities for the removal of a 500-gallon gasoline and 1,000-gallon diesel UST. Soil concentrations detected after removal of the USTs were non-detect. ACDEH closed the LUST case in 1997.	This listing is closed by the regulatory authority and does not represent a potential impact to the subject property.
Pleasanton Ready Mix Concrete 3400 Boulder St SW 0.266 mi. Crossgradient	LUST	The site is listed in GeoTracker as a gasoline LUST case with soil as the potential media of concern. ACDEH provided several files for the site including a closure letter confirming the completion of a site investigation and remedial action for closure activities for the removal of a 10,000-gallon diesel and two 2,000-gallon gasoline USTs. Soil concentrations detected after removal of the USTs were non-detect. ACDEH closed the LUST case in 1998.	This listing is closed by the regulatory authority and does not represent a potential concern to the subject property.

Property Name & Location	Database/ Record Identified	Description	Potential Impact to Subject Property
B&J Trucking 3742 VALLEY AVE WSW 0.305 mi. Crossgradient	LUST	The site is listed in GeoTracker as a gasoline LUST with soil as the potential media of concern. The site was completed case closed in 1997. There was no additional information available.	This listing is closed by the regulatory authority and does not represent a potential concern to the subject property.
Utility Vault Company 3786 VALLEY AVE 0.309 mi. Crossgradient	LUST	The site is listed in GeoTracker as a gasoline LUST with soil as the potential media of concern. The site was completed case closed in 1997. There was no additional information available.	This listing is closed by the regulatory authority and does not represent a potential impact to the subject property.

5.4 VAPOR MIGRATION

The ASTM E1527-21 Standard states that "for the purposes of this practice, “migrate” and “migration” refers to the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface." Thus, this section specifies whether or not we perceive a risk of vapor migration to the subject property.

To assess a vapor migration risk we conducted a detailed review and analysis of the site-specific environmental database report and/or other reasonably ascertainable records to assess whether:

1. Off-site properties have documented chlorinated volatile organic compound (VOC) contamination located within 100 feet of the subject property, or
2. Off-site properties have documented volatile petroleum hydrocarbon contamination within 30 feet of the subject property.

Based on our records review, it is unlikely that a potential source of vapor migration currently exists beneath the subject property.

6. Subject Property Reconnaissance and Key Personnel Interview(s)

A site visit to observe subject property conditions was conducted by Hannah Sawyer and Austin Vuong of Haley & Aldrich on 10 May 2023. Access to the subject property was provided by Bridget Metz with USL Pleasanton Lakes L.P.

Haley & Aldrich observed the exterior portions of the subject property, including the property boundaries where accessible by access road, and observed adjoining property conditions from the subject property boundaries and/or public thoroughfares. Given the subject property's size/overgrown areas and topography, some areas could not be directly observed.

An interview with Bridget Metz of USL Pleasanton Lakes L.P., the key site manager, was performed in conjunction with the site visit. Per the ASTM Standard, past owners, operators, and occupants of the subject property who are likely to have material information regarding the potential for contamination at the subject property shall be contacted to the extent that they can be identified and that the information likely to be obtained is not duplicative of information already obtained from other sources. Haley & Aldrich was not provided with contact information in order to interview past owners and/or operators at the subject property. Based upon historical data collected from other sources, this potential data gap is not expected to adversely impact the results of this assessment.

The findings of the site visit and interviews are discussed below. Subject property photographs are included in Appendix E.

ASTM E1527-21 Standard Section 10.8 requires that, prior to the site visit**,** the current subject property owner or key site manager and user, if different from the current owner or key site manager, be asked if there are any helpful documents that can be made available for review. Documents were not provided.

6.1 CURRENT USE OF THE SUBJECT PROPERTY

The subject property is currently comprised of undeveloped land.

6.2 GENERAL DESCRIPTION OF STRUCTURES

There are no structures on the subject property.

6.3 USE, STORAGE, AND DISPOSAL OF PETROLEUM PRODUCTS AND HAZARDOUS MATERIALS

The use, storage and/or disposal of petroleum products or hazardous materials was not observed or reported at the subject property.

6.4 OTHER SUBJECT PROPERTY OBSERVATIONS

The table below summarizes items that were observed and/or reported at the subject property during the site visit other than those items related to use, storage, and disposal of petroleum or hazardous materials (described in Section 6.3 above). If items were observed or reported, they are further described either in the table or below.

Description	Observed or Reported at Time of Site Visit	Observations/Comments
Potable Water Supply	N/A[1]	
Nearest Drinking Water Source	N/A[1]	
Sewage Disposal System	N/A[1]	
Septic System	N/A[1]	
Unidentified Storage Containers	Yes	Unidentified drum observed on adjoining property bounding the subject property to the west.
Wastewater Discharge	N/A[1]	
Stormwater Discharge	N/A[1]	
Odors	No	
PCBs Associated with Electrical or Hydraulic Equipment	No	
Elevators (Traction or Hydraulic)	N/A[1]	
Vehicle Maintenance Lifts	N/A[1]	
Emergency Generators	N/A[1]	
Sprinkler System Pumps	N/A[1]	
Heating System	N/A[1]	
Cooling System	N/A[1]	
Stains or Corrosion on Floors, Walls, or Ceilings	N/A[1]	
Floor Drains	N/A[1]	
Sumps	No	
Catch Basins	No	
Pits, Ponds, Lagoons, and Pools of Liquid	No	
Stained Soil or Pavement	No	
Stressed Vegetation	No	Overgrown areas.
Solid Waste and Evidence of Waste Filling	Yes	Minimal debris observed in areas along roadways throughout subject property, abandoned pipes located around various portions of the subject property.
Dry Wells	No	
Monitoring Wells	No	
Water Supply Wells	Yes	Water supply well listed on GAMA was not observed during site walk due to Fire Department training activity occurring in the vicinity.
Irrigation Wells	No	
Injection Wells	No	
Abandoned Wells	Yes	Unmarked well observed located near southeastern boundary of 946-4634-03 on adjacent property.

Notes:

1. *N/A items are those that were not observed or reported and/or not anticipated to be present given the nature of the subject property (e.g., building features not present on an undeveloped property).*

6.5 ADJOINING PROPERTY OBSERVATIONS

The subject property is bounded to the north and east by large ponds followed by El Charro Road. The surrounding properties to the south mixed commercial/industrial properties followed by Stanley Boulevard and residential properties to the west. In their current use, do not appear to pose an environmental risk to the subject property.

6.6 USER RESPONSIBILITIES

The AAI Rule requires that the User of the report consider the following:

- Whether the user has specialized knowledge about previous ownership or uses of the subject property that may be material to identifying RECs;
- Whether the user has determined that the subject property's Title contains environmental liens or other information related to the environmental condition of the property, including engineering and institutional controls and Activity and Use Limitations (AULs), as defined by ASTM;
- Whether the user is aware of commonly known or reasonably ascertainable information about the subject property including whether or not the presence of contamination is likely on the subject property and to what degree it can be detected; and
- whether the user has prior knowledge that the price of the subject property has been reduced for environmentally related reasons.

While such information is not required to be provided to the environmental professional(s), the information can assist the environmental professional in identifying recognized environmental conditions. The "All Appropriate Inquiries" Final Rule (40 CFR Part 312) requires that these tasks be performed by or on behalf of a party seeking to qualify for a landowner liability protection (LLP) to CERCLA liability.

Haley & Aldrich was provided with a completed user responsibilities questionnaire, which is attached in Appendix A.

7. Findings and Opinions

7.1 SIGNIFICANT DATA GAPS

Our ability to identify and evaluate RECs at the subject property is conditioned upon significant data gaps identified as part of this Phase I. The ASTM E1527-21 Standard defines a significant data gap as a data gap that affects the ability of the environmental professional to identify a REC.

No significant data gaps were identified during the performance of this Phase I. Thus, it is our opinion that sufficient information was obtained to identify subject property conditions indicative of releases or threatened releases of hazardous substances and petroleum hydrocarbons. Our opinion is limited by the conditions prevailing at the time our work is performed and the applicable regulatory requirements in effect.

7.2 RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines a REC as (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

RECs were not identified in connection with the subject property.

7.3 CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines a CREC as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

The CREC listed below was identified in connection with the subject property.

CREC #1: Former Hanson Aggregates Radum Facility

The Former Hanson Aggregates Radum Facility is a closed aggregates facility being overseen by Alameda County Department of Environmental Health (ACDEH) who has split the 1,000 acres formerly encompassing this facility in separate regulatory cases based on APN boundaries and Areas of Concern (AOCs). Environmental investigations previously completed within the boundaries of the Former Hanson Aggregates Radum Facility starting in approximately 2007 included the collection of soil and groundwater samples as part of due diligence activities following the cessation of the former aggregate facility's mining operations. The results of these investigations revealed environmental concerns for nine AOCs within the former aggregates facility, with AOC 7 and EB-35 contained within the subject property. AOC 7 is comprised of former boring investigation location SS31 and associated step-out locations. Boring location SS31 contained elevated TPHd and TPHmo concentrations, but was adequately delineated through step-outs. EB-35 was identified as an area of concern associated with a shallow soil petroleum hydrocarbon impact. The impacted soil was determined to be the result of an asphalt layer

encountered at approximately 2 and 5.5 feet below ground surface (bgs). Given the presence of AOC 7, and EB-35 and the subject property's inclusion within the former aggregates facility, ACDEH required a Soil Import Management Plan (SIMP) to be prepared which establishes screening levels and other requirements for importing soil for the development of the subject property. Given this condition, the subject property is currently receiving regulatory oversight under ACDEH Case Number RO0003228 and is listed as being open with long-term management as of 18 July 2017.

7.4 HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

The ASTM E1527-21 Standard defines an HREC as "a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls. A historical recognized environmental condition is not a recognized environmental condition.

HRECs were not identified in connection with the subject property.

7.5 DE MINIMIS CONDITIONS

The ASTM E1527-21 Standard defines a *de minimis* condition as a condition related to a release that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The ASTM E1527-21 Standard notes that conditions determined to be *de minimis* are not recognized environmental conditions.

8. Conclusions

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of the ASTM Practice E1527 of APNS 946-4634-10, and 946-4634-22, the subject property. Any exceptions to or deletions from, this practice are described in Section 1.4 of this report.

This Phase I has identified one CREC associated with the subject property.

9. Environmental Professional Certification

The undersigned declare the following:

I declare that, to the best of our professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312 and

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Jason Grant, P.E. (CA)
Senior Project Manager | Engineer

10. Credentials

This Phase I report was prepared by Hannah Sawyer, under the direct supervision of Jason Grant, who served as the Environmental Professionals for this project. Qualification information for the project personnel is provided below.

Hannah Sawyer
Senior Scientist

Ms. Sawyer is a senior scientist focused on geotechnical and environmental projects. She has experience performing Phase I Environmental Site Assessments for agricultural, undeveloped, and commercial properties.

Jason Grant, P.E. (CA)
Senior Project Manager

Mr. Grant is senior project manager and environmental engineer with more than 20 years of environmental consulting experience. Mr. Grant has designed, managed and implemented environmental investigations on a variety of project sites, including commercial/industrial facilities and research complexes, dry cleaning facilities, gas stations, electric substations, waterways, ports and harbors, lumber yards, and landfills.

11. Glossary and Other Descriptions

11.1 GLOSSARY

All Appropriate Inquiry (AAI) — that inquiry constituting "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in CERCLA, 42 U.S.C §9601(35)(B), that will qualify a party to a commercial real estate transaction for one of threshold criteria for satisfying the LLPs to CERCLA liability (42 U.S.C §9601(35)(A) & (B), §9607(b)(3), §9607(q); and §9607(r)), assuming compliance with other elements of the defense.

Business Environmental Risk — a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of business environmental risk issues may involve addressing one or more non-scope considerations.

Controlled Recognized Environmental Condition (CREC) – as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

Significant Data Gap — a data gap that affects the ability of the environmental professional to identify a recognized environmental condition.

De Minimis Conditions — a condition related to a release that generally does not present those conditions which "do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." The ASTM E1527-21 Standard notes that conditions determined to be *de minimis* are not recognized environmental conditions.

Environmental Professional — a person meeting the education, training, and experience requirements as set forth in 40 CFR §312.10(b).

Historical Recognized Environmental Condition (HREC) — a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls. A historical recognized environmental condition is not a recognized environmental condition.

Key Site Manager — the person identified by the owner or operator of a subject property as having good knowledge of the uses and physical characteristics of the subject property.

Material Threat —an obvious threat which is likely to lead to a release and that, in the opinion of the environmental professional, would likely result in impact to public health or the environment.

Orphan Site — (not ASTM E1527-21 definition) — sites that could not be mapped due to poor or inadequate address information.

Recognized Environmental Condition (REC) — (1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not RECs.

11.2 DESCRIPTIONS OF DATABASES SEARCHED

Numerous regulatory databases were searched during this Phase I. Each database reviewed is described in the database report presented in Appendix D. Those databases required by the ASTM E1527-21 Standard are identified below.

1. **NPL Sites:** The National Priorities List (NPL) is a list of contaminated sites that are considered the highest priority for cleanup by the U.S. Environmental Protection Agency (USEPA).
2. **Delisted NPL Sites:** The Delisted National Priorities List (NPL) is a list of formal NPL sites formerly considered the highest priority for cleanup by the USEPA that met the criteria of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) for deletion from the NPL because a no further response was appropriate.
3. **CERCLIS Sites:** The Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) list identifies sites which are suspected to have contamination and require additional investigation to assess whether they should be considered for inclusion on the NPL.
4. **CERCLIS-NFRAP Sites:** CERCLIS-NFRAP status indicates that a site was once on the CERCLIS List but has No Further Response Actions Planned (NFRAP). Sites on the CERCLIS-NFRAP List were removed from the CERCLIS List in February 1995 because, after an initial investigation was performed, no contamination was found, contamination was removed quickly, or the contamination was not significant enough to warrant NPL status.
5. **Federal ERNS:** The Federal Emergency Response Notification System (ERNS) list tracks information on reported releases of oil and hazardous materials.
6. **RCRA non-CORRACTS TSD facilities:** The Resource Conservation and Recovery Act (RCRA) non-CORRACTS TSD Facilities List tracks facilities which treat, store, or dispose of hazardous waste and are not associated with corrective action activity.
7. **RCRA CORRACTS TSD facilities:** The RCRA CORRACTS TSD Facilities list catalogues facilities that treat, store, or dispose of hazardous waste and have been associated with corrective action activity.
8. **RCRA Generators:** The RCRA Generator list is maintained by the USEPA to track facilities that generate hazardous waste.
9. **Federal Institutional Controls/Engineering Controls:** The Federal Institutional Control list and Engineering Control list are maintained by the USEPA. Some Institutional Control and Engineering Control information may not be made publicly available and therefore will not be included on this registry.
10. **State and Tribal Equivalent CERCLIS Sites:** The ASTM E 1527-21 Standard requires searching "State and Tribal Equivalent NPL Sites." In California, the equivalent NPL is the RESPONSE

database and the equivalent CERCLIS is the ENVIROSTOR database, which are maintained by the California Department of Toxic Substances Control (DTSC).

11. **State and Tribal Registered Storage Tanks:** In California, local regulatory agencies (e.g., County health departments and fire departments) and the State Water Resources Control Board (SWRCB) maintain lists of aboveground and underground storage tanks registered with those agencies (e.g., County health departments). For tribal property, the USEPA Region 9 maintains a list of underground storage tanks on Indian land.

12. **State and Tribal Landfills and Solid Waste Disposal Sites:** In California, the SWRCB in coordination with the Regional Water Quality Control Boards (RWQCB), and the Integrated Waste Management Board (IWMB) maintain lists of regulated waste disposal sites.

13. **State and Tribal Leaking Storage Tanks:** In California, the SWRCB in coordination with the RWQCBs maintains lists of Leaking Storage Tanks (LUST/LAST). The LUST/LAST lists are a listing of release sites that have an underground or aboveground storage tank listed as the source. For tribal property, the USEPA Region 9 maintains a list of leaking USTs on Indian land.

14. **State and Tribal Institutional Controls/Engineering Controls:** The USEPA maintains lists of sites with Institutional controls or Engineering controls in place. In addition, DTSC maintains a list of environmental deed restrictions.

15. **State and Tribal Voluntary Cleanup Sites:** In California, the DTSC, RWQCBs, and local regulatory agencies (e.g., County health departments) maintain lists of Voluntary Cleanup sites.

16. **State and Tribal Brownfield Sites:** In California, the DTSC maintains a list of Brownfield sites which includes any property where a redevelopment or re-use may be compromised by the presence or presumed presence of hazardous materials or petroleum.

APPENDIX A

Limitations
User Responsibilities Questionnaire

APPENDIX A

Haley & Aldrich, Inc. Limitations

Environmental site assessment (Phase I Environmental Site Assessment) reports prepared by Haley & Aldrich are for the sole and exclusive use of its Client. Haley & Aldrich represents that the Phase I Environmental Site Assessment was prepared in accordance with the ASTM International (ASTM) Standard E1527-21 entitled "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" (ASTM E1527-21). The findings, opinions, conclusions, and information contained in the ASTM E1527-21Phase I Environmental Site Assessment are limited to, and solely based upon, information reasonably ascertainable by Haley & Aldrich at the time the ASTM E1527-21 Phase I Environmental Site Assessment was completed.

All users of this ASTM E1527-21 Phase I Environmental Site Assessment are bound to the terms and conditions and limitations contained in the accompanying Proposal, Terms and Conditions, and Limitations for this ASTM E1527-21 Phase I Environmental Site Assessment. The findings, opinions, conclusions, and information contained in this report are based solely on the Scope of Services provided pursuant to the Proposal and its attachments and the information reasonably ascertainable by Haley & Aldrich at the time the ASTM E1527-21 Phase I Environmental Site Assessment was completed. Haley & Aldrich has not performed any additional observations, investigations, studies, or other testing not specified in the Scope of Services. Haley & Aldrich shall not be liable for the existence of any condition the discovery of which would have required the performance of services not authorized under the Scope of Services.

This ASTM E1527-21 Phase I Environmental Site Assessment is prepared for the exclusive use of Haley & Aldrich's client in connection with the subject property for the purpose of assessing the potential or existing environmental contamination liabilities associated with the subject property. There are no intended beneficiaries other than Haley & Aldrich's client. Haley & Aldrich shall owe no duty whatsoever to any other person or entity by issuing the ASTM E1527-21 Phase I Environmental Site Assessment. Use of this ASTM E1527-21 Phase I Environmental Site Assessment by any person or entity, including by Haley & Aldrich's client, for a purpose other than for the purpose of assessing the potential or existing environmental contamination liabilities associated with the subject property is expressly prohibited unless such person or entity obtains written authorization from Haley & Aldrich indicating that the ASTM E1527-21 Phase I Environmental Site Assessment is adequate for such other use. Use of this ASTM ASTM E1527-21 Phase I Environmental Site Assessment by any person or entity for such other purpose without written authorization by Haley & Aldrich shall be at such person's or entity's sole risk and shall be without legal exposure or liability to Haley & Aldrich.

Haley & Aldrich may authorize third-party reliance on the ASTM E1527-21 Phase I Environmental Site Assessment by providing reliance letters to third party(ies) provided that the third party(ies) agree: (1) to use the ASTM E1527-21 Phase I Environmental Site Assessment only for the purpose of assessing the potential or existing environmental contamination liabilities associated with real property; (2) to be bound by the terms and conditions and limitations contained in the ASTM E1527-21 Phase I Environmental Site Assessment report and the proposal and its Attachments, Terms and Conditions, and Limitations; (3) to accept the form and substance of Haley & Aldrich's reliance letter; and (4) to deliver to Haley & Aldrich a signed copy of a reliance letter by an authorized representative of the relying party, within thirty (30) days after said reliance letter is provided to the relying party, signifying the relying party's acceptance of the aforementioned conditions. Upon Haley & Aldrich's receipt of the signed

reliance letter by the relying party(ies), the relying party(ies) will be authorized to rely on Haley & Aldrich's ASTM E1527-21 Phase I Environmental Site Assessment for the limited purpose of identifying potential or existing environmental contamination liabilities associated with the subject property. The relying party(ies) agree(s) to bind each of its respective successors and assigns to the aforementioned Terms and Conditions.

This ASTM E1527-21 Phase I Environmental Site Assessment reflects subject property conditions observed and described by records available to Haley & Aldrich as of the date of the ASTM E1527-21 Phase I Environmental Site Assessment preparation. The passage of time may result in significant changes in subject property conditions, technology, or economic conditions, which could alter the findings and/or recommendations of the ASTM E1527-21 Phase I Environmental Site Assessment. Accordingly, Haley & Aldrich's client and any other party to whom the ASTM E1527-21 Phase I Environmental Site Assessment is provided recognize and agree that Haley & Aldrich shall bear no liability for deviations from observed conditions or available records after the time of ASTM E1527-21 Phase I Environmental Site Assessment preparation. Haley & Aldrich makes no express or implied representation that the information contained in the ASTM E1527-21 Phase I Environmental Site Assessment has continued viability after 180 days of the ASTM E1527-21 Phase I Environmental Site Assessment's completion date, and any use or reliance on the ASTM E1527-21 Phase I Environmental Site Assessment after 180 days of the ASTM E 1527-21 Phase I Environmental Site Assessment's completion date by Haley & Aldrich's client or any other authorized person or entity will be at that party's sole risk and without liability to Haley & Aldrich.

Notwithstanding anything contained herein, Haley & Aldrich shall not be liable for any claim or damage arising from environmental contamination liabilities that occurred on the subject property after the effective date of the ASTM E1527-21 Phase I Environmental Site Assessment. Likewise, Haley & Aldrich shall not be liable for any existing or future property owner's failure to satisfy any continuing obligation for CERCLA liability protection or under the Federal Environmental Protection Agency's All Appropriate Inquiries rule.

Attachment II

User Responsibilities Questionnaire
All Appropriate Inquiries Under ASTM E1527-13

Date: 6/13/2023
Subject Property Name:
Address:
Prepared By:

In order to qualify for one of the Landowner Liability Protections (LLP) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"), the user must conduct "All Appropriate Inquiry" (AAI), which includes consideration of the following information (if available). Though it is not required that this information be provided to the environmental professional for the completion of the ASTM E1527-13 Phase I Environmental Site Assessment, failure of the user to consider this information could result in a determination that AAI is not complete.

(1.) Environmental cleanup liens that are filed or recorded against the subject property (40 CFR 312.25).
Are you aware of any environmental cleanup laws against the subject property that are filed or recorded under federal, tribal, state, or local law? If yes, give a description and attach copies of the liens.

none

(2.) Activity and land use limitations that are in place on the subject property or that have been filed or recorded in a registry (40 CFR 312.26).
Are you aware of any Activity and Use Limitations (AUL), such as engineering controls, land use restrictions or institutional controls that are in place at the subject property or have been filed or recorded in a registry under federal, tribal, state, or local law?

The property is subject to the limitations imposed by the Reclamation Plan associated with Surface Mining Permit 31-36.

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
As the user of this Phase I Environmental Site Assessment do you have any specialized knowledge or experience related to the subject property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the subject property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? No

(4.) Relationship of the purchase price to the fair market value of the subject property if it were not contaminated (40 CFR 312.29).
Does the purchase price being paid for this subject property reasonably reflect the market value of the subject property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the subject property?

The property is not currently for sale.

(5.) **Commonly known or reasonably ascertainable information about the subject property (40 CFR 312.30).**
Are you aware of commonly known, or reasonably ascertainable information about the subject property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,

(a.) Do you know the past uses of the subject property*?*
yes...the property was formerly a quarry site

(b.) Do you know the specific chemicals that are present or once were present at the subject property?
No

(c.) Do you know of spills or other chemical releases that have taken place at the subject property?
No

(d.) Do you know of any environmental cleanups that have taken place at the subject property?
No

(6.) **The degree of obviousness of the presence or likely presence of contamination at the subject property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).**
As the user of this Phase I Environmental Site Assessment, based on your knowledge and experience related to the subject property are there any obvious indicators that point to the presence or likely presence of contamination at the subject property?

No

Former Hanson Aggregates Radum Facility
Pleasanton, California
(ACDEH VRAP Case No. RO0003228)

Dear Ms. Soo:

The enclosed *Closure Plan – APNs 946-1250-6-4 & 946-1350-3-12*, dated 29 March 2017, was prepared by Haley & Aldrich, Inc. on behalf of USL Pleasanton Lakes, L.P. for the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. This *Closure Plan* is being submitted pursuant to the Voluntary Remedial Action Agreement established for this site under Alameda County Department of Environmental Health Case Number RO0003228.

I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely yours,
USL PLEASANTON LAKES, L.P.

John W. Enerson

Former Hanson Aggregates Radum Facility
Pleasanton, California
(ACDEH VRAP Case No. RO0003228)

Dear Ms. Soo:

On behalf of USL Pleasanton Lakes, L.P., Haley & Aldrich, Inc. (Haley & Aldrich) is pleased to submit this *Closure Plan* for Alameda County Assessor Parcel Numbers (APNs) 946-1250-6-4 and 946-1350-3-12, which are contained within the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. Haley & Aldrich prepared this *Closure Plan* as requested by Alameda County Department of Environmental Health (ACDEH) for these two APNs as they are currently being evaluated for regulatory closure under the ACDEH Voluntary Remedial Action Program. This document is being submitted to ACDEH to replace Haley and Aldrich's *Draft Closure Plan*, dated 21 February 2017.

If you have any questions, please contact either of the undersigned.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

Haley & Aldrich, Inc. (Haley & Aldrich) prepared this *Closure Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California (Closure Plan)* on behalf of USL Pleasanton Lakes, L.P. (USL Pleasanton) for Alameda County Assessor Parcel Numbers (APNs) 946-1250-6-4 and 946-1350-3-12, which are contained within the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California. This *Closure Plan* was requested by Alameda County Department of Environmental Health (ACDEH) as USL Pleasanton is seeking regulatory closure for these two APNs under the ACDEH Voluntary Remedial Action Program (VRAP) Case No. RO0003228. This document is being submitted to ACDEH to replace Haley & Aldrich's *Draft Closure Plan*, dated 21 February 2017.

1.1 FORMER AGGREGATES FACILITY HISTORY

The Former Hanson Radum Aggregates Facility (Former Aggregates Facility) is comprised of a total of approximately 1,200 acres, of which about 320 acres is dry land and 700 acres is lakes and ponds (Figure 1). Beginning in 1938, aggregate mining operations were initiated at this facility by Kaiser Sand and Gravel under Surface Mining Permit (SMP) 31. These mining operations included excavating areas to remove the aggregate, and then backfilling the mined areas with rubble, debris and/or mine waste, or for use as disposal ponds for water, silt and the aggregate washing operations. In 1991, Hanson Aggregates purchased the facility and continued the mining operations through 2001, at which time the aggregate resource was considered depleted.

Following the cessation of the mining operations, the Former Aggregates Facility was purchased in September 2007 by Legacy Pleasanton Land, LLC. This purchase included the entire Former Aggregates Facility, except for a 16.5-acre portion located adjacent and behind the current 7-acre Pleasanton Garbage Services transfer station. During the Fourth Quarter 2010, Legacy Pleasanton Option Land, LLC, purchased the 16.5-acre portion. In the Third Quarter 2012, USL Pleasanton foreclosed on the Former Aggregates Facility, except for the 16.5-acre portion. Subsequently, on 1 January 2013, Legacy Pleasanton Option Land, LLC contributed its 16.5-acre portion of land into a joint venture partnership with USL Pleasanton.

USL Pleasanton currently owns the approximately 320 acres of land contained with the Former Aggregates Facility. The 700 acres of lakes and ponds include Lake I and Cope Pond, which are currently owned by Alameda County Flood Control and Water Conservation District – Zone 7 (Zone 7), and Lake H, which is currently owned by Pleasanton Gravel Company, but contracted to imminently transfer to Zone 7. USL Pleasanton has and retains stormwater discharge rights to Cope Pond for this land's current use and ultimate development, upon entitlement and permitting.

The table below provides a summary of the 23 APNs contained within the Former Aggregates Facility, along with their current owners, and identifies whether these APNs are within the boundaries of the City of Pleasanton or County of Alameda lands. Figure 2 shows the locations of the 23 APNs within the Former Aggregates Facility.

Former Aggregate Facility APNs and Current Ownership

APN	Current Owner	City or County Land
946-1128-4-4	USL Pleasanton	County of Alameda
946-1250-6-4		County of Alameda
946-1250-7-6		City of Pleasanton
946-1250-19-5		City of Pleasanton
946-1251-7-2		City of Pleasanton
946-1350-3-8		City of Pleasanton
946-1350-3-12		County of Alameda
946-1128-4-6	Zone 7	County of Alameda
946-1128-5		County of Alameda
946-1128-6-1		County of Alameda
946-1151-1-3		County of Alameda
946-1151-11-6		County of Alameda
946-1250-6-5		County of Alameda
946-1250-41		County of Alameda
946-1350-1		County of Alameda
946-1350-3-3		City of Pleasanton
946-1350-3-9		County of Alameda
946-1350-3-10		County of Alameda
946-1350-3-13		County of Alameda
904-1-2-5	Pleasanton Gravel	County of Alameda
904-1-4-2		County of Alameda
904-1-7-8		County of Alameda
904-1-7-18		County of Alameda

1.2 FORMER AGGREGTES FACILITY REGULATORY OVERSIGHT

The Former Aggregates Facility receives regulatory oversight from ACDEH, the Alameda County Community Development Agency (ACCDA), and the Livermore-Pleasanton Fire Department (LPFD).

1.2.1 Alameda County Department of Environmental Health

ACDEH is providing oversight of the environmental concerns related to potential releases to soil and groundwater that may have resulted from the former mining operations. Environmental investigation activities began in 2006, which resulted in identifying the following nine Areas of Concern (AOCs):

- AOC1 – Former Asphalt Plant;
- AOC 2 – Idle Truck Maintenance Area;
- AOC 3 – Heavy Equipment Maintenance and Wash Rack Area;[1]
- AOC 4 – Former Concrete Batch Plant Area;

[1] AOC 3 was previously also associated with the potential environmental concern (PEC) identified by temporary soil boring EB-35. However, further investigation of this boring location revealed the PEC is related to a subsurface asphalt layer and not a former feature included within the heavy equipment maintenance and wash rack area.

- AOC 5 – Former Mining Operation Area;
- AOC 6 – Storm Water Retention Pond ("Busch Pit");
- AOC 7 – PEC Identified by Temporary Soil Boring SS31;
- AOC 8 – PEC Identified by Temporary Soil Boring SS123; and
- AOC 9 – Vulcan Materials Company Storm Water Runoff Area.

The approximate locations and boundaries of these nine AOCs are shown on Figure 3, and the table below identifies the five APNs that contain these AOCs.

Former Aggregate Facility APNs and AOCs

APN	AOCs
946-1250-19-5	AOCs 1 & 2
946-1350-3-8	AOCs 2, 3, 4, 5*, 8* & 9*
946-1250-7-6	AOC 3
946-1250-6-4	AOC 6
946-1350-3-12	AOC 7

Note: * - A portion of AOC 5 and all of AOCs 8 and 9 are not within the City of Pleasanton's Urban Growth Boundary.

ACDEH's oversight is separated into the following three regulatory cases:

- GeoTracker Case No. RO0002941, Hanson Aggregates Radum Plant (SLT19719376) – established for AOC 1;
- GeoTracker Case No. RO0002952, Hanson Aggregates Legacy Radum Facility (SL0600101555) – originally established for AOCs 2 through 9, however, was revised to remove AOCs 6 and 7; and
- GeoTracker Case No. RO0003228, USL Pleasanton Lakes (T10000009398) – established for AOCs 6 and 7.

Further information regarding the status of the Former Aggregate Facility's AOCs and related regulatory cases are provided in Haley and Aldrich's *Summary of Environmental Status, Former Hanson Aggregates Radum Site, Pleasanton, California*, dated 20 February 2017.

1.2.2 Alameda County Community Development Agency

ACCDA is providing oversight of the Reclamation Plan being implemented on the Former Aggregates Facility under SMP 31. Activities conducted as part of this Reclamation Plan has included the reuse of soil stockpiles generated from the previous mining operations to level the ground surface in order to prevent depressions where surface water could pond and to also facilitate drainage in to Cope Pond. In addition, the previously existing storm water retention pond identified as Busch Pit was backfilled with approximately 367,000 cubic yards of on-site soil obtained from an adjacent stockpile generated from the previous mining operations (see Section 2.2.1). Per the SMP 31 Reclamation Plan, the land within the Former Aggregates Facility was hydroseeded to mitigate erosion and is currently being monitored to ensure compliance with this plan.

1.2.3 Livermore-Pleasanton Fire Department

LPFD, the Certified Unified Program Agency (CUPA), with assistance from ACDEH, provided oversight of the facility closure activities conducted on the mining operation's former features that were contained within the Former Aggregates Facility. The facility closure activities were performed in 2013 and 2014, and included the following activities:

- Abatement of hazardous building materials (i.e., asbestos-containing materials [ACM], lead-based paint [LBP], and other hazardous or potentially hazardous materials);
- Demolition and removal of the following structures: idle truck maintenance shop and associated fuel lines; heavy equipment maintenance shop; office buildings; plant lube storage shed/warehouse; electrical transformers; concrete batch plant; rock crusher; aboveground waste oil tank; concrete pads and footing; asphalt paving; underground storage tanks (USTs) and associated piping and fuel dispenser island; wash rack and associated piping; oil/water separator; septic tank and associated clay pipes and leach field; former rod mill; truck scale; and underground cistern and associated conveyor tunnel;
- Collection of soil samples to assess and characterize the existing conditions, and determine whether further excavation was warranted to mitigate impacted conditions;
- Off-site transportation and disposal of impacted soil; and,
- Backfilling of the areas excavated during the demolition and removal activities using a mixture of soil stockpiles generated from the previous mining operations, clean excavated material and select sand from the adjacent Vulcan Materials Company Quarry.

Reports documenting the facility closure activities are available for review in the GeoTracker Case Nos. RO0002941 and RO0002952. The facility closure was approved of by the LPFD on 1 April 2016.[2]

1.3 APNS INCLUDED IN CLOSURE PLAN – THE "SITE"

ACDEH requested USL Pleasanton prepare this *Closure Plan* in order to obtain regulatory closure for AOCs 6 and 7. These two AOCs are contained within APNs 946-1250-6-4 and 946-1350-3-12. For the purposes of this *Closure Plan*, these two APNs are collectively referred to as the "Site" (see Figure 3). USL Pleasanton is seeking regulatory closure for the Site as the potential environmental impacts from the former mining operations within this area of the Former Aggregates Facility have been adequately investigated and delineated. Procedures to be followed by contractors implementing USL Pleasanton's future entitled and permitted, if any, development activities to manage and handle impacted soils are specified in Haley & Aldrich's *Soil Management Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California (Soil Management Plan)*, dated 29 March 2017. Following the removal of the impacted soils, USL Pleasanton will request from ACDEH a no further action determination and seek regulatory closure for the Site under the VRAP Case No. RO0003228.

[2] See Appendix A for a copy of the LPFD approval letter.

2. Background

Presented below is a summary of the environmental investigations performed within the boundaries of the Site. These investigations were conducted in 2006, 2007 and 2008. The information presented below has been gathered from the following reports:

- *Summary of the Limited Subsurface Investigation Activities at the Hanson Aggregates West Radum Facility in Pleasanton California*, dated 2 August 2006, prepared by Brown and Caldwell;
- *Draft Phase II Environmental Site Assessment, 3000 Busch Road, Pleasanton, California*, dated November 2006, prepared by ENV America;
- *Additional Soil and Groundwater Investigation Report, 3000 Busch Road, Pleasanton, California*, dated February 2007, prepared by ENV America;
- *Phase I Environmental Site Assessment, Hanson Radum Site, Pleasanton, California*, dated May 2007, prepared by ENV America;
- *Site Investigation Report for the Eastern Portion of AOC #2 and AOCs #3 through #9, ACEH Case #RO0002952 and Geotracker Global ID #SL0600101555, Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, Alameda County, California*, dated 26 October 2007, prepared by LFR; and
- *Groundwater Monitoring, Well Installation, Development, Sampling, and Soil Excavation Report, Legacy Hanson Radum Site, 3000 Busch Road, Pleasanton, California, SLIC Case RO0002952 and Geotracker Global ID SL0600101555,* dated 17 April 2008, prepared by ENV America.

The investigation activities documented in the reports listed above included locations that are both within the boundaries of the Site, and within the entire Former Aggregates Facility. Copies of these reports are provided in Appendix A. Further reports documenting the investigation activities performed within the boundaries of the entire Former Aggregates Facility can be obtained from GeoTracker.

2.1 FORMER MINING OPERATION FACILITY FEATURES

Limited mining operations were performed within the boundaries of the Site. The only former features of these operations located within the Site's boundaries with potential environmental concerns included the following:

- Electrical Transformer;
- Storm Water Retention Pond; and
- Surface Water Runoff Discharge Point.

2.2 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

The Site has undergone a series of environmental investigations to evaluate potential concerns associated with the former mining operations. The investigation activities were performed to both

evaluate areas suspected to contain potential environmental concern based on the former mining operations, and also to provide a general evaluation of the soil and groundwater conditions present following the cessation of the mining operations. ACDEH was the lead regulatory agency overseeing these investigations.

Environmental investigation activities were performed on the Site between 2006 and 2008, and included the following four sampling events:[3]

- May 2006: a limited subsurface investigation was conducted that included the collection of sediment and surface water samples from the bottom of the storm water retention pond previously known as Busch Pit;
- November 2006: a Phase II Environmental Site Assessment (ESA) was conducted that included the collection of additional sediment and surface water samples from the bottom of Busch Pit, and also investigated two areas of potential environmental concern, with one soil sample collected at the location of a former electrical transformer and a second soil sample collected at a former storm water runoff discharge point to Cope Pond;
- February 2007: a due diligence environmental sampling program was conducted that included five borings advanced within the boundaries of the Site and one additional targeted boring location to investigate potential downgradient migration from an impacted area of concern, with soil and groundwater samples collected to provide an evaluation of the subsurface conditions; and,
- October 2007: a step-out soil boring sampling program was conducted based on previously identified potential areas of environmental concerns, which included for the Site two of the February 2007 boring locations, and additional sediment samples were collected from Busch Pit; this sampling program established the locations and concerns for AOCs 1 through 9.

The following sections present summaries of the above environmental investigations. These investigations included collecting soil, sediment, surface water and/or groundwater samples following standard environmental sampling and handling procedures. Figure 4 shows the locations of the environmental samples collected from within the boundaries of the Site. These samples were submitted for laboratory analysis for constituents of potential concern based on the respective area's former operations and sampling objectives. Laboratory analyses were performed following United States Environmental Protection Agency (USEPA) methods, and included:

- total petroleum hydrocarbons as gasoline (TPHg), as diesel (TPHd) and as motor oil (TPHmo) following USEPA Method 8015;
- benzene, ethylbenzene, toluene and xylenes (BTEX) following USEPA Method 8260;
- fuel oxygenates: methyl tertiary-butyl ether (MTBE), tertiary-amyl methyl ether (TAME), diisopropyl ether (DIPE), ethyl tertiary-butyl ether (EDBE), and tertiary-butyl alcohol (TBA) following USEPA Method 8260;
- lead scavengers: ethylene dibromide (EDB), and ethylene dichloride (EDC) following USEPA Method 8260;

[3] Summary below is for sampling within the boundaries of the Site. The listed investigations included additional sampling at locations outside the Site and within the Former Aggregate Facility.

- volatile organic compounds (VOCs) following USEPA Method 8260;
- semivolatile organic compounds (SVOCs) following USEPA Method 8260;
- organochlorine pesticides (OCPs) following USEPA Method 8082;
- polychlorinated biphenyls (PCBs) following USEPA Method 8081;
- California Title 22 Metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc); hexavalent chromium; and magnesium following USEPA Method 6010/7471.

In order to assess whether the previous investigation results pose potential risk to human health or the environment, the analytical findings are compared against Tier 1 Environmental Screening Levels (ESLs) established by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), dated February 2016 (Revision 3).[4] Concentrations detected less than or equal to Tier 1 ESLs indicate the SFBRWQCB does not consider there to be any potential human health or environmental risks and the property would be deemed acceptable for unrestricted (i.e., residential) development.

For three metal constituents, arsenic, chromium and nickel, the Tier 1 ESL is not an appropriate screening level. Rather, the following screening levels were relied upon for evaluating the detected concentrations.

- Arsenic: the Tier 1 ESL for arsenic is 0.067 milligrams per kilogram (mg/kg), however, this concentration is less than natural background arsenic concentrations for soils in the San Francisco Bay Area. Therefore, for this evaluation the detected concentrations were compared against the upper estimate for background arsenic concentrations that has been accepted by the SFBRWQCB per "Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region," by Dylan Jacques Duverge, dated December 2011. Per this study, the background arsenic concentration for San Francisco Bay Area soils is 11 mg/kg.
- Chromium: there is no Tier 1 ESL established for total chromium. Rather, there are Tier 1 ESLs established for chromium III (120,000 mg/kg) and for chromium VI (0.30 mg/kg).[5] As there is no expectation of chromium VI being present on the Site as it was not used by the previous mining operations, and chromium VI was not detected in the select samples that underwent this analysis, the total chromium concentrations were compared against the chromium III Tier 1 ESL.
- Nickel: the Tier 1 ESL for nickel, 86 mg/kg, is based on direct exposure human health for construction workers, which is not a long-term exposure risk for the Site. Rather, the long-term exposure risk for the Site is residential land use. The ESL for direct exposure human health for residential, shallow soil is 820 mg/kg, which is the screening level the detected concentrations were compared against for evaluating the Site's soil conditions.

[4] The summaries below and provided in the report tables also cite the 2005 and 2007 ESLs for residential, shallow soil, as these regulatory screening criteria were relied upon for evaluating the previously detected concentrations.
[5] Chromium III is also known as trivalent chromium, and chromium VI is also known as hexavalent chromium.

2.2.1 Busch Pit (AOC 6)

Busch Pit was a storm water retention pond formerly located in the southern half of APN 946-1250-6-4 that extended approximately 50 to 70 feet deep below the surrounding ground surface. This pond reportedly received surface water runoff diverted from the former mining facility, as well as from two adjacent commercial operations located to the south, the Kiewet property and the Pleasanton Garbage Service property. Three large diameter pipes (approximately 12- to 20-inch diameter) were observed to discharge into this pond, one located near the southwestern corner of the pond and two located near the southeastern corner of the pond.

As Busch Pit received discharges of surface water runoff from areas with commercial operations, environmental investigations were conducted May 2006, November 2006 and October 2007 to evaluate potential impacts, with Busch Pit established as AOC 6 following the October 2007 investigation. These investigations included collecting two pond surface water samples and 14 sediment samples from the bottom of the pond. Summaries of the environmental investigations and results for the Busch Pit samples are provided in Tables 1A, 1B, 1C and 1D. The first surface water sample collected in May 2006, sample Pond Water, contained TPHd at a concentration of 170 micrograms per liter (µg/L), which exceeds the Tier 1 ESL for groundwater (100 µg/L) that is based on drinking water concerns, and the ESL for direct exposure human health (150 µg/L). As the sample collected did not represent groundwater conditions and was collected from a location that is currently 50 to 70 feet below ground surface (bgs), these two ESLs are not exposure concerns for the Site. Rather, this sample represented surface water conditions, and the elevated TPHd concentration likely signified transient impacts associated with the surface water discharges this former stormwater pond received. It is noted that the second surface water sample collected in October 2007, sample PW-2, did not contain any detectable petroleum hydrocarbon concentrations (less than 50 µg/L). Further, the May 2006 concentration does not exceed the ESL for groundwater, aquatic habitat goal (640 µg/L). Groundwater conditions in the vicinity of Busch Pit were separately evaluated and found to not present any potential environmental concerns (see Section 2.2.2).

In addition, one sediment sample collected from Busch Pit, sample Sediment, contained TPHd at a concentration of 530 mg/kg, which exceeds the TPHd Tier 1 ESL for soil (230 mg/kg). However, the Tier 1 ESL is based on direct exposure human health risk in shallow (i.e., less than 10 feet bgs) soil. As this sediment sample was collected from soil that is currently 50 to 70 feet bgs, this Tier 1 ESL is not appropriate for comparison. The TPHd concentration in this sediment sample does not exceed either the ESLs established by the SFBRWQCB for assessing risks for leaching to groundwater, drinking water source (570 mg/kg) or for direct exposure human health risk at any depth (880 mg/kg). Further, the other seven sediment samples collected from Busch Pit that underwent TPHd and TPHmo analyses did not contain concentrations exceeding Tier 1 ESLs for soil. Therefore, the findings of the environmental investigations indicate the subsurface conditions within the former Busch Pit, also identified as AOC 6, do not pose a potential risk to human health or the environment.

In 2013, under order from ACCDA to comply with SMP 31, Busch Pit was backfilled with approximately 367,000 cubic yards of on-site soil obtained from an adjacent stockpile. The backfilling activities are documented in the reports provided in Appendix B, which included geotechnical testing services and environmental characterization sampling. ACDEH oversaw the backfilling activities and approved the environmental characterization results as documented in their 28 August 2012 letter.[6]

[6] See Appendix B for a copy of the ACDEH approval letter.

2.2.2 Due Diligence Sampling

In February 2007, an additional soil and groundwater investigation was conducted to further characterize areas of the Former Aggregate Facility that were not specifically targeted during the November 2006 Phase II ESA. These investigation activities included drilling 16 borings as part of a due-diligence, statistical sampling program. Five of these borings were located on the Site, with four situated on APN 946-1250-6-4, locations SS22, SS33, SS63 and SS78, and one on APN 946-1350-3-12, location SS31. A total of 25 discrete soil samples were collected at depths down to 40 feet bgs and one grab groundwater sample was collected. Summaries of the environmental investigations and results for these five due diligence sampling locations are provided in Tables 2A, 2B, 2C, 2D and 2E. As indicated in these tables, soil samples from one of the five borings, location SS31, contained TPHd and TPHmo concentrations at depths of 2 and 40 feet bgs exceeding the former 2007 ESLs for residential, shallow soil. Therefore, further characterization of this one location with a potential environmental concern was conducted in October 2007 (see Section 2.2.3.1).

In addition, the February 2007 investigation activities included one boring location, EB-35, drilled to investigate potential downgradient migration from an impacted subsurface zone discovered during the November 2006 Phase II ESA. The November 2006 investigation activities conducted on APN 946-1250-19-5 included drilling 13 borings to evaluate the extent a heavy, viscous, black, free phase petroleum product encountered at a depth of approximately 33 to 40 feet bgs.[7] In February 2007, boring location EB-35 was drilled on APN 946-1350-3-12 to evaluate potential downgradient migration from this impacted subsurface zone. Five discrete soil samples were collected from EB-35 at depths down to 40 feet bgs and one grab groundwater sample was collected. A summary of the environmental investigation and results for this boring is provided in Tables 2A, 2B, 2C, 2D and 2E. As indicated in these tables, although the deeper soil and groundwater samples collected did not reveal potential downgradient migration from the 33 to 40 feet bgs impacted zone, a shallow soil sample collected from EB-35 at 2 feet bgs contained TPHd and TPHmo at concentrations of 400 mg/kg and 3,400 mg/kg, respectively, which exceeded the former 2007 ESLs for residential shallow soil (100 mg/kg and 500 mg/kg, respectively). The detected TPHd concentration also exceeds the 2016 Tier 1 ESL (230 mg/kg). Therefore, further investigation of the shallow soil impact at this location was conducted in October 2007 (see Section 2.2.3.2).

2.2.3 Step-Out Sampling

Step-out sampling was conducted during the October 2007 investigation to further evaluate two areas of potential environmental concern identified on APN 946-1350-3-12.

2.2.3.1 *SS31 (AOC 7)*

As two soil samples collected during the November 2006 investigation from boring location SS31 contained elevated TPHd and TPHmo concentrations, the October 2007 investigation included drilling four step-out borings, SS31(A), SS31(B), SS31(C) and SS31(D), at locations surrounding this initial boring to characterize the extent of this potential impact. The area investigated by these step-out borings was established as AOC 7. A total of 39 discrete soil samples were collected at depths down to 67.5 feet bgs and four grab groundwater samples were collected (one per boring). Summaries of the environmental

[7] Following the October 2007 investigation, this deeper impacted zone was established to be within AOC 1.

investigation and results for these step-out sampling locations are provided in Tables 3A, 3B, 3C and 3D. None of the samples contained concentrations exceeding either the former 2007 ESLs for residential, shallow soil, or the current 2016 Tier 1 ESLs for soil and groundwater. In addition, the TPHd and TPHmo concentrations detected in the initial SS31 samples (200 mg/kg and 1,500 mg/kg, respectively, at 2 feet bgs; and 210 mg/kg and 1,500 mg/kg, respectively, at 40 feet bgs) do not exceed 2016 Tier 1 ESLs for soil (230 mg/kg and 5,100 mg/kg, respectively). Therefore, the area of potential environmental concern indicated by boring SS-31, also identified as AOC 7, has been adequately delineated and its conditions do not pose a potential risk to human health or the environment.

2.2.3.2 *EB-35*[8]

As one shallow soil sample collected from boring location EB-35 contained elevated TPHd and TPHmo concentrations, four step-out borings, EB-35A, EB-35B, EB-35C and EB-35D, were drilled surrounding this initial boring to characterize the extent of this shallow soil impact. A total of 12 discrete soil samples, three per step-out boring, were collected at depths down to 10.5 feet bgs. A black petroleum product observed to be similar to asphalt concrete was encountered in three of the four boring locations at depths between 2.5 and 4 feet bgs.[9] Summaries of the environmental investigation and results for these step-out sampling locations are provided in Table 4. Although some of the samples collected between 3.5 and 5 feet bgs contained TPHd and/or TPHmo concentrations exceeding the former 2007 ESLs for residential shallow soil, there were no ESL exceedances for the soil samples collected between 8.5 and 10 feet bgs. In addition, none of the soil samples collected contained TPHd or TPHmo concentrations exceeding the current 2016 Tier 1 ESLs.

In 2008, an additional investigation was conducted in the EB-35 area of concern. This investigation consisted of excavating the locations of previously drilled borings EB-35 and EB-35B, with the former excavated approximately 4 feet bgs and the latter excavated approximately 5.5 feet bgs. In the excavation of EB-35 an asphalt layer was encountered between approximately 2 and 3 feet bgs, while in the excavation of EB-35B this asphalt layer was encountered between approximately 3.5 and 5.5 feet bgs. Summaries of the environmental investigation and results for these excavation sampling locations are provided in Table 4. Although the soil sample collected from within this layer at 2.5 feet bgs, sample T-35A, contained TPHd and TPHmo at concentrations of 3,500 mg/kg and 45,000 mg/kg, respectively, which exceed their Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively), the soil sample collected from immediately below this layer at 3.5 feet bgs, sample T-35B, contained TPHd and TPHmo at concentrations of 14 mg/kg and 150 mg/kg, respectively, which do not exceed their Tier 1 ESLs. Given these results, it was concluded that this area's petroleum hydrocarbon impacted conditions are limited to the depths of the asphalt layer and do not appear to present a leachability risk for deeper soil impacts. ACDEH agreed with this conclusion per their 13 June 2008 letter.[10]

The investigation activities conducted in the EB-35 area of concern detected elevated petroleum hydrocarbons in the soil samples collected due to the presence of an asphalt layer encountered at depths ranging between approximately 2 and 5.5 feet bgs. Although soil samples collected from within this asphalt layer contain TPHd and TPHmo concentrations exceeding 2016 Tier 1 ESLs, soil samples

[8] EB-35 was initially identified to contain a potential environmental concern (PEC) associated with AOC 3. However, as described in this section, further investigation activities revealed this PEC to be associated with an asphalt layer that is not affiliated with the former mining operation features comprising AOC 3.

[9] This shallow petroleum product is not related to the deeper zone of petroleum product that was encountered on APN 946-1250-19-5 for which boring EB-35 was initially investigating.

[10] See Appendix A for a copy of the ACDEH letter.

collected immediately below do not. Therefore, the petroleum hydrocarbon impacted conditions are limited to the subsurface soil horizon containing this asphalt layer and do not represent an immediate concern to human health or the environment that warrants remediation.

If entitled and permitted, USL Pleasanton's anticipated development plan for the vicinity of the EB-35 area of concern includes grading activities that are expected to cut this area approximately 11 to 12 feet deep.[11] Therefore, the asphalt layer encountered between 2 and 5.5 feet bgs would be removed as part of the Site's development. The removal of the EB-35 area of concern is identified in the *Soil Management Plan* to be followed during the development of the Site. This *Soil Management Plan* has been prepared to provide the contractors performing the soil handling and management activities an understanding of where impacted soil conditions are currently known to exist, and includes procedures to be implemented for both these known impacts and suspected unknown conditions of concern should they be encountered during the development's earthwork activities.

2.2.4 Other Areas of Potential Environmental Concern

Two other areas of potential environmental concern were sampled within the boundaries of the Site.

2.2.4.1 *Former Electrical Transformer*

The location of a former electrical transformer within APN 946-1250-6-4 was sampled as part of the November 2006 Phase II ESA. Summaries of the environmental investigation and results for this location, sample TRANS-D, are provided in Tables 5A and 5B. The soil sample collected from this location did not contain concentrations exceeding 2007 ESLs for residential, soil shallow, nor exceeding 2016 Tier 1 ESLs. Therefore, this location does not pose a potential risk to human health or the environment.

2.2.4.2 *Cope Pond Discharge Point*

Cope Pond received discharges of surface water runoff from the former mining operations. These discharges were responsible for providing a significant source of water to fill this pond. As the mining operations have ceased, the volume of water discharged to and collected by Cope Pond has significantly decreased, thereby receding its shoreline.

A former storm drain discharge point to Cope Pond located within APN 946-1350-3-12 was sampled as part of the November 2006 Phase II ESA. This storm drain was reportedly connected to a former wash rack operational area and was located at the previously existing shoreline of Cope Pond prior to its receding. This location was sampled as it likely represented a worst-case condition for potential impacts due to discharges from the former wash rack area. Summaries of the environmental investigation and results for this location, sample CPI, are provided in Tables 5A and 5B. The soil sample collected from this location did not contain concentrations exceeding 2007 ESLs for residential, soil shallow, nor exceeding 2016 Tier 1 ESLs. Therefore, this location does not pose a potential risk to human health or the environment.

[11] The ground surface elevation at this location is approximately 365 to 366 feet above mean sea level (msl). USL Pleasanton's development plan for this area anticipates having the future ground surface at 354 feet above msl.

2.2.5 Summary

The environmental investigation previously completed within the boundaries of the Site included the collection of soil, sediment and groundwater samples as part of due diligence activities following the cessation of the Former Aggregate Facility's mining operations. The results of these investigation revealed environmental concerns based on a comparison of analytical results against the 2007 ESLs, with this evaluation resulting in establishing AOC 6 for area of the former Busch Pit and AOC 7 for the area surrounding boring SS31. Further evaluation of these two AOC's analytical results against the current 2016 ESLs indicates no potential risk to human health or the environment, and therefore, these two AOCs have been addressed and require no further investigation or remedial measures.

The environmental investigation activities did identify one area of concern associated with a shallow soil petroleum hydrocarbon impact in the vicinity of boring EB-35. The impacted soil was determined to be the result of an asphalt layer encountered at approximately 2 and 5.5 feet bgs. This asphalt layer will be removed from the Site following the procedures specified in the *Soil Management Plan*. Once this asphalt layer is removed, no further environmental concerns will exist within the boundaries of Site and regulatory closure will be requested from ACDEH for VRAP Case No. RO0003228.

3. Future Proposed Development[12]

If entitled and permitted, USL Pleasanton is proposing the development of the entire former aggregate mining operations facility, which will include: residential and commercial development; roadway improvements; a new school; and parks and open space, including sports fields, hiking and biking trails, and recreational and educational access to the ponds. If entitled and permitted, the potential development of the former mining facility is anticipated to be performed in five phases, extending from 2020 through 2030+.

Figure 5[12] presents USL Pleasanton's proposed development plan for the Former Aggregates Facility, with further details provided in Appendix C. USL Pleasanton anticipates that the Former Aggregates Facility will be developed in five phases. The table below identifies the APNs owned by USL Pleasanton that are included within each anticipated developmental phase, with Figure 6[12] showing the extents of each developmental phase.

Former Aggregates Facility APNs and Developmental Phases

APN	Development Phase
946-1128-4-4	Phase 2
946-1250-6-4	Phases 1, 2 & 4
946-1250-7-6	Phases 2 & 3
946-1250-19-5	Phase 3
946-1251-7-2	Phase 3
946-1350-3-8	Phases 3 & 5
946-1350-3-12	Phase 4

Although the Site (i.e., APNs 946-1250-6-4 and 946-1350-3-12) is not developed as one complete phase, with other areas of the Former Aggregates Facility shown as being developed prior to the completion of the Site, the overall timeline for the phased development will allow USL Pleasanton and ACDEH to negotiate closure of the environmental concerns identified for the other APNs. Figure 7[12] presents the proposed development within the boundaries of the Site, and additionally shows the locations of the collected environmental samples.

TABLES

TABLE 1A
HISTORICAL ANALYTICAL DATA: BUSCH PIT - ORGANIC COMPOUNDS - SOIL (mg/kg)
PLEASANTON, CALIFORNIA

Sample Location	Date Sampled	Sample Depth (feet bgs)	Matrix	Source of Sample Data	Purpose of Sampling	Rationale for Analyses	Result or Conclusion	Total Petroleum Hydrocarbons (TPH) (mg/kg)			VOCs
								TPHd	TPHmo	TPHg	
Sediment	5/8/2006	0.5	soil	BC 5/2006 [1]	A 2006 Limited Subsurface Investigation was conducted for Hansom America, which included collecting one sediment and one surface water sample from the stormwater retention pond identified as Busch Pit. This stormwater retention pond received surface water runoff from the Site and the adjacent Kiewit and Pleasanton Garbage Service Inc. properties.	The sediment and surface water samples were analyzed for constituents of potential concern that may be present in surface water runoff generated within the Site's and adjacent properties' operational areas, including: Total Petroleum Hydrocarbons as Gasoline (TPHg), as Diesel (TPHd) and as Motor Oil (TPHmo); and Volatile Organic Compounds (VOCs).	TPHg and VOCs were not detected at concentrations greater than laboratory reporting limits. TPHd was detected at a concentration that exceeded the 2005 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Level (ESL) for residential and commercial, shallow soil (100 mg/kg). TPHmo was detected at a concentration that exceeded the 2005 ESL for residential, shallow soil (500 mg/kg) and for commercial, shallow soil (1,000 mg/kg). Therefore, additional investigation of sediment/shallow soil in Busch Pit was recommended. The TPHd concentration exceeds the 2016 Tier 1 ESL (230 mg/kg), which is based on direct exposure human health risk to shallow, residential soil. However, this sediment sample was collected from a location that is currently 50 to 70 feet below ground surface (bgs) as noted in Haley & Aldrich's "Geotechnical Services During Construction, Filling of Busch Pit, Pleasanton Lakes Development, Pleasanton, California", dated December 13, 2013, and therefore, is not "shallow soil" as defined by the SBFRWQCB (less than 10 feet bgs). The TPHd concentration does not exceed the 2016 ESL for direct exposure human health risk at any land use, any depth (880 mg/kg), or the 2016 ESL for leaching to groundwater, drinking water (570 mg/kg). The TPHmo concentration does not exceed the 2016 Tier 1 ESL (5,100 mg/kg). Therefore, no further evaluation is warranted.	**530**	1,500	<0.1	ND [a]
RP-A	9/29/2006	0.5	soil	ENV 11/2006 [2]	A 2006 Phase II Environmental Site Assessment was performed for Legacy Partners Commercial, LLC. As part of this investigation, additional environmental sampling activities were conducted that included the collection of three shallow soil samples from the shores of the bottom of the stormwater retention pond. Upon obtaining the initial analytical results, six more soil samples were collected to further investigate the extent of two metals (chromium and lead) detected at elevated concentrations in one of the initial samples (RP-C).	The three initial soil samples were analyzed for constituents of potential concern based on the findings of the 2006 Limited Subsurface Investigation, which included: TPHd; TPHmo; and California Title 22 Metals, plus magnesium. The six subsequent samples were only analyzed for California Title 22 Metals, plus Hexavalent Chromium; TPHd and TPHmo were not analyzed as they were not detected at elevated concentrations in the three initial samples.	TPHd and TPHmo were not detected at concentrations greater than laboratory reporting limits. Therefore, further evaluation was not recommended.	<0.99	<50	-	-
RP-B	9/29/2006	0.5	soil				TPHd and TPHmo were not detected at concentrations greater than laboratory reporting limits. Therefore, further evaluation was not recommended.	<0.99	<49	-	-
RP-C	9/29/2006	0.5	soil				TPHmo was not detected at a concentration greater than laboratory reporting limit. TPHd was detected at a concentration less than the 2005 ESL for residential, shallow soil (100 mg/kg). Therefore, further evaluation was not recommended.	8.8	<50	-	-
RP-C-3.5	10/18/2006	3.5	soil				TPHd, TPHmo and VOCs were not analyzed. (See Table 1C for California Title 22 Metals analytical results.)	-	-	-	-

SED-1	7/13/2007	0.5	soil	LFR 10/2007 [3]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which furthered the investigation of the stormwater retention pond based on the findings of the previously completed environmental investigations. This investigation included the collection of four sediment samples and one composite surface water sample.	The sediment samples were analyzed for constituents of potential concern based on the previous environmental investigation findings, which included: TPHd; TPHmo; and California Title 22 Metals. The surface water sample was analyzed for a wide-range of constituents of potential concern that could be associated with stormwater runoff, including: TPHg; TPHd; TPHmo; VOCs; Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); Fuel Oxygenates; Lead Scavengers; Semivolatile Organic Compounds (SVOCs); and California Title 22 Metals.	TPHd was detected at concentrations less than or equal to the 2005 ESL for residential, shallow soil (100 mg/kg). TPHmo was detected in one sample at a concentration greater than the 2005 ESL for residential, shallow soil (500 mg/kg), but less than the 2005 ESL for commercial, shallow soil (1,000 mg/kg). Given these TPH detections, no further evaluation was recommended. The detected TPHd and TPHmo concentrations do not exceed 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). Therefore, no further evaluation is warranted.	<1	7.1 H	-	-

Pond Water	5/8/2006	surface	water	BC 5/2006 [1]	A 2006 Limited Subsurface Investigation was conducted for Hansom America, which included collecting one sediment and one surface water sample from the stormwater retention pond identified as Busch Pit. This stormwater retention pond received surface water runoff from the Site and the adjacent Kiewit and Pleasanton Garbage Service Inc. properties.	The sediment and surface water samples were analyzed for constituents of potential concern that may be present in surface water runoff generated within the Site's and adjacent properties' operational areas, including: Total Petroleum Hydrocarbons as Gasoline (TPHg), as Diesel (TPHd) and as Motor Oil (TPHmo); and Volatile Organic Compounds (VOCs).	TPHg, TPHmo and VOCs were not detected at concentrations greater than laboratory reporting limits. TPHd was detected at a concentration less than the 2005 ESL established for "Fresh Water Aquatic Habitat Goal" (640 µg/L) and "Drinking Water (toxicity)" (210 µg/L), but greater than "Ceiling Value (Taste & Odors, etc.)" (100 µg/L). Therefore, further evaluation of the surface water contained within the stormwater retention pond water was not recommended. The TPHd concentration exceeds the 2016 Tier 1 ESL for groundwater (100 µg/L), which is based on drinking water concerns, and exceeds the 2016 ESL for groundwater, direct exposure human health (150 µg/L). Neither of these two ESLs are based on exposure concerns for the Site. In addition, the sample collected was not groundwater, rather former surface water that is now approximately 50 to 70 feet bgs. The TPHd concentration does not exceed the 2016 ESL for groundwater, aquatic habitat goal (640 µg/L). A second sample of the surface water within the stormwater retention pond was collected in 2007 (see Sample Location "PW-2"), which did not contain any detectable TPHd concentrations. It is likely that the 2006 TPHd concentration represented the transient condition of this pond as it intermittently received storm water discharges. Therefore, no further evaluation is warranted.	**170**	<480	<50	-	-	-	-	-	-	-	-	-	-	-	-	-
PW-2	7/13/2007	surface	water	LFR 10/2007 [3]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which furthered the investigation of the stormwater retention pond based on the findings of the previously completed environmental investigations. This investigation included the collection of four sediment samples and one composite surface water sample.	The sediment samples were analyzed for constituents of potential concern based on the previous environmental investigation findings, which included: TPHd; TPHmo; and California Title 22 Metals. The surface water sample was analyzed for a wide-range of constituents of potential concern that could be associated with stormwater runoff, including: TPHg; TPHd; TPHmo; VOCs; Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); Fuel Oxygenates; Lead Scavengers; Semivolatile Organic Compounds (SVOCs); and California Title 22 Metals.	None of the analyzed constituents were detected at concentrations exceeding laboratory reporting limits, except for select metals (see Table 1D). Therefore, no further evaluation was recommended. Given the detected concentrations, no further evaluation is warranted.	<50	<300	<50	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<10	<0.5	<0.5	ND [a]

feet bgs = feet below ground surface
µg/L = micrograms per liter
ND = not detected at a concentration greater than laboratory reporting limit
"-" = sample not analyzed
Bold indicates concentration exceeds SFBRWQCB Tier 1 ESL for Groundwater (February 2016, Revision 3)
a = Laboratory reporting limits were less than Tier 1 ESLs, except for: 1,2-Dibromoethane (EDB); carbon tetrachloride; 1,2-dibromo-3-chloropropane; hexachlorobutadiene; methylene chloride; naphthalene; and vinyl chloride. The Tier 1 ESLs for these five of these seven constituents, except carbon tetrachloride and vinyl chloride, are based on drinking water concerns (i.e., Maximum Contaminant Levels [MCLs]), which is not an exposure concern for the Site. The laboratory reporting limits for these five constituents are less than their next lowest ESLs. The Tier 1 ESLs for carbon tetrachloride and vinyl chloride are based on vapor intrusion for shallow groundwater (i.e., less than 10 feet bgs), which does not represent this sample that was collected 50 to 70 feet bgs. The laboratory reporting limits for these two constituents are less than the ESLs established for vapor intrusion for deep groundwater (i.e., the next lowest ESLs).

RP-A	9/29/2006	0.5	soil	ENV 11/2006 [2]	A 2006 Phase II Environmental Site Assessment was performed for Legacy Partners Commercial, LLC. As part of this investigation, additional environmental sampling activities were conducted that included the collection of three shallow soil samples from the shores of bottom of the stormwater retention pond. Upon obtaining the initial analytical results, six more soil samples were collected to further investigate the extent of two metals (chromium and lead) detected at elevated concentrations in one of the initial samples (RP-C).	The three initial soil samples were analyzed for constituents of potential concern based on the findings of the 2006 Limited Subsurface Investigation, which included: TPHd; TPHmo; and California Title 22 Metals, plus magnesium. The six subsequent samples were only analyzed for California Title 22 Metals, plus Hexavalent Chromium; TPHd and TPHmo were not analyzed as they were not detected at elevated concentrations in the three initial samples.	Metals were not detected at concentrations exceeding 2005 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil. Additionally, metals concentrations do not exceed the 2016 Tier 1 ESLs (see notes regarding arsenic, chromium and nickel). Therefore, no further evaluation is warranted.	<0.96	4	140	<0.48	<0.48	12	48	-	24	8,900	<0.96	80	6.5	<1.9	<1.9	<0.96	24	43	0.058

HISTORICAL ANALYTICAL DATA: DUE DILIGENCE SAMPLES - ORGANIC COMPOUNDS - SOIL (mg/kg)
PLEASANTON, CALIFORNIA

Sample Location	Date Sampled	Sample Depth (feet bgs)	Matrix	Source of Sample Data	Purpose of Sampling	Rationale for Analyses	Result or Conclusion	Total Petroleum Hydrocarbons (TPH) (mg/kg)		
								TPHd	TPHmo	TPHg
SS(22)-2	1/31/2007	2	soil	ENV 2/2007[1]	An 2007 Additional Soil and Groundwater Investigation was performed for Legacy Partners Commercial, LLC, based on the findings of the previously completed Phase II Environmental Site Assessment. As part of this additional investigation, 17 due diligence soil borings were advanced at randomly selected locations throughout the site, with five of these borings (identified as "SS" locations) advanced in the parcels currently being evaluated. One additional boring, EB-35, was advanced as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Discrete soil samples were collected approximately every 10 vertical feet down to 40 feet deep, with the boring then further advanced deeper for the collection of a grab groundwater sample.	The soil and groundwater samples were analyzed for potential constituents of concern based on an evaluation of the site's historical operations and the findings of previously completed Phase I Environmental Site Assessments. In addition, the environmental sampling results obtained from the previously completed investigation activities were reviewed to both determine chemical constituents that warrant further evaluation (detected at concentrations exceeding regulatory screening levels) and those that do not warrant further evaluation (detected at concentrations below regulatory screening levels). This evaluation resulted in the samples being analyzed for: Total Petroleum Hydrocarbons as Gasoline (TPHg), as diesel (TPHd) and as Motor Oil (TPHmo); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); and California Title 22 Metals. Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations. Metals were not analyzed for in discrete soil samples collected from locations SS(33), SS(63) and SS(78) as the due diligence sampling effort randomly selected locations to undergo metals analysis and these three locations were not included.	TPHg was not detected at concentrations greater than laboratory reporting limits. TPHd and TPHmo were either non detected at concentrations greater than laboratory reporting limits or were not detected at concentrations exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil, except two samples collected from SS-31. Sample locations SS(31)-2 and SS(31)-40 contained TPHd and TPHmo at concentrations exceeding the 2007 ESLs for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). However, these concentrations do not exceed the 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). Therefore, no further evaluation is warranted. (Further investigation of boring location SS(31) was conducted as the 2007 ESLs for TPHd and TPHmo were exceeded, see Tables 3A, 3B, 3C and 3D.)	2.5	<50	<0.25

SS(78)-40	2/1/2007	40	soil					<0.99	<50	<0.23
EB35-2	1/10/2007	2	soil				TPHg was not detected at concentrations greater than laboratory reporting limits. TPHd and TPHmo were either non detected at concentrations greater than laboratory reporting limits or were not detected at concentrations exceeding the 2007 ESLs for residential, shallow soil, except for one sample. Sample location EB35-2 contained TPHd and TPHmo at concentrations exceeding the 2007 ESLs for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). The TPHmo concentration does not exceed the 2016 Tier 1 ESL (5,100 mg/kg), while the TPHd concentration does exceed the 2016 Tier 1 ESL (230 mg/kg). Therefore, further investigation was conducted. The lateral and vertical extent of this TPHd impact was delineated based on subsequent sampling activities, which included four step-out borings locations and two excavation areas (see Table 4). These additional sampling activities conducted in this area determined that the petroleum hydrocarbon impact is due to the presence of a subsurface asphalt layer, with limited leaching risk to deeper soils. Therefore, no further evaluation is warranted. The petroleum hydrocarbon impacted soil will be removed per the procedures specified in the Soil Management Plan.	**400**	3,400	<0.24

SS(22)-2	1/31/2007	2	soil	ENV 2/2007 [1]	An 2007 Additional Soil and Groundwater Investigation was performed for Legacy Partners Commercial, LLC, based on the findings of the previously completed Phase II Environmental Site Assessment. As part of this additional investigation, 17 due diligence soil borings were advanced at randomly selected locations throughout the site, with five of these borings (identified as "SS" locations) advanced in the parcels currently being evaluated. One additional boring, EB-35, was advanced as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Discrete soil samples were collected approximately every 10 vertical feet down to 40 feet deep, with the boring then further advanced deeper for the collection of a grab groundwater sample.	The soil and groundwater samples were analyzed for potential constituents of concern based on an evaluation of the site's historical operations and the findings of previously completed Phase I Environmental Site Assessments. In addition, the environmental sampling results obtained from the previously completed investigation activities were reviewed to both determine chemical constituents that warrant further evaluation (detected at concentrations exceeding regulatory screening levels) and those that do not warrant further evaluation (detected at concentrations below regulatory screening levels). This evaluation resulted in the samples being analyzed for: Total Petroleum Hydrocarbons as Gasoline (TPHg), as diesel (TPHd) and as Motor Oil (TPHmo); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); and California Title 22 Metals. Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations. Metals were not analyzed for in discrete soil samples collected from locations SS(33), SS(63) and SS(78) as the due diligence sampling effort randomly selected locations to undergo metals analysis and these three locations were not included.	BTEX were not detected at concentrations greater than laboratory reporting limits. Therefore, no further evaluation is warranted. (Further investigation of boring location SS(31) was conducted as the 2007 ESLs for TPHd and TPHmo were exceeded, see Tables 3A, 3B, 3C and 3D.)	<0.0049	<0.0049	<0.0049	<0.0099

SS(22)-2	1/31/2007	2	soil	ENV 2/2007 [1]	An 2007 Additional Soil and Groundwater Investigation was performed for Legacy Partners Commercial, LLC, based on the findings of the previously completed Phase II Environmental Site Assessment. As part of this additional investigation, 17 due diligence soil borings were advanced at randomly selected locations throughout the site, with five of these borings (identified as "SS" locations) advanced in the parcels currently being evaluated. One additional boring, EB-35, was advanced as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Discrete soil samples were collected approximately every 10 vertical feet down to 40 feet deep, with the borings then further advanced deeper for the collection of a grab groundwater sample.	The soil and groundwater samples were analyzed for potential constituents of concern based on an evaluation of the site's historical operations and the findings of previously completed Phase I Environmental Site Assessments. In addition, the environmental sampling results obtained from the previously completed investigation activities were reviewed to both determine chemical constituents that warrant further evaluation (detected at concentrations exceeding regulatory screening levels) and those that do not warrant further evaluation (detected at concentrations below regulatory screening levels). This evaluation resulted in the samples being analyzed for: Total Petroleum Hydrocarbons as Gasoline (TPHg), as diesel (TPHd) and as Motor Oil (TPHmo); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); and California Title 22 Metals. Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations. Metals were not analyzed for in discrete soil samples collected from locations SS(33), SS(63) and SS(78) as the due diligence sampling effort randomly selected locations to undergo metals analysis and these three locations were not included.	Metals were either non detected at concentrations greater than laboratory reporting limits or not exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil. Although soils samples collected from locations SS(33), SS(63) and SS(78) did not undergo metals analysis, as the metals results from the other two borings, SS(22) and SS(31), did not include a potential environmental concern, it is likely these three locations also do not have an environmental concern due to metals impacts. Therefore, no further evaluation was recommended. Additionally, metals concentration do not exceed 2016 Tier 1 ESLs (see notes regarding arsenic, chromium and nickel). Therefore, no further evaluation is warranted.		<0.98	4.7	200	<0.49	<0.49	14	54	31	<0.98	100	6.4	<2.0	<2.0	<0.98	28	43	0.06

SS(78)-W	2/1/2007	80	groundwater	ENV 2/2007 [1]	An 2007 Additional Soil and Groundwater Investigation was performed for Legacy Partners Commercial, LLC, based on the findings of the previously completed Phase II Environmental Site Assessment. As part of this additional investigation, 17 due diligence soil borings were advanced at randomly selected locations throughout the site, with five of these borings (identified as "SS" locations) advanced in the parcels currently being evaluated. One additional boring, EB-35, was advanced as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Discrete soil samples were collected approximately every 10 vertical feet down to 40 feet deep, with the borings then further advanced deeper for the collection of a grab groundwater sample.	The soil and groundwater samples were analyzed for potential constituents of concern based on an evaluation of the site's historical operations and the findings of previously completed Phase I Environmental Site Assessments. In addition, the environmental sampling results obtained from the previously completed investigation activities were reviewed to both determine chemical constituents that warrant further evaluation (detected at concentrations exceeding regulatory screening levels) and those that do not warrant further evaluation (detected at concentrations below regulatory screening levels). This evaluation resulted in the samples being analyzed for: Total Petroleum Hydrocarbons as Gasoline (TPHg), as diesel (TPHd) and as Motor Oil (TPHmo); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); and California Title 22 Metals. Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations. Metals were not analyzed for in discrete soil samples collected from locations SS(33), SS(63) and SS(78) as the due diligence sampling effort randomly selected locations to undergo metals analysis and these three locations were not included.	Metals were either non detected at concentrations greater than laboratory reporting limits or not exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for groundwater, current or potential drinking water source. Sample EB35-GW-68 was not analyzed for metals as downgradient migration of metals from the encountered petroleum product was not a potential concern. Therefore, no further evaluation was recommended. Additionally, no 2016 Tier 1 ESLs were exceeded. Therefore, no further evaluation is warranted.	<0.0047	<0.0047	0.18	<0.0047	<0.0019	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.0047	<0.00932	<0.00020

TABLE 3A
HISTORICAL ANALYTICAL DATA: SS-31 STEP-OUT BORINGS - ORGANIC COMPOUNDS - SOIL (mg/kg)
PLEASANTON, CALIFORNIA

Sample Location	Date Sampled	Sample Depth (feet bgs)	Matrix	Source of Sample Data	Purpose of Sampling	Rationale for Analyses	Result or Conclusion	Total Petroleum Hydrocarbons (TPH) (mg/kg)			VOCs	SVOCs	Organo-chlorine Pesticides	PCBs
								TPHd	TPHmo	TPHg				
SS-31(A)-5.5	7/18/2007	5.5	soil	LFR 10/2007 [1]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which included further investigation of one of the 2006 Phase II Environmental Site Assessment due diligence borings. Sample location SS-31 reported elevated petroleum hydrocarbon concentrations in the soil samples collected at depths of 2 feet and 40 feet. Therefore, four step-out borings were advanced approximately 75 feet to the north, south, east and west of the initial sample location to delineate the horizontal and vertical extent of the encountered petroleum hydrocarbon soil impact. Discrete soil samples were collected approximately every 5 vertical feet for the first 30 feet, and then approximately every 10 vertical feet until the bottom of the boring. In addition, as the deepest sample collected from the initial boring indicated impacted conditions, the step-out borings were advanced deeper for the collection of grab groundwater samples.	The previous discrete soil samples collected from SS-31 at 2 and 40 feet deep contained Total Petroleum Hydrocarbons as diesel (TPHd) and as Motor Oil (TPHmo) at concentrations exceeding regulatory screening levels. Therefore, the soil samples were analyzed for these two constituents, plus additional constituents associated with potential petroleum hydrocarbon impacts, including: Total Petroleum Hydrocarbons as Gasoline (TPHg); Volatile Organic Compounds (VOCs); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); Fuel Oxygenates; and Lead Scavengers. In addition, the first two upper soil samples from each boring were analyzed for: Polychlorinated Biphenyls (PCBs); Semivolatile Organic Compounds (SVOCs); and California Title 22 Metals. The grab groundwater samples were analyzed for a broad range of constituents associated with potential petroleum hydrocarbon impacts including: TPHg; TPHd; TPHmo; VOCs; BTEX; Fuel Oxygenates; and Lead Scavengers.	TPHg, VOCs, BTEX, Fuel Oxygenates, Lead Scavengers, SVOCs and PCBs were not detected in the soil and groundwater samples at concentration greater than laboratory reporting limits. TPHd and TPHmo were either not detected at concentrations greater than laboratory report limits or not detected at concentrations exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). TPHd and TPHmo were not detected in the groundwater samples at concentrations greater than laboratory reporting limits. Therefore, it was concluded that the any potential petroleum hydrocarbon impacts detected in the initial sampling location was limited in extent and no further evaluation was recommended. Additionally, no 2016 Tier 1 ESLs were exceeded. Therefore, no further evaluation is warranted.	<0.99	5.9 H	<1	ND [a]	ND [b]	ND [c]	ND [d]

SFBRWQCB Tier 1 ESL for Soil (February 2016, Revision 3)								230	5,100	100	-	-	-	0.25

feet bgs = feet below ground surface
mg/kg = milligrams per kilogram
H = heavier hydrocarbons contributed to the quantitation
L = lighter hydrocarbons contributed to the quantitation
Y = sample exhibits chromatographic pattern which does not resemble standard
Z = sample exhibits unknown single peak or peaks
"-" = sample not analyzed

a = Laboratory reporting limits are less than Tier 1 ESLs, except for: 1,2-dibromomethane (EDB); 1,2,-dichloroethane (EDC); and tert-butyl alcohol (TBA). The Tier 1 ESLs for these three VOCs are based on leaching to groundwater, drinking water, which is not an exposure concern for the Site. The laboratory reporting limits for EDC and EDB are less than the ESLs for direct exposure human health residential, shallow soil, which is an exposure concern for the Site. A direct exposure human health residential, shallow soil ESL for TBA is not established. The laboratory reporting limit for TBA is less than the ESL for odor nuisance residential, shallow soil.

b = Laboratory reporting limits are less than Tier 1 ESLs, except for: 2,4,5-trichlorophenol; 2,4,6-trichlorophenol; 2,4-dichlorophenol; 2,4-dintrophenol; 2,4-dinitroluene; 2-chlorophenol; 3.3'-dichlorobenzidine; benzo(a)pyrene; bis(2-chloroethyl)ether; bis(2-chloroisopropyl)ether; dibenz(a,h)anthracene; diethylphthalate; dimethylphthalate; naphthalene; and phenol. The Tier 1 ESL for 14 of these 15 SVOCs, except dibenz(a,h)anthracene, are based on leaching to groundwater, drinking water, which is not an exposure concern for the Site. The laboratory reporting limits for 12 and these 14 SVOCs, except bis(2-chloroethyl)ether and dimethylphthalate, are less than the ESLs for direct exposure human health residential, shallow soil. The Tier 1 ESL for dibenz(a,h)anthracene is based on direct exposure human health residential, shallow soil; however, this constituent is not suspected for the Site as it is a component of coal tars, shale oils and soots. The laboratory reporting limit for dibenz(a,h)anthracene is less than the ESL for odor nuisance residential, shallow soil. For bis(2-chloroethyl)ether, the laboratory reporting limit exceeds the direct exposure human health residential, shallow soil ESL; however, this constituent is not suspected for the Site as it is a solvent to purify oils and gases and cleaning of textiles. The laboratory reporting limit for bis(2-chloroehtyl)ether is less than the ESL for odor nuisance residential, shallow soil. For dimethylphthalate, no direct exposure human health residential, shallow soil ESL is established. The laboratory reporting limit for dimethylphthalete is less than the ESL for odor nuisance residential, shallow soil.

c = Laboratory reporting limits are less than Tier 1 ESLs, except for: dieldrin; endrin; heptachlor; heptachlor epoxide; and toxaphene. The Tier 1 ESLs for these five organochlorine pesticides are based on leaching to groundwater, drinking water, which is not an exposure concern for the Site. The laboratory reporting limits for these five organochlorine pesticides as less than the ESLs for direct exposure human health residential, shallow soil, which is an exposure concern for the Site.

d = Laboratory report limits are less than Tier 1 ESLs.

SS-31(A)-GGW	7/19/2007	65.2	groundwater	LFR 10/2007 [1]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which included further investigation of one of the 2006 Phase II Environmental Site Assessment due diligence borings. Sample location SS-31 reported elevated petroleum hydrocarbon concentrations in the soil samples collected at depths of 2 feet and 40 feet. Therefore, four step-out borings were advanced approximately 75 feet to the north, south, east and west of the initial sample location to delineate the horizontal and vertical extent of the encountered petroleum hydrocarbon soil impact. Discrete soil samples were collected approximately every 5 vertical feet for the first 30 feet, and then approximately every 10 vertical feet until the bottom of the boring. In addition, as the deepest sample collected from the initial boring indicated impacted conditions, the step-out borings were advanced deeper for the collection of grab groundwater samples.	The previous discrete soil samples collected from SS-31 at 2 and 40 feet deep contained Total Petroleum Hydrocarbons as diesel (TPHd) and as Motor Oil (TPHmo) at concentrations exceeding regulatory screening levels. Therefore, the soil samples were analyzed for these two constituents, plus additional constituents associated with potential petroleum hydrocarbon impacts, including: Total Petroleum Hydrocarbons as Gasoline (TPHg); Volatile Organic Compounds (VOCs); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); Fuel Oxygenates; and Lead Scavengers. In addition, the first two upper soil samples from each boring were analyzed for: Polychlorinated Biphenyls (PCBs); Semivolatile Organic Compounds (SVOCs); and California Title 22 Metals. The grab groundwater samples were analyzed for a broad range of constituents associated with potential petroleum hydrocarbon impacts including: TPHg; TPHd; TPHmo; VOCs; BTEX; Fuel Oxygenates; and Lead Scavengers.	TPHg, VOCs, BTEX, Fuel Oxygenates, Lead Scavengers, SVOCs and PCBs were not detected in the soil and groundwater samples at concentration greater than laboratory reporting limits. TPHd and TPHmo were either not detected at concentrations greater than laboratory report limits or not detected at concentrations exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). TPHd and TPHmo were not detected in the groundwater samples at concentrations greater than laboratory reporting limits. Therefore, it was concluded that the any potential petroleum hydrocarbon impacts detected in the initial sampling location was limited in extent and no further evaluation was recommended. Additionally, no 2016 Tier 1 ESLs were exceeded. Therefore, no further evaluation is warranted.	<50	<300	<50	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<10	<0.5	<0.5	ND [a]	-	-	-

a = Laboratory reporting limits were less than Tier 1 ESLs, except for: 1,2-Dibromoethane (EDB); carbon tetrachloride; 1,2-dibromo-3-chloropropane; hexachlorobutadiene; methylene chloride; naphthalene; and vinyl chloride. The Tier 1 ESLs for these five of these seven constituents, except carbon tetrachloride and vinyl chloride, are based on drinking water concerns (i.e., Maximum Contaminant Levels [MCLs]), which is not an exposure concern for the Site. The laboratory reporting limits for these five constituents are less than their next lowest ESLs. The Tier 1 ESLs for carbon tetrachloride and vinyl chloride are based on vapor intrusion for shallow groundwater (i.e., less than 10 feet bgs), which does not represent this sample that was collected 50 to 70 feet bgs. The laboratory reporting limits for these two constituents are less than the ESLs established for vapor intrusion for deep groundwater (i.e., the next lowest ESLs).

								Silver	Arsenic	Barium	Beryllium	Cadmium	Cobalt	Chromium	Copper	Molybdenum	Nickel	Lead	Antimony	Selenium	Thallium	Vanadium	Zinc	Mercury
SS-31(A)-5.5	7/18/2007	5.5	soil	LFR 10/2007 [1]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which included further investigation of one of the 2006 Phase II Environmental Site Assessment due diligence borings. Sample location SS-31 reported elevated petroleum hydrocarbon concentrations in the soil samples collected at depths of 2 feet and 40 feet. Therefore, four step-out borings were advanced approximately 75 feet to the north, south, east and west of the initial sample location to delineate the horizontal and vertical extent of the encountered petroleum hydrocarbon soil impact. Discrete soil samples were collected approximately every 5 vertical feet for the first 30 feet, and then approximately every 10 vertical feet until the bottom of the boring. In addition, as the deepest sample collected from the initial boring indicated impacted conditions, the step-out borings were advanced deeper for the collection of grab groundwater samples.	The previous discrete soil samples collected from SS-31 at 2 and 40 feet deep contained Total Petroleum Hydrocarbons as diesel (TPHd) and as Motor Oil (TPHmo) at concentrations exceeding regulatory screening levels. Therefore, the soil samples were analyzed for these two constituents, plus additional constituents associated with potential petroleum hydrocarbon impacts, including: Total Petroleum Hydrocarbons as Gasoline (TPHg); Volatile Organic Compounds (VOCs); Benzene, Toluene, Ethylbenzene and Xylenes (BTEX); Fuel Oxygenates; and Lead Scavengers. In addition, the first two upper soil samples from each boring were analyzed for: Polychlorinated Biphenyls (PCBs); Semivolatile Organic Compounds (SVOCs); and California Title 22 Metals. The grab groundwater samples were analyzed for a broad range of constituents associated with potential petroleum hydrocarbon impacts including: TPHg; TPHd; TPHmo; VOCs; BTEX; Fuel Oxygenates; and Lead Scavengers.	Metals were either not detected at concentration greater than laboratory reporting limits or not exceeding 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil, except for arsenic. However, arsenic was detected at concentrations within the ranges of natural background concentrations for soils in the San Francisco Bay Area. Therefore, no further evaluation was recommended. In addition, metals were not detected at concentrations exceeding 2016 Tier 1 ESLs (see notes regarding arsenic, chromium and nickel). Therefore, no further evaluation is warranted.	<0.25	8.3	260	0.4	<0.25	9.8	27	35	<0.2	40	6.9	0.95	<0.5	<0.5	39	46	0.13

TABLE 4
HISTORICAL ANALYTICAL DATA: EB-35 STEP-OUT BORINGS - ORGANIC COMPOUNDS - SOIL (mg/kg)
PLEASANTON, CALIFORNIA

Sample Location	Date Sampled	Sample Depth (feet bgs)	Matrix	Source of Sample Data	Purpose of Sampling	Rationale for Analyses	Result or Conclusion	Total Petroleum Hydrocarbons (TPH) (mg/kg)		
								TPHd	TPHmo	TPHg
EB-35(A)-3	7/17/2007	2.5	soil	LFR 10/2007 [1]	A 2007 Site Investigation was performed for Hanson Aggregates Northern California, which included further investigation of one of the borings advanced as part of the 2006 Phase II Environmental Site Assessment as part of a grouping of 13 borings to evaluate the extent of and potential downgradient migration from a zone of heavy, viscous, black, free phase petroleum product encountered in a parcel located to the south at a depth of approximately 33 to 40 feet. Sample location EB-35 reported elevated petroleum hydrocarbon concentrations in the soil sample collected at 2 feet deep. Therefore, four step-out borings were advanced approximately 25 feet to the north, south, east and west of the initial sample location to delineate the horizontal and vertical extent of the encountered petroleum hydrocarbon soil impact. Three discrete soil samples were collected from each boring down to a depths of 8.5 to 10 feet, with the two deeper soil samples submitted for laboratory analysis.	The previous discrete soil samples collected from EB-35 at 2 feet deep contained Total Petroleum Hydrocarbons as diesel (TPHd) at a concentration exceeding a regulatory screening level. Therefore, the soil samples were analyzed for TPHd and Total Petroleum Hydrocarbons as Motor Oil (TPHmo).	TPHmo was detected in the three shallower samples at a concentration exceeding the 2007 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil (500 mg/kg), while it was not detected at concentrations exceeding the 2007 ESL in the deeper soil samples. TPHd was detected in one of the shallow soil samples at a concentration exceeding the 2007 ESL for residential, shallow soil (100 mg/kg), but was not detected at concentrations greater than laboratory reporting limits in the three deeper samples. A black petroleum product was observed in three of the four step-out borings between approximately 2.5 and 4 feet deep, with this product assumed to be the same material that was sample in the initial boring that resulted in the elevated petroleum hydrocarbon concentrations. This product was observed to be dry, similar to asphalt concrete, with a trace of oil. Given these observations, it was concluded that the horizontal and vertical extent of the observed petroleum hydrocarbon impact is limited to the area of the initial boring location and has been delineated, and no further evaluation was recommended. The TPHd and TPHmo concentrations detected in the step-out boring samples do not exceed the 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). Therefore, no further evaluation is warranted.	-	-	-

T-35A	3/25/2008	2.5	soil	ENV 4/2008 [2]	A 2008 Soil Excavation was conducted in the location of previous borings EB-35 and EB-35(B) to further investigate the extent of petroleum hydrocarbon impacted soil. The excavation activities encountered an asphalt layer between approximately 2 and 3 feet deep in the excavation of EB-35, and between approximately 3.5 and 5.5 feet deep in the excavation of EB-35B. In order to evaluate potential leaching concerns associated with this layer, for excavation EB-35, one soil sample was collected from within this layer at 2.5 feet deep and a second soil sample was collected immediately below at 3.5 feet deep.	Each soil sample was analyzed for this area's constituents of concern, TPHd and TPHmo.	TPHd and TPHmo were detected in the soil sampled collected from within the asphalt layer exceeding 2007 ESLs for residential, shallow soil, however, the ESL was not exceeded in the soil sample collected immediately below this layer. Therefore, it was concluded that leaching of petroleum hydrocarbons from the asphalt layer to deeper soils does not appear to pose a risk and the petroleum hydrocarbon impacted conditions are limited to this layer. No further excavation or investigation activities were recommended. Alameda County Environmental Health (ACEH) agreed with this conclusion in a June 18, 2008, letter. The TPHd and TPHmo concentrations detected in the soil sample collected from within the asphalt layer exceeds the 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). As this area will be excavated as part of the site's development following the requirements of the Soil Management Plan, no further evaluation is warranted.	**3,500**	**45,000**	-

CPI	10/11/2006	3	soil	ENV 11/2006 [1]	A 2006 Phase II Environmental Site Assessment was performed for Legacy Partners Commercial, LLC. As part of this investigation, two samples were collected from the parcels currently being evaluated. Sample location CPI was collected from the discharge point to Cope Pond for a storm drain connected to an inlet that appeared to be located adjacent to a wash rack sump. Sample TRANS-D was collected from the location of a former transformer pad.	The soil sample was analyzed for constituents of potential concern associated with the wash rack operations, including: Total Petroleum Hydrocarbons as Gasoline (TPHg), as Diesel (TPHd) and as Motor Oil (TPHmo); and Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations.	TPHd and TPHmo were detected at concentrations not exceeding 2005 San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Environmental Screening Levels (ESLs) for residential, shallow soil (100 mg/kg and 500 mg/kg, respectively). Therefore, no further evaluation was recommended. The TPHd and TPHmo concentrations also do not exceed 2016 Tier 1 ESLs (230 mg/kg and 5,100 mg/kg, respectively). Therefore, no further evaluation is warranted.	93	360	<0.24
TRANS-D	9/29/2006	0.5	soil			The soil sample was analyzed for constituents of potential concern associated with the oil previously contain within former transformer pad, including: TPHd; TPHmo; and Polychlorinated Biphenyls (PCBs).	TPHmo was not detected at concentrations greater than laboratory reporting limits. TPHd was detected at a concentration not exceeding 2005 ESL for residential, shallow soil. Therefore, no further evaluation was recommended. The TPHd concentration also does not exceed 2016 Tier 1 ESL (230 mg/kg). Therefore, no further evaluation is warranted.	3.9	<50	-

CPI	10/11/2006	3	soil	ENV 11/2006 [1]	A 2006 Phase II Environmental Site Assessment was performed for Legacy Partners Commercial, LLC. As part of this investigation, two samples were collected from the parcels currently being evaluated. Sample location CPI was collected from the discharge point to Cope Pond for a storm drain connected to an inlet that appeared to be located adjacent to a wash rack sump. Sample TRANS-D was collected from the location of a former transformer pad.	The soil sample was analyzed for constituents of potential concern associated with the wash rack operations, including: Total Petroleum Hydrocarbons as Gasoline (TPHg), as Diesel (TPHd) and as Motor Oil (TPHmo); and Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). Analysis for the complete list of Volatile Organic Compounds (VOCs) was determined to be unnecessary as there is no evidence of chlorinated solvents or other volatile solvents being historically used, and the previous investigation findings that did include analysis for the complete list of VOCs reported non detectable concentrations.	BTEX was not detected at concentrations greater than laboratory reporting limits. Therefore, no further evaluation was recommended.	<0.0048	<0.0048	<0.0048	<0.0097	-
TRANS-D	9/29/2006	0.5	soil			The soil sample was analyzed for constituents of potential concern associated with the oil previously contain within former transformer pad, including: TPHd; TPHmo; and Polychlorinated Biphenyls (PCBs).	PCBs were not detected at concentrations greater than laboratory reporting limits. Therefore, no further evaluation was recommended.	-	-	-	-	<50

Subject: Facility Closure of Former Hanson Aggregates Radum Plant, 3000 Busch Road, Pleasanton, CA 94566

Dear Mr. Green,

Livermore-Pleasanton Fire Department (LPFD) staff has reviewed the Facility Closure Report for the Surface and Subsurface Feature Closure Report for the Former Hanson Aggregates Radum Facility at 3000 Busch Road, Pleasanton, California 94588, dated December 4, 2014, which addressed closure of former site operations including demolition and removal of buildings, surface and subsurface structures, and impacted soil in Areas of Concern (AOC) 1 through 5.

The results of demolition, excavation, removal/disposal of hazardous materials, and inspection observations made during closure activities at this site indicate that no further action will be required by LPFD with respect to those portions of the former Hanson Aggregates Radum Plant at this time. The fence surrounding the area with unfilled excavations in AOC 1 must remain and be maintained while the excavations exist.

With this letter and attached Unauthorized Release Form, oversight of any further investigation, cleanup and closure to address environmental contamination is transferred to the Alameda County Environmental Health LUFT/SLIC Program.

If you have any questions, please feel free to contact me at 925-454-2333 or ehung@lpfire.org.

Sincerely,

Eumy Hung
Hazardous Materials Inspector

BROWN AND CALDWELL

Mr. Marvin Howell
Director of Land Use Planning
Hanson America
Post Office Box 639069
San Diego, California 92163-9069 1044-130041.002

Subject: Summary of the Limited Subsurface Investigation Activities at the Hanson Aggregates West Radum Facility in Pleasanton, California

Dear Mr. Howell:

Brown and Caldwell (BC) has prepared this letter on behalf of Hanson Aggregates West (Hanson). This letter summarizes the soil sampling results from the limited soil investigation conducted at the Hanson American/Radum Plant located at 3000 Bush Road in Pleasanton, California (Site), Figure 1.

On May 8, 2006, BC collected soil samples from the Radum Plant to investigate possible chemical releases from sources such as leaking equipment, parts cleaning and lubrication, chemical storage, and equipment maintenance operations. The locations of these potential sources were identified in the Phase I ESA prepared by BC at the facility, June 2006.

The aggregate quarrying and processing infrastructure has been decommissioned. There are five permanent structures on the property located south of Busch Road and El Charro Road. They include a single story office building, a heavy equipment shop building, a warehouse and storage area, an oil storage shed, and a truck shop building (currently leased to Pleasanton Garbage Services). The former hot mix asphalt plant has been dismantled on the southwest corner of the Site. There are three office trailers on the premises.

INVESTIGATION AREAS

The following areas were investigated based on findings presented in BC's Phase I investigation (BC 2006) and/or Site visit on April 27, 2006:

- Subsurface soil on the perimeter of the southwestern portion of the Site asphalt.

- Subsurface soil at the location of the former truck spray rack north of the hot mix asphalt plant.
- Subsurface soil, sediment, and surface water in the storm water retention basin on the north side of Busch Road.
- Subsurface soil near the oil water separator at the equipment maintenance building.
- Subsurface soil near the drum storage area at the equipment maintenance building.

These locations are shown on Figure 2.

Note: The center of the hot mix asphalt plant was not investigated due to the obvious oil-saturated soil located in the area for which remedial work is already being planned.

FIELD INVESTIGATION ACTIVITIES

Field activities were conducted in accordance with the site-specific health and safety plan, which follows Occupational Safety and Health Administration regulations. BC contacted Underground Service Alert and subcontracted a private underground utility locating service to identify and mark underground utilities in the investigation areas before work began.

On May 8, 2006, BC personnel collected soil samples from selected depths at 6 soil boring locations at the Site (Figure 2). The soil borings were advanced using a GeoProbe rig and extended to total depths of approximately 4 to 11 feet below ground surface (bgs). Soil samples were collected from the GeoProbe rig using acetate liners. The liners were opened for visual inspection of the soil, volatile organic vapor screening using a field photoionization detector (PID), and sample collection. Soil samples were collected for chemical analysis by cutting 6-inch sections of the acetate liner. The ends were then sealed with Teflon sheets and plastic caps, labeled, and placed in zip-lock bags in an ice-chilled cooler for transport to Sequoia Analytical, a California state-certified analytical laboratory, following strict chain-of-custody protocol. A BC field geologist/engineer prepared a soil lithologic log to document lithology using the Unified Soil Classification System. PID readings, visual observations and soil sample depths were recorded on the logs, which are maintained in the BC project file.

Samples were selectively analyzed for total petroleum hydrocarbons as gasoline (TPHg), as diesel (TPHd), and as motor oil (TPHmo), and total recoverable petroleum hydrocarbons (TRPH) using EPA Method 8015, and volatile organic compounds (VOCs) using EPA Method 8260.

ANALYTICAL RESULTS

Analytical results for petroleum hydrocarbons are presented in Table 1 and on Figure 3. VOCs were not detected above laboratory analytical detection limits in the soil and water samples collected. TPH results were compared to current regulatory screening levels and results are summarized below. Laboratory analytical reports are included in Attachment A.

COMPARISON OF RESULTS TO REGULATORY SCREENING LEVELS

TPH soil results from the Site were compared to San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) which help asses the need for further investigation and/or soil remediation. These ESLs include concentration values for both residential and commercial/industrial site use. The ESLs are presented in a technical document prepared by the staff of the RWQCB entitled, "Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater" (Interim Final–February 2005). Volume 1 of that document presents lookup tables of conservative ESLs for chemicals commonly found at sites with contaminated soil and groundwater. Site analytical results were compared to shallow soil (<3 meter) values presented in Table A-1 for residential and commercial/industrial land use where potentially affected groundwater is a current or potential drinking water resource.

Analytical results from the water sample collected in the storm water retention basin were compared to ESLs for surface water in fresh water habitats. Specifically, concentrations were compared to the "Fresh Water Aquatic Habitat Goal," "Drinking Water (toxicity)," and the "Ceiling Value (Taste & Odors, etc.)" values presented in the RWQCB document mentioned above.

TOTAL PETROLEUM HYDROCARBONS IN SOIL

The range of TPHg, TPHd, TPHmo, and TRPH concentrations in soil samples and the corresponding ESL screening levels are presented in Table A below.

Table A. TPH Concentration Ranges and Screening Criteria

	TPHg (mg/kg)	TPHd (mg/kg)	TPHmo (mg/kg)	TRPH (mg/kg)
Concentration Range	<1.0 to 16	3.3 to 6,600	11 to 7,300	<50 to 1,400
Residential ESL	100	100	500	500
Industrial/Commercial ESL	100	100	1,000	1,000
Chemical parameter list on ESL Table	TPHg	TPHmd	TPHmd	TPHr

Notes:
TPHg = TPH as gasoline
TPHmd = TPH middle distillate
TPHr = TPH residual fuels
TRPH = Total recoverable petroleum hydrocarbons

As shown on Table A, detected TPHg concentrations were compared to the ESLs for TPH as a gasoline, detected TPHd concentrations were compared to the ESL for TPH as middle distillate, and detected TPHmo and TRPH concentrations were compared to the ESLs for TPH residual fuel. TPHd, TPHmo, and/or TRPH were detected above their Residential and Commercial/Industrial ESLs in three soil sample locations. TPHg was detected in two soil samples but concentrations are below the Residential and Commercial/Industrial ESLs. Petroleum hydrocarbon analytical data are summarized in Table 1 and presented on Figure 3.

Areas with TPH concentrations above ESLs include the former truck spray rack area, the drum storage area, and the storm water retention basin. These areas are presented on Figure 4. Boring-1 (B-1) was drilled in the drum storage area and Boring-3 (B-3) was drilled in the spray rack area. At location B-1 TPHd, TPHmo, and TRPH were detected at concentrations of 890 mg/kg, 680 mg/kg, and 1,400 mg/kg, respectively. At location B-3 TPHd and TPHmo were detected at concentrations of 6,600 mg/kg and 7,300 mg/kg, respectively. A sediment sample was collected from the storm water retention basin and TPHd and TPHmo were detected at a concentration of 530 mg/kg and 1,500 mg/kg, respectively.

TOTAL PETROLEUM HYDROCARBONS IN SURFACE WATER

A water sample from the storm water retention basin was analyzed for TPHg, TPHmo, TPHd, and VOCS. TPHg, TPHmo, and VOCs were not detected in the water sample. The TPHd concentration was below the "Fresh Water Aquatic Habitat

Goal" (640 µg/l) and "Drinking Water (toxicity)" (210 µg/l) but was above the "Ceiling Value (Taste & Odors, etc.)" (100 µg/l).

CONCLUSIONS AND RECOMMENDATIONS

Soil samples were selectively analyzed for TPHg, TPHd, TPHmo, TRPH, and VOCs based on the reported chemical uses determined in the Phase I ESA. VOCs were not detected in the samples submitted for analysis. TPH results were compared to residential ESLs and commercial/industrial ESLs for shallow soil in areas where groundwater is a potential source of drinking water. TPHg, TPHd, TPHmo, and/or TRPH were detected above their ESLs in samples collected from the former truck spray rack area, the drum storage area, and the storm water retention basin.

A surface water sample was also collected from the storm water retention basin and was analyzed for TPHg, TPHmo, TPHd, and VOCs. TPHg, TPHmo, and VOCs were not detected in the sample although low levels of TPHd were detected. The TPHd concentration in the water sample was compared to the Surface Water ESLs for protection of Fresh Water Aquatic Habitats. The TPHd concentration was below the ESL. Therefore, further evaluation of storm water retention basin water is not recommended.

BC does recommends further evaluation of the elevated TPHd concentrations detected in the former truck spray rack area and near the drum storage area to better estimate the lateral and vertical extent of petroleum-affected soil in these areas (Figure 4). The collection of additional sediment samples is also recommended in storm water retention basin to estimate the extent of petroleum-affected sediment around the storm drain outfall.

Removal of the TPH affected soil in the former truck spray rack area, and drum storage area would likely be required by regulatory agencies prior to residential site re-development. The additional soil investigation activities recommended above could be performed at the same time that remedial work is conducted in the hot mix asphalt plant area. The further evaluations could be immediately followed by removal of affected soil, which could expedite site remedial activities in preparation for future sale of the property.

Brown and Caldwell also recommends that a Work Plan for soil remediation be prepared and presented to the RWQCB to request their approval and oversight of the work, so that a "No Further Action" letter can be issued after completion of the soil removal activities. Investigation of ground water quality in these areas may also be warranted depending on the vertical extent of TPH affected soil encountered there.

If you have any questions, please call Ms. Lisa Ehlers (925) 210-2341 or Mr. Andy Lojo (925) 210-2287.

Very truly yours,

BROWN AND CALDWELL

(1) Residential Land Use Environmental Screening Level for Shallow Soils (less than or equal to 3 meters bgs) where Groundwater IS a Currecnt or Potential Source of Drinking Water presented on Table A.

(2) Commercial/Industrial Land Use Environmental Screening Level for Shallow Soils (less than or equal to 3 meters bgs) where Groundwater IS a Currecnt or Potential Source of Drinking Water presented on Table A.

Acronyms/Abreviations

TPHg = total petroleum hydrocarbons as gasoline

TPHd = total petroleum hydrocarbons as diesel

TPHmo = total petroleum hydrocarbons as motor oil

TRPH = total recoverable petroleum hydrocarbons

VOCs = volital organic compounds

mg/kg = milligrams per kilogram

bgs = below ground surface

bold = results above Commercial/Industrial ESL

ND = Not detected above various laboratory reporting limits

-- = not analyzed or not applicable

[a] = sample analyzed outside of hold time.

RE: Hanson - Martinez, CA
Work Order: MPE0524

Enclosed are the results of analyses for samples received by the laboratory on 05/08/06 18:03. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Tim Costello
Client Services Department Manager

CA ELAP Certificate # 1210

Notes and Definitions

S08	The surrogate recovery for this sample is not available due to sample dilution which was required by high analyte concentration and/or matrix interference.
S04	The surrogate recovery for this sample is above control limits due to interference from the sample matrix.
QM02	The spike recovery was below control limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
HT-05	This sample was requested to be analyzed beyond the EPA recommended holding time.
HT-04	This sample was analyzed beyond the EPA recommended holding time.
HT-01	This sample was received beyond the EPA recommended holding time.
HC-12	Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. Unless otherwise stated, results are reported on a wet weight basis. This analytical report must be reproduced in its entirety.

1.0 SITE BACKGROUND INFORMATION

The Site is located at 3000 Busch Road, Pleasanton, California (Figure 1) and consists of a total of approximately 1,050 acres, of which approximately 320 acres are developable land. The Site is currently developed with seven structures: a 12,000 sq. ft. single story office building where Hanson maintains offices, a 12,150 sq. ft. heavy maintenance shop, two open warehouse structures totaling approximately 10,400 sq. ft., a 900 sq. ft. lubricant storage shed, a 7,200 sq. ft. truck maintenance shop, and two temporary office trailer buildings. Beginning in 1938 the Site was mined for its aggregate resources by Kaiser Sand and Gravel. Initially mining operations were carried out in the southwestern portion of the site and later expanded to the east, northeast, and northwestern portions of the Site. As mining progressed from one area to the next, mined out areas were either backfilled with rubble, debris, and mine waste, or used as dispos.al ponds for water, silt, and sand from aggregate washing operations and new pit dewatering. In 1991 the mining operation was purchased by Hanson Aggregates and operated until 2001 at which time the aggregate resource was considered mined out. During various periods of operation of the facility a concrete batch plant and an asphalt plant were operated on portions of the Site. Hanson currently maintains a single story office building, a heavy equipment maintenance shop, a lube shed, and several storage buildings on the Site. The Pleasanton Garbage Transfer Facility leases and occupies a portion of the Site along its western border where they perform maintenance on their fleet of vehicles.

Currently there are three large ponds, Lake I, Lake H, and Cope Pond, and one small stormwater retention pond on the Site. The total area of the ponds is approximately 730 acres. The dry land portions of the Site consist primarily of areas that have been mined for aggregate and backfilled with spoil from mining in the current pond areas and material from unknown outside sources. The remains of mining building foundations and concrete slabs are common in the southwestern areas of the site. Piles of broken concrete from building demolition also occupy the southeastern portions of the Site. Large piles of unused aggregate occupy southern portions of Site. The current operation areas of the Site (Hanson's office, maintenance, and warehouse, and the idle truck maintenance shop) are all located in the southwestern portion of the Site.

The Site is generally flat except where mining operations have created large depressions that are currently occupied by ponds, areas where large piles of aggregate have been left in place, and areas where foundations have been removed and large piles of concrete have been stored. The general surface elevation, except in the pond areas, varies from approximately 360 to 375 feet above mean sea level.

2.0 SUMMARY OF PHASE I ESA FINDINGS

In September 2006 ENV America performed a Phase I ESA of the Site. This Phase I identified several known or suspect environmental conditions listed below.

- Underground Storage Tanks (USTs) Removed in 1995 - Soil contamination was encountered during the removal of four USTs in 1995 under a permit from the Livermore-Pleasanton Fire Department. Petroleum hydrocarbon detection in confirmation samples did not exceed 100 mg/kg. However, no database entry or letter from the regulating agency has been found indicating the case is closed, therefore, these former tank locations have to be considered potential environmental conditions.
- USTs Removed in 2003 - Two USTs were removed from north of the idle truck maintenance shop in 2003. Low concentrations of petroleum hydrocarbons were left in place in the soil and the environmental consultant recommended no further investigation. Action from the regulatory agency is pending and, as such, this site constitutes a current *recognized environmental condition.*
- Existing Aboveground Storage Tanks (ASTs) – The ASTs adjacent to the heavy equipment shop have not been decommissioned to date and still contain waste oil and antifreeze. Until they are emptied and decommissioned and the soil beneath the concrete they are sitting on can be sampled, they represent potential environmental conditions.
- Lube Shed – Total Petroleum Hydrocarbon (TPH) constituents above Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) were detected in soil samples from borings adjacent to the lube shed in 2006. This soil is still in place, therefore, this site represents a *recognized environmental condition.*
- Spray Rack - TPH constituents above RWQCB ESLs were detected in soil samples from borings drilled in the spray rack area in 2006. This soil is still in place, therefore, this site represents a *recognized environmental condition.*
- Stormwater Retention Pond - TPH constituents above RWQCB ESLs were detected in a surface water sample from the stormwater retention pond in 2006. Until this condition is shown to be abated, this site represents a *recognized environmental condition.*
- Wash Rack – Visible oil and grease staining are present at the surface in the wash rack area, the wash rack sump, and the oil/water separator and water recycling system. This site constitutes a potential *recognized environmental condition.*
- Former Asphalt Plant – Because of the nature of the material used at the asphalt plant, which included paving oil, greases, lubricants, and fuels, and the presence of paving oil on the ground surface at the plant, and the presence of a pile of visibly contaminated soil at the plant site, this site represents a *recognized environmental condition*.

- Contaminated Soil Area – An area of soil contaminated with TPH has been documented to exist on the southwestern Site border between the Hanson and Kewit properties. The regulatory status of this site is currently unknown, therefore, this site constitutes a *recognized environmental condition*.
- Union Pacific Railroad - Railroads are frequently sources of contaminants. The proximity of the Union Pacific Railroad tracks adjacent to the southern border of the site constitutes a potential environmental condition.
- Concrete Batch Plant – Cement used in concrete is a known source of high pH. In addition, lubricants used at the plant and an associated UST that was removed from the plant in 1995 that had low concentrations of petroleum hydrocarbons on the soil, contribute to this site having potential environmental conditions.
- Plastic Tanks North of Former Concrete Batch Plant Location – The disintegrating plastic tanks north of the former concrete batch plant that have leaked an unknown quantity of plasticizer onto the ground constitute a *recognized environmental condition*.
- Mining Facilities – Former mining facilities including the rod mill, the crusher, the former waste oil AST, the lube plant storage shed and the former warehouse all are documented to have used or stored petroleum lubricants or, in the case of the former warehouse, potentially given off heavy metals during the welding that was performed at that site. These sites constitute potential environmental conditions.
- Idle Truck Maintenance Area – Because of the nature of the operations performed in the idle truck maintenance area and the fuels, lubricants, and solvents typically used in such operations and because of the soil staining around the facility, a potential environmental condition exists at this facility.
- Transformers – There are four former pad-mounted transformer locations and one current pad-mounted transformer on the site. Because these transformers contained transformer oil and, in some cases, PCBs, until demonstrated otherwise, they constitute potential environmental conditions.
- Vulcan Materials Company (VMC) Runoff Area – The area in the southeast corner of the Site adjacent to the VMC property reportedly has received runoff from the VMC property. Because a previous Phase I Environmental Site Assessment conducted at the VMC property indicated the presence of known environmental conditions associated with the VMC site, it is possible that runoff from that property could have carried contaminants onto the Site. Until documented to the contrary, a potential environmental condition exists in the runoff area.
- Stormwater Drain Inlet Adjacent to the Wash Rack Sump – If, as appears to be the case, water from the wash rack is entering the storm drain inlet, and if this inlet drains to Cope Pond as indicated in one document reviewed, the area around the discharge would

constitute a potential environmental condition. The discharge point of this storm drain needs to be confirmed.

- Production Well and Monitoring Well – A 640-foot deep, 14-inch diameter production well and a 2-inch diameter, approximately 100-foot deep monitoring well exist on the Site. The locations of these wells are shown on the figure in Exhibit B. Both of these wells will require proper abandonment.

3.0 PROJECT OBJECTIVES AND SCOPE OF WORK

ENV America, upon authorization from Legacy, performed a Phase II subsurface environmental investigation at the Site during September/October 2006 based on the Phase I ESA findings presented above. The objectives of this subsurface investigation are to 1) characterize the soil conditions at each of the areas outlined in Section 2.0 and in areas subsequently assessed as potentially contaminated based on initial sample results; 2) characterize the groundwater conditions specifically at the UST locations around the idle truck maintenance shop; and 3) characterize the groundwater in Site locations where soil conditions observed in the field were considered to potentially cause detectable contaminant impacts to groundwater.

3.1 Scope of Work

The initial Phase II scope of work included excavating and collecting soil samples from 20 shallow test pits, drilling six shallow soil borings to collect soil samples, and two deeper soil borings to collect samples of soil and groundwater. In addition, three shallow soil samples were collected from each of the retention ponds and from the southeast corner of the Site. Five shallow soil samples were also collected from four former and one present transformer locations, two shallow soil samples were collected from locations along the Union Pacific Railroad, and two composite samples were collected from a slag pile and adjacent affected soil located in the southeast corner of the Site. Because contaminants were detected at concentrations above RWQCB ESL residential standards in a number of samples, additional investigation was needed to assess the extent of the contaminants. Additional samples of soil and water also needed to be collected in areas where newly acquired Site information indicated contaminants might exist.

One sediment sample was collected from a corrugated metal pipe leading from the storm drain adjacent to the wash rack toward Cope Pond. One shallow soil sample was collected from a location where old drums were found and one was collected from a former warehouse location. One sample of concrete was collected from the former concrete batch plant area. Five additional soil samples were collected from the retention pond to investigate the extent of elevated metals concentrations detected in one of the three original samples collected in the pond. Water samples were collected from the two existing sanitary sewer tanks. One new boring was drilled to assess soil conditions adjacent to a former railroad siding encountered below the surface in the asphalt plant/spray rack area during test pit excavation activities. Six new borings were drilled in the vicinity of the former asphalt hot mix plant and spray rack to assess the lateral extent of contaminants detected in those areas. Two groundwater samples were also collected to evaluate whether the groundwater has been affected by the contaminants detected in the soil.

During the drilling of boring *EB-14* to collect a groundwater sample, a zone of heavy, viscous, black, free phase petroleum product was encountered at a depth of 33½ feet. Thirteen new borings were drilled to evaluate the extent of this free product in the soil. Groundwater samples were collected from two of these new borings. One boring was also drilled in the vicinity of the heavy equipment maintenance shop to assess soil and groundwater conditions within an area reportedly used as a disposal pond during mining operations.

3.2 Project Coordination

Prior to initiating drilling, excavation, and sampling activities, ENV America coordinated the following tasks:

- Coordination with Underground Services Alert (USA) to clear drilling locations for underground utilities at proposed drilling locations;
- Coordination with a private utility locator to additionally screen for underground utilities at proposed drilling and digging locations on-Site; and
- Preparation of a Site-specific Health and Safety Plan for ENV America personnel.

3.3 Investigation Procedure Summary

ENV America coordinated the drilling of 34 soil borings with both truck and track-mounted drill rigs and the excavation of 20 test pits with a backhoe and an excavator for the purposes of collecting and analyzing the Site soil and groundwater from the areas of concern outlined in Section 2.0 and subsequently discovered areas of concern. Soil was continuously screened and logged in the field by an ENV America geologist for indications of the presence of contaminants as suggested by soil odor and/or color indicative of contamination, and with continuous use of a photo-ionization detector (PID) that screens for volatile organic compounds. After field screening, soil samples were selected for submittal for laboratory analysis. Exhibit A contains notes and boring logs describing soil conditions during backhoe excavation and drilling activities. Twenty-seven shallow soil samples were collected by hand in 10 targeted areas or facility types, e.g., the retention pond, transformers, etc. The soil samples collected were placed in appropriate sample containers and put in an iced cooler for delivery to STL Laboratories (STL) in Pleasanton, California.

"Grab" groundwater samples were collected from six of the soil boreholes, two at the UST locations adjacent to the Idle Truck Maintenance Shop (locations *EB-1, EB-2*) and four in the vicinity of the former hot mix asphalt plant and spray rack (*EB-15, -16, -22,* and *-29*). The

groundwater samples were collected through the augers from these six borings using disposable bailers and placed in appropriate sample containers and put in an iced cooler for delivery to STL.

All soil and water samples retained for laboratory analysis were assigned a unique identification label, placed into an ice-filled cooler, and delivered under chain of custody protocol to Severn Trent Laboratories in Pleasanton, California, a State-of-California certified laboratory.

3.4 Investigation Procedures

Test Pits

Test pits were excavated using a backhoe fitted with a three-foot wide bucket. Soil samples were taken by pushing laboratory-provided glass jars into the middle of the soil in the backhoe bucket. Each test pit was backfilled and compacted with the soil excavated from the test pit.

Boreholes

Boreholes were installed with a Mobile B-61, Mobile B-53, CME-75, CME-D57, or CME Rhino hollow-stem auger drill rig. The augers were decontaminated between each sampling location with a pressure washing steam cleaner and all down-hole sampling equipment was decontaminated prior to each use with liquinox detergent and triple washing/rinsing techniques. The soil was collected in new six-inch by 1.5-2.5 inch brass liners fitted into a split-spoon sampler. Soil samples retained for laboratory analysis were sealed with teflon sheets and tightly fitting end caps. Boreholes with a total depth of greater than 20 feet were backfilled by tremie-pipe techniques and type I/II neat cement grout; boreholes less than 20 feet of total depth were backfilled with type I/II neat cement grout by free-pouring the grout.

3.4 Sampling Locations

The following summarizes the investigations performed at each sampling location. The analytical tests performed and results of each sample analysis are presented in Table 1; Figure 2 shows the Site sampling locations while Figure 3 shows the sampling locations within the former asphalt plant area.

Former Asphalt Plant Area

Spray Rack

Initially 11 soil samples were collected and analyzed from four test pits excavated at the Spray Rack area, the area immediately north of the asphalt plant former operations area (test pits *SR-1, SR-2, SR-3*, and *SR-4*). Subsequently, 16 soil borings were drilled in the area of the spray rack

and the area to the east of the spray rack and 27 soil samples were analyzed from those borings to further evaluate the extent of petroleum hydrocarbon contaminants detected in those areas (see Figure 3). Borings *EB-21* through *EB-26* were drilled specifically to visually identify the extent of free phase petroleum product and no soil samples from those borings were analyzed in the laboratory. Grab groundwater samples were collected from borings *EB-15* and *EB-22* to evaluate whether groundwater in those areas is affected by contaminants found in the adjacent soil.

Paving Oil

Nine soil samples were collected and analyzed from two test pits and two soil boreholes adjacent to the paving oil containment structure (boreholes *EB-9, EB-10* and test pits *PO-1, PO-2*).

Asphalt Plant

Seventeen soil samples were collected and analyzed from six test pits and two boreholes in the general asphalt plant operational area (test-pits *AP-1, AP-1a, AP-2, AP-3, AP-4, AP-5* and boreholes *EB-12* and *EB-13*). Subsequently, borings *EB-16* through *EB-19* were drilled and sampled to further delineate soil contamination in the former asphalt plant area, and, in the case of *EB-19*, the southern extent of the deep soil contamination zone. A grab groundwater sample was collected from boring *EB-16* to evaluate whether groundwater in that area is affected by contaminants found in the adjacent soil. Boring *EB-29* was drilled approximately 200 feet east of the asphalt plant to assess soil and groundwater conditions southeast of the area of deep soil contamination. Two soil samples and a grab groundwater sample were analyzed from that boring.

Contaminated Soil Area

Findings from the Phase I ESA conducted by ENV America identified an area to the southwest of the asphalt plant where contaminated soil was reported to be present. Eight soil samples were collected and analyzed from two test pits (*CS*) and one borehole (*EB-11*) in this location. Subsequently borings *EB-17* and *EB-18* were drilled south and southeast of this area to further evaluate the extent of soil contamination in those directions.

Other Site Locations

Idle Truck Maintenance Shop

Five 5 boreholes were drilled in the vicinity of the Idle Truck Maintenance Shop. According to information presented in a previous environmental assessment of the Site[1], three 12,000-gallon diesel USTs, two 10,000-gallon gasoline USTs, one 5,000 gallon “new oil” UST, and one 1,000-gallon waste oil UST were reported to have existed at various locations around the Idle Truck

Maintenance Shop. Seventeen soil samples and two groundwater samples were collected and analyzed from the five borings drilled in these locations (borings *EB-1, EB-2, EB-6, EB-7*, and *EB-8*) (Table 1; Figure 2).

Heavy Equipment Maintenance Shop/Lube Shed

The heavy equipment maintenance shop is currently in use to service and repair large industrial vehicles. Various lubricants, solvents, and oils are stored and used at this location, including waste oil and antifreeze. Twelve soil samples were collected and analyzed from one test pit and three boreholes in this area (boreholes *EB-3, EB-4, EB-5*, and test pit *LS*). A soil boring (*EB-31*) was also drilled approximately 100 feet south of the heavy equipment maintenance shop to assess soil conditions in the vicinity of an old disposal pond that reportedly existed in that area.

Plant Lube Storage Shed/Warehouse (demolished/gone)

Four soil samples were collected and analyzed from two test pits at the plant lube storage shed/warehouse area (test pits *WH, PL*).

Plastic Tanks North of Former Concrete Batch Plant Location

Two soil samples were collected and analyzed from one test pit at the location of two plastic tanks that once contained plasticizers. A shallow soil sample was also collected from a stained area immediately adjacent to one of the tanks.

Rod Mill/Waste Oil/Crusher Location (demolished/gone)

Five soil samples were collected and analyzed from three test pits from this area (test pits *RM, WO, CR*).

Concrete Batch Plant (demolished/gone)

Two soil samples were collected and analyzed from one test pit at the former concrete batch plant (test pit *CB*). A sample of concrete was also collected from this area and analyzed for PCBs and metals, including hexavalent chromium.

Septic Systems

Liquid samples were collected from two on Site septic tanks and analyzed (*SAN-1, SAN-2).*

Transformers

One shallow soil sample was collected and analyzed from each of five transformer locations (shallow soil sampling locations *TRANS-A, TRANS-B, TRANS-C, TRANS-D,* and *TRANS-E*).

VMC Runoff

Three shallow soil samples were collected and analyzed from three locations within the VMC Runoff area (shallow soil sampling locations *RO-A, RO-B, and RO-C*).

Stormwater Retention Pond

Three shallow soil samples were collected and analyzed from the shores of the stormwater retention pond (shallow soil sampling locations *RP-A, RP-B,* and *RP-C*). Subsequently, six additional samples were collected from the pond to assess the extent of metals contamination detected in one of the initial samples.

Other Site Ponds

Water samples were collected and analyzed from Lake H and Lake I for concentrations of dissolved metals.

Railroad Locations

One soil sample was collected from each of two shallow test pits excavated along the southern boundary of the Site adjacent to the active Union Pacific Railroad (test pits *RR-1, RR-2*). One soil sample was collected and analyzed at a location in the Spray Rack area where evidence of a former railway was encountered approximately two feet below ground surface (borehole *RR-3*).

Slag Stockpile

Three soil samples were collected from and adjacent to the slag stockpile located at the southeastern corner of the Site (*COMPSP-1, COMPSPA-1, and SLAG1a*).

Corrugated Metal Pipe

One sediment sample (*CPI*) was collected from a corrugated metal pipe that reportedly transmitted water from the storm drain adjacent to the wash rack to Cope Pond.

Abandoned Drums

One soil sample (*DR*) was collected from an area where a number of old decaying drums were located, east of the Hanson office building.

4.0 RESULTS OF SOIL AND WATER SAMPLES

Analytical results for soil samples and one concrete sample are presented in Table 1. Table 2 presents results for groundwater samples, Lake H and I samples, and septic tank samples. Table 1 lists the unique sample identifications assigned to each sample. The prefix indicates the sampling location and the suffix indicates the depth in feet below ground surface (e.g., *LS-8* refers to a sample from the *lube shed* at *eight* feet below ground surface. A note on Table 1 defines the prefix abbreviations).

4.1 Soil Results Summary

The soil analytical results have been compared to ESLs for shallow (10 feet or less) residential soil established by the RWQCB and, based on those comparisons, areas that will require remediation to comply with the established standards were recognized. Based on the analytical results for the samples collected from the borings and test pits, the approximate lateral and vertical extent of soil exceeding the ESL standards were estimated. ESLs applicable to shallow soil in a residential setting where groundwater is a current or potential drinking water resource were used. ESLs for TPH-g, -d, and -mo under this scenario are 100 mg/kg, 100 mg/kg, and 500 mg/kg, respectively. Applicable ESLs for metals include: arsenic @ 5.5 mg/kg, barium @ 750 mg/kg, cobalt @ 40 mg/kg, chromium (total) @ 58 mg/kg, copper @ 230 mg/kg, nickel @ 150 mg/kg, vanadium @ 150 mg/kg, and zinc @ 600 mg/kg.

Soil in the vicinity of the hot mix asphalt plant and the spray rack and the area east of the spray rack appear to be the most affected by the industrial operations that were carried out at the Site. TPH-g, -d, and –mo, and PNAs have been detected at concentrations above residential ESLs in this area on two levels. Areas of relatively shallow (up to approximately 18 feet in depth) soil contaminated with TPH constituents detected at concentrations above residential ESLs were encountered in the spray rack, hot mix asphalt plant areas, and in the area south of the hot mix asphalt plant. These areas are shown on Figure 3 as blocks proposed for excavation with the approximate excavation depth shown. An area of deeper soil contaminated with TPH constituents detected at concentrations above residential ESLs was encountered in the spray rack area and extending to the east from the spray rack area, also shown on Figure 3. The depth of this contaminated soil zone extends between approximately 30 feet to 40 feet below the ground surface and includes areas of smelly heavy, black, viscous free phase petroleum product. This product was identified visually in borings EB-*14, -20, -21, -23, -24, -25, -26,* and -*33*. The source of the free phase product has not been definitively established, although a similar appearing free phase petroleum product can be seen on the surface in the well of the old asphalt plant scale. To

date, a direct connection between the product in the scale well and the product in the ground has not been established.

Other areas where contaminants have been detected at concentrations exceeding ESLs include the lube shed area, an isolated area adjacent to the Union Pacific Railroad, and an area in the southwest corner of the site; all were affected by TPH constituents. In addition, the metals chromium and nickel were detected at concentrations above their respective ESLs and magnesium was detected at an elevated concentration in one sample collected from the south side of the retention pond. Additional sampling in the retention pond indicates that the area of elevated metals contamination is of limited extent.

4.2 Water Results Summary

Water samples from Lakes H and I were analyzed for metals. The only metal detected above the reporting limit is barium, detected at low concentrations in both samples. Water samples were also collected from two existing septic tanks on Site, one adjacent to Hanson's office building and one southeast of the idle truck maintenance shop. Low to moderate concentrations of TPG-g, -d, and –mo were detected in the sample from the tank southeast of the truck maintenance shop. Low concentrations of TPH-d, benzene, ethylbenzene, and chlorobenzene were detected in the septic tank sample from adjacent to the Hanson offices.

Groundwater samples were collected from six soil borings, two in the vicinity of the idle truck maintenance shop where underground storage tanks had previously been removed, and four from around the area of soil contamination in the vicinity of the asphalt plant and spray rack and the area east of the spray rack. A low concentration of TPH-d was detected in one water sample from near the idle truck maintenance shop, and low to moderate concentrations of TPH-d and TPH-mo were detected in the grab groundwater sample from southeast of the deep soil contamination area east of the spray rack. An elevated concentration of chromium was also detected in the grab groundwater sample from boring *EB-29*. The detected concentrations of TPH-d, -mo, and chromium in the sample from *EB-29* all exceed RWQCB ESLs where groundwater is a current or potential drinking water resource.

5.0 CONCLUSIONS

Based on the Site history, the Phase I and Phase II Site assessments performed by ENV America, information provided by Hanson, and information obtained from regulatory agencies, ENV America concludes that soil present in several areas of the Site is contaminated above RWQCB residential standards (ESLs) as a result of past Site activities. The main area of soil contamination occurs in the former hot mix asphalt plant and associated spray rack area and the deeper soil in and east of the spray rack area. The areas of shallow soil contamination (less than 20 feet deep) could be from the former asphalt plant that recently operated in this area or from the older mining operations that were originally located in this area. The deeper soil contamination could be from the old mining operation or associated operations or from leakage of petroleum product from the scales associated with the former asphalt plant or from some other as yet unidentified source. The primary contaminants detected include TPH-g, -d, and –mo, metals, and PAHs.

Other isolated areas of soil contamination above residential standards include the area immediately east of the lube shed, an area near the Union Pacific Railroad tracks and a small area in the southwest corner of the Site. The most prevalent soil contaminants detected in the aforementioned areas are TPH-d, TPH-mo and metals.

The metals chromium and nickel were both detected in a sample from the retention pond at concentrations above residential standards for soil. Magnesium was also detected at an elevated concentration, although there is no residential standard published for this metal. Additional sampling performed to assess the extent of the metals contamination indicates that it is of limited extent.

One groundwater monitoring well at the site will require abandonment. The monitoring well is a 2-inch diameter PVC well approximately 100 feet deep. There is also an inactive 640-foot deep, 14-inch diameter production well on Site southwest of the idle truck maintenance shop. There are currently no plans to abandon this well.

On-Site Lakes H and I were sampled and analyzed for dissolved metals. No metals were detected at concentrations that would be considered significant. Low to moderate concentrations of TPH constituents were detected in the samples from the two existing septic tanks on Site. A low concentration of TPH-d was detected in the groundwater adjacent to where USTs were removed from the Site in 1991.

Of four grab groundwater samples collected from the immediate vicinity of the deep contaminated soil underlying and east of the spray rack, TPH-d and -mo and chromium were detected at concentrations above residential ESLs (where groundwater is a current or potential drinking water resource) in the sample from boring *EB-29*. No constituents were detected above residential ESLs in the remaining three groundwater samples. Further investigation should be performed to evaluate the lateral and vertical extent of these contaminants in the groundwater in the vicinity of *EB-29* and directly beneath the deep soil contamination area.

DRAFT

Asphalt Plant General Area

Spray Rack

		TD (ft):	Samples (ft):
SR-1	graded sand with gravel, no indication of contamination or obvious fill	15	1, 8, 15
SR-2	slight hydrocarbon odor from 1-5'	15	5, 8, 15
SR-3	pea gravel vein from 3.5-4', asphalt product (granular & gooey) from 4-7' sporadically, pea gravel from 7-12; first dig encountered railroad ties uniformly spaced running E/W, relocated ~10' S	12	7, 12
SR-4	pea gravel from 10-13', wood encountered at 11', possible ACM pipe insulation encountered around 2⅜ OD pipe @~4'	13.5	2, 8, 13

Asphalt Plant

AP-1	pea-gravel from 3-11', metal/wood encountered from 6-8', broken glass at 10.5', no indication of contamination.	11	1, 8, 11
AP-2	2-5" gravel, obvious fill to 13', no indication of contamination.	13	2, 8, 13
AP-3	sand with fine gravel, no indication of contamination or obvious fill	15	2, 8, 15
AP-4	2-3" subrounded gravel to 9', metal scraps/wood encountered at 9'; obviously impacted soil, gray/black clay chunks with hydrocarbon odor encountered from 9-10', apparent solid floor (concrete?) encountered at 10'	10	9-10
AP-5	subrounded gravel with sand to 15', seemed clean	15	2, 8, 15

Paving Oil

PO-1	0-5' mix 3/4-1" road base gravel, 5-12' fine pea gravel. Corrugated vertical metal exposed on southern edge of excavation from 8-12'. Above corrugated metal is stained soil/wood from ~6-8'. Stained soil chunks and wood only fraction of pea-gravel matrix (~5%), though pea-gravel had slight TPH odor from 8-12'.	12	2, 8, 12
PO-2	0-5' mix baserock/gravel/sand, 5-15' homogeneous well graded sand, no gravel, loose, obvious fill; no indication	15	2, 8, 15

Contaminated Soil (formerly present, reportedly removed)

CS-1	Substantial debris encountered to 12', including massive concrete pieces, networks of rebar, i-beams, concrete wall extending from ~4' to 12' with an apparent window	12	
CS-2	Clearly impacted from 6.5-18.5'.	18.5	8, 5, 15

Idle Truck Maintenance Shop (USTs)

Two borings to groundwater (*EB-1, EB-2*) - no indication of contamination, groundwater samples collected from 27-28', boreholes extended to 120'. Three shallow borings to 20' (*EB-6, EB-7, EB-8*) - no indication of contamination. Soil samples submitted from each boring.	120, 120 20, 20, 20	various

Heavy Maintenance Shop

EXHIBIT A

DRAFT

Wash Rack/Heavy Maintenance Shop

Three shallow borings (to 35', 15', 15'; *EB-3, EB-4, EB-5* , respectively). Hydrocarbon odor at EB-3 at 5'. No other indication. No water encountered at EB-3 to 35'.	35, 15, 15	various

Lube Shed
One test pit at the eastern side of Lube Shed. Chunks of asphalt encountered to 5'. No other indication of obvious fill/contamination.

Other areas

Crusher *(CR)* - Subrounded gravel/sand to 15', no indication of contamination.	15	2, 8, 15
Rod Mill - *(RM)* Sporadic debris encountered throughout, including scrap metal, wires, asphalt chunks. Pea gravel encountered form 14-15'	15	2, 8, 15
Concrete Batch Plant *(CB)* - Pea Gravel from 2' to 9', no indication of contamination.	9	0.5
Plant Lube Storage Shed *(PL)* - 4-5 pieces of asphalt encountered throughout to 16', no other indication.	16	2, 8, 16
Waste Oil *(WO)* sand/gravel. No indication of obvious fill/contamination.	15	2, 8, 15
Runoff *(RO)* - Three shallow soil samples neighboring Vulcan Property (near slag stockpile)	-	0.5
Retention Pond *(RP)* - Three shallow soil samples from stormwater retention pond.	-	0.5
Transformers *(TRANS)* - One shallow soil sample from each of the five transformers/former transformers	-	0.5
Slag Stockpile - One sample from prominent slag stockpile.	-	-
Railroad *(RR)* - Two shallow soil samples next to southern fence adjacent to railroad.	-	0.5

1.0 SITE BACKGROUND INFORMATION

The Site is located at 3000 Busch Road, Pleasanton, California (Figure 1) and consists of a total of approximately 1,050 acres, of which approximately 320 acres are developable land. The Site is currently developed with seven structures: a 12,000 square foot (sq. ft.) single story office building where Hanson maintains offices, a 12,150 sq. ft. heavy maintenance shop, two open warehouse structures totaling approximately 10,400 sq. ft., a 900 sq. ft. lubricant storage shed, a 7,200 sq. ft. truck maintenance shop, and two temporary office trailer buildings. Beginning in 1938 the Site was mined for its aggregate resources by Kaiser Sand and Gravel. Initially mining operations were carried out in the southwestern portion of the site and later expanded to the east, northeast, and northwestern portions of the Site. As mining progressed from one area to the next, mined out areas were either backfilled with rubble, debris, and mine waste, or used as disposal ponds for water, silt, and sand from aggregate washing operations and new pit dewatering. In 1991 the mining operation was purchased by Hanson Aggregates and operated until 2001 at which time the aggregate resource was considered mined out. During various periods of operation of the facility a concrete batch plant and an asphalt plant were operated on portions of the Site. Hanson currently maintains a single story office building, a heavy equipment maintenance shop, a lube shed, and several storage buildings on the Site. The Pleasanton Garbage Transfer Facility leases and occupies a portion of the Site along its western border where they perform maintenance on their fleet of vehicles.

Currently there are three large ponds, Lake I, Lake H, and Cope Pond, and one small stormwater retention pond on the Site. The total area of the ponds is approximately 730 acres. The dry land portions of the Site consist primarily of areas that have been mined for aggregate and backfilled with spoil from mining in the current pond areas and material from unknown outside sources. The remains of mining building foundations and concrete slabs are common in the southwestern areas of the site. Piles of broken concrete from building demolition also occupy the southeastern portions of the Site. Large piles of unused aggregate occupy southern portions of Site. The current operation areas of the Site (Hanson's office, maintenance, and warehouse, and the idle truck maintenance shop) are all located in the southwestern portion of the Site.

The Site is generally flat except where mining operations have created large depressions that are currently occupied by ponds, areas where large piles of aggregate have been left in place, and areas where foundations have been removed and large piles of concrete have been stored. The general surface elevation, except in the pond areas, varies from approximately 360 to 375 feet above mean sea level.

2.0 PROJECT OBJECTIVES AND SCOPE OF WORK

ENV America, upon authorization from Legacy, performed an additional soil and groundwater investigation at the Site during January/February 2007. The objective of this additional soil and groundwater investigation is to further characterize the soil and groundwater conditions at the Site.

2.1 Scope of Work

The additional soil and groundwater investigation scope of work included drilling 12 shallow soil borings to collect soil samples, and five deeper soil borings to collect samples of soil and groundwater within parcels B, C, D, E, F, and G. In addition, one water sample was collected for analysis from a water production well on Site.

2.2 Project Coordination

Prior to initiating drilling, and sampling activities, ENV America coordinated the following tasks:

- Coordination with Underground Service Alert (USA) to clear drilling locations for underground utilities at proposed drilling locations;
- Coordination with a private utility locator to additionally screen for underground utilities at proposed drilling locations on-Site; and
- Preparation of a Site-specific Health and Safety Plan for ENV America personnel.

2.3 Investigation Procedure Summary

ENV America coordinated the drilling of 17 soil borings with a truck-mounted drill rig for the purposes of collecting and analyzing the Site soil and groundwater. Sixteen of the 17 borings drilled are part of a statistical sampling program, and one of the borings (EB-35) was drilled to collect a groundwater sample from a specific location on parcel D. Soil was screened every 10 feet, and logged in the field by an ENV America geologist for indications of the presence of contaminants as suggested by soil odor and/or color indicative of contamination, and with continuous use of a photo-ionization detector (PID) that screens for volatile organic compounds. After field screening, soil samples were selected for submittal for laboratory analysis.

"Grab" groundwater samples were collected from five of the boreholes (locations *SS(78), SS(105), SS(128), SS(130), and EB35*). Additionally, one water sample was collected from an on-Site groundwater production well.

During the Phase II subsurface environmental investigation conducted in September/October 2006, a zone of heavy, viscous, black, free phase petroleum product was encountered in parcel A at a depth of approximately 33 to 40 feet in soil. Following the discovery of the free product, 13 new borings were drilled to evaluate the extent of this free product in the soil. Groundwater samples were collected from two of these new borings. As part of this Additional Soil and Groundwater Investigation, five borings, including boring EB-35, were drilled and a groundwater sample was collected from each one to further evaluate whether groundwater in the area of parcel D has been affected by the free product discovered during the Phase II subsurface environmental investigation. The location of EB-35 was chosen independent of, and in addition to, the statistical soil sampling program to fill in a gap in the groundwater sampling program.

2.4 Investigation Procedures

Soil Sampling

Boreholes were drilled with a Mobile B-61, or a CME-75, hollow-stem auger drill rig. The augers were decontaminated between each sampling location with a pressure washing steam cleaner and all down-hole sampling equipment was decontaminated with liquinox detergent and triple washing/rinsing techniques prior to each use. Soil samples were collected from depths of approximately 2, 10, 20, 30, and 40 feet below ground surface (bgs) for laboratory analysis. The soil was collected in new six-inch by 1.5- to 2.5-inch brass liners fitted into a split-spoon sampler. Soil samples retained for laboratory analysis were sealed with teflon sheets and tightly fitting end caps. Boreholes were backfilled by tremie-pipe techniques using type I/II neat cement grout.

All soil samples were analyzed for Total Petroleum Hydrocarbons as gasoline (TPH-g) and benzene, toluene, ethylbenzene, and xylenes (BTEX) by Environmental Protection Agency (EPA) Test Method 8260B and diesel (TPH-d), and motor oil (TPH-mo) by EPA Test Method 8015 Modified. Soil samples selected from borings SS(22, 31, 90, 97, 105, 123, 128, 130, 137, and 143) were analyzed for Title 22 metals by EPA Test Method 6010B.

All soil samples were retained for laboratory analysis in appropriate sample containers, assigned a unique identification label, placed into an ice-filled cooler, and delivered under chain of

custody protocol to Severn Trent Laboratories in Pleasanton, California, a State of California certified laboratory.

Groundwater Sampling

The groundwater samples were collected from five boring locations, *SS(78), SS(105), SS(128), SS(130), and EB35*. Groundwater samples were collected through the augers using disposable bailers. One water sample (W-1) was collected from a non-operational on-Site water production well using a disposable bailer. Water samples were analyzed for TPH-g/BTEX by EPA Test Method 8260B, TPH-d and TPH-mo by EPA Test Method 8015 Modified, and Title 22 metals by EPA Test Method 6010B.

All water samples were retained for laboratory analysis in appropriate sample containers, assigned a unique identification label, placed into an ice-filled cooler, and delivered under chain of custody protocol to Severn Trent Laboratories in Pleasanton, California, a State of California certified laboratory.

2.5 Sampling Locations

The following summarizes the sampling locations. The analytical tests performed and results of each sample analysis are presented in Table 1; Figure 2 shows the Site sampling locations.

Parcels B, C, D, E, F, and G were divided into a matrix of 144 squares, each approximately 300 feet wide by 300 feet long. Each square was assigned a sample number (SS#) and sixteen sampling locations were randomly selected. The one additional boring (EB-35) was drilled in parcel D, and was solely intended for the purpose of evaluating groundwater in this parcel. Figure 2 shows the sampling matrix and the seventeen boring locations.

3.0 RESULTS OF SOIL AND GROUNDWATER SAMPLE ANALYSES

Analytical results for soil samples are presented in Table 1. Table 2 presents results for groundwater samples. Table 1 lists the unique sample identifications assigned to each sample. The suffix indicates the depth in feet bgs (e.g., *SS(5)-2* refers to a sample from square five at two feet bgs). A note on Table 1 describes the prefix abbreviations.

3.1 Soil Results Summary

The soil analytical results have been compared to applicable ESLs for soil established by the RWQCB for TPH-d and -mo. ESLs applicable to shallow soil in a residential setting where groundwater is a current or potential drinking water resource were used to evaluate TPH-d and -mo results and metals results of samples collected down to a depth of 10 feet. ESLs applicable to deep soil in a residential setting where groundwater is a current or potential drinking water resource were used to evaluate TPH-d and -mo results and metals results of samples collected below a depth of 10 feet. Because TPH-g/BTEX was not detected in any of the samples analyzed, no additional evaluation of these results is required. ESLs for TPH-d, and -mo under the former scenario are 100 mg/kg and 500 mg/kg, respectively. Applicable ESLs for TPH-d and -mo for the latter scenario are 100 mg/kg and 1,000 mg/kg, respectively.

Applicable ESLs for metals in shallow soil include: arsenic @ 5.5 mg/kg, barium @ 750 mg/kg, beryllium @ 4.0 mg/kg, cadmium @ 1.7 mg/kg, cobalt @ 40 mg/kg, chromium (total) @ 58 mg/kg, copper @ 230 mg/kg, nickel @ 150 mg/kg, lead @ 200 mg/kg, antimony @6.3 mg/kg, selenium @ 10 mg/kg, thallium @ 1.0 mg/kg, vanadium @ 150 mg/kg, zinc @ 600 mg/kg, and mercury @ 2.5mg/kg.

Applicable ESLs for metals in deep soil include: arsenic @ 16 mg/kg, barium @ 2,500 mg/kg, beryllium @ 98 mg/kg, cadmium @ 38 mg/kg, cobalt @ 94 mg/kg, chromium (total) @ 58 mg/kg, copper @ 2,500 mg/kg, nickel @ 1,000 mg/kg, lead @ 1,000 mg/kg, antimony @ 310 mg/kg, selenium @2,500 mg/kg, thallium @51 mg/kg, vanadium @ 2,500 mg/kg, zinc @ 2,500 mg/kg, and mercury @110 mg/kg.

TPH-d, and TPH-mo have been detected in shallow soil (10 feet bgs or less) from borings SS(31), and EB-35 at concentrations above residential ESLs. TPH-d, and TPH-mo have also been detected in deeper soil (10 feet bgs or greater) from borings SS(123), and SS(31) at

concentrations above residential ESLs. Chromium was detected generally in deeper soil from borings SS(97), SS(105), SS(130), SS(137), and SS(143) at concentrations above residential ESLs. These boring locations are shown on Figure 2.

To assess soil conditions on a site-wide basis, we have calculated the 95% upper confidence interval (UCI) of the mean of all the soil samples collected during this investigation with the exception of the samples collected from EB35 because this was not part of the random sample set. The UCI was then compared to the applicable regulatory thresholds (ESLs) to evaluate whether the soil mass at the site, in general, meets ESL criteria for the analytes assessed. The results of that evaluation are discussed in Section 4.0.

3.2 Water Results Summary

Groundwater samples were collected from five soil borings. Low concentrations of barium were detected below the RWQCB ESL (1,000 µg/L) in water samples from borings SS(78) at 0.18 µg/L and SS(130) at 0.22 µg/L. Barium (0.037 µg/L) was also detected below the RWQCB ESL in the sample collected from the on-Site water production well. No other analytes were detected.

4.0 STATISTICAL ANALYSES OF THE SOIL MASS

A statistically random sample set was collected at the Hanson site to evaluate the general mass of soil beneath the site to a depth of 40 feet. Sixteen borings were drilled and five samples were collected from each boring, for a total of 80 samples. ENV America's evaluation of the general soil mass based on the data set, indicates that the 95% UCI of the analyzed parameters in the general soil mass are all less than their respective ESLs. The following sections describe the statistical analyses performed and the results of these analyses.

4.1 Parameters

Statistical calculations were performed on TPH-d in the interval from 0 to 40 feet bgs. This was possible because the regulatory threshold (ESL) for TPH-d is the same (100 mg/kg) for shallow (<10 feet) and deep (>10 feet) soil. Statistical calculations were performed on TPH-mo in the interval from 0 to 10 feet bgs and the interval from 10 to 40 feet bgs because the regulatory threshold (ESL) is different in shallow soil (500 mg/kg) than it is in deep soil (1,000 mg/kg). Statistical calculations were also performed for chromium in the interval from 0 to 40 feet bgs because the ESL for chromium (58 mg/kg) is the same for both shallow and deep soil. The only parameters that were subjected to statistical analyses are those parameters that exceeded their respective ESLs in one or more sample analysis.

4.2 Statistical Calculation Procedure

This statistical assessment was performed using procedures adopted from Chapter 9 of SW846. These procedures outline a strategy for evaluating whether chemical contaminants are present in solid waste that exceed specific regulatory thresholds. The specific procedures followed were those where simple random sampling has been performed. These procedures entail calculating the sample mean, the standard deviation, standard error, and confidence interval and comparing the 95% UCI to the regulatory threshold. These calculations were performed on the specific parameters indicated above and the results of these calculations are described in the following sections.

TPH-d

All analytical results for TPH-d in the data set were subjected to the calculation procedure described above. Because the ESL is the same for shallow and deep soil, no differentiation was

made between the shallow and deep zones. The calculated 95% UCI for TPH-d for the data set is 39 mg/kg, which is below the ESL of 100 mg/kg.

TPH-mo

The TPH-mo results from the two feet and 10 feet bgs sample analyses were subjected to the SW846 procedure and compared to the ESL of 500 mg/kg for TPH-mo in shallow soil. The 95% UCI for this data set is 216 mg/kg, which is below the ESL of 500 mg/kg.

The TPH-mo results from the 20-, 30-, and 40-foot sample analyses were also subjected to the SW846 procedure and compared to the ESL of 1,000 mg/kg for TPH-mo in deep soil. The 95% UCI for TPH-mo in the deep soil is 319 mg/kg, which is below the ESL of 1,000 mg/kg.

Chromium

All analytical results for chromium in the data set were included in the calculation of the 95% UCI because the ESL for chromium of 58 mg/kg is the same for both shallow and deep soil. The calculated 95% UCI for chromium for the data set is 53 mg/kg, which is below the ESL of 58 mg/kg.

4.3 Discussion of Results

The results of the statistical analysis in general indicate that the specific parameters analyzed, when considered as a whole within the soil mass present in the upper 40 feet of the site exist at average concentrations that are below their respective ESLs. Because of the large soil mass under consideration, there are likely to be specific limited areas where the analyzed parameters may exceed their respective ESLs. An example of this is the soil in the vicinity of boring SS(123). The TPH-d and -mo results from the analysis of the 20-, 30-, and 40-foot samples all exceed their respective ESLs. However, the calculated 95% UCI for all analytes of concern were below regulatory limits established by RWQCB for residential areas where groundwater is a current or potential drinking water source. Statistical calculation sheets are included as Exhibit B.

5.0 SUMMARY AND RECOMMENDATIONS

Seventeen borings were drilled at the Hanson Site to assess soil and groundwater conditions. Sixteen of the boring locations were selected in a statistically random manner to allow the collection of a random set of soil analytical data. Five of the borings were also used for collecting grab groundwater samples. One groundwater sample was also collected from a non-operational production well on Site. Both soil and groundwater samples were analyzed for TPH-g/BTEX, TPH-d, TPH-mo, and metals.

The only analyte detected in groundwater was barium, which was detected at concentrations significantly below its regulatory threshold (ESL). TPH-g/BTEX was not detected in any of the soil samples. TPH-d and -mo were detected in a number of samples, in some case above their respective regulatory thresholds. Many individual metals were detected in most of the soil samples analyzed. Only chromium was detected above its regulatory threshold.

Statistical analyses of the data set for those analytes that, in some samples, exceeded their regulatory thresholds indicate that the soil mass at the site is, in general, below respective regulatory thresholds for all analytes in the data set. However, local areas of soil do exceed regulatory thresholds for some analytes, one specific area being at boring SS(123), where both TPH-d and TPH-mo exceed their respective ESL. At this specific location ENV America recommends that additional investigations be performed to assess the lateral and vertical extent of the TPH-d and -mo in soil and collect grab groundwater samples as well to evaluate whether groundwater in the vicinity of these high TPH soil results is affected.

6.0 SIGNATURE PAGE

6.1 Corporate Qualifications

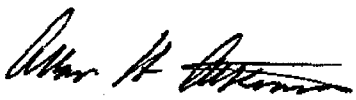
ENV America was formed in 1992 and incorporated in the State of Delaware. ENV America provides professional services in environmental engineering, involving the application of science and engineering to environmental compliance, contamination assessment and cleanup, and the management of hazardous, solid and industrial waste. Soil and Groundwater Investigations are a part of this practice area.

6.2 Individual Qualifications

The qualifications of the Project Manager and the other environmental professionals involved in this Additional Soil and Groundwater Investigation meet ENV America's corporate requirements for performing soil and groundwater investigations.

This report was prepared under my supervision.

ENV America Incorporated



Allan Atkinson, P.G. #3515, exp. 10/31/08
