RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

EPA Waste Codes Addendum

Code	Description
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
D002	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
F002	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F003	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/27/2006

Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Last EDR Contact: 03/21/2007
Next Scheduled EDR Contact: 06/18/2007
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Data Release Frequency: Annually

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Historical Auto Stations: EDR Proprietary Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 12/31/2004
Date Data Arrived at EDR: 02/17/2006
Date Made Active in Reports: 04/07/2006
Number of Days to Update: 49

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

HANSON
3000 BUSCH ROAD
PLEASANTON, CA 94588

TARGET PROPERTY COORDINATES

Latitude (North):	37.68230 - 37° 40' 56.3''
Longitude (West):	121.8496 - 121° 50' 58.6''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	601440.5
UTM Y (Meters):	4170984.2
Elevation:	366 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	37121-F7 LIVERMORE, CA
Most Recent Revision:	1980

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

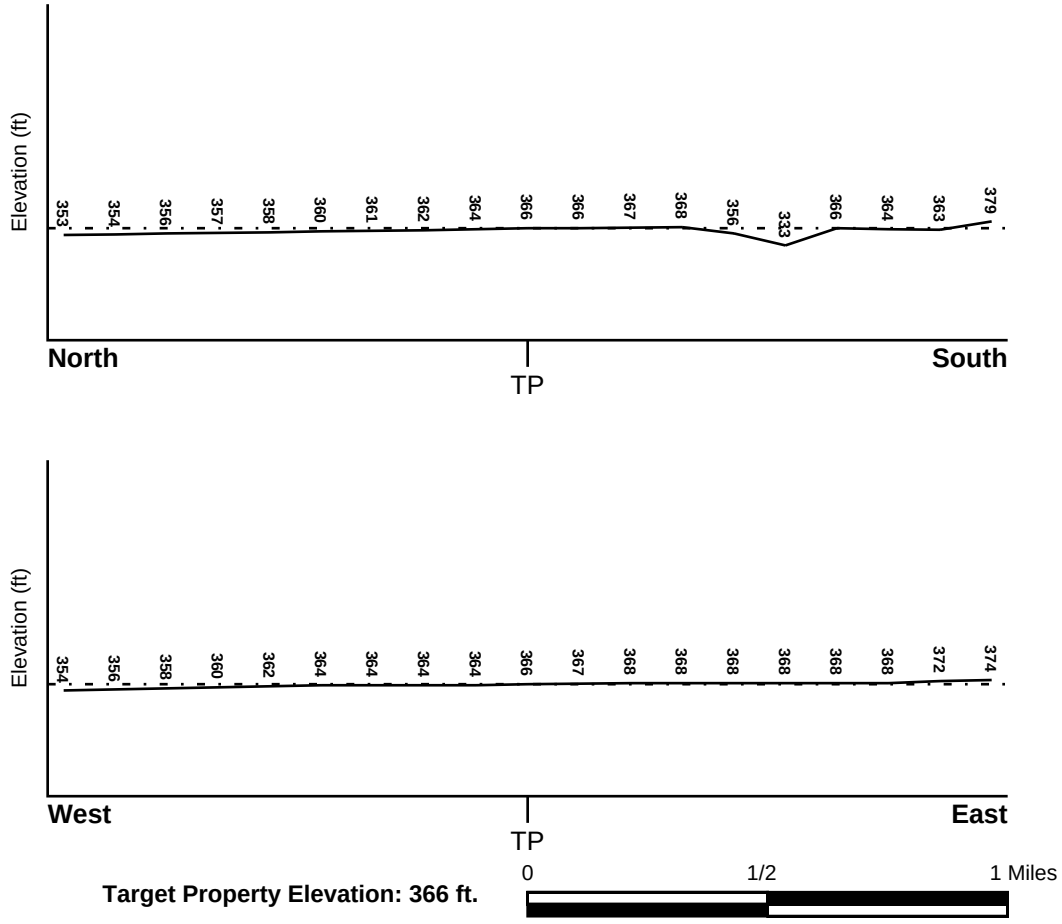
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
ALAMEDA, CA	YES - refer to the Overview Map and Detail Map

0600120004D
0600010210B

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LIVERMORE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
B9	1/2 - 1 Mile SW	W
19	1/2 - 1 Mile North	SW

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: YOLO

Soil Surface Texture: gravelly - loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	gravelly - loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 6.00 Min: 2.00	Max: 7.80 Min: 7.40
2	16 inches	60 inches	stratified	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 6.00 Min: 2.00	Max: 8.40 Min: 7.90

Soil Map ID: 2

Soil Component Name: YOLO

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.80 Min: 7.40
2	16 inches	60 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 2.00 Min: 0.60	Max: 8.40 Min: 7.90

Soil Map ID: 3

Soil Component Name: YOLO

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.80 Min: 7.40
2	16 inches	36 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 2.00 Min: 0.60	Max: 8.40 Min: 7.90
3	36 inches	60 inches	gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand.	Max: 20.00 Min: 6.00	Max: 8.40 Min: 7.90

Soil Map ID: 4

Soil Component Name: GRAVEL PIT

Soil Surface Texture: extremely gravelly - sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	extremely gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00
2	6 inches	60 inches	extremely gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening report designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SUMMARY

- ***City Directories:***

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1975 through 2005. (These years are not necessarily inclusive.) A summary of the information obtained is provided in the text of this report.

Mr. Lawrence Appleton
Kaiser Sand & Gravel Company
P.O. Box 580
Pleasanton, CA 94566

RE: KAISER SAND & GRAVEL COMPANY, 3000 BUSCH ROAD, PLEASANTON

Dear Mr. Appleton:

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]) of the California Health and Safety Code. The State Water Resources Control Board (SWRCB) has required since March 1, 1997 that this agency use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at this site.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Up to 1,600 parts per million Total Petroleum Hydrocarbons as Diesel remain in native soil beneath a former UST at a depth of 25 feet below current grade.

If you have any questions, please contact the undersigned at (510) 567-6783.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

REMEDIAL ACTION COMPLETION CERTIFICATION

Kaiser Sand & Gravel Company
P.O. Box 580
Pleasanton, CA 94566
Attn: Lawrence Appleton

RE: KAISER SAND & GRAVEL, 3000 BUSCH ROAD, PLEASANTON

Dear Mr. Appleton:

This letter confirms the completion of a site investigation and remedial action for the underground storage tanks formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tanks are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Mee Ling Tung
Director, Environmental Health Services

2	3000 "	"	"	"
3	1000 "	waste oil	"	"
4	5000* "	new oil	"	"
5	12K "	diesel	"	11/02/90
6	12K "	"	"	"
7	10K "	gasoline	"	"

* This UST described in various documents as both of 3000 and 5000 gallon capacity.

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and type of release: UNK

Site characterization complete? YES

Date approved by oversight agency:

Monitoring Wells installed? YES Number: 1

Proper screened interval? YES (25 - 33' BG)

Highest GW depth below ground surface: 26.54' Lowest depth: 27.89'

Flow direction: reportedly towards the west

Most sensitive current use: gravel mining

Are drinking water wells affected? NO Aquifer name: Amador Subbasin, Livermore Valley

Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

Is surface water affected? NO Nearest affected SW name: NA

Off-site beneficial use impacts (addresses/locations): NONE

Report(s) on file? **YES** Where is report filed? **Alameda County**
1131 Harbor Bay Pkwy
Alameda CA 94502

Treatment and Disposal of Affected Material:

Material	Amount (include units)	Action (Treatment or Disposal w/destination)	Date
Tank	(2x12K; 1x10K gals)	Disposal - H&H Ship Svc San Francisco, CA	11/02/90
	(1x10K; 1x5K; 1x3K; 1x1K)	Disposal - Erickson, Inc. Richmond, CA	02/06/90
Piping	UNK		
Product/sludge	270 gals	Disposal - Erickson, Inc. Richmond, CA	02/90
Soil	~832 tons	Disposal - Forward L.F. Stockton, CA	May 1997

Maximum Documented Contaminant Concentrations - - Before and After Cleanup

Contaminant	Soil[1] (ppm) Before	Soil[1] (ppm) After	Water (ppb) Before	Water (ppb) After
TPH (Gas)	ND	ND	ND	ND
TPH (Diesel)	190	1600	1600	"
TPH (mtr oil)	59	NA	NA	NA
Benzene	ND	ND	ND	ND
Toluene	"	"	"	"
Xylene	"	"	"	"
Ethylbenzene	"	"	"	"
Oil & Grease	60	"	NA	NA
Heavy metals	[geogenic conc.]		"	"
Other SVOC, HVOC	ND	NA	"	"

Note: 1) "Before" soil results from samples collected from UST excavations during 1990 and 1995 closures as follows: TPH-G, TPH-D, BTEX, and O&G result from *Area 4* tank cluster; TPH-mo from *Area 2* tank; metals, SVOC and HVOC from *Area 1* tank. "After" soil results from sample collected after overexcavation of *Area 4* tank pit.

Comments (Depth of Remediation, etc.):

During November 1990, one 10,000 gallon gasoline and two 12,000 gallon diesel USTs were removed from a shared excavation located adjacent to the vehicle service shop, identified as *"Area 4."* During February 1995, one 3,000 gallon diesel, one 10,000 gallon diesel, and one 1,000 gallon waste

Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

oil and one 5,000 gallon new oil USTs were removed from *"Area 3," "Area 2," and "Area 1,"* respectively. Only those samples collected during the 1990 tank closures in *"Area 4"* revealed noteworthy levels of hydrocarbon compounds consistent with an unauthorized release. Consequently, only the *"Area 4"* tank closures and subsequent activities will be presented in the remainder of this report.

Historically, the subject UST area was reportedly a former gravel mining pit in the 1940s and 1950s. Mining continued vertically until reaching clay encountered at a reported depth of 30 to 40' BG. The pit was partially restored using pea gravel, and then converted to a "settling pond" where silts and clays were accumulated. The tank complex and shop structure of *"Area 4"* were built upon this former settling pond.

Initial samples collected from the base of the *"Area 4"* excavation identified up to 190 ppm TPH-D in sample KP-E4, collected in the southwest corner of the tank pit at an approximate depth of 11' BG. TPH-G and BTEX were not present above method detection limits. This area of the excavation was deepened to 25' BG at which point one bottom (KP-BOTTOM 1) and three (3) sidewall samples were collected. Up to 1600 ppm TPH-D was identified in the noted bottom sample, and 180 ppm TPH-D was identified in one of the sidewall samples collected at 8' BG.

A total of approximately 480 yds^3 was reportedly excavated from the *"Area 4"* pit during initial and subsequent excavation activities. The excavation was restored to grade using clean gravel derived from elsewhere at this site. Excavated soil from *"Area 4"* and the remaining UST sites totalling some 832 tons was transported to Forward landfill (Stockton, CA) during May 1997 for disposal.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? _____

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? _____

Does corrective action protect public health for current land use? YES
Site management requirements: NA

Should corrective action be reviewed if land use changes? YES

Monitoring wells Decommisioned: NO

Number Decommisioned: 0 Number Retained: 1 (pending case closure)

Leaking Underground Fuel Storage Tank Program

IV. CLOSURE (Continued)

List enforcement actions taken: None

List enforcement actions rescinded: None

VI. RWQCB NOTIFICATION

Date Submitted to RB: 1/6/98 RB Response: Concur
RWQCB Staff Name: ~~Kevin Graves~~ Stephen Hill Title: ~~San. Eng. Assoc.~~ ES IV Sup Date: 1/5/98

VII. ADDITIONAL COMMENTS, DATA, ETC.

During March 1991, four soil borings were advanced through the former "Area 4" UST pit to depths ranging from 28 to 35.5' BG. A single monitoring well (MW-KP1) was installed within one of the borings. No detectable HC compounds were identified in soil samples collected from any of the borings to the depth explored (27.5 - 34' BG).

Well MW-KP1 was sampled quarterly through February 1993 and then yearly through February 1996. No detectable target compounds were identified in the final 3 annual sampling events. BTEX were never identified in any of the water samples at any time during this ground water investigation.

Subject: **Site Investigation Report for the Eastern Portion of AOC #2 and AOCs #3 through #9, ACEH Case #RO0002952 and Geotracker Global ID #SL0600101555, Hanson Aggregates Radum Facility, 3000 Busch Road Pleasanton, Alameda County, California**

Dear Mr. Wickham:

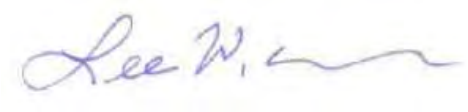
The enclosed "Site Investigation Report for the Eastern Portion of AOC #2 and AOCs #3 through #9, ACEH Case #RO0002952 and Geotracker Global ID#SL0600101555, Hanson Aggregates Radum Facility, 3000 Busch Road Pleasanton, Alameda County, California" ("the SI Report") was prepared by LFR Inc. (LFR) on behalf of Hanson Aggregates Northern California ("Hanson") for the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California ("the Site"). This report presents the findings of additional subsurface investigations conducted during July 2007 by LFR to further characterize the extent of contamination in specific areas of concern (AOCs) at the Site. The scope of work for the investigations conducted was described in a work plan that was submitted to Alameda County Environmental Health (ACEH) on May 16, 2007, and was approved by ACEH on June 22, 2007.

The investigations completed during July 2007 included advancing temporary soil borings to collect depth-discrete soil samples and grab groundwater samples in AOCs #2, #3, #7, and #8, and shallow sediment samples and a composite surface-water sample from the storm-water retention pond in AOC #6. In addition, four existing groundwater monitoring wells were located, purged, and sampled. This report includes an overview of environmental conditions, a summary of previous investigations conducted by LFR and other consultants, and a description of the field investigations completed during July 2007, and presents and discusses the results of the investigations.

As required, this report will be submitted electronically via the Alameda County Environmental Cleanup Oversight Program FTP website, and via the Regional Water Quality Control Board's Geotracker electronic submittal system.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report are true and correct to the best of my knowledge. If you have any questions or comments concerning this SI Report, please call me at (925) 426-4170 or Katrin Schliewen of LFR at (510) 652-4500.

Sincerely,



Lee W. Cover
Environmental Manager
Hanson Aggregates Northern California

EXECUTIVE SUMMARY

This Site Investigation Report presents the findings of the additional investigations conducted at the Hanson Aggregates Radum Facility ("the Site") during July 2007. The purpose of the investigations was to further characterize the extent of affected soil and groundwater in areas of concern (AOCs) #2, #4, #6, #7, and #8. The environmental investigations were conducted according to the scope of work described in the May 16, 2007 "Work Plan for Additional Site Characterization at the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California," which was submitted to Alameda County Environmental Health (ACEH) and subsequently approved by ACEH on June 22, 2007, with certain modifications. Additional investigations are currently being conducted at AOC #1 (the former hot mix asphalt plant; ACEH Case Number RO0002941) under a separate scope of work, and the results of that investigation will be submitted to ACEH under separate cover on November 30, 2007.

The July 2007 investigations consisted of advancing a total of 16 temporary soil borings to depths ranging from approximately from 10 to 70 feet below ground surface. The purposes of the soil borings were to collect soil samples for lithologic logging and to collect depth-discrete soil samples and grab groundwater samples for laboratory analyses. Shallow sediment and surface-water samples were collected from the storm water retention pond for laboratory analyses. In addition, samples were collected from four existing groundwater monitoring wells for laboratory analyses. All analytical results were compared to the Environmental Screening Levels (ESLs) for soil or water beneath commercial/industrial land use areas published by the Regional Water Quality Control Board. The investigation and analytical results are presented and discussed in this report.

The analytical results of the soil and groundwater samples collected during the recent investigations have substantiated that the primary compounds of concern in soil and groundwater at the Site are total petroleum hydrocarbons (TPH) as diesel (TPHd) and TPH as motor oil (TPHmo). With a few exceptions, no other organic compounds were detected in soil and water samples collected, including TPH as gasoline (TPHg); volatile organic compounds (VOCs); benzene, toluene, ethylbenzene, and total xylenes (BTEX); fuel oxygenates; lead scavengers; semivolatile organic compounds (SVOCs); pesticides; and polychlorinated biphenyls (PCBs).

VOCs were detected in one grab groundwater sample at concentrations below the ESLs. The metals arsenic, cobalt, and chromium were detected in several samples at concentrations that exceeded the ESLs; however, these concentrations are within ranges published for naturally occurring metals detected in soils in the San Francisco Bay Area.

Results from these investigations, evaluated in conjunction with results from previous investigations, indicate that AOCs #2, #6, and #7 have been sufficiently characterized and that no additional investigations are warranted for these areas. Additional

subsurface investigations may be required to confirm an elevated TPHmo concentration detected in a grab groundwater sample collected from one soil boring at AOC #3. However, soil and grab groundwater samples collected from nearby sample locations (at AOC #3) indicate that this area has not been significantly affected by petroleum hydrocarbons.

LFR Inc. (LFR) does recommend that additional subsurface investigations be conducted at AOC #8 (SS-123 area), to further characterize the lateral extent of petroleum-affected groundwater to the south in the SS-123 area. Previous consultants have concluded that groundwater in this area may be perched; this has not been confirmed. LFR also recommends re-sampling existing groundwater monitoring well 3S/1E 10D8, located north of Lake I, to confirm the SVOC and dissolved mercury concentrations detected in the groundwater sample collected from this well.

1.0 INTRODUCTION

This Site Investigation Report presents the results and findings of additional subsurface investigations conducted by LFR Inc. (LFR) on behalf of Hanson Aggregates Northern California ("Hanson") to confirm and further assess the extent of affected soil and groundwater in areas previously identified as areas of concern (AOCs) at the Hanson Aggregates Radum Facility, located at 3000 Busch Road, Pleasanton, California ("the Site"; Figure 1). To facilitate the investigation of environmental conditions at the Site, LFR has subdivided the approximately 1,000-acre Site into nine AOC, as illustrated on Figure 2. The scope of work for the investigations conducted at the Site was described in the "Work Plan for Additional Site Characterization at the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California," submitted to Alameda County Environmental Health (ACEH) on May 16, 2007 ("the Work Plan"). The Work Plan was approved by ACEH on June 22, 2007, with modifications to the scope of work including advancing additional soil borings, collecting additional samples, and conducting additional analyses. ACEH is the regulatory agency overseeing the environmental characterization of the Site under ACEH case number #RO0002952 (Geotracker Global ID #SL0600101555).

In accordance with the scope of work in the Work Plan and as approved by ACEH, LFR conducted investigations that included collecting soil, sediment, surface-water, and groundwater samples at locations in the eastern portion of AOC #2 and in AOCs #3, #6, #7, and #8 (Figure 2). As described further below, no additional investigations were necessary in the western portion of AOC #2 and at AOCs #4, #5, and #9, and the report of the investigations planned to be conducted in AOC #1 (the former hot mix asphalt plant area) will be completed under a separate scope of work. In addition, in anticipation of a property transfer from Hanson to Legacy Partners ("Legacy"), LFR collected groundwater samples from existing groundwater monitoring wells owned by Alameda County Flood Control and Water Conservation District Zone 7 ("Zone 7") and located on the Site. Results for samples collected from existing groundwater monitoring wells are also presented in this report.

This report summarizes field activities performed at the Site during July 12 through 25, 2007, and presents and discusses results from these field activities. This report is organized as follows.

- Section 2.0 presents a description of the Site, the site history and potential environmental impacts, a summary of previous environmental investigations conducted at the Site, and an overview of regulatory oversight to date.
- Section 3.0 describes the methodology of the investigations conducted.
- Section 4.0 presents the results of the environmental investigations conducted to confirm or further characterize the extent of contamination previously identified in various AOCs of the Site.

- Section 5.0 describes the methodology to sample existing deep groundwater monitoring wells and presents the results of the well sampling.
- Section 6.0 presents the conclusions and recommendations developed based on the results of the environmental investigations and well sampling.
- Section 7.0 defines LFR's professional limitations.
- Section 8.0 provides a reference list of primary documents related to environmental investigations conducted at the Site to date.

2.0 SITE HISTORY OF POTENTIAL ENVIRONMENTAL IMPACTS AND PREVIOUS INVESTIGATIONS

2.1 Site Description and History

The Site is located at 3000 Busch Road, Pleasanton, California, and consists of approximately 1,050 acres located partly within the city limits of Pleasanton and partly within an unincorporated area of Alameda County (Figures 1 and 2). Approximately two-thirds of the Site consist of large ponds or lakes, namely Lake I, Lake H, and Cope Pond, created during historical aggregate mining operations (Figure 2). The remaining approximately 320 acres of the Site (generally the southern third) consist of developable land. As described in the Phase I Environmental Site Assessment (ESA) by ENV America Inc. (ENV 2006a), several buildings remain on the Site, including Hanson offices, a minimally used heavy equipment maintenance shop and two warehouses, an idle truck maintenance shop currently occupied and used by the City of Pleasanton garbage company, and several smaller structures including temporary trailers and a lube shed associated with the heavy equipment maintenance shop. Structures previously associated with the historical mining and aggregate product manufacturing, including the former hot mix asphalt and concrete batch plants, have been removed from the Site. Partial structures, including concrete foundations and miscellaneous debris, remain within the former hot mix asphalt plant area in the southwestern corner of the Site (AOC #1; Figure 2).

As described in ENV's Phase I ESA report, mining of sand and gravel in the Livermore-Amador Valley began prior to 1900. Mining operations for aggregate resources at the Site were begun in 1938 by Kaiser Sand and Gravel. Reportedly, as sections of the property were mined out, the former mining pits were used for storage and/or as disposal ponds for water (from dewatering of new pits) and fine-grained sediments (silt and sand) washed out of the aggregate material. In addition, some mining pits were likely backfilled with debris and mine waste, as is evident from debris encountered during drilling. Hanson purchased the property in 1991 and continued mining operations until 2001. Mining was discontinued at that time due to lack of available aggregate materials.

Within the former mining operations areas (e.g., the former hot mix asphalt and concrete batch plants), several former underground storage tanks (USTs) were used to store fuel products, including gasoline, diesel, or used or new motor oil. As described below, historical mining and aggregate processing operations at the Site (in particular in the former hot mix asphalt plant area) have resulted in localized petroleum hydrocarbon-affected soil and groundwater beneath the Site.

2.2 Regional and Site Geology and Hydrogeology

2.2.1 Regional Geology and Hydrogeology

The regional geology and hydrogeology summarized in this section are based on information provided in the most recent Zone 7 Annual Report for the Groundwater Management Program (Zone 7 2007). The Hanson Radum property is located in the Livermore-Amador Valley, an east-west trending valley surrounded by north-south trending faults and hills that are part of the Diablo Range. The Site lies within the Main Basin of the Livermore-Amador Valley Groundwater Basin and, more specifically, within the Amador Sub-Basin (Zone 7 2007).

The regional geology consists primarily of alluvial deposits (fan, stream, and lake) that range in thickness from a few feet at the margins to almost 800 feet in the west-central portions of the valley (Zone 7 2007). The alluvial deposits consist primarily of gravels and sands and are underlain by the Livermore Formation, which consists of relatively less permeable clayey gravels and sands, and silts and clays. Two major aquifer zones have been identified: the "Upper Aquifer Zone" and the "Lower Aquifer Zone." The Upper Aquifer Zone is generally unconfined and consists of unconsolidated coarse-grained alluvial sediments (primarily sandy gravel and sandy clayey gravel) encountered beneath surficial clays and between approximately 20 to 40 feet below ground surface (bgs) and 80 to 150 feet bgs. Permeable sediments encountered beneath the Upper Aquifer Zone and the underlying clay aquitard are grouped into the Lower Aquifer Zone, which is semi-confined to confined.

2.2.2 Site Geology and Hydrogeology

Subsurface investigations conducted by LFR during July 2007 have encountered unconsolidated sediments consisting predominantly of clays and silts with gravel and intervals of coarser-grained gravels and sands. Because of the historical activities at the Site, some areas may consist of native sediments while others may consist of fill material. The locations of the former aggregate mining pits are not well defined. In certain areas, including the SS-123 area (AOC #8), concrete or cement material was encountered during drilling (at approximately between 10 and 30 feet bgs), indicating that historical mining pits likely were located in this area and subsequently filled by debris from the former mining operations.

With the exception of the SS-123 area (AOC #8), groundwater beneath the Site has generally been encountered approximately between 45 and 65 feet bgs. During the July 2007 subsurface investigations summarized in this report, groundwater was encountered approximately between 65 and 70 feet in temporary soil borings located in AOCs #2, #3, and #7. During a previous investigation conducted in AOC #1 in November 2006, groundwater was encountered in temporary soil borings approximately between 45 and 55 feet bgs. The difference in depth to groundwater between the July 2007 and the November 2006 investigations may accurately define differences in the depth to groundwater in the different areas of the Site, or may reflect seasonal variations. During the July 2007 investigations, depth to groundwater also was measured in four existing groundwater monitoring wells to be approximately between 53 and 57 feet below the top of the well casing (TOC), which is equivalent to approximately 50 to 54 feet bgs assuming 3-foot well risers. However, these four monitoring wells have well screens deeper than 170 feet bgs and possibly are not monitoring the same shallow groundwater encountered in the temporary soil borings that were advanced to a maximum depth of 75 feet bgs.

In the SS-123 area, groundwater was encountered between 25 and 30 feet bgs during LFR's investigations in July 2007 and ENV's investigations conducted between February and May 2007. ENV has concluded that this represents a perched groundwater zone; however, the presence of a perched groundwater zone in this area has not been confirmed.

The local groundwater flow direction and gradient beneath the Site currently is not known. New shallow groundwater monitoring wells were installed in AOC #1 in October 2007. Water-level elevations measured at these new wells will be used to assess the local groundwater flow direction and gradient in the southwestern portion of the Site.

2.3 Summary of PECs/RECs and Previous Environmental Site Investigations

Several subsurface investigations have been conducted at the Site to date by various consultants, including Baseline Environmental Consulting ("Baseline"), ENV, Brown & Caldwell (B&C), and LFR. The investigations conducted by Baseline were conducted on behalf of Hanson during 1991 and 1995 and predominantly were associated with the removal of former USTs. ENV completed several investigations on behalf of Legacy during 2006 and 2007, including a Phase I ESA and a Phase II ESA, and additional subsurface sampling in randomly selected locations. These investigations were conducted as part of Legacy's due diligence work prior to entering into a purchase agreement with Hanson for the Site. B&C completed three investigations on behalf of Hanson during 2006 and 2007, including a Phase I ESA, a limited Phase II ESA, and a subsurface investigation to assess soil and groundwater quality near two former USTS removed from approximately north of the idle truck maintenance shop in 2003. Based on the results of the B&C subsurface investigations, regulatory closure for these two former USTs was granted in June 2007.

LFR conducted an additional Phase II subsurface investigation in the former hot mix asphalt plant area (AOC #1) in November 2006 on behalf of Hanson to confirm previous findings by ENV and to further characterize the extent of suspected petroleum hydrocarbon contamination. Based on the results of LFR's November 2006 investigation, Hanson reported to ACEH the presence of elevated concentrations of petroleum hydrocarbons in soil and groundwater beneath the former hot mix asphalt plant area. Because of the large number of individual investigations conducted at the Site by various consultants, ACEH requested that a single document be prepared presenting a summary of all potential or recognized environmental concerns (PECs or RECs) on a site-wide basis.

On May 16, 2007, LFR submitted the Work Plan, which included a summary of the history of the Site and a detailed summary of site-wide environmental conditions based on results from investigations conducted by LFR and other consultants (LFR 2007a). To facilitate the data review and to focus future proposed investigations at the Site, LFR defined the nine AOCs that contained one or more PECs or RECs. In order to identify a PEC or REC, LFR compared all available analytical results to the Environmental Screening Levels (ESLs) for commercial/industrial land use areas developed by the Regional Water Quality Control Board (RWQCB 2005). Concentrations were considered elevated, and a PEC or REC was identified, based on whether analytical results exceeded the ESLs. The nine AOCs are shown on Figure 2 and are described below.

- AOC #1 Former Hot Mix Asphalt Plant Area (investigation being conducted during October 2007 and results will be presented under separate cover)
- AOC #2 Idle Truck Maintenance Area
- AOC #3 Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Temporary Soil Boring EB-35
- AOC #4 Former Concrete Batch Plant Area
- AOC #5 Former Mining Operations Area
- AOC #6 Storm-Water Retention Pond
- AOC #7 PEC Identified by Temporary Soil Boring SS-31
- AOC #8 PEC Identified by Temporary Soil Boring SS-123
- AOC #9 Vulcan Materials Company Storm-Water Runoff Area

The following sections present a brief overview of known site conditions in each of the AOCs based on the more detailed information presented in the Work Plan. Site maps were prepared for each individual AOC and were presented in the Work Plan. The individual site maps have been updated for this report to include results from the subsurface investigations completed recently by ENV (ENV 2007c) and by LFR (reported herein). Figures 3 through 7 present updated detailed maps of AOCs #2, #3, #6, #7, and #8, respectively. In agreement with ACEH and as described below,

PECs/RECs within AOC #1 have been further characterized under a separate scope of work and the results of that investigation will be presented under separate cover. As such, a site plan for AOC #1 and detailed site description and history are not included in this report.

2.3.1 AOC #2: Idle Truck Maintenance Area

The former idle truck maintenance area is located in the west-central portion of the Site (AOC #2; Figures 2 and 3). The eastern portion of AOC #2 contains several structures, including the idle truck maintenance shop currently used by the Pleasanton Garbage Service Inc. and several trailers. Approximately seven former USTs have been removed from this AOC; these have been investigated and closed to the satisfaction of regulatory oversight agencies. An inactive 640-foot-deep water supply well owned by Zone 7, well 3E/1S 15F3, also known as well Kaiser #6, is located southwest of the idle truck maintenance shop and was sampled by ENV in February 2007 (sample name W-1; Figure 3).

The western portion of AOC #2 contains the idle truck maintenance yard and mostly undeveloped areas. Based on previous investigations, a PEC was identified near the northeastern corner of the maintenance yard during the Phase II ESA by ENV, based on the analytical results from soil samples collected from temporary soil boring EB-31. Former boring EB-31 was advanced by ENV reportedly because a former "waste pit" or disposal pond existed in this portion of the Site (ENV 2006b). Analytical results identified that the soil sample collected from approximately 10 feet bgs slightly exceeded the ESL for total petroleum hydrocarbons (TPH) as diesel (TPHd). Other soil samples collected from above and below the 10-foot interval did not exceed the ESLs.

LFR recommended that this PEC and data gap identified by the results from former soil boring EB-31 be further characterized laterally.

2.3.2 AOC #3: Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Temporary Soil Boring EB-35

The heavy equipment maintenance area and soil boring EB-35 are located in the north-central portion of the Site (AOC #3; Figures 2 and 4). This area encompasses several existing buildings and/or structures that were identified as PECs or RECs in the Work Plan, such as a heavy equipment maintenance shop and two warehouses (no longer significantly in use), the lube shed associated with the maintenance shop, a truck wash rack, sump, and associated oil-water separator, and two aboveground waste oil tanks. In addition, one active transformer located approximately at the northwestern corner of the building housing the Hanson offices was identified. Former soil boring EB-35 was advanced in a vacant area approximately 2,000 feet northeast of the Hanson offices as part of ENV's random sampling program (ENV 2007a). Although elevated concentrations of TPH were detected in shallow soil samples collected in the vicinity of

former boring EB-35, no known or suspected historical activities were reported to have taken place in this portion of the Site.

Following a review of subsurface investigations conducted by B&C and ENV, LFR identified only two PECs in AOC #3. Two soil samples collected from approximately 2 and 2.5 feet bgs near the northeastern corner of the lube shed resulted in TPHd concentrations that exceeded the ESL. Also, the soil samples collected from approximately 2 feet bgs from former soil boring EB-35 contained TPHd and TPH as motor oil (TPHmo) at concentrations above the ESLs. In the Work Plan, LFR recommended that additional subsurface investigations be conducted to further characterize the lateral extent of petroleum hydrocarbons in shallow soil in the vicinity of former soil borings B-1 and EB-35.

2.3.3 AOC #4: Former Concrete Batch Plant Area

The former concrete batch plant was located in the southwestern portion of the (AOC #4; Figure 2). The concrete batch plant was operated until 2004 when the majority of the equipment was removed. No structures remain from these operations, although four broken aboveground plastic tanks remain that likely contained plasticizers. One former diesel UST was removed in 1995, and confirmation sampling resulted in the receipt of a UST case closure letter from a regulatory agency (ACEH 1998). As discussed in the Work Plan, subsurface investigations conducted by ENV confirmed the former concrete batch plant operations did not significantly affect the subsurface and LFR did not identify any data gaps. Therefore, no additional subsurface investigations were proposed in the Work Plan.

2.3.4 AOC #5: Former Mining Operations Area

The former mining operations area was located in the central portion of the Site (AOC #5; Figure 2). Mining operations were conducted until 2004, when the majority of the equipment was removed. All that remains in this area are concrete slabs, large piles of broken concrete, and areas of bare earth. As discussed in the Work Plan, subsurface investigations conducted by ENV confirmed that the former mining operations area did not significantly affect the subsurface and LFR did not identify any data gaps. Therefore, no additional subsurface investigations were proposed in the Work Plan.

2.3.5 AOC #6: Storm-Water Retention Pond

The storm-water retention pond is located along the western boundary of the Site on the northern side of Busch Road adjacent to the Kiewit property (AOC #6; Figures 2 and 5). According to Hanson, the source of the water to this pond is surface runoff water diverted from the Kiewit property, the Pleasanton Garbage Service Inc. operations, and the Hanson property. There are three large-diameter (approximately 12- to 20-inch-diameter) pipes visible that appear to discharge water from these properties into the

pond; one pipe is located near the southwestern corner of the pond and two pipes are located near the southeastern corner of the pond.

ENV reported that sediment and surface-water samples collected from this pond in 1992 contained detectable concentrations of petroleum hydrocarbons (ENV 2006a). Surface-water and sediment samples subsequently were collected from the storm-water retention pond by ENV and B&C in 2006. Analytical results from one of the sediment samples and from the one surface-water sample, both collected near the southeastern corner of the pond by B&C, contained TPHd and TPHmo concentrations that exceeded the ESLs. In the Work Plan, LFR recommended that additional shallow sediment and surface-water samples be collected to confirm these results.

2.3.6 AOC #7: PEC Identified by Temporary Soil Boring SS-31

Temporary soil boring SS-31 was advanced by ENV approximately near the southeastern corner of Lake I (AOC #7; Figures 2 and 6), as part of its subsurface investigations conducted in randomly selected locations (ENV 2007a). LFR is not aware of any historical mining operations in this portion of the Site. The soil samples collected from approximately 2 and 40 feet bgs from former boring SS-31 contained TPHd and TPHmo concentrations that exceeded the ESLs. Based on these results, LFR recommended that four temporary soil borings be advanced in step-out locations to collect additional soil samples to characterize the lateral and vertical extent of petroleum hydrocarbon-affected soil in this area. Because the deepest soil sample collected contained elevated concentrations of TPH, in the Work Plan LFR also recommended the collection and analysis of grab groundwater samples in this area.

2.3.7 AOC #8: PEC Identified by Temporary Soil Boring SS-123

As part of its subsurface investigations conducted in randomly selected locations, ENV advanced temporary soil boring SS-123 in the area located between the Vulcan Materials Company (VMC) property and the former mining operations area (AOC #8; Figures 2 and 7; ENV 2007a). LFR is not aware of any historical mining operations that may have taken place in this portion of the Site. Analytical results for soil samples collected from former soil boring SS-123 in January 2007 indicated the presence of petroleum hydrocarbon-affected soil at depths of approximately 20 to 40 feet bgs. Based on these results, ENV advanced four additional temporary soil borings located approximately 25 feet to the north, east, south, and west of soil boring SS-123 in March 2007. Analytical results from soil and grab groundwater samples contained TPHd and TPHmo at concentrations that exceeded the ESLs in soil samples collected from approximately between 2 and 30 feet bgs, and in grab groundwater samples collected from approximately 30 feet bgs in each of the four soil borings.

Based on the results of the March 2007 investigation, ENV concluded that the groundwater encountered approximately between 25 to 30 feet bgs represented a perched groundwater interval (ENV 2007b), and that additional characterization was

necessary. ENV proposed to conduct a third investigation in May 2007, consisting of additional step-out temporary soil boring locations.

When LFR submitted the Work Plan to ACEH on May 16, 2007, the results of ENV's third investigation conducted during May 2007 in this area were not available. LFR did not make any recommendations for additional investigations in the Work Plan, pending the results of ENV's investigation. Subsequently, a draft summary report presenting the results from ENV's third investigation was made available to LFR on July 3, 2007, and LFR later obtained a copy of the final report dated June 2007 from the ACEH on-line document library (ENV 2007c).

According to ENV's June 2007 report, four temporary soil borings were advanced in locations stepping out approximately 125 feet to the east, south, west, and north of the original SS-123 location (Figure 5). Former soil borings SS-123(E) through SS-123(H) were advanced to depths of approximately 30 to 35 feet bgs. Elevated TPHd and TPHmo concentrations were detected in a depth-discrete soil sample collected from approximately 5 feet bgs in former soil boring SS-123(G) located farthest west. Elevated TPHd concentrations were detected in the soil samples collected from approximately 15 feet bgs from former soil borings SS-123(H), located to the north, and SS-123(E), located to the east. No other soil samples collected from the three soil borings advanced by ENV at locations to the west, north, and east contained elevated hydrocarbon concentrations. In addition, grab groundwater samples collected from former soil borings SS-123(E), SS-123(G), and SS-123(H) did not contain TPHd concentrations above the ESL, and TPHmo was not detected above the laboratory reporting limit. Based on these results, the lateral and vertical extents of hydrocarbon contamination have been sufficiently characterized to the west, north, and east of former boring SS-123.

Of the four step-out locations advanced by ENV, only the southernmost soil boring (SS-123(F)) contained elevated petroleum hydrocarbons in soil samples and in the grab groundwater sample. Soil samples collected from approximately 5, 10, 15, and 20 feet bgs contained TPHd concentrations that exceeded the ESL and the 5-foot soil sample contained TPHmo at a concentration that exceeded the ESL. The grab groundwater sample contained TPHd and TPHmo at concentrations that exceeded the ESL (Figure 5; ENV 2007c).

Based on ENV's draft results, LFR planned to advance four additional temporary soil borings in the vicinity of former soil boring SS-123 during the July 2007 site-wide investigations, to further assess the lateral extent of petroleum-affected soil and groundwater in this area. Three soil boring locations were identified as step-out locations from former soil boring SS-123(F). One soil boring location was selected to be approximately adjacent to the original soil boring SS-123, in order to collect continuous core samples and create a more detailed soil boring log (ENV collected soil samples at approximately every 10 feet), and to collect a grab groundwater sample (ENV did not collect a grab groundwater sample from former boring SS-123). LFR

planned to collect depth-discrete soil samples and grab groundwater samples from each soil boring.

2.3.8 AOC #9: Vulcan Materials Company Storm-Water Runoff Area

The VMC property is located adjacent to the Site and to the east and is an active aggregate mining and product facility. The VMC runoff area is located along the southeastern edge of the Site (AOC #9; Figure 2). According to the Phase II ESA report by ENV, previous reports indicated that surface-water runoff from the VMC property onto the Site has occurred in the past (ENV 2006b). Reportedly, a berm was installed between the VMC property and the Site to control surface-water runoff; the current condition of this berm could not be determined by LFR or Hanson.

ENV collected three shallow soil samples from the VMC storm-water runoff area during September 2006, approximately where surface-water runoff may have taken place. Analytical results showed that TPHd was slightly elevated in one of the soil samples; however, the soil samples collected approximately upgradient and downgradient from this soil sample did not contain significant TPHd or TPHmo concentrations. No data gaps were identified and LFR did not recommend any additional investigations for this area.

2.4 Regulatory Determinations

Based on its review of documentation and reports of environmental investigations conducted by various consultants on behalf of Hanson and Legacy, ACEH issued a letter to Hanson on March 16, 2007, requesting that a work plan be prepared to propose a scope of work for additional site-wide characterization investigations. ACEH requested that the work plan include:

- A detailed site history
- A description of current conditions and PECs or RECs
- An improved presentation of available analytical data
- Copies of relevant reports or documents not previously provided to ACEH, in particular regarding environmental investigations conducted at the neighboring Kiewit property and case closure letters from regulatory agencies for former USTs
- A scope of work for additional characterization investigations

LFR prepared and submitted the May 16, 2007 Work Plan to ACEH, addressing ACEH's requests. In the Work Plan, LFR included a summary of the various PECs and RECs on a site-wide basis, a comprehensive summary of all available analytical data, individual site maps presenting analytical data and site features and at appropriate scales, and a scope of work for additional characterization investigations (LFR 2007a). On June 20, 2007, a project planning meeting was held at the ACEH offices with

ACEH, Hanson, LFR, and Nuquest on behalf of Hanson, Legacy, and ENV, and AIG Environmental on behalf of Legacy, to discuss current site conditions, the Work Plan and proposed scope of work, and the anticipated property transfer for the majority of the Hanson property to Legacy. During this meeting, two areas were highlighted as being of primary environmental concern, namely the deep soil contamination in the northern portion of the former hot mix asphalt plant area and in the vicinity of former soil boring SS-123.

ACEH subsequently approved the Work Plan in a letter dated June 22, 2007, and provided technical comments consisting primarily of requests for advancing certain proposed soil borings deeper and conducting additional analyses on soil and/or groundwater samples collected from specific locations (ACEH 2007c). ACEH agreed with LFR that no additional investigations would be required in the western portion of AOC #2, and in AOCs #4, #5, and #9.

2.4.1 Property Transfer and New Case Number

In anticipation of the property transfer between Hanson and Legacy, the Radum property has been divided into two primary parcels. Investigations and summary reports are now being conducted separately for the two primary areas of the Site.

It is LFR's understanding that Hanson has retained the portion of the property delineated by the Lot Line Adjustment, the approximately 15-acre area defined as Parcel 1, and the small, irregularly shaped area located south of the Kiewit property, and that the rest of the Site has been transferred to Legacy. In anticipation of the planned property transfer from Hanson to Legacy, Hanson requested that ACEH assign a new Spills, Leaks, Investigations, and Cleanups (SLIC) case number to the portion of the property transferred to Legacy (LFR 2007b). ACEH approved this request (ACEH 2007d), and currently there exist two SLIC case numbers for the Site, defined as follows:

ACEH SLIC case number RO0002941 and Geotracker Global ID SLT19719376 refer to the approximately 15-acre Parcel 1 and the small area south of the Kiewit property, including AOC #1 and the western portion AOC #2.

ACEH SLIC case number RO0002952 and Geotracker Global ID SL0600101555 refer to the rest of the Hanson Radum property, including the eastern portion of AOC #2 and AOCs #3 through #9.

2.4.2 Investigation and Reporting Schedule

In accordance with the Work Plan and ACEH technical comments outlined in its June 22, 2007 letter, LFR conducted subsurface investigations in the eastern portion of AOC #2, and in AOCs #3, #6, #7, and #8, during July 2007. The results on these

investigations are summarized and discussed in this report, which has been transmitted to ACEH on October 26, 2007.

The subsurface investigations proposed to be conducted in the former hot mix asphalt plant area (AOC #1) and in the irregularly shaped area south of the Kiewit property were completed during October 2007. As approved by ACEH via e-mail on October 9, 2007, LFR will submit a summary report presenting results from these investigations on November 30, 2007.

2.5 Investigation Objectives

The primary objective of the subsurface investigations proposed in the Work Plan is to further characterize the lateral and/or vertical extent of petroleum hydrocarbons in soil and/or groundwater in AOCs #2, #3, #6, #7, and #8. Below is a summary of the investigations proposed to fill the data gaps.

AOC #2 - Idle truck maintenance area: advance three temporary soil borings near former boring EB-31 to characterize the lateral extent of TPHd in soil and to assess groundwater quality in this area of the Site.

AOC #3 - Heavy equipment maintenance and wash rack area, and former soil boring EB-35 area: advance one temporary soil boring near former boring B-1 to characterize the lateral and vertical extent of TPHd in soil and to evaluate whether groundwater has been affected in this area, and advance four temporary soil borings in the vicinity of former boring EB-35 to assess the lateral extent of TPHd and TPHmo in soil.

AOC #6 - Storm-water retention pond: collect sediment and surface-water samples from the pond to confirm previous TPHd and TPHmo results.

AOC #7 - Former soil boring SS-31 area: advance four temporary soil borings near former boring SS-31 to characterize the lateral and vertical extent of TPHd and TPHmo in soil and to assess groundwater quality in this area of the Site.

AOC #8 - Former soil boring SS-123 area: advance four temporary soil borings in the vicinity of former boring SS-123 to assess the lateral and vertical extent of TPHd and TPHmo in soil and groundwater in this area of the Site.

3.0 INVESTIGATION METHODOLOGY

3.1 Pre-Field Activities

3.1.1 Permitting

LFR applied for and received the appropriate soil boring drilling permit from Zone 7. Based on the drilling locations, no other permits were required for the proposed activities. A copy of the approved soil boring permit is included in Appendix A.

3.1.2 Subsurface Utility Clearance

LFR notified Underground Service Alert (USA) to identify any public underground utilities located in the vicinity of the proposed soil boring locations. LFR did not receive any utility alerts from USA. LFR also subcontracted a private underground utility locator to clear all proposed soil boring locations using geophysical and pipe/cable location methods. All proposed soil boring locations were cleared satisfactorily. Due to the extreme hardness of the surface soil and the presence of gravel in the upper 5 feet of soil, the temporary soil borings could not be started using hand-auger techniques as was proposed in the Work Plan as an additional precaution against encountering utilities during drilling.

3.1.3 Health and Safety Plan

A Health and Safety Plan (HSP) previously prepared by LFR for the subsurface investigations conducted at the former hot mix asphalt plant area in November 2006 was revised to address health and safety concerns specific to the planned field activities.

Health and safety tailgate meetings were conducted before beginning fieldwork each day, and fieldwork was monitored according to the HSP to ensure that appropriate health and safety procedures were followed during the field investigations. In addition, in accordance with standard Hanson Radum facility operations, LFR and LFR's subcontractors attended on-site health and safety training conducted by a Hanson representative.

3.2 Temporary Soil Borings

A total of 16 temporary soil borings was advanced to depths ranging approximately from 10 to 70 feet bgs in AOCs #2, #3, #7, and #8, as described below.

3.2.2 Soil Boring Advancement and Soil and Grab Groundwater Sampling Procedures

Drilling and Lithologic Logging

LFR subcontracted HEW Drilling Co., Inc., of Palo Alto, California, a state-certified drilling subcontractor, to advance the 16 temporary soil borings using hollow-stem auger (HSA) drilling technology using a CME-75 drill rig and an 8-inch-diameter HSA (although a larger drill rig and HSA were used to advance several soil borings in the SS-123 area, as explained in Section 3.2.3). The drilling and soil and grab groundwater sampling activities were completed during July 16 through 24, 2007. During drilling, continuous soil cores were collected for lithologic evaluation and field screening. LFR collected depth-discrete soil samples for laboratory analyses from intervals where field screening and field observations indicated the possible presence of petroleum hydrocarbons or other contaminants in the soil. Where no indication of contamination was observed in the soil cores, LFR collected depth-discrete soil samples at approximately 5-foot intervals, until groundwater was first encountered or to a target depth, depending on the soil boring location.

Field boring logs were prepared for each soil boring location, and lithologic and field screening results were recorded on the field boring logs. Field boring logs were prepared by an LFR field geologist based on visual lithologic soil logging procedures and the Unified Soil Classification System (ASTM D2488-00). All boring logs were reviewed, edited, and signed by a California Professional Geologist.

All downhole drilling and sampling equipment was appropriately cleaned with high-pressure hot water (steam cleaned) before use at each drilling location. After soil and groundwater samples were collected, each borehole was abandoned by sealing it with a mixture of cement and bentonite ("grout") from the bottom up to the ground surface using a tremie pipe if groundwater was present, or directly from the ground surface if no groundwater was present. Waste soil generated during drilling was placed on plastic tarps on the ground surface near each temporary soil boring and will be disposed of as necessary during future land development activities.

Soil Sampling

LFR attempted to collect continuous soil cores using California split-spoon-type samples driven in approximately 18-inch intervals. This was conducted variably, depending on soil conditions, in soil borings EB-35(A) through EB-35(D), B-1(A), EB-31(A), EB-31(C), and SS-31(A). The coarse-grained nature of the soils (typically gravels) made this sampling method difficult to nearly impossible in certain locations. Therefore, LFR switched to collecting 5-foot continuous cores during HSA drilling where necessary. The continuous coring resulted in somewhat poorer soil core recovery in certain soil borings. Where the California split-spoon sampler was used, soil cores were collected in brass tube liners. Where continuous coring methods were

used, soil samples selected for laboratory analyses were transferred from the core barrel to brass tube liners.

Depth-discrete soil samples were selected for laboratory analyses based on the potential presence of contaminants, in particular petroleum hydrocarbons, as apparent from field screening using a photoionization detector (PID) or from visual/olfactory evaluation of the soil cores. All soil samples selected to be submitted for laboratory analyses were properly labeled with the boring identification number and depth interval, the time and date of collection, and the initials of the sampler. Soil samples were stored in ice-chilled coolers that were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

Grab Groundwater Sampling

Ten of the 16 temporary soil borings were advanced until groundwater was first encountered to collect grab groundwater samples. After drilling was completed, a temporary well casing consisting of a polyvinyl chloride (PVC) well screen and casing was placed through the HSA and the HSA was raised approximately 3 to 5 feet to allow groundwater to enter the borehole. Grab groundwater samples were collected using clean, disposable bailers lowered into the PVC casing and gently pouring the groundwater from the bailer into the appropriate clean, laboratory-supplied sample containers. The sample containers were properly labeled with the boring identification number, the time and date of collection, and the initials of the sampler. Groundwater samples were stored in ice-chilled coolers along with the soil samples, and were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

Grab groundwater samples were successfully collected from each location where grab groundwater samples were proposed to be collected, although most soil borings needed to be advanced deeper than anticipated. Based on previous investigations conducted at the former hot mix asphalt plant, groundwater was anticipated to be encountered between approximately 50 and 55 feet bgs. During the drilling conducted site-wide in July 2007, however, borings were advanced to approximately 70 feet bgs in order to encounter sufficient groundwater for sampling, with the exception of the area near former soil boring SS-123 where groundwater previously had been encountered at approximately 30 feet bgs.

3.2.3 Temporary Soil Boring Locations and Target Depths

The locations of temporary soil borings advanced by LFR in AOCs #2, #3, #7, and #8 during July 16 though 24, 2007 are shown on Figures 3, 4, 6, and 7, respectively. Sample locations and target depths are described below.

Idle Truck Maintenance Area (AOC #2)

LFR advanced at total of three temporary soil borings in the idle truck maintenance area (AOC #2), in the vicinity of former soil boring EB-31, which was located approximately northeast of the idle truck maintenance yard. Soil borings EB-31(A) through EB-31(C) were advanced to further characterize the lateral and vertical extent of elevated TPHd and TPHmo concentrations detected in a soil sample previously collected from approximately 10 feet bgs in former boring EB-31. The three new soil borings were located approximately 15 feet southeast, southwest, and north, respectively, of former boring EB-31 (Figure 3). Soil borings EB-31(A) and EB-31(C) were advanced to approximately 20 feet bgs, and soil boring EB-31(B) was advanced to approximately 70 feet bgs until groundwater was first encountered. In each soil boring, depth-discrete soil samples were collected for laboratory analyses from approximately every 5 feet to approximately 20 feet bgs and analyzed for TPHd and TPHmo. A grab groundwater sample was collected from boring EB-31(B) and analyzed for TPHd; TPHmo; TPH as gasoline (TPHg); volatile organic compounds (VOCs); benzene, toluene, ethylbenzene, and total xylenes (BTEX); fuel oxygenates; and lead scavengers (Table 1).

Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Former Soil Boring EB-35 (AOC #3)

Five temporary soil borings were advanced in AOC #3 (Figure 4). One soil boring (B-1(A)) was located approximately 18 feet north of former soil boring B-1 near the lube shed, and was advanced to approximately 70 feet bgs to collect a grab groundwater sample.

Four soil borings (EB-35(A) though EB-35(D)) were advanced surrounding former soil boring EB-35, to further characterize the lateral and vertical extent of elevated TPHd concentrations detected in soil samples collected from approximately 2 feet bgs in these two areas (Figure 4). These four borings were located approximately 25 feet to the east, south, west, and north of former boring EB-35 and were advanced to approximately 10 or 11 feet bgs.

Continuous soil cores were collected from each temporary soil boring for lithologic logging, and depth-discrete soil samples were collected for laboratory analyses from approximately 5 and 10 feet bgs in each soil boring and were analyzed for TPHd, TPHmo, TPHg, polychlorinated biphenyls (PCBs), semivolatile organic compounds (SVOCs), and metals concentrations. An additional soil sample was collected from approximately 35 feet bgs (based on field screening results) at boring B-1(A) and analyzed for TPHd and TPHmo. A grab groundwater sample was collected from boring B-1(A) and was analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

PEC Identified by Former Soil Boring SS-31 (AOC #7)

AOC #7 was defined by elevated petroleum hydrocarbon concentrations detected in soil samples collected from former soil boring SS-31 (Figure 6). LFR advanced four temporary soil borings approximately surrounding former soil boring SS-31 to further characterize the lateral and vertical extent of elevated TPHd and TPHmo concentrations previously detected in soil samples from approximately 2 and 40 feet bgs. Soil borings SS-31(A) through SS-31(D) were located approximately 75 feet to the west, north, east, and south, respectively (Figure 6). Each soil boring was advanced to approximately 70 feet bgs to collect grab groundwater samples. Depth-discrete samples were collected for laboratory analyses from the four soil borings from approximately every 5 feet from ground surface to approximately 30 feet bgs, and then approximately every 10 feet bgs until groundwater was encountered. An additional depth-discrete soil sample was collected from the 52- to 53-foot interval in boring SS-31(A) based on the field screening results. All soil samples were analyzed for TPHd, TPHmo, TPHg, BTEX compounds, fuel oxygenates, and lead scavengers. In addition, the 5- and 10-foot samples were analyzed for pesticides, PCBs, SVOCs, and metals concentrations (Table 1).

Grab groundwater samples were collected from each of the four soil borings and analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

PEC Identified by Former Soil Boring SS-123 (AOC #8)

AOC #8 was defined by elevated petroleum hydrocarbon concentrations detected in soil samples collected from the initial former soil boring SS-123 (Figure 7). As described in Section 2.3.7, ENV subsequently advanced a total of eight soil borings in step-out locations from former boring SS-123 to investigate the nature and extent of potential petroleum hydrocarbon contamination in this area. Based on ENV's results, LFR proposed to advance three soil borings in step-out locations from former soil boring SS-123(F) and one temporary soil boring adjacent to the original former boring SS-123.

Soil boring SS-123(AA) was advanced approximately adjacent to former boring SS-123, to approximately 20 feet bgs to collect a continuous soil core and a grab groundwater sample, neither of which was collected from the original soil boring SS-123. In addition, based on ENV's conclusion that a perched zone of groundwater exists in the SS-123 area, LFR attempted to confirm the presence of perched groundwater. Soil boring SS-123(AA) was drilled using a relatively powerful HSA drilling rig (CME-95 instead of standard CME-75) and large-diameter HSA (16-inch diameter instead of standard 8-inch). LFR intended to advance the 16-inch-diameter HSA into a relatively less permeable interval, possibly beneath the perched groundwater zone, and then continue drilling deeper using the 8-inch-diameter HSA advanced inside the 16-inch-diameter HSA, which would serve as a temporary casing sealing the perched groundwater from deeper groundwater zones. However, the

suspected perched groundwater could not be adequately sealed from entering the borehole using the 16-inch-diameter HSAs; therefore, the presence of a perched groundwater zone could not be confirmed using this drilling method.

Soil borings SS-123(F1), SS-123(F2), and SS-123(F3) were advanced as step-out locations to former soil boring SS-123(F), and were located approximately 75 feet to the east, south, and west, respectively. Soil borings SS-123(F1) through SS-123(F3) were advanced to approximately 30 feet bgs. Continuous soil cores were collected and depth-discrete soil samples were collected from approximately every 5 feet until a grab groundwater sample could be collected from the first encountered groundwater.

3.3 Surface Sediment and Water Samples from the Storm-Water Retention Pond

LFR collected a total of four surface-sediment samples and one composite surface-water sample from the storm-water retention pond (AOC #6; Figure 5). LFR subcontracted NRC Environmental Services (NRC) of Alameda, California, to assist in collecting the samples from within the storm-water retention pond on July 13, 2007. NRC provided a boat that was lowered into the pond and from which two of the four sediment samples were collected from beneath the water using a potable dredge to collect the composite surface-water sample. The sediment collected using the dredge was placed in clean, laboratory-provided sample containers. The two sediment samples collected from the wet sediment above the surface water were collected by pushing clean sample containers into the sediment. The four sediment samples were collected approximately in line and approximately at 50-foot intervals between the southeastern corner of the pond and approximately the center of the pond. The southeasternmost sediment sample was collected approximately below the outflow of two large diameter pipes that appear to direct surface-water runoff from the Hanson and Kiewit properties into the pond.

The composite surface-water sample was collected by compositing surface water from approximately the southeastern and southwestern corners of the pond, approximately beneath the outflow of the two large-diameter pipes leading into the pond in the southeastern corner and one large-diameter pipe leading into the pond in the southwestern corner of the pond. The surface-water samples were collected directly into clean, laboratory-provided sample containers. All samples were placed in ice-chilled coolers, which were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

The four storm-water sediment samples were analyzed for TPHd, TPHmo, and metal concentrations while the composite surface-water sample was analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, lead scavenger compounds, and metals concentrations (Table 1).

3.4 Laboratory Analyses

All soil and water samples selected for laboratory analyses were submitted to Curtis & Tompkins, Ltd. (C&T), a California-certified analytical laboratory located in Berkeley, California. All samples were analyzed for TPHd and TPHmo by U.S. Environmental Protection Agency (EPA) Method 8015 (after undergoing silica gel cleanup). Selected samples were analyzed variably for the following analyses: TPHg by EPA Method 8015 (soil and sediment samples) or EPA Method 8260 (groundwater and surface-water samples); VOCs, BTEX, fuel oxygenates, and lead scavengers by EPA Method 8260; pesticides by EPA Method 8081; PCBs by EPA Method 8082; SVOCs by EPA Method 8270; and metals (CAM 17 by EPA Method 6010). Table 1 presents a sample matrix that summarizes the laboratory analyses conducted from individual soil, groundwater, sediment, and surface-water samples.

3.5 Field Documentation

Field activities were documented using the appropriate forms for HSP tailgate meetings, field boring logs, sample labels, and chain-of-custody forms. Forms will be kept on file at LFR and will be available upon request.

3.6 Land Survey of Sample Locations

After all samples were collected, LFR subcontracted a licensed land surveyor to survey the location of individual temporary soil borings and the approximate location of the sediment and surface-water samples collected from the storm-water retention pond. All sample locations from the July 2007 field investigations presented on Figures 3 through 7 are based on the land survey results.

4.0 RESULTS OF ADDITIONAL SITE-WIDE CHARACTERIZATION

Results from investigations conducted in AOCs #2, #4, #7, and #8 and in the storm water retention pond (AOC #6) during July 2007 are summarized and discussed below. All analytical results are summarized in Tables 2 through 14, based on laboratory-certified analytical reports included in Appendix B. Soil boring logs for temporary soil borings are included in Appendix C. Analytical results for TPHd, TPHmo, and TPHg are presented on Figures 3 through 7.

All analytical results were compared to RWQCB ESLs for shallow or deep soils beneath commercial/industrial land use areas (RWQCB 2005). The ESLs are included in the summary tables. Compounds detected at concentrations that exceed the ESLs are highlighted in the tables and on the figures.

In general, the primary compounds detected in soil samples are TPHd and TPHmo. No other organic compounds, including TPHg, VOCs, BTEX, fuel oxygenates, lead

scavengers, SVOCs, pesticides, PCBs, or SVOCs, were detected in any soil or sediment samples. Although several metals were detected, only arsenic, cobalt, and chromium were detected at concentrations that exceeded the ESLs. One or more of these three metals were detected in shallow samples collected from AOCs #3, #6, and #7. However, the detected concentrations of these three metals are well within the reported ranges for naturally occurring metals for the San Francisco Bay Area, based on the report entitled "Analysis of Background Distributions of Metals in the Soil at Lawrence Berkeley National Laboratory (LBNL)," prepared by LBNL in June 2002. Based on the LBNL study, natural background ranges for arsenic, cobalt, and chromium in San Francisco Bay Area soils can be defined as follows (arithmetic mean plus or minus the standard deviation):

- Arsenic: 0.1 to 10.9 milligrams per kilogram (mg/Kg)
- Cobalt: 9.2 to 18.8 mg/Kg
- Chromium: 32 to 84 mg/Kg

Similarly, the primary compounds detected in grab groundwater samples are TPHd and TPHmo. With one exception, TPHg, BTEX, fuel oxygenates, and lead scavengers were not detected above laboratory reporting limits; toluene was detected in one grab groundwater sample at a concentration below the ESL. Several VOCs were detected in a grab groundwater sample collected from AOC #8, but none of these concentrations exceeded the ESLs. Several metals were detected in the surface-water sample, but no concentrations exceeded the ESLs.

4.1 Idle Truck Maintenance Area (AOC #2)

Predominantly fine-grained sediments (silts and clays) were encountered in soil borings EB-31(A), EB-31(B), and EB-31(C) (Figure 3). In soil boring EB-31(B), fine-grained sediments were encountered to approximately 62 feet bgs, below which relatively coarse-grained sediments (clayey gravel with sand) were encountered to the total depth of the soil boring (approximately 70 feet bgs). No evidence of petroleum-affected soil or groundwater was identified during drilling of these three soil borings.

TPHd and TPHmo were detected in several soil samples at concentrations significantly below their respective ESLs (100 mg/Kg for TPHd and 1,000 mg/Kg for TPHmo; Table 2A and Figure 3). All concentrations of TPHd and TPHmo were qualified by the laboratory, indicating that the hydrocarbons detected in the soil samples did not resemble TPHd or TPHmo; as noted by the laboratory, hydrocarbons detected generally were heavier than TPHd and lighter than TPHmo. Heavier hydrocarbons such as TPHmo typically consist of longer carbon chain hydrocarbons (C10 to C24) while lighter hydrocarbons such as TPHd typically consist of shorter chain hydrocarbons (C24 to C36). The laboratory qualifiers indicate that the detected concentrations do not resemble standards for TPHd and TPHmo.

At soil boring EB-31(B), groundwater was first encountered between 65 and 70 feet bgs. After drilling was completed, the depth to groundwater was measured at approximately 64.8 feet bgs. Continuous soil cores were collected from soil boring EB-31(B) from the ground surface to approximately 21.5 feet bgs, after which sediments were logged from auger cuttings because recovery was poor and continuous soil sampling was not required (the primary objective for drilling deeper than approximately 20 feet bgs at this location was to collect a grab groundwater sample). Petroleum hydrocarbons, VOCs including BTEX, fuel oxygenates, and lead scavenger compounds were not detected above the laboratory reporting limits in samples collected in this area (Tables 8A, 8B, and 9).

Based on the results from soil borings EB-31(A), EB-31(B), and EB-31(C), this area has been sufficiently characterized laterally and vertically. The potential petroleum hydrocarbon contamination identified in the 10-foot samples from former soil boring EB-31 appears to be limited to a localized area and depth. Groundwater does not appear to have been affected by petroleum hydrocarbons detected in soil in this area.

4.2 Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Former Soil Boring EB-35 (AOC #3)

4.2.1 Wash Rack and Lube Shed Area

Soil boring B-1(A) was advanced in the vicinity of the lube shed to a total depth of 70 feet bgs (Figure 4). Predominantly fine-grained sediments (clays) were encountered from approximately 3 to 34 feet bgs. Predominantly coarser-grained sediments (sands and gravels) were encountered between 34 feet bgs and the total depth of the boring (70 feet bgs). No evidence of petroleum-affected soil was identified during drilling, with the exception of a slightly elevated PID reading at approximately 35 feet bgs. Only TPHmo was detected in the depth-discrete soil samples collected from boring B-1(A), in the sample collected from approximately 9.5 feet bgs at a low concentration just above the laboratory reporting limit. Several metals were detected above laboratory reporting limits, but none were detected at concentrations above the ESLs.

A grab groundwater sample was collected from soil boring B-1(A) at approximately 68 feet bgs. TPHmo was detected in this sample at a concentration of 1,100 micrograms per liter (μg/L), slightly above the ESL of 1,000 μg/L for TPHmo (Table 8A and Figure 4). The laboratory qualified the TPHmo result, stating that "hydrocarbons heavier than TPHmo contributed to the result." TPHd was detected at a concentration of 76 μg/L, and that result was also qualified by the laboratory; the TPHd detection was below the ESL for TPHd (100 μg/L; Table 8A). The only VOC detected in the grab groundwater sample was acetone, which was detected at a concentration of 10 μg/L. This concentration is well below the ESL of 1,500 μg/L for acetone (Table 9). Because acetone is a common laboratory contaminant and has not been detected in any other samples collected, this low acetone concentration may be associated with laboratory contamination. No other compounds were detected above

laboratory reporting limits for the grab groundwater sample collected from soil boring B-1(A) (Tables 8A, 8B, and 9).

4.2.2 PEC Identified by Former Soil Boring EB-35

In the four soil borings (EB35(A), EB35(B), EB35(C), and (EB35(D)) advanced in the vicinity of former boring EB-35, primarily gravels and/or sands were encountered from ground surface to approximately 3 to 5 feet bgs (Figure 4). Sediments below approximately 3 to 5 feet bgs were comprised of fine-grained material (silts and clays) to the total depth of the soil borings. In each soil boring except for EB-35(C), a black petroleum product was observed between approximately 2.5 and 4 feet bgs. The product was observed to be dry, similar to asphalt concrete, with a trace of oil (see soil boring log in Appendix C). It is assumed that this petroleum product is the same material that was sampled at soil boring EB-35 from approximately 2 feet bgs, which resulted in TPHd and TPHmo concentrations that exceeded the ESLs (Figure 4). TPHd and TPHmo were detected in the soil samples collected from approximately 5 feet bgs in borings EB-35(A), EB-35(B), and EB-35(D) (Table 2A and Figure 4). TPHd concentrations ranged from 38 to 160 mg/Kg, and TPHmo concentrations ranged from 540 to 3,600 mg/Kg. Only the 5-foot sample from boring EB-35(B) contained TPHd and TPHmo concentrations that exceeded the ESLs. All results were qualified by the laboratory as containing heavier hydrocarbons than the standards for TPHd and TPHmo.

TPHd and TPHmo were not detected above laboratory reporting limits in any of the soil samples collected from approximately 10 feet bgs, with the exception TPHmo detected at a low qualified concentration of 5.2 mg/Kg in a sample collected from boring EB-35(A) (Table 2A and Figure 4).

A grab groundwater sample was collected from former boring EB-35 by ENV in January 2007 from approximately 68 feet bgs. TPHd, TPHmo, and TPHg were not detected above laboratory reporting limits (Figure 4).

In general, analytical results for soil samples collected from soil borings EB-35(A) through EB-35(D) indicate that the lateral extent of petroleum-affected soil may extend farther south than the location of soil boring EB-35(B). However, the petroleum-affected soil appears to be limited to shallow soil (approximately less than 4 or 5 feet bgs), the petroleum product appears to be dry and not mobile, and groundwater quality has not been affected. LFR does not recommend that any additional subsurface investigations be conducted in this area. It is LFR's understanding that this property will be developed for commercial/industrial land use by Legacy. LFR recommends that, if affected soil is identified during the redevelopment of this area, the material should be removed as necessary.

4.3 PEC Identified by Former Soil Boring SS-31 (AOC #7)

Predominantly fine-drained sediments (clays and some silts) were encountered from ground surface to approximately 41 to 43 feet bgs in soil borings SS 31(C) and SS-31(D), to approximately 50 feet bgs in boring SS-31(B), and to approximately 65 feet bgs in boring SS-31(A) (Figure 6). Relatively coarser-grained sediments (gravels and some sands) were encountered below the fine-grained sediment to the total depth of each soil boring. Groundwater was encountered at approximately 66 feet bgs at each soil boring location. Visual observations identified the potential presence of petroleum hydrocarbons in soil samples from only soil boring SS-31(A), between approximately 52 and 53 feet bgs; however, the PID did not register a response. At soil boring SS-31(C), elevated PID readings were noted during field screening of the soil cores collected from the ground surface to approximately 35 feet bgs; however, no visual or olfactory evidence of petroleum-affected soil was noted. It is possible that the PID instrument was responding to organic matter that may have been present in the sediment or that the PID was malfunctioning.

TPHd and/or TPHmo were detected at low concentrations (approximately less than 35 mg/Kg for TPHd and less than 160 mg/Kg for TPHmo) in one soil sample collected from boring SS-31(A) (from approximately 2 feet bgs), in all soil samples collected from boring SS-31(B), and in three samples collected from borings SS-31(C) and SS-31(D) (Table 2A and Figure 6). Except for metals, no other compounds analyzed were detected above laboratory reporting limits for the soil samples collected from these soil borings (Tables 2A, 2B, 3, 4, 5, and 6). Several metals were detected above laboratory reporting limits; however, only three metals (arsenic, cobalt, and chromium) were detected at concentrations that exceeded the ESLs for these metals (Table 7). As noted in Section 4.0, the detected concentrations are well within the ranges of natural background concentrations for soils in the San Francisco Bay area.

The grab groundwater samples collected from each of the four soil borings did not contain any compounds above their laboratory reporting limits (Tables 8A, 8B, and 9).

Based on the field investigation and analytical results, the lateral and vertical extent of potential petroleum contamination previously identified in two samples collected from former soil boring SS-31 appears limited in extent to the immediate vicinity of former boring SS-31. It should be noted that the two soil samples from former boring SS-31, in which elevated TPHd and TPHmo concentrations were detected from approximately 2 and 40 feet bgs, resulted in nearly identical TPHd and TPHmo concentrations, and that the three soil samples collected from approximately 10, 20, and 30 feet bgs did not contain TPHd or TPHmo above laboratory reporting limits other than low concentrations of TPHd and TPHmo detected in the 10-foot sample. These results raise the question as to whether a field or a laboratory error could explain the presence of TPHd and TPHmo in the sample collected from 40 feet bgs. In any event, the analytical results from the 37 depth-discrete soil samples and the four grab groundwater samples collected from soil borings SS-312(A) through SS-31(D) confirm that, if there is any potential hydrocarbon contamination in this area, it is limited in extent both

vertically and laterally. LFR does not recommend any additional subsurface investigations for the vicinity of former soil boring SS-31.

4.4 PEC Identified by Former Soil Boring SS-123 (AOC #8)

4.4.1 Temporary Soil Boring SS-123(AA)

Soil boring SS-123(AA) was located approximately adjacent to the original soil boring SS-123 (Figure 7) and was advanced to approximately 20 feet bgs. Continuous soil cores were collected although soil recovery was less than 50% from ground surface to approximately 10 feet bgs. LFR encountered predominantly fine-grained sediment (clay or silt) from just below ground surface to the total depth of the soil boring. Petroleum hydrocarbon material described as hard black asphalt concrete (asphalt bound with gravel and sand, pieces up to 2-1/2 inches in diameter, no odor) was observed at approximately 7.5, 12.5, and 15.5 feet bgs. In addition, concrete material was encountered between approximately 14.5 and 15 feet bgs. Groundwater was encountered at approximately 16 feet bgs during drilling and was measured to be at approximately 15.6 feet bgs after the total depth of 20 feet bgs was reached.

Depth-discrete soil samples were collected from soil boring SS-123(AA) for TPHd and TPHmo analyses from approximately 5.5, 7.5, 10.5, and 15.5 feet bgs, and from 18 feet bgs, which was below the apparent water table. A grab groundwater sample also was collected from this soil boring for TPHd and TPHmo analyses. TPHd and TPHmo were detected in each of the soil samples, but only the soil sample collected from approximately 18 feet bgs (below the water table) contained TPHd and TPHmo at concentrations above the ESLs (Table 2A and Figure 7). The grab groundwater sample collected from this soil boring also contained TPHd and TPHmo at concentrations that exceeded the ESLs for TPHd and TPHmo (Table 8A).

4.4.2 Temporary Soil Borings SS-123(F1) through SS-123(F3)

Soil borings SS-123(F1), SS-123(F2), and SS-123(F3) were located approximately 75 feet east, south, and west, respectively, of former boring SS-123(F) (Figure 7). These three soil borings were advanced to approximately 30 feet bgs. As noted on the soil boring logs in Appendix C, significant intervals of concrete or cement materials were encountered in each of the three soil borings. Depth-discrete soil samples and a grab groundwater sample were collected from each soil boring and analyzed for TPHd and TPHmo (Table 1). The grab groundwater samples also were analyzed for TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

In soil boring SS-123(F1), concrete or cement material was encountered (and mostly ground to powder during drilling) between approximately 9 and 15 feet bgs and again between approximately 18 and 25 feet bgs. Fine-grained sediments were encountered from ground surface to approximately 9 feet bgs (gravelly silt) and from approximately 25 feet bgs to the total depth of the boring (clay). No evidence of petroleum

hydrocarbon was observed during field screening. Depth to groundwater was measured to be approximately 21 feet bgs after drilling was completed. Depth-discrete soil samples for laboratory analyses were collected from approximately 5 and 15 feet bgs, and a grab groundwater sample was collected.

In soil boring SS-123(F2), silty gravel and gravelly silt were encountered from ground surface to approximately 15 feet bgs, and mostly concrete or cement material was encountered from approximately 16.5 feet bgs to the total depth of the boring, resulting in relatively poor sample recovery (less than 25%). No evidence of petroleum hydrocarbon was observed during field screening. Depth to groundwater was measured to be approximately 26 feet bgs after drilling was completed. Depth-discrete soil samples were collected from 6, 10, 17, and 21 feet bgs, and a grab groundwater sample was collected.

In soil boring SS-123(F3), predominantly fine-grained sediments were encountered (clays or silts). Concrete or cement material was identified between approximately 7 and 10 feet bgs, a significantly shorter interval than was encountered in nearby soil borings SS-123(F1) and SS-123(F2). The depth to groundwater was measured at approximately 27 feet bgs after drilling was completed. Depth-discrete soil samples were collected from approximately 5, 10, 15, 20, and 25 feet bgs, and a grab groundwater sample was collected.

With one exception, TPHd and TPHmo were detected above laboratory reporting limits in all soil and grab groundwater samples collected from soil borings SS-123(F1) through SS-123(F3) (Table 2A). These compounds were not detected in the soil sample collected from approximately 20 feet bgs from boring SS-123(F3). For soil samples, all reported TPHd and TPHmo concentrations were below the ESLs (Table 2A).

For grab groundwater samples, the reported TPHd and TPHmo concentrations exceeded the ESLs only in the grab groundwater sample collected from boring SS-123(F2) (Table 8A). Other than TPHd and TPHmo, several VOCs were detected at low concentrations ranging between the detection limit to 4.6 μg/L in the grab groundwater sample collected from boring SS-123(F2) (Tables 8A and 9). None of these VOC concentrations exceeded the ESLs, and no other compounds were detected. The VOCs detected in the grab groundwater sample from boring SS-123(F2) are associated with the elevated TPHd and TPHmo concentrations detected in this sample.

4.4.3 Investigation Results for the SS-123 Area

A review of analytical results for the SS-123 area shows that the lateral extent of petroleum-affected soil has been adequately characterized to the north, east, south, and west (Figure 7). The lateral extent of petroleum-affected groundwater has been adequately characterized to the west, north, and east, but not to the south. The analytical results for the grab groundwater sample collected from the southernmost soil boring, SS-123(F2), indicate the presence of TPHd and TPHmo concentrations that exceed the ESLs. Additional step-out grab groundwater sample locations will be

necessary to further characterize the extent of petroleum-affected groundwater to the south of former boring SS-123(F2).

The potential source of the petroleum hydrocarbon in groundwater in this area has not been characterized. ENV has concluded that the source of contamination in this area is a historical mining pit that was filled in with debris and sediment. In addition, ENV also concluded that the groundwater encountered in the SS-123 area is perched on relatively less permeable fill material or sediment. All investigations conducted in the SS-123 area have shown that groundwater is encountered at significantly shallower depths than in other areas of the Site. However, the presence of a perched groundwater interval has not been confirmed by investigations conducted to date.

4.5 Surface Sediment and Water Samples from the Storm-Water Retention Pond (AOC #6)

Analytical results for the four sediment samples (SED1 through SED4) collected from the storm-water retention pond are summarized in Tables 2A and 7, and sample locations are presented on Figure 5. TPHd and TPHmo were detected in each sediment sample, with the exception of the southeasternmost sediment sample (SED-1) in which TPHd was not detected above laboratory reporting limits (Figure 5). Only sample SED-3 contained a TPHd concentration that was equivalent to the ESL and therefore was highlighted in Table 2A as exceeding the ESL. Several metals were detected above the laboratory reporting limits, but, with only one exception, detected concentrations were below the ESL. Cobalt was detected in sample SED-4 at a concentration of 10 mg/Kg, which is equivalent to the ESL. As noted in Section 4.0, the concentration of cobalt detected in this sample is within the range of natural background concentrations for soil in the San Francisco Bay Area.

Analytical results for the composite surface-water sample (PW-2) are presented in Tables 8A, 8B, 9, and 10 and Figure 5. No petroleum hydrocarbons or VOCs were detected above laboratory reporting limits in the surface-water sample. Four metals were detected, but all at concentrations significantly less than the ESLs.

Based on the analytical results for the sediment and surface-water samples collected by LFR, there does not appear to be a significant impact to the storm-water retention pond from storm-water runoff from nearby properties. The elevated TPHd and TPHmo concentrations detected in the sediment and the pond water samples previously collected by B&C (Figure 5; B&C 2006b) were not confirmed. LFR does not recommend any additional investigations for the storm-water retention pond area.

5.0 SAMPLING OF EXISTING GROUNDWATER MONITORING WELLS

5.1 Wells Sampled and Sampling Methodology

5.1.1 Well TW-5

In accordance with the scope of work described in the Work Plan, LFR searched for missing groundwater monitoring well 3S/1E 14D1 (also known as well TW-5), reportedly installed approximately near the southwestern corner of Cope Pond. The date of installation and well construction information has not been included in the records kept by Zone 7. Zone 7 records indicate that the well could not be located in 1984 and was located in 2003. Verbally, Zone 7 stated that the well could not be found. According to Zone 7 records, this well is reported to be 103 feet deep.

LFR successfully located well TW-5 on July 12, 2007, during a site reconnaissance effort. The well was found to be in good condition with a 2-inch-diameter PVC well casing inside a 4-inch-square metal above-grade protective well box. LFR measured the depth to groundwater in the well to be 53.2 feet TOC and the total depth of the well to be approximately 110.7 feet TOC. On July 12, 2007, LFR purged and sampled well TW-5 using a disposable bailer. Purge water was disposed of on the ground surface in the vicinity of the well. Water-quality parameters were monitored during well purging and were recording on a field sheet (Appendix D). Purging was completed once water-quality parameters stabilized and at least three casing volumes were removed. Approximately 28 gallons of groundwater were purged from the well, equivalent to approximately three casing volumes. Groundwater samples collected from the well using the disposable bailer were poured into clean, laboratory-provided sample containers, properly labeled, and placed into an ice-chilled cooler for transport to the laboratory under chain-of-custody protocol. The samples were analyzed by C&T for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers.

5.1.2 Additional Monitoring Wells Sampled

On July 12, 2007, Hanson received a request from ENV (on behalf of Legacy) to collect samples from four existing wells (monitoring or water supply) located on or near the Hanson property. LFR, Hanson, and ENV together identified four existing groundwater monitoring wells to be sampled, namely: 3S/1E 14D1, 3S/1E 10D8, 3S/1E 10K2, and 3S/1E 10N3 (Figure 8). ENV requested that samples from each well be analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, lead scavengers, SVOCs, and dissolved metals. One of the wells requested to be sampled was TW-5 (3S/1E 14D1), which LFR had already sampled. Fortunately, LFR had collected sufficient sample volume to request the laboratory to analyze the samples for the additional compounds requested by ENV.

At Hanson's request, LFR coordinated with Zone 7 to identify and gain access to the remaining three groundwater monitoring wells proposed to be sampled. LFR

subcontracted Blaine Tech Environmental Services ("Blaine Tech"), an environmental field services consultant from San Jose, California, to purge the three remaining groundwater monitoring wells on July 25, 2007. A summary of known or estimated well details is provided in the table below.

Well ID	Approximate Location	Well Diameter (inches)	Total Depth (Zone 7 Records) (feet bgs)	Well Screen Interval (Zone 7 Records) (feet bgs)	Depth to Groundwater on July 12 or July 25, 2007 (feet TOC)
3S/1E 14D1 (TW-5)	Southwestern corner of Cope Pond	2	103	Unknown	53.20
3S/1E 10D8	North of Lake I	2	215	190 – 210	56.32
3S/1E 10K2	Northwestern corner of Cope Pond	4	590.6	Unknown	55.50
3S/1E 10N3	South of Lake I	2	195	170 - 190	56.80

Blaine Tech used a 2-inch-diameter Rediflo electric submersible pump in the 2-inch-diameter wells and a 2-inch-diameter Grunfos pump in the 4-inch-diameter well to purge approximately three casing volumes from each of the three wells. Water-quality parameters were monitored and recorded on field sheets (Appendix D). Purging was completed once water-quality parameters stabilized and at least three casing volumes were removed. Purge water was temporarily contained in a plastic tank (estimated to be 500 gallons) on a trailer and was them disposed of in Cope Pond, in agreement with Zone 7 and Hanson. Approximately 75 gallons of purge water were removed from well 3S/1E 10D8, 1,043 gallons from well 3S/1E 10K2, and 64.5 gallons from well 3S/1E 10N3. After purging was completed at each well, groundwater samples were collected using a single-use disposal bailer. At ENV's request, a blind duplicate groundwater sample was collected from well 3S/1E 10K2. The blind duplicate sample was labeled "MW-10." As an additional quality assurance/quality control (QA/QC) measure, a trip blank sample was collected and analyzed for selected VOCs.

Groundwater samples were poured into clean, laboratory-provided sample containers, properly labeled, and placed into an ice-chilled cooler for transport to the laboratory under chain-of-custody protocol. The samples were analyzed by C&T for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates and lead scavengers, SVOCs, and dissolved metals.

5.2 Analytical Results

Analytical results for groundwater samples collected from the four existing groundwater monitoring wells are summarized in Tables 11A, 11B, 12, 13, and 14. Analytical results for TPHd, TPHmo, and TPHg also are presented on Figure 8.

Petroleum hydrocarbon-related compounds were not detected above laboratory reporting limits in any of the groundwater monitoring wells sampled, including TPHd, TPHmo, TPHg, BTEX, fuel oxygenates, and lead scavengers. In addition, VOCs were not detected in any of the groundwater samples, although the VOC bromomethane was detected at an estimated concentration below the laboratory reporting limit in the trip blank sample (Table 12). Because this compound was not detected in any of the groundwater samples, no QA/QC problems were noted. The groundwater sample collected from well 3S/1E 10D8 did contain a low concentration of one SVOC; bis(2-ethylhexyl)phthalate was detected at a concentration of 25 μg/L. This concentration exceeded the ESL for this compound (4 μg/L). Bis(2-ethylhexyl)phthalate is a plasticizer commonly associated with PVC and other plastics. This compound also is a known laboratory contaminant. The laboratory did not identify any evidence of laboratory contamination from this compound during the period that these groundwater samples were analyzed. The well casing for well 3S/1E 10D8 is made of PVC. It is possible that the presence of this SVOC may be due to the well casing and/or to the plastic tubing or fittings used to purge the well. Because no known use of plasticizers is associated with facilities and manufacturing processes historically present at the Site, it is assumed that this detection is not associated with historical industries. LFR recommends the re-sampling of this well to confirm this SVOC detection.

A few dissolved metals were detected above laboratory report limits, although, with only one exception, none of the detections exceeded the ESLs (Table 14). Dissolved mercury was detected in the groundwater sample collected from well 3S/1E 10D8 at a concentration of 0.63 μg/L, which is above the ESL for mercury (0.012 μg/L). No potential source of mercury has been identified, and mercury was not detected in any of the other groundwater samples. LFR also recommends the re-sampling of this well to confirm this detection.

6.0 SUMMARY AND RECOMMENDATIONS

6.1 Summary

The investigations conducted during July 2007 consisted of advancing a total of 16 temporary soil borings in AOCs #2, #4, #7, and #8, to depths ranging from approximately 10 to 70 feet bgs. The soil borings were advanced to collect continuous cores for lithologic logging and depth discrete soil samples and grab groundwater samples for laboratory analyses. Shallow sediment and surface-water samples were collected from the storm-water retention pond in AOC #6 for laboratory analyses. In

addition, four existing groundwater monitoring wells were sampled for laboratory analyses. All investigation and analytical results were presented and discussed in this report.

The primary compounds of concern at the Site are TPHd and TPHmo. No other organic compounds were detected, including TPHg, VOCs, BTEX, fuel oxygenates, lead scavengers, SVOCs, pesticides, PCBs, and SVOCs, in any soil samples collected from soil borings or samples collected from the storm-water retention pond. With one exception, none of these compounds were detected in any grab groundwater samples collected from the soil borings. Several VOCs were detected in one grab groundwater sample collected from the SS-123 area; however, concentrations were low and well below the ESLs.

Several metals were detected in soil or water samples, although only arsenic, cobalt, and chromium were detected in soil samples at concentrations that exceeded the ESLs. However, the metals concentrations that exceeded the ESLs are well within the concentration ranges published for naturally occurring metals detected in soils in the San Francisco Bay Area (LBNL 2002).

Groundwater samples collected from the existing monitoring wells did not contain organic compounds detected at concentrations above laboratory limits, with the exception of one SVOC. The compound bis(2-thylhexyl)phthalate was detected in one groundwater well sample at a concentration that exceeded the ESL. This compound is a known laboratory contaminant and a plasticizer commonly associated with PVC and other plastics. This same sample also contained dissolved mercury at a concentration greater than the ESL.

6.1 Recommendations

Results from investigations conducted by LFR during July 2007, evaluated in conjunction with results from previous investigations, indicate that AOCs #2, #6, and #7 have been sufficiently characterized. LFR does not recommend any additional investigations be conducted in these areas.

Additional subsurface investigations may be required in AOC #3 to confirm the analytical results for the grab groundwater sample collected from soil boring B-1(A) in which TPHmo was detected at a concentrations that exceeded the ESL. However, soil samples and a grab groundwater sample collected from less than 200 feet away from soil boring B-1(A) indicate that the petroleum hydrocarbon-affected soil (or groundwater) at this AOC is not a widespread problem.

LFR recommends that additional subsurface investigations be conducted in AOC #8 (SS-123 area) to further characterize the lateral extent of petroleum-affected groundwater south of soil boring SS-123(F2). Based on the results of the soil and groundwater samples collected in the SS-123 area, soil and groundwater quality has

been sufficiently characterized laterally to the west, north, and east. Previous consultants have concluded that groundwater in this area may be perched; the presence of a perched groundwater zone has not been confirmed.

To confirm the SVOC and dissolved mercury concentrations detected in the groundwater sample collected from existing monitoring well 3S/1E 10D8 located north of Lake I, LFR recommends re-sampling the well.

7.0 LIMITATIONS

The opinions and recommendations presented in this report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by LFR and the party for whom this report was originally prepared. This report is an instrument of professional service and was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and circumstances established by the environmental consulting industry. No representation, warranty, or guarantee, express or implied, is intended or given. To the extent that LFR relied upon any information prepared by other parties not under contract to LFR, LFR makes no representation as to the accuracy or completeness of such information. This report is expressly for the sole and exclusive use of the party for whom this report was originally prepared for a particular purpose. Only the party for whom this report was originally prepared and/or other specifically named parties have the right to make use of and rely upon this report. Reuse of this report or any portion thereof for other than its intended purpose, or if modified, or if used by third parties, shall be at the user's sole risk.

Results of any investigations or testing and any findings presented in this report apply solely to conditions existing at the time when LFR's investigative work was performed. It must be recognized that any such investigative or testing activities are inherently limited and do not represent a conclusive or complete characterization. Conditions in other parts of the Site may vary from those at the locations where data were collected. LFR's ability to interpret investigation results is related to the availability of the data and the extent of the investigation activities. As such, 100% confidence in environmental investigation conclusions cannot reasonably be achieved.

LFR, therefore, does not provide any guarantees, certifications, or warranties regarding any conclusions regarding environmental contamination of any such property. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and applicable laws, codes, regulations, or standards.

Notes:

AOC = area of concern

feet bgs = feet below ground surface

"~" = approximate sample depth

"1" = analyzed

"-" = not analyzed

na = not applicable

* MW-10 = blind duplicate of 3S/1E 10K2

TPHd = total petroleum hydrocarbons as diesel by EPA Method 8015 (after silica gel cleanup)

TPHmo = total petroleum hydrocarbons as motor oil by EPA Method 8015 (after silica gel cleanup)

TPHg = total petroleum hydrocarbons as gasoline by EPA Method 8015 (soil) and 8260 (water)

VOCs = volatile organic compounds by EPA Method 8260

BTEX = benzene, toluene, ethylbenzene, and total xylenes by EPA Method 8260

Fuel Ox = fuel oxygenates by EPA Method 8260

Lead Scav = lead scavengers by EPA Method 8260

Pest = organochlorine pesticides by EPA Method 8081

PCBs = polychlorinated biphenyls by EPA Method 8082

SVOCs = semivolatile organic compounds by EPA Method 8270

Metals = CAM17 metals (total concentrations in soil samples; dissolved concentrations in water samples) by EPA Method 6010

Table 2A - Summary of Analytical Results of
Petroleum Hydrocarbons and Associated Compounds Detected in Soil Samples
Hanson Radum Facility, 3000 Busch Road, Pleasanton, California

(Concentrations reported in milligrams per kilogram (mg/Kg) or micrograms per kilogram (ug/Kg), as noted)

Sample Location	Sample ID	Date Sampled	Sample Interval top (feet bgs)	Sample Interval bottom (feet bgs)	Matrix	Total Petroleum Hydrocarbons TPHd (mg/Kg)	TPHmo (mg/Kg)	TPHg (mg/Kg)	BTEX compounds B (ug/Kg)	T (ug/Kg)	E (ug/Kg)	m,p-X (ug/Kg)	o-X (ug/Kg)

Notes:

feet bgs = feet below ground surface

mg/Kg = milligrams per kilogram

ug/Kg = micrograms per kilogram

TPHd = total petroleum hydrocarbons as diesel

TPHmo = total petroleum hydrocarbons as motor oil

TPHg = total petroleum hydrocarbons as gasoline

BTEX = benzene, toluene, ethylbenzene, and total xylenes

B = benzene

T = toluene

E = ethylbenzene

m,p-X = m,p-xylenes

o-X = o-xylenes

bold indicates that the compound was detected above the laboratory reporting limit.

1,500 H boxed values exceed the respective ESL.

"<" = not detected above the laboratory report given

"-" = sample not analyzed

H = heavier hydrocarbons contributed to the quantitation

L = lighter hydrocarbons contributed to the quantitation

Y = sample exhibites chromatographic pattern which does not resemble standard

Z = sample exhibits unknown single peak or peaks

ESLs = Environmental Screening Levels by San Francisco Bay Regional Water Quality Control Board, February 2005, for Shallow or Deep Soils (as noted) beneath Industrial/Commercial Land Use Areas where Groundwater is a Current or Potential Source of Drinking Water.

Table 2B - Summary of Analytical Results of
Petroleum Hydrocarbons and Associated Compounds Detected in Soil Samples
Hanson Radum Facility, 3000 Busch Road, Pleasanton, California

(Concentrations reported in micrograms per kilograms (ug/Kg))

Sample Location	Sample ID	Date Sampled	Sample Interval top (feet bgs)	Sample Interval bottom (feet bgs)	Matrix	Fuel Oxygenates MTBE (ug/Kg)	TAME (ug/Kg)	DIPE (ug/Kg)	ETBE (ug/Kg)	TBA (ug/Kg)	Lead Scavengers EDB (ug/Kg)	EDC (ug/Kg)

Notes:

feet bgs = feet below ground surface

ug/Kg = micrograms per kilogram

MTBE = methyl tert-butyl ether

TAME = tert-amyl methyl ether (methyl tert-amyl ether)

DIPE = diisopropyl ether (isopropyl ether)

ETBE = ethyl tert-butyl ether

TBA = tert-butyl alcohol

EDB = 1,2-dibromoethane (ethylene dibromide)

EDC = 1,2-dichloroethane

"<" = not detected above the laboratory report given

"-" = sample not analyzed or ESL not established

CAM 17 Metals Detected in Soil Samples
Hanson Radum Facility, 3000 Busch Road, Pleasanton, California

(Concentrations reported in millgrams per kilogram (mg/Kg))

Sample Location	Sample ID	Date Sampled	Sample Interval top (feet bgs)	Sample Interval bottom (feet bgs)	Matrix	Total Metals (mg/Kg) Ag	As	Ba	Be	Cd	Co	Cr	Cu	Hg	Mo	Ni	Pb	Sb	Se	Tl	V	Zn

Notes:

Ag = silver
As = arsenic
Ba = barium
Be = beryllium
Cd = cadmium
Co = cobalt
Cr = Chromium
Cu = Copper
Hg = Mercury
Mo = Molybdenum
Ni = Nickel
Pb = Lead
Sb = Antimony
Se = Selenium
Tl = Thallium
V = Vanadium
Zn = Zinc

feet bgs = feet below ground surface

mg/Kg = milligrams per kilogram

bold indicates that the compound was detected above the laboratory reporting limi

10 boxed values exceed the respective ESL.

"<" = not detected above the laboratory report given

"-" = sample not analyzed or ESL not established

ESLs = Environmental Screening Levels by San Francisco Bay Regional Water Quality Control Board, February 2005, for Shallow or Deep Soils (as noted) beneath Industrial/Commercial Land Use Areas where Groundwater is a Current or Potential Source of Drinking Water.

PERMIT NUMBER 27122
WELL NUMBER _____
APN _____

PERMIT CONDITIONS

(Circled Permit Requirements Apply)

(A.) GENERAL
1. A permit application should be submitted so as to arrive at the Zone 7 office five days prior to proposed starting date.
2. Submit to Zone 7 within 60 days after completion of permitted work the original Department of Water Resources Water Well Drillers Report or equivalent for well projects or drilling logs and location sketch for geotechnical projects.
3. Permit is void if project not begun within 90 days of approval date.

B. WATER SUPPLY WELLS
1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.
3. An access port at least 0.5 inches in diameter is required on the wellhead for water level measurements.
4. A sample port is required on the discharge pipe near the wellhead.

C. GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS
1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.

(D.) GEOTECHNICAL. Backfill bore hole with compacted cuttings or heavy bentonite and upper two feet with compacted material. In areas of known or suspected contamination, tremied cement grout shall be used in place of compacted cuttings.

E. CATHODIC. Fill hole above anode zone with concrete placed by tremie.

F. WELL DESTRUCTION. See attached.

(G.) SPECIAL CONDITIONS. Submit to Zone 7 within 60 days after the completion of permitted work the well installation report including all soil and water laboratory analysis results.

Approved Wyman Hong Date 7/13/07
Wyman Hong

Revised: April 27, 2005

CASE NARRATIVE

Laboratory number:	**195976**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/13/07**
Samples Received:	**07/13/07**

This hardcopy data package contains sample and QC results for four soil samples and one water sample, requested for the above referenced project on 07/13/07. The samples were received cold and intact. All data were e-mailed to Larry Lapuyade on 07/23/07.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
Matrix spikes were not reported for this analysis because the parent sample required a dilution that would have diluted out the spikes. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A) Soil:
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A) Filtrate:
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196019**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/16/07**
Samples Received:	**07/16/07**

This hardcopy data package contains sample and QC results for eight soil samples and one water sample, requested for the above referenced project on 07/16/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/23/07.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196042**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/17/07**
Samples Received:	**07/17/07**

This hardcopy data package contains sample and QC results for eleven soil samples, requested for the above referenced project on 07/17/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/24/07.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
No analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
Low surrogate recovery was observed for TCMX in the method blank for batch 127391; the corresponding decachlorobiphenyl surrogate recovery was within limits. No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196066**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/19/07**
Samples Received:	**07/19/07**

This hardcopy data package contains sample and QC results for ten soil samples and one water sample, requested for the above referenced project on 07/19/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/26/07.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
High surrogate recovery was observed for hexacosane in EB-35(D)-9.5 (lab # 196066-006); no target analytes were detected in the sample. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
No analytical problems were encountered.

Pesticides (EPA 8081A):
Responses exceeding the instrument's linear range were observed for decachlorobiphenyl in the MS/MSD for batch 127426; affected data was qualified with "b". High surrogate recoveries were observed for decachlorobiphenyl in the MS/MSD for batch 127426; the corresponding TCMX surrogate recoveries were within limits, and the parent sample was not a project sample. No other analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196103**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/20/07**
Samples Received:	**07/20/07**

This hardcopy data package contains sample and QC results for thirteen soil samples and one water sample, requested for the above referenced project on 07/20/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/27/07.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196141**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/23/07**
Samples Received:	**07/20/07**

This hardcopy data package contains sample and QC results for two soil samples, requested for the above referenced project on 07/23/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/26/07.

Semivolatile Organics by GC/MS (EPA 8270C):
Matrix spikes were not reported for this analysis because the parent sample needed to be re-extracted. SS-31(B)-10.5 (lab # 196141-002) was diluted due to the viscous nature of the sample extract. No other analytical problems were encountered.

Pesticides (EPA 8081A):
No analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196134**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/23/07**
Samples Received:	**07/23/07**

This hardcopy data package contains sample and QC results for thirteen soil samples and two water samples, requested for the above referenced project on 07/23/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/27/07.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
No analytical problems were encountered.

Pesticides (EPA 8081A):
No analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196163**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/23/07**
Samples Received:	**07/23/07**

This hardcopy data package contains sample and QC results for nine soil samples and two water samples, requested for the above referenced project on 07/23/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/26/07.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
High RPD was observed for diesel C10-C24 in the MS/MSD of SS-31(D)-50.5 (lab # 196163-006). No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Water:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B) Soil:
No analytical problems were encountered.

Curtis & Tompkins, Ltd.

CASE NARRATIVE

Laboratory number:	**196188**
Client:	**LFR Levine Fricke**
Project:	**001-09567-02**
Location:	**Hanson Radum**
Request Date:	**07/24/07**
Samples Received:	**07/24/07**

This hardcopy data package contains sample and QC results for twelve soil samples and three water samples, requested for the above referenced project on 07/24/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/26/07.

TPH-Extractables by GC (EPA 8015B) Water:
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B) Soil:
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
SS-123(F2)-GGW (lab # 196188-003) and SS-123(AA)-GGW (lab # 196188-004) had pH greater than 2. No other analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**195957**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/12/07**
Samples Received:	**07/12/07**

This hardcopy data package contains sample and QC results for one water sample, requested for the above referenced project on 07/12/07. The sample was received cold and intact. All data were e-mailed to Katrin Schliewen on 07/23/07.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7470A):
No analytical problems were encountered.

CASE NARRATIVE

Laboratory number:	**196218**
Client:	**LFR Levine Fricke**
Project:	**001-09567-01**
Location:	**Hanson Radum**
Request Date:	**07/25/07**
Samples Received:	**07/25/07**

This hardcopy data package contains sample and QC results for five water samples, requested for the above referenced project on 07/25/07. The samples were received cold and intact. All data were e-mailed to Katrin Schliewen on 07/26/07.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
Low recovery was observed for 1,1-dichloroethene in the MSD for batch 127592; the parent sample was not a project sample, and the BS/BSD were within limits. High RPD was also observed for 1,1-dichloroethene in the MS/MSD for batch 127592; the RPD was acceptable in the BS/BSD, and this analyte was not detected at or above the RL in the associated sample. 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene were detected between the MDL and the RL in the method blank for batch 127592 and the method blank for batch 127594; these analytes were not detected in samples at or above the RL. No other analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
No analytical problems were encountered.

Metals (EPA 6020 and EPA 7470A):
No analytical problems were encountered.

APPENDIX C

Soil Boring Logs

PROJECT NAME Hanson Radum
CLIENT Hanson Aggregates

BORING NUMBER B-1(A)

PROJECT LOCATION 3000 Busch Road, Pleasanton, California
PROJECT NUMBER 001-09567-02
LOCATION Not recorded
SAMPLING METHOD California Modified; continuous soil core
GROUND ELEVATION Not available **HOLE DIAMETER** 8 inches
TOP OF CASING ELEVATION N/A **HOLE DEPTH** 70.0 ft
▽ **FIRST ENCOUNTERED WATER** 65.0 ft
▼ **STABILIZED WATER** 67.6 ft
LOGGED BY Larry Lapuyade **DATE** 7/17/07 - 7/18/07

DRILLING CONTRACTOR HEW Drilling
DRILLING METHOD Hollow Stem Auger (CME 75)
STAMP (IF APPLICABLE) AND/OR NOTES

DEPTH (feet)	SAMPLE TYPE NUMBER	SAMPLE RECOVERY	BLOW COUNTS (per 6 inches)	U.S.C.S.	GRAPHIC LOG	DEPTHS (feet)	LITHOLOGIC DESCRIPTION	PID (ppm)	DEPTH (feet)
				GM			Silty Gravel (GM), light yellowish brown (2.5Y 6/3), well-graded subangular fine to coarse gravel to 1-1/2 inches diameter, dry to moist		
			20 20 20					0.0	
			20 10 10			3.0	Silty Clay (CL), dark brown (10YR 3/3), low to medium plasticity, moist, firm	0.0

	SS-123(AA) -5.5					at 5 feet, color changes to very dark gray (2.5Y 3/1), trace subangular gravel	0.0	
	SS-123(AA) -7.5					at 7.5 feet, petroleum product observed: black asphalt bound with gravel and sand, pieces up to 2-1/2 inches, dry, no odor, similar to asphalt concrete (i.e., roadway paving)	0.0 0.0	
10								10
	SS-123(AA) -10.5		CL			at 10 feet, color changes to olive (5Y 5/3)	0.0	
						at 12.5 feet, petroleum product observed: black asphalt as described at 7.5 feet	0.0 0.0	
15						at 14.5 to 15 feet, concrete chunks		15
	SS-123(AA) -15.5					at 15.5 feet, petroleum product observed: black asphalt as described at 7.5 feet	0.0	
	SS-123(AA) -GGW					▼ depth to water measured at 15.65 feet in borehole after drilling ▽ at 16 feet, color changes to black (5Y 2.5); depth to water in sediments at approximately 16 feet during drilling	0.0	
	SS-123(AA) -18						0.0	
20					20.0	Bottom of boring at approximately 20 feet Borehole backfilled with cement grout (5 sacks per 50 gallons water)		20

COMMENTS

15.5 ft: Petroleum product (e.g., asphalt) was observed only at depths noted above (7.5, 12.5, and 15.5 feet).
15.6 ft: After completion of drilling, collected grab groundwater sample using a disposable bailer; depth of sample is estimated to be at 15.6 feet□; water was turbid, containing soil sediments.

SUBJECT: GROUNDWATER MONITORING WELL INSTALLATION, DEVELOPMENT, SAMPLING, AND SOIL EXCAVATION REPORT
Legacy Hanson Radum Site
3000 Busch Road
Pleasanton, California
SLIC Case RO0002952 and Geotracker Global ID SL0600101555

Dear Mr. Wickham:

ENV America Incorporated (ENV America) has prepared this Groundwater Monitoring Well Installation, Development, Sampling, and Soil Excavation Report (Report) for the Legacy Hanson Radum Property located at 3000 Busch Road in Pleasanton, California (Site, Figure 1) on behalf of Legacy Partners Commercial, LLC (Legacy). The purpose of this Report is to describe the work conducted by ENV America and document the results. The work is described in ENV America's February 6, 2008 work plan, which was approved by ACEH in a letter dated February 26, 2008.

PROJECT BACKGROUND

In July 2007 LFR, Inc. (LFR), on behalf of Hanson Permanente Cement, Inc. (Hanson), conducted soil and groundwater investigations in areas previously identified as areas of concern (AOCs) at the Site. To facilitate investigation of the Site, LFR divided the site into nine AOCs. A report describing the results of those investigations was submitted to Alameda County Health Agency-Department of Environmental Health (ACEH) on October 26, 2007.

In the October 2007 report, LFR reported detecting total petroleum hydrocarbon quantified as diesel (TPHd) at a concentration of 79 micrograms per liter (µg/l) and motor oil (TPHmo) at a concentration of 1,100 µg/l in a grab groundwater sample collected from 68 feet below ground surface (bgs) in boring B-1(A), located in AOC 3 between Hanson's office, the heavy maintenance shop, and the lube shed.

In a November 28, 2007 letter ACEH requested that groundwater in the vicinity of this boring be further evaluated to assess whether the results from boring B-1(A) are representative of groundwater quality in that area and whether a significant subsurface source of total petroleum hydrocarbons (TPH) exists.

Also in AOC 3, TPHd and TPHmo were detected above commercial/industrial environmental screening levels (ESLs, Figure 2) established by the San Francisco Bay Regional Water Quality Control Board (RWQCB) in 2007, in shallow soil samples collected at two and five feet bgs in the vicinity of borings EB35 and EB35(B), respectively. In the November 28th letter ACEH requested to either 1) provide plans for additional investigation of the extent of petroleum hydrocarbons in shallow soils, particularly less than five feet bgs, or 2) describe general plans for future soil removal and confirmation sampling.

MONITORING WELL INSTALLATION ACTIVITES

Consistent with the approved work plan, one monitoring well (ENV-1) was installed, developed, and sampled in the area of soil boring B-1(A). The following describes the work conducted during monitoring well installation, development, and sampling.

Pre-Field Activities

The following pre-field activities were conducted prior to commencement of field work:

- A monitoring well installation permit was obtained from Zone 7 Water Agency (Attachment A);
- Underground Service Alert (USA), a regional utility notification service for underground utility protection, was notified of the proposed drilling location after the proposed drilling location was outlined in white paint;

- Subsurface Locating Services of Petaluma, California, a private underground utility locating company, was retained to additionally screen the boring location for subsurface utilities;
- A site-specific health and safety plan was prepared for the project.

Field Work

On March 7, 2008, WDC Exploration and Wells of Richmond, California, a California C-57 licensed drilling company, provided monitoring well drilling services at the Site. A hollow-stem auger drill rig was used to advance the boring (Figure 2).

Soil samples were collected continuously to the total depth of the boring using a CME continuous core sampling device. All down-hole equipment was decontaminated prior to starting using either a steam cleaner/pressure washer or by washing and triple rinsing techniques using laboratory grade detergent.

The recovered soil samples were screened for staining and volatile compounds visually and using a photoionization detector (PID). The recovered soil was logged under the direction of a California professional geologist using the visual-manual procedures of ASTM Standard D-2488-06 as guidance and Munsell Soil Chart designations.

Water was first encountered at 15 feet bgs. ENV America oversaw the installation and construction of a groundwater monitoring well within the boring such that the screen extended approximately two feet above the observed water bearing zone. Two-inch diameter Schedule 40 polyvinyl chloride (PVC) casing and 10 feet of matching 0.010-inch factory slot screen were used to construct the well to a total depth of 22.8 feet bgs. The screen interval was set between 12.8 and 22.2 feet bgs. Clean silica filter pack sand (Monterey #2/16) was placed in the annular space from the total depth of the well to approximately two feet above the screened interval. Approximately two feet of uncoated bentonite chips were placed in the annular space above the sand to create a seal, and neat cement grout was placed in the annular space above the bentonite seal to approximately one foot bgs. The well completion consists of a flush mounted well box rated for vehicular traffic. Soil cuttings were placed on visqueen and covered pending analytical results for proper disposal. Well construction details are presented on Figure 3.

On March 10, 2008 ENV America oversaw the development of the well. Surging, bailing, and pumping were used to develop the well until the water was visually clear and below 50 nephelometric turbidity units (NTU). Development water was contained in 55-gallon steel drums pending analytical results for proper disposal.

On March 13, 2008 ENV America sampled the groundwater from the monitoring well using low flow sampling techniques. Monitoring well ENV-1 was purged and sampled using a peristaltic pump. Groundwater parameters of temperature, specific conductivity, and temperature, as well as the water level, stabilized prior to sampling. Once groundwater parameters stabilized, laboratory-provided bottles were filled directly from the discharge of the pump. All sample containers were uniquely labeled, immediately placed on ice, and submitted to Test America of Pleasanton, California (Test America), a California-certified laboratory under chain-of-custody protocol for the analyses of TPHd and TPHmo in accordance with Environmental Protection Agency Method (EPA) Method 8015M following a silica gel cleanup in accordance with EPA Method 3630, and for TPH quantified as gasoline (TPHg) and benzene, toluene, ethyl benzene, and total xylenes (BTEX) in accordance with EPA method 8260B.

On March 13, 2008 the monitoring well location and elevation were surveyed by Kier and Wright Surveyors, a professionally licensed land surveyor, of Pleasanton, California.

SOIL EXCAVATION ACTIVITES

Pre-Field Activities

The following pre-field activities were conducted prior to commencement of potholing work:

- Underground Service Alert (USA), a regional utility notification service for underground utility protection, was notified of the proposed excavation locations after the proposed locations were outlined in white paint;
- Subsurface Locating Services of Petaluma, California, a private underground utility locating company, was retained to additionally screen the locations for subsurface utilities;
- A site-specific health and safety plan was prepared for the project.

Field Work

On March 25, 2008, ENV Environmental International of Richmond, California was retained to provide backhoe services for the excavations. The backhoe bucket was decontaminated prior to use. Excavations were dug at the previous locations of soil borings EB-35 and EB-35(B), where soil results indicated TPHd and TPHmo above ESL criteria (Figure 2).

The excavated soil was screened for staining and volatile compounds visually and using a PID. The soil was logged under the direction of a California professional geologist using the visual-manual procedures of ASTM Standard D-2488-06 as guidance and Munsell Soil Chart designations. Trench logs from the excavations are included as Figures 4 and 5.

Based on field conditions, buried asphalt was observed in the subsurface at similar depth intervals where TPHd and TPHmo were previously detected above ESLs and ENV America asked ACEH to observe the excavations. Mr. Jerry Wickham, P.G., CHG, of ACEH visited the Site to observe the excavations. The excavations in general were comprised of silty sandy gravel and asphalt cobbles of various sizes throughout the unit, underlain by a layer of asphalt, which was underlain by more silty sandy gravel.

ACEH requested that ENV America collect a sample of the asphaltic material as a well as a sample of the silty sandy gravel with no visible asphalt particles from directly below the asphaltic layer. Samples were collected using hand tools and placed in laboratory provided glass sampling jars.

The sample containers were uniquely labeled, immediately placed on ice, and submitted to Test America under chain-of-custody protocol for the analyses of TPHd and TPHmo in accordance with EPA Method 8015M following a silica gel cleanup in accordance with EPA Method 3630.

Following sampling the excavations were backfilled to ground surface and compacted using the backhoe bucket.

FINDINGS

Lithology and Hydrology

Lithology encountered in boring ENV-1 consisted primarily of fine-grained soil with varying amounts of sand and gravel with interbedded coarser zones at approximately 14.5, 19.5, and 20.5 feet bgs. First observed water encountered during drilling was at 15 feet bgs. The water level was measured at 15.70 feet below the top of the casing (btc) three days after development.

Soil in the area of EB35 consisted of silty sandy gravel with asphalt, and a distinct asphalt layer that occurred at corresponding depths of the samples previously collected from EB35 and EB35(B); this asphalt layer was underlain by another silty sandy gravel. There was no staining or odor and no PID readings that would indicate the presence of free phase or residual TPHd or TPHmo contamination in the locations potholed.

Groundwater Analytical Results

The groundwater sample was designated ENV-1 and analyzed for TPHd and TPHmo in accordance with EPA Method 8015M following a silica gel cleanup in accordance with EPA Method 3630, and for TPHg and BTEX in accordance with EPA Method 8260B. Analytes were not detected above their method detection limits. A complete laboratory report is included as Attachment A.

Excavation Soil Sample Results

Two soil samples were collected from the excavation location T-35, advanced at previous boring location EB-35. The samples were called T-35A, which was a soil sample collected from the asphaltic layer, and T-35B, which was a soil sample collected directly below the asphaltic layer. These samples were analyzed for TPHd and TPHmo in accordance with EPA Method 8015M following a silica gel cleanup in accordance with EPA Method 3630. The analytical results were as follows:

- Sample T-35A collected from the asphalt layer at 2.5 feet bgs, TPHd = 3,500 mg/kg, and TPHmo = 45,000 mg/kg; and

- Sample T-35B collected directly below the asphalt layer at 3.5 feet bgs in the silty sandy gravel, TPHd = 14 mg/kg, and TPHmo = 150 mg/kg.

A complete copy of the laboratory analytical package from the soil sampling activities is attached to this report as Attachment C.

CONCLUSION AND RECOMMENDATIONS

Groundwater by B-1(A)

Based on the groundwater analytical results, it is ENV America's opinion that groundwater in the vicinity of ENV-1 has not been affected by TPH constituents. Constituents detected in LFR's grab groundwater sample from boring B-1(A) may be caused by asphalt particulates suspended in the grab groundwater sample. Based on the findings, we recommend that the monitoring well be abandoned, and no further action be required with respect to the groundwater in this area of the Site.

Soil by EB-35

Excavation activities in the area of EB-35 and EB-35B were conducted to observe material in subsurface soil for a potential source of TPH. In both excavation locations, asphaltic material was observed. The analytical results indicate that when asphaltic material is sampled and the laboratory extracts the sample for analysis with aggressive solvents, TPHd and TPHmo from the material leach out at concentrations that exceed regulatory criteria. Based on the sample collected directly below the asphaltic layer (T-35B), it does not appear that the asphaltic material leaches out under normal conditions. The results of soil sample T-35B were at least two orders of magnitude below the results from T-35A and significantly below Environmental Screening Levels (ESLs) established by the RWQCB. The ESL for TPHd = 83 mg/kg and the ESL for TPHmo = 410 mg/kg.

Based on the results ENV America recommends no additional excavation or soil sampling in this area of the Site.

ENV America is pleased to provide this Groundwater Well Installation, Development, Sampling and Soil Excavation Report for the Site. If you have any questions regarding this report please call the undersigned at (415) 989-9933.

Sincerely,
ENV America Incorporated

DRILLER'S LICENSE NO. 733326 C57

WELL SPECIFICATIONS:
Drill Hole Diameter 8 in. Maximum
Casing Diameter 2 in. Depth 15 ft.
Surface Seal Depth 10 ft. Number 1

SOIL BORINGS:
Number of Borings _____ Maximum
Hole Diameter _____ in. Depth _____ ft.

ESTIMATED STARTING DATE March 5th, 2008
ESTIMATED COMPLETION DATE April 1, 2008

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.

APPLICANT'S SIGNATURE _____ Date 3/1/08
Charles Rome

ATTACH SITE PLAN OR SKETCH

PERMIT NUMBER 28026
WELL NUMBER 3S/1E-15F6
APN 946-1250-019-01

PERMIT CONDITIONS
(Circled Permit Requirements Apply)

(A.) GENERAL
1. A permit application should be submitted so as to arrive at the Zone 7 office five days prior to proposed starting date.
2. Submit to Zone 7 within 60 days after completion of permitted work the original Department of Water Resources Water Well Drillers Report or equivalent for well projects, or drilling logs and location sketch for geotechnical projects.
3. Permit is void if project not begun within 90 days of approval date.

B. WATER SUPPLY WELLS
1. Minimum surface seal diameter is four inches greater than the well casing diameter.
2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.
3. Grout placed by tremie.
4. An access port at least 0.5 inches in diameter is required on the wellhead for water level measurements.
5. A sample port is required on the discharge pipe near the wellhead.

(C.) GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS
1. Minimum surface seal diameter is four inches greater than the well or piezometer casing diameter.
2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.
3. Grout placed by tremie.

D. GEOTECHNICAL. Backfill bore hole with compacted cuttings or heavy bentonite and upper two feet with compacted material. In areas of known or suspected contamination, tremied cement grout shall be used in place of compacted cuttings.

E. CATHODIC. Fill hole above anode zone with concrete placed by tremie.

F. WELL DESTRUCTION. See attached.

(G.) SPECIAL CONDITIONS. Submit to Zone 7 within 60 days after completion of permitted work the well installation report **including all soil and water laboratory analysis results**.

Approved Wyman Hong Date 3/5/08

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

GC Semi VOA
Method(s) 8015B: The method blank for preparation batch 32994 contained a target compound above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Subject: SLIC Case RO0002952 and Geotracker Global ID SL0600101555, Hanson Aggregates Radum Plant, 3000 Busch Road, Pleasanton, CA 94566

Dear Mr. Cover and Mr. Dunn:

Alameda County Environmental Health (ACEH) staff has reviewed the Spills, Leaks, Investigations, and Cleanups (SLIC) case file for the above referenced site including the recently submitted report entitled, "*Groundwater Monitoring Well Installation, Development, Sampling and Soil Excavation Report, Legacy Hanson Radum Site, 3000 Busch Road, Pleasanton, California, SLIC Case RO0002952 and Geotracker Global ID SL0600101555*," dated April 17, 2008. The report, which was prepared on behalf of Legacy Partners Commercial, LLC by ENV America, presents the results from installation and sampling of one monitoring well adjacent to previous boring B-1A and results from shallow soil excavation in the area of former boring EB-35.

The Hanson Radum facility has been subdivided into Areas of Concern (AOCs) for the purpose of conducting soil and groundwater investigations (Levine Fricke 2007). All activities discussed in the April 17, 2008 report were conducted within AOC #3. Shallow soil excavation and sampling was conducted in the area of former boring EB-35 to evaluate petroleum hydrocarbons detected in soil in the area of soil borings EB-35, EB-35A, EB-35B, EB-35C, and EB-35D.

We request that you address the following technical comments, perform the proposed work, and send us the technical reports requested below.

TECHNICAL COMMENTS

1. **Shallow Soil Excavation in EB35 Area.** Asphaltic materials were observed in shallow soils during excavation in the area of EB-35 and EB-35B. Soil samples were collected from the asphaltic material and from soil directly below the asphaltic layer. TPH as diesel and TPH as motor oil were detected at significantly higher concentrations in the asphaltic material than in the underlying soil. Based on these sample results, the April 18, 2008 ENV America report concluded that the asphaltic material leaches out during the analytical procedures but does not leach out under ambient field conditions. ENV America

RECEIVED JUN 17 2008

recommends that no additional excavation or soil sampling is necessary in this area of the site. We concur that no additional excavation or investigation is required in the EB-35 area at this time.

2. **Monitoring Well in B-1A Area.** Monitoring well ENV-1 was installed to investigate water quality in the area of former boring B-1A. A grab groundwater sample collected in July 2007 from a depth of approximately 68 feet bgs from boring B-1A contained TPH as diesel at a concentration of 79 micrograms per liter (µg/L) and TPH as motor oil at a concentration of 1,100 µg/L. Well ENV-1 was installed with a screened interval from approximately 13 feet bgs to 23 feet bgs with the filter pack extending to a depth of 28.5 feet bgs. The static water level in ENV-1 was 15.7 feet below the top of casing three days after development. The depth to water measured in well ENV-1 was significantly shallower than the expected depth to water based on results from boring B-1A. A groundwater sample collected in March 2008 from well ENV-1 did not contain detectable concentrations of TPH as gasoline, TPH as diesel, TPH as motor oil, or BTEX. ENV America recommended no further action with respect to groundwater in this area and recommended abandoning well ENV-1. We do not concur with abandoning well ENV-1 at this time. We request that well ENV-1 be sampled to confirm the previous results. Please re-sample well ENV-1 and present the results in the Well Sampling Report requested below. The Well Sampling Report must include a field sampling sheet that documents water level measurements prior to, during, and following purging, purging and sampling methods, purge volumes, and parameter stabilization. Analysis of the groundwater sample for TPH as diesel, TPH as motor oil, TPH as gasoline, and BTEX is acceptable.

TECHNICAL REPORT REQUEST

Please submit technical reports to Alameda County Environmental Health (Attention: Jerry Wickham), according to the following schedule:

- **September 13, 2008** – Well Sampling Report

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

ELECTRONIC SUBMITTAL OF REPORTS

ACEH's Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of reports in electronic form. The electronic copy replaces paper copies and is expected to be used for all public information requests, regulatory review, and compliance/enforcement activities. Instructions for submission of electronic documents to the Alameda County Environmental Cleanup Oversight Program FTP site are provided on the attached "Electronic Report Upload Instructions." Submission of reports to the Alameda County FTP site is an addition to existing requirements for electronic submittal of information to the State Water Resources Control Board (SWRCB) Geotracker website. In September 2004, the SWRCB adopted regulations that require

electronic submittal of information for all groundwater cleanup programs. For several years, responsible parties for cleanup of leaks from underground storage tanks (USTs) have been required to submit groundwater analytical data, surveyed locations of monitoring wells, and other data to the Geotracker database over the Internet. Beginning July 1, 2005, these same reporting requirements were added to Spills, Leaks, Investigations, and Cleanup (SLIC) sites. Beginning July 1, 2005, electronic submittal of a complete copy of all reports for all sites is required in Geotracker (in PDF format). Please visit the SWRCB website for more information on these requirements (http://www.swrcb.ca.gov/ust/cleanup/electronic_reporting).

PERJURY STATEMENT

All work plans, technical reports, or technical documents submitted to ACEH must be accompanied by a cover letter from the responsible party that states, at a minimum, the following: "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report is true and correct to the best of my knowledge." This letter must be signed by an officer or legally authorized representative of your company. Please include a cover letter satisfying these requirements with all future reports and technical documents submitted for this fuel leak case.

PROFESSIONAL CERTIFICATION & CONCLUSIONS/RECOMMENDATIONS

The California Business and Professions Code (Sections 6735, 6835, and 7835.1) requires that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments be performed under the direction of an appropriately registered or certified professional. For your submittal to be considered a valid technical report, you are to present site specific data, data interpretations, and recommendations prepared by an appropriately licensed professional and include the professional registration stamp, signature, and statement of professional certification. Please ensure all that all technical reports submitted for this fuel leak case meet this requirement.

AGENCY OVERSIGHT

If it appears as though significant delays are occurring or reports are not submitted as requested, we will consider referring your case to the Regional Board or other appropriate agency, including the County District Attorney, for possible enforcement actions. California Health and Safety Code, Section 25299.76 authorizes enforcement including administrative action or monetary penalties of up to $10,000 per day for each day of violation.

If you have any questions, please call me at (510) 567-6791 or contact me my electronic mail at jerry.wickham@acgov.org.

Sincerely,

Jerry Wickham, California PG 3766, CEG 1177, and CHG 297
Senior Hazardous Materials Specialist

Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC)	**ISSUE DATE:** July 5, 2005
	REVISION DATE: December 16, 2005
	PREVIOUS REVISIONS: October 31, 2005
SECTION: Miscellaneous Administrative Topics & Procedures	**SUBJECT:** Electronic Report Upload (ftp) Instructions

Effective **January 31, 2006**, the Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of all reports in electronic form to the county's ftp site. Paper copies of reports will no longer be accepted. The electronic copy replaces the paper copy and will be used for all public information requests, regulatory review, and compliance/enforcement activities.

REQUIREMENTS

- Entire report including cover letter must be submitted to the ftp site as **a single portable document format (PDF) with no password protection.** (Please do not submit reports as attachments to electronic mail.)
- It is **preferable** that reports be converted to PDF format from their original format, (e.g., Microsoft Word) rather than scanned.
- Signature pages and perjury statements **must** be included and have either original or electronic signature.
- **Do not password protect the document.** Once indexed and inserted into the correct electronic case file, the document will be secured in compliance with the County's current security standards and a password. **Documents with password protection will not be accepted.**
- Each page in the PDF document should be rotated in the direction that will make it easiest to read on a computer monitor.
- Reports must be named and saved using the following naming convention:
  RO#_Report Name_Year-Month-Date (e.g., RO#5555_WorkPlan_2005-06-14)

Additional Recommendations

- A separate copy of the tables in the document should be submitted by e-mail to your Caseworker in **Excel** format. These are for use by assigned Caseworker only.

Submission Instructions

1) Obtain User Name and Password:
   a) Contact the Alameda County Environmental Health Department to obtain a User Name and Password to upload files to the ftp site.
      i) Send an e-mail to dehloptoxic@acgov.org
         or
      ii) Send a fax on company letterhead to (510) 337-9335, to the attention of Alicia Lam-Finneke.
   b) In the subject line of your request, be sure to include **"ftp PASSWORD REQUEST"** and in the body of your request, include the **Contact Information, Site Addresses**, and the **Case Numbers (RO# available in Geotracker) you will be posting for.**

2) Upload Files to the ftp Site
   a) Using Internet Explorer (IE4+), go to ftp://alcoftp1.acgov.org
      (i) Note: Netscape and Firefox browsers will not open the FTP site.
   b) Click on File, then on Login As.
   c) Enter your User Name and Password. (Note: Both are Case Sensitive.)
   d) Open "My Computer" on your computer and navigate to the file(s) you wish to upload to the ftp site.
   e) With both "My Computer" and the ftp site open in separate windows, drag and drop the file(s) from "My Computer" to the ftp window.

3) Send E-mail Notifications to the Environmental Cleanup Oversight Programs
   a) Send email to dehloptoxic@acgov.org notify us that you have placed a report on our ftp site.
   b) Copy your Caseworker on the e-mail. Your Caseworker's e-mail address is the entire first name then a period and entire last name at acgov.org. (e.g., firstname.lastname@acgov.org)
   c) The subject line of the e-mail must start with the RO# followed by **Report Upload.** (e.g., Subject: RO1234 Report Upload)

Attention: Mr. Jerry Wickham

Subject: Environmental On-Site Stockpile Sampling Results
Former Hanson Aggregate Facility
3000 Busch Road
Pleasanton, California

Dear Mr. Wickham:

Haley & Aldrich, Inc. (Haley & Aldrich) is pleased to submit this report to the Alameda County Health Care Services Agency (Agency) for environmental sampling performed to assess the environmental quality of the soil stockpile located at the Former Hanson Aggregates (Hanson) Radum Facility at 3000 Busch Road in Pleasanton, California (Site). The environmental testing was used to evaluate whether the stockpile is an acceptable fill source for backfilling activities at Busch Pit, which is also located at the Site. Our work was performed in response to the letter from the Agency dated 30 April 2012, "Response to Comments Regarding Filling Activities at the Busch Pit."

This report presents the on-site soil sampling procedures, review of test results, and conclusions on the environmental quality of the stockpile as backfill.

BACKGROUND

Busch Pit is located along the western portion of the Site, just north of Busch Road. The pit has plan dimensions of roughly 400 feet by 500 feet, and will require approximately 354,000 cubic yards (CY) of soil to fill. To date, approximately 30,800 CY have already been placed within the pit. The pit was originally excavated as a gravel pit as part of the Kaiser Sand and Gravel mining operation. Based on aerial photographs and historical topographic maps, the pit was excavated between 1980 and 1982. After the gravel pits in this section were mined out, most were backfilled with mine spoil and aggregate wash water sediment. However, Busch Pit was not backfilled and was subsequently used as a storm water retention pond. USL Pleasanton Lakes, LP (Pleasanton Lakes) purchased this Site on 25 May 2012.

The on-site source stockpile is located 500 feet northeast of the pit. The 750,000 CY that comprise the stockpile consist of overburden soil from prior on-site mining activities. The average height of the stockpile appears to range from 5 to 15 feet above the surrounding ground surface. Previous environmental testing has been performed on the stockpile by Treadwell & Rollo (T&R) and presented in a letter titled "Borrow Soil Characterization, Pleasanton Quarry – Parcels E and F, Pleasanton,

California" dated 24 October 2007. The information contained in the T&R letter indicates that the 750,000 CY fill stockpile is suitable material for filling Busch Pit. The analyses included testing for the presence of total petroleum hydrocarbons (TPH) quantified as gasoline, diesel, and motor oil; volatile organic compounds (VOCs); semi-volatile organic compounds (SVOCs); CAM 17 metals; organochlorine pesticides; and polychlorinated biphenyls (PCBs).

SAMPLING METHODOLOGY

The purpose of the June 2012 soil sampling event was to collect representative samples to assess the environmental quality of the soil for use as backfill. As stated in the 30 April 2012 letter from the Agency, the stockpile must meet the criteria presented in the "Information Advisory, Clean Imported Fill Material," prepared by the California Department of Toxic Substances Control (DTSC) and dated October 2001. Based on this guidance document and the volume of soil at the stockpile, a large number of samples were to be taken and analyzed (approximately 350).

Haley & Aldrich decided that 50 samples would be adequate if the sample group was evaluated using the EPA guidance document, SW-846, *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (EPA, 2010).

For sample selection, the stockpile was divided into a grid of 55 boxes, 160 feet by 160 feet each, as shown on Figure 2. Each grid location had a range of possible samples based on depth. The sample depths were dependant on the proposed amount of soil that will be removed during backfill activities (top of stockpile versus proposed grading contours). The grading plan is shown on Figure 2 and was provided by Kier & Wright Civil Engineers & Surveyors, Inc. dated 12 June 2012. Each grid location with a sample depth was given a number and placed in the random number generator to generate the location and depth to be sampled.

During the investigation, 53 subsurface soil sampling locations, as shown on Figure 2, were selected using a random number generator. Soil samples were tested for TPH (EPA method 8015B and 8260B), SVOCs (EPA method 8270 C), CAM 17 metals (EPA method 6010B and 7471A), and every fifth sample was tested for PCBs (EPA method 8082). Soil sample locations with depths and corresponding sample IDs are shown on Table I.

Samples were obtained with an excavator or a hand auger digging to the desired depth. Soil samples were immediately placed on ice after collection and delivered under chain-of-custody protocol to TestAmerica Laboratories in Pleasanton, California for analysis. Locations were backfilled with the spoils and tamped by the bucket for compaction.

RESULTS

A total of 53 soil samples were collected, HA01 through HA50, and HAS1 through HAS3, ranging in depth of 0.5 to 10 feet bgs. Laboratory reports were reviewed by a staff chemist for quality assurance. Analytes with test results higher than the reporting limit are tabulated in Table II. The majority of

analytes was non-detect, and therefore, not listed on the table. All laboratory reports are compiled in Appendix A.

Soil Description

Soil was not logged during this investigation. The majority of the stockpile soils were a brown silty clayey material, with increased gravel content on the eastern side of the stockpile. Gravels encountered were 2 inches in diameter. No unusual odors, staining, or materials such as asphalt were observed during the sampling.

Statistical Analysis

Upon review of test results, the EPA-developed program ProUCL 4.1.00 was utilized to calculate a 95% upper confidence limit (95% UCL) of the mean concentration for each analyte with at least one result that was detected in the soil above the Tier 1 environmental screening levels (ESLs) established by the San Francisco Bay Region, California Regional Water Quality Control Board (SFRWQCB, 2008) for "Shallow Soil Screening Levels for Residential Land Use (Potentially Contaminated Groundwater is a Current or Potential Drinking Water Resource)". The ProUCL program was developed to evaluate data sets with and without non-detect observations. Analytes that were evaluated include motor oil, nickel, naphthalene, 2-methylnaphthalene, and diesel although no results were above the ESL for this analyte. When a sample was non-detect for an analyte, half of the reporting limit was used to calculate the 95% UCL. Table II presents the 95% UCL values calculated and recommended by the ProUCL program, as listed under the ESL for the particular analyte.

The frequencies of detection for motor range oil, naphthalene, and 2-methylnaphthalene are very low (<6%). The calculated UCL values are generally overestimated. Under such circumstances, the sample median or mode may be used as an estimate for espouser point concentration (ProUCL, 2010).

DISCUSSION AND SCREENING LEVEL COMPARISON

The 30 April 2012 letter received from the Agency states that the Tier 1 ESLs should be used to evaluate if the soil meets the environmental criteria for fill acceptance. Table II presents the soil laboratory results that were above the ESLs, as shown in bold type.

Arsenic and vanadium results were higher than the ESLs for Tier I, but lower than background levels found in California soils. The SFRWQCB proposes that an arsenic level of 11 milligrams per kilogram (mg/Kg) is a background level that can be used when screening for this element within soils, although they have not yet updated the ESLs to reflect this change. The Kearny Foundation of Soil Science research found that an average background level for vanadium in California soils is 112 mg/Kg.

CONCLUSIONS AND RECOMMENDATIONS

Based on our review of the laboratory test results and the environmental assessment of the stockpile soils, it is our professional opinion that the stockpile soils meet the environmental criteria, and are

therefore an acceptable use of backfill material for the Busch Pit. The few analytes with test results above the ESL have a 95% upper confidence limit well below the ESL for that analyte.

Sincerely yours,
HALEY & ALDRICH, INC.

Definitions/Glossary

Client: Haley & Aldrich, Inc.
Project/Site: Hansen

TestAmerica Job ID: 720-42932-1

Qualifiers

Metals

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Client: Haley & Aldrich, Inc.

Comments
No additional comments.

Receipt
The samples were received on 6/25/2012 6:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.4º C and 5.9º C.

GC/MS VOA
No analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 116265 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 7471A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 116318 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 7471A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 116367 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Sampling Comments

Evidence samples were tampered with? YES NO

If YES, please explain in section below.

PRESERVATION KEY

A Sample chilled	C NaOH	E H_2SO_4	G Methanol
B Sample filtered	D HNO_3	F HCL	H Water/NaHSO4 (circle)

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

_____ The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

_____ Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

_____ This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

_____ If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyz

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 720-42947-1

Laboratory: TestAmerica Pleasanton

Narrative

Job Narrative
720-42947-1

Comments
No additional comments.

Receipt
The samples were received on 6/26/2012 3:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 4.7º C and 6.0º C.

GC/MS VOA
Method 8260B: Internal standard responses were outside of acceptance limits for the following sample 42947-18MS.

No other analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C: The following sample was diluted due to the abundance of non-target analytes: HA25-G35-5.0 (720-42947-12), HA11-G26-5.0 (720-42947-20). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8082: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 116212 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 116515 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 7471A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 116465 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Detection Summary

Client: Haley & Aldrich, Inc.
Project/Site: Hansen

Certification Summary

Client: Haley & Aldrich, Inc.
Project/Site: Hansen

TestAmerica Job ID: 720-42947-1

Laboratory	Authority	Program	EPA Region	Certification ID
TestAmerica Pleasanton	California	State Program	9	2496

Accreditation may not be offered or required for all methods and analytes reported in this package . Please contact your project manager for the laboratory's current list of certified methods and analytes.

Method Summary

Client: Haley & Aldrich, Inc.
Project/Site: Hansen

TestAmerica Job ID: 720-42947-1

Method	Method Description	Protocol	Laboratory
8260B/CA_LUFTMS	8260B / CA LUFT MS	SW846	TAL SF
8270C	Semivolatile Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)	SW846	TAL SF
8015B	Diesel Range Organics (DRO) (GC)	SW846	TAL SF
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	TAL SF
6010B	Metals (ICP)	SW846	TAL SF
7471A	Mercury (CVAA)	SW846	TAL SF

Protocol References:

If YES, please explain in section below.

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

_____ The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

_____ Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

_____ This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

_____ If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyz

Sharma, Dimple

From: Bernardini, Jessica [JBernardini@haleyaldrich.com]
Sent: Thursday, July 05, 2012 4:44 PM
To: Sharma, Dimple
Subject: RE: Files from 720-42947-1 Hansen

Hi Dimple – there is an error on the sample ID for this set of data. Sample HA37-G37-5.0 should be HA27-37-5.0

Please correct and forward back to me.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Qualifiers

Metals

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/5/2012 10:37 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 23.2º C.

GC/MS VOA
Method 8260B: Internal standard responses were outside of acceptance limits for the following sample 43121-3. The sample shows ND and confirmed by reanalysis.

No other analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Subject: Geotechnical Services During Construction
Filling of Busch Pit
Pleasanton Lakes Development
Pleasanton, California

Ladies and Gentlemen:

This letter summarizes the geotechnical services provided by Haley & Aldrich, Inc. (Haley & Aldrich) during placement and compaction of fill in Busch Pit at the Pleasanton Lakes Development (Site) in Pleasanton, California. The approximate location of the Site is presented on Figure 1.

Prior to filling, the pit was located immediately north of Busch Road at the western end of the Site. It had plan dimensions of approximately 400 feet in the east-west direction and about 500 feet in the north-south direction. The surface elevation of the pit varied from approximately 50 feet deep at the southern end to 70 feet deep at the northern end, with the sides of the excavation supported by slopes cut at inclinations of approximately 1.5:1 to 2:1 (horizontal to vertical).

To satisfy surface mining permit requirements, the Busch Pit was filled with soil from a nearby on-site soil stockpile. This letter describes our site observations and presents the test results associated with the placement and compaction fill within Busch Pit.

GRADING AND EARTHWORK

Between 2 and 30 April 2013 and 25 and 26 July 2013, Teichert Construction of Stockton, California placed and compacted approximately 367,000 cubic yards (cy) of fill within Busch Pit in general accordance with the drawings titled “Rough Grading Plan Scheme B of Busch Pit Fill and Regrading Project,” prepared by Kier & Wright, dated 12 June 2012, and “Grading and Drainage Plan of SMP 31/36 for Area B,” prepared by Kier & Wright and dated 13 May 2013.

The fill originated from an on-site stockpile located north of the pit, as shown on Figure 2. The stockpiled fill was previously evaluated by Haley & Aldrich and the results of the soil sampling and analytical testing program were presented in a report titled “Environmental On-Site Stockpile Sampling Results, Former Hanson Aggregates Facility, 3000 Busch Road, Pleasanton, California,” dated 17 July 2012. Alameda County Health Care Services Agency reviewed the report and issued a letter dated 28 August 2012 indicating that they had no objections to the use of the material, as represented by the analytical test results, to fill Busch Pit.

The fill material from the stockpile was generally uniform and homogeneous in composition and was typically characterized as sandy clay to clayey sand with traces of gravel. Trace roots and organics were occasionally encountered in the fill.

The contractor placed fill throughout the pit using 637G and 615F Caterpillar scrapers. Prior to placement, the fill was moisture-conditioned, as needed, to a point at or near its optimum moisture content. The scrapers placed fill in thin lifts spread evenly throughout the base of the pit. Compaction was achieved by driving scrapers and 815F Caterpillar compactors equipped with sheepsfoot wheels over the loose fill. Filling of the pit proceeded until rough grades had been achieved in general conformance with the original grading plan.

Following the completion of rough grading in April 2013, Kier & Wright amended the grading plan to eliminate a "low spot" at the northern end of the pit and modify the grades along the pit's western and southern boundaries. Specific details of this grading plan are depicted on the drawing prepared by Kier & Wright dated 13 May 2013. The improvements were constructed by Teichert in July 2013.

Haley & Aldrich observed the placement and compaction of fill at Busch Pit on a part-time basis. The compaction of the fill was checked by Haley & Aldrich personnel using a nuclear moisture-density gauge to verify that a minimum of 90 percent relative compaction was being achieved for each lift. Compaction tests were typically performed two to three times per day. Unless stated otherwise in this report, all areas initially failing to meet the minimum standard of compaction were reworked and retested until adequate compaction was achieved. Exceptions to this standard and other notable events observed during grading are listed as follows:

- On 10 April 2013, a problem with the density gauge prevented testing of the fill; no data could be collected during the midday testing period to confirm that 90 percent compaction was achieved. However, based on our field personnel's observations of the behavior of the loaded scrapers and compaction equipment over compacted subgrade, we concluded that the fill was adequately compacted and the contractor was allowed to proceed.

- On 19 April 2013, high winds occurred during grading. The amount of water supplied to the fill for dust suppression was higher than usual.

Results of field density tests are summarized in Appendix A. The approximate locations of these tests are shown on Figure 3, Field Density Test Location Map. The final site grades are shown on the drawing titled "As-Built of SMP 31/36 Area B," prepared by Kier & Wright, dated 10 November 2013.

LABORATORY AND FIELD DENSITY TESTING

The maximum dry density and optimum-moisture content criteria for compaction testing were obtained by conducting a total of six Modified Proctor compaction tests on samples from the on-site soil stockpile. In-situ moisture content tests were performed to confirm calibration of the nuclear density gauge. The laboratory test results of fill materials are included in Appendix B.

Field density tests were performed in accordance with ASTM Test Method D 6938. The tests were performed using a nuclear moisture-density gauge supplied by Instrotek, Inc. of Concord, California.

CONCLUSIONS

Based on the results of our field observations and compaction testing activities, we conclude that where tested, the grading and earthwork at the site conformed to the project requirements and our geotechnical recommendations.

The presence of our field representative at the site was intended to provide the owner with professional advice, opinions, and recommendations based on observations of the contractor's work. Although our observations did not reveal deficiencies or deviations from project specifications, we do not guarantee the contractor's work, nor do our services relieve the contractor of responsibility if defects in the work are subsequently discovered. The conclusions in this report are based on test results and observations of the grading and earthwork procedures used, and represent our engineering opinion as to the compliance of the results with the project specifications.

We appreciate the opportunity to provide geotechnical observation and testing services on this project. Please do not hesitate to call if you have any questions or comments.

Sincerely yours,
HALEY & ALDRICH, INC.

Dean H. Iwasa, P.E., G.E.
Senior Project Manager

Subject: Soil Sampling Results for Backfilling Activities at the Busch Pit, SLIC Case RO0002952 and GeoTracker Global ID SL0600101555, Hanson Aggregates Radum Plant, 3000 Busch Road, Pleasanton, CA 94566

Dear Mr. Cover, Mr. Dunn, and Ms. Patterson:

Alameda County Environmental Health (ACEH) staff has reviewed the case file for the above referenced site including the recently submitted document entitled, "*Environmental On-Site Stockpile Sampling Results, Former Hanson Aggregates Facility, 3000 Bush Road, Pleasanton, California,*" dated July 17, 2012 and received by ACEH on July 23, 2012 (Report). The Report, which was prepared by Haley & Aldrich, presents sampling and analytical results from 53 soil samples collected from an on-site stockpile. The purpose of the sampling and analyses was to evaluate whether the soil stockpile is an acceptable fill source for backfilling the Bush Pit. Soil samples were collected from the material to be removed during backfill activities as defined by a grading plan shown on Figure 2 of the Report.

Haley & Aldrich conclude in the Report that the stockpile soils meet the acceptance criteria for use as backfill material in the Busch Pit. Based on the results presented, ACEH has no objection to use of the material represented by the soil samples as backfill material within the Busch Pit.

TECHNICAL REPORT REQUEST

Please submit technical reports to Alameda County Environmental Health (Attention: Jerry Wickham), according to the following schedule:

- **October 31, 2012** – Quarterly Summary Report of Fill Activities for the Busch Pit
  File to be named: STAT_R_yyyy-mm-dd RO2952

- **January 31, 2013** – Quarterly Summary Report of Fill Activities for the Busch Pit
  File to be named: STAT_R_yyyy-mm-dd RO2952

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

If you have any questions, please call me at (510) 567-6791 or send me an electronic mail message at jerry.wickham@acgov.org.

Sincerely,

Jerry Wickham, California PG 3766, CEG 1177, and CHG 297

Responsible Party(ies) Legal Requirements / Obligations

REPORT REQUESTS

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

ELECTRONIC SUBMITTAL OF REPORTS

ACEH's Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of reports in electronic form. The electronic copy replaces paper copies and is expected to be used for all public information requests, regulatory review, and compliance/enforcement activities. Instructions for submission of electronic documents to the Alameda County Environmental Cleanup Oversight Program FTP site are provided on the attached "Electronic Report Upload Instructions." Submission of reports to the Alameda County FTP site is an addition to existing requirements for electronic submittal of information to the State Water Resources Control Board (SWRCB) GeoTracker website. In September 2004, the SWRCB adopted regulations that require electronic submittal of information for all groundwater cleanup programs. For several years, responsible parties for cleanup of leaks from underground storage tanks (USTs) have been required to submit groundwater analytical data, surveyed locations of monitoring wells, and other data to the GeoTracker database over the Internet. Beginning July 1, 2005, these same reporting requirements were added to Spills, Leaks, Investigations, and Cleanup (SLIC) sites. Beginning July 1, 2005, electronic submittal of a complete copy of all reports for all sites is required in GeoTracker (in PDF format). Please visit the SWRCB website for more information on these requirements (http://www.waterboards.ca.gov/water_issues/programs/ust/electronic_submittal/).

PERJURY STATEMENT

All work plans, technical reports, or technical documents submitted to ACEH must be accompanied by a cover letter from the responsible party that states, at a minimum, the following: "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report is true and correct to the best of my knowledge." This letter must be signed by an officer or legally authorized representative of your company. Please include a cover letter satisfying these requirements with all future reports and technical documents submitted for this fuel leak case.

PROFESSIONAL CERTIFICATION & CONCLUSIONS/RECOMMENDATIONS

The California Business and Professions Code (Sections 6735, 6835, and 7835.1) requires that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments be performed under the direction of an appropriately registered or certified professional. For your submittal to be considered a valid technical report, you are to present site specific data, data interpretations, and recommendations prepared by an appropriately licensed professional and include the professional registration stamp, signature, and statement of professional certification. Please ensure all that all technical reports submitted for this fuel leak case meet this requirement.

UNDERGROUND STORAGE TANK CLEANUP FUND

Please note that delays in investigation, later reports, or enforcement actions may result in your becoming ineligible to receive grant money from the state's Underground Storage Tank Cleanup Fund (Senate Bill 2004) to reimburse you for the cost of cleanup.

AGENCY OVERSIGHT

If it appears as though significant delays are occurring or reports are not submitted as requested, we will consider referring your case to the Regional Board or other appropriate agency, including the County District Attorney, for possible enforcement actions. California Health and Safety Code, Section 25299.76 authorizes enforcement including administrative action or monetary penalties of up to $10,000 per day for each day of violation.

Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC)	**REVISION DATE:** July 20, 2010
	ISSUE DATE: July 5, 2005
	PREVIOUS REVISIONS: October 31, 2005; December 16, 2005; March 27, 2009; July 8, 2010
SECTION: Miscellaneous Administrative Topics & Procedures	**SUBJECT:** Electronic Report Upload (ftp) Instructions

The Alameda County Environmental Cleanup Oversight Programs (LOP and SLIC) require submission of all reports in electronic form to the county's ftp site. Paper copies of reports will no longer be accepted. The electronic copy replaces the paper copy and will be used for all public information requests, regulatory review, and compliance/enforcement activities.

REQUIREMENTS

- **Please do not submit reports as attachments to electronic mail.**
- Entire report including cover letter must be submitted to the ftp site as **a single portable document format (PDF) with no password protection**.
- It is **preferable** that reports be converted to PDF format from their original format, (e.g., Microsoft Word) rather than scanned.
- **Signature pages and perjury statements must be included and have either original or electronic signature.**
- **Do not password protect the document**. Once indexed and inserted into the correct electronic case file, the document will be secured in compliance with the County's current security standards and a password. **Documents with password protection will not be accepted**.
- Each page in the PDF document should be rotated in the direction that will make it easiest to read on a computer monitor.
- Reports must be named and saved using the following naming convention:

  RO#_Report Name_Year-Month-Date (e.g., RO#5555_WorkPlan_2005-06-14)

Submission Instructions

1) Obtain User Name and Password
   a) Contact the Alameda County Environmental Health Department to obtain a User Name and Password to upload files to the ftp site.
      i) Send an e-mail to deh.loptoxic@acgov.org
   b) In the subject line of your request, be sure to include **"ftp PASSWORD REQUEST"** and in the body of your request, include the **Contact Information, Site Addresses**, and the **Case Numbers (RO# available in Geotracker) you will be posting for**.

2) Upload Files to the ftp Site
   a) Using Internet Explorer (IE4+), go to ftp://alcoftp1.acgov.org
      (i) Note: Netscape, Safari, and Firefox browsers will not open the FTP site as they are NOT being supported at this time.
   b) Click on Page located on the Command bar on upper right side of window, and then scroll down to Open FTP Site in Windows Explorer.
   c) Enter your User Name and Password. (Note: Both are Case Sensitive.)
   d) Open "My Computer" on your computer and navigate to the file(s) you wish to upload to the ftp site.
   e) With both "My Computer" and the ftp site open in separate windows, drag and drop the file(s) from "My Computer" to the ftp window.

3) Send E-mail Notifications to the Environmental Cleanup Oversight Programs
   a) Send email to deh.loptoxic@acgov.org notify us that you have placed a report on our ftp site.
   b) Copy your Caseworker on the e-mail. Your Caseworker's e-mail address is the entire first name then a period and entire last name @acgov.org. (e.g., firstname.lastname@acgov.org)
   c) The subject line of the e-mail must start with the RO# followed by **Report Upload**. (e.g., Subject: RO1234 Report Upload) If site is a new case without an RO#, use the street address instead.
   d) If your document meets the above requirements and you follow the submission instructions, you will receive a notification by email indicating that your document was successfully uploaded to the ftp site.

APPENDIX C

USL Pleasanton Proposed Development

EAST PLEASANTON PROJECT OVERVIEW
3000 BUSCH ROAD

MASTER PLAN PROGRAM

- 320 Total Acres owned by Steelwave
- 195 Acres within Master Plan boundary
- 889 Total Units developed over 10+ years
- 26 acres of programmed park space and preserved open space
- 600 acres of open space within Zone 7 boundaries
- 386,000 square feet of neighborhood retail and commercial office space
- Traditional neighborhood design focused on walkability, connectivity, mix of uses, respect for nature and open space

PROJECT HIGHLIGHTS:

Access to the Chain of Lakes
Extensive recreation and education opportunities

Improved Circulation
• New El Charro Rd. connects Stoneridge & Stanley
• New Iron Horse trail connection along Busch Road greenway
• Busch Road extension connects Pleasanton to the parks, lakes and mountain views

Diverse housing options
Incl. senior housing and smaller footprint

Respects Urban Growth Boundary

New Village Center and Village Green

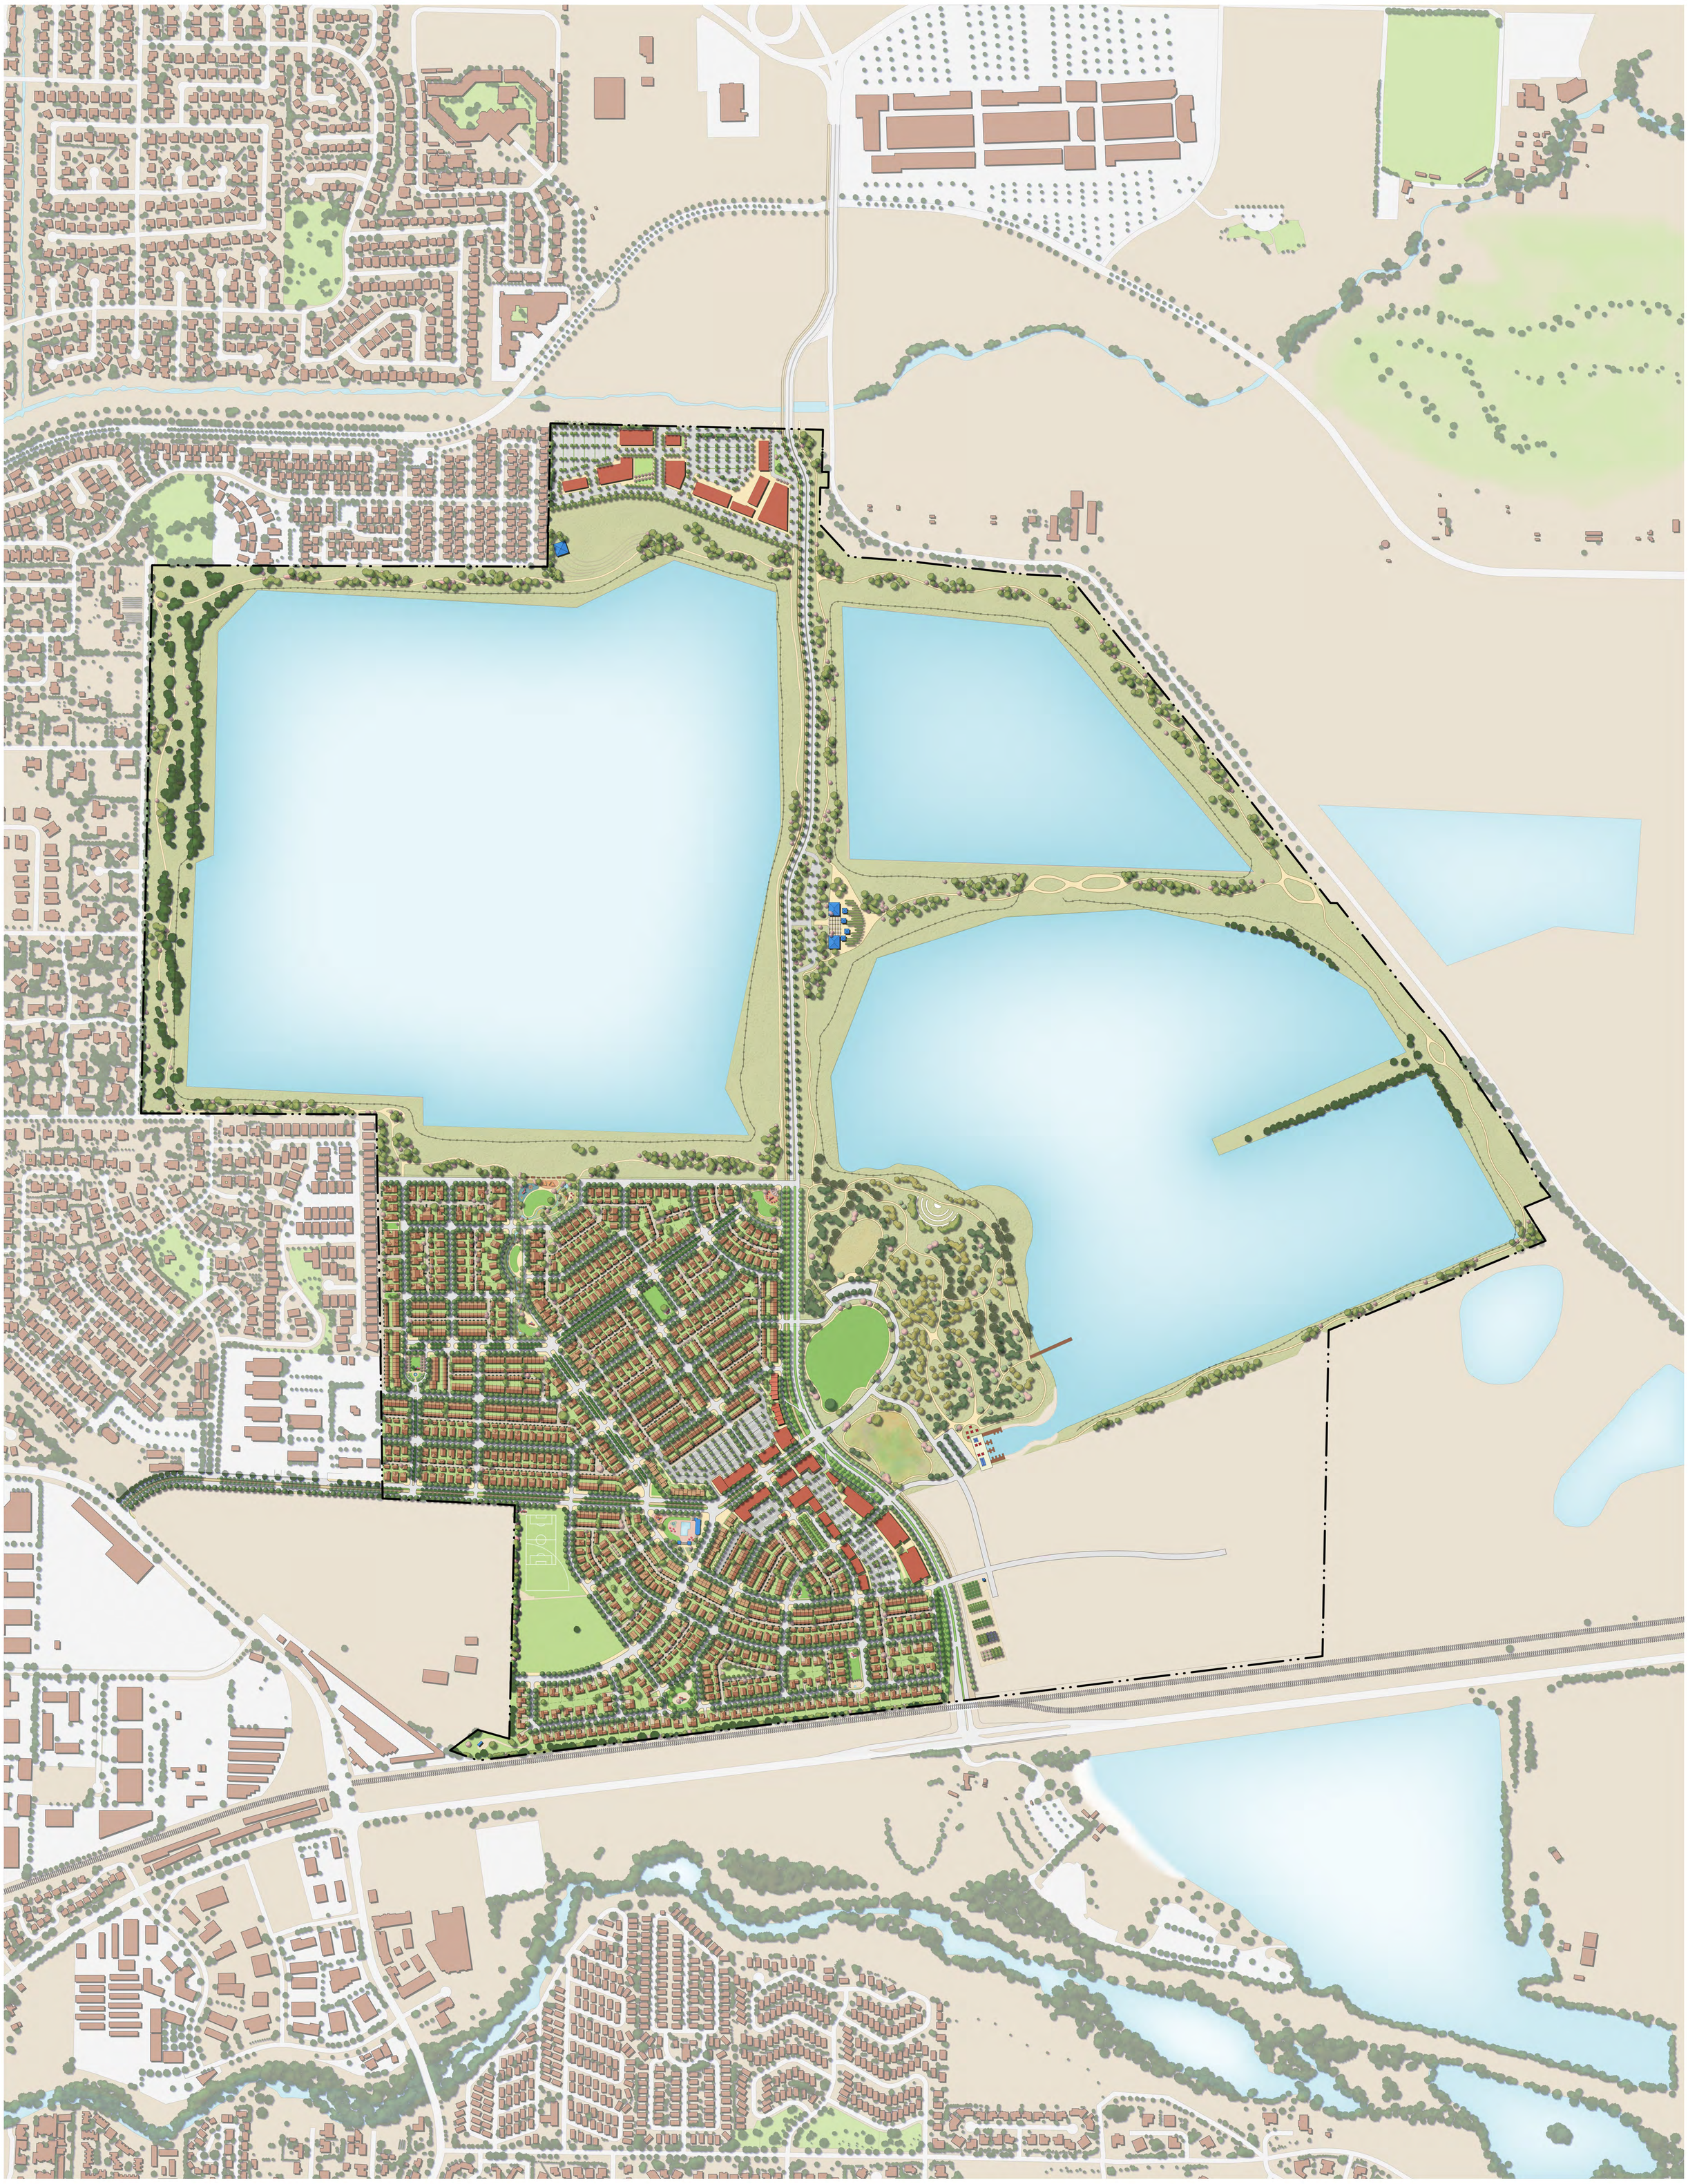
New Community Pool and Gathering Hall

Schools
• Land for new school
• Millions in fees for schools city-wide

Traffic
• New street grid provides for better traffic dispersion and helps reduce congestion
• Integration of "Complete Streets" enhance vehicular circulation while promoting bike and pedestrian connectivity.

Water
• Fixture replacement program, additional recycled water infrastructure and extensive grey water reuse to achieve net zero on new water use

Soccer Fields, Hiker/Biker trails and other Active Recreation areas



Phased Approach

Subject: Soil Import Management Plan
Former Hanson Aggregates Radum Facility
Pleasanton, California

Dear Ms. Roe:

The enclosed *Soil Import Management Plan,* dated 8 August 2018, was prepared by Haley & Aldrich, Inc. on behalf of USL Pleasanton Lakes, L.P. for the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California.

I certify under penalty of law that this document and all attachments are prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely yours,
USL PLEASANTON LAKES, L.P.

1. Introduction

Haley & Aldrich, Inc. (Haley & Aldrich) prepared this *Soil Import Management Plan, Former Hanson Aggregates Radum Facility, Pleasanton, California (Soil Import Management Plan)* on behalf of USL Pleasanton Lakes, L.P. (USL Pleasanton) for the Former Hanson Aggregates Radum Facility located at 3000 Busch Road, Pleasanton, California (Site). USL Pleasanton is currently planning the redevelopment of this former mining facility. Alameda County Department of Environmental Health (ACDEH) is providing regulatory environmental oversight for this redevelopment. This *Soil Import Management Plan* was requested by ACDEH as USL Pleasanton is required to receive approval from ACDEH on the environmental conditions for any soil imported to the Site.

This *Soil Import Management Plan* presents: 1) criteria required to evaluate the environmental conditions of the proposed import borrow site; 2) the environmental sampling and analysis required to characterize the soil to be imported from the proposed import borrow site; 3) the Site-specific screening levels to be referenced for accepting the soil proposed to be imported; and 4) the documentation to be submitted to ACDEH for their timely review and approval of the soil proposed to be imported.

1.1 BACKGROUND

ACDEH is providing oversight for the Site under the following three regulatory cases, which are separated by the Site's nine Areas of Concerns (AOCs):

- GeoTracker Case No. RO0002941, Hanson Aggregates Radum Plant (SLT19719376) – established for AOC 1;
- GeoTracker Case No. RO0002952, Hanson Aggregates Legacy Radum Facility (SL0600101555) – established for AOCs 2, 3, 4, 5, 8 and 9; and
- GeoTracker Case No. RO0003228, USL Pleasanton Lakes (T10000009398) – established for AOCs 6 and 7.

Figure 1 shows the location of the Site and the nine AOCs. Additional information regarding the environmental conditions for the Site's nine AOCs is provided in the following reports:

- Closure Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California, dated 29 March 2017, prepared by Haley & Aldrich; and,
- Summary of Environmental Status: AOCs 1-5, 8 & 9, Former Hanson Aggregates Radum Facility, Pleasanton, California, dated 17 August 2017, prepared by Haley & Aldrich.

This *Soil Import Management Plan* has been prepared to be consistent with the provisions established in the *Soil Management Plan – APNs 946-1250-6-4 & 946-1350-3-12, Former Hanson Aggregates Radum Facility, Pleasanton, California,* dated 29 March 2017, prepared by Haley & Aldrich, including permitting, best management practices, and health and safety.

2. Soil Import Environmental Screening

Presented below are the requirements for screening the environmental conditions of soil proposed to be imported to the Site. USL Pleasanton will retain an Environmental Professional to perform this screening, which will include evaluating the environmental conditions of the import borrow site, collecting and analyzing soil samples of the proposed imported material, and assessing the analytical results against the site-specific import screening levels presented in this *Soil Import Management Plan*. If the Environmental Professional indicates the proposed import material is acceptable, an email will be submitted to ACDEH documenting this evaluation and requesting approval from ACDEH. No soil shall be imported to the Site without prior approval from ACDEH.

2.1 IMPORT BORROW SITE BACKGROUND

The environmental conditions of the proposed import borrow site will be assessed by the Environmental Professional. Background information will be evaluated to determine if current or historical conditions and/or operations may have impacted the borrow site's environmental conditions. Specific information required for this evaluation include:

- Location/address of the proposed import borrow site.
- History of the borrow site, including any previous activities or development. If a Phase I Environmental Site Assessment has been prepared for the borrow site, it will be reviewed.
- Total volume of soil proposed to be imported, including a figure showing the location within the borrow site from which this soil would be obtained, and the total depth of the soil excavation.
- Schedule for the soil excavation activities planned for the borrow site.

2.2 ENVIRONMENTAL SAMPLING

The environmental conditions of the proposed import borrow site will be characterized in accordance with the California Department of Toxic Substances Control (DTSC) *Information Advisory Clean Imported Fill Material*, dated October 2001,[1] with additionally requested requirements specified by Zone 7. The DTSC Information Advisory provides recommended analytical methods for testing the proposed import material based on the proposed borrow site's setting (e.g., agricultural land, residential property), and specifies the number of soil samples to be collected to adequately characterize the soil's environmental conditions. The sampling requirements also depend on whether the proposed import material will be obtained from an "Individual Borrow Area," which is a site where the soil has not been impacted by historical activities or constructed upon, or a "Borrow Area Stockpile," which is a site with soil generated and then stockpiled for general construction activities. If the Environmental Professional identifies the proposed borrow import site as an "Individual Borrow Area," an email will be submitted to Zone 7 presenting the respective site's classification. Upon receiving concurrence from Zone 7 on the site's classification, the environmental sampling will be implemented.

Tables 1 and 2 respectively summarize the laboratory analyses and soil sampling requirements to characterize proposed import material.

[1] A copy of this DTSC Information Advisory is provided in Appendix A.

2.3 SITE-SPECIFIC IMPORT SCREENING LEVELS

The analytical characterization results will be compared against the Environmental Screening Levels (ESLs), dated February 2016 (Revision 3), established by the San Francisco Bay Regional Water Quality Control Board (RWQCB). The ESLs include various screening level concentrations calculated for a range of human health and environmental exposure scenarios. The RWQCB has specified Tier 1 ESLs as the most conservative (i.e., lowest) concentration, which will be referenced to screen imported soil analytical results.

For select metals, including arsenic, chromium, and nickel, naturally occurring background concentrations for soil in the San Francisco Bay Area region are at levels exceeding their respective Tier 1 ESL. Given this condition, the Site-specific import screening level for arsenic is based on the findings of *Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region*, dated December 2011, prepared by Dylan Jacques Duverge, a copy of which is provided in Appendix B. For chromium and nickel, the Site-specific import screening levels are based on the findings of the Zone 7 Water Agency (Zone 7) analysis of soil data collected in the area of Cope Lake, a copy of which is provided in Appendix C.

Table 3 summarizes the Site-specific import screening levels for evaluating the acceptance of soil proposed to be imported to the Site.

2.3.1 Leachability Testing

Several of the Tier 1 ESLs selected to be Site-specific import screening levels are established to assess potential leaching of impacted soil conditions to an underlying groundwater unit. If a Site-specific import screening level for soil is exceeded, or if a non-detect result is reported where the method detection limit exceeds the Site-specific import screening level, with the exceeded screening level based on potential leachability concerns, then further analysis of the sample will be conducted using the California Waste Extraction Test modified with distilled water (DI-WET).[2] To evaluate potential leachability concerns, a dilution attenuation factor (DAF) is applied to the DI-WET analytical result to calculate the theoretical groundwater concentration. For this evaluation, a DAF of 20[3] will be applied, with the theoretical groundwater concentration calculated by dividing the DI-WET analytical result (reported in micrograms per liter [µg/L]) by the DAF. The calculated groundwater concentration will be compared against the ESLs for groundwater established by the RWQCB based on maximum contaminant level (MCL) human health direct exposure, as summarized in Table 4.

[2] Conducting the DI-WET analysis to evaluate potential leachability concerns complies with the RWQCB *ESL User's Guide*. As indicated in Section 6.3, site-specific evaluations for assessing potential soil leachability concerns can include simulated leaching tests for sites where the depth to groundwater is deep, and specifically references performing the DI-WET.

[3] The RWQCB *ESL User's Guide* references the US Environmental Protection Agency (USEPA) 1996 *Soil Screening Guidance: Technical Background Document* (https://www.epa.gov/superfund/superfund-soil-screening-guidance) to determine DAFs. This USEPA guidance establishes a default DAF of 20.

2.4 ACDEH SUBMITTAL

If the Environmental Professional's review of the proposed borrow import site indicates acceptable environmental conditions, an email will be submitted to ACDEH documenting this evaluation. This email will summarize the review and include the following:

- Background information on the borrow site, including location/address and previous development(s) and/or operation(s);
- Total volume of soil proposed to be imported, including a figure showing the location within the borrow site from which this soil would be obtained, and the total depth of the soil excavation;
- A figure depicting the proposed location within the Former Hanson Aggregate Site where the import soil will be placed;
- Summary of the environmental sampling activities and the associated analytical results tabulated and compared against the Site-specific screening levels; and,
- Copies of the certified analytical laboratory reports.

3. Reporting

Following the completion of importing soil to the Site, a final report will be prepared documenting the various import events. This report will summarize the information presented in the email submittals to ACDEH for each respective import borrow site.

TABLES

TABLE 1: LABORATORY ANALYSES FOR PROPOSED IMPORT BORROW SITE

Laboratory Analysis	USEPA Method	Site Setting			
		Land Near an Existing Freeway	Land Near a Mining Area or Rock Quarry	Agricultural Land	Residential/ Acceptable Commercial Land
California Title 22 Metals	USEPA Methods 6010B and 7471A	X	X	X	X
Asbestos	Polarized Light Microscopy (PLM) or OSHA Method ID-191		X (PLM)		X (OSHA)
pH	USEPA Method 9045D		X		
Pesticides	Organochlorine Pesticides: USEPA Method 8081A or 8080A; Organophosphorus Pesticides: USEPA Method 8141A; Chlorinated Herbicides: USEPA Method 8151A	X [1]	X [1]	X	X [1]
VOCs	USEPA Method 8260B, combined with collection by USEPA Method 5035				X
Semi-VOCs/ PAHs	USEPA Method 8270C/8270C SIM	X (PAHs only)			X
TPH Gasoline, Diesel and Motor Oil	USEPA Method 8015B; USEPA Method 8260B also acceptable for TPH Gasoline	X [1]	X [1]	X [1]	X
PCBs	USEPA Method 8082 or 8080A				X

Notes:

The recommended analyses should be performed in accordance with USEPA SW-846 methods (1996). Other possible analyses include Hexavalent Chromium: USEPA method 7199.

1 = Laboratory analysis added as Zone 7's request

TABLE 2: SAMPLING REQUIREMENTS FOR PROPOSED IMPORT MATERIAL

Site Classification	Area/Volume	Number of Soil Samples to be Collected
Individual Borrow Area [1]	≤ 2 acres	minimum of 8 samples
	2 – 4 acres	1 sample per every ¼ acre
	4 – 10 acres	Minimum of 16 samples
	≥ 10 acres	Minimum of 16 locations with 4 samples collected per location (minimum of 64 samples)
Borrow Area Stockpile [2]	≤ 1,000 cubic yards	1 sample per 250 cubic yards
	1,000 – 5,000 cubic yards	4 samples for first 1,000 cubic yards + 1 sample for each additional 500 cubic yards
	≥ 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample for each additional 1,000 cubic yards

Notes:

1 = site where the soil has not been impacted by historical activities or constructed upon

2 = site with soil generated and then stockpiled for general construction activities

DTSC Information Advisory Clean Imported Fill Material

Information Advisory
Clean Imported Fill Material

October 2001

DEPARTMENT OF TOXIC SUBSTANCES CONTROL

It is DTSC's mission to restore, protect and enhance the environment, to ensure public health, environmental quality and economic vitality, by regulating hazardous waste, conducting and overseeing cleanups, and developing and promoting pollution prevention.

State of California

California Environmental Protection Agency

Executive Summary

This fact sheet has been prepared to ensure that inappropriate fill material is not introduced onto sensitive land use properties under the oversight of the DTSC or applicable regulatory authorities. Sensitive land use properties include those that contain facilities such as hospitals, homes, day care centers, and schools. This document only focuses on human health concerns and ecological issues are not addressed. It identifies those types of land use activities that may be appropriate when determining whether a site may be used as a fill material source area. It also provides guidelines for the appropriate types of analyses that should be performed relative to the former land use, and for the number of samples that should be collected and analyzed based on the estimated volume of fill material that will need to be used. The information provided in this fact sheet is not regulatory in nature, rather is to be used as a guide, and in most situations the final decision as to the acceptability of fill material for a sensitive land use property is made on a case-by-case basis by the appropriate regulatory agency.

Introduction

The use of imported fill material has recently come under scrutiny because of the instances where contaminated soil has been brought onto an otherwise clean site. However, there are currently no established standards in the statutes or regulations that address environmental requirements for imported fill material. Therefore, the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) has prepared this fact sheet to identify procedures that can be used to minimize the possibility of introducing contaminated soil onto a site that requires imported fill material. Such sites include those that are undergoing site remediation, corrective action, and closure activities overseen by DTSC or the appropriate regulatory agency. These procedures may also apply to construction projects that will result in sensitive land uses. The intent of this fact sheet is to protect people who live on or otherwise use a sensitive land use property. By using this fact sheet as a guide, the reader will minimize the chance of introducing fill material that may result in potential risk to human health or the environment at some future time.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our website at www.dtsc.ca.gov.

Overview

Both natural and manmade fill materials are used for a variety of purposes. Fill material properties are commonly controlled to meet the necessary site specific engineering specifications. Because most sites requiring fill material are located in or near urban areas, the fill materials are often obtained from construction projects that generate an excess of soil, and from demolition debris (asphalt, broken concrete, etc.). However, materials from those types of sites may or may not be appropriate, depending on the proposed use of the fill, and the quality of the assessment and/or mitigation measures, if necessary. Therefore, unless material from construction projects can be demonstrated to be free of contamination and/or appropriate for the proposed use, the use of that material as fill should be avoided.

Selecting Fill Material

In general, the fill source area should be located in nonindustrial areas, and not from sites undergoing an environmental cleanup. Nonindustrial sites include those that were previously undeveloped, or used solely for residential or agricultural purposes. If the source is from an agricultural area, care should be taken to insure that the fill does not include former agricultural waste process byproducts such as manure or other decomposed organic material. Undesirable sources of fill material include industrial and/or commercial sites where hazardous ma-

Potential Contaminants Based on the Fill Source Area

Fill Source:	Target Compounds
Land near to an existing freeway	Lead (EPA methods 6010B or 7471A), PAHs (EPA method 8310)
Land near a mining area or rock quarry	Heavy Metals (EPA methods 6010B and 7471A), asbestos (polarized light microscopy), pH
Agricultural land	Pesticides (Organochlorine Pesticides: EPA method 8081A or 8080A; Organophosphorus Pesticides: EPA method 8141A; Chlorinated Herbicides: EPA method 8151A), heavy metals (EPA methods 6010B and 7471A)
Residential/acceptable commercial land	VOCs (EPA method 8021 or 8260B, as appropriate and combined with collection by EPA Method 5035), semi-VOCs (EPA method 8270C), TPH (modified EPA method 8015), PCBs (EPA method 8082 or 8080A), heavy metals including lead (EPA methods 6010B and 7471A), asbestos (OSHA Method ID-191)

**The recommended analyses should be performed in accordance with USEPA SW-846 methods (1996). Other possible analyses include Hexavalent Chromium: EPA method 7199*

Recommended Fill Material Sampling Schedule

Area of Individual Borrow Area	Sampling Requirements
2 acres or less	Minimum of 4 samples
2 to 4 acres	Minimum of 1 sample every 1/2 acre
4 to 10 acres	Minimum of 8 samples
Greater than 10 acres	Minimum of 8 locations with 4 subsamples per location
Volume of Borrow Area Stockpile	**Samples per Volume**
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

terials were used, handled or stored as part of the business operations, or unpaved parking areas where petroleum hydrocarbons could have been spilled or leaked into the soil. Undesirable commercial sites include former gasoline service stations, retail strip malls that contained dry cleaners or photographic processing facilities, paint stores, auto repair and/or painting facilities. Undesirable industrial facilities include metal processing shops, manufacturing facilities, aerospace facilities, oil refineries, waste treatment plants, etc. Alternatives to using fill from construction sites include the use of fill material obtained from a commercial supplier of fill material or from soil pits in rural or suburban areas. However, care should be taken to ensure that those materials are also uncontaminated.

Documentation and Analysis

In order to minimize the potential of introducing contaminated fill material onto a site, it is necessary to verify through documentation that the fill source is appropriate and/or to have the fill material analyzed for potential contaminants based on the location and history of the source area. Fill documentation should include detailed information on the previous use of the land from where the fill is taken, whether an environmental site assessment was performed and its findings, and the results of any testing performed. It is recommended that any such documentation should be signed by an appropriately licensed (CA-registered) individual. If such documentation is not available or is inadequate, samples of the fill material should be chemically analyzed. Analysis of the fill material should be based on the source of the fill and knowledge of the prior land use.

Detectable amounts of compounds of concern within the fill material should be evaluated for risk in accordance with the DTSC Preliminary Endangerment Assessment (PEA) Guidance Manual. If

metal analyses are performed, only those metals (CAM 17 / Title 22) to which risk levels have been assigned need to be evaluated. At present, the DTSC is working to establish California Screening Levels (CSL) to determine whether some compounds of concern pose a risk. Until such time as these CSL values are established, DTSC recommends that the DTSC PEA Guidance Manual or an equivalent process be referenced. This guidance may include the Regional Water Quality Control Board's (RWQCB) guidelines for reuse of non-hazardous petroleum hydrocarbon contaminated soil as applied to Total Petroleum Hydrocarbons (TPH) only. The RWQCB guidelines should not be used for volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCS). In addition, a standard laboratory data package, including a summary of the QA/QC (Quality Assurance/Quality Control) sample results should also accompany all analytical reports.

When possible, representative samples should be collected at the borrow area while the potential fill material is still in place, and analyzed prior to removal from the borrow area. In addition to performing the appropriate analyses of the fill material, an appropriate number of samples should also be determined based on the approximate volume or area of soil to be used as fill material. The table above can be used as a guide to determine the number of samples needed to adequately characterize the fill material when sampled at the borrow site.

Alternative Sampling

A Phase I or PEA may be conducted prior to sampling to determine whether the borrow area may have been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with DTSC or appropriate regulatory agency. However, if it is not possible to analyze the fill material at the borrow area or determine that it is appropriate for use via a Phase I or PEA, it is recommended that one (1) sample per truckload be collected and analyzed for all compounds of concern to ensure that the imported soil is uncontaminated and acceptable. (See chart on Potential Contaminants Based on the Fill Source Area for appropriate analyses). This sampling frequency may be modified upon consultation with the DTSC or appropriate regulatory agency if all of the fill material is derived from a common borrow area. However, fill material that is not characterized at the borrow area will need to be stockpiled either on or off-site until the analyses have been completed. In addition, should contaminants exceeding acceptance criteria be identified in the stockpiled fill material, that material will be deemed unacceptable and new fill material will need to be obtained, sampled and analyzed. Therefore, the DTSC recommends that all sampling and analyses should be completed prior to delivery to the site to ensure the soil is free of contamination, and to eliminate unnecessary transportation charges for unacceptable fill material.

Composite sampling for fill material characterization may or may not be appropriate, depending on quality and homogeneity of source/borrow area, and compounds of concern. Compositing samples for volatile and semivolatile constituents is not acceptable. Composite sampling for heavy metals, pesticides, herbicides or PAH's from unanalyzed stockpiled soil is also unacceptable, unless it is stockpiled at the borrow area and originates from the same source area. In addition, if samples are composited, they should be from the same soil layer, and not from different soil layers.

When very large volumes of fill material are anticipated, or when larger areas are being considered as borrow areas, the DTSC recommends that a Phase I or PEA be conducted on the area to ensure that the borrow area has not been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with the DTSC.

CERTIFICATION OF APPROVAL

I certify that I have read *Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region* by Dylan Jacques Duvergé, and that in my opinion this work meets the criteria for approving a thesis submitted in partial fulfillment of the requirements for the degree: Master of Science in Geosciences at San Francisco State University.

Dr. Jason Gurdak
Assistant Professor of Geology

Dr. Jerry Davis
Professor of Geography and Environmental Studies

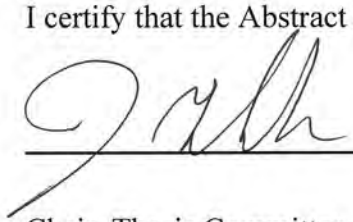
Mary Rose Cassa, P.G.
Professional Geologist, San Francisco Bay Regional Water Quality Control Board

ESTABLISHING BACKGROUND ARSENIC IN SOIL OF THE URBANIZED SAN FRANCISCO BAY REGION

Dylan Jacques Duvergé
San Francisco, California
2011

Soil analysis data within the nine-county San Francisco Bay Area was compiled from the State Water Quality Control Board's Geotracker online database to determine the background levels and variability of arsenic concentrations across four Quaternary geologic units. Arsenic analyses of 1,454 soil samples across 77 sites were screened from Geotracker for inclusion in a JMP 7.0 database. Mean arsenic concentrations within Holocene alluvium (5.10 mg/kg) were determined to be statistically greater than those within Pleistocene alluvium (3.65 mg/kg) and "other" Quaternary units (3.30 mg/kg); and no significant relationship was found between arsenic concentrations and sampling depth. The proposed upper estimate for background arsenic (99^{th} percentile) within undifferentiated flatland soils of the study area—11.00 mg/kg—is markedly lower than commonly cited sources in the literature. These findings present the first regional estimates of background arsenic concentrations in the San Francisco Bay Area.

I certify that the Abstract is a correct representation of the content of this thesis.



Chair, Thesis Committee

12-5-2011

Date

ACKNOWLEDGEMENT

First and foremost, I would like to thank my advisor, Dr. Jason Gurdak, for his receptiveness, thoughtful guidance and support. I consider it an honor to have worked with such a respected professional, and I admire his ingenuity and commitment to this research. I would also like to thank my thesis committee, Dr. Jerry Davis and Mary Rose Cassa for their unique perspectives, and invaluable insight. I am immensely thankful for my friends and family, who have provided moral support throughout my studies; as well as the workload flexibility and tuition assistance offered by my employer, Environmental Science Associates.

1.0 INTRODUCTION AND BACKGROUND

1.1 Introduction

The San Francisco Bay Area (Bay Area) has an enormous natural and cultural diversity where concern for environmental quality permeates regional and local land use planning decisions on a daily basis. Among the broad spectrum of environmental problems is the potential for contaminated soil and groundwater to adversely affect human health. Arsenic—recognized as a potential contaminant by local, state and federal environmental agencies—is a trace metal that is present in low levels in all environmental media (soil and rock, water, and air). Over our lifetimes, we ingest trace levels of arsenic that are naturally occurring in food, drinking water, and (to a lesser extent) air without suffering adverse health effects. However, long-term exposure to elevated levels of inorganic arsenic is known to decrease production of red and white blood cells, cause damage to blood vessels, and lead to characteristic effects such as changes in skin pigmentation, appearance of warts or bruises, skin irritation, and increased risk of skin and other cancers (ASTDR, 2009). In the Bay Area, arsenic is present both as a natural component of soil and rock, as well as a byproduct of human activities such as historical pesticide applications and the presence of copper chromated arsenate- (CCA) treated wood. In this context, environmental investigators face the difficult challenge of determining whether arsenic detections at a site reflect the local soil type or anthropogenic inputs, particularly when detected in the upper range of arsenic concentrations thought to occur naturally.

By screening from an extensive database of soil sampling results that have been submitted to regulatory agencies in the course of environmental cleanup activities, this thesis aims to estimate background arsenic concentrations in soil around the Bay Area, and investigate whether spatial variability in arsenic concentrations can be at least

partially explained by variations in soil type. Estimates of the mean and range for trace metals have been developed nationally (7.2, <0.1 – 97 mg/kg) (Shacklette and Boerngen, 1984), for California (3.5, <0.2 -11 mg/kg) (UCR, 1996), and for localized areas in the San Francisco Bay region (5.5, <DL – 42 mg/kg) (LBNL, 2002; Scott, 1991); but there has thus far been no effort to characterize background arsenic on a regional scale or investigate the effect of soil type on arsenic concentrations in the Bay Area. An improved understanding of background concentrations of trace metals and their variability across soil types could help regulators make informed decisions on whether trace metal detections on a property reflect site-related contamination.

1.2 Definitions

This thesis uses several terms and concepts that may have various meanings in other works depending on their topic, scope, and purpose. The meaning of commonly used terms in this thesis is clarified below:

Arsenic: Toxicological profile sheets distributed by the U.S. Department of Health and Human Services (ASTDR, 2009) define arsenic as a naturally occurring element that is widely distributed in the Earth's crust. Arsenic is a chemical element (As) classified as a metalloid, having both properties of a metal and a nonmetal; however, it is frequently referred to as a metal. Elemental arsenic (sometimes referred to as metallic arsenic) is a steel grey solid material. However, arsenic is usually found in the environment combined with other elements such as oxygen, chlorine, and sulfur. Arsenic combined with these elements is called inorganic arsenic. Arsenic combined with carbon and hydrogen is called organic arsenic.

Background: Both U.S. Environmental Protection Agency (EPA) and U.S. Navy describes "background" as substances or locations that are not influenced by existing site-

related sources of contamination and is often specified as either representing the naturally occurring background or the anthropogenic background (NAVFAC, 2002; EPA, 2002):

- The *natural background* refers to substances present as a result of geochemical processes that have not been influenced by human activity. Naturally occurring organic and inorganic background substances in soil are solely attributable to the natural geological characteristics of the area.
- The *anthropogenic background* (sometimes referred as the "ambient" levels of a substance) refers to substances present at concentrations that potentially exceed the natural background as a result of human activities, but that cannot be attributed to a specific land-use activity or contaminated area.

Soil: The term "soil" as used in this thesis is broadly defined as loose, unconsolidated clay, silt, sand, and gravel found from the ground surface down to the depth of bedrock. This meaning is consistent with the usage in the field of engineering and environmental geology, and is broader than the definition used by soil scientists and agronomists.

Soil Type: Soils are classified in this thesis based on mapping of quaternary geology, which distinguishes soils by age (e.g., Holocene or Pleistocene) and depositional process (e.g., fluvial, marine, estuarine, or lacustrine). References to soil type contained herein are not synonymous with U.S. Department of Agriculture soil series or surveys, which are more specific and focused on the upper 200 cm of soil for agricultural and other resource management purposes.

Source Rock/Parent Material: The source rock or parent material of a soil refers to the bedrock upon which the soil formed (for residual soils), or from which the soil material was originally derived (for transported soils).

Censored Data: Censored data refers to analytical values that are determined by the laboratory, but that are lower than limits deemed reliable enough to report as numerical values. These observations are reported as seminumerical values that contain qualifiers indicating that the analyte is below the limits of reliability for accurate quantification. Typically, these values are expressed as ‘‘nondetects’’ or ‘‘less thans’’ such as <0.5.

Environmental Screening Levels (ESLs): ESLs are a compilation of screening levels specific for use at sites overseen by San Francisco Bay Regional Water Quality Control Board for a number of different environmental concerns. ESLs for chemicals in soil are developed for protection against direct exposure (ingestion, dermal absorption, inhalation of vapors and dust in outdoor air), protection of groundwater quality (leaching of chemicals from soil), protection of terrestrial (nonhuman) biota; and protection against nuisance concerns (odors, etc.).

1.3 Arsenic Variability in Soil and Rock

Arsenic (atomic number 33 and relative atomic mass 74.92) belongs to a group of elements often referred to as “trace” elements because its concentration does not normally exceed 1,000 mg/kg (0.1%) while a small group of ten “major” elements make up over 99% of the earth’s crust (Alloway, 1990). Trace elements are initially introduced into igneous rocks by substituting for the more common cations that form the crystal matrix of minerals. Typically, substitution occurs when arsenic has similar elemental properties and atomic radii of the more common heavy element. Numerous arsenic containing minerals have been identified, the most common of which are arsenopyrite (FeAsS), realgar (AsS), orpiment (As_2S_3), and enargite (Cu_3AsS_4). Arsenic in sedimentary rocks is related to the source and absorptive properties of the sedimentary material that was lithified, the properties of secondary minerals and clays, and the arsenic content of the water that deposited the sedimentary material (Alloway, 1999).

Alloway (1990) reported global mean concentrations of arsenic in different types of rock (Table 1). Mean arsenic content is generally consistent among the major rock types—about 1–1.5 mg/kg—except for some argillaceous sedimentary rocks (shales, mudstones, slates) and phosphorites, which have mean arsenic concentrations from 10–15 mg/kg and have locally been reported to have natural concentrations as high as 900 mg/kg. Separating by rock type, the typical range of concentrations is <1–15 mg/kg for various igneous rocks, <1–20 mg/kg for sandstones and limestones, and <1–200 mg/kg for phosphate rocks. The arsenic content of metamorphic rocks usually reflects the arsenic content of the original, unmetamorphosed rock type.

The typical range of concentrations for arsenic in soils is 1–40 mg/kg with most soils being on the lower end. Kabata-Pendias (1985) reported the mean and range of arsenic background concentrations for several different types of soil, including alluvial soils (8.2, 1.2 to 22 mg/kg), clay and clay loamy soils (7.7, 1.7 to 27 mg/kg), light loamy soils (7.3, 0.4 to 31 mg/kg), and granitic soils (3.6, 0.7 to 15 mg/kg). The type of parent rock is only one of the factors that control metal concentrations in soils. Weathering, biological chemical reactions, and other natural geochemical processes can significantly enrich or deplete the concentrations of certain metals. Due to the high capacity of clay and organic matter to adsorb metallic ions, arsenic concentrations tend to be highest in

Table 1 – Worldwide mean and range of arsenic for major rock types (mg/kg)

	Earth's Crust	Igneous Rocks			Sedimentary Rocks			Alluvial Soils
		Ultra Mafic	Mafic	Granitic	Limestone	Sandstone	Shale	
Mean	1.5	1.5	1	1	1.5	1	9	8.2
Range	--	1-15			1-20		1-900	1.2-22

Sources: Alloway, 1999; Kabata-Pendias, 1985

soils that contain high percentages of clay and organic material (e.g., clay and clay loamy soils, organic light [or rich] soils) (NAVFAC, 2002; Alloway, 1990). Therefore, it is expected that finer-grained depositional environments within the Bay Area would likely have higher natural concentrations of arsenic relative to sandy or gravelly soils.

1.4 Geologic Sources of Elevated Arsenic

As discussed above, soil and rock rich in clay and organic material have been reported to contain elevated concentrations of arsenic relative to other rock types and sandy soils. In addition, unusually high arsenic concentrations have been attributed to highly mineralized geologic environments and zones of hydrothermal alteration. For this reason, arsenic concentrations are commonly used as a pathfinding tool in mineral resource prospecting because high concentrations can indicate the presence of mineralized areas containing valuable commodities such as silver and gold (Alloway, 1990). Further, a national study by Welch et al. (2000) associated thermal waters (e.g. Yellowstone and the Mono Basin), presence of sulfide minerals (e.g. pyrite and marcasite), and areas of high evapotranspiration to high levels of arsenic in groundwater. Welch et al. (2000) did not identify the Bay Area as a region with high arsenic concentrations associated with these processes; however, due to the coarse scale of their study, the possibility that the Bay Area contains localized "hot spots" of naturally-occurring arsenic cannot be ruled out.

Hydrothermally altered mineral zones and coal deposits are relatively rare in the Bay Area, but such environments are locally present in the hills of the region. For example, abundant sulfide bearing rocks are present in the Mt. Diablo district in Contra Costa County, where mercury sulfides and copper were mined in scattered locations on and off throughout the latter half of the 18th century until about the mid-1950s (USGS, 1940; USGS, 2005). Sulfide minerals, including pyrite, marcasite, cinnabar and

metacinnibar were formed via hydrothermal deposits within Franciscan Complex rocks bounded on the east by the Great Valley Sequence (USGS, 1940). In addition, locations on either side of the central and southern Santa Clara Valley (including the historic New Almaden Quicksilver District) have also been reported to contain mercury and other precious metals, although associated sulfide minerals are less abundant than in the Mt. Diablo District (USGS, 2005: Bailey and Everhart, 1964). Aside from the mineral districts around Mt. Diablo and New Almaden, the USGS mineral resources data system indicates widely scattered locations within the hills and mountains of the region that contain occurrences of mercury, copper, gold, silver and other mineral commodities that are possible indicators of hydrothermally altered zones and sulfide minerals (USGS, 2005). The only extensive deposits of coal in Northern California are located in the Black Diamond Mines area, north of the Mt. Diablo district. The coal originates from lignite coal beds in the Domengine Formation, and was extensively mined from the 1860's to the beginning of this century (Mount Diablo Interpretive Association, 2009).

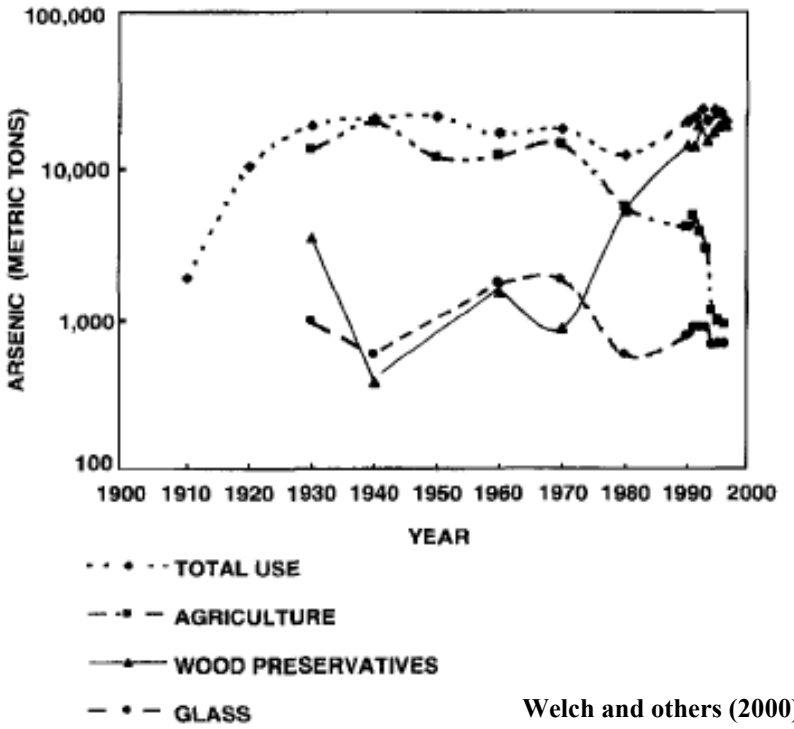
There are no studies specifically aimed at confirming or quantifying the presence of arsenic "hot spots" within the aforementioned locales; but similar geologic environments have been reported in the literature to contain naturally high concentrations of arsenic (USGS, 1940; Alloway, 1990; NAVFAC, 2002; Welch et al., 2000). Such mineralized areas and coal-bearing deposits are confined to a few localized areas in the hills and mountains of the region. Moreover, mercury deposits and associated sulfide minerals in these areas are concentrated in narrow fracture zones within the host rock (Bailey and Everhart, 1964; USGS, 1940). The predominant bedrock and the Quaternary-age deposits of the region are likely to have arsenic concentrations that reflect the more typical concentration ranges discussed in Section 1.3.

1.5 Anthropogenic Sources of Arsenic

Arsenic has a long history of use as a poison dating back to ancient times, but there are several modern uses of arsenic that has made primary production of arsenic compounds, primarily arsenic trioxide, commercially viable. Arsenic trioxide or elemental arsenic is no longer produced in the United States, but it continues to be imported in large quantities, primarily for use as a wood preservative using copper chromated arsenate (CCA). CCA-treated wood, also referred to a "pressure" treated wood, currently accounts for over 50% of domestic consumption of arsenic trioxide; though prior to 2004, it accounted for over 90% of consumption (USGS, 2010). CCA is a water-based product that protects several commercially available species of western lumber from decay and insect attack and is widely used in treating utility poles, building lumber, and wood foundations. The use of CCAs in the wood industry has experienced more recent declines, owing to voluntary elimination of CCA in residential wood products in 2004 (USGS, 2010). However, CCA continues to be used in commercial and industrial applications, and is present in residential structures built prior to 2004 (e.g., in wood needing all-weather proofing). None of the major manufacturers of CCA-treated wood are located in the Bay Area.

Arsenic has also been used in the agricultural industry for pest and weed control. As shown in Figure 1, the use of arsenic in the agricultural industry has experienced a significant decline since the early 1900s. Prior to the introduction of organic pesticides (such as DDT) in the 1940s, inorganic arsenic was the primary pesticide used by orchard growers and farmers. Inorganic arsenic compounds continued to be used as an herbicide, fungicide, growth regulator, desiccant, and/or as a weed control agent along railroad right-of-ways, in potato fields, on grape vines, on lawns, cotton crops, in industrial areas, as well as in baits and to debark trees (ASTDR, 2009). As a result of voluntary industry

Figure 1 – Arsenic consumption in the United States by industrial sector (1900-2000)



Welch and others (2000)

phase-outs and regulatory decisions by the EPA, the use of inorganic arsenic in agriculture has virtually disappeared since the 1980's and 1990's (ASTDR, 2009). The only remaining allowable uses are as ant baits and wood preservatives. Arsenic is also used in the manufacture of glass products, as an alloying element in ammunition and solders, and in semiconductors that are broadly used in computer, biomedical, communications, solar cells, space research and electronics applications (USGS, 2010). Certain industrial processes and mining activities release arsenic as a byproduct, such as stack emissions from copper smelting, coal combustion, and waste incineration; and from mine tailings (Alloway, 1990).

Of particular relevance to the Bay Area is that many of the flatlands surrounding the San Francisco Bay (in particular the Santa Clara Valley) have historically supported

irrigated agriculture, such as orchards and other crops that are likely to have utilized arsenic-based agricultural chemicals (Anderson, 1998). As urbanization has encroached on formerly agricultural land, the underlying soils may continue to have elevated arsenic levels representative of its past agricultural use. However, the extent to which former land owners actually applied arsenic-based pesticides, and whether or how much of the arsenic has since leeched out of soils is usually unknown. Generally, anthropogenic sources of arsenic which cannot be attributed to a specific waste discharge, disposal activity, or emission source can be considered "non-point" sources. As defined in Section 1.2, the natural background combined with the anthropogenic background (i.e., non-point anthropogenic sources) makes up the regional or "ambient" levels of background arsenic.

Arsenic may also have been released to the environment from current or former smelters, coal-fired power plants, and municipal incinerators; but very little is known about arsenic atmospheric deposition rates to Bay Area soils. Coal combustion is commonly cited as a source of atmospheric emissions of arsenic, although review of the USGS mineral resources data system shows no current or former coal mines or natural geological occurrence of coal in the Bay Area aside from the Black Diamond Mine area discussed in Section 1.3 (USGS, 2005). Alloway (1999) reports that the annual rate of increase in arsenic concentrations in soil due to atmospheric deposition is minor—about 0.05% for the northern hemisphere. Further, energy production facilities in the Bay Area use natural gas, solar, wind, geothermal, and landfill gas as energy sources rather than coal (EIA, 2009). Prior to the availability of natural gas, manufactured gas plants, primarily concentrated in San Francisco and Oakland, used coal and oil to produce gas for lighting, heating and cooking., these gas plants have all been closed and operated for a short time in the early 1900s (PG&E, 2011). Today, air pollution control technologies used in the Bay Area for stationary sources are advanced and tightly regulated by the EPA and the California Air Resources Board (BAAQMD, 2011). Given the lack of coal

combustion or copper smelting facilities in the Bay Area, atmospheric deposition is not likely to be a significant contributor to arsenic concentrations in soil. However, current and former stack emissions cannot be entirely ignored as a possible contributor to the anthropogenic background level of arsenic in the Bay Area.

Disposal of arsenic-containing products, including CCA-treated wood and electronic-wastes (for arsenic-containing products such as semiconductors), can cause locally concentrated levels of arsenic in regulated landfills; or if improperly disposed of, in undocumented areas on private or public property. Numerous former military bases located around the margins of the San Francisco Bay have been closed and identified as hazardous waste or superfund sites (EPA, 2011). Since arsenic was used for munitions and other military applications (USGS, 2010), areas on these bases that formerly stored munitions may also have elevated arsenic concentrations. Numerous state and federal laws—such as the Resource Conservation and Recovery Act and Title 22, Division 4.5 of the California Code of Regulations—regulate the generation, treatment, and disposal of solid and potentially hazardous wastes such that most arsenic-containing products are likely to end up in a landfill. However, such regulations originated in the 1970s and thus improper disposal of arsenic-containing wastes could have occurred prior to that time, and may still occur as a result of negligent or unlawful activities. Generally, anthropogenic sources of arsenic such as these, which can be traced back to an identifiable source, can be considered "point" sources.

1.6 Arsenic Background Studies

Many environmental scholars, managers, and regulators have recognized the need to characterize the source and distribution of trace metals in the soil environment. Previous work has focused on a) the association between groups of trace metals and their potential to predict other geochemical properties, b) the effect of rock type and land use

on metal concentrations at the scale of cities, and c) the advantages and disadvantages of various methods for characterizing geochemical background environments (Facchinelli et al, 2001; Yesilonis et al., 2008; Zhang and Selenius, 1998; Li et al., in press). Traditionally, classical statistics and multivariate analysis have been used to characterize trace metal populations in soils; however, researchers have increasingly recognized the value of using Geographic Information Systems (GIS) and geostatistics to map the spatial pattern and variability of trace metals in soil and visualizing relations with geology and land use (Zhang and Selenius, 1998). While researchers often carry out their own sampling and laboratory analyses for local studies, regional studies have increasingly utilized publically available geochemical databases for the study of trace metals (Rawlins et al., 2003; Zhao et al., 2007; and Lado et al., 2008). Existing studies of background concentrations of arsenic that are relevant to the Bay Area are listed in Table 2 and described below.

Table 2 – Scope and findings for existing background studies of arsenic

Author(s)	Geographic Scope	Number of Samples / Depth	Average, Range (mg/kg)
Shacklette and Boerngen (1984)	National, along major roads, average of 1 sample / 6000 km^2	1,318 / 20 cm (7.9 inches)	7.2, <0.1 – 97
UCR (1996)	Statewide, agricultural soils, primarily Central Valley	50 / 50 cm (1.6 feet)	3.5, <0.2 -11
Lawrence Berkeley National Laboratory (2002)	Local, Berkeley Hills, large cleanup site	1,397 / up to 60 meters (197 feet)	5.5, <DL - 42
Scott (1991)	Local, northern Santa Clara Valley, urbanized light industrial and research land uses	108 / up to 10 meters (33 feet)	2.86, <DL – 20

On a national level, the most comprehensive study of naturally-occurring trace metals in the environment has been performed by Shacklette and Boerngen (1984). The study collected 1,318 soil samples from around the country at depths of 20 cm below the ground surface (bgs) from locations about 80 km apart that, insofar as possible, had surficial materials that were very little altered from their natural condition and that supported native plants. The mean concentration of arsenic for the western conterminous United States was 7.2 mg/kg, with a maximum concentration of 97 mg/km. Three Bay Area samples that were collected near Stanford University, in the City of San Francisco, and near Mill Valley were all within the upper 40% of the frequency distribution plot (Shacklette and Boerngen, 1984). Gustavvson et al., (2001) later re-interpolated the results and produced a colored surface map of arsenic distribution in the United States, which indicated broad regional variability in arsenic concentrations. For example, high arsenic concentrations in northern Idaho and the Appalachian Basin were at least in part coincident with base- and precious-metal mining, coal-bearing deposits and coal-fired power plants (Gustavvson et al., 2001). An area in north-central Nebraska with low concentrations of arsenic corresponds to the Nebraska Sand Hills, the largest dune field in the Western Hemisphere. The authors observe that many of the geochemical abundance patterns reflect regional geological characteristics. However, they acknowledge that the low spatial density of the dataset means that some of the observed patterns may be due to random chance rather than geologic source controls.

On the state level, an important source of information on background trace metals is from the Kearny Foundation Special Report on Background Concentrations of Trace and Major Elements in California Soils (UCR, 1996). The study selected 50 samples from 22 benchmark soils from a collection of soil profiles held at the University of California, Berkeley (the soil profiles were collected in 1967). The profiles were taken from sites distant from known point sources of contamination throughout the state at 50

cm bgs, primarily within agricultural fields. Arsenic concentrations across the 22 "benchmark" soils had an average of 3.5 mg/kg, a standard deviation of 2.5 mg/kg, and values ranging from 0.6-11 mg/kg. The report authors used the W test for normality, finding arsenic to be neither normally nor lognormally distributed.

In the Bay Area, private consulting firms, local governments, and academic researchers have used a variety of methods to characterize background concentration of trace metals. A study by researchers at the Lawrence Berkeley National Laboratory (LBNL) (2002) characterized the natural background metal concentrations on the LBNL property in the Berkeley Hills by compiling the results of previous environmental investigations, eliminating outliers, evaluating the probability distributions of metal samples, and deriving summary statistics. The LBNL (2002) study determined that the 1,257 soil samples at various depths less than 60 meters (179 feet) bgs had a mean arsenic concentration of 5.5 mg/kg and standard deviation of 5.4 mg/kg. The authors also observed that naturally occurring concentrations of arsenic in samples taken from the Great Valley Sequence were elevated relative to those within Tertiary-age sedimentary rocks. Similar to the Kearny Foundation Special Report, the authors found that arsenic concentrations did not appear to be either normally or lognormally distributed, even after separating the dataset by rock type. The LBNL study determined the upper limit of background concentrations for arsenic to be 42 mg/kg for the Great Valley Sequence, and 24 mg/kg for other geologic units.

Anderson's (1998) literature review of natural concentrations of selenium, nickel, and arsenic in soil and groundwater of the South Bay identified that that certain geologic environments are naturally enriched in nickel (from serpentinite) and selenium (from marine shales and sulfides), but found no evidence or areas with naturally enriched with arsenic. A master's thesis by Scott (1991) characterized background soil metals in an area

within a two mile (3.2 kilometer) radius in Mountain View and Sunnyvale in northern Santa Clara County. An analysis of 108 samples up to 10 meters (33 feet) bgs revealed mean arsenic concentration to be 2.86 mg/kg with a standard deviation of 2.61 mg/kg. Neither of the studies proposed upper limits for background concentrations of arsenic.

The existing studies of background arsenic vary greatly in scale, geographic scope and data source. While all the studies described above took measures to avoid obvious sources of anthropogenic arsenic contamination, the studies at the local and state scale (UCR, 1996; LBNL, 2002; Scott, 1991) were located in agricultural fields or heavily urbanized settings previously disturbed by humans, whereas the study by Shacklette and Boerngen (1984) targeted natural areas supporting native plants (although many were located close to roads, and not necessarily outside of urban areas). While all of the studies reported high variability and ranges, even in relatively localized study areas; interestingly, arsenic concentrations detected in the national study were generally higher than those reported in the local and state studies which have high degree of anthropogenic disturbance relative to the undisturbed areas sampled in the Shacklette and Boerngen study. Due to differences in study design, such as variability in number and depth of samples, land-use setting, and geographic scope, the available background studies report inconsistent arsenic concentrations and thus may provide misleading benchmarks of background arsenic for use by environmental managers and regulators in the Bay Area or any other specific location.

1.7 Problem Statement and Purpose

Arsenic found in soil—either naturally occurring or from anthropogenic releases—forms insoluble complexes with iron, aluminum, and magnesium oxides found in soil surfaces, and in this form, arsenic is relatively immobile. However, under certain reducing conditions, arsenic can be released from the solid phase, resulting in soluble

mobile forms of arsenic, which may potentially leach into groundwater or result in runoff of arsenic into surface waters (Alloway, 1990). Thus, in addition, to arsenic in soil representing a direct exposure hazard (i.e., via inhalation of dust during construction activities; children eating soil in open-space areas; or consumption of food crops grown on contaminated soils), elevated arsenic levels in soil could also lead to elevated levels of arsenic in surface and groundwater used as sources of drinking water—leading to the potential for more dispersed and widespread exposure to the public. It is in this context that regulators seek to control and minimize potentially hazardous levels of arsenic in soil.

To protect the human health and/or the environment, state environmental regulators have established environmental screening levels (ESLs) for arsenic, above which trace metal concentrations are considered potentially hazardous (San Francisco Bay RWQCB, 2008). Generally, locations with arsenic concentrations below ESLs are assumed to not pose a significant, long-term (chronic) threat to human health and the environment. Locations with arsenic concentrations above ESLs usually require some form of action which may range from additional sampling and analysis to contaminant removal. The ELSs used in the San Francisco Bay Region are risk based screening values, which are derived from equations combining exposure assumptions with toxicity data, and are not related to background levels of a substance in the environment. The risk-based screening level for arsenic in soil varies based on exposures assumptions. For example, the ESL for arsenic in shallow residential soil is 0.39 mg/kg (San Francisco Bay RWQCB, 2008). Due to regional background concentrations of arsenic, ESLs are nearly always exceeded, even in locations where no anthropogenic arsenic contamination has occurred (UCR, 1996; San Francisco Bay RWQCB, 2008). Therefore, as a practical matter, regulators have generally accepted the background levels of arsenic found in the environment as an appropriate screening criteria, because property owners are not

considered liable for arsenic concentrations that are representative of background (ITRC, 2005).

When environmental contamination is reported or suspected on a site, or in the course of non-residential real estate transactions, environmental site assessments (ESAs) are typically performed to identify potential sources of contamination and guide further cleanup efforts. When laboratory analyses of soil are performed as part of an ESA, detections of arsenic above ESLs may require no further action (with respect to arsenic) if there is a reasonable basis to conclude that arsenic concentrations are representative of background (San Francisco Bay RWQCB, 2008). In the absence of site-specific background control samples, it is my experience that ESAs in the Bay Area frequently use data from Shacklette and Boerngen (1984), LBNL (2002) or other studies of uncertain applicability to conclude trace metal concentrations found on a property are non-anthropogenic in origin. Most Bay Area properties that require ESAs are located on the urbanized bay plain whereas the LBNL site is located in the east bay hills where the rock type, geomorphology and soil forming processes differ. As such, use of LBNL background concentrations, or nationwide estimates, may not be appropriate given that geology may be a significant control on background arsenic concentrations.

Despite the abundance of soil analytical data publically available through environmental agencies, in particular the State Water Resources Control Board (SWRCB), there has been little attempt to discern whether there are geochemical patterns of arsenic that correlate with soil types or source rocks. Sites undergoing environmental investigations and cleanups often submit soils for laboratory analysis of a standard suite of trace metals (referred to as CAM 17 metals) that are incidental to the primary contaminants of concern on the site, such as motor fuels or organic solvents. As such, the data represents a potentially valuable source of background information that has thus far

been underutilized. By incorporating regional information on soil type to these analytical results, this thesis will assess whether there are statistically significant differences in arsenic concentrations across the different soil environments in the Bay Area.

The purpose of this thesis is to provide regulators and environmental investigators with a locally relevant study of background arsenic in the Bay Area. The findings herein can be used as a tool to make informed decisions about whether arsenic detections on a property are indicative of background in cases where site-specific background reference samples are infeasible or cost-prohibitive. Rather than the current reliance on background arsenic data of low-resolution and questionable applicability, this thesis provides a regional and geologic context to the question of "what is background arsenic in soil?"

2.0 STUDY AREA

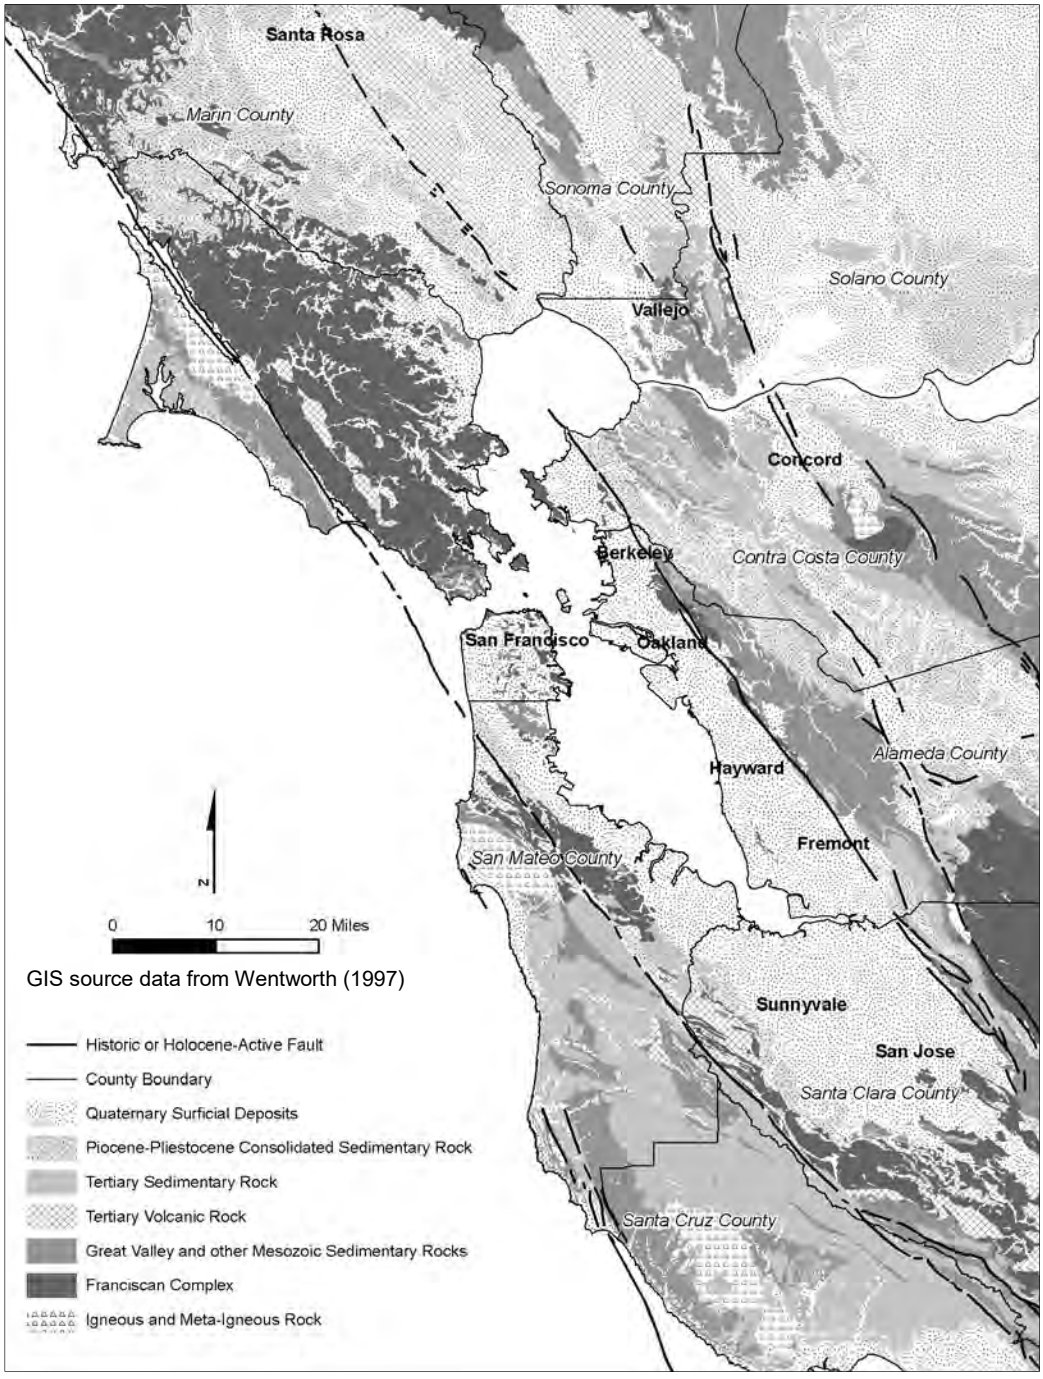
2.1 Study Area

The geographic scope of this study encompasses the nine-county Bay Area (Figure 2), including Alameda, Contra Costa, Marin, Napa, San Mateo, San Francisco, Santa Clara, Solano, and Sonoma Counties. Because environmental investigations are most often done in urban land use settings where the potential for contamination is greatest, the study area is restricted to the urbanized flatlands of the bay region underlain by Quaternary-age geologic units. By restricting the geographic scope of analysis in this way, the resulting background estimates are more likely to be directly applicable to future ESAs.

2.2 Regional Geologic Setting

The Bay Area is part of the Coast Range geomorphic province characterized by northwest-trending mountain ranges and valleys that are subparallel to the general structural trend of the San Andreas Fault System (CGS, 2008). The Coast Range is predominantly composed of thick Mesozoic and Cenozoic sedimentary strata. In the northern Bay Area, the Coast Ranges are dominated by the irregular, knobby, landslide topography of the Franciscan Complex, which is overlain in several regions by volcanic cones and flows of the Quien Sabe, Sonoma and Clear Lake volcanic fields. In the eastern Bay Area, the Coast Ranges are characterized by strike-ridges and valleys in Tertiary and Upper Mesozoic sedimentary strata. The southern Bay Area is characterized by a mix of Franciscan Complex rocks on the east side of the Santa Clara Valley, and both Tertiary sedimentary rocks as well as granitic rocks of the Salinian Block west of the valley in the Santa Cruz Mountains.

Figure 2 – Geologic map of the San Francisco Bay Area

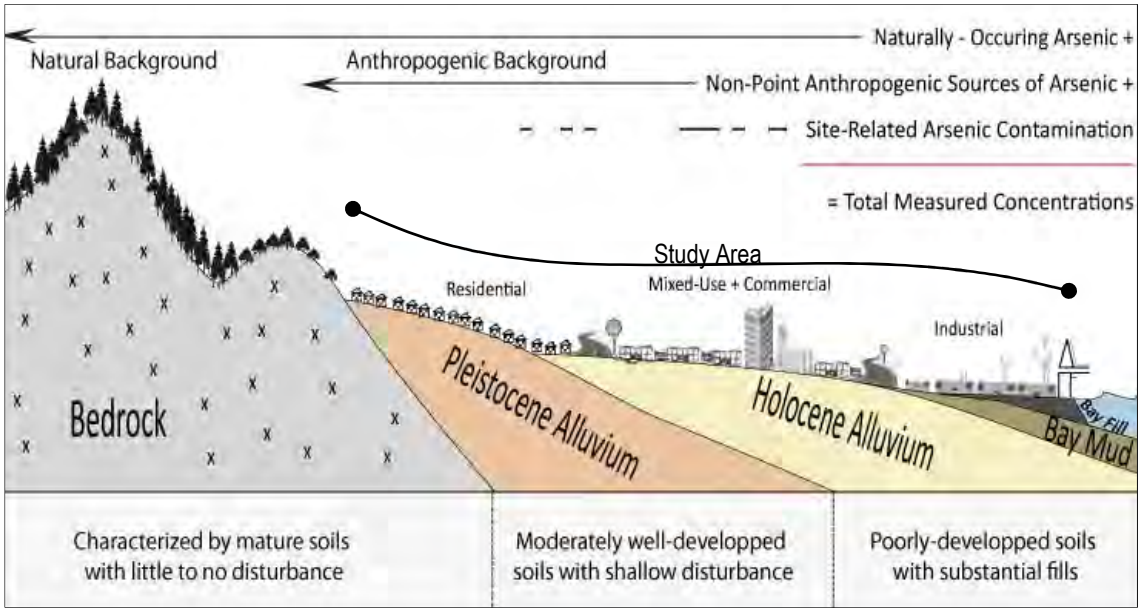


The core of the urbanized Bay Area is located on Quaternary-age surficial deposits that have formed the flatlands around the margins of the bay. These flatland deposits include Pleistocene and Holocene alluvial fans emanating out from the hills and mountains, as well as floodplain, basin and bay mud deposits located closer to the bay margins (Helley et al., 1979).

2.3 Land Use Setting

With 7.1 million residents, the Bay Area is the fifth most populous metropolitan area in the United States (ABAG and MTC, 2011). In 2000, approximately 16 percent (or about 700,000 acres) of the region's total acreage was developed for urban use (ABAG and MTC, 2011). The majority of the land areas developed for urban use consists of flatlands that surround the San Francisco Bay and which create several large inland valleys in the east bay. Generally the most intensely developed areas, including ports, airports, former military bases, and major industrial areas, are located close to the bay margins, whereas the urban fringes and foothills of major mountain ranges generally support low-density residential development. Mixed use, high-density residential areas, and commercial districts are concentrated in urban centers and along major highway corridors. Figure 3 presents a conceptual cross section of the east bay, showing the general relationship between geology, land use, and the components of total measured arsenic concentrations. Because this study is regional in scope, a rough understanding of the interplay between geology, land use and their possible effects on measured arsenic concentrations can help frame the discussion of results.

Figure 3 – Representative cross section of land use and geology and the relation to total measured arsenic concentrations



Geologic cross section based on Helley et al., 1979, not to scale.

3.0 METHODS

Results of soil chemical analyses from previous environmental investigations in the Bay Area were used to derive summary statistics and investigate the variability of arsenic concentrations across different Quaternary soil types. The source data, site selection criteria, database compilation, analysis and treatment of data, and statistical tests are described below.

3.1 Source Data

The data used in this study was retrieved from the State Water Resources Control Board (SWRCB) "Geotracker" database. Geotracker is a data system for managing sites that impact groundwater, especially those that require groundwater cleanup. In September 2004, the SWRCB formally adopted regulations that require Electronic Submittal of Information (ESI) for all groundwater cleanup programs, although parties responsible for cleanup of underground storage tanks had already been required to submit groundwater analytical data, surveyed locations of monitor wells, and other data to the Geotracker database for several years (since about 2001). As of January 1, 2005, ESI has been required by all groundwater cleanup programs including underground storage tanks, non-tank site cleanups, military sites, and land disposal sites. ESIs include site location information, soil and groundwater analytical data, monitoring well and boring log information, and electronic (pdf) copies of site investigation reports prepared by responsible parties and/or their consultants. GeoTracker's ESI module is the largest receiving system nationally for analytical and field data for cleanup sites (SWRCB, 2010). Geotracker has about 4,500 sites from the Bay Area.

Other sources of publically accessible soil analytical data exist—namely from the Department of Toxics Substances Control (DTSC), which regulates sites that handle,

treat, store, or dispose of hazardous wastes, and some limited data from the U.S. Geological Survey (USGS) geochemical database. Geotracker has advantages over other data sources because of the large volume of data and the common reporting protocol required for Geotracker, which includes specific guidelines for preparing datasets and a defined set of valid values for each database field. This protocol helps ensure that the various laboratories that analyze soil samples report data in a consistent manner. Direct electronic reporting also avoids the need for manual re-entry of hard-copy laboratory data, minimizing data entry errors and inconsistencies. Data in Geotracker is generally less than five years old, which means that the laboratory methods used are consistent and reflect the current industry standard. This is important because analysis procedures and method detection limits have frequently changed over the past decades, which can present problems in obtaining reliable or comparable statistics.

Finally, the majority of the sites regulated by the SWRCB are those that have underground storage tanks that have leaked or are potentially leaking their contents, or that for other reasons have groundwater contaminated with motor fuels or organic solvents. For most sites, there will be little or no correlation between the metal and organic compound distributions (NAVFAC, 2010). Chemical releases that contain both types of contaminants are relatively uncommon and, more importantly, organic compounds and metals have very different fate and transport properties. It also is important to note that the presence of organic co-contaminants has no effect on metal concentration background ranges (NAVFAC, 2002). In most cases, the soils analyzed for arsenic are done so as a precautionary measure to demonstrate the absence of arsenic contamination, and are generally incidental to the primary contaminants of concern. In this context, such analyses have value as a potential source of background data.

3.2 Site Selection Criteria and Database Compilation

The user interface on the Geotracker website allows for site or location queries, allowing users to search by address, site name, or other identifying information. In order to perform a custom query of the database, raw ESI data was downloaded as a tab-delimited file for each of the nine counties in the Bay Area (called an electronic data file, or EDF). Geotracker is always being updated as additional sampling and analytical data is generated at regulated sites. As such, the arsenic-related data presented in this thesis should be considered as representative of the database as of March 2010, which is the date the EDFs were downloaded. The EDF contains raw laboratory analytical data for the numerous cleanup sites in the Bay Area that are associated with the specific locations using a Global ID field. Concurrently with the download of ESI data, an excel file of regulated site information was downloaded, which contains site names, addresses, coordinates, cleanup/regulatory status, potential contaminants of concern, and other site information fields that are also associated to a Global ID field. Additional information on the database structure is available on the Geotracker website (geotracker.waterboards.ca.gov).

Using JMP 7.0, a statistical software package, the ESI data and regulated site information were linked by Global ID and queried to return all sites that have analytical data for arsenic from soil samples. The criteria for including sites in the database were as follows:

- Arsenic is not identified as a contaminant of potential concern
- ESI data includes arsenic analyses on soil samples (analyte=AS and Matrix=Soil).
- At least 5 samples per site (N>=5)
- At least 25% of the data is above the reporting limit.
