EXHIBIT B

STATISTICAL CALCULATION SHEETS

STATISTICAL ANALYSIS OF TPH-d IN SOIL

Hanson Aggregate Site

3000 Busch Road
Pleasanton, California

STATISTICAL RESULTS	
Mean	23.1275
Standard Error	7.955982658
Median	1.1
Mode	0.5
Standard Deviation	71.1604722
Sample Variance	5063.812804
Kurtosis	19.85326583
Skewness	4.301646587
Range	449.52
Minimum	0.48
Maximum	450
Sum	1850.2
Count	80
Confidence Level(95.0%)	15.83598708

CONCLUSION

With a 95% confidence level the mean TPH-d concentration at the Site is between 7.0 mg/kg and 39 mg/kg. The 95% UCI (39 mg/kg) was used for comparison to the ESL.

STATISTICAL ANALYSIS OF TPH-mo IN SHALLOW SOILS

Hanson Aggregate Site

3000 Busch Road
Pleasanton, California

STATISTICAL RESULTS	
Mean	117.96875
Standard Error	48.20385212
Median	25
Mode	25
Standard Deviation	272.6821657
Sample Variance	74355.56351
Kurtosis	22.6209686
Skewness	4.523690871
Range	1476
Minimum	24
Maximum	1500
Sum	3775
Count	32
Confidence Level(95.0%)	98.31240419

CONCLUSION

With a 95% confidence level the mean TPH-mo concentration shallow soils (< or = 10-feet below ground surface) at the Site is between 19.65 mg/kg and 216 mg/kg. The 95% UCI (216 mg/kg) was used for comparison to the ESL.

STATISTICAL ANALYSIS OF TPH-mo IN DEEP SOILS

Hanson Aggregate Site

3000 Busch Road
Pleasanton, California

STATISTICAL RESULTS	
Mean	181.5729167
Standard Error	68.28825596
Median	25
Mode	25
Standard Deviation	473.1149155
Sample Variance	223837.7233
Kurtosis	10.69409486
Skewness	3.33445334
Range	2276.5
Minimum	23.5
Maximum	2300
Sum	8715.5
Count	48
Confidence Level(95.0%)	137.3782488

CONCLUSION

With a 95% confidence level the mean TPH-mo concentration deep soils (>10-feet below ground surface) at the Site is between 44.2 mg/kg and 319 mg/kg. The 95% UCI (319 mg/kg) was used for comparison to the ESL.

STATISTICAL ANALYSIS OF CHROMIUM IN SOIL

Hanson Aggregate Site

3000 Busch Road
Pleasanton, California

STATISTICAL ANALYSIS OF CHROMIUM IN SOIL	
Mean	47.83333333
Standard Error	2.464965241
Median	51
Mode	54
Standard Deviation	13.50117066
Sample Variance	182.2816092
Kurtosis	-0.909096334
Skewness	-0.162701361
Range	47
Minimum	25
Maximum	72
Sum	1435
Count	30
Confidence Level(95.0%)	5.041419901

CONCLUSION

With a 95% confidence level the mean chromium concentration in soil at the Site is between 42.8 mg/kg and 53 mg/kg. The 95% UCI (53 mg/kg) was used for comparison to the ESL.

LOGIN SAMPLE RECEIPT CHECK LIST

Client: ENV America, Incorporated Job Number: 720-7234-1

Login Number: 7234

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Client: ENV America, Incorporated Job Number: 720-7261-1

Login Number: 7261

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	False	NO ICE
Cooler Temperature is acceptable.	False	SOILS RECEIVED OUT OF TEMP-TOLD CLIENT AT TIME OF RECEIPT
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Semi Volatiles GC Analysis

Surrogate - Diluted out

Due to the level of dilution required for sample 720-7263-1, surrogate recoveries are not reported.

Affected Items

720-7263-A-1-A +A

Batch: 720-17727
Method: 720-8015B_DRO

Volatiles MS

ISTD - Matrix

Internal standard responses for sample 720-7263-1 were outside of acceptance limits. The sample shows evidence of matrix interference.

Affected Items

720-7263-A-1

Batch: 720-17533
Method: 720-8260B

METHOD SUMMARY

Client: ENV America, Incorporated Job Number: 720-7263-1

Description	Lab Location	Method	Preparation Method
Matrix: Solid			
Volatile Organic Compounds by GC/MS	STL SF	SW846 8260B	
Purge and Trap for Solids	STL SF		SW846 5030B
Nonhalogenated Organics using GC/FID -Modified (Diesel Range Organics)	STL SF	SW846 8015B	
Microscale Solvent Extraction (MSE)	STL SF		SW846 3570
Matrix: Water			
Volatile Organic Compounds by GC/MS	STL SF	SW846 8260B	
Purge-and-Trap	STL SF		SW846 5030B
Nonhalogenated Organics using GC/FID -Modified (Diesel Range Organics)	STL SF	SW846 8015B	
Separatory Funnel Liquid-Liquid Extraction	STL SF		SW846 3510C SGC

Client: ENV America, Incorporated Job Number: 720-7263-1

Login Number: 7263

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

METHOD SUMMARY

Client: ENV America, Incorporated Job Number: 720-7500-1

Description	Lab Location	Method	Preparation Method
Matrix: Solid			
Volatile Organic Compounds by GC/MS	STL SF	SW846 8260B	
Purge and Trap for Solids	STL SF		SW846 5030B
Nonhalogenated Organics using GC/FID -Modified (Diesel Range Organics)	STL SF	SW846 8015B	
Ultrasonic Extraction	STL SF		SW846 3550B
Silica Gel Cleanup	STL SF		SW846 3630C
Inductively Coupled Plasma - Atomic Emission Spectrometry	STL SF	SW846 6010B	
Acid Digestion of Sediments, Sludges, and Soils	STL SF		SW846 3050B
Mercury in Solid or Semisolid Waste (Manual Cold Vapor Technique)	STL SF	SW846 7471A	
Mercury in Solid or Semi-Solid Waste (Manual	STL SF		SW846 7471A
Matrix: Water			
Volatile Organic Compounds by GC/MS	STL SF	SW846 8260B	
Purge-and-Trap	STL SF		SW846 5030B
Nonhalogenated Organics using GC/FID -Modified (Diesel Range Organics)	STL SF	SW846 8015B	
Separatory Funnel Liquid-Liquid Extraction	STL SF		SW846 3510C SGC
Inductively Coupled Plasma - Atomic Emission Spectrometry	STL SF	SW846 6010B	
Sample Filtration	STL SF		FILTRATION
Acid Digestion of Waters for Total Recoverable or	STL SF		SW846 3005A
Mercury in Liquid Waste (Manual Cold Vapor Technique)	STL SF	SW846 7470A	
Mercury in Liquid Waste (Manual Cold Vapor	STL SF		SW846 7470A
Sample Filtration	STL SF		FILTRATION

DATA REPORTING QUALIFIERS

Client: ENV America, Incorporated Job Number: 720-7500-1

Lab Section	Qualifier	Description
GC/MS VOA		
	F	RPD of the MS and MSD exceeds the control limits
GC Semi VOA		
	D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.

Client: ENV America, Incorporated Job Number: 720-7500-1

LOGIN SAMPLE RECEIPT CHECK LIST

Client: ENV America, Incorporated Job Number: 720-7500-1

Login Number: 7500

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

Job Number: 720-7522-1

Job Description: Legacy Hansen

For:
ENV America, Incorporated
244 California St., Ste 500
San Francisco, CA 94111

Attention: Mr. David O Connor

LOGIN SAMPLE RECEIPT CHECK LIST

Client: ENV America, Incorporated Job Number: 720-7522-1

Login Number: 7522

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

Job Number: 720-7541-1

Job Description: Legacy Hansen

For:
ENV America, Incorporated
244 California St., Ste 500
San Francisco, CA 94111

Attention: Mr. David O Connor

Dimple Sharma
Project Manager I

Semi Volatiles GC Analysis

Surrogate - Matrix

Surrogate recovery for sample 720-7541-14 was outside control limits. This sample shows evidence of matrix interference confirmed by re-extraction.

Affected Items

720-7541-A-14-E

Batch: 720-18119
Method: 720-8015B_DRO

LOGIN SAMPLE RECEIPT CHECK LIST

Client: ENV America, Incorporated Job Number: 720-7541-1

Login Number: 7541

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	False	1of3 vials SS(78)-W
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Client: ENV America, Incorporated

Job Number: 720-7542-1

Login Number: 7542

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

EXECUTIVE SUMMARY

This Phase I Environmental Site Assessment (Phase I ESA) of the property located at 3000 Busch Road, Pleasanton, California (Site) (Figure 1) was performed based on a verbal request and authorization from Legacy Partners Commercial, L.L.C. (Legacy). The purpose of this Phase I ESA is to identify, to the extent feasible, *recognized environmental conditions* and *historic environmental conditions* in connection with the Site, pursuant to the processes prescribed in the American Society for Testing and Materials (ASTM) designation E 1527-05.

The Site is located at 3000 Busch Road, Pleasanton, California and consists of a total of approximately 1,000 acres, of which approximately 300 acres are developable land and the remainder consists of ponds. Figures 1, 2, and 3 depict the general and immediate vicinity surrounding the Site. The Site is currently developed with seven structures: a 12,000 sq. ft. single story office building where Hanson maintains offices, a 12,150 sq. ft. heavy maintenance shop, two open warehouse structures totaling approximately 10,400 sq. ft., a 900 sq. ft. lubricant storage shed, and two temporary office trailer buildings. The Site is currently zoned as "General and Limited Industrial".

One *recognized environmental condition,* and no *historical recognized environmental conditions* were identified in connection with the subject Site. See Section 7.0 for a summary list of historic, current, and potential environmental conditions. Soil, and groundwater, at the Site have been affected.

All off-site properties listed in the Geotracker and/or EDR searched databases that are close enough to affect the Site are listed as "closed". Therefore, it is unlikely that any of these properties have had or will have any effect on environmental conditions at the Site. There are three properties adjacent to the Site that may have potential to affect the Site. They include a horse ranch immediately north of the Site where an environmental investigation is currently underway, potential contaminated runoff from the Vulcan Materials Company property southeast of the site. Also included, as reported in the ENV America Draft Phase II ESA report dated November 2006, is an area of contamination that was found in soil and groundwater adjacent to the southwester corner of the Site. This area is part of the Hanson Aggregates property, however this portion of the property where contamination was reported is not included as part of the Site currently being considered for purchase, but has the potential to cause an environmental condition at the Site.

The scope of work conducted as part of this Phase I ESA included site reconnaissance to assess the potential for onsite releases of hazardous material and petroleum products, records review, interviews, and preparation of this report presenting findings and conclusions.

1.0 INTRODUCTION

1.1 Authorization

This Phase I ESA of the Site (Figure 1) was performed under a verbal authorization from Legacy.

1.2 Purpose

The purpose of this Phase I ESA is to identify, to the extent feasible, *recognized environmental conditions* and *historical recognized environmental conditions* in connection with the subject Site, pursuant to the processes prescribed in ASTM designation E 1527-05.

1.3 Scope of Work

The scope of work included the following tasks:

- A reconnaissance-level visit to the Site for potential evidence of the release(s) of hazardous material or petroleum products, and to assess the potential for onsite releases of hazardous material or petroleum products;
- Records review; and,
- Preparation of a report presenting findings and conclusions.

1.4 Assumptions

For the purpose of this Phase I ESA, it is assumed that the information provided by the property owner, regulatory database provider, and regulatory agencies is true and reliable.

1.5 Limitations and Exceptions

Site-specific activities performed and information collected regarding these activities are summarized in the following sections. The findings of this Phase I ESA are summarized in Section 7.0. Conclusions drawn based on the information collected as part of this Phase I ESA are presented in Section 8.0.

This Phase I ESA was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions.

The observations and conclusions presented in this report are professional opinions based on the scope of activities, work schedule, and information obtained through the Phase I ESA described herein. Opinions presented herein apply to Site conditions existing at the time of study and cannot necessarily be taken to apply to Site conditions or changes that ENV America is not aware of or has not had the opportunity to evaluate. The conclusions drawn from these data are limited to the amount, type, distribution, and integrity of the information collected at the time of the investigation, and the methods used to collect and evaluate the data. Therefore, a full and complete determination of environmental risks cannot be made. Although steps were taken to obtain true copies of available information, no representation or warranty can be made with respect to the accuracy or completeness of the information.

1.6 Special Terms and Conditions

The scope of work for this Phase I ESA did not include inspection of electrical equipment for the presence of polychlorinated biphenyls (PCBs) or collection of other environmental samples such as building materials or paint; assessment of natural hazards such as naturally occurring asbestos, radon gas or methane gas; assessment of the potential presence of radionuclides; or assessment of nonchemical hazards such as the potential for damage from earthquakes or floods; or the presence of endangered species or wildlife habitats. Also, this Phase I ESA did not include an assessment of the environmental compliance status of the Site or of the businesses adjacent to the Site. An asbestos survey was not conducted as part of this investigation.

1.7 User Reliance

This Report was prepared by ENV America on behalf of and for use by Legacy. Other parties or persons shall not rely on this Report without prior written agreement from ENV America and Legacy.

2.0 SITE DESCRIPTION

2.1 Site Locations and Legal Description

The Site is located at 3000 Busch Road, Pleasanton, California and consists of a total of approximately 1,000 acres, of which approximately 300 acres are developable land. Figures 1, 2, and 3 depict the general and immediate vicinity surrounding the Site. The Site is currently developed with seven structures: a 12,000 sq. ft. single story office building where Hanson maintains offices, a 12,150 sq. ft. heavy maintenance shop, two open warehouse structures totaling approximately 10,400 sq. ft., a 900 sq. ft. lubricant storage shed, and two temporary office trailer buildings. The Site is currently zoned as "General and Limited Industrial" and includes all or portions of Alameda County Assessor's Parcels 946-1128-004-04, 946-1250-019-01, 946-1250-006-02, 946-1250-007-06, 946-1251-007-02, 946-1251-007-04, 946-1350-003-04, 946-1350-003-06, and 946-1350-003-07.

2.2 Site and Vicinity General Characteristics

Prior to 1938, portions of the Site were used for agriculture and portions were undeveloped. Beginning in 1938 the Site was mined for its aggregate resources by Kaiser Sand and Gravel. Initially mining operations were carried out in the southwestern portion of the site and later expanded to the east, northeast, and northwestern portions of the Site. As mining progressed from one area to the next, mined out areas were either backfilled with rubble, debris, and mine waste, or used as disposal ponds for water, silt, and sand from aggregate washing operations and new pit dewatering. In 1991 the mining operation was purchased by Hanson Aggregates and operated until 2001 at which time the aggregate resource was considered mined out. During various periods of operation of the facility a concrete batch plant and an asphalt plant were operated on portions of the Site. Hanson currently maintains a single story office building, a heavy equipment maintenance shop, a lube shed and several storage buildings on the Site.

Currently there are three large ponds, Lake I, Lake H, and Cope Pond, and one small storm water retention pond on the Site. The total area of the ponds is approximately 700 acres. The dry land portions of the Site consist primarily of areas that have been mined for aggregate and backfilled with spoil from mining in the current pond areas and material from unknown outside sources. The remains of mining building foundations and concrete slabs are common in the southwestern areas of the site. Piles of broken concrete from building demolition also occupy the southern portions of the Site. Large piles of unused aggregate also occupy southern portions of Site. The

current operation areas of the Site (Hanson's office, heavy equipment maintenance shop, and warehouse) are all located in the southwestern portion of the Site.

The Site is generally flat except where mining operations have created large depressions that are currently occupied by ponds, areas where large piles of aggregate have been left in place, and areas where foundations have been removed and large piles of concrete have been stored. The general surface elevation, except in the pond areas, varies from approximately 360 to 375 feet above mean sea level.

2.3 Descriptions of Structures, Roads, and Other Improvements on the Site

The Site is bordered on the south by the Union Pacific Railroad and Stanley Boulevard, on the west by industrial and residential properties, on the north by residential properties and El Charro Road, and on the east by El Charro Road and the Vulcan Materials Company's Pleasanton aggregate mining facilities. US Highway 580 is about a mile north of the site. The Las Positas Golf Course and the Livermore Municipal Airport both lie northeast of the Site. The entire northeastern half or the site falls within the Livermore Municipal Airport-Airport Protection Area. The City of Pleasanton Urban Growth Boundary transects the Site in a north-south direction along the alignment of the north-south section of Busch Road. Busch Road is the only paved road that traverses the Site.

The actively used structures on the Site include:

- A 12,000 sq. ft. single story office building where Hanson maintains offices.
- A 12,150 sq. ft. heavy equipment maintenance shop where Hanson mechanics maintain heavy equipment.
- Two open warehouse structures totaling approximately 10,400 sq. ft. where Hanson stores old electric motors, diesel engines, and a variety of other material and equipment.
- A 900 sq. ft. lubricant storage shed where Hanson stores various lubricants for use in the heavy maintenance shop.
- Two temporary office trailers.

Facilities previously located on the Site include large scale mining facilities and a concrete batch plant.

There is one active pad mounted transformer on the Site adjacent to the front of the heavy equipment maintenance shop and one pole mounted transformer was observed west of the

Hanson office building. Three other pad mounted transformers and five portable transformers were removed from the Site. One active septic system is on the Site.

2.4 Current Uses of Adjoining Properties

Because of the large size of the Site there are numerous adjoining properties. In general, the Site is bordered on the south by the Union Pacific Railroad and Stanley Boulevard, on the west by industrial and residential properties, on the north by residential properties and El Charro Road, and on the east by El Charro Road and the Vulcan Materials Company's Pleasanton aggregate mining facilities. US Highway 580 is about a mile north of the site. The Las Positas Golf Course and the Livermore Municipal Airport both lie northeast of the Site. The entire northeastern half of the site falls within the Livermore Municipal Airport-Airport Protection Area. The sections below summarize the significant properties adjacent to the Site based on location.

South

The Union Pacific Railroad and Stanley Boulevard form the border of the Site to the south. Properties to the south of Stanley Boulevard include, from west to east, a Pacific Gas and Electric Company electrical substation, an East Bay Regional Park District property and Shadow Cliffs Regional Park, and an aggregate mining operation owned by RMC Pacific Materials, Inc.

West

From north to south, the properties along the west side of the Site include residential properties, the Busch property, the City of Pleasanton Operations Service Center, the Pleasanton Garbage Company offices and recycling facility, the Kewit Concrete Products Company property, and an excluded portion of the Hanson property that now forms the southwest border of the Site.

North

From west to east, the properties along the north side of the Site include residential properties, Staples Ranch, and a horse ranch.

East

From north to south, the properties along the east side of the Site include the aggregate mining facilities of the Pleasanton Gravel Company and Vulcan Materials Company.

3.0 USER PROVIDED INFORMATION

Legacy, the users of this Phase I ESA, provided numerous documents for ENV America's use in compiling this assessment, including deeds, titles, lease licenses, use permits, claims releases and legal documents, title reports, easements and agreements, geotechnical and archeological reports, reclamation plans, and environmental reports. Those user provided documents that provided the most valuable information in compiling this ESA included:

- Heck, J.J., 1956, Henry J. Kaiser Co., Sand and Gravel Properties, Plot Plan, Aug 25, 1956.
- EMCON Associates, 1971, Progress Report, Preliminary Feasibility Study, Proposed Waste Disposal Site, Radum Pits, Pleasanton California, for Kaiser Sand and Gravel; May 18, 1971.
- State Water Resources Control Board, 1973, State Water Resources Control Board Order No. WQ 73-23; Oct 4, 1973.
- Appleton, L.W., 2001, Letter to Mr. Eric Lauritzen, Pleasanton Garbage re: Improper Discharge to Hanson Property; May 1, 2001.
- Baseline Environmental Consulting, 2005, Closure Plan Report, Radum Plant, for Hanson Aggregates Mid Pacific, Inc.; Jan. 2005.
- Brown and Caldwell, 2006, Final Phase I Environmental Site Assessment, Hanson Aggregates West/Radum Plant, 3000 Busch Road, Pleasanton California; June 2006.
- Brown and Caldwell, 2006, Summary of the Limited Subsurface Investigation Activities at the Hanson Aggregates West Radum Facility in Pleasanton, California; Aug. 2, 2006.
- ENV America Incorporated, 2006, Draft Phase I Environmental Site Assessment (Draft Phase I ESA), 3000 Busch Road, Pleasanton, California; November 2006.
- ENV America Incorporated, 2006, Draft Phase II Environmental Site Assessment (Phase II ESA), 3000 Busch Road, Pleasanton, California; November 2006.
- ENV America Incorporated, 2007, Additional Soil and Groundwater Investigation, 3000 Busch Road, Pleasanton, California; February 2007.
- ENV America Incorporated, 2007, Second Additional Soil and Groundwater Investigation, 3000 Busch Road, Pleasanton, California; April 2007.

4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources

Environmental Data Resources, Inc. (EDR) [EDR, 2007], of Milford, Connecticut conducted a search of various government databases. The databases search was conducted on May 7, 2007. The details and results of each database search are provided in the attached EDR report found in Exhibit A.

The Geotracker database was also reviewed for Leaking Underground Fuel Tank (LUFT) sites, Spills, Leaks, Investigations, and Cleanups (SLIC) sites, and Underground Storage Tank (UST) sites.

4.1.1 *Site*

The EDR database search indicates that the Site is listed on the LUST, and UST databases. The LUST database listing shows a "case closed" for one diesel tank, but also listed the Site as "leak being confirmed". According to the 2005 Baseline *Closure Plan Report* there were a total of three USTs removed from the Site. One tank was removed in 1995 from near the former concrete batch plant. Two USTs were removed in 2003 from the area north of the idle truck maintenance shop. Baseline recommended no additional investigation or remediation for the tanks removed in 2003. According to Mr. Lee Cover (Environmental Manager for Hanson Aggregates), Hanson Aggregates received a verbal closure for the two tanks removed from north of the idle truck maintenance shop in 2003, although they are still waiting for the closure letter to be processed. Additional tanks existed in the areas of the Hanson Property that have now been excluded from the current purchase area. The histories of those tanks are described in the ENV America Draft Phase I ESA dated October 2006. The Baseline report and the Brown and Caldwell Phase I ESA report both indicate that the three tanks removed from the east side of the idle truck maintenance shop received a closure letter from the Alameda County Health Services (Exhibit G) in 1998. The three tanks removed from the east side of the idle truck maintenance shop were removed from an area that is not within the current property being evaluated in this ESA.

The EDR database search also indicates the Site is listed on the CORTESE, SWEEPS, CS, and HAZNET databases. The CORTESE database also lists the case as "closed", but has no specific information as to which tank(s) is being referred to. The SWEEPS database lists one 12,000 gallon diesel tank and one 10,000 gallon unleaded gasoline tank under an "A" status, and one 10,000 gallon unleaded gasoline tank and two 12,000 gallon diesel tanks under a status of "not reported". Again, it

is not possible to assess which tanks are being referred to. The Baseline report and the Brown and Caldwell Phase I ESA report both indicate that the three tanks removed from the east side of the idle truck maintenance shop received closure from the Regional Water Quality Control Board in 1998 and the two tanks removed from north of the idle truck maintenance shop in 2003 are pending agency action. The CS database listing reported by EDR shows "case closed" and "leak being confirmed". The HAZNET database listing reported by EDR shows 3.7 tons of unspecified oil containing waste, 0.35 tons of waste oil and mixed oil, and 0.76 tons of surplus unspecified inorganics as being transported from the Site under manifest for "disposal", "recycling" "land-fill" or "transfer station". The HAZNET database also shows 11.84 tons of polychlorinated biphenyls (PCBs) as being transported from the Site under manifest to a "treatment or incineration" facility.

The EDR database search listed the Site as Granite Construction on the EMI database and as Beazer West Inc. on the FINDS database. There is no history of Granite Construction's or Beazer West's Inc. association with the Site address, and, therefore, these listings appear to be erroneous.

4.1.2 *Offsite*

The EDR database search reveals that properties within a two mile radius of the center of the Site are listed in the databases searched a total of 742 times. Many of these are multiple listings for the same property. Plus, there are 80 "orphan sites" listed for which there is insufficient information available to locate the properties. After evaluation of the available information, including cross checking with the Geotracker LUST, SLIC, and UST databases, ENV America has compiled a list of eleven properties from the database search that had reported tank leaks and are close enough to the Site perimeter to potentially affect environmental conditions on the Site. These properties are:

- Pleasanton Ready Mix Concrete at 3400 Boulder Ct.
- B&J Trucking at 3742 Valley Avenue
- Utility Vault Company at 3786 Valley Avenue
- Jamieson Company at 501 El Charro Road
- Industrial Asphalt at 52 El Charro Road
- The Pleasanton Truck and Equipment Company at 3110 Busch Road
- Airdance Farm LLC at 770 El Charro Road
- RMC Lonestar at 1544 Stanley Blvd.
- Reliable Trucking Inc. at 51 El Charro Road
- California Rock Plant at 501 El Charro Road
- The Combs Property at 1808 Courtney Avenue

All of these properties are listed as "closed" in the Geotracker and/or EDR searched databases. Therefore, it is unlikely that any of these properties have had or will have any affect on environmental conditions at the Site.

A Phase I Environmental Site Assessment on the adjacent VMC property southeast of the Site indicates the presence of known environmental conditions at that site based the presence of petroleum hydrocarbon staining, a faulty oil water separator, and the use of acidic chemicals to wash down trucks. If runoff from the VMC site enters the Hanson Site it could potentially cause an environmental condition to exist in that area.

4.2 Physical Setting Sources

ENV America reviewed pertinent maps and readily available literature for information on the physical geography, geology, and hydrogeology of the Site. A summary of this information is presented in the following subsections.

4.2.1 *Topography*

Topographic map coverage of the Site vicinity is provided by the United States Geological Survey (USGS) "Livermore" 7.5-minute, 1:24,000 scale quadrangle dated 1980. The Site is generally flat except where mining operations have created large depressions that are currently occupied by ponds, areas where large piles of aggregate have been left in place, and areas where foundations have been removed and large piles of concrete have been stored. The topography slopes gently in a generally westerly direction with an elevation between approximately 360 and 375 feet above mean sea level (MSL) except in the pond areas where the water surface is around an elevation of 320 feet above MSL, but varies seasonally.

4.2.2 *Surface Water*

There are currently three large ponds and one small pond on the Site. The large ponds, Lake I (approximately 340 acres), Lake H (approximately 115 Acres) and Cope Pond (approximately 270 acres) occupy most of the north and northeast portions of the Site (Figure 2). Cope Pond is currently managed by the Alameda County Flood Control and Water Conservation District – Zone 7. The small pond on the site is a stormwater retention pond and it is located in the southwest portion of the Site, just east of the City of Pleasanton Operations Service Center. This pond receives stormwater from the immediately surrounding Site area and the water surface level fluctuates throughout the year based on the amount of rainfall runoff.

4.2.3 *Geology and Hydrogeology*

Originally, sediments in the vicinity of the Site consisted of Pleistocene to Recent alluvial deposits of sand, silt, gravel, and clay. Large quantities of these deposits have now been removed during aggregate mining at the Site and replaced with fill derived from mine waste and, potentially, other unknown sources. Underlying the original Pleistocene deposits is the middle Pliocene to lower Pleistocene Livermore Formation. The Livermore Formation is up to 4,000 feet thick and consists of consolidated to semi-consolidated alluvial deposits of sand, silt, clay, and gravel.

In the past, agricultural pumping caused overdrafting of the aquifers in the area. Efforts to recharge the aquifers with imported water have been successful in restoring water levels in the area. However, the shallow hydrogeologic regime in the Site vicinity has been significantly disrupted by mining activities. Hydrogeologic units that were once laterally and/or vertically continuous have been removed and replaced by a heterogeneous mix of dumped fill and pond sediments. These inhomogeneities disrupt both lateral and vertical groundwater flow and can give rise to local "perched" groundwater conditions and cause significant local variations in groundwater levels and flow directions.

4.2.4 *Oil and Gas Fields*

The EDR GeoCheck Physical Setting Source Summary did not identify any oil or gas fields within a one-mile radius of the site.

4.2.5 *Wetlands and Floodplain*

A review of the EDR Report and USGS topographic maps suggests the Site is within ¼-mile of a national wetland area and the 100-year or 500-year flood zones.

4.3 Historical Use Information on the Site

Prior to 1938, portions of the Site were used for agriculture and portions were undeveloped. Beginning in 1938 the Site was mined for its aggregate resources by Kaiser Sand and Gravel. Initially mining operations were carried out in the southwestern portion of the site and later expanded to the east, northeast and northwestern portions of the Site. As mining progressed from one area to the next, mined out areas were either backfilled with rubble, debris, and mine waste, or used as disposal ponds for water, silt, and sand from aggregate washing operations and new pit dewatering. In 1991 the mining operation was purchased by Hanson Aggregates and operated

until 2001 at which time the aggregate resource was considered mined out. During various periods of operation of the facility a concrete batch plant and an asphalt plant were operated on portions of the Site. Hanson currently maintains a single story office building, a heavy equipment maintenance shop, a lube shed and several storage buildings on the Site. ENV America reviewed historical aerial photographs, historical topographic maps and city directories for evidence of environmentally threatening practices and land uses. The following sections chronologically summarize the review.

4.3.1 *Historical Aerial Photograph and Historical Topographic Map Review*

EDR provided the following historical aerial photos for the Site and its vicinity: 1939, 1950, 1958, 1965, 1974, 1982, 1993 and 1998. Copies of these aerial photographs are included in Exhibit B.

4.3.1.1 Historical Aerial Photograph Review

Year	Description
1939	Most of the Site appears to be in agricultural use, with several groups of small structures located throughout the Site. Small roads cross the Site. In the southern portion of the Site, is an apparent area of earthmoving activity.
1950	The Site remains largely the same as in the 1939 photo, except that the area of earthmoving activity has expanded northward. The area also includes a large gravel pit in the Site's southeast corner.
1958	The Site remains largely the same as in the 1950 photo, except that the southeastern pit is now filled with water.
1965	The Site and vicinity remain largely the same as in the 1958 photo, except that an additional gravel pit has been made north and west of the original gravel pits. There are small structures in the north central portion of the Site.
1974	Additional gravel pits have been made north and east of the previous pits. Tracts of land adjacent to the pits have been cleared. A small pit is shown in the northern portion of the Site.
1982	A small pit has been added in the north central portion of the Site. Two large pits have been created in the southwest corner of the Site. The large pits in the southeast quadrant have merged into two larger pits.

Year	Description
1993	New pits have been created in the northeast and northwest corners of the Site. The large pits in the southeast quadrant have merged into one pit. The two large pits in the southwest corner of the Site have been filled in except for a small pond in the southwest corner. The land on the Site not occupied by pits or former pits has been cleared.
1998	A large pit has been created in the northwest portion of the Site.

4.3.1.2 Topographic Map Review

EDR provided the following topographic maps for the Site and its vicinity: 1906, 1947, 1953, 1961, 1968, 1973, and 1980. Copies of these maps are included in Exhibit D.

Year	Name	Description
1906	Pleasanton	The Site is located in the Livermore Valley. The Site is vacant except for some roads and several small structures next to the roads. Arroyo Mocho crosses the Site from northwest to southeast. A Forest Service administrative area boundary traverses the southern portion of the Site. The Site's southern boundary is formed by a Southern Pacific railroad track (which is the current Union Pacific track) and a road. Part of the Site's western boundary is formed by a road. Several small roads are shown entering the Site. The general vicinity is developed with roads and scattered small structures next to the roads. A road, later labeled Highway 50 in subsequent maps, passes north of the Site. A city grid is shown in Livermore. Several creeks and arroyos flow through the vicinity.
1947	Pleasanton	The Site is largely unchanged from the 1906 map except the Forest Service administrative area boundary is no longer shown. A quarry or open pit mine is shown adjacent to the Site's southwest boundary. Two other mines are shown southeast of the Site. A railroad track has been constructed west of the Site. Several orchards are shown west and southwest of the Site and farther away to the northwest. Several streams and/or canals are shown west of the Site. The general vicinity has been further developed; the City of Pleasanton is more densely developed.

Year	Name	Description
1953	Livermore	Several small structures and wells are shown on the Site. A road crosses the Site from east to west. Gravel pits are shown in the southern portion of the Site. A quarry or open pit mine is located in the Site's southwest corner. An intermittent stream with a levee forms part of the Site's northern and eastern boundaries. A road parallels this stream on the eastern boundary. The line that denoted the Forest Service administrative area boundary is now shown as a land grant, mining claim, donation land claim, or tract line. In the vicinity gravel pits and mines are shown south and southwest of the Site, just across the Site's border. Wells are scattered throughout the vicinity. Southwest of the Site the City of Pleasanton is shaded to show a built up area. North of the Site is the Santa Rita Rehabilitation Center Annex and Dow Airport. Northwest of the Site, across Highway 50, is Parks Air Force Base.
1961	Livermore	The Site remains largely the same as in the 1953 map, except that there is no longer a quarry or open pit mine noted in the southwest corner. The intermittent stream forming the Site's northern and eastern border is now labeled Arroyo Mocho; the 1947 map shows Arroyo Mocho within the Site's borders, not on the border. An orchard is shown adjacent to the Site's western border. Another, smaller orchard is shown northeast of the Site. South/southeast of the Site the gravel pits have expanded. The City of Pleasanton, southwest of the Site has expanded closer to the Site. Parks Air Force Base is now labeled Camp Parks. Dow Airport is no longer shown on the map.
1968	Livermore	Additional large gravel pits are shown on the Site north of the previous gravel pits, which are still shown. A levee surrounds the new pits. A smaller gravel pit is shown in the north end of the Site. Several small structures are shown on the Site, next to the roads. One of the roads on the Site has been extended north. Northwest of the Site new residential streets have been developed. A road has been built leading east from the Site's northeast boundary; several small structures are next to the road. To the northeast of this road is the Las Positas Golf Course. Additional roads have been built in the vicinity of the Site.

Year	Name	Description
1973	Livermore	The Site remains largely the same as in the 1968 map, except there are an additional gravel pit and more small structures in the southern half of the Site. The residential streets to the northwest of the Site have expanded and now show small structures. Additional roads and structures have been built near the Site's northeast boundary. South of the Site the City of Pleasanton has expanded and more streets have been developed.
1980	Livermore	Additional gravel pits are shown north of the previously existing pits. The pits are surrounded by roads or levees. Northwest, west, and southwest of the Site the residential areas have expanded. Mine dumps are indicated in the central part of the Site, next to the gravel pits. Other mine dumps are shown east and southeast of the Site, across from the Site boundary and next to the gravel pits.

4.3.2 *Sanborn Maps*

No Sanborn Fire Insurance Maps are available for the Site.

4.3.3 *Additional Resources*

Business directories including city, cross reference, and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1975 through 2005. (These years are not necessarily inclusive.) A summary of the information obtained is provided below.

Site

Year	Description
1975-1985	Address not listed in research source.
1990-1995	Beazer West Inc Kaiser Cement Corp
2000-2005	Beazer West Inc Hanson Aggregates Hanson Permanente Cement Inc. Kaiser Cement Corp

Off-Site

Year	Description
1975	Address not listed in research source.
1980-1985	Office Building (4 Occupants) – 3110 Busch Road No other addresses in 2900-3199 range
1990-1995	Office Building (5 Occupants) – 3110 Busch Road No other addresses in 2900-3199 range
2000-2005	Office Building (6 Occupants) – 3110 Busch Road No other addresses in 2900-3199 range

4.3.4 *File Review*

File review requests were submitted to the Regional Water Quality Control Board – San Francisco Bay Region, Department of Toxic Substances Control, Alameda County, Zone 7 Water Agency, and the City of Pleasanton Fire Department. At the time this Phase I ESA was submitted, the agencies had not responded back to our requests. If information becomes available that would change the conclusions of this report, ENV America will issue an addendum to the report documenting the findings.

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

On Wednesday, August 16, 2006 ENV America representatives met on the Site with Mr. Larry Appleton and Mr. Lee Cover, representatives for Hanson, and discussed Site history with respect to environmental issues. Mr. Cover then gave a tour of specific Site facilities to include the heavy maintenance shop, the lube shed and wash rack, the two storage buildings west of the heavy maintenance shop, the former asphalt plant and asphalt tank area, and the west conveyor tunnel entrance. On subsequent visits to the Site on Monday September 18, 2006 and September 21, 2006 ENV America personnel observed the idle truck maintenance facility area (no longer within the property purchase area), the former concrete batch plant area, and an area in the southwest corner of the Site where contaminated soil was reportedly removed from the site (no longer within the property purchase area). Four former transformer locations and one active transformer location were observed. Former crusher, rod mill, waste oil UST, and plant lube storage shed sites were also visited. ENV America personnel also observed the area along the eastern side of the Site adjacent to the Vulcan Materials Company and the stormwater retention pond along the western side of the Site, adjacent to the City of Pleasanton Operations Service Center.

5.2 Site Observations

See section 2.0 for details of the Site and vicinity. Photographs of the Site and vicinity are included in Exhibit F. The Site reconnaissance consisted of the visual inspection of the areas visited.

Heavy Equipment Maintenance Shop

The heavy equipment maintenance shop is currently in use to service and repair large equipment such as large front end loaders. Various lubricants are used in the building as are solvents for parts cleaning. Staining was observed in floor areas beneath the solvent parts cleaning area and the oil containment troughs. No floor drains were observed in the building. There was an area of stained soil behind the heavy equipment maintenance shop where some drums and equipment were stored. The drums and equipment have now been removed and the stained soil was scraped up and removed.

Lube Shed

The lube shed consists of a raised concrete platform with corrugated metal roof and walls, with one open side. The shed contains a number of 55 gallon drums of various lubricants. The drums are connected to pipes along the north wall of the shed. The pipes go under the concrete slab between the lube shed and the heavy equipment shop and up the south wall of the heavy equipment shop. They go through the wall into the shop where they deliver the various products for use in the shop. The drums of lubricants are delivered to the lube shed along the open east side of the shed. The ground on the east side of the shed is bare soil. The darker color of the soil in this area suggests that some spillage has occurred over time.

Wash Rack

There is a wash rack adjacent to the west side of the lube shed. The wash rack area is paved with reinforced concrete. Wash water collects in a sump at the southeast corner of the wash rack and is pumped through an oil/water separator recycling system. The concrete is heavily stained with oil and grease and the sump appears encrusted with oil and grease. The wash water recycling system is located at the north side of the lube shed. There is a large plastic drum that appears to skim and collect oil from the system. This drum appears to be full of heavy black oil. There is a hose connected to an overflow port on the drum. At the time of the Site walk the discharge end of the hose was on the ground and the concrete around it was oil stained.

Storm Drains

There is a storm drain inlet immediately adjacent to the wash rack sump. It is not apparent how water from the wash rack is prevented from entering the storm drain. The storm drain in one instance is reported to drain to the stormwater retention pond along the western edge of the property, and elsewhere is reported to drain to Cope Pond. Additional inquiry of Mr. Appleton confirmed that this inlet drains to Cope Pond. No other storm drains were observed on the Site.

Above Ground Storage Tanks

There are two above ground storage tanks (ASTs) along the south wall of the heavy equipment maintenance shop, between the shop and the lube shed. There is a 200 gallon waste oil tank and a 150 gallon antifreeze tank. Both of these thanks appear to be in good condition with no staining that might indicate leakage.

Storage Warehouses

There are two large storage warehouses at the west end of the heavy equipment maintenance shop. These warehouses are each opened on one side. They contain used engines, electric motors, parts, and equipment of various descriptions. They do not appear to be a significant source of contaminants.

Railroad

A Union Pacific railroad line forms the southern boundary of the site and historical maps indicate that railroad spurs entered the southwestern portion of the site, although none are currently visible. Railroads often have contaminants such as oil and grease, heavy metals, and PCBs, along their right-of-way. No obvious signs of contamination were visible along the Site adjacent to the railroad line.

Former Concrete Batch Plant Location

There was formerly a concrete batch plant located in the southwest portion of the Site. The cement used in the concrete can lead to high pH conditions in the soil. The concrete plant also had a UST adjacent to it. The UST was removed in 1995. Low concentrations (less than 100 mg/kg) of TPH were detected in the tank excavation and the consultant recommended no further investigation at that site. No information is provided as to the regulatory agency response to this recommendation. All that remains at the location of the former concrete batch plant, which was removed in 2004, are a concrete slab, large piles of broken concrete, and areas of bare earth. No obvious signs of contamination were noted at this location.

Plastic Tanks North of Concrete Batch Plant

Two plastic tanks were observed approximately 150 feet north of the former concrete batch plant location. These tanks are deteriorated and cracked and have leaked most of their contents on the ground. The labels on the tanks indicate that they contained plasticizers. These chemicals were probably used as additives in concrete mixed at the batch plant.

Former Mining Facilities

A number of former mining facilities reportedly stored or used lubricants of various types to maintain and lubricate the processing equipment. These facilities included the crusher, the aggregate processing plant, the rod mill, a waste oil above ground storage tank (AST), and a

plant lube storage shed. These facilities are now all gone from the Site. However, ENV America personnel ascertained and observed their approximate locations based on measured distances from recognizable landmarks. The ground surface at each of these locations has been significantly disturbed by the demolition process and no obvious signs of surface contamination were recognizable at any of these locations.

Former Warehouse Location Adjacent to the Former Plant Lube Storage Shed Location

Welding was reportedly performed at this former warehouse location. Welding can contaminate the area with heavy metals. No obvious contamination was observed at this location.

Transformers

Hanson had 13 oil filled transformers and one dry transformer on the Site. Five of the transformers, including the dry transformer, were mobile transformers and nine were stationary pad-mounted transformers. One pole mounted transformer, presumably belonging to PG&E, was also observed on the Site. Of the nine stationary transformers, one, located at the northeast corner of the heavy equipment maintenance shop, is still operational. The remaining 13 transformers (stationary and mobile) have all been removed from the Site. Two of the transformers were mounted as single units, including the one adjacent to the heavy equipment shop. The remaining seven were mounted in one group of three and one group of four. Two of the four stationary transformer locations can be recognized by the electrical conduits and cables coming out of the ground at their former locations. The location of the remaining transformer bank can only be approximated by measuring from recognizable landmarks.

Hanson had the oil in all their transformers sampled and analyzed for PCBs. PCBs were detected in seven of the ten stationary pad-mounted transformers. Transformers, if leaking, can be a source of oil and PCB contamination in the soil.

Vulcan Materials Company Runoff Area

Previous reports indicate that runoff occurs from the Vulcan Materials Company (VMC) property onto the southeast corner of the Site. These reports also indicate that contaminants from the VMC property may be present in the runoff. There is currently a berm between the VMC property and the Site in this area, so it is not apparent that this condition still exists. If it existed in the past, it would appear that any significant runoff from the VMC property would run down slope to the southeast corner of Cope Pond. No obvious indications of contaminated soil were observed in this area.

Stormwater Retention Pond

There is a stormwater retention pond along the western Site boundary, immediately east of the City of Pleasanton Operations Service Center. Sediment and surface water in this pond were sampled in 1992 and, reportedly, petroleum hydrocarbons were detected in both. Hanson alleged that the contamination was coming from the Pleasanton Garbage company outfall and sent them a letter requesting that they properly treat their discharge and cease to discharge contaminated water into the pond. Hanson's environmental consultant recommended that additional sampling be performed at the pond to assess the lateral and vertical extent of the petroleum contamination.

Septic Systems

One active septic system is present on the Site. The system was observed during the Site reconnaissance to be in good condition.

Slag Pile

A pile of material reported to be furnace slag is located in the southeast corner of the site. A sample of this material was collected and analyzed for CCR 17 Metals. The analytical results do not indicate significant concentrations of heavy metals.

Wells

According to the Zone 7 Water Agency there are nine wells on the Site. One of the wells is a water production well and was sampled during the previous soil and ground water investigation. Barium was detected below the regulatory threshold. The remaining wells were not observed but are reported by the Zone 7 Water Agency to be monitoring wells.

6.0 SUMMARY OF PREVIOUS INVESTIGATIONS PERFORMED BY ENV AMERICA

The purpose of the following section is to provide a summary of previous environmental assessments conducted at the Site by ENV America.

ENV America Incorporated, 2006, Draft Phase II Environmental Site Assessment

ENV America prepared a draft Phase I ESA report for the Site in May 2006, and based on the findings of that Phase I ESA, ENV America conducted a Phase II ESA for the Site in the summer and fall of 2006. ENV America's Phase II ESA scope of work included the collection and analysis of soil, groundwater, pond water, and septic-tank liquid located within the current Site boundary in addition to sampling and analysis of soil and shallow groundwater from an area that is no longer part of the Site. Since preparation of the Draft Phase II ESA in November 2006, the Site boundary was adjusted, via a formal lot line adjustment, to exclude an approximately 15-acre contiguous area west of the most southern and southwestern corner of the Site boundary. The area removed from the Site includes an area associated with historical asphalt plant operations and includes the majority of the Phase II ESA soil and groundwater sampling locations. Laboratory results of soil and groundwater samples indicate a substantial source of total petroleum hydrocarbons (TPH) in the diesel and motor oil range in that area. It is ENV America's understanding that the current owner, Hanson Aggregates, is coordinating the investigation and remediation of TPH in soil and groundwater in that area under regulatory agency oversight. The complete results and findings of the Phase II ESA are presented in ENV America's report titled *Draft Phase II Environmental Site Assessment, 3000 Busch Road, Pleasanton, California,* dated November 2006. The following summary refers only to the sampling that was conducted within the current Site boundary.

ENV America collected soil samples from eight shallow test pits, five shallow soil borings drilled with a hollow-stem auger drill rig, nineteen shallow soil sample locations drilled with a hand auger or slide hammer, and three shallow soil samples from an existing stockpile (Figure 4). A total of 58 soil samples and four groundwater samples were collected from locations within the current Site boundary. Of the 58 soil samples collected at the Site, laboratory results of samples from the following five sampling locations exceed Environmental Screening Levels (ESLs) established by the Regional Water Quality Control Board (RWQCB) for residential soil where groundwater is a potential source of drinking water:

Heavy Equipment Maintenance Shop/Lube Shed

Twelve soil samples were collected and analyzed from one test pit and three boreholes in this area (boreholes *EB-3, EB-4, EB-5*, and test pit *LS*). A soil boring (*EB-31*) was also drilled approximately 100 feet south of the heavy equipment maintenance shop to assess soil conditions in the vicinity of an old disposal pond that reportedly existed in that area. Laboratory results of two soil samples from this area exceed their ESL for TPH-d (EB-5-2 @ 170 mg/kg, EB-31-10 @120 mg/kg); one soil sample exceeds the ESL for TPH-mo (EB-31-10 @ 920 mg/kg); one soil sample exceeds the ESL for chromium (EB31-5 @ 75 mg/kg).

Plastic Tanks North of Former Concrete Batch Plant Location

Two soil samples were collected and analyzed from one test pit at the location of two plastic tanks that formerly contained plasticizers (PT-0.5, PT-5). A shallow soil sample was also collected from a stained area immediately adjacent to one of the tanks *(PTA-0.2)*. The laboratory result of one soil sample exceeds the ESL for phenol (*PTA-0.2 @ 0.10 ug/kg*), however, no other detected analytes exceed their respective ESLs.

Vulcan Materials Company (VMC) Runoff

Three shallow soil samples were collected approximately 6-inches below ground surface and were analyzed from three locations within the VMC Runoff area (shallow soil sampling locations *RO-A, RO-B, and RO-C*). The laboratory result of one soil sample exceeds the ESLs for TPH-d and TPH-mo (*RO-B @ 130 mg/kg for TPH-d and 670 mg/kg for TPH-mo*), however no other detected analytes exceed their respective ESLs.

Stormwater Retention Pond

Nine shallow soil samples were collected and analyzed from the shores of the stormwater retention pond (shallow soil sampling locations *RP-A thru RP-H*). The laboratory result of one soil sample exceeds the ESLs for arsenic (*RP-C @ 7.6 mg/kg*), chromium (*RP-C @ 120 mg/kg*, and nickel), and nickel (RP-C @ 410 mg/kg), no other detected analytes exceed their respective ESLs.

Railroad Locations

One soil sample was collected from each of two shallow test pits excavated along the southern boundary of the Site adjacent to the active Union Pacific Railroad (test pits *RR-1, RR-2*). The laboratory results of *RR-1* (560 mg/kg) exceeds the ESL for TPH-mo, although no other detected analytes exceed their respective ESLs.

Laboratory results for samples collected in the above areas indicate that the majority of the sampling locations were generally unaffected by historical Site operations. However, laboratory

results from soil samples from the lube shed area and an area adjacent to the Union Pacific Railroad indicate TPH constituents that exceed respective ESL values. In addition, the metals chromium, nickel, and magnesium were detected at concentrations above their respective ESLs in one sample collected from the south side of the retention pond. Additional sampling in the retention pond indicates that the area of elevated metals concentration is of limited extent.

In summary, the five areas discussed above include contaminant concentrations that exceed applicable Environmental Screening Levels (ESLs) for residential land use as established by the California's Regional Water Quality Control Board (RWQCB, Bay Area), although not at concentrations, depths, and/or nature that constitute *recognized environmental conditions* in connection with the Site. Refer to the attached Figure 4 for sampling locations (note: sampling locations identified as "SS-.." indicate sampling locations from the reports discussed below).

ENV America collected and analyzed surface water from Lake I and Lake H, liquid from a septic tank located north of and adjacent to the Hanson offices (*San-2),* and groundwater approximately 50 feet west of trailers north of the off-Site Idle Truck Maintenance Area. Laboratory results from theses samples did not exceed any ESLs, thus, laboratory results from liquid sampling at the Site during the initial Phase II investigation do not indicate recognized environmental conditions in connection with the Site.

ENV America Incorporated, 2006, Additional Soil and Groundwater Investigation

During January/February 2007 seventeen borings were drilled at the Site to assess soil and groundwater conditions. Sixteen of the boring locations were selected in a statistically random manner to allow the collection of a random set of soil analytical data. Five of the borings were also used for collecting grab groundwater samples. One groundwater sample was also collected from a non-operational production well on Site. Both soil and groundwater samples were analyzed for TPH-g/BTEX, TPH-d, TPH-mo, and metals. Refer to the attached Figure 4 for sampling locations.

The only analyte detected in groundwater was barium, which was detected at concentrations significantly below its regulatory threshold. TPH-g/BTEX was not detected in any of the soil samples. TPH-d and -mo were detected in a number of samples, in some cases above their respective regulatory thresholds. Many individual metals were detected in most of the soil samples analyzed. Only chromium was detected above its regulatory threshold.

Statistical analyses of the data set for those analytes that, in some samples, exceeded their regulatory thresholds indicate that the soil mass at the site is, in general, below respective

regulatory thresholds for all analytes in the data set. However, local areas of soil do exceed regulatory thresholds for some analytes, one specific area being at boring SS(123), where both TPH-d and TPH-mo exceed their respective regulatory threshold. At this specific location ENV America recommended that additional investigations be performed to assess the lateral and vertical extent of the TPH-d and -mo in soil and collect grab groundwater samples as well as to evaluate whether groundwater in the vicinity of these high TPH soil results is affected.

ENV America Incorporated, 2006, Second Additional Soil and Groundwater Investigation

On March 8, 2007 four soil borings were drilled at the Site to assess soil and groundwater conditions. The boring locations were selected to assess the vertical and lateral extent of previous detections of TPH-d and TPH-mo in soil in parcel C in the vicinity of the SS(123) boring location and reported in the Additional Soil and Groundwater Investigation Report, dated February, 2007, and summarized above. The borings were also used for collecting grab groundwater samples. Both soil and groundwater samples were analyzed for TPH-d, TPH-mo, TPH-g/BTEX, and metals. Refer to the attached Figure 4 for sampling locations.

TPH-d was detected in shallow soil (10 feet bgs or less) and in deep soil (greater than 10 feet bgs) from all four borings at concentrations above their regulatory threshold. TPH-mo was detected in shallow soil (10 feet bgs or less) from borings 123(B), 123(C), and 123(D), and in deep soil (greater than 10 feet bgs) from borings 123(A), 123(B), and 123(C) at concentrations above their regulatory threshold. TPH-g and BTEX were not detected in any of the soil samples.

TPH-d was detected above the regulatory threshold in groundwater from all four borings. TPH-mo was detected above its regulatory threshold in groundwater from boring 123(B) at 520 µg/L. Due to EPA Test Method 8015 Modified laboratory procedure limitations, the detection limit of TPH-mo is 500 µg/L. TPH-mo was not detected above the detection limit. TPH-g and BTEX were not detected in any of the water samples. Molybdenum, lead, vanadium and zinc were detected above its respective groundwater regulatory threshold.

7.0 SUMMARY OF FINDINGS

ENV America has performed a Phase I ESA of the Site located at 3000 Busch Road in Pleasanton, California in accordance with ASTM Practice E 1527-05. Based on the scope of work completed and the limitations described in this report, the known or suspect environmental conditions for the Site and off site facilities are listed below.

7.1 Onsite

Database and literature searches and on-site observations have revealed evidence of historical, current and potential environmental conditions at the site. The following summarizes these conditions:

- UST Removed in 1995 - Soil contamination was encountered during the removal of one UST in 1995 under a permit from the Livermore-Pleasanton Fire Department. TPH detected in confirmation samples did not exceed 100 mg/kg. Laboratory results from soil and groundwater samples collected during ENV America's Phase II ESA show non-detect results of TPH at the location of the UST and indicate that TPH-affected soil or groundwater is limited in that area, and thus do not constitute a *Recognized Environmental Condition* in connection with the Site.
- USTs Removed in 2003 - Two USTs were removed from north of the idle truck maintenance shop in 2003. Low concentrations of petroleum hydrocarbons were left in place in the soil and the environmental consultant recommended no further investigation. Action from the regulatory agency is pending, although according to Mr. Lee Cover (Environmental Manger, Hanson Aggregates) they received verbal closure and, as such, this site is not a current *recognized environmental condition.*
- Existing ASTs – The ASTs adjacent to the heavy equipment shop have not been decommissioned to date and still contain waste oil and antifreeze. Until they are emptied and decommissioned and the soil beneath the concrete they are sitting on can be sampled, they represent potential environmental conditions. TPH constituents and chromium were detected in levels exceeding respective ESLs in the general area of the heavy equipment shop. However, based on the number of detections relative to the number of samples collected at the area, the depth of the detections, and the concentrations of the detections, the detections are not considered to constitute a *Recognized Environmental Condition* in connection with the Site.

- Lube Shed - TPH constituents were detected at concentrations exceeding respective ESLs. However, based on the number of detections relative to the number of samples collected at the area, the depth of the detections, and the concentrations of the detections, the detections are not considered to constitute a *Recognized Environmental Condition* in connection with the Site.
- Stormwater Retention Pond
  The laboratory result of one soil sample (RP-C) out of nine soil samples exceeds the ESLs for arsenic, chromium, and nickel. A *recognized environmental condition* was not identified in connection with the stormwater retention pond.
- Union Pacific Railroad – Laboratory results of soil samples from the railroad track areas were not identified to constitute a recognized environmental condition in connection with the Site.
- Plastic Tanks North of Former Concrete Batch Plant Location – The laboratory results of three soil samples from this area do not indicate a recognized environmental condition in connection with the Site.
- Mining Facilities – Former mining facilities including the rod mill, the crusher, the former waste oil AST, the lube plant storage shed and the former warehouse all are documented to have used or stored petroleum lubricants or, in the case of the former warehouse, potentially given off heavy metals during the welding that was performed at that site. The laboratory results of nine soil samples from these areas do not indicate a recognized environmental condition in connection with the Site.
- Transformers – There are three former pad-mounted transformer locations and one current pad-mounted transformer on the site. The laboratory results of soil samples from these areas do not indicate a recognized environmental condition in connection with the Site.
- Soil and Groundwater Contamination in the Area of Soil Boring SS123 – As reported in the Second Additional Soil and Groundwater Investigation dated April 2007 TPH-d and TPH-mo were detected in soil and groundwater above their respective regulatory thresholds in the area of boring SS123. The vertical and lateral extent of the contamination has not been completely evaluated. Until this contamination has been evaluated these detections of TPH-d and TPH-mo in soil and groundwater represents a *recognized environmental condition.*

7.2 Offsite

The EDR database search reveals that properties within a two mile radius of the center of the Site are listed in the databases searched a total of 742 times. Many of these are multiple listings for the same property. Plus, there are 80 "orphan sites" listed for which there is insufficient information available to locate the properties. After evaluation of the available information,

including cross checking with the Geotracker LUFT, SLIC, and UST databases, ENV America has compiled a list of eleven properties from the database search that had reported tank leaks and are close enough to the Site perimeter to potentially affect environmental conditions on the Site. These properties are:

- Pleasanton Ready Mix Concrete at 3400 Boulder Ct.
- B&J Trucking at 3742 Valley Avenue
- Utility Vault Company at 3786 Valley Avenue
- Jamieson Company at 501 El Charro Road
- Industrial Asphalt at 52 El Charro Road
- The Pleasanton Truck and Equipment Company at 3110 Busch Road
- Airdance Farm LLC at 770 El Charro Road
- RMC Lonestar at 1544 Stanley Blvd.
- Reliable Trucking Inc. at 51 El Charro Road
- California Rock Plant at 501 El Charro Road
- The Combs Property at 1808 Courtney Avenue

All of these properties are listed as "closed" in the Geotracker and/or EDR searched databases. Therefore, it is unlikely that any of these properties have had or will have any effect on environmental conditions at the Site.

Due to the nature of the operations performed in the idle truck maintenance area and the fuels, lubricants, and solvents typically used in such operations and because of the soil staining around the facility, a potential environmental condition exists at this facility.

In the ENV America Draft Phase II ESA report dated November 2006 an area of contamination was found in soil adjacent to the west of the most southern and southwestern corner of the Site boundary. This area is part of the Hanson Aggregates property, however this portion of the property where contamination was reported is not included as part of the Site currently being considered for purchase, but has the potential to cause an environmental condition at the Site.

A Phase I Environmental Site Assessment on the adjacent VMC property southeast of the Site indicates the presence of known environmental conditions at that site based the presence of petroleum hydrocarbon staining, a faulty oil water separator, and the use of acidic chemicals to wash down trucks. If runoff from the VMC site enters the Hanson Site it could potentially cause an environmental condition to exist in that area.

Reconnaissance in the area north of the Site revealed the presence of a horse ranch where a number of drums were noted. Labels on the drums indicated they are from an environmental investigation. Personnel at the site provided a contact name of a person to contact for information related to the investigation but would not provide further details. Additional information on this site is being sought.

8.0 CONCLUSIONS

ENV America has performed a Phase I ESA in conformance with the scope and limitations of ASTM Standard Practice E 1527-05 of 3000 Busch Road, Pleasanton, California. This assessment has revealed evidence of one *recognized environmental conditions,* and no *historical recognized environmental conditions* in connection with the subject Site. Soil and groundwater at the Site have been affected. ENV America recommends that additional Phase II investigation be performed to evaluate the extent of soil and groundwater contamination detected in the vicinity of boring SS123.

9.0 QUALIFICATIONS

9.1 Corporate

ENV America was formed in 1992 and incorporated in the State of Delaware. ENV America provides professional services in environmental engineering, involving the application of science and engineering to environmental compliance, contamination assessment and cleanup, and the management of hazardous, solid and industrial waste. Phase I ESAs are a part of this practice area.

9.2 Individual

The qualifications of the Project Manager and the other environmental professionals involved in this Phase I ESA meet ENV America's corporate requirements for performing Phase I ESAs.

ENV America Incorporated

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous

waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/13/2006 has revealed that there are 2 RCRA-LQG sites within approximately 2 miles of the target property.

SSTS: Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

A review of the SSTS list, as provided by EDR, and dated 12/31/2005 has revealed that there is 1 SSTS site within approximately 2 miles of the target property.

EXECUTIVE SUMMARY

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, and dated 10/19/2006 has revealed that there are 3 HIST FTTS sites within approximately 2 miles of the target property.

STATE AND LOCAL RECORDS

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, and dated 03/12/2007 has revealed that there are 3 SWF/LF sites within approximately 2 miles of the target property.

CDL: A listing of drug lab locations. Listing of a location in this database does not indicate that any illegal drug lab materials were or were not present there, and does not constitute a determination that the location either requires or does not require additional cleanup work.

A review of the CDL list, as provided by EDR, and dated 12/31/2006 has revealed that there are 2 CDL sites within approximately 2 miles of the target property.

Equal/Higher Elevation	Address	Dist / Dir		Map ID	Page
Not reported	3375 NORTON WAY, #5	1 - 2	S	253	332
Not reported	763 PALOMINO DR, APT 3	1 - 2	S	318	409

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2005 has revealed that there are 259 HAZNET sites within approximately 2 miles of the target property.

information on the 'Best Available' air pollution technologies that have been required to reduce the emission of air pollutants from stationary sources (e.g., power plants, steel mills, chemical plants, etc.). This information has been provided by State and local permitting agencies. The Clearinghouse also contains a regulation data base that summarizes EPA emission limits required in New Source Performance Standards (NSPS), National Emission Standards for Hazardous Air Pollutants (NESHAP), and Maximum Achievable Control Technology (MACT) standards.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

California - Hazardous Waste Tracking System - Datamart

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to

UTILITY VAULT COMPANY (Continued) **S101580459**

represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CEMEX PLEASANTON (Continued) **1000188572**

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

CA WDS:

Facility ID:	San Francisco Bay 019156001
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.

PLEASANTON QUARRY (Continued) **1001237418**

Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	CAG982001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board
Subregion:	2
Facility Telephone:	Not reported
Facility Contact:	RICHARD BUTCH KELLY
Agency Name:	CAL MAT CO.
Agency Address:	PO BOX 636
Agency City,St,Zip:	PLEASANTON 94566
Agency Contact:	DAVE CREWS
Agency Telephone:	9258462852
Agency Type:	Private
SIC Code:	1442
SIC Code 2:	Not reported
Primary Waste:	Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type)
Primary Waste Type:	Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	4.6
Baseline Flow:	4
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The POTW Does not have an approved pretreatment program. Some POTWs may have local pretreatment programs that have not been approved by the regional board and/or EPA.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Solid Waste Assessment Test Program:	True
Toxic Pits Cleanup Act Program:	False
Resource Conservation Recovery Act:	False
Department of Defence:	False
Solid Waste Assessment Test Program:	PLEASANTON GARBAGE SERVICE
Threat to Water Quality:	Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
Sub Chapter 15:	True
Regional Board Project Officer:	DMA
Number of WMUDS at Facility:	1
Section Range:	03S01E
RCRA Facility:	No
Waste Discharge Requirements:	Inactive - Any discharger under WASTE Discharge requirements that is not currently operating/discharging, but may begin to discharge in the future. When the facility begins operating/discharging, the status must be reset to active.
Self-Monitoring Rept. Frequency:	Semiannual Submittal
Waste Discharge System ID:	2 019106001
Solid Waste Information ID:	01-AA-0020

CA WDS:

Facility ID:	San Francisco Bay 01I003893
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Facility ID:	San Francisco Bay 019106001
Facility Type:	Solid Waste Site-Class III - Landfills for non hazardous solid wastes.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RACT/BACT/LAER Clearinghouse (RBLC) data base contains case-specific information on the 'Best Available' air pollution technologies that have been required to reduce the emission of air pollutants from stationary sources (e.g., power plants, steel mills, chemical plants, etc.). This information has been provided by State and local permitting agencies. The Clearinghouse also contains a regulation data base that summarizes EPA emission limits required in New Source Performance Standards (NSPS), National Emission Standards for Hazardous Air Pollutants (NESHAP), and Maximum Achievable Control Technology (MACT) standards.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and

PLEASANTON TRUCKING & MAT (Continued) **S106101747**

disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

California - Hazardous Waste Tracking System - Datamart

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

California - Hazardous Waste Tracking System - Datamart

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Other Pertinent Environmental Activity Identified at Site

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

California - Hazardous Waste Tracking System - Datamart

UORS (California - Used Oil Recycling System). California Integrated Waste Management Board (CIWMB) helps communities establish and promote convenient collection opportunities for used oil and used oil filters.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

SIC Code:	1442
SIC Code 2:	Not reported
Primary Waste:	Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type)
Primary Waste Type:	Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Secondary Waste:	Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type)
Secondary Waste Type:	Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Design Flow:	5.8
Baseline Flow:	2.9
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The POTW Does not have an approved pretreatment program. Some POTWs may have local pretreatment programs that have not been approved by the regional board and/or EPA.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

California - Hazardous Waste Tracking System - Datamart

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

EPA Waste Codes Addendum

Code	Description
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
D002	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
F002	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F003	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/27/2006
Date Data Arrived at EDR: 11/01/2006
Date Made Active in Reports: 11/22/2006

Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/27/2007

Last EDR Contact: 03/21/2007
Next Scheduled EDR Contact: 06/18/2007
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Date of Government Version: 04/03/2007

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services

Target Property Map:	37121-F7 LIVERMORE, CA
Most Recent Revision:	1980

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

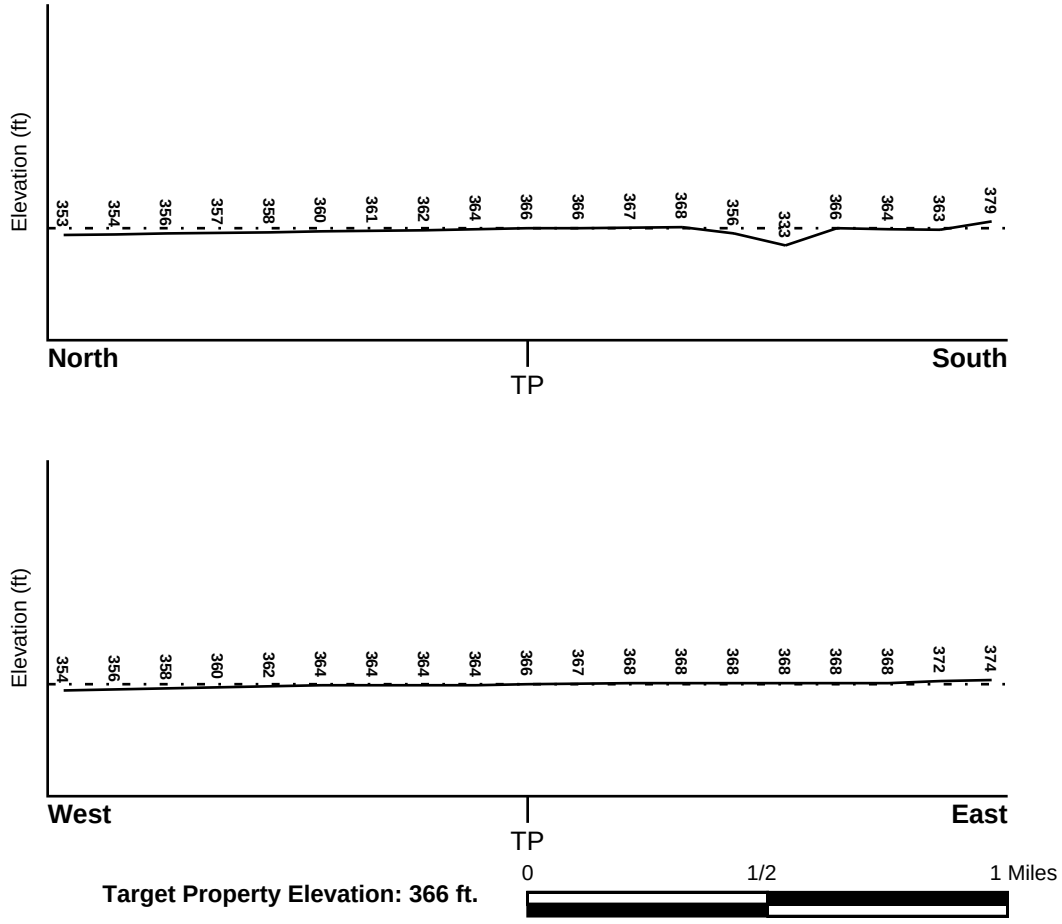
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

LIVERMORE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
B9	1/2 - 1 Mile SW	W
19	1/2 - 1 Mile North	SW

For additional site information, refer to Physical Setting Source Map Findings.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: YOLO

Soil Surface Texture: gravelly - loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	gravelly - loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 6.00 Min: 2.00	Max: 7.80 Min: 7.40
2	16 inches	60 inches	stratified	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 6.00 Min: 2.00	Max: 8.40 Min: 7.90

Soil Map ID: 2

Soil Component Name: YOLO

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.80 Min: 7.40
2	16 inches	60 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 2.00 Min: 0.60	Max: 8.40 Min: 7.90

Soil Map ID: 3

Soil Component Name: YOLO

Soil Surface Texture: loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.80 Min: 7.40
2	16 inches	36 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 2.00 Min: 0.60	Max: 8.40 Min: 7.90
3	36 inches	60 inches	gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand.	Max: 20.00 Min: 6.00	Max: 8.40 Min: 7.90

Soil Map ID: 4

Soil Component Name: GRAVEL PIT

Soil Surface Texture: extremely gravelly - sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	extremely gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00
2	6 inches	60 inches	extremely gravelly - sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.

Mr. Lawrence Appleton
Kaiser Sand & Gravel Company
P.O. Box 580
Pleasanton, CA 94566

RE: KAISER SAND & GRAVEL COMPANY, 3000 BUSCH ROAD, PLEASANTON

Dear Mr. Appleton:

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]) of the California Health and Safety Code. The State Water Resources Control Board (SWRCB) has required since March 1, 1997 that this agency use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at this site.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Up to 1,600 parts per million Total Petroleum Hydrocarbons as Diesel remain in native soil beneath a former UST at a depth of 25 feet below current grade.

If you have any questions, please contact the undersigned at (510) 567-6783.

Sincerely,

Scott O. Seery, CHMM
Hazardous Materials Specialist

Enclosures:

REMEDIAL ACTION COMPLETION CERTIFICATION

Kaiser Sand & Gravel Company
P.O. Box 580
Pleasanton, CA 94566
Attn: Lawrence Appleton

RE: KAISER SAND & GRAVEL, 3000 BUSCH ROAD, PLEASANTON

Dear Mr. Appleton:

This letter confirms the completion of a site investigation and remedial action for the underground storage tanks formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tanks are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact our office if you have any questions regarding this matter.

Sincerely,

Mee Ling Tung
Director, Environmental Health Services

CASE CLOSURE SUMMARY
Leaking Underground Fuel Storage Tank Program

I. AGENCY INFORMATION

Date: 12/24/97

Agency name: **Alameda County-EPD** Address: **1131 Harbor Bay Pkwy #250**
City/State/Zip: **Alameda, CA 94502** Phone: **(510) 567-6700**
Responsible staff person: **Scott Seery** Title: **Haz. Materials Spec.**

II. CASE INFORMATION

Site facility name: **Kaiser Sand and Gravel**
Site facility address: **3000 Busch Road, Pleasanton 94566**
RB LUSTIS Case No: **N/A** Local Case No./LOP Case No.: **5829**
URF filing date: UNK SWEEPS No: **N/A**

Responsible Parties:	Addresses:	Phone Numbers:
Kaiser Sand & Gravel Co. Attn: Lawrence Appleton	P.O. Box 580 Pleasanton, CA 94566	

Tank No:	Size in gal.:	Contents:	Closed in-place or removed?:	Date:
1	10K gal	diesel	removed	02/06/95
2	3000 "	"	"	"
3	1000 "	waste oil	"	"
4	5000* "	new oil	"	"
5	12K "	diesel	"	11/02/90
6	12K "	"	"	"
7	10K "	gasoline	"	"

* This UST described in various documents as both of 3000 and 5000 gallon capacity.

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and type of release: UNK

Site characterization complete? YES

Date approved by oversight agency:

Monitoring Wells installed? YES Number: 1

Proper screened interval? YES (25 - 33' BG)

Highest GW depth below ground surface: 26.54' Lowest depth: 27.89'

Flow direction: reportedly towards the west

Most sensitive current use: gravel mining

Are drinking water wells affected? NO Aquifer name: Amador Subbasin, Livermore Valley

Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

Is surface water affected? NO Nearest affected SW name: NA

Off-site beneficial use impacts (addresses/locations): NONE

Report(s) on file? **YES** Where is report filed? **Alameda County**
1131 Harbor Bay Pkwy
Alameda CA 94502

Treatment and Disposal of Affected Material:

Material	Amount (include units)	Action (Treatment or Disposal w/destination)	Date
Tank	(2x12K; 1x10K gals)	Disposal - H&H Ship Svc San Francisco, CA	11/02/90
	(1x10K; 1x5K; 1x3K; 1x1K)	Disposal - Erickson, Inc. Richmond, CA	02/06/90
Piping	UNK		
Product/sludge	270 gals	Disposal - Erickson, Inc. Richmond, CA	02/90
Soil	~832 tons	Disposal - Forward L.F. Stockton, CA	May 1997

Maximum Documented Contaminant Concentrations - - Before and After Cleanup

Contaminant	Soil[1] (ppm) Before	Soil[1] (ppm) After	Water (ppb) Before	Water (ppb) After
TPH (Gas)	ND	ND	ND	ND
TPH (Diesel)	190	1600	1600	"
TPH (mtr oil)	59	NA	NA	NA
Benzene	ND	ND	ND	ND
Toluene	"	"	"	"
Xylene	"	"	"	"
Ethylbenzene	"	"	"	"
Oil & Grease	60	"	NA	NA
Heavy metals	[geogenic conc.]		"	"
Other SVOC, HVOC	ND	NA	"	"

Note: 1) "Before" soil results from samples collected from UST excavations during 1990 and 1995 closures as follows: TPH-G, TPH-D, BTEX, and O&G result from *Area 4* tank cluster; TPH-mo from *Area 2* tank; metals, SVOC and HVOC from *Area 1* tank. "After" soil results from sample collected after overexcavation of *Area 4* tank pit.

Comments (Depth of Remediation, etc.):

During November 1990, one 10,000 gallon gasoline and two 12,000 gallon diesel USTs were removed from a shared excavation located adjacent to the vehicle service shop, identified as *"Area 4."* During February 1995, one 3,000 gallon diesel, one 10,000 gallon diesel, and one 1,000 gallon waste

Leaking Underground Fuel Storage Tank Program

III. RELEASE AND SITE CHARACTERIZATION INFORMATION (Continued)

oil and one 5,000 gallon new oil USTs were removed from *"Area 3," "Area 2," and "Area 1,"* respectively. Only those samples collected during the 1990 tank closures in *"Area 4"* revealed noteworthy levels of hydrocarbon compounds consistent with an unauthorized release. Consequently, only the *"Area 4"* tank closures and subsequent activities will be presented in the remainder of this report.

Historically, the subject UST area was reportedly a former gravel mining pit in the 1940s and 1950s. Mining continued vertically until reaching clay encountered at a reported depth of 30 to 40' BG. The pit was partially restored using pea gravel, and then converted to a "settling pond" where silts and clays were accumulated. The tank complex and shop structure of *"Area 4"* were built upon this former settling pond.

Initial samples collected from the base of the *"Area 4"* excavation identified up to 190 ppm TPH-D in sample KP-E4, collected in the southwest corner of the tank pit at an approximate depth of 11' BG. TPH-G and BTEX were not present above method detection limits. This area of the excavation was deepened to 25' BG at which point one bottom (KP-BOTTOM 1) and three (3) sidewall samples were collected. Up to 1600 ppm TPH-D was identified in the noted bottom sample, and 180 ppm TPH-D was identified in one of the sidewall samples collected at 8' BG.

A total of approximately 480 yds^3 was reportedly excavated from the *"Area 4"* pit during initial and subsequent excavation activities. The excavation was restored to grade using clean gravel derived from elsewhere at this site. Excavated soil from *"Area 4"* and the remaining UST sites totalling some 832 tons was transported to Forward landfill (Stockton, CA) during May 1997 for disposal.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? _____

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? _____

Does corrective action protect public health for current land use? YES
Site management requirements: NA

Should corrective action be reviewed if land use changes? YES

Monitoring wells Decommisioned: NO

Number Decommisioned: 0 Number Retained: 1 (pending case closure)

Leaking Underground Fuel Storage Tank Program

IV. CLOSURE (Continued)

List enforcement actions taken: None

List enforcement actions rescinded: None

RWQCB Staff Name: ~~Kevin Graves~~ Stephen Hill Title: ~~San. Eng. Assoc.~~ ES IV Sup Date: 1/5/98

VII. ADDITIONAL COMMENTS, DATA, ETC.

During March 1991, four soil borings were advanced through the former "Area 4" UST pit to depths ranging from 28 to 35.5' BG. A single monitoring well (MW-KP1) was installed within one of the borings. No detectable HC compounds were identified in soil samples collected from any of the borings to the depth explored (27.5 - 34' BG).

Well MW-KP1 was sampled quarterly through February 1993 and then yearly through February 1996. No detectable target compounds were identified in the final 3 annual sampling events. BTEX were never identified in any of the water samples at any time during this ground water investigation.

Subject: **Site Investigation Report for the Eastern Portion of AOC #2 and AOCs #3 through #9, ACEH Case #RO0002952 and Geotracker Global ID #SL0600101555, Hanson Aggregates Radum Facility, 3000 Busch Road Pleasanton, Alameda County, California**

Dear Mr. Wickham:

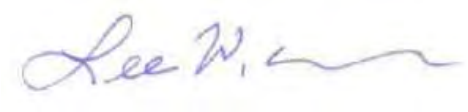
The enclosed "Site Investigation Report for the Eastern Portion of AOC #2 and AOCs #3 through #9, ACEH Case #RO0002952 and Geotracker Global ID#SL0600101555, Hanson Aggregates Radum Facility, 3000 Busch Road Pleasanton, Alameda County, California" ("the SI Report") was prepared by LFR Inc. (LFR) on behalf of Hanson Aggregates Northern California ("Hanson") for the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California ("the Site"). This report presents the findings of additional subsurface investigations conducted during July 2007 by LFR to further characterize the extent of contamination in specific areas of concern (AOCs) at the Site. The scope of work for the investigations conducted was described in a work plan that was submitted to Alameda County Environmental Health (ACEH) on May 16, 2007, and was approved by ACEH on June 22, 2007.

The investigations completed during July 2007 included advancing temporary soil borings to collect depth-discrete soil samples and grab groundwater samples in AOCs #2, #3, #7, and #8, and shallow sediment samples and a composite surface-water sample from the storm-water retention pond in AOC #6. In addition, four existing groundwater monitoring wells were located, purged, and sampled. This report includes an overview of environmental conditions, a summary of previous investigations conducted by LFR and other consultants, and a description of the field investigations completed during July 2007, and presents and discusses the results of the investigations.

As required, this report will be submitted electronically via the Alameda County Environmental Cleanup Oversight Program FTP website, and via the Regional Water Quality Control Board's Geotracker electronic submittal system.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report are true and correct to the best of my knowledge. If you have any questions or comments concerning this SI Report, please call me at (925) 426-4170 or Katrin Schliewen of LFR at (510) 652-4500.

Sincerely,



Lee W. Cover
Environmental Manager
Hanson Aggregates Northern California

Senior Associate Geologist

EXECUTIVE SUMMARY

This Site Investigation Report presents the findings of the additional investigations conducted at the Hanson Aggregates Radum Facility ("the Site") during July 2007. The purpose of the investigations was to further characterize the extent of affected soil and groundwater in areas of concern (AOCs) #2, #4, #6, #7, and #8. The environmental investigations were conducted according to the scope of work described in the May 16, 2007 "Work Plan for Additional Site Characterization at the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California," which was submitted to Alameda County Environmental Health (ACEH) and subsequently approved by ACEH on June 22, 2007, with certain modifications. Additional investigations are currently being conducted at AOC #1 (the former hot mix asphalt plant; ACEH Case Number RO0002941) under a separate scope of work, and the results of that investigation will be submitted to ACEH under separate cover on November 30, 2007.

The July 2007 investigations consisted of advancing a total of 16 temporary soil borings to depths ranging from approximately from 10 to 70 feet below ground surface. The purposes of the soil borings were to collect soil samples for lithologic logging and to collect depth-discrete soil samples and grab groundwater samples for laboratory analyses. Shallow sediment and surface-water samples were collected from the storm water retention pond for laboratory analyses. In addition, samples were collected from four existing groundwater monitoring wells for laboratory analyses. All analytical results were compared to the Environmental Screening Levels (ESLs) for soil or water beneath commercial/industrial land use areas published by the Regional Water Quality Control Board. The investigation and analytical results are presented and discussed in this report.

The analytical results of the soil and groundwater samples collected during the recent investigations have substantiated that the primary compounds of concern in soil and groundwater at the Site are total petroleum hydrocarbons (TPH) as diesel (TPHd) and TPH as motor oil (TPHmo). With a few exceptions, no other organic compounds were detected in soil and water samples collected, including TPH as gasoline (TPHg); volatile organic compounds (VOCs); benzene, toluene, ethylbenzene, and total xylenes (BTEX); fuel oxygenates; lead scavengers; semivolatile organic compounds (SVOCs); pesticides; and polychlorinated biphenyls (PCBs).

VOCs were detected in one grab groundwater sample at concentrations below the ESLs. The metals arsenic, cobalt, and chromium were detected in several samples at concentrations that exceeded the ESLs; however, these concentrations are within ranges published for naturally occurring metals detected in soils in the San Francisco Bay Area.

Results from these investigations, evaluated in conjunction with results from previous investigations, indicate that AOCs #2, #6, and #7 have been sufficiently characterized and that no additional investigations are warranted for these areas. Additional

subsurface investigations may be required to confirm an elevated TPHmo concentration detected in a grab groundwater sample collected from one soil boring at AOC #3. However, soil and grab groundwater samples collected from nearby sample locations (at AOC #3) indicate that this area has not been significantly affected by petroleum hydrocarbons.

LFR Inc. (LFR) does recommend that additional subsurface investigations be conducted at AOC #8 (SS-123 area), to further characterize the lateral extent of petroleum-affected groundwater to the south in the SS-123 area. Previous consultants have concluded that groundwater in this area may be perched; this has not been confirmed. LFR also recommends re-sampling existing groundwater monitoring well 3S/1E 10D8, located north of Lake I, to confirm the SVOC and dissolved mercury concentrations detected in the groundwater sample collected from this well.

1.0 INTRODUCTION

This Site Investigation Report presents the results and findings of additional subsurface investigations conducted by LFR Inc. (LFR) on behalf of Hanson Aggregates Northern California ("Hanson") to confirm and further assess the extent of affected soil and groundwater in areas previously identified as areas of concern (AOCs) at the Hanson Aggregates Radum Facility, located at 3000 Busch Road, Pleasanton, California ("the Site"; Figure 1). To facilitate the investigation of environmental conditions at the Site, LFR has subdivided the approximately 1,000-acre Site into nine AOC, as illustrated on Figure 2. The scope of work for the investigations conducted at the Site was described in the "Work Plan for Additional Site Characterization at the Hanson Aggregates Radum Facility, 3000 Busch Road, Pleasanton, California," submitted to Alameda County Environmental Health (ACEH) on May 16, 2007 ("the Work Plan"). The Work Plan was approved by ACEH on June 22, 2007, with modifications to the scope of work including advancing additional soil borings, collecting additional samples, and conducting additional analyses. ACEH is the regulatory agency overseeing the environmental characterization of the Site under ACEH case number #RO0002952 (Geotracker Global ID #SL0600101555).

In accordance with the scope of work in the Work Plan and as approved by ACEH, LFR conducted investigations that included collecting soil, sediment, surface-water, and groundwater samples at locations in the eastern portion of AOC #2 and in AOCs #3, #6, #7, and #8 (Figure 2). As described further below, no additional investigations were necessary in the western portion of AOC #2 and at AOCs #4, #5, and #9, and the report of the investigations planned to be conducted in AOC #1 (the former hot mix asphalt plant area) will be completed under a separate scope of work. In addition, in anticipation of a property transfer from Hanson to Legacy Partners ("Legacy"), LFR collected groundwater samples from existing groundwater monitoring wells owned by Alameda County Flood Control and Water Conservation District Zone 7 ("Zone 7") and located on the Site. Results for samples collected from existing groundwater monitoring wells are also presented in this report.

This report summarizes field activities performed at the Site during July 12 through 25, 2007, and presents and discusses results from these field activities. This report is organized as follows.

- Section 2.0 presents a description of the Site, the site history and potential environmental impacts, a summary of previous environmental investigations conducted at the Site, and an overview of regulatory oversight to date.
- Section 3.0 describes the methodology of the investigations conducted.
- Section 4.0 presents the results of the environmental investigations conducted to confirm or further characterize the extent of contamination previously identified in various AOCs of the Site.

- Section 5.0 describes the methodology to sample existing deep groundwater monitoring wells and presents the results of the well sampling.
- Section 6.0 presents the conclusions and recommendations developed based on the results of the environmental investigations and well sampling.
- Section 7.0 defines LFR's professional limitations.
- Section 8.0 provides a reference list of primary documents related to environmental investigations conducted at the Site to date.

2.0 SITE HISTORY OF POTENTIAL ENVIRONMENTAL IMPACTS AND PREVIOUS INVESTIGATIONS

2.1 Site Description and History

The Site is located at 3000 Busch Road, Pleasanton, California, and consists of approximately 1,050 acres located partly within the city limits of Pleasanton and partly within an unincorporated area of Alameda County (Figures 1 and 2). Approximately two-thirds of the Site consist of large ponds or lakes, namely Lake I, Lake H, and Cope Pond, created during historical aggregate mining operations (Figure 2). The remaining approximately 320 acres of the Site (generally the southern third) consist of developable land. As described in the Phase I Environmental Site Assessment (ESA) by ENV America Inc. (ENV 2006a), several buildings remain on the Site, including Hanson offices, a minimally used heavy equipment maintenance shop and two warehouses, an idle truck maintenance shop currently occupied and used by the City of Pleasanton garbage company, and several smaller structures including temporary trailers and a lube shed associated with the heavy equipment maintenance shop. Structures previously associated with the historical mining and aggregate product manufacturing, including the former hot mix asphalt and concrete batch plants, have been removed from the Site. Partial structures, including concrete foundations and miscellaneous debris, remain within the former hot mix asphalt plant area in the southwestern corner of the Site (AOC #1; Figure 2).

As described in ENV's Phase I ESA report, mining of sand and gravel in the Livermore-Amador Valley began prior to 1900. Mining operations for aggregate resources at the Site were begun in 1938 by Kaiser Sand and Gravel. Reportedly, as sections of the property were mined out, the former mining pits were used for storage and/or as disposal ponds for water (from dewatering of new pits) and fine-grained sediments (silt and sand) washed out of the aggregate material. In addition, some mining pits were likely backfilled with debris and mine waste, as is evident from debris encountered during drilling. Hanson purchased the property in 1991 and continued mining operations until 2001. Mining was discontinued at that time due to lack of available aggregate materials.

Within the former mining operations areas (e.g., the former hot mix asphalt and concrete batch plants), several former underground storage tanks (USTs) were used to store fuel products, including gasoline, diesel, or used or new motor oil. As described below, historical mining and aggregate processing operations at the Site (in particular in the former hot mix asphalt plant area) have resulted in localized petroleum hydrocarbon-affected soil and groundwater beneath the Site.

2.2 Regional and Site Geology and Hydrogeology

2.2.1 Regional Geology and Hydrogeology

The regional geology and hydrogeology summarized in this section are based on information provided in the most recent Zone 7 Annual Report for the Groundwater Management Program (Zone 7 2007). The Hanson Radum property is located in the Livermore-Amador Valley, an east-west trending valley surrounded by north-south trending faults and hills that are part of the Diablo Range. The Site lies within the Main Basin of the Livermore-Amador Valley Groundwater Basin and, more specifically, within the Amador Sub-Basin (Zone 7 2007).

The regional geology consists primarily of alluvial deposits (fan, stream, and lake) that range in thickness from a few feet at the margins to almost 800 feet in the west-central portions of the valley (Zone 7 2007). The alluvial deposits consist primarily of gravels and sands and are underlain by the Livermore Formation, which consists of relatively less permeable clayey gravels and sands, and silts and clays. Two major aquifer zones have been identified: the "Upper Aquifer Zone" and the "Lower Aquifer Zone." The Upper Aquifer Zone is generally unconfined and consists of unconsolidated coarse-grained alluvial sediments (primarily sandy gravel and sandy clayey gravel) encountered beneath surficial clays and between approximately 20 to 40 feet below ground surface (bgs) and 80 to 150 feet bgs. Permeable sediments encountered beneath the Upper Aquifer Zone and the underlying clay aquitard are grouped into the Lower Aquifer Zone, which is semi-confined to confined.

2.2.2 Site Geology and Hydrogeology

Subsurface investigations conducted by LFR during July 2007 have encountered unconsolidated sediments consisting predominantly of clays and silts with gravel and intervals of coarser-grained gravels and sands. Because of the historical activities at the Site, some areas may consist of native sediments while others may consist of fill material. The locations of the former aggregate mining pits are not well defined. In certain areas, including the SS-123 area (AOC #8), concrete or cement material was encountered during drilling (at approximately between 10 and 30 feet bgs), indicating that historical mining pits likely were located in this area and subsequently filled by debris from the former mining operations.

With the exception of the SS-123 area (AOC #8), groundwater beneath the Site has generally been encountered approximately between 45 and 65 feet bgs. During the July 2007 subsurface investigations summarized in this report, groundwater was encountered approximately between 65 and 70 feet in temporary soil borings located in AOCs #2, #3, and #7. During a previous investigation conducted in AOC #1 in November 2006, groundwater was encountered in temporary soil borings approximately between 45 and 55 feet bgs. The difference in depth to groundwater between the July 2007 and the November 2006 investigations may accurately define differences in the depth to groundwater in the different areas of the Site, or may reflect seasonal variations. During the July 2007 investigations, depth to groundwater also was measured in four existing groundwater monitoring wells to be approximately between 53 and 57 feet below the top of the well casing (TOC), which is equivalent to approximately 50 to 54 feet bgs assuming 3-foot well risers. However, these four monitoring wells have well screens deeper than 170 feet bgs and possibly are not monitoring the same shallow groundwater encountered in the temporary soil borings that were advanced to a maximum depth of 75 feet bgs.

In the SS-123 area, groundwater was encountered between 25 and 30 feet bgs during LFR's investigations in July 2007 and ENV's investigations conducted between February and May 2007. ENV has concluded that this represents a perched groundwater zone; however, the presence of a perched groundwater zone in this area has not been confirmed.

The local groundwater flow direction and gradient beneath the Site currently is not known. New shallow groundwater monitoring wells were installed in AOC #1 in October 2007. Water-level elevations measured at these new wells will be used to assess the local groundwater flow direction and gradient in the southwestern portion of the Site.

2.3 Summary of PECs/RECs and Previous Environmental Site Investigations

Several subsurface investigations have been conducted at the Site to date by various consultants, including Baseline Environmental Consulting ("Baseline"), ENV, Brown & Caldwell (B&C), and LFR. The investigations conducted by Baseline were conducted on behalf of Hanson during 1991 and 1995 and predominantly were associated with the removal of former USTs. ENV completed several investigations on behalf of Legacy during 2006 and 2007, including a Phase I ESA and a Phase II ESA, and additional subsurface sampling in randomly selected locations. These investigations were conducted as part of Legacy's due diligence work prior to entering into a purchase agreement with Hanson for the Site. B&C completed three investigations on behalf of Hanson during 2006 and 2007, including a Phase I ESA, a limited Phase II ESA, and a subsurface investigation to assess soil and groundwater quality near two former USTS removed from approximately north of the idle truck maintenance shop in 2003. Based on the results of the B&C subsurface investigations, regulatory closure for these two former USTs was granted in June 2007.

LFR conducted an additional Phase II subsurface investigation in the former hot mix asphalt plant area (AOC #1) in November 2006 on behalf of Hanson to confirm previous findings by ENV and to further characterize the extent of suspected petroleum hydrocarbon contamination. Based on the results of LFR's November 2006 investigation, Hanson reported to ACEH the presence of elevated concentrations of petroleum hydrocarbons in soil and groundwater beneath the former hot mix asphalt plant area. Because of the large number of individual investigations conducted at the Site by various consultants, ACEH requested that a single document be prepared presenting a summary of all potential or recognized environmental concerns (PECs or RECs) on a site-wide basis.

On May 16, 2007, LFR submitted the Work Plan, which included a summary of the history of the Site and a detailed summary of site-wide environmental conditions based on results from investigations conducted by LFR and other consultants (LFR 2007a). To facilitate the data review and to focus future proposed investigations at the Site, LFR defined the nine AOCs that contained one or more PECs or RECs. In order to identify a PEC or REC, LFR compared all available analytical results to the Environmental Screening Levels (ESLs) for commercial/industrial land use areas developed by the Regional Water Quality Control Board (RWQCB 2005). Concentrations were considered elevated, and a PEC or REC was identified, based on whether analytical results exceeded the ESLs. The nine AOCs are shown on Figure 2 and are described below.

- AOC #1 Former Hot Mix Asphalt Plant Area (investigation being conducted during October 2007 and results will be presented under separate cover)
- AOC #2 Idle Truck Maintenance Area
- AOC #3 Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Temporary Soil Boring EB-35
- AOC #4 Former Concrete Batch Plant Area
- AOC #5 Former Mining Operations Area
- AOC #6 Storm-Water Retention Pond
- AOC #7 PEC Identified by Temporary Soil Boring SS-31
- AOC #8 PEC Identified by Temporary Soil Boring SS-123
- AOC #9 Vulcan Materials Company Storm-Water Runoff Area

The following sections present a brief overview of known site conditions in each of the AOCs based on the more detailed information presented in the Work Plan. Site maps were prepared for each individual AOC and were presented in the Work Plan. The individual site maps have been updated for this report to include results from the subsurface investigations completed recently by ENV (ENV 2007c) and by LFR (reported herein). Figures 3 through 7 present updated detailed maps of AOCs #2, #3, #6, #7, and #8, respectively. In agreement with ACEH and as described below,

PECs/RECs within AOC #1 have been further characterized under a separate scope of work and the results of that investigation will be presented under separate cover. As such, a site plan for AOC #1 and detailed site description and history are not included in this report.

2.3.1 AOC #2: Idle Truck Maintenance Area

The former idle truck maintenance area is located in the west-central portion of the Site (AOC #2; Figures 2 and 3). The eastern portion of AOC #2 contains several structures, including the idle truck maintenance shop currently used by the Pleasanton Garbage Service Inc. and several trailers. Approximately seven former USTs have been removed from this AOC; these have been investigated and closed to the satisfaction of regulatory oversight agencies. An inactive 640-foot-deep water supply well owned by Zone 7, well 3E/1S 15F3, also known as well Kaiser #6, is located southwest of the idle truck maintenance shop and was sampled by ENV in February 2007 (sample name W-1; Figure 3).

The western portion of AOC #2 contains the idle truck maintenance yard and mostly undeveloped areas. Based on previous investigations, a PEC was identified near the northeastern corner of the maintenance yard during the Phase II ESA by ENV, based on the analytical results from soil samples collected from temporary soil boring EB-31. Former boring EB-31 was advanced by ENV reportedly because a former "waste pit" or disposal pond existed in this portion of the Site (ENV 2006b). Analytical results identified that the soil sample collected from approximately 10 feet bgs slightly exceeded the ESL for total petroleum hydrocarbons (TPH) as diesel (TPHd). Other soil samples collected from above and below the 10-foot interval did not exceed the ESLs.

LFR recommended that this PEC and data gap identified by the results from former soil boring EB-31 be further characterized laterally.

2.3.2 AOC #3: Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Temporary Soil Boring EB-35

The heavy equipment maintenance area and soil boring EB-35 are located in the north-central portion of the Site (AOC #3; Figures 2 and 4). This area encompasses several existing buildings and/or structures that were identified as PECs or RECs in the Work Plan, such as a heavy equipment maintenance shop and two warehouses (no longer significantly in use), the lube shed associated with the maintenance shop, a truck wash rack, sump, and associated oil-water separator, and two aboveground waste oil tanks. In addition, one active transformer located approximately at the northwestern corner of the building housing the Hanson offices was identified. Former soil boring EB-35 was advanced in a vacant area approximately 2,000 feet northeast of the Hanson offices as part of ENV's random sampling program (ENV 2007a). Although elevated concentrations of TPH were detected in shallow soil samples collected in the vicinity of

former boring EB-35, no known or suspected historical activities were reported to have taken place in this portion of the Site.

Following a review of subsurface investigations conducted by B&C and ENV, LFR identified only two PECs in AOC #3. Two soil samples collected from approximately 2 and 2.5 feet bgs near the northeastern corner of the lube shed resulted in TPHd concentrations that exceeded the ESL. Also, the soil samples collected from approximately 2 feet bgs from former soil boring EB-35 contained TPHd and TPH as motor oil (TPHmo) at concentrations above the ESLs. In the Work Plan, LFR recommended that additional subsurface investigations be conducted to further characterize the lateral extent of petroleum hydrocarbons in shallow soil in the vicinity of former soil borings B-1 and EB-35.

2.3.3 AOC #4: Former Concrete Batch Plant Area

The former concrete batch plant was located in the southwestern portion of the (AOC #4; Figure 2). The concrete batch plant was operated until 2004 when the majority of the equipment was removed. No structures remain from these operations, although four broken aboveground plastic tanks remain that likely contained plasticizers. One former diesel UST was removed in 1995, and confirmation sampling resulted in the receipt of a UST case closure letter from a regulatory agency (ACEH 1998). As discussed in the Work Plan, subsurface investigations conducted by ENV confirmed the former concrete batch plant operations did not significantly affect the subsurface and LFR did not identify any data gaps. Therefore, no additional subsurface investigations were proposed in the Work Plan.

2.3.4 AOC #5: Former Mining Operations Area

The former mining operations area was located in the central portion of the Site (AOC #5; Figure 2). Mining operations were conducted until 2004, when the majority of the equipment was removed. All that remains in this area are concrete slabs, large piles of broken concrete, and areas of bare earth. As discussed in the Work Plan, subsurface investigations conducted by ENV confirmed that the former mining operations area did not significantly affect the subsurface and LFR did not identify any data gaps. Therefore, no additional subsurface investigations were proposed in the Work Plan.

2.3.5 AOC #6: Storm-Water Retention Pond

The storm-water retention pond is located along the western boundary of the Site on the northern side of Busch Road adjacent to the Kiewit property (AOC #6; Figures 2 and 5). According to Hanson, the source of the water to this pond is surface runoff water diverted from the Kiewit property, the Pleasanton Garbage Service Inc. operations, and the Hanson property. There are three large-diameter (approximately 12- to 20-inch-diameter) pipes visible that appear to discharge water from these properties into the

pond; one pipe is located near the southwestern corner of the pond and two pipes are located near the southeastern corner of the pond.

ENV reported that sediment and surface-water samples collected from this pond in 1992 contained detectable concentrations of petroleum hydrocarbons (ENV 2006a). Surface-water and sediment samples subsequently were collected from the storm-water retention pond by ENV and B&C in 2006. Analytical results from one of the sediment samples and from the one surface-water sample, both collected near the southeastern corner of the pond by B&C, contained TPHd and TPHmo concentrations that exceeded the ESLs. In the Work Plan, LFR recommended that additional shallow sediment and surface-water samples be collected to confirm these results.

2.3.6 AOC #7: PEC Identified by Temporary Soil Boring SS-31

Temporary soil boring SS-31 was advanced by ENV approximately near the southeastern corner of Lake I (AOC #7; Figures 2 and 6), as part of its subsurface investigations conducted in randomly selected locations (ENV 2007a). LFR is not aware of any historical mining operations in this portion of the Site. The soil samples collected from approximately 2 and 40 feet bgs from former boring SS-31 contained TPHd and TPHmo concentrations that exceeded the ESLs. Based on these results, LFR recommended that four temporary soil borings be advanced in step-out locations to collect additional soil samples to characterize the lateral and vertical extent of petroleum hydrocarbon-affected soil in this area. Because the deepest soil sample collected contained elevated concentrations of TPH, in the Work Plan LFR also recommended the collection and analysis of grab groundwater samples in this area.

2.3.7 AOC #8: PEC Identified by Temporary Soil Boring SS-123

As part of its subsurface investigations conducted in randomly selected locations, ENV advanced temporary soil boring SS-123 in the area located between the Vulcan Materials Company (VMC) property and the former mining operations area (AOC #8; Figures 2 and 7; ENV 2007a). LFR is not aware of any historical mining operations that may have taken place in this portion of the Site. Analytical results for soil samples collected from former soil boring SS-123 in January 2007 indicated the presence of petroleum hydrocarbon-affected soil at depths of approximately 20 to 40 feet bgs. Based on these results, ENV advanced four additional temporary soil borings located approximately 25 feet to the north, east, south, and west of soil boring SS-123 in March 2007. Analytical results from soil and grab groundwater samples contained TPHd and TPHmo at concentrations that exceeded the ESLs in soil samples collected from approximately between 2 and 30 feet bgs, and in grab groundwater samples collected from approximately 30 feet bgs in each of the four soil borings.

Based on the results of the March 2007 investigation, ENV concluded that the groundwater encountered approximately between 25 to 30 feet bgs represented a perched groundwater interval (ENV 2007b), and that additional characterization was

necessary. ENV proposed to conduct a third investigation in May 2007, consisting of additional step-out temporary soil boring locations.

When LFR submitted the Work Plan to ACEH on May 16, 2007, the results of ENV's third investigation conducted during May 2007 in this area were not available. LFR did not make any recommendations for additional investigations in the Work Plan, pending the results of ENV's investigation. Subsequently, a draft summary report presenting the results from ENV's third investigation was made available to LFR on July 3, 2007, and LFR later obtained a copy of the final report dated June 2007 from the ACEH on-line document library (ENV 2007c).

According to ENV's June 2007 report, four temporary soil borings were advanced in locations stepping out approximately 125 feet to the east, south, west, and north of the original SS-123 location (Figure 5). Former soil borings SS-123(E) through SS-123(H) were advanced to depths of approximately 30 to 35 feet bgs. Elevated TPHd and TPHmo concentrations were detected in a depth-discrete soil sample collected from approximately 5 feet bgs in former soil boring SS-123(G) located farthest west. Elevated TPHd concentrations were detected in the soil samples collected from approximately 15 feet bgs from former soil borings SS-123(H), located to the north, and SS-123(E), located to the east. No other soil samples collected from the three soil borings advanced by ENV at locations to the west, north, and east contained elevated hydrocarbon concentrations. In addition, grab groundwater samples collected from former soil borings SS-123(E), SS-123(G), and SS-123(H) did not contain TPHd concentrations above the ESL, and TPHmo was not detected above the laboratory reporting limit. Based on these results, the lateral and vertical extents of hydrocarbon contamination have been sufficiently characterized to the west, north, and east of former boring SS-123.

Of the four step-out locations advanced by ENV, only the southernmost soil boring (SS-123(F)) contained elevated petroleum hydrocarbons in soil samples and in the grab groundwater sample. Soil samples collected from approximately 5, 10, 15, and 20 feet bgs contained TPHd concentrations that exceeded the ESL and the 5-foot soil sample contained TPHmo at a concentration that exceeded the ESL. The grab groundwater sample contained TPHd and TPHmo at concentrations that exceeded the ESL (Figure 5; ENV 2007c).

Based on ENV's draft results, LFR planned to advance four additional temporary soil borings in the vicinity of former soil boring SS-123 during the July 2007 site-wide investigations, to further assess the lateral extent of petroleum-affected soil and groundwater in this area. Three soil boring locations were identified as step-out locations from former soil boring SS-123(F). One soil boring location was selected to be approximately adjacent to the original soil boring SS-123, in order to collect continuous core samples and create a more detailed soil boring log (ENV collected soil samples at approximately every 10 feet), and to collect a grab groundwater sample (ENV did not collect a grab groundwater sample from former boring SS-123). LFR

planned to collect depth-discrete soil samples and grab groundwater samples from each soil boring.

2.3.8 AOC #9: Vulcan Materials Company Storm-Water Runoff Area

The VMC property is located adjacent to the Site and to the east and is an active aggregate mining and product facility. The VMC runoff area is located along the southeastern edge of the Site (AOC #9; Figure 2). According to the Phase II ESA report by ENV, previous reports indicated that surface-water runoff from the VMC property onto the Site has occurred in the past (ENV 2006b). Reportedly, a berm was installed between the VMC property and the Site to control surface-water runoff; the current condition of this berm could not be determined by LFR or Hanson.

ENV collected three shallow soil samples from the VMC storm-water runoff area during September 2006, approximately where surface-water runoff may have taken place. Analytical results showed that TPHd was slightly elevated in one of the soil samples; however, the soil samples collected approximately upgradient and downgradient from this soil sample did not contain significant TPHd or TPHmo concentrations. No data gaps were identified and LFR did not recommend any additional investigations for this area.

2.4 Regulatory Determinations

Based on its review of documentation and reports of environmental investigations conducted by various consultants on behalf of Hanson and Legacy, ACEH issued a letter to Hanson on March 16, 2007, requesting that a work plan be prepared to propose a scope of work for additional site-wide characterization investigations. ACEH requested that the work plan include:

- A detailed site history
- A description of current conditions and PECs or RECs
- An improved presentation of available analytical data
- Copies of relevant reports or documents not previously provided to ACEH, in particular regarding environmental investigations conducted at the neighboring Kiewit property and case closure letters from regulatory agencies for former USTs
- A scope of work for additional characterization investigations

LFR prepared and submitted the May 16, 2007 Work Plan to ACEH, addressing ACEH's requests. In the Work Plan, LFR included a summary of the various PECs and RECs on a site-wide basis, a comprehensive summary of all available analytical data, individual site maps presenting analytical data and site features and at appropriate scales, and a scope of work for additional characterization investigations (LFR 2007a). On June 20, 2007, a project planning meeting was held at the ACEH offices with

ACEH, Hanson, LFR, and Nuquest on behalf of Hanson, Legacy, and ENV, and AIG Environmental on behalf of Legacy, to discuss current site conditions, the Work Plan and proposed scope of work, and the anticipated property transfer for the majority of the Hanson property to Legacy. During this meeting, two areas were highlighted as being of primary environmental concern, namely the deep soil contamination in the northern portion of the former hot mix asphalt plant area and in the vicinity of former soil boring SS-123.

ACEH subsequently approved the Work Plan in a letter dated June 22, 2007, and provided technical comments consisting primarily of requests for advancing certain proposed soil borings deeper and conducting additional analyses on soil and/or groundwater samples collected from specific locations (ACEH 2007c). ACEH agreed with LFR that no additional investigations would be required in the western portion of AOC #2, and in AOCs #4, #5, and #9.

2.4.1 Property Transfer and New Case Number

In anticipation of the property transfer between Hanson and Legacy, the Radum property has been divided into two primary parcels. Investigations and summary reports are now being conducted separately for the two primary areas of the Site.

It is LFR's understanding that Hanson has retained the portion of the property delineated by the Lot Line Adjustment, the approximately 15-acre area defined as Parcel 1, and the small, irregularly shaped area located south of the Kiewit property, and that the rest of the Site has been transferred to Legacy. In anticipation of the planned property transfer from Hanson to Legacy, Hanson requested that ACEH assign a new Spills, Leaks, Investigations, and Cleanups (SLIC) case number to the portion of the property transferred to Legacy (LFR 2007b). ACEH approved this request (ACEH 2007d), and currently there exist two SLIC case numbers for the Site, defined as follows:

ACEH SLIC case number RO0002941 and Geotracker Global ID SLT19719376 refer to the approximately 15-acre Parcel 1 and the small area south of the Kiewit property, including AOC #1 and the western portion AOC #2.

ACEH SLIC case number RO0002952 and Geotracker Global ID SL0600101555 refer to the rest of the Hanson Radum property, including the eastern portion of AOC #2 and AOCs #3 through #9.

2.4.2 Investigation and Reporting Schedule

In accordance with the Work Plan and ACEH technical comments outlined in its June 22, 2007 letter, LFR conducted subsurface investigations in the eastern portion of AOC #2, and in AOCs #3, #6, #7, and #8, during July 2007. The results on these

investigations are summarized and discussed in this report, which has been transmitted to ACEH on October 26, 2007.

The subsurface investigations proposed to be conducted in the former hot mix asphalt plant area (AOC #1) and in the irregularly shaped area south of the Kiewit property were completed during October 2007. As approved by ACEH via e-mail on October 9, 2007, LFR will submit a summary report presenting results from these investigations on November 30, 2007.

2.5 Investigation Objectives

The primary objective of the subsurface investigations proposed in the Work Plan is to further characterize the lateral and/or vertical extent of petroleum hydrocarbons in soil and/or groundwater in AOCs #2, #3, #6, #7, and #8. Below is a summary of the investigations proposed to fill the data gaps.

AOC #2 - Idle truck maintenance area: advance three temporary soil borings near former boring EB-31 to characterize the lateral extent of TPHd in soil and to assess groundwater quality in this area of the Site.

AOC #3 - Heavy equipment maintenance and wash rack area, and former soil boring EB-35 area: advance one temporary soil boring near former boring B-1 to characterize the lateral and vertical extent of TPHd in soil and to evaluate whether groundwater has been affected in this area, and advance four temporary soil borings in the vicinity of former boring EB-35 to assess the lateral extent of TPHd and TPHmo in soil.

AOC #6 - Storm-water retention pond: collect sediment and surface-water samples from the pond to confirm previous TPHd and TPHmo results.

AOC #7 - Former soil boring SS-31 area: advance four temporary soil borings near former boring SS-31 to characterize the lateral and vertical extent of TPHd and TPHmo in soil and to assess groundwater quality in this area of the Site.

AOC #8 - Former soil boring SS-123 area: advance four temporary soil borings in the vicinity of former boring SS-123 to assess the lateral and vertical extent of TPHd and TPHmo in soil and groundwater in this area of the Site.

3.0 INVESTIGATION METHODOLOGY

3.1 Pre-Field Activities

3.1.1 Permitting

LFR applied for and received the appropriate soil boring drilling permit from Zone 7. Based on the drilling locations, no other permits were required for the proposed activities. A copy of the approved soil boring permit is included in Appendix A.

3.1.2 Subsurface Utility Clearance

LFR notified Underground Service Alert (USA) to identify any public underground utilities located in the vicinity of the proposed soil boring locations. LFR did not receive any utility alerts from USA. LFR also subcontracted a private underground utility locator to clear all proposed soil boring locations using geophysical and pipe/cable location methods. All proposed soil boring locations were cleared satisfactorily. Due to the extreme hardness of the surface soil and the presence of gravel in the upper 5 feet of soil, the temporary soil borings could not be started using hand-auger techniques as was proposed in the Work Plan as an additional precaution against encountering utilities during drilling.

3.1.3 Health and Safety Plan

A Health and Safety Plan (HSP) previously prepared by LFR for the subsurface investigations conducted at the former hot mix asphalt plant area in November 2006 was revised to address health and safety concerns specific to the planned field activities.

Health and safety tailgate meetings were conducted before beginning fieldwork each day, and fieldwork was monitored according to the HSP to ensure that appropriate health and safety procedures were followed during the field investigations. In addition, in accordance with standard Hanson Radum facility operations, LFR and LFR's subcontractors attended on-site health and safety training conducted by a Hanson representative.

3.2 Temporary Soil Borings

A total of 16 temporary soil borings was advanced to depths ranging approximately from 10 to 70 feet bgs in AOCs #2, #3, #7, and #8, as described below.

3.2.2 Soil Boring Advancement and Soil and Grab Groundwater Sampling Procedures

Drilling and Lithologic Logging

LFR subcontracted HEW Drilling Co., Inc., of Palo Alto, California, a state-certified drilling subcontractor, to advance the 16 temporary soil borings using hollow-stem auger (HSA) drilling technology using a CME-75 drill rig and an 8-inch-diameter HSA (although a larger drill rig and HSA were used to advance several soil borings in the SS-123 area, as explained in Section 3.2.3). The drilling and soil and grab groundwater sampling activities were completed during July 16 through 24, 2007. During drilling, continuous soil cores were collected for lithologic evaluation and field screening. LFR collected depth-discrete soil samples for laboratory analyses from intervals where field screening and field observations indicated the possible presence of petroleum hydrocarbons or other contaminants in the soil. Where no indication of contamination was observed in the soil cores, LFR collected depth-discrete soil samples at approximately 5-foot intervals, until groundwater was first encountered or to a target depth, depending on the soil boring location.

Field boring logs were prepared for each soil boring location, and lithologic and field screening results were recorded on the field boring logs. Field boring logs were prepared by an LFR field geologist based on visual lithologic soil logging procedures and the Unified Soil Classification System (ASTM D2488-00). All boring logs were reviewed, edited, and signed by a California Professional Geologist.

All downhole drilling and sampling equipment was appropriately cleaned with high-pressure hot water (steam cleaned) before use at each drilling location. After soil and groundwater samples were collected, each borehole was abandoned by sealing it with a mixture of cement and bentonite ("grout") from the bottom up to the ground surface using a tremie pipe if groundwater was present, or directly from the ground surface if no groundwater was present. Waste soil generated during drilling was placed on plastic tarps on the ground surface near each temporary soil boring and will be disposed of as necessary during future land development activities.

Soil Sampling

LFR attempted to collect continuous soil cores using California split-spoon-type samples driven in approximately 18-inch intervals. This was conducted variably, depending on soil conditions, in soil borings EB-35(A) through EB-35(D), B-1(A), EB-31(A), EB-31(C), and SS-31(A). The coarse-grained nature of the soils (typically gravels) made this sampling method difficult to nearly impossible in certain locations. Therefore, LFR switched to collecting 5-foot continuous cores during HSA drilling where necessary. The continuous coring resulted in somewhat poorer soil core recovery in certain soil borings. Where the California split-spoon sampler was used, soil cores were collected in brass tube liners. Where continuous coring methods were

used, soil samples selected for laboratory analyses were transferred from the core barrel to brass tube liners.

Depth-discrete soil samples were selected for laboratory analyses based on the potential presence of contaminants, in particular petroleum hydrocarbons, as apparent from field screening using a photoionization detector (PID) or from visual/olfactory evaluation of the soil cores. All soil samples selected to be submitted for laboratory analyses were properly labeled with the boring identification number and depth interval, the time and date of collection, and the initials of the sampler. Soil samples were stored in ice-chilled coolers that were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

Grab Groundwater Sampling

Ten of the 16 temporary soil borings were advanced until groundwater was first encountered to collect grab groundwater samples. After drilling was completed, a temporary well casing consisting of a polyvinyl chloride (PVC) well screen and casing was placed through the HSA and the HSA was raised approximately 3 to 5 feet to allow groundwater to enter the borehole. Grab groundwater samples were collected using clean, disposable bailers lowered into the PVC casing and gently pouring the groundwater from the bailer into the appropriate clean, laboratory-supplied sample containers. The sample containers were properly labeled with the boring identification number, the time and date of collection, and the initials of the sampler. Groundwater samples were stored in ice-chilled coolers along with the soil samples, and were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

Grab groundwater samples were successfully collected from each location where grab groundwater samples were proposed to be collected, although most soil borings needed to be advanced deeper than anticipated. Based on previous investigations conducted at the former hot mix asphalt plant, groundwater was anticipated to be encountered between approximately 50 and 55 feet bgs. During the drilling conducted site-wide in July 2007, however, borings were advanced to approximately 70 feet bgs in order to encounter sufficient groundwater for sampling, with the exception of the area near former soil boring SS-123 where groundwater previously had been encountered at approximately 30 feet bgs.

3.2.3 Temporary Soil Boring Locations and Target Depths

The locations of temporary soil borings advanced by LFR in AOCs #2, #3, #7, and #8 during July 16 though 24, 2007 are shown on Figures 3, 4, 6, and 7, respectively. Sample locations and target depths are described below.

Idle Truck Maintenance Area (AOC #2)

LFR advanced at total of three temporary soil borings in the idle truck maintenance area (AOC #2), in the vicinity of former soil boring EB-31, which was located approximately northeast of the idle truck maintenance yard. Soil borings EB-31(A) through EB-31(C) were advanced to further characterize the lateral and vertical extent of elevated TPHd and TPHmo concentrations detected in a soil sample previously collected from approximately 10 feet bgs in former boring EB-31. The three new soil borings were located approximately 15 feet southeast, southwest, and north, respectively, of former boring EB-31 (Figure 3). Soil borings EB-31(A) and EB-31(C) were advanced to approximately 20 feet bgs, and soil boring EB-31(B) was advanced to approximately 70 feet bgs until groundwater was first encountered. In each soil boring, depth-discrete soil samples were collected for laboratory analyses from approximately every 5 feet to approximately 20 feet bgs and analyzed for TPHd and TPHmo. A grab groundwater sample was collected from boring EB-31(B) and analyzed for TPHd; TPHmo; TPH as gasoline (TPHg); volatile organic compounds (VOCs); benzene, toluene, ethylbenzene, and total xylenes (BTEX); fuel oxygenates; and lead scavengers (Table 1).

Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Former Soil Boring EB-35 (AOC #3)

Five temporary soil borings were advanced in AOC #3 (Figure 4). One soil boring (B-1(A)) was located approximately 18 feet north of former soil boring B-1 near the lube shed, and was advanced to approximately 70 feet bgs to collect a grab groundwater sample.

Four soil borings (EB-35(A) though EB-35(D)) were advanced surrounding former soil boring EB-35, to further characterize the lateral and vertical extent of elevated TPHd concentrations detected in soil samples collected from approximately 2 feet bgs in these two areas (Figure 4). These four borings were located approximately 25 feet to the east, south, west, and north of former boring EB-35 and were advanced to approximately 10 or 11 feet bgs.

Continuous soil cores were collected from each temporary soil boring for lithologic logging, and depth-discrete soil samples were collected for laboratory analyses from approximately 5 and 10 feet bgs in each soil boring and were analyzed for TPHd, TPHmo, TPHg, polychlorinated biphenyls (PCBs), semivolatile organic compounds (SVOCs), and metals concentrations. An additional soil sample was collected from approximately 35 feet bgs (based on field screening results) at boring B-1(A) and analyzed for TPHd and TPHmo. A grab groundwater sample was collected from boring B-1(A) and was analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

PEC Identified by Former Soil Boring SS-31 (AOC #7)

AOC #7 was defined by elevated petroleum hydrocarbon concentrations detected in soil samples collected from former soil boring SS-31 (Figure 6). LFR advanced four temporary soil borings approximately surrounding former soil boring SS-31 to further characterize the lateral and vertical extent of elevated TPHd and TPHmo concentrations previously detected in soil samples from approximately 2 and 40 feet bgs. Soil borings SS-31(A) through SS-31(D) were located approximately 75 feet to the west, north, east, and south, respectively (Figure 6). Each soil boring was advanced to approximately 70 feet bgs to collect grab groundwater samples. Depth-discrete samples were collected for laboratory analyses from the four soil borings from approximately every 5 feet from ground surface to approximately 30 feet bgs, and then approximately every 10 feet bgs until groundwater was encountered. An additional depth-discrete soil sample was collected from the 52- to 53-foot interval in boring SS-31(A) based on the field screening results. All soil samples were analyzed for TPHd, TPHmo, TPHg, BTEX compounds, fuel oxygenates, and lead scavengers. In addition, the 5- and 10-foot samples were analyzed for pesticides, PCBs, SVOCs, and metals concentrations (Table 1).

Grab groundwater samples were collected from each of the four soil borings and analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

PEC Identified by Former Soil Boring SS-123 (AOC #8)

AOC #8 was defined by elevated petroleum hydrocarbon concentrations detected in soil samples collected from the initial former soil boring SS-123 (Figure 7). As described in Section 2.3.7, ENV subsequently advanced a total of eight soil borings in step-out locations from former boring SS-123 to investigate the nature and extent of potential petroleum hydrocarbon contamination in this area. Based on ENV's results, LFR proposed to advance three soil borings in step-out locations from former soil boring SS-123(F) and one temporary soil boring adjacent to the original former boring SS-123.

Soil boring SS-123(AA) was advanced approximately adjacent to former boring SS-123, to approximately 20 feet bgs to collect a continuous soil core and a grab groundwater sample, neither of which was collected from the original soil boring SS-123. In addition, based on ENV's conclusion that a perched zone of groundwater exists in the SS-123 area, LFR attempted to confirm the presence of perched groundwater. Soil boring SS-123(AA) was drilled using a relatively powerful HSA drilling rig (CME-95 instead of standard CME-75) and large-diameter HSA (16-inch diameter instead of standard 8-inch). LFR intended to advance the 16-inch-diameter HSA into a relatively less permeable interval, possibly beneath the perched groundwater zone, and then continue drilling deeper using the 8-inch-diameter HSA advanced inside the 16-inch-diameter HSA, which would serve as a temporary casing sealing the perched groundwater from deeper groundwater zones. However, the

suspected perched groundwater could not be adequately sealed from entering the borehole using the 16-inch-diameter HSAs; therefore, the presence of a perched groundwater zone could not be confirmed using this drilling method.

Soil borings SS-123(F1), SS-123(F2), and SS-123(F3) were advanced as step-out locations to former soil boring SS-123(F), and were located approximately 75 feet to the east, south, and west, respectively. Soil borings SS-123(F1) through SS-123(F3) were advanced to approximately 30 feet bgs. Continuous soil cores were collected and depth-discrete soil samples were collected from approximately every 5 feet until a grab groundwater sample could be collected from the first encountered groundwater.

3.3 Surface Sediment and Water Samples from the Storm-Water Retention Pond

LFR collected a total of four surface-sediment samples and one composite surface-water sample from the storm-water retention pond (AOC #6; Figure 5). LFR subcontracted NRC Environmental Services (NRC) of Alameda, California, to assist in collecting the samples from within the storm-water retention pond on July 13, 2007. NRC provided a boat that was lowered into the pond and from which two of the four sediment samples were collected from beneath the water using a potable dredge to collect the composite surface-water sample. The sediment collected using the dredge was placed in clean, laboratory-provided sample containers. The two sediment samples collected from the wet sediment above the surface water were collected by pushing clean sample containers into the sediment. The four sediment samples were collected approximately in line and approximately at 50-foot intervals between the southeastern corner of the pond and approximately the center of the pond. The southeasternmost sediment sample was collected approximately below the outflow of two large diameter pipes that appear to direct surface-water runoff from the Hanson and Kiewit properties into the pond.

The composite surface-water sample was collected by compositing surface water from approximately the southeastern and southwestern corners of the pond, approximately beneath the outflow of the two large-diameter pipes leading into the pond in the southeastern corner and one large-diameter pipe leading into the pond in the southwestern corner of the pond. The surface-water samples were collected directly into clean, laboratory-provided sample containers. All samples were placed in ice-chilled coolers, which were submitted to the analytical laboratory under strict chain-of-custody protocols on a daily basis.

The four storm-water sediment samples were analyzed for TPHd, TPHmo, and metal concentrations while the composite surface-water sample was analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, lead scavenger compounds, and metals concentrations (Table 1).

3.4 Laboratory Analyses

All soil and water samples selected for laboratory analyses were submitted to Curtis & Tompkins, Ltd. (C&T), a California-certified analytical laboratory located in Berkeley, California. All samples were analyzed for TPHd and TPHmo by U.S. Environmental Protection Agency (EPA) Method 8015 (after undergoing silica gel cleanup). Selected samples were analyzed variably for the following analyses: TPHg by EPA Method 8015 (soil and sediment samples) or EPA Method 8260 (groundwater and surface-water samples); VOCs, BTEX, fuel oxygenates, and lead scavengers by EPA Method 8260; pesticides by EPA Method 8081; PCBs by EPA Method 8082; SVOCs by EPA Method 8270; and metals (CAM 17 by EPA Method 6010). Table 1 presents a sample matrix that summarizes the laboratory analyses conducted from individual soil, groundwater, sediment, and surface-water samples.

3.5 Field Documentation

Field activities were documented using the appropriate forms for HSP tailgate meetings, field boring logs, sample labels, and chain-of-custody forms. Forms will be kept on file at LFR and will be available upon request.

3.6 Land Survey of Sample Locations

After all samples were collected, LFR subcontracted a licensed land surveyor to survey the location of individual temporary soil borings and the approximate location of the sediment and surface-water samples collected from the storm-water retention pond. All sample locations from the July 2007 field investigations presented on Figures 3 through 7 are based on the land survey results.

4.0 RESULTS OF ADDITIONAL SITE-WIDE CHARACTERIZATION

Results from investigations conducted in AOCs #2, #4, #7, and #8 and in the storm water retention pond (AOC #6) during July 2007 are summarized and discussed below. All analytical results are summarized in Tables 2 through 14, based on laboratory-certified analytical reports included in Appendix B. Soil boring logs for temporary soil borings are included in Appendix C. Analytical results for TPHd, TPHmo, and TPHg are presented on Figures 3 through 7.

All analytical results were compared to RWQCB ESLs for shallow or deep soils beneath commercial/industrial land use areas (RWQCB 2005). The ESLs are included in the summary tables. Compounds detected at concentrations that exceed the ESLs are highlighted in the tables and on the figures.

In general, the primary compounds detected in soil samples are TPHd and TPHmo. No other organic compounds, including TPHg, VOCs, BTEX, fuel oxygenates, lead

scavengers, SVOCs, pesticides, PCBs, or SVOCs, were detected in any soil or sediment samples. Although several metals were detected, only arsenic, cobalt, and chromium were detected at concentrations that exceeded the ESLs. One or more of these three metals were detected in shallow samples collected from AOCs #3, #6, and #7. However, the detected concentrations of these three metals are well within the reported ranges for naturally occurring metals for the San Francisco Bay Area, based on the report entitled "Analysis of Background Distributions of Metals in the Soil at Lawrence Berkeley National Laboratory (LBNL)," prepared by LBNL in June 2002. Based on the LBNL study, natural background ranges for arsenic, cobalt, and chromium in San Francisco Bay Area soils can be defined as follows (arithmetic mean plus or minus the standard deviation):

- Arsenic: 0.1 to 10.9 milligrams per kilogram (mg/Kg)
- Cobalt: 9.2 to 18.8 mg/Kg
- Chromium: 32 to 84 mg/Kg

Similarly, the primary compounds detected in grab groundwater samples are TPHd and TPHmo. With one exception, TPHg, BTEX, fuel oxygenates, and lead scavengers were not detected above laboratory reporting limits; toluene was detected in one grab groundwater sample at a concentration below the ESL. Several VOCs were detected in a grab groundwater sample collected from AOC #8, but none of these concentrations exceeded the ESLs. Several metals were detected in the surface-water sample, but no concentrations exceeded the ESLs.

4.1 Idle Truck Maintenance Area (AOC #2)

Predominantly fine-grained sediments (silts and clays) were encountered in soil borings EB-31(A), EB-31(B), and EB-31(C) (Figure 3). In soil boring EB-31(B), fine-grained sediments were encountered to approximately 62 feet bgs, below which relatively coarse-grained sediments (clayey gravel with sand) were encountered to the total depth of the soil boring (approximately 70 feet bgs). No evidence of petroleum-affected soil or groundwater was identified during drilling of these three soil borings.

TPHd and TPHmo were detected in several soil samples at concentrations significantly below their respective ESLs (100 mg/Kg for TPHd and 1,000 mg/Kg for TPHmo; Table 2A and Figure 3). All concentrations of TPHd and TPHmo were qualified by the laboratory, indicating that the hydrocarbons detected in the soil samples did not resemble TPHd or TPHmo; as noted by the laboratory, hydrocarbons detected generally were heavier than TPHd and lighter than TPHmo. Heavier hydrocarbons such as TPHmo typically consist of longer carbon chain hydrocarbons (C10 to C24) while lighter hydrocarbons such as TPHd typically consist of shorter chain hydrocarbons (C24 to C36). The laboratory qualifiers indicate that the detected concentrations do not resemble standards for TPHd and TPHmo.

At soil boring EB-31(B), groundwater was first encountered between 65 and 70 feet bgs. After drilling was completed, the depth to groundwater was measured at approximately 64.8 feet bgs. Continuous soil cores were collected from soil boring EB-31(B) from the ground surface to approximately 21.5 feet bgs, after which sediments were logged from auger cuttings because recovery was poor and continuous soil sampling was not required (the primary objective for drilling deeper than approximately 20 feet bgs at this location was to collect a grab groundwater sample). Petroleum hydrocarbons, VOCs including BTEX, fuel oxygenates, and lead scavenger compounds were not detected above the laboratory reporting limits in samples collected in this area (Tables 8A, 8B, and 9).

Based on the results from soil borings EB-31(A), EB-31(B), and EB-31(C), this area has been sufficiently characterized laterally and vertically. The potential petroleum hydrocarbon contamination identified in the 10-foot samples from former soil boring EB-31 appears to be limited to a localized area and depth. Groundwater does not appear to have been affected by petroleum hydrocarbons detected in soil in this area.

4.2 Heavy Equipment Maintenance and Wash Rack Area, and PEC Identified by Former Soil Boring EB-35 (AOC #3)

4.2.1 Wash Rack and Lube Shed Area

Soil boring B-1(A) was advanced in the vicinity of the lube shed to a total depth of 70 feet bgs (Figure 4). Predominantly fine-grained sediments (clays) were encountered from approximately 3 to 34 feet bgs. Predominantly coarser-grained sediments (sands and gravels) were encountered between 34 feet bgs and the total depth of the boring (70 feet bgs). No evidence of petroleum-affected soil was identified during drilling, with the exception of a slightly elevated PID reading at approximately 35 feet bgs. Only TPHmo was detected in the depth-discrete soil samples collected from boring B-1(A), in the sample collected from approximately 9.5 feet bgs at a low concentration just above the laboratory reporting limit. Several metals were detected above laboratory reporting limits, but none were detected at concentrations above the ESLs.

A grab groundwater sample was collected from soil boring B-1(A) at approximately 68 feet bgs. TPHmo was detected in this sample at a concentration of 1,100 micrograms per liter (μg/L), slightly above the ESL of 1,000 μg/L for TPHmo (Table 8A and Figure 4). The laboratory qualified the TPHmo result, stating that "hydrocarbons heavier than TPHmo contributed to the result." TPHd was detected at a concentration of 76 μg/L, and that result was also qualified by the laboratory; the TPHd detection was below the ESL for TPHd (100 μg/L; Table 8A). The only VOC detected in the grab groundwater sample was acetone, which was detected at a concentration of 10 μg/L. This concentration is well below the ESL of 1,500 μg/L for acetone (Table 9). Because acetone is a common laboratory contaminant and has not been detected in any other samples collected, this low acetone concentration may be associated with laboratory contamination. No other compounds were detected above

laboratory reporting limits for the grab groundwater sample collected from soil boring B-1(A) (Tables 8A, 8B, and 9).

4.2.2 PEC Identified by Former Soil Boring EB-35

In the four soil borings (EB35(A), EB35(B), EB35(C), and (EB35(D)) advanced in the vicinity of former boring EB-35, primarily gravels and/or sands were encountered from ground surface to approximately 3 to 5 feet bgs (Figure 4). Sediments below approximately 3 to 5 feet bgs were comprised of fine-grained material (silts and clays) to the total depth of the soil borings. In each soil boring except for EB-35(C), a black petroleum product was observed between approximately 2.5 and 4 feet bgs. The product was observed to be dry, similar to asphalt concrete, with a trace of oil (see soil boring log in Appendix C). It is assumed that this petroleum product is the same material that was sampled at soil boring EB-35 from approximately 2 feet bgs, which resulted in TPHd and TPHmo concentrations that exceeded the ESLs (Figure 4). TPHd and TPHmo were detected in the soil samples collected from approximately 5 feet bgs in borings EB-35(A), EB-35(B), and EB-35(D) (Table 2A and Figure 4). TPHd concentrations ranged from 38 to 160 mg/Kg, and TPHmo concentrations ranged from 540 to 3,600 mg/Kg. Only the 5-foot sample from boring EB-35(B) contained TPHd and TPHmo concentrations that exceeded the ESLs. All results were qualified by the laboratory as containing heavier hydrocarbons than the standards for TPHd and TPHmo.

TPHd and TPHmo were not detected above laboratory reporting limits in any of the soil samples collected from approximately 10 feet bgs, with the exception TPHmo detected at a low qualified concentration of 5.2 mg/Kg in a sample collected from boring EB-35(A) (Table 2A and Figure 4).

A grab groundwater sample was collected from former boring EB-35 by ENV in January 2007 from approximately 68 feet bgs. TPHd, TPHmo, and TPHg were not detected above laboratory reporting limits (Figure 4).

In general, analytical results for soil samples collected from soil borings EB-35(A) through EB-35(D) indicate that the lateral extent of petroleum-affected soil may extend farther south than the location of soil boring EB-35(B). However, the petroleum-affected soil appears to be limited to shallow soil (approximately less than 4 or 5 feet bgs), the petroleum product appears to be dry and not mobile, and groundwater quality has not been affected. LFR does not recommend that any additional subsurface investigations be conducted in this area. It is LFR's understanding that this property will be developed for commercial/industrial land use by Legacy. LFR recommends that, if affected soil is identified during the redevelopment of this area, the material should be removed as necessary.

4.3 PEC Identified by Former Soil Boring SS-31 (AOC #7)

Predominantly fine-drained sediments (clays and some silts) were encountered from ground surface to approximately 41 to 43 feet bgs in soil borings SS 31(C) and SS-31(D), to approximately 50 feet bgs in boring SS-31(B), and to approximately 65 feet bgs in boring SS-31(A) (Figure 6). Relatively coarser-grained sediments (gravels and some sands) were encountered below the fine-grained sediment to the total depth of each soil boring. Groundwater was encountered at approximately 66 feet bgs at each soil boring location. Visual observations identified the potential presence of petroleum hydrocarbons in soil samples from only soil boring SS-31(A), between approximately 52 and 53 feet bgs; however, the PID did not register a response. At soil boring SS-31(C), elevated PID readings were noted during field screening of the soil cores collected from the ground surface to approximately 35 feet bgs; however, no visual or olfactory evidence of petroleum-affected soil was noted. It is possible that the PID instrument was responding to organic matter that may have been present in the sediment or that the PID was malfunctioning.

TPHd and/or TPHmo were detected at low concentrations (approximately less than 35 mg/Kg for TPHd and less than 160 mg/Kg for TPHmo) in one soil sample collected from boring SS-31(A) (from approximately 2 feet bgs), in all soil samples collected from boring SS-31(B), and in three samples collected from borings SS-31(C) and SS-31(D) (Table 2A and Figure 6). Except for metals, no other compounds analyzed were detected above laboratory reporting limits for the soil samples collected from these soil borings (Tables 2A, 2B, 3, 4, 5, and 6). Several metals were detected above laboratory reporting limits; however, only three metals (arsenic, cobalt, and chromium) were detected at concentrations that exceeded the ESLs for these metals (Table 7). As noted in Section 4.0, the detected concentrations are well within the ranges of natural background concentrations for soils in the San Francisco Bay area.

The grab groundwater samples collected from each of the four soil borings did not contain any compounds above their laboratory reporting limits (Tables 8A, 8B, and 9).

Based on the field investigation and analytical results, the lateral and vertical extent of potential petroleum contamination previously identified in two samples collected from former soil boring SS-31 appears limited in extent to the immediate vicinity of former boring SS-31. It should be noted that the two soil samples from former boring SS-31, in which elevated TPHd and TPHmo concentrations were detected from approximately 2 and 40 feet bgs, resulted in nearly identical TPHd and TPHmo concentrations, and that the three soil samples collected from approximately 10, 20, and 30 feet bgs did not contain TPHd or TPHmo above laboratory reporting limits other than low concentrations of TPHd and TPHmo detected in the 10-foot sample. These results raise the question as to whether a field or a laboratory error could explain the presence of TPHd and TPHmo in the sample collected from 40 feet bgs. In any event, the analytical results from the 37 depth-discrete soil samples and the four grab groundwater samples collected from soil borings SS-312(A) through SS-31(D) confirm that, if there is any potential hydrocarbon contamination in this area, it is limited in extent both

vertically and laterally. LFR does not recommend any additional subsurface investigations for the vicinity of former soil boring SS-31.

4.4 PEC Identified by Former Soil Boring SS-123 (AOC #8)

4.4.1 Temporary Soil Boring SS-123(AA)

Soil boring SS-123(AA) was located approximately adjacent to the original soil boring SS-123 (Figure 7) and was advanced to approximately 20 feet bgs. Continuous soil cores were collected although soil recovery was less than 50% from ground surface to approximately 10 feet bgs. LFR encountered predominantly fine-grained sediment (clay or silt) from just below ground surface to the total depth of the soil boring. Petroleum hydrocarbon material described as hard black asphalt concrete (asphalt bound with gravel and sand, pieces up to 2-1/2 inches in diameter, no odor) was observed at approximately 7.5, 12.5, and 15.5 feet bgs. In addition, concrete material was encountered between approximately 14.5 and 15 feet bgs. Groundwater was encountered at approximately 16 feet bgs during drilling and was measured to be at approximately 15.6 feet bgs after the total depth of 20 feet bgs was reached.

Depth-discrete soil samples were collected from soil boring SS-123(AA) for TPHd and TPHmo analyses from approximately 5.5, 7.5, 10.5, and 15.5 feet bgs, and from 18 feet bgs, which was below the apparent water table. A grab groundwater sample also was collected from this soil boring for TPHd and TPHmo analyses. TPHd and TPHmo were detected in each of the soil samples, but only the soil sample collected from approximately 18 feet bgs (below the water table) contained TPHd and TPHmo at concentrations above the ESLs (Table 2A and Figure 7). The grab groundwater sample collected from this soil boring also contained TPHd and TPHmo at concentrations that exceeded the ESLs for TPHd and TPHmo (Table 8A).

4.4.2 Temporary Soil Borings SS-123(F1) through SS-123(F3)

Soil borings SS-123(F1), SS-123(F2), and SS-123(F3) were located approximately 75 feet east, south, and west, respectively, of former boring SS-123(F) (Figure 7). These three soil borings were advanced to approximately 30 feet bgs. As noted on the soil boring logs in Appendix C, significant intervals of concrete or cement materials were encountered in each of the three soil borings. Depth-discrete soil samples and a grab groundwater sample were collected from each soil boring and analyzed for TPHd and TPHmo (Table 1). The grab groundwater samples also were analyzed for TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers (Table 1).

In soil boring SS-123(F1), concrete or cement material was encountered (and mostly ground to powder during drilling) between approximately 9 and 15 feet bgs and again between approximately 18 and 25 feet bgs. Fine-grained sediments were encountered from ground surface to approximately 9 feet bgs (gravelly silt) and from approximately 25 feet bgs to the total depth of the boring (clay). No evidence of petroleum

hydrocarbon was observed during field screening. Depth to groundwater was measured to be approximately 21 feet bgs after drilling was completed. Depth-discrete soil samples for laboratory analyses were collected from approximately 5 and 15 feet bgs, and a grab groundwater sample was collected.

In soil boring SS-123(F2), silty gravel and gravelly silt were encountered from ground surface to approximately 15 feet bgs, and mostly concrete or cement material was encountered from approximately 16.5 feet bgs to the total depth of the boring, resulting in relatively poor sample recovery (less than 25%). No evidence of petroleum hydrocarbon was observed during field screening. Depth to groundwater was measured to be approximately 26 feet bgs after drilling was completed. Depth-discrete soil samples were collected from 6, 10, 17, and 21 feet bgs, and a grab groundwater sample was collected.

In soil boring SS-123(F3), predominantly fine-grained sediments were encountered (clays or silts). Concrete or cement material was identified between approximately 7 and 10 feet bgs, a significantly shorter interval than was encountered in nearby soil borings SS-123(F1) and SS-123(F2). The depth to groundwater was measured at approximately 27 feet bgs after drilling was completed. Depth-discrete soil samples were collected from approximately 5, 10, 15, 20, and 25 feet bgs, and a grab groundwater sample was collected.

With one exception, TPHd and TPHmo were detected above laboratory reporting limits in all soil and grab groundwater samples collected from soil borings SS-123(F1) through SS-123(F3) (Table 2A). These compounds were not detected in the soil sample collected from approximately 20 feet bgs from boring SS-123(F3). For soil samples, all reported TPHd and TPHmo concentrations were below the ESLs (Table 2A).

For grab groundwater samples, the reported TPHd and TPHmo concentrations exceeded the ESLs only in the grab groundwater sample collected from boring SS-123(F2) (Table 8A). Other than TPHd and TPHmo, several VOCs were detected at low concentrations ranging between the detection limit to 4.6 μg/L in the grab groundwater sample collected from boring SS-123(F2) (Tables 8A and 9). None of these VOC concentrations exceeded the ESLs, and no other compounds were detected. The VOCs detected in the grab groundwater sample from boring SS-123(F2) are associated with the elevated TPHd and TPHmo concentrations detected in this sample.

4.4.3 Investigation Results for the SS-123 Area

A review of analytical results for the SS-123 area shows that the lateral extent of petroleum-affected soil has been adequately characterized to the north, east, south, and west (Figure 7). The lateral extent of petroleum-affected groundwater has been adequately characterized to the west, north, and east, but not to the south. The analytical results for the grab groundwater sample collected from the southernmost soil boring, SS-123(F2), indicate the presence of TPHd and TPHmo concentrations that exceed the ESLs. Additional step-out grab groundwater sample locations will be

necessary to further characterize the extent of petroleum-affected groundwater to the south of former boring SS-123(F2).

The potential source of the petroleum hydrocarbon in groundwater in this area has not been characterized. ENV has concluded that the source of contamination in this area is a historical mining pit that was filled in with debris and sediment. In addition, ENV also concluded that the groundwater encountered in the SS-123 area is perched on relatively less permeable fill material or sediment. All investigations conducted in the SS-123 area have shown that groundwater is encountered at significantly shallower depths than in other areas of the Site. However, the presence of a perched groundwater interval has not been confirmed by investigations conducted to date.

4.5 Surface Sediment and Water Samples from the Storm-Water Retention Pond (AOC #6)

Analytical results for the four sediment samples (SED1 through SED4) collected from the storm-water retention pond are summarized in Tables 2A and 7, and sample locations are presented on Figure 5. TPHd and TPHmo were detected in each sediment sample, with the exception of the southeasternmost sediment sample (SED-1) in which TPHd was not detected above laboratory reporting limits (Figure 5). Only sample SED-3 contained a TPHd concentration that was equivalent to the ESL and therefore was highlighted in Table 2A as exceeding the ESL. Several metals were detected above the laboratory reporting limits, but, with only one exception, detected concentrations were below the ESL. Cobalt was detected in sample SED-4 at a concentration of 10 mg/Kg, which is equivalent to the ESL. As noted in Section 4.0, the concentration of cobalt detected in this sample is within the range of natural background concentrations for soil in the San Francisco Bay Area.

Analytical results for the composite surface-water sample (PW-2) are presented in Tables 8A, 8B, 9, and 10 and Figure 5. No petroleum hydrocarbons or VOCs were detected above laboratory reporting limits in the surface-water sample. Four metals were detected, but all at concentrations significantly less than the ESLs.

Based on the analytical results for the sediment and surface-water samples collected by LFR, there does not appear to be a significant impact to the storm-water retention pond from storm-water runoff from nearby properties. The elevated TPHd and TPHmo concentrations detected in the sediment and the pond water samples previously collected by B&C (Figure 5; B&C 2006b) were not confirmed. LFR does not recommend any additional investigations for the storm-water retention pond area.

5.0 SAMPLING OF EXISTING GROUNDWATER MONITORING WELLS

5.1 Wells Sampled and Sampling Methodology

5.1.1 Well TW-5

In accordance with the scope of work described in the Work Plan, LFR searched for missing groundwater monitoring well 3S/1E 14D1 (also known as well TW-5), reportedly installed approximately near the southwestern corner of Cope Pond. The date of installation and well construction information has not been included in the records kept by Zone 7. Zone 7 records indicate that the well could not be located in 1984 and was located in 2003. Verbally, Zone 7 stated that the well could not be found. According to Zone 7 records, this well is reported to be 103 feet deep.

LFR successfully located well TW-5 on July 12, 2007, during a site reconnaissance effort. The well was found to be in good condition with a 2-inch-diameter PVC well casing inside a 4-inch-square metal above-grade protective well box. LFR measured the depth to groundwater in the well to be 53.2 feet TOC and the total depth of the well to be approximately 110.7 feet TOC. On July 12, 2007, LFR purged and sampled well TW-5 using a disposable bailer. Purge water was disposed of on the ground surface in the vicinity of the well. Water-quality parameters were monitored during well purging and were recording on a field sheet (Appendix D). Purging was completed once water-quality parameters stabilized and at least three casing volumes were removed. Approximately 28 gallons of groundwater were purged from the well, equivalent to approximately three casing volumes. Groundwater samples collected from the well using the disposable bailer were poured into clean, laboratory-provided sample containers, properly labeled, and placed into an ice-chilled cooler for transport to the laboratory under chain-of-custody protocol. The samples were analyzed by C&T for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, and lead scavengers.

5.1.2 Additional Monitoring Wells Sampled

On July 12, 2007, Hanson received a request from ENV (on behalf of Legacy) to collect samples from four existing wells (monitoring or water supply) located on or near the Hanson property. LFR, Hanson, and ENV together identified four existing groundwater monitoring wells to be sampled, namely: 3S/1E 14D1, 3S/1E 10D8, 3S/1E 10K2, and 3S/1E 10N3 (Figure 8). ENV requested that samples from each well be analyzed for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates, lead scavengers, SVOCs, and dissolved metals. One of the wells requested to be sampled was TW-5 (3S/1E 14D1), which LFR had already sampled. Fortunately, LFR had collected sufficient sample volume to request the laboratory to analyze the samples for the additional compounds requested by ENV.

At Hanson's request, LFR coordinated with Zone 7 to identify and gain access to the remaining three groundwater monitoring wells proposed to be sampled. LFR

subcontracted Blaine Tech Environmental Services ("Blaine Tech"), an environmental field services consultant from San Jose, California, to purge the three remaining groundwater monitoring wells on July 25, 2007. A summary of known or estimated well details is provided in the table below.

Well ID	Approximate Location	Well Diameter (inches)	Total Depth (Zone 7 Records) (feet bgs)	Well Screen Interval (Zone 7 Records) (feet bgs)	Depth to Groundwater on July 12 or July 25, 2007 (feet TOC)
3S/1E 14D1 (TW-5)	Southwestern corner of Cope Pond	2	103	Unknown	53.20
3S/1E 10D8	North of Lake I	2	215	190 – 210	56.32
3S/1E 10K2	Northwestern corner of Cope Pond	4	590.6	Unknown	55.50
3S/1E 10N3	South of Lake I	2	195	170 - 190	56.80

Blaine Tech used a 2-inch-diameter Rediflo electric submersible pump in the 2-inch-diameter wells and a 2-inch-diameter Grunfos pump in the 4-inch-diameter well to purge approximately three casing volumes from each of the three wells. Water-quality parameters were monitored and recorded on field sheets (Appendix D). Purging was completed once water-quality parameters stabilized and at least three casing volumes were removed. Purge water was temporarily contained in a plastic tank (estimated to be 500 gallons) on a trailer and was them disposed of in Cope Pond, in agreement with Zone 7 and Hanson. Approximately 75 gallons of purge water were removed from well 3S/1E 10D8, 1,043 gallons from well 3S/1E 10K2, and 64.5 gallons from well 3S/1E 10N3. After purging was completed at each well, groundwater samples were collected using a single-use disposal bailer. At ENV's request, a blind duplicate groundwater sample was collected from well 3S/1E 10K2. The blind duplicate sample was labeled "MW-10." As an additional quality assurance/quality control (QA/QC) measure, a trip blank sample was collected and analyzed for selected VOCs.

Groundwater samples were poured into clean, laboratory-provided sample containers, properly labeled, and placed into an ice-chilled cooler for transport to the laboratory under chain-of-custody protocol. The samples were analyzed by C&T for TPHd, TPHmo, TPHg, VOCs, BTEX, fuel oxygenates and lead scavengers, SVOCs, and dissolved metals.

5.2 Analytical Results

Analytical results for groundwater samples collected from the four existing groundwater monitoring wells are summarized in Tables 11A, 11B, 12, 13, and 14. Analytical results for TPHd, TPHmo, and TPHg also are presented on Figure 8.

Petroleum hydrocarbon-related compounds were not detected above laboratory reporting limits in any of the groundwater monitoring wells sampled, including TPHd, TPHmo, TPHg, BTEX, fuel oxygenates, and lead scavengers. In addition, VOCs were not detected in any of the groundwater samples, although the VOC bromomethane was detected at an estimated concentration below the laboratory reporting limit in the trip blank sample (Table 12). Because this compound was not detected in any of the groundwater samples, no QA/QC problems were noted. The groundwater sample collected from well 3S/1E 10D8 did contain a low concentration of one SVOC; bis(2-ethylhexyl)phthalate was detected at a concentration of 25 μg/L. This concentration exceeded the ESL for this compound (4 μg/L). Bis(2-ethylhexyl)phthalate is a plasticizer commonly associated with PVC and other plastics. This compound also is a known laboratory contaminant. The laboratory did not identify any evidence of laboratory contamination from this compound during the period that these groundwater samples were analyzed. The well casing for well 3S/1E 10D8 is made of PVC. It is possible that the presence of this SVOC may be due to the well casing and/or to the plastic tubing or fittings used to purge the well. Because no known use of plasticizers is associated with facilities and manufacturing processes historically present at the Site, it is assumed that this detection is not associated with historical industries. LFR recommends the re-sampling of this well to confirm this SVOC detection.

A few dissolved metals were detected above laboratory report limits, although, with only one exception, none of the detections exceeded the ESLs (Table 14). Dissolved mercury was detected in the groundwater sample collected from well 3S/1E 10D8 at a concentration of 0.63 μg/L, which is above the ESL for mercury (0.012 μg/L). No potential source of mercury has been identified, and mercury was not detected in any of the other groundwater samples. LFR also recommends the re-sampling of this well to confirm this detection.

6.0 SUMMARY AND RECOMMENDATIONS

6.1 Summary

The investigations conducted during July 2007 consisted of advancing a total of 16 temporary soil borings in AOCs #2, #4, #7, and #8, to depths ranging from approximately 10 to 70 feet bgs. The soil borings were advanced to collect continuous cores for lithologic logging and depth discrete soil samples and grab groundwater samples for laboratory analyses. Shallow sediment and surface-water samples were collected from the storm-water retention pond in AOC #6 for laboratory analyses. In

addition, four existing groundwater monitoring wells were sampled for laboratory analyses. All investigation and analytical results were presented and discussed in this report.

The primary compounds of concern at the Site are TPHd and TPHmo. No other organic compounds were detected, including TPHg, VOCs, BTEX, fuel oxygenates, lead scavengers, SVOCs, pesticides, PCBs, and SVOCs, in any soil samples collected from soil borings or samples collected from the storm-water retention pond. With one exception, none of these compounds were detected in any grab groundwater samples collected from the soil borings. Several VOCs were detected in one grab groundwater sample collected from the SS-123 area; however, concentrations were low and well below the ESLs.

Several metals were detected in soil or water samples, although only arsenic, cobalt, and chromium were detected in soil samples at concentrations that exceeded the ESLs. However, the metals concentrations that exceeded the ESLs are well within the concentration ranges published for naturally occurring metals detected in soils in the San Francisco Bay Area (LBNL 2002).

Groundwater samples collected from the existing monitoring wells did not contain organic compounds detected at concentrations above laboratory limits, with the exception of one SVOC. The compound bis(2-thylhexyl)phthalate was detected in one groundwater well sample at a concentration that exceeded the ESL. This compound is a known laboratory contaminant and a plasticizer commonly associated with PVC and other plastics. This same sample also contained dissolved mercury at a concentration greater than the ESL.

6.1 Recommendations

Results from investigations conducted by LFR during July 2007, evaluated in conjunction with results from previous investigations, indicate that AOCs #2, #6, and #7 have been sufficiently characterized. LFR does not recommend any additional investigations be conducted in these areas.

Additional subsurface investigations may be required in AOC #3 to confirm the analytical results for the grab groundwater sample collected from soil boring B-1(A) in which TPHmo was detected at a concentrations that exceeded the ESL. However, soil samples and a grab groundwater sample collected from less than 200 feet away from soil boring B-1(A) indicate that the petroleum hydrocarbon-affected soil (or groundwater) at this AOC is not a widespread problem.

LFR recommends that additional subsurface investigations be conducted in AOC #8 (SS-123 area) to further characterize the lateral extent of petroleum-affected groundwater south of soil boring SS-123(F2). Based on the results of the soil and groundwater samples collected in the SS-123 area, soil and groundwater quality has

been sufficiently characterized laterally to the west, north, and east. Previous consultants have concluded that groundwater in this area may be perched; the presence of a perched groundwater zone has not been confirmed.

To confirm the SVOC and dissolved mercury concentrations detected in the groundwater sample collected from existing monitoring well 3S/1E 10D8 located north of Lake I, LFR recommends re-sampling the well.

7.0 LIMITATIONS

The opinions and recommendations presented in this report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by LFR and the party for whom this report was originally prepared. This report is an instrument of professional service and was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and circumstances established by the environmental consulting industry. No representation, warranty, or guarantee, express or implied, is intended or given. To the extent that LFR relied upon any information prepared by other parties not under contract to LFR, LFR makes no representation as to the accuracy or completeness of such information. This report is expressly for the sole and exclusive use of the party for whom this report was originally prepared for a particular purpose. Only the party for whom this report was originally prepared and/or other specifically named parties have the right to make use of and rely upon this report. Reuse of this report or any portion thereof for other than its intended purpose, or if modified, or if used by third parties, shall be at the user's sole risk.

Results of any investigations or testing and any findings presented in this report apply solely to conditions existing at the time when LFR's investigative work was performed. It must be recognized that any such investigative or testing activities are inherently limited and do not represent a conclusive or complete characterization. Conditions in other parts of the Site may vary from those at the locations where data were collected. LFR's ability to interpret investigation results is related to the availability of the data and the extent of the investigation activities. As such, 100% confidence in environmental investigation conclusions cannot reasonably be achieved.

LFR, therefore, does not provide any guarantees, certifications, or warranties regarding any conclusions regarding environmental contamination of any such property. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and applicable laws, codes, regulations, or standards.

Notes:

AOC = area of concern

feet bgs = feet below ground surface

"~" = approximate sample depth

"1" = analyzed

"-" = not analyzed

na = not applicable

* MW-10 = blind duplicate of 3S/1E 10K2

TPHd = total petroleum hydrocarbons as diesel by EPA Method 8015 (after silica gel cleanup)

TPHmo = total petroleum hydrocarbons as motor oil by EPA Method 8015 (after silica gel cleanup)

TPHg = total petroleum hydrocarbons as gasoline by EPA Method 8015 (soil) and 8260 (water)

VOCs = volatile organic compounds by EPA Method 8260

BTEX = benzene, toluene, ethylbenzene, and total xylenes by EPA Method 8260

Fuel Ox = fuel oxygenates by EPA Method 8260

Lead Scav = lead scavengers by EPA Method 8260

Pest = organochlorine pesticides by EPA Method 8081

PCBs = polychlorinated biphenyls by EPA Method 8082

SVOCs = semivolatile organic compounds by EPA Method 8270

Metals = CAM17 metals (total concentrations in soil samples; dissolved concentrations in water samples) by EPA Method 6010

Table 2A - Summary of Analytical Results of
Petroleum Hydrocarbons and Associated Compounds Detected in Soil Samples
Hanson Radum Facility, 3000 Busch Road, Pleasanton, California

(Concentrations reported in milligrams per kilogram (mg/Kg) or micrograms per kilogram (ug/Kg), as noted)

Sample Location	Sample ID	Date Sampled	Sample Interval top (feet bgs)	Sample Interval bottom (feet bgs)	Matrix	Total Petroleum Hydrocarbons TPHd (mg/Kg)	TPHmo (mg/Kg)	TPHg (mg/Kg)	BTEX compounds B (ug/Kg)	T (ug/Kg)	E (ug/Kg)	m,p-X (ug/Kg)	o-X (ug/Kg)

Notes:

feet bgs = feet below ground surface

mg/Kg = milligrams per kilogram

ug/Kg = micrograms per kilogram

TPHd = total petroleum hydrocarbons as diesel

TPHmo = total petroleum hydrocarbons as motor oil

TPHg = total petroleum hydrocarbons as gasoline

BTEX = benzene, toluene, ethylbenzene, and total xylenes

B = benzene

T = toluene

E = ethylbenzene

m,p-X = m,p-xylenes

o-X = o-xylenes

bold indicates that the compound was detected above the laboratory reporting limit.

1,500 H boxed values exceed the respective ESL.

"<" = not detected above the laboratory report given

"-" = sample not analyzed

H = heavier hydrocarbons contributed to the quantitation

L = lighter hydrocarbons contributed to the quantitation

Y = sample exhibites chromatographic pattern which does not resemble standard

Z = sample exhibits unknown single peak or peaks

ESLs = Environmental Screening Levels by San Francisco Bay Regional Water Quality Control Board, February 2005, for Shallow or Deep Soils (as noted) beneath Industrial/Commercial Land Use Areas where Groundwater is a Current or Potential Source of Drinking Water.
