Query Criteria: Quad IS (Santa Teresa Hills (3712127) OR San Jose East (3712137))

Species	Element Code	Federal Status	State Status	Global Rank	State Rank	Rare Plant Rank/CDFW SSC or FP
Adela oplerella Opler's longhorn moth	IILEE0G040	None	None	G2	S2	
Agelaius tricolor tricolored blackbird	ABPBXB0020	None	Threatened	G1G2	S2	SSC
Ambystoma californiense pop. 1 California tiger salamander - central California DPS	AAAAA01181	Threatened	Threatened	G2G3T3	S3	WL
Aneides niger Santa Cruz black salamander	AAAAD01070	None	None	G3	S3	SSC
Anniella pulchra Northern California legless lizard	ARACC01020	None	None	G3	S2S3	SSC
Anodonta californiensis California floater	IMBIV04220	None	None	G3Q	S2?	
Antrozous pallidus pallid bat	AMACC10010	None	None	G4	S3	SSC
Aquila chrysaetos golden eagle	ABNKC22010	None	None	G5	S3	FP
Ardea alba great egret	ABNGA04040	None	None	G5	S4	
Ardea herodias great blue heron	ABNGA04010	None	None	G5	S4	
Athene cunicularia burrowing owl	ABNSB10010	None	None	G4	S2	SSC
Balsamorhiza macrolepis big-scale balsamroot	PDAST11061	None	None	G2	S2	1B.2
Bombus caliginosus obscure bumble bee	IIHYM24380	None	None	G2G3	S1S2	
Bombus crotchii Crotch bumble bee	IIHYM24480	None	Candidate Endangered	G2	S2	
Bombus occidentalis western bumble bee	IIHYM24252	None	Candidate Endangered	G3	S1	
Calyptridium parryi var. hesseae Santa Cruz Mountains pussypaws	PDPOR09052	None	None	G3G4T2	S2	1B.1
Centromadia parryi ssp. congdonii Congdon's tarplant	PDAST4R0P1	None	None	G3T2	S2	1B.1
Chlorogalum pomeridianum var. minus dwarf soaproot	PMLIL0G042	None	None	G5T3	S3	1B.2
Chorizanthe robusta var. robusta robust spineflower	PDPGN040Q2	Endangered	None	G2T1	S1	1B.1
Cirsium fontinale var. campylon Mt. Hamilton thistle	PDAST2E163	None	None	G2T2	S2	1B.2

Species	Element Code	Federal Status	State Status	Global Rank	State Rank	Rare Plant Rank/CDFW SSC or FP
Clarkia concinna ssp. automixa Santa Clara red ribbons	PDONA050A1	None	None	G5?T3	S3	4.3
Collinsia multicolor San Francisco collinsia	PDSCR0H0B0	None	None	G2	S2	1B.2
Corynorhinus townsendii Townsend's big-eared bat	AMACC08010	None	None	G4	S2	SSC
Coturnicops noveboracensis yellow rail	ABNME01010	None	None	G4	S2	SSC
Cypseloides niger black swift	ABNUA01010	None	None	G4	S3	SSC
Dicamptodon ensatus California giant salamander	AAAAH01020	None	None	G2G3	S2S3	SSC
Dudleya abramsii ssp. setchellii Santa Clara Valley dudleya	PDCRA040Z0	Endangered	None	G4T2	S2	1B.1
Egretta thula snowy egret	ABNGA06030	None	None	G5	S4	
Emys marmorata western pond turtle	ARAAD02030	None	None	G3G4	S3	SSC
Euphydryas editha bayensis Bay checkerspot butterfly	IILEPK4055	Threatened	None	G5T1	S3	
Fritillaria liliacea fragrant fritillary	PMLIL0V0C0	None	None	G2	S2	1B.2
Gonidea angulata western ridged mussel	IMBIV19010	None	None	G3	S2	
Hoita strobilina Loma Prieta hoita	PDFAB5Z030	None	None	G2?	S2?	1B.1
Lasiurus cinereus hoary bat	AMACC05032	None	None	G3G4	S4	
Lasthenia conjugens Contra Costa goldfields	PDAST5L040	Endangered	None	G1	S1	1B.1
Lessingia micradenia var. glabrata smooth lessingia	PDAST5S062	None	None	G2T2	S2	1B.2
Malacothamnus arcuatus arcuate bush-mallow	PDMAL0Q0E0	None	None	G2Q	S2	1B.2
Malacothamnus hallii Hall's bush-mallow	PDMAL0Q0F0	None	None	G2	S2	1B.2
Microcina homi Hom's micro-blind harvestman	ILARA47020	None	None	G1	S2	
Monolopia gracilens woodland woollythreads	PDAST6G010	None	None	G3	S3	1B.2
Myotis evotis long-eared myotis	AMACC01070	None	None	G5	S3	

Species	Element Code	Federal Status	State Status	Global Rank	State Rank	Rare Plant Rank/CDFW SSC or FP
Myotis yumanensis Yuma myotis	AMACC01020	None	None	G5	S4	
Neotoma fuscipes annectens San Francisco dusky-footed woodrat	AMAFF08082	None	None	G5T2T3	S2S3	SSC
Nycticorax nycticorax black-crowned night heron	ABNGA11010	None	None	G5	S4	
Oncorhynchus mykiss irideus pop. 8 steelhead - central California coast DPS	AFCHA0209G	Threatened	None	G5T3Q	S3	
Penstemon rattanii var. kleei Santa Cruz Mountains beardtongue	PDSCR1L5B1	None	None	G4T2	S2	1B.2
Phrynosoma blainvillii coast horned lizard	ARACF12100	None	None	G4	S4	SSC
Plagiobothrys glaber hairless popcornflower	PDBOR0V0B0	None	None	GX	SX	1A
Rana boylii pop. 4 foothill yellow-legged frog - central coast DPS	AAABH01054	Proposed Threatened	Endangered	G3T2	S2	
Rana draytonii California red-legged frog	AAABH01022	Threatened	None	G2G3	S2S3	SSC
Senecio aphanactis chaparral ragwort	PDAST8H060	None	None	G3	S2	2B.2
Serpentine Bunchgrass Serpentine Bunchgrass	CTT42130CA	None	None	G2	S2.2	
Streptanthus albidus ssp. albidus Metcalf Canyon jewelflower	PDBRA2G011	Endangered	None	G2T1	S1	1B.1
Streptanthus albidus ssp. peramoenus most beautiful jewelflower	PDBRA2G012	None	None	G2T2	S2	1B.2
Taxidea taxus American badger	AMAJF04010	None	None	G5	S3	SSC

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Santa Clara County, California

Local office

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building

2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
San Joaquin Kit Fox Vulpes macrotis mutica Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/2873	Endangered

Birds

NAME	STATUS
California Condor Gymnogyps californianus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8193	Endangered
California Least Tern Sterna antillarum browni Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/8104	Endangered
Marbled Murrelet Brachyramphus marmoratus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/4467	Threatened

Amphibians

NAME	STATUS
California Red-legged Frog Rana draytonii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2891	Threatened

NOT FOR CONSULTATION

California Tiger Salamander Ambystoma californiense — Threatened
There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
https://ecos.fws.gov/ecp/species/2076

Foothill Yellow-legged Frog Rana boylii — Proposed Threatened
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/5133

Insects

NAME	STATUS

Bay Checkerspot Butterfly Euphydryas editha bayensis — Threatened
Wherever found
There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
https://ecos.fws.gov/ecp/species/2320

Monarch Butterfly Danaus plexippus — Candidate
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/9743

Flowering Plants

NAME	STATUS

Metcalf Canyon Jewelflower Streptanthus albidus ssp. albidus — Endangered
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/4186

Santa Clara Valley Dudleya Dudleya setchellii — Endangered
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/3207

NOT FOR CONSULTATION

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

Bald & Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act and the Migratory Bird Treaty Act.

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

Additional information can be found using the following links:

- Eagle Managment https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

There are bald and/or golden eagles in your project area.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list,click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON

NOT FOR CONSULTATION

Bald Eagle Haliaeetus leucocephalus — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the

NOT FOR CONSULTATION

probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

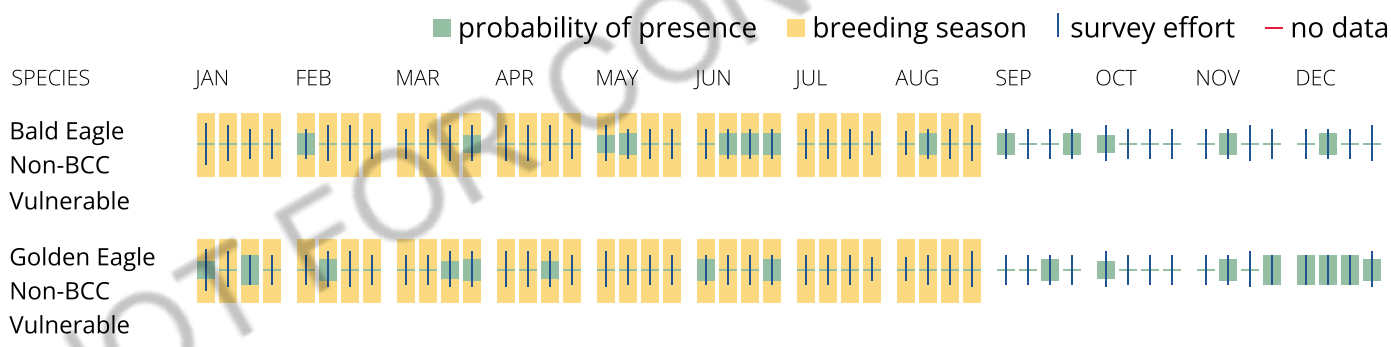
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply). To see a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs of bald and golden eagles in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur. Please contact your local Fish and Wildlife Service Field Office if you have questions.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern https://www.fws.gov/program/migratory-birds/species
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date

range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
Belding's Savannah Sparrow Passerculus sandwichensis beldingi This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/8	Breeds Apr 1 to Aug 15
Bullock's Oriole Icterus bullockii This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Mar 21 to Jul 25
California Gull Larus californicus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 1 to Jul 31
California Thrasher Toxostoma redivivum This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Jul 31

NOT FOR CONSULTATION

Clark's Grebe Aechmophorus clarkii — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3914

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

NOT FOR CONSULTATION

Western Grebe aechmophorus occidentalis — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/6743

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Yellow-billed Magpie Pica nuttalli — Breeds Apr 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9726

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

NOT FOR CONSULTATION

3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

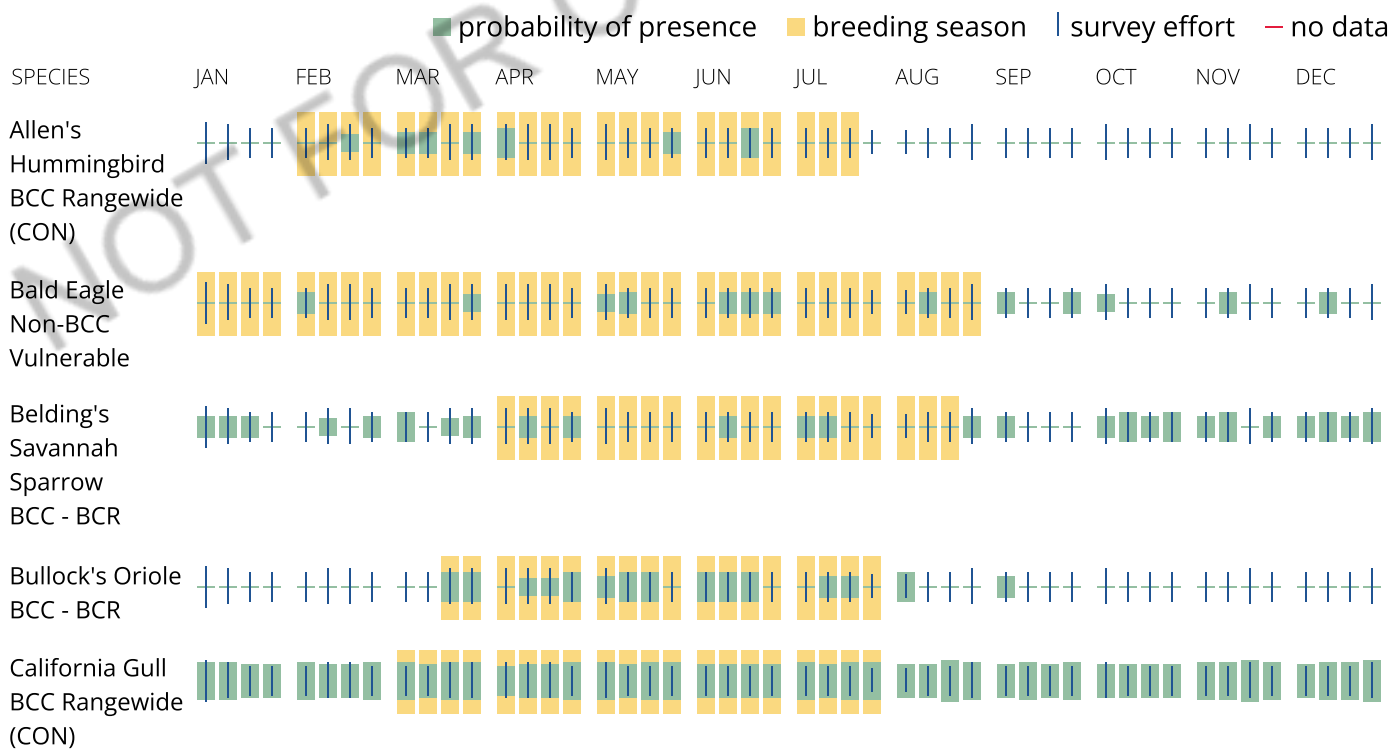
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

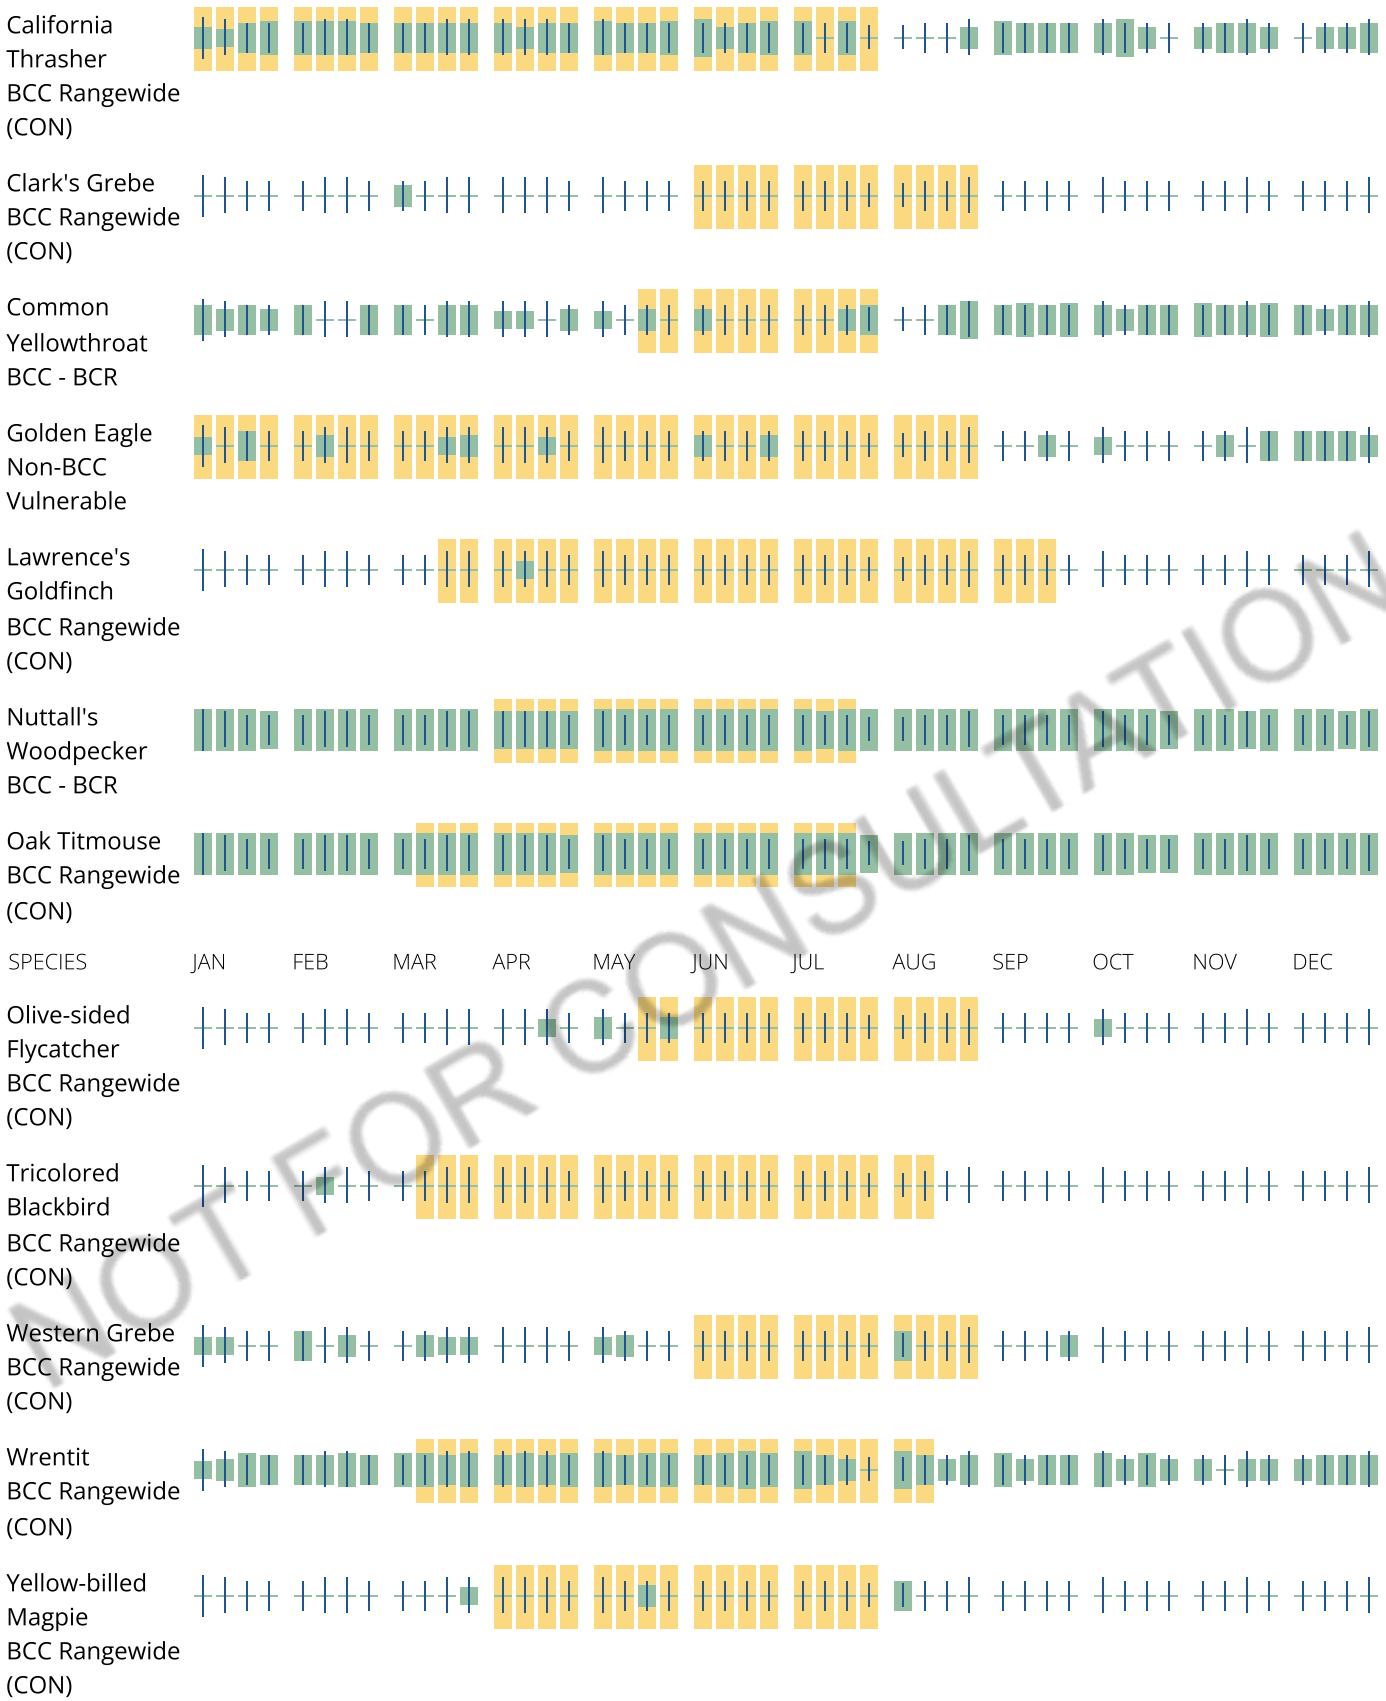
To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION



NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the RAIL Tool and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);

NOT FOR CONSULTATION

2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

NOT FOR CONSULTATION

This location did not intersect any wetlands mapped by NWI.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

SUMMARY OF FINDINGS

Environmental Science Associates (ESA) has prepared this Historic Resources Evaluation Report for the Kaiser Permanente San José Medical Center Project (project). Kaiser Foundation Hospitals (Kaiser Permanente or Kaiser), the project applicant, proposes to demolish the existing approximately 250,000-square-foot (sf) hospital and construct a new 685,000-sf hospital (including basement), a new central utility plant (energy center), and a parking structure at their San José Medical Center campus (SJMC campus or campus). Projected future campus improvements would include demolition of two one-story medical offices (both approximately 10,100 sf), construction of a 250,000-sf outpatient facility, and a parking garage.

The SJMC campus is located on an approximately 40-acre site and bounded by Highway 85 and the Valley Transit Authority (VTA) Cottle Light Rail Station and parking lot to the north; Cottle Road to the west; Santa Teresa Boulevard to the south; and Liska Lane to the east. Hospital Parkway, Camino Verde, and International Boulevard provide access to and through the campus. The proposed project is subject to review under the California Environmental Quality Act (CEQA). The City of San José is serving as the Lead Agency under CEQA for the proposed project.

To determine whether historical resources are in the project site, ESA conducted a cultural resources records search, pedestrian survey, and architectural history review. ESA identified the 1974 hospital (250 Hospital Parkway) and medical office building (275 Hospital Parkway, Building 6), and a 1978 medical office building complex (280 Hospital Parkway, Buildings A-D) as age-eligible historic-era buildings within the project area. As a result of this report, ESA recommends that these resources are not eligible for listing in the National Register of Historic Places, the California Register of Historical Resources, nor the City of San José Historic Resources Inventory as a Candidate City Landmark, and as such are not considered historical resources for the purposes of CEQA.

KAISER PERMANENTE SAN JOSÉ MEDICAL CENTER PROJECT

Historic Resources Evaluation Report

1. Introduction

Environmental Science Associates (ESA) has prepared this Historic Resources Evaluation Report (HRER) for the Kaiser Permanente San José Medical Center Project (Project). Kaiser Foundation Hospitals (Kaiser Permanente or Kaiser), the project applicant, proposes to demolish the existing approximately 250,000-square-foot (sf) hospital and construct a new 685,000-sf hospital (including basement), a new central utility plant (energy center), and a parking structure at their San José Medical Center campus (SJMC campus or campus). Projected future campus improvements would include demolition of two one-story medical offices (both approximately 10,100 sf), construction of a 250,000-sf outpatient facility, and a parking garage.

The proposed project is subject to review under the California Environmental Quality Act (CEQA). The City of San José is serving as the Lead Agency under CEQA for the proposed project. The purpose of this report, in accordance with CEQA, is to:

- Identify cultural resources,[1] including buildings and structures, within the project site;
- Preliminarily evaluate cultural resources according to the criteria set forth by the California Register of Historical Resources (California Register); and
- Determine whether the project would have an impact on California Register-listed or eligible resources (i.e., historical resources as defined by CEQA).

Kathy Cleveland, MA, completed the architectural history portions of this report. Ms. Cleveland meets the Secretary of the Interior Professional Qualification Standards (SOI PQS) for Architectural History. Becky Urbano, MS, reviewed the report and meets the SOI PQS for History and Architectural History.

1.1 Project Location and Description

The SJMC campus is located on an approximately 40-acre site and bounded by Highway 85 and the Valley Transit Authority (VTA) Cottle Light Rail Station and parking lot to the north; Cottle Road to the west; Santa Teresa Boulevard to the south; and Liska Lane to the east. Hospital Parkway, Camino Verde, and International Boulevard provide access to and through the campus.

[1] Cultural resources are defined as buildings, sites, structures, or objects, each of which may have historic, architectural, archaeological, cultural, or scientific importance, according to CEQA.

The campus is surrounded by urban uses, including a gas station at the northeast corner of Cottle Road and Santa Teresa Boulevard adjacent to the campus; commercial uses to the south; the Oakridge Palmia residential neighborhood and daycare and pre-school to the west; and the Santa Teresa Branch Library, daycare, and residential uses to the east (**Figures 1 and 2**).

The existing approximately 40-acre SJMC campus contains approximately 675,000 sf of hospital and medical office space. The campus is located at 250 Hospital Parkway and is comprised of multiple structures and APNs (APN 706-05-011; 706-05-025; 706-05-017; 706-05-037; 706-05-020; 706-05-032; and 706-05-035).[2] The majority of the campus is developed and includes the existing hospital and emergency center, medical office buildings, one administrative building, two parking structures, surface parking, and support uses. The campus provides both outpatient and inpatient clinical services. As described in the site-specific history in Section 3.3 below, prior to the construction of the hospital complex, the site was historically used as an orchard.

The core of the campus is encircled by International Circle and contains the approximately 250,000 sf, seven-story hospital and emergency center with 247 patient beds (250 Hospital Parkway), an eight-story medical office building (275 Hospital Parkway), medical office buildings A through D (280 Hospital Parkway), and associated parking lots. The campus north of Hospital Parkway and International Circle is developed with modern buildings, including a one-story outpatient surgery building (274 International Circle), four medical office buildings ranging between two to three stories (256, 270, and 277 International Circle), a five-level parking structure, a one-story administration building (258 International Circle), and a two-story facility engineering building (255 International Circle). The portion of the campus located south of Hospital Way and International Circle is currently developed with surface parking lots, portions of which are currently occupied by temporary portable buildings (284 Hospital Parkway) and tents associated with the COVID-19 center testing and vaccine distribution (at the date of this report). **Figure 3** presents the existing campus buildings.

The proposed project includes demolition of the existing 250,000 sf hospital and construction of a new 685,000 sf hospital, an energy center, and a six-level parking structure. The proposed 110-foot-tall, six-story hospital including basement level would be constructed in the southwest corner of the campus where surface parking is currently located. A 35-foot-tall, 35,000-sf energy center would house the main electrical, mechanical, and plumbing equipment to supply the new hospital and would be located to the south along Santa Teresa Boulevard. A six-level, 419,320-sf parking garage would be constructed at the northeast corner of Camino Verde Drive and Santa Teresa Boulevard, east of the new hospital, on what is currently a surface parking lot. In addition, approximately 200 surface parking spaces would be constructed on the demolished existing hospital site.

[2] Other addresses assigned to the site include 255, 256, 258, 260, 270, 274, 275, 276, and 280 Hospital Parkway and 1275 International Circle.

Age-eligible Resources

ESA

Kaiser Permanente anticipates future campus improvements beyond 2030, which would include the following components:

- Demolition of two one-story medical office buildings totaling 20,200 sf. (280 Hospital Parkway, for the construction of approximately 116 surface parking spaces);
- Demolition of the existing surface parking lot at the northeast corner of the site between the administration building (258 International Circle) and the facility engineering building (255 International Circle), and construction of a six-story parking garage with approximately 930 parking spaces; and
- Construction of a four- to six-story, approximately 250,000-sf medical office building at the southeast corner of the central portion of the campus on the existing surface parking lot.

The sizing, timing, and exact locations of these future improvements will be determined at a future date. These project components are analyzed in the environmental impact report (EIR) for the project based on the available information. When precise details of this later phase are known, further CEQA analysis will be conducted as warranted.

2. Regulatory Context

2.1 California Regulations

The City's decisions on the project are subject to review under CEQA. This report does not identify or evaluate tribal cultural resources (TCRs) as defined under Assembly Bill (AB) 52. If tribal cultural resources are identified during consultation, this information may be documented in the tribal cultural resources section of the CEQA document, with the approval of the consulting tribe(s) providing the tribal cultural resources information.

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state. CEQA requires lead agencies to determine, in part, whether a project would have a significant effect on historical resources.

The state implements the provisions of CEQA through its statewide comprehensive cultural resources surveys and preservation programs. Typically, a resource must be more than 50 years old to be considered as a potential historical resource. The State Office of Historic Preservation (OHP) advises recordation of any resource 45 years or older, since there is commonly a five-year lag between resource identification and the date that planning decisions are made.

Historical Resources

The CEQA Guidelines recognize that a *historical resource* includes: (1) a resource in the California Register of Historical Resources (California Register); (2) a resource included in a local register of historical resources, as defined in Public Resources Code Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of Public Resources Code Section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript

which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record.

California Register of Historical Resources

The California Register is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties qualify to be protected, to the extent prudent and feasible, from substantial adverse change" (Public Resources Code Section 5024.1[a]). The criteria for eligibility for the California Register are based upon the criteria for listing in the National Register of Historic Places (National Register) (Public Resources Code Section 5024.1[b]), as defined above. Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register.

To be eligible for the California Register, a cultural resource must be significant at the local, State, and/or federal level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must be of sufficient age and retain enough of its historic character or appearance (integrity) to convey the reason for its significance. Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and
- Those California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historic resources;

- Historic resources contributing to historic districts; and
- Historic resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone; and
- Tribal Cultural Resources.

2.2 Local Regulation

Historic Preservation Ordinance

The City of San José Historic Preservation Ordinance (Municipal Code Chapter 13.48) is designed to identify, protect, and encourage the preservation of significant resources as a means to stabilize neighborhoods, enhance property values, carry out the goals of the General Plan, foster civic pride in the city's cultural resources, and celebrate the unique historical identity of San José. The Historic Preservation Ordinance requires the City to do all the following:

- Establish a Historic Landmarks Commission and retain a City historic preservation officer
- Maintain a Historic Resources Inventory
- Preserve historic properties using a landmark designation process
- Protect the community character of historic neighborhoods by regulating Conservation Areas
- Require a Historic Preservation (HP) permit for alterations of any designated City Landmark (excluding candidate landmarks) or property within a City historic district
- Provide financial incentives through a Mills Act Historical Property Contract

Specifically, Municipal Code Section 13.48.210 requires HP permits for the following work performed on a proposed or designated City landmark or in a City historic district:

> *[C]onstruction, reconstruction, alteration, basic color change, repair, rehabilitation, restoration, remodeling, or any other changes to the exterior of any structure or any other similar activity … [including] installation of new or additional pavement or sidewalks or the erection of new or additional structures. Work [subject to the HP permit process] shall also include installation of new or additional pavement or sidewalks or the erection of new or additional structures. Work shall also include demolition, removal, or relocation of any structure or portion thereof.*

In accordance with Municipal Code Chapter 13.48, Part 3, additional reviews, assessments, and submission materials may be required during the HP permit process. This may include development of, and required adherence to, project design standards and guidelines by City staff in consultation with the San José Historic Landmarks Commission and as approved by the City Council.

City Landmarks, candidate City Landmarks, Landmark Historic Districts, and candidate Landmark Historic Districts

As presented in Municipal Code Section 13.48.020(A-C), designated or candidate City Landmarks[3] and City Landmark Historic Districts[4] (and their contributors) are highly significant historic resources. They are designated by the City Council through a formal process as defined in the Historic Preservation Ordinance. These resources are considered historic resources under CEQA.

A designated City Landmark must conform to the General Plan and have special historical, architectural, cultural, aesthetic, or engineering value of a historic nature. In making a recommendation to the City Council on an application for a proposed City Landmark, the Historic Landmarks Commission may consider eight criteria and other relevant factors as outlined in Municipal Code Section 13.48.110(H) such as:

> *[I]ts character, interest or value as part of the local, regional, state or national history, heritage or culture; its location as a site of a significant historic event; its identification with a person or persons who significantly contributed to the local, regional, state or national culture and history; its exemplification of the cultural, economic, social or historic heritage of the City of San José; its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style; its embodiment of distinguishing characteristics of an architectural type or specimen; its identification as the work of an architect or master builder whose individual work has influenced the development of the City of San José; and its embodiment of elements of architectural or engineering design, detail, materials or craftsmanship which represents a significant architectural innovation or which is unique.*

Historic Resources Inventory

The City of San José Historic Resources Inventory (HRI) includes known and potential historic resources of varying significance, including individual properties and districts listed in or eligible for listing in the California and National Registers, City Landmarks, Candidate City Landmarks, City Landmark Districts (and their contributing sites/structures), and Candidate City Landmark Districts (and their contributing sites/structures). In addition, the HRI includes Structures of Merit, Identified Sites/Structures, and Conservation Areas (and their contributing sites/structures). HRI properties are classified into one of 16 categories, depending on how they were evaluated at the time they were added. The HRI serves as a resource for conducting environmental and project review related to demolition permits, as well as for land use and development approvals. It is not a definitive list of all historic resources in the City of San José, and it is continually updated as new information, project-related evaluations, and neighborhood surveys are completed. The purpose of the HRI is to promote awareness of community resources and to further preservation of historic resources and community character.

---

3 The term "landmark" shall mean any of the following which have a special historical, architectural, cultural, aesthetic or engineering interest or value of an historical nature: 1.An individual structure or portion thereof; 2.An integrated group of structures on a single lot; 3.A site, or portion thereof; or 4.Any combination thereof.

4 "Historic district" shall mean a geographically definable area of urban or rural character, possessing a significant concentration or continuity of site, building, structures or objects unified by past events or aesthetically by plan or physical development.

3. Historical Background

3.1 Santa Clara Valley

Spanish explorers in the late 1760s and 1770s were the first Europeans to traverse the Santa Clara Valley. José Francisco Ortega, a soldier in the exploring party of Gaspar de Portola and Juan Crespi, made the first recorded crossing of the Guadalupe River in the vicinity of present-day Alviso during November 1769, but no clear record remains of his exact route or his impressions of the area.[5] Juan Bautista de Anza and Pedro Font led the next expedition through the area in early 1776, leaving a substantial record of their travels. The explorers commented on the level land and good pasturage, concluding that the area would be an excellent site for settlement. Anza recorded three native villages in the vicinity of his campsite, each reportedly composed of approximately 70 people. Anza noted some "paths and trails" heading to the south and concluded that the same tribe of Indians dwelled throughout the entire valley.[6]

After an initial period of exploration, the Spanish focused on the founding of presidios, missions, and secular towns with the land held by Spain. Following the favorable reports by Anza and Font, the Spanish moved to occupy the lands in the Santa Clara Valley, founding both Pueblo de San José and Mission Santa Clara de Asis in 1777. The Pueblo of San José de Guadalupe was California's first civilian settlement, and one of three towns founded to administer and coordinate the missions and presidios of Alta California.[7] By the late 18th century, the Embarcadero de Santa Clara, at the mouth of the Guadalupe River into the San Francisco Bay, had developed as a trading port and separate community. Mission Santa Clara provided for the religious needs of the Pueblo, and, as one of seven missions located within Ohlone territory, would have been the mission with the greatest impact on the indigenous population living in the Santa Clara Valley.

After the independence of Mexico and the secularization of the missions in the 1830s, the mission's property was divided into ranchos and distributed to private citizens. The hospital is located within land grant Rancho Posolmi, also known as Rancho Yñigo, and was granted to Lupe Yñigo in 1884.[8] Yñigo was a Ohlone man who worked as an alcalde at Mission Santa Clara until it was secularized.[9] The Ohlone and other Native Californians gradually left the now-secular missions, with many going to work as wage laborers on the ranchos, in mines, and in domestic positions. There was a partial return to indigenous religious practices and subsistence strategies, but for the most part, the Ohlone culture was greatly diminished.[10] Today, descendants of the

Ohlone still live in the area and many are active in restoring their traditions and advocating for Native American issues.

After California became part of the United States in 1848, San José was initially (and temporarily) named the state's capital. In the 1850s, the Gold Rush led to major changes in San José, which then became a supply town for the prospectors who flooded the area. The population of the Santa Clara Valley expanded as a result of the Gold Rush, followed later by the construction of the railroad to San Francisco (1864) and the completion of the transcontinental railroad in 1869.[11]

San José in the 20th Century

In 1992, the City of San José prepared a *Historical Overview and Context for the City of San Jose,* spanning the history of San José from 1777 through 1991.[12] This document provides a historical context for the region to support the evaluation of significance of historic properties within the region. Additionally, the City of San José prepared a context statement regarding its modern 20th century history, *San José Modernism Historic Context Statement*, to establish the chronology of development in San José between the years of 1935 and 1975. The following history is summarized from these documents, focusing on the 20th century development that led to the establishment of Kaiser SJMC.

Between 1870 and 1930, Santa Clara Valley and the City of San José experienced an expansion of the fruit industry as a major economic driver. Fruit trees had been introduced to the area as early as the 1850s, and by the 1860s orchards were being established in East San Jose, Milpitas, and the north valley.[13] Orchard production continued to grow and dominate agricultural production through the 1920s. A regional canning industry developed out of the dominance of orchards, along with other support industries such as box, basket, and can factories. Commercial growth in San José boomed during the 1880s and continued through the end of the century.[14]

Most of the undeveloped land within the city limits was subdivided and filled with homes during the 1880s, with new suburban tracts expanding out through the end of the 19th and beginning of the 20th centuries. The City's first annexations were the Gardiner District and East San José in 1911. During the interwar period, population growth continued to expand out from the urban core, replacing orchards with residential development. World War II had a significant effect on the economy of San José, with the large naval air station at Moffett Field being a center of activity with thousands of military personnel relocating to the region.[15]

Following World War II into 1950, fruit processing remained the main economic driver For San José. Following the war, hundreds of thousands of servicemen and defense workers chose to permanently reside in Santa Clara Valley, resulting in a construction boom to supply the houses and infrastructure needed to support the new population growth. Dutch Hamann was elected City Manager in spring 1950 and became the most active City Manager in San José history, overseeing

an unprecedented era of citywide expansion and land acquisition.[16] At the time of his retirement in December 1969, the City had grown from 17 to 137 square miles, with a population that had grown from 92,000 to 450,000.[17] Hamann strongly promoted the outward expansion of residential and commercial development from downtown, including associated infrastructure including roadways, utilities, schools, police and fire stations, and hospitals.[18]

3.2 Regional Hospitals

During the early 1850s, the City of San José was subject to various epidemics, including cholera, smallpox, diphtheria, and typhoid fever, among other diseases. While the California Legislature had mandated as early as 1850 that counties should "perform all other acts necessary to county welfare," and several doctors resided in Santa Clara County, no hospital existed in the county until 1860. That year City supervisors purchased twelve acres from Hiram Cahill near the western city limits, converting existing buildings for use as the first county hospital. In 1876 the County replaced the Cahill facility with a new County Hospital facility on a 114-acre site, in the location that would become the site of the Valley Medical Center on South Bascom Avenue.[19]

Santa Clara County Hospital's brick buildings were severely damaged by the 1906 earthquake. The County built a new hospital building on the site of the original building (South Bascom Avenue) in 1907, an E-shaped wood-frame building with neoclassical portico and pillars that served the community until its demolition in 1968. A seven-story addition was completed in 1960, and the remaining 1906 building was replaced in 1970 by a large rehabilitation wing. At the end of 1966, the supervisors changed the name of the institution from the County Hospital to the Santa Clara Valley Medical Center.[20]

San José Hospital (675 E. Santa Clara St., San José) opened in 1923. It was designed to "accommodate the emerging middle class living the central San José that were excluded from city, county, and state-run hospitals that served the poor and the private hospitals that catered to the more affluent."[21] The facility closed in 2004.

Following the end of World War II and the subsequent population boom experienced by the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and most were constructed within the San José city limits.[22]

3.3 Kaiser San José Medical Center

The Kaiser SJMC, originally known as the Santa Teresa Community Medical Center, was constructed in 1974 (January 1974 completion date; **Photo 1**). Prior to that time the site was used for agricultural purposes. The Santa Teresa Ranch consisted of 10,000 acres and was deeded to Joaquin Bernal by Carlos III of Spain in 1769. Bernal had been sent to Mexico and later California as a mining engineer and assayer, and for his services he was provided a land grant. In 1834, Bernal (at 94 years old) petitioned the Mexican government to have his lands confirmed.[23]

SOURCE: San José News, November 20, 1973 Kaiser Permanente San José Medical Center Project

Photo 1
Santa Teresa Community Hospital,
Main Hospital and Building 6, 1973

Historic maps and aerial imagery provide an overview of the historical development of the project site. The earliest (1876) historic map of the area shows the project site as part of a 451.22-acre-parcel owned by Francisco Bernal.[24] Francisco Bernal was the grandson of Jose Joaquin Bernal, the original recipient of the 9,647-acre Santa Teresa land grant. The earliest U.S. Geological Survey topographic map from 1916 shows a building at that same location, with a dirt road leading from Cottle Road. The alignment of Santa Teresa Boulevard is also depicted on the 1916 map.

The earliest aerial image of the project site from 1948 shows it was primarily orchard land with a large farm complex in the southeast. The building and dirt roads on earlier images and maps are no longer depicted. The orchard and farm complex are also on the 1953, 1956, 1960 and 1968 aerial images.

The 1980 aerial image shows that the orchards had been cleared and the hospital complex was under development. A gas station is shown at the corner of Cottle Road and Santa Teresa

[23] *Santa Teresa Community Hospital Dedication pamphlet*, n.d. Santa Teresa Community Hospital Folder at San José Library California Room.

[24] Thompson & West, 1876, Map of Santa Clara County, California, Thompson & West, San Francisco.

Boulevard. Additional development is shown on the aerial images through the 1980s and early 1990s. By 2002, the entire SJMC had been constructed in its current configuration.

American Medical International (AMI), Inc., the developer and primary investor in the hospital, began in 1956 as a central medical laboratory in Los Angeles, and by 1966 had transitioned to investor-ownership in the hospital field. By 1974, AMI owned and operated 45 facilities (with 43 in the United States and two in Europe), with Santa Teresa Community Hospital representing the 46th hospital.[25]

As described above, early hospital development was primarily government led, with private citizens hiring private doctors and the poorer citizens relying on government provided care. World War II transformed health care nationwide, with both the Veterans Administration hospital managing a range of care for servicemembers and veterans and the exponential growth of private healthcare during and after the war. During the wage freeze of the war years, U.S. companies began offering private health insurance as a benefit, which provided coverage to millions of people and reshaped the face of health care.[26] Additionally, the introduction of Medicare and Medicaid in 1965 provided money for the care of the aged and the poor, respectively. The newly available funding allowed for expansion of both government and private hospitals to provide treatment for a significantly larger population than earlier generations.[27]AMI hired Ruth and Going, an engineering, planning, and architecture firm in San José, to design the hospital complex. The main building plans were signed off by William H. Bender, a structural engineer for Ruth and Going, with F. Hazen "Skip" MacLaren acting as principal architect for the project.[28] F.A. Rossi Construction Company of Los Angeles began construction of the project in 1971, with the majority of the work completed by E.A. Hathaway Construction Company of San José at a cost $9 million of the $30 million total for the medical complex.[29]

Both the Main Hospital and Building 6 were completed by January 1974, with plans for future growth including emergency facilities, medical and commercial offices, employee housing, as well as a motel, drug store, bank, and other commercial stores.[30] The Y-shape of the tower was designed to provide efficient patient care, replacing the older, long, single corridor model with multiple shorter corridors extending out from the central core. The central core housed nursing stations, supply areas, and reception, allowing for more efficient care.[31]

In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital for an undisclosed amount. This was Kaiser's second hospital in Santa Clara County, following the construction of the Kaiser Santa Clara Hospital on Kaiser Drive off Kiely Boulevard in 1964.[32] The purchase of the Santa Teresa Hospital was described as including the eight-story [sic] hospital (Main Hospital), eight story medical office (Building 6),[33] a two-story parking structure, and 61-acre site.[34] By 1979, the four medical office Buildings A-D at 280 International Circle had been constructed, and a review of aerial photographs from 1980 shows full development within International Circle (**Photo 2**).[35]

[35] City of San José, Draft Environmental Impact Report – Kaiser Santa Teresa Medical Center, June 1994; Western Aerial Photos, 1980.

Over the following twenty years, the area surrounding International Circle developed similarly to the original proposed campus design, with parking lots and structures, as well as medical and commercial offices. In 1979 and 1984, the zoning was changed to allow for greater building density and flexibility for Kaiser's eventual campus build out.[36] Review of historic aerials show development extending counterclockwise from the southeast around International Circle, with medical offices and surface parking slowly filling in the campus by 1998.

In 2003, the Main Hospital building was expanded north and west to include a 17,700-sf emergency room extending westward to Building 6 (275 Hospital Parkway). The one-story expansion consisted of a one-story steel brace framed building with a rectangular footprint, measuring 218 by 60 feet along the northern side of the building, with a triangular addition extending 40 feet on the western side of the building connecting to Building 6.[37]

Ruth & Going

Leo W. Ruth, Jr. was a civil and mechanical engineer who co-founded Ruth & Going engineering firm with Edward Jackson Going, Jr. in 1960. Born in Santa Clara in 1917 (d. 2003), Ruth attended Santa Clara University and earned his civil and mechanical engineering degree in 1938. After being drafted into World War II in 1940, Ruth returned to San José where he was employed as an office engineer for the San José Department of Public Works as well as the firm James Waters & Associates (JWA). He worked at JWA for a decade before becoming a partner in the renamed Waters, Ruth and Going in 1956.[38] Going was born in 1928 in Houston, Texas (d. 2020) before moving to Santa Clara County in 1944 and attending Santa Clara University in 1949.[39] He joined the JWA firm directly after graduating, became partner in 1952, and formed Waters, Ruth and Going in 1956; and then four years later in 1960 established Ruth & Going when James Waters retired. Ruth and Going retired from the firm in 1983 and 1984, respectively.[40] Projects attributed to Ruth & Going include the Santa Teresa General Hospital, the 8,000 seat University of Santa Clara Buck Shaw Stadium, and the Villages Adult Residential Complex in San José.[41]

In 1990, Ruth was part of the inaugural class of the Silicon Valley Engineering Council (SVEC) Hall of Fame. Established in 1989, the SVEC is a "cooperative educational association of local engineering and technical societies" formed to promote engineering throughout the valley and Greater Bay Area. Ruth was nominated in recognition of his professional and personal merit as a member of numerous local organizations.[42] In 1993, the Santa Clara University School of

Engineering bestowed its highest honor on Going by presenting him with the Distinguished Engineering Alumni Award in recognition of his accomplishments, both in his profession, his community, and in service to the University.[43]

Archival review uncovered little information outside some biographical and professional information about William Bender. Per newspaper review, he was employed by Ruth & Going as early as 1962 and became a senior vice president of structural engineering at Ruth & Going in 1981.[44] MacLaren was born in New Jersey in 1935, attended Stanford University from 1954 to 1958 before joining the U.S. Navy from 1959 to 1963. From 1969 through 1973 he worked as an architect at Ruth & Going before relocating to Mendocino to start a new career in retail.[45]

E.A. Hathaway Construction Company

E.A. Hathaway Construction is one of the oldest commercial construction firms in Northern California. The company was founded by Ernest A. Hathaway, who moved to Santa Clara County from Oregon in 1923 to establish a construction company. In Oregon, Hathaway had been building docks, railroad facilities, and other industrial structures. During the slow period of the Great Depression, Hathaway worked out of his home, remodeling older structures in downtown San José and building small commercial buildings in Santa Clara Valley.[46] After his son Ron returned home from World War II, Ron joined the family business and eventually took over as president in 1954, two years prior to Ernest's death in 1956.[47] Among the buildings attributed to E.A. Hathaway Construction Company are the Santa Teresa Community Hospital, downtown San José's Wells Fargo Bank and PG&E buildings, the 1.8 million-square-foot Safeway distribution center in San José, and NASA's Ames Flight Center in Mountain View.[48]

3.4 Corporate Architecture Context (1949-1975)

Corporate Architecture, also referred to as Corporate International style or Corporate Modernism, is a derivative of postwar Modernism that primarily applied to large-scale commercial office buildings and government facilities. It was the dominant mode of corporate architecture between the 1950s and 1970s and reflected the postwar economic growth and the increasing importance of American corporations, showcasing how these entities "sought to position themselves as agents of modernity,

technology, and progress."[49] The "suburbanization of corporate headquarters" began in the mid-20th century when large corporations such as IBM moved out of the city centers and closer to the senior executives.[50] Typical elements included low-rise buildings surrounded by parking lots and landscaping, with larger complexes often having a parklike setting with large scale public art or, in the case of John Deere, large-scale products on display.[51] The corporate campus or estate model were generally large complexes of buildings within a landscaped, park-like setting, where "the site planning, automobile approaches, visitor entrances, employee parking lots, and service docks all exemplified the functionalism of mid-20th century Modernism."[52] The office park, while including many of the same elements as the corporate campus or estate, was more modest in scale notably with regards to their setting. Office parks still provided the necessary building facilities with ample parking and some amount of landscaping, but not to the scale of a park-like setting. As described by one historian, "created by speculative real estate developers in the 1950s, the office park provided a lower cost, flexible alternative to the corporate campus and estate." [53]

Character-defining features of Corporate Architecture include:[54]

- Large rectangular massing
- Flat or low-pitched roofs
- Steel or concrete structure as primary expression of the building
- Horizontal bands of windows set within the structural module
- Alternate design of large concrete volume with little or no fenestration
- Building tower set back from the street in a landscaped plaza
- Tower frequently set atop a multi-story base framed by plain concrete or steel columns
- Overall absence of applied ornamentation, with the exception of corporate advertisement signs mounted directly to building

3.5 New Formalism Context (1960-1975)

Developed as a reaction to the perceived formulaic and rigid expression of the International Style and the "glass box" of the Corporate Architecture, New Formalism incorporated streamlined and highly stylized classical elements into modernism. New Formalist buildings are defined by their monumental scale and powerful visual presence, with large volumes, rectangular massing, symmetrical facades, and full height colonnades. Buildings were often perched above a podium or articulated base, which reinforced the sense of monumentality. Arches and columns were

incorporated in stylized ways, along with modern geometric motifs (such as honeycomb screens, shell forms, or folded plates).[55]

Character-defining features of New Formalism include:[56]

- Symmetrical plan
- Monumental in size and appearance
- Flat roofs with heavy overhanging roof slab
- Full-height columns of steel or concrete connecting the roof slab to the site
- Colonnade of stylized full-height columnar supports
- Repeating arches or rounded openings
- Cast stone or concrete block screens
- Building tower set back from the street in a landscaped plaza
- Building expressed as tower of steel
- Presence of stylized ornamentation
- Smooth wall surfaces

4. Research Methods and Results

4.1 Records Search

ESA received the results of a records search from the Northwest Information Center (NWIC) of the California Historical Resources Information System (CHRIS) on April 20, 2023 (File No. 22-1643). The purposes of the records search were to: (1) determine whether known cultural resources have been recorded within or adjacent to the project site; (2) assess the likelihood for unrecorded cultural resources to be present based on historical references and the distribution of nearby sites; and (3) develop a context for the identification and preliminary evaluation of cultural resources. The records search consisted of an examination of the following documents:

- NWIC digitized base maps (USGS *Santa Teresa Hills, California* 7.5-minute topographic map), to identify recorded archaeological sites and studies within 0.5 mile of the project site.
- NWIC digitized base maps (USGS *Santa Teresa Hills, California* 7.5-minute topographic map), to identify recorded architectural resources (building, structures, and objects) within 0.5 mile of the project site.
- Resource Inventories: *California Inventory of Historical Resources*, *California Historical Landmarks*, *Built Environment Resource Directory* (BERD; OHP 2023) (through March 2020), and *Archaeological Determinations of Eligibility* (ADOE, as of April 2012) for Santa Clara County.

Previously Recorded Resources

The NWIC records search indicated that no resources have been previously recorded within or immediately adjacent to the project site. The closest California Register resource is the site of the New Almaden Mine (Monterey Highway at Flintwell Way; California Historical Landmark No. 339), approximately 0.85 mile northeast of the project site. The closest National Register-listed resource is the Hayes Mansion (200 Edenvale Avenue, San José; National Register No. 75000481), approximately 1.9 miles northwest of the project site.

5. Pedestrian Survey

5.1 Methods

ESA architectural historian Becky Urbano completed a pedestrian survey on April 14, 2023. The purpose of this survey was to document all exterior and publicly accessible interior spaces of the main hospital and other buildings on the project site constructed prior to 1978. Three resources, comprising six buildings including the Main Hospital and five ancillary buildings, were surveyed and documented as part of the evaluation:

- Main Hospital, 250 Hospital Parkway (1974)

- Building 6, 275 Hospital Parkway (1974)
- Buildings A-D, 280 Hospital Parkway (1978)

Figure 3 shows the locations of cultural resources identified within the project site as a result of the pedestrian survey.

6. Cultural Resources Identified on the Project Site

During the architectural history survey, six buildings including the Main Hospital and five ancillary buildings were recorded: the Main Hospital, 250 Hospital Parkway (1974), Building 6, 275 Hospital Parkway (1974), and Buildings A-D, 280 Hospital Parkway (1978). Previously unevaluated architectural resources are described and evaluated below. Due to their similar design, age, and function, Buildings A-D were evaluated as a single resource. **Appendix A** includes the Department of Parks and Recreation (DPR) 523 site records and evaluation forms for all three resources.

6.1 Main Hospital Building (250 Hospital Parkway)

SOURCE: ESA, 2023 Kaiser Permanente San José Medical Center Project

Photo 3
Main Hospital, facing northeast

The 1974 Main Hospital Building (MHB) at 250 Hospital Parkway (APN 706-05-037) consists of a 7-story, 250,000- sf hospital and emergency center. The MHB takes up the northeastern quadrant of the campus core surrounded by International Circle and is constructed of bi-colored reinforced concrete. The MHB is an irregularly shaped structure designed in the New Formalism style, consisting of a seven-story (approximately 95 feet tall) reinforced concrete tri-wing tower topped with a utility penthouse and surrounded by one- and two-story sections at the base. The building

tower is clad in alternating wide and narrow full height stylized pilasters dividing pairs of curtain wall windows, with the ends of the wings consisting of wide concrete panels with narrow vertical bands of windows extending the height of the concrete building end cap, as well as sets of three-pane picture windows along every story.

The building's irregular concrete base extends out on all sides between tower wings and connects on the northwestern side to Building 6. The base's concrete walls alternate between smooth and textured concrete, with a cubic second story projection extending out from the exterior wall on all three sides.

The primary entrance is located on the southwestern façade, underneath a wide concrete overhang extending out from the southern end of the building. The 2003 addition on the northern facade of the hospital's base consists of concrete panels bisected by ribbon windows running the length of the building's base (**Photo 4**). The northern entrance is a glazed, aluminum-framed sliding door set in a glass curtain wall. The addition connects the MHB and Building 6 on the northwestern side of the MHB.

Photo 4
Main Hospital northern facade, facing southwest towards Building 6

Evaluation

The MHB at 250 Hospital Parkway is evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding the City of San José Landmark criteria is presented after.

Criterion A/1 (Events)

The MHB at 250 Hospital Parkway was constructed between 1971 and 1973, opening in January 1974.[57] The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the project.[58] AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities.[59] In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening of the Kaiser Permanent Santa Clara hospital in 1964.[60] Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.[61]

While the MHB provided an important service meeting the medical needs of the population of South San José, it does not appear to have been historically significant for its associations with the development of San José during the later decades of the 20th century. Research about the building did not reveal any particularly significant associations or innovations connecting the facility with the development of San José, but rather it functioned as a typical community hospital. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the building is associated with community medical services, but this association does not appear to rise to the level where it could be considered important within the historic context. It was one of many hospitals constructed throughout the history of San José in the latter half of the 20th century. Because the MHB at 250 Hospital Parkway does not appear to be historically significant within the context of 20th century hospital development in San José, it is recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with the MHB at 250 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with the MHB. Therefore, the MHB at 250 Hospital Parkway is recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

61 Archives and Architecture, 2012.

Criterion C/3 (Design)

The MHB at 250 Hospital Parkway is an example of New Formalism within a hospital setting. The building's monument-like arrangement with the 7-story tower on a substantial concrete base, decorative pilasters and glass wall running the height of the building, smooth concrete exterior, and symmetrical appearance are all characteristics of the New Formalism style. The building has also been somewhat modified since its original construction, with the 2003 northwestern addition expanding the massing at the base of the building and connecting it to Building 6 (275 Hospital Parkway). While a recognizable example of New Formalism, the building does not embody the style, nor does it possess high artistic value. Additionally, the building does not appear to represent the work of a master. Neither William H. Bender, a structural engineer, nor F. Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. Additionally, no individual associated with either the F.A. Rossi Construction Company or the E.A. Hathaway Construction Company appear to have achieved professional acclaim for association with the construction of the Santa Teresa Community Hospital. As such, the MHB at 250 Hospital Parkway is recommended not eligible for listing as individual resource on the National or California registers under Criterion C/3 for its design.

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. The MHB at 250 Hospital Parkway is constructed of common materials using standard building techniques. The building is unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, the MHB at 250 Hospital Parkway is recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because the MHB at 250 Hospital Parkway is not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory, Municipal Code Section 13.48.110[H])

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

   The MHB at 250 Hospital Parkway does not represent the character of San José. Its value was as the local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the hospital. Rather it was one of many hospitals constructed during the postwar period in San José to address the needs of the growing population and does not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

   Research does not suggest that the MHB at 250 Hospital Parkway was the location of a significant historic event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

   Archival research did not reveal any significant persons associated with the MHB at 250 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with the MHB.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

   The MHB at 250 Hospital Parkway does not appear to exemplify a particular aspect of cultural, social, or historic heritage of San José. It served as a community hospital in South San José for many years but does not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

   There is no specific overall style or distinctive character to the MHB at 250 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

   The MHB at 250 Hospital Parkway is an example of New Formalism within a hospital setting. The building's monument-like arrangement with the 7-story tower on a substantial concrete base, decorative pilasters and glass wall running the height of the building, smooth concrete exterior, and symmetrical appearance are all characteristics of the New Formalism style. While a recognizable example of New Formalism, the building does not embody the style, but is rather a typical example of the style within a hospital context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

   Neither William H. Bender, a structural engineer, nor F, Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project.

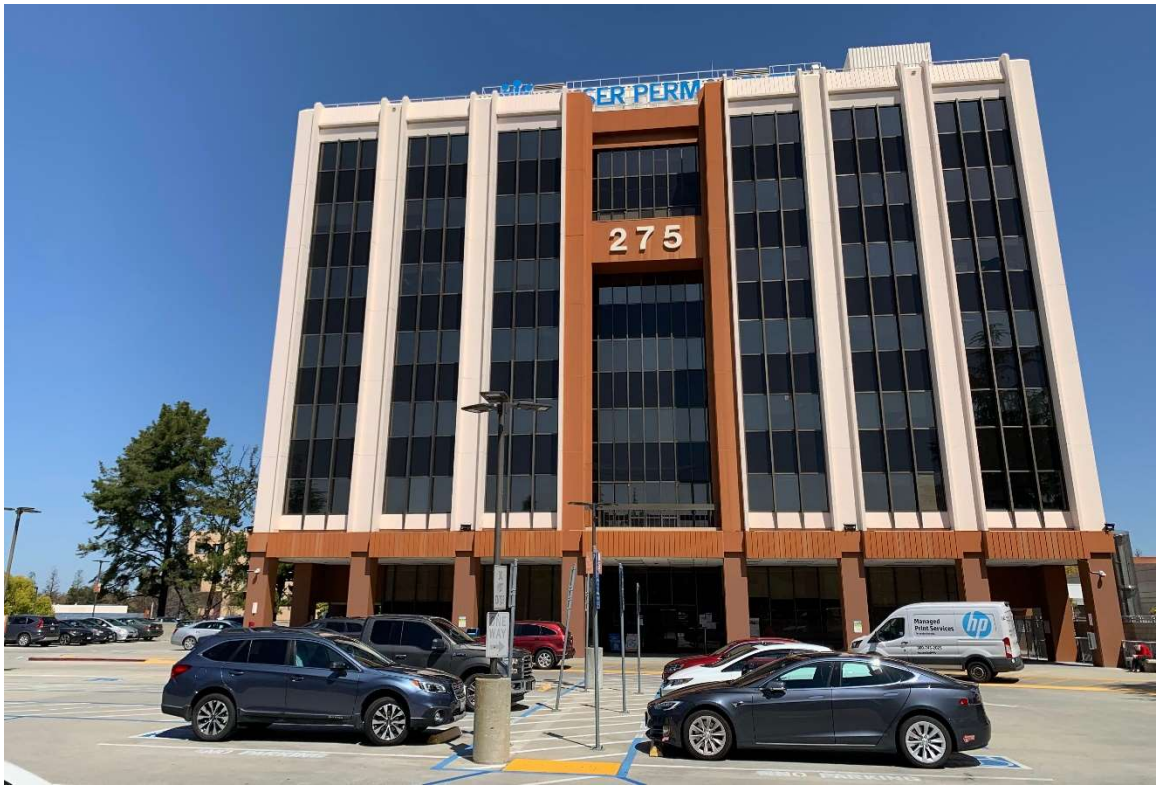
8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

   The architectural design of the MHB at 250 Hospital Parkway does not represent a significant architectural innovation, but rather is a typical example of New Formalism within a hospital setting.

Conclusions

As the MHB at 250 Hospital Parkway does not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends it ineligible for listing under national, state, or local criteria.

6.2 Building 6 (275 Hospital Parkway)



SOURCE: ESA, 2023

Kaiser Permanente San José Medical Center Project

Photo 5
Building 6, facing northwest

The 1974 Building 6 at 275 Hospital Parkway (APN 706-05-020) is a 7-story, reinforced concrete medical office building with a square footprint measuring approximately 125 by 125 feet. Building 6 takes up the northwestern quadrant of the core of International Circle and is constructed of bi-colored reinforced concrete. The building has a flat roof with utility penthouse, and the first floor is recessed from the main (southern) façade, providing the appearance of a building floating on square concrete posts from the primary facade. The main entrance is on the southern façade and consists of a glazed, aluminum-framed sliding door set in a glass curtain wall in the recessed first floor. Textured concrete panels run the length of the first floor and roof line, and signage consists of the building address in the center of the southern façade and "Kaiser Permanente" on the utility penthouse. The design of Building 6 is similar to that of the MHB, with the tall monument-like massing of the bi-colored 7-story building, decorative pilasters and glass wall running the height of the building, and a symmetrical appearance, all of which are characteristics of the New Formalism style.

Evaluation

Building 6 at 275 Hospital Parkway is evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding City of San José Landmark criteria is presented after.

Criterion A/1 (Events)

Building 6 at 275 Hospital Parkway was constructed between 1971 and 1973, opening in January 1974 as a medical office building associated with the Santa Teresa Community Hospital. The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the proposed project.[62] AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities.[63] In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening the Kaiser Permanent Santa Clara hospital in 1964.[64] Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.[65]

While Building 6 provided an important service meeting the medical needs of the population of South San José, it does not appear to have been historically significant for its associations with the development of San José during the later decades of the 20th century. Research about the building did not reveal any particularly significant associations connecting the facility with the development of San José, but rather it functioned as a typical medical office building. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the building is associated with community medical services, but this association does not appear to rise to the level where it could be considered important within the historic context. It was one of many medical office buildings constructed throughout the history of San José in the latter half of the 20th century. Because Building 6 at 275 Hospital Parkway does not appear to be historically significant within the context of 20th century hospital development in San José, it is recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with Building 6 at 275 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their

62 "Hospital to be Started Next Week," San José Mercury News; May 31, 1971, 29.

63 "Hospital Target January '74," San José Mercury News; January 28, 1973 194; "Hospital to be Started Next Week," San José Mercury News; May 31, 1971 29.

64 "Kaiser Permanente's 70th Anniversary celebrated at Silicon Valley medical centers," Karl Sonkin, July 31, 2015.

65 Archives and Architecture, 2012.

association with Building 6. Therefore, Building 6 at 275 Hospital Parkway is recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3 (Design)

Building 6 at 275 Hospital Parkway is an example of New Formalism within a medical office setting. Similar to the MHB, Building 6 has a tall monument-like massing with the bi-colored 7-story building, decorative pilasters and glass wall running the height of the building, and a symmetrical appearance, all of which are characteristics of the New Formalism style. While possessing recognizable characteristics of the New Formalism style, the building does not embody the style, nor does it possess high artistic value. Additionally, the building does not appear to represent the work of a master Neither William H. Bender, a structural engineer, nor F. Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. Additionally, no individual associated with either the F.A. Rossi Construction Company nor the E.A. Hathaway Construction Company appear to have achieved professional acclaim for association with the construction of Building 6 or the Santa Teresa Community Hospital. As such, Building 6 at 275 Hospital Parkway is recommended not eligible for listing as individual resource on the National or California registers under Criterion C/3 for its design.

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. Building 6 at 275 Hospital Parkway is constructed of common materials using standard building techniques. The building is unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, Building 6 at 275 Hospital Parkway is recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because Building 6 at 275 Hospital Parkway is not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory, Municipal Code Section 13.48.110[H])

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

   Building 6 at 275 Hospital Parkway does not represent the character of San José. Its value was as a medical office building associated with a local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the building. Rather it was one of many medical office buildings constructed during the postwar period in San José to address the needs of the growing population and does not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

   Research does not suggest that Building 6 at 275 Hospital Parkway was the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

   Archival research did not reveal any significant persons associated with Building 6 at 275 Hospital Parkway. No specific individual within Santa Teresa Hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Building 6.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

   Building 6 at 275 Hospital Parkway does not appear to exemplify a particular cultural, social, or historic heritage with the City of San José. It served as a medical office building for a community hospital in South San José for many years but does not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

   There is no specific overall style or distinctive character to Building 6 at 275 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

   Building 6 at 275 Hospital Parkway is an example of New Formalism within a medical office setting. The building's monument-like arrangement with the 7-story massing, decorative pilasters and glass wall running the height of the building, and symmetrical appearance are all characteristics of the New Formalism style. While possessing recognizable characteristics of the New Formalism style, the building does not embody the style, but is rather a typical example of the style within a medical office context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

   Neither William H. Bender, a structural engineer, nor F, Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about

Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

   The architectural design of Building 6 at 275 Hospital Parkway does not represent a significant architectural innovation, but rather is a typical example of New Formalism within a medical office setting.

Conclusions

As Building 6 at 275 Hospital Parkway does not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends it ineligible for listing under national, state, or local criteria.

6.3 Buildings A-D (280 Hospital Parkway)

SOURCE: ESA, 2023

Kaiser Permanente San José Redevelopment Project

Photo 6
Buildings A and C, facing east

280 Hospital Parkway is a collection of four one-story medical office buildings built in 1978,[66] located on a 2.36-acre parcel (APN 706-05-017) in the southwestern quadrant of the inner core of the hospital campus encircled by International Circle. All four buildings (A-D) are stylistically similar and are surrounded by landscaping as well as surface parking lots that are present to the

66 Building permit issued October 10, 1978. San Jose Building Permit database, https://portal.sanjoseca.gov/deployed/sfjsp

south, east, and west, and a parking garage to the north. Each building measures 100 by 100 feet, with a square footprint and hipped roof with boxed overhangs supported by large concrete pillars concentrated at the building corners and more widely dispersed along the sides of the building. Buildings A-D are constructed of concrete and largely lack architectural distinction. The largely blank facades are clad in smooth stucco and punctuated by aluminum-framed windows.

Evaluation

As described above, due to their similar design, age, and function, Buildings A-D were evaluated as a single resource. Buildings A-D at 280 Hospital Parkway are evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding City of San José Landmark criteria is presented after.

Criterion A/1 (Events)

Buildings A-D at 280 Hospital Parkway were constructed in 1978 as additional medical office buildings associated with the Santa Teresa Community Hospital. The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the proposed project.[67] AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities.[68] In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening the Kaiser Permanent Santa Clara hospital in 1964.[69] Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.[70]

While Buildings A-D provided an important service meeting the medical needs of the population of South San José, they do not appear to have been historically significant for their associations with the development of San José during the later decades of the 20th century. Research about the buildings did not reveal any particularly significant associations connecting the buildings with the development of San José, but rather they functioned as typical medical office buildings. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the buildings are associated with community medical services, but this association does not appear to rise to the level where it could be considered important within the historic context. They are just some of the many medical office buildings constructed throughout the history of San José in the late 20th century. Because Buildings A-D at 280 Hospital Parkway do not appear to be historically

67 "Hospital to be Started Next Week," San José Mercury News; May 31, 1971, 29.

68 "Hospital Target January '74," San José Mercury News; January 28, 1973, 194; "Hospital to be Started Next Week," San José Mercury News; May 31, 1971, 29.

69 "Kaiser Permanente's 70th Anniversary celebrated at Silicon Valley medical centers," Karl Sonkin, July 31, 2015.

70 Archives and Architecture, 2012.

significant within the context of 20th century medical development in San José, they are recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with Buildings A-D at 280 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Buildings A-D. Therefore, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3 (Design)

Buildings A-D at 280 Hospital Parkway is an example of Corporate Architecture within a medical office setting. Buildings A-D have low horizontal massing, low-pitched hipped roofs, large volumes of concrete with little fenestration, are positioned within a landscaped plaza, and lack ornamentation, all of which are characteristics of the Corporate Architecture style. While possessing recognizable characteristics of the Corporate Architecture style, the building does not embody the style, nor do they possess high artistic value. Additionally, the building does not appear to represent the work of a master. Archival research did not reveal any specific architect or builder associated with the buildings at 280 Hospital Parkway. As such, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing as an individual resource on the National or California registers under Criterion C/3 for its design.

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. The Buildings A-D at 280 Hospital Parkway are constructed of common materials using standard building techniques. The buildings are unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because Buildings A-D at 280 Hospital Parkway are not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory, Municipal Code Section 13.48.110[H])

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

   Buildings A-D at 280 Hospital Parkway do not represent the character of San José. Their value was as medical office buildings associate with a local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the buildings. Rather, they were some of many medical office buildings constructed during the postwar period in San José to address the needs of the growing population and do not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

   Research did not suggest that Buildings A-D at 280 Hospital Parkway were the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

   Archival research did not reveal any significant persons associated with Buildings A-D at 280 Hospital Parkway. No specific individual within Santa Teresa Hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Buildings A-D.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

   Buildings A-D at 280 Hospital Parkway do not appear to exemplify a particular cultural, social, or historic heritage with the City of San José. They served as medical office buildings for a community hospital in South San José for many years but do not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

   There is no specific overall style or distinctive character to Buildings A-D at 280 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

   Buildings A-D at 280 Hospital Parkway is an example of Corporate Architecture within a medical office setting. The buildings' low horizontal massing, low-pitched hipped roofs, large volumes of concrete with little fenestration, positioning within a landscaped plaza, and general lack of ornamentation are all characteristics of Corporate Architecture. While possessing recognizable characteristics of the style, the building does not embody the style, but is rather a typical example of the style within a medical office context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

   Archival research failed to indicate any significant persons associated with Buildings A-D at 280 Hospital Parkway.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

   The architectural design of Buildings A-D at 280 Hospital Parkway do not represent a significant architectural innovation, but rather are a typical example of Corporate Architecture within a medical office setting.

Conclusions

As Buildings A-D at 280 Hospital Parkway do not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends them as ineligible for listing under national, state, or local criteria.

6.4 Potential Kaiser SJMC Historic District

The six buildings in the central core of International Drive at the Kaiser SJMC (MHB, Building 6, and Buildings A-D) are associated with the 1974 Kaiser Santa Teresa Hospital/Santa Teresa Community Hospital. As described above, the hospital was one many established in San José in the late-20th century and underwent multiple expansions and building renovations during its period of use. The following discussion analyzes the National Register and California Register eligibility of the Kaiser SJMC as a potential historic district. An analysis of the Kaiser SJMC as a potential historic district with regard to the City of San José Landmark criteria is presented after.

Criterion A/1

Archival research indicates that the Kaiser SJMC was associated with the development of hospitals in San José during the late postwar period. As mentioned above, following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits. The Santa Teresa Community Hospital, Building 6, and Buildings A-D, all of which are components of the Kaiser SJMC, were constructed in 1974 and 1978, respectively. While the Kaiser SJMC provided important service meeting the medical needs of the population of South San José, collectively they do not appear to have been historically significant for their associations with the development of San José during the later decades of the 20th century. Research about the Kaiser SJMC did not reveal any significant associations with the development of San José, but rather the hospital and associated buildings functioned as typical hospital and medical office buildings. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the Kaiser SJMC is associated with community medical services, but this association does not rise to the level where it could be considered important within the historic context. It is one of many hospital complexes constructed throughout the history of San José in the late 20th century. Because Kaiser SJMC does not appear to be historically significant within the context of 20th century medical development in San José, it is recommended not eligible for listing as a historic district on the National or California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2

Archival research did not reveal any significant persons associated with Kaiser SJMC. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Kaiser SJMC. Therefore, Kaiser SJMC is recommended not eligible for listing as a historic district on the National or California registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3

The Kaiser SJMC is not significant for its design, but rather reflects a variety of styles of buildings accumulated over time, namely New Formalism and Corporate Architecture. To be eligible under Criterion C/3, a resource must embody the distinctive characteristic of a type, period, or method of construction, reflect high artistic value, or represent the work of a master. Within the context as a hospital complex, the Kaiser SJMC does not appear to rise to a level of significance as a property that embodies distinctive characteristics of the style, nor reflect high artistic value. Additionally, as described above, William H. Bender, a structural engineer, nor F. Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. For these reasons, Kaiser SJMC is recommended not eligible for listing as a historic district on the National or California Registers under Criterion C/3 for its design.

Criterion D/4

Criterion D/4 applies to properties that have the potential to inform important research questions about human history. According to National Register Bulletin 15, to qualify for listing, the property must "have, or have had, information to contribute to our understanding of human history or prehistory and the information must be considered important". Because the buildings associated with the Kaiser SJMC are examples of a common construction type built using readily available materials, and designed in a common style, it has little to no potential to yield information important to the prehistory or history of the local area, California, or the nation. Therefore, the Kaiser SJMC does not appear to be eligible for listing as a historic district under Criterion D/4.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because Kaiser SJMC is not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory, Municipal Code Section 13.48.110[H])

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

   The Kaiser SJMC does not represent the character of San José. Its value was as a hospital with associated medical office buildings in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the buildings. Rather, it was one of many hospital complexes constructed during the postwar period in San José to address the needs of the growing population and does not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

   Research does not suggest that the Kaiser SJMC was the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

   Archival research did not reveal any significant persons associated with Kaiser SJMC. No specific individual within Santa Teresa Hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Kaiser SJMC.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

   Kaiser SJMC does not appear to exemplify a particular cultural, social, or historic heritage with the City of San José. It served as a hospital and medical office complex for a community hospital in South San José for many years but does not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

   There is no specific overall style or distinctive character to Kaiser SJMC that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

   Kaiser SJMC is an example of New Formalism and Corporate Architecture within a medical office setting. The Main Hospital building and Building 6's monument-like arrangement with the 7-story massing, decorative pilasters and glass wall running the height of the building, and symmetrical appearance are all characteristics of the New Formalism style. The associated medical offices' low horizontal massing, low-pitched hipped roofs, large volumes of concrete with little fenestration, positioning within a landscaped plaza, and general lack of ornamentation are all characteristics of Corporate Architecture. While possessing recognizable characteristics of the New Formalism and Corporate Architecture styles, the Kaiser SJMC does not embody either style, but is rather a typical example of these styles within a medical office complex context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

   Neither William H. Bender, a structural engineer, nor F, Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. Archival research failed to indicate any significant persons associated with Buildings A-D at 280 Hospital Parkway.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

   The architectural design of Kaiser SJMC does not represent a significant architectural innovation, but rather is a typical example of New Formalism and Corporate Architecture within a medical complex setting.

Conclusion

As Kaiser SJMC does not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends it as ineligible for listing as a historic district under national, state, or local registers.

7. Conclusions

Based on the results of the records search, background research, pedestrian survey, resource significance evaluations, and assessment of impacts, three potential cultural resources were identified within the project site: the MHB, 250 Hospital Parkway (1974); Building 6, 275 Hospital Parkway (1974); and Buildings A-D, 280 Hospital Parkway (1978). None of these buildings are recommended eligible for listing in the National Register, California Register, or San José Historic Resources Inventory as a City Landmarks as individual historic resources or a collectively as a historic district.

***P3a. Description:**

The 1974 Main Hospital Building (MHB) at 250 Hospital Parkway (APN 706-05-037) consists of a 7-story, 250,000- sf hospital and emergency center. The MHB takes up the northeastern quadrant of the campus core surrounded by International Circle and is constructed of bi-colored reinforced concrete. The MHB is an irregularly shaped structure designed in the New Formalism style, consisting of a seven-story (approximately 95 feet tall) reinforced concrete tri-wing tower topped with a utility penthouse and surrounded by one- and two-story sections at the base. The building tower is clad in alternating wide and narrow full height stylized pilasters dividing pairs of curtain wall windows, with the ends of the wings consisting of wide concrete panels with narrow vertical bands of windows extending the height of the concrete building end cap, as well as sets of three-pane picture windows along every story.

The building's irregular concrete base extends out on all sides between tower wings and connects on the northwestern side to Building 6. The base's concrete walls alternate between smooth and textured concrete, with a cubic second story projection extending out from the exterior wall on all three sides.

Period of Significance n/a **Property Type** hospital **Applicable Criteria** n/a

The building at 250 Hospital Parkway was constructed in 1974 to serve as the Santa Teresa Community Hospital. It was augmented in 2003 with the construction of an emergency room expansion on the northwestern façade. No historically associations with people, businesses, or events were uncovered during archival research. The building is recommended **not eligible** for listing on either the National Register of Historic Places (National Register) or the California Register of Historical Resources (California Register). Additionally, the building is recommended **not eligible** for consideration as a City of San Jose Landmark.

***Date of Evaluation:** May 31, 2023.

***P3a. Description:**

The building's irregular concrete base extends out on all sides between tower wings and connects on the northwestern side to Building 6. The base's concrete walls alternate between smooth and textured concrete, with a cubic second story projection extending out from the exterior wall on all three sides.

The primary entrance is located on the southwestern façade, underneath a wide concrete overhang extending out from the southern end of the building. The 2003 addition on the northern facade of the hospital's base consists of concrete panels bisected by ribbon windows running the length of the building's base. The northern entrance is a glazed, aluminum-framed sliding door set in a glass curtain wall. The addition connects the MHB and Building 6 on the northwestern side of the MHB.

***B10.Significance:**

The Kaiser SJMC, originally known as the Santa Teresa Community Medical Center, was constructed in 1974. Prior to that time the site was used for agricultural purposes. The Santa Teresa Ranch consisted of 10,000 acres and was deeded to Joaquin Bernal by Carlos III of Spain in 1769. Bernal had been sent to Mexican and California as a mining engineer and assayer, and for his services was provided a land grant. In 1834, Bernal (at 94 years old) petitioned the Mexican government to have his lands confirmed.[1]

Historic maps and aerial imagery provide an overview of the historical development of the project site. The earliest (1876) historic map of the area shows the project site as part of a 451.22-acre-parcel owned by Francisco Bernal. Francisco Bernal was the grandson of Jose Joaquin Bernal, the original recipient of the 9,647-acre Santa Teresa land grant. One building is shown in the project site near the north side of International Circle. The earliest U.S. Geological Survey topographic map from 1916 shows a building at that same location, with a dirt road leading from Cottle Road. The alignment of Santa Teresa Boulevard is also depicted on the 1916 map.

The earliest aerial image of the project site from 1948 shows it was primarily orchard land with a large farm complex in the southeast. The building and dirt roads on earlier images and maps are no longer depicted. The orchard and farm complex are also on the 1953, 1956, 1960 and 1968 aerial images.

The 1980 aerial image shows that the orchards had been cleared and the hospital complex was under development. A gas station is shown at the corner of Cottle Road and Santa Teresa Boulevard. Additional development is shown on the aerial images through the 1980s and early 1990s. By 2002, the entire SJMC had been constructed in its current configuration. American Medical International (AMI), Inc,, the developer and primary investor in the hospital, began in 1956 as a central medical laboratory in Los Angeles, and by 1966 had transitioned to investor-ownership in the hospital field. By 1974, AMI owned and operated 45 facilities (with 43 in the United States and two in Europe), with Santa Teresa Community Hospital representing the 46th hospital.[2]

Early hospital development was primarily government led, with private citizens primarily hiring private doctors and the poorer citizens relying on government provided care. World War II transformed health care nationwide, with both the Veterans Administration hospital managing a range of care for servicemembers and veterans and the exponential growth of private healthcare during and after the war. During the 4-year wage freeze of the war years, US companies began offering private health insurance as a benefit, which provided coverage to millions of works and reshaped the face of health care. Additionally, the

1 *Santa Teresa Community Hospital Dedication pamphlet*, n.d. Santa Teresa Community Hospital Folder at San José Library California Room.

2 Ibid.

introduction of Medicare and Medicaid in 1965 provided money for the care of the aged and the poor, respectively. The newly available funding allowed for expansion of both government and private hospitals to provide treatment for a significantly larger population than earlier generations.

AMI hired Ruth and Going, an engineering, planning, and architecture firm in San José, to design the hospital complex. The main building plans were signed off by William H. Bender, a structural engineer for Ruth and Going, with F Hazen "Skip" MacLaren acting as principal architect for the project.[3] F.A. Rossi Construction Company of Los Angeles began construction of the project in 1971, with the majority of the work completed by E.A. Hathaway Construction Company of San José at a cost $9 million of the $30 million total for the medical complex.[4]

Both the Main Hospital and Building 6 were completed by January 1974, with plans for future growth including emergency facilities, medical and commercial offices, employee housing, as well as a motel, drug store, bank, and other commercial stores.[5] The Y-shape of the tower was designed to provide efficient patient care, replacing the older, long, single corridor model with multiple shorter corridors extending out from the central core. The central core housed nursing stations, supply areas, and reception, allowing for more efficient care.[6]

In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital for an undisclosed amount. This was Kaiser's second hospital in Santa Clara County, following the construction of the Kaiser Santa Clara Hospital on Kaiser Drive off Kiely Boulevard in 1964. [7] The purchase of the Santa Teresa Hospital was described as including the eight-story hospital (Main Hospital), eight story medical office (Building 6), a two-story parking structure, and 61-acre site.[8] By 1979, the four medical office Buildings A-D at 280 International Circle had been constructed, and a review of aerial photographs from 1980 shows full development within International Circle.[9]

Over the following twenty years, the area surrounding International Circle developed similarly to the original proposed campus design, with parking lots and structures, as well as medical and commercial offices. In 1979 and 1984 the zoning was changed to allow for greater building density and flexibility for Kaiser's eventual campus build out.[10] Review of historic aerials show development extending counterclockwise from the southeast around International Circle, with medical offices and surface parking slowly filling in the campus by 1998.

In 2003, the Main Hospital building was expanded north and west to include a 17,700-sf emergency room extending westward to Building 6 (275 Hospital Parkway). The one-story expansion consisted of a one-story steel brace framed building with a rectangular

footprint, measuring 218 by 60 feet along the northern side of the building, with a triangular addition extending 40 feet on the western side of the building connecting to Building 6.[11]

Ruth & Going

Leo W. Ruth, Jr. was a civil and mechanical engineer who co-founded Ruth & Going engineering firm with Edward Jackson Going, Jr. in 1960. Born in Santa Clara in 1917 (d. 2003), Ruth attended Santa Clara University and earned his civil and mechanical engineering degree in 1938. After being drafted into World War II in 1940, Ruth return to San José where he was employed as an office engineer for the San José Department of Public Works as well as the firm James Waters & Associates (JWA). He worked at JWA for a decade before becoming a partner in the renamed Waters, Ruth and Going in 1956.[12] Going was born in 1928 in Houston, Texas (d. 2020) before moving to Santa Clara County in 1944 and attending Santa Clara University in 1949.[13] He joined the JWA firm directly after graduating, became partner in 1952, and formed Waters, Ruth and Going in 1956; and then four years later in 1960 established Ruth & Going when James Waters retired. Ruth and Going retired from the firm in 1983 and 1984, respectively.[14] Projects attributed to Ruth & Going include the Santa Teresa General Hospital, the 8,000 seat University of Santa Clara Buck Shaw Stadium, and the Villages Adult Residential Complex in San José.[15]

In 1990, Ruth was part of the inaugural class of the Silicon Valley Engineering Council (SVEC) Hall of Fame. Established in 1989, the SVEC is a "cooperative educational association of local engineering and technical societies" formed to promote engineering throughout the valley and Greater Bay Area. Ruth was nominated in recognition of his professional and personal merit as a member of numerous local organizations.[16] In 1993, the Santa Clara University School of Engineering bestowed its highest honor on Going by presenting him with the Distinguished Engineering Alumni Award in recognition of his accomplishments, both in his profession, his community, and in service to the University.[17]

Archival review uncovered little information outside some biographical and professional information about William Bender. Per newspaper review, he was employed by Ruth & Going as early as 1962 and became a senior vice president of structural engineering at Ruth & Going in 1981.[18] MacLaren was born in New Jersey in 1935, attended Stanford University from 1954 to 1958 before joining the U.S. Navy from 1959 to 1963. From 1969 through 1973 he worked as an architect at Ruth & Going before relocating to Mendocino to start a new career in retail.[19]

E.A. Hathaway Construction Company

E.A. Hathaway Construction is one of the oldest commercial construction firms in Northern California. The company was founded by Ernest A. Hathaway, who moved to Santa Clara County from Oregon in 1923 to establish a construction company. In Oregon,

Hathaway had been building docks, railroad facilities, and other industrial structures. During the slow period of the Great Depression, Hathaway worked out of his home, remodeling older structures in downtown San José and building small commercial buildings in Santa Clara Valley.[20] After his son Ron returned home from World War II, Ron joined the family business and eventually took over as president in 1954, two years prior to Ernest's death in 1956.[21] Among the buildings attributed to E.A. Hathaway Construction Company are the Santa Teresa Community Hospital, downtown San José's Wells Fargo Bank and PG&E buildings, the 1.8 million-square-foot Safeway distribution center in San José, and NASA's Ames Flight Center in Mountain View.[22]

New Formalism Context (1960-1975)

Developed as a reaction to the perceived formulaic and rigid expression of the International Style and the "glass box" of the Corporate Architecture, New Formalism incorporated streamlined and highly stylized classical elements into modernism. New Formalist buildings are defined by their monumental scale and powerful visual presence, with large volumes, rectangular massing, symmetrical facades, and full height colonnades. Buildings were often perched above a podium or articulated base, which reinforced the sense of monumentality. Arches and columns were incorporated in stylized ways, along with modern geometric motifs (such as honeycomb screens, shell forms, or folded plates).[23]

Character-defining features of New Formalism include:[24]

- Symmetrical plan
- Monumental in size and appearance
- Flat roofs with heavy overhanging roof slab
- Full-height columns of steel or concrete connecting the roof slab to the site
- Colonnade of stylized full-height columnar supports
- Repeating arches or rounded openings
- Cast stone or concrete block screens
- Building tower set back from the street in a landscaped plaza
- Building expressed as tower of steel
- Presence of stylized ornamentation
- Smooth wall surfaces

23 Survey LA. Los Angeles Citywide Historic Context Statement – ContextArchitecture and Engineering – Sub-context: LA Modernism, 1919-1980, 190. Available at: https://planning.lacity.org/odocument/4f67bd39-631a-4f26-9a52-cd5809a66655/LA_Modernism_1919-1980.pdf.

24 Past Consultants, LLC, *San José Modernism: Historic Context* Statement, June 2009, 82.

The MHB at 250 Hospital Parkway is evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding the City of San José criteria is presented after.

Criterion A/1 (Events)

The MHB at 250 Hospital Parkway was constructed between 1971 and 1973, opening in January 1974. The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the project. AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities. In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening of the Kaiser Permanent Santa Clara hospital in 1964. Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.

While the MHB provided an important service meeting the medical needs of the population of South San José, it does not appear to have been historically significant for its associations with the development of San José during the later decades of the 20th century. Research about the building did not reveal any particularly significant associations connecting the facility with the development of San José, but rather it functioned as a typical community hospital. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the building is associated with community medical services, but this association does not appear to rise to the level where it could be considered important within the historic context. It was one of many hospitals constructed throughout the history of San José in the latter half of the 20th century. Because the MHB at 250 Hospital Parkway does not appear to be historically significant within the context of 20th century hospital development in San José, it is recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with the MHB at 250 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with the MHB. Therefore, the MHB at 250 Hospital Parkway is recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3 (Design)

The MHB at 250 Hospital Parkway is an example of New Formalism within a hospital setting. The buildings monument-like arrangement with the 7-story tower on a substantial concrete base, decorative pilasters and glass wall running the height of the building, smooth concrete exterior, and symmetrical appearance are all characteristics of the New Formalism style. The building has also been somewhat modified since its original construction, with the 2003 northwestern addition expanding the massing at the base of the building and connecting it to Building 6 (275 Hospital Parkway). While a recognizable example of New Formalism, the building does not embody the style, nor does it possess high artistic value. Additionally, the building does not appear to represent the work of a master. Neither William H. Bender, a structural engineer, nor F. Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. Additionally, no individual associated with either the F.A. Rossi Construction Company or the E.A. Hathaway Construction Company appear to have achieved professional acclaim for association with the construction of the Santa Teresa Community Hospital. As such, the MHB at 250 Hospital Parkway is recommended not eligible for listing as individual resource on the National or California registers under Criterion C/3 for its design.

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. The MHB at 250 Hospital Parkway is constructed of common materials using standard building techniques. The building is unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, the MHB at 250 Hospital Parkway is recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because the MHB at 250 Hospital Parkway is not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory)

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

The MHB at 250 Hospital Parkway does not represent the character of San José. Its value was as the local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the hospital. Rather it was one of many hospitals constructed during the postwar period in San José to address the needs of the growing population and does not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

Research does not suggest that the MHB at 250 Hospital Parkway was the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

Archival research did not reveal any significant persons associated with the MHB at 250 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with the MHB.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

The MHB at 250 Hospital Parkway does not appear to exemplify a particular aspect of cultural, social, or historic heritage of San José. It served as a community hospital in South San José for many years but does not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

There is no specific overall style or distinctive character to the MHB at 250 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

The MHB at 250 Hospital Parkway is an example of New Formalism within a hospital setting. The building's monument-like arrangement with the 7-story tower on a substantial concrete base, decorative pilasters and glass wall running the height of the building, smooth concrete exterior, and symmetrical appearance are all characteristics of the New Formalism style. While a recognizable example of New Formalism, the building does not embody the style, but is rather a typical example of the style within a hospital context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

Neither William H. Bender, a structural engineer, nor F, Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

The architectural design of the MHB at 250 Hospital Parkway does not represent a significant architectural innovation, but rather is a typical example of New Formalism within a hospital setting.

Conclusions

As the MHB at 250 Hospital Parkway does not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends it ineligible for listing under national, state, or local criteria.

***P3a. Description:**

The 1974 Building 6 at 275 Hospital Parkway (APN 706-05-020) is a 7-story, reinforced concrete medical office building with a square footprint measuring approximately 125 by 125 feet. Building 6 takes up the northwestern quadrant of the core of International Circle and is constructed of bi-colored reinforced concrete. The building has a flat roof with utility penthouse, and the first floor is recessed from the main (southern) façade, providing the appearance of a building floating on square concrete posts from the primary facade. The main entrance is on the southern façade and consists of a glazed, aluminum-framed sliding door set in a glass curtain wall in the recessed first floor. Textured concrete panels run the length of the first floor and roof line, and signage consists of the building address in the center of the southern façade and "Kaiser Permanente" on the utility penthouse. The design of Building 6 is similar to that of the Main Hospital Building, with tall monument-like massing of the bi-colored 7-story building, decorative pilasters and glass wall running the height of the building, and a symmetrical appearance, all of which are characteristics of the New Formalism style.

The building at 275 Hospital Parkway was constructed in 1974 to serve as a medical office building associated with the Santa Teresa Community Hospital. No historically associations with people, businesses, or events were uncovered during archival research. The building is recommended **not eligible** for listing on either the National Register of Historic Places (National Register) or the California Register of Historical Resources (California Register). Additionally, the building is recommended **not eligible** for consideration as a City of San Jose Landmark.

***B10.Significance:**

The Kaiser SJMC, originally known as the Santa Teresa Community Medical Center, was constructed in 1974. Prior to that time the site was used for agricultural purposes. The Santa Teresa Ranch consisted of 10,000 acres and was deeded to Joaquin Bernal by Carlos III of Spain in 1769. Bernal had been sent to Mexican and California as a mining engineer and assayer, and for his services was provided a land grant. In 1834, Bernal (at 94 years old) petitioned the Mexican government to have his lands confirmed.[1]

Historic maps and aerial imagery provide an overview of the historical development of the project site. The earliest (1876) historic map of the area shows the project site as part of a 451.22-acre-parcel owned by Francisco Bernal. Francisco Bernal was the grandson of Jose Joaquin Bernal, the original recipient of the 9,647-acre Santa Teresa land grant. One building is shown in the project site near the north side of International Circle. The earliest U.S. Geological Survey topographic map from 1916 shows a building at that same location, with a dirt road leading from Cottle Road. The alignment of Santa Teresa Boulevard is also depicted on the 1916 map.

The earliest aerial image of the project site from 1948 shows it was primarily orchard land with a large farm complex in the southeast. The building and dirt roads on earlier images and maps are no longer depicted. The orchard and farm complex are also on the 1953, 1956, 1960 and 1968 aerial images.

The 1980 aerial image shows that the orchards had been cleared and the hospital complex was under development. A gas station is shown at the corner of Cottle Road and Santa Teresa Boulevard. Additional development is shown on the aerial images through the 1980s and early 1990s. By 2002, the entire SJMC had been constructed in its current configuration. American Medical International (AMI), Inc,, the developer and primary investor in the hospital, began in 1956 as a central medical laboratory in Los Angeles, and by 1966 had transitioned to investor-ownership in the hospital field. By 1974, AMI owned and operated 45 facilities (with 43 in the United States and two in Europe), with Santa Teresa Community Hospital representing the 46th hospital.[2]

Early hospital development was primarily government led, with private citizens primarily hiring private doctors and the poorer citizens relying on government provided care. World War II transformed health care nationwide, with both the Veterans Administration hospital managing a range of care for servicemembers and veterans and the exponential growth of private healthcare during and after the war. During the 4-year wage freeze of the war years, US companies began offering private health insurance as a benefit, which provided coverage to millions of works and reshaped the face of health care. Additionally, the introduction of Medicare and Medicaid in 1965 provided money for the care of the aged and the poor, respectively. The newly available funding allowed for expansion of both government and private hospitals to provide treatment for a significantly larger population than earlier generations.

AMI hired Ruth and Going, an engineering, planning, and architecture firm in San José, to design the hospital complex. The main building plans were signed off by William H. Bender, a structural engineer for Ruth and Going, with F Hazen “Skip” MacLaren acting as principal architect for the project.[3] F.A. Rossi Construction Company of Los Angeles began construction of the project in

2 Ibid.

3 Ruth & Going, Santa Teresa Community Hospital – As Built Drawings; “Groundbreaking set today for Santa Teresa Hospital,” San José Mercury News, June 23, 1971, 17.

1971, with the majority of the work completed by E.A. Hathaway Construction Company of San José at a cost $9 million of the $30 million total for the medical complex.[4]

Both the Main Hospital and Building 6 were completed by January 1974, with plans for future growth including emergency facilities, medical and commercial offices, employee housing, as well as a motel, drug store, bank, and other commercial stores.[5] The Y-shape of the tower was designed to provide efficient patient care, replacing the older, long, single corridor model with multiple shorter corridors extending out from the central core. The central core housed nursing stations, supply areas, and reception, allowing for more efficient care.[6]

In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital for an undisclosed amount. This was Kaiser's second hospital in Santa Clara County, following the construction of the Kaiser Santa Clara Hospital on Kaiser Drive off Kiely Boulevard in 1964. [7] The purchase of the Santa Teresa Hospital was described as including the eight-story hospital (Main Hospital), eight story medical office (Building 6), a two-story parking structure, and 61-acre site.[8] By 1979, the four medical office Buildings A-D at 280 International Circle had been constructed, and a review of aerial photographs from 1980 shows full development within International Circle.[9]

Over the following twenty years, the area surrounding International Circle developed similarly to the original proposed campus design, with parking lots and structures, as well as medical and commercial offices. In 1979 and 1984 the zoning was changed to allow for greater building density and flexibility for Kaiser's eventual campus build out.[10] Review of historic aerials show development extending counterclockwise from the southeast around International Circle, with medical offices and surface parking slowly filling in the campus by 1998.

In 2003, the Main Hospital building was expanded north and west to include a 17,700-sf emergency room extending westward to Building 6 (275 Hospital Parkway). The one-story expansion consisted of a one-story steel brace framed building with a rectangular footprint, measuring 218 by 60 feet along the northern side of the building, with a triangular addition extending 40 feet on the western side of the building connecting to Building 6.[11]

Ruth & Going

Leo W. Ruth, Jr. was a civil and mechanical engineer who co-founded Ruth & Going engineering firm with Edward Jackson Going, Jr. in 1960. Born in Santa Clara in 1917 (d. 2003), Ruth attended Santa Clara University and earned his civil and mechanical engineering degree in 1938. After being drafted into World War II in 1940, Ruth return to San José where he was employed as an

office engineer for the San José Department of Public Works as well as the firm James Waters & Associates (JWA). He worked at JWA for a decade before becoming a partner in the renamed Waters, Ruth and Going in 1956.[12] Going was born in 1928 in Houston, Texas (d. 2020) before moving to Santa Clara County in 1944 and attending Santa Clara University in 1949.[13] He joined the JWA firm directly after graduating, became partner in 1952, and formed Waters, Ruth and Going in 1956; and then four years later in 1960 established Ruth & Going when James Waters retired. Ruth and Going retired from the firm in 1983 and 1984, respectively.[14] Projects attributed to Ruth & Going include the Santa Teresa General Hospital, the 8,000 seat University of Santa Clara Buck Shaw Stadium, and the Villages Adult Residential Complex in San José.[15]

In 1990, Ruth was part of the inaugural class of the Silicon Valley Engineering Council (SVEC) Hall of Fame. Established in 1989, the SVEC is a "cooperative educational association of local engineering and technical societies" formed to promote engineering throughout the valley and Greater Bay Area. Ruth was nominated in recognition of his professional and personal merit as a member of numerous local organizations.[16] In 1993, the Santa Clara University School of Engineering bestowed its highest honor on Going by presenting him with the Distinguished Engineering Alumni Award in recognition of his accomplishments, both in his profession, his community, and in service to the University.[17]

Archival review uncovered little information outside some biographical and professional information about William Bender. Per newspaper review, he was employed by Ruth & Going as early as 1962 and became a senior vice president of structural engineering at Ruth & Going in 1981.[18] MacLaren was born in New Jersey in 1935, attended Stanford University from 1954 to 1958 before joining the U.S. Navy from 1959 to 1963. From 1969 through 1973 he worked as an architect at Ruth & Going before relocating to Mendocino to start a new career in retail.[19]

E.A. Hathaway Construction Company

E.A. Hathaway Construction is one of the oldest commercial construction firms in Northern California. The company was founded by Ernest A. Hathaway, who moved to Santa Clara County from Oregon in 1923 to establish a construction company. In Oregon, Hathaway had been building docks, railroad facilities, and other industrial structures. During the slow period of the Great Depression, Hathaway worked out of his home, remodeling older structures in downtown San José and building small commercial buildings in Santa Clara Valley.[20] After his son Ron returned home from World War II, Ron joined the family business and eventually took over as president in 1954, two years prior to Ernest's death in 1956.[21] Among the buildings attributed to E.A.

21 Ron Hathaway Obituary, January 28, 1999. Available at: https://www.sfgate.com/news/article/Ron-Hathaway-2950131.php.

Hathaway Construction Company are the Santa Teresa Community Hospital, downtown San José's Wells Fargo Bank and PG&E buildings, the 1.8 million-square-foot Safeway distribution center in San José, and NASA's Ames Flight Center in Mountain View.[22]

Character-defining features of New Formalism include:[23]

- Symmetrical plan
- Monumental in size and appearance
- Flat roofs with heavy overhanging roof slab
- Full-height columns of steel or concrete connecting the roof slab to the site
- Colonnade of stylized full-height columnar supports
- Repeating arches or rounded openings
- Cast stone or concrete block screens
- Building tower set back from the street in a landscaped plaza
- Building expressed as tower of steel
- Presence of stylized ornamentation
- Smooth wall surfaces

Evaluation

Building 6 at 275 Hospital Parkway is evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding City of San José criteria is presented after.

Criterion A/1 (Events)

Building 6 at 275 Hospital Parkway was constructed between 1971 and 1973, opening in January 1974 as a medical office building associated with the Santa Teresa Community Hospital. The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the proposed project. AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities. In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening the Kaiser Permanent Santa Clara hospital in 1964. Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.

While Building 6 provided an important service meeting the medical needs of the population of South San José, it does not appear to have been historically significant for its associations with the development of San José during the later decades of the 20th century. Research about the building did not reveal any particularly significant associations connecting the facility with the development of San José, but rather it functioned as a typical medical office building. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the building is associated with community medical services, but this association does not appear to

23 Past Consultants, LLC, *San José Modernism: Historic Context* Statement, June 2009, 82.

rise to the level where it could be considered important within the historic context. It was one of many medical office buildings constructed throughout the history of San José in the latter half of the 20th century. Because Building 6 at 275 Hospital Parkway does not appear to be historically significant within the context of 20th century hospital development in San José, it is recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with Building 6 at 275 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Building 6. Therefore, Building 6 at 275 Hospital Parkway is recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3 (Design)

Building 6 at 275 Hospital Parkway is an example of New Formalism within a medical office setting. Similar to the MHB, Building 6 has a tall monument-like massing with the bi-colored 7-story building, decorative pilasters and glass wall running the height of the building, and a symmetrical appearance, all of which are characteristics of the New Formalism style. While possessing recognizable characteristics of the New Formalism style, the building does not embody the style, nor does it possess high artistic value. Additionally, the building does not appear to represent the work of a master Neither William H. Bender, a structural engineer, nor F. Hazen “Skip” MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project. Additionally, no individual associated with either the F.A. Rossi Construction Company nor the E.A. Hathaway Construction Company appear to have achieved professional acclaim for association with the construction of Building 6 or the Santa Teresa Community Hospital. As such, Building 6 at 275 Hospital Parkway is recommended not eligible for listing as individual resource on the National or California registers under Criterion C/3 for its design.

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. Building 6 at 275 Hospital Parkway is constructed of common materials using standard building techniques. The building is unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, Building 6 at 275 Hospital Parkway is recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because Building 6 at 275 Hospital Parkway is not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory)

1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

Building 6 at 275 Hospital Parkway does not represent the character of San José. Its value was as a medical office building associated with a local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the building. Rather it was one of many medical office buildings constructed during the postwar period in San José to address the needs of the growing population and does not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

Research does not suggest that Building 6 at 275 Hospital Parkway was the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

Archival research did not reveal any significant persons associated with Building 6 at 275 Hospital Parkway. No specific individual within Santa Teresa Hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Building 6.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

Building 6 at 275 Hospital Parkway does not appear to exemplify a particular cultural, social, or historic heritage with the City of San José. It served as a medical office building for a community hospital in South San José for many years but does not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

There is no specific overall style or distinctive character to Building 6 at 275 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

Building 6 at 275 Hospital Parkway is an example of New Formalism within a medical office setting. The building's monument-like arrangement with the 7-story massing, decorative pilasters and glass wall running the height of the building, and symmetrical appearance are all characteristics of the New Formalism style. While possessing recognizable characteristics of the New Formalism style, the building does not embody the style, but is rather a typical example of the style within a medical office context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

Neither William H. Bender, a structural engineer, nor F, Hazen "Skip" MacLaren, a principal architect of Ruth & Going, appear to reflect the professional acclaim that would indicate master status in their craft. Archival research indicated little specific information about Bender, and MacLaren left the architectural field soon after completing the Santa Teresa Community Hospital project.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

The architectural design of Building 6 at 275 Hospital Parkway does not represent a significant architectural innovation, but rather is a typical example of New Formalism within a medical office setting.

Conclusions

As Building 6 at 275 Hospital Parkway does not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends it ineligible for listing under national, state, or local criteria.

***P3a. Description:**

280 Hospital Parkway is a collection of four one-story medical office buildings built in 1978, located on a 2.36-acre parcel (APN 706-05-017) in the southwestern quadrant of the inner core of the hospital campus encircled by International Circle. All four buildings (A-D) are stylistically similar and are surrounded by landscaping as well as surface parking lots that are present to the south, east, and west, and a parking garage to the north. Each building measures 100 by 100 feet, with a square footprint and hipped roof with boxed overhangs supported by large concrete pillars concentrated at the building corners and more widely dispersed along the sides of the building. Buildings A-D are constructed of concrete and largely lack architectural distinction. The largely blank facades are clad in smooth stucco and punctuated by aluminum-framed windows.

Buildings A-D at 280 Hospital Parkway were constructed between 1977 and 1979 to serve as a medical office buildings associated with the Santa Teresa Community Hospital. No historically associations with people, businesses, or events were uncovered during archival research. The buildings are recommended **not eligible** for listing on either the National Register of Historic Places (National Register) or the California Register of Historical Resources (California Register). Additionally, the buildings are recommended **not eligible** for consideration as a City of San Jose Landmark.

***B10.Significance:**

The Kaiser SJMC, originally known as the Santa Teresa Community Medical Center, was constructed in 1974. Prior to that time the site was used for agricultural purposes. The Santa Teresa Ranch consisted of 10,000 acres and was deeded to Joaquin Bernal by Carlos III of Spain in 1769. Bernal had been sent to Mexican and California as a mining engineer and assayer, and for his services was provided a land grant. In 1834, Bernal (at 94 years old) petitioned the Mexican government to have his lands confirmed.[1]

Historic maps and aerial imagery provide an overview of the historical development of the project site. The earliest (1876) historic map of the area shows the project site as part of a 451.22-acre-parcel owned by Francisco Bernal. Francisco Bernal was the grandson of Jose Joaquin Bernal, the original recipient of the 9,647-acre Santa Teresa land grant. One building is shown in the project site near the north side of International Circle. The earliest U.S. Geological Survey topographic map from 1916 shows a building at that same location, with a dirt road leading from Cottle Road. The alignment of Santa Teresa Boulevard is also depicted on the 1916 map.

The earliest aerial image of the project site from 1948 shows it was primarily orchard land with a large farm complex in the southeast. The building and dirt roads on earlier images and maps are no longer depicted. The orchard and farm complex are also on the 1953, 1956, 1960 and 1968 aerial images.

The 1980 aerial image shows that the orchards had been cleared and the hospital complex was under development. A gas station is shown at the corner of Cottle Road and Santa Teresa Boulevard. Additional development is shown on the aerial images through the 1980s and early 1990s. By 2002, the entire SJMC had been constructed in its current configuration. American Medical International (AMI), Inc,, the developer and primary investor in the hospital, began in 1956 as a central medical laboratory in Los Angeles, and by 1966 had transitioned to investor-ownership in the hospital field. By 1974, AMI owned and operated 45 facilities (with 43 in the United States and two in Europe), with Santa Teresa Community Hospital representing the 46th hospital.[2]

Early hospital development was primarily government led, with private citizens primarily hiring private doctors and the poorer citizens relying on government provided care. World War II transformed health care nationwide, with both the Veterans Administration hospital managing a range of care for servicemembers and veterans and the exponential growth of private healthcare during and after the war. During the 4-year wage freeze of the war years, US companies began offering private health insurance as a benefit, which provided coverage to millions of works and reshaped the face of health care. Additionally, the introduction of Medicare and Medicaid in 1965 provided money for the care of the aged and the poor, respectively. The newly available funding allowed for expansion of both government and private hospitals to provide treatment for a significantly larger population than earlier generations.

AMI hired Ruth and Going, an engineering, planning, and architecture firm in San José, to design the hospital complex. The main building plans were signed off by William H. Bender, a structural engineer for Ruth and Going, with F Hazen “Skip” MacLaren acting as principal architect for the project.[3] F.A. Rossi Construction Company of Los Angeles began construction of the project in

2 Ibid.

3 Ruth & Going, Santa Teresa Community Hospital – As Built Drawings; “Groundbreaking set today for Santa Teresa Hospital,” San José Mercury News, June 23, 1971, 17.

1971, with the majority of the work completed by E.A. Hathaway Construction Company of San José at a cost $9 million of the $30 million total for the medical complex.[4]

Both the Main Hospital and Building 6 were completed by January 1974, with plans for future growth including emergency facilities, medical and commercial offices, employee housing, as well as a motel, drug store, bank, and other commercial stores.[5] The Y-shape of the tower was designed to provide efficient patient care, replacing the older, long, single corridor model with multiple shorter corridors extending out from the central core. The central core housed nursing stations, supply areas, and reception, allowing for more efficient care.[6]

In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital for an undisclosed amount. This was Kaiser's second hospital in Santa Clara County, following the construction of the Kaiser Santa Clara Hospital on Kaiser Drive off Kiely Boulevard in 1964. [7] The purchase of the Santa Teresa Hospital was described as including the eight-story hospital (Main Hospital), eight story medical office (Building 6), a two-story parking structure, and 61-acre site.[8] By 1979, the four medical office Buildings A-D at 280 International Circle had been constructed, and a review of aerial photographs from 1980 shows full development within International Circle.[9]

Over the following twenty years, the area surrounding International Circle developed similarly to the original proposed campus design, with parking lots and structures, as well as medical and commercial offices. In 1979 and 1984 the zoning was changed to allow for greater building density and flexibility for Kaiser's eventual campus build out.[10] Review of historic aerials show development extending counterclockwise from the southeast around International Circle, with medical offices and surface parking slowly filling in the campus by 1998.

In 2003, the Main Hospital building was expanded north and west to include a 17,700-sf emergency room extending westward to Building 6 (275 Hospital Parkway). The one-story expansion consisted of a one-story steel brace framed building with a rectangular footprint, measuring 218 by 60 feet along the northern side of the building, with a triangular addition extending 40 feet on the western side of the building connecting to Building 6.[11]

Ruth & Going

Leo W. Ruth, Jr. was a civil and mechanical engineer who co-founded Ruth & Going engineering firm with Edward Jackson Going, Jr. in 1960. Born in Santa Clara in 1917 (d. 2003), Ruth attended Santa Clara University and earned his civil and mechanical engineering degree in 1938. After being drafted into World War II in 1940, Ruth return to San José where he was employed as an

office engineer for the San José Department of Public Works as well as the firm James Waters & Associates (JWA). He worked at JWA for a decade before becoming a partner in the renamed Waters, Ruth and Going in 1956.[12] Going was born in 1928 in Houston, Texas (d. 2020) before moving to Santa Clara County in 1944 and attending Santa Clara University in 1949.[13] He joined the JWA firm directly after graduating, became partner in 1952, and formed Waters, Ruth and Going in 1956; and then four years later in 1960 established Ruth & Going when James Waters retired. Ruth and Going retired from the firm in 1983 and 1984, respectively.[14] Projects attributed to Ruth & Going include the Santa Teresa General Hospital, the 8,000 seat University of Santa Clara Buck Shaw Stadium, and the Villages Adult Residential Complex in San José.[15]

In 1990, Ruth was part of the inaugural class of the Silicon Valley Engineering Council (SVEC) Hall of Fame. Established in 1989, the SVEC is a "cooperative educational association of local engineering and technical societies" formed to promote engineering throughout the valley and Greater Bay Area. Ruth was nominated in recognition of his professional and personal merit as a member of numerous local organizations.[16] In 1993, the Santa Clara University School of Engineering bestowed its highest honor on Going by presenting him with the Distinguished Engineering Alumni Award in recognition of his accomplishments, both in his profession, his community, and in service to the University.[17]

Archival review uncovered little information outside some biographical and professional information about William Bender. Per newspaper review, he was employed by Ruth & Going as early as 1962 and became a senior vice president of structural engineering at Ruth & Going in 1981.[18] MacLaren was born in New Jersey in 1935, attended Stanford University from 1954 to 1958 before joining the U.S. Navy from 1959 to 1963. From 1969 through 1973 he worked as an architect at Ruth & Going before relocating to Mendocino to start a new career in retail.[19]

E.A. Hathaway Construction Company

E.A. Hathaway Construction is one of the oldest commercial construction firms in Northern California. The company was founded by Ernest A. Hathaway, who moved to Santa Clara County from Oregon in 1923 to establish a construction company. In Oregon, Hathaway had been building docks, railroad facilities, and other industrial structures. During the slow period of the Great Depression, Hathaway worked out of his home, remodeling older structures in downtown San José and building small commercial buildings in Santa Clara Valley.[20] After his son Ron returned home from World War II, Ron joined the family business and eventually took over as president in 1954, two years prior to Ernest's death in 1956.[21] Among the buildings attributed to E.A.

Hathaway Construction Company are the Santa Teresa Community Hospital, downtown San José's Wells Fargo Bank and PG&E buildings, the 1.8 million-square-foot Safeway distribution center in San José, and NASA's Ames Flight Center in Mountain View.[22]

Corporate Architecture Context (1949-1975)

Corporate Architecture, also referred to as Corporate International style or Corporate Modernism, is a derivative of postwar Modernism that primarily applied to large-scale commercial office buildings and government facilities. It was the dominant mode of corporate architecture between the 1950s and 1970s and reflected the postwar economic growth and the increasing importance of American corporations, showcasing how these entities "sought to position themselves as agents of modernity, technology, and progress."[23] The "suburbanization of corporate headquarters" began in the mid-20th century when large corporations such as IBM moved out of the city centers and closer to the senior executives.[24] Typical elements included low-rise buildings surrounded by parking lots and landscaping, with larger complexes often having a parklike setting with large scale public art or, in the case of John Deere, large-scale products on display.[25] The corporate campus or estate model were generally large complexes of buildings within a landscaped, park-like setting, where "the site planning, automobile approaches, visitor entrances, employee parking lots, and service docks all exemplified the functionalism of mid-20th century Modernism."[26] The office park, while including many of the same elements as the corporate campus or estate, was more modest in scale notably with regards to their setting. Office parks still provided the necessary building facilities with ample parking and some amount of landscaping, but not to the scale of a park-like setting. As described by one historian, "created by speculative real estate developers in the 1950s, the office park provided a lower cost, flexible alternative to the corporate campus and estate." [27]

Character-defining features of Corporate Architecture include:[28]

- Large rectangular massing
- Flat or low-pitched roofs
- Steel or concrete structure as primary expression of the building
- Horizontal bands of windows set within the structural module
- Alternate design of large concrete volume with little or no fenestration
- Building tower set back from the street in a landscaped plaza
- Tower frequently set atop a multi-story base framed by plain concrete or steel columns
- Overall absence of applied ornamentation, with the exception of corporate advertisement signs mounted directly to building

Evaluation

As described above, due to their similar design, age, and function, Buildings A-D were evaluated as a single resource. Buildings A-D at 280 Hospital Parkway are evaluated first within the criteria of the National and California registers. Because the criteria are nearly identical, they are evaluated for both registers simultaneously. A discussion regarding City of San José Landmark criteria is presented after.

Criterion A/1 (Events)

Buildings A-D at 280 Hospital Parkway were constructed in 1978[29], as additional medical office buildings associated with the Santa Teresa Community Hospital. The Santa Teresa Community Hospital was constructed to serve the surrounding community of South San José, with the local homeowners group in favor of the proposed project. AMI developed the hospital facility as a "total concept" multi-service medical center, their third such facility nationwide of AMI's 20 previously constructed hospital facilities. In October 1976, the Kaiser Foundation Hospital announced its plans to purchase the Santa Teresa Community Hospital, following the opening the Kaiser Permanent Santa Clara hospital in 1964. Following the end of World War II and the subsequent population boom in the Bay Area, over a dozen hospitals were constructed in Santa Clara County between 1953 and 1991. The majority of these were constructed prior to 1971, and a majority were constructed within the San José city limits.

While Buildings A-D provided an important service meeting the medical needs of the population of South San José, they do not appear to have been historically significant for their associations with the development of San José during the later decades of the 20th century. Research about the buildings did not reveal any particularly significant associations connecting the buildings with the development of San José, but rather they functioned as typical medical office buildings. For an association with historic events and patterns to be historically significant, National Register Bulletin 15 states that "a property must be associated with one or more events important in the defined historic context…the event or trends, however, must clearly be important within the associated context." Within the context of 20th century development in San José, the buildings are associated with community medical services, but this association does not appear to rise to the level where it could be considered important within the historic context. They are just some of the many medical office buildings constructed throughout the history of San José in the late 20th century. Because Buildings A-D at 280 Hospital Parkway do not appear to be historically significant within the context of 20th century medical development in San José, they are recommended not eligible for listing as an individual resource on the National or the California registers under Criterion A/1 for its association with 20th century development in San José.

Criterion B/2 (People)

Archival research did not reveal any significant persons associated with Buildings A-D at 280 Hospital Parkway. No specific individual within Santa Teresa hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Buildings A-D. Therefore, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing as an individual resource on the National or California Registers under Criterion B/2 for its association with historically significant persons.

Criterion C/3 (Design)

Buildings A-D at 280 Hospital Parkway is an example of Corporate Architecture within a medical office setting. Buildings A-D have low horizontal massing, low-pitched hipped roofs, large volumes of concrete with little fenestration, are positioned within a landscaped plaza, and lack ornamentation, all of which are characteristics of the Corporate Architecture style. While possessing recognizable characteristics of the Corporate Architecture style, the buildings do not embody the style, nor do they possess high artistic value. Additionally, the buildings do not appear to represent the work of a master. Archival research did not reveal any specific architect or builder associated with the buildings at 280 Hospital Parkway. As such, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing as an individual resource on the National or California registers under Criterion C/3 for its design.

[29] Building permit issued October 10, 1978. San Jose Building Permit database, https://portal.sanjoseca.gov/deployed/sfjsp

Criterion D/4 (Information Potential)

Criterion D/4 is most typically applied to archaeological sites. As applied to buildings and structures, it is necessary for the building or structure to have been a principal source of information that could not be gathered from other sources nearby or elsewhere. The Buildings A-D at 280 Hospital Parkway are constructed of common materials using standard building techniques. The buildings are unlikely to provide additional information on its construction methods, the history of San José, or hospital design and construction. As such, Buildings A-D at 280 Hospital Parkway are recommended not eligible for listing on the National or California registers under Criterion D/4 for its information potential.

Integrity

An assessment of integrity is necessary if the resource is found to be historically significant under one or more criteria for listing on the National or California registers. Because Buildings A-D at 280 Hospital Parkway are not recommended eligible under any criteria, a further assessment of integrity is not required.

City Landmark Criteria (City of San José Historic Resources Inventory)

1. 1. Its character, interest, or value as part of the local, regional, state, or national history, heritage for culture;

Buildings A-D at 280 Hospital Parkway do not represent the character of San José. Their value was as medical office buildings associate with a local hospital in South San José during the late-20th century, but archival review did not reveal any significant heritage or cultural importance of the buildings. Rather, they were some of many medical office buildings constructed during the postwar period in San José to address the needs of the growing population and do not appear to be significant under this criterion.

2. Its location as a site of a significant historic event;

Research did not suggest that Buildings A-D at 280 Hospital Parkway were the location of a significant historical event.

3. Its identification with a person or persons who significantly contributed to the local, regional, state, or national culture and history;

Archival research did not reveal any significant persons associated with Buildings A-D at 280 Hospital Parkway. No specific individual within Santa Teresa Hospital administration, AMI, or Kaiser Foundation Hospitals was determined to have achieved significance for their association with Buildings A-D.

4. Its exemplification of the cultural, economic, social, or historic heritage of the city of San José;

Buildings A-D at 280 Hospital Parkway do not appear to exemplify a particular cultural, social, or historic heritage with the City of San José. They served as medical office buildings for a community hospital in South San José for many years but do not represent a particular group, period, or aspect of life in San José that is historically important.

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

There is no specific overall style or distinctive character to Buildings A-D at 280 Hospital Parkway that is associated with the environment of a group of people.

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

Buildings A-D at 280 Hospital Parkway is an example of Corporate Architecture within a medical office setting. The buildings' low horizontal massing, low-pitched hipped roofs, large volumes of concrete with little fenestration, positioning within a landscaped plaza, and general lack of ornamentation are all characteristics of Corporate Architecture. While possessing recognizable characteristics of the style, the building does not embody the style, but is rather a typical example of the style within a medical office context.

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the city of San José; and

Archival research failed to indicate any significant persons associated with Buildings A-D at 280 Hospital Parkway.

8. Its embodiment of the elements of architectural or engineering design, detail, materials, or craftsmanship which represents a significant architectural innovation, or which is unique.

The architectural design of Buildings A-D at 280 Hospital Parkway do not represent a significant architectural innovation, but rather are a typical example of Corporate Architecture within a medical office setting.

Conclusions

As Buildings A-D at 280 Hospital Parkway do not meet any of the National Register, California Register, or City of San José Landmark criteria, ESA recommends them as ineligible for listing under national, state, or local criteria.

GEOLOGIC HAZARD EVALUATION AND GEOTECHNICAL INVESTIGATION
Kaiser Permanente San Jose Replacement Hospital
Hospital, Energy Center, and Service Yard
San Jose, California

1.0 INTRODUCTION

This report presents the results of the geologic hazard evaluation and geotechnical investigation performed by Langan Engineering and Environmental Services, Inc. (Langan) for the new hospital and associated energy center and service yard that are part of the proposed development at Kaiser Permanente Medical Center (Kaiser) in San Jose, California.

The development site coordinates are 37.2394° (latitude) and -121.8006° (longitude). The site is part of the San Jose Kaiser campus, which occupies the majority of the land bounded by Highway 85 on the north, Cottle Road on the west, Santa Teresa Boulevard on the south, and Liska Lane on the east. Figure 1 shows the campus and site location map. The Kaiser campus consists of hospital and medical office buildings, a parking structure, asphalt-paved surface parking lots, concrete walkways, and landscaping.

We understand the proposed development includes a new hospital, energy center, a service yard, a Hub/Ambulatory Surgery Center (ASC), and two parking structures, designated as Parking Structure 1 and 2. The new buildings are to be constructed on four parcels in the southwestern, southern, central, and northeastern portions of the San Jose Kaiser campus (APN 70605011, APN 70605025, APN 70605037, and APN 70605032), that are used as asphalt-paved surface parking lots. This report addresses the proposed hospital and associated energy center and service yard (site). The proposed Parking Structure 1 will be located in the southeastern portion of the Kaiser campus and will be seven stories constructed at grade. The finished floor will be at Elevation 189 feet. The proposed Parking Structure 1 will be addressed in a separate report.

The proposed Hub/ASC building and Parking Structure 2 are future developments and not addressed in this report.

We understand the hospital building, energy center, and service yard will be designed as Level 1 facilities and therefore will be under the jurisdiction of the Department of Health Care Access and Information (HCAI). Stantec Architecture Inc. is the project architect, KPFF is the project structural engineer, Sandis is the project civil engineer, and Rudolph and Sletten, Inc. is the general contractor for the project.

DRAFT

1.1 Proposed Hospital, Energy Center, and Service Yard

The proposed hospital, energy center, and service yard (site) will be located in the southwestern portion of the Kaiser campus. The project site is bound by Cottle Road on the west, Santa Teresa Boulevard on the south, Camino Verde Drive on the east, Hospital Parkway on the north, and International Circle on the northeast. A gas station is adjacent to the southwest portion of the site, outside the Kaiser property. The site is relatively level, with elevations ranging from about 184 to 188 feet[1]. The existing conditions and the proposed improvements for the project are shown on Figures 2 and 3, respectively.

The hospital will be a six-story L-shaped building constructed over a one-level basement that occupies the entire building footprint. The hospital will have a footprint of 130,000 square feet. The finished floor for the hospital basement level and ground floor level will be at Elevation 172 and 188 feet, respectively, with the basement about 16 feet below existing grade. The hospital site is occupied by a parking lot, driveways, landscaping, and contractor trailers. An existing water utility well is located near the hospital site. We understand the existing improvements within the footprint of the proposed hospital site, with the exception of the water utility well, will be demolished and removed, and the trailers relocated, prior to construction of the new hospital. The existing utility well will remain.

The energy center will be one story with a basement and will be located in the southeast corner of the proposed service yard. The planned lower finished floor level for the energy center will be at Elevation 168.5 feet, about 19½ feet below existing grade. The energy center will have a footprint of 13,000 square feet. The basement floor for the energy center will support heavy equipment. The proposed site for the energy center is occupied by a landscaping area that will be removed prior to construction of the energy center.

The service yard will be constructed south of and immediately adjacent to the new hospital building and will be about 80,500 square feet. The majority of the service yard will be about 20 feet below surrounding grades, corresponding to approximately Elevation 168 feet. The perimeter of the service yard will be supported by retaining walls. A ramp will be constructed at the northeast corner of the service yard. The service yard will include a loading dock for the hospital basement, storage tanks placed on top of the service yard pad and several equipment pads. The proposed site for the service yard is occupied by a parking lot, an equipment storage

[1] All elevations referenced herein are based on "Supplemental Utility and Tree Survey" by SANDIS, dated 28 October 2022 and reference National Geodetic Vertical Datum of 1929 (NGVD29).

DRAFT

area, and landscaping. The existing improvements will be removed from the site prior to construction of the service yard.

Preliminary unfactored dead plus live loads provided by KPFF for the proposed structures and for the tanks inside the service yard are summarized in Table 1.

TABLE 1
Preliminary Structural Loads

Proposed Improvements	Unfactored Dead plus Live Loads
Hospital	525- to 925-kip column loads
Energy Center	230-kip column typical dead plus live loads and up to 500-kip column dead loads for heavy equipment
Service Yard Tanks	6,300 kips per tank

Additionally, we understand the project will include at-grade improvements consisting of equipment pads, retaining walls and other ancillary structures, and light poles. The planned at-grade improvements consisting of generators and switchgear equipment will weigh approximately 120 kips and 40 to 50 kips, respectively. The at-grade pads for the generators and switchgear equipment will be located directly east of the service yard. Loads are currently not available for the remaining ancillary structures; however, we anticipate they will be light.

2.0 SCOPE OF SERVICES

Our geologic hazard evaluation and geotechnical investigation was completed in accordance with the scope of services outlined in our proposal dated 19 September 2022, and our Budget Increase Request No. 1 dated 8 December 2022. In accordance with California Code of Regulations (CCR) Title 24, California Building Code (CBC) requirements, geologic, earthquake and geotechnical reports for hospitals and essential services buildings are submitted for review and approval to HCAI. The California Geological Survey (CGS) serves under contract to HCAI for engineering geology and seismology review. CGS uses a checklist, CGS Note 48, to evaluate the adequacy of the engineering geology, geotechnical, and seismology reports. Our report is intended to comply with 2019 CCR Title 24 and includes the information listed in CGS Note 48.

Our services were separated into three tasks: 1) Geologic Hazard Evaluation, 2) Geotechnical Investigation, and 3) Site-Specific Response Spectra. The scope of services for each task is discussed in more detail in the following subsections.

DRAFT

Langan performed a Phase I Environmental Site Assessment and Soil Management Plan for the development and presented the results in reports dated 8 March 2023 and 3 May 2023, respectively.

2.1 Geologic Hazard Evaluation

We performed the geologic hazard evaluation concurrently with our geotechnical investigation. Our scope of services for the geologic hazard evaluation included:

- reviewing available published and unpublished geologic, seismic, groundwater, flooding, and geotechnical literature and maps
- interpreting stereo paired aerial photographs
- performing a geologic reconnaissance for the medical center campus
- preparing a campus engineering geologic map
- reviewing boring logs produced during our geotechnical investigation
- preparing two geologic cross sections through the new building sites using information from our geotechnical investigation.

2.2 Geotechnical Investigation

Our geotechnical investigation consisted of evaluating subsurface conditions at the site and performing engineering analyses to provide recommendations for the proposed development. To evaluate subsurface conditions at the site, we drilled 11 borings and advanced 27 cone penetration tests (CPTs) for the new hospital, energy center, and service yard. Several of the borings and CPTs were performed along the boundaries between the adjacent structures and were used to evaluate subsurface conditions below both structures. Additionally, we drilled four borings and advanced four CPTs in the Parking Structure 1 footprint. Per CBC Section 1803A.3.1, the essential facilities of the project, including the hospital, energy center, and service yard, should include one exploration point for every 5,000 square feet of building/structure footprint, with a minimum of two exploration points per structure. A summary of the field exploration is presented in Table 2.

DRAFT

TABLE 2
Field Exploration Summary

Proposed Building or Structure	Assumed Footprint Area (square feet)	Required Number of Investigation Points per CBC	Number of CPTs	Number of Borings
Hospital	130,000	26	19	7
Energy Center	13,000	3	2	1
Service Yard	80,000	16	10[1]	6[1]

[1] One or more of these investigation points is shared between adjacent buildings or structures.

We performed laboratory tests on representative soil samples. We used the results of our field investigation and laboratory testing to perform engineering analyses and develop conclusions and recommendations for the new hospital and associated energy center and service yard site, regarding:

- soil and groundwater conditions
- seismic hazards, including fault rupture, liquefaction, and seismic settlements
- appropriate foundation type(s) for the proposed hospital building, energy center, and service yard
- design criteria for the most appropriate foundation type(s), including values for vertical and lateral capacities
- estimated foundation settlements, including total and differential settlements
- lateral earth pressures for design of basement and retaining walls
- floor slabs
- site grading, including soil subgrade preparation and criteria for quality and compaction of fill and backfill
- excavation, temporary slopes, and dewatering
- temporary shoring
- underground utilities
- protection of the existing water utility well near the hospital site
- flexible and rigid pavement

DRAFT

- concrete flatwork
- 2022 California Building Code (CBC) seismic design criteria, including site classification, mapped values S_S and S_1, modification factors F_A and F_V, and S_{MS} and S_{M1}
- corrosion characteristics
- construction considerations.

The results of our field investigation, engineering analyses and our conclusions and recommendations for Parking Structure 1 will be presented in a separate report.

2.3 Site-Specific Response Spectra

We performed probabilistic seismic hazard analysis (PSHA) and deterministic analysis to develop site-specific respond spectra for the Risk-targeted Maximum Considered Earthquake (MCE_R) and Design Earthquake (DE) per the 2022 CBC and by reference ASCE 7-16.

3.0 REGIONAL GEOLOGY

The site is located within the Coast Ranges geomorphic province (Coast Ranges) of California. The Coast Ranges are characterized by northwest-trending structural and topographic (valleys and ridges) fabrics. The fabrics formed initially by folding and thrust faulting in a subduction zone environment (approximately 120 to 80 million years ago), and later by right-lateral shear within the San Andreas fault system (starting approximately 28 million years ago). The Bay Area lies within the "diffuse" transform plate boundary between the Pacific Plate and North American Plate. It is a seismically active region that encompasses several Holocene - and historically, active faults (U.S. Geological Survey Quaternary fault and fold database).

Topographically, the site lies on a low-relief alluvial surface called the Santa Teresa-San Jose Plain (DWR, 1967), which borders San Francisco Bay on the southeast. Regional geologic maps by the U.S. Geological Survey (Helley et al., 1994; Wentworth et al., 1998) show the medical center and surrounding area are underlain by Holocene basin and levee deposits, geologic units Qhb and Qhl, respectively (Figure 4a). A legend summarizing the deposits shown on the regional geologic map is presented on Figure 4b. The Holocene levee deposits (Qhl) are described by Wentworth et al. (1998) as loose and moderately- to well-sorted sandy and clayey silt and sandy and silty clay that were deposited adjacent to streams where spreading, slowing floodwaters occurred. The Holocene basin deposits (Qhb) are described as organic rich, dark-colored clay and very fine silty clay that were deposited in flood basins beyond the adjacent levees and floodplains.

DRAFT

Given the regional topographic gradients, both map units were likely sourced from Coyote Creek and/or Santa Teresa Ridge to the east and south, respectively.

4.0 FIELD INVESTIGATION AND LABORATORY TESTING

We began our investigation by reviewing previous geotechnical investigations performed by others at the San Jose Kaiser campus. To investigate subsurface conditions at the project site, we drilled 11 borings and advanced 27 CPTs. In addition, one of the borings was converted to a groundwater level monitoring well (piezometer). We also drilled four borings and advanced four CPTs to investigate subsurface conditions at the parking structure site.

Prior to performing the field investigation, we:

- obtained drilling and well construction permits from Santa Clara Valley Water District (Valley Water)
- notified Underground Service Alert (USA) and followed up with USA utility companies
- checked the boring and CPT locations for underground utilities using a private utility locator.

Details of the field exploration activities and laboratory testing are described in the remainder of this section.

4.1 Borings

Fifteen borings, designated as B-1 through B-15, were drilled at the hospital and parking structure sites at the approximate locations presented on Figures 2 and 3. The borings were drilled between 9 and 20 January 2023 by Exploration Geoservices, Inc. (EGI) of San Jose, California using a truck-mounted drill rig equipped with hollow-stem-auger drilling equipment. The borings were advanced to depths between 31.5 and 101.5 feet below the existing ground surface (bgs). A summary of the ground surface elevations at the Langan boring locations and boring depths is presented in Table 3.

DRAFT

TABLE 3
Approximate Ground Surface and Depths at Boring Locations

Boring	Approximate Ground Surface Elevation (feet, NGVD29)	Total Depth (feet)
B-1	186.5	101.5
B-2	185.7	51.5
B-3	186.0	31.5
B-4	186.5	101.5
B-5	187.7	51.5
B-6	188.0	51.5
B-7	188.3	51.5
B-8	187.7	51.5
B-9	188.6	101.5
B-10	186.0	51.5
B-11	188.0	51.5
B-12	189.6	76.5
B-13	189.0	51.5
B-14	188.3	51.5
B-15	187.5	75.4

During drilling, our engineer logged the borings and obtained samples of the material encountered for visual classification and laboratory testing. Logs of the borings are presented in Appendix A as Figures A-1 through A-15. The soil encountered in the borings was classified in accordance with the Classification Chart presented on Figure A-16.

Soil samples were obtained using two different types of driven split-barrel samplers. The sampler types are as follows:

- Sprague & Henwood (S&H) split-barrel sampler with a 3.0-inch outside diameter and 2.5-inch inside diameter, lined with steel or brass tubes with an inside diameter of 2.43 inches

- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and 1.5-inch inside diameter, without liners.

The sampler types were chosen on the basis of soil type being sampled and desired sample quality for laboratory testing. In general, the S&H sampler was used to obtain samples in medium

DRAFT

stiff to very stiff cohesive soil and the SPT sampler was used to evaluate the penetration resistance of sandy soil.

The SPT and S&H samplers were driven with 140-pound, above-ground, automatic safety hammers falling 30 inches. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers every six inches of penetration were recorded and are presented on the boring logs. A "blow count" is defined as the number of hammer blows per six inches of penetration. The blow counts required to drive the S&H and SPT samplers were converted to approximate SPT N-values using factors of 0.6 and 1.0, respectively, to account for sampler type and hammer energy, and are shown on the boring logs. The blow counts used for this conversion were the last two blow counts. The conversion factors are based on hammer efficiency data provided by EGI for the drill rig.

Upon completion, the boreholes were backfilled with cement grout in accordance with the requirements of Valley Water. The soil cuttings from the borings were collected in 55-gallon drums, which were stored temporarily at the site, tested, and eventually transported off-site for proper disposal.

4.2 Piezometer

Upon completion of boring B-6, per our request, the drillers converted the boring to a piezometer. The piezometer was installed to a depth of about 50 feet bgs. The approximate location of piezometer B-6 is shown on Figures 2 and 3. Details of the piezometer, including screen interval, sand packs and grout zones, are shown on Figure A-6 in Appendix A. The screen interval for piezometer B-6 is from depths of 25 to 50 feet bgs. The piezometer installation was in accordance with the requirements of Valley Water and a well construction summary was submitted to Valley Water at the end of the field investigation.

4.3 Cone Penetration Tests

Thirty-one CPTs, designated as CPT-1 through CPT-31, were performed at the hospital and parking structure sites between 9 and 26 January 2023 by ConeTec Inc. of San Leandro, California, at the locations shown on Figures 2 and 3. The CPTs were advanced to approximately 50.5 to 150.4 feet bgs. A summary of the ground surface elevations at the CPT locations and CPT depths is presented in Table 4.

DRAFT

TABLE 4
Approximate Ground Surface and Depths at CPT Locations

Boring	Approximate Ground Surface Elevation (feet, NGVD29)	Total Depth (feet)
CPT-1	186	50.5
CPT-2	185.2	150
SCPT-3[1]	186.3	110.6
CPT-4	185.7	50.5
CPT-5	186.5	50.5
CPT-6	186.0	50.5
CPT-7	186.3	50.5
CPT-8	187.8	50.5
CPT-9	187.4	50.5
CPT-10	187.3	50.5
CPT-11	186.0	150.4
CPT-12	188.2	50.5
CPT-13	187.0	50.5
SCPT-14[1]	187.6	110.6
CPT-15	187.6	50.5
CPT-16	187.8	50.5
CPT-17	188.6	149.5
CPT-18	187.6	75.2
CPT-19	188.4	50.5
CPT-20	185.8	50.9
CPT-21	188.6	100.6
CPT-22	188.6	100.6
CPT-23	187.7	50.5
CPT-24	187.7	50.5
CPT-25	186.7	50.7
CPT-26	187.9	75.5
CPT-27	187.6	50.8
CPT-28	188.0	50.5
CPT-29	188.8	150.1
CPT-30	189.5	50.5
SCPT-31[1]	188.5	100.6

1. SCPT = Seismic Cone Penetration Test

The CPTs were performed by hydraulically pushing a 1.7-inch-diameter, cone-tipped probe, with a projected area of 15 square centimeters, into the ground. The cone tip measures tip resistance, and the friction sleeve behind the cone tip measures frictional resistance. Electrical strain gauges

DRAFT

or load cells within the cone continuously measure the cone tip resistance and frictional resistance during the entire depth of each probing. Accumulated data was processed by computer to provide engineering information, such as the types and approximate strength characteristics of the soil encountered. The CPT logs, showing tip resistance, side friction and friction ratio by depth, as well as interpreted soil classification, are presented in Appendix B. Soil types were estimated using the classification chart shown in Appendix B.

Pore pressure dissipation tests (PPDTs) were performed during the advancement of each CPT at various depths, except at CPT-15. PPDTs were conducted to measure hydrostatic water pressures and to determine the approximate depth to groundwater. The variation of pore pressure with time is measured behind the tip of the cone and recorded. One PPDT was performed in CPT-1, CPT-3 through CPT-6, CPT-8 through CPT-10, CPT-12, CPT-14 through CPT-28, CPT-30, and CPT-31. Two PPDTs were performed in CPT-2, CPT-7, CPT-11, CPT-13, and CPT-29. For this investigation, the duration of the tests ranged from approximately 235 to 2,760 seconds. The results of the thirty-five PPDTs are presented in Appendix B.

Seismic cone penetration testing (SCPT) soundings were performed during the advancement of CPT-3, CPT-14, and CPT-31. The soundings were conducted at five feet intervals to measure shear wave velocities through the soil profile. The shear wave velocity results are included in Appendix B.

After completion, the CPTs were backfilled with cement grout in accordance with Valley Water requirements.

4.4 Laboratory Testing

The soil samples collected from the field exploration program were reexamined in the office for soil classifications and representative samples were selected for laboratory testing. The laboratory testing program was designed to evaluate engineering properties of the soil at the site. Samples were tested to measure moisture content, dry density, plasticity (Atterberg limits), gradation, shear strength, compressibility, and resistance value (R-value), where appropriate. Results of the laboratory testing are included on the boring logs and in Appendix C on Figures C-1 through C-28.

Analytical laboratory testing was performed on selected soil samples collected from the borings; the results are presented in our Soil Management Plan report.

DRAFT

4.5 Soil Corrosivity Testing

To evaluate the corrosivity of the near-surface soil, we performed corrosivity tests on four samples obtained from the upper five feet. The corrosivity of the soil samples were evaluated by CERCO Analytical using the following ASTM test methods:

- Redox – ASTM D1498
- pH – ASTM D4972
- Resistivity (100% Saturation) – ASTM G57
- Sulfide – ASTM D4658M
- Chloride – ASTM D4327
- Sulfate – ASTM D4327.

The laboratory corrosion test results and a brief corrosivity evaluation by Cerco Analytical Inc. are presented in Appendix D.

4.6 Reconnaissance Engineering Geologic Mapping

On 16 February 2023, our geologist performed reconnaissance engineering geologic mapping of the medical campus. The purpose of the mapping was to identify, characterize, and evaluate overall surface geologic conditions and their potential impact on proposed site improvements. The majority of the campus is covered by buildings and pavements; in the open areas, the geologic units are covered with landscape and therefore not exposed at the ground surface. Based on our review of the available geologic and geotechnical information, we identified the lateral extent of the geologic units at the campus (basin and levee deposits) shown on Figure 5. The project site (proposed hospital and associated service yard and energy center) is underlain by basin deposits.

4.7 Previous Geotechnical Investigations

Prior to performing our geologic hazard evaluation and field investigation, we reviewed the following geotechnical investigation reports for previous developments at the San Jose Kaiser campus:

- Geotechnical Engineering Evaluation, Exterior Fuel Cell Installation for KSR074 – 250 Hospital Parkway, San Jose, California, by Kleinfelder, dated 8 June 2018

DRAFT

- Geotechnical Engineering Letter Report, Kaiser San Jose Medical Center – MOB 275 Emergency Generator Replacement, 275 Hospital Parkway, San Jose, California, by Geosphere Consultants, Inc., dated 28 July 2017

- Engineering Geologic and Geotechnical Report, Emergency Room Expansion, Kaiser Santa Teresa Medical Center, San Jose, California, by Geomatrix Consultants, Inc., dated 25 May 2001

- Geologic Hazards Evaluation, Kaiser Santa Teresa Medical Center, San Jose, California, by Geomatrix Consultants, Inc., dated 20 July 2000

- Addendum for Geologic Hazards Evaluation, Kaiser Santa Teresa Medical Center, San Jose, California, by Geomatrix Consultants, Inc., dated 20 October 2000

- Geotechnical Consultation, Proposed Seismic Upgrade of Existing Parking Structure, Kaiser Santa Teresa Medical Center, San Jose, California, by Bay Area Geotechnical Group (BAGG), dated 15 November 1991.

The locations of the borings performed during the previous geotechnical investigations are shown on Figure 5 and the available borings logs are included in Appendix E. The logs of borings B-3 and B-4 performed by BAGG were not included in the 1991 report, and therefore are not available.

We also reviewed the results of the laboratory testing performed during the previous geotechnical investigations. Samples were tested to measure moisture content, dry density, Atterberg limits, gradation, shear strength and corrosivity. Results of the laboratory testing are included in Appendix E.

5.0 SITE AND SUBSURFACE CONDITIONS

The aerial photograph review, site conditions, and subsurface conditions are discussed in the following sections.

5.1 Aerial Photograph Review

We reviewed single-frame and stereo-pair, black-and-white aerial photographs of the site and surrounding area that were collected between the years 1958 and 2005. A list of the photographs we reviewed is presented in Table 5. The purpose of the air photo review was to understand the land-use and grading history of the site. We also used the air photos to screen the site for potential geohazards features, discussed in Section 7.1.1.

DRAFT

TABLE 5
List of Aerial Photographs Reviewed

Date	Photograph Number	Scale	Source
03/07/1958	SF-Area 3-162	1:36,000	Pacific Aerial Surveys
07/12/1960	AV 385-10-03, -04	1:30,000	Pacific Aerial Surveys
10/12/1971	AV 1006-18-23, -24, -25	1:12,000	Pacific Aerial Surveys
05/23/1974	AV 1138-18-22, -23	1:12,000	Pacific Aerial Surveys

07/23/1990	AV 3845-29-94, -95	1:12,000	Pacific Aerial Surveys
08/20/1999	AV 6100-231-35, -36	1:12,000	Pacific Aerial Surveys
03/25/2005	KAV 9010-125-17, -18	1:10,000	Pacific Aerial Surveys

The available photos show from 1958 through October 1971 the hospital campus was mostly undeveloped agricultural fields. There is very little topographic relief in the area other than Santa Teresa Ridge to the south and levees along Coyote Creek to the north—both well beyond the site limits. A farmhouse or greenhouse occupied the site adjacent to the intersection of Santa Teresa Boulevard and Camino Verde Drive.

Other than farm roads, the earliest signs of grading at the campus were in 1971 when ground was broken for International Circle. By May 1974, International Circle as well as Hospital Parkway were completed, and the Emergency Room, Employee Health Building, and parking lot at the southeast corner of the campus was built. A gas station was constructed at the intersection of Hospital Parkway and Cottle Road. Development took place around and immediately north of Highway 85. The southwest quadrant of the campus where the proposed hospital will be constructed remained undeveloped.

By 1980, the area of the campus bounded by International Circle was developed, and the campus building layout matches the present-day configuration. A parking lot was constructed in the northeast portion of the campus. The area of the proposed hospital remained undeveloped. Beyond the campus, residential construction was occurring south of Santa Teresa Boulevard and east of Camino Verde Drive. In addition, there was minor grading/removal of ground cover for the adjacent public library site to the east, and the Santa Teresa Apartments were built at the northwest corner of Santa Teresa Boulevard and Liska Lane.

DRAFT

By July 1990, a strip of parking lot was built near the proposed hospital site along International Circle. Development of the hospital campus north and northeast of International Circle was completed. Grading and construction had begun for the Cattle Light Rail Station and Highway 85 to the north of the site; these improvements were completed by 1999. The 1999 photos also show that construction of the parking lot that currently occupies the proposed hospital site was completed. Through 2005, development continued around the site, in particular in the area west of Cottle Road and north of Santa Teresa Boulevard.

5.2 Site Conditions

The site for the proposed hospital, energy center, and service yard is located within the southwestern portion of the San Jose Kaiser campus that consists of two assessor's parcels, 70605011 and 70605025. The site is occupied by a parking lot, driveways, contractor trailers, an equipment storage area, and landscaping areas. The parking lot and landscaping areas are relatively flat with elevations ranging from 184 to 188 feet.

The site is bounded by Cottle Road on the west, Santa Teresa Boulevard on the south, Camino Verde Drive on the east, Hospital Parkway on the north, and International Circle on the northeast. A gas station is adjacent to the southwest portion of the site. The existing hospital and medical office buildings are located to the north and east of the project limits, across Hospital Parkway and International Circle.

An existing water utility well operated by Valley Water is within the project limits, on the northeast side of the proposed hospital, as shown on Figures 2 and 3. We understand the well will be protected during construction of the project.

5.3 Subsurface Conditions

Our understanding of the local geology and soil conditions at the site is based on our site geologic reconnaissance and the results of our geotechnical investigation. Our interpretation of the subsurface geologic conditions at the project site are summarized on two idealized geologic cross sections, designated as A-A' and B-B,' presented on Figures 6 and 7, respectively.

The results of our investigations and laboratory testing indicate the soil conditions are relatively uniform across the site. The description of the geologic units at the site are presented below.

DRAFT

5.3.1 Existing Pavement

The results of our field exploration indicate the existing pavement, where explored at the site, consists of about 2 to 6 inches of asphalt concrete (AC). Beneath the AC, we encountered about 6 to 10 inches of aggregate base (AB).

5.3.2 Basin Deposits (Holocene)

The existing pavement and landscaping areas at the project site are generally underlain by recent alluvial basin deposits (Holocene) consisting of clay and silt interbedded with sand and gravel layers. The soil encountered in the upper 70 to 75 feet of our borings and CPTs generally consisted of medium stiff to hard clay and silt with varying amounts of sand, silt, and gravel. The upper clay is moderately compressible and is interbedded with medium dense to dense sand and gravel layers with varying amounts of fines. The upper clay is generally slightly overconsolidated[2], with overconsolidation ratio[3] (OCR) greater than 1.1. Where tested, the shear strengths of the silt and clay range from 600 to 2,600 pounds per square foot (psf). Where tested, the plasticity index (PI) of the top five feet of clay ranges between about 16 and 21, indicating it has moderate expansion potential[4].

The upper clay and silt are underlain by about 25 feet of dense to very dense sand and gravel extending to depths of about 95 to 100 feet bgs. Below the sand and gravel are stiff to hard silt and clay (moderately compressible to relatively incompressible) interbedded with layers of dense to very dense sand and gravel to the maximum depth explored of 150 feet bgs. Where tested, the lower clay and silt are overconsolidated with OCRs greater than 1.5, and have undrained shear strengths ranging from about 2,500 to 6,000 psf.

5.3.3 Groundwater

To evaluate the groundwater level at the site we reviewed available historic data, data from monitoring wells at/near the site, groundwater level measurements from previous explorations performed at the hospital campus, and measurements from our recent field investigation at the project site. According to our review of the CGS Seismic Hazard Zone Report for the Santa Teresa Hills Quadrangle (CGS, 2003), historic high groundwater level in the project vicinity is

[2] An underconsolidated clay has not yet achieved equilibrium under the existing load; an overconsolidated clay has experienced a pressure greater than its current load.

[3] The overconsolidation ratio (OCR) for a soil is defined as the ratio between the maximum sustained pressure the soil has experienced and the present effective vertical pressure.

[4] Soil with moderate expansion potential undergoes moderate volume changes with changes in moisture content.

DRAFT

approximately 20 feet bgs, corresponding to approximately Elevation 168 feet. Additionally, we reviewed data available from monitoring wells at and near the site from Valley Water; the data indicate the groundwater level at the site was as high as 12 feet bgs (Elevation 174 feet) within the past ten years. Considering the site is at least 15 miles from the San Francisco Bay and significantly higher in elevation, sea level rise should not exceed the design groundwater level.

The groundwater levels measured in the borings during previous investigations performed at the San Jose Kaiser campus (from 1971 to 2018) range from about 19 to 35 feet bgs, corresponding to approximately Elevations 155 to 171 feet. Some measurements were recorded during and immediately after exploration and may not represent stabilized levels. The groundwater levels measured in the 2023 Langan borings range from 25 to 31 feet bgs, corresponding to Elevations 156.7 to 162.6 feet, as summarized in Table 6. Seasonal fluctuations in rainfall influence groundwater levels and may cause several feet of variation.

TABLE 6
Summary of Groundwater Measurements at Langan Boring Locations

Boring Location	Manual Reading(s) Before Grouting	
	Depth to Groundwater (feet, bgs)	Groundwater Elevation (feet, NGVD29)
B-1	29	157.5
B-2	29	156.7
B-3	28	158
B-4	27	159.5
B-5	31	156.7
B-6[1]	31	157.0
B-7	27	161.3
B-8	27	160.7
B-9	31	157.6
B-10[2]	25, 29	161.0, 157.0
B-11	31	157.0
B-12	27	162.6
B-13	28	161.0
B-14[2]	28, 27	160.3, 161.3
B-15	28	159.5

1. Boring B-6 was converted to piezometer upon completion of drilling.
2. Two manual readings were taken before grouting.

DRAFT

The PPDTs conducted in Langan CPT-1 through CPT-14 and CPT-16 though CPT-31 were performed at depths ranging from 24.4 to 150 feet bgs. Groundwater depths interpreted from the PPDTs range from 18.1 to 35.0 feet bgs, corresponding to approximately Elevations 150.2 to 167.6 feet, as summarized in Table 7.

TABLE 7
Summary of Groundwater Measurements at Langan CPT Locations

CPT Location	Depth of PPDT[1] (feet, bgs)	Interpreted Groundwater Depth from PPDT (feet, bgs)	Interpreted Groundwater Elevation from PPDT (feet, NGVD29)
CPT-1	27.6	22.9	163.1
CPT-2	48.6	30.1	155.1
CPT-2	150.0	35.0	150.2
SCPT-3	78.7	32.5	153.8

6.0 REGIONAL SEISMICITY AND FAULTING

The project site is in a seismically active region. Numerous earthquakes have been recorded in the region in the past, and moderate to large earthquakes should be anticipated during the service life of the proposed development. The Hayward-Rodgers Creek, Calaveras, and San Andreas faults are the major faults closest to the site. These and other faults of the region are shown on Figure 8. For each of these faults, as well as other active faults within about 50 kilometers (km)

DRAFT

of the site, the distance from the site and estimated mean Moment magnitude[5] [2014 Working Group on California Earthquake Probabilities (WGCEP) (2015) and Uniform California Earthquake Rupture Forecast Version 3 (UCERF3) as detailed in the United States Geological Survey Open File Report 2013-1165] are summarized in Table 9. The mean Moment magnitude presented on Table 9 was computed assuming full rupture of the segment using Hanks and Bakun (2008) relationship.

Note:
1. The table above is a summary and does not include all the fault segmentation, alternate traces and low activity faults included in the UCERF3 model.

[5] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

DRAFT

Figure 8 also shows the earthquake epicenters for events with magnitude greater than 5.0 from January 1800 through August 2014. Since 1800, four major earthquakes have been recorded on the San Andreas fault. In 1836 an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale (Figure 9) occurred east of Monterey Bay on the San Andreas fault (Toppozada and Borchardt 1998). The estimated Moment magnitude, M_w, for this earthquake is about 6.25. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas fault from Shelter Cove to San Juan Bautista approximately 470 km in length. It had a maximum intensity of XI (MM), an M_w of about 7.9, and was felt 560 km away in Oregon, Nevada, and Los Angeles. The Loma Prieta Earthquake occurred on 17 October 1989 in the Santa Cruz Mountains with an M_w of 6.9, the epicenter of which is approximately 24 km from the site.

In 1868 an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake (M_w = 6.2).

The most recent earthquake to affect the Bay Area occurred on 24 August 2014 and was located on the West Napa fault, approximately 118 km northeast of the site, with an M_W of 6.0.

The 2016 U.S. Geologic Survey (USGS) predicted a 72 percent chance of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area in 30 years (Aagaard et al. 2016). More specific estimates of the probabilities for different faults in the Bay Area are presented in Table 10.

7.0 SEISMIC AND GEOLOGIC HAZARDS

Seismic hazards and geologic hazards as they pertain to the proposed improvements are discussed in the following sections.

7.1 Fault Rupture

Historically, ground surface fault ruptures closely follow the traces of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo (AP) Earthquake Fault Zoning Act[6], and no Holocene-active or potentially active faults exist on the site. The San Jose fault is currently mapped to cross the project site; however, it is not zoned by the CGS under the AP Earthquake Fault Zoning Act. The San Jose fault is discussed in further detail in the following section.

In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure at the site is low.

7.1.1 San Jose Fault

The U.S. Geological Survey's Quaternary Fault and Fold Database[7] shows the surface projection of the San Jose fault (SJF), crossing the proposed footprints of the new hospital, service yard, and Parking Structure 1. The SJF is classified as an undifferentiated Quaternary structure with a

[6] The Alquist-Priolo Act zones certain faults which are known to be active. The CGS defines active as having recorded movement within Holocene time, or within the last 11,700 years.

[7] https://usgs.maps.arcgis.com/apps/webappviewer/index.html?id=5a6038b3a1684561a9b0aadf88412fcf

DRAFT

poorly constrained locational certainty. The projected trace is based on a 1:750,000-scale compilation map by Jennings (1994).

The existence of the SJF was inferred (i.e., it has not been directly observed) based on interpretation of gravity surveys and groundwater well logs by the California Department of Water Resources (CDWR, 1967 and 1975). CDWR interpreted a system of mostly concealed faults to explain elevation changes that occur on the top of buried Franciscan Complex bedrock; the bedrock lays at depths of hundreds of feet below the alluvial cover. CDRW also interpreted a series of buried stream channel deposits that are abruptly truncated; they interpret the truncations as the near-surface manifestation of the same faults. The concealed fault system is shown traversing Santa Clara Valley between Redwood City and South San Jose. The tip-lines of the faults (i.e., the uppermost reaches of the faults), including the SJF, were interpreted at depths of approximately 50 feet below ground surface—terminating in Older Alluvial Fan deposits for which no absolute age is given.

A more recent study by the U.S. Geological Survey (Wentworth et al., 2010) casts considerable doubt on the existence of the SJF. Using independent sequence stratigraphic analyses that incorporate new well data, and reinterpreting the older geophysical data using modern techniques, Wentworth et al. (2010) argue that the interpreted buried channels and resultant fault patterns are unreasonable and inconsistent with their findings. The buried channels are laterally continuous layers that gradually pinch out as opposed to being abruptly truncated. They conclude that "*Any continued dependence on the CDWR mapping (1967; 1975) is without foundation*."

Geomatrix (2000) performed a geologic hazards evaluation for the Kaiser campus for the main hospital, at the center of the campus. The SJF (referenced as the Santa Clara fault) was addressed in the Geomatrix report. Geomatrix concluded that the potential for surface fault rupture at the main hospital building is very low. They also concluded no significant surface fault rupture hazard was identified for the designated hospital building at the site.

We used the historical stereo air photographs described in Section 5.1 to screen the pre-development ground surface for geomorphic features that could indicate potential faulting. The photographs from 1960 were of particular value because they were collected before the site and surrounding properties were developed, and the scale provides broader coverage beyond the site. Although the SJF was interpreted as a concealed feature, displacement on buried faults can still generate surface deformation such as localized uplift and/or down warping (e.g., Dolan et al., 2003). We did not observe any lineaments, topographic or surface gradient changes on the

DRAFT

1960 stereo air photograph near where the fault was mapped. More broadly, we did not observe any other anomalous landforms that suggest ground deformation. As discussed in Section 5.1, the ground surface within the site and surrounding area is relatively flat.

Based on our review of available studies we concur with Geomatrix (2000) findings and conclude the potential for surface fault rupture at the Kaiser campus is low.

7.2 Liquefaction and Associated Hazards

The site is in a seismically active area and will likely be subjected to strong shaking during a major earthquake on a nearby active fault. Strong shaking during an earthquake can result in ground failures such as those associated with soil liquefaction[8], lateral spreading[9], and seismic densification[10]. We evaluated each of these conditions based on our review of available information, field investigation, and results of our analysis, as discussed in this section.

7.2.1 Liquefaction-Induced Settlement

As shown on Figure 10, the site is within a zone designated with the potential for liquefaction, as identified by the California Geological Survey (formerly the California Division of Mines and Geology), on a map titled, "State of California Seismic Hazard Zones, Santa Teresa Hills Quadrangle" (CGS, 2003). Specifically, the map shows the site is in an area "where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693 (c) would be required."

To evaluate the liquefaction potential at the site, we performed liquefaction analysis using the results of the CPTs in accordance with the State of California Special Publication 117A, Guidelines for Evaluation and Mitigation of Seismic Hazards in California (2008). The SPT blow count data from the hollow-stem-auger borings was judged to be unreliable because of the potential for heave and flow into the augers disturbing granular soil below the groundwater level.

[8] Liquefaction is a phenomenon in which saturated (submerged), cohesionless soil experiences a temporary loss of strength because of the buildup of excess pore water pressure, especially during cyclic loading such as those induced by earthquake. Soils most susceptible to liquefaction are loose to medium dense sand and gravel, low plasticity silt, and some low plasticity clay deposits.

[9] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[10] Seismic densification (also referred to as cyclic densification or differential compaction) is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground surface settlement.

DRAFT

We used the procedures presented in Boulanger and Idriss (2014) to evaluate the liquefaction potential at the site. These procedures are updates of the simplified procedures developed by Seed et al. (1971) and Idriss and Boulanger (2008). To estimate volumetric strain and associated liquefaction-induced settlement, we used the procedures developed by Zhang et al. (2002).

These analytical methods calculate a factor of safety against liquefaction triggering by taking the ratio of soil strength (resistance of the soil to cyclic shaking) to the seismic demand that can be expected from a design level seismic event. Specifically, two distinct terms are used in the liquefaction triggering analyses:

- Cyclic Resistance Ratio (CRR), which quantifies the soil's resistance to cyclic shaking, is a function of soil depth, relative density, depth of groundwater, earthquake magnitude, and overall soil behavior
- Cyclic Stress Ratio (CSR), which quantifies the stresses that may develop during cyclic shaking.

The factor of safety (FS) against liquefaction triggering can be expressed as the ratio of CRR over CSR. For our analyses, if the FS for a soil layer is less than 1.3, we judge the soil layer may generate excess pore pressure and liquefy during a large seismic event.

The primary design parameters used in our liquefaction triggering calculations are summarized in Table 11.

TABLE 11
Values Used in Liquefaction Evaluation

Parameter	Value
Depth to groundwater (Historic depth to high groundwater based on monitoring of wells at and near the site)	Approximately 12 feet below ground surface (Elevation 175 feet, NGVD29)
Peak Ground Acceleration (PGA_M)[1]	0.65g
Predominant Earthquake Moment Magnitude (M_w)	7.2
Factor of Safety for Liquefaction Triggering	1.3

1. PGAM is based on site-specific response spectra per Section 21.5 of ASCE 7-16.

DRAFT

The proposed hospital will include one basement level. The anticipated excavation depth[11] to construct the hospital basement is approximately 24 feet bgs. The energy center and service yard will be constructed about 26 and 22 feet below surrounding grades, respectively. The recommended procedures for implementation of Special Publication 117 (1999) require a minimum depth of 50 feet below lowest proposed bottom of excavation grade for evaluation of liquefaction potential. During our investigation, several of the cone penetration tests CPT-1 to CPT-31 were advanced to depths ranging approximately between 75 and 150 feet bgs to meet the State's guidelines.

In our analyses, soil that has significant amount of plastic fines, I_c greater than 2.6, were considered too cohesive to liquefy. Additionally, soil with a cone tip resistance q_{c1N} greater than 160 tons per square foot (tsf) and/or a corrected shear wave velocity (V_{s1}) greater than 200 meters per second (m/s) was considered too dense to liquefy.

In our assessment, we also considered the approach for soil classification and behavior presented in Robertson (2016). In this approach, CPT data is used to determine dilative and contractive behavior. The soil classification and behavior chart uses the normalized CPT tip resistance and friction ratio to separate material into clayey, sandy, and transitional soil types. The chart further uses another parameter, CD, to divide the dilative and contractive behavior of these soil types. A CD value of 70 or higher separates the soil between contractive and dilative tendencies. To capture transitional and borderline material, we used a CD cut-off value of 80. Soil that was classified as dilative based on the contractive-dilative boundary (Robertson 2016) was considered to have a buildup in pore water pressure and potentially liquefy, however, would not settle significantly.

Layers of medium dense saturated sand, silty sand, and sandy silt varying in thickness from less than approximately ¼- to ½- foot were encountered below the historic high groundwater level of approximately 12 feet bgs. On the basis of the results of our analyses, we conclude several of these layers could potentially liquefy during a major earthquake and may experience liquefaction-induced settlement. However, the layers are 0.1 to 0.5 feet thick, and discontinuous. A summary of our CPT subsurface data, as well as other relevant parameters regarding liquefaction triggering and associated settlement, is presented in Table 12.

[11] The anticipated excavation depths do not account for excavation to construct a working pad.

DRAFT

									Total Estimated Settlement at CPT-28	**0.1**

The 22- to 26-foot-deep excavation for the basement for the hospital, energy center, and service yard will remove some of the layers with liquefaction potential. We conclude that less than ¼ inch of liquefaction-induced settlement should occur beneath the basement. In the areas of the project site surrounding excavation, we similarly conclude less than ¼ inch of liquefaction-induced-settlement could occur. We conclude up to ¼ inch of differential settlement over a horizontal distance of 30 feet could occur at the site.

The results of our liquefaction analyses are presented in Appendix F.

DRAFT

7.2.2 Surface Manifestation of Liquefaction

We estimated the potential for surface manifestation (sand boils or ejecta and ground fissures) considering the Ishihara (1985) and Youd and Garris (1995) methods using the non-liquefiable soil cover thickness, liquefiable sand thickness, and maximum acceleration. Layers at the site that may potentially liquefy are thin and have sufficient non-liquefiable soil cover; therefore, we conclude that the potential for sand boils to manifest at the ground surface is low.

7.2.3 Lateral Spreading

Lateral spreading is a phenomenon in which a surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. The surficial blocks are transported downslope or in the direction of a free face, such as a channel, by earthquake and gravitational forces. Lateral spreading is generally the most pervasive and damaging type of liquefaction-induced ground failure generated by earthquakes.

According to Youd et al. (2002), for significant lateral spreading displacements to occur, the liquefied soil should consist of saturated, cohesionless sandy sediments with corrected blow counts $(N_1)_{60}$ less than 15.

The layers encountered at the site that are potentially susceptible to liquefaction are thin, discontinuous, and generally have sufficient plasticity such that they are not cohesionless. Additionally, the site is relatively level and not located near a free face or channel. During the 1906 and Loma Prieta earthquakes, lateral spreading was not observed at the site. We therefore judge the potential for lateral spreading at the site is low.

7.2.4 Seismic Densification

Seismic densification can occur during strong ground shaking in loose, granular deposits above the water level, resulting in ground surface settlement. The degree of susceptibility to seismic densification is directly related to the relative density of the existing granular soils. Seismic densification of non-saturated, cohesionless soil following a major earthquake was analyzed using Tokimatsu and Seed (1984) and Pradel (1998). Some of the borings and CPTs indicate thin layers of loose to medium dense sand with varying amounts of clay and silt are present above the historic high groundwater level (approximately Elevation 175 feet). We estimate seismic densification settlement in these layers of up to approximately ¼ inch during a major earthquake, with differential settlement of approximately ¼ inch over a horizontal distance of 30 feet.

DRAFT

Within the proposed hospital basement and service yard footprint, the planned excavation will be deep enough to remove the soil susceptible to seismic densification; however, settlement due to seismic densification may occur within the surrounding soils outside of the proposed excavation footprint.

7.3 Slope Stability and Landslides

Considering the relatively flat topography at the site, we consider the hazard from landslides to be nil.

7.4 Flooding

Published maps (Federal Emergency Management Agency 2009) indicate the site is within Zone D, an area in which flood hazards are undetermined, but possible. The project civil engineer should evaluate the potential risk of inundation from flooding.

7.5 Tsunami

Recent maps published by the California Department of Conservation (2021) indicate the project site is not within the tsunami inundation zone; therefore, we conclude the potential risk by inundation from tsunami to be low within the project site. However, these maps may not account for the impact of sea level rise on the potential risk of inundation from a tsunami; the project civil engineer should evaluate the impact of sea level rise on the potential risk of inundation from a tsunami over the service life of the project.

7.6 Asbestos and Other Geologic Hazards

Bedrock is estimated deeper than 1,000 feet below existing site grades. We therefore conclude that potential for naturally occurring asbestos (such as within serpentine bedrock) exposure is negligible. No other geologic hazards such as hydrocollapse of soils, regional subsidence, or Radon-222 gas are documented at the site.

8.0 DISCUSSION AND CONCLUSIONS

From a geotechnical standpoint, we conclude the proposed project is feasible provided the geotechnical issues discussed below are properly addressed during the design and construction of the proposed improvements.

The primary geotechnical issues for this project include:

DRAFT

- presence of moderately expansive soil
- presence of shallow groundwater level
- selection of appropriate foundation systems to support the building loads and accommodate estimated static and seismic settlements
- support for proposed excavations during construction and associated dewatering
- stability of the soil subgrade at the base of the excavation
- corrosivity of onsite soil

On the basis of our findings, we conclude the proposed hospital, energy center, and service yard improvements can be supported on a mat provided the mat is waterproofed and designed for hydrostatic uplift. To limit the ground settlement to one inch, the proposed tanks at the service yard will need to be supported on piles. Lightly loaded equipment pads constructed at grade can be supported on spread footings or mat foundations bearing on firm, native soil. At-grade improvements will need to be designed and constructed per our recommendations to mitigate the effects of expansive soil. A soldier-pile-and-lagging shoring system with tiebacks or internal bracing can be used to support the proposed excavations.

Our discussions and conclusions regarding the geotechnical aspects of the project are presented in detail in the following sections.

8.1 Expansive Soil Considerations

The existing near-surface soil has moderate expansion potential. Moisture fluctuations in near-surface expansive soil could cause the soil to expand or contract, resulting in movement and potential damage to improvements that overlie them. Potential causes of moisture fluctuations include drying during construction, subsequent wetting from rain, capillary rise, landscape irrigation, and type of plant selection.

For at-grade improvements, the volume changes from expansive soil can cause cracking of foundations, floor slabs, and exterior flatwork. Therefore, foundations and slabs of at-grade structures and concrete flatwork will need to be designed and constructed to resist the effects of the expansive soil. These effects can be mitigated by moisture conditioning the expansive soil and providing select, non-expansive ("select") fill below interior and exterior slabs and deepening shallow foundations to gain support below the zone of severe moisture change.

DRAFT

An alternative to importing select fill includes lime treatment of the near-surface soil. Lime stabilization beneath at-grade equipment pads and the subgrade of exterior flatwork may be a cost-effective means of improving on-site soils and mitigating expansion potential. Lime treatment is further discussed in Section 8.6.

8.2 Groundwater Considerations

Groundwater was encountered at the site at depths of 18 to 35 feet bgs, corresponding to approximately Elevations 150 to 168 feet. Additionally, data from wells at and near the site indicate the groundwater level has been as high as 12 feet bgs (Elevation 174 feet) within the past ten years. The groundwater level is likely influenced by wet and dry seasons. On the basis of our knowledge of groundwater conditions at the site and in the vicinity, we conclude a high groundwater elevation of Elevation 175 feet is appropriate for design of permanent structures. For design and construction of the temporary shoring system, a lower groundwater level may be used depending on the time of year the shoring is installed.

Because the hospital building will be constructed with one basement level and the energy center and service yard will be constructed about 20 feet below grade, the basement and below-grade walls and foundations will need to be designed to resist hydrostatic pressures (lateral and uplift, respectively,) using a design groundwater level at Elevation 175 feet. If the weight of a structure is not sufficient to resist uplift and/or span between columns, tiedowns can be used to resist the anticipated uplift pressures. The basement/below-grade walls and foundations will need to be waterproofed and waterstops provided across all below-grade construction joints.

8.3 Foundations and Settlement

The primary considerations related to the selection of appropriate foundation systems for the proposed structures are the final excavation depths, final building loads, and the anticipated building settlements resulting from consolidation of moderately compressible soil. Settlements and potential foundation types for the proposed hospital, energy center, service yard and tanks, and at-grade improvements are discussed in the following subsections.

The estimated static settlements presented in the following subsections assume the groundwater level will be lowered about three feet below bottom of the excavations for 14 months during construction. Additional dewatering depth and/or duration can cause an increase in the settlements. If the groundwater level will be lowered more than three feet below

DRAFT

the bottom of the excavations or for a longer duration, we will need to evaluate the increase of the estimated static settlements.

8.3.1 Hospital

Currently, plans show the finished floor elevation of the basement will extend approximately 16 feet bgs, corresponding to Elevation 172 feet. Additionally, we understand an interstitial space that will extend about four feet from bottom of basement floor slab to top of foundation will be utilized for installation of utilities. Based on a preliminary mat foundation thickness of four feet, the anticipated depth of the excavation is approximately 24 feet bgs, corresponding to approximately Elevation 164 feet. The soil at the bottom of the proposed excavation will consist predominantly of stiff to very stiff clay and medium dense to dense sand. Therefore, we conclude the hospital basement can be supported on a mat foundation provided the estimated static settlements discussed below are acceptable. Design recommendations for a mat foundation are presented in Section 9.2.

The proposed excavation and removal of about 24 feet of soil for the hospital basement will provide a stress reduction in the underlying soils of about 2,300 psf. Laboratory test results and CPT data indicate the clay below the proposed excavation is overconsolidated, with OCRs of 1.1 to 2.0. The estimated building foundation pressure (including the weight of mat foundation and the weight of fill placed within the interstitial space) is about 2,200 psf, similar to the weight of soil removed during excavation; therefore, we anticipate static settlement will be limited to recompression of the stiff to very stiff clay under the new building loads.

Initially, as the proposed excavation is made, the removal of soil will result in pressure relief and the base of the excavation will rebound (rise), especially near the center of the excavation. Our calculations estimate rebound of up to three inches near the center of the excavation, which will occur as the excavation proceeds (and therefore will not be noticed during construction). As the foundation is constructed and building loads are applied, the underlying clay will partially recompress. We calculate the settlement associated with this recompression will be on the order of ¾ inch near the edge of the mat and about 1½ inches near the center of the mat. We estimate post-construction differential settlement between the edge and center of the mat (over a horizontal distance of about 120 feet) will be on the order of ¾ inch; this estimate does not include the rigidity of the foundation system, which would tend to reduce the differential settlement. In addition, as previously discussed, we estimate liquefaction-induced total settlement of up to ¼ inch, with about ¼ inch of differential settlement over a horizontal distance of 30 feet, could occur during a major earthquake beneath the basement.

DRAFT

8.3.2 Energy Center

The finished floor elevation for the lower level of the energy center will extend approximately 19½ feet bgs, corresponding to Elevation 168.5 feet. Additionally, we understand an interstitial space that will extend about four feet from bottom of basement floor slab to top of foundation will be utilized for installation of utilities. Based on a preliminary mat foundation thickness of two feet, the anticipated depth of the excavation is approximately 25½ feet bgs, corresponding to approximately Elevation 162.5 feet. The soil at the bottom of the proposed excavation will consist predominantly of stiff to very stiff clay and medium dense to dense sand. Therefore, we conclude the energy center can be supported on a mat foundation provided the estimated settlements discussed below are acceptable. Design recommendations for a mat foundation are presented in Section 9.2.

The proposed excavation and removal of about 25½ feet of soil will provide a stress reduction in the underlying soils of about 2,400 psf. As discussed in Section 8.3.1, laboratory test results and CPT data indicate the clay below the proposed excavation is overconsolidated, with OCRs of 1.1 to 2.0. We estimate the foundation pressure will be about 1,350 psf (including weight of mat foundation and weight of fill placed within interstitial space). Because the stress reduction from the soil removal exceeds the building foundation pressure, we anticipate static settlement will be limited to recompression of the upper clay.

The estimated rebound during excavation for the energy center and service yard will be similar to the estimates provided in Section 8.3.1 for the hospital excavation. As the foundation is constructed and building loads are applied, the clay will partially recompress. We calculate the recompression settlement will be on the order of ¾ inch near the edges and 1¼ inches near the center of the mat, respectively. We estimate post-construction differential settlement between the edge and center of the mat (over a horizontal distance of about 30 feet) will be on the order of ½ inch; this estimate does not include the rigidity of the foundation system, which would tend to reduce the differential settlement. As previously discussed, we estimate liquefaction-induced total settlement of up to ¼ inch and differential settlement of about ¼ inch over a horizontal distance of 30 feet could occur during a major earthquake beneath the building.

8.3.3 Service Yard and Tanks

The finished floor elevation for the service yard will extend approximately 20 feet bgs, corresponding to Elevation 168 feet. Additionally, two proposed at-grade storage tanks will be

DRAFT

placed in the northeast corner of the service yard. Settlements and feasible foundations for the service yard and tanks are discussed in the following subsections.

8.3.3.1 Service Yard

The service yard slab will be below the design groundwater level (Elevation 175 feet); therefore, the slab will need to be designed as a mat or structural slab and be waterproofed and designed to resist hydrostatic uplift loads. We anticipate that equipment pads within the service yard will be relatively lightly loaded and will be integrated into the service yard mat. Design recommendations for a mat foundation are presented in Section 9.2. Tiedown anchors can be used to resist uplift loads where the weight of the mat is not sufficient for resist hydrostatic uplift; recommendations for design of tiedowns are provided in Section 9.8.

Based on a preliminary mat thickness of two feet, the anticipated depth of the excavation for the service yard is approximately 22 feet bgs, corresponding to approximately Elevation 166 feet. We anticipate the soil at the bottom of the excavation will consist predominantly of stiff to very stiff clay and medium dense to dense sand.

The stress reduction and estimated rebound in underlying soils during excavation for the service yard will be similar to the estimates provided in Section 8.3.2 for the energy center. After the construction of the mat, the clay will partially recompress under the weight of the mat. The settlement associated with this recompression will be up to ½ inch in the center of mat and up to ¼ inch at the edges of the mat. We estimate post-construction differential settlement will be on the order of ¼ inch over a horizontal distance of about 125 feet between the center and edges of the mat; this estimate does not include the rigidity of the foundation system. As previously discussed, we estimate liquefaction-induced total settlement of up to ¼ inch and differential settlement of ¼ inch over a horizontal distance of 30 feet could occur during a major earthquake beneath the service yard.

8.3.3.2 Service Yard Tanks

Based on the preliminary tank loads provided by KPFF, we conclude there will be a significant increase in overburden pressure from the at-grade tanks within the service yard (Elevation 168 feet). Assuming the tanks are supported on a mat foundation with an average foundation pressure for dead plus live loads of 3,250 psf, we estimate the resulting static settlement would be on the order of three inches. To reduce settlement to one inch or less, pile foundations gaining support in skin friction in the underlying stiff clay and dense sands will be needed to support the tanks. Design recommendations for piles are presented in Section 9.3.

DRAFT

On the basis of our past experience at sites in the vicinity, we conclude a drilled pile system, such as augered cast-in-place (ACIP) piles or similar pile system is the most practical for the tanks within the service yard. ACIP piles are a low-vibration, low-noise, deep foundation option. ACIP piles are installed by drilling to the required depth with a hollow-stem, continuous-flight auger. When the auger tip reaches the required depth or refusal, as indicated by predetermined depth or refusal criteria, grout is injected through the ports in the hollow stem auger. Grout is injected under pressure as the auger is slowly withdrawn, replacing the soil removed by the drilling operation. While the grout is still fluid, a steel reinforcing cage and center bar is inserted into the shaft. ACIP piles can range in diameter; 16-inch-, 18-inch, and 24-inch-diameter piles are typical.

We evaluated the static settlement of a deep foundation system consisting of groups of ACIP piles using the preliminary dead plus live tank loads provided by KPFF. Based on our discussions with the design team, we considered 60-foot-long ACIP piles. The loads were modeled as equivalent footings at a depth of about two-thirds of the pile length. We calculate that the proposed tanks will settle about one inch at the center of the pile-supported tank pads and up to ½ inch at the edges of the pads. We estimate post-construction differential settlement will be on the order of ½ inch between the center and edge of the tank pads. Because the piles will extend through potentially liquefiable soil layers, we anticipate that seismically induced settlements will not impact the tanks. Additional differential seismically induced settlement on the order of ¼ inch could occur between the pile-supported tanks and the adjacent service yard mat. Because the thickness of the potentially liquefiable soil layers is less than ½ foot, we conclude the downdrag load resulting from liquefaction-induced settling soil is negligent.

Piles will need to be load tested to confirm the design values. ACIP piles can also be integrity tested by methods such as thermal integrity profiling (TIP) and crosshole sonic logging (CSL). TIP is performed by embedding thermal wires within the pile concrete that read the concrete temperature during curing. The temperature sensors are typically spaced every foot along the length of the wire. The wires are typically attached to a center bar or reinforcing cage. During curing of the concrete, the hydrating cement generates heat, increasing the temperature in the shaft. The temperature readings during curing can be correlated to evaluate pile shape and integrity, concrete quality, and location of reinforcing cage. TIP is standardized by ASTM D7949 – Standard Test Methods for Thermal Integrity Profiling of Concrete Deep Foundations.

Piles are prepared for integrity testing by CSL during their construction by installation of at least four 2-inch-inside-diameter tubes. These tubes are usually attached to the reinforcing cage along

DRAFT

the full length of the elements. After concrete has been poured, the tubes are filled with water. During testing, a transmitter emits an ultrasonic signal in one tube, and the signal is sensed sometime later by the receiver in another tube. Poor concrete or soil inclusions between the tubes will delay or disrupt the signal. CSL integrity testing is standardized by ASTM D6760 – Standard Test Method for Integrity Testing of Concrete Deep Foundations by Ultrasonic Crosshole Testing.

Installation of ACIP piles will generate some spoils. Spoils generated during drilling may be used as fill, provided the material meets the recommendations in Section 9.1.

8.3.4 At-Grade Improvements

Settlements and potential foundation types for at-grade equipment pads and other lightly loaded ancillary structures constructed at grade are discussed in the following subsections. Equipment pads and shallow foundations for at-grade structures will need to be designed to mitigate the effects of expansive soil, as discussed in Section 8.1.

8.3.4.1 At-Grade Equipment Pads

Current plans show four generator enclosures, and an electrical equipment yard will be constructed at grade to the east of the service yard, between the service yard retaining wall and Camino Verde Drive. We conclude the lightly loaded equipment pads constructed at grade can be supported on spread footings or mat foundations bearing on firm, native soil. A deepened continuous footing or downturned edge will be needed at the perimeter of the equipment pads to mitigate the effects of expansive soil. Design recommendations for shallow foundations for equipment pads are presented in Section 9.4.1.

For the relatively lightly loaded at-grade equipment pads, assuming average foundation pressures between 100 and 250 psf, we estimate static settlements of approximately ¼ inch will occur. Static differential settlement over a horizontal distance of about 30 feet is anticipated to be about ¼ inch. We estimate total seismically induced (liquefaction plus seismic densification) settlement of up to ½ inch, and about ½ inch of differential settlement over a horizontal distance of 30 feet could occur during a major earthquake.

At-grade equipment pads will be underlain by moderately expansive soil. In addition to constructing the pads with a continuous perimeter footing or downturned edge, the pads will need to be underlain by non-expansive soil to mitigate the potential for movement of the slabs where expansive soil is present. The non-expansive soil can consist of select (non-expansive) fill

DRAFT

or lime treated on-site soil. The purpose of the lime treatment is to reduce the expansion potential of the surface soil and provide a firm surface for construction of the pad. Lime treatment is discussed in Section 8.6.

8.3.4.2 Ancillary Structures

We understand other ancillary structures, including site retaining walls, are planned. Structural loads are currently unavailable for these structures; however, we anticipate that the loads will be relatively low. Lightly loaded ancillary structures can be supported on deepened spread footings bearing in stiff clay or engineered fill that was prepared in accordance with our recommendations. Design recommendations for shallow foundations supporting ancillary structures are presented in Section 9.4.2.

For the relatively lightly loaded structures, assuming an allowable dead plus live load bearing pressure of approximately 500 to 750 psf and 5-foot-square footings, we estimate static settlements of approximately ½ to 1 inch could occur, respectively. Static differential settlement over a distance of about 30 feet is anticipated to be less than ½ inch. In addition, we estimate total seismically induced (liquefaction plus seismic densification) settlement of up to ½ inch and about ½ inch of differential settlement over a horizontal distance of 30 feet could occur during a major earthquake.

8.3.4.3 Light Poles

Light poles can be supported on drilled piers embedded in stiff clay. Although structural loads for light poles were not available at the time this report was prepared, we anticipate they will be relatively light. We anticipate drilled piers supporting light poles could settle up to approximately ½ inch under anticipated loads. Recommendations for design of light pole foundations are provided in Section 9.4.3.

8.4 Dewatering

Excavations that extend below groundwater will need to be dewatered. Variables that influence the performance of a dewatering system and the quantity of water produced include the number of wells, the depth and positioning of the wells, the interval over which each well is screened, and the rate at which each well is pumped. Different combinations of these variables can be used to successfully dewater the site.

During excavation, the groundwater table within the site will need to be drawn down to at least three feet below the bottom of the excavation and maintained at that depth until sufficient

DRAFT

building weight is available to resist the hydrostatic uplift pressure of the design groundwater level.

Because of the size of the site, a system of perimeter wells (within the excavation) may not sufficiently dewater it. Interior wells may also be needed to adequately dewater the site and reduce disturbance to the subgrade. In addition to the wells, a working pad, if needed (see Section 9.7), can be used as a temporary drainage blanket to assist with the dewatering of the site.
