Widespread dewatering can result in subsidence of the area around the site due to increases in effective stress in the soil. We anticipate up to ½ inch of settlement could occur as a result of lowering the groundwater level outside the excavation. The estimated settlement assumes the groundwater level will be lowered 3 feet below the bottom of the planned excavations for a period of 14 months.

8.5 Shoring Considerations

Construction of the hospital, energy center, and service yard will require excavations of about 22 to 26 feet below the existing site grades. Temporary shoring will be required to laterally restrain the sides of the excavation and limit the movement of adjacent improvements. There are several key considerations in selecting a suitable shoring system. Those we consider to be primary concerns are:

- protection of surrounding improvements, including roadways, utilities, and adjacent structures
- penetration of shoring supports into the clay and sand below the bottom of the excavation
- proper construction of the shoring system to reduce the potential for ground movement
- cost.

Based on the anticipated excavation depths, we conclude that soldier piles with wood lagging are a feasible shoring system for the project. A soldier-pile-and-lagging system consists of concrete encased steel H-beams placed in predrilled holes extending below the bottom of the excavation. Wood lagging is placed between the piles as the excavation proceeds.

During excavation, the shoring system is expected to move and deform, which could cause surrounding improvements to settle and move. The magnitude of shoring movements and resulting settlements of the ground surface behind shoring walls are difficult to estimate because

DRAFT

they depend on many factors, including the method of installation and the contractor's skill in the shoring installation. Clough and O'Rourke (1990) summarized the measured settlements adjacent to excavations in sand and concluded that the settlements varied from 0.1 to 0.3 percent of the excavation depth. The data also show the settlements at some sites where the excavations were shored with a soldier-pile-and-lagging system were higher than these values. Therefore, for an excavation depth of 22 to 26 feet, we estimate settlement immediately behind the shoring wall could be on the order of ¼ to 1 inch. These settlements assume the quality of construction will meet or exceed that considered standard in the construction industry. The settlement will decrease with distance from the wall and will be small at a distance twice the excavation depth.

The shoring system for the basement level will require either grouted tiebacks or internal bracing, depending on whether encroachment permits can be obtained to drill beneath the adjacent properties. Internal braces will be required if there are below-grade obstructions precluding the use of tiebacks or if extending them beyond property lines is not permitted. We understand that tiebacks can be used within the public right-of-way and the Kaiser property, and internal cross bracing or raker bracing will be required where the excavation is adjacent to the gas station.

Because of the potential for blowout in the lower sand layers below the bottom of the excavation due to hydrostatic upheave, it may be necessary to depressurize these layers. This may require continuous dewatering until there is sufficient weight of mat foundation and/or building. If continuous dewatering is an issue, then a cutoff wall could be used to reduce the amount of dewatering.

As discussed in Section 8.4, lowering the groundwater table outside of the excavation could cause settlement of surrounding improvements. If the estimated ground movements due to lowering the groundwater table and deformation of the shoring system near the surrounding structures are unacceptable, it may be necessary to use a stiffer, impermeable shoring system such as soil-cement-mix wall for the shoring, which will potentially reduce the amount of dewatering and associated settlements. A monitoring program will need to be established to evaluate the effects of the construction on the adjacent improvements.

8.6 Lime Treatment

Lime treatment can be a cost-effective means of improving on-site materials for use as non-expansive fill below at-grade equipment pads and concrete flatwork. Lime treatment can strengthen the soil and reduce its expansive potential. However, the final result of the lime treatment depends on many factors including the type of on-site material and the lime, and the

DRAFT

process of applying the lime, mixing, curing, remixing, and compaction. The primary geotechnical concerns for the lime treatment include the following:

- Preparing the site to reduce high and low spots that would adversely affect mix design in the even distribution of lime.
- Determining the thickness of soil to be treated, the type of lime to be used, the amount to be applied and method of application to produce uniformity.
- Mixing the lime and soil with water; water is used to hydrate the lime and achieve activation of the cation exchange, flocculation-agglomeration reactions. Activation of these reactions is required to increase mixture strength and durability.
- Curing the lime treated soil; lime-treated soil must be allowed to cure to allow the lime to completely react with the soil. Temperature and moisture are two important factors that affect curing times.
- Conditioning the areas to receive the lime treated soil with water.
- Compacting the lime treated soil; the moisture-density relation for a lime-treated soil mixture is dependent on the curing time. If the soil-lime mixture is reworked at a later date following initial construction, the maximum dry density[12] and optimum moisture content for the mixture will be different.
- Testing the lime-treated soil to confirm desired strength is achieved.

Quality control of the lime treatment is therefore important if the desired results are to be achieved. Our recommendations for quality control of lime treatment are presented in Section 9.1.5.

8.7 Construction Considerations

We anticipate soil excavated from the site can be removed with conventional earthmoving equipment such as excavators and backhoes. The project site is occupied by pavements and landscaping areas that will be removed. However, if buried foundations or other structures are encountered during excavation, the use of jackhammers or hoe-rams may be required to break apart and remove the obstructions.

Heavy vibratory equipment should not be used during site preparation and grading, especially near excavation subgrade; a vibratory compactor will likely cause a capillary rise of the

[12] The maximum dry density is the maximum density as determined by the ASTM D1557 laboratory compaction procedure. The optimum moisture content is the moisture content at which the soil achieves its maximum dry density.

DRAFT

groundwater, creating a wet subgrade that may become unstable and unsuitable for support of a mat foundation or construction equipment. If site grading is performed during wet weather, the exposed soil subgrade may become wet and difficult to compact. Wet soil may need to be aerated during dry weather prior to compaction, or the wet soil can be excavated and replaced with drier soil or aggregate base. If needed, the soil can be lime treated to aid in compaction.

8.8 Corrosion Potential

Corrosive soil can adversely affect underground utilities and foundation elements; therefore, laboratory testing was performed as part of this investigation to evaluate the corrosivity of the near-surface soil.

CERCO Analytical performed tests on soil samples to evaluate corrosion potential to buried metals and concrete. The results of the tests are summarized in Table 13 and presented in Appendix D.

TABLE 13
Summary of Corrosivity Test Results

Test Boring	Sample Depth (feet)	pH	Sulfates (mg/kg)	Resistivity (ohms-cm)	Redox (mV)	Chlorides (mg/kg)
B-2	4.0	8.34	17	3,600	240	N.D.
B-9	2.5	8.09	N.D.	3,100	230	N.D.
B-10	3.0	8.21	N.D.	2,400	240	N.D.
B-14	2.5	7.35	15	2,100	240	N.D.

Note:
1. N.D. = None Detected

Based upon resistivity measurements, the soil samples tested are classified as "moderately corrosive" to buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron. All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron will need to be properly protected against corrosion depending upon the critical nature of the structure. For more detailed recommendations regarding the corrosion protection of buried metals and concrete, a licensed corrosion consultant should be retained.

8.9 Stormwater Management

The near-surface soil generally consists of clay which has low permeability. If site improvements will include permeable pavers and bioretention planters, infiltration will be limited, and subdrains

DRAFT

will need to be provided to direct water to a suitable outlet. Because the clay is moderately expansive, permeable pavers, bioretention planters, and other stormwater management measures (e.g., bio-swales) will need to be lined with an impermeable membrane to reduce the potential for poor pavement performance. Infiltration systems will need to be set back at least 10 feet from the proposed buildings, pavements, and flatwork.

9.0 RECOMMENDATIONS

Recommendations for site preparation, foundation support, shoring design, below-grade walls, seismic design, and other geotechnical aspects of the project are presented in the following sections of this report.

9.1 Earthwork

The following subsections present recommendations for site preparation, subgrade preparation, and fill placement.

9.1.1 Site Preparation

An existing water utility well operated by Valley Water is located within the project limits, on the northeast side of the hospital, as shown on Figures 2 and 3. We understand the well will be protected during construction of the project; the protection method should be determined by the project general contractor. The presence of the well will need to be considered in the temporary shoring design, so that tiebacks are aligned around the well location. Valley Water should be consulted regarding whether they require a minimum distance be maintained for tiebacks near the well.

Demolition in areas to be developed should include the removal of existing pavement and underground obstructions, including foundations of any previous structures at the site. Any vegetation and organic topsoil should be stripped in areas to receive new site improvements. Stripped organic soil can be stockpiled for later use in landscaped areas, if approved by the owner and architect; organic topsoil should not be used as compacted fill.

Demolished asphalt and concrete at the site can be crushed to provide recycled construction materials, including sand, free-draining crushed rock, or Class 2 aggregate base (AB), provided their re-use onsite is acceptable from an environmental standpoint. Where crushed rock will be used in applications where free-draining materials are required, the rock should have no greater than six percent of material passing the 3/8-inch sieve. Where recycled Class 2 AB will be used

DRAFT

beneath pavements and flatwork, it should meet requirements of the Caltrans Standard Specifications. Where crushed concrete or asphalt are mixed with soil to be used as fill, particles between 1½ and 3 inches in greatest dimension should comprise no more than 30 percent of the fill by weight.

Existing underground utilities beneath areas to receive new improvements should be removed or abandoned in-place by filling them with grout. The procedure for in-place abandonment of utilities should be evaluated on a case-by-case basis and will depend on location of utilities relative to new improvements. However, in general, existing utilities within four feet of final grades should be removed, and the resulting excavation should be properly backfilled based on the recommendations presented in this section. Where utilities to be removed extend off site, they should be capped or plugged with grout at the property line. It may be feasible to abandon utilities in-place, outside the proposed excavation footprint, provided they will not interfere with future utilities or structures. If utilities are abandoned in-place, the pipes should be completely filled with flowable cement grout over their entire length within the site limits.

9.1.2 Subgrade Preparation for Mat Foundation

Because the excavation for the hospital, energy center, and service yard will extend below the design groundwater level, the clayey soil where exposed at the subgrade level will be near saturation even after dewatering. To protect the subgrade, we recommend heavy construction equipment not be allowed within three feet of the subgrade elevation and that the final excavations be made with excavators or backhoes with smooth buckets. Without an extended period for drying, we judge the subgrade may not support even light equipment and foot traffic without experiencing excessive disturbance. To help protect the subgrade if it is susceptible to disturbance, we recommend excavating to below the planned bottom of mat and backfilling the overexcavation with crushed rock. This layer of crushed rock (working pad) can also be used as part of a dewatering system (further discussed in Section 9.7).

For the working pad, we anticipate an excavation of about 12 inches will suffice if used in conjunction with a woven reinforcing fabric (geotextile), such as Mirafi 500x (or equivalent). After placing the reinforcing fabric on the exposed subgrade, the excavation should be backfilled with clean one-inch minus crushed rock or similar material. The shoring system should be designed to accommodate the additional excavation for crushed rock placement.

Because the foundation for hospital, energy center, and service yard will be below the design groundwater level, we recommend waterproofing the base of the foundation and the

DRAFT

below-grade walls. A 3- to 4-inch-thick mud slab (thin layer of lean concrete) can be placed on the crushed rock and then the waterproofing can be installed, and the mat constructed. The waterproofing should be placed directly on a mud slab and be covered by a second mud slab. The mud slab covering should reduce the potential for damage to the waterproofing and provide a firm, smooth surface on which to place the reinforcing steel for the mat. We recommend the waterproofing be placed in accordance with the manufacturer's specifications. If they differ from our recommendations, the manufacturer's specification should be followed to preserve their warranty.

The soil subgrade should be free of standing water, debris, and disturbed materials prior to placing the reinforcing fabric and crushed rock. If loose, weak, or disturbed material is observed in the excavation, it should be excavated to firm, competent material and replaced with lean concrete. We should check the exposed subgrade after cleaning and prior to placement of the working pad, mud slab or waterproofing.

9.1.3 Subgrade Preparation for At-Grade Improvements

The near-surface soils are moderately expansive. The subgrade exposed after demolition, stripping, and site clearing, as well as any subgrade that will receive new fill or site improvements, should be scarified to a depth of 12 inches, moisture-conditioned to at least three percent above optimum moisture content, and compacted to between 88 and 93 percent relative compaction[13]. In areas where the native subgrade has low expansion potential, the subgrade should be scarified to a depth of 8 inches, moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction. Within vehicle pavement areas, the upper six inches of the pavement soil subgrade should be compacted to at least 95 percent relative compaction, regardless of expansion potential.

The prepared soil subgrade should be kept moist until it is covered by engineered, non-expansive (select or lime-treated) soil. If site grading occurs in late summer or in fall, the surface soil may be dry to depths exceeding 12 inches. Therefore, prior to grading, we should perform moisture content tests on the upper three feet of soil subgrade within at-grade improvement areas. Surface soil that has a moisture content of less than 20 percent (the approximate plastic limit of the soil) should be excavated, moisture-conditioned to at least three percent above optimum moisture content and compacted to between 88 and 93 percent relative compaction to reduce

[13] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557 laboratory compaction procedure.

DRAFT

its expansion potential. We anticipate the maximum depth of required excavation for moisture conditioning will be two feet.

For improved performance of the hardscape improvements, we recommend concrete flatwork be underlain by at least 12 inches of engineered, non-expansive soil. At least four inches of Class 2 aggregate base material (or the minimum thickness per City of San Jose Standards) compacted to at least 95 percent relative compaction, should be placed over the non-expansive soil. The non-expansive soil should extend at least three feet beyond the slab edges.

If soft or loose soil is encountered at subgrade, the unsuitable material should be removed and be replaced with suitable fill that is properly compacted and moisture conditioned. The subgrade should be kept moist until it is covered with fill or other improvements. If the compacted subgrade is disturbed, it should be re-rolled to provide a smooth, firm surface. Clay exposed at the foundation level may be susceptible to disturbance under construction equipment traffic. Heavy construction equipment should not be allowed directly on the final subgrade. It may be necessary to lime treat or to place a temporary layer of crushed rock to protect the final subgrade.

9.1.4 Fill Placement

We anticipate fill placement at the site will consist primarily of backfill for utility trenches and grading for flatwork and hardscapes. Additionally, fill will be placed at an interstitial space between the mat and basement floor slab within the hospital and energy center footprints.

We anticipate that soil excavated during construction will generally be acceptable for use as general fill and backfill. Any on site soil used as fill and backfill should meet the following criteria:

- be free of organic matter or other deleterious material
- contain no rocks or lumps larger than three inches in greatest dimension
- be non-hazardous and approved by the project corrosion consultant
- be approved by Langan.

Soil excavated near or below the groundwater will require significant drying before it can be used as fill and compacted to the specified relative compaction.

Select fill should consist of either on-site or imported fill that meets the following criteria:

- be free of organic matter or other deleterious material

DRAFT

- contain no rocks or lumps larger than three inches in greatest dimension
- have a low expansion potential (defined by a liquid limit of less than 40 and plasticity index lower than 12)
- have at least 20 percent fines (particles passing the No. 200 sieve)
- be non-hazardous
- be approved by the project corrosion consultant
- be approved by Langan.

Fill consisting of on-site clay with moderate expansion potential (upper 5 feet of onsite soil) should be placed in horizontal lifts not exceeding eight inches in uncompacted thickness, moisture-conditioned to at least three percent above optimum moisture content and compacted to between 88 and 93 percent relative compaction. On-site soil with low expansion potential and select fill should be placed in horizontal lifts not exceeding eight inches in uncompacted thickness, moisture-conditioned to near optimum moisture content, and compacted to at least 90 percent relative compaction for fill thicknesses equal or less than five feet and 95 percent compaction for fill thicknesses greater than five feet. If imported clean sand or gravel (defined as soil with less than 10 percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction regardless of fill thickness. Any imported soil will need to be meet any analytical testing requirements established by owner and Langan's environmental personnel.

Fill placed at the interstitial space between the mat and basement floor slab for the hospital and energy center should consist of one or more of the following:

- compacted sand fill meeting the requirements of select fill in this section
- aggregate base compacted to 95 percent relative compaction (recycled aggregate base is acceptable from a geotechnical perspective but should be confirmed by Langan's environmental personnel)
- lean concrete, controlled density fill (CDF), or lightweight cellular concrete.

During construction, we should check that the on-site soil and/or any proposed import material is suitable for use as fill. Samples of all fill should be submitted to Langan for testing at least three business days prior to use at the site. A flowable cement grout, such as lean concrete or CDF, may also be used as backfill under most conditions, but we should be consulted prior to its use.

DRAFT

9.1.5 Lime Treatment

As an alternative to placement of select fill below the at-grade equipment pads and exterior concrete flatwork, the upper 12 inches of the soil subgrade (measured below Class 2 aggregate base) can be treated in place with dolomitic quicklime. The degree to which lime will react with soil depends on such variables as type of soil, minerals present, quantity of lime, and the length of time the lime-soil mixture is cured. The quantity of lime added generally ranges from 5 to 7 percent by dry weight of the soil and should be determined by laboratory testing. If lime is intended to reduce swelling potential and/or increase the strength of the soil, the contractor should collect a bulk sample of the soil and perform laboratory tests to determine what type of lime will react with the soil and how much lime will be required to reduce the plasticity index to meet the criteria for select fill. We recommend a minimum of six percent lime by weight be used.

The limit of lime treatment should extend at least three feet beyond the slab and flatwork edges. Prior to lime treatment, the site should be graded to a level pad elevation in accordance with our previous recommendations and all below-grade obstructions be removed. The soil treated with lime should be mixed and compacted in one lift. The lime should be thoroughly blended with the soil and allowed to cure for 24 hours prior to compaction. The lime-treated soil should be moisture-conditioned to above optimum moisture content and compacted to at least 90 percent relative compaction. Lime-treated soil should be removed from landscaping areas as it will inhibit growth of vegetation. It should be noted that disposal of lime-treated soil is typically expensive because of the high pH of the treated soil.

A specialty subcontractor typically performs lime treatment, and we recommend this work be performed only by an experienced contractor. Field quality control measures should include checking the depth of lime treatment, degree of pulverization, lime spread rate measurement, lime content measurement, and moisture content and density measurements, and mixing efficiency. Quality control will also include laboratory tests for expansion potential and plasticity index on representative samples. If the lime treatment alternative is selected, we recommend that the specialty contractor prepare a soil treatment specification for our review prior to construction. Lime treated soil should have a low expansion potential (defined by a liquid limit of less than 40 and plasticity index lower than 12, and an Expansion Index of less than 50).

DRAFT

9.1.6 Utility Trenches

The corrosivity test results provided in Appendix D should be reviewed and corrosion protection measures used to protect below-grade utilities, if needed. A corrosion engineer should be retained if corrosion recommendations are needed.

Utility trenches should be excavated a minimum of four inches below the bottom of pipes or conduits and have clearances of at least four inches on both sides. Where necessary, trench excavations should be shored and braced, in accordance with all safety regulations, to prevent cave-ins. Where sheet piling is used as shoring, and is to be removed after backfilling, it should be placed a minimum of two feet away from the pipes or conduits to prevent disturbance to them as the sheet piles are extracted. It may be difficult to drive sheet piles if coarse grained gravel layers or buried obstructions are encountered.

Backfill for utility trenches should be compacted according to the recommendations presented for the general site fill. Jetting of trench backfill is not permitted. To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of sand or fine gravel. After pipes and conduits are tested, inspected (if required), and approved, they should be covered to a depth of six inches with sand or fine gravel, which should then be mechanically tamped or compacted with a vibratory plate. Backfill should then be placed as recommended for fill. Where utility trenches extend below the design groundwater elevation, any sand or gravel with less than 10 percent fines used as pipe bedding, shading, or cover should be wrapped in a filter fabric such as Mirafi 140N.

Where utility trenches backfilled with sand or gravel enter the at-grade equipment pads, an impermeable plug consisting of native clay or lean concrete, at least five feet in length and the full depth and width of the trench, should be installed at the edge of the pad. Further, where sand- or gravel-backfilled trenches cross planter areas and pass below asphalt or concrete pavements, an impermeable plug consisting of native clay or lean concrete, at least five feet in length and the full depth and width of the trench, should be installed at the edge of the pavement. The purpose of these plugs is to reduce the potential for water to become trapped in trenches beneath the concrete slabs and pavements. Trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements.

Special care should be taken in controlling utility backfilling in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to exterior improvements.

DRAFT

9.2 Mat Foundation

The proposed hospital and energy center can be supported on mat foundations. Additionally, the service yard slab should be constructed as a mat or structural slab. The mats should gain support in undisturbed stiff to very stiff clay and medium dense to dense sand. We expect the average bearing pressure from the mat will be on the order of 2,200 psf for the hospital and about 1,350 psf for the energy center, based on estimated column loads and a column spacing of about 30 feet. Average bearing pressure for the service yard mat/slab is anticipated to be low, about 300 psf. However, concentrated stresses may occur at interior columns, at the edges of the mats, and at the location of equipment pads within the service yard. We recommend mats for the hospital, energy center, and service yard be designed to impose a maximum dead plus live load pressure under columns and walls equivalent to an allowable bearing capacity of 3,000 psf. This value includes a factor of safety of at least 2.0 and can be increased by one-third for total design loads, including wind or seismic forces to account for a factor of safety of at least 1.5. This is equivalent to an ultimate bearing capacity of 6,000 psf. During a seismic event, these pressures could be exceeded under portions of the mat; we should review the predicted stress distributions when available.

For the initial design of the mats/slabs using the modulus of subgrade reaction method, we recommend using the moduli of subgrade reaction for the static condition and the seismic condition presented in Table 14. The moduli are representative of the anticipated settlement under the preliminary building and foundation loads. After the mat analyses are completed, we should review the computed settlement and bearing pressure plots to check that the moduli of subgrade reaction are appropriate and provide updated moduli, if needed. We anticipate an iterative process with the project structural engineer will be needed to converge on a solution.

DRAFT

TABLE 14
Summary of Recommended Moduli of Subgrade Reaction

Building/Improvement	Modulus of Subgrade Reaction for the Static Condition (kcf[1])	Modulus of Subgrade Reaction for the Seismic Condition[2] (kcf)	Applicable Average Foundation Pressure[3] (psf[4])
Hospital	17	30	2,200
Energy Center	13	30	1,350
Service Yard	7	30	300

Notes:
1. kcf = kips per cubic foot
2. Estimated using method presented in FEMA 356 (Chapter 4, Section 4.4.2.1 Shallow Bearing Foundations) and based on a zone of influence depth of approximately two times the width of the mat foundation
3. The static modulus is applicable for the noted average foundation pressure for dead plus live loads
4. psf = pounds per square foot

The mats/slabs should be designed to resist hydrostatic uplift associated with the design groundwater level of Elevation 175 feet. If additional uplift resistance is needed, tiedown anchors can be used; recommendations for tiedown anchors are provided in Section 9.8. Because the mats will be below the design groundwater level, we recommend that they be waterproofed as recommended in Section 9.1.2. A waterproofing consultant should be retained to provide recommendations for the type of waterproofing and its installation.

Lateral forces on mats can be resisted by a combination of friction along the base of the mat and passive resistance against the vertical faces of the foundation. Where bentonite-based membranes, such as Paraseal and Voltex, are used to waterproof the mat, a friction factor of 0.15 should be used at the base of the mat. Friction factors for other types of waterproofing membranes can be provided upon request. To calculate the passive resistance against the vertical faces of the mat, we recommend a uniform pressure of 1,750 psf. The friction coefficient and passive pressure values include a factor of safety of 1.5.

9.3 Deep Foundations

We recommend the proposed service yard tanks located in the northeast corner of the service yard be supported on ACIP piles. The ACIP piles will gain support in friction in the underlying stiff clay and dense sands. Recommendations for ACIP piles are presented below.

DRAFT

9.3.1 Axial Capacity

We performed axial pile capacity analyses using methodologies following FHWA Geotechnical Circular 8 (FHWA 2007) and NAVFAC 7.2 considering only skin friction resistance (i.e., no end bearing resistance). Recommended ultimate compressive and uplift pile capacities for 18-inch- and 24-inch-diameter ACIP piles are presented in Figure 11, for up to 80-foot-long piles. A factor of safety of 2.0 should be used to calculate allowable compressive or permanent uplift capacities for dead plus live loads and a factor of safety of 1.5 should be used for allowable total loads (including wind and seismic) and temporary uplift capacities. The load placed on the pile should not exceed the structural capacity of the piles, as determined by the 2022 CBC. The factors of safety recommended in this section should be confirmed with a load test program as recommend in Section 9.3.3.

Deep foundation elements should be spaced at least three pile widths or diameters center-to-center to prevent vertical capacity reductions due to pile interaction effects. The outer auger diameter should be used when determining the pile spacing for piles.

9.3.2 Lateral Capacity

Lateral load resistance can be mobilized by the individual piles in combination with other foundation elements embedded below the ground surface. The allowable lateral capacity of the piles depends on:

- the pile stiffness
- the strength of the surrounding soil
- axial load on the pile
- the allowable deflection at the pile top and the ground surface
- the allowable bending moment capacity of the pile.

We calculated lateral load resistance for ACIP piles with a top deflection of about ¼ inch, ½ inch, ¾ inch, and 1 inch for both fixed- and free-head conditions; the resulting pile deflection and bending moment profiles are presented for 18-inch- and 24-inch-diameter ACIP piles on Figures 12 through 15. We understand the structural engineer will incorporate the pile head movement and, in accordance with 2022 CBC Section 1810A.3.3.2, will show "that the predicted lateral movement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any element to be loaded beyond its capacity." Based on discussions with KPFF, we used

DRAFT

50 percent of the theoretical section modulus (EI) to account for a cracked section[14]. The lateral capacity of the piles is based on the soil strength and does not take into account a limiting bending moment capacity of the pile. The final pile design should be based on the structural capacities of the pile such that the lateral pile demands in terms of load, deflection, and bending moment do not exceed the capacity of the pile. The results presented on Figures 12 through 15 are for single piles, or pile groups with pile center-to-center pile spacing of at least eight diameters. If the piles are spaced closer than eight pile diameters, center to center, the lateral capacity should be reduced to account for group effects. The final pile design by the design-build contractor should include a moment curvature analysis based on the designed reinforcing and concrete strength.

The lateral capacities presented on Figures 12 through 15 are for single piles only. To account for group effects, the lateral load capacity of a single pile should be multiplied by the appropriate reduction factors shown in Table 15 for pile groups up to 10 piles. However, the maximum bending moment for a single pile with an unfactored load should be used to check the design of individual piles in a group. The reduction factors are based on a minimum center-to-center spacing of three pile diameters.

TABLE 15
Lateral Group Reduction Factors

Number of Piles within Pile Cap	Lateral Group Reduction Factor
2	0.9
3 to 5	0.8
6 to 10	0.7

Additional lateral load resistance can be developed by passive resistance acting against the faces of the pile caps and grade beams. Passive resistance may be calculated using a uniform pressure of 1,750 psf. This value includes a factor of safety of about 1.5, which is equivalent to an ultimate passive resistance of 2,625 psf; the upper 12 inches of soil should be ignored unless confined by a concrete slab or pavement.

[14] We understand provisions of ACI 318-14, Section 6.6.3.1.2 note that for factored lateral load analysis, it shall be permitted to assume that the moment of inertia is equal to 50% of the initial moment of inertia for all members.

9.3.3 Indicator and Load Test Program

An indicator pile program should be performed to develop installation criteria, confirm production pile capacities, and facilitate a load test program. For the service yard tanks, we recommend at least four indicator piles be installed. Once the final number of piles needed to support the tanks is determined, we should evaluate the proposed number of indicator piles and adjust as needed. The indicator piles should be installed with the same equipment that will be used to install the production piles. Changes to the equipment or installation procedure during production should be evaluated by Langan, and additional load tests may be required.

Upon completion of the indicator pile program, at least two of the indicator piles should be statically load tested in compression. Test pile locations should be chosen by Langan in consultation with the project structural engineer. Test piles can be used as production piles if they are installed in the proper location, meet the final installation criteria, and are not damaged during installation or testing.

The static compression load tests should be performed in accordance with the current version of ASTM D1143. Equipment used for the static test (load frame, jacks, and reaction piles) should be capable of applying at least 200 percent the allowable dead plus live design load or 150 percent of the allowable total loads, whichever is greater. The static load tests should be interpreted using accepted criteria per the 2022 CBC to determine the ultimate capacities of the piles. We recommend installing the test/indicator piles with strain gauges that are placed on sister bars in pairs and spaced at 20-foot intervals. If the test/indicator piles are installed at the existing ground surface, we recommend double casing the portion of the pile within the basement depth to eliminate friction contribution from the soil that will be removed during excavation.

Additionally, we recommend integrity testing for test piles and 50 percent of production piles. Acceptable integrity testing techniques include TIP and CSL as discussed in Section 8.3.3.2. Additional pile load tests and/or integrity tests will be required if, during production installation, the equipment or installation procedure deviates from the approved work plan and indicator pile load test program.

9.3.4 Pile Installation Work Plan

The piles should be installed by a qualified contractor with demonstrated experience in this type of foundation. A work plan describing the proposed pile equipment and methodology, including but not limited to pile installation equipment, monitoring equipment, pile diameter, pile length, pile capacity, proposed load test set-up and procedure, and sample automated monitoring report

DRAFT

should be submitted to Langan for review and approval at least two weeks prior to the indicator pile and load test programs. The automated monitoring report should include drilling depth, drilling/advancement rate, retraction rate, torque, rotations per minute (rpm), crowd or down pressure, pumping rate, grout pressure, total grout volume, and grout factor. The work plan should include a calculation justifying the number of strokes that the contractor plans to pump at the bottom of each ACIP pile to develop 5 feet of pressure head above the auger tip as discussed in Section 9.3.5. The work plan should also include a site plan showing the locations of reaction piles relative to permanent foundation elements and a drawing showing the layout of the load test set up. Following the completion of load tests, we will require at least one week to review and to evaluate the load test results and develop recommendations for production pile installation. The results of the load tests will be submitted to HCAI for review.

9.3.5 Pile Installation

We recommend the piles be installed from a working pad at least three feet above the final subgrade elevation. Depending on the soil conditions exposed at the working pad elevation, a layer of granular material could be required to further stabilize the working pad and help with site access. The final thickness of the working pad and granular layer, if necessary, should be evaluated as the excavation approaches the final subgrade level. If the ACIP piles are installed at the final subgrade elevation and the subgrade is disturbed, the disturbed soil should be overexcavated, removed, and backfilled per Section 9.1.2.

During installation of ACIP piles, the contractor should provide a tablet or alternative option for Langan personnel to safely observe the installation parameters listed in Section 9.3.4 in real time. The contractor should be prepared to confirm the pile depth using an alternative method in addition to the automated system. A functional pressure gauge should be installed to monitor grout pressure head. A minimum pressure head of five feet should be developed at the beginning of grouting by pumping extra strokes at the pile tip and maintained at all times during grouting of the ACIP pile. If at any point this minimum pressure head is lost, or if the grouting of the pile is stopped, the contractor should stop retracting the auger or mandrel and readvance the auger or mandrel five feet below the top of grout before resuming grouting. Grout return should occur at the ground surface when the auger is no less than five feet below grade. If any communication, bleeding, bubbling, or drop or rise in grout level is observed during or after installation of a pile, the pile should be redrilled or replaced.

The grout pump should be calibrated prior to the start of the project, immediately after any pump maintenance is performed, at any indication that the pump is operating differently from the last

DRAFT

calibration, and regularly throughout production pile installation; at a minimum, the grout pump should be calibrated weekly. The grout factor[15] should be at least 1.15 for the overall pile length as well as at least 1.15 for each five-foot section of pile. During center bar and/or rebar cage placement, the bar and/or cage should be placed without difficulty or resistance. If excessive effort is required to install reinforcement, the pile should be integrity tested. The automated monitoring report for each pile should be sent to Langan for review within 24 hours of pile installation.

We recommend 50 percent of production piles be integrity tested using TIP or CSL. Integrity testing should also be performed on any ACIP pile that does not meet the installation specifications, or the pile should be redrilled or replaced. Langan will evaluate the allowable capacity of any piles that meet early refusal on a case-by-case basis.

9.4 Shallow Foundations for At-Grade Improvements

Recommendations for shallow foundations for at-grade improvements, including equipment pads, ancillary structures, and light poles, are presented below.

9.4.1 Equipment Pads

The proposed at-grade equipment pads outside of the service yard should be designed as mats or slabs-on-grade. The mats/slabs should have a continuous deepened perimeter footing, grade beam, or thickened slab edge extending at least 24 inches below the lowest adjacent soil subgrade. The mats/slabs and footings located adjacent to utility trenches should bear below an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the adjacent trench.

The at-grade mats and equipment pad slabs will be underlain by moderately expansive soil. Equipment pad mats and slabs should be underlain by at least 12 inches of non-expansive soil to mitigate the potential for movement of the slab due to expansive soil.

Footings and mats supporting the at-grade equipment pads east of the service yard should be designed using an allowable bearing capacity of 750 psf for dead plus live loads to limit static settlements to 1 inch. This value includes a factor of safety of at least 2.0 and can be increased by one-third for total design loads, including wind or seismic forces. This is equivalent to an

[15] Grout factor is calculated as the number of pump strokes multiplied by the calibrated grout volume per stroke, divided by the theoretical volume of the installed pile shaft.

DRAFT

ultimate bearing capacity of 1,500 psf. To design footings or mats using the modulus of subgrade reaction method, we recommend a modulus of subgrade reaction of 12 kcf; this modulus is representative of the anticipated settlement of ¼ inch under the estimated bearing pressures of 250 psf for dead plus live loads.

Lateral loads can be resisted by a combination of passive pressure acting on the vertical faces of the foundations and friction along the base of the foundations. We recommend passive resistance be calculated using the following values:

- an allowable equivalent fluid weight (triangular distribution) of 350 pounds per cubic foot (pcf) (ultimate equivalent fluid weight of 525 pcf) in select fill
- an allowable uniform pressure of 2,000 psf (ultimate uniform pressure of 3,000 psf) in lime-treated soil
- an allowable uniform pressure of 1,750 psf (ultimate uniform pressure of 2,625 psf) for onsite soil.

The upper foot of soil should be ignored unless it is confined by slabs or pavement. Frictional resistance at the base of the footings and mats/slabs should be computed using a friction coefficient of 0.25 (ultimate friction coefficient of 0.38). The allowable passive resistance and friction values include a factor of safety of about 1.5. Uplift loads may be resisted by the weight of the footing and any overlying soil. Passive resistance should not be used for footings on slopes or excavations unless the face of the footing is at least 7 feet from the slope/excavation face, measured horizontally.

The foundation excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. If loose or soft soil or non-engineered fill is encountered in a footing/mat/slab excavation, the weak soil or fill should be excavated to expose stiff clay or medium dense to dense sand. The excavated material should be replaced with engineered fill or lean concrete. The bottoms and sides of excavations should be wetted following excavation and maintained in a moist condition until concrete is placed. If the foundation soil dries during construction, the foundation will eventually heave, which may result in cracking and distress. We should check foundation excavations prior to placement of reinforcing steel to confirm suitable bearing material is present. We should recheck the condition of the excavations just prior to concrete placement to confirm the excavations are sufficiently moist.

DRAFT

9.4.2 Ancillary Structures

Lightly loaded ancillary structures constructed at grade can be supported on individual spread or continuous footings. Spread footings should be bottomed at least 24 inches below the lowest adjacent exterior soil subgrade to reduce the potential for movement of the footings due to shrink and swell of the expansive clay. Footings located adjacent to utility trenches should bear below an imaginary 1.5:1 (horizontal to vertical) plane projected upward from the bottom edge of the adjacent trench.

Footings supporting at-grade improvements should be designed using an allowable bearing capacity of 750 psf for dead plus live loads to limit static settlements to 1 inch assuming 5-foot-square footings, as discussed in Section 8.3.4.2. This allowable bearing capacity value includes a factor of safety of at least 2.0 and can be increased by one-third for total design loads, including wind or seismic forces. This is equivalent to an ultimate bearing capacity of 1,500 psf.

Lateral loads can be resisted by a combination of passive pressure acting on the vertical faces of the foundations and friction along the base of the foundations. Passive resistance should be calculated using the recommended values provided in Section 9.4.1.

The foundation excavations should be free of standing water, debris, and disturbed materials prior to placing concrete. If loose or soft soil or non-engineered fill is encountered in a footing excavation, the weak soil or fill should be excavated to expose stiff clay or medium dense to dense sand. The excavated material should be replaced with engineered fill or lean concrete. The bottoms and sides of excavations should be wetted following excavation and maintained in a moist condition until concrete is placed. If the foundation soil dries during construction, the foundation will eventually heave, which may result in cracking and distress. We should check foundation excavations prior to placement of reinforcing steel to confirm suitable bearing material is present. We should recheck the condition of the excavations just prior to concrete placement to confirm the excavations are sufficiently moist.

9.4.3 Light Pole Foundations

We recommend using an allowable skin friction of 350 psf for drilled piers. This value includes a factor of safety of about 2.0 and corresponds to an ultimate skin friction of 700 psf. Alternatively, light pole foundations founded in clay may be designed in accordance with Section 1807A.3 of the 2022 California Building Code, using values provided for Class 5 material in Table 1806A.2.

DRAFT

9.5 Below-Grade Wall Design

Below-grade walls, including the basement walls for the hospital and energy center and the walls surrounding the service yard, should be designed to resist both static lateral earth pressures, accounting for the presence of moderately expansive soil, and lateral pressures caused by earthquakes. The more critical condition of either the at-rest pressure or the active pressure plus seismic increment should be checked. We used the procedures outlined in Sitar et al. (2012) to compute the seismic increment. At-rest and total equivalent fluid weights (active plus seismic increment) for Design Earthquake (DE) and Risk-Targeted Maximum Considered Earthquake (MCE_R) levels of shaking at the site, assuming level backfill conditions and that backfill will consist of on-site expansive clay, are presented in Table 16.

TABLE 16
Equivalent Fluid Weights for Below-Grade Wall Design

Retained Material	Static Conditions		Seismic Conditions[1]			
			Seismic Increment (pcf)		Total (Active Plus Seismic Increment) (pcf)	
	Active (pcf)	At-Rest (pcf)	DE[2]	MCE_R[3]	DE	MCE_R
Drained Condition[4]	60	85	30	40	90	125
Undrained Condition	85	95	15	20	100	105

Notes:
1. The more critical condition of either at-rest pressure (static condition) or active pressure plus a seismic pressure increment (seismic condition) should be checked for walls 6 feet or higher.
2. DE = Design Earthquake, PGA = 0.42g
3. MCER = Risk-Targeted Maximum Considered Earthquake, PGA = 0.63g
4. Applicable to walls that are backdrained above the design groundwater level to prevent the buildup of hydrostatic pressure. Recommended design groundwater level is Elevation 175 feet.
5. Structural engineer to determine appropriate load combinations for design of below-grade walls.

Where surcharge loads are present above an imaginary line projected up at an inclination of 1½:1 (horizontal to vertical) from the bottom of a wall, a surcharge pressure should be included in the wall design. Where vehicular traffic will pass within 10 feet of the walls, traffic loads should be considered in the design of the walls. Traffic loads may be modeled by a uniform horizontal pressure of 100 psf applied on the upper 10 feet of the walls. Where equipment pads are planned at the top of walls (such as at the east side of the service yard), we recommend a horizontal surcharge pressure of 40 psf be applied to the entire height of the wall, assuming an average bearing pressure of 100 psf on the equipment pad. In addition, the walls should be designed for

surcharge loads where there will be construction equipment, stockpiled soil, or other surcharge loads within a horizontal distance of 1½ times the wall height. If these conditions exist, we can compute the additional pressure increment if provided the loading condition.

To protect against moisture migration, basement walls should be waterproofed, and water stops should be placed across all construction joints. The waterproofing should be placed directly against the backside of the walls. The waterproofing should be designed by a consultant with local experience.

Walls should be properly backdrained if they are designed for the drained condition above the design groundwater level. One acceptable method for back-draining below-grade walls is to place a prefabricated drainage panel against the backside of the walls. If temporary shoring is used, the panel may be placed directly on the shoring prior to casting the wall. We should check the manufacturer's specifications regarding the proposed prefabricated drainage panel material to verify it is appropriate for its intended use.

As an alternative to using prefabricated drainage panel, the wall may be drained using Caltrans Class 2 permeable material (Caltrans Standard Specifications Section 68-1.025) or clean crushed drain rock wrapped in a geotextile filter fabric (Mirafi 140N or equivalent). The gravel drain should be at least 12 inches wide and should extend up the back of the wall to about 2 feet below the ground surface; the upper 2 feet should be covered with a cap of native soil to reduce infiltration of surface water.

The drainage panel or gravel backdrain should extend down to a four-inch-diameter PVC collector pipe or "flat" equivalent pipe (such as AdvanEdge) at the design groundwater level (Elevation 175 feet). The PVC collector pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material (see Caltrans Standard Specifications Section 68-1.025), or clean crushed rock wrapped in filter fabric (Mirafi 140N or equivalent. If a flat pipe surrounded by a filter fabric is used, it is not necessary to surround it with rock. The pipe should be connected to a suitable discharge point. If water is collected in a sump, a pumping system may be required to carry the water to the storm drain system.

DRAFT

9.6 Excavation and Temporary Shoring

9.6.1 Temporary Cut Slopes

We judge that temporary cuts in native soil which are less than 12 feet high and inclined no steeper than 1.5:1 (horizontal:vertical) will be stable provided that they are above the groundwater level and are not surcharged by equipment or building material. Temporary shoring will be required where temporary slopes are not possible because of space constraints.

9.6.2 Temporary Shoring

The proposed hospital, energy center, service yard will include 22- to 26-foot-deep excavations for one basement level and mat foundations. Because the excavations will be relatively deep and will extend below the design groundwater level (design groundwater level at Elevation 175 feet), temporary shoring will be required. We judge that a cantilevered and/or tied-back soldier-pile-and-lagging shoring system with active dewatering is appropriate for the project. We assume that the shoring system will be active for no longer than one year. The temporary shoring should be designed to support the planned excavation depths, including any excavations needed to construct a working pad and/or mud slab at the base of the excavation.

For design of a temporary cantilevered shoring system retaining level ground, we recommend using an active earth pressure equivalent to an equivalent fluid weight of 60 pcf, assuming the ground behind the shoring is level and to account for expansive soil.

Because excavation depths will extend 22 to 26 feet below site grades, tiebacks or internal bracing will be required. For a temporary soldier-pile-and-lagging system with tiebacks or internal bracing, the recommended lateral pressures are presented on Figure 16. The values presented on Figure 16 assume level backfill conditions. The soldier piles should extend sufficiently below the excavation to achieve lateral stability and resist the downward loading of the tiebacks. Recommendations for tiebacks are presented in Section 9.6.3. Recommendations for internal bracing consisting of rakers supported at the base of the excavation are provided in Section 9.6.5.

Where traffic is within a distance equal to the excavation depth, a uniform horizontal surcharge load of 100 psf acting on the upper 10 feet of the shoring should be used in the design. In addition, the shoring should be designed for surcharge loads where there will be construction equipment, stockpiled soil, or other surcharge loads within a horizontal distance of 1½ times the excavation depth. If these conditions exist, we can compute the additional pressure increment if provided the loading condition.

DRAFT

Lateral resistance can be gained by passive pressure acting on the face of the embedded soldier piles. Passive resistance can be computed using a passive pressure diagram presented on Figure 16. These values include a factor of safety of at least 1.5. Passive pressure can be assumed to act over an area of three soldier pile widths assuming the toe of the soldier pile is filled with structural concrete, or the center-to-center pile spacing, whichever is less.

The shoring designer should evaluate the required penetration depth of the soldier piles. The soldier piles should have sufficient axial capacity to support the vertical load acting on the piles, if any. To compute the axial capacity of the soldier piles below the excavation level, we recommend using an allowable skin friction on the perimeter of the piles of 350 psf. This value includes a factor of safety of 2.0. This is equivalent to an ultimate skin friction of 700 psf. Vertical support from end bearing should be neglected.

The anticipated deflections of the shoring system should be estimated to check if they are acceptable. The shoring system should be sufficiently rigid to prevent detrimental movement of the shoring and possible damage to existing improvements, including underground utilities and gas station adjacent to the site. The shoring and tieback system should be designed so that it does not conflict with nor damage existing improvements outside of the excavation boundaries.

The shoring system should be installed by an experienced shoring specialty contractor. The contractor should be familiar with applicable local, state, and federal regulations for temporary shoring, including the current OSHA Excavation and Trench Safety Standards. We should review the shoring plans to check that they are consistent with the recommendations presented in this report. In addition, we recommend a representative from our office observe the installation of the shoring system.

9.6.3 Tiebacks

Tiebacks can be used to restrain the shoring/retaining wall system. The vertical load from the tiebacks should be accounted for in the design of the vertical elements. Design criteria for tiebacks are presented on Figure 16.

Tiebacks should be 6 inches in diameter or greater. Tiebacks should derive their load-carrying capacity from the soil behind an imaginary line sloping upward from a point H/5 feet away from the bottom of the excavation and sloping upwards at 60 degrees from the horizontal, where H is the wall height in feet. Tiebacks with bar and strand tendons should have minimum unbonded lengths of 10 and 15 feet, respectively. The unbonded length should be created by placing an

DRAFT

oversized rigid smooth plastic casing (i.e., PVC pipe) over the bars or strands; flexible plastic does not provide adequate bond-break for the unbonded zone. All tiebacks should be spaced at least six times the grouted diameter of the bonded zone or four feet, whichever is greater. The bottom of the excavation should not extend more than two feet below a row of unsecured tiebacks. We recommend all tiebacks be post-grouted and a minimum grout pressure of 300 pounds per square inch (psi) be used for installation and post-grouting.

Tieback allowable capacity will depend upon the drilling method, hole diameter, grout pressure, post grouting, and workmanship. To reduce the potential or caving of sandy layers within the clay at the site, we recommend a flight auger or smooth cased tieback installation method (such as a Klemm type rig) be used. We recommend using the allowable skin friction value for grouted tiebacks shown on Figure 16; these values include a factor of safety of at least 1.5.

The contractor should be responsible for determining the actual length of tiebacks required to resist the lateral earth and surcharge pressures imposed on the shoring system. Determination of the tieback length should be based on recommended tieback capacities presented on Figure 16. The computed bond length should be confirmed by a performance- and proof-testing program under our observation, as recommended in Section 9.6.4. Replacement tiebacks should be installed for tiebacks that fail the load tests.

9.6.4 Tieback Testing

Each tieback should be tested. The first two production tiebacks should be performance-tested to at least 2.0 times the design load and two percent of the remaining tiebacks should be performance-tested to at least 2.0 times the design load. All other tiebacks should be proof-tested to at least 1.50 times the design load. The performance and proof tests shall not exceed 80 and 70 percent of the minimum tensile strength of the anchor rod, respectively.

The performance test is used to determine the load carrying capacity and the load-deformation behavior of the tiebacks. It is also used to separate and identify the causes of movement, and to check that the designed unbonded length has been established. In the performance test, the load applied to the tieback and its movement is measured during several cycles of incremental loading and unloading. A proof test is a simple test which is used to measure the total movement of the tiebacks during one cycle of incremental loading.

The maximum test load should be held for a minimum of 10 minutes, with readings taken at 1, 2, 3, 4, 5, 6, and 10 minutes. If the difference between the 1- and 10-minute readings is less than

DRAFT

0.04 inch during the loading, the test is discontinued. If the difference is more than 0.04 inch, the holding period is extended to 60 minutes, and the movements should be recorded at 15, 20, 25, 30, 45, and 60 minutes. The movement of each tieback should be monitored with a free standing, tripod-mounted dial gauge during performance and proof testing. The tiebacks should be checked 24 hours after initial lock off to confirm stress relaxation has not occurred.

We should evaluate the results of performance and proof tests to check that the tiebacks can resist the design load. For any tiebacks that fail to meet the performance and proof testing requirements, additional tiebacks should be installed to compensate for the deficiency, as required by the shoring or wall designer. A performance- or proof-tested tieback with a ten-minute hold is acceptable if the tieback carries the maximum test load with less than 0.04-inch movement between one and ten minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbounded length.

A performance- or proof-tested tieback with a 60-minute hold is acceptable if the tieback carries the maximum test load with a creep rate that does not exceed 0.08 inch/log cycle of time, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length. If the total movement of the tiebacks at the maximum test load does not exceed 80 percent of the theoretical elastic elongation of the unbonded length, the tieback should be replaced by the contractor.

9.6.5 Raker Bracing Support

Where rakers are used to brace the soldier piles in lieu of tiebacks, the rakers can be supported on temporary concrete pads constructed at the base of the excavation, or on the permanent service yard mat foundation. Raker pads should be designed using an allowable bearing capacity of 3,000 psf, which includes a factor of safety of at least 2.0. This is equivalent to an ultimate bearing capacity of 6,000 psf. This allowable bearing capacity is based on a pad at least 18 inches in width and length as well as at least 18 inches deep. The base of the pad should be horizontal. The raker pads should be positioned so that they do not interfere with permanent service yard mat.

Lateral loads can be resisted by a combination of passive pressure acting on the vertical faces of the pads and friction along the base of the pads. We recommend passive resistance be calculated using an allowable uniform pressure of 1,750 psf (ultimate uniform pressure of 2,625 psf). The upper foot of soil should be ignored. Frictional resistance at the base of the pads should be

DRAFT

computed using a friction coefficient of 0.25 (ultimate friction coefficient of 0.38). The allowable passive resistance and friction values include a factor of safety of about 1.5.

9.7 Dewatering

The excavations for the new hospital, energy center, and service yard will encounter groundwater. Prior to and during excavation, the groundwater should be drawn down so that the groundwater level inside the excavation is at least three feet below the bottom of the excavation. The groundwater should be drawn down sufficiently to allow for a stable working surface for constructability. This level should be maintained until sufficient building weight and/or uplift capacity is available to resist the hydrostatic uplift pressure of the groundwater based on the design groundwater elevation. Elevator and sump pits can be locally dewatered. Adjacent improvements should be monitored for vertical movement caused by the dewatering.

In addition to the wells, a working pad consisting of 12 inches of crushed rock can be used as a temporary drainage blanket to assist with the dewatering of the site. Perforated pipes should be placed in the gravel blanket to collect water and conduct it to a sump during construction. The sump and collector pipes should be decommissioned once they are no longer needed.

The hydrostatic pressure in the sand and gravel layers below the excavation may need to be lowered to prevent basal heave (blow-out of the excavation bottom). The dewatering designer should check that there is sufficient overburden to resist hydrostatic pressures in the granular layers below the bottom of the proposed excavation and mitigation measures should be included in the dewatering plans.

While dewatering is in progress, nearby streets and other improvements should be monitored for vertical movement, and groundwater levels outside the excavation should be monitored through wells. Should excessive settlement or groundwater drawdown be measured, the contractor should be prepared to recharge the groundwater outside the excavation through recharge wells. A recharge program should be submitted as part of the dewatering plan.

The site dewatering system, including the number and depth of dewatering wells or sump pumps, should be designed by an experienced dewatering designer, and implemented by an experienced dewatering contractor, in coordination with the shoring designer and contractor. The design of the dewatering system should be provided to the shoring designer so that the temporary groundwater elevation can be incorporated in the shoring design. We should review

DRAFT

the dewatering system proposed by the contractor prior to installation. The dewatering designer and contractor are solely responsible for the success of their system.

9.8 Tiedown Anchors

Tiedown anchors can be used to resist uplift loads where the weight of the buildings and foundation elements are not sufficient. Uplift resistance can be developed in skin friction between the anchor shafts and the surrounding soil. Tiedown anchors should be spaced at least four shaft diameters apart, or four feet, whichever is greater. Tiedowns should be of a minimum diameter of 6 inches. The uplift capacity of tiedown anchors will depend on the construction procedure used to install them. For a preliminary estimate of bond lengths, we recommend using an allowable pullout capacity of 1,000 psf for small diameter, post-grouted anchors. This pullout capacity includes a factor of safety of 2.0 (appropriate for sustained uplift loads). If tiedowns are used for temporary loads only, a factor of safety of 1.5 can be used. This corresponds to an ultimate pullout capacity of 2,000 psf. Anchor capacities should be verified in the field by proof and performance test programs as described below. We recommend all tiedowns be post-grouted and a minimum grout pressure of 300 psi be used for installation and post-grouting. Tiedowns should be double corrosion protected because they are permanent.

During drilling of anchor holes, localized granular soil deposits below groundwater may be encountered. Therefore, the contractor should use an augercast system or use a smooth cased installation method (such as a Klemm type rig) to prevent caving. High strength bars or strands may be used as tensile reinforcement in the anchors. For stressing, the steel bar and strand should have at least 10 and 15 feet of free length, respectively. We recommend the first two tiedowns and at least 10 percent of the remaining anchors be performance-loaded to at least 200 percent of the design static load or 160 percent of the seismic load, whichever is greater, under our observation. The test load should not exceed 0.8 times the specified minimum tensile strength of the tendon. The remainder tiedowns should be proof tested to 160 percent of the static design load or 125 percent of the seismic load, whichever is greater. The proof load should be held for at least 10 minutes without significant yielding of the anchor. Replacement anchors should be provided, as directed by the structural engineer, for anchors that fail the test. After testing, all anchors should be loaded to 10 percent of their design load (higher if specified by the structural engineer) and locked off.

In the performance test, the load applied to the anchor and its movement are measured during several cycles of incremental loading and unloading. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 0, 1, 2, 3, 6, and 10 minutes. If the difference

DRAFT

between the 1- and 10-minute reading is less than 0.04 inch during the loading, the test is discontinued. If the difference is more than 0.04 inch, the holding period is extended to 60 minutes, and the movements should be recorded at 15, 20, 25, 30, 45, and 60 minutes.

A proof test is a simple test used to measure the total movement of the anchor during one cycle of incremental loading. The maximum test load should be held for a minimum of 10 minutes, with readings taken at 0, 1, 2, 3, 6, and 10 minutes. If the difference between the 1- and 10-minute reading is less than 0.04 inch, the test is discontinued. If the difference is more than 0.04 inch, the load should be maintained, and the observation is continued until the creep rate can be determined. We should evaluate the anchor test results and determine whether the anchors are acceptable. A performance- or proof-tested anchor with a ten-minute hold is acceptable if the anchor carries the maximum test load with less than 0.04-inch movement between one and 10 minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length. A performance- or proof-tested anchor with a 60-minute hold is acceptable if the anchor carries the maximum test load with less than 0.08-inch movement between six and 60 minutes, and total movement at the maximum test load exceeds 80 percent of the theoretical elastic elongation of the unbonded length. If the total movement of the anchor at the maximum test load does not exceed 80 percent of the theoretical elastic elongation of the unbonded length, the anchor should be replaced by the contractor.

9.9 Basement Floor Slabs

The basement floor slabs for the hospital and energy center will be supported on fill placed within the interstitial space above the mat foundation and can be designed to bear on grade. Recommendations for fill placement within the interstitial space are provided in Section 9.1.4.

The floor slabs will be in contact with the backfill within the interstitial space. We understand utilities will be routed within this space beneath the slab and moisture could condense on the underside of the slab if leaks occur. Consequently, a moisture barrier should be considered if movement of water vapor through the slabs would be detrimental to its intended use. A typical moisture barrier consists of a capillary moisture break and a water vapor retarder.

The capillary moisture break should consist of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class C vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of ASTM E1643. These requirements include overlapping seams by six inches, taping seams,

DRAFT

and sealing penetrations in the vapor retarder. The particle size of the gravel/crushed rock should meet the gradation requirements presented in Table 17.

TABLE 17
Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
Gravel or Crushed Rock	
1 inch	90 – 100
3/4 inch	30 – 100
1/2 inch	5 – 25
3/8 inch	0 – 6

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the floor slab should have a low w/c ratio - less than 0.45. The slab should be properly cured. Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

9.10 Pavement and Concrete Flatwork Design

Our recommendations for flexible and rigid pavement and concrete flatwork are presented in this section.

9.10.1 Flexible and Rigid Pavement

The State of California flexible pavement design method was used to develop the recommended pavement sections. Because of the presence of moderately expansive near-surface soil, we selected an R-value of 5 for our evaluations. We assumed various Traffic Indices (TIs), from 4.5 to 8.0 for design of areas ranging from automobile parking with occasional buses or trucks through roadways and bus parking areas. These TIs should be confirmed by the project civil engineer. Table 18 presents our recommendations for asphalt pavement sections.

DRAFT

TABLE 18
Flexible Pavement Sections
Subgrade R-Value = 5

TI	Asphaltic Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	10.0
5.0	3.0	10.0
5.5	3.0	12.0
6.0	3.5	13.0
6.5	4.0	13.5
7.0	4.0	15.5
7.5	4.5	16.5
8.0	5.0	17.5

Where rigid pavement is required, for loading and service areas, we recommend a minimum of six inches of concrete for medium traffic (TI of 5.5 or lower) and a minimum of eight inches of concrete for heavy traffic (TIs of 6 and higher). The concrete should be underlain by at least six inches of Class 2 aggregate base, compacted to at least 95 percent relative compaction.

Pavement components should conform to the current Caltrans Standard Specifications. The subgrade should be prepared following the guidance in Section 9.1.3 to provide a smooth, non-yielding surface. The aggregate base should be moisture conditioned and compacted to a relative compaction of at least 95 percent. Recycled aggregate base is acceptable provided it meets the Caltrans criteria for Class 2 material.

The finished compacted aggregate base should be firm and unyielding and be proof rolled prior to placement of the pavement. If unstable areas are identified during proof rolling, or if the contractor is unable to achieve the recommended degree of compaction, the aggregate base in these areas should be removed in order to repair the underlying soil subgrade. In these areas the upper six inches of the soil subgrade should be moisture-conditioned to at or above optimum and compacted to at least 95 percent relative compaction.

9.10.2 Concrete Flatwork

Exterior concrete flatwork should be underlain by at least four inches of aggregate base compacted to at least 95 percent relative compaction. Prior to placement, the subgrade should be scarified to a depth of at least 12 inches, moisture-conditioned to at least three percent above

DRAFT

optimum moisture content and compacted to between 88 and 93 percent relative compaction. The near-surface soils are moderately expansive. Hardscape improvements should be underlain by at least 12 inches of engineered, non-expansive (select or lime-treated) soil that extends at least three feet beyond the slab edges.

9.11 Site Drainage

Positive surface drainage should be provided around the hospital building and service yard to direct surface water away from the structure. To reduce the potential for water ponding adjacent to buildings, we recommend the ground surface within a horizontal distance of five feet from the building be designed to slope down and away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the building.

Drainage control design should include provisions for positive surface gradients so that surface runoff is not permitted to pond, particularly adjacent to structures, or on roadways or pavements. Surface runoff should be directed away from the building to properly designed and installed drop inlets.

To reduce the potential for irrigation water entering the pavement section, vertical curbs adjacent to landscaped areas should extend through any aggregate base and at least six inches into the underlying soil. In heavily watered areas, such as lawns, it may also be necessary to install a subdrain behind the curb to intercept excess irrigation water.

9.12 Bioretention Systems

Bioretention areas are landscaping features used to treat stormwater runoff within a development site. They are commonly located in parking lot islands and landscape areas. Surface runoff is directed into shallow, landscaped depressions, which usually include mulch and a prepared soil mix. Typically, the filtered runoff is collected in a perforated underdrain beneath the bioretention system and returned to the storm drain system. For larger storms, runoff will generally overflow the bioretention areas and is diverted to the storm drain system.

The soil within a bioretention system should typically have an infiltration rate sufficient to draw down any pooled water within 48 hours after a storm event. Bioretention soil should be installed in accordance with the Santa Clara County's C.3 stormwater technical guidelines. Because the soil subgrade beneath bioretention areas will likely be moderately expansive clay, an underdrain

DRAFT

system with a waterproof liner on the sides and bottom of the bioretention swale should be installed.

Underdrains are typically at the invert of the bioretention system to intercept water that does not infiltrate into the surrounding soils. Underdrains consist of a perforated PVC pipe surrounded by threat least two inches of Class 2 Permeable material (Caltrans Standard Specifications Section 68-2.02F(3)). The perforated PVC pipe cross section area should be determined based on the desired hydraulic conductivity of the underdrain. Underdrains should be installed in accordance with the Santa Clara County's C.3 stormwater technical guidelines.

Because of the presence of near surface expansive soil, bioretention systems should be set back a minimum of five feet from building foundations, slabs, concrete flatwork, or pavements. Overflow from bioretention areas should be directed to the storm drain system away from building foundations and slabs. If bioretention systems are closer than five feet, passive resistance of foundation elements should be neglected.

Typically, the bottom of the bioretention system is recommended to be a minimum of two feet or more above the groundwater table.

9.13 Landscaping

The use of water-intensive landscaping around the perimeter of at grade improvements should be avoided to reduce the amount of water introduced to the subgrade. Irrigation of landscaping around improvements that are at grade should be limited to drip or bubbler-type systems. Trees with large roots or have high water demand should also be avoided since they can dry out the soil beneath foundations and cause settlement. The purpose of these recommendations is to avoid large differential moisture changes adjacent to the foundations, which have been known to cause significant differential movement over short horizontal distances in expansive soil, resulting in cracking of slabs and architectural damage.

To reduce the potential for irrigation water entering the pavement section, vertical curbs adjacent to landscaped areas should extend through any aggregate base and at least six inches into the underlying soil. In heavily watered areas, such as lawns, it may also be necessary to install a subdrain behind the curb to intercept excess irrigation water.

DRAFT

9.14 Construction Monitoring

A monitoring program should be established to evaluate the effects of the construction on the adjacent improvements. The contractor should install surveying points to monitor the movement of shoring and settlement of the adjacent ground surface during below-grade construction activities. The shoring system and adjacent improvements should be monitored for movements throughout the excavation and at least until the hospital and energy center street-level slab is cast and the service yard below-grade walls are constructed.

To monitor ground movements, groundwater levels, and shoring movements during the excavation activities, we recommend installing the instrumentation listed below:

Slope inclinometers: We recommend installing 4 to 8 slope inclinometers adjacent to the proposed shoring system. If possible two slope inclinometers should be installed behind each of the north, east, south, and west shoring walls for the hospital and energy center/service yard. The slope inclinometers should be installed following the installation of the shoring beams and prior to excavation. We should coordinate with the shoring contractor regarding the number and locations of slope inclinometers. The slope inclinometers should extend to a depth of at least two times the excavation depth.

Piezometers: We recommend two groundwater monitoring wells be installed to monitor the groundwater level outside the excavation. In addition, if blowout is an issue, we recommend a groundwater monitoring well be installed in the center of the hospital footprint and the service yard footprint and extend into the sand layers below the bottom of excavation. The upper portions of the piezometers should be properly sealed with cement-bentonite mix to reduce surface water infiltration.

Survey points: Survey points should be installed on the adjacent streets and improvements that are within 50 feet of the proposed excavation. These points should be used to monitor the vertical and horizontal movements of the shoring and these improvements. These points should be selected with the help of the geotechnical engineer, so they can provide the most value to the project. The survey points should be monitored regularly, and the results should be submitted to us in a timely manner for review. For estimating purposes, assume that the survey points will be read as follows:

- prior to any shoring work at the site
- after installing shoring beams

DRAFT

- weekly during excavation work
- after the excavation reaches the planned excavation level
- every week until the hospital and energy center street-level floor slab is constructed and the service yard below-grade walls are constructed.

We should obtain inclinometer and piezometer readings regularly. Initially, depending upon the speed of excavation, the instrumentation should be read about every week. The frequency of readings may, in the later stage of construction, be modified as appropriate.

In addition, the conditions the nearby gas station should be photographed and surveyed prior to the start of construction and monitored periodically during construction. A thorough crack survey of the nearby gas station should be performed prior to the start of construction and immediately after its completion.

10.0 SEISMIC DESIGN

We understand the proposed project will be designed under the 2022 CBC and by reference ASCE 7-16.

We expect the site will experience strong ground shaking during a major earthquake on any of the nearby faults. Based on the results of the field investigation, including borings, CPTs, and shear wave velocity testing, we conclude the site can be classified as Site Class D, in accordance with the 2022 CBC and ASCE 7-16.

10.1 Mapped Values

The following mapped seismic coefficients for design in accordance with the provisions of ASCE 7-16 can be used if the structural exceptions in Section 11.4.8 of ASCE 7-16 are met:

- Risk-Targeted Maximum Considered Earthquake (MCE_R) S_S and S_1 of 1.799g and 0.637g, respectively
- Site Coefficients F_a and F_v of 1.0 and 1.7, respectively
- MCE_R spectral response acceleration parameters at short periods, S_{MS}, and at one-second period, S_{M1}, of 1.799g and 1.083g, respectively
- Design Earthquake (DE) spectral response acceleration parameters at short period, S_{DS}, and at one-second period, S_{D1}, of 1.199g and 0.722g, respectively.

DRAFT

10.2 Site-Specific Response Spectra

We performed probabilistic seismic hazard analysis (PSHA) and deterministic analysis to develop site-specific recommended horizontal spectra at the ground surface for the buildings for the Risk-Targeted Maximum Considered Earthquake (MCE_R) and Design Earthquake (DE) consistent with ASCE 7-16 and 2022 CBC. Details of our analysis for the MCE_R earthquake are presented in Appendix G.

The recommended horizontal spectra are presented on Figure G-8 in Appendix G for 5 percent damping; digitized values of the horizontal MCE_R and DE spectra, respectively, for damping ratio of 5 percent are presented in Table 19.

TABLE 19
Recommended MCE_R, and DE Spectra
Spectral Acceleration (g's)

Period (seconds)	MCE_R (5% damping)	DE (5% damping)
0.01	0.744	0.496
0.10	1.129	0.753
0.20	1.579	1.053
0.30	1.852	1.235
0.40	1.935	1.290
0.50	1.925	1.284
0.75	1.677	1.118
1.00	1.452	0.968
1.50	1.083	0.722
2.00	0.848	0.565
3.00	0.583	0.389
4.00	0.413	0.276

Note:
1. DE and MCER correspond to the Design Earthquake and Risk-Targeted Maximum Considered Earthquake, respectively, per 2022 CBC and ASCE 7-16.

Because site-specific procedure was used to determine the recommended response spectra, the corresponding values of S_{MS}, S_{M1}, S_{DS} and S_{D1} per Section 21.4 of ASCE 7-16 should be used, as shown in Table 20.

DRAFT

TABLE 20
Design Spectral Acceleration Value

Parameter	Spectral Acceleration Value (g's)
S_{MS}	1.741[13]
S_{M1}	1.750[14]
S_{DS}	1.161[16]
S_{D1}	1.167[17]

11.0 SERVICES DURING DESIGN, CONSTRUCTION DOCUMENTS, AND CONSTRUCTION QUALITY ASSURANCE

During final design and HCAI/CGS review we should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design drawings should incorporate Langan's recommendations. When authorized, Langan will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, shallow and deep foundations, backfill, lime treatment, and excavation support. Langan should also, when authorized, review the project plans, as well as Contractor submittals relating to materials and construction procedures for geotechnical work, to confirm the designs incorporate the intent of our recommendations.

Langan has investigated and interpreted the site subsurface conditions and developed the foundation design recommendations contained herein and is therefore best suited to perform quality assurance observation and testing of geotechnical-related work during construction. The work requiring quality assurance confirmation and/or special inspections per the California Building Code includes, but is not limited to, earthwork, backfill, subgrade preparation, shallow and deep foundations, and excavation support.

Recognizing that construction observation is the final stage of geotechnical design, quality control observation during construction by Langan is necessary to confirm the design assumptions and

[16] S_{DS} is based on the site-specific response spectra and is based on 90 percent of the maximum spectral acceleration within the period range of 0.2 to 5 seconds; it is governed by 90 percent of the spectral acceleration at a period of 0.4 seconds. S_{MS} is 1.5 times the S_{DS}.

[17] S_{D1} is based on the site-specific response spectra and is the maximum of the product of period, T, and spectral acceleration, Sa, for periods from 1.0 to 5.0 seconds; it is governed by the product of the period and spectral acceleration at a period of 3.0 seconds. S_{M1} is 1.5 times the S_{D1}.

design elements, to maintain our continuity of responsibility on this project, and allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended herein are predicated upon Langan assisting with the final design and providing construction observation services for the Owner. Should Langan not be retained for these services, we cannot assume the role of geotechnical engineer of record, and the entity providing the final design and construction observation services must serve as the engineer of record.

12.0 OWNER AND CONTRACTOR RESPONSIBILITIES

The Contractor is responsible for construction quality control, which includes satisfactorily constructing the foundation system and any associated temporary works to achieve the design intent while not adversely impacting or causing loss of support to neighboring property, structures, utilities, roadways, etc. Construction activities that can alter the existing ground conditions such as excavation, fill placement, foundation construction, pile drilling, dewatering, etc. can also induce stresses, vibrations, and movements in nearby structures and utilities, and disturb occupants. Contractors are solely responsible to ensure that their activities will not adversely affect the structures and utilities and will not disturb occupants. Contractors must also take all necessary measures to protect the existing structures, utilities, etc. during construction. By using this report, the Owner agrees that Langan will not be held responsible for any damage to adjacent structures, utilities, etc.

13.0 LIMITATIONS

The conclusions and recommendations provided in this report result from our interpretation of the geologic and geotechnical conditions existing at the site inferred from a limited number of borings and CPTs, as well as architectural and structural information provided by Stantec Architecture Inc., the project architect, and KPFF, the project structural engineer. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others.

Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, as they may affect our recommendations.

DRAFT

This report has been prepared to assist the Owner, architect, and structural engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities on adjacent properties which are beyond the limits of that which is the specific subject of this report.

Environmental services provided by Langan for the project included performing a Phase I Environmental Site Assessment and Soil Management Plan for the development and presenting the results in reports dated 8 March 2023 and 3 May 2023, respectively.

DRAFT

EXPLANATION

Qhb Basin deposits (Holocene) (subunits below)

CLAY (CL) with varying sand and silt content and SANDY SILT (ML), medium stiff to hard

SAND (SP), SAND with GRAVEL (SP), GRAVEL with CLAY (GP-GC), CLAYEY SAND (SC), CLAYEY GRAVEL (GC), CLAYEY GRAVEL with SAND (GC), CLAYEY SAND with GRAVEL (SC), SILTY SAND (SM) medium dense to very dense

? – – – – – Geologic contact, dashed where approximate, queried where uncertain

Approximate finished floor elevation of basement

Approximate extent of excavation

Approximate groundwater level measured during drilling

Approximate groundwater level measured in piezometer

Notes:
1. See Figures 2, 3 and 5 for location of subsurface profile.
2. The above profile represents a generalized geologic cross section interpreted from widely spaced borings and CPTs. Soil deposits may vary in type, strength, and other important properties between points of exploration.
3. All elevations are based on National Geodetic Vertical Datum of 1929 (NGVD29) per "Supplemental Utility and Tree Survey" prepared by SANDIS dated 28 October 2022.
4. The ground surface in existing parking lot consists of asphalt pavement with variable thickness of asphalt concrete over variable thickness of aggregate base.
5. Approximate locations of proposed structure and basement finished floor elevations are based on preliminary drawing provided by Stantec and SANDIS titled "Conceptual Grading and Drainage Plan", dated 12 January 2023. Proposed basement finished floor (FF) elevation for hospital is assumed to be at approximately Elevation 172 feet.
6. Potentially liquefiable layers are not shown on idealized geologic cross section because the thickness of the layers is less than 1/2 foot. See Table 12 in our report for location, approximate depth, and estimated liquefaction-induced vertical settlement for potentially liquefiable layers.

I Not felt by people, except under especially favorable circumstances. However, dizziness or nausea may be experienced.
Sometimes birds and animals are uneasy or disturbed. Trees, structures, liquids, bodies of water may sway gently, and doors may swing very slowly.

II Felt indoors by a few people, especially on upper floors of multi-story buildings, and by sensitive or nervous persons.
As in Grade I, birds and animals are disturbed, and trees, structures, liquids and bodies of water may sway. Hanging objects swing, especially if they are delicately suspended.

III Felt indoors by several people, usually as a rapid vibration that may not be recognized as an earthquake at first. Vibration is similar to that of a light, or lightly loaded trucks, or heavy trucks some distance away. Duration may be estimated in some cases.
Movements may be appreciable on upper levels of tall structures. Standing motor cars may rock slightly.

IV Felt indoors by many, outdoors by a few. Awakens a few individuals, particularly light sleepers, but frightens no one except those apprehensive from previous experience. Vibration like that due to passing of heavy, or heavily loaded trucks. Sensation like a heavy body striking building, or the falling of heavy objects inside.
Dishes, windows and doors rattle; glassware and crockery clink and clash. Walls and house frames creak, especially if intensity is in the upper range of this grade. Hanging objects often swing. Liquids in open vessels are disturbed slightly. Stationary automobiles rock noticeably.

V Felt indoors by practically everyone, outdoors by most people. Direction can often be estimated by those outdoors. Awakens many, or most sleepers. Frightens a few people, with slight excitement; some persons run outdoors.
Buildings tremble throughout. Dishes and glassware break to some extent. Windows crack in some cases, but not generally. Vases and small or unstable objects overturn in many instances, and a few fall. Hanging objects and doors swing generally or considerably. Pictures knock against walls, or swing out of place. Doors and shutters open or close abruptly. Pendulum clocks stop, or run fast or slow. Small objects move, and furnishings may shift to a slight extent. Small amounts of liquids spill from well-filled open containers. Trees and bushes shake slightly.

VI Felt by everyone, indoors and outdoors. Awakens all sleepers. Frightens many people; general excitement, and some persons run outdoors.
Persons move unsteadily. Trees and bushes shake slightly to moderately. Liquids are set in strong motion. Small bells in churches and schools ring. Poorly built buildings may be damaged. Plaster falls in small amounts. Other plaster cracks somewhat. Many dishes and glasses, and a few windows break. Knickknacks, books and pictures fall. Furniture overturns in many instances. Heavy furnishings move.

VII Frightens everyone. General alarm, and everyone runs outdoors.
People find it difficult to stand. Persons driving cars notice shaking. Trees and bushes shake moderately to strongly. Waves form on ponds, lakes and streams. Water is muddied. Gravel or sand stream banks cave in. Large church bells ring. Suspended objects quiver. Damage is negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in poorly built or badly designed buildings, adobe houses, old walls (especially where laid up without mortar), spires, etc. Plaster and some stucco fall. Many windows and some furniture break. Loosened brickwork and tiles shake down. Weak chimneys break at the roofline. Cornices fall from towers and high buildings. Bricks and stones are dislodged. Heavy furniture overturns. Concrete irrigation ditches are considerably damaged.

VIII General fright, and alarm approaches panic.
Persons driving cars are disturbed. Trees shake strongly, and branches and trunks break off (especially palm trees). Sand and mud erupts in small amounts. Flow of springs and wells is temporarily and sometimes permanently changed. Dry wells renew flow. Temperatures of spring and well waters varies. Damage slight in brick structures built especially to withstand earthquakes; considerable in ordinary substantial buildings, with some partial collapse; heavy in some wooden houses, with some tumbling down. Panel walls break away in frame structures. Decayed pilings break off. Walls fall. Solid stone walls crack and break seriously. Wet grounds and steep slopes crack to some extent. Chimneys, columns, monuments and factory stacks and towers twist and fall. Very heavy furniture moves conspicuously or overturns.

IX Panic is general.
Ground cracks conspicuously. Damage is considerable in masonry structures built especially to withstand earthquakes; great in other masonry buildings - some collapse in large part. Some wood frame houses built especially to withstand earthquakes are thrown out of plumb, others are shifted wholly off foundations. Reservoirs are seriously damaged and underground pipes sometimes break.

X Panic is general.
Ground, especially when loose and wet, cracks up to widths of several inches; fissures up to a yard in width run parallel to canal and stream banks. Landsliding is considerable from river banks and steep coasts. Sand and mud shifts horizontally on beaches and flat land. Water level changes in wells. Water is thrown on banks of canals, lakes, rivers, etc. Dams, dikes, embankments are seriously damaged. Well-built wooden structures and bridges are severely damaged, and some collapse. Dangerous cracks develop in excellent brick walls. Most masonry and frame structures, and their foundations are destroyed. Railroad rails bend slightly. Pipe lines buried in earth tear apart or are crushed endwise. Open cracks and broad wavy folds open in cement pavements and asphalt road surfaces.

XI Panic is general.
Disturbances in ground are many and widespread, varying with the ground material. Broad fissures, earth slumps, and land slips develop in soft, wet ground. Water charged with sand and mud is ejected in large amounts. Sea waves of significant magnitude may develop. Damage is severe to wood frame structures, especially near shock centers, great to dams, dikes and embankments, even at long distances. Few if any masonry structures remain standing. Supporting piers or pillars of large, well-built bridges are wrecked. Wooden bridges that "give" are less affected. Railroad rails bend greatly and some thrust endwise. Pipe lines buried in earth are put completely out of service.

XII Panic is general.
Damage is total, and practically all works of construction are damaged greatly or destroyed. Disturbances in the ground are great and varied, and numerous shearing cracks develop. Landslides, rock falls, and slumps in river banks are numerous and extensive. Large rock masses are wrenched loose and torn off. Fault slips develop in firm rock, and horizontal and vertical offset displacements are notable. Water channels, both surface and underground, are disturbed and modified greatly. Lakes are dammed, new waterfalls are produced, rivers are deflected, etc. Surface waves are seen on ground surfaces. Lines of sight and level are distorted. Objects are thrown upward into the air.

EXPLANATION

Earthquake-Induced Landslides ; Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical, and subsurface water conditions indicate a potential for permanent ground displacements.

Liquefaction ; Areas where historic occurrence of liquefaction, or local topographic, geological, geotechnical, and subsurface water conditions indicate a potential for permanent ground displacements.

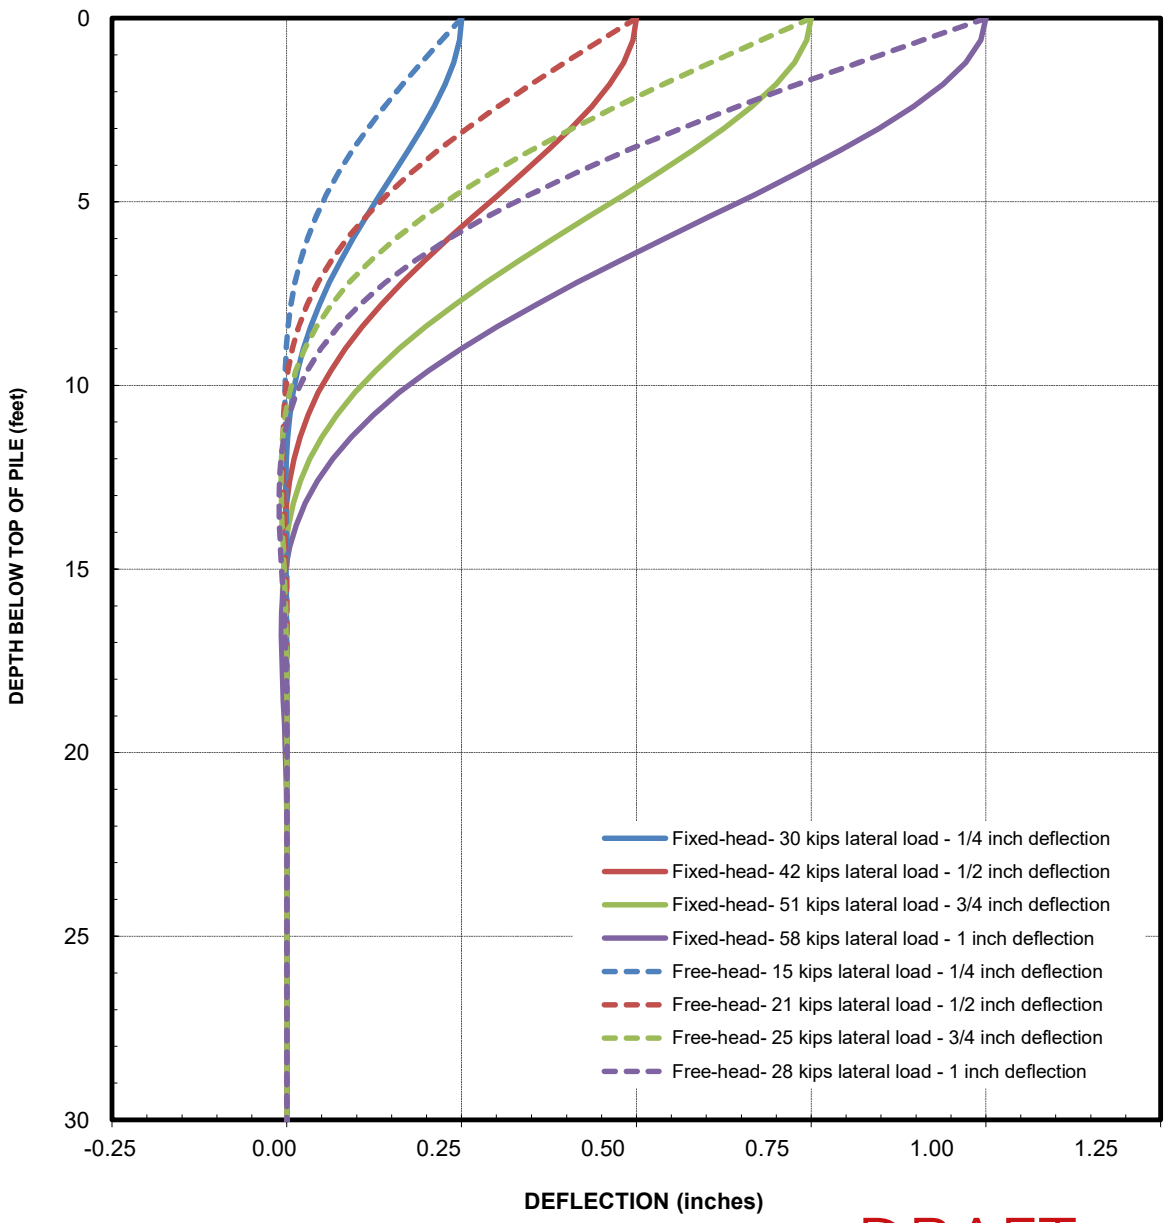
Notes:

1. For a single 18-inch and 24-inch-diameter augered cast-in-place (ACIP) pile.
2. Embedment length of 0 feet correponds to bottom of pile cap, which is assumed to be at a depth of 3 feet below the planned bottom of excavation of the service yard. The planned top of pile is at approximately Elevation 163 feet.
3. To estimate allowable capacities, a factor of safety (FS) of 2.0 should be used for dead plus live loads and 1.5 for temporary loads that include wind and/or seismic. Capacity to be confirmed by load tests in accordance with ASTM D1143.
4. A FS of 2.0 should be applied for permanent uplift and 1.5 for temporary uplift. Capacity to be confirmed by load tests in accordance with ASTM D3689.
5. Capacities are based on the ultimate strength of the supporting soil; the structural capacity of the pile may govern.
6. Piles should be spaced no closer than three diameters center-to-center.
7. Capacities are based on ultimate skin friction and neglect end bearing.

DRAFT

LANGAN Langan Engineering and Environmental Services, Inc. 1 Almaden Boulevard, Suite 590 San Jose, California 95113 T: 408.283.3600 F: 408.283.3601 www.langan.com	Project KAISER PERMANENTE SAN JOSE REPLACEMENT HOSPITAL SAN JOSE SANTA CLARA COUNTY CALIFORNIA	Figure Title ULTIMATE VERTICAL COMPRESSIVE CAPACITY OF AUGERED CAST-IN-PLACE PILE FOR SERVICE YARD TANKS	Project No. 750677301 Date 4/19/2023 Scale AS SHOWN Prepared By: KM	Figure No. 11



DRAFT

Notes:

1. The profiles shown are for a single augered cast-in-place pile, at least 60 feet long, with 185 kip axial load applied to top of pile.
2. If piles are spaced closer than six pile diameters, center to center, the lateral capacity should be reduced (see Table 15).
3. The lateral capacity of the piles is based on the soil strength and does not limit based on capacity of the pile. The actual bending moment capacity of the pile should be checked and should be confirmed by the selected design-build contractor.
4. Assumes concrete has a minimum compressive strength (f'c) of 5,000 psi, modulus of elasticity (E) of 4,000,000 psi, and the moment of inertia (I) of 2,500 in4 (assumes a 50% cracked section).
5. Passive resistance of pile caps has not been included.

2. If piles are spaced closer than six pile diameters, center to center, the lateral capacity should be reduced (see Table 15).
3. The lateral capacity of the piles is based on the soil strength and does not limit based on capacity of the pile. The actual bending moment capacity of the pile should be checked and should be confirmed by the selected design-build contractor.
4. Assumes concrete has a minimum compressive strength (f'c) of 5,000 psi, modulus of elasticity (E) of 4,000,000 psi, and the moment of inertia (I) of 2,500 in4 (assumes a 50% cracked section).
5. Passive resistance of pile caps has not been included.

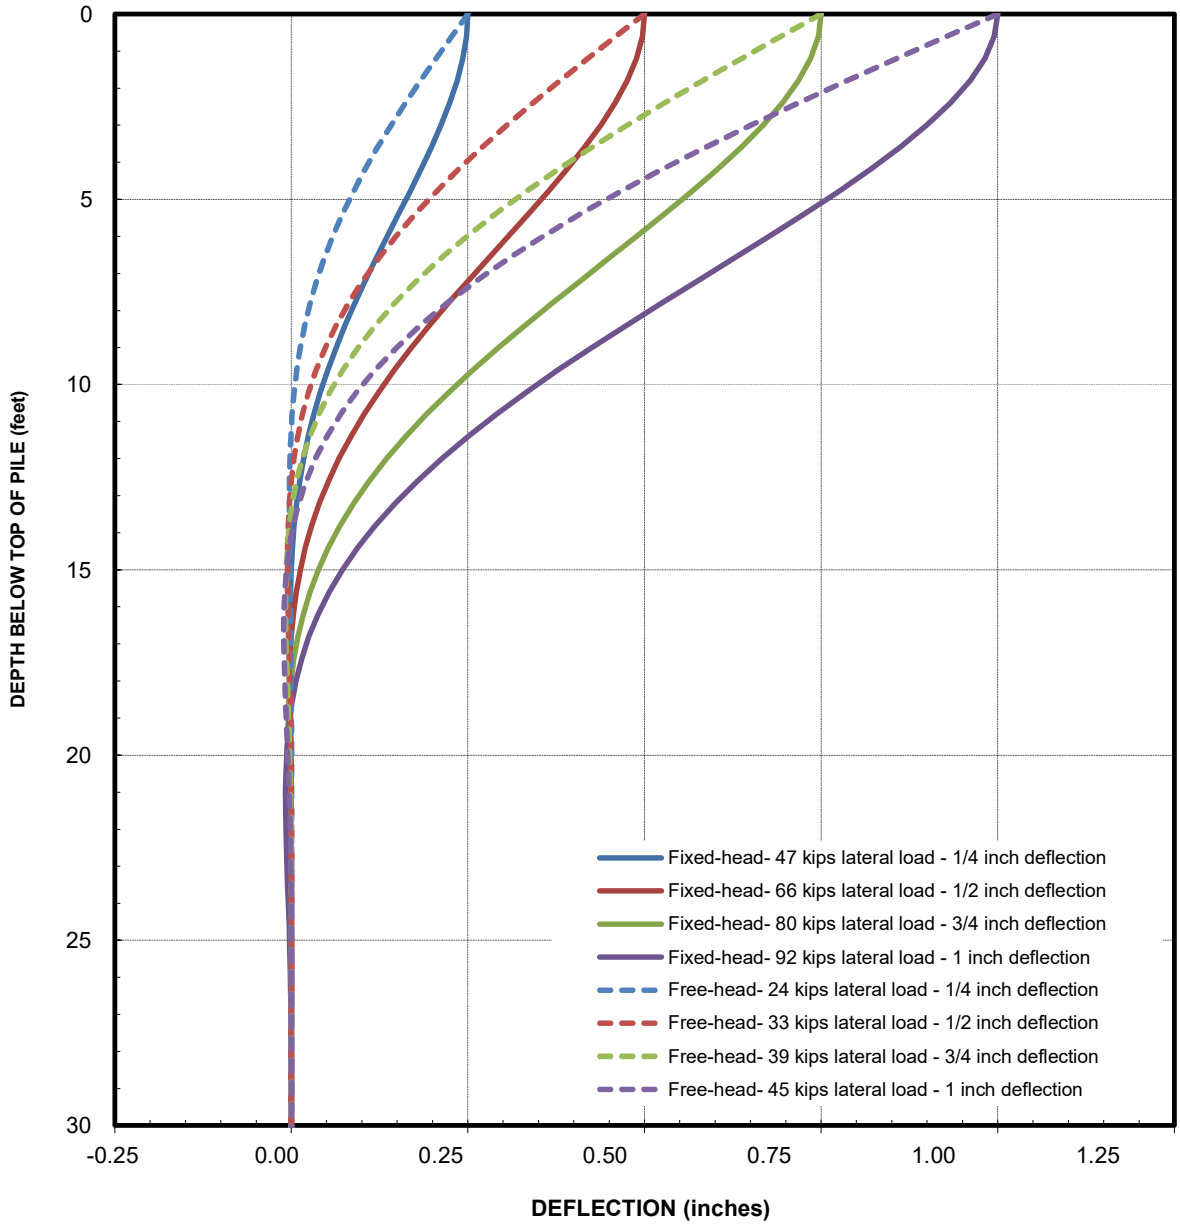
		Prepared By: KM	



DRAFT

Notes:

1. The profiles shown are for a single augered cast-in-place pile, at least 60 feet long, with 185 kip axial load applied to top of pile.
2. If piles are spaced closer than six pile diameters, center to center, the lateral capacity should be reduced (see Table 15).
3. The lateral capacity of the piles is based on the soil strength and does not limit based on capacity of the pile. The actual bending moment capacity of the pile should be checked and should be confirmed by the selected design-build contractor.
4. Assumes concrete has a minimum compressive strength (f'c) of 5,000 psi, modulus of elasticity (E) of 4,000,000 psi, and the moment of inertia (I) of 2,500 in4 (assumes a 50% cracked section).
5. Passive resistance of pile caps has not been included.

Project	Figure Title	Project No.	Figure No.
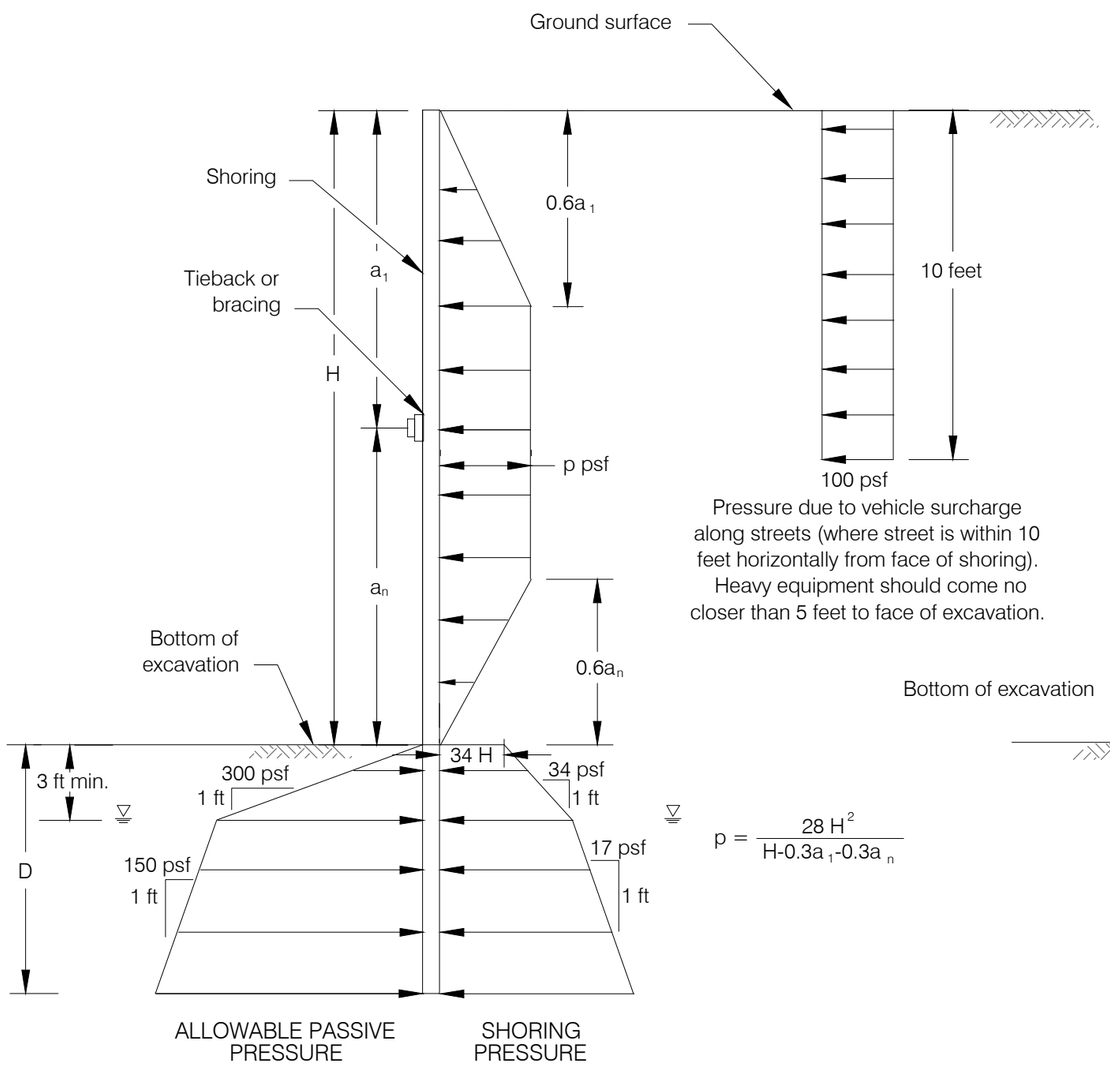
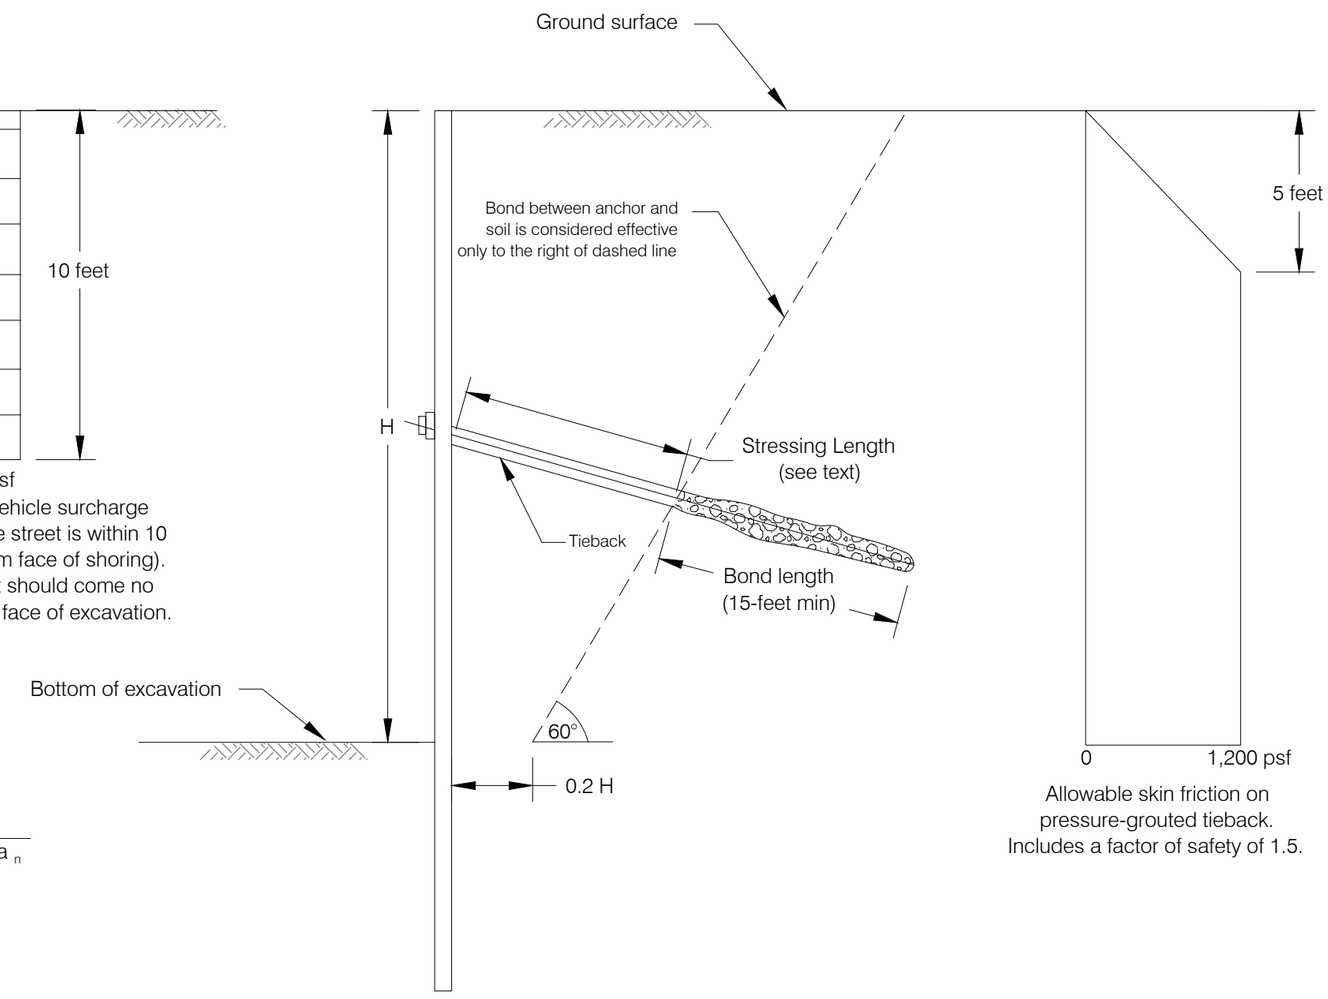
KAISER PERMANENTE SAN JOSE REPLACEMENT HOSPITAL SAN JOSE SANTA CLARA COUNTY CALIFORNIA	BENDING MOMENT PROFILES FOR 24-INCH-DIAMETER AUGERED CAST-IN-PLACE PILE FOR SERVICE YARD TANKS	750677301 Date 4/19/2023 Scale AS SHOWN Prepared By: KM	15



Pressure due to vehicle surcharge along streets (where street is within 10 feet horizontally from face of shoring). Heavy equipment should come no closer than 5 feet to face of excavation.

$$p = \frac{28\,H^2}{H-0.3a_1-0.3a_n}$$



Allowable skin friction on pressure-grouted tieback. Includes a factor of safety of 1.5.

NOT TO SCALE

Notes and assumptions:

1. The groundwater table is drawn down to at least 3 feet below excavation level.
2. Passive pressure includes a factor of safety of about 1.5.
3. The passive pressure should be assumed to act over three diameters or the spacing of the soldier piles, whichever is less.
4. The embedment, D, of the shoring should be determined by the shoring designer, but not be less than 10 feet.
5. a_1 and a_n and H are in feet; psf = pounds per square foot; pcf = pounds per cubic foot.
6. Surcharge pressure from construction equipment, if any, should be added to the above shoring pressures.
7. The recommended pressures do not include surcharges from adjacent structures. Surcharge pressures from adjacent structures should be added to above shoring pressures, where adjacent structures are within a 1:1 (horizontal:vertical) plane projected up from the bottom of the excavation.

DRAFT

Boring terminated at a depth of 101.5 feet below ground surface (bgs).
Boring backfilled with cement grout.
Groundwater encountered at approximately 29 feet bgs at 9:46 AM on 1/9/23.
PP = Pocket Penetrometer.

[1] S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.6 and 1.0, respectively to account for sampler type and hammer energy.
[2] Elevations based on National Geodetic Vertical Datum of 1929 (NGVD29) per "Supplemental Utility and Tree Survey" prepared by SANDIS dated 28 October 2022.

DRAFT

Boring terminated at a depth of 101.5 feet below ground surface (bgs).
Boring backfilled with cement grout.
Groundwater encountered at approximately 27 feet bgs at 8:50 AM on 1/12/23.
PP = Pocket Penetrometer.

[1] S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.6 and 1.0, respectively to account for sampler type and hammer energy.
[2] Elevations based on National Geodetic Vertical Datum of 1929 (NGVD29) per "Supplemental Utility and Tree Survey" prepared by SANDIS dated 28 October 2022.

DRAFT

Boring terminated at a depth of 51.5 feet below ground surface (bgs).
Boring backfilled with cement grout.
Groundwater encountered at approximately 28 feet bgs at 9:00 AM and recorded at approximately 27 feet bgs at 12:09 PM on 1/18/23.

[1] S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.6 and 1.0, respectively to account for sampler type and hammer energy.
[2] Elevations based on National Geodetic Vertical Datum of 1929 (NGVD29) per "Supplemental Utility and Tree Survey" prepared by SANDIS dated 28 October 2022.

TEST GEOTECH LOG 750677301 - KAISER.GPJ TEMPLATE_CA-MODIFIED.GDT 04/13/23

UNIFIED SOIL CLASSIFICATION SYSTEM			
Major Divisions		**Symbols**	**Typical Names**
Coarse-Grained Soils (more than half of soil > no. 200 sieve size	**Gravels** (More than half of coarse fraction > no. 4 sieve size)	**GW**	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	**SW**	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	**Silts and Clays** LL = < 50	**ML**	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	**MH**	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		**PT**	Peat and other highly organic soils

GRAIN SIZE CHART		
Classification	**Range of Grain Sizes**	
	U.S. Standard Sieve Size	**Grain Size in Millimeters**
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel	3" to No. 4	76.2 to 4.76
coarse	3" to 3/4"	76.2 to 19.1
fine	3/4" to No. 4	19.1 to 4.76
Sand	No. 4 to No. 200	4.76 to 0.075
coarse	No. 4 to No. 10	4.76 to 2.00
medium	No. 10 to No. 40	2.00 to 0.420
fine	No. 40 to No. 200	0.420 to 0.075
Silt and Clay	Below No. 200	Below 0.075

Unstabilized groundwater level

Stabilized groundwater level

PP = Pocket Penetrometer

TV = Torvane

SAMPLE DESIGNATIONS/SYMBOLS

Sample taken with Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter. Darkened area indicates soil recovered

Classification sample taken with Standard Penetration Test sampler

Undisturbed sample taken with thin-walled tube

Disturbed sample

Sampling attempted with no recovery

Core sample

Analytical laboratory sample

Sample taken with Direct Push or Drive sampler

Sonic

SAMPLER TYPE

C Core barrel

CA California split-barrel sampler with 2.5-inch outside diameter and a 1.93-inch inside diameter

D&M Dames & Moore piston sampler using 2.5-inch outside diameter, thin-walled tube

O Osterberg piston sampler using 3.0-inch outside diameter, thin-walled Shelby tube

PT Pitcher tube sampler using 3.0-inch outside diameter, thin-walled Shelby tube

S&H Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter

SPT Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.38- or 1.5-inch inside diameter - see report text

ST Shelby Tube (3.0-inch outside diameter, thin-walled tube) advanced with hydraulic pressure

ABOUT THIS REPORT

The enclosed report presents the results of the site investigation program conducted by ConeTec, Inc. The program consisted of Seismic Piezocone Penetration Testing and Pore Pressure Dissipation Testing. Please note that this report, which also includes all accompanying data, are subject to the 3rd Party Disclaimer and Client Disclaimer that follow in the 'Limitations' section of this report.

Project Information	
Client	Langan Engineering
Project	Kaiser San Jose CPT
ConeTec Project Number	22-56-25216
Rig Description	30-ton Truck CPT Rig (C-15) and 20-ton Track CPT Rig (GPT2)

Coordinates	
Collection Method	Consumer Grade GPS
EPSG Number	32610 (WGS 84 / UTM 10S)

Cone Penetration Test (CPTu)	
Depth Reference	Existing ground surface at the time of the investigation
Sleeve data offset	0.1 Meters

Calculated Geotechnical Parameters Tables	
Additional Information	The Normalized Soil Behaviour Type Chart based on Q_{tn} (SBT Q_{tn}) (Robertson, 2009) was used to classify the soil for this project. A detailed set of calculated CPTu parameters have been generated and are provided in Excel format files in the release folder. The CPTu parameter calculations are based on values of corrected tip resistance (q_t) sleeve friction (f_s) and pore pressure (u_2). Effective stresses are calculated based on unit weights that have been assigned to the individual soil behaviour type zones and the assumed equilibrium pore pressure profile. Soils were classified as either drained or undrained based on the Q_{tn} Normalized Soil Behaviour Type Chart (Robertson, 2009). Calculations for both drained and undrained parameters were included for materials that classified as silt mixtures (zone 4).

Please refer to the list of attached documents following the text of this report. A test summary, location map, and plots are included. Thank you for the opportunity to work on this project.

CONE PENETRATION TEST SUMMARY

Sounding ID	File Name	Date	Cone	Cone Area (cm^2)	Assumed Phreatic Surface[1] (ft)	Final Depth (ft)	Northing[2]	Easting[2]	Elevation[3] (ft)	Refer to Notation Number
CPT-31	22-56-25216_SP31	17-Jan-2023	EC815:T1500F15U35	15	31.3	100.56	4121880	606423	192	

1. The assumed phreatic surface was based off the shallowest pore pressure dissipation tests performed within or nearest the sounding. Hydrostatic conditions were assumed for the calculated parameters.
2. The coordinates were collected using consumer grade GPS equipment. EPSG number: 32610 (WGS84 / UTM Zone 10S).
3. Elevations are referenced to the ground surface and were acquired from the Google Earth Elevation for the recorded coordinates.
4. The assumed phreatic surface is based on the pore pressure dissipation to not reach equilibrium within the sounding, and the pore pressure dissipation tests at nearby soundings.

Methodology Statements and Data File Formats

CONETEC

Cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and two geophone sensors for recording seismic signals. All signals are amplified and measured with minimum sixteen-bit resolution down hole within the cone body, and the signals are sent to the surface using a high bandwidth, error corrected digital interface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm^2 and 15 cm^2 tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table presented in the first appendix. The 15 cm^2 penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm^2 piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 millimeters diameter over a length of 32 millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u_2" position (ASTM Type 2). The filter is six millimeters thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current ASTM D5778 standard. ConeTec's calibration criteria also meets or exceeds those of the current ASTM D5778 standard. An illustration of the piezocone penetrometer is presented in Figure CPTu.

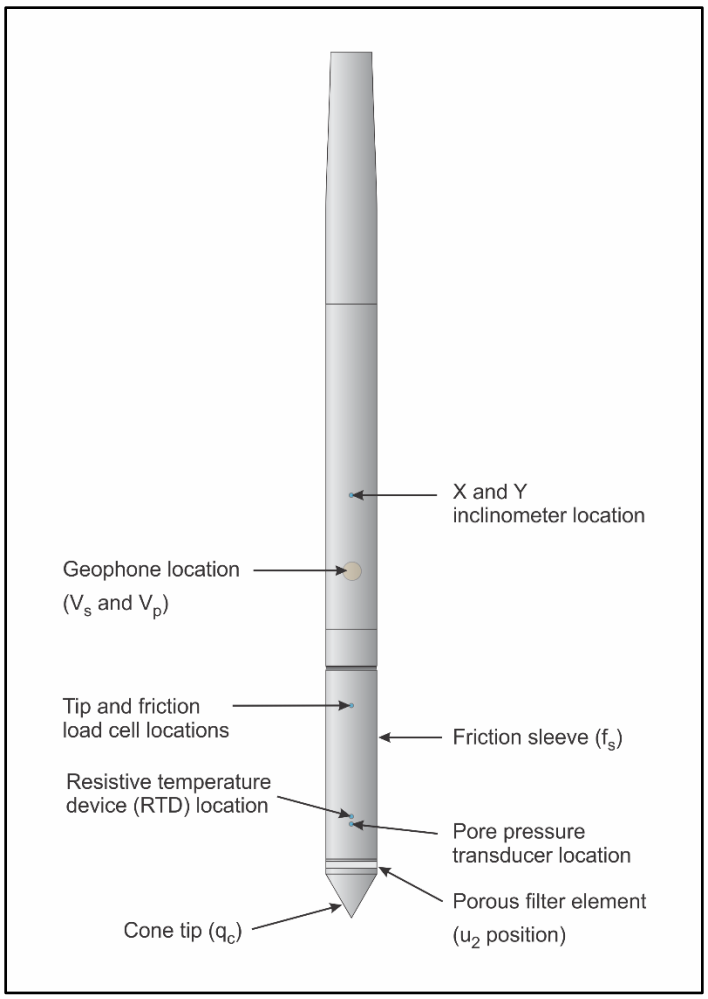

Figure CPTu. Piezocone Penetrometer (15 cm^2)

The ConeTec data acquisition systems consist of a Windows based computer and a signal interface box and power supply. The signal interface combines depth increment signals, seismic trigger signals and the downhole digital data. This combined data is then sent to the Windows based computer for collection and presentation. The data is recorded at fixed depth increments using a depth wheel attached to the push cylinders or by using a spring loaded rubber depth wheel that is held against the cone rods. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPTu operating procedures which are in general accordance with the current ASTM D5778 standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches (38.1 millimeters) are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with ASTM standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by Robertson et al. (1986) and Robertson (1990, 2009). It should be noted that it is not always possible to accurately identify a soil behavior type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in Robertson et al. (1986):

$$q_t = q_c + (1\text{-}a) \bullet u_2$$

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (R_f) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

A summary of the CPTu soundings along with test details and individual plots are provided in the appendices. A set of files with calculated geotechnical parameters were generated for each sounding based on published correlations and are provided in Excel format in the data release folder. Information regarding the methods used is also included in the data release folder.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to Robertson et al. (1986), Lunne et al. (1997), Robertson (2009), Mayne (2013, 2014) and Mayne and Peuchen (2012).

Shear wave velocity (Vs) testing is performed in conjunction with the piezocone penetration test (SCPTu) in order to collect interval velocities. For some projects seismic compression wave velocity (Vp) testing is also performed.

ConeTec's piezocone penetrometers are manufactured with one horizontally active geophone (28 hertz) and one vertically active geophone (28 hertz). Both geophones are rigidly mounted in the body of the cone penetrometer, 0.2 meters behind the cone tip. The vertically mounted geophone is more sensitive to compression waves.

Shear waves are typically generated by using an impact hammer horizontally striking a beam that is held in place by a normal load. In some instances, an auger source or an imbedded impulsive source may be used for both shear waves and compression waves. The hammer and beam act as a contact trigger that initiates the recording of the seismic wave traces. For impulsive devices an accelerometer trigger may be used. The traces are recorded in the memory of the cone using a fast analog to digital converter. The seismic trace is then transmitted digitally uphole to a Windows based computer through a signal interface box for recording and analysis. An illustration of the shear wave testing configuration is presented in Figure SCPTu-1.

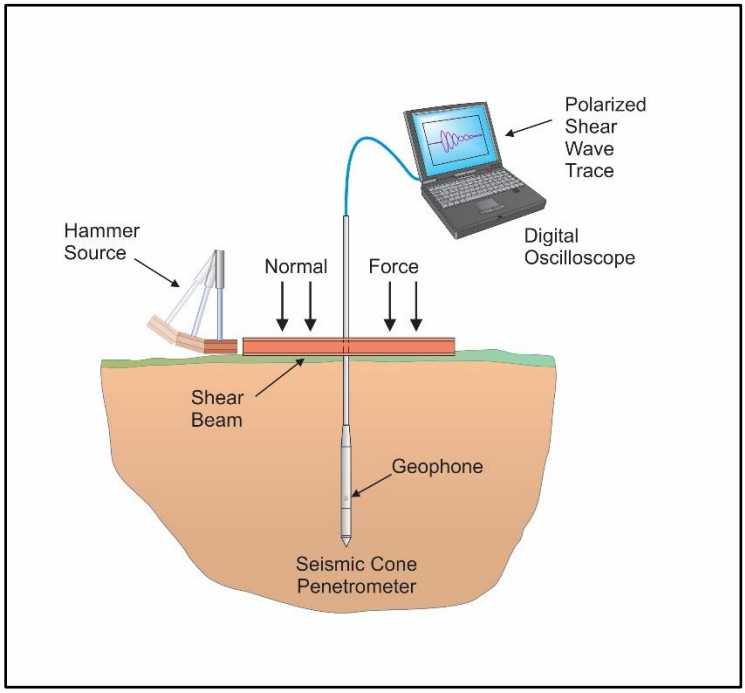

Figure SCPTu-1. Illustration of the SCPTu system

All testing is performed in accordance to ConeTec's SCPTu operating procedures which are in general accordance with the current ASTM D5778 and ASTM D7400 standards.

Prior to the start of a SCPTu sounding, the procedures described in the Cone Penetration Test section are followed. In addition, the active axis of the geophone is aligned parallel to the beam (or source) and the horizontal offset between the cone and the source is measured and recorded.

Prior to recording seismic waves at each test depth, cone penetration is stopped and the rods are decoupled from the rig to avoid transmission of rig energy down the rods. Typically, five wave traces for

each orientation are recorded for quality control and uncertainty analysis purposes. After reviewing wave traces for consistency the cone is pushed to the next test depth (typically one meter intervals or as requested by the client). Figure SCPTu-2 presents an illustration of a SCPTu test.

For additional information on seismic cone penetration testing refer to Robertson et al. (1986).

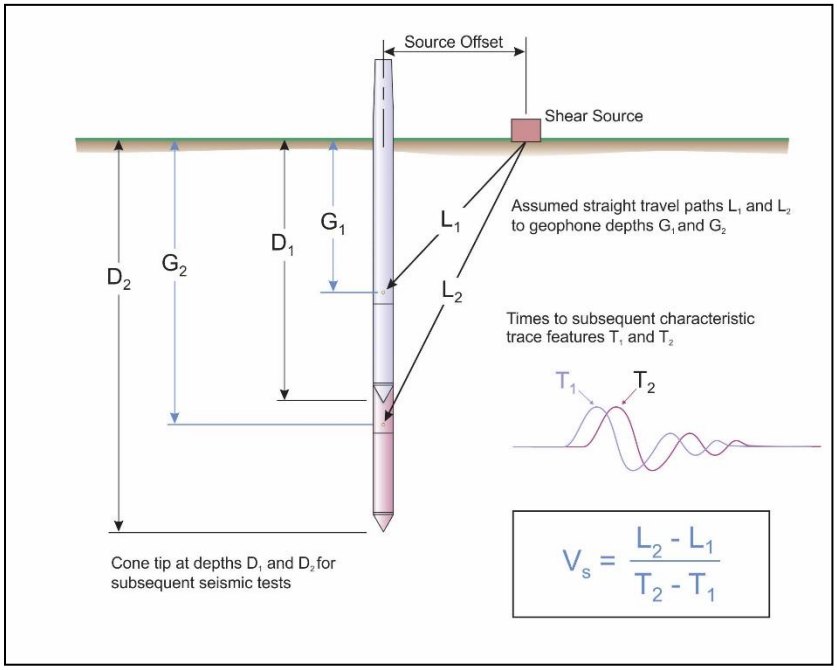

Figure SCPTu-2. Illustration of a seismic cone penetration test

Calculation of the interval velocities are performed by visually picking a common feature (e.g. the first characteristic peak, trough, or crossover) on all of the recorded wave sets and taking the difference in ray path divided by the time difference between subsequent features. Ray path is defined as the straight line distance from the seismic source to the geophone, accounting for beam offset, source depth and geophone offset from the cone tip.

For all SCPTu soundings that have achieved a depth of at least 100 feet (30 meters), the average shear wave velocity to a depth of 100 feet ($\bar{v}_s$) has been calculated and provided for all applicable soundings using the following equation presented in ASCE (2010).

$$\bar{v}_s = \frac{\sum_{i=1}^{n} d_i}{\sum_{i=1}^{n} \frac{d_i}{v_{si}}}$$

where: $\bar{v}_s$ = average shear wave velocity ft/s (m/s)
d_i = the thickness of any layer between 0 and 100 ft (30 m)
v_{si} = the shear wave velocity in ft/s (m/s)
$\sum_{i=1}^{n} d_i$ = the total thickness of all layers between 0 and 100 ft (30 m)

Average shear wave velocity, $\bar{v}_s$ is also referenced to V_{s100} or V_{s30}.

The layer travel times refers to the travel times propagating in the vertical direction, not the measured travel times from an offset source.

Tabular results and SCPTu plots are presented in the relevant appendix.

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in Figure PPD-1. For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

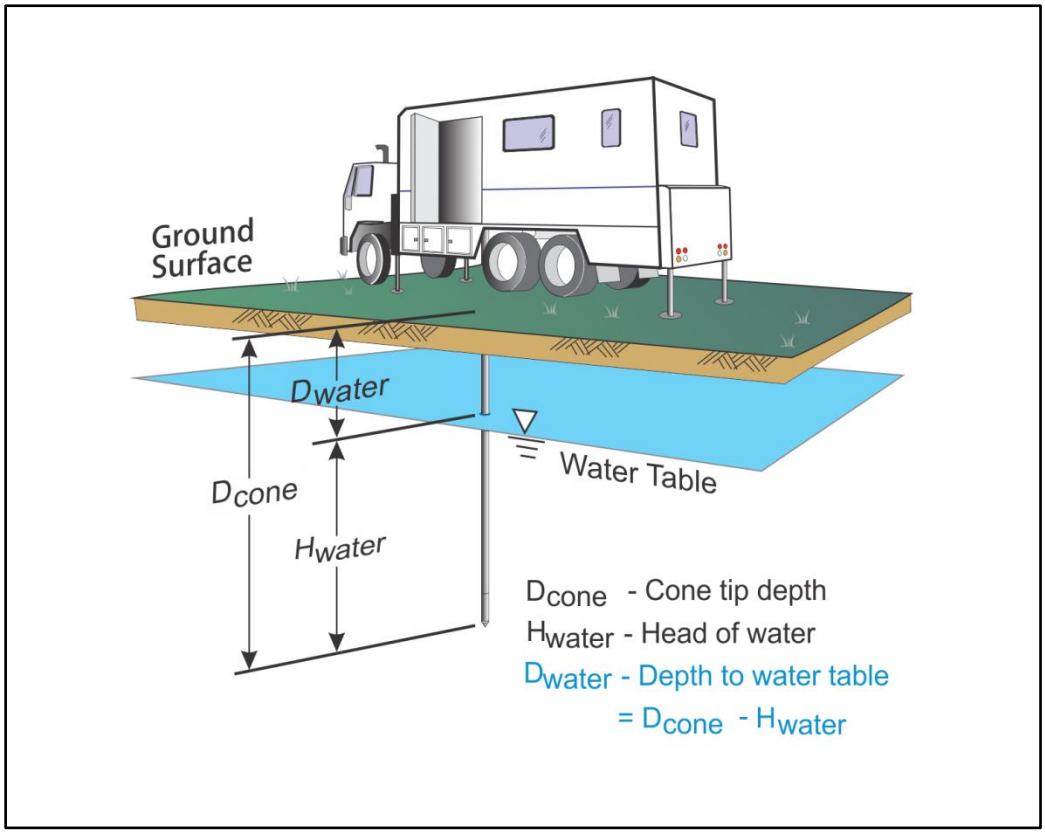

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in Figure PPD-2 are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

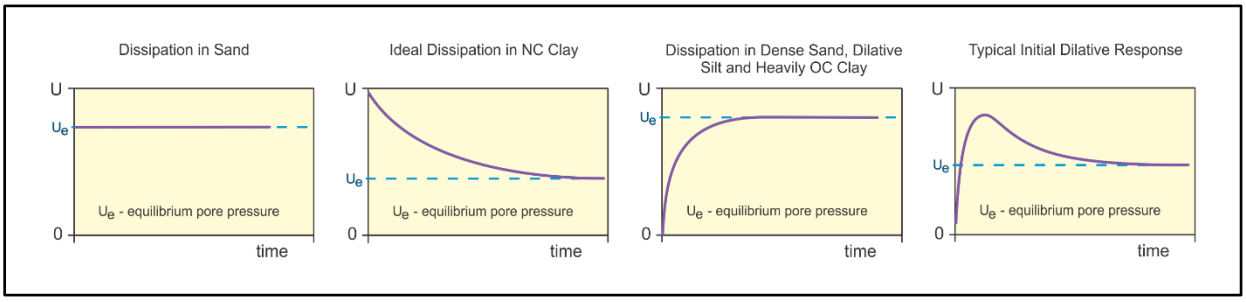

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve in Figure PPD-2.

In fine grained deposits the point at which 100% of the excess pore pressure has dissipated is known as t_{100}. In some cases this can take an excessive amount of time and it may be impractical to take the dissipation to t_{100}. A theoretical analysis of pore pressure dissipations by Teh and Houlsby (1991) showed that a single curve relating degree of dissipation versus theoretical time factor (T*) may be used to calculate the coefficient of consolidation (c_h) at various degrees of dissipation resulting in the expression for c_h shown below.

$$c_h = \frac{T^* \cdot a^2 \cdot \sqrt{I_r}}{t}$$

Where:
T* is the dimensionless time factor (Table Time Factor)
a is the radius of the cone
I_r is the rigidity index
t is the time at the degree of consolidation

Table Time Factor. T* versus degree of dissipation (Teh and Houlsby (1991))

Degree of Dissipation (%)	20	30	40	50	60	70	80
T* (u_2)	0.038	0.078	0.142	0.245	0.439	0.804	1.60

The coefficient of consolidation is typically analyzed using the time (t_{50}) corresponding to a degree of dissipation of 50% (u_{50}). In order to determine t_{50}, dissipation tests must be taken to a pressure less than u_{50}. The u_{50} value is half way between the initial maximum pore pressure and the equilibrium pore pressure value, known as u_{100}. To estimate u_{50}, both the initial maximum pore pressure and u_{100} must be known or estimated. Other degrees of dissipations may be considered, particularly for extremely long dissipations.

At any specific degree of dissipation the equilibrium pore pressure (u at t_{100}) must be estimated at the depth of interest. The equilibrium value may be determined from one or more sources such as measuring the value directly (u_{100}), estimating it from other dissipations in the same profile, estimating the phreatic surface and assuming hydrostatic conditions, from nearby soundings, from client provided information, from site observations and/or past experience, or from other site instrumentation.

For calculations of c_h (Teh and Houlsby (1991)), t_{50} values are estimated from the corresponding pore pressure dissipation curve and a rigidity index (I_r) is assumed. For curves having an initial dilatory response in which an initial rise in pore pressure occurs before reaching a peak, the relative time from the peak value is used in determining t_{50}. In cases where the time to peak is excessive, t_{50} values are not calculated.

Due to possible inherent uncertainties in estimating I_r, the equilibrium pore pressure and the effect of an initial dilatory response on calculating t_{50}, other methods should be applied to confirm the results for c_h.

Additional published methods for estimating the coefficient of consolidation from a piezocone test are described in Burns and Mayne (1998, 2002), Jones and Van Zyl (1981), Robertson et al. (1992) and Sully et al. (1999).

A summary of the pore pressure dissipation tests and dissipation plots are presented in the relevant appendix.

Description of Methods for Calculated CPT Geotechnical Parameters

CONETEC

CALCULATED CPT GEOTECHNICAL PARAMETERS

A Detailed Description of the Methods Used in ConeTec's CPT Geotechnical Parameter Calculation and Plotting Software

Revision SZW-Rev 14

Revised November 26, 2019
Prepared by Jim Greig, M.A.Sc, P.Eng (BC)

Limitations

The geotechnical parameter output was prepared specifically for the site and project named in the accompanying report subject to objectives, site conditions and criteria provided to ConeTec by the client. The output may not be relied upon by any other party or for any other site without the express written permission of ConeTec Group (ConeTec) or any of its affiliates. For this project, ConeTec has provided site investigation services, prepared factual data reporting and produced geotechnical parameter calculations consistent with current best practices. No other warranty, expressed or implied, is made.

To understand the calculations that have been performed and to be able to reproduce the calculated parameters the user is directed to the basic descriptions for the methods in this document and the detailed descriptions and their associated limitations and appropriateness in the technical references cited for each parameter.

ConeTec's Calculated CPT Geotechnical Parameters as of November 26, 2019

ConeTec's CPT parameter calculation and plotting routine provides a tabular output of geotechnical parameters based on current published CPT correlations and is subject to change to reflect the current state of practice. Due to drainage conditions and the basic assumptions and limitations of the correlations, not all geotechnical parameters provided are considered applicable for all soil types. The results are presented only as a guide for geotechnical use and should be carefully examined for consideration in any geotechnical design. Reference to current literature is strongly recommended. ConeTec does not warranty the correctness or the applicability of any of the geotechnical parameters calculated by the program and does not assume liability for any use of the results in any design or review. For verification purposes we recommend that representative hand calculations be done for any parameter that is critical for design purposes. The end user of the parameter output should also be fully aware of the techniques and the limitations of any method used by the program. The purpose of this document is to inform the user as to which methods were used and to direct the end user to the appropriate technical papers and/or publications for further reference.

The geotechnical parameter output was prepared specifically for the site and project named in the accompanying report subject to objectives, site conditions and criteria provided to ConeTec by the client. The output may not be relied upon by any other party or for any other site without the express written permission of ConeTec Group (ConeTec) or any of its affiliates.

The CPT calculations are based on values of tip resistance, sleeve friction and pore pressures considered at each data point or averaged over a user specified layer thickness (e.g. 0.20 m). Note that q_t is the tip resistance corrected for pore pressure effects and q_c is the recorded tip resistance. The corrected tip resistance (corrected using u_2 pore pressure values) is used for all of the calculations. Since all ConeTec cones have equal end area friction sleeves pore pressure corrections to sleeve friction, f_s, are not required.

The tip correction is: $q_t = q_c + (1-a) \bullet u_2$ (consistent units are implied)

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the cone (typically 0.80 for ConeTec cones)

The total stress calculations are based on soil unit weight values that have been assigned to the Soil Behavior Type (SBT) zones, from a user defined unit weight profile, by using a single uniform value throughout the profile, through unit weight estimation techniques described in various technical papers or from a combination of these methods. The parameter output files indicate the method(s) used.

Effective vertical overburden stresses are calculated based on a hydrostatic distribution of equilibrium pore pressures below the water table or from a user defined equilibrium pore pressure profile (typically obtained from CPT dissipation tests) or a combination of the two. For over water projects the stress effects of the column of water above the mudline have been taken into account as has the appropriate unit weight of water. How this is done depends on where the instruments were zeroed (i.e. on deck or at the mudline). The parameter output files indicate the method(s) used.

A majority of parameter calculations are derived or driven by results based on material types as determined by the various soil behavior type charts depicted in Figures 1 through 5. The parameter output files indicate the method(s) used.

The Soil Behavior Type classification chart shown in Figure 1 is the classic non-normalized SBT Chart developed at the University of British Columbia and reported in Robertson, Campanella, Gillespie and Greig (1986). Figure 2 shows the original normalized (linear method) SBT chart developed by Robertson (1990). The Bq classification charts shown in Figures 3a and 3b incorporate pore pressures into the SBT classification and are based on the methods described in Robertson (1990). Many of these charts have been summarized in Lunne, Robertson and Powell (1997). The

Jefferies and Davies SBT chart shown in Figure 3c is based on the techniques discussed in Jefferies and Davies (1993) which introduced the concept of the Soil Behavior Type Index parameter, I_c. Please note that the I_c parameter developed by Robertson and Fear (1995) and Robertson and Wride (1998) is similar in concept but uses a slightly different calculation method than that used by Jefferies and Davies (1993) as the latter incorporates pore pressure in their technique through the use of the Bq parameter. The normalized Qtn SBT chart shown in Figure 4 is based on the work by Robertson (2009) utilizing a variable stress ratio exponent, n, for normalization based on a slightly modified redefinition and iterative approach for I_c. The boundary curves drawn on the chart are based on the work described in Robertson (2010).

Figure 5 shows a revised behavior based chart by Robertson (2016) depicting contractive-dilative zones. As the zones represent material behavior rather than soil gradation ConeTec has chosen a set of zone colors that are less likely to be confused with material type colors from previous SBT charts. These colors differ from those used by Dr. Robertson.

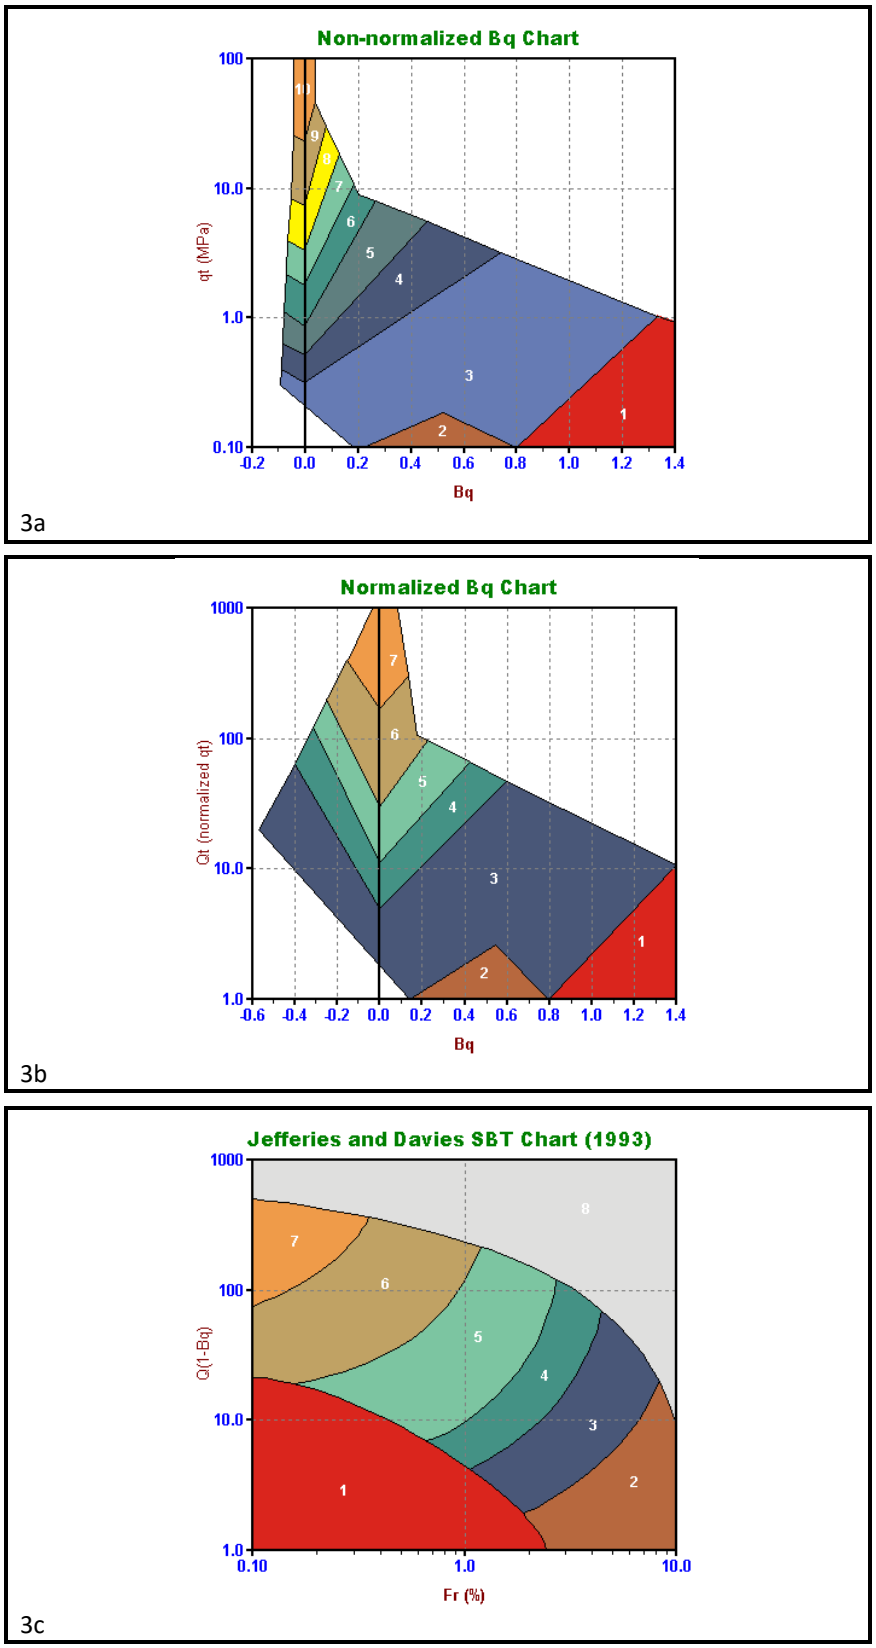

Figure 3. Alternate Soil Behavior Type Charts

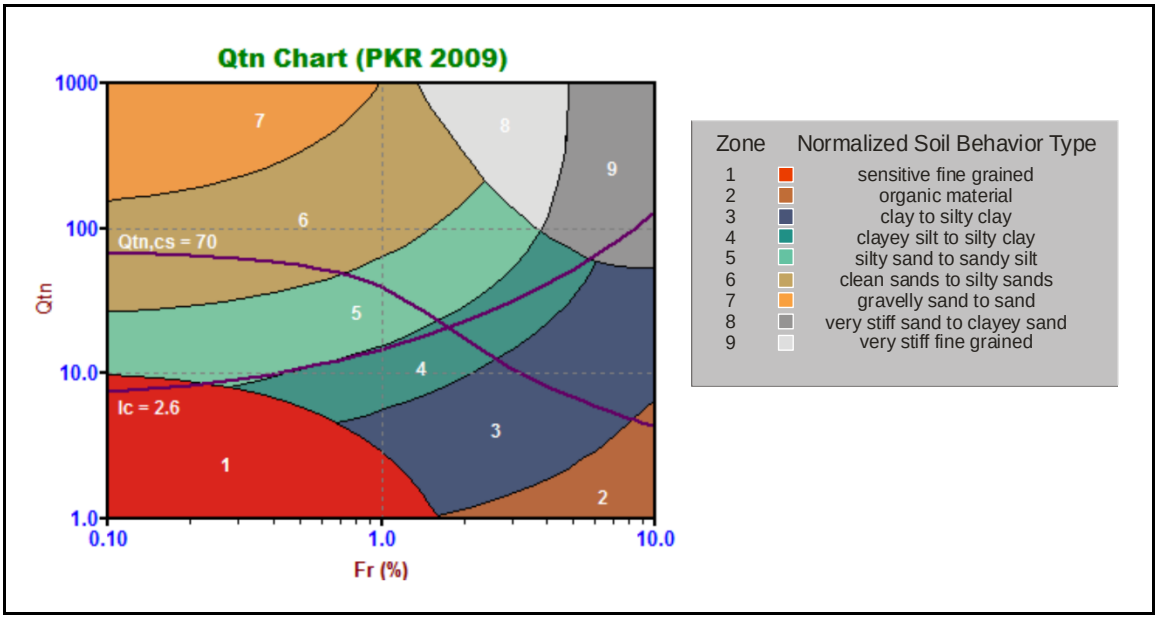

Figure 4. Normalized Soil Behavior Type Chart using Q_{tn} (SBT Qtn)

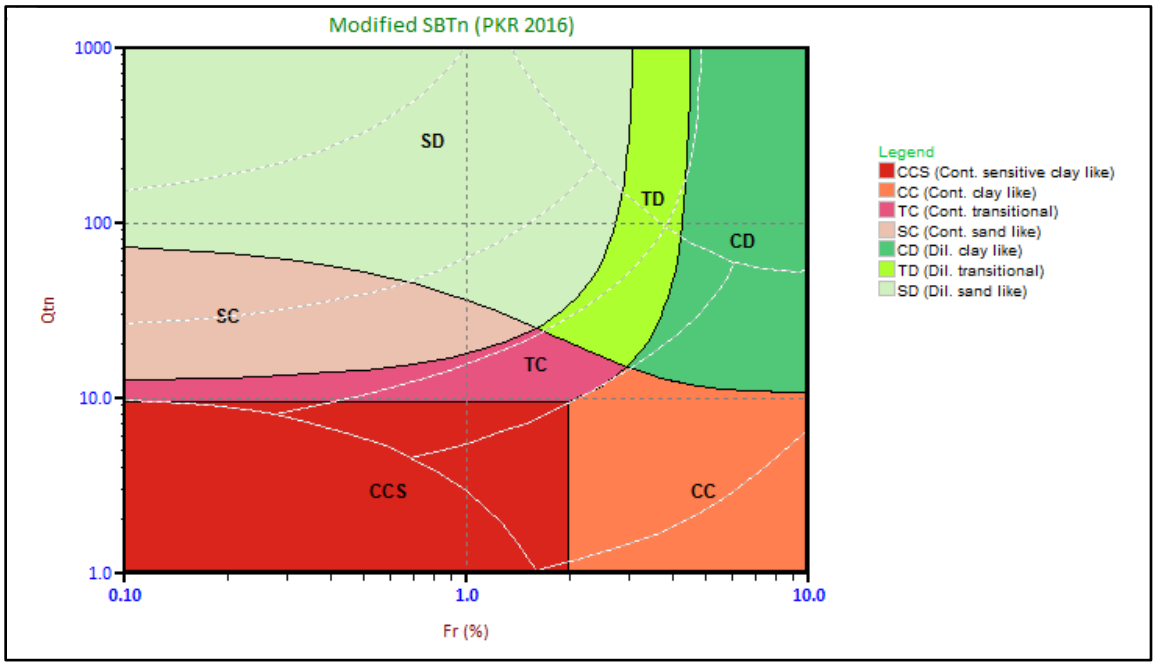

Figure 5. Modified SBTn Behavior Based Chart

Details regarding the geotechnical parameter calculations are provided in Tables 1a and 1b. The appropriate references cited are listed in Table 2. Non-liquefaction specific parameters are detailed in Table 1a and liquefaction specific parameters are detailed in Table 1b.

Where methods are based on charts or techniques that are too complex to describe in this summary the user should refer to the cited material. Specific limitations for each method are described in the cited material.

Where the results of a calculation/correlation are deemed *'invalid'* the value will be represented by the text strings "-9999", "-9999.0", the value 0.0 (Zero) or an empty cell. Invalid results will occur because of (and not limited to) one or a combination of:

1. Invalid or undefined CPT data (e.g. drilled out section or data gap).

2. Where the calculation method is inappropriate, for example, drained parameters in a material behaving as an undrained material (and vice versa).

3. Where input values are beyond the range of the referenced charts or specified limitations of the correlation method.

4. Where pre-requisite or intermediate parameter calculations are invalid.

The parameters selected for output from the program are often specific to a particular project. As such, not all of the calculated parameters listed in Table 1 may be included in the output files delivered with this report.

The output files are typically provided in Microsoft Excel XLS or XLSX format. The ConeTec software has several options for output depending on the number or types of calculated parameters desired or requested by the client. Each output file is named using the original COR file base name followed by a three or four letter indicator of the output set selected (e.g. BSC, TBL, NLI, NL2, IFI, IFI2) and possibly followed by an operator selected suffix identifying the characteristics of the particular calculation run.

Table 1a. CPT Parameter Calculation Methods – Non liquefaction Parameters

Calculated Parameter	Description	Equation	Ref
Depth	Mid Layer Depth *(where calculations are done at each point then Mid Layer Depth = Recorded Depth)*	*[Depth (Layer Top) + Depth (Layer Bottom)]/ 2.0*	CK*
Elevation	Elevation of Mid Layer based on sounding collar elevation supplied by client or through site survey	Elevation = Collar Elevation - Depth	CK*
Avg qc	Averaged recorded tip value (q_c)	$Avgqc = \frac{1}{n}\sum_{i=1}^{n} q_c$ *n=1 when calculations are done at each point*	CK*
Avg qt	Averaged corrected tip (q_t) where: $q_t = q_c + (1-a) \bullet u_2$	$Avgqt = \frac{1}{n}\sum_{i=1}^{n} q_t$ *n=1 when calculations are done at each point*	1
Avg fs	Averaged sleeve friction (f_s)	$Avgfs = \frac{1}{n}\sum_{i=1}^{n} fs$ *n=1 when calculations are done at each point*	CK*
Avg Rf	Averaged friction ratio (R_f) where friction ratio is defined as: $Rf = 100\% \bullet \frac{fs}{q_t}$	$AvgRf = 100\% \cdot \frac{Avgfs}{Avgqt}$ *n=1 when calculations are done at each point*	CK*
Avg u	Averaged dynamic pore pressure *(u)*	$Avgu = \frac{1}{n}\sum_{i=1}^{n} u_i$ *n=1 when calculations are done at each point*	CK*

Calculated Parameter	Description	Equation	Ref
Avg Res	Averaged Resistivity (this data is not always available since it is a specialized test requiring an additional module)	$AvgRes = \frac{1}{n}\sum_{i=1}^{n} Resistivity_i$ *n=1 when calculations are done at each point*	CK*
Avg UVIF	Averaged UVIF ultra-violet induced fluorescence (this data is not always available since it is a specialized test requiring an additional module)	$AvgUVIF = \frac{1}{n}\sum_{i=1}^{n} UVIF_i$ *n=1 when calculations are done at each point*	CK*
Avg Temp	Averaged Temperature (this data is not always available since it requires specialized calibrations)	$AvgTemp = \frac{1}{n}\sum_{i=1}^{n} Temperature_i$ *n=1 when calculations are done at each point*	CK*
Avg Gamma	Averaged Gamma Counts (this data is not always available since it is a specialized test requiring an additional module)	$AvgGamma = \frac{1}{n}\sum_{i=1}^{n} Gamma_i$ *n=1 when calculations are done at each point*	CK*
SBT	Soil Behavior Type as defined by Robertson et al 1986 (often referred to as Robertson and Campanella, 1986)	See Figure 1	1, 5
SBTn	Normalized Soil Behavior Type as defined by Robertson 1990 (linear normalization)	See Figure 2	2, 5
SBT-Bq	Non-normalized Soil Behavior type based on the Bq parameter	See Figure 3	1, 2, 5
SBT-Bqn	Normalized Soil Behavior based on the Bq parameter	See Figure 3	2, 5
SBT-JandD	Soil Behavior Type as defined by Jeffries and Davies	See Figure 3	7
SBT Qtn	Soil Behavior Type as defined by Robertson (2009) using a variable stress ratio exponent for normalization based on I_c	See Figure 4	15
Modified SBTn (contractive /dilative)	Modified SBTn chart as defined by Robertson (2016) indicating zones of contractive/dilative behavior.	See Figure 5	30
Unit Wt.	Unit Weight of soil determined from one of the following user selectable options: 1) uniform value 2) value assigned to each SBT zone 3) value assigned to each SBTn zone 4) value assigned to SBTn zone as determined from Robertson and Wride (1998) based on q_{c1n} 5) values assigned to SBT Qtn zones 6) Mayne fs (sleeve friction) method 7) Robertson 2010 method 8) user supplied unit weight profile The last option may co-exist with any of the other options	See references	3, 5, 15, 21, 24, 29

Calculated Parameter	Description	Equation	Ref
TStress σ_v	Total vertical overburden stress at Mid Layer Depth *A layer is defined as the averaging interval specified by the user where depths are reported at their respective mid-layer depth.* *For data calculated at each point layers are defined using the recorded depth as the mid-point of the layer. Thus, a layer starts half-way between the previous depth and the current depth unless this is the first point in which case the layer start is at zero depth. The layer bottom is half-way from the current depth to the next depth unless it is the last data point.* *Defining layers affects how stresses are calculated since the unit weight attributed to a data point is used throughout the entire layer. This means that to calculate the stresses the total stress at the top and bottom of a layer are required. The stress at mid layer is determined by adding the incremental stress from the layer top to the mid-layer depth. The stress at the layer bottom becomes the stress at the top of the subsequent layer. Stresses are NOT calculated from mid-point to mid-point.* *For over-water work the total stress due to the column of water above the mud line is taken into account where appropriate.*	$TStress = \sum_{i=1}^{n} \gamma_i h_i$ *where* γ_i is layer unit weight h_i is layer thickness	CK*
EStress σ_v'	Effective vertical overburden stress at mid-layer depth	$\sigma_v' = \sigma_v - u_{eq}$	CK*
Equil u u_{eq} or u_0	Equilibrium pore pressure determined from one of the following user selectable options: 1) hydrostatic below water table 2) user supplied profile 3) combination of those above When a user supplied profile is used/provided a linear interpolation is performed between equilibrium pore pressures defined at specific depths. If the profile values start below the water table then a linear transition from zero pressure at the water table to the first defined pointed is used. Equilibrium pore pressures may come from dissipation tests, adjacent piezometers or other sources. Occasionally, an extra equilibrium point ("assumed value") will be provided in the profile that does not come from a recorded value to smooth out any abrupt changes or to deal with material interfaces. These "assumed" values will be indicated on our plots and in tabular summaries.	For hydrostatic option: $u_{eq} = \gamma_w \cdot (D - D_{wt})$ where u_{eq} is equilibrium pore pressure γ_w is unit weight of water D is the current depth D_{wt} is the depth to the water table	CK*
K_0	Coefficient of earth pressure at rest, K_0	$K_0 = (1 - \sin\Phi') OCR^{\sin\Phi'}$	17
C_n	Overburden stress correction factor used for $(N_1)_{60}$ and older CPT parameters	$C_n = (P_a/\sigma_v')^{0.5}$ where $0.0 < C_n < 2.0$ *(user adjustable, typically 1.7)* P_a *is atmospheric pressure (100 kPa)*	12
C_q	Overburden stress normalizing factor	$C_q = 1.8 / (0.8 + (\sigma_v'/P_a))$ where $0.0 < C_q < 2.0$ *(user adjustable)* P_a *is atmospheric pressure (100 kPa)*	3, 12

Calculated Parameter	Description	Equation	Ref
N_{60}	SPT N value at 60% energy calculated from q_t/N ratios assigned to each SBT zone. This method has abrupt N value changes at zone boundaries.	*See Figure 1*	5
(N1)60	SPT N_{60} value corrected for overburden pressure	$(N_1)_{60} = C_n \bullet N_{60}$	4
N60Ic	SPT N_{60} values based on the I_c parameter [as defined by Roberston and Wride 1998 (5), or by Robertson 2009 (15)].	$(q_t/P_a)/ N_{60} = 8.5 (1 – I_c/4.6)$ $(q_t/P_a)/ N_{60} = 10^{(1.1268 – 0.2817Ic)}$ Pa being atmospheric pressure	5 15, 31
(N1)60Ic	SPT N_{60} value corrected for overburden pressure (using N_{60} I_c). User has 3 options.	1) $(N_1)_{60}Ic = C_n \bullet (N_{60} I_c)$ 2) $q_{c1n}/ (N_1)_{60}I_c = 8.5 (1 – I_c/4.6)$ 3) $(Q_{tn})/ (N_1)_{60}I_c = 10^{(1.1268 – 0.2817Ic)}$	4 5 15, 31
Su or Su (Nkt)	Undrained shear strength based on q_t S_u factor N_{kt} is user selectable	$Su = \frac{qt - \sigma_v}{N_{kt}}$	1, 5
Su or Su (Ndu)	Undrained shear strength based on pore pressure S_u factor $N_{\Delta u}$ is user selectable	$Su = \frac{u_2 - u_{eq}}{N_{\Delta u}}$	1, 5
Dr	Relative Density determined from one of the following user selectable options: a) Ticino Sand b) Hokksund Sand c) Schmertmann (1978) d) Jamiolkowski (1985) - All Sands e) Jamiolkowski et al (2003) (various compressibilities, K_o)	See reference (methods a through d) Jamiolkowski et al (2003) reference	5 14
PHI ϕ	Friction Angle determined from one of the following user selectable options (methods a through d are for sands and method e is for silts and clays): a) Campanella and Robertson b) Durgunoglu and Mitchel c) Janbu d) Kulhawy and Mayne e) NTH method (clays and silts)	See appropriate reference	5 5 5 11 23
Delta U/qt	Differential pore pressure ratio (older parameter used before B_q was established)	$= \frac{\Delta u}{qt}$ *where:* $\Delta u = u - u_{eq}$ *and* u = dynamic pore pressure u_{eq} = equilibrium pore pressure	CK*
Bq	Pore pressure parameter	$Bq = \frac{\Delta u}{qt - \sigma_v}$ where : $\Delta u = u - u_{eq}$ *and* u = dynamic pore pressure u_{eq} = equilibrium pore pressure	1, 2, 5
Net qt or qtNet	Net tip resistance (used in many subsequent correlations)	$qt - \sigma_v$	CK*
qe	Effective tip resistance (using the dynamic pore pressure u_2 and not equilibrium pore pressure)	$qt - u_2$	CK*

Calculated Parameter	Description	Equation	Ref
qeNorm	Normalized effective tip resistance	$\frac{qt-u_2}{\sigma_v}$	CK*
Q_t or Norm: Qt	Normalized q_t for Soil Behavior Type classification as defined by Robertson (1990) using a linear stress normalization. Note this is different from Q_{tn}.	$Qt=\frac{qt-\sigma_v}{\sigma_v}$	2, 5
F_r or Norm: Fr	Normalized Friction Ratio for Soil Behavior Type classification as defined by Robertson (1990)	$Fr=100\%\cdot\frac{fs}{qt-\sigma_v}$	2, 5
Q(1-Bq)	Q(1-Bq) grouping as suggested by Jefferies and Davies for their classification chart and the establishment of their I_c parameter	$Q\cdot(1-Bq)$ *where Bq is defined as above and Q is the same as the normalized tip resistance, Q_t, defined above*	6, 7
qc1	Normalized tip resistance, q_{c1}, using a fixed stress ratio exponent, n (this method has stress units)	$q_{c1} = q_t \cdot (Pa/\sigma_v')^{0.5}$ where: Pa = atmospheric pressure	21
qc1 (0.5)	Normalized tip resistance, q_{c1}, using a fixed stress ratio exponent, n (this method is unit-less)	$q_{c1}\ (0.5)= (q_t/P_a) \cdot (Pa/\sigma_v')^{0.5}$ where: Pa = atmospheric pressure	5
qc1 (Cn)	Normalized tip resistance, q_{c1}, based on C_n (this method has stress units)	$q_{c1}(Cn) = C_n * q_t$	5, 12
qc1 (Cq)	Normalized tip resistance, q_{c1}, based on C_q (this method has stress units)	$q_{c1}\ (Cq)= C_q * q_t$ (some papers use q_c)	5, 12
qc1n	normalized tip resistance, q_{c1n}, using a variable stress ratio exponent, n (where n=0.0, 0.70, 1.0) (this method is unit-less)	$q_{c1n} = (q_t / P_a)(P_a/\sigma_v')^n$ where: P_a = atm. Pressure and n varies as described below	3, 5
I_c or Ic (RW1998)	Soil Behavior Type Index as defined by Robertson and Fear (1995) and Robertson and Wride (1998) for estimating grain size characteristics and providing smooth gradational changes across the SBTn chart	$I_c = [(3.47 - \log_{10}Q)^2 + (\log_{10} Fr + 1.22)^2\ ]^{0.5}$ *Where:* $Q=\left(\frac{qt-\sigma_v}{P_a}\right)\left(\frac{P_a}{\sigma_v'}\right)^n$ *Or* $Q=q_{c1n}=\left(\frac{qt}{P_a}\right)\left(\frac{P_a}{\sigma_v'}\right)^n$ *depending on the iteration in determining I_c* *And* *Fr is in percent* *P_a = atmospheric pressure* *n varies between 0.5, 0.70 and 1.0 and is selected in an iterative manner based on the resulting I_c*	3, 5, 21
Ic (PKR 2009)	Soil Behavior Type Index, I_c (PKR 2009) based on a variable stress ratio exponent n, which itself is based on I_c (PKR 2009). An iterative calculation is required to determine Ic (PKR 2009) and its corresponding n (PKR 2009).	I_c (PKR 2009) = $[(3.47 - \log_{10}Q_{tn})^2 + (1.22 + \log_{10}F_r)^2]^{0.5}$	15

Calculated Parameter	Description	Equation	Ref
n (PKR 2009)	Stress ratio exponent n, based on I_c (PKR 2009). An iterative calculation is required to determine n (PKR 2009) and its corresponding Ic (PKR 2009).	*n (PKR 2009) = 0.381 (I_c) + 0.05 (σ_v'/P_a) – 0.15*	15
Qtn (PKR 2009)	Normalized tip resistance using a variable stress ratio exponent based on I_c (PKR 2009) and n (PKR 2009). An iterative calculation is required to determine Qtn (PKR 2009).	*$Q_{tn} = [(qt - \sigma_v)/P_a](P_a/\sigma_v')^n$* *where P_a = atmospheric pressure (100 kPa)* *n = stress ratio exponent described above*	15
FC	Apparent fines content (%)	*$FC=1.75(Ic^{3.25}) - 3.7$* *$FC=100$ for $I_c > 3.5$* *$FC=0$ for $I_c < 1.26$* *FC = 5% if $1.64 < I_c < 2.6$ AND $F_r<0.5$*	3
I_c Zone	This parameter is the Soil Behavior Type zone based on the I_c parameter (valid for zones 2 through 7 on SBTn or SBT Qtn charts)	$I_c < 1.31$ Zone = 7 $1.31 < I_c < 2.05$ Zone = 6 $2.05 < I_c < 2.60$ Zone = 5 $2.60 < I_c < 2.95$ Zone = 4 $2.95 < I_c < 3.60$ Zone = 3 $I_c > 3.60$ Zone = 2	3
State Param or State Parameter or ψ	The state parameter index, ψ, is defined as the difference between the current void ratio, e, and the critical void ratio, e_c. Positive ψ - contractive soil Negative ψ - dilative soil This is based on the work by Been and Jefferies (1985) and Plewes, Davies and Jefferies (1992) - vertical effective stress is used rather than a mean normal stress	See reference	6, 8
Yield Stress σ_p'	Yield stress is calculated using the following methods a) General method b) 1st order approximation using q_tNet (clays) c) 1st order approximation using Δu_2 (clays) d) 1st order approximation using q_e (clays)	All stresses in kPa a) *$\sigma_p' = 0.33\cdot(q_t - \sigma_v)^{m'} (\sigma_{atm}/100)^{1-m'}$* where $m' = 1 - \frac{0.28}{1+(I_c/2.65)^{25}}$ b) *$\sigma_p' = 0.33\cdot(q_t - \sigma_v)$* c) *$\sigma_p' = 0.54\cdot(\Delta u_2)$* $\Delta u_2 = u_2 - u_0$ d) *$\sigma_p' = 0.60\cdot(q_t - u_2)$*	19 20 20 20
OCR OCR(JS1978) OCR(Mayne2014) OCR (qtNet) OCR (deltaU) OCR (qe) OCR (Vs) OCR (PKR2015)	Over Consolidation Ratio based on a) Schmertmann (1978) method involving a plot plot of S_u/σ_v' /($S_u/\sigma_v')_{NC}$ and OCR b) based on Yield stresses described above c) approximate version based on qtNet d) approximate version based on Δu e) approximate version based on effective tip, q_e f) approximate version based on shear wave velocity, V_s g) based on Qt	 a) requires a user defined value for NC Su/P_c' ratio b through f) *based on yield stresses* g) OCR = *$0.25\cdot(Qt)^{1.25}$*	 9 19 20 20 20 18 32

Calculated Parameter	Description	Equation	Ref
Es/qt	Intermediate parameter for calculating Young's Modulus, E, in sands. It is the Y axis of the reference chart.	Based on Figure 5.59 in the reference	5
Es Young's Modulus E	Young's Modulus based on the work done in Italy. There are three types of sands considered in this technique. The user selects the appropriate type for the site from: a) OC Sands b) Aged NC Sands c) Recent NC Sands Each sand type has a family of curves that depend on mean normal stress. The program calculates mean normal stress and linearly interpolates between the two extremes provided in the E_s/q_t chart. Es is evaluated for an axial strain of 0.1%.	Mean normal stress is evaluated from: $\sigma'_m = \frac{1}{3}\left(\sigma'_v + \sigma'_h + \sigma'_h\right)^3$ where σ_v'= vertical effective stress σ_h'= horizontal effective stress *and* $\sigma_h = K_o \bullet \sigma_v'$ with K_o assumed to be 0.5	5
Delta U/TStress	Differential pore pressure ratio with respect to total stress	$= \frac{\Delta u}{\sigma_v}$ *where:* $\Delta u = u - u_{eq}$	CK*
Delta U/Estress, P Value, Excess Pore Pressure Ratio	Differential pore pressure ratio with respect to effective stress. Key parameter (P, Normalized Pore Pressure Parameter, Excess Pore Pressure Ratio) in the Winckler et. al. static liquefaction method.	$= \frac{\Delta u}{\sigma'_v}$ *where:* $\Delta u = u - u_{eq}$	25, 25a, CK*
Su/EStress	Undrained shear strength ratio with respect to vertical effective overburden stress using the S_u (N_{kt}) method	$= Su\ (N_{kt}) / \sigma_v'$	CK*
Gmax	G_{max} determined from SCPT shear wave velocities (not estimated values)	$G_{max} = \rho V_s^2$ where ρ is the mass density of the soil determined from the estimated unit weights at each test depth	27
qtNet/Gmax	Net tip resistance ratio with respect to the small strain modulus G_{max} determined from SCPT shear wave velocities (not estimated values)	$= (qt - \sigma_v) / G_{max}$ where $G_{max} = \rho V_s^2$ and ρ is the mass density of the soil determined from the estimated unit weights at each test depth	15, 28, 30

*CK – common knowledge

Table 1b. CPT Parameter Calculation Methods – Liquefaction Parameters

Calculated Parameter	Description	Equation	Ref
K_{SPT}	Equivalent clean sand factor for $(N_1)60$	$K_{SPT} = 1 + ((0.75/30) \bullet (FC - 5))$	10
K_{CPT} or K_C (RW1998)	Equivalent clean sand correction for q_{c1N}	$K_{cpt} = 1.0$ for $I_c \leq 1.64$ $K_{cpt} = f(I_c)$ for $I_c > 1.64$ (see reference) $K_c = -0.403\ I_c^4 + 5.581\ I_c^3 - 21.63 I_c^2 + 33.75\ I_c - 17.88$	3, 10
Kc (PKR 2010)	Clean sand equivalent factor to be applied to Q_{tn}	$K_c = 1.0$ for $I_c \leq 1.64$ $K_c = -0.403\ I_c^4 + 5.581\ I_c^3 - 21.63 I_c^2 + 33.75\ I_c - 17.88$ for $I_c > 1.64$	16
$(N_1)_{60cs}Ic$	Clean sand equivalent SPT $(N_1)_{60}I_c$. User has 3 options.	1) $(N_1)_{60cs}Ic = \alpha + \beta((N_1)_{60}I_c)$ 2) $(N_1)_{60cs}Ic = K_{SPT} * ((N_1)_{60}I_c)$ 3) $(q_{c1ncs})/(N_1)_{60cs}I_c = 8.5\ (1 - I_c/4.6)$ FC ≤ 5%: $\alpha = 0,\ \beta = 1.0$ FC ≥ 35% $\alpha = 5.0,\ \beta = 1.2$ 5% < FC < 35% $\alpha = exp[1.76 - (190/FC^2)]$ $\beta = [0.99 + (FC^{1.5}/1000)]$	10 10 5
q_{c1ncs}	Clean sand equivalent q_{c1n}	$q_{c1ncs} = q_{c1n} \bullet K_{cpt}$	3
Qtn,cs (PKR 2010)	Clean sand equivalent for Q_{tn} described above - Q_{tn} being the normalized tip resistance based on a variable stress exponent as defined by Robertson (2009)	$Q_{tn,cs} = Q_{tn} \cdot K_c$ (PKR 2016)	16
Su(Liq)/ESv	Liquefied shear strength ratio as defined by Olson and Stark	$\frac{Su(Liq)}{\sigma_v'} = 0.03 + 0.0143(q_{c1})$ Note: σ_v' and s_v' are synonymous	13
Su(Liq)/ESv (PKR 2010)	Liquefied shear strength ratio as defined by Robertson (2010)	$\frac{Su(Liq)}{\sigma_v'}$ Based on a function involving $Q_{tn,cs}$	16
Su (Liq) (PKR 2010)	Liquefied shear strength derived from the liquefied shear strength ratio and effective overburden stress		16
Cont/Dilat Tip	Contractive / Dilative qc1 Boundary based on $(N_1)_{60}$	$(\sigma_v')_{boundary} = 9.58 \times 10^{-4}\ [(N_1)_{60}]^{4.79}$ *qc1* is calculated from specified qt(MPa)/N ratio	13
CRR	Cyclic Resistance Ratio (for Magnitude 7.5)	$q_{c1ncs} < 50$: $CRR_{7.5} = 0.833\ [q_{c1ncs}/1000] + 0.05$ $50 \leq q_{c1ncs} < 160$: $CRR_{7.5} = 93\ [q_{c1ncs}/1000]^3 + 0.08$	10
Kg	Small strain Stiffness Ratio Factor, Kg	[Gmax/qt]/[qc1n^{-m}] m = empirical exponent, typically 0.75	26

Calculated Parameter	Description	Equation	Ref
SP Distance	State Parameter Distance, Winckler static liquefaction method	Perpendicular distance on Qtn chart from plotted point to state parameter Ψ = -0.05 curve	25
URS NP Fr	Normalized friction ratio point on Ψ = -0.05 curve used in SP Distance calculation		25
URS NP Qtn	Normalized tip resistance (Qtn) point on Ψ = -0.05 curve used in SP Distance calculation		25

Project Name: San Jose Campus Master Planning Kaiser Permanente Medical Center
Corrosivity Analysis – ASTM Test Methods

Dear Ms. McCurdy:

Pursuant to your request, CERCO Analytical has analyzed the soil samples submitted on January 31, 2023. Based on the analytical results, this brief corrosivity evaluation is enclosed for your consideration.

Based upon the resistivity measurements, all samples are classified as "moderately corrosive". All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron should be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines should be protected against corrosion.

The chloride ion concentrations reflect none detected with a reporting limit of 15 mg/kg.

The sulfate ion concentrations ranged from none detected to 17 mg/kg and are determined to be insufficient to damage reinforced concrete structures and cement mortar-coated steel at these locations.

The pH of the soils ranged from 7.35 to 8.34, which does not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures.

The redox potentials ranged from 230-mV to 240-mV. All samples are indicative of potentially "slightly corrosive" soils resulting from anaerobic soil conditions.

This corrosivity evaluation is based on general corrosion engineering standards and is non-specific in nature. For specific long-term corrosion control design recommendations or consultation, please call *JDH Corrosion Consultants, Inc. at (925) 927-6630.*

We appreciate the opportunity of working with you on this project. If you have any questions, or if you require further information, please do not hesitate to contact us.

Very truly yours,
CERCO ANALYTICAL, INC.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

ABBREVIATIONS
WOH - Weight of Hammer
WOR - Weight of Rod

UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D 2487)

COARSE GRAINED SOILS (More than half of material is larger than the #200 sieve)	**GRAVELS** (More than half of coarse fraction is larger than the #4 sieve)	CLEAN GRAVEL WITH <5% FINES	Cu ≥4 and 1≤ Cc≤3		**GW**	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
			Cu <4 and/ or 1>Cc >3		**GP**	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
		GRAVELS WITH 5% TO 12% FINES	Cu ≥4 and 1≤ Cc≤3		**GW-GM**	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
					GW-GC	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
			Cu <4 and/ or 1>Cc >3		**GP-GM**	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
					GP-GC	POORLY GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
		GRAVELS WITH > 12% FINES			**GM**	SILTY GRAVELS, GRAVEL-SILT-SAND MIXTURES
					GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES
					GC-GM	CLAYEY GRAVELS, GRAVEL-SAND-CLAY-SILT MIXTURES
	SANDS (More than half of coarse fraction is smaller than the #4 sieve)	CLEAN SANDS WITH <5% FINES	Cu ≥6 and 1≤ Cc≤3		**SW**	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
			Cu <6 and/ or 1>Cc >3		**SP**	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
		SANDS WITH 5% TO 12% FINES	Cu ≥6 and 1≤ Cc≤3		**SW-SM**	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
					SW-SC	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
			Cu <6 and/ or 1>Cc >3		**SP-SM**	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
					SP-SC	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
		SANDS WITH > 12% FINES			**SM**	SILTY SANDS, SAND-GRAVEL-SILT MIXTURES
					SC	CLAYEY SANDS, SAND-GRAVEL-CLAY MIXTURES
					SC-SM	CLAYEY SANDS, SAND-SILT-CLAY MIXTURES

FINE GRAINED SOILS (More than half of material is smaller than the #200 sieve)	SILTS AND CLAYS (Liquid Limit less than 50)	**ML**	INORGANIC SILTS AND VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS, SILTS WITH SLIGHT PLASTICITY
		CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
		CL-ML	INORGANIC CLAYS-SILTS OF LOW PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
		OL	ORGANIC SILTS & ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS (Liquid Limit greater than 50)	**MH**	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILT
		CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
		OH	ORGANIC CLAYS & ORGANIC SILTS OF MEDIUM-TO-HIGH PLASTICITY

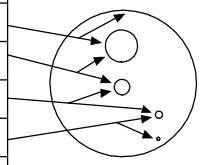
GRAIN SIZE

DESCRIPTION		SIEVE SIZE	GRAIN SIZE	APPROXIMATE SIZE
Boulders		>12 in. (304.8 mm.)	>12 in. (304.8 mm.)	Larger than basketball-sized
Cobbles		3 - 12 in. (76.2 - 304.8 mm.)	3 - 12 in. (76.2 - 304.8 mm.)	Fist-sized to basketball-sized
Gravel	coarse	3/4 -3 in. (19 - 76.2 mm.)	3/4 -3 in. (19 - 76.2 mm.)	Thumb-sized to fist-sized
	fine	#4 - 3/4 in. (#4 - 19 mm.)	0.19 - 0.75 in. (4.8 - 19 mm.)	Pea-sized to thumb-sized
Sand	coarse	#10 - #4	0.079 - 0.19 in. (2 - 4.9 mm.)	Rock salt-sized to pea-sized
	medium	#40 - #10	0.017 - 0.079 in. (0.43 - 2 mm.)	Sugar-sized to rock salt-sized
	fine	#200 - #40	0.0029 - 0.017 in. (0.07 - 0.43 mm.)	Flour-sized to sugar-sized
Fines		Passing #200	<0.0029 in. (<0.07 mm.)	Flour-sized and smaller



SECONDARY CONSTITUENT

	AMOUNT	
Term of Use	Secondary Constituent is Fine Grained	Secondary Constituent is Coarse Grained
Trace	<5%	<15%
With	≥5 to <15%	≥15 to <30%
Modifier	≥15%	≥30%

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT - N_{60} (# blows / ft)	Pocket Pen (tsf)	UNCONFINED COMPRESSIVE STRENGTH (Q_u)(psf)	VISUAL / MANUAL CRITERIA
Very Soft	<2	PP < 0.25	<500	Thumb will penetrate more than 1 inch (25 mm). Extrudes between fingers when squeezed.
Soft	2 - 4	0.25≤ PP <0.5	500 - 1000	Thumb will penetrate soil about 1 inch (25 mm). Remolded by light finger pressure.
Medium Stiff	4 - 8	0.5≤ PP <1	1000 - 2000	Thumb will penetrate soil about 1/4 inch (6 mm). Remolded by strong finger pressure.
Stiff	8 - 15	1≤ PP <2	2000 - 4000	Can be imprinted with considerable pressure from thumb.
Very Stiff	15 - 30	2≤ PP <4	4000 - 8000	Thumb will not indent soil but readily indented with thumbnail.
Hard	>30	4≤ PP	>8000	Thumbnail will not indent soil.

Dense	30 - 50	35 - 60	40 - 70	65 - 85
Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

Laboratory Test Report

Client:	**Bloom Energy Corporation**	Report No.:	**18-HAY-00831 Rev. 0**	Issued:	**6/4/2018**
Project:	**20180981.020A**			Field ID:	**HL11270**
	Bloom Energy: Kaiser San Jose KSR074	Sampled by:	**H. Fattal**	Date:	**5/26/2018**
	03-000L - KSR074 Task 3 - Laboratory Analysis	Submitted by:	**H. Fattal**	Date:	**5/29/2018**

Expansion Index Test

Tested on **5/31/2018** by **C. Pimentel**

Material Description: **Dark Brown Sandy Lean Clay (CL)**

Sample Location: **B-1 Bulk**

Test Method:	**ASTM D4829**
Expansion Index :	**73**
Dry Density, pcf :	**112.7**
Water Content, as molded, %:	**9.3**
Final Water Content, %:	**22.8**
Initial Saturation, as molded %:	**50.9**

Classification of Potentially Expansive Soil	
Expansion Index, EI	Potential Expansion
0 - 20	Very Low
21 - 50	Low
51 - 90	Medium
91 - 130	High
Above 130	Very High

Remarks:

Potential Expansion: Medium

UNIFIED SOIL CLASSIFICATION (ASTM D-2487)						
Material Types	**Criteria for Assigning Soil Group Names**			**Group Symbol**	**Soil Group Names**	**Legend**
Coarse Grained Soils	Gravels >50% of Coarse Fraction Passes on No. 4 Sieve	Clean Gravels <5% Fines	Cu≥4 and 1≤Cc≤3	GW	Well-Graded Gravel	
			Cu<4 and/or [Cc<1 or Cc>3]	GP	Poorly-Graded Gravel	
		Gravels with Fines >12% Fines	Fines Classify as ML or MH	GM	Silty Gravel	
>50% Retained on No. 200 Sieve			Fines Classify as CL or CH	GC	Clayey Gravel	
	Sands ≥50% of Coarse Fraction Passes on No. 4 Sieve	Clean Sands <5% Fines	Cu≥6 and 1≤Cc≤3	SW	Well-Graded Sand	
			Cu<6 and/or [Cc<1 or Cc>3]	SP	Poorly-Graded Sand	
		Sands and Fines >12% Fines	Fines Classify as ML or MH	SM	Silty Sand	
			Fines Classify as CL or CH	SC	Clayey Sand	
Fine Grained Soils	Silts and Clays Liquid Limits<50	Inorganic	PI>7 and Plots≥"A" Line	CL	Lean Clay	
			PI<4 and Plots<"A" Line	ML	Silt	
		Organic	LL (Oven Dried)/LL(Not Dried <0.75)	OL	Organic Silt	
≥50% Passes No. 200 Sieve	Silts and Clays Liquid Limits≥50	Inorganic	PI Plots≥"A" Line	CH	Fat Clay	
			PI Plots<"A" Line	MH	Elastic Silt	
		Organic	LL (Oven Dried)/LL(Not Dried <0.75)	OH	Organic Clay	
Highly Organic Soils		Primarily Organic Matter, Dark in Color and Organic Odor		PT	Peat	

PENETRATION RESISTANCE (RECORDED AS BLOWS/0.5 FEET)				
SAND AND GRAVEL		SILT AND CLAY		
RELATIVE DENSITY	N-VALUE (BLOWS/FOOT)*	CONSISTENCY	N-VALUE (BLOWS/FOOT)*	COMPRESSIVE STRENGTH
Very Loose	0 - 3	Very Soft	0 - 1	0 - 0.25
Loose	4 - 10	Soft	2 - 4	0.25 - 0.50
Medium Dense	11 - 29	Medium Stiff	5 - 7	0.50 - 1.0
Dense	30 - 49	Stiff	8 - 14	1.0 - 2.0
Very Dense	50 +	Very Stiff	15 - 29	2.0 - 4.0
		Hard	30 +	Over 4.0

SOIL MOISTURE	
DESCRIPTOR	**DESCRIPTION**
Dry	Dry of Standard Proctor Optimum
Damp	Sand Dry
Moist	Near Standard Proctor Optimum
Wet	Wet of Satandard Proctor Optimum
Saturated	Free Water in Sample

PARTICLES SIZES		
COMPONENTS		**SIZE OR SIEVE NUMBER**
Boulders		Over 12 Inches
Cobbles		3 to 12 Inches
Gravels	-Coarse	3/4 to 3 Inches
	-Fine	Number 4 to 3/4 Inch
Sand	-Coarse	Number 10 to Number 4
	-Medium	Number 40 to Number 10
	-Fine	Number 200 to Number 40
Fines (Silt and Clay)		Below Number 200

Grab Bulk Sample

Standard Penetration Test

2.5 Inch Modified California

Shelby Tube

No Recovery

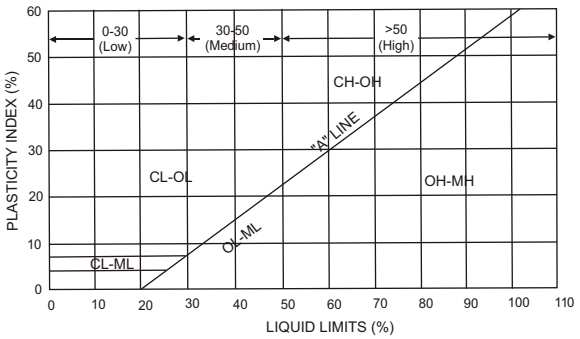
Initial Water Level Reading

Final Water Level Reading

Blow Count
The number of blows of the sampling hammer required to drive the sampler through each of three 6-inch increments. Less than three increments may be reported if more than 50 blows are counted for any increment. The notation 50/5" indicates 50 blows recorded for 5 inches of penetration.

N-Value
Number of blows 140 LB hammer falling 30 inches to drive a 2 inch outside diameter (1-3/8 inch I.D) split barrel sampler the last 12 inches of an 18 inch drive (ASTM-1586 Standard Penetration Test)

PLASTICITY CHART



CU -Consolidated Undrained triaxial test completed. Refer to laboratory results
DS - Results of Direct Shear test in terms of total cohesion (C, KSF) or effective cohesion and friction angles (C', KSF and degrees)
LL - Liquid Limit
PI - Plasticity Index
PP - Pocket Penetrometer test
TV - Torvane Shear Test results in terms of undrained shear strength (KSF)
UC - Unconfined Compression test results in terms of undrained shear strength (KSF)
#200 - Percent passing number 200 sieve
Cu - Coefficient of Uniformity
Cc - Coefficient of Concavity

General Notes

1. The boring locations were determined by pacing, sighting and/or measuring from site features. Locations are approximate. Elevations of borings (if included) were determined by interpolation between plan contours or from another source that will be identified in the report or on the project site plan. The location and elevation of borings should be considered accurate only to the degree implied by the method used.

2. The stratification lines represent the approximate boundary between soil types. The transition may be gradual.

3. Water level readings in the drill holes were recorded at time and under conditions stated on the boring logs. This data has been reviewed and interpretations have been made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, tides, temperature and other factors at the time measurements were made.

4. The boring logs and attached data should only be used in accordance with the report.

NOTES:

1. The stratification lines shown on the boring logs represent the approximate boundaries between material types. The actual transitions between materials may be gradual.
2. These logs of the test borings and related information depict subsurface conditions only at the specific locations and at the particular time the boring was made.
3. Soil conditions at other locations may differ from conditions occurring at these locations. Also, the passage of time may result in changes in the soil and groundwater conditions at these locations.
4. Soil colors from Munsell Soil Color Charts.

Attention: Mr. Derek Morley

Subject: **Corrosion Investigation - Santa Theresa Medical Center**
Geomatrix Project No. 7013.000.0

Dear Mr. Morley,

In accordance with your request, we present the following general analysis with respect to the above referenced materials of construction.

SCOPE

A. Determine the corrosivity of four samples furnished by **Geomatrix** and evaluate the potential for corrosion on materials of construction.

B. Conduct chemical and electrical tests on the soil samples in accordance with generally accepted methods and standards.

C. Analyze test data and provide a short letter-type report which includes test results and recommendations necessary for corrosion control.

PROCEDURES

Laboratory Tests:

Soil tests which were conducted which are useful in the evaluation of soil corrosivity in four basic categories:

1. ELECTRICAL RESISTIVITY

   The resistivity of soil is a good general indicator of soil corrosivity since metal corrosion is an electrochemical reaction, i.e., the greater the current in a given corrosion cell the higher the corrosion rate.

2. ANAEROBIC CONDITIONS (pH, Redox, sulfides)

   Anaerobic conditions indicate the presence of depolarizing agents which sustain greater current levels and result in corrosion rates which can be two to ten times higher than that indicated by soil resistivity alone.

3. ACIDITY (pH)

   Acidity can be a key indicator of the tendency for metal ions to go into solution in the soil electrolyte.

4. CONCRETE AND CEMENT MORTAR COATED STEEL (sulfates, chlorides, acidity)

   Acidity (pH <5.5) is also an indication of possible chemical attack on concrete. Steel in concrete has also been found to sustain severe corrosion where chlorides are able to migrate to the steel surface and sulfates are found to promote the deterioration of the concrete and chloride attack on the rebar.

Standard test methods were selected which were best suited for repeatable results, accuracy, interpretation, and generally accepted practice. The standard methods for the tests involved are listed at the bottom of Table I. A complete description of the test procedures and standard references can be furnished if required.

DISCUSSION

The NACE International classifications of corrosivity for the soils reported in Table I would be as shown below:

NACE SOIL CORROSIVITY CLASSIFICATION[1]

Soil Resistivity (ohm-cm)	Soil Classification
Below 500	Very Corrosive
500 to 1,000	Corrosive
1,000 to 2,000	Moderately Corrosive
2,000 to 10,000	Mildly Corrosive
Above 10,000	Progressively Less Corrosive

[1]NACE, Corrosion Basics - An Introduction, NACE, Houston, TX., pp. 191 (1984)

Steel:

The NACE soil corrosivity classification is based on average soil resistivity values for soils in general. Based upon the lowest resistivity alone (1,330 ohm-cm), the soil would be classified as moderately corrosive. A low redox (+1.9 mV), pH which were optimum for anaerobic bacteria growth, though no concentration of sulfides were detected, indicates that it is a depolarizing environment; thus we would classify the soils tested as being "corrosive" to steel.

Ductile and Cast Iron:

The evaluation of ductile iron and cast iron can be compared to the steel classification presented above and the table from Appendix A, ANSI A21, attached. Since the corrosion rates of iron and steel are very close, we generally compare the two classification systems. The two classification systems compare favorably and lead to the conclusion that soil represented the sample tested are "corrosive" to ductile and gray cast iron.

Concrete Rebar:

The Uniform Building Code (UBC) sets standards for exposure limits (see Table 26-A-7); and, if we convert the chloride and sulfate content from ppm to percent, we can see that amounts in the soil samples tested fall within these limits for Type II cement as follows.

Sample No.	Water Soluble Chloride in Soil % by Weight (from Table I)	Water Soluble Sulfate in Soil % by Weight (from Table I)
8-1	0.0040 (40 ppm)	0.0140 (140 ppm)
1-3	0.0020 (20 ppm)	0.0410 (410 ppm)
3-3	0.0022 (22 ppm)	0.0090 (90 ppm)
10-3	0.0018 (18 ppm)	<0.0001 (<1 ppm)

Concrete:

The Uniform Building Code (UBC) sets standards for exposure limits and the sulfate content of the sample tested is compared to the soil class by the UBC and the USBR (U.S. Bureau of Reclamation). The maximum sulfate content in the soil sampled was 0.0410% (410 ppm) and was in the "Moderate" Sulfate Exposure class for soils and would be non-aggressive to concrete, with Type II cement, exposed to water of this type. The water soluble chloride found in the sample is low and would cause moderate corrosion on any rebar not fully coated with good quality concrete. No special requirements are needed for good structural concrete with 3-inches of cover in these soils.

CONCLUSIONS

1. The soils tested were classified in accordance with the National Association of Corrosion Engineers (NACE) for steel, the American National Standards Institute (ANSI) A21.5 for cast or ductile iron, the Portland Cement Association (PCA) for concrete and on the basis of our experience, research and investigations for concrete encased steel or mortar coated steel. Materials anticipated for use in this project are classified as follows:

Material	Corrosion Class
Steel, Bare/Galvanized/Coated	Corrosive
Iron, Cast/Ductile or Mortar Coated Steel	Corrosive
Steel, Concrete Coated(good quality)	Non-Corrosive
Copper	Not tested

2. The lowest pH value of 7.3 indicates a near neutral soil which is not aggressive to portland cement. Soils containing sulfates and chloride levels found in these samples generally do not cause corrosion of steel rebar in uncracked, good quality concrete with Type II cement.

RECOMMENDATIONS

1. All buried bare, galvanized, concrete/mortar, or dielectric coated steel, and ductile or cast iron should be cathodically protected. The cathodic protection system should be designed by a qualified corrosion engineer.

2. Steel reinforcement for concrete should be protected by providing at least 3-inch minimum good quality concrete cover, to avoid corrosion of rebar from chloride contamination for soils representative of soil.

3. Cast iron or ductile iron pipe and fittings should be polyethylene encased in accordance with ANSI A21.5, as a cost effective method to reduce current requirements for cathodic protection.

4. Tests for the soil corrosivity to copper were not conducted. If there is an indication that the soils in this area may be aggressive to copper, testing should be conducted to determine any corrosion control requirements.

5. Insulating elements should be provided between different materials and different environs (concrete-soil, soil-air, low pH native soil-high pH sand, etc.) both above and below ground. Most importantly is an insulating union or flange between above and below grade piping with insulator located just **above grade**.

6. Soil conditions are not the only factors which may cause corrosion loss; design and construction practice may also be primary causes for failure. A review of plans and specifications for underground structures should be conducted by a qualified corrosion engineer prior to construction.

The user of this report should keep in mind that these conclusions were derived from nine soil samples. These conclusions and recommendations are preliminary; and, depending upon the size of the project and how representative of the site or of the soil samples tested, a more extensive corrosivity study may be required.

We appreciate the opportunity to provide this service to you and your company. If further information is required in this matter or if we can be of further service, please advise.

Sincerely,
ConCeCo Engineering, Inc.

Robert E. Colson, P.E.

Notes:

1. Appendix A of ANSI/AWWA C105/A215, TABLE A, provides soil test methods and evaluation for conditions corrosive to gray or ductile-cast iron pipe and fittings.
2. The above test (excluding redox and sulfides) were performed in accordance with the following Caltrans Test Methods:
   a. California Test 643 (1993): METHODS FOR ESTIMATING THE SERVICE LIFE OF STEEL CULVERTS.
   b. California Test 532 (1993): METHOD FOR ESTIMATING THE TIME TO CORROSION OF REINFORCED CONCRETE SUBSTRUCTURES.
   c. California Test 422 (1978): METHOD OF TESTING SOILS AND WATERS FOR CHLORIDE CONTENT.
   d. California Test 417 (1986): METHOD OF TESTING SOILS AND WATERS FOR SULFATE CONTENT.

TABLE NO. 26-A-6—REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

SULFATE EXPOSURE	WATER SOLUBLE SULFATE (SO_4) IN SOIL, PERCENT BY WEIGHT	SULFATE (SO_4) IN WATER, PPM	CEMENT TYPE	NORMAL-WEIGHT AGGREGATE	LIGHTWEIGHT-AGGREGATE CONCRETE
				Maximum Water-Cement Ratio, by Weight[1]	Minimum Compressive Strength, f'_c psi[1]
Negligible	0.00-0.10	0-150	—	—	—
Moderate[2]	0.10-0.20	150-1500	II, IP(MS), IS(MS)	0.50	3750
Severe	0.20-2.00	1500-10,000	V	0.45	4250
Very Severe	Over 2.00	Over 10,000	V plus pozzolan[3]	0.45	4250

[1] A lower water-cement ratio or higher strength may be required for watertightness or for protection against corrosion of embedded items or freezing and thawing (Table No. 26-A-5).

[2] Seawater.

[3] Pozzolan that has been determined by test or service record to improve sulfate resistance when used in concrete containing Type V cement.

TABLE NO. 26-A-7—MAXIMUM CHLORIDE ION CONTENT FOR CORROSION PROTECTION

TYPE OF MEMBER	MAXIMUM WATER SOLUBLE CHLORIDE ION (CL) IN CONCRETE, PERCENT BY WEIGHT OF CEMENT
Prestressed concrete	0.06
Reinforced concrete exposed to chloride in service	0.15
Reinforced concrete that will be dry or protected from moisture in service	1.00
Other reinforced concrete construction	0.30

FIELD NOTES

1. The borings were drilled on December 7, 1989, with a truck-mounted, 6-inch-diameter, helical auger drilling rig.

2. The samples were obtained with a 2.5-inch-diameter, split barrel sampler driven into the soils with a 140-pound hammer, falling 30 inches onto drill rods extending above the ground surface. The number recorded under "Blows/Foot" is the number of blows required to drive the sampler from 6 to 18 inches below the bottom of the boring.

3. Free groundwater was not encountered in any of the borings drilled for this investigation.

LABORATORY NOTES

1. "DS" Strain controlled direct shear test of an undisturbed soil sample, performed at natural moisture content.

2. "DSI" Strain controlled direct shear test after the the sample was submerged in water until movement stopped under a surcharge equal to the test surcharge pressure.

3. The indicated shear strengths are yield point values.

FIELD NOTES

1. The borings were drilled on July 25 through 28, 1972 with truck-mounted, 5-inch-diameter, rotary-wash equipment.
2. The following symbol, □, denotes an undisturbed sample taken in a 2½-inch-diameter, split-tube barrel, driven into the soil by 325 pound slip jars falling 18± inches inside the boring.
3. Boring elevations were estimated by interpolation between the plot plan contours.

LABORATORY NOTES AND ABBREVIATIONS

The tabulated shear strengths are yield point values.

DS = Strain controlled direct shear test at natural moisture content.

DSX = Strain controlled direct shear test after the sample had been submerged in water until movement ceased under a surcharge equal to the test surcharge.

DSY = Strain controlled direct shear test on a sample which was affected by circulated water during drilling.

FIELD NOTES

1. The borings were drilled on April 30 and May 3, 4 and 5, 1971 with truck-mounted, 5-inch-diameter, rotary-wash equipment.
2. The following symbol, □, denotes an undisturbed sample taken in a 2½-inch-diameter, split-tube barrel, driven into the soil by 335-pound slip jars falling 18± inches inside the boring.
   The following symbol, ⊡, denotes an attempted undisturbed sample with no recovery or with the sample partially disturbed.
3. Boring elevations are relative to City of San Jose Datum.

LABORATORY NOTES AND ABBREVIATIONS

The tabulated shear strengths are Yield Point values.

DS = Strain controlled direct shear test at natural moisture content.

DSX = Strain controlled direct shear test after the sample had been submerged in water until movement ceased under a surcharge equal to the test surcharge.

TR = Strain controlled, consolidated, undrained triaxial shear test at natural moisture content.

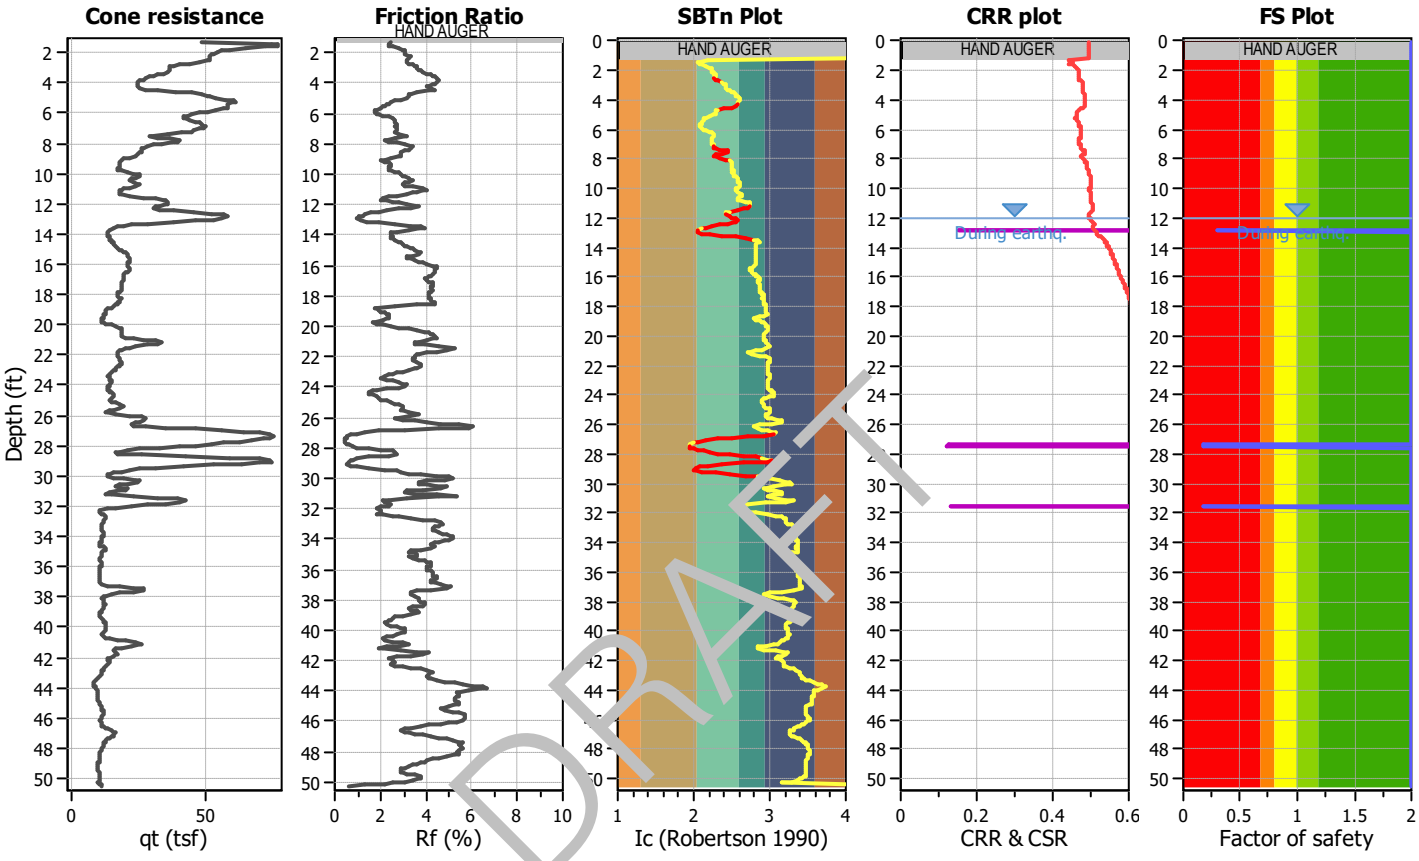
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

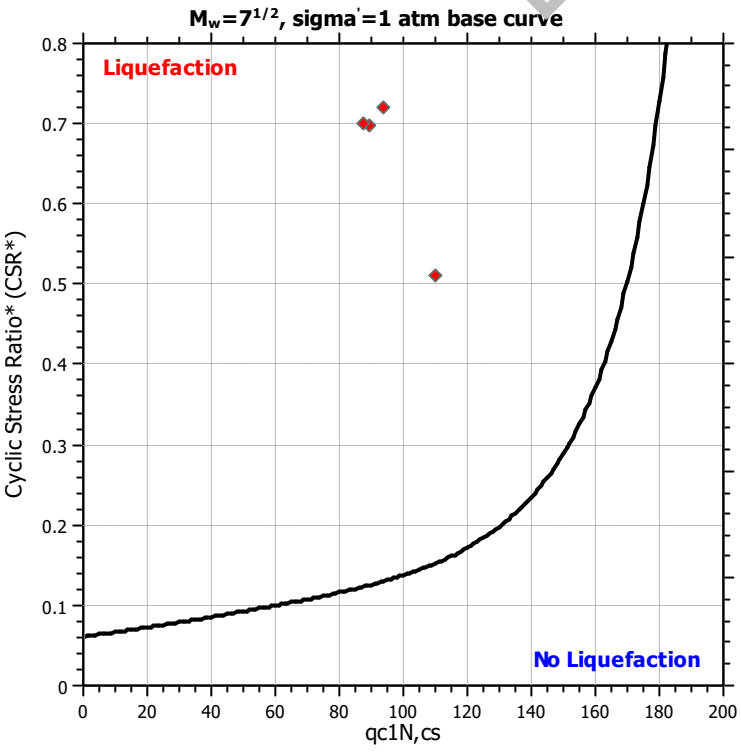
CPT file : CPT-1

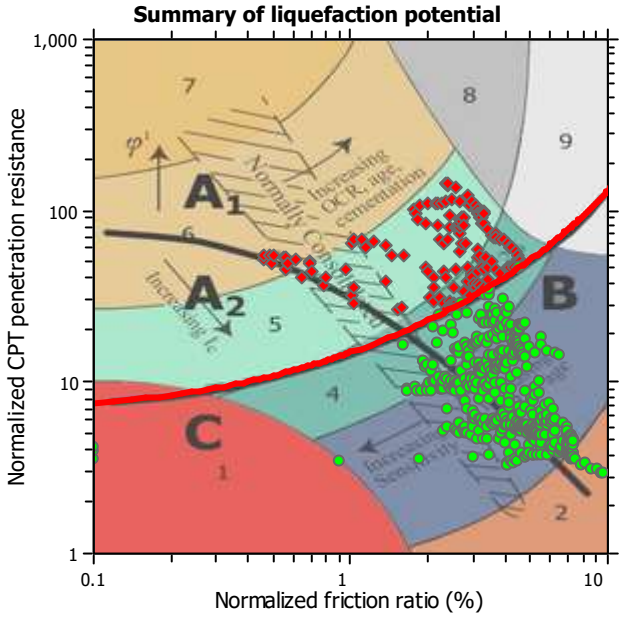
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



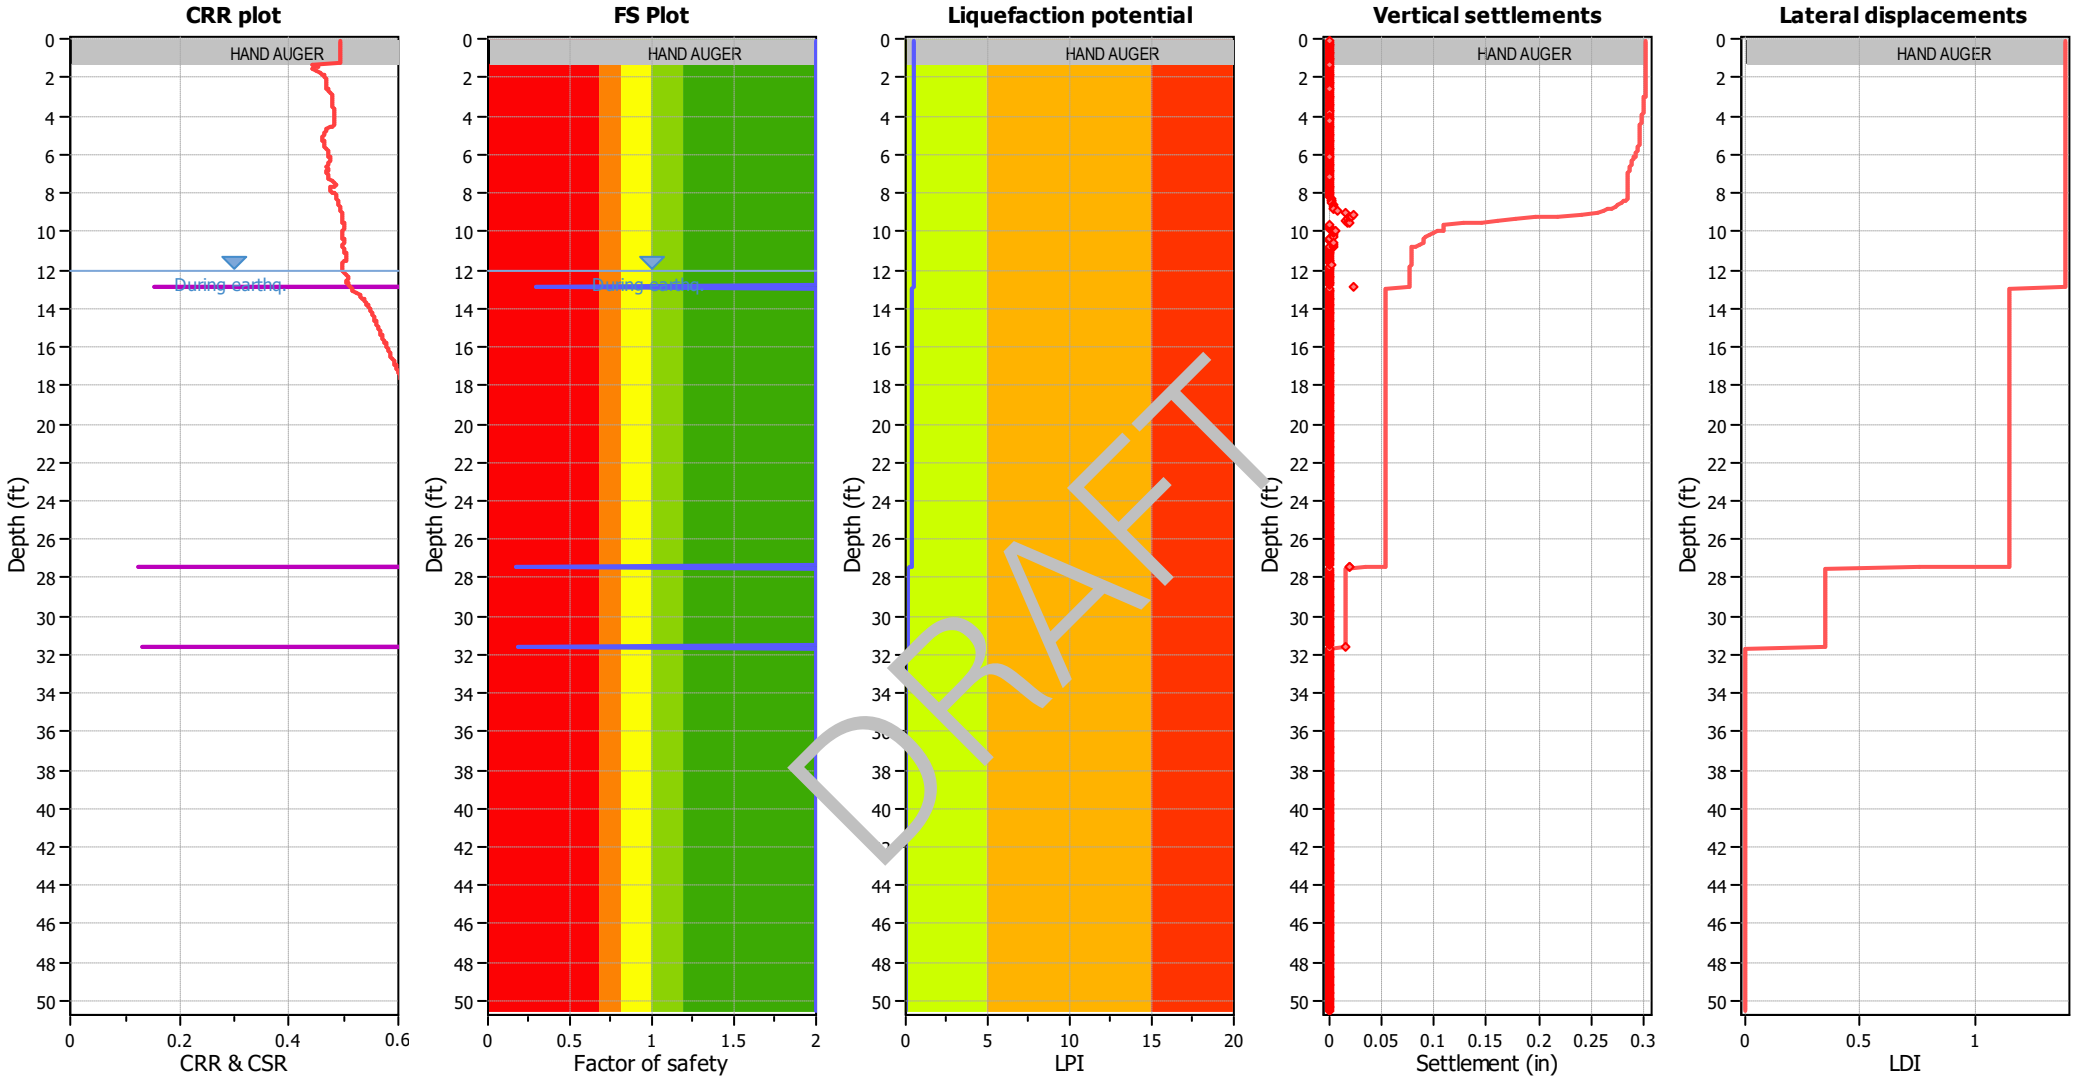
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

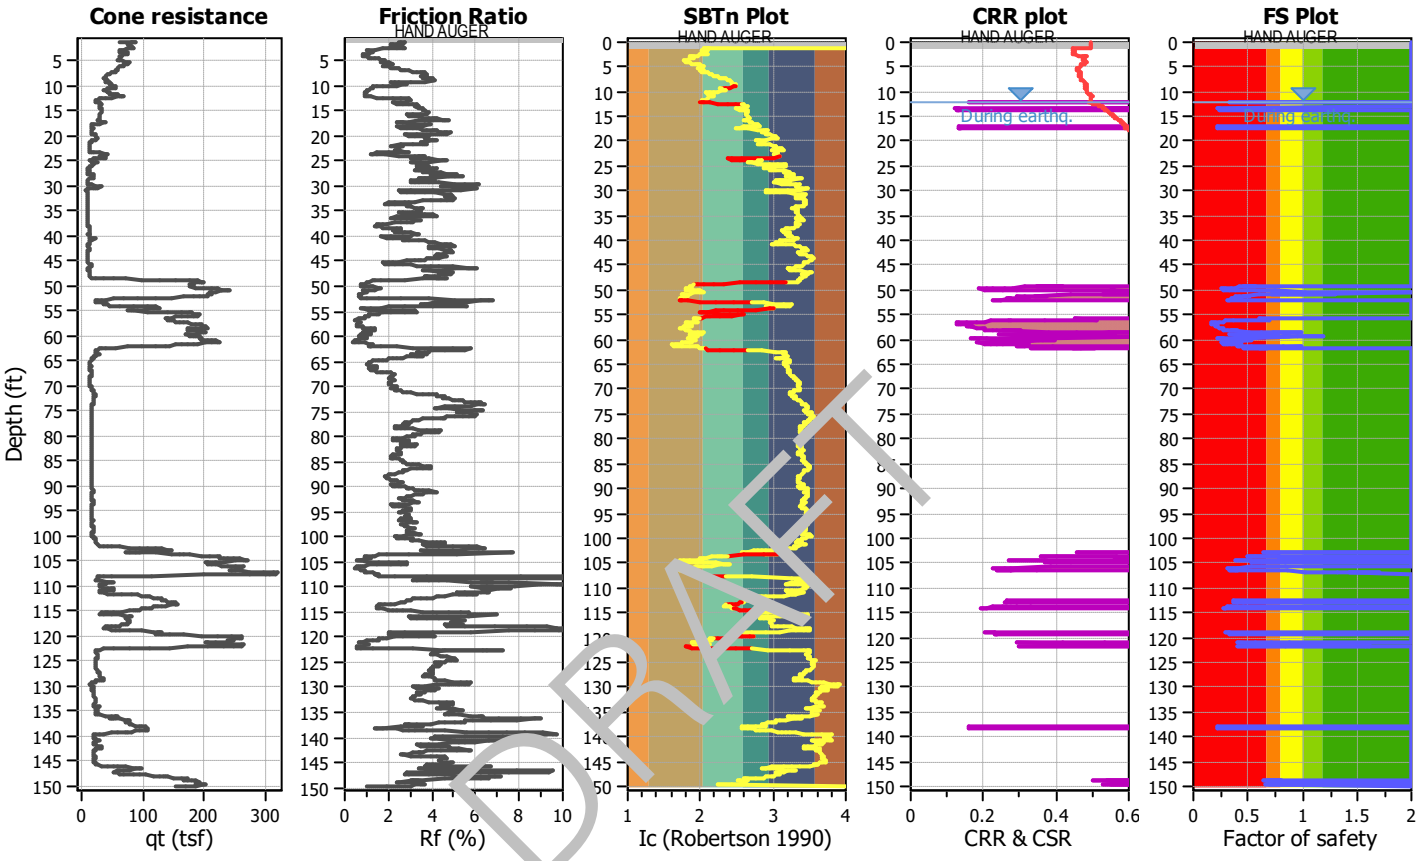
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

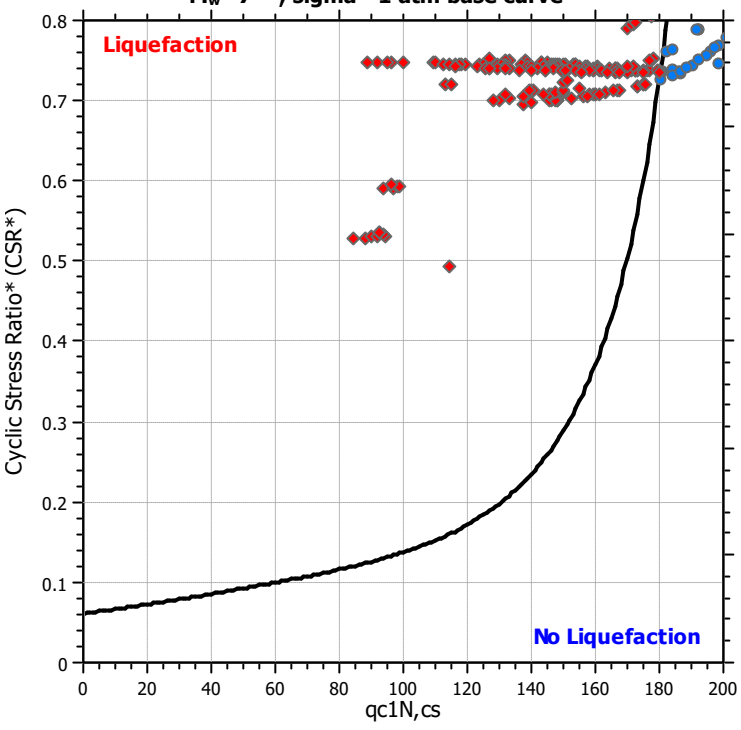
CPT file : CPT-2

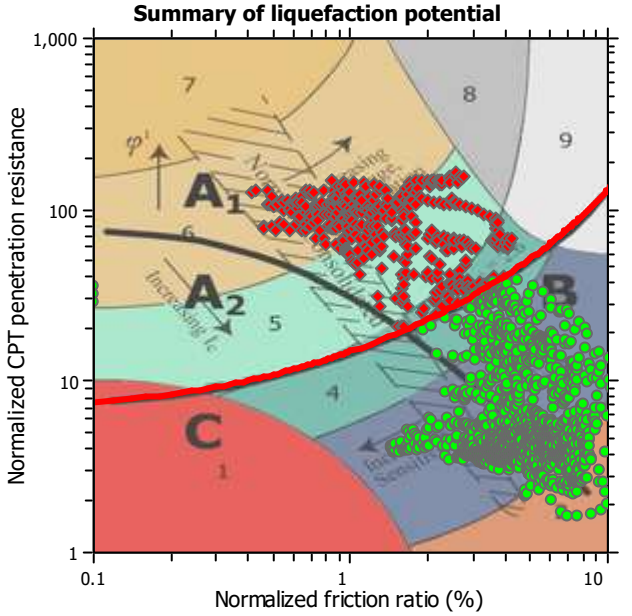
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



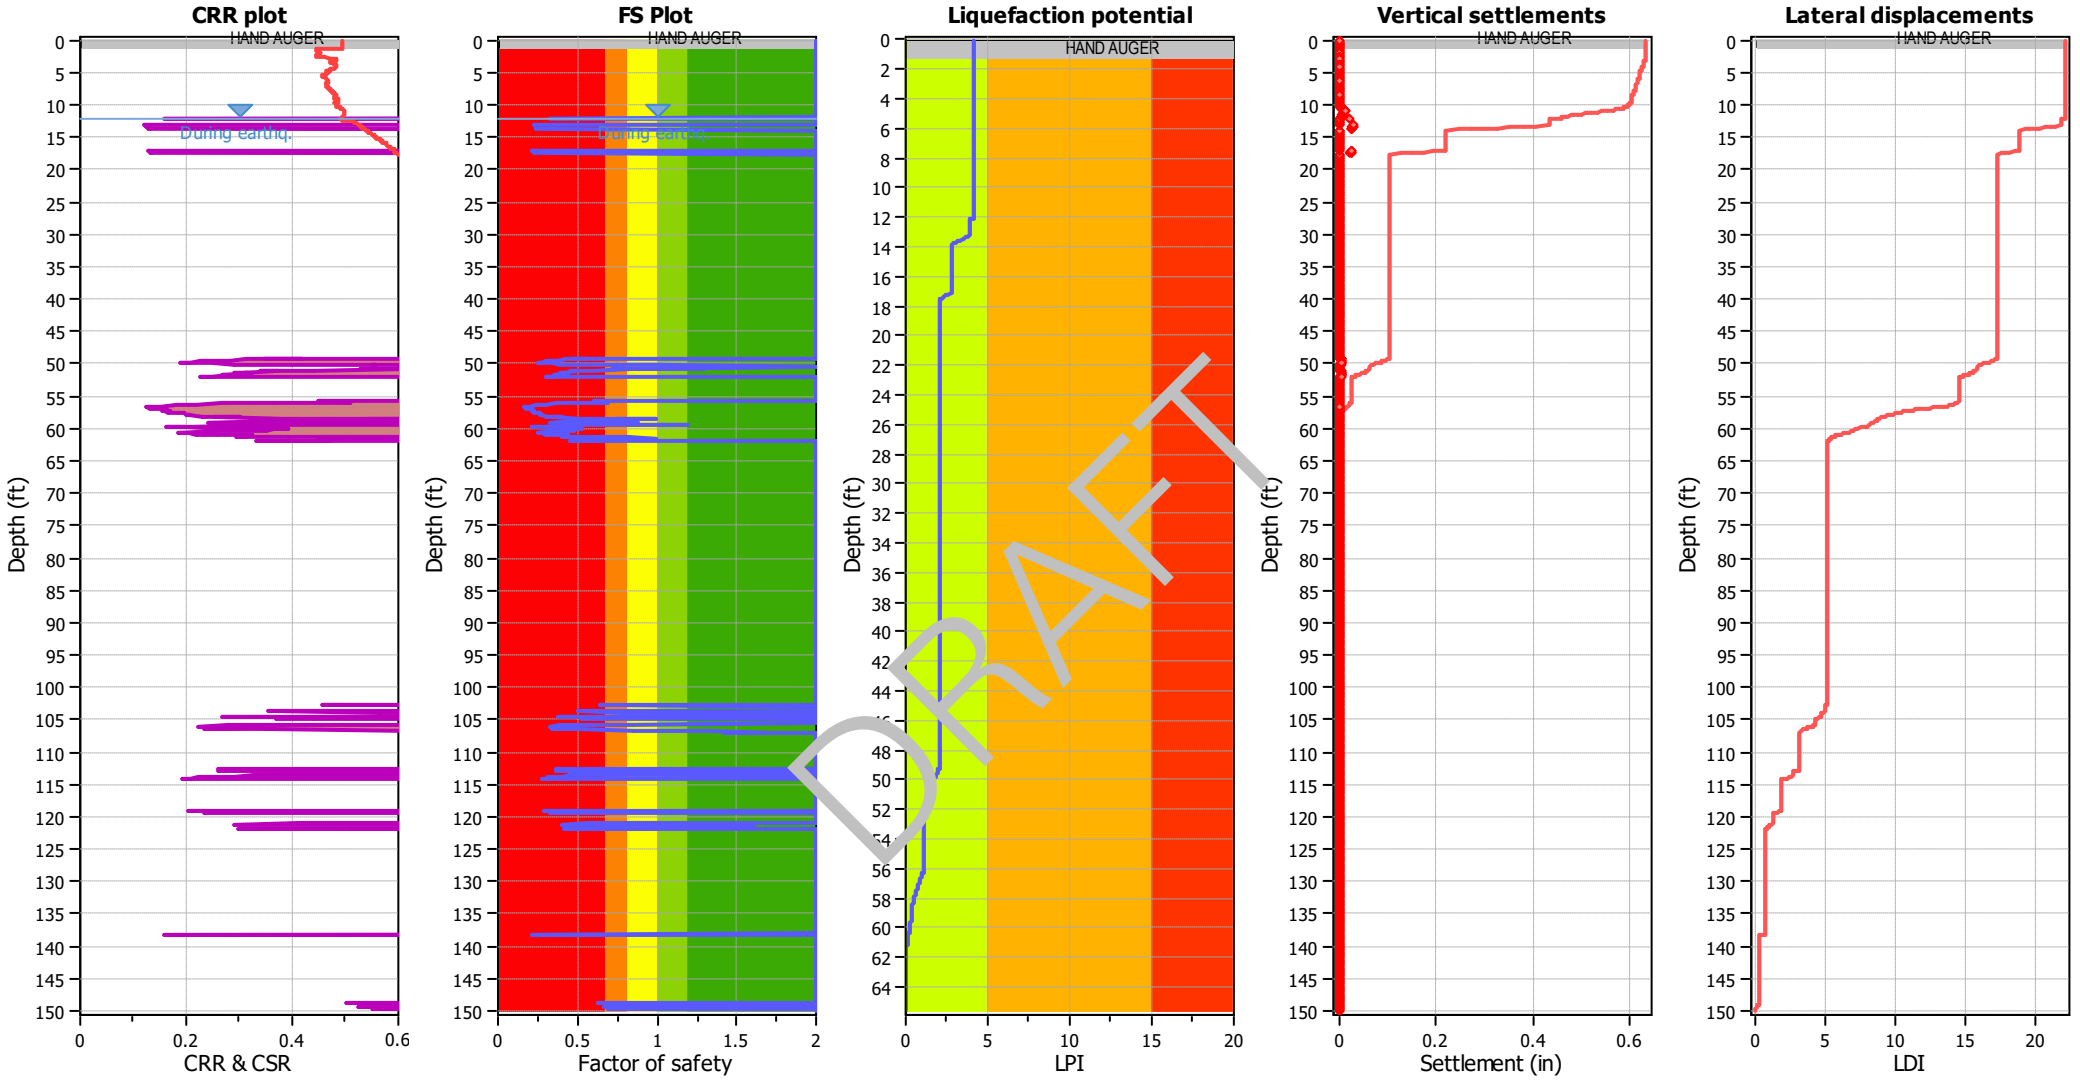
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

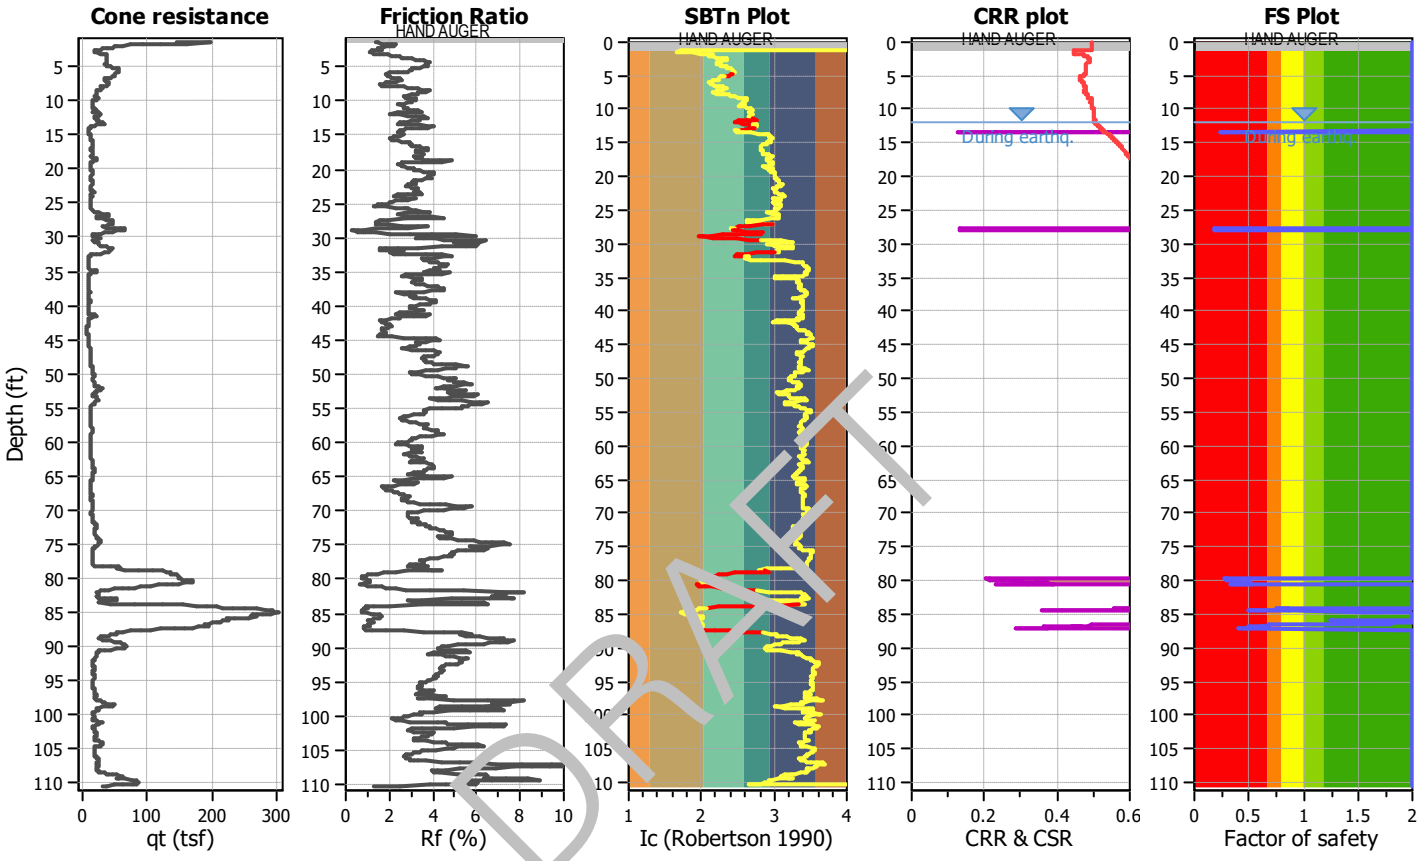
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

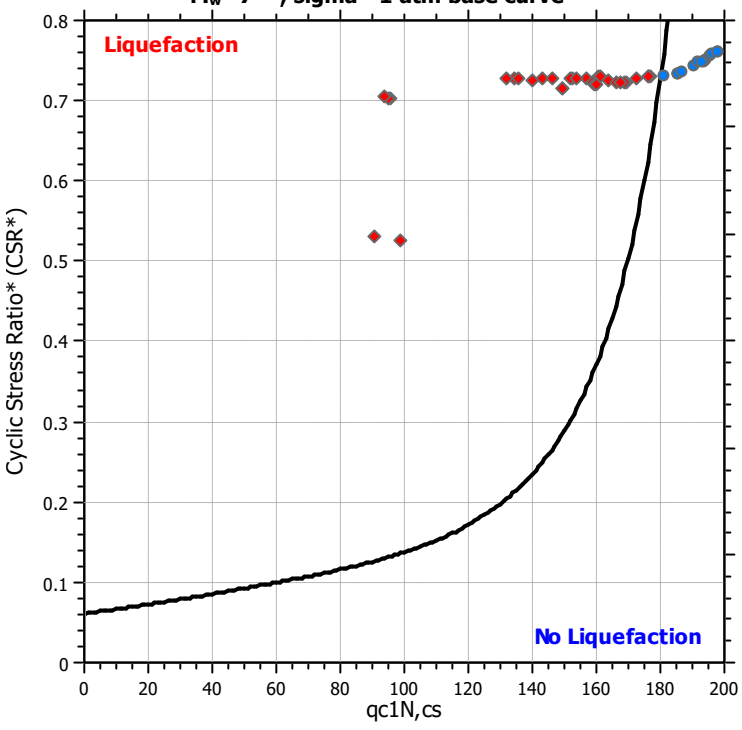
CPT file : sCPT-3

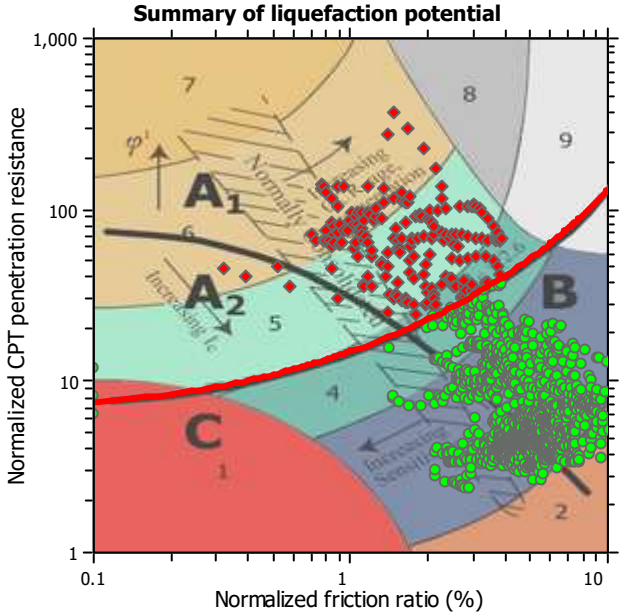
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



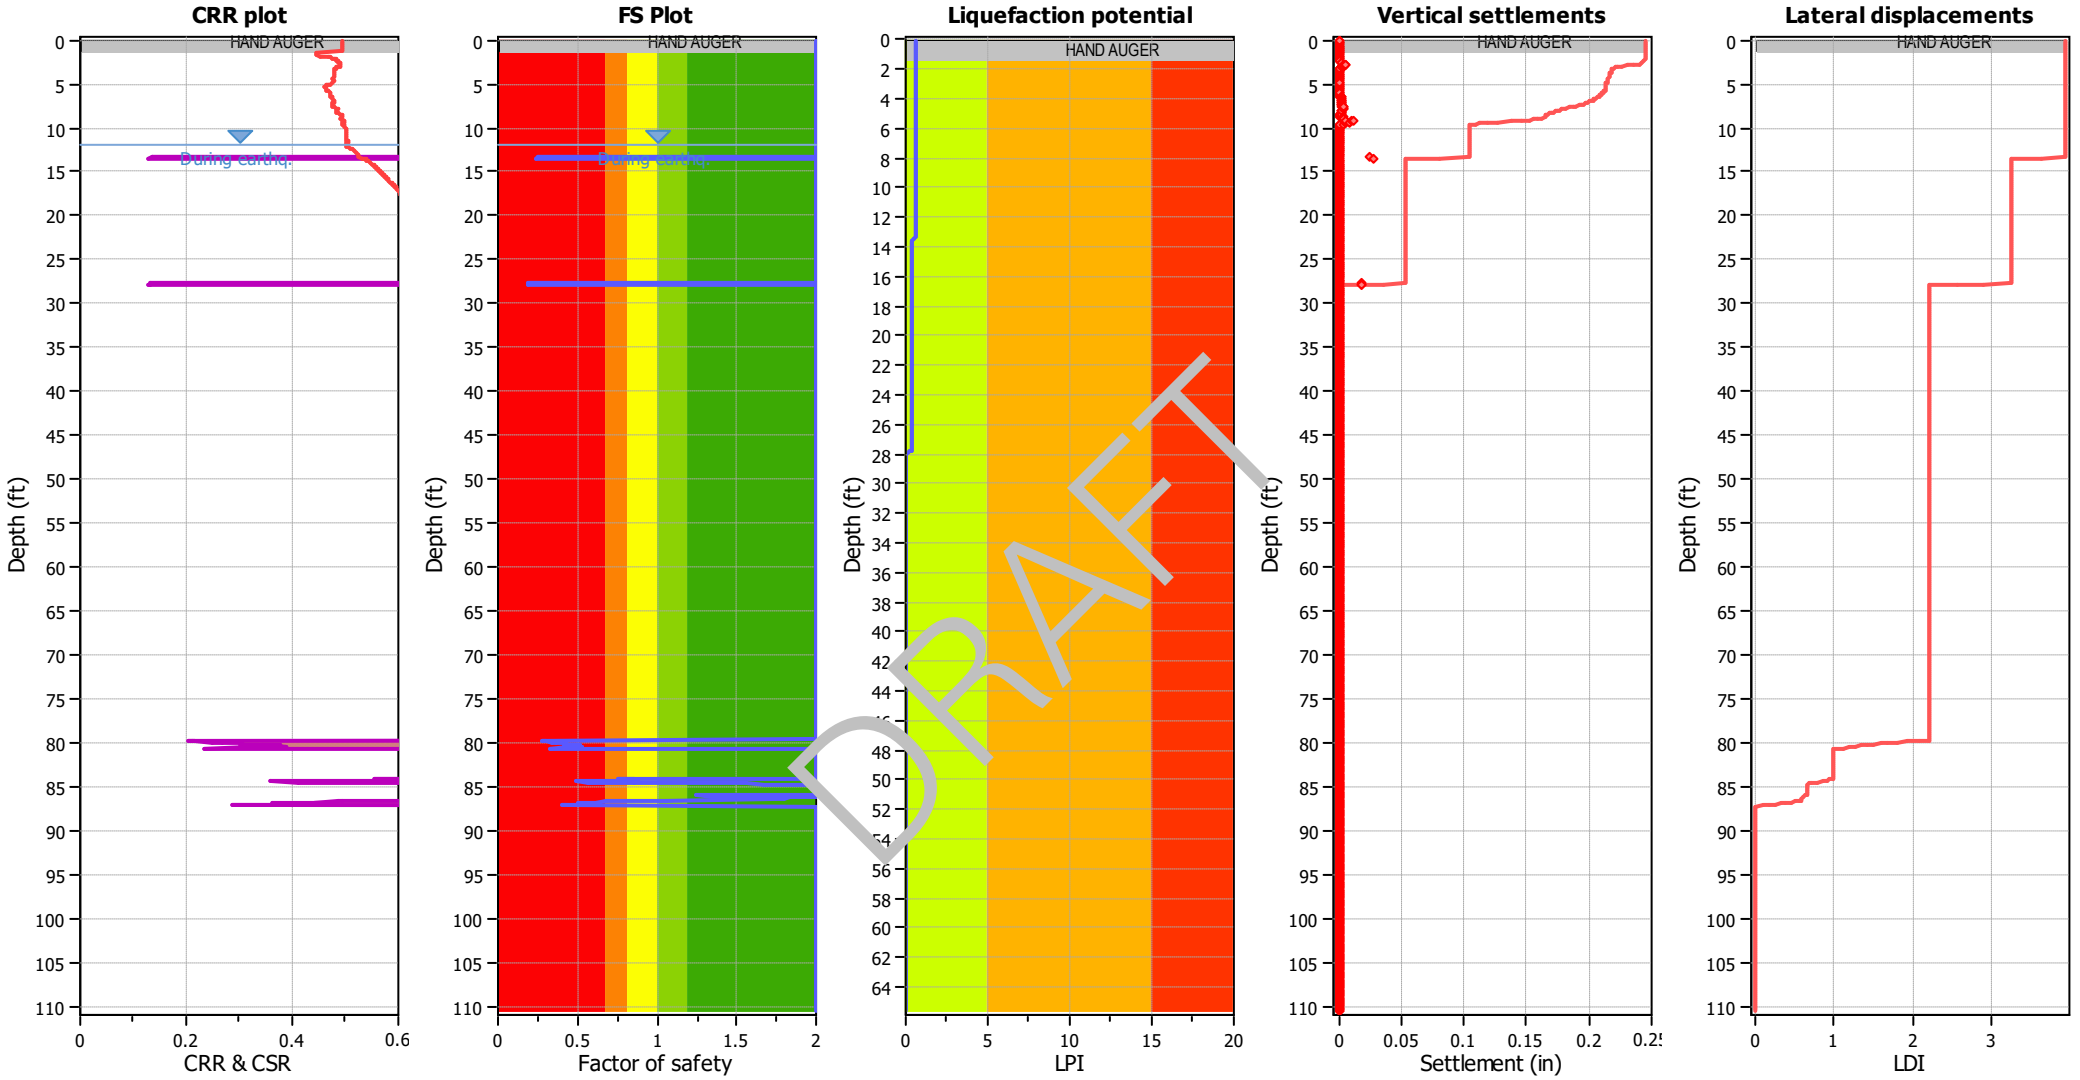
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

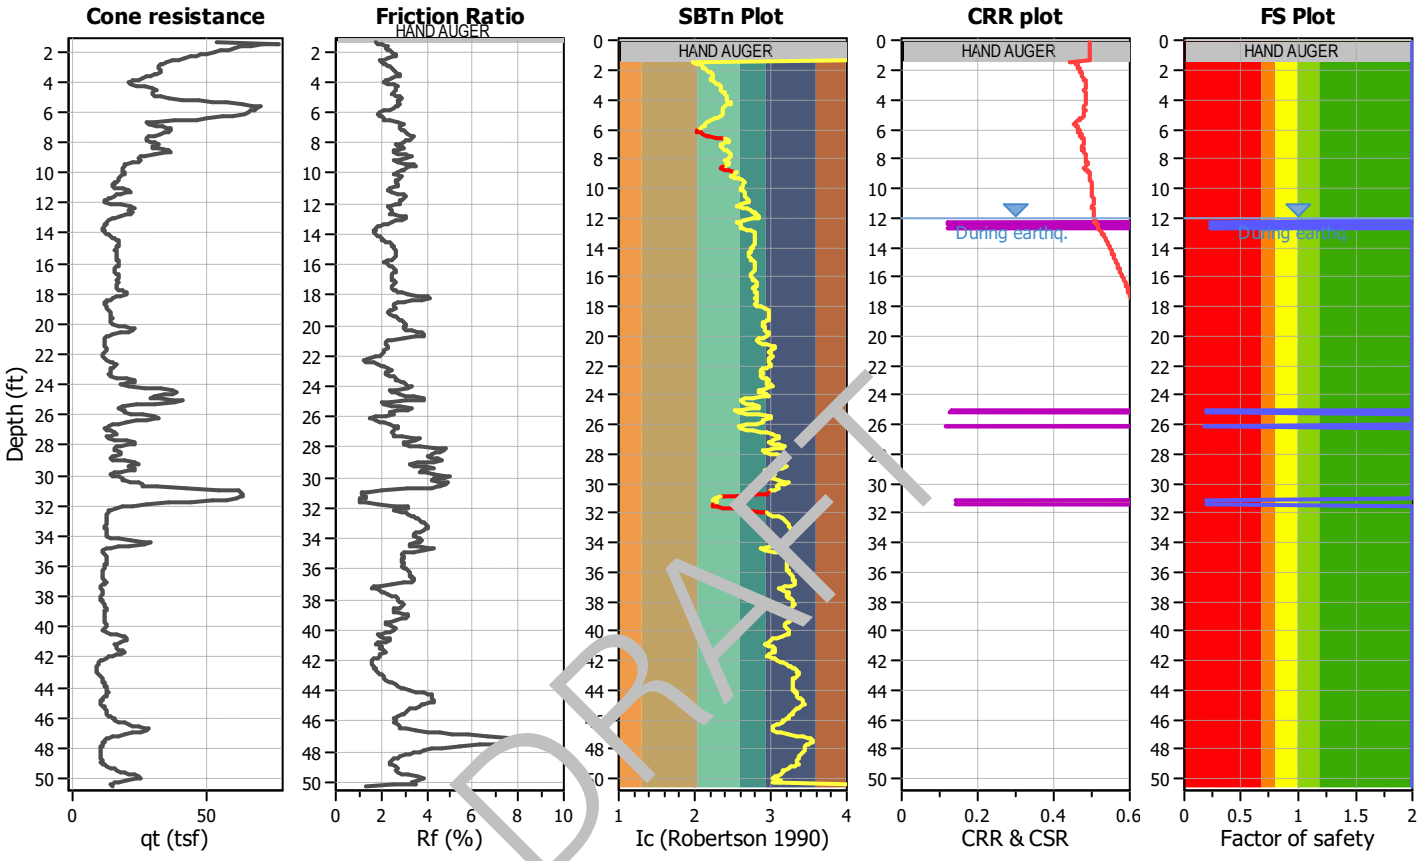
LIQUEFACTION ANALYSIS REPORT

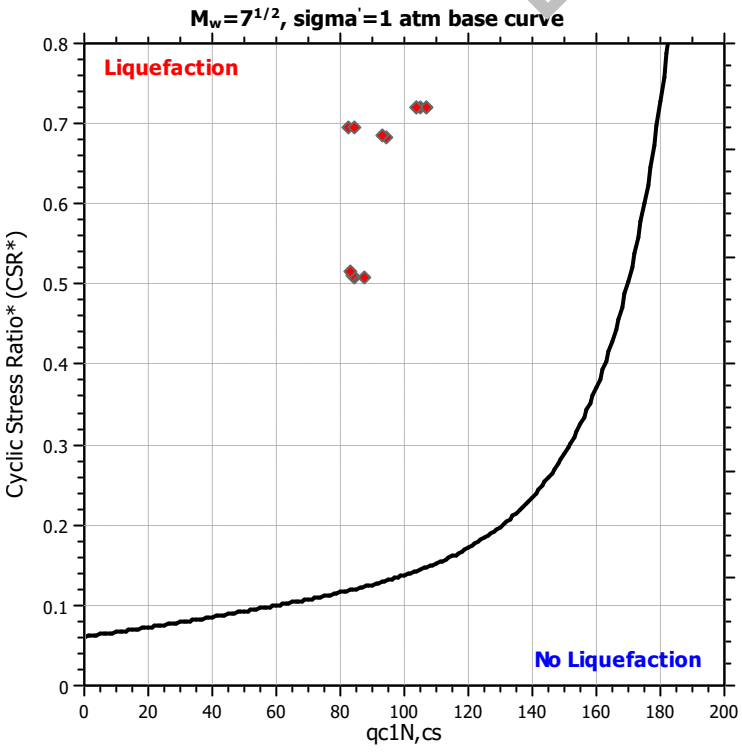
Project title : **Location :**

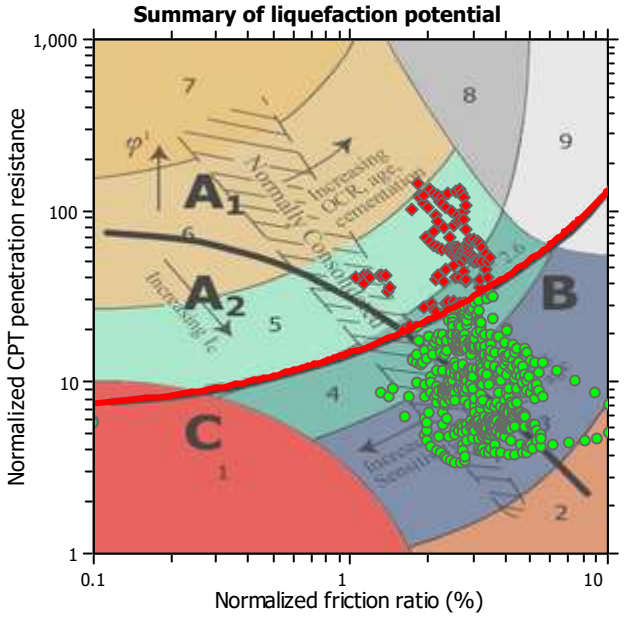
CPT file : CPT-4

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

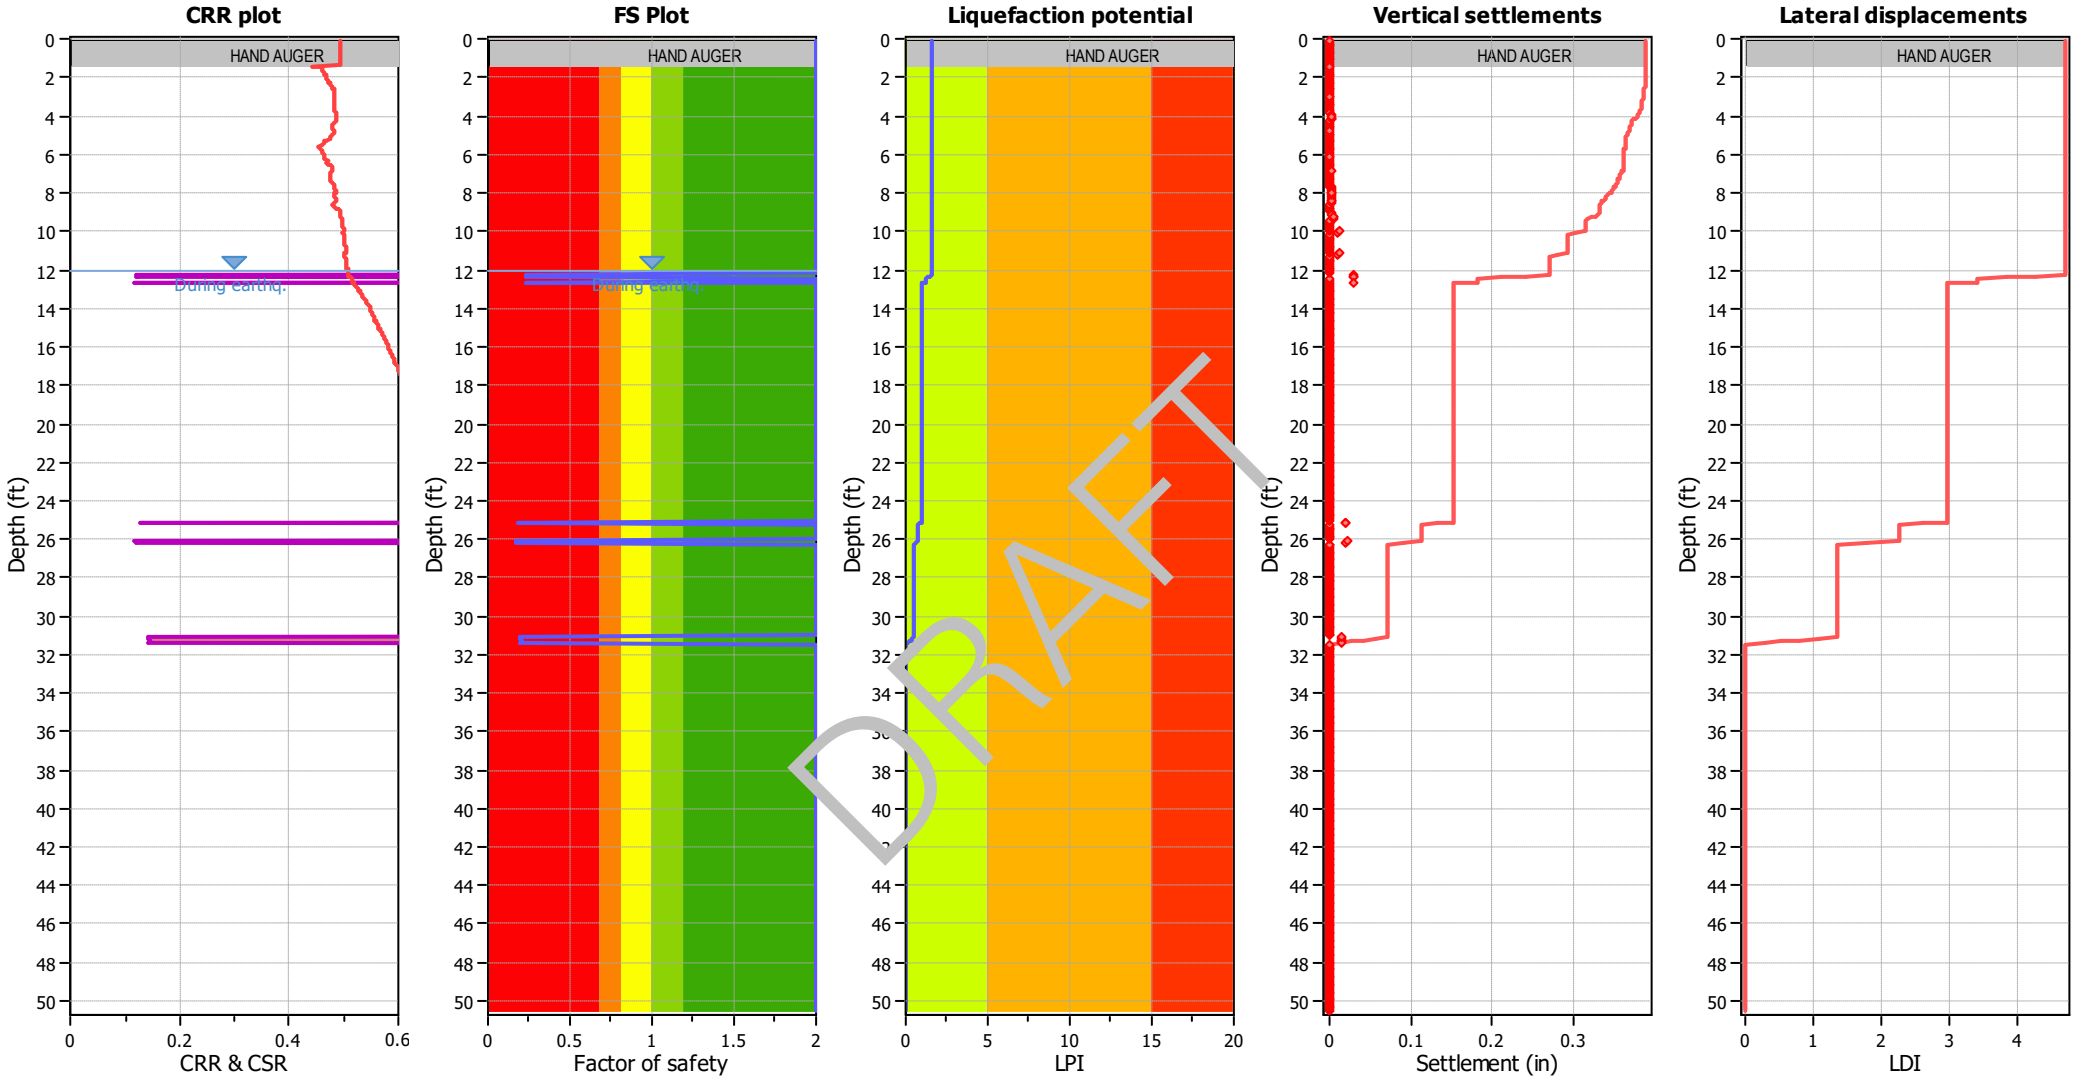






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

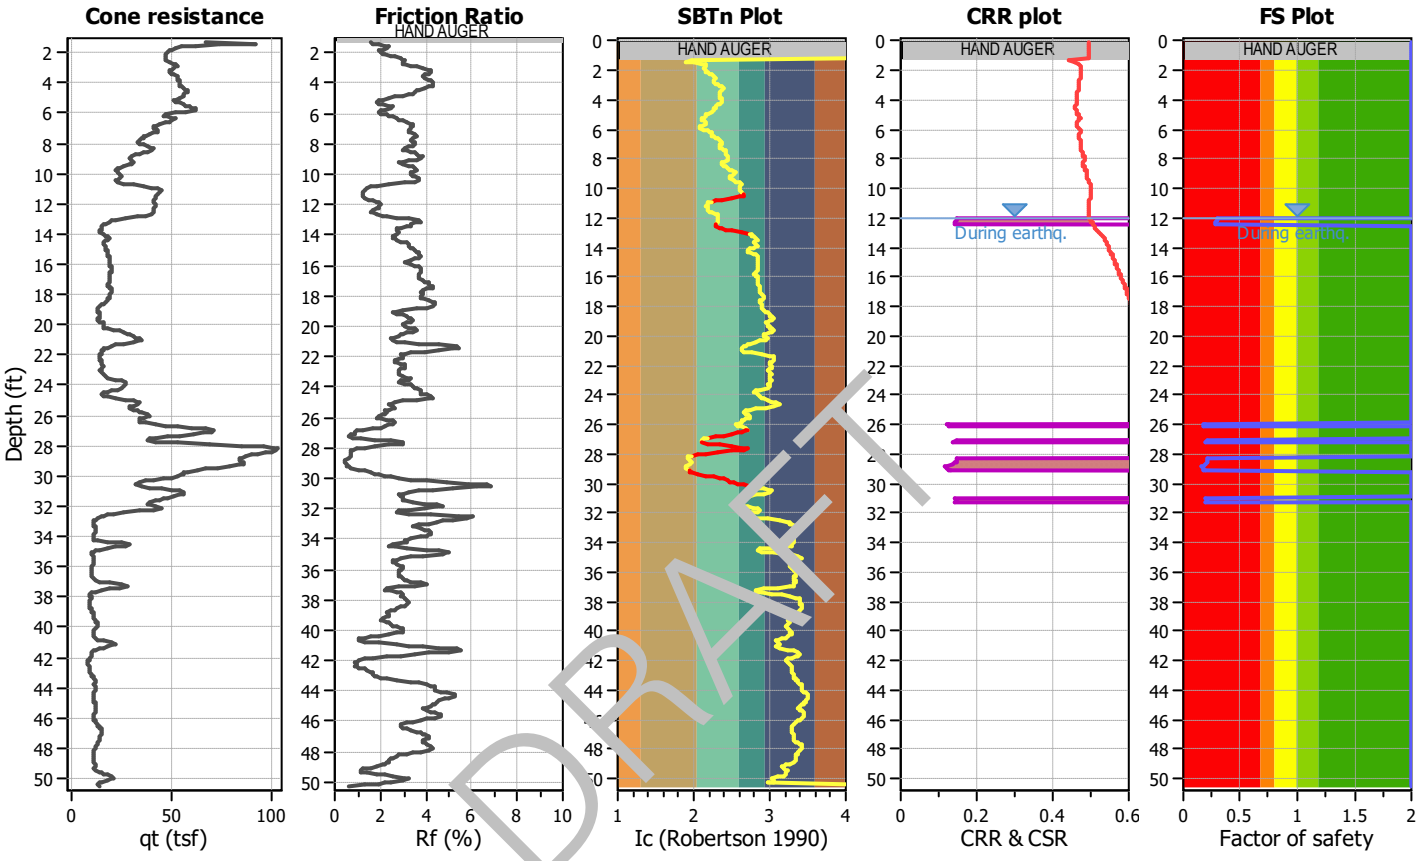
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

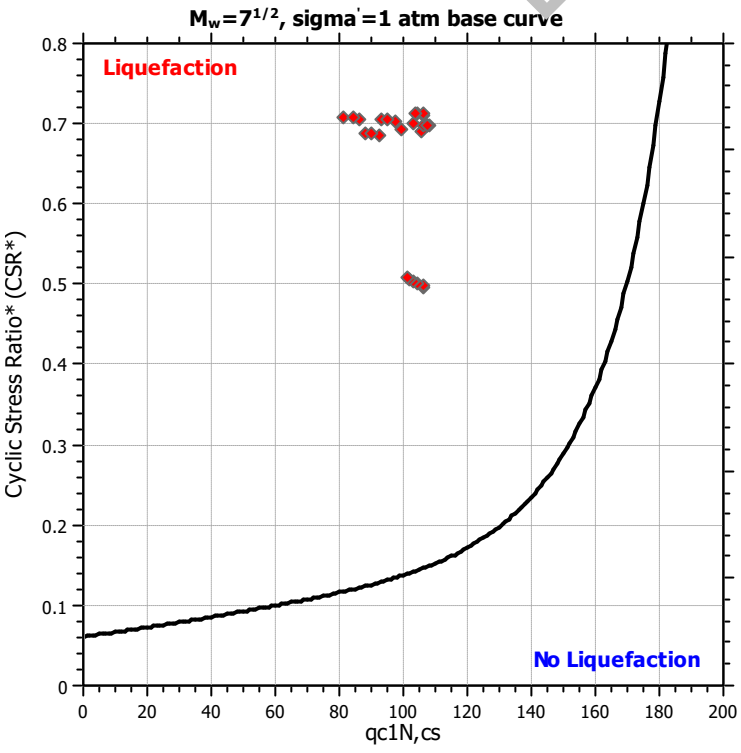
CPT file : CPT-5

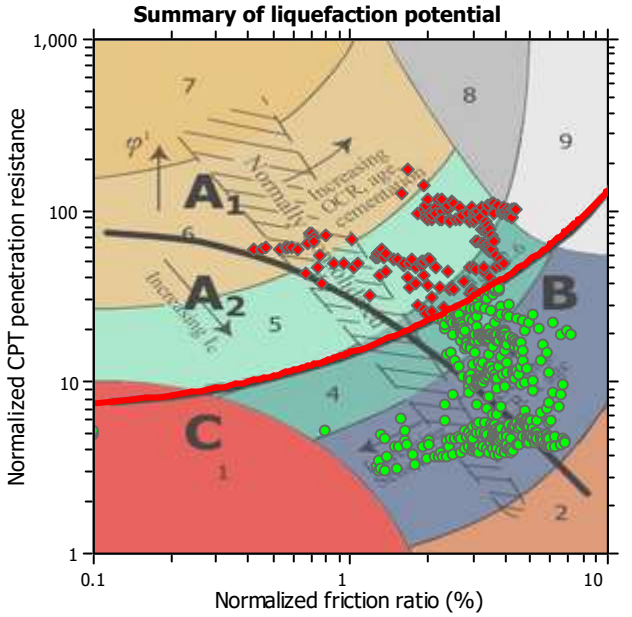
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



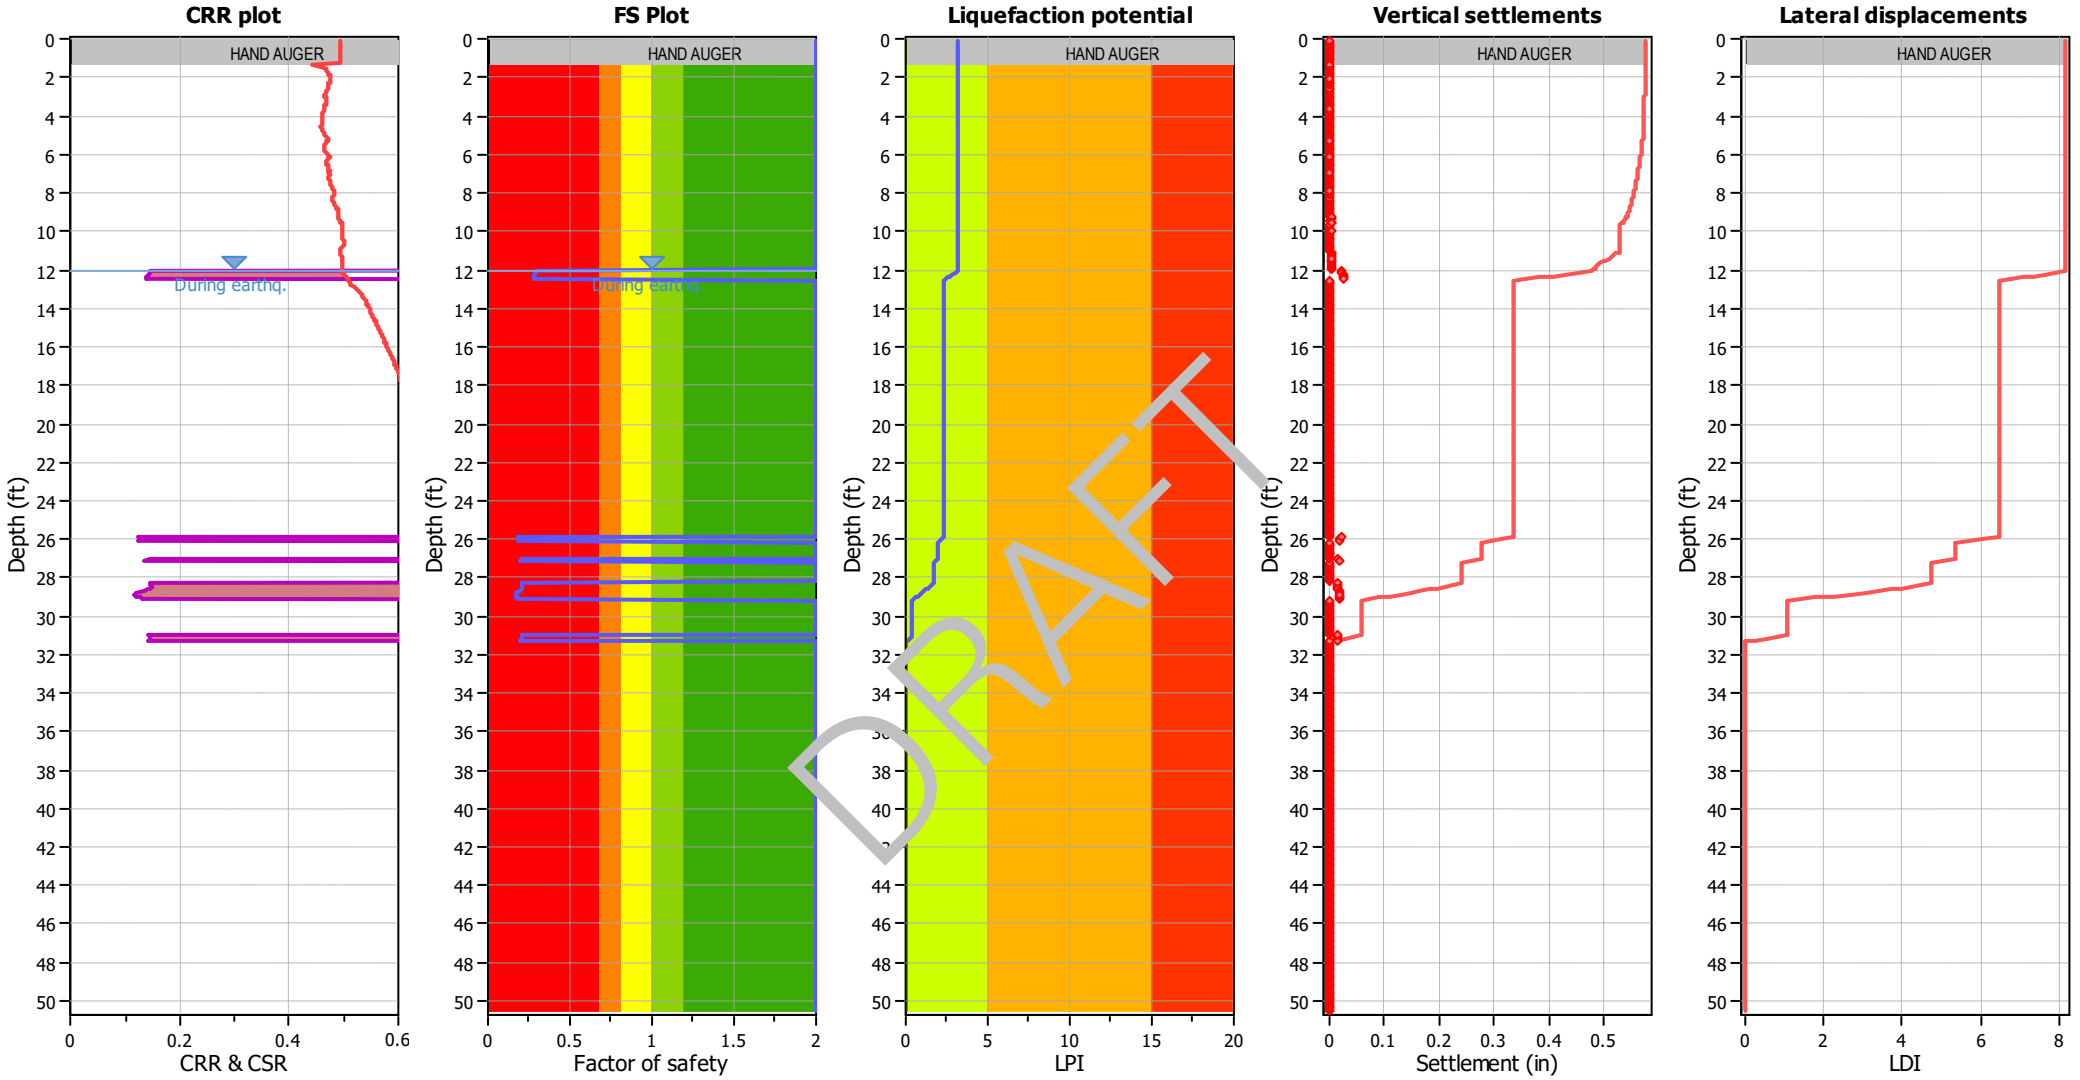
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

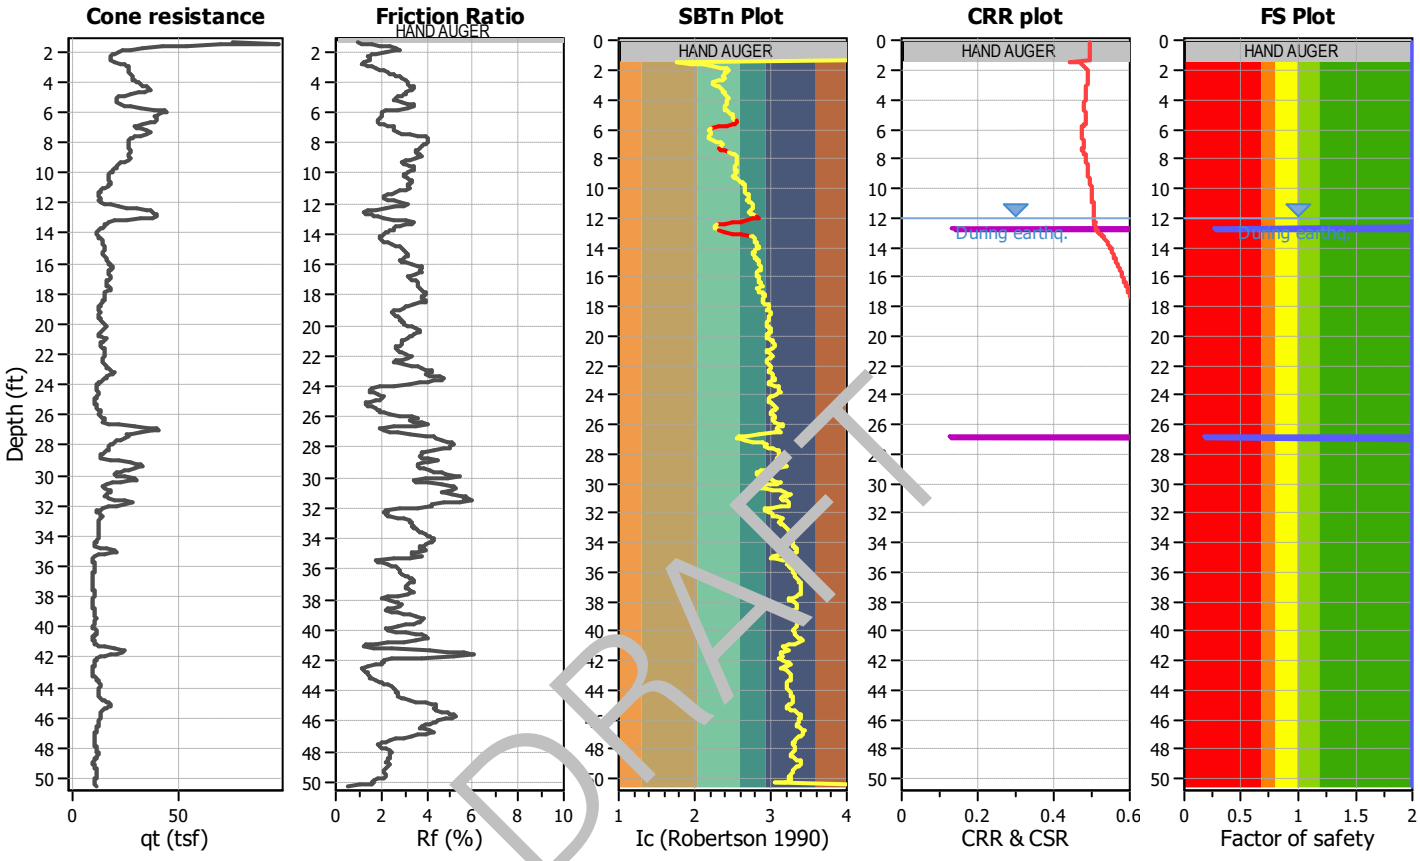
LIQUEFACTION ANALYSIS REPORT

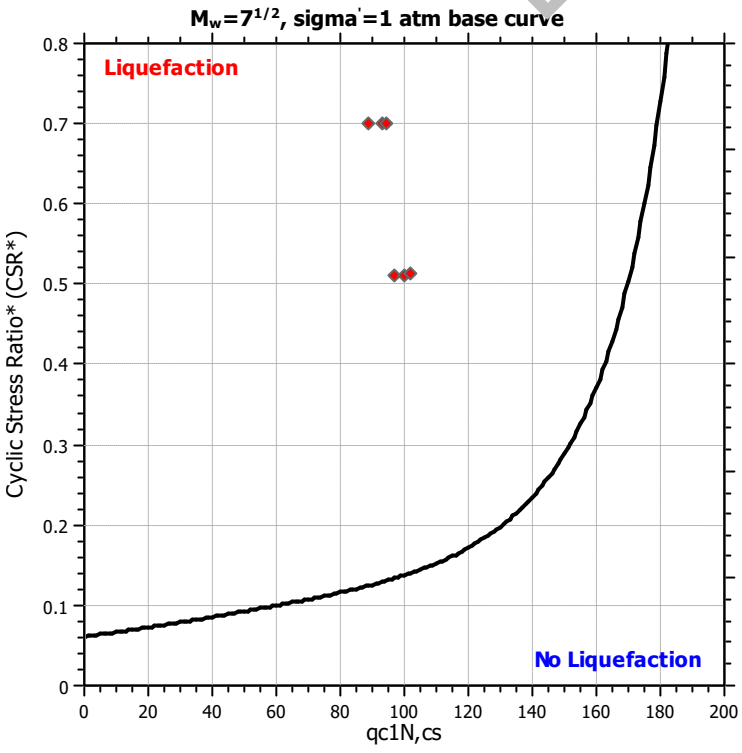
Project title : **Location :**

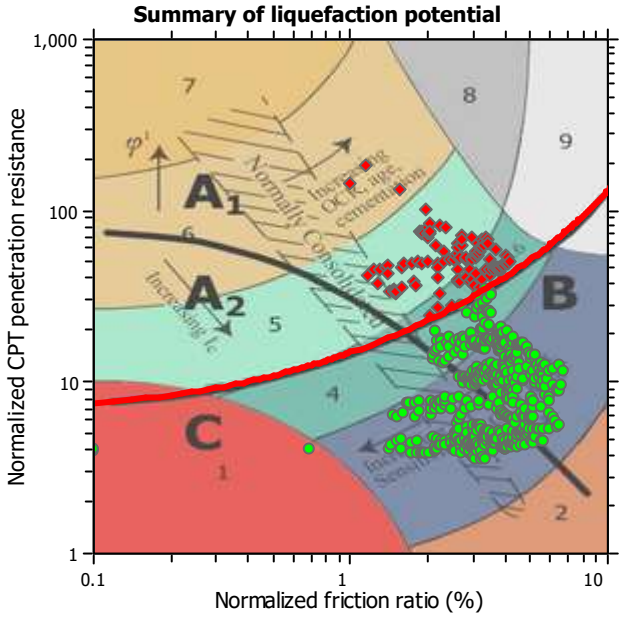
CPT file : CPT-6

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

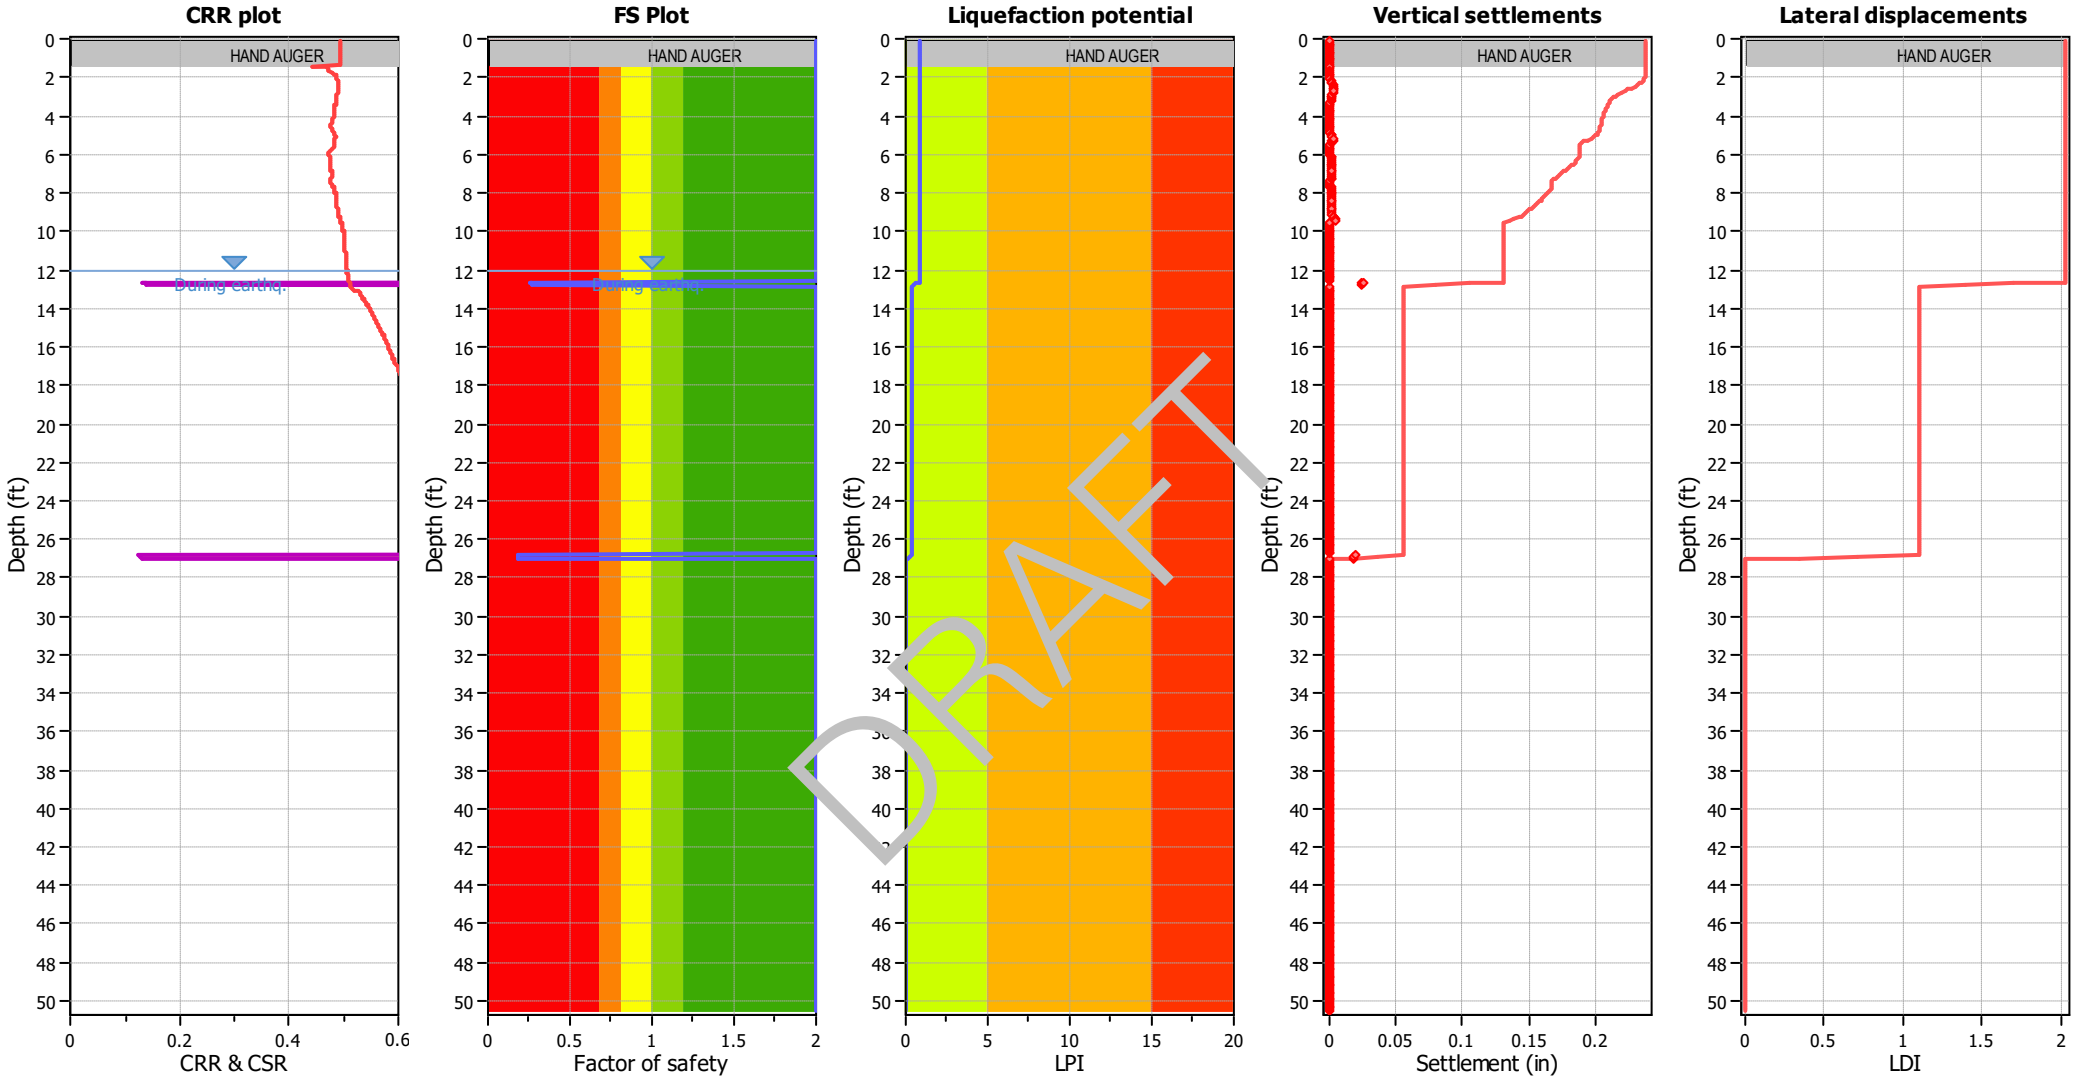






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

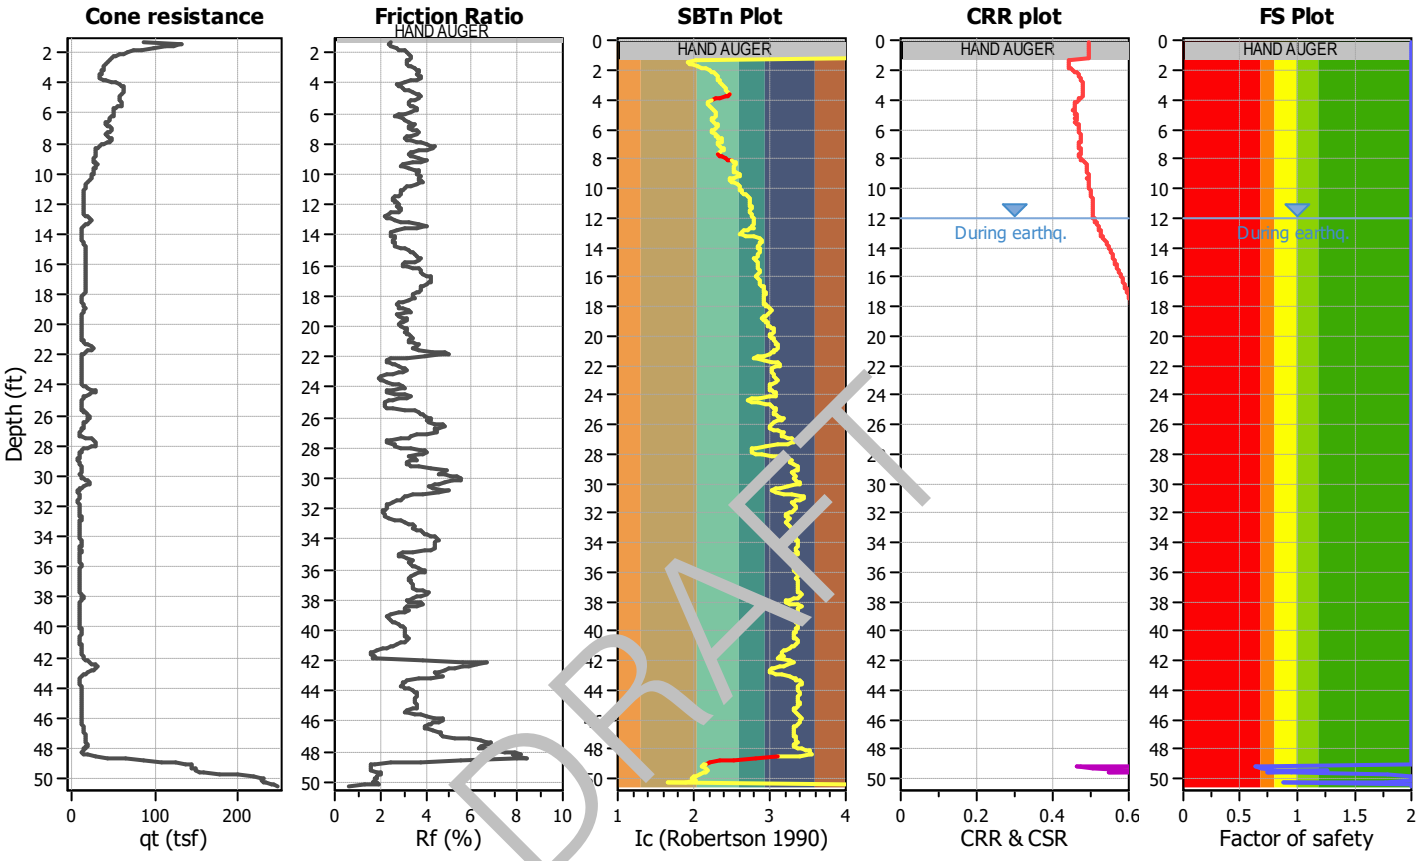
LIQUEFACTION ANALYSIS REPORT

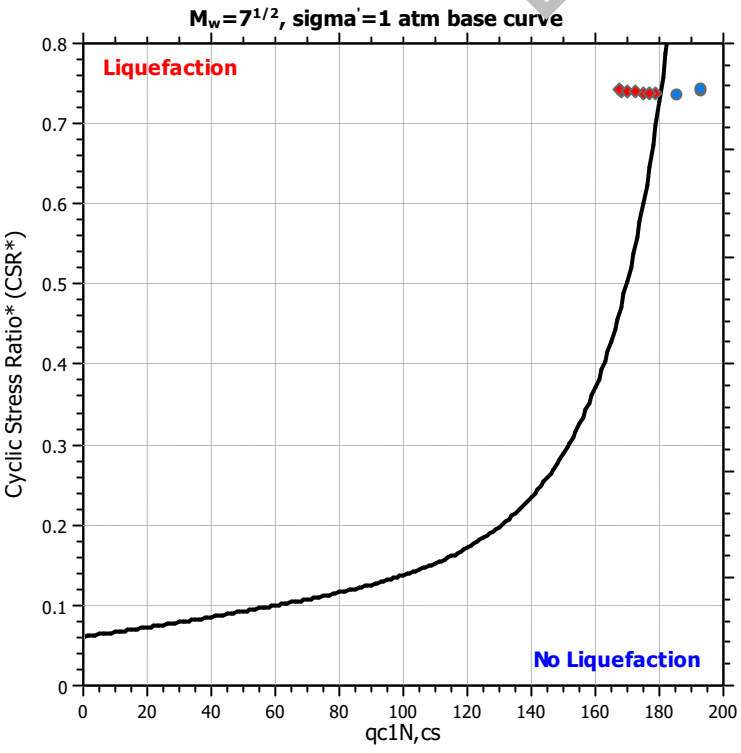
Project title : **Location :**

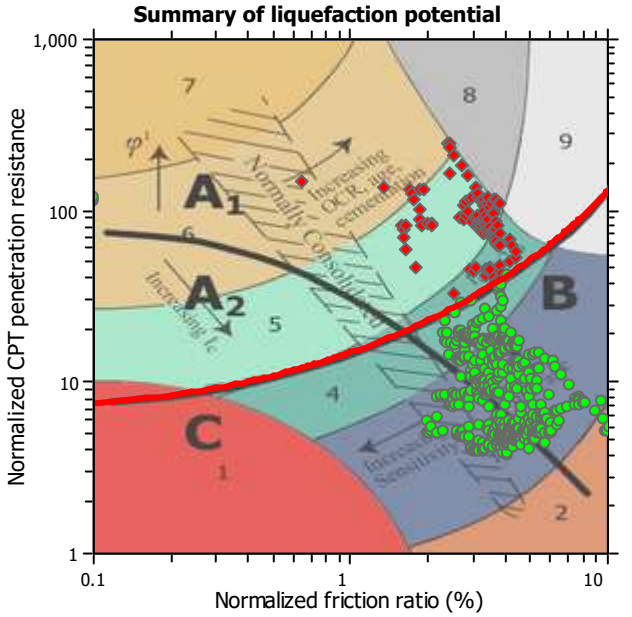
CPT file : CPT-7

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

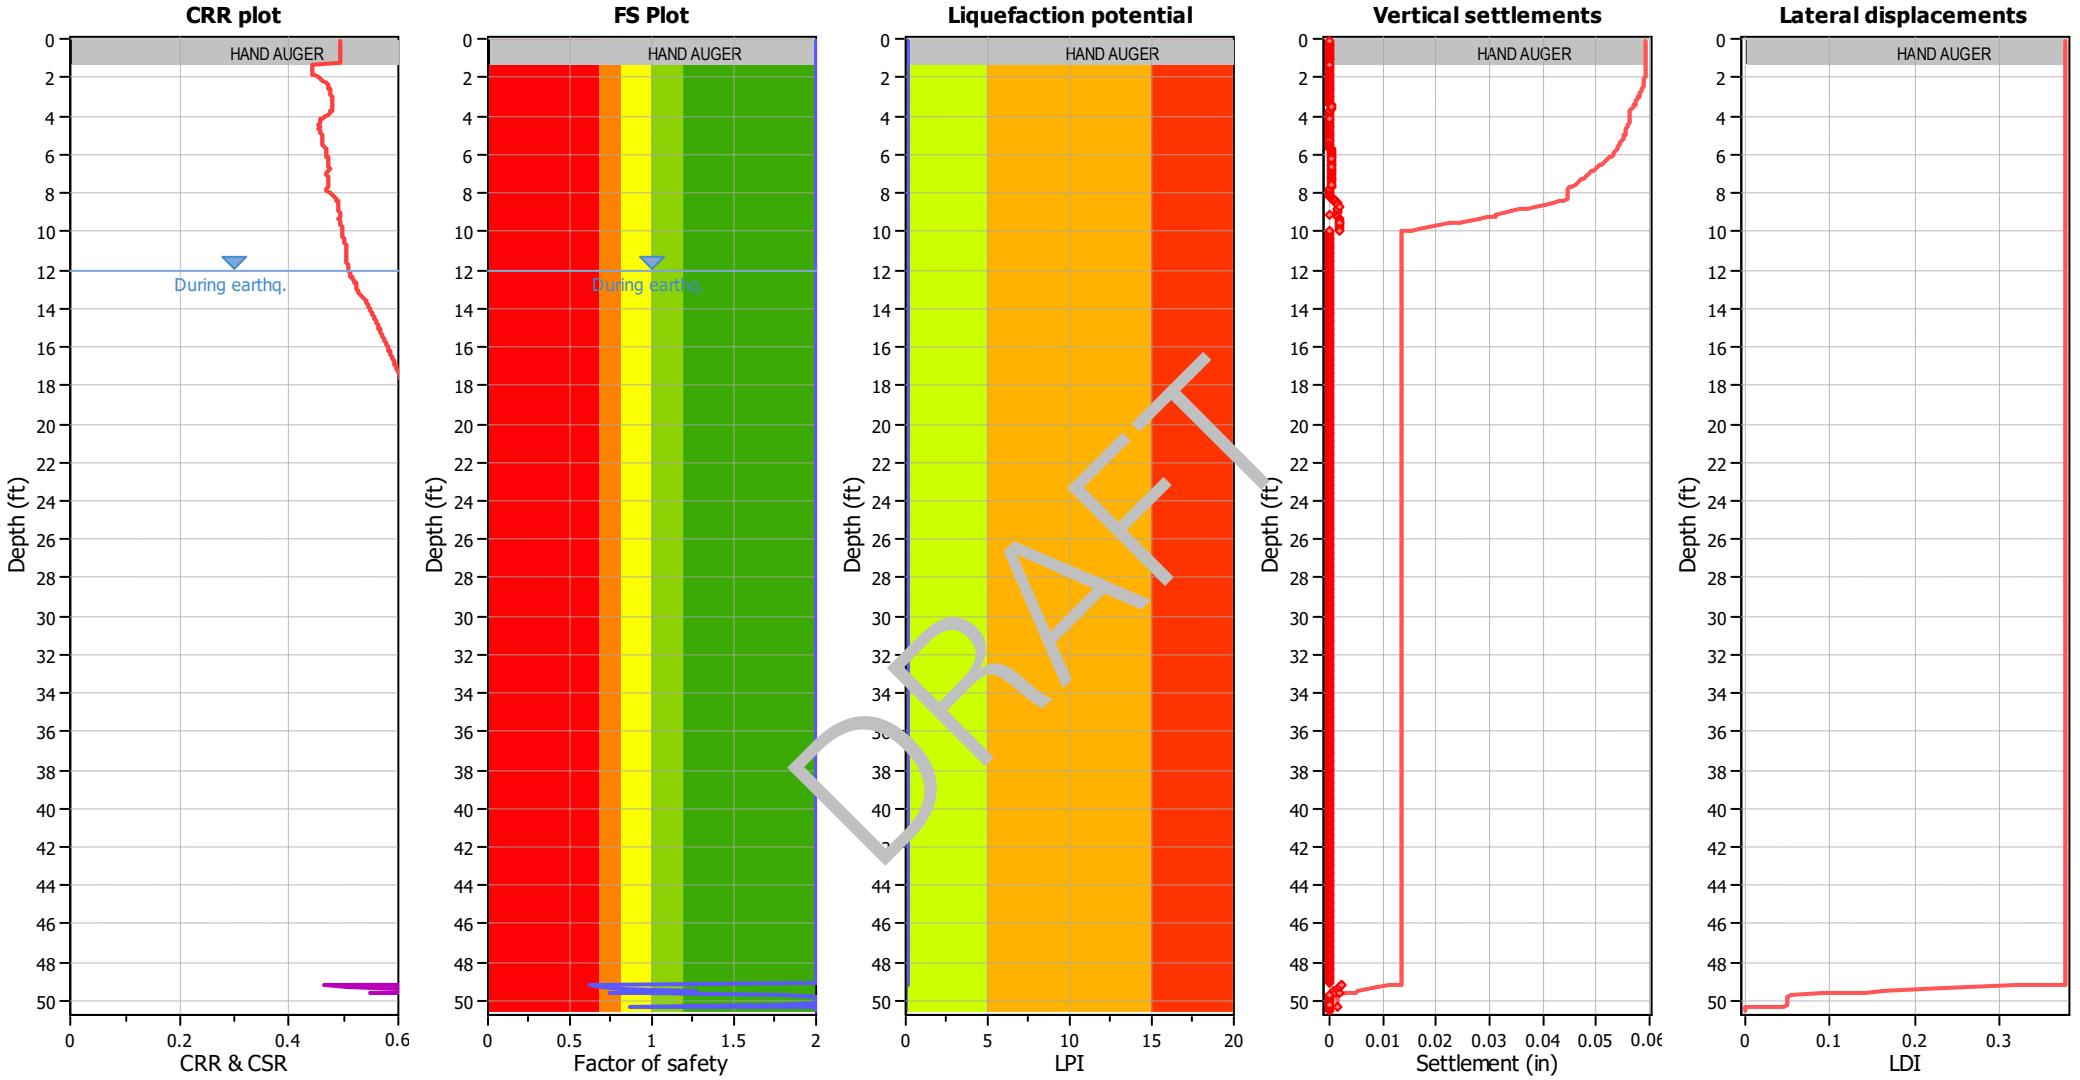






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



DRAFT

Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

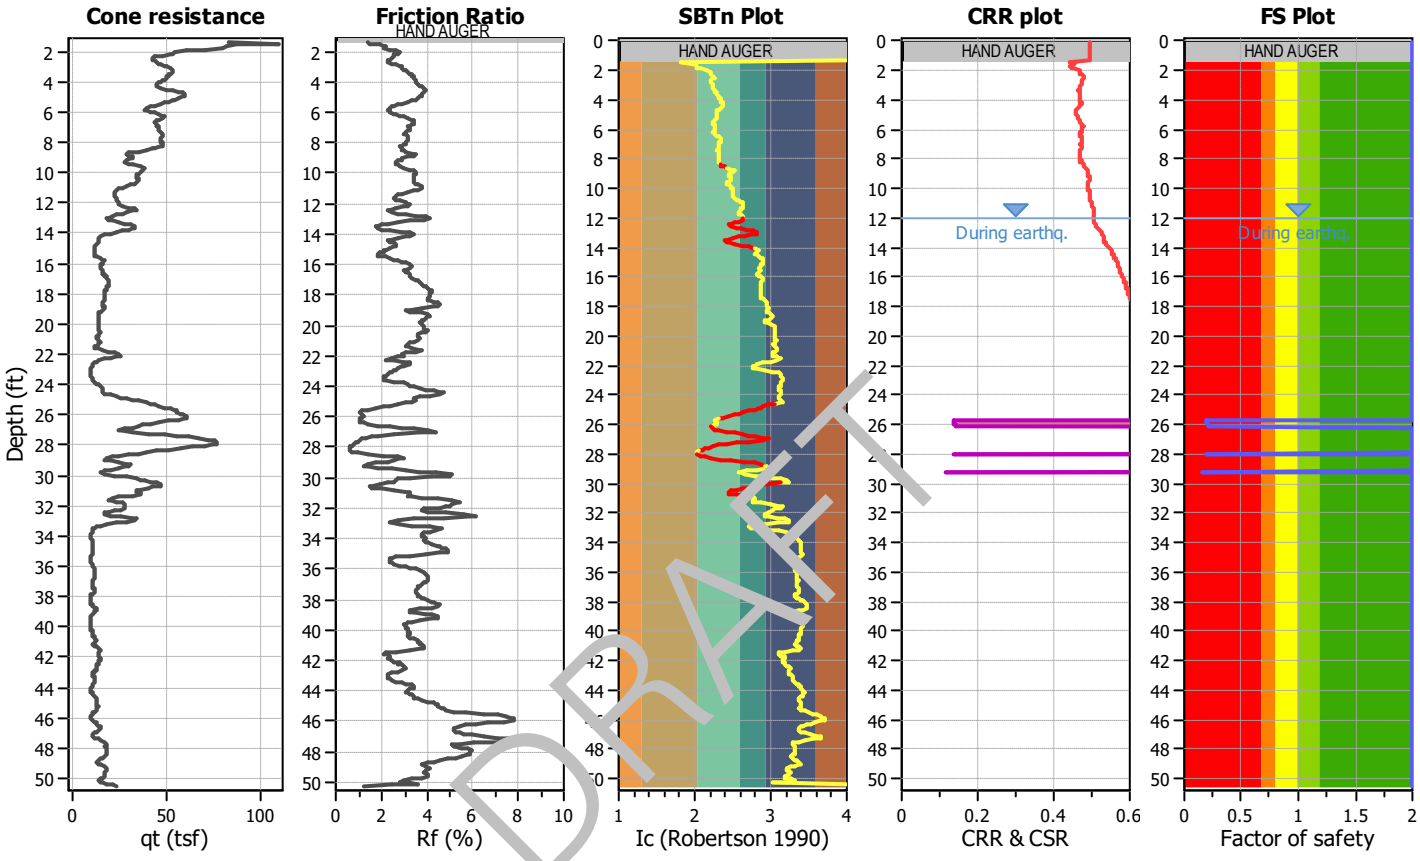
LIQUEFACTION ANALYSIS REPORT

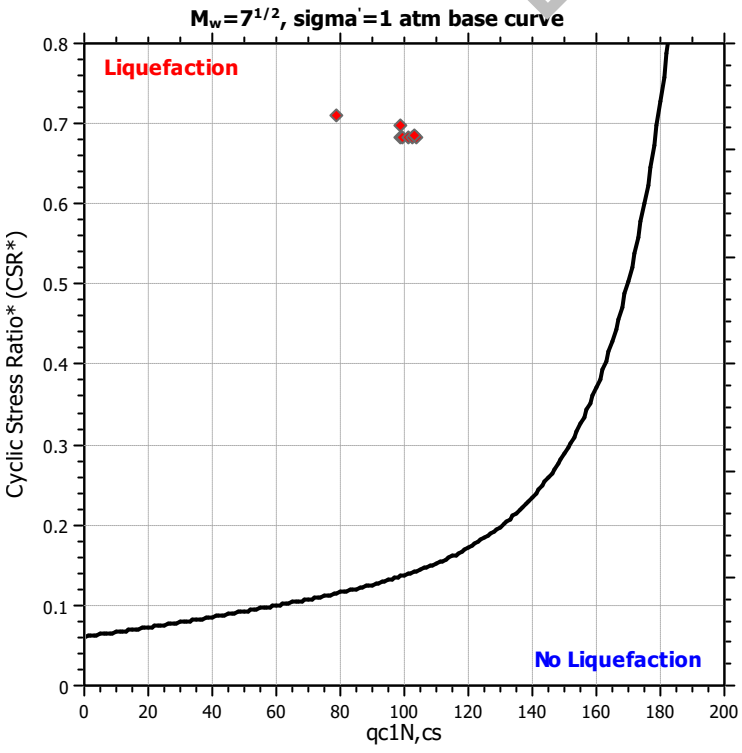
Project title : **Location :**

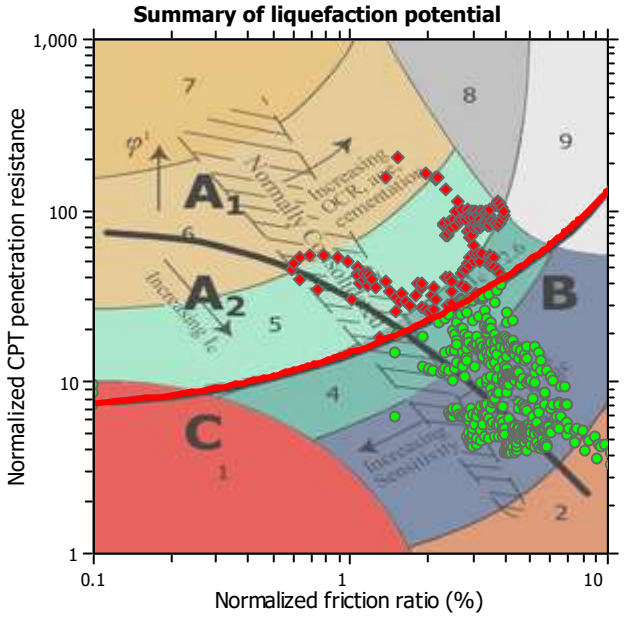
CPT file : CPT-8

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

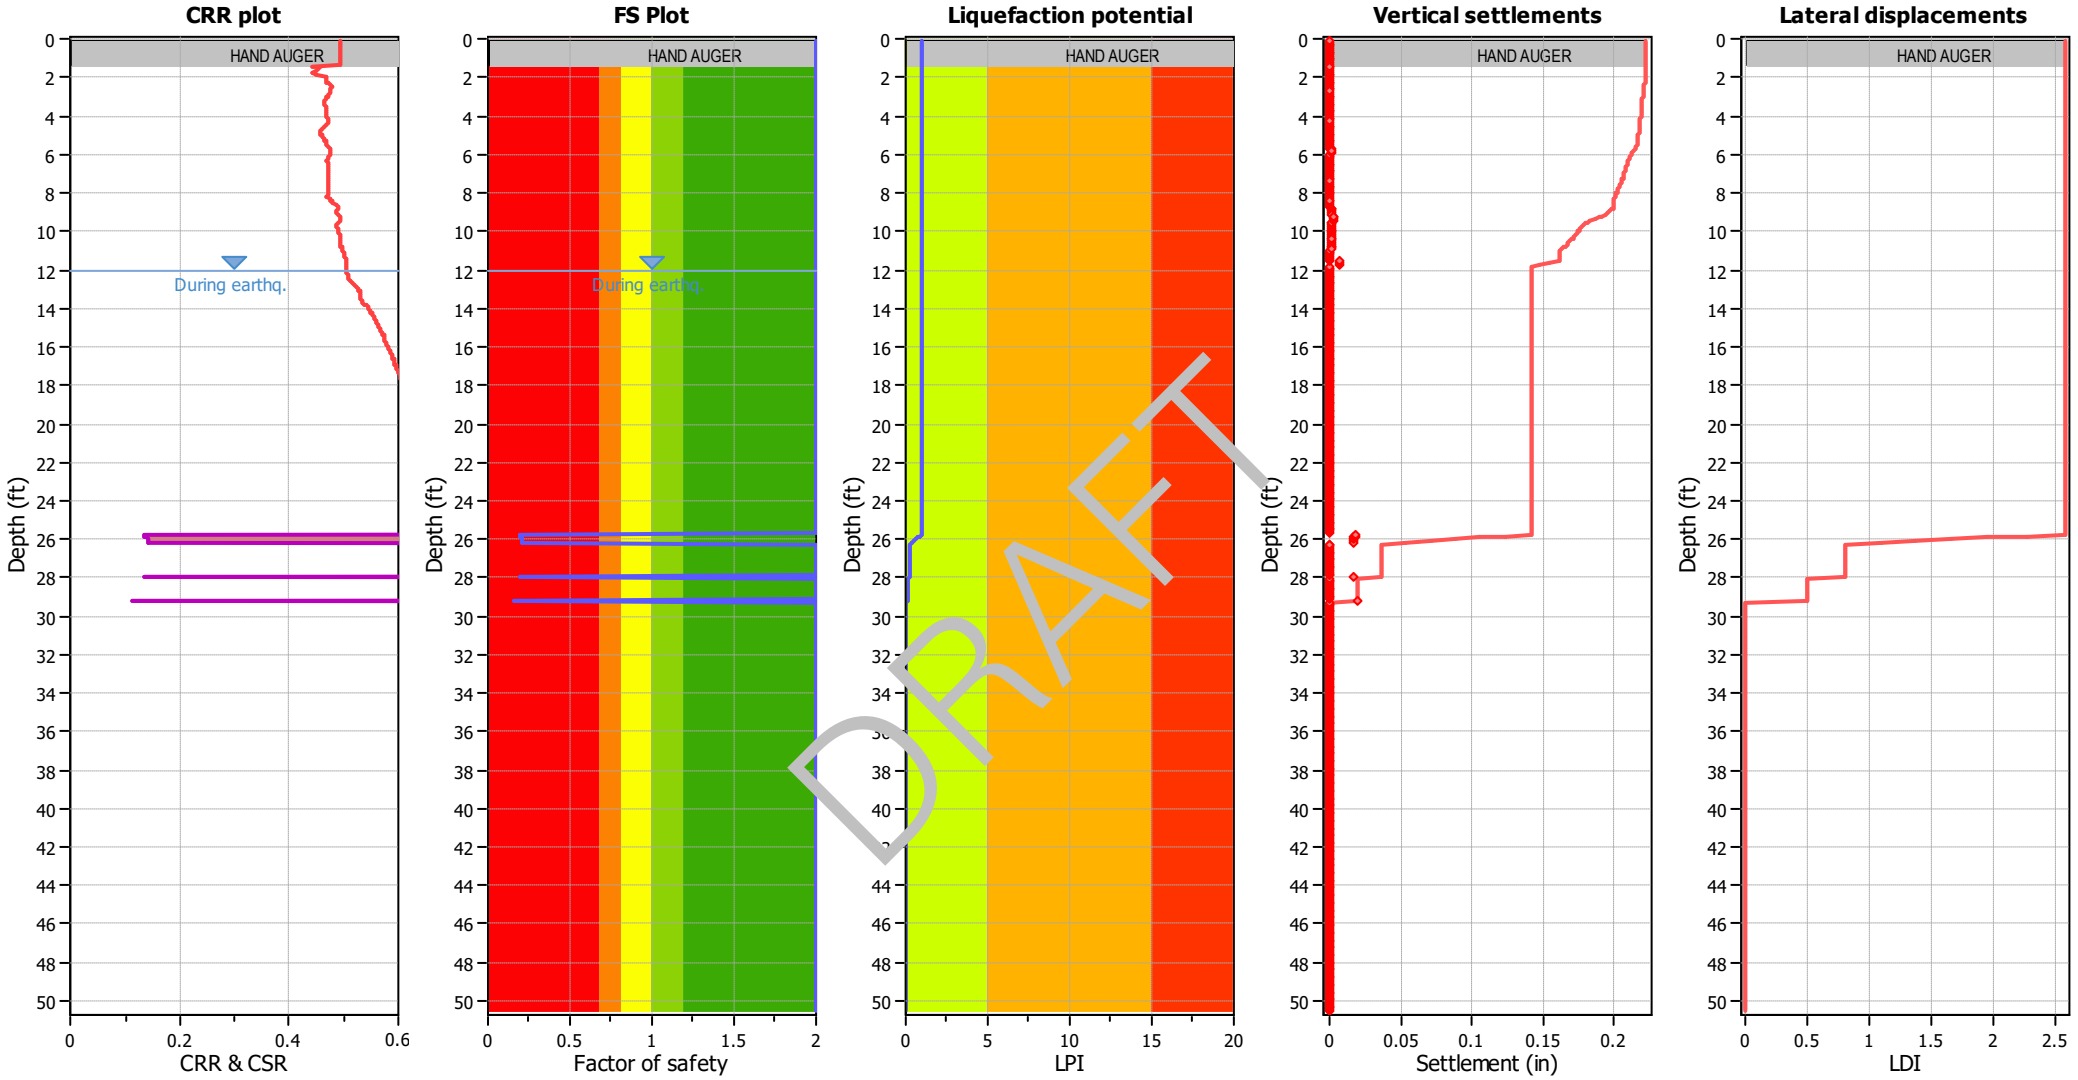






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

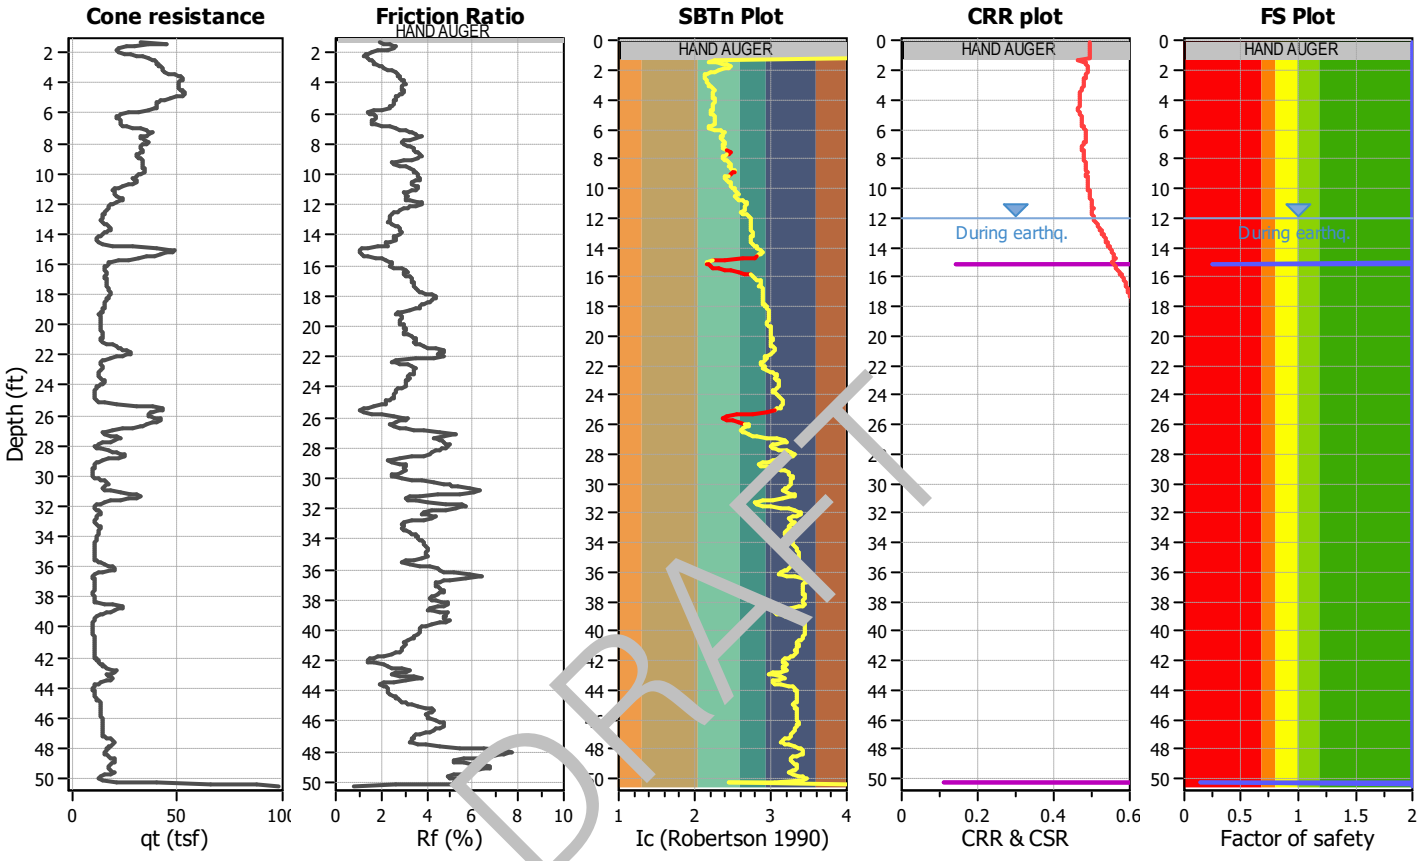
LIQUEFACTION ANALYSIS REPORT

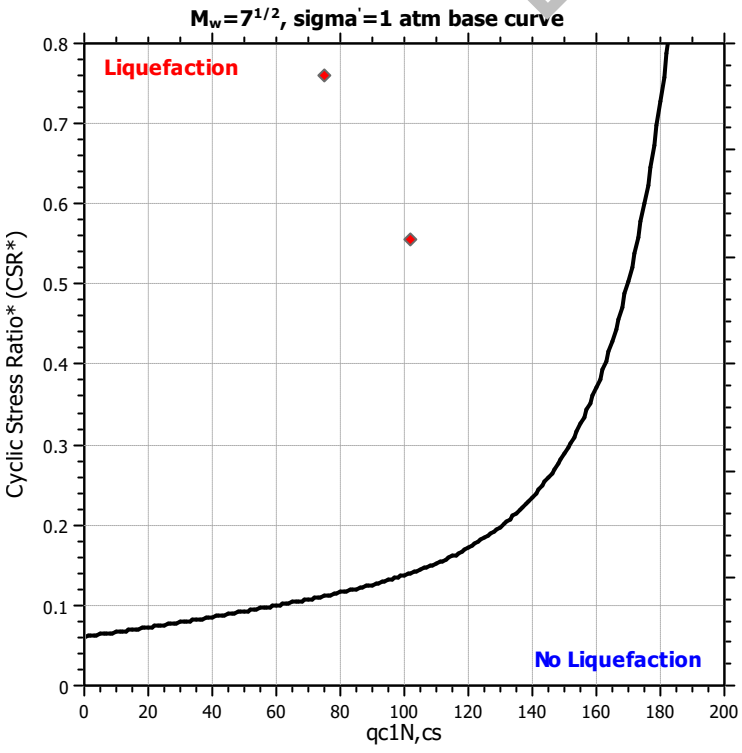
Project title : **Location :**

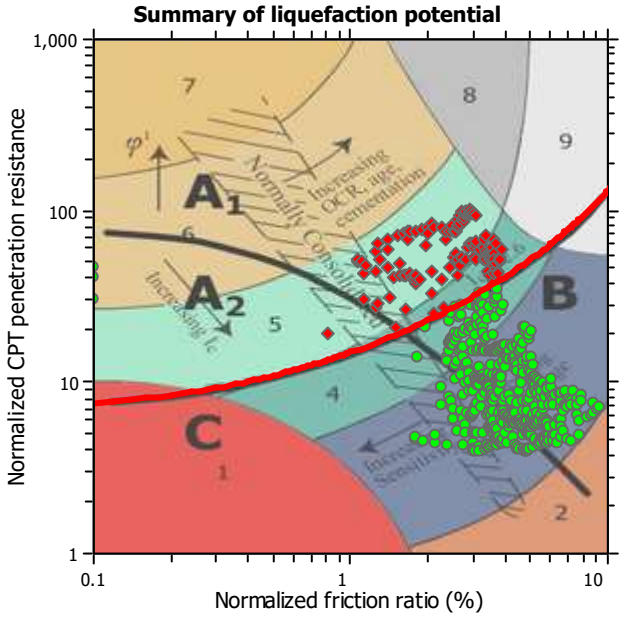
CPT file : CPT-9

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

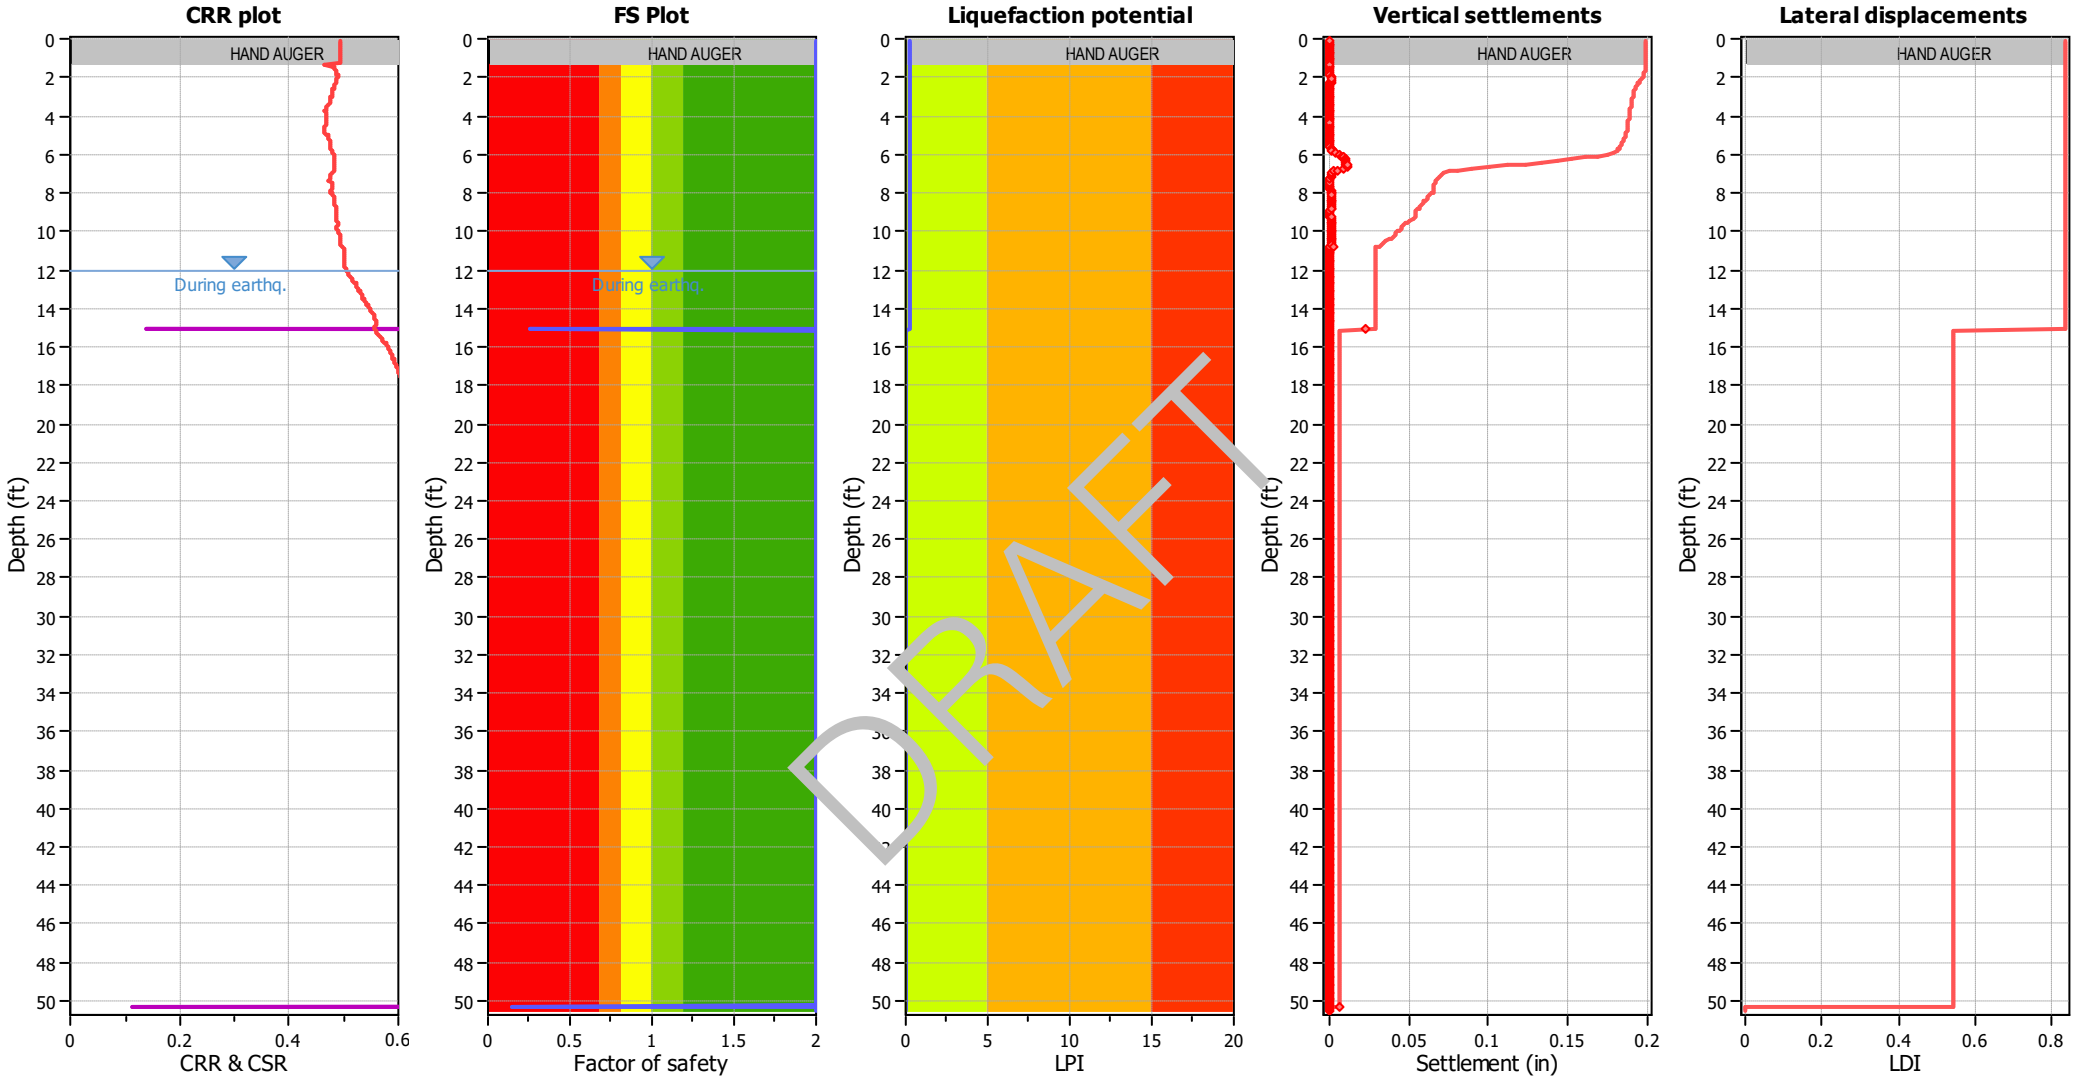






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

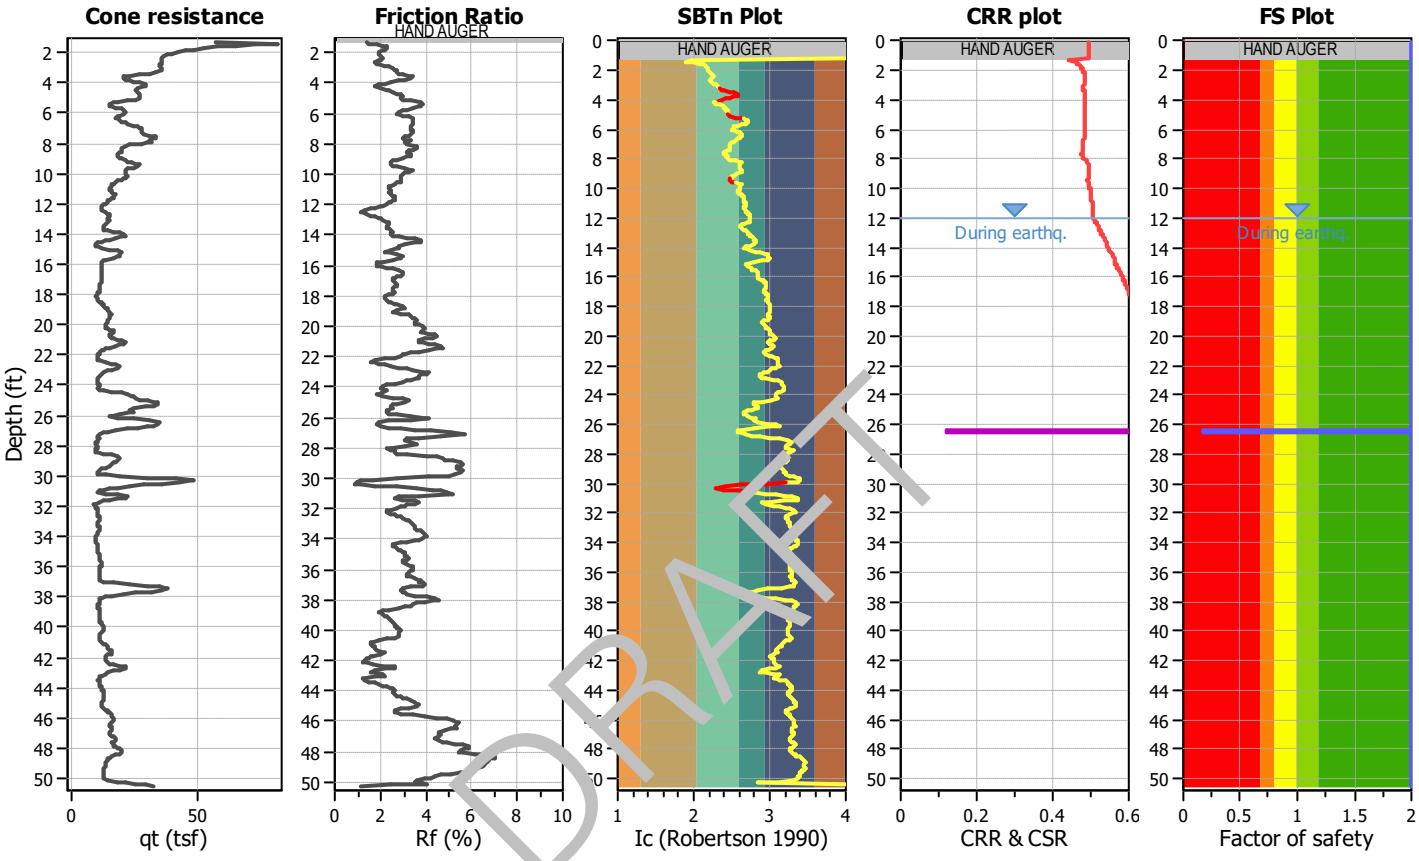
LIQUEFACTION ANALYSIS REPORT

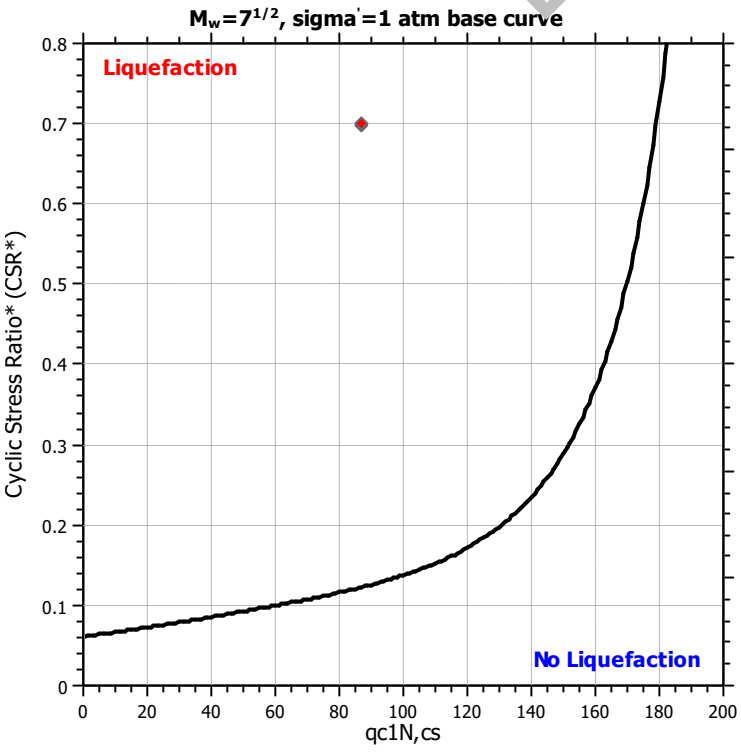
Project title : **Location :**

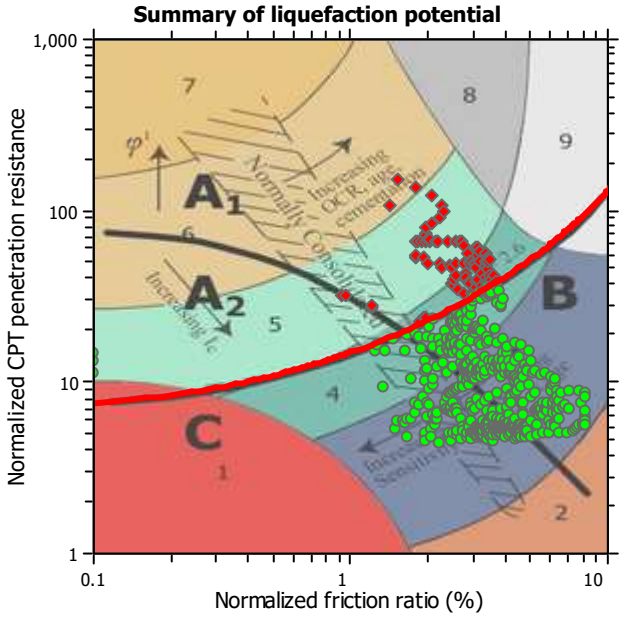
CPT file : CPT-10

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

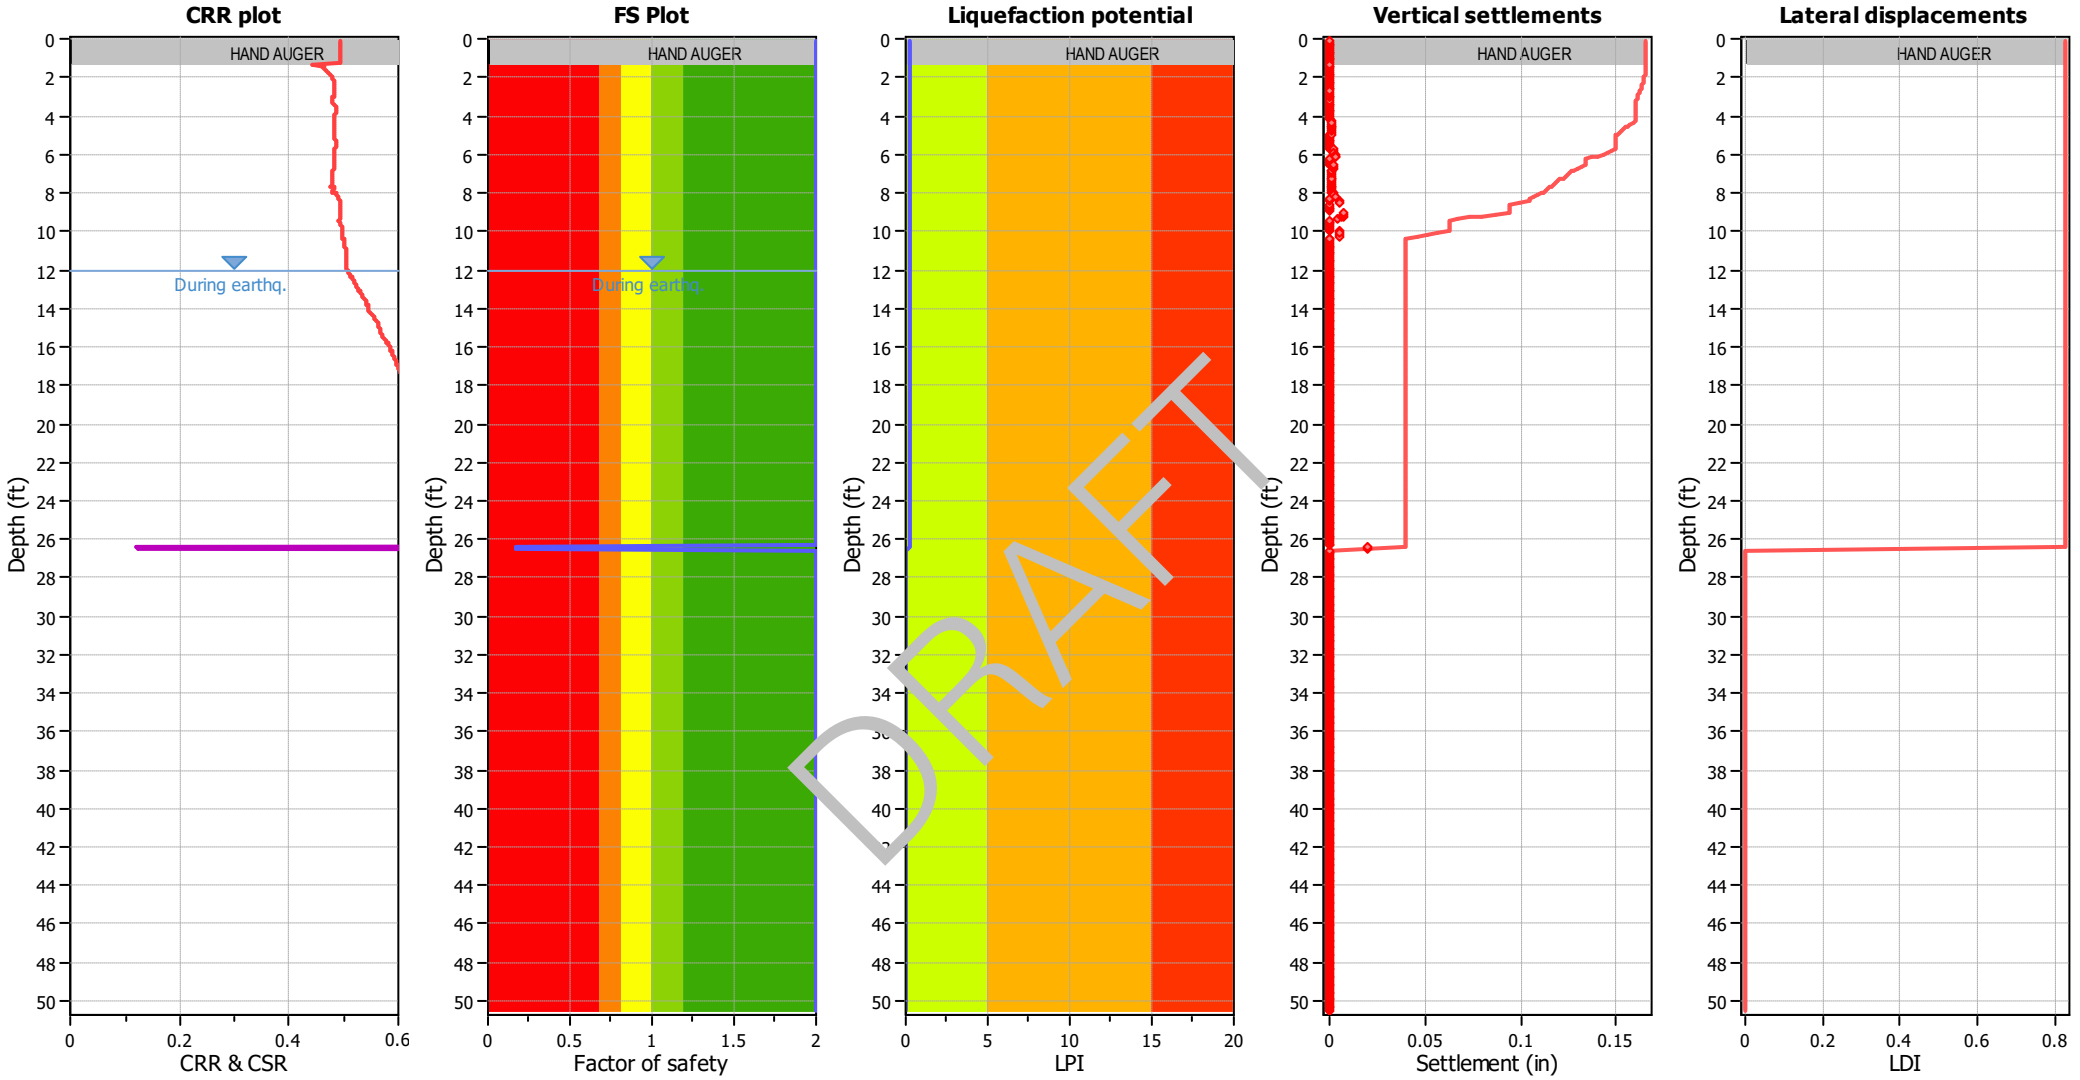






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



DRAFT

Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

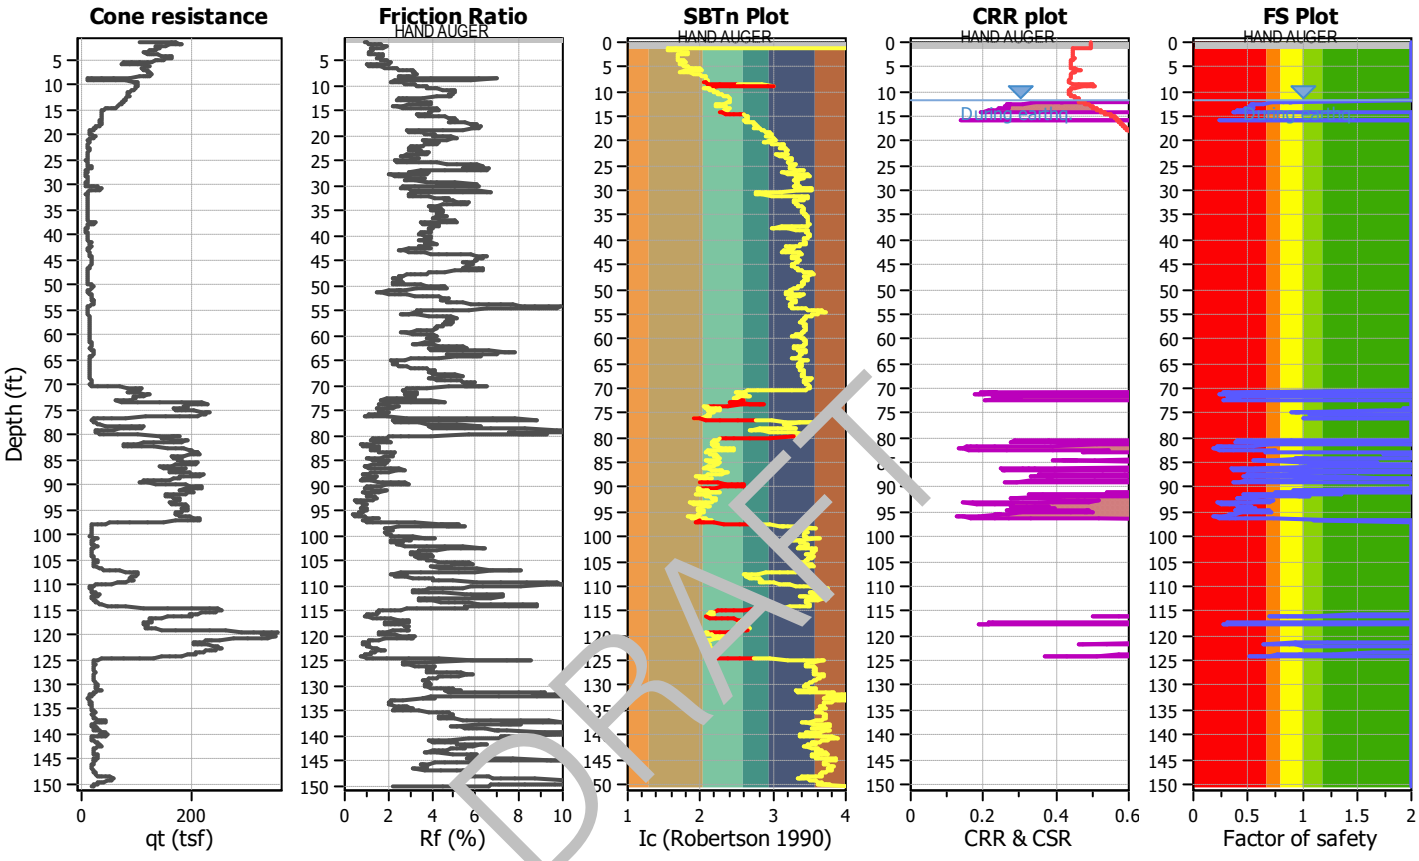
LIQUEFACTION ANALYSIS REPORT

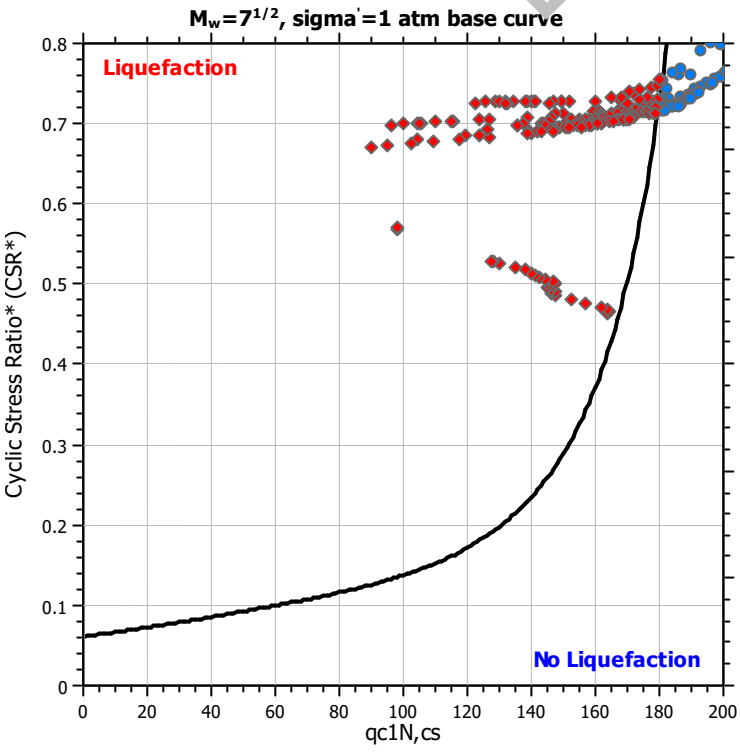
Project title : **Location :**

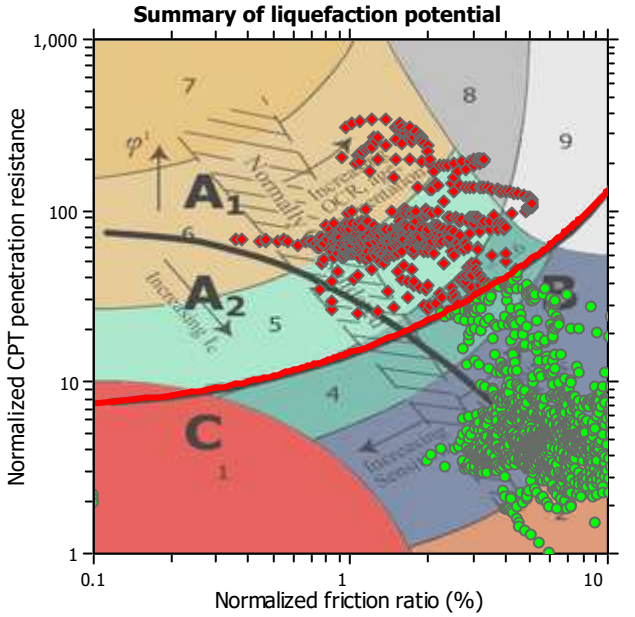
CPT file : CPT-11

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

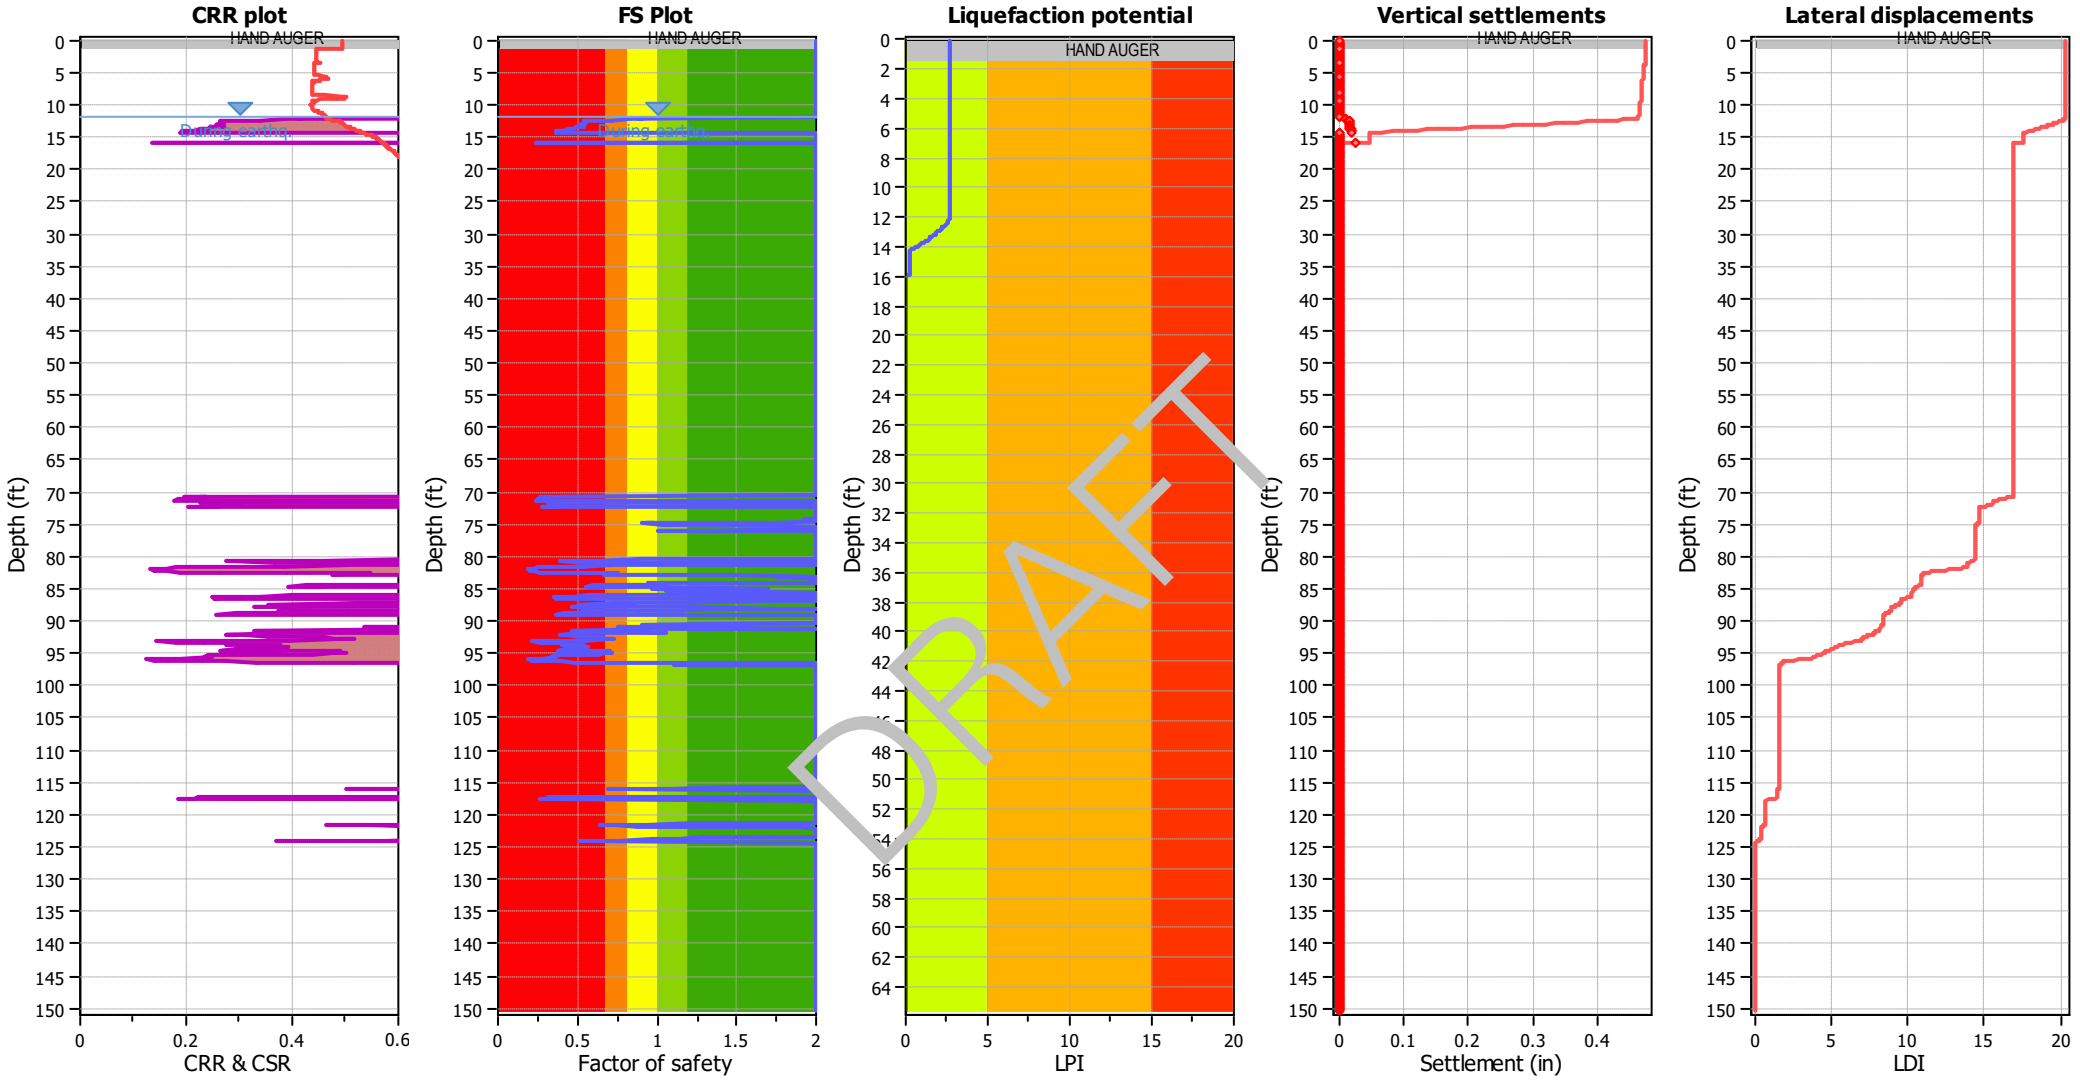






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

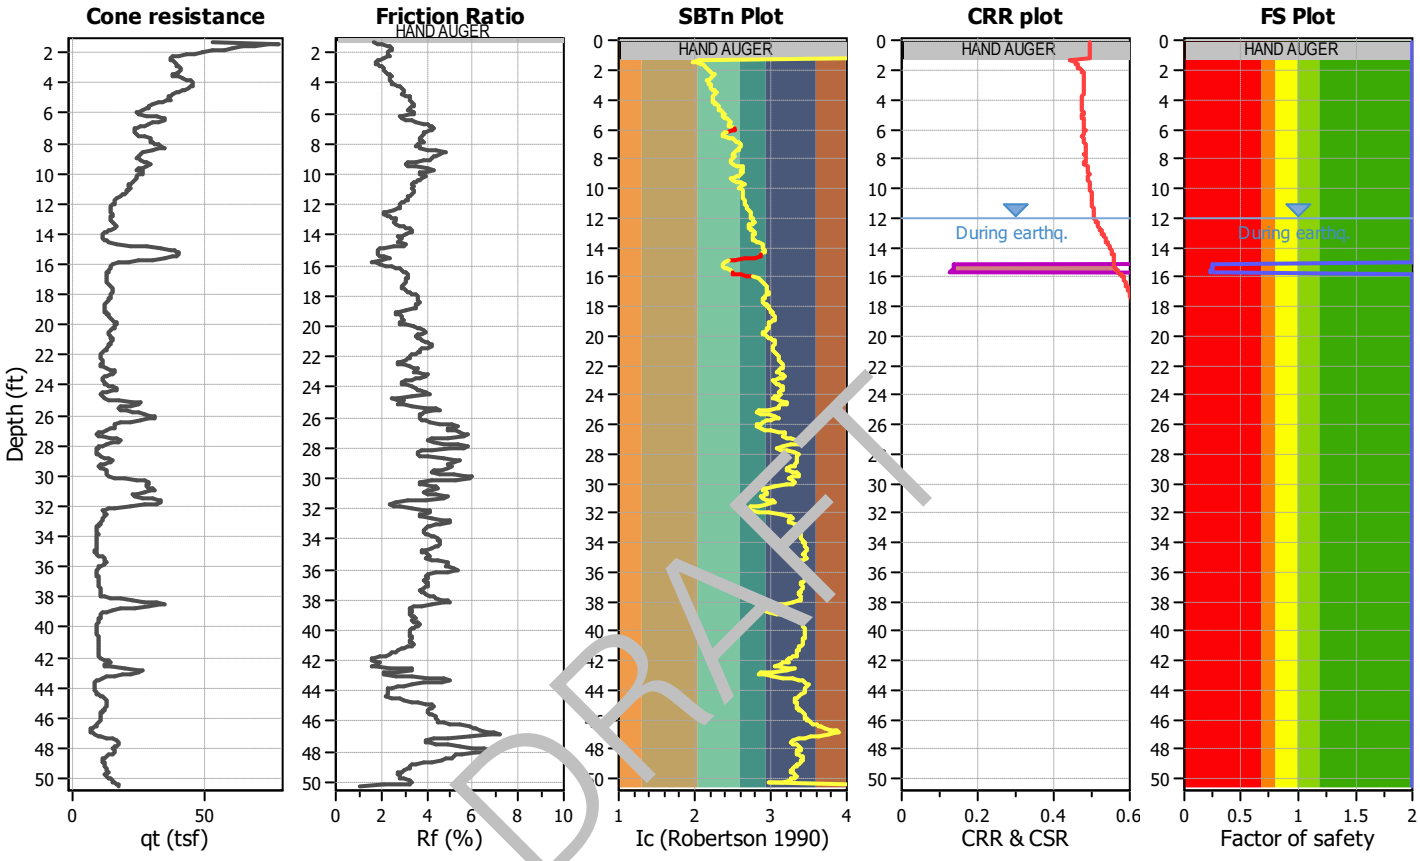
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

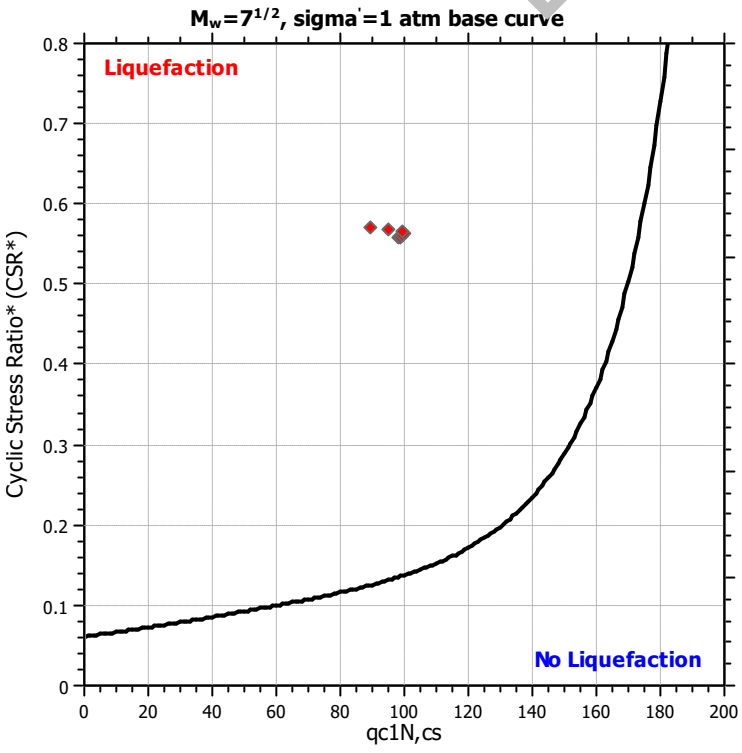
CPT file : CPT-12

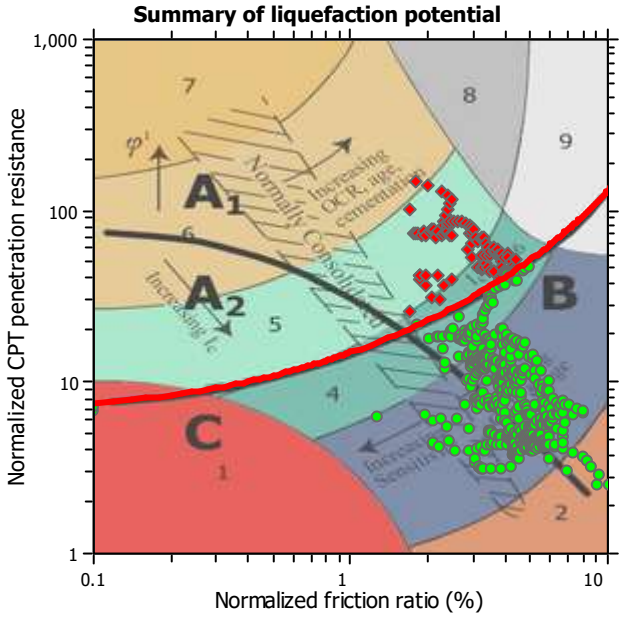
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



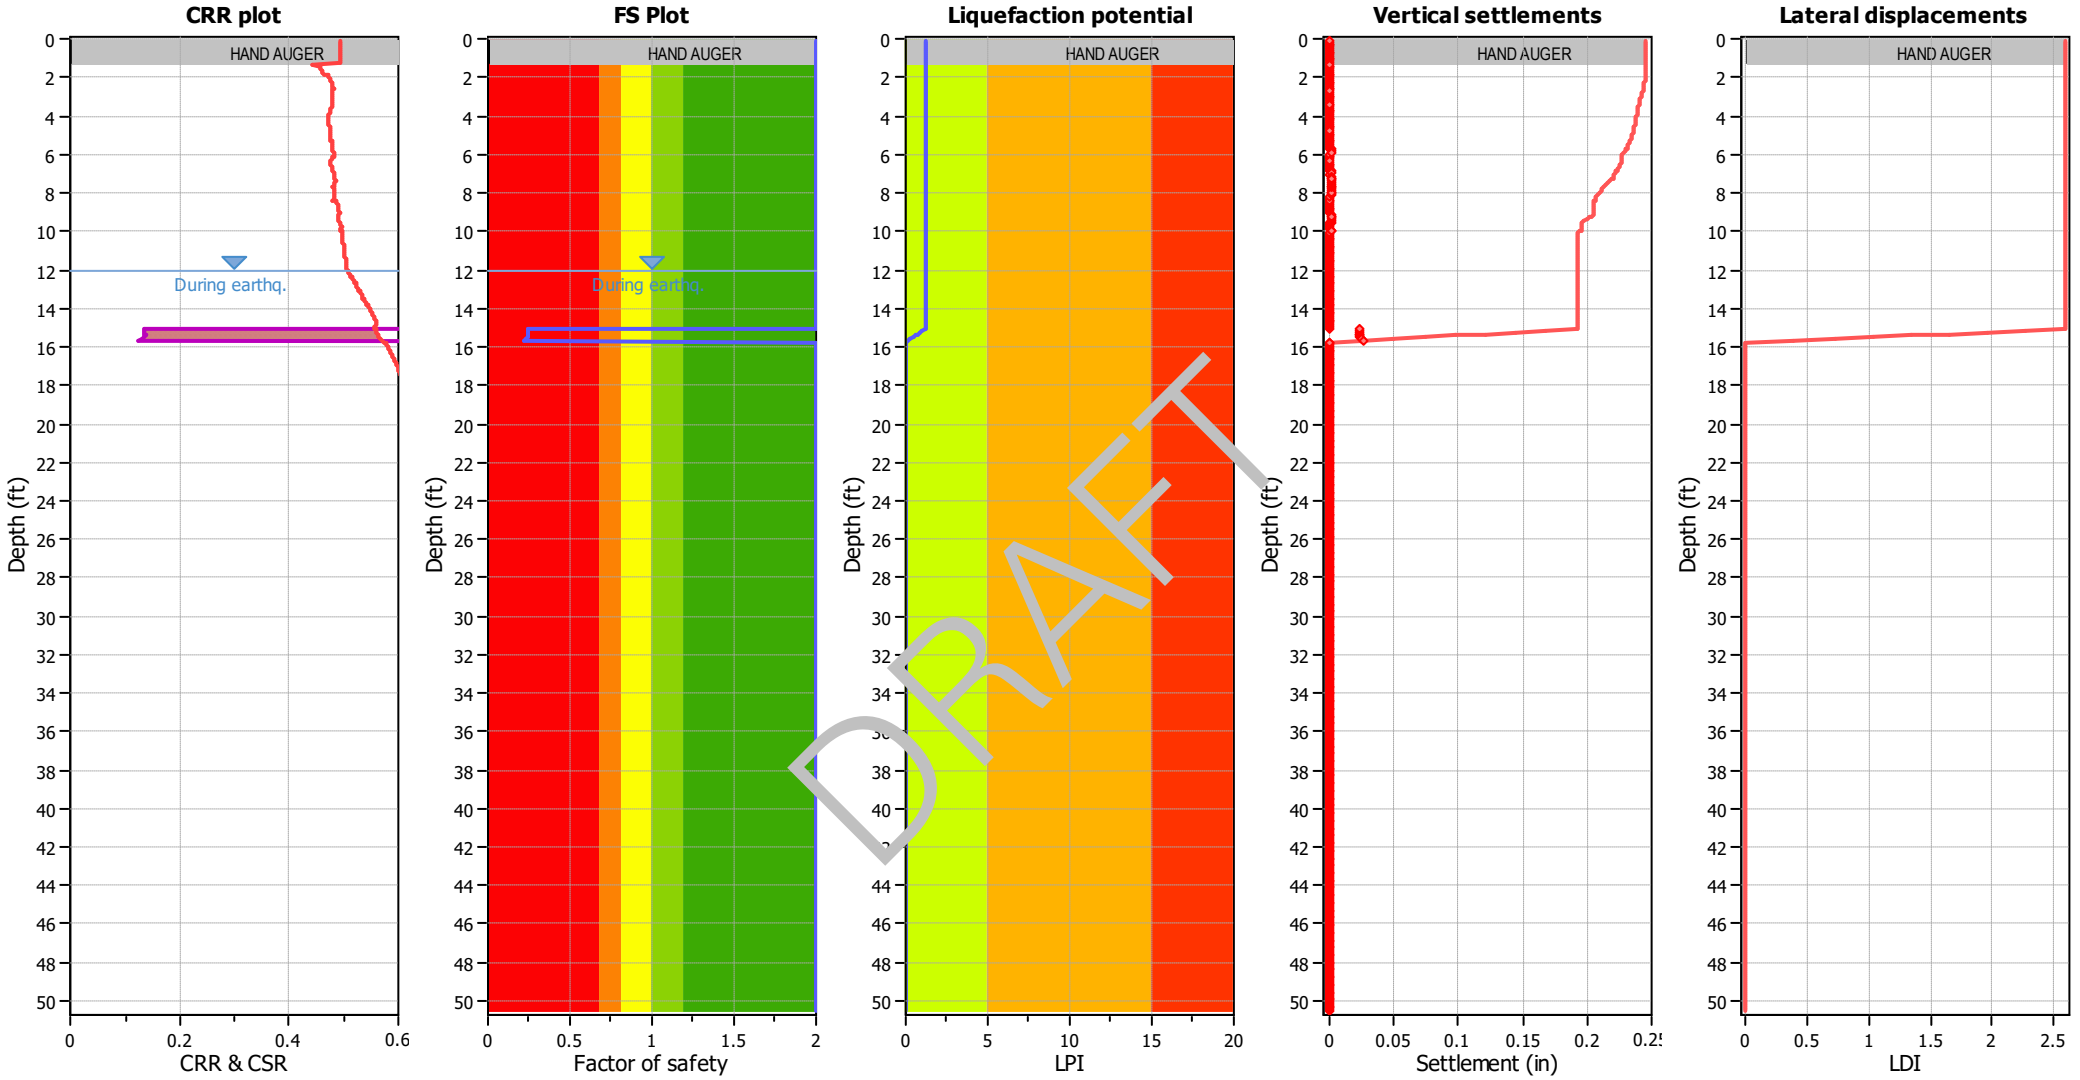
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



DRAFT

Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

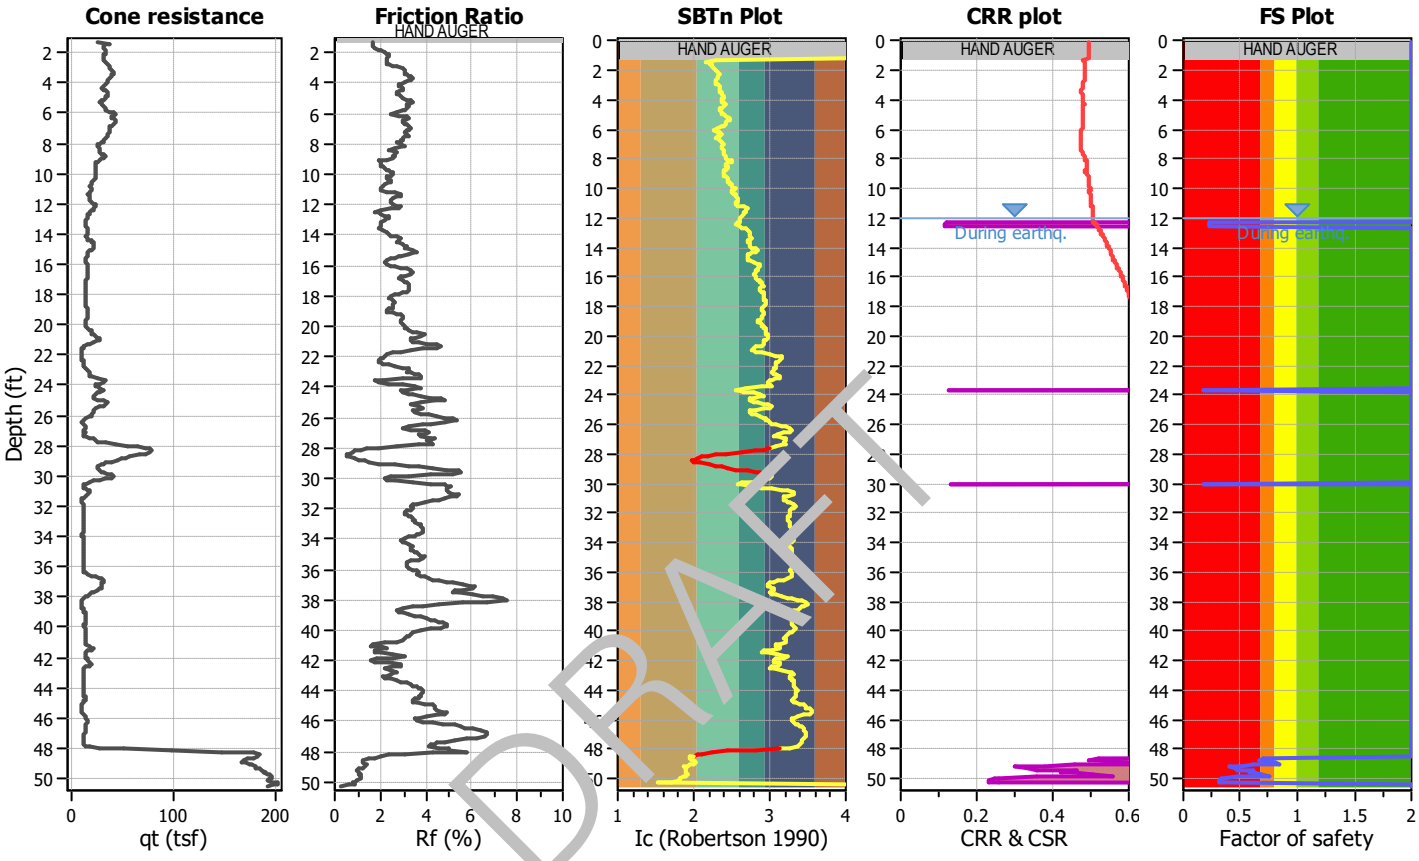
LIQUEFACTION ANALYSIS REPORT

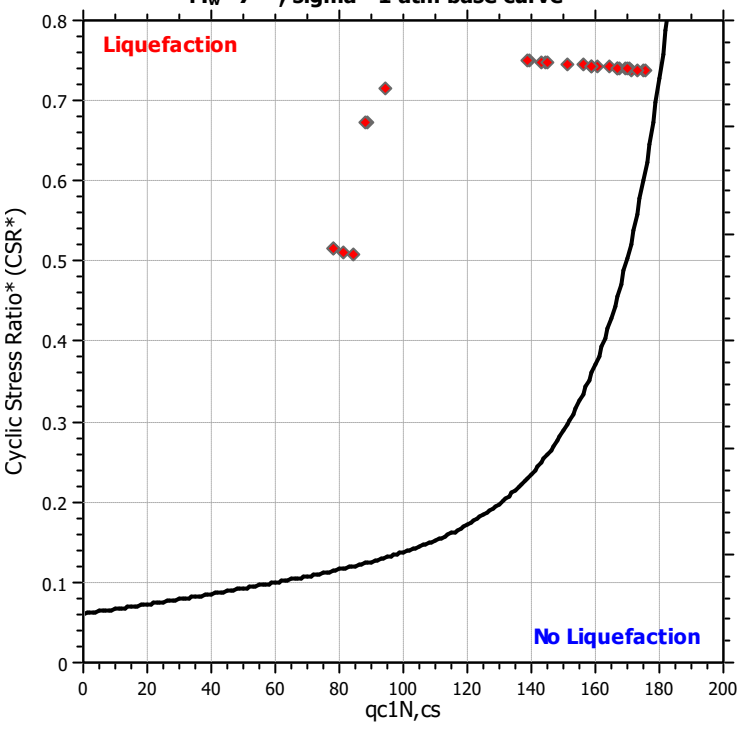
Project title : **Location :**

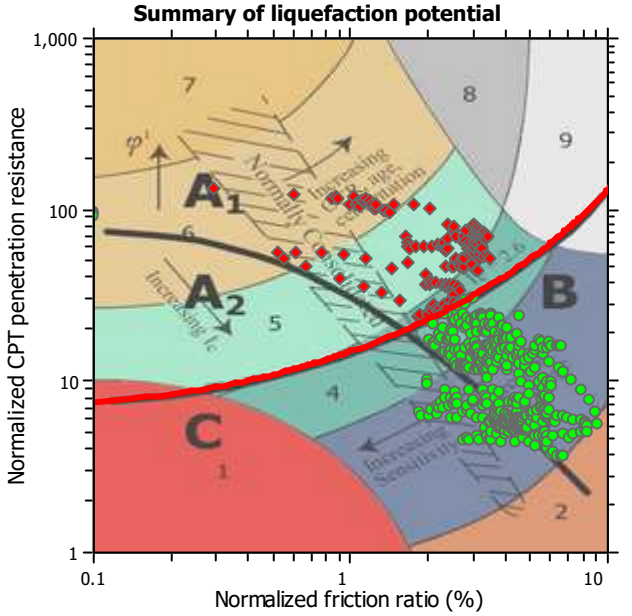
CPT file : CPT-13

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

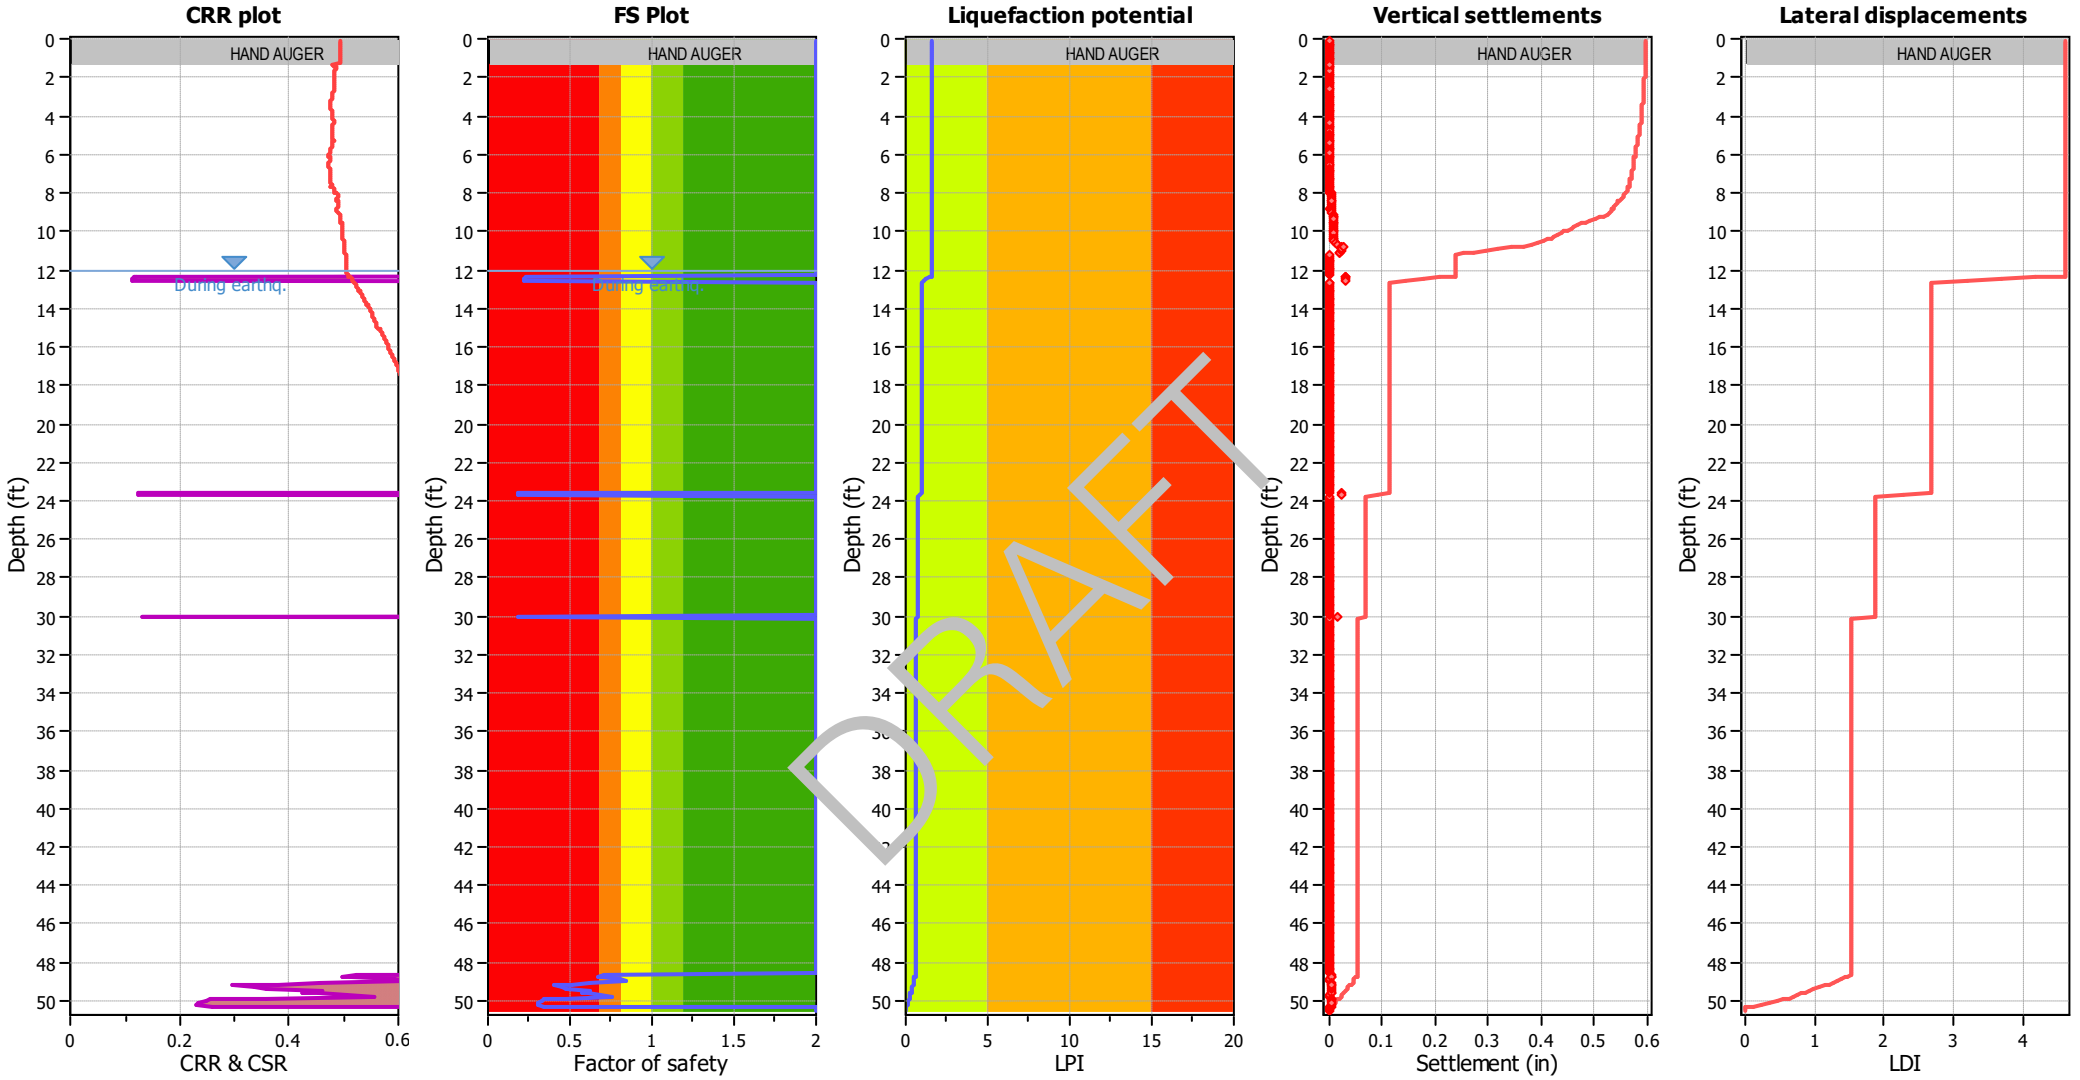






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

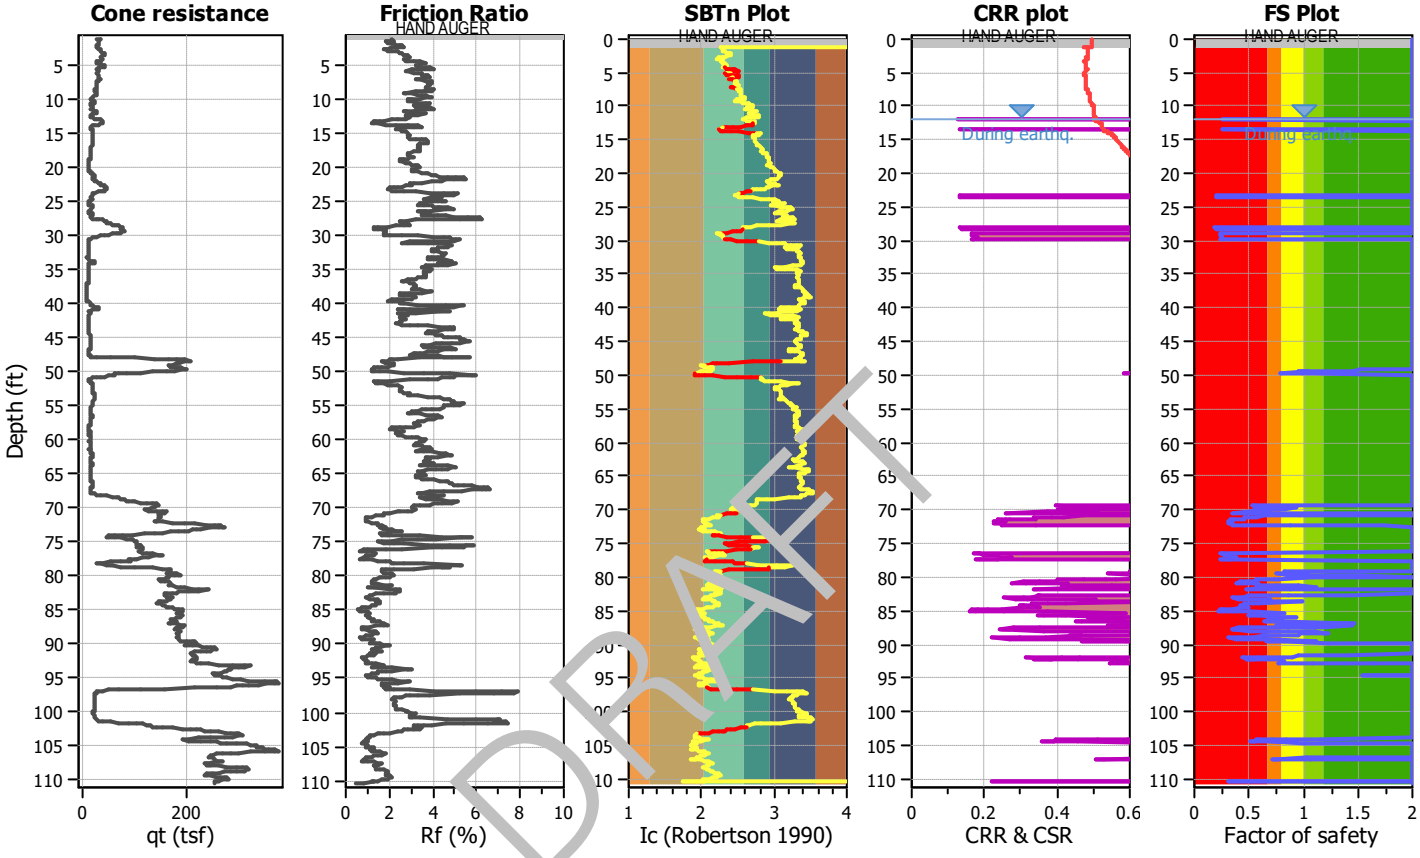
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

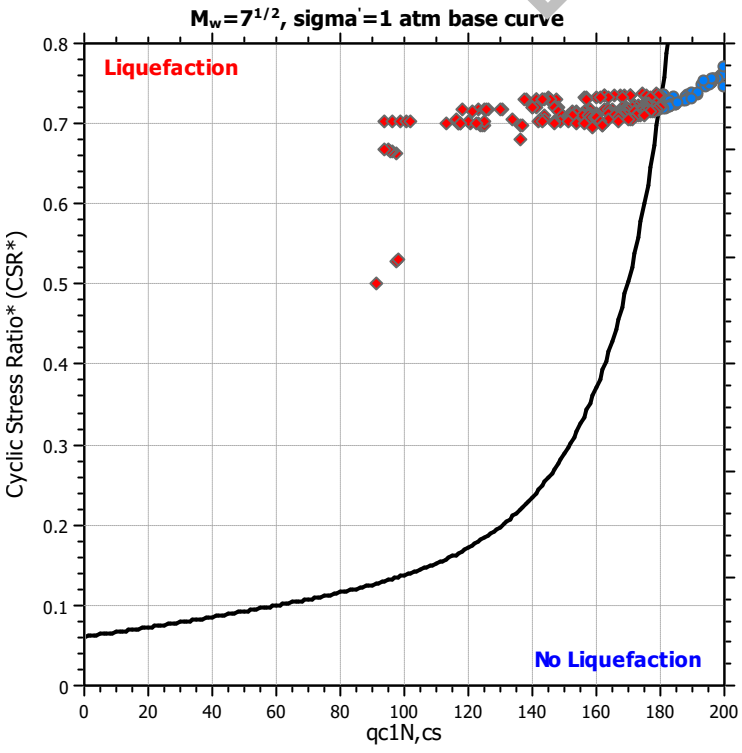
CPT file : CPT-14

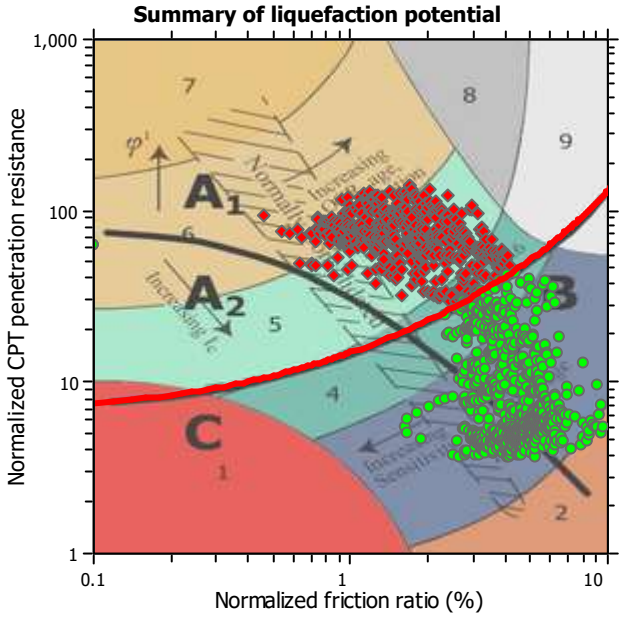
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



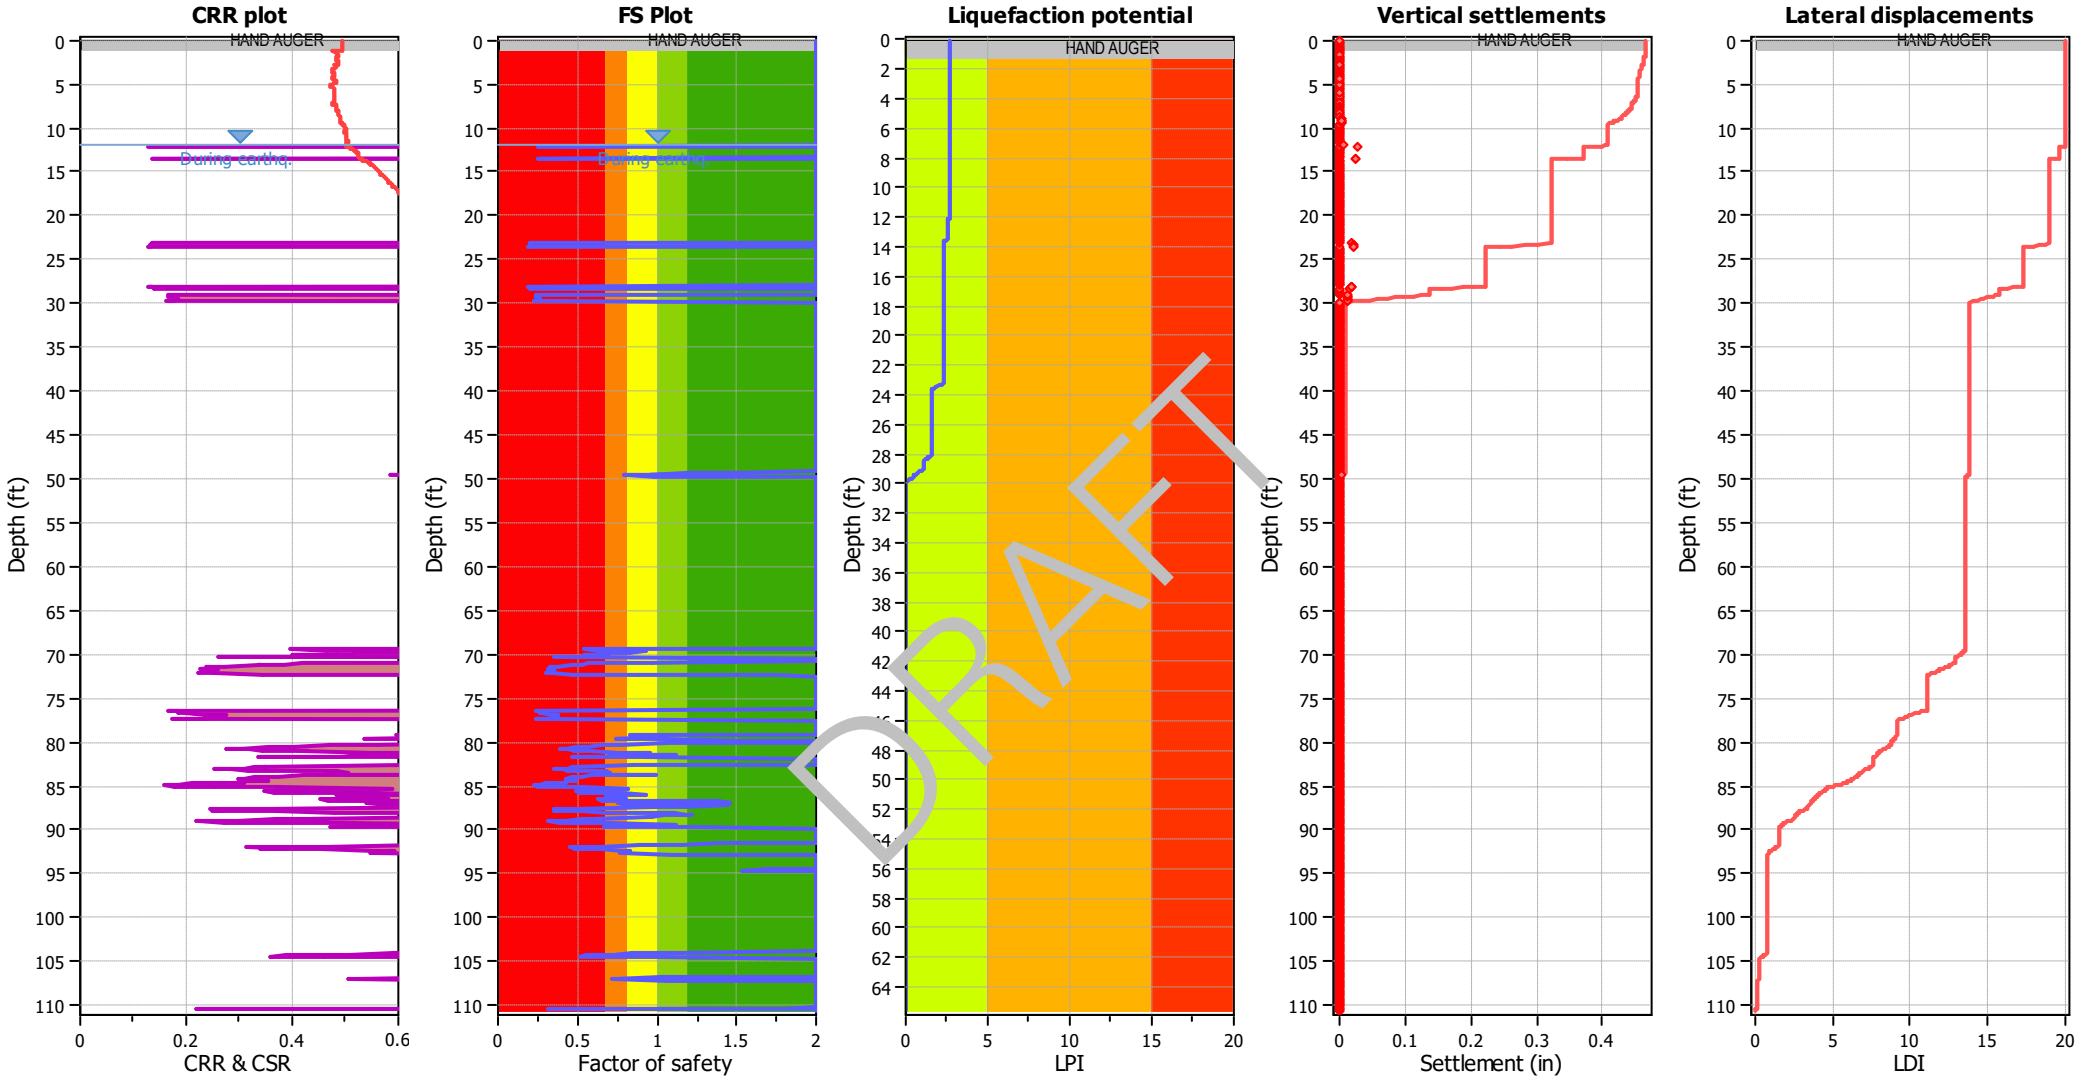
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

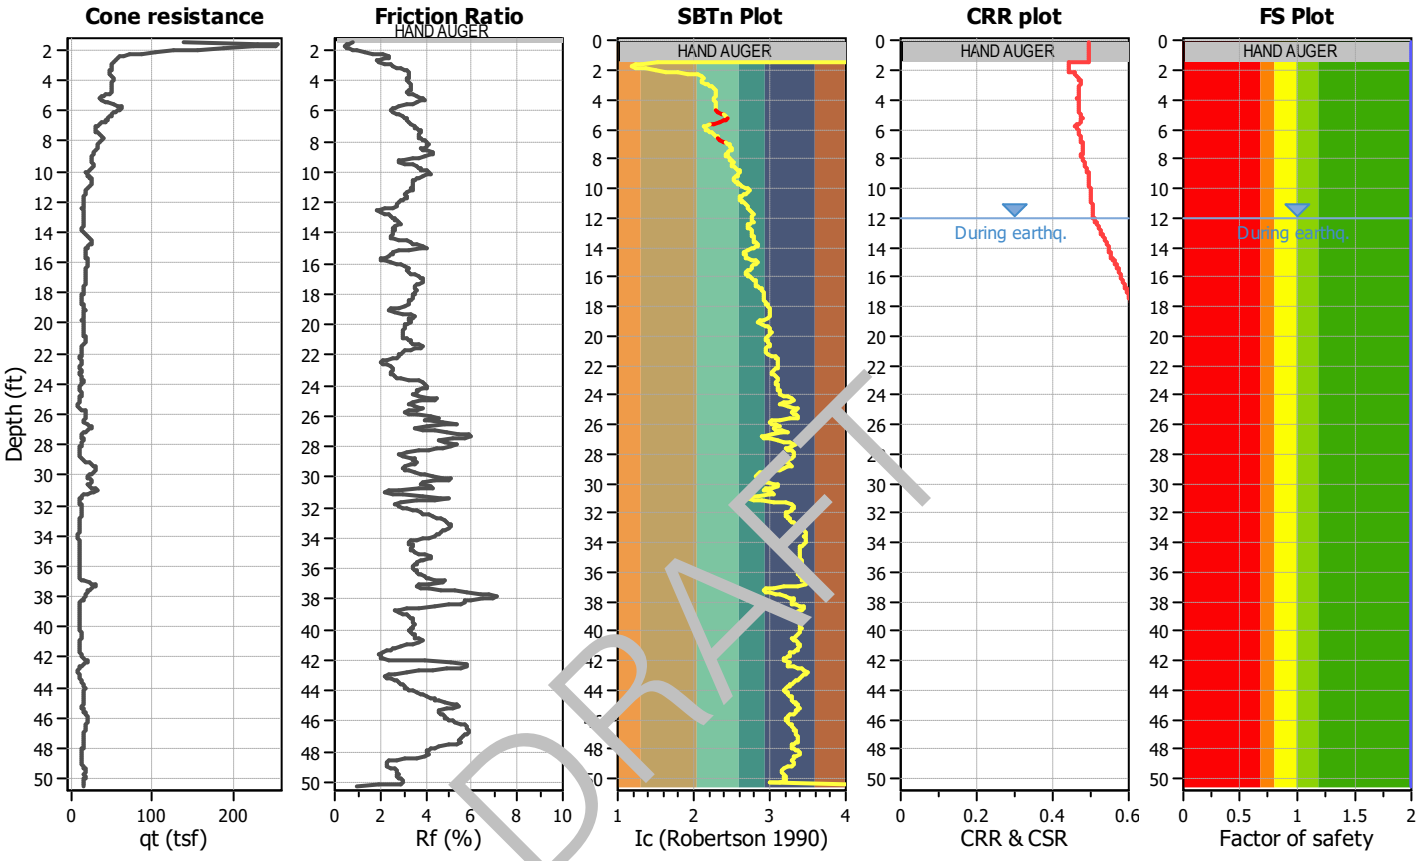
LIQUEFACTION ANALYSIS REPORT

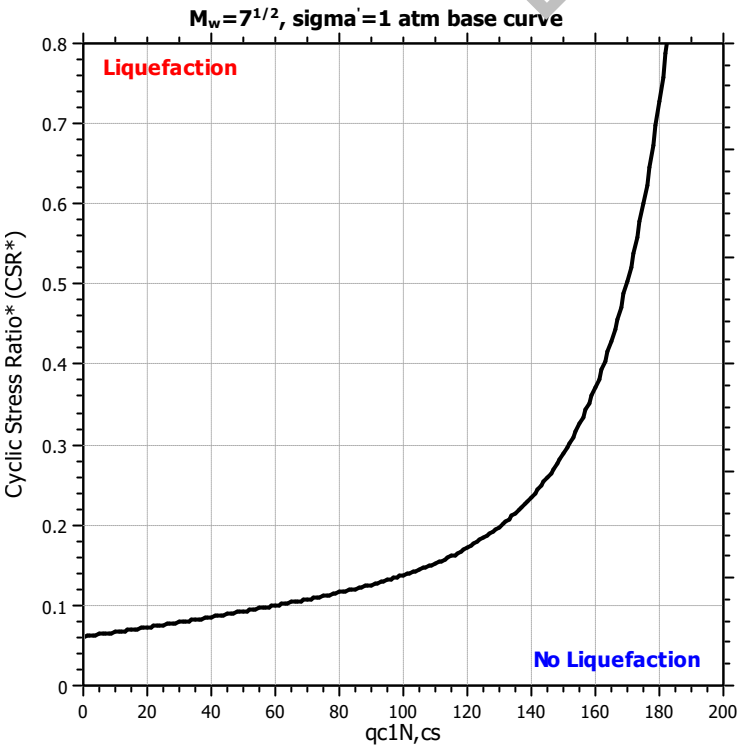
Project title : **Location :**

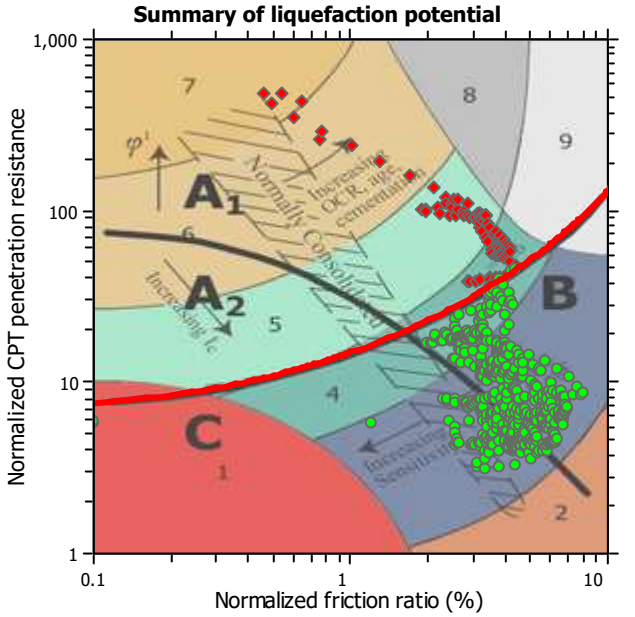
CPT file : CPT-15

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

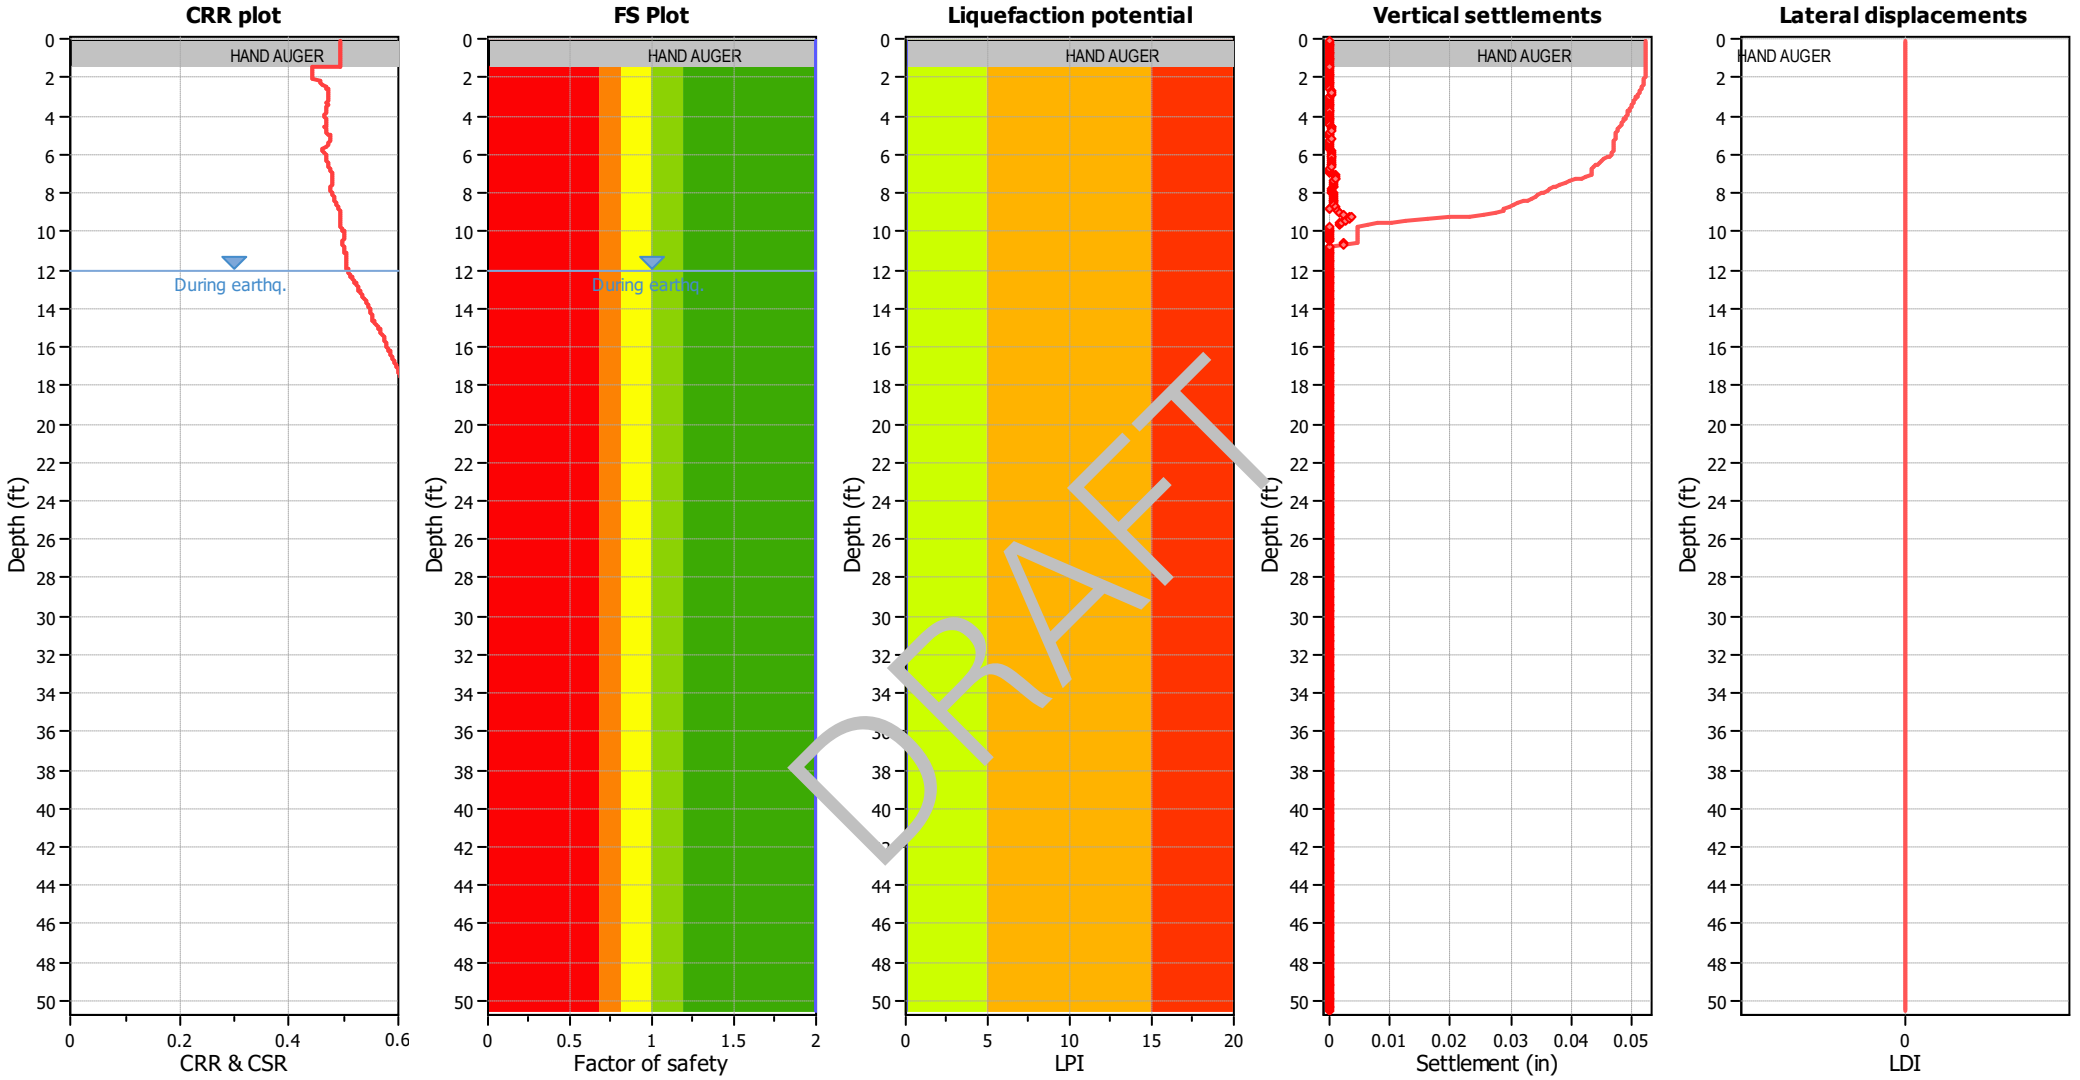






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



DRAFT

Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

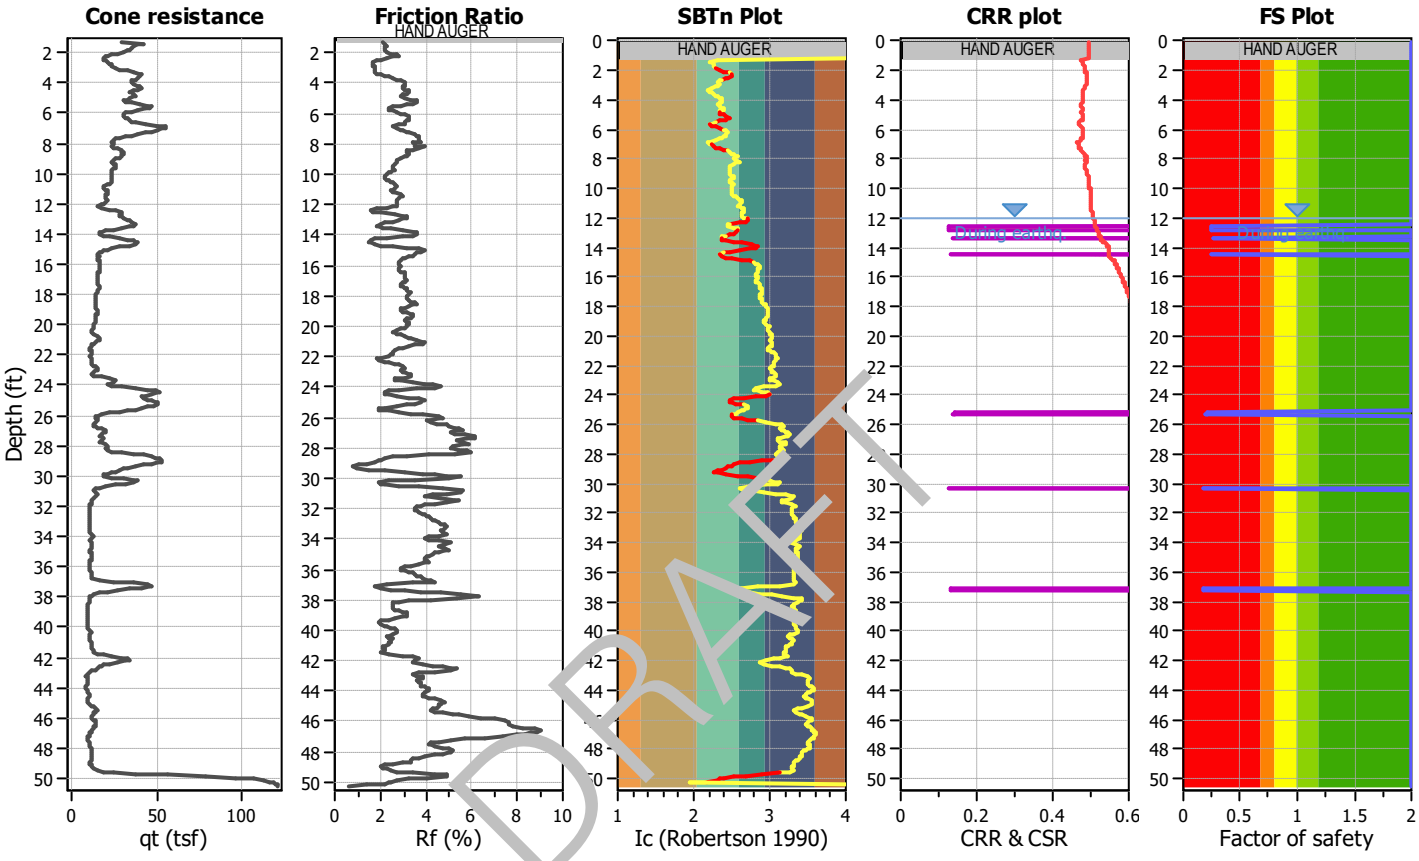
LIQUEFACTION ANALYSIS REPORT

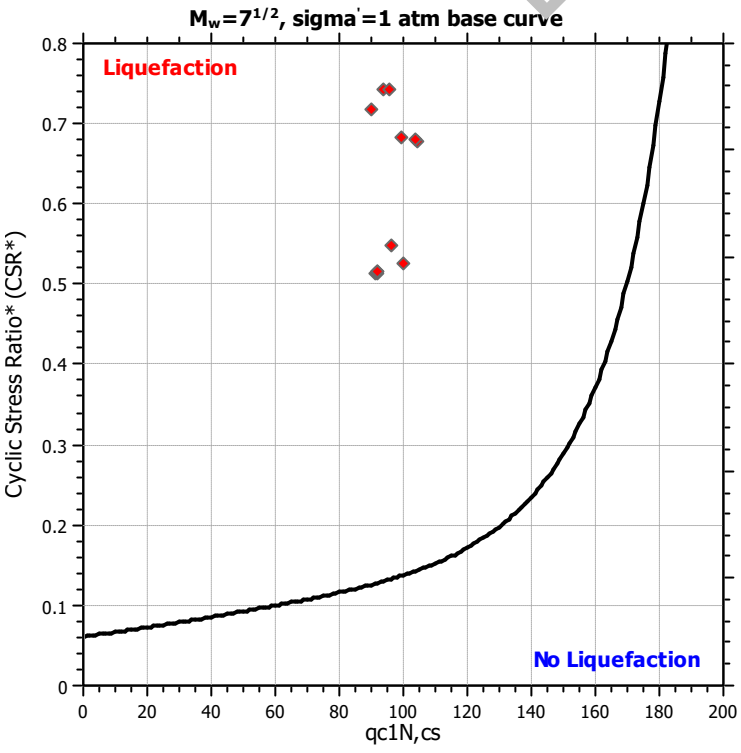
Project title : **Location :**

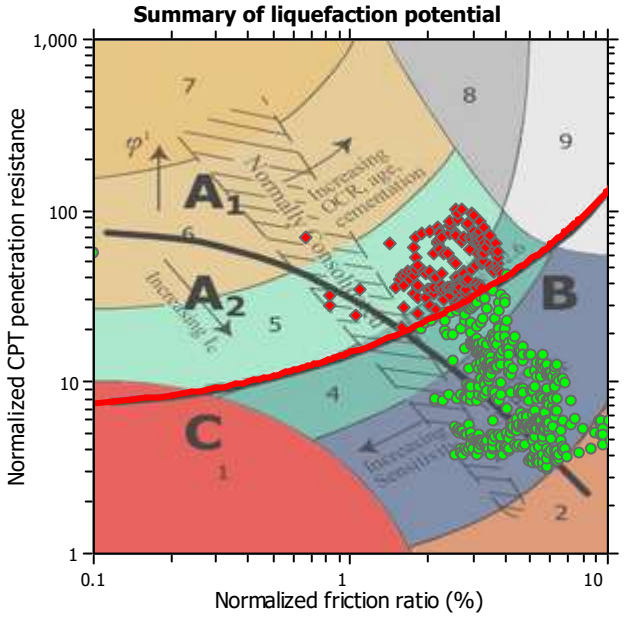
CPT file : CPT-16

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

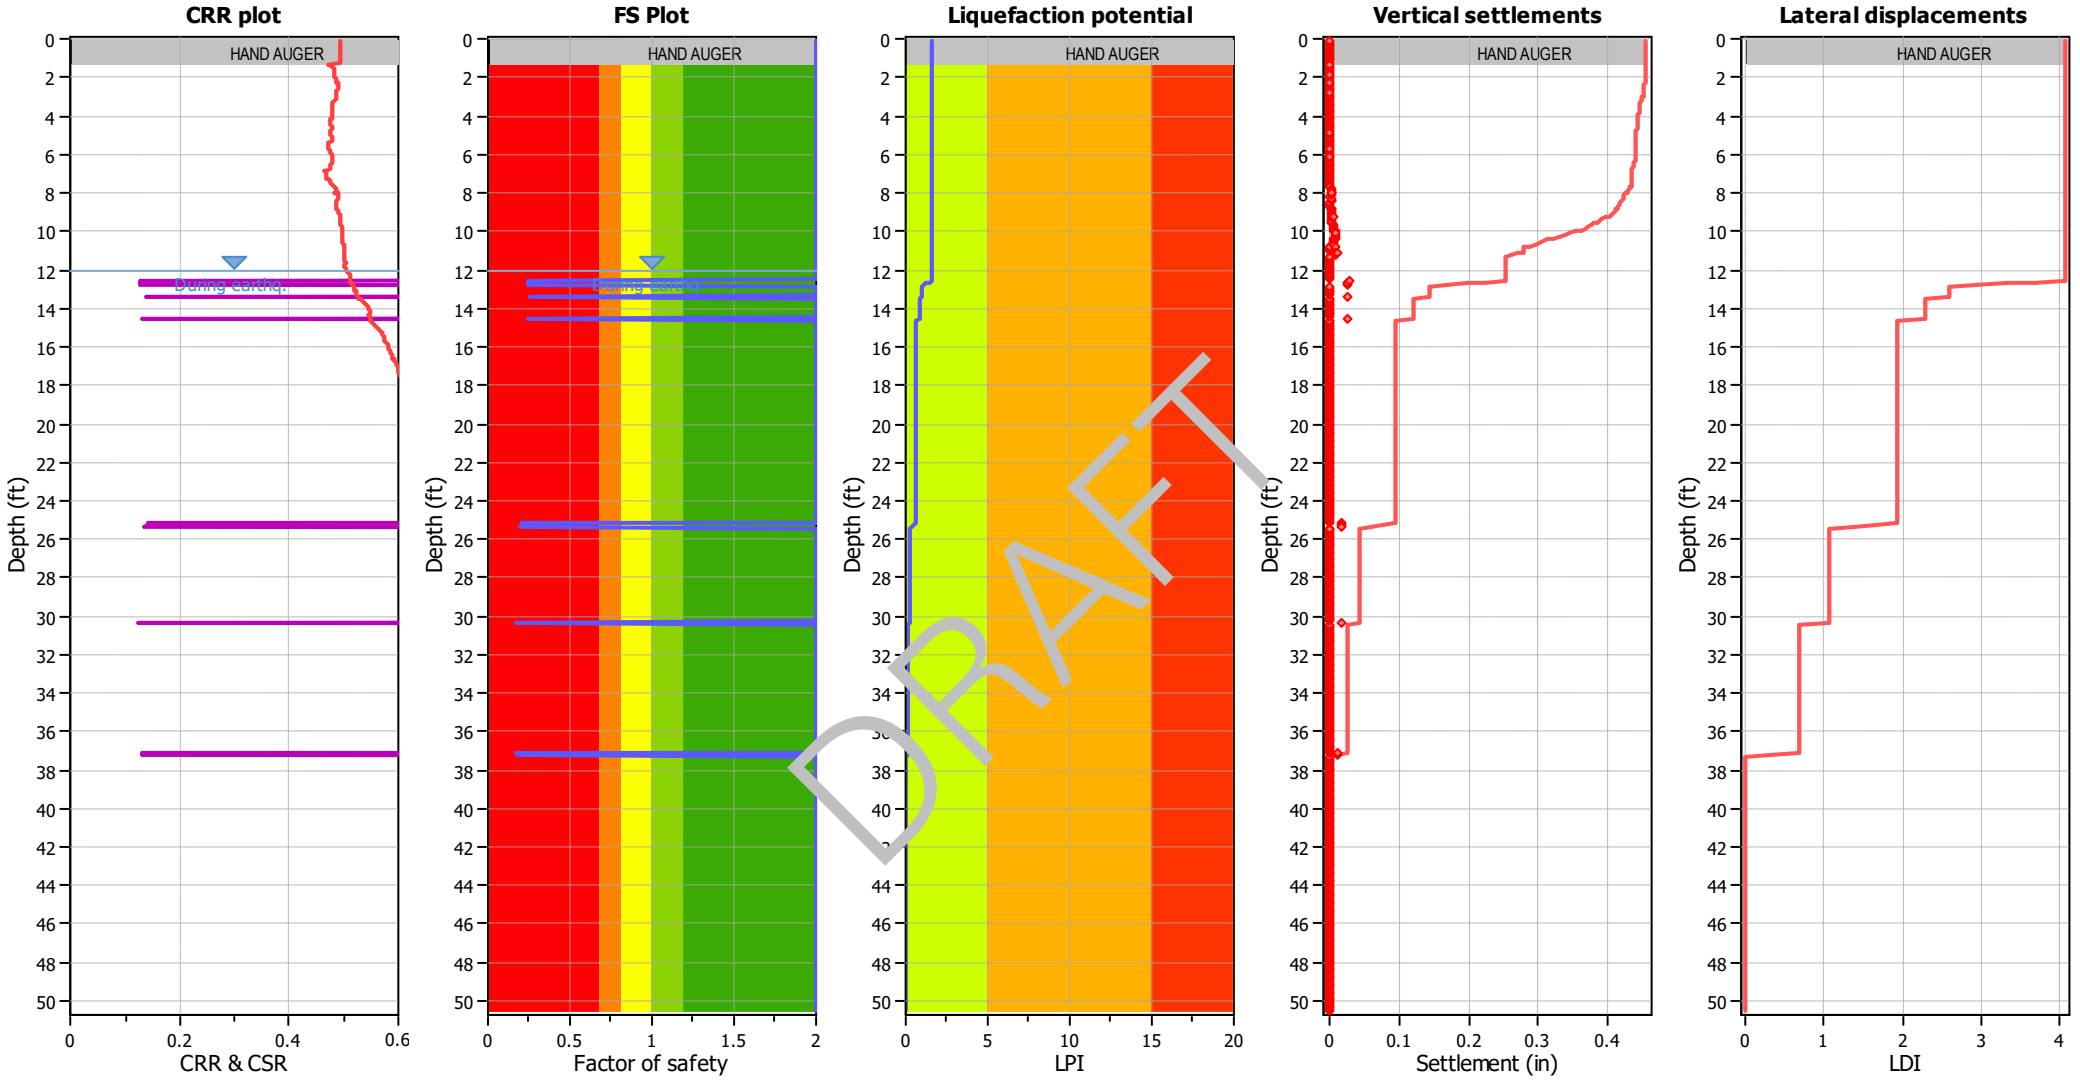






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

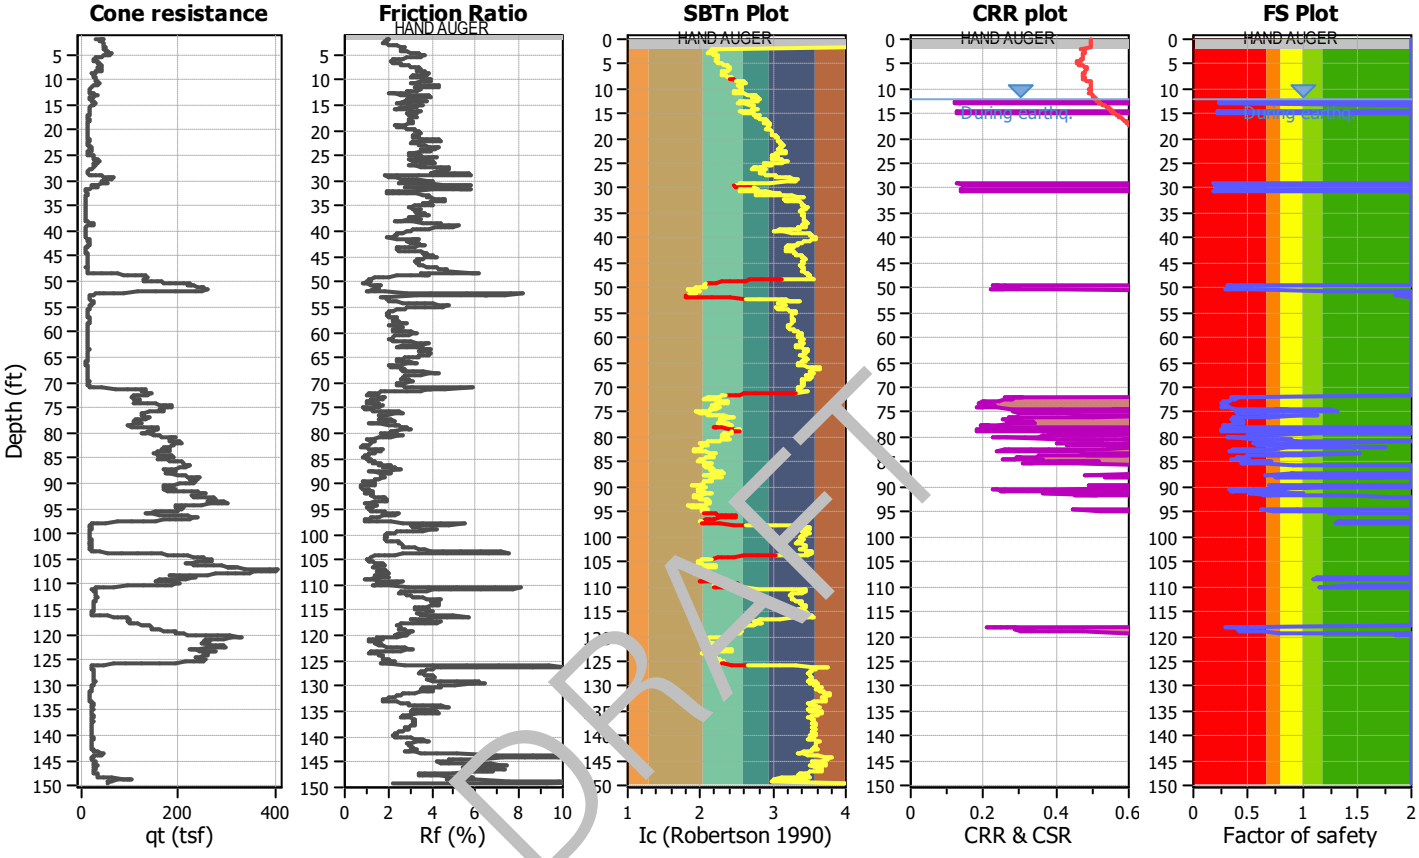
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

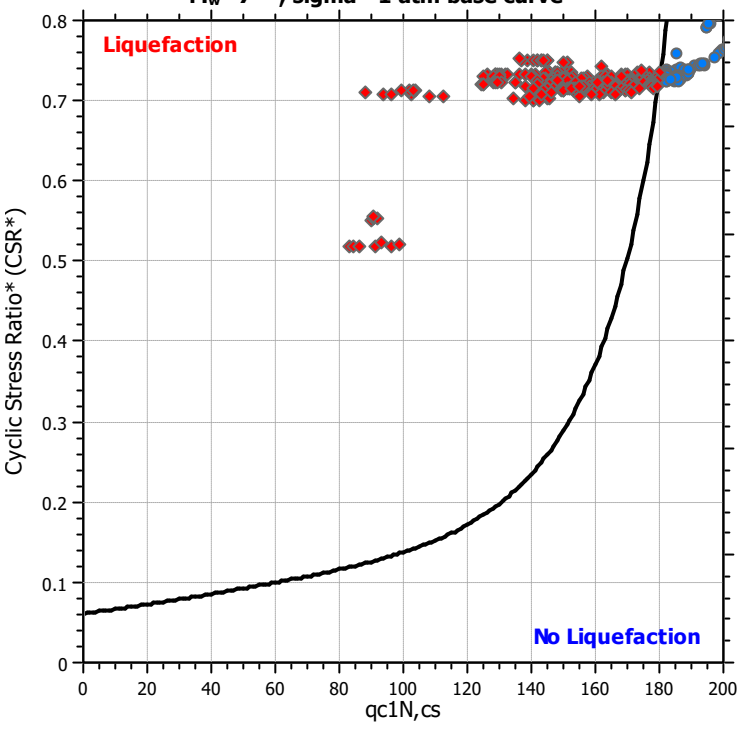
CPT file : CPT-17

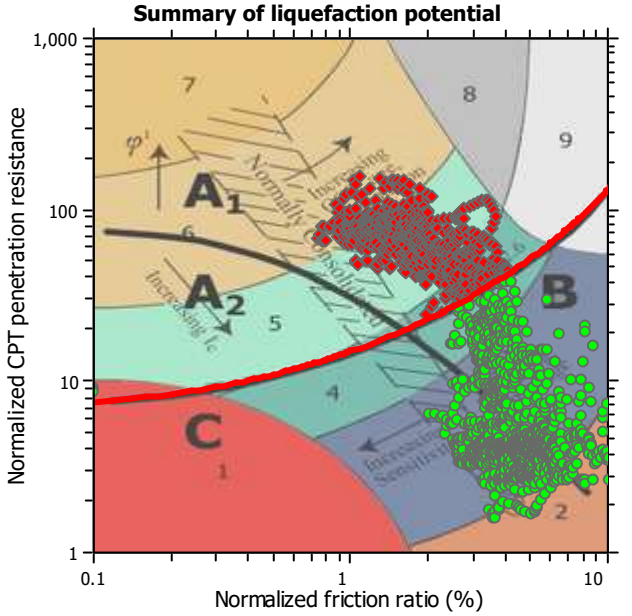
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



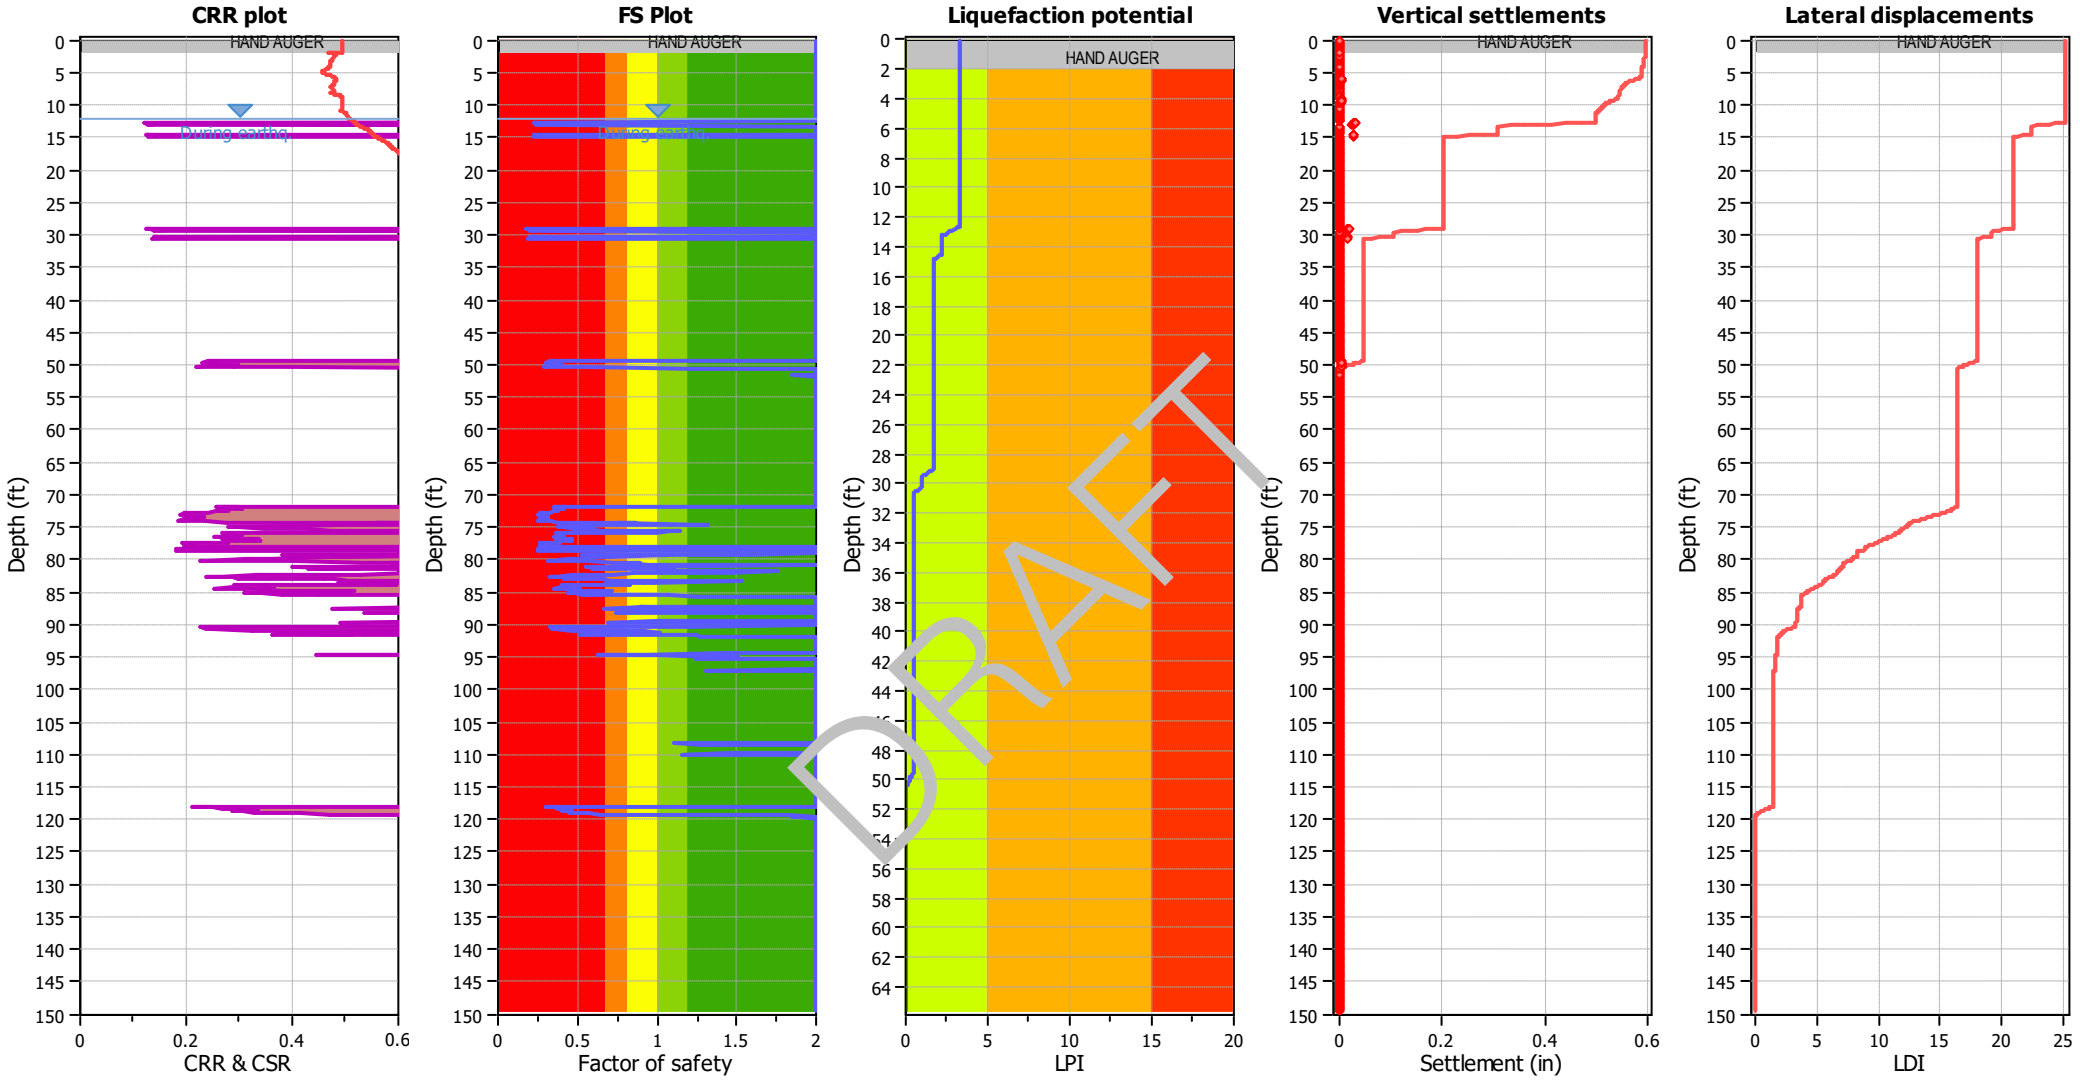
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

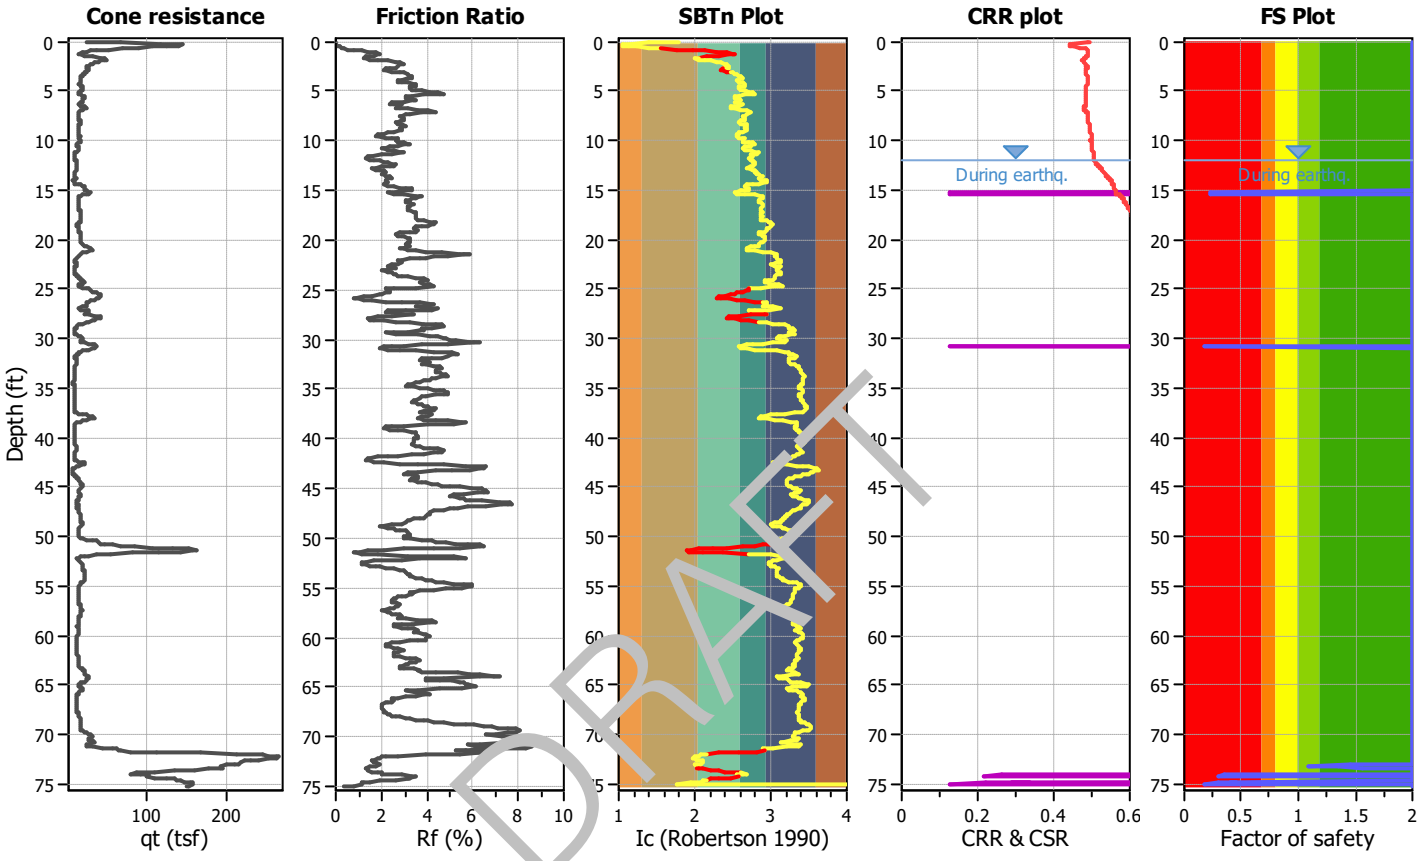
LIQUEFACTION ANALYSIS REPORT

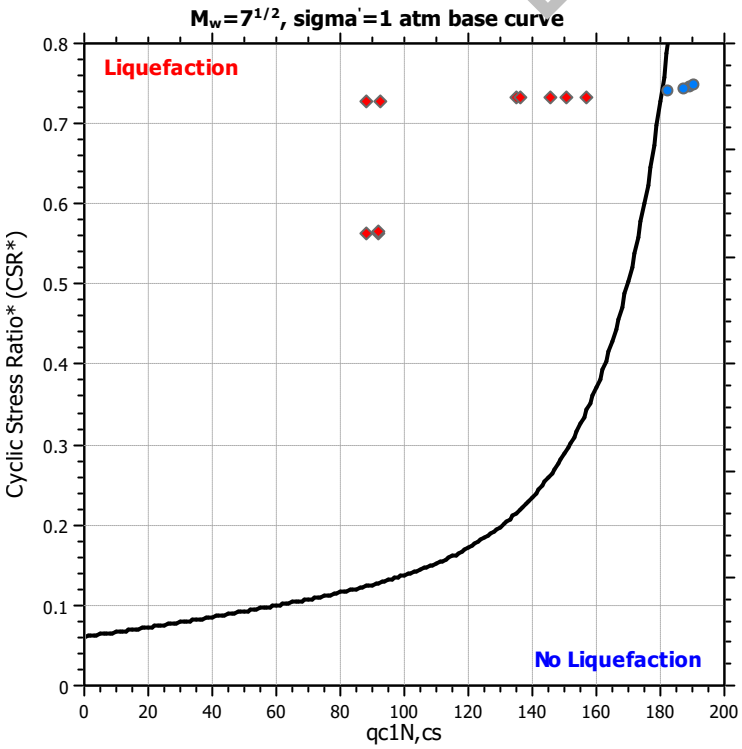
Project title : **Location :**

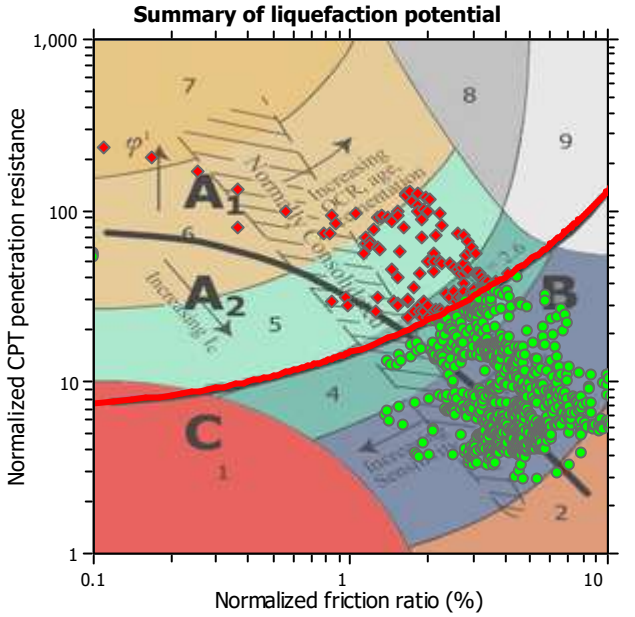
CPT file : CPT-18

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

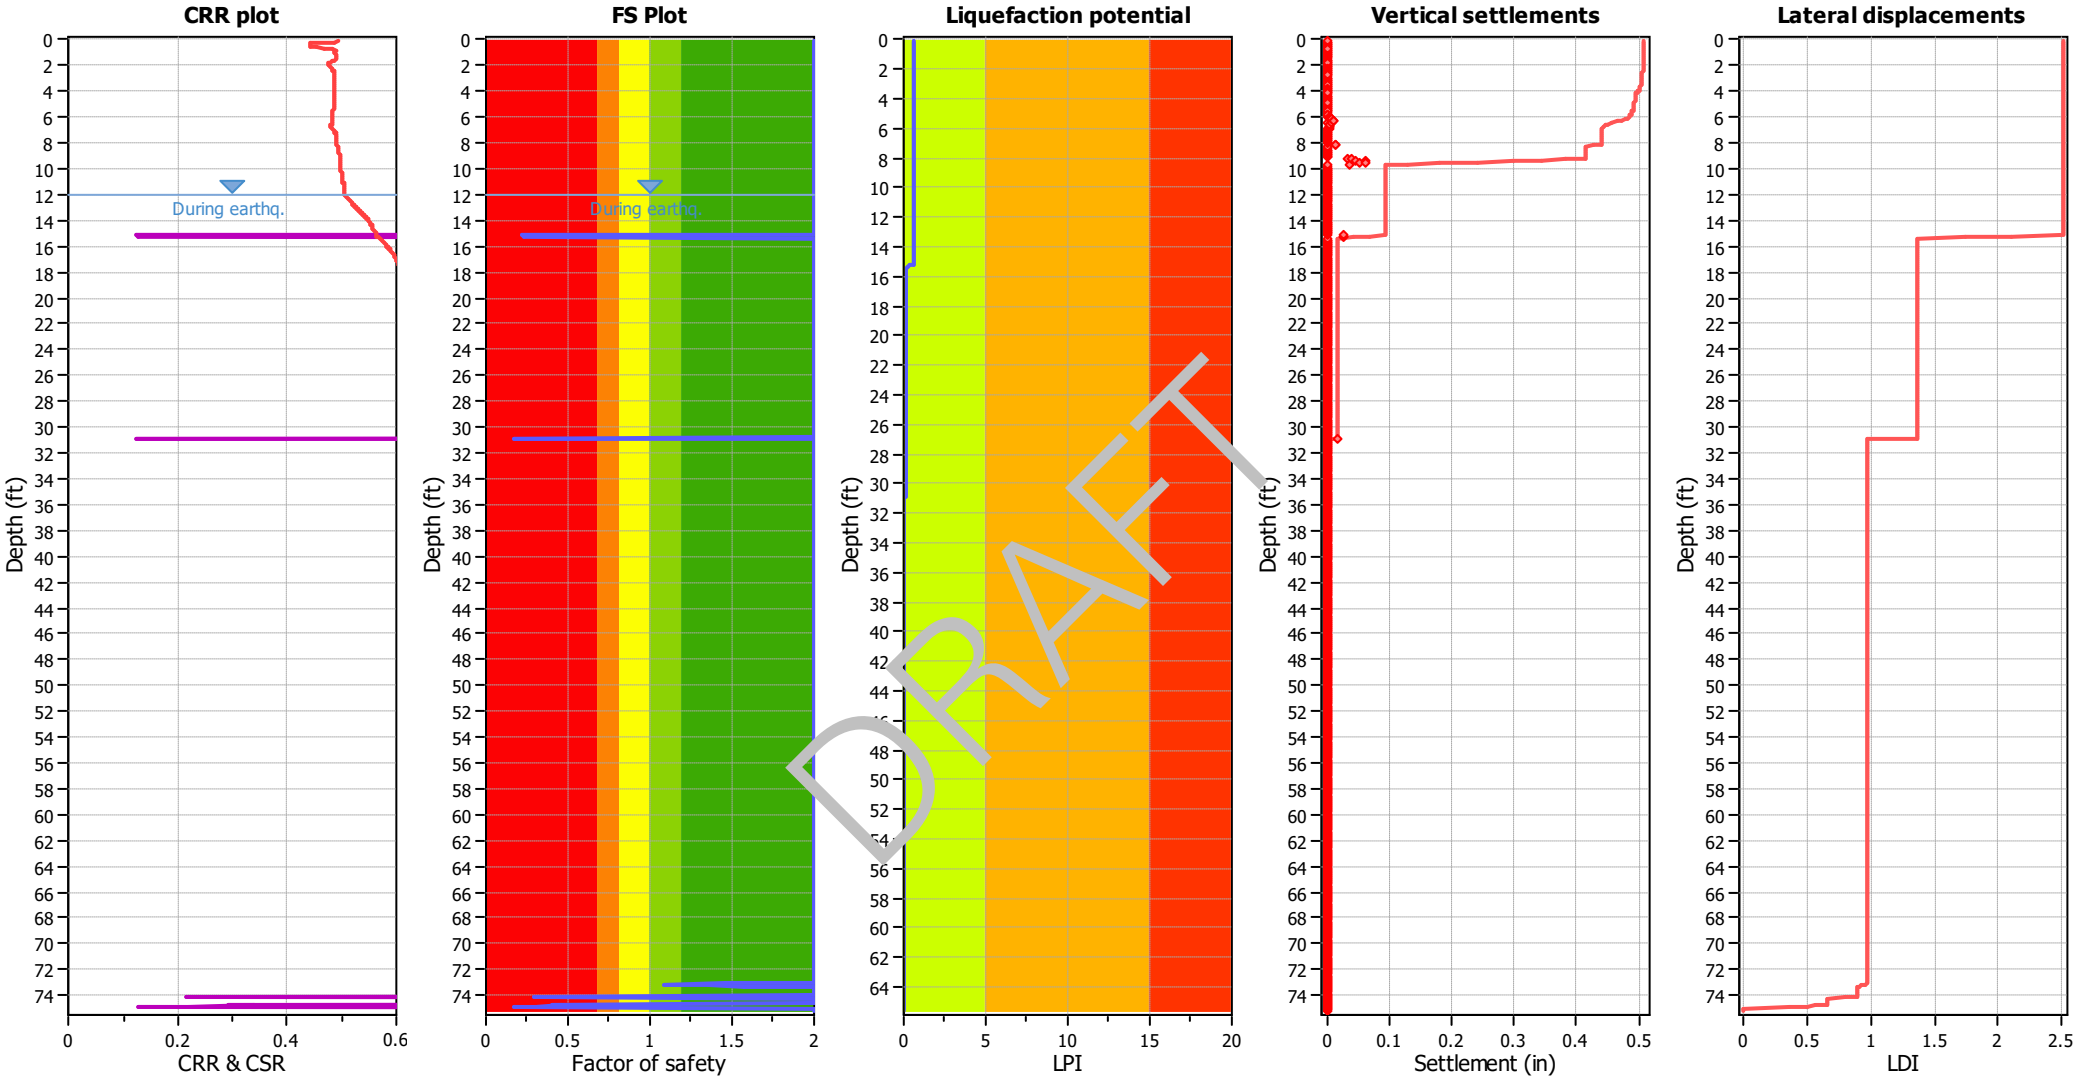






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

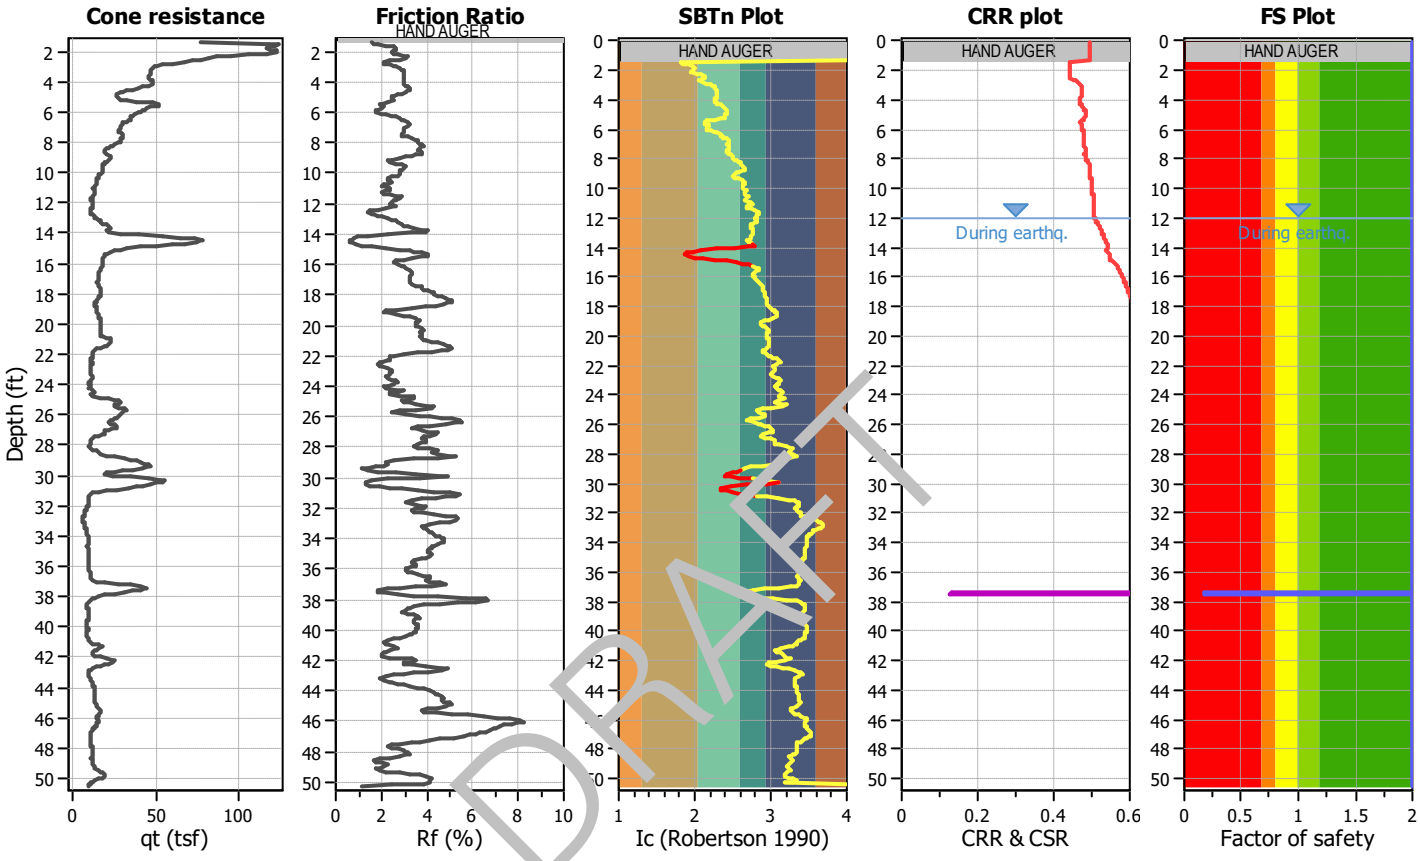
LIQUEFACTION ANALYSIS REPORT

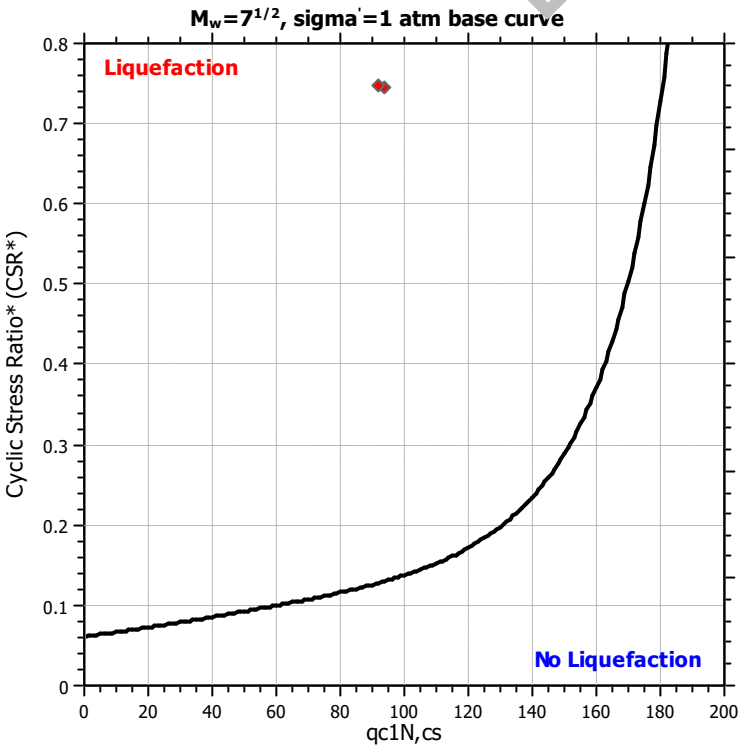
Project title : **Location :**

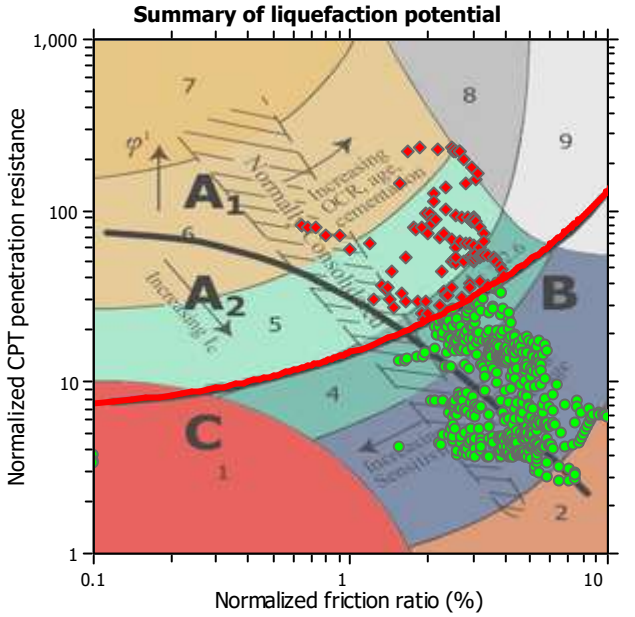
CPT file : CPT-19

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

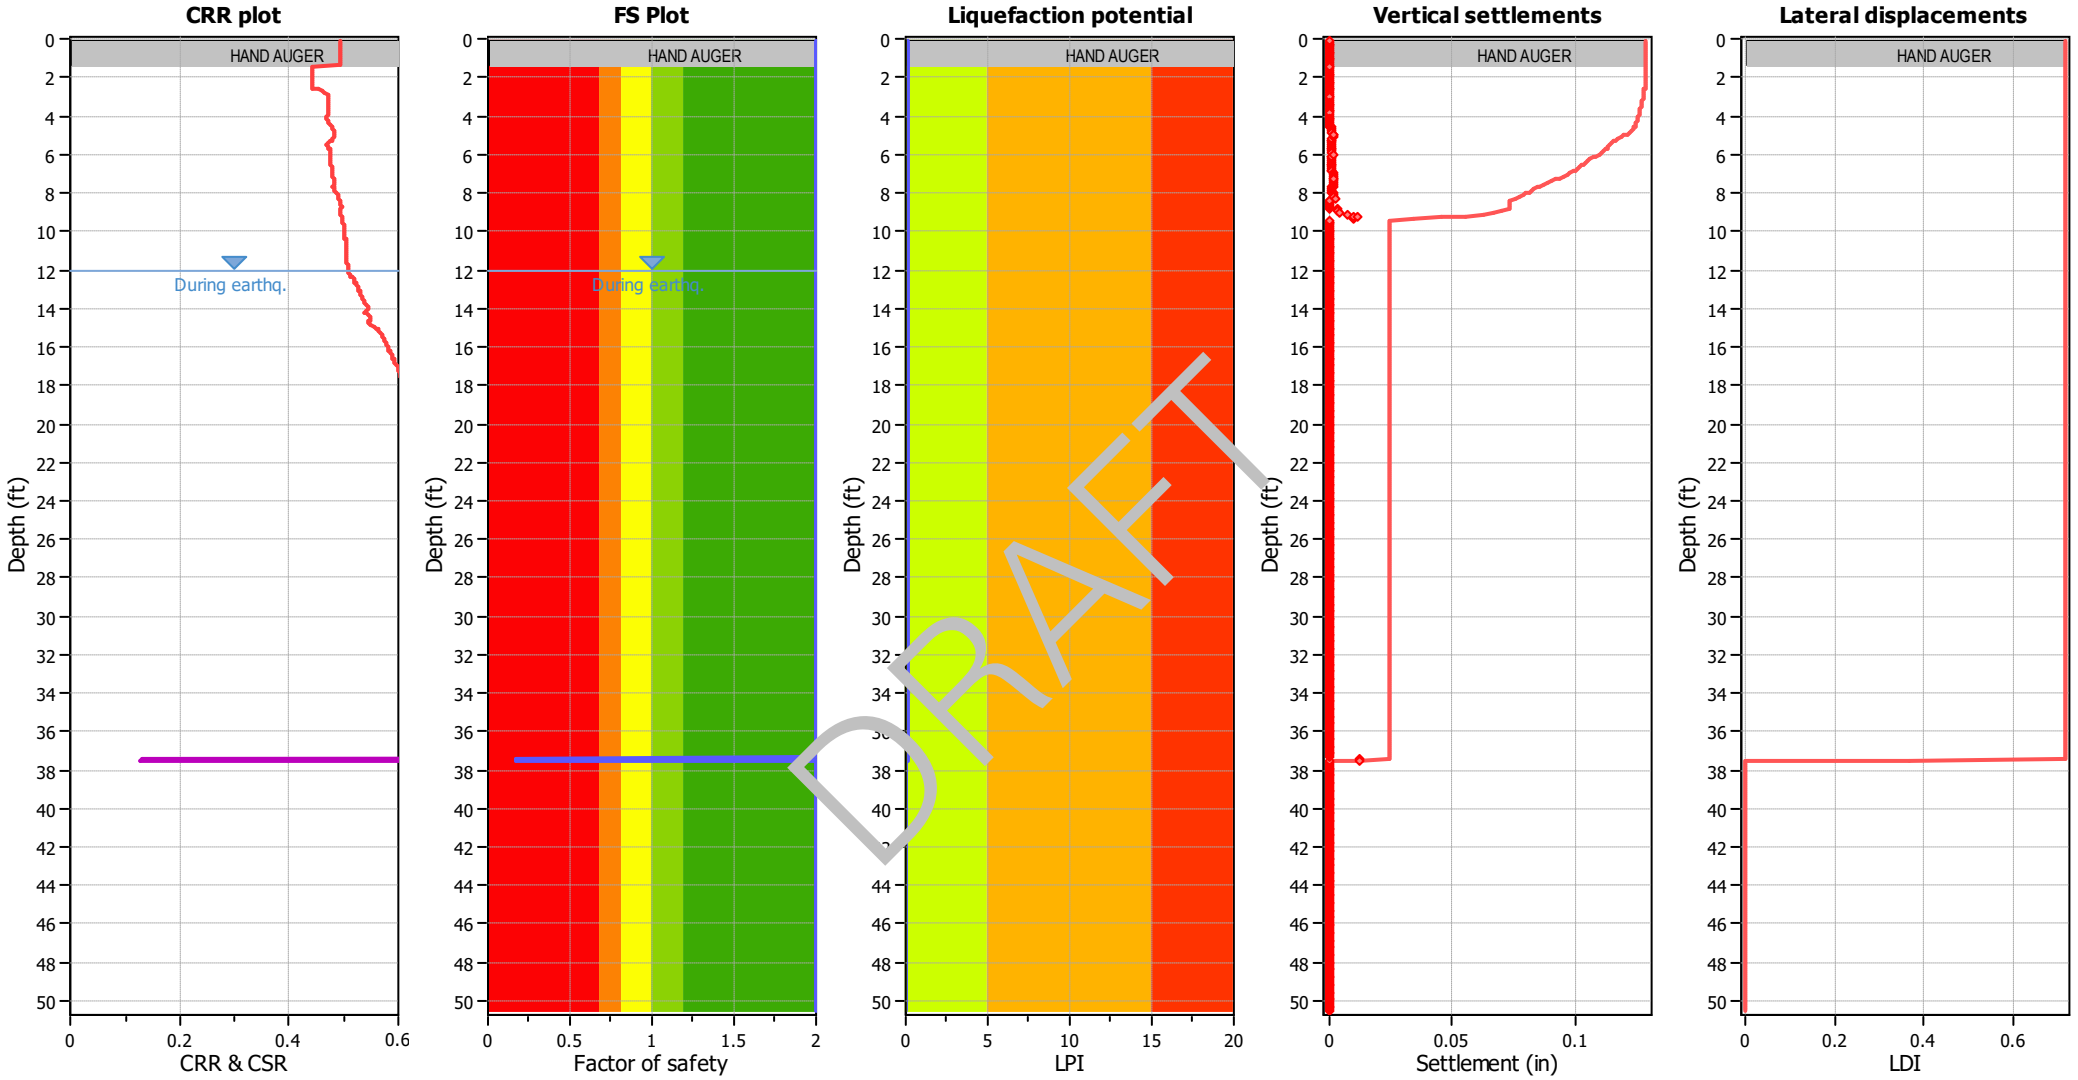






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

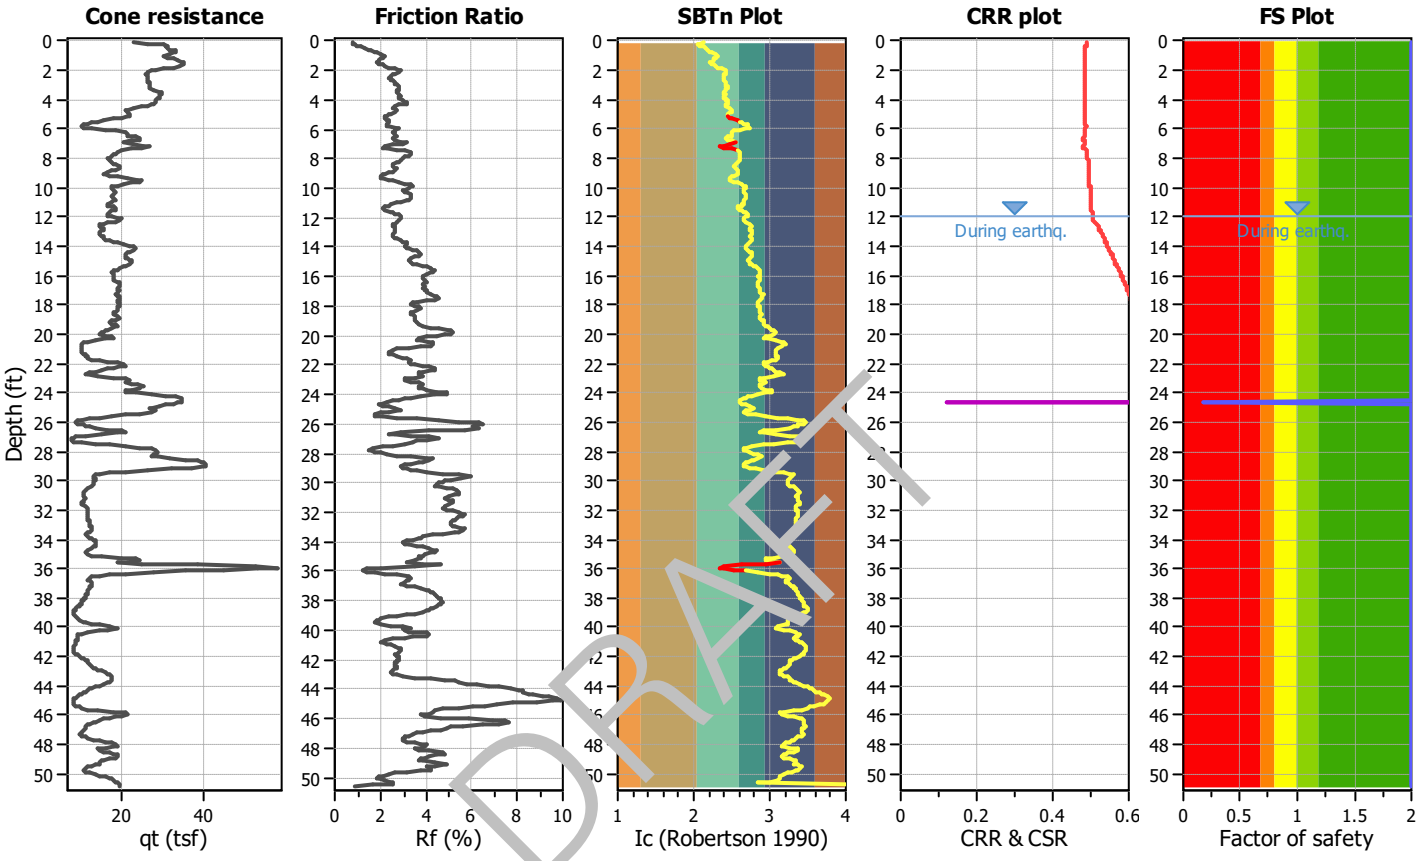
LIQUEFACTION ANALYSIS REPORT

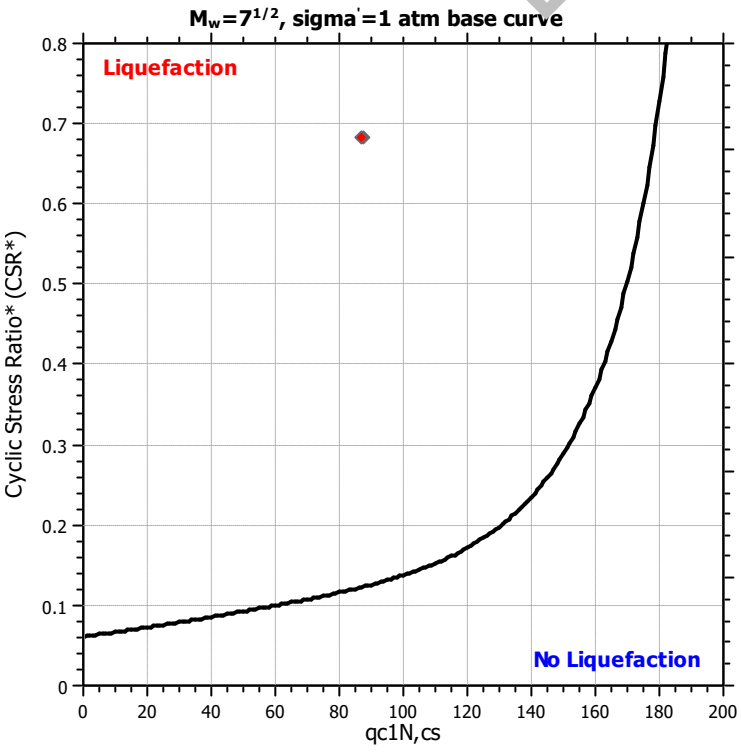
Project title : **Location :**

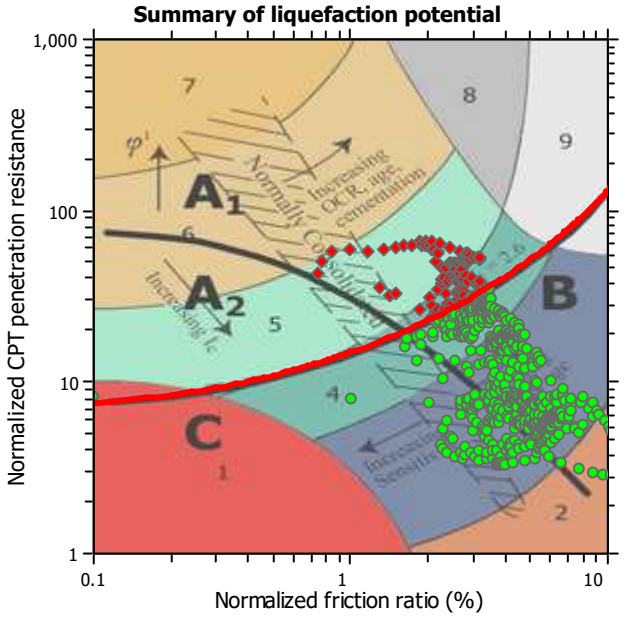
CPT file : CPT-20

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

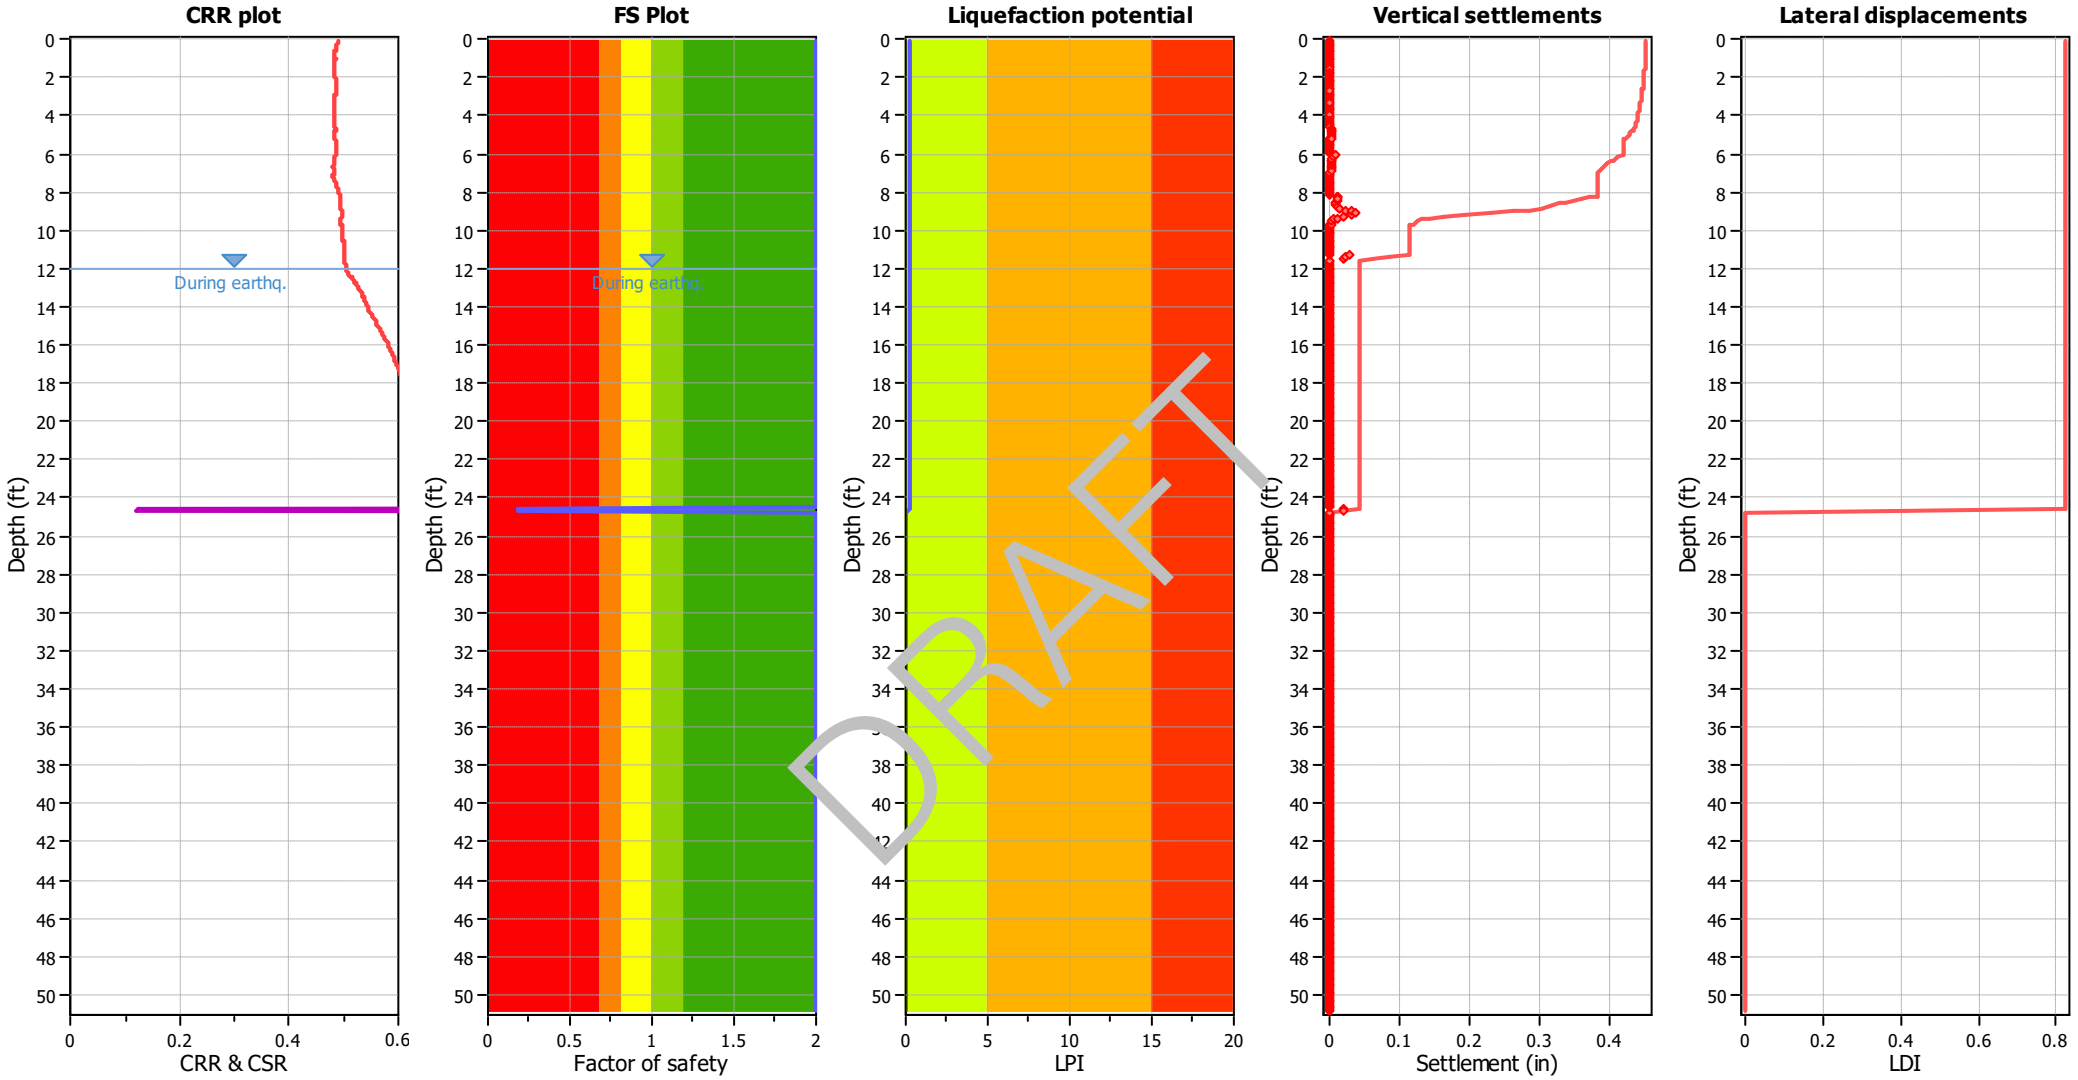






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

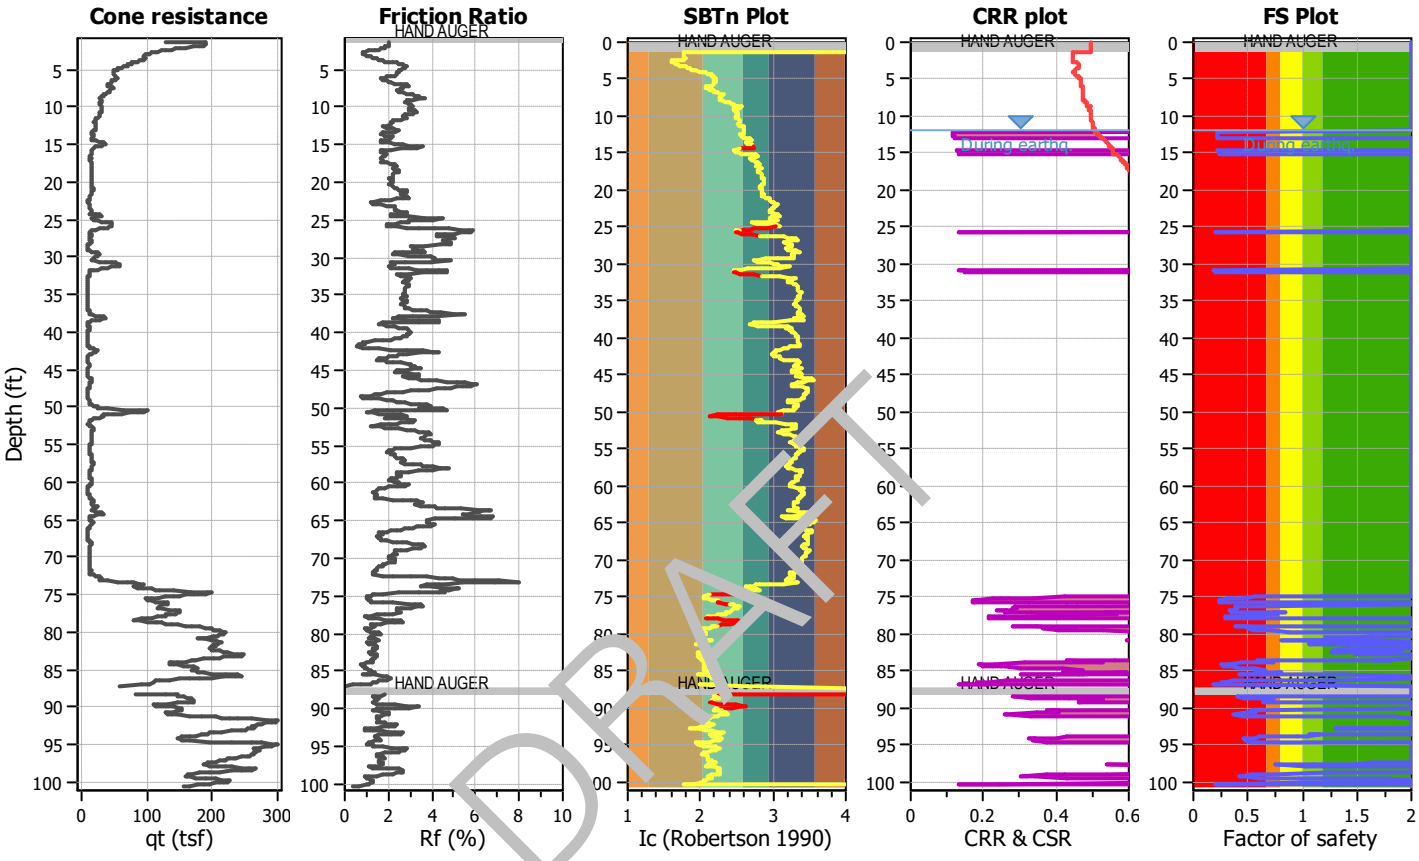
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

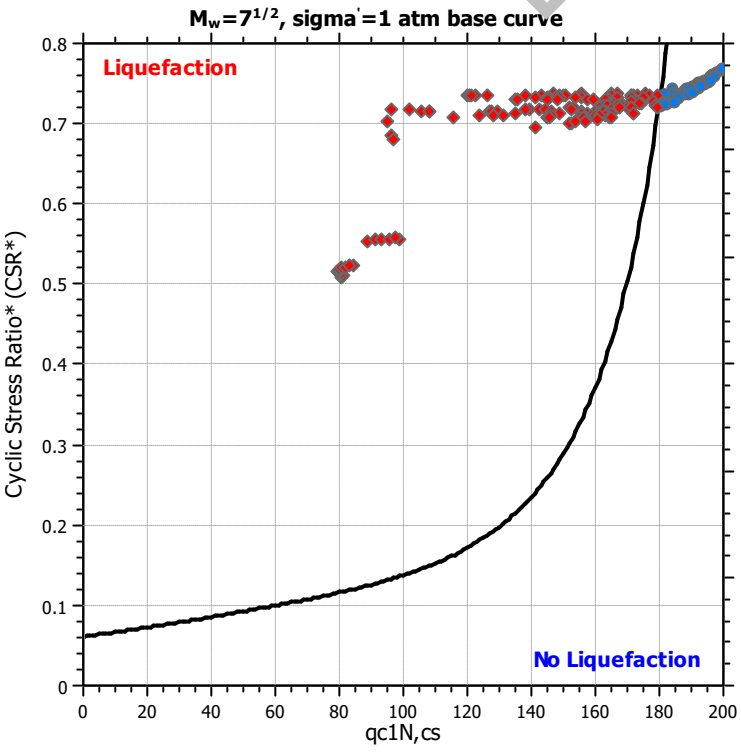
CPT file : CPT-21

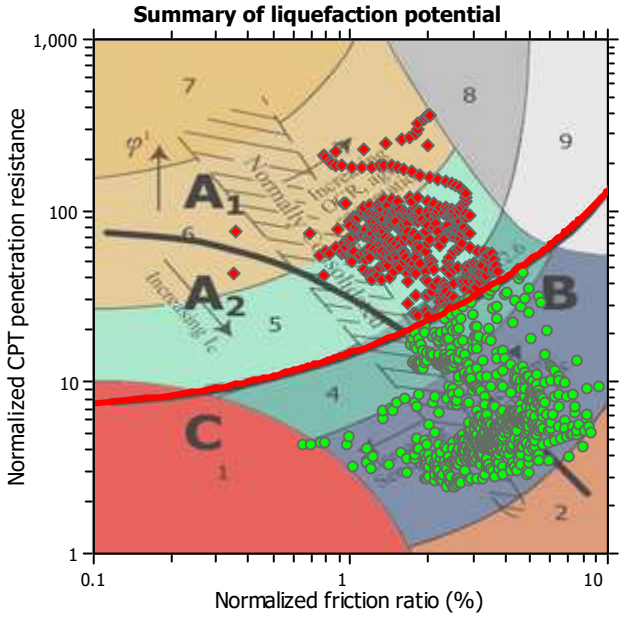
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



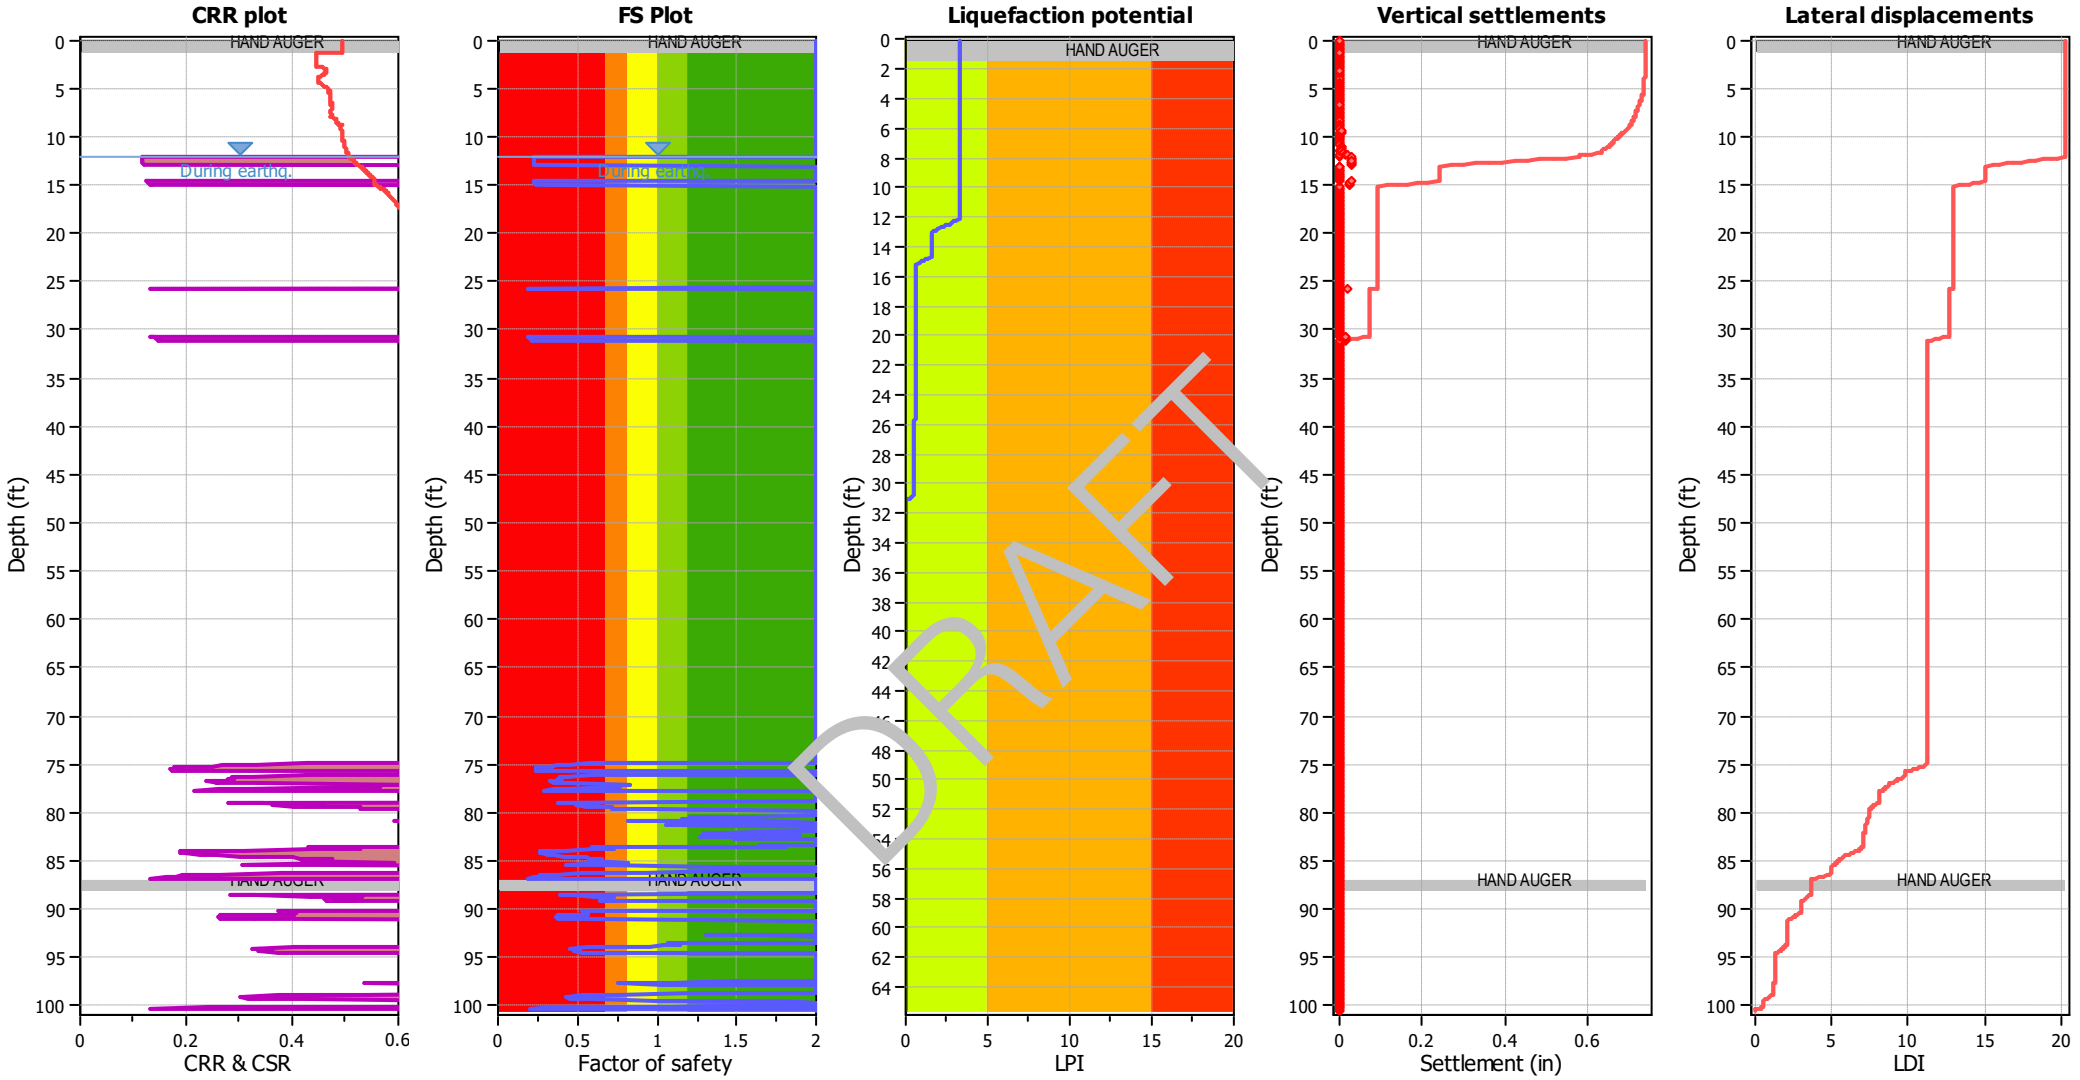
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

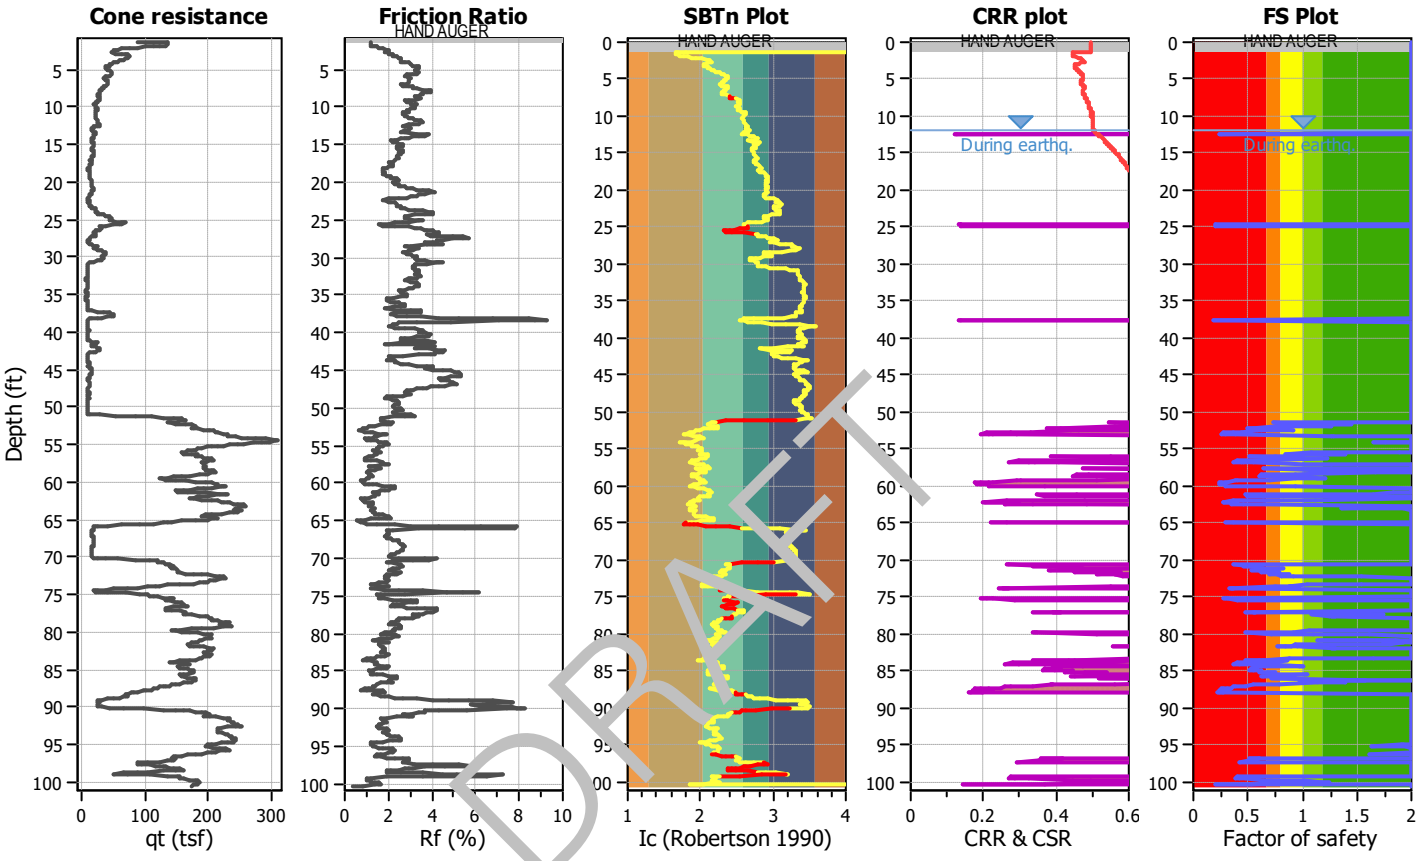
LIQUEFACTION ANALYSIS REPORT

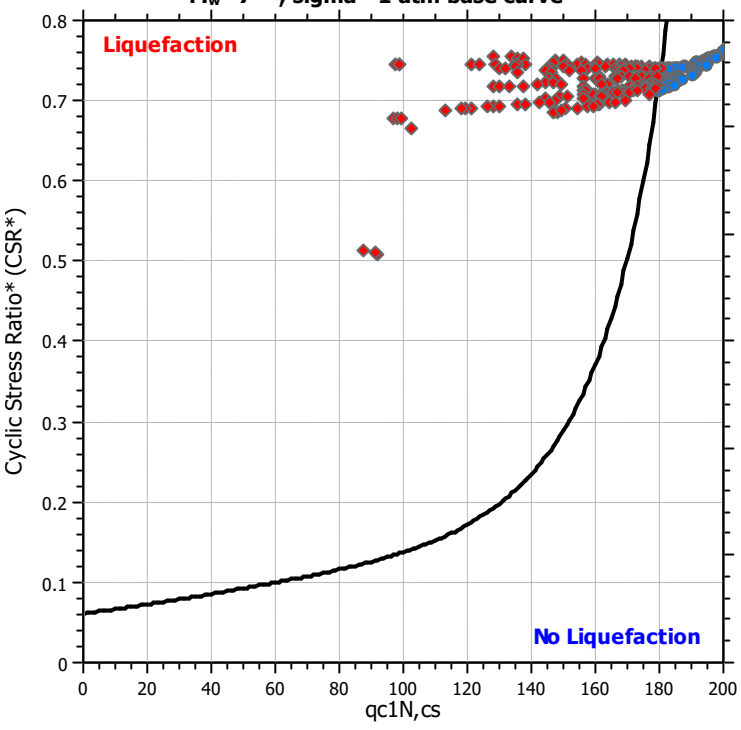
Project title : **Location :**

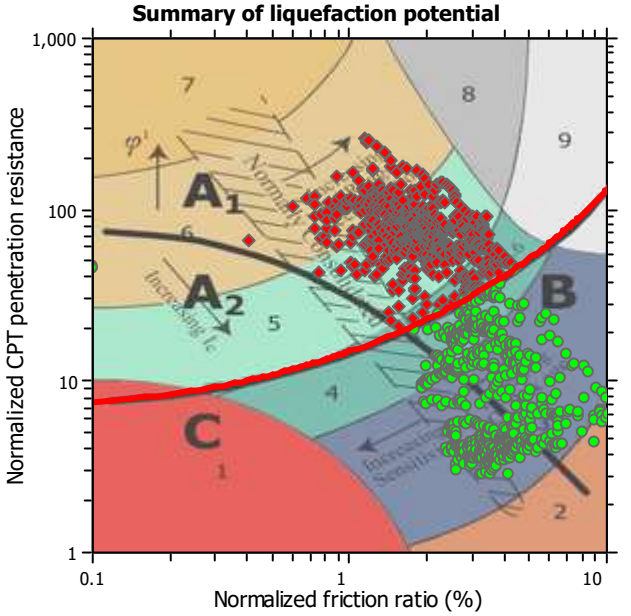
CPT file : CPT-22

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

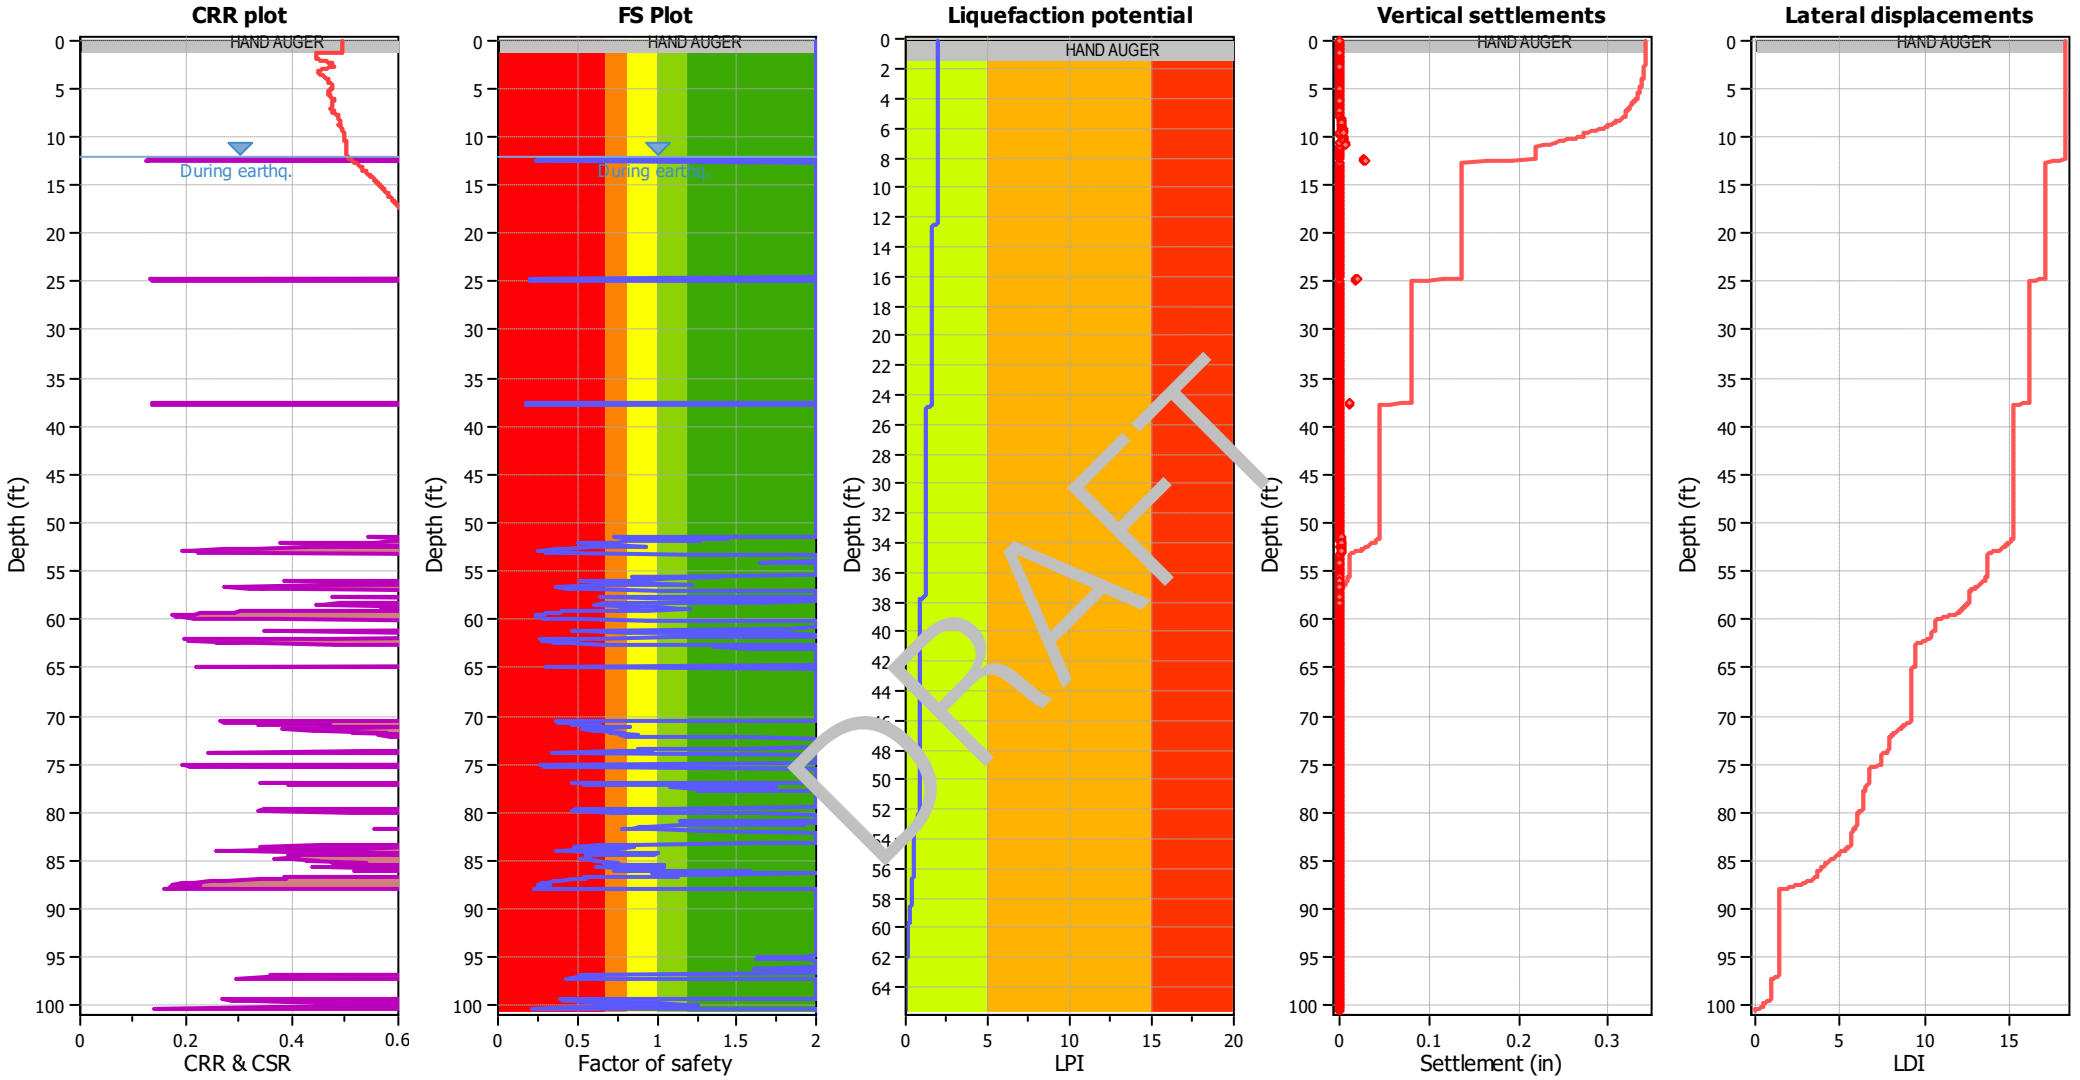






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

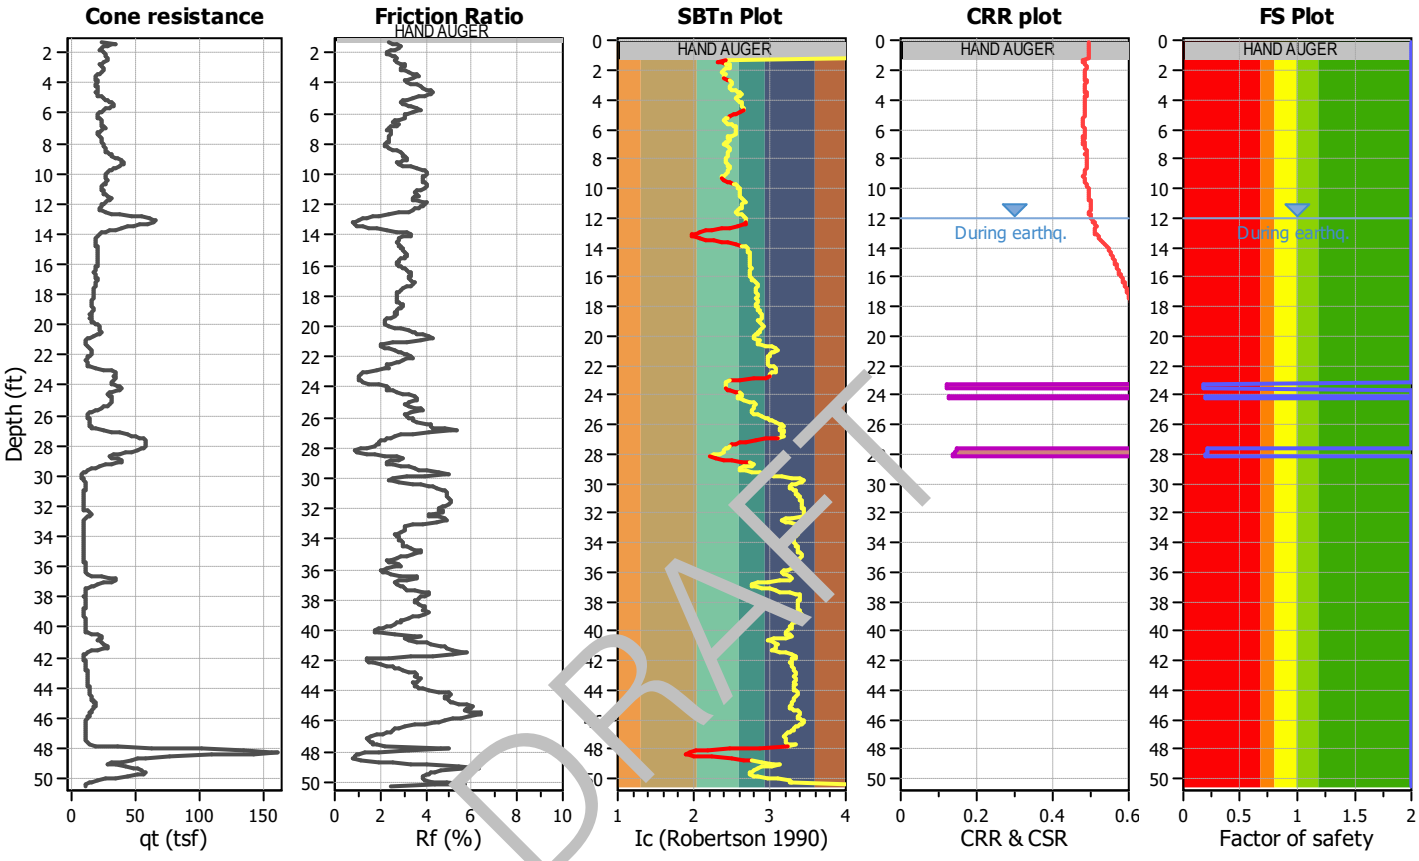
LIQUEFACTION ANALYSIS REPORT

Project title : **Location :**

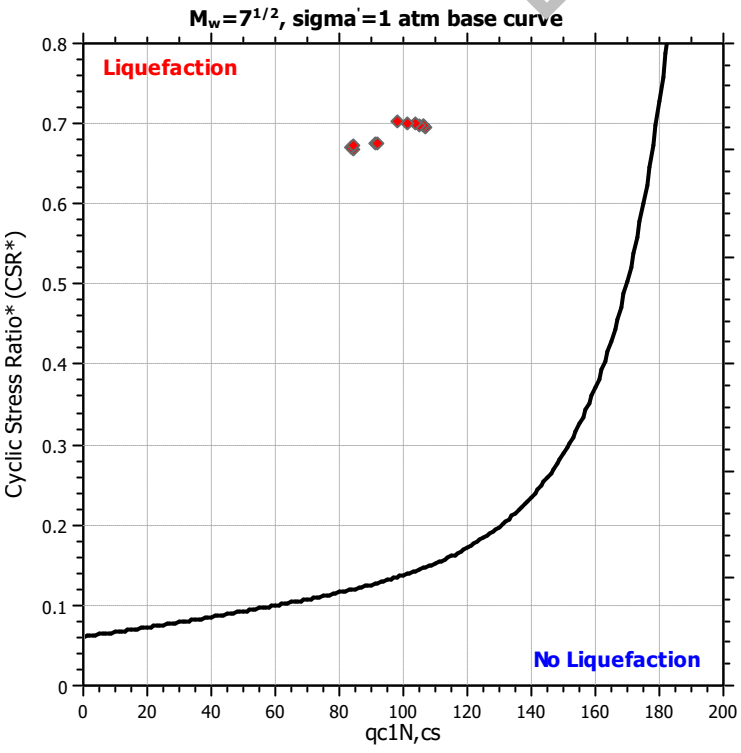
CPT file : CPT-23

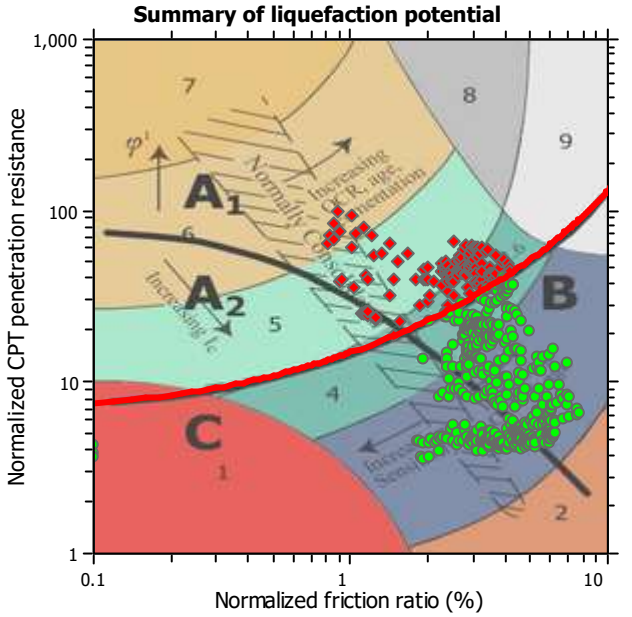
Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



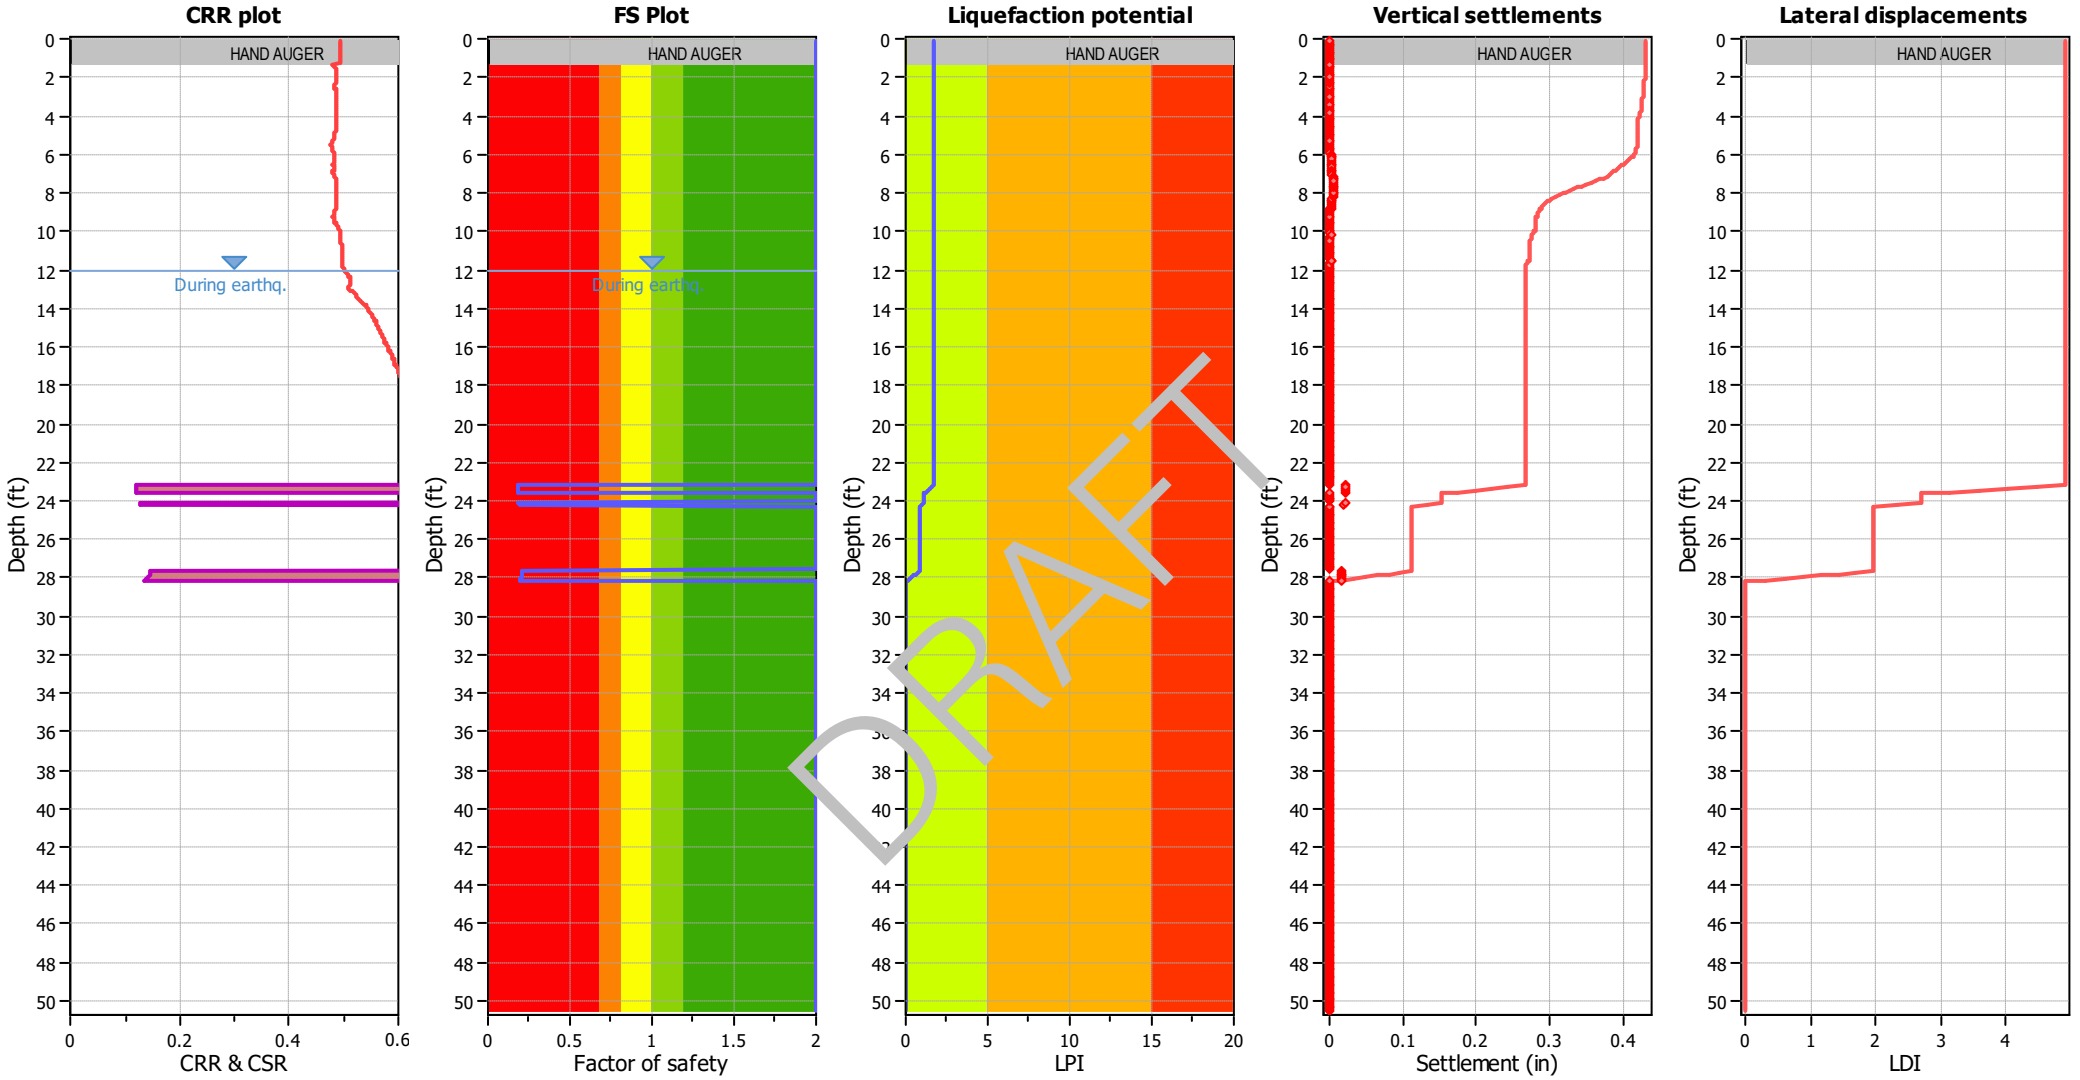
DRAFT





Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

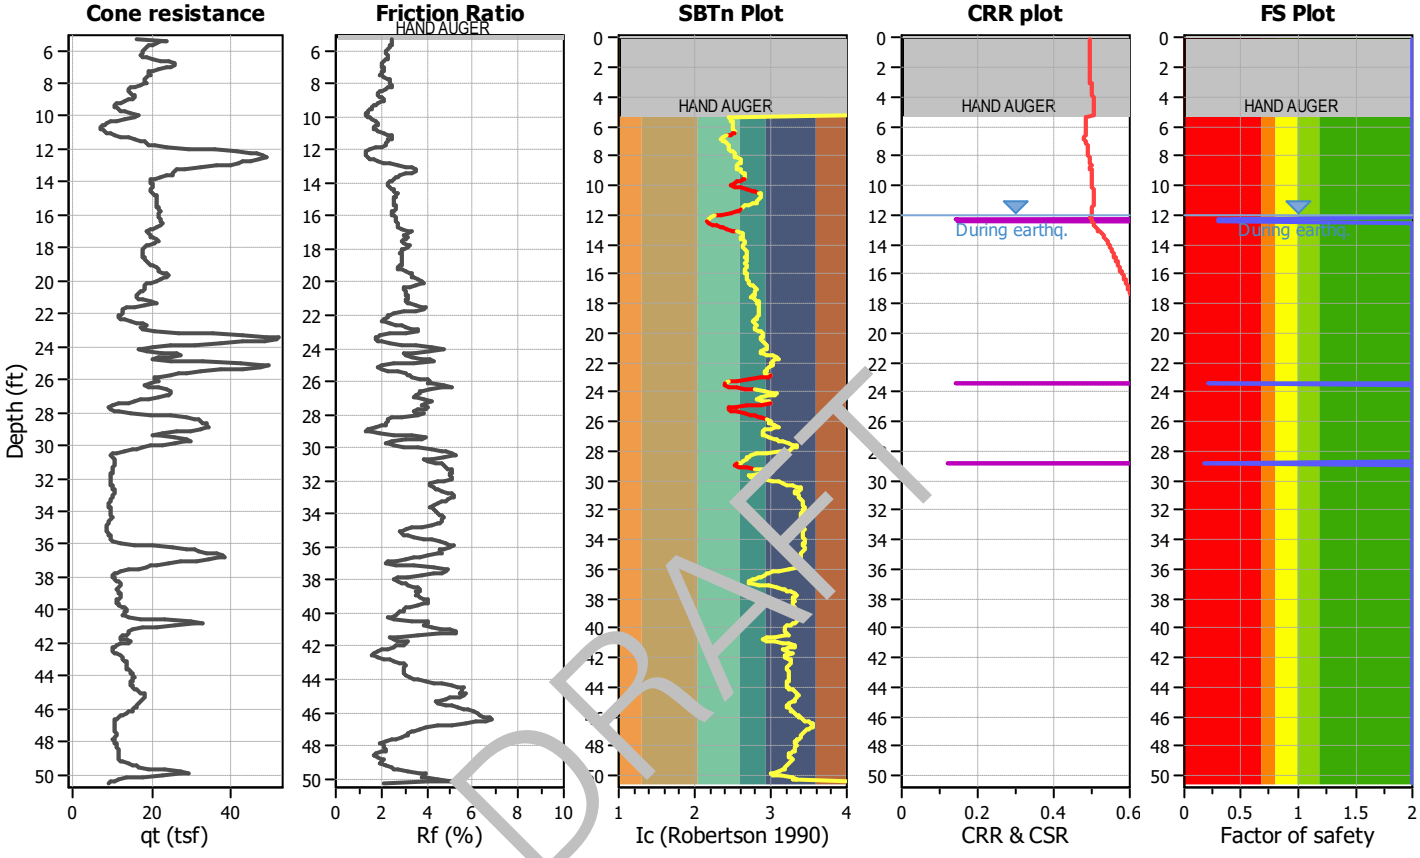
LIQUEFACTION ANALYSIS REPORT

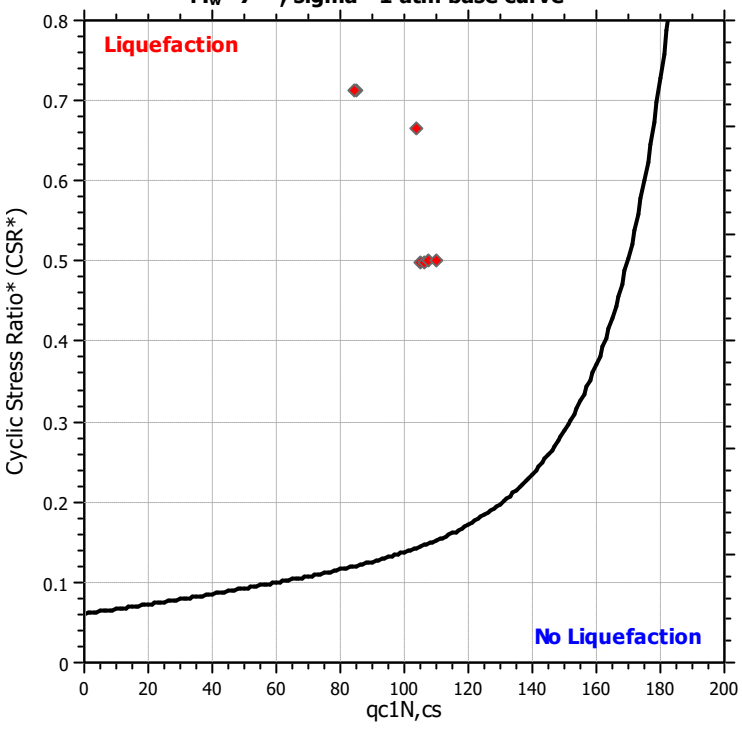
Project title : **Location :**

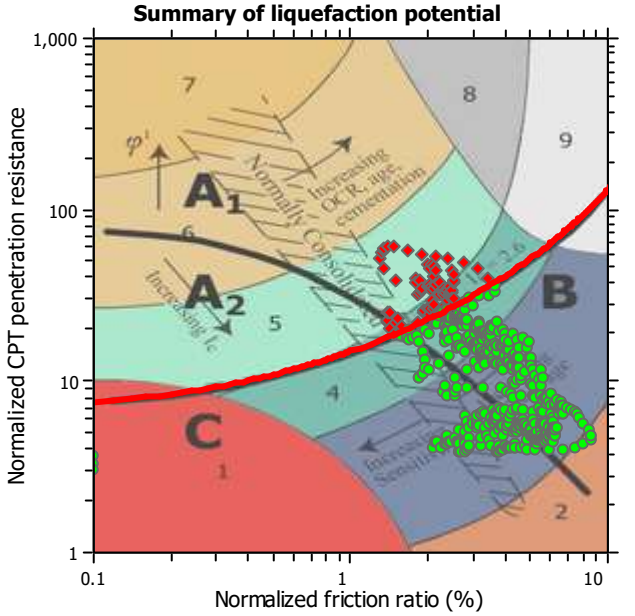
CPT file : CPT-24

Input parameters and analysis data

Analysis method:	B&I (2014)	G.W.T. (in-situ):	25.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	B&I (2014)	G.W.T. (earthq.):	12.00 ft	Fill height:	N/A	Limit depth applied:	No
Points to test:	Based on Ic value	Average results interval:	3	Fill weight:	N/A	Limit depth:	N/A
Earthquake magnitude M_w:	7.20	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method
Peak ground acceleration:	0.65	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

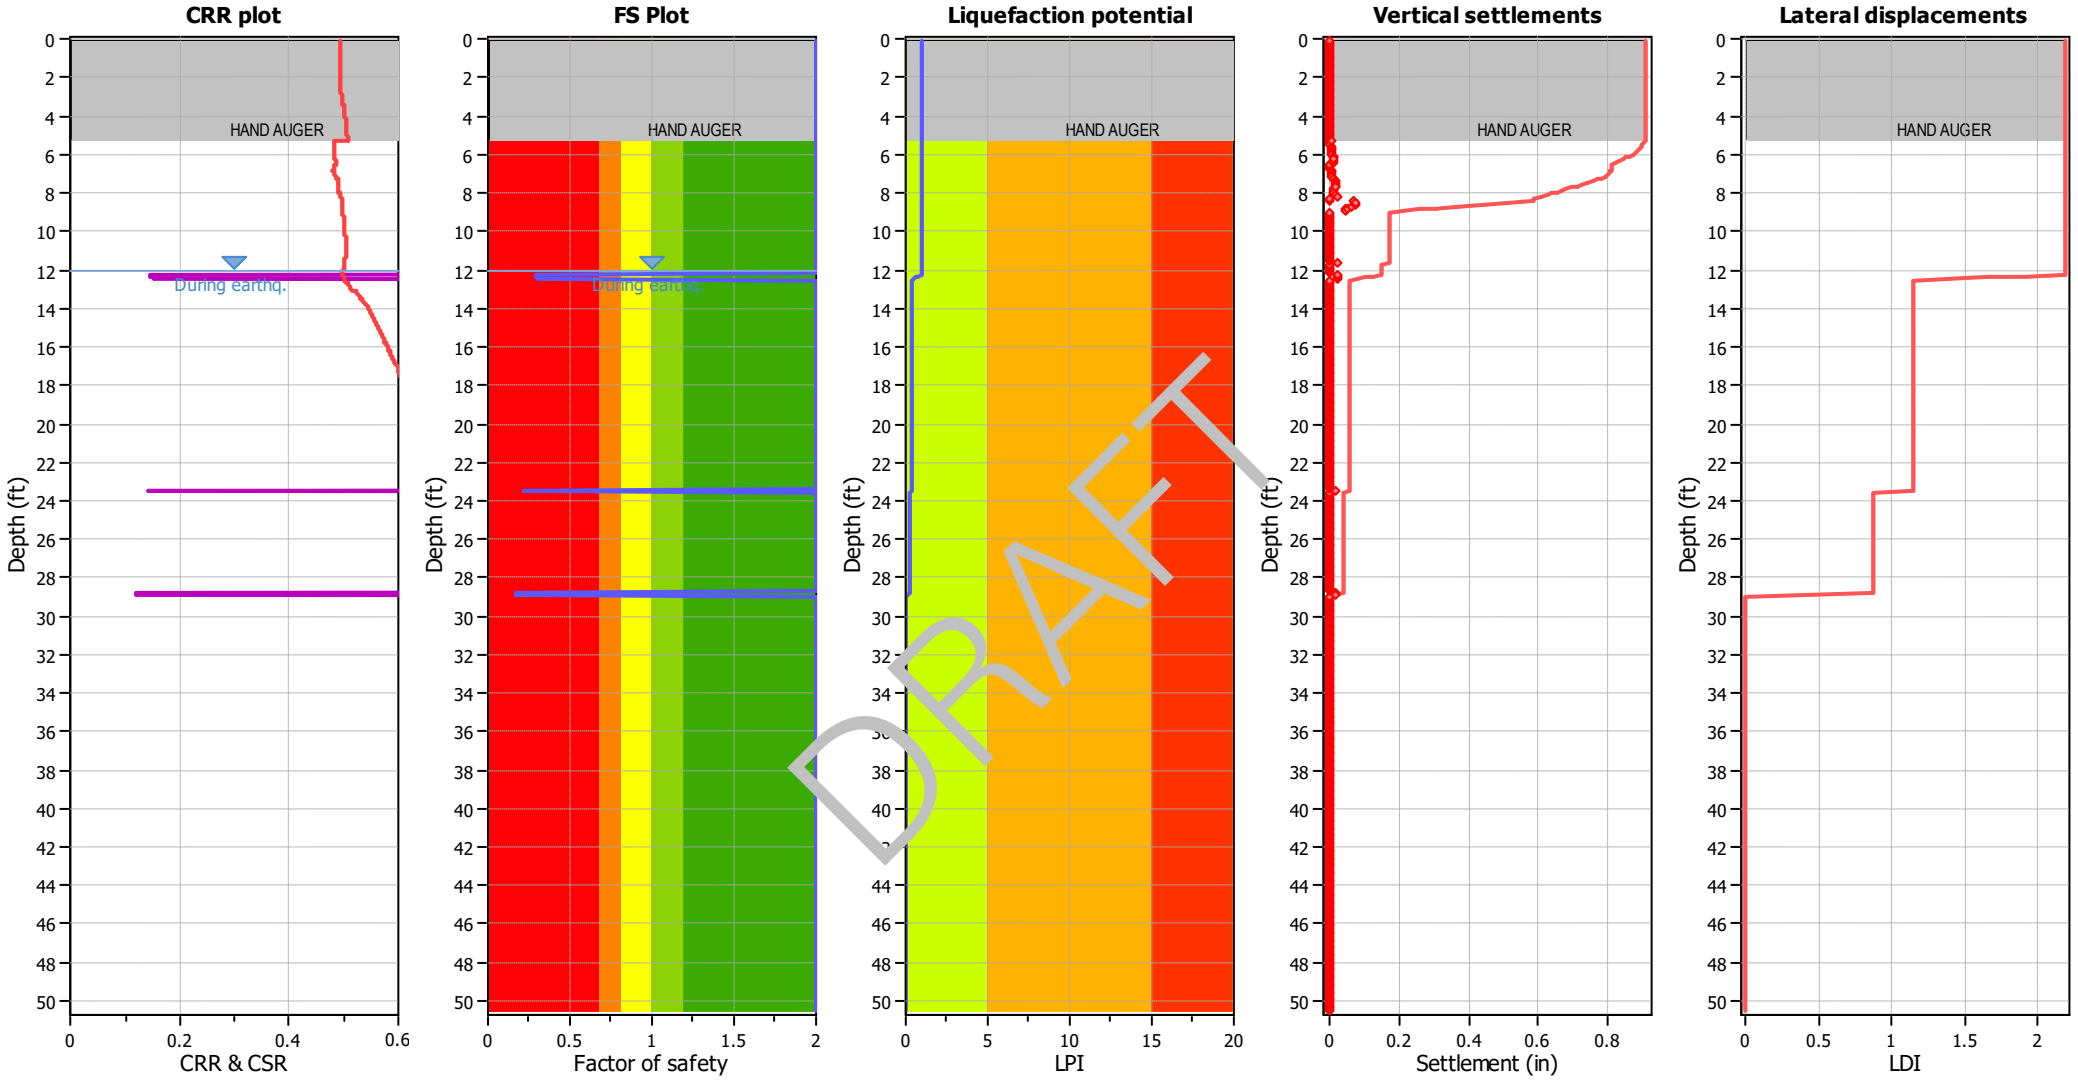






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

Liquefaction analysis overall plots



Input parameters and analysis data

Analysis method:	B&I (2014)	Depth to GWT (erthq.):	12.00 ft	Fill weight:	N/A
Fines correction method:	B&I (2014)	Average results interval:	3	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	7.20	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.65	Use fill:	No	Limit depth applied:	No
Depth to water table (insitu):	25.00 ft	Fill height:	N/A	Limit depth:	N/A

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk
