 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for   164 Source(s),
```

```
   for Total of    1 Urban Area(s):
   Urban Population =   2035210.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

 **This Run Includes:    164 Source(s);       6 Source Group(s); and     775
Receptor(s)

               with:      1 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:    163 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
```

Missing Hours

 **Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) =   481.00 ; Decay Coef. =   0.000   ; Rot. Angle =   0.0
                  Emission Units = GRAMS/SEC   ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =   4.3 MB of RAM.

 **Input Runstream File: aermod.inp

 **Output Print File: aermod.out

 **Detailed Error/Message File: Highland_Meines&Palm_Op.err

 **File for Summary of Results: Highland_Meines&Palm_Op.sum

Biological Resources Assessment

December 13, 2022

KIMLEY-HORN
Contact: Kari Cano
3880 Lemon Street, Suite 420
Riverside, California 92501

SUBJECT: Habitat Assessment for the Proposed Project Located on the Northwest Corner of the Intersection of Meines Street and Palm Avenue in the City of Highland, San Bernardino County, California

Introduction

This report contains the findings of ELMT Consulting's (ELMT) habitat assessment for the proposed Project (project site or site) located on the northwest corner of the intersection of Meines Street and Palm Avenue in the City of Highland, San Bernardino County, California. The habitat assessment was conducted by biologist Rachael A. Lyons on September 20, 2022 to document baseline conditions and assess the potential for special status[1] plant and wildlife species to occur within the project site that could pose a constraint to implementation of the proposed project.

Special attention was given to the suitability of the project site to support burrowing owl (*Athene cunicularia*) and San Bernardino Merriam's kangaroo rat (*Dipodomys merriami parvus*), and other special-status plant and wildlife species identified by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB), and other electronic databases as potentially occurring in the general vicinity of the project. Additionally, the report also addresses resources protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (FGC), federal Clean Water Act (CWA) regulated by the United States Army Corps of Engineers (Corps) and Regional Water Quality Control Board (Regional Board) respectively, and Section 1602 of the FGC administered by CDFW.

Project Location

The project site is generally located east of Interstate 215, north Interstate 10, and south and west of State Route 210 in the City of Highland, San Bernardino County, California. The site is depicted on the Redlands quadrangle of the United States Geological Survey's (USGS) 7.5-minute map series within Section 5, Township 1 South, Range 3 West. Specifically, the site is bounded to the east by Palm Avenue, to the south by Meines Street, and lies east of Central Avenue and south of 9th Street within Assessor Parcel Numbers (APN) 1192-601-01, -05, -07, -09; 621-02, -03, -04, -05, -06, -07, -08, -09, -10, -20, -21, -22, and -23. Refer to Exhibits 1-3 in Attachment A.

1 As used in this report, "special-status" refers to plant and wildlife species that are federally and State listed, proposed, or candidates; plant species that have been designated with a California Native Plant Society Rare Plant Rank; wildlife species that are designated by the CDFW as fully protected, species of special concern, or watch list species; and specially protected natural vegetation communities as designated by the CDFW.

Methodology

A literature review and records search were conducted to determine which special-status biological resources have the potential to occur on or within the general vicinity of the project site. In addition to the literature review, a general habitat assessment or field investigation of the project site was conducted to document existing conditions and assess the potential for special-status biological resources to occur within the project site.

Literature Review

Prior to conducting the field investigation, a literature review and records search was conducted for special-status biological resources potentially occurring on or within the vicinity of the project site. Previously recorded occurrences of special-status plant and wildlife species and their proximity to the project site was determined through a query of the CDFW's QuickView Tool in the Biogeographic Information and Observation System (BIOS), CNDDB Rarefind 5, the California Native Plant Society's (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California, Calflora Database, compendia of special-status species published by CDFW, and the United States Fish and Wildlife Service (USFWS) species listings.

All available reports, survey results, and literature detailing the biological resources previously observed on or within the vicinity of the project site was reviewed to understand existing site conditions and note the extent of any disturbances that have occurred within the project site that would otherwise limit the distribution of special-status biological resources. Standard field guides and texts were reviewed for specific habitat requirements of special-status and non-special-status biological resources, as well as the following resources:

- Google Earth Pro historic aerial imagery (1985-2021);
- United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), Soil Survey[2];
- USFWS Critical Habitat designations for Threatened and Endangered Species; and
- USFWS Endangered Species Profiles.

The literature review provided a baseline from which to inventory the biological resources potentially occurring within the project site. The CNDDB database was used, in conjunction with ArcGIS software, to locate the nearest recorded occurrences of special-status species and determine the distance from the project site.

Field Investigation

Following the literature review, biologist Rachael A. Lyons inventoried and evaluated the condition of the habitat within the project site on September 20, 2022. Plant communities and land cover types identified on aerial photographs during the literature review were verified by walking meandering transects throughout the project site. In addition, aerial photography was reviewed prior to the site investigation to

2 A soil series is defined as a group of soils with similar profiles developed from similar parent materials under comparable climatic and vegetation conditions. These profiles include major horizons with similar thickness, arrangement, and other important characteristics, which may promote favorable conditions for certain biological resources.

locate potential natural corridors and linkages that may support the movement of wildlife through the area. These areas identified on aerial photography were then walked during the field investigation.

Soil Series Assessment

On-site and adjoining soils were researched prior to the field investigation using the USDA NRCS Soil Survey for San Bernardino County, California. In addition, a review of the local geological conditions and historical aerial photographs was conducted to assess the ecological changes that the project site has undergone.

Plant Communities

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photography. The plant communities were classified in accordance with Sawyer, Keeler-Wolf and Evens (2009), delineated on an aerial photograph, and then digitized into GIS Arcview. The Arcview application was used to compute the area of each plant community and/or land cover type in acres.

Plants

Common plant species observed during the field investigation were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less-familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

Wildlife

Wildlife species detected during the field investigation by sight, calls, tracks, scat, or other sign were recorded during surveys in a field notebook. Field guides used to assist with identification of wildlife species during the survey included The Sibley Field Guide to the Birds of Western North America (Sibley 2003), A Field Guide to Western Reptiles and Amphibians (Stebbins 2003), and A Field Guide to Mammals of North America (Reid 2006). Although common names of wildlife species are well standardized, scientific names are provided immediately following common names in this report (first reference only).

Jurisdictional Drainages and Wetlands

Aerial photography was reviewed prior to conducting a field investigation in order to locate and inspect any potential natural drainage features, ponded areas, or water bodies that may fall under the jurisdiction of the United States Army Corps of Engineers (Corps), Regional Water Quality Control Board (Regional Board), or CDFW. In general, surface drainage features indicated as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory jurisdiction. In addition, ELMT reviewed jurisdictional waters information through examining historical aerial photographs to gain an understanding of the impact of land-use on natural drainage patterns in the area. The USFWS National Wetland Inventory (NWI) and Environmental Protection Agency (EPA) Water Program “My Waters” data layers were also reviewed to determine whether any hydrologic features and wetland areas have been documented on or within the vicinity of the project site.

Existing Site Conditions

The proposed project site is located in Highland, San Bernadino County, California, north of the Santa Ana River. The site is bounded by Palm Avenue to the east, Meines Street to the south, residential development to the west, and City Creek, which has been channelized, to the north. The majority of the site supports commercial development associated with the various manufacturing companies which exist on the site. Additionally, some parcels also support institutional and residential development and vacant, undeveloped land that have been heavily disturbed.

Topography and Soils

On-site elevation ranges from approximately 1,180 to 1,196 feet above mean sea level and the site generally slopes from east to west. On-site topography is relatively flat with no noticeable topographic relief. Based on the NRCS USDA Web Soil Survey, approximately 85.2 percent of the project site is historically underlain by Tujunga gravelly loamy sand (0 to 9 percent slopes), and the remaining 14.8 percent of the site is underlain by Psamments, Fluvents and Frequently flooded soils (0 to 5 percent slopes). Refer to Exhibit 4, *Soils*, in Attachment A. The majority of the site has been mechanically disturbed and compacted from grading activities and on-site and surrounding development.

Vegetation

The project site supports two (2) land cover types that would be classified as developed and disturbed (refer to Exhibit 5, *Vegetation*, in Attachment A). Additionally, this site does not support any natural plant communities. Refer to Attachment B, *Site Photographs*, for representative site photographs.

Disturbed

Disturbed areas on-site include unpaved areas that are unvegetated or minimally vegetated and do not otherwise support a recognizable plant community. Most of the disturbed areas on site occur in the form of graded or compressed soil. Due to anthropogenic disturbance, portions of the site have weathered and support weedy/early successional species that are adapted to growing in such conditions. Common plant species observed in the disturbed areas of the project site include telegraph weed (*Heterotheca grandiflora*), and Bermuda grass (*Cynodon dactylon*).

Developed

Developed areas generally refer to paved or otherwise impervious surfaces, ornamental landscaping, and all buildings/structures. Onsite development includes the paved and gravel driveways and access areas for the existing commercial, residential, and institutional developments on site, as well as the structures which support these operations. These areas are generally unvegetated or support minimal non-native weedy species. The parcel which contains residential development also supports ornamental landscaping. Common ornamental plant species observed here include Mexican fan palm (*Washingtonia robusta*), boxwood (*Buxus* sp.), Mediterranean cypress (*Cupressus sempervirens*), pine (*Pinus* sp.), wintercreeper (*Euonymus fortunei*), juniper (*Juniperus* sp.), and Douglas iris (*Iris douglasiana*).

Wildlife

Plant communities provide foraging habitat, nesting/denning sites, and shelter from adverse weather or predation. This section provides a discussion of those wildlife species that were observed or are expected to occur within the project site. The discussion is to be used as a general reference and is limited by the season, time of day, and weather conditions in which the field investigation was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation. The project site provides some suitable habitat for wildlife species, especially those adapted to a high degree of anthropogenic disturbances and development.

Fish

No fish or hydrogeomorphic features (e.g., creeks, ponds, lakes, reservoirs) with frequent sources of water that would support populations of fish were observed on or within the vicinity of the project site. Therefore, no fish are expected to occur and are presumed absent from the project site.

Amphibians

No amphibians or hydrogeomorphic features (e.g., creeks, ponds, lakes, reservoirs) with frequent sources of water that would support populations of amphibians were observed on or within the vicinity of the project site. Therefore, no amphibians are expected to occur and are presumed absent from the project site.

Reptiles

The project site provides foraging and cover habitat for a limited variety of reptile species adapted to a high degree of routine anthropogenic disturbance. No reptile species were observed on the project site at the time of the investigation. Common reptile species expected to occur onsite include western fence lizard (*Sceloporus occidentalis*) and southern alligator lizard (*Elgaria multicarinata*).

Birds

The project site and surrounding area provide limited foraging and nesting habitat for a bird species adapted to a high degree of anthropogenic disturbance. Bird species detected during the field investigation include rock pigeon (*Columba livia*), common raven (*Corvus corax*), and house finch (*haemorhous mexicanus*).

Mammals

The project site provides limited foraging and cover habitat for a mammalian species adapted to a high degree of anthropogenic disturbance. Non mammalian species were observed during the field investigation Common mammalian species that could potentially occur include coyote (*Canis latrans*), feral cat (*felis catus*), opossum (*Didelphis virginiana*), and raccoon (*Procyon lotor*).

Nesting Birds

The project site and surrounding area provide limited foraging and nesting habitat for year-round and seasonal avian residents adapted to a high degree of anthropogenic disturbance, as well as migrating songbirds that could occur in the area. Tall power lines, buildings, and trees within and surrounding the project site do allow for perching and nesting opportunities for raptor species. No active nests or birds displaying nesting behavior were observed on the project site.

Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted prior to the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction.

Migratory Corridors and Linkages

Habitat linkages provide connections between larger habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species yet still inadequate for others. Wildlife corridors are features that allow for the dispersal, seasonal migration, breeding, and foraging of a variety of wildlife species. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

The project site is isolated from any nearby wildlife corridors or linkages. City Creek lies immediately north of the project site. This drainage does provides local movement opportunities for wildlife adapted to urban environments. However, the proposed project will be confined to existing disturbed and developed areas and is surrounded by development, which has removed most natural plant communities from the surrounding area. As a result, implementation of the proposed project will not disrupt or have any adverse effects on any migratory corridors or linkages in the surrounding area.

Jurisdictional Areas

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates discharge of dredge or fill materials into "waters of the United States" pursuant to Section 404 of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFW regulates alterations to streambed and bank under Fish and Wildlife Code Sections 1600 et seq., and the Regional Board regulates discharges into surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

No jurisdictional drainage and/or wetland features were observed on the project site during the field investigation. Further no blueline streams have been recorded on the project site. Therefore, development of the project will not result in impacts to Corps, Regional Board, or CDFW jurisdiction and regulatory approvals will not be required.

It should be noted that City Creek occurs immediately north of the project site. Project activities are not expected to encroach into this channel. However, if project activities impact the channel, further review will be required to determine the jurisdictional limits of the Corps, Regional Board or CDFW jurisdiction, and if regulatory approvals are required.

Special-Status Biological Resources

The CNDDB Rarefind 5 and the CNPS Electronic Inventory of Rare and Endangered Vascular Plants of

California were queried for reported locations of special-status plant and wildlife species as well as special-status natural plant communities in the Redlands USGS 7.5-minute quadrangle. The habitat assessment evaluated the conditions of the habitat(s) within the boundaries of the project site to determine if the existing plant communities, at the time of the survey, have the potential to provide suitable habitat(s) for special-status plant and wildlife species.

The literature search identified twenty-one (21) special-status plant species, fifty-nine (59) special-status wildlife species, and three (3) special-status plant communities as having the potential to occur within the Redlands 7.5-minute quadrangle. Special-status plant and wildlife species were evaluated for their potential to occur within the project site based on habitat requirements, availability and quality of suitable habitat, and known distributions. Species determined to have the potential to occur within the general vicinity of the project site are presented in Attachment C*: Potentially Occurring Special-Status Biological Resources*.

Special-Status Plants

According to the CNDDB and CNPS, twenty-one (21) special-status plant species have been recorded in the San Bernadino North quadrangle (refer to Attachment C). No special-status plant species were observed on-site during the field investigation. The project site has been subject to anthropogenic disturbances from previous land uses and grading activities, and surrounding development. These disturbances have reduced the suitability of the habitat to support special-status plant species known to occur in the general vicinity of the project site. Based on habitat requirements for specific special-status plant species and the availability and quality of habitats needed by each species, it was determined that the project site does not provide suitable habitat for any listed species. Any special-status plant species known to occur in the area are presumed to be absent from the project site. No focused surveys are recommended.

Special-Status Wildlife

According to the CNDDB, fifty-nine (59) special-status wildlife species have been reported in the San Bernadino North and Harrison Mountain quadrangles (refer to Attachment C). No special-status wildlife species were observed on-site during the field investigation. Based on habitat requirements for specific species and the availability and quality of on-site habitats, it was determined that the project site has a low potential to support Cooper's hawk (*Accipiter cooperii*). All remaining special-status wildlife species are presumed to be absent from the project site due to a lack of quality habitat.

Cooper's hawk is not federally or state listed as endangered or threatened. To ensure impacts to Cooper's hawk do not occur from implementation of the proposed project, a pre-construction nesting bird clearance survey shall be conducted prior to ground disturbance. With implementation of mitigation through the pre-construction nesting bird clearance survey, impacts to these species will be less than significant.

Based on regional significance, the suitability of the project site to support burrowing owl and San Bernardino kangaroo rat within the project site is described in further detail below.

Burrowing Owl

The burrowing owl is currently listed as a California Species of Special Concern. It is a grassland specialist distributed throughout western North America where it occupies open areas with short vegetation and bare

ground within shrub, desert, and grassland environments. Burrowing owls use a wide variety of arid and semi-arid environments with well-drained, level to gently sloping areas characterized by sparse vegetation and bare ground (Haug and Didiuk 1993; Dechant et al. 1999). Burrowing owls are dependent upon the presence of burrowing mammals (such as ground squirrels) whose burrows are used for roosting and nesting (Haug and Didiuk 1993). The presence or absence of colonial mammal burrows is often a major factor that limits the presence or absence of burrowing owls. Where mammal burrows are scarce, burrowing owls have been found occupying man-made cavities, such as buried and non-functioning drainpipes, stand-pipes, and dry culverts. Burrowing mammals may burrow beneath rocks and debris or large, heavy objects such as abandoned cars, concrete blocks, or concrete pads. They also require open vegetation allowing line-of-sight observation of the surrounding habitat to forage as well as watch for predators.

No burrowing owls or recent sign (i.e., pellets, feathers, castings, or whitewash) was observed during the field investigation. The majority of the project site is highly disturbed, and no suitable burrows were observed on-site or within in the buffer areas immediately surrounding the site. Additionally, the site is surrounded by power poles, overhead power lines, ornamental trees, and buildings, which decrease the likelihood that burrowing owls would occur on the project site as these features provide perching opportunities for larger raptor species (i.e., red-tailed hawk [*Buteo jamaicensis*]) that prey on burrowing owls.

Based on the results of the field investigation, it was determined that the project site does not have potential to support burrowing owls and focused surveys are not recommended.

San Bernardino Kangaroo Rat

The San Bernardino kangaroo rat, federally listed as endangered, is one of several kangaroo rat species in its range. The Dulzura, the Pacific kangaroo rat (*Dipodomys agilis*) and the Stephens kangaroo rat (*Dipodomys stephensi*) occur in areas occupied by the San Bernardino kangaroo rat, but these other species have a wider habitat range. The habitat of the San Bernardino kangaroo rat is described as being confined to pioneer and intermediate Riversidean Alluvial Fan Sage Scrub (RAFSS) habitats, with sandy soils deposited by fluvial (water) rather than Aeolian (wind) processes. Burrows are dug in loose soil, usually near or beneath shrubs.

The San Bernardino kangaroo rat is one of three subspecies of the Merriam's kangaroo rat. The Merriam's kangaroo rat is a widespread species that can be found from the inland valleys to the deserts. The subspecies known as the San Bernardino kangaroo, however, is confined to inland valley scrub communities, and more particularly, to scrub communities occurring along rivers, streams and drainages. Most of the drainages have been historically altered as a result of flood control efforts and the resulting increased use of river resources, including mining, off-road vehicle use and road and housing development. This increased use of river resources has resulted in a reduction in both the amount and quality of habitat available for the San Bernardino kangaroo rat. The past habitat losses and potential future losses prompted the emergency listing of the San Bernardino kangaroo rat as an endangered species (USFWS, 1998a). PCE's are physical or biological features essential to the conservation of a species for which its designated critical habitat is based on. Examples of PCE's include food, water, space for individual and population growth, cover or shelter, etc. The PCEs essential to support the biological needs of foraging, reproducing, rearing of young, intra-specific communication, dispersal, genetic exchange, or sheltering for San Bernardino kangaroo rat are:

1. River, creek, stream, and wash channels; alluvial fans, flood plains, flood benches and terraces; and historic braided channels that are subject to dynamic geomorphological and hydrological processes;
2. Alluvial sage scrub and associated vegetation such as coastal sage scrub and chamise chaparral with a moderately open canopy;
3. Soil series consisting of sand, sandy loam, or loam within its geographical range; and
4. Upland areas proximal to flood plains containing suitable habitat (land adjacent to alluvial fan that provides Refugia).

San Bernardino kangaroo rat is known to occur within Lytle Creek. The project site consists of vacant, heavily disturbed land with compacted soils that have been disturbed from previous land uses. Field sign for kangaroo rat, including San Bernardino kangaroo rat, is distinctive and readily noted in the field. No sign (e.g., San Bernardino kangaroo rat characteristic burrows, dusting baths, and/or tail drags) were observed on the project site. Additionally, the project site no longer is subject to the hydrologic influence of Cajon Wash.

As noted above, the project site and surrounding areas have not been exposed to fluvial processes associated with the streams in the area since development in the area occurred. The project site is not subject to dynamic geomorphological and hydrological processes needed to scour and reset the onsite habitats back to pioneer or intermediate RAFSS habitats. Further, the project site no longer receives sand or sandy loam soils from scouring events needed by San Bernardino kangaroo rat for burrowing. Instead, the site supports highly graded and compacted rocky soils.

Based on these conditions, it was determined that the project site does not provide the requisite habitat elements needed by San Bernardino kangaroo rat to be present. Therefore, it was determined that San Bernardino kangaroo rat is presumed absent from the project site. No focused surveys are recommended.

Special-Status Plant Communities

According to the CNDDB, three (3) special-status plant communities have been reported in the Redlands USGS 7.5-minute quadrangle: Riversidian Alluvial Fan Sage Scrub, Southern Sycamore Alder Riparian Woodland, and Southern Mixed Riparian Forest (refer to Attachment C), none of which were observed on-site during the field investigation. Therefore, no special-status plant communities will be impacted by implementation of the proposed project.

Critical Habitats

Under the federal Endangered Species Act, "Critical Habitat" is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the USFWS regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not

affect private landowners, unless a project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a Clean Water Act Permit from the United States Army Corps of Engineers). If there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The project site is not located within federally designated Critical Habitat for any species. The nearest critical habitats occur 0.3 mile to the southeast for Santa Ana sucker (*Catostomas santaanae*) and 0.17 mile to the south for San Bernadino Merriam's kangaroo rat (*Dipodomys merriami*). Refer to Exhibit 6, *Critical Habitat* in Attachment A. The entire project site and most adjacent areas have been converted from natural habitat into commercial, residential, and institutional development. The site supports no natural plant communities, and it was determined that the project does not support suitable habitat for any listed species. Furthermore, since the proposed project does not have a federal nexus a Section 7 consultation with the USFWS would not be required for loss or adverse modifications to Critical Habitat.

Conclusion

Based on the proposed project footprint and existing site conditions discussed in this report, no special-status plant or wildlife species were observed during the field investigation. In addition, Cooper's hawk was determined to have a low potential to occur. With the implementation of a pre-construction nesting bird clearance survey, impacts to Cooper's hawk will be less than significant. Further, no special-status plant species or other special-status wildlife species known to occur in the general vicinity of the project site is expected to be directly or indirectly impacted from implementation of the proposed project. With completion of the recommendations provided above, no impacts to year-round, seasonal, or special-status avian residents or special-status species will occur from implementation of the proposed project. Therefore, it was determined that implementation of the project will have "no effect" on federally or State listed species known to occur in the general vicinity of the project site. Additionally, the development of the project will not impact designated Critical Habitats, regional wildlife movement corridors/linkages, or jurisdictional drainage features.

Recommendations

Migratory Bird Treaty Act and Fish and Game Code

Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). In order to protect migratory bird species, a nesting bird clearance survey should be conducted prior to any ground disturbance or vegetation removal activities that may disrupt the birds during the nesting season.

If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted within three (3) days of the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction. The biologist conducting the clearance survey should document a negative survey with a brief letter report indicating that no impacts to active avian nests will occur. If an active avian nest is discovered during the pre-construction clearance survey, construction activities should stay outside of a no-disturbance buffer. The size of the no-disturbance buffer will be determined by the wildlife biologist and will depend on the level of noise and/or surrounding

anthropogenic disturbances, line of sight between the nest and the construction activity, type and duration of construction activity, ambient noise, species habituation, and topographical barriers. These factors will be evaluated on a case-by-case basis when developing buffer distances. Limits of construction to avoid an active nest will be established in the field with flagging, fencing, or other appropriate barriers; and construction personnel will be instructed on the sensitivity of nest areas. A biological monitor should be present to delineate the boundaries of the buffer area and to monitor the active nest to ensure that nesting behavior is not adversely affected by the construction activity. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, construction activities within the buffer area can occur.

Please do not hesitate to contact Tom McGill at (951) 285-6014 or tmcgill@elmtconsulting.com or Travis McGill at (909) 816-1646 or travismcgill@elmtconsulting.com should you have any questions this report.

Sincerely,

Thomas J. McGill, Ph.D.

Potentially Occurring Special-Status Biological Resources

Table D-1: Potentially Occurring Special-Status Biological Resources

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
SPECIAL-STATUS WILDLIFE SPECIES				
Accipiter cooperii Cooper's hawk	Fed: None CA: WL	Generally found in forested areas up to 3,000 feet in elevation, especially near edges and rivers. Prefers hardwood stands and mature forests, but can be found in urban and suburban areas where there are tall trees for nesting. Common in open areas during nesting season.	No	**Low** There is marginal foraging habitat on the site and minimal nesting opportunities. This species is adapted to urban environments and occurs commonly.
Agelaius tricolor tricolored blackbird	Fed: None CA: **THR**	Prefers wetland and grassland habitats. Nests in cattails bulrushes, and willows. Due to habitat loss, most native populations now found in rice-growing regions and flooded agricultural areas.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	Fed: None CA: WL	Typically found between 3,000 and 6,000 feet in elevation. Breed in sparsely vegetated shrublands on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush (*Artemisia californica*), but can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Anniella stebbinsi southern California legless lizard	Fed: None CA: SSC	Occurs primarily in areas with sandy or loose loamy soils under sparse vegetation of beaches, chaparral, or pine-oak woodland; or near sycamores, oaks, or cottonwoods that grow on stream terraces. Often found under or in the close vicinity of logs, rocks, old boards, and the compacted debris of woodrat nests.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Antrozous pallidus pallid bat	Fed: None CA: SSC	Found in arid and semi-arid regions, often in mountainous or rocky areas near water. Can also by found over open, sparsely vegetated grasslands. Roosts in cracks, crevices, and rocky outcrops.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Aquila chrysaetos golden eagle	Fed: None CA: FP; WL	Occupies nearly all terrestrial habitats of the western states except densely forested areas. Favors secluded cliffs with overhanging ledges and large trees for nesting and cover. Hilly or mountainous country where takeoff and soaring are supported by updrafts is generally preferred to flat habitats. Deeply cut canyons rising to open mountain slopes and crags are ideal habitat.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Ardea alba great egret	Fed: None CA: None	Found among marshes, ponds, shores, and mud flats. Forages in open areas like along rivers, lake edges, large marshes, shallow coastal lagoons, and estuaries.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Ardea Herodias great blue heron	Fed: None CA: None	Found in both salt and freshwater habitats. Common around open coasts, marshes, sloughs, riverbanks, and lakes, but can also be found in along urban ponds. Forages in grasslands and agricultural fields. Nests in trees high off the ground.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Arizona elegans occidentalis California glossy snake	Fed: None CA: SSC	Occurs in a wide variety of habitat types including open desert, grasslands, shrublands, chaparral, and woodlands. Prefers areas where the soil is loose and sandy which allows for burrowing.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Artemisiospiza belli belli Bell's sage sparrow	Fed: None CA: WL	Occurs in chaparral dominated by fairly dense stands of chamise. Also found in coastal sage scrub in south of range.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Aspidoscelis hyperythra orangethroat whiptail	Fed: None CA: SSC	Inhabits low-elevations coastal scrub, chamise-redshank chaparral, mixed chaparral, and valley-foothill hardwood habitats. Semi-arid brushy areas typically with loose soil and rocks, including washes, stream sides, rocky hillsides, and coastal chaparral.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Aspidoscelis tigris stejnegeri coastal whiptail	Fed: None CA: SSC	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage such as chaparral, woodland, and riparian areas.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Athene cunicularia burrowing owl	Fed: None CA: SSC	Inhabits open, dry, sparsely vegetated land with available burrows abandoned by small rodents. Found in grasslands, deserts, and along the slopes of drainages, but can also be found in more urban areas like airport runways and golf courses.	No	**Presumed Absent** No suitable burrows observed within the project site or in the surrounding buffer zone.
Bombus crotchii Crotch bumble bee	Fed: None CA: None	Exclusive to coastal California east towards the Sierra-Cascade Crest; less common in western Nevada.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Buteo regalis ferruginous hawk	Fed: None CA: WL	Occurs primarily in open grasslands and fields, but may be found in sagebrush flats, desert scrub, low foothills, or along the edges of pinyon-juniper woodland. Feeds primarily on small mammals and typically found in agricultural or open fields.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Buteo swainsonii Swainson's hawk	Fed: None CA: THR	Lives in open areas like savannas, grasslands, steppes, and cultivated lands. Habitat is dependent on an abundance of small mammal prey. Nests in small thickets of trees and sometimes yuccas.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Calypte costae Costa's hummingbird	Fed: None CA: None	Desert and semi-desert, arid brushy foothills and chaparral. A desert hummingbird that breeds in the Sonoran and Mojave Deserts. Departs desert heat moving into chaparral, scrub, and woodland habitats.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Chaetodipus fallax fallax northwestern San Diego pocket mouse	Fed: None CA: SSC	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters above msl. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Chaetodipus fallax pallidus pallid San Diego pocket mouse	Fed: None CA: SSC	Lives in coastal scrub, chamise-redshank chaparral, mixed chaparral, sagebrush, desert wash, desert scrub, desert succulent scrub, pinyon-juniper woodlands, and annual grasslands. Prefers moderate canopy coverage of arid shrubland or on or near rocky slopes and sandy areas.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Circus hudsonius northern harrier	Fed: None CA: SSC	Found in wide-open habitats in prairie grasslands, fields, and marshes. Nests are concealed on the ground in grasses or wetland vegetation.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Coccyzus americanus occidentalis western yellow-billed cuckoo	Fed: **THR** CA: **END**	Can be found in coastal scrub, second-growth forests and woodlands, hedgerows, forest edges, and in smaller riparian patches than those used for breeding. Wintering yellow-billed cuckoos generally reside in woody lowland vegetation near freshwater resources.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Crotalus ruber red-diamond rattlesnake	Fed: None CA: SSC	Inhabits arid scrub, coastal chaparral, oak and pine woodlands, rocky grassland, and cultivated areas from sea level to 3,000 feet in elevation. Common on desert slopes of mountains and rocky desert flats.		**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Diadophis punctatus modestus Sand Bernadino ringneck snake	Fed: None CA: None	Found in various moist habitats including woodland chaparral, forest and grassland. Can also be found in farmlands and gardens. Shelters under logs, stones or boards and is not an active burrower.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Dipodomys merriami parvus San Bernardino kangaroo rat	Fed: **END** CA: CE; SSC	Primarily found in Riversidian alluvial fan sage scrub and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May occur at lower densities in Riversidian upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to Riversidian alluvial fan sage scrub habitats. Tend to avoid rocky substrates and prefer sandy loam substrates for digging of shallow burrows.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Dipodomys simulans Dulzura kangaroo rat	Fed: None CA: None	Relatively common in chaparral, coastal sage scrub, Riversidean alluvial fan sage scrub, and peninsular juniper woodland habitats.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Dipdomys stephensi Stephen's kangaroo rat	Fed: **THR** CA: **THR**	Common in coastal sage scrub habitats and transition areas such as grasslands and mixed chaparral as well as agricultural areas. Prefers sparse, perennial vegetation and well-drained soils.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Elanus leucurus white-tailed kite	Fed: None CA: FP	Found in open groves, river valleys, savannas, open woodlands, marshes, desert grasslands, partially cleared lands, and cultivated fields. Avoids heavily grazed areas. Requires some trees for perching and nesting, as well as open ground with an abundance of small mammals.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Empidonax traillii Willow flycatcher	Fed: None CA: **END**	Found in bushes, willows, thickets, brushy fields and upland copses. Breeds in thickets of deciduous trees and shrubs, especially willows or along woodland edges. Often near streams or marshes, especially in southern part of range, but may be found in drier habitats than Alder Flycatcher.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Empidonax traillii extimus Southwestern willow flycatcher	Fed: **END** CA: **END**	Requires dense riparian habitats for nesting. Breeds in thickets of deciduous trees and shrubs, especially willows or along woodland edges. Often near streams or marshes. Winters around clearings and second growth in the tropics, especially near water.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Eremophila alpestris actia California horned lark	Fed: None CA: WL	Generally found in shortgrass prairies, grasslands, disturbed fields, or similar habitat types along the coast or in deserts. Trees are shrubs are usually scarce or absent. Generally rare in montane, coniferous, or chaparral habitats. Forms large flocks outside of the breeding season.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Eugnosta busckana Busk's gallmoth	Fed: None CA: None	Little is known about the habitat and distribution of this species.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Eumops perotis californicus western mastiff bat	Fed: None CA: SSC	Occurs in many open spaces in semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, annual and perennial grasslands, palm oases, chaparral, desert scrub, and urban. Potential roost locations require vertical faces to drop off from to take flight.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Falco columbarius merlin	Fed: None CA: WL	Winters in open forests, grasslands and coastal areas. Breeds in forested openings, edges and along rivers. Habitat varies from coniferous forests to open conifer woodland, prairie groves, foothill marshes and open country.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Falco peregrinus anatum American peregrine falcon	Fed: None CA: FP	Found in a wide range of open habitats. Often along mountain ranges, or near water, especially along the coast. Adapted to urban environments and cities, often nesting on building ledges.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Gymnogyps californianus *California condor*	Fed: **END** CA: FP	Inhabits rugged canyons, gorges and forested mountains between 985 and 8,860 feet. Nests primarily between 2,000 and 4,500 feet in cliff caves.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Icteria virens yellow-breasted chat	Fed: None CA: SSC	Primarily found in tall, dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush with well-developed understories. Nesting areas are associated with streams, swampy ground, and the borders of small ponds. Breeding habitat must be dense to provide shade and concealment. It winters south the Central America.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Lanius ludovicianus loggerhead shrike	Fed: None CA: SSC	Often found in broken woodlands, shrublands, and other habitats. Prefers open country with scattered perches for hunting and fairly dense brush for nesting.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Lasiurus xanthinus Western yellow bat	Fed: None CA: SSC	Roosts in palm trees in foothill riparian, desert wash, and palm oasis habitats with access to water for foraging.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	Fed: None CA: SSC	Occurs in diverse habitats, but primarily is found in arid regions supporting shortgrass habitats. Openness of open scrub habitat is preferred over dense chaparral.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Myotis yumanensis Yuma myotis	Fed: None CA: None	Resides in moist and dry forests, riparian areas, grasslands, shrubsteppe, and deserts. Closely associated with rivers, streams, lakes, and ponds. Generally found at lower elevations. Roosts in bridges, buildings, cliff crevices, caves, mines, and trees.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Neolarra alba white cuckoo bee	Fed: None CA: None	Found in dry, sandy areas (particularly deserts) in the American southwest near the host plants for *Perdita* bee species, of which it is a nest parasite.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Neotoma lepida intermedia San Diego desert woodrat	Fed: None CA: SSC	Occurs in coastal scrub communities between San Luis Obispo and San Diego Counties. Prefers moderate to dense canopies, and especially rocky outcrops.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Nyctinomops femorosaccus pocketed free-tailed bat	Fed: None CA: SSC	Often found in pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Oncorhynchus mykiss irideus **pop. 10** steelhead – southern california DPS	Fed: **END** CA: None	Found in permanent coastal streams from San Diego to the Smith River.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Perognathus alticola alticola white-eared pocket mouse	Fed: None CA: SSC	Endemic to the San Bernadino and Tehachapi Mountains. Found in isolated montane areas among ponderosa and Jeffrey pine habitats, but sometimes found in mixed chaparral and sagebrush habtitats as well as in fallow fields dominated by Russian thistle. Forages in open ground and beneath shrubs.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Perognathus longimembris brevinasus Los Angeles pocket mouse	Fed: None CA: SSC	Occurs in lower elevation grasslands and coastal sage scrub communities in and around the Los Angeles Basin. Prefers open ground with fine sandy soils. May not dig extensive burrows but will seek refuge under weeds and dead leaves instead.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Phrynosoma blainvillii coast horned lizard	Fed: None CA: SSC	Occurs in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. In inland areas, this species is restricted to areas with pockets of open microhabitat, created by disturbance (i.e. fire, floods, roads, grazing, fire breaks). The key elements of such habitats are loose, fine soils with a high sand fraction; an abundance of native ants or other insects; and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Polioptila californica californica coastal California gnatcatcher	Fed: **THR** CA: SSC	Obligate resident of sage scrub habitats that are dominated by California sagebrush (*Artemisia californica*). This species generally occurs below 750 feet elevation in coastal regions and below 1,500 feet inland. Ranges from the Ventura County, south to San Diego County and northern Baja California and it is less common in sage scrub with a high percentage of tall shrubs. Prefers habitat with more low-growing vegetation.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Progne subis purple martin	Fed: None CA: SSC	Prefers open spaces that are located near water sources. Forages in meadows, grasslands, over lakes and ponds and flooded pastures. Also inhabits urban areas like farms, croplands, parks and gardens. Nests in cavities of trees, cactus, buildings, or cliffs.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Pyrocephalus rubinus vermillion flycatcher	Fed: None CA: SSC	Prefers open habitat such as arid scrubland, farmland, desert savannah, cultivated lands and riparian woodlands. Nests can be found specifically in willows, oaks, cottonwoods, mesquites and sycamores.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Rana draytonii California red-legged frog	Fed: **THR** CA: SSC	Found from sea level to elevations of about 5,200 feet, primarily in coastal drainages.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Rana muscosa southern mountain yellow-legged frog	Fed: **END** CA: **END**; WL	Occurs in lower elevation habitats characterized by rocky streambeds and wet meadows, while higher elevation habitats include lakes, ponds, and streams. Occupy streams in narrow, rock-walled canyons. Often found along rock walls or vegetated banks and always within a few feet of the water.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
***Rhinichthys osculus* ssp. 3** Santa Ana speckled dace	Fed: None CA: SSC	Requires permanent flowing streams within summer water temperatures of 17 – 20 degrees Celsius. Inhabits shallow cobble and gravel riffles and small streams that flow through steep, rocky canyons with chaparral covered walls.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Salvadora hexalepis virgultea coast patch-nosed snake	Fed: None CA: SSC	Inhabits semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains. Requires friable soils for burrowing.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Setophaga petechia yellow warbler	Fed: None CA: SSC	Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near stream courses.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Spea hammondii Western spadefoot	Fed: None CA: SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washed, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rainpools which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Spinus lawrencei Lawrence's Goldfinch	Fed: None CA: None	Open woodlands, chaparral, and weedy fields. Closely associated with oaks. Nests in open oak or other arid woodland and chaparral near water.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Strix occidentalis occidentalis California spotted owl	Fed: None CA: SSC	Breeds and roosts in forests and woodland with large old trees and snags, high basal areas of trees and snags, dense canopies, multiple canopy layers, and downed woody debris. Large old trees are key as they provide nest sites and cover from weather.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Taricha torosa coast range newt	Fed: None CA: SSC	Can be found in coastal areas and coastal range mountains in oak forests, woodlands, and rolling grasslands. In the terrestrial phase, they live in moist to dry habitats under woody or leafy debris, in rock crevices, or in animal burrows. In the aquatic phase they are found in ponds, lakes, resevoirs, and slow-moving streams.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Taxidea taxus American badger	Fed: None CA: SSC	Primarily occupy grasslands, parklands, farms, tallgrass and shortgrass prairies, meadows, shrub-steppe communities and other treeless areas with sandy loam soils where it can dig more easily for its prey. Occasionally found in open chaparral (with less than 50% plant cover) and riparian zones.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Thamnophis hammondii Two-striped gartersnake	Fed: None CA: SSC	Occurs in or near permanent fresh water, often along streams with rocky beds and riparian growth up to 7,000 feet in elevation.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Vireo bellii pusillus least Bell's vireo	Fed: **END** CA: **END**	Primarily occupy Riverine riparian habitat that typically feature dense cover within 1-2 meters of the ground and a dense, stratified canopy. Typically it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodlands, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses, 2,000 feet elevation in the interior.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Xanthocephalus xanthocephalus yellow-headed blackbird	Fed: None CA: SSC	Winters in the western United States. Breeds in freshwater sloughs, marshy lake boarders, and tall cattails. Nests primarily in large wetlands, but also in mountain meadows and along the edges of ponds and rivers. Forages in fields and open country.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
SPECIAL-STATUS PLANT SPECIES				
Abronia villosa* var. *aurita chaparral sand-verbena	Fed: None CA: None CNPS: 1B.1	Associated with creosote-bush scrub and coastal sage scrub communities. Grows in well-drained sandy soils in desert habitats and flood plains within the southwestern United States and northern Mexico. Occurs at elevations up to 4,500 feet. Blooms from February to May.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Arenaria paludicola marsh sandwort	Fed: **END** CA: **END** CNPS: 1B.1	Grows mainly in wetlands and freshwater marshes in arid climates. The plant can grow in saturated acidic bog soils and soils that are sandy with a high organic content. Found at elevations ranging from 33 to 558 feet. Blooming period is from May to August.	No	**Presumed Absent** No suitable habitat is present within the project site.
Artemisia palmeri San Diego sagewort	Fed: None CA: None CNPS: 4.2	Grows along coastal creeks and drainages and other small pockets with residual moisture in coastal sage scrub and chaparral communities. Prefers sandy soils. Occurs in areas below 2,000 feet in elevation. Blooms from June to July.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.
Berberis nevinii Nevin's barrberry	Fed: **END** CA: **END** CNPS: 1B.1	Prefers a riparian and alluvial scrub habitat and can be found in foothill woodlands, coastal sage scrub, and chaparral communities. Grows on sandy soils in washes, alluvial terraces and canyon bottoms.	No	**Presumed Absent** No suitable habitat is present within the project site.
Bouteloua trifida three-awned grama	Fed: None CA: None CNPS: 2B.3	Grows on dry open plains, shrubby hills, and rocky slopes. Occur at elevations ranging from 7,200 to 8,200 feet. Prefers rocky, well-drained soils in areas with full sun. Seeds in May and June.	No	**Presumed Absent** No suitable habitat is present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Calochortus plummerae Plummer's mariposa-lily	Fed: None CA: None CNPS: 4.2	Prefers openings in chaparral, foothill woodland, coastal sage scrub, valley foothill grasslands, cismontane woodland, lower montane coniferous forest and yellow pine forest. Often found on dry, rocky slopes and soils and brushy areas. Can be very common after a fire. Found at elevations ranging from 459 to 6,299 feet. Blooming period is from May to July.	No	**Presumed Absent** No suitable habitat is present within the project site.
Centromadia pungens* ssp. *Laevis Smooth tarplant	Fed: None CA: None CNPS: 1B.1	Occurs in alkaline soils within chenopod scrub, meadows and seeps, playas, riparian woodland, and valley and foothill grassland habitats. Grows in elevation from 0 to 2,100 feet. Blooming period ranges from April to September.	No	**Presumed Absent** No suitable habitat is present within the project site.
Chloropyron maritimum* ssp. *Maritimum Salt marsh bird's-beak	Fed: **END** CA: **END** CNPS: 1B.2	Upper terraces and higher edges of coastal salt marshes where tidal inundation is periodic. Found at elevations ranging from 0 to 98 feet. Blooming period is from May to October.	No	**Presumed Absent** No suitable habitat is present within the project site. The project site occurs outside of the known elevation range for this species.
Chorizanthe leptotheca Penninsular spineflower	Fed: None CA: None CNPS: 4.2	Grows in chaparral and forest habitats in sandy or gravelly soils from sea level to 5,000 feet in elevation. Blooms from May to August.	No	**Presumed Absent** No suitable habitat is present within the project site.
Chorizanthe parryi* var. *parryi Parry's spineflower	Fed: None CA: None CNPS: 1B.1	Occurs on sandy and/or rocky soils in chaparral, coastal sage scrub, and sandy openings within alluvial washes and margins. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	No	**Presumed Absent** No suitable habitat is present within the project site.
Chorizanthe xanti* var. *leucotheca white-bracted spineflower	Fed: None CA: None CNPS: 1B.2	Grows in sandy to gravelly places in saltbush communities, coastal scrub, Mojavean desert scrub, pinyon-juniper and pine-oak woodlands. Blooms from April to June.	No	**Presumed Absent** No suitable habitat is present within the project site.
Convolvus simulans small-flowered morning-glory	Fed: None CA: None CNPS: 4.2	Found in northern coastal scrub, coastal sage scrub, and valley grassland communities. Blooms from March to July.	No	**Presumed Absent** No suitable habitat is present within the project site.
Cuscuta obtusiflora* var. *glandulosa Peruvian dodder	Fed: None CA: None CNPS: 2B.2	Grows in marshes and freshwater swamps. Often seen parasitizing other host plants by clinging to groundcover-type plants or climbing up other vines and tall vegetation. Blooms from July to October.	No	**Presumed Absent** No suitable habitat is present within the project site.
Deinandra paniculate paniculate tarplant	Fed: None CA: None CNPS: 4.2	Found in vernal pool margins, grasslands, open areas such as roadsides and in other disturbed soils inland from the coast. Blooms from May to November. Elevation range is sea level to 1,000 feet.		**Presumed Absent** No suitable habitat is present within the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
Dodecahema leptoceras slender-horned spineflower	Fed: **END** CA: **END** CNPS: 1B.1	Chaparral, coastal scrub (alluvial fan sage scrub). Flood deposited terraces and washes. Found at elevations ranging from 1,181 to 2,690 feet. Blooming period is from April to June.	No	**Presumed Absent** No suitable habitat is present within the project site.
Eriastrum densifolium* ssp. *sanctorum Santa Ana River woollystar	Fed: **END** CA: **END** CNPS: 1B.1	Found in sandy soil in association with mature alluvial scrub. Ideal habitat appears to be a terrace or bench that receives overbank deposits every 50 to 100 years. Cryptogamic crusts are frequently present in occupied areas. Found at elevations ranging from 299 to 2,001 feet. Blooming period is from April to September.	No	**Presumed Absent** No suitable habitat is present within the project site. The project site occurs outside of the known elevation range for this species.
Imperata brevifolia California satintail	Fed: None CA: None CNPS: 2B.1	Grows primarily in riparian habitats and has an affinity for moist soils, but can be found in chaparral, coastal scrub, Mojavean desert scrub, meadows and seeps. Found at elevations ranging from 0 to 3,986 feet. Blooming period is from September to May.	No	**Presumed Absent** No suitable habitat is present within the project site.
Juglans californica southern California black walnut	Fed: None CA: None CNPS: 4.2	Found in chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 164 to 2,953 feet. Blooming period is from March to August.	No	**Presumed Absent** No suitable habitat is present within the project site.
Lepidium virginicum* var. *robinsonii Robinson's pepper-grass	Fed: None CA: None CNPS: 4.3	Found in chaparral and coastal sage scrub communities. Grows along roadsides, in bottomlands, gravelly and sandy shores, in waste grounds, stream banks, grassy meadows, dry flats, and stream beds. Blooms from January to July.	No	**Presumed Absent** No suitable habitat is present within the project site.
Malacothamnus parishii Parish's bush-mallow	Fed: None CA: None CNPS: 1A	Found only in and around San Bernadino. Thought to be extirpated from native habitat. Historically found in chaparral and coastal sage scrub communities. Grows at elevations ranging from 1,000 to 1,500 feet. Blooms from March to May.	No	**Presumed Absent** No suitable habitat is present within the project site.
Pseudoriontium cyathiferum Deep Canyon snapdragon	Fed: None CA: None CNPS: 2B.3	Found in rocky slopes and washes in desert or dry habitats below 2,650 feet in elevation. Blooms from January to April.	No	**Presumed Absent** No suitable habitat is present within the project site.
Ribes divaricatum* var. *parishii Parish's gooseberry	Fed: None CA: None CNPS: 1A	Grows in forests, woodlands, and in willow swales, riparian habitats, and coastal scrub communities along the West coast. Blooms from February to April.	No	**Presumed Absent** No suitable habitat is present within the project site.

CDFW SENSITIVE HABITATS				
Riversidian Alluvial Fan Sage Scrub	CDFW Sensitive Habitat	Occur within broad washes of sandy alluvial drainages that carry rainfall runoff sporadically in winter and spring but remain relatively dry through the remainder of the year. Is restricted to drainages and floodplains with very sandy substrates that have a dearth of decomposed plant material. These areas do not develop into riparian woodland or scrub due to the limited water resources and scouring by occasional floods.	No	**Absent**. This plant community was not observed on-site.
Southern Mixed Riparian Forest	CDFW Sensitive Habitat	Comprised of winter-deciduous trees that require water near the soil surface. Representative species include willow cottonwood, western sycamore, mule fat, stinging nettle, and wild grape.	No	**Absent**. This plant community was not observed on-site.
Southern Sycamore Alder Riparian Woodland	CDFW Sensitive Habitat	Occurs below 2,000 meters in elevation, sycamore and alder often occur along seasonally flooded banks; cottonwoods and willows are also often present. Poison oak, mugwort, elderberry and wild raspberry may be present in understory.	No	**Absent**. This plant community was not observed on-site.

Attachment E

Regulations

Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to continued existence and existing knowledge of population levels.

Federal Regulations

Endangered Species Act of 1973

As defined within the Federal Endangered Species Act (FESA) of 1973, an endangered species is any animal or plant listed by regulation as being in danger of extinction throughout all or a significant portion of its geographical range. A threatened species is any animal or plant that is likely to become endangered within the foreseeable future throughout all or a significant portion of its geographical range. Without a special permit, federal law prohibits the "take" of any individuals or habitat of federally listed species. Under Section 9 of the FESA, take is defined as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct." The term "harm" has been clarified to include "any act which actually kills or injures fish or wildlife, and emphasizes that such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife." The presence of any federally threatened or endangered species within a project area generally imposes severe constraints on development, particularly if development would result in "take" of the species or its habitat. Under the regulations of the FESA, the United States Fish and Wildlife Service (USFWS) may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act.

Critical Habitat is designated for the survival and recovery of species listed as threatened or endangered under the ESA. Critical Habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an FESA listed species and which may require special management considerations or protection. Critical Habitat may also include unoccupied habitat if it is determined that the unoccupied habitat is essential for the conservation of the species.

Whenever federal agencies authorize, fund, or carry out actions that may adversely modify or destroy Critical Habitat, they must consult with USFWS under Section 7 of the ESA. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highway Administration or a permit from the U.S. Army Corps of Engineers (Corps)).

If the USFWS determines that Critical Habitat will be adversely modified or destroyed from a proposed action, the USFWS will develop reasonable and prudent alternatives in cooperation with the federal institution to ensure the purpose of the proposed action can be achieved without loss of Critical Habitat. If the action is not likely to adversely modify or destroy Critical Habitat, USFWS will include a statement in its biological opinion concerning any incidental take that may be authorized and specify terms and conditions to ensure the agency is in compliance with the opinion.

Migratory Bird Treaty Act

Pursuant to the Migratory Bird Treaty Act (MBTA) (16 U.S. Government Code [USC] 703) of 1918, as amended in 1972, federal law prohibits the taking of migratory birds or their nests or eggs (16 USC 703; 50 CFR 10, 21). The statute states:

> *Unless and except as permitted by regulations made as hereinafter provided in this subchapter, it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill...any migratory bird, any part, nest, or egg of any such bird...included in the terms of the [Migratory Bird] conventions…*

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. Disturbances causing nest abandonment and/or loss of reproductive effort (i.e., killing or abandonment of eggs or young) may also be considered "take." This regulation seeks to protect migratory birds and active nests.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protects all species and subspecies of the families listed above. The MBTA protects over 800 species including geese, ducks, shorebirds, raptors, songbirds and many relatively common species.

State Regulations

California Environmental Quality Act (CEQA)

The California Environmental Quality Act (CEQA) provides for the protection of the environment within the State of California by establishing State policy to prevent significant, avoidable damage to the environment through the use of alternatives or mitigation measures for projects. It applies to actions directly undertaken, financed, or permitted by State lead agencies. If a project is determined to be subject to CEQA, the lead agency will be required to conduct an Initial Study (IS); if the IS determines that the project may have significant impacts on the environment, the lead agency will subsequently be required to write an Environmental Impact Report (EIR). A finding of non-significant effects will require either a Negative Declaration or a Mitigated Negative Declaration instead of an EIR. Section 15380 of the CEQA Guidelines independently defines "endangered" and "rare" species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, "endangered" species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while "rare" species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

California Endangered Species Act (CESA)

In addition to federal laws, the state of California implements the CESA which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in "take" of individuals (defined in CESA as; "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") are regulated by CDFW. Habitat degradation or modification is not included in the definition of "take" under CESA. Nonetheless, CDFW has interpreted "take" to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

Fish and Game Code

Fish and Game Code Sections 3503, 3503.5, 3511, and 3513 are applicable to natural resource management. For example, Section 3503 of the Code makes it unlawful to destroy any birds' nest or any birds' eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs. A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*). Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

Native Plant Protection Act

Sections 1900–1913 of the Fish and Game Code were developed to preserve, protect, and enhance Rare and Endangered plants in the state of California. The act requires all state agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at

least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

California Native Plant Society Rare and Endangered Plant Species

Vascular plants listed as rare or endangered by the CNPS, but which have no designated status under FESA or CESA are defined as follows:

California Rare Plant Rank

1A- Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere

1B- Plants Rare, Threatened, or Endangered in California and Elsewhere

2A- Plants Presumed Extirpated in California, But More Common Elsewhere

2B- Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3- Plants about Which More Information is Needed - A Review List

4- Plants of Limited Distribution - A Watch List

Threat Ranks

.1- Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2- Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

.3- Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates activities pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFG regulates activities under the Fish and Game Code Section 1600-1616, and the Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

Federal Regulations

Section 404 of the Clean Water Act

Since 1972, the Corps and U.S. Environmental Protection Agency (EPA) have jointly regulated the filling of "waters of the U.S.," including wetlands, pursuant to Section 404 of the Clean Water Act (CWA). The Corps has regulatory authority over the discharge of dredged or fill material into the waters of the United States under Section 404 of the CWA. The Corps and EPA define "fill material" to include any "material placed in waters of the United States where the material has the effect of: (i) replacing any portion of a water of the United States with dry land; or (ii) changing the bottom elevation of any portion of the waters of the United States." Examples include, but are not limited to, sand, rock, clay, construction debris, wood chips, and "materials used to create any structure or infrastructure in the waters of the United States." In order to further define the scope of waters protected under the CWA, the Corps and EPA published the Clean Water Rule on June 29, 2015. Pursuant to the Clean Water Rule, the term "*waters of the United States*" is defined as follows:

(i) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide.

(ii) All interstate waters, including interstate wetlands[1].

(iii) The territorial seas.

(iv) All impoundments of waters otherwise defined as waters of the United States under the definition.

(v) All tributaries[2] of waters identified in paragraphs (i) through (iii) mentioned above.

(vi) All waters adjacent[3] to a water identified in paragraphs (i) through (v) mentioned above, including wetlands, ponds, lakes, oxbows, impoundments, and similar waters.

---

1 The term *wetlands* means those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

2 The terms *tributary* and *tributaries* each mean a water that contributes flow, either directly or through another water (including an impoundment identified in paragraph (iv) mentioned above), to a water identified in paragraphs (i) through (iii) mentioned above, that is characterized by the presence of the physical indicators of a bed and banks and an ordinary high water mark.

3 The term *adjacent* means bordering, contiguous, or neighboring a water identified in paragraphs (i) through (v) mentioned above, including waters separated by constructed dikes or barriers, natural river berms, beach dunes, and the like.

(vii) All prairie potholes, Carolina bays and Delmarva bays, Pocosins, western vernals pools, Texas coastal prairie wetlands, where they are determined, on a case-specific basis, to have a significant nexus to a water identified in paragraphs (i) through (iii) meantioned above.

(viii) All waters located within the 100-year floodplain of a water identified in paragraphs (i) through (iii) mentioned above and all waters located within 4,000 feet of the high tide line or ordinary high water mark of a water identified in paragraphs (i) through (v) mentioned above, where they are determined on a case-specific basis to have a significant nexus to a waters identified in paragraphs (i) through (iii) mentioned above.

The following features are not defined as "waters of the United States" even when they meet the terms of paragraphs (iv) through (viii) mentioned above:

(i) Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of the Clean Water Act.

(ii) Prior converted cropland.

(iii) The following ditches:

(A) Ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary.
(B) Ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands.
(C) Ditches that do not flow, either directly or through another water, into a water of the United States as identified in paragraphs (i) through (iii) of the previous section.

(iv) The following features:

(A) Artificially irrigated areas that would revert to dry land should application of water to that area cease;
(B) Artificial, constructed lakes and ponds created in dry land such as farm and stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, or cooling ponds;
(C) Artificial reflecting pools or swimming pools created in dry land;
(D) Small ornamental waters created in dry land;
(E) Water-filled depressions created in dry land incidental to mining or construction activity, including pits excavated for obtaining fill, sand, or gravel that fill with water;
(F) Erosional features, including gullies, rills, and other ephemeral features that do not meet the definition of a tributary, non-wetland swales, and lawfully constructed grassed waterways; and
(G) Puddles.

(v) Groundwater, including groundwater drained through subsurface drainage systems.

(vi) Stormwater control features constructed to convey, treat, or store stormwater that are created in dry land.

(vii) Wastewater recycling structures constructed in dry land; detention and retention basins built for wastewater recycling; groundwater recharge basins; percolation ponds built for wastewater recycling; and water distributary structures built for wastewater recycling.

Section 401 of the Clean Water Act

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits, and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Water Quality Control Boards (Regional Board) that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board assumed this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

State Regulations

Fish and Game Code

Fish and Game Code Sections 1600 et. seq. establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

Fish and Game Code Section 1602 requires any person, state, or local governmental agency or public utility to notify the CDFW before beginning any activity that will do one or more of the following:

(1) substantially obstruct or divert the natural flow of a river, stream, or lake;
(2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or
(3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, the CDFW takes jurisdiction to the top of bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

Porter Cologne Act

The California *Porter-Cologne Water Quality Control Act* gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Act has become an important tool in the post SWANCC and Rapanos regulatory environment, with respect to the state's authority over isolated and insignificant waters. Generally, any person proposing to discharge waste into a water body that could affect its water quality must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although "waste" is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include fill discharged into water bodies.

Executive Summary

ELMT Consulting (ELMT) has prepared this Delineation of State and Federal Jurisdictional report for the Meines Street and Palm Avenue Project (project) located in the City of Highland, San Bernardino County, California. The jurisdictional delineation documents the regulatory authority of the U.S. Army Corps of Engineers (Corps), the Regional Water Quality Control Board (Regional Board), and the California Department of Fish and Wildlife (CDFW) pursuant to Section 401 and 404 of the Federal Clean Water Act (CWA), the California Porter-Cologne Water Quality Control Act, and Sections 1600 *et. seq.* of the California Fish and Game Code.[1]

One (1) drainage feature (City Creek), a channelized potion of City Creek, was observed along the northern boundary of the project site, outside of the project footprint, during the field delineation. City Creek generally flows in an east to west direction, bordering the northern boundary of the project site. City Creek originates in the San Bernardino Mountains to the north of the site and flows roughly south and southeastward before aligning with the northern boundary of the site at Palm Avenue and leaving site adjacency at the northeast corner of the site. City Creek conveys surface flows during storm event and from urban runoff. City Creek flows westward past San Bernardino International Airport before converging with East Twin Creek, which is ultimately tributary to the Santa Ana River. Therefore, the City Creek will qualify as waters of the United States and fall under the regulatory authority of the Corps. Placement of fill and/ or alteration within this jurisdictional area is subject to Corps, Regional Board, and CDFW jurisdiction and approval.

As part of the project, a storm drain outlet is proposed to be constructed along the southern bank of the channel. The storm drain outlet is proposed to be installed above the OHWM and thus would be exempt from having to obtain regulatory approvals from the Corps and Regional Board. Further, the storm drain outlet would be installed outside the jurisdictional boundary of CDFW. The storm drain outlet is not expected to result in any appreciable increase in discharge into City Creek. There should be no impacts to downstream habitats.

If any impacts occur to the on-site drainage features, the project applicant must obtain the following regulatory approvals prior to impacts occurring within the identified jurisdictional areas: Corps CWA Section 404 Permit; Regional Board CWA Section 401 Water Quality Certification; and CDFW Section 1602 Streambed Alteration Agreement (SAA). Refer to Sections 1-7 for a detailed analysis of site conditions and regulatory requirements.

[1] The field surveys for this jurisdictional delineation were conducted on June 24, 2021 pursuant to the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0* (Corps 2008); and *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (Corps 2017); *The MESA Field Guide: Mapping Episodic Stream Activity* (CDFW 2014); and a *Review of Stream Processes and Forms in Dryland Watersheds* (CDFW 2010).

Appendix C Methodology

Section 1 Introduction

This delineation has been prepared for the proposed project located at the northwest corner of the intersection of Meines Street and Palm Avenue (project site, project) order to document the jurisdictional authority of the U.S. Army Corps of Engineers' (Corps), the Regional Water Quality Control Board (Regional Board), and the California Department of Fish and Wildlife (CDFW) pursuant to Section 401 and 404 of the Federal Clean Water Act (CWA), the California Porter-Cologne Water Quality Control Act, and Sections 1600 *et seq.* of the California Fish and Game Code. The analysis presented in this report is supported by a field survey of site conditions conducted on May 8, 2023.

This jurisdictional delineation explains the methodology undertaken by ELMT Consulting (ELMT) to define the regulatory authority of the aforementioned regulatory agencies and documents the findings made by ELMT. This report presents our best effort at documenting the jurisdictional boundaries using the most up-to-date regulations, written policy, and guidance from the regulatory agencies. Ultimately the regulatory agencies make the final determination of jurisdictional boundaries.

1.1 PROJECT LOCATION

The project site is generally located east of Interstate 215, north Interstate 10, and south and west of State Route 210 in the City of Highland, San Bernardino County, California. The site is depicted on the Redlands quadrangle of the United States Geological Survey's (USGS) 7.5-minute map series within Section 5, Township 1 South, Range 3 West. Specifically, the site is bounded to the east by Palm Avenue, to the south by Meines Street, and lies east of Central Avenue and south of 9th Street within Assessor Parcel Numbers (APN) 1192-601-01, -05, -07, -09; 621-02, -03, -04, -05, -06, -07, -08, -09, -10, -20, -21, -22, and -23. Refer to Exhibits 1-3 in Attachment A.

Section 2 Regulations

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Division regulates activities pursuant to Section 404 of the CWA, Section 10 of the Rivers and Harbors Act, and Section 103 of the Marine Protection, Research, and Sanctuaries Act. The Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act and the CDFW regulates activities under Sections 1600 *et seq*. of the California Fish and Game Code.

2.1 U.S. ARMY CORPS OF ENGINEERS

Since 1972, the Corps and U.S. Environmental Protection Agency (EPA) have jointly regulated the discharge of dredged or fill material into waters of the United States, including wetlands, pursuant to Section 404 of the CWA. The Corps and EPA define "fill material" to include any "material placed in waters of the United States where the material has the effect of: (i) replacing any portion of a water of the United States with dry land; or (ii) changing the bottom elevation of any portion of the waters of the United States." Examples include, but are not limited to, sand, rock, clay, construction debris, wood chips, and "materials used to create any structure or infrastructure in the waters of the United States."

On April 21, 2020, the Environmental Protected Agency and Corps published a final rule defining the scope of waters subject to federal regulation under the Clean Water Act ("Navigable Waters Protection Rule"). The rule codifies the long-standing exclusion of "water-filled depressions constructed or excavated upland or in non-jurisdictional waters incidental to mining or construction activity, and pits excavated in upland or in non-jurisdictional waters for the purpose of obtaining fill, sand, or gravel." (33 CFR 328.3(b)(9); *see also* 85 FR 22252, 22323 (Apr. 21, 2020).)

On December 30, 2022, the agencies announced the final "Revised Definition of 'Waters of the United States'" rule. This rule also considers the best available science and extensive public comment to establish a definition of "waters of the United States" that supports public health, environmental protection, agricultural activity, and economic growth. In accordance with the Revised Definition of "Waters of the United States" (March 20, 2023), "waters of the United Sates" are defined as follows:

> The ''waters of the United States'' are defined in paragraph (a) of this rule:
> (1) traditional navigable waters, the territorial seas, and interstate waters;
> (2) impoundments of ''waters of the United States'';
> (3) tributaries to traditional navigable waters, the territorial seas, interstate waters, or impoundments when the tributaries meet either the relatively permanent standard or the significant nexus standard (''jurisdictional tributaries'');
> (4) wetlands adjacent to traditional navigable waters; wetlands adjacent to and with a continuous surface connection to relatively permanent paragraph impoundments or to jurisdictional tributaries when the jurisdictional tributaries meet the relatively permanent standard; and wetlands adjacent to impoundments or jurisdictional tributaries when the wetlands meet the significant nexus standard (''jurisdictional adjacent wetlands''); and

(5) intrastate lakes and ponds, streams, or wetlands not identified in (1) through (4) above that meet either the relatively permanent standard or the significant nexus standard.

The ‘‘relatively permanent standard’’ means relatively permanent, standing or continuously flowing waters connected to traditional navigable waters, and waters with a continuous surface connection to such relatively permanent waters or to traditional navigable waters. The ‘‘significant nexus standard’’ means waters that, either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, the territorial seas, or interstate waters.

2.2 REGIONAL WATER QUALITY CONTROL BOARD

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Boards that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board (SWRCB) assumes this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

Additionally, the California Porter-Cologne Water Quality Control Act gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Water Quality Control Act has become an important tool post *Solid Waste Agency of Northern Cook County vs. United States Corps of Engineers* [2] (SWANCC) and *Rapanos v. United States* [3] (Rapanos) court cases with respect to the State’s regulatory authority over isolated and insignificant waters. Generally, any applicant proposing to discharge waste into a water body must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although “waste” is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include discharge of dredged and fill material into water bodies.

Under the State Water Resources Control Board Sate Wetland Definition, an area is a wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area’s vegetation is dominated by hydrophytes or the area lacks vegetation.

[2] Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, 531 U.S. 159 (2001)
[3] Rapanos v. United States, 547 U.S. 715 (2006)

2.3 CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

Sections 1600 *et seq.* of the California Fish and Game Code establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not substantially adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided. Pursuant to Section 1602 of the California Fish and Game Code, a notification must be submitted to the CDFW for any activity that will divert or obstruct the natural flow or alter the bed, channel, or bank (which may include associated biological resources) of a river or stream or use material from a streambed. One CDFW guidance document, although not a formally adopted rule or policy, requires notification for activities taking place within rivers or streams that flow perennially or episodically and that are defined by the area in which surface water currently flows, or has flowed, over a given course during the historic hydrologic regime, and where the width of its course can reasonably be identified by physical and biological indicators. If the project will not "substantially adversely affect an existing fish or wildlife resource," following notification to CDFW, the project may commence without an agreement with CDFW. (Fish & G. Code, § 1602(a)(4)(A)(i).)

Section 3 Methodology

The analysis presented in this report is supported by field surveys and verification of site conditions conducted on May 8, 2023. ELMT conducted a field delineation to determine the jurisdictional limits of "waters of the State" and jurisdictional streambed (including potential wetlands), located within the boundaries of the project site. While in the field, jurisdictional features were recorded on an aerial base map at a scale of 1" = 50' using topographic contours and visible landmarks as guidelines. Data points were obtained with a Garmin Map62 Global Positioning System to record and identify specific widths for ordinary high water mark (OHWM) indicators and the locations of photographs, soil pits, and other pertinent jurisdictional features, if present. This data was then transferred as a .shp file and added to the Project's jurisdictional exhibits. The jurisdictional exhibits were prepared using ESRI ArcInfo Version 10 software.

3.1 WATERS OF THE UNITED STATES

In the absence of adjacent wetlands, the limits of the Corps jurisdiction in non-tidal waters extend to the OHWM, which is defined as " . . . *that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*"[4] Indicators of an OHWM are defined in *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Corps 2008). An OHWM can be determined by the observation of a natural line impressed on the bank; shelving; changes in the character of the soil; destruction of terrestrial vegetation; presence of litter and debris; wracking; vegetation matted down, bent, or absent; sediment sorting; leaf litter disturbed or washed away; scour; deposition; multiple observed flow events; bed and banks; water staining; and/or change in plant community. The Regional Board shares the Corps' jurisdictional methodology, unless SWANCC or Rapanos conditions are present. In the latter case, the Regional Board considers such drainage features to be jurisdictional waters of the State.

Pursuant to the Corps Wetland Delineation Manual (Corps 1987), the identification of wetlands is based on a three-parameter approach involving indicators of hydrophytic vegetation, hydric soils, and wetland hydrology. In order to qualify as a wetland, a feature must exhibit at least minimal characteristics within each of these three parameters. It should also be noted that both the Regional Board and CDFW follow the methods utilized by the Corps to identify wetlands. For this project location, Corps jurisdictional wetlands are delineated using the methods outlined in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0* (Corps 2008).

[4] CWA regulations 33 CFR §328.3(e).

3.2 WATERS OF THE STATE

3.2.1 REGIONAL WATER QUALITY CONTROL BOARD

The California *Porter-Cologne Water Quality Control Act* gives the Regional Board very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Regional Board shares the Corps' methodology for delineating the limits of jurisdiction based on the identification of OHWM indicators and utilizing the three parameter approach for wetlands.

3.2.2 CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

Sections 1600 *et seq*. of the California Fish and Game Code applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. Generally, the CDFW's jurisdictional limit is not defined by a specific flow event, nor by the presence of OHWM indicators or the path of surface water as this path might vary seasonally. Instead, CDFW's jurisdictional limit is based on the topography or elevation of land that confines surface water to a definite course when the surface water rises to its highest point. Further, the CDFW's jurisdictional limit extends to include any habitat (e.g. riparian), including wetlands and vernal pools, supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. For this project location, CDFW jurisdictional limits were delineated using the methods outlined in the *MESA Field Guide* (Brady, III and Vyverberg 2013) and *A Review of Stream Processes and Forms in Dryland Watersheds* (Vyverberg 2010), which were developed to provide guidance on the methods utilized to describe and delineate episodic streams within the inland deserts region of southern California.

Section 4 Literature Review

ELMT conducted a thorough review of relevant literature and materials to preliminarily identify areas that may fall under the jurisdiction of the regulatory agencies. A summary of materials utilized during ELMT's literature review is provided below and in Appendix A. In addition, refer to Section 8 for a complete list of references used throughout the course of this delineation.

4.1 WATERSHED REVIEW

The project site is located within the Santa Ana River Watershed (HUC 18070203). The Santa Ana River watershed is located in southern California, south and east of the City of Los Angeles. The watershed includes much of Orange County, the northwestern corner of Riverside County, the southwestern corner of San Bernardino County, and a small portion of Los Angeles County. The watershed is bounded on the south by the Santa Margarita watershed, on the east by the Salton Sea and Southern Mojave watersheds, and on the north/west by the Mojave and San Gabriel watersheds. The watershed is approximately 2,800 square miles in area.

The Santa Ana River Watershed is located in the Peninsular Ranges and Transverse Ranges Geomorphic Provinces of Southern California (California Geological Survey Note 36). The highest elevations (upper reaches) of the watershed occur in the San Bernardino Mountains (San Gorgonio Peak – 11,485 feet in elevation), eastern San Gabriel Mountains (Transverse Ranges Province; Mt. Baldy – 10,080 feet in elevation), and San Jacinto Mountains (Peninsular Ranges Province, Mt. San Jacinto – 10,804 feet in elevation). Further downstream, the Santa Ana Mountains and the Chino Hills form a topographic high before the river flows into the Coastal Plain (in Orange County) and into the Pacific Ocean. Primary slope direction is northeast to southwest, with secondary slopes controlled by local topography.

This watershed is in an arid region, and therefore has little natural perennial surface water. Surface waters start in the upper erosion zone of the watershed, primarily in the San Bernardino and San Gabriel Mountains. This upper zone has the highest gradient and soils/geology that do not allow large quantities of percolation of surface water into the ground. Flows consist mainly of snowmelt and storm runoff from the lightly developed San Bernardino National Forest; this water is generally high quality at this point. In this zone, the Santa Ana River is generally confined in its lateral movement, contained by the slope in the mountainous regions. In the upper valley, flows from the Seven Oaks Dam to the City of San Bernardino consist mainly of storm flows, flows from San Timoteo Creek, and groundwater that is rising due to local geological conditions. From the City of San Bernardino to the City of Riverside, the river flows perennially, and it includes treated discharges from wastewater treatment plants. From the City of Riverside to the recharge basins below Imperial Highway, river flow consists of highly treated wastewater discharges, urban runoff, irrigation runoff, and groundwater forced to the surface by shallow/rising bedrock. Near Corona, the river cuts through the Santa Ana Mountains and the Puente-Chino Hills. The river then flows into the Orange County Coastal Plain; the channel lessens and the gradient decreases. In a natural environment, a river in this area would have a much wider channel, increased meandering, and increased sediment build-up. However, much of the Santa Ana River channel in this area has been contained in concrete-lined

channels, which modifies the flow regime and sediment deposition environment. The only major tributary of the Santa Ana River in Orange County is Santiago Creek, which joins the river in the City of Santa Ana. There is only one natural freshwater lake of any size – Lake Elsinore. A variety of water storage reservoirs (Lake Perris, Lake Mathews, and Big Bear Lake) and Flood Control areas (Prado Dam area and Seven Oaks Dam area) have been created to hold surface water.

4.2 LOCAL CLIMATE

San Bernardino County is characterized by cool winter temperatures and warm summer temperatures, with rainfall occurring almost entirely in the winter. Relative to other areas in Southern California, winters are colder with chilly to cold morning temperatures common. Climatological data obtained for the nearby City of Fontana indicates the annual precipitation averages 14.77 inches per year. Almost all of the precipitation occurs in the months between November and March, with hardly any occurring in July. The wettest month is March, with a monthly average total precipitation of 3.49 inches. The average maximum and minimum temperatures for the region are 80- and 53-degrees Fahrenheit (°F) respectively with July and August (monthly average 95° F) being the hottest months and December (monthly average 44°F) being the coldest. Temperatures during the site visit were in the low-70s (°F) with clear skies.

4.3 USGS TOPOGRAPHIC QUADRANGLE

The project site is depicted on the Redlands quadrangle of the United States Geological Survey's (USGS) 7.5-minute topographic map series within Section 5, Township 1 South, Range 3 West. According to the topographic map, the project site consists entirely of developed land along a channelized portion of City Creek.

On-site elevation ranges from approximately 1,180 to 1,196 feet above mean sea level and the site generally slopes from east to west. On-site topography is relatively flat with no noticeable topographic relief.

4.4 AERIAL PHOTOGRAPH

Prior to conducting the field delineation, ELMT reviewed current and historical aerial photographs (1985-2021) of the project as available from Google Earth Pro Imaging. Aerial photographs can be useful during the delineation process, as they often indicate the presence of drainage features and riverine habitat within the boundaries of the project site, if any.

The project site occurs in an area that historically supported agricultural land uses have been gradually replaced by industrialization and urbanization. A channelized portion of City Creek parallels the northern boundary of the project site, and land use in the vicinity of the site generally consists of industrial and commercial development to the south of the creek, and residential, commercial, and institutional development to the norther of the creek. The site is bounded to the west, south, and east by industrial and commercial developments, and to the north by City Creek with residential development and undeveloped, vacant land beyond.

The project site itself supports industrial and residential developments. The entirety of the site has been subject to several decades of anthropogenic disturbances associated with historic agricultural land uses,

grading activities, flood control infrastructure, and on-site and surrounding development. Historic aerials show these activities have been ongoing since at least 1938. The portion of City Creek that parallels the northern boundary of the site was channelized between 1959 and 1966.

4.5 SOILS

On-site and adjoining soils were researched prior to the field visits using the U.S. Department of Agriculture National Resources Conservation Service and Soil Survey for Western Riverside Area, California. Soil surveys furnish soil maps and interpretations originally needed in providing technical assistance to farmers and ranchers; in guiding other decisions about soil selection, use and management; and in planning, research and disseminating the results of the research. In addition, soil surveys are now heavily utilized in order to obtain soil information with respect to potential wetland environments and jurisdictional areas (i.e., soil characteristics, drainage, and color). Based on the NRCS USDA Web Soil Survey, the project site is historically underlain by Tujunga gravelly loamy sand (0 to 9 percent slopes) and Psamments, Fluvents and Frequently flooded soils (Exhibit 4, *Soils*).

4.6 HYDRIC SOILS LIST OF CALIFORNIA

ELMT reviewed the USDA NRCS Hydric Soils List of California in an effort to verify whether on-site soils are considered to be hydric[5]. It should be noted that lists of hydric soils along with soil survey maps provide off-site ancillary tools to assist in wetland determinations, but they are not a substitute for field investigations. The presence of hydric soils is initially investigated by comparing the mapped soil series for the site to the County list of hydric soils. According to the hydric soils list, Tujunga gravelly loamy sand (0 to 9 percent slopes) and Psamments, Fluvents and Frequently flooded soils have been listed as hydric in San Bernardino County Southwestern Part.

4.7 NATIONAL WETLANDS INVENTORY

The USFWS NWI and the USGS National Hydrography Dataset were reviewed to determine if any blueline streams or riverine resources have been documented within or immediate surrounding the project site. Based on this review, one (1) riverine feature is mapped as occurring adjacent to the northern boundary of the project site. This feature correlates with a channelized portion of City Creek. Refer to Appendix A, *Documentation*.

4.8 FLOOD ZONE

The Federal Emergency Management Act (FEMA) website was searched for flood data for the project site. Based on Flood Insurance Rate Map No. 06071C8702H the entire project site is located within Zone X – areas with reduced flood risk due to levee. Adjacent portions of City Creek are located within Zone AE – Regulatory Floodway. Refer to Appendix A, *Documentation*.

[5] A hydric soil is a soil that formed under conditions of saturation, flooding or ponding long enough during the growing season to develop anaerobic conditions in the upper part.

MEINES AND PALM PROJECT

ELMT CONSULTING

Source: ESRI Aerial Imagery, Soil Survey Geographic Database, San Bernardino County

Soils

Exhibit 4

Section 5 Site Conditions

ELMT biologist Jacob H. Lloyd Davies conducted a field delineation on May 8, 2023, to verify existing site conditions and document the extent of potential jurisdictional areas within the boundaries of the project site. ELMT field staff encountered no limitations during the field delineation. Refer to Appendix B for representative photographs taken throughout the project site.

5.1 JURISDICTIONAL FEATURES

5.1.1 DRAINAGE FEATURES

ELMT carefully assessed the site for depressions, inundation, presence of hydrophytic vegetation, staining, cracked soil, ponding, and indicators of active surface flow and corresponding physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris. Suspected jurisdictional areas were checked for the presence of definable channels, soils, and hydrology.

City Creek

One (1) drainage feature (City Creek), a channelized potion of City Creek, was observed along the northern boundary of the project site, outside of the project footprint, during the field delineation (refer to Exhibit 5, *Jurisdictional Areas*). City Creek generally flows in an east to west direction, bordering the northern boundary of the project site. City Creek originates in the San Bernardino Mountains to the north of the site and flows roughly south and southeastward before aligning with the northern boundary of the site at Palm Avenue and leaving site adjacency at the northeast corner of the site.

Surface water was present within City Creek near the culverts at Palm Avenue. Evidence of an OHWM within on-site and adjacent portions of City Creek was observed via scour, changes in substrate, shelving, and lack of vegetation. The OHWM within City Creek ranged from approximately 10-20 feet in width throughout the length. In general, the channelized portion of City Creek conveys surface flows during storm event and from urban runoff. City Creek flows westward past San Bernardino International Airport before converging with East Twin Creek, which is ultimately tributary to the Santa Ana River.

In-channel vegetation consisted of non-native weedy plant species such as oats (*Avena barbata*), red brome (*Bromus rubens*), hairy sunflower (*Helianthus annuus*), tropical horseweed (*Erigeron sumatrensis*), and Crete weed (*Hedypnois rhagadioloides*). No riparian vegetation is present within portions of City Creek that occur within or adjacent to the proposed storm drain outlet.

5.1.2 WETLAND FEATURES

In order to qualify as a wetland, a feature must exhibit all three wetland parameters (i.e., vegetation, soils, and hydrology) described in the Corps Arid West Regional Supplement. Drainage 1 at its origin outside of site boundaries at Palm Avenue primarily consisted of loose, silty/sandy substrate with dense vegetation, including seep monkey flower (*Erythranthe guttata*, OBL), common knotweed (*Persicaria lapathifolia*, FACW), rabbitfoot grass (*Polypogon monspeliensis*, FACW), water beard grass (*Polypogon viridis*,

FACW), flax-leaved horseweed (*Erigeron bonariensis*, FACU), spiny sow thistle (*Sonchus asper*, FAC), brass buttons (*Cotula australis*, FAC), Mexican fan palm (*Washingtonia robusta*, FACW), and broadleaf cattail (*Typha latifolia*, OBL). The periphery of the off-site wetland feature, outside of available surface water, supported primarily weedy/early-successional species such as Italian rye grass (*Festuca perennis*), sweet alyssum (*Lobularia maritimum*), hairy vetch (*Vicia villosa*), red boerhaavia (*Boerhavia coccinea*), mustard (*Hirschfeldia incana*), Mediterranean grass (*Schismus barbatus*), and red brome.

Project activities are isolated to downstream portions of City Creek, away from the wetland feature. No impacts to the wetland feature will occur from project implementation.

Section 6 Findings

This report presents the extent of jurisdictional features using the most up-to-date regulations, written policy, and guidance from the regulatory agencies. Please refer to the following sections for a summary of jurisdictional areas within the Project site.

6.1 U.S. ARMY CORPS OF ENGINEERS DETERMINATION

6.1.1 WATERS OF THE UNITED STATES DETERMINATION

City Creek is tributary to the Santa Ana River (Relatively Permanent Water) and ultimately the Pacific Ocean (Traditional Navigable Water). Therefore, the City Creek will qualify as waters of the United States and fall under the regulatory authority of the Corps.

6.2 REGIONAL WATER QUALITY CONTROL BOARD

No isolated or Rapanos conditions were observed within the boundaries of the Project site. Therefore, the Regional Board jurisdictional limit follows that of the Corps. Refer to Exhibit 5, *Jurisdictional Areas*, for an illustration of on-site Regional Board jurisdictional areas.

6.3 CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

City Creek exhibits characteristics consistent with CDFW's methodology and would be considered CDFW streambed. Refer to Exhibit 5, *Jurisdictional Areas*, for an illustration of on-site CDFW jurisdictional areas.

Section 7 Regulatory Approval Process

As part of the project, a storm drain outlet is proposed to be constructed along the southern bank of the channel. The storm drain outlet is proposed to be installed above the OHWM and thus would be exempt from having to obtain regulatory approvals from the Corps and Regional Board. Further, the storm drain outlet would be installed outside the jurisdictional boundary of CDFW. The storm drain outlet is not expected to result in any appreciable increase in discharge into City Creek. There should be no impacts to downstream habitats.

The following is a summary of the various permits, certifications, and agreements that may be necessary prior to construction and/or alteration within jurisdictional areas. Ultimately the regulatory agencies make the final determination of jurisdictional boundaries and permitting requirements.

7.1 U.S. ARMY CORPS OF ENGINEERS

The Corps regulates discharges of dredged or fill materials into waters of the United States, including wetlands, pursuant to Section 404 of the CWA. Therefore, any impacts to on-site jurisdictional areas will require a CWA Section 404 permit prior to project implementation.

Based on the proposed limits of disturbance the storm drain outlet will be installed above the OHWM and would not result in any impacts to Corps jurisdictional waters. A corps CWA Section 404 permit will not be required.

7.2 REGIONAL WATER QUALITY CONTROL BOARD

The Regional Board regulates discharges to surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act. Based on the proposed limits of disturbance the storm drain outlet will be installed outside of Regional Board jurisdictional waters, and therefore, would not result in any impacts to Regional Board jurisdictional waters. A Regional Board CWA Section 401 Water Quality Certification will not be required.

7.3 CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE

Pursuant to Section 1602 of the California Fish and Game Code, the CDFW regulates any activity that will divert or obstruct the natural flow or alter the bed, channel, or bank (which may include associated biological resources) of a river or stream. Therefore, any impacts to the on-site jurisdictional areas will require a Section 1602 Streambed Alteration Agreement from the CDFW prior to project implementation. The notification will require a processing fee which is based on the term and cost of the proposed Project. It should also be noted that the CDFW requires that the payment of the process fee be paid and CEQA compliance be obtained prior to the issuance of the final Section 1602 Streambed Alteration Agreement.

7.4 RECOMMENDATIONS

It is recommended that this delineation be forwarded to the regulatory agencies for their review and concurrence. The concurrence/receipt would solidify findings noted within this report.

Photograph 2: Looking at the riparian vegetation present at the origin of the drainage.

Photograph 3: From within the drainage looking upstream. Vegetation has transitioned from riparian to upland species, primarily weedy/ruderal species.

Photograph 4: From within the drainage looking downstream.

Photograph 5: Looking at the northeast corner of the project site and the terminal downstream portion of the drainage that occurs in proximity to site boundaries.

Photograph 6: The location of the proposed storm drain outlet.

Appendix C Methodology

WATERS OF THE UNITED STATES

Section 404 of the Clean Water Act

In accordance with the Revised Definition of "Waters of the United States" (March 20, 2023), "waters of the United Sates" are defined as follows:

> The ''waters of the United States'' are defined in paragraph (a) of this rule:
>
> (1) traditional navigable waters, the territorial seas, and interstate waters;
>
> (2) impoundments of ''waters of the United States'';
>
> (3) tributaries to traditional navigable waters, the territorial seas, interstate waters, or impoundments when the tributaries meet either the relatively permanent standard or the significant nexus standard (''jurisdictional tributaries'');
>
> (4) wetlands adjacent to traditional navigable waters; wetlands adjacent to and with a continuous surface connection to relatively permanent paragraph impoundments or to jurisdictional tributaries when the jurisdictional tributaries meet the relatively permanent standard; and wetlands adjacent to impoundments or jurisdictional tributaries when the wetlands meet the significant nexus standard (''jurisdictional adjacent wetlands''); and
>
> (5) intrastate lakes and ponds, streams, or wetlands not identified in (1) through (4) above that meet either the relatively permanent standard or the significant nexus standard.

The ''relatively permanent standard'' means relatively permanent, standing or continuously flowing waters connected to traditional navigable waters, and waters with a continuous surface connection to such relatively permanent waters or to traditional navigable waters. The ''significant nexus standard'' means waters that, either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, the territorial seas, or interstate waters.

WETLANDS

For this project location, Corps jurisdictional wetlands are delineated using the methods outlined in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0* (Corps 2008). This document is one of a series of Regional Supplements to the Corps Wetland Delineation Manual (Corps 1987). The identification of wetlands is based on a three-parameter approach involving indicators of hydrophytic vegetation, hydric soil, and wetland hydrology. In order to be considered a wetland, an area must exhibit at least minimal characteristics within these three (3) parameters. The Regional Supplement presents wetland indicators, delineation guidance, and other information that is specific to the Arid West Region. In the field, vegetation, soils, and evidence of hydrology are examined using the methodology listed below and documented on Corps wetland data sheets, when applicable. It should be noted that both the Regional Board and the CDFW jurisdictional wetlands encompass those of the Corps.

Vegetation

Nearly 5,000 plant types in the United States may occur in wetlands. These plants, often referred to as hydrophytic vegetation, are listed in regional publications by the U.S. Fish and Wildlife Service (USFWS). In general, hydrophytic vegetation is present when the plant community is dominated by species that can tolerate prolonged inundation or soil saturation during growing season. Hydrophytic vegetation decisions are based on the assemblage of plant species growing on a site, rather than the presence or absence of particular indicator species. Vegetation strata are sampled separately when evaluating indicators of hydrophytic vegetation. A stratum for sampling purposes is defined as having 5 percent or more total plant cover. The following vegetation strata are recommended for use across the Arid West:

- *Tree Stratum:* Consists of woody plants 3 inches or more in diameter at breast height (DBH), regardless of height;
- *Sapling/shrub stratum:* Consists of woody plants less than 3 inches DBH, regardless of height;
- *Herb stratum:* Consists of all herbaceous (non-woody) plants, including herbaceous vines, regardless of size; and,
- *Woody vines:* Consists of all woody vines, regardless of size.

The following indicator is applied per the test method below.[1] Hydrophytic vegetation is present if any of the indicators are satisfied.

Indicator 1 – Dominance Test

Cover of vegetation is estimated and is ranked according to their dominance. Species that contribute to a cumulative total of 50% of the total dominant coverage, plus any species that comprise at least 20% (also known as the "50/20 rule") of the total dominant coverage, are recorded on a wetland data sheet. Wetland indicator status in California (Region 0) is assigned to each species using the *National Wetland Plant List, version 2.4.0* (Corps 2012). If greater than 50% of the dominant species from all strata were Obligate, Facultative-wetland, or Facultative species, the criteria for wetland vegetation is considered to be met. Plant indicator status categories are described below:

- *Obligate Wetland (OBL):* Plants that almost always occur in wetlands;
- *Facultative Wetland (FACW):* Plants that usually occur in wetlands, but may occur in non-wetlands;
- *Facultative (FAC):* Plants that occur in wetlands and non-wetlands;

[1] Although the Dominance Test is utilized in the majority of wetland delineations, other indicator tests may be employed. If one indicator of hydric soil and one primary or two secondary indicators of wetland hydrology are present, then the Prevalence Test (Indicator 2) may be performed. If the plant community satisfies the Prevalence Test, then the vegetation is hydric. If the Prevalence Test fails, then the Morphological Adaptation Test may be performed, where the delineator analyzes the vegetation for potential morphological features.

- *Facultative Upland (FACU):* Plants that usually occur in non-wetlands, but may occur in wetlands; and,

- *Obligate Upland (UPL):* Plants that almost never occur in wetlands.

Hydrology

Wetland hydrology indicators are presented in four (4) groups, which include:

Group A – Observation of Surface Water or Saturated Soils

Group A is based on the direct observation of surface water or groundwater during the site visit.

Group B – Evidence of Recent Inundation

Group B consists of evidence that the site is subject to flooding or ponding, although it may not be inundated currently. These indicators include water marks, drift deposits, sediment deposits, and similar features.

Group C – Evidence of Recent Soil Saturation

Group C consists of indirect evidence that the soil was saturated recently. Some of these indicators, such as oxidized rhizospheres surrounding living roots and the presence of reduced iron or sulfur in the soil profile, indicate that the soil has been saturated for an extended period.

Group D – Evidence from Other Site Conditions or Data

Group D consists of vegetation and soil features that indicate contemporary rather than historical wet conditions, and include shallow aquitard and the FAC-neutral test.

If wetland vegetation criteria is met, the presence of wetland hydrology is evaluated at each transect by recording the extent of observed surface flows, depth of inundation, depth to saturated soils, and depth to free water in the soil test pits. The lateral extent of the hydrology indicators are used as a guide for locating soil pits for evaluation of hydric soils and jurisdictional areas. In portions of the stream where the flow is divided by multiple channels with intermediate sand bars, the entire area between the channels is considered within the OHWM and the wetland hydrology indicator is considered met for the entire area.

Soils

A hydric soil is a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper 16-20 inches.[2] The concept of hydric soils includes soils developed under sufficiently wet conditions to support the growth and regeneration of hydrophytic vegetation. Soils that are sufficiently wet because of artificial measures are included in the

[2] According to the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version 2.0 (Corps 2008), growing season dates are determined through on-site observations of the following indicators of biological activity in a given year: (1) above-ground growth and development of vascular plants, and/or (2) soil temperature.

concept of hydric soils. It should also be noted that the limits of wetland hydrology indicators are used as a guide for locating soil pits. If any hydric soil features are located, progressive pits are dug moving laterally away from the active channel until hydric features are no longer present within the top 20 inches of the soil profile.

Once in the field, soil characteristics are verified by digging soil pits along each transect to an excavation depth of 20 inches; in areas of high sediment deposition, soil pit depth may be increased. Soil pit locations are usually placed within the drainage invert or within adjoining vegetation. At each soil pit, the soil texture and color are recorded by comparison with standard plates within a *Munsell Soil Chart* (2009). Munsell Soil Charts aid in designating color labels to soils, based by degrees of three simple variables – hue, value, and chroma. Any indicators of hydric soils, such as organic accumulation, iron reduction, translocation, and accumulation, and sulfate reduction, are also recorded.

Hydric soil indicators are present in three groups, which include:

All Soils

"All soils" refers to soils with any United States Department of Agriculture (USDA) soil texture. Hydric soil indicators within this group include histosol, histic epipedon, black histic, hydrogen sulfide, stratified layers, 1 cm muck, depleted below dark surface, and thick dark surface.

Sandy Soils

"Sandy soils" refers to soil materials with a USDA soil texture of loamy fine sand and coarser. Hydric soil indicators within this group include sandy mucky mineral, sandy gleyed matrix, sandy redox, and stripped matrix.

Loamy and Clayey Soils

"Loamy and clayey soils" refers to soil materials with a USDA soil texture of loamy very fine sand and finer. Hydric soil indicators within this group include loamy mucky mineral, loamy gleyed matrix, depleted matrix, redox dark surface, depleted dark surface, redox depressions, and vernal pools.

SWANCC WATERS

The term "isolated waters" is generally applied to waters/wetlands that are not connected by surface water to a river, lake, ocean, or other body of water. In the presence of isolated conditions, the Regional Board and CDFW take jurisdiction through the application of the OHWM/streambed and/or the 3 parameter wetland methodology utilized by the Corps.

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to Kimley-Horn to conduct a Cultural Resources Assessment of the Lovett Meines & Palm Project (the project) located in the City of Highland (City), San Bernardino County, California. Tasks completed for the scope of work include a cultural resources records search, an intensive-level pedestrian cultural resources survey, Sacred Lands File search with the Native American Heritage Commission, and paleontological overview. These tasks were performed in partial fulfillment of California Environmental Quality Act (CEQA) requirements. An archaeological records search was conducted at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. This research has revealed that 21 cultural resource studies have taken place within one half-mile of the project site. One of the previous studies has assessed the project site for cultural resources and one cultural resource (two historic-period structures and a historic-period refuse scatter) has been identified within the project boundaries.

During the field survey, BCR Consulting archaeologists identified the previously recorded resource (designated P-36-13750) and two new cultural resources (both historic-period residences) within the project boundaries. None of these resources is eligible for the California Register of Historical Resources (California Register) and as such, none of these resources is recommended "historical resources". They are not significant under CEQA and do not warrant further consideration. Based on these results, BCR Consulting recommends that no additional cultural resources work or monitoring is necessary for any proposed project activities. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist should be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

Findings were positive during the Sacred Lands File search with the NAHC. The City will initiate Assembly Bill (AB) 52 Native American Consultation for the project. Since the City will initiate and carry out the required Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix D has recommended that:

> The geologic units underlying the project area are mapped primarily as alluvial sand and clay deposits from Holocene epoch (Dibblee and Minch 2004). Holocene alluvial units are considered to be of high preservation value, but material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase. The Western Science Center does not have localities within the project area or within a 1-mile radius.

> While the presence of any fossil material is unlikely, if excavation activity disturbs deeper sediment dating to the earliest parts of the Holocene or Late Pleistocene periods, the material would be scientifically significant. Excavation activity associated with the development of the project area is unlikely to be paleontologically sensitive, but caution during development should be observed.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to Kimley-Horn to conduct a Cultural Resources Assessment of the Lovett Meines & Palm Project (the project) located in the City of Highland (City), San Bernardino County, California. An intensive-level pedestrian cultural resources survey of the project site was completed in partial fulfillment of California Environmental Quality Act (CEQA) requirements. The project site is located in Section 5 of Township 1 South, Range 3 West, San Bernardino Baseline and Meridian, as depicted on the United States Geological Survey (USGS) *Redlands, California* (1988) 7.5-minute topographic quadrangle (Figure 1).

Regulatory Setting

The California Environmental Quality Act. CEQA applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations 14(3), § 15002(i)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (Cal. Code Regs. tit. 14(3), § 15064.5(b)). State CEQA Guidelines section 15064.5(a) defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or eligible for listing in, the California Register of Historical Resources (California Register)
- Listed in a local register of historical resources (as defined at Cal. Public Res. Code § 5020.1(k))
- Identified as significant in a historical resource survey meeting the requirements of § 5024.1(g) of the Cal. Public Res. Code
- Determined to be a historical resource by a project's lead agency (Cal. Code Regs. tit. 14(3), § 15064.5(a))

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California…Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing in the California Register of Historical Resources" (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)).

The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource.

Section 5024.1 of the Cal. Public Res. Code established the California Register. Generally, a resource is considered by the lead agency to be "historically significant" if the resource

Kimley-Horn

meets the criteria for listing in the California Register (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)). The eligibility criteria for the California Register are similar to those of the National Register of Historic Places (National Register), and a resource that meets one of more of the eligibility criteria of the National Register will be eligible for the California Register.

The California Register program encourages public recognition and protection of resources of architectural, historical, archaeological, and cultural significance, identifies historical resources for state and local planning purposes, determines eligibility for state historic preservation grant funding and affords certain protections under CEQA. Criteria for Designation:

1. Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). Fifty years is normally considered sufficient time for a potential historical resource, and in order that the evaluation remain valid for a minimum of five years after the date of this report, all resources older than 45 years (i.e. resources from the "historic-period") will be evaluated for California Register listing eligibility, or CEQA significance. The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Assembly Bill 52. California Assembly Bill 52 was approved on September 25, 2014. As stated in Section 11 of AB 52, the act applies only to projects that have a notice of preparation or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015.

AB 52 establishes "tribal cultural resources" (TCRs) as a new category of resources under CEQA. As defined under Public Resources Code Section 21074, TCRs are "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe" that are either: (1) included or determined to be eligible for inclusion in the CRHR; included in a local register of historical resources as defined in Public Resources Code Section 5020.1(k); or (2) determined by the lead agency to be significant pursuant to the criteria for inclusion in the California Register set forth in Public Resources Code Section 5024.1(c), if supported by substantial evidence and taking into account the significance of the resource to a California Native American tribe. A "historical resource" as

defined in Public Resources Code Section 21084.1, a "unique archaeological resource" as defined in Public Resources Code Section 21083.2(g), or a "nonunique archaeological resource" as defined in Public Resources Code Section 21083.2(h) may also be TCRs.

AB 52 further establishes a new consultation process with California Native American tribes for proposed projects in geographic areas that are traditionally and culturally affiliated with that tribe. Per Public Resources Code Section 21073, "California Native American tribe" includes federally and non-federally recognized tribes on the NAHC contact list. Subject to certain prerequisites, AB 52 requires, among other things, that a lead agency consult with the geographically affiliated tribe before the release of an environmental review document for a proposed project regarding project alternatives, recommended mitigation measures, or potential significant effects, if the tribe so requests in writing. If the tribe and the lead agency agree upon mitigation measures during their consultation, these mitigation measures must be recommended for inclusion in the environmental document (Public Resources Code Sections 21080.3.1, 21080.3.2, 21082.3, 21084.2, and 21084.3).

Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff are available to answer questions and address comments as necessary.

Paleontological Resources. CEQA provides guidance relative to significant impacts on paleontological resources, indicating that a project would have a significant impact on paleontological resources if it disturbs or destroys a unique paleontological resource or site or unique geologic feature. Section 5097.5 of the California Public Resources Code specifies that any unauthorized removal of paleontological remains is a misdemeanor. Further, California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources. CEQA documentation prepared for projects would be required to analyze paleontological resources as a condition of the CEQA process to disclose potential impacts. Please note that as of January 2018 paleontological resources are considered in the geological rather than cultural category. Therefore, paleontological resources are not summarized in the body of this report. A paleontological overview completed by professional paleontologists from the Western Science Center is provided as Appendix D.

NATURAL SETTING

The elevation of the project site is approximately 1,200 feet above mean sea level (AMSL). The property has been subject to disturbances related to previous construction, landscaping, and weed abatement related to the subject property. The project site is composed of as alluvial sand, gravel and clay deposits dating to the Holocene. The current study has not yielded any evidence that local sediments have produced raw materials used in prehistoric tool manufacture within one half-mile of the project site. Local rainfall ranges from 5 to 15 inches annually (Jaeger and Smith 1971:36-37).

Although recent and historical impacts have decimated local vegetation, remnants of a formerly dominant coastal sage scrub vegetation community have been sporadically observed in the area. Signature plant species include black sage (*Salvia mellifera*), California brittlebush (*Encelia californica*), California buckwheat (*Eriogonum fasciculatum*), California sagebrush (*Artemesia californica*), deerweed (*Lotus scoparius*), golden yarrow

(*Eriophyllum confertiflorum*), laurel sumac (*Malosma laurina*), lemonadeberry (*Rhus integrifolia*), poison oak (*Toxicodendron diverilobum*), purple sage (*Salvia leucophyla*), sticky monkeyflower (*Mimulus aurantiacus*), sugar bush (*Rhus ovate*), toyon (*Heteromeles arbutifolia*), white sage (*Salvia apiana*), coastal century plant (*Agave shawii*), coastal cholla (*Opuntia prolifera*), Laguna Beach liveforever (*Dudleya stolonifera*), many-stemmed liveforever (*Dudleya multicaulis*), our Lord's candle (*Yucca whipplei*), prickly pear cactus (*Opuntia sp.*) (Williams et al. 2008:118-119). Signature animal species within Coastal Sage Scrub habitat include the kangaroo rat (*Dipodomys sp.*), California horned lizard (*Phrynosoma coronatum frontale*), orange throated whiptail (*Cnemidophorus hyperthrus*), San Diego horned lizard (*Phrynosoma coronatum blainvillii*), brown-headed cowbird (*Molothrus ater*), California gnatcatcher (*Polioptila californica californica*), California quail (*Callipepla californica*), and San Diego cactus wren (*Campylorhynchus brunnecapillus sandiegensis*) (Williams et al. 2008:118-120). Local native groups made use of many of these species (see Lightfoot and Parrish 2008).

CULTURAL SETTING

Prehistoric Context

The local prehistoric cultural setting has been organized into many chronological frameworks (see Warren and Crabtree 1986; Bettinger and Taylor 1974; Lanning 1963; Hunt 1960; Wallace 1958, 1962, 1978; Campbell and Campbell 1935), although there is no definitive sequence for the region. The difficulties in establishing cultural chronologies for western San Bernardino County are a function of its enormous size and the small amount of archaeological excavations conducted there. Moreover, throughout prehistory many groups have occupied the area and their territories often overlap spatially and chronologically resulting in mixed artifact deposits. Due to dry climate and capricious geological processes, these artifacts rarely become integrated in-situ. Lacking a milieu hospitable to the preservation of cultural midden, local chronologies have relied upon temporally diagnostic artifacts, such as projectile points, or upon the presence/absence of other temporal indicators, such as groundstone. Such methods are instructive, but can be limited by prehistoric occupants' concurrent use of different artifact styles, or by artifact re-use or re-sharpening, as well as researchers' mistaken diagnosis, and other factors (see Flenniken 1985; Flenniken and Raymond 1986; Flenniken and Wilke 1989). Recognizing the shortcomings of comparative temporal indicators, this study recommends review of Warren and Crabree (1986), who have drawn upon this method to produce a commonly cited and relatively comprehensive chronology.

Ethnography

The project site vicinity has been peripherally occupied by the Gabrielino and Serrano. Each group consisted of semi-nomadic hunter-gatherers who spoke a variation of the Takic language subfamily. Individual ethnographic summaries are provided below.

Gabrielino. The Gabrielino probably first encountered Europeans when Spanish explorers reached California's southern coast during the 15th and 16th centuries (Bean and Smith 1978; Kroeber 1925). The first documented encounter, however, occurred in 1769 when Gaspar de Portola's expedition crossed Gabrielino territory (Bean and Smith 1978). Other brief encounters took place over the years, and are documented in McCawley 1996 (citing numerous sources). The Gabrielino name has been attributed by association with the Spanish mission of San Gabriel, and refers to a subset of people sharing speech and customs with other Cupan speakers (such as the Juaneño/Luiseño/Ajachemem) from the

greater Takic branch of the Uto-Aztecan language family (Bean and Smith 1978). Gabrielino villages occupied the watersheds of various rivers (locally including the Santa Ana) and intermittent streams. Chiefs were usually descended through the male line and often administered several villages. Gabrielino society was somewhat stratified and is thought to have contained three hierarchically ordered social classes which dictated ownership rights and social status and obligations (Bean and Smith 1978:540-546). Plants utilized for food were heavily relied upon and included acorn-producing oaks, as well as seed-producing grasses and sage. Animal protein was commonly derived from rabbits and deer in inland regions, while coastal populations supplemented their diets with fish, shellfish, and marine mammals (Boscana 1933, Heizer 1968, Johnston 1962, McCawley 1996). Dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles were specifically not utilized as a food source (Kroeber 1925:652).

Serrano. The Uto-Aztecan "Serrano" people occupied the western Mojave Desert periphery. Kroeber (1925) applied the generic term "Serrano" to four groups, each with distinct territories: the Kitanemuk, Tataviam, Vanyume, and Serrano. Only one group, in the San Bernardino Mountains and West-Central Mojave Desert, ethnically claims the term Serrano. Bean and Smith (1978) indicate that the Vanyume, an obscure Takic population, was found along the Mojave River at the time of Spanish contact. The Kitanemuk lived to the north and west, while the Tataviam lived to the west. The Serrano lived mainly to the south (Bean and Smith 1978). All may have used the western Mojave area seasonally (see deBarros 2004; Lightfoot and Parrish 2009). Historical records are unclear concerning precise territory and village locations.

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the region in 1772. Searching for San Diego Presidio deserters, Fages had traveled through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However,

beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought further diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that have continued to proliferate to this day (Beattie and Beattie 1974; Cleland 1941).

Local Sequence. In 1856, John Henry Cram and his six sons were among the first Europeans to settle on the eastern edge of Highland then known as Cramville. By 1859, Henry Rabel purchased 120 acres of land in western Highland which contained natural springs from artesian and thermal wells. Highland saw rapid development during the late 1860s through 1890s. Large tracts owned by the U.S. government became locally available for homesteading during the 1860s and settlers began to take advantage of new homestead and economic opportunities. These included new roads, homes, the first Highland school district, a post office, grocery store, and a new Santa Fe Railroad extension from Los Angeles to as far east as Redlands. In 1887, Rabel constructed bath houses and a hotel where guests could bathe in springs thought to have medicinal properties. The Highland Lumber Company was formed during this time and lumber from the mountains north of Highland supplied the material. By 1895, the Highland Lumber Company was sold to the Brookings Lumber Company which grew to be among the largest in the area. By 1892, the Santa Fe Railroad had constructed a loop which passed through Highland on the way to Los Angeles. Multiple Santa Fe Depots found within the city limits of Highland accommodated passengers. The railroads brought people and economic opportunities into Highland. Citrus packing houses were built adjacent to the train depots and the plentiful water sources surrounding Highland made extensive citrus growing possible. Highland was now known as the home of the finest Navel and Valencia oranges in Southern California. This was a change from the apricots, peaches, grapes, and grains grown in the early days of Highland (Highland Historical Society 2022).

Since Highland is located near the headwaters of the Santa Ana River, City Creek, and other tributaries, these precious resources soon became thoroughly exploited during this era. Indeed, upon California's cession into the United States, government officials recognized the local value of water and instituted a Board of Water Commissioners to regulate irrigation and authorize construction of canals and ditches. Agriculture (particularly citrus orchards) was central to Highland's success, and by the late 19th century, numerous canals, weirs, dams, and flood control systems had been constructed throughout the region. Local notable water delivery features constructed between 1858 and 1888 included the Plunge Creek Ditch, the North Fork Ditch (or canal), the Cram and Van Leuven Ditch, the City Creek Ditch, and the Highland Ditch (see Quales 2008:10). Flood management became vital to the region, evident after the catastrophic rains of 1938. Flood-caused damage influenced state legislation that led to the formation of the San Bernardino County Flood Control District in 1939. During the ensuing decades, the channelization and paving of local waterways including many in the project region has helped reduce negative effects resulting from subsequent floods (Department of Public Works 2007).

By the early 1900s, Highland had a developed townscape well defined by a business district, an industrial sector adjacent to the Santa Fe tracks, and residential areas. With a prospering economy connected to citrus production and shipping, the First Bank of Highland

was established in 1904. The Highland citrus industry continued to grow and in 1911 an electric railway was installed within city limits. This electric railway provided additional citrus freight service and now included an interchange with Southern Pacific; a direct competitor to Santa Fe. Highland's economy began to experience some changes in the late 1920s and early 1930s. Multiple fires swept through a concentration of packing houses and the townsite gradually expanded onto the site of a former orange grove. While the economic downturn of the Great Depression was locally significant, its effects in Highland were initially blunted by the strong citrus economy. However, in 1937 the area was hit by the worst freeze in a generation which destroyed large amounts of citrus and other produce. In 1938, torrential rains caused flooding throughout Highland and damaged many orchards, roads, and bridges. Subsequently, the Pacific Electric railroad closed, the First Bank of Highland was purchased by a large outside company, and large-scale suburbanization related to the construction of the San Bernardino Army Air Depot in 1943 all combined to shift Highland away from its agricultural roots (United States Department of the Interior National Park Service 2001). By the 1950s, most of the citrus groves were removed, Santa Fe depots were demolished, and housing tracts replaced the old townsite. By the 1980s, the original central business district had been replaced by modern shopping centers (United States Department of the Interior National Park Service 2001).

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study and compiled the technical report and Department of Park and Recreation (DPR) 523 forms. Mr. Brunzell completed the archaeological records search at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. BCR Consulting Archaeological Field Director Joseph Orozco, M.A., RPA contributed to the site DPR 523 forms and the technical report. BCR Consulting Staff Historian George Brentner, B.A., completed the pedestrian field survey.

METHODS

Records Search

The archaeological records search, completed at the SCCIC at California State University, Fullerton, reviewed all recorded historic and prehistoric cultural resources, as well as a review of known cultural resources, and survey and excavation reports generated from projects completed within one half-mile of the project site. In addition, a review was conducted of the National Register of Historic Places (National Register), the California Register of Historical Resources (California Register), and documents and inventories from the California Office of Historic Preservation including the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Field Survey

An archaeological pedestrian field survey of the project site was conducted on November 10, 2022. The survey was conducted by walking parallel transects approximately 15 meters apart across 100 percent of the project site. Soil exposures, including natural and artificial clearings were carefully inspected for evidence of cultural resources.

RESULTS

Records Search

The archaeological records search was completed at the SCCIC at California State University, Fullerton. This research has revealed that 21 cultural resource studies have taken place within one-half mile of the project site. One of the previous studies assessed a small portion at the eastern edge of the project site for cultural resources and one cultural resource (designated P-36-13750) was identified within the project boundaries. Results are summarized in Table A, and a comprehensive records search bibliography is provided in Appendix A.

Table A. Cultural Resources and Reports Within One Half-Mile of the Project Site

USGS 7.5 Min. Quad.	Cultural Resources Within One Half-Mile of Project Site	Cultural Resource Studies Within One Half-Mile of Project Site
Redlands, California (1988)	P-36-13750*: Historic-Period Structures and Refuse Scatter	SB-106-308, 1409, 1783, 1808, 2260, 2587, 2853, 3736, 3753, 4102, 4826, 4831, 5803**, 6631, 6758, 7144, 7309, 7465, 7823, 7959, 8097

*Located within project site **Assessed a portion of project site

Additional Research. The entire subject property was part of a larger 83.57-acre property patented to Salas Cox as a homestead grant by the state of California on August 20, 1881. Research did not indicate any development within the project site connected with this era. Additional land-use history research was performed to provide context for individual parcels within the project site that contained historic-period buildings (see also Field Survey Results, below). Please note that references for this section are provided in Appendix B.

27184 Meines Street. The residence was built 1950 but no permit records were available to date the modifications. The property contained a garage prior to 1938 that remains in place. The earliest known residents of the subject residence were Aron (1893-1986) and Susie Pruett (1904-1988) who lived there between 1950 and 1976. Aron was a railroad laborer and occasionally rented out a trailer at the property to other residents. In 1976, Robert Forshay acquired the subject property. Mr. Forshay, an American citizen born in the Phillipines, graduated from Pacific High School in San Bernardino. Ownership passed to QR LI Highland CA Commerce Center, the current owner, in 2022.

27220 Meines Street. The buildings were both constructed between 1938 and 1959 according to aerial photos, but assessor information did not indicate an exact build date and no permit records were available. The first recorded owner of 27220 Meines Street was Mrs. Gertha Evans. Mrs. Evans was born in Texas in 1890 and moved to California where she had lived for 40 years. Mrs. Evans lived in Highland for 25 years and acquired the subject property at an unknown date prior to 1963. Mrs. Evans was a member of the St. Paul's AME church in San Bernardino and died in 1963. In 1976, Robert Forshay acquired the subject property. Mr. Forshay an American citizen born in the Phillipines, graduated from Pacific High School in San Bernardino. Ownership passed to QR LI Highland CA Commerce Center, the current owner, in 2022.

P-36-13750. Previous identification efforts indicated that the site comprised an early 20th Century residential site. This interpretation is presumably based on domestic debris that was identified there in 2007. However, no residential structures have been identified within this parcel, and the domestic debris has been removed. Current research did not reveal any residents for this property. Aerial photos show the garage in 1938 (still present), and by 1959 two small ancillary structures had been built to the northwest (no longer present). Disturbances connected with offroad vehicle activity were consistently visible surrounding these features throughout this era, but no evidence of residential use or cultivation were apparent.

Field Survey

During the field survey, BCR Consulting staff carefully inspected the project site, and identified three properties that contained historic-period buildings. These resources have been recorded on DPR 523 forms (Appendix B) and are described in detail below.

27184 Meines Street. The subject property is occupied by a 480 square foot single-family residence that is historic in age (i.e. over 45 years old). The post-war Minimal-Style residence features a wood frame construction, single-story floor plan, and was built in 1950. It features a side-gabled roof with moderate pitch and topped with new composition shingles. The outer walls have been re-surfaced with light-colored stucco and stone accents on the lower portion of the home. The original windows have been replaced with vinyl windows. The subject property shares a dirt lot with an adjacent trucking company. A large wood-framed corrugated structure is visible behind the residence. This building was constructed after 1980 and is not historic in age. As such it does not merit further consideration.

27220 Meines Street. The subject property is a one-acre lot that contains a single-family residence and an ancillary structure that is historic in age (i.e. over 45 years old). The residence is a post-war, minimal-style residence which features wood frame construction, a single-story floor plan, and was built circa 1950. It is fronted by a small concrete pad. A second, historic-period structure is located on the same lot directly north of the residential unit. This structure is made from a stone and concrete matrix and features a wooden gable roof. Both the residence and the stone structure have been neglected and fallen into a state of disrepair. A small concrete foundation from an unknown structure is located northwest of the two buildings.

P-36-13750. This resource was originally recorded in February 2007 by Archaeological Consulting Services as a historic-period residential site which included one garage, a shed, and refuse scatter. BCR Consulting archaeologists relocated the site on November 10, 2022. The shed has been demolished and the area containing the former refuse scatter has been subject to excavation and grading for the construction of an industrial building. The pre-1938 garage is in place as recorded (see historicaerials.com). It is a wood-framed building with corregated aluminum siding and roofing. The south-facing (main) façade has no door and is covered with temporary steel fencing. It is a utilitarian building that lacks architectural style and ornamentation. The graded lot was not accessible.

No other cultural resources were identified within the project site boundaries. Surface visibility was approximately 60 percent within the project site. Sediments consisted of sandy silt with poorly sorted gravels. The property has been subject to severe disturbances related building construction, landscaping, and weed abatement.

SIGNIFICANCE EVALUATIONS

During the field survey, 12 properties containing historic-period buildings were identified. CEQA calls for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, or designation under a local ordinance.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion on the California Register, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local, California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

California Register Evaluations

27184 Meines Street. Criterion 1: Substantial research has not indicated a close association between the subject property and any important events. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Substantial research has failed to connect the subject property with the lives of persons important in California's past. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The residence lacks architectural distinction and does not display significant elements of the era during which it was constructed. The building does not significantly represent the work of an important creative individual or possess high artistic values. Therefore, the subject property is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to

yield information important in prehistory or history and is therefore not eligible for listing under Criterion 4. The subject property and its historic-age building are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

27220 Meines Street. Criterion 1: Substantial research has not indicated a close association between the subject property and any important events. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Substantial research has failed to connect the subject property with the lives of persons important in California's past. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The residence and stone building lack architectural distinction and do not display significant elements of the era during which it was constructed. The buildings do not significantly represent the work of an important creative individual or possess high artistic values. Therefore, the subject property is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and is therefore not eligible for listing under Criterion 4. The subject property and its historic-age building are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

P-36-13750. Criterion 1: Substantial research has not indicated a close association between the subject property and any important events. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Substantial research has failed to connect the subject property with the lives of persons important in California's past. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The residence and stone building lack architectural distinction and does not display significant elements of the era during which it was constructed. The building does not significantly represent the work of an important creative individual or possess high artistic values. Therefore, the subject property is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and is therefore not eligible for listing under Criterion 4. The subject property and its historic-age building is therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

RECOMMENDATIONS

BCR Consulting conducted a Cultural Resources Assessment of the Lovett Meines & Palm Project located in the City of Highland, San Bernardino County, California. During the field survey, BCR Consulting identified three Historic-Period cultural resources within the project boundaries. These three resources are recommended not eligible for the California Register and as such are not "historical resources". They are not significant under CEQA and do not warrant further consideration. Based on these results, BCR Consulting recommends that no additional cultural resources work or monitoring is necessary for any proposed project activities. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist shall be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

Findings were positive during the Sacred Lands File search with the NAHC. The NAHC recommended contacting representatives of San Manuel Band of Mission Indians regarding this finding. The city will initiate Assembly Bill (AB) 52 Native American Consultation for the project. Since the city will initiate and carry out the required Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix D has recommended that:

> The geologic units underlying this project are mapped entirely as alluvial sand, gravel and clay deposits dating to the Holocene (Dibblee & Minch, 2003). While Holocene alluvial units are considered to be of high preservation value, material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, if development requires any substantial depth of disturbance, the likelihood of reaching older Holocene or Late Pleistocene alluvial sediments would increase. The Western Science Center does not have localities within the project area or within a 1 mile radius.
>
> While the presence of any fossil material is unlikely, if excavation activity for the Giant RV Project disturbs deeper sediment dating to the earliest parts of the Holocene or Late Pleistocene periods, the material would be scientifically significant. Excavation activity associated with the development of the project area is unlikely to be paleontologically sensitive, but caution during development should be observed.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

d. UTM: Zone: N/A mE/ Elevation: 1,200' AMSL
e. Other Locational Data: The subject property is located on the north side of Meines Street, west of Palm Avenue.

***P3a. Description:** The subject property is occupied by a 480 square foot single-family residence that is historic in age (i.e. over 45 years old). The post-war Minimal-Style residence features a wood frame construction, single-story floor plan, and was built in 1950. It features a side-gabled roof with moderate pitch and topped with new composition shingles. The outer walls have been re-surfaced with light-colored stucco and stone accents on the lower portion of the home. The original windows have been replaced with vinyl windows. The subject property shares a dirt lot with an adjacent trucking company. A large wood-framed corrugated structure is visible behind the residence. This building was constructed after 1980 and is not historic in age. As such it does not merit further consideration.

History

Highland. In 1856, John Henry Cram and his six sons were among the first Europeans to settle on the eastern edge of Highland then known as Cramville. By 1859, Henry Rabel purchased 120 acres of land in western Highland which contained natural springs from artesian and thermal wells. Highland saw rapid development during the late 1860s through 1890s. Large tracts owned by the U.S. government became locally available for homesteading during the 1860s and settlers began to take advantage of new homestead and economic opportunities. These included new roads, homes, the first Highland school district, a post office, grocery store, and a new Santa Fe Railroad extension from Los Angeles to as far east as Redlands. In 1887, Rabel constructed bath houses and a hotel where guests could bathe in springs thought to have medicinal properties. The Highland Lumber Company was formed during this time and lumber from the mountains north of Highland supplied the material. By 1895, the Highland Lumber Company was sold to the Brookings Lumber Company which grew to be among the largest in the area. By 1892, the Santa Fe Railroad had constructed a loop which passed through Highland on the way to Los Angeles. Multiple Santa Fe Depots found within the city limits of Highland accommodated passengers. The railroads brought people and economic opportunities into Highland. Citrus packing houses were built adjacent to the train depots and the plentiful water sources surrounding Highland made extensive citrus growing possible. Highland was now known as the home of the finest Navel and Valencia oranges in Southern California. This was a change from the apricots, peaches, grapes, and grains grown in the early days of Highland (Highland Historical Society 2022). [Continued on page 3]

Period of Significance: Post World War II **Property Type:** Residential

B10. Significance/History [Continued from page 2]:

By the early 1900s, Highland had a developed townscape well defined by a business district, an industrial sector adjacent to the Santa Fe tracks, and residential areas. With a prospering economy connected to citrus production and shipping, the First Bank of Highland was established in 1904. The Highland citrus industry continued to grow and in 1911 an electric railway was installed within city limits. This electric railway provided additional citrus freight service and now included an interchange with Southern Pacific; a direct competitor to Santa Fe. Highland's economy began to experience some changes in the late 1920s and early 1930s. Multiple fires swept through a concentration of packing houses and the townsite gradually expanded onto the site of a former orange grove. While the economic downturn of the Great Depression was locally significant, its effects in Highland were initially blunted by the strong citrus economy. However, in 1937 the area was hit by the worst freeze in a generation which destroyed large amounts of citrus and other produce. In 1938, torrential rains caused flooding throughout Highland and damaged many orchards, roads, and bridges. Subsequently, the Pacific Electric railroad closed, the First Bank of Highland was purchased by a large outside company, and large-scale suburbanization related to the construction of the San Bernardino Army Air Depot in 1943 all combined to shift Highland away from its agricultural roots (United States Department of the Interior National Park Service 2001). By the 1950s, most of the citrus groves were removed, Santa Fe depots were demolished, and housing tracts replaced the old townsite. By the 1980s, the original central business district had been replaced by modern shopping centers (United States Department of the Interior National Park Service 2001).

Property History The subject property was part of an 83.57-acre property patented to Salas Cox by the state of California on August 20, 1881 (General Land Office 1881). The property contained a garage prior to 1938 that remains in place, but research has not connected this development to Mr. Cox. The earliest known residents of the subject residence were Aron (1893-1986) and Susie Pruett (1904-1988) who lived there between 1950 and 1976. Aron was a railroad laborer and occasionally rented out a trailer at the property to other residents (San Bernardino County Sun 9 Jan 1988, page 14; U.S. Census Records 1950). Robert Forshay owned the property from 1976 until selling to the current owner, QR LI Highland CA Commerce Center (San Bernardino County PIMS Ownership History 2022).

Evaluation
Criterion 1: Substantial research has not indicated a close association between the subject property and any important events. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Substantial research has failed to connect the subject property with the lives of persons important in California's past. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The residence lacks architectural distinction and does not display significant elements of the era during which it was constructed. The building does not significantly represent the work of an important creative individual or possess high artistic values. Therefore, the subject property is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and is therefore not eligible for listing under Criterion 4. The subject property and its historic-age building is therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

Integrity. As the building remains in its original position and is still in use as a residential property, it retains integrity of location, setting, and association. Alterations have diminished integrity of design, materials, workmanship, and feeling.

d. UTM: Zone: N/A mE/ Elevation: 1,200' AMSL

e. Other Locational Data: The subject property is located on the north side of Meines Street, west of Palm Avenue.

***P3a. Description:** The subject property is a one-acre lot that contains a single-family residence and an ancillary structure that is historic in age (i.e. over 45 years old). The residence is a post-war, minimal-style residence which features wood frame construction, a single-story floor plan, and was built circa 1950. It is fronted by a small concrete pad. A second, historic-period structure is located on the same lot directly north of the residential unit. This structure is made from a stone and concrete matrix and features a wooden gable roof. Both the residence and the stone structure have been neglected and fallen into a state of disrepair. A small concrete foundation from an unknown structure is located northwest of the two buildings.

The Highland Lumber Company was formed during this time and lumber from the mountains north of Highland supplied the material. By 1895, the Highland Lumber Company was sold to the Brookings Lumber Company which grew to be among the largest in the area. By 1892, the Santa Fe Railroad had constructed a loop which passed through Highland on the way to Los Angeles. Multiple Santa Fe Depots found within the city limits of Highland accommodated passengers. The railroads brought people and economic opportunities into Highland. Citrus packing houses were built adjacent to the train depots and the plentiful water sources surrounding Highland made extensive citrus growing possible. Highland was now known as the home of the finest Navel and Valencia oranges in Southern California. This was a change from the apricots, peaches, grapes, and grains grown in the early days of Highland (Highland Historical Society 2022). [Continued on page 3]

B10. Significance/History [Continued from page 2]:

By the early 1900s, Highland had a developed townscape well defined by a business district, an industrial sector adjacent to the Santa Fe tracks, and residential areas. With a prospering economy connected to citrus production and shipping, the First Bank of Highland was established in 1904. The Highland citrus industry continued to grow and in 1911 an electric railway was installed within city limits. This electric railway provided additional citrus freight service and now included an interchange with Southern Pacific; a direct competitor to Santa Fe. Highland's economy began to experience some changes in the late 1920s and early 1930s. Multiple fires swept through a concentration of packing houses and the townsite gradually expanded onto the site of a former orange grove. While the economic downturn of the Great Depression was locally significant, its effects in Highland were initially blunted by the strong citrus economy. However, in 1937 the area was hit by the worst freeze in a generation which destroyed large amounts of citrus and other produce. In 1938, torrential rains caused flooding throughout Highland and damaged many orchards, roads, and bridges. Subsequently, the Pacific Electric railroad closed, the First Bank of Highland was purchased by a large outside company, and large-scale suburbanization related to the construction of the San Bernardino Army Air Depot in 1943 all combined to shift Highland away from its agricultural roots (United States Department of the Interior National Park Service 2001). By the 1950s, most of the citrus groves were removed, Santa Fe depots were demolished, and housing tracts replaced the old townsite. By the 1980s, the original central business district had been replaced by modern shopping centers (United States Department of the Interior National Park Service 2001).

Property History. The subject property was part of an 83.57-acre property patented to Salas Cox by the state of California on August 20, 1881 (General Land Office 1881). Research has not connected existing buildings on the subject property with Mr. Cox. The first recorded owner of 27220 Meines Street was Mrs. Gertha Evans. Mrs. Evans was born in Texas in 1890 and moved to California where she had lived for 40 years. Mrs. Evans lived in Highland for 25 years and acquired the subject property at an unknown date prior to 1963. Mrs. Evans was a member of the St. Paul's AME church in San Bernardino and died in 1963. In 1976, Robert Forshay acquired the subject property. Mr. Forshay an American citizen born in the Phillipines, graduated from Pacific High School in San Bernardino. Ownership passed to QR LI Highland CA Commerce Center, the current owner, in 2022. (San Bernardino County 2022 [PIMS]; [SBCS] 31 Mar. 1963, 15 Aug. 1965, 7 July. 1966, 5 Aug. 1966, 20 Apr. 1984)

Evaluation
Criterion 1: Substantial research has not indicated a close association between the subject property and any important events. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Substantial research has failed to connect the subject property with the lives of persons important in California's past. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The residence and stone building lack architectural distinction and do not display significant elements of the era during which it was constructed. The buildings do not significantly represent the work of an important creative individual or possess high artistic values. Therefore, the subject property is not eligible under Criterion 3. Criterion 4: The subject property has not and is not likely to yield information important in prehistory or history and is therefore not eligible for listing under Criterion 4. The subject property and its historic-age buildings are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such are not recommended historical resources under CEQA.

Integrity. As the building remains in its original position and is still in use as a residential property, it retains integrity of location, setting, and association. Alterations have diminished integrity of design, materials, workmanship, and feeling.

Overview of Historic-Period Building North of Residence at 27220 Meines St. (View NE)

***Recorded by:** G. Brentner ***Date:** November 10, 2022 ☐ Continuation ☑ Update

This resource was originally recorded in February 2007 by Archaeological Consulting Services as a historic-period residential site which included one garage, a shed, and refuse scatter. BCR Consulting archaeologists relocated the site on November 10, 2022. The shed has been demolished and the area containing the former refuse scatter has been subject to excavation and grading for the construction of an industrial building. The pre-1938 garage is in place as recorded (see historicaerials.com). It is a wood-framed building with corregated aluminum siding and roofing. The south-facing (main) façade has no door and is covered with temporary steel fencing. It is a utilitarian building that lacks architectural style and ornamentation. The graded lot was not accessible.

Re: Meines Street and Palm Avenue Project (KIM2225), San Bernardino County

Dear Mr. Brunzell:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the Tribes on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

APPENDIX D

PALEONTOLOGICAL RESOURCES ASSESSMENT

WESTERN SCIENCE CENTER

November 1st, 2022

BCR Consulting, LLC
Joseph Orozco
505 W. 8th St.
Claremont, CA 91711

Dear Mr. Orozco,

This letter presents the results of a record search conducted for the Meines Street and Palm Avenue Project located in the city of Highland, San Bernardino County, CA. The project site is north of Meines Street and west of Palm Avenue on Township 1 South, Range 3 West, on Section 5 of the *Redlands, CA* USGS 7.5 minute quadrangles.

The geologic units underlying the project area are mapped primarily as alluvial sand and clay deposits from Holocene epoch (Dibblee and Minch 2004). Holocene alluvial units are considered to be of high preservation value, but material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. However, if development requires any substantial depth of disturbance, the likelihood of reaching Pleistocene alluvial sediments would increase. The Western Science Center does not have localities within the project area or within a 1 mile radius.

While the presence of any fossil material is unlikely, if excavation activity disturbs deeper sediment dating to the earliest parts of the Holocene or Late Pleistocene periods, the material would be scientifically significant. Excavation activity associated with the development of the project area is unlikely to be paleontologically sensitive, but caution during development should be observed.

If you have any questions, or would like further information, please feel free to contact me at bstoneburg@westerncentermuseum.org.

Sincerely,

Brittney Elizabeth Stoneburg, MSc
Collections Manager

APPENDICES
Appendix A: Energy Data

1 INTRODUCTION

This report documents the results on the Energy Assessment to evaluate potential short- and long-term energy consumption impacts of the Meines Street and Palm Avenue Warehouse (Project). The assessment evaluates the potential construction and operational energy consumption associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The proposed Project is located at the northwest corner of Meines Street and Palm Avenue in the City of Highland, California (City). The proposed site consists of 14 parcels (APN 1192-601-05, -09, and -43; 1192-621-02 through -08, and -20 through -23) on 12.8 acres. Currently, the site is used for industrial and non-conforming single-family residential uses. The Project site is relatively flat and has elevations ranging from approximately 1,175 to 1,193 feet above mean sea level (amsl). The site's topographic slightly slopes down to the west.

The Project site is bounded by the City Creek stormwater channel to the north, Palm Avenue to the east, Meines Street to the south, and an industrial lot to the west. In addition, the proposed Project is located approximately 1.2-mile northeast of the San Bernardino International Airport (SBIA).

Local access to the Project site is provided via Meines Street and Palm Avenue. The nearest major freeways to the site include Interstate 210 (I-210), located approximately 0.55-mile to the east and Interstate 10 (I-10), located approximately 2.86 miles to the south of the site; refer to Exhibit 1: Regional Vicinity Map and Exhibit 2: Site Vicinity Map.

1.2 Project Description

The Project proposes the development of single new industrial concrete tilt-up dock high warehouse building totaling 284,917 square feet, including 5,000 square feet of office space and 3,000 feet of mezzanine space. The structure will be supported by a screened truck yard, vehicular parking areas, tractor-trailer storage stalls, drive aisles, and landscaped areas. On-site improvements will include storm drains, stormwater/water quality treatment facilities (including underground infiltration chambers), sewer (including a private lift station), water, and dry utility systems. Additionally, minor onsite slopes and deepened building panels will be utilized. Vehicular access to the Project site will be provided by two new 40 foot-wide and 26-foot-wide driveways off Palm Avenue and one new 40-foot-wide driveway off Meines Street. The project also proposes a 40-foot-wide internal driveway which would provide vehicular access throughout the Project site. The Project provides a total of 240 parking spaces that includes 47 trailer stalls, 159 standard auto stalls, and 34 compact auto stalls. Refer to Exhibit 3: Site Plan for further Project details.

The Project would increase onsite impermeable areas as a result of the construction of a 284,917-SF warehouse building and parking areas. However, the Project would also create a storm drain connection to the existing channel near the northwest corner of the Project site.

Project Phasing

The Project is anticipated to be developed in one phase. Construction activity is anticipated to occur over a duration of approximately 10 months, beginning in October 2023.

General Plan Land Use and Zoning Designations

As designated by the City's Development Code, the Project site has a General Plan land use designation of Industrial (I) and a Zoning designation of Industrial (I). As such, the Project is anticipated to be consistent with the existing land use and zoning.

Site Access

Local access to the Project site is provided via Meines Street, which traverses the south of the site in a west-east direction, Palm Avenue that traverses east of the site in a north-south direction. Regional access to the Project site is via the W 5th Street off-ramp from I-210. The Project would include two (2) new 40 foot-wide and 26-foot-wide driveways off Palm Avenue and one new 40-foot-wide driveway off Meines Street. The Project also proposes a 40-foot-wide internal driveway which would provide vehicular access throughout the Project site.

Walls and Fences

The Project would include the following walls and fences on-site:

- An 8-foot-high metal fence would be located along the northwestern, northeastern, and western boundaries of the Project site;
- A 10-foot-high screen wall would run along the northern property line and would also surround the truck trailer parking and loading dock area in the northern portion of the site; and
- Two 8-foot-high metal gates would border the western and eastern boundaries of the truck loading area in the northern portion of the site.

Parking

The Project proposes to provide a total of 240 parking spaces that include 159 standard parking stalls (9 feet by 19 feet), 34 compact auto stalls (9 feet by 14 feet), and 47 trailer parking stalls (10 feet by 53 feet). Trailer stalls would be positioned along the northern Project boundary to the north of the loading dock area. The proposed auto standard parking stalls would be provided along the northeast, east, and west portions of the site.

2 ENVIRONMENTAL SETTING

2.1 Energy Conservation

In 1975, largely in response to the oil crisis of the 1970s, the California State Legislature adopted Assembly Bill 1575 (AB 1575), which created the California Energy Commission (CEC). The statutory mission of the CEC is to forecast future energy needs, license thermal power plants of 50 megawatts or larger, develop energy technologies and renewable energy resources, plan for and direct State responses to energy emergencies, and, perhaps most importantly, promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended Public Resources Code Section 21100(b)(3) to require Environmental Impact Reports (EIRs) to consider the wasteful, inefficient, and unnecessary consumption of energy caused by a project. Thereafter, the State Resources Agency created Appendix F, *Energy Conservation*, in the California Environmental Quality Act Guidelines (CEQA Guidelines). CEQA Guidelines Appendix F is an advisory document that assists EIR preparers in determining whether a project will result in the inefficient, wasteful, and unnecessary consumption of energy.

In addition, the California Natural Resources Agency finalized updates to the CEQA Guidelines in December 2018. CEQA Guidelines Section 15126.2(b) treats "wasteful, inefficient, or unnecessary" energy consumption as a significant environmental impact. As a result, energy thresholds have been incorporated into Appendix G of the CEQA Guidelines. This report has been prepared to assess energy impacts in accordance with Appendix G of the CEQA Guidelines.

2.2 Energy Consumption

Energy consumption is analyzed in this technical memorandum due to the potential direct and indirect environmental impacts associated with the Project. Such impacts include the depletion of nonrenewable resources and emissions of pollutants during both construction and long-term operational phases.

Electrical Service. Southern California Edison (SCE) provides electrical services to the City of Highland (City) through State-regulated public utility contracts. Over the past 15 years, electricity generation in California has undergone a transition. Historically, California has relied heavily on oil- and gas-fired plants to generate electricity. Spurred by regulatory measures and tax incentives, California's electrical system has become more reliant on renewable energy sources; including cogeneration, wind energy, solar energy, geothermal energy, biomass conversion, transformation plants, and small hydroelectric plants. Unlike petroleum production, electricity generation is not usually tied to the location of the fuel source and can be delivered great distances via the electrical grid. The generating capacity of a unit of electricity is expressed in megawatts (MW). Net generation refers to the gross amount of energy produced by a unit, minus the amount of energy the unit consumes. Generation is typically measured in megawatt-hours (MWh), kilowatt-hours (kWh), or gigawatt-hours (GWh).

Natural Gas Services. Southern California Gas Company (SoCalGas) provides natural gas services to the City of Highland (City) and San Bernardino County (County). Natural gas is a hydrocarbon fuel found in reservoirs beneath the Earth's surface and is composed primarily of methane (CH_4). It is used for space and water heating, process heating and electricity generation, and as transportation fuel. Use of natural gas to generate electricity is expected to increase in coming years because it is a relatively clean alternative to other fossil fuels (e.g., oil and coal). In California and throughout the western United States, many new electrical generation plants fired by natural gas are being brought online. Thus, there is great

interest in importing liquefied natural gas from other parts of the world. California's natural gas-fired electric generation increased by 2 percent in 2021, accounting for 50 percent of in-state generation.[1]

Energy Usage. Energy usage is typically quantified using the British Thermal Unit (BTU). Total energy usage in California was 6,922.8 trillion BTUs in 2020 (the most recent year for which this specific data is available).[2] Of California's total energy usage, the breakdown by sector is 34.0 percent transportation, 24.6 percent industrial, 19.6 percent commercial, and 21.8 percent residential.[3] Electricity and natural gas in California are generally consumed by stationary users such as residences, commercial, and industrial facilities, whereas petroleum consumption is generally accounted for by transportation-related energy use. In 2022, taxable gasoline sales (including aviation gasoline) in California accounted for 13,919,678,835 gallons of gasoline.[4]

The electricity consumption attributable to the County from 2011 to 2021 is shown in Table 1: Electricity Consumption in San Bernardino County 2011-2021. As indicated in Table 1, energy consumption in the County steadily increased between 2011 to 2021 with the exception of 2019 in which energy decreased slightly from previous years.

Table 1: Electricity Consumption in San Bernardino County 2011-2021

Year	Electricity Consumption (in millions of kilowatt hours)
2011	13,730
2012	14.348
2013	14,374
2014	14,731
2015	14,731
2016	14,946
2017	15,282
2018	15,376

Automotive fuel consumption in the County from 2012 to 2022 is shown in Table 3: Automotive Fuel Consumption in San Bernardino County 2012-2022. As shown in Table 3, on-road automotive fuel consumption in the County increased between 2012 and 2019 and fluctuated from 2020 to 2022. Heavy-duty vehicle fuel consumption steadily increased between 2012 and 2022 with a slight decrease in 2018, and 2019.

3 REGULATORY SETTING

3.1 State of California

California's Energy Efficiency Standards for Residential and Non-Residential Buildings (Title 24)

Energy conservation standards for new residential and nonresidential buildings were adopted by the California Energy Resources Conservation and Development Commission (now the California Energy Commission) in June 1977 and are updated every three years (Title 24, Part 6, of the California Code of Regulations). Title 24 requires the design of building shells and building components to conserve energy. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. On June 10, 2015, the CEC adopted the 2016 Building Energy Efficiency Standards, which went into effect on January 1, 2017. On May 9, 2018, the CEC adopted the 2019 Building Energy Efficiency Standards, which took effect on January 1, 2020. The 2022 version of Title 24 was adopted by the California Energy Commission (CEC) and became effective on January 1, 2023.

The 2016 Standards improved upon the previous 2013 Standards for new construction of and additions and alterations to residential and nonresidential buildings. Under the 2016 Standards, residential buildings are 28 percent more energy efficient and nonresidential buildings are 5 percent more energy efficient than under the 2013 Standards. Buildings that are constructed in accordance with the 2013 Building Energy Efficiency Standards are 25 percent (residential) to 30 percent (nonresidential) more energy efficient than the prior 2008 standards as a result of better windows, insulation, lighting, ventilation systems, and other features.

The 2019 Standards improve upon the 2016 Standards. Under the 2019 Title 24 standards, residential buildings are about 7 percent more energy efficient, and when the required rooftop solar is factored in for low-rise residential construction, residential buildings that meet 2019 Title 24 standards use about 53 percent less energy than those built to meet the 2016 standards.

The 2022 Title 24 standards became effective January 1, 2023, and will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption across California. For example, the 2022 Title 24 standards will require efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards.

On August 11, 2021, the CEC adopted the 2022 Energy Code. In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. Among other updates like strengthened ventilation standards for gas cooking appliances, the 2022 Energy Code includes updated standards in three major areas:

- New electric heat pump requirements for residential uses, schools, offices, banks, libraries, retail, and grocery stores.

- The promotion of electric-ready requirements for new homes including the addition of circuitry for electric appliances, battery storage panels, and dedicated infrastructure to allow for the conversion from natural gas to electricity.

- The expansion of solar photovoltaic and battery storage standards to additional land uses including high-rise multifamily residences, hotels and motels, tenant spaces, offices, (including

medical offices and clinics), retail and grocery stores, restaurants, schools, and civic uses (including theaters auditoriums, and convention centers).

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary measures (CALGreen Tier 1 and Tier 2) that local governments may adopt which encourage or require additional measures in the five green building topics. The most recent update to the CALGreen Code was adopted in 2022 and went into effect January 1, 2023. Projects whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.[5]

California Public Utilities Commission Energy Efficiency Strategic Plan

The California Public Utilities Commission (CPUC) prepared an Energy Efficiency Strategic Plan in 2011 with the goal of promoting energy efficiency and a reduction in greenhouse gases. AB 1109, adopted in 2007, also serves as a framework for lighting efficiency. This bill requires the State Energy Resources Conservation and Development Commission to adopt minimum energy efficiency standards as a means to reduce average Statewide electrical energy consumption by not less than 50 percent from the 2007 levels for indoor residential lighting and not less than 25 percent from the 2007 levels for indoor commercial and outdoor lighting by 2018. According to the Energy Efficiency Strategic Plan, lighting comprises approximately one-fourth of California's electricity use while non-residential sector exterior lighting (parking lot, area, walkway, and security lighting) usage comprises 1.4 percent of California's total electricity use, much of which occurs during limited occupancy periods.

Renewable Portfolio Standard

In 2002, California established its Renewable Portfolio Standard program with the goal of increasing the annual percentage of renewable energy in the State's electricity mix by the equivalent of at least 1 percent of sales, with an aggregate total of 20 percent by 2017. The California Public Utilities Commission subsequently accelerated that goal to 2010 for retail sellers of electricity (Public Utilities Code Section 399.15(b)(1)). Then-Governor Schwarzenegger signed Executive Order S-14-08 in 2008, increasing the target to 33 percent renewable energy by 2020. In September 2009, then-Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing Executive Order S-21-09, which directs the California Air Resources Board under its AB 32 authority to enact regulations to help the State meet its Renewable Portfolio Standard goal of 33 percent renewable energy by 2020. In September 2010, the California Air Resources Board adopted its Renewable Electricity Standard regulations, which require all of the State's load-serving entities to meet this target. In October 2015, then-Governor Brown signed into legislation Senate Bill 350, which requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030. Signed in 2018, SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Under

[5] California Energy Commission, *2022 Building Energy Efficiency Standards*, https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency, accessed May 2023.

the bill, the State cannot increase carbon emissions elsewhere in the western grid or allow resource shuffling to achieve the 100 percent carbon-free electricity target.

3.2 City of Highland

City of Highland General Plan

The following are relevant policies of the Highland General Plan, which may contribute to reducing potential energy impacts.

Conservation and Open Space Element

Goal 5.16 **Continue to encourage, support, and adopt energy-conservation practices.**

Policy 5.16.1 Consolidate and adopt energy-saving practices for all City departments.

Policy 5.16.2 Monitor energy usage for all City facilities.

Policy 5.16.3 Provide information on free energy audits for the public given by public utilities.

Policy 5.16.4 Distribute energy-conservation information, in both English and Spanish, to residents and businesses.

Policy 5.16.5 Coordinate energy-related policies and actions with local utilities and energy agencies.

Goal 5.17 **Encourage site design practices that reduce and conserve energy use.**

Policy 5.17.1 Encourage energy and environmentally sustainable designs— such as "Green Development Standards"—in the design and approval of new projects.

Policy 5.17.3 Incorporate passive solar design techniques including building orientation, energy-saving materials, roof overhangs, and window and door placement.

Policy 5.17.4 Increase minimum building insulation standards.

Policy 5.17.7 Encourage energy-efficient retrofitting of existing buildings, where practical, throughout the City including assisting applicants in the installation of more efficient HVAC (heating, ventilation, air conditioning) systems.

Policy 5.17.8 Distribute and participate in incentive programs for incorporation of solar and photovoltaic panels (active solar) into existing or new buildings.

Policy 5.17.10 Adopt LEED (Leadership in Energy and Environmental Design) design standards for public buildings.

Policy 5.17.11 Participate in the CEEP (Community Energy Efficiency Program) Certificate and Recognition Program.

Policy 5.19.1 Reduce locally generated emissions through traffic flow improvements (including signal synchronization) and construction management practices.

Policy 5.19.13 Continue comprehensive efforts to reduce energy consumption.

Public Health and Safety Element

Policy 6.8.7 Support current incentive programs that recognize and reward developments using new and innovative emission reduction techniques such as innovative efficient window glazing, wall insulation, and ventilation systems; efficient air conditioning, heating, and appliances; use of passive solar design, and solar heating systems; use of energy cogeneration and/or use of waste energy; and landscape techniques that reduce water consumption and provide passive solar benefits.

Community Design Element

Goal 10.12 Encourage development that is energy efficient and environmentally sustainable.

Policy 10.12.1 Encourage landscaping practices that increase energy efficiency and conserve natural resources.

Policy 10.12.6 Encourage site planning and building orientation that maximizes solar and wind resources for cooling and heating.

Action 10.12.1 Participate in the CEEP (Community Energy Efficiency Program) Certificate and Recognition Program.

Action 10.12.2 Adopt LEED (Leadership in Energy and Environmental Design) design standards for public buildings.

Action 10.12.4 Continue to use water and energy conservation practices in all public buildings and on City property.

Action 10.12.5 Sponsor community outreach and educational programs that encourage local schools to study and participate in green building design practices.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

In accordance with State CEQA Guidelines, the effects of a project are evaluated to determine whether they would result in a significant adverse impact on the environment. This assessment focuses on these effects and offer mitigation measures to reduce or avoid any significant impacts that are identified. The criteria used to determine the significance of impacts may vary depending on the nature of the project. According to State CEQA Guidelines Appendix G, the proposed Project would have a significant impact related to energy, if it would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation; and/or

- Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

The impact analysis focuses on the three sources of energy that are relevant to the proposed Project: electricity, natural gas, and transportation fuel for vehicle trips associated with the Project as well as the fuel necessary for Project construction. The analysis of the Project's electricity and natural gas use is based on the California Emissions Estimator Model (CalEEMod), which quantifies energy use for occupancy. The results of CalEEMod are included in the Project's Air Quality Assessment, prepared by Kimley-Horn (May 2023). Modeling related to Project energy use was based primarily on the default settings in CalEEMod. The amount of operational fuel use was estimated using CalEEMod outputs for the Project and CARB Emissions Factor (EMFAC) 2021 computer program for typical daily fuel use in Orange County. Construction fuel was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry.

5 POTENTIAL IMPACTS AND MITIGATION

Threshold 5.1 Would the project result in wasteful, inefficient, or unnecessary consumption of energy resources?

Threshold 5.2 Would the project conflict with or obstruct a State or local plan for renewable energy or energy efficiency?

Construction

The Project is anticipated to be constructed in one phase. Construction activity is anticipated to occur over a duration of approximately 10 months, beginning in October 2023. The energy associated with Project construction includes electricity use associated with water utilized for dust control, diesel fuel from on-road hauling trips, vendor trips, and off-road construction diesel equipment, as well as gasoline fuel from on-road worker commute trips. Because construction activities typically do not require natural gas, it is not included in the following discussion. The methodology for each category is discussed below. Quantifications of construction energy are provided by the Project below; see Table 4: Energy Use During Construction.

Table 4: Energy Use During Construction

Project Source	Total Construction Energy	San Bernardino County Annual Energy	Percentage Increase Countywide
Electricity Use		**GWh**	
Water Use[1]	0.0026	161,181	0.00002%
Diesel Use		**Gallons**	
On-Road Construction Trips[2]	37,606	279,150,963	0.0135%
Off-Road Construction Equipment[3]	91,335		0.0327%
Construction Diesel Total	128,941		0.0462%
Gasoline		**Gallons**	
On-Road Construction Trips	43,737	865,975,498	0.0051%

Notes:
1. Construction water use based on acres disturbed per day per construction sequencing and estimated water use per acre.
2. On-road mobile fuel source based on vehicle miles traveled (VMT) from CalEEMod and fleet-average fuel consumption in gallons per mile from EMFAC2021 in San Bernardino for 2023.
3. Construction fuel use was calculated based on CalEEEMod emissions outputs and conversion ratios from the Climate Registry.

Source: Refer to energy calculations in Appendix A: Energy Data.

Electricity

Water for Construction Dust Control. Electricity use associated with water use for construction dust control is calculated based on total water use and the energy intensity for supply, distribution, and treatment of water. The total number of gallons of water used is calculated based on acreage disturbed during grading and site preparation, as well as the daily watering rate per acre disturbed.

- The total acres disturbed are calculated using the methodology described in Chapter 4.2 of Appendix C of the CalEEMod User's Guide.
- The water application rate of 3,020 gallons per acre per day is from the Air and Waste Management Association's Air Pollution Engineering Manual (1992).

The energy intensity value is based on the CalEEMod default energy intensity per gallon of water for the South Coast Hydrologic Region. As summarized in Table 4, the total electricity demand associated with water use for the Project construction dust control would be approximately 0.0026 GWh over the duration of construction.

Petroleum Fuel

On-Road Diesel Construction Trips. The diesel fuel associated with on-road construction mobile trips is calculated based on vehicle miles traveled (VMT) from vehicle trips (i.e., worker, vendor, and hauling), the CalEEMod default diesel fleet percentage, and vehicle fuel efficiency in miles per gallon (MPG). VMT for the entire construction period is calculated based on the number of trips multiplied by the trip lengths for each phase shown in CalEEMod. Construction fuel was calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry. Total diesel fuel consumption associated with on-road construction trips for the Project would be approximately 37,606 gallons (see Table 4).

Off-Road Diesel Construction Equipment. Similarly, the construction diesel fuel associated with the off-road construction equipment that is calculated based on CalEEMod emissions outputs and conversion ratios from the Climate Registry. The total diesel fuel associated with the Project off-road construction equipment is approximately 91,335 gallons (see Table 4). Combined diesel usage from on-road and off-road construction sources is 128,941 gallons.

On-Road Gasoline Construction Trips. The gasoline fuel associated with on-road construction mobile trips is calculated based on VMT from vehicle trips (i.e., worker, vendor, and hauling), the CalEEMod default gasoline fleet percentage, and vehicle fuel efficiency in MPG using the same methodology as the construction on-road trip diesel fuel calculation discussed above. The total gasoline fuel associated with Project on-road construction trips would be approximately 43,737 gallons (see Table 4).

Construction Energy Use Analysis

As indicated in Table 4, Project construction electricity would represent approximately 0.00002 percent of the current electricity use in San Bernardino County. In 2023, Californians are anticipated to use approximately 14,438,550,403 gallons of gasoline and approximately 3,189,559,232 gallons of diesel fuel.[6] San Bernardino County annual gasoline fuel use in 2023 is anticipated to be 865,975,498 gallons and diesel use would be approximately 279,150,963 gallons. Total Project construction gasoline fuel would represent approximately 0.005 percent of annual gasoline used in the County, and total Project construction diesel fuel would also represent 0.046 percent of annual diesel used in the County. Total Project construction gasoline and diesel fuel would also represent less than one percent (0.0003 percent and 0.004 percent, respectively) of the State's fuel use. Based on the total Project's relatively low construction fuel use proportional to annual County use, the Project would not substantially affect existing energy fuel supplies or resources. New capacity or additional sources of construction fuel are not anticipated to be required.

SCE's total energy sales are projected to be 94,230 GWh of electricity in 2023 (the first year of Project construction).[7] The Project's construction-related net annual electricity consumption of 0.0026 GWh would represent less than one percent of SCE's projected sales. Therefore, it is anticipated that SCE's existing and planned electricity capacity and electricity supplies would be sufficient to serve the Project's

[6] California Air Resources Board, *EMFAC 2021 Emissions Inventory*. Retrieved from CARB Website: https://arb.ca.gov/emfac/emissions-inventory/0a2cdd4bc96187e60199e39957d9118bd835b622. Accessed May 1, 2023.

[7] California Energy Commission, *CED 2022 LSE and BA planning Forecast Tables,* https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2022-integrated-energy-policy-report-update-2. Accessed May 2, 2023.

temporary construction electricity demand. Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, current crude soil production would be sufficient to meet demand until 2050.[8] As such, it is expected that existing and planned transportation fuel supplies would be sufficient to serve the Project's temporary construction demand.

Furthermore, there are no unusual characteristics that would necessitate the use of construction equipment that would be less energy-efficient than at comparable construction sites in the region or state. In addition, some energy conservation would occur during construction through compliance with State requirements that equipment not in use for more than five minutes be turned off. Project construction equipment would also be required to comply with the latest EPA and CARB engine emissions standards. These engines use highly efficient combustion engines to minimize unnecessary fuel use.

The Project would have construction activities that would use energy, primarily in the form of diesel fuel (e.g., mobile construction equipment) and electricity (e.g., power tools). Contractors would be required to monitor air quality emissions of construction activities using applicable regulatory guidance such as from SCAQMD CEQA Guidelines. Additionally, construction is subject to and would comply with California regulations (e.g., California Code of Regulations, Title 13, Sections 2485 and 2449), which reduce diesel PM and criteria pollutant emissions from in-use off-road diesel-fueled vehicles and limit the idling of heavy-duty construction equipment to no more than five minutes. This requirement indirectly relates to construction energy conservation because when air pollutant emissions are reduced from the monitoring and the efficient use of equipment and materials, energy use is reduced. There are no aspects of the Project that would foreseeably result in the inefficient, wasteful, or unnecessary use of energy during construction activities.

Due to increasing transportation costs and fuel prices, contractors and owners have a strong financial incentive to avoid wasteful, inefficient, and unnecessary use of energy during construction. There is growing recognition among developers and retailers that sustainable construction is not prohibitively expensive and that there is a significant cost-savings potential in green building practices. Substantial reduction in energy inputs for construction materials can be achieved by selecting building materials composed of recycled materials that require substantially less energy to produce than non-recycled materials. The Project-related incremental increase in the use of energy bound in construction materials such as asphalt, steel, concrete, pipes, and manufactured or processed materials (e.g., lumber and gas) would not substantially increase demand for energy compared to overall local and regional demand for construction materials. It is reasonable to assume that production of building materials such as concrete, steel, etc., would employ all reasonable energy conservation practices in the interest in minimizing the costs of business.

As described above, the Project's fuel consumption and energy usage from the entire construction period would increase fuel use in the County by less than one percent. It should be noted that the State CEQA Guideline Appendix G and Appendix F criteria require the Project's effects on local and regional energy supplies and on the requirements for additional capacity to be addressed. A less than one percent increase in temporary demand is not anticipated to trigger the need for additional capacity. Project construction would have a nominal effect on the local and regional energy supplies. Additionally, use of construction fuel would be temporary and would cease once the Project is fully developed. As such, Project construction would have a nominal effect on the local and regional energy supplies.

[8] US Energy Information Administration. *California Energy Consumption Estimates*. Retrieved from EIA Website: https://www.eia.gov/state/print.php?sid=CA. Accessed May 2, 2023.

As stated above, there are no unusual characteristics that necessitate the use of construction equipment that would be less energy-efficient than at comparable construction sites in the region or state. It is expected that construction fuel use associated with the Project would not be any more inefficient, wasteful, or unnecessary than other similar development projects of this nature. Therefore, potential impacts are considered less than significant.

Operations

The energy consumption associated with Project operations would occur from building energy (electricity and natural gas) use, water use, and transportation-related fuel use. Annual energy use during Project operations is shown in Table 5: Project Annual Energy Use During Operations. It is noted that the Project's unmitigated energy consumption estimates are provided in Table 5 to provide a conservative impact analysis.

Table 5: Project Annual Energy Use During Operations

Source	Annual Operational Energy[3]	San Bernardino County Annual Energy	Percentage Increase Countywide
Electricity Use		**GWh**	
Total Electricity (Electricity Demand + Water Conveyance)	1.63	16,181	0.0101%
Natural Gas Use		**Therms**	
Area[1]	54,839	561,360,617	0.0098%
Diesel Use		**Gallons**	
Mobile[2]	193,574	280,907,070	0.0079%
Gasoline Use		**Gallons**	
Mobile[2]	64,978	853,915,250	0.0689%

Notes:
1. The electricity, natural gas, and water usage are based on Project-specific estimates and CalEEMod defaults.
2. Calculated based on the mobile source fuel based on vehicle miles traveled (VMT) and fleet-average fuel consumption (in gallons per mile) from EMFAC2021 for operational year 2024.
3. Annual Operational Energy represents the mitigated operational from CalEEMod.

Source: Refer to energy calculations in Appendix A.

Petroleum Fuel

The gasoline and diesel fuel associated with on-road vehicular trips is calculated based on total VMT calculated for the analyses within the Project's Air Quality Assessment and average fuel efficiency from the EMFAC model. The EMFAC fuel efficiency data incorporates the Pavley Clean Car Standards and the Advanced Clean Cars Program.[9] As summarized in Table 5, the total gasoline and diesel fuel associated with on-road trips would be approximately 64,978 gallons per year and 193,574 gallons per year, respectively.

[9] The CARB EMFAC 2017 Technical Documentation from March 2018 notes that emissions are estimated with all current controls active, except Low Carbon Fuel Standards (LCFS). The reason for excluding LCFS is that most of the emissions benefits due to the LCFS come from the production cycle (upstream emissions) of the fuel rather than the combustion cycle (tailpipe). As a result, LCFS is assumed to not have a significant impact on CO2 emissions from EMFAC's tailpipe emission estimates.

Electricity

The electricity use during the Project is based on CalEEMod defaults. The Project would use approximately 1.63 GWh of electricity per year (see Table 5). While the electricity associated with operational water use is estimated based on the annual water use and the energy intensity factor is the CalEEMod default energy intensity per gallon of water for San Bernardino County. Project area water use is based on the CalEEMod default rates. The Project would use approximately 66 million gallons annually of water annually which would require approximately 0.451 GWh per year for conveyance and treatment, which is 27.67 percent of the total electricity demand. Unmitigated Project electricity consumption would only increase countywide electricity use by 0.0101 percent; see Table 5.

Natural Gas

The methodology used to calculate the natural gas use associated with the Project is based on CalEEMod default rates. As shown in Table 5, unmitigated natural gas consumption from the Project would represent only 0.0098 percent increase over Countywide natural gas usage.

Operational Energy Use Analysis

Californians used 280,738.4 GWh of electricity in 2021, of which San Bernardino County used 16,180.8 GWh.[10] The Project's unmitigated operational electricity use would represent a nominal portion of electricity used in the State and Riverside County. Regarding natural gas, Californians used 11.9 billion therms of natural gas and 561.4 million terms of natural gas in San Bernardino County in 2021. The Project's unmitigated operational natural gas use would contribute to only 0.0005 percent of natural gas use in the State and 0.0098 percent in the County.

San Bernardino County's annual gasoline fuel use in 2024 is anticipated to be 853,915,250 gallons and diesel fuel is anticipated to be 280,907,070 gallons. Expected Project operational gasoline and diesel consumption would represent approximately 0.0076 percent of gasoline use and 0.0689 of diesel use in the County.

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, the global supply of crude oil, other liquid hydrocarbons, and biofuels is expected to be adequate to meet the world's demand for liquid fuels through 2050.[11]

The Project's unmitigated energy consumption represents less than one percent of energy consumption within the County. Project operations would not substantially affect existing energy or fuel supplies or resources. The Project would comply with applicable energy standards and new capacity would not be required. Impacts would be less than significant.

[11] U.S. Energy Information Administration, *International Energy Outlook 2021* IEO2021: Schedule, Focus, and Publication https://www.eia.gov/outlooks/ieo/pdf/IEO2021_Narrative.pdf. Accessed May 2, 2023.

Compliance with Energy Efficient Measures

As discussed above, California's Energy Efficiency Standards for Residential and Non-Residential Buildings create uniform building codes to reduce California's energy use and provide energy efficiency standards for residential and non-residential buildings. These standards are incorporated within the California Building Code and are expected to substantially reduce the growth in electricity and natural gas use. 2022 Title 24 standards for new residential and nonresidential buildings will focus on encouraging electric heat pump technology and use, promote electric-ready buildings to get owners to use cleaner electric heating, cooking, and vehicle charging, expanding solar photovoltaic systems and battery storage systems to reduce reliance on fossil fuel power plants.

Regarding water energy conservation, the Project would incorporate drought-tolerant landscaping throughout portions of the site. Water-efficient irrigation controls would also be used in landscaped areas. Comprehensive water conservation strategies would be developed to each respective land use as part of the Project plan development. Buildings would incorporate water-efficient fixtures and appliances, to comply with Title 24.

It should also be noted that SCE is subject to California's Renewables Portfolio Standard (RPS). The RPS requires investor-owned utilities, electric service providers, and community choice aggregators to increase total procurement from eligible renewable energy resources to 33 percent by 2020 and 50 percent by 2030. SB 100 revised the goal of the program to achieve the 50 percent renewable resources target by December 31, 2026, and to achieve a 60 percent target by December 31, 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045. Renewable energy is generally defined as energy that comes from resources which are naturally replenished within a human timescale such as sunlight, wind, tides, waves, and geothermal heat.

As discussed above, California's Energy Efficiency Standards create uniform building codes to reduce California's energy use and provide energy efficient standards for residential and non-residential buildings. These standards are incorporated within the California Building Code and are expected to substantially reduce the growth in electricity and natural gas use.

The Project's energy consumption would exceed less than one percent of the corresponding energy sources within the County. Project operations would not substantially affect existing energy or fuel supplies or resources. All Project buildings will comply with energy and fuel efficiency laws and regulations; thus, the Project would not be wasteful or inefficient. Therefore, the project would result in a less than significant impact in this regard.

Mitigation Measure: No mitigation is required.

Level of Significance: Less than significant impact.

Cumulative Impacts

Potential cumulative impacts to energy would result if the proposed Project, in combination with past, present, and future projects, would result in the wasteful or inefficient use of energy. This could result from development that would not incorporate sufficient building energy efficiency features, would not achieve building energy efficiency standards, or would result in the unnecessary use of energy during construction and/or operation.

The cumulative projects within the areas serviced by the energy service providers would be applicable to this analysis. Projects that include development of large buildings or other structures that would have the potential to consume energy in an inefficient manner would have the potential to contribute to a cumulative impact.

Construction and operations associated with implementation of the Project would result in the use of energy, but not in an inefficient or wasteful manner. The use of energy would not be substantial in comparison to statewide electricity, natural gas, gasoline, and diesel demand; refer to Table 4 and Table 5. As discussed above, the electricity used for construction would be less than that required during operation of the Project, would be temporary, and would have a minimal contribution to the Project's overall energy consumption. Construction of the Project would not typically involve the consumption of natural gas. The Project's construction electricity consumption would be negligible relative to SCE's generated electricity and electricity supplies would be sufficient to serve the Project's temporary construction electricity demand.

SCE will review the Project's estimated electricity consumption in order to ensure that the estimated power requirement would be part of the total load growth forecast for their service area and accounted for in the planned growth of the power system if the electricity demand was to increase past what the PV panels can provide. It should be noted that SCE and SoCalGas consider planned development for their service areas and are in and of themselves providing for cumulative growth. Therefore, it is likely that cumulative growth associated with the related projects is already accounted for in the planning of future supplies to cover projected demand.

SCE and SoCalGas have policies, programs, and projects in place to provide continued, adequate energy to their users, including the proposed Project. Substantial reductions to the cumulative demand for energy can result from an increased reliance on renewable energy systems (as required by the State's Renewable Portfolio Standards) and the construction of energy-efficient buildings. Cumulative projects would be subject to applicable Title 24 and CALGreen requirements similar to the Project, which includes energy efficiency standards to minimize the wasteful and inefficient use of energy.

Furthermore, transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, current crude oil production would be sufficient to meet worldwide consumption demand until 2050. As such, it is expected that existing and planned transportation fuel supplies would be sufficient to serve the Project's construction and operational demand. New capacity or supplies of energy resources would not be required. Additionally, the Project would be subject to compliance with all federal, state, and local requirements for energy efficiency. State regulations, including the Low Carbon Fuel Standard, Pavley Clean Car Standards, and Low Emission Vehicle Program, would serve to reduce the transportation fuel demand of cumulative projects.

In consideration of cumulative energy use, the Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Additionally, as discussed above, the Project would increase overall electricity and natural gas demand but would not require additional facilities other than local connections to, or undergrounding of, existing facilities in the Project vicinity. Therefore, the proposed Project's incremental demand for electricity and natural gas facilities would not be cumulatively considerable. Thus, the Project would not contribute to a cumulative impact to the wasteful or inefficient use of energy. A less than significant cumulative impact would occur.

The Project would also be required to comply with all the same applicable federal, state, and local measures aimed at reducing fossil fuel consumption and the conservation of energy. The anticipated Project impacts, in conjunction with cumulative development in the vicinity, would increase urbanization and result in increased energy use. Potential land use impacts are site-specific and require evaluation on a case-by-case basis. As noted above, the Project would not result in significant impacts to state or local plans for renewable energy or energy efficiency. Therefore, the Project and identified cumulative projects are not anticipated to result in a significant cumulative impact. Therefore, potential impacts are considered less than significant.

Preliminary Geotechnical Evaluation

July 7, 2022 Project No. 22081-01

Mr. Tyler Banton
Lovett Industrial
1730 East Holly Avenue, #808
El Segundo, California 90245

Subject: ***Preliminary Geotechnical Evaluation, Proposed Industrial Development, Northwest of the Intersection of Meines Street & Palm Avenue, Highland, California***

In accordance with your request, LGC Geotechnical, Inc. has performed a preliminary geotechnical evaluation for the proposed industrial development to be located northwest of the intersection of Meines Street and Palm Avenue in the city of Highland, California. The purpose of our study was to evaluate the existing onsite geotechnical conditions and to provide preliminary geotechnical recommendations relative to the proposed development.

Should you have any questions regarding this report, please do not hesitate to contact our office. We appreciate this opportunity to be of service.

Respectfully,

LGC Geotechnical, Inc.

Ryan L. Douglas, GE 3147
Project Engineer

Kevin B. Colson, CEG 2210
Vice President

KBC/RLD/klr

1.0 INTRODUCTION

LGC Geotechnical has performed a geotechnical evaluation for the proposed redevelopment of the site located northwest of the intersection of Meines Street and Palm Avenue in the city of Highland, California. (Figure 1). This report summarizes our findings, conclusions, and preliminary geotechnical design recommendations relative to the proposed redevelopment of the site.

1.1 Project Description and Background

The approximately 13-acre, roughly rectangular-shaped site, currently consists of multiple industrial properties. The overall site is bound in the westerly direction by similar industrial property, to the north by "City Creek" drainage channel, to the east by Palm Avenue, and to the south by Meines Street.

The site is essentially flat at an elevation of approximately 1,185 feet above mean sea level (MSL). Surface drainage on the site is very gentle from northeast to southwest. The unlined, City Creek drainage channel is located north of the site. The channel is approximately 10 feet deep with sides at approximately 5:1 (horizontal to vertical) inclinations or flatter in the vicinity of the site.

We understand that the proposed redevelopment is to include grading and construction for an approximately 282,000 square-foot, one-story, warehouse building, associated parking, drive isles, water quality systems, and appurtenant improvements.

Preliminary building (dead plus live) loads were not provided at the time of this report. However, we have estimated a maximum structural (dead plus live) column and wall load of 125 kips and 8 kips per lineal foot, respectively. A preliminary grading plan was not available at the time of this report. However, proposed grades are not anticipated to significantly change from existing.

The recommendations given in this report are based on the layout and estimated structural loads and grading information as indicated above. LGC Geotechnical should be provided with any updated project information, plans and/or any structural loads when they become available, in order to either confirm or modify the recommendations provided herein.

1.2 Subsurface Exploration

Our subsurface evaluation consisted of the excavation of nine borings (HS-1 through HS-6 & I-1 through I-3), excavated using a truck-mounted drill rig equipped with 6 and 8-inch-diameter hollow-stem augers with depths ranging from approximately 2 to 21 feet below existing grade. Auger refusal was encountered in all borings prior to the target depth, with the exception of Infiltration Borings I-1 & I-2. Additional attempts for most of the borings were made to obtain greater depths. The 8-foot and 10-foot borings for I-1 through I-3 were excavated for field percolation testing. An LGC Geotechnical representative observed the drilling operations, logged the borings, and collected soil samples for laboratory testing. Driven soil samples were collected by means of the Standard Penetration Test (SPT) and Modified California Drive (MCD) sampler. The SPT sampler (1.4-inch ID) and MCD sampler (2.4-inch ID, 3.0-inch OD) were driven using a

140-pound hammer falling 30 inches to advance the sampler a total depth of 18 inches or until refusal. Bulk samples were also collected and logged for laboratory testing at select depths. The raw blow counts for each 6-inch increment of penetration were recorded on the boring logs. After removal of the augers, caving of the boreholes was measured in select borings and is noted on the boring logs. The borings were backfilled with cuttings. At the completion of infiltration testing of I-1 through I-3, the installed pipes were removed, and the resulting voids backfilled with native soils.

The approximate locations of our subsurface explorations are provided on Figure 2. The boring logs are provided in Appendix B.

1.3 Field Percolation Testing

Field percolation tests (I-1 through I-3) were performed to approximate depths ranging from 8 to 10 feet below existing grade. The approximate locations are shown on Figure 2. The borings for the percolation tests were excavated using a drill rig equipped with 8-inch diameter hollow-stem augers.

Field percolation testing was performed in general accordance with the guidelines set forth by the County of San Bernardino (2013). For the falling head test, a 3-inch-diameter slotted PVC pipe was placed in the boreholes to a depth of approximately 8 to 10 feet below existing grade and the annulus was backfilled with gravel to the surface including placement of approximately 2 inches of gravel at the bottom of the borehole. The infiltration wells were pre-soaked per the County guidelines. Based on the County of San Bernardino methodology, the observed infiltration rate, summarized in Table 1, has normalized the three-dimensional flow that occurs within the field test to a one-dimensional flow out of the bottom of the boring. The observed infiltration rates provided below in Table 1 do not include any factor of safety.

TABLE 1

Summary of Infiltration Testing

Infiltration Test Location	Infiltration Test Approx. Depth Below Existing Grade (ft)	Observed Infiltration Rate* (inch/hour)
I-1	10.0	8.2
I-2	9.5	8.5
I-3	8.0	13.3

*Normalized to One-Dimensional Flow, does not include any Factor of Safety.

It should be emphasized that infiltration test results are only representative of the location and depth where they are performed. Varying subsurface conditions may exist outside of the test locations which could alter the calculated infiltration rates indicated above. Infiltration tests are performed using relatively clean water free of particulates, silt, etc. Please refer to Section 4.9 for subsurface water infiltration recommendations.

1.4 Laboratory Testing

Representative bulk and driven samples were obtained for laboratory testing during our field evaluation. Laboratory testing included in-situ moisture content, collapse/swell, expansion index, and corrosion (sulfate, chloride, pH and minimum resistivity). A summary of the laboratory test results are presented in Appendix C.

- Dry density of the samples collected ranged from approximately 97 pounds per cubic foot (pcf) to 118 pcf, with an average of 109 pcf. Field moisture contents ranged from approximately 1 percent to 3 percent, with an average of 2 percent.
- One Expansion Index (EI) test indicated EI value of 1, corresponding to "Very Low" expansion potential.
- Two collapse/swell tests were performed. The collapse swell results are provided in Appendix C.
- Corrosion testing indicated soluble sulfate contents less than approximately 0.01 percent, a chloride content of 220 parts per million (ppm), pH of 6.8, and a minimum resistivity of 3,398 ohm-centimeters.

Laboratory test results obtained from our field evaluation are provided in Appendix C.

2.0 GEOTECHNICAL CONDITIONS

2.1 Regional Geology

The site is located in the flood plain for the Santa Ana River. The regional geologic map of the area indicates the site is underlain by "young axial-valley deposits", including silt, sand, gravel, cobble, and boulder deposits (USGS, 2003).

USGS Bulletin 1898 (USGS, 1991) indicates that the location of the site is not a zone mapped as susceptible to liquefaction. The Geologic Hazard Overlay for the San Bernardino County Land Use Plan indicates that the site is not located in a liquefaction hazard zone, a zone of landslide susceptibility, or County designated fault zones (County, 2009). The subject site is not located within a State of California Fault Rupture Hazard Zone (CGS, 2018). There are no known active or potentially active faults mapped on the site.

2.2 Site-Specific Geology and Generalized Subsurface Conditions

Based on our review of regional geologic maps for the area of the site (USGS, 2003), the project area is mapped as being underlain by Quaternary young axial-valley deposits, which generally include sand, gravel, cobble, and boulders. These native materials are likely locally overlain by thin areas of artificial fill associated with original development of the site. For the purposes of this study, areas of artificial fill are not differentiated from the alluvial deposits.

In general, our borings indicate that the site contains primarily medium dense to very dense sands with varying amounts of silt, gravel, and cobbles to the maximum explored depth of approximately 21 feet below existing grade. Blow counts of the hollow stem borings for sandy soils are very likely impacted by the presence of gravel and cobbles. Moisture contents are generally well below optimum.

It should be noted that borings are only representative of the location and time where/when they are performed, and varying subsurface conditions may exist outside of the performed location. In addition, subsurface conditions can change over time. The soil descriptions provided above should not be construed to mean that the subsurface profile is uniform, and that soil is homogeneous within the project area. For details on the stratigraphy at the exploration locations, refer to Appendix B.

2.3 Geologic Structure

Geologic structure was not identified in the subject site geotechnical evaluation. The alluvial materials encountered are generally massive, but may include low angle bedding, dipping in a westerly direction.

2.4 Landslides

Our research and field observations do not indicate the presence of landslides on the site or in the immediate vicinity. Review of regional geologic maps of the area do not indicate the presence of known or suspected landslides in the vicinity of the site (USGS, 2003).

The Geologic Hazard Overlay for the San Bernardino County Land Use Plan indicates that the site is not located in a a zone of landslide susceptibility (County, 2009).

2.5 Groundwater

Groundwater was not encountered during our subsurface evaluation to the maximum explored depth of approximately 21 feet below existing ground surface. USGS Bulletin 1898 (USGS, 1991) indicates that the minimum historic depth to groundwater at the site is greater than 50 feet.

Review of a geotechnical evaluation report by others (SCG, 2020), for a site located approximately 0.35 miles west of the site did not encounter groundwater to the total depth evaluation of 51 feet below the ground surface.

Groundwater and/or groundwater seepage conditions may occur in the future due to changes in land use and/or following periods of heavy rain. Seasonal fluctuations of groundwater elevations should be expected over time. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present within the near-surface deposits due to local landscape irrigation or precipitation especially during rainy seasons.

2.6 Faulting

Prompted by damaging earthquakes in Northern and Southern California, State legislation and policies concerning the classification and land-use criteria associated with faults have been developed. The Alquist-Priolo Earthquake Fault Zoning Act was implemented in 1972 to prevent the construction of urban developments across the trace of active faults. California Geologic Survey Special Publication 42 was created to provide guidance for following and implementing the law requirements. Special Publication 42 was most recently revised in 2018 (CGS, 2018). According to the State Geologist, an "active" fault is defined as one which has had surface displacement within Holocene time (roughly the last 11,700 years). Regulatory Earthquake Fault Zones have been delineated to encompass traces of known, Holocene-active faults to address hazards associated with surface fault rupture within California. Where developments for human occupation are proposed within these zones, the state requires detailed fault evaluations be performed so that engineering-geologists can identify the locations of active faults and recommend setbacks from locations of possible surface fault rupture.

The subject site is not located within a State of California Fault Rupture Hazard Zone (CGS, 2018). The Geologic Hazard Overlay for the San Bernardino County Land Use Plan indicates that the site is not located in a County designated fault zone (County, 2009). There are no known active or potentially active faults mapped on the site. The possibility of damage due to ground rupture, as a result of faulting, is considered very low since active faults are not known to cross the site.

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the Southern California region, which may affect the site, include ground lurching and shallow ground rupture, soil liquefaction, dynamic settlement, seiches and tsunamis. These secondary effects of seismic shaking are a possibility throughout the Southern California region and are dependent on the distance between the site and causative fault and the onsite geology. A discussion of these secondary effects is provided in the following sections.

2.6.1 Lurching and Shallow Ground Rupture

Soil lurching refers to the rolling motion on the ground surface by the passage of seismic surface waves. Effects of this nature are not likely to be significant where the thickness of soft sediments do not vary appreciably under structures. Ground rupture due to active faulting is not likely to occur onsite due to the absence of known active fault traces. Ground cracking due to shaking from distant seismic events is not considered a significant hazard, although it is a possibility at any site.

2.6.2 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that saturated, loose near-surface cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction, depending on their plasticity and moisture content (Bray & Sancio, 2006). Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Dynamic settlement of dry loose sands can occur as the sand particles tend to settle and densify as a result of a seismic event.

USGS Bulletin 1898 (USGS, 1991) indicates that the location of the site is not a zone mapped as susceptible to liquefaction. The Geologic Hazard Overlay for the San Bernardino County Land Use Plan also indicates that the site is not located in a liquefaction hazard zone (County, 2009).

In general, the site will consist of compacted fill over medium dense to very dense alluvial soils. Due the absence of groundwater in the upper 50 feet and presence of medium dense to very dense sandy soils, the potential for liquefaction is considered very low.

2.6.3 Lateral Spreading

Lateral spreading is a type of liquefaction-induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move down-slope towards a free face (such as a river channel or an embankment). Lateral spreading may

cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the very low potential for liquefaction the potential for lateral spreading is considered very low.

2.6.4 Tsunamis and Seiches

Based on the elevation of the site, with respect to sea level, there is a low possibility of damage to the site during a large tsunami event.

2.7 Seismic Design Parameters

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2019 California Building Code (CBC) and applicable portions of ASCE 7-16 which has been adopted by the CBC. Please note that the following seismic parameters are only applicable for code-based acceleration response spectra and are not applicable for where site-specific ground motion procedures are required by ASCE 7-16. Representative site coordinates of latitude 34.1099 degrees north and longitude -117.2091 degrees west were utilized in our analyses. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class C are provided in Table 2 on the following page. The structural designer should contact the geotechnical consultant if structural conditions (e.g., number of stories, seismically isolated structures, etc.) require site-specific ground motions.

TABLE 2

Seismic Design Parameters

Selected Parameters from 2019 CBC, Section 1613 - Earthquake Loads	**Seismic Design Values**	**Notes/Exceptions**
Distance to applicable faults classifies the site as a "Near-Fault" site.		Section 11.4.1 of ASCE 7
Site Class	C	Chapter 20 of ASCE 7
Ss (Risk-Targeted Spectral Acceleration for Short Periods)	2.403g	From SEAOC, 2022
S_1 (Risk-Targeted Spectral Accelerations for 1-Second Periods)	0.896g	From SEAOC, 2022
F_a (per Table 1613.2.3(1))	1.2	For Simplified Design Procedure of Section 12.14 of ASCE 7, F_a shall be taken as 1.4 (Section 12.14.8.1)
F_v (per Table 1613.2.3(2))	1.4	-
S_{MS} for Site Class C [Note: $S_{MS} = F_aS_S$]	2.884g	-
S_{M1} for Site Class C [Note: $S_{M1} = F_vS_1$]	1.255g	-
S_{DS} for Site Class C [Note: $S_{DS} = (^2/_3) S_{MS}$]	1.923g	-
S_{D1} for Site Class C [Note: $S_{D1} = (^2/_3) S_{M1}$]	0.837g	-
C_{RS} (Mapped Risk Coefficient at 0.2 sec)	0.913	ASCE 7 Chapter 22
C_{R1}(Mapped Risk Coefficient at 1 sec)	0.889	ASCE 7 Chapter 22

A deaggregation of the PGA based on a 2,475-year average return period (MCE) indicates that an earthquake magnitude of 7.27 at a distance of approximately 4.85 km from the site would contribute the most to this ground motion. A deaggregation of the PGA based on a 475-year average return period (Design Earthquake) indicates that an earthquake magnitude of 7.11 at a distance of approximately 5.58 km from the site would contribute the most to this ground motion (USGS, 2014).

Section 1803.5.12 of the 2019 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 1.188g (SEAOC, 2022). The design PGA is equal to 0.792g (2/3 of PGA_M).

2.8 Rippability

Excavation for grading should be achievable with the appropriate heavy earthwork equipment. Excavation difficulty may be encountered with light-duty equipment or hand excavation for deep, narrow excavations (trenches and drilled piles) due to cobbles and possible oversized material.

2.9 Oversized Material

Generation of a surplus of oversized material (material greater than 8 inches in maximum dimension) should be expected in the areas of abundant cobbles which may not be suitable for reuse in site fill, trench backfill, and retaining wall backfill. The need to "screen" onsite soils should be anticipated. Cobbles were observed and encountered, and boulder size material may also be present.

If feasible, crushing oversized materials onsite or exporting oversized materials may be considered. Incorporating oversized materials into "rock fills" (windrows, rock blankets or individual rock burial) is likely not feasible due to the limited depth of grading. Special handling recommendations should be provided on a case-by-case basis, if necessary. Recommendations are provided for appropriate handling of oversized materials in Appendix E.

3.0 FINDINGS AND CONCLUSIONS

Based on the results of our geotechnical evaluation, it is our opinion that the proposed site development is feasible from a geotechnical standpoint, provided the following conclusions and recommendations are incorporated into the site design, grading, and construction.

The following is a summary of the primary geotechnical factors, which may affect future development of the site.

- In general, our borings indicate that the site contains primarily dense sands with varying amounts of silt, gravel and cobble to the maximum explored depth of approximately 21 feet below existing grade. Moisture contents are generally well below optimum.
- Groundwater was not encountered to the maximum explored depth of approximately 21 feet below existing ground surface. Historic high groundwater is deeper than 50 feet below existing grade (USGS, 1991).
- The proposed development will likely be subjected to strong seismic ground shaking during its design life from one of the regional faults. The subject site is not located within an Alquist-Priolo Earthquake Fault Zone or County designated fault zone and no faults were identified on the site during our site evaluation.
- The site is not located in a seismic hazard zone for liquefaction potential. The site will consist of compacted fill over existing medium dense to very dense native soils. Due to the absence of groundwater the potential for liquefaction is considered very low.
- Soils exposed at the proposed foundation level are anticipated to have a "Very Low" expansion potential (EI not exceeding 20). This shall be confirmed at the completion of site earthwork.
- From a geotechnical perspective, the existing onsite soils are suitable material for use as general fill, provided that they are relatively free from rocks (larger than 8 inches in maximum dimension), construction debris, and significant organic material.
- Excavation for grading should be achievable with the appropriate equipment. Excavation difficulty may be encountered with light-duty equipment or hand excavation for deep, narrow excavations (trenches and drilled piles) due to oversized material. Caving of excavations due to friable sands should also be anticipated.
- Generation of a surplus of over-sized material, that may not be suitable for reuse in site fills, trench backfill, and retaining wall backfill should be expected. The need to "screen" onsite soils in order to remove over-sized materials should be anticipated.
- If feasible, crushing oversized materials onsite or exporting oversized materials may be considered. Incorporating oversized materials into "rock fills" (windrows, rock blankets or individual rock burial) is likely not feasible due to the limited depth of grading. Trench excavations should also be expected to have irregular sides and bottoms due to "plucking" of cobbles during excavation.
- On-site soils will most likely be suitable for backfill of site retaining walls provided the soils are screened of materials larger than 3 inches in maximum dimension.
- Field testing resulted in measured infiltration rates ranging from 8.2 to 13.3 inches per hour. The measured infiltration rates do not include a factor of safety. Discussion regarding infiltration is provided in Section 4.9.

4.0 RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the City. It is the responsibility of the builder to ensure these recommendations are provided to the appropriate parties.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2019 California Building Code (CBC) requirements. With regard to the potential occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed development to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "the level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvement may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed development, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that although our recommendations are intended to maintain the structural integrity of the proposed development and structures given the site geotechnical conditions, they cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual exposed conditions.

4.1 Site Earthwork

We anticipate that earthwork at the site will consist of required earthwork removals, foundation construction and utility line construction and backfill. We recommend that earthwork onsite be performed in accordance with the following recommendations, 2019 CBC/ City of Highland and the General Earthwork and Grading Specifications included in Appendix E. In case of conflict, the following recommendations shall supersede previous recommendations and those included as part of Appendix E.

4.1.1 Site Preparation

Prior to grading of areas to receive structural fill, engineered structures or improvements, the existing structures and improvements should be demolished, and the area should be cleared of existing vegetation, surface obstructions, existing debris and potentially compressible or otherwise unsuitable material. Debris should be removed and properly disposed of off-site. Holes resulting from the removal of buried obstructions, which extend below proposed removal bottoms, should be replaced with suitable compacted fill material. Any abandoned utility lines should be completely removed and replaced with

properly compacted fill. Deeper demolition may be required in order to remove existing foundations. We recommend the trenches associated with demolition which extend below the remedial grading depth be backfilled and properly compacted prior to the demolition contractor leaving the site.

If cesspools or septic systems are encountered they should be removed in their entirety. The resulting excavation should be backfilled with properly compacted fill soils. As an alternative, cesspools can be backfilled with lean sand-cement slurry. Any encountered wells should be properly abandoned in accordance with regulatory requirements. At the conclusion of the clearing operations, a representative of LGC Geotechnical should observe and accept the site prior to further grading.

4.1.2 Removal Depths and Limits

Building Structures: In order to provide a relatively uniform bearing condition for the planned structural improvements, removals should extend a minimum depth of 5 feet below existing grade or 2 feet below the proposed footings, whichever is greater. In general, the envelope for removals should extend laterally a minimum horizontal distance of 5 feet beyond the edges of the proposed building footprint.

Retaining/Free-Standing Wall Structures: Removals should extend a minimum of 3 feet below existing grade, or 1-foot below proposed footings, whichever is greater. Where space is available, the envelope for removal and recompaction should extend laterally a minimum distance of 3 feet beyond the edges of the proposed minor site structure improvements.

Pavement and Hardscape Areas: Removals should extend to a depth of at least 2 feet below the existing grade. Removals in any design cut areas of the pavement may be reduced by the depth of the design cut but should not be less than 1-foot below the finished subgrade (i.e., below planned aggregate base/asphalt concrete). In general, the envelope for removals should extend laterally a minimum lateral distance of 2 feet beyond the edges of the proposed improvements.

Local conditions may be encountered during excavation that could require additional over-excavation beyond the above-noted minimum in order to obtain an acceptable subgrade including localized areas of undocumented fill. The actual depths and lateral extents of grading will be determined by the geotechnical consultant, based on subsurface conditions encountered during grading. Removal areas should be accurately staked in the field by the Project Surveyor.

4.1.3 Temporary Excavations

Temporary excavations should be performed in accordance with project plans, specifications, and all Occupational Safety and Health Administration (OSHA) requirements. In general, interior non-property line temporary slopes up to 10 feet in height should be sloped back to a maximum slope ratio of 1.5:1 (horizonal to vertical) or flatter. Temporary slopes excavated near existing temporary shoring may reduce the

stability of temporary shoring, if proposed this should be evaluated on a case-by-case basis. The temporary slope should not include a vertical cut. Prolonged exposure of backcut slopes during construction may result in localized slope instability. Sandy soils are present and should be considered susceptible to caving. Raveling of the sandy soils should be anticipated for temporary slopes. Flatter slope inclinations should be considered if raveling cannot be tolerated. The exposed slope surface may be kept surficially moist (but not saturated) during construction to reduce (not eliminate) potential sloughing. Soil conditions should be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Close coordination with the geotechnical consultant should be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor.

Surcharge loads (e.g., soil stockpiles, construction equipment, etc.) placed on top of the excavation/temporary slope should not be permitted within a horizontal distance equal to the height of the excavation/temporary slope from the top of the excavation or 5 feet from the top of the slope, whichever is greater, unless the cut is properly shored and designed for the applicable surcharge load. In general, any excavation that extends below a 1:1 (horizontal to vertical) projection of an existing foundation will remove existing support of the structure foundation. Once an excavation has been initiated, it should be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations should be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain.

It should be noted that any excavation that extends below a 1:1 (horizontal to vertical) projection of an existing foundation will remove existing support of the structure foundation. If requested, temporary shoring parameters can be provided.

4.1.4 Removal Bottoms and Subgrade Preparation

In general, removal bottom areas and any areas to receive compacted fill should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition, and re-compacted per project recommendations.

Removal bottoms and areas to receive fill should be observed and accepted by the geotechnical consultant prior to subsequent fill placement.

4.1.5 Material for Fill

From a geotechnical perspective, the onsite soils are generally considered suitable for use as general compacted fill (i.e., non-retaining wall backfill), provided they are screened of organic materials, construction debris and any oversized material (8 inches in greatest dimension). Moisture conditioning of site soils should be anticipated as outlined in the section below.

Any required retaining wall backfill should consist of sandy soils with a maximum of 35 percent fines (passing the No. 200 sieve) per American Society for Testing and Materials (ASTM) Test Method D1140 (or ASTM D6913/D422) and a Very Low expansion potential (EI of 20 or less per ASTM D4829). Soils should also be screened of organic materials, construction debris and any material greater than 3 inches in maximum dimension. The site may contain soils that are not suitable for retaining wall backfill due to oversize material and fines content, therefore select grading, stockpiling, and screening and/or import may be required by the contractor for obtaining suitable retaining wall backfill soil.

From a geotechnical viewpoint, any required import soils should consist of clean, relatively granular soils of Very Low expansion potential (expansion index 20 or less based on ASTM D4829) and no particles larger than 4 inches in greatest dimension. Source samples of planned importation should be provided to the geotechnical consultant for laboratory testing a minimum of 3 working days prior to any planned importation for required laboratory testing.

Aggregate base (crushed aggregate base or crushed miscellaneous base) should conform to the requirements of Section 200-2 of the Standard Specifications for Public Works Construction ("Greenbook") for untreated base materials (except processed miscellaneous base) or Caltrans Class 2 aggregate base. Crushed aggregate base, crushed miscellaneous base and Caltrans Class 2 aggregate base are acceptable for pavement sections.

4.1.6 Fill Placement and Compaction

Material to be placed as fill should be brought to near-optimum moisture content (generally at about 2 percent above optimum moisture content) and recompacted to at least 90 percent relative compaction (per ASTM D1557). Significant moisture conditioning of site soils should be anticipated in order to achieve the required degree of compaction. In general, soils will require additional moisture conditioning in order to achieve the required compaction. Drying and/or mixing of very moist soils may also be required prior to reusing the materials in compacted fills. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in compacted thickness. Each lift should be thoroughly compacted and accepted prior to subsequent lifts. Generally, placement and compaction of fill should be performed in accordance with local grading ordinances and with observation and testing by the geotechnical consultant. Oversized material as previously defined should be removed from site fills.

Fill placed on any slopes greater than 5:1 (horizontal to vertical) should be properly keyed and benched into firm and competent soils as it is placed in lifts.

Aggregate base material should be compacted to a minimum of 95 percent relative compaction at or slightly above-optimum moisture content per ASTM D1557. Subgrade below aggregate base should be compacted to a minimum of 90 percent relative compaction per ASTM D1557 at or slightly above-optimum moisture content.

If gap-graded ¾-inch rock is used for backfill (around storm drain storage chambers, retaining wall backfill, etc.) it will require compaction. Rock shall be placed in thin lifts (typically not exceeding 6 inches) and mechanically compacted with observation by geotechnical consultant. Backfill rock shall meet the requirements of ASTM D2321. Gap-graded rock is required to be wrapped in filter fabric to prevent the migration of fines into the rock backfill.

4.1.7 Trench and Retaining Wall Backfill and Compaction

Bedding material used within the pipe zone should conform to the requirements of the current Greenbook and the pipe manufacturer. Where applicable, sand having a sand equivalent (SE) of 20 or greater (per Caltrans Test Method [CTM] 217) may be used to bed and shade the pipes within the bedding zone. Sand backfill should be densified by jetting or flooding and then tamped to ensure adequate compaction. Bedding sand should be from a natural source, manufactured sand from recycled material is not suitable for jetting. The onsite soils may generally be considered suitable as trench backfill (zone defined as 12 inches above the pipe to subgrade), provided the soils are screened of rocks greater than 6 inches in maximum dimension, construction debris and organic material. Trench backfill should be compacted in uniform lifts (as outlined above in Section "Material for Fill") by mechanical means to at least 90 percent relative compaction (per ASTM D1557). If gap-graded rock is used for trench backfill, refer to above Section 4.1.6.

In backfill areas where mechanical compaction of soil backfill is impractical due to space constraints, flowable fill such as sand-cement slurry may be substituted for compacted backfill. The slurry should contain about one sack of cement per cubic yard. When set, such a mix typically has the consistency of compacted soil. Sand cement slurry placed near the surface within landscape areas should be evaluated for potential impacts on planned improvements.

Any required retaining wall backfill should consist of predominately granular, sandy soils outlined in Section 4.1.5. The limits of select sandy backfill should extend at minimum ½ the height of the retaining wall or the width of the heel (if applicable), whichever is greater (Refer to Figure 3). Retaining wall backfill soils should be compacted in relatively uniform thin lifts to a minimum of 90 percent relative compaction (per ASTM D1557). Jetting or flooding of retaining wall backfill materials should not be permitted. If gap-graded rock is used for retaining wall backfill, refer to above Section 4.1.6.

A representative from LGC Geotechnical should observe, probe, and test the backfill to verify compliance with the project recommendations.

4.2 Preliminary Foundation Recommendations

The proposed structure may be supported on spread or continuous footings and conventional slabs, provided earthwork is performed in accordance with the recommendations presented in this report. Since the site soils are anticipated to be "Very Low" expansion potential (EI of 20 or less per ASTM D4829), special design considerations from a geotechnical perspective are not anticipated, however, this must be verified based on as-graded conditions. Footings should be

supported on properly compacted fill. Please note that the following foundation recommendations are preliminary and must be confirmed by LGC Geotechnical at the completion of grading.

Preliminary foundation recommendations are provided in the following sections. The foundation design must be performed by the structural engineer based on the following geotechnical parameters and minimum values provided.

4.2.1 Slab Design and Construction

From a geotechnical perspective, minimum slab thicknesses of 6 inches and 4 inches are recommended for new slabs in the warehouse areas and office areas, respectively. Slabs are to be supported on compacted fill soils properly prepared in accordance with the recommendations provided in this report. Actual slab reinforcement and thickness should be determined by the structural engineer based on the imposed loading. Additional slab-on-grade recommendations can be provided for alternative building types upon request.

The foundation designer may use a modulus of vertical subgrade reaction (k) of 200 pounds per cubic inch (pounds per square inch per inch of deflection). This value is for a 1-foot by 1-foot square loaded area and should be adjusted by the structural designer for the area of the proposed footing using the following formula:

$k = 200 \times [(B+1)/2B]^2$
k = modulus of vertical subgrade reaction, pounds per cubic inch (pci)
B = foundation width (feet)

It is recommended that subgrade soils below slabs be moisture conditioned in order to maintain the recommended moisture content up to the time of concrete placement. The recommended moisture content of the slab subgrade soils should be between optimum moisture content and approximately 2 percent above optimum moisture content to a minimum depth of 12 inches. The moisture content of the slab subgrade should be verified by the geotechnical consultant within 1 to 2 days prior to concrete placement. In addition, this moisture content should be maintained around the immediate perimeter of the slab during construction and up to occupancy of the building structures.

The following recommendations are for informational purposes only, as they are unrelated to the geotechnical performance of the foundation. The following recommendations may be superseded by the foundation engineer and/or owner. Some post-construction moisture migration should be expected below the foundation. In general, interior floor slabs with moisture sensitive floor coverings should be underlain by a minimum 10 mil thick polyolefin material vapor retarder, which has a water vapor transmission rate (permeance) of less than 0.03 perms. The need for sand and/or the sand thickness (above and/or below the vapor retarder) should be specified by the structural engineer, architect or concrete contactor. The selection and thickness of sand is not a geotechnical engineering issue and is therefore outside our purview.

4.2.2 Foundation Design Parameters

For the proposed industrial warehouse structures, minimum continuous wall and column footing widths should be 12 inches and 24 inches, respectively, minimum exterior foundation embedment should extend a minimum of 18 inches below the adjacent exterior grade, and interior column footings should be embedded a minimum of 12 inches beneath the adjacent subgrade. The following allowable bearing pressures for both continuous and column spread footings presented in Table 3 below are recommended for corresponding footing widths and embedments.

TABLE 3

Allowable Soil Bearing Pressures

Allowable Static Bearing Pressure (psf)	Minimum Footing Width (feet)	Minimum Footing Embedment* (feet)
3,500	4	2
3,000	3	2
2,500	2	1.5
2,000	1	1.5

* Refers to minimum depth measured below lowest adjacent grade.

These allowable bearing values indicated above (exclusive of the weight of the footings) are for total dead loads and frequently applied live loads and may be increased by ⅓ for short duration loading (i.e., wind or seismic loads). The allowable bearing pressures are applicable for level (ground slope equal to or flatter than 5H:1V) conditions only.

In utilizing the above-mentioned allowable bearing capacity and provided our earthwork recommendations are implemented, foundation settlement due to structural loads is anticipated to be on the order of 1-inch. Differential static settlement may be taken as half of the static settlement (i.e., ½-inch over a horizontal span of 40 feet).

4.2.3 Foundation Construction

The foundation is to be excavated into competent compacted artificial fill placed during grading operations. It is recommended that the foundation subgrade soils be evaluated by the geotechnical engineer prior to steel and/or concrete placement.

The geotechnical parameters provided herein assume that if the areas adjacent to the foundations are planted and irrigated, these areas will be designed with proper drainage and adequately maintained so that ponding, which causes significant moisture changes below the foundation, does not occur. Our recommendations do not account for excessive irrigation and/or incorrect landscape design. Plants should only be provided with sufficient irrigation for life and not overwatered to saturate subgrade soils. Sunken

planters placed adjacent to the foundation should either be designed with an efficient drainage system or liners to prevent moisture infiltration below the foundation.

4.2.4 Lateral Load Resistance

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. For concrete/soil frictional resistance, an allowable coefficient of friction of 0.35 may be assumed with dead-load forces. An allowable passive lateral earth pressure of 250 psf per foot of depth (or pcf) to a maximum of 2,500 psf may be used for the sides of footings poured against properly compacted fill. Allowable passive pressure may be increased to 340 pcf (maximum of 3,400 psf) for short duration seismic loading. This passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions. Frictional resistance and passive pressure may be used in combination without reduction. We recommend that the upper foot of passive resistance be neglected if finished grade will not be covered with concrete or asphalt. The provided allowable passive pressures are based on a factor of safety of 1.5 and 1.1 for static and seismic loading conditions, respectively.

4.3 Lateral Earth Pressures for Retaining Wall Design

Lateral earth pressures are provided as equivalent fluid unit weights, in pound per square foot (psf) per foot of depth or pcf. A soil unit weight of 125 pcf may be assumed for calculating the actual weight of soil over the wall footing.

The following lateral earth pressures are presented on Table 4 below for design of site retaining walls backfilled with approved select sandy soils with a maximum of 35 percent fines (passing the No. 200 sieve per ASTM D1140) and a Very Low expansion potential (EI of 20 or less per ASTM D4829). The site may contain soils that are not suitable for retaining wall backfill due to oversize material and fines content, therefore select grading, stockpiling, and screening and/or import may be required by the contractor for obtaining suitable retaining wall backfill soil.

TABLE 4

Lateral Earth Pressures – Approved Sandy Backfill

Conditions	**Equivalent Fluid Unit Weight (pcf)**	**Equivalent Fluid Unit Weight (pcf)**
	Level Backfill	**2:1 Sloped Backfill**
	Approved Sandy Soils	**Approved Sandy Soils**
Active	35	55
At-Rest	55	70

If the wall can yield enough to mobilize the full shear strength of the soil, it can be designed for

"active" pressure. If the wall cannot yield under the applied load, the earth pressure will be higher. The equivalent fluid pressure values assume free-draining conditions. Retaining wall structures should be provided with appropriate drainage and appropriately waterproofed (Refer to Figure 3). Please note that waterproofing and outlet systems are not the purview of the geotechnical consultant. If conditions other than those assumed above are anticipated, the equivalent fluid pressure values should be provided on an individual-case basis by the geotechnical consultant.

Surcharge loading effects from any adjacent structures should be evaluated by the retaining wall designer. In general, structural loads within a 1:1 (horizontal to vertical) upward projection from the bottom of the proposed retaining wall footing will surcharge the proposed retaining structure. In addition to the recommended earth pressure, retaining walls adjacent to streets should be designed to resist vehicular traffic if applicable. Uniform surcharges may be estimated using the applicable coefficient of lateral earth pressure using a rectangular distribution. A factor of 0.35 and 0.5 may be used for the active and at-rest conditions, respectively. The vertical traffic surcharge may be determined by the structural designer. The retaining wall designer should contact the geotechnical engineer for any required geotechnical input in estimating any applicable surcharge loads.

If required, the retaining wall designer may use a seismic lateral earth pressure increment of 15 pcf for a level backfill condition. This increment should be applied in addition to the provided static lateral earth pressure using a "normal" triangular distribution with the resultant acting at H/3 in relation to the base of the retaining structure (where H is the retained height). For the restrained, at-rest condition, the seismic increment may be added to the applicable active lateral earth pressure (in lieu of the at-rest lateral earth pressure) when analyzing short duration seismic loading. Per Section 1803.5.12 of the 2019 CBC, the seismic lateral earth pressure is applicable to structures assigned to Seismic Design Category D through F for retaining wall structures supporting more than 6 feet of backfill height. This seismic lateral earth pressure is estimated using the procedure outlined by the Structural Engineers Association of California (Lew, et al, 2010).

Soil bearing and lateral resistance (friction coefficient and passive resistance) are provided in Section 4.2. Earthwork considerations (temporary backcuts, backfill, compaction, etc.) for retaining walls are provided in Section 4.1 (Site Earthwork) and the subsequent earthwork related sub-sections.

4.4 Soil Corrosivity

Although not corrosion engineers (LGC Geotechnical is not a corrosion consultant), several governing agencies in Southern California require the geotechnical consultant to determine the corrosion potential of soils to buried concrete and metal facilities. We therefore present the results of our testing with regard to corrosion for the use of the client and other consultants, as they determine necessary.

Corrosion testing indicated soluble sulfate contents less than approximately 0.01 percent, a chloride content of 220 parts per million (ppm), pH of 6.82, and a minimum resistivity of 3,398 ohm-centimeters. Based on Caltrans Corrosion Guidelines (2021), soils are considered corrosive if the pH is 5.5 or less, or the chloride concentration is 500 ppm or greater, or the

sulfate concentration is 1,500 ppm (0.15 percent) or greater. Based on the test results, soils are not considered corrosive using Caltrans criteria.

Based on laboratory sulfate test results, the near surface soils are designated to a class "S0" per ACI 318, Table 19.3.1.1 with respect to sulfates. Concrete in direct contact with the onsite soils can be designed according to ACI 318, Table 19.3.2.1 using the "S0" sulfate classification.

Laboratory testing may need to be performed at the completion of grading by the project corrosion engineer to further evaluate the as-graded soil corrosivity characteristics. Accordingly, revision of the corrosion potential may be needed, should future test results differ substantially from the conditions reported herein. The client and/or other members of the development team should consider this during the design and planning phase of the project and formulate an appropriate course of action.

4.5 Preliminary Asphalt Concrete Pavement Sections

The following preliminary minimum asphalt concrete (AC) pavement sections are provided in Table 5 based on an assumed R-value of 40. These recommendations must be confirmed with R-value testing of representative near-surface soils at the completion of grading and after underground utilities have been installed and backfilled. Determination of the Traffic Index (TI) is not the purview of the geotechnical consultant. Final pavement sections should be confirmed by the project civil/transportation engineer based upon the final design Traffic Index. If requested, LGC Geotechnical will provide sections for alternate TI values.

TABLE 5

Preliminary Asphalt Concrete Pavement Section Options

Pavement Area	Assumed Traffic Index	Section Thickness (inches)	
		Asphalt Concrete	Aggregate Base
Auto Parking	5.0	4.0	4.0
Circulation Drives (little to no truck traffic)	6.0	4.0	5.0
Truck Driveways (limited truck traffic)	7.0	4.0	7.0

The thicknesses shown are for minimum thicknesses. Increasing the thickness of any or all of the above layers will reduce the likelihood of the pavement experiencing distress during its service life. The above recommendations are based on the assumption that proper maintenance and irrigation of the areas adjacent to the roadway will occur through the design life of the pavement. Failure to maintain a proper maintenance and/or irrigation program may jeopardize the integrity of the pavement.

Earthwork recommendations regarding aggregate base and subgrade are provided in the previous section "Site Earthwork" and the related sub-sections of this report.

4.6 Preliminary Portland Cement Concrete Pavement Sections

For the purposes of these preliminary recommendations, we assumed an R-value of 40. Preliminary minimum Portland Cement Concrete (PCC) pavement street sections are provided in Table 6 for Traffic Indices of 5.0 (or less), 6.0, and 7.0 and may be utilized in the design of the truck parking/circulation areas or loading docks. These recommendations must be confirmed with R-value testing of representative near-surface soils at the completion of grading and after underground utilities have been installed and backfilled. Final street sections should be confirmed by the project civil engineer based upon the projected design Traffic Index. If requested, LGC Geotechnical will provide sections for alternate TI values. The appropriate paving section must be selected by the project civil engineer/client based on design traffic indexes.

TABLE 6

Preliminary PCC Pavement Sections

Provided Traffic Index	5.0 (or less)	6.0	7.0
Assumed Pavement Area	Auto Parking	Circulation Drives (little to no truck traffic)	Truck Driveways (limited truck traffic)
R -Value Subgrade	40	40	40
PCC Thickness	5.0 inches	6.0 inches	7.0 inches
95% Compacted Subgrade	12.0 inches	12.0 inches	12.0 inches

For preliminary planning purposes, the PCC pavement sections may consist of a minimum of concrete over subgrade soils compacted to 95 percent relative compaction (see Table 6 for section thicknesses). The concrete should have a minimum compressive strength of 3,250 psi and a minimum flexural strength of 505 psi at the time the pavement is subjected to traffic. Steel reinforcement is not required (ACI, 2017). The provided pavement sections assume that edge restraints like a curb and gutter will be provided. To reduce the potential (but not eliminate) for cracking, paving should provide control joints at regular intervals in each direction. The maximum joint spacing within all PCC pavements is recommended to be equal to or less than 30 times the pavement thickness; however, we recommend joint spacing not exceed 15 feet in each direction. Joints should be a depth of 1/3 of the concrete thickness. Decreasing the spacing of these joints will further reduce, but not eliminate the potential for unsightly cracking.

If semi-trailers are to be disconnected from the tractors from dolly jacks the design should consider concentrated loads imposed on the concrete pavement. These loads typically exceed the axle loads of the semi-trailer combination and are applied to smaller contact areas, especially if applied near joint locations. If these irregular loadings are confined to specific areas of the site, the pavement section required thickness can be economized. These and other factors (e.g., traffic patterns, irregular loading, doweled vs un-doweled joints, etc.) outlined in ACI, 2017 should be addressed for the final design.

The thicknesses shown are minimum thicknesses. Increasing the thickness of any or all of the above layers will reduce the likelihood of the pavement experiencing distress during its service life. The above recommendations are based on the assumption that proper maintenance and irrigation of the areas adjacent to the roadway will occur through the design life of the

pavement. Failure to maintain a proper maintenance and/or irrigation program may jeopardize the integrity of the pavement.

Subgrade below the PCC pavement should be compacted to a minimum of 95 percent relative compaction per ASTM D1557 near optimum moisture content (generally within optimum and 2 percent above optimum moisture content). Earthwork recommendations are provided in Section 4.1 "Site Earthwork" and the related sub-sections of this report.

4.7 Nonstructural Concrete Flatwork

Nonstructural concrete (such as flatwork, sidewalks, etc.) has a potential for cracking due to changes in soil volume related to soil-moisture fluctuations. To reduce the potential for excessive cracking and lifting, concrete should be designed in accordance with the minimum guidelines outlined below. These guidelines will reduce the potential for irregular cracking and promote cracking along construction joints but will not eliminate all cracking or lifting. Thickening the concrete and/or adding additional reinforcement will further reduce cosmetic distress.

Nonstructural and non-vehicular concrete flatwork placed on compacted subgrade may be a minimum 4-inches in thickness with crack control joints spaced 8 feet apart for flatwork slabs and 6 feet apart for flatwork sidewalks. Crack control joints should be sawcut or deep open tool joint to a minimum of 1/3 the concrete thickness. The compacted subgrade below the nonstructural and non-vehicular concrete flatwork should be wet down prior to placing concrete.

To reduce the potential for nonstructural concrete flatwork to separate from entryways and doorways, the owner may elect to install dowels to tie these two elements together.

4.8 Control of Surface Water and Drainage Control

From a geotechnical perspective, we recommend that compacted finished grade soils adjacent to proposed structures be sloped away from the proposed structures and towards an approved drainage device or unobstructed swale. If required, drainage swales, wherever feasible, should not be constructed within 5 feet of buildings. Where lot and building geometry necessitates that drainage swales be routed closer than 5 feet to structural foundations, we recommend the use of area drains together with drainage swales. Drainage swales used in conjunction with area drains should be designed by the project civil engineer so that a properly constructed and maintained system will prevent ponding within 5 feet of the foundation. Code compliance of grades is not the purview of the geotechnical consultant.

Planters with open bottoms adjacent to buildings should be avoided. Planters should not be designed adjacent to buildings unless provisions for drainage, such as catch basins, liners, and/or area drains, are made. Overwatering must be avoided.

4.9 Subsurface Water Infiltration

Recent regulatory changes have occurred that mandate that storm water be infiltrated below grade rather than collected in a conventional storm drain system. It should be noted that collecting and concentrating surface water for the purpose of intentionally infiltrating it below grade, conflicts with the geotechnical engineering objective of directing surface water away from slopes, structures and other improvements. The geotechnical stability and integrity of a site is reliant upon appropriately handling surface water. In general, we do not recommend that surface water be intentionally infiltrated into the subsurface soils.

If it is determined that water must be infiltrated due to regulatory requirements, we recommend the absolute minimum amount of water be infiltrated and that the infiltration areas not be located near slopes or near settlement sensitive existing/proposed improvements. Contamination and environmental suitability of the site for infiltration is not the purview of the geotechnical consultant and should be evaluated by others. LGC Geotechnical only addressed the geotechnical issues associated with stormwater infiltration.

As with all systems that are designed to concentrate surface flow and direct the water into the subsurface soils, some minor settlement, nuisance type localized saturation and/or other water related issues should be expected. Due to variability in geologic and hydraulic conductivity characteristics, these effects may be experienced at the onsite location and/or potentially at other locations well beyond the physical limits of the subject site. Infiltrated water may enter underground utility pipe zones or flow along heterogeneous soil layers or geologic structure and migrate laterally impacting other improvements which may be located far away or at an elevation much different than the infiltration source.

Based on the results of our field infiltration testing the measured 1-D infiltration rates for I-1, I-2, and I-3 (not including required factors of safety for design) were 8.2, 8.5, and 13.3 inches per hour, respectively. The design infiltration rate shall be determined by dividing the measured infiltration by a series of safety factors for site suitability and design considerations that are the purview of both the geotechnical consultant and designer of the infiltration system (County of San Bernardino, 2013). The recommended geotechnical factors of safety that are to be used to determine the design infiltration rate are provided in Table 7 on the following page.

TABLE 7

Geotechnical Factors of Safety for Design Infiltration Rate

A: Site Suitability Considerations (From Table VII.3)	
Consideration	**Factor of Safety (F.S.)**
Soil Assessment Methods	2
Texture Class	1
Site Soil Variability	2
Depth to Groundwater/Impervious Layer	1
Calculated Suitability Assessment Factor of Safety	**1.5**
B: Design Related Considerations (From Table VII.4)	
Consideration	**Factor of Safety (F.S.)**
Tributary Size Area	Per Infiltration Designer
Level of Pretreatment	Per Infiltration Designer
Redundancy of Treatment	Per Infiltration Designer
Compaction during Construction	2
Calculated Design Factor of Safety	Per Infiltration Designer
Combined F.S.= Suitability F.S x Design F.S.	**TBD**

The factor of safety used to determine the design infiltration rate is determined by multiplying the calculated suitability assessment factor of safety of 1.50 by the design factor of safety which is to be determined by the infiltration system designer. The design infiltration rate is thereby equal to the Measured Infiltration Rate provided in Table 1 (inches per hour) divided by the product of 1.50 times the calculated design factor of safety. The combined factor of safety must be a minimum of 2.0 but need not exceed 9.0.

Please note that the infiltration values reported herein are for native materials only and are not for compacted fill. Water discharge from any infiltration systems should not occur within the zone of influence of foundation footings (column and load bearing wall locations). For preliminary purposes we recommend a minimum setback of 15 feet from the structural improvements. Infiltration shall not be permitted directly on or into compacted fill soils. The infiltration values provided are based on clean water and this requires the removal of trash, debris, soil particles, etc., and on-going maintenance. Over time, siltation, plugging and clogging of the system may reduce the infiltration rate and subsequently reduce the effectiveness of the infiltration system. Any designed infiltration system will require routine periodic maintenance. It should be noted that methods to prevent this shall be the sole responsibility of the infiltration designer and are not the purview of the geotechnical consultant. If adequate measures cannot be incorporated into the design and maintenance of the system, then the infiltration rates may need to be further reduced. These and other factors should be considered in selecting a design infiltration rate.

We recommend the design of any infiltration system include at least one redundancy or overflow system. It may be prudent to provide an overflow system connected directly to a

storm drain system in order to prevent failure of the infiltration system, either as a result of lower than anticipated infiltration with time and/or very high flow volumes. Contamination and environmental suitability of the site for infiltration was not evaluated by us and should be evaluated by others (environmental consultant). We only addressed the geotechnical issues associated with stormwater infiltration.

LGC Geotechnical should be provided with details for any planned required infiltration system early in the design process for geotechnical input.

4.10 Pre-Construction Documentation and Construction Monitoring

It is highly recommended that a program of documentation and monitoring be devised and put into practice before the onset of any groundwork. LGC Geotechnical can perform these services at your request. This should include, but not necessarily be limited to, detailed documentation of the existing improvements, buildings, and utilities around the area of proposed excavation, with particular attention to any distress that is already present prior to the start of work. Subsequent readings should be scheduled consistent with the program of work.

4.11 Geotechnical Plan Review

Project plans (e.g., grading, foundation, retaining wall, etc.) and final project drawings should be reviewed by this office prior to construction to verify that our geotechnical recommendations, provided herein, have been appropriately incorporated. Additional or modified geotechnical recommendations may be required based on the proposed design.

4.12 Geotechnical Observation and Testing During Construction

The recommendations provided in this report are based on limited subsurface observations and geotechnical analysis. The interpolated subsurface conditions should be checked in the field during construction by a representative of LGC Geotechnical. Geotechnical observation and testing is required per Section 1705 of the 2019 California Building Code (CBC).

Geotechnical observation and/or testing should be performed by LGC Geotechnical at the following stages:

- During grading (removal bottoms, fill placement, etc.);
- During retaining wall and utility trench backfill and compaction;
- Preparation of pavement subgrade and placement of aggregate base;
- After building and wall footing excavation and prior to placing reinforcement and/or concrete; and
- When any unusual soil conditions are encountered during any construction operation subsequent to issuance of this report.

5.0 LIMITATIONS

Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report. The samples taken and submitted for laboratory testing, the observations made, and the in-situ field testing performed are believed representative of the entire project; however, soil and geologic conditions revealed by excavation may be different than our preliminary findings. If this occurs, the changed conditions must be evaluated by the project soils engineer and geologist and design(s) adjusted as required or alternate design(s) recommended.

This report is issued with the understanding that it is the responsibility of the owner, or of his/her representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and/or project engineer and incorporated into the plans, and the necessary steps are taken to see that the contractor and/or subcontractor properly implements the recommendations in the field. The contractor and/or subcontractor should notify the owner if they consider any of the recommendations presented herein to be unsafe.

The findings of this report are valid as of the present date. However, changes in the conditions of a property can and do occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. Therefore, the findings, conclusions, and recommendations presented in this report can be relied upon only if LGC Geotechnical has the opportunity to observe the subsurface conditions during grading and construction of the project, in order to confirm that our preliminary findings are representative for the site.

In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and modification, and should not be relied upon after a period of 3 years.

Appendix C
Laboratory Test Results

APPENDIX C

Laboratory Testing Procedures and Test Results

The laboratory testing program was formulated towards providing data relating to the relevant engineering properties of the soils with respect to residential construction. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on relatively undisturbed samples obtained from the test borings and/or trenches. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Expansion Index: The expansion potential of selected samples was evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	Expansion Index	Expansion Potential*
HS-4 @ 1-5 feet	1	Very Low

* ASTM D4829

Collapse/Swell Potential: Two collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The results are in this appendix.

Chloride Content: Chloride content was tested in accordance with Caltrans Test Method (CTM) 422. The results are presented below.

Sample Location	Chloride Content, ppm
LGC-HS-1 @ 1-5 feet	220

Laboratory Testing Procedures and Test Results

Soluble Sulfates: The soluble sulfate contents of selected samples were determined by standard geochemical methods (CTM 417). The soluble sulfate content is used to determine the appropriate cement type and maximum water-cement ratios. The test results are presented in the table below.

Sample Location	Sulfate Content (ppm)	Sulfate Exposure Class *
LGC-HS-1 @ 1-5 feet	58	S0

*Based on ACI 318R-14, Table 19.3.1.1

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
LGC-HS-1 @ 1-5 feet	6.82	3,398

ONE-DIMENSIONAL SWELL OR SETTLEMENT POTENTIAL OF COHESIVE SOILS

ASTM D 4546

Project Name:	Lovett Industrial - Palm, Highland	Tested By:	G. Bathala	Date:	06/07/22

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval (min)	Initial Depth to Water (feet)	Final Depth to Water (feet)	Total Change in Water Level (feet)	Greater Than or Equal to 0.5 feet (yes/no)
1	10:16	10:41	25.0	6.37	7.91	1.54	Yes
2	10:43	11:08	25.0	6.22	7.85	1.63	Yes

*If two consecutive measurements show that six inches of water seeps away in less than 25 minutes, the test shall be run for an additional hour with measurements taken every 10 minutes. Otherwise, pre-soak (fill) overnight, and then obtain at least twelve measurements per hole over at least six hours (approximately 30 minute intervals) with a precision of at least 0.25 inches

Main Test Data

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval, Δt (min)	Initial Depth to Water, D_o (feet)	Final Depth to Water, D_f (feet)	Change in Water Level, ΔD (feet)	Observed Infiltration Rate(in/hr)
1	11:11	11:21	10.0	6.76	7.87	1.11	15.6
2	11:23	11:33	10.0	6.72	7.81	1.09	14.5
3	11:39	11:49	10.0	6.88	7.92	1.04	16.3
4	11:51	12:01	10.0	6.48	7.66	1.18	12.9
5	12:05	12:15	10.0	6.49	7.55	1.06	11.1
6	12:17	12:27	10.0	6.75	7.76	1.01	13.3

Observed Infiltration Rate (Does Not Include Any Factor of Safety) **13.3**

Appendix E
General Earthwork & Grading

General Earthwork and Grading Specifications for Rough Grading

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ a qualified Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to confirm that the attained level of compaction is being accomplished as specified. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the project plans and specifications. The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of “equipment” of work and the estimated quantities of daily earthwork

contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the
Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate personnel will be available for observation and testing. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified. It is the contractor's sole responsibility to provide proper fill compaction.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed. The contractor is responsible for all hazardous waste relating to his work. The Geotechnical Consultant does not have expertise in this area. If hazardous waste is a concern, then the Client should acquire the services of a qualified environmental assessor.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be over-excavated as specified in the following section. Scarification shall continue until soils are broken down and free of oversize material and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Over-excavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. Please see the Standard Details for a graphic illustration. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of the geotechnical consultant. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than
5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and the Standard Details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

7.1 The Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.

7.2 All bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over

the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of maximum from 1 foot above the top of the conduit to the surface.

7.3 The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.

7.4 The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

1 INTRODUCTION

This report documents the results of a Greenhouse Gas (GHG) Emissions Assessment completed for the Meines Street and Palm Avenue Warehouse Project ("Project" or "proposed Project"). The purpose of this GHG Emissions Assessment is to evaluate the potential construction and operational emissions associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The proposed Project is located at the northwest corner of Meines Street and Palm Avenue in the City of Highland, California (City). The proposed site consists of 14 parcels (APN 1192-601-05, -09, and -43; 1192-621-02 through -08, and -20 through -23) on 12.8 acres. Currently, the site is used for industrial and non-conforming single-family residential uses. The Project site is relatively flat and has elevations ranging from approximately 1,175 to 1,193 feet above mean sea level (amsl). The site's topographic slightly slopes down to the west.

The Project site is bounded by the City Creek stormwater channel to the north, Palm Avenue to the east, Meines Street to the south, and an industrial lot to the west. In addition, the proposed Project is located approximately 1.2-mile northeast of the San Bernardino International Airport (SBIA).

Local access to the Project site is provided via Meines Street and Palm Avenue. The nearest major freeways to the site include Interstate 210 (I-210), located approximately 0.55-mile to the east and Interstate 10 (I-10), located approximately 2.86 miles to the south of the site; refer to Exhibit 1: Regional Location Vicinity Map and Exhibit 2: Site Vicinity Map.

1.2 Project Description

The Project proposes the development of single new industrial concrete tilt-up dock high warehouse building totaling 284,917 square feet, including 5,000 square feet of office space and 3,000 feet of mezzanine space. The structure will be supported by a screened truck yard, vehicular parking areas, tractor-trailer storage stalls, drive aisles, and landscaped areas. On-site improvements will include storm drains, stormwater/water quality treatment facilities (including underground infiltration chambers), sewer (including a private lift station), water, and dry utility systems. Additionally, minor onsite slopes and deepened building panels will be utilized. Vehicular access to the Project site will be provided by two new 40 foot-wide and 26-foot-wide driveways off Palm Avenue and one new 40-foot-wide driveway off Meines Street. The project also proposes a 40-foot-wide internal driveway which would provide vehicular access throughout the Project site. The Project provides a total of 240 parking spaces that includes 47 trailer stalls, 159 standard auto stalls, and 34 compact auto stalls. Refer to Exhibit 3: Site Plan for further Project details.

The Project would increase onsite impermeable areas as a result of the construction of a 284,917-SF warehouse building and parking areas. However, the Project would also create a storm drain connection to the existing channel near the northwest corner of the Project site.

Project Phasing

The Project is anticipated to be developed in one phase. Construction activity is anticipated to occur over a duration of approximately 10 months, beginning in October 2023.

General Plan Land Use and Zoning Designations

As designated by the City's Development Code, the Project site has a General Plan land use designation of Industrial (I) and a Zoning designation of Industrial (I). As such, the Project is anticipated to be consistent with the existing land use and zoning.

Site Access

Local access to the Project site is provided via Meines Street, which traverses the south of the site in a west-east direction, Palm Avenue that traverses east of the site in a north-south direction. Regional access to the Project site is via the W 5th Street off-ramp from I-210. The Project would include two (2) new 40 foot-wide and 26-foot-wide driveways off Palm Avenue and one new 40-foot-wide driveway off Meines Street. The Project also proposes a 40-foot-wide internal driveway which would provide vehicular access throughout the Project site.

Walls and Fences

The Project would include the following walls and fences on-site:

- An 8-foot-high metal fence would be located along the northwestern, northeastern, and western boundaries of the Project site;
- A 10-foot-high screen wall would run along the northern property line and would also surround the truck trailer parking and loading dock area in the northern portion of the site; and
- Two 8-foot-high metal gates would border the western and eastern boundaries of the truck loading area in the northern portion of the site.

Parking

The Project proposes to provide a total of 240 parking spaces that include 159 standard parking stalls (9 feet by 19 feet), 34 compact auto stalls (9 feet by 14 feet), and 47 trailer parking stalls (10 feet by 53 feet). Trailer stalls would be positioned along the northern Project boundary to the north of the loading dock area. The proposed auto standard parking stalls would be provided along the northeast, east, and west portions of the site.

2 ENVIRONMENTAL SETTING

2.1 Greenhouse Gases and Climate Change

Certain gases in the earth's atmosphere classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion of this radiation is reflected back toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about one day), GHGs have long atmospheric lifetimes (one to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the atmosphere.[1] Table 1: Description of Greenhouse Gases describes the primary GHGs attributed to global climate change, including their physical properties.

In: Climate Change 2013: The Physical Science Basis*, *Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2013. http://www.climatechange2013.org/ images/report/WG1AR5_ALL_FINAL.pdf.

Table 1: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. Methane is the major component of natural gas, about 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is about 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluorocarbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacture for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

Source: Compiled from U.S. EPA, *Overview of Greenhouse Gases*, April 11, 2018 (https://www.epa.gov/ghgemissions/overview-greenhouse-gases); U.S. EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2016*, 2018; Intergovernmental Panel on Climate Change, *Climate Change 2007: The Physical Science Basis*, 2007; National Research Council, Advancing the Science of Climate Change, 2010; U.S. EPA, *Methane and Nitrous Oxide Emission from Natural Sources*, April 2010.

3 REGULATORY SETTING

3.1 Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

U.S. Environmental Protection Agency Endangerment Finding

The U.S. Environmental Protection Agency's (U.S. EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA* (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the U.S. EPA finalized an endangerment finding in December 2009. Based on scientific evidence it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the U.S. EPA's assessment of the scientific evidence that form the basis for the U.S. EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the U.S. EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the U.S. EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, U.S. EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the U.S. EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking. On January 12, 2017, the U.S. EPA finalized its decision to maintain the current GHG emissions standards for model years 2022–2025 cars and light trucks. It should be noted that the U.S. EPA is currently proposing to freeze the vehicle fuel efficiency standards at their planned 2020 level (37 mpg), canceling any future strengthening (currently 54.5 mpg by 2026).

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the U.S. EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the U.S. EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baseline.

In August 2016, the U.S. EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program.[2]

On September 27, 2019, the U.S. EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.)[3] The SAFE Rule (Part One) revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the U.S. EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration has repealed SAFE Rule Part One, effective January 28, 2022 and is reconsidering Part Two.

In December 2021, the U.S. EPA finalized federal GHG emissions standards for passenger cars and light trucks for Model Years 2023 through 2026. These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector and are based on sound science and grounded in a

rigorous assessment of current and future technologies. The updated standards will result in avoiding more than 3 billion tons of GHG emissions through 2050.[4]

3.2 State of California

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of CO_2 equivalents (CO_2e) in the world and produced 369 million gross metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2020.[5] The transportation sector is the State's largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark Assembly Bill (AB) 32, *California Global Warming Solutions Act of 2006*, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the legislation's major provisions.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verification of statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

2017 CARB Scoping Plan

CARB adopted the Scoping Plan to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that would be adopted to reduce California's GHG emissions. CARB determined that achieving the 1990 emissions level would require a reduction of GHG emissions of approximately 29 percent below what would otherwise occur in 2020 in the absence of new laws and regulations (referred to as "business-as-usual").[6] The Scoping Plan evaluates opportunities for sector-specific reductions, integrates early actions and additional GHG reduction measures by both CARB and the State's Climate Action Team, identifies additional measures to be pursued as regulations, and outlines

[4] U.S. EPA, *Final Rule to Revise Existing National GHG Emissions Standards for Passenger Cars and Light Trucks Through Model Year 2026,* 2021. Available at: https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-revise-existing-national-ghg-emissions. Accessed May 2023.

[5] California Air Resources Board, *Current California GHG Emissions Inventory Data, 2000-2020 GHG inventory (2022 Edition)*, https://ww2.arb.ca.gov/ghg-inventory-data, accessed May 2023.

[6] CARB defines business-as-usual (BAU) in its Scoping Plan as emissions levels that would occur if California continued to grow and add new GHG emissions but did not adopt any measures to reduce emissions. Projections for each emission-generating sector were compiled and used to estimate emissions for 2020 based on 2002–2004 emissions intensities. Under CARB's definition of BAU, new growth is assumed to have the same carbon intensities as was typical from 2002 through 2004.

the adopted role of a cap-and-trade program.[7] Additional development of these measures and adoption of the appropriate regulations occurred through the end of 2013. Key elements of the Scoping Plan include:

- Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
- Achieving a statewide renewables energy mix of 33 percent by 2020.
- Developing a California cap-and-trade program that links with other programs to create a regional market system and caps sources contributing 85 percent of California's GHG emissions (adopted in 2011).
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets (several sustainable community strategies have been adopted).
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, heavy-duty truck measures, the Low Carbon Fuel Standard (amendments to the Pavley Standard adopted 2009; Advanced Clean Car standard adopted 2012), goods movement measures, and the Low Carbon Fuel Standard (adopted 2009).
- Creating targeted fees, including a public goods charge on water use, fees on gasses with high global warming potential, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.
- The California Sustainable Freight Action Plan was developed in 2016 and provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. This transition of California's freight transport system is essential to supporting the State's economic development in coming decades while reducing pollution.
- CARB's Mobile Source Strategy demonstrates how the State can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The mobile Source Strategy includes increasing ZEV buses and trucks.

In 2012, CARB released revised estimates of the expected 2020 emissions reductions. The revised analysis relied on emissions projections updated in light of current economic forecasts that accounted for the economic downturn since 2008, reduction measures already approved and put in place relating to future fuel and energy demand, and other factors. This update reduced the projected 2020 emissions from 596 million metric tons of CO_2e ($MMTCO_2e$) to 545 $MMTCO_2e$. The reduction in forecasted 2020 emissions means that the revised business-as-usual reduction necessary to achieve AB 32's goal of reaching 1990 levels by 2020 is now 21.7 percent, down from 29 percent. CARB also provided a lower 2020 inventory forecast that incorporated State-led GHG emissions reduction measures already in place. When this lower forecast is considered, the necessary reduction from business-as-usual needed to achieve the goals of AB 32 is approximately 16 percent.

[7] The Climate Action Team, led by the secretary of the California Environmental Protection Agency, is a group of State agency secretaries and heads of agencies, boards, and departments. Team members work to coordinate statewide efforts to implement global warming emissions reduction programs and the State's Climate Adaptation Strategy.

CARB adopted the first major update to the Scoping Plan on May 22, 2014. The updated Scoping Plan summarizes the most recent science related to climate change, including anticipated impacts to California and the levels of GHG emissions reductions necessary to likely avoid risking irreparable damage. It identifies the actions California has already taken to reduce GHG emissions and focuses on areas where further reductions could be achieved to help meet the 2020 target established by AB 32.

In 2016, the Legislature passed Senate Bill (SB) 32, which codifies a 2030 GHG emissions reduction target of 40 percent below 1990 levels. With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017 CARB adopted a second update to the Scoping Plan[8]. The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping Plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support other Federal actions.

2022 CARB Scoping Plan

Adopted December 15, 2022, CARB's *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen. The 2022 Scoping Plan sets one of the most aggressive approaches to reach carbon neutrality in the world. Unlike the 2017 Scoping Plan, CARB no longer includes a numeric per capita threshold and instead advocates for compliance with a local GHG reduction strategy (i.e., Climate Action Plan) consistent with CEQA Guidelines section 15183.5.

The key elements of the 2022 CARB Scoping Plan focus on transportation. Specifically, the 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by CARB on vehicle manufacturers and are outside the jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Included in the 2022 Scoping Plan is a set of Local Actions (2022 Scoping Plan Appendix D) aimed at providing local jurisdictions with tools to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. Appendix D to the 2022 Scoping Plan includes a section on evaluating plan-level and project-level alignment with the State's Climate Goals in CEQA GHG analyses. In this section, CARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency with the 2022 Scoping Plan. Notably, this section is focused on Residential and Mixed-Use Projects.[9] CARB specifically states that Appendix D does not address

[8] California Air Resources Board, *California's 2017 Climate Change Scoping Plan,* November 2017.
[9] California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*, *Appendix D: Local Actions*, Page 21, November 2022.

other land uses (e.g., industrial).[10] However, CARB plans to explore new approaches for other land use types in the future.[11]

As such, it would be inappropriate to apply the requirements contained in Appendix D of the 2022 Scoping Plan to any land use types other than residential or mixed-use residential development.

Senate Bill 32 (California Global Warming Solutions Act of 2006: Emissions Limit)

Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions. With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008)

Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans, and funding priorities to help California meet AB 32's GHG reduction goals. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards)

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the U.S. EPA's denial of an implementation waiver. The U.S. EPA subsequently granted the requested waiver in 2009, which was upheld by the by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards for passenger vehicle and light duty truck model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new passenger vehicles are anticipated to emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards)

SB 1368, which is AB 32's companion bill, directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

[10] Ibid.
[11] Ibid.

SB 1078, SB 107, and SBX1-2 (Renewable Electricity Standards)

SB 1078 (2002) required California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 (2006) changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the State's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23. SBX1-2 (2011) codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015)

Signed into law on October 7, 2015, SB 350 implements Executive Order B-30-15's goals. The SB 350 objectives are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 45 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms)

Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air contaminants and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans)

Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases)

Signed into law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.

AB 1346 (Air Pollution: Small Off-Road Engines)

Signed into Law in October 2021, AB 1346 requires CARB, to adopt cost-effective and technologically feasible regulations to prohibit engine exhaust and evaporative emissions from new small off-road engines, consistent with federal law, by July 1, 2022. The bill requires CARB to identify and, to the extent feasible, make available funding for commercial rebates or similar incentive funding as part of any updates to existing applicable funding program guidelines to local air pollution control districts and air quality management districts to implement to support the transition to zero-emission small off-road equipment operations.

AB 1279 (The California Climate Crisis Act)

Signed on September 16, 2022, AB 1279 established the goal to achieve net-zero GHG emissions no later than 2045 and net negative thereafter. The bill establishes a goal toward at least an 85% reduction target for anthropogenic GHG emissions below statewide emissions limit from Section 36550 of the California Health and Safety Code.

SB 1020 (100 Percent Clean Electric Grid)

Signed on September 16, 2022, SB 1020 provides additional goals for the path to the 2045 goal of 100 percent clean electricity retail sales. It creates a target of 90 percent clean electricity retail sales by 2035 and 95 percent clean electricity retail sales by 2040.

SB 905 (Carbon Sequestration Program)

Signed on September 16, 2022, SB 905 establishes regulatory framework and policies that involve carbon removal, carbon capture, utilization, and sequestration. It also prohibits the injecting of concentrated carbon dioxide fluid into a Class II injection well for the purpose of enhanced oil recovery.

AB 1757 (Nature-Based Solutions)

Signed on September 16, 2022, AB 1757 requires state agencies to develop a range of targets for natural carbon sequestration and nature-based climate solutions that reduce GHG emissions to meet the 2030, 2038, and 2045 goals which would be integrated into a scoping plan addressing natural and working lands.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the tone for the State and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S 01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission (CEC), CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009.

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the State's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the State come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewable Portfolio Standard (RPS) to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e (MMTCO2e). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the State's climate adaptation plan to be updated every three years and for the State to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The CEC adopted the 2022 Energy Code on August 11, 2021, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as the CALGreen Code, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and commercial buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The latest update to the CALGreen Code went into effect January 1, 2020 (2019 CALGreen). The 2019 CALGreen standards improve upon the previous standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The new 2019 CALGreen standards require residential buildings are required to be solar ready through solar panels (refer to Section 110.10 in the 2019 Building Energy Efficiency

Standards for more details). The CEC adopted the 2022 CALGreen Code, which went into effect on January 1, 2023.

CARB Advanced Clean Truck Regulation. CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.

- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

3.3 Regional

South Coast Air Quality Management District Thresholds

The South Coast Air Quality Management District (SCAQMD) formed a GHG California Environmental Quality Act (CEQA) Significance Threshold Working Group to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. This working group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the SCAB, various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. The Working Group has proposed a tiered approach to evaluating GHG emissions for development projects where SCAQMD is not the lead agency, wherein projects are evaluated sequentially through a series of "tiers" to determine whether the project is likely to result in a potentially significant impact due to GHG emissions.

With the tiered approach, a project is compared against the requirements of each tier sequentially and would not result in a significant impact if it complies with any tier. Tier 1 excludes projects that are specifically exempt from SB 97 from resulting in a significant impact. Tier 2 excludes projects that are consistent with a GHG reduction plan that has a certified final CEQA document and complies with AB 32 GHG reduction goals. Tier 3 excludes projects with annual emissions lower than a screening threshold. The SCAQMD has adopted a threshold of 10,000 $MTCO_2e$ per year for industrial projects and a 3,000 $MTCO_2e$ threshold was proposed for non-industrial projects but has not been adopted. During Working Group Meeting #7 it was explained that this threshold was derived using a 90 percent capture rate of a

large sampling of industrial facilities. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution. The Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.). The SCAQMD concluded that projects with emissions less than the screening threshold would not result in a significant cumulative impact.

Tier 4 consists of three decision tree options. Under the Tier 4 first option, SCAQMD initially outlined that a project would be excluded if design features and/or mitigation measures resulted in emissions 30 percent lower than business as usual emissions. However, the Working Group did not provide a recommendation for this approach. The Working Group folded the Tier 4 second option into the third option. Under the Tier 4 third option, a project would be excluded if it was below an efficiency-based threshold of 4.8 $MTCO_2e$ per service population per year. Tier 5 would exclude projects that implement offsite mitigation (GHG reduction projects) or purchase offsets to reduce GHG emission impacts to less than the proposed screening level.

Tier 3 Screening Thresholds

When the tiered approach is applied to a proposed project, and the project is found not to comply with Tier 1 or Tier 2, the project's emissions are compared against a screening threshold, as described above, for Tier 3. The screening threshold formally adopted by SCAQMD is an "interim" screening threshold for stationary source industrial projects where the SCAQMD is the lead agency under CEQA. The threshold was termed "interim" because, at the time, SCAQMD anticipated that CARB would be adopting a statewide significance threshold that would inform and provide guidance to SCAQMD in its adoption of a final threshold. However, no statewide threshold was ever adopted, and the interim threshold remains in effect.

For projects for which SCAQMD is not a lead agency, no screening thresholds have been formally adopted. However, the SCAQMD Working Group has recommended a threshold of 10,000 $MTCO_2e$/year for industrial projects and 3,000 $MTCO_2e$/year for residential and commercial projects. SCAQMD determined that these thresholds would "capture" 90 percent of GHG emissions from these sectors, "capture" meaning that 90 percent of total emissions from all new projects would be subject to some type of CEQA analysis (i.e., found potentially significant).[12]

Southern California Association of Governments

On September 3, 2020, SCAG's Regional Council adopted Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy [2020 RTP/SCS]). The RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The strategy was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, non-profit organizations, businesses and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The RTP/SCS is a long-range vision plan that balances future mobility and housing needs with economic, environmental, and public health goals. The SCAG region strives toward

[12] SCAQMD, "Staff Report: Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans," December 5, 2008, Attachment E: "Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold," October 2008, p. 3-2.

sustainability through integrated land use and transportation planning. The SCAG region must achieve specific federal air quality standards and is required by state law to lower regional GHG emissions.

3.4 Local

City of Highland General Plan

The following are relevant goals and policies of the Highland General Plan, which may reduce GHG emissions impacts.

Circulation Element

Policy 3.1.1 Require new development proposals to ensure that all mid-block street segments operate at LOS "D" or better during the peak hours of traffic.

Policy 3.1.2 Ensure that all intersections operate at LOS "D" or better during the peak hours of traffic.

Policy 3.1.10 Encourage major employers to reduce vehicular trips by offering incentive concepts discussed in the General Plan Circulation Element, including but not limited to reduced transit passes and preferential parking for ridesharing.

Policy 3.2.5 Develop and implement programs and policies that require additional improvements or mitigation from industries or entities that generate heavy truck traffic and pavement impacts.

Policy 3.4.11 Encourage and improve pedestrian connections from residential neighborhoods to retail activity centers, employment centers, schools, parks, open space areas and community centers.

Goal 3.5 **Promote bus service and paratransit improvements.**

Policy 3.5.1 Continue to support the regional bus system to provide intracity service, intercity service to major employment centers, and connection to regional transportation transfer points.

Policy 3.5.2 Plan for the provision of areas within the City to be used as park-and-ride regional bus and carpool facilities.

Policy 3.5.3 Work with Omnitrans to ensure that transit services are extended to serve residents in the eastern portion of the study area.

Policy 3.5.5 Ensure accessibility of disabled persons to public transportation.

Policy 3.5.7 Support privately funded local transit systems for commuter residents and maintain local transit systems for seniors and youth.

Policy 3.7.1 Develop a system of continuous and convenient bicycle routes to places of employment, shopping centers, schools, and other high activity areas with potential for increased bicycle use.

Policy 3.7.4 Assure that local bicycle routes will complement regional systems and be compatible with routes of neighboring municipalities.

Policy 3.8.5 Coordinate transit planning with the Southern California Association of Governments, SANBAG, Omnitrans and adjacent communities.

Policy 3.8.6 Work with the Southern California Commuter Rail Council and the San Bernardino Association of Governments and Omnitrans to establish a transit connection with the Metrolink Commuter Rail System.

Policy 3.8.8 Coordinate with human services agencies and public schools to reduce duplicate transportation where feasible.

Policy 3.9.6 Develop strategies for the control of parking demand such as improved transit service, amenities for bicyclists and rideshare vehicles.

Public Services and Facilities Element

Policy 4.5.3 Reduce the volume of solid waste material sent to landfills by continuing source reduction, recycling and composting programs in compliance with State law and encouraging the participation of all residents and businesses in these programs.

Land Use Element

Policy 2.1.1 Actively plan and promote the development of the Town Center, Golden Triangle and other designated mixed-use areas.

Policy 2.10.3 Provide access to multiple modes of travel, including pedestrian, bicycle, transit and automobile.

Conservation and Open Space Element

Policy 5.10.29 Locate parks and recreation facilities within convenient walking and biking distance of all neighborhoods.

Policy 5.16.1 Consolidate and adopt energy-saving practices for all City departments.

Policy 5.16.2 Monitor energy usage for all City facilities.

Policy 5.16.4 Distribute energy-conservation information, in both English and Spanish, to residents and businesses.

Policy 5.16.5 Coordinate energy-related policies and actions with local utilities and energy agencies.

Policy 5.17.1 Encourage energy and environmentally sustainable designs— such as "Green Development Standards"—in the design and approval of new projects.

Policy 5.17.7 Encourage energy-efficient retrofitting of existing buildings, where practical, throughout the City including assisting applicants in the installation of more efficient HVAC (heating, ventilation, air conditioning) systems.

Policy 5.17.8 Distribute and participate in incentive programs for incorporation of solar and photovoltaic panels (active solar) into existing or new buildings.

Policy 5.19.1 Reduce locally generated emissions through traffic flow improvements (including signal synchronization) and construction management practices.

Policy 5.19.2 Encourage the use of public transit within the City through coordination with regional transit providers and publication of routes and timetables on the City website and publications.

Policy 5.19.3 Encourage land use planning and urban design that reduces vehicle trips through mixed and multi-use development, consolidation of commercial development along major arterials, provision of pedestrian connections from residential to retail areas, and development of a multi-use Town Center.

Policy 5.19.7 Encourage employers to develop trip reduction plans to promote alternative work schedules, ridesharing, telecommuting and work-at-home programs, employee education and preferential parking.

Policy 5.19.8 Conduct City staff in-service training, in conjunction with regional air quality agencies, on the latest policies, techniques, programs and technology for air quality planning.

Policy 5.19.10 Reduce particulate emissions from roads, parking lots, construction sites and agricultural lands to the maximum extent practical through dust suppression, street cleaning and other practices.

Policy 5.19.13 Continue comprehensive efforts to reduce energy consumption.

Policy 5.19.14 Offer incentives to home-based businesses, carpool networks and park-and-ride facilities.

Policy 5.19.15 Evaluate the desirability of developing a multi-modal, transit hub in the City.

Public Health and Safety Element

Policy 6.8.3 Create and integrate innovative local emissions reducing pilot programs into city plans for future government facilities and equipment.

Policy 6.8.4 Support the development and use of alternative fuel sources for transportation-related activities to reduce local government energy demand.

Policy 6.8.6 Cooperate with regional transit agencies in the continued development of diverse and efficiently operated transportation systems that generate the minimum feasible pollutants.

Policy 6.8.7 Support current incentive programs that recognize and reward developments using new and innovative emission reduction techniques such as innovative efficient window

glazing, wall insulation, and ventilation systems; efficient air conditioning, heating, and appliances; use of passive solar design, and solar heating systems; use of energy cogeneration and/or use of waste energy; and landscape techniques that reduce water consumption and provide passive solar benefits.

Policy 6.8.8 Develop transportation demand management programs and incentives to reduce home to work vehicle trips.

Policy 6.8.9 Reduce work trips in the City and peak period auto travel by enforcing the City's Transportation Demand Ordinance; supporting current staggered, flexible, and compressed work schedules in public agencies; working with private agencies to encourage work schedule flexibility programs for employers with more than 25 employees in a single location; educating City residents on the advantages of ride sharing and public transit; and encouraging the development of job-intensive uses within designated employment centers for local residents.

Policy 6.8.10 Reduce vehicle emissions by supporting the design and implementation of the Citywide system of bikeways and pedestrian trails as a non-polluting circulation alternative by requiring as part of the development review process the installation of planned bicycle routes, paths, and lanes where designated; and the construction of necessary bicycle parking and storage areas within convenient commercial, employment and recreation activity areas.

Policy 6.8.11 Reduce the number of vehicles driven to work by requiring as part of the development review process that preferential parking be included in parking lot designs to high occupancy vehicles, vanpools, and shuttle services, if applicable.

San Bernardino County Greenhouse Gas Reduction Plan

The County of San Bernardino adopted the *San Bernardino County Regional Greenhous Gas Reduction Plan* (County GHG Reduction Plan) in September 2021 (GHG Reduction Plan). The County GHG Reduction Plan provides a means of implementing state regulations, including AB 32, AB 1493, Executive Order S-3-05, SB 375, Executive Order B-30-15, SB 32, AB 398, and SB 97, at the County level. The County GHG Reduction Plan provides a target and comprehensive set of actions for GHG emission reductions for the year 2030 (i.e., an emissions reduction 40 percent below 2007 levels). This reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Thresholds and Significance Criteria

Addressing GHG emissions generation impacts requires an agency to determine what constitutes a significant impact. The amendments to the CEQA Guidelines specifically allow lead agencies to determine thresholds of significance that illustrate the extent of an impact and are a basis from which to apply mitigation measures. This means that each agency is left to determine whether a project's GHG emissions will have a "significant" impact on the environment. The guidelines direct that agencies are to use "careful judgment" and "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" the project's GHG emissions.[13]

Based upon the criteria derived from Appendix G of the CEQA Guidelines, a project normally would have a significant effect on the environment if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, based on any applicable threshold of significance; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

South Coast Air Quality Management District Thresholds

On December 5, 2008, the SCAQMD Governing Board adopted a 10,000 $MTCO_2e$ industrial threshold for projects where the SCAQMD is lead agency. During the GHG CEQA Significance Threshold Working Group Meeting #15, the SCAQMD noted that it was considering extending the industrial GHG significance threshold for use by all lead agencies. This working group was formed to assist SCAQMD's efforts to develop a GHG significance threshold and is composed of a wide variety of stakeholders including the State Office of Planning and Research, CARB, the Attorney General's Office, a variety of city and county planning departments in the SCAB, various utilities such as sanitation and power companies throughout the SCAB, industry groups, and environmental and professional organizations. However, the SCAQMD has not announced when staff is expecting to present GHG thresholds for land use projects where the SCAQMD is not the lead agency to the governing board. During Meeting #8, the Working Group defined industrial uses as production, manufacturing, and fabrication activities or storage and distribution (e.g., warehouse, transfer facility, etc.). Additionally, the SCAQMD GHG Significance Threshold Stakeholder Working Group has specified that a warehouse is considered to be an industrial project.[14] Furthermore, the Working Group indicated that the 10,000 $MTCO_2e$ per year threshold applies to both emissions from construction and operational phases plus indirect emissions (electricity, water use, etc.).

Although the screening threshold for industrial projects is 10,000 $MTCO_2e$ per year, this analysis conservatively utilizes 3,000 $MTCO_2e$ per year as the Project GHG threshold.

[13] 14 California Code of Regulations, Section 15064.4a

[14] South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #8*, 2009.

4.2 Methodology

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022.1.1 (CalEEMod). Details of the modeling assumptions and emission factors are provided in Appendix A: Greenhouse Gas Emissions Data. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. GHG emissions during construction were forecasted based on the proposed construction schedule and applying the mobile-source and fugitive dust emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. The Project's operational-related GHG emissions would be generated by vehicular traffic, area sources (e.g., landscaping maintenance and consumer products), electrical generation, natural gas consumption, water supply and wastewater treatment, and solid waste.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 Greenhouse Gas Emissions

Threshold 5.1 Would the Project generate GHG emissions, either directly or indirectly, that could have a significant impact on the environment?

Short-Term Construction Greenhouse Gas Emissions

Project construction activities would generate direct CO_2, N_2O, and CH_4 emissions from construction equipment, transport of materials, and construction workers commuting to and from the Project site. Total GHG emissions generated during all construction phases were combined and are presented in Table 2: Construction-Related Greenhouse Gas Emissions

Table 2: Construction-Related Greenhouse Gas Emissions

Category	$MTCO_2e$
2023 Construction	259
2024 Construction	271
Total Construction Emissions	530
30-Year Amortized Construction	17.66

Source: CalEEMod version 2022.1. Refer to Appendix A for model outputs.

As indicated in Table 2, the Project would result in the generation of approximately 530 $MTCO_2e$ over the course of construction. Construction GHG emissions are typically summed and amortized over a 30-year period, then added to the operational emissions.[15] The amortized Project construction emissions would be 17.66 $MTCO_2e$ per year. Once construction is complete, construction-related GHG emissions would cease.

Long-Term Operational Greenhouse Gas Emissions

Operational or long-term emissions occur over the life of the Project. GHG emissions would result from direct emissions such as Project generated vehicular traffic, on-site combustion of natural gas, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power, the energy required to convey water to, and wastewater from the Project, the emissions associated with solid waste generated from the Project, and any fugitive refrigerants from air conditioning or refrigerators.

Total GHG emissions associated with the Project are summarized in Table 3: Project Greenhouse Gas Emissions. As shown in Table 3, the Project's unmitigated GHG emissions would be approximately 3,839.66 $MTCO_2e$ annually from both construction and operations of the proposed Project. The existing steel processing facility and a residential unit uses currently located on the Project site generates approximately 595 $MTCO_2e$ annually and will be removed and replaced by the Project. Existing emissions have been estimated based on the CalEEMod default emissions factors for building operations and

[15] The amortization period is 30 years per the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13,* August 26, 2009).

estimated trip generation. Therefore, the net unmitigated emissions from the proposed Project would be approximately 3,244.66 $MTCO_2e$/year.

Table 3: Project Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year	
	Unmitigated	**Mitigated**
Proposed Emissions		
Construction Amortized Over 30 Years	17.66	17.66
Area Source	<1	<1
Energy	551	551
Mobile	2,640	2,640
Off-Road – Forklifts[1]	228	0
Off-Road – Yard Trucks[1]	158	0
Waste	84	84
Water and Wastewater	161	161
Proposed Total	**3,839.66**	**3,453.66**
Existing Emissions		
Area Source	1	1
Energy	11	11
Mobile	22	22
Off-Road – Forklifts[2]	82	82
Off-Road – Yard Trucks[2]	475	475
Waste	1	1
Water and Wastewater	2	2
Existing Total	**595**	**595**
Net New Emissions	**3,244.66**	**2,858.66**
Threshold	*3,000*	*3,000*
Net Emissions Exceeds Threshold?	**Yes**	**No**

Notes:
1. Mitigation Measure HRA-1 (refer to the Project's Health Risk Assessment, Kimley-Horn 2023) requires operation of electric forklifts and yard trucks.
2. Three forklifts and two yard trucks have been assumed for the current steel processing facility on the proposed Project site.

Source: CalEEMod version 2022.1. Refer to Appendix A for model outputs.

The majority of Project-generated GHG emissions (67 percent unmitigated and 82 percent mitigated) are associated with non-construction related mobile sources. Emissions of motor vehicles are controlled by State and federal standards, and the Project has no control over these standards.

The Project would reduce GHG emissions through implementation of Mitigation Measure HRA-1 from the Project's Health Risk Assessment (Kimley-Horn, 2023). Mitigation Measure HRA-1 requires that off-road cargo handling equipment (e.g., forklifts and yard trucks) used during operational activities be electrically powered/zero emission. As shown in Table 3, implementation of Mitigation Measure HRA-1 would reduce the Project's net GHG emissions to 2,858.66 $MTCO_2e$ which is below the SCAQMD's 3,000 $MTCO_2e$ per year threshold. Therefore, the GHG emission of the proposed Project would be less than significant with implementation of mitigation measures.

Laws, Ordinances, and Regulations:

Laws, Ordinances, and Regulations (LOR) are existing requirements that are based on local, state, or federal regulations or laws that are frequently required independently of CEQA review. Typical LORs and requirements include compliance with the provisions of the Building Code, SCAQMD Rules, etc. The City may impose additional conditions during the approval process, as appropriate. Because LORs are neither Project specific nor a result of development of the Project, they are not considered to be either Project Design Features or Mitigation Measures.

LOR GHG-1 Require diesel powered construction equipment to turn off when not in use per Title 13 of the California Code of Regulations, Section 2449.

LOR GHG-2 Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and sensors for landscaping according to the City's Water Efficient Landscape requirements (Chapter 16.40.390 of the City's Municipal Code).

LOR GHG-3 The Project shall be designed in accordance with the applicable Title 24 Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations [CCR], Title 24, Part 6). These standards are updated, nominally every three years, to incorporate improved energy efficiency technologies and methods. The Building Official, or designee shall ensure compliance prior to the issuance of each building permit. The Title 24 Energy Efficiency Standards (Section 110.10(b)1) require all buildings to be designed to have a total area of at least 15 percent (after subtracting any skylights) "solar ready" zone on the roof top that will structurally accommodate later installation of rooftop solar panels. The installation of the solar panels is specific to the end use and will be determined at the time the specific projects are developed. If future building operators pursue providing rooftop solar panels, they will submit plans for solar panels prior to occupancy.

LOR GHG-4 The Project shall be designed in accordance with the applicable California Green Building Standards (CALGreen) Code (24 CCR, Part 11). The Building Official, or designee shall ensure compliance prior to the issuance of each building permit. These requirements include, but are not limited to:

- Design buildings to be water-efficient. Install water-efficient fixtures in accordance with Section 4.303 (residential) and Section 5.303 (nonresidential) of the California Green Building Standards Code Part 11.

- Recycle and/or salvage for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste in accordance with Section 4.408.1 (residential) and Section 5.408.1 (nonresidential) of the California Green Building Standards Code Part 11.

- Provide storage areas for recyclables and green waste and adequate recycling containers located in readily accessible areas in accordance with Section 4.410 (residential) and Section 5.410 (nonresidential) of the California Green Building Standards Code Part 11.

- To facilitate future installation of electric vehicle supply equipment (EVSE), residential construction shall comply with Section 4.106.4 (residential electric vehicle charging) of the California Green Building Standards Code Part 11 and nonresidential construction shall comply with Section 5.106.5.3 (nonresidential electric vehicle charging) of the California Green Building Standards Code Part 11.

Mitigation Measures: Refer to Mitigation Measure HRA-1 in the Project's Health Risk Assessment.

Level of Significance: Less than significant with mitigation incorporated.

5.2 Greenhouse Gas Reduction Plan Compliance

Threshold 5.2 Would the Project conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing GHG emissions?

Regional Transportation Plan/Sustainable Communities Strategy Consistency

On September 3, 2020, SCAG's Regional Council adopted Connect SoCal (*2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy* [2020 RTP/SCS]). The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders in the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG's RTP/SCS establishes GHG emissions goals for automobiles and light-duty trucks for 2020 and 2035 as well as an overall GHG target for the Project region consistent with both the target date of AB 32 and the post-2020 GHG reduction goals of Executive Orders 5-03-05 and B-30-15.

The RTP/SCS contains over 4,000 transportation projects, ranging from highway improvements, railroad grade separations, bicycle lanes, new transit hubs and replacement bridges. These future investments were included in county plans developed by the six county transportation commissions and seek to reduce traffic bottlenecks, improve the efficiency of the region's network, and expand mobility choices for everyone. The RTP/SCS is an important planning document for the region, allowing project sponsors to qualify for federal funding.

The plan accounts for operations and maintenance costs to ensure reliability, longevity, and cost effectiveness. The RTP/SCS is also supported by a combination of transportation and land use strategies that help the region achieve state GHG emissions reduction goals and Federal Clean Air Act (FCAA) requirements, preserve open space areas, improve public health and roadway safety, support our vital goods movement industry, and utilize resources more efficiently. GHG emissions resulting from

development-related mobile sources are the most potent source of emissions, and therefore Project comparison to the RTP/SCS is an appropriate indicator of whether the Project would inhibit the post-2020 GHG reduction goals promulgated by the state. The Project's consistency with the RTP/SCS goals is analyzed in detail in Table 4: Regional Transportation Plan/Sustainable Communities Strategy Consistency.

Table 4: Regional Transportation Plan/Sustainable Communities Strategy Consistency

SCAG Goals		Compliance	
GOAL 1:	Encourage regional economic prosperity and global competitiveness.	N/A:	This is not a Project-specific policy and is therefore not applicable. However, the Project is located on an occupied site that is surrounded by development. Redevelopment of the site would contribute to regional economic prosperity.
GOAL 2:	Improve mobility, accessibility, reliability, and travel safety for people and goods.	Consistent:	Although this Project is not a transportation improvement project, the Project is located near existing transit routes of I-215, I-10, and SR-210.
GOAL 3:	Enhance the preservation, security, and resilience of the regional transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 4:	Increase person and goods movement and travel choices within the transportation system.	N/A:	This is not a transportation improvement project and is therefore not applicable.
GOAL 5:	Reduce greenhouse gas emissions and improve air quality.	Consistent:	The Project site is located within an urban area in proximity to existing transit routes, freeways, and residential development. Locating an employment center in close proximity to existing residential uses would potentially reduce trip lengths required for existing residents to travel to work and/or commercial services. Reduction of trip lengths would result in reduced GHG and air quality emissions. The Project would also reduce air quality and GHG emissions through mitigation measures such as providing electrifying cargo handling equipment (Mitigation Measure HRA-1).
GOAL 6:	Support healthy and equitable communities	Consistent:	As discussed in the Air Quality Assessment and the Health Risk Assessment, the Project would not exceed thresholds or result in health impacts. The Project does not violate any air quality standards or contribute substantially to an existing or projected air quality violation. The Project would not conflict with the surrounding community's ability to access healthy food or parks.
GOAL 7:	Adapt to a changing climate and support an integrated regional development pattern and transportation network.	N/A:	This is not a project-specific policy and is therefore not applicable.
GOAL 8:	Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	N/A:	This is not a project-specific policy and is therefore not applicable. However, the Project is located in a developed area in proximity to existing truck routes and freeways. Location of the Project within a developed area would reduce trip lengths, which would result in more efficient travel.

Table 4: Regional Transportation Plan/Sustainable Communities Strategy Consistency			
SCAG Goals		**Compliance**	
GOAL 9:	Encourage development of diverse housing types in areas that are supported by multiple transportation options.	Consistent:	The Project involves development of a warehouse and does not include housing.
GOAL 10:	Promote conservation of natural and agricultural lands and restoration of habitats.	N/A:	This Project is located within an urban area and is not located on agricultural or habitat lands.
Source: Southern California Association of Governments, *Connect SoCal (2020 - 2045 Regional Transportation Plan/Sustainable Communities Strategy,* 2020.			

The goals stated in the RTP/SCS were used to determine consistency with the planning efforts previously stated. As shown in Table 4, the Project would be consistent with the stated goals of the RTP/SCS. Therefore, the Project would not result in any significant impacts or interfere with SCAG's ability to achieve the region's post-2020 mobile source GHG reduction targets.

California Air Resources Board Scoping Plan Consistency

As previously noted, the 2022 Scoping Plan sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and trucks). Additional GHG reductions are achieved through decarbonizing the electricity and industrial sectors.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets regulation to deploy zero-electric vehicle buses and trucks. Additional transportation policies include the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, and Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation. The 2022 Scoping Plan would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate carbon dioxide removal projects and technology.

As indicated in Table 3, approximately 92 percent of the Project's mitigated GHG emissions are from energy and mobile sources which would be further reduced by the 2022 Scoping Plan measures described above. It should be noted that the City has no control over vehicle emissions (approximately 82 percent of the Project's total emissions). However, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover. Several of the State's plans and policies would contribute to a reduction in mobile source emissions from the Project. These include the following:

- **CARB's Advanced Clean Truck Regulation**: Adopted in June 2020, CARB's Advanced Clean Truck Regulation requires truck manufacturers to transition from diesel trucks and vans to electric zero-

emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

- **Executive Order N-79-20**: Executive Order N-79-20 establishes the goal for all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035 and all medium and heavy-duty vehicles will be zero-emission by 2045. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new ZEVs "towards the target of 100 percent."

- **CARB's Mobile Source Strategy**: CARB's Mobile Source Strategy takes an integrated planning approach to identify the level of transition to cleaner mobile source technologies needed to achieve all of California's targets by increasing the adoption of ZEV buses and trucks.

- **CARB's Sustainable Freight Action Plan**: The Sustainable Freight Action Plan which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of ZEV trucks. This Plan applies to all trucks accessing the Project site and may include existing trucks or new trucks that are part of the statewide goods movement sector.

- **CARB's Emissions Reduction Plan for Ports and Goods Movement**: CARB's Emissions Reduction Plan for Ports and Goods Movement identifies measures to improve goods movement efficiencies such as advanced combustion strategies, friction reduction, waste heat recovery, and electrification of accessories.

While these measures are not directly applicable to the Project, any commercial activity associated with goods movement would be required to comply with these measures as adopted. The Project would not obstruct or interfere with efforts to increase ZEVs or state efforts to improve system efficiency. As such, the Project would not interfere with their implementation.

San Bernardino County Regional Greenhouse Gas Reduction Plan

The Project's GHG emissions would not conflict with the County GHG Reduction Plan. The Project would be consistent with the applicable Highland General Plan policies that form the foundation for the City's GHG emissions reduction measures outlined in the County GHG Reduction Plan. In addition, the Project would be required to implement Mitigation Measure HRA-1 which would help reduce its GHG and air pollutant emissions and would also support the goals of the County GHG Reduction Plan. Therefore, the proposed Project would be consistent with the County GHG Reduction Plan.

The proposed Project would be consistent with the SCAG's RTP/SCS and the CARB Scoping Plan, and would be required to comply with existing regulations, including applicable measures from the City's General Plan. The Project would be directly affected by the outcomes (vehicle trips and energy consumption would be less carbon intensive due to statewide compliance with future low carbon fuel standard amendments and increasingly stringent Renewable Portfolio Standards). As such, the Project would not conflict with any other State-level regulations pertaining to GHGs.

Conclusion

As shown in Table 3, approximately 92 percent of the Project's GHG emissions are from energy and mobile sources which would be further reduced by the 2022 Scoping Plan goals described above (including achieve 100 percent clean electricity by 2045 [SB 100], achieving 100 percent zero emission vehicle sales in 2035 [Advanced Clean Cars II], and implementing the Advanced Clean Fleets regulation [ZEV buses and trucks]). It should be noted that the City has no control over vehicle emissions. However, these emissions would decline in the future due to Statewide measures discussed above (including the reduction in fuels' carbon content, CARB's Advanced Clean Car Program, CARB's Mobile Source Strategy, fuel efficiency standards, etc.), as well as cleaner technology and fleet turnover. It is also noted that the Project would not convert any Natural and Working Lands (NWL) and/or decrease the urban forest carbon stock in the State, which are areas of emphasis in the 2022 Scoping Plan. SCAG's 2020 RTP/SCS is also expected to help California reach its GHG reduction goals, with reductions in per capita transportation emissions of 19 percent by 2035.[16]

In conclusion, the Project does not conflict with the applicable plans that are discussed above and therefore, with respect to this particular threshold, the Project does not have a significant impact.

Mitigation Measures: Refer to Mitigation Measure HRA-1 as identified in the Project's Health Risk Assessment.

Level of Significance: Less than significant with mitigation incorporated.

5.3 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about 1 day), GHGs have much longer atmospheric lifetimes of 1 year to several thousand years that allow them to be dispersed around the globe.

Cumulative Impacts

It is generally the case that an individual project of this size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory.[17] The State CEQA Guidelines generally address GHG emissions as a cumulative impact because of the global nature of climate change.[18] As the California Supreme Court explained, "because of the global scale of climate change, any one project's contribution is unlikely to be significant by itself".[19] As such, GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of Project-related GHGs would not result in a reasonably foreseeable cumulatively considerable contribution to global climate change. In addition, the Project as well as other cumulative related projects would also be subject to all applicable regulatory requirements,

[19] *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 512.

which would further reduce GHG emissions. As discussed above, the Project would not conflict with the RTP/SCS, or the CARB Scoping Plan and the Project-related net GHG emissions would not exceed the SCAQMD's 3,000 $MTCO_2e$ threshold of significance with implementation of Mitigation Measure HRA-1 (from the Project's Health Risk Assessment). Therefore, the Project's cumulative contribution of GHG emissions would be less than significant and the Project's cumulative GHG impacts would also be less than cumulatively considerable.

Mitigation Measures: Refer to Mitigation Measure HRA-1 as identified in the Project's Health Risk Assessment.

Level of Significance: Less than significant with mitigation incorporated.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	26.6	annual days of extreme heat
Extreme Precipitation	4.20	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	6.46	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A

Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	100
AQ-PM	54.7
AQ-DPM	45.4
Drinking Water	85.2
Lead Risk Housing	51.4
Pesticides	61.9
Toxic Releases	43.6
Traffic	54.3
Effect Indicators	—
CleanUp Sites	78.6
Groundwater	41.1
Haz Waste Facilities/Generators	84.5
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	61.5
Cardio-vascular	77.6
Low Birth Weights	92.5
Socioeconomic Factor Indicators	—
Education	65.8
Housing	35.3
Linguistic	39.8
Poverty	38.6

Unemployment	59.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	34.38983703
Employed	23.22597203
Median HI	32.7216733
Education	—
Bachelor's or higher	18.42679328

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	84.0
Healthy Places Index Score for Project Location (b)	21.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Per project construction schedule
Construction: Architectural Coatings	SCAQMD Rule 1113
Operations: Vehicle Data	Trip rates per traffic study Trip length for truck and passenger cars has been modified for warehouse Trip percentage for truck and passenger cars has been modified for warehouse
Construction: Dust From Material Movement	Per project site info 5,000 cubic yard for off-site improvement activity
Operations: Fleet Mix	Truck fleet mix under the warehouse land use Passenger car fleet mix under the general office building land use
Operations: Refrigerants	Warehouse is unrefrigerated and has no cold storage
Operations: Architectural Coatings	SCAQMD Rule 1113

Model Output: OFFROAD2021 (v1.0.4) Emissions Inventory
Region Type: Sub-Area
Region: San Bernardino (SC)
Calendar Year: 2024
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	26.6	annual days of extreme heat
Extreme Precipitation	4.20	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	6.46	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	3	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	100
AQ-PM	54.7
AQ-DPM	45.4

Drinking Water	85.2
Lead Risk Housing	51.4
Pesticides	61.9
Toxic Releases	43.6
Traffic	54.3
Effect Indicators	—
CleanUp Sites	78.6
Groundwater	41.1
Haz Waste Facilities/Generators	84.5
Impaired Water Bodies	0.00
Solid Waste	52.9
Sensitive Population	—
Asthma	61.5
Cardio-vascular	77.6
Low Birth Weights	92.5
Socioeconomic Factor Indicators	—
Education	65.8
Housing	35.3
Linguistic	39.8
Poverty	38.6
Unemployment	59.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	34.38983703

Employed	23.22597203
Median HI	32.7216733
Education	—
Bachelor's or higher	18.42679328

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	84.0
Healthy Places Index Score for Project Location (b)	21.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

SIGNATURE AND ENVIRONMENTAL PROFESSIONAL STATEMENT

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the subject property. We have developed and performed all the appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

1. SUMMARY OF CONCLUSIONS

Ramboll US Consulting, Inc. (Ramboll) was retained by Lovett Industrial, LLC to perform a Phase I Environmental Site Assessment (ESA) of the site located northwest of the intersection of Palm Avenue and Meines Street in Highland, California (herein referred to as the "site"; see Figures 1, 2, and 3). Ramboll's assessment was conducted in connection with a potential purchase of the site.

The objective of the Phase I ESA, which was conducted in conformance with the scope and limitations of ASTM International's *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* E1527-21[1] (the "ASTM Standard"), was to identify Recognized Environmental Conditions (RECs), as defined in the ASTM Standard (see Section 8).

The scope of work for the Phase I ESA was expanded to include an evaluation of certain additional considerations that are not included within the ASTM Standard,[2] as noted in Section 2.1 of this report.

1.1 Site Summary

The site is approximately 13.7-acres and located at 27124-27280 Meines Street in Highland, California. The site is located in San Bernardino County approximately 66 miles east of downtown Los Angeles. The site is composed of 15 tax parcels owned by eight different entities and occupied by five different parties.

- Ten parcels (1192-601-05, 1192-601-43, 1192-601-09, 1192-621-05, 1192-621-06, 1192-621-07, 1192-621-08, 1192-621-21, 1192-621-22, and 1192-621-23) are occupied by KCB Towers Inc. and are developed with an approximately 22,500-square-foot warehouse, which is located in the eastern portion of the lot. The warehouse building includes a two-story office space in the southeast corner and a single-story warehouse space used for steel cutting and welding in the remainder of the building. Other smaller structures on the site include a second smaller approximately 5,150-square-foot warehouse on the western portion of the site used for the owner's personal storage, two small residential buildings on the western portion of the site, one metal container used as a contained fuel station on the western portion of the site, a vehicle and machine maintenance shop on the northern portion of the site, and approximately 10 metal storage containers throughout the site.
- Two parcels (1192-621-02 and 1192-621-20) are occupied by Mazzulla Offroad and are developed with an approximately 3,200-square-foot building, which is located in the southwest portion of the lot. The single-story building includes a manufacturing space with metal cutting and welding machinery and a small office space. Other smaller structures on the site include metal containers, owned by Mazzulla Offroad and third parties, that are used for miscellaneous storage, including scrap metal, furniture, construction supplies, and truck parts.
- One parcel (1192-621-03) is owned by Robert Forshay and is not currently occupied. Two residential buildings, approximately 520 square-feet and 220 square-feet, are located on the southeast portion of the lot. The buildings were used as personal residences from approximately the 1930s to the 1980s and have been vacant since the 1980s.
- One parcel (1192-621-04) is occupied by Ransom (Randy) and Sandy Tirb and is developed with an approximately 1,568-square-foot residential building, which is located in the southern portion of the lot. The single-story building is used as a personal residence for the parcel owners. Other

[1] While this report was prepared to meet the 2021 ASTM Standard, it also meets the requirements of the 2013 ASTM Standard.

[2] The ASTM Standard refers to these areas as "non-scope considerations."

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

smaller structures on the site include a personal swimming pool and four small structures on the northern portion of the lot that are used as personal storage.

- One parcel (1192-621-09) is occupied by the Filipino Association of San Bernardino County and is developed with an approximately 4,275-square-foot building in the center of the lot. The building is used as an event space and gathering center for the association.

The site was undeveloped land until residences were constructed on the site from approximately 1930 to 1960. In the 1960s, some portions of the site began to be developed for industrial use while other portions of the site remained residential. Notable site occupants include the Bogh family, who started their steel cutting and welding business around 1982 and the Mazzulla family, who started their grading operations on the site around 1983.

1.2 Phase I ESA Conclusions

1.2.1 Recognized Environmental Conditions

Ramboll performed a Phase I ESA of the site in conformance with the scope and limitations of the ASTM Standard. Any exceptions to, or deletions from, this practice are described in Section 7.2 of this report. This assessment has identified no RECs in connection with the site.

1.2.2 Other Findings

Although not considered to be RECs or CRECs, Ramboll identified the following other findings, which represents a contingent risk not clearly defined by the ASTM Standard:

- **Past Light Industrial Operations at the Site.** Metalworking operations by KCB Towers Inc. began at the site around 1982 and has continued to the present. There is no readily available information as to the specific use of chemicals in the past, but there is no indication that these operations were chemically intensive or involved the use of significant amounts of petroleum products or hazardous substances. Because of the nature of the operations, it is possible that the use of the site for metalworking operations involved the use of chlorinated solvents. The site is not listed on any environmental databases indicative of a release or of hazardous waste generation. Also, Ramboll notes that these operations were conducted during a time period when robust environmental regulations were in the process of being put in place regarding chemical handling and waste management. While it is possible that small-scale spills or releases of chemicals or petroleum products may have occurred in the past, Ramboll identified no specific contamination concerns (e.g., obvious evidence of contamination, former underground storage tanks, listings indicating past chlorinated solvent use in significant quantities, known releases), and thus this matter is not considered a REC.
- **Presence of Floor Drains and Below-Grade Grease Pits.** Two areas with floor drains and below-grade grease pits are located on the KCB Towers lot, one adjacent to the vehicle and equipment maintenance area on the northern portion of the lot and one adjacent to the refueling station on the southwest corner of the lot. The drains are used to collect, and the grease pits are used to contain, any fluid containing petroleum products or chemicals from each area. The pits (1,000-gallon capacity) are constructed of concrete and are pumped out for cleaning on a routine basis by a third-party. Ramboll could not evaluate the integrity of the pits at the time of the site visit and cannot rule out the possibility of leakage from the pits and contamination to the subsurface. Site representatives indicated that no breaches in the pit have been discovered during the cleanings, which include a visual inspection, and no spills or leaks have occurred. Documentation of the cleanings and inspections was not available. Because Ramboll's review did not identify documentation of a release, a suspected release, or a potentially material threat of a

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

release of a hazardous substance or petroleum product related to this matter, it is not considered a REC.

- **Staining on Unpaved Ground.** Ramboll observed multiple areas of darkened staining from unknown substances on unpaved surface on parcel 1192-621-20 owned by Mark Mazzulla, in areas associated with vehicle storage, minor auto repair operations, and around drums of hazardous substances. Portions of the stains were covered, obscuring visibility, but the largest staining was approximately three feet by five feet in area. While the nature of the stain was not clear, the use of the lot is related to vehicle storage and vehicle maintenance has occurred on the lot. However, Ramboll considers this minor staining matter unlikely to be the subject of additional investigation if brought to the attention of a regulatory authority and considers this matter to represent an Other Finding.

Additional findings of Ramboll's Phase I ESA that are not considered RECs or CRECs, *de minimis* conditions, are discussed in Section 7 of this report.

1.3 Additional Considerations

Ramboll conducted a screening-level review of certain additional considerations that are not considered part of the ASTM Standard, as discussed in Section 5.3. Ramboll did not identify any concerns relating to wetlands, flood plains, and radon. Ramboll's key finding from its review of additional considerations includes the following:

- **Possible Presence of Asbestos-Containing Material (ACM) in Site Buildings.** A formal asbestos survey has not been conducted within site buildings. The use of asbestos was phased out of many building materials in the 1980s. Given the date of construction of the buildings at the site, it is possible that ACMs are present in building materials. The building materials that were observed by Ramboll did not appear to be extensively damaged, broken or deteriorated, except for the two residential buildings on parcel 1192-621-03.
- **Possible Presence of Lead-Based Paint.** Lead was an ingredient in certain paint pigment prior to and through the 1940s. While other pigments were used in the 1950s, the use of lead in paint continued until the 1970s. In 1978, the Consumer Products Safety Commission banned paint and other surfacing coating materials that are "lead-containing paint." Based on the construction date of some of the site buildings (i.e., the two residential buildings on parcel 1192-621-03 in the 1930s, one residential building on parcel 1192-621-05 in the 1950s, and one building on parcel 1192-621-09 in the 1960s), it is possible that lead-based paint was used historically on the buildings. Site personnel knew of no lead-based paint, but Ramboll observed damaged and degraded paint in the two residential buildings on parcel 1192-621-03.

Table 1: Sources of Information Relied on for the Phase I ESA

Resource	Description	Date
Physical Setting Sources	Current USGS 7.5-minute topographic map for the site and surrounding area. Geologic, hydrogeologic, and hydrologic information provided in the EDR report.	April 28, 2022
User-provided Information		
User-provided Information	Information provided by the user of this assessment, including responses to a User Questionnaire (Appendix D) consistent with Appendix X3 of the ASTM Standard and other information identified in Section 10.8 and 10.9 of the ASTM Standard.	May 18, 2022

Notes:

[1] - The site representatives interviewed by Ramboll were identified by the owners as having good knowledge of the uses, physical characteristics, and operations of the site (i.e., "key site manager" as defined by the ASTM Standard).

[2] - The radius searched for each database, as well as the databases themselves, were selected in accordance with the ASTM Standard.

This Phase I ESA was conducted in accordance with the methodology specified in the ASTM Standard, as agreed upon by Ramboll and its client in the proposal for this assignment.

The scope of work for this assignment was expanded to include an evaluation of certain additional considerations that are not included in the ASTM Standard, which included a screening-level review of wetlands, flood plains, radon, asbestos, and lead-based paint. The review of additional considerations was conducted based on available information and documentation; no samples of any media were collected as part of this assignment unless explicitly stated otherwise. Any other areas referred to as non-scope considerations by the ASTM Standard not listed above were outside the scope of this assessment.[3]

2.2 Significant Assumptions

In conducting this review, Ramboll made no significant assumptions, except for the following:

- Site-specific field measurements or other detailed hydrogeological information for the site were not publicly available or reasonably ascertainable. In the absence of such data, Ramboll has assumed that the flow direction of shallow groundwater beneath the site and in the local vicinity generally mimics surface topography and is affected by nearby surface water bodies. Therefore, in evaluating potential on-site impacts from off-site sources, those off-site facilities not located adjacent to or upgradient of the site are not considered to represent a significant contamination concern to the site. This interpretation is based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a

[3] The ASTM Standard considers per-/polyfluoroalkyl substances (PFAS) and other emerging contaminants as non-scope considerations; however, for the purposes of this assessment, Ramboll considered PFAS within the context of the Phase I ESA.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

significant distance, although a hazardous material can migrate in the groundwater in a generally downgradient direction.

2.3 Reliance and General Limitations

This report has been prepared for the exclusive use of Lovett Industrial, LLC and may not be relied upon by any other person or entity without Ramboll's prior express written permission. Reliance on Ramboll's report may be granted through the issuance of a separate reliance letter. If granted, and unless otherwise specified in writing, Ramboll's total aggregate exposure and liability in connection with the Report to Lovett Industrial, LLC and any third-party to which reliance has been issued shall not exceed the limits of liability established in the contract between Ramboll and its client for this assignment.

This report is considered current only for a period of 180 days from the site inspection (or the earliest date identified in the table above). The conclusions presented in this report represent Ramboll's professional judgment based upon the information available and conditions existing as of the date of this report. In performing its assignment, Ramboll must rely upon publicly available information, information provided by the client, and information provided by third parties. Accordingly, the conclusions in this report are valid only to the extent that the information provided to Ramboll was accurate and complete. This review is not intended as legal advice, nor is it an exhaustive review of site conditions. Ramboll makes no representations or warranties, expressed or implied, about the conditions of the site.

Ramboll's scope of work for this assignment did not include collecting samples of any environmental media. As such, this review cannot rule out the existence of latent conditions including contamination not identified and defined by the data and information available for Ramboll's review; however, this report is intended, consistent with normal standards of practice and care, to assist the client in identifying the risks of such latent conditions.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

3. SITE DESCRIPTION

3.1 Site Setting

The site is an approximately 13.7-acre site located at 27124-27280 Meines Street in Highland, California. The site is in San Bernardino County and is located approximately 66 miles east of downtown Los Angeles (Figure 1).

The site is composed of 15 tax parcels owned by eight different entities and occupied by five different parties (see Figures 2 and 3):

- Ten parcels (1192-601-05, 1192-601-43, 1192-601-09, 1192-621-05, 1192-621-06, 1192-621-07, 1192-621-08, 1192-621-21, 1192-621-22, and 1192-621-23) are occupied by KCB Towers Inc. and are developed with an approximately 22,500-square-foot warehouse, which is located in the eastern portion of the lot. The warehouse building includes a two-story office space in the southeast corner and a single-story warehouse space used for steel cutting and welding in the remainder of the building. Other smaller structures on the site include a second smaller approximately 5,150-square-foot warehouse on the western portion of the site used for the owner's personal storage, two small residential buildings on the western portion of the site, one metal container used as a contained fuel station on the western portion of the site, a vehicle and machine maintenance shop on the northern portion of the site, and approximately 10 metal storage containers throughout the site.
- Two parcels (1192-621-02 and 1192-621-20) are occupied by Mazzulla Offroad and are developed with an approximately 3,200-square-foot building, which is located in the southwest portion of the lot. The single-story building includes a manufacturing space with metal cutting and welding machinery and a small office space. Other smaller structures on the site include metal containers, owned by Mazzulla Offroad and third parties, that are used for miscellaneous storage, including scrap metal, furniture, construction supplies, and truck parts.
- One parcel (1192-621-03) is owned by Robert Forshay and is not currently occupied. Two residential buildings, approximately 520 square-feet and 220 square-feet, are located on the southeast portion of the lot. The buildings were used as personal residences from approximately the 1930s to the 1980s and have been vacant since the 1980s.
- One parcel (1192-621-04) is occupied by Ransom (Randy) and Sandy Tirb and is developed with an approximately 1,568-square-foot residential building, which is located in the southern portion of the lot. The single-story building is used as a personal residence for the parcel owners. Other smaller structures on the site include a personal swimming pool and four small structures on the northern portion of the lot that are used as personal storage.
- One parcel (1192-621-09) is occupied by the Filipino Association of San Bernardino County and is developed with an approximately 4,275-square-foot building in the center of the lot. The building is used as an event space and gathering center for the association.

There are multiple site access points along Meines Street at the southern site boundary and one site access at the northeast corner of the site along Palm Avenue.

The following table provides an overview of physical setting and utility information for the site.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 2: Physical Setting Information

Conditions	Description
Site Information	
Ownership	Bogh Family Trust (1192-601-05, 1192-601-43, 1192-621-21, 1192-621-22, and 1192-621-23), Lynn Bogh (1192-621-05), KCB Towers Inc. (1192-601-09, 1192-621-07, and 1192-621-08), Mark J Mazzulla (1192-621-02 and 1192-621-20), Robert Forshay (1192-621-03), Ransom Tirb (1192-621-04), Raymond C. T.R. Ramirez (1192-621-06), and Filipino Association of San Bernardino County (1192-621-09).
Size	Approximately 13.7 acres
Property Tax ID	APNs: 1192-601-05, 1192-601-09, 1192-601-43, 1192-621-02, 1192-621-03, 1192-621-04, 1192-621-05, 1192-621-06, 1192-621-07, 1192-621-08, 1192-621-09, 1192-621-20, 1192-621-21, 1192-621-22, and 1192-621-23.
Topography and Hydrology	
Topography	Site: Generally flat Region: Regionally, the ground slopes downward to the west
Nearest Surface Water Body to the Site	On-site: There is one approximately 500-square-foot personal swimming pool on parcel 1192-621-04. Off-site: City Creek, a tributary of the Santa Ana River, adjacent to the north.
Geology and Hydrogeology	
Presumed Direction of Shallow Groundwater Flow[1]	According to the "*Operations, Maintenance, and Monitoring 2017 Annual Report*" prepared for the former Norton Air Force Base located 0.18 miles to the southwest, groundwater in the vicinity of the site flows to the southwest. Based on the topographic gradient of the site and the flow of the City Creek to the southwest, shallow groundwater at the site likely flows to the southwest.
Depth to Groundwater	Depth to groundwater information for the site was not readily available. Groundwater at the former Norton Air Force Base located 0.18 miles to the southwest of the site was encountered at 185.7 to 188.4 feet below-ground surface (bgs) during the January 2019 monitoring event according to the "*IRP Site 2 Landfill OMM 2019 Annual Report – Final*".
Nearby Groundwater Supply Wells	According to well database information provided in the EDR report, one federally registered well is present on-site and 26 state and federally registered wells are present within one-quarter mile of the site; none are identified as a public supply well.
Geologic Conditions	Regional soils are well drained to excessively drained gravelly loamy sands with moderate to high infiltration rates.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 2: Physical Setting Information	
Conditions	**Description**
Notes: Information in this table was obtained through visual observations during the site visit; a review of USGS topographic maps, Google Earth imagery, information contained in the database search report, prior environmental assessment reports (if available), and local agency sources (noted in Chapter 2), and information provided by site representatives. [1] - In the absence of on-site measurements of groundwater flow direction, presumed direction of groundwater flow is based on local/regional topography and the location and direction of flow of nearby surface water bodies.	

3.2 Current Use of the Site

Parcel 1192-621-04 is currently used by Ransom (Randy) Tirb as a residential lot, which includes a residential home on the southern portion of the lot, a personal pool, and four storage structures on the northern portion of the lot. Operations on the lot do not involve any manufacturing or fabrication activities. The tenant conducts vehicle maintenance and upkeep on the lot as a personal activity. The storage structures on the northern portion of the lot contain vehicles, vehicle parts, and maintenance materials. Maintenance-related chemicals and janitorial supplies, including lubricants, antifreeze, coolant, and paint, are used in small quantities (containers of five gallons and smaller). Site representatives knew of no use of chlorinated solvents or polyfluoroalkyl substances (PFAS) at the site, and the use of such chemicals is considered unlikely based on the nature of site uses.

Parcel 1192-621-03 is currently owned by Robert Forshay and is vacant. Structures on the site include two small, residential buildings that have been vacant since the 1980s. Operations on the site do not involve the storage of any raw materials and do not involve any manufacturing or fabrication activities. Site representatives knew of no use of chlorinated solvents or polyfluoroalkyl substances (PFAS) at the site, and the use of such chemicals is considered unlikely based on the nature of site uses.

Parcel 1192-621-09 is currently used by the Filipino Association of San Bernardino County as an event space, which involves the gathering of people at the site. Operations on the site do not involve the storage any raw materials and do not involve any manufacturing or fabrication activities. Site representatives knew of no use of chlorinated solvents or polyfluoroalkyl substances (PFAS) at the site, and the use of such chemicals is considered unlikely based on the nature of site uses.

The parcels 1192-621-02 and 1192-621-20 are currently used by Mazzulla Offroad for metal auto parts manufacturing, truck parking, and storage. The major operations conducted at the site are described below:

- *Metal Manufacturing* – Mazzulla Offroad performs minor metalworking operations in the warehouse on the southern portion of the lot to manufacture offroad truck products, including control arms, skid plates, bumpers, and hubs. The manufacturing process includes cutting machines and turning machines.
- *Third-party Storage* – The site owner rents out space to third parties that store trucks, vehicles, and miscellaneous materials on the site. Notable items stored at the site include containers of scrap metal, stucco material, and drums of oil.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

- *Ancillary Operations* – Mazzulla Offroad also performs packaging, shipping and administrative operations, none of which involve the use of significant quantities of chemicals. In addition, Mazzulla Offroad conducts the following activities in support of the major operations:
  - General building and machinery/equipment maintenance, which includes replacing the coolant and small parts.
  - Transfer of raw materials and finished products using one propane-powered forklift; the unit is serviced on-site by outside contractors.

The primary raw materials used at the site include metal, oil, coolant, and propane. In addition, the Mazzulla Offroad uses maintenance-related materials, such as lubricants, greases, and welding gases. According to site representatives, no chlorinated solvents or PFAS are currently used at the site. However, because of the history of metalworking at the site and the lack of information about historical chemical use, it is possible that chlorinated solvents have been used at the site. This matter is further discussed in Section 6.

The parcels 1192-601-05, 1192-601-43, 1192-601-09, 1192-621-05, 1192-621-06, 1192-621-07, 1192-621-08, 1192-621-21, 1192-621-22, and 1192-621-23 are currently used by KCB Towers Inc. for steel product manufacturing and distribution. The major operations conducted at the site are described below:

- *Receiving* – Raw, unfinished steel is received from the site entrance at the northeast corner of the lot. The raw steel is stored on the exterior gravel on the western portion of the site until it is ready to be processed.
- *Metalworking* – Metalworking, including cutting, drilling, and welding, is performed on the raw steel in the warehouse on the eastern portion of the lot.
- *Finishing* – If needed, the steel pieces are painted in a concrete-paved area surrounded by a berm on the northeast corner of the lot.
- *Vehicle Refueling* – Vehicles and heavy machinery are refueled with diesel fuel at the contained fueling station at the southwest corner of the lot.
- *Personal Storage* – The owner and employees of KCB Towers Inc. store personal belongings, including furniture, teaching supplies, and ATVs in metal storage containers and the small warehouse and residential buildings on the western portion of the site.
- *Ancillary Operations* – KCB Towers Inc. also performs shipping and administrative operations, none of which involve the use of significant quantities of chemicals. In addition, KCB Towers Inc. conducts the following activities in support of the major operations:
  - General building and machinery/equipment maintenance, including parts changing, fluid changes, and vehicle repair.
  - Operation of one parts washer unit, containing a petroleum-based degreaser, in the maintenance area.
  - Transfer of raw materials and finished products using two propane-powered forklifts and approximately six diesel-fueled heavy machinery; the units are serviced on-site by outside contractors.

The primary raw materials used at the site include steel, diesel fuel, and compressed gases. In addition, KCB Towers Inc. uses maintenance-related materials, such as fuels, oils, lubricants, coolant, antifreeze, greases, non-chlorinated degreasers, welding gases, and detergents. According to site

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

representatives, no chlorinated solvents or PFAS are currently used at the site. However, because of the history of metalworking at the site and the lack of information about historical chemical use, it is possible that chlorinated solvents have been used at the site. This matter is further discussed in Section 6.

4. RECORDS REVIEW

4.1 Historical Site Use and Local Agency Information

The site was undeveloped land until residences were constructed on the site from approximately 1930 to 1960. In the 1960s, some portions of the site began to be developed for industrial use while other portions of the site remained residential. Notable site occupants include the Bogh family, who started their steel cutting and welding business around 1982 and the Mazzulla family, who started their grading operations on the site around 1983.

Based on Ramboll's review of the past uses of the site, it is possible that former use of the site for metalworking operations involved the use of chlorinated solvents; Ramboll considers the historical use of PFAS at the site to be unlikely.

The following table provides a summary of key information obtained by Ramboll from a review of available historical resources and information obtained from local governmental agencies and regulatory bodies.

Table 3: Summary of Historical Resources and Local Agency Information for the Site

Historical Resource	Key Observations Regarding Site History
Historical Resources	
Aerial Photographs (1930, 1938, 1949, 1953, 1959, 1966, 1968, 1975, 1985, 1989, 1994, 2002, 2006, 2009, 2012, and 2016) Satellite Imagery [1] (1985 to 2021)	1930 – 1938: The site is mostly undeveloped, vacant land with one small residential structure on the southeast corner of the site (lot 1192-621-22). 1949 – 1953: Two more residential structures appear along the southern boundary of the site (lots 1192-621-05 and 1192-621-03). Each residential structure has associated smaller structures (about three) around them. 1959: All previous structures remain the same. A small residential structure is present on the northwest corner of the site (lot 1192-621-07). 1966: All previous structures remain the same. A small warehouse-like structure is located on the western portion of the site (lot 1192-621-09). 1968 – 1975: All previous structures remain the same. One larger warehouse structure is added to lot 1192-621-09. One lot on the eastern portion of the site (lot 1192-621-21) is developed for industrial purposes with two warehouse buildings and vehicle parking. 1985: All previous structures remain the same. One lot in the center (current parcel 1192-621-04) appears to be developed for residential purposes with a residential structure and storage on the northern portion of the lot. 1989 – 1994: All previous structures remain the same. Two lots on the eastern portion of the site (1192-621-02 and 1192-621-20) are now developed for industrial use with one warehouse structure on the southwest corner of lot 1192-621-02. One large warehouse structure has been constructed in the center of lot 1192-621-21 on the eastern portion of the site. 2002: All previous structures remain the same, except for the warehouse on lot 1192-621-02 which has been extended to the north. A large portion of the northern and western sites (lots 1192-601-05, 1192-601-43, 1192-601-09, 1192-621-08, 1192-621-07) are developed for industrial use. 2006 – 2012: All previous structures remain the same. Lot 1192-621-06 has been developed for light industrial use and appears to be used as storage.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 3: Summary of Historical Resources and Local Agency Information for the Site

Historical Resource	Key Observations Regarding Site History
	2016 – 2021: All previous structures remain the same.
Topographic Maps (1899 to 2018)	1899 – 1901: No development depicted. 1953 – 1954: Three small structures are depicted along the southern boundary of the site. 1967 – 1988: One of the structures along the southern boundary has been removed. Two additional structures are depicted on the western portion of the site. 2012 – 2018: No development depicted.
City Directory Abstracts (1971, 1976, 1980, 1986, 1992, 1995, 2000, 2005, 2010, 2014, and 2017)	Prior uses and occupants of the site are listed as: 27124 Meines Street: Philipino Association San Bernardino (1971-2010) 27184 Meines Street: Aron Pruett Sr. (1971-1986), Ed Kruse (1992), and Oscar Uribe (2005) 27200 Meines Street: Marvin Peek (1980-1986), Pride Utilities (1992-1995) and Ransom Tirb (2005-2017) 27220 Meines Street: Salvador L Yepez (1980) and Gonzalo Uribe (1986) 27232 Meines Street: Mazzulla Offroad and Mazzulla Grading (2010) 27260 Meines Street: Mark J Mazzulla Grading Company (1986-2000), Highland Crane (1992-2000), Highlander Group (2005), and KCB Towers Inc. (1995-2017) 27280 Meines Street: S P Manning Tree Service (1971-1980), Simon P Manning (1971-1986) and Lynn Bogh (2005-2014)
Local Agency Information	
Tax assessor website	The site is composed of 15 tax parcels: 1192-601-05: Bogh Family Trust, site owner since 2008 1192-601-43: Bogh Family Trust, site owner since 2019 1192-601-09: KCB Towers Inc, site owner since 2017 1192-621-02: Mark J Mazzulla, site owner since 2013 1192-621-03: Robert Forshay, site owner since 1976 1192-621-04: Ransom Tirb, site owner since 2001 1192-621-05: Lynn Bogh, site owner since 2009 1192-621-06: Raymond Ramirez, site owner since 1997 1192-621-07: KCB Towers Inc, site owner since 2017 1192-621-08: KCB Towers Inc, site owner since 2017 1192-621-09: Filipino Association of San Bernardino County, site owner since 1963 1192-621-20: Mark J Mazzulla, site owner since 2013 1192-621-21: Bogh Family Trust, site owner since 2008 1192-621-22: Bogh Family Trust, site owner since 2008 1192-621-23: Bogh Family Trust, site owner since 2014

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 3: Summary of Historical Resources and Local Agency Information for the Site

Historical Resource	Key Observations Regarding Site History
San Bernardino County Fire Department	Ramboll requested records from the San Bernardino County Fire Department concerning the utilization, manufacture, storage, and discharge of hazardous materials and waste and any information concerning previous or ongoing site investigations and remediation pertaining to hazardous materials and waste at the site. The San Bernardino County Fire Department informed Ramboll that the department only had records for 27232 and 27260 Meines Street. Records provided by the department include: • Special Generator and Special Handler permits for Ronald A. Dieffenbacher (27232 Meines Street) from 1997 to 2002. • Ronald A. Dieffenbacher (27232 Meines Street) was declared Out of Business in 2002. A hazardous waste generator and handler inspection was conducted, and one 300-gallon AST of waste oil was properly removed. • Limited Quantity Generator and Hazardous Material Handler 3-10 Employees permits for KCB Towers Inc. (27260 Meines Street) from 1995 to 2016. • KCB Towers Inc. (27260 Meines Street) submitted their Hazardous Materials Business Plan (HMBP) in 1996 and updated it in 1997, 2000, 2006, 2007, 2008, 2009, 2010, 2011, 2012, and 2013. • CUPA Compliance Inspection Report of KCB Towers Inc. (27260 Meines Street) from 2000, 2005, 2011, 2014, 2017, and 2020. Violations included failure to obtain EPA ID, illegal disposal of hazardous waste due to an inactive EPA ID, improper labeling, improper management of hazardous waste, improper disposal of waste oil filters, and administrative violation. All violations have been returned to compliance.
City of Highland Fire Department	Ramboll requested records from the City of Highland Fire Department concerning the storage of hazardous materials and waste and underground storage tanks at the site. The City of Highland Fire Department informed Ramboll that they do not have records for the site and the lead agency for the site is the San Bernardino County Fire Department.
City of Highland Building Department	Ramboll requested records from the City of Highland Building Department concerning building permits and certificates of occupancy for the site. Records from the City of Highland Building Department include: • Electrical permits for address 27162 Meines Street, owned by Margaret and Miles Bogh, from 2008. • Building permits for address 27184 Meines Street, owned by E. W. Kruse, to add detached garage in 1988 and to build a carport in 1991. • Building permits for address 27184 Meines Street, owned by Clarene and Stanley Harris, to add two walls to an existing carport in 1998, to tear off and reroof the building in 2007, and to board up and remove utilities from the garage and metal building in 2008. • Building permit for address 27200 Meines Street, owned by Ransom and Sandra Tirb, to replace windows and doors in 2021. • Building permit for address 27232 Meines Street, owned by Mark Mazzulla, for electrical upgrades in 2020. • Certificate of occupancy for address 27260 Meines Street by IWA Engineers in 1996.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 3: Summary of Historical Resources and Local Agency Information for the Site	
Historical Resource	**Key Observations Regarding Site History**
	• Building permit for address 27260 Meines Street, owned by KCB Towers Inc, for electrical upgrades in 1996, to construct a garden wall in 2000, for a building extension in 2000, and for a new heating system in 2005. • Building permit for address 27280 Meines Street, owned by Bogh Family Trust, to build a fence in 2020.

Notes:

[1] In addition to aerial photographs provided by the third-party provider, Ramboll viewed historical satellite imagery available on Google Earth. Printed copies were not obtained, and imagery dates were not independently verified.

The third-party provider reported that Sanborn fire insurance map coverage is not available for the site.

4.2 Environmental Regulatory Database Review for the Site

Ramboll reviewed the results of the state and federal environmental database searches performed by EDR (see Appendix B) and reviewed information available in California GeoTracker and EnviroStor. The site is listed on several environmental databases, as discussed in the table below.

Table 4: Summary of Environmental Database Listings for the Site	
Summary of Information Contained in Database	**Ramboll's Comments**
KCB Towers Inc. (27260 Meines Street) is listed on the following databases: Resource Conservation and Recovery Act as a Non-generator or No Longer Regulated (RCRA NONGEN/NLR), Hazardous Waste Tracking System (HWTS), Facility and Manifest Data (HAZNET), California Environmental Reporting System (CERS), CERS Hazardous Waste (CERS HAZ WASTE), and the San Bernardino County Permit (SAN BERN. CO. PERMIT) for the generation of California-regulated hazardous materials. EPA IDs used in association with these listings include CAC002209065 (active from 2000 to 2001) and CAL000248885 (active from 2002 and is currently active). Hazardous wastes generated include unspecified solvent mixture, off-specification, aged, or surplus organics, unspecified oil-containing waste, unspecified organic liquid mixture, organic solids with halogens, and other organic solids. Violations included improper handling of wastes, improper labeling, and administrative violations. All violations have been returned to compliance in a timely manner. KCB Towers Inc. is also listed on the Aboveground Storage Tank (AST) database for the presence of an on-site AST. The date of installation, contents, and size of the AST is not reported.	Listings related to hazardous waste generation and on-site ASTs, without indication of spills or releases, do not suggest a contamination concern to the site.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 4: Summary of Environmental Database Listings for the Site

Summary of Information Contained in Database	Ramboll's Comments
Ron Dieffenbacher Equipment (27232 Meines Street) is listed on the HWTS and SAN BERN. CO. PERMIT databases for the generation of California-regulated hazardous materials. The EPA ID registered with this listing is CAC002557205 (active from 2002 to 2003). The type of wastes generated at the site are not reported and there are no violations reported.	Listings related to hazardous waste generation, without indication of spills or releases, do not suggest a contamination concern to the site.
Equipment Storage (27256 Meines Street) is listed on the HWTS for the generation of California-regulated hazardous materials. The EPA ID registered with this listing is CAL000250323 (active from 2002 to 2008). The type of wastes generated at the site are not reported and there are no violations reported.	Listings related to hazardous waste generation, without indication of spills or releases, do not suggest a contamination concern to the site.

Notes:

The site is also listed on the following databases related to regulatory compliance: National Pollutant Discharge Elimination System (NPDES), California Integrated Water Quality System (CIWQS), Enforcement & Compliance History Information (ECHO), and Facility Index System/Facility Registration System (FINDS). Listings on these databases, by themselves, are not necessarily indicative of contamination.

4.3 Previous Environmental Assessments and Activities

Based on a review of historical site documents and interviews with site representatives, no prior Phase I environmental assessments, UST closures, environmental sampling, or remediation activities are known to have been conducted at the site.

4.4 User-Provided Information

Ramboll provided Lovett Industrial, LLC with a User Questionnaire (consistent with Appendix X3 of the ASTM Standard) that requested information relating to environmental liens, activity use limitations (AULs), specialized knowledge of the site, property value diminution, chain-of-title, and any other commonly known or obvious indications of site contamination, as well as information on any proceedings involving the site (as noted in Section 10.9 of the ASTM Standard) that was not otherwise provided to Ramboll (see Appendix D). The user did not provide any information that was not otherwise obtained and reviewed by Ramboll.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

5. SITE OBSERVATIONS

5.1 Chemical and Petroleum Storage

5.1.1 Underground Storage Tanks (USTs)

According to site representatives, there are no current or former USTs at the site, and Ramboll identified no visual evidence of such (e.g., vent pipes, fill ports, or dispensing equipment) during the site visit or in the review of records pertaining to the site.

5.1.2 Aboveground Storage Tanks (ASTs)

Several ASTs are maintained at the site, as summarized in the table below. Site representatives knew of no leaks or spills relating to the tanks, and Ramboll did not observe evidence of staining or past releases at the time of the site visit. Site representatives indicated that there are no current or former underground transfer lines used to convey the materials from the tanks.

Table 5: Aboveground Storage Tanks and Bulk Containers

Location	# of tanks	Contents	Sizes	Observations
Northeast corner of parcel 1192-601-43	1	Propane gas	499 gallons	Tank is maintained within a secondary containment area constructed on concrete block. No evidence of spills or releases observed.
Oil reservoir in cutting machine on parcel 1192-621-02	1	Coolant	50 gallons	No secondary containment is provided but the cutting equipment is located indoors, and no evidence of significant spills or releases of oils was observed.
North side of parcel 1192-621-02	1	Propane gas	499 gallons	Tank is maintained within a secondary containment area constructed on concrete block. No evidence of spills or releases observed.
South side of parcel 1192-621-08	2	Diesel fuel	1000 gallons and 500 gallons	Tanks are maintained within a concrete area with a drain and containment pit. No evidence of spills or releases observed.

5.1.3 Other Chemical and Petroleum Containers

Chemical storage at the Mazzulla Offroad lot is limited to lubricating oils and coolant (stored in 5-gallon pails in the warehouse), welding gases (stored in cylinders in the warehouse), oil (owned by third parties and stored in 55-gallon drums on the exterior of the site), propane (stored in an AST), and janitorial and maintenance chemicals (stored in retail-sized containers of 5-gallons of less inside of the warehouse). Staining, the largest approximately three feet by five feet in surface area, was observed around the oil drums on the exterior gravel of the site. This matter is discussed further in Section 7.

Several dedicated drum and other storage areas for chemicals and petroleum products are maintained at the KCB Towers Inc. facility:

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

- Lubricating oils and other petroleum products are stored in 55-gallon drums and 5-gallon pails in the maintenance area on the northern portion of the site. During the site visit, Ramboll observed 5 drums stored on wooden pallets and approximately 7 pails stored on pavement in this area.
- Small, retail-sized containers (5-gallons or less) of chemicals are stored on a shelf in the maintenance area on the northern portion of the site. Chemical stored in this area include paint thinner, paint, non-chlorinated solvents, engine oil, brake fluid, adhesives, detergents, and sanitizers.
- Empty drums and chemical storage containers are stored in the eastern maintenance area on the northern portion of the site. During the site visit, Ramboll observed approximately 15 empty drums and chemical storage containers stored on pavement.
- Tanks of compressed gases and liquefied gases, including oxygen, argon, nitrogen, and propane, of various sizes from are stored along the exterior of the eastern wall of the warehouse.

Site representatives knew of no significant spills or releases of materials at drum and container storage areas. While dedicated secondary containment was not provided for all of the drums and containers, Ramboll did not observe evidence of spills or uncontrolled releases from these storage areas, other than minor staining on the paved flooring of the maintenance area. Staining did not appear to extend to unpaved surfaces.

Chemical storage at the remainder of the site is limited to retail-sized containers (5-gallons or less) of maintenance and cleaning chemicals, including motor oil, lubricants, detergents, bleach, and sanitizers stored inside of the Filipino Association of San Bernardino County's building and inside of Randy Tirb's garage and warehouses. No evidence of releases was observed in these areas. Chemicals are not stored in exterior areas of the site.

5.2 Other Site Reconnaissance Observations

During the site visit, Ramboll made observations of interior and exterior portions of the site to look for and identify the features, activities, uses, and conditions specified in Section 9.4 of the ASTM Standard, as discussed in the table below.

Table 6: Site Reconnaissance Observations

Conditions	Description
Site Utilities and Equipment	
Heating and Cooling Equipment	The buildings are cooled with packaged electric air conditioning units.
Natural Gas Service	The site is provided with natural gas service.
Use of Fuel Oil for Building Heat	No current or known former use of fuel oil for building heat.
Foam-based Fire Suppression System	According to site representatives, the site is not equipped with a built-in foam-based fire suppression system.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 6: Site Reconnaissance Observations

Conditions	Description	
Water Supply and On-site Water Wells	The site receives drinking and process water from the East Valley Water District water system.	
PCB-containing Equipment	Site representatives were not aware of any on-site equipment that is known to contain PCBs. There are currently three pole-mounted transformers along the southern boundary of the site and one pad-mounted transformer located at the southwest corner of parcel 1192-621-21; the units are owned by Southern California Edison. The units are not labeled as to their PCB content. Because the units may have been installed before the 1979 federal ban on the manufacture of PCBs, it is possible that transformer oils contain PCBs. Because the buildings were constructed prior to the 1979 federal ban on the manufacture of PCBs, it is possible that hydraulic or other types of electrical equipment, such as capacitors, contain PCBs. Ramboll observed no evidence of leaks or releases from transformers or other hydraulic/electrical equipment during the site visit.	
Waste, Wastewater and Stormwater		
Waste	Hazardous and Universal	Hazardous wastes generated at the site, which include metal shavings and waste oil, are stored in 55-gallon drums inside of the Mazzulla Offroad warehouse and in the KCB Towers Inc. maintenance area. Universal wastes, which include batteries and light bulbs, are stored inside the Mazzulla Offroad warehouse and the KCB Towers Inc. office.
	Nonhazardous	Nonhazardous waste generated at the site includes general waste and recyclable waste and is stored on pavement in lidded dumpsters and trash bins along the southern site boundary and on pavement on the northeast corner of the site.
	Observations	Ramboll observed staining around the hazardous waste drums containing waste oil in the maintenance area of KCB Towers Inc. Staining was limited in size, on pavement, and did not extend to unpaved surfaces or stormwater drains.
Wastewater	Sanitary	Sanitary wastewater from the site is discharged to the municipal sanitary sewer system.
	Process	Operations at the site do not generate process wastewater.
	Septic Systems	Sanitary wastewater is discharged to a septic tank with associated leach field located at parcel 1192-621-02 owned by the Filipino Association of San Bernardino County.
	Observations	Ramboll observed no evidence a contamination concern associated with wastewater management at the site.
Stormwater	Management	Percolates into the ground surface at unpaved areas and enters catch basins that discharge to the municipal storm sewer system.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 6: Site Reconnaissance Observations

Conditions	Description	
	Observations	Ramboll observed no evidence of a contamination concern associated with stormwater management at the site.
Other Interior and Exterior Observations		
Exterior Ponds, Pits, Lagoons and Standing Surface Water	Ramboll observed a personal swimming pool on parcel 1192-621-04, owned by Randy Tirb, but did not identify any evidence of spills or releases of chemicals or petroleum products to the pool.	
On-site Disposal or Fill Material	Ramboll observed a pile of soil and dirt on the southwest corner of the KBC Towers Inc. lot. Facility personnel reported that the soil originated at the site and is the remnants of leveling activities at the site.	
Staining and Stressed Vegetation	Other than previously mentioned staining, Ramboll observed no evidence of additional staining or stressed vegetation at the site.	
Interior Drains, Sumps, Pits, and Trenches	Ramboll observed two areas with floor drains and below-ground, 1000-gallon grease pits adjacent to the vehicle and equipment maintenance area on the northern portion of the KCB Towers Inc. lot and adjacent to the refueling station on the southwest corner of the KCB Towers Inc. lot. The drains are used to collect and the grease pits are used to contain releases of oils, oily water, and any fluid from the maintenance and refueling areas. According to a site representative, these pits are constructed of concrete, do not have outlets, and are routinely serviced by a third-party if liquid accumulates. The interiors of the drains and pits could not be observed during the site visit. No staining on the concrete or other evidence of releases to the drains and grease pits were observed during the site visit. The drains and grease pits are further discussed in Section 7.1.	
Odors	At the time of the site visit, Ramboll did not note strong odors in interior or exterior areas at the site.	

5.3 Additional Considerations

Ramboll's scope of work also included a review of certain additional considerations that are not included within the scope of the ASTM Standard (i.e., "ASTM non-scope considerations"). A summary of Ramboll's findings for these additional considerations is provided in the table below and in Section 5.3.1.

Table 7: Review of Additional Considerations

Consideration	Site Visit Information and Observations	Comments/Findings
Flood Plains	Site representatives reported no known occurrences of flooding at the site. The site is not located within a 500-year flood zone.	No issues identified
Wetlands	According to the wetlands information provided by the National Wetland Inventory (NWI) (as obtained	No issues identified

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

Table 7: Review of Additional Considerations

Consideration	Site Visit Information and Observations	Comments/Findings
	from the EDR database report), there are no on-site federally designated wetlands.	
Lead-Based Paint	Lead was a major ingredient in paint pigment prior to and through the 1940s. While other pigments were used in the 1950s, the use of lead in paint continued until the early 1970s. In 1978, the Consumer Products Safety Commission banned paint and other surfacing coating materials that are "lead-containing paint." Based on the construction date of some of the site buildings (i.e., the two residential buildings on parcel 1192-621-03 in the 1930s, one residential building on parcel 1192-621-05 in the 1950s, and one building on parcel 1192-621-09 in the 1960s), it is possible that lead-based paint was used historically on the buildings. Ramboll made limited, non-exhaustive observations of painted surfaces at the site. Site representatives indicated that no LBP surveys have been performed at the site. Ramboll observed damaged and degraded paint in the two residential buildings on parcel 1192-621-03.	Ramboll observed damaged and degraded paint in the two residential buildings on parcel 1192-621-03. Based on the age of the site buildings, it is possible that these surfaces contain LBP.
Radon	According to site representatives, no radon surveys have been completed at the site. According to the USEPA's radon zone information for the site (as obtained from the EDR database report), the site is located in an area categorized as Zone 2, which has average indoor basement radon levels from 2 to 4 picoCuries per Liter (pCi/L). California tested radon levels at 21 properties in the zip code in which the site is located (i.e., 92346), and found that none of the sites surveyed found radon levels greater than 4 pCi/L and the maximum result for all sites surveyed was 2 pCi/L.	The USEPA's continuous exposure limit for radon, which is the limit at which further testing or remedial action is suggested, is 4.0 pCi/L. This USEPA continuous exposure limit applies to residential, not commercial, properties. The risk of exposure to radon is limited by the fact that, according to California's radon test results, no sites within the zip code have exceeded 2 pCi/L.

Notes:

Ramboll did not conduct a comprehensive survey for any of the issues noted above. Furthermore, Ramboll's observations were inherently limited and included only non-exhaustive visual observations.

5.3.1 Asbestos Containing Materials (ACMs)

Although an asbestos inspection and sampling of suspect building materials in conformance with established protocols (as outlined in 40 CFR §763), applicable state or local regulations, or industry standards, were beyond our scope of work, Ramboll made limited visual observations[4] of representative building materials in those areas accessed during the site tour to identify readily apparent PACM and suspect ACM. OSHA's definition of PACM is limited to thermal system insulation

[4] Ramboll did not observe all building materials or formally survey the facility to determine the presence and condition of PACM and suspect ACM.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

(TSI) and surfacing materials present in buildings constructed before 1981. Vinyl floor tiles are not considered PACM, but OSHA nonetheless requires that asphalt and vinyl floor tiles present in buildings constructed before 1981 be treated similarly to PACM. The term suspect ACM is not defined by OSHA but can include numerous building materials manufactured using asbestos currently or in the past (e.g., ceiling tiles, roofing materials, joint compound), as well as TSI, surfacing materials, and flooring materials installed after 1981.

Because most of the buildings at the site were constructed prior to 1981, including two small residential buildings on parcel 1192-621-03 built-in the 1930s, one residential building on parcel 1192-621-05 built-in the 1950s, one building occupied by Filipino Association of San Bernardino County on parcel 1192-621-09 built-in the 1960s, and one residential home occupied by Randy Tirb on parcel 1192-621-04 built-in 1979, and a comprehensive asbestos survey has not been conducted, TSI, surfacing materials and vinyl/asphalt flooring must be treated as PACM. Also, based on the building age, the roofing materials may be considered suspect ACM.

There are no regulatory requirements to remove PACM, suspect ACM and known ACM or to confirm whether building materials contain asbestos, unless the materials are damaged and have the potential to release fibers or the materials have the potential to be disturbed during renovation or demolition activities. Ramboll observed certain building materials that were damaged or deteriorating, specifically including the two small residential buildings on parcel 1192-621-03 built-in the 1930s. OSHA requires building owners and employers to identify locations of PACM and confirmed ACM at the facility and comply with certain employee notification, training, labeling and recordkeeping requirements (29 CFR §1910.1001(j)) and housekeeping programs (1910.1001(k)).

6. SURROUNDING PROPERTIES

The ASTM Phase I Standard requires an evaluation of the potential for migration of contamination onto the site from adjoining and other off-site properties. Ramboll's review of potential contamination risks posed by properties surrounding the site is presented below.

6.1 Current and Past Uses of Adjoining Properties and Surrounding Area

The site is located in a mixed industrial, commercial, and residential land use area, as summarized below. The nearest residence to the site is located adjacent to the site to the south.

The properties in the vicinity of the site have primarily been used for agricultural purposes (north, east, south, and west) since as early as the 1960s, with a few residences along Pomfret Road to the north and south. Ramboll did not observe obvious indications of environmental concern on the historical sources reviewed.

Table 8: Current and Past Uses of Adjoining Properties

Uses of Adjoining and Nearby Properties	Notable Past Uses and Approximate Time Period	Observations and Notes
North		
City Creek, a tributary of the Santa Ana River. Residential homes and vacant lots are present beyond the creek.	Undeveloped land (<1960) Residential (1966 – Present)	Ramboll did not observe conditions on or identify past uses of adjacent properties that represent a potential contamination concern to the site.
East		
Palm Avenue, beyond which is H & H General Contractors Inc, MEI Electrical Construction, KCB Offroad auto parts manufacturer, and vacant lots.	Undeveloped land (<1975) Small commercial/industrial buildings (1985 – Present)	H & H General Contractors is listed on databases related to generation of hazardous waste and ASTs and is further discussed in Section 6.2.1.
South		
Farmer Boys restaurant, vacant lots, Cool Distribution merchandise liquidator, and residential homes.	Undeveloped land (<1938) Residential homes (1949 – 1975) Residential home and small commercial buildings (1985 – Present)	Ramboll did not observe conditions on or identify past uses of adjacent properties that represent a potential contamination concern to the site.

Table 8: Current and Past Uses of Adjoining Properties		
Uses of Adjoining and Nearby Properties	**Notable Past Uses and Approximate Time Period**	**Observations and Notes**
West		
Residential homes and ongoing construction.	Undeveloped land (<1938) Residential homes (1949 – Present)	Ramboll did not observe conditions on or identify past uses of adjacent properties that represent a potential contamination concern to the site.
Notes: During the site visit, Ramboll walked or drove by the borders of the properties that are adjacent to the site. Ramboll did not enter the neighboring properties.		

6.2 Database Review for Off-site Properties

6.2.1 Adjoining Properties

Based on a review of the environmental database search report, Ramboll identified the adjoining property listed below on databases relating to known or potential past releases.

Table 9: Database Listings Relating to Known/Potential Releases at Adjoining Properties[1]		
Listing Name or Address and Location Relative to the Site	**Summary of Information Contained in Database**	**Ramboll's Comments**
H & H General Contractors Inc. 7919 Palm Avenue (Adjoining to the east)	The property is listed on the AST and CERS Tanks database for the presence of an on-site AST. The date of installation, contents, and size of the AST are not reported.	Because there is no indication of any spills or releases, this off-site listing does not suggest a contamination concern to the site.
Notes: [1] Ramboll's analysis of adjoining properties was based on observations made during the site reconnaissance and location information for off-site listings as presented in the database report. Also, for purposes of this analysis, Ramboll considers as "adjoining" properties that are adjacent, even if separated by a road or other physical barrier. Ramboll has not included a discussion of compliance-related databases in this table, as Ramboll considers it unlikely that off-site properties listed on compliance-related databases without indication of a release or chemical mishandling represent a potential risk for contamination to the site.

6.2.2 Other Surrounding Properties

There are several listings in the environmental database report for non-adjoining off-site facilities within applicable ASTM search radii; however, Ramboll has not identified any properties that are likely to represent a potential contamination concern to the site.[5]

Ramboll notes that the site is located approximately 0.18 miles northeast of the former Norton Air Force Base, which is listed on the National Priorities List (NPL). The northeast corner of the former Norton Air Force Base, the corner closest to the subject site, is referred to as Installation Restoration Program Site 2 (IRP Site 2) and was a former base landfill used between 1958 and 1980. This site is also listed on GeoTracker as a "Military Cleanup Site with Open-Verification Monitoring as of 7/31/2009" status. A landfill cover and cover gas collection and control system were installed and completed in 1998. Groundwater monitoring reports for the former Norton Air Force Base site indicate that groundwater flows to the southwest, away from the subject site. Therefore, contamination associated with the former Norton Air Force Base site does not extend northeast of the base in the direction of the site. Further, groundwater impacts at the former Norton Air Force Base have been remediated to the satisfaction of regulatory agencies and the base-wide groundwater monitoring program was discontinued in 2019.

The database report indicates that poor or inadequate address information was available for several properties located in the vicinity of the site; therefore, these properties could not be readily mapped by the third-party provider. Because the location of these properties with respect to the site could not be evaluated, Ramboll is limited in its ability to express an opinion regarding the potential for impact to the site from these properties. It was beyond the scope of this review to accurately locate each of the unmapped properties identified in the database report; however, Ramboll reviewed the list of unmapped properties and verified that none appeared to be adjacent to the site.

[5] Ramboll considered non-adjoining properties to represent a potential risk of contamination to the site only if they are listed on databases indicative of contamination, with open status, and located potentially upgradient of the site (as the issuance of regulatory closure suggests that impacts to the site from the noted off-site property are unlikely).

7. FINDINGS, OPINIONS, AND CONCLUSIONS

7.1 Findings, Opinions, and Conclusions

7.1.1 Recognized Environmental Conditions

Ramboll has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E1527-21 of the site at 27124-27280 Meines Street in Highland, California. Any exceptions to, or deletions from, this practice are described in Section 7.2 of this report. This assessment has revealed no evidence of RECs in connection with the site.

7.1.2 Other Findings

In addition, the following additional findings related to potential contamination concerns were identified:

- **Past Light Industrial Operations at the Site.** Metalworking operations by KCB Towers Inc. began at the site around 1982 and has continued to the present. There is no readily available information as to the specific use of chemicals in the past, but there is no indication that these operations were chemically intensive or involved the use of significant amounts of petroleum products or hazardous substances. Because of the nature of the operations, it is possible that the use of the site for metalworking operations involved the use of chlorinated solvents. The site is not listed on any environmental databases indicative of a release or of hazardous waste generation. Also, Ramboll notes that these operations were conducted during a time period when robust environmental regulations were in the process of being put in place regarding chemical handling and waste management. While it is possible that small-scale spills or releases of chemicals or petroleum products may have occurred in the past, Ramboll identified no specific contamination concerns (e.g., obvious evidence of contamination, former USTs, listings indicating past chlorinated solvent use in significant quantities, known releases), and thus this matter is not considered a REC.
- **Presence of Floor Drains and Below-Grade Grease Pits.** Two areas with floor drains and below-grade grease pits are located on the KCB Towers lot, one adjacent to the vehicle and equipment maintenance area on the northern portion of the lot and one adjacent to the refueling station on the southwest corner of the lot. The drains are used to collect, and the grease pits are used to contain, any fluid containing petroleum products or chemicals from each area. The pits (1,000-gallon capacity) are constructed of concrete and are pumped out for cleaning on a routine basis by a third-party. Ramboll could not evaluate the integrity of the pits at the time of the site visit and cannot rule out the possibility of leakage from the pits and contamination to the subsurface. Site representatives indicated that no breaches in the pit have been discovered during the cleanings, which include a visual inspection, and no spills or leaks have occurred. Documentation of the cleanings and inspections was not available. Because Ramboll's review did not identify documentation of a release, a suspected release, or a potentially material threat of a release of a hazardous substance or petroleum product related to this matter, it is not considered a REC.
- **Staining on Unpaved Ground.** Ramboll observed multiple areas of darkened staining from unknown substances on unpaved surface on parcel 1192-621-20 owned by Mark Mazzulla, in areas associated with vehicle storage, minor auto repair operations, and around drums of hazardous substances. Portions of the stains were covered, obscuring visibility, but the largest staining was approximately three feet by five feet in area. While the nature of the stain was not clear, the use of the lot is related to vehicle storage and vehicle maintenance has occurred on the lot. However, Ramboll considers this minor staining matter unlikely to be the subject of additional

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

investigation if brought to the attention of a regulatory authority and considers this matter to represent an Other Finding.

7.1.3 *De Minimis* Conditions

De minimis conditions are those that do not represent a material risk of harm to public health or the environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies. Ramboll identified the following *de minimis* conditions related to the site:

- **Septic System and Leach Field.** An active septic system and associated leach field are used to collect sanitary wastewater from the building owned by the Filipino Association of San Bernardino County on parcel 1192-621-09. Site representatives indicated that only sanitary waste is discharged to the system. Further, the system services a building that has not historically included manufacturing operations, no known discharges of hazardous materials to the system have occurred, and no floor drains are present other than routine restroom drains. Because of the nature of the reported discharge and the absence of known past releases to the septic system, it is unlikely to represent a threat to human health or the environment. Thus, Ramboll characterizes this finding as a *de minimis* condition.
- **Pavement and Floor Staining.** Ramboll observed multiple areas of exterior pavement and interior flooring where oil stains were apparent. Stains approximately three feet by five feet in area were observed around the hazardous waste drums in KCB Tower Inc's maintenance area. The stains were limited in areal extent, the underlying pavement/flooring appeared to be intact, and no stains appeared to reach floor drains or stormwater drains. As such, Ramboll considers this matter to represent a *de minimis* condition.

7.2 Analysis of Data Gaps

The ASTM Standard defines a data gap as "a lack of or inability to obtain information required by the practice despite good faith efforts by the environmental professional to gather such information." A data gap is only significant if other information obtained during the ESA, or professional experience, raises reasonable concerns and affects the ability of the environmental professional to identify whether a given issue is a REC. The ASTM Standard requires that the ESA report identify and comment on significant data gaps.

Limiting conditions and deviations to the ASTM Standard for the assessment are discussed below.

- Site representatives did not have current contact information for representatives of former site owners/occupants or all current property owners. Ramboll made reasonable attempts to obtain such information, but it was not otherwise readily available. Thus, Ramboll was unable to interview former owners/occupants about historical operations and site conditions or all current property owners. However, Ramboll conducted interviews with representatives of KCB Towers Inc. with tenure at the site dating back to 1989, Mazzulla Offroad with tenure at the site dating back to 1999, Randy Tirb with tenure at the site dating back to 2001, and Tyler Plata, a representative of Robert Forshay and the Filipino Association of San Bernardino County, and reviewed other historical sources regarding former uses of the site.
- During the site visit, parcel 1192-621-09 owned by the Filipino Association of San Bernardino County was inaccessible due to a closed gate. The parcel and the building on this parcel were observed from perimeter areas. Based on the information provided by site representatives regarding this parcel, this limitation is not considered to have affected the analysis of site

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

conditions. In addition, Ramboll did not observe the roofs of the buildings due to access and safety constraints.

- As it is a user requirement, Ramboll did not conduct a review of records to identify whether any environmental liens or AULs have been imposed on the site.

None of the exceptions, deletions, deviations, or site reconnaissance limitations noted above is considered to represent significant data gaps.

8. ASTM DEFINITIONS

The following definitions are presented in the ASTM Standard:

REC - Recognized Environmental Condition:

(1) The presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.
