 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   138 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    983489.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_2.5

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    138 Source(s);       5 Source Group(s); and     945
Receptor(s)

                with:      2 POINT(s), including
```

```
                    0 POINTCAP(s) and      0 POINTHOR(s)
               and:    136 VOLUME source(s)
               and:      0 AREA type source(s)
               and:      0 LINE source(s)
               and:      0 RLINE/RLINEXT source(s)
               and:      0 OPENPIT source(s)
               and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
               and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    15.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                              ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      4.2 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Good Sam_Ops_1.err

 **File for Summary of Results:   Good Sam_Ops_1.sum

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =    983489.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: TOG

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:      1 Source(s);       2 Source Group(s); and     945
Receptor(s)

                with:      0 POINT(s), including
```

```
                    0 POINTCAP(s) and      0 POINTHOR(s)
               and:      0 VOLUME source(s)
               and:      1 AREA type source(s)
               and:      0 LINE source(s)
               and:      0 RLINE/RLINEXT source(s)
               and:      0 OPENPIT source(s)
               and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
               and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    15.50 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0

Subject: Tree Inventory and Evaluation for Good Samaritan Hospital, San Jose, Santa Clara County, California

Dear Mr. Leung:

LSA conducted a tree inventory and evaluation of all trees associated with the Good Samaritan Hospital, located at 2425 Samaritan Drive in San Jose, Santa Clara County, California (see **Attachment A, Figure 1**). The purpose of this inventory was to document existing conditions with the approximately 20-acre project site composed of Assessor's Parcel Numbers 421-36-009 and 421-36-011. The project site is bounded by State Route 85 to the north, Samaritan Place to the east, Samaritan Drive to the south, and medical office buildings to the west.

The proposed project consists of three phases. The first phase would include construction of a new hospital wing and a new parking structure to accommodate the hospital's existing acute care facilities and operations. The second phase would include construction of an additional hospital wing, a medical office building, additional floors on the first phase parking structure, and an additional parking structure. The optional third phase would remove the existing hospital and construct additional parking. Hospital facility upgrades are required for the hospital to meet seismic compliance guidelines established by Senate Bill 1953, stay up to date with current hospital care guidelines, and keep up with changes in the healthcare industry.

METHODS

Field Survey and Evaluation

LSA inventoried and evaluated trees within the project site with a single main stem of at least 6 inches in diameter at breast height (DBH)[1]. The primary objective of the review was to document existing trees and determine if any trees qualify as an "ordinance tree", "street tree", or "heritage tree" as defined by the City's Tree Ordinance.

[1] Diameter at breast height, or DBH, is normally measured at 54 inches above the average ground height. Exceptions include leaning trees, trees on sloped terrain, and trees with low branches or multiple stems. Leaning trees or trees on sloped terrain are measured at a right angle to the trunk, 54 inches from the ground height along the center axis of the trunk. Trees with branches below 54 inches are measured at the smallest diameter below the smallest branch. Trees with multiple stems (from ground level) are measured at 54 inches from the average ground height for each stem. A combination logger/diameter tape was used to measure DBH.

All trees identified on the site were marked with a green anodized aluminum, square shaped numbered tag (image to right). Each tag was labeled: LSA, Tree Tags, and a pre-stamped number. Tags were attached with a galvanized 8D nail at 6 feet above ground level.

LSA performed a Level 2 – Basic Visual Assessment in accordance with the ISA's Best Management Practices. This assessment level is limited to the observation of conditions and defects that are readily visible from the ground. No laboratory or chemical testing or analysis was performed.

Data collected included species identification and measurements of DBH, height, and canopy spread. Each tree was also evaluated for overall health (including a rating) and recommendations were noted as applicable.

Due to the timing of the survey in early spring and the unusually wet winter, deciduous trees were largely lacking leaves, fruit, or other identifying characteristics. This made species identification and overall tree health difficult to establish. All efforts were made to identify each tree to species or genus, however trees which could not be identified are listed as "Unknown". Additionally, all deciduous species were assigned a health rating of 3 – "Good" unless other visual signs (e.g., wounds, loss of bark, structural issues, fungal fruiting bodies, disease) were noted to warrant a less favorable rating.

Personnel

LSA arborist Anna Van Zuuk, International Society of Arboriculture (ISA) Certified Arborist #WE-12612A, conducted a field visit on March 28–30, 2023. LSA botanist Hannah de la Calle assisted the tree inventory and evaluation.

CITY OF SAN JOSE TREE ORDINANCE (CHAPTERS 13.28 AND 13.32)

LSA reviewed the City of San Jose's (City) municipal code[2] (updated July 31, 2023) to determine which ordinances (if any) were applicable to the project. 'Chapter 13.28 – Street Trees, Hedges, and Shrubs' and 'Chapter 13.32 – Tree Removal Controls' contain the City's policies which apply to tree resources. The full language of the County ordinance can be viewed online, however the following definitions and policies are applicable to this report.

Definitions – Sections 13.28.010-105 and 13.32.020

The following definitions govern the application, interpretation, and construction of the City's Tree Ordinance:

[2] City of San Jose. 2023. Municipal Code City of San Jose, California. Codified through Ordinance No. 30929. Adopted June 20, 2023. (Supp. No. 42, Update 4). Online content updated on July 31, 2023. Available online at: https://library.municode.com/ca/san_jose/codes/code_of_ordinances (accessed August 6, 2023).

- “American National Standards Institute (ANSI)” means the most current version of the ANSI A300 (Part 1 – Pruning) setting forth the standards and practices for the care and protection of trees, shrubs, hedges, and other plants.

- "Certified arborist" means an individual who has demonstrated knowledge and competency of arboriculture through the obtainment of an arborist certification from the International Society of Arboriculture, or its successor organization if that organization no longer exists, or who is a member of the American Society of Consulting Arborists, or its successor organization if that organization no longer exists.

- “Critical root zone” means a defined circular area around a tree with a radius measured to the nearest foot of the tree’s longest dripline radius plus one foot.

- “Dead” or "Dead tree" means a tree that is no longer alive, has been damaged beyond repair, or is in an advanced state of decline (where an insufficient amount of live tissue, green leaves, limbs or branches exists to sustain life) and has been determined to be in such a state by a certified arborist during a non-dormant or other natural stage of the tree that would minimize the likelihood that the tree would be mistakenly identified as being in such a dead state.

- "Director" means the Director of Planning, Building and Code Enforcement of the City of San José or such other person designated by the City Manager to administer and enforce the provisions of this Chapter.

- "Dripline" means the area around the base of a tree directly under the canopy cover of the tree and extending out as far as the canopy.

- "Hazardous condition" shall mean any tree that is or appears to be: (i) dead; (ii) likely to fall; (iii) seriously diseased; (iv) an obstruction or potential obstruction to pedestrian or vehicular travel in any street; (v) an obstruction or potential obstruction to any traffic signs, traffic controls, streetlights, regulatory sign, or similar type of equipment or sign; or (vi) in a condition that is detrimental to the public health, safety, or general welfare.

- "Imminently hazardous condition" shall mean a hazardous condition which presents an immediate threat to the health, safety or general welfare of persons or property and/or the public which requires immediate action to abate.

- "Invasive Tree" means any Tree that is both non-native and able to establish on many sites within the South San Francisco Bay Area, grow quickly, and spread to the point of disrupting local plant communities or ecosystems.

- "Live tree" means any tree that is not a dead tree.

- "Ordinance tree" means a tree defined in this section hereinbelow and whose removal or topping is covered by and subject to the provisions of this Chapter.”

- “Planting easement” means an easement in the name of the city for planting trees, shrubs or hedges contiguous to the public right-of-way for vehicular traffic.

- “Remove” means eliminate, take away, uproot or destroy. For purposes of this Chapter, “remove” also means taking any action that reasonably and foreseeably will lead to the death of a tree or to permanent significant damage to the health or structural integrity of a tree. Such actions can include, without limitation and by way of example, excessive pruning, cutting, girding, poisoning, or watering of a tree; the unauthorized relocation or transportation of a tree; excessive excavation, alteration, or grading of the soil within the dripline of a tree, or excessively bruising, tearing or breaking the roots, bark, trunk or branches of a tree.

- “Street” means a public right-of-way owned by or under the control of the City of San Jose whose primary function is to carry vehicular traffic and shall also include sidewalks, park strips and planting easements.

- “Street tree” means any tree that is planted on a street.

- “Topping” means cutting the branches of an ordinance tree in a manner that destroys the existing symmetrical appearance or natural shape of the tree and involves the removal of main lateral branches and leaving the trunk of the tree or major branches of the tree with a stub appearance.

- “Tree” means any live or dead woody perennial plant characterized by having a main stem or trunk which measures thirty-eight (38) inches or more in circumference (12 inches in diameter) at a height of fifty-four (54) inches above natural grade slope. For purposes of this Chapter, a multi-trunk tree shall be considered a single tree and measurement of that tree shall include the sum of the circumference of the trunks of that tree at a height of fifty-four inches above natural grade slope. "Tree" shall include the plural of that term.

- “Unsuitable Tree” means a live tree or dead tree on a lot that is used for a one-family dwelling as defined in Section 20.200.320, a two-family dwelling as defined in Section 20.200.330 or any other land use as defined in Title 20 of the San José Municipal Code, where the tree is not a heritage tree as defined in Section 13.32.140, a candidate for heritage tree status, or a palm tree in the Palm Haven Conservation Area and meets at least one of the following criteria:

    1. On any lot used for a one-family dwelling, two-family dwelling, or multi-family dwelling, the part of the tree trunk nearest to the one-family dwelling, two-family dwelling, or multi-family dwelling including any secondary unit or garage on the same lot is five (5) feet or less from the nearest above-grade part of the one-family dwelling, two-family dwelling, or multi-family dwelling, including secondary unit or garage; or

    2. On any lot, the part of the tree trunk nearest to a below-grade utility pipe or line is five (5) feet or less from the centerline of that below-grade utility pipe, below-grade utility line; or

    3. On a lot used for a one-family dwelling or a two-family dwelling, the tree belongs to a species that has been found by the City Council to be uniquely less compatible with the

immediate environment because the species is invasive or non-native to the San José region or is susceptible to disease. Such tree species shall be placed on an Unsuitable Tree species list which shall be adopted by the City Council by resolution, which resolution may be amended from time to time to add or delete certain tree species.

4. A Tree on any lot that creates an Imminently Hazardous Condition as evidenced by a report prepared and executed by a certified arborist that is submitted to the Director documenting that the tree creates an Imminently Hazardous Condition pursuant to the definition set forth in Section 13.32.020 above.

(Prior code § 8931; Ords. 29000, 21363, 26595, 29195, 30057.)

Heritage Trees – Sections 13.28.220, 13.32.140

a. Any tree as the term "tree" is defined which, because of factors including but not limited to its history, girth, height, species or unique quality, has been found by the city council to have a special significance to the community shall be designated a heritage tree. Such trees shall be placed on a heritage tree list which shall be adopted by the city council by resolution, which resolution may be amended from time to time to add to or delete certain trees therefrom.

b. Any person who unlawfully vandalizes, grievously mutilates, removes or destroys such a heritage tree shall be subject to any appropriate enforcement action by the city, including without limitation the imposition of an administrative citation with the imposition of a civil penalty in the amount up to thirty thousand dollars or set forth by resolution of the city council for each such tree so vandalized, mutilated, removed or destroyed within a three-year period, the collection of which shall be enforced by civil action brought in the name of the city by the city attorney.

(Ords. 29000, 21362, 26595.)

Activities Requiring a Permit – Sections 13.28.300-310, 13.32.030-041

The City's Tree Ordinance considers the following actions to be unlawful unless a permit has been issued or the activity is required:

- Planting or installation of a street tree (Section 13.28.300);
- Pruning or removal of a street tree, or conducting any construction work or activity that may affect the critical root zone of a street tree (Section 13.28.310);
- Removal of any live tree from any private parcel of land in the City (Section 13.32.030);
- Removal of a dead tree from any private parcel of land in the City (Section 13.32.040);
- Removal of an unsuitable tree from any private parcel of land in the City (Section 13.32.041);

(Prior code § 8932; Ords. 29000, 21363, 26595.)

Development Permit Combined – 13.28.330, 13.32.080

The request for a street tree planting or tree removal permit pursuant to the provisions of these chapters may be included as part of an application for a development permit under the provisions of Title 20 of this Municipal Code. Where the request for a tree removal permit is included as a part of a development permit application under Title 20, the development permit may serve as the tree removal permit and be processed under the application, noticing, hearing and appeal provisions applicable to the development permit application, and no separate tree removal permit application and tree removal permit shall be required, so long as all of the substantive provisions and permit processing requirements of this chapter are met as a part of processing that development permit application.

(Ord. 29000, 26595.)

Safeguarding Trees During Construction - 13.32.130

For the purpose of safeguarding trees during construction, all of the following conditions shall apply to all such trees except for trees for which a tree removal permit has been issued or which are required to be removed pursuant to Chapter 13.28:

a. Prior to the issuance of any approval or permit for the construction of any improvement on the building site, all trees on the site shall be inventoried by the owner or contractor as to size (including diameter/circumference), species and location on the lot and the inventory shall be submitted on a topographical map to the director; and

b. Damage to any tree during construction shall be immediately reported by a person causing the damage, the responsible contractor, or the owner to the director, and the contractor and/or owner shall treat the tree for damage in the manner specified by the city arborist; and

c. No construction equipment, vehicles or materials shall be stored, parked or standing within the tree dripline; and

d. Drains shall be installed according to city specifications so as to avoid harm to trees due to excess watering; and

e. Wires, signs and other similar items shall not be attached to trees; and

f. Cutting and filling around the base of trees shall be done only after consultation with the city arborist and then only to the extent authorized by the city arborist; and

g. No paint thinner, paint, plaster or other liquid or solid excess or waste construction materials or wastewater shall be dumped on the ground or into any grate between the dripline and the base of the tree or uphill from any tree where certain substances might reach the roots through a leaching process; and

h. Fencing shall be installed outside the canopy of the tree to the dripline unless otherwise directed by the certified arborist to prevent injury to trees making them susceptible to disease causing organisms; and

i. Wherever cuts or soil disturbances are made in the ground near the roots of trees, appropriate measures shall be taken to prevent exposed soil from drying out and causing damage to tree roots as prescribed in a certified arborist report.

(Ords. 21362, 26595, 30057.)

RESULTS

A total of 414 trees (**Table A**) were inventoried and evaluated within the project site or on adjacent private property with potential canopy or root zone intrusion into the project site (see **Attachment A, Figure 2**).

Of the 414 trees that were inventoried, 161 qualify as "ordinance trees" and 44 qualify as "street trees" (of which 18 trees also qualify as ordinance trees) as defined by the City's tree ordinance. All trees identified within the survey area are summarized in **Table A** below and shown in **Figure 2**. A table listing all trees species, their size, general health, and any supporting notes or recommendation is included in **Attachment B**. Ordinance trees are highlighted green in **Attachment B** and are noted with a green tree tag label in **Figure 2**; street trees are highlighted blue in **Attachment B** and are noted with a blue tree tag label in **Figure 2** (if not also an ordinance tree).

LSA queried the City's heritage tree database[3] on June 8, 2023, and determined that one heritage tree is listed as occurring within the project site. This listing (File No. HT-09-001) is for a coast live oak at the entrance of Good Samaritan Hospital with a diameter of 52 inches. Based on the photograph included in the listing (dated July 31, 1995) and the trees inventoried within the project area, this tree is no longer present within the project site. No information could be located regarding the tree's removal or failure.

Due to the nature of the project, the vast majority of the existing 414 trees would be removed during construction. Approximately 44 trees would be retained – several trees in the northwest corner of the project site around the helipad (Tree Nos 132, 135-138, and A4430 – A4432), a grove of oaks in the central portion of the site near the northern boundary (Tree Nos A4433 – A4452), a line of planted trees along the western wall of the existing hospital (Tree Nos A4662 – A4670), and a cluster of mature trees at the hospital entrance at the junction of Samaritan Place and Samaritan Drive (Tree Nos. A4614 – A4615, A4619, and A4621 – A4624). The project is being designed to retain the maximum number of trees practicable, and more trees may be retained than those mentioned above.

* Includes 18 trees which also qualify as ordinance trees.
TBR = to be removed

GENERAL RECOMMENDATIONS

Due to the evolving nature of the project design, the following recommendations are intended to apply to all retained trees and tree removals within the project site and are not specific to any one tree. The tree protection measures, in combination with the safeguards outlined in the City's tree ordinance (Section 13.32.130, above), will ensure that any construction impacts to retained trees will be minimal. Additionally, tree replacement requirements and in-lieu fee options to compensate for tree removals are outlined below.

Tree Protection Measures for Retained Trees

Tree Protection During Construction

Trees to be retained should be enclosed in a tree protection zone (TPZ) to prevent direct damage to the trees and their growing environment during construction. A TPZ fence should be installed around each tree or group of trees at a distance no less than 5 feet outside the dripline (canopy). In no case should the TPZ fence be less than 10 feet from the trunk of the tree. The fencing should be installed before site preparation, construction activities, or tree trimming begins and should consist of blaze orange barrier fencing supported by metal "T-rail" fenceposts.

Tree Maintenance Prior to and During Construction, Canopy

It may be necessary to trim the canopy of a tree to reduce the hazard of accidental limb failure or to allow the movement of construction machinery. Although no specific branch or branches are recommended for removal, planned tree work should consider removing dead, crossed, and/or malformed limbs. All branches to be removed should be pruned back to an appropriately sized lateral or to the trunk by following proper pruning guidelines. It is recommended that a professional tree company with certified arborists be retained to do this work. If accidental damage of tree trunks and limbs should occur during constriction, a professional arborist should be consulted to properly address these issues. Tree trimming should not be allowed to be performed by construction personnel.

Tree Maintenance Prior to and During Construction, Root Zones

Tree roots often extend far beyond the canopy dripline. To reduce the root shock trees are likely to experience during construction, a watering schedule should be initiated a minimum of 30 days prior to the start of construction. During construction, supplemental irrigation should be applied as needed based upon seasonal temperatures and soil moisture. An arborist can help determine the watering schedules.

If encroachment into the TPZ cannot be avoided, the design should consider special construction to allow the roots to breathe and obtain water. In situations where construction leads to excavation work within the dripline of trees, this work should be done with light equipment or by hand whenever possible to avoid tearing large diameter roots. All roots encountered during excavation should be cut with a sharp blade, taking care not to rip the roots. Excavation adjacent to any retained tree should not be permitted where damage to the large structural or fibrous matting root system will result. Root removal that jeopardizes the structural integrity or the health of the tree should be avoided. The existing ground surface within the TPZ should not be cut, filled, compacted,

or paved. Root collars should not be buried when exposed roots are backfilled with native soil to a natural grade. Any root pruning required for construction purposes should receive the prior approval of and be supervised by a certified arborist or a consulting arborist retained for the supervision of tree work on site.

Methods or treatments used to minimize damage to nearby roots may include root pruning prior to grading, use of retaining walls with discontinuous footings avoiding large structural roots, use of paving sections that require a minimum amount of excavation, and the use of air and water pervious pavement. If pervious pavement cannot be used, then a root aeration system should be considered. There are many different methods and designs for venting impervious pavement for root aeration, and a professional arborist can assist the developer in finding the best solution.

Activities Prohibited Within Canopy Driplines

Heavy machinery should not be allowed to operate or park within the TPZ, nor should any excess soil, chemicals, debris, equipment, or other materials be dumped or stored within the TPZ or upslope of the protected trees. If it is necessary for heavy machinery to operate within the dripline of the preserved protected trees, then a layer of mulch or pea gravel at least 4 inches in depth should be placed on the ground beneath the dripline. A ¾-inch sheet of plywood should be placed on top of the mulch. The plywood and mulch will reduce compaction of the soil within the dripline. Debris or materials shall not be placed within TPZs or against tree trunks.

Tree Replacement

The replacement tree requirements outlined the **Table B** below were provided by the City's Planning Division for this project:

Table B: City of San Jose Tree Replacement Requirements

Circumference of Tree to be Removed (measured at 4.5 feet above ground)	Type of Tree to be Removed		Minimum Size of Each Replacement Tree
	Native	Non-Native	
38 inches or greater	5:1	4:1	15-gallon
18 – 38 inches	3:1	2:1	15-gallon
Less than 18 inches	1:1	1:1	15-gallon

Source: City of San Jose (2023).
x:x = tree replacement to tree loss ratio.
A 24-inch box tree can be used in lieu of two 15-gallon trees.

There are a total of 31 species of trees present in the project site, only three of which are native to California: California fan palm, coast live oak, and coast redwood. The remaining 28 tree species are non-native species. For the purposes of this calculation, all 'Unknown' species are considered non-native tree species.

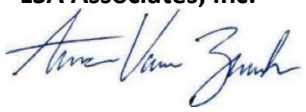
Based on this information, the project would be required to provide a minimum of 920 15-gallon replacement trees: 336 for the loss of native tree species and 584 for the loss of non-native tree species. A 24-inch box tree may be used in place of two 15-gallon trees, which would equate to 460 24-inch box trees: 068 for the loss of native tree species and 292 for the loss of non-native tree species. Tree replacements are summarized below in **Table C**.

Table C: Required Replacement Trees for the Project

Circumference of Removed Tree	Number of Trees to be Removed		Replacement Ratio		Required Replacement Trees (15-gallon / 24-inch box)	
	Native	Non-Native	Native	Non-Native	Native	Non-Native
38 inches or greater	40	77	5:1	4:1	200 / 100	308 / 154
18 – 38 inches	39	122	3:1	2:1	117 / 58 + 1 15-gallon	244 / 122
Less than 18 inches	19	32	1:1	1:1	19 / 9 + 1 15-gallon	32 / 16
Total	**98**	**231**	**–**	**–**	**336 / 168**	**584 / 292**

If the project site does not contain sufficient area to accommodate the required replacement tree plantings, the project may choose one of the following options:

- Replacement trees may be planted at an off-site location deemed appropriate by the Director of Planning within the City of San Jose (City of San Jose Tree Ordinance Section 13.32.110.C); or



- Pay an in-lieu fee to the City prior to the issuance of the Public Works grading permit(s) in accordance with the approved City Council Fee Schedule. The current fee schedule, effective August 15, 2022, lists a fee of $775 per tree.

On-site or off-site replacement trees must remain alive for 3 years after planting. Any replacement tree that fails within 3 years after planting shall be promptly replaced (City of San Jose Tree Ordinance Section 13.32.110).

If you have any questions, please contact me at (916) 844-2983 or at anna.vanzuuk@LSA.net.

Sincerely,

LSA Associates, Inc.

---	Holly oak	Quercus ilex	5	15.70795	---	---	---	DBH <6". Not tagged.
---	Japanese maple	Acer palmatum	4	12.56636	---	---	---	DBH <6". Not tagged.
---	Sycamore	Platanus sp.	5.5	17.278745	---	---	---	DBH <6". Not tagged.
---	Sycamore	Platanus sp.	5	15.70795	---	---	---	DBH <6". Not tagged.
---	Unknown	---	11	34.55749	28	12.5	3	Inaccessible, not tagged. No leaves.
---	Unknown	---	7	21.99113	26	12	3	Inaccessible, not tagged. No leaves.
---	Unknown	---	9	28.27431	27	12	3	Inaccessible, not tagged. No leaves.
---	Washington hawthorn	Crataegus phaenopyrum	---	---	---	---	---	DBH <6". Not tagged.
---	Washington hawthorn	Crataegus phaenopyrum	---	---	---	---	---	DBH <6". Not tagged.
113	Holly oak	Quercus ilex	23	72.25657	29	17	4	Growing in 12' planting strip.
114	Holly oak	Quercus ilex	17.5	54.977825	23.5	14	3	Growing in 12' planting strip.

Tree #	Common Name	Scientific Name	DBH Combined (inches)	Circumference (inches)	Height (feet)	Canopy Radius (feet)	Health	Notes
115	Holly oak	Quercus ilex	18	56.54862	19.5	17.5	4	Growing in 12' planting strip. DBH taken @ 2' below branching. Minimal basal sprouting.
117	Holly oak	Quercus ilex	14.25	44.7676575	18.5	12	4	Growing in 12' planting strip.
118	Holly oak	Quercus ilex	5	15.70795	---	---	---	DBH <6". Not tagged.
119	Holly oak	Quercus ilex	9	28.27431	14	9	0	Growing in 12' planting strip. Only live vegetation basal, adventitious sprouts.
120	Holly oak	Quercus ilex	15.5	48.694645	20.5	18	4	Growing in 12' planting strip. DBH taken @ 4' below branching. Basal sprouting.
121	Sawleaf zelkova	Zelkova serrata	18	56.54862	15	12	3	Growing in 12' planting strip. Basal sprouting.
122	Holly oak	Quercus ilex	7.25	22.7765275	10	7.5	3	Growing in 12' planting strip. DBH taken @ 4' below branching. Basal sprouting.
123	Holly oak	Quercus ilex	5.5	17.278745	14	---	---	DBH <6". Not tagged.
124	Holly oak	Quercus ilex	17	53.40703	23.5	19.5	4	Growing in 12' planting strip. DBH taken @ 3' below branching.
125	Holly oak	Quercus ilex	29	91.10611	25	17	4	Growing in 12' planting strip. Minor limb dieback.
126	Coast live oak	Quercus agrifolia	4.75	14.9225525	---	---	---	DBH <6". Not tagged.
129	Holly oak	Quercus ilex	17	53.40703	28	18.75	3	Growing in 5' planting strip. Basal, adventitious sprouting. Sparse canopy.
132	Coast live oak	Quercus agrifolia	6.75	21.2057325	15	10.5	3	Growing in 5' planting strip.
135	Purple-leaf plum	Prunus cerasifera 'Atropurpurea'	7.25	22.7765275	14.5	9	3	Surrounded by oleander.
136	Cherry plum	Prunus cerasifera	6.25	19.6349375	11	9	3	Surrounded by oleander. Flowering, few leaves.
137	Purple-leaf plum	Prunus cerasifera 'Atropurpurea'	7.25	22.7765275	9	9	2	DBH taken below trunk split. Surrounded by oleander. Minimal live canopy (competition with oleander). Bird nest.
138	Siberian elm	Ulmus parviflora	8	25.13272	18.5	14	3	Surrounded by oleander. Same species as RUP2101. Sparse canopy.
221	Holly oak	Quercus ilex	15.5	48.694645	19.5	14	3	Growing in 12' planting strip.
A4367	Coast live oak	Quercus agrifolia	10.75	33.7720925	15	10.25	2	Growing in 4' planting strip, shrubs on either side. Foliar chlorosis, sparse canopy.
A4368	Coast live oak	Quercus agrifolia	10	31.4159	15	6.5	2	Growing in 4' planting strip, shrubs adjacent. Foliar chlorosis, sparse canopy.
A4369	Coast live oak	Quercus agrifolia	9.75	30.6305025	16	8.5	3	Growing in ~5' planting island, decomposed granite surrounding. Water sprouts on main trunk.
A4370	Holly oak	Quercus ilex	13.75	43.1968625	17.5	14.5	3	Growing in 6' planting strip. DBH taken at 3' below branching.
A4371	Holly oak	Quercus ilex	7.5	23.561925	12	8	2	Growing in 6' planting strip. Foliar chlorosis, interior rot.
A4372	Holly oak	Quercus ilex	12.75	40.0552725	17.5	14.5	3	Growing in 6' planting strip. DBH taken @ 2' below branching. Wounds on S side from branch loss. Adventitious sprouts along trunk, scaffold branches.
A4373	Holly oak	Quercus ilex	9.5	29.845105	13	7.75	1	Growing in 6' planting strip. DBH taken @ 4' below partially girdling support wire. Canopy dieback.
A4374	Coast live oak	Quercus agrifolia	8	25.13272	14	7.75	3	Growing in 5' planting island. Minor adventitious sprouting from trunk. Bird nest
A4375	Holly oak	Quercus ilex	10	31.4159	15	10.75	3	Growing in 6' planting strip. Basal sprouts.
A4376	Holly oak	Quercus ilex	9.25	29.0597075	14	9	2	Growing in 6' planting strip. Sparse canopy. Lots of lower limbs removed, good wound response.
A4377	Holly oak	Quercus ilex	25.25	79.3251475	14	10	2	Growing in 6' planting strip. Multiple stems. Trunk wounds. Sparse canopy.
A4378	Holly oak	Quercus ilex	9	28.27431	14	10	2	Growing in 6' planting strip. Large trunk wound on S side, poor wound response.
A4379	Holly oak	Quercus ilex	8	25.13272	14	8	3	Growing in 6' planting strip. Basal sprouts.
A4380	Holly oak	Quercus ilex	9.5	29.845105	14	10	3	Growing in 6' planting strip.
A4381	Coast live oak	Quercus agrifolia	9	28.27431	12	11	3	Growing in 4.5' planting strip.
A4382	Coast live oak	Quercus agrifolia	10	31.4159	14	13	3	Growing in 5' planting island. Large limb lost on W side, good wound response.
A4383	Holly oak	Quercus ilex	15.5	48.694645	15	13.5	3	Growing in 4x7 planting area. Bird nest (x3).
A4384	Holly oak	Quercus ilex	11	34.55749	13.5	11.5	3	Growing in 8' planting strip.
A4385	Holly oak	Quercus ilex	10.25	32.2012975	12	11	3	Growing in 8' planting strip.
A4386	Holly oak	Quercus ilex	14.25	44.7676575	21	13.5	3	Growing in 8' planting strip. Sparse canopy.
A4387	Holly oak	Quercus ilex	9	28.27431	12	8	2	Growing in 8' planting strip. Lots of adventitious sprouts up trunk.
A4388	Holly oak	Quercus ilex	10.5	32.986695	12	10.5	1	Growing in 8' planting strip. Major canopy dieback. Lots of adventitious sprouts.
A4389	Holly oak	Quercus ilex	12.5	39.269875	14.5	12	2	Growing in 8' planting strip. Large limb die off on S side.
A4390	Holly oak	Quercus ilex	11.25	35.3428875	14	14	3	Growing in 6' planting strip. Some basal sprouting.
A4391	Holly oak	Quercus ilex	11	34.55749	14.5	10	2	Growing in 6' planting strip. Wounds on S side of trunk, poor response. Adventitious sprouting, some canopy dieback.
A4392	Holly oak	Quercus ilex	8.75	27.4889125	14	10	3	Growing in 6' planting strip. Minor basal sprouting. Canopy limbs removed on S side, some rot.
A4393	Holly oak	Quercus ilex	10	31.4159	16	10	2	Growing in 6' planting strip. Moderate canopy dieback.
A4394	Holly oak	Quercus ilex	14.5	45.553055	21	13.5	3	Growing in 6' planting strip. Minor basal sprouting, canopy dieback.
A4395	Coast live oak	Quercus agrifolia	6.5	20.420335	14	8	3	Growing in 5' planting island.
A4396	Coast live oak	Quercus agrifolia	7.5	23.561925	14	8	2	Growing in 5' planting island. Lots of adventitious sprouting, small leaves.
A4397	Holly oak	Quercus ilex	11	34.55749	17	11.5	3	Growing in 6' planting strip. Adventitious sprouting.
A4398	Holly oak	Quercus ilex	9.25	29.0597075	15.5	8	3	Growing in 6' planting strip. Adventitious sprouting.
A4399	Holly oak	Quercus ilex	10	31.4159	13	11	3	Growing in 6' planting strip. Minor basal sprouting.
A4400	Holly oak	Quercus ilex	11.5	36.128285	16	11	3	Growing in 6' planting strip.
A4401	Holly oak	Quercus ilex	12.5	39.269875	21	12.5	2	Growing in 8' planting strip. Canopy dieback.
A4402	Holly oak	Quercus ilex	12	37.69908	15	12	3	Growing in 6' planting strip.

Tree #	Common Name	Scientific Name	DBH Combined (inches)	Circumference (inches)	Height (feet)	Canopy Radius (feet)	Health	Notes
A4403	Holly oak	Quercus ilex	10	31.4159	15	11	2	Growing in 6' planting strip. Canopy dieback. Adventitious and basal sprouting.
A4404	Holly oak	Quercus ilex	8	25.13272	10	7	3	Growing in 6' planting strip. Minor branch dieback.
A4405	Holly oak	Quercus ilex	10	31.4159	12	12.5	2	Growing in 6' planting strip. Adventitious sprouting, limb dieback.
A4406	Holly oak	Quercus ilex	11	34.55749	17	12.25	3	Growing in 6' planting strip. Adventitious sprouting.
A4407	Coast live oak	Quercus agrifolia	7.25	22.7765275	14	10.5	3	Growing in 5' planting island. Minor adventitious sprouting.
A4408	Coast live oak	Quercus agrifolia	6.5	20.420335	12	8	3	Growing in 5' planting island. Adventitious sprouting.
A4409	Holly oak	Quercus ilex	10.25	32.2012975	13	11.5	3	Growing in 7' planting strip.
A4410	Holly oak	Quercus ilex	10.5	32.986695	17	10	3	Growing in 7' planting strip. Nest on N side.
A4411	Holly oak	Quercus ilex	12	37.69908	17	13	3	Growing in 7' planting strip. Minor basal sprouting.
A4412	Holly oak	Quercus ilex	8.5	26.703515	16	11	3	Growing in 7' planting strip.
A4413	Holly oak	Quercus ilex	10.5	32.986695	15	11	3	Growing in 7' planting strip.
A4414	Holly oak	Quercus ilex	9.75	30.6305025	16	11.5	2	Growing in 7' planting strip. Basal sprouting, canopy dieback on E side.
A4415	Holly oak	Quercus ilex	13	40.84067	16	13.75	2	Growing in 7' planting strip. Canopy dieback. Minor adventitious, basal sprouting.
A4416	Coast live oak	Quercus agrifolia	6	18.84954	12	8.5	3	Growing in 5' planting island. Bird nest.
A4417	Coast live oak	Quercus agrifolia	8	25.13272	12	3	3	Growing in 5' planting island. Adventitious sprouting.
A4418	Holly oak	Quercus ilex	9.25	29.0597075	21	14	2	Growing in 6' planting strip. Canopy dieback.
A4419	Holly oak	Quercus ilex	16	50.26544	20	12.75	3	Growing in 6' planting strip.
A4420	Holly oak	Quercus ilex	12.5	39.269875	20	17	3	Growing in 6' planting strip. Minor canopy dieback on N side.
A4421	Holly oak	Quercus ilex	12	37.69908	18	12.25	3	Growing in 6' planting strip.
A4422	Holly oak	Quercus ilex	6.5	20.420335	8	6.75	2	Growing in 6' planting strip. Interior rot in some scaffold limbs.
A4423	Coast live oak	Quercus agrifolia	8.5	26.703515	12	8.5	3	Growing in 5' planting island.
A4424	Coast live oak	Quercus agrifolia	8	25.13272	15.5	12.25	3	Growing in 5' planting island.
A4425	Holly oak	Quercus ilex	7.25	22.7765275	13	8.75	3	Growing in 7' planting strip. Large lower limbs removed, good wound response.
A4426	Coast live oak	Quercus agrifolia	8.25	25.9181175	18.5	11	3	Growing in 7' planting strip.
A4427	Holly oak	Quercus ilex	8	25.13272	17.5	10	2	Growing in 7' planting strip. Basal sprouting, tip dieback.
A4428	Holly oak	Quercus ilex	9	28.27431		8.5	1	Growing in 7' planting strip. Canopy dieback, sparse canopy. Root damage.
A4429	Coast live oak	Quercus agrifolia	6.75	21.2057325	10	8.25	3	Growing in 5' planting island.
A4430	Holly oak	Quercus ilex	29.5	92.676905	29	13	3	Growing in 6x9 planting area. DBH taken @ 4' below secondary branching. Circling root on E side.
A4431	Holly oak	Quercus ilex	11	34.55749	16	12.25	3	Growing in 6x9 planting area. Lower limbs removed, good wound response. Bird nest.
A4432	Holly oak	Quercus ilex	10.5	32.986695	16	11	3	Growing in 6x9 planting area. DBH taken @ 3' below branching.
A4433	Coast redwood	Sequoia sempervirens	29	91.10611	41.5	14	3	Damaging curb and lifting asphalt. Large burl with basal sprouts.
A4434	Coast redwood	Sequoia sempervirens	23	72.25657	40	13.75	3	Large burl with basal sprouts.
A4435	Holly oak	Quercus ilex	15.5	48.694645	12	9	1	Topped. Minimal canopy.
A4436	Holly oak	Quercus ilex	9.25	29.0597075	12	17	3	Strong lean to NW. Bird nest.
A4437	Holly oak	Quercus ilex	12	37.69908	27	14.75	3	Bird nest (x2).
A4438	Coast live oak	Quercus agrifolia	28	87.96452	28	26.5	4	Bird nest (x6).
A4439	Coast live oak	Quercus agrifolia	20.25	63.6171975	20	22.5	3	Leans strongly NW. Bird nest (x2).
A4440	Coast live oak	Quercus agrifolia	20	62.8318	25	22.5	3	Bird nest (x5).
A4441	Coast live oak	Quercus agrifolia	12.25	38.4844775	25	18	3	Secondary trunk dead. Bird nest (x3).
A4442	Coast live oak	Quercus agrifolia	9.75	30.6305025	22	30	2	Leans strongly N. Minimal canopy.
A4443	Holly oak	Quercus ilex	16.5	51.836235	25	12	3	Bird nest (x3).
A4444	Coast live oak	Quercus agrifolia	13.5	42.411465	24	22	3	Leans strongly N. Bird nest.
A4445	Holly oak	Quercus ilex	11.5	36.128285	25	12.75	3	Bird nest.
A4446	Holly oak	Quercus ilex	8.5	26.703515	24	17	3	Bird nest (x2).
A4447	Holly oak	Quercus ilex	7	21.99113	25	12	3	Bird nest (x2).
A4448	Holly oak	Quercus ilex	11.5	36.128285	26	12	3	Bird nest.
A4449	Holly oak	Quercus ilex	6.5	20.420335	23	10.5	3	
A4450	Coast live oak	Quercus agrifolia	10	31.4159	23	11.5	3	
A4451	Holly oak	Quercus ilex	7.5	23.561925	25	13		
A4452	Coast live oak	Quercus agrifolia	10.25	32.2012975	25	14	3	
A4453	Coast live oak	Quercus agrifolia	13.75	43.1968625	23	16	3	
A4454	Coast live oak	Quercus agrifolia	20.25	63.6171975	22	21.25	3	Leans strongly N. Bird nest.
A4455	Coast live oak	Quercus agrifolia	9.25	29.0597075	20	11	3	Bird nest.
A4456	Coast live oak	Quercus agrifolia	14	43.98226	25	17.5	3	
A4457	Coast live oak	Quercus agrifolia	16.5	51.836235	25	12	3	
A4458	Holly oak	Quercus ilex	13	40.84067	25	14	3	Minimal basal, adventitious sprouting.
A4459	Coast live oak	Quercus agrifolia	15	47.12385	18	16	3	

Tree #	Common Name	Scientific Name	DBH Combined (inches)	Circumference (inches)	Height (feet)	Canopy Radius (feet)	Health	Notes

ATTACHMENT C

DEFINITIONS

Canopy: Canopy is the farthest extent of the crown composed of leaves and small twigs. This measurement further defines the Critical Root Zone (CRZ) or Protection Zone (PZ), which is a circular area around a tree with a radius equal to a tree's largest dripline plus 1 foot. Our canopy measurement is the longest dripline measurement from the center point of the tree and includes the 1 foot only on the Tree Site Map.

Co-Dominant Leader: Stems or trunks of the tree that are equal in size and relative importance.

Diameter: Diameter (diameter breast height) is normally measured at 4 feet 6 inches (above the average ground height for "Urban Forestry"), but if that varies then the location where it is measured is noted here. A Spencer Combination Logger's and Diameter steel tape was used to measure tree DBH.

Epicormic Growth: Shoots that arise from latent buds along the tree's trunk or mature branches. This growth is usually a sign that the tree has undergone a stressful period.

Included Bark: A sharp "V" crotch, usually less than a 45-degree angle of attachment, between two branches where the bark is kept between two narrowly joined branches and the bark is continually turned inward, rather than being pushed out. It is a common point for potential massive structural failure and this hazard can be minimized with properly installed and maintained cabling, bolting, or bracing.

Lean with Correction: The trunk of these trees developed at an angle as the canopy grew toward sunlight and corrected to an upright shape when it reached a space where direct sunlight could reach the leaves. This type of lean is not normally associated with a higher risk of failure.

Narrow Angle Attachment: A sharp "V" crotch, usually less than a 45-degree angle of attachment. Included bark is explained above and is common in branches with narrow attachments. In addition, these branches may not be attached to the trunk as well as others with wider angles of attachment and can fail more frequently depending on the size of the branch.

Poor Crown Ratio: Trees that have self-limbed to have foliage only at the top. The weight of the foliage at the tip of a long lever (the trunk) can be a significant factor in analysis of risk of failure.

Poor Structure: These trees have grown with structural imperfections that cannot be corrected and therefore render them hazardous and more likely to fail in the future.

Rating: Rating is subjective to condition and is based on both the health and structure of the tree, per the recognized national standard established by the Council of Tree and Landscape Appraisers and the International Society of Arboriculture (ISA) on a numeric scale of 5 (being the highest) to 0

(the worst condition, dead) as in Table B. Rating is performed in the field at the time of the measuring and inspection. The rating scale is shown below.

- **Rating #0 – Dead:** This indicates a tree that has no significant sign of life.

- **Rating #1 – Poor:** The problems are extreme. This rating is assigned to a tree that has structural and/or health problems that no amount of work or effort can change. The issues may or may not be considered a dangerous situation.

- **Rating #2 – Fair:** The tree has significant problems. If the option is taken to preserve the tree, its condition could be improved with correct arboricultural work including, but not limited to pruning, cabling, bracing, bolting, guying, spraying, mistletoe removal, vertical mulching, fertilization, etc. If the recommended actions are completed correctly, hazard can be reduced, and the rating can be elevated to a 3. If no action is taken, the tree is considered a liability and should be removed.

- **Rating #3 – Good:** The tree is in good condition. There are some minor structural or health problems that pose no immediate danger. When the recommended actions in an arborist report are completed correctly, the defect(s) can be minimized or eliminated.

- **Rating #4 – Above Average:** The tree is in above average condition and there are no apparent problems that a Certified Arborist can see from a visual ground inspection. If potential structural or health problems are tended to at this stage, future hazard can be reduced, and more serious health problems can be averted.

- **Rating #5 – Excellent:** No problems found from a visual ground inspection. Structurally, these trees have properly spaced branches and near perfect characteristics for the species. Highly rated trees are not common in natural or developed landscapes. No tree is ever perfect especially with the unpredictability of nature, but with this highest rating, the condition should be considered excellent.

Species: Species of trees is listed by our local and correct common name and botanical name by genus (capitalized) and species (lower case). Oaks frequently cross-pollinate and hybridize, but the identification is towards the strongest characteristics.

Sparse Canopy or Poor Leaf Surface: A measure of the opacity of the leaves in the tree associated with reduced growth, reduced energy for disease and pest resistance, and overall poor health.

Splits: Splits are open cracks or fissures in tree trunks or branches.

Suckers: Suckers are upright, epicormic shoots arising from the roots or base of the tree, often as a result of injury.

Unbalanced Canopy: Either the trunk is leaning and/or the canopy is phototropic and overly heavy on one side. This is normally considered a correctible defect.

EXECUTIVE SUMMARY

Good Samaritan Hospital, L.P. and HCA Management Services, L.P. plan to construct additional buildings at Good Samaritan Hospital (GSH) to meet state of California seismic compliance standards that will be in effect by 2030 while providing uninterrupted acute care services. The proposed new construction (project) would take place within the approximately 20-acre project site within Assessor Parcel Numbers 421-36-009 and -011 at 2425 Samaritan Drive in southwestern section of San José, Santa Clara County, California. LSA conducted background research, field survey, and resource documentation as part of this Cultural Resource Study prepared for the project. LSA identified the following built environment resources in the project site:

- A variable story hospital (GSH Main Hospital) constructed 1963–1965 at 2425 Samaritan Dr.
- Five single-story portable buildings installed circa 2005 north of GSH Main Hospital.
- A detached helipad structure constructed circa 2004 northeast of GSH Main Hospital.
- One associated building constructed circa 1990 at 2333 Samaritan Place, approx. 400 feet east of GSH Main Hospital.

Based on background research and the field survey, LSA concludes the GSH Main Hospital is associated with the mid- to late-20th century growth of San José and the West Valley. The building possesses several characteristics of Brutalist-influenced institutional building type constructed during this period in San José, Santa Clara County, and statewide. However, background research and field survey indicate the original hospital building has sustained numerous significant alterations and additions periodically in the 58 years since it opened in 1965 and therefore no longer retains sufficient integrity to convey these historical associations. The other buildings and the helipad structure listed above range from 18 to 33 years of age and, accordingly, have not reached sufficient age to allow sufficient perspective to evaluate for historic significance and are not addressed in this study.

LSA concludes that the GSH Main Hospital building does not appear individually or collectively eligible as part of a potential or unidentified district for inclusion under any of the evaluative criteria of the California Register of Historical Resources due to insufficient integrity to convey its associative significance. For the same reasons, LSA concludes that the GSH Main Hospital building does not appear eligible for inclusion in the San José Historic Resource Inventory as a Candidate City Landmark. Therefore, the GSH Main Hospital building evaluated in this study does not qualify as a "historical resource" for the purposes of the California Environmental Quality Act as defined at Public Resources Code §5024.1(c).

No archaeological resources were identified in the project site during this study. Because the project site sits on Pleistocene alluvial fan sediments that were deposited prior to human occupation of the

area, and the project site was not historically situated near freshwater sources, LSA considers the project site to have low sensitivity for pre-contact archaeological deposits.

The absence of early historical structures within the project site (with associated below-surface features such as wells and privies) means that the potential for encountering buried historic-period archaeological resources is also low.

LSA recommends providing Worker's Environmental Awareness Program training for grading/excavation crews prior to the start of construction to review regulations regarding archaeological resources, summarize and show examples of the types of resources that could be identified during earthmoving activities, and provide notification protocols to be followed in the event suspected cultural resources are encountered.

1.0 INTRODUCTION

Good Samaritan Hospital, L.P. (GSH) and HCA Management Services, L.P. plan to construct new hospital buildings (project) at Good Samaritan Hospital in San Jose that meet State of California seismic compliance standards that will take effect by 2030 while providing uninterrupted acute care services. LSA conducted background research, field survey, and resource documentation as part of this Cultural Resource Study prepared for the project. LSA identified the following built environment resources in the project site:

- A variable story hospital complex (GSH Main Hospital) constructed 1963–1965 at 2425 Samaritan Drive.
- Five single-story portable buildings installed circa 2005 north of the GSH Main Hospital.
- A detached helipad structure constructed circa 2004 northeast of the GSH Main Hospital.
- One associated building constructed circa 1990 at 2333 Samaritan Place, 400 feet east of the GSH Main Hospital.

Background research and field survey indicate the original hospital building has sustained numerous significant alterations and additions in the 58 years since it opened in 1965 and therefore no longer retains sufficient integrity to convey historical associations, as discussed in Section 4.5, below. The other buildings and the helipad structure listed above range from 18 to 33 years of age and accordingly have not reached sufficient age to provide adequate perspective of historical significance and thus do not warrant evaluation for eligibility and are not addressed in this study.

LSA concludes that the GSH Main Hospital building does not appear individually or collectively eligible as part of a potential or unidentified district for inclusion under any of the evaluative criteria of the California Register of Historical Resources (CRHR) due to insufficient integrity to convey its associative significance. For the same reasons, LSA concludes that the GSH Main Hospital building does not appear eligible for inclusion in the San José Historic Resources Inventory (HRI) as an individual City Landmark, Structure of Merit, an Identified Site/Structure or as Contributing Structure(s) to a potential historic district. Therefore, the GSH Main Hospital building evaluated in this study does not qualify as a "historical resource" for the purposes of the California Environmental Quality Act (CEQA) as defined at Public Resources Code (PRC) §5024.1(c).

1.1 PROJECT LOCATION AND DESCRIPTION

The approximately 20-acre project site is contained within Assessor's Parcel Numbers 421-36-009 and -011 at 2425 Samaritan Drive in the Carlton Neighborhood in the southwestern portion of San José, Santa Clara County, California (Figures 1, 2, and 3). The project would include a new hospital wing to accommodate the hospital's existing acute care facilities and operations. Seismic compliance for acute hospital requirements under Senate Bill 1953 is the primary reason for the project. Other legislative requirements, updated hospital care guidelines, and changes in the healthcare industry further compel project need.

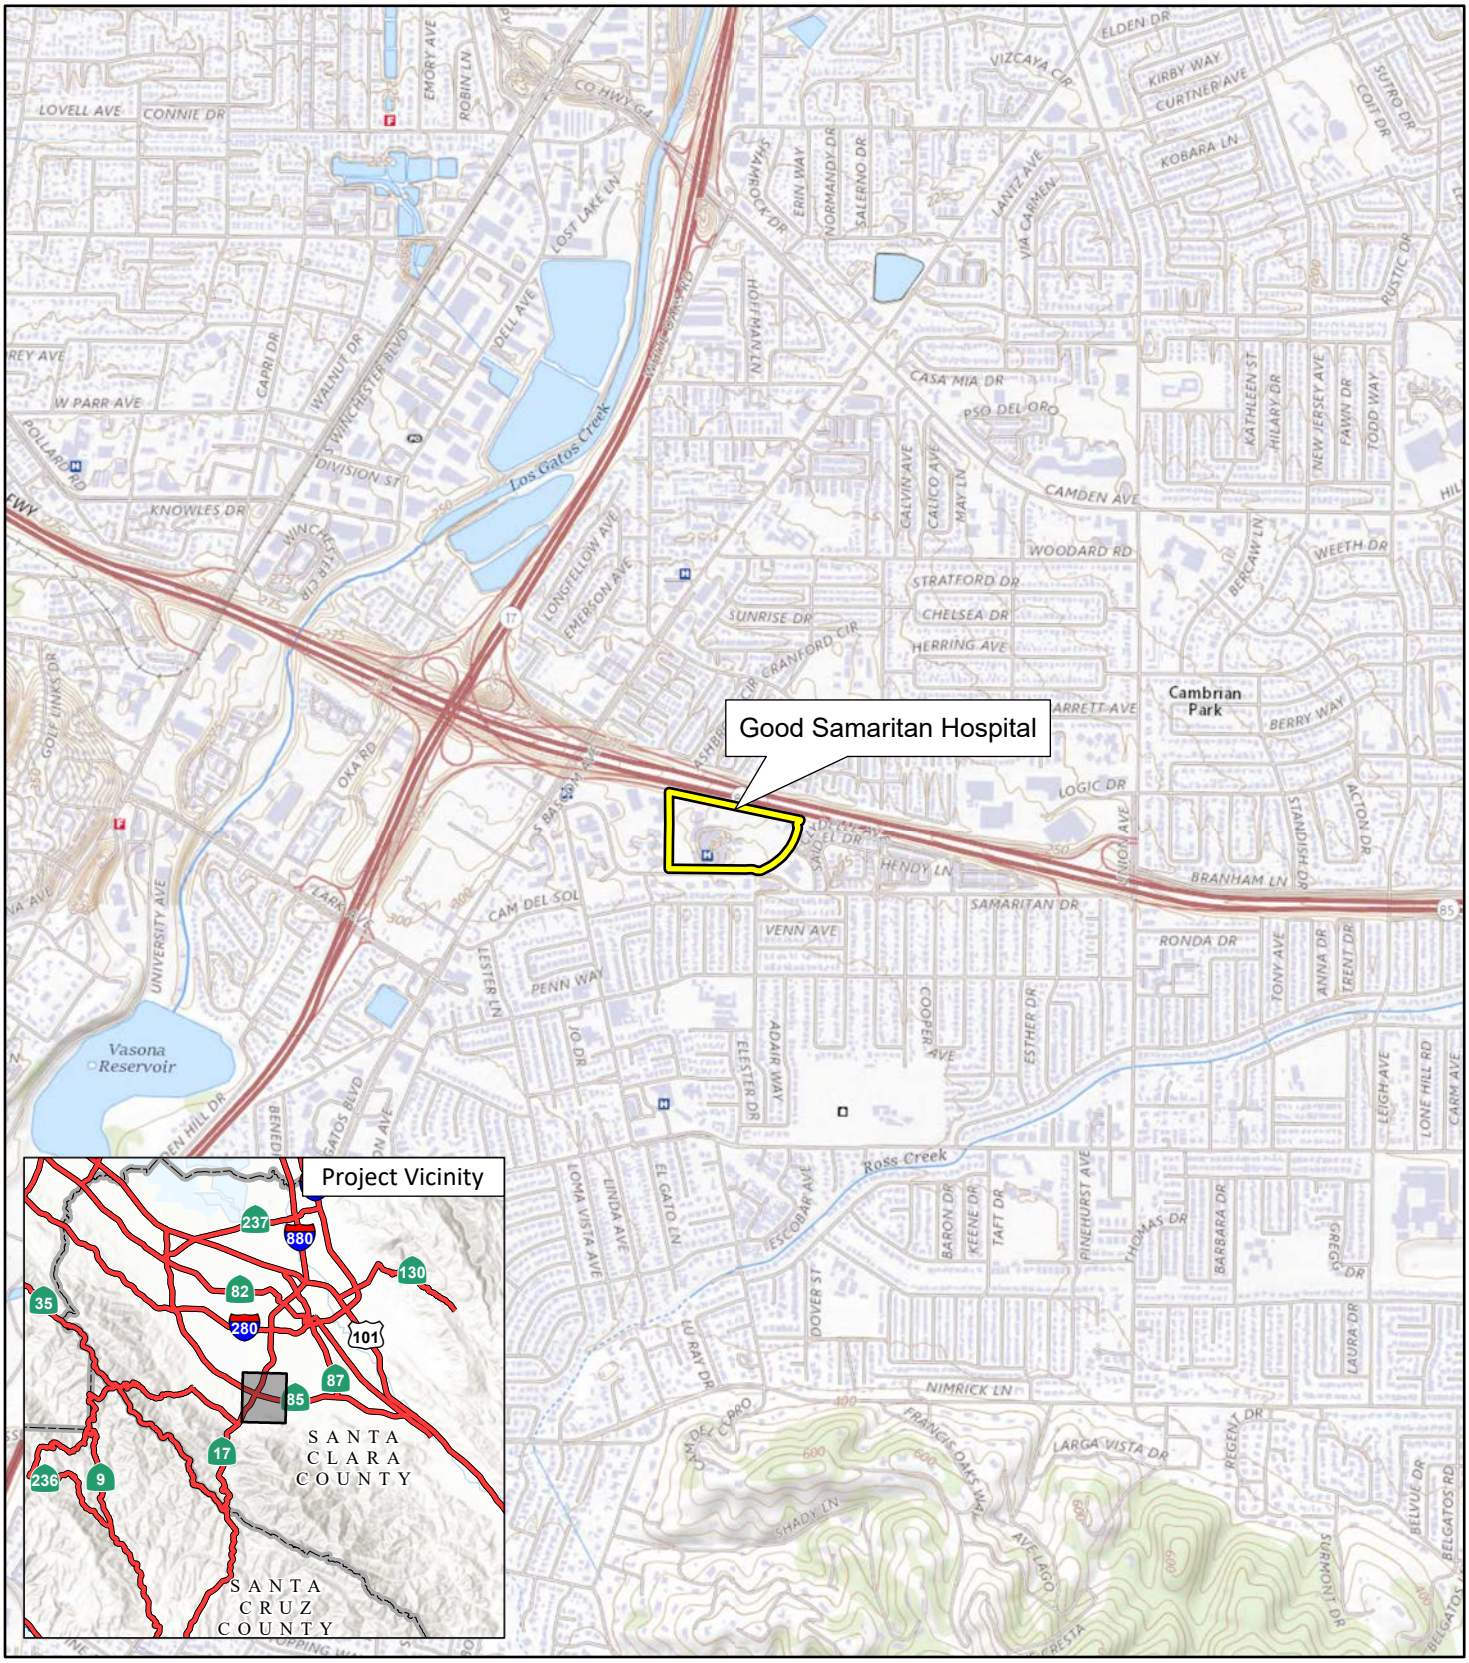
The applicant is considering a three-phase project but may not construct the third phase. Phase 1 would demolish the 5,200 square foot chapel in Building A, construct a new SPC 5 rated 260,000 square foot Building C, and partially construct Garage East. Phase 2 would include the construction and operation of an approximately 455,000 square foot hospital wing (Building D), an approximately 200,000 square foot medical office building (Building E), and an approximately 420,000 square foot garage structure (Garage West), and landscaping. If construction stops after Phase 2, the project would retain and expand the current GSH Main Hospital; if Phase 3 is constructed, the project would remove the GSH Main Hospital and construct a new medical facility and additional parking. The estimated maximum depth of construction-related excavations is 18.6 feet below extant ground surface.

1.1.1 Environmental Setting

The project site is in Township 8 South, Range 1 West, Section 11, Mount Diablo Base Line and Meridian, as depicted on the United States Geological Survey (USGS) *San Jose West*, Calif. 7.5-minute topographic quadrangle (USGS 1980). At approximately 275 feet in elevation, the project site sits on a gently sloping alluvial plain below the eastern flank of the Santa Cruz Mountain range at the southwestern end of the San Francisco Bay region. No perennial water sources are nearby. Historical maps show the project site situated approximately 1 mile east of Los Gatos Creek and 0.7 mile north of what is now called Ross Creek (Thompson and West 1876, USGS 1889 and 1919).

The project site falls within Valley oak savanna (Küchler 1977), which historically was typified by woodland canopies dominated by valley oaks, shrub understory including poison oak, blue elder, California wild grape, toyon, California coffeeberry, and California blackberry, and ground cover consisting variably of wild oats, brome, barley, ryegrass, and needlegrass (Ritter 1988). This vegetation community supports a variety of wildlife. Historically, this may have included native fauna such as Tule elk, black-tailed deer, grizzly bear, and mountain lion, and various smaller mammals, reptiles, and birds.

Geologic mapping of the Santa Clara Valley shows the project site is situated on Pleistocene alluvial fan deposits (Qpaf or Qpf) (Helley et al. 1994, McLaughlin et al. 2001, Witter et al. 2006). The soil within the project site is mapped as Urban land-Flaskan complex (NRCS 2023). The Urban land designation refers to disturbed and human transported material. The Flaskan soil forms on alluvial fans and typically features an A horizon, consisting of sandy to sandy clay loam that extends ca. 7 inches below surface, overlying a B horizon of gravelly sandy clay loam that reaches ca. 31 inches below surface. Relatively unweathered very gravelly sandy loam comprises the basal C horizon that extends to the bottom of the soil profile at ca. 59 inches below surface.



1.2 REPORT PREPARERS

LSA cultural resources staff Michael Hibma and Kendra Kolar prepared this cultural resource study. Mr. Hibma meets the Secretary of the Interior's *Professional Qualifications Standards* as a Historian and Architectural Historian (48 Code of Federal Regulations [CFR] 44716; 36 CFR Part 61), has more than 17 years' experience in cultural resources management, and holds an M.A. in History from California State University, Sacramento. Mr. Hibma conducted background research, property specific archival research, and prepared the Historical and Architectural contexts and the

background and archival research sections, the NWIC records search, conducted a pedestrian field survey, and prepared the built environment evaluations in the DPR 523 form records.

Ms. Kolar meets the Secretary of the Interior's *Professional Qualifications Standards* for Archaeology and has more than 12 years of cultural resource management experience in California and the Pacific Northwest. She holds a B.A. in Anthropology from the University of California, Berkeley, and a M.A. in Applied Anthropology (Archaeology, Cultural Resource Management) with a secondary emphasis in Geomorphology/Geology from Oregon State University, Corvallis. Ms. Kolar prepared the Environmental, Pre-contact Archaeology, Ethnographic Context, and Geoarchaeological Sensitivity sections of the study.

2.0 REGULATORY CONTEXT

2.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations [CCR] Title 14 §15002(i)). CEQA states that it is the policy of the State of California to "take all action necessary to provide the people of this state with… historic environmental qualities…and preserve for future generations examples of the major periods of California history" (PRC §21001(b), (c)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (CCR Title 14 §15064.5(b)).

CEQA §21084.1 defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or determined eligible by the State Historical Resources Commission, for listing in, the California Register of Historical Resources (CRHR).
- Included in a local register of historical resources (as defined at PRC §5020.1(k)) unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
- Identified as significant in a historical resource survey meeting the requirements defined at PRC §5024.1(g) unless the preponderance of evidence demonstrates that it is not historically or culturally significant; or
- Determined to be a historical resource by a project's lead agency based on substantial evidence in light of the whole record (CCR Title 14 §15064.5(a)).

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California… Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (CCR Title 14 §15064.5(a)(3)).

2.1.1 California Register of Historical Resources

The CRHR is a guide to cultural resources that must be considered when a government agency undertakes a discretionary action subject to CEQA. The CRHR helps government agencies identify and evaluate California's historical resources (California Office of Historic Preservation 2001b:1), and indicates which properties are to be protected, to the extent prudent and feasible, from substantial adverse change (PRC §5024.1(a)). Any resource listed in, or eligible for listing in, the CRHR is to be considered during the CEQA process (California Office of Historic Preservation 2001a:7).

The CRHR is modeled after the National Register of Historic Places (NRHP), and its significance and integrity criteria are parallel those of the NRHP. A resource eligible for the NRHP is eligible for the CRHR. The NRHP criteria, however, have been modified for state use by the California Office of

Historic Preservation (OHP) to include a range of historical resources which better reflect the history of California (California Office of Historic Preservation 2001c:69-70; 2006:1). There are three instances in which a resource not eligible for the NRHP may be CRHR eligible: moved resources; resources achieving significance in the past 50 years; and reconstructed resources (California Office of Historic Preservation 2006):

- *Moved buildings, structures, or objects*. A moved building, structure, or object that is otherwise eligible may be listed in the CRHR if it was (1) moved to prevent its demolition at its former location; and (2) if the new location is compatible with the original character and use of the historical resource.

- *Reconstructed buildings*. A building less than 50 years old may be listed in the CRHR if it embodies traditional building methods and techniques that play a vital role in a community's historically rooted beliefs, customs, and practices (e.g., a Native American roundhouse or sweat lodge).

- *Historical resources achieving significance within the past 50 years*. Resources less than 50 years old may be listed in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance.

2.1.1.1 Significance Criteria

A cultural resource is evaluated under four CRHR criteria to determine its historical significance. A resource must be significant in accordance with one or more of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

2. Is associated with the lives of persons important in our past.

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

4. Has yielded, or may be likely to yield, information important in prehistory or history.

2.1.1.2 Age

In addition to meeting one or more of the above criteria, the CRHR requires that sufficient time must have passed to allow a "scholarly perspective on the events or individuals associated with the resource." Fifty years is used as a general estimate of the time needed to understand the historical importance of a resource (California Office of Historic Preservation 2006:3; CCR Title 14 §4852 (d)(2)). OHP recommends documenting, and taking into consideration in the planning process, any cultural resource that is 45 years or older (California Office of Historic Preservation 1995:2).

2.1.1.3 Period of Significance

The period of significance for a property is "the span of time when a property was associated with important events, activities, persons, cultural groups, and land uses or attained important physical qualities or characteristics" (National Park Service 1999:21). The period of significance begins with the date of the earliest important land use or activity that is reflected by historic characteristics tangible today. The period closes with

the date when events having historical importance ended (National Park Service 1999:21). The period of significance for an archeological property is "the time range (which is usually estimated) during which the property was occupied or used and for which the property is likely to yield important information" (National Park Service 2000:34). Cultural resources may have more than one period of significance.

2.2 INTEGRITY

To be eligible for the NRHP and/or CRHR, a cultural resource must be significant under one or more criteria and must retain enough of its historic character and appearance to possess integrity, which is defined as the ability, or *authenticity*, to convey the reasons for its significance (CCR Title 14 §4852(c)). The evaluation of integrity must be grounded in an understanding of a resource's physical features and its environment, and how these relate to its significance. "The retention of specific aspects of integrity is paramount for a property to convey its significance" (National Park Service 1997:44).

National Register Bulletin 15, *How to Apply the National Register Criteria for Evaluation* (National Park Service 1997:2), states that the quality of significance is present in districts, sites, buildings, structures, and objects that possess integrity. There are seven aspects of integrity to consider when evaluating a cultural resource: *location*, *design*, *setting*, *materials*, *workmanship*, *feeling*, and *association*; these aspects are described below.

- *Location* is the place where the historic property was constructed or the place where the historic event occurred. The actual location of a historic property, complemented by its setting, is particularly important in recapturing the sense of historic events and persons.

- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property. Design includes such elements as organization of space, proportion, scale, technology, ornamentation, and materials.

- *Setting* is the physical environment of a historic property. Setting refers to the character of the place where the property played its historic role. Physical features that comprise the setting of a historic property can be either natural or manmade, including topographic features, vegetation, paths or fences, or relationships between buildings and other features or open space.

- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory. It is the evidence of the artisan's labor and skill in constructing or altering a building, structure, object, or site.

- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period. It results from the presence of physical features that, taken together, convey the property's historic character.

- *Association* is the direct link between an important historic event or person and a historic property.

"To retain historic integrity a property will always possess several, and usually most, of the aspects" (National Park Service 1997:44).

2.3 ELIGIBILITY

National Register Bulletin 15, *How to Apply the National Register Criteria for Evaluation* (National Park Service 1997:3), states that for a property to qualify for listing in the National Register, it must meet at least one of the National Register criteria for evaluation by:

1. being associated with an important historic context *and*

2. retaining historic integrity of those features necessary to convey its significance.

Resources that meet the age guidelines, are significant, and possess integrity will generally be considered eligible for listing in the NRHP and/or CRHR.

2.3.1 City of San José

The City of San José's (City) HRI identifies known historical resources (these include city landmark district and conservation areas in addition to the classifications listed below) of relative significance, including properties listed on or eligible for listing in the National Register or California Register, or on the local level as a City Landmark, Candidate City Landmark, Structure of Merit, Contributing Structure, or Identified Site/Structure (City of San José, n.d.).

- A *City Landmark* is a highly significant historic resource meeting the qualifications for landmark designation as defined in the Historic Preservation Ordinance. A City Landmark is considered a historical resource for the purposes of CEQA.

- A *Structure of Merit* is a special historic resource that does not merit Landmark designation but contributes to the City's historic fabric; a Structure of Merit is not considered a historic resource for the purposes of CEQA.

- A *Contributing Structure* may be less significant individually when compared to an element of a National Register-eligible historic district, City Landmark Historic District, or Conservation Area. A Contributing Structure may be considered a historical resource for the purposes of CEQA, if the larger resource it contributes to is eligible for national state, or local listing per California Public Resources Code (PRC) §21084.1.

- The category of *Identified Site/Structure* (IS) is applied when further evaluation of the significance of the structure should be undertaken.

The City of San José considers properties that are determined eligible for listing in the Historic Resources Inventory as a Candidate City Landmark as a historical resource under CEQA.

In considering eligibility as a City Landmark, the City of San José uses the following criteria found in Section 13.48.110(H) of the San José Municipal Code:

1. Its character, interest or value as part of the local, regional, state or national history, heritage or culture;

2. Its location as a site of a significant historic event;

3. Its identification with a person or persons who significantly contributed to the local, regional, state or national culture and history;

4. Its exemplification of the cultural, economic, social or historic heritage of the City of San José;

5. Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style;

6. Its embodiment of distinguishing characteristics of an architectural type or specimen;

7. Its identification as the work of an architect or master builder whose individual work has influenced the development of the City of San José; and

8. Its embodiment of elements of architectural or engineering design, detail, materials or craftsmanship which represents a significant architectural innovation or which is unique.[1]

Properties that are documented and evaluated and eligible for listing in the San José Historic Resources Inventory as a Candidate City Landmark are determined by the City of San José to be a historical resource based on substantial evidence in light of the whole record (CCR Title 14 §15064.5(a)).

3.0 METHODS

LSA requested record searches (including at the Northwest Information Center and Native American Heritage Commission), conducted a literature and map review, and a pedestrian field survey to prepare the study. These tasks were conducted to identify the project site's land use history, identify potentially significant associations, prepare a historic context for cultural resources within the project site, and assess the potential for undiscovered archaeological deposits in the project site. The following sections summarize the methods and the results of these tasks.

3.1 RECORD SEARCHES

3.1.1 Northwest Information Center

At LSA's request, the staff of the Northwest Information Center (NWIC) of the California Historical Resources Information System conducted a records search (NWIC File No.: 22-1409) on March 20, 2023. The NWIC, an affiliate of the OHP, is the official State repository of cultural resources records and reports for Santa Clara County. The search consisted of a review of records for cultural resources studies, archaeological sites, and built-environment resources within the project site and a 0.25-mile radius.

As part of the records search, LSA also reviewed the following federal and state cultural resource inventories:

- *California Inventory of Historic Resources* (California OHP 1976).
- *Five Views: An Ethnic Historic Site Survey for California* (California OHP 1988).
- *California Points of Historical Interest* (California OHP 1992).
- *California Historical Landmarks* (California OHP 2023a).
- *Built Environment Resource Directory for Santa Clara County* (OHP 2023b).

3.1.1.1 Record Search Results

The NWIC identified no previously recorded cultural resources within the project site or within a 0.25-mile radius. However, according to the Built Environment Resource Directory for Santa Clara County, the GSH was assigned a California Historical Resource Status Code of "6Y" on May 31, 2010, indicating the GSH was "Determined ineligible for the [National Register of Historic Places] by consensus through Section 106 process – Not evaluated for [California Register of Historical Resources] or local listing" (California OHP 2023b; line 5349).

The NWIC record search identified a study prepared June 1, 2016, by Archaeological Resources Technology (ART) in accordance with a Nationwide Programmatic Agreement for the Collocation of Wireless Antennas. The 2016 ART study identified an earlier study prepared in 2010 by Michael Brandman Associates (MBA) for an FCC project at 5018 Charlotte Avenue in San José, 0.25-mile from

GSH.[2] The study found the GSH not eligible for inclusion in the NRHP due to significant alterations. The California State Historic Preservation Officer concurred with this finding noting, "the [GSH] built in 1963 has had successive alterations and additions to the structure such that it i doubled in size and the original design, style and significant appearance has been irretrievably lost. It appears to have no context of associations under [National Register of Historic Places] Criteria A, B, or C" (Archaeological Resources Technology 2016:11). LSA presumes the MBA study (and its subsequent reliance by ART in 2016) is the source of the GSH entry in the Built Environment Resources Directory of Santa Clara County.

In total, the NWIC record search identified ten previously conducted studies that overlapped the project site or were within a 0.25-mile radius (these are listed in Table A).

NWIC = Northwest Information Center

3.1.2 Native American Heritage Commission

LSA submitted a request to the Native American Heritage Commission (NAHC) to search the Sacred Lands File (SLF) for Native American cultural resources that may be impacted by the proposed project. The NAHC maintains the SLF database and is the official State repository of Native American sacred-site location records in California.

Cody Campagne, NAHC Cultural Resources Analyst, responded to the SLF search request on April 10, 2023, stating that the results were negative and that there were no known Native American cultural resources in the project site (Appendix B). Analyst Campagne noted, however, that "the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area." The NAHC provided a list of Native American individuals to contact for additional information regarding the potential for cultural resources in the project site.

LSA understands that the City of San José is responsible for undertaking Native American consultation per Assembly Bill 52 for this project.

3.2 SAN JOSÉ HISTORIC RESOURCE INVENTORY

LSA examined the current online GIS-based City of San José's HRI and found that it did not include the Good Samaritan Hospital (City of San José 2024).

3.3 SAN JOSÉ MODERNISM HISTORIC CONTEXT STATEMENT

LSA examined the current online version of the *San José Modernism Historic Context Statement* that describes the period in America's architectural history during which the Good Samaritan Hospital was built. Neither Good Samaritan Hospital nor the San Francisco-based Anshen and Allen, the architectural firm responsible for designing the Good Samaritan Hospital, were mentioned (City of San José 2009).

3.4 LITERATURE AND MAP REVIEW

LSA reviewed the following publications, maps, and websites for historical information about the project site and vicinity:

- *Historic Civil Engineering Landmarks of San Francisco and Northern California (American Society of Civil Engineers, San Francisco Section* 1977)
- *California Place Names* (Gudde 1998)
- *Historic Spots in California* (Kyle 2002)
- *California 1850: A Snapshot in Time* (Marschner 2000)
- *An Architectural Guidebook to San Francisco and the Bay Area* (Cerny 2007)
- *Architecture of the San Francisco Bay Area: A History & Guide* (Schwarzer 2007)
- *San Francisco Architecture* (Woodbridge et al. 1992 and 2005)
- *A Living Legacy: Historic Architecture of the East Bay* (Wilson 1987)
- *Online Archive of California*
- USGS topographic quadrangle maps (1889, 1897, 1899, 1953a, 1953b, 1961a, 1961b, 1968, 1973, 1980)
- Aerial photographs (University of California, Santa Barbara 1939, 1958, 1965, 1980)

3.4.1 Results

The literature and map review indicated that the project site remained rural in character with cultivation of orchard crops as the primary land use until the construction of Good Samaritan Hospital in the 1960s. After World War II, the area surrounding the project site underwent a piecemeal transition from intensive agriculture to single-family residential tract development. The results of the topographic map and aerial photograph review are presented below in Table B.

Table B: Topographic Map and Aerial Photograph Review

Map/Photograph	Results
1889 *San Jose, Calif.*, 15-minute USGS topographic quadrangle (1:62,500)	No buildings or structures are depicted within the project site. The map indicates the project site is east of the boundary of *Rancho Los Gatos* and west of the original *Pueblo Lands of San Jose* grant. A segment of modern South Bascom Road / Los Gatos Boulevard is depicted west of the project site.
1897 *San Jose, Calif.*, 15-minute USGS topographic quadrangle (1:62,500)	No buildings or structures are depicted within the project site. This map depicts the same area development shown eight years before.
1899 *San Jose, Calif.*, 15-minute USGS topographic quadrangle (1:62,500)	This map depicts the same built environment as shown in 1889 and 1897.
1953 *San Jose, Calif.*, 15-minute USGS topographic quadrangle (1:62,500)	This map depicts the project site amidst a densely cultivated area – presumably, orchard crops. A segment of Lundy Avenue is depicted. The "Cambrian Village" tract development and Lewis Parker School are depicted east of the project site. The wider vicinity is depicted as an area in transition from agriculture interspersed with residential tract developments. Modern South Bascom Road / Los Gatos Boulevard is depicted as both Highway 17 and the *San Jose Los Gatos Road*.
1953 *San Jose West, Calif.*, 7.5-minute USGS topographic quadrangle (1:24,000)	This map depicts the same land use pattern, built environment, and infrastructure shown in 1953.
1961 *San Jose, Calif.*, 15-minute USGS topographic quadrangle (1:62,500)	This map depicts the same land use pattern as shown in the 1953, albeit with increased density as orchards are replaced by residential tract developments. The Cambrian Golf Club is depicted east of the project site, which itself remains shown as an orchard.
1961 *San Jose West, Calif.*, 7.5-minute USGS topographic quadrangle (1:24,000)	This map depicts the same land use pattern, built environment, and infrastructure shown in the 1961 *San Jose* topographic map
1968 *San Jose West, Calif.*, 7.5-minute USGS topographic quadrangle (1:24,000)	This map depicts GSH set amongst orchards. The building footprint shown corresponds to the main multi-story core Main Building. No outlying buildings, structures, or objects in the project site are depicted. Samaritan Drive is depicted as a new

Table B: Topographic Map and Aerial Photograph Review

Map/Photograph	Results
	(unnamed road). The surrounding area reflects the increased density of residential tract development. The San José city boundary is depicted north and east of the project site, reflecting subsequent annexations of lands during the post-war growth.
1973 *San Jose West, Calif.*, 7.5-minute USGS topographic quadrangle (1:24,000)	This map depicts the same land use pattern, built environment, and infrastructure shown in 1968 albeit with several substantial building additions to the north and south façades of GSH. There is increasing development to the east and south that indicates a waning of agricultural uses and an emerging modern suburban and industrial development pattern.
1980 *San Jose West, Calif.*, 7.5-minute USGS topographic quadrangle (1:24,000)	This map depicts the same land use pattern, built environment, and infrastructure shown in the 1973 *San Jose West* topographic map
1948 Aerial Photograph	This black and white photograph depicts the project site amidst orchards. No buildings, structures, or objects are depicted in the project site.
1953 Aerial Photograph	This black and white photograph depicts the same land use pattern depicted in 1948.
1956 Aerial Photograph	This black and white photograph depicts the same land use pattern depicted in 1948 and 1953.
1960 Aerial Photograph	This black and white photograph depicts the same land use pattern depicted in 1956.
1968 Aerial Photograph	This black and white photograph depicts the core building of the GSH along with the parking lots east and west of the main building. Lands north, east, and west are shown containing remnant orchards. Modern Samaritan Drive is depicted, and an undeveloped strip is shown south of and across from GSH, presumably prepared in advance of satellite medical clinics and doctor's offices.
1980 Aerial Photograph	This black and white photograph depicts the GSH in the project site. Notable differences appear to be an attached grouping of single-story buildings north of the Main Building. These buildings – since demolished – appear to be arranged as quadrangles each arranged around a central courtyard. Modern Highway 85 is not depicted however orchard clearance in advance of construction is. The building complex in the far northeastern corner of the project site at 2333 Samaritan Place is depicted containing three baseball diamonds with a parking lot suggesting this area was used as a park or recreation facility at this time. Relatedly, modern

Table B: Topographic Map and Aerial Photograph Review

Map/Photograph	Results
	Samaritan Place is depicted connecting to White Oaks Avenue and the residential tract development north of the modern Highway 85.
1982 Aerial Photograph	This color photograph depicts the buildings in the project site as shown in 1980.
1987 Aerial Photograph	This color photograph depicts the buildings in the project site as shown in 1982. However, the baseball diamonds at 2333 Samaritan Place are no longer depicted.
1993 Aerial Photograph	This color photograph depicts the buildings in the project site as shown in 1987. The building complex at 2333 Samaritan Place is depicted and construction of Highway 85 is active cutting off Samaritan Place from White Oaks Avenue.
1998 Aerial Photograph	This black and white photograph depicts the same built environment shown in 1987.
2002 Aerial Photograph	This color photograph depicts the same built environment shown in 1998.
2004 Aerial Photograph	This color photograph depicts the grouping of single-story buildings north of the Main Building first depicted in 1980 were removed and the area shown as a construction site.
2005 Aerial Photograph	This color photograph depicts the basic built environment configuration present in the project site.

Sources: USGS n.d., Nationwide Environmental Title Research, n.d.

Sanborn Fire Insurance maps do not provide coverage of the project site or vicinity, indicating that physical development was too sparse in the late 19th and early-to-mid-20th century to warrant inspection and risk assessment by the insurance industry.

Architectural guidebooks of the San Francisco Bay Area and the East Bay do not include the project site (Woodbridge et al. 1992 and 2005; Cerny 2007; Schwarzer 2007; Wilson 1987). No other built environment resources in or adjacent to the project site are listed or depicted in the publications, maps, and websites reviewed by LSA (a complete list of materials and sources reviewed is provided in a Bibliography at section 5.0 of this study).

3.5 GEOARCHAEOLOGICAL SENSITIVITY

Large-scale environmental changes significantly altered the landscape in the Bay Area over the past 15,000 years. This has important implications for the archaeological record since humans have been in the region since at least 10,000 B.P., and many of these changes have resulted in the burial and/or submergence of large segments of the landscape that were once available for human use and occupation (Meyer and Rosenthal 2007:7; ASC 2013:43). Thus, much of the evidence relating to

past occupation of the Bay Area, especially that pre-dating 3,000-4,000 years ago, is also buried (Byrd et al. 2017:4-1).

Fundamentally, there is an inverse relationship between landform age and the potential for buried pre-contact archaeological deposits. Pleistocene-age landforms (1.8 million years to ca. 11,500 cal B.P.) pre-date human occupation of the region; archaeological deposits on these landforms, if present, would be located at or near the surface. In contrast, landforms that formed during the Holocene (ca. 11,500 years ago to the present) may contain buried surfaces (paleosols) that would have been available in the past for human habitation (Meyer and Rosenthal 2007).

Estimating where sites could be expected on a given landform is a complex question. On a basic level, it is generally understood that archaeological deposits are not distributed randomly throughout the landscape, but rather tend to occur in specific geo-environmental settings (Byrd and Allen 2010). Habitation sites, for example, are typically associated with level or nearly level landforms that occur near stream confluences, especially where at least one stream is perennial.

Geoarchaeological studies in the region identify landform age, type, and position in the landscape as important criteria for assessing the potential for buried archaeological deposits. In their geoarchaeological study and sensitivity model for nine San Francisco Bay Area counties, Meyer, and Rosenthal (2007) identified Holocene-age landforms as having a general potential for containing buried pre-contact archaeological deposits. They further found that pre-contact archaeological sites tend to be at the bases of hills near sources of water, on stream terraces, and buried beneath a few inches to several feet of alluvial soils.

Because the Pleistocene alluvial fan sediments underlying the project site were deposited prior to human occupation of the area, and the project site was not historically near fresh water sources, LSA considers the project site to have low sensitivity for pre-contact archaeological deposits.

3.6 FIELD SURVEY

On April 7, 2023, LSA Architectural Historian Michael Hibma conducted a pedestrian field survey to identify built environment cultural resources within the project site and to obtain information about the architectural context and land use patterns of the project site and its vicinity. The purpose of the survey was to identify potential cultural resources with the project site. The field survey was documented through field notes and photographs taken with an Olympus Stylus *Tough* TG-4, 16-megapixel digital camera. The entire project site was thoroughly surveyed. The principal buildings identified were the GSH Main Hospital and adjoining single and multi-story buildings or “wings,” a detached helipad, a cluster of detached portable buildings. A detached single-story building at the far eastern corner of the project site were also identified and photographed. The remaining area within the project site included landscaped areas and paved parking lots west and east of the GSH Main Hospital building.

LSA did not undertake an archaeological survey due to the highly developed nature of the project site and vicinity. Previous construction of the hospital complex and adjacent roadways (including Samaritan Drive and State Route 85) would have entailed substantial earth moving. Any soil presently exposed within the project site is therefore likely in a disturbed context.

4.0 ELIGIBILITY EVALUATION

This section presents the pre-contact, ethnographic, historical, and architectural contexts of the project site and evaluates the project site under CRHR evaluative criteria. Please see Appendix A for a presentation of CRHR and City-based resource evaluations.

4.1 PRE-CONTACT ARCHAEOLOGY

The Paleo-Archaic-Emergent cultural sequence developed by Fredrickson (1974) is commonly used to interpret pre-contact occupation of the Bay Area. Fredrickson's cultural sequence has been updated (Milliken et al. 2007), however, to account for new radiocarbon and archaeological data informing the timing and nature of Native Californian occupation during the pre-contact period. The updated sequence—briefly summarized below—consists of the Pleistocene-Holocene Transition/Paleo-Indian Period (cal 11,500 to 8,000 B.C.), the Early Holocene/Lower Archaic (cal 8,000-3,500 B.C.), the Early Period/Middle Archaic (cal 3,500-500 B.C.), the Lower Middle Period/Initial Upper Archaic (cal 500 B.C.-A.D. 430), the Upper Middle Period/Late Upper Archaic (cal A.D. 430-1050), the Initial Late Period/Lower Emergent (cal A.D. 1050 to 1550), and the Terminal Late Period/Upper Emergent (cal A.D. 1550 to contact).

The Paleo-Indian Period began with the first entry of people into California, with the San Francisco Bay area presumably being settled between 11,500 to 8,000 B.C. (Milliken et al. 2007:114). Human populations during the Paleo-Indian period were low and probably consisted of small groups moving frequently to exploit plant and animal resources. Current research, however, is indicating more sedentism, plant processing, and trading than previously believed.

The Early Holocene is characterized by "a generalized mobile forager pattern," as indicated by assemblages containing millingslabs and handstones, and large wide-stemmed and leaf-shaped projectile points (Milliken et al. 2007:114). Early Holocene archaeological sites are rare, although this may in part be due to ancient deposits likely underlying several feet of sediment or having been submerged by sea-level rise (Meyer and Rosenthal 2007). Early Holocene sites have been identified in interior Contra Costa County at Los Vaqueros Reservoir, where a radiocarbon date of 9870 cal B.P. (7920 cal B.C.) was obtained from charcoal beneath an inverted millingslab associated with a deeply buried component (Meyer and Rosenthal 1997:III.64-III.65).

Although local variations occur, increased sedentism, regional trade, and symbolic integration generally mark the Early Period. Trade and symbolic integration is evidenced by marine shell ornaments, including rectangular *Olivella* and *Haliotis* shell ornaments (Elsasser 1978:38). A transition from a forager adaption to semi-sedentism is indicated in the archaeological record of bayshore shellmounds during this period.

Symbolic integration systems and technology evolved during the Lower Middle Period. At the onset of the Middle Period—referred to as the Early-Middle Transition (EMT)—rectangular shell beads, markers of the Early Period, are replaced in the archaeological record with stylistically new beads, including split-beveled and saucer *Olivella.* Other artifacts were also introduced during this period, including barbless fish spears, elk femur spatula, tubes, whistles, and bone basketry awls (Elsasser

1978:39). Culturally distinct traits appear by the Upper Middle Period, suggesting migration of a new population. This new population, known as the Meganos Aspect, is primarily characterized by its mortuary complex, which typically includes extended burial posture. The Meganos Aspect spread from the San Joaquin Delta during the EMT to the Livermore Valley, reaching the Walnut Creek/San Ramon Valley by the Upper Middle Period (Bennyhoff 1994a).

The Initial Late Period is marked in part by increased sedentism, status ascription and social stratification observed in burial practices, and the introduction of new technology. The latter consists notably of the bow and arrow, which is evidenced in the archaeological record by arrow-sized projectile points. Other artifacts associated with the Initial Late Period include *Haliotis* "banjo" ornaments, *Olivella* callus cup beads, and collared smoking pipes (Bennyhoff 1994b). It has been suggested that these changes in burial practices and artifacts is associated with the emergence of the Kuksu Cult, a ceremonial system found throughout northern California at European contact.

Sudden cultural changes occurred during the Terminal Late Period, which are indicated by changes in artifact types. These include replacement of Initial Late Period shell bead types with clamshell disk beads, as well the appearance of toggle harpoon tips. The presence of magnesite tube beads and corner-notched arrowheads from the North Coast Ranges, and Desert side-notched points from the central coast, along with other evidence, indicates widespread exchange of material culture in the Bay Area. This suggests considerable population movement and regional integration and may represent development of new regional cultural pattern that was interrupted by Spanish incursion into the Bay Area (ASC 2013:64).

4.2 ETHNOGRAPHIC CONTEXT

The project site[3] is within the ethnographic territory of the Ohlone, which stretched along the coast from the San Francisco peninsula to south of Monterey Bay and inland as far east as Livermore and Soledad. "Ohlone" was the term used by ethnographers to refer to the inhabitants of this area, who were present when Europeans first arrived. They are often also called by the name of their broader linguistic group, Costanoan, which was the name incorrectly bestowed by the Spanish. The word Costanoan comes from the Spanish word Costanos, meaning coast people, which was given to the tribes in 1770 when the first mission was established in their traditional tribal territory. The Costanoan represented a group of people who spoke eight separate languages, but whose dialects were like those of their geographic neighbors. The languages included Karkin, Chochenyo, Ramaytush, Tamyen, Awaswas, Mutsun, Rumsen, and Chalon. Although ethnographers differentiate the tribes by language and cultural expression, the Native American populations consisted of numerous politically autonomous nations. Forced displacement and recombination of Native American communities has led to a change in the way cultural affiliation is described and mapped today (ICF 2022:3.16-3).

[3] Portions of this section are adapted from *Archaeological Data Recovery at the Yerba Buena Site (CA-SFR-114) for the Moscone Center Expansion Project, San Francisco, California* (Byrd et. al. 2018); *San Francisco Bay-Delta Regional Context and Research Design for Native American Archaeological Resources, Caltrans District 4* (Byrd et al. 2017), and *Willow Village Master Plan Project, Final Environmental Impact Report* (ICF 2022).

The city of San Jose, where the project site is, falls within the area associated with the Tamyen (or Tamien) tribe (Levy 1978:485). Contemporary Tamien are direct descendants of Chief Tulum and Yaayaye and others who were taken to Mission Santa Clara. Having recently exercised their self-determination, they recognize that they have always been Tamien. In 1770, there were approximately 1,200 speakers of the Tamyen language. Today, the language is being actively revitalized and documented by tribal language expert Quirina Geary (ICF 2022:3.16-4).

Traditional households of Ohlone tribes are generally large, consisting of approximately 15 individuals from multiple generations. Groups of households form larger districts that share a common language as well as adjacent resource gathering and processing locations. Ethnographic studies have documented approximately 40 such districts, with each one consisting of 200 to 250 people (ICF 2022:3.16-4). Permanent villages were established near the coast, the bay, and along river drainages, while temporary camps were in prime resource-processing areas (Byrd et al. 2017:3-28). In the San Jose area, many of these villages were located along waterways.

The Ohlone traditionally utilized a wide variety of seasonally available food resources. These included plant foods (acorns, nuts, seeds, greens, and bulbs) and terrestrial mammals (deer, pronghorn, tule elk, and smaller animals), and sea mammals and waterfowl. They also fished and collected shellfish (oysters, mussels, and abalone), relying heavily on marine resources for food as evidenced by "the proliferation of shell middens throughout the Bay Area" (Byrd et al. 2018:16). To encourage growth of useful plant species and large game forage, the Ohlone regularly burned areas in their landscape.

Plants and animals were also important sources of raw materials. Tule, for example, was used for making canoes, mats, and baskets; plant materials, generally, were made into cordage, nets, and baskets, and shelters, sweathouses, and fences (Levy 1978:492). Animal bones, teeth, beaks, and claws were made into awls, pins, knives, and scrapers. Pelts and feathers became clothing and bedding, while sinews were used for cordage and bow strings. Feathers, bone, and shells were crafted into ornaments. Shell was also fashioned into beads, which were used for ornamentation, gaming, and trading.

Trade relations with neighboring villages and groups were well established with "bows, arrows, basketry materials, paints, and feather blankets…procured from the east, while the Ohlone traded mussels, dried abalone, salt, and abalone shells to the neighboring Yokut groups and provided the Sierra Miwok with *Olivella* and abalone shell beads" (Byrd et al. 2018:16). Obsidian was also acquired through trade, and along with locally procured chert and other stone types, was used to produce a range of tools including knives, arrow, and spear points, handstones and millingslabs, mortars and pestles, net sinkers, anchors, and pipes.

Ohlone culture was disrupted by the influx of European explorers and then decimated by the subsequent establishment of Spanish missions in the late 18th century. Colonization and occupation quickly reduced Ohlone populations, displaced them, and dramatically altered their traditional way of life. Specifically, mission life was devastating to the tribal population. When the first mission was established in the region in 1776, the Ohlone population (inclusive of all eight language groups) was estimated to be 10,000. By 1832, they numbered less than 2,000 because of introduced disease, harsh living conditions, and reduced birth rates. The Mexican government began to earnestly

secularize the mission lands in 1834 and divide the former mission land among loyal Mexican subjects. Those who opted to remain in their ancestral territory were branded as squatters. Others fled in the interest of survival. The Tamien, for example, were forced to relocate to Madera, Hollister, Gilroy, Los Banos, and San José. Because ceremonies and lifeways are dependent on the traditional spatial organization and proximity of households, as well as the reliance on the family as the sole support system, it has been difficult for many dispersed contemporary groups to maintain their cultural identity and language (ICF 2022:3.16-8).

Ethnographic information for the Ohlone is limited, compared to Native groups in other regions of California, coming primarily from early European accounts (by explorers and mission staff) and a few 20th century interviews by anthropologists who gathered information on remembered lifeways (Byrd et al. 2017:3-27). Formal recognition, assertion, and self-determination began to move to the forefront during the early 20th century. This movement was enforced by legal suits brought by the Indians of California against the United States government (1928–1964) for reparation due to them for the loss of traditional lands. Tribally led political advocacy groups brought attention to the community and resulted in a re-evaluation of Native American rights (ICF 2022:3.16-9).

4.3 HISTORICAL CONTEXT

4.3.1 Spanish Period

Recorded Spanish activity in the Bay Area begins in 1769 with the Gaspar de Portolá Expedition. The subsequent years brought more expeditions that favorably noted the fresh water, adequate timber, and rich soils of the Bay Area. In 1777, a party of settlers from San Francisco led by Lieutenant Moraga set out for the Santa Clara Valley to establish, on the banks of the Guadalupe River, the first civic settlement (or *pueblo*) in California. Spain's colonization policy goals were to pacify native peoples, encourage settlement by those of European heritage, and preempt competing foreign claims to territory claimed by Spain. Implementing this policy utilized three institutions: missions, presidios, and pueblos designed to operate in an interdependent relationship to reinforce each other and secure the land for the Spanish Crown.

The land that would become *Pueblo de San José de Guadalupe* was granted on July 22, 1778, by Governor Felipe de Neve in the name of King Charles III under provisions of the *Recompilacion de Leyes de los Reynos de las Indias*, a four-volume codex of Spanish colonial law to standardize Spanish colonial town planning. Based loosely on ancient Roman military camp layouts, the regulations required arranging streets in a gridiron plan and spread out four blocks deep from a central square that in turn was fixed by the location of a church (Reps 1979, 35-38, 97-98, 103-108). Instead of four blocks, the codex called for the boundaries of a pueblo grant to be four leagues square of flat ground, one square league in each cardinal direction from a central plaza (Hall 1871:334; Munro-Fraser 1881:370).

4.3.2 Mexican Period

After Mexico declared independence in 1821, the republican ethos of the Mexican state favored secular growth over ecclesiastical and disbanded the mission system in 1834. This policy emancipated tens of thousands Native American neophytes from church custody and made available hundreds of thousands of acres then held in trust by the church for the Spanish Crown.

California's Mexican governors liquidated church lands into land grant ranchos to populate the countryside with politically aligned citizens and assert Mexican sovereignty. As a result, the total number of ranchos in California doubled by 1844. During this time, political developments in central Mexico distracted the Mexican government. Consequently, the Spanish-speaking native-born Alta Californians, or *Californios*, enjoyed peace and a relatively high degree of political, social, and economic autonomy with minimal intrusion into their affairs by the Mexican state (Works Progress Administration 1939:47-50; Bancroft 1888 II:607-627; McWilliams 1973:38, Monroy 1990:123-132; Marschner 2000:4-6; Robinson 1948:29-31).

4.3.3 Gold Rush and Statehood

As more Anglo-Americans—mostly single young men from the United States—came to California, sympathies for joining the Union spread. The Mexican American War, the Treaty of Guadalupe Hidalgo, and the discovery of gold on the American River in January 1848, set in motion the Californios' loss of California (Laffey 1992:5). Following the Mexican American War, the United States annexed California in 1848 and occupied it via a military government. Statehood was granted as part of the Compromise of 1850, which settled, among other issues, a four-year political impasse in the United States Senate between free and slave-holding states regarding whether slavery could expand into territories won during the war (Greenburg 2012:266-267). California entered the Union as a free state and the hastily drafted and ratified California Constitution of 1849 specified relocation of the state capital from the former colonial and Mexican capital at Monterey to San José.

4.3.4 Santa Clara County

During the latter half of the 19th century, there was a growing migration of Anglo-Americans into Santa Clara County, an influx accompanied by regional cultural and economic changes. Many miners failed to strike it rich and turned to agriculture, particularly livestock and grain dry farming (Vaught 2003:449). The county experienced its first economic boom during a dry farming grain bonanza during the 1860s and 1870s. Anglo-American culture expanded at the expense of the established Hispanic culture; farmsteads slowly began to populate the immense Mexican ranchos, while the cultivation of various crops replaced cattle ranching as the primary regional economic activity. Larger tracts of pasturage converted to irrigated, specialty crop agriculture, requiring a large labor force and prompting a wave of immigration. Increasing population density in the San Francisco Bay Area converted agricultural lands to small towns and settlements, typically sited along the Southern Pacific Railroad (SPRR) or Western Pacific Railroad (WPRR) lines.

Following the end of World War II, many defense industry workers, returning veterans who had trained in California and others from the eastern United States wanted to remain and enjoy the state's warm climate and plentiful jobs, spurring a 20-year-long construction boom. "As the fifth most populous state in 1940, California rose to be the second most populous by 1950 and the first most populous by 1963" (Transportation Research Board 2012:60). By 1970, the state's population doubled to nearly 20 million. Most new residents were mostly young people forming families, which in turn quadrupled the population of school-age children in the state (Self 2003:257). The pace of this demographic change transformed California. Then Governor Earl Warren characterized the influx of residents equal to creating "a whole new city of ten thousand people every Monday morning" (Weaver 1967:147). These general trends of economic expansion and increasing

population have continued into the 21st century and generally characterize the development of Santa Clara County and San José to the present.

4.3.5 City of San José

San José[4] was founded on the banks of the Guadalupe River at what is now the corner of Hobson and Vendome streets, 6.75 miles northeast of Good Samaritan Hospital. The first courthouse in the region, an adobe known as the *juzgado*, was built in 1783; a second was built on higher ground 5 years later to avoid flooding. This building remained the seat of local government until 1850, when work began on the county courthouse that remains, though somewhat modified, a major presence on today's St. James Square. San José served briefly as California's first capital. However, the city was judged too damp, and the Legislature relocated first to Vallejo, then Benicia, and, finally to Sacramento in 1854.

In the years following the Civil War, the farming town continued to grow. During the 19th century, the Santa Clara Valley was famous for its orchards, fruit drying, and produce packing plants. The French prune, introduced to the region by Louis Pellier at his nursery, City Gardens, on St. James Street, became an important regional crop (Kyle 2002:438). Fruit production and processing was a mainstay of San José's economy until the 1960s. During the 1930s and 40s, when San José's population was approximately 70,000, between 20,000 and 25,000 men, women and children found seasonal employment in San José's more than two dozen fruit canneries. Cannery work was difficult, requiring laborers to stand for long hours performing repetitive tasks. The take-home pay at the canneries was higher than at many other occupations, which meant that, despite the difficult working conditions, many workers were willing to stay through the canning season.

San José has always been known for being on the forefront of developments in electronics—and as the site of some notorious technical failures. In 1881, J.J. Owen, then-editor of the *San Jose Mercury*, convinced the City to install a 237-foot-tall light tower that would, he claimed, make night become day in downtown. The tower, straddling the intersection of Santa Clara and Market streets, failed to illuminate the city as claimed. The tower was severely damaged in a 1915 windstorm and collapsed later that year. In 1909, the city was the site of a more successful technical endeavor: Dr. Charles Herrold established the world's first radio broadcast station at the corner of First and San Fernando streets. The station, which later became KCBS, broadcasts today from San Francisco.

In the years following World War II, the Santa Clara Valley experienced tremendous growth. Electronics, aviation, and semiconductor companies opened offices and factories in "Silicon Valley," creating thousands of jobs for returning military personnel, defense workers, and their families. Between 1960 and 1990, according to an article in *BusinessWeek*, companies started in the South Bay by graduates of Stanford University created more than 250,000 jobs. These workers needed housing, and the valley's fruit orchards soon gave way to housing developments. San José transformed from a market town with an agricultural economic base to a business and residential community known for its high-technology companies.

[4] Unless cited, this section is adapted from Powers 2018.

4.3.6 Health Care in Santa Clara County

After statehood in 1850[5], the State capital moved from Monterey to San José and the population of the then-small pueblo swelled. Swift population growth soon led to sanitation problems. "There were epidemics of cholera, smallpox, diphtheria, and typhoid fever, among other diseases." Such a rapid rise in public heath challenges overwhelmed the capacity of existing medical care. The growing city needed a hospital to provide medical care for the sick and destitute, but funds were not available until 1855, when the County of Santa Clara (County) Board of Supervisors Health Committee appointed a County Physician and contacted medical services to private parties at a rate of $2.50 per patient per day.

The need for services and a County hospital to provide them grew. In 1860, County Supervisors purchased 12 acres of land from Hiram Cahill on the-then western boundary of San José. The County enlarged the existing buildings and constructed a new "pest house" for patients suffering from acute contagious diseases (Sawyer 1922:193-194). In 1875, these buildings were relocated to a new, 114-acre site on South Bascom Avenue that now contains Valley Medical Center, 5 miles north of GSH. The County Hospital's brick buildings sustained considerable damage following the 1906 earthquake and a new, wood-framed hospital building was constructed the next year. However, the "specters of overcrowding and inadequate funding were constant companions of the hospital staff and Board of Supervisors throughout the hospital's history." The struggle to maintain adequate hospital capacity for a growing region in the post-war era was a constant occupation of the County Board of Supervisors. In 1960, a seven-story addition was built to the existing hospital and the facility was renamed Santa Clara Valley Medical Center.

Other notable medical facilities in the region included Agnews Development Center, a State hospital originally built in 1885 for mental asylum and later closed in 1997-98. The San José Hospital built in 1923 at 675 East Santa Clara Street (demolished in 2004) was at the time it opened "the only first class and strictly modern hospital between Santa Barbara and San Francisco" and later expanded to "accommodate the emerging middle class living the central [sic] San Jose that were excluded from the city, county, and state-run hospitals that served the poor and private hospitals that catered to the more affluent." As described above in section 4.3.5, the post war period was a time of rapid population and economic growth in San José and the Santa Clara Valley. The *San Jose Historic Context Statement* described the "*population of Santa Clara Valley experienced phenomenal growth after 1950. Correspondingly, the land area of the city spread from 17 square miles in 1950 to over 120 square miles in 1970.*" (City of San José 2023:91). In response to this explosion, a corresponding expansion of institutional infrastructure was needed to meet the demand for social and public services. Among the universe of needs was more capacity for health services. Existing hospitals were inadequate to meet the surge in needs. By 1965, seven additional hospitals were built and opened.

The table below provides the names of hospitals and other medical-related facilities within Santa Clara County in addition to GSH.

[5] Unless cited, this section is adapted from Archives & Architecture 2014.

Table C: Santa Clara County Hospitals

Facility Name	Address	Date Opened
O'Connor Hospital	2105 Forest Ave., San José	1953
Stanford University Medical Center	300 Pasteur Dr., Stanford	1959
Palo Alto Veterans Medical Center	3801 Miranda Ave., Palo Alto	circa 1960
El Camino Hospital	2500 Grant Rd., Mountain View	1961
Community Hospital of Los Gatos	815 Pollard Rd., Los Gatos	1962
Regional Medical Center of San José	225 N. Jackson Ave., San José	1965
Mission Oaks Hospital	15891 Los Gatos-Almaden Rd., Los Gatos	Before 1972
Sainte Louise Hospital	18500 Saint Louise Dr., Morgan Hill	1989-1999
Sainte Louise Regional Hospital	9400 No Name Uno, Gilroy	1989
Lucile Salter Packard Children's Hospital	725 Welch Rd., Palo Alto	1991
Kaiser Permanente Santa Clara	900 Kiely Blvd., Santa Clara	Before 1980
Kaiser Permanente Santa Theresa	250 Hospital Parkway, San José	Before 1980

4.3.7 Project Site

Background research indicates that the site remained undeveloped until the early 20th century, when the area became intensively cultivated with stone fruit trees and other orchard crops. The SPRR and later the WPRR connected famers with distant markets, further spurring growth. Historical maps from the late 19th century and aerial photographs from the mid-20th century that include the project site and vicinity show few buildings or structures along with the SPRR and later the WPRR alignments (JRP Historical 2002:5-6). The general area remained intensively cultivated until the early 1960s, when topographic maps and aerial photographs depict new residential and commercial buildings to the north, east, and south of the GSH site (USGS 1973, 1980; Nationwide Environmental Title Research). The GSH was built by 1965 and appears to have been intentionally located in anticipation of further density of development and potential connections with an expanding highway system.

4.3.7.1 Good Samaritan Hospital

According to background research, construction of GSH began in 1963, finished in 1965, and the hospital was formally dedicated May 14, 1966. Until GSH was built, residents in western Santa Clara Valley communities of Los Gatos, Monte Sereno, Saratoga, Campbell, Cambrian Park, and development along the eastern flank of the Santa Cruz Mountains had few options for health care and emergency medical services. The push to build a hospital in this area began as early as 1947, as residents and community leaders recognized the rapidly increasing population of Santa Clara County and San José overwhelmed exiting medical facilities near the central core of San José (Beilharz and Demers 1980:190). An article in the September 13, 1965, edition of the *Los Gatos Times-Saratoga Observer* noted the "need for additional hospital facilities was apparent as long ago as 1950. The West Valley Hospital District was formed [for tax purposes], but twice voters turned down bond issues for a tax-supported hospital, and the district was dissolved in 1958" (*Los Gatos Times-Saratoga Observer*, September 13, 1965:5). However, the pressures of population growth led to an increased demand for medical facilities to serve the ill, injured, and indigent. These realities had, by

1960, prompted action to address a rapidly nearing "emergency situation with the hospital bed shortage become more acute each year" (*Los Gatos Times-Saratoga Observer* 4/19/1961:4).

In response, West Valley religious leaders and laypeople "joined forces to raise money for the proposed plant [i.e., hospital], to be called Good Samaritan Hospital" (*The Peninsula Times Tribune*, 3/4/1960:18). The organization and coordination of GSH was due in large part to local religious leaders and congregations. This influence is reflected in the namesake of GSH, a reference to the Parable of the Good Samaritan, a story in the Book of Luke of a Samaritan merchant traveling on the road between Jerusalem and Jericho who found a man robbed, beaten, and left for dead. The Samaritan took mercy on the stranger and secured the stranger medical care and lodging without expecting repayment. With respect to GSH, "[t]here was no quibbling of the name: Good Samaritan, with its implication of man's service to man was the obvious choice" (Beilharz and DeMers 1980:190).

The group had to adopt a different approach via securing funds to construct a 200-bed, non-profit, general hospital. A new approach to raise funds from grants and donations received a significant boost by using funding available by the Hospital Survey and Construction Act, passed by Congress, and signed by President Truman in 1946. Known as Hill-Burton Act of 1946, this legislation provided federal matching grants to states to build new community hospitals (*Los Gatos Times-Saratoga Observer* 4/19/1961:4). As a result, the Hill-Burton Act "became a major influence in the expansion of the hospital industry. More than 4,000 projects to expand existing facilities or construct new ones were initiated within 20 years after its passage" (Sultz and Young 1999:86).

By April 1961, the State Bureau of Hospitals received an application from the GSH Board of Trustees for $3,120,570, one-half of the anticipated total amount of $6,241,140 to build the 200-bed hospital (*Los Gatos Times-Saratoga Observer* 4/19/1961:4). Later that year, the State Bureau of Hospitals approved the application and the total estimate to build a 225-bed hospital grew to $6,456,285[6] (*Los Gatos Times-Saratoga Observer* 10/20/1961). A year-long effort by GSH Trustees, churches, residents, and donations by local heads of industry, business, and corporations raised the funds to meet the matching grant. The State Bureau of Hospitals approved the financial plan for GSH on February 20, 1962, prompting "a sigh of relief among the campaign workers" (*Los Gatos Times-Saratoga Observer* 2/20/1962:1).

The San Francisco-based architectural firm of Anshen and Allen[7] was selected to design GSH and the San Francisco-based Rothschild and Weirick was the building contractor, which by late 1962 was envisioned as a facility to "open in 1965 with 225 beds. It will be a six-story structure with wings extending from the two sides to accommodate offices, chapel, radiology, pathology, surgery, emergency, and psychiatric units. Bed distribution will be surgical-medical, 130; maternity, 40; pediatrics, 30; psychiatric, 25. Eventually it will be expanded to include 450 beds" (*Los Gatos Times-Saratoga Observer* 12/6/1962:1). A scaled model of GSH was prepared and displayed in various local banks in San José. An article in the February 20, 1963, edition of the *Los Gatos Times-Saratoga Observer* noted the "main building of [GSH] will have eight floors-six for patients and two for service,

6 According to the Federal Reserve Bank of Minneapolis' online *Inflation Calculator*, (n.d.) $6,456,285 in 1961 dollars is equivalent to $66,878,880 in (May) 2023 dollars.

7 See section 4.4.2 of this report for more information of Anshen and Allen.

including a basement. Facing the entrance, visitors will also see two wings, one containing the area or the chapel, and the psychiatric unit; the other ending in the emergency entrance" (*Los Gatos Times-Saratoga Observer* 2/20/1963:1).

The Good Samaritan Nurses Association assisted in designing the functional layout and operations of GSH. They coordinated with architects and engineers to push for what was at the time innovations such as an "intercom system planned to facilitate communication between nurse and patient and a pneumatic [vacuum] tube to facilitate interdepartmental communication." In addition, GSH "would be completely air-conditioned" (*Los Gatos Times-Saratoga Observer* 3/14/1962:3).

With the plans and organizational framework in place, GSH Trustees and local officials broke ground on April 24, 1963, on an approximately 20-acre site on what was then called the San Jose-Los Gatos Road near National Avenue (*Los Gatos Times-Saratoga Observer* 4/25/1963). Interestingly, it is notable that expansion of GSH was anticipated as part of the original design vision, albeit this anticipated expansion was envisioned to occur vertically and not horizontally. An article in the June 12, 1962, edition of the *Los Gatos Times-Saratoga Observer*, noted that the Los Gatos Town Council approved "development of a 185-acre area located South Bascom and Union avenues as a future medical and business community" which would include a "proposed 12-story Good Samaritan Hospital" (*Los Gatos Times-Saratoga* Observer, June 12, 1962). The vision of a 12-story hospital tower was scaled back, likely to clear the fund erasing hurdles. Less than two years later the *Los Gatos Times-Saratoga Observer* article noted, "[p]lans for future expansion call for the addition of another four floors when population increase demands it" (*Los Gatos Times-Saratoga* Observer, 1/9/1964).

Hospital Chapel. The organization of GSH was due in large part to the efforts by the West Valley religious community. As part of their efforts to build a non-profit hospital, GSH was "devoted to the entire person – body, mind and spirit" (Bielharz and DeMers 1980:191). A chapel was part of the original design, albeit the funds to plan, design, and build the chapel had to be privately funded, as federal law prevented public money being used for religious uses. The funds were raised via donations from individuals, local churches, and local artists such as Helen Caswell, a local artist of some renown who "offered to donate portrait fees for the [GSH's] inter-denominational chapel-chaplaincy program" (*Los Gatos Times-Saratoga Observer* 6/11/1963).

The chapel is a relatively small space set on the northern side of the GSH Main Hospital's main tower and has a two full-height colored glass windows in an abstract design, set in concrete.[8] The name(s) of the artists responsible for its design as not identified in background research. It is presumed that the architectural firm of Anshen and Allen, in conjunction with local religious members, designed the window, the chapel interior, and the Chaplain's Office.

Phase II. GSH formally opened its doors on September 22, 1965. The original configuration was not to remain in place for long. A "Phase II" of GSH "called for additional fund raising and planning efforts that spanned the years 1968-1974. The expansion more than doubled Good Samaritan's original size, enabling the hospital to provide 395 patient beds and to increase the number of

[8] See the DPR523 from record attached to this report for pictures of the Chapel's interior and exterior and stained-glass window.

employees" (Beilharz and DeMers 1980:190). As originally envisioned GSH's Main Hospital Tower was "engineered for addition of several more floors" as the population of the West Valley continued to grow (*Los Gatos Times-Saratoga Observer*, 24 April 1968:1). However, demand for services soon set aside intended plans to expand via adding floors to the GSH Main Hospital. Instead, space for an additional 35 beds was found by re-organizing existing space and expanding outward, as this was a "type of construction that can be completed within a year; additions to the tower unit, which contains permanent medical-surgical units, would take longer." Anshen and Allen were commissioned to design the addition (*Los Gatos Times-Saratoga Observer*, 6 August 1968:1).

According to an article in the September 22, 1970, edition of the *Los Gatos Times-Saratoga Observer* celebrating GSH's fifth year anniversary, it was noted that expansion of GSH would take place in the 1970s, "Instead, the hospital was in its third year when it became obvious that additional space was needed. Early this year [1970], 40 beds were added with the construction of the West Pavilion and with re-arrangement of space in the pediatrics department." The article went on to state the proposed expansion would cost $8.8 million and "will wrap around the tower on first, second, and third floor levels" (*Los Gatos Times-Saratoga Observer* 22 September 1970:2). A groundbreaking ceremony on the $9½ million Phase Two addition" took place June 15, 1971 (*Los Gatos Times-Saratoga Observer* 15 June 1971:4).

1980s – Today. By 1980, GSH had a full-time staff of 1,200. By the mid-2000s, GSH had expanded to nearly quadruple its original size. Background research revealed that, by 2003, the modern East Entrance to GSH's Pre-Surgical Admitting/Endoscopy and Surgery Waiting areas was in place along with a landscaped areas and access stairs leading to below ground floors. Beginning in July 2003, two single-story wings resting on square building footprints north of the GSH's Main Hospital Tower and Building were demolished and construction of the modern, four-story Women and Children's Services wing began and completed by November 2004 on the hospital's north and west-facing façades.

In 2017–2018, GSH renovated and expanded its Emergency Department to "double the Department's current square footage and [. . .] provide for faster patient diagnosis and treatment" (GSH 2017). The $30 million expansion renovated the interior and exterior providing a "new exterior walk-in entry and drop-off canopy for incoming patients, the expanded Emergency Department includes a new ambulance drop-off canopy and five ambulance parking spaces" (GSH 2017). The renovated ER and hospital signage altered the far-left side (western) portion of the main, street-facing façade, and the entrance off Samaritan Drive, the primary access point for arriving non-surgical patients and visitors. Concurrently, GSH undertook a separate, $14 million renovation of a portion of the Women's & Children's Services area as well as a project to renovate the Main Entrance arrival area and lobby (GSH 2023). While completed to provide additional services and accommodate and implement modern medical and technological advances, these renovations, when taken together, significantly altered GSH's primary and secondary façades.

Today, GSH is a 404-bed acute care hospital providing "emergency care, anesthesia and pain management, cancer care, cardiology, children's services, emergency care, general surgery, rehabilitation, robotic surgery, women's services, and wound care. Hospital facilities also include a birthing center, breast care center, a comprehensive stroke center, heart rhythm center, and joint replacement center. GSH is a certified Comprehensive Stroke Center, STEMI Receiving Center,

accredited Chest Pain Center, and a certified [Atrial Fibrillation] Center" (Town of Los Gatos 2022:6-25).

4.4 ARCHITECTURAL CONTEXT

Architecture in and around the project site follows trends elsewhere in mid- to late-20th century California. This section provides an overview of the major architectural trends represented by these resources.

4.4.1 International/Modernist

The International or Modernist style has its roots in the rise of industrial manufacturing during the late-19th century. Architects who favored this style focused on open floor plans and challenged traditional concepts of building layouts and massing. They sought to move away from decorative elements that referenced historical designs and motifs, and toward designs that emphasized a building's function. During this period of intense American industrial and commercial growth, a new form of building was needed to house workers in the increasingly dense and expensive downtown commercial core areas. Expanding horizontally was not a viable or affordable option, so the obvious solution was to expand vertically. Two practical innovations made this possible: steel-framed superstructure and elevators (Kunstler 1993:65; Brechin 2006:67-70). These support and communications systems were readily adapted to above ground uses. For architects, the boxed steel frame used in buildings no longer made the use of heavy timbers, stone, or brick necessary. Several architects, such as Louis Sullivan, seized on this new method and mocked the continued use of stone and/or wood by architects as obsolete. The outer wall now became a veneer, and could be clad with metal, glass, porcelain, or tiles (Kunstler 1993:65).

Modernist style buildings also represent a large range of designs, from simple, functional ranch residences to high-concept public facilities. During the early decades of the 20th century, architects gradually embraced the machine age, prompting a turn toward a sleeker, more refined appearance. Modern buildings also encompass several subtypes, including Prairie, Craftsman, and Brutalist designs. The advent of the Modern style was dependent on advances in building material technology, as the availability of steel and concrete encouraged 20th-century architects to move away from traditional forms by removing their dependence on walls as load-bearing necessities.

Early-20th century architects gradually embraced a minimally decorated façade and began to strip historically sourced symbols and motifs from their commercial buildings. The embrace of the machine age favored a sleeker, more refined appearance (Wiseman 2000:149).

Following the October 1929 crash of the New York Stock Exchange and the ensuing Great Depression of the 1930s set the stage for the International-styled design of European architects Walter Gropius, Mies van der Rohe, and Le Corbusier. These and other architects applied the basic principles of Deidesheimer's Square to create a building that required no load-bearing exterior walls. Sheets of glass or metal panels replaced bricks, stone, and concrete. This found widespread favor as reflective of post-war American society's optimism and prosperity. It soon spread to all major cities and outlying areas (Gelernter 1999:262-263). International-styled buildings were economical to build and easily replicated, as their uncomplicated design did without elaborate ornamentation,

qualities that appealed to businesses (Wiseman 2000:149). The general character-defining features of the International/Modernist style are:

- Square or rectangular footprint
- Flat or very low- pitched roof
- Subdued color schemes
- Minimal amount of façade ornamentation to draw attention of passersby to the inside
- Simple cubic "extruded rectangle" massing
- Windows running in broken horizontal or vertical rows forming a grid
- Façade angles at 90 degrees
- Building materials are steel, formed concrete, chrome, or plated surfaces (Gelernter 1999:248-249; McAlester 2013:616-627).

4.4.2 Brutalism

Brutalist buildings while massive and imposing represent a relatively short-lived application of reinforced concrete as an expressive medium. The style's origins are not clear. Some argue the style originated with English architects Allen and Peter Smithson in 1953 while French architect Le Corbusier experimented with it during the 1940s and 1950s. What is clear is that Brutalism is an offshoot of the larger encompassing development of Modernism during the post-WW II period (Past Consultants 2009:85; Brown 2011:201; Gelernter 1999:265; Gowans 1993:303-304).

Brutalism is derived from the French "*beton brut*" or raw concrete and describes the use of it as the defining characteristic in its crudest, rawest, most unadorned form. Brutalist buildings can use large expanses of glass; however typically deeply recessed, creating deep shadows generating reverse voids contrasting with the exposed concrete panels and cubic massing. The ability of wet concrete to fill any form creates the possibility for a wide variety of shapes and forms, though repetitive angled geometries predominate to reinforce the unadorned aspect of the style (Gelernter 1999:277). Concrete is poured on-site and left unfinished, revealing the texture and grain of wood forms or aggregate base thereby creating visual texture. Brutalist designs could use narrow, vertical ribs closely arranged as a finished surface creating a changing visual texture as sunlight and shadow wax and wane during the day. These ribs are themselves brutalized further by intentional breaking, chipping, or otherwise deforming the ribs creating a jagged and uneven surface, giving the impression of advanced weathering, and ageing the building.

Brutalist buildings can embody the distinctive characteristics and high artistic values of a short-lived method of construction and design. Brutalism's rawness and unadorned qualities is a direct rebuke of the machine-like precision of the glass-clad steel-framed towers of Mies van der Rohe and other International architects. As an inexpensive building material, concrete implies solidity and a sense of permanence. As such it was employed widely around the world in large-scale building projects during the 1950-1970s. While concrete is a character-defining feature of Brutalist architecture, raw concrete "might refer to the archaic in one case, to stark urban reality in another, to natural erosion in the third" (Curtis 1996:550).

Brutalism was popular for large, institutional applications, such as universities, municipal buildings, libraries, and others. Brutalist architecture could also allow for a building's interior elements such as plumbing, electrical, and climate control to be turned inside out as exemplified by Wurster Hall, at UC Berkeley. Several examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the John Portman's Embarcadero Center, and the Hyatt Regency Hotel both in San Francisco. Other notable examples within California and the United Staes are the Salk Institute and the Geisel Library at UC San Diego, both in in La Jolla, Boston City Hall in Boston, Massachusetts, and the J. Edgar Hoover FBI Building in Washington D.C.

The general character-defining features of the Brutalism style are: square or rectangular cubist footprint; rough, unadorned poured concrete construction; flat roofs; heavy, cubic massing with right angled façades; wood grain imprints from concrete forms; deliberately chipped or blemished surface to create visual texture; recessed windows and deeply shadowed irregular openings; and repeating geometric patterns (Brown 2011:201-203; Walker 1996:268-269; Past Consultants 2009:86).

4.4.3 Reinforced Concrete

The spread of reinforced concrete construction in the United States was generally in response to the needs for improved resistance to fire and earthquake damage. As a building medium, reinforced concrete was simple to work with and required minimal skilled labor (in comparison to professional masons). Roughly beginning in 1890, the spread of reinforced concrete structural systems "including walls, columns, slabs and beams" along with steel-frame building, was at the forefront of American construction by 1910 (Friedman 2010: 131).

According to historian Betsy Hunter Bradley, the motivation in spreading the use of reinforced concrete was (1) the refinement of the preparation of Portland cement through a process of grinding and heating to make a material that would be uniform in composition and strength, and (2) the use of steel reinforcing bars, pioneered by San Francisco-based engineer Ernest Leslie Ransome. By 1900, Ransome's method of steel reinforcement allowed concrete structural systems to adopt a more skeletal form, which allowed for more windows providing more interior lighting for manufacturing and other industrial uses (Bradley 1999:156-157; Tobriner 2006:204). The term "Portland cement," according to essayist Brian Hayes, dates to the 1820s when concrete was rediscovered by builders in the English Midlands. The term "*Portland cement*" refers to the Isle of Portland, of the Dorset Coast of England, which was the source of the white limestone that architect Christopher Wren chose for St. Paul's Cathedral in London. Portland cement does not come from the Isle of Portland, but the name was thought to suggest quality" (Hayes 2005:42).

4.4.4 Anshen and Allen

An article in the January 10, 1962, edition of the *Los Gatos Time-Saratoga Observer* noted a "medical-architectural committee for the Good Samaritan Hospital" composed of 26 physicians and surgeons served as an advisory body "in design and planning with" Anshen and Allen, a San Francisco-based architectural firm (*Los Gatos Time-Saratoga Observer* 10 January 1962:1). According

to the *San Francisco Modern Architecture and Landscape Design Historic Context Statement*, the San Francisco-based firm of Anshen and Allen was established in 1940 by Robert S. Anshen and William Stephen "Steve" Allen, who "began their careers primarily as residential architects and were the first designers for the mass-produced homes of Joseph Eichler, beginning in 1949. The firm expanded throughout the 1950s, producing commercial and institutional buildings, and opening offices in Boston, Massachusetts; Columbus, Ohio; and London, England. Although both Anshen and Allen have passed away, the firm remained a successful presence in educational and healthcare facilities" (San Francisco Planning Department 2011:210). As the firm "best known today as the original designers of Eichler homes" the firm later "played a major role in setting the tone for Bay Area modernism as something warmer and more Wrightian than its Southern California counterpart" (Weinstein, n.d.). In 2010, the design and consulting company Stantec acquired Anshen & Allen (Online Archive of California 2023).

4.4.4.1 Robert Anshen, A.I.A.

According to the AIA's *American Architects Directory* for 1962, Robert Anshen was born January 29, 1910, in Revere, Massachusetts. Like William Allen, Robert Anshen graduated from the University of Pennsylvania's undergraduate and graduate architecture schools in 1936, where he formed a lifelong friendship and later San Francisco-based architectural partnership with Allen. After partnering with Allen in 1940, Anshen served as "the face of the business". Their big break came in 1940 when the "two won over Standard Oil Vice President Ralph K. Davies […] when he was searching for architects to design a Tudor mansion for him in [the unincorporated San Mateo community of] Woodside" (American Institute of Architects 1962: 17; San Francisco Planning Department 2011:209).

Winning the Woodside commission proved "a job that put [Anshen and Allen] on the map and that led to most of the jobs that followed" (Eichler Network 2021). Robert Anshen was a member of the Northern Californian Chapter of the American Institute of Architects (AIA) beginning in 1946, served as a Lecturer in Design at the University of California, Berkeley from 1952-1953, a juror in architectural design competitions, wrote a monthly column on architecture for the *San Francisco Examiner* in 1962, and was highly regarded among the architectural and design professional community. Robert Anshen died in 1964 (Pacific Coast Architecture Database 2023).

4.4.4.2 William Allen, A.I.A.

According to online information available at the American Institute of Architects (AIA), William Stephen "Steve" Allen was born July 15, 1912, in Neptune Township, New Jersey. He attended the University of Pennsylvania, graduating in 1935 with a bachelor's degree in architecture. He remained a student at University of Pennsylvania and graduated the next year with a master's degree in architecture. After graduation, he went abroad traveling through Germany, Italy, and Japan "with his schoolmate and future partner, Robert Anshen" (American Institute of Architects 1962: 10, 17; San Francisco Planning Department 2011:209). After returning to United States and nearly broke, Allen and Anshen ended up in San Francisco during the Great Depression. Allen soon found work a designer for Masten & Hurd as well as Blanchard & Maher. While engaged in design work, Allen and Anshen formed a partnership in 1940, which they would operate until 1964, when Robert Anshen died. William Allen continued as senior partner until 1972, when he retired. He died in 1989.

4.4.4.3 Selected Portfolio

From its founding and through the 1960s, Anshen and Allen maintained their offices in the Jeweler's Manufacturing Building built in 1907 at 461 Bush Street (extant, contributing element to the Kearny-Market-Mason-Sutter Conservation District and a historical resource for the purposes of CEQA). Anshen and Allen, both members of the American Institute of Architects, operated as a partnership until 1964 when Robert Anshen no longer was a partner and William Allen retired in 1972. During their operation, "doing primarily residential designs; its work, over 3,000 houses by 1962," the firm won prestigious awards for their architectural designs and generally was regarded as a top-tier architectural design firm (Pacific Coast Architectural Database 2023; AIA 1962).

In 2010, the firm was absorbed as a subsidiary of Stantec, an international consulting firm based in Edmonton, Alberta, Canada. Information reviewed indicates that, along with the Good Samaritan Hospital, the firm of Anshen and Allen are credited with designing many buildings, the following are in the wider San Francisco Bay Area and the western United States that are contemporary with GSH:

- 1950: Various Eichler Homes Developments San Francisco Bay Area
- 1956: Chapel of the Holy Cross, Sedona, Arizona
- 1957: Quarry Visitor Center, Dinosaur National Monument, Utah (razed)
- 1961: 601 California Street, San Francisco
- 1963: Latimer Hall, University of California, Berkeley
- 1964: Central United Methodist Church, Stockton, California
- 1966: Samuel Silver Space Sciences Laboratory, University of California, Berkeley,
- 1966: Hildebrand Hall, University of California, Berkeley
- 1967: Bank of California Building, San Francisco
- 1968: Lawrence Hall of Science, University of California, Berkeley
- 1969: Bank of California Tower (now Union Bank Tower), Portland, Oregon (Wikipedia 2023)

4.5 ELIGIBILITY EVALUATION

The following section presents an evaluation to assess whether the Good Samaritan Hospital within the approximately 20-acre parcel evaluated in this study is eligible for inclusion in the CRHR or for local designation, thereby qualifying as a historical resource for the purposes of CEQA.

4.5.1 Application of California Register of Historical Resources Criteria – Good Samaritan Hospital

4.5.1.1 Criterion 1: Is it associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage?

Research indicates that GSH, evaluated in this study, is associated with the growth of San José in the mid- to late-20th century, as it relates to increasing the overall level of medical care in San José in general, and those communities in the West Santa Clara Valley specifically. Organization for a hospital in this area began shortly after the end of World War II, as the population quickly expanded soon overwhelming San José's then-existing medical care infrastructure. Due to tireless efforts to organize and raise funds, Good Samaritan Hospital was built. The portion of GSH of sufficient age to warrant evaluation here consists of the original six-story tower and adjacent wings dating to the

original period of construction of 1962 to 1965 designed by San Francisco-based Anshen and Allen. The other built environment elements within the approximately 20-acre site range from 18 to 33 years old and have not reached sufficient age to provide sufficient scholarly perspective to warrant evaluation for eligibility and ae not addressed in this study.

GSH was designed and built to operate as a general hospital. The facility was initially designed for subsequent expansion in anticipation of continued regional population growth and with it, an increased need for medical services. However, such expansion was envisioned to be vertical, i.e., additional floors (up to 12) for the Main Tower, rather than horizontal expansion, as LSA's research and field survey indicated occurred. Good Samaritan Hospital is among several hospitals and medical facilities in San José and Santa Clara County associated with this period of growth in San José, Santa Clara County, and California. Background research indicates this facility continues to serve as a hub to support a variety of secondary and tertiary specialty clinics, offices, and related medical services in the vicinity. Accordingly, GSH possesses specific, important associations with the context of San José's late-20th century growth, an event that made a significant contribution to the broad patterns of the history of San José, Santa Clara County, and the West Valley.

For these reasons, LSA concludes that the Good Samaritan Hospital evaluated in this study appears individually eligible under CRHR Criterion 1.

4.5.1.2 Criterion 2: Is it associated with the lives of persons important in our past?

The GSH evaluated in this study was created to address a pressing and growing deficiency in the level of medical care in the western portion of Santa Clara County in the aftermath of World War II. Background research did not identify individuals whose lives are important in our past. Individuals who practiced medicine at GSH or their associative or supporting professions (e.g., members of the GSH Trustees or Boards of Directors, administrative staff, religious, or other professionals, etc.) would not have lived within the project site, as these buildings were used for medical care and treatment. Accordingly, such potential associations with the project site primarily existed to serve the hospital's mission to treat disease and provide medical care via a nonprofit organization, an arrangement common historically and in modern times. Background research did not identify an association with GSH and medical doctors or other specialists with a pioneering medical procedure or course of treatment. Accordingly, GSH does not appear associated with the lives of individuals important to the history of medical practice in California or the United States, or individuals important in the wider history of San José, Santa Clara County, or California.

For these reasons, LSA concludes that the Good Samaritan Hospital evaluated in this study does not appear significant under CRHR Criterion 2.

4.5.1.3 Criterion 3: Does it embody the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values?

The GSH evaluated in this study is a representative example of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. Associated with the larger trend of International/Modernist, architecture, Brutalism was more severe in appearance, used raw exposed concrete, and included

few, if any, historicist elements. A review of popular architectural guides of the Bay Area and a database of West Coast-based architect biographies did not indicate that GSH's built environment evaluated in this study is notable for its architectural or design qualities or as an important example of an architectural aesthetic. The portion of GSH evaluated in this study shows evidence of extensive modification, which is common to these building types that were subsequently modified to meet the needs of a growing population, or make use of new technologies and practices, equipment upgrades, or repair damage.

GSH was designed in 1963–1965 by Anshen and Allen, a prolific San Francisco-based architectural firm. Background research indicates that Anshen and Allen designed a series of subsequent alterations up to 1980. Background research did not link GSH with Anshen and Allen's copious portfolio describing it as a notable example of their work in notable architectural publications, indicating that the building was not known for its architectural or design qualities, although Anshen and Allen are widely considered notable or important architects within the architectural and professional design community. Although the building has aspects that exemplify Brutalist architecture, a well-represented style in the existing building stock of the Bay Area. Better and more expressive examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the John Portman's Embarcadero Center, and the Hyatt Regency Hotel both in San Francisco. As described above in section 4.4.4.3, better, more representative examples of Anshen and Allen's work can be found in the San Francisco Bay Area, California, and the western United States.

Nevertheless, LSA concludes that the portion of Good Samaritan Hospital evaluated in this study appears significant under CRHR Criterion 3. As discussed in Section 4.5.3, however, the Good Samaritan Hospital no longer retains sufficient integrity to convey this association.

4.5.1.4 Criterion 4: Has it yielded, or may it be likely to yield, information important in prehistory or history?

This criterion provides the means to evaluate the potential for archaeological deposits to contain information important in San José's historic-period and pre-contact past. Its application to architecture and the built environment is less common in eligibility evaluations due to modern written sources, plans, and other forms of technical analysis. Information about GSH's general Brutalist-influenced utilitarian architectural aesthetic and construction methods, as represented by the portion of the approximately 20-acre parcel containing GSH's built environment evaluated in this study, can be obtained from widely available sources on the Brutalist architectural style. The portion of GSH evaluated in this study is unlikely to yield information important to the history of medical care in the United States, San José, Santa Clara County, or California.

For these reasons, LSA concludes that the portion of Good Samaritan Hospital evaluated in this study does not appear significant under CRHR Criterion 4.

4.5.1.5 Special Criteria Consideration 2: Historical resources achieving significance within the past fifty years.[9]

According to the Office of Historic Preservation, "[i]n order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than fifty years old may be considered for listing in the California Register if it can be demonstrated that sufficient time has passed to understand its historical importance" (OHP 2006:3).

A resource less than fifty years old may be considered for listing if it can be demonstrated that sufficient time has passed to obtain a scholarly perspective on the events or individuals associated with the resource to properly understand its historical importance. While GSH is more than fifty years old, this consideration is sometimes also applied to association with events and persons that took place in the more recent past at older properties.

To assess the potential for GSH to be eligible for association with important events or lives of important period within the recent past, LSA reviewed official guidance as well as sources that may reveal associative significance with GSH and important events or persons in the recent past.

By design, hospitals are associated with important milestone events in the lives of individuals and communities. Hospitals are places where the origins of individuals, treatment of disease or injury, recovery, as well as the end of life occur. Good Samaritan Hospital accrued significance with these types of important events since opening in 1965 and continues through to today. These events, while of momentous importance in the lives of those who live in the geographical region surrounding GSH as well as those who are present due to circumstance, are associative qualities inherent to hospitals everywhere.

According to NPS guidance, associations with birthplaces are not sufficient to warrant eligibility. A given resource "cannot be simply the birthplace or grave of a person significant in our past" (NPS 1997:32). However, potential eligibility for a birthplace can emerge if other potential sites or resources "strongly associated with a person of outstanding importance has lost all other properties directly associated with his or her formative years or productive life" (ibid).

LSA reviewed GSH's website and other online information for potential associations linking GSH with innovative medical practices and techniques or individuals important in the context of medical history. A review of GSH's website, the American Medical Association, and the Nobel Prize in Medicine did not identify or link GSH with any notable or significant medical advancements in the field or practice of medicine.

Based on this review, the GSH website notes, "The hospital continued to expand through the 1980s with advancing services, including pioneering work in cardiovascular medicine and surgery; family-centered birthing facilities; oncology services taking advantage of new medical, surgical, and radiological advances; and additional behavioral health facilities." In addition, by "the 1990s, the

[9] While GSH is clearly over fifty years old, LSA assessed the potential for GSH's eligibility under this criterion to provide a robust analysis to account for potential association(s) of GSH with events or persons important in the recent past.

hospital became a national leader in stroke services, the highest level of neonatal intensive care services, as well as high-risk pregnancies." In 2016 GSH was awarded certification "from the Joint Commission for Hip and Knee Joint Replacement Programs" (GSH 2023). Lastly, GSH "is only one of ten hospitals to be award four consecutive times with the Outstanding Achievement Award from the American College of Surgeons Commission on Cancer" (GSH 2016). However, in each case, specific medical doctors, specialists, or personnel were not identified to associate GSH with significant or notable medical professionals in the recent past. A review of American Medical Association (AMA) awards lists or via a simple institutional search, or via review of Nobel Prizes in Medicine did not identify GSH (AMA 2023; Nobleprize.org 2023). Based on this review, although GSH remains important in providing medical care in the West Valley, it has not accrued a higher associative stature for notable events or individuals in the recent past.

For these reasons, LSA concludes that Good Samaritan Hospital does not appear significant under CRHR Special Criterion Consideration 2 for achieving significance within the past fifty years.

4.5.2 Application of City of San José Evaluative Criteria – Good Samaritan Hospital

The section below provides a discussion of the Good Samaritan Hospital's eligibility for listing in the San José Historic Resources Inventory as a Candidate City Landmark. The City of San José utilizes the City Landmark eligibility criteria in Section 13.48.110(H) of the San José Municipal Code (as described above in section 2.3.1) to determine whether based on substantial evidence a project involves a historical resource on the local level under CEQA.

1) San José Municipal Code Section 13.48.110(H) Its character, interest, or value as part of the local, regional, state or national history, heritage or culture.

Good Samaritan Hospital is among several hospitals and medical facilities in San José and Santa Clara County associated with post war growth in San José, Santa Clara County, and California. Background research indicates this facility continues to serve as a hub to support a variety of secondary and tertiary specialty clinics, offices, and related medical services nearby. Accordingly, GSH possesses specific, important associations with the context of San José's late-20th century growth, an event that made a significant contribution to the broad patterns of the history of San José, Santa Clara County, and the West Valley. For these reasons, LSA concludes that the portion of Good Samaritan Hospital (GSH) evaluated in this study appears significant under criterion 1. However, as discussed in the Integrity Assessment below the Good Samaritan Hospital no longer retains sufficient integrity to convey this association.

2) Its location as a site of a significant historic event.

The GSH evaluated in this study was the result of local organization efforts that began shortly after World War II. The hospital was sited to also serve the adjacent community of Los Gatos as well as in anticipation of further residential and commercial growth into the West Valley. Background research and field survey does not indicate the siting and construction of GSH constitutes an event that reveals a higher associative stature for other hospitals whose development was the result of a similar pattern of community organization, fund raising, and construction. Coupled with the analyses described above, background research did not indicate that GSH was the location that contained

within it a significant event. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 2.

3) Its identification with a person or persons who significantly contributed to the local, regional, state or national culture and history.

The GSH evaluated in this study was created to address the growing deficiency in medical care in the West Valley after World War II. Individuals who practiced medicine at GSH or their associative or supporting professions (e.g., members of the GSH Trustees or Boards of Directors, administrative staff, religious, or other professionals, etc.) would not have lived within the project site, as these buildings were used for medical care and treatment. Accordingly, such potential associations with the project site primarily existed to serve the hospital's mission to treat disease and provide medical care via a nonprofit organization, an arrangement not uncommon historically and in modern times. Background research did not identify an association with GSH and medical doctors or other specialists with a pioneering medical procedure or course of treatment. Accordingly, GSH does not appear associated with the lives of individuals important to the history of medical practice in California or the United States, or individuals important in the wider history of San José. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 3.

4) Its exemplification of the cultural, economic, social or historic heritage of the City of San José.

As stated above in sections 4.5.2.1 and 4.5.2.2, GSH was built and put into operation to address a pressing need for medical care facility resulting from a rapid population growth in San José and western Santa Clara Valley in the decades after World War II. This event is one of several similar examples of medical facilities being constructed to address this demographic change in San José and statewide. Background research did not indicate Good Samaritan Hospital was the first such resource associated with this important context and does not possess higher associative stature under this criterion. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 4.

5) Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style.

Background research indicates that GSH was designed using the then-popular architectural aesthetic of Brutalist interpretation of Internationalist/Modernist architectural style which followed trends elsewhere in mid- to late-20th century California for similar institutional buildings. GSH does not appear to have been designed to appeal or otherwise incorporate architectural design cues, massing, or ornamentation in a way to reflect the architectural traditions of a distinct group of people in any era of history within San José, the Santa Clara Valley, or California. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 5.

6) Its embodiment of distinguishing characteristics of an architectural type or specimen.

The GSH evaluated in this study is a representative examples of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. Associated with the larger trend of International/Modernist, architecture, Brutalism was more severe in appearance, used raw exposed concrete, and included few, if any, historicist elements. A review of popular architectural guidebooks of the Bay Area and a database of West Coast-based architect biographies did not indicate that GSH's built environment evaluated in this study is notable for its architectural or design qualities or as an important example of an architectural aesthetic. The portion of GSH evaluated in this study shows evidence of extensive modification, which is common to these building types that were subsequently modified to meet the needs of a growing population, or make use of new technologies and practices, equipment upgrades, or repair damage.

Although the portion of GSH evaluated in this study has aspects that exemplify Brutalist architecture, a well-represented style in the existing building stock of the Bay Area. Better and more expressive examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the Embarcadero Center in San Francisco, and the Hyatt Regency Hotel both in San Francisco. Nevertheless, LSA concludes that the portion of Good Samaritan Hospital evaluated in this study appears significant under criterion 6. However, as discussed in the Integrity Assessment below the Good Samaritan Hospital no longer retains sufficient integrity to convey this association.

7) Its identification as the work of an architect or master builder whose individual work has influenced the development of the City of San José.

GSH was designed in 1963–1965 by Anshen and Allen, a prolific San Francisco-based architectural firm. Background research indicates that Anshen and Allen also designed a series of subsequent alterations up to 1980. Background research did not link GSH with Anshen and Allen's copious portfolio describing it as a notable example of their work in notable architectural publications, indicating that the building was not known for its architectural or design qualities, although Anshen and Allen are widely considered notable or important architects within the architectural and professional design community. As described above in section 4.4.4.3 better, more representative examples of Anshen and Allen's work can be found in the San Francisco Bay Area, California, and the western United States. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 7.

8) Its embodiment of elements of architectural or engineering design, detail, materials or craftsmanship which represents a significant architectural innovation or which is unique.

The GSH evaluated in this study is a representative example of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. It uses materials and construction techniques common to that era, and it possesses few distinguishing or distinctive elements; the building typology that resulted from this architectural trend has been thoroughly documented through published architectural history books, websites, and local field guides that are widely available. Further study of GSH will not result in new information about construction techniques or the Modern/Brutalist architectural style. For these

reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 8.

4.5.3 Integrity Assessment

In addition to being significant under one or more criteria, a resource must retain enough of its historic character and appearance to be recognizable as an historical resource and retain integrity, which is defined as the ability of a resource to convey the reasons for its significance. There are seven aspects of integrity used to measure a property's ability to convey its significance: *location*, *design*, *setting*, *materials*, *workmanship*, *feeling*, and *association* (National Park Service 1997:45). The evaluation of integrity must be grounded in an understanding of a resource's physical features and its environment, and how these relate to its significance. A property's integrity is assessed only after its significance is established.

Per the City Landmark eligibility assessment above, the GSH Main Hospital Building appears individually significant under City Landmark criterion 1 and criterion 6 for associations with significant events and for its associations with Brutalist architecture. Therefore, the Good Samaritan Hospital Building is potentially individually eligible for listing in the San José Historic Resources Inventory as a Candidate City Landmark; therefore, its historic integrity was assessed.

Location: The GSH Main Hospital Building at 2425 Samaritan Drive has not been moved and retains integrity of *location*.

Design, Materials and Workmanship: Soon after the hospital opened in 1965, a "Phase II" construction program was underway to increase the number of hospital beds. As discussed above in section 4.3.8.1, this expansion more than doubled Good Samaritan's original size, enabling the hospital to provide 395 patient beds and to increase the number of employees" (Beilharz and DeMers 1980:190). By 1980, GSH had a full-time staff of 1,200. By the mid-2000s, GSH had expanded to nearly double its original size. Background research revealed that by 2003, the modern East Entrance to GSH's Pre-Surgical Admitting/Endoscopy and Surgery Waiting areas was in place along with a landscaped areas and access stairs leading to below-ground floors. Beginning in July 2003, two single-story wings resting on square building footprints north of the GSH's Main Hospital Building were demolished and construction of the modern four-story Women and Children's Services wing began and was completed by November 2004. In 2018, GSH renovated and remodeled the Emergency Room, the hospital Main Entrance and Lobby area, and additional alterations to the Women and Children's Services wing as part of a $50 million project.

Accordingly, except for the central six-story central tower and the remaining elements of the original single-story adjacent wings, the hospital appears radically different than when it opened 58 years ago. The portions of the hospital that reflect this subsequent growth reflect a range of architectural styles, with each newer addition moving further away from Anshen and Allen's original Brutalist aesthetic. There may have been practical reasons for this. GSH's purpose is to provide medical care and services and not remain an intact specimen of Brutalist architecture. Nevertheless, these alterations when taken together, have changed the hospital's primary elements that composed its original symmetrical façade, wall cladding, roof forms, massing, and footprint, which conveyed its ability to be a representative example of Brutalist architectural style as applied to a hospital or

other similar institutional property type. Therefore, the GSH Main Hospital Building does not retain sufficient integrity of *design*, *materials*, or *workmanship.*

Setting and Feeling: The GSH Main Hospital Building no longer retains sufficient integrity of *setting or feeling* due to subsequent removal of adjacent orchards and agricultural land use patterns in this area when the hospital was under construction, the growth of residential tract subdivisions, as well as the construction of State Route 85 north of and adjacent to GSH.

Association: The Main Hospital Building retains integrity of *association as* a regional medical facility.

The other buildings and helipad structure that share the same parcel as GSH range from 18 to 33 years of age and have not reached sufficient age to provide sufficient scholarly perspective to warrant evaluation for eligibility and are not addressed in this study; therefore, their integrity was not assessed.

4.5.3.1 Conclusion

According to the NPS guidance, "[t]he retention of specific aspects of integrity is paramount for a property to convey its significance." In addition, "[t]o retain historic integrity a property must always possess several, and usually most of, the aspects" (National Park Service 1997:44). As described above, Good Samaritan Hospital retains integrity of location and association as a regional medical facility. However, the remaining five aspects of integrity have significantly diminished via subsequent alterations, additions, and expansion of the hospital since its founding in 1965. Therefore, Good Samaritan Hospital does not retain sufficient collective integrity to convey its associative qualities with the period of post war growth in San José, Santa Clara County, and California as well as a specimen of Brutalist architecture. For these reasons, Good Samaritan Hospital does not appear eligible as a Candidate City Landmark.

5.0 SUMMARY AND RECOMMENDATIONS

The study consisted of background research, a cultural resource field survey, and NRHP evaluation of the built-environment cultural resource in the project site.

5.1.1 Summary

Based on the background research and field survey conducted for this study, LSA concludes the GSH Main Hospital is associated with the mid- to late-20th century growth of San José and the western portion of Santa Clara County. The building possesses several characteristics of a general Brutalist-influenced utilitarian building type associated with institutional buildings during this period in San José, Santa Clara County, and statewide. However, background research and field survey indicate the original hospital building has sustained numerous alterations and additions in the 58 years since construction in 1965 and therefore no longer retains sufficient integrity to convey these historical associations. The other buildings and helipad structure in the project site range from 18 to 33 years old and have not reached sufficient age to provide adequate scholarly perspective to warrant evaluation for eligibility and are not addressed in this study.

For these reasons, LSA concludes that the GSH Main Hospital building does not appear individually or collectively eligible as part of a potential or unidentified district for inclusion under any of the evaluative criteria of the CRHR due to a lack of historic integrity to convey associative significance. For the same reasons, LSA concludes that the GSH Main Hospital building does not appear eligible for inclusion in the San José HRI as a Candidate City Landmark. Therefore, the GSH Main Hospital building evaluated in this study does not qualify as a "historical resource" for the purposes of CEQA as defined at PRC §5024.1(c).

See Table D, below, for a summary of the resource status of the GSH Main Hospital in the project site.

Table D: Resource Summary

Resource Name	California Register eligible?	Candidate San José City Landmark?	CEQA Historical Resource?
Good Samaritan Hospital Main Building	No	No	No

No archaeological resources were identified in the project site during this study. Because the project site sits on Pleistocene alluvial fan sediments that were deposited prior to human occupation of the area, and the project site was not historically near freshwater sources, LSA considers the project site to have reduced sensitivity for pre-contact archaeological deposits.

The absence of early historical structures within the project site (with associated below-surface features such as wells and privies) means that the potential for encountering buried historic-period archaeological resources is also low.

5.1.2 Recommendations

Given the low sensitivity for pre-contact archaeological deposits, LSA does not recommend additional archaeological investigation prior to construction. However, LSA does recommend providing Worker's Environmental Awareness Program training for grading/excavation crews prior to the start of construction. This mandatory training would be provided by the project archaeologist, who would review regulations regarding archaeological resources, summarize and show examples of the types of resources that could be identified during earthmoving activities, and provide notification protocols to be followed in the event suspected cultural resources are encountered.

Recommendations are provided below should unanticipated archaeological deposits or human remains be encountered during construction activities.

9) Inadvertent Discovery of Archaeological Deposits[10]

The following procedures should be followed in the event that subsurface cultural resources or archaeological deposits are identified during project activities, and an archaeologist is not present on the site. If prehistoric or historic resources are encountered during excavation and/or grading of the site, all activity within a 50-foot radius of the find shall be stopped, the Director of Planning, Building and Code Enforcement (PBCE) or the Director's designee and the City's Historic Preservation Officer shall be notified, and a qualified archaeologist in consultation with a Native American Tribal representative registered with the Native American Heritage Commission for the City of San José and that is traditionally and culturally affiliated with the geographic area as described in Public Resources Code Section 21080.3 shall examine the find. The archaeologist in consultation with the Tribal representative shall 1) evaluate the find(s) to determine if they meet the definition of a historical or archaeological resource; and (2) make appropriate recommendations regarding the disposition of such finds prior to issuance of building permits. Recommendations could include collection, recordation, and analysis of any significant cultural materials. A report of findings documenting any data recovery shall be submitted to the Director of PBCE or the Director's designee the City's Historic Preservation Officer and the Northwest Information Center (if applicable). Project personnel shall not collect or move any cultural materials.

10) Human Remains

If any human remains are found during any field investigations, grading, or other construction activities, all provisions of California Health and Safety Code Sections 7054 and 7050.5 and Public Resources Code Sections 5097.9 through 5097.99, as amended per Assembly Bill 2641, shall be followed. If human remains are discovered during construction, there shall be no further excavation or disturbance of the site, or any nearby area reasonably suspected to overlie adjacent remains. The project applicant shall immediately notify the Director of Planning, Building and Code Enforcement (PBCE) or the Director's designee and the qualified archaeologist, who shall then notify the Santa Clara County Office of Medical Examiner-Coroner.

[10] The language in this section reflects the City of San José's *Standard Permit Conditions* as provided to LSA by Kimley-Horn July 18, 2023, via email.

The Medical Examiner-Coroner will decide as to whether the remains are Native American. If the remains are believed to be Native American, the Medical Examiner-Coroner will contact the Native American Heritage Commission (NAHC) within 24 hours. The NAHC will then designate a Most Likely Descendant (MLD). The MLD will inspect the remains and make a recommendation on the treatment of the remains and associated artifacts. If one of the following conditions occurs, the landowner or his authorized representative shall work with the Medical Examiner-Coroner to reinter the Native American human remains and associated grave goods with appropriate dignity in a location not subject to further subsurface disturbance:

i. The NAHC is unable to identify a MLD or the MLD failed to make a recommendation within 48 hours after being given access to the site.

ii. The MLD identified fails to make a recommendation; or

iii. The landowner or his authorized representative rejects the recommendation of the MLD, and mediation by the NAHC fails to provide measures acceptable to the landowner.

 Resource Name: Good Samaritan Hospital

P1. Other Identifier: None

P2. Location ☐ **Not for Publication** ☒**Unrestricted**

- **a. County:** Santa Clara
- **b. USGS 7.5' Quads:** *San Jose West* & *Los Gatos, Calif.*, **Date:** 1980; T8S; R1W, Section 11, M.D.B. & M.
- **c. Address:** 2425 Samaritan Drive **City**: San José **Zip**: 95124
- **d. UTM:** Zone 10S 593496mE/4123381mN (approx. center of 20-acre parcel)
- **e. Other Locational Data:** APNs 421-36-009; -011; western Santa Clara County

P3a. Description: This resource consists of the Good Samaritan Hospital (GSH), a variable-height, multi-unit, general services, and acute care hospital providing "emergency care, anesthesia and pain management, cancer care, cardiology, children's services, emergency care, general surgery, rehabilitation, robotic surgery, women's services, and wound care. Hospital facilities also include a birthing center, breast care center, a comprehensive stroke center, heart rhythm center, and joint replacement center. GSH is a certified Comprehensive Stroke Center, STEMI Receiving Center, accredited Chest Pain Center, and a certified [Atrial Fibrillation] Center" (Town of Los Gatos 2022:6-25). Built in 1963-1965 on a 20-acre parcel in what was at the time a semi-rural setting, this hospital is of reinforced concrete construction with a deep street setback on the north side of Samaritan Drive. The building is covered by a low-pitched or flat roof with no overhang and sheathed in an undetermined type of roofing. The walls are of reinforced concrete and the building rests on a concrete foundation with a basement. The main entrance is located on the western, non-street facing façade. The GSH building is in fair condition. A detached helipad is located north of the building and a detached single-story building is located approx. four hundred feet east of the building.

B1. Historic Name: *Good Samaritan Hospital*
B2. Common Name: Same
B3. Original Use: Non-profit general hospital.
B4. Present Use: Same
B5. Architectural Style: Brutalist
B6. Construction History: According to information in the *Los Gatos Times-Saratoga Observer*, the Good Samaritan Hospital (GSH) was built in 1963-1965. The San Francisco-based architectural firm Anshen and Allen designed GSH. A "Phase II" called for additional fund raising and planning efforts that spanned the years 1968-1974. The expansion more than doubled Good Samaritan's original size to provide 395 patient beds and to increase the number of employees. Beginning in July 2003, two single-story, wings resting on square building footprints north of GSH were demolished and construction of the modern four-story Women and Children's Services wing began and completed by November 2004 on the hospitals north and west-facing façades. In 2017-2018, GSH renovated and expanded its Emergency Department to double the Department's current square footage and will provide for faster patient diagnosis and treatment. Concurrently, GSH renovated the Women's & Children's Services area, the Main Entrance arrival area, and lobby as well as landscaping changes.

B7. Moved? ☒ No
B8. Related Features: detached freestanding tank.
B9. a. Architect: Anshen & Allen, San Francisco (1965-1980)
b. Builder: Rothschild and Weirick, San Francisco (1963-1965)
B10. Significance: Theme: N/A **Area:** City of San José, Santa Clara County
Period of Significance: N/A **Property Type:** Hospital building **Applicable Criteria:** N/A

This approximately 20-acre area contains the Good Samaritan Hospital (GSH) an active hospital located at 2425 Samaritan Drive in a semi-urban, residential tract setting. Research indicates that the building was built in 1965, dedicated May 15, 1966, and has continuously operated as a regional general and acute care hospital. The seven-story primary or Main Building is also an example of the Brutalist architectural style, an aesthetic in large institutional buildings during late-20th century in San José, Santa Clara County, and statewide. (see continuation sheets).

B10. Significance (continued)

HISTORICAL CONTEXT

The study area and vicinity have undergone many of the primary historic-period land uses of San José and Santa Clara County. These general historical trends are discussed below to provide context for the events that occurred in the resource area and its vicinity. The broad patterns of events that shaped the study area's land use history are described first below, followed by a description of local developments from the mid-19th through the early 20th centuries.

Exploration

Recorded Spanish activity in the Bay Area begins in 1769 with the Gaspar de Portolá Expedition. The subsequent years brought more expeditions that favorably noted the fresh water, adequate timber, and rich soils of the Bay Area. In 1777, a party of settlers from San Francisco led by Lieutenant Moraga set out for the Santa Clara Valley to establish, on the banks of the Guadalupe River, the first civic settlement (or *pueblo*) in California. Spain's colonization policy goals were to pacify native peoples, encourage settlement by those of European heritage, and preempt competing foreign claims to territory claimed by Spain. Implementing this policy utilized three institutions: missions, presidios, and pueblos designed to operate in an interdependent relationship to reinforce each other and secure the land for the Spanish Crown.

The land that would become *Pueblo de San José de Guadalupe* was granted on July 22, 1778, by Governor Felipe de Neve in the name of King Charles III under provisions of *the Recompilacion de Leyes de los Reynos de las Indias*, a four-volume codex of Spanish colonial law to standardize Spanish colonial town planning. Based loosely on ancient Roman military camp layouts, the regulations required arranging streets in a gridiron plan and spread out four blocks deep from a central square that in turn was fixed by the location of a church (Reps 1979, 35-38, 97-98, 103-108). Instead of four blocks, the codex called for the boundaries of a pueblo grant to be four leagues square of flat ground, one square league in each cardinal direction from a central plaza (Hall 1871:334; Munro-Fraser 1881:370).

Mexican Period

After Mexico declared independence in 1821, the republican ethos of the Mexican state favored secular growth over ecclesiastical and disbanded the mission system in 1834. This policy emancipated tens of thousands Native American neophytes from church custody and made available hundreds of thousands of acres then held in trust by the church for the Spanish Crown. California's Mexican governors liquidated church lands into land grant ranchos to populate the countryside with politically aligned citizens and assert Mexican sovereignty. As a result, the total number of ranchos in California doubled by 1844. During this time, political developments in central Mexico distracted the Mexican government. Consequently, the Spanish-speaking native-born Alta Californians, or Californios, enjoyed peace and a relatively high degree of political, social, and economic autonomy with minimal intrusion into their affairs by the Mexican state (Works Progress Administration 1939:47-50; Bancroft 1888 II:607-627; McWilliams 1973:38, Monroy 1990:123-132; Marschner 2000:4-6; Robinson 1948:29-31).

Gold Rush and Statehood

As more Anglo-Americans—mostly single young men from the United States—came to California, sympathies for joining the Union spread. The Mexican American War, the Treaty of Guadalupe Hidalgo, and the discovery of gold on the American River in January 1848, set in motion the Californios' loss of California (Laffey 1992:5). Following the Mexican American War, the United States annexed California in 1848 and occupied it via a military government. Statehood was granted as part of the Compromise of 1850, which settled, among other issues, a four-year political impasse in the United States Senate between free and slave-holding states regarding whether slavery could expand into territories won during the war (Greenburg 2012:266-267). California entered the Union as a free state and the hastily drafted and ratified California Constitution of 1849 specified relocation of the state capital from the former colonial and Mexican capital at Monterey to San José.

B10. Significance (continued)

Santa Clara County

During the latter half of the 19th century, there was a growing migration of Anglo-Americans into Santa Clara County, an influx accompanied by regional cultural and economic changes. Many miners failed to strike it rich and turned to agriculture, particularly livestock and grain dry farming (Vaught 2003:449). The county experienced its first economic boom during a dry farming grain bonanza during the 1860s and 1870s. Anglo-American culture expanded at the expense of the established Hispanic culture; farmsteads slowly began to populate the immense Mexican ranchos, while the cultivation of various crops replaced cattle ranching as the primary regional economic activity. Larger tracts of pasturage converted to irrigated, specialty crop agriculture, requiring a large labor force and prompting a wave of immigration. Increasing population density in the San Francisco Bay Area converted agricultural lands to small towns and settlements, typically sited along the Southern Pacific Railroad (SPRR) or Western Pacific Railroad (WPRR) lines.

Following the end of World War II, many defense industry workers, returning veterans who had trained in California and others from the eastern United States wanted to remain and enjoy the state's warm climate and plentiful jobs, spurring a 20-year-long construction boom. "As the fifth most populous state in 1940, California rose to be the second most populous by 1950 and the first most populous by 1963" (Transportation Research Board 2012:60). By 1970, the state's population doubled to nearly 20 million. Most new residents were mostly young people forming families, which in turn quadrupled the population of school-age children in the state (Self 2003:257). The pace of this demographic change transformed California. Then Governor Earl Warren characterized the influx of residents equal to creating "a whole new city of ten thousand people every Monday morning" (Weaver 1967:147). These general trends of economic expansion and increasing population have continued into the 21st century and generally characterize the development of Santa Clara County and San José to the present.

City of San José*

San José was founded on the banks of the Guadalupe River at what is now the corner of Hobson and Vendome streets, 6.75 miles northeast of Good Samaritan Hospital. The first courthouse in the region, an adobe known as the *juzgado*, was built in 1783; a second was built on higher ground 5 years later to avoid flooding. This building remained the seat of local government until 1850, when work began on the county courthouse that remains, though somewhat modified, a major presence on today's St. James Square. San José served briefly as California's first capital. However, the city was judged too damp, and the Legislature relocated first to Vallejo, then Benicia, and, finally to Sacramento in 1854.

In the years following the Civil War, the farming town continued to grow. During the 19th century, the Santa Clara Valley was famous for its orchards, fruit drying, and produce packing plants. The French prune, introduced to the region by Louis Pellier at his nursery, City Gardens, on St. James Street, became an important regional crop (Kyle 2002:438). Fruit production and processing was a mainstay of San José's economy until the 1960s. During the 1930s and 40s, when San José's population was approximately 70,000, between 20,000 and 25,000 men, women and children found seasonal employment in San José's more than two dozen fruit canneries. Cannery work was difficult, requiring laborers to stand for long hours performing repetitive tasks. The take-home pay at the canneries was higher than at many other occupations, which meant that, despite the difficult working conditions, many workers were willing to stay through the canning season.

B10. Significance (continued)

City of San José*

San José has always been known for being on the forefront of developments in electronics—and as the site of some notorious technical failures. In 1881, J.J. Owen, then-editor of the *San Jose Mercury*, convinced the City to install a 237-foot-tall light tower that would, he claimed, make night become day in downtown. The tower, straddling the intersection of Santa Clara and Market streets, failed to illuminate the city as claimed. The tower was severely damaged in a 1915 windstorm and collapsed later that year. In 1909, the city was the site of a more successful technical endeavor: Dr. Charles Herrold established the world's first radio broadcast station at the corner of First and San Fernando streets. The station, which later became KCBS, broadcasts today from San Francisco.

In the years following World War II, the Santa Clara Valley experienced tremendous growth. Electronics, aviation, and semiconductor companies opened offices and factories in "Silicon Valley," creating thousands of jobs for returning military personnel, defense workers, and their families. Between 1960 and 1990, according to an article in *BusinessWeek*, companies started in the South Bay by graduates of Stanford University created more than 250,000 jobs. These workers needed housing, and the valley's fruit orchards soon gave way to housing developments. San José transformed from a market town with an agricultural economic base to a business and residential community known for its high-technology companies.

Health Care in Santa Clara County*

After statehood in 1850 , the State capital moved from Monterey to San José and the population of the then-small pueblo swelled. Swift population growth soon led to sanitation problems. "There were epidemics of cholera, smallpox, diphtheria, and typhoid fever, among other diseases." Such a rapid rise in public heath challenges overwhelmed the capacity of existing medical care. The growing city needed a hospital to provide medical care for the sick and destitute, but funds were not available until 1855, when the County of Santa Clara (County) Board of Supervisors Health Committee appointed a County Physician and contacted medical services to private parties at a rate of $2.50 per patient per day. The need for services and a County hospital to provide them grew. In 1860, County Supervisors purchased 12 acres of land from Hiram Cahill on the-then western boundary of San José. The County enlarged the existing buildings and constructed a new "pest house" for patients suffering from acute contagious diseases (Sawyer 1922:193-194). In 1875, these buildings were relocated to a new, 114-acre site on South Bascom Avenue that now contains Valley Medical Center, 5 miles north of GSH. The County Hospital's brick buildings sustained considerable damage following the 1906 earthquake and a new, wood-framed hospital building was constructed the next year. However, the "specters of overcrowding and inadequate funding were constant companions of the hospital staff and Board of Supervisors throughout the hospital's history." The struggle to maintain adequate hospital capacity for a growing region in the post-war era was a constant occupation of the County Board of Supervisors. In 1960, a seven-story addition was built to the existing hospital and the facility was renamed Santa Clara Valley Medical Center.

Other notable medical facilities in the region included Agnews Development Center, a State hospital originally built in 1885 for mental asylum and later closed in 1997-98. The San José Hospital built in 1923 at 675 East Santa Clara Street (demolished in 2004) was at the time it opened "the only first class and strictly modern hospital between Santa Barbara and San Francisco" and later expanded to "accommodate the emerging middle class living the central [sic] San Jose that were excluded from the city, county, and state-run hospitals that served the poor and private hospitals that catered to the more affluent."

* Note: unless cited, this section is adapted *from County of Santa Clara Historic Context Statement*. Prepared in 2014 by Archives & Architecture and the County of Santa Clara Department of Planning and Development. Electronic copy available, https://stgenpln.blob.core.windows.net/document/HHP_201202_Historic_Context.pdf.

B10. Significance (continued)

As described above the post war period was a time of rapid population and economic growth in San José and the Santa Clara Valley. The *San Jose Historic Context Statement* described the "population of Santa Clara Valley experienced phenomenal growth after 1950. Correspondingly, the land area of the city spread from 17 square miles in 1950 to over 120 square miles in 1970" (City of San José 2023:91). In response to this explosion, a corresponding expansion of institutional infrastructure was needed to meet the demand for social and public services. Among the universe of needs was more capacity for health services. Existing hospitals were inadequate to meet the surge in needs. By 1965, seven additional hospitals were built and opened.

Good Samaritan Hospital

According to background research, construction of GSH began in 1963, finished in 1965, and the hospital was formally dedicated May 14, 1966. Until GSH was built, residents in western Santa Clara Valley communities of Los Gatos, Monte Sereno, Saratoga, Campbell, Cambrian Park, and development along the eastern flank of the Santa Cruz Mountains had few options for health care and emergency medical services. The push to build a hospital in this area began as early as 1947, as residents and community leaders recognized the rapidly increasing population of Santa Clara County and San José overwhelmed exiting medical facilities near the central core of San José (Beilharz and Demers 1980:190). An article in the September 13, 1965, edition of the *Los Gatos Times-Saratoga Observer* noted the "need for additional hospital facilities was apparent as long ago as 1950. The West Valley Hospital District was formed [for tax purposes], but twice voters turned down bond issues for a tax-supported hospital, and the district was dissolved in 1958" (*Los Gatos Times-Saratoga Observer*, September 13, 1965:5). However, the pressures of population growth led to an increased demand for medical facilities to serve the ill, injured, and indigent. These realities had, by 1960, prompted action to address a rapidly nearing "emergency situation with the hospital bed shortage become more acute each year" (*Los Gatos Times-Saratoga Observer* 4/19/1961:4).

In response, West Valley religious leaders and laypeople "joined forces to raise money for the proposed plant [i.e., hospital], to be called Good Samaritan Hospital" (*The Peninsula Times Tribune*, 3/4/1960:18). The organization and coordination of GSH was due in large part to local religious leaders and congregations. This influence is reflected in the namesake of GSH, a reference to the Parable of the Good Samaritan, a story in the Book of Luke of a Samaritan merchant traveling on the road between Jerusalem and Jericho who found a man robbed, beaten, and left for dead. The Samaritan took mercy on the stranger and secured the stranger medical care and lodging without expecting repayment. With respect to GSH, "[t]here was no quibbling of the name: Good Samaritan, with its implication of man's service to man was the obvious choice" (Beilharz and DeMers 1980:190). The group had to adopt a different approach via securing funds to construct a 200-bed, non-profit, general hospital. A new approach to raise funds from grants and donations received a significant boost by using funding available by the Hospital Survey and Construction Act, passed by Congress, and signed by President Truman in 1946. Known as Hill-Burton Act of 1946, this legislation provided federal matching grants to states to build new community hospitals (*Los Gatos Times-Saratoga Observer* 4/19/1961:4). As a result, the Hill-Burton Act "became a major influence in the expansion of the hospital industry. More than 4,000 projects to expand existing facilities or construct new ones were initiated within 20 years after its passage" (Sultz and Young 1999:86).

By April 1961, the State Bureau of Hospitals received an application from the GSH Board of Trustees for $3,120,570, one-half of the anticipated total amount of $6,241,140 to build the 200-bed hospital (*Los Gatos Times-Saratoga Observer* 4/19/1961:4). Later that year, the State Bureau of Hospitals approved the application and the total estimate to build a 225-bed hospital grew to $6,456,285 (*Los Gatos Times-Saratoga Observer* 10/20/1961). A year-long effort by GSH Trustees, churches, residents, and donations by local heads of industry, business, and corporations raised the funds to meet the matching grant. The State Bureau of Hospitals approved the financial plan for GSH on February 20, 1962, prompting "a sigh of relief among the campaign workers" *(Los Gatos Times-Saratoga Observer* 2/20/1962:1).

B10. Significance (continued)

Good Samaritan Hospital

The San Francisco-based architectural firm of Anshen and Allen was selected to design GSH and the San Francisco-based Rothschild and Weirick was the building contractor, which by late 1962 was envisioned as a facility to "open in 1965 with 225 beds. It will be a six-story structure with wings extending from the two sides to accommodate offices, chapel, radiology, pathology, surgery, emergency, and psychiatric units. Bed distribution will be surgical-medical, 130; maternity, 40; pediatrics, 30; psychiatric, 25. Eventually it will be expanded to include 450 beds" (*Los Gatos Times-Saratoga Observer* 12/6/1962:1). A scaled model of GSH was prepared and displayed in various local banks in San José. An article in the February 20, 1963, edition of the Los Gatos Times-Saratoga Observer noted the "main building of [GSH] will have eight floors-six for patients and two for service, including a basement. Facing the entrance, visitors will also see two wings, one containing the area or the chapel, and the psychiatric unit; the other ending in the emergency entrance" (*Los Gatos Times-Saratoga Observer* 2/20/1963:1). The Good Samaritan Nurses Association assisted in designing the functional layout and operations of GSH. They coordinated with architects and engineers to push for what was at the time innovations such as an "intercom system planned to facilitate communication between nurse and patient and a pneumatic [vacuum] tube to facilitate interdepartmental communication." In addition, GSH "would be completely air-conditioned" (*Los Gatos Times-Saratoga Observer* 3/14/1962:3).

With the plans and organizational framework in place, GSH Trustees and local officials broke ground on April 24, 1963, on an approximately 20-acre site on what was then called the San Jose-Los Gatos Road near National Avenue (*Los Gatos Times-Saratoga Observer* 4/25/1963). Interestingly, it is notable that expansion of GSH was anticipated as part of the original design vision, albeit this anticipated expansion was envisioned to occur vertically and not horizontally. An article in the June 12, 1962, edition of the Los Gatos Times-Saratoga Observer, noted that the Los Gatos Town Council approved "development of a 185-acre area located South Bascom and Union avenues as a future medical and business community" which would include a "proposed 12-story Good Samaritan Hospital" (*Los Gatos Times-Saratoga Observer*, June 12, 1962). A vision of a 12-story hospital tower was scaled back, likely to clear the fund erasing hurdles. Less than two years later the Los Gatos Times-Saratoga Observer article noted, "[p]lans for future expansion call for the addition of another four floors when population increase demands it" (*Los Gatos Times-Saratoga Observer*, 1/9/1964).

Hospital Chapel. The organization of GSH was due in large part to the efforts by the West Valley religious community. As part of their efforts to build a non-profit hospital, GSH was "devoted to the entire person – body, mind and spirit" (Bielharz and DeMers 1980:191). A chapel was part of the original design, albeit the funds to plan, design, and build the chapel had to be privately funded, as federal law prevented public money being used for religious uses. The funds were raised via donations from individuals, local churches, and local artists such as Helen Caswell, a local artist of some renown who "offered to donate portrait fees for the [GSH's] inter-denominational chapel-chaplaincy program" (*Los Gatos Times-Saratoga Observer* 6/11/1963). The chapel is a relatively small space set on the northern side of the tower and has a two full-height colored glass windows in an abstract design, set in concrete. The name(s) of the artists responsible for its design as not identified in background research. It is presumed that Anshen and Allen, in conjunction with local religious members, designed the window, the chapel interior, and the Chaplain's Office.

Phase II. GSH formally opened its doors on September 22, 1965. The original configuration was not to remain in place for long. A "Phase II" of GSH "called for additional fund raising and planning efforts that spanned the years 1968-1974. The expansion more than doubled Good Samaritan's original size, enabling the hospital to provide 395 patient beds and to increase the number of employees" (Beilharz and DeMers 1980:190). As originally envisioned GSH's Main Hospital Tower was "engineered for addition of several more floors" as the population of the West Valley continued to grow (*Los Gatos Times-Saratoga Observer*, 24 April 1968:1). However, demand for services soon set aside intended plans to expand via adding floors to the GSH Main Hospital. Instead, space for an additional 35 beds was found by re-organizing existing space and expanding outward as this was a "type of construction that can be completed within a year; additions to the tower unit, which contains permanent medical-surgical units, would take longer." Anshen and Allen were commissioned to design the addition (*Los Gatos Times-Saratoga Observer*, 6 August 1968:1).

B10. Significance (continued)

Good Samaritan Hospital

According to an article in the September 22, 1970, edition of the Los Gatos Times-Saratoga Observer celebrating GSH's fifth year anniversary, it was noted that expansion of GSH would take place in the 1970s, "Instead, the hospital was in its third year when it became obvious that additional space was needed. Early this year [1970], 40 beds were added with the construction of the West Pavilion and with re-arrangement of space in the pediatrics department." The article went on to state the proposed expansion would cost $8.8 million and "will wrap around the tower on first, second, and third floor levels" (*Los Gatos Times-Saratoga Observer* 22 September 1970:2). A groundbreaking ceremony on the $9½ million Phase Two addition" took place June 15, 1971 (*Los Gatos Times-Saratoga Observer* 15 June 1971:4).

1980s – Today. By 1980, GSH had a full-time staff of 1,200. By the mid-2000s, GSH had expanded to nearly quadruple its original size. Background research revealed that, by 2003, the modern East Entrance to GSH's Pre-Surgical Admitting/Endoscopy and Surgery Waiting areas was in place along with a landscaped areas and access stairs leading to below ground floors. Beginning in July 2003, two single-story wings resting on square building footprints north of the GSH's Main Hospital Tower and Building were demolished and construction of the modern, four-story Women and Children's Services wing began and completed by November 2004 on the hospital's north and west-facing façades.

In 2017–2018, GSH renovated and expanded its Emergency Department to "double the Department's current square footage and [. . .] provide for faster patient diagnosis and treatment" (GSH 2017). The $30 million expansion renovated the interior and exterior providing a "new exterior walk-in entry and drop-off canopy for incoming patients, the expanded Emergency Department includes a new ambulance drop-off canopy and five ambulance parking spaces" (GSH 2017). The renovated ER and hospital signage altered the far-left side (western) portion of the main, street-facing façade, and the entrance off Samaritan Drive, the primary access point for arriving non-surgical patients and visitors. Concurrently, GSH undertook a separate, $14 million renovation of a portion of the Women's & Children's Services area as well as a project to renovate the Main Entrance arrival area and lobby (GSH 2023). While completed to provide additional services and accommodate and implement modern medical and technological advances, these renovations, when taken together, significantly altered GSH's primary and secondary façades.

Today, GSH is a 404-bed acute care hospital providing "emergency care, anesthesia and pain management, cancer care, cardiology, children's services, emergency care, general surgery, rehabilitation, robotic surgery, women's services, and wound care. Hospital facilities also include a birthing center, breast care center, a comprehensive stroke center, heart rhythm center, and joint replacement center. GSH is a certified Comprehensive Stroke Center, STEMI Receiving Center, accredited Chest Pain Center, and a certified [Atrial Fibrillation] Center" (Town of Los Gatos 2022:6-25).

ARCHITECTURAL CONTEXT

Architecture in and around GSH site follows trends elsewhere in mid- to late-20th century California. This section provides an overview of the major architectural trends represented by these resources.

International/Modernist.

The International or Modernist style has its roots in the rise of industrial manufacturing during the late-19th century. Architects who favored this style focused on open floor plans and challenged traditional concepts of building layouts and massing. They sought to move away from decorative elements that referenced historical designs and motifs, and toward designs that emphasized a building's function. During this period of intense American industrial and commercial growth, a new form of building was needed to house workers in the increasingly dense and expensive downtown commercial core areas. Expanding horizontally was not a viable or affordable option, so the obvious solution was to expand vertically. Two practical innovations made this possible: steel-framed superstructure and elevators (Kunstler 1993:65; Brechin 2006:67-70).

B10. Significance (continued)

ARCHITECTURAL CONTEXT

These support and communications systems were readily adapted to above ground uses. For architects, the boxed steel frame used in buildings no longer made the use of heavy timbers, stone, or brick necessary. Several architects, such as Louis Sullivan, seized on this new method and mocked the continued use of stone and/or wood by architects as obsolete. The outer wall now became a veneer, and could be clad with metal, glass, porcelain, or tiles (Kunstler 1993:65).

Modernist style buildings also represent a large range of designs, from simple, functional ranch residences to high-concept public facilities. During the early decades of the 20th century, architects gradually embraced the machine age, prompting a turn toward a sleeker, more refined appearance. Modern buildings also encompass several subtypes, including Prairie, Craftsman, and Brutalist designs. The advent of the Modern style was dependent on advances in building material technology, as the availability of steel and concrete encouraged 20th century architects to move away from traditional forms by removing their dependence on walls as load-bearing necessities.

Early-20th century architects gradually embraced a minimally decorated façade and began to strip historically sourced symbols and motifs from their commercial buildings. The embrace of the machine age favored a sleeker, more refined appearance. While some architects created eclectic interpretations of traditional design and forms, other architects disregarded such influences as archaic. The World War I experience further disillusioned many architects and artists who regarded traditional forms as representations of "a failed social and political structure" (Wiseman 2000:149).

Following the October 1929 crash of the New York Stock Exchange and the ensuing Great Depression, designers stripped away Art Deco's rich materials and jazzy ornamentation to emphasize a sense of smooth motion via clean lines that, according to Professor Morris Dickstein, conveyed "the very qualities of speed, motion, and forward energy that are built into the streamlining of Deco" (Dickstein 2009:436). Streamlining was a design concept that reflected the hope held by many that science and technology would rejuvenate the economy. Applying a streamlined, aerodynamic approach to machines such as automobiles, train locomotives, and ships reflected the need for increased speed and efficiency (Gelernter 1999:248-250).

When applied to architecture, this design aesthetic was known as Streamline Moderne. Finding a broader and wider exposure in commercial and industrial applications, this new image replaced Art Deco as the signature modern design, and "both served in tandem with the New Deal, to get people moving again, to lift sagging morale and stimulate optimism about the future" (Dickstein 2009:437). Although shorn of most decorative elements and historical references, the subdued and streamlined Moderne architecture of the 1930s set the stage for the rapid adoption and expansion of Modern architecture in the United States following World War II (Longstreth 2000:126-127; Gelernter 1999:226-227, 250-251).

The 1930s set the stage for the International-styled design of European architects Walter Gropius, Mies van der Rohe, and Le Corbusier. These and other architects applied the basic principles of Deidesheimer's Square to create a building that required no load bearing exterior walls. Sheets of glass or metal panels replaced bricks, stone, and concrete. This found widespread favor as reflective of post-war American society's optimism and prosperity. It soon spread to all major cities and outlying areas (Gelernter 1999:262-263). International-styled buildings were economical to build and easily replicated, as their uncomplicated design did without elaborate ornamentation, qualities that appealed to businesses (Wiseman 2000:149).

The general character-defining features of the International/Modernist style are: square or rectangular footprint; flat or very low- pitched roof; subdued color schemes; minimal amount of façade ornamentation to draw attention of passersby to the inside; simple cubic "extruded rectangle" massing; windows running in broken horizontal or vertical rows forming a grid; façade angles at 90 degrees; and materials are steel, formed concrete, chrome, or plated surfaces (Gelernter 1999:248-249; McAlester 2013:616-627

B10. Significance (continued)

ARCHITECTURAL CONTEXT

Brutalism

A later off-shoot of International/Modernist architectural aesthetic, brutalist buildings while massive and imposing represent a relatively short-lived application of reinforced concrete as an expressive medium. The style's exact origins are not clear. Some argue the style originated with English architects Allen and Peter Smithson in 1953 while French architect Le Corbusier experimented with it during the 1940s and 1950s. What is clear is that Brutalism is an offshoot of the larger encompassing development of Modernism during the post-WW II period (Past Consultants 2009:85; Brown 2011:201; Gelernter 1999:265; Gowans 1993:303-304).

Brutalism is derived from the French "*beton brut*" or raw concrete and describes the use of it as the defining characteristic in its crudest, rawest, most unadorned form. Brutalist buildings can use large expanses of glass; however typically deeply recessed, creating deep shadows generating reverse voids contrasting with the exposed concrete panels and cubic massing. The ability of wet concrete to fill any form creates the possibility for a wide variety of shapes and forms, though repetitive angled geometries predominate to reinforce the unadorned aspect of the style (Gelernter 1999:277).

Concrete is poured on-site and left unfinished, revealing the texture and grain of wood forms or aggregate base thereby creating visual texture. Brutalist designs could use narrow, vertical ribs closely arranged as a finished surface creating a changing visual texture as sunlight and shadow wax and wane during the day. These ribs are themselves brutalized further by intentional breaking, chipping, or otherwise deforming the ribs creating a jagged and uneven surface, giving the impression of advanced weathering, and ageing the building.

Brutalist buildings can embody the distinctive characteristics and high artistic values of a short-lived method of construction and design. Brutalism's rawness and unadorned qualities is a direct rebuke of the machine-like precision of the glass-clad steel-framed towers of Mies van der Rohe and other International architects. As an inexpensive building material, concrete implies solidity and a sense of permanence. As such it was employed widely around the world in large-scale building projects during the 1950-1970s. While concrete is a character-defining feature of Brutalist architecture, raw concrete "might refer to the archaic in one case, to stark urban reality in another, to natural erosion in the third" (Curtis 1996:550).

Brutalism was popular for large, institutional applications, such as universities, municipal buildings, libraries, and others. Brutalist architecture could also allow for a building's interior elements such as plumbing, electrical, and climate control to be turned inside out as exemplified by Wurster Hall, at UC Berkeley. Several examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the John Portman's Embarcadero Center, and the Hyatt Regency Hotel both in San Francisco. Other notable examples within California and the United Staes are the Salk Institute and the Geisel Library at UC San Diego, both in in La Jolla, Boston City Hall in Boston, Massachusetts, and the J. Edgar Hoover FBI Building in Washington D.C.

The general character-defining features of the Brutalism style are square or rectangular cubist footprint; rough, unadorned poured concrete construction; flat roofs; heavy, cubic massing with right angled façades; wood grain imprints from concrete forms; deliberately chipped or blemished surface to create visual texture; recessed windows and deeply shadowed irregular openings; and repeating geometric patterns (Brown 2011:201-203; Walker 1996:268-269; Past Consultants 2009:86).

B10. Significance (continued)

ARCHITECTURAL CONTEXT

William Allen, A.I.A. According to online information available at the American Institute of Architects (AIA), William Stephen "Steve" Allen was born July 15, 1912, in Neptune Township New Jersey. He attended the University of Pennsylvania, graduating in 1935 with a bachelor's degree in architecture. He remained a student at U. Penn and graduated the next year with a master's degree in architecture. After graduation, he went abroad traveling through Germany, Italy, and Japan "with his schoolmate and future partner, Robert Anshen" (American Institute of Architects 1962: 10, 17; San Francisco Planning Department 2011:209). After returning to United States and nearly broke Allen and Anshen ended up in San Francisco during the Great Depression. Allen soon found work a designer for Masten & Hurd as well as Blanchard & Maher. While engaged in design work, Allen and Anshen formed a partnership in 1940 which they would operate until 1964, when Robert Anshen passed away. William Allen continued as Senior partner until 1972 when he retired. He passed away in 1989. In 2010, the design and consulting company Stantec acquired Anshen & Allen (Online Archive of California 2023).

Robert Anshen, A.I.A. According to the AIA's *American Architects Directory* for 1962, Robert Anshen was born January 29, 1910, in Revere, Massachusetts. Like William Allen, Robert Anshen graduated from the University of Pennsylvania's undergraduate and graduate architecture schools in 1936 where he formed a lifelong friendship and later San Francisco-based architectural partnership with Allen. After partnering with Allen in 1940, Anshen served as "the face of the business" Their big break came in 1940 when the "two won over Standard Oil Vice President Ralph K. Davies […] when he was searching for architects to design a Tudor mansion for him in [the unincorporated San Mateo community of] Woodside" (American Institute of Architects 1962: 17; San Francisco Planning Department 2011:209).

Winning the Woodside commission proved "a job that put [Anshen and Allen] on the map and that led to most of the jobs that followed" (Eichler Network 2021). Robert Anshen was a member of the Northern Californian Chapter of the American Institute of Architect s (AIA) beginning in 1946, served as a Lecturer in Design at the University of California, Berkeley from 1952-1953, a juror in architectural design competitions, wrote a monthly column on architecture for the *San Francisco Examiner* in 1962, and was highly regarded among the architectural and design professional community and was a. Robert Anshen passed away in 1964 (Pacific Coast Architecture Database 2023).

***Selected Portfolio*.** From its founding and through the 1960s, Anshen and Allen maintained their offices in the Jeweler's Manufacturing Building built 1907 at 461 Bush Street (extant, contributing element to the Kearny-Market-Mason-Sutter Conservation District and a historical resource for the purposes of CEQA). Anshen and Allen, both members of the American Institute of Architects, operated as a partnership until 1964 when Robert Anshen no longer was a partner and William Allen retired in 1972. During their operation, "doing primarily residential designs; its work, over 3,000 houses by 1962", the firm won prestigious awards for their architectural designs and generally regarded as a top-tier architectural design firm (Pacific Coast Architectural Database 2023; AIA 1962). In 2010, the firm was absorbed as a subsidiary of Stantec, an international consulting firm based in Edmonton, Alberta Province, Canada.

Information reviewed indicates that, along with the Good Samaritan Hospital, the firm of Anshen and Allen are credited with designing many buildings, the following are several in the wider San Francisco Bay Area, California, and the western United States that are contemporary with GSH: **1950**, various Eichler Homes Developments San Francisco Bay Area; **1956**, Chapel of the Holy Cross, Sedona, Arizona; **1957**, Quarry Visitor Center, Dinosaur National Monument, Utah (razed); **1961**, 601 California Street, San Francisco; **1963**, Latimer Hall, University of California, Berkeley; **1964**, Central United Methodist Church, Stockton, California; **1966,** Samuel Silver Space Sciences Laboratory, University of California, Berkeley; **1966**, Hildebrand Hall, University of California, Berkeley; **1967**, Bank of California Building, San Francisco; **1968**, Lawrence Hall of Science, University of California, Berkeley; **1969**, Bank of California Tower (now Union Bank Tower), Portland, Oregon (Wikipedia 2023).

B10. Significance (continued)

ELIGIBILITY EVALUATION

The following section presents an evaluation to assess whether the Good Samaritan Hospital (GSH) is eligible for inclusion in the California Register of Historical Resources (CRHR) or for local designation, thereby qualifying as a historical resource for the purposes of the California Environmental Quality Act.

Application of CRHR Criteria – Good Samaritan Hospital

CRHR Criterion 1: Is it associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage?

Research indicates that the portion of GSH evaluated here is associated with the growth of San José in the mid- to late-20th century, as it relates to increasing the overall level of medical care in San José in general, and those communities in the West Santa Cara Valley specifically. Organization for a hospital in this area began shortly after the end of World War II as the population quickly expanded soon overwhelming San José's then existing medical care infrastructure. Due to tireless efforts to organize and raise funds, GSH was built. The portion of GSH of sufficient age to warrant evaluation here consists of the original seven-story tower, and adjacent wings dating to the original period of construction of 1962-1965 designed by San Francisco-based Anshen and Allen. The other built environment elements within the approximately 20-acre site range from 18 to 33 years of age and have not reached sufficient age to provide sufficient scholarly perspective warrant evaluation for eligibility and were not addressed in this evaluation.

GSH was designed and built to operate as a general hospital. The facility was initially designed for subsequent expansion in anticipation of continued regional population growth and with it, an increased need for medical services. However, such expansion was envisioned to be vertical, i.e., additional floors (up to 12) for the Main Tower, rather than horizontal expansion, as research and field survey indicated occurred. Good Samaritan Hospital is among several hospitals and medical facilities in San José and Santa Clara County associated with this period of growth in San José, Santa Clara County, and California. Background research indicates this facility continues to serve as a hub to support a variety of secondary and tertiary specialty clinics, offices, and related medical services in the vicinity. Accordingly, GSH possesses specific, important associations with the context of San José's late-20th century growth, an event that made a significant contribution to the broad patterns of the history of San José, Santa Clara County, and the West Valley.

For these reasons, LSA concludes that the Good Samaritan Hospital evaluated in this study appears individually eligible under CRHR Criterion 1.

CRHR Criterion 2: Is it associated with the lives of persons important in our past?

The portion of GSH evaluated here was created to address a pressing and growing deficiency in level of medical care in the western portion of Santa Clara County in the aftermath of World War II. Background research did not identify individuals whose lives are important in our past. Individuals who practiced medicine at GSH or their associative or supporting professions (e.g., members of the GSH Trustees or Boards of Directors, administrative staff, religious, or other professionals, etc.) would not have lived at GSH, as these buildings were used for medical care and treatment.

Accordingly, such potential associations with GSH primarily served to serve the hospital's mission to treat disease and provide medical care via a non-profit organization, an arrangement common historically and in modern times. Background research did not identify an association with GSH and medical doctors or other specialists with a pioneering medical procedure or course of treatment. Accordingly, GSH does not appear associated with the lives of individuals important to the history of medical practice in California or in the San Francisco Bay Area, or individuals important in the wider history of San José, Santa Clara County, or California.

For these reasons, LSA concludes that the Good Samaritan Hospital evaluated in this study does not appear significant under CRHR Criterion 2.

B10. Significance (continued)

ELIGIBILITY EVALUATION; Application of CRHR Criteria – Good Samaritan Hospital (Continued)

CRHR Criterion 3: Does it embody the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values?

The GSH evaluated in this study is a representative examples of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. Associated with the larger trend of International/Modernist, architecture, Brutalism was more severe in appearance, used raw exposed concrete, and included few, if any, historicist elements. A review of popular architectural guides of the Bay Area and a database of West Coast-based architect biographies did not indicate that GSH's built environment evaluated in this study is notable for its architectural or design qualities or as an important example of an architectural aesthetic. The portion of GSH evaluated in this study shows evidence of extensive modification, which is common to these building types that were subsequently modified to meet the needs of a growing population, or make use of new technologies and practices, equipment upgrades, or repair damage.

GSH was designed in 1963–1965 by Anshen and Allen, a prolific San Francisco-based architectural firm. Background research indicates that Anshen and Allen designed a series of subsequent alterations up to 1980. Background research did not link GSH with Anshen and Allen's copious portfolio describing it as a notable example of their work in notable architectural publications, indicating that the building was not known for its architectural or design qualities, although Anshen and Allen are widely considered notable or important architects within the architectural and professional design community. Although the building has aspects that exemplify Brutalist architecture, a well-represented style in the existing building stock of the Bay Area. Better and more expressive examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the John Portman's Embarcadero Center, and the Hyatt Regency Hotel both in San Francisco. As described above better, more representative examples of Anshen and Allen's work can be found in the San Francisco Bay Area, California, and the western United States.

Nevertheless, LSA concludes that the portion of Good Samaritan Hospital evaluated here appears significant under CRHR Criterion 3.

CRHR Criterion 4: Has it yielded, or may it be likely to yield, information important in prehistory or history?

This criterion provides the means to evaluate the potential for archaeological deposits to contain information important in San José's historic-period and precontact past. Its application to architecture and the built environment is less common in eligibility evaluations due to modern written sources, plans, and other forms of technical analysis. Information about GSH's general Brutalist International/Modernist-influenced utilitarian architectural aesthetic and construction methods, as represented by the portion of the approximately 20-acre parcel containing Good Samaritan Hospital's built environment evaluated here, can be obtained from widely available sources on the Brutalist architectural style. The portion of Good Samaritan Hospital evaluated here is unlikely to yield information important to the history of medical care in the United States, or the City of San José, Santa Clara County, or California.

For these reasons, LSA concludes that the portion of Good Samaritan Hospital evaluated here does not appear significant under CRHR Criterion 4.

CRHR Special Criteria Consideration 2: Historical Resources Achieving Significance within the past Fifty Years.

According to the Office of Historic Preservation, "[i]n order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than fifty years old may be considered for listing in the California Register if it can be demonstrated that sufficient time has passed to understand its historical importance" (OHP 2006:3).

B10. Significance (continued)

A resource less than fifty years old may be considered for listing if it can be demonstrated that sufficient time has passed to obtain a scholarly perspective on the events or individuals associated with the resource to properly understand its historical importance. While GSH is more than fifty years old, this consideration is sometimes also applied to association with events and persons that took place in the more recent past at older properties.

To assess the potential for GSH to be eligible for association with important events or lives of important period within the recent past, LSA reviewed official guidance as well as sources that may reveal associative significance with GSH and important events or persons in the recent past.

By design, hospitals are associated with important milestone events in the lives of individuals and communities. Hospitals are places where the origins of individuals, treatment of disease or injury, recovery, as well as the end of life occur. Good Samaritan Hospital accrued significance with these types of important events since opening in 1965 and continues through to today. These events, while of momentous importance in the lives of those who live in the geographical region surrounding GSH as well as those who are present due to circumstance, are associative qualities inherent to hospitals everywhere. According to NPS guidance, associations with birthplaces are not sufficient to warrant eligibility.

A given resource "cannot be simply the birthplace or grave of a person significant in our past" (NPS 1997:32). However, potential eligibility for a birthplace can emerge if other potential sites or resources "strongly associated with a person of outstanding importance has lost all other properties directly associated with his or her formative years or productive life" (ibid). LSA reviewed GSH's website and other online information for potential associations linking GSH with innovative medical practices and techniques or individuals important in the context of medical history. A review of GSH's website, the American Medical Association, and the Nobel Prize in Medicine did not identify or link GSH with any notable or significant medical advancements in the field or practice of medicine.

Based on this review, the GSH website notes, "The hospital continued to expand through the 1980s with advancing services, including pioneering work in cardiovascular medicine and surgery; family-centered birthing facilities; oncology services taking advantage of new medical, surgical, and radiological advances; and additional behavioral health facilities." In addition, by "the 1990s, the hospital became a national leader in stroke services, the highest level of neonatal intensive care services, as well as high-risk pregnancies." In 2016 GSH was awarded certification "from the Joint Commission for Hip and Knee Joint Replacement Programs" (GSH 2023).

Lastly, GSH "is only one of ten hospitals to be award four consecutive times with the Outstanding Achievement Award from the American College of Surgeons Commission on Cancer" (GSH 2016). However, in each case, specific medical doctors, specialists, or personnel were not identified to associate GSH with significant or notable medical professionals in the recent past. A review of American Medical Association (AMA) awards lists or via a simple institutional search, or via review of Nobel Prizes in Medicine did not identify GSH (AMA 2023; Nobleprize.org 2023). Based on this review, although GSH remains important in providing medical care in the West Valley, it has not accrued a higher associative stature for notable events or individuals in the recent past.

For these reasons, LSA concludes that Good Samaritan Hospital evaluated in this study does not appear significant under CRHR Special Criterion Consideration 2 for achieving significance within the past fifty years.

Note: *While GSH is clearly over fifty years old, LSA assessed the potential for GSH's eligibility under Special Criterion Consideration 2 criterion to provide a robust analysis to account for potential association(s) of GSH with events or persons important in the recent past.*

B10. Significance (continued)

Application of City of San José Evaluative Criteria – Good Samaritan Hospital

The section below provides a discussion of the Good Samaritan Hospital's eligibility for listing in the San José Historic Resources Inventory as a Candidate City Landmark. The City of San José utilizes the City Landmark eligibility criteria in Section 13.48.110(H) of the San José Municipal Code (as described above in section 2.3.1) to determine whether based on substantial evidence a project involves a historical resource on the local level under CEQA.

1) *San José Municipal Code Section 13.48.110(H) Its character, interest, or value as part of the local, regional, state or national history, heritage or culture.*

Good Samaritan Hospital is among several hospitals and medical facilities in San José and Santa Clara County associated with post war growth in San José, Santa Clara County, and California. Background research indicates this facility continues to serve as a hub to support a variety of secondary and tertiary specialty clinics, offices, and related medical services nearby. Accordingly, GSH possesses specific, important associations with the context of San José's late-20th century growth, an event that made a significant contribution to the broad patterns of the history of San José, Santa Clara County, and the West Valley. For these reasons, LSA concludes that the portion of Good Samaritan Hospital (GSH) evaluated in this study appears significant under criterion 1. However, as discussed in the Integrity Assessment below the Good Samaritan Hospital no longer retains sufficient integrity to convey this association.

2) *Its location as a site of a significant historic event.*

The GSH evaluated in this study was the result of local organization efforts that began shortly after World War II. The hospital was sited to also serve the adjacent community of Los Gatos as well as in anticipation of further residential and commercial growth into the West Valley. Background research and field survey does not indicate the siting and construction of GSH constitutes an event that reveals a higher associative stature for other hospitals whose development was the result of a similar pattern of community organization, fund raising, and construction. Coupled with the analyses described above, background research did not indicate that GSH was the location that contained within it a significant event. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 2.

3) *Its identification with a person or persons who significantly contributed to the local, regional, state or national culture and history.*

The GSH evaluated in this study was created to address the growing deficiency in medical care in the West Valley after World War II. Individuals who practiced medicine at GSH or their associative or supporting professions (e.g., members of the GSH Trustees or Boards of Directors, administrative staff, religious, or other professionals, etc.) would not have lived within the project site, as these buildings were used for medical care and treatment. Accordingly, such potential associations with the project site primarily existed to serve the hospital's mission to treat disease and provide medical care via a nonprofit organization, an arrangement not uncommon historically and in modern times. Background research did not identify an association with GSH and medical doctors or other specialists with a pioneering medical procedure or course of treatment. Accordingly, GSH does not appear associated with the lives of individuals important to the history of medical practice in California or the United States, or individuals important in the wider history of San José. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 3.

4) *Its exemplification of the cultural, economic, social or historic heritage of the City of San José.*

As stated above in sections 4.5.2.1 and 4.5.2.2, GSH was built and put into operation to address a pressing need for medical care facility resulting from a rapid population growth in San José and western Santa Clara Valley in the decades after World War II. This event is one of several similar examples of medical facilities being constructed to address this demographic change in San José and statewide. Background research did not indicate Good Samaritan Hospital was the first such resource associated with this important context and does not possess higher associative stature under this criterion. For these reasons, LSA concludes that the portion of GSH evaluated in this study does not appear significant under criterion 4.

B10. Significance (continued)

Application of City of San José Evaluative Criteria – Good Samaritan Hospital (continued)

5) *Its portrayal of the environment of a group of people in an era of history characterized by a distinctive architectural style.*

Background research indicates that GSH was designed using the then-popular architectural aesthetic of Brutalist interpretation of Internationalist/Modernist architectural style which followed trends elsewhere in mid- to late-20th century California for similar institutional buildings. GSH does not appear to have been designed to appeal or otherwise incorporate architectural design cues, massing, or ornamentation in a way to reflect the architectural traditions of a distinct group of people in any era of history within San José, the Santa Clara Valley, or California. For these reasons, LSA concludes that the portion of GSH evaluated here does not appear significant under criterion 5.

6) *Its embodiment of distinguishing characteristics of an architectural type or specimen*.

The GSH evaluated here is a representative examples of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. Associated with the larger trend of International/Modernist, architecture, Brutalism was more severe in appearance, used raw exposed concrete, and included few, if any, historicist elements. A review of popular architectural guidebooks of the Bay Area and a database of West Coast-based architect biographies did not indicate that GSH's built environment evaluated here is notable for its architectural or design qualities or as an important example of an architectural aesthetic. The portion of GSH evaluated here shows evidence of extensive modification, which is common to these building types that were subsequently modified to meet the needs of a growing population, or make use of new technologies and practices, equipment upgrades, or repair damage. Although the portion of GSH evaluated here has aspects that exemplify Brutalist architecture, a well-represented style in the existing building stock of the Bay Area. Better and more expressive examples of Bay Area Brutalism are the Woo Hon Fai Hall in Berkeley, the Oakland Museum of California in Oakland, the Leo J. Ryan Federal Records Center in San Bruno, the Student Union Building at San José State University, the Embarcadero Center in San Francisco, and the Hyatt Regency Hotel both in San Francisco. Nevertheless, LSA concludes that the portion of Good Samaritan Hospital evaluated here appears significant under criterion 6. However, as discussed in the Integrity Assessment below the Good Samaritan Hospital no longer retains sufficient integrity to convey this association.

7) *Its identification as the work of an architect or master builder whose individual work has influenced the development of the City of San José*.

GSH was designed in 1963–1965 by Anshen and Allen, a prolific San Francisco-based architectural firm. Background research indicates that Anshen and Allen also designed a series of subsequent alterations up to 1980. Background research did not link GSH with Anshen and Allen's copious portfolio describing it as a notable example of their work in notable architectural publications, indicating that the building was not known for its architectural or design qualities, although Anshen and Allen are widely considered notable or important architects within the architectural and professional design community. As described above better, more representative examples of Anshen and Allen's work can be found in the San Francisco Bay Area, California, and the western United States. For these reasons, LSA concludes that the portion of GSH evaluated here does not appear significant under criterion 7.

8) *Its embodiment of elements of architectural or engineering design, detail, materials or craftsmanship which represents a significant architectural innovation or which is unique*.

The GSH evaluated here is a representative example of a general Brutalist-influenced institutional building type associated with mid- to late-20th century development in San José, Santa Clara County, and California. It uses materials and construction techniques common to that era, and it possesses few distinguishing or distinctive elements; the building typology that resulted from this architectural trend has been thoroughly documented through published architectural history books, websites, and local field guides that are widely available. Further study of GSH will not result in new information about construction techniques or the Modern/Brutalist architectural style. For these reasons, LSA concludes that the portion of GSH evaluated here does not appear significant under criterion 8.

B10. Significance (continued)

Integrity Assessment. In addition to being significant under one or more criteria, a resource must retain enough of its historic character and appearance to be recognizable as an historical resource and retain integrity, which is defined as the ability of a resource to convey the reasons for its significance. There are seven aspects of integrity used to measure a property's ability to convey its significance: ***location***, ***design***, ***setting***, ***materials***, ***workmanship***, ***feeling***, and ***association*** (National Park Service 1997:45). The evaluation of integrity must be grounded in an understanding of a resource's physical features and its environment, and how these relate to its significance. A property's integrity is assessed only after its significance is established. Per the City Landmark eligibility assessment above, the GSH Main Hospital Building appears individually significant under City Landmark criterion 1 and criterion 6 for associations with significant events and for its associations with Brutalist architecture. Therefore, the Good Samaritan Hospital Building is potentially individually eligible for listing in the San José Historic Resources Inventory as a Candidate City Landmark; therefore, its historic integrity was assessed

GSH Main Hospital Building

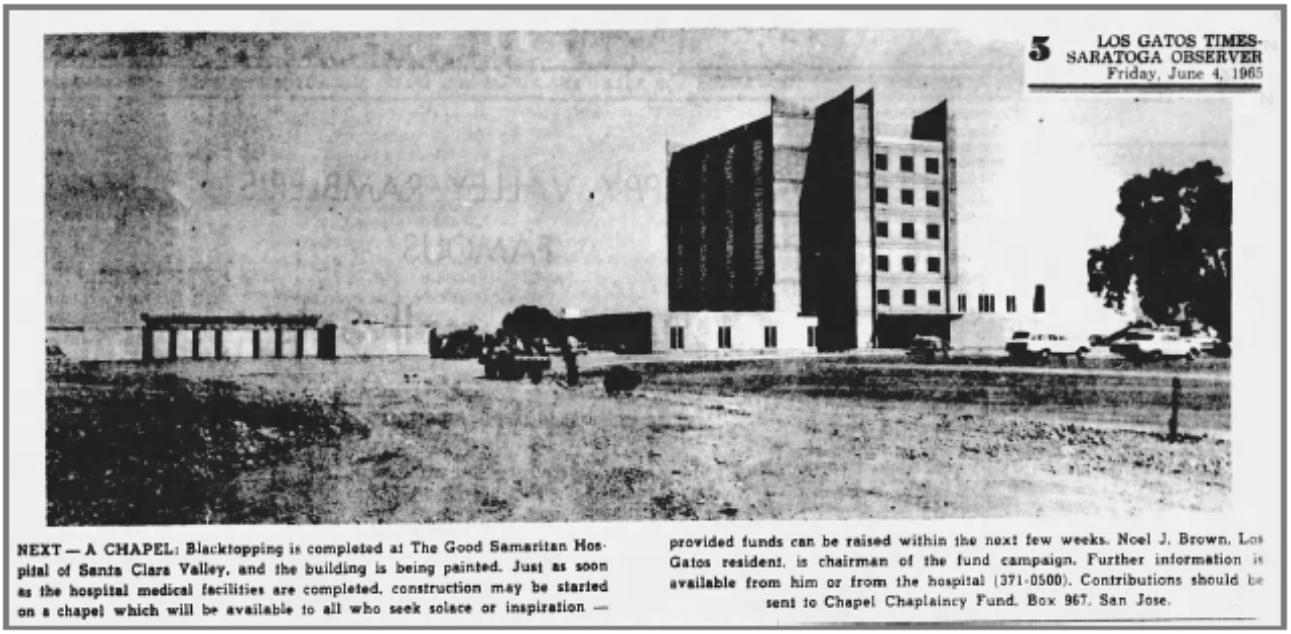
Location: The GSH Main Hospital Building at 2425 Samaritan Drive has not been moved and retains integrity of location.

Design, Materials and Workmanship: Soon after the hospital opened in 1965, a "Phase II" construction program was underway to increase the number of hospital beds. As discussed above, this expansion more than doubled Good Samaritan's original size, enabling the hospital to provide 395 patient beds and to increase the number of employees" (Beilharz and DeMers 1980:190). By 1980, GSH had a full-time staff of 1,200. By the mid-2000s, GSH had expanded to nearly double its original size. Background research revealed that by 2003, the modern East Entrance to GSH's Pre-Surgical Admitting/Endoscopy and Surgery Waiting areas was in place along with a landscaped areas and access stairs leading to below ground floors. Beginning in July 2003, two single-story wings resting on square building footprints north of the GSH's Main Hospital Building were demolished and construction of the modern four-story Women and Children's Services wing began and was completed by November 2004. In 2018, GSH renovated and remodeled the Emergency Room, the hospital's Main Entrance and Lobby area, and additional alterations to the Women and Children's Services wing as part of a $50 million project.

Accordingly, except for the central six-story central tower and the remaining elements of the original single-story adjacent wings, the hospital appears radically different than when it opened 58 years ago. The portions of the hospital that reflect this subsequent growth reflect a range of architectural styles, with each newer addition moving further away from Anshen and Allen's original Brutalist aesthetic. There may have been practical reasons for this. GSH's purpose is to provide medical care and services and not remain an intact specimen of Brutalist architecture. Nevertheless, these alterations when taken together, have changed the hospital's primary elements that composed its original symmetrical façade, wall cladding, roof forms, massing, and footprint, which conveyed its ability to be a representative example of Brutalist architectural style as applied to a hospital or other similar institutional property type. Therefore, the GSH Main Hospital Building does not retain sufficient integrity of design, materials, or workmanship.

Setting and Feeling: The GSH Main Hospital Building no longer retains sufficient integrity of setting or feeling due to subsequent removal of adjacent orchards and agricultural land use patterns in this area when the hospital was under construction, the growth of residential tract subdivisions, as well as the construction of State Route 85 north of and adjacent to GSH.

Association: The Main Hospital Building retains integrity of association as a regional medical facility.



The other buildings and helipad structure that share the same parcel as GSH range from 18 to 33 years of age and have not reached sufficient age to provide sufficient scholarly perspective to warrant evaluation for eligibility and are not addressed in this study; therefore, their integrity was not assessed.

B10. Significance (continued)

Conclusion.

According to the NPS guidance, "[t]he retention of specific aspects of integrity is paramount for a property to convey its significance." In addition, "[t]o retain historic integrity a property must always possess several, and usually most of, the aspects" (National Park Service 1997:44). As described above, Good Samaritan Hospital retains integrity of location and association as a regional medical facility. However, the remaining five aspects of integrity have significantly diminished via subsequent alterations, additions, and expansion of the hospital since its founding in 1965. Therefore, Good Samaritan Hospital does not retain sufficient collective integrity to convey its associative qualities with the period of post war growth in San José, Santa Clara County, and California as well as a specimen of Brutalist architecture. For these reasons, Good Samaritan Hospital does not appear eligible as a Candidate City Landmark. Therefore, the GSH Main Hospital building evaluated in this study does not appear to qualify as a "historical resource" for the purposes of the CEQA as defined at PRC §5024.1(c).

5 LOS GATOS TIMES-SARATOGA OBSERVER
Friday, June 4, 1965

NEXT — A CHAPEL: Blacktopping is completed at The Good Samaritan Hospital of Santa Clara Valley, and the building is being painted. Just as soon as the hospital medical facilities are completed, construction may be started on a chapel which will be available to all who seek solace or inspiration — provided funds can be raised within the next few weeks. Noel J. Brown, Los Gatos resident, is chairman of the fund campaign. Further information is available from him or from the hospital (371-0500). Contributions should be sent to Chapel Chaplaincy Fund, Box 967, San Jose.

Re: Good Samaritan Hospital Project, Santa Clara County

Dear Ms. Collison:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cody.Campagne@nahc.ca.gov.

Sincerely,

Cody Campagne

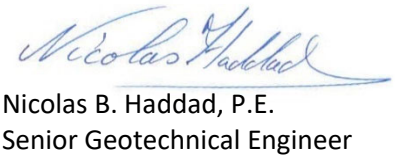
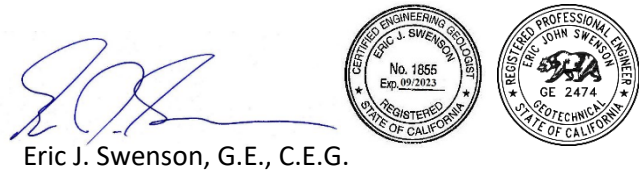
Attention: Mr. Russell Triplett

Subject: **Feasibility Level Geotechnical Engineering and Geologic Hazards Study**
Good Samaritan Hospital Entitlements
2425 Samaritan Drive, San Jose, CA
Geo-Eng Project No. 133-1442



Dear Mr. Triplett:

In accordance with your authorization, **Geo-Engineering Solutions, Inc. (Geo-Eng)** has completed a Feasibility Level Geotechnical Engineering and Geologic Hazards Study to provide geotechnical services for the main campus of Good Samaritan Hospital in San Jose, California. Transmitted herewith are the results of our findings, conclusions, and recommendations.



Should you or members of the design team have questions or need additional information, please contact the undersigned by email: nhaddad@geo-eng.net or eswenson@geo-eng.net or at (925) 433-0450. We greatly appreciate the opportunity to provide our services and to be involved in the design of this project.

Sincerely,

GEO-ENGINEERING SOLUTIONS, INC.

Nicolas B. Haddad, P.E.
Senior Geotechnical Engineer

Eric J. Swenson, G.E., C.E.G.

1.0 INTRODUCTION

1.1 Purpose and Scope

We understand that HCA is going through the initial entitlement process of new modifications and additions to the main campus of Good Samaritan Hospital in San Jose, California. As part of this process, a geotechnical feasibility study is required to outline geologic hazards as well as possible geotechnical design issues which would affect this development.

The purpose of our work was to prepare a Feasibility Level Geotechnical Engineering and Geologic Hazards Study for the site and provide preliminary geotechnical recommendations for the proposed development at the site. Based on our experience, this study is based on previously published works as well as a review of any available subsurface data on the campus. The intent of the study is to provide a context of possible global geologic hazards and not to provide specific design level recommendations. This study did not include an in-depth assessment of potentially toxic or hazardous materials that may be present on or beneath the site.

1.2 Site Description

The Good Samaritan Hospital is located at 2425 Samaritan Drive in San Jose, California, as shown on the attached Figure 1-Site Vicinity Map. The site is approximately 20-acre and is bordered by Samaritan Drive to the east and south, Highway 85 to the north, and existing medical office buildings to the west. Several buildings exist on the campus which occupies the center of the site with at grade parking on the east and west sides of the site.

The topography of the site is generally flat with elevations on the order of +280 feet above mean sea level, based on Google Earth elevations. The average geographic coordinates of the site, used in our engineering analyses, are 37.2523 degrees north latitude and -122.9466 degrees west longitude.

1.3 Proposed Development

Based on the proposed Master Plan, prepared by Perkins & Will, we understand that the proposed development project will include the addition of a new diagnostic and treatment building to the north, a Medical Office building to the southeast, and two six-story at grade parking garages on the east and west sides of the site, Figure 2-Site Development Map. Surface parking, driveways, and landscaping would also be included in the proposed project. It is assumed there will also be other associated minor site improvements such as site grading, landscaping and utilities.

2.0 GEOLOGIC AND SEISMIC OVERVIEW

2.1 Geologic Setting

The site is located within the central portion of the Coast Ranges geomorphic province of California. The Coast Ranges geomorphic province consists of numerous small to moderate linear mountain ranges trending north to south and northwest to southeast. The Coast Ranges lies between the Pacific Ocean to the west and the Great Valley Geomorphic Province to the east. This province is approximately 400 miles long and extends from the Klamath Mountains in the north to the Santa Ynez River within Santa Barbara County in the south. It generally consists of marine sedimentary rocks and volcanic rocks. The province is characterized by northwest-trending faults and folds, as well as erosion and deposition within the broad transform boundary between the North American and Pacific plates. Translational motion along the plate boundary occurs across a distributed zone of right-lateral shear expressed as a nearly 50-mile-wide zone of northwest-trending, near-vertical active strike-slip faults. This motion occurs primarily along the active San Andreas, Hayward, Calaveras and San Gregorio faults.

The site is located within the southwestern portion of the Santa Clara Valley, which is a large depositional valley located at the southern end of the San Francisco Bay. Historically, sediments from this valley are sourced from the Santa Cruz Mountains located to the west and the Diablo Range to the east, as wells as interbedded bay deposits. The Santa Cruz Mountains primarily consist of Cretaceous to Miocene sandstone and basalt. Near the vicinity of Santa Clara Valley, the Diablo Range primarily consists of middle to upper Miocene shale, sandstone, pebble conglomerate, and claystone from the Claremont, Briones, and Orinda Formations (Wentworth et al., 1999).

The subject property overlies Quaternary alluvial fan deposits consisting of sand, silt, and gravel (Dibblee and Minch, 2007), Figure 3-Site Vicinity Geology Map. Based on the mapped geological unit and our experience at other sites in the vicinity, we anticipate the site is underlain by low plasticity, relatively dense silty and clayey sand, gravel and cobbles.

West of the property are Pliocene conglomerate, sandstone, siltstone, claystone, and mudstone of the Santa Clara Formation. In addition, stream alluvium consisting of gravel, sand, silt and clay is located within the vicinity of Los Gatos Creek, located north of the site.

2.2 Regional Faulting and Tectonics

Regional transpression has caused uplift and folding of the bedrock units within the Coast Ranges. This structural deformation occurred during periods of tectonic activity that began in the Pliocene and continues today. The site is located in a seismically active region that has experienced periodic, large magnitude earthquakes during historic

times. This seismic activity appears to be largely controlled by displacement between the Pacific and North American crustal plates, separated by the San Andreas Fault zone located about 6 miles southwest of the site. This plate displacement produced regional strain that is concentrated along major faults of the San Andreas Fault System including the San Andreas, Hayward, and Calaveras faults in the greater San Francisco Bay area.

The subject property is in a seismically active region dominated by the San Andreas Fault, located about 6 miles (9.7 km) southwest of the site, and the Hayward Fault, located approximately 12 miles (19.3 km) northeast of the site. Other major faults within the vicinity of the site include the northern portion of the Calaveras Fault, located 14 miles (22.5 km) northeast of the site. The site is not mapped within an Alquist-Priolo Earthquake Fault Zone. The site location relative to active and potentially active faults in the San Francisco Bay Area is shown on Figure 4, Regional Fault Map.

According to the California Department of Conservation's Fault Activity Map of California, the subject property is situated between the Cascade Fault and Monte Vista-Shannon Fault. According to this map, the Cascade Fault is located about 0.6 miles northeast of the site and the Monte Vista-Shannon Fault is located about 0.3 miles southwest of the site. The Cascade Fault is a potentially active reverse fault that is about 22 miles long (California Department of Transportation, 2017).

2.3 Groundwater

Based on the Seismic Hazard Zone Report for the San Jose Quadrangle prepared by the California Geologic Survey (CGS) historic ground water in the vicinity of the subject site is expected to be on the order of 30 to 40 feet below ground surface. Groundwater levels can vary in response to time of year, variations in seasonal rainfall, well pumping, irrigation, and alterations to site drainage.

3.0 GEOLOGIC HAZARDS

3.1 Seismic Induced Hazards

Seismic hazards resulting from the effects of an earthquake generally include ground shaking, liquefaction, lateral spreading, dynamic settlement, fault ground rupture and fault creep, dam inundation, and tsunamis and seiches. The site is not necessarily impacted by all of these potential seismic hazards. Nonetheless, potential seismic hazards are discussed and evaluated in the following sections in relation to the planned construction.

3.1.1 Ground Shaking

The site may experience moderate to strong ground shaking from a major earthquake originating from one or more of the close or major Bay Area faults such as the San Andreas and Hayward faults. Earthquake intensities vary throughout the region depending upon the magnitude of the earthquake, the distance of the site from the causative fault, the type of materials underlying the site and other factors. Potential mitigation of strong ground shaking includes designing new structures to meet current building codes and applicable requirements.

In addition to shaking of the structure, strong ground shaking can induce other related phenomena that may have an effect on structures, such as liquefaction and dynamic densification settlement.

3.1.2 Liquefaction Induced Phenomena

Research and historical data indicate that soil liquefaction generally occurs in saturated, loose granular soil (primarily fine to medium-grained, clean sand deposits) during or after strong seismic ground shaking and is typified by a loss of shear strength in the affected soil layer, thereby causing the soil to flow as a liquid. However, because of the higher inter-granular pressure of the soil at greater depths, the potential for liquefaction is generally limited to the upper 40 feet of the soil. Potential hazards associated with soil liquefaction below or near a structure include loss of foundation support, lateral spreading, sand boils, and areal and differential settlement.

Lateral spreading is lateral ground movement, with some vertical component, as a result of liquefaction. The soil literally rides on top of the liquefied layer. Lateral spreading can occur on relatively flat sites with slopes less than two percent under certain circumstances, generally when the liquefied layer is in relatively close proximity to an open, free slope face such as the bank of a creek channel. Lateral spreading can cause surficial ground tension cracking (i.e., lurch cracking) and settlement.

The site is not mapped by the CGS in a geologic hazard zone requiring liquefaction investigation, as shown in Figure 5-Liquefaction Hazard Map. The site is underlain by low plasticity, relatively dense silty and clayey sand, gravel and cobbles. These soils are expected to be generally less susceptible to liquefaction due to their relatively moderate fine-grain content and moderate density. Therefore, the potential for liquefaction of the site subsurface soils is judged to be moderate.

The site is not considered to be susceptible to lateral spreading due to the lack of a nearby free slope face. Therefore, the potential for future seismic settlement due to lateral spreading is judged to be very low.

3.1.3 Dynamic Compaction (Settlement)

Dynamic compaction is a phenomenon where loose, relatively clean sandy soil located above the water table is densified from vibratory loading, typically from seismic shaking or vibratory equipment. The site soils generally consist of relatively dense silty and clayey sand, gravel and cobbles. Therefore, in our opinion, dynamic settlement and/or any potential effect of dynamic settlement on the proposed construction is not expected to be significant.

3.1.4 Fault Ground Rupture and Fault Creep

The State of California adopted the Alquist-Priolo Earthquake Fault Zone Act of 1972 (Chapter 7.5, Division 2, Sections 2621 – 2630, California Public Resources Code), which regulates development near active faults for preventing surface fault rupture hazards to structures for human occupancy. In accordance with the Alquist-Priolo (A-P) Act, the California Geological Survey established boundary zones, or Earthquake Fault Zone surrounding faults or fault segments judged to be sufficiently active, well-defined, and mapped for some distance. Structures for human occupancy within designated Earthquake Fault Zone boundaries are not permitted unless surface fault rupture and fault creep hazards are adequately addressed in a site-specific evaluation of the development site.

The site is not currently mapped or within a designated Earthquake Fault Zone as defined by the State (Hart and Bryant, 1997). The closest Earthquake Fault Zone is associated with the San Andreas Fault located about 6 miles southwest of the site, as shown on Figure 4. However, the Cascade Fault is located about 0.6 miles northeast of the site and the Monte Vista-Shannon Fault is located about 0.3 miles southwest of the site.

Since the site is not within or near an A-P Earthquake Fault Zone, and there are no faults mapped through the site or trending toward the site, the potential for fault ground rupture and fault creep hazards are judged to be very low.

3.1.5 Tsunamis and Seiches

Tsunamis are long-period sea waves generated by seafloor movements from submarine earthquakes or volcanic eruptions that rapidly displace large volumes of water. Coastal communities along the Pacific Ocean are particularly susceptible to such phenomena. The project site is located at an elevation of about 280 feet above mean sea level and approximately 15 miles south of the San Francisco Bay. Therefore, the potential for tsunami inundation at the site is considered to be nil.

Earthquake-induced waves generated within enclosed bodies of water are called seiches. Such waves may overtop dam embankments or extreme cases, cause dam failure, and in either case result in downstream inundation. The site is not within the downstream drainage area of any significant body of water. Therefore, the site is not considered to be susceptible to seiches.

3.2 Other Hazards

Potential geologic hazards other than those caused by a seismic event generally include ground failure and subsidence, consolidation settlement, landslides under static loading conditions, expansive and collapsible soils, flooding, naturally occurring asbestos (NOA) and soil erosion. These are discussed and evaluated in the following sections.

3.2.1 Ground Cracking and Subsidence

Withdrawal of groundwater and other fluids (i.e. petroleum and the extraction of natural gas) from beneath the surface has been linked to large-scale land subsidence and associated cracking on the ground surface. Other causes for ground cracking and subsidence include the oxidation and resultant compaction of peat beds, the decline of groundwater levels and consequent compaction of aquifers, hydro-compaction and subsequent settlement of alluvial deposits above the water table from irrigation, or a combination of any of these causes. Determining the impacts from subsidence on the project is beyond the scope of this study however, subsidence generally impacts a region, and should not produce excessive differential settlement in a single location. Local and regional locations prone to subsidence generally subside equally over time.

3.2.2 Consolidation Settlement

Consolidation is the densification of soil into a denser arrangement from additional loading, such as from new fills or foundation loads. Consolidation of clayey soils is usually a long-term process, whereby the water is squeezed out of the soil matrix with time. Sandy soils consolidate relatively rapidly with an introduction of a load. Consolidation of soft and loose soil layers and lenses can cause settlement of the ground surface or buildings. Based on relatively dense silty and clayey sand, gravel and cobbles at the site, the near-surface soils are considered to have a low potential for consolidation settlement.

3.2.3 Landslides

Landslides can occur under a variety of loading conditions, including both static and seismic, but involve sloping ground. As shown on Figure 4 the subject site is not adjacent to an "earthquake-induced landslide zone." The site and immediate vicinity are moderately flat and does not exhibit landslide features as determined by our geologic site reconnaissance and literature review. Therefore, the site is not susceptible to landsliding.

3.2.4 Flooding

The site is not located in a mapped area of flooding hazard, as shown on Figure 6-Flood Hazard Map, based on the FIRM (2009) map produced for the site vicinity. The site is located within Zone D, described as "Areas in which flood hazards are undetermined but possible". We recommend the project civil engineer be retained to verify the base flood elevation.

Based on our review of the Santa Clara Valley Water District Inundation Maps, the site is located within a dam failure inundation area for Lexington Reservoir.

3.2.5 Soil Erosion

Present construction techniques and agency requirements have provisions to limit soil erosion and resultant siltation during construction. These measures will reduce the potential for soil erosion at the site during the various construction phases. Long-term erosion at the site will be reduced by designing landscaping and/or hardscape areas such as parking lots and walkways with appropriate surface drainage facilities.

3.2.6 Naturally Occurring Asbestos (NOA)

The project site is not located within 10 miles of a mapped geographic ultramafic rock unit (GURU) or serpentinite, as shown on Figure 3. Therefore, it is our opinion that the subject site should be exempt from any special regulation or mitigation procedures relating to NOA before and during construction.

3.2.7 Other Geologic Hazards

Due to the site's location and geology, subsurface soil conditions, groundwater levels and land use factors, the site is not subject to the potential geologic hazards of loss of mineral resources, volcanism, cyclic softening of soils or loss of unique geologic features.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and engineering recommendations are based upon the analysis of the information gathered during the course of this study and our understanding of the proposed improvements.

4.1 Conclusions

The site is considered suitable from a geotechnical and geologic perspective for the proposed improvements provided the recommendations of this report are incorporated into the design and implemented during construction. The predominant geotechnical and geological issues that could affect design and construction at this site are summarized below.

Seismic Considerations – The site is located within a seismically active region and expected to be subjected to moderately strong to very strong ground shaking during the life of the new structures. As a minimum, the building designs should consider the effects of seismic activity in accordance with the latest edition of the California Building Code (CBC).

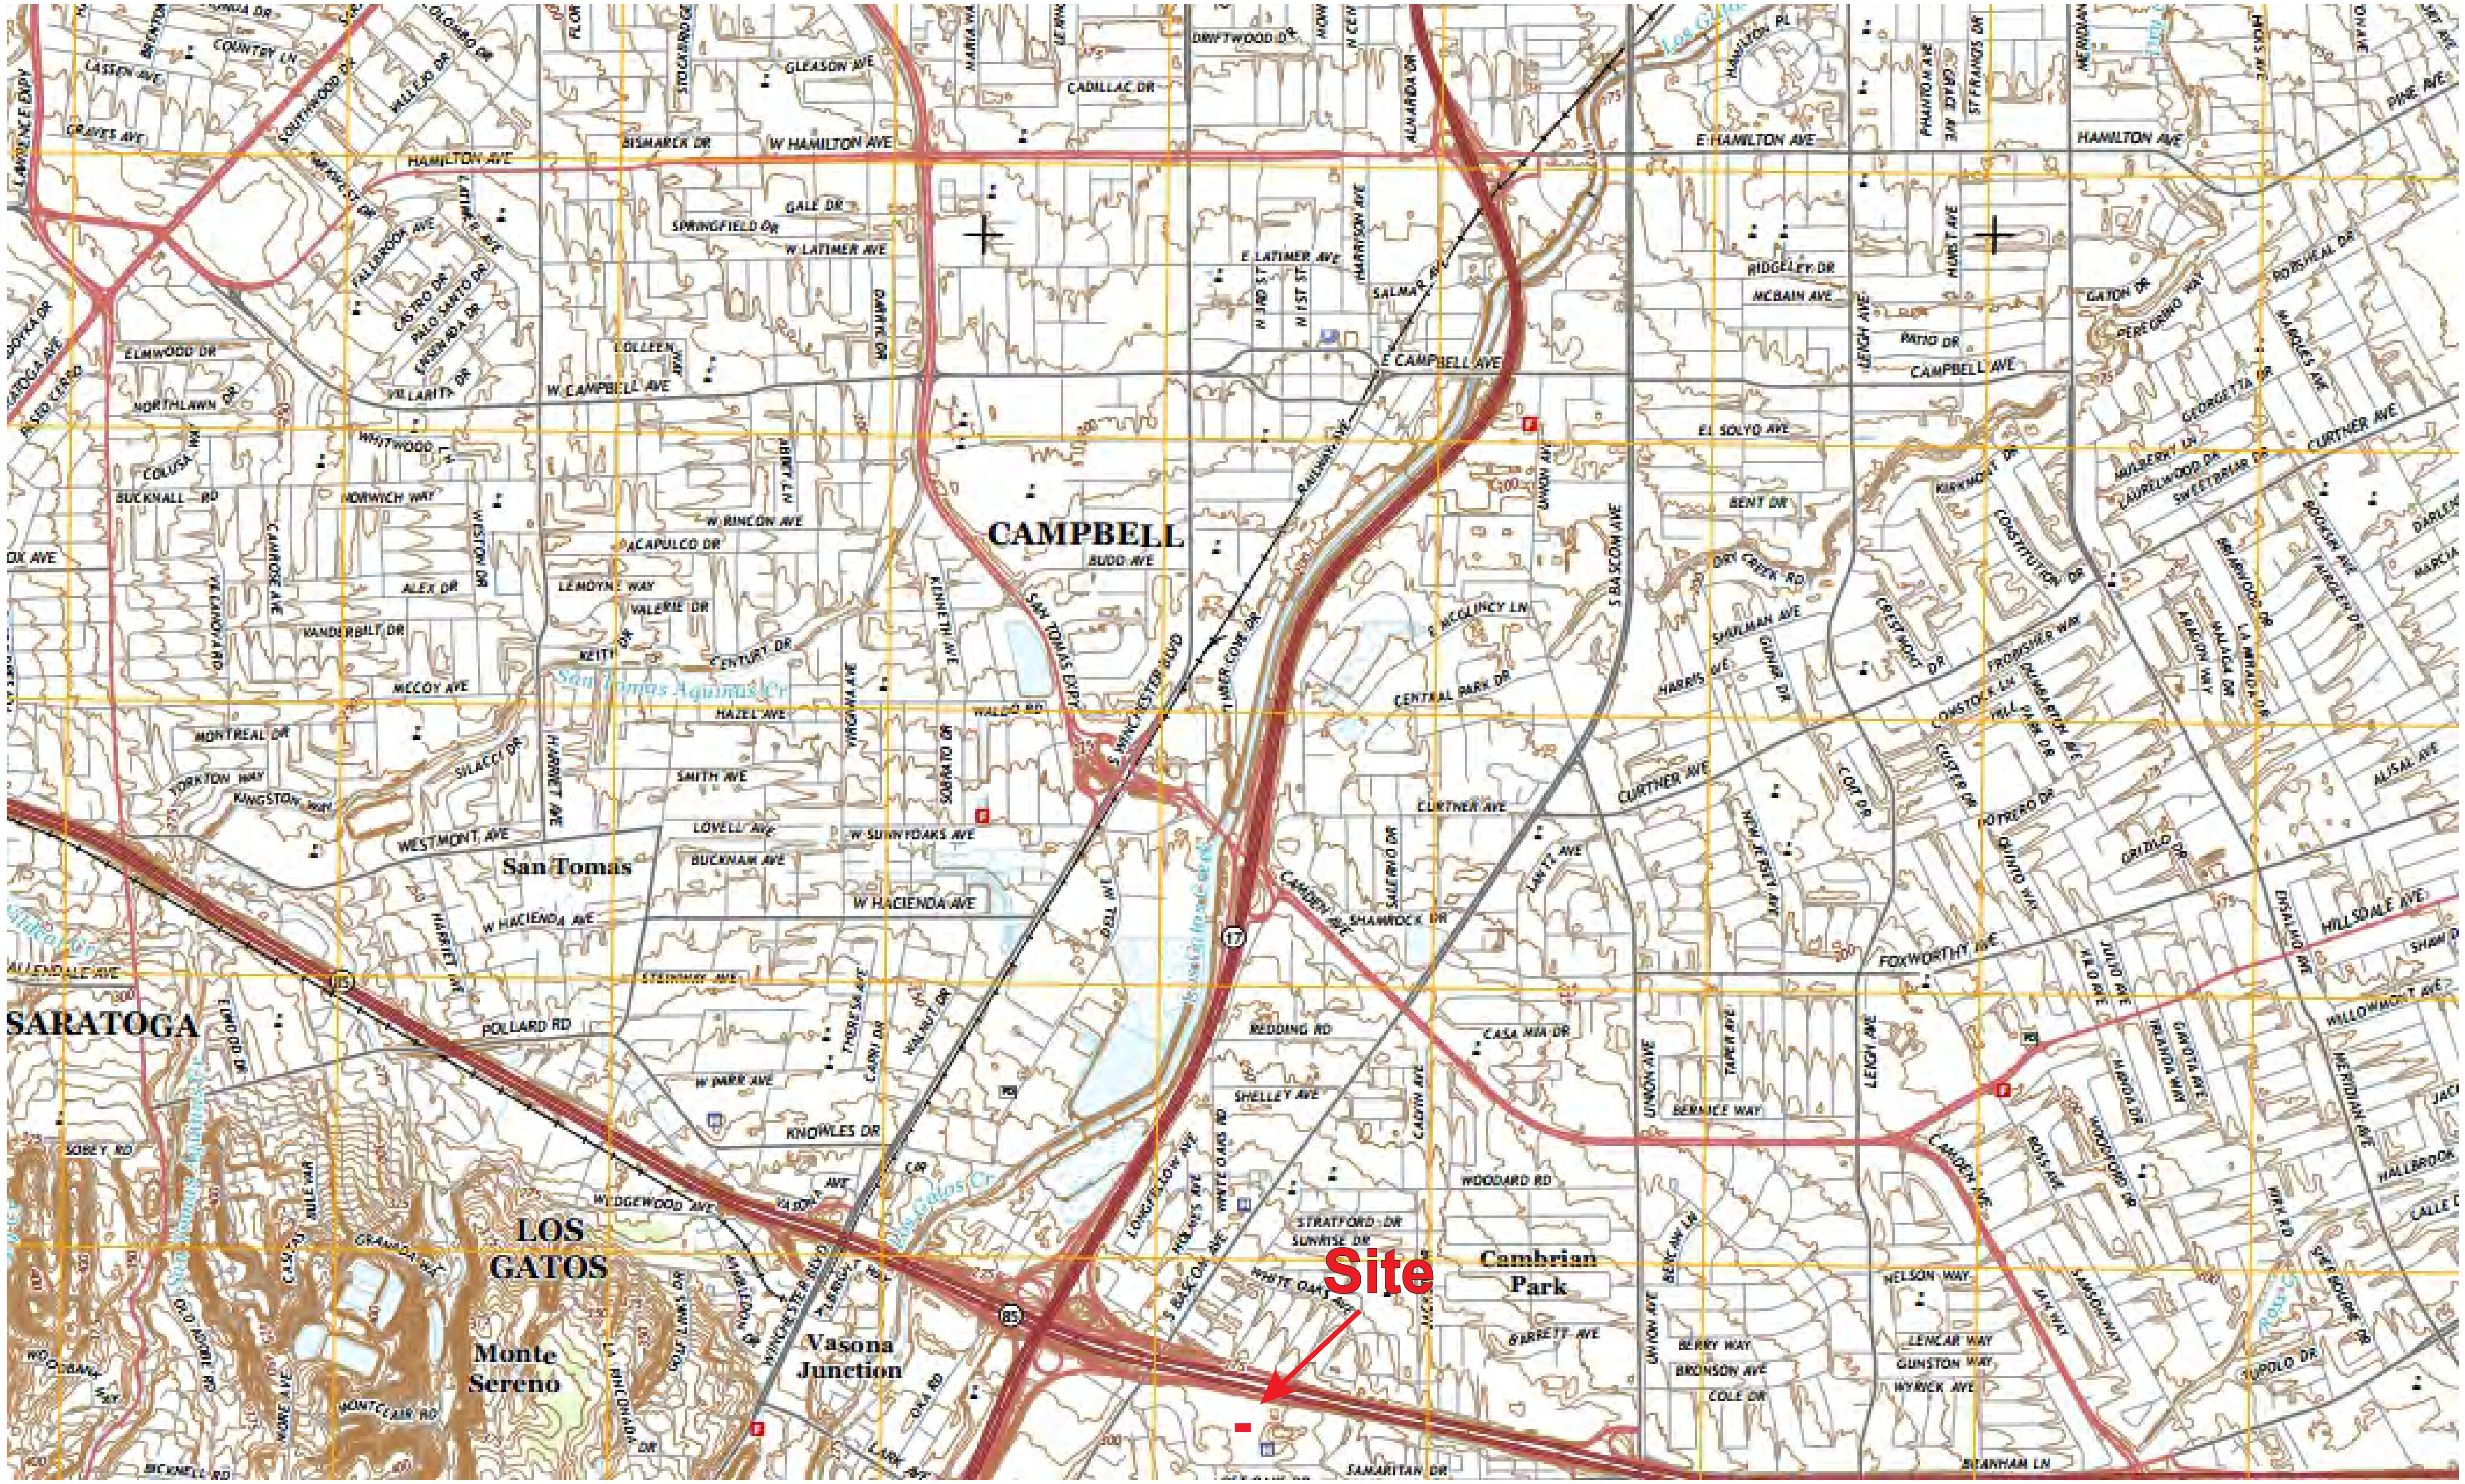
Undocumented Fill Soils –Undocumented onsite fill soils if encountered in the new building pad and loose or debris laden soils if encountered in other areas, should be completely removed and replaced by engineered compacted fill. The portion of over-excavated material not consisting of debris or organic topsoil may be reused as fill material upon approval of the Geotechnical engineer.

Grading in previously paved areas – The contractor should take notice that they are removing an existing paved area and moisture is often trapped below paved surfaces. Additional drying and working should be anticipated to achieve required moisture content for compaction.

4.2 Potential Foundation Recommendations

For the design of the new buildings and the addition to the existing facilities, we anticipate that smaller buildings on the order of 2 to 3 stories can readily be supported on continuous and /or isolated spread footings bearing on undisturbed stiff to very stiff, onsite native soil. The feasibility of the spread footings should be evaluated further during the design-level geotechnical investigation. Larger or heavier structures may require a deep foundations depending on structural loading conditions. If the total or differential settlement cannot be tolerated, an alternative foundation system such as deep concrete pile foundations or auger-cast pile system will be required.

4.3 Design-Level Geotechnical Investigation



The feasibility recommendations contained in this report were based on the provided design plans and available published information for the site and the vicinity. It is recommended that Geo-Eng be retained to perform a design-level geotechnical investigation for the improvement project at the Good Samaritan Hospital.

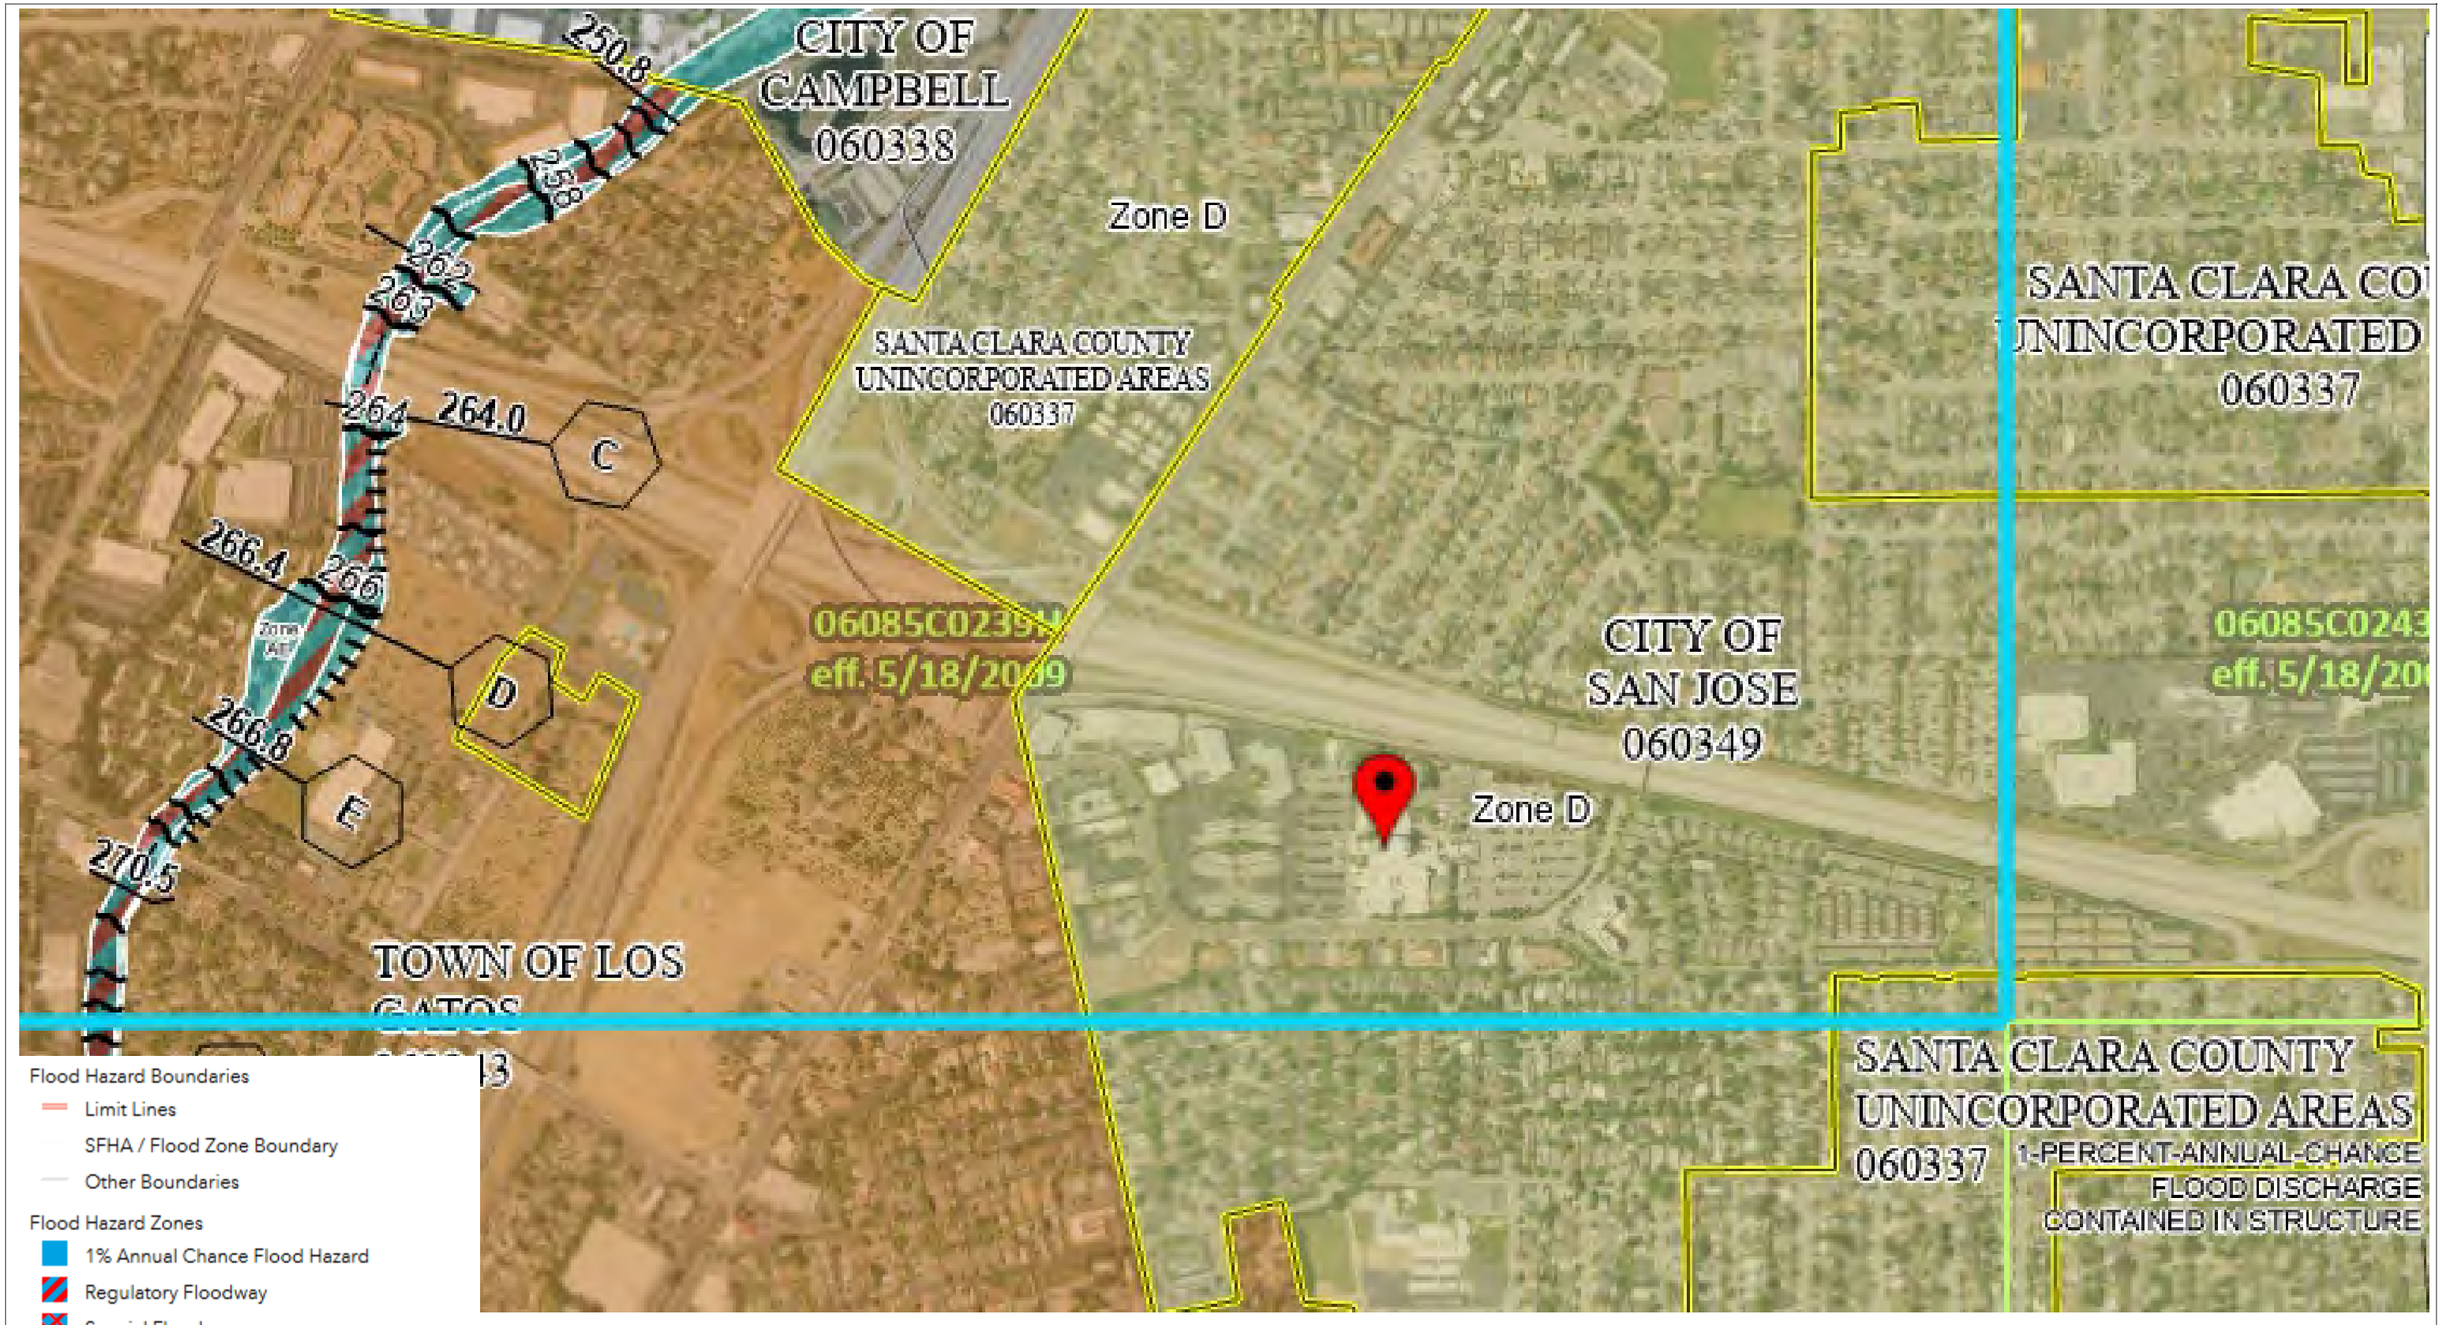
Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake Fault Zones
Zone boundaries are delineated by straight-line segments; the boundaries define the zone encompassing active faults that constitute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Section 2621.5(a) would be required.



Active Fault Traces
Faults considered to have been active during Holocene time and to have potential for surface rupture: Solid Line in Black or Red where Accurately Located; Long Dash in Black or Solid Line in Purple where Approximately Located; Short Dash in Black or Solid Line in Orange where Inferred; Dotted Line in Black or Solid Line in Rose where Concealed; Query (?) indicates additional uncertainty. Evidence of historic offset indicated by year of earthquake-associated event or C for displacement caused by fault creep.

1 INTRODUCTION

This section describes effects on climate change and greenhouse gas (GHG) emissions that would be caused by implementation of the Project. The study area for climate change and the analysis of GHG emissions is broad because climate change is influenced by world-wide emissions and their global effects. However, the study area is also limited by the California Environmental Quality Act (CEQA) Guidelines [Section 15064(d)], which directs lead agencies to consider an "indirect physical change" only if that change is a reasonably foreseeable impact that may be caused by the Project. This analysis limits discussion to those physical changes to the environment that are not speculative and are reasonably foreseeable.

1.1 Project Location

The approximately 20-acre Project site is located at 2425 Samaritan Drive and 2333 Samaritan Place (Accessor Parcel Numbers (APNs): 421-36-009 and 421-36-011). Regionally, Good Samaritan Hospital is in the southwestern region of San José within an urban area that contains a mix of medical offices and clinics as well as single- and multi-family residential developments. The northern boundary of the Project site abuts the eastbound on-ramp to SR-65. Along the eastern boundary of the Project site is the Cambrian Center, a multi-family residential complex, and single-family residences. To the south of the Project site are various medical office buildings. Along the western boundary of the Project site is the Samaritan Medical Center, a medical office complex with surface parking. Figure 1: Regional Vicinity and Figure 2: Site Vicinity, depict the Project site in a regional and local context.

1.2 Project Description

Located in an urban area with a mix of commercial uses, single-family, and multi-family residential developments, the Project site is currently the Good Samaritan Hospital campus. The campus contains a day care center, the hospital building (Building A and Building B), a helipad in the northwest corner of the site, landscaping, and surface parking. The existing hospital building is divided into two different wings. Building A is the main building with emergency operations totaling approximately 359,000 square feet (sf), and Building B operates as a women's and children's services wing totaling approximately 85,000 sf. With the day care center totaling approximately 6,700 sf, the existing hospital campus is approximately 450,700 sf. Figure 3: Existing Conditions depicts the Project site along with the current existing uses.

The proposed Project's existing land use designation is Neighborhood/Community Commercial (NCC), and the existing zoning designation is Planned Development (Agriculture Base District) (A(PD)). Project implementation would require a new Planned Development District to authorize the Project's new uses and therefore a zone change would be required. The Project proposes a rezone (File No. PDC22-132) from the existing (A(PD)) Planned Development Zoning District to the Commercial General Planned Development (CG(PD)) Zoning District.[1] The new (CG(PD)) Planned Development Zoning District would authorize the new hospital wing components and additional uses (i.e., cafeterias and retail shops), as well as updated standards to address the modernization of the hospital's healthcare system and operations. In addition, a new planned development permit(s) would be required to implement the new PD Zoning.

Although the Project would be constructed in phases, the hospital would plan and stage operations throughout the expansion in order to allow for continuous uninterrupted operation of the hospital. Construction for all phases would follow a conventional construction sequence of demolition, site

[1] The file number that refers to the rezone from the existing A(PD) to the CGCG(PD) is PDC22-132. Available at https://www.sanjoseca.gov/home/showpublisheddocument/98866/638212178270430000, accessed July 11, 2023.

preparation, grading/earthwork, paving, building construction, and architectural coating. See Figure 4: Project Site Plan for more details.

Phase 1

Phase 1 would include demolition of 20,946 square feet in Building A and demolition of the 6,700 sf daycare center to construct a new 253,000-square –foot, five-story parking garage (Garage East), a 23,750-square-foot detached central utility plant and underground water and sewer tanks, and an approximately 548,444-square-foot, eight-story hospital building (Building C).

Garage East would be in the northeastern region of the Project site and would provide 653 parking spaces that would aid in parking capacity for future expansion. Additionally, a new loading dock and accompanying dock canopy is proposed at grade-level on the west side of Building C, north of the existing four-story Women's and Children Center hospital wing (existing Building B). The loading area would be accessed from an internal drive aisle from Samaritan Drive, and the northern perimeter drive aisle.

In Phase 1, a Health Care Access and Information (HCAI) compliant two-story approximately 23,750 sf Central Utility Plant, Mechanical Yard, and Oxygen (O_2) Yard is proposed to the east of proposed Building C and west of Garage East to provide power and utility infrastructure to support the hospital operations.

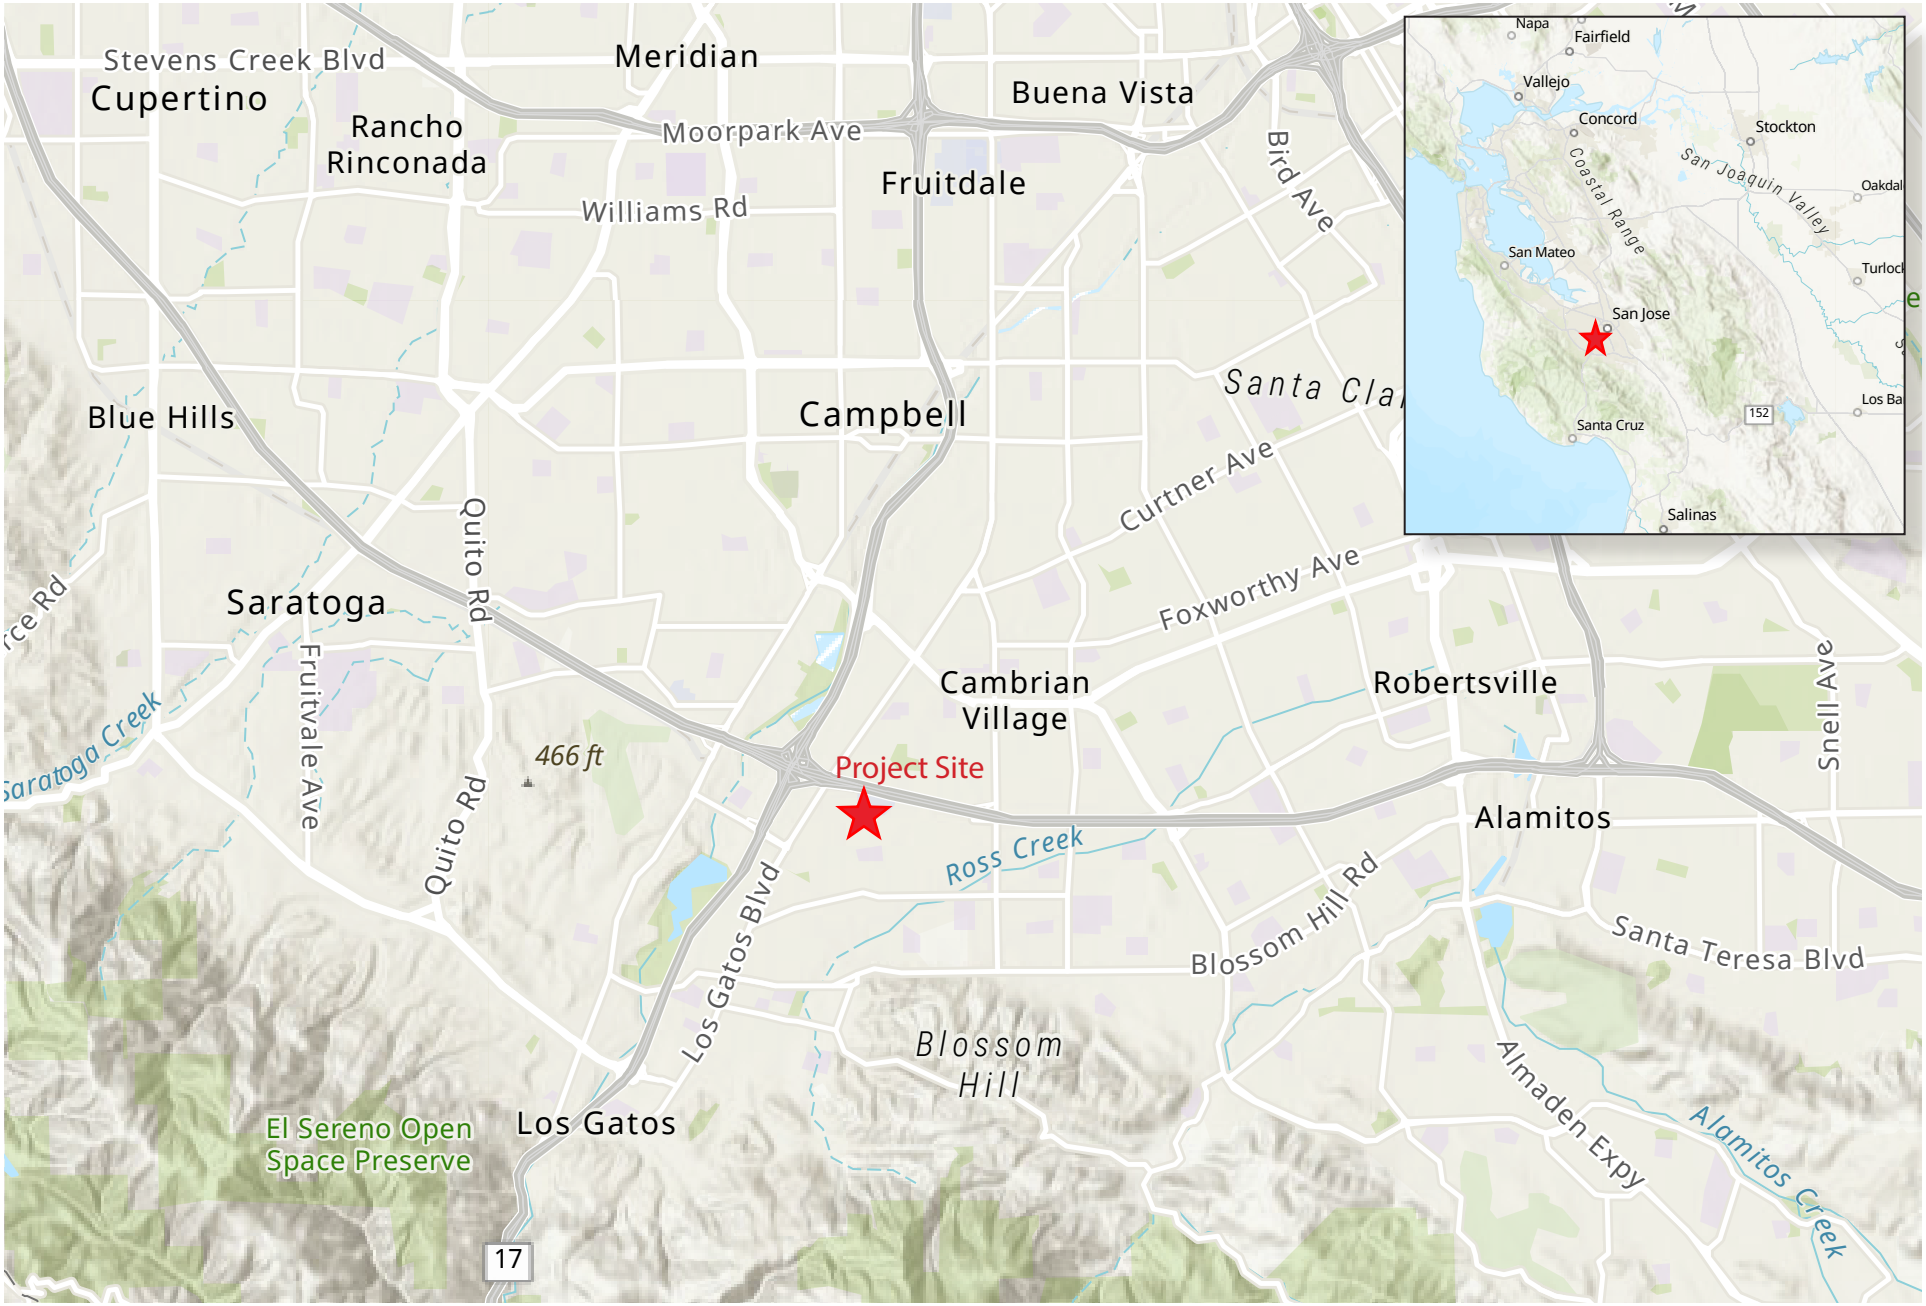
Phase 1 would result in approximately 40,000 cubic yards (cy) of soil export from the Project site and approximately 10,000 cy of soil import. Construction Phase 1 would occur over approximately 5.8 years (i.e., 69 months), anticipated to begin in March 2024. See Figure 5: Proposed Project Phase 1 Conceptual Site Plan for more details.

Phase 2

In Phase 2 the existing non-compliant hospital building (Building A) would be demolished totaling approximately 338,054 sf of demolition. The basement of the demolished hospital would be infilled with approximately 16 feet of fill and then approximately 421 surface parking stalls would be constructed.

Phase 2 would result in approximately 1,000 cy of soil export and 70,000 cy of soil import. Phase 2 is anticipated to begin in 2029 and occur over approximately two years. See Figure 6: Proposed Project Phase 2 Conceptual Site Plan for more details.

Phase 3



Phase 3 would construct an approximately 202,000 sf hospital wing (Building D), an approximately 200,000 sf medical office building (Building E), and an approximately 425,208 sf six-story garage structure (Garage West) with up to 1,154 parking stalls.

Building E is proposed to be constructed at the southern edge of the Project site, near the intersection of Samaritan Drive at Samaritan Place and would be eight stories tall and have approximately 25,000 sf of office space per floor with approximately 200,000 sf total.

Additional patient, staff, and visitor parking would be provided in a new free-standing parking structure (Garage West) located on the western edge of the site. Garage West would be fully constructed in Phase 3 and would have approximately 1,154 parking spaces with five levels of parking, including basement. At Phase 3 completion the Good Samaritan Hospital would have up to approximately 2,179 parking spaces. See Figure 7: Proposed Buildout Conceptual Site Plan for more details.

Phase 3 would result in approximately 21,000 CY of soil export and 5,000 CY of soil import. Phase 3 would be constructed over approximately 2.8 years (i.e., 34 months) starting in 2032. The schedule for

construction in all phases would typically occur six days a week (Monday through Saturday) from 7:00 a.m. to 7:00 p.m.

2 ENVIRONMENTAL SETTING

2.1 Greenhouse Gases and Climate Change

Certain gases in the earth's atmosphere classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface and a smaller portion of this radiation is reflected toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. Because the earth has a much lower temperature than the sun, it emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

The primary GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Fluorinated gases also make up a small fraction of the GHGs that contribute to climate change. Examples of fluorinated gases include chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3); however, it is noted that these gases are not associated with typical land use development. Human-caused emissions of GHGs exceeding natural ambient concentrations are believed to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the Earth's climate, known as global climate change or global warming.

GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants (TACs), which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (approximately one day), GHGs have long atmospheric lifetimes (one to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of a GHG molecule is dependent on multiple variables and cannot be pinpointed, more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, or other forms of carbon sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent is sequestered through ocean and land uptakes every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remains stored in the atmosphere (Intergovernmental Panel on Climate Change, 2013). Table 1: Description of Greenhouse Gases, describes the primary GHGs attributed to global climate change, including their physical properties.

Table 1: Description of Greenhouse Gases

Greenhouse Gas	Description
Carbon Dioxide (CO_2)	CO_2 is a colorless, odorless gas that is emitted naturally and through human activities. Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, and industrial facilities. The atmospheric lifetime of CO_2 is variable because it is readily exchanged in the atmosphere. CO_2 is the most widely emitted GHG and is the reference gas (Global Warming Potential of 1) for determining Global Warming Potentials for other GHGs.
Nitrous Oxide (N_2O)	N_2O is largely attributable to agricultural practices and soil management. Primary human-related sources of N_2O include agricultural soil management, sewage treatment, combustion of fossil fuels, and adipic and nitric acid production. N_2O is produced from biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 120 years. The Global Warming Potential of N_2O is 298.
Methane (CH_4)	CH_4, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices and landfills. CH_4 is the major component of natural gas, approximately 87 percent by volume. Human-related sources include fossil fuel production, animal husbandry, rice cultivation, biomass burning, and waste management. Natural sources of CH_4 include wetlands, gas hydrates, termites, oceans, freshwater bodies, non-wetland soils, and wildfires. The atmospheric lifetime of CH_4 is approximately 12 years and the Global Warming Potential is 25.
Hydrofluorocarbons (HFCs)	HFCs are typically used as refrigerants for both stationary refrigeration and mobile air conditioning. The use of HFCs for cooling and foam blowing is increasing, as the continued phase out of CFCs and HCFCs gains momentum. The 100-year Global Warming Potential of HFCs range from 124 for HFC-152 to 14,800 for HFC-23.
Perfluorocarbons (PFCs)	PFCs have stable molecular structures and only break down by ultraviolet rays approximately 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Global Warming Potentials range from 6,500 to 9,200.
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in CH_4 or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). CFCs were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987. Global Warming Potentials for CFCs range from 3,800 to 14,400.
Sulfur Hexafluoride (SF_6)	SF_6 is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas. The Global Warming Potential of SF_6 is 23,900.
Hydrochlorofluoro-carbons (HCFCs)	HCFCs are solvents, similar in use and chemical composition to CFCs. The main uses of HCFCs are for refrigerant products and air conditioning systems. As part of the Montreal Protocol, HCFCs are subject to a consumption cap and gradual phase out. The United States is scheduled to achieve a 100 percent reduction to the cap by 2030. The 100-year Global Warming Potentials of HCFCs range from 90 for HCFC-123 to 1,800 for HCFC-142b.
Nitrogen Trifluoride (NF_3)	NF_3 was added to Health and Safety Code section 38505(g)(7) as a GHG of concern. This gas is used in electronics manufacture for semiconductors and liquid crystal displays. It has a high global warming potential of 17,200.

Potential Climate Change Effects Climate change is a complex process that has the potential to alter local climatic patterns and meteorology. Although modeling indicates that climate change will result in sea-level rise, both globally and in San Francisco Bay, as well as changes in climate and rainfall, among other effects, there remains uncertainty about characterizing precise local climate characteristics and predicting precisely how various ecological and social systems will react to changes in the existing climate at the local level. Regardless of this uncertainty, it is widely understood that substantial climate change has occurred and will continue to occur in the future, although the precise extent will take further research to define. Specifically, the effects from global climate change in California and worldwide include the following:

- Declining sea ice and mountain snowpack levels, thereby increasing sea levels and sea surface evaporation rates, with a corresponding increase in atmospheric water vapor due to the atmosphere's ability to hold more water vapor at higher temperatures.[2]
- Rising average global sea levels, due primarily to thermal expansion in the oceans and the melting of glaciers, ice caps, and the Greenland and Antarctic ice sheets.[3]
- Changing weather patterns, including changes in precipitation and wind patterns, and more energetic episodes of extreme weather, including droughts, heavy precipitation, heat waves, extreme cold, and intense tropical cyclones.[4]
- Declining Sierra Nevada snowpack levels, which account for approximately half of the surface water storage in California. Snow levels could decline by 70 to as much as 90 percent over the next 100 years.[5]
- Increases in the number of days that could be conducive to ground-level ozone formation (e.g., clear days with intense sunlight) by the end of the 21st century in areas with high levels of ozone. The number of days could increase by 25 to 85 percent, depending on the future temperature scenario.[6]
- Increases in the potential for erosion of California's coastlines as well as seawater intrusion into the Sacramento Delta and associated levee systems due to the rise in sea level.[7]
- The severity of drought conditions in California could be exacerbated (e.g., durations and intensities could be amplified, ultimately increasing the risk of wildfires and consequential damage).[8]
- Under changing climate conditions, agricultural operations are forecast to experience lower crop yields due to extreme heat waves, heat stress, increased water needs of crops and livestock (particularly during dry and warm years), and new and changing pest and disease threats.[9]

The impacts of climate change, such as increases in the number of heat-related events, droughts, and wildfires, pose direct and indirect risks to public health, with people experiencing worsening episodes

of illness and an earlier death. Indirect impacts on public health include increases in incidents of vector-borne diseases, stress and mental trauma due to extreme events and disasters, economic disruptions, and residential displacement.[10]

3 REGULATORY SETTING

3.1 Federal

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

Clean Air Act

In April 2007, in Massachusetts v. EPA, the U.S. Supreme Court directed the Administrator of the U.S. Environmental Protection Agency (U.S. EPA) to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In making these decisions, the U.S. EPA Administrator was directed to follow the language of Section 202(a) of the Clean Air Act (CAA). In December 2009, the Administrator signed a final rule with two distinct findings regarding GHGs under Section 202(a) of the CAA:

- Elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the "endangerment finding."
- The combined emissions of GHGs— CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is referred to as the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the CAA.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (December 2007), among other key measures, requires the following, which would aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

[10] Ibid.

Additional provisions of the Energy Independence and Security Act (EISA) address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

U.S. Environmental Protection Agency Endangerment Finding

The U.S. EPA authority to regulate GHG emissions stems from the U.S. Supreme Court decision in Massachusetts v. EPA (2007). The Supreme Court ruled that GHGs meet the definition of air pollutants under the existing Federal Clean Air Act (FCAA) and must be regulated if these gases could be reasonably anticipated to endanger public health or welfare. Responding to the Court's ruling, the U.S. EPA finalized an endangerment finding in December 2009. Based on scientific evidence, it found that six GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) constitute a threat to public health and welfare. Thus, it is the Supreme Court's interpretation of the existing FCAA and the U.S. EPA's assessment of the scientific evidence that form the basis for the U.S. EPA's regulatory actions.

Federal Vehicle Standards

In response to the U.S. Supreme Court ruling discussed above, Executive Order 13432 was issued in 2007 directing the U.S. EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011, and in 2010, the U.S. EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, an Executive Memorandum was issued directing the Department of Transportation, Department of Energy, U.S. EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the U.S. EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the U.S. EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the U.S. EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baseline.[11]

In August 2016, the U.S. EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program.

[11] U.S. EPA and NHTSA, *Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium and Heavy-Duty Engines and Vehicles – Phase 2,* 2016. Available at: https://www.gpo.gov/fdsys/pkg/FR-2016-10-25/pdf/2016-21203.pdf. Accessed: September 2023.

On September 27, 2019, the U.S. EPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.)[12] The SAFE Rule (Part One) revoked California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the U.S. EPA and NHTSA finalized rulemaking for SAFE Part Two sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021-2026. The current U.S. EPA administration repealed SAFE Rule Part One, effective January 28, 2022, and is reconsidering Part Two.

In December 2021, the U.S. EPA finalized federal GHG emissions standards for passenger cars and light trucks for Model Years 2023 through 2026. These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector and are based on sound science and grounded in a rigorous assessment of current and future technologies. The updated standards will result in avoiding more than three billion tons of GHG emissions through 2050.[13]

Paris Climate Agreement

The Paris Agreement was negotiated within the United Nations Framework Convention on Climate Change in 2015 to reduce GHG emissions internationally. The goal of the Paris Agreement was to keep the global temperature rise this century to below 2 degrees Celsius above pre-industrial standards, with efforts to limit temperature increase even further to 1.5 degrees Celsius. The Paris Agreement became effective on November 4, 2016. As of October 5, 2016, 155 of 197 parties had ratified the Paris Agreement. On January 20, 2021, President Biden signed an Executive Order formally rejoining the United States to the Paris Agreement.[14]

Executive Order 14008

On January 27, 2021, President Biden issued an Executive Order on Tackling the Climate Crisis at Home and Abroad (Executive Order 14008)[15]. Part I of the Order highlights putting the climate crisis at the center of United States foreign policy and national security. Addressing the climate crisis will require significant short-term global reductions in GHG emissions and net-zero global emissions by mid-century or sooner. The United States will pursue green recovery efforts and initiatives to advance the clean energy transition.

Part II of the Order relays the government-wide approach to the climate crisis, which involves reducing climate pollution in every sector of the economy, especially through innovation, commercialization, and deployment of clean energy technologies and infrastructure. A National Climate Task Force is established to focus on addressing the climate crisis through key federal actions to reduce climate change impacts. A 100 percent carbon pollution-free electricity sector is targeted by no later than 2035 and a net-zero emissions economy is to be achieved by no later than 2050. Offshore wind is aimed to be doubled by 2030. Opportunities for federal funding of clean energy technology and infrastructure shall be identified. Federal permitting decisions need to consider the effects of GHG emissions and climate change.[2]

3.2 State of California

California Air Resources Board

The California Air Resources Board (CARB) is responsible for the coordination and oversight of State and local air pollution control programs in California. Various statewide and local initiatives to reduce California's contribution to GHG emissions have raised awareness about climate change and its potential for severe long-term adverse environmental, social, and economic effects. California is a significant emitter of carbon dioxide equivalent (CO_2e) in the world and produced 369 million gross metric tons (MMT) of CO_2e in 2020.[16] The transportation sector is the State's largest emitter of GHGs, followed by industrial operations such as manufacturing and oil and gas extraction.

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation, such as the landmark AB 32 California Global Warming Solutions Act of 2006, was specifically enacted to address GHG emissions. Other legislation, such as Title 24 building efficiency standards and Title 20 appliance energy standards, were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major legislation related to GHG emissions reduction.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

AB 32 instructs the CARB to develop and enforce regulations for the reporting and verifying statewide GHG emissions. AB 32 also directed CARB to set a GHG emissions limit based on 1990 levels, to be achieved by 2020. It set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.

CARB Scoping Plan

Adopted December 15, 2022, CARB's 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. To achieve the targets of AB 1279, the 2022 Scoping Plan relies on existing and emerging fossil fuel alternatives and clean technologies, as well as carbon capture and storage. Specifically, the 2022 Scoping Plan focuses on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen.

The key elements of the 2022 CARB Scoping Plan focus on transportation. Specifically, the 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by CARB on vehicle manufacturers and are outside the jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Included in the 2022 Scoping Plan is a set of Local Actions (2022 Scoping Plan Appendix D) aimed at providing local jurisdictions with recommendations to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. Appendix D to the 2022 Scoping Plan is not regulatory, is not exhaustive, and does not include everything local governments can implement to

[16] California Air Resources Board, Current California GHG Emissions Inventory Data, 2000-2020 GHG inventory (2022 Edition), https://ww2.arb.ca.gov/ghg-inventory-data, accessed September 2023.

support the State's climate goals. It focuses primarily on climate action plans (CAPs) and local authority over new residential development. It includes a section on evaluating plan-level and project-level alignment with the State's Climate Goals in CEQA GHG analyses. In this section, CARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency with the 2022 Scoping Plan. CARB specifically states that Section 3 of Appendix D, which discusses land use plans and development projects, does not address land uses other than residential and mixed-use residential such as industrial. However, CARB plans to explore new approaches for other land use types in the future.

Senate Bill (SB) 32 (California Global Warming Solutions Act of 2006: Emissions Limit)

Signed into law in September 2016, SB 32 codifies the 2030 GHG reduction target in Executive Order B-30-15 (40 percent below 1990 levels by 2030). The bill authorizes CARB to adopt an interim GHG emissions level target to be achieved by 2030. CARB also must adopt rules and regulations in an open public process to achieve the maximum, technologically feasible, and cost-effective GHG reductions.

With SB 32, the Legislature passed companion legislation, AB 197, which provides additional direction for developing the Scoping Plan. On December 14, 2017, CARB adopted a second update to the Scoping Plan (CARB, 2017b). The 2017 Scoping Plan details how the State will reduce GHG emissions to meet the 2030 target set by Executive Order B-30-15 and codified by SB 32. Other objectives listed in the 2017 Scoping Plan are to provide direct GHG emissions reductions; support climate investment in disadvantaged communities; and support the Clean Power Plan and other Federal actions. In 2022, CARB published the 2022 Scoping Plan, which is discussed above.

SB 375 (The Sustainable Communities and Climate Protection Act of 2008)

Signed into law on September 30, 2008, SB 375 provides a process to coordinate land use planning, regional transportation plans (RTP), and funding priorities to help California meet AB 32's GHG reduction goals. SB 375 requires metropolitan planning organizations to include sustainable community strategies in their RTPs reducing GHG emissions, aligns planning for transportation and housing, and creates specified incentives for the implementation of the strategies. The Metropolitan Transportation Commission (MTC) and Association of Bay Area Governments (ABAG) serve as the metropolitan planning organization for the nine counties in the Bay Area region. The applicable sustainable community strategy in the Bay Area is Plan Bay Area 2050, which sets out a path toward achieving a 20 percent per capita reduction in GHG emissions from passenger cars and light-duty trucks by 2035.

AB 1493 (Pavley Regulations and Fuel Efficiency Standards)

AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the U.S. EPA's denial of an implementation waiver. The U.S. EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011. The regulations establish one set of emission standards passenger vehicle and light duty truck model years 2009–2016 and a second set of emissions standards for model years 2017 to 2025. By 2025, when all rules will be fully implemented, new automobiles will emit 34 percent fewer CO_2e emissions and 75 percent fewer smog-forming emissions.

SB 1368 (Emission Performance Standards)

SB 1368 is the companion bill of AB 32, which directs the California Public Utilities Commission (CPUC) to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB

1368 limits carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. The new law effectively prevents California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the state. The CPUC adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, for 1,100 pounds of CO_2 per megawatt-hour.

SB 1078, SB 107, and SBX1-2 (Renewable Electricity Standards)

SB 1078 (2002) required California to generate 20 percent of its electricity from renewable energy by 2017. SB 107 (2006) changed the due date to 2010 instead of 2017. On November 17, 2008, Executive Order S-14-08 established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Executive Order S-21-09 also directed CARB to adopt a regulation by July 31, 2010, requiring the state's load serving entities to meet a 33 percent renewable energy target by 2020. CARB approved the Renewable Electricity Standard on September 23, 2010, by Resolution 10-23. SB X1-2 codified the 33 percent by 2020 goal.

SB 350 (Clean Energy and Pollution Reduction Act of 2015)

Signed into law on October 7, 2015, SB 350 implements Executive Order B-30-15's goals. The SB 350 objectives are to increase the procurement of electricity from renewable sources from 33 percent to 50 percent (with interim targets of 40 percent by 2024, and 45 percent by 2027) and to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation. SB 350 also reorganizes the Independent System Operator to develop more regional electricity transmission markets and improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

AB 398 (Market-Based Compliance Mechanisms)

The Cap-and-Trade program covers approximately 80 percent of California's GHG emissions.[17] The statewide cap for GHG emissions from the capped sectors (i.e., electricity generation, industrial sources, petroleum refining, and cement production) commenced in 2013 and would decline approximately three percent each year, achieving GHG emission reductions throughout the program's duration. Signed on July 25, 2017, AB 398 extended the duration of the Cap-and-Trade program from 2020 to 2030. AB 398 required CARB to update the Scoping Plan and for all GHG rules and regulations adopted by the State. It also designated CARB as the statewide regulatory body responsible for ensuring that California meets its statewide carbon pollution reduction targets, while retaining local air districts' responsibility and authority to curb toxic air TACs and criteria pollutants from local sources that severely impact public health. AB 398 also decreased free carbon allowances over 40 percent by 2030 and prioritized Cap-and-Trade spending to various programs including reducing diesel emissions in impacted communities.

SB 150 (Regional Transportation Plans)

Signed on October 10, 2017, SB 150 aligns local and regional GHG reduction targets with State targets (i.e., 40 percent below their 1990 levels by 2030). SB 150 creates a process to include communities in discussions on how to monitor their regions' progress on meeting these goals. The bill also requires the CARB to regularly report on that progress, as well as on the successes and the challenges regions

[17] California Air Resources Board, *Cap-and-Trade Program*, https://ww2.arb.ca.gov/our-work/programs/cap-and-trade-program/about, Accessed September 2023.

experience associated with achieving their targets. SB 150 provides for accounting of climate change efforts and GHG reductions and identify effective reduction strategies.

AB 1346 (Air Pollution: Small Off-Road Engines)

Signed into Law in October 2021, AB 1346 requires CARB, to adopt cost-effective and technologically feasible regulations to prohibit engine exhaust and evaporative emissions from new small off-road engines, consistent with federal law, by July 1, 2022. The bill requires CARB to identify and, to the extent feasible, make available funding for commercial rebates or similar incentive funding as part of any updates to existing applicable funding program guidelines to local air pollution control districts and air quality management districts to implement to support the transition to zero-emission small off-road equipment operations.

AB 1279 (The California Climate Crisis Act)

AB 1279 establishes the policy of the State to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage technologies.

SB 100 and SB 1020 (California Renewables Portfolio Standard Program: 100 Percent Clean Electric Grid)

Signed into law in September 2018, SB 100 increased California's renewable electricity portfolio from 50 to 60 percent by 2030. SB 100 also established a further goal to have an electric grid that is entirely powered by clean energy by 2045.SB 1020 provides additional goals for the path to the 2045 goal of 100 percent clean electricity retail sales. It creates a target of 90 percent clean electricity retail sales by 2035 and 95 percent clean electricity retail sales by 2040.

SB 905 (Carbon Sequestration Program)

Signed on September 16, 2022, SB 905 establishes regulatory framework and policies that involve carbon removal, carbon capture, utilization, and sequestration. It also prohibits the injecting of concentrated $_{CO2}$ fluid into a Class II injection well for the purpose of enhanced oil recovery.

AB 1757 (Nature-Based Solutions)

Signed on September 16, 2022, AB 1757 requires State agencies to develop a range of targets for natural carbon sequestration and nature-based climate solutions that reduce GHG emissions to meet the 2030, 2038, and 2045 goals which would be integrated into a scoping plan addressing natural and working lands.

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs using executive orders. Although not regulatory, they set the state's tone and guide the actions of state agencies.

Executive Order S-3-05. Executive Order S-3-05 was issued on June 1, 2005, which established the following GHG emissions reduction targets:

- By 2010, reduce greenhouse gas emissions to 2000 levels.
- By 2020, reduce greenhouse gas emissions to 1990 levels.
- By 2050, reduce greenhouse gas emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07. Issued on January 18, 2007, Executive Order S-01-07 mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The executive order established a Low Carbon Fuel Standard (LCFS) and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, CARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. CARB adopted the LCFS on April 23, 2009

Executive Order S-13-08. Issued on November 14, 2008, Executive Order S-13-08 facilitated the California Natural Resources Agency development of the 2009 California Climate Adaptation Strategy. Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order S-14-08. Issued on November 17, 2008, Executive Order S-14-08 expands the state's Renewable Energy Standard to 33 percent renewable power by 2020. Additionally, Executive Order S-21-09 (signed on September 15, 2009) directs CARB to adopt regulations requiring 33 percent of electricity sold in the state come from renewable energy by 2020. CARB adopted the Renewable Electricity Standard on September 23, 2010, which requires 33 percent renewable energy by 2020 for most publicly owned electricity retailers.

Executive Order S-21-09. Issued on July 17, 2009, Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewable Portfolio Standard (RPS) to 33 percent by 2020. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II.

Executive Order B-30-15. Issued on April 29, 2015, Executive Order B-30-15 established a California GHG reduction target of 40 percent below 1990 levels by 2030 and directs CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2e ($MMTCO_2e$). The 2030 target acts as an interim goal on the way to achieving reductions of 80 percent below 1990 levels by 2050, a goal set by Executive Order S-3-05. The executive order also requires the state's climate adaptation plan to be updated every three years and for the state to continue its climate change research program, among other provisions. With the enactment of SB 32 in 2016, the Legislature codified the goal of reducing GHG emissions by 2030 to 40 percent below 1990 levels.

Executive Order B-55-18. Issued on September 10, 2018, Executive Order B-55-18 establishes a goal to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter. This goal is in addition to the existing statewide targets of reducing GHG emissions. The executive order requires CARB to work with relevant state agencies to develop a framework for implementing this goal. It also requires CARB to update the Scoping Plan to identify and recommend measures to achieve carbon neutrality. The executive order also requires state agencies to develop sequestration targets in the Natural and Working Lands Climate Change Implementation Plan.

Executive Order N-79-20. Issued on September 23, 2020, Executive Order N-79-20 established a goal to end the sales of new internal combustion engine vehicles in the state as soon as possible, and no later than 2035, and continue to phaseout fossil-fueled cars and trucks. By setting a course to end sales of internal combustion passenger vehicles by 2035, the Governor's Executive Order establishes a target for the transportation sector that helps put the state on a path to carbon neutrality by 2045. It is important

to note that the Executive Order focuses on new vehicle sales for automakers, and therefore does not require Californians to give up the existing cars and trucks they already own.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat, even with rapid population growth.

Title 20 Appliance Efficiency Regulations. The appliance efficiency regulations (California Code of Regulations [CCR] Title 20, Sections 1601-1608) include standards for new appliances. Twenty-three categories of appliances are included in the scope of these regulations. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

Title 24 Building Energy Efficiency Standards. California's Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The California Energy Commission (CEC) adopted the 2022 Energy Code on August 11, 2021, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Title 24 standards will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption across California. For example, the 2022 Title 24 standards will require efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards.

Title 24 California Green Building Standards Code. The California Green Building Standards Code (CCR Title 24, Part 11 code) commonly referred to as CALGreen, is a statewide mandatory construction code developed and adopted by the California Building Standards Commission and the Department of Housing and Community Development. The CALGreen standards require new residential and nonresidential buildings to comply with mandatory measures under the topics of planning and design, energy efficiency, water efficiency/conservation, material conservation and resource efficiency, and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt that encourage or require additional measures in the five green building topics. The latest CALGreen Code took effect on January 1, 2023 (2022 CALGreen). The 2022 CALGreen standards has improved upon the 2019 standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

California Vehicles Regulations

Advanced Clean Cars I and II. Advanced Clean Cars combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks and SUVs and require an increased number of zero-emission vehicles to meet air quality and climate change emissions goals. By 2035 all new passenger cars, trucks and SUVs sold in California will be zero emissions. The Advanced Clean Cars II regulations take the state's already growing zero-emission vehicle market and robust motor vehicle emission control rules and augments them to meet more aggressive tailpipe emissions standards and ramp up to 100% zero-emission vehicles.

ARB Advanced Clean Fleets Regulation. CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

3.3 Regional

Bay Area Air Quality Management District Thresholds

The Bay Area Air Quality Management District (BAAQMD) is the primary agency responsible for addressing air quality concerns in the San Francisco Bay Area, including the City of San José. BAAQMD also recommends methods for analyzing project-related GHGs in CEQA analyses as well as multiple GHG reduction measures for land use development projects. BAAQMD released its *Justification Report CEQA Thresholds for Evaluating the Significance of Climate Impacts from Land Use Projects and Plans* (BAAQMD Justification Report) in April 2022. BAAQMD Justification Report presents updates to the CEQA GHG thresholds from the 2017 CEQA Guidelines, which were not consistent with the statewide GHG target established by SB 32. The GHG thresholds of significance were updated to consider newer state reduction targets (e.g., SB 32) and plans for eventual carbon neutrality by 2045 (e.g., Executive Order B-55-18 and SB 1279), as well as evolving case law. The BAAQMD Justification Report (and thus the GHG thresholds) was adopted by the Board of Directors on April 20, 2022. In summary, the updated thresholds emphasize:

- Avoiding wasting electricity and developing fossil fuel infrastructure (i.e., natural gas plumbing or appliances) in new buildings that will be in place for decades and thus conflict with carbon neutrality by 2045.
- Compliance with California Green Building Standards Code (CALGreen) Tier 2 EV requirements and per capita VMT reductions consistent with SB 743.
- Consistency with a qualified GHG reduction strategy (also known as a Climate Action Plan).

Clean Air Plan

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans. The federal and state CAA require plans to be developed for areas designated as nonattainment (with the exception of areas designated as nonattainment for the state PM_{10} standard). The 2017 Clean Air Plan: Spare the Air, Cool the Climate was adopted on April 19, 2019, by BAAQMD.

The 2017 Clean Air Plan provides a regional strategy to protect public health and protect the climate. To protect public health, the plan describes how BAAQMD will continue progress toward attaining all state and federal air quality standards and eliminating health risk disparities from exposure to air pollution among Bay Area communities. To protect the climate, the 2017 Clean Air Plan defines a vision for transitioning the region to a post-carbon economy needed to achieve ambitious GHG reduction targets for 2030 and 2050 and provides a regional climate protection strategy that will put the Bay Area on a pathway to achieve those GHG reduction targets.

The 2017 Clean Air Plan includes a wide range of control measures designed to decrease emissions of the air pollutants that are most harmful to Bay Area residents, such as particulate matter, ozone, and TACs; to reduce emissions of CH_4 and other "super-GHGs" that are potent climate pollutants in the near-term; and to decrease emissions of CO_2 by reducing fossil fuel combustion.

3.4 Local

City of San José Municipal Code

The City's Municipal Code includes the following regulations that would reduce GHG emissions from future development:

- Green Building Regulations for Private Development (Chapter 17.84)
- Water Efficient Landscape Standards for New and Rehabilitated Landscaping (Chapter 15.11)
- Transportation Demand Programs for employers with more than 100 employees (Chapter 11.105)
- Construction and Demolition Diversion Deposit Program (Chapter 9.10)
- Wood Burning Ordinance (Chapter 9.11)

City of San José General Plan

The General Plan includes a GHGRS that is designed to help the City sustain its natural resources, grow efficiently, and meet California legal requirements for GHG emissions reduction. Multiple policies and actions in the General Plan have GHG implications including those targeting land use, housing, transportation, water usage, solid waste generation and recycling, and reuse of historic buildings. The policies also include a monitoring component that allows for adaptation and adjustment of City programs and initiatives related to sustainability and associated reductions in GHG emissions. The GHGRS is intended to meet the mandates as outlined in the CEQA Guidelines and the recent standards for "qualified plans" as set forth by BAAQMD.

The GHGRS was re-adopted by the San José City Council in December 2015. The environmental impacts of the GHGRS were analyzed in the General Plan Final Program Environmental Impact Report (FPEIR) and a 2015 Supplement to the General Plan FPEIR. The City's projected emissions and the GHGRS are consistent with the measures necessary to meet state-wide 2020 goals established by AB 32 and addressed in the Climate Change Scoping Plan. Measures have not been identified that would ensure GHG emissions would be consistent with state-wide 2045 goals; however, the City adopted overriding considerations for identified future impacts associated with buildout of the City's General Plan.

The General Plan includes the following GHG reduction policies, which are applicable to the project. These policies are also described within the City's GHGRS.

Goal MS – 1:	Demonstrate San José's commitment to local and global Environmental Leadership through progressive use of green building policies, practices, and technologies to achieve 100 million square feet of new or retrofitted green buildings by 2040.
Policy MS-1.1	Demonstrate leadership in the development and implementation of green building policies and practices. Ensure that all projects are consistent with or exceed the City's Green Building Ordinance and City Council Policies as well as State and/or regional policies which require that projects incorporate various green building principles into their design and construction.
Policy MS-1.2	Continually increase the number and proportion of buildings within San José that make use of green building practices by incorporating those practices into both new construction and retrofit of existing structures.

Policy MS-1.3	Continually update and strengthen the City's Green Building policies and ordinances for new construction and rehabilitation of existing buildings to provide flexibility for application of new technologies and innovative techniques that may develop in the green building field.
Policy MS-1.4	Foster awareness in San José's business and residential communities of the economic and environmental benefits of green building practices. Encourage design and construction of environmentally responsible commercial and residential buildings that are also operated and maintained to reduce waste, conserve water and meet other environmental objectives.
Policy MS-1.5	Advocate for new or revised local, regional, state, or national policies and laws that further the use of green building techniques and to further the development of green building technology. Support the development and implementation of new and innovative technologies to achieve the construction of all types of environmentally high-performing buildings.
Policy MS-1.6	Recognize the interconnected nature of green building systems, and, in the implementation of Green Building Policies, give priority to green building options that provide environmental benefit by reducing water and/or energy use and solid waste.
Goal MS – 2:	Maximize the use of green building practices in new and existing development to maximize energy efficiency and conservation and to maximize the use of renewable energy sources.
Policy MS-2.1	Develop and maintain policies, zoning regulations, and guidelines that require energy conservation and use of renewable energy sources.
Policy MS-2.3:	Utilize solar orientation (i.e., building placement), landscaping, design, and construction techniques for new construction to minimize energy consumption.
Policy MS-2.4	Promote energy efficient construction industry practices.
Policy MS-2.6	Promote roofing design and surface treatments that reduce the heat island effect of new and existing development and support reduced energy use, reduced air pollution, and a healthy urban forest. Connect businesses and residents with cool roof rebate programs through City outreach efforts.
Policy MS-2.7:	Encourage the installation of solar panels or other clean energy power generation sources over parking areas.
Policy MS-2.11:	Require new development to incorporate green building practices, including those required by the Green Building Ordinance. Specifically, target reduced energy use through construction techniques (e.g., design of building envelopes and systems to maximize energy performance), through architectural design (e.g., design to maximize cross ventilation and interior daylight) and through site design techniques (e.g. orienting buildings on sites to maximize the effectiveness of passive solar design).
Goal MS – 3:	Maximize the use of green building practices in new and existing development to minimize use of potable water and to reduce water pollution.

Policy MS-3.1:	Require water-efficient landscaping, which conforms to the State's Model Water Efficient Landscape Ordinance, for all new commercial, institutional, industrial, and developer-installed residential development unless for recreation needs or other area functions.
Policy MS-3.2:	Promote use of green building technology or techniques that can help reduce the depletion of the City's potable water supply, as building codes permit. For example, promote the use of captured rainwater, graywater, or recycled water as the preferred source for non-potable water needs such as irrigation and building cooling, consistent with Building Codes or other regulations.
Policy MS-3.3:	Promote the use of drought tolerant plants and landscaping materials for nonresidential and residential uses.
Policy MS-3.4:	Promote the use of green roofs (i.e., roofs with vegetated cover), landscape-based treatment measures, pervious materials for hardscape, and other stormwater management practices to reduce water pollution.
Goal MS – 5:	Divert 100% of waste from landfills by 2022 and maintain 100% diversion through 2040.
Policy MS-5.3:	Evaluate recycling collection strategies to improve marketability of cleaner materials.
Policy MS-5.4:	Increase program participation and reduce disposal of recyclable materials through intensive outreach, incentives, enforcement or mandates.
Policy MS-5.5:	Maximize recycling and composting from all residents, businesses, and institutions in the City.
Policy MS-5.6:	Enhance the construction and demolition debris recycling program to increase diversion from the building sector.
Goal MS – 6:	Reduce generation of solid and hazardous waste.
Policy MS-6.5:	Reduce the amount of waste disposed in landfills through waste prevention, reuse, and recycling of materials at venues, facilities, and special events.
Goal MS – 10:	Minimize air pollutant emissions from new and existing development.
Policy MS-10.5:	In order to reduce vehicle miles traveled and traffic congestion, require new development within 2,000 feet of an existing or planned transit station to encourage the use of public transit and minimize the dependence on the automobile through the application of site design guidelines and transit incentives.
Goal MS – 14:	Reduce per capita energy consumption by at least 50 percent compared to 2008 levels by 2022 and maintain or reduce net aggregate energy consumption levels equivalent to the 2022 (Green Vision) level through 2040.
Policy MS-14.4:	Implement the City's Green Building Policies so that new construction and rehabilitation of existing buildings fully implements industry best practices, including the use of optimized energy systems, selection of materials and resources, water efficiency, sustainable site selection, passive solar building

design, and planting of trees and other landscape materials to reduce energy consumption.

Goal CD-2: Create integrated public and private areas and used that work together to support businesses and to promote pedestrian activity and multi-modal transportation.

Policy CD-2.5: Integrate Green Building Goals and Policies of this Plan into site design to create healthful environments. Consider factors such as shaded parking areas, pedestrian connections, minimization of impervious surfaces, incorporation of stormwater treatment measures, appropriate building orientations, etc.

City of San José Greenhouse Gas Reduction Strategy

The City of San José adopted its 2030 GHGRS in November 2020, consistent with SB 32. SB 32 established an interim statewide GHG reduction goal for 2030 to meet the long-term target of carbon neutrality by 2045 (EO B-55-18). SB 32 expands upon AB 32, the Global Warming Solutions Act of 2006, and requires a reduction in GHG emissions of at least 40 percent below the 1990 levels by 2030.

The 2030 GHGRS allows for tiering and streamlining of GHG analyses under CEQA because it serves as a qualified Climate Action Plan for the City of San José. The GHGRS was prepared under the BAAQMD CEQA Guidelines, and particularly in conformance with CEQA Guidelines Section 15183.5, which specifically addresses the development of GHG Reduction Plans for tiering and streamlining GHG analysis under CEQA. The 2030 GHGRS identifies major General Plan strategies and polices to be implemented by development project such as green building practices, transportation strategies, energy use, water conservation, waste reduction and diversion, and other sectors that contribute to GHG reductions and advancements of the City's broad sustainability goals.

The GHGRS identifies GHG emissions reduction measures to be implemented by development projects in three categories: built environment and energy, land use and transportation, and recycling and waste reduction. Some measures are mandatory for all proposed development projects and others are voluntary. Voluntary measures could be incorporated as mitigation measures for proposed projects, at the City's discretion. The GHGRS includes a compliance checklist (GHGRS Checklist), the purpose of which is to :

- Implement GHG reduction strategies from the 2030 GHGRS to new development projects. ▪
- Provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to CEQA.

Compliance with the GHGRS Checklist ensures that an individual project conforms with the GHGRS and would not constitute a cumulatively considerable contribution to significant cumulative global climate change impacts.

City of San José Private Sector Green Building Policy (6-32)

In October 2008, the City adopted the Private Sector Green Building Policy (6-32) that establishes baseline green building standards for private sector new construction and provides framework for the implementation of these standards. This policy requires that applicable projects achieve minimum green building performance levels using the Council adopted standards.

Climate Smart San José

Climate Smart San José was developed by the City to reduce air pollution, save water, and create a healthier community. The plan contains nine strategies to reduce carbon emissions consistent with the Paris Climate Agreement. These strategies include use of renewable energy, densification of neighborhoods, electrification and sharing of vehicle fleets, investments in public infrastructure, creating local jobs, and improving building energy-efficiency.

Reach Building Code

In 2019, the San José City Council approved Ordinance No. 30311 and adopted Reach Code Ordinance (Reach Code) to reduce energy-related GHG emissions consistent with the goals of Climate Smart San José. The Reach Code applies to new construction projects in San José. It requires new residential construction to be outfitted with entirely electric fixtures. Mixed-fuel buildings (i.e., use of natural gas) are required to demonstrate increased energy efficiency through a higher Energy Design Ratings and be electrification ready. In addition, the Reach Code requires electric vehicle charging infrastructure for all building types (above current CALGreen requirements), and solar readiness for non-residential buildings.

San José Clean Energy

San José Clean Energy (SJCE) is a not-for-profit electricity supplier operated by the City of San José. The utility offers a suite of electricity sourcing options. The GHRS Checklist requires participation in at least SJCE GreenSource program which includes 60 percent renewable energy and up to 95 percent carbon-free power. There is also the Total Green Level program, which provides 100% carbon-free electricity.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Thresholds and Significant Criteria

Based upon the criteria derived from State CEQA Guidelines Appendix G, a Project normally would have a significant effect on the environment if it would:

GHG-1 Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

GHG-2 Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

BAAQMD's approach to developing a threshold of significance for GHG emissions for local development projects that are not stationary sources is to identify features that, if included, would show that the project would not interfere with the state's goal to have net zero emissions by 2045. Under the BAAQMD thresholds a project that meets either A or B is a project that would make a less than cumulatively considerable contribution to significant cumulative climate change impacts:

A. Projects must include, at a minimum, the following Project design elements:
    1. Buildings
        a. The Project would not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).
        b. The Project would not result in any wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the State CEQA Guidelines.

2. Transportation

   a. Achieve a reduction in project-generated vehicle miles traveled (VMT) below the regional average consistent with the current version of the California Climate Change Scoping Plan (currently 15 percent) or meet a locally adopted SB 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA:

      i. Residential projects: 15 percent below the existing VMT per capita

      ii. Office projects: 15 percent below the existing VMT per employee

      iii. Retail projects: no net increase in existing VMT

   b. Achieve compliance with electric vehicle requirements in the most recently adopted version of CALGreen Tier 2.

B. Be consistent with a local GHGRS that meets the criteria under the CEQA Guidelines section 15183.5(b)

A qualified GHGRS adopted by a local jurisdiction shall include the following elements as described in the State CEQA Guidelines Section 15183.5(b)(1):

i. Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;

ii. Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;

iii. Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;

iv. Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

v. Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and

vi. Be adopted in a public process following environmental review.

It shall be noted that BAAQMD does not have an adopted threshold of significance for construction-related GHG emissions. BAAQMD recommends that the Lead Agency shall make a determination on the significance of these construction generated GHG emission impacts in relation to meeting AB 32 GHG reduction goals, as required by the Public Resources Code, Section 21082.2. The Lead Agency is encouraged to incorporate best management practices to reduce GHG emissions during construction, as feasible and applicable.

The City of San José has established consistency with their GHGRS would result in a less than cumulatively considerable impact. The City of San José does not have a construction-related GHG emission threshold. The GHGRS meets the requirements of CEQA Guidelines section 15183.5.

4.2 Methodology

Global climate change is, by definition, a cumulative impact of GHG emissions. Therefore, there is no project-level analysis. The baseline against which to compare potential impacts of the Project includes the natural and anthropogenic drivers of global climate change, including world-wide GHG emissions from human activities which almost doubled between 1970 and 2010 from approximately 27 gigatonnes (Gt) of CO_2/year to nearly 49 $GtCO_2$/year.[18] Further, average annual GHG emissions during 2010–2019 were higher than in any previous decade on record, while the rate of growth between 2010 and 2019 (1.3 percent per year) was lower than that between 2000 and 2009 (2.1 percent per year) and world-wide GHG emissions in 2019 were estimated to be 59 $GtCO_2$/year.[19] As such, the geographic extent of climate change and GHG emissions' cumulative impact discussion is worldwide.

The Project's construction and operational emissions were calculated using the California Emissions Estimator Model version 2022 (CalEEMod). Details of the modeling assumptions and emission factors are provided in Appendix A: Greenhouse Gas Emissions Data. For construction, CalEEMod calculates emissions from off-road equipment usage and on-road vehicle travel associated with haul, delivery, and construction worker trips. The Project's construction-related GHG emissions were forecasted based on the proposed construction schedule and applying the mobile-source emissions factors derived from CalEEMod. The Project's construction-related GHG emissions would be generated from off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles.

The Project's operations-related GHG emissions would be generated by vehicular traffic, area sources (e.g., landscaping maintenance, consumer products), electrical generation, water supply and wastewater treatment, and solid waste. The operational analysis uses compliance with the City's GHGRS Checklist as a threshold. The City's GHGRS Checklist aims to achieve its proportional share of State GHG emission reductions for the interim target year 2030 based on the mandate to reduce statewide GHG emissions by 85 percent of 1990 levels by 2045. This prescribes the interim target to be a 48 percent reduction of GHGs by 2030. It is assumed the GHGRS Checklist aims to achieve the City's proportional share of the state mandate beyond 2030 to the State 2045 mandate.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 Greenhouse Gas Emissions

Impact GHG-1 Would the Project generate greenhouse gas emissions, either directly or indirectly, that could have a significant impact on the environment?

Impact GHG-2: Would the Project conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing greenhouse gas emissions?

Construction Greenhouse Gas Emissions

Project construction would result in minor increases in GHG emissions from on-site and construction equipment and emissions from construction workers' personal vehicle travelling to and from the Project construction site. Construction-related GHG emissions vary depending on the level of activity, length of the construction period, specific construction operations, types of equipment, and number of construction workers. Neither the City of San José nor BAAQMD have an adopted threshold of significance

[18] Intergovernmental Panel on Climate Change, *Climate Change 2014 Mitigation of Climate Change Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2014.

[19] Intergovernmental Panel on Climate Change, 2023: Summary for Policymakers. In: Climate Change 2023: Synthesis Report. Contribution of Working Groups I, II and III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change, 2023

for construction-related GHG emissions; however, BAAQMD recommends quantifying emissions and disclosing that GHG emissions would occur during construction. The CalEEMod outputs prepared for the proposed Project (refer to Appendix A) calculated emissions with Project construction to be 13,472 $MTCO_2e$ for the total construction period 10 years. Phase 1 would total 8,254 $MTCO_2e$, Phase 2 would total 1,994 $MTCO_2e$, and Phase 3 would total 3,224 $MTCO_2e$. Project construction would be a temporary condition (a total of 10 years) and would not result in a permanent increase in emissions that would interfere with the implementation of the State's GHG reduction goals (established by AB 32, SB 32, AB 1279, etc.). In addition, the Project would implement the City's standard permit conditions, which includes BAAQMD Basic Construction Control Measures (BMP), to control dust at the Project site during all phases of construction stated in Table 6-1 of the BAAQMD CEQA Guidelines. Details on implementation of the BMPs can be found in the Good Samaritan Hospital Project Air Quality Assessment.

Operational Greenhouse Gas Emissions

The proposed Project would demolish the 353,800 sf Hospital Building A and the 6,700 sf Day Care Center. The Project would additionally construct Hospital Buildings C, D and E, refer to *1.2, Project Description*. In total, the proposed Project buildout would include net 384,680 sf of hospital buildings. Operational or long-term emissions would occur over the Project's life. GHG emissions would result from direct emissions such as Project generated vehicular traffic, and operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power over the life of the Project, the energy required to convey water to, and wastewater from the Project site, the emissions associated with solid waste generated from the Project site, and any fugitive refrigerants from air conditioning or refrigerators.

The Project would comply with the Title 24 Part 6 Building Energy Efficiency Standards in effect when building permits are submitted, which may be the current 2022 Title 24 Part 6 or a later version, as Title 24 is updated every three years. To be conservative, the analysis assumes all Project buildings would comply with 2022 Title 24 Part 6. Among other updates to the 2019 version, like strengthened ventilation standards for gas cooking appliances, the 2022 Energy Code includes updated standards including new electric heat pump requirements for residential uses, schools, offices, banks, libraries, retail, and grocery stores; and the expansion of solar photovoltaic and battery storage standards to additional land uses beyond low-rise residential, including high-rise multifamily residences, hotels and motels, tenant spaces, offices, (including medical offices and clinics), retail and grocery stores, restaurants, schools, and civic uses (including theaters auditoriums, and convention centers). The Project would comply with existing requirements for electric heat pumps for space heating through the CUP. Medical facilities are not included in the updated standards for solar photovoltaic and battery storage standards. Projects whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.[20]

The Project would also comply with the appliance energy efficiency standards in Title 20 of the CCR. The Title 20 standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances. The California Energy Commission proposed to adopt changes based upon agency discretion.[21] The Project would be constructed according to the standards for high-efficiency water fixtures for indoor plumbing and water efficient irrigation systems required in the applicable version of Title 24, Part 11 (CALGreen), assumed to be 2022 Title 24, Part 11 for this analysis.

[20] California Energy Commission. 2022. *2022 Building Energy Efficiency Standards*, https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency (accessed September 2023).

[21] California Energy Commission. 2021. *2021Public Hearing – California Energy Commission* , https://www.energy.ca.gov/event/meeting/2021-08/public-hearing-california-energy-commission-proposes-adopt-changes-california (accessed October 2023).

At the State and global level, improvements in technology, policy, and social behavior would influence and reduce Project operational emissions. The State is currently on a pathway to achieving the Renewable Portfolio Standards goal of 52 percent by December 31, 2027, 60 percent renewables by 2030 per SB 100, and achieve carbon neutrality by 2045 per AB 1279. Energy and mobile sources are targeted by statewide measures such as low carbon fuels, cleaner vehicles, strategies to promote sustainable communities and improved transportation choices that result in reducing VMT. With continued implementation of various statewide measures, the Project's operational energy and mobile source emissions would continue to decline in the future.

As discussed below, the Project would be constructed in compliance with the City's Council Policy 6-32 and the City's Green Building Ordinance which would ensure operational emissions reductions consistent with the 2030 GHGRS. As shown in Appendix B, the Project would be consistent with Table A: General Plan policies and Table B: 2030 GHGRS Checklist.

City of San José Greenhouse Gas Reduction Strategy Compliance Checklist

The City's 2030 GHGRS outlines the actions the City would undertake to achieve its proportional share of State GHG emission reductions for the interim target year 2030. Individual projects demonstrate their compliance with the GHGRS through the GHGRS Compliance Checklist. The City of San José 2030 GHGRS is a qualified local GHG reduction plan under CEQA, which can be used to determine the significance of GHG emissions from a Project (CEQA Guidelines Section 15183.5). BAAQMD also recognizes the use of a GHGRS as a significance threshold for a project's GHG emissions. Therefore, if the Project is consistent with the 2030 GHGRS, then the Project would result in a less than significant cumulative impact to global climate change in 2030.

Prior to Project approval, the applicant is required to complete the GHGRS Compliance Checklist to demonstrate the Project's compliance with the City of San José 2030 GHGRS, refer to Appendix B. Compliance with the checklist is demonstrated by completing Section A (General Plan Policy Conformance) and Section B (Greenhouse Gas Reduction Strategies). Projects that propose alternative GHG mitigation measures must also complete Section C (Alternative Project Measures and Additional GHG Reductions). The proposed Project does not include any alternative measures.

As discussed above, the Project would be constructed in accordance with the latest California Building Code, green building regulations/CalGreen, the City's Council Policy 6-32, and the City's Green Building Ordinance. Additionally, Project construction and demolition waste would be diverted to exceed City requirements and at least 75 percent of construction and demolition waste and 100 percent of metal would be recycled. Per the 2030 GHGRS requirements, implementation of the City's standard permit condition (see below) would require the Project to provide proof of enrollment in a San José Clean Energy Program. Additionally, the Project would be solar-ready by including building roof space for a "Future PV Array" per California Code. Thus, the proposed Project would be consistent with the 2030 GHGRS.

The proposed Project would be consistent with the 2030 GHGRS through compliance with the State's Model Water Efficient Landscape Ordinance and the City's Water-Efficient Landscape Ordinance (Chapter 15.11 of the San José Municipal Code). The proposed Project would include landscaped shading, including trees, in the parking areas and walkways. The trees would provide shading to help mitigate the urban heat island effect. Additionally, the Project would include low-flow fixtures and appliances and would utilize recycled water for the outdoor landscaping.

Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a Project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively

considerable if it complies with the requirements of the GHGRS. As described above, the Project would not conflict with the 2030 GHGRS (refer to Appendix B for further detail). Therefore, the Project would be consistent with a qualified local GHG reduction plan under CEQA Guidelines Section 15183.5. GHG emissions caused by long-term operation of the proposed would be less than significant.

2022 CARB Scoping Plan

As previously noted, the 2022 Scoping Plan sets a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels by 2045 in accordance with AB 1279. The transportation, electricity, and industrial sectors are the largest GHG contributors in the State. The 2022 Scoping Plan plans to achieve the AB 1279 targets primarily through zero-emission transportation (e.g., electrifying cars, buses, trains, and trucks). Additional GHG reductions are achieved through decarbonizing the electricity, carbon sequestration, and industrial sector emission reductions.

Statewide strategies to reduce GHG emissions in the latest 2022 Scoping Plan include implementing SB 100, which would achieve 100 percent clean electricity by 2045; achieving 100 percent zero emission vehicle sales in 2035 through Advanced Clean Cars II; and implementing the Advanced Clean Fleets regulation to deploy zero-electric vehicle buses and trucks. Additional transportation policies include the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, and Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation. The 2022 Scoping Plan would continue to implement SB 375. GHGs would be further reduced through the Cap-and-Trade Program carbon pricing and SB 905. SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CO_2 removal projects and technology.

As described above, the Project would implement the City's Standard Permit Conditions included in the *Air Quality Assessment* during construction. For example, the construction measures include enforcing idling time restrictions on construction vehicles, use of added exhaust muffling and filtering devices, which also reduce GHG emissions.

The 2022 Scoping Plan states that local CAPs that address the State's largest sources of emissions and prioritize transportation electrification, VMT reduction, and building decarbonization, contribute to the alignment between local climate action and the State's climate goals. The City GHGRS Checklist addresses alignment between local climate action and the State's climate goals through implementation of measures promoting green building practices, harmonious pedestrian, bicycle and transit designs, water conservation, renewable energy development, and zero waste goals. As indicated above, the proposed Project would be consistent with the 2030 GHGRS and would also be constructed in accordance with the latest California Building Code, green building regulations/CalGreen, the City's Council Policy 6-32 and the City's Green Building Ordinance. The Project would be solar-ready by including building roof space for a "Future PV Array" per California Code. Further, Project's GHG emissions associated with energy and mobile sources would be reduced by the 2022 Scoping Plan measures described above. It shall be noted that the City has no control over vehicle emissions; however, these emissions would decline in the future due to Statewide measures discussed above, as well as cleaner technology and fleet turnover.

As shown in Table 2: Project Consistency with Applicable CARB Scoping Plan Measures the Project is consistent with most of the strategies, while others are not applicable to the Project.

Table 2: Project Consistency with Applicable CARB Scoping Plan Measures

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
Transportation	California Cap-and-Trade Program Linked to Western Climate Initiative	Regulation for the California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanism April 1, 2019 (CCR 95800)	**Consistent.** The Cap-and-Trade Program applies to large industrial sources such as power plants, refineries, and cement manufacturers. However, the regulation indirectly affects people who use the products and services produced by these industrial sources when increased cost of products or services (such as electricity and fuel) are transferred to the consumers. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period.
	California Light-Duty Vehicle Greenhouse Gas Standards	Advanced Clean Cars II Regulations	**Consistent.** The Advanced Clean Cars II Regulations provide reductions from new vehicles sold in California between 2026 and 2035. Passenger vehicles associated with the site would comply with the Advanced Clean Cars II standards.
	Low Carbon Fuel Standard	2009 readopted in 2015 and updated in 2018. Regulations to Achieve Greenhouse Gas Emission Reductions Sub article 7. Low Carbon Fuel Standard CCR 95480	**Consistent.** This measure applies to transportation fuels utilized by vehicles in California. The Project would not conflict with implementation of this measure. Motor vehicles associated with construction and operation of the Project would utilize low carbon

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
			transportation fuels as required under this measure.
	Regional Transportation-Related Greenhouse Gas Targets	SB 375. Cal. Public Resources Code §§ 21155, 21155.1, 21155.2, 21159.28	**Consistent**. The Project would provide development in the region that is consistent with the growth projections in the Regional Transportation Plan/Sustainable Communities Strategy (SCS) (Plan Bay Area 2040).
	Medium/Heavy-Duty Vehicle	The Advanced Clean Trucks Regulation, the Heavy-Duty Omnibus Regulation and the California Phase 2 Regulation	**Consistent**. This measure applies to medium and heavy-duty vehicles that operate in the state. The Project would not conflict with implementation of this measure. Medium and heavy-duty vehicles associated with construction and operation of the Project would be required to comply with the requirements of this regulation.
Electricity and Natural Gas	Energy Efficiency	Title 20 Appliance Efficiency Regulation	**Consistent.** The Project would not conflict with implementation of this measure. The Project would comply with the latest energy efficiency standards.
		Title 24 Part 6 Energy Efficiency Standards for Residential and Non-Residential Building	
		Title 24 Part 11 California Green Building Code Standards	
	Renewable Portfolio Standard/Renewable Electricity Standard.	SB 100 The 100 Percent Clean Energy Act of 2018 (65% 2030) and Affordability Act of 2022 and SB 100 The 100 Percent Clean Energy Act of 2018 (60% 2030)	**Consistent**. The Project would obtain electricity from the electric utility company, SJCE. Per the 2030 GHGRS requirements, implementation of the City's Standard Permit Condition (see below) would require the Project to provide proof of enrollment in a San José Clean Energy Program which would provide 100 percent carbon-free electricity.
		SB 350 Clean Energy and Pollution Reduction Act of 2015	
	California Solar Initiative	Tax incentive program	**Consistent.** This measure is to increase solar throughout California, which is being done by various electricity

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
			providers and existing solar programs. The Project and its tenants are required to enroll in the SJCE TotalGreen program, which is powered through 100 percent renewable energy.
Water	Water	Title 24 Part 11 California Green Building Code Standards SBX 7-7—The Water Conservation Act of 2009 Model Water Efficient Landscape Ordinance	**Consistent.** The Project would comply with the indoor water use requirements listed in the 2022 California Green Building Standards Code. The Project would also comply with the actions listed in the Conserve Water Section (Chapter 4) of the Bay-Friendly Landscape Guidelines.
Green Buildings	Green Building Strategy	Title 24 Part 11 California Green Building Code Standards	**Consistent.** The State goal is to increase the use of green building practices. The Project would implement required green building strategies through existing regulation that requires the Project to comply with various CalGreen requirements.
Industry	Industrial Emissions	CARB Mandatory Reporting of Greenhouse Gas Emissions (MRR) Regulation	**Not Applicable.** The Project does not include light industrial uses such as a warehouse.
Recycling and Waste Management	Recycling and Waste	Title 24 Part 11 California Green Building Code Standards AB 1383 Statewide 75 Percent Diversion Goal by 2025 and waste reduction requirements listed in AB 1826 and AB 341	**Consistent.** The Project would not conflict with implementation of these measures. The Project is required to achieve the waste reduction and recycling mandates via compliance with the CALGreen code.
Forests	Sustainable Forests	Cap and Trade Offset Projects	**Not applicable.** The Project site is an existing disturbed site located in an urban area. No forested lands exist on-site.

Scoping Plan Sector	Scoping Plan Measure	Implementing Regulations	Project Consistency
High Global Warming Potential	High Global Warming Potential Gases	CARB Refrigerant Management Program CCR 95380	**Not applicable**. The regulations are applicable to refrigerants used by large air conditioning systems and large commercial and industrial refrigerators and cold storage system. The Project is not expected to use large systems subject to the refrigerant management regulations adopted by CARB.
		2022 Amendments to the Airborne Toxic Control Measure for In-use Diesel Fueled Transport Refrigeration Units (TRUs) and TRUs Generator sets and Facilities where TRUs operate	
Agriculture	Agriculture	Cap and Trade Offset Projects for Livestock and Rice Cultivation	**Not applicable**. The Project site is an infill site. No grazing, feedlot or other agricultural activities that generate manure currently exist on-site or are proposed to be implemented by the Project.
		SB 1383 Methane Reductions for Dairy and Livestock Operations	

Source: California Air Resources Board (CARB), *California's 2022 Climate Change Scoping Plan*, 2022 and CARB, *Climate Change Scoping Plan*, December 2017.

The Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would not impede or conflict with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan.

Plan Bay Area

The Project would not conflict with the overall goals of Plan Bay Area 2050 to provide housing, healthy and safe communities, and climate protection with an overall goal to reduce adverse health impacts. Plan Bay Area 2050 is based on the land use in the City's General Plan. As noted above, the Project would redevelop the existing hospital with new hospital uses consistent with the General Plan. The Project would add employment and vehicle trips related to new employees that work directly at the Project site but such trips are anticipated by Plan Bay Area. The Project would allow the hospital to continue to operate in its current location, preventing the need of people in the area from having to drive farther to obtain health care. Further, the Plan Bay Area seeks to decrease vehicle per capita emissions to 20 percent below 2005 levels by 2035. Achievement of the decrease in vehicle per capita emissions is conducted by regional planning efforts through the MTC and other agencies with regard to land use and transportation decision making; for which the Project's land use remains unchanged. The Project would not impede the region from reaching its GHG reductions required under Plan Bay Area.

Thus, implementation of the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and this impact would be less than significant.

Standard Permit Condition

Proof of Enrollment in SJCE. Prior to issuance of any Certificate of Occupancy for the Project, the occupant shall provide to the Director of the Department of Planning, Building, and Code Enforcement (PBCE), or Director's designee, proof of enrollment in the SJCE TotalGreen program (approx. 100 percent renewable energy)] assumed in the approved environmental clearance for the project in accordance with CEQA. If it is determined the project's environmental clearance requires enrollment in the TotalGreen program, neither the occupant, nor any future occupant, may opt out of the TotalGreen program.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than cumulatively considerable impacts.

5.2 Cumulative Setting, Impacts, and Mitigation Measures

Cumulative Setting

Climate change is a global problem and the geographic scope of cumulative impacts is global. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (approximately one day), GHGs have much longer atmospheric lifetimes of one year to several thousand years that allow them to be dispersed around the globe.

Cumulative Impacts and Mitigation Measures

It is generally the case that an individual project of the Project's size and nature is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory. GHG impacts are recognized as exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. The additive effect of Project-related GHG emissions would not result in a cumulatively considerable contribution to global climate change. As shown in Appendix B and discussed in GHG-1 and GHG-2 above, the Project would be consistent with the 2030 GHGRS, 2022 Scoping Plan, and Plan Bay Area 2050. Thus, the Project would not conflict with any applicable GHG reduction plan and would not interfere with the State's goal to achieve carbon neutrality by 2045. Therefore, the Project's cumulative contribution of GHG emissions would be less than cumulatively considerable.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than cumulatively considerable impacts.
