APPENDIX A

NOTICE OF PREPARATION AND COMMENT LETTERS

CITY OF SAN JOSE
CAPITAL OF SILICON VALLEY

Planning, Building and Code Enforcement
CHRISTOPHER BURTON, DIRECTOR

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE GOOD SAMARITAN HOSPITAL PROJECT

FILE NO:	PDC22-132
PROJECT APPLICANT:	HCA Healthcare (Attn: Nicholas Paul)
APNs:	421-36-009 and 421-36-011

Project Description: The project proposes to rezone the project site to a Commercial General Planned Development CG(PD) Zoning District to allow for the expansion of the existing Good Samaritan Hospital. The anticipated project would result in the construction of two new hospital wings totaling approximately 715,000 square feet, an approximately 200,000 square foot medical office building, a new heliport, two new parking garage structures totaling approximately 720,000 square feet, and one level of subterranean parking.

Location: The approximately 20-acre site is comprised of two parcels located in southwestern portion San José. The site is located at 2425 Samaritan Drive and 2333 Samaritan Place near the borders to the Town of Los Gatos and the City of Campbell.

As the Lead Agency, the City of San José will prepare an Environmental Impact Report (EIR) for the project summarized above. The City welcomes your input regarding the scope and content of the environmental information that is relevant to your area of interest, or to your agency's statutory responsibilities in connection with the proposed project. If you are affiliated with a public agency, this EIR may be used by your agency when considering subsequent approvals related to the project.

A **joint community and environmental public scoping meeting** for this project will be held:

When: Thursday, June 15, 2023 from 6:00 to 7:30 p.m.
Where: Via Zoom (see instructions below and on www.sanjoseca.gov/activeeirs)

The project description, location, and probable environmental effects to be analyzed in the EIR for the project can be found on the City's Active EIRs website at www.sanjoseca.gov/activeeirs, including the EIR Scoping Meeting information. According to State law, the deadline for your response is 30 days after receipt of this notice, and responses provided before the 30-day deadline are always welcome. The City will accept comments on the scope of the EIR until **5:00 p.m. on Wednesday, July 5, 2023**. If you have comments on this Notice of Preparation (NOP), please identify a contact person from your organization, and send your response via mail or email to:

City of San José, Department of Planning, Building and Code Enforcement

Deputy

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT
FOR GOOD SAMARITAN HOSPITAL PROJECT
JUNE 2023

Introduction

The purpose of an Environmental Impact Report (EIR) is to inform decision-makers and the general public of the environmental effects of a proposed project that an agency may implement or approve. The EIR process is intended to provide sufficient information to evaluate a project and its potential for significant impacts on the environment; to identify methods of reducing adverse impacts; and to consider alternatives to the project.

The City of San José will be the lead agency and will prepare and process the EIR for the Good Samaritan Hospital Project (Project) in accordance with the California Environmental Quality Act (CEQA) of 1970, as amended. In accordance with the requirements of CEQA, the EIR will include the following:

- Table of Contents;
- A summary of the Project and its impacts;
- A Project description;
- A description of the existing environmental setting, environmental impacts, and mitigation measures for the Project;
- Alternatives to the Project as proposed; and
- Environmental consequences, including (a) any significant environmental effects which cannot be avoided if the Project is implemented; (b) any significant irreversible and irretrievable commitments of resources; (c) the growth inducing impacts of the Project; and (d) cumulative impacts.

The Notice of Preparation solicits guidance from agencies as to the scope and content of the environmental information to be included in the Good Samaritan Hospital Project EIR. The City of San José as the Lead Agency requests the views of your agency as to the scope and content of the environmental information that is germane to your agency's statutory responsibilities in connection with the Project. Your agency will need to use the EIR prepared by our agency when considering your permit to other approval for the Project.

Due to limits mandated by State law, your response must be sent at the earliest possible date but no later than 30 days after receipt of this notice.

Project Location

The approximately 20-acre Project site is located at 2425 Samaritan Drive and 2333 Samaritan Place (Assessor Parcel Numbers (APNs) 421-36-009 and 421-36-011) in the City of San Jose, County of Santa Clara, California; see **Figure 1 and 2**. The Project site is bounded by SR-85 to the north, Samaritan Place to the east, Samaritan Drive to the south, and the Samaritan Medical Center to the west. The Project site is within the southwestern portion of the City, approximately 0.25-mile east of the Town of Los Gatos border and approximately 0.20-mile southeast of the City of Campbell.

Existing Conditions

The project site is located in an urban area with a mix of medical office and clinics, single-family, and multi-family residential developments.

Adjacent and surrounding land uses include the following:

North Eastbound on-ramp to SR-85.

East Multi-family residences (Cambrian Center, and Redwood Collection at Parkwood).

South Medical offices.

West Medical office complex with surface parking (Samaritan Medical Center).

The Project site is currently developed as the Good Samaritan Hospital campus, as shown in **Figure 3**. Specifically, the existing hospital building is divided into two different wings: main building with emergency operations totaling approximately 359,000 square feet, (Building A on **Figure 3**) and a women's and children's services wing totaling approximately 85,000 square feet (Building B on **Figure 3**). The hospital campus also contains a day care center totaling approximately 6,700 square feet. In total, the existing hospital campus totals approximately 450,700 square feet. The Good Samaritan Hospital currently has one permitted 45 square foot heliport with one touchdown and liftoff area (TLOF) (helipad) on the northwest corner of the Project site that accommodates the transportation of up to 125 patients per year.[1]

There are currently four driveways on Samaritan Drive providing access to the Project site. The Project site has existing landscaping along all site boundaries and throughout surface parking areas. There is existing utility access (water and sewer, stormwater management, dry utilities and solid waste management) to the Project site. Finally, the Project site has existing site lighting for security and wayfinding.

The Project site has a General Plan land use designation of Neighborhood Community Commercial (NCC) as shown in **Figure 4**. The NCC designation allows for commercial uses serving communities in neighboring areas, including general office and hospitals. The Project site is zoned A(PD) Agricultural Planned Development Zoning District, as shown in **Figure 5**. Allowable uses under the current PD Zoning (File No. PDC01-063) include:

- All permitted medical office uses in the CO – Commercial Office Zoning District.
- Heliport uses related to the transportation of patients.
- Conditional uses related to Health Service uses of the CO – Commercial Office Zoning District shall be subject to a Planned Development permit as described in Chapter 20.100 of the City of San José Zoning Ordinance ("Administration and Permits").
- Hospital uses and 24-hour uses are allowed by right with no additional review

[1] California Code of Regulations (CCR), Title 21, Airports and Heliports, defines a heliport as, "an area of land, water, or structure used or intended to be used for the landing and takeoff of helicopters." Typical hospital and corporate heliport landing areas meet this definition and are therefore heliports. A helipad is a touchdown and liftoff area (TLOF), defined by the Federal Aviation Administration (FAA) as, "a load-bearing, generally paved area, normally centered in the FATO, on which the helicopter lands, and/or takes off." While the heliport refers to the landing pad and surrounding area and equipment, the helipad or TLOF is the actual prepared surface upon which a helicopter lands.

required by the Director of Planning, Building and Code Enforcement.

- A Subsequent Planned Development Permit will be required prior to the use of the Hospital as a trauma center. Evidence of approval by the Department of Health Services shall be provided.
- Incidental Uses – Incidental uses, including the gift shop, flower shop, cafeteria, news stand, etc. shall abide by the City of San Jose Zoning Ordinance Section 20.40.110 ("Commercial Zoning Districts and Public/Quasi-Public Zoning District, Incidental uses, office") and are allowed by right with no review required by the Director of Planning, Building and Code Enforcement.

Project Background

Good Samaritan Hospital has served the City of San José and greater Bay Area for over 50 years since its opening in 1965. The hospital operates a heart attack receiving center, emergency department, orthopedics department, cardiovascular department, neurosciences department, and a women's and children's services department including a Level 3 neonatal intensive care unit.

The 1971 San Fernando earthquake, also known as the Sylmar earthquake, caused the collapse of several hospital buildings, endangering the lives of patients in those hospitals at the time and rendered the hospitals incapable of providing emergency care to people injured in the earthquake. As a result, the California State legislature passed the Alfred E. Alquist Hospital Seismic Safety Act and, since 1973, all hospital construction has been governed by the provisions of that legislation. The Alfred E. Alquist Hospital Seismic Safety Act's title was changed to the Alfred E. Alquist Hospital Facilities Seismic Safety Act in 1983. Senate Bill 1953 (SB 1953) was an amendment and in furtherance of the Alfred E. Alquist Hospital Facilities Seismic Safety Act, signed into law following the 1994 Northridge earthquake. SB 1953 requires all California acute care hospitals to meet structural and nonstructural seismic strengthening requirements by the established deadlines of January 1, 2002, 2008, and 2030. Good Samaritan Hospital has complied with the 2002 and 2008 seismic mandates under SB 1953, with construction of new seismically compliant hospital additions and improvements and retrofits in recent years.

The existing main hospital building (Building A) that contains the acute hospital care was built in 1971, prior to the adoption of the Alquist Hospital Seismic Safety Act of 1983 and SB 1953 in 1994. Building A has a Structural Performance Category (SPC) of 2. According to the California Department of Health Care Access and Information, SPC 2 rated structures do not significantly jeopardize life, but may not be repairable or functional following strong ground motion.[2] These buildings must be brought into compliance with the structural provisions of the Alquist Hospital Facilities Seismic Safety Act, including its regulations and its retrofit provisions, by January 1, 2030, or be removed from acute care service. Therefore, Building A will be removed from providing general acute care services by January 1, 2030. As a result, acute hospital care needs to be relocated to a compliant SPC 5 rated structure prior to January 1, 2030. SPC 2 buildings, such as Building A, may contain hospital support services after January 1, 2030. Building B that contains the women's and children's center has an SPC of 5 and would continue to provide general acute care services after January 1, 2030.

[2] California Department of Health Care Access and Information (HCAI). Seismic Performance Ratings: Structural Performance Category (SRC) Ratings and Definitions. Available at: https://hcai.ca.gov/construction-finance/seismic-compliance-and-safety/seismic-performance-ratings/

Seismic compliance for acute hospital requirements under SB 1953 is the primary factor for the Project. Other legislative requirements (for example, the Americans with Disabilities Act(ADA)), updated hospital care guidelines, and the changes in the healthcare industry are also contributing factors to the need for the Project.

Project Description

"Project," as defined by the State CEQA Guidelines, means "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment." (14 CCR §15378[a]). A project includes "[a]n activity involving the issuance to a person of a lease, permit, license, certificate, or other entitlement for use by one or more public agencies." (14 CCR §15378[a]).

The Project would expand the existing Good Samaritan Hospital at 2425 Samaritan Drive and 2333 Samaritan Place in the City of San José. Seismic compliance for acute hospital requirements under Senate Bill (SB) 1953 is the Project's primary purpose. Other legislative requirements such as those in the ADA, updated hospital care guidelines, and changes in the healthcare industry contribute to the need for the Project.

It is anticipated that the Project's full buildout would result in the construction of two new hospital wings totaling approximately 715,000 square feet, an approximately 200,000 square foot medical office building, two new parking garage structures totaling approximately 720,000 square feet, and one level of subterranean parking. The Project would be developed in two phases, with an optional third phase: Phase 1, which would be constructed over approximately four years starting in 2025 and Phase 2, which would be constructed over approximately five years starting in 2029, and Phase 3, which is an optional third phase that could be undertaken concurrently with or after Phase 2.

Specifically, Phase 1 would demolish 5,200 square feet of the existing hospital main building (Building A) to construct a new SPC 5 rated 260,000 square foot hospital wing (Building C) and demolish the existing 6,700 square foot day care center to partially construct four of the six stories of a parking garage (Garage East). Phase 2 would construct an approximately 455,000 square foot hospital wing (Building D), an approximately 200,000 square foot medical office building (Building E), a five-story garage structure (Garage West), and construct the remaining two levels of Garage East. Garage East would have a total of six stores at the end of Phase 2. At full buildout, if Phase 3 is undertaken, the Project would demolish the non-seismically compliant (SPC 2) main hospital building (Building A) and replace it with approximately 355 surface and one level of subterranean parking stalls (Subterranean Garage). **Figure 6: Proposed Project Phase 1 Conceptual Site Plan** depicts Phase 1, **Figure 7: Proposed Project Phase 2 Conceptual Site Plan** depicts Phase 2, and **Figure 8: Proposed Project Phase 3 Conceptual Site Plan** depicts the Project at full buildout, if undertaken.

Table 1: Proposed Development Phases provides a breakdown of the building area square footage for the three phases, excluding parking structures. **Table 2: Proposed Project Phasing Summary** breaks down the proposed Project's phasing.

Table 1: Proposed Development Phases	
Development Scenarios	**Total Square Footage (Retained + Added)**
Phase 1	698,800
Phase 2	1,353,800
Phase 3	1,000,000

Total Demolition/Removal			-353,800	-	-
Total Construction/Addition			0		-
Total[1]			1,000,000	419	-

Notes:
(1) The hospital's existing bed license would be updated to accommodate the additional beds that are a result of the Project.

Source: Perkins & Will - ReZone Application Plan Set, 2022.

PROPOSED PROJECT: PHASE 1

Phase 1 would demolish the 5,200 square foot chapel in Building A, construct a new SPC 5 rated 260,000 square foot Building C, and partially construct Garage East.

Building C - Hospital Wing Expansion

Building C would have an SPC 5 rating, which would be in compliance with the structural provisions of SB 1953 and would be capable of providing services to the public following strong ground motion. The SPC 5 rating would enable Good Samaritan Hospital to continue to operate acute hospital care functions after the January 1, 2030, SB 1953 deadline. Building C would be seven stories including a basement level with a Central Utility Plant. During Phase 1, 131 beds would be relocated from the existing Building A to Building C and nine additional beds would be added to Building C for a total of 140 beds. Building C would likely include Behavioral Health, Intensive Care, Rehabilitation, and Surgical services.

Loading Docks

In Phase 1, the loading docks and services yard would be relocated north of the existing four-story Women's and Children Center hospital wing (Building B), adjacent to the cooling towers toward the northern portion of Building C. The loading area would be accessed from an internal drive aisle from Samaritan Drive, and the northern perimeter drive aisle. Solid waste collection, medical waste collection, and scheduled supply drop-offs would have access to the loading docks.

Parking

Additional patient, staff, and visitor parking would be provided in a new free-standing parking structure (Garage East) located on the eastern edge of the site. Garage East would be partially constructed in Phase 1 and would have approximately 504 parking spaces with four levels of parking above grade. The existing Children Daycare Center at 2333 Samaritan Drive would be demolished to accommodate Garage East. In addition to Garage East, Phase 1 would include 745 existing surface parking spaces. At Phase 1 completion, the Good Samaritan Hospital would have up to 1,249 parking spaces.

Vehicular Access

Vehicular access to the Project site is currently provided via four driveways on Samaritan Drive, although Driveway 3 is restricted to ambulances only. In Phase 1 the Project would keep the existing four driveways and add two new driveways to provide access to Garage East, as shown in **Figure 6**.

PROPOSED PROJECT: PHASE 2

As shown in **Figure 7**, Phase 2 would construct an approximately 455,000 square foot hospital wing (Building D), an approximately 200,000 square foot medical office building (Building E), an approximately 400,000 square foot story garage structure (Garage West), and complete construction of Garage East. During Phase 2, 35 beds would be relocated from Building A to Building C for a total of 175 beds in Building C.

Building D - Hospital Wing Expansion

Building D would be constructed as a seven-story (including basement) SPC 5 rated building with 148 acute beds relocated from the existing Building A to Building D and six additional beds added to Building D for a total of 154 beds. The emergency room would be relocated from Building A to Building D as well. Building D would likely include engineering, housekeeping, and surgery rooms.

During Phase 2 the Project would relocate the existing heliport from the Project site's northwest corner to the Building D rooftop (closer to emergency operations) and add an additional helipad (two helipads total). The Project does not propose to open a trauma facility at the Good Samaritan Hospital and helicopter operations are not anticipated to substantially increase due to the Project, which increases existing bed capacity by only 15 beds. The helicopters would remain at the heliport for limited durations to safely transport patients. The rooftop heliport would not be used to store any helicopters, nor would maintenance or training activities occur.

Building E - Medical Office Building

Building E is proposed to be constructed at the southern edge of the Project site, near the intersection of Samaritan Drive at Samaritan Place. Building E allows for doctor and patient comprehensive care on one campus. Building E would be eight stories tall and have approximately 25,000 square feet of office space per floor with approximately 200,000 square feet total.

Parking

Additional patient, staff, and visitor parking would be provided in a new free-standing parking structure (Garage West) located on the western edge of the site. Garage West would be fully constructed in Phase 2 and would have up to 1,154 parking spaces with five levels of parking above grade. Additionally, the remaining two levels of Garage East would be constructed during Phase 2, which would result in a six-story parking structure with 757 parking spaces. In addition to Garages East and West, Phase 2 would maintain 146 of the 745 existing surface parking spaces as noted in Phase 1. At Phase 2 completion the Good Samaritan Hospital would have up to 2,057 parking spaces.

Vehicular Access

Vehicular access to the Project site is currently provided via four driveways on Samaritan Drive, although Driveway 3 is restricted to ambulances only. Phase 2 would maintain the driveways and movements described in Phase 1 and add an additional driveway at the Samaritan Place Cul-De-Sac, as shown in **Figure 6**. Driveway 7 would be restricted to ambulance and supply truck traffic only. Driveway 7 leads to the relocated ambulance entry at the rear of Building D, adjacent to the Project site boundary with SR-85. As depicted in **Figure 6**, a perimeter fire lane around the Project site is proposed along the northern and western edges, connecting Driveway 7 at Samaritan Place to Driveway 1 at Samaritan Drive.

PROPOSED PROJECT: PHASE 3

At full buildout, if Phase 3 is undertaken, the Project would demolish the remaining portions of Building A (the chapel would be demolished in Phase 1), replace it with approximately 555 surface and subterranean parking stalls (Subterranean Garage), and relocate Driveway 3 approximately 330 feet east and reconfigure that driveway to provide full access. The subterranean garage would only have one level. If Phase 3 is not completed, Building A would remain intact and would be used for administration (conference center, meeting rooms, break rooms, etc.), maintenance and operations (biomed, public cafeteria, housekeeping, etc.), medical services (clinics, clinical lab, day surgery for procedures with less than 24-hour stay, diagnostic and treatment units, etc.), as allowed by the City of San José Municipal Code and SB 1953. Further, the additional surface parking and subterranean levels would not be built.

LANDSCAPE PLAN

The Project Landscaping Plan and Plant Palette is provided in **Figure 9**. The Project Landscape Plan shows mature landscape vegetation including trees and shrubs along the site boundary. There is existing landscaping around the existing main hospital building, including interior courtyards and entrances. A majority of the existing perimeter and parking lot landscaping would be removed as part of Project implementation. Tree removals would be in accordance with San José Municipal Code Section 13.32 which requires project applicants to obtain and comply with a Tree Removal Permit. The Project Landscape Plan would be required to meet the City of San José's Water Efficient Landscape Requirements. Proposed features would include but not limited to a low-flow, point source irrigation system equipped with a weather based smart controller. On-site landscaping would meet State water efficient landscape standards and stage 2 drought restrictions.

ARCHITECTURE AND LIGHTING

Architecture. Buildings C, D, and E, and Garage East and West, are designed to be architecturally consistent with the existing structures at the Good Samaritan Hospital campus. The proposed buildings

would consist of concrete masonry blocks, metal panels, and Exterior Insulation and Finish Systems (EIFS) paneling. Conceptual architectural elevations are provided in **Figure 10** through **Figure 11**.

Specifically, the buildings would consist of EIFS paneling and glass windows with a color palette largely consisting of greys as well as accented use of whites and blues. Buildings C, D, and E would include articulation and roof line modulation to reduce building massing. Further, Garage East and West would have metal screening along the exteriors to further articulate the elevation and provide visual interest.

Lighting. The Project lighting would provide additional exterior building and site lights for safety and security purposes along building facades, walls, and pole-mounted lights in parking areas around the medical buildings, walkways, and surface parking lots. All light sources would be shielded so that the light is directed away from streets and adjoining properties.

OFF-SITE IMPROVEMENTS

Off-site improvements include new curb cuts for the proposed driveway access, as well as rehabilitation of the existing pedestrian sidewalks.

UTILITY INFRASTRUCTURE

Utilities for the Project would connect to the existing utility infrastructure in adjacent roadways via laterals, with the final sizing and design occurring during final building design and plan review.

Water and Sewer. The Project site is within the San José Water Company's jurisdictional boundaries. Although the site's existing use has connections to the utility system, the Project would provide new connections to the municipal water system. A Water Supply Assessment would be prepared for this Project.

Stormwater Management. The Project would have different drainage management areas throughout the site containing unlined bioretention basins with underdrains for treatment. The Project would treat onsite flows prior to discharging into the City storm drain system.

Anticipated Project Approvals

Planned Development Rezoning (File No. PDC22-132): Project implementation would require a new Planned Development Zoning District to authorize the uses proposed by the Project; therefore a rezone would be required. Specifically, a rezone from the existing A(PD) (see **Figure 5**) Planned Development Zoning District (File No. PDC01-063) to the CG(PD) Planned Development Zoning District (File No. PDC22-132) would be required. The new CG(PD) Planned Development Zoning District would authorize the new hospital wing components and additional uses (cafeterias and retail shops), as well as updated standards to address the modernization of the hospital's healthcare system and operations.

Planned Development Permit(s): A Planned Development Permit application to allow for the Project improvements at the site, such as site buildings and landscaping.

Tree Removal Permit: A majority of the existing perimeter and parking lot landscaping would be removed as part of Project implementation. Tree removals would be in accordance with San José Municipal Code Section 13.32 which requires project applicants to obtain and comply with a Tree Removal Permit.

Bay Area Air Quality Management District (BAAQMD) Permits for Generators: The Project would require a BAAQMD Authority to Construct Permit and Permit to Operate for the proposed two generators.

HCAI Building Permit: The Department of Health Care Access and Information (HCAI), formerly the Office

of Statewide Health Planning and Development (OSHPD), regulates the design and construction of healthcare facilities to ensure safety and operations of providing services to the public, and provides finance tools for capital projects. HCAI provides plan review and construction observation of the design and specifications for the architectural, structural, mechanical, plumbing, electrical and fire and life safety components of these health facilities.

Potential Environmental Impacts of the Project

The EIR will describe the existing environmental conditions on the Project site, discuss and analyze the impacts of the Project, and identify the significant environmental effects anticipated to result from development of the Project. Mitigation measures will be identified for potentially significant environmental impacts, as warranted. The analysis in the EIR will include the following specific categories of environmental impacts related to the Project.

1. Aesthetics & Visual Resources

The Project site is located in an urban area with a mix of medical office and clinics, single-family, and multi-family residential developments. The EIR will describe the existing visual setting of the area and discuss the visual changes that are anticipated to occur as a result of the Project. The EIR will assess whether the Project would conflict with applicable zoning and other regulations governing scenic resources. The EIR will also discuss possible light and glare impacts from the development. If significant impacts related to visual resources and aesthetics are found, mitigation measures will be identified.

2. Agricultural and Forestry Resources

The Project site and surrounding areas are not designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance on the State of California Important Farmland Map.[3] Further, the Project site is not currently under a Williamson Act contract or within an agricultural, forest land, or timberland zoning district.[4] Finally, the Project site is fully developed and does not contain any forest land. Therefore, the Project would result in no impact concerning mapped farmlands, Williamson Act contracts, agricultural, forest, or timberland zoning, or the conversion or loss of Farmland, forest land or timberland. Since no impacts would occur, these issues will not be further analyzed in the EIR.

3. Air Quality

The EIR will address the regional air quality conditions in the San Francisco Bay Area and discuss the Project's impacts to local and regional air quality based on the Bay Area Air Quality Management District (BAAQMD) CEQA guidelines and thresholds. The EIR will discuss sensitive receptors (including patients and adjacent residences), temporary construction impacts to air quality, and operational air quality impacts. Mitigation measures, if found to be required, will be discussed.

4. Biological Resources

The Project site is located in a developed and urbanized area of San José, more than 2,000 feet south of Los Gatos Creek, more than 5,000 feet east of Vasona Reservoir, and more than 3,000 feet north of Ross Creek. Habitats in the area are low in species diversity and include predominately urban adapted species. The Project site is currently developed as the Good Samaritan Hospital campus and associated parking, but contains trees and other landscaped vegetation. The EIR will address any removal of trees onsite and any need for replacement trees per City standard conditions. The EIR will identify and discuss potential biological impacts resulting from Project construction and operation and the Project's consistency with the Santa Clara County Habitat Conservation Plan. Mitigation measures, if found to be required, will be discussed.

---

[4] California Department of Conservation. (2016). Williamson Act/Land Conservation Act. https://maps.conservation.ca.gov/dlrp/WilliamsonAct/App/index.html

5. Cultural Resources

No buildings on-site or within the immediate vicinity of the Project site have been listed in the City's Historic Resources Inventory. One or more of the buildings on site are 45 years old or older and will be evaluated in the EIR. The EIR will address potential impacts to buried archaeological resources on site, as well as impacts to potential historic structures on and/or near the site. The EIR will address the potential to encounter human and or archaeological remains at the Project site. If impacts to cultural resources are found to be significant, mitigation measures will be identified.

6. Energy

Implementation of the Project may result in an increased demand for energy on site. The EIR will address the potential for the project to have an environmental impact due to wasteful, inefficient, or unnecessary consumption of energy or obstruct or conflict with a State or local plan for renewable energy or energy efficiency. Mitigation measures, if found to be required, will be discussed.

7. Geology and Soils

The Project site is in a seismically active region dominated by the San Andreas Fault, located about 6 miles southwest of the site, and the Hayward Fault, located approximately 12 miles northeast of the site.[5] Other major faults within the vicinity of the site include the northern portion of the Calaveras Fault, located approximately 14 miles northeast of the Project site. The Project site is not mapped within an Alquist-Priolo Earthquake Fault Zone.[6] The EIR will discuss the possible geological impacts associated with existing soils, groundwater conditions on the Project site, and seismicity activity. The EIR will also evaluate potential impacts to paleontological resources. Mitigation measures, if found to be required, will be discussed.

8. Greenhouse Gas Emissions

The EIR will address the Project's contribution to global greenhouse gas emissions impacts in compliance with SB 32 and based on the City of San José's 2030 GHG Reduction Strategy for consistency with policies for reducing GHG emissions adopted by the City of San José. Proposed design features to reduce energy consumption, which in turn will reduce greenhouse gas emissions, will be analyzed. Mitigation measures, if found to be required, will be discussed.

9. Hazards and Hazardous Materials

The Project site is not listed as a Hazardous Waste and Substances Site (Cortese) List.[7] The EIR will summarize known hazardous materials conditions on and adjacent to the Project site and will address the potential for hazardous materials impacts to result from construction and operation of the Project. The EIR also will address whether the Project would interfere with an emergency response plan. Mitigation measures, if found to be required, will be discussed.

10. Hydrology and Water Quality

Based on Flood Insurance Rate Maps from the Federal Emergency management Agency, the Project site is

[5] Geo-Engineering Solutions, Inc. Feasibility Level Geotechnical Engineering and Geologic Hazards Study for 2425 Samaritan Drive, San Jose, CA 95124.

[6] California Department of Conservation. (2021). EQ Zapp: California Earthquake Hazards Zone Application. https://maps.conservation.ca.gov/cgs/EQZApp/app/

[7] Department of Toxic Substances Control Hazardous Waste and Substances Site List – Site Cleanup Cortese List). https://dtsc.ca.gov/dtscs-cortese-list/

located in Zone D- an area of undetermined flood hazard.[8] The EIR will address whether the Project would violate any water quality standards, decrease groundwater supplies or interfere with groundwater recharge, alter drainage course in a manner that would cause impacts, risk release of pollutants due to flood, tsunami, or seiche, or conflict with a water quality control plan or sustainable groundwater management plan. Mitigation measures, if found to be required, will be discussed.

11. Land Use

The Project site is located in an urban area with a mix of medical office and clinics, single-family, and multifamily residential developments. The EIR will describe the existing land uses adjacent to and within the Project site. This discussion will evaluate whether the Project will physically divide an established community. The EIR will evaluate whether the Project would have an environmental impact due to a conflict with existing land use regulations including the City's Envision San José 2040 General Plan, zoning and municipal code, and the City's Design Guidelines and Standards adopted for the purpose of avoiding or mitigating an environmental effect. Mitigation measures, if found to be required, will be discussed.

12. Mineral Resources

The Project site is currently developed as the Good Samaritan Hospital. The Project site does not currently support mineral resource extraction activities. Furthermore, the City of San José General Plan notes that the State Geologist nor the State Mining and Geology Board has classified any other areas in San José as containing mineral deposits which are either of statewide significance or the significance of which requires further evaluation. The Project would remain a hospital use and would not impact mineral resources. Since no impacts would occur, these issues will not be further analyzed in the EIR.

13. Noise and Vibration

The EIR will identify existing ambient noise and analyze potential noise and vibration impacts of Project operation and construction on the existing environment and nearby sensitive receptors. Noise levels will be evaluated for consistency with applicable standards and guidelines from the City of San José's Municipal Code and General Plan. If noise and vibration impacts are found to be significant, mitigation measures will be identified.

14. Population and Housing

The EIR will examine whether the Project would induce substantial unplanned population growth or displace a substantial number of existing people or housing. The EIR will evaluate the applicable regional and City plans, policies and regulations to the development. Mitigation measures, if found to be required, will be discussed.

15. Public Services

The EIR will address the availability of public services including fire and police protection, schools, and parks. Mitigation measures, if found to be required, will be discussed.

16. Recreation

The Project proposes to construct two new hospital wings totaling approximately 715,000 square feet and an approximately 200,000 square foot medical office building that would increase the hospital's existing

[8] Geo-Engineering Solutions, Inc. Feasibility Level Geotechnical Engineering and Geologic Hazards Study for 2425 Samaritan Drive, San Jose, CA 95124.

bed capacity by only 15 beds. Accordingly, visitors to the Project site would not substantially increase as compared to existing conditions.

The Project's primary purpose is to comply with SB 1953 requirements for acute care hospitals and is not intended to significantly expand the patient population. Additionally, since the Project is a non-residential hospital use the Project would not generate a substantial increase in employees or visitors to the Project site that would result in increased use of parks or recreational facilities. While on-site employees could visit nearby park facilities, Project implementation would result in approximately 63 more employees as compared to existing conditions, which is an insufficient number of new jobs to result in recreation resource use to the point of degradation. Additionally, the Project would contribute to the City's on-going park operation and maintenance plans by way of property taxes. Since the Project is a non-residential hospital use that would not substantially increase visitors or employees on the Project site, the Project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration of the facility would occur.

Further, the Project does not include development of any recreational facilities, nor would the Project result in direct or substantial indirect population growth within the City. Therefore, the Project would not require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment and no impact would occur. Since no impacts would occur, these issues will not be further analyzed in the EIR.

17. Transportation and Circulation

The EIR will evaluate the Project's transportation impacts pursuant to Senate Bill 743 and the City's Transportation Analysis Policy (Council Policy 5-1). The Project's consistency with programs, plans, ordinances, or policies addressing the circulation system (including transit, roadway, bicycle, and pedestrian facilities) will be discussed in the EIR. The Project's impact on Vehicle Miles Traveled (VMT) will be discussed. The EIR also will discuss any increase in hazards due to geometric design features impacts to emergency access. Mitigation measures, if found to be required, will be discussed.

18. Tribal Cultural Resources

The EIR will address the impacts to tribal cultural resources on site. If impacts to tribal cultural resources are found to be significant, mitigation measures will be identified.

19. Utilities and Service Systems

Implementation of the Project may result in an increased demand on utilities compared to existing conditions. The EIR will examine the impacts of the Project on wastewater system, storm drains, water supply and demand (based on the Water Supply Assessment), solid waste management, energy, and telecommunications facilities. The EIR will analyze the Project's consistency with applicable State, regional, and local plans and policies related to utilities. Mitigation measures, if found to be required, will be discussed.

20. Wildfire

According to the California Department of Forestry and Fire Protection (CAL FIRE) State Responsibility Area Fire Hazard Severity Zones Map for Santa Clara County, the Project site is not within a State Responsibility

Area.[9] The Project site is in a Non-Very High Fire Hazard Severity Zone (Non-VHFHSZ) within a local responsibility area.[10] Project design and site access would adhere to San José Fire Department (SJFD) regulations and design. Further, Project construction would not require the complete closure of any public or private streets during construction. Temporary construction activities would not impede use of the streets for emergencies or access for emergency response vehicles, as the hospital would remain operational during Project construction. Project implementation would not result in the construction, installation, or maintenance of new infrastructure that would exacerbate fire risk. Additionally, there are no landslides near the site nor is the site in the path of any known or potential landslides.[11] Therefore no impacts related to wildfire would occur. These issues will not be further analyzed in the EIR.

21. Alternatives

Pursuant to CEQA Guidelines Section 15126.6, the EIR will examine a range of reasonable alternatives to the Project. Alternatives discussed will be chosen based on their ability to reduce or avoid identified significant impacts of the Project while achieving most of the identified objectives of the Project. The environmentally superior alternative(s) will be identified based on the number and degree of associated environmental impacts.

22. Significant Unavoidable Impacts

The EIR will identify those significant impacts that cannot be avoided if the Project is implemented as proposed.

23. Cumulative Impacts

Pursuant to CEQA Guidelines Section 15130, the EIR will include a cumulative impacts section that will address the potentially significant cumulative impacts of the Project when considered with other past, present, and reasonably foreseeable future projects in the area.

24. Other Sections

In conformance with the CEQA Guidelines, the EIR will also include the following sections: 1) growth inducing impacts, 2) significant irreversible environmental changes, 3) areas of known controversy, 4) references, 5) organizations/ persons consulted, 6) EIR author and consultants, and 7) appendices.

[External Email]

Dear Ms. Telahun,

Thank you for providing the Town of Los Gatos an opportunity to comment on the attached Notice of Preparation of a Draft Environmental Report for the GOOD SAMARITAN HOSPITAL PROJECT at 2425 Samaritan Drive and 2333 Samaritan Place. Thanks too for hosting the community meeting last Thursday, June 15th, and informing those at the meeting that the Draft EIR should be ready to circulate early in 2024.

The Town's comments for the NOP of a Draft EIR for the Good Samaritan Hospital Project are as follows:

- Please have the EIR also evaluate the Project's transportation impacts pursuant to the standards and methodologies set forth by the Town of Los Gatos' Transportation Analysis Policy at the following link: 1-08-Transportation-Impact-Policy (losgatosca.gov) , the Town's VMT policies at Vehicle Miles Traveled - VMT | The Los Gatos CA Official Site! and the Town's 2040 General Plan.

- If all three proposed phases are completed the proposed project buildout will total 1,000,000 SF with 419 licensed beds. However, Phase 3 is also described as "optional third phase" and "if Phase 3 is undertaken". If Phase 3, which includes demolition of an existing building and additional parking, is not completed, the proposed project buildout will be 1,353,800 SF with 419 licensed beds and fewer available parking spaces. What if Phase 3 is not undertaken? Please confirm the EIR will address this possibility.

- Pgs 7 & 8, please add a column to Table 2: Proposed Project Buildout Summary showing total parking spaces for existing conditions and each phase or provide a separate Table for parking.

- Pg 11, Off-site Improvements- please add: "Other off-site improvements may also include infrastructure improvements, such as roadway improvements, improved access to pedestrian and bicycle facilities and traffic calming, to mitigate potential traffic impacts."

Thanks again for your consideration. We look forward to reviewing the Draft EIR when it is ready for circulation.

Best regards,

Mike Vroman, T.E. ● Senior Traffic Engineer

Public Review Notice of Preparation: Good Samaritan Hospital Project

The Notice of Preparation for the Good Samaritan Hospital is available online. Public review period will start June 5, 2023 and end on July 5, 2023.

Post Date: 06/05/2023 11:00 AM

NOTICE OF PREPARATION OF A

DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE

GOOD SAMARITAN HOSPITAL PROJECT

FILE NO: PDC22-132

PROJECT APPLICANT: HCA Healthcare (Attn: Nicholas Paul)

APNs: 421-36-009 and 421-36-011

Project Description: The project proposes to rezone the project site to a Commercial General Planned Development CG(PD) Zoning District to allow for the expansion of the existing Good Samaritan Hospital. The anticipated project would result in the construction of two new hospital wings totaling approximately 715,000 square feet, an approximately 200,000 square foot medical office building, a new heliport, two new parking garage structures totaling approximately 720,000 square feet, and one level of subterranean parking.

Location: The approximately 20-acre site is comprised of two parcels located in southwestern portion San José. The site is located at 2425 Samaritan Drive and 2333 Samaritan Place near the borders to the Town of Los Gatos and the City of Campbell.

As the Lead Agency, the City of San José will prepare an Environmental Impact Report (EIR) for the project summarized above. The City welcomes your input regarding the scope and content of the environmental information that is relevant to your area of interest, or to your agency's statutory responsibilities in connection with the proposed project. If you are affiliated with a public agency, this EIR may be used by your agency when considering subsequent approvals related to the project.

A **joint community and environmental public scoping meeting** for this project will be held:

When: Thursday, June 15, 2023 from 6:00 to 7:30 p.m.

Where: Via Zoom (see instructions below and on www.sanjoseca.gov/activeeirs)

The project description, location, and probable environmental effects to be analyzed in the EIR for the project can be found on the City's Active EIRs website at www.sanjoseca.gov/activeeirs, including the EIR Scoping Meeting information. According to State law, the deadline for your response is 30 days after receipt of this notice, and responses provided before the 30-day deadline are always welcome. The City will accept comments on the scope of the EIR until **5:00 p.m. on Wednesday, July 5, 2023**. If you have comments on this Notice of Preparation (NOP), please identify a contact person from your organization, and send your response via mail or email to:

Re: PDC22-132
HCA Helathcare

Dear Bethelhem Telahun,

Thank you for providing PG&E the opportunity to review the proposed plans for PDC22-132 dated 6/5/2023. Our review indicates the proposed improvements do not appear to directly interfere with existing PG&E facilities or impact our easement rights.

Please note this is our preliminary review and PG&E reserves the right for additional future review as needed. This letter shall not in any way alter, modify, or terminate any provision of any existing easement rights. If there are subsequent modifications made to the design, we ask that you resubmit the plans to the email address listed below.

If the project requires PG&E gas or electrical service in the future, please continue to work with PG&E's Service Planning department: https://www.pge.com/cco/.

As a reminder, before any digging or excavation occurs, please contact Underground Service Alert (USA) by dialing 811 a minimum of 2 working days prior to commencing any work. This free and independent service will ensure that all existing underground utilities are identified and marked on-site.

If you have any questions regarding our response, please contact the PG&E Plan Review Team at pgeplanreview@pge.com.

Sincerely,

PG&E Plan Review Team
Land Management

Subject: Comments for NOP of the DEIR for the Good Samaritan Hospital Project, City of San Jose

Follow Up Flag: Follow up
Flag Status: Flagged

You don't often get email from aquan@valleywater.org. Learn why this is important

[External Email]

Dear Bethelhem Telahun:

The Santa Clara Valley Water District (Valley Water) has received the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the proposed Good Samaritan Hospital Project, located at 2425 Samaritan Drive and 2333 Samaritan Place in the City of San Jose, received by Valley Water on June 5, 2023.

Valley Water has the following comments regarding the project:

1. According to the Federal Emergency Management Agency Flood Insurance Rate Map (FIRM) 06085C0239H, effective May 18, 2009, the entire site is located within Zone D, representing areas of undetermined flood hazard.

2. Much of the southern half of San Jose is within the recharge area of the Santa Clara Plain Groundwater Basin, including the subject property. Natural groundwater recharge is an important component of the region's water supply. Although the loss of a small amount of pervious surface is minor compared to the total amount of natural recharge, Valley Water encourages the City to require low impact development features in the project design to retain as much recharge of treated stormwater capacity on site as possible.

3. Santa Clara Valley Water District (District) records indicate that 3 active wells are located on the subject property (APN:421-36-009). If the wells will continue to be used following permitted activity, they must be protected so that they do not become lost or damaged during completion of permitted activity. If the wells will not be used following permitted activity, they must be properly destroyed under permit from the District.

   While the District has records for most wells located in the County, it is always possible that a well exists that is not in the District's records. If previously unknown wells are found on the subject property during development, they must be properly destroyed under permit from the District or registered with the District and protected from damage. For more information, please call the District's Well Ordinance Program Hotline at 408-630-2660.

4. There is no Valley Water right of way or facilities at the project site; therefore, in accordance with Valley Water's Water Resources Protection Ordinance, a Valley Water encroachment permit is not required for the proposed improvements.

We appreciate the opportunity to comment on the NOP and would also appreciate the opportunity to review the DEIR document when it becomes available. If you have any questions, or need further information, you can reach me at (408) 630-1667, or by e-mail at AQuan@valleywater.org. Please reference Valley Water File No. 29104 on future correspondence regarding this project.

Thank you,

ANDREW QUAN

SUBJECT: Public Notice of Preparation of a Draft Environmental Impact Report for the Good Samaritan Hospital Project (PDC22-132)

The County of Santa Clara Roads and Airports Department (The County) appreciates the opportunity to review the Public Notice of Preparation of a Draft Environmental Impact Report for the Good Samaritan Hospital Project (PDC22-132). We submit the following comments:

- The Transportation Impact Analysis (TIA) should include Local Transportation Analysis (LTA).
- LTA study intersections should include the following:
  - Union Avenue and Charmeran Avenue
  - San Tomas Expressway & Hwy 17
  - Camden Avenue & White Oaks Road/Curtner Avenue
- Please provide queuing analysis at turn pockets and freeway on/off ramp where project trips will be added.

Thank you again for your continued outreach and coordination with the County. If you have any questions or concerns about these comments, please feel free to contact me at ben.aghegnehu@rda.sccgov.org

Thank you,

3rd Floor Tower
San José, CA 95113-1905

E-mail: Bethelhem.Telahun@sanjoseca.gov

Re: Notice of Preparation of a Draft Environmental Impact Report for the Good Samaritan Hospital Project

Dear Ms. Bethelhem Telahun,

The members and officers of Carpenters Union Local 405 ("Local 405") appreciate the opportunity to comment regarding the Notice of Preparation of a Draft Environmental Impact Report for the Good Samaritan Hospital Project.

Our members have a direct interest in securing high-road job opportunities and investment in their local communities. Local 405 is proud to count many San Jose and surrounding area residents among its membership ranks, including those who live and/or work in the vicinity of the project. This project will create sustainable work for our members, whose skills will contribute towards robust, interconnected development.

We request that we be put on the list of interested parties who receive notices regarding the issuance of environmental review documents or project-related public hearings.

The proposed project, if guided with proper guardrails, contains tremendous economic opportunities for the City of San Jose. To maximize the benefits to the local community while mitigating environmental harms, Local 405 strongly advocates that **future construction activity related to this development comply with local hire and responsible bidder requirements** that should be incorporated in the City's EIR.

Local 405 intends to participate in the CEQA process and beyond to ensure that the City complies with CEQA's mandate to minimize the proposed project's avoidable environmental impacts while maximizing benefits for the community and skilled trades workers. Illustratively, Local 405 requests that the City analyze all impacts required by CEQA, including, but not limited to, the following:

2102 ALMADEN ROAD, SUITE 115 • SAN JOSE, CA 95125 • (408) 269-7316 FAX: (408) 264-7650

- Emission Impacts resulting from construction-related employment
- Environmental impacts on the proposed project's construction workers

1. Emission impacts resulting from construction-related employment

The Notice of Preparation (NOP) identifies environmental impacts related to greenhouse gas emissions will be one area of focus for the eventual EIR. To account for greenhouse gas emissions during the construction phase of this project, the EIR should analyze how employers will manage and mitigate the environmental impact of the construction workforce's commuting patterns. One way to meet this objective is to introduce a *local hire policy* for construction activity associated with the proposed project.

A local employment preference requirement for construction activity linked to the proposed project will *reduce vehicle emissions* from worker commutes to and from project sites, while providing economic benefits to workers from the local community. Unfortunately, Local 405 is aware that many projects in Santa Clara County have been constructed by low-wage, out-of-area workers. This compromises meaningful training opportunities for the local community's future construction workforce, while also unnecessarily increasing inbound transportation emissions into the community.

The scope of the City's eventual EIR should compare the economic and environmental impacts of the proposed project with and without legal measures that encourage a local hiring preference, commit to utilizing local apprentices, or demonstrate other mechanisms that increase the likelihood of hiring workers from the local community. Doing so ensures economically beneficial local employment and training for skilled craft workers, while upholding the City of San Jose's environmental goals.

2. Environmental Impacts on the proposed project's construction workers

The proposed project will likely necessitate mitigation steps to mitigate the construction workforce's exposure to hazards and hazardous materials. The NOP identifies the presence of hazards and hazardous materials as one environmental impact area within the EIR. To fully account for the harms associated with potential hazards/hazardous conditions on the project site, the EIR should examine both direct harms to workers and indirect costs associated with this topic area.

Hazards that prevent a safe jobsite, impose a clear burden on taxpayers when factoring in injury-related calls for funds from the State's workers' compensation system. Recent research cited by the Department of Labor has advocated for **responsible bidder provisions**[1] as an "insurance" policy for taxpayers. This same research demonstrates that construction projects with responsible

[1] The Impact of Unions On Construction Worksite Health and Safety: Evidence From OSHA Inspections, Illinois Economic Policy Institute and Illinois Labor and Employment, November, 2023.

contractors were 19% less likely to have OSHA violations when compared to projects that failed to require responsible contractors.

A lack of a clear policy on these issues jeopardizes the City's ability to enforce adherence to the entire EIR. To facilitate the necessary cooperation between the City and contractors regarding worker exposure to environmental hazards, having clear provisions for responsible contractors are necessary.

Conclusion

Local 405 hopes that the City uses the CEQA process to minimize the proposed project's negative environmental impacts while maximizing the economic benefits presented to the City, workers, and region. We look forward to reviewing the Draft Environmental Impact Report, including its acknowledgement of the issues we have raised in this letter.

Sincerely,

Samuel Munoz

Re: 2023060108, Good Samaritan Hospital Project, Santa Clara County

Dear Ms. Telahun:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cody.Campagne@nahc.ca.gov

Re: Comments on Good Samaritan Hospital Project (File No: ER23-41)

To Whom It May Concern:

The City of Campbell staff has received and reviewed the Notice of Preparation (dated June 5, 2023) for the Good Samaritan Hospital Project (File No.: ER23-41). The project proposes to rezone the project site to a Commercial General Planned Development CG(PD) Zoning District to allow for the expansion of the existing Good Samaritan Hospital. We understand the anticipated project would result in the construction of two new hospital wings totaling approximately 715,000 square feet, an approximately 200,000 square foot medical office building, a new heliport, two new parking garage structures totaling approximately 720,000 square feet, and one level of subterranean parking.

The City of Campbell submits the following comments for consideration:

Transportation and Circulation:

With the understanding that Level of Service (LOS) analysis is not a consideration under CEQA, these comments relate to the review of the project as part of the Local Transportation Analysis (LTA).

Per the project description, the net trip generation is likely to exceed approximately 560 AM peak hour trips and 670 PM peak hour trips. Our concern is the impact the additional peak hour traffic will have on traffic coming out of East Mozart Avenue. Therefore, we request that the TIA Local Transportation Analysis (LTA) include the intersection of Bascom Avenue and East Mozart Avenue (unsignalized) in Campbell.

Campbell residents who live on East Mozart Avenue and Beethoven Lane have voiced their frustration that it is difficult to access Bascom Avenue to the north without having to cut across three lanes of heavy traffic on southbound Bascom Avenue to make a southbound U-turn to go north on Bascom Avenue. We would like the TIA to analyze the delay impacts on eastbound East Mozart Avenue traffic to 1) make an eastbound right-turn onto southbound Bascom Avenue, 2) head southbound through the Bascom Avenue/Highway 85 Northbound Ramps intersection, 3) make a U-turn at the Bascom Avenue/Highway 85 Southbound Ramps intersection, and 4) travel northbound through the Bascom Avenue/Highway 85 Northbound Ramps intersection. See the yellow arrows in the aerial snapshots below. We would like to know how long it takes to make this series of turning movements under Existing Conditions and under Proposed Conditions.

Eventually, we would like the TIA to evaluate the attached proposed concept to create a median island opening and modify the Bascom Avenue/Highway 85 Northbound Ramps signal to include East Mozart Avenue as a signalized leg of this intersection. A southbound overlap with green extension would help to clear the queues between East Mozart Avenue and the Highway 85 Northbound Ramps.

Please see the additional attached document.

Construction Impacts:

The Environmental Impact Report should analyze noise, vibration, and dust control impacts on City of Campbell residents during construction. The analysis should consider impacts associated with specific construction equipment and methods of mitigating impacts. The closest Campbell neighborhood is roughly bounded by the 85 and 17 interchanges, the west side of South Bascom Avenue, and Camden Avenue.

Operational Impacts:

The Environmental Impact Report should also analyze any and all impacts associated with the three heliports, generators (temporary and permanent), and ambulatory services including but not limited to noise and air quality impacts. The analysis should include the closest Campbell neighborhood, roughly bounded by the 85 and 17 interchanges, the west side of South Bascom Avenue, and Camden Avenue.

The City of Campbell appreciates the opportunity to provide comment on this Notice of Preparation and requests to be notified of when the Environmental Impact Report is available for public review and comment. You may email the Planning Division at planning@campbellca.gov for all future notices.

Sincerely,

Rob Eastwood
Community Development Director

Re: Good Samaritan Hospital Project – Notice of Preparation (NOP) for a Draft Environmental Impact Report (DEIR)

Dear Bethelhem Telahun:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the Good Samaritan Hospital Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system.

The Local Development Review Program reviews land use projects and plans to ensure consistency with our mission and state planning priorities. The following comments are based on our review of the June 2023 NOP.

Project Understanding

HCA Healthcare, the project applicant, proposes to demolish the existing 359,000 square foot hospital and construct two new hospital wings totaling approximately 715,000 square feet, an approximately 200,000 square foot medical office building, two new parking garage structures totaling approximately 720,000 square feet, and one level of subterranean parking. Project implementation would require a new Planned Development Zoning District to authorize the uses proposed by the project. This project site is adjacent to State Route (SR)-85.

Construction-Related Impacts
Potential impacts to Caltrans' Right-of-Way (ROW) from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified. Project work that requires movement of oversized or excessive load vehicles on State roadways requires a transportation permit that is issued by Caltrans. To apply, please visit Caltrans Transportation Permits (*link*).

Prior to construction, coordination may be required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to the State Transportation Network (STN).

Equitable Access
If any Caltrans facilities are impacted by the project, those facilities must meet American Disabilities Act (ADA) Standards after project completion. As well, the project must maintain bicycle and pedestrian access during construction. These access considerations support Caltrans' equity mission to provide a safe, sustainable, and equitable transportation network for all users.

Encroachment Permit
Please be advised that any permanent work or temporary traffic control that encroaches onto Caltrans' ROW requires a Caltrans-issued encroachment permit. As part of the encroachment permit submittal process, you may be asked by the Office of Encroachment Permits to submit a completed encroachment permit application package, digital set of plans clearly delineating Caltrans' ROW, digital copy of signed, dated and stamped (include stamp expiration date) traffic control plans, this comment letter, your response to the comment letter, and where applicable, the following items: new or amended Maintenance Agreement (MA), approved Design Standard Decision Document (DSDD), approved encroachment exception request, and/or airspace lease agreement. Your application package may be emailed to D4Permits@dot.ca.gov.

To obtain information about the most current encroachment permit process and to download the permit application, please visit Caltrans Encroachment Permits (*link*).

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Llisel Ayon, Associate Transportation Planner, via LDR-D4@dot.ca.gov.

For future early coordination opportunities or project referrals, please contact LDR-D4@dot.ca.gov.

Sincerely,

YUNSHENG LUO
Acting District Branch Chief

1 INTRODUCTION

This section describes effects on air quality conditions from the Project. The current condition and quality of air quality was used as the baseline against which to compare potential impacts of the Project. The purpose of this Air Quality Assessment is to evaluate potential short- and long-term air quality impacts resulting from implementation of the proposed Good Samaritan Hospital Project in the City of San José.

1.1 PROJECT LOCATION

The approximately 20-acre Project site is located at 2425 Samaritan Drive and 2333 Samaritan Place (Assessor's Parcel Number [APNs]: 421-36-009 and 421-36-011). Regionally, Good Samaritan Hospital is in the southwestern region of San José within an urban area that contains a mix of medical offices and clinics as well as single and multi-family residential developments. The northern boundary of the Project site abuts the eastbound on-ramp to SR-65. To the south of the Project site are various medical office buildings. Along the eastern boundary of the Project site is the Cambrian Center, a multi-family residential complex along with existing single-family residences. Along the western boundary of the Project site is the Samaritan Medical Center, a medical office complex with surface parking. Figure 1: Regional Vicinity and Figure 2: Site Vicinity, depict the Project site in a regional and local context.

1.2 PROJECT DESCRIPTION

Located in an urban area with a mix of commercial uses, single-family, and multi-family residential developments, the Project site is currently the Good Samaritan Hospital campus. The campus contains a day care center, two building structures (Building A and Building B), a helipad in the northwest corner of the site, and surface parking. The existing hospital building is divided into two different wings. Building A is the main building with emergency operations totaling approximately 359,000 square feet (sf), and Building B operates as a women's and children's services wing totaling approximately 85,000 sf. With the day care center totaling approximately 6,700 sf, the existing hospital campus is approximately 450,700 sf. Figure 3: Existing Conditions depict the Project site along with the current existing uses.

The proposed Project's existing land use designation is Neighborhood/Community Commercial (NCC), and the existing zoning designation is Planned Development (Agriculture Base District) (A(PD)). Project implementation would require a new Planned Development District to authorize the Project's uses, therefore a zone change would be required. Specifically, a rezone (File No. PDC22-132) from the existing (A(PD)) Planned Development Zoning District to the Commercial General Planned Development (CG(PD)) Zoning District would be required.[1] The new (CG(PD)) Planned Development Zoning District would authorize the new hospital wing components and additional uses (i.e., cafeterias and retail shops), as well as updated standards to address the modernization of the hospital's healthcare system and operations. In addition, a new planned development permit(s) would be required to implement the new PD Zoning.

Although the Project would be constructed in phases, the hospital would plan and stage operations throughout the expansion in order to allow for continuous uninterrupted operation of the hospital. Construction for all phases would follow a conventional construction sequence of demolition, site

[1] The file number that refers to the rezone from the existing A(PD) to the CGCG(PD) is PDC22-132. Available at https://www.sanjoseca.gov/home/showpublisheddocument/98866/638212178270430000, accessed July 11, 2023.

preparation, grading/earthwork, paving, building construction, and architectural coating. See Figure 4: Project Site Plan for more details.

Phase 1

Phase 1 would include demolition of 20,946 square feet in Building A and demolition of the 6,700 sf daycare center to construct a new 253,000-square –foot, five-story parking garage (Garage East), a 23,750-square-foot detached central utility plant and underground water and sewer tanks, and an approximately 548,444-square-foot, eight-story hospital building (Building C).

Garage East would be in the northeastern region of the Project site and would provide 653 parking spaces. Additionally, a new loading dock and accompanying dock canopy is proposed at grade-level on the west side of Building C, north of the existing four-story Women's and Children Center hospital wing (existing Building B). The loading area would be accessed from an internal drive aisle from Samaritan Drive, and the northern perimeter drive aisle.

In Phase 1, a Health Care Access and Information (HCAI) compliant two-story approximately 23,750 sf Central Utility Plant, Mechanical Yard, and Oxygen (O_2) Yard is proposed to the east of proposed Building C and west of Garage East to provide power and utility infrastructure to support the hospital operations.

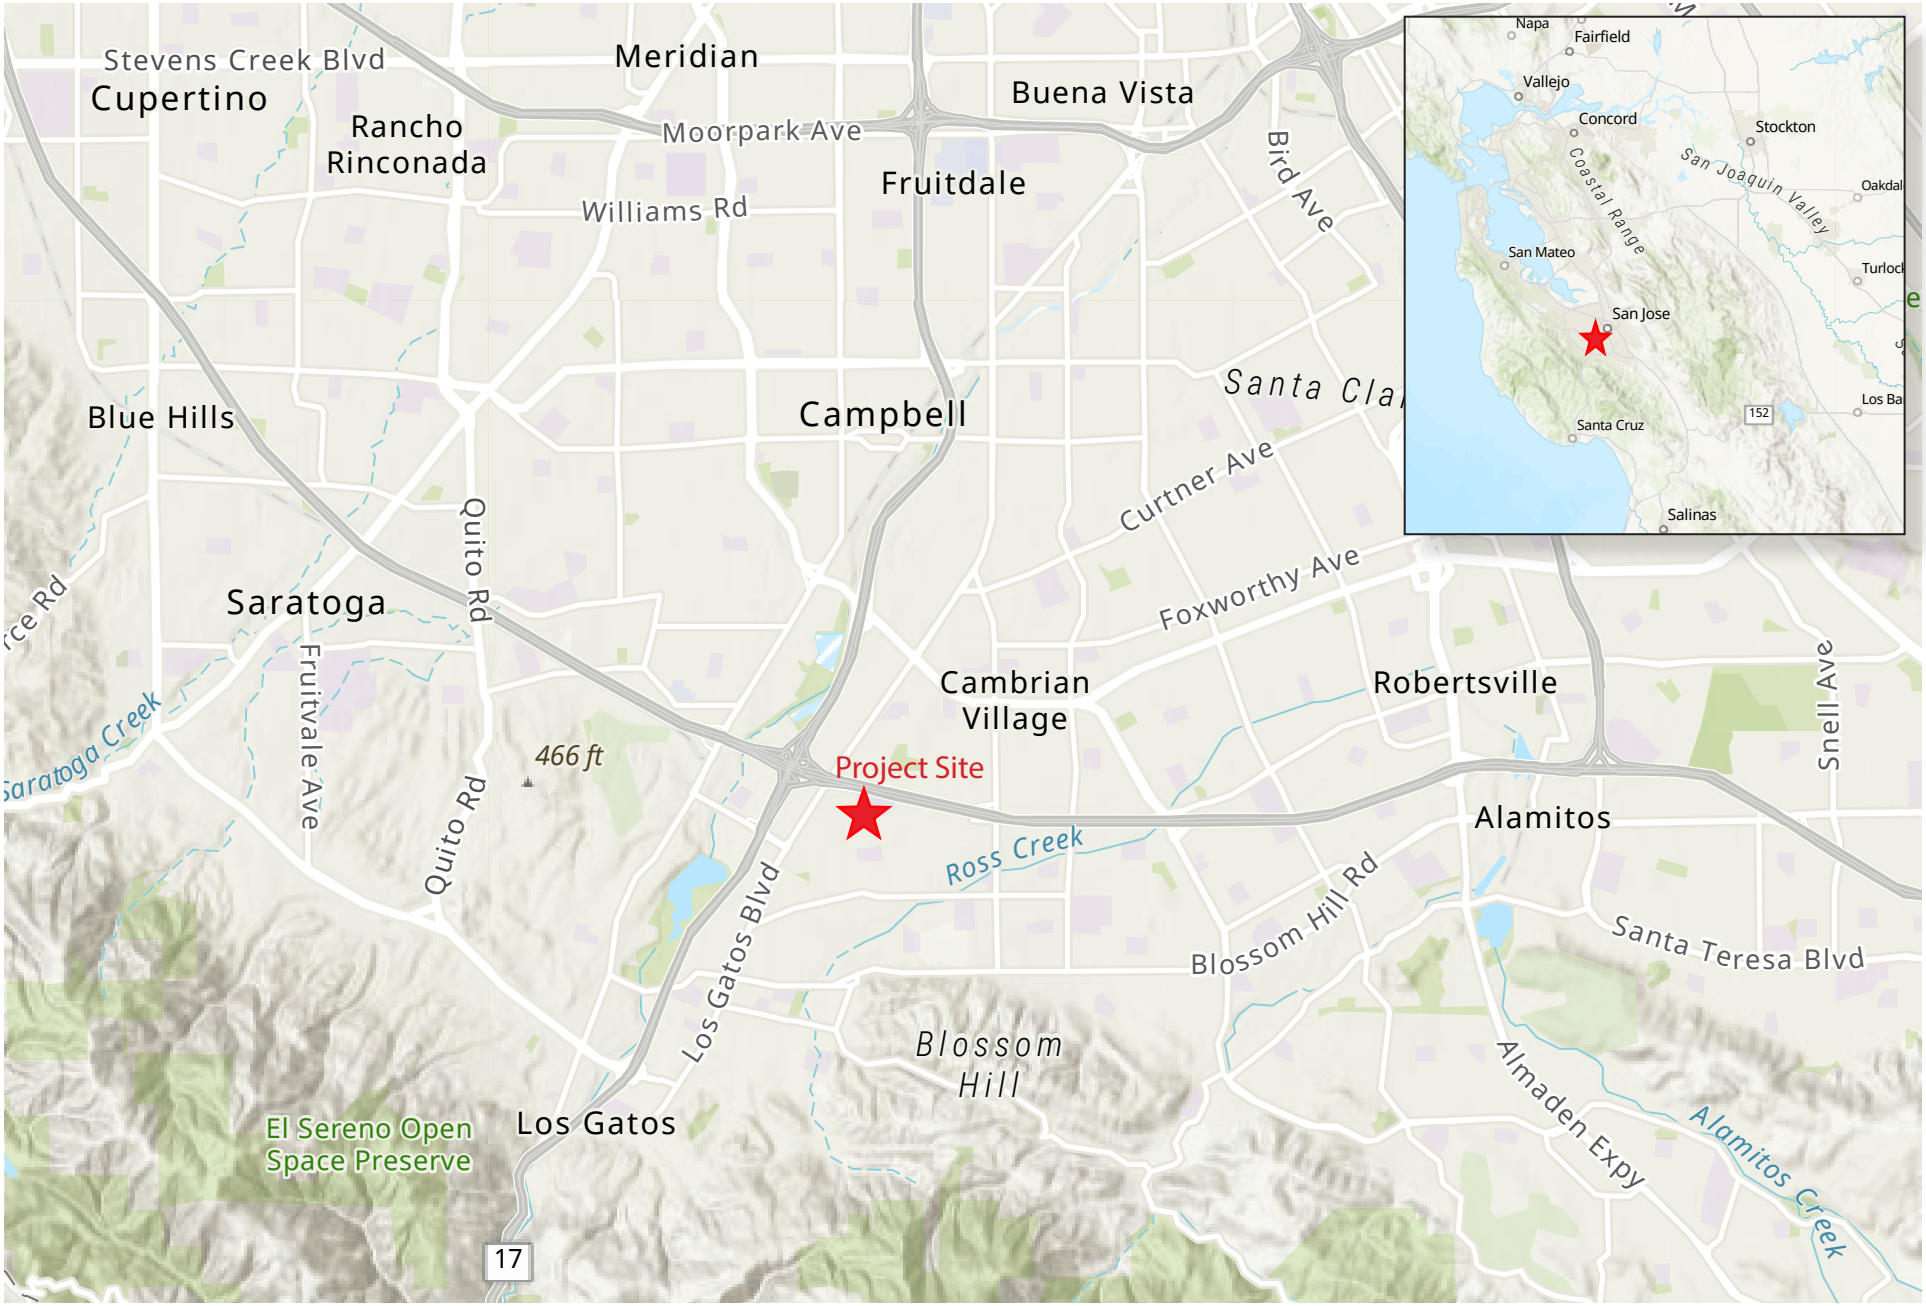
Phase 1 would result in approximately 40,000 cubic yards (cy) of soil export from the Project site and approximately 10,000 cy of soil import. Construction Phase 1 would occur over approximately 5.8 years (i.e., 69 months), anticipated to begin in March 2024. See Figure 5: Proposed Project Phase 1 Conceptual Site Plan for more details.

Phase 2

In Phase 2 the existing non-seismically-compliant hospital building (Building A) would be demolished totaling approximately 338,054 sf of demolition. The basement of the demolished hospital would be infilled with approximately 16 feet of fill and then approximately 421 surface parking stalls would be constructed.

Phase 2 would result in approximately 1,000 cy of soil export and 70,000 cy of soil import. Phase 2 is anticipated to begin in 2029 and occur over approximately two years. See Figure 6: Proposed Project Phase 2 Conceptual Site Plan for more details.

Phase 3



Phase 3 would construct an approximately 202,000 sf hospital wing (Building D), an approximately 200,000 sf medical office building (Building E), and an approximately 425,208 sf six-story garage structure (Garage West) with up to 1,154 parking stalls.

Building E is proposed to be constructed at the southern edge of the Project site, near the intersection of Samaritan Drive at Samaritan Place and would be seven stories tall with a basement (eight stories) and have approximately 25,000 sf of office space per floor, for a total of approximately 200,000 sf.

Additional patient, staff, and visitor parking would be provided in a new free-standing parking structure (Garage West) located on the western edge of the site. Garage West would be fully constructed in Phase 3 and would have approximately 1,154 parking spaces with five levels of parking, including basement. At

Phase 3 completion the Good Samaritan Hospital would have up to 2,179 parking spaces. See Figure 7: Proposed Buildout Conceptual Site Plan for more details.

Phase 3 would result in approximately 21,000 CY of soil export and 5,000 CY of soil import. Phase 3 would be constructed over approximately 2.8 years (i.e., 34 months) starting in 2032. The schedule for construction in all phases would typically occur six days a week (Monday through Saturday) from 7:00 a.m. to 7:00 p.m. since the Project is within 500 feet of a residence. More detail on Project proximity to sensitive receptors is discussed in **Section 2.4**.

2 ENVIRONMENTAL SETTING

2.1 CLIMATE AND METEOROLOGY

The California Air Resources Board (CARB) divides the State into 15 air basins that share similar meteorological and topographical features. The Project is located within the San Francisco Bay Area Air Basin (SFBAAB, Air Basin, or Basin). This Basin comprises all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the southern portion of Sonoma County, and the southwestern portion of Solano County. Air quality in this area is determined by natural factors such as topography, meteorology, and climate, in addition to the presence of existing air pollution sources and ambient conditions. These factors along with applicable regulations are discussed below. The Bay Area Air Quality Management District (BAAQMD) is responsible for local control and monitoring of criteria air pollutants throughout the Basin.

Climate, or the average weather condition, affects air quality in several ways. Wind patterns can remove or add air pollutants emitted by stationary or mobile sources. Inversion, a condition where warm air traps cooler air underneath it, can hold pollutants near the ground by limiting upward mixing (dilution). Topography also affects the local climate, as valleys often trap emissions by limiting lateral dispersal.
The inversions typical of winter, called radiation inversions, are formed as heat quickly radiates from the earth's surface after sunset, causing the air in contact with it to rapidly cool. Radiation inversions are strongest on clear, low-wind, cold winter nights, allowing the build-up of such pollutants as carbon monoxide (CO) and particulate matter. When wind speeds are low, there is little mechanical turbulence to mix the air, resulting in a layer of warm air over a layer of cooler air next to the ground. During radiation inversions downwind transport is slow, the mixing depths are shallow, and turbulence is minimal, all factors which contribute to ozone (O_3) formation.

The frequency of hot, sunny days during the summer months in the Basin is another important factor that affects air pollution potential. It is at the higher temperatures that O_3 is formed. In the presence of ultraviolet sunlight and warm temperatures, reactive organic gases (ROG) and oxides of nitrogen react to form secondary photochemical pollutants, including O_3.

The climate is dominated by the location and strength of a semi-permanent, subtropical high-pressure cell. In the summer, the Pacific cell is centered over the northeastern Pacific Ocean, resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below the surface because of the northwesterly flow produces a band of cold water off the coast which results in condensation and the presence of fog and stratus clouds along the coast. In the winter, the high-pressure cell weakens and shifts southward, resulting in increased wind flow offshore, the absence of upwelling, and the occurrence of storms.

The Basin is characterized by moderately wet winters (November through March) and dry summers. The rainfall in the mountains reaches 40 inches while the valley sees less than 16 inches. Generally, coastal temperatures can be 35 degrees Fahrenheit cooler than temperatures 15 to 20 miles inland. At night, this contrast usually decreases to less than 10 degrees Fahrenheit. In the winter, the relationship of minimum and maximum temperatures is reversed.

The Project site is located in the City of San José and Santa Clara County, on the southern perimeter of the San Francisco Bay. The City of San José has a generally mild climate, with average temperatures in the low

80's Fahrenheit in the summer and high 50's Fahrenheit in the winter. The annual rainfall is approximately 19 inches in the City, primarily between November and April. The regulatory section below discusses the regulations in place to reduce adverse health and nuisance impacts from air emissions on nearby receptors.

2.2 AIR POLLUTANTS OF PRIMARY CONCERN

The air pollutants emitted into the ambient air by stationary and mobile sources are regulated by federal and state laws. These regulated air pollutants are known as "criteria air pollutants" and are categorized into primary and secondary pollutants. Primary air pollutants are those that are emitted directly from sources. CO, ROG, nitrogen oxide (NO_X), sulfur dioxide (SO_2), particulate matter 10 microns or less in diameter (PM_{10}), particulate matter 2.5 microns or less in diameter ($PM_{2.5}$), and lead (Pb) are primary air pollutants. Of these, CO, NO_X, SO_2, PM_{10}, and $PM_{2.5}$ are primary criteria pollutants. ROG and NO_X are criteria pollutant precursors and go on to form secondary criteria pollutants through chemical and photochemical reactions in the atmosphere. For example, the criteria pollutant O_3 is formed by a chemical reaction between ROG and NO_X in the presence of sunlight. O_3 and nitrogen dioxide (NO_2) are the principal secondary pollutants. Sources and health effects commonly associated with criteria pollutants are summarized in Table 1: Air Contaminants and Associated Public Health Concerns.

O_3, or smog, is not emitted directly into the environment, but is formed in the atmosphere by complex chemical reactions between ROG and NO_X in the presence of sunlight. O_3 formation is greatest on warm, windless, sunny days. The main sources of NO_X and ROG, often referred to as O_3 precursors, are combustion processes (including motor vehicle engines) the evaporation of solvents, paints, and fuels, and biogenic sources. Automobiles are the single largest source of O_3 precursors in the Basin. Tailpipe emissions of ROG are highest during cold starts, hard acceleration, stop-and-go conditions, and slow speeds. They decline as speeds increase up to about 50 miles per hour (mph), then increase again at high speeds and high engine loads. ROG emissions associated with evaporation of unburned fuel depend on vehicle and ambient temperature cycles. NO_x emissions exhibit a different curve; emissions decrease as the vehicle approaches 30 mph and then begin to increase with increasing speeds.

O_3 levels usually build up during the day and peak in the afternoon hours. Short-term exposure can irritate the eyes and cause constriction of the airways. Besides causing shortness of breath, it can aggravate existing respiratory diseases such as asthma, bronchitis, and emphysema. Chronic exposure to high O_3 levels can permanently damage lung tissue. O_3 can also damage plants and trees, and materials such as rubber and fabrics.

Table 1: Air Contaminants and Associated Public Health Concerns

Pollutant	Major Man-Made Sources	Human Health Effects
Particulate Matter (PM_{10} and $PM_{2.5}$)	Power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, automobiles and others.	Increased respiratory symptoms, such as irritation of the airways, coughing, or difficulty breathing; asthma; chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility.
Ozone (O_3)	Formed by a chemical reaction between reactive organic gases/volatile organic compounds (ROG or VOC)[1] and nitrogen oxides (NO_X) in the presence of sunlight. Motor vehicle exhaust industrial emissions,	Irritates and causes inflammation of the mucous membranes and lung airways; causes wheezing, coughing, and pain when inhaling deeply; decreases lung capacity; aggravates lung and heart problems. Damages plants; reduces crop yield.

Pollutant	Major Man-Made Sources	Human Health Effects
	gasoline storage and transport, solvents, paints and landfills.	
Sulfur Dioxide (SO_2)	A colorless gas formed when fuel containing sulfur is burned and when gasoline is extracted from oil. Examples are petroleum refineries, cement manufacturing, metal processing facilities, locomotives, and ships.	Respiratory irritant. Aggravates lung and heart problems. In the presence of moisture and oxygen, sulfur dioxide converts to sulfuric acid which can damage marble, iron, and steel. Damages crops and natural vegetation. Impairs visibility. Precursor to acid rain.
Carbon Monoxide (CO)	An odorless, colorless gas formed when carbon in fuel is not burned completely; a component of motor vehicle exhaust.	Reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impairs vision, causes dizziness, and can lead to unconsciousness or death.
Nitrogen Dioxide (NO_2)	A reddish-brown gas formed during fuel combustion for motor vehicles and industrial sources. Sources include motor vehicles, electric utilities, and other sources that burn fuel.	Respiratory irritant; aggravates lung and heart problems. Precursor to ozone. Contributes to global warming and nutrient overloading which deteriorates water quality. Causes brown discoloration of the atmosphere.
Lead (Pb)	Lead is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Due to the phase out of leaded gasoline, metals processing is the major source of lead emissions to the air today. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.	Exposure to lead occurs mainly through inhalation of air and ingestion of lead in food, water, soil, or dust. It accumulates in the blood, bones, and soft tissues and can adversely affect the kidneys, liver, nervous system, and other organs. Excessive exposure to lead may cause neurological impairments such as seizures, mental retardation, and behavioral disorders. Even at low doses, lead exposure is associated with damage to the nervous systems of fetuses and young children, resulting in learning deficits and lowered IQ.

[1] Volatile Organic Compounds (VOCs or Reactive Organic Gases [ROG]) are hydrocarbons/organic gases that are formed solely of hydrogen and carbon. There are several subsets of organic gases including ROGs and VOCs. Both ROGs and VOCs are emitted from the incomplete combustion of hydrocarbons or other carbon-based fuels. The major sources of hydrocarbons are combustion engine exhaust, oil refineries, and oil-fueled power plants; other common sources are petroleum fuels, solvents, dry cleaning solutions, and paint (via evaporation).

Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne substances that can cause short-term (acute) or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes more than 200 compounds, including particulate emissions from diesel-fueled engines.

CARB identified diesel particulate matter (DPM) as a toxic air contaminant. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Diesel exhaust is a complex mixture of particles and gases produced when an engine burns diesel fuel. DPM is a concern because it causes lung cancer; many compounds found in diesel exhaust are carcinogenic. DPM includes the particle-phase constituents in diesel exhaust. The chemical composition and particle sizes of DPM vary between different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate), fuel formulations (high/low sulfur fuel), and the year of the engine. Some short-term (acute)

effects of diesel exhaust include eye, nose, throat, and lung irritation, and diesel exhaust can cause coughs, headaches, light-headedness, and nausea. DPM poses the greatest health risk among the TACs. Almost all diesel exhaust particle mass is 10 microns or less in diameter. Because of their extremely small size, these particles can be inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

Odors

Although offensive odors rarely cause physical harm, they can be unpleasant and lead to considerable distress among the public. This distress often generates citizen complaints to local governments and air districts. According to BAAQMD's California Environmental Quality Act (CEQA) Guidelines and CARB's Air Quality and Land Use Handbook, land uses associated with odor complaints typically include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, chemical plants, petroleum refineries, auto body shops, coating operations, fiberglass manufacturing plants, foundries, rendering plants, and livestock operations. BAAQMD provides recommended screening distances for citing new receptors near existing odor sources.

2.3 AMBIENT AIR QUALITY

CARB monitors ambient air quality at approximately 250 air monitoring stations across the state. Air quality monitoring stations usually measure pollutant concentrations ten feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. Existing ambient air quality levels, historical trends, and projections near the Project site are documented by measurements made by BAAQMD's air pollution regulatory agency that maintains air quality monitoring stations, which process ambient air quality measurements.

O_3 and particulate matter (PM_{10} and $PM_{2.5}$) are pollutants of concern in the Basin. The closest air monitoring station to the Project site that monitors ambient concentrations of these pollutants is the Los Gatos Monitoring Station (located approximately 3.4 miles southwest of the Project site). The second closest is the San José-Jackson Street Monitoring Station located approximately 12.7 miles northeast of the Project site. Local air quality data from 2019 to 2021 is provided in Table 2: Ambient Air Quality Data lists the monitored maximum concentrations and number of exceedances of federal or state air quality standards for each year. State particulate matter standards (PM_{10} and $PM_{2.5}$) were exceeded in 2020, 2021 and 2022 at one of the closest monitoring stations.

Table 2: Ambient Air Quality Data

Pollutant	Los Gatos[1]			San José- Jackson Street[2]		
	2020	2021	2022	2020	2021	2022

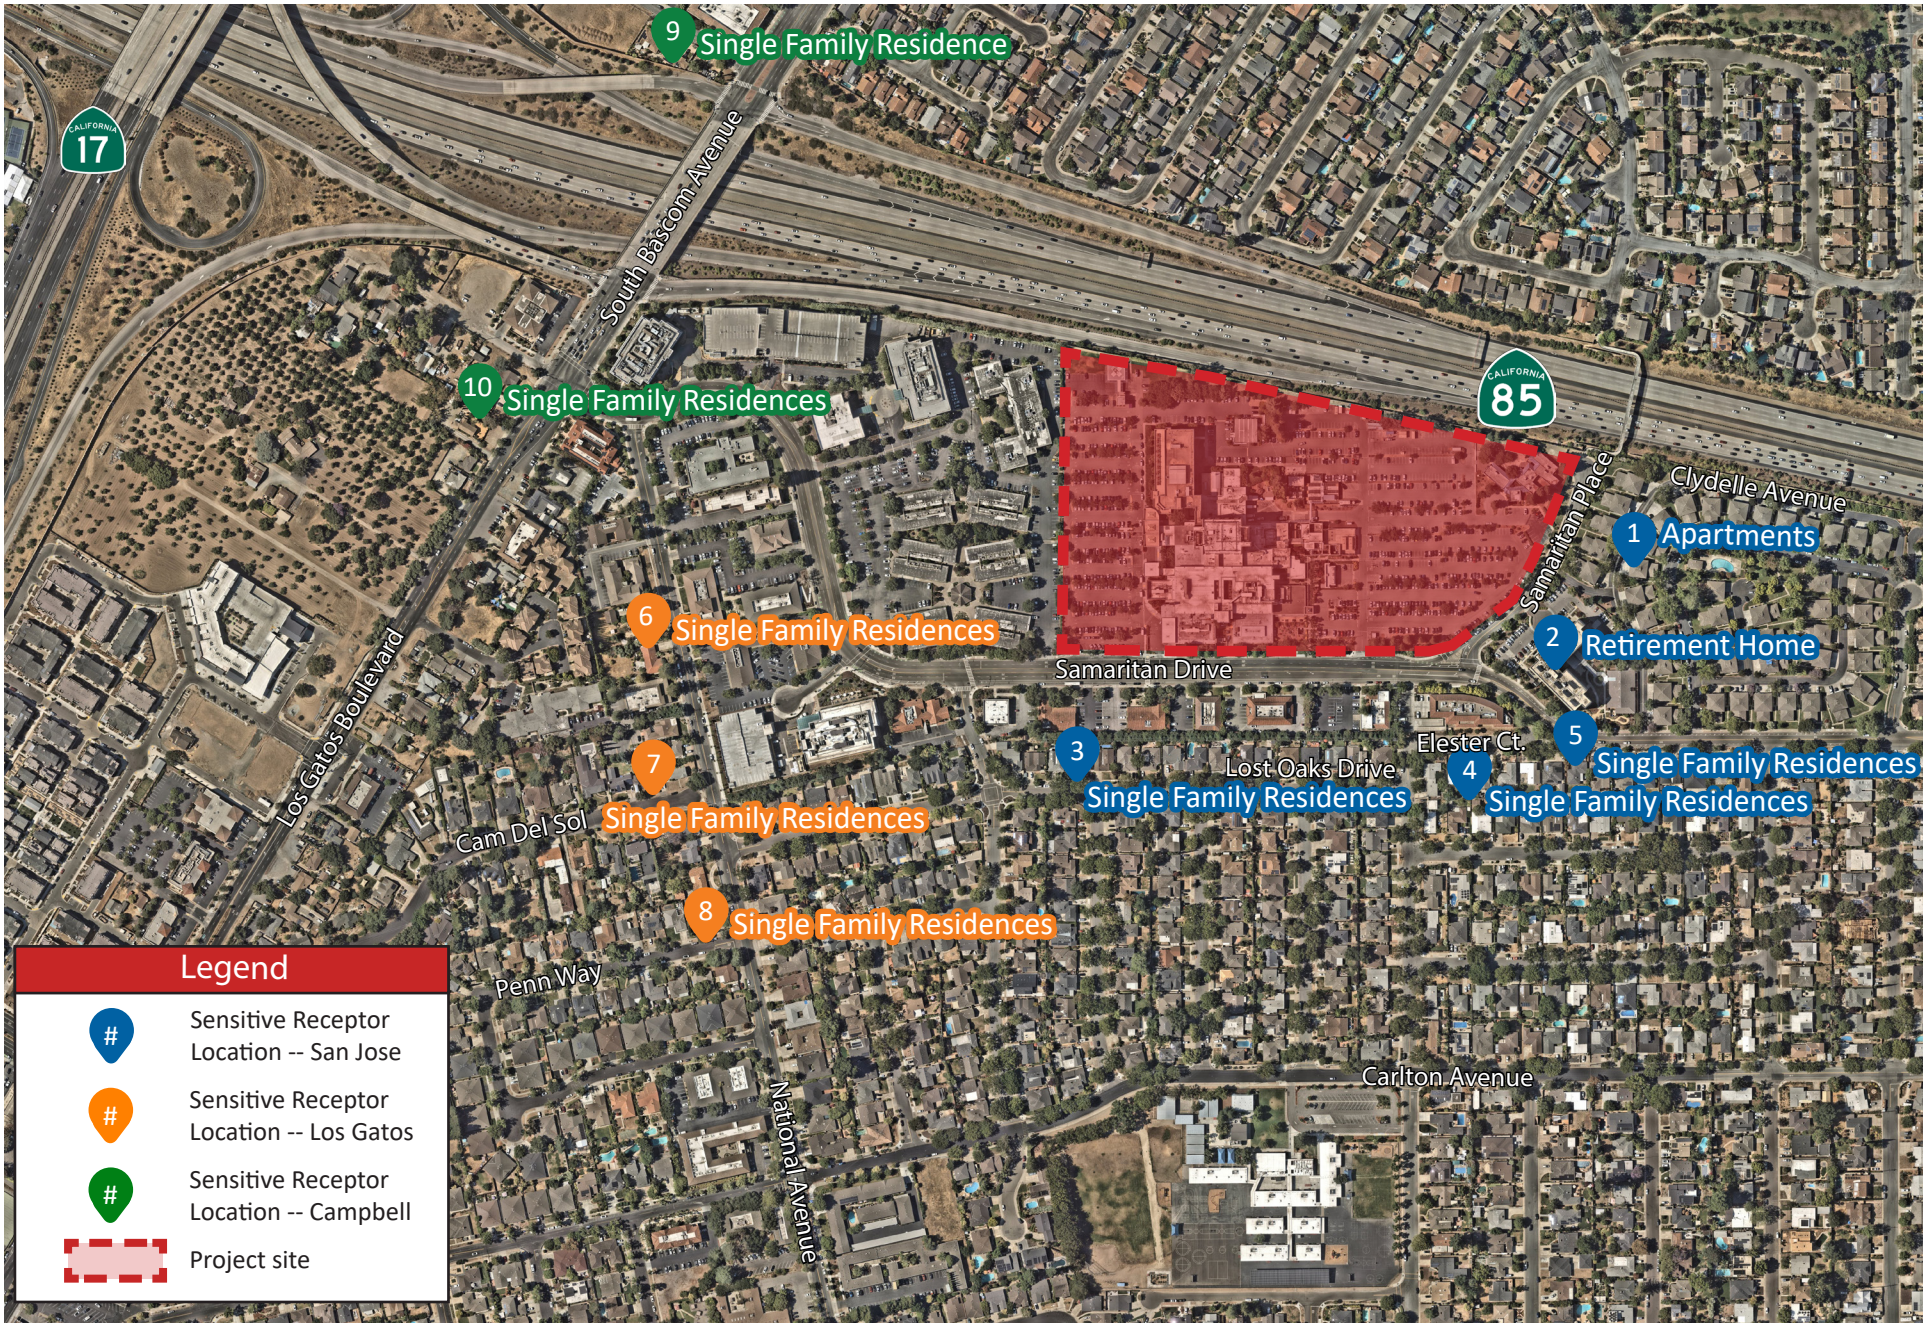
2.4 SENSITIVE RECEPTORS

Sensitive populations are more susceptible to the effects of air pollution than the general population. Sensitive receptors in proximity to localized sources of toxics are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes.



The Project site is located in an urban area in City of San José. As shown in Figure 8: Sensitive Receptors, the surrounding land uses are predominantly residential to the east and southeast of the Project site. The eastern boundary of the site includes apartments across Samaritan Place. Table 3: Sensitive Receptors, lists the distances and locations of nearby sensitive receptors, which primarily include single- family and multi-family residences. These distances are from the Project site to the sensitive receptor property line.

Table 3: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Multi-family residences along Samaritan Place	45 feet east
Cambrian Center Retirement Home	50 feet southeast
Residences along Lost Oaks Drive	200 feet south
Residences along Elester Court	230 feet southeast
Residences along Samaritan Drive	480 feet southeast

3 REGULATORY SETTING

3.1 FEDERAL

Federal Clean Air Act

Air quality is federally protected by the Federal Clean Air Act (FCAA) and its amendments. Under the FCAA, the EPA developed the primary and secondary National Ambient Air Quality Standards (NAAQS) for the criteria air pollutants including O_3, NO_2, CO, SO_2, PM_{10}, $PM_{2.5}$, and lead. The standards are set at levels protective of human health. Depending on whether the standards are met or exceeded, the local air basin is classified as in "attainment" or "nonattainment." Some areas are unclassified, which means no monitoring data are available. Unclassified areas are considered to be in attainment. Proposed projects in or near nonattainment areas could be subject to more stringent air-permitting requirements. The FCAA requires that each state prepare a State Implementation Plan (SIP) to demonstrate how it will attain the NAAQS within the federally imposed deadlines. The U.S. Environmental Protection Agency (EPA) has designated enforcement of air pollution control regulations to the individual states. Applicable federal standards are summarized in Table 4: State of California.

Corporate Average Fuel Economy Standards

In October 2012, the EPA and the National Highway Traffic Safety Administration (NHSTA), on behalf of the Department of Transportation, issued final rules to further reduce greenhouse gas (GHG) emissions and improve corporate average fuel economy (CAFE) standards for light-duty vehicles for model years 2017 and beyond (77 Federal Register [FR] 62624). NHTSA's CAFE standards have been enacted under the Energy Policy and Conservation Act since 1978. This national program requires automobile manufacturers to build a single light-duty national fleet that meets all requirements under both federal programs and the standards of California and other states. This program would increase fuel economy to the equivalent of 54.5 miles per gallon (mpg) limiting vehicle emissions to 163 grams of carbon dioxide (CO_2) per mile for the fleet of cars and light-duty trucks by model year 2025. In August 2022, NHTSA announced that it intends to prepare an environmental impact statement to analyze the potential environmental impacts of new CAFE standards for model years 2027 and beyond for passenger cars and light trucks, and new fuel efficiency standards for model years 2029 and beyond for heavy-duty pickup trucks and vans. In July 2023, the NHTSA officially proposed the new CAFÉ standards and invited public comments.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[2] The PM emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also, the nitrogen oxide (NOX) and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010. In December 2022, the EPA final rule set new, more stringent standards to reduce NO_X pollution from heavy-duty vehicles and engines starting in model year 2027. The

[2] United States Environmental Protection Agency (U.S. EPA), *Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements*, Final Rule. 40 Code of Federal Regulations, Parts 69, 80, and 86. January 18, 2001.

rule will reduce NO_X emissions from heavy-duty trucks by almost 50 percent by 2045, producing significant health-related benefits.[3]

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 1 through Tier 3 standards are to be increasingly more stringent, respectively, and vary by pollutant and engine size. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. The Tier 4 standards require that emissions of PM and NO_X be further reduced by about 90% from Tier 3 standards. CARB currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce oxides of nitrogen (NO_X) and particulate matter (PM) emissions from new, off-road compression-ignition (CI) engines, by an additional 50% to 90%, compared to what is allowed by today's Tier 4 final emission standards.

3.2 STATE

California Air Resources Board

CARB administers California's air quality policy. The California Ambient Air Quality Standards (CAAQS) were established in 1969 pursuant to the Mulford-Carrell Act. These standards, included with the NAAQS in Table 4, are generally more stringent and apply to more pollutants than the NAAQS, and also are set at levels the state has determined to be protective of human health. In addition to the criteria pollutants, CAAQS have been established for visibility reducing particulates, hydrogen sulfide (H_2S), and sulfates (SO_{4-2}). In general, the Bay Area experiences low concentrations of most pollutants when compared to federal standards, except for O_3 and PM, for which standards are exceeded periodically. With respect to federal standards, the Bay Area's attainment status for 8-hour O_3 is classified as "marginal nonattainment" and "nonattainment" for $PM_{2.5.}$ The region is also considered to be in nonattainment with the CAAQS for PM_{10} and $PM_{2.5}$. Area sources generate the majority of these airborne particulate emissions. The Basin is considered in attainment or unclassified with respect to the CO, NO_2 and SO_2 NAAQS and CAAQS.

The California Clean Air Act (CCAA) requires that each local air district prepare and maintain an Air Quality Management Plan (AQMP) to achieve compliance with CAAQS. These AQMPs also serve as the basis for the preparation of the SIP for meeting federal clean air standards for the State of California. Like the EPA, CARB also designates areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events such as wildfires, volcanoes, etc. are not considered violations of a State standard, and are not used as a basis for designating areas as nonattainment. The applicable State standards are summarized in Table 4.

Table 4: State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	State Standards[1]		Federal Standards[2]	
		Concentration	Attainment Status	Concentration[3]	Attainment Status
Ozone (O_3)	1 Hour	0.09 ppm (180 µg/m³)	N	NA	N/A[4]
	8 Hour	0.070 ppm (137 µg/m³)	N[9]	0.070 ppm	N[5]
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m³)	A	35 ppm (40 mg/m³)	A
	8 Hour	9.0 ppm (10 mg/m³)	A	9 ppm (10 mg/m³)	A[6]
Nitrogen Dioxide (NO_2)	1 Hour	0.18 ppm (339 µg/m³)	A	0.100 ppm (188 µg/m³)[11]	U
	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)	-	0.053 ppm (100 µg/m³)	A
Sulfur Dioxide[12] (SO_2)	1 Hour	0.25 ppm (655 µg/m³)	A	0.075 ppm (196 µg/m³)	A
	24 Hour	0.04 ppm (105 µg/m³)	A	0.14 ppm (365 µg/m³)	A
	Annual Arithmetic Mean	NA	-	0.030 ppm (80 µg/m³)	A
Particulate Matter (PM_{10})	24-Hour	50 µg/m³	N	150 µg/m³	U
	Annual Arithmetic Mean	20 µg/m³	N[7]	NA	-
Fine Particulate Matter ($PM_{2.5}$) [15]	24-Hour	NA	-	35 µg/m³	U/A[10]
	Annual Arithmetic Mean	12 µg/m³	N[7]	12 µg/m³	N
Sulfates (SO_{4-2})	24 Hour	25 µg/m³	A	NA	-
Lead (Pb)[13, 14]	30-Day Average	1.5 µg/m³	-	NA	A
	Calendar Quarter	NA	-	1.5 µg/m³	A
	Rolling 3-Month Average	NA	-	0.15 µg/m³	-
Hydrogen Sulfide (H_2S)	1 Hour	0.03 ppm (42 µg/m³)	U	NA	-
Vinyl Chloride (C_2H_3Cl)	24 Hour	0.01 ppm (26 µg/m³)	-	NA	-
Visibility Reducing Particles[8]	8 Hour (10:00 to 18:00 PST)	-	U	-	-

A = attainment; N = nonattainment; U = unclassified; N/A = not applicable or no applicable standard; ppm = parts per million; µg/m³ = micrograms per cubic meter; mg/m³ = milligrams per cubic meter; – = not indicated or no information available.

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter - PM_{10}, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe carbon monoxide, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour or 24-hour average (i.e., all standards except for lead and the PM_{10} annual standard), then some measurements may be excluded. In particular, measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe CO standard is 6.0 ppm, a level one-half the national standard and two-thirds the state standard.
2. National standards shown are the "primary standards" designed to protect public health. National standards other than for ozone, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour ozone standard is attained if, during the most recent three-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour ozone standard is attained when the 3-year average of the 4th highest daily concentrations is 0.070 ppm (70 ppb) or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 µg/m_3. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of 98th percentiles is less than 35 µg/m³.
   Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for PM_{10} is met if the 3-year average falls below the standard at every site. The annual $PM_{2.5}$ standard is met if the 3-year average of annual averages spatially-averaged across officially designed clusters of sites falls below the standard.
3. National air quality standards are set by the EPA at levels determined to be protective of public health with an adequate margin of safety.
4. The national 1-hour ozone standard was revoked by U.S. EPA on June 15, 2005.
5. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour ozone concentration per year, averaged over three years, is equal to or less than 0.070 ppm. EPA will make recommendations on attainment designations by October 1, 2016, and issue final designations October 1, 2017. Nonattainment areas will have until 2020 to late 2037 to meet the health standard, with attainment dates varying based on the ozone level in the area.
6. In April 1998, the Bay Area was redesignated to attainment for the national 8-hour carbon monoxide standard.
7 In June 2002, CARB established new annual standards for $PM_{2.5}$ and PM_{10}.
8 Statewide VRP Standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70 percent. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.
9. The 8-hour CA ozone standard was approved by the Air Resources Board on April 28, 2005, and became effective on May 17, 2006.

10. On January 9, 2013, EPA issued a final rule to determine that the Bay Area attains the 24-hour $PM_{2.5}$ national standard. This EPA rule suspends key SIP requirements as long as monitoring data continues to show that the Bay Area attains the standard. Despite this EPA action, the Bay Area will continue to be designated as "nonattainment" for the national 24-hour $PM_{2.5}$ standard until such time as the Air District submits a "redesignation request" and a "maintenance plan" to EPA, and EPA approves the proposed redesignation.
11. To attain this standard, the 3-year average of the 98th percentile of the daily maximum 1-hour average at each monitor within an area must not exceed 0.100ppm (effective January 22, 2010). The US Environmental Protection Agency (EPA) expects to make a designation for the Bay Area by the end of 2017.
12. On June 2, 2010, the U.S. EPA established a new 1-hour SO_2 standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. The existing 0.030 ppm annual and 0.14 ppm 24-hour SO_2 NAAQS however must continue to be used until one year following U.S. EPA initial designations of the new 1-hour SO_2 NAAQS.
13. CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure below which there are no adverse health effects determined.
14. National lead standard, rolling 3-month average: final rule signed October 15, 2008. Final designations effective December 31, 2011.
15. In December 2012, EPA strengthened the annual $PM_{2.5}$ National Ambient Air Quality Standards (NAAQS) from 15.0 to 12.0 micrograms per cubic meter ($\mu g/m^3$). In December 2014, EPA issued final area designations for the 2012 primary annual $PM_{2.5}$ NAAQS. Areas designated "unclassifiable/attainment" must continue to take steps to prevent their air quality from deteriorating to unhealthy levels. The effective date of this standard is April 15, 2015.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals include an 85 percent reduction in DPM by 2020 from the 2000 baseline[4]. CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[5] The DRRP includes regulations to establish cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce PM and NO_X emissions from existing diesel vehicles operating in California. The regulation requires PM retrofits on all diesel trucks and buses that operate in California (i.e., existing vehicles are required to be upgraded to reduce emissions). Heavier trucks must be retrofitted with PM filters beginning January 1, 2012, and older trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses would need to have 2010 model year engines or equivalent.

The regulation applies to most diesel-fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to DPM and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles including transportation refrigeration units (TRUs). The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and

[4] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.

[5] California Air Resources Board, *Overview: Diesel Exhaust & Health*, available at: https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed August 2023.

is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools). On February 24, 2022, CARB approved amendments to the TRU ATCM (2022 Amendments) to achieve additional emission and health risk reductions from diesel-powered TRUs and increase the use of zero-emission technology in the off-road sector. The 2022 Amendments will help meet the State's multiple risk reduction, air quality, and climate goals, as well as the directive of Executive Order N-29-20, which set a goal for 100 percent zero-emission off-road vehicles and equipment in the State by 2035.

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

Advanced Clean Cars I and II.

Advanced Clean Cars combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations

rapidly scale down emissions of light-duty passenger cars, pickup trucks and SUVs and require an increased number of zero-emission vehicles to meet air quality and climate change emissions goals. By 2035 all new passenger cars, trucks and SUVs sold in California will be zero emissions. The Advanced Clean Cars II regulations take the state's already growing zero-emission vehicle market and robust motor vehicle emission control rules and augments them to meet more aggressive tailpipe emissions standards and ramp up to 100% zero-emission vehicles.

CARB Advanced Clean Fleets Regulation.

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

California Energy Commission – Title 24 Building Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings, as specified in California Code of Regulations (CCR) Title 24 Part 6, were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated every three years to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2019 Energy Standards include requirements for mandatory mechanical ventilation intended to improve indoor air quality in homes, and requirements for Minimum Efficiency Reporting Value (MERV) 13 air filtration on space conditioning systems, and ventilation systems that provide outside air to a dwelling's occupiable space. The Residential Compliance Manual for the 2019 Building Energy Efficiency Standards notes that air filter efficiencies of at least MERV 13 protect occupants from exposure to the smaller airborne particles (i.e., $PM_{2.5}$) that are known to adversely affect respiratory health. CCR Title 24 Part 6 requires a particle size efficiency rating equal to or greater than 85 percent in the 1.0 to 0.3 micrometer (µm) range. The California Energy Commission (CEC) adopted the 2022 Energy Code on August 11, 2021, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Title 24 standards will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption across California. For example, the 2022 Title 24 standards will require efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards.

CalEnviroScreen

OEHHA has developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores.

According to CalEnviroScreen, the Project site is located within Census Tract 6085502702, which is within the 34th percentile.[6] It should be noted that the CalEnviroScreen scores are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

Senate Bill 535

Senate Bill (SB) 535 directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (DACs) (as identified by the OEHHA mapping). These funds must be used for programs that further reduce greenhouse gas emissions. Funding programs that reduce greenhouse gas emissions would also potentially reduce exposure to other emissions including TACs. Based on OEHHA mapping, the closest SB 535 designated disadvantaged community is located approximately six miles northeast of the Project site (Census Tract 6085503122).[7] SB 535 does not include project specific requirements or prohibit developments in proximity to the designated communities.

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

3.3 REGIONAL

Bay Area Air Quality Management District

BAAQMD is the regional agency with jurisdiction over the nine-county region located in the Basin. The Association of Bay Area Governments (ABAG), Metropolitan Transportation Commission (MTC), county transportation agencies, cities and counties, and various nongovernmental organizations also join in the efforts to improve air quality through a variety of programs. These programs include the adoption of regulations and policies, as well as implementation of extensive education and public outreach programs.

Clean Air Plan

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans (SIPs). The federal and State Clean Air Acts require plans to be developed for areas designated as

[6] California Office of Environmental Health Hazard Assessment, *CalEnviroScreen 4.0*, https://experience.arcgis.com/experience/11d2f52282a54ceebcac7428e6184203/page/CalEnviroScreen-4_0/, accessed October 2023.

[7] California Office of Environmental Health Hazard Assessment, *SB 535 Disadvantaged Communities (2022 Update)*, https://oehha.ca.gov/calenviroscreen/sb535, accessed October 2023.

nonattainment (with the exception of areas designated as nonattainment for the State PM_{10} standard). BAAQMD is responsible for developing a Clean Air Plan, which guides the region's air quality planning efforts to attain the CAAQS. BAAQMD adopted the 2017 Clean Air Plan: Spare the Air, Cool the Climate on April 19, 2017.

BAAQMD periodically develops air quality plans that outline the regional strategy to improve air quality and protect the climate. The most recent plan, 2017 Bay Area Clean Air Plan, includes a wide range of control measures designed to reduce emissions of air pollutants and greenhouse gases (GHG)s, including the following examples that may be relevant to this Project: reduce emissions of TACs by adopting more stringent limits and methods for evaluating toxic risks; implement pricing measures to reduce travel demand; accelerate the widespread adoption of electric vehicles; promote the use of clean fuels and low or zero carbon technologies in trucks and heavy-duty vehicles; promote energy efficiency in both new and existing buildings; and promote the switch from natural gas to electricity for space and water heating in Bay Area buildings.

The 2017 Clean Air Plan provides a regional strategy to protect public health and protect the climate. To protect public health, the plan describes how BAAQMD will continue progress toward attaining all state and federal air quality standards and eliminating health risk disparities from exposure to air pollution among Bay Area communities. To protect the climate, the 2017 Clean Air Plan defines a vision for transitioning the region to a post-carbon economy needed to achieve ambitious GHG reduction targets for 2030 and 2050 and provides a regional climate protection strategy that will put the Bay Area on a pathway to achieve those GHG reduction targets. The 2017 Clean Air Plan contains district-wide control measures to reduce O_3 precursor emissions (i.e., ROG and NO_X), particulate matter, TACs, and greenhouse gas emissions. The Bay Area 2017 Clean Air Plan updates the Bay Area 2010 Clean Air Plan in accordance with the requirements of the CCAA to implement "all feasible measures" to reduce O_3; provides a control strategy to reduce O_3, PM, TACs, and greenhouse gases in a single, integrated plan; reviews progress in improving air quality in recent years; and establishes emission control measures to be adopted or implemented in both the short term and through 2050.

The 2017 Clean Air Plan includes a wide range of control measures designed to decrease emissions of the air pollutants that are most harmful to Bay Area residents, such as particulate matter, O_3, and TACs to reduce emissions of methane and other "super-GHGs" that are potent climate pollutants in the near-term; and to decrease emissions of carbon dioxide by reducing fossil fuel combustion.

The following BAAQMD rules would limit emissions of air pollutants from construction and operation of the Project:

- Regulation 6, Rule 1 – General Requirements. The purpose of this Regulation is to limit the quantity of particulate matter in the atmosphere through the establishment of limitations on emissions rates, emission concentrations, visible emissions, and opacity.

- Regulation 8, Rule 1 – General Provisions 2021 Amendment. The purpose of this Regulation is to limit the emission of organic compounds to the atmosphere. Certain organic compounds may also be subject to the requirements of Regulations 11 or 12.

- Regulation 8, Rule 3 – Architectural Coatings. The purpose of this Rule is to limit the quantity of volatile organic compounds in architectural coatings supplied, sold, offered for sale, applied,

solicited for application, or manufactured for use within BAAQMD's jurisdiction. Although this rule does not directly apply to the Project, it does dictate the ROG content of paint available for use during the construction.

- Regulation 8, Rule 15 – Emulsified and Liquid Asphalts. The purpose of this Rule is to limit the emissions of volatile organic compounds caused by the use of Emulsified and Liquid asphalt in paving materials and paving and maintenance operations. Although this rule does not directly apply to the Project, it does dictate the ROG content of asphalt for use during the construction.

- Regulation 9, Rule 8 – Nitrogen Oxides and Carbon Monoxide from Stationary Internal Combustion Engines. This rule limits the emissions of nitrogen oxides and CO from stationary internal combustion engines with an output rated by the manufacturer at more than 50 brake horsepower.

- Regulation 11, Rule 1 – Asbestos Demolition, Renovation, and Manufacturing. The purpose of this Rule is to control emissions of asbestos to the atmosphere during demolition, renovation, milling, and manufacturing, and establish appropriate waste disposal procedures. Although this rule may not apply to the Project, since the facility was constructed in the 1960s, asbestos may be present.

- Regulation 11, Rule 18 – Reduction of risk from air toxic emissions at existing facilities. The purpose of this rule is to ensure that facilities that emit toxic air contaminants do not pose an unacceptable health risk to nearby residents, workers, or students.

BAAQMD prepared an Ozone Attainment Demonstration Plan to satisfy the federal 1-hour O_3 planning requirement because of the Air Basin's nonattainment for federal and State O_3 standards. The U.S. EPA revoked the 1-hour O_3 standard and adopted an 8-hour O_3 standard. BAAQMD will address the new federal 8-hour O_3 planning requirements once they are established.

Community Air Risk Evaluation Program

BAAQMD began its Community Air Risk Evaluation (CARE) program in 2004 to evaluate and reduce health risks associated with exposures to outdoor TACs in the Bay Area. The program examines TAC emissions from point sources, area sources, and on-road and off-road mobile sources with an emphasis on diesel exhaust, which is a major contributor to airborne health risk in California. The CARE program is an on-going program that encourages community involvement and input. The technical analysis portion of the CARE program is implemented in three phases that includes an assessment of the sources of TAC emissions, modeling and measurement programs to estimate concentrations of TAC, and an assessment of exposures and health risks. Throughout the program, information derived from the technical analyses is used to focus emission reduction measures in areas with high TAC exposures and high density of sensitive populations.

Risk reduction activities associated with the CARE program are focused on the most at-risk communities in the Bay Area. BAAQMD has identified six communities as impacted as part of the CARE program: Concord, Richmond/San Pablo, Western Alameda County, San José, Redwood City/East Palo Alto, and Eastern San Francisco. Overburdened communities are areas located (i) within a census tract identified by the California Communities Environmental Health Screening Tool (CalEnviroScreen), Version 4.0 implemented by OEHHA, as having an overall score at or above the 70th percentile, or (ii) within 1,000 feet of any such census tract. The project site is not located in the San José CARE area or within an

overburdened area as identified by CalEnviroScreen as the Project site is scored at the 9th percentile and is not within 1,000 feet of a census tract at or above the 70th percentile.

CEQA Air Quality Guidelines

BAAQMD prepared its California Environmental Quality Act (CEQA) Air Quality Guidelines to assist in the evaluation of air quality impacts of projects and plans proposed within the Bay Area. The guidelines provide recommended procedures for evaluating potential air impacts during the environmental review process consistent with CEQA requirements including thresholds of significance, mitigation measures, and background air quality information. They also include assessment methodologies for TACs, odors, and GHG emissions. BAAQMD most recently updated its guidelines in April 2023, after revising its climate impact threshold on April 20, 2022.

3.4 LOCAL

City of San José Municipal Code

The City's Municipal Code includes the following regulations that addresses air quality standards for future development:

- Transportation Demand Management (Chapter 11.105)
- Green Building Regulations for Private Development (Chapter 17.84)

City of San José General Plan

The San José General Plan includes the following policies intended to control or reduce air pollution impacts:

Goal MS – 10: Minimize air pollutant emissions from new and existing development.

Policy MS-10.1: Assess projected air emissions from new development in conformance with the BAAQMD CEQA Guidelines and relative to state and federal standards. Identify and implement feasible air emissions reduction measures.

Policy MS – 10.2: Consider the cumulative air quality impacts from proposed developments for proposed land use designation changes and new development, consistent with the region's Clean Air Plan and State law.

Policy MS – 10.4: Encourage effective regulation of mobile and stationary sources of air pollution, both inside and outside of San José. In particular, support federal and State regulations to improve automobile emission controls.

Policy MS – 10.6: Encourage mixed land use development near transit lines and provide retail and other types of service-oriented uses within walking distance to minimize automobile dependent development.

Policy MS – 10.7: Encourage regional and statewide air pollutant emission reduction through energy conservation to improve air quality.

Policy MS – 10.11: Enforce the City's wood-burning appliance ordinance to limit air pollutant emissions from residential and commercial buildings.

Policy MS – 10.13: As a part of City of San José Sustainable City efforts, educate the public about air polluting household consumer products and activities that generate air pollution. Increase public awareness about the alternative products and activities that reduce air pollutant emissions.

Goal MS – 11: Minimize exposure of people to air pollution and toxic air contaminants such as ozone, carbon monoxide, lead, and particulate matter.

Policy MS – 11.1: Require completion of air quality modeling for sensitive land uses such as new residential developments that are located near sources of pollution such as freeways and industrial uses. Require new residential development projects and projects categorized as sensitive receptors to incorporate effective mitigation into project designs or be located an adequate distance from sources of TACs to avoid significant risks to health and safety.

Policy MS – 11.2: For projects that emit toxic air contaminants, require project proponents to prepare health risk assessments in accordance with BAAQMD-recommended procedures as part of environmental review and employ effective mitigation to reduce possible health risks to a less than significant level. Alternatively, new projects (such as, but not limited to, industrial, manufacturing, and processing facilities) that are sources of TAC's to be located an adequate distance from residential areas and other sensitive receptors.

Policy MS – 11.4: Encourage the installation of appropriate air filtration at existing schools, residences, and other sensitive receptor uses adversely affected by pollution sources.

Policy MS – 10.5: Encourage the use of pollution absorbing trees and vegetation in buffer areas between substantial sources of TACs and sensitive land uses.

Action MS-11.6: Develop and adopt a comprehensive Community Risk Reduction Plan that includes: baseline inventory of TACs and particulate matter smaller than 2.5 microns ($PM_{2.5}$), emissions from all sources, emissions reduction targets, and enforceable emission reduction strategies and performance measures. The Community Risk Reduction Plan will include enforcement and monitoring tools to ensure regular review of progress toward the emission reduction targets, progress reporting to the public and responsible agencies, and periodic updates of the plan, as appropriate.

Action MS-11.7: Consult with BAAQMD to identify stationary and mobile TAC sources and determine the need for and requirements of a health risk assessment for proposed developments.

Action MS-11.8: For new projects that generate truck traffic, require signage which reminds drivers that the State truck idling law limits truck idling to five minutes.

Goal MS – 12: Minimize and avoid exposure of residents to objectionable odors.

Policy MS-12.2: Require new residential development projects and projects categorized as sensitive receptors to be located an adequate distance from facilities that are existing and potential sources of odor. An adequate separation distance will be determined based upon the type, size, and operations of the facility.

Goal MS – 13: Minimize air pollutant emissions during demolition and construction activities.

Policy MS-13.1: Include dust, particulate matter, and construction equipment exhaust control measures as conditions of approval for subdivision maps, site development and planned development permits, grading permits, and demolition permits. At minimum, conditions shall conform to construction mitigation measures recommended in the current BAAQMD CEQA Guidelines for the relevant project size and type.

Policy MS-13.2: Construction and/or demolition projects that have the potential to disturb asbestos (from soil or building material) shall comply with all the requirements of the California Air Resources Board's air toxic control measures (ATCMs) for Construction, Grading, Quarrying, and Surface Mining Operations.

Action MS-13.4: Adopt and periodically update dust, particulate, and exhaust control standard measures for demolition and grading activities to include on project plans as conditions of approval based upon construction mitigation measures in the BAAQMD CEQA Guidelines.

Action MS-13.5: Prevent silt loading on roadways that generates particulate matter air pollution by prohibiting unpaved or unprotected access to public roadways from construction sites.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 AIR QUALITY THRESHOLDS

State CEQA Guidelines Appendix G

Based upon the criteria derived from State CEQA Guidelines Appendix G, a project normally would have a significant effect on the environment if it would:

AQ-1 Conflict with or obstruct implementation of the applicable air quality plan?

AQ-2 Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

AQ-3 Expose sensitive receptors to substantial pollutant concentrations?

AQ-4 Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Air Quality Thresholds for Criteria Air Pollutants and Precursors

Under the California Environmental Quality Act (CEQA), BAAQMD is an expert commenting agency on air quality within its jurisdiction or impacting its jurisdiction. Under the FCAA, BAAQMD has adopted federal attainment plans for O_3 and $PM_{2.5}$. BAAQMD reviews projects to ensure that they would not: (1) cause or contribute to any new violation of any air quality standard; (2) increase the frequency or severity of any existing violation of any air quality standard; or (3) delay timely attainment of any air quality standard or any required interim emission reductions or other milestones of any Federal attainment plan.

The BAAQMD Thresholds of Significance Justification (2022) establishes thresholds based on substantial evidence within the 2022 CEQA Air Quality Guidelines. The thresholds have been developed by BAAQMD to attain State and federal ambient air quality standards, which are set at levels protective of human health. Therefore, projects below these thresholds would not violate an air quality standard and would not make a cumulatively considerable contribution to an existing or projected cumulative air quality violation in the Air Basin.

BAAQMD's CEQA Air Quality Guidelines provides significance thresholds for both construction and operations of project. Ultimately the lead agency determines the thresholds of significance for impacts. However, if a project proposes development in excess of the established thresholds, as outlined below, a significant air quality impact may occur.

Table 5: BAAQMD Emissions Thresholds for Criteria Air Pollutants and Precursors

Criteria Air Pollutants and Precursors (Regional)	Construction-Related	Operational-Related	
	Average Daily Emissions (pounds/day)	Average Daily Emission (pounds/day)	Annual Average Emission (tons/year)
Reactive Organic Gases (ROG)	54	54	10
Nitrogen Oxides (NO_X)	54	54	10
Coarse Particulates (PM_{10})	82 (exhaust)	82	15
Fine Particulates ($PM_{2.5}$)	54 (exhaust)	54	10
PM_{10} / $PM_{2.5}$ (fugitive dust)	Best Management Practices*	None	
Local CO	None	9.0 ppm (8-hour average) 20.0 ppm (1-hour average)	
Source: Bay Area Air Quality Management District, *2022 CEQA Air Quality Guidelines*, April 2023.			

4.2 METHODOLOGY

This air quality impact analysis considers the Project's construction and operational impacts. Where criteria air pollutant quantification was required, emissions were modeled using the California Emissions Estimator Model (CalEEMod). CalEEMod is a statewide land use emissions computer model designed to quantify potential criteria pollutant emissions associated with both construction and operations from a variety of land use projects. Air quality impacts were assessed according to methodologies recommended by CARB and BAAQMD.

Construction equipment, trucks, worker vehicles, and ground-disturbing activities associated with Project construction would generate emissions of criteria air pollutants and precursors. Air quality impacts were assessed according to CARB and BAAQMD recommended methodologies. Daily regional construction emissions are estimated by assuming construction occurs at the earliest feasible date (i.e., a conservative estimate of construction activities) and applying off-road, fugitive dust, and on-road emissions factors in CalEEMod.

Project operations would result in emissions of area sources (consumer products), energy sources (natural gas usage), and mobile sources (motor vehicles from project generated vehicle trips). Project-generated increases in operational emissions would be predominantly associated with motor vehicle use. The increase of traffic over existing conditions as a result of the Project was obtained from the Project's Transportation Analysis prepared by Kimley-Horn (August 2023). Other operational emissions from area, energy, and stationary sources were quantified in CalEEMod based on land use activity data. In addition, two helipads will be placed on campus to serve the patients at this hospital. The use will include patients being transported to the emergency room due to a trauma incident and used to transport patients to a tertiary medical center. Providing two helipads will allow for redundancy and the ability to aid in accommodating the clinical needs necessary of the patients as demand dictates. The addition of a second helipad to the existing one will not increase helicopter use. Thus, Project operations does not quantitatively examine helicopter use as there is no change from existing.

As discussed above, BAAQMD provides significance thresholds for emissions associated with proposed Project construction and operations. The proposed Project's construction and operational emissions are compared to the daily criteria pollutant emissions significance thresholds in order to determine the significance of the Project's impact on regional air quality. Impacts of the proposed Project on sensitive receptors are determined by analyzing Project impacts on toxic air contaminants, construction diesel

particulate matter, of which those two impacts ae determined within the Human Health Risk Assessment (HRA), and CO hotspots on nearby receptors. The proposed Project's impacts in other emissions (such as those leading to odors) that adversely affecting a substantial number of people are determined by BAAQMD considerations of land uses.

5 POTENTIAL IMPACTS AND MITIGATION

5.1 AIR QUALITY ANALYSIS

Threshold AQ-1: Would the Project conflict with or obstruct implementation of the applicable air quality plan?

BAAQMD's most recently adopted plan, the Clean Air Plan (2017), outlines how the San Francisco area will attain air quality standards, reduce population exposure and protect public health, and reduce GHG emissions. BAAQMD has not established a quantitative threshold of significance for project-level consistency with an air quality plan. However, per BAAQMD guidelines, if a project is consistent with Criterion 1 through Criterion 3 (see analysis below), the project would not conflict with or obstruct the implementation of the applicable air plan.

Criterion 1: Does the Project support the primary goals of the Air Quality Plan?

The Clean Air Plan has two paramount goals: (1) protect air quality and health at the regional and local scale by (a) attaining all state and national air quality standards and (b) eliminating disparities among Bay Area communities in cancer health risk from toxic air contaminants, and (2) protect the climate by keeping the Bay Area region on track to achieve the statewide greenhouse gas emission reduction targets in Senate Bill 32 and 2050 goal in Executive Order S-3-05.

The Project supports these two primary goals. Regarding Goal 1(a), as described below, construction and operational air quality emissions, with mitigation, generated by the proposed Project would not exceed BAAQMD's emissions thresholds for criteria air pollutants. Since the proposed Project would not exceed these thresholds, the proposed Project would not be considered by BAAQMD to be a substantial emitter of criteria air pollutants and would not contribute to any non-attainment areas in the Basin and would be consistent with the goal to attain all state and national air quality standards.

Regarding Goal 1(b), as described below, construction and operational cancer health risk from toxic air contaminants would be below BAAQMD's project-level and cumulative thresholds. Therefore, the Project would not conflict with the Clean Air Plan's goal to eliminate disparities in Bay Area communities in cancer health risk from toxic air contaminants.

Regarding Goal 2, as discussed in the *Good Samaritan Hospital Greenhouse Gas Emissions Assessment* (Kimley-Horn, 2023), the Project would be consistent with the City's Greenhouse Gas Reduction Strategy (GHGRS), which aligns with the targets in SB 32 and is designed to put the City on the path to meet the long-term target of carbon neutrality by 2045. Therefore, the Project would not conflict with the second goal of protecting the climate by being consistent with the SB 32 targets and executive orders related to future greenhouse gas emissions.

Criterion 2: Does the Project include applicable control measures from the Air Quality Plan?

The Project is consistent with the 2017 Clean Air Plan policies that are applicable to the Project site. As shown below, projects are considered consistent with the 2017 Clean Air Plan if they incorporate all applicable and feasible control measures from the 2017 Clean Air Plan and would not disrupt or hinder implementation of any 2017 Clean Air Plan control measures. As discussed in Table 6: Project Consistency with Applicable Clean Air Plan Control Measures, the Project would comply with applicable Clean Air Plan requirements.

Table 6: Project Consistency with Applicable Clean Air Plan Control Measures

Control Measure	Project Consistency
Stationary Source Control Measures	
SS21: New Source Review of Toxic Air Contaminants	**Consistent**. The Project would include uses that would generate new sources of TAC impacts to the nearby sensitive receptors. As such, the Project health risk analysis evaluates TAC impacts consistent with OEHHA risk methodology (see Threshold AQ-3 discussion below). New emissions sources would be subject to BAAQMD Regulation 2, Rule 2 (New Source Review), which requires Best Available Control Technology (BACT).
SS25: Coatings, Solvents, Lubricants, Sealants and Adhesives	**Consistent**. The Project would comply with Regulation 8, Rule 3: Architectural Coatings, which would dictate the ROG content of paint available for use during construction (also required per City of San José Environmental Standard Conditions).
SS26: Surface Prep and Cleaning Solvent	
SS29: Asphaltic Concrete	**Consistent**. Paving activities associated with the Project would be required to utilize asphalt that does not exceed BAAQMD emission standards in Regulation 8, Rule 15.
SS31: General Particulate Matter Emissions Limitation	**Consistent**. This control measure is implemented by BAAQMD through Regulation 6, Rule 1. This rule limits the quantity of particulate matter in the atmosphere through the establishment of limitations on emission rates, emission concentrations, visible emissions, and opacity. The Project would be required to comply with applicable BAAQMD rules.
SS32: Emergency Back-up Generators	**Consistent**. Use of an emergency generator by the Project is anticipated. Therefore, when the emergency generators are installed, it would be required to meet BAAQMD's emissions standards for emergency back-up generators.
SS36: Particulate Matter from Trackout	**Consistent**. As required by the City's Standard Permit Condition, mud and dirt that may be tracked out onto the nearby public roads during construction activities would be removed by the contractor based on BAAQMD's requirements.
SS37: Particulate Matter from Asphalt Operations	**Consistent**. Abatement/control of blue smoke emissions related to asphalt delivery to roadway paving projects would be required based on BAAQMD's requirements.
SS38: Fugitive Dust	**Consistent**. Material stockpiling and track out during grading activities as well as smoke and fumes from paving and roofing asphalt operations would be required to utilize best management practices, such as watering exposed surfaces twice a day, covering haul trucks, keeping vehicle speeds on unpaved roads under 15 mph, to minimize the creation of fugitive dust. See City of San José Standard Permit Conditions for a more detailed list.
SS40: Odors	**Consistent**. The Project would comply with BAAQMD Regulation 7 to strengthen odor standards and enhance enforceability.
Transportation Control Measures	
TR2: Trip Reduction Programs	**Consistent.** The Project would include a number of travel demand measures (TDM) such as a road diet along Samaritan Drive and roundabout improvements at the Samaritan Drive and Samaritan Place intersection. These TDM Programs would help reduce vehicle miles traveled (VMT) and mobile greenhouse gas emissions. Additionally, the Project is located in proximity to transit services (e.g., VTA Bus Routes 27 and 61), where the Clipper® fare payment system can be used. Further, ridesharing services to Project employees are available through the 511 Regional Rideshare Program as well as other private rideshare programs.
TR5: Transit Efficiency and Use	
TR8: Ridesharing and Last-Mile Connections	
TR9: Bicycle and Pedestrian Access Facilities	**Consistent**. There is currently pedestrian access to/from the Project site via sidewalks along Samaritan Drive and Samaritan Place. Existing bicyclist facility includes an area along Samaritan Drive which provides Class II bike lanes with buffered striping to separate vehicle and bike travel. On Samaritan Drive, bicyclists either share the traffic lane or ride on the sidewalk. The proposed

Control Measure	Project Consistency
	Project includes installation of bike parking in accordance with CALGreen Code. According to San Jose Better Bike Plan 2025, there will be a class 3B bike boulevard along Samaritan Place, and a protected Class IV bike lane along Samaritan Drive. The proposed project would include 67 bicycle parking spaces as well as bicycle and pedestrian access on the driveways. This would promote safety and encourage employees to use alternative sources of transportation.
TR10: Land Use Strategies	**Consistent.** The proposed Project is consistent with Plan Bay Area, which considers the general plans of the jurisdictions that it covers. The Project is consistent with the General Plan and thus is within the expected development in Plan Bay Area. The Project site is located within 75 feet of eight transit stops at Samaritan Drive. Therefore, Project employment opportunities would be easily accessible via transit, furthering the City's General Plan goals to support a healthy community, reduce traffic congestion and decrease greenhouse gas emissions and energy consumption. The Project would not conflict with implementation of this measure.
TR19: Medium and Heavy-Duty Trucks	**Not Applicable**. The Project does not involve warehousing or industrial uses that would generate substantial truck trips. However, medium and heavy-duty trucks were modeled as part of the Health Risk Analysis and operational PM and TAC emissions are below BAAQMD thresholds. The Project would not conflict with the implementation of this measure.
TR22: Construction, Freight and Farming Equipment	**Consistent**. The Project would comply through implementation of CARB Tier 4 construction equipment and BAAQMD control measures.
Energy and Climate Control Measures	
EN1: Decarbonize Electricity Generation	**Consistent**. The Project would be constructed in accordance with the latest California Building Code and green building regulations/CalGreen and with the City of San José's California Green Building Standards Code, which include requirements that make new buildings more energy efficient than older buildings. Further, consistent with the City's Standard Permit Condition, the Project would be enrolled in the San José Clean Energy (SJCE) GreenSource Program (approximately 95 percent carbon free power) or TotalGreen (approximately 100 percent carbon free power). SJCE enrollment is required to comply with SB 100 requirements.
EN2: Decrease Electricity Demand	
Buildings Control Measures	
BL1: Green Buildings	**Consistent**. The Project would be constructed in accordance with the latest California Building Code and green building regulations/CalGreen. The proposed development would be constructed in compliance with the City's Council Policy 6-32 and the City's Green Building Ordinance.
BL2: Decarbonize Buildings	
BL4: Urban Heat Island Mitigation	**Consistent**. The Project would demolish the existing hospital main building (Building A) and existing daycare center. Project implementation would remove 370 trees but the Project is planting 530 24-inch box trees that will increase overall shading on the site compared to existing conditions. Additional landscaping is proposed throughout the Project site and would include a mix of grasses, shrubs, and ground cover. Tree and additional landscaping is consistent with the use of cool surface treatments to reduce urban heat island effects. The Project would also comply with the cool roof requirements in California's Title 24, Part 6 Building Energy Efficiency Standards, which would further reduce the urban heat island effect from existing conditions.
Natural and Working Lands Control Measures	
NW2: Urban Tree Planting	**Not Applicable**. The Project site is in an existing hospital. The Project site includes landscaping with a mix of trees, grasses, shrubs, and ground cover. Additional trees will also be planted along the Samaritan Drive frontage, increasing public urban tree access.

Control Measure	Project Consistency
Waste Management Control Measures	
WA3: Green Waste Diversion	**Consistent**. The waste service provider for the Project would be required to meet the AB 341 and SB 939, 1374, and 1383 requirements that require waste service providers to divert and recycle waste. Per Cal Green requirements and the City's Zero Waste strategic plan, which requires diversion of 90 percent of waste aways from landfills, the Project would recycle construction waste.
WA4: Recycling and Waste Reduction	
Water Control Measures	
WR2: Support Water Conservation	**Consistent**. The Project would implement water conservation measures and low flow fixtures as required by Title 24, CalGreen, and the City of San José's Municipal Code Section 15-11 Water Efficient Landscaping Ordinance, which includes various specifications for plant types, water features, and irrigation design etc.
Source: BAAQMD, Clean Air Plan, 2017 and Kimley-Horn & Associates, 2023.	

As discussed above, the Project would include appliable control measures from the Clean Air Plan.

Criterion 3: Does the Project hinder or disrupt the implementation of any Air Quality Control Measures?

The Clean Air Plan assumptions for projected air emissions and pollutants in the City of San José are based on the Envision San José 2040 General Plan Land Use Designation Map which designates the Project site use as Neighborhood/Community Commercial (NCC). The Project land use is consistent with the City's General Plan land use designation. The Project has a floor area ratio (FAR) within the allowable range for the Neighborhood/Community Commercial (NCC) land use designation. The use and FAR are consistent with the permitted uses and density of the NCC designation. Therefore, the Project is consistent with the General Plan assumptions. The proposed Project consists of an expansion of Good Samaritan Hospital consistent with the Envision San José 2040 General Plan land use designation and would not increase the regional population growth or cause changes in vehicle traffic that would obstruct implementation of the Clean Air Plan in the San Francisco Bay Area Basin.

Specifically, the Project is anticipated to generate approximately 89[8] new hospital jobs and 869 new MOB jobs within the City. ABAG predicts that job opportunities in the City of San José will grow from 369,500 in 2019 to 708,980 by 2040. Therefore, the 958 new jobs generated by the Project would be within the ABAG growth projections for the City. As identified in the General Plan Environmental Impact Report (EIR), the City currently has an existing ratio of 0.8 jobs per resident. The General Plan Final EIR identified that at full buildout of the General Plan, the existing ratio of jobs per employed resident would be increased to a job per employed resident ratio of 1.3. Because the Project is consistent with planned land uses for the Project site, the Project would not exceed the level of population or housing in regional planning efforts. Population growth from the Project would be consistent with ABAG's projections for the City and with the City's General Plan and accounted for in BAAQMD's assumptions in its Clean Air Plan. Thus, the jobs associated with the Project would not conflict with the Clean Air Plan.

Further, Table 6 outlines the Project's consistency with the applicable 2017 Clean Air Plan policies. Therefore, the Project would not hinder or disrupt the implementation of any 2017 Clean Air Plan Control Measures and impacts would be less than significant.

[8] The Project would increase the number of licensed acute care beds from 405 to 419 and result in a net increase of 89 new jobs. The proposed 200,000 sf medical office building is anticipated to result in an approximate net increase of 869 jobs. This would result in 958 new jobs.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

Threshold AQ-2: Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Unmitigated Construction Emissions

Project construction activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the Project area include O_3-precursor pollutants (i.e., ROG and NO_x) and PM_{10} and $PM_{2.5}$ because the Air Basin is in non-attainment for O_3 and particulate matter Construction-generated emissions are short term and temporary, lasting only while construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds BAAQMD's thresholds of significance.

Construction results in the temporary generation of emissions during demolition, site preparation, site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities, as well as weather conditions and the appropriate application of water.

The Project's construction-related emissions were calculated using the BAAQMD-approved CalEEMod computer program, which is designed to model emissions for land use development projects, based on typical construction requirements. Three construction phases were modeled for the Project. Phase 1 of construction of the Project was modeled to begin March 2024 with a construction duration of approximately 68 months and would include 392,650 sf of demolition, including existing buildings and pavement. Phase 2 construction was modeled to being in December 2029 for a duration of 24 months and includes 603,600 sf of demolition. Phase 3 was modeled to being in January 2032 for a duration of 29 months and includes 218,000 of demolition. The construction schedules are shown in Table 7: Construction Schedule. The exact construction timeline is unknown; however, to be conservative, earlier dates for the commencement of construction were utilized in the modeling. This approach is conservative given that emissions factors decrease in future years due to regulatory and technological improvements and fleet turnover. See Appendix B: Air Quality Assessment for additional information regarding the construction assumptions used in this analysis.

Table 7: Unmitigated Construction-Related Emissions

Phase type	Start	End	Days
Phase 1			
Site Preparation	3/27/2024	4/23/2024	24
Demolition	4/24/2024	7/16/2024	72
Grading	7/17/2024	8/13/2024	24
Building Construction + Infrastructure Improvements	4/24/2024	12/25/2029	1,776

Source: Refer to Appendix A: Modeling Data.			

Additionally, Table 8: Grading Estimates provides the total material imported and exported during each phase of construction.

Table 8: Unmitigated Construction-Related Emissions

Phase	Total Material Imported (cubic yards)	Total Material Exported (cubic yards)
Phase 1	10,000	40,000
Phase 2	70,000	1,000
Phase 3	5,000	21,000
Source: Refer to Appendix A: Modeling Data.		

The Project's predicted maximum daily unmitigated construction-related emissions are summarized in Table 9: Unmitigated Construction-Related Emissions. Unmitigated emissions from project construction would exceed BAAQMD's CEQA thresholds of significance for NO_X.

Table 9: Unmitigated Construction-Related Emissions

Construction Year	Pollutant (maximum pounds per day)[1]					
	ROG	NO_x	Exhaust		Fugitive Dust	
			PM_{10}	$PM_{2.5}$	PM_{10}	$PM_{2.5}$
Phase 1						
2024	6.54	76.30	2.36	2.08	43.20	14.20
2025	2.42	17.20	0.50	0.46	3.82	0.94
2026	2.28	16.30	0.44	0.41	3.82	0.94

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. Emissions were calculated using CalEEMod. Unmitigated emissions include compliance with BAAQMD's Basic Construction Mitigation Measures Recommended for All Projects and the City of San José Environmental Standard Conditions. These measures include the following: water exposed surfaces two times daily; cover haul trucks; clean track outs with wet powered vacuum street sweepers; limit speeds on unpaved roads to 15 miles per hour; complete paving as soon as possible after grading; limit idle times to 5 minutes; properly maintain mobile and other construction equipment; and post a publicly visible sign with contact information to register dust complaints and take corrective action within 48 hours.
2. Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, updated April 2022.
3. BMPs = Best Management Practices. BAAQMD recommends the implementation of all Basic Construction Mitigation Measures, whether or not construction-related emissions exceed applicable significance thresholds. Implementation of Basic Construction Mitigation measures are considered to mitigate fugitive dust emissions to be less than significant.

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

Fugitive Dust Emissions. Fugitive dust emissions are associated with land clearing, ground excavation, cut-and-fill operations, demolition, and truck travel on unpaved roadways. Dust emissions also vary substantially from day to day, depending on the level of activity, the specific operations, and weather conditions. Fugitive dust emissions may have a substantial, temporary impact on local air quality. In addition, fugitive dust may be a nuisance to those living and working in the Project vicinity. Uncontrolled dust from construction can become a nuisance and potential health hazard to those living and working nearby. BAAQMD recommends the implementation of all Basic Construction Control Measures, whether or not construction-related emissions exceed applicable significance. The measures would be implemented by the project as they are required by the City's standard permit conditions for construction. With the implementation of the City's standard permit conditions, which includes BAAQMD Basic Construction Control Measures (BMP), to control dust at the Project site during all phases of construction.

Standard Permit Condition (SPC)

These measures would be included on the Project plan documents prior to the issuance of any grading permits for the proposed Project.

i. Water active construction areas at least twice daily or as often as needed to control dust emissions.
ii. Cover trucks hauling soil, sand, and other loose materials and/or ensure that all trucks hauling such materials maintain at least two feet of freeboard.
iii. Remove visible mud or dirt track-out onto adjacent public roads using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
iv. Enclose, cover, water twice daily or apply non-toxic soil binders to exposed stockpiles (dirt, sand, etc.).
v. Pave new or improved roadways, driveways, and sidewalks as soon as possible.
vi. Lay building pads as soon as possible after grading unless seeding or soil binders are used.
vii. Limit all vehicle speeds on unpaved roads to 15 mph.

viii. Replant vegetation in disturbed areas as quickly as possible.
ix. Install sandbags or other erosion control measures to prevent silt runoff to public roadways.
x. Minimizing idling times either by shutting off equipment when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Provide clear signage for construction workers at all access points.
xi. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified visible emissions evaluator.
xii. Post a publicly visible sign with the telephone number and person to contact at the lead agency regarding dust complaints.

Construction Equipment and Worker Vehicle Exhaust. Exhaust emission factors for typical diesel-powered heavy equipment are based on the CalEEMod program defaults. Variables factored into estimating the total construction emissions include: level of activity, length of construction period, number of pieces/types of equipment in use, site characteristics, weather conditions, number of construction personnel, and the amount of materials to be transported onsite or offsite. Exhaust emissions from construction activities include emissions associated with the transport of machinery and supplies to and from the Project site, emissions produced on site as the equipment is used, and emissions from trucks transporting materials and workers to and from the site. Emitted pollutants would include ROG, NO_X, PM_{10}, and $PM_{2.5}$. NO_X emissions are primarily generated by engine combustion in construction equipment, haul trucks, and employee commuting, requiring the use of newer construction equipment with better emissions controls would reduce construction-related NO_X emissions. The Project would also include BAAQMD BMPs and City SPC. As detailed in Table 7, Project construction emissions would be above BAAQMD threshold for NO_X during Phase 1 and construction emissions would result in a potentially significant impact.

ROG Emissions. In addition to gaseous and particulate emissions, the application of asphalt and surface coatings creates ROG emissions, which are O_3 precursors. In accordance with the methodology prescribed by BAAQMD, the ROG emissions associated with paving have been quantified with CalEEMod. The highest concentration of ROG emissions would be generated from architectural coating in Phase 1 beginning in Winter 2028 and lasting approximately seven months. This phase includes the interior and exterior painting as well as striping of all paved parking areas and driveways. Paints would be required to comply with BAAQMD Regulation 8, Rule 3: Architectural Coating. Regulation 8, Rule 3 provides specifications on painting practices and regulates the ROG content of paint.

Summary. As shown in Table 9 NO_X would be above the 54 lbs/day during Phase 1 construction, while the rest of the criteria pollutant emissions would remain below their respective thresholds. Further, due to cancer risk exceeding BAAQMD thresholds, the Project would include MM HRA-1 below which requires the Project to include, at a minimum, Tier 4 engines and particulate matter emissions control equivalent to CARB Level 3 verifiable diesel emission control devices for construction equipment greater than 25 horsepower (hp) or obtain written approval by the City to use other equipment meeting the same emission profile.

Mitigated Construction Emissions

The Project's predicted maximum daily mitigated construction-related emissions are summarized in Table 10: Mitigated Construction-Related Emissions.

Table 10: Mitigated Construction-Related Emissions

Construction Year	Pollutant (maximum pounds per day)[1,2]					
	ROG	NO_x	Exhaust		Fugitive Dust	
			PM_{10}	$PM_{2.5}$	PM_{10}	$PM_{2.5}$
Phase 1						
2024	2.79	38.10	0.61	0.49	31.30	8.02
2025	1.62	9.61	0.14	0.14	3.82	0.94

Exceed BAAQMD Threshold?	**No**	**No**	**No**	**No**	**N/A**	**N/A**

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. Emissions were calculated using CalEEMod. Unmitigated emissions include compliance with BAAQMD's Basic Construction Mitigation Measures Recommended for All Projects and the City of San José Environmental Standard Conditions. These measures include the following: water exposed surfaces two times daily; cover haul trucks; clean track outs with wet powered vacuum street sweepers; limit speeds on unpaved roads to 15 miles per hour; complete paving as soon as possible after grading; limit idle times to 5 minutes; properly maintain mobile and other construction equipment; and post a publicly visible sign with contact information to register dust complaints and take corrective action within 48 hours.
2. Mitigated construction emissions assume watering control consistent with BAAQMD recommendations and the use of CARB Tier 4 Final construction equipment.
3. Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, updated April 2022.
4. BMPs = Best Management Practices. BAAQMD recommends the implementation of all Basic Construction Mitigation Measures, whether or not construction-related emissions exceed applicable significance thresholds. Implementation of Basic Construction Mitigation measures are considered to mitigate fugitive dust emissions to be less than significant.

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

As described above, the Project would implement the City's Standard Permit Conditions, which includes BAAQMD Basic Construction Control Measures, whether or not construction-related emissions exceed applicable significance thresholds (see the above listed Standard Permit Condition). With implementation of the Standard Permit Condition and Project condition of approval, listed above, and MM HRA-1, the proposed Project's construction would not worsen ambient air quality, create additional violations of federal and state standards, or delay the Basin's goal for meeting attainment standards. Impacts would be less than significant with mitigation.

Operational Emissions

Operational emissions for hospital developments are typically generated from mobile sources (burning of fossil fuels in cars); energy sources (cooling, heating, and cooking); and area sources (landscape equipment and household products).[9] Table 11 shows that the Project's maximum emissions would not exceed BAAQMD operational thresholds.

Table 11: Maximum Daily Project Operational Emissions: Existing and Buildout

Emissions Source	Pollutant (maximum pounds per day)[1]					
	ROG	NO_x	Exhaust		Fugitive Dust	
			PM_{10}	$PM_{2.5}$	PM_{10}	$PM_{2.5}$

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. Emissions were calculated using CalEEMod.
2. This analysis conservatively assumed no existing operational emergency generators. Stationary emissions sources for the buildout scenario include four diesel emergency backup generators, five natural gas boilers, and nine natural gas water heaters.
3. Central Utility Plant Calculated separate from CalEEMod model run and can be found in Appendix B.
4. Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines*, 2022.

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

[9] It should be noted that helicopter emissions were not calculated for this analysis as there would be no changes to helicopter operations as a result of the Project.

Area Source Emissions Area source emissions would be generated due to an increased demand for consumer products, architectural coating, and landscaping. As shown in Table 11, area source emissions from the Project would not exceed BAAQMD thresholds for ROG, NO_X, PM_{10}, and $PM_{2.5}$.

Energy Source Emissions. Energy source emissions would be generated as a result of electricity usage associated with the Project. The primary use of electricity by the Project would be for space heating and cooling, water heating, ventilation, lighting, appliances, and electronics. As shown in Table 11, energy source emissions from the Project would not exceed BAAQMD thresholds for ROG, NO_X, PM_{10}, and $PM_{2.5}$.

Mobile Sources. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions. Depending upon the pollutant being discussed, the potential air quality impact may be of either regional or local concern. For example, ROG, NO_X, PM_{10}, and $PM_{2.5}$ are all pollutants of regional concern (NO_X and ROG react with sunlight to form O_3 [photochemical smog], and wind currents readily transport PM_{10} and $PM_{2.5}$). However, CO tends to be a localized pollutant, dispersing rapidly at the source.

Project-generated vehicle emissions have been estimated using CalEEMod. Trip generation rates associated with the Project were based on the Project Transportation Analysis prepared by Kimley-Horn (2023). Based on the Transportation Analysis, the Project would result in a gross total of 15,724 daily vehicle trips. However, with applicable trip reductions including pass-by trips and location-based mode-share the Project would result in 14,965 new trips. The Transportation Analysis takes further credit for the existing land uses on the Project site which anticipates the proposed Project to generate a net total of 9,861 net daily trips to the roadway network. Table 11 shows the net Project emissions generated by the Project would not exceed established BAAQMD regional thresholds.

Stationary Sources and Emergency Generators. Four diesel emergency generators, five natural gas boilers, and nine natural gas water heaters, which are within the central utility plant, were included in the modeling. Emission factors from the South Coast Air Quality Management District (SCAQMD) *AB 2588 Quadrennial Air Toxics Emissions Inventory Reporting Procedures, Annual Emissions Reporting Program* (June 2020) were used for natural gas combustion associated with the boilers and hot water heater operations as this data is not provided by BAAQMD and is not geographically dependent. Generator emissions were derived from CARB OFFROAD emissions data.

Emergency generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. The reliance on generators to supply the power needed to keep the hospital running during power loss is not expected to be frequent of prolonged, is not a reasonably foreseeable scenario, and therefore is not analyzed under CEQA. Nonetheless, testing and maintenance emissions associated with four emergency generators were included to be conservative. The Applicant would be required to obtain Permits to Operate prior to the installation and operation of the emergency generators. Testing and maintenance includes 50 hours per year per generator. If emergency generators are required, the end user would be required to obtain a permit from the BAAQMD and include the Best Available Control Technology (BACT) prior to installation.

Due to hospital requirements and Project construction Phasing, parts of the Project will be operational during active construction. To assess the maximum daily emissions associated with the Project, interim operational phases, as Phase 1 Interim and Phase 2 Interim, were determined in relation to the construction phases. As indicated in Table 12: Operational Phase 1 and Phase 2 Emissions, Project operational emissions would not exceed BAAQMD thresholds. The federal ambient air quality standards establish the levels of air quality necessary, with an adequate margin of safety, to protect the public

health. Therefore, the Project would not violate any air quality standards or contribute substantially to an existing or projected air quality violation and no criteria pollutant health impacts would occur. Project operational emissions would be less than significant.

Table 12: Operational Phase 1 and Phase 2 Emissions

Emissions Source	Pollutant (maximum pounds per day)[1]

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. Assumes emissions from gas vehicles only. Electric Vehicles would not generate criteria air pollutant emissions.
2. The operation of the CUP (stated as stationary sources) would serve both Phase 1 Interim and Phase 2 Interim operations resulting in shared emissions. Thus, the stationary emissions were only included as part of the Phase 2 Interim to avoid double-counting. Stationary emissions sources include five natural gas boilers and nine natural gas water heaters.
3. The four emergency generators are assumed to be operational during Phase 2 Interim.
4. Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, 2022.

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

Overlapping Emissions

The Project would be built in phases which would result in operational emissions and construction emissions to overlap. The overlapping emissions would occur with the following scenarios:

- Phase 1 operation and Phase 2 construction.
- Phase 1 operation, Phase 2 operation, and Phase 3 construction.

The overlapping emissions of Phase 1 operations, Phase 2 construction and operation, and Phase 3 construction are shown in Table 13: Unmitigated Project Overlapping Emissions and Table 14: Mitigated Project Overlapping Emissions. Table 13 shows that total overlapping emissions would not exceed BAAQMD thresholds for ROG and NO_X.

Table 13: Unmitigated Project Overlapping Emissions

Emissions Source	Pollutant (maximum pounds per day)[1]					
	ROG	NO_x	Exhaust		Fugitive Dust

Exceed BAAQMD Threshold?	No	No	No	No	No	No

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. Assumes emissions from gas vehicles only. Electric Vehicles would not generate criteria air pollutant emissions.
2. The operation of the CUP (stated as stationary sources) would serve both Phase 1 Interim and Phase 2 Interim operations resulting in shared emissions. Thus, the stationary emissions were only included as part of the Phase 2 Interim to avoid double-counting. Stationary emissions sources include five natural gas boilers and nine natural gas water heaters.
3. The four emergency generators are assumed to be operational during Phase 2 Interim.
4. The reduction/credits for construction emissions are based on "mitigation" included in CalEEMod and as typically required by BAAQMD (Basic Control Measures). The mitigation includes the following: replace ground cover on disturbed areas quickly, water exposed surfaces twice daily, and proper loading/unloading of mobile and other construction equipment (BMP). The reduction/credits for construction emissions also includes Tier 4 construction equipment (MM HRA-1).
5. Bay Area Air Quality Management District, California Environmental Quality Act Air Quality Guidelines, 2022.

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

Additionally, mitigation measures such as Tier 4 construction equipment (MM HRA-1), and standard BAAQMD basic construction control measures were included to reduce construction emissions (BMP). After mitigation, Table 14 shows that total overlapping emissions would continue to not exceed BAAQMD thresholds.

Table 14: Mitigated Project Overlapping Emissions

Source: CalEEMod version 2022.1.1.20 Refer to Appendix A: Air Quality Modeling Data.

Federal and state ambient air quality standards for criteria air pollutants have been set to protect public health, with an adequate margin of safety, and the climate. The BAAQMD thresholds for criteria air pollutants represent the level of emissions a project can have while allowing the air basin to attain federal and state ambient air quality standards. With mitigation, the Project would not have a significant impact on criterial air pollutants during construction or operation and thus would not have an adverse impact on human health due to criteria air pollutant emissions.

Cumulative Impacts

The geographic scope of the cumulative impacts is the Air Basin. The Basin is designated nonattainment for O_3, PM_{10}, and $PM_{2.5}$ for State standards and nonattainment for O_3 and $PM_{2.5}$ for federal standards.

The analysis of criteria air pollutants is inherently cumulative. No single project is sufficient in size, by itself, to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. BAAQMD developed the criteria air pollutant thresholds of significance based on the level above which a project's individual emissions would result in a cumulatively considerable contribution to the Basin's existing air quality conditions. Therefore, a project that exceeds BAAQMD's project-level criteria air pollutant thresholds also would make a cumulatively considerable contribution to a significant cumulative impact. If a project is considered to have cumulatively significant impacts, the analysis will also determine if the project is a cumulatively considerable contributor.

Construction

As discussed above and shown in Table10, the Project's construction-related emissions, with mitigation, by themselves would not have the potential to exceed BAAQMD significance thresholds for criteria

pollutants. Since these thresholds indicate whether an individual project's emissions have the potential to make a cumulatively considerable contribution to significant cumulative regional air quality impacts, the Project-related construction emissions with mitigation (implementation of MM HRA-1) also would not be cumulatively considerable. BAAQMD recommends Basic Construction Control Measures for all projects whether or not construction-related emissions exceed the thresholds of significance. Compliance with BAAQMD construction-related mitigation requirements is considered to reduce a project's contribution to cumulative impacts at a Basin-wide level to less than cumulatively considerable. As a result, construction emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

Operations

As shown in Table 13 and Table 14, the Project's operational emissions would not exceed BAAQMD thresholds for criteria pollutants. As a result, operational emissions associated with the Project would not result in a cumulatively considerable contribution to significant cumulative air quality impacts.

Mitigation Measures: Mitigation Measure HRA-1.

Level of Significance: Less than significant with mitigation and compliance with standard conditions and City policies.

Threshold AQ-3: Would the Project expose sensitive receptors to substantial pollutant concentrations?

Sensitive land uses are defined as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. Sensitive receptors nearest to the Project site include multi-family approximately 45 feet southeast of the Project site across Samaritan Place, the Cambrian Center Retirement Home approximately 50 feet southeast of the Project site, and single-family residences along Lost Oaks Drive approximately 200 feet south of the Project site. These distances are from the Project site to the sensitive receptor property line.

Carbon Monoxide Hotspots

Intersection Hotspots. The primary mobile-source criteria pollutant of local concern is CO. Concentrations of CO are a direct function of the number of vehicles, length of delay, and traffic flow conditions. Transport of this criteria pollutant is extremely limited; CO disperses rapidly with distance from the source under normal meteorological conditions. Under certain meteorological conditions, however, CO concentrations close to congested intersections that experience high levels of traffic and elevated background concentrations may reach unhealthy levels, affecting nearby sensitive receptors. Areas of high CO concentrations, or "hot spots," are typically associated with intersections that are projected to operate at unacceptable levels of service during the peak commute hours. CO concentration modeling is therefore typically conducted for intersections that are projected to operate at unacceptable levels of service during peak commute hours.

The SFBAAB is designated as in attainment for CO. Emissions and ambient concentrations of CO have decreased dramatically in the Basin with the introduction of the catalytic converter in 1975. No exceedances of the CAAQS or NAAQS for CO have been recorded at nearby monitoring stations since 1991. As a result, the BAAQMD screening criteria notes that CO impacts may be determined to be less

than significant if a project would not increase traffic volumes at local intersections to more than 44,000 vehicles per hour, or 24,000 vehicles per hour for locations in heavily urban areas, where "urban canyons" formed by buildings tend to reduce air circulation. Traffic would increase along surrounding roadways during long-term operational activities.

According to the Traffic Analysis prepared for the Project (2023), the Project would generate 9,861 net daily trips. The Project's effects to existing vehicle distribution and travel speeds would be nominal. Therefore, the project would not involve intersections with more than 24,000 or 44,000 vehicles per hour. As a result, the Project would not have the potential to create a CO hotspot and impacts would be less than significant.

Parking Structure Hotspots. CO concentrations are a function of vehicle idling time, meteorological conditions, and traffic flow. Therefore, parking structures (and particularly subterranean parking structures) tend to be of concern regarding CO hotspots, as they are enclosed spaces with frequent cars operating in cold start mode. The proposed Project includes approximately 2,179 parking spaces which includes surface parking and other construction of spaces within garage east and west. The proposed Project would be required to comply with the ventilation requirements of the International Mechanical Code (Section 404 [Enclosed Parking Garages]), which requires that mechanical ventilation systems for enclosed parking garages operate automatically by means of CO detectors in conjunction with NO_2 detectors. Section 404.2 requires a minimum air flow rate of 0.05 cubic feet per second per SF and the system shall be capable of producing a ventilation airflow rate of 0.75 cubic per second per SF of floor plan area. Impacts in regard to parking structure CO hotspots would be less than significant.

Toxic Air Contaminants

Construction equipment and associated heavy-duty truck traffic generate diesel exhaust, which is a known TACs. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors. The closest sensitive receptor to the Project site are the residences to the east of the Project site. BAAQMD provides guidance for evaluating impacts from TACs in its CEQA Air Quality Guidelines document. As noted therein, an incremental cancer risk of greater than 10 cases per million at the Maximally Exposed Individual (MEI) will result in a significant impact. BAAQMD considers exposure to annual $PM_{2.5}$ concentrations that exceed 0.3 $\mu g/m^3$ from a single source to be significant. The BAAQMD significance threshold for non-cancer hazards is 1.0.

Stationary sources within a 1,000-foot radius of the Project site were identified using BAAQMD's Stationary Source Screening Analysis Tools and consultation with BAAQMD. BAAQMD confirmed four sources exist within 1,000-feet of the Project site and are further evaluated in the Health Risk Assessment (HRA) prepared by Kimley-Horn 2023.

Construction-Related Diesel Particulate Matter

Project construction would generate DPM emissions from the use of off-road diesel equipment required for grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site poses a

health risk to nearby sensitive receptors. The closest sensitive receptor are single-family residences approximately 45 feet east of the Project site.

The amount to which the receptors are exposed (a function of concentration and duration of exposure) is the primary factor used to determine health risk (i.e., potential exposure to TAC emission levels that exceed applicable standards). On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur in various phases throughout the Project site. Additionally, construction activities would limit idling to no more than five minutes (per City and State standards, see Standard Permit Condition in impact section above), which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense year of construction, emissions of DPM would be generated from different locations on the Project site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time.

$PM_{2.5}$ construction emissions rates in grams per second were calculated from the total annual mitigated on-site exhaust emissions reported in CalEEMod total during construction. It shall be noted that although construction would span over several years, the modeling conservatively uses the year with the highest emission for each phase. Annual emissions were converted to grams per second and these emissions rates were input into AERMOD.

As noted above, maximum (worst case) $PM_{2.5}$ exhaust construction emissions over the entire construction period were used in AERMOD to approximate construction DPM emissions. Risk levels were calculated based on the California Office of Environmental Health Hazard Assessment (OEHHA) guidance document, Air Toxics Hot Spots Program Risk Assessment Guidelines (February 2015). Results of this assessment are summarized in Table 15: Particulate Matter Concentration and Carcinogenic Risk. The reported annual pollutant concentrations in Table 15 are at the closest maximally exposed individual (MEI) at the residential receptors to the east of the Project site, the on-site patient and worker receptor at the existing hospital building, and the worker receptors to the west of the Project site.

Table 15: Particulate Matter Concentration and Carcinogenic Risk

Exposure Scenario	$PM_{2.5}$ Annual Concentration (µg/m³)	$PM_{2.5}$ Threshold (µg/m³)	Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Risk Significance Threshold?
Unmitigated					
Construction

Off-Site Worker Receptor[2]	0.03	0.30	4.90	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual (MEI) to the Project site.
2. The mitigated exposure scenario accounts for implementation of MM HRA-1 which requires all heavy-duty off-road construction equipment to meet CARB Tier 4 Final. This would reduce construction risk levels below BAAQMD thresholds. No mitigation is required for operations.

Source: Refer to HRA Report Appendix A: Modeling Data.

As shown in Table 13, the unmitigated construction risk at residential and on-site patient receptors would be approximately 17 and 15 in one million, respectively. The unmitigated construction risk at the on-site worker and off-site worker receptors would be approximately five in one million each. Additionally, the unmitigated operational cancer risk at residential and on-site patient receptors would be approximately three and four in one million, respectively. The operational risk at the on-site worker receptor would be approximately three in one million and four in one million at the off-site worker receptor.

The unmitigated combined construction and operational cancer risk at the on-site worker receptor would be approximately seven in one million and nine in one million at the off-site worker receptor. Further, the unmitigated combined construction and operational cancer risk at residential and on-site patient receptors would be approximately 20 and 19 in one million, respectively. Therefore, the maximum unmitigated construction cancer risk and unmitigated combined construction and operational cancer risk would exceed the BAAQMD threshold of 10 in one million.

The Project would implement mitigation measure HRA-1 (MM HRA-1) to reduce cancer risk. MM HRA-1 requires the use of construction equipment that would meet CARB Tier 4 Final emissions standards in order to reduce diesel exhaust construction emissions. Implementation of MM HRA-1 would reduce cancer risk from Project construction to below BAAQMD's 10 in one million threshold; refer to Table 13. Therefore, the Project's cancer risk would not exceed BAAQMD's 10 in one million threshold and impacts associated with carcinogenic risk would be less than significant.

Mitigation Measures:

HRA-1 All construction equipment must meet the standards set forth below.

- All diesel-powered off-road equipment, larger than 25 horsepower, operating on the site for more than two days continuously shall meet Tier 4 Final U.S. Environmental Protection Agency (EPA) particulate matter emissions standards.
- If Tier 4 Final equipment are not available, other measures may include the use of added exhaust devices, alternatively fueled equipment, or a combination of measures, provided that these measures demonstrate reduction in community risk impacts to a less than significant level, are verified by an air quality specialist, and approved by the City.
- The construction operations plan prepared by the construction contractor shall outline how the contractor will achieve the measures outlined in this mitigation measure. The plan shall include, but not be limited to the following:
    - List of activities and estimated timing.
    - Equipment that would be used for each activity.
    - Manufacturer's specifications for each equipment that provides the emissions level; or the manufacturer's specifications for devices that would be added to each piece of equipment to ensure the emissions level meet the thresholds in the mitigation measure.
    - How the construction contractor would ensure that the measures listed are monitored.
    - How the construction contractor would remedy any exceedance of the thresholds.
    - How often and the method the construction contractor would use to report compliance with this mitigation measure.

Non-Carcinogenic Hazard

Table 14: Chronic and Acute Hazard show that the highest calculated carcinogenic risk at the Project site would be less than hazard index of 1.0 at off-site sensitive receptors and on-site receptors. Therefore, impacts from construction and operational non-carcinogenic hazards would be less than significant.

Table 16: Chronic and Acute Hazard

Exposure Scenario[1]	Chronic Hazard	Acute Hazard[2]
Unmitigated Construction		
Residential Receptor	0.0202	N/A

Exposure Scenario[1]	Chronic Hazard	Acute Hazard[2]
On Site Patient Receptor	0.0474	N/A
On Site Worker Receptor[2]	0.0422	N/A
Off Site Worker Receptor[2]	0.0380	N/A
Unmitigated Operation		
Residential Receptor	0.0009	0.0001
On Site Patient Receptor	0.0019	<0.0001
On Site Worker Receptor[2]	<0.0001	<0.0001
Off Site Worker Receptor[2]	0.0067	<0.0001
BAAQMD Threshold	*1.0*	*1.0*
Threshold Exceeded?	**No**	**No**

1. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).
2. DPM is the primary TAC occurring during construction. There is no acute REL for DPM and acute health risk cannot be calculated. The Acute hazard would occur from natural gas boiler exhaust and is calculated using RELs from OEHHA.

Source: Refer to HRA Report Appendix A: Modeling Data.

Cumulative Health Impacts

Mobile and stationary sources within a 1,000-foot-radius of the Project site were identified using BAAQMD's Stationary Source Screening Analysis Tools and consultation with BAAQMD. As indicated in Table 15: Cumulative Health Risk, TACs generated from the stationary and roadway sources within a 1,000-foot-radius would not exceed BAAQMD thresholds.

Table 15 shows that cumulative impacts related to cancer risk and hazard would be less than cumulatively considerable and within acceptable limits. Additionally, cumulative $PM_{2.5}$ concentrations at the residential MEI would not exceed BAAQMD's cumulative threshold of 0.8 µg/m^3, the primary contributor to those concentrations is the existing highway sources near the Project area. The existing highway sources have a high $PM_{2.5}$ concentration (0.37 µg/m^3). The highway sources represent approximately 80 percent of the total concentrations and are unrelated to the Project. The Project represents less than one percent of total cumulative $PM_{2.5}$ in the Project area.

Table 17: Cumulative Health Risk

Emissions Sources	$PM_{2.5}$ (µg/m^3)	Cancer Risk (per million)	Hazard
Project Emissions	0.005	3.15	0.02
Stationary Sources[2]			
California Skin Institute	0.00	0.05	0.00
Major Street Sources[1]	0.08	3.64	0.32
Highway Sources[1]	0.37	10.85	1.48
Railway Sources[1]	0.00	0.11	0.00
Cumulative Health Risk Values	**0.46**	**17.80**	**1.82**
BAAQMD Cumulative Threshold	*0.8*	*100*	*10*
Threshold Exceeded?	**No**	**No**	**No**

1. BAAQMD GIS data.

Emissions Sources	$PM_{2.5}$ (µg/m³)	Cancer Risk (per million)	Hazard
2. Good Samaritan Emergency Room is listed as an existing stationary source within BAAQMD's Stationary Source Data Inventory. However, this source will be demolished in Phase 1 of Project construction and is therefore not included in this analysis.			
Source: BAAQMD's Stationary Source Data and GIS Mapping Tools, 2023.			

The Project and the cumulative project total $PM_{2.5}$ concentrations and cancer risk would not exceed BAAQMD cumulative thresholds. Therefore, the combined effects from both the proposed Project and related projects would not be cumulatively significant. The Project is also below BAAQMD's incremental health risk thresholds with the implementation of MM HRA-1. Therefore, the incremental effect of the individual Project is also less than cumulatively considerable.[10] As the related cumulative TAC sources in the Project area do not exceed BAAQMD cumulative thresholds for cancer risk and the Project does not exceed BAAQMD incremental thresholds, impacts would not be cumulatively considerable. Therefore, the project's cumulative impacts would be less than cumulatively considerable.

Mitigation Measures: Mitigation Measure HRA-1.

Level of Significance: Less than significant impact and less than cumulatively considerable impacts.

Threshold AQ-4: Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Construction

According to BAAQMD, land uses associated with odor complaints typically include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants. The Project does not include any uses identified by BAAQMD as being associated with odors.

Construction activities associated with the Project may generate detectable odors from heavy duty equipment (i.e., diesel exhaust), as well as from architectural coatings and asphalt off-gassing. Odors generated from the referenced sources are common in the man-made environment and are not known to be substantially offensive to adjacent receptors. Any construction-related odors would be episodic due to the nature of construction and cease upon Project completion. Odors also would be limited due to the requirement that construction vehicles not idle for longer than five minutes. Odors also would be within odors expected in urban areas, which tend to be exposed to more development and redevelopment than rural areas. As a result, impacts to existing adjacent land uses from construction-related odors would be short-term in duration and therefore would be less than significant.

Operational

BAAQMD has established odor screening thresholds for land uses that have the potential to generate substantial odor complaints, including wastewater treatment plants, landfills or transfer stations, composting facilities, confined animal facilities, food manufacturing, and chemical plants. BAAQMD's thresholds for odors are qualitative based on BAAQMD's Regulation 7, Odorous Substances. This rule

[10] CEQA case law has held that any additional emissions in an impacted area does not necessarily create a significant cumulative impact, finding that "the 'one [additional] molecule rule' is not the law" (Communities for a Better Environment v. California Resources Agency (2002) 103 Cal. App. 4th 98, 120).

places general limitations on odorous substances and specific emission limitations on certain odorous compounds. Further, BAAQMD CEQA Guidelines identifies a significant impact for odors if there are five confirmed complaints per year averaged over 3 years.

With respect to odor impacts from adjacent and nearby properties that could affect Project visitors (although not a CEQA impact) no land uses typically producing objectionable odors are located near the Project site and there have been no confirmed complaints of odor for the existing land use. Further, the project site is an existing hospital and odors from the proposed Project will remain unchanged from the existing land uses. Impacts would be less than significant.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impacts.

5.2 CUMULATIVE SETTING, IMPACTS, AND MITIGATION MEASURES

Cumulative Setting

The cumulative setting for air quality includes the City and the Air Basin. The Air Basin is designated as a nonattainment area for state standards of O_3, PM_{10}, and $PM_{2.5}$ and federal standards of O_3 and $PM_{2.5,}$ attainment, and serious maintenance for federal PM_{10} standards, and is designated as unclassified or attainment for all other pollutants. Cumulative growth in population and vehicle use could inhibit efforts to improve regional air quality and attain the ambient air quality standards.

Cumulative Impacts and Mitigation Measures

The BAAQMD CEQA Air Quality Guidelines do not include separate significance thresholds for cumulative operational or construction emissions that result in criteria air pollutants. However, with respect to regional air pollution, the development of the Project would result in population growth that is consistent with ABAG projections and the City General Plan. Therefore, the Project would be consistent with the 2017 Clean Air Plan that uses ABAG population forecasts.

As described in threshold BAAQMD construction BMPs above, the Project would also be consistent with the appropriate 2017 Clean Air Plan control measures, which are provided to reduce air quality emissions for the entire Bay Area region. Additionally, the discussion in threshold AQ-2 addresses cumulative impacts and demonstrates that the Project would not exceed the applicable BAAQMD thresholds for construction or operations. The BAAQMD CEQA Air Quality Guidelines note that the nature of air emissions is largely a cumulative impact. As a result, no single project is sufficient in size by itself to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. As mentioned on pages 2-10, 2-12, and 2-14 of the BAAQMD CEQA Guidelines (2022), if the project emissions of criteria air pollutants or its precursors are below the BAAQMD Thresholds of Significance, the project would result in a less than significant cumulative impact.

Consistency with the 2017 Clean Air Plan control measures would ensure that the Project would not make a cumulatively considerable contribution to air quality impacts in the Basin. In addition, in the discussion above in AQ-3 and AQ-4 the Project would not exceed the applicable BAAQMD thresholds for exposure of sensitive receptors to substantial pollutant concentrations after mitigation nor for other emissions

(such as those leading to odors) adversely affecting a substantial number of people. Therefore, impacts would be less than significant and less than cumulatively considerable.

Mitigation Measures: Refer to Mitigation Measure HRA-1.

Level of Significance Less than significant with mitigation and compliance with standard conditions and City policies.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0
Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00

Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Operations: Vehicle Data	Updated to reflect trip rate that we calculated in assumptions spreadsheet
Operations: Refrigerants	No changes, making consistent with Hospital land use.

Good Sam Phase 1 Construction Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.3. Construction Emissions by Year, Mitigated

3. Construction Emissions Details

3.1. Demolition (Phase 1) (2024) - Unmitigated

3.2. Demolition (Phase 1) (2024) - Mitigated

3.3. Site Preparation (Phase 1) (2024) - Unmitigated

3.4. Site Preparation (Phase 1) (2024) - Mitigated

3.5. Grading (Phase 1) (2024) - Unmitigated

3.6. Grading (Phase 1) (2024) - Mitigated

3.7. Building Construction (Phase 1) (2024) - Unmitigated

3.8. Building Construction (Phase 1) (2024) - Mitigated

3.9. Building Construction (Phase 1) (2025) - Unmitigated

3.10. Building Construction (Phase 1) (2025) - Mitigated

3.11. Building Construction (Phase 1) (2026) - Unmitigated

3.12. Building Construction (Phase 1) (2026) - Mitigated

3.13. Building Construction (Phase 1) (2027) - Unmitigated

3.14. Building Construction (Phase 1) (2027) - Mitigated

3.15. Building Construction (Phase 1) (2028) - Unmitigated

3.16. Building Construction (Phase 1) (2028) - Mitigated

3.17. Building Construction (Phase 1) (2029) - Unmitigated

3.18. Building Construction (Phase 1) (2029) - Mitigated

3.19. Paving (Phase 1) (2027) - Unmitigated

3.20. Paving (Phase 1) (2027) - Mitigated

3.21. Architectural Coating (Phase 1) (2028) - Unmitigated

3.22. Architectural Coating (Phase 1) (2028) - Mitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.3.2. Mitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

6. Climate Risk Detailed Report

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Good Sam Phase 1 Construction
Construction Start Date	3/27/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.00
Precipitation (days)	12.8
Location	2425 Samaritan Dr, San Jose, CA 95124, USA
County	Santa Clara
City	San Jose
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1917
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.20

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Hospital	548	1000sqft	12.6	548,444	51,200	0.00	—	Building C

Parking Lot	552	Space	4.97	0.00	0.00	—	—	Parking Lot
Enclosed Parking with Elevator	653	Space	5.88	352,000	0.00	—	—	Garage East
General Heavy Industry	23.8	1000sqft	0.55	23,750	0.00	—	—	CUP
Other Asphalt Surfaces	20.4	1000sqft	0.47	0.00	0.00	—	—	Mech Yard, & O2 Yard

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-2*	Limit Heavy-Duty Diesel Vehicle Idling
Construction	C-5	Use Advanced Engine Tiers
Construction	C-10-A	Water Exposed Surfaces
Construction	C-11	Limit Vehicle Speeds on Unpaved Roads

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

2. Emissions Summary

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth

Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0

Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	10.0
Cardio-vascular	5.75
Low Birth Weights	26.6
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.6
Linguistic	49.6
Poverty	7.24
Unemployment	14.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	79.16078532
Employed	64.53227255
Median HI	79.73822661
Education	—
Bachelor's or higher	80.25150776
High school enrollment	100

Preschool enrollment	64.96856153
Transportation	—
Auto Access	46.0284871
Active commuting	48.69754908

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Includes both KSF and Parking space data for garage. Hospital Building "C" is being constructed with partial demolition of Building "A" and total demolition of the Day Care.

Construction: Construction Phases	Data provided by excel sheet, updating Construction Phases to reflect excel doc.
Construction: Dust From Material Movement	Based on provided construction assumptions and site plan.
Construction: Demolition	Based on provided construction assumptions and site plan.
Construction: Off-Road Equipment	Plate compactor is meant to represent the use of pile driving equipment necessary for the CUP.

Good Sam Phase 2 - Construction Detailed Report

Table of Contents

1. Basic Project Information

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Good Sam Phase 2 - Construction
Construction Start Date	1/21/2032
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.00
Precipitation (days)	12.8
Location	2425 Samaritan Dr, San Jose, CA 95124, USA
County	Santa Clara
City	San Jose
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1917
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.20

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Parking Lot	421	Space	3.79	0.00	0.00	—	—	Parking Lot

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-2*	Limit Heavy-Duty Diesel Vehicle Idling
Construction	C-5	Use Advanced Engine Tiers
Construction	C-10-A	Water Exposed Surfaces
Construction	C-11	Limit Vehicle Speeds on Unpaved Roads

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

2. Emissions Summary

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Demolition	Demolition	1/23/2030	6/10/2031	6.00	432	—
Site Preparation (Phase 2)	Site Preparation	12/26/2029	1/22/2030	6.00	24.0	—
Grading (Phase 2)	Grading	6/11/2031	7/8/2031	6.00	24.0	—
Building Construction (Phase 2)	Building Construction	1/23/2030	1/20/2032	6.00	624	—
Paving (Phase 2)	Paving	10/01/2031	11/25/2031	6.00	48.0	—
Architectural Coating (Phase 2)	Architectural Coating	11/26/2031	1/20/2032	6.00	48.0	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Rubber Tired Dozers	Diesel	Average	2.00	8.00	367	0.40
Demolition	Concrete/Industrial Saws	Diesel	Average	1.00	8.00	33.0	0.73
Demolition	Excavators	Diesel	Average	3.00	8.00	36.0	0.38
Site Preparation (Phase 2)	Rubber Tired Dozers	Diesel	Average	3.00	8.00	367	0.40
Site Preparation (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Average	4.00	8.00	84.0	0.37
Grading (Phase 2)	Graders	Diesel	Average	1.00	8.00	148	0.41
Grading (Phase 2)	Excavators	Diesel	Average	1.00	8.00	36.0	0.38
Grading (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Average	3.00	8.00	84.0	0.37
Grading (Phase 2)	Rubber Tired Dozers	Diesel	Average	1.00	8.00	367	0.40
Building Construction (Phase 2)	Forklifts	Diesel	Average	3.00	8.00	82.0	0.20
Building Construction (Phase 2)	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Building Construction (Phase 2)	Cranes	Diesel	Average	1.00	7.00	367	0.29
Building Construction (Phase 2)	Welders	Diesel	Average	1.00	8.00	46.0	0.45
Building Construction (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Average	3.00	7.00	84.0	0.37
Paving (Phase 2)	Pavers	Diesel	Average	1.00	8.00	81.0	0.42
Paving (Phase 2)	Paving Equipment	Diesel	Average	2.00	6.00	89.0	0.36
Paving (Phase 2)	Rollers	Diesel	Average	2.00	6.00	36.0	0.38

Paving (Phase 2)	Tractors/Loaders/Backh	Diesel	Average	1.00	8.00	84.0	0.37
Paving (Phase 2)	Cement and Mortar Mixers	Diesel	Average	2.00	6.00	10.0	0.56
Architectural Coating (Phase 2)	Air Compressors	Diesel	Average	1.00	6.00	37.0	0.48

5.2.2. Mitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Rubber Tired Dozers	Diesel	Tier 4 Final	2.00	8.00	367	0.40
Demolition	Concrete/Industrial Saws	Diesel	Tier 4 Final	1.00	8.00	33.0	0.73
Demolition	Excavators	Diesel	Tier 4 Final	3.00	8.00	36.0	0.38
Site Preparation (Phase 2)	Rubber Tired Dozers	Diesel	Tier 4 Final	3.00	8.00	367	0.40
Site Preparation (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	4.00	8.00	84.0	0.37
Grading (Phase 2)	Graders	Diesel	Tier 4 Final	1.00	8.00	148	0.41
Grading (Phase 2)	Excavators	Diesel	Tier 4 Final	1.00	8.00	36.0	0.38
Grading (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	3.00	8.00	84.0	0.37
Grading (Phase 2)	Rubber Tired Dozers	Diesel	Tier 4 Final	1.00	8.00	367	0.40
Building Construction (Phase 2)	Forklifts	Diesel	Tier 4 Final	3.00	8.00	82.0	0.20
Building Construction (Phase 2)	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Building Construction (Phase 2)	Cranes	Diesel	Tier 4 Final	1.00	7.00	367	0.29
Building Construction (Phase 2)	Welders	Diesel	Tier 4 Final	1.00	8.00	46.0	0.45
Building Construction (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	3.00	7.00	84.0	0.37

Paving (Phase 2)	Pavers	Diesel	Tier 4 Final	1.00	8.00	81.0	0.42
Paving (Phase 2)	Paving Equipment	Diesel	Tier 4 Final	2.00	6.00	89.0	0.36
Paving (Phase 2)	Rollers	Diesel	Tier 4 Final	2.00	6.00	36.0	0.38
Paving (Phase 2)	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	1.00	8.00	84.0	0.37
Paving (Phase 2)	Cement and Mortar Mixers	Diesel	Average	2.00	6.00	10.0	0.56
Architectural Coating (Phase 2)	Air Compressors	Diesel	Tier 4 Final	1.00	6.00	37.0	0.48

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Site Preparation (Phase 2)	—	—	—	—
Site Preparation (Phase 2)	Worker	17.5	11.7	LDA,LDT1,LDT2
Site Preparation (Phase 2)	Vendor	—	8.40	HHDT,MHDT

Demolition	Hauling	9.41	20.0	HHDT
Demolition	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating (Phase 2)	0.00	0.00	0.00	0.00	9,903

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	353,600	—
Site Preparation (Phase 2)	—	—	36.0	14,500	—
Grading (Phase 2)	70,000	1,000	360	0.00	—
Paving (Phase 2)	0.00	0.00	0.00	0.00	3.79

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Parking Lot	3.79	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2029	0.00	204	0.03	< 0.005
2030	0.00	204	0.03	< 0.005

2031	0.00	204	0.03	< 0.005

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0
Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	10.0
Cardio-vascular	5.75
Low Birth Weights	26.6
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.6
Linguistic	49.6
Poverty	7.24
Unemployment	14.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	79.16078532
Employed	64.53227255
Median HI	79.73822661
Education	—
Bachelor's or higher	80.25150776
High school enrollment	100
Preschool enrollment	64.96856153
Transportation	—
Auto Access	46.0284871

2016 Voting	84.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Have excel spreadsheet with specific land use data for project. This reflects information provided within spreadsheet.
Construction: Construction Phases	Reflects construction schedule given in excel spreadsheet.
Construction: Dust From Material Movement	Based on provided grading material movement
Construction: Demolition	Site preparation is based on provided pavement material demolition.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Good Sam Phase 3 Construction
Construction Start Date	1/21/2032
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.00
Precipitation (days)	12.8
Location	2425 Samaritan Dr, San Jose, CA 95124, USA
County	Santa Clara
City	San Jose
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1917
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.20

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Hospital	202	1000sqft	4.64	201,936	51,200	—	—	Building D

Medical Office Building	200	1000sqft	4.59	200,000	0.00	—	—	Building E
Enclosed Parking with Elevator	1,154	Space	10.4	425,208	0.00	—	—	Garage West
Other Asphalt Surfaces	4.56	1000sqft	0.10	0.00	0.00	—	—	Offsite Improvements

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-2*	Limit Heavy-Duty Diesel Vehicle Idling
Construction	C-5	Use Advanced Engine Tiers
Construction	C-10-A	Water Exposed Surfaces
Construction	C-11	Limit Vehicle Speeds on Unpaved Roads

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2

AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7

Education	12.0
Housing	20.6
Linguistic	49.6
Poverty	7.24
Unemployment	14.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract

Economic	—
Above Poverty	79.16078532
Employed	64.53227255
Median HI	79.73822661
Education	—
Bachelor's or higher	80.25150776
High school enrollment	100
Preschool enrollment	64.96856153
Transportation	—
Auto Access	46.0284871
Active commuting	48.69754908
Social	—
2-parent households	79.75105864
Voting	87.07814706
Neighborhood	—
Alcohol availability	33.76106762
Park access	81.35506224
Retail density	67.23983062

2016 Voting	84.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Based on specific land use data for project. This reflects information provided within spreadsheet. Offsite improvements were estimated at 4.558 ksf from aerial imagery of the overlaid site plan.
Construction: Construction Phases	Reflects construction schedule give by Client
Construction: Dust From Material Movement	Based on provided soil movement
Construction: Demolition	Based on estimated pavement material movement.

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0
Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	10.0
Cardio-vascular	5.75
Low Birth Weights	26.6
Socioeconomic Factor Indicators	—
Education	12.0
Housing	20.6
Linguistic	49.6
Poverty	7.24
Unemployment	14.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	79.16078532
Employed	64.53227255
Median HI	79.73822661
Education	—
Bachelor's or higher	80.25150776
High school enrollment	100
Preschool enrollment	64.96856153
Transportation	—
Auto Access	46.0284871
Active commuting	48.69754908
Social	—
2-parent households	79.75105864

Neighborhood	—
Alcohol availability	33.76106762
Park access	81.35506224
Retail density	67.23983062
Supermarket access	40.4465546
Tree canopy	74.84922366
Housing	—
Homeownership	65.75131528
Housing habitability	59.01450019
Low-inc homeowner severe housing cost burden	47.13204158
Low-inc renter severe housing cost burden	52.66264596
Uncrowded housing	59.34813294

Health Outcomes	—
Insured adults	73.50186064
Arthritis	36.9
Asthma ER Admissions	91.8
High Blood Pressure	39.5
Cancer (excluding skin)	21.2
Asthma	65.7
Coronary Heart Disease	47.4
Chronic Obstructive Pulmonary Disease	59.8
Diagnosed Diabetes	70.5
Life Expectancy at Birth	70.0
Cognitively Disabled	60.3
Physically Disabled	83.0
Heart Attack ER Admissions	91.0
Mental Health Not Good	77.2
Chronic Kidney Disease	64.9
Obesity	76.5
Pedestrian Injuries	19.6
Physical Health Not Good	71.4
Stroke	58.2
Health Risk Behaviors	—
Binge Drinking	73.8
Current Smoker	79.5
No Leisure Time for Physical Activity	71.9
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0

Children	75.0
Elderly	34.5
English Speaking	69.4

Outdoor Workers	56.2
Climate Change Adaptive Capacity	—
Impervious Surface Cover	36.2
Traffic Density	82.8
Traffic Access	65.9
Other Indices	—
Hardship	21.2
Other Decision Support	—
2016 Voting	84.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Includes both KSF and Parking space data for garage. Hospital Building "C" is being constructed with partial demolition of Building "A" and total demolition of the Day Care.
Construction: Construction Phases	Data provided by excel sheet, updating Construction Phases to reflect excel doc.
Construction: Dust From Material Movement	Based on provided construction assumptions and site plan.
Construction: Demolition	Based on provided construction assumptions and site plan.
Operations: Vehicle Data	Based on Trip Generation and VMT analysis for project
Operations: Energy Use	Based on San Jose banning natural gas usage in new developments. Any NG usage by the hospital for required purposes was calculated outside of CalEEMod.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0
Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00

Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Have excel spreadsheet with specific land use data for project. This reflects information provided within spreadsheet.
Construction: Construction Phases	Reflects construction schedule given in excel spreadsheet.
Construction: Dust From Material Movement	Based on provided grading material movement
Construction: Demolition	Site preparation is based on provided pavement material demolition.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Good Sam - Buildout Operations 2034 v2
Operational Year	2034
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.00
Precipitation (days)	12.8
Location	2425 Samaritan Dr, San Jose, CA 95124, USA
County	Santa Clara
City	San Jose
Air District	Bay Area AQMD
Air Basin	San Francisco Bay Area
TAZ	1917
EDFZ	1
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.20

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Hospital	85.0	1000sqft	1.95	85,000	51,200	—	—	Building B

Hospital	548	1000sqft	12.6	548,444	0.00	—	—	Building C
General Light Industry	23.8	1000sqft	0.55	23,750	0.00	—	—	Central Utility Plant
Enclosed Parking with Elevator	653	Space	5.88	350,000	0.00	—	—	East Garage
Enclosed Parking with Elevator	1,154	Space	10.4	425,208	0.00	—	—	West Garage
Parking Lot	552	Space	4.97	0.00	0.00	—	—	Phase 1
Parking Lot	421	Space	3.79	0.00	0.00	—	—	Phase 2
Medical Office Building	200	1000sqft	4.59	200,000	0.00	—	—	MOB Building E
Hospital	202	1000sqft	4.64	201,936	51,200	—	—	Hospital Expansion
Other Asphalt Surfaces	20.4	1000sqft	0.47	0.00	0.00	—	—	Mech Yard and O2 Yard
Other Asphalt Surfaces	4.56	1000sqft	0.10	0.00	0.00	—	—	Off-site Improvements

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.6	annual days of extreme heat
Extreme Precipitation	5.85	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	22.2
AQ-PM	14.8
AQ-DPM	62.5
Drinking Water	22.7
Lead Risk Housing	21.0
Pesticides	0.00
Toxic Releases	29.7
Traffic	75.0
Effect Indicators	—
CleanUp Sites	38.5
Groundwater	92.3
Haz Waste Facilities/Generators	91.1
Impaired Water Bodies	23.9
Solid Waste	0.00
Sensitive Population	—
Asthma	10.0
Cardio-vascular	5.75
Low Birth Weights	26.6
Socioeconomic Factor Indicators	—

Education	12.0
Housing	20.6
Linguistic	49.6
Poverty	7.24
Unemployment	14.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	79.16078532
Employed	64.53227255
Median HI	79.73822661
Education	—
Bachelor's or higher	80.25150776

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	9.00
Healthy Places Index Score for Project Location (b)	79.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Based on provided land uses. Off-site improvements were estimated from aerial imagery of improvement plans.
Operations: Vehicle Data	Based on Good Sam Trip Generation and default VMT and Trip Generation inputs.
Operations: Energy Use	Energy requirements within the CUP are calculated outside of CalEEMod.

1 INTRODUCTION

The purpose of this Health Risk Assessment (HRA) is to evaluate potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) resulting from the implementation of the Project. This HRA was prepared in accordance with the requirements of the Bay Area Air Quality Management District (BAAQMD) and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if health risks are likely to occur from the Project. Technical data are included as Appendix A: Modeling Data.

Project Location

The approximately 20-acre Project site is located at 2425 Samaritan Drive and 2333 Samaritan Place (Accessor Parcel Numbers (APNs): 421-36-009 and 421-36-011). Regionally, Good Samaritan Hospital is in the southwestern region of San José within an urban area that contains a mix of medical offices and clinics as well as single- and multi-family residential developments. The northern boundary of the Project site abuts the eastbound on-ramp to SR-65. Along the eastern boundary of the Project site is the Cambrian Center, a multi-family residential complex, and single-family residences. To the south of the Project site are various medical office buildings. Along the western boundary of the Project site is the Samaritan Medical Center, a medical office complex with surface parking. Figure 1: Regional Vicinity and Figure 2: Site Vicinity, depict the Project site in a regional and local context.

Project Description

Located in an urban area with a mix of commercial uses, single-family, and multi-family residential developments, the Project site is currently the Good Samaritan Hospital campus. The campus contains a day care center, the hospital building (Building A and Building B), a helipad in the northwest corner of the site, landscaping, and surface parking. The existing hospital building is divided into two different wings. Building A is the main building with emergency operations totaling approximately 359,000 square feet (sf), and Building B operates as a women's and children's services wing totaling approximately 85,000 sf. With the day care center totaling approximately 6,700 sf, the existing hospital campus is approximately 450,700 sf. Figure 3: Existing Conditions depict the Project site along with the current existing uses.

The proposed Project's existing land use designation is Neighborhood/Community Commercial (NCC), and the existing zoning designation is Planned Development (Agriculture Base District) (A(PD)). Project implementation would require a new Planned Development District to authorize the Project's new uses and, therefore a zone change would be required. The Project proposes a rezone (File No. PDC22-132) from the existing (A(PD)) Planned Development Zoning District to the Commercial General Planned Development (CG(PD)) Zoning District.[1] The new (CG(PD)) Planned Development Zoning District would authorize the new hospital wing components and additional uses (i.e., cafeterias and retail shops), as well as updated standards to address the modernization of the hospital's healthcare system and operations. In addition, a new planned development permit(s) would be required to implement the new PD Zoning.

Although the Project would be constructed in phases, the hospital would plan and stage operations throughout the expansion in order to allow for continuous uninterrupted operation of the hospital. Construction for all phases would follow a conventional construction sequence of demolition, site

[1] The file number that refers to the rezone from the existing A(PD) to the CGCG(PD) is PDC22-132. Available at: https://www.sanjoseca.gov/home/showpublisheddocument/98866/638212178270430000, accessed July 2023.

preparation, grading/earthwork, paving, building construction, and architectural coating. See Figure 4: Project Site Plan for more details.

Phase 1

Phase 1 would include demolition of 20,946 square feet in Building A and demolition of the 6,700 sf daycare center to construct a new 253,000-square –foot, five-story parking garage (Garage East), a 23,750-square-foot detached central utility plant and underground water and sewer tanks, and an approximately 548,444-square-foot, eight-story hospital building (Building C).

Garage East would be in the northeastern region of the Project site and would provide 653 parking spaces. Additionally, a new loading dock and accompanying dock canopy is proposed at grade-level on the west side of Building C, north of the existing four-story Women's and Children Center hospital wing (existing Building B). The loading area would be accessed from an internal drive aisle from Samaritan Drive, and the northern perimeter drive aisle.

In Phase 1, a Health Care Access and Information (HCAI) compliant two-story approximately 23,750 sf Central Utility Plant, Mechanical Yard, and Oxygen (O_2) Yard is proposed to the east of proposed Building C and west of Garage East to provide power and utility infrastructure to support the hospital operations.

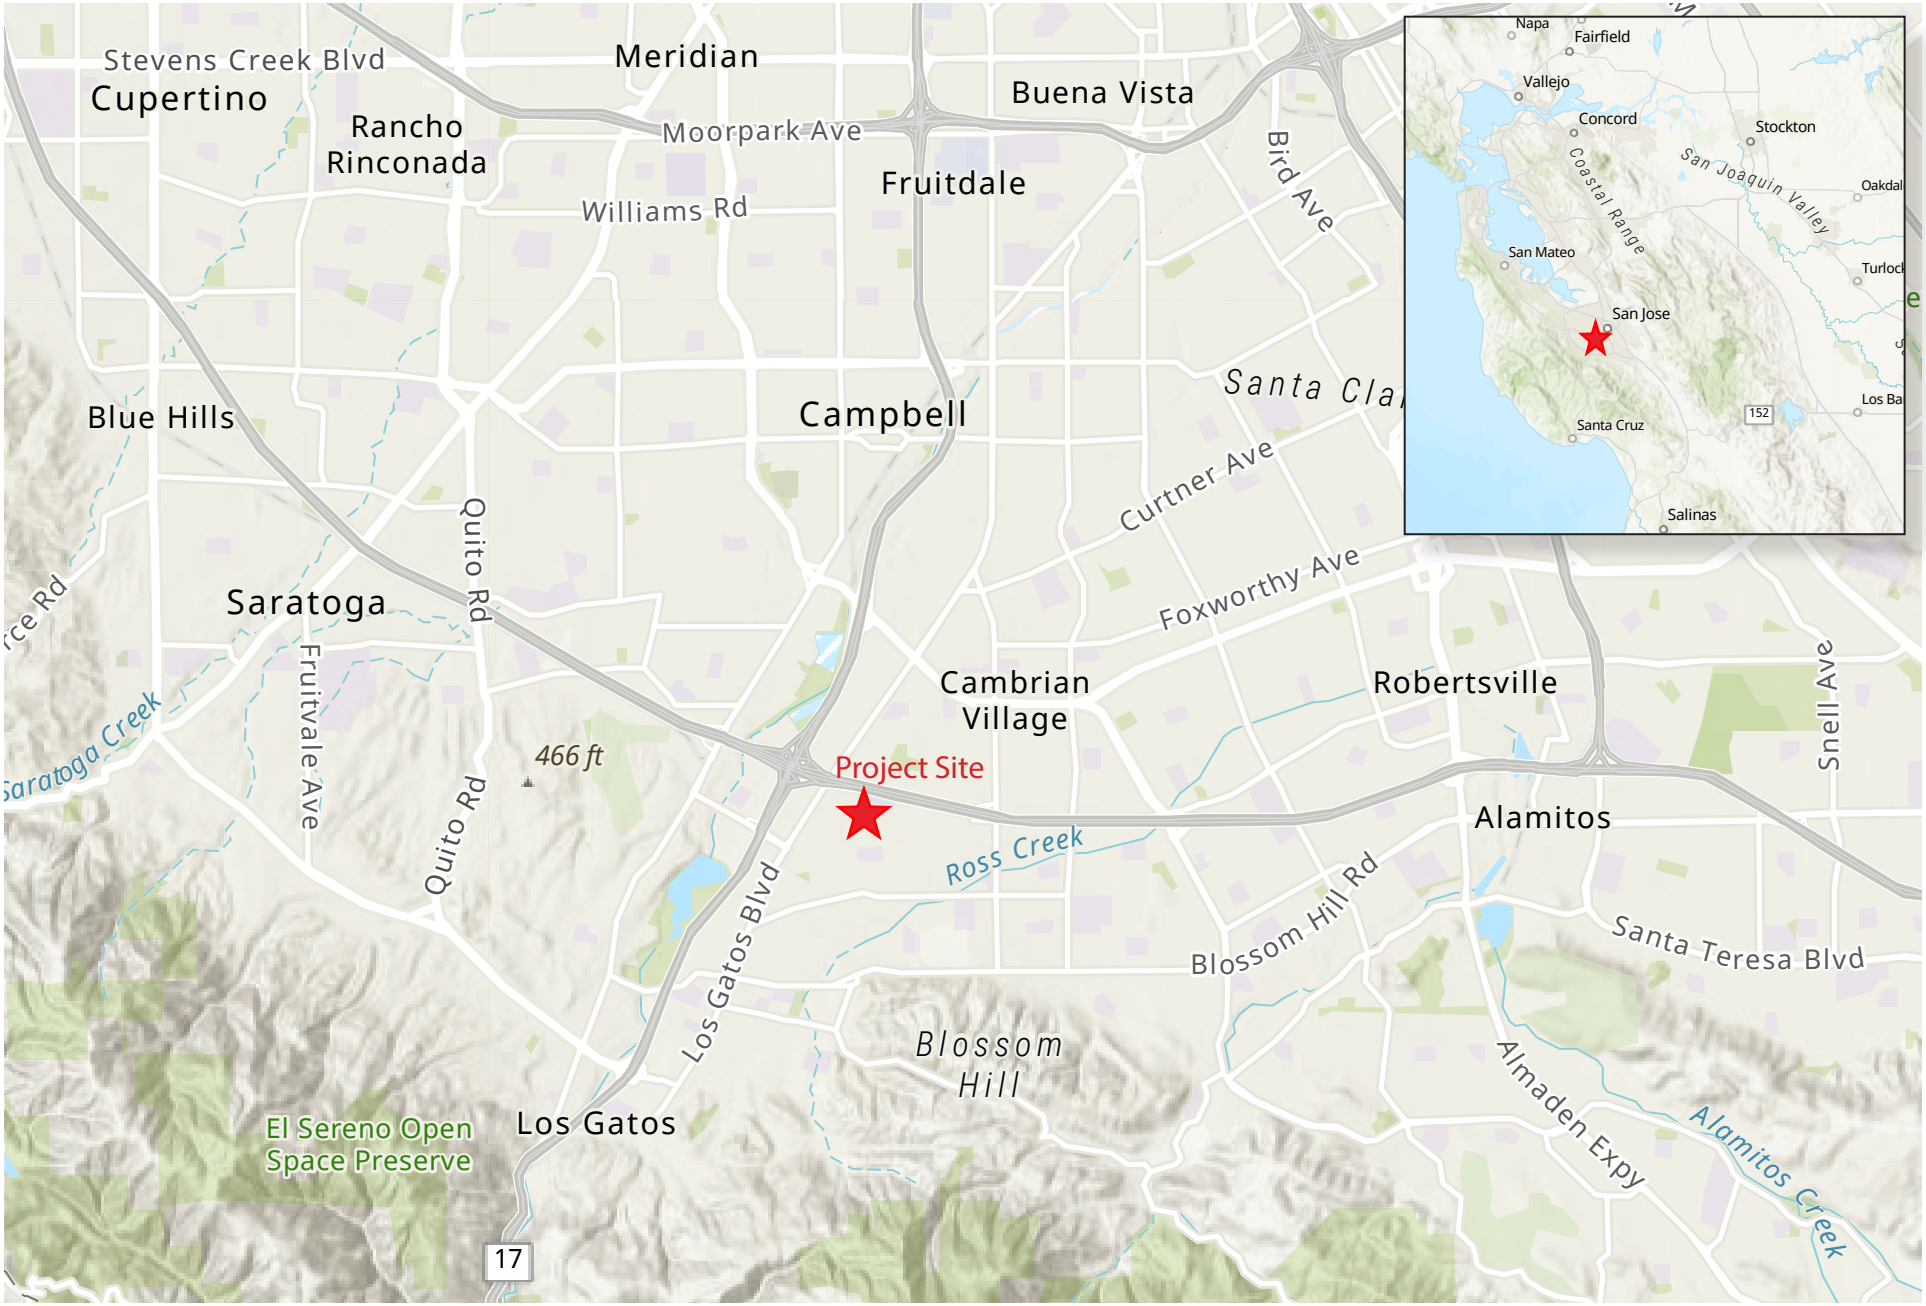
Phase 1 would result in approximately 40,000 cubic yards (cy) of soil export from the Project site and approximately 10,000 cy of soil import. Construction Phase 1 would occur over approximately 5.8 years (i.e., 69 months), anticipated to begin in March 2024. See Figure 5: Proposed Project Phase 1 Conceptual Site Plan for more details.

Phase 2

In Phase 2, the existing non-seismically-compliant hospital building (Building A) would be demolished, totaling approximately 338,054 sf of demolition. The basement of the demolished hospital would be infilled with approximately 16 feet of fill and then approximately 421 surface parking stalls would be constructed.

Phase 2 would result in approximately 1,000 cy of soil export and 70,000 cy of soil import. Phase 2 is anticipated to begin in 2029 and occur over approximately two years. See Figure 6: Proposed Project Phase 2 Conceptual Site Plan for more details.

Phase 3



Phase 3 would construct an approximately 202,000 sf hospital wing (Building D), an approximately 200,000 sf medical office building (Building E), and an approximately 425,208 sf six-story garage structure (Garage West) with up to 1,154 parking stalls.

Building E is proposed to be constructed at the southern edge of the Project site, near the intersection of Samaritan Drive at Samaritan Place and would be eight stories tall and have approximately 25,000 sf of office space per floor, for a total of approximately 200,000 sf.

Additional patient, staff, and visitor parking would be provided in a new free-standing parking structure (Garage West) located on the western edge of the site. Garage West would be fully constructed in Phase 3 and would have approximately 1,154 parking spaces with five levels of parking, including basement. At

Phase 3 completion, the Good Samaritan Hospital would have up to 2,179 parking spaces. See Figure 7: Proposed Buildout Conceptual Site Plan for more details.

Phase 3 would result in approximately 21,000 CY of soil export and 5,000 CY of soil import. Phase 3 would be constructed over approximately 2.8 years (i.e., 34 months) starting in 2032. The schedule for construction in all phases would typically occur six days a week (Monday through Saturday) from 7:00 a.m. to 7:00 p.m.

2 ENVIRONMENTAL SETTING

Climate

The project is within the San Francisco Bay Area Air Basin (SFBAAB), which comprises all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the southern portion of Sonoma, and the southwestern portion of Solano County. SFBAAB is characterized by complex terrain, consisting of coastal mountain ranges, inland valleys, and bays, which distort wind flow patterns. The Coast Range splits resulting in a western coast gap, Golden Gate, and an eastern coast gap, Carquinez Strait, which allow air to flow in and out of the SFBAAB and the Central Valley.

The climate is dominated by the strength and location of a semi-permanent, subtropical high-pressure cell. During the summer, the Pacific high-pressure cell is centered over the northeastern Pacific Ocean resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below to the surface because of the northwesterly flow produces a band of cold water off the California coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold-water band resulting in condensation and the presence of fog and stratus clouds along the Northern California coast.

In the winter, the Pacific high-pressure cell weakens and shifts southward resulting in wind flow offshore, the absence of upwelling, and the occurrence of storms. Weak inversions coupled with moderate winds result in a low air pollution potential.

2.2 Toxic Air Contaminants

TACs are airborne substances capable of causing short-term (acute) and long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TACs includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Hazardous Air Pollutants (HAP) is a term used by the Federal Clean Air Act (FCAA) that includes a variety of pollutants generated or emitted by industrial production activities. Identified as TACs under the California Clean Air Act (CCAA), TACs have been singled out through ambient air quality data as being the most substantial health risk in California. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. The California Air Resources Board (CARB) provides emission inventories for only the larger air basins, including the SFBAAB.

Industrial facilities and mobile sources are significant sources of TACs. The electronics industry, including semiconductor manufacturing, has the potential to contaminate both air and water due to the highly toxic chlorinated solvents commonly used in semiconductor production processes. In addition to industrial sources, various common urban facilities also produce TAC emissions, such as gasoline stations (benzene), hospitals (ethylene oxide), and dry cleaners (perchloroethylene). Automobile exhaust also contains TACs such as benzene and 1,3-butadiene. DPM was identified as a TAC by CARB in 1998. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. BAAQMD

research indicates that mobile-source emissions of DPM, benzene, and 1,3-butadiene represent a substantial portion of the ambient background risk from TACs in the SFBAAB.

TACs do not have ambient air quality standards because no safe levels of TACs can be determined. Instead, TAC impacts are evaluated by calculating the health risks associated with a given exposure. The requirements of the Air Toxic "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588) apply to facilities that use, produce, or emit toxic chemicals. Facilities subject to the toxic emission inventory requirements of the act must prepare and submit toxic emission inventory plans and reports, and periodically update those reports.

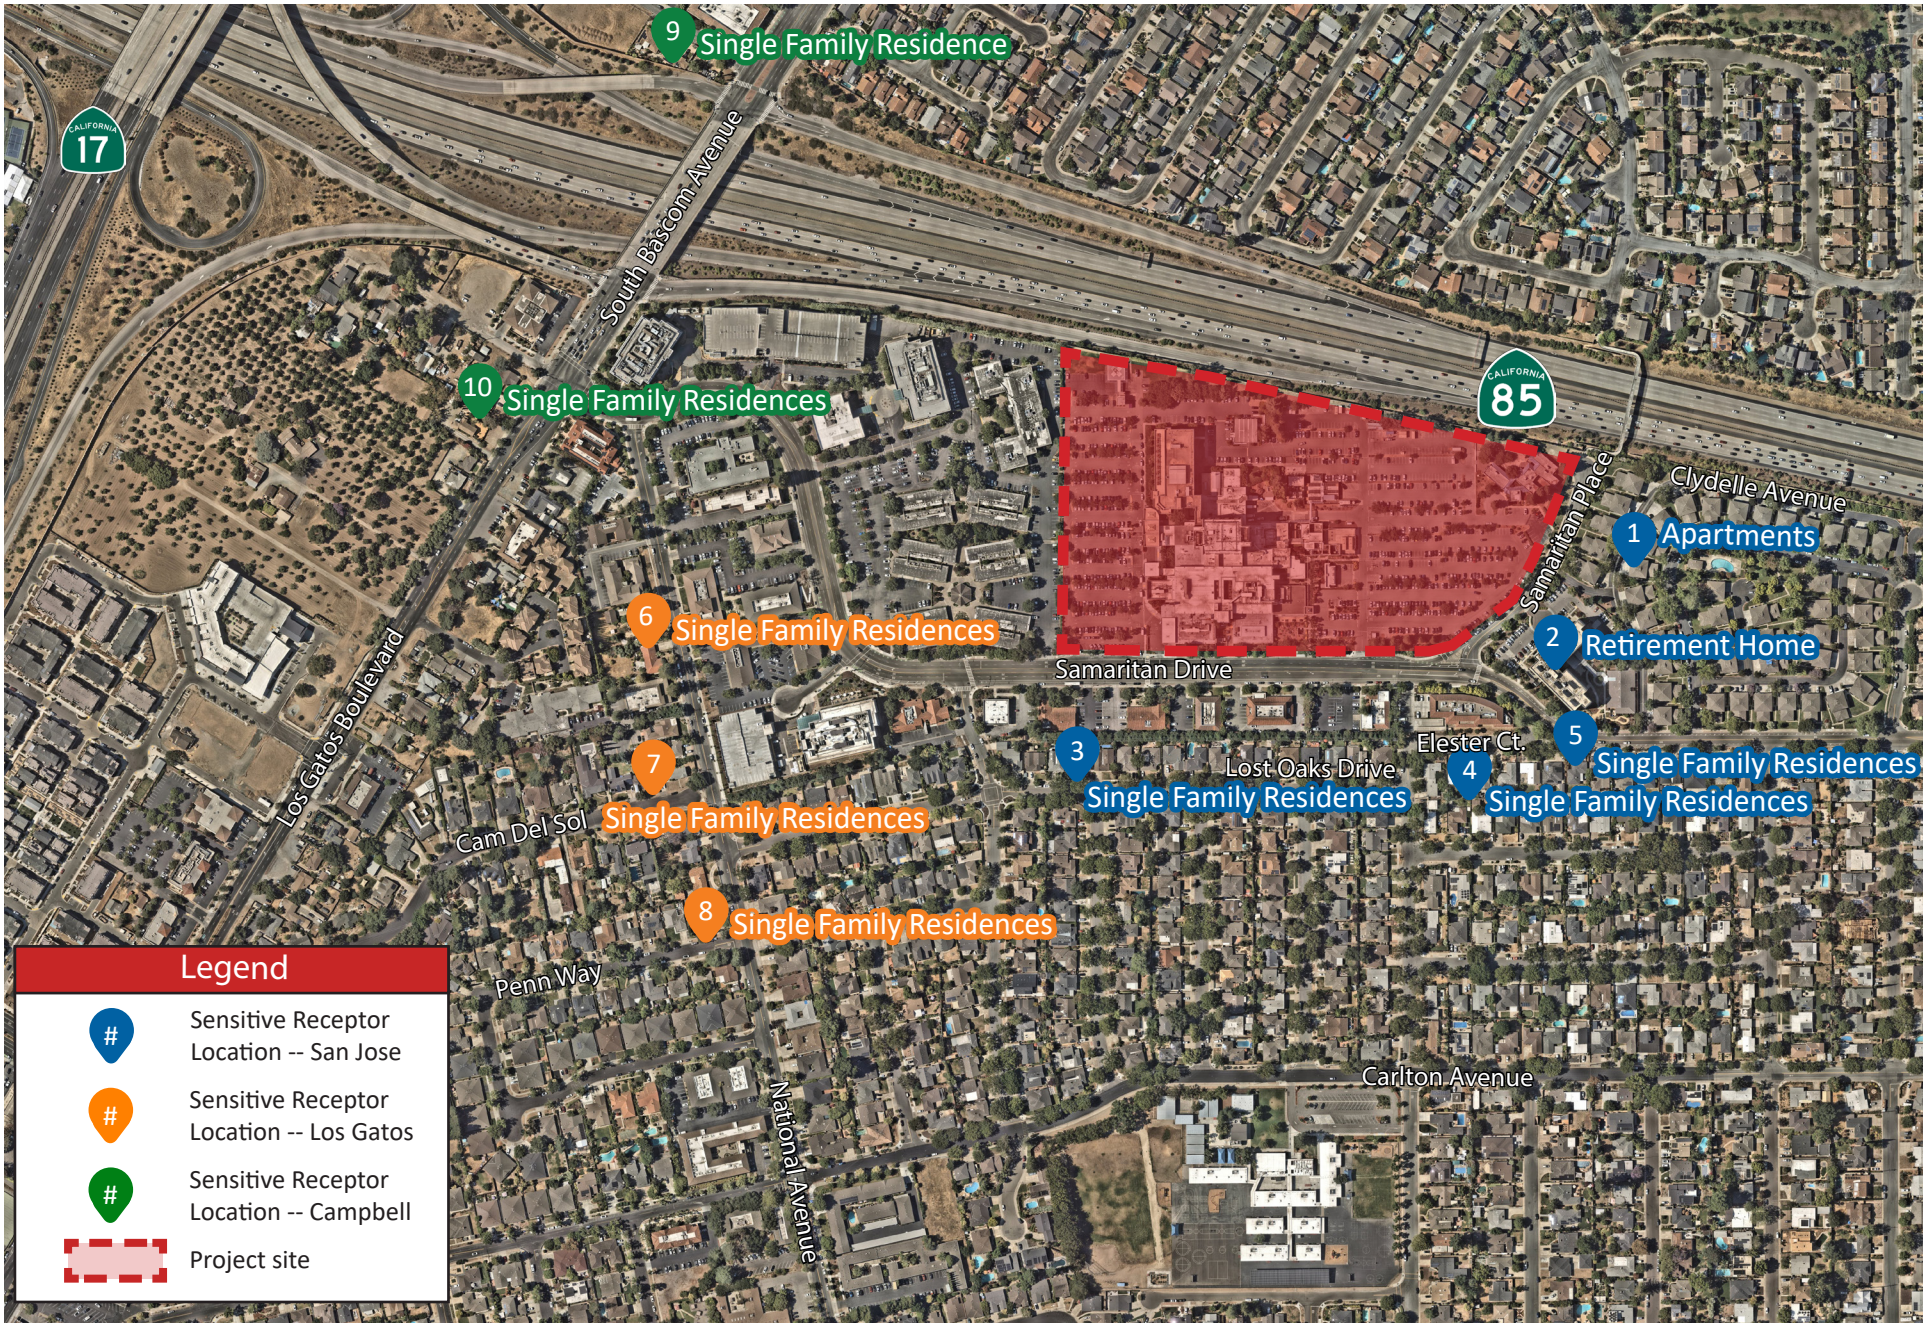
Toxic contaminants often result from fugitive emissions during fuel storage and transfer activities, and from leaking valves and pipes. Sources of air toxics go beyond industry, however. Automobile exhaust also contains toxic air pollutants such as benzene and 1,3-butadiene.

In California, on-road diesel-fueled engines contribute approximately 24 percent of the statewide total DPM emissions, with an additional 71 percent attributed to other mobile sources such as construction and mining equipment, agricultural equipment, and transport refrigeration units. Stationary sources contribute about 5 percent of total DPM. CARB has developed several plans and programs to reduce diesel emissions including, but not limited to, the Diesel Risk Reduction Plan (DRRP), the Statewide Portable Equipment Registration Program (PERP), and the Diesel Off-Road Reporting System (DOORS). The PERP and DOORS programs allow owners or operators of portable engines and certain other types of equipment to register their units to operate their equipment throughout California without having to obtain individual permits from local air districts.

As stated above, diesel exhaust and many individual substances contained in it (including arsenic, benzene, formaldehyde, and nickel) have the potential to contribute to mutations in cells that can lead to cancer. Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB estimates that about 70 percent of the cancer risk that the average Californian faces from breathing toxic air pollutants stems from diesel exhaust particles.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. California has identified diesel exhaust particles as a carcinogen.



2.3 Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than is the general population. Sensitive receptors that are in proximity to localized sources of TACs are of particular concern. Land uses considered sensitive receptors include residences, schools, playgrounds, childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes.

As shown in Table 1: Sensitive Receptors and Figure 8: Sensitive Receptors, sensitive receptors nearest to the Project site include apartments approximately 45 feet east of the Project site across Samaritan Place, the Cambrian Center Retirement Home approximately 50 feet southeast of the Project site, and single family residences along Lost Oaks Drive approximately 200 feet south of the Project site. These distances are from the Project site to the sensitive receptor property line.

Table 1: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Multi-family residences along Samaritan Place	45 feet east
Cambrian Center Retirement Home	50 feet southeast
Residences along Lost Oaks Drive	200 feet south
Residences along Elester Court	230 feet southeast
Residences along Samaritan Drive	480 feet southeast
1. Distances are measured from the Project site boundary to the property line.

3 REGULATORY SETTING

3.1 Federal

Federal Clean Air Act

The FCAA was amended in 1990 to address the numerous air pollutants that are known to cause or may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects. 188 specific pollutants and chemical groups were initially identified as HAPs, and the list has been modified over time. The FCAA Amendments included new regulatory programs to control acid deposition and for the issuance of stationary source operating permits.

In 2001, the United States Environmental Protection Agency (U.S. EPA) issued its first Mobile Source Air Toxics Rule, which identified 21 mobile source air toxic (MSAT) compounds as being HAPs that required regulation. A subset of six of these MSAT compounds were identified as having the greatest influence on health: benzene, 1,3-butadiene, formaldehyde, acrolein, acetaldehyde, and DPM. More recently, the U.S. EPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. Unlike the criteria pollutants, toxics do not have National Ambient Air Quality Standards (NAAQS) making evaluation of their impacts less uniform.

National Emissions Standards for Hazardous Air Pollutants (NESHAPs) were incorporated into a greatly expanded program for controlling toxic air pollutants. The provisions for attainment and maintenance of the NAAQS were substantially modified and expanded. Other revisions included provisions regarding stratospheric ozone protection, increased enforcement authority, and expanded research programs.

Section 112 of the FCAA Amendments governs the federal control program for HAPs. NESHAPs are issued to limit the release of specified HAPs from specific industrial sectors. These standards are technology-based, meaning that they represent the best available control technology an industrial sector could afford. The level of emissions controls required by NESHAPs are not based on health risk considerations because allowable releases and resulting concentrations have not been determined to be safe for the public. The FCAA does not establish air quality standards for HAPs that define legally acceptable concentrations of these pollutants in ambient air.

Federal Emissions Standards for On-Road Trucks

To reduce emissions from on-road, heavy-duty diesel trucks, the U.S. EPA established a series of increasingly strict emission standards for new engines, starting in 1988. The U.S. EPA promulgated the final and cleanest standards with the 2007 Heavy-Duty Highway Rule.[2] The PM emission standard of 0.01 gram per horsepower-hour (g/hp-hr) is required for new vehicles beginning with model year 2007. Also, the nitrogen oxide (NO_X) and nonmethane hydrocarbon (NMHC) standards of 0.20 g/hp-hr and 0.14 g/hp-hr, respectively, were phased in together between 2007 and 2010 on a percent of sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010. In December 2022, the EPA final rule set new, more stringent

[2] United States Environmental Protection Agency (U.S. EPA), *Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements*, Final Rule. 40 Code of Federal Regulations, Parts 69, 80, and 86. January 18, 2001.

standards to reduce NO_X pollution from heavy-duty vehicles and engines starting in model year 2027. The rule will reduce NO_X emissions from heavy-duty trucks by almost 50 percent by 2045, producing significant health-related benefits.[3]

Emission Standards for Off-Road Diesel Engines

To reduce emissions from off-road diesel equipment, the U.S. EPA established a series of cleaner emission standards for new off-road diesel engines. Tier 1 standards were phased in from 1996 to 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in from 2001 to 2006. Tier 3 standards were phased in from 2006 to 2008. Tier 1 through Tier 3 standards are to be increasingly more stringent, respectively, and vary by pollutant and engine size. Tier 4 standards, which generally require add-on emission control equipment to attain them, were phased in from 2008 to 2015. The Tier 4 standards require that emissions of PM and NOx be further reduced by about 90% from Tier 3 standards. CARB currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. CARB currently developing potential amendments to the off-road diesel engine standards, in a Tier 5 rulemaking. The Tier 5 rulemaking aims to reduce oxides of nitrogen (NO_X) and particulate matter (PM) emissions from new, off-road compression-ignition (CI) engines, by an additional 50% to 90%, compared to what is allowed by today's Tier 4 final emission standards.

3.2 State of California

California Air Resources Board

CARB's statewide comprehensive air toxics program was established in 1983 with AB 1807 the Toxic Air Contaminant Identification and Control Act (Tanner Air Toxics Act of 1983). AB 1807 created California's program to reduce exposure to air toxics and sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an airborne toxic control measure (ATCM) for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology (T-BACT) to minimize emissions.

CARB also administers the state's mobile source emissions control program and oversees air quality programs established by state statute, such as the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588). Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the air quality management district or air pollution control district. High priority facilities are required to perform a health risk assessment and, if specific thresholds are exceeded, required to communicate the results to the public in the form of notices and public meetings. In September 1992, the AB 2588 was amended by Senate Bill (SB) 1731 which required facilities that pose a significant health risk to the community to reduce their risk through a risk management plan.

Diesel Risk Reduction Plan

The identification of DPM as a TAC in 1998 led CARB to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (DRRP) in October 2000. The DRRP's goals

[3] United States Environmental Protection Agency (U.S. EPA), *Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements*, Final Rule. 40 Code of Federal Regulations, s 2, 59, 60, 80, 85, 86, 600, 1027, 1030, 1031, 1033, 1036, 1037, 1039, 1042, 1043, 1045, 1048, 1051, 1054, 1060, 1065, 1066, 1068, and 1090. January 24, 2023.

include an 85 percent reduction in DPM by 2020 from the 2000 baseline[4]. CARB estimates that emissions of DPM in 2035 will be less than half those in 2010, further reducing statewide cancer risk and non-cancer health effects.[5] The DRRP includes regulations to establish cleaner new diesel engines, cleaner in-use diesel engines (retrofits), and cleaner diesel fuel.

Truck and Bus Regulation Reducing Emissions from Existing Diesel Vehicles

On December 12, 2008, CARB approved the Truck and Bus Regulation to significantly reduce PM and NO_X emissions from existing diesel vehicles operating in California. The regulation requires PM retrofits on all diesel trucks and buses that operate in California (i.e., existing vehicles are required to be upgraded to reduce emissions). Heavier trucks must be retrofitted with PM filters beginning January 1, 2012, and older trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses would need to have 2010 model year engines or equivalent.

The regulation applies to most privately-owned and federally-owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Small fleets with three or fewer diesel trucks can delay compliance for heavier trucks and there are several extensions for low-mileage construction trucks, early PM filter retrofits, adding cleaner vehicles, and other situations. Privately and publicly owned school buses have different requirements.

Heavy-Duty Vehicle Idling Emission Reduction Program

The purpose of the CARB ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling is to reduce public exposure to DPM and criteria pollutants by limiting the idling of diesel-fueled commercial vehicles including transportation refrigeration units (TRUs). The driver of any vehicle subject to this ATCM is prohibited from idling the vehicle's primary diesel engine for greater than five minutes at any location and is prohibited from idling a diesel-fueled auxiliary power system (APS) for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools). On February 24, 2022, CARB approved amendments to the TRU ATCM (2022 Amendments) to achieve additional emission and health risk reductions from diesel-powered TRUs and increase the use of zero-emission technology in the off-road sector. The 2022 Amendments will help meet the State's multiple risk reduction, air quality, and climate goals, as well as the directive of Executive Order N-29-20, which set a goal for 100 percent zero-emission off-road vehicles and equipment in the State by 2035.

CARB Final Regulation Order, Requirements to Reduce Idling Emissions from New and In-Use Trucks, beginning in 2008, requires that new 2008 and subsequent model-year heavy-duty diesel engines be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to "neutral" or "park", and the parking brake is engaged.

Section 2485 and Section 2449 of Title 13 of the California Code of Regulations limits diesel-fueled motor vehicle idling to no more than five minutes. Section 2485 limits idling for diesel-fueled commercial motor

[4] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.

[5] California Air Resources Board, *Overview: Diesel Exhaust & Health*, available at: https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health, accessed August 2023.

vehicles with gross vehicle weight ratings of greater than 10,000 pounds that are or must be licensed to operate on publicly maintained highways and streets within California. Section 2449 limits idling for off-road diesel-fueled fleets.

CARB Advanced Clean Truck Regulation

CARB adopted the Advanced Clean Truck Regulation in June 2020 requiring truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. This rule directly addresses disproportionate risks and health and pollution burdens and puts California on the path for an all zero-emission short-haul drayage fleet in ports and railyards by 2035, and zero-emission "last-mile" delivery trucks and vans by 2040. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8. The regulation has two components including a manufacturer sales requirement, and a reporting requirement:

- Zero-Emission Truck Sales: Manufacturers who certify Class 2b through 8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales need to be 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales.
- Company and Fleet Reporting: Large employers including retailers, manufacturers, brokers and others would be required to report information about shipments and shuttle services. Fleet owners, with 50 or more trucks, would be required to report about their existing fleet operations. This information would help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

Advanced Clean Cars I and II

Advanced Clean Cars combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks and SUVs and require an increased number of zero-emission vehicles to meet air quality and climate change emissions goals. By 2035 all new passenger cars, trucks and SUVs sold in California will be zero emissions. The Advanced Clean Cars II regulations take the state's already growing zero-emission vehicle market and robust motor vehicle emission control rules and augments them to meet more aggressive tailpipe emissions standards and ramp up to 100% zero-emission vehicles.

ARB Advanced Clean Fleets Regulation. CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

CARB Advanced Clean Fleets Regulation.

CARB approved Advanced Clean Fleets Regulation (ACF) on April 28, 2023, requires fleet owners to begin transitioning toward ZEVs starting in 2024. Due to the impact that truck traffic has on residents living near heavily trafficked corridors, drayage trucks will need to be zero-emissions by 2035. All other fleet owners have the option to transition a percentage of their vehicles to meet expected zero-emission milestones, which gives owners the flexibility to continue operating combustion-powered vehicles as needed during the move toward cleaner technology.

Executive Order N-79-20

Signed in September 2020, Executive Order N-79-20 establishes as a goal that where feasible, all new passenger cars and trucks, as well as all drayage/cargo trucks and off-road vehicles and equipment, sold in California, will be zero-emission by 2035. The executive order sets a similar goal requiring that all medium and heavy-duty vehicles will be zero-emission by 2045 where feasible. It also directs CARB to develop and propose rulemaking for passenger vehicles and trucks, medium-and heavy-duty fleets where feasible, drayage trucks, and off-road vehicles and equipment "requiring increasing volumes" of new zero emission vehicles (ZEVs) "towards the target of 100 percent." The executive order directs the California Environmental Protection Agency, the California Geologic Energy Management Division (CalGEM), and the California Natural Resources Agency to transition and repurpose oil production facilities with a goal toward meeting carbon neutrality by 2045. Executive Order N-79-20 builds upon the CARB Advanced Clean Trucks regulation, which was adopted by CARB in July 2020.

California Energy Commission – Title 24 Building Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings, as specified in California Code of Regulations (CCR) Title 24 Part 6, were established in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated every three years to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2019 Energy Standards include requirements for mandatory mechanical ventilation intended to improve indoor air quality in homes, and requirements for Minimum Efficiency Reporting Value (MERV) 13 air filtration on space conditioning systems, and ventilation systems that provide outside air to a dwelling's occupiable space. The Residential Compliance Manual for the 2019 Building Energy Efficiency Standards notes that air filter efficiencies of at least MERV 13 protect occupants from exposure to the smaller airborne particles (i.e., $PM_{2.5}$) that are known to adversely affect respiratory health. CCR Title 24 Part 6 requires a particle size efficiency rating equal to or greater than 85 percent in the 1.0 to 0.3 micrometer (µm) range. The California Energy Commission (CEC) adopted the 2022 Energy Code on August 11, 2021, which was subsequently approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Title 24 standards will result in less energy use, thereby reducing air pollutant emissions associated with energy consumption across California. For example, the 2022 Title 24 standards will require efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards.

CalEnviroScreen

OEHHA has developed CalEnviroScreen 4.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially

vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores.

According to CalEnviroScreen, the Project site is located within Census Tract 6085502702, which is within the 34th percentile.[6] It should be noted that the CalEnviroScreen scores are not an expression of health risk, and do not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment.

Senate Bill 535

Senate Bill (SB) 535 directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (DACs) (as identified by the OEHHA mapping). These funds must be used for programs that further reduce greenhouse gas emissions. Funding programs that reduce greenhouse gas emissions would also potentially reduce exposure to other emissions including TACs. Based on OEHHA mapping, the closest SB 535 designated disadvantaged community is located approximately six miles northeast of the Project site (Census Tract 6085503122).[7] SB 535 does not include project specific requirements or prohibit developments in proximity to the designated communities.

3.3 Regional

Bay Area Air Quality Management District

The BAAQMD is the regional agency tasked with managing air quality in the region and has regulated TACs since the 1980s. The CCAA provides the BAAQMD with the authority to manage transportation activities as indirect sources and regulate stationary source emissions. Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution.

Under BAAQMD Regulation 2-1 (General Permit Requirements), Regulation 2-2 (New Source Review), and Regulation 2-5 (New Source Review), all nonexempt sources that possess the potential to emit TACs are required to obtain permits from BAAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. The BAAQMD limits emissions and public exposure to TACs through a number of programs. Section 301 of Regulation 2, Rule 2, requires Best Available Control Technology (BACT) and is triggered for any new or modified source with the potential to emit specific levels of pollutants. The BAAQMD prioritizes TAC-emitting stationary sources for regulation based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

The BAAQMD has published California Environmental Quality Act (CEQA) Air Quality Guidelines that are used in this assessment to evaluate health risk impacts of projects.

Community Air Risk Evaluation Program

The BAAQMD's Community Air Risk Evaluation (CARE) program estimates and reports both local and regional impacts of TACs in the Bay Area. The objective of the CARE Program is to reduce health impacts linked to local air quality. The goals of the CARE Program are to: (1) identify areas where air pollution contributes most to health impacts and where populations are most vulnerable to air pollution; (2) apply sound scientific methods and strategies to reduce health impacts in these areas; and (3) engage community groups and other agencies to develop additional actions to reduce local health impacts. Information from the CARE program is used by the BAAQMD to design and focus effective mitigation measures in areas with highest impacts.

3.4 Local

San José General Plan

MS-10.1: Assess projected air emissions from new development in conformance with the BAAQMD CEQA Guidelines and relative to state and federal standards. Identify and implement feasible air emission reduction measures.

MS-10.2: Consider the cumulative air quality impacts from proposed developments for proposed land use designation changes and new development, consistent with the region's Clean Air Plan and State law.

MS-10.4: Encourage effective regulation of mobile and stationary sources of air pollution, both inside and outside of San José. In particular, support Federal and State regulations to improve automobile emission controls.

MS-11.1: Require completion of air quality modeling for sensitive land uses such as new residential developments that are located near sources of pollution such a freeways and industrial uses. Require new residential development projects and projects categorized as sensitive receptors to incorporate effective mitigation into project designs or be located an adequate distance from sources of TACs to avoid significant risks to health and safety.

MS-11.2 For projects that emit toxic air contaminants, require project proponents to prepare health risk assessments in accordance with BAAQMD-recommended procedures as part of environmental review and employ effective mitigation to reduce possible health risks to a less than significant level. Alternatively, require new projects (such as, but not limited to, industrial, manufacturing, and processing facilities) that are sources of TACs to be located an adequate distance from residential areas and other sensitive receptors.

MS-11.5: Encourage the use of pollution absorbing trees and vegetation in buffer areas between substantial sources of TACs and sensitive land uses.

MS-11.6: Develop and adopt a comprehensive Community Risk Reduction Plan that includes: baseline inventory of TACs and particulate matter less than 2.5 microns ($PM_{2.5}$), emissions from all sources, emissions reduction targets, and enforceable emission reduction strategies and performance measures. The Community Risk Reduction Plan will include enforcement and monitoring tools to ensure regular review of progress toward the

emission reduction targets, progress reporting to the public and responsible agencies, and periodic updates of the plan, as appropriate.

MS-11.7: Consult with BAAQMD to identify stationary and mobile TAC sources and determine the need for and requirements of a HRA for proposed developments.

MS-11.8: For new projects that generate truck traffic, require signage which reminds drivers that the State truck idling law limits truck idling to five minutes.

MS-13.1: Include dust, particulate matter, and construction equipment exhaust control measures as conditions of approval for subdivision maps, site development and planned development permits, grading permits, and demolition permits. At minimum, conditions shall conform to construction mitigation measures recommended in the current BAAQMD CEQA Guidelines for the relevant project size and type.

MS-13.2 Construction and/or demolition projects that have the potential to disturb asbestos (from soil or building material) shall comply with all the requirements of the California Air Resources Board's air toxic control measures (ATCMs) for Construction, Grading, Quarrying, and Surface Mining Operations.

MS-13.4 Adopt and periodically update dust, particulate, and exhaust control standard measures for demolition and grading activities to include on project plans as conditions of approval based upon construction mitigation measures in the BAAQMD CEQA Guidelines.

4 SIGNIFICANCE CRITERIA AND METHODOLOGY

4.1 Health Risk Analysis Thresholds

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. The BAAQMD publishes the CEQA Air Quality Guidelines, which were most recently updated in April 2022. The BAAQMD thresholds for air toxic emissions that are used for this project are shown below:

Individual Projects:

- **Excess (Incremental)_Cancer Risk:** Emit contaminants that result in a maximum individual cancer risk (MICR) greater than 10 in one million.
- **Non-Cancer Risk:** Emit contaminants that exceed the maximum hazard index of 1.0 in one million.
- **Ambient $PM_{2.5}$ Concentration:** Incremental increase in average annual $PM_{2.5}$ concentration greater than 0.3 µg/m^3

Cumulative Thresholds:

- **Excess Cancer Risk:** Emit contaminants that would contribute to cumulative emissions, resulting in an exceedance of the MICR of 100 in one million.
- **Non-Cancer Risk:** Emit contaminants that that would contribute to cumulative emissions, resulting in an exceedance of the maximum hazard index of 10.0 in one million.
- **Ambient $PM_{2.5}$ Concentration:** Incremental increase in average cumulative annual $PM_{2.5}$ concentration of greater than 0.8 µg/m^3

Cancer risk is expressed in terms of expected incremental incidence per million population. The BAAQMD has established an individual project incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk. The 10 in one million standard is a health-protective significance threshold. A risk level of 10 in one million implies a likelihood that up to 10 persons, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of TACs over a specified duration of time. This risk would be an excess cancer that is in addition to any cancer risk borne by a person not exposed to these air toxics. To put this risk in perspective, the risk of dying from accidental drowning is 1,000 in one million which is 100 times more than the BAAQMD's threshold of 10 in one million.

The BAAQMD has also established non-carcinogenic risk parameters for use in HRAs. Noncarcinogenic risks are quantified by calculating a hazard index (HI), expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A HI less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

The 2022 BAAQMD CEQA Air Quality Guidelines recommend assessing impacts within 1,000 feet of the project. The 1,000-foot radius is consistent with findings in CARB's Air Quality and Land Use Handbook (2005) and the California Health & Safety Code §42301.6 (Notice for Possible Source Near School). The

2005 CARB Air Quality and Land Use Handbook found that TAC concentrations are reduced substantially at a distance 1,000 feet downwind from sources such as freeways or large distribution centers.

4.2 Methodology

Construction Risk

Construction would generate DPM emissions from the use of off-road diesel equipment required for grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary TAC of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site potentially poses a health risk to nearby sensitive receptors. The closest sensitive receptors to the Project are residences to the east and southeast. The nearest school to the Project site is the Carlton Elementary School located approximately 0.20 miles (1,130 feet) south.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the Project site. Construction activities would limit idling to no more than five minutes pursuant to Section 2485 and Section 2449 of Title 13 of the California Code of Regulations, which would further reduce nearby sensitive receptors' exposure to temporary and variable DPM emissions. Furthermore, even during the most intense period of construction, emissions of DPM would be generated from different locations on the Project site rather than in a single location because different types of construction activities (e.g., site preparation and building construction) would not occur at the same place at the same time. Construction emissions rates for $PM_{2.5}$ (DPM) were calculated from the CalEEMod construction emissions modeling conducted for the Project.

Three construction phases were modeled for the Project. Phase 1 of construction of the Project was modeled to begin March 2024 with a construction duration of approximately 68 months and would include 392,650 sf of demolition, including existing buildings and pavement. Phase 2 construction was modeled to being in December 2029 for a duration of 24 months and includes 603,600 sf of demolition. Phase 3 was modeled to being in January 2032 for a duration of 29 months and includes 218,000 of demolition. The construction schedules are shown in Table 2: Construction Schedule.

Table 2: Construction Schedule

Phase type	Start	End	Days
Phase 1			
Site Preparation	3/27/2024	4/23/2024	24

Additionally, Table 3: Grading Estimates provides the total material imported and exported during each phase of construction.

Table 3: Grading Estimates

Phase	Total Material Imported (cubic yards)	Total Material Exported (cubic yards)
Phase 1	10,000	40,000
Phase 2	70,000	1,000
Phase 3	5,000	21,000
Source: Refer to Appendix A: Modeling Data.		

As described above, $PM_{2.5}$ exhaust construction emissions over the entire construction period were used in AERMOD to approximate construction DPM emissions. AERMOD requires meteorological, traffic volumes, and vehicle emissions data. Meteorological data used in the HRA is discussed below. AERMOD provides concentrations in an isopleth to visually show the dispersion of the pollutant. All AERMOD assumptions, input data, and outputs are provided herein. Risk levels were calculated based on the California Office of Environmental Health Hazard Assessment (OEHHA) guidance document, *Air Toxics Hot Spots Program Risk Assessment Guidelines* (February 2015).

Operational Risk

Mobile Sources. The Project is located near existing sensitive receptors. The Project is anticipated to generate a maximum of 262 daily trucks including 250 medium-heavy duty truck and 12 heavy-heavy duty trucks based on existing driveway counts[8] An emission rate for $PM_{2.5}$ (DPM) was calculated using trip data and an EMFAC model run for Santa Clara County; refer to Appendix A. EMFAC generates emission factors in terms of grams of pollutant emitted per vehicle activity and can calculate a matrix of emission factors at specific values of vehicle speed and type. The model was run for medium-duty and heavy-duty diesel vehicles traveling along off-site roads, adjacent to the Project site, and idling at the proposed loading area. The analysis includes on-street idling and truck traffic on the following roadways and vehicle speeds:

- Samaritan Drive (35 miles per hour)
- Los Gatos Boulevard (35 miles per hour)
- On-Street Truck Movement (15 miles per hour)
- On-Street Idling (idle)

[8] Existing driveway count data was collected on November 8th, 2022, by Kimley-Horn.

Idling emissions assumed 15 minutes of idling[9] for each truck. The emissions rates were calculated using 2029 emissions factors; refer to Appendix A. This approach is conservative as it assumes no cleaner technology in future years.

Emergency Backup Generators, Boilers, and Water Heaters. Four diesel emergency backup generators, four natural gas boilers, and nine natural gas water heaters were included in the modeling. Emission factors from the South Coast Air Quality Management District *AB 2588 Quadrennial Air Toxics Emissions Inventory Reporting Procedures, Annual Emissions Reporting Program* (June 2020) were used for natural gas combustion associated with the boilers and hot water heater operations as this data is not provided by BAAQMD and is not geographically dependent. Generator emissions were derived from CARB OFFROAD emissions data.

Backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. Nonetheless, testing and maintenance emissions associated with four backup generators were included to be conservative. If backup generators are required, the end user would be required to obtain a permit from the BAAQMD and include the Best Available Control Technology (BACT) prior to installation.

Dispersion Modeling

The air dispersion modeling for the operational risk assessment was performed using U.S. EPA AERMOD dispersion model. AERMOD is a steady-state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the stack heights of the emission sources (not a factor in this case). AERMOD requires hourly meteorological data consisting of wind vector, wind speed, temperature, stability class, and mixing height. AERMOD regulatory defaults, the "Urban" modeling option for the County, and "Elevated" terrain were used for this analysis. In addition, National Elevation Dataset (NED) terrain data was imported into AERMOD for the Project. Surface and upper air meteorological data is provided by BAAQMD. Surface and upper air meteorological data from the San José International Airport Monitoring Station was selected as being the most representative for meteorology based on proximity to the Project site.

AERMOD was run to obtain the period (i.e., annual) average concentration in micrograms per cubic meter ($\mu g/m^3$) at the surrounding sensitive receptors as well as workers, students, and on-site patient and worker receptors. The period (annual) average concentrations were used to calculate the MICR, the maximum chronic hazard index (HI), as well as peak hourly concentrations to calculate the health impact from substances with acute non-cancer health effects. To achieve these goals, a receptor grid was placed over the Project site to cover the zone of impact. Due to the size of the Project site, nearby sensitive receptors were modeled with a 35-meter grid spacing. In addition, National Elevation Dataset (NED) terrain data was imported into AERMOD for the Project. The modeling and analysis was prepared in accordance with the BAAQMD Modeling Guidance for AERMOD.[10]

The emission sources in the model are line volume sources (comprised of smaller adjacent volume sources) for construction and truck operations. Construction line volume sources were assigned a release

[9] An idling time of 15 minutes per truck has been used per BAAQMD recommendations. Although the Project is required to comply with CARB's idling limit of 5 minutes, the BAAQMD recommends the on-site idling emissions should be estimated for 15 minutes of truck idling, which would take into account on-site idling that occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

[10] Bay Area Air Quality Management District, *BAAQMD Air Toxics NSR Program Health Risk Assessment (HRA) Guidelines*, December 2021.

height of 11.2 feet (3.40 meters). Operational sources include the loading dock idling area and off-site truck routes. Medium and heavy-duty operational vehicle emissions were assigned a release height of 10 feet (3.15 meters), a plume height of 20.6 feet (6.29 meters). A release height of 12 feet is the average stack height for trucks and the plume height is based on U.S. EPA guidance for vehicle volume sources. Four backup generators were modeled as point sources. The point source was assigned a release height of 16.4 feet (5 meters) for the generators. The boilers and water heaters were modeled as an area source. The area source was assigned a release height of 12 feet (3.60 meters).

The cancer risk calculations were based on applying age sensitivity weighting factors for each emissions period modeled. Age-sensitivity factors reflect the greater sensitivity of infants and small children to cancer causing TACs. The chronic and carcinogenic health risk calculations are based on the standardized equations contained in the OEHHA Guidance Manual. Only the risk associated with the worst-case location of the proposed Project was assessed. Risk levels were calculated according to the OEHHA guidance document, *Air Toxics Hot Spots Program Risk Assessment Guidelines* (February 2015).

Note that the concentration estimate developed using this methodology is conservative and is not a specific prediction of the actual concentrations that would occur at or near the Project site at any one point in time. Receptors are often indoors and not in one location over the course of a lifetime exposure. Therefore, risk levels identified in this report represent a worst-case scenario. Actual annual average concentrations are dependent on many variables, particularly the number and type of vehicles and equipment operating at specific distances during time periods of adverse meteorology. A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on these worst-case exposure duration scenarios. The chronic and carcinogenic health risk calculations are based on the standardized equations contained in the OEHHA Guidance Manual. Only the risk associated with the worst-case location of the Project was assessed (i.e., the maximally exposed individuals [MEI] identified in Section 5, below).

Risk and Hazard Assessment

Cancer Risk. Based on the OEHHA methodology, residential inhalation cancer risk from annual average DPM are calculated by multiplying the daily inhalation dose, cancer potency factor (CPF), age sensitivity factor (ASF), frequency of time spent at home, and ED divided by averaging time (AT), yielding the excess cancer risk. These factors are discussed in more detail below. Exposure through inhalation (Dose-air) is a function of breathing rate, exposure frequency (EF), and concentration of substance in the air. To estimate cancer risk, the dose was estimated by applying the following formula to each ground-level concentration:

$$\text{Dose-air} = C_{air} * (BR/BW) * A * EF * 10^{-6}$$

Where:

Dose-air	=	dose through inhalation (mg/kg/day)
C_{air}	=	air concentration (µg/m^3) from air dispersion model
(BR/BW)	=	daily breathing rate normalized to body weight (L/kg bodyweight-day)
A	=	inhalation absorption factor (unitless)
EF	=	exposure frequency (approximately 350 days per year for residential)
10^{-6}	=	conversion factor (micrograms to milligrams, liters to cubic meters)

OEHHA developed ASFs to consider the increased sensitivity to carcinogens during early-life exposure. In the absence of chemical-specific data, OEHHA recommends a default ASF presented in Table 4: Default Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates. Fraction of time at home (FAH) during the day is used to adjust ED and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. OEHHA recommends the FAH values presented in Table 4.

Table 4: Default Age Sensitivity Factors, Fraction of Time at Home, and Daily Breathing Rates

Age	Exposure Frequency (days/year)	Exposure Duration (years)	Age Sensitivity Factor[1] (ASF)	Fraction of Time at Home (FAH)	Daily Breathing Rate[2] (L/kg BW-day)
Residential					
Third trimester	350	0.25	10	85%	361
0 to 2 years	350	2	10	85%	1,090
Ages 2 through 8 years	350	7	3	72%	631
Ages 9 through 15 years	350	7	3	72%	572
Ages 16 and greater	350	14	1	73%	261
Worker[3]	250	25	1	N/A	230
Student[3]	180	9	3	N/A	640

1. Accounts for potential increased sensitivity to carcinogens during childhood.
2. 95th percentile daily breathing rate normalized to body weight (L/kg body weight-day) (95th percentile for less than two years old and 80th percentile for two years old and greater).
3. Worker and Student breathing rates are 95th percentile 8-hour breathing rates based on moderate intensity activity.

Source: California Office of Environmental Health Hazard Assessment, *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015.

To estimate the cancer risk, the dose is multiplied by the CPF, the ASF, the ED divided by AT, and the frequency of time spent at home (for residents only):

$$Risk_{inh\text{-}res} = (Dose_{air} * CPF * ASF * (ED/AT) * FAH)$$

Where:

$Risk_{inh\text{-}res}$	=	residential inhalation cancer risk (potential chances per million)
$Dose_{air}$	=	daily dose through inhalation (mg/kg-day)
CPF	=	inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF	=	age sensitivity factor for a specified age group (unitless)
ED	=	exposure duration (in years) for a specified age group
AT	=	averaging time of lifetime cancer risk (years)
FAH	=	Fraction of time spent at home (unitless)

Chronic Non-Cancer Hazard. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system. The following equation was used to determine the non-cancer risk:

$$Hazard\ Index = C_i/REL_i$$

Where:

Ci	=	Concentration in the air of substance i (annual average concentration in $\mu g/m^3$)
RELi	=	Chronic noncancer Reference Exposure Level for substance i ($\mu g/m^3$)

Acute Non-Cancer Hazard. The potential for acute non-cancer hazards is evaluated by comparing the maximum short-term exposure level to an acute REL. RELs are designed to protect sensitive individuals within the population. The calculation of acute non-cancer impacts is similar to the procedure for chronic non-cancer impacts. The equation is as follows:

$$\text{Acute HQ} = \text{Maximum Hourly Air Concentration } (\mu g/m^3) / \text{Acute REL } (\mu g/m^3)$$

Health Risk Computation. A health risk computation was performed to determine the risk of developing an excess cancer risk calculated on a 30-year exposure scenario using the approach and the daily breathing rates, age sensitivity factors, exposure duration, and fraction of time at home described in the OEHHA *Air Toxics Program Guidance Manual for the Preparation of Health Risk Assessments* (February 2015). Health risks were analyzed at the point of maximum impact and are a conservative estimate. The pollutant concentrations are then used to estimate the long-term cancer health risks to an individual as well as the non-cancer chronic health index.

The off-site impacts would occur from the on-site mechanical equipment and diesel trucks accessing the proposed Project. The cancer and chronic health risks are based on the annual average concentration of $PM_{2.5}$ (used as a proxy for DPM). As noted above, the acute, chronic, and carcinogenic health risk calculations are based on the standardized equations contained in the U.S. EPA *Human Health Evaluation Manual* (1991) and the OEHHA Guidance Manual (2015).

5 POTENTIAL HEALTH RISK IMPACTS

CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines. As the Project includes construction activities and operational sources near sensitive receptors (i.e., within the BAAQMD 1,000-foot zone of influence) an analysis of health risk impacts from TACs was performed for both construction and operations.

Carcinogenic Risk

Construction-related activities would result in Project-generated emissions of DPM from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g. demolition, clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, DPM is the primary toxic air contaminant of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site poses a health risk to nearby sensitive receptors.

Table 5: Carcinogenic Risk Assessment shows the health risk for the following scenarios: construction, operation, and combined construction and operation of the Project. Based on OEHHA *Risk Assessment Guidelines*, the exposure duration for a resident is 30 years, beginning with the third trimester. Operations would commence following construction of each phase. The analysis calculates risk based on exposure to construction concentrations during the first 10 years of the exposure duration and operational concentrations for the remainder of the exposure duration.

The reported annual pollutant concentrations in Table 5 are at the closest maximally exposed individual (MEI) at the residential receptors to the east of the Project site, the on-site patient and worker receptor at the existing hospital building, and the worker receptors to the west of the Project site. As shown in Table 5, the unmitigated construction risk at residential and on-site patient receptors would be 17 and 15 in one million, respectively. The unmitigated construction risk at the on-site worker and off-site worker receptors would be five in one million, respectively. Additionally, the unmitigated operational cancer risk at residential and on-site patient receptors would be three and four in one million, respectively. The operational risk at the on-site worker receptor would be three in one million and four in one million at the off-site worker receptor.

The unmitigated combined construction and operational cancer risk at the on-site worker receptor would be seven in one million and nine in one million at the off-site worker receptor. Further, the unmitigated combined construction and operational cancer risk at residential and on-site patient receptors would be 20 and 19 in one million, respectively. Therefore, the maximum unmitigated construction cancer risk and unmitigated combined construction and operational cancer risk would exceed the BAAQMD threshold of 10 in one million. The Project would implement Mitigation Measure HRA-1 to reduce cancer risk. Mitigation Measure HRA-1 requires the use of construction equipment that would meet CARB Tier 4 Final emissions standards in order to reduce diesel exhaust construction emissions. Implementation of Mitigation Measure HRA-1 would reduce cancer risk from Project construction to below the BAAQMD's 10 in one million threshold; refer to Table 5. Therefore, the Project's cancer risk would not exceed the BAAQMD's 10 in one million threshold and impacts associated with carcinogenic risk would be less than significant with mitigation.

Table 5: Carcinogenic Risk Assessment

Exposure Scenario	Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Significance Threshold?
Unmitigated			
Construction			
Residential Receptor	16.89	10	**Yes**
On-Site Patient Receptor	15.09	10	**Yes**
On-Site Worker Receptor[2]	4.91	10	No
Off-Site Worker Receptor[2]	5.03	10	No
Operations			
Residential Receptor	3.15	10	No
On-Site Patient Receptor	4.07	10	No
On-Site Worker Receptor[2]	2.49	10	No
Off-Site Worker Receptor[2]	4.03	10	No
Combined Construction + Operations			
Residential Receptor	20.05	10	**Yes**
On-Site Patient Receptor	19.16	10	**Yes**
On-Site Worker Receptor[2]	7.40	10	No
Off-Site Worker Receptor[2]	9.05	10	No
Mitigated[3]			
Construction			
Residential Receptor	3.49	10	No
On-Site Patient Receptor	3.52	10	No
On-Site Worker Receptor[2]	0.89	10	No
Off-Site Worker Receptor[2]	0.87	10	No
Combined Construction + Operations			
Residential Receptor	6.64	10	No
On-Site Patient Receptor	7.59	10	No
On-Site Worker Receptor[2]	3.38	10	No
Off-Site Worker Receptor[2]	4.90	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual (MEI) to the Project site.
2. CCR Title 24 Part 6 requires new development (i.e., the Project) to use MERV 13 air filtration on space conditioning systems and ventilation systems that provide outside air to the occupiable space of a room. A MERV 13 filter has a particle removal efficiency in the range of 80-90 percent. An 80 percent removal efficiency was conservatively used for the purposes of this study.
3. The mitigated exposure scenario accounts for implementation of Mitigation Measure HRA-1 which requires all heavy-duty off-road construction equipment to meet CARB Tier 4 Final. This would reduce construction risk levels below BAAQMD thresholds. No mitigation would be required for operations.

Source: Refer to Appendix A: Modeling Data.

As described above, worst-case construction risk levels based on AERMOD and conservative assumptions would be below the BAAQMD's thresholds for construction with Mitigation Measure HRA-1. Therefore, construction risk levels would be less than significant with implementation of the identified mitigation measure.

Mitigation Measures:

HRA-1 All construction equipment must meet the standards set forth below.

- All diesel-powered off-road equipment, larger than 25 horsepower, operating on the site for more than two days continuously shall meet Tier 4 Final U.S. Environmental Protection Agency (EPA) particulate matter emissions standards.
- If Tier 4 Final equipment are not available, other measures may include the use of added exhaust devices, alternatively fueled equipment, or a combination of

measures, provided that these measures demonstrate reduction in community risk impacts to a less than significant level, are verified by an air quality specialist, and approved by the City.

- The construction operations plan prepared by the construction contractor shall outline how the contractor will achieve the measures outlined in this mitigation measure. The plan shall include, but not be limited to the following:
    - List of activities and estimated timing.
    - Equipment that would be used for each activity.
    - Manufacturer's specifications for each equipment that provides the emissions level; or the manufacturer's specifications for devices that would be added to each piece of equipment to ensure the emissions level meet the thresholds in the mitigation measure.
    - How the construction contractor would ensure that the measures listed are monitored.
    - How the construction contractor would remedy any exceedance of the thresholds.
    - How often and the method the construction contractor would use to report compliance with this mitigation measure.

Level of Significance: Less than significant with mitigation incorporated.

Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[11]

Chronic non-carcinogenic impacts are shown in Table 6: Chronic Hazard Assessment. A chronic hazard index of 1.0 is considered significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the MEIR. It should be noted that there is no acute REL for DPM and acute health risk cannot be calculated.

Table 6: Chronic Hazard Assessment

Exposure Scenario[2]	Chronic Hazard	Acute Hazard[1]
Unmitigated Construction		
Residential Receptor	0.0202	N/A
On-Site Patient Receptor	0.0474	N/A
On-Site Worker Receptor[2]	0.0422	N/A

[10] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, available at https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary.

Exposure Scenario[2]	Chronic Hazard	Acute Hazard[1]
Off-Site Worker Receptor[2]	0.0380	N/A
Unmitigated Operation		
Residential Receptor	0.0009	0.0001
On-Site Patient Receptor	0.0019	<0.0001
On-Site Worker Receptor[2]	<0.0001	<0.0001
Off-Site Worker Receptor[2]	0.0067	<0.0001
BAAQMD Threshold	*1.0*	*1.0*
Threshold Exceeded?	**No**	**No**

1. DPM is the primary TAC occurring during construction. There is no acute REL for DPM and acute health risk cannot be calculated. The acute hazard would occur from natural gas boiler exhaust and is calculated using RELs from OEHHA.
2. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).

Source: Refer to Appendix A: Modeling Data.

The highest maximum chronic hazard index associated with DPM emissions from unmitigated Project construction would be 0.02 at the residential receptor and 0.05 at the on-site patient receptor. The highest maximum chronic hazard index associated with DPM emissions from unmitigated Project construction would be 0.04 at the on-site worker receptor and 0.04 at the off-site worker receptors. Additionally, the highest maximum chronic hazard index associated with DPM emissions from unmitigated Project operations would be 0.001 at the residential receptor, 0.002 at the on-site patient receptor, <0.0001 at the on-site worker receptor, and 0.007 at the off-site worker receptor. Therefore, unmitigated construction and operational non-carcinogenic hazards would not exceed the acceptable limits of 1.0 and impacts would be less than significant. Additionally, Mitigation Measure HRA-1 would further reduce chronic non-carcinogenic impacts by requiring all construction equipment to meet CARB Tier 4 Final emissions standards.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

Cumulative Health Impacts

Cumulative impacts are defined as two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. CEQA Guidelines 15065(a)(3) states "… 'Cumulatively considerable' means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."

Mobile and stationary sources within a 1,000-foot radius of the Project site were reviewed using BAAQMD's Stationary Source Screening Analysis Tools. One stationary source is located within a 1,000-foot radius of the project site. As shown in Table 7: Cumulative Operational Health Risk, cumulative impacts related to cancer risk and hazard would be less than significant and within acceptable limits.

Table 7: Cumulative Operational Health Risk

Emissions Sources	$PM_{2.5}$ (µg/m³)	Cancer Risk (per million)	Hazard
Project Emissions	0.005	3.15	0.02

Emissions Sources	$PM_{2.5}$ (µg/m³)	Cancer Risk (per million)	Hazard
Stationary Sources[2]			
California Skin Institute	0.00	0.05	0.00
Major Street Sources[1]	0.08	3.64	0.32
Highway Sources[1]	0.37	10.85	1.48
Railway Sources[1]	0.00	0.11	0.00
Cumulative Health Risk Values	**0.46**	**17.80**	**1.82**
BAAQMD Cumulative Threshold	*0.8*	*100*	*10*
Threshold Exceeded?	**No**	**No**	**No**

1. BAAQMD GIS data.
2. Good Samaritan Emergency Room is listed as an existing stationary source within BAAQMD's Stationary Source Data Inventory. However, this source will be demolished in Phase 1 of Project construction and is therefore not included in this analysis.

Source: BAAQMD's Stationary Source Data and GIS Mapping Tools, 2023.

Table 7 shows that cumulative impacts related to cancer risk and hazard would be less than significant and within acceptable limits. Additionally, cumulative $PM_{2.5}$ concentrations at the residential MEI would not exceed the BAAQMD's cumulative threshold of 0.8 µg/m³, the primary contributor to those concentrations is the existing highway sources near the Project area. The existing highway sources have a high $PM_{2.5}$ concentration (0.37 µg/m³). The highway sources represent approximately 80 percent of the total concentrations and are unrelated to the Project. The Project represents less than one percent of total cumulative $PM_{2.5}$ in the Project area.

The Project and the cumulative projects total $PM_{2.5}$ concentrations and cancer risk would not exceed BAAQMD cumulative thresholds. Therefore, the combined effects from both the proposed Project and related projects would not be cumulatively significant. The Project is also below the BAAQMD's incremental health risk thresholds with the implementation of Mitigation Measure HRA-1. Therefore, the incremental effect of the individual Project is also less than cumulatively considerable.[12] As the related cumulative TAC sources in the Project area do not exceed BAAQMD cumulative thresholds for cancer risk and the Project does not exceed the BAAQMD's incremental thresholds, impacts would not be cumulatively significant. Therefore, the project would have a less than cumulatively considerable contribution to less than significant cumulative health risk impacts.

Mitigation Measures: Refer to Mitigation Measure HRA-1.

Level of Significance: Less than significant and less than cumulatively considerable impacts.

Conclusion

As described above, impacts related to incremental excess cancer risk would be less than significant with implementation of Mitigation Measure HRA-1. Additionally, non-carcinogenic hazards are calculated to be within acceptable limits. Project and related project total $PM_{2.5}$ concentrations, cancer risk, chronic hazard, and acute hazard would not exceed BAAQMD cumulative thresholds. The Project's would not make a cumulatively considerable contribution to significant cumulative health risk.

[12] CEQA case law has held that any additional emissions in an impacted area does not necessarily create a significant cumulative impact, finding that "the 'one [additional] molecule rule' is not the law" (Communities for a Better Environment v. California Resources Agency (2002) 103 Cal. App. 4th 98, 120).

Mitigation Measures: Refer to Mitigation Measure HRA-1.

Level of Significance: Less than significant and less than cumulatively considerable impacts.

1 MMBTU = 0.00096432 MMSCF
1 year = 8760 hours
1 hour = 3600 seconds

MBH = 1,000 BTU per hour
MMBH = 1 million BTU per hour
MMBTU = metric million British thermal unit
MMSCF = million standard cubic feet
CAS Number = Chemical Abstract Service Registry Number
PAH = Polycyclic Aromatic Hydrocarbons
